In London we were hard pressed for a long time to find space for our continually expanding activities, and at one time, occupied premises at seven different addresses. We are now awaiting completion of the reconstruction and modernising of spacious premises in Hammersmith where we shall be able to house all sections of our London Organisation, excepting London Sales, which will remain in Kensington. These new premises will also give us the possibility of further expansion for many years to come.

The move into the new premises, which we hope will take place towards the end of this summer, and the re-equipping of our offices, as well as the progress with several recent development projects, requires additional capital. Your Directors have, therefore, decided to make a "Rights" Issue of 500,000 Ordinary shares at 1s. each on the basis of one new share for every seven shares held. It is expected to announce the price at which the shares will be issued shortly before the annual general meeting. (Price announced on May 17th.) It is anticipated that allotment letters will be posted on June 3, 1957.

It may interest you to know that it was 35 years ago last March that I laid the foundation of this business, starting with a small office in St. Paul's Churchyard. The original staff consisted of three people. Today your company, with its subsidiaries, employs nearly 1,000.

HOPEFUL OUTLOOK

With regard to the outlook for the current year, I am glad to say that the recent Suez crisis does not seem to have affected our line of business and, although it is too early to judge, I hope that we shall be equally successful in counteracting any adverse effect of the recent industrial unrest, providing it will not last too long.

The continued success of your company depends to a large extent on the wholehearted support and co-operation of our management and staff and I want to thank, on your behalf and on behalf of your Board, all members of our personnel at home and abroad for the excellent work and devotion to duty which they have shown during the past year.

The report and accounts were unanimously adopted; the proposed dividend was approved; the retiring director, Mr L. E. Brougham, was re-elected and the remuneration of the auditors, Messrs Peat, Marwick, Mitchell and Co., was fixed.

BANCO DI SANTO SPIRITO

ROME

Established 1605

Capital and Reserve Funds: Lit. 1.830.000.000

THE ANNUAL GENERAL MEETING of the Banco di Santo Spirito was held in Rome on March 30, 1957, the Marchese Giovanni Battista Sacchetti being in the chair. The following Balance Sheet was approved:—

Statement of Conditions as of December 31, 1956

ASSETS			LIABILITIES		
Cash and Balances with other Banks	Lit.	6.308.461.089	Capital	Lit.	750.000.000

It was further resolved to transfer Lit. 330.000.000 to reserves and to distribute a dividend of Lit. 50 (10%) per share.

THE CAPE ASBESTOS COMPANY LIMITED

CONTINUED GRATIFYING PROGRESS

MR ROBERT WALKER ON SUBSTANTIAL EXPORT SALES

The sixty-fourth annual general meeting of The Cape Asbestos Company Limited will be held on June 12th in London.

The following is an extract from the statement by the chairman, Mr Robert Walker, MBE, which has been circulated with the *report* and accounts for the year ended December 31, 1956: The Balance Sheet and Accounts of your Company for the year to December 31st last, show, I am pleased to say, an improvement on the results for the previous year. In view of the increased earnings for the year, your Board has felt justified in recommending a moderate rise in the rate of dividend which I trust will meet with approval.

The general pattern of the Group's activities in what is generally admitted to have been a *somewhat difficult year, was not* dissimilar to that of 1955, the emphasis being on a further growth in the sales of manufactured products and continued efforts further to improve the quality and increase the production of crude asbestos fibre.

TURNOVER

The Sales revenue of the Group in 1956 increased by approximately 13 per cent. The proportion of our turnover in manufactured goods which was shipped to export markets was approximately 22 per cent. Something in excess of 5 million dollars was earned in sales, principally of crude asbestos, both Blue and Amosite, to the North American Continent. These figures I regard as eminently satisfactory, and there is every indication that with the increased production which has been planned for our Mines they can be further improved.

Great credit is due to our Sales force for these results and it is gratifying to observe the way in which the expansion of your Company's activities into the various new fields to which I have referred over the past three or four years is dovetailing into a cohesive pattern.

I should also like to make a special reference to the success of our subsidiary companies in Canada and the United States of America, which are opening up new markets, and cementing relationships with existing customers.

FACTORIES

All the factories of the Parent Company maintained a high level of productivity throughout the year, and at Stirling, where our fine quality and successful range of mineral wool insulation products marketed under the name of ROCKSIL are manufactured, the projected doubling of the factory's capacity was completed late in 1956.

At Barking, where our largest factory is situated, efficiency has been further improved and additional facilities for the manufacture of ASBESTOLUX insulation board, the demand for which is exceptional, are being installed.

The output of your Company's principal insulation product, CAPOSITE high-temperature Amosite asbestos insulation reached a record level and the demand shows no sign of slackening during 1957. All your Company's insulating materials are eminently suited to the demands for insulation of atomic power stations, and to other nuclear developments.

Research, both fundamental and in relation to specific requirements, continues at our Central laboratory and there are a number of interesting projects under review.

SUBSIDIARIES

The difficulties which have been encountered in the last two years in the mining and treatment of Blue and Amosite fibre are still a source of some anxiety. In the Blue Asbestos fields, however, our major problems have been surmounted, and I am glad to be able to report that production has increased and is steadily increasing. The continued maintenance of a high standard of quality of treated fibre is a matter of the first importance to us, and more scientific methods of both mining and treatment are constantly being introduced.

In the Amosite fields, which are operated by the subsidiaries Egnep Limited and Amosa Limited, 1956 was not a happy period, though I am glad to say that since the turn of the year there has been a very definite improvement. We have every confidence in the fibre resources of the deposit, but production has been handicapped by a number of mining and physical difficulties and a sharp increase in costs was experienced. I can explain the situation shortly by saying that we are passing through a transition stage from relatively simple adit level operations to mining at deeper levels, with attendant problems of pumping and ventilation. With the efforts that have been made to increase production in tune with customer demand, the development of ore reserves has lagged behind to some extent and must now be speeded up.

CAPITAL EXPENDITURE

The provision of sufficient power to cover the increasing scale of operations is a necessity which is being tackled as energetically as possible, and the first section of a large steam generating plant came into commission during 1956. More houses have been built and more equipment for fibre treatment has been and is being erected. All these operations constitute a heavy drain upon the Group's resources of both money and skill. During the next two years capital equipment at the mines will call for very substantial expenditures and the total will be swollen when other plans for expansion of manufacturing capacity both in the United Kingdom and abroad are put into effect.

The cash position of your Company remains strong, and it is my belief that our programme can be financed from existing resources supplemented by current earnings.

The demand for both our highly specialised types of fibre, Blue and Amosite, remains as strong as ever.

The statement concluded with a review of the other subsidiary companies at home and overseas.

GOPENG CONSOLIDATED, LIMITED

MR D. W. THOMAS'S STATEMENT

The forty-fourth annual general meeting of Gopeng Consolidated, Limited, was held on May 15th at the Registered Office, Station Hill, Redruth.

Major W. E. Hosking (a director), presided, in the absence of Mr D. W. Thomas (Chairman).

The Reports and Accounts for the year ended September 30, 1956, having been circulated for the prescribed time, were taken as read, as was also the Chairman's Statement, circulated with the Reports and Accounts, which was as follows:

The Accounts for the financial year ended September 30, 1956, show a profit of £113,331, after payment to the Malayan government of £72,860 for Royalty on Ore Sales and the provision of £154,269 for United Kingdom and Malayan Taxation. Four dividends, each of 2s. per £1 stock paid in respect of the year under review, absorbed a nett amount of £91,026. From the available balance £13,812 was written off Capital Expenditure and £8,485 written off in respect of Rubber Estates Replanting Costs. After sundry small adjustments the balance unappropriated at September 30, 1956, was £57,983, an increase over the previous year of £125.

The attention of Stockholders is drawn to the Report of our General Managers, Messrs Osborne & Chappel, circulated with the accounts, where comparative figures of ground treated, tin ore recovered, etc., are clearly set out. The volume of ground treated was a little more than in the previous year and the recovery per cubic yard slightly higher and, in consequence, the amount of tin ore produced was 849.85 tons as against 758.73 tons during the year ended September 30, 1955. The General Managers anticipate that the same satisfactory rate of production will be maintained during the current year.

From the Moynalpy Estate a profit of £6,103 resulted; and from the Sanglop Estate, in which your Company owns a half interest, the profit was £1,924.

Stockholders have been advised as follows of the production of tin ore for the first 5 months of the current year: October, 1956-February, 1957—6,500 piculs=387 tons.

The Security position at the Mine and Estates continues to improve and no incidents occurred during the year.

I have pleasure once again to record our appreciation of the services of the General Managers, the Resident Manager, and the Staff at the Mine and the Estates.

INTERNATIONAL TIN AGREEMENT

Since the beginning of the current financial year the agreement has become operative and and an initial Buffer Stock of 15,000 tons metal, or its equivalent in cash, originally calculated at £640 per ton, is being established

Producers were of course unlikely to contribute metal at £640 per ton while it commanded a much higher price on the market and, consequently it seemed probable that the Buffer Stock would consist entirely of cash. It has now been announced that the International Tin Council has approved the raising of the floor price, with immediate effect, from £640 to £730 per ton. The complete range of prices therefore become as follows:

Below £730 per ton the Manager of the Buffer Stock must buy tin, between £730 and £780 per ton he may buy and between £780 and £830 per ton he may neither buy nor sell. The ceiling remains at £880 per ton, but the Manager may sell when the price is £830 per ton or over.

Since the inception of the Buffer Stock your Company has made the following payments in accordance with the provisions of the International Tin Agreement:

October, 1956	£3,068
November, 1956	£3,862
December, 1956	£3,173
January, 1957	£3,394
February, 1957	£2,940

TAKE-OVER BID

In October, 1956, a take-over bid for the whole of the Issued Capital of your Company was made by a London Finance House. In the opinion of the Board the offer was totally inadequate, and thanks to the support given to the Board by the Stockholders it was rejected by an overwhelming majority. On behalf of the Directors I take this opportunity of thanking Stockholders for their continued support of the Board and its policy.

REPAYMENT OF CAPITAL

At an Extraordinary General Meeting held on December 6, 1956, Special Resolutions were passed with a view to repaying 1s. 6d. on each 5s. Stock Unit. I regret the repayment has, at the time of writing this statement, not been made, but the Petition has been filed and application is proceeding. The Court has, however, required copies of the audited balance sheet and Accounts for the year ended September 30, 1956, to be produced, and so delay has been unavoidable, but the latest advices indicate that the Repayment should be possible shortly before or soon after the Annual Meeting.

It is with deep regret that I have to report the recent death of our co-Director, Mr Francis Tom Rostron, who had been a Director of this Company for ten years. Apart from being a most agreeable colleague, he was a mining engineer of great experience and gave unstintingly of his services to the affairs of this Company.

The Statement of Accounts and Balance Sheet, together with the Directors' Report, were received and adopted.

At the close of the meeting the Chairman announced that a second Intetim Dividend of 2s. per £1 Stock on account of the profits for the year ending September 30, 1957, had been declared, payable on June 28, 1957.

COMPAGNIE MARITIME BELGE (LLOYD ROYAL)

SOCIÉTÉ ANONYME

ANTWERP, BELGIUM

The Annual General Meeting of the Compagnie Maritime Belge was held on May 2, 1957, and the following are details of the report presented by the Board of Directors.

REVIEW

The demand for shipping space, which had risen steadily in 1955, showed an even greater increase in 1956.

In addition to the factors mentioned in last year's report, the closing of the Suez Canal made a contribution of its own. The alternative routing of vessels round the Cape severely cut the tonnage available whilst the disparity between supply and demand was accentuated.

The cost of tramp freightage for dry cargo increased by some 25 per cent in 1956. Increases in charter rates and the price of secondhand ships followed a similar trend. In accordance with their traditional policy the established shipping lines participating in freight conferences made only moderate increases in their charges.

Total tonnage currently on order or under construction exceeds 26 million tons. Shipyards' order books are full, and many of them have work in hand to last until 1962. Shipowners wishing to ensure normal replacement of their fleet are obliged to place orders several years before renewal becomes necessary. At the same time, the shipping companies face rising operative costs, which are not being offset by the moderate increase in freight charges. These higher costs are reflected in every sector by demands for higher pay and shorter hours, and by rises in port expenses, maintenance costs, equipment prices and purchase of fuel and food supplies.

Current developments point to a continuation of this trend in 1957, a factor which must be taken into account in future decisions in the industry.

FUTURE DEVELOPMENTS

For many years the policy has been to offset rising costs by improving operating efficiency.

During the last year this policy led to a number of achievements. They include the commissioning of the mixed liner *Jadotville*, and the fast freighters *Lukuga, Lusambo* and *Lulua*.

The sister ship to the *Jadotville* was launched on January 10, 1957, and christened *Baudouinville*.

During 1955, the Company ordered four ships of a new design. In 1956, to ensure planned replacement of the fleet, a further order for four ships was made, to be delivered in 1959 and 1960. The first four of these will be assigned to the East African routes. The last four ships will be on the West African run.

Competition on the main route Antwerp-Congo caused a drop in freight rates in 1956 and led to the conclusion of an agreement. The rates in force in 1953 were restored as from February, 1957, and thus once again ensured commercial stability.

PROFIT

The result of the past year's operations was a profit of Bfrs.115,176,248—which, with the balance of Bfrs.1,685,073 brought forward from 1955, produced a total of Bfrs.116,861,321—which it is proposed to distribute as follows:

(1) A net dividend of 6 per cent on 31,540 units of registered stock at Bfrs.100 each, totalling	Bfrs.222,636
(2) To be carried forward ...	Bfrs.1,557,496
The balance of Bfrs. 115,081,189 is to be allocated as follows in accordance with Article 36 of the Company's statutes:	
9 per cent to profit sharing rights	Bfrs.10,357,307
91 per cent to 323,692 non-par shares ...	...Bfrs.104,723,882

The report and accounts were adopted.

BOARD OF DIRECTORS

MM. Paul Gillet, Chairman; André de Spirlet, Managing Director; Comte Gobert d'Aspremont Lynden; Carl de Brouwer; Baron Edouard Empain; John Hall Joyce; Robert Lippens; Alfred Loesch; Aimé Marthozh; Frédéric Osterrieth; Gilbert Périer; Léonard Scraeyen.

BANK OF BRITISH WEST AFRICA

SATISFACTORY OUTCOME OF ACTIVITIES

The sixty-third annual general meeting of the Bank of British West Africa Limited will be held on June 13th at the Office of the Company, 37 Gracechurch Street, London, E.C.3.

The following is an extract from the circulated statement of the Chairman, The Right Honourable Lord Harlech, KG, GCMG:

The extension of our network of branches undertaken in the past few years now provides a very good coverage of banking services throughout the territories.

The Balance Sheet shows some contraction in total, due to the loss of deposits in London, but I am pleased to tell you that in fact the volume of our business in West Africa shows again a steady increase. The Profit and Loss Account records an improvement of some £35,666 on the year's trading which I am sure Shareholders will regard as a satisfactory outcome of our activities.

The further improvement in our profits justifies an increase in the distribution to Shareholders and your Directors have much pleasure in recommending a final dividend at the rate of 7 per cent, which together with the interim dividend of 5 per cent paid in November last makes a total of 12 per cent for the year. This is an increase of 2 per cent, compared with the distribution for the year to March, 1956.

MOVEMENT TOWARDS SELF-GOVERNMENT

In all the West African territories the movement continues towards self-government. The successful conclusion of the arrangements for placing Ghana under her own Constitution was a great credit to the statesmanship of all those involved. Negotiations for further constitutional advance in Nigeria are proceeding. The precedent in Ghana has inevitably brought forward the aspirations of Nigerians.

The scheme for technical help very recently agreed between Ghana and the United Kingdom should be of great value not only in economic and administrative development but in drawing even closer the ties of mutual understanding and friendly co-operation.

There has been deep disappointment in West Africa occasioned by the fall in the price of cocoa. For several years these territories have profited by world prices which have been disproportionately high by comparison with other commodities. Happily a large part of this excess income has been channelled into reserves and the people have been saved from the serious slump into which they would have been plunged had the surplus not been syphoned off into Government controlled stabilisation funds, development schemes and reserves. Current prices leave little surplus for the financing of further programmes but the success of a sound policy of orderly marketing is very apparent in the recently prevailing conditions.

The statement then reviewed developments in Nigeria, Ghana, Sierra Leone and The Gambia, and concluded:

Our experience in these territories now extends over some 63 years. In addition we have our offices in Duala, French Cameroons, and in Tangier, Morocco. With our specialised knowledge and connections, I am sure we can look to the future with confidence.

POWER SECURITIES CORPORATION, LIMITED

LARGER PROFIT AND DIVIDEND

The thirty-fourth annual general meeting of this company will be held on June 12th in London.

The following is an extract from the Statement by the Chairman and Managing Director, Sir Andrew M. MacTaggart, circulated with the report and accounts:

In submitting the results for the year ended December 31, 1956, I do so with a feeling of satisfaction that, despite the somewhat stringent time we have been through during the past year, we are able to produce figures which I trust you will regard as satisfactory also.

The consolidated gross profit of £1,292,203, shows an increase of just over £198,000 on the previous year's figure. We have, however, had to meet higher expenses including depreciation of property and plant, which has increased by £119,000 over last year's figure. This year we have made provision for Contract Contingencies in the Profit and Loss account to the extent of £100,000, whereas in 1955 we transferred a similar amount to Contracts Reserve in the Appropriation account. The result is that the consolidated net profit of £222,680 is £88,316 less than the previous year, but for a true comparison the £100,000 provided for Contract Contingencies should be added to the net profit. If this is done the result is an increase compared with the previous year of £11,684. Adding to the consolidated net profit the balance brought forward from the previous year, there is a total of £398,769.

Your Board of Directors have given careful consideration to the results of the various companies in which this Corporation is interested, and having made ample provision for foreseeable risks, recommend that the dividend on the Ordinary shares shall be increased by one per cent, making 11 per cent for the year.

BALFOUR, BEATTY & COMPANY

Our principal source of income continues to come from our Subsidiary Companies, which comprise a wide cross-section of the constructional industries. Balfour, Beatty & Company, Limited, our principal Subsidiary Company, I am pleased to report continue to hold a leading position in civil and electrical engineering contracting, both at home and abroad, despite the ever-changing conditions one has to face in a world of cosmopolitan politics, creating at times situations which completely surpass anything one would reasonably expect and foresee in the constructional industry, and which add one more uninsurable risk to those we already run.

I ventured to remark in my statement last year that the Middle East was, in my opinion, problem number one for this country, and I am afraid it still is. It is a problem which must be solved if we want to be assured of a period of peace and prosperity in the world. All parties concerned appear to have collected different data, and so are unable to resolve a common formula, without which no real solution is possible.

We are well equipped to deal with any constructional work which may come our way, although undoubtedly the financial restrictions will affect our usual progressive adventure into new fields—even if only temporarily—but we are hopeful that the proposals regarding Overseas Trade Corporations in the Finance Bill will prove helpful.

THE UNITED MOLASSES COMPANY LIMITED

IMPROVED RESULTS

The thirty-first annual general meeting of this company will be held on June 11th in London.

The following is an extract from the circulated statement of the chairman, Mr G. W. Scott, CBE, for 1956:

The gross profits of the Group for 1956 at £7,101,533 showed an increase of £1,930,879 over the gross profits for the year 1955. This improvement is largely due to the increased level of tanker and general cargo freights prevailing during the year. The benefit derived from the incorporation of the results of E. N. Bray Limited and The Olympic Portland Cement Company Limited was also included for the first time.

Taxation again proved a heavy burden on the company's revenue and absorbed more than 60 per cent of the gross profits of the company after charging depreciation. The recent Budget concessions are welcome but will not materially affect the burden of taxation likely to be borne by your company for the ensuing year.

Molasses prices in producing areas showed a steady and substantial increase during 1956.

The new year started off well, with freights remaining at a satisfactory level and profits on the molasses trading and manufacturing well maintained. In view of the good start in trading your company has experienced during the first few months, it is felt that the profits for the ensuing year should be reasonable and sufficient to cover distributions at the rate for 1956.

ASSOCIATED FISHERIES LIMITED

At the General Meeting held on May 21st in London Mr W. A. Bennett reported another period of satisfactory trading by the Group. Keen competition continues in the Fishing Industry and these results were only obtained by efficient management, rigorous control of rising costs and continuation of a progressive policy. Our fleets' daily rate of catch attained a new record level and the average price realised also improved. This combination of higher productivity and higher price was quite insufficient to cover the increase in catching costs. These alarming increases in production costs are much too large to be absorbed either by increased effort or efficiency. Over the past three years our costs per sea day have risen by 35 per cent with only an increase of 8½ per cent on the average price realised.

The turnover of the Group rose by over £1,300,000, or 19 per cent, to a new record of £10,250,000. Excellent quality of fish, good value for money, and the Industry's advertising campaign stimulated public demand. After covering all costs and depreciation the profit remaining out of every 20s. turnover is 1s. 1½d. Taxation absorbs 6½d., net dividends 2½d., leaving 4½d. retained against the ever increasing costs of replacement and development.

Terrible weather conditions, lack of fish on the grounds, and mounting costs, including the staggering increase of 40 per cent in fuel oil costs consequent upon the Suez crisis, have markedly affected the results of the current year to date. Such testing conditions have been surmounted in the past, and the endeavours of your Board in expansion and development testify to their confidence in the future.

THE LONDON ASSURANCE

COMBINED ASSETS OF GROUP EXCEED £62 MILLION

The Annual General Court of The London Assurance will be held on June 12th in London.

The following is an extract from the circulated statement of the Governor, Mr R. Olaf Hambro:

The figures for 1956 show a further substantial increase in our premium income, the total for the Fire, Accident and Marine Departments amounting to £22,723,405, as compared with £17,540,757 in 1955. The post-war growth in income has continued, and the only indication of a levelling-off in the upward trend is in the Marine Department.

Over-all, the year has been a bad one. Notwithstanding a notable maintenance of our excellent profit record in the Marine Department, the adverse experience in the Fire and Accident Departments, principally in North America, has produced a total underwriting deficit. Broadly speaking, our two main troubles have been, as with other companies carrying on a similar business, the further deterioration of the Motor Account all over the world, particularly in North America, and in the latter territory a parallel deterioration in the experience of the Fire Department.

Life Account.—Our new Life Assurance business has for the first time exceeded £10 million, an increase of £1,600,000 on the previous year. The premium income in the Life Assurance Account increased by £140,000 to £2,443,537, and the Fund from £23,035,954 to £24,735,297.

Fire Account.—The fire premium income amounted to £8,937,689, compared with £8,521,416. The claims cost at £4,466,747 represented just 50 per cent of the premiums. An underwriting loss of £453,910 had to be met by a transfer from Profit and Loss Account.

Accident Account.—The premium income in the Accident Department shows a very large increase from £5,832,852 to £10,537,691. Of this increase, amounting to over £4,700,000, approximately £3 million represents the business of the Guarantee Insurance Company of Los Angeles and the Securitas Insurance Company of Bremen, now included in the total figures for the first time. It has been necessary to transfer from Profit and Loss Account the sum of £707,278 to balance the Account. As I have said, the Motor Account is principally responsible for this unfortunate result. It is greatly to be hoped that premiums and claims can be brought into more proper relation before very long.

Marine Account.—The total premiums at £3,248,025 show a small increase compared with the 1955 figure of £3,186,489. The transfer to Profit and Loss Account is £550,000, the same amount as in 1955.

PROFIT AND LOSS ACCOUNT

When a balance is struck, a net figure of £68,362 is brought out, and this represents the over-all loss for the Group on the year's operations. The Directors recommend that the dividend be maintained at the same rate as for 1955.

Balance Sheet.—The combined assets of the Group in the General Fund and the Life Department show very substantial increases. The total is now £62,412,563, as compared with £55,945,795 at the end of 1955.

"MONTECATINI" SOCIETA GENERALE PER L'INDUSTRIA MINERARIA E CHIMICA

(Milan, Italy)

The Ordinary General Meeting of "Montecatini" has been held in Milan under the chairmanship of Count Dr Carlo Faina. The Report of the Board of Directors whilst pointing out the contribution made by Montecatini to the economic progress recorded in Italy during 1956, emphasises the interest with which the Company has been following the programmes and agreements relating to a Common European Market. The Company reasonably expects to achieve within a European framework even more favourable results than those firmly established so far by operating mainly in the field of Italian economy.

The Report also expresses the hope that with an eye to the European community the Italian Parliament will make arrangements at the earliest possible moment to bring home legislation into line with the legal standards of the other countries, especially as regards Patent Law.

The Report then goes on to describe the results achieved in 1956 in the various spheres of operation of Montecatini, making special mention of the production of pyrites, blende, galena, aluminium and zinc. So far as the power division is concerned, special attention is drawn to the plans of the SORIN (Societa Ricerche Impianti Nucleari) which was formed on a basis of equal partnership by Montecatini and Fiat for operation in the field of atomic power. It is the purpose of SORIN to design and develop the experimental equipment and to bring into being plant for the utilisation of this source of power.

Prospecting for liquid and gaseous hydrocarbons has been intensified since the promulgation of the new Italian law which governs the field of prospecting for and exploiting hydrocarbon deposits. Nonetheless, it is hoped that a few modifications will be made to this law so as to give greater incentive to activities in this sector.

Progress made in chemical industry was satisfactory, especially in those branches of Montecatini which have become traditional: sulphuric acid (production in 1956: 1,297,598 tons), phosphatic fertilisers (production: 1,268,000 tons), nitrogen, chemical products for industry, fungicides and insecticides, paints and varnishes, and pharmaceutical products. Montecatini has brought about a marked increase in its plastics production; and a similar increase has been attained in the production of polyamide fibres. In particular, fresh successes have been achieved in sales of "Nailon" and "Terital."

In the field of hydrocarbons and their derivatives the Report mentions the commencement of work on an industrial scale in the polymerisation of olefines. This is a field which has been opened up to chemical industry by the researches carried out, using original processes, by Montecatini. Work was carried on in 1956 on the erection at the Ferrara Works of the new plant for the production of one of these new products: polypropylene. This new plastic material has been given the name "Moplen." Its mechanical strength and resistance to heat and to chemicals are such as to assure it a paramount position among other thermoplastic materials already known. For this reason the applications of this material are extremely numerous. The year 1956 also witnessed the continued success of the Fauser-Montecatini production processes abroad. In point of fact, contracts have been awarded for a further 25 installations for third parties in various countries. The number of employees also increased during 1956: Labour costs rose from 41,200 million lire in 1955 to 44,900 million lire in 1956.

Montecatini's Balance Sheet, which was unanimously adopted, closed on December 31, 1956, showing a net profit of 10,870,093,641 lire as against 10,178,846,649 lire in 1955. Profits totalling 9,660,000,000 lire rank for distribution to shareholders, equivalent to a dividend of 115 lire for each of the 84 million shares with a nominal value of 1,000 lire which made up the capital of the Company on December 31, 1956.

LUNUVA (CEYLON) TEA & RUBBER ESTATES LIMITED

MR H. W. HORNER'S STATEMENT

The Annual General Meeting of the Lunuva (Ceylon) Tea and Rubber Estates, Limited, will be held on June 13th in London.

The following are extracts from the address by the Chairman, Mr H. W. Horner, circulated with the report and accounts:

The tea crop for the year was nearly 9½ million pounds, only a little short of that harvested in 1955. The rubber crop, at just over 1½ million pounds, was slightly below the estimate but in excess of the actual crop for 1955.

Tea realised an average price (including 104,512 lb. unsold at the time of completion of the accounts and conservatively valued) of 40.82d. a lb. net, an increase of 3.91d. on the average for 1955. The comparable net cost per lb. shows an increase of just under 1d. Tea export duty was maintained throughout the year at 65 cents (about 1s.) a pound.

Profit, before taxation, is £464,450 and, after deducting the net tax and making an adjustment in respect of tax for previous years, the amount carried to appropriation account is £200,270 compared with £156,033 for the previous year. The Board recommend a final dividend of 19 per cent, making 25 per cent for the year.

For the current year production of tea is estimated at 9½ million pounds and of rubber 1½ million pounds. Climatic conditions so far have been good and there is every prospect of securing the crops. The trend of selling prices for tea of the character produced by this company should continue to be profitable, but is, of course unpredictable; rubber prices are reasonably secure. Our estates are in excellent order and well managed.

APPOINTMENTS

INVESTMENT SUPERVISION IN CANADA

Leading Canadian trust company has attractive positions for men (aged 30/45) with experience in the supervision of investment portfolios and capable of analysing financial statements and industrial trends.

Persons interested are invited to submit detailed accounts of their background and experience, giving names of two references and accompanied by two photographs to:

Messrs. Thomson, Dickson and Shaw W.S., 1, Thistle Court, Edinburgh, Scotland.

Arrangements will be made to interview selected applicants in the latter part of June.

MARKET RESEARCH EXECUTIVE

Applications are invited from fully experienced men (aged 27/35 years) for vacancies in the Marketing Research Division on London of a large manufacturer of consumer goods. Applicants must have had at least five years' practical experience in the design of consumer studies covering sampling procedures, questionnaire construction and report writing. Appointments will be permanent and pensionable. Starting salary not less than £1,000 per annum.—Replies, which should give full details of qualifications and experience, will be treated in confidence and should be addressed to Box 696.

Membership of the F.S.S.U. and Children's Allowance Scheme.—Applications must be sent not later than June 15, 1957, to the Registrar, the University Manchester, 13, from whom further particulars and forms of application may be obtained. Overseas candi*dates may apply by letter (no forms)*, giving qualifications and experience and names of three persons to whom reference may be made.

ECONOMIST. British Nylon Spinners, Ltd., invites applications from honours graduates in economics or commerce for an interesting and responsible post in its Commercial Department. Duties will be concerned with economic research and forecasting and export intelligence, covering a wide range of markets. There will also be opportunities for the study of special problems, including those connected with the *European Trade Area* proposals. Preference will be given to applicants with (1) some economic research experience and (2) a good knowledge of *German.* Both starting salary and prospects are good.—Applications to Personnel Manager, Pontypool, Mon.

CAREER OPPORTUNITIES IN CANADA

Leading Canadian Trust Company, which performs a wide range of fiduciary functions and offers careers in estate administration, corporate financing and investment management, has attractive openings in its various offices for graduates (aged 22-35) in Arts, Law, Economics or Accountancy, with excellent *opportunities* for advancement in this rapidly expanding organisation.

Persons interested are invited to submit *detailed accounts* of their background, giving names of two references and accompanied by two photographs, to:

Messrs. Thomson, Dickson and Shaw, W.S., 1 Thistle Court, Edinburgh, 2; Messrs. A. and L. Goodbody, 24 Dame Street, Dublin, Eire.

Arrangements will be made to interview selected applicants in the latter part of June.

UNIVERSITY OF GLASGOW

LECTURESHIP AND ASSISTANTSHIP IN SOCIAL AND ECONOMIC RESEARCH

Applications are invited for a Lectureship and for an Assistantship in Social and Economic Research, tenable from October 1, 1957. Salary scales: Lecturer—£900-£1,650; Assistant—£700-£850. Initial salary according to experience and qualifications. F.S.S.U. and family allowance benefits.

Applications (6 copies) should be lodged, not later than June 15, 1957, with the undersigned, from whom further particulars may be obtained.—Robert T. Hutcheson, Secretary of University Court.

OTHER NOTICES APPEAR ON PAGES 750 AND 751.

APPOINTMENTS

UNIVERSITY OF SOUTHAMPTON

Applications are invited for the post of Lecturer or Assistant Lecturer in Sociology or Psychology with Sociology. Salary Scales : Lecturer, £900 x £50—£1,350 x £75—£1,650 ; Assistant Lecturer, £700 x £50—£850. Appointment may be made at any point on the scale appropriate to the candidate's qualifications and experience. Duties to commence on October 1, 1957.—Further particulars should be obtained from the Secretary and Registrar, to whom applications (7 copies) should be sent not later than June 15, 1957.

YOUNG & RUBICAM, ADVERTISING

REQUIRE

A SENIOR MARKETING EXECUTIVE with at least five years' experience on either the agency or client side, in the preparation and supervision of marketing plans for nationally advertised consumer goods. He will be an advantage to have had practical selling experience ; but the essential quality required is a capacity to analyse marketing facts objectively and to co-ordinate advertising, sales and merchandising policy in a comprehensive plan that will sell goods.

A SENIOR RESEARCH EXECUTIVE with at least three years' experience in a responsible market research position and a good degree in economics or one of the social sciences. This man will be required to handle the planning and analysis of market research of all kinds on an important group of accounts. He should have the capacity to present his findings, and to make constructive recommendations to groups of people inside and outside the agency.

Applications, which will be treated with the strictest confidence, should be sent to :
The Personnel Manager,
Young and Rubicam, Ltd.,
285 Regent Street,
London W.1.

THE UNIVERSITY OF SHEFFIELD

DEPARTMENT OF EXTRAMURAL STUDIES
(Amended advertisement)

Applications are invited for the post of STAFF TUTOR in Industrial Relations/Economics to take day-release and normal evening classes, and to begin duties as early as possible in the session 1957/58. Initial salary according to qualifications and experience on new salary scales that are being introduced and are expected to be £700 x £50—£850 for a probationary post and £900 x £50—£1,350 x £75—£1,650 for a full Staff Tutor, with F.S.S.U. provision and family allowance.—Further particulars should be obtained from the Registrar to whom applications (12 copies) should be sent by June 8, 1957.

UNIVERSITY OF ABERDEEN

Applications are invited for the post of Lecturer in Political Economy. Salary scale (b) at present £950-£1,350, or scale (a), at present £650-£950 ; maximum scale (b) on revised scales expected to be £1,650 ; F.S.S.U., child allowance, and removal allowance.

Further particulars should be obtained from the Secretary, The University, Aberdeen, with whom applications (8 copies) should be lodged by Wednesday, June 5, 1957. Applicants outside the British Isles may submit one copy.

UNIVERSITY OF NOTTINGHAM

DEPARTMENT OF EXTRA-MURAL STUDIES

Applications are invited from graduates for the appointment of a STAFF TUTOR IN ECONOMICS AND INDUSTRIAL RELATIONS which may be made in the grade of Assistant Lecturer or Lecturer. Salary scales : Assistant Lecturer £700 to £850 ; Lecturer £900 to £1,300 to £1,650 ; plus superannuation and family allowances.—Conditions of appointment and form of application, which should be returned not later than Friday, June 21st from the Registrar.

UNIVERSITY OF ST ANDREWS

LECTURESHIP IN POLITICAL ECONOMY

The University Court of the University of St. Andrews invites applications for a Lectureship in Political Economy in St. Salvator's College. Preference will be given to a candidate who has a particular interest in Welfare Economics, the economic development of Britain and U.S.A. in the present century, and the history of economic doctrine. The appointment will date from October 1, 1957. The present salary scale is £650 x £50 to £1,350 per annum (subject to an efficiency bar at £1,000), but the scale is under review and the successful candidate will be placed at a point on the newly revised scale according to qualifications and experience. The post carries F.S.S.U. benefits and family allowances, and a grant towards expenses of removal will be made.—Further particulars may be obtained from the undersigned, with whom five copies of the application, together with the names of three referees, should be lodged not later than June 15, 1957.

D. M. DEVINE,
Joint Clerk to the University Court.
College Gate, St. Andrews.

THE DURHAM COLLEGES

IN THE UNIVERSITY OF DURHAM

Applications are invited for the post of LECTURER IN POLITICS IN THE DEPARTMENT OF SOCIAL STUDIES from October 1, 1957. The salary scale attaching to the appointment will be £900—£1,650 a year.

Applications (three copies) together with the names of three referees, should be sent not later than June 18, 1957, to the Secretary, 38 North Bailey, from whom further particulars may be obtained.

THE POLYTECHNIC

309, REGENT STREET, W.1
SCHOOL OF COMMERCE

Applications are invited for a full-time post as Grade B teacher to take Economics (Principles and Applied) to final Economics degree standard, duties to commence if possible on September 1st next.

The salary scale for a graduate commences at £725 rising by annual increments to a maximum of £1,100 plus London allowance of £36 or £48 per annum. Additional allowances are payable for a good honours degree and training where applicable. The commencing salary may include increments in respect of previous teaching or professional experience.

A form of application, which should be returned not later than two weeks from the date of this advertisement, may be obtained on application to the undersigned.—J. E. Richardson, Director of Education.

OTHER NOTICES APPEAR ON PAGE 749.

NATIONAL COAL BOARD

NORTH EASTERN DIVISION

Divisional Staff Training Officer required at Divisional Headquarters, Sheffield (salary range £1,710—£2,275 per annum) to take charge of the Staff Training Branch of the Divisional Staff Department, and report to the Staff Director. He will be responsible for the development and operation of training schemes in accordance with the National Coal Board's policy, of : (1) education and training for non-industrial staff and junior officials, including courses and conferences, and management training schemes ; (2) courses of further education for certain industrial employees, including apprentices, in collaboration with the Department responsible for their practical training. Candidates should have broad administrative experience, a keen interest in the work and the ability to organise and develop, within the Yorkshire coalfield, the arrangements for education and training referred to above ; a technical qualification would be an advantage.

Apply, giving full details, to Staff Director, N.C.B., Holmwood House, Lodge Hill Road South, Sheffield 11, by May 31, 1957. Mark envelopes "Staff Vacancy," and quote N.E.V 141 (T.L.).

ENGINEERING IN THE CHEMICAL INDUSTRY?

Why is the Chemical Industry of interest to the Engineer ? Firstly because it uses a wider selection of engineering plant and equipment than any other branch of industry ; secondly, because the problems which it has to tackle are such that their solution depends as much on the Engineer as on the Chemist. The industry is expanding rapidly, and at

IMPERIAL CHEMICAL INDUSTRIES LTD., WILTON WORKS

over 4,700 men are working on the design and construction of the largest single project in Britain's chemical history. Wilton Works is a manufacturing centre with its own Power Station, where any Division of I.C.I. can build and operate production units. Twenty-one plants are in operation to-day, and included in these are "Perspex," "Terylene" and Titanium. The number of

MECHANICAL, ELECTRICAL AND INSTRUMENTATION ENGINEERS

required for design, construction, operation and Work Study is steadily increasing as the Works continue to grow.

Salaries depend on ability and experience and are reviewed annually after appointment. Promotion is by merit alone and individuals are considered at regular intervals. Help will be given with housing and removing. The design offices are pleasantly situated in the parklands of Wilton Castle, which lies at the foot of the Cleveland Hills.

Suitable applicants who should possess an honours degree will be invited for interview at the Company's expense. Please write to the Staff Manager, Imperial Chemical Industries, Ltd., Wilton Works, Middlesbrough, Yorkshire quoting reference 390/101.

SOLICITORS are invited to apply for an appointment in the Legal Department in London of a large industrial corporation. Applicants must have experience of conveyancing and be prepared to carry through substantial transactions with a measure of supervision and ready, if required, to undertake other legal work. Initial salary between £848 and £1,100 according to qualifications and experience. Good prospects for an able and energetic man. Superannuation Scheme.

Write, giving particulars of age, education qualifications and experience, to Box 698 before June 5, 1957.

UNIVERSITY OF BIRMINGHAM

FACULTY OF COMMERCE AND SOCIAL SCIENCE
EDWARD WILSHAW POSTGRADUATE EXHIBITION

One exhibition of the order of £200, but the amount to be determined in each case by the applicants' merits and circumstances, will be offered each year from a fund founded by Sir Edward Wilshaw, KCMG, DL, LLD, FCIS, JP. The Exhibition is open to graduates of this and other universities who wish to prepare themselves for careers in business administration and management and who propose to read for the Graduates' Commerce Diploma in business administration.—Applications (two copies), including the names of two referees should be sent by June 15, 1957, to the Registrar, the University, Birmingham 15.

UNIVERSITY OF BIRMINGHAM

The University will offer a number of Scholarships to graduates and to those expected to graduate this summer who wish to read for higher degrees in the Faculty of Commerce and Social Science. There will be opportunities for advanced study and training in research in all the main departments of the Faculty and in subjects common to more than one department.

Further particulars may be obtained from the Registrar, the University, Birmingham 15, to whom applications should be sent before June 15, 1957.

UNIVERSITY OF GLASGOW

ASSISTANTSHIP IN POLITICAL ECONOMY

Applications are invited for an Assistantship in Political Economy, tenable from October 1, 1957. Salary scale : £700—£850. Initial salary according to qualifications and experience. F.S.S.U. and family allowance benefits.

Applications (3 copies) should be lodged, not later than June 10, 1957, with the undersigned, from whom further particulars may be obtained.—Robert T. Hutcheson, Secretary of University Court.

UNIVERSITY COLLEGE, IBADAN, NIGERIA

DEPARTMENT OF EXTRA-MURAL STUDIES

Applications are invited from Honours graduates for (A) 3 Assistant Tutorships or Tutorships (Grade II) to work in the Northern and Western Regions (B) one Tutorship (Grade II) in Industrial Relations.

Initial appointment 3 years from October, 1957.

Salary scales :

Tutor (Grade II) : £1,000 x £50—£1,300 p.a.
Assistant Tutor : £800 x £50—£900 p.a.

Entry point determined by qualifications and experience. Allowance for up to 3 children £50 p.a. per child resident in Nigeria, £100 p.a. per child resident elsewhere. Part-furnished accommodation at rent not exceeding 7.7 per cent. of salary. Passages for appointee, wife and up to 3 children under 11 years on appointment, overseas leave and termination. F.S.S.U. Outfit allowance £60. Basic tour 15-18 months.—Detailed applications (8 copies) naming 3 referees by June 21, 1957, to Secretary, Inter-University Council for Higher Education Overseas, 29, Woburn Square, London, W.C.1, from whom further particulars may be obtained.

NORTH WESTERN GAS BOARD

CENTRAL LANCASHIRE GROUP
STATISTICAL ASSISTANT

Applications are invited for the above pensionable appointment at a salary within Grade A.P.T. 9 (£795/£895 p.a.).

The successful applicant will be required to deal with production and other statistics throughout the Group. Applicants should be suitably qualified and be experienced in the preparation and use of industrial statistics.

Detailed applications, giving the names of two referees, should reach the General Manager, Central Lancashire Group, N.W.G.B., Stanley Buildings, Silver Street, Bury within 14 days.

FIFE COUNTY COUNCIL

ORGANISATION AND METHODS

Applications are invited for appointment as Organisation and Methods Officer. The successful candidate will be attached to the County Chief's Department, and will be the head of an Organisation and Methods section which is being established to provide a service for all departments of the Council. Applicants should have experience in the operation of an Organisation and Methods Department and hold appropriate professional or other qualifications. Salary commensurate with the duties and responsibilities to be undertaken, but not less than a scale commencing at £1,500 per annum. Housing accommodation may be provided if required. Medical examination for admission to Superannuation Scheme. Interviews may be arranged to take place in London or elsewhere. Applications, stating age, experience, qualifications, etc., and accompanied by copies of recent testimonials, to be lodged with the undersigned not later than June 30, 1957. No canvassing.

MATTHEW POLLOCK,
County Clerk.
County Buildings, Cupar, Fife.

ORGANISATION AND METHODS DEPARTMENT

An important group of light engineering companies of international repute mainly based in the Midlands, which is broadening its activities in this important sphere, invites applications for the position of Head of its Organisation and Methods Department.

The group has around 6,000 employees, and the position carries direct responsibility to the board for the conception development and practical application of all methods, systems and organisational procedures throughout the Group's offices and factories.

The ideal candidate would have experience of both factory and administrative procedures, with broad knowledge of work study and similar techniques for the promotion of higher productivity.

Applicants should have a University degree or be able to show equivalent attainments. They must have had several years' practical experience and executive status in a similar appointment, and be conversant with the most modern methods and techniques.

Emoluments will be of the order of £2,500 upwards according to qualifications and experience, with adequate pension provision and excellent prospects for advancement.

Applicants should state age and in chronological order their education, training, qualifications, positions held and other relevant information, to Box 697.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the full-time posts of Assistant in the Research Section of the Faculty of Economic and Social Studies. The successful candidates will be expected to pursue research in Economics, Economic Statistics, Government, Social Administration, Social Anthropology or Sociology, and should be graduates in any of these subjects or in Modern History or Economic History. There are vacancies in both Grades II and III. The salary scales are at present under review and are expected to be as follows : Grade II—£700 to £850 per annum. Grade III—£600 to £650 per annum.—Applications should be sent not later than June 8, 1957, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

UNIVERSITY OF NATAL

INSTITUTE FOR SOCIAL RESEARCH DURBAN
SOCIOLOGIST OR SOCIAL ANTHROPOLOGIST

The Institute for Social Research will be undertaking a study of certain social and demographic aspects of recent developments in the Swaziland Protectorate. The scheme, which is sponsored by the Colonial Social Science Research Council through the Swaziland Government, provides for the appointment, for a three-year period, of a sociologist or social anthropologist.

Applications are invited for this post, which will be on the salary scale, £1,050 x £50—£1,400, starting salary being dependent on seniority, qualifications and experience. Applicants should be suitably qualified in sociology or social anthropology, familiar with demographic techniques and prepared to learn the Swazi language. Some academic training in economics or law will be a recommendation.

A married appointee would receive a cost of living allowance which would be at the Swaziland rate (at present 12 per cent of salary up to a maximum of £132) when in the field, and at the South African rate (at present £234) when in Durban, e.g., when writing his report during the final nine months of the scheme. Housing in Swaziland Government rates (30 per cent of salary with a maximum of £150 per annum) and free medical service would be provided during service in Swaziland. This scheme makes provision for passages, local travelling and camping and transport, subsistence allowance when away from headquarters. Pension fund contributions, where applicable, will be paid.

Application forms and further details about the scheme are obtainable from the Director, Institute for Social Research, University of Natal, King George V Avenue, Durban. Application forms should be submitted in triplicate, one copy going to each of the following :

The Permanent Under Secretary of State for Commonwealth Relations,
Downing Street,
London, S.W.1.
The High Commissioner for the United Kingdom,
Hill Street,
Pretoria.
The Director,
Institute for Social Research,
University of Natal,
King George V Avenue,
Durban.

The closing date for South African and Federation candidates is : June 15, 1957 ; and for United Kingdom candidates : July 15, 1957.

APPOINTMENTS

TARIFF SPECIALIST. A very well-known and expanding Company, with Head Office and chief manufacturing unit in the provinces, invites applications for an important appointment in its Market Research Section. The position is an exacting and responsible one, requiring sound judgment and high intellectual ability. Duties will be connected entirely with tariffs and related problems affecting the Company's activities and interests and will extend over a wide range of products and markets. Essential qualifications are a University degree with first or second class honours and at least two years' experience as a tariff specialist in industry or a trade association. Applications, which will be regarded as strictly confidential, should set out full personal history.—Box 692.

DIRECTOR OF DEVELOPMENT

IMPORTANT BRITISH COMPANY WITH WORLD-WIDE INTERESTS, including subsidiaries in the U.S.A., Europe and elsewhere and with growing interests in the organic and inorganic chemical fields, requires a SENIOR EXECUTIVE to direct a new Department embracing scientific research, development of new products and their production in this country and overseas. Research facilities, management and staff are already in existence and liquid resources are sufficient to back very large scale developments.

The successful candidate whose headquarters will be in London, will be required to act as technical adviser to Board of Directors with particular reference to acquisition of new interests and subject to satisfaction may expect promotion to the Board within approximately twelve months.

Candidates must have a good University degree in chemistry or chemical engineering and experience of actual chemical production work, including planning and management of men. Broad knowledge of the chemical industry in this country or overseas is desirable.

Since one of the principal responsibilities will be to recommend and implement production of new chemical products, it is essential that candidates should have the COMMERCIAL EXPERIENCE necessary to distinguish the practical from the visionary as well as the capacity to discern technical possibilities.

Starting salary, in addition to considerable fringe benefits, will be in the region of £4,000 per annum depending on qualifications. An outstanding man may expect more.

The position offers an exceptional opportunity and only exceptional men are invited to apply.

Candidates, who should be within the age group 30—40, should apply to ASHURST, MORRIS, CRISP AND CO., 17, Throgmorton Avenue, London E.C.2. Applications will be treated in strictest confidence.

BARRISTER OR SOLICITOR (age about 30) required in the Legal Department at the London Headquarters of a large industrial corporation. The successful candidate will be engaged principally upon commercial matters, but will also undertake some common law work. Initial salary between £850 and £1,350 according to qualifications and experience. Good prospects for an able and energetic man. Superannuation Scheme.

Write, giving particulars of age, education, qualifications and experience, to Box 699 before June 5, 1957.

CORNER BROOK

CANADIAN PROVINCE OF NEWFOUNDLAND
CITY MANAGER

Applications are invited for the post of Manager of the City of Corner Brook (population 23,000) situated on the west coast of the Province of Newfoundland, Canada. The duties of the successful candidate will be similar in some respects to those of a Town Clerk, but are better compared to those of a General Manager reporting not to a Board of Directors but to the City Council. Experience of municipal administration is essential. Salary $Can. 12/15,000 per annum.—Applications, giving full personal particulars and details of experience, should be sent to Box 694.

NEW SOUTH WALES UNIVERSITY OF TECHNOLOGY

LECTURER IN HISTORY, DEPARTMENT OF ARTS, NEWCASTLE UNIVERSITY COLLEGE

Salary : £A1,270 range £A1,820 per annum. Commencing salary according to qualifications and experience.

Applicants must possess a degree with honours or equivalent qualifications and previous university experience will be an advantage.

The Department of Arts prepares students for Arts Degrees of the University of New England and also undertakes courses in Humanities for Science and Engineering students of the N.S.W. University of Technology.

Successful applicant will be eligible, subject to medical fitness, to contribute to the New South Wales State Superannuation Fund, and shipping fares to Sydney of himself and family will be paid.

Five copies of applications (including the names of two referees) should be lodged with the Agent-General for New South Wales, 56, The Strand, London, W.C.2, and a copy airmailed to the Registrar, N.S.W. University of Technology, Box 1, Post Office, Kensington, New South Wales, Australia, before June 14, 1957. There are no special forms of application.

THE NGERIAN RAILWAY CORPORATION invites applications for the following appointments :

DISTRICT ENGINEER.—Pay £2,350 p.a. consolidated. Candidates must be A.M.I.C.E. and have at least 10 years' experience of maintenance of railway permanent way and work.

RESIDENT ENGINEER.—Pay £2,350 p.a. consolidated. Candidates, over 35 years of age, must be A.M.I.C.E., have engineering degree from recognised university, and have wide experience in reinforced concrete and steel. Railway experience desirable but not essential.

SENIOR ASSISTANT ENGINEER.—Pay £1,575 by £50 to £1,775 p.a. plus £300 p.a. Overseas Pay. Candidates must be A.M.I.C.E. and preferably have had experience in railway engineering, bridge work, and general reinforced concrete construction.

SUPERINTENDENT OF TRAINING.—Pay £1,575 by £50 to £1,775 p.a. plus £300 p.a. Overseas Pay. Candidates, preferably with railway experience, must have passed Parts I and II of A.M.I.C.E. examination or equivalent, and must have at least five years' experience in technical instruction of engineering apprentices or equivalent experience of teaching in a Technical Institute.

ASSISTANT ENGINEER.—Pay £800 by £50 to £1,600 p.a. plus £300 p.a. Overseas Pay. Candidates must be A.M.I.C.E. or have passed Parts I and II or equivalent and have two years' railway engineering experience or five years' experience of general construction in connection with a railway.

All posts are pensionable, or on contract with gratuity of 20 per cent. p.a. of total pay—except Resident Engineer, which is on contract terms.

Tours : 15-month tours followed by 15 weeks' leave in U.K. on full pay.

Allowances : In addition there are attractive allowances.

Applications to :
The London Representative,
NIGERIAN RAILWAY CORPORATION,
11, Manchester Square,
London, W.1.

A LARGE manufacturing company in the West Country has vacancies in its expanding Market Research Section for women university graduates, aged under 25, with good degrees in Economics. The work, which is in a new and interesting field involves interviewing members of the public and assisting in analysis and reporting of the data collected. Retail surveys are also undertaken. About six months in the year is spent interviewing both in London and the provinces. A full training will be given.—Apply to Box 693.

ASSISTANT ADVISER

UNILEVER LIMITED requires a qualified accountant or cost accountant, age 28-40, for advisory work in the fields of Organisation, Production Study, Budgetary Control and Distribution Cost Analysis. The successful applicant will be based on Head Office in London but may be assigned for short or long periods to any of the operating units in this country in which case expense and travel allowances will be paid. He must possess a first-class professional and/or industrial background, a sound knowledge of modern methods of cost control, and the ability to express himself clearly.

Starting salary will be dependent on age and experience but not less than £1,350 p.a. The post will offer the opportunity for original thinking and the broadening of experience over a wide field of subjects, and should lead eventually to a more senior appointment within the Concern. Pension scheme. Interviews in London or the North.

Replies, stating age, qualifications, current salary and brief details of education and experience to date, should be sent to Personnel Division (PRB/355) Unilever Limited, Unilever House, London, E.C.4.

CONSUMER COUNCIL associates get shopping advice, free help if sold shoddy goods, exhibition tickets and regular copies of *Shopper's Guide*. All for 10s.—Write to B.S.I., Consumer Council, 2 Park Street, London, W.1.

SECRETARIAL TRAINING especially for university graduates and older students, six-month and intensive 14-week courses.—Write, Organising Secretary, DAVIES'S, 2 Addison Road, W.14. PARK 8392.

FRETFUL FANDANGOISTS.—Nothing makes your toecaps tingle more than a few glasses of Duff Gordon's El Cid Sherry. Out with the bottles ! On with the dance ! Olé !

HOW TO INVEST in Ordinary Shares profitably : a suggested system. Lectures in North Room, Conway Hall, Red Lion Square, London, W.C.1. Fridays until June 21 (except June 7), 6-6.45 p.m., by Mr. J. C. Lamont (25 years' experience). Single lecture, 5s. ; 10s. the course. Preferably 'phone beforehand VIGilant 2737 (before 10.40 a.m. or after 8.15 p.m.). 5 Avenue Road, Belmont, Surrey.

PIT PONIES. 12,000 still used (and stabled) underground in British coal mines. No other coal-producing country has such a large number. No pony employed in a deep mine should work longer than 11 years. All horses and ponies should have a summer surface holiday each year and a supply of balanced food and stables provided above ground. Electric battery lamps should be fixed to their collars while at work or their roadways electrically lit. Ample dimensions for travel guaranteed, especially under bad roofs, and they should not be worked on steep inclines. No inspection by outside bodies is allowed in mines, and supervision that is normal in a factory is often impossible underground. Why not discontinue to employ horses and ponies in mines ? Why not an independent inquiry to see if this can be done in seven years ? Why not plan atomic power stations to generate nuclear electricity equivalent to 30 million tons of coal in seven years ? Contributions gratefully received.—D. Jeffrey Williams, Secretary, Pit Ponies' Protection Society, 66, Carlton Hill, London, N.W.8.

SUEZ CANAL COMPANY

Notice is hereby given that the Annual General Meeting of shareholders will be held in the Hall of Palais de Chaillot, Place du Trocadéro, Paris 16e, on Tuesday, June 25, 1957, at 10 a.m.

The business to be considered at this Meeting will be the following, namely :

1. Approval of the Directors' Report, of the Accounts for the year 1956 and of the balance sheet.
2. Termination of Directors' mandate.
3. Renewal of Directors whose term of office has expired.
4. Powers to be given to the Board to authorise, if need be, the payment of Debenture interest and redemption in Paris in accordance with a Resolution proposed at the Extraordinary General Meeting of Debenture holders.
5. Amendment of Article 2 of Statutes.
6. Amendment of Article 4 of Statutes.
7. Amendment of Statutes for the purpose of making them comply with the provisions of the Law of France of July 24, 1867, and subsequent enactments.
8. Amendment of Article 3 of Statutes.
9. Expressing Share Capital in French legal currency by amending Article 6 of Statutes.
10. Empowerment for the Board to seek the government sanction required under the old Article 37 of the French Code de Commerce and under Article 26 of the French Law of July 24, 1867, and to take steps to comply with all legal formalities entailed.
11. Approval of the composition of the Board during the interim period between the General Meeting and the date on which the government sanction referred to above will be given by decree.
12. Acceptance of conditional resignation of Directors to take effect on the date of the said decree.
13. Conditional appointment of Directors to take effect on the date of the same decree.

Resolutions Nos. 4, 5, 6, 7, 8, 9, 10 and 11 relating to amendments of the Statutes will require, particularly in regard to quorum and extraordinary majority, to be passed in accordance with the provisions of Article 57 of the Statutes.

Resolutions Nos. 1, 2, 3, 12 and 13 will require to be passed in the manner and in accordance with conditions laid down in Article 50 of the Statutes.

The new draft of Articles to be amended will be available to shareholders for perusal at the Head Office of the Company, 1 rue d'Astorg, Paris, 8e, one month before the Meeting.

Holders of not less than twenty-five shares who are desirous of being present or represented at the Meeting must prove at the Head Office of the Company, 1 rue d'Astorg, Paris, 8e, before 10 a.m., on Thursday, June 20, 1957, that they have deposited their shares with the Company or with any of the Company's appointed Agents.

Shares may be deposited in London with Messrs. N. M. Rothschild and Sons, who will in due course deliver a card of admission for the Meeting.

J. GEORGES-PICOT,
General Manager.

NORTH GLOUCESTERSHIRE INDUSTRIAL EDUCATION COUNCIL

gives advance notice of a

CONFERENCE OF INDUSTRIALISTS AND EDUCATIONISTS

to be held at

THE TOWN HALL AND THE QUEEN'S HOTEL, CHELTENHAM

on October 9 and 10, 1957.

The object of this Conference is to give Educationists and Industrialists the opportunity to discuss together the promotion of education for Industry, with particular emphasis on engineering, as part of the School Curriculum.

Full details of the Conference, which will be addressed by Lord Hives, Sir Harold Roxbee Cox, The High Master of St. Paul's School, Dr. B. V. Bowden, Mr. Henry Gardner, Mr. E. G. Sterland, Dr. J. S. Tait, and other nationally known personalities, will be available shortly. Meanwhile, enquiries are welcomed at the

Secretariat of the Council,
8 Lansdown Place, Cheltenham.

ASHRIDGE. Course 43. World Power Blocs. May 31st/June 3rd. Introductory Address : The Values of Western Civilisation, Professor G. J. Renier Ph.D. ; Armed Defence, Major-General A. C. Shortt C.B., O.B.E. ; Aims of the "Uncommitted" Nations, Lieut.-Colonel The Lord Birdwood, M.V.O. ; The Commonwealth, Mr. J. A. Cross, M.A. ; Prospects for the Future, Mr. Frank Darvall, C.B.E.

Inclusive fee : £4 4s.

Applications to the Secretary, Ashridge, Berkhamsted Herts. Tele. : Little Gaddesden 3191.

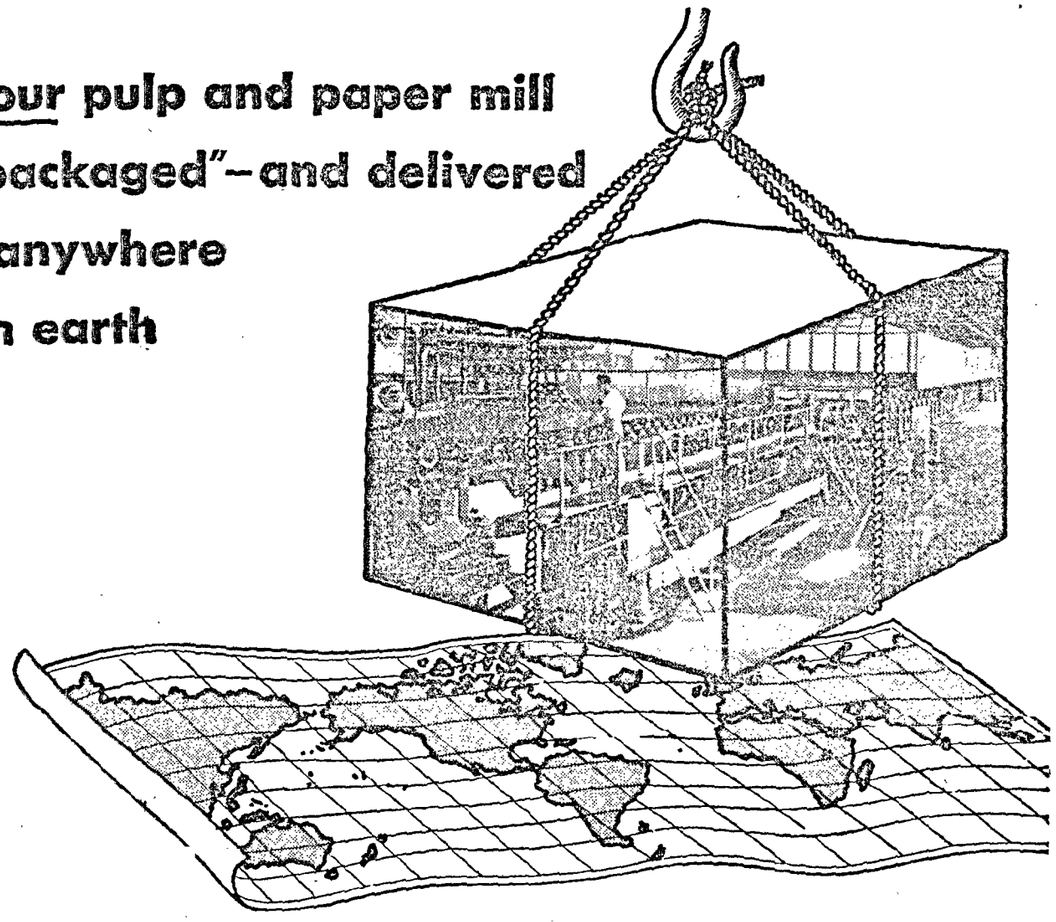
FITTED CARPETS expertly cleaned on site ; also repaired.—Yakoubian Bros., Ltd., 7 Milk Street, Cheapside, E.C.2.

EXPERT POSTAL TUITION

for Examinations—University Law, Accountancy, Costing Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus—and, or advice mentioning examination or subjects in which interested, to the Secretary (69/12).

METROPOLITAN COLLEGE, ST ALBANS

or call at 30 Queen Victoria Street, London, E.C.4.



ANNUAL AIR SUBSCRIPTION RATES

Subscriptions to most countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is either because the alternative is not available or not recommended.

	Airmail	Air Freight		Airmail	Air Freight		Airmail	Air Freight
Australia	£8 5s. strlg.	—	India & Ceylon	£7 15s.	£6	Pakistan	£7 15s.	£6

Your pulp and paper mill "packaged"—and delivered —anywhere on earth

We are now building the first newsprint mill in Mexico (100 metric ton daily capacity); the first newsprint mill in Colombia (100 metric ton daily capacity); the first *pre-hydrolysis* kraft pulp mill in France (100 metric ton daily capacity); a straw pulp mill in Mexico (100 metric ton daily capacity); and a bagasse pulp and paper mill in Colombia (80 metric ton daily capacity). We are also supplying equipment for the first bleached bagasse pulp and paper mill in Cuba (100 metric ton daily capacity). Several other mills are in the project stage but building has not yet commenced.

Behind this concept of "packaged" paper mills stands our world-wide organization with over 100 years of experience in pulp, paper and machinery. We are equipped to render you *any* or *all* of the following services:

1. Conduct a technical and economic survey and prepare an appraisal report.
2. Engineer the complete project in cooperation with the world's leading consulting engineers.
3. Produce and deliver all the pulp and paper machinery and other necessary equipment that cannot be produced in the country where the mill is to be built.
4. Supply the necessary trained personnel to assure proper operation of the project until local workers can take over.
5. Assist the local group to obtain financing within the currencies available in the particular country, such as dollars, sterling, francs, D-Marks, Finn-Marks, etc.
6. Assist the local group to obtain the necessary raw materials and chemicals to operate the mill after it is built, as well as sell the output through Parsons & Whittemore's own offices.

Our book—"Growing with the Paper Industry Since 1853"—will give you more information on our ability to handle any pulp and paper mill project through all of the necessary steps from inception to completion or any combination of responsibilities that best suits your interests. Write for it without obligation.

to bend nature

For all his progress and scientific development, man remains a vulnerable creature. He is capable of generating heat that will pulverise a city, and he can reach down to within a fraction of a degree of absolute zero; yet for himself life is impossible outside a small range of temperatures. Fortunately he has at hand much accumulated knowledge and a wide range of materials to aid him in the conservation of heat and in its distribution to calculated points at controlled rates. Enabling him so to bend nature to give him a more useful and happy life are the many products of The Cape Asbestos Co. Ltd.

Owning mines and quarries in this country and abroad, and with complete facilities for processing and marketing, Cape Asbestos back up this world-wide organisation with intensive and continuous research and development.

CAPOSITE — in the form of moulded blocks and pipe sections of Amosite asbestos: for thermal insulation.

MARINITE — non-combustible sheet, made from Amosite asbestos: for the construction of A and B bulkheads in ships and for industrial ovens, driers etc.

ASBESTOLUX — non-combustible insulation board, made from Amosite asbestos: for structural insulation combined with maximum fire protection.

ROCKSIL—rock wool, processed from natural Scottish rock and available in a variety of different forms: for heat and acoustic insulation, and refrigeration.

Basic International Symbols

Like the basic international chemical and engineering equations, the Kellogg symbol is internationally recognized as fundamental to the planning, engineering, and operation of profitable petroleum and petrochemical plants. In these two areas, Kellogg has gained high international recognition because it is international... in its approach to process and plant design... in its facilities to procure materials, equipment, labour... in its ability to co-ordinate and direct every phase of a major capital expenditure toward an early on-stream date, wherever in the world the project may be.

Through its offices in London, Paris, New York, Toronto, Rio de Janeiro, and Caracas, Kellogg has worked with leading oil refiners and chemical firms the world over. If you are planning new or expanded facilities at home or abroad, Kellogg's unique international background and constant contact with technological advances here and overseas will result in a more profitable investment for your company.

Labour Fundamentalism

SIR HARTLEY SHAWCROSS has never been in the main stream of Labour political thought about nationalisation or anything else. When he said at St Helens last week that the idea that "the state should engage in the wholesale nationalisation of industry . . . is as dead as a dodo," and that even steel "should not be renationalised merely in a fit of political pique," he was speaking only for himself. He probably was not, in any conscious way, trying out his ideas on the dog in his party's manger. The interesting thing, nevertheless, will be to see how loudly the dog is or is not set barking.

In the next twelve months, Labour's executive is due to do a lot of thinking and feeling about nationalisation. The reasons for this are rather odd. The chief of them is that Labour candidates found at the last election that nationalisation was a supremely uninspiring issue—where it was not actively unpopular. The decision was therefore taken to concentrate Labour's immediate post-1955 "rethinking" on what were believed to be the more lively issues, such as equality and housing; the idea was to take first things first. In practice, however, this has meant that these first things have been first forgotten. There is now much less danger that the next Labour Government will try to carry through "another 1909" against the middle classes than there would have been if the party's policy document on equality had been published just before the next election instead of just after the last one.

This is all to the good. But the unforeseen disadvantages of the re-thinking timetable have now caught up with its unforeseen advantages. Before its party conference in October, Labour is due to publish its views about existing nationalised industries and its plans for new ones. The broad pattern which is emerging out of this re-thinking and re-wrangling has become fairly evident. The trend is plainly against naming whole industries for prospective take-over. Moderate Labour leaders would no doubt resist Sir Hartley Shawcross's argument that "nationalising great firms like ICI and Unilevers" would "lead the country to disaster"; but they do now recognise the crucial fact that enterprise is more important than ownership. Some of them also see that for a variety of reasons—political pressure for uneconomic pricing policies, the brake put by Treasury consent on proper salaries for people like atomic scientists, certain difficulties in the way of laying off redundant staff under a regime of deficit finance—the nationalisation of whole industries can be an impediment to enterprise instead of a spur towards it.

In its place, however, Labour is now toying with the idea of introducing two new sorts of nationalisation. It is about these that debate is likely to rage in the year ahead. The test in each case should be whether the scheme suggested is designed merely as a *genuflection* to the original socialist ideal of public ownership of all means of production, distribution and exchange (in which Labour now believes to about the same extent as the Archbishop of Canterbury believes in Adam and Eve), or

whether it is designed as a remedy for some particular and real economic problem. By this test the first of Labour's burgeoning ideas—that the state might be empowered to take over majority control of particular firms rather than of particular industries—could presumably be turned into a not wholly uneconomic ginger device. There is room for discussion of it as a useful threat for certain industries which are still insufficiently competitive, and where the entry of a state competitor belonging to no trade association might do some good. (On pure grounds of efficiency, there has always been a better case for nationalising some small British firms than any large ones.) But, even if this objective was recognised and pursued, nobody can seriously suggest that a Labour Government would find that this inculcation of state competition was one of the first things that needed to be done.

It is, however, the second glint in Labour's eye that seems much more unfortunate and alarming. This is the idea (quarter-baked as yet) that the state should establish some vast nationalised investment trust, with its funds presumably accruing through an unnecessary transfer to public from private savings, *via* a higher rate of death duties and backdoor nationalisation of private superannuation schemes; and that this trust should then buy sizeable blocks of the shares of publicly quoted companies. The idea here cannot be to secure part-ownership of inefficient companies; an investment trust that concentrated on holding only the shares of inefficient companies would hardly accord with the brightest tenets of even Labour finance. The aim can only be to secure a stake for the state in the biggest and most efficient companies—on the theory that this need not bring into play as many undesirable political and governmental pressures as would the complete nationalisation of the same concerns; two or three state directors would be less inhibiting than a whole board. But it would introduce none of the benefits that were originally supposed to be associated with nationalisation either; and the best advice that can be given to Labour, on the brink of such re-thinking, is to chuck it.

This is why the party reaction to Sir Hartley Shawcross's assault upon the old type of nationalisation will be so interesting to observe. The first reaction, of course, will be complaints of disloyalty, tactlessness, impropriety; that happened long ago when a small boy drew attention to the fact that the old Emperor was no longer wearing any clothes. One of the tasks of Labour leadership this summer should be soberly to judge how far this orthodox party reaction really goes. To suggest that nationalisation (old-fashioned or new-fangled) should be left out of Labour's next election programme is, one suspects, somewhat akin to suggesting that bishops should be brought into the Church of Scotland; both propositions arouse very similar prejudices among the faithful, and Mr Gaitskell is not the only Moderator to be mortally afraid of Disruption. But Labour is now in a position where its most obvious risk of playing itself out of the prospect of being Britain's next government is by giving widespread offence; and it so happens that the issues of nationalisation which it is now weighing are precisely those that give most offence to the most marginal of its prospective fifteen million voters, perhaps to almost as illogically extreme an extent as they give delight to the most ardent of its few thousand active party workers. If Mr Gaitskell thinks that the most faithful can never be successfully withstood by an appeal to the more numerous—well, let him look first at the forecasts and then at the facts of the outcome of the Presbyterian Church's General Assembly at Edinburgh this week.

European Insecurity

Projects for the reuniting of Germany and for limited disarmament in Europe are really parts of a larger problem—and the parts should not be allowed to obscure the whole

A REALISTIC world map would show postwar Western Europe as a narrow strip of land, little more than an isthmus, between the broad blue Atlantic and the red-flagged Eurasian mass that stretches from Saxony to Shanghai. For all the energy and talent of the crowded peoples of this fringe area, their free societies could scarcely have survived the successive onslaughts of Nazi aggression and communist pressure without support from across the ocean. That is one half of the problem of European security. The other is the imposition of police states on east European peoples whose longing for freedom was made agonisingly vivid by the Hungarian revolt last autumn. As long as these two unstable situations persist, the problem of Europe's security will remain unsolved.

Today, with reunion looming large in the West German elections, and neutralised or "open" areas in discussion of disarmament, the European problem in its various guises is once more the focus of attention. Looking back, it is striking to note how little serious debate it was evoking a year ago. The four-power conferences of 1955 had bared post-Stalin Russia's determination to hold Stalin's ground. Neither the Geneva meetings nor Dr Adenauer's journey to Moscow produced any reduction of the unpayable price which Russia set for German reunion; the fate of eastern Europe was not even acceptable as a topic for discussion. From the sunlit "summit" Europe descended into new depths of gloomy resignation. In early 1956 Mr Khrushchev's "destalinising" experiment excited hopes which, however, were quickly dashed by his condemnation of "national communism" and "revisionism." The encouraging trend in Poland was darkened by the shadow of the Hungarian tragedy; and then the conflict in Egypt drew attention away to the immediate perils in the Middle East.

NOW the European problem is back in the centre of the stage, unchanged in essentials, yet changed in appearance. The approach of long-range nuclear strategy is transforming the military equation. In the continuing disarmament talks between the powers, possible zones of mutual inspection, or of arms limitation, have a new prominence. This, as was pointed out in *The Economist* on May 18th, and as both Dr Adenauer and Herr Ollenhauer have newly emphasised, is liable to make Germans (of all parties) fearful lest any disarmament scheme might take as its base line, and thereby perpetuate, the division of their country. It bears also on the new position of the satellites. As the nuclear age evolves Russia may be less concerned to preserve a military glacis of dwindling value in eastern Europe. And the Hungarian revolt and Poland's insubordination must have led at least some Russians to wonder if their east European empire is now more a liability than an asset.

It is, of course, arguable that events in Hungary and Poland should already have suggested to the Soviet rulers themselves that a withdrawal from eastern Europe would serve their own interests. This reasoning has inspired, among other projects, the "Gaitskell plan," which the Leader of the Opposition expounded in his recent Harvard lectures. This plan called for the progressive withdrawal of all foreign forces from Germany and the satellites, which countries would thenceforth be neutralised, their armaments restricted, and their frontiers guaranteed by each other and by the major powers. Many variations on the same theme have been put forward. All such plans evoke certain objections in the West itself. Western Europe without western Germany, it is objected, would be so weak, and so narrow an "isthmus," that its defenders' task would be impossible. A fatal blow would be struck to the domestic position and prestige of German champions of solidarity with the West. Moreover, the neutrality of seventy million reunited Germans simply could not be ensured by other powers whose mutual hostility might be skilfully exploited by a future German government bent on aggrandisement. These arguments boil down to a fear that projects of this kind would upset even the present uneasy balance of power in Europe—unless they went with a general disarmament programme drastic enough to produce a truly stable world balance of power.

But there would be at least an incentive for more lively discussion of these calculations if it were not so painfully clear that Russia will not look at any of the current projects. From the recent spate of Soviet statements, Marshal Bulganin's voluminous correspondence, and Mr Khrushchev's interview with the *New York Times*, one thing stands out. Moscow's objectives in Europe remain what they were in 1954-55. The Atlantic alliance must be dismantled; American and other allied forces must withdraw to their home countries; German reunion cannot be granted unless these things are done, and even then its basis must be a fifty-fifty deal between the elected government of the Federal Republic and the Soviet-imposed one of the "Democratic Republic"; political freedom in eastern Europe must be regarded as a dead letter. All that Russia offers in exchange is the scrapping of the 1955 Warsaw Pact—a painless concession, for its military grip on eastern Europe was if anything stronger before 1955 than it has been since; the reunion of a Germany which would be imperilled domestically by the privileged position obtained by Herr Ulbricht's communist apparatus, and externally by the sharp tilting of the European balance in Russia's favour; and Mr Molotov's familiar version of a European "security system."

THIS last dusty exhibit from the Kremlin archives is worth examining. Ostensibly its purpose is to reinforce the peace of Europe through an exchange of guarantees. But when, at the "summit" in 1955, Sir Anthony Eden offered an exchange of guarantees, specifically recognising Russian fears of German resurgence, Marshal Bulganin's terse rebuff was the comment that powerful states need no guarantees. Everything that has happened since then has confirmed the simple deduction that the Molotov "security" project has only one purpose: to make west Europeans think they can dispense with the alliances from which they in fact derive their security. It would be more accurate to call it an insecurity system. The cool attitude that west Europeans have adopted toward it for three years does credit to their good sense.

It might appear that the German Socialists are an exception in this respect. Herr Ollenhauer has just restated their inclination towards a somewhat vague European security arrangement which, in their view, would make it possible to dispense with the Atlantic alliance. But Dr Adenauer has likewise reaffirmed his government's support for a system of guarantees such as Sir Anthony proposed in 1955. And in practice the Socialists could stomach no better than the Chancellor the conditions with which Russia's plan is garnished—in particular, its insistence that western Germany must go cap in hand to Herr Ulbricht. They

may squeeze some electoral advantage out of their ill-defined position ; and Moscow, for its part, may dangle some new Damoclean question marks over the approaching German elections. But it is hard to see any reality in these gestures. Whatever government emerges from the elections will find its policy confined within very narrow limits as long as Russia's general intentions in Europe remain unchanged.

The prominence given this week to Dr Adenauer's success in obtaining allied reassurances about German reunification makes it pertinent to point out that, while the division of Germany undoubtedly complicates the disarmament problem, there is no evidence that this problem would be easily solved even if Germany did not exist. The same is true of the European problem. The Germans' longing for reunion provides Russia's strongest card in the European game ; but if Germany were to vanish from the map, the essential problem—the unstable division of Europe itself—would remain. The Soviet rulers, who regularly declare themselves dedicated to the worldwide triumph of their system, have motives other than fear of Germany for keeping their grip on eastern Europe.

To suppose that the grip can be maintained for ever would, however, be needlessly pessimistic. The east European peoples are increasingly restive. The Russian people are beginning to question their masters' argument that east Europeans must be subjugated and, if necessary, slaughtered to save them from alleged western bellicosity. Resentment at insulation from the outside world is mounting in both Russia and eastern Europe. Moscow has found that "competitive coexistence" is apt to turn into competitive disintegration, that the mood of relaxation which it has tried to foster is at least as dangerous for its own system as for the West. Its reaction has been to intensify its splitting tactics, which now range from the new series of warnings to west Europeans about nuclear perils, and the exploitation of anti-Americanism since the Suez crisis in Britain and France, to such well-worn themes as Rapallo talk for Germans and anti-German talk for Frenchmen.

The present tasks for the West are to maintain its unity in face of these tactics ; to keep discussion of a European settlement alive without letting Moscow make too much hay out of the inevitable controversy that this involves ; and to get its messages, reassuring as well as encouraging, across the iron curtain. Only in this way can a constructive approach be made to the restoration of true security in Europe.

Malthusians and Marxists

World population is liable to be doubled by the end of the century, according to a UN estimate. But will it ? Recent experience has exploded every available theory of population growth, revealing "social engineering" to be a very inexact science

IT is not long since the appearance of almost any current population statistics could be counted on to release a spate of warnings of imminent Malthusian calamity. The conquest—so ran the argument—of major killing diseases and the application of new standards of maternal and child care had triggered in the under-developed areas of the world a demographic explosion far vaster than that similarly set off in eighteenth-century Britain. No correspondingly vast open spaces remained to play the role that pampas and prairie played in the Industrial Revolution ; on the contrary, erosion, deforestation, and soil exhaustion threatened even the existing inadequate "estate of man." Chronic malnourishment punctuated by famine already afflicted most of humanity ; and it was—according to the prophet's pessimistic or Utopian cast of mind—the duty of the more fortunate nations either to get really tough and stop their misguided interference with mortality rates, or to get really tender and earmark a large part of their own resources to feeding, and educating into more moderate procreative habits, the victims of the Malthusian devil.

The human chain-reaction certainly continues. The latest United Nations Demographic Yearbook* shows that world population is increasing at a rate which would double the present total of over 2,700 million by the end of the century ; more significantly, it reveals that those countries which had the highest rate of increase in 1945-49 further accelerated that rate in 1950-54. But the forecast results of the chain reaction simply have not materialised. So far from famine extending its grip, it has retreated and, however precariously, has been contained. Even the swing of relative prices in favour of farmers and against secondary producers, which was supposed to constitute the chief economic feature of our time, has been halted and partly reversed. It is too soon to crow ; but humanity evidently has a longer breathing space, in which to adjust its breeding habits to the facts of "death control," than either pessimists or Utopians thought ten years ago.

Unadjusted breeding habits do impose a desperately heavy handicap, especially on under-developed nations aiming at economic transformation. So far as current output goes, they must run faster and faster to stay in the same place ; so far as capital development goes, they must earmark for the mere minimum housing and equipment of their new millions most of the resources that could otherwise be used to increase productivity. The weight of that handicap is now recognised even by Communist China, which until recently was proclaiming, in spite of all the hyena-economics of imperialist plotters, that the more babies the merrier. Since March, Chinese women have been able (in principle) to get abortions and sterilising operations on request ; the planned output of contraceptives has been stepped up five-fold and their prices cut by 30-60 per cent ; there have even been proposals to raise the minimum age for marriage to 23. China's *volte-face* has not so far been matched in Russia, but the deliberate drive for numbers seems to have been soft-pedalled there, too. A faint hope is discernible that demography may be taken out of politics.

* United Nations Demographic Yearbook, 1956. HMSO. 751 pages. 50s. paper, 60s. cloth.

EVEN without ideological blinkers, however, population policy still works largely at random for want of adequate knowledge of the factors affecting man's breeding habits. Hardly a wrack remains of the crude Malthusian theory that better living automatically raises birth rates and numbers. Its successor, diametrically opposite, was the argument that better living automatically lowered birth rates ; that theory hardly survived the spectacle of a rise in the American net reproduction rate to parity with that of India. Sociological theories, stressing the subservience or emancipation of women or the effectiveness or absence of "social capillarity"—the urge to rise in the world—are equally laid waste, as a comprehensive explanation, by the American evidence. Marxist theory, treating babies as a raw commodity, output of which varies with the demand for labour, and so with the class relationships arising from successive phases of economic development, has absolutely nothing to say about demographic causation once classes have been abolished. No theory has yet enabled demographers to predict numbers even half a generation ahead with a degree of accuracy sufficient for "social engineering," let alone indicated to governments the means of changing their peoples' breeding habits.

The latest attempt at a comprehensive theory* is neo-Marxist. In the eyes of its author, Mr Coontz, diet, health, income, contraceptive knowledge, social capillarity, feminism and all the rest, are direct or indirect effects of one overriding cause—the demand for labour power, interpreted in a sense rather more sophisticated than Marx's to allow for variations in the kind of labour power demanded and thus in its price, and the conditions, of supply. Procrustes himself had no harder job than Mr Coontz, and inflicted no more drastic maltreatment on his raw material, in the way of stretching, twisting and amputation ; but his book has a certain usefulness both positive and negative. Positively, it substitutes general economic opportunity—of which employment opportunity is, in a developed or developing economy, the most important kind—both for food supply and for achieved standards of living as the main economic influence on demographic change: which is a manifest improvement in realism. Only in actual famine does food take absolute priority over all other ingredients in the standard of living ; the chronically malnourished Asian or African will no more sacrifice all other amenities to a sufficiency of diet than the chronically shivering Englishman will sacrifice all other amenities to a sufficiency of space-heating. And the absolute level of the standard has less influence on family-raising attitudes than does a feeling, however unexplicit, that it is buoyant, stable, or threatened—a feeling largely dependent on the "demand for labour" in the widest sense.

* Population Theories and the Economic Interpretation. By Sidney H. Coontz. Routledge and Kegan Paul. 195 pages. 25s.

NEGATIVELY, Mr Coontz's omissions focus attention, paradoxically, on the obvious, but oddly neglected, matter of sheer personal taste. Admitting, in a footnote, that procreation itself is not economically motivated (a refreshing touch of realism), he discloses an assumption that "children are regarded as a good" whose acquisition is permitted or discouraged by economic circumstances. In other words, if raising families cost them nothing, all parents would produce as large a family as was physically possible. Anyone, of course, who believes that economic considerations alone settle a woman's willingness or unwillingness to spend half her adult life in a state of pregnancy, or for that matter a man's willingness or unwillingness to live permanently surrounded by clamorous babies, would believe anything.

But the very absurdity of this belief highlights the question: what does in fact determine the personal, subjective, emotional attitudes on which economic causes exert their influence ? What gives them their strength ? Those couples who are absolutely resolved not to have more babies will avoid them, whatever their material standards and prospects, by means ranging from total abstinence, however difficult, at one extreme to sterilisation, however repugnant, at the other, with a range of more or less satisfactory contraceptive practices and more or less dangerous abortions in between. Those who only mildly prefer not to have more babies will, even with adequate contraceptive devices to hand, take chances—and the consequences. These subjective differences stand out most clearly where contraception is universally familiar and the size of families is consequently a matter of means and taste. But they emerge even where contraception is forbidden (as witness the differing family patterns of Roman Catholic, agricultural Ireland and Roman Catholic, agricultural Italy), or only beginning to be known and respectable (as witness the precipitous fall in the Japanese birth rate between 1949 and 1954, and the lack of any comparable fall, despite official encouragement, in India).

Any government, or world organisation, trying to develop new family patterns must evidently take these differences into account. Equally evidently, in no field is prediction less possible or policy more uncertain of

effect. The projections of the UN Demographic Yearbook may well, in another couple of decades, look as funny as do today those of Dr Enid Charles, who in the 1930s was convincingly demonstrating that by 1950 the population of Britain would have begun to lead that of the West in general in a rapid and disastrous fall.

Complacency, however, is as unjustifiable as fatalism or panic. It is a fact that birth and death rates are still wildly out of step; it is a fact that the more overcrowded nations lack a hair's breadth of safety-margin against drought, flood, or other threat to their food supplies; it is a fact that their economic progress—in which, even from the narrowest national point of view, Britain has a strong interest—is hampered and endangered by their disproportionate fertility. That these facts should have been recognised in the teeth of that virtually fact-proof obstacle, Marxist dogma, gives them the greater weight. If any Asians still suspect that the West whips up population scares for its own obscure but nefarious purposes, the news from Peking should do more to convince them than any number of statistical demonstrations.

Harveian Ovation

William Harvey, who discovered the circulation of the blood and whom many regard as the founder of scientific medicine, died three hundred years ago next Monday. His outlook and methods still teach important lessons today

"He was . . . of the lowest stature, round-faced, olivaster complexion; little eie, round, very black, full of spirit." So John Aubrey, writing towards the end of the seventeenth century, described the man whom doctors from all over the world are honouring in London next week. The tercentenary of William Harvey's death in 1657 is being commemorated on a scale unprecedented in British medicine. Besides a full week of scientific sessions, ending in a meeting at Folkestone, Harvey's birthplace, there will be colour television demonstrations of human physiological experiments and a discussion on cardiac surgery, in which American doctors attending the annual meeting of the American Medical Association will participate by transatlantic radiotelephone.

Why is Harvey the most revered of English physicians? Most people who have heard of him at all will know that he discovered the circulation of the blood, and a first edition of that tiny book, "Exercitatio de Motu Cordis et Sanguinis," first published* in 1628, is worth several thousand pounds today. The layman, still pretty ignorant of how his body works, may find it hard to appreciate the importance of this work. But to the doctor it places Harvey in the same position in medicine as Newton in physics and Galileo in astronomy. In Harvey's day the ancient theories of the functions of the heart, the blood and blood vessels still possessed the inviolable imprint of Galen's teaching in the second century. They were so confused, and so far from reality, that it is difficult for anyone, brought up on the true facts of the circulation, to grasp them. It was asserted, for instance, that blood in the veins carried nutriment from the liver, and that blood in the arteries carried spirits mixed with air to all parts of the body; that blood ebbed and flowed like the tide in both arteries and veins; that the heart was the seat of primordial heat and charged the blood with vital spirit.

Others had made tentative attacks upon this theory even before Harvey began to study medicine at Padua in 1600, but it was the twenty years of his experiments, persistent demonstrations and teaching, culminating in the publication of his slim book, that eventually swept it away. It is wholly appropriate, therefore, that the general theme of next week's congress is "A review of the present knowledge of the circulation."

Yet Harvey's fame rests not only on his discovery itself, but also, and even more surely, on the way he reached it. There seems to have been no Eureka about the circulation of the blood. It was, his latest biographer† tells us, Harvey's anatomical observations as a medical student that first led him to question Galen's teaching, and he built up his theory bit by bit from what he observed over the following years in his experiments in his "museum." Here, evening after evening, after a professional day in St Bartholomew's hospital, at the Royal College of Physicians, or seeing patients (he was physician to Charles I), he dissected

* A new translation by Professor K. J. Franklin, together with the Latin text, has been published by Blackwell Scientific Publications. Price 17s. 6d.

† William Harvey. By Louis Chauvois. Hutchinson Medical Publications. 271 pages. 25s.

eels, frogs, shrimps, snails, snakes, fish and some warm-blooded creatures, too, examining their hearts and vessels and watching the minute pulse in a fertile egg. He did all this with inadequate instruments and what was little more than a magnifying glass, for Leeuwenhoek did not invent his microscope until after Harvey's death; he never actually saw the capillary vessels, but had to infer them. Yet were he alive today and possessed all the accumulation of modern knowledge and the precision of modern technique, there is little of substance that he would want to alter in "De Motu Cordis."

Harvey was, in fact, the first experimental physiologist—"the first that I heare of," says Aubrey, "that was curious in anatomie in England." But his curiosity was matched by his patience and thoroughness, and it was his demonstration of the virtues of systematic observation, of measurement, of planned experiment that entitles him to be called the originator of scientific medicine. He was an exponent of a dictum of Francis Bacon, whose doctor he had been, that

> all true and fruitful natural philosophy hath a double scale or ladder . . . ascending from experiments, to the invention of causes; and descending from causes, to the invention of new experiments:

Scientific medicine did not flower immediately. Indeed, it is only in this century that it has reached maturity, and in the eighteen-seventies, when the tercentenary of Harvey's birth was celebrated, it was still possible to regard clinical medicine as an art as much as a science. But the great clinicians of the past could not have practised as they did without the knowledge generated from Harvey's experiments, and there is a direct connection between these and the large-scale laboratory experiments of today, the Medical Research Council and the carefully controlled trials of therapeutic procedures.

Harvey's claim to immortality extends, however, even beyond the wide field of medical science. Nor is it only the immense range of his activities that gives him a place among the great minds of the world. In that, he was essentially a man of the seventeenth century, the century of Newton, Galileo and Descartes, the century of abounding energy in almost every walk of life, the century that saw the foundation of the Royal Society, some of whose founding members had been Harvey's friends. The eager questing minds of the intellectual giants of this century would not allow them to become blind to all pursuits but their own. Christopher Wren was an astronomer, who had also done physiological experiments, before he became the King's Surveyor of Works. Harvey himself was a general practitioner—though in this respect his contemporary reputation was poor—as well as a lecturer, demonstrator, anatomist and physiologist. Nor was "De Motu Cordis" his only published work. Towards the end of his life he published, somewhat reluctantly, his "Exercitationes de Generatione Animalium," which shows him as a pioneer embryologist: grasping, though admittedly imperfectly, the principle *omne vivum ex ovo*; and anticipating nineteenth century workers in his enunciation of the theory that the term of a new life is not suddenly transformed into a homunculus or animalunculus, but that in its development the new organism recapitulates the stages of evolution. Harvey had made numerous similar notes on the generation of insects, but they were all lost when Parliament's soldiers pillaged his house in the Civil War—as he himself put it, "the greatest crucifying" to him that he had ever suffered.

The specialists who will be gathered in London next week would do well to ponder the breadth of Harvey's mind. Pervading all his life, and what would have given him a lasting eminence even without his discovery of the circulation of the blood, was his passion for truth, combined with humility about his own experiments and tolerance for the views of others. This scientific pursuit of truth is apparent in his dedication of "De Motu Cordis," in which he addresses his colleagues of the Royal College of Physicians. "For true philosophers," he says,

> aflame with love of truth and wisdom, never find themselves so sage or so full of wisdom or so abounding in perception but that they cede place to truth from whomsoever or whensoever it comes.

Philosophers, he goes on, do not lose their freedom "in bondage to the traditions and precepts of any, except their own eyes convince them." Honest men should not let themselves become so angry or envious that they cannot give a fair hearing to proposals made on behalf of truth.

This was a vain plea. "De Motu Cordis" was received, especially abroad, with all the hostility that still greets a revolutionary idea; and even at home, Harvey told John Aubrey, "he fell mightily in his practize, and that 'twas beleeved by the vulgar that he was crackbrained." But it was not fear of unpopularity that had made him delay so long in publishing both "De Motu Cordis" and "De Generatione Animalium." Rather it was a genuine wish to be sure of his facts by repeated experiments, and to convince his colleagues and his students by demonstrations, so that they would believe only what they themselves had seen, that made him reluctant to rush into print—in such striking contrast to many medical researchers of today.

Harvey, moreover, never presumed that his investigations of the heart's movement represented the last word. "Others," he says, "given this lead, and relying on more productive talents, may find an opportunity to carry out the task more accurately and to investigate more skilfully." He was, says Aubrey, "far from bigotry." He disclaimed, in his dedication of "De Motu Cordis," any wish "to provoke a contemporary," or to "charge with falsehood any searcher after truth, or besmirch any man with a stigma of error." Observation is sacred, belief is free—this guiding principle of Harvey's life has an application as universal today as three hundred years ago.

NOTES OF THE WEEK

LORD SALISBURY

Ice and Acid

LORD SALISBURY last week displayed some very simple emotions in the House of Lords, but did so in a sufficiently familiar manner—detached, almost embarrassingly self-deprecating, and never angry—to make a much greater impact within the House than he seems to have made outside it. He spoke with his usual impressive authority, and chilled the House with the note of personal tragedy in his feeling (perhaps premature) that he will not take office again. But there was no playing to a wider gallery here—not a single striking, quotable phrase—and the magic of the manner could not disguise the fact that the content seemed almost lightweight. He would have liked the British and French governments to continue a partial boycott, and he pushed aside the obvious economic snags by evoking the spirit of Dunkirk. This was more up to date than Lord Hinchingbrooke, who took the Commons back to Agincourt, but it was no more relevant to the economic realities of 1957. By the end of the debate Lord Salisbury himself came near to acknowledging that a purely Anglo-French boycott might be difficult, and he shifted his complaint to the Government's failure to build up a wider resistance movement to Egypt within the Canal Users' Association. For the future, Lord Salisbury's one positive suggestion was that Britain should plan, as a matter of announced policy, to re-route all tankers round the Cape as soon as practicable. Even this, however, he recognised might take some years.

These were fairly narrow grounds for disagreement, and the nub of Lord Salisbury's dissatisfaction was no doubt to be found in his final homily about the need for being firm and consistent in foreign policy—with the implication that, over Cyprus and Suez at least, Mr Macmillan had been neither. But such strictures only deepened the mystery of why Lord Salisbury, having suffered silently the snipe-like course of Sir Anthony Eden, so quickly recoiled from the new Prime Minister. When Lord Salisbury sat down he was vulnerable to, and hurt by, the acid little historical reminiscences of Lord Attlee; and one was left to wonder whether the real event of the debate was not the contribution by Lord Halifax, whose criticism that those who ordered the invasion of Port Said did not seem to have "thought out fully the conditions of a successful issue" was one of the best Conservative speeches about last October for a very long time.

Yet it would be wrong to dismiss the Cecil influence from all future reckoning. The Government has still some major hurdles to clear: Cyprus, for instance, and the final Suez settlement. Mr Macmillan has got Tory MPs into a state where he can sell them anything (witness another deliberate success in twisting Mr Gaitskell's tail at question time on Tuesday), but he is still meeting sales resistance in the country. Many rank and file Tories instinctively warm to the appeal of Lord Salisbury and the eight Independents. Lord Salisbury told the peers that he did not want to rock the boat, but Mr Macmillan could still find him an awkwardly dragging anchor.

FRANCE

Tight Shoes and an Unmanned Helm

M. PLEVEN'S exploratory consultations deepened the French political deadlock by revealing the economic burden that will fall on M. Pflimlin or any other new premier. This week the treasury was compelled to make a first appeal to the Bank of France for money. But M. Pleven's most striking revelation was that drastic measures must be taken at once if a crisis in foreign payments is to be avoided. He suggested that France should go back on its obligations to OEEC, suspend all measures of trade liberalisation and revert temporarily to quotas and restrictions. Any such moves would go so much against the prevailing "European" spirit as to endanger the prospects of ratification of the common market treaties—and not in France alone.

Stubborn financial facts are apparently beginning to influence the general approach to the Algerian question. It is also significant that most of the politicians consulted on this topic have pointed to the need to face the United Nations Assembly later in the autumn. The feeling is growing that new initiatives have become inevitable. One suggestion is that representatives of all French overseas possessions should be called to a conference. There a new statute for Algeria might be evolved within a French Union reformed on federal lines.

The next prime minister will face a grim task, and there is understandably little enthusiasm for the job of filling M. Mollet's down-at-heel shoes. One man with both the stature and courage required is not only ignored, but has removed himself from the centre of the political stage. M. Mendès-France has resigned the leadership of the Radical party nearly two years after taking it over. Some of his admirers will say two years too late, since they could never understand what he was doing in the Radical galley. He tried to set it on a new course by imposing discipline. Recalcitrants, including figures as important as MM. Faure and René Mayer, were thrown overboard. But even this proved no cure for insubordination, and now M. Mendès-France has given up his command. It is not yet clear whether the alarmed Radicals will call him back to the helm of their drifting craft, or whether he will now paddle his own canoe. But what is clear is that he will not be called upon to solve the Algerian question—at least, not yet.

CYPRUS

Judgment Against the Police

DISQUIETING reports have been coming out of Cyprus about the treatment of accused persons by the police and about the conduct of trials. In five cases over the past month irregularities of various sorts have caused the courts, very properly, to quash convictions or award acquittals. In two cases (one of which involved five death sentences) the irregularity was the technical one of failing to translate all the evidence into Greek. But other cases have been more serious. Last week, for instance, the Supreme Court set aside a ten-year sentence passed on a Greek Cypriot found guilty of carrying and placing a bomb, on the grounds that there was a reasonable doubt whether the man's confession had been voluntary. Two days later, Nicos Sampson, a Greek Cypriot journalist, was acquitted on a charge of murdering a British police sergeant because of insufficient evidence. The judge strongly criticised the treatment that the police themselves admitted Sampson had received after his arrest; he ruled that an alleged confession made at that time was inadmissible because the prosecution could not prove that it was free and voluntary.

Although the border-line between torture and ill-treatment may sometimes be ill-defined, no question of actual torture is now involved. Fanatical supporters of Eoka will doubtless stick at nothing to discredit the British and, as the Cyprus government points out, neither in the Sampson case, nor in any other, have the courts accepted allegations of torture. But the authorities in Cyprus also maintain that the judges' findings in both cases last week do not support allegations of ill-treatment by the police. But the fact that in the Sampson case the police were criticised largely for acts of omission, and on their own admission, does not alter the fact that ill-treatment evidently took place. Some rough handling of suspected terrorists must be inevitable. But the evidence gives rise to fears that in a good many cases there has been a good deal more than was inevitable. If the government of Cyprus can put these fears to rest more convincingly in future, it has nothing to lose and a good deal to gain.

GERMANY

Adenauer Assured

THERE is no doubt who has won this week's set in the endless political game of fives between Dr Adenauer and Herr Ollenhauer, with Russia the wall and German reunification the ball. The aim of Dr Adenauer's fifth visit to the United States was to give a decisive boost to his electoral campaign. It has been achieved. The faithful ally got the usual warm welcome from Congressmen and President. And he obtained a specific assurance from the President (which has been echoed by the Foreign Office) that no comprehensive disarmament agreement would be concluded without German reunification. The German fear that the great powers might reach a settlement on the basis of the division of Germany, roused anew by the hopeful sounds from the disarmament talks in London, has been allayed.

The Chancellor paid a price for his success. He did agree that he was content for first steps toward disarmament to go ahead without reunification. It was not a big concession, for the first steps now envisaged in the American proposals directly affect German rearmament or prejudice reunification. But domestic critics are already accusing Dr Adenauer of having sold the pass. There seems, indeed, little prospect of any early realisation of his proposal (backed by Mr Eisenhower) that, once the first phase is over, a new foreign ministers' conference might be convened to discuss the German question. Meanwhile he is taking the initiative himself. Bonn's firm but restrained note, published this week, replying to Russia's note on reunification last autumn, surrenders nothing of the western case. But it does hold out the hope to Germans that the coming trade talks between Russia and Western Germany could be expanded into a broader parley. Badly defeated in the match with Mr Bulganin over atomic weapons, the Chancellor has recovered his poise.

Herr Ollenhauer has found it difficult to quarrel with all this. In detail, after all, the differences between Socialists and Christian Democrats on the key issue of German politics have become very small. The main distinction, a Socialist would claim, is one of sincerity, and in the differing roles ascribed to a "European security system" which would embrace a reunited Germany. So long, in any case, as Russia remains as unconciliatory as it is at present, the foreign policies of both parties will be severely circumscribed. Reunification will be a much discussed ideal at election times; the western alliance is still the plain necessity of west German political life.

THE LUNACY LAWS

Abolishing Certification

THE laws relating to lunacy and mental defect have always had to steer a safe course between, on the one hand, the preservation of civil liberties and, on the other, the provision of humane care and treatment for the mentally ill or defective. Usually, it is civil liberties that are most often heard about. Cases are taken up which appear to be a gross infringement of these liberties; and the other side of the question—the need to ensure that care and treatment are given to those who need it—tends to be ignored.

The royal commission on the subject is, on the whole, disposed to make the law veer nearer towards the safeguarding of the subject's liberty without abandoning the principle that there are times when liberty has to be forgone either for the patient's own sake or to protect other members of society. So far as mentally ill people are concerned the commission's proposals (Cmnd 169) would mean the end of the existing categories of patients—voluntary, temporary and certified. The purpose of the Mental Treatment Act of 1930 was to enable patients to enter hospital voluntarily, that is, without having to be certified and thus be detained against their will. But voluntary patients have to sign a form declaring not only that they are willing to enter hospital but also that they will give three days' notice before they discharge themselves. Even this formality has sometimes discouraged mentally sick people from entering hospital willingly, and the Percy commission accordingly recommends that it should be dispensed with altogether. This means that the great majority of patients would enter and leave mental hospitals as simply and easily as physically ill patients enter and leave other

hospitals. The commission also proposes that the same freedom should apply to "mental defectives" (as distinct from the "mentally ill") entering mental deficiency hospitals. Informal admission for mental defectives, who at present almost always enter under certification, could, the commission considers, start at once, without any change in the law. It is a far-reaching proposal.

But there will always be a small minority, of mentally ill and defective patients, who refuse treatment, or whose relatives refuse it for them, but who clearly need it either to protect society or because their illness is so serious. For these the Percy commission recognises that compulsion is necessary, but it has tried to remove the stigma of certification by new procedures—abolishing judicial orders and establishing independent mental health review tribunals instead of the Board of Control—and by new names (the word "certified" is to go). Its proposals for compulsory care without stigma are valiant and commendable. But it is doubtful whether they can entirely remove the feelings of resentment that are bound to be associated with compulsory detention—whatever new clothes it is given.

DEFENCE

Ending the Call-up in Britain

THE Government's choice of methods to taper off the call-up over the next three years is reasonably fair. Of the 570,000 men available for national service between now and 1960, when the call-up ends, 240,000 are on deferment and 330,000 are men who have not yet been called on to register. It is hoped that only 320,000 conscripts will be required. The men on deferment are those who would normally be called up after completing their university, technical or apprenticeship courses; the Government has decided that they should serve their turn, and that the classes to be called up in succeeding years should be cut back to the level required. According to this week's white paper (Cmnd 175) this will mean that men born before 1939 and up to the second quarter of 1939 will be called up; those born in the third quarter of 1939 may be called up if regular recruiting lags; men born in the fourth quarter of 1939 are told they should escape; and the 1940 and later classes will not be called up—unless volunteering fails. In all these classes, including those born in 1939, men who would normally get deferment will not be called up. An eighteen-year-old who can get a university place by October, 1959, is therefore likely to avoid service altogether; this is naturally causing a bigger crush at the universities' doors than ever.

Those in the doubtful classes—born in the second half of 1939 and, indeed, those in the 1940 and 1941 age groups too—should keep a critical eye on the recruiting figures issued by the Ministry of Defence, for their fate will depend on whether the Government's expectation is fulfilled that "it will be possible by voluntary recruitment to obtain the reduced manpower required under the new defence plan." The figures they (and our Nato allies) should look at in the returns are those taking six-year engagements or longer; the three-year engagements are to be discontinued when the Army Act is amended. During the past year, regular engagements have increased slightly, but at present men are joining the forces as volunteers at the rate of about 32,000 a year. On an average service of eight years this would produce armed forces of 250,000, compared with the 375,000 that are expected to be needed when conscription ends; there is therefore a considerable shortfall, particularly in the army where long-service recruiting will have to triple if the plan is to succeed. For the forces as a whole, 47,000 men a year will be needed as long-service volunteers out of an annual crop of 450,000 young men in the bulge-years ahead. In other words, something like one out of every ten young men will have to want to be a regular serviceman if the promise to end conscription in Cmnd 175's way is not to be a pipe-dream. It still seems a very high proportion for an unmilitary race.

Economic Crystal Gazing

ONCE again, immediately after the budget, the study section of the Royal Statistical Society invited leading economists and statisticians to forecast the movement in the current year of key indicators in the British economy. Of the 100 people invited to participate in this guessing game, 67 forecast the general trends, but only 36 went so far as to set out in detail what these would mean in changes in real supply and demand this year.

The average forecast of these bolder economists is that the real gross domestic product will increase this year by some £400 million (or by between 2 and 2½ per cent) compared with £240 million last year; and that a rather larger rise in the volume of imports will mean that total supplies will increase by some £550 million. On the demand side, real personal consumption is forecast to rise by £290 million (against only £60 million last year), which means that it would take just over half of the extra supplies; whereas exports are forecast to rise by £220 million, which would be only slightly smaller than their expansion in 1956, but would mean that they would take only about two-fifths of the extra supplies, compared with about three-quarters of last year's smaller rise in supplies.

These forecasts, set down in Table I, assume that industrial production will rise by 2½ per cent and that the unemployment rate will average 1.3 per cent over the year. Since in the first four months of 1957 output was still dead level on last year's plateau and average unemployment was 1.7 per cent, the forecasts imply a considerable improvement in the rest of the year. Unemployment does, of course, normally fall off in the summer months, and it would in fact have to fall no more than in 1954 to prove the unemployment forecast correct. If the index of production rose between now and the end of the year by only a little more than it did in the same period of 1954, the forecasts of output could prove correct also.

Are these economists likely to be right in believing that industrial expansion will get back to or beyond its 1954 keel this year? Some people will say that the present "feel" of the economy makes this assumption plausible, and the tighter restrictions on motor car hire purchase which the Government imposed this week presumably mean that the authorities think they are operating in a climate of potentially rising demand. But such indications as are available of the rise in consumption are not noticeably more buoyant than one should expect at this stage of the hire purchase cycle, and there could be some check to consumption at the end of this year with the onset of widespread rent increases. One would also have thought that the estimate in Table I for the fall in current government expenditure this year was on the low side. Last year the economists who participated in this guessing game were far too optimistic about industrial production, but underestimated the rise in exports. Our own hazardous guess is that they—and the authorities?—might well be making, at least to some degree, the first of these miscalculations again.

TABLE I—GUESSES AT THE BALANCE SHEET
(£ million at 1955 Factor Cost)

	Actual for 1956	Forecast for 1957		Actual for 1956	Forecast for 1957
Changes in supplies			*Changes in demand*		
Gross domestic product	+240	+400	Consumption	+ 60	+290
Imports	+100	+150	Govt. current expenditure	+ 50	− 50
			Fixed investment	+ 80	+ 50
			Stockbuilding	−100	+ 40
			Exports	+250	+220
Total	+340	+550		+340	+550

TABLE II—GUESSES AT THE INDICES

	Actual for 1956	Forecasts for 1957 Av.	Forecasts for 1957 Range
Industrial production (1948=100)	137	140·5	136 to 146
Volume of exports (1954=100)	113·5	118·1	115 to 122
% unemployment	1·2	1·3	1·0 to 1·6
Personal consumption (% change over previous year)	+0·5	+2·5	+0·5 to +5·2
Retail prices (% change over previous year)	+5·0	+3·7	+1·6 to +6·0

Belgians Debate a Cut

A FIRST explosion has already occurred in the chain reaction of defence cuts which our European allies prophesied as the disquieting sequel to Britain's defence white paper. Belgium's Christian Social (Catholic) opposition leaders have declared that if they are returned to office in the 1958 elections they will cut national service from eighteen months to a year. The cabinet, spurred on by this challenge, is also considering modifications in the call-up. Competition in defence cuts promises to become a live and dangerous element in the electoral campaign.

Ironically, some four years ago it was a Catholic government that stoutly proclaimed the necessity of a continued two-year period of national service. It was the Socialists and Liberals who were then carried to power on the promise of reducing conscription, which they carried out. The temptation to beat the Socialists at their own electoral game is naturally a strong one for the Catholic opposition, but their new move has been precipitated not by electoral considerations alone but by Britain's change of course.

The April white paper aroused a flurry of discussion in Belgium about the organisation and equipment of its forces. They are perhaps more closely modelled on Britain's than those of any other European ally, and Belgian and British forces in Germany are closely linked. The military planners in Brussels are bound to follow Britain's lead to some extent.

It is, however, regrettable that the first move toward the remodelling of Belgian forces is the promise of a cut which will probably reduce their strength. Yet another unilateral act (and there may be more from other allies) threatens to disrupt Nato's efforts to achieve a concerted adaptation to the new military needs. Taking a leaf out of Britain's apologia, the Christian Socialists offer assurances that more regulars will be brought in, to make their forces as strong as ever; and that Nato's studies will not be prejudiced. But until these claims are proved in practice, they will arouse as much scepticism as Britain's attempts to whitewash its withdrawals from "the shield."

Patching the Shield

HERR STRAUSS'S visit to London was successful in its aims. Like Mr Macmillan's visit to Bonn, it helped to smooth down the resentments aroused in Germany by Britain's abruptly announced new defence policy. A step forward has been taken in co-operation on arms development and research. And the £25 million of further German arms orders in Britain which are under discussion, as Herr Strauss explained, are a German gesture of good will.

The task now is to develop the European partnership. Co-operation on arms should reach out beyond mere German shopping in, say, Britain and France, and sporadic get-togethers on research, to embrace common planning—so that both the design and production of future weapons are based on an appraisal of needs by the alliance as a whole and common plans. Now seems the moment, for example, to decide together on a new tank, as successor to the lumbering Centurion, a light, fast vehicle, quick to scurry through the void left by a tactical atomic explosion. Britain is developing one already. France and Germany both have similar ideas. It would be absurd if two or three such European tanks came into service, quite apart from an American one. And the new bilateral links between Britain, France and Germany should be gradually extended to all the European allies.

Now that the Germans, who were most disturbed by Britain's new defence policy, have been mollified, Mr Sandys's main constructive task will be the fitting of his new policy into the reappraisal which is being undertaken in the alliance as a whole. At present, as each ally seeks to sort out for itself the implications of Britain's new defence policy, confusion is pretty complete. By next October, however, Nato and Western European Union hope to produce a common plan, both for a new concert in weapon production and for "new model" forces. Britain, which caused the disruption in the first place, has a special obligation to take Nato's comments seriously. At Dr Adenauer's suggestion, General Norstad is to set down his views on the new style forces and on Britain's contribution to "the shield." Mr Sandys's next mission might well be a pilgrimage to Fontainebleau to hear these opinions and defend his own.

UNIVERSITIES

Screening the Students

LORD CHORLEY'S complaints about the inquiries of MI5 in the universities could mean much or little—that little being the essential minimum of security inquiries which can reasonably be made when the authorities take up the university references given by graduates who put

in for jobs on secret work. Clearly it is extremely difficult to get precise information about how much questioning is done, and it is doubtful how far an inquiry among members of the Association of University Teachers will throw reliable light on it. The warning that MI5 is getting security reports on students and teachers in "nearly every" university in Britain hardly suggests that the network is complete. Fears that the political notions of young people are being noted down in large numbers to be used in evidence at every subsequent stage in their careers may be misplaced.

But complacency is out of place, too. The main things to guard against are clearly the spread of the habit and too much diffusion of responsibility. How far a check can be kept on the habit when national security is directly involved is doubtful, although it would be nice to know on roughly what proportion of the population MI5 considers it necessary to keep files. But universities should resist such questions being asked by all sorts of unauthorised departments or persons—industrial personnel officers, for example. As for the diffusion of responsibility, the danger here is of an unhealthy growth of amateur security agents among the less sensible and well-balanced type of university teacher. It has been suggested that some teachers may band together to refuse to answer any inquiries which they think improper or irrelevant; certainly they have a right to do this, but unco-ordinated action could do more harm than good. It might leave the candidate for a job at the mercy of the one teacher who was self-important enough to provide such answers, and his answers might be precisely those that were most illiberal and wild.

University organisation is surely adaptable enough to meet this difficulty. A good code of rules to lay down might be that security inquiries must normally be routed through an agreed channel—such as the principal's office or what corresponds to it—and that teachers and tutors should ordinarily confine their comments to a student's work, abilities and general character in the time-honoured way. The principal's office could decide how far the nature of the inquiry justified the provision of any further report on the student's (or ex-student's) political affiliations or associations, and how much of what was known should, in fact, be passed on. Of course, principals—like ordinary teachers—will vary in their interpretation of such rules, and possibly in their tendencies to distinguish between a healthy pink and red; but if the security authorities collected their information from a strictly limited number of dignitaries, they would have less excuse for not recognising which sort of reference-giver was which.

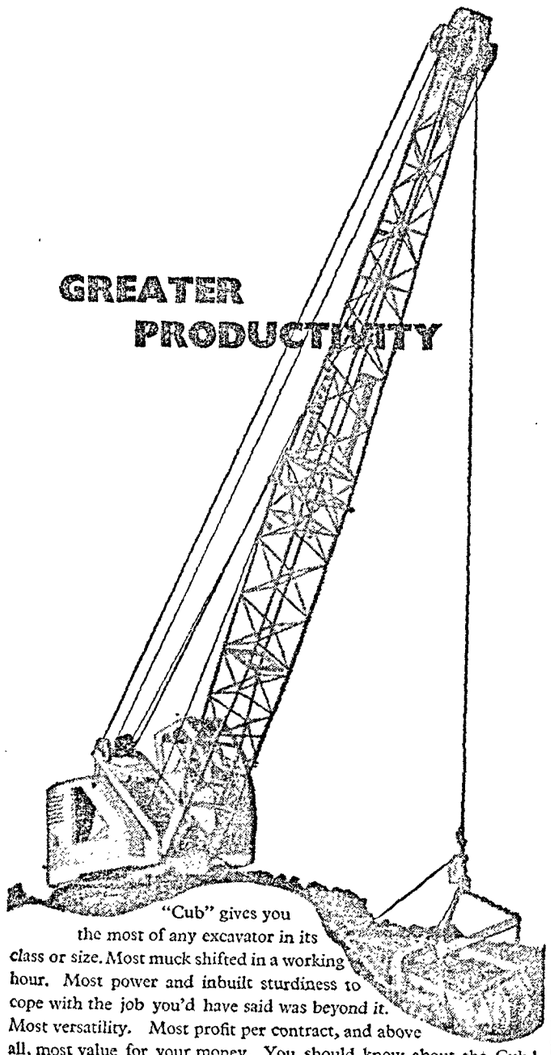
CHINA TRADE

Fission in "Chincom"

THE news that Britain's embargo on trade with China will be brought into line with that on Russia in defiance of the views of the United States is no surprise. The much-publicised "secret" negotiations in Paris have made it clear that the British and American standpoints cannot be reconciled. The break is regrettable. Though both governments will continue to work in "Chincom" and "Cocom," the allied co-ordinating committees on strategic trade restrictions, the blatant divergence of policy will hardly improve Anglo-American relations. The British view, however, is that the irritating difference between the two embargoes was more harmful to Anglo-American relations than a clean break. Certainly the old anomaly made the embargo difficult to operate and provided a dangerous focus for anti-American feeling. Britain had the sympathy of many other member countries for its logical point of view, and though most, including the Japanese, Germans and French, have been more disposed than Britain to find some sort of compromise, all these countries are likely in time to follow the British lead.

It will be interesting to see if the relaxation in fact yields the major increase in British exports which some traders hope for. The embargo which remains is still severe and in its twilight zone—the goods under "surveillance" or quotas—Britain may well be prepared to concede much in practice to the American view. A group of British business men, under the auspices of the Sino-British trade committee, may visit China soon; they should learn something of the possibilities. China has considerable sterling assets, as a note in *The Economist* last week pointed out. But this sterling is used to finance much of its trade with other areas, including eastern Europe. Political as well as economic factors will decide where China buys.

FORMOSA



Storm in Taipeh

IN the anti-American riots in Taipeh there appeared to be some careful organisation behind the visible mob hysteria. The demonstrators were equipped with flags bearing anti-American slogans, and warning telephone calls were made to United States officials. The killing by an American sergeant of a Chinese civilian could scarcely have been planned, but it looks as if it was exploited by people who had been planning a demonstration since the sergeant's arrest in March. The fact that the Nationalist Chinese police stood by without trying to save the American embassy offices from being wrecked suggests either passive approval or collusion; the first is the more likely, for the rioters later turned on the police themselves and attacked their headquarters.

Who were the organisers? The young Formosan who ran up a Nationalist flag over the embassy in place of the United States one may have been moved by purely nationalistic and anti-American feelings. But his symbolic gesture suggests a state of mind receptive to the propaganda poured out of Peking in the past few months, which represents the Americans as hostile to President Chiang Kai-shek's regime and bent upon permanently colonising Formosa.

The fire behind this smoke is that the Chinese Nationalists have a genuine grievance about the retention of extra-territorial and diplomatic privileges by the American armed forces stationed on the island. The court-martial's acquittal of the sergeant was the spark that fired this explosive tinder.

Though the incident was serious, too much should not be read into it. Anti-Americanism is unfortunately a phenomenon of which Formosa does not have the monopoly: it is liable to arise at a popular level wherever American troops are stationed and American money is distributed. The grievance of extra-territoriality—a subject on which the Chinese are historically touchy—was fully shared by the Nationalist government, as the foreign minister's statement showed. But it would be absurd to suggest that the government condoned the riots, or is susceptible to communist

"Cub" gives you the most of any excavator in its class or size. Most muck shifted in a working hour. Most power and inbuilt sturdiness to cope with the job you'd have said was beyond it. Most versatility. Most profit per contract, and above all, most value for your money. You should know about the Cub! Built as a small, but essentially robust excavator, the Cub combines typical Priestman power and reliability with a new manoeuvrability which enables it to go anywhere. Six front-end equipments and choice of three track widths (13", 18" or 24") make the Cub the most versatile excavator yet! Site-to-site transport is simplified by the Cub's matched trailer onto which it loads in five minutes and is then conveyed at normal road speed.

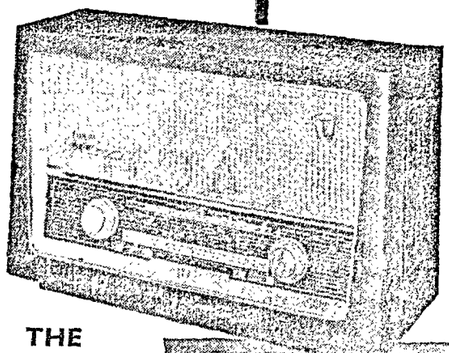
For the educated ear

V.H.F. transmission is of *undeniable excellence* — as any high-fidelity radio enthusiast will tell you. But its excellence is beyond the range of an ordinary radio.

It's as well you should know this if you are thinking of buying a new one.



In fact, the set must be capable of reproducing the more extended audio frequencies that V.H.F. makes available.

The Grundig 'Pembroke' V.H.F./F.M. table radio is designed for V.H.F. reception at its best. Designed to give you all the scope, subtlety, and depth of the whole audio frequency range.

It has two speakers, one bass and one treble, acoustically arranged to give three-dimensional sound reproduction and the inspired circuitry makes provision for four independently variable tone controls covering the entire sound spectrum.

With two built-in aerials and an interlocking control system for V.H.F. as well as standard reception, the 'Pembroke' is really two sets in one—and the performance of either is an experience.

DROP IN TO YOUR RADIO DEALER AS SOON AS YOU CAN AND ARRANGE TO HEAR IT FOR YOURSELF.

propaganda. The Taipeh government's very existence depends upon American aid and support, and its leaders have no illusions about Peking's offers and reassurances.

KENYA

Mr Mboya Rampant

An African nationalist of the most awkward type has emerged to lead his race in Kenya, and at the worst possible moment. Mr Tom Mboya, the leader of the elected Africans in the Kenya legislature, has now put forward his case for repudiating the Lyttelton settlement, which brought multi-racial government to the country until the direct African election last March put eight nationalists in the house. He says that as the agreement was made with nominated, not elected, African members it cannot be held binding on their successors, who are the real voice of African aspirations. His demands fall into two parts. The first, specifically, is for fifteen additional African elected members at once, to give the Africans parity with the elected members of all other races. The second is that the present ministerial system should be discontinued and presumably, that there should be an interim return to rule by colonial officials until a new constitution is agreed.

Since the next stage in a more "advanced" colonial constitution is the replacement of official by elected members and the creation of a responsible government of elected ministers, Mr Mboya knows quite well that his second demand will not be granted. And the objective of his first demand is painfully clear: to get enough support in the legislature for an African government—or perhaps, at first, an Afro-Asian coalition. It is because he knows that the *local Europeans will not accept this that he is demanding* that negotiations should be between himself and the British Government. But by tying his immediate and longer-range aims so closely he is either being very naïve—or reckoning on a period of struggle which will end in him negotiating with an incoming Labour Government in Britain.

Mr Mboya disingenuously asks why such a programme should be regarded as demagoguery. The demagoguery lies not in what he says to the British press—however unpalatable to local Europeans—but what he and his lieutenants say to African mass audiences, which are, as usual, totally different things. The Kenya press has plainly been at some pains to make sure that some of his worst utterances—admittedly most come from a single political meeting—are reported back to Britain. They give grounds for disquiet. The consequences could be disquieting too. Already the Kenya government is seeking to curb African political activities again, which is a counsel of despair. Means should be found to expose and counter Mr Mboya when he tells lies or stirs up civil non-co-operation; but the worst step would be to make him a martyr. The Europeans will need to show great political skill and understanding of African mentality to bring Mr Mboya to a reasonable and bargaining frame of mind.

DENMARK

Odd Bedfellows

After a fortnight of kaleidoscopic manœuvring Hr H. C. Hansen, who led Denmark's outgoing Socialist ministry, has managed to form the country's first postwar majority government. He has coaxed into his coalition not only the Radicals, who have supported the Socialists on most domestic issues, but also, surprisingly, the mildly Poujadist single-tax party. This party's supporters may well view collaboration with the Socialists as a betrayal, all the more since its unexpected gains in the mid-May elections were mainly attributable to the broadcast fulminations of its leader, Dr Starcke, against bureaucracy and high taxes.

Charges of betrayal have also been launched against the Radicals by the right-wing parties. The Liberals were apparently confident of forming a Liberal-Conservative coalition government which, given Radical support, would be sure of a majority. But the Radicals proved willing to co-operate only with the Liberals, not with the Conservatives, whom they heartily dislike. The right wing's quandary may eventually lead to the Liberals absorbing their Conservative allies into a single "bourgeois" party—which, as things stand, would have 75 seats to the Socialists' 70 in a chamber of 175.

It is unfortunate that no broadly based coalition could be formed, for grave economic problems confront Denmark. The £20 million foreign exchange surplus inherited by the Socialists in 1953 has been turned into a corresponding deficit. Agricultural prices are low, and, against a background of creeping inflation, trade unions are clamouring for shorter hours. Hr Hansen and the former Liberal finance minister, Hr Thorkil Kristensen, would together have commanded general confidence; but the new coalition scarcely looks strong enough to stand the strain of the kind of austerity programme that the Prime Minister forecast on Wednesday. Once again, the utopian fairness of proportional representation appears ill suited to nations whose difficulties call for firm and speedy decisions.

HAITI

Too Many Presidents

Haiti, which shares a Caribbean island with the Dominican Republic, is overcrowded, badly in debt and at present politically chaotic. On Sunday a new provisional president, Professor Fignole, was sworn in, but it is still doubtful whether he will achieve a longer term than his immediate predecessors. Haiti has personalities and pressure groups, but no political parties. Six months ago President Magloire, who had ruled for six years with increasing totalitarianism and extravagance, was brought down by means of a prolonged general strike. The trouble since then has been an excess of presidential candidates.

Two provisional presidents were thrown out in quick succession; then Haiti was ruled for a short time by an executive council. This was overthrown last week by General Contave, the army chief of staff. Political comings and goings, however abrupt, had thus far been effected reasonably peacefully, but the general's barefaced snatch at power brought the republic to the verge of civil war. Colonel Armand, the police chief, was nominated head of the army by the ousted council, and led a force against General Contave. There was rioting and some bloodshed, ending with the appointment of President Fignole.

The new president has promised free and honest elections next month, but he has been discreet about his own personal plans. He has a lot to contend with. General Contave is unlikely to fade into the background. As usual

in Haiti in times of crisis there is a general strike, and the president is not supported by Senator Dejoie, who controls powerful business interests. The country is almost on the economic rocks. It lives largely on coffee and tourism, and not only is the coffee crop this season believed to be the worst for ten years, but tourists are notoriously gun shy. Haiti gets a fair amount of money and technical assistance from outside, but if it is to regain a modicum of political and economic stability it will need more.

CEYLON

Summer Lightning

FLICKERS of lightning in Ceylon's political sky give warning that a bad storm may be brewing, but provide little illumination. Alarming attitudes are being struck by the contestants, but are they meant merely to alarm ? The Tamil parties and organisations have given warning that they will launch a civil disobedience movement in mid-August, in protest against the imposition of Sinhalese as the country's only official language. They say they will limit themselves to non-violent action in the Gandhian tradition of satyagraha. It is to be hoped that they will ; but the Prime Minister, Mr Bandaranaike, and his Sri Lanka Freedom party seem to doubt it, for they propose to recruit thousands of volunteers to help the army and police in the event of trouble. Sections of the Ceylon press have sharply criticised this move as a step towards the creation of a private army.

Mr Bandaranaike may be bluffing, or seeking to call the Tamil leaders' bluff. His real aim may be to show the restive minority that he is in earnest, and to persuade them to call off their campaign. The same may apply to his reported decision to suspend the issue of passports and prevent anyone from leaving Ceylon between now and August unless the government approves of their leaving. This report could not be confirmed at the time of writing, and the purpose of the move is in any case obscure—unless it too is primarily a gesture meant to daunt the prospective satyagrahis. But the game that is now being played is a dangerous one. If the Tamils remain undeterred and the Prime Minister carries out his counter-measures, the August storm will loom black over a normally peaceful island.

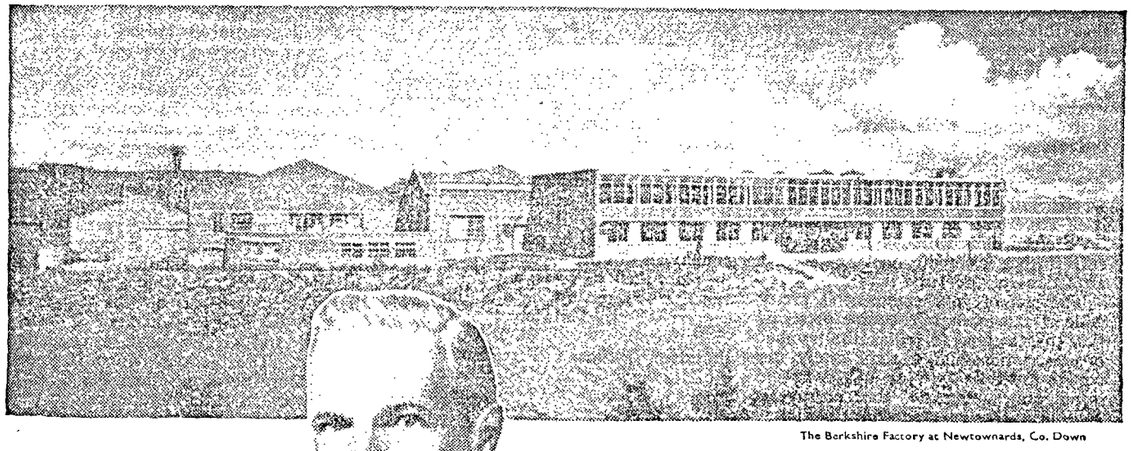
THE YOUNG READER

Sixty per cent Book-buyers

THE survey of boys' and girls' reading habits carried out by W. H. Smith and Son and the publishing firm of George Harrap and Co (unpublished but circulated to the press), is on the whole an encouraging document ; it goes far to dispose of the popular legend that a telly-soaked younger generation is growing up either ignorant of the joys and uses of leisure reading or incapable of the necessary effort. The respondents were 4,000 boys and 4,000 girls at public, grammar and secondary modern schools in England and Wales ; once the schools had been chosen (on geographical principles) all pupils were included and, presumably with their teachers' encouragement, all replied.

As might be expected, public and grammar school pupils bought more books, and visited bookshops more often, than did the rest ; but even outside this group 60 per cent, on an average, claimed to be actual book buyers and a rather higher proportion belonged to a library. The choice of authors, revealing Mr W. E. Johns (of " Biggles ") as a runaway favourite among boys at all types of school and Miss Enid Blyton as holding an even longer lead among girls, may be hopefully related to the fact that numerically the middle forms constituted the largest group of respondents. Any writer proposing to challenge these two winners should note that both boys and girls preferred adventure stories by a wide margin to all others—the boys having a specific taste for war—but that for space fiction they appear to stick to their favourite weeklies. Only girls had a taste for romance. A fair percentage of respondents, especially at public and grammar schools, were interested in books on travel, history, biography and hobbies. On the choice of books the most powerful influence was clearly the library, with recommendations (by friends ? parents ? teachers ?) and bookshops as the next most important. All groups mentioned television as a guide to reading—a finding which lends force to the suggestion that any encroachment it makes on reading time may well be outweighed by its stimulus to interests and curiosities demanding print for their further satisfaction.

The Economist



MAY 30, 1857

THE IMPORTANCE OF FOOD

¶ We have all of us looked for a long period with something like disdain on the cabbage broth and macaroni, the olives and chestnuts, the crout and the rye bread that constitute the diet of Continental Europe. We have attributed, and not without reason, some of the national superiority to our being better fed. We all believe that the poor rice-fed Hindoos would be more formidable foes, and we find them in our service more useful soldiers, from enjoying a superior diet. Throughout Europe the bulk of the opulent classes take great care to feed themselves well. Cooking is deservedly cultivated as an important art, and the due nourishment of the body is studied by those who look after their own welfare, or who secure a share of the wealth of the wealthy from ministering to their wants. What all the opulent classes do, what we see so plainly is necessary for the welfare of the Hindoos, the French, German, and Italian peasantry cannot be otherwise than very useful and desirable for all. To nourish the body regularly and well is a great part of civilisation. It preserves it in health, keeps the temper even, the mind free and active, and makes men altogether more pleasant and useful to one another. The public must learn, therefore, with some regret and alarm, that the " Scotch peasantry, in general, are worse fed than Scotch paupers in lunatic asylums." . . . Wretchedly fed as these people are, however, they contribute of their substance to the support of the opulent and the Government. There is nothing which they consume on which rent has not been paid and on which taxation has not been levied. . . . We mention the fact not invidiously, but to show how we are all bound up together, and that the opulence we admire in one class and the strength we admire in the State are conjoined with great poverty, great suffering, and with much disease and terrible insanity. We would further deduce from the fact of the intimate union between us all . . . that it is not a safe policy to meddle with one of its great businesses . . . lest we damage some other of equal or greater importance. After our experience of the corn laws and similar laws which the Legislature meant should be beneficial, it is greater wisdom not again to make such laws than to make them and repeal them after suffering their enormous evils.

Berkshire to build second mill in Northern Ireland—

They expanded first mill four times!

The Berkshire Factory at Newtownards, Co. Down

Mr. Ferdinand K. Thun, Chairman of the Board of the American parent Company, praises Northern Ireland workers' "traditional skill and workmanship."

A second full-fashioned nylon stocking mill is to be established in Northern Ireland by Berkshire Knitting (Ulster) Ltd. Mr. Ferdinand K. Thun, Chairman of the Board of the American parent Company, says: "Berkshire Knitting was established at Newtownards, County Down, in 1948, in a modern factory of 70,000 sq. ft., which was planned to reach optimum production in 1951 with a labour force of 320. Although no labour in the area had experience of fine gauge full-fashioned and seamless hosiery, local men and women were trained successfully in all operations. Our decision to continue expansion in Northern Ireland was influenced by our experience in developing a fully integrated local management and labour force which was completely self-sufficient."

Mr. Fetherston

Mr. Alex H. Fetherston, Managing Director of the Northern Ireland Company, recently stated: "We now employ 750 (of whom 430 are men) and the mill, after four extensions, now covers 120,000 sq. ft. Our Newtownards mill is now recognised as being one of the best equipped and versatile hosiery plants in the world. Our second mill will be established in Dundonald, between Newtownards and Belfast, in a factory of 28,000 sq. ft. to be provided by the Northern Ireland Government. When the first complement of machines is installed, 170 workpeople (50% men) will be employed."

Announcements of new developments in Northern Ireland have been made in recent months by

DU PONT COMPANY (UNITED KINGDOM) LTD. · CHEMSTRAND LTD.
PYE LTD. (Bessbrook Products Ltd. & Unidare Engineering Ltd.)
BRITISH OXYGEN CO. LTD. · FLEXIBOX LTD.
SUMMERSON HOLDINGS LTD. · F. M. ASPIN (TOOLS) LTD.
BALLANTYNE SPORTSWEAR CO. LTD.

They will join over 100 new firms which have set up there since the war. 25% capital grants are available for you to build your own factory, and for plant, machinery, etc. Twelve new Government factories are planned or building now to rent (for as little as 9d. per sq. ft.)

If you, too, are thinking of expansion, consult

A Salaried Medical Service

SIR—I notice that you commented last week on a speech I made to the Socialist Medical Association, when I suggested that a salaried service would have real advantages for the medical profession. And so it would! But I did not suggest that this either could or should be imposed on an unwilling profession. I argued that too many doctors are still isolated from other social and medical work and that they should be encouraged to co-operate in group practice and in the smaller type of health centre—co-operate both among themselves and with local authority health staff. I agree wholeheartedly that co-operation is in itself important; a pay structure should be evolved that would encourage this still further by reducing the financial attractions of the large list.

The rest of your comment is pretty wide of the mark. Of course prescription charges tend to reduce the number of prescriptions and, to some extent, the cost to the Exchequer, though even this is not quite automatic. Recent experience has shown that quantities prescribed have increased as charges have risen—and this can be dangerous medically as well as wasteful. But the strongest criticism of charges, and remember that charges are opposed by the British Medical Association itself, is that they have distorted the whole medical picture. The very patients who bring pressure to bear on their doctor are the least likely to be deterred by the charge, while some of those who really need the treatment may well not come forward for it. In fact, a purely financial decision takes the place of a medical one.

Finally, to come back to the question of a salary. If a salary were to be paid to doctors practising in a particular health centre, that need not prevent patients from making their choice of doctor. What I am above all concerned with is that we seem to have got into a rut at the very time when general practice could offer a most exciting and satisfying future for a doctor. In isolation he denies himself the opportunities of wider medical interests and denies his patients their right to a better service.—Yours faithfully, ARTHUR BLENKINSOP
House of Commons

Something for How Much?

SIR—In suggesting some amendments to Labour's proposed national superannuation scheme in your article of May 18th, you ask "Should the scheme be managed by the insurance companies instead of by the state?" and you answer "There would be certain advantages if the insurance companies could run a basic and self-supporting 'approved scheme,' but with each company offering variations of its own if its customers wished."

To avoid possible misunderstanding, we think it should be made clear that in addition to the private pension schemes which are arranged through insurance companies there are also many which are self-administered by their own trustees. Indeed, the statistics published by the Phillips Committee showed that the number of members covered by self-administered schemes (including those of the nationalised industries) was greater than the number covered by insured schemes. At present an employer who wishes to provide pension benefits for his employees has a choice of either a self-administered or an insured scheme. It is important that that choice should be preserved and that both types of scheme should be allowed to play their part if any "approved scheme" is set up on the lines you suggest.—Yours faithfully,

A Perverse Report

SIR—May we reply to the criticism in your last issue of our report on the flammability of apparel fabrics? Essentially this criticism was aimed at the committee's decision against grading of fabrics in an "order of flammability."

The most important finding of the committee, not mentioned by you, is that most lightweight fabrics are about equally flammable and all require the same precautions; there are not, as some people have supposed, a number of relatively "safe" fabrics alongside the more dangerous ones. It is to the credit of the textile industries that they have accepted what might be thought an indictment of all their most popular products rather than offer an illusory grading scale which might delude purchasers into thinking that fabrics marginally higher in the scale than others were appreciably safer. For example, how much safer for a child's nightdress is a wincеyette with a flame-resistance rating of 50 than another cotton material rated at 30? Either will burn the complete length of the child's garment in less than 20 seconds with equally disastrous results.

The committee found that there are in effect only three possible grades—flame-resistant, potentially dangerous, and actively dangerous (at present almost non-existent). These facts were not generally known, either to the trades concerned or to the public, and the committee's final objective was precisely that mentioned by your contributor—to draw public attention to the danger of clothes catching fire and to stimulate demand for flame-resistant fabrics.—Yours faithfully, H. A. R. BINNEY,
British Standards Institution Director

Britain's Turkish Friends

SIR—Referring to the article in your issue of May 4th, I should like to express the opinion that too great stress is laid on the value to Britain of the friendship of Turkey, whilst that of Greece is entirely ignored. In World War I Turkey declared war on you without provocation, whilst Greece fought on your side. In World War II, although you had guaranteed Turkey's integrity and even when you were hard pressed in the Near East, she prudently kept out of the fray, preferring to sit on the fence and enjoy the benefits of neutrality; while Greece again fought throughout the war on your side, being in 1940, at one of the worst periods of the war, your sole ally. How should friendships be compared? By words or deeds?

As for the proximity of Cyprus to the coast of Asia Minor, it is, as your correspondent mentions, less than that of the islands of Mitylene, Chios, Samos and the Dodecanese—or of the Channel Islands to France—while in Thrace, Turkey and Greece have a common frontier. The Turkish nation is three times more numerous than the Greek, so of what strategic importance can the proximity of Cyprus be? The Turks in western Thrace and the Dodecanese live on entirely friendly terms with the Greeks, as they have always done, until quite recently, in Cyprus. They would again if the islanders were given the right of self-determination.—Yours faithfully, N. G. PASPATI
Athens

*

SIR—Your correspondent in your issue of May 4th analyses the situation in Cyprus from an English point of view. To me as a Turk the Cyprus question is not a simple matter of give and take. It is a question of prestige; or *amour propre*. The world is well aware that the Turks defied a much more powerful country than Greece in a much more critical situation. The question here is not one of hostility or fear of Greece. Why did we not ask for Mytilene, Chios and the Dodecanese islands? It was not that we were afraid; simply that we wished to keep our word.

But in the case of Cyprus the situation is totally different; if, for example, I gave you my purse to keep and a third person came along and insisted upon taking it; and if you yourself also wanted to give it to him; but at the same time said to me, "never you mind, old pal, we still are friends"; wouldn't it sound rather queer?

On the other hand one must ask what will become of Britain as a Middle Eastern power after the Suez crisis and with its bases in Egypt and Jordan gone. If it loses Cyprus too, what foothold will remain to it in the Near East?

There is an old saying that diplomacy is the ability to see the future and take the necessary precautions in advance.—Yours faithfully, RIFAT ATAMER
Istanbul

Ghana on Honeymoon

SIR—It is not desired to discuss the experience or judgment as an expert on matrimonial affairs of your special correspondent in Accra. But it might be useful to correct a few of the errors of fact in his article in your issue of May 18th. The Queen and the Ghana national anthem have always been played at official functions attended by the Governor-General. Your correspondent is misinformed on both the decision and design of the bank notes. A decision on the design of the bank notes has not been deferred; the printers are producing a final proof for consideration by this Government. The statement that the Government of Ghana intends to have a university something much more American in style is hardly consistent with the University Council's invitation to Professor Stoughton of Reading University to become the next Principal in the University of Ghana. I am asked by Mr Gbedemah to say that much of the speculation about his policies as Minister of Finance and his relationship to his political party is as wide of the mark as, for example, the statement that he has been completing the budget in the seclusion of his Togoland home. Mr Gbedemah completed the budget before he left Accra.—Yours faithfully, GERALD PLANGE,
Acting Director of Information Services
Accra

Tanganyika

SIR—In the article of April 20th your correspondent rightly stresses the importance of the economic horse preceding the political cart, but he does less than justice to some of the work being carried out. The memory of Mr Strachey's groundnuts may have faded from the mind of the British public, but in the Territory, the Tanganyika Agricultural Corporation, having taken over a somewhat ill-proportioned offspring from its original parents, the Overseas Food Corporation, is prominent in the search for ways to raise the standard of living of the African.

Development is proceeding along different lines in each of the three original groundnut scheme areas. At Urambo, in the Western Province, the Corporation, having proved the possibility of flue-cured tobacco production, has handed over most of its farms to European tenant farmers. Kongwa, the scene of such tremendous activity in 1948, has long since been shown to be entirely unsuited to the large-scale production of arable crops, owing to the unreliability of the rainfall. Nevertheless the emphasis in research work there has been effectively moved to the production of beef cattle on improved pasture. At Nachingwea in the Southern Province large areas of groundnuts and soya bean and, to a lesser extent, maize and sorghum are being grown at a level of yield that makes more certain the prospect of eventually achieving economic operation.

Although most of the farms are run by European managers with African labour, the problem of helping the African to rise above the limits of hoe cultivation is being tackled concurrently on an African Tenant Scheme. Here tenants farm holdings of 20-25 acres each under the general supervision of a European manager. Improved seed, technical advice and mechanical cultivations are available to the tenant, but for all services he pays the full market price, and much of the success of the scheme to date can be attributed to the fact that, from the outset, emphasis has been placed on the importance of utilising the labour of the tenant and his family to the maximum.

As in many other countries, capital for both agricultural and industrial development is extremely scarce, and only recently the plan put forward by a South African firm for the production of sugar on 60,000 acres in the Kilombero Valley had to be turned down due to the lack of £3¾ million required to build the necessary railway. Unless the Territory can continue to look to other countries and international agencies for a supply of development capital, independence celebrations in Dar Es Salaam would bring only cold comfort for the majority of the African population.—Yours faithfully, R. F. LORD
Tanganyika Agricultural Corporation, Nachingwea, Tanganyika Territory

Faith or Myth?

SIR—Your article "Aspects of a Myth" (in *The Economist* of February 9th) is somewhat misleading. It deals with the recovery by the Chinese Nationalists of the mainland now under the oppression and tyranny of Communism, but its argument is inferred from what "the highest American officials" would think.

I say it is not a myth but a faith, as much a faith as the War of American Independence, the wars of liberation against Napoleon's empire and the wars of freedom against Hitler's empire. "The battle is not to the strong alone."

In China's own history, the empire of Ch'in-Shih-Huang-ti (221-207 BC) is an illuminating example of an empire built entirely on force, formidable but fragile, and therefore easily overthrown by the people, and going down in history as the shortest empire ever recorded. During the years of war against Japanese aggression, Mao Tse-tung wrote of his aspiration to become even greater than Ch'in-Shih-Huang-ti. Helped by his greater brutality and ruthlessness and his complete submission to Russia, he certainly "outshines" the latter and the logic of events will certainly mean that his empire outdoes the Ch'in Dynasty in shortness of life. To "recover the mainland" is therefore not a myth but a faith, vindicated by history and destined to make history.—Yours faithfully,
Taipeh, Formosa CHEN-YU CHENG

Industry and Technical Progress

Factors governing the Speed of Application of Science

C. F. CARTER AND B. R. WILLIAMS

This report on factors influencing the rate of adoption of new scientific ideas in British industry is written by the two Directors of Research of the Science and Industry Committee appointed by the Royal Society of Arts, the British Association, and the Nuffield Foundation. It is an authoritative book on an important subject, and includes case studies of the pottery, jute, cutlery and paper-making industries. 25s. *net*

OXFORD UNIVERSITY PRESS

BOOKS

Strategic Birds in Hand

History of the Second World War: *Grand Strategy Volume II, September 1939—June 1941.*

By J. R. M. Butler.
Her Majesty's Stationery Office. 622 pages. 42s.

THE editor of the United Kingdom Military Series of the official History of the Second World War has revealed a proper responsibility in tackling this, perhaps the trickiest, volume personally: for it requires the closest, even rose-tinted, scrutiny to perceive between the outbreak of war and June, 1941, many of the lineaments of grand strategy—save, perhaps, to miss no opportunity of gaining American support. The hand-to-mouth, episodic, nature of the emerging problems pushed into the background, at the risk of outmoding, such longer-term priorities as were formulated by those responsible for thinking about our strategy. "When a man knows he is to be hanged in a fortnight, it concentrates his mind wonderfully," but it does not assist the best assessment of the subsequent priorities. One might be left with the impression from this volume that suspended over events (and usually disastrous events) was something called "grand strategy" which we were going to come to, as it were, when we were less busy. Yet the matters about which we were busy were already outlining, distorting, even dictating, ahead, decisions of grand strategic import. The Chief of the Imperial General Staff reminded the Prime Minister in the spring of 1941 that it had been accepted that in the last resort the security of Singapore ranked before that of Egypt. But we were busy in Egypt, the bird-in-hand.

One of the problems in organising this volume must have been to decide what detail to include of what we were busy about: a problem only apparently made easier by the publication already of the "campaign" studies (by Dr. Derry, Major Ellis, or General Playfair), not to mention the quite admirable "War at Sea" by Captain Roskill or several of the civil histories such as Professor Medlicott's concerning the economic blockade. Professor Butler may hardly be expected to do more than summarise their findings admirably and to provide an overall perspective. Whereas these authors had fairly clear frontiers within which to control their separate studies, he has had to discover a strategic unity in an essentially incoherent phase. The imposition, over all these organisational difficulties, of a single mastering mind is perhaps more than one should expect in an official history. Moreover, one such mastering mind has already imposed upon this period an unforgettable pattern which no subsequent annalist, official or otherwise, may disregard; for Sir Winston has twice (in neither case without some dissent) enforced his own grand strategy: first, at the time; and, since, about how it shall be remembered.

Mr Butler provides, instead, a well-stitched and effective summary, balanced and sensible: aware of the controversial matters and putting them before us in unobtrusive perspective. It would be asking too much of a sponsored, if independent, analysis of punctured optimisms that we should find it consistently enthralling. We get what we have the right to ask for: decent workmanship. Not many people will be reading this book through twice; but it will often be usefully referred to (about, say, British intervention in Greece, to take but one example), and it will be surprising if the reader, once started again, does not then move on to a reperusal of Mr Butler's short and competent final chapter, in which he looks back at his previous 550 pages to give us his own quiet personal measure of their upshot.

Father of Capitalism

Polity and Economy: *An Interpretation of the Principles of Adam Smith*

By J. Cropsey.
Martinus Nijhoff, The Hague. Distributed by *Batsford.* 113 pages. 20s.

TO most of his readers Adam Smith is a man of one book, the "Wealth of Nations," and one idea, commercial liberty. Certainly for a thousand who have read his masterpiece there can hardly be one who is acquainted with more than the title of his other major work, the "Theory of Moral Sentiments." It is the strongly supported contention of Dr Cropsey that the greater work cannot be properly understood—understood, that is, in the sense which remains relevant to our own day despite the obsolescence of its analytical theory—except in relation to Smith's views on ethics and society. "Polity and Economy" is an account of those views and a correlation of Smith's political conclusions with his economic precepts.

The harmony between them is by no means obvious. Smith's ethical and social theory is a theory of the practicable second best. The Christian and the philosophical virtues hold in it a place hardly less peripheral and unimportant than in that of Macchiavelli; indeed, if he champions the "commercial principle," it is in much the same spirit as Macchiavelli championed the

Prince—that is, as a remedy for worse evils. Princes, tyrannous, perfidious and cruel, save the polity from a more deeply bloodstained chaos; the "commercial principle," admittedly debasing the common people, giving power to ignoble hucksters and greedy landlords, saves it from princes—temporal and spiritual. It is based on "nature"—the instinct for self-preservation—and can therefore be relied on to remain operative, which is more than can be said for loftier virtues. It is civilised by the equally "natural" faculty of sympathy, coupled with the universal desire to be approved by one's fellows; but Smith did not see in this harnessing of egotism to ethics any prospect of a millennium of human perfectibility.

Dr Cropsey takes it as an axiomatic premise of his study that "capitalism is an embodiment of Smithian principles," from which it follows that an understanding of the tension between Smith's moral and economic thought is an understanding of continuing tension in the western world today. This is a highly debatable view. Modern capitalism would have to be curiously crushed and lopped to fit neatly into a Smithian mould, and in the light of modern psychology and anthropology Smith's theories of human motivation look naïve indeed. This intelligent and stimulating monograph may, however, have a salutary effect on those readers—commoner in the United States than in Britain—who are inclined to over-exalt the "commercial principle," by showing that the spiritual father of the capitalist order had few illusions about his offspring.

Copyright Reshaped

The Law of Copyright

By J. P. Eddy.
Butterworth. 373 pages. 35s.

THIS is a very good book, which will be found of great assistance to all legal practitioners who number authors, publishers, film companies or makers of gramophone records among their clients. The author begins by examining the previous law on the subject contained in the Copyright Act of 1911 and the cases decided thereunder; then he shows the shortcomings of the old law, as set out in the report of the copyright committee and the evidence laid before it; and lastly he examines, section by section, the new Copyright Act of 1956 to see how the shortcomings of the old Act have been put right in the new. This is obviously a sound and practical way of dealing with a complicated subject. Moreover, by way of further clarification, the new Act is printed in full in the book, with extremely good notes and cross-references by Mr Eddy's colleague, M Roydhouse.

The publication of such a book could not be more timely, since the Board of Trade has now made an Order bringing the new Act into force on June 1. It will, of course, still be necessary to consider the old law—for instance, to resolve matters of title, and existing controversies—but Mr Eddy's treatment of the subject, proceeding as it does from a detailed analysis of the Act of 1911, contains most of what is required in that respect.

The treatment of copyright from its international aspect is, however, a little disappointing. The Brussels Convention of 1948 is, indeed, reproduced in full, and so is the Universal Copyright Convention of 1952, to both of which the United Kingdom will now be able to adhere; but the outline of the previous international position is too sketchy to afford any real practical assistance. For example, the provisions about translation rights in the original Berne Convention, which were altered in the Act of Paris and altered again in the Act of Berlin, are not dealt with at all. It is, perhaps, unfair to labour this shortcoming in a book which is primarily concerned with the law of the United Kingdom, but the author himself stresses —rightly—the international importance of copyright, and every lawyer practising in that sphere knows only too well that nine of of ten transactions with which he has to deal—whether relating to books, films or broadcasting and television—are not limited to "the home market." If this weakness could be made good in subsequent editions, the book would fulfil almost every requirement of the busy practitioner.

War in Purple

This Hallowed Ground

By Bruce Catton.
Gollancz. 446 pages. 16s.

MR CATTON made his reputation in the United States with his trilogy on the Army of the Potomac, a long piece of historical impressionism. His next book, a short biography of Grant, was thin stuff. His latest, and the first to be published in this country, is over-blown. Its sub-title is "The Story of the Union Side of the Civil War." In fact, it is the story of the Federal Army and Navy. It is largely the story of the man in the ranks, built up from a mass of letters, memoirs and regimental histories on the foundation of that almost inexhaustible source, the "Official Records." Unfortunately, it reads as if Mr Catton had used his best material on the campaign in the East in his trilogy and, not wishing merely to re-hash it, has been content to make use of more trivial detail. And to that is added the matter he has extracted on the campaigns in the West.

Mr Catton has become the victim of a technique. That technique is worth examining as an attempt to make history familiar. What it is in essence and what it is at its best is shown in a quotation from William Faulkner:

> For every Southern boy fourteen years old, not once but whenever he wants it, there is the instant when it's still not two o'clock on that July afternoon in 1863, the brigades are in position behind the rail fence, the guns are laid and ready in the woods and the furled flags are already loosened to break out, and Pickett himself with his long oiled ringlets and his hat in one hand probably and his sword in the other looking up the hill, waiting for Longstreet to give the word, and it's all in the balance, it hasn't happened yet. . . .

That catches a mood exactly. Mr Catton, for all his striving, does not recapture it. Nor is it too fanciful to trace the origin of Mr Catton's technique to William Faulkner, with whom the past is always flowing into the present. Another obvious literary origin is Carl Sandburg, who built up a monumental lyrical biography on the minutiæ of Lincoln's life.

In "This Hallowed Ground" this derivative technique is handled clumsily. Mr Catton uses a *pointilliste* accumulation of detail. He can do so because the American Civil War is superbly documented—indeed, it is still alive in oral tradition—and because he knows his sources intimately. Here his book is only a comparative failure—in the sense that he used his sources more tellingly in his earlier books. But he is also anxious to make his story significant, to try to recapture the mood of the time and to communicate that mood to the reader. He has, then, to pull the reader away from his concentration on detail. Here he fails.

He does not make the military strategy of the war, which was basically simple, clear. His choice of emphasis is wrong: he devotes a paragraph to the origin of the swords John Brown used, and later he dismisses in a single sentence Lincoln's letter to Hooker (which in effect sets out the dilemma of command in the war), calling it "canny." He indulges in cascades of high-sounding but practically meaningless phrases. To keep on reading that "a doom was taking shape" or to be told of the "unforgettable moment, hanging suspended in the memories of that war forever after" does not make the Civil War momentous (which it was); it makes it monotonous (which it was not).

Yet it is a pity that the book is a failure. Mr Catton has a knowledge (almost a love) of the military aspects of the Civil War that is second to none. He has written a book to feed the apparently limitless appetite of American readers for volumes re-examining and re-appraising the war. With more discipline, he was capable of producing a book that would have made the great, inevitable tragedy of that war as apparent to the British reader as it is to his own countrymen.

Sugar War

The Dutch in Brazil 1624-1654

By C. R. Boxer.
Oxford University Press. 340 pages. 42s.

THE silver of Peru, the spices of the East, the sugar of Brazil—these were the colonial prizes for which European powers fought in the first half of the seventeenth century. The period was dominated by the ambitions and the successes of the Dutch in breaking the Iberian monopoly of colonial wealth. But though the Dutch triumphed in the East Indies, they were less successful in the West. In particular they failed to make good their bid for mastery of the south Atlantic. They never conquered Brazil, chiefly valued for its sugar, and they failed to hold Angola, complementary as the source of African labour for the sugar plantations. And when Portugal re-emerged as an independent power in 1640, its survival turned on the retention of the profits from Brazilian sugar.

Professor Boxer has already written one illuminating study of seventeenth-century Brazil woven around the career of Salvador de Sá, a great Portuguese figure in this struggle. Now, in this definitive study of the abortive Dutch campaign for Brazil, he shows an equal mastery of the Dutch sources. Necessarily he covers some of the same ground, but there is much that is new, and his modest but astringent scholarship is admirably deployed and impartially applied in this history of a sugar war.

Previous historians have held that the failure of the Dutch was inevitable. Mr Boxer shows how near they came to success. They enjoyed superiority at sea, great financial strength and, above all, an admirable eye for broad economic strategy. They had quick early successes, despite stiff guerrilla resistance by the Portuguese, and in 1629, thanks to the capture of a silver fleet, the Dutch East Indies Company was able to distribute a dividend of 75 per cent to its shareholders. In 1637 John Maurice of Nassau was sent out to Brazil as Governor, and his warm humanity did much to smother racial and religious hatred there. Mr Boxer writes a delightful chapter on John Maurice, a magnificent spender, a great builder and an enlightened patron of art and learning. The Portuguese called him "Santo Antonio" after their most popular saint; the Brazilian natives worshipped him; and his interest in natural history meant that "no such systematic and intelligently directed scientific work by white men in the tropics was to be seen again until Captain Cook."

But the guerrilla campaign reduced the sugar profits, and, in 1644, the directors, lulled into security by a truce with Portugal, decided to economise by recalling John Maurice. His departure was followed by a Portuguese rising sparked off by the planters, who were deeply indebted to the Dutch. It was now the turn of the Portuguese to put economics before religious orthodoxy. The Jesuit Father Antonio Vieira raised Jewish capital for the Portuguese Brazil Company by exempting Jewish subscribers from the penalties of the Inquisition. And the forces of the company, largely financed by Jewish capital, sailed and conquered under a flag adorned by a representation of Our Lady of the Immaculate Conception. The Portuguese capture of Recife in 1654 ended the dream of a Dutch empire of the south Atlantic. Its

failure, like its inception, can be ascribed to the diversified interests of the Dutch. There were deep divisions between the aggressive colonial traders of Zeeland and the powerful pacific interest of Amsterdam merchants, more interested in the immediate returns of the salt trade with Portugal than in the gamble for sugar. Moreover, the Dutch had wide commitments in Europe; and both France and England wished to preserve the independence of Portugal as a counterpoise to Spain. It is a fascinating study. Professor Boxer enjoys using his scholarship to deflate legends, is balanced but never dull, and has an appreciative eye for character and the humanities.

Unnecessary Intrusion

A. E. Housman: *A Divided Life*

By George L. Watson.
Hart-Davis. 235 pages. 25s.

THE idea that a man's private life may be of absorbing interest to other men is a comparatively modern notion. Until the Renaissance, only lives of heroic proportions were considered worthy of record. Dryden was one of the first Englishmen to commend biography because

> here you are led into the private lodgings of the Heroe: you see him in his undress, and are made familiar with his private actions and conversations. . . . The Pageantry of Life is taken away; you see the poor reasonable Animal, as naked as ever nature made him; are made acquainted with his passions and follies, and find the Demy-God a Man.

Dryden underlines the pleasure that is to be found in reducing the great to small proportions, and implies that it is legitimate to intrude and pry, for the sake of establishing a bond of common human weakness between the subject of a biography and its readers. Nowadays we take such intrusion to be the most natural thing in the world. The more outrageously vulgar manifestations of inquisitiveness may receive occasional censure; but a marked desire for privacy during a man's life is regarded as eccentric, and after his death—if he was a notability—it is flouted with the least possible delay.

A. E. Housman has been dead for twenty-one years; but his brother Laurence, his literary executor, is still living, and he refused to supply Mr Watson with unpublished material for this biography. Undeterred even by the reflection that A. E. Housman himself would have resented the project, Mr Watson has pursued his self-appointed task: "an undertaking, against his will, but in emulation of his own search for truth, to exhume that pattern, half-obliterated like a Roman pavement, of his buried life." Housman was not an archæologist, but an emendator of texts, and if Mr Watson had applied himself to a minutely critical examination of the poems in their several drafts, at least his claim to emulate Housman would have been apt. But he attempts no fresh assessment of either "A Shropshire Lad" or "Last Poems." His book is entirely concerned with Housman's life.

Most people who knew anything of its odd pattern must have guessed that the clue to its discrepancies was a sternly repressed tendency to homosexuality. The poems themselves suggest as much. Now the story of Housman's infatuation for an Oxford contemporary is fully set out. The author compels our pity and admiration for Housman's relentless determination to crush his passionate instincts and to build an unassailable academic reputation upon the humiliation of a failure in Greats. It is a story at once pathetic and, in a rather distorted way, noble; but does its telling enable us to read the poems with greater understanding? Perhaps this book, in spite of its affected style, may gain new readers for Housman's verse. If it does not, it has very little justification for its existence.

Housman during his lifetime was deliberately a recluse. He kept his own counsel and cultivated a dignified solitude. This violation of a dead man's privacy might have provided him with the theme for a bitter little lyric.

A Prairie Pepys

Alexander Begg's Red River Journal *and Other Papers Relative to the Red River Resistance of 1869-1870*

Edited with an Introduction by W. L. Morton.
The Champlain Society, Toronto. 659 pages. No price given.

IN 1870 the Great Plains of the north-west became the keystone of the infant Canadian nation and not, as had seemed likely, a northward extension of the United States—but only after a prolonged crisis precipitated by the transfer of the control of this vast fur-trading empire from the Hudson's Bay Company to Canada. The people of the Red River Settlement (modern Winnipeg), unaccountably left in official ignorance of the transaction, were alarmed and outraged, especially the Métis, the remarkable French half-breed "new nation" of the Plains. Under their fiery and able leader, Louis Riel, they refused the Canadian Lieutenant-Governor-designate admission to the territory; they organised a provisional government to negotiate terms with the Canadian government (Riel making great efforts to secure the co-operation in it of the English-speaking settlers); they seized Fort Garry; and they imprisoned a number of the local Canadian party led by the redoubtable Dr Schultz. For a tense year civil war, Indian war and annexation to the United States seemed imminent possibilities.

For most of this decisive period Alexander Begg, a shrewd and knowledgeable observer of the moderate party with a penchant for collecting important documents, kept the detailed, day-by-day record published in this volume by the Champlain Society. It is an exciting and fascinating story of the interplay of contending personalities, of human foibles and idiosyncrasies, of manœuvre and counter-manœuvre, told with terse economy of phrase and a sardonic humour. It has moments of high tragedy and moments of diverting farce. It gives a vivid picture of the place, the period and the people—as colourful a collection of characters as could well be imagined.

Its historical importance is made abundantly clear in an admirable introduction, in which the editor, Professor W. L. Morton, analyses its contribution to a fuller understanding of the significance of the Red River Resistance in the emerging pattern of the Canadian nation; in its effect on the future of Métis and Indians; in the triumph of agriculture and settlement over the fur trade; in the permanent extension of the French Catholic influences of Quebec to a national scope; in the pattern of nascent self-government on the western Canadian frontier achieved in the creation of the new Province of Manitoba.

SHORTER NOTICES

The Australian Wheat-Growing Industry 1788-1948

By Edgars Dunsdorfs.
Melbourne University Press. London: *Cambridge University Press.* 547 pages. 55s. 6d.

Dr Edgars Dunsdorfs has, with scholarly thoroughness, traced the story of the development of the Australian wheat industry from the beginning of British settlement in 1788. In doing so, he has made a close examination of the sources of statistical material. Concentration upon such sources, with less use of written sources, was done deliberately, since the author's intention, as he explains in his preface, was to trace the quantitative development of the industry. In the first part of his work he recounts, chronologically, the history of the industry; in the second he offers to the specialist a statistical analysis of the major factors encountered in the course of that history.

The book will find a ready place in economic and agricultural libraries. Data are carefully sifted; sources are acknowledged; the conclusions are lucidly drawn; and the reader is assisted by summaries of each chapter. For readers in this country a fuller and more up-to-date treatment of the International Wheat Agreement would have been well worth while. For readers in his own country he makes the point that an intelligently planned economic policy is not made superfluous by such an agreement.

Trends in Employment in the Service Industries

By George J. Stigler. National Bureau of Economic Research. *Princeton University Press.* London: *Oxford University Press.* 185 pages. 30s. $3.75.

From the short preface it appears that this is the last of the National Bureau's valuable studies of employment and output. Its appearance is timely, for it provides a most helpful background to recent trends in the service industries in the United States; two of the striking economic developments in that country today are the rising costs of services and the increasing proportion of consumer income which is being spent on them.

Nuclear power
for the nation's future

AN EXAMPLE of industry pooling its resources to prepare for a mighty project is the linking of the A.E.I.—John Thompson Nuclear Energy Company with two important firms of Civil Engineering Contractors—Balfour, Beatty and Co. Ltd. and John Laing and Son Ltd.

To the strength of the A.E.I.—John Thompson Nuclear Energy Company and its constituents (British Thomson-Houston, Metropolitan-Vickers and John Thompson) is added a fund of knowledge in the civil engineering field.

The Balfour Beatty Group has a world-wide reputation in all forms of engineering and construction work and is at present carrying out major contracts for the Central Electricity Authority. John Laing and Son Ltd. has carried out building and civil engineering work at the first Government Atomic Energy Establishment at Windscale and is at present engaged in the construction of power stations in the United Kingdom, as well as in major development schemes in Canada.

USI BILLION DOLLAR BOARD

JOHN HILLDRING (Major General, Retired, U. S. Army); President, General Aniline & Film Corporation; Member, Advisory Committee Bankers Trust Company; Assistant Secretary of State (1946-47).

USI's Board is as diversified as it is high in caliber. Here are men with first rank management experience in transportation, chemicals, finance, precision tool manufacturing, research and government planning. It would be hard to imagine a group better qualified to chart USI's own diversification! So far the company has branched out into making aircraft parts, engine lathes, petroleum pumping equipment, giant metal forming presses, welded steel pipe for water, oil and gas transmission, dairy equipment, cookware, electrical fittings, steel tanks, and electronic components and systems for jet aircraft and guided missiles. And USI is just starting to grow!

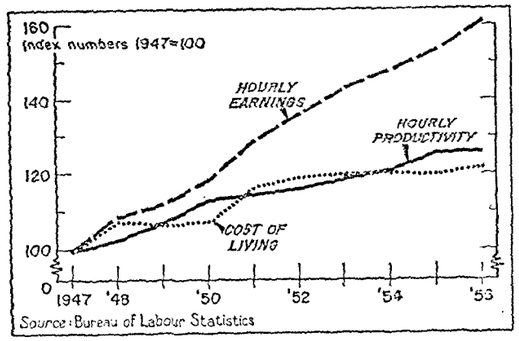
AMERICAN SURVEY



AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Inflation Come to Stay?

WASHINGTON, D.C.

THE persistence of inflation has plunged the government's economic managers into deep pessimism. Despite eighteen months of monetary restraint and a budget surplus during the last two years, prices paid by consumers are rising steadily. The cost of living, as measured by the consumer's price index, is now a little more than 4 per cent above the level it stood at in February, 1956, when the rise began; prices have been going up at the rate of more than 3 per cent a year.

Two equally important elements contribute to the despondency of the moderate conservatives who run Republican economic policy. The first is the distress which always accompanies the frustration of an ideal. Such Republicans as Mr Arthur Burns, their first chairman of the Council of Economic Advisers, and Mr Gabriel Hauge, the Economic Assistant to the President, came to Washington in 1953 with great hopes of proving that a modern capitalist society could have full employment without inflation. They used all of the classic weapons with great courage and considerable vigour and for three years it seemed that they would succeed. Prices were astonishingly stable. Though they had the good fortune of a somewhat fortuitous, and politically embarrassing, decline in farm and food prices, on balance the retail prices of manufactured good declined as well. Thus, while prices of a wide variety of services rose, the cost of living remained stable. Now, although the same weapons are being employed with equal vigour, all three categories of prices are rising month after month with depressing regularity. Conservatives who had attributed the first wave of postwar inflation to the huge wartime deficits in the Budget and the second, in large part, to a policy of artificially "easy money," see prices continuing to rise, although both these causes have been removed.

The second cause of gloom is the almost unanimous conviction of the President's economic advisers and of the economists in the Federal Reserve System that creeping inflation is bound to gather speed. Professor Sumner Slichter of Harvard has become the most articulate spokesman of a school whose argument, in brief, is that under modern conditions creeping inflation is inevitable, that it is an acceptable price to pay for many of the benefits of modern economic organisation, and that it can be lived with indefinitely. Professor Slichter has become a sort of devil's advocate to the men at the top in the Treasury, the Council of Economic Advisers and the Federal Reserve, who are passionately convinced that a creeping inflation cannot help but turn into a galloping one, and that this is certain to produce the very depression which Mr Slichter feels has been ruled out by modern organisation and techniques. Their argument is a complex one, centring mainly on the effect of expectations about price on decisions to spend or invest, but their conclusion is simple: that, if the rise in prices and business costs is not checked, the United States may once again be faced with massive unemployment.

The two parties to the debate—the Eisenhower economists and the Slichterites—are strikingly agreed upon one crucial point, the responsibility of wage settlements negotiated in modern conditions of collective bargaining for the rise in prices. This raises perhaps the most discouraging aspect of the problem. There is today a quite unbridgeable chasm between the public and most economists, on the one hand, and, on the other, the spokesmen of the trade unions and the small band of economists on the left who support their point of view. The strongly-held belief of the labour leaders is that with the decline in competition corporations have become able to fix their prices high enough to finance the bulk of their huge investment programmes out of earnings rather than by the "classic" method of raising new capital or borrowing at long term. Their profits, measured in dollars or as a proportion of capital, have risen markedly and are responsible for the high cost of living.

This argument has convinced hardly anyone except trade unionists and their apologists. The fact is that profit margins—the only fair measure of the impact of profits on prices—are a shade lower now than they were during most of the postwar period. The share of profits in the national income has declined fairly steadily; one of the great problems of directors of big corporations is what they think of as a profits squeeze. The "neutral" in the government may not accept the idea of a squeeze; he may agree that in many sectors of the economy prices are indeed administered rather than set by competition; he may even agree that too much business investment has been financed out of earnings. But he simply cannot find anything that makes the current level of profits in any way to blame for the rise in prices. The

evil of administered prices, as he sees it, is that they create a condition in which large corporations can grant excessive wage increases in the near certainty that they can pass along the higher costs.

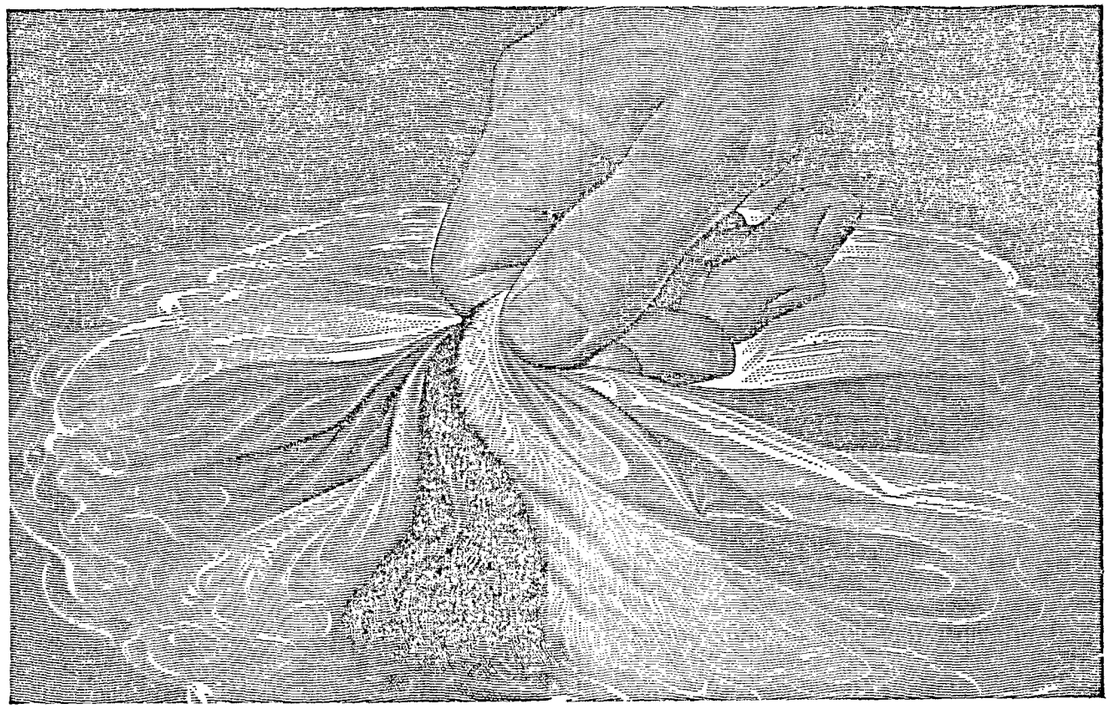
A recent study by the Bureau of Labour Statistics, while carefully avoiding any conclusion that could seem to favour either trade unions or management, tells the story. Payments to wage earners as a whole have risen 61 per cent in the past decade while their productivity rose only 26 per cent. Even if it is conceded that wages followed prices upward during the surging inflation of the early stages of the Korean War, events since 1953 are damaging to the trade unions' case. The cost of living was stable for most of the period. Demand was restrained by the government and by the 1953-54 recession, yet wage increases continued to be granted year after year, and they were usually considerably larger than the gains in productivity. The resulting cost inflation was disguised for a time by a number of things, such as the fall in food prices and an outbreak of intense competition in durable goods. But it could not be concealed forever, particularly as the new wage levels tended to spread, under reasonably full employment, to the unorganised service trades where it is hard to increase productivity. Inevitably, it became necessary to pay higher wages to the vast army of government workers ; this in turn meant higher state and local excise and property taxes with all their impact on the cost of living.

In many unionised industries, especially in manufacturing, wage increases have scarcely exceeded the increase in productivity, if they have exceeded it at all. But most of the independent economists inside and outside of the government consider it to be both unjust and inflationary for a small group of highly productive and highly organised workers to usurp for themselves all of the annual national increase in productivity, instead of allowing consumers to get some of the benefits, through lower prices, in those areas where increases in productivity are rapid.

Nobody wants a recession, but it seems probable that only a substantial dose of unemployment could halt the month-by-month rise in prices. The lull in economic activity during the past four months has produced only a levelling off in wholesale prices and none whatever in retail prices. The Chairman of Finance of the United States Steel Corporation, in a thoughtful if partisan speech, argued recently that a totally " new force "—the social and political and economic power of the trade unions—had entered the realm of price economics in a way which negates all the classic formulae. The once-hopeful modern Republican economists around the President are increasingly, and gloomily, prepared to concede that he is right.

To and Fro on the Budget

THE long-expected resignation of Mr George Humphrey as Secretary of the Treasury has come at last ; he is to be succeeded by another, less well-known businessman, Mr Robert Anderson, once a Texan Democrat, now a New York Republican, who has already served in Mr Eisenhower's Administration, in the Navy and Defence Departments, from 1953 to 1955. Mr Humphrey's departure does not mean that the President's new aggressiveness on behalf of his Budget has led him to get rid of the man who, even if unintentionally, did much to inspire the original attack by publicly suggesting that such high government spending might be avoidable. Mr Eisenhower's regret at Mr Humphrey's resignation is obviously sincere. Nor does Mr Humphrey's departure mean that the battle of the Budget is over ; he is in fact to stay, at the President's request, until most of the critical problems before Congress at this session have been settled.



On the most critical of them, defence spending, the House of Representatives has just subjected the President to a discouraging reverse. It has insisted on cutting military funds for the coming year by the whole $2.6 billion which its committee approved, down to $33.6 billion, even though Mr Eisenhower himself insisted that, while half of this cut was only a matter of book-keeping, the other half would do real damage to aircraft procurement and to the development of guided missiles. The Republican leaders in the House rallied at last to the President's aid on this Bill, but without success, and there is every prospect that the Senate will confirm, or even deepen, the cut.

But on the other side of the Budget equation the battle has turned in the President's favour. The Democrats in the House of Representatives have reluctantly abandoned hope of passing a tax reduction this year, although they still intend to have one in time for the congressional elections next year. The main reason for their haste had been fear that the Republicans would beat them to the cut, and they have now received assurances that the Administration has no intention of proposing a tax reduction yet. Moreover, the President has implied that he would veto such a reduction if the Democrats succeeded in pushing it through Congress, and in the process he would presumably accuse them of endangering the country's solvency. Behind this change of mood on taxes is a realisation, confirmed by two reports from congressional experts, that government spending is running above estimates, and is likely to go on doing so, unless Congress deals much more drastically with appropriations than even it would contemplate ; as a result, the Budget surpluses both this year and next are expected to be even smaller than was originally forecast.

Occupational Disease

FEW Americans are likely to take the anti-American riots in Formosa as philosophically as Mr Dulles and, in the long run, this demonstration of ingratitude on the part of a country which exists only by virtue of American friendship and lavish aid may cause a revulsion of feeling toward all foreign allies. Even Mr Knowland, " the Senator from Formosa," has been shaken. But the immediate harm done to the mutual security programme—just as the President seemed to have brought off a successful rescue operation—depends on the closeness of the vote and on whether members of Congress are prepared to recognise that the presence of well-off American troops in poorer foreign countries inevitably causes frictions. The Administration is accelerating its review of the 250 American bases abroad with the aim of thinning out the number of troops where possible and of reducing tensions.

The spark which set off the conflagration in Formosa was the acquittal by an American court-martial, of an American who had killed a Chinese, allegedly in self-defence, whom he

Looks like water, but...

. it's really an amazing chemical

bringing you wonderful new textile fibers, plastics, and rubber

FROM NATURAL GAS, air, and ammonia, science has created one of the most versatile of modern chemicals—a crystal-clear liquid called acrylonitrile*. This useful chemical is the stepping stone to an ever-increasing number of man-made wonders that lead to more new things for all of us.

DYNEL, Union Carbide's remarkable textile fiber, is made from acrylonitrile. Fluffy and soft, this tough fiber is woven into everything from work clothes to evening dresses. And women everywhere are excited about the new furlike coats made with Dynel.

SYNTHETIC RUBBER made from acrylonitrile goes into shoe soles, gasoline hose, and many industrial products that must withstand hard use. When certain plastics are blended with acrylonitrile, they become shock resistant and gain a toughness that helps them last much longer.

ACRYLONITRILE is only one of over 400 chemicals made by the people of Union Carbide. They are constantly at work developing still more chemicals to make better products possible.

This building flew up—

at 20,000 sq. ft. a month!

This building—100,000 sq. ft. of it—was completed in 5 months from contract to occupation. On another building, the largest warehouse in Europe covering an area of over ¾ of a million sq. ft. the delivery and erection of steelwork was completed in less than 14 months. Either may well be a record, but what matters is how it was done.

The technique was originated and developed by Tube Investments engineers. It involves the use of prefabricated arches manufactured from cold formed steel sections with a strength/weight ratio so high that it saves as much as 40% on steel. All components are built on precision jigs so that erection can be carried out by relatively unskilled labour without special equipment.

This new constructional principle is widely used by TI, not only in buildings, but also in the fabrication of bus, coach and railcar bodies and has exceptional possibilities throughout industry as a whole. It typifies ways in which TI companies are adding to the new products and processes which the country needs to pay its way.

had found peeping at his wife. The United States and Formosa have not yet signed a status of forces agreement, of the kind which in European countries permits the host country to try Americans for offences committed when they are not on duty; United States troops thus enjoy the extra-territorial privileges of which the Chinese have such long and humiliating knowledge. Such cases bring to a head Eastern suspicions that Americans regard Oriental lives and Oriental justice as of little account. And it is true that Americans, despite the good record of foreign

Saving the Water Crop

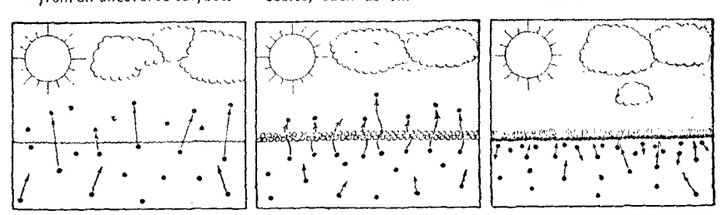
FROM A CORRESPONDENT IN COLORADO

In the United States the annual loss of stored water by evaporation from its exposed surface varies from about 30 vertical inches in the coolest part of the country to as much as 120 inches in the south-west, where the sun is fiercest and water is most precious. In Texas, for example, it is estimated that each year human beings use 8 million acre-feet of water from reservoirs, but that an equal amount is lost by evaporation before it can be used. (An acre-foot, about 325,850 gallons, would cover one acre one foot deep.) The United States Geological Survey puts the annual loss from western reservoirs at 18 million acre-feet yearly. All this is water which has been stored in works built at great expense and it therefore has a value as part of the "manageable water crop."

To lessen this loss at relatively small expense is the aim of anti-evaporation treatments; one of the most interesting and hopeful of these devices, which is now the subject of large-scale experiments in the water-starved western states, involves covering the surface of a lake or reservoir with a chemical layer, one molecule thick, in order to prevent evaporation. These monomolecular films are so strong that dew forms on them, on top of a water-surface, and evaporates again without ever breaking through to the water beneath. This was first tried on a large scale out of doors by Mr W. W. Mansfield, of the Commonwealth Scientific and Industrial Research Organisation of Australia, a few years ago. He found that a few pounds of a chemical called hexadecanol or cetyl alcohol, used principally as a base for cosmetics and costing about 50 cents a pound, could be manipulated to cover a 320-acre lake, and that it would prevent up to 45 per cent of evaporation.

Last year, in the middle of the great drought, Mr Mansfield described his experiments at a meeting called by the Southwest Research Institute of San Antonio, Texas, which immediately began an expensive research programme with funds contributed by both private and public groups interested in water conservation. In the meantime various federal government agencies, in co-operation with the State of Oklahoma and others, had also started large-scale experiments around the 2,500-acre Lake Hefner, from which Oklahoma City is supplied with water. This summer similar experiments are also going on at the 100-acre Rattlesnake Reservoir, high in Colorado's Rocky Mountains, where wind, freezing, snow and other conditions are much more severe.

The question is whether such an intangible film (it cannot be detected visually in any way) can be maintained on a large, continuously disturbed water surface long enough to be of value. So far the answer seems to be that it can. Moreover, the Public Health Service has already certified tentatively that hexadecanol is apparently harmless either to water-life, animal or vegetable, or to animals or humans drinking the water. In fact, the only biological drawback to this substance seems to be that certain greedy bacteria like it too well, multiply in the water and eat holes in the invisible covering.



The peculiar magic of hexadecanol is that it is one of the long-chain molecules called "polar," which means that such a molecule, a long thin structure like an eel or snake, has one end allergic to water while the other end loves it. Therefore, if the edge of a water-surface covered with it is looked at through a super-powerful microscope, these is seen a thick forest of these molecules, only 6-10,000,000ths of an inch long, but all standing crowded together with their water-loving ends in the water and their water-hating ends lifted out of it. Evaporation occurs when individual molecules of water absorb so much energy from the heat of the sun that they get up "flying speed" and take off from the surface; but when they are underneath a complete carpet of hexadecanol molecules, they batter at it in vain. Ordinary "non-polar" molecules, such as those of oil, lie inert upon the surface like little pillows instead of clinging together; and heat-excited water molecules can easily escape between them.

To apply the coating, hexadecanol in flake or pellet form is brought into contact with water by being placed in a raft with a gauze or mesh bottom; the tiny molecules then begin to "march" into the surrounding water at amazing speed, millions upon millions each second, until the surface is covered. This process can be observed from its stilling effect upon the water; this calm spreads at a rate of many feet a minute. When parted by wind or rain, or by boats, the film will reform quickly as long as there is a reserve supply of "hexy" in contact with the water. Naturally, however, it is impracticable to cover really large surfaces of water from individual rafts and other methods are being discussed, such as spraying from an aircraft or boat.

Even if in the end these experiments show that only a small proportion of water, say 10 to 20 per cent, can be saved from evaporation by this treatment, it may still be worthwhile. In Oklahoma City, for example, water delivered to taps or industrial installations costs an average of $61 an acre-foot, while the annual cost of maintaining a hexadecanol cover is estimated at not much more than $1.60 per acre-foot. Farmers pay much less for water for irrigation—usually not much over $5 an acre-foot—but the cost of water is going up in the semi-arid west as the expanding population is forced to bring it in from farther and farther away.

WATER EVAPORATION

—from an uncovered surface. *—from a surface coated with ordinary non-polar molecules, such as oil.* *—from a surface coated with polar molecules, such as hexadecanol.*

countries in similar cases, and America's own historic stand against extra-territoriality, are reluctant to subject their fellow-countrymen to foreign—and particularly to Eastern—justice.

Resentment against the privileges of American troops has broken out in Okinawa, South Korea, Vietnam, and even in the Philippines; the Girard case in Japan shows that a status-of-forces agreement does not solve everything. This is the first time that, when jurisdiction was disputed, Japan has insisted on the letter of its rights; it has already chosen the judges to try an American soldier who killed a Japanese woman eking out her living by picking up spent shells on a firing range. The decision of Mr Wilson, the Secretary of Defence, to review the problem after the American authorities on the spot had given way is causing the Japanese Government to lose face—and political advantage—it can ill afford to its opposition. But the melancholy truth, which America's allies would do well to bear in mind, is that no occupying power in history has ever been so willing to accept the advice "Yanks, Go Home!"

Arthur Miller: Act II

WASHINGTON, DC

THE trial of Mr Arthur Miller, the playwright, for contempt of Congress ended last week after a fortnight of wrangling over the pertinency of the questions put by the Un-American Activities Committee which he had refused to answer. The proceedings took place in one of the brightly-lit panelled courtrooms of the modern federal district court building in Washington, but the brightest star connected with the case—Miss Marilyn Monroe, Mr Miller's wife—was absent. She had wanted to be there as a wife but the lawyers decided she might prejudice the case as a spectacle. The accused did not testify. Much of the time he was fingering the newly published collected edition of his plays which includes two—"The Crucible" and "A View from the Bridge"—in which he has attacked informers and written of the importance to a person of safeguarding his name. Mr Miller's present troubles stem from the day in June last year when he told members of the House committee that he would not give them a list of those present at a meeting of Marxist writers in 1947 because

> I am trying to and I will protect my sense of myself. I could not use the name of another person and bring trouble on him.

For twenty years the Un-American Activities Committee has been parading prominent personalities from the arts and the entertainment world, calling on them to atone for their ideological offences by naming others likewise involved in Communist associations. There has been the fiercest controversy in artistic circles about the right position to take. Some, like Mr Paul Robeson, have turned the hearings into noisy, ranting demonstrations. Others have quietly taken refuge in their constitutional protection against self-incrimination, while Mr Elia Kazan and Mr Leo Cobb, the producer and leading actor in Mr Miller's first major play, "Death of a Salesman," were among those who answered all the committee's questions.

Theoretically when the committee originally questioned Mr Miller it was supposed to be looking into a Communist conspiracy to misuse American passports. Mr Miller's connection with this endeavour was most tenuous. The State Department had once refused him a passport for security reasons, when he had asked for it at very short notice, but had relented later. At the trial, the government's chief witness was Mr Arens, the committee's counsel, a genuine primitive who delights in humbling famous men and whose clashes with Mr Miller had made the committee hearings rich in drama and irony. Protected by the judge, who refused the request of the defence that the committee's files should be produced, Mr Arens was able to state that the committee had evidence that Mr Miller had been a Communist from 1943 to 1947. Mr Miller, although he admitted to the committee that he had signed so many fellow-travelling petitions after the war that an outsider might have mistaken him for a Communist, has always denied that he was ever under Communist discipline.

Compared with most trials for contempt of Congress, which are usually brief and almost automatically result in convictions, Mr Miller's ordeal has been prolonged; the prosecution seemed determined to crush as well as to convict him. But arid as the trial has been compared with the hearings, the vein of irony has persisted. Mr Miller has declined to turn informer as a matter of conscience, but his lawyer had to argue his case solely on the narrow basis of the relevance of the question to the committee's legislative purpose. And while Mr Miller has repeatedly argued that no limits should be placed on an artist's right of advocacy, the only defence witness, Mr Harry Cain, a former McCarthyite who caught religion and campaigned against the injustices of the security system, gave expert witness that a writer's relation to Communism should be judged by his writings rather than his associations.

The maximum sentence to which Mr Miller is liable is a year's imprisonment and a $1,000 fine. But whatever the verdict, there will be lengthy appeals. The final outcome will probably be decided by the decision of the Supreme Court in another case, that of Mr John Watkins, a labour organiser, in which the issue is whether there are definable limits to the questions which a congressional committee may ask.

Atomic Hurdle

A HUMILIATING defeat for the President in his struggle with the right wing of his own party seems to have been averted in the Senate Foreign Relations Committee. Until the hearings ended last week, there was a real danger that Mr Eisenhower's "atoms for peace" programme, which drew almost universal applause when he launched it in 1953, might be repudiated. The opposition to the treaty authorising American membership in the United Nations International Atomic Energy Agency included such prominent Republicans as Senator Knowland, the minority leader, and Senator Hickenlooper as well as a scattering of Democrats; and a treaty requires a two-thirds vote in the Senate. Only by the most patient and prolonged testimony has the Administration overcome senatorial suspicions that a new "giveaway" was in prospect, this time of American atomic power, and one attended by the risk that it would help Communist countries to provide themselves with atomic weapons. In fact, the United States is to sell not give, atomic fuel to the agency; China, Senator Knowland's *bête noire*, is not a member, and the safeguards against improper use are similar to those in the bilateral pacts already concluded with nearly forty countries by the United States. The advantage of the new agency is that neutral countries can use it without committing themselves to anything except the proposition that atomic power should be used for peaceful, not warlike, ends.

Senator Hickenlooper, who at one time had forty-eight different doubts, is credited with suggesting that if the Administration would submit, in writing, its interpretation of disputed points, the committee would not insist on crippling reservations. Senator Knowland still has not committed himself, but his proposal that the United States should be able to withdraw from the agency looks like a grudging surrender. The prospect now is that the Senate will ratify the treaty before it goes home, so that the postponed first general conference of the agency can take place in October. It cannot come into being until three of the five atomic powers have ratified the treaty; of these five, so far only the Soviet Union has done so.

An American refusal to back up the President's leadership in a field where it has been enthusiastically accepted by most of the world would have been an invaluable propaganda gift for the Communists. It would have been particularly damaging to the President's prestige in the very week that Mr Eisenhower over-ruled some of his advisers by deciding to send Mr Stassen back to London with instructions to make concessions to the Russian point of view if progress toward disarmament seemed to warrant them. The new agency's approach to disarmament is the constructive, if roundabout, one of channelling atomic power into peaceful development; but it should also provide useful experience in the working of an international inspection system operating in both the Communist and free worlds.

Beck Climbs Down

MR DAVE BECK has evidently realised at last that he will be kicked out of the driver's seat of the teamsters' union if he does not go willingly. He has still not resigned but he has announced that he will not run for re-election as the lorrydrivers' president next September. He may be forced to go sooner, at a special meeting of the executive board which he is calling for next month, presumably to discuss the successor whom he had hoped to be allowed to nominate himself. His favourite, Mr Einar Mohn, is under indictment for refusing to answer the questions of a congressional committee, the predecessor of the one which displayed to the world Mr Beck's misuse of his union's funds and of his office. Mr James Hoffa, who until recently seemed Mr Beck's obvious heir, is also under indictment on charges of bribery and his future depends on the outcome of his trial in June. Neither of these two candidates, nor several others whose names have been mentioned, seem suitable presidents for a union whose reputation needs to be restored in the eyes of its members as well as of its critics.

There are other, more satisfactory, possibilities but so far they do not include Mr English, the present secretary-treasurer of the union, even though he has been chosen by the American Federation of Labour and Congress of Industrial Organisations to replace Mr Beck as one of its officers. When the executive council of the national labour organisation expelled Mr Beck last week, it was formally condemning only him personally, not his union. But the appointment of Mr English, an old antagonist of Mr Beck, without waiting for the teamsters themselves to nominate someone, in effect served notice on the union that it must cleanse itself of the Beck infection. It was then given time to do so: the AFL-CIO's hearings on the charges of corruption brought against the teamsters have been postponed indefinitely. At the same time the executive council also suspended the laundryworkers' union and put two others on probation, because none of them had yet dealt adequately with corruption among their officers which had been exposed some time ago. Finally, the council promulgated a new code of financial standards for trade unions.

As a result of all this unusual, even if indirect, interference in the private affairs of member unions, it is being asked whether the AFL-CIO, in its determination to re-establish labour's good name, is not in danger of arousing resentment among the autonomous unions whose creature it is supposed to be. What is certain is that the AFL-CIO does not want to expel the teamsters, as it was forced in the end to do in the similar case of the defiant longshoremen's union. With these two groups and with Mr Lewis's mineworkers all outside the federation, the unity which labour established so proudly only eighteen months ago would be shattered.

Television out of the Net?

FROM A CORRESPONDENT IN NEW YORK

UNTIL recently, the three television networks in the United States—the Columbia Broadcasting System, the National Broadcasting Company and the American Broadcasting Company—with their almost unlimited funds, ruled the airwaves virtually without challenge. No one else could afford the $100,000 or more that it costs to produce a programme for showing all across the country. In fact no one else could even show a programme in this way and thus provide a national advertising medium on television. The Federal Communications Commission does not allow more than seven stations to be owned by any individual or group, but the networks have affiliation agreements with privately-owned stations in nearly every city in the country. Under these contracts the networks supply programmes to a national chain of stations and share with

them the revenues received from advertisers who sponsor the shows; in return, the stations agree to reserve for network programmes nine hours of time each day. Most of the 600-odd stations throughout the country are affiliated with one or more of the three networks, while each network, in addition to its owned-and-operated stations, contains upward of 180 affiliates.

At present, only Los Angeles and New York, each with seven stations—three network-owned and four unaffiliated independents—have more than four television outlets in the very high-frequency range, the only type of television signal which the majority of sets are adapted to receive; there are only five other cities with as many as four stations each. But the FCC has been granting additional allocations so that, by the autumn, there will be at least four stations—three with network affiliations and one completely independent—in the fifteen leading cities, with a potential audience of more than half the population of the United States; altogether there will then be more than one hundred independent stations in the country.

A year ago these independents would not have provided a very serious challenge to the networks, since the only programmes available to them would have been old second-rate moving pictures and filmed half-hour television shows not of network quality. But now the Hollywood studios have released feature films made before 1948 for showing on television and a number of organisations are distributing these films to the stations and arranging for advertising sponsorship. The independents have snapped up these ready-made, ready-sponsored and inexpensive programmes as fast as they have been offered. Moreover, it has been found that a moving picture, no matter how old, with a famous star, will nearly always draw more viewers than even a top-rated network programme.

As if this competition were not serious enough, the three networks are having troubles with their own programmes. Of the 121 shows appearing on network television this year, nearly half will be dropped at the end of the current season in June. Of this year's 34 new programmes, only 15 are still on the air; most of them have been so poorly received that, at the end of the standard 26-week contract, they have disappeared and, in many cases, taken their sponsors along with them. In the past, the fact that some programmes were failures did not unduly concern the networks, since there were always others to take their places and there were always advertisers willing and able to pay anything to get their names into homes all over the country. This is no longer the case: the cost of producing a television show has more than doubled within the past few years; and sponsors are no longer willing to risk their money on the types now being offered. The advertising agencies, as a result, are demanding more and more control over the programming end, even going so far as to take charge of production, leaving the networks as mere distributing centres.

To meet this threat, all three networks have changed both their presidents and their programmes without, however, impressing either the critics or the public. For the networks, in search of shows which will not be excessively expensive and will attract the greatest possible audience without antagonising or alienating anyone, have rushed to embrace the stereotyped. Programmes of a more intellectual or challenging nature, such as the Ford Foundation's "Omnibus," have either been relegated to unattractive times or been discontinued altogether. The comedians, once their ratings begin to slip, are cancelled out, so that the autumn will see the end of such one-time and long-time favourites as Sid Caesar and Jackie Gleason.

Instead of searching for new ideas in programming, the networks, desperately trying to hold audiences and sponsors, have gone into mass production of the types of programmes which are favoured in the popularity polls—westerns, quiz shows and situation comedies, such as "I Love Lucy." These will therefore be standard fare this autumn. More than twenty hours a week of westerns have been scheduled; for every quiz show that falls by the wayside, two more are waiting to take its place—offering if not more entertainment than the fallen one, then more money to contestants; variation on variation of "I Love Lucy" is ready to roll.

Perhaps the one imaginative project on television's horizon—and it is still no more than a prospect—came last April when Mr Sylvester L. (Pat) Weaver, until recently head of NBC, revealed that he was founding a new Programme Service. Mr Weaver, who has shown himself one of the most original and interesting thinkers in television, proposes to provide audiences and advertisers with genuine alternatives to the few offered by the three networks; his new organisation is to distribute programmes, either live, on film or by the new process of video-tape recording, to the independent stations. Advertisers will be able to buy time on as many or as few stations as they wish; under current network practices a sponsor must purchase a certain basic number of stations—usually over fifty—at a cost of more than $125,000 for each hour. The cost to the advertiser under his plan, Mr Weaver says, will be considerably less; moreover, the sponsor will not have to take stations in areas where he does not sell his products merely because they form part of the "basic network."

While the advertising agencies and their clients have, naturally, expressed considerable interest in such a departure from traditional network habits, Mr Weaver's programme plans have created a comparable stir among viewers. When the networks have children's programmes he proposes to offer programmes for adults. When none of the networks seem interested in vital and stimulating programmes, he will devise such a project—and "try to see that the audience for it at Programme Service price is a good buy for the advertiser." Mr Weaver's plans, then, may be another of the growing and serious problems facing the television networks, on top of the abuse from the critics, the jaundiced looks of both advertisers and audiences, the growing interest in some sort of "pay-as-you-view" television, and the anti-trust investigations in Washington.

SHORTER NOTE

Last week President Eisenhower ruled that this year an *ad valorem* duty of 45 per cent, nearly double the normal rate, must be paid on imports of woollen textiles when they exceed 14 million pounds. This is an extension of the quota imposed in the last quarter of 1956 to protect the depressed home industry against foreign, and particularly British, competition, although the American woollen trade has lost even more markets to domestic synthetic textiles. Imports, which last year totalled 17.2 million pounds, are expected to be held down to little more than 14 million by the punitive duty; already over half this amount has entered the United States.

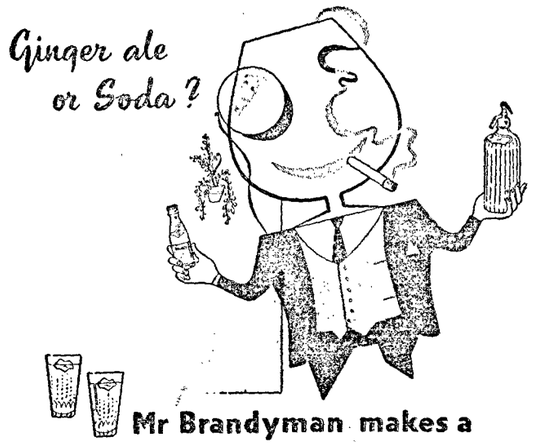
...and one for the pot!

Witches of old brewed heroic broths to encourage visions, prognostications, spells, and spasms. Even unrequited love yielded to these near-lethal potions. Add the tail of a cat, the ear of a rabbit, sixteen varieties of tree roots, and a few "trigger" ingredients, known only to the witches guild . . . and stand back!

Folklore ignores the witches' maintenance problems, but such overwhelming corrosives must have liquidated many a cauldron inventory. After all, the witches had no titanium.



Titanium is available today, and it is the most promising metal for the chemical, textile and pulp industries . . . or any place where severe corrosion presents forbidding maintenance or design problems.

Titanium is inherently passive to such vicious corroding agents as ferric, cupric, stannic and mercuric chlorides, and the hypochlorites. There is even little or no pitting or localized attack — a source of difficulty with practically all other metals. Stagnant conditions, surface deposits, fouling marine organisms and moist salt crystals are not troublesome to titanium. Strongly oxidizing agents in high concentrations and at high temperatures are readily handled with titanium. Slight additions of oxidizing agents to sulfuric, hydrochloric or phosphoric acid inhibit attack.

Titanium tubing, sheet, strip, plate, extrusions, bar and billet are all available from T.M.C.A.— and prices are dropping to competitive levels. T.M.C.A. technical service is available upon request.

THE WORLD OVERSEAS

Strydom Scorns the Doubters

FROM OUR CORRESPONDENT IN SOUTH AFRICA

THE deeper the Nationalist government drives South Africa into the turbulent waters of "baasskap apartheid," the more insistent become the expressions of apprehension and doubt—explicit and outspoken from anti-Nationalist sources, indirect and circumspect from party sympathisers. Although in recent weeks Mr Strydom and his colleagues have been forced to make tactical retreats or to stage diversionary sorties, they have not given ground anywhere on principle. They are determined, it seems, to attain two objectives: to prevent contact between the races on anything except a master-servant relationship, and to ensure this they demand the maximum physical separation of the races; and secondly, to possess powers to control the leadership of the emerging black urban proletariat whose economic and political demands will inevitably increase.

This is what lies behind the Native Laws Amendment Bill; it is a consolidating measure which has introduced into South African law the State's right to regulate the life of the individual in social, political and religious activities. Because there is so little inter-racial contact in the social and political spheres, and because the State already possesses the most fantastic powers to control and regulate the lives of Africans in urban areas, public attention was inevitably focused primarily on the church clause in the Bill. And to the extent that this constitutes an infringement of the right to worship freely, it has been fought with a vigour, persistence and determination which patently distressed and at times embarrassed the government—and some of its more sensitive supporters.

The powerful Dutch Reformed Church added to the Nationalist government's discomfiture by sending a deputation to the Minister of Native Affairs, Dr Verwoerd, seeking assurances about the State's intentions on freedom of worship. The emissaries went in secret, and Dr Verwoerd appealed to them not to make common cause with the English churches because that might result in a breakthrough for the anti-apartheid forces. The deputation of churchmen not only expressed themselves satisfied with the Minister's assurances about religious freedom and the "safeguards" of his amended version, but also agreed to publish only four of their eight points of principle on religious freedom and to amend two of the remainder. This striking if saddening manifestation of the close liaison between the Nationalist party and the Dutch Reformed Church has not obscured the fact that there is concern in both quarters over the Bill.

On university apartheid the government was also compelled to give ground for tactical reasons. It did so not only because it had encountered unexpectedly vigorous opposition from the "open" universities and their supporters, but because in its own ranks it was realised that the terms of the Separate Universities Bill were wholly unacceptable in academic circles. In its present form the Bill would make the proposed universities for non-whites into travesties of seats of higher education. After weeks of agitation from what the prime minister called "exaggerated liberalists" and "left-wing elements," this realisation even dawned on Nationalist sympathisers, and it was therefore decided to send the Bill to a select committee after the second reading. This means the postponement of university apartheid till after the general election next year—a breathing space which is being used by the government as an excuse to postpone its plans to increase the taxation of Africans (ostensibly to pay for their own education) and by the protagonists of academic freedom to rally further support to their cause.

A casual ministerial admission about the problem of issuing identity cards under the Population Registration Act—another concession to white resentment at having to carry passes—and the government's hopelessly inept handling of the Rand bus boycott, both add to the picture of Nationalist unease. This restlessness—it is no more—is aggravated by the fact that living costs rise steadily, that taxation remains high (by South African standards) and that for the average white man-in-the-street and white woman-in-the-home apartheid has produced nothing of direct benefit and a deal of turmoil. It was partly to divert attention from this, and in particular from the religious freedom debate, that the prime minister announced the abolition of "God Save the Queen," and the recognition of "Die Stem van Suid-Afrika" as the sole national anthem. The decision was accepted with muttered resignation—and in some quarters by bitterness—by non-Nationalists, many of whom were quite happy to accept "Die Stem" but deplored the government's arrogance, tactlessness and discourtesy in making a change which affected sentiment without any pretence at consultation.

Where does the United party stand in all this? To the great satisfaction of its more progressive friends it has fought splendidly in Parliament against the Native Laws Amendment Bill and university apartheid. Sir de Villiers Graaff has led his heterogeneous team firmly if cautiously, but since he has to look constantly over his shoulder at the timid United party follower, the uncommitted voter and the wavering Nationalist, all of whom are shockingly reactionary when it comes to colour issues, his position is intolerably difficult.

The brutal fact is that a progressive stand on colour pays no dividends: it tends, rather, to play into Nationalist hands. The leadership of the United party, therefore, apparently feels it must find other means of exploiting the discontent becoming apparent in Nationalist ranks—a discontent which is not yet significant and may not even grow, but which is there nonetheless. Mr Strydom's decision not to go to London for the conference of Commonwealth prime ministers is interpreted in some quarters as a concession to extremists in his party who have been reared on the story that attendance at these gatherings is a sign of subservience and who are grumbling at the government's delay in proclaiming a republic.

At the same time the "Black peril" argument, albeit in a more sophisticated form than in 1929, for instance, is being used increasingly in an attempt to rally support behind the white supremacists and to discredit the opposition groups. There seems little doubt that fear, prejudice and race consciousness will between them win next year's general election for the Nationalist party without much difficulty. So potent is the appeal to blood, so effective is Nationalist discipline—and loyalty—and so considerable the fear of non-conformity that there is little prospect of a substantial swing-away of votes from Mr Strydom. At the same time the growing realisation that the economic implications of Verwoerd apartheid, logically applied, are likely to be grave, and that South Africa is becoming more and more isolated on the African continent, is beginning to worry more and more people. There is also the constant criticism of Nationalist extremism by Dr Wassenaar, the expelled Nationalist leader in the Transvaal and the swelling chorus of world criticism of the Union and its policies.

The Nationalist leaders, however, are determined men who are gambling for what they have convinced themselves are the highest stakes: the very survival of Afrikanerdom, which they equate with white civilisation. And men in that position are not easily persuaded of the folly of their ways, especially when the electorate is as docile and unsophisticated as the majority of South Africa's white voters.

What is Pakistan to be?

FROM A SPECIAL CORRESPONDENT IN KARACHI

THE crowds of ministers, officials and journalists who are now descending on Karachi for the Baghdad Pact meeting are immensely welcome. Pakistan always suffers from a feeling of being unknown, unrecognised and neglected in comparison with India. Every effort will be made to win friends and influence the visitors by displaying the progress Pakistan has made in its ten-year life.

There is a good deal that is impressive. Partition left Pakistan practically without any industry; now, as the result of external aid and the Pakistan Industrial Development Corporation, there is a flourishing jute and textile industry, enough paper is produced to meet the country's needs, and sources of power (natural gas and hydro-electric) have been more than trebled. In spite of the extreme scarcity of imported consumer goods (which affects mainly the wealthy and the European residents) Karachi has the look of a prosperous capital of a fairly well-to-do state.

Those numerous prophets who said in 1947 that Mr Jinnah's new state would not last ten years are about to be *proved wrong.* But it is still uncertain what sort of a state Pakistan is going to be. Is it to be a modern, largely westernised, democracy, like its ally Turkey, or is it to make a Muslim compromise with both modernity and democracy, like its ally Iran? More pessimistically, is it in danger of becoming a military dictatorship like Egypt, or is it already, as its enemies claim, an intolerant theocratic state?

One thing which no amount of window-dressing can conceal is that Pakistan is not a working democracy in the western sense, or in the sense that India has just proved itself to be. West Pakistan, the province in which the capital is situated, has, since March, lived under "president's rule." The main point revealed by the complex political manoeuvres which preceded the suspension of the provincial assembly was that the rival parties still have no real basis in popular esteem or in coherent policies. This is not altogether surprising because—and this is the skeleton in Pakistan's cupboard—there has been no general election since independence: the central legislature and the West Pakistan assembly are predominantly co-opted bodies, still largely reflecting pre-partition elections.

★

But it would be a great mistake to suppose that Pakistan is dedicated to undemocratic principles. True, the constitution adopted last year declares that it is an Islamic state and that the ultimate source of all laws is the Koran; but any observer on the spot can quickly see that this is window-dressing designed to appease a few zealots. The mullahs, who insist on references to Islam in every state document, resemble those members of the British Labour party who press for references to the socialist state in every public pronouncement when they are in power, and would like to begin parliamentary proceedings with the singing of the "Red Flag" instead of with prayers. The men who really carry on the business of government in Pakistan privately curse these passionate proponents of orthodoxy who make their country look so ludicrously medieval.

In essence the constitution is democratic in the Westminster sense; but until general elections are held it will remain a democracy *in posse* rather than *in esse.* The failure to hold such elections is the reason why the political parties have no policy, no authority and no meaning; that long overdue reforms of land-tenure have not been attempted; and that the two provinces seem to be drifting apart. What then are the obstacles to elections?

The prime obstacle is fear—in particular the fear of successive governments that the state could not stand the shock of a general election. This lack of faith in the people is one of the more distressing features of political life in Karachi. The president does not trouble to conceal his view that democracy on the Westminster model is not suitable for Pakistan. The alternatives he has mooted are "controlled democracy," which has a rather sinister Orwellian ring, and, more recently, "presidential democracy" on the American model.

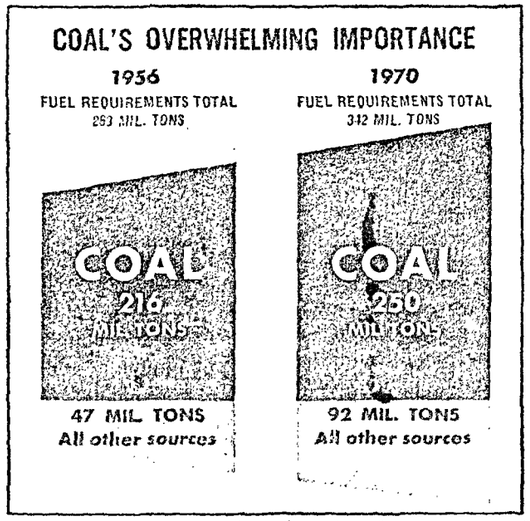
The other cause of fear is India. Pakistan is hypnotised by the threat of India, not only in Kashmir, but along all its borders in the eastern and western wings, and many Pakistanis fear that, in the confusion which an election might produce, India would somehow steal a march on them. Certainly the foreign policy of the prime minister, Mr Suhrawardy, is only explicable, and is only explained, in

How much coal has Britain got left?

PLENTY, AND IT CONCERNS YOU

A ¼ INCH HIGH. *This is a microphotograph of a piece of coal. Small as it is, we need every particle to maintain the standard of life we lead.*

Make no mistake, we have sufficient coal below ground to meet our power requirements for centuries to come. Although today coal is being used to help to build nuclear, oil, and hydro-electric power-plants, it will not be replaced or superseded by these sources of energy within our time. Every lump of coal that can be mined affects our future. For you, your children and their children—*this is the age of opportunity in coal.*



Don't think of coal as lumps in a scuttle. Think of it as your own work, your own wealth, and the good things in your own life. Warmth, light, clothing. Cars, houses, TV. Coal gives you them; lack of coal can take them away. Have we enough left? Yes, more than enough for all our needs in this century and the next. But every ton we take from the earth *makes the next ton harder to get.*

Expanding industry requires more and more coal. How is this to be achieved? *By a far more highly developed mining technology, including a very much greater use of new machinery.* And this means the enlistment of young men—engineers and scientists—on whose skill and training the whole operation of the industry will more and more depend.

The premium on skill

The problems must be handled by skilled men on the spot, using new and better machines developed by the technical specialists behind them. Face workers will therefore have a greater variety of more skilled and specialised jobs; they will be served by a team of engineers—mining, mechanical, electrical, ventilation, strata control, civil, method-study engineers—who will, in their various ways, transform the business of getting coal out of the ground.

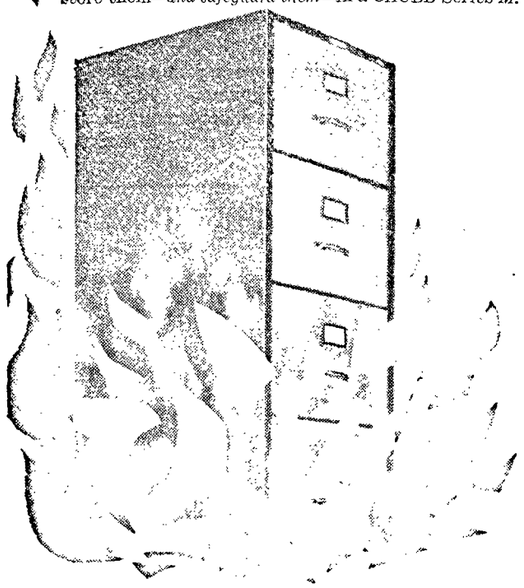
For all these men this is the age of opportunity in coal. And they have, as an added incentive, the prospect of building a higher standard of living for us all.

As this chart shows, coal will not be replaced by other sources of power for many generations. Although oil and nuclear power will each year increase their supply of energy, our need for energy is also increasing—at an even faster rate. The result is a growing gap between the energy we have and the energy we need. We have more than enough coal under our own ground to fill this gap—if we can dig it out. With new methods and new men we can.

ISSUED BY THE NATIONAL COAL BOARD, Hobart House, London, S.W.1
Divisional Headquarters in: Edinburgh, Newcastle upon Tyne, Sheffield, Manchester, Arnold, Dudley, Cardiff, Dover

7101/1

"Bake in a very hot furnace for two hours..."



That's Chubb's special recipe for one of the rigorous factory tests of standard equipment selected at random from the production line.

Routine Tests of Series M Filing Cabinets

In furnace tests of the new Series M Filing Cabinets a temperature of 1715°F has been attained, compared with the usual maximum of 500°F reached by the household gas oven. Yet in all cases the contents—office correspondence and record cards representing vital information—are removed undamaged, as legible after the ordeal as before.

Incorporating new principles of design and construction, the Series M affords a very high degree of fire protection—and yet, to all outward appearances, it is a normal, good-looking filing cabinet, as convenient to use as any conventional model.

There are documents in your office you cannot afford to lose. For your own peace of mind, and in your own interests, store them—*and safeguard them*—in a CHUBB Series M.

Series M Filing Cabinets

SCOTCH LIQUEUR

A sight to gladden the heart of man!

RONALD MORRISON & CO. LTD. EDINBURGH

terms of this "cold war" with India. When he was leader of the Awami League party in East Pakistan, Mr Suhrawardy was a vigorous opponent of both Seato and the Baghdad Pact. Today he justifies his support of these alliances by claiming that they are essential to the gaining of allies who will support Pakistan over Kashmir.

However, Mr Suhrawardy is also aware that Pakistan's great weakness in appealing to world opinion on Kashmir is its failure to appear as a genuine democracy. For this reason, and perhaps because he himself has appealed successfully to the people in the eastern province's elections, he has declared his support for nation-wide elections in March, 1958. He is not the first prime minister to favour elections in a year's time, but there are reasons to believe that Mr Suhrawardy means what he says, and intends to translate it into practice. Last month he suddenly introduced a bill to abolish the system of communal rolls, whereby Christians and other minorities were given special representation in West Pakistan (it had already been abolished in the east), and replaced it by a simple one man, one vote system. This move has been violently attacked by orthodox Muslims and Christians alike, but the way the prime minister shoved the bill through the assembly indicated that he was determined to get on with the job.

The question now is whether yet another crisis, real or imaginary, will supervene to prevent progress towards elections. The president might decide that the country was not ready for so liberal a dose of democracy and simply delay the elections again; the army—a very powerful independent influence—might advise the president that they could not guarantee stability during elections. Obstacles of a less subjective nature could also cause delay—for instance a severe food crisis if the floods of last summer are repeated. But the most likely cause of an upset remains the possibility of a sharp deterioration in relations with India. If, after its expectations have been roused by the 10—0 vote against India in the Security Council last winter, Pakistan were to get no satisfaction over Kashmir, and were even to see its supporters melt away, then there may be an outburst of passion which might in truth make elections and real democracy a very distant prospect.

Red Meat for Russians

MR KHRUSHCHEV has a knack for exciting slogans and lively comparisons. He coined his latest—"to catch up the United States in the output of meat, milk and butter per head of population"—last week in Leningrad, when he addressed a meeting of agricultural workers. In the same speech Mr Khrushchev pleaded for the abolition of nuclear weapons, but he added that, if such a rise in agricultural production were achieved by Russia, it would be more potent than the H-bomb; "we shall have struck the pillars of capitalism with the most powerful torpedo yet seen."

The call to a race with the United States is not new, but hitherto it has been limited to industrial production. Agriculture was the poor relation which the Russians were reluctant to exhibit for invidious comparison. Mr Khrushchev himself, when drawing an agricultural balance-sheet in 1953, had to admit that the number of livestock in Russia was then scarcely higher than in Tsarist times. True, some progress has been made since then, but the task now set, as Mr Khrushchev's figures make clear, remains tremendous. And the American level is to be reached, not in the distant future, but in two or three years' time, or four at the most.

The objective for meat seems truly fantastic, since Russia would have to more than treble its output within three years. Mr Khrushchev candidly admits that, when Soviet economists were asked for a date when parity in meat production could be reached with the United States, they mentioned 1975. Dismissing contemptuously such caution, Mr Khrushchev sets the target fifteen years earlier. What if the new schedule is not kept? At least the Russian peasants would have been exhorted to greater efforts in a spirit of competition, with a dazzling prize at the end of the road. Mr Khrushchev, after all, was formulating a slogan, designed to whip up enthusiasm, rather than an accurately formulated plan.

PRODUCTION PER HEAD OF POPULATION, 1956*
(lb)

	Meat	Milk	Butter
USSR	71·5	544	6·2
USA	227·3	762	8·5

* Mr Khrushchev's figures. Meat, presumably liveweight.

His optimism, if exaggerated, has certain foundations. It is claimed that the pig population has doubled since 1953 (rising from 28.5 million to 56.4 million this year). Supplies of meat and dairy produce have been growing, though not spectacularly, and apparently showed a marked increase in the first months of this year. The bumper crop from the virgin lands must have given the planners the feeling that they can now rely on a broader fodder base. Mr Khrushchev cannot be displeased with his policy of tax reliefs and price incentives for the peasants, since he has just promised them a new dose of the same medicine: from next year farmers will no longer have to deliver to the state part of their produce from their small private plots. Simultaneously, supplies of industrial consumer goods to the countryside are being stepped up to encourage production and sales.

Previous progress both in production and supplies is far from justifying Mr Khrushchev's confidence. He is clearly hoping that the new mood of the peasantry will finally yield the results expected from past investments in machinery, fertilisers and other equipment. Though the emphasis in Soviet investment has always been on heavy industry, money has been poured into agriculture without obtaining corresponding yields. One comparison with the United States that Mr Khrushchev failed to draw is the output per man employed in agriculture. In the United States agricultural employment absorbs less than one-tenth of a civilian labour force of 67.5 million people and the proportion could probably be reduced still further without greatly affecting output. Comparative Soviet figures are not available, but the striking difference is shown by the fact that in the Soviet Union 57 per cent out of a population of over 200 million are still living and working in the countryside. If and when Russia reaches a comparable state of efficiency, releasing manpower for industry, it will be better equipped for its economic race with the United States.

Mr Khrushchev's speech belongs to the field of political psychology rather than applied economics and must be treated as such. A good cornucopia of food replaces Mr

Malenkov's vision of plentiful industrial consumer goods. Even if his agricultural programme is only partly fulfilled, nobody will bother Mr Khrushchev with dates, while red meat could act as a temporary substitute for vacuum cleaners or television sets, though not for houses. Realistic or not, his speech makes pleasant reading: it is more relaxing to contemplate butter than atom bombing.

New Defences for Australia

FROM A CORRESPONDENT IN CANBERRA

THE Federal Government's new defence programme, which has been under lively debate in the Commonwealth Parliament, has been designed to take advantage of some of the technological advances of the past five years. Like the British programme, it has sought to "cut the tail and sharpen the teeth" without increasing the defence vote. In Australia there has been no pressing need or public demand to cut defence spending, though there has been considerable criticism of how the money has been spent. A number of government supporters would, in fact, like to see some slight increase in defence spending even if this were to mean forgoing tax reductions.

Australia has been budgeting for between £A190 million and £A210 million on defence during each of the past five years. The share of defence in total budget expenditure has fallen, however, from 20 to 16 per cent. The government, however, proposes again to spend about £A190 million on defence in the financial year beginning on July 1st. It is trying to get more defence value for the same amount of money—though the same amount now buys a little less—by the re-equipment and re-composition of the Australian forces.

The government has based its programme primarily on the concept of a limited war in South-East Asia in which Australia would be obliged to render swift aid to its Seato allies. For this reason the programme emphasises compatibility, as far as possible, with the United States. The Royal Australian Air Force is to be re-equipped with American fighter aircraft with a performance equivalent to that of the Lockhead F104 Starfighter and with American transport aircraft of the C130 type. The Australian aircraft industry, whose production of Avon Sabre jets is now drawing to a close, will concentrate on the new American-type fighters. The prime minister has emphasised that the programme relies particularly on mobility and fire power rather than on numbers.

The national service training scheme, which has given about 40,000 youths each year three months of enthusiastic but incomplete training, is to be "reluctantly modified" to cater for one-third of that number. The scheme is reducing, instead of increasing, the number of fully trained men available in an emergency. The compulsory inclusion of national servicemen in the voluntary Citizens Military Force for a couple of weeks' camp yearly and occasional night parades, has tended to keep citizen-soldier volunteers out of the CMF. As national servicemen cannot be compelled to serve abroad, the value of CMF battalions which included them became less, and it is upon the CMF that the government relies for rapid expansion of the army in an emergency. Moreover, the decision to cut national service will free about 2,000 regular soldiers who can ill be spared from their army duties. In order to decide which youths shall be called up the new programme introduces an ingenious "birthday ballot" which has intrigued lottery-loving Australians. It has also amused them since a demographer disclosed that the number of date-of-birth marbles, which had to be drawn—a Labour MP performed this duty a few days ago—depended on the seasonal mating habits of Australians.

To provide a regular, well-equipped and readily available force a brigade group of more than 4,000 men has begun to be organised: it will be trained in tropical warfare, and will be in addition to the infantry battalion group serving with the British Commonwealth Strategic Reserve in Malaya. Australian gunners will be given the American 105 mm field gun. The FN rifle will be produced at the Lithgow Arms Factory for the Australian infantry. There will be a speed-up of the naval construction programme. The Navy has been further consoled by the retention of the two fleet carriers—HMAS Melbourne with a front line establishment of 40 aircraft and HMAS Sydney as a flight training ship. Australia will continue in vigorous partnership with Britain in the long range weapons programme in South Australia. The strength of the regular Air Force will be raised by 10 per cent over three years. The first ground-to-air guided weapon unit will be introduced in the Sydney defence area. The defence administration will also become less remote by the transfer from Melbourne to the capital, as quickly as possible, of significant sections of the defence and services ministries so as to bring them within close reach of the Cabinet, Treasury and the External Affairs Department.

The programme has met with three sorts of criticism; that made by the official Federal Opposition has, unfortunately, proved the least effective. The Labour party is still so unhappily engaged with its domestic troubles that it has not evolved a comprehensive defence policy. It announced its opposition to continued national service and to nuclear war, and its sentimental support for the retention of the digger's slouch hat; then, after a few nostalgic reminiscences about Labour in office during the Pacific war, it sat down to watch the party crisis in Queensland. Friendship with all was the best defence policy for Australia, according to the party's chief spokesman on defence.

★

Among the ranks of the government's supporters, one group disagrees with the limited war concept on which the government's programme is based. Air Vice Marshal W. D. Bostock, a former deputy chief of staff of the RAAF and now a Liberal MP, is treated as chief spokesman of the group; he and his supporters believe that present defence planning mistakenly omits the possibility of a nuclear attack on Australia, which would be short of a total world nuclear war. The group has asked the government to provide Australia with a nuclear deterrent in the form of a dozen or so atom bombs at about £5 million a dozen, and ten intercontinental bombers, American B 52s or B 56s, instead of, and at the same cost as, the thirty American intercepter fighters. Their plan is based on the premise that, even if a nuclear attack on Australia may be only a small possibility, ten million Australians could not, in the event of an attack, morally ask the 200 million odd Americans and Britons to risk entire destruction by nuclear retaliation, and that both countries might well refuse to oblige. This argument has been considered rather too far-fetched by most onlookers, as well as by the government.

The less radical of the government's critics believe that the programme does not go sufficiently far to meet even the government's concept of a limited war. They believe that at least two regular mobile brigades should not be beyond the ability of a £190 million programme, and that the brigade force should be armed with tactical atomic weapons. Both groups criticise the government's casual approach to civil defence and the national service change. The government has announced, however, that it will make a study to see if civil defence training can be included in the national service scheme and that, should this prove feasible, it will seriously consider adopting it.

France's Power Shortage

FROM OUR PARIS CORRESPONDENT

THAT M. Mollet should "on principle," and alone, boycott the Suez Canal beyond the point of no return and be applauded by much of the French public shows how much France's traditions are still military rather than commercial—even if M. Poujade proves it is also a nation of shopkeepers. Yet the unenthusiastic reactions of the business community show that the day for such gestures is passing. The moral of industrial expansion and the rising import bill is that France will have to become more of a trader on world markets. And the biggest item in that bill is a growing expenditure on fuel imports, which Suez itself has dramatised. France is Europe's biggest fuel importer; hence the recent emphasis on oil from the Sahara and the importance attached to the recent first flow of natural gas from Lacq, in the Pyrenees, towards Bordeaux.

Lacq's reserves are not yet fully known, but it should produce the equivalent of 4 million tons of coal a year by 1961 and double that by 1965. In five years it will be yielding twice the gas sold in the whole of France last year. This will be gradually piped, not only throughout the south-west, but to Nantes, to the St Etienne-Lyons region and, later, even to Paris. The experts, like the brilliant and ubiquitous Louis Armand, consider the Lacq pocket should be cleared out, whatever its reserves, in thirty years, by which time nuclear power should be solving energy problems.

The company developing the field has, in fact, been criticised for excessive caution: the gas field discovered in the Po Valley in 1949, two years before Lacq, produced as much in 1955 as Lacq will by 1961. But there are extenuating circumstances. The company has had great trouble, in particular, with the sulphur in the gas, which rapidly turns ordinary steel wells into something like blotting-paper. But the economic prospects are good, especially for neighbouring Gascony and Acquitaine, which have long been backwaters more romantic for the tourist than the native, because they lack power. By French standards Lacq gas is cheap fuel. An aluminium plant will be set up near the field; and chemicals should develop, fuelled by the gas and using the by-products as raw materials. These include some high-grade petrol and above all sulphur. Lacq will turn France from a major importer of sulphur into the world's biggest producer after the United States. The French hope to export to Britain and Scandinavia and save £30 million a year of precious foreign exchange.

Lacq is France's first windfall since the war in the way of home power resources. The Ministry of Industry is so enthusiastic that it announced the flow had begun a week before the stopcocks were opened. For last year alone, nearly a third of the big trade gap was due to greater fuel imports. Last year was, perhaps, exceptional: the inflationary boom raised the tonnage and Suez the price of foreign fuel. But even if France's coming trade crisis holds up output for the next eighteen months, it seems highly plausible that, as the planners estimate, France's energy needs will rise at least by half between 1955 and 1965. (Even then its consumption of energy per head, which roughly represents its level of industrial development, will only reach Germany's present level in 1965 and Britain's ten years later.) Fresh coal and hydroelectric power, the mainstays of postwar output, can only meet a third of this increase and Lacq raises the proportion to half. The rest *must* come, to save foreign exchange, from the atom or the Sahara.

Part of the official gloom over France's immediate trading prospects is due to the conviction that the fuel import bill must go on rising till 1961. The question is how soon it can be levelled-off afterwards. Nuclear development, at present rates, cannot save the day until the late seventies, too late to be helpful. If Euratom is ratified, the French seem ready to attempt the maximum rate of development recommended by the "wise men." That would give them about 4 million kW of capacity by the end of 1967, and level-off imports in the mid-sixties. But even this is late, and the French are not sure they can reach their targets. In any case, these estimates assume big French oil finds at home, despite the prospectors' moderate success so far.

These uncertainties explain why the government is giving top billing to the Sahara, where prospects, at least technically, are solid and substantial. Desert production could probably hold energy imports down at their present level from 1960 onwards. Here, again, there is a hitch: while the semi-war continues in Algeria, and no agreement is reached with Tunisia and Morocco, desert oil remains largely a mirage. In the most favourable circumstances, the investment effort needed will be very great. One of the most remarkable aspects of the Mollet reign has been the piling up of the cost of progress almost independently of government decisions. To create a more modern economy, the French must in the coming years pay for more schools, more export industries, especially in engineering, for dams and nuclear power stations, for Lacq and the Sahara, for overseas development and the costly reconversion of much land to dairy farming. The bill grows larger every time it is added up. The problem is not only how to finance the required investment (M. Mollet meant to launch a £250 million loan this autumn for the Sahara), but how to find productive resources for so many priority jobs.

Energy investments, for instance, were £375 million in 1956, but should rise to £560 million next year and £660 million in the mid-sixties. (And this excludes nuclear energy.) If these investments are cut to stem inflation, there is a grave danger that energy imports will drag down the trade accounts in five years' time. If they are not cut, other investments must be curtailed, or consumption reduced—always hard in a country with France's social tensions. The risk is that, unable in practice to fix steady

priorities, France will find its growth held up in a formative decade by its trade gap; and that this will lead it to continual backsliding on the spirit, if not the letter, of the common market. In face of this challenge, the expenditure of men and resources in Algeria becomes even sadder; and M. Mollet's willingness to cut off France's nose to spite Nasser's face at Suez seems a piece of gratuitous masochism.

Canada and the Younger Sisters

FROM OUR OTTAWA CORRESPONDENT

CANADA has now given its reply to the vaguely defined proposal for a Commonwealth Development Bank, on which the British Government asked other Commonwealth countries to comment. The Canadian view is understood to be quite unfavourable enough to satisfy Whitehall.

The question arises from the rapid emergence of independent territories in the Commonwealth. By moving out of the "colonial" column into the "Commonwealth" column, they sacrifice the chance of getting grants from the Colonial Development Fund. A couple of debates at Westminster have shown that there is anxiety about how the Commonwealth can help its new members to get a good start. The Canadian prime minister, Mr St. Laurant, has also talked about the problem in several election speeches.

Officials left behind in the capital, while the politicians are out campaigning, have been considering what practical means Canada might use to express its good will. It does not at present come to very much. The Commonwealth Bank idea is not much favoured. It looks like a new piece of machinery to distribute development funds, whereas the problem is not machinery nor distribution: it is to get the funds. Britain is the only Commonwealth country with a net export of capital. It is a moot point whether its limited savings might not be better used at home than abroad; and if they are going to be exported Canada might be a better place for them than the underdeveloped countries. That is for Britain to decide; but Canadians do not see that the decision would be any easier if there were a Commonwealth Development Bank.

Ghana is the first test case, and Canada's small study has not revealed any major need for government investment funds, unless for the Volta River project and the government is not inclined to get involved in this. If the Aluminium Company eventually goes for the project, that would mean private, not public, capital. It seems here that the most practical thing Canada can do for the new state is to provide technical training, particularly for administrative civil servants. The need for this was stressed by Dr O. E. Ault, Director of Planning for the Civil Service Commission, who visited Ghana last year on behalf of the United Nations Technical Assistance Service. Canada has approved the appointment of a High Commissioner to Ghana, and an *agrément* is now awaited. His first job will probably be to arrange for selected Ghana officials to come to Canada for training.

The second case engaging Canadian attention is the Federation of the British West Indies. Although full independence for the Federation may be some years off, Canada feels a special interest in the Caribbean islands; and there is some discussion whether Canada's relatively limited aid for Commonwealth countries should not be concentrated on this neighbouring area rather than spread more widely and thinly. Discussions are going on with West Indian leaders about the sort of help which would be most useful. The most favourite projects at present are modest, and training of administrators again tops the list. Canadian officials have also been impressed by the need to improve the inter-island steamship services, and the government might accept a recommendation to provide two suitable steamers as a sort of birthday present on Federation. This would give a hand to Canadian shipyards on the side, which commends it to politicians. It is, however, very doubtful whether an inter-island shipping service could operate economically; and the Canadian government would not find it easy to provide operating subsidies when it refuses to subsidise its own shipping even on coastal and inland routes—though it does subsidise a modest service between Canada and the West Indies.

Realistic International Assistance

FROM OUR UNITED NATIONS CORRESPONDENT

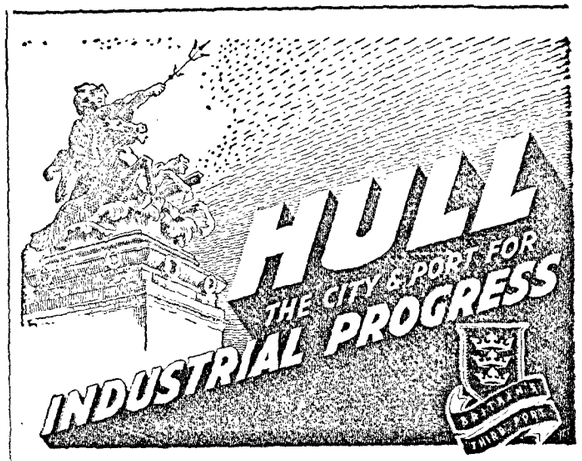
COMPETITION between different United Nations agencies can be as healthy as co-operation, and it will be interesting to see how the agencies react to the latest development of the germ of an idea which Mr Hammarskjöld planted a year ago and which has since been carefully tended by the UN Department of Economic and Social Affairs. A serious deficiency of United Nations technical assistance is that experts sent to underdeveloped countries can offer advice but cannot do what is often more badly needed: set a practical example of efficient administration. To meet this difficulty Mr Hammarskjöld urged the creation of an international pool of administrators and experts who could be employed in underdeveloped countries on a temporary basis and integrated into national administrations. For complicated technical and legal reasons it will be necessary to run this plan within the UN Secretariat somewhat separately from the ordinary technical assistance programmes.

Some officials of former colonial countries have been speaking of United Nations technical assistance as a concealed form of imperialism and have implied that the colonial countries are using the United Nations programmes to increase their influence in Asia and Africa in the guise of sending United Nations advisers. This is utter nonsense, but the serious thing is not so much whether it is true but whether it is believed. When the Economic and Social Council reviewed the plan for an international pool of professional experts, the Indonesian delegate praised the idea with faint damns and then suggested that the UN Secretariat should study the question of setting up a world training institution. This proposal no doubt springs from a suspicion of all technical assistance which involves training people in the West. The Indonesian idea is the sort of airy-fairy notion which takes a great deal of time to discuss but prevents action being taken on a more modest and realistic basis. It is to be hoped that when the Economic and Social Council meets in Geneva this summer, the British delegation will press for a modest and sensible experiment along the lines suggested by Mr Hammarskjöld.

The manufacture of business ledgers and nightwear are two of the many hundreds of jobs that over 80 industries are doing more efficiently with the help of starches, dextrines, and glucose.

CAN STARCH HELP YOU? That's a question worth asking—and Brown & Polson are the people to ask. We can give you an exceptionally well informed opinion—and shall be pleased to do so.

STARCHES, GLUCOSE, OR DEXTRINES, ARE USED IN:



ADHESIVES • BEER • CORSETS • DAYBOOKS • FACE & TALCUM POWDERS • GRINDING WHEELS • HOUSEHOLD STARCH INSECTICIDES • JUTE TEXTILES • KRAFT PAPER • LEATHER PROCESSING • MATCH BOXES • NIGHTDRESSES • OIL WELL DRILLING • PLASTERBOARD • QUICK-SETTING GLUES RUBBER DUSTING • SAND CORES AND MOULDS • TABLETS UPHOLSTERY • VITREOUS ENAMEL WARE • WALLPAPER XMAS DECORATIONS • YARN • ZIP FASTENER TAPES

Advantages for the Location of New Industry

FORTY NEW INDUSTRIES (new firms or new ventures of old local companies) established since the war testify to the enduring virility of this City and Port.

SPLENDID OPPORTUNITIES exist for many more new industries. Hundreds of acres available near Docks and Humber Estuary for large scale enterprise. Selected sites to suit special requirements of medium and small industries.

RAW MATERIALS—Labour and Services readily available.

LOCAL SUPPLIES—Chemicals, solvents, pigments, adhesives, oils (mineral and vegetable), chalk, cement, leather, engineering services, fish, grain and wood products, packing material.

MARKETS—Hull serves an inland population of 14,000,000 and exports to all parts of the world.

ADVANCE PREPARATIONS FOR EUROPEAN FREE TRADE

The choice of the Port of Hull for the departure of the Royal Yacht BRITANNIA on the State Visit to Denmark clearly indicates the convenience of this port for continental traffic. All hoping to benefit by any relaxation of trade restrictions are invited to make enquiries now about port, shipping and forwarding facilities for their imports or exports.

Regular services to all principal and many out-ports in Scandinavia, Germany, the Baltic, Low countries, Channel, Bay and Atlantic ports, the Mediterranean and Adriatic Ports.

Portrait of a man who invested in **SAFETY...**

with **ABBEY NATIONAL** naturally!

At the helm of his little five-tonner he's as happy as a king and as free as the breeze. On weekdays, you'll find him in an architect's office, well-established in his profession with a partnership in the offing. Like all people in responsible positions, he has his worries, but at least he loses no sleep over the security of his savings, for he has invested in Safety with Abbey National.

The Abbey National gives him a good return free of income tax. Today this is 3½ per cent—equal to £6.1.9 per cent where the standard rate of income tax is paid.

"When stocks and shares are meeting squalls or headwinds," says our yachtsman, "give me the good ship Abbey National." Any amount from £1 to £5,000 is accepted.

Taking the East into account

Twenty-five years ago you would have found this 'adding machine' of antiquity in every eastern branch of The Chartered Bank. It was of particular use in calculating the intricacies of exchange rates which often fluctuated with great rapidity. Today, the abacus is being replaced by the slide rule and the electric computer. The East is changing but The Chartered Bank remains in step, so that its knowledge of eastern trade, travel and investment is always up-to-date. This knowledge and a century of experience sustain a complete banking service available throughout a branch system, which extends to most centres of commercial importance in Southern and South-East Asia and the Far East.

THE BUSINESS WORLD

India's Crisis of Ambition

WHEN budgets succeed each other at Indian speed, the outside world (which thinks a budget a year enough and two an act of desperation) is bound to feel scared. Mr T. T. Krishnamachari's latest budget (described by our Indian correspondent last week) is indeed something much more imaginative than a mere collection of fiscal plugs to seal the holes in the Indian economy. It presents the fascinating equipoise of the Finance Minister himself—the man of business and the minister anxious to get things done, and the politician anxious to give his supporters a convincing display of soaking the rich. In an economy as over-extended as India, there is not much scope for handing out incentives; yet this is what Mr Krishnamachari's budget manages, in a very modest way, to do. His incentives are a shot of digitalis to keep the managerial classes interested in life to the extent of 23 per cent, instead of 8 per cent. It now becomes possible to save without evading taxes. But there is a price. Mr Krishnamachari's proposals for a tax on expenditure plunge him into the uncharted sea of fiscal discovery. Mr Kaldor will now have the opportunity of watching the government of India work out in practice the proposals that he submitted last year, in a field experiment of about 6,000 cases and at a maximum 100 per cent rate on taxable expenditure (after sizeable allowances) exceeding Rs 50,000 (£3,750).

This is an innovation of imagination, though it can have no immediate relevance in easing India's present economic stresses. Nor, for that matter, do Mr Krishnamachari's increased excises (some of them since modified) reduce the uncovered gap in government expenditures to a tolerable size. The second five-year plan was deliberately framed as an exercise in deficit financing—it was not, as Mr Krishnamachari was once heard to observe, "an exercise in budgeting by an accountant." He has made valiant attempts to keep the deficit to what was intended (though how one draws the line between deficit financing that is "allowable" and temporary deficits that ought to be covered later takes one into metaphysics) but he is still short of his aim by Rs 5,200 million. The impetus of the plan dominates the Indian economy, and it now confronts India with a first-class problem, not of controlling her internal inflation alone, but of finding the means to pay for the flood of imports that the plan is sucking into India.

In the original conceptions of the second five-year plan, the degree of dependence on external finance was reckoned to be modest, if not indeed marginal. The capital programmes were to cost Rs 3,800 crores (£2,850 million) towards which Rs 800 crores (£600 million) were to be found from investment by foreigners and Rs 200 crores (£150 million) were to be taken from India's sterling balances during the whole five-year period 1956-61. All the figures have gone astray, but none more seriously than the drawing-down of the sterling balances. They were intended to act as a balancing reserve to make good a relatively small gap in external resources. The figures are not easy to render in simple and accurate form; but the recent rate of drawing has been equal to £200 million a year, and the actual loss (excluding the reinforcements) in the first plan year must have been close to £250 million. India's sterling balances now stand at £370 million—this after they have recently been reinforced by the proceeds of $127 million drawn from the International Monetary Fund. In fact, these dollar proceeds have not offset the loss of reserves. Mr Krishnamachari has rather blandly stated that a further £70 million of the balances might be drawn to finance the plan. This provokes two comments: £70 million would last four months at the recent rate, and £300 million is the statutory minimum of sterling that the Reserve Bank must hold—unless the figure is again reduced by law.

It would not be sensible for anyone in this country to gloat that here is another plan gone wrong. The probability that something fairly violent would go wrong with India's second plan might be said to have been built into it from the start. In India, that is not usually admitted ; the doctrine that the plan is inviolable is thrust down one's throat although it has been perfectly plain for months that a process of stretching out had become inevitable. The main constituents of the plan may not be much changed but they will take longer to complete. During the elections no such hint was allowed to escape. But now there is growing criticism of the doctrine of " the plan at all costs and within five years." It will not happen, if only because India is using up her sterling so fast that it cannot happen.

To attract foreign capital has proved less easy than India had hoped. She has had a fair success in a new and not especially amiable kind of blackmail. " You in the West," said one of India's economic policy makers a few months ago, " will lend to us if you are sensible ; if not, the communist countries will." Credit at 2½ per cent for the Russian steel plant goes a long way to offset a certain disillusionment about Russian methods and manners ; so, in a very different kind of way, did credit at 13 per cent demanded by the Germans for the steel plant they are building. Such attempts to get the two opposing sides to outbid each other in a gigantic give-away competition (whether in steel, engineering, or military aircraft) are being pushed further. And they are meeting with a certain degree of response in London. But whatever industrial firms here will do under the encouraging pressure of their own government and of leading industrial spokesmen, they do not seem prepared to venture far on their own account. If, for example, the project for an Indian heavy machinery plant goes forward, with British assistance, it will be politics that primarily dictate the decision ; private commitments, privately financed, would be likely to take more direct cognisance of the weaknesses in certain of the big industrial plans that are under way.

It is not going to be easy to attract the venture capital that India still needs. One or two gestures in the latest budget, such as the modest tax concession to foreign companies, show an awareness that foreign capital deserves consideration—but it has not got much yet. A mixed pattern of socialism and private enterprise in the Indian economy has been proclaimed ; but it is heavily loaded towards the public sector. What the foreign investor sees is a country in which the plan has taken charge, where the Finance Minister has no field for manœuvre, where there is growing prejudice against private capital, where foreign companies are still thinking about the deposits they must hand over to Mr Krishnamachari (following his November budget) rather than the tax savings, if any, that they will gain from his May budget. He has shown himself capable of accepting a freer opportunity for private investment against the opposition of those who think of all investors, Indian or foreign, as demon figures devoted to unconscionable profit-making. But the urgent question is whether this modest change of attitude will be enough to persuade new capital into India.

An increasing number of western investors would answer that capital will not move there if its only reward is to be insulted or done down. There are foolish suggestions that India should block the transfer of profits earned by foreign firms ; Mr Krishnamachari has repudiated any such suggestions, save in the last extremity, but they do India's credit no good. Nor does the attempt to set a limit on profits by Indian ideas of what is "right." There is no such test. What matters to the foreign investor is how much he can earn in his investment in India compared with what can be earned in other countries. If India says 8 per cent and no more, and the capital can earn twice as much elsewhere, it will keep away from India. Nor will the urge to trade with India stand the pressure of linking import licences to the promise of five or seven year credit ; this policy would obviously suit India very well, for it enables a trade debt to be postponed and avoids the need for raising long-term capital. But it seems to be finding no broad commercial support in Europe or London, even though individual exporters may consider that they are justified, in their particular circumstances, in entering into such long-term credit arrangements. Dollars from the World Bank are hoped for, though they would be tied to transport improvement. Perhaps there will be a chance, eventually, of a loan in London. Meanwhile, some limited flow of private capital and a further running down of the sterling balances (though how can it be for long?) are the only sources of external finance. And the imports continue to roll in—not only for the investment programmes, but also for food ; the underweight given to agriculture in the plan is becoming increasingly apparent as large areas of Indian population are crossing the borderline from mere subsistence into positive scarcity.

British firms can hardly be blamed if they are tempted to go a little slowly in trading or investing in India. The rupee is under its own special pressure. This is marked by a fall in India's sterling reserves that cannot be indefinitely sustained and by the consequential drain on the central gold and dollar reserves of the sterling area countries. It is also marked internally by an inordinate rise in Indian domestic prices. Whether there is scope left to stem the drain, to check internal inflation, to maintain the basic necessities of the plan but to rephase its component parts, and finally to persuade the Indian people that their longing for economic improvement is not being abandoned—all this is clouded in uncertainty. But if the economic choices that now confront India sound difficult, they are immeasurably easier than would be the political and social consequences of a plan that failed because it got out of hand.

Aircraft for a Common Market?

French experts on air defence are sceptical about Britain's decision to go straight on to missiles—which would leapfrog their own brilliant supersonic fighters. But both industries could still gain by co-operation

Aircraft production anywhere, whether civil or military, has become such an expensive business that it needs an increasingly big order to justify tooling for a new design. This, in a nutshell, is the dilemma of the French aircraft industry. It has the designers, the pilots, the tools, labour and productive capacity to build aircraft that compare more than favourably with any in the world, but is hard put to find orders big enough to make their production an economic undertaking. Such an impasse is by no means peculiar to France. British manufacturers of civil aircraft have argued for some years that they cannot afford to build an airliner if it will be used only by the British corporations. In the United States there are rumours that one new airliner may be abandoned because its initial orders, which run to more than 100, are not big enough to justify pressing on with the venture.

In France, however, the numbers of military as well as civil aircraft ordered have never more than narrowly exceeded the minimum numbers required to break even on production: now this narrow margin is dwindling to nothing. The budget for the French Air Force has never been higher than it is this year, but the extra money is being spent in North African operations. Less and less is being spent on the production and development of aircraft, and no French manufacturer is optimistic enough to believe that this policy may be reversed.

Steps are therefore being taken with the blessing of the French Air Ministry to try to establish ties with the aircraft industries of other countries that may promise French machines a market outside France. The object is to secure enough home and export orders to give a new aircraft a decent production run. The practical result might very well be some degree of standardisation in the types of aircraft built in France, in the nascent aircraft factories of Western Germany and in the smaller aircraft industries of Belgium and Holland.

Above all the French are anxious to prevent the reviving German aircraft industry from developing along competitive lines, for there is not room for two industries of this size in Western Europe. The only hope for joint survival and conservation of the resources of both seems to lie in co-ordinating their research and production. While what would amount to the development in this way of a common market for aircraft in Western Europe is an obvious and sensible suggestion, it is understandably enough regarded with no enthusiasm by the British aircraft industry.

British aircraft exports to Western Europe have dwindled steadily since the days when Meteors and Vampires formed the backbone of the air forces on the Continent and Rolls-Royce engines were used in almost every aircraft flying. The decline has been connected partly with price, partly with the performance of later types of aircraft but also to some extent with the revival of aircraft production in Europe—mainly French. Yet the British industry has never stood more in need of firm export markets than it does today and a concerted drive by the major companies involved is planned to sell guided weapons abroad.

It would not be easy for British manufacturers to compete in Western Europe with a closely-knit local aircraft industry. The international air show which opened in Paris at Le Bourget airport last week served to stress both the high standard of French aircraft development and the widening gap that has emerged between Britain's and Europe's concept of air defence. Neither seems likely to assist British aircraft exports.

The French industry, which is partly nationalised and partly privately owned, consists of 21 companies employing about 80,000 people against the British industry's 270,000, but the bulk of development has been carried out by a handful of large companies. These are the state-owned groups of factories in the north and south (the latter is a new and still rather uneasy amalgamation of two regional groups) ; the privately owned Marcel Dassault factories ; the nationalised engine company and Hispano-Suiza, which builds Rolls-Royce engines under licence. Of the smaller manufacturers, one private company, S.E.P.R., has specialised in rocket motors ; the company owned by René Leduc has achieved remarkable results with ram-jet aircraft ; and the Breguet company, from building big transports, is branching out into fighters and anti-submarine aircraft.

Development in the French industry has been carried out on a much narrower front than in Britain with some remarkably successful results. No attempt has been made to develop either heavy or medium-range bombers or long-range civil transports. Civil development has consisted mainly of vast, weight-lifting aircraft, designed with an eye to French army requirements, and the medium-range, twin-jet Caravelle

airliner tailored for Air France's African services. Of the big transports, the Nordatlas built by the northern state factories has probably been the most successful. About 200 have been ordered, and most of them now delivered; this aircraft distinguished itself during the Suez operations, when the lack of a similar RAF aircraft was painfully apparent, and it has been ordered for the Germany Army. The Caravelle, built by the southern state factories, has not sold readily, even though it is highly regarded by engineers. Air France has 12 on order, and with them is likely to be the first airline to reopen jet passenger services.

Development of French military aircraft has taken two forms, one of them highly unconventional. The Dassault factories have evolved a wholly conventional series of Mystère fighters culminating in the Super-Mystère which is supersonic in level flight and should be coming into service this year; 370 are on order, compared with total orders for 420 of the slower Mystère IVs which are now in service (these compare for speed roughly with the Hunter). The southern state factories have built the Vautour light bomber as a complement to the Mystère. The Vautour doubles as a bomber or all-weather fighter; it might compare therefore roughly with the Javelin in this country, except that it is faster.

It is in the unconventional fighters that the gap between British and French ideas on defence becomes so apparent. The French have concentrated for several years on developing fighters that can climb at a rate approaching twice the speed of sound, toying with a variety of methods, afterburners, ram-jets and rockets, to attain this rate of ascent. They have an understandably scant respect for the efficiency of the early warning radar network in Western Europe—at least as far as giving adequate warning for defence of French targets—and are therefore still pinning their faith to a fighter that can get up to its target at the shortest notice. The fact that it may not be able to stay in the air very long because of its fuel consumption is immaterial. It is because they consider Europe's radar network to be inadequate that most Western European countries also consider that Britain's rapid shift towards reliance on a missile defence system is impractical at present.

These French aircraft are well advanced, and no longer merely aerodynamic curiosities. The rocket-powered Trident, which crashed just before the air show was due to open, has now been ordered in a development batch of 10. The Trident comes from the southern nationalised factories; other still experimental fighters have been built by the northern factories, by Dassault, by Leduc and by Breguet. Many people in Europe believe that such aircraft, carrying guided weapons and flying under radar instruction from the ground, will remain for several years a more effective means of air defence than any type of guided missile on offer. Some years ago the same view had enough adherents in Britain for a development contract to be placed for the Saunders-Roe combined jet and rocket fighter, which made its first flight a few weeks ago. This aircraft was intended for the close defence of bomber airfields: whether it is still intended to play this or any role in Britain's changed air defence system is not clear. At that time, although the funds spent on development in Britain needed to be husbanded for the most essential projects, no attempt was made to benefit from the extensive French work on various small, high-speed fighters either to accelerate development of the Saunders-Roe project or to save money by considering French assistance.

With its fundamentally different conception of air defence in present circumstances the French Air Force is thus about to put into service this year fighters and light bombers that are faster than those used by the RAF. Even though a bare handful of French geese turn into swans, the few that do are impressive. The French industry still buys some of its equipment from Britain, particularly electronic apparatus, but much less than it used to do. Dassault, for example, has set up an electronics division specially to make the miniature radar and electronics needed for the company's small fighters; British engines are used no longer, whatever their quality, if there is a French-designed substitute available. There is no chance that sales of British aircraft and engines can be maintained to France and to Western Europe unless Britain is prepared to take something in return from the aircraft industries of those countries, and genuine scope for interchange probably still exists.

There has been plenty of evidence in recent years that the British aircraft industry could have learned from the extensive programme of supersonic flying carried out in France; a much earlier exchange of data, or even of actual equipment, might have been of mutual advantage. Today, the divergence of views on air defence policy limits the possible common ground, and wishful thinking on the Continent that Britain's new policy will turn out in practice to mean the reverse of what it says can be dismissed as pipedreams. In re-shaping its own air defence, the British Government has not spared its own aircraft industry; it is certainly unlikely to go back on its new decisions because those in other countries have chosen to develop aircraft it does not want. But the French aircraft industry, in particular, has already turned a good deal of its technical brilliance to the study of guided weapon systems that show its characteristic ingenuity; moreover, its knowledge of high-speed manned aircraft might still offer valuable know-how for Britain's manufacturers. There was a hint in the recent Defence White Paper that steps might be taken to co-operate more closely with aircraft industries on the Continent. This ought to be made into more than a polite gesture.

BUSINESS NOTES

IN THE MARKET

Industrials Still in Demand

A BRIGHT start to the three week Stock Exchange Account on Wednesday and Thursday, a sharp rise in oil shares, a rally in industrials and a firmer tone in the gilt-edged market are hardly sufficient to justify a major re-assessment of the market. Two items more at least would be needed to justify a change of view—a broadening of the present narrow business in gilt-edged and a strengthening of sterling. Neither has been markedly weak. Sterling closed against the dollar on Wednesday at $2.79 3/16, against $2.79 1/8 a week earlier. Gilt-edged stocks, despite the rally, on balance show the loss of a little more ground; the *Financial Times* index of government securities over the week to last Wednesday declined from 84.70 to 84.28. The argument whether a rise in sterling is needed to promote new confidence in gilt-edged, or a rise in gilt-edged to strengthen the pound is highly unprofitable; it would become more relevant if the authorities intended, which at present they clearly do not, to promote a rise in the market as an exercise in pure tactics. The basic facts are that the two main channels of investment on which the gilt-edged market would have to rely for any sustained rise—the banks and the pension funds—are both reluctant to buy.

Investors still prefer equities. Some of them naturally enough are going for oil shares which enjoyed a good rise on the increase in British Petroleum's Persian gulf prices and the excellent quarterly figures of the Royal Dutch/Shell group. Over the week "Shell" Transport has risen from 188s. to 193s. and BP from 160s. to 163s. 1½d. The rally, which more than offset earlier losses, occurred on Wednesday when Shell gained 6s. and BP 8s. 1½d. Industrials generally attracted buyers with the start of the new account, and the rise gained momentum on Thursday, but it has been a modest rise and insufficient to offset in full the declines of the previous few days. Over the week ended on Wednesday *The Economist* indicator shows a fall from 218.7 to 216.2. But many investors must have had profits and some of them must have been taken in the closing days of the old account.

INDUSTRIAL OUTPUT

Hardly a Ripple

CAR sales in Britain may have recovered enough to alarm the Government; but motor output has not yet recovered enough to ripple the placid surface of industrial production as a whole. The index of industrial output for March, after allowance for seasonal factors, turns out to have been 136 (1948=100); and in April it is expected to be no higher, 136-137. It is true that manufacturing, at the beginning of the year, showed a slight upward tendency—later offset by the engineering and shipbuilding strikes and within total production by rather less buoyant sales of gas and electricity; moreover, there may exist certain "built-in lags" in the recording between actual production and the index, which in many industries depends upon deliveries from stock. But there is no real reflection at all of the somewhat livelier activity that many people in industry have been talking about recently, and

INDUSTRIAL PRODUCTION, SEASONALLY CORRECTED

	All industries			Manufacturing		
	1955	1956	1957	1955	1956	1957
January	134	138	137	139	143	139
February	134	136	137	140	141	141

November	139	137	...	144	141	...
December	141	135	...	147	139	...

which the renewed growth of personal consumption, at any rate, might lead one to expect. Recent wage settlements have been a powerful reminder that major elements of inflation in the economy remain unchecked; but it is much too early to fear that rising production will be adding its own influence through excessive demands on imports. It would indeed be ironical if the motor industry had brought this sudden new hire-purchase restraint upon itself by exaggerated complaints to the Board of Trade that in the autumn it would need more sheet steel than Britain could produce; but the joke would be on the economy as a whole.

OIL PRICES

Not Quite in Line

MIDDLE EAST oil prices began to swing back into line with the American "world prices" this week—but so far, not all the way. While the Suez Canal was blocked, sharply reducing Western demand for Persian Gulf crude, and leaving that demand to be filled by higher imports from Venezuela and Texas, the two price levels naturally moved apart; once the canal was re-opened, the normal pull of the reunited market began to re-assert itself. In practice last winter, the price divergence took the form that Middle Eastern prices were held level while crude prices in the Western Hemisphere rose about 20-30 cents a barrel. This week British Petroleum led the way in raising Persian Gulf prices: but it increased its posted price at Mina al Ahmadi by only 13 cents a barrel. It followed, incidentally, by posting prices for a variety of petroleum products in the Gulf—the first time this has happened.

Very roughly, it can be said that the "normal" relationship between Middle Eastern and American crude prices implies that they would compete equally when delivered on the eastern seaboard of the United States. The high cost of shipment via the Cape, which added about 80 cents a barrel to the price of crude transported from the Middle East to the United States during the winter, might indeed have implied a fall in Persian Gulf prices while the canal was closed, even allowing for the rise in western hemisphere prices. Today, with the canal open and tanker freights back to the level of about a year ago, it would have taken a much larger increase than BP has posted to restore the price relationship that existed before Suez. Other companies that post prices in the Middle East are certain to follow BP quickly: it will be interesting to see how closely they follow its price level. Product prices are already being shaded in the United States as the emergency demand for extra Texan and Venezuelan supplies falls away; and it remains to be seen whether the crude price in the western hemisphere can be held. But while the two price levels are held, Middle East oil is markedly more cheap by world standards than it was last year.

CENTRAL MINING

Mr Glazer Steps In

THE most gentlemanly takeover on record was in process when Mr Sam Glazer stepped in. Nothing was being done in the Central Mining affair without the approval of Lord Baillieu and his fellow directors. The syndicate—C. W. Englehard and Gordon Richdale, Anglo American, Union Corporation and the merchant bankers, Rothschild, Schroeder, and Benson-Lonsdale—had bought 80 per cent of the cheap votes through the preference shares at 24s. a share (£6 a vote) and were bidding the same sum for the rest. The institutions, too, had sold only on the assurance that Central Mining approved. The syndicate would make no general bid for the ordinary (about £25 a vote) but would form their new company in South Africa without the assurance of mathematical control. The new company would canalise some of the Oppenheimer millions and some of other people's money into new and re-invigorating mining investment, partly outside Southern Africa. The Central Mining-Rand Mines group still resident in London would have a stake in the new venture; the Trinidad Oil profits would be reinvested, and everyone would be happy.

At that moment Mr Sam Glazer, the South African property man, took up residence in the Savoy Hotel, and placed some of his cards almost face upwards on the table. He indicated that he would bid not 24s. but 30s. for all the preference and no less than £5 a share for 66⅔ per cent of the ordinary (then about 62s. 6d. and now standing at 70s. 7½d.). If the resolutions reducing the preference share votes to equality with the ordinary were not approved at Thursday's meeting of Central Mining, Mr Glazer would, in order to obtain control, bid for not 66⅔ per cent but 70 per cent of the ordinary. He let it be known that he had acquired a block of ordinary shares in bearer form, that he had satisfied himself that the number of disenfranchised Central Mining shares in foreign ownership was about 1½ million, and that subject only to satisfactory assurances from Lord Baillieu and to reference to his associates the bid would be on. Who were Glazer Brothers' associates? Mr Glazer has flatly refused to confirm or deny that they include the one and only Afrikaner mining finance house, Federale Mynbou, which has a stake in coal mining and would like one in gold.

It would not explain everything. Why did Mr Glazer wait so long? Why has he not as *The Economist* goes to press yet made a firm bid on which shareholders could be asked to decide? Why did he leave it open to the directors to reply that shareholders should ignore any announcement made in such vague terms? Mr Glazer explains his hesitancy by reference to the five million shares that the directors of Central Mining can issue after Thursday's meeting—a number that Mr Glazer claims "could easily turn a majority into a minority." Lord Baillieu at Thursday's meeting did not give Mr Glazer much help: only if and when there was a firm bid would the directors of Central Mining consider advising shareholders what to do. There was no present intention of issuing the new shares, but he would make no promise that any issue would be reserved for Ordinary shareholders. But for the general body of shareholders there was interest in his disclosure that even if the Trinidad Oil profits are taxable the incidence can be mitigated by using them as a reserve against the remaining portfolio.

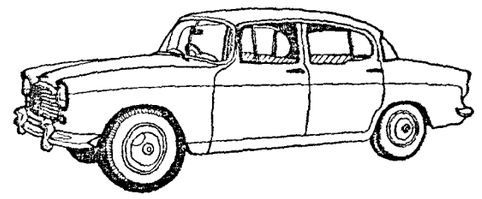
AIR FARES

Stalemate on the North Atlantic

MAY the first was the day fixed by the international airlines for a 5 per cent increase on fares over the North Atlantic. Precisely one month later they are still waiting to put that increase into effect. Passengers along the route have been obtaining their tickets at the old cheaper rates by courtesy of the United States. The American Civil Aeronautics Board is still cross-examining American airlines about the reasons why they want any increase at all. Until the Cab has satisfied itself and authorised them to charge higher fares, no other international airline can make the move either. At the back of all rate-fixing among the airlines lies the basic requirement that before an operator flies into a foreign country, that country must approve the fares at which he flies. It would not, in fact, break the letter of the rules of the airlines' own organisation, the International Air Transport Association, if hard-put European airlines were to raise their fares regardless of American decisions: IATA rules specify simply that operators must charge the same minimum fares. But no operator yet has shown any desire to use its freedom to charge fares higher than the IATA minimum.

Because negotiations with the Cab have dragged on for so long, the airlines no longer fear that the increase will be rejected out of hand. But the American carriers involved, Pan-American World Airways and Trans-World Airlines, may have some difficulty in explaining why, when traffic is so buoyant, their fares should go up.

TRADE TALKS

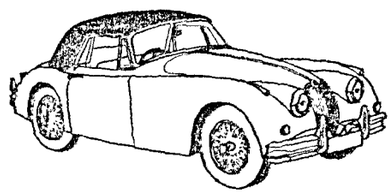


Little Joy for New Zealand

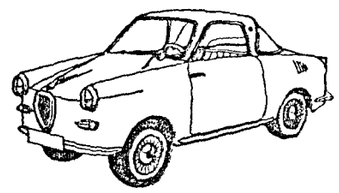
IT can hardly have been a joyful New Zealand trade mission that left London this week. After weeks of negotiation it has obtained no real concessions from the British Government. New Zealand argued that the balance of advantage under the Ottawa Agreements of 1932 had moved against it. While New Zealand granted high *ad valorem* preferences on imports from Britain, the specific duties granted by Britain on New Zealand produce had lost much of their protective value owing to the rise in prices. Though New Zealand enjoyed free entry to the British market, its sales here had suffered from the subsidised expansion of British agriculture and increasing competition from foreign suppliers, and were likely to suffer still more in the future. In the joint statement published at the end of the negotiations Britain implies that New Zealand's fears may be exaggerated. Present British policies and international commitments, it is stated, preclude the introduction of import quotas on foreign meat and higher preferences. But the existing undertaking for ten years not to restrict imports of New Zealand lamb and beef would be extended to pork and milk products; and Britain's qualified assurance, under the Ottawa Agreements, of duty-free entry for milk products, eggs and poultry, would henceforth be unqualified. These assurances seem academic: there never was any doubt that New Zealand would continue to have unrestricted access, in this sense, to the British market.

The two governments will consult regularly on their agricultural production and marketing policies, on British food import policy, and will take each other's views into full account. They will also co-operate on international measures for the disposal of agricultural surpluses, and consult on developments for a European free trade area. New Zealand

THE NEW CARS



Excitement and Value



FOR the motorist to whom motoring is a matter of excitement as well as convenience, two new vehicles of very different character have just been added to the range of choice. At one end of the scale is the new Jaguar XK 150, in which a further development of the very successful 3.4 litre engine is mounted in a remodelled body—of the same character as the preceding XK 120 and XK 140 sports cars, but having a good deal in common with the 2.4 litre four-door saloon. In its latest state, the engine develops 210 bhp, which with a kerb weight of about 27 cwt will give a phenomenal performance. To match a top speed that should be of the order of 125 mph, the XK 150 has disc brakes on all four wheels—the first production car to be so equipped.

These brakes, which have been developed by Dunlop, have a far greater capacity to dissipate the heat into which, in braking, the energy of the car's speed is converted. In brakes of the conventional drum type, with heavy and repeated braking, the heat absorbed but not dissipated by the braking mechanism leads to dimensional changes that can rapidly nullify the effectiveness of the brakes—the phenomenon known as "fade" can be a real menace to cars in which high performance is freely used. With such tremendous performance and an appearance well in advance of its predecessors, and prices which, excluding purchase tax, start as low as £1,175, the car is likely to command a considerable market, especially in the United States, even though on all but a tiny proportion of American roads the maximum legal speed is no more than 70 per cent of the Jaguar's maximum.

At the other end of the scale comes the new Goggomobil coupe—a completely new and exceedingly attractive sporting body with the mechanical components of the very successful miniature saloon car made by a Bavarian agricultural machinery maker. Sales of 60,000 of the latter have been reported in the first two years since its production began—which must easily be a record for a newcomer to the vehicle business. Both models have a twin cylinder air-cooled two-stroke engine of 294 cc developing 17 bhp, mounted in unit with the gear box on the rear axle. The design shows how much can be saved and gained by technical boldness; and the coupe shows an eye for styling which would rather become a couturier than an agricultural machinery maker. With a maximum speed not much above half that of the XK 150—but at about one-third of the price—the Goggo coupe's appeal is, fundamentally, to the same emotions.

PARTICULARLY among successful conventional cars, the reluctance of motor car manufacturers to part with a name that has served them well may sometimes rob them of credit they have earned. The new Humber Hawk has basically the same 4-cylinder engine as its 2¼ litre predecessor, and the same kerb weight—28 cwt—which seemed in the old model to be perhaps 3 cwt too much. At a price of £840 plus tax, against £650, the new Hawk hardly seems a promising vehicle on paper. But when the car itself is examined, it does give full value for the material embodied in it. Within an overall length which is 3 inches longer than the old Hawk, really ample accommodation is offered for six persons. The interior dimensions of the new Hawk are almost identical with those of the standard American saloon of the Chevrolet-Plymouth-Ford class. The ratio of accommodation to weight must therefore be accounted very satisfactory. This is the largest body of integral construction in Europe.

In appearance the new car is very satisfying. A wrap-around windscreen is used without menacing the knees of anyone entering or leaving the front seat. But where the wrap-around rear light marches with the rear edge of the window in the rear door, there are curves that seem out of keeping with the idiom of 1956. The 2¼ litre engine is perhaps slightly overtasked with 12.4 cwt per litre, compared, for example, to 9.3 cwt per litre in the case of the Ford Zodiac II; but a 4-cylinder engine can shoulder a slightly greater burden, and there should be a reward in fuel economy.

expressed its concern lest the free trade area restricts its opportunities in British and other European markets by encouraging larger agricultural surpluses in Europe. It gave notice that if Britain was unable to absorb at profitable prices the full increase in New Zealand's exportable production, it would have to try to enlarge its markets elsewhere ; to this end it might be necessary to press for a reduction in the contractual rates of preference on British exports. It may have been unrealistic of New Zealand to seek quotas and higher preferences ; it is on firmer ground in seeking some reduction in official encouragement to British agriculture. The two governments will consult on agricultural matters each November, some months before the annual price review of British agriculture falls due. This is one field in which international obligations do not circumscribe Britain's freedom to act.

COMMERCIAL VEHICLES

Ford Moves Out to Pass

FOR some years the Ford company's range of medium weight goods vehicles have had only one major "selling point"—diesel economy at a remarkably low first cost. The quality and price of the excellent four-cylinder engine they embody—of which, in one form or another, and in tractors as well as lorries, little short of 250,000 must by now have been produced—have, indeed, even won it a place as a replacement engine in vehicles by other manufacturers. But the new range of commercial vehicles recently unveiled may well transform Ford's position in the goods market. For power plants (ignoring petrol alternatives which, at all events in the home market, are not likely to be of importance), the four-cylinder diesel engine is supplemented by a six-cylinder version for the heavier vehicles: in the middle of the range the user can choose between the two. Following its practice in passenger cars, Ford is using the same cylinder dimensions in the two sizes of engine, with the same pistons, connecting rods, bearings, and other components, which will give a valuable saving in production cost with a considerable reduction in manufacturing investment.

The new Ford vehicles—marketed under the name Thames Trader—will be in direct competition with the Bedford trucks made by Vauxhall, whose output of medium-weight trucks is a much higher proportion of their total output than in the case of other major passenger car makers. Vauxhall's output of commercial vehicles in 1956 was about 48 per cent of their total output, against a proportion of 30 per cent for the whole industry. Prices have not yet been announced for the heaviest vehicles of the Thames Trader range, which runs up to 7-ton capacity ; but for the medium sizes they are close to the Bedford prices. For example, a 5-ton truck with the 6-cylinder diesel engine will sell at £1,138, against Bedford's price of £1,111.

Most of the specialist producers of heavy vehicles produce trucks only in heavier sizes than this ; but typical prices of Albion trucks (made by the Glasgow associates of Leyland's) are some 40 per cent higher, while the Commer trucks made by the Rootes group and equipped with their original—and successful—opposed-piston Hill-type diesel engine carry a price tag intermediate between the Bedford and the Albion. Commercial vehicle users watch their operating costs closely and will pay substantial premiums in price only when they have good reason to think that the more expensive vehicles yield them value for money. Ford's manufacturing programme for Thames Traders is obviously based on the calculation that buyers will consider them under-priced in relation to their prospective operating economy. If operating experience confirms expectations, Ford's will certainly increase their share of the commercial vehicle market at home, and can be expected to add quite significantly to the volume of British automobile exports.

BANK FIGURES

Credit Expands

THE latest statements of the eleven London clearing banks show a sharp upward turn in the supply of credit. In the four weeks to May 15th, net deposits rose by £71 million —an exceptionally large increase for this season, as is reflected in the jump in the seasonally adjusted index compiled by Lloyds Bank by 1.2 to 106.8 (1948=100). But too much should not be read into this change following a notable shrinkage in credit in the preceding three months. Thus Lloyds' index is just back to its level in mid-January —though more than two points up on the year.

The two big influences in last month's expansion were Treasury bills and investments. The banks' holding of Treasury bills rose by nearly £55 million. This was notably larger than the rise in the tender issue during the period, and reflected to a considerable degree the banks' efforts to

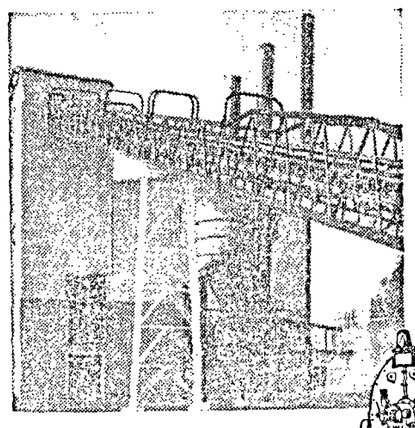
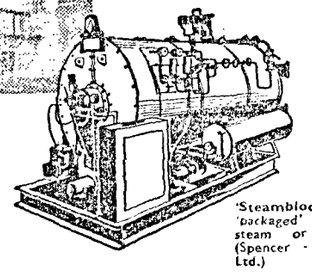
hold more bills themselves and lend less at call to the discount market in a period when many people expected a reduction in Bank rate. On balance, as the accompanying table shows, the total liquid assets of the bank rose by £39 million—a more than seasonal increase. The rise in the banks' investment portfolios, after two successive months of decline, was entirely attributable to the Midland and the Westminster—the two banks that took cash for their maturing '54-56 War Bonds in August last year. Their latest purchases—of £20 million and £5 million, respectively, just offsetting the previous month's sales by Lloyds and the District—still leave their portfolios a little below their level in July last.



Advances again registered only a small rise of £5 million ; the large increases in January-March thus appear to have been caused partly by special factors. As liquid assets rose by more than risk assets, liquidity improved ; the ratio to deposits rose from 32.7 to 32.9 per cent. All banks are

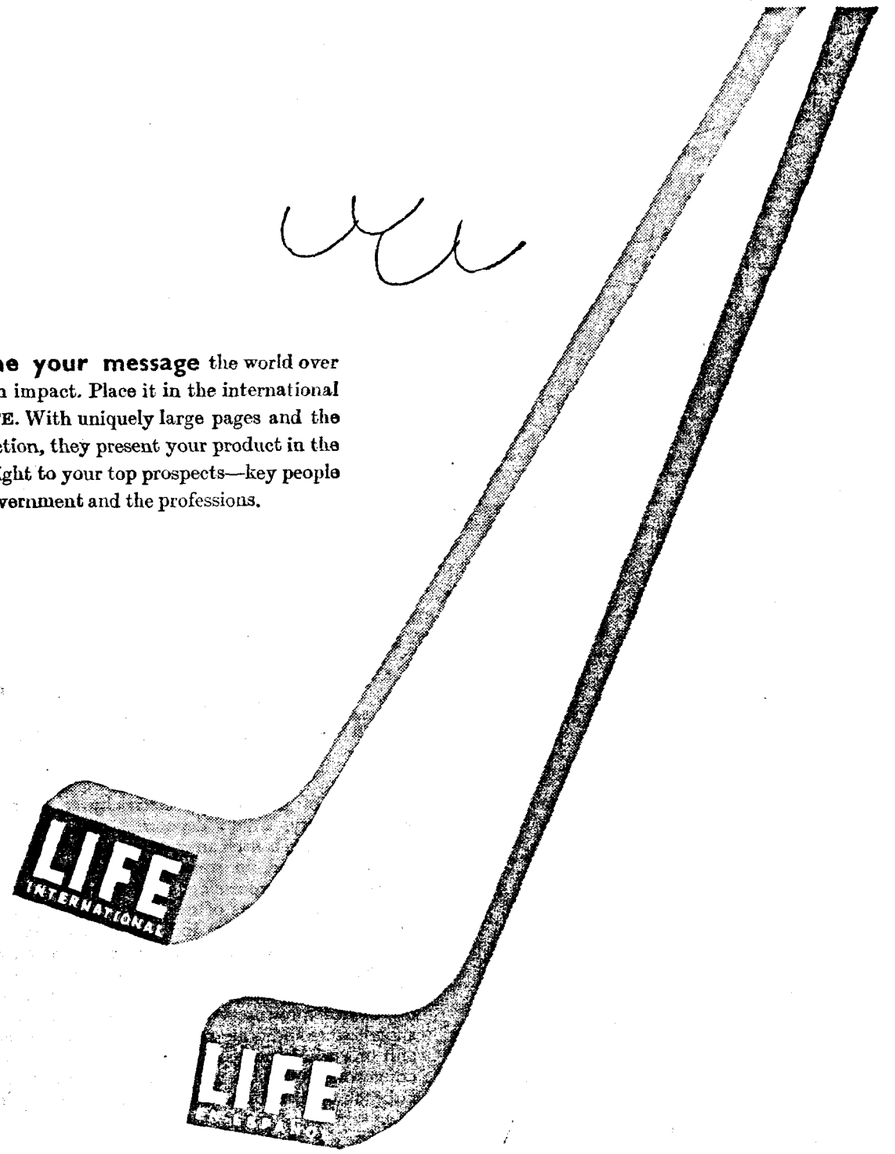


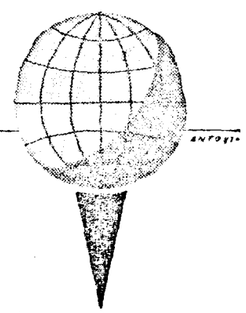
Carrington power station. Equipment includes Babcock boilers, coal-pulverizing mills, ash and dust-handling plant.

"Industry depends on STEAM"

MOST of the world's electricity is steam-generated, and Industry, largely dependent upon electricity from steam power stations, is itself an enormous user of steam for processing and heating and, in some large industries, for both power-generation and processing. Babcock & Wilcox are the world's largest manufacturers of steam-raising equipment for both land and marine applications, and offer to steam-users *large or small*, a comprehensive, world-wide service embracing everything from fuel-handling and boiler plant, for every kind of fuel, to complete systems of ash and dust disposal. They are also large makers of welded pressure-vessels, heat-exchangers, separately-fired superheaters and other plant for the oil and chemical industries, and of a whole range of general equipment such as cranes and conveyors, steel chimneys and fabricated steel structures. The Babcock organisation serves Industry at every level.

Boiler house of H. J. Heinz Co. (Fty.) Ltd. factory in Australia; equipped with Babcock boilers, coal, ash and dust-handling plant and steel self-supporting chimneys.





'Steambloc' automatic, oil-fired 'packaged' boiler for industrial steam or hot-water supply. (Spencer - Bonecourt - Clarkson Ltd.)

HIRE PURCHASE

In All Directions

THOSE who hope to find logic and clarity of purpose in the actions of government may find it difficult to reconcile the activities in the field of hire purchase taken this week by the fairy godmothers at the Board of Inland Revenue and the hard hearted stepmothers at the Board of Trade. The Board of Trade has fixed at 33⅓ per cent the minimum initial deposit on hire purchase contracts for all motor vehicles and on machinery and plant. This is an increase from 20 per cent on cars, motor cycles and light vans, but a reduction from 50 per cent on heavy vehicles and on machinery and plant. The reduction on the industrial equipment is naturally to be welcomed, but the main effect must be to act as a minor restraint on the booming hire purchase sales of second hand cars and on motor scooters and to a much smaller extent on new cars.

The Board of Trade is entitled to the argument that the minimum initial deposit on cars was fixed for credit squeeze purposes at 50 per cent in February of last year and that the reduction to 20 per cent in December was intended as a temporary offset for petrol rationing and Suez blues. Since that reduction, and perhaps partly because of it, the second hand car trade has been booming and HP motor sales in April were a record. It is also true, though irrelevant, that some of the finance houses do not like the statutory deposit too low: they prefer to see their rivals prevented by law from taking risks that they do not wish to take themselves. To restrain competition among finance houses is no duty of the Board of Trade.

The department of Inland Revenue seems less worried about inflation for without visibly altering its official stand it has agreed that finance houses may pay deposit interest without deduction of tax. A deposit for a fixed term of less than twelve months qualifies for that concession. Indeed by administrative practice, two finance houses already enjoy it. The deposit, however must be terminated (and if necessary restarted) at the end of the fixed period. A general arrangement to deposit money at, say, six months' notice will not qualify. Finance houses hope now to improve the attractions they can offer to foreign money. It will cost them something, since they will lose the use of the tax money which they normally deduct at three monthly intervals, but pay over to the Treasury at the end of the financial year.

Deposit interest naturally is not made tax free; the finance houses will have to account in detail for interest payments exceeding £15 just as the banks do and the obligation on the taxpayer to make a true return remains. But there will be some who will spread small sums around so as not to exceed £15 of interest from any one house. Some sound finance houses pay 6½ per cent on six months' money. To the evader escaping the standard rate of tax 6½ per cent is equivalent to 11.3 per cent. It seems possible that national savings and the building societies may feel the effect of the attractions that hire purchase finance can now offer.

Are you

PLOUGHING BACK ENOUGH

to keep pace with changing
capital replacement costs?

Our standard indices for twenty types of equipment are the most economical way of measuring the rise in costs over the last eighteen years.

NUCLEAR ENERGY

Atomic Gamesmanship

THE smokescreen set up by American atomic salesmen in Tokyo, who have been busily attacking British atomic plants in preference to explaining why their own projects are running behind schedule and costing well above estimate, seems to have been intended to draw attention away from what looks like being the final Japanese decision on the matter. By all accounts, the Japanese government decided to hold the scales evenly between Britain and the United States and to buy one atomic power station from each country.

The two new installations there will be relatively small by current standards, only 140,000 kW. The American design will probably be one of the pressurised water types, while a delegation headed by the Japanese minister in charge of atomic energy is coming to Britain in the middle of next month to look at what variations on the classical Calder Hall type of gas-cooled, natural uranium reactor the four main atomic groups have to offer. Japanese technical experts have already come down heavily in favour of atomic power on the British pattern; but it is not surprising that the government has chosen to try out at least one American reactor at the same time, especially bearing in mind the heavy American sales pressure to which it has been subjected.

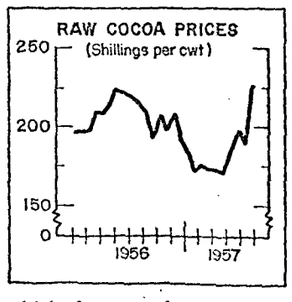
The Japanese will not be the only mission making a serious study of British atomic power stations. A group of German technical experts from the Baden-Wurtemburg electricity authorities has been in this country since the middle of May discussing atomic power projects with manufacturers and the Central Electricity Authority; they are likely to spend at least another week here. Atomic customers have so far shown a certain dislike for the limelight: it is surprising that the Americans think their decisions are likely to be influenced by the kind of atomic gamesmanship they have been playing in Tokyo.

THE AEA

Nuclear Accounting

IN most respects, the Atomic Energy Authority is neither grudging nor behindhand in giving information: but financially, it publishes less and later than almost any other organisation, private or nationalised, in British industry. It

never publishes full annual accounts; its operating account is withheld entirely because it deals mainly with the provision of warheads and work on atomic weapons carried out for the Ministry of Supply and its latest report, just published, deals with a year that ended 14 months ago. What remains therefore is a somewhat emasculated version of the year's activities dealing mainly with the value of fixed assets and plant under construction. During the year ended in March, 1956, the value of AEA's fixed assets had risen by £7 million to nearly £102.5 million while "assets in course of construction" had gone up by £16 million to nearly £30.5 million. This was largely due to the rising tempo of building at Calder Hall during the year.



The Authority's loans and advances for the production of uranium had risen by nearly £3 million to £25.4 million, and total stocks and work in progress at March 31, 1956, amounted to nearly £63 million, against £41 million the year before. Sir Frank Tribe, the Comptroller and Auditor General, says that the valuation of work in progress (at over £45.5 million) did not include an element of interest on capital or provision for insurance. In all, the total assets of the AEA had gone up from £178 million in March, 1955 (and £113 million at the time the Authority took over the plants from the Ministry of Supply), to over £232 million. On the liabilities side, net advances from the Lord President's office had more than doubled from £25.8 million to £52.8 million.

Since the date of these accounts, March, 1956, the pace of building at the AEA's power stations at Calder "B" and at Annan in Scotland have greatly accelerated as has building at the experimental breeder reactor at Dounreay. But it is possible that by now the peak of the Authority's heavy capital expenditure has been passed—or is rather in process of being transferred to the electricity authorities that will own the commercial nuclear power stations.

RAW COCOA

Brazil Tries a Squeeze

RAW cocoa prices have risen sharply since Brazil announced its long-awaited new marketing policy for cocoa. By the beginning of this week Accra cocoa for June-August shipment had risen by 38s. to about 234s. a cwt cif, though it slipped back later to close on Thursday at about 226s. Some details of the new policy are still obscure, but the broad outline seems to be this: All purchases and sales are controlled by the Bank of Brazil. Growers are assured of a minimum ex-farm price of 1,200 cruzeiros per bag of 60 kilos, and the minimum price for exporters is 1,800 cruzeiros per bag fob. This is equivalent to about 31½ cents a lb or about 254s. 6d. a cwt fob; the equivalent price cif UK is about 271s. a cwt, which is 45s. above the present market price. When world market prices are above the minimum Brazilian exporters may be allowed to operate as principals; when prices are below it the Bank of Brazil will be the sole seller. In addition the bank will initially withdraw some 300,000 to 400,000 bags of cocoa from the market. In anticipation of the new policy little of the new crop has been sold; the decision to withdraw supplies will not deprive the farmers of their income, and it will help to squeeze world prices higher. Sales may begin again in July, when it is no doubt hoped that world prices will have reached or exceeded the minimum.

Brazil's action means that the governments of the three largest producing countries, Ghana, Brazil and Nigeria, now assure their cocoa farmers of a minimum price and control sales. Ghana and Nigeria, however, have sensibly refused to withhold supplies when prices are low; their single selling agent simply follows the world market. Brazil cannot hope to dominate the market for long, and its past record suggests that it would be unwise to try. But in the next few months it may be able to force prices higher. Some consumers and dealers, in the United States and Germany, for instance, do not appear to be fully covered, and Brazil has the market almost to itself. But when the new season's crops in West Africa start to be sold later in the summer Brazil will have competitors to face.

TAKE-OVER BIDS

Rubber Directors' Defensive

THE outgoing chairman of the Rubber Growers' Association, Mr H. T. Karsten, devoted a section of his speech at the association's meeting last week to trouncing the take-over bidders and the financial papers that, in his view, had supported them.

> These gentlemen with complete disregard for the well being either of this country or of the producing territories, are doing what they can to undermine a great industry so that they can benefit from liquidating what others have created.

It is not difficult to provide an answer to Mr Karsten's strictures. The natural rubber industry, still as he himself points out young, finds itself with cash and other liquid assets beyond any foreseeable need. That industry, which is one of Britain's finest overseas investments, was not built by sitting on surplus cash, but by scraping up risk capital—with risk in the truest sense of accepting big losses and making occasional big profits. If there is now money to spare, it is best that it should be handed to those equity owners to whom it truly belongs and who might put it to use again; otherwise somebody will come along with designs on it. The Guthrie group—one of the richest and most progressive in the industry—has seen the problem and wisely, after one false start, several companies of that group have begun making special distributions to stockholders.

Yet there are some real problems. The market in rubber shares is narrow, and the purchase of a few shares coupled with the rumour of a bid which may never materialise can give the directors a fright and the operator a killing. It may not be in the best interests of the industry that managements should be exposed to that risk. It surely is not desirable that large estates should be bought by Chinese to be broken up into highly priced and probably uneconomic small holdings. Moreover, Tengku Abdul Rahman, Chief Minister of the Federation, has made all the right gestures to encourage overseas investors in Malaya. It might be bad politics to meet those gestures by appearing to pull out. The answer is not yet clear. Something more than mere refusal by directors to part with surplus funds is the least that justice to share-

Overheard in "The Cornish Riviera"

"Don't be absurd old man, no growing business can afford to do without advertising."

"Of course it can't, but you can still waste money if you don't advertise to the right people. For example, people living in the industrial areas have more money to spend because their wages and salaries are higher."

"That's obvious, but if you are going to advertise on a national scale you can't advertise in the industrial areas only."

"So you concentrate on the papers with the biggest percentage of sales in those areas. Take the eight main industrial areas for example, including Greater London. You can blanket them with three national dailies."

"And what are they?"

"The papers which come out top in the *I.P.A. Survey. The Mirror, the Express and the News Chronicle. Concentrate on those three and you can pretty well guarantee that your products will be seen by the people with the money to buy them. The News Chronicle is an absolute 'must', of course, because it appeals to the type of reader who likes to make up his own mind and knows good value when he sees it."

"Do you waste money on advertising?"

* *The Independent survey conducted by the Institute of Practitioners in Advertising.*

"And if you wish to know how economical it is to advertise in the News Chronicle, just ring William Memory, Advertisement Director, FLEET STREET 5000.

NEWS CHRONICLE
AND DAILY DISPATCH

holders demands. Is this the time for a defensive scheme for the plantation industry as a whole—a co-operation between some of the more powerful to defeat outside bids by take-overs from within the industry? So far the majority has held that this problem is not the concern of the industry as a whole or of the RGA, but of some individual companies in it, and that may still be the right view.

CYCLE MANUFACTURE

A Healthy Concentration

LAST year's setback to the cycle industry has claimed one notable but not unexpected victim. BSA's cycle business is being taken over by Raleigh, but the former's three cycle subsidiaries had been steadily losing ground, mainly to Phillips the fast developing Tube Investment subsidiary. For several years BSA cycles had been operating at a loss, despite a fairly recent reorganisation based upon the group's Waverley works. This was a modern factory laid out for quantity production with a capacity of 8,000 machines a week. The works, and most of the plant and the 800 or so factory staff, will remain with BSA, as will the group's auto-cycles which are to be transferred to the motor cycle division—which remains the largest producer on that side of the industry. It appears that Raleigh's main acquisition, for a price that remains unrevealed, is the manufacturing rights in BSA's models.

But this will be a welcome accretion for Raleigh, just as much as BSA should be healthier for the divorce. And the cycle industry itself should be better off, since it now largely lies in the hands of two very large groups. Tube Investments is gradually concentrating the production of all its Birmingham factories, apart from the manufacture of components, at Handsworth, where its new subsidiary, British Cycle Corporation, will be in charge of the greater part of this side of the group's business. Raleigh is already largely concentrated at Nottingham and is probably now producing more machines than TI.

This massive reorganisation comes at a time when the sellers' market in cycles has disappeared with a suddenness that is almost brutal. Cycle output last year fell by a fifth, exports by a seventh, and home sales by a half. Credit restrictions in the industry's home market coincided with the advent of real competition from the Continent, Japan, and from indigenous manufacturers in a number of hitherto good overseas markets. Sales to the United States, which before the increase in the tariff two years ago accounted for a quarter of the industry's direct exports, were cut by half last year and are lower still this year. The United States is now considering whether to impose a quota, particularly on imports of heavyweight models which several continental firms have been selling there in great numbers, to the cost of both British and American firms. The British cycle industry will no doubt be glad of any benefits its new concentration can give it.

FILM FINANCE

A Specialised Bank

LAST April the life of the National Film Finance Corporation was extended for another ten years and its powers of lending "end money"—the riskiest kind of finance in film production—were widened so that it could put up loans even if financial facilities could be obtained "on reasonable terms" elsewhere. But it now has to pay its way; it must act as a specialised bank rather than a distributor of a disguised subsidy to British film production. In the last eight years the corporation has lent £13¾ million for the production of some 450 films, 300 of them first features. About £6½ million has been repaid and of the rest just over £4¼ million has had to be written off or provided against further losses, including about £160,000 in its last financial year which ended on March 31st. Allowing for interest, fees, and the shares of profits received by the corporation, its total deficit since 1949 is about £3½ million. But the bulk of this deficiency, and of the loan write-offs, occurred two or three years ago with the old British Lion Company. Its successor, British Lion Films, is owned by the corporation and provides distribution guarantees and, through its subsidiary, studio space at Shepperton for film producers. It has made a profit in each of the last two years, and is now worth, the corporation states, somewhat more than £600,000, the price NFFC gave for its shares.

The corporation's statutory borrowing powers have not been increased, and virtually all of the £6 million it may borrow from the Board of Trade has been fully employed in its business for several years. By making small profits in its last two years, £84,727 in the year to March 31st and £79,132 in the previous year, the corporation has been able to operate without calling substantially on the £2 million it may borrow with Treasury guarantee from elsewhere. It borrowed £100,000 from its bankers last year and nothing the year before. Last year it helped to finance 58 films, a larger number than in any year since 1953, including 38 first feature films but as rather more films were being made this was still about half the total for the whole industry. But of the 32 first feature films assisted by the corporation which were released last year only 12 are expected to be profitable, though the combined earnings of the 32 would just about cover the costs of making all of them. This is better than in 1954 and 1955 and with the larger Eady levy that is to start next October the whole group of films produced would have shown a small total surplus. But this does not necessarily make British film production a sound commercial proposition: on the side of costs, the corporation notes a recent significant increase in the pay of producers, directors, artists, and other staff, which between them account for over half of total costs.

PRICING COPPER

One Price for Rhodesia

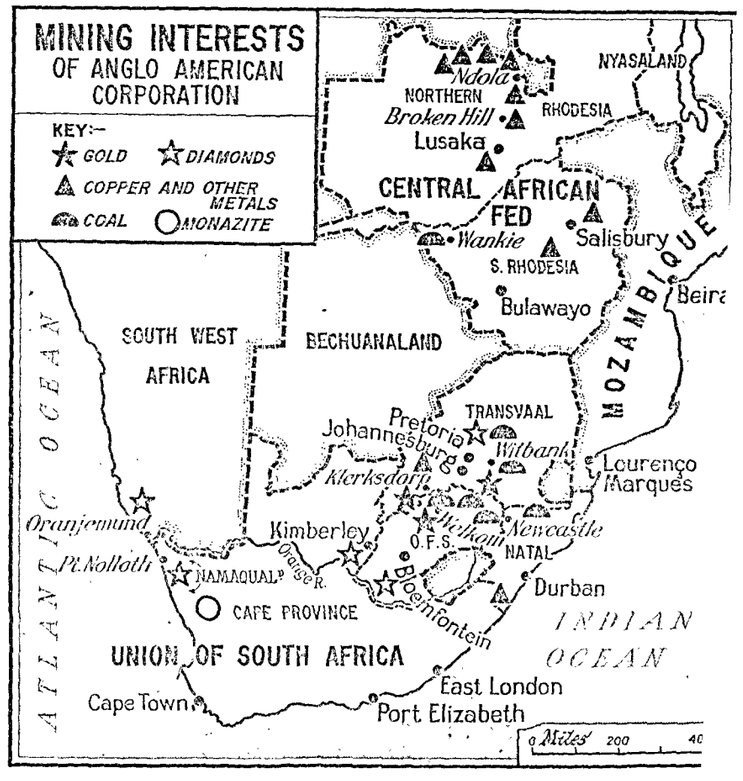
REPORTS from Salisbury confirm that Anglo American Corporation and Rhodesian Selection Trust have reached agreement on a common basis of pricing Rhodesian copper sold to British consumers, and that proposals have been sent to consumers. The two groups supply the bulk of Britain's requirements. The common price, it is understood, is to change less frequently than the London Metal Exchange price, but is to be related to it over a period. Details will be announced later. It may be several weeks before the consumers have completed their own discussions and forwarded their comments to the producers, and it cannot be assumed that all consumers will be willing to accept the new policy. Consumers seem to have been given little more information on the basis of pricing than has appeared in the press. The impression is that Anglo

Continued on page 820

Where Now in Kaffir Finance?

AT the end of last year, the Anglo American Corporation of South Africa held in its consolidated accounts investments entered in the books at £27 million, but worth £58½ million in the market, and £32½ million in cash; from associated companies and others it had borrowed over £48 million. Its dividend was left unchanged at 70 per cent but a 10 per cent free scrip issue is to be made and the dividend is likely to be maintained on the new capital. Similar free scrip issues will be made in the future. At the end of last year, General Mining (on whose board some of the leading members of Anglo American sit) had on its books quoted investments of nearly £10 million, with a market value of nearly £14½ million, and it held over £2¾ million in cash; it had borrowed £1 million as a short-term loan from Anglo American (with the right to call up another £1 million) and over £3½ million on deposit. Its dividend was reduced from 25 to 20 per cent.

These figures are not quoted merely to emphasise the difference between the "big brother" and the smaller finance house in South Africa, nor to draw attention to the comparative successes and failures of the two groups in the OFS and Klerksdorp areas. They form the background to the problems of mining finance in Southern Africa. The Oppenheimer nexus has money to lend. The General Mining directors say this:



> A disturbing feature was the almost complete cessation of the traditional inflow of capital funds into the Union. . . . This trend must inevitably affect adversely development . . . of mining where no enterprise of any consequence can be initiated without the employment of risk capital on a substantial scale.

The continued depression of the Kaffir market has put the capital problems of the South African finance houses in a stark light. They made only a tiny profit from share dealings last year and they had to write off much bigger sums from their investments. One of their methods of financing new ventures is to sell some of the shares they hold in established mines to the public in London and Paris, those sales representing the inflow of capital into South Africa that has now dried up. Their portfolios are now crammed with shares and a long steady rise, rather than a short-lived boomlet, is needed to start the capital turning over again. The rise in working costs continues to press against a fixed gold price, reducing working profits. Yet last year the gross revenue from gold mines in the Union advanced from £177 million to £193 million and the profit from gold mining from £44¾ million to £48¾ million, while uranium profits rose from £17½ million to £24½ million. There are good dividends in prospect from the new producers. The yields on the shares of the new producing mines are high and the shares, as well as being a currency hedge, may attract a few investors as yield "sweeteners" in their portfolios.

Without an increase in the gold price—and the prospects of that look as remote as ever—the finance houses will have to generate their own capital for new gold developments. Development in the OFS and Klerksdorp areas is not complete and there is the Bethal area to be exploited fully. Where is the money to come from? Wherever one looks, the eye keeps coming back to the resources of the Oppenheimer trinity.

THE capital problem spreads beyond the borders of the Union to embrace all of Southern Africa. It spreads beyond gold and diamonds to other minerals: copper, lead, zinc, manganese, vanadium and the list will grow. Extensive prospecting is sure to produce some areas worth developing on a large scale and it is necessary for the vitality of the industry that they should be exploited. The exploitation of mineral deposits in Africa demands not merely heavy capital investment in mines but also in hydro-electric power, in transport, in housing and in social services. And in such developments, Anglo American, Rhodesian Anglo American or De Beers cannot help but be big partners. That does not mean that these corporations will seek absolute control of the new developments: indeed, from the recent examples of the South West Africa Company and Central Mining, it looks as if the destiny of Anglo American is to come in as a large minority holder in joint ventures.

To put money back into Africa, from whose soil the minerals have been torn, is in the tradition of Cecil Rhodes, but Rhodes always had behind him in the home country a big surplus available for investment. Without doubt, Sir Ernest Oppenheimer wishes to carry on in that tradition. It is to his credit that he has been able to do so on his own steam. That is the answer to the critics who deplored the diversion of diamond money into other enterprises. Where else could the money have been found? The great bulk of the capital generated from gold, diamond and copper profits will continue to go back into Southern Africa and back, moreover, into mining. Sentiment, politics and plain economic facts will always impel the Oppenheimer trinity to have the vast majority of its investments in Africa. But do not its directors now feel the need to devote some modest portion of its funds to developments in other promising areas?

Continued from page 818

American has moved much closer to RST than this group has moved to Anglo American. Up to now Anglo American has sold on the basis of the open market prices established on the London Metal Exchange. For the last two years RST has sold at fixed prices, and is now selling at £240 a ton; the open market price has held close to that level, partly by support buying by producers. In the past the two prices have diverged sharply from time to time.

Acceptance of the new policy would substantially reduce the volume of copper sold at prices established daily on the London exchange, but it would not diminish the turnover of the exchange. Nearly all the Rhodesian copper supplied to British consumers is sold direct by the producers. In the long run, however, it is hard to see how the new policy could be other than detrimental to the interests of the exchange.

NON-VOTING SHARES

A Compromise Proposal

THE Chartered Institute of Secretaries has come out strongly against non-voting shares. It recently accepted the view "that the issue of non-voting ordinary shares tended to contravene the commonly accepted doctrine that all equity shareholders should have a voice in the control of the company and that it contained inherent dangers for uninformed investors." This clearly defined opposition to a widespread practice, particularly among family controlled companies, where the issue of non-voting shares has been found a convenient mode for raising death duties without parting with voting control, was taken a stage further in a paper recently read to the Institute by S. L. Mears, who is secretary and joint general manager of the Sun Life Assurance Society.

Mr Mears thinks that legislation should be avoided if the dangers and difficulties of non-voting share issues can be avoided by other means. The most obvious of these, he pointed out, is to issue preference shares as a bonus instead of non-voting ordinaries. Mr Mears puts up the compromise idea that the court should be given power to enfranchise non-voting shareholders if satisfied on an application, supported by holders of at least 15 per cent of the equity, that such a course was in the interests of the company as a whole. He also suggests that holders of non-voting shares should receive for information a copy of every notice convening a meeting of ordinary shareholders and that they should be entitled to attend and speak, but not to vote. He argues that this would deter the submission of doubtful proposals.

SHORTER NOTES

Agreement in principle has been reached to merge the interests of Guardian Assurance and Caledonian Insurance. Guardian will issue seven of its 5s. ordinary units (now standing at 66s.) for every ten 5s. ordinary units of Caledonian (now standing at 34s. 9d.).

* * *

The Standard Bank of South Africa has announced a scheme to simplify its capital. Following the example set by each of the big clearing banks except the Midland, it is extinguishing uncalled liability of shareholders. The present capital consists of 4 million £1 shares fully paid and 5 million £2 shares, £1 paid. These are to be converted into £1 shares fully paid; and to compensate the holders of existing fully paid shares for the loss of preferential status in the event of liquidation, they are to be given a scrip issue of one for twenty-five. The board gives no indication of its intentions on dividends on the new capital. For the year to end-March, the dividend has been maintained at 12½ per cent.

* * *

The dividend of the mining finance house, Selection Trust, has been raised from 60 to 70 per cent and there is again to be a 5 per cent free scrip issue. Its investment income, thanks in part to the higher dividend of American Metal, in which it holds about a quarter of the equity, has risen from £2,920,024 to £4,534,811.

* * *

A series of highly successful conferences held by the Dollar Exports Council in seven British cities came to an end last week-end. They were attended by senior executives of British firms for the purpose of discussing present day sales and marketing research techniques in the United States with two leading American consultants in that field, Professor R. G. Seymour and Mr C. M. Johnson. The interest shown in this series has led the Council to think of arranging others on the same subject.

* * *

International Business Machines has opened at their new London office an electronic computing centre, which combines the dual functions of demonstrating the computors and ancillary equipment this British subsidiary of IBM is manufacturing at its factory at Greenock, and a fully equipped data processing centre available for use by other organisations. One IBM 650 digital computor has been installed and it will soon be joined by the larger 700 series computor.

* * *

In the year to March 31st, the gross income of the Commonwealth Development Finance Company rose from £103,463 to £124,859. Its investments remained practically unchanged at £8¾ million but during the year it made a token subscription to the Development Finance Corporation of Ceylon, and it arranged to lend £3 million on the Kariba hydro-electric scheme and £1 million to Fisons (Pty) Ltd of South Africa. CDFC is now also a channel through which the new Commonwealth countries can seek advice and assistance on industrial and other development problems. CDFC is faced with many complex tax problems on its investments in the Commonwealth, but it is unlikely to benefit from the tax reliefs granted to overseas trading corporations.

COMPANY AFFAIRS

BRITISH AND COMMONWEALTH SHIPPING

THE directors of British and Commonwealth Shipping, the child of the merger between Clan Lines and Union Castle, foreshadowed that its 1956 ordinary dividend would not be less than 16 per cent. In November they paid an interim of 6½ per cent (against their earlier forecast of 6 per cent) and that has now been followed by a final of 11 per cent, making 17½ per cent for the year to December 31st last. They have also announced a 5 per cent free scrip issue of 10s. ordinary stock units, requiring the capitalisation of £321,500 from the share capital account. That issue is so small that the market will automatically assume that there will be no corresponding scaling down in the 1957 dividend.

In an interim report, the directors said that the 1956 results would reflect an increase in earnings of tramp tonnage, thanks to higher freight rates, and that there had been some improvement in liner earnings. "Increase" and "improvement" turn out to be understatements. Before tax the group's profits have risen by nearly 54½ per cent, from £5,860,000 to £9,047,000, and this is after charging £3,020,000 (against £3,161,000) for depreciation. Tax has gone up from £2,887,000 to £4,556,000, but the net profit is £1,588,000 (or 55 per cent) higher at £4,474,000. Much of the 1956 net profit has been ploughed back into the business, with the net ordinary dividend absorbing only £647,000; that is inevitable with a big fleet replacement programme on hand. No one will expect the current year's results to match those of last year but the directors would hardly have announced a 17½ per cent dividend and a small free scrip issue unless they had hopes of maintaining the dividend.

ROYAL DUTCH-SHELL

THE Royal Dutch-Shell group was expected to make a good showing in the first quarter of this year. And it has done so. The directors make the reason clear:

> The enhanced income is attributable largely to higher earnings by Shell Oil Company in the United States and to a material increase in output in Venezuela, where production of crude oil available to the group averaged 962,000 barrels a day in the first quarter of 1957, compared with 753,000 barrels a day in the corresponding period last year.

Sales proceeds and other income in the first quarter of this year totalled nearly £644 million (higher than any quarterly figure recorded in 1955 or 1956) and net income was nearly £51¼ million (also a higher figure than any recorded in the two previous years). The ratio of net income to sales is thus just over 8 per cent, compared with 7.6 per cent for the first and for the last quarter of 1956. The Royal Dutch-Shell group needs such margins to finance its enormous capital programme (likely to be of the order of £400 million this year) but the two parent concerns have in the past shown some willingness to distribute a small part of the extra earnings to shareholders.

BICC

MR WILLIAM MCFADZEAN, the chairman of British Insulated Callender's Cables, comments on current prospects:

> In total our orders received are up to our figures for the corresponding period last year; the immediate trend of demand for some of our products is still uncertain; and competition remains exceptionally keen.

This cautious summing-up follows a year which saw an increase of £10 million in the sales of BICC to £129 million. Sales on the home market rose by £3 million to £79 million—but there was a decline of £2,530,308 to £9,322,544 in trading profits. About £560,000 of this decline follows from the exclusion from the 1956 figures of the profits of Indian Cable, the control of which BICC has reluctantly relinquished because of Indian tax laws. But the principal reason for the drop in profits was the inability of the group fully to recoup increases in costs in selling prices; "benefits from recent capital expenditure" served only as a partial off-set.

Another reason for the fall in profits was that in 1955, when prices were rising, the group made a stock profit on copper; in 1956 prices fell and a stock loss resulted. These profits and losses were not "substantial." The group tries to keep a "level book" in metals, matching purchases to sales, but it cannot always keep a precise balance. It is therefore a strong supporter of the Rhodesian Selection Trust policy of fixed prices, buying most of its copper from that group. The fall in copper prices has reduced the working capital commitments of BICC—stocks were nearly £2 million down at £27 million at the end of the year—and Mr McFadzean describes the current price as being "more realistic."

Though the immediate prospect is for little change, Mr McFadzean, observing the growth of the electrical industry all over the world, has every confidence in the long-term outlook. But the investment programme of the electrical supply industry sets up a capital problem for BICC. Between 1952 and 1956, the group spent about £7,300,000 on normal replacements and another £10 million on "major replanning and expansion schemes." Over the next three years another £9 million will be spent to complete this programme (the largest single item in it being in Canada). Earnings will eventually spring from that expenditure but some part, Mr McFadzean suggests, may be needed simply to maintain the current level of profits. For the time being, ordinary dividends may be held on a firm rein. Last year the dividend was maintained at 12½ per cent; the yield on the £1 units at 5cs. 6d. is about 5 per cent.

ASSOCIATED PORTLAND CEMENT

MR HALFORD REDDISH of Rugby Portland Cement was the first to let the cat out of the bag that cement prices will be raised at the end of June. Now, the new chairman of Associated Portland Cement, Mr J. A. E. Reiss, says that "the extra costs incurred, together with increases in wages and the expected rise in the price of coal this year, must inevitably lead to a rise in home prices for cement during the next few months." The increase, it is believed, will probably be not less than 2½ per cent. The opening of the Suez Canal may give the cement manufacturers, who charge for exports what the market can bear, the opportunity "to make up some of the leeway in shipments overseas." At home, Mr Reiss does not expect that the annual rate of increase in demand for cement that has been experienced since the war will be maintained but he does not expect "any significant reduction in demand compared with 1956."

Consolidated Earnings:	1955	1956
	£	£
Trading surplus	13,073,681	13,672,867
Depreciation	3,301,319	3,276,599
Replacement reserve	847,133	870,956
Taxation	4,564,363	5,738,307
Other reserves and c/f.	2,712,413	2,295,360
Ordinary dividends	1,035,000	1,035,000
Consol. balance sheet:		
Net fixed assets	42,812,651	44,604,211

Capital reserves	27,230,224	19,947,769
Ordinary capital	8,000,000	20,000,000
£1 ordinary share at 44s. 3d. yields £4 1s. per cent.		

The cement industry earns good profits—the Associated Portland Cement group earned over £13½ million last year—and it is spending quite heavily on capital replacement and development. The "Blue Circle" group spent £4¾ million on capital account last year and will probably spend £4 million this year. Since the war it has spent over £36½ million, without appealing to the capital market. The consumer, faced with another increase in prices, may feel he is paying for that development. But his is not surely the biggest grouse. That must surely come from the ordinary shareholder in Associated Portland. Last year the ordinary dividend was left effectively unchanged; it cost just over £1 million. In all, the group ploughed back nearly £6½ million last year and the total of its investments and liquid assets rose by about £2½ million to nearly £16½ million. The company's dividend policy looks conservative in the extreme.

PHILIP HILL

PHILIP HILL INVESTMENT TRUST is more than an investment trust. It holds an investment portfolio, heavily geared towards equities, worth at market values about £12½ million on March 31st (against a net book cost of £6½ million). Its portfolio is growing; on March 31, 1956, the market value was £10¼ million, against a book cost of £6 million. But its real business through its subsidiary, Philip Hill, Higginson, is that of an active issuing and merchant banker. In the year to March 31, the investment trust had an income of £617,829 and received a gross dividend of £50,000 from its issuing house subsidiary. That subsidiary had an investment income of £101,532 and gained a profit from its other activities of £430,384 (against £296,872).

By its nature, the income of the subsidiary fluctuates sharply with the activity of the London capital market; and the subsidiary retains much of its net income within its own accounts. The directors of the parent investment trust therefore pursue a policy of covering the ordinary dividend paid to shareholders from the trust's own revenue. That dividend has just been raised from 15 to 16 per cent. This was a prelude to a "rights" issue of 3,500,000 new 5s. ordinary shares at 12s. 6d. each in the ratio of two for five. The directors intend to maintain the 16 per cent dividend on the increased capital and "have every hope that this can continue to be done out of the trust's investment income," even though the investment of the new money must inevitably be a "gradual process."

One key to success in an investment trust is gearing. Before the new issue, the Philip Hill trust had an ordinary capital of £2,125,000, ranking behind a preference capital of £1,312,000 (at 5 per cent) and a debenture capital of £2,500,000 (at 4½ per cent). That gearing has to be preserved and hence it is not surprising that the directors intend to follow the rights issue with a £2 million issue of a debenture "when conditions are considered propitious." In the meantime, the rights issue got off to a satisfactory start. The new shares were quoted at 3s. 6d. premium and the old shares ex-rights at 16s., against a price of 17s. 7½d. on the eve of the announcement of the issue.

CADBURY BROTHERS

COCOA prices fell again last year, but not so steeply as they did in 1955. Thus Cadbury Brothers had again to write down stocks but nothing like so drastically as in 1955. Mr L. J. Cadbury does not put a figure on this stock loss in his statement, and is to that extent less revealing than Rowntree and Company, which wrote down its stocks last year by some £2 million. But other figures in the accounts of Cadbury Brothers and the holding company of the group, British Cocoa and Chocolate, show how much easier the year 1956 was for the group than was 1955. The net profit of Cadbury Brothers was £3,659,015, compared with £952,112. At the end of last year stocks of British Cocoa and Chocolate were valued at £24.3 million, against £29.8 million, and the total of bank loans and acceptance credits had come down from just under £11 million to just under £3 million.

Mr L. J. Cadbury attributes the fall in the price of cocoa beans to "the extortionate level at which it stood two and a half years ago." Earlier he had said: "In the long run, of course, less expensive cocoa is good for us; while the lower prices are being reached, however, it is an expensive matter." He says that any attempt by the government of Ghana "to try a restrictive policy" would be "disastrous" and then argues that the "true solution" is "to stimulate world consumption."

The efforts of British Cocoa and Chocolate to increase consumption can be gauged to some extent by the growth of about 9 per cent in the volume of sales last year. In value the group's sales went up from £76.3 million to nearly £79.6 million, the increase of 6 per cent in home sales outweighing the fall of 2 per cent cent in exports.

London Stock Exchange

FIRST DEALINGS:	May 15	May 29	June 19
LAST DEALINGS:	May 28	June 18	July 2
ACCOUNT DAY:	June 4	June 25	July 9

BEFORE the week-end small sellers of gilt-edged continued to dictate the pace of the decline in prices and by last Friday the *Financial Times* index of Government securities registered a fresh low mark for the year of 83.43. Since Monday prices have improved steadily, but again without a proportionate rise in business done. New Dominion, corporation and industrial loans recovered; the new East Africa loan regained ⅞ to 2⅛ discount and the Birmingham stock ⅜ to 1⅞ discount. Industrial stocks receded farther from their recent peaks, but the downward movement was arrested on Wednesday at the beginning of the new three-week account. Due to Wednesday's sharp recovery, the decline in *The Economist* share price indicator was limited to a fall of 2.5 to 216.2. The Chancellor's remarks about the desirability of tax reductions assisted further recovery on Thursday.

Bank loans and discount houses suffered further setbacks and insurance shares weakened again, Equity and Law Life falling 10s. to 140s. Breweries improved. Tobacco stocks lost ground; BAT fell 3s. 9d. to 54s. 3d. and Imperial Tobacco sank lower. Folland Aircraft advanced 3s. 4½d. to 12s. 1½d. Vickers hardened as a consequence of the BOAC orders. John I. Thornycroft continued to fall after the interim dividend reduction, losing 3s. 7½d. to 30s. 7½d. xd. Unilever attained a new peak of 104s. 1½d. Paper, steel and shipping shares recovered on Wednesday after drifting earlier. The increase in British Petroleum's Persian Gulf prices and the Royal Dutch/Shell quarterly touched off a sharp rise in oil shares on Wednesday; BP recouped early losses and advanced to 163s. 1½d. and Shell was 4s. 10½d. higher on balance at 192s. 10½d. Ultramar lost 4s. 6d. to 73s. 9d. on disappointment with the distribution. Kaffirs were mainly quiet. Some rubber shares went ahead.

(1) For a rough conversion to basis of June, 1947, multiply throughout by 1·534. (2) The interim index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the London and Cambridge Economic Service. (3) For a rough conversion to basis of June, 1947, multiply throughout by 1·562. (4) Surveys made twice a year; annual figures relate to October survey. (5) Revised figures for April 30th: food 97·6 and fibres 96·0.

(1) 1939 figures calculated on the basis of a smaller sample. From January, 1957, as a result of a change in definition some 200,000 to 300,000 persons temporarily laid off or waiting to start new jobs formerly classed as employed are subsequently classed as unemployed. (2) 1939 figures not strictly comparable with rest of series; stocks are at end of period. (3) All commercial banks. (4) Annual figures are totals for the fiscal year ended June 30th. (5) Figure for fourth quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended May 25, 1957, there was an "above-line" deficit (after allowing for Sinking Funds) of £1,909,000 compared with a deficit of £21,650,000 in the previous week and a deficit of £3,869,000 in the corresponding period of last year. There was a net receipt "below-line" last week of £30,906,000, leaving a total deficit from April 1st, of £10,470,000 (£44,279,000 in 1956–57).

THE MONEY MARKET

THE Treasury bill rate rose at last week's tender. The discount houses reduced their common bid by 5d. per cent to £99 0s. 5d. per cent—equivalent to a rise in their discount rate to nearly 3 1/8 per cent above the low point of 3 1/4 per cent reached early in May when the Bank rate speculation was at its height. Since then the rate has moved back under the pressure of the market's constricted margins—the average cost of its money has been around 3 1/4 per cent.

Last week's move by the market appears to have been broadly followed by outside tenderers; the average rate of discount on all bills rose by 1s. 7 1/4d. per cent to £3 18s. 2.85d. per cent. Total applications rose by only £10 million (to £378.9 million), whilst the allotment was up by £30 million, to £220 million, so that the successful portion of the market's application rose from 33 to 37 per cent. At yesterday's tender the offer was raised by a further £10 million, to £230 million.

Credit has remained tight except around the week-end. On Thursday last the Bank gave a large amount of special help, mainly through the banks, which passed on loans to the market at 3 7/8 per cent—then actually above the market's Treasury bill rate. Further special help was given on Monday, but only on a small scale, two or three houses finding themselves "in" the Bank for a very small amount. The Bank continued to give special support on Tuesday and on Wednesday (when it was again large).

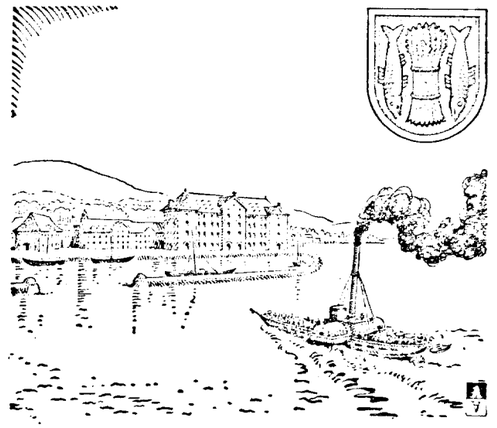
What does
THE LONDON CORRESPONDENT
say today?

Pigeon Pose. Unlike the tourists, here today and gone tomorrow, the pigeons, who obligingly pose for photographs with them, have a permanent home in Trafalgar Square. A very nice home, too, with every mod. con., running water in all the basins, and—in the summer season—dozens of square meals a day.

Even in the early spring, though the square may be almost deserted, the pigeons are still around—the photographers see to that. For to ensure that there are pigeons (and therefore tourists, and therefore profits) in the square next summer, the photographers keep the birds well-fed throughout the winter. Sensible fellows. They know which side their breadcrumbs are buttered.

A bird in the hand. It's the same principle, really, as a London Assurance Endowment Policy. You pay the premiums now so that you can enjoy the benefits later. It may be a little later, with an Education Policy which will pay off when your children's school bills are heaviest; or a good deal later, with a policy designed to provide for a comfortably-off retirement.

If there is any help we can give you, either with Fire, Accident or Life policies of any kind, please get in touch with us by telephone or letter. (Not necessarily, of course, by pigeon post.)



THE LONDON ASSURANCE

Since 1720

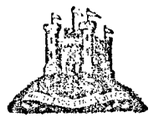
Very good people to deal with

1 KING WILLIAM STREET, DEPT. 6, LONDON, E.C.4

Perhaps you didn't know that
RORSCHACH

a town on the southern shores of the large and lovely Lake of Constance, welcomed the first lake steamship which sailed across from Friedrichshafen for its trial run, on the 26th November, 1824.

But everybody knows



that since then, Rorschach has developed into a centre of the lace, embroidery and machine industries. Needless to say, the Rorschach Branch of the Union Bank of Switzerland plays an important part in the financial life of Rorschach. Its services are, of course, also entirely at your disposal.

BANKING BUSINESS OF EVERY DESCRIPTION TRANSACTED

COMPANY MEETINGS

SEARS HOLDINGS LIMITED

EXPANSION OF GROUP'S ACTIVITIES

MR CHARLES CLORE ON DIVERSE RANGE OF OPERATIONS

The forty-sixth annual general meeting of Sears Holdings Limited was held on May 30th in London, Mr Charles Clore (the Chairman) presiding. The following are extracts from the Chairman's statement which had been circulated with the report and accounts:

ADDITIONS TO THE GROUP

The main additions to the Group in 1956 have been:

Parmeko Limited.—The issued share capital was acquired for cash at the end of March, 1956. The company is well known as specialists in the manufacture of the smaller kinds of electrical transformer, electrical and electronic equipment.

The Scottish Motor Traction Company Limited.—About two-thirds of the issued share capital of "SMT" has been acquired. The two principal businesses owned are The SMT Sales and Service Company Limited (motor vehicle distributors and service depots) and Alexander Findlay & Company Limited (structural steel).

Manfield & Sons Limited.—The whole of the capital of this well-known manufacturer and retailer of footwear was acquired in August last.

Dolcis Limited.—The whole of the Ordinary share capital was acquired in September last.

TRADING RESULTS FOR 1956

A summarised analysis of the trading profits, with the 1955 figures set alongside, is:

	1956 £	1955 £
FOOTWEAR:		
Freeman Hardy & Willis Group	1,782,000	1,501,000
Interests acquired in 1956	1,027,000	—
ENGINEERING AND OTHER INTERESTS:		
Bentley Group	1,842,000	1,952,000
Furness Group	663,000	844,000
Interests acquired in 1956	836,000	—
	£6,150,000	£4,297,000

Generally, comparing 1956 results with the Group as it existed at the end of 1955 our footwear profits are up by £281,000, whereas our engineering, shipbuilding and other profits are down by £291,000. The fall has been due to various factors, principally the credit squeeze, absorption of increased costs and, in the case of shipbuilding, the working out of old contracts. That under these conditions the net balance is a reduction of only £10,000 is an illustration of the benefits of diversification.

The appropriations, including the proposed Ordinary dividends of 22½ per cent, result in about £1 million, plus the pre-acquisition profits (less taxation thereon and dividends paid by these companies prior to acquisition) being retained in the business.

DIVIDENDS

Your Directors have given careful consideration to the amount of the dividend. After making appropriate adjustments in respect of pre-acquisition profits and that part of the "A" Ordinary capital which does not rank for 1956 dividend, we calculate that the 1956 rate of earnings cover twice the proposed dividend on the total issued capital. Your Board came to the conclusion that, under present circumstances, this is a reasonable balance to maintain between Ordinary dividend and retained profits, bearing in mind that it is intended to develop and expand the various businesses under the control of your Company.

THE FOOTWEAR GROUP

So far as I am aware no retail footwear business in the United Kingdom has achieved an improvement in results during the past year, comparable with us. That this was possible during a year when summer weather conditions were far from favourable and when costs continued to rise is, I feel, a vindication of our policy.

As I have already mentioned, during 1956 we acquired both Manfield and Sons Limited and Dolcis Limited. Thus the Sears footwear group now comprises six major factories, a number of smaller factories and nearly 1,500 retail shops, with corresponding warehouses and distribution facilities. As a first step in the rationalisation of these large footwear interests, a new, wholly owned subsidiary company, the British Shoe Corporation, Limited, has been formed. We are transferring to this Company, with effect from January 1, 1957, the whole of our holdings in the footwear companies, but it is our intention to preserve the identities of the various businesses which comprise the British Shoe Corporation. Despite the difficulties of the general industrial situation and increased competition in the trade, I am confident that our footwear group will progress in 1957 and that, in the absence of a more severe decline in public purchasing power than we need at present anticipate, our results will compare favourably with those for 1956.

THE BENTLEY ENGINEERING GROUP

In my statement of a year ago I explained that there are sections of this group which are vulnerable to the credit squeeze and that this might affect the results for 1956. In fact, despite the continued restriction of credit and the setback encountered in certain sections of the hosiery industry, our sales have been well maintained; but rising costs and keen competition from overseas have brought about a fall in profit margins. The combined effect of these factors has been a small decline in the total profits.

Over half the total sales by the Bentley Group are to customers overseas, where we have to meet severe competition. The quality and performance of Bentley Group machines will remain superior to those of our competitors, but our prices are already high and rising costs could affect us.

THE FURNESS GROUP

During 1956, Furness Shipbuilding Company Limited launched five vessels having a total gross tonnage of 87,377; this compares with six vessels with a gross tonnage of 91,196 launched in 1955. Once again it appears that in 1956 our output in terms of gross tonnage of vessels launched was the highest for any individual yard in Great Britain and this was achieved despite a reduction of approximately 6,000 tons of steel delivered during the year. The yard was, in fact, as fully occupied throughout the year as supplies of steel and labour would permit. The profits of the Group were, however, lower, due mainly to the fact that the Company has been working on contracts booked some years ago when, in order to ensure full employment at the yard, we gave advantageous terms to our customers.

The Furness Shipbuilding Company has accepted a number of additional orders during 1956 and is now fully booked for five or six years ahead.

At present, the maximum size of tanker which the Company is equipped to build is between 40,000 tons and 50,000 tons, according to the owners' dimension requirements. Your directors are studying plans for extending the Furness yard to enable one or more very large tankers to be constructed there at any one time. The cost of these extensions would be great and the expenditure can be justified only if we are assured of adequate supplies of steel for the vessels to be built therein and if owners are prepared to accept contract terms which will provide a fair return on the capital investment which we should be making.

The 1956 profits of the Furness Group should prove a low point for many years to come. This is no reckless prophecy because our programme of work for some years ahead is already laid down.

PARMEKO

During 1956 Parmeko suffered from the effects of the credit squeeze and from restrictions on hire purchase, which caused a setback to the sales of many kinds of electrical apparatus and appliances which incorporate Parmeko transformers. A second disappointment in 1956 arose from the fact that the

company has recently developed a transformer for the ignition unit in oil-fired boilers. Many enquiries and considerable orders were being received for this equipment when the Suez crisis and the subsequent shortage of oil supplies caused a falling away in the number of conversions from solid fuel to oil.

Despite these disappointments, Parmeko has been very fully occupied and has earned satisfactory profits.

SCOTTISH MOTOR TRACTION

The principal subsidiary (The SMT Sales and Service Company Limited) comprises about fifteen main depots sited in most of the principal towns in Scotland and North-West England. In these areas SMT Sales and Service are the principal distributors of Vauxhall and Bedford vehicles and hold agencies for a number of other makers. In February, 1957, an offer was made to the Ordinary shareholders of Shaw and Kilburn Limited, one of the most important Vauxhall and Bedford distributors in the South. This offer has been accepted by over 90 per cent of the Shaw and Kilburn shareholders. In order to ensure the close co-operation of SMT Sales and Service with Shaw and Kilburn, arrangements are being made for the ownership of the Shaw and Kilburn shares to pass (at a price equivalent to their cost to Sears) to The Scottish Motor Traction Company Limited.

Various proposals for the extension of our car and commercial vehicle distribution business are being examined, and as suitable opportunities arise it is intended to develop still further this branch of the activities of Sears Holdings Limited.

ALEXANDER FINDLAY

Whilst Findlays have successfully undertaken the design, manufacture and erection of all types of steelwork since the end of the last war they have become especially well known for their work in connection with power stations and large specialised, industrial buildings. They are very closely associated with atomic developments, and have been responsible for the steelwork at the Windscale and Capenhurst atomic factories and at the atomic power station at Calder. They are presently engaged on the steelwork at the atomic stations at Chapelcross and at Dounreay. Findlays are participants in The Nuclear Power Plant Company Limited, the group which has been awarded the contract for the new atomic power station at Bradwell in Essex.

We consider Findlays to be worthy members of the Sears Group. They have very able management and this, together with the big demand that exists for their services, should ensure that they remain valuable contributors to our net profits.

CONCLUSION

The diversity of our businesses undoubtedly offers a protection against the vicissitudes of individual trades, but our main objective has been to build up a group of industrial undertakings which are sound in themselves, which will benefit from energetic management and which are capable of expansion. We think we have achieved this so far, but the improvements and the expansions are still in their early stages; much is being done and will continue to be done.

We shall not hesitate to add to our family as and when suitable opportunities are found, provided we are satisfied that by so doing we are keeping to the policy outlined above. In this connection several of your directors have visited the United States of America in recent months. I believe that Sears could benefit from some association with that great country, both directly by investment in the vast developments in North America and indirectly by exchange of ideas through co-operation between managements. We are, therefore, considering various possibilities in these directions.

Lastly, I ask you to join the Board in conveying a message of thanks to all our employees. The Sears Group employs nearly 30,000 men and women, and we are grateful to all of them for their loyalty, efforts and enthusiasm during the past year.

The report and accounts were adopted and the other formal business duly transacted.

DARWINS LIMITED

COMPANY'S CONTINUED PROGRESS

VALUE OF DIVERSIFICATION

The twenty-eighth annual meeting of Darwins Limited was held on May 23rd in Sheffield, Mr F. Thompson-Schwab (the Chairman) presiding.

The following is an extract from his circulated review:

I trust you will agree that the Company's progress has again been satisfactory, particularly when it is borne in mind that, in respect of the year 1956, special consideration must be given to the troubled conditions in the Middle East, which had so unsettling an effect on business during the last quarter of the year.

In spite of these, and of other handicaps, the trading profits were £565,000 compared with £542,000 for 1955. These results have been achieved because we have been in a position to keep the majority of the Departments in our Group engaged on a programme of full production. We are fortunate in that our products are so diversified that a temporary recession in business from any one source does not affect us to the extent that it would if we had our eggs in one basket. Improvements and additions to your Company's Capital Equipment which have been made in recent years are progressively coming into operation and are now gradually adding their quota to the earning capacity of the Group.

WELL EQUIPPED ORGANISATION

The Chairman continued:

Your Company is well equipped, both in plant and personnel. It also boasts a customer service of which it has every reason to be proud. With these important assets the future can be faced without misgiving.

Profit and Loss Account.—After all charges, the balance remaining is £461,587, from which must be deducted taxation provisions of £238,350. Including the balance of £92,816 brought forward, the amount for disposal is £283,738. It is proposed to transfer £100,000 to General Reserve, making that Reserve £400,000, to pay a final dividend of 8 per cent, less tax (making 12 per cent) and to carry forward £150,158.

The report and accounts were adopted, and at a subsequent extraordinary general meeting the Board's capitalisation proposals and scrip issue of one new Ordinary Share for every ten Ordinary Shares held were approved.

GUARDIAN ASSURANCE COMPANY LIMITED

The Annual General Meeting of the Guardian Assurance Company Limited was held on May 27th in London, The Right Honourable Lord Blackford, DSO, DL, JP (Chairman of the Company), presiding.

The following are extracts from the Directors' Report:

LIFE DEPARTMENT

Net new sums assured increased by £2,441,403 during the year to a new record total of £22,799,979. Immediate Annuities securing £127,667 per annum and Deferred Annuities securing £576,260 were issued.

The gross rate of interest earned on the fund was £5 18s. 5d. per cent and the fund increased during the year to £37,303,211.

REDEMPTION ASSURANCE ACCOUNT

The fund at the end of the year after making a transfer of £15,000 to Profit and Loss was £5,809,982.

FIRE DEPARTMENT

The net premium income increased during the year by £987,510 to £6,424,836. The loss ratio was 47.5 per cent and after providing for unexpired risks on the usual 50 per cent basis the surplus transferred to Profit and Loss was £394,535.

ACCIDENT AND GENERAL DEPARTMENTS

The net premium income increased by £2,339,237 to £11,503,473. The loss ratio was 60.9 per cent and after providing for unexpired risks on the usual 45 per cent basis the deficit in the account of £67,796 has been transferred from Profit and Loss.

MARINE DEPARTMENT

The net premiums amounted to £2,499,345, against £1,980,027 in the previous year. After a transfer of £324,433 to Profit and Loss the Marine Fund was £2,924,992, representing 117 per cent of the premium income.

PROFIT AND LOSS

After making full provision for taxation, including that on the profit for the year, and after transferring £350,000 to General Reserve and providing for the increased final dividend recommended by the Directors of 1s. 3d., less tax, on each 5s. ordinary share (making 2s. 3d. per share less tax for the year) and meeting the cost of the preference dividend the balance carried forward was £454,723.

BALANCE SHEET

The total assets of the Company and its subsidiaries (the share capital of the Licenses & General Insurance Company Limited was acquired during the year) increased to £82,950,099.

ALL THE PRINCIPAL CLASSES OF INSURANCE TRANSACTED.

The Company undertakes the office of Trustee, Executor and Administrator.

HEAD OFFICE: 68 King William Street, LONDON, E.C.4.

CADBURY BROTHERS LIMITED

GROUP HOME AND OVERSEAS SALES INCREASED TO £79.5 MILLION

PROBLEM OF FLUCTUATING COCOA PRICES

TRUE SOLUTION—STIMULATION OF WORLD CONSUMPTION

MR L. J. CADBURY ON OUTSTANDING ACHIEVEMENTS

The fifty-eighth annual general meeting of Cadbury Brothers Limited will be held on June 17th at Bournville, Birmingham.

The following is the statement by the Chairman, Mr L. J. Cadbury, which has been circulated with the Report and Accounts:

At our last Annual General Meeting I commented on the fall that had taken place in the price of cocoa. It fell again in 1956, the figure at which we valued our stock at the end of the year being 202s. 6d. per cwt cif, compared with 252s. 6d. in 1955.

The end of the year is about the middle of the buying season of the cocoa crop, and we were again involved in writing down our stock to its market value. I am glad to say that this cost was very much less than the figure we had to face last year, and this is reflected in the recovery shown in our Consolidated Profits.

Naturally we do not like having to write down the value of our stocks, but we have to keep the factory supplied with cocoa throughout the twelve months. The only way we can do so with a seasonal crop is to hold a heavy stock while it is being marketed, and for the last two years we have had to do this on a falling market. In the long run, of course, less expensive cocoa is good for us; while the lower prices are being reached, however, it is a costly matter.

CONCERN IN COCOA-GROWING COUNTRIES

There is another aspect of lower prices that is important. It is causing considerable concern in the cocoa-growing countries at the moment, particularly in West Africa.

In Ghana the country's economy is largely bound up with cocoa. At 182s. 6d. per cwt, at which it stood earlier this year, the authorities were in a quandary. In the past the Cocoa Marketing Board has made handsome profits on the difference between the price it has paid the farmer and the price at which it has sold the cocoa after paying the Government export tax. Now, if it is to continue to pay the existing rates of export tax on which the Government depends for its solvency and to maintain the same price to the farmer, it has to operate at a loss. True, it accumulated profits generally estimated at about £90 million at September, 1955, but looking to the future this is not very reassuring.

It is politically embarrassing for the authorities that the return of cocoa to more normal prices should coincide with the grant of self-government. In the last few weeks the price has recovered to about £200; even so, the new autonomous State is worried. It may be tempted to try a restrictive policy, but taking the long view this would be disastrous.

GROUP'S EFFORTS TO STIMULATE CONSUMPTION

The true solution, of course, is to stimulate world consumption. We recently had a deputation from the Cocoa Marketing Board visit us at Bournville. They were shown the tremendous efforts we had made in this country to encourage the consumption of cocoa products and as a result our very high consumption here *per capita;* higher even than such countries as the USA. We were glad to have an opportunity of putting this important fact to the deputation and to show what opportunities there were for world markets to consume more cocoa.

The fall that has taken place in the price of beans is largely due to the extortionate level at which it stood two and a half years ago. With beans at over £500 a ton, demand was discouraged. This was particularly so in the case of one of the bean's main products, cocoa butter. Its high price inevitably encouraged the use of substitutes. As a result cocoa butter has for the last year or so been at a much lower figure than its traditional relationship to the cocoa bean. We thus switched over very substantially for our cocoa butter supplies to purchased butter in place of butter extruded and extracted from the raw bean at our factories. We are now modifying this policy, which is governed by a complicated cost calculation in which the various costs of beans, butter, extrusion and solvent extraction, export drawback and so on all play their part.

AN IMPORTANT YEAR

1957 is an important year as far as our West African interests are concerned. The creation of Ghana and self-government there has already been mentioned. This summer we also celebrate the fiftieth anniversary of starting our own African buying agencies. At this double celebration I think we can take credit for having played an important part in the emergence of a self-governing state from a primitive colonial dependency. We have done much to promote the growth of its cocoa and by our aggressive marketing policies we have led the world in the consumption per head of cocoa products—two achievements of which we may be justly proud.

The experiences of our agency in Nigeria have been less happy. We have found it increasingly difficult there to carry on business to our traditional standards. We are therefore considering a curtailment of our activities in that country.

FURTHER SALES PROGRESS

Turning to our sales figures, I am glad to say we can report further progress. We had an increase of 6 per cent in the value of Cadbury home sales, which more than outweighed a decrease of 2 per cent in exports. The total reached nearly £50 million. In terms of tonnage, our slightly lower prices gave an increase of 9.2 per cent. The sales for our group at home and abroad increased to £79.5 million. After paying overseas taxation as well as UK Income and Profits Tax of £3.7 million, we are left with a profit of £3.6 million. Taking this with the 1955 figure we are left with an average for the two years just under that of the last five years.

IMPROVED OVERALL LABOUR SITUATION

In view of the financial circumstances existing in the early part of last year, our development programme was slowed down in certain directions. We have however continued to expand at our Moreton factory in the Wirral Peninsula of Cheshire, also at some of our railhead distribution depots. Our production at Moreton has now grown to nearly 20 per cent of the parent factory, and the plant layout this entirely new factory has permitted continues to give most economical results.

We did not originally go to Moreton of our own choice but when we wished to build here at the end of the war were directed there by the Board of Trade. It has turned out to be a very wise move. Not only have we ample space there for our plant but also labour from a new industrial district. It has in addition been right from the point of view of Birmingham's development. If we had extended at Bournville it would have meant one more large factory competing for labour and abetting the urge for workers to migrate into the city from other parts of the country, from the Commonwealth and overseas countries.

The city's continuously increasing population creates a housing shortage that is threatening the few remaining open spaces on its outskirts. This will go on as long as there is no check on the proliferation of employment-giving factories. It is a great pity that the Board of Trade's powers of direction in this matter have not been exercised of recent years more effectively.

While what I have just said represents the overall picture of the labour situation in Birmingham, nevertheless for the first time since the war ended twelve years ago staffing the factory became substantially easier. This was of course due primarily to the recession in the motor industry. The national unemployment figure rose from 1 per cent at the beginning of the year to 1.4 per cent in December. More significant for us is the Midland figure, which began the year at .4 per cent and ended it at .9. During the year, however, the Midland average rose to 2.5 per cent. Thus, though the Midland increase in those seeking jobs was only very temporary and was generally lower than the national level, it had considerable effect as far as we were concerned. On the men's side we had nearly a thousand fewer leave us last year than in 1955.

This drop in turnover had its repercussions on our efficiency. It is obvious that the fewer untrained newcomers you have, the greater the overall efficiency, and our experience is in line with this view. The conditions of 1956 also meant not only a reduced turnover but less absenteeism and a higher standard level of applicants for jobs.

The number of men and women employed at Bournville was 11,500 at the end of the

year. Our total staff there and at our subsidiaries, home and overseas, amounted to over 25,000.

OVERSEAS ACTIVITIES

Overseas our experiences have varied. Australia, with a turnover of over £5 million sterling, was £500,000 up. Canada, with sales of just over £4 million sterling, had an increase of £180,000. New Zealand and Eire were practically unchanged, while both in tonnage and in cash we were down in South Africa.

In Australia, despite further increases in cocoa prices we have maintained our sales, Drinking Chocolate continues to be successful, and we are holding our own with Bournvita despite severe competition. The labour position is still unsatisfactory. Recruiting has been improved with the help of special transport, but we are short of good fitters and can only obtain satisfactory staff by the offer of housing accommodation on the estate. We have built 17 more houses for this purpose.

Shipping from Tasmania to the mainland has been irregular and during a severe shipping strike in February we had to make some deliveries by air.

Like the parent Company, Australia is suffering from insufficient storage capacity at its main distribution depots. Building has commenced for a new depot at Sydney, to be followed by Perth and Melbourne and alterations in Adelaide and Brisbane.

In Canada despite a competitive market we are still progressing with Breakfast Cocoa. Confectionery sales have dropped a little, but Snack Bar is still very popular; it has been backed by heavy advertising and has featured in several television programmes. Sales of imported biscuits in ½ lb packets have been good, plans are in hand for local production of Wafers, and Snack Packs will shortly be introduced.

In Eire until recently our goods were being made in three separate Dublin factories, while we also have a large condensery in the south at Rathmore near Killarney making "crumb" (semi-finished milk chocolate) both for Irish consumption and for export to the UK.

We have just completed a new factory in a developing area north of Dublin on the Malahide Road. We hope this will lead to lower factory costs through more concentration of production.

In India for some years we have been packing bulk cocoa powder into tins and have been moulding imported bulk chocolate. Towards the end of 1955 in addition to this small plant we acquired another existing factory building in Bombay. It has now been fully equipped so that we can manufacture from the raw beans, and experimental production started at the end of the year. The new factory features in the Firm's latest film, "Chocolate Odyssey." Owing to lack of liquid milk supplies we cannot manufacture CDM, but make a milk chocolate from milk powder.

There is only one other chocolate factory—an Indian one—besides ourselves in the sub-continent, so we hope to work up our sales to the limit of our factory capacity.

CONSOLIDATED BALANCE SHEET FEATURES

In conclusion, may I turn to the Consolidated Balance Sheet of our parent Company, the British Cocoa & Chocolate Company Limited, which gives the best overall picture of our finances.

There is no change in the Share Capital, and Total Assets at £63.9 million shows little alteration. There have however been several important changes of individual items. Plant and Machinery minus Depreciation have gone up from £6.75 million to £10.7 million, while on the other side Capital Reserve has increased from £6.8 million to £10.1 million. This is because we have revalued at home (but not overseas) our plant and machinery at replacement value as at January 1, 1956.

Stock is down from nearly £30 million to £24 million, mainly owing to less money being locked up in cocoa stocks; while on the other side Balances due to Bankers and Acceptance Credits are down from nearly £11 million to just under £3 million. We have also been able to increase our Revenue Reserve (including Profit and Loss Balances) from £12 million to £14.9 million. The dividend on the Ordinary Shares of the B.C. & C. Company remains unchanged.

YORKSHIRE INSURANCE COMPANY

FURTHER EXPANSION

The annual general meeting of The Yorkshire Insurance Company, Limited, was held on May 28th at York. The Right Honourable Lord Middleton, K.G., M.C., LL.D., chairman, in the course of his speech, said:

Life and Annuity Account.—New assurances have risen to a fresh peak of over £24 million. The volume of premium income has risen to over £4,400,000, and the Life and Annuity Fund is now over £40 million.

Fire Account.—The premium income amounted to £4,826,000, compared with £4,524,000 last year, an increase of £302,000, or approximately 7 per cent. The loss ratio was 45.50 per cent compared with 44.01 per cent in 1955. After making the usual provision for unexpired risks, we are able to transfer £249,261 to the Profit and Loss Account, compared with £426,450 last year.

Accident and General Account.—All sections contributed to the increase of 12 per cent, or over £1,068,000, in the premium income, which now stands at £9,600,000. After meeting an overall claims ratio of 63.74 per cent, and expenses, the underwriting loss of £595,408 has been transferred to Profit and Loss Account. The fund at the close of the year stands higher by over £470,000.

Marine Account.—The premium income rose by £115,000 to over £2,153,000. Claims totalled £1,667,000, compared with £1,570,000 in 1955. We have transferred £200,000 to the Profit and Loss Account, as we did last year, leaving the Fund at over £3,321,000, representing more than 154 per cent of the current year's income.

PROFIT AND LOSS ACCOUNT

We have a total sum available for appropriation of £551,594, against £781,309 in 1955. The Directors recommend that the dividend for the year shall be the same as provided in the 1955 accounts, absorbing £168,188.

Summarising our position, there is no doubt that, notwithstanding a year of unprecedented loss in the Motor section, we remain sound at heart, confident that we shall continue to provide the "Yorkshire's" high standard of service to its insured, with satisfaction to its Shareholders.

The report and accounts were adopted.

HENLEY CABLES

The annual general meeting of W. T. HENLEY'S TELEGRAPH WORKS CO. LTD. was held in London on 30th May, and the following are points from Sir John Dalton's statement:—

1. 1956 has been dominated by the drastic variations in the price of copper, partly accounting for the lower profit compared with the previous year; keener prices were another reason. However the Group turnover, with improved figures from abroad, is again a record.

2. Large power cable contracts in the U.K. include power station work for the Central Electricity Authority and for the Atomic Energy Commission, and the British Transport Commission, under their electrification plan.

3. Overseas business was 16% above that for 1955 and the proportion of overseas orders constituted 35% of the total business compared with 31% the previous year. Substantial orders have been received for telephone cables from abroad.

4. The chairman said that the year 1957 opened with better indications for future prospects.

The report and accounts were adopted.

The following are the salient figures relating to the accounts for the Group.

1955		1956
£		£
1,897,656	Trading Profit..	*1,470,742
1,573,254	Profit subject to Taxation	*1,402,184

MIDDLE WITWATERSRAND (WESTERN AREAS) LIMITED

(Incorporated in the Union of South Africa)

MR S. G. MENELL'S REVIEW OF ACTIVITIES

The annual general meeting of Middle itwatersrand (Western Areas) Limited will held in Anglovaal House, 71 Fox Street, hannesburg, on June 24, 1957, at 11 a.m. he following review by the chairman, Mr G. Menell, accompanies the annual report d accounts for the year ended Decemr 31, 1956:

The flotation of the Riebeeck Gold lining Company Limited during the past ar marked the culmination of your comny's pioneering work in prospecting and eveloping the Sand River and van den eeverstrust areas in the Orange Free State. s a result of this work and the active prosecting work carried out by your company the Klerksdorp area substantial interests ve been obtained in seven mining comnies in these areas. In addition your irectors were able to arrange for offers of hares to be made to members of your ompany in respect of six of the flotations.

Your company has become interested, with ther companies, in a number of base mineral rospects in Southern and Northern hodesia. Included among these are rights r a ten-year period over the 10,000 square ile North Charterland Concession incorrating copper and other prospects in the ort Jameson area of Northern Rhodesia, as ell as chrome, copper, nickel and lithium rospects in Southern Rhodesia. Active rospecting work in the Central African ederation is being conducted through nglovaal Rhodesian Exploration (Pvt.) imited which has its headquarters in alisbury.

In my review last year it was stated that he profit of £199,198 earned in 1955 arose ainly out of the realisation of certain vestments. This step had been necessary order to finance your company's participaion in the initial capital of Free State aaiplaas Gold Mining Company Limited nd the exercise of its options over additional hares in the Hartebeestfontein and Buffelsontein Gold Mining Companies. This year e have financed our participations in Riebeeck Gold Mining Company Limited, in Zandpan Gold Mining Company Limited nd in various prospecting ventures out of urrent profits and resources without resorting to the disposal of investments to any large extent.

The balance sheet at December 31, 1956, now submitted, reveals that **Quoted Investments** which cost £2,795,193, had an "ex-dividend" market value at that date of £4,974,198, an excess over cost of approximately £2,179,000. At April 30, 1957, the excess of the market price over the book value was £2,164,800. This was satisfactory in view of the conditions prevailing.

Unquoted Investments are shown on the balance sheet at £116,807, compared with £36,116 in the previous year. The increase is mainly accounted for by our acquisition of shares in Zandpan Gold Mining Company Limited and in Anglovaal Charterland Exploration Company Limited, the company formed to prospect the North Charterland Concession in Northern Rhodesia.

PROGRESS OF PRINCIPAL COMPANIES

The following are brief details of the progress achieved by the principal companies in which your company retains substantial shareholdings:

At the **Hartebeestfontein Mine** satisfactory progress has been made. The monthly rate of gold production has been increased from 44,000 tons at a recovery grade of 6.704 dwt per ton in July, 1955 (when production commenced), to 85,000 tons at a recovery grade of 10.700 dwt per ton in March, 1957. Uranium production was commenced in November, 1956. A maiden dividend of 1s. per share was declared in June, 1956, and dividend No. 2 of 1s. 6d. per share in December, 1956. Two new shafts are being sunk to the Vaal Reef in the deeper north-western portion of the mine. The capital expenditure which will be incurred in sinking and equipping these shafts and a 14-foot diameter unlined ventilation shaft, as well as in the provision of additional equipment and services for an increased scale of operations, is estimated to be £6 million. This expenditure will be spread over the next four years and will be financed from the company's own resources. During this period it is anticipated that it will be possible to appropriate the necessary funds from profits to meet this capital expenditure programme, to repay loans on due date and to make reasonable dividend distributions to shareholders. During the quarter ended March 31, 1957, 245,000 tons were milled at a recovery grade of 10.455 dwt per ton and 300,000 tons of slime were treated for uranium oxide at a recovery grade of 0.734 lb per ton. During that quarter the working profit from gold production, including sundry mining revenue, was £802,459 and the estimated profit from uranium production was £593,051, making a total of £1,395,510.

At the **Virginia Mine** during the financial year ended December 31, 1956, the tonnage milled amounted to 1,016,000 tons at a recovery grade of 4.600 dwt per ton and the tonnage treated for uranium oxide amounted to 1,479,374 tons at a recovery grade of 0.404 lb per ton. The working profit from all operations for the year amounted to £2,110,264 (subject to adjustment), of which £288,842 was derived from acid production and £1,334,051 (subject to adjustment) from uranium production. The capacity of the reduction plant has been increased to 108,000 tons per month and further extensions are in progress. Extensions to the uranium plant to provide a capacity of 130,000 tons per month were completed early in 1956. During the quarter ended March 31, 1957, 288,000 tons were milled at a recovery grade of 5.317 dwt per ton and 397,654 tons of slime were treated for uranium oxide at a recovery grade of 0.507 lb per ton. During that quarter the working profit from gold production, including sundry mining revenue, was £199,013 and, in addition, an estimated profit of £587,269 accrued from uranium and acid production, making a total of £786,282.

At the **Merriespruit Mine** official production was commenced during March, 1956, the milling rate of 75,000 tons per month being equal to the capacity of the reduction plant. Inrushes of water during October, 1956, flooded the mine and all mining operations ceased. Baling operations were carried out at No. 1 and 2 shafts in order to obtain information on which decisions were made regarding the methods to be employed for dewatering the mine. A two-stage programme for bringing the mine back into production has now been proposed. The first stage, involving some development work and the dewatering of the mine, both to be carried out from the neighbouring Virginia mine, will commence shortly. The estimated cost of this first stage is £1,200,000. This finance has been obtained by the sale of the housing owned by the company, which has retained the right to lease housing from the purchaser (Virginia Land & Estate Company Limited) for its requirements. When the first stage has been completed the Consulting Engineers will be in a position to make their recommendations as to the second stage.

At **New Klerksdorp Gold Estates Limited** during the quarter ended March 31, 1957, after taking into account the profit from uranium production estimated at £28,500, and the £15,475 loss on gold production, operations resulted in a working profit of £13,025.

At the **Riebeeck Mine** work is progressing on the concrete headgear and collar of No. 1 shaft and arrangements have been made for compressed air, electric power and water supplies. On March 31, 1957, the twin haulage from No. 2 shaft of the Loraine Gold Mine had reached a position approximately 2,400 feet from the point where it will reach the Riebeeck property.

At the **Stilfontein Mine** the ore reserve at December 31, 1956, was estimated at 4,286,000 tons having an average gold value of 9.54 dwt per ton and an average uranium oxide content of 0.304 lb per ton over a stoping width of 38.1 inches. Working profit from all operations has increased from £742,398 for the quarter ended December 31, 1955, to £950,633 for the quarter ended March 31, 1957.

At the **Buffelsfontein Mine** the reduction plant, which has a capacity of 100,000 tons per month, was completed and trial milling commenced during November, 1956. During the year ended December 31, 1956, 13,410 feet of development had been sampled, all of which proved payable. Official production was commenced in January, 1957, when 80,000 tons were milled at a recovery grade of 5.25 dwt per ton. During the quarter ended March 31, 1957, 261,000 tons were milled at a recovery grade of 5.610 dwt per ton, and the working profit including sundry revenue was £247,337. The construction of the uranium plant is proceeding satisfactorily. The Atomic Energy Board has approved the construction of a pyrite recovery plant and a sulphuric acid plant, each with a capacity of 100 tons daily.

At the **Free State Saaiplaas Mine** good progress is being achieved on the sinking of No. 1 and No. 2 vertical shafts and on the erection of plant and buildings.

The drilling of boreholes Z5, Z6 and Z7 by **Zandpan Gold Mining Company Limited** on farm Zandpan No. 43 in the Klerksdorp district of the Transvaal was completed during the year. Boreholes Z5 and Z6 intersected the Vaal Reef at borehole depths of approximately 7,210 feet and 7,419 feet respectively. Borehole Z7 encountered severely faulted ground and was abandoned after reaching a

depth of 7,263 feet in Witwatersrand Sediments below the horizon of the Vaal Reef. Although no exposure of Vaal Reef suitable for sampling was obtained, it was established that this horizon lies at a borehole depth of approximately 6,940 feet. The attention of members is drawn to an announcement made in the press by the Zandpan Company on November 6, 1956, indicating that the published results of boreholes Z5 and Z6 were to be regarded as unreliable. The matter is still under investigation.

Since the close of the financial year we have acquired further shares in our subsidiary company, **Virginia Land and Estate Company Limited,** which during the year under review made a net profit of £242,578 before providing for taxation. It has now sold residential, industrial and business sites in Virginia to the value of over £1,500,000. Branches of many leading commercial firms have been established in the town. Since the flooding of the Merriespruit mine, one of the four mines served by the town, the demand for stands has fallen off but is expected to revive in due course. The company also owns or is very substantially interested in buildings in Virginia to the value of approximately £400,000 and in addition has recently acquired a large block of housing from the Merriespruit (Orange Free State) Gold Mining Company Limited. This housing which consists of 432 houses, a block of flats and 12 vacant stands was acquired for £1,700,000, of which £1,200,000 is payable over twelve months, and £500,000 is payable when the Merriespruit mine resumes normal production. Of the finance required for this transaction £1,150,000 has been obtained by raising mortgage bonds and these bonds have been guaranteed by Anglo-Transvaal Consolidated Investment Company Limited and by your company. These houses will be leased to private individuals and mining companies in the area, and it has been agreed that the Merriespruit Company will have the right to lease such housing as it may from time to time require. It is anticipated that this will bring in a satisfactory return.

In conclusion I desire to place on record your Board's appreciation of the services rendered by our secretaries and technical advisers, Anglo-Transvaal Consolidated Investment Company Limited, both at the head and London offices, and also by the managers and staffs of our subsidiary companies.

ANGLO-NEWFOUNDLAND DEVELOPMENT COMPANY

(Inc. in Newfoundland)

CONSOLIDATED EARNINGS 17 PER CENT HIGHER

MR ELLIOT M. LITTLE'S REVIEW OF GROUP'S ACTIVITIES

The ordinary general meeting of Anglo-Newfoundland Development Company, *Limited,* was held on May 23rd at the offices of the Company, Grand Falls, Province of Newfoundland, Mr Elliot M. Little (the *President) presiding*

The following is the statement by the President which had been circulated with the report and accounts for the year ended December 31, 1956:

Consolidated earnings of the Company were 17 per cent higher than last year. This increase arose largely from its mining *interests.* Income was adversely affected by further weakening of the United States dollar, particularly in the latter months of 1956.

ANGLO-NEWFOUNDLAND DEVELOPMENT COMPANY, LIMITED

The mill produced 247,231 tons of newsprint, or 15,495 tons more than the record established in 1955. The increase of $4.00 per ton which came into effect at the beginning of 1956 was completely nullified by increased labour, material and transportation costs. A general wage increase of approximately 6½ per cent was granted on June 1, 1956, with an agreement for a further increase in 1957 of 5 per cent of the newly established rates.

Capital Expenditure during the year amounted to $1,851,633 and consisted mainly of *work to increase* production.

World newsprint supply will be in balance with demand during 1957. New capacity expected to be in operation in 1958 and 1959 will likely result in a moderate over-supply situation in the industry However, your Company's contract position is satisfactory and capacity operations are expected at least in 1957.

Rapidly rising costs of labour, materials and transportation, combined with the loss of income due to the discount on the US dollar, give some cause for concern.

SIOUX LOOKOUT

The Company has been granted a timber *licence in the vicinity of* Sioux Lookout, Ontario, on the condition that the construction of a pulp or pulp and paper mill, with an initial capacity to consume at least 150,000 cords of pulpwood per annum, will be commenced by May 1, 1959.

The Company has deposited with the Treasurer of Ontario, Bonds of the Government of Canada of the par value of $250,000 as security for the fulfilment of the condition in respect of the construction of such a mill. Under the terms of the Agreement, these bonds will be forfeited if the Company does not commence the construction of a mill before May 1, 1959.

GRAND FALLS CENTRAL RAILWAY COMPANY, LIMITED

This company was incorporated by a special Act of the Parliament of Canada, under the provisions of the Railway Act of Canada, on June 12, 1956, with an authorised share capital of $100,000 divided into 1,000 shares of $100 each. Only 250 of these shares have been issued and they were all subscribed for and issued to Anglo-Newfoundland Development Company, Limited. The purpose of this company is to operate the existing railway located between the mills at Grand Falls and the shipping port at Botwood, Newfoundland. The net profit of $83,264 shown is the result of 3½ months' operation of this railway.

GASPESIA SULPHATE COMPANY, LTD

This company's mill operated at capacity throughout the year and produced a total of 81,491 tons or 1,717 tons more than in 1955. Of this total, the tonnage of unbleached sulphite pulp was 19,361 and bleached pulp was 62,130

There was no change during the year in the basic prices of our products and the demand for sulphite pulp remains firm. In spite of higher transportation costs and higher exchange discount in 1956, the net sales proceeds per ton were somewhat higher than in 1955 due to the fact that full advantage was obtained from the pulp price increase that became effective in 1955. The Directors have appropriated the sum of $505,000 for the acquisition of a modern high pressure boiler to replace old units of low efficiency, and also to provide additional steam capacity. This new boiler is expected to be in operation in the autumn of 1958.

TERRA NOVA PROPERTIES, LIMITED

Operations at the Buchans Mine were continuous throughout the year and ore mined and milled was 366,000 short tons, an increase of 75,000 tons over the tonnage treated in 1955. Base metal prices, with the exception of copper, were firm throughout the year.

Exploration and geological reconnaissance work was carried out throughout the summer within the Crown Lands concession without any definite results.

Ore reserves as of December 31, 1956, were estimated to contain approximately 5,900,000 tons of assured and probable ore as compared with 6 million tons at the end of 1955.

Mine development for the year consisted of 9,261 feet of diamond drilling, compared with approximately 16,000 feet carried out during the preceding year.

Production for 1957 is expected to be approximately 360,000 short tons of the same grade as that obtained during 1956.

MONTMORENCY SHIPPING, LIMITED

The operation of a fleet of time chartered vessels to effect the delivery of the parent Company's product resulted in a net profit of $88,226 for the year 1956 against a profit of $13,264 for the previous year. Due to the policy of time chartering, newsprint freight rates were maintained without increase, in spite of rapid and substantial increases in general shipping rates.

The financial results, while satisfactory, were adversely affected by the loss of a vessel through requisitioning by the UK Government during the Suez crisis, and by labour difficulties in United States Atlantic and Gulf Ports.

CONSOLIDATED POSITION

Consolidated Profit, after depreciation and taxes, of $5,425,707 is equivalent to 99c per stock unit, compared with $4.632,139 or 84c per stock unit for the previous year. Consolidated Working Capital amounted to $24,964,256 compared with $22,028,640 as at December 31, 1955.

I wish to express my appreciation of the loyal and efficient services rendered by the officers and employees of the Company and its subsidiaries throughout the year.

The report and accounts were adopted.

OTTOMAN BANK

STRONG LIQUID POSITION MAINTAINED

LORD LATYMER'S SPEECH

The Ninetieth Annual General Meeting of the Ottoman Bank was held on May 22nd at Winchester House, Old Broad Street, London, E.C.

The Right Honourable Lord Latymer, the chairman, presided, and in the course of his speech said:

TURKEY

In Turkey 1956 was a year of further economic expansion. The country continued, by hard work, to fulfil the equipment and industrialisation programme adopted a few years ago. A number of schemes were completed and are already making their contribution to the general economy. The national revenue therefore is rising.

It was an important year for public works. As regards power, progress has been made with the schemes undertaken. Of the five hydro-electric power stations under construction, those at Seyhan (capacity 54,000 kW) and at Sariyar (capacity 80,000 kW) were completed in 1956 and are now in production.

Among the large thermal power stations, extensions at Catalagzi and Tunçbilek were finished in April, 1956.

In addition, three large barrages with hydro-electric power stations are being built.

In 1958, when all the projected power stations are built, the annual output of electric power, which amounted to only 737 million kWh in 1950, will have reached 4,000 million kWh. The building of electric power transmission lines progressed and over 1,000 kilometres of line were brought into service in 1956.

The barrages already completed and those still under construction will greatly improve the country's agriculture. When all these undertakings are complete 750,000 acres of land will be brought under irrigation, 400,000 acres protected from flood risk, and some 225,000 acres of marshland drained.

There is also a definite increase in industrial output as several new establishments have been completed and started production both in the mining industry and in the textile, cement, and sugar refining industries.

As regards foreign trade, the deficit in the trade balance, which reached Ltq.516 million in 1955, was reduced to Ltq.286,600,000 in 1956, following the steps taken to cut imports, especially of consumer goods. Purchases from abroad were about Ltq.1,140,600,000, against Ltq.1,393,400,000 in 1955. There was little change in the export totals: Ltq.854 million in 1956, against Ltq.877,400,000 in 1955.

SUDAN

The year 1956 was the inaugural one of the independence of the Sudan, which a recent census now shows as a country of over 10 million inhabitants, and which in November became a member of the United Nations Organisation. A currency board has been set up to supervise the introduction of the new Sudanese currency and to prepare the way for the establishment of a Central Bank.

During the year imports totalled about £S45 million and exports over £S66 million, of which about £S40 million represented cotton. Trade generally speaking was encouraging and the country's main port, Port Sudan, was very active; our new premises there were opened in May and the branch has shared fully in the increasing activity.

JORDAN

For Jordan, which could scarcely remain unaffected by events in neighbouring countries, it was an unsettled year, with repeated and important political changes. I feel, however, that the record of the Ottoman Bank in terms of service to Jordan is one which is recognised by her leaders and one of which the Bank may be proud.

Jordan's income in 1956, with careful administration and with financial assistance from abroad, remained steady.

IRAQ

Three pumping stations on the pipeline from Iraq were incapacitated in Syria in November, 1956: this has meant that Iraq's oil exports—the country's principal source of wealth—have fallen from some 32 million tons in 1955 to some 29 million tons in 1956. Nevertheless, the Iraq Development Board, with reserves amply sufficient to cover the 1957 programme under the ID500 million development plan for the period 1955-60, has been able to press forward firmly with its schemes.

It has been on the whole an encouraging year for the country and indeed the "Suez Crisis" which shook the whole of the Middle East towards the end of the year and had immediate and strong repercussions in Iraq, affected business activities and general trade somewhat less than might have been expected.

CYPRUS

It is perhaps both surprising and reassuring to realise that in spite of the widespread unrest the island, economically, has had a very prosperous year.

The exports total reached the record figure of Cy£20,700,000 against Cy£17,300,000 for the previous year. Imports also rose from Cy£30,400,000 to Cy£39,100,000. There were also substantial increases both in the total of money in circulation and of banking deposits.

It has not been an easy year for the management and staff of your Bank, but nevertheless, our services to the Government, to the military authorities, and to our other customers has been developed; a number of additional sub-offices for the convenience of military personnel have been opened.

DOHA

Early in 1956 the Bank's representatives paid a series of visits to the Sheikdoms of the Persian Gulf, following which it was decided to open a branch at Doha, the capital of the Sheikdom of Qatar. The branch opened for business in November last. The new branch already shows an encouraging volume of business.

The Chairman then reviewed the other territories where the Bank has interests, namely, Morocco, Lebanon and Syria, continued: Our Paris and London offices our branch at Marseilles had a busy satisfactory year.

EGYPT

The activity of the bank in Eg has been brought to a close by Egyptian Government. By Military P clamation of November 1, 1956, Sequestrator was appointed to control branches in Egypt.

After being closed for two days to al the Sequestrator's staff to take over, branches reopened for business on Nov ber 5, but they were branches of the O man Bank in name only.

The next stage was the passing of a on January 14, 1957, providing for what called the Egyptianisation of foreign ba in Egypt. This measure was to applied immediately to British and Fre banks, and within five years to o foreign banks.

On April 18, the assets and liabilitie the Ottoman Bank and its branches in Eg and their administration were transferred the Bank of the Republic, an institut formed in 1956 which has Governm support.

One of the Sequestrator's first acts wa suspend from duty all members of the of British and French nationality as wel certain locally recruited staff; these offi and employees—many of long service—w dismissed by the Sequestrator from employment of the bank, with effect f November 15.

The rights of the Bank to compens for the action in Egypt will be fully pur but, as a measure of precaution in the m time, we have put aside full provision for loss which might occur in this regard.

BALANCE-SHEET ITEMS

The Bank's business in Egypt has not b included in the accounts. In these circ stances, you will not find it surprising the balance-sheet totals are £11½ mi lower than last year, with decreases of million in "Acceptances, Endorsements Guarantees" and £7 million in "Cur Deposit, and Other Accounts." It is inter ing to note that this latter item stand over £86 million, which is still slightly ab *the figure at the end of 1954.*

The liquid position is very strong, cash, money at call, and bills receiv together totalling more than 50 per ce the deposits. The proportion of investm remains unchanged and the ratio of adva to deposits is down to 39 per cent—a re tion of more than 6 per cent compared last year.

The total amount of profit avail including the balance of £32,636 bro forward, is £422,863, compared £432,636 last year, After appropri £200,000 to "Reserve for Contingenc the balance remaining is £222,863.

The committee proposes that a divi of eight shillings per share be paid again year, absorbing £200,000 and leaving £22 to be carried forward to 1957.

The report was adopted.

PRESSED STEEL COMPANY

BUSINESS IMPROVING AFTER LAST YEAR'S DECLINE

MR A. ABEL SMITH ON THE OUTLOOK

The thirtieth annual general meeting of the Pressed Steel Company Limited was held on May 29th at Winchester House, Old Broad Street, London, EC, Mr Alex Abel Smith, TD, JP (chairman of the company), presiding.

The following is the speech by the chairman which had been circulated with the report and accounts:

PROFIT AND APPROPRIATIONS

Ladies and Gentlemen, From the accounts you will see that the balance of profit for the year ended December 31, 1956, after all taxes was £713,047; this compares with £958,079 for 1955. Taxation was lower by £135,507, but the charge for depreciation and obsolescence of buildings, machinery and equipment was again higher by £169,014, reflecting a further increase in the fixed assets of the Company. The profit figure has been struck after an allocation to reserve of £238,635 for the increased cost of replacement of plant, machinery and equipment. This special reserve now stands at £2,500,000 which your Board considers to be an adequate figure, having regard to the extensive programme of modernisation and replacement of equipment which has been carried out during the past three years.

The Carry Forward on the Profit and Loss Account from 1955 was £1,267,413. To this must now be added the profit referred to above of £713,047 from which must be deducted the amount of the regular dividends on the Preference Shares and an interim dividend of 5 per cent paid last November on the Ordinary Stock, amounting in all to £149,631. This leaves a balance of £1,830,829 to be dealt with.

Your Board recommends a transfer to General Reserve of £250,000 and the payment of a final dividend on the Ordinary Stock of 10 per cent less tax, requiring £217,806, leaving £1,363,023 to be carried forward.

BALANCE SHEET

On the asset side you will note that there has been a further substantial increase in Fixed Assets amounting to £2,520,694 mainly in respect of further additions to the productive facilities at our Cowley and Swindon factories. Current Assets are lower reflecting this additional capital investment.

Current Liabilities are also lower, despite a rise in Bankers' Acceptances due to the considerable imports of foreign sheet steel for which firm orders had to be placed many months in advance in order to ensure supplies at a time when the motor car body business was running at a high level.

Outstanding capital commitments at the end of the year amounted to £625,000 mainly for presses and other equipment for our Swindon factory.

CONVERTIBLE DEBENTURE ISSUE

Since the close of the Company's financial year, £2 million has been raised by means of a Convertible Debenture issue. Preference Shareholders and Ordinary Stockholders of the Company were invited to subscribe to this issue. Their response was most gratifying and in applying for over eleven times more than the sum asked for they indicated their faith in the future of the Company. I explained the purposes for which this new money is required in the circular letter in which I invited Members of the Company to subscribe to these new Debentures.

MOTOR CAR BODY DIVISION

Demand for bodies had already started to fall at the commencement of the year under review. It continued to fall throughout the year and reached a low point in December last. January this year saw the first slight improvement and since then, I am glad to say, our customers' requirements of bodies have steadily increased.

Production on a restricted scale began last summer in our new Swindon factory. The Company will not reap the full benefits of this modern lay-out until business picks up sufficiently to permit volume production.

Despite the most rigid control of overheads, rising costs continue to plague us and I regret to say look like presenting an even more serious problem in the coming months. Heavier costs, coupled with a falling volume of business and the expense inevitably involved in bringing the Swindon factory into production, particularly when that production could only be on a very limited scale, resulted in lower profits being earned in this important section of the Company's business.

RAILWAY WAGON DIVISION

At our Linwood factory, production of sixteen-ton mineral wagons continued throughout the year at a high level and orders on hand should keep us busy for some time The first standard passenger brake van came off the production line last November. The rate of production is building up and will shortly reach our target figure of ten per week. The Company has recently obtained an important order from British Railways for utility vans to be attached to passenger trains primarily for the transport of passengers' private motor cars.

At the present time the Company is engaged in tendering for other types of railway equipment and I have every confidence that some orders will be obtained. With this in mind and in order that we may be in a position to take full advantage of the business that will be offering over the next few years, your Board is negotiating for the lease of a factory building of approximately 400,000 sq ft, which adjoins the Linwood factory, and being well equipped with rail sidings, could be adapted to our requirements.

REFRIGERATION DIVISION

Once again I can report satisfactory results from the commercial side of our business. On the other hand, as far as domestic refrigerators and home freezers are concerned, we, in common with other manufacturers, suffered a triple blow in the course of the year; first in the form of increased purchase tax which at 60 per cent cannot be other than a real deterrent to sales; a second, in the further restriction of hire purchase facilities and finally in the cold, wet summer which would, under any circumstances, have had an adverse effect on home and European sales.

Your Company's representatives have played a leading part in putting to HM Treasury and to the Board of Trade the industry's case for a relaxation of the penal handicap of a high purchase tax, unfortunately, so far, without success. A flourishing home trade is an essential factor in attaining volume production; this is vital in the face of rising costs if we are to compete effectively in foreign markets, where, given the right price, the potential demand is very great. As regards the home market, when I tell you that, according to the latest census, less than 10 per cent of the 14½ million electrically wired houses in this country are equipped with a refrigerator, you will appreciate the scope that lies before this branch of our business.

SUMMARY

Last year was, as I have said, a year of recession in the motor car business and of standstill in our domestic refrigerator business. These two factors, the first in particular, account for the fall in earnings which is reported and which has resulted in your Board's decision to pay a reduced dividend on the Ordinary Stock. While, as I have mentioned, motor car body business is at the moment picking up, it would be a bold man who ventures to forecast what the rest of the year holds in store, particularly having regard to the continuing penal level of purchase tax from which no relief was obtained in the recent budget. This is a matter of grave concern to all of us in an industry in which the keynote to low cost production is volume. The railway business is satisfactory and will, I hope, expand further. The commercial refrigeration business is also going well but the domestic side is awaiting its chance—we have a first class product and the facilities to produce it in quantity.

BOARD AND MANAGEMENT CHANGES

During the year the Company had the good fortune to secure the services of Mr J. R. Edwards who for twenty-eight years had been associated with the Austin Motor Company and who latterly was Director of Manufacture for the British Motor Corporation. Mr Edwards was appointed Managing Director and Mr Bellhouse, who had previously held this post, was appointed Executive Deputy Chairman. To facilitate these moves, Lord Ashburton and Mr Shuttleworth offered to relinquish their appointments as Joint Deputy Chairmen. I should like to express my gratitude to both these colleagues for their unfailing co-operation.

During the year, to the great regret of my colleagues and myself, Mr Cyril Lloyd, on account of advancing years, tendered his resignation to the Board. Mr Lloyd was first appointed to the Board in 1929. A man of

great business ability and experience, I cannot speak too highly of the contribution he has made over the years. His wise counsel will be much missed.

In August last Colonel F. T. Davies was appointed to the Board. He brings to our counsels a wide business experience covering not only this country, but the Continent and the United States of America.

TRIBUTE TO STAFF

The past year was a particularly difficult and worrying one, not only for the management, but also for the staff and employees. Many difficult decisions involving both management and employees had to be reached, and the degree of co-operation and understanding which was shown throughout merits the praise and warm thanks of the shareholders.

The report and accounts were unanimously adopted and the dividend as recommended was approved.

The retiring director, Mr J. R. Edwards, Colonel F. T. Davies, Mr Michael A. H. Bellhouse, MA, and Mr R. T. Pemberton, MIMechE, MIChemE, were re-elected and, the remuneration of the auditors, Messrs Price, Waterhouse & Company, having been fixed, the proceedings terminated.

At a subsequent extraordinary general meeting a resolution was passed approving and adopting new Articles of Association.

THE RUBBER GROWERS' ASSOCIATION

PRICE THE DOMINATING FACTOR

The Ordinary General Meeting of the Rubber Growers' Association (Incorporated) was held on May 24th in London.

Mr H. T. Karsten, the Chairman, presided, and in the course of his speech said:

Although there was a decline in total rubber consumption in non-Communist countries last year, there was a marked increase in the use of synthetic rubber. This tends to confirm that so long as the price of natural rubber is above that of synthetic there is an inducement to the manufacturer to use the substitute material.

The aim of the natural rubber producer is therefore straightforward—to increase the supply of competitively priced natural rubber.

Improvements will undoubtedly be made in the quality of synthetic rubber, but it has to be made from raw materials so that there is a minimum below which its price cannot fall. Many of the cards may be stacked in favour of synthetic rubber, but I believe that we natural rubber producers have got the ace of trumps—we should be able to beat synthetic in price. I believe also, when I consider the recent decision of rubber manufacturers who are also synthetic rubber producers, to enter the plantation rubber industry, that I am not alone in this view.

Of course we will have our problems. The transition from the present low-yielding areas to the high-yielding plantations we want will take time. However, as I have indicated, the very existence of our synthetic competitors will benefit us in that there will be a floor price set for our product. In other words, synthetic rubber will serve to stabilise the price of natural, and there should be a ready market for all that those normally engaged in the plantation industry can produce. There is in fact, no longer any need to consider artificial measures for stabilising natural rubber prices.

UNION MINIÈRE DU HAUT-KATANGA

IMPORTANCE OF CAPITAL EXPENDITURE PROGRAMME

The annual Meeting of Shareholders of Union Minière du Haut-Katanga was held in Brussels on May 23rd, Mr Gillet being in the Chair.

In accordance with the agenda, the Meeting first approved the accounts for the financial year ended December, 1956. The Profit and Loss Account for 1956, circulated to the shareholders, showed a gross profit of F6,579,082,805—. Taking into account the amortisation of the year, the provision for taxation on profits and the sundry charges, the available profit balance, including the amount brought forward, totalled F4,632,219,794—.

Out of this balance, F228,570,219—and F750,000,000—have been allocated respectively to the Reserve Fund and the Special Reserve and Contingencies Fund; a sum of F72,607,681—was carried forward. The amount left for distribution was accordingly F3,581,041,894—.

The Meeting fixed the net dividend for the year 1956 at F2.300—net per share (or F230— per tenth of share). Taking into account the two interim dividends of F700— each paid in November, 1956, and in February, 1957, this entails a complementary dividend amounting to F900— net per share, or F90— net per tenth of share.

The Chairman informed the Meeting that MM. H. Buttenbach and F. Van Brée had resigned their director's mandate as of the date of this meeting. The Meeting conferred on Mr Buttenbach the title of honorary director. Mr Van Brée was confirmed in his title of honorary chairman which he held since he left the Company's chairmanship.

MM. J. P. Paulus and L. Wallef were appointed directors and Mr A. Bourgeois auditor of the Company.

MR SENGIER'S STATEMENT

After evoking the commemoration in Africa of the fiftieth anniversary of the Company and paying tribute to the abilities and devotion of the personnel, Mr Sengier, Chairman of the Executive Committee of Union Minière, emphasised the importance of the capital expenditures' programme in the mining, metallurgical, social and hydroelectric fields, necessary to develop the productions of the Company.

The copper production reached 247,400 metric tons in 1956. The tonnage delivered to the consumers during the financial year amounted to 237,600 tons. The characteristic figures of the accounts are the following:

Net amount distributed to the shareholders, including the Comité Spécial du Katanga	2,856 million
Taxes and duties	3,432 million
Royalty to the Comité Spécial du Katanga	331 million
Amortisation	900 million
Capital expenditures, including 525 million for the Le Marinel power-station	2,241 million
Amount carried to reserve of which: to the Statutory Reserve Fund (5 per cent of the profit) 228 million to the Special Reserve and Contingencies Fund 750 million	978 million

Mr Sengier emphasised the State's growing share in the results of the activity of Union Minière.

The years 1955 and 1956 were for the copper market a very special period of transition, marked in 1955 by a deficiency of production resulting from various strikes and in 1956 by a still tight situation, becoming easier in the course of the second half of the year as a consequence of an increased production and of the slackening of consumption.

During this period, the copper quotation registered strong fluctuations unknown in the past, varying in New York from 30 to 46 cents in 1955 and from 32 to 50 cents in 1956, whereas in London, it exceeded the equivalent of 53 cents in March, 1956, to fall back recently to levels approximating 30 cents. Quotations as high as those reached towards the end of 1955 and the beginning of 1956, continued Mr Sengier, are prejudicial to the interests of producers and consumers by encouraging the opening up of mines with questionable rentability and by stimulating the use of substitute products. On the other hand, due to the exaggerated deterioration of quotations, certain producers are already at a loss.

It would be imprudent, added Mr Sengier, to make forecasts regarding consumption and quotations of the metal, but there are good reasons to be optimistic.

The renovation and extension programme of Union Minière will be carried out, excluding unforeseen circumstances, without raising new capital, which will enable the Company to keep itself in a good position as regards its production costs; Mr Sengier recalled that the latter vary in fact to a certain extent according to the selling price and this is a stabilising factor. Satisfactory results can be expected for the future.

POINTS FROM THE DIRECTORS' REPORT

The capital of the Company was raised from 5 to 8 billion Congolese francs, without issuing new shares, by deduction of 3 billion francs from the Special Reserve and Contingencies Fund.

The Company's copper production marked further progress in 1956, reaching 247,452 metric tons against 234,673 tons in 1955. Cobalt output amounted to 9,089 metric tons, against 8,567 tons in 1955.

The other productions were zinc concentrates, cadmium, uranium, radium, germanium and precious metals.

Important quantities of over-burden were removed at the Kamoto copper-cobaltiferous deposit, and the equipment of the Kambove-West mine, the exploitation of which was decided with a view to compensate the future reduction of production at the Kipushi deposit, is in progress.

The producing capacity of the Shituru electrolysis plant was brought to 135,000 tons a year with the commissioning of a new electrolytic copper removal section.

The first civil engineering works connected with the erection of the new Western lixiviation-electrolysis plants were undertaken.

The increase of its cobalt production enabled the Company to reduce its selling price from $2.60 to $2.35 per lb. This measure, followed by a new reduction to $2 early in 1957, will presumably have a favourable influence on the metal consumption.

A programme designed to develop the cobalt uses was undertaken, and an "Institut du Cobalt" (Cobalt Development Institute) was created, grouping the representatives of the main cobalt world producers, their executive organ being the "Centre d'Information du Cobalt" (Cobalt Information Centre). In no way will the action of this organisation cover the commercial activities nor the fixing of the quotations of the metal and of its salts.

The exportation of uranium concentrates continued, in conformity with the existing agreements.

The Le Marinel power station was put into service in 1956. Three of the four groups were operating at mid-March, 1957.

The supply of electric power to Northern Rhodesia began on October 1, 1956, after the completion of the 220,000 volts Le Marinel-Jadotville - Elisabethville - Kitwe (Northern Rhodesia) power transmission line and the commissioning of the first transformer at the Rhodesian sub-station.

A total of 1,293 million kWh has been produced by the four power stations: Francqui, Bia, Delcommune, Le Marinel, in 1956.

New social complexes for Congolese workers have been created in the big cities.

A programme of medico-social action in the hinterland of the large Katangese centres has been initiated with the collaboration of the governmental services.

EQUITABLE LIFE ASSURANCE SOCIETY

STEADY EXPANSION

Mr J. H. Bevan, the President, was in the Chair at the hundred and ninety-fifth Annual General Meeting of the Equitable Life Assurance Society held in London. The following are extracts from his speech:

The accounts now before you are evidence of the steady expansion of the funds of the Society. For the first time in our history they exceed £30 million.

It has been our policy gradually to increase the holdings in equities; the policy may well provide some part of the answer to the continuing problem of inflation.

We are all only too familiar with the problems associated with rising costs but even now the ratio of expenses to premium income is still under 7 per cent.

I turn now to the results of the quinquennial valuation made as at December 31st last. The bonuses declared in the major profits class are at rates greater by about 40 per cent than those declared five years ago. For endowment assurances, they are the highest ever declared by the Society and for whole-life assurances the rates have not been exceeded for more than 100 years.

The minor profits class, which shares in profits when certain standard rates are exceeded in the major profits class, receives bonuses for the first time. The bonuses in this class are marginal in character and always likely to be small but I would remind you that the premiums are very little, if any, greater than those usually charged by other offices for non-participating contracts.

The report and accounts were adopted.

RELAY EXCHANGES LIMITED

The Twelfth Annual General Meeting of Relay Exchanges Limited was held on May 28th at the Connaught Rooms, London, WC, the Right Honourable Sir Walter Womersley, Bart, the Chairman, presiding.

The following is extracted from his statement, which had been circulated with the report and accounts:

It says much for the reputation of the Company and for its treatment of Subscribers in the matter of supplying service that it has been able to maintain progress during 1956 although at a reduced rate.

The profit on trading has increased from £969,197 for the year 1955, to £1,441,813 for 1956. In 1956 £822,958 has been put aside for depreciation, compared with £533,218 in 1955.

Net Profit before Taxation is £478,546, whereas for 1955 it was £330,537 and in 1954 £180,235.

The provision for Taxation which appears as a total sum of £254,216 includes £129,000 as an addition to reserve for equalisation of Taxation, which now becomes £333,000.

In the 1956 Budget the Chancellor terminated Investment Allowances. This has had the effect of reducing the total Investment Allowance from £160,000 in 1955 to £50,000 in 1956, and also accounts for the greater amount set aside for the equalisation of Taxation.

After the provision for taxation, the profit for the year is £224,330 to which must be added the balance brought forward of £65,696, making a gross total of £290,026. Out of this sum, the Directors considered it advisable that a sum of £70,000 be transferred to general reserve, so building that reserve up to a total of £300,000. A dividend of 12½ per cent less tax has been paid and a final dividend of 20 per cent less tax has now been provided for, leaving a balance to be carried forward of £114,783.

The value of the Fixed Assets has risen from £3,519,710 in 1955, to £4,683,722 as at December 31, 1956, an increase of £1,164,012.

The Directors state that reasonable progress was made by the Company in spite of the restrictions directed at slowing up the demand for rental services, and they are able to report a continuance of that progress in 1957, particularly in the renting of Television sets by their rental services operating under the title "Rentaset."

The name "Rentaset" which is the sign under which the Company trades is being more and more recognised as indicative of fair terms and first class maintenance by which means alone it can hope to retain the confidence of the public.

The report and accounts were adopted.

The meeting closed with an expression of thanks to the staff.

COMPAGNIE FINANCIÈRE BELGE DES PÉTROLES "PETROFINA"

BRUSSELS, BELGIUM

AMERICAN SUBSIDIARY FORMED

The Annual General Meeting of Petrofina was held in Brussels on May 10th, and the following are details from the Board of Directors' report.

REVIEW

Events in the course of the last few months have demonstrated the importance of the geographical distribution of interests which the Company has practised for many years.

The Group's investments in 1956 amounted to some Bfrs.4,500 million, and the budget for 1957 makes provisions for a similar sum.

At the Extraordinary General Meeting which was held on March 19, 1956, it was resolved to increase the Company's share capital from Bfrs.1,600 million to Bfrs.2,920 million. The new issue received the customary support from investors and was well subscribed. As in the previous year, 50,000 shares were allocated to the Company's employees.

ACTIVITIES IN AMERICA

The American subsidiary, American Petrofina, was set up on April 18, 1956, secured control of the Panhandle Oil Corporation and increased its capital to a total of $51 million by means of a public share issue. In January, 1957, agreement was reached on taking over the American Liberty Oil Company. Once this operation is completed, American Petrofina will dispose of oil reserves amounting to 4 million tons, an annual refining capacity of 1.25 million tons and a distribution network covering 650 sales points. Its assets will amount to some $90 million, and the Company has high hopes for the future of this subsidiary.

In spite of restrictions imposed in the latter part of the year, consumption showed the following increases on 1955:

4.6 per cent in the United States
14 per cent in Western Europe
24 per cent in Belgium.

Total sales of the Company and its subsidiaries exceeded 6 million tons.

EXPANSION

Canadian production increased by 35 per cent and accounted for 65 per cent of total consumption. Reserves of natural gas are to be exploited shortly when the first part of the Trans-Canada Pipe Line has been completed. Output from Venezuela and Europe was most satisfactory. Prospecting was carried out with success in Mexico, Angola and the Sahara desert.

The Group's refining capacity of 5.5 million tons per year will be doubled by 1960. New installations are being planned in Italy and Germany, and the plant in the United States is being improved. New pipelines are being planned in the Middle East, Europe and the Sahara desert, and efforts were made in all countries last year to expand and consolidate the Company's distribution network.

PROFITS

Net profit for 1956 amounted to Bfrs. 656,120,315 including the balance of Bfrs. 70,383,640 brought forward from the previous year. It is proposed:

- to transfer Bfrs.100 million to the reserves;
- to distribute Bfrs.387 million in the form of a net dividend of Bfrs.110 for each of the Company's 3,520,000 shares;
- to distribute a further Bfrs.60.8 million by way of a net dividend of Bfrs.55 per share in respect of the Company's 1.1 million new shares;
- to make statutory payments amounting to Bfrs.33,722,688;
- to carry forward the balance of Bfrs. 74,367,627.

The report, the accounts and the proposals put forward by the Board were adopted.

LONDON BRICK COMPANY LIMITED

DEMAND FOR ALL PRODUCTS WELL MAINTAINED

ONEROUS BURDEN OF EVER-INCREASING EXPENSES

MR A. T. WORBOYS ON COMPANY'S COMPETITIVE STRENGTH

The fifty-seventh annual general meeting of London Brick Company Limited was held on May 28th in London.

Mr A. T. Worboys, CBE (the Chairman), presided and, in the course of his speech, said:

The Trading Profit and Sundry Income for the year amounted to £2,179,576, compared with £2,352,076 for the preceding year. After providing £400,000 for depreciation and £1,028,479 for taxation and other charges, there remains a net profit of £751,097. To this has been added £311,032 the unappropriated profits at the beginning of the year, and £16,818 for taxation adjustment for previous years, making available a balance of £1,078,947.

After deducting the transfer of £300,000 to General Reserve, the net dividend on the 8 per cent Cumulative Preference Stock and the net interim dividends of 20 per cent on the Ordinary Stock, there remains an amount of £312,047 to be carried forward. The Directors do not recommend the payment of any further dividend for 1956.

FACTORS AFFECTING RESULTS

The decline in trading profits is directly attributable to the continued increase in expenses and to the severe weather conditions encountered in the early part of the year when, to meet the delivery position, we simply had to make bricks irrespective of cost. When addressing you last year I drew particular attention to our policy of price stabilisation upon which we embarked in March, 1954, and maintained unbroken to the end of June last year. I then expressed concern whether, with increasing expenses, this policy could be maintained.

Towards the end of the first six months it became apparent that the weight of these ever-increasing costs was becoming too onerous and, after the most careful consideration, it was regretfully decided that some advance had become inevitable. The price of all our products was therefore raised on July 1, 1956. Some might think that we shouldered and absorbed these additional costs for too long a period, but the result has been that in a period of reduced building activity and growing competition, the demand for all our products has been well maintained and we have, to some extent, contributed towards stabilising the overall cost of building upon which the future of the industry largely depends.

Dealing now with our two Subsidiary Companies, Stewartby Housing Association Limited continues in full operation. With regard to Transformers (Watford) Limited, our manufacturing Subsidiary Company, the factory output has risen considerably during the year and is now approximately three times higher than the figure of five years ago.

The order and contract book has been well maintained and despite the increased output achieved during the year, the orders on hand at the close of the year were as high as at the beginning. Production is already partially covered in some sections as far ahead as July, 1958. The steadily increasing manufacturing facilities based on the natural growth of the electricity supply industry establishes confidence in the future which is felt by all concerned in our manufacturing subsidiary at Watford.

PARENT COMPANY'S ACHIEVEMENTS

Returning to the Parent Company, it is my pleasure to report that once again the output and deliveries of the Company's products were fully maintained throughout the year. Our record daily make now stands at 8,587,369 bricks.

The necessity of maintaining the Company's productive efficiency is always first and foremost in our minds and our Engineering and Research staffs continue to experiment and search for still higher standards in this direction. Our policy of increased mechanisation is being steadily pursued throughout the Company's works.

During the year there has been unusual activity in those departments dealing with land, boring surveys and preparation of land for pit extensions. Many of our old pit areas are nearly worked out and plans are well in hand for extending the clay working areas during this and the next few years.

The output of our facing bricks has steadily increased throughout the year, but neither the art of brickmaking nor this Company can stand still. Only those who are in close touch with the industry realise the ingenuity and patience needed to obtain the mastery of what appears to be such a simple material as clay.

During the year under review building remained at a high level, but there were signs of a slackening in activity towards the year's end. The industry was slow to react to the period of retrenchment brought about by Government monetary policy. Whilst the number of houses built during the year dropped below the record 1955 figure of 317,000, the general level of construction and repair work was maintained at a high level and indeed for the first nine months of the year (for which official figures are available) showed a physical expansion of some 6 per cent.

STRONG COMPETITIVE POSITION

Largely due to our strong competitive position throughout England and Wales, a strong order book was achieved and deliveries were maintained at a high level. Our major sales problem since the war has been to retain the goodwill of our friends throughout the industry at a time when the demand for our products far exceeded the supply. A slight reduction in the national demand, therefore has enabled us to shorten irksome delays in delivery, to improve our service to the sites and to widen our fields of distribution.

PRICE FACTOR

Our competitive strength was not affected by the increase in the price of all our products in July. This was the first advance in the price of our bricks since March, 1954, and it was the inevitable consequence of steadily increasing costs of labour, transport and fuel which could no longer be absorbed.

Our increases ranged from an average of 4s. per thousand on bricks and up to 2d. yard on hollow clay blocks and were generall lower than the advances in the price of com petitive materials. Their infliction on th cost of building was negligible, adding onl £4 to the cost of a three bedroom counc house.

Over the years the policy of price restrain followed by the Company has meant that u to the end of 1956, whilst our basic wage ha risen by 230 per cent since 1939, the work selling price of our common bricks has onl been increased by 120 per cent. The abilit to achieve such a record has been gaine through increased efficiency in every field c the Company's operations.

During the year the deliveries of hollo clay blocks, augmented by the production c our two new plants at Clock House an Warboys, were a new record.

The delivery of field drain pipes in th year was greater than ever before. "Phor pres" pipes are designed to do the jo required of them at the most economic pric and, in spite of increased production, th demand still exceeds the supply.

EFFICIENT TRANSPORT FLEET

The efficient operation of our transpor fleet continues to afford many advantages t our customers and, in spite of bad weathe conditions during the year, the deliveries made by the Company's vehicles reached a all-time record of some 915 million brick and brick equivalents which were conveye over 20½ million road miles. The closin months of the year under review were over shadowed by the fuel crisis and the distribu tion of the Company's products became matter of some concern. We took steps t protect our interests as far as possible an up to date, with the assistance of the appro priate Ministries, we have been able to main tain an efficient delivery service.

TECHNICAL AND RESEARCH

There is hardly any part of the Company' production activities in which our Technica and Research Department has not participate during the past year. The raw materials w use, all the processes of brick and bloc making that we employ, the properties of th finished products we sell and the new pro ducts we are developing have all bee included in our research programme.

CURRENT YEAR'S PROSPECTS

As to the prospects for the current year, do not want in any way to embark upon th role of a prophet. However, I can tell yo that with five months trading behind us, th results so far achieved are quite satisfactor and exceed those for the corresponding perio of last year and compare very favourabl with those recorded for the same period i 1955. Trading conditions are difficult, but the demand holds and nothing of an excep tional nature crosses our path during th second half of the year, then I think you wi be well satisfied and happy when we mee again next year.

The report and accounts were adopted.

HARLAND AND WOLFF, LIMITED

OUTPUT AFFECTED BY LABOUR DISPUTES

SUBSTANTIAL VOLUME OF WORK ON HAND

SIR FREDERICK E. REBBECK ON ESSENTIALS FOR MAXIMUM PRODUCTION

The seventy-second Annual General Meeting of Harland and Wolff, Limited, was held on May 23, 1957, at the registered offices of the Company, Queen's Island, Belfast. Sir Frederick E. Rebbeck, KBE, DSc, DL, Chairman and Managing Director, presided.

The Secretary read the Notice convening the meeting and the Report of the Auditors.

The Chairman said:

Before I comment on the Statement of Accounts and the Directors' Report I wish to refer briefly to the loss the Company sustained by the death of Sir John Craig on February 1st. Sir John was one of the great figures of British industry, and throughout the thirty-two years of his membership of the Board of this Company we had the benefit of his unrivalled knowledge and experience derived from a lifetime of service in the Steel Industry of which he was an acknowledged leader.

As the Statement of Accounts and the Directors' Report have already been in your hands for some time, I propose with your agreement to take them as read. (Agreed.)

TRADING RESULTS

As will be seen from the Group Profit and Loss Account, the Net Profit after Taxation is very similar to the figure for 1955. It is significant, however, that if the balance of profit on settlement of contracts completed in previous years is omitted from both years, the profit attributable to this year's trading shows an improvement. The Directors propose to repeat the Dividend of 10 per cent on the Ordinary Stock, and to add the sum of £530,000 to Reserves and carry forward £16,499 on Profit and Loss Account in the books of the parent Company.

It will be seen that the cash resources of Harland and Wolff have diminished during the year 1956, with corresponding increases in the amounts of Debtors and Work-in-Progress which have risen by more than £3,000,000 as compared with the previous year. This position is attributable in no small measure to the adverse effects of the many labour disputes during the year, particularly during the autumn, which seriously interrupted our construction programme and resulted in delay to a number of vessels due to be launched or delivered before the end of 1956.

The proposed appropriations from profits are in continuation of our financial policy of maintaining necessary reserves to finance the purchase of new plant and machinery and also in times of rising costs of both labour and materials, as at present, to supplement the working Capital required for a very extensive Shipbuilding and Engineering programme.

The tonnage of vessels launched during the year, though substantial, fell short of the anticipated output, due to the incidence of labour disputes to which I have already referred.

The thirteen merchant vessels delivered during 1956 included the passenger steamer *Reina Del Mar* (20,225 tons gross) for The Pacific Steam Navigation Company, the TSS *Duke of Lancaster* and TSS *Duke of Argyll* for the Heysham/Belfast Service of British Railways, and important cargo liners and oil tankers for British and Norwegian owners. Naval vessels completed comprised the Anti-Submarine Frigate *Torquay* and two coastal minesweepers for Her Majesty's Navy, while the Light Fleet Carrier *Bonaventure* for the Royal Canadian Navy was commissioned in January of this year.

NOTABLE ADDITIONS TO ORDER BOOK

I am pleased to be able to report some notable additions to our order book, reference to some of which has already been made in the Press. During the last twelve months we have contracted to build three 20,000 tons passenger and cargo liners for Royal Mail Lines Limited, a 45,000 tons passenger liner for Peninsular & Oriental Steam Navigation Company, a group of five cargo liners for the British India Steam Navigation Company Limited, and a large number of cargo liners, tankers and ore carriers not only for British and Commonwealth companies but also for owners in Norway and the USA. From the Admiralty we have received orders for the construction of two further frigates and a Guided Weapon Destroyer for Her Majesty's Navy; and we have also been entrusted with the work of modernisation and fitting-out of the Light Fleet Carrier *Hercules* for the Indian Navy.

This substantial volume of new work, added to the varied programme of merchant and naval contracts already in hand and on order, should ensure a satisfactory utilisation of our shipbuilding capacity for some time to come. But obviously if our capacity is to be used to the full two conditions must obtain—steel supplies must be geared to our requirements in terms of volume and sequence and in the field of industrial relations, in common with the industry as a whole, we must have a period of stability free from wasteful disputes which prevent the attainment of maximum production.

DIVISIONAL ACTIVITIES

The *Marine Engineering Division* was fully employed throughout the year on the manufacture of the principal types of main propelling and auxiliary machinery for ships building in our own shipyards. As in previous years, we have built a number of main machinery installations for hulls building by other shipbuilders. The high reputation which we enjoy in this important field of activity has been fully maintained, and the volume of work in hand and on order is satisfactory.

In the *Land Engine Division* output continued at a high level. The demand for our standard range of Diesel engines, both naturally aspirated and turbo-charged, continues, and we have secured a number of important orders for units for public service and industry both at home and abroad. Under our arrangement with the Cooper-Bessemer Corporation of Ohio, USA, we have also built a large number of compressor units for a wide range of industrial purposes. Our Scotstoun Works continues to be engaged on important hydro-electric work on behalf of the English Electric Company, on ordnance work for the Admiralty, and on the manufacture of large mechanically-operated power presses for the motor car industry under our arrangement with Danly Machine Specialties, Inc, of Chicago, USA.

The *Electrical Division* was well employed during the year on the installation of electrical systems on board both naval and merchant vessels. The volume of manufacturing work carried out was up to expectations.

The *Steel Construction Division* was fully engaged on a wide range of contracts for the supply and erection of steelwork for buildings and civil engineering projects, outstanding amongst which was the completion of the steelwork for the very large factory at Larne for the British Thomson-Houston Company, Limited.

The Company's Shiprepairing and Engineering Works at London, Liverpool and Southampton have again maintained a high level of activity, and as usual a number of important shiprepairing contracts were also undertaken at Belfast and Glasgow.

TRIBUTE TO STAFF

In conclusion, I wish to extend our thanks to all members of our staff both at home and abroad for the excellent work they have done throughout the year.

The Report and Accounts were adopted; the proposed dividend was approved; the retiring Directors, namely: Mr J. H. McCuaig, Mr C. C. Pounder and Dr Denis Rebbeck were re-elected. Messrs Price Waterhouse and Company were re-appointed Auditors and their remuneration was fixed.

The meeting terminated with a unanimous vote of thanks to the Chair.

E. POLLARD & CO

The forty-fifth annual general meeting of E. Pollard & Company Limited was held on May 24th in London.

Mr H. Edward Pollard (chairman and managing director) presided, and said:

Evidence of the expansion and development of your Group is shown by comparing the value of the net assets, i.e., £1,805,000, with the present Issued Share Capital of £668,855. It is in order to bring the issued Share Capital more into line with the value of the Assets employed that your directors are recommending the Capitalisation of £400,000 of the General Reserve Account and the issuing of one new Ordinary Share for every existing Ordinary Share.

The Group Profits, as a result of a very large increase in Turnover, have reached a record figure of £390,000—an increase of £91,000.

We are again proposing to pay a Capital Dividend; this year of £45,390. This Capital Dividend will not be subject to Income Tax or Surtax. We also propose to pay an Ordinary Dividend of 15 per cent less tax.

The satisfactory results were due to an all-round increase in business. All sections were fully occupied during the year and our resources were able to cope with the very large extra volume of production in spite of the continuing shortage of skilled labour, and our delivery promises and schedules were well maintained.

As regards the future given a fair trade wind, we have the resources, experience and determination necessary for having another prosperous year.

The report was adopted.

HALL ENGINEERING INDUSTRIES, LIMITED

BROADENING SCOPE OF ACTIVITIES

The Second Annual General Meeting of Hall Engineering Industries Limited was held on May 22nd in London, Mr Ernest N. Hall, the Chairman, presiding.

The following is his circulated statement: As was forecast in my statement last June, the Group has completed another successful year.

Despite the still continuing spiral of increased costs and a recession in certain sections of the Engineering Industry, profits have been maintained, due, in large measure, to increased deliveries of the Group's range of products.

Compared with the 1955 results of £873,229, the profits of the year under review are slightly lower at £845,009, and, after making full provision for Taxation on these profits, both in the United Kingdom and Overseas, amounting to £482,410, there remains a profit of £362,599.

The expansion of the Group's activities, both territorially and in its diversity of products, should contribute towards continuing success.

SUBSIDIARY COMPANIES

Hall and Pickles Limited: In all departments at the Sheffield works output increased both in weight and value. The Tool factory had a record year, as did the Mining Tool Section, which produces Rotary Coal Borers and Percussive Rock Drill Bits.

Equally, the Wire Mill, with increased facilities, surpassed the previous year's high level of production of Nickel Chromium electrical resistance alloys and valuable Kanthal alloys used in the domestic appliance industry.

In Canada a steady increase in sales has been achieved in the last year, but the Company is not yet on a profit-earning basis. The activities of the South African Company continue to expand.

Improved Metal Label Company Limited: New extensions and machinery recently installed by this Company have resulted in further increased profits, and fair progress is being made with ventures overseas.

Composite Forging Limited: The recent recession in the motor industry had its effect on the order book for die work during the year and adversely affected the results of the Company. The Directors are, however, confident that the products of the Company will be in increasing demand, and additional new equipment is being installed.

Harry Heath (General Advertisers) Limited: A controlling interest in this Company, which manufactures all kinds of reflector and non-reflector signs, including road signs, was acquired during the year.

The British Reinforced Concrete Engineering Company Limited: During the year, the supply of raw materials became more freely available and, in consequence, the output of mesh increased considerably. In spite of a shortage of reinforcing bars, the output of the Drawing Office increased and further Design Offices were opened in the Provinces. Abroad, the new Bulawayo plant started up in November last, and the capacity of the Johannesburg Works has been extended to deal with the additional demand from that market.

The erection of the Vancouver factory is almost complete and ready for the installation of the machinery, which is expected to go into operation towards the end of May.

The factory for drawing wire, which has been built at Stafford for BRC Steel Limited, in which Company the Lancashire Steel Corporation and ourselves have a joint interest, is now in production.

Chatwood-Milner Limited: Considerable benefit should accrue to the Group following the installation of new plant and equipment and a reorganisation programme at the Shrewsbury and Speke factories. There is a growing order book for this Company's well-known traditional products of security and office equipment, and at the same time the General Engineering Division continues to expand rapidly, large contracts having been secured in connection with the atomic power stations now being constructed.

The turnover of the South African Company has increased, resulting in a modest profit.

PROSPECTS

There are indications that in 1957 profit margins will be lower due to increasing costs and more intensive competition, but I am of the opinion that the steps taken to broaden and expand the scope of the Company's activities should stand it in good stead.

The report was adopted and the total dividend of 10 per cent was approved.

ALBRIGHT & WILSON LIMITED

SATISFACTORY TRADING RESULTS

CHANGES IN THE GROUP

MR KENNETH H. WILSON'S STATEMENT

The Sixty-Fifth Annual General Meeting of Albright & Wilson Limited was held on May 23rd at Oldbury, near Birmingham.

The Chairman, Mr Kenneth H. Wilson, OBE, JP, presided. The following is an extract from his statement.

GROUP ACCOUNTS

In 1956 the trading profit of the Group rose by more than one-third to £4,416,000, compared with £3,200,000 in 1955. A large part of this increase is attributable to the inclusion of the profits of Marchon Products Limited and its subsidiaries for a full year, against less than two weeks in 1955. If this factor is discounted by adding to the 1955 published Group total the profits of these companies prior to their acquisition, the increase in Group trading profit in 1956 appears as £652,000.

Whilst all companies in the Group succeeded in expanding their sales the pressure of rising costs prevented several of them from earning corresponding increases in profits; indeed, for this reason the trading profit of the parent company fell slightly. On the other hand, the 1956 results of Midland Silicones Limited showed a marked improvement following the elimination of initial manufacturing difficulties, and Marchon Products Limited, together with its subsidiary, Solway Chemicals Limited, showed considerable increases in sales and profits.

The total tax charge of £1,262,000 is £342,000 higher than in 1955. After allowing for this the net profit attributable to the stockholders of Albright and Wilson Limited was £1,203,000, or £344,000 more than in 1955. As forecast at the time of the rights issue of November, 1955, the accounts show a total ordinary dividend of 18 per cent in respect of 1956, made up of a first interim of 5 per cent paid in September and a second interim of 13 per cent payable on May 8th, which it is proposed should be confirmed as final.

In 1956 total capital expenditure by the Group amounted to more than £2,500,000, of which about half was devoted to expansion in Canada.

UNITED KINGDOM COMPANIES

The parent company during 1956 experienced heavy increases in manufacturing costs. Most remarkably the freight on phosphate rock, under the stress of increased shipments of coal across the Atlantic, and the Suez crisis, reached a new peak towards the end of the year. Faced with these and other increased charges we paid particular attention during the year to improving our operating efficiencies, and I am pleased to report that significant economies in the use of power and raw materials have resulted.

Marchon Products and Solway Chemicals had a good year. 1956 was the first full year of operation for Solway, which produces sulphuric acid and cement from anhydrite. I am glad to report that their plant has operated satisfactorily, and that the first full year's production of sulphuric acid and cement was at 90 per cent of rated capacity. Marchon have increased their sales to the detergent and cosmetic industries, and are continuing to expand production facilities.

There was a marked improvement during 1956 in the trading results for Midland Silicones Limited, despite increasingly severe competition from both home and foreign sources. Capacity in this country is still substantially greater than demand, but the market continues to develop at a satisfactory rate, and we are maintaining our position as the leading United Kingdom suppliers. The forecast for 1957 is that the volume of sales will grow, and results so far have confirmed this expectation.

OVERSEAS COMPANIES

The most important development in our overseas interests in the year under review was the amalgamation of Oldbury Electro-Chemical Company with Hooker Electro-chemical Company, a large and progressive concern with five factories in the United States. Hooker acquired the entire share capital of our subsidiary and Albright & Wilson obtained common stock in Hooker worth £5,490,000. Despite keen regret at parting company with our oldest subsidiary we are confident that the change will prove to be in the best interests of the Group. We had been conscious for some time of our vulnerability in markets dominated by much larger concerns and of increasing difficulty in generating in the United States new funds commensurate with the opportunities for expansion. Plans for heavy capital investment in the United Kingdom and in Canada emphasised the need for some concentration of resources.

Electric Reduction Company of Canada Limited had a busy year. Sales of all major products increased and profit was also higher. At Buckingham, our original works in Canada, phosphorus output was reduced in accordance with the plan to transfer production to our new plant at Varennes. At the same time the output of the other processes at Buckingham was increased and, in particular, the production of sodium chlorate. The construction of the factory at Vancouver was the main object of our capital expenditure and technical effort in Canada during 1956, and production began as planned, in the first quarter of this year.

Sales and profits of our Australian company showed a satisfactory increase for the year, despite very heavy additions to costs, and the re-imposition of import restrictions.

ORGANISATION

In order to improve flexibility and control in the management of Group affairs the Board has decided to reorganise the structure of the group of companies under its control. At present, Albright & Wilson carries on manufacturing activities and also acts as the Group holding company. It has now been decided to transfer the manufacturing assets and activities to a wholly owned subsidiary, leaving Albright & Wilson to concentrate entirely on Group affairs. The necessary steps to implement this decision are being taken.

PROSPECT FOR 1957

The forecast for 1957 is that Group sales will continue to expand, and that given reasonably stable economic conditions the profit from our manufacturing activities will also rise. On the other hand, Group profit as a whole is expected to show little change, since only the distributed profit on our investment in Hooker will be shown, instead of the whole profit of Oldbury Electro-Chemical Company hitherto included. We plan to spend in 1957 about £3 million on projects due for completion during the next two or three years, in the belief that it is only by sustaining our rate of expansion that we shall maintain our position in an industry notable for its achievements since the war and for its promise of future growth.

The report and accounts were adopted, and the retiring directors, Mr W. B. Albright, Mr R. E. Threlfall, and Mr J. C. Wilson, were re-elected.

At the Extraordinary General Meeting which followed a Special Resolution was passed, altering the Company's Memorandum of Association so as to empower the company to enter into guarantees in order to facilitate the financing of subsidiary companies in the Group.

GENERAL LIGHTERAGE (HOLDINGS)

(Transport and Storage)

The annual general meeting of General Lighterage (Holdings) Limited was held on May 24th in London. The chairman, Mr P. S. Henman, in his statement, said that the year had been one of ceaseless activity, with expanding revenue, increasing costs and often finer profit margins, but despite the Middle East situation the Group had emerged with trading profits which exceeded those of the preceding year.

Profit Summary

1955 £		1956 £
1,603,802	Capital employed	2,008,68
2,001,343	Gross receipts	2,378,20
374,297	Group profit	420,90
109,077	Depreciation	132,52
134,336	Taxation.....	146,94
130,884	Net profit.....	141,44
14,016	Preference dividend ..	14,01
44,248	(Eq. 10 5-14th%) Ord. dividend* (11%)...	50,20
72,620	Retained profit	77,22

* *Plus a 1½ per cent, tax free, distribution of capital profits in respect of* 1956.

A steady expansion in facilities had taken place, with the introduction of bulk haulage vehicles, the acquisition of two barge fleets and the opening of three new warehouses. The Group had made a promising beginning of the new trading year.

The report and accounts were adopted, and a special resolution was passed that the name of the company be changed to Transport Development Group Limited.

"SHELL" TRANSPORT & TRADING CO., LTD.

ANNUAL MEETING

The annual general meeting of The "Shell" Transport and Trading Company, Limited, was held on May 29th in London.

The Right Honourable Lord Godber, chairman, in the course of his speech, said:

I mentioned in my Statement that supplies of oil to Europe had been materially better than could have been reasonably forecast in the emergency caused by the closure of the Suez Canal. Since then, the position has further improved and, with one or two exceptions, all outstanding restrictions on consumption in European countries have now been rescinded. As far as this country is concerned, petrol rationing has happily ended.

WIDESPREAD OPERATIONS

For us, the Suez crisis has demonstrated in a very practical manner the strength and resilience derived from the wide spread of our operations. So far as crude oil is concerned, the major areas of production in the world are few in number. In fact, the USA, the Middle East and Venezuela together accounted for almost 90 per cent of the free world's production in 1956. Our Group is well represented in each of these areas. Moreover, quite substantial quantities were also derived from the Far East and from such widely separated countries as Canada, Colombia, Trinidad, as well as the Netherlands and a few other countries. The Group is indeed second to none in the diversity of its crude oil sources.

From these sources Group companies carry their oil supplies for manufacture and sale in almost every country of the free world, and the Group's earnings are divided, broadly speaking, in equal proportions between the Western and Eastern Hemispheres.

Just as the flexibility of the industry enabled supplies to Europe during the past few months to be better than expected, so the flexibility afforded by the Group's world wide resources enabled us to make a major contribution to that achievement.

CURRENT YEAR'S RESULTS

I am glad to say that as a consequence of all this our financial results for the first quarter of 1957 have continued the upward trend of recent years.

Net income for the three months ended March 31, 1957, amounted to £51.7 million after deduction of estimated taxation for the period; this compares with a figure of £40.7 million for the same period of 1956.

The enhanced income is attributable partly to higher earnings by Shell Oil Company in the United States and to a material increase in output in Venezuela, where production of crude oil available to the Group averaged some 960,000 barrels a day in the first quarter of 1957, compared with some 750,000 barrels a day in the corresponding period last year.

I also referred in my Statement to the study which was being made by members of the international oil industry of the best ways and means of transporting increasing quantities of Middle East oil by pipeline. Meanwhile a continuing group has been set up which will give the necessary detailed study to the many intricate problems involved. These will be pursued with as much speed as possible so that the project, as ultimately defined, can be discussed with the appropriate governments.

The report was adopted.

LONDON ASIATIC RUBBER

The Annual General Meeting of The London Asiatic Rubber and Produce Company Limited will be held on June 17th in London.

The following is an abstract of the address of the Chairman, Sir Eric Macfadyen, circulated with the report and accounts:

The output of 13,657,800 lb compared with 13,189,830 lb for 1955 and 12,238,539 lb for 1954. We may look to see the upward trend continue as more of our postwar pedigree areas come into bearing (output in 1957 should approximate 15 million lb). The profit before taxation was £630,433. Taxation (other than export duty) absorbed 47.69 per cent of this, £300,662, leaving us with £329,771. We transfer £131,047 to Replacement Reserve and £25,000 to Capital General Reserve and then recommend the payment of a 17½ per cent final dividend, making 22½ per cent in all for the year.

You were advised by circular dated April 26th last of the offer the Board had made for the issued capital of Bukit Kajang Rubber Estates Limited. We received acceptances from the holders of over 96 per cent of the capital and we are taking steps under the relevant provisions of the Companies Acts to acquire the remainder. In addition to that Company's three properties comprising in all 4,647 acres, we acquire control of surplus liquid assets which represent over 10s. per Bukit Kajang share.

Since 1948 we have replanted, or new planted, 900 acres a year on average. The tempo has been accelerating as security conditions improved: in 1955, 1,571, and 1956, 2,130 acres.

BRITISH ROPES LIMITED

CONTINUED PROGRESS

The thirty-fifth annual general meeting of British Ropes Limited was held on May 29th in London.

Mr Herbert Smith (the chairman), in the course of his speech, said: The accounts again disclose a satisfactory year's trading. The group profits for the year, before charging depreciation and auditors' remuneration at £2,676,000 compared wth £2,321,000 for the prevous year and the increase of £355,000 reflects the continuing progress made by your company. The heavy burden of taxation has this year absorbed an even higher proportion of the profits. Your directors have transferred £450,000 to General Reserves and have decided to recommend a final dividend of 13 per cent on the Ordinary Stock making a total of 17 per cent for the year, compared with 16 per cent for the previous year.

Our export business, which now amounts to something like 20 per cent of our total trade, has increased during the year under review.

So far as our Home Trade in wire rope is concerned there has been a steady increase in sales totals, both as to tonnage and value, though Government Departments bought on a reduced scale. Demand from the Fishing and Shipping Trades has improved somewhat, and General Engineering provides a fairly constant market for ropes.

As regards the Wire Section of your company, this has shown a very definite improvement in sales tonnage, and has particularly expanded in the Export Market.

The report and accounts were adopted.

SCHWEPPES LIMITED

THE HONOURABLE R. HANNING PHILIPPS ON ANOTHER SUCCESSFUL YEAR

DIFFICULT TRADING CONDITIONS SURMOUNTED

The sixtieth annual general meeting of Schweppes Limited was held on May 30th in London, The Honourable R. Hanning Philipps, MBE (the chairman) presiding.

The following is an extract from his circulated statement:

A year ago I predicted that we should have a struggle to maintain our Schweppes Home profits at the 1955 level. This prediction assumed at least an ordinary summer and no exceptional change in the upward curve of rising costs. In the event we had no summer at all, in fact it was the worst for 50 years and in the autumn our distributon costs were increased by the introduction of petrol rationing and the higher price of fuel. Despite these unexpected troubles we have held our Schweppes Home net profit before taxation at £1,114,340, compared with £1,109,604 in 1955. This, I think, is a remarkable achievement and reflects the resiliency of our business. In fact, the Home sales of Schweppes products fell heavily in the key months of July, August and September, yet they finished the year 7.7 per cent above the total for the year 1955. And these satisfactory results were achieved once again without any increases in our prices during the year.

In 1957, with the exception of a modest adjustment in the price of our syphon Soda Water we are continuing to hold the prices of our Schweppes minerals at the level ruling in 1948.

Your Board recommend a final dividend of 12½ per cent on the increased Ordinary capital now amounting to a total of £2,267,000.

This payment with the interim payment of 5 per cent costs £222,021 and is covered approximately two and a half times by the year's profit after paying the large sum in taxation of £561,633.

CONSOLIDATED PROFITS

The Schweppes Consolidated profits which cover the overseas as well as the home operations do not compare as favourably with the 1955 figure as do the Home profits. The consolidated net profit before taxation amounted to £1,211,116 compared with £1,371,675 in 1955. This less favourable situation for the organisation as a whole is mainly attributable to two of our home subsidiaries, Kia-Ora Limited and Pepsi-Cola Bottling Company (London), and our American subsidiary. Sales of both the Kia-Ora products and Pepsi-Cola are much more sensitive to changes in the weather and they both suffered very severely from the bad summer.

HOME DEVELOPMENT

During 1956 we doubled the Kia-Ora Suncrush plant at our Aintree factory and completed the extra fruit juice bottling line at Manchester and Colwall.

The new Brislington factory near Bristol put in hand in 1955, is now completed and will shortly be in production. We have recently purchased Stock Depots at Llandudno and Aberdeen which will be in full operation this coming summer; and we are planning to open three further depots at Carmarthen, Middlesbrough and Romford.

PEPSI-COLA BOTTLING COMPANY (LONDON)

In 1957 the first three months' sales have shown substantial increases and there is some evidence that the long and costly merchandising effort we have put behind this product is now beginning to bear fruit. We opened up the Bristol area at the beginning of April and are taking over the existing Newcastle on Tyne bottling plant.

OVERSEAS FRANCHISES

USA.—We suffered an important setback in 1956, when the Bottler handling New York, which is our most important market, met with a prolonged "strike" at the height of our selling season in June and July. As a result we not only disappointed our customers but failed to benefit from our continued heavy charges for advertising our Tonic Water. This very serious blow prevented the realisation of the hope I expressed in my 1954 review that, in the USA, we should break even in 1956.

However, the sales of Schweppes (USA) Limited for the first three months of this year show substantial increases over last year, and suggest that the current year will be very much better.

Canada.—Sales in Canada continue to expand and it seems reasonable to expect that the Canadian Company will shortly be making trading profits.

Of the two other Franchises operated in conjunction with the Pepsi-Cola Corporation, the Venezuelan operation is progressing well, but in Mexico we are so far disappointed with the sales.

Outside the Americas our Franchises are progressing with varying degrees of success, but I would especially mention Belgium and France, Malta and Hong Kong, in all of which countries we have increased sales substantially to the benefit both of the local Franchise Bottler and ourselves.

During the year arrangements were made for a Franchise in Italy and this is now in operation from Milan. In Portugal technical difficulties arising from local laws have delayed the opening of our Franchise, but we expect it to be working shortly.

I am glad to report that up to the time of Easter this year Home sales of our Schweppes products have increased by 15 per cent over 1956.

The report and accounts were adopted.

THE KLABANG RUBBER COMPANY LIMITED

SIR JOHN D. BARLOW'S SPEECH

The Thirty-Seventh Annual General Meeting of The Klabang Rubber Company Limited, was held on May 28th at Plantation House, London.

Sir John D. Barlow, Bart, MP, the Chairman, in the course of his speech said: The profit for 1956 was £20,236 compared with £29,843 last year. United Kingdom and Malayan Taxation requires £7,900. The transfer to Replanting Reserve is £6,500. An Interim Dividend of 1s. per share (5 per cent) less Income Tax was paid on May 14, 1957, and required £5,750. No further dividend is proposed in respect of 1956. The carry forward is £14,161, slightly more than the previous year.

A Special Capital Distribution of 1s. per share was paid at the same time as the dividend of 1s. per share. This Capital Distribution is exempt from Income Tax and was paid from the Capital Realisation Surplus Account which has been reduced to £12,473.

The output of rubber was 777,000 lb, slightly more than the previous year.

REPLANTING

During the year 150 acres were replanted. Since 1948 we have replanted 1,378 acres. With the areas planted just before the war, over 50 per cent of the planted area on the estates is under high yielding material. It is disappointing that the 1948 and 1949 replantings on Klabang Estate are not in bearing yet, but it seems to be a common failing of replanted rubber in the district. When the replants come into bearing, we can expect good crops, judging by present yields of budded rubber on our estates and we should soon be harvesting annual crops of 1 million lb and over. No replanting is to be undertaken in 1957 and it is planned to replant a small area in 1958.

COMPANY'S INVESTMENTS

The Company has invested in Government Securities £35,603 which earned an income of £1,405 and £20,729 in Produce Company Investments, which gave a gross dividend of £3,483 or 17 per cent on the original cost of the shares. The Produce Company Investments consist of shares in seven Rubber Companies which cost £11,820 and in the Tea Companies which cost £8,909.

We are continuing our policy of extending the Company's Investments as opportunity occurs.

During the last two years there has been a change from overproduction of natural rubber, to a position where all the natural rubber produced is required. This is an encouraging development.

RECORD WORLD PRODUCTION

World production of natural and synthetic rubber in 1956 reached the all time record of 3,135,000 tons. Natural rubber accounted for 1,925,000 tons and the rest was synthetic. Figures for 1957 show that probably 3,165,000 tons of natural and synthetic will be produced; with production and consumption of the two types of rubber evenly balanced.

Each year the demand for rubber increases. It has been estimated that by 1965 the annual consumption of rubber will be approximately 4 million tons. Probably 2 million tons will be natural rubber and the other half of the world's production will be synthetic rubber. By giving close attention to methods of reducing our costs of production and by continuing research into the uses of natural rubber, we will ensure that our product remains competitive with the man made synthetic rubbers.

BUDGET TAX RELIEF

The recent budget announcement of the Chancellor of the Exchequer giving relief from UK tax to companies, which operate abroad, is a most welcome tax concession. I have been urging the British Government to adopt this tax procedure for several years.

Until the provisions of the Finance Bill now before Parliament have become law, it is difficult to determine exactly what saving of tax, if any, can be expected by this Company. It must be appreciated that under existing laws the cost of replanting and upkeep of immature areas are allowed as an expense for tax and consequently with a large replanting programme on hand, the Company's tax liability is relatively small.

MALAYA'S INDEPENDENCE

On August 31, 1957, Malaya will be granted Independence. This will be an important milestone in the history of the country. With half its people under 21 years old and with four-fifths of the country, which is the same size as England, still under jungle, Malaya has great scope for development. The prices of rubber and tin—the two main products of the country—are high and Malaya is now the most prosperous country in SE Asia. We all wish Tungku Abdul Rahman every success in leading his country as an independent nation in the Commonwealth.

The Report and Accounts were adopted.

VAB PRODUCTS LIMITED

A SATISFACTORY ACHIEVEMENT

The twentieth annual general meeting of Vab Products Limited was held on May 23 in London.

Mr Iver Lloyd, AMIAE, FCS, MInstBE (the chairman), presided and, in the course of his speech, said:

The Accounts disclose that the Profits of the Group, before providing for Taxation, amounted to £35,904 for the year ended December 31, 1956, compared with £45,583 for the previous year. After providing for Taxation, the available profits for 1956 were £18,692, against £17,783 for the year 1955.

The incidence of Taxation still continues to be a drain on the resources of your Company. From the profit earned, about 50 per cent is due to be paid in Taxes, and we still have Purchase Tax on a number of our manufactured products, which is bound to react on sales.

The Group Profits carried forward at December 31, 1956, increased to £35,314, against £32,577 brought forward from last year, and the Capital Reserves have increased from £83,749 to £91,470. I think you will regard this as a satisfactory achievement, since conditions remained difficult throughout most of the year. In spite of very fierce competition which your principal subsidiary Companies experienced, output and turnover were increased, and this has to some extent offset the lower Net Profits of your other subsidiary Companies which were affected by the fluctuating conditions in the metal market, in spite of which the Company's products were sold at stabilised selling prices.

The turnover continues to increase during the first four months of 1957, and if this is maintained the results for the current year should be pleasing to you.

We are now actively developing new lines which I have every reason to believe will contribute to the expansion of your Company. The results of these may not be reflected during the current year, but I look forward to the future with every confidence.

Your Directors are pleased to recommend a Final Dividend of 7½ per cent, less Income Tax, for the year, which, with the Interim of 2½ per cent already paid, makes a total of 10 per cent for the year 1956.

The report was unanimously adopted.

LISBON ELECTRIC TRAMWAYS

LORD RATHCAVAN ON YEAR'S OPERATIONS

The annual general meeting of Lisbon Electric Tramways, *Limited*, will be held on June 26th in London.

The following is an extract from the circulated statement of the Chairman, The Right Honourable the Lord Rathcavan:

The total number of fare-paying passengers carried on our vehicles continued to increase, despite the fact that tram passengers declined very slightly. In 1956 passengers carried totalled 363,728,000 as compared with 357,410,745 in 1955, an increase of 6,317,255, or 1.76 per cent, whilst the mileage run by our vehicles (comprising both trams and buses) at 29,821,712 compared with 28,843,992 in 1955 shows an increase of 977,720, or 3.39 per cent.

Once again, although revenue has increased, expenses have also risen appreciably. The major part is accounted for by an increase in wages. The higher wages which we shall be paying in 1957 are bound to affect our net revenue adversely and may mean that we shall not have available sufficient to cover the usual ordinary dividend. If this should happen, we rely upon the Authorities in Portugal to help us towards a solution which will resolve our difficulties and enable us to do justice to the shareholders and to finance and to maintain the high degree of service which we now extend to the expanding City of Lisbon.

The year's operations show a profit of £75,283. This profit, together with the balance of £72,738 brought forward, gives a total of £148,021.

The Preference Dividend and Ordinary Dividend of 6½ per cent net for the year absorb £76,499, leaving to carry forward a balance of £71,522.

APPOINTMENTS

BRITISH OVERSEAS AIRWAYS CORPORATION require a number of Station Officer Trainees to commence duty in September 1957. Training, which will be for a period of up to three years during which salary will range from £550 to £675 per annum, will cover specialised work, such as passenger and cargo handling and operational flight watch, and also some aspects of general management. Applicants must be under 25 years of age, have finished their National Service, and be prepared to serve mainly overseas. The minimum educational qualification is General Certificate of Education at Advanced Level and, in addition, the Corporation will look for the personal qualities essential to overseas representation and ultimate management.—Applications, giving full personal particulars, should be submitted to *Staff Manager, Ground Services, B.O.A.C. Headquarters, London Airport.*

H.M. TREASURY: The Civil Service Commissioners invite *applications for at least two posts of* ECONOMIC ASSISTANT. The appointments are initially for five years (or less by arrangement).

Age at least 21 and preferably under 30 on July 1, 1957.

Candidates must have at least a Second-class Honours degree in Economics or a *related subject*. Applications will be considered from those taking their degrees this summer.

Salary (according to age and *experience*): £605-£1,055 (men); £605-£980 (women). Women's pay being improved to reach equality with men's by 1961.

F.S.S.U. applies.

Particulars and application form from Secretary, Civil Service Commission, 6 Burlington Gardens, London, W.1, quoting No. 4715/57/T. Completed application forms *should be returned* by June 19, 1957.

ASSISTANT TO COMMERCIAL MANAGER ORB A DEPARTMENT WANTED. SOME KNOWLEDGE OF *GERMAN ESSENTIAL. GOOD PROSPECTS FOR* YOUNG MAN WITH DRIVE AND INITIATIVE.—BOX 700.

WOMAN GRADUATE wanted to *edit* Works Magazine and to assist in running Works Library. West London district. Experience of office routine desirable.—Please apply, giving age, *education and relevant experience*, to Box 704.

UNIVERSITY OF OXFORD

The Readership in Commonwealth Government will fall vacant on June 30, 1957. The electors *invite applications*, in eight copies, naming three referees, but without testimonials, to be received by the Registrar (from whom further particulars may be obtained) by July 4, 1957. The present stipend (under review) is on the scale £1,400 to £1,650. The reader will be required to lecture or give instruction on Commonwealth Government in two at least of the three University terms, and to join the F.S.S.U.

THE UNIVERSITY OF MANCHESTER

RESEARCH STUDENTSHIPS AND RESEARCH GRANTS IN ECONOMIC AND SOCIAL STUDIES

Applications are invited for the above studentships and grants, tenable for one year in the first instance, and renewable for a further period not exceeding two years. The *studentships* are normally of the value of £350 or £400 per annum. They are intended for candidates who have obtained the degree of Bachelor or Master in this or any other *approved University*.—Applications should be sent not later than July 1, 1957, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of ASSISTANT LECTURER in AGRICULTURAL ECONOMICS. The salary scale is at present *under review, and is expected* to be £700 to £850 per annum. Membership of F.S.S.U. and Children's Allowance Scheme.—Applications should be sent not later than June 22, 1957, to the *Registrar*, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

THE UNIVERSITY OF SHEFFIELD

Applications are invited for a post of ASSISTANT *LECTURER in the DEPARTMENT OF ECONOMICS* to teach Economic History mediaeval and early modern, to begin duties on October 1, 1957. A new *salary scale is to be introduced and is expected to be* £700 x £50 to £850, with F.S.S.U. provision and family allowance.—Further particulars may be obtained from the Registrar to whom applications *(four copies), including* the names and addresses of three referees, should be sent by June 26, 1957.

AUSTRALIA—UNIVERSITY OF MELBOURNE

Applications are invited for a position of LECTURER IN ECONOMIC HISTORY.

The appointee will be expected to commence duty not later than March 1, 1958. Preference will be given to candidates having a particular interest in Australian economic history.

The salary will be £A1,300 to £A1,800 per annum according to qualifications, with annual increments of £50.

Superannuation is similar to F.S.S.U.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

The closing *date* for the receipt of applications, in Australia and London, is July 15, 1957.

HOME OFFICE: RESEARCH OFFICER. The Civil Service Commissioners invite applications for at least one post in London for period of three to five years. Appointments may be renewed.

Duties comprise research on Home Office and Prison *Commission subjects, particularly* on causes of delinquency and treatment of offenders.

Age normally at least 30 on April 1, 1957, but candi*dates under that age may be considered* exceptionally. Candidates must have had sound practical experience in organisation of social or psychological research or research *in analogous field. They must have a University degree*, preferably but not necessarily including law, sociology, psychology or statistics, or an appropiate professional qualification. Some knowledge of *modern statistical* theory and methods desirable.

Salary (men) £1,375 to £1,950 (lower if appointed under the age of 30). Exceptionally starting pay above *minimum*. Women's pay somewhat lower but being improved to reach equality with men's in 1961.

F.S.S.U. applies.

Further particulars and application form from Secretary, Civil Service Commission, 6 Burlington Gardens, London, W.1, quoting No. 4716/57/T.

Application forms should be returned by June 18, 1957.

STATISTICIAN is required by Tube Investments, Ltd., for its operational research team. This is an excellent opportunity for a fully qualified mathematical statistician to take part in interesting work that will broaden his experience and offer wider opportunities for advancement. An attractive salary is offered. Contributory Pension Scheme.—Full details to Personnel Manager, T.I. (Group Services) Ltd., Rocky Lane Aston, Birmingham, 6.

ORGANISATION AND METHODS

SENIOR ASSISTANTS AND GRADUATE TRAINEES

A large organisation which is expanding its O. and M. work for the improvement of administrative services, requires two senior assistants (*aged* 28 to 33) with at least four years' experience in this field, and four graduate trainees (aged 21 to 24).

First-class opportunities for promotion to senior executive positions in O. and M. or in other management spheres are in prospect for men of *the right calibre.*

Training will be given in O. and M. techniques and in the application of electronic computers for business purposes. Training will be individually designed for the development of each man. Candidates should preferably have knowledge of mathematics up to G.C.E. "A" level.

Commencing salaries: Senior Assistants, £1,000 to £1,250; Graduate Trainees, £550 to £700 (according to ability).

Place of employment: Industrial establishments in the provinces or London as required.

Apply in strictest confidence to Box 709.

UNIVERSITY OF DURHAM

Applications are invited for the post of Assistant Appointments Officer. The person appointed will be chiefly concerned with students and graduates in Arts and cognate subjects. Possession of a degree and experience of work in a field in which Arts graduates are commonly employed are essential. Starting salary will be within the *range* for University Lecturers (initially £900 to £1,450) together with membership of F.S.S.U.—Further *particulars* of the post may be obtained from the Registrar of the University at 46 North Bailey, Durham, with whom twelve copies of applications should be lodged not later than Saturday, June 15, 1957. (Candidates outside the British Isles may *submit one copy only.*)

HERTFORDSHIRE COUNTY COUNCIL

NORTH HERTS TECHNICAL COLLEGE

Principal: F. W. Kellaway, B.Sc., Dip.Ed.

Applications are invited for the post of Head of Department of *Mathematics*, Grade II, vacant through the promotion of the present holder to a Principalship.

Salary according to Burnham Scale £1,400 to £1,600. Duties to be taken up as *soon* as possible and not later than January 1, 1958.

Further particulars may be obtained by sending a stamped addressed foolscap envelope to The Principal, North Herts Technical College, Letchworth, to whom applications should be *sent* by June 15, 1957.

UNIVERSITY COLLEGE OF THE WEST INDIES

Applications are invited for appointment to research staff of Institute of Social and Economic Research from persons with good honours degree in economics and interest in economic analysis. Investigations may be made in any part of the British Caribbean territories. *Appointment* will be in one of the following grades according to qualifications and experience.

Junior Research Fellow £750 x £50—£850 p.a.
Research Fellow £900 x £50—£1,200 x £50—£1,600 p.a.
Senior Research Fellow £1,300 x £50—£1,500 p.a.
Child allowance. F.S.S.U. Unfurnished accommodation at rental of 5 per cent basic salary or allowance in lieu. Duties to be assumed as early as possible. Appointment for 3 years in first instance. *Passages* for appointee and family (maximum 5 passages).

Applications (6 copies) detailing qualifications and experience and naming 3 referees by June 29, 1957, to Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

INFORMATION OFFICER CLASS IN THE CIVIL SERVICE

The Civil Service Commissioners invite applications for pensionable appointments as Principal Information Officer (about six), Senior Information Officer (about 20), Information Officer (about 47) and Assistant Information Officer (about 25) in various Government Departments. Vacancies mainly in London.

All the posts call for a good standard of general *education*, a lively *interest in current affairs*, and a wide general knowledge. For posts in the basic and higher grades a good publicity sense and organising ability are essential. Some knowledge of Government organisation will be an advantage. In addition candidates are required to have experience, varying in degree according to the grading of the post, of one or more of the following fields: general publicity work, journalism and book and picture editing, exhibitions, *documentary films, social* research, preparation of reference material, illustration research, advertising, art and design, tours.

Salary scales (in London):

Principal Information Officer—£1,635 to £1,845 (men); £1,508 to £1,722 (women). Senior Information Officer—£1,285 to £1,530 (men); £1,191 to £1,408 (women). *Information Officer*—£1,055 to £1,225 (men); £967 to £1,129 (women). Assistant Information Officer—Salary on entry ranges from £365 at age 18 to £625 (men) or £605 (women) at age 25, *thence rising* to £1,000 (men) or £910 (women).

Salaries outside London somewhat less. Starting pay above minimum *in certain cases*. Women's pay where lower than men's being improved to reach equality with men's by 1961. Five-day week generally. Prospects of promotion.

Particulars and application forms from Secretary, Civil Service Commission, 6 Burlington Gardens, London, W.1, quoting No. *76/57/9*; completed *application forms* should be returned by June 6, 1957.

ECONOMICS AND MARKET RESEARCH DEPARTMENT in large steel company requires a senior research assistant. This is a responsible post requiring initiative and the work is interesting and varied. It involves both desk research and the collecting of information by interview. Good prospects for advancement within the Company for a man of the right calibre. Applicants should have an appropriate university degree *some experience in this type of work and a knowledge of* applied statistics. Age preferably not over 30.—Application to Central Staffing Department, Richard Thomas & *Baldwins Limited*, 47 Park Street, London, W.1.

A LIFE OFFICE requires at its Head Office in London an ACTUARIAL STUDENT who has already passed several sections of *Part I or Part II of the* Institute or Faculty examinations. Our own staff have been notified of this advertisement.—Apply Box 705.

AUSTRALIAN NATIONAL UNIVERSITY

CANBERRA

RESEARCH SCHOOL OF SOCIAL SCIENCES

Applications are invited for appointment as RESEARCH FELLOW IN THE DEPARTMENT OF SOCIAL PHILOSOPHY.

Other things being equal, preference will be given to a person whose main interests lie within the field of Political and Social Theory, but this is not decisive and the University will be glad to receive applications from philosophers who desire to carry on research in other branches of philosophy as applied, are expected to *have* had experience in postgraduate work.

Salaries of Research Fellows are at present within the range of £A1,224 to £1,824, but the *Council of the* University at its next session will consider whether the The appointment will be for three years, with a possible extension to the *maximum of five years. Reasonable* removal expenses will be paid, and superannuation on the F.S.S.U. pattern is applied.

Further details should be obtained from the *Secretary*, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close in Australia and London on July 1, 1957.

NOTTINGHAM AND DISTRICT TECHNICAL COLLEGE

SHAKESPEARE STREET, NOTTINGHAM

Applications are invited for the post of LECTURER IN ENGLISH STUDIES, with Work Study experience.

Salary in accordance with the Burnham Technical Scale as follows: £1,230 rising by annual increments of £30 to £1,380 per annum.

The policy of the College is to encourage staff and students to undertake research work, an appreciable amount being *in progress* at the *present time*.

Further particulars and form of *application* may be obtained from the Principal. Completed forms should be returned not later than June 11, 1957.

UNIVERSITY COLLEGE OF GHANA

Applications are invited for Research Fellowship in Economics, tenable for one year in first instance, research into some aspect of Ghana economy. Salary *range* £960 to £1,600 p.a. Outfit allowance £30. Family allowance £100 p.a. per child (maximum £500 p.a.). F.S.S.U. Passages for appointee, wife and maximum of five children. *Part-furnished* accommodation at rent not exceeding 7.5 per cent of salary.

Detailed applications (six copies), naming three *referees, by June 28, 1957, to Secretary, Inter-University Council for Higher Education Overseas*, 29 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

Desirable, but not essential, qualifications are previous practical or academic study of competition in present-day markets, a knowledge of the chemical industry or of chemistry, an acquaintance with at least one West European language, and the ability to interpret international trade agreements, tariff *schedules*, and the like.

Salary according to qualifications and experience, but not less than £1,000 per annum. Non-*contributory* pension scheme.

Write Staff Manager, The Distillers Company Limited, 21 St. James's Square, London, S.W.1. Quote Ref. 25/57.

MAKERERE COLLEGE, THE UNIVERSITY COLLEGE OF EAST AFRICA

EAST AFRICAN INSTITUTE OF SOCIAL RESEARCH

Applications are invited for Senior Research Fellowship in Economics. Salary between £1,107 and £1,560 p.a., entry *point according to qualifications and experience. Family* allowance. F.S.S.U. Passages provided. Contract 2½ years (two years in Africa).

Detailed *applications* (six copies) stating research interests and naming three referees, by June 28, 1957, to Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1. from whom further particulars may be received.

ORGANISATION AND METHODS DEPARTMENT

An important group of light engineering companies of international repute mainly based in the Midlands, which is broadening its activities in this *important sphere*, invites applications for the position of Head of its Organisation and Methods Department.

The group has around 6,000 employees, and the position carries direct responsibility to the board for the conception, *development and practical application of all* methods, systems and organisational procedures throughout the Group's offices and factories.

The ideal candidate would have experience of both factory and administrative procedures, with broad knowledge of work study and similar techniques for the promotion of higher productivity.

Applicants should have a University degree or be able to show equivalent attainments. They must have had several years' practical experience and executive status in a similar appointment, and be conversant with the *most modern methods and techniques.*

Emoluments will be of the order of £2,500 upwards, *according to qualifications and experience, with adequate* pension provision and excellent prospects for advancement.

Applicants should state age and in chronological order their education, training, qualifications, positions held and other relevant information, to Box 697.

A LEADING MERCHANT HOUSE in Malaya offers an attractive appointment to experienced executive aged 35-40 with successful commercial engineering background to take charge of all their engineering activities involving the sale, installation and servicing of a wide range of engineering plant and equipment and the representation of many well-known U.K. manufacturers. This senior post involves control of technical staff and direct responsibility to the Board for the success of a major department. Total remuneration would be not less than £4,000 per annum.—Apply with full details to Box No. W.505, Haddon, Salisbury Square, E.C.4.

UNIVERSITY COLLEGE, LONDON (Gower Street, W.C.1), requires ASSISTANT LECTURER in POLITICAL ECONOMY. Duties to commence October 1, 1957. Salary £600-£700 p.a. (scale under review), according to *qualifications and experience*. Superannuation and Family Allowance.—Applications, to be received by June 12, 1957, should be sent to the Secretary, from whom further particulars may be obtained.

FINANCIAL EXECUTIVE required in London by major Industrial Company. Exceptional opportunity for first-class man, aged about 40, with good City background combining wide experience of banking and investment with intelligent interest in international economic affairs. In addition to assuming responsibility in financial matters the successful applicant must be capable of making *an effective contribution to overall management.*—Box 711.

FORMER H.M. INSPECTOR OF TAXES (40). Oxford Graduate, last five years as Assistant in Tax Department of very large international group of companies, seeks similar appointment. Experienced in the preparation of extensive computations and of studies of the tax problems arising in such a group. Salary £1,700.—Box 703.

YOUNG executive, early thirties, public school and university trained, nine years' experience sales promotion and market research, consumer and industrial goods, seeks position of responsibility in the field of marketing. Present salary over £2,000 p.a.—Box 702.

STUDIOUS YOUNG MAN (25), R.S.A. Transport, A. Inst. Econ., preparing for final, would welcome opportunity where knowledge of transport, property and costing coupled with a flair for writing, could be used to best advantage in economic sphere.—Box 701.

GRADUATE OXON, 25, requires interesting indoor commercial post. French, German; could travel for *firm in those countries. Experienced commercial* translator.—Box 706.

EXPORT. Man, 32, public school, with commercial experience, including selling, is keen to join exporting company on temporary or permanent basis. Some language ability, glad to travel.—Box 707.

RETIRED Colonial Civil Servant, 49, wide administrative political experience, seeks post in *industry* where organising ability, tact and drive required.—Box 708.

AGENCY and client trained marketing and research economist (32) seeks progressive situation.—Box 710.

THE CUNARD STEAM-SHIP COMPANY LIMITED

5% CUMULATIVE PREFERENCE STOCK
6% SECOND CUMULATIVE PREFERENCE STOCK

NOTICE IS HEREBY GIVEN that the *Transfer* Books in respect of the above Stocks will be closed from June 5 to 7, 1957, both dates inclusive, for the purpose of preparing Warrants in respect of Dividends for the half-year ending June 30, 1957, to be paid on and after July 1, 1957.

By Order of the Board,
J. C. TOMLINSON,
Secretary.

Offices:
Cunard Building, Liverpool.
May 30, 1957.

PIT PONIES. 12,000 still used (and stabled) underground in British coal mines. No other coal-producing country has such a large number. No pony *employed* in a deep mine should work longer than 11 years. All horses and ponies should have a summer surface holiday each year and a supply of balanced food and stables *provided above ground*. Electric battery lamps should be fixed to their collars while at work or their roadways electrically lit. Ample dimensions for travel guaranteed, *especially under bad roofs, and they* should not be worked on steep inclines. No inspection by outside bodies is allowed in mines, and supervision that is normal in a *factory is often impracticable below ground. Why not* discontinue to employ horses and ponies in mines? Why not an independent inquiry to see if this can be *done in seven years?* Why not plan atomic power stations to generate nuclear electricity equivalent to 30 million tons of coal in seven years? Contributions gratefully received.—D. Jeffrey Williams, Secretary, Pit Ponies' Protection Society, 69 Carlton Hill, London, N.W.8.

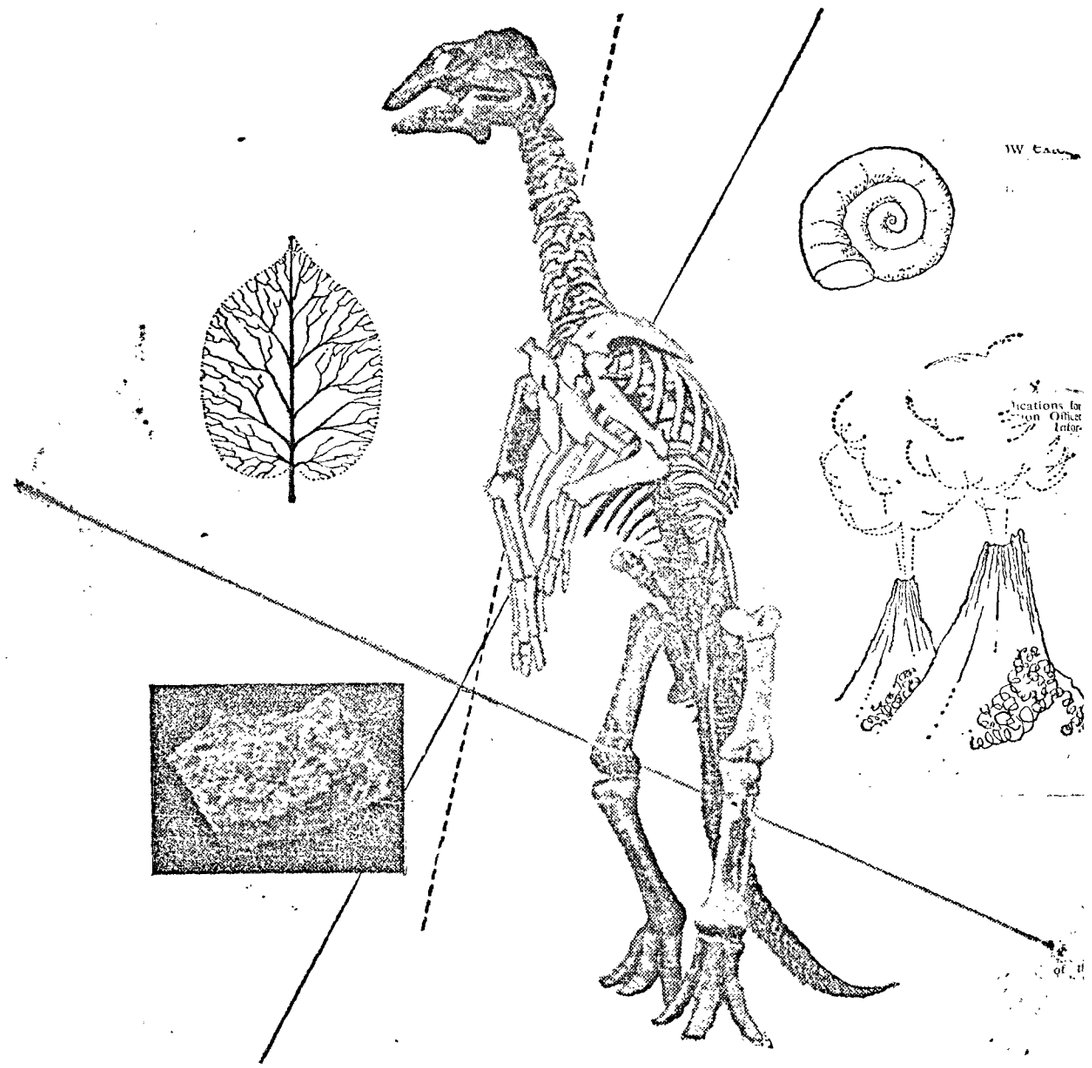
INDIA BY ROAD

An exciting adventure by coach has been arranged by L. D. Cooper, 47 Vineyard Hill Road, London, S.W.19. Twelve weeks glorious holiday through ever-changing *scenery. Three weeks stay in India.* Few vacant seats. Single £65, return £120.

QUEENS HOUSE DAY SCHOOL FOR GIRLS, 69 Fitzjohn's Avenue, N.W.3 (Tel. HAM 1306), provides a unique individual education from 8-18 years. General course to university entrance standard. Ballet, drama, fencing, skating, tennis. Special care given to *each child's needs.* Well-qualified staff, small classes. Trained caterer. Pleasantly situated near the Heath. A few vacancies exist for Autumn Term for suitable candidates.

COUNTRY INDUSTRIES. Demonstrations by blacksmiths, wheelwrights, brickmakers, boatbuilders, potters, agricultural engineers, saddlers, etc. In Holland Park (off Kensington High Street) from June 1st to 15th. Open 11 a.m.-12.30 p.m. Sundays) to 9 p.m.

SECRETARIAL TRAINING especially for university graduates and older students, six-month and intensive 14-week courses.—Write, *Organising Secretary*, DAVIES'S, 2 Addison Road, W.14. PARK 8392.



WORK STUDY. Part-time (evening) 20 weeks' Diploma Course *starts September 9th. Enrolments* open now.—Details of this and five other Courses, including Full-time (6 weeks) and Correspondence, from School of *Time and Motion Study, 29 Cork Street, W.1. Regent* 0516.

FITTED CARPETS expertly cleaned on site; also repaired.—Yakoubian Bros., Ltd., 7 Milk Street, *Cheapside*, E.C.2.

TRY going to a fancy dress ball disguised as a bottle of *Duff Gordon's* El Cid Sherry. You may not win a prize but you'll be in constant demand.

EXPERT POSTAL TUITION for Examinations—University Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export. Commercial, General Certificate of Education, etc. Also *many practical* (non-examination) courses in business subjects.—Write today for free prospectus—and/or advice, mentioning examination or subjects in which interested, to the Secretary (G9/2),

METROPOLITAN COLLEGE, ST. ALBANS
or call at 30 *Queen Victoria Street, London, E.C.4.*

Once upon a time...

... this monstrous creature walked the earth. Tyrannosaurus was his name, but no man ever addressed him by it, for the first man was not to be born for another eighty million years or so, long after Tyrannosaurus and his family had disappeared for ever.

But even then the world was old. Zinc, copper, silver, lead, and many of the other metals and minerals so familiar to us today, had already been formed during the cooling of the earth's crust. They lay unnoticed far beneath the shambling feet of Tyrannosaurus and it was not until some two thousand million years after their formation that man really began to discover how best to use them to his own advantage.

Today the resources of the earth are being exploited more efficiently and more economically than ever before, by great groups of companies such as Consolidated Zinc. We have come a long way in a short time: but we know that there will always be a way ahead. That is why we never cease in our efforts to find new ways of turning the mineral wealth of the world to the service of man.

Harder times are bringing the Rhodesian copper producers closer together, but are they wise in trying to hold the price to £240 a ton?

Your factory can have thermal insulation and fire protection— if you use

ASBESTOLUX

regd.

the NON-COMBUSTIBLE Asbestos Insulation Board

You need not lose money

THE COST OF THE WASTED HEAT that escapes through your uninsulated factory roof each year is probably in the region of 8s. 8d. a square yard. It can add up to a lot of money—and money that has done no work. Lining your roof may well *reduce this loss to as little as one shilling a square yard of insulated roof*—a yearly saving of £360 for every thousand square yards. You should be able to recover the capital cost in three to four years*.

you need not fear fire

A LINING OF ASBESTOLUX asbestos insulation board can at the same time provide a barrier that will contain a fire *for many hours*. For not only is it non-combustible, but it will neither fracture not shatter at any temperature up to 2000°F.

UNAFFECTED BY STEAM OR HUMIDITY Factory conditions of heat, steam or humidity will not affect the structural strength of this lightweight, inorganic sheet.

NOT ASBESTOS CEMENT Asbestolux represents the greatest advance known in the production of insulating sheet lining materials. It is unique in method of manufacture, ingredients and performance. Asbestolux asbestos insulation board is not to be confused with asbestos-cement sheeting which contains a high proportion of cement. The principal ingredient of Asbestolux is Amosite asbestos (from The Cape Asbestos Company's South African mines). The bonding of the fibres is effected not with cement but by a high pressure steam process which ensures an entirely inorganic bond that withstands extremes of heat and is unaffected by steam or moisture.

★ excluding tax considerations

SPECIAL SURVEY OFFER *We shall be glad to arrange for an independent heating consultant to assess the fuel saving that can be made at your factory. Details of this service, technical information and advice are obtainable from the manufacturers.*

ASBESTOLUX is now available on immediate delivery

Economics Handbook Series

The American Economy

ALVIN H. HANSEN

Lucius N. Littauer Professor Emeritus of Political Economy, Harvard University

This stimulating new book by one of the most eminent American economists grew out of the Walgreen lectures which he gave last year at the University of Chicago. It may well prove to be his most important book, since it brings together his thoughts on the American economy at the end of his active teaching career. Opening with a broad survey of economic developments throughout the free world since the end of the Second World War, Professor Hansen continues with a detailed discussion of the American economic situation under Truman and under Eisenhower. The book concludes with a provocative chapter on Keynsian economics and the problems of our time.

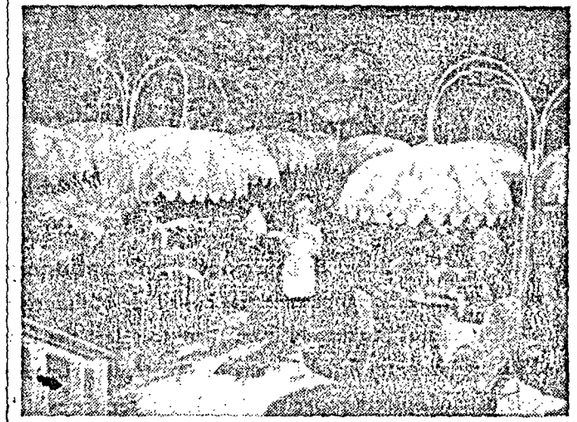
International and Interregional Economics



SEYMOUR E. HARRIS

Chairman, Department of Economics, Harvard University

In this new book the theory of international economics is considered in relation to the actual problems of the world over the past ten years. In particular, Dr. Harris discusses the lack of equilibrium in the economic situation during this period and the extent to which this can be explained by theory. Special attention is given to the dollar shortage and to international institutions such as the Monetary Fund and the European Payments Union. This practical book should have much to offer government officials and businessmen concerned with exporting and importing.

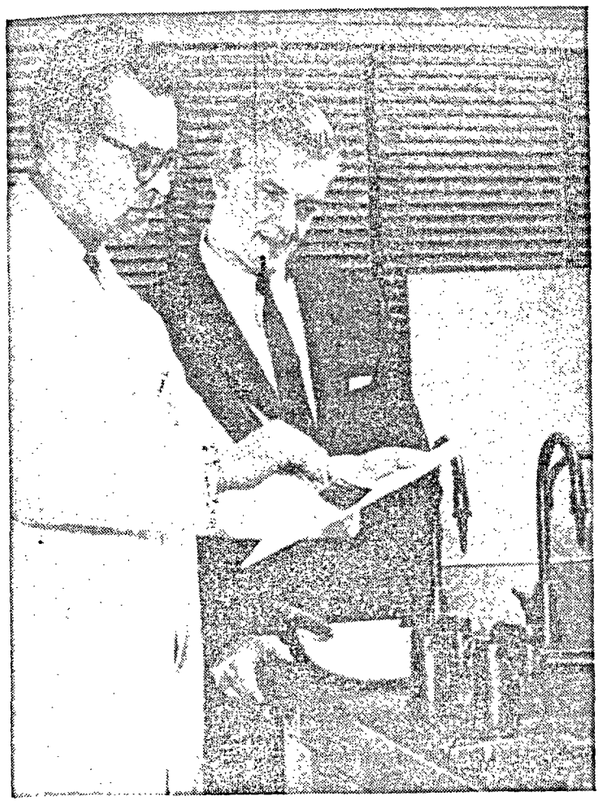
the NEW *'Triple-cut'*

DUNLOP FORT

—motoring's greatest tyre value....



By Appointment to Her Majesty the Queen Manufacturers of Motor Car Tyres Dunlop Rubber Co. Ltd.

THE DUNLOP FORT has long been established as the best value in tyre safety, tyre reliability, tyre life. The new Dunlop Fort is designed and built to the same high standard of quality but has the added advantage of the "Triple-cut" tread, a feature which makes for even greater safety, increased road holding, more silence on the road, longer and more even wear. For modern motoring conditions there is no better tyre and it is well worth the little extra it costs.

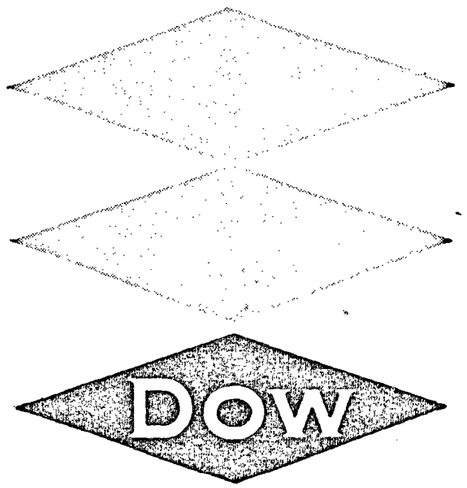
problems in management:



Maintaining quality of product

Quality control can be a difficult problem in manufacturing. Or it can be a routine operation that causes little or no concern. Your own quality control depends upon the uniform quality of the material you purchase from others. Dow latex is a good example.

Manufacturers know that every can of paint must be of consistently high quality. Dow makes certain they can depend on uniformity of the basic material—latex.

Continuous batch testing with the latest scientific equipment is just one of the many ways in which Dow assures dependable quality. This uniformity has helped latex claim much of the credit for the rapid increase in paint sales. Painters like it because it's fast and easy to apply, has beauty, wears well and is easily washed.

Whether you are using latex in the manufacture of paint, paper or textiles, make sure your high standards are maintained. Get in touch with your local Dow representative or the nearest Dow branch office for your latex requirements.

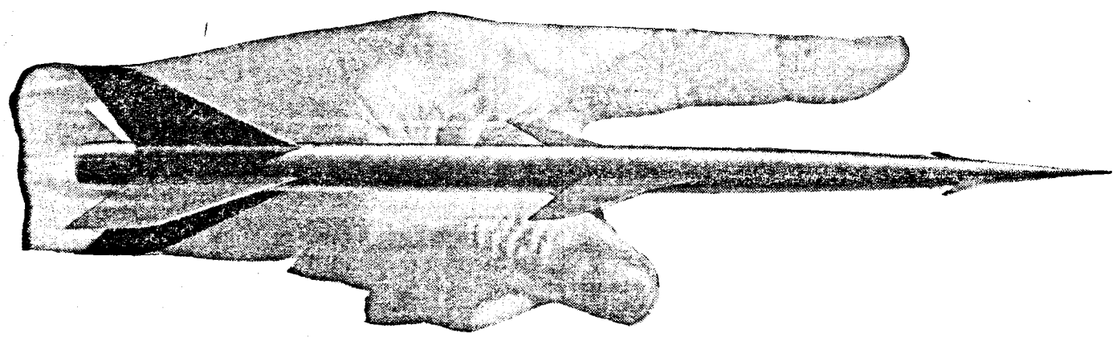
TORYISM
a time of reappraisal

ONE OF THE MOST IMPORTANT PRINCIPLES of the Tory Party is the avoidance of theories and doctrines. This gives desirable flexibility but it also means that Toryism can mean rather different things to different sections of the party.

Sometimes, as now, this can be carried too far. Not for the first time the Tory Party is now involved in a fundamental conflict of meanings and attitudes. It has become time for the party to conduct a self-examination.

The Observer has therefore asked a Tory, Lord Altrincham, to write a series of articles on the state of his party. Lord Altrincham, who is the editor of the National and English Review, was one of the leading critics of the Government's Suez policy. He has campaigned vigorously against Capital Punishment, and his resignation in protest against the colour-bar practised in one of the Victoria League's hostels forced a revision of its policy. He is the 33-year-old son of a former Governor of Kenya and has stood as Conservative candidate for Oldham West at two General Elections.



Altrincham believes that Toryism needs a new direction and a new vitality. In his first article next Sunday he will criticise the party organization and examine the Tory principle of opportunity as opposed to the Socialist doctrine of equality.

To make sure of your copy of The Observer next Sunday, it is advisable to order one now from your newsagent.

THE OBSERVER

What next in the air? How high? How fast?

In meeting the demands for ever-increasing speed and altitude, the English Electric Aviation Group is tackling and progressively resolving the inherent problems of heating and cooling: for, apart from aerodynamic shape, future performance will be governed more and more by the ability of materials and components to endure a rapidly widening range of temperatures. Whatever is to be the future of aviation, it is now being foreshadowed on the drawing-boards of English Electric, Marconi's and Napier—three famous firms sharing talents, experience and resources in the English Electric Aviation Group.

The projects on which we are now working are secret but our achievements speak for themselves— English Electric produce the famous Canberra and supersonic P.1., and are now foremost in the development of Guided Weapons; Marconi's are pre-eminent in radar, radio and navigational aids; and Napier are renowned for experience in the design and production of gas turbines, ram jets and rocket motors.

Vital Truisms

BACK home again this week after his brave fight against a cruel illness Sir Anthony Eden must have found some things very like old times. Here, as in his heyday, are Ministers talking confidentially to "masters and men," as Mr Macmillan still likes to call them, about the need for "reasonable restraint" in their claims for more money. Here, under the Prime Minister's own wing, is the three-year-old and still very vague idea of an independent, impartial body to watch over wages and prices—with profits brought into the brief to coax trade union support, and productivity to give it realism. What chance has Mr Macmillan of succeeding where Sir Anthony did not?

The answer depends upon what the Prime Minister and his colleagues are hoping to achieve. All he has said is that "If such a body can help us, we shall do our best to get it into being." But what sort of help has he *in mind*? The first point to be grasped is that an independent (and irresponsible) committee cannot take over the Government's duty to decide policy; the second is that, if it could, the policy would very likely be wrong. The two objectives most often talked about, though not by Mr Macmillan himself, are some sort of central wages policy or the freezing of wages, prices and profits. Both, it should be said, are not only impossible industrially but also undesirable economically.

Without a doubt the built-in pressure of wage inflation is the bane of our economy. Yet stabilisation, whether by corporate agreement or not, is a will o' the wisp; where it has been tried in other countries, it may have helped to keep the peace in industry, but it has not kept wages and prices down. What is certainly not wanted now is a new collective procedure which will, on the one hand, cut off the motor of dynamic business by condemning all high profits, while, on the other hand, it encourages, according to some "agreed" statistical standard or at the signal of some nationalised industry, uniform increases in wage rates across all industry. What is wanted, as Mr Macmillan knows well enough, is an increase in productivity and output with earnings and profits—and savings as well—going up in step.

It is, in fact, by driving home just these vital truisms to both sides of industry, and to the public, that the independent vigilance committee might be most helpful—always provided that it could get their trust. The character of its members (that is, their quality *not* their representative character) would be crucial. Its job, in effect, would be one of prestige advertising—for the advantage to everybody of a balanced growth in wealth (and welfare) and for the all-round benefits of the high-producing and high-earning economy, unbloated by inflation.

There should be no illusions. Trust, from the trade unions, will be grudging. It is one thing to point to the opportunities, and the necessity, for higher productivity; to intensify and extend, with evidence, the climate of opinion against restrictive (and repressive) practices; or to bring into the "open air" the facts of industrial finance. It is always

worthwhile to give economic good sense a proper airing. But it is quite another thing to make men and managers mend their ways. And the Government's responsibility for husbanding the economy remains paramount. It may well be worth making this attempt "to knock," as Keynes said of Bagehot's *Lombard Street,* "two or three fundamental truths into the heads," not now of City magnates, but of industry's two kinds of magnates. But, to get results, this really needs a Bevin not a body.

China's Sorrows

To the outside world, Mao Tse-tung's regime may look strong and sure of its success as pacemaker for all Asia. But behind its "bamboo curtain" there is brutal frankness about its loss of popularity and economic setbacks

At first glance, the Far Eastern tide would seem to be running strongly in China's favour. May was a merry month for Mao Tse-tung in three respects. Anti-American violence in Formosa and Anglo-American rifts over trade embargoes have been fully exploited by the communists as evidence that the "imperialists" are retreating in disorder. India's economic difficulties and austerity budget have evoked more tactful comment in Peking, but a note of quiet satisfaction pervades it. To uphold its claim to be Asia's "wave of the future," China has to discredit not only America and its friends, but also the idea that Asian poverty can be conquered without loss of liberty.

It is no fire-breathing dragon that looms over the Far East today. Since 1955 China has taken on the look of a suavely implacable python awaiting the dinner gong. It is content to swamp Asia with propaganda and to mesmerise its neighbours by its aura of inevitable triumph. It proclaims its confidence that Formosa and all its other objectives are coming to it in Mr Mao's good time. The world is politely invited to draw its own conclusions from the contrast between other Asian countries, struggling with disunity, discontent and stagnation, and the picture of New China, marching with giant strides to wealth and power.

This picture, as it is usually presented to the outsider's eye, is radiant with news of bumper crops and over-fulfilled plan targets; with the grateful smiles of collectivised peasants, and of reformed capitalists too; even with the claim that, since a year ago, freedom of speech has been added to the other blessings of Peking's benevolent rule. Protests from Formosa or Hongkong that all is not so fair in Mr Mao's garden are easily dismissed as propagandist slanders. Peking's claims are as rich in corroborative detail as in artistic verisimilitude.

But a world seeking the truth need only contrast the tale it is told with what the Chinese communist leaders say within their own "bamboo curtain." Without any material other than their speeches and the columns of their controlled press, New China's sorrows can be clearly observed. Instead of a great well-oiled economic and political machine rolling irresistibly forward, the eye sees a pattern of lurches, checks and plunges, of sharp frictions, suffering, unrest and repression.

A general wage freeze is now being imposed. Some wages are being cut, and managers have been warned not to take on additional hands. Unemployment is so far from being a memory of the past that the workless have now been told not to expect labour exchanges to help them, but to go out and find jobs for themselves. Inflation, another unsolved problem, has eaten away earlier wage increases. Higher prices for such essentials as salt, pork, vegetables, cooking oil, tea, textiles and shoes have lately been announced.

Bedrock rations of rice, wheat and other grains, and cotton cloth are often not honoured, and for cloth they have been halved. The housing programme has come to a dead stop. Overcrowding in towns is made worse by the continuing "blind flooding-in" of penniless peasants, although as many of them as possible are rounded up and shipped back. Famine still recurs, and relief funds are frequently misappropriated. Production of pigs has fallen in two years from 100 to 80 million. Among the government farms which were supposed to set an example of efficiency for all China, one in three is running at a loss.

The "planned economy," that cynosure of Asian eyes, is proving to be a boom-and-bust affair, a matter of plunging rather than planning. When things looked good a year ago, targets were set higher with scant regard for the obvious risks; now the planners have hastily lowered them again behind a smokescreen of jargon. This has cost China dear. The state planning commission itself confessed last month that its methods were "too inflexible . . . waste has been very serious." Not till late 1956 did the commission think of sending out inspectors to check its blueprints against reality, and by then it was "too late to correct many mistakes."

It is a "common practice" for local bosses to falsify reports of production, stocks, and manpower. How real can "planning" based on such dubious data be?

Even in heavy industry, the communists' favourite field, the picture is one of muddle, waste, costly and cumbrous administration, and drastic checks caused by lack of materials or by plain bad planning. The latest cutbacks affect even the much heralded steel centres to be built at Wuhan and Paotou. Many new industrial projects are being left half built. Plans for railway extensions are being pigeonholed. Orders are to drop ambitious projects and concentrate on cheap, quick-return operations such as opencast coal-mining and the repairing of old blast furnaces. As part of the new economy drive, even safety standards, already inadequate, must be "revised downward."

Outwardly monolithic, the communist state is yet riven by the new "contradictions among us" which Mr Mao lamented in his speeches of three months ago (the full texts are still unpublished). The newly collectivised peasants resent the townsmen's privileges, and hold back their produce, feeling that in any case there is little they can buy in exchange for it. Their unwillingness to grow enough cotton has half starved the textile industry. They have already quit the collectives in such large (but unrevealed) numbers that the government innocently boasts of the many thousands who have come back in, while admitting that this is only a fraction of the total who withdrew. The urban workers, for their part, resent the way the trade unions "operate as government organs interested only in collecting dues" and "resort to harsh measures when dissatisfied workers start trouble." They resent, too, the extremely high wage differential and the fat pay packets of the managers; while the managers in turn are sick of being supervised by incompetent communist officials.

The workers' discontent has been shown in illegal strikes, go-slow action and absenteeism; that of the peasants, and of students indignant at being drafted into unsuitable jobs, in rowdy demonstrations. The managers and technicians are mostly too "afraid of being purged" to act so openly, but their very prudence makes for inefficiency, for they have often not dared to question orders which they knew to be stupid. Much the same applies to scientists and other intellectuals. Although the "all flowers blooming together" doctrine has theoretically been in force for a full year, few intellectuals have been rash enough to speak their minds, and some who rashly did so suffered for it.

It is not surprising that Mr Mao himself should have singled out "contradictions between the people and their rulers" as China's worst problem. He has warned his hierarchs that to continue treating discontented people as "the enemy" will turn them into really dangerous enemies. His new call for less harsh repression of popular unrest may at the least give many Chinese a sensation of relief, even if the communists clamp down again when they think enough steam has been let off to avert a full-scale explosion.

Meanwhile, some oddly uncommunist palliatives are being adopted. Free markets have been revived for farm produce such as vegetables. The new price increases for scarce foods are frankly explained as a form of rationing by the purse. Dividends of eight per cent and guaranteed permanent ownership of their shares are offered to Chinese living abroad who invest in enterprises in the communist homeland. The newly emancipated women of China have been told to get back into the kitchen and thus ease unemployment among a male labour force which is increasing by six million each year. They are also being urged to use cut-price contraceptives (the only product output of which is being steeply stepped up this year).

This is not the picture that Peking likes to present to the world; but every detail here given is derived from official communist pronouncements. These little-known realities should be kept in mind in any assessment of the Far Eastern problem, which is essentially the problem of China. They suggest that Mr Mao has good reason to move slowly on the international stage—but less reason to be sure of ultimate triumph. They indicate that "fraternal aid" from Russia falls off sharply when the beneficiary can no longer pay for it; sharp cuts in China's exports to Russia have been accompanied by a general switch to the more modest kind of industrial project "which we can carry out with our own resources." Russia may not be over-keen to help China through its difficulties—or it may not be able to. Neither the mystique of the plan, nor the supposed dynamism of communist society, nor the vaunted support of the Soviet block has saved China from its new sorrows.

Those Asians tempted to think that to sacrifice one's freedom to the Marxist gods is a sure way of propitiating the demon of poverty may do well to ponder these facts, and think again. Those, in both Asia and the West, who look with fear at a China apparently united under an ambitious and tyrannical regime, may feel some relief at the discovery that it is less monolithic than they thought, and welcome the possibility that its rulers may be forced to become less tyrannical. But they would be unwise to let their new knowledge induce complacency. There is no sign of Peking moderating its ambitions. At present Mr Mao evidently hopes to solve by suaver means some of the problems which Stalin tackled with the iron fist. But his failure in this attempt would lead almost inevitably to a reversion to open ruthlessness—and perhaps to a bid to rally a discontented people, and divert its attention from its domestic woes, by embarking on some foreign adventure. Whatever else is being cut back in China's hard-pressed economy, its rulers have emphasised that its arms programme is going ahead.

Left Hands across the Sea

If British taxpayers' money, hatred of race prejudice, idealism, paper planning and dominion status for all would solve colonial problems, Labour has the answer. But do they really get to the heart of the matter?

HARDLY anything bores and empties the House of Commons as colonial policy does—until, as the result of that policy, or lack of it, a colony blows up and provides the opportunity for party political capital. In this, unhappily, the House reflects the nation. There is therefore good reason to commend the Labour party for its attempt to rethink its colonial policy, even if the fruits need to be examined rather critically. The first fruit was the recipe for racial harmony, the document on "The Plural Society" which was adopted by last year's party conference; it has been followed this week by documents on "Economic Aid" and the "Smaller Territories." It is no more than a coincidence that delegates from the colonies are attending the Labour Commonwealth conference this week also. It would be a happy one for Labour if British colonial voters, like French, sent members to the mother parliament. For, after promising to cast out the colour bar by enforcing democracy in East and Central Africa, the authors of the new policy now propose to deal with poverty and illiteracy by flushing all the channels of colonial development with powerful jets of British taxpayers' money. It is bound to be a popular idea in the colonies.

Yet it is only helpful to the Labour party to recognise the canny realism that has been threaded through these idealistic plans. "The Plural Society" admitted that "we cannot expect to establish the common roll immediately everywhere," and that white minorities needed to be safeguarded against "excessive nationalist ardour." In "Economic Aid," the same flashes of insight appear.

Thus it is plainly recognised that the proposal to spend, in colonial grants-in-aid and other forms of public investment, an amount equal to one per cent of the national income "means a decision either to hold back personal consumption by taxation or other means, or a reduction in some other item of government expenditure." It is to be hoped that when "Economic Aid" is discussed at the party conference someone will point out that the taxation involved is about 8d. on the income tax, or an amount approximately equal to the total wage increases so far granted this year. Labour agrees that "to vote money for overseas development without creating . . . a genuine trade surplus to cover it is a mockery." Again someone ought to point out that, if £170 million is to be voted in subsidies to colonies, and they are to be free to raise trustee loans and to tap other sources of capital as now, the surplus will have to be a hefty one. Britain cannot invest a deficit.

EVEN so, the ideas upon which this policy for a future Labour colonial secretary is based are painfully familiar and doctrinaire. There is the assumption that private investment in the colonies is exploitation and does little or nothing (though it pays taxes) to create welfare—education, health, housing and social betterment; that, on the contrary, capitalism is responsible for a wide range of evils from shanty slums to detribalisation and soil erosion. The contrast is drawn between colonial progress before the war (which was greater than Labour thinks) and that achieved since a Labour Government encouraged colonies to draw up development plans. There is the inevitable deduction that what is now wanted is more planning, more social investment, and the injection of public money into all those projects on which the return is too small to attract the capitalist who must make his ventures pay. The fact that what has really enabled the colonies to make such rapid progress since the war has been high commodity prices and "exploitative" investment in mineral production is hardly recognised.

Nobody will deny that almost all colonies could use larger grants and free loans for development, just as nobody will deny that in central Africa the franchise ought to be extended as quickly as possible. But it does not seem to have struck Labour policy-makers that there is a limit to the rate at which social, even more than economic, investment can be made. What limits the spread of education is not only funds, but the gestation period required to produce decent teachers in quantity—which is a long one. It is possible to make large sums available to buy technicians, and yet not get any; most colonial budgets already include appropriations for appointing technicians which just cannot be spent. This will still be true even if the United Nations and Sunfed are brought in. Nor will the mere provision of money improve administration, especially if the white cadre leaves when colonies move to independence. It may be easier to invest public as well as private money in East rather than West Africa, simply because there are more Europeans (and Asians) on the ground to push the jobs through.

Again, it is one thing to give £170 million a year to the colonies in an orderly and effective manner—granting that this is felt to be the best way to use Britain's slender invisible surplus, rather than in, say, Canada, where the returns are far higher; it is another thing to spend this surplus wastefully. Yet Labour's present thoughts offer few safeguards against waste. Someone has inserted the sensible proviso that before the United Nations is given large sums of British money to spend on good works, its administrators must be subject to a competitive entry examination. But simultaneously to give the Colonial Development Corporation far more public money to invest and to warn it against investing it in partnership with private industry seems to put a premium on waste. The party's obsessional demand for a return to bulk purchase is, in some ways, the most disheartening feature of all. Labour seems to have learned nothing from experience. It was high prices, it must be repeated, not bulk purchase, which put the fortunate colonies in the money. The real effects of bulk purchase are twofold: First, if under it Britain gets the stuff below the world price, the producers can (and do) complain of exploitation; secondly, if Britain pays more than the world price, its own costs as a manufacturing nation are inflated, and the colonies are encouraged to cripple their long-term prospects by continuing with forms of production that are uneconomic.

LABOUR may find it is even less easy to give away someone else's power than to give away British money; and it would be wise to stress the reservations on forcing the pace in multiracial societies—notably East and Central Africa—towards one-man, one-vote equality. The presence of a number of colonial nationalist leaders at the Commonwealth socialist conference provided that opportunity. Unfortunately, the moderation of Mr Gaitskell in public session may not have been matched in private conversation by other Labour men and women; and some African nationalists may all too easily assume that they have had the promises which they covet and, on their return, tell their supporters that they have had them.

Probably not too much should be made of the Commonwealth socialist conference. It was very unrepresentative. India, Pakistan and Ceylon sent no representatives; it seems that, for example, the Indian National Congress was not invited, although it can certainly claim to be as socialist as the Ghana Convention People's Party. While Dr Evatt came from Australia, the West Indies, which have Labour governments, sent no minister. The choice among colonial parties was also rather curious; but, broadly, the conference has helped to put some purely nationalist colonial movements under the wing of purely socialist movements in Britain and elsewhere. The tendency will certainly be for these nationalists throughout the colonies eagerly to await the election of a Labour government in Britain as the pledged giver of money, power, independence (or in the case of smaller but often plural and complex territories, "dominion status"). This week's policy statement even suggests dominion status for Tristan da Cunha.

When the time comes for these spring chickens to roost, however, there will be other considerations. Nobody should underestimate the extent to which Mr Bevan, as Labour Foreign Secretary, might want to lay down colonial policy; he is likely to put first things first, and he will probably not want to see money thrown away which could be used to back his foreign policy more effectively (he will remember Mr Bevin's call for coal and an export surplus) or colonial uproars that would embarrass him in more important negotiations. He will, perhaps, have underscored in red all those saving clauses in his copies of "Plural Societies," "Economic Aid," and "Smaller Territories," even while the colonial politicians concerned are overscoring them in roseate.

Care, Compulsion and Community

The main purpose of Lord Percy's royal commission was to inquire into the law relating to mental illness and mental deficiency. But its report has far wider implications for the mental health services.

FOR some people the highlight of the report of the royal commission on the lunacy and mental deficiency laws will be the proposed abolition from the mental health services of the words certification, idiot and imbecile, together with most of the existing procedure for enforcing treatment on unwilling patients. Such an abolition would have a symbolic importance as great as the formal abolition of the poor law in the National Assistance Act of 1948. The commission's terms of reference would indeed appear to have focused its inquiry on the legal and administrative procedure for the care of patients. In fact, its apparently restricted remit has not prevented it from making far-reaching recommendations that could establish an entirely new approach towards mental disorder.

Mental disorder is the general term used by the commission to include all forms of mental abnormality. At present, the law and administrative machinery divide the mentally disordered into two groups: the mentally ill and the mentally defective, roughly corresponding to what the ordinary person would unmedically and unkindly call the mad and the dimwitted. For legal and administrative purposes the commission would retain the first category; the second it would reduce to what it calls the "severely sub-normal," that is, those at present classed as idiots and imbeciles and some of the feeble-minded. It also proposes that legal and administrative recognition should be given to a third

group about which much has been heard in recent years, especially in any discussion of crime and punishment. This is the group of people, known as psychopaths, whose characteristics are aggressive or inadequate social behaviour and inability to learn from experience (even when it includes punishment), and who cannot be certified as mentally defective or mentally ill. The commission would extend this group to cover those classified as feeble-minded or moral defectives under the present law and who are not severely sub-normal.

ALTHOUGH the Percy report adopts these three groups of mental disorder for the purpose of its legal recommendations, one of its aims has been to eliminate the present rigid distinctions between the mentally ill and the mental hospitals on the one hand and the mentally defective and their hospitals or institutions on the other. These distinctions may prevent patients from receiving the hospital care appropriate to their case: transfer from the one type of hospital to the other may be quite impossible because each is "designated" under a different Act to receive strictly defined categories of patients, and each has a different legal procedure for their admission and discharge.

This barrier would disappear if one of the commission's main recommendations were adopted, and the existing Lunacy and Mental Treatment Acts and Mental Deficiency Acts were repealed. Admission of most patients to either type of hospital would be as informal as it is to general hospitals; there would be no need for a patient to be capable of expressing willingness to enter a mental hospital in order to have the status of a voluntary patient and thereby avoid being certified. Similarly, there would be no need for the cumbersome process of certification for mental defectives. If a patient from any of the commission's three groups needed hospital treatment he could be admitted without more ado to the appropriate hospital, provided he was not positively unwilling to enter.

The commission's proposals for compulsory admission would be effective, therefore, only if this unwillingness were manifest, or if the patient were not unwilling but his relatives objected unreasonably, and if it was clearly desirable that he should enter hospital either for his own welfare or for the protection of society. But the procedure for compulsion and the safeguards should be embodied in a single new Act that would be applicable to all three groups of the mentally disordered. The commission's proposed procedure is certainly far simpler than the existing one, and the mental health review tribunals, to whom a patient, and in some circumstances his relative, could appeal for his discharge, should win a greater measure of confidence than the remote Board of Control, even though they would probably not produce many more discharges against medical advice than occur at present.

Two difficulties might arise. One concerns the psychopathic group. The commission proposes that psychopaths should be compelled to enter hospital only if they are under twenty-one, and therefore likely to benefit from treatment and training; if they have broken the law and the court considers that ordinary penal measures are inappropriate; and, like the other two groups, for observation for not longer than a month. These three sets of circumstances, however, do not cover the psychopaths who act so madly and are such a nuisance to others that compulsory admission to hospital seems the only way to dispose of them.

The second difficulty concerns troublesome patients to whom compulsion is applied. Mental hospitals are now obliged to take a certified patient. The commission recommends that compulsion should authorise a hospital to admit and detain a patient, but not oblige it to do so; there might, therefore, grow up a category of patients whom no hospital will accept because they are awkward and uncooperative. To remove the hospitals' obligation to take them is comparable to the removal, with the abolition of the poor law, of the obligation on the former local authority hospitals to take in destitute patients—which has resulted in so many of the aged infirm being denied a bed.

The royal commission also attempts to break down completely the barriers between the provision for physical and mental disorder. This is not new. Since the health service was introduced, the general hospitals have greatly expanded their psychiatric clinics for out-patients, and many of them have provided beds for mental patients, who can come and go without formality. But the extent to which general hospitals can give in-patient treatment is limited (even apart from the shortage of staffed beds as a whole) by the lunacy laws, for only hospitals designated under the Acts can admit certified and "temporary" patients within the health service.

The commission's proposals for reform of the law would remove any legal barriers to treatment in the hospital most suited to a patient's needs, and the hospital authorities would specify which hospitals were most suitable for which type of case. There would be no reason why a general hospital should not receive a "compelled" patient; the probable criterion for admitting mental patients is whether they would be manageable in a general hospital and whether they are likely to recover quickly. The removal of many early and recoverable cases to the general hospitals might, it has been suggested, downgrade the mental hospitals into care and maintenance institutions for the incurable. On the other hand, it is equally arguable that mental hospital staffs would then be able to give more time and attention to chronic patients and make many of them fit to be discharged.

HOSPITAL care is not the only, or even in many cases the most important, form of care for the mentally disordered. The segregation of thousands of people in vast mental hospitals, outside the community, is nowadays regarded as unnecessary and bad for the patients. Most of the prewar hospitals were built when

all their patients were certified and likely, many of them, to stay in hospital for the rest of their lives. Today these hospitals still include a large reservoir of chronic patients. But many of them (perhaps a quarter to a third of a typical hospital of about 2,000 beds) could be discharged if they had somewhere to go to, and one of the most far-reaching recommendations of the Percy Commission's report is its emphasis on the need to provide community care for the mentally disordered. At present, almost the only form of residential after-care for mental hospital patients is provided by a voluntary body, the Mental After-Care Association, which valiantly keeps a few homes going in south-east England. The commission now proposes that the responsibility for this service, which should be available to all three groups of the mentally disordered, should be placed squarely on the local authorities. Nor should the provision of community care stop at residential homes. Local authorities should be obliged, instead of merely being able, to provide occupational, training and social centres, and sheltered workshops, the object again being to keep the disordered within the community instead of dismissing them out of sight—and out of the community's mind.

Initially all this is bound to be very expensive, even if some saving in hospital costs is allowed for. Like many another royal commission before it, this one was not concerned with the financial implications of its recommendations, and it is not surprising that the Government is taking its time in considering the report. But as a general ideal to be pursued when practicable, the proposals deserve wholehearted support, for they would fit care for the mentally disordered into the general social services. As the commission points out, although the disordered should be given the special treatment their disorder needs, they should not be denied access to other services simply because they are disordered.

Just as the poor law was broken up, and the poor were provided for under the general health and welfare services, so would the rigidly separate mental health services, started indeed for pauper lunatics (who had to be certified to establish their eligibility for care), be merged with them, too. So far as money is concerned, provision for mental disorder has long been described as the Cinderella of the health service. The commission's proposals would go far towards putting an end to its other role of ugly sister.

The State and Stately Homes

Our special correspondent has been visiting some of the great country houses of England, and examining the different ways in which they are being maintained—by a mixture of public money, tax arrangements, and private economy. The problem he reveals has relevance to some MPs' rather narrowly emotional approach to the Duke of Norfolk's private bill.

IN 1579, an old Elizabethan, having taken advantage of the opportunity state by acquiring a noble protector and marrying the daughter of the Lord Mayor of London, built himself a magnificent house in Wiltshire. The Marquess of Bath, a direct descendant of that same Sir John Thynne, still owns it. But, although his heir has a two-roomed flat on the ground floor, he himself no longer lives there. Charabancs grind past the Tudor-Italianate front of Longleat, bringing women's institutes and factory workers to wander in the wide parklands and through the picture-hung corridors. A white peacock still haunts the steps from the wine-vaults; but the vaults are now a tea-room, and the bird is hoping for some pickings.

In 1914, there were forty indoor servants; now nobody could afford to run a purely private household on that scale (work out the before-tax income that would be required to pay the wages of forty indoor servants, and you will see why). Moreover, death-watch beetles have been gnawing at Longleat's beams. Simply to keep the house from falling down—solid though it is among ancient houses—costs some £5,000 a year. So, in 1948, Longleat was opened to the public, to anyone willing to pay one shilling for admission to the grounds, or half-a-crown to see the house itself. Some 130,000 visitors come each year, and on the indoor staff of twelve there are six regular guides. Eighteen daily helps keep the house clean; in the dining-room the table is laid for a banquet which will never be eaten, and the carpets are protected by strips of dark hessian against the massed queues of feet. The cost of keeping the house open to the public is about £20,000 a year, and receipts are around £16,000; but since the house is run as a commercial concern, the expenses are business expenses and the loss can be set off against the owner's private income tax. When the death-watch beetle has been defeated and the backlog of neglect left by the war has been overcome, the house should be making a slight profit. Even if it is no longer a home for its owner, it will perhaps provide him with as much income as a small draper's shop—and it will be saved for the nation and the tourists.

But Longleat is one of the most famous English

houses; the family affairs and the family seat have long been of interest to the newspapers. Not many of England's great houses have its popular attractions, and can be opened in this way to the public as a mainly commercial proposition. Knole, at Sevenoaks, is an example of a great house which is open to the public under a different system. Taken by Henry VIII from the reluctant Cranmer, it was given by Queen Elizabeth to her cousin, Thomas Sackville. It is still the home of the Sackville family, but they no longer own it. In 1946, the house, with its magnificent collection of furniture and pictures, was transferred to the National Trust. With its 365 rooms, 52 staircases and 12 courtyards, it is big enough to house a small village, so it is not surprising that the family wanted it off their hands. But they and their heirs will continue to live in part of it, while the administration and upkeep are entirely the responsibility of the Trust.

Only about 60 great houses are owned by the National Trust, the limiting factor being the money necessary for their upkeep. The Trust is unable to accept houses that may be given or bequeathed to it, unless the gift includes an endowment for their upkeep. This requirement means that until recently many lovely houses which their owners would like to have given to the nation had to be refused. Their collections were divided and sold; their tapestry and panelling ripped out; with luck, they were sold as schools or institutions —without it, just allowed to fall into decay. But in 1953, as a result of the Gowers report, a new way was found of saving these buildings for the nation—the system of Ministry of Works grants for the preservation of historic buildings, even if their owners still live in them. These grants have totalled over a million pounds (to some 360 houses) in the last three years.

MEREWORTH CASTLE, in Kent, is an example of a house still in full private habitation that is preserved under this system. It is a most improbable building to find in Kent; it is not a castle at all, but an eighteenth-century imitation of a famous villa built by Palladio near Vicenza. The elegant classical columns and the dome of the house rise from English trees—and from the green fields of a stud-farm for racehorses. But the fabric of the house was weakened by death-watch beetles and slow decay, the roof began to sink, and in the eighty-foot drawing-room the fantastic ceiling of paintings and stucco in Venetian style was in danger.

Since 1953, the Ministry of Works has been able to make grants to save such houses, even though their owners are still in residence, provided that they are opened to the public on a reasonable number of days in a year. To obtain a grant, the owner of Mereworth had to write to the Historic Buildings Council, pointing out that his beams were crumbling, and that he himself had not enough money to do the necessary repairs. An ancient monuments inspector and architect then turned up to advise the council on whether the building was of enough architectural and historical interest to warrant a grant. The owner got his grant, although not enough to cover the whole cost of the work; that happens rarely or never.

So the house was put in order, and every Wednesday and all through August the normal life of the family stops while the tourists file through their drawing-room. But it is abundantly clear that private families can live in great houses under this system only by drawing on capital—which cannot go on for ever. Mereworth, for example, is neither a big house nor an obvious place to go for the firm's annual outing. It can be seen in half an hour, and the taste for its classical-fantastical architecture is obviously limited. And while the customers are limited, the overheads are high. Guides must be hired, and an indoor staff of six is needed to keep the house in the condition it deserves; because there are few visitors, only a small proportion of the expenses of maintaining the house are allowable against income tax. Some 4,000 visitors in a year at half-a-crown each leave a meagre profit of £50 on the opening itself, quite apart from the cost of maintaining the house and gardens.

The Ministry of Works also owns and administers a few houses that are not occupied; very occasionally, it will buy up some especially famous house, with especially fine chattels—perhaps to hand it over, after renovation, to the National Trust for operation as a sort of museum. But this system of direct Government acquisition of empty houses is a means of conservation of last resort. It has several disadvantages. One is social: only houses that are lived in preserve their characters as houses. Another is purely economic.

Audley End, one of the most famous of the Ministry's acquisitions, makes a loss on running expenses alone of some £3,500 a year, despite its 25,000 visitors; there can be no doubt that Ministry grants for repairs to private owners give the taxpaper better value for his money. But the Ministry has not got much money to hand out in grants (out of 1,752 applications of all kinds to the Historic Buildings Council, 1,062 have been refused); and the owners can meet their share of maintenance under the present scale of grants only out of capital (which is progressively mulcted by death duties) or by much less comfortable living than they would enjoy by moving to a flat in town. Either some new arrangements will have to be allowed for death duties, or the great country houses of England will some day be inhabited only by a few eccentrics.

This problem is now being given a public airing by the Duke of Norfolk's private bill, which in effect seeks to persuade the state (through an arrangement for remission of future death duties) to meet some of the costs of maintaining Arundel Castle as a home for his heirs in their capacity as Earl Marshals of England. Any discrimination about taxes is admittedly invidious. But Parliament should not merely scotch this bill (or even scotch all parts of it save that lifting the discriminatorily tight entail on Arundel), and then run away from the problem. It is a problem that stretches much further than Arundel.

The central question to be answered is whether the nation wants houses of this sort to be preserved, for aestheticism's sake, not for their owners'. If it does not, well and good. If it does, then it will be much cheaper to maintain them with their owners in them (and meeting part of the cost of maintenance) than to take them into full state ownership and control; although in this event there must, of course, be rules about their opening to the public. Let us be economic, not romantic or spiteful, in our rethinking about what some might like to call the socialisation, and others the conservation, of the stately homes of England.

NOTES OF THE WEEK

THE KHRUSHCHEV SHOW

Watching Big Brother

WITH a single performance Mr Khrushchev has become an international television star. The millions of Americans who have gazed at him for an hour are unlikely to forget his broad, good-humoured peasant face. British viewers who saw the same filmed programme on Tuesday, and were not discouraged by the rather slow initial exchanges on meat and butter, must have gone to bed feeling that this was certainly what the TV world calls a "personality." Mr Khrushchev, prophesying to his American audience that their grandchildren would live under a communist system, looked a picture of self-confidence; and the impact was tempered by the gentle assurance that it would all be painless and for their own good.

He confirmed his reputation as a politician skilled in the art of evasion. With a smile, but no chuckle, he used the American television network which had offered him its services to complain that America had an "iron curtain" which prevented free contacts. Asked about jamming of foreign broadcasts, he replied that Russia is "very musical" and naturally jams any voice which "gets on one's nerves." Reminded that a general withdrawal from Europe would mean American troops retiring 3,000 miles across the ocean, while the Russians could get back within two hours, he innocently remarked that it was as far from Irkutsk or Vladivostok to Germany as across the Atlantic. He seemed more at a loss when asked if he agreed with the newly stated Chinese view that leaders and people can be at odds in a communist state. On one occasion his hedging was too obvious: when he declined to reveal any figure for manpower in Russia's forces, pleading the need for precision.

Western viewers, who distrust political propaganda in general, doubtless took his points with a grain of salt. Yet some of them must have struck home. One was his challenge to a general withdrawal of forces from France, Germany, Poland and Hungary, to test whether the Kadar government could survive without Soviet tanks. Earlier he had said that Russia would withdraw all its troops from eastern Europe if American forces also left the continent (he did not specify Britain). His second telling point was the Russian proposal to stop all nuclear tests.

Will the Soviet television and radio now reciprocate by offering their services to outstanding western spokesmen? A refusal to do so would make nonsense of Mr Khrushchev's outwardly confident offer of an honest battle of ideas. If such a return match is arranged, it might be worth showing it to western audiences too, to dispel any doubts that his skilful performance may have aroused.

BAGHDAD PACT

Orchestra Out of Tune?

THE offices of the Baghdad Pact, which are in Baghdad, are such an oasis of harmony in a turbulent world that any discrepancies in the order of importance in which member states place their interests are apt to be forgotten between meetings. At the high level meeting this week in Karachi, the opening gambit by Nuri es-Said of Iraq therefore came as something of a jolt to those who imagined there were no flaws in the alliance.

It has always had a flaw—the fact that three of its adherents, Britain, Turkey and Iran, regard it as a bastion

against Soviet aggression, while the other two, Iraq and Pakistan, regard the chief external threat to their security as coming, not from Russia, but from Israel in Iraq's case and from India in Pakistan's. Needless to say, its new semi-adherent, the United States, shares the first view. This difference of emphasis has been greatly publicised as a result of Nuri's speech, though Mr Suhrawardy of Pakistan has been at pains publicly to deny that it has held up the proceedings.

There are differences of this kind inside any alliance that has not been hardened by the test of mutual experience. Nato is an exceptional case because all its members have had the same kind of fright. What matters is whether, despite these differences, there is an adequate common denominator. Undoubtedly there is an economic one, and in the realm of defence there are many matters of obvious common concern. It is surely better to come into the open with difficulties than to issue anodyne communiqués which seek to paper over fissures in the too common style which our Middle Eastern correspondent describes on page 893.

BY-ELECTIONS

Not Centrifugal

THE results of last week's three by-elections repay study. At Edinburgh South the intervening Liberal candidate (a personable one) got 23.5 per cent of the vote ; of this, 21.9 per cent came from the Conservative compared with 1955 and 1.6 per cent from Labour. The lesson here seems to be that the Tories' main electoral trouble is still their large semi-detachable left. In straight fights, some members of this detachable left still vote Tory, some stay away from the polls, and some unwillingly vote Labour ; when a reasonably good Liberal candidate turns up, he can get most of their vote. These Tory droppings are now large enough to save some Liberals' deposits ; in one of the very few constituencies where they might conceivably even be large enough to win the Liberals a seat, Dorset North (Liberal swing from Tory needed 9.9 per cent), a by-election is now pending.

In the second by-election last week, the straight Conservative-Labour fight at Hornsey, there was a swing from the Conservatives of 6.7 per cent. The average swing from Conservative to Labour at last month's local elections seemed to be about 5 per cent. It was to be expected that the swing at Hornsey would be above average, and not principally because of the Rent Bill. This now over-large constituency of Hornsey is one where working-class London (Finsbury Park) stretches out into bank clerks' London (Muswell Hill) ; it is stretching steadily and progressively, and these inner suburban constituencies are getting bigger and slightly more Labour all the time—for reasons of geography, quite apart from politics.

Last week's third by-election was the four-contestant affair at East Ham North. The anti-H-bomb ILP candidate got only 458 votes, which was not much more than would have been won by an oddity like a flat-earther: the H-bomb is clearly not a searing electoral issue with the mass of the British people. The drop in the orthodox Labour candidate's share of the vote was 0.7 per cent greater than the exiguous share that the ILP man took away from him, so that in a sense there was actually a swing to the right in this election ; even allowing for the fact that most of the "swing" was probably caused by Labour supporters in a very safe Labour seat not bothering to vote, it is surprising that the Conservatives have not made more of this. Finally, the orthodox Tory got 29.4 per cent of East Ham's vote, and to his right the People's League's Mr Martell got only 12.2 per cent (thus just forfeiting his deposit). The mild excitement caused by Mr Martell's candidature probably brought more right-wing people out to vote—but most of them, it seems, for the official Conservative. Taken together, these three by-elections therefore suggest a leftward shift of the middle block of political opinion, but no movement in favour of the extremes. Compared with the sizeable block of former "middle of the road Tories" who are at present inclined or half-inclined to desert to the Liberals and Labour, the abstaining right-wing colonel seems to be a largely mythological beast.

RENT ACT

Timetable for a Storm

THE Rent Bill passed its final parliamentary stage on Wednesday, and will come into operation early next month. The Government deserves congratulation on having stood up to the storm in Parliament ; for the next nine months or so it will now have to brace itself to stand up to a storm in the country. As soon as the Act becomes operative, landlords of the 4½ million houses that are to remain in control will be free to make immediate application for increases of rent up to twice the gross value of their houses (or 1½ times their value if they have no responsibility for repairs). These increases will require three months' notice to take effect and for a further six months will be restricted to an upper limit of 7s. 6d. a week.

As, this time, increases in controlled rents will not have to wait on proof that the house is in good repair (although they can be cancelled if tenants get a certificate saying the house is in bad repair), it is sensible to suppose that the applications for increases in controlled rents will be made fairly quickly ; the main working class storm may therefore fall on the Government between about October of this year and April, 1958. What effect this will have on the usual winter round of wage negotiations—despite the standstill agreement on engineering wages—remains to be seen. Fortunately, however, the beneficial results of the Act, in the working class sphere, should come fairly quickly too. Landlords will have a strong incentive to speed up repairs and renovations, since they can hardly wish to bring on their heads a shower of "disrepair certificates"; and tenants may be expected, as accommodation eases, to become increasingly aware of their very real rights in the matter.

The timetable of storm and subsequent benefit in middle class housing is more difficult to gauge. As the Act finally emerges, the date for what now has to be called "Clause 10 decontrol" has been shifted to fifteen months' time—that is, to October, 1958. At that time the landlord of any dwelling whose rateable value exceeds £30 (or £40 in Greater London and Scotland) can resume possession or charge any rent obtainable provided he has also given six months' notice of his intentions. Alternatively, he can make an agreed contract with his tenant before this date so long as it provides at least three years' security of tenure. Another sort of decontrol comes into effect immediately: from next month houses falling vacant or at present occupied by their owners will no longer, when let, come within the scope of rent control.

Because of the fifteen month standstill on the 800,000 houses under Clause 10, the market in middle class housing could remain uneasy and artificial for a considerable time to come—possibly up to near the date of the next election, which would be politically unfortunate for the Tories and economically a pity for the country. But even here—thanks to the cushioning effect of owner-occupied houses that may now be gradually offered for renting—the pressure on resources could ease more swiftly than most people expect. Tenants of "clause 10" accommodation might be unwise to seize on any proffered three-year agreements in too much of a hurry.

MEMBERS' PAY

No Representatives without Taxes

THE Government seems to be screwing up its courage to give pay rises all round at Westminster. This is the best time of the year for doing so without setting off a chain reaction in industry, and ministers will be well advised to delay no longer. The case for increases both to MPs and junior ministers is convincing, and so is the case for granting either a small salary or a daily allowance to peers who regularly attend the House of Lords. But one strong cautionary word must be added. It is being said that the Government might leave MPs' salaries at £1,000 and give the increase in the form of a £750 tax free allowance. This would be wrong both in principle and practice: in principle, because it would appear to give MPs a special tax exemption not open to the general public ; in practice, because it would treat all MPs alike (making no differentiation between the London member living a stone's throw from the House and the Scottish member who must keep a home going in the north and meet weekly hotel bills in London). MPs may well be entitled to £1,750 a year, but they should get it as a flat salary. The present £2 a day sessional allowance should be scrapped, and each MP's claim for tax relief on his legitimate expenses should be scrutinised separately on its merits—and quite as closely as that of other taxpayers.

If this is done, there seems no reason why ministers of all grades should not get an MP's salary, in addition to their pay as ministers. At present junior ministers get £1,500 as members of the government and £500 as MPs. There is a good case now for putting up their salaries (to £2,000?), and also giving them their full pay as MPs. Senior ministers probably do not need a salary increase, but they might well be allowed to draw their MP's pay from now on; it has never been clear why junior ministers get some pay as MPs but senior ministers get none. All are equally liable to meet the normal expenses of a member. Any changes will no doubt raise indignant cries, not least in Tory committee rooms, but even after increases on this scale Britain would still be getting its democracy much cheaper than many other countries, especially the United States.

SETTLING WITH EGYPT

Twigs from the Log-Jam

THE discussions between the British and Egyptian financial missions in Rome last week did not get far. But whereas the Foreign Office is inclined to say the talks got nowhere at all, Cairo reports progress. Dr Abdel Monsim el-Kaissouni, the finance minister, has instructed the National Bank of Egypt to implement the "agreement" regarding British goods contracted for before the freezing of Egyptian sterling last July, and to resume payments to British pensioners of the Egyptian government living in the United Kingdom. There is no confirmation in London yet of these decisions, which are represented as the fruits of the Rome meeting.

Actually, Mr Macmillan referred, in his announcement that Britain would resume use of the Suez Canal, to an agreement in principle that limited releases would be made from Egypt's No. 1 Account (its "current account" in sterling) to clear pre-July trade. The Egyptian government has said these releases will total £6 million, although the sum involved is unknown and releases will only be made as each item of trade is cleared by exchange control. The undertaking to pay the pensioners is presumably intended as a *quid pro quo* to ensure that Britain does agree to free some sterling ; the British delegation had argued the pensioners' case strenuously.

These are only a couple of twigs broken off the log-jam in Anglo-Egyptian relations. The Egyptian government wants both its sterling accounts defrosted before dealing with British claims. This would mean that Egypt could use the £23 million in its current account and draw, in accordance with the 1955 sterling agreement, another £20 million from the £80 million which remains of its blocked wartime balances. Egypt is also asking, somewhat wildly, for about £400 million reparations for damage done by the invasion. Mr Macmillan did not even mention this claim in outlining the subjects for discussion at Rome, although it seems obvious that Egypt is hardly likely to waive it. The Government is meanwhile demanding that agreement on its claim for £140 million of British property and funds seized or sequestered must precede the unfreezing of Egyptian sterling, and, believing that Egypt's economic plight is fairly desperate, it feels it can sit back and wait.

In clearly inspired comment, the Cairo newspaper *Al Ahram* has stated that British property has not been confiscated, which implies that, being merely sequestered, it will in due course be released. This hardly accords with the known "Egyptianisation" of British banks and insurance firms. The Egyptians could help now by specifying what has been grabbed, and what is being merely held in custody and ought therefore to be eventually released. The Government, on the other hand, having been practical about using the canal, should be careful to go on being practical. If it concentrates on trying to score points off President Nasser while he is hard pressed, it is likely to find that Egypt is poor enough to stay poorer for many months to come.

LEBANON

Bullets Before The Ballot

THE triviality of the compromise between the Lebanese government and the opposition, by which "neutral" ministers will enter the cabinet, is incomprehensible against the background of the bloodshed which marred the election campaign in Beirut last week, when five people were killed and Saeb Salam, a former prime minister, was thrown into gaol with a cracked pate. One can only presume that the opposition National Front had had enough trouble and that the government, for the sake of peace, gave the Front the chance to yield gracefully.

The trouble really began on April 1st when the Front, led by Saeb Salam and Abdullah Yafi, presented demands to the president which were, in effect, intended to align Lebanon with Syria and Egypt, notably in resistance to the Eisenhower doctrine. Neither President Shamoun nor the pro-western foreign minister, Dr Charles Malek, was deterred by this demand—accompanied though it was by a threat of "practical measures which the country's interests would necessitate"—from accepting the doctrine and strengthening their opposition to Egypt. Last week's disturbances were apparently in the nature of "practical measures," and there is evidence that Egypt, the Syrian Deuxième Bureau, and the Syrian Communist party contributed cash and mercenaries for them.

At rock bottom, the struggle remains one between those in Lebanon who are resisting the policy of President Nasser and those who, for power or pelf or both, are willing to impose his policy on the country at any cost. The loser is likely to be President Nasser for, while popular nationalism is still with him, Lebanon seasons its politics with a nice sense of its need for the tranquillity in which trade and tourism can flourish. Even Lebanese Moslem nationalists, who showed last week how easily they could flare up, can easily get fed up with troubles which disturb trade.

JORDAN

Appeal For Aid

THE Jordan government has paid £702,000 to Britain as the first instalment due for the British installations and equipment it received by the agreement terminating the Anglo-Jordanian treaty, and has asked for economic aid. It was British practice for some years to give Jordan interest-free development advances, quite separate from the subsidies provided for by the treaty, and the Jordan government drew only £1,120,000 of the £2,250,000 which Britain was at one time ready to pay for the year 1956-57. The termination of the treaty did not necessarily mean that these development grants, euphemistically termed loans, would cease, and the Foreign Office is at present considering the Jordanian request.

There are some excellent reasons why the aid should be given. King Hussein fought a spectacular battle against Egyptian subversion in the area and will be all the stronger if he gets aid from many different sources: Britain, the United States, Saudi Arabia, perhaps Iraq, and even Egypt. Arab nationalism can be muted by a multiplicity of friends. And Britain would in this case be responding to the plea of a friend, not thrusting money upon it by treaty right.

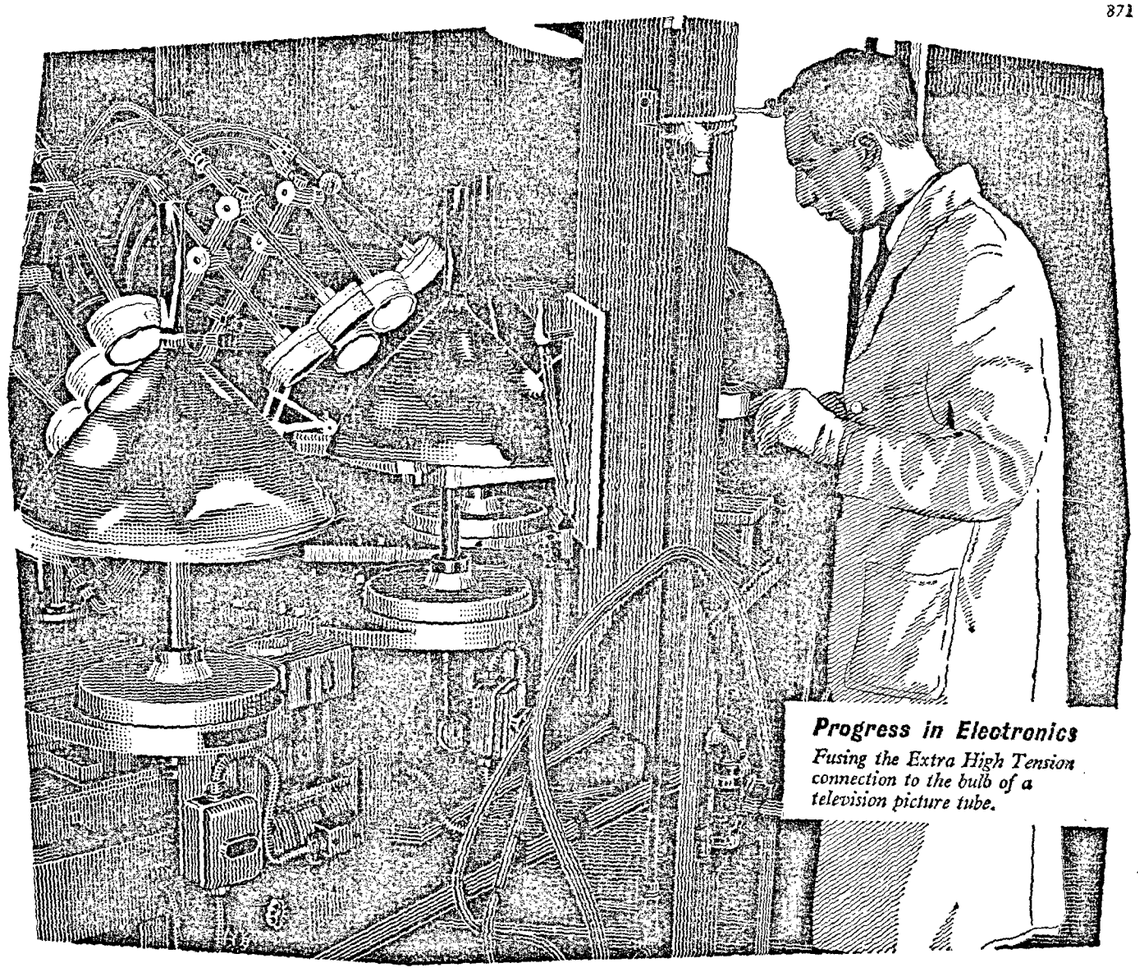
The moment is particularly suitable for a gift. The British ambassador handed the Mafraq airfield over to King Hussein last weekend, three months ahead of schedule. The ambassador told the King at the ceremony that Britain and Jordan were old friends and intended to stay that way. A modest offer of hard cash from one old friend to another would therefore be appropriate.

FINANCE BILL

High Assumptions of Lower Taxes

THE headlines in some newspapers last week alleging that Mr Thorneycroft had "promised that he would go on cutting taxes" sprang from an impromptu parliamentary exchange on a day in which headline material happened to be scarce. The prepared part of Mr Thorneycroft's statement which led up to this exchange began with his rather gloomy acceptance of the view that because of "what this country has been through in two world wars, we shall have a high level of taxation anyway." The Chancellor went on to detail the taxes which he considered to be "high, much too high"—and not unnaturally picked out those that he had reduced in the budget. Since he was speaking against a Labour amendment that sought to cut off earned income relief at £3,500 or £6,500 (Labour did not seem quite sure which), he amplified his case for relief of the better off: "it is not unreasonable that they should expect to keep a fair proportion, and if possible a slowly increasing proportion, of what they have earned." That very cautious statement was clearly the only so-called hint of future tax reductions which he had been prepared to make when he originally rose to his feet.

At this stage, however, Mr Wilson made one of his usual politically loaded interventions. The "young executive" (whom Mr Thorneycroft had mentioned as one of the most overtaxed members of the community) would not, said Mr Wilson, gain anything from this budget unless he had children over 11 or was earning more than £2,000 a year. The Chancellor replied:



> That is a perfectly fair point. I am happy to say that ever since a Conservative Government came to power they have steadily reduced taxes and as long as they remain in power the country can look forward to their reduction.

It was this statement that aroused loud cheers, and that hit the headlines next day. The cheers were perhaps more significant than the headlines. There is a restless urge among Conservative backbenchers that taxes have got to be reduced in the next two pre-election budgets. This need not necessarily degenerate into lamentable and inflationary politicking; if it were translated into a feeling that a Conservative government should prefer to keep inflation in check by tight money and high interest rates, rather than by large budget surpluses and high taxes, it could be a very good thing. But it is nevertheless surprising that such undue attention has been drawn to last week's one sentence by the Chancellor. In its context, it was clearly very little of a deliberate statement of policy and very much of a piece of impromptu political rodomontade.

SHOPS BILL

A Famous Victory

THE dropping of the Shops Bill — nominally because Parliament no longer had the time, but in fact because the Government no longer has the stomach—deserves to be hailed as something of a political event, perhaps even a turning point. This is the first time one can remember since the war when a piece of restrictive vested interest legislation —dubbed a social charter and therefore pretending to be progressive—has been stopped so completely in its tracks. For the bill's original intention, the clearing up of the tangled mess of anomalies left by past legislation, there was something to be said; for its method, which was to abolish the anomalies by imposing uniformly stiffer restrictions even on self-employed people working in their own one-man shops, there was nothing to be said whatever—though Lord Hailsham, who earns general sympathy in his undeservedly absurd position, said it very well, and Mr Walter Padley,

Progress in Electronics
Fusing the Extra High Tension connection to the bulb of a television picture tube.

Which is the end product?

The great new Mullard TV Tube factory at Simonstone in Lancashire is probably the most advanced in the world. In it is machinery and equipment so revolutionary in conception that visitors are startled by its Wellsian appearance.

The greater part of this machinery was designed, developed and built by Mullard's own engineering department. It is, in effect, an end-product in itself.

Plants such as this are typical of the Mullard attitude towards production. Constant research into manufacturing techniques and progressive development of plant and machinery are among the reasons why Mullard products enjoy a world-wide reputation for performance and reliability.

* See a Mullard factory one day, and you'll see the end-products of industrial team-work—from research to manufacture.

** If you are interested in visiting a Mullard factory, and if you belong to an organisation concerned with the application of electronics, write to the address below on your official letter heading mentioning your position in the organisation.*

CIVIL ENGINEERING

A rugged valley becomes the site of a giant hydro-electric scheme; a complete new industry grows out of a wasteland. Schools, power stations, modern hospitals, city skyscrapers and whole new towns transform the skyline in many parts of the world. Plans like these can only be realised economically by men of diverse talents working together in harmony for a single aim. Such close co-operation is assured when Cubitts undertake projects of any magnitude; every phase, from their inception to the installation of engineering services and final finishing, is carried out by specialist divisions within the Group.

the Labour MP who leads the shopworkers' union, said it very loudly.

It remains to be seen whether the embattled members of Mr Padley's union will try to enforce the bill's provisions by direct industrial action: to put up a fight against even properly remunerated overtime or shift work—even by those shopworkers or self-employed shopkeepers who actively want to work it. The union can feel little confidence in its threats of such a campaign, complete with picket lines, against late-opening shopkeepers. To put a union picket outside every one-man corner shop would stretch the resources of an abler organiser even than Mr Padley; to set sandwichmen tramping up and down before the shop windows of recalcitrant department stores would merely present these with magnificent free advertising.

If, however, the picket lines do appear, there will be a temptation for liberal members of the public to make a quite deliberate demonstration by going out of their way to cross them. There is still something to demonstrate for. What has been achieved by the dropping of the Shops Bill is not a positive instalment of freedom; it is a narrow escape from heavier fetters. The right sort of shop hours legislation would be a bill that set maximum hours for shop employees (though not for the self-employed), but which made no legislative provision about at what times of the day or evening they should be worked; this latter point should be determined solely by the expense of compensating employees for working inconvenient hours (at rates which the unions can and should negotiate toughly) and by the willingness of individuals in a fully employed society to take up shop work under these conditions.

CYPRUS

A Snub for the Archbishop

THE recent exchanges between Archbishop Makarios and the British Government have confirmed the continuing deadlock over Cyprus. There is little sign that the Archbishop has acquired a greater sense of reality, or a more moderate outlook, since he was released from the Seychelles. He alleges—wrongly—that the government of Cyprus has kept the emergency regulations in full force; he demands that the emergency should be called off and that he should be allowed to return to the island; and he announces that he is ready to take part in "bilateral talks on a basis of the application of self-determination." He has also said that he would be prepared to accept a short transitional period before self-determination ("to show our good-will"), preferably under the United Nations or a state named by the UN; and—rather confusingly—that he rejects Nato "intervention," but not "mediation from any quarter."

The British Government has, quite rightly, turned down the proposal for bilateral talks. "Other and wider interests have a right to be consulted." It is, indeed, inconceivable that the Turkish interest in Cyprus should be ignored. So long as the Archbishop shows no sign of seeing reason on this, there seems little to be gained, and perhaps a good deal to be lost, by letting him return to the island. Nor can the authorities in Cyprus be expected to abolish the emergency regulations altogether, or abandon military operations against Eoka, so long as the threat of renewed terrorism remains. The Archbishop may consider that this threat is a potent weapon in his hands; but it is an increasingly double-edged one, since a renewal of violence for which he could be blamed would not improve his standing either inside or outside the island.

Archbishop Makarios has only himself to blame for the snub he has received. Yet one would like to be sure that the Government is making every possible effort to break the deadlock. Its reply to the Archbishop is not altogether reassuring; to stand pat on its willingness to discuss the Radcliffe proposals, when neither the Greeks nor the Turks will have anything to do with them, is not good enough. It is probably not yet time to bury these proposals; but it is time to do some energetic artificial respiration on them. One hopes that, behind the scenes, this is in fact being done.

FRANCE

Premier-Maker

VIEWS may differ about M. Mollet's performance as prime minister, but nobody will now deny his skill at pulling strings from behind the parliamentary scene. His government was defeated more than two weeks ago, but ever since then he has dictated the course of the crisis. The hundred Socialist votes are his trump card, and he has used it mercilessly to defeat one candidate for the premiership after another, either by refusing the votes or by showing a much greater insistence on immediate social reforms than while he was in office. When the situation had ripened to his satisfaction and President Coty asked him for advice, he put forward the name of the Radical minister of education in his own outgoing government, who promptly declined the offer on the grounds of inexperience. The President then had no choice but to call on another Radical who would have no such inhibitions.

It is more than suspected in Paris that M. Bourgès-Maunoury was the joker in M. Mollet's pack all along. As minister of defence in the outgoing cabinet he shared responsibility for the official policy in Algeria, and he was also M. Mollet's trusted lieutenant (many will say his inspirer) in the Suez adventure. Now he should have even more reason to be grateful to his former chief. He has the further advantage of being a very difficult target for the Right to hit without appearing "unpatriotic," since he has become one of the symbols of a tough policy in Algeria. Although at the time of writing the problem of the premiership is still unsolved, M. Bourgès-Maunoury seems the most likely contender for the post to have appeared so far.

Last week's horrible massacre of 300 Moslems by the Algerian rebels has outwardly strengthened the hand of those Frenchmen who argue that there is no sense in negotiating with "barbarians." But it has also shown how ineffective the "pacification" has proved, and its very horror may quicken the approach to a decision. As *Le Monde* puts it, the next prime minister should make a choice between peace and war. In other words, the deputies have to decide whether France must undertake even greater military efforts, which might overtax not only its economic resources but also its political system. If not, they should strive immediately for a compromise, ensuring the protection of French lives, but accepting the idea of Algerian independence, if necessary. The choice of M. Bourgès-Maunoury for the premiership would look like a vote of confidence in a policy which has led France into a blind alley—despite the new opening of political eyes described in a message on page 897.

TUNISIA

Parthian Misfire

REPREHENSIBLY, M. Mollet made a last minute clutch at right wing votes to save his cabinet without much heed to the effect of his gesture on tempers in North Africa. He withheld from Tunisia an instalment of credit promised only a month previously, on the grounds that French money must not go to a government that might use it, even indirectly, to help the rebels in Algeria. His move failed even in its primary purpose of saving his skin ; and so his successors are left to calm the burst of temper it caused in Tunisia.

M. Bourguiba, the Tunisian premier, reacted sharply. The main theme of the speech he promptly made was that all traces of past dependence must be eliminated, and that if a month-old agreement was to be called in question, so were the 1955 conventions whereby Tunisia belongs to the franc zone and to a customs union with France ; he also referred to *turning* elsewhere for aid. Among the "traces" of the old relationship is of course the stationing of French forces in Tunisia. A few days' pause brought calmer counsel. Paris made soothing gestures. M. Bourguiba remembered his economic straits, and in his next speech referred only to revision by negotiation ; he seems to have reflected that aid from elsewhere is not so quickly to be had as once it was, and that Tunisia would be on balance the bigger loser if the 1955 agreements were to be ended abruptly.

But while tempers were at their shortest, an ugly situation arose elsewhere in Tunisia. As a result of a military operation in Algeria, refugees in many thousands poured over the frontier. M. Bourguiba, anxious both to emphasise the strain on his economy and to reaffirm Tunisia's inseparability from the Algerian cause, reported the matter to the United Nations. Meantime, a French detachment of troops in Tunisia moved up to investigate ; so did a Tunisian detachment, and (during an affray about which both French and Tunisian statements are manifest exaggerations) the two forces exchanged fire and suffered casualties.

Both episodes show how near tempers are to boiling point ; they further suggest that if French troops are to be used to control refugee movements they had better be deployed on the Algerian side of the border, or else France may endanger its most valuable arrangement in Tunisia—not the right to station its troops there, but the right to use Bizerta.

FARM IMPROVEMENT

Wasted Aid

WHAT is the purpose of the £50 million which the Government is proposing to pay out in grants for farm improvement under the new Agriculture Bill ? With agricultural surpluses mounting at home and overseas, the only possible justification for this expenditure will be if it raises the general efficiency and competitive power of British agriculture. But will it ? The most eager customers for the new grants (which will cover a third of the cost of improvements, leaving farmer or landlord to find the remaining two-thirds) are certain to be farmers who are already reasonably efficient and progressive—and who really do not require an added incentive. Many small farmers will be unable or unwilling, particularly at present interest rates, to find their share of the capital, while landlords may well be coy about their contribution until given back some freedom in their choice of tenants. The great bane of British agriculture—the factor which each year thwarts the attempt to make price guarantees more realistic—is the wide spread in efficiency between the best and the worst farmers. Mr Heathcoat-Amory's present proposals seem more likely to widen this gap than diminish it.

Secondly, it is clear that the new grants will stimulate the production of commodities already in surplus, such as milk and eggs. The Minister has rejected various suggestions for discriminating against particular branches of production—on the grounds that the effect on the farmers' efficiency ought to be the sole criterion as to whether a grant is made. This sounds reasonable enough. It is, after all, just as important (or more so) to have more efficient milk producers as more efficient beef producers. But everything depends on how "efficiency" is interpreted. Does it imply the capacity to produce extra supplies profitably at present guaranteed prices, or to do so at prices which (in the case of the "surplus" commodities) are progressively reduced until supply is brought into balance with demand ? The second test is the right one—but its application would rule out large numbers of small livestock producers utilising imported feedingstuffs, and would therefore smack too strongly of "discrimination against the small man" for the Ministry to dare to use it.

Mr Heathcoat-Amory can make his scheme sensible only by converting it frankly into a plan for dealing with uneconomic farms. Grants might even be paid up to 50 per cent in appropriate cases, subject to the requirement that whenever necessary uneconomic farms should be amalgamated. These ideas have a place in the Minister's present scheme—but their whole force is vitiated by its inclusion of all farms. It is no answer to point to the difficulties of selecting the right farms for treatment and of persuading farmers to co-operate ; Sweden and Denmark have successfully solved these problems and the English Ministry of Agriculture—in this as other matters—ought not to be too insular to learn from more successful competitors. By contrast, the Government's present plan is yet another lazy and pointless agricultural subsidy: it looks like completely precluding uneconomic farms from getting either the amount of assistance or the kind of treatment they require.

EAST AFRICA

Older Than Adam

IT was only because Mr *James Johnson* was successful in the ballot for private members' motions that the report of the Royal Commission on East Africa has been debated even within two years of its appearance. It must now be sadly recorded that the debate last Friday buried the report so far as any real action on its recommendations are concerned. It is hard now to recollect the sense of urgency when the commission was set its task, and the high hopes that it might find a solution to the dangers inherent in the problems of population and land in East Africa, which had flamed into the Mau Mau revolt. The commission proposed a radical operation: that land should be taken out of politics and tribalism to become a commodity available for individual ownership, sale and collateral for loans. From this basic idea the commission developed its detailed proposals

to solve the political problems of the area by breaking down the barriers to an expanding economy.

The governments of the territories did not like the radicalism of the proposals ; the Colonial Office was equally coy ; and clearly there is no greater liking for it from either party in the House of Commons, so far as may be judged from the speeches of those few members who stuck to the main point. There were obeisances to the commission for its work, but no belief in its basic findings ; and Mr Profumo, for the British Government, pronounced its death knell in his cosy declaration that all the East African governments concerned were in fact getting on very well with land registration—so far, that is, as individual tribes were ready for it. No doubt this is true ; but it will not generate the wind of economic freedom which the commission hoped might sweep through the territory, blowing away tribal divisions, suspicions and land reserves (including those round the White Highlands of Kenya) and turning African thoughts to the pursuit of wealth and betterment by individual effort and profit. *Laisser-faire* seems in fact to be too revolutionary a doctrine for those who today control territories many of whose most debilitating political and economic features would have been understandable to—and attacked by—Adam Smith back in 1776. The members of the royal commission must comfort themselves by reflecting that the report will at least become prescribed reading for African students of economics, who in time may become African Ministers of Agriculture, Land or Finance. Meanwhile, timorous MPs of both British parties remain one hundred and eighty years behind the times.

JUGOSLAVIA AND RUSSIA

Doves Over Belgrade

DOVES of peace are once more flying between Moscow and Belgrade. Two weeks ago, Marshal Tito's 65th birthday inspired a flock of friendly telegrams from all the communist parties of the Soviet block—with the exception of the Albanians, whose vendetta against the Jugoslav comrades is apparently too fierce to be turned on and off like a tap. And this week the second anniversary of the famous visit to Belgrade of Mr Khrushchev and Marshal Bulganin has been a peg on which to hang some unexceptionable sentiments about friendship.

According to Marshal Tito, the initiative for this rapprochement came from the Jugoslav side. It has apparently met with a response from the Russian leaders that must be all the more gratifying since Marshal Tito has not had to sacrifice either his pride or his principles. He has not retracted any of the tough things he was saying, only just over a month ago at Brioni, about the Soviet block's propaganda campaign against Jugoslavia and the behaviour of the Soviet leaders. And in his recent interview with the editor of *Politika* he stated firmly that he was prepared to co-operate whenever possible "without forsaking our positions of principle." The Jugoslavs will not abandon their good relations with the West ; and they remain convinced that the Hungarian revolt was primarily provoked not by counter-revolutionaries, but by the failure of the regime to respect the elementary rights of the people.

In short, the Jugoslavs and the Russians appear to have agreed to live and let live. The advantages to Marshal Tito are clear. His relations with the Soviet block had deteriorated so much since he adopted an independent stand on Hungary that he was beginning to be in danger of losing his cherished balance between east and west. The Russians, for their part, may reckon that the sooner the events of last October are forgotten, the better ; to patch up relations with the Jugoslavs will help to draw a veil over them. Moreover, after all that has happened, Marshal Tito may well have lost his taste for encouraging the satellites to seek their own roads to socialism.

INDONESIA

The 'Concept' Takes Shape

MR DJUANDA, the Indonesian prime minister, is working hard to put President Sukarno's new political "concept" into effect, although he has not neglected more practical tasks. He has announced that a national advisory council—the main plank in Dr Sukarno's plan for a "guided democracy"—would be formed, but it would not be a super-cabinet and the government would remain fully responsible to parliament. At first hearing, this sounds like

The Economist

JUNE 6, 1857

TRAINING THE ARMY

"That England should have an efficient standing army seems to be a point determined by the clear and conscious will, no less than by the most obvious and painfully experienced necessity of the country. That that army should be officered by thoroughly educated, and, if we may use the expression, keenly trained professional men, seems a condition absolutely necessary to an efficient army, though hitherto little understood. In point of fact, there is really no profession whatever, unless it be the clerical, for the large, thorough, and yet also strictly professional education of which, such grave reasons exist as may be shown in the case of military officers. In most other professions there is the stimulus of constant and close individual competition ; in all other professions—perhaps including even the navy—there is more regular and necessary work to keep the rust off professional habits and ability than in the profession of an officer in time of peace. . . . But being not only usually a profession of leisure, but a profession of leisurely command over an inferior social class, the reasons for providing as far as possible against a transformation of leisure into indolence or worse than indolence are indefinitely multiplied. And the only mode in which it is clearly competent to us to guard against this danger has hitherto been sadly neglected. For the Bar, for the Church, for the service of the State, and for Literature, we prepare men by plunging them early into stirring intellectual pursuits with still more stirring motives to pursue them. We give them at once a taste for culture and a habit of prosecuting those cultivating studies with all the eagerness of a profession. And yet in the one service of the State in which that culture is most socially needful and that rapidity of intellectual circulation in the greatest danger of decline, we have guarded against the possibility of an ordinary college life, substituted nothing of value in its place, and above all neglected those healthy competitive influences which infuse alacrity, hope, and vigour into the somewhat depressing atmosphere of a profession which is most successful in its function when it has least to do. A standing army must always be in danger of becoming not only still but stagnant. By general briskness in the intellectual training, and the subsequent competition for distinctions of merit, the danger not only of intellectual stagnation, but of the moral degradation which so often accompanies it, must to a large extent be avoided.

a sizeable modification of the concept, but Dr Sukarno has never said that the government would cease to be responsible to parliament; merely that it would have to take advice from the national council. Mr Djuanda's comment therefore does nothing to allay the fears aroused by the president's ideas.

On a more practical plane, Mr Djuanda, who has been visiting some of the regions that have been defying central authority, said that the government was willing to meet the regions' demands "as far as possible within the limit of state finances." An emergency act on regional taxes had been passed, and two bills fixing the percentages of taxes, duties and excises allocated to the regions were being drafted; a commission for autonomy and decentralisation would soon be set up. Although the government continues to proclaim the "unitary" nature of the Indonesian state, it seems simultaneously to be groping towards a *de facto* federal structure not unlike the short-lived United States of Indonesia which the independence leaders have consistently reviled as a Dutch creation.

The government's power to carry out its plans remains in doubt, however. Under an army decree issued last week, two of the rebel commanders in the Celebes, Colonels Sumual and Sudirman, have been dismissed and are to be transferred elsewhere. It remains to be seen whether they will accept these orders after defying so many others.

UNIONS

Electric Sparks

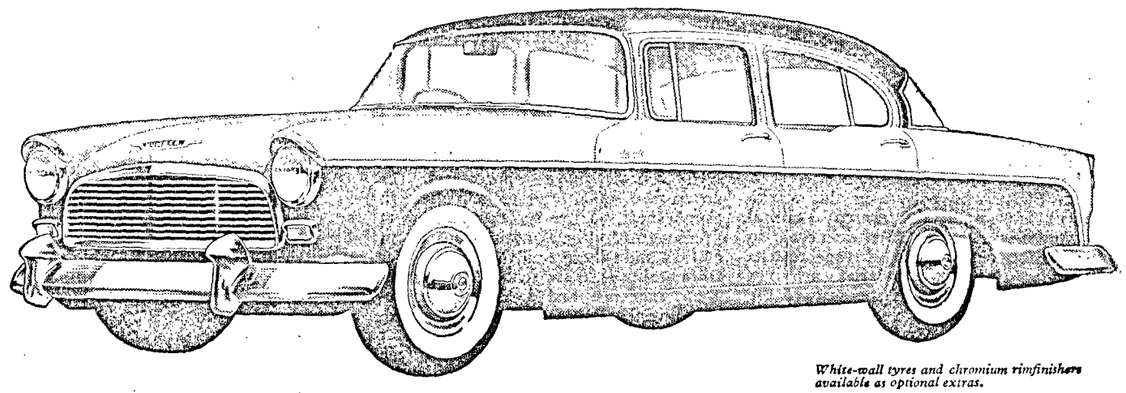
It was not at all a nice day by the sea for the leaders of the communist-dominated Electrical Trades Union last Monday. With an inkling, no doubt, of the public humiliation that was in store, it had been arranged that political questions should be discussed in private session. But afterwards Mr Foulkes, the president, and Mr Haxell, the general secretary, spoke to reporters. It appeared that the executive had been narrowly defeated on two important resolutions. The first expressed concern at the executive's attitude towards the "shooting down of workers at Poznan and its belated protest against the attempts of Russian troops to suppress the workers' revolution in Hungary." The second condemned the "brutal attack" of the Soviet armed forces on the Hungarian people and demanded their withdrawal unless their presence was agreed by a government freely elected by Hungarians. The executive's amendment seeking approval of its statement on Hungary last December (good party stuff) was defeated.

The flap into which these decisions threw the ETU leaders must be judged from the fact that next day Mr Foulkes denied that he had told the press the facts that had been printed by the newspapers. The well-known technique of blaming the reporters when in difficulties has been carried to a fine art by the ETU. (It is one of the few unions that maintains a press office, though not for the purpose of telling the press anything.) The technique was continued on Tuesday when Mr Foulkes embarked on a tirade against the newspapers for their account of the closing down of the ETU indoctrination centre at Esher: he says it is not to be closed, but only to be put in mothballs. He was defending himself here against a burgeoning feeling, expressed in one resolution, that the union should stop squandering its depleted resources on non-industrial activities.

It would be rash to say that the communist grip is now slipping from this union. One difficulty is that in industrial matters communism can still be made to seem indistinguishable from militant—and cynical—unionism of the old school. Mr Foulkes was heard by his conference with approval when he condemned the wage standstill agreement accepted by the engineering workers, which affects electricians in engineering firms. Although the agreement has been signed in its name, the ETU seems blithely prepared to break it in certain circumstances. Another difficulty is the mode of elections in communist-influenced unions. The election of an anti-communist to the executive of the Amalgamated Union of Foundry-workers has just been declared void, and a new election ordered; the anti-communist organisation called Iris had indicated the man whom it considered to be the best candidate, and this was held to constitute "interference by an outside body." But Mr Foulkes's troubles this week, following upon the upheaval in the Fire Brigades Union and other rumblings, are indicative of a trend. The Hungarian workers who died in the October rising have opened the eyes of some trade unionists here as no one else could have done.

INDO-CHINA

Setbacks for Laos



The return of Prince Katay Sasorith to the premiership of Laos is welcomed in London and Washington, where it is recognised that he is less likely than his predecessor, Prince Souvanna Phouma, to make a bad bargain with the communist-controlled Pathet Lao movement. But it must be admitted that his return marks the government's failure to make good the agreement with the Pathet Lao announced on New Year's eve. A solution to the problem set by the Pathet Lao's illegal control over two of the northern provinces now seems as remote as ever.

The rock on which all this year's negotiations have foundered is the provision in the agreement for the early formation of a "government of national union." Prince Souvanna Phouma's uphill task has been to "sell" the inclusion of Pathet Lao ministers in the cabinet before further general elections are held, to deputies sceptical of the value of assurances given by his half-brother, Prince Souvanna Vong, the Pathet Lao leader.

There have been minor differences of opinion between the three western powers specially interested in Laos—France; Britain, which shared the chairmanship of the 1954 Geneva conference; and the United States, which subsidises the kingdom's budget. But on April 24th, all three issued Notes reaffirming their interest in the independence of Laos and emphasising the right of the government in Vientiane to establish its authority over the whole of the country.

These Notes were bitterly resented on the communist side, and Souvanna Vong complained of American "interference." Souvanna Phouma was forced to resign on May 28th when the national assembly, in a secret ballot, voted 13 to 11 against continuing the negotiations, after the Pathet Lao had insisted that the government should accept aid from China as well as from the West. Prince Katay's task is likely to be made more difficult by the return of the aged rebel Prince Pethsarath, after many years' exile in Siam. Pethsarath, who has been given back his old title of viceroy, is the object of much praise from Hanoi radio, and has lately visited the communist-held provinces.

More Power—More Room—
More M.P.G.—and Greater Safety!

White-wall tyres and chromium rimfinishers available as optional extras.

THE NEW
HUMBER HAWK

The most sweeping claim to leadership ever made by HUMBER

6-seater comfort Exceptionally wide doors and a lower floor give easy access to the luxury of an interior that is *inches more roomy in every direction*. Legs can really stretch out in the new Hawk! The broad *deep-cushioned* seats are set between the axles for a *smoother-than-ever* ride.

6 Extra-Safety features ★ Unit construction that combines *lightness* with *immense strength* ★ Panoramic vision—wrap-round windscreen and rear window ★ Low centre of gravity and *Balanced Weight Distribution* ★ Instant response . . . vivid acceleration ★ Big brakes to match ★ Padded safety roll.

Greatly improved power unit High power/weight ratio assists the famous—*and now improved* Humber 4-cylinder engine to deliver an *even more exciting* and *velvet-smooth* performance. Increased M.P.G. puts the new Hawk completely in tune with the times.

In each of its distinctive single or two-tone colour treatments, in every flowing line and contour, the new Hawk blends advanced styling with traditional Humber dignity and reliability.

LETTERS

Egypt's Empire Builders

SIR—I write to make known the point of view of a person who is directly related to the problem which your article of April 27th presumes to tackle:—

1. The Arab nationalist movement is much older than the Egyptian revolution. It was deeply rooted in different parts of the Arab world long before it became the declared policy of the Egyptian government. The movement comes from within the nation, and is not, as the writer of the article insinuates, a destructive spirit conjured by Abdul-Nasser and his men.

2. Those who believe in this movement look upon the present political boundaries as having been delineated to serve the convenience of the western powers. These boundaries are not viewed as obstacles in the way of the pan-Arab movement and one's loyalty to one's state is not incongruous with the belief in a greater Arab nation. It is on the contrary believed that the interests of one Arab state are inseparable from those of another and that there is a common cause in whose pursuance political boundaries are transcended.

3. The Egyptian government does not pay the salary of any seconded teacher; the government of Kuwait, for instance, pays the whole salary as the teacher is considered to be in the service of the government of Kuwait; and Egypt cannot be spoken of as being too eager to send teachers abroad as we are rarely given the numbers we need.

4. Teachers in Kuwait, irrespective of their country of origin, have been careful to observe and respect the local traditions and institutions of the country; their behaviour from the point of view of a Kuwaiti has been exemplary.

5. The writer says that schools should not be built in, say, Kuwait unless there are enough Kuwaiti teachers to staff them, and adds that the Kuwaitis are not keen on teaching and that the numbers of the Kuwaiti teachers are on the decrease. It follows, according to this remarkable reasoning, that Kuwait should indefinitely stop building schools, in spite of her tremendous income from oil. How can we ever get out of this vicious circle except by inviting teachers from the Arab countries to start supplying professional men?

6. The writer does not seem to be aware, moreover, that the educational authorities in this part of the world are alive to the need for having primary school teachers who were brought up and educated in the same environment as the children. In Kuwait, for instance, all means to make the profession as lucrative and attractive as possible to Kuwaitis have been followed: they are paid higher salaries than non-Kuwaitis with the same qualifications, they have opportunities to get quick promotion and scholarships for higher studies abroad.

The writer's suggestion of establishing an institute in the Lebanon for training teachers is extremely naive. Why Lebanon in particular? The American University was founded in Beirut almost a century ago and many of the teachers whose ideas the writer considers objectionable are graduates of that university.

7. Some of the sheikhs in the Trucial Coast of Oman who—on financial grounds—cannot afford to build their own schools have approached the government of Kuwait to help them in that respect. Three such schools are at present run by the Kuwaiti Department of Education there, and the sheikhs—far from seeing in these schools a threat to their existence and interests—are demanding that more of them be opened.

8. The school children of Qatar who acted the short play which the writer saw were actually giving an outlet in their primitive way to a true feeling in the minds of the Arab masses towards Israel.

The article, as a whole, was bitterly reminiscent of the humbug that we used to hear during the recent crisis in the Middle East, when Abdul-Nasser was one day spoken of as a new Hitler, and the next as a communist or fellow-traveller; or when an attack upon Egypt was depicted as an attempt to protect the Suez Canal against other invaders, and in the next breath spoken of as an operation to foil a plot to seize power in the Middle East. Are you attempting to sow discord among the Arab states by following the same methods?—Yours faithfully, ABDUL-AZIZ HUSSAIN

Education Department, Kuwait

India's Crisis of Ambition

SIR—The articles in your issue of June 1st, called "India's Crisis of Ambition" and "What is Pakistan to be?" respectively, show that both countries are in a state of crisis, although for very different reasons. Curiously enough, however, there is a problem common to both countries for which a solution might do more than any other single factor to initiate trends in the desired directions. That problem is to secure an agreed solution for Kashmir.

India cannot find the capital needed to complete her second plan in the five-year period. A reduction in the targets or an extension of the period would inevitably lead (*inter alia*) to increased unemployment, with disastrous economic and probably political results. She needs more capital from both domestic and overseas sources. Domestically a reduction in expenditure (i.e. on defence) would help more than an equivalent increase in taxation, whilst the improvement in international prestige and creditworthiness that would follow from agreement on Kashmir would greatly assist to secure capital from abroad.

Your article on Pakistan cites two "fears" as the main obstacles to advance, of which one is fear of India. "Pakistan is hypnotised by the threat of India, not only in Kashmir but along all its borders." This fear would be removed, in due course, not only in Kashmir, by agreement on Kashmir.

May I once more plead for serious consideration of the suggestion put forward in my letter published in your issue of May 25th, that Kashmir should federate with both India and Pakistan?—Yours faithfully, VERA ANSTEY

University of London

Nasser Gets His Dues

SIR—As you talk about "a baffling quality of innocence," which had enabled "the remaining partisans of last autumn's military adventure" to contrive not to see the facts, may I draw your attention to Mr Selwyn Lloyd's recent speech in the House of Commons? He said: There was a common command of the armies of Syria, Jordan and Egypt. There were Russian technicians in Egypt capable of manning the Egyptian air force, and other arms. Every one of them knew that this dangerous situation might degenerate into a major war. This, he said, "was the real issue," transcending that of the canal, and it is indeed strange that you do not as much as mention it. It is, I hope, the result of innocence, but to an old reader it is certainly baffling.—Yours faithfully,

DESMOND ALLHUSEN

Beaminster, Dorset

Still Too Old at Forty

SIR—Government spokesmen have expressed their belief in an "opportunity state," and presumably we are supposed to be living in one. The experiences of some of us, however, lead to rather different conclusions. How many opportunities are there for the unemployed person of middle age?

I was in my early fifties when, at the end of 1954, I lost my job owing to a long illness due to coronary heart trouble. Having recovered from this, I found that the only jobs available were short-term ones, and one was very lucky even to get one of these.

Part of the difficulty seems to be that entry into a superannuation scheme is impossible over a certain age. Whatever the reason, a person who loses his job late in life often finds there is no longer any hope of security. For the young there is everything; the older people are not even allowed to compete with the young on the same terms.—Yours faithfully, J. C.

BOOKS

Two Marshals

By Command of the Emperor: *A Life of Marshal Berthier*

By S. J. Watson.
The Bodley Head. 236 pages. 25s.

The Trial of Marshal Ney

By Harold Kurtz.
Hamish Hamilton. 335 pages. 25s.

GIVEN little more than a walking-on part in "The Dynasts," though Hardy puts his Ulm campaign directives into blank verse; presented as an apprehensive, nail-biting amanuensis in Britten Austin's "Road to Glory"; dismissed by Macdonell as a desk-soldier who "failed to grasp the vaguest elements of Napoleonic strategy", and by Colonel Vachée as a talented supervisor of "copyists"—Marshal Alexandre Berthier, Prince of Neuchatel and of Wagram, at last receives his due in this book. It deserves study at Camberley and Sandhurst and by every lecturer and writer on Napoleon. In a sense, Berthier's reputation needs revision more than Carnot's, whose life by Major Watson was published in 1955, for Carnot is renowned as the forger of Napoleon's thunderbolts, whereas Berthier has seldom been credited with any say in their use or direction.

Major Watson's narrative, unencumbered by military jargon, marches briskly along like the Revolutionary armies, weighted only with the bare necessities of its campaigns: enough political history to explain (if not excuse) Napoleon's war aims, and simple maps containing all strategically important features and places. There are no diagrams, for Berthier was not concerned with tactics; although if involved in fighting he showed courage, an "eye for country" and decisive leadership, qualities unfairly disallowed by his detractors.

Berthier, born sixteen years before Bonaparte, was the son of the Director of Military Survey under Louis XV and XVI. He was commissioned as a topographical engineer in 1769. Attached in turn to infantry and dragoons and to Rochambeau's staff in the American War of Independence, he acquired an appreciation of the needs and functions of different arms during the important pre-Revolutionary period of the French Army's renaissance. He showed outstanding ability as a staff officer while Bonaparte was still unknown. He wrote in 1787 a manual on the functions and duties of the staff, and Major Watson regards him as the creator of the operational machine which, electrified by the dynamism of Bonaparte, drove the army of Italy, and later of the Empire, to victory.

The book's title is well chosen: in his dealings with the jealously competitive Marshals, Berthier's cautious insistence that he was only the Emperor's mouthpiece resulted in Napoleon's claiming credit for everything that went right and letting his chief-of-staff take the blame for what went wrong. Yet Major Watson ascribes much of the speed of the Italian campaign of 1796 to the work done by Berthier before Bonaparte assumed command. Berthier was not only a first-class organiser of recruitment and training but, on Major Watson's evidence, may also have originated the "general ideas" of the Montenotte and (four years later) Marengo campaigns. His self-effacing loyalty silently covered the Emperor's mistakes in the Jena-Auerstädt battles, but lessened his own reputation as an army commander while he struggled to correct the errors of Napoleon's attempt to control by semaphore signals from Paris the movements of troops in the prelude to Eckmühl. He was no "yes-man"; he advised against the tactical recklessness which crowded the army into Lobau, and it was largely due to him that the Wagram campaign ended without disaster.

Berthier's loyalty to the Emperor was severely tested but unbroken between 1809 and 1814; but his personal regard for the man ended when Napoleon callously threatened to deport Madame Visconti, to whom Berthier had been constant for ten years, and insisted on his marrying a Bavarian princess. But loyalty was Berthier's strongest virtue; and his devotion to duty was unaffected by political careerism or ideology. He had served France faithfully and efficiently under Louis XVI, Lafayette, the Committee of Public Safety (despite the terrorists' suspicion of regular officers) and Bonaparte; after the imperial abdication at Fontainebleau he regarded Louis XVIII as the rightful ruler of France, and his allegiance was unshaken by a personal appeal from Napoleon in 1815. When the King withdrew to Belgium Berthier obtained permission to retire with his wife to Bavaria, where he died, following a fall from a window shortly before Waterloo. Major Watson is satisfied that sensational rumours of suicide or assassination were completely groundless. Berthier was sixty-two and had recently suffered from giddiness undoubtedly caused by high blood pressure; he was the victim not of an unresolved moral conflict, but of physical stress due to years of strain.

Unfortunately, the same cannot be said of Marshal Ney; and though Mr Kurtz's book illuminates the motives of those who condemned "the bravest of the brave" to face a firing squad, it leaves one feeling that he was, in a sense, his own executioner. A great warrior, he nevertheless lacked Berthier's mental clarity and strength. His instinctive military reactions were quickened by a fearless spirit which inspired his men to face hopeless odds; but the superb soldier of Yvon's painting, "Covering the retreat in 1812," became a bewildered neurotic faced with the choice between his old and new masters in 1815. When, after feverish vacillation, he deserted the Bourbons Napoleon thought him deranged, and hesitated to give him any command till the eve of the Waterloo campaign, in which even Ney's heroism could not redeem tactics so reckless that the obscurity of the orders he received from the Emperor does not explain them.

But Ney's equally incompetent political tactics and the "treason" into which he drifted do not excuse the frenzied rancour of the "ultras" who hounded him to death, and Mr Kurtz's condemnation of their vindictive folly is fairer than his criticism of the British Government. It is unhistorical to ignore the strong political reasons for Liverpool's refusal to defy the Allies and undermine the dynasty they had restored, and for Wellington's reluctance to disobey his instructions by intervening on Ney's behalf. Moreover, as Mr Kurtz admits, it was symptomatic of the Marshal's mental confusion that he refused to be tried by a court martial, which would almost certainly have acquitted him, and insisted on trial by "his peers," who assembled in the atmosphere of a "White Terror." In such a situation neither the factious clamour of the Holland House Whigs nor the quixotic rescue plot of some eccentric Britons in Paris could save the prisoner; and it is perhaps significant that after the verdict he prepared for and met his end with admirable calm.

Books and Bookmaking

The Book World Today

Edited by John Hampden.
Allen and Unwin. 278 pages, 21s.

IT is over twenty years since a symposium, of this authority, on the production of books was published. In this entirely new successor to "The Book World" Mr Hampden has mustered a formidable batting list of publishers, booksellers, librarians and authors to state, often with an agreeable disunity, their views on the state of the nation as far as books are concerned. Some of the contributions are of the first order, notably Mr Walter Allen writing as an author and Mr W. G. Taylor on general publishing, and a few are rather less good than one would expect from the author or than the subject is worth.

Educational publishing receives slender mention and Mr Donne-Smith is wildly off the beam when he attacks the public libraries for supplying popular fiction. It is, after all, a canon of

librarianship that the seeker of "westerns" may be lured to more serious reading if both are supplied. The book also contains a serious omission. Much is said about writing, publicity, distribution, but although Mr David Bland writes well on book production he is writing from the publishers' point of view and not from the printers'. It would have been interesting to read the views of a practising printer on both publishers and authors and to have had some harder hitting at the printers than any contributor has dared. It is common knowledge that the restrictive practices in the printing trade are one of the biggest single factors which delay the production and increase the cost of books. Literary gentlemen should not be too fastidious to ignore this solid truth: it is intensely relevant to the future of what is still the most important civilising influence of our time.

Grief Writ Large

Left over Life to Kill

By Caitlin Thomas.
Putnam. 240 pages. **18s.**

EXTRACTS from this book by the widow of Dylan Thomas have been appearing serially in *The Observer*. These may have given readers the impression that the poet is its central figure. This is not so. The pages with the widest general interest are naturally those which deal with someone well on his way to becoming a legendary figure, *le Villon de nos jours*. But the bulk of the book, written in a vehement pseudo-Dylan style, is concerned with Caitlin Thomas herself.

It is largely an account of her winter's sojourn on a mining island off the coast of Italy, where she went with her youngest child after the death of her husband, ostensibly to recuperate. Unable to help herself, unwilling to accept help from others, nothing that happened to her there really reduced her acute sense of deprivation, though she took various and violent means to deaden the ache.

It is a squalid story, and she makes no attempt whatever to sentimentalise it. There is a good deal of tough humour in the book, and its main merit is its honesty. But one soon begins to long for a moment of reticence, an occasional brief tribute to decency; never more than when she casually quotes, from a letter that she carries with her, a profoundly moving avowal of love from husband to wife.

There is a medieval treatise about the Remorse of Conscience whose vivid title, in modernised spelling, is "The Again-bite of Inwit." Some odd association brought it to mind during the reading of this book, superficially so extremely unedifying. Mrs Thomas has plenty of inwit, and it gnaws at her most cruelly. It is not self-pity so much as self-disgust that seems to have driven her to write this outburst of autobiography; plus, perhaps, the temptation to cash in on the publicity attaching to the very name of Dylan Thomas. But essentially these clamorous pages are the articulate equivalent of a scream of pain and frustration. People who can look appreciatively at the canvases of Francis Bacon and not turn shuddering from his frantic, flayed, disintegrating images may be able to relish the exhibitionism of Caitlin Thomas.

At the Court of King James

The Lion and the Throne: *The Life and Times of Sir Edward Coke 1552-1634*

By Catherine Drinker Bowen.
Hamish Hamilton. 545 pages. **42s.**

The Life of Sir John Eliot 1592-1632

By Harold Hulme.
Allen and Unwin. 423 pages. **35s.**

IN 1606, as Maitland pointed out, Coke was settling the first charter of Virginia; and the appearance of these two biographies by American scholars reminds us that the story of the parliamentary opposition to the Crown in the early seventeenth century belongs as much to American as to English history. In that opposition Sir John Eliot was the fervent orator, who knew how to raise the emotional temper of the Commons; and his death in the Tower made him a martyr for the cause of parliamentary privilege. But it was the common lawyers who were the architects of victory, and of these the greatest, alike for his work as a lawyer and as a political leader, was Sir Edward Coke.

Much of the interest of Coke's career lies in its apparent inconsistency. As attorney-general under Elizabeth and James he accepted the wide discretionary powers claimed by the Crown, authorised the use of torture and was the savage prosecutor of Essex and of Raleigh. Yet he became the upholder of the integrity of the law and the most dangerous opponent of the monarchy. And his Reports, enshrining and perpetuating the learning of the common law, drew from his enemy, Bacon, the tribute that without them "the law by this time had almost been like a ship without ballast." Mrs. Bowen, the author of "Yankee from Olympus," finds it surprising that so few biographies of Coke have been attempted; yet the combination of legal knowledge and historical skill demanded might have daunted even Maitland. She has contented herself with aiming at "introduction, evocation," and tells us that she has always found "the narrative method more persuasive." This concern with persuasion seems unnecessary, since she inflates into 460 pages of narrative the view of Coke which Sir William Holdsworth gave in 70 pages. Mrs. Bowen has shown great industry, combines vivacity with shrewdness and possesses insight into personality; but the gushing tone and often speculative evocation are out of place in a life of this great lawyer and astute politician. Of Coke's Institutes she remarks that his only fear was that he might leave something out; and as a biographer she seems to share this fear. Yet she omits to mention the help Coke gave the Crown in the case of Goodwin versus Fortescue, or to discuss the part he played in disinterring the weapon of impeachment which terrorised the ministers of the Stuarts.

In contrast Professor Hulme's definitive biography of Sir John Eliot is almost antiseptic in its treatment. His book replaces the two volumes of hagiography by Forster, who certainly distorted evidence and may even have fabricated it. Mr Hulme has no illusions about Eliot. Originally the client of Buckingham, Eliot showed himself little more honest as vice-admiral of Devon than most office-holders of the time. But Eliot was too independent to be a client for long; and he retained profits he should have shared with Buckingham. In 1626 he was the most savage of Buckingham's opponents. But the hold of this "sharp-tongued, loquacious idealist" on the Commons was never secure. He talked too much; he was easily diverted to minor issues; and he was bored by the common lawyers. Yet it was Coke's learning and adroitness that secured the Petition of Right, while Eliot's rancorous intransigence brought the dissolution of 1629 and his own imprisonment. Mr Hulme's careful scholarship demands close attention from the reader, and he keeps the temperature low, even when dealing with the impeachment of Buckingham. There is a fascinating chapter on the elections in Cornwall in 1628, when Eliot was elected despite the tactics of Buckingham's henchman in the West. If Mr Hulme renounces the temptation to dramatise his account, he has closed the chapter on Eliot, whereas the great Sir Edward Coke still awaits his biographer.

Zero's Hour

Zero! *The Story of the Japanese Navy Air Force 1937-1945.*

By Masatake Okumiya and Jiro Horikoshi with Martin Caidin.
Cassell. 383 pages. 30s.

ABOUT half-way through this book the authors remark that "the greatest single factor" in the early Japanese successes against the British and American navies . . . "was the superior performance of the Zero fighter." Obviously that statement is an oversimplification, since many other factors—such as Britain's under-estimation of the Japanese navy's proficiency and prowess and misreading of Japan's strategic intentions—contributed more to the débâcle of 1941-42 than any single enemy weapon. Nevertheless, the Zero was a remarkably successful fighter, and it was not outclassed until the Lockheed Lightning and the Grumman Hellcat tilted the scales in 1943.

But if the Japanese naval fighter pilots and their Zeros are the chief heroes of the book, it is also one of the best accounts of the war in the Pacific so far published. The authors, who are by their service and experience well qualified to write on the subject, tell their story with an attractive directness, and their American collaborator has used their knowledge to build up what is in fact an authoritative contribution to the enemy's war history. Thus we here learn as much as we are ever likely to know about events on the other side of the hill in the sinking of the *Prince of Wales* and the *Repulse*, in the foray into the Indian Ocean in April, 1942, and in the many encounters with the American carrier-borne aircraft by which the Japanese navy's offensive power was finally destroyed.

It is a great pity that so little attention has been paid to the Pacific war in this country, for it is rich in strategic and tactical lessons. Thus we have never really asked ourselves how it came to pass that in the prewar Royal Navy the Fleet Air Arm was not recognised to be the spearhead of modern maritime power, as in the Japanese and American navies. A heavy price was exacted for the conservatism which seems to have been chiefly responsible for that misjudgment. Of course in due time the Japanese made their errors too; and they are here set out with commendable candour. Light is also thrown on many previously obscure points. For instance we are told that foreknowledge of the Japanese movement towards Midway and the interception of Admiral Yamamoto's aircraft in the Solomons both came about through decryption of enemy signals by the Americans—a matter on which official Allied histories have been too discreetly silent.

It is a measure of the book's success that the reader shares with his erstwhile enemies the sufferings of the Japanese navy as the end approaches. No fewer than 2,363 of that service's aircraft took off on Kamikaze flights in the final phase, and it is the authors' opinion that the two atomic bombs only provided a means of ending the war without "losing face." The book is made all the more valuable by tables setting out, for instance, the whole Japanese aircraft carrier strength; and a most useful appendix on aircraft types and performance will help to remove the lay reader's difficulty in remembering what were, for instance, a "Betty" and a "Kate."

The Rational Monad

Bertrand Russell: *The Passionate Sceptic*

By Alan Wood.
Allen and Unwin. 249 pages. 21s.

BERTRAND RUSSELL'S colourful and brilliant life makes a wonderful subject for a biographer. Mr Wood, who is both a philosopher and a journalist, has done a very competent job on it. He shows insight into Russell's greatness as a philosopher, even to the extent of giving a simple and accurate account of his great contribution to philosophy—the theory of descriptions; and he links Russell's philosophy, which he obviously admires, with his social setting and his personal preoccupations.

One of the keys to Russell's social setting is that he had a small but sufficient independent income. The importance of this is brought out by Mr Wood: "In fact almost all the great philosophical advances of this epoch came from men who did not have to work for a living: this applied to Moore and Wittgenstein as well." This social disengagement was enhanced by Russell's lack of permanent commitment to any academic institution. After the 1914-18 war he said "I foresee a rather delightful career as a free-lance philosopher like Abelard." Russell had lacked personal involvement ever since his childhood; he was a precocious recluse brought up by his grandparents, emerging only when he had to go to a crammer to learn enough classics to get him to Cambridge. This sense of isolation appeared in his peculiarly individual approach to society, whose irrational traditions and processes he never properly understood. It gave him, too, a craving for affection and a longing to belong to a crowd. He was, therefore, at his best as a political commentator when he was alone, and at his worst as a member of one of the many progressive movements to which he belonged during the two wars. This atomic individualism appeared in the enthusiasm with which he adopted neutral monism—the view that minds and physical objects are constructed out of individual experiences—and in the brilliance with which he expounded Leibniz's philosophy of the monad, which many modern philosophers regard as Russell's best book. The monadic picture of Russell becomes rather blurred as his energy flowed into social movements. There is, for instance the pathetic picture of him feverishly writing popular books to save the finances of the school run by his second wife.

Bertrand Russell's main driving force has been his rigorous quest for certainty. At the age of eleven he doubted Euclid's axioms, a doubt which led to his magnum opus—"Principia Mathematica"—when he was thirty-eight; at the age of sixty-eight, in his "Inquiry into Meaning and Truth," he was still trying to find a set of "basic propositions" which would give some substitute for certainty; and at the age of seventy-six, in his "Human Knowledge," he tried to make explicit the undemonstrable basic postulates which an empiricist must take for granted. He has never been satisfied with doubt. At the age of five he asked his Aunt Agatha "Do limpets think?" "I don't know," she replied. "Then you must learn," said Russell. This search for perfection, for a secure resting place, led him both to China and to Russia to find out for himself about these developing civilisations. The Victorian belief in progress goaded him on in his quest; but he was always disappointed when he got there—as he was in matrimony. He was never really satisfied with his views on ethics either: for instance, his subjectivism, which led him to analyse his judgment that Nazis were wicked into the statement that he just did not like them.

For Bertrand Russell is a great humanist. Suffering appals him; cruelty has always given rise to his passionate indignation. But he worries because he cannot justify his feelings. It is a pity that his seeming dislike of Kant and of post-Russellian philosophy have prevented his re-examination of the connection between morality and the use of reason, in which he has probably not met his equal.

Extraordinary Mission

The Lost Opportunity

By Alexandre Cretzianu.
Cape. 188 pages. 18s.

MR CRETZIANU has written an accurate book, which is readable notwithstanding his curious use of the word ambient as a noun and a few other eccentricities of the kind. In September, 1943, he was sent to Turkey as the emissary of the anti-Axis opposition in Roumania but with the sanction of the two Antonescus, the Marshal and his foreign Minister, Mihai. This was a remarkable consignment, for to be sent to a neutral country like Turkey meant of course that he was to seek contact and reconciliation with the Allies—the Western Allies only—by the wish both of Maniu and Bratianu as of Hitler's former friend, the Conducator.

Apart from describing this extraordinary mission and apart from stating the fact that Prince Stirbey, who was sent as a special envoy to the Allies early in the following year, was his

GUNNAR MYRDAL

uncle, Mr Cretzianu has nothing to tell us that we did not already know. It is a melancholy byword by now that the opportunity was lost of attacking Germany in the Balkans and thus saving the Balkan countries from Russia, while it has long been evident, as Mr Cretzianu emphasises, that the Allied invasion of the south of France was to all intents and purposes superfluous. What he fails to make sufficiently clear is that Hitler was frantically afraid of the Allied attack upon the Balkan peninsula which Churchill had projected; this fact should have pointed the moral of Mr Cretzianu's story and adorned his tale. His account of Maniu's activities during the war is of value. In his concluding chapter, which is otherwise repetitive, he suggests that if the Western Allies had found themselves unable to liberate all the countries now dominated by Russia they might yet have assured "some system of joint occupation in each and every one of them on the Austrian model." In view of Austria's exceedingly successful handling of the Russians since the State Treaty restored its independence, this possibility becomes almost unbearably tantalising.

The attitude of several leading Turkish diplomats during the war is well illustrated by Mr Cretzianu. It may be summed up in the words he quotes:—"We don't want to risk having Hitler seize the Straits if the only prospect is liberation by Stalin."

To Moscow—And Back

Seven Roads to Moscow

By W. G. F. Jackson.
Eyre and Spottiswoode. 344 pages. 30s.

THE title is a misnomer. The first four roads are so lost in time that they provide no foundation for military analysis. And this is a book of military analysis. Logical and convincing, amply illustrated with good maps and embellished by a neat use of analogy and metaphor, it reveals the mind of a highly trained and thoughtful staff officer at its best. But the title should be "Three Roads to Moscow," for in effect the book is an extended study of the invasions of Russia by Charles XII of Sweden, by Napoleon and by Hitler. All failed.

Space and time brought the invaders to military defeat. Space and time allowed the Russians to build up their reserves for the inevitable counter-offensive. The invasions failed, too, because of the lack of a clear political objective. To Charles war in itself—the excitement of the march, the camp and the battle—seemed to be sufficient. Tactically superior, as all the invaders were at the beginning, he swerved south from Moscow, seeking but failing to find a strong alliance with the Cossacks of the Ukraine, to be defeated by Peter at Poltava.

Napoleon, too, sought to crush the Russians in battle. He failed to do so in the frontier lands, and when at last the set piece battle was fought at Borodino his army, worn down in the long approach march, was not strong enough to annihilate the enemy. It was strong enough to occupy Moscow—the emptiest of all triumphs with a growing Russian army still in the field and the Tsarist Government still in being. There, Napoleon did not—perhaps he dared not—seek the political decision which his military genius and his armies had failed to give him; he did not proclaim the emancipation of the Russian serfs. Then inexorably came the long horror of the retreat. The Russian armies were curiously reluctant to close the trap. The name of Napoleon still had its awe. But they did not have to do so. The plains and the snows killed as finally as the armies would have done.

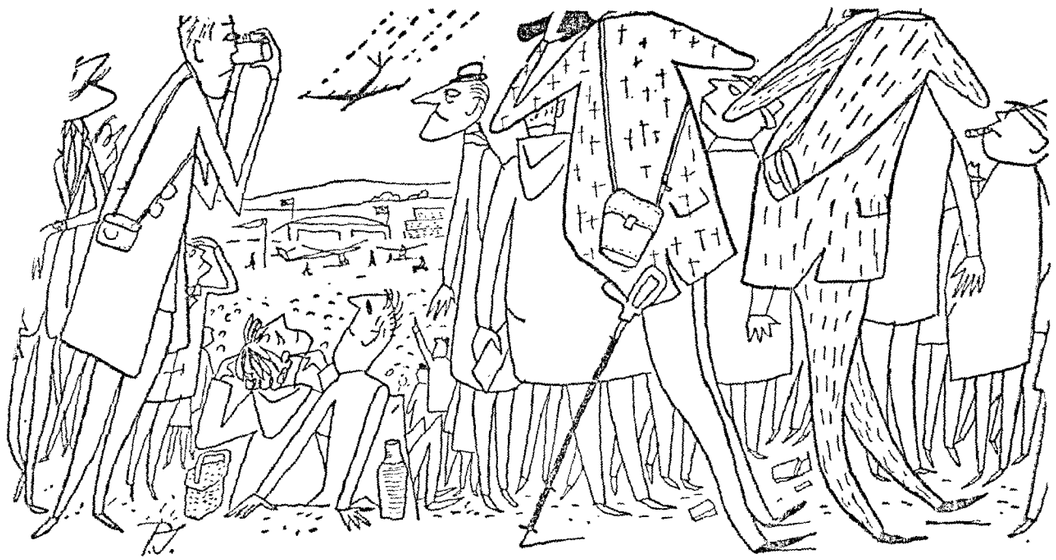
Hitler's armies, relying on long-range Panzer tactics, did succeed in bringing the Russians to battle and to defeat in the frontier zones. They overran the Ukraine, but they failed to capture Leningrad and Moscow. The winter had come and the balance shifted decisively from the tank to the reinforced Russian infantry. Space and time defeated the Germans, just as they had defeated the French. The Germans, too, contributed to their own defeat by havering between military objectives. Their final effort was split between two objectives—Stalingrad and the Caucasus—and it came too late: Russia could then bring its economic and military reserves up into the battleline. Politically, the German strategy was inept, compounded of nothing more than conquest, destruction and terrorism.

The course of these three campaigns and the reasons for their failure are examined in detail by Lieutenant-Colonel Jackson. His conclusion is negative: "the only lasting road to Moscow was the Viking road that provided the constructive services which the Russian people themselves wanted, and for which they themselves asked. Let us hope that no one will be tempted to emulate Charles, Napoleon or Hitler in imposing a military solution of the kind which history has shown must fail, and which may well bring nuclear annihilation to mankind."

Uneasy Dividing Line

The Indivisible Island: *the story of the partition of Ireland*

By Frank Gallagher.
Gollancz. 316 pages. 21s.



FEW will say that the partition of Ireland is not a tragedy. If they do not deplore the division of the island itself they will deplore the larger breach by which Eire is partitioned from Britain and the Commonwealth, too. But the tragedy of this book is that although Mr Gallagher knows much about the uneasy line that is drawn across Ireland, he does not really know why it is there. Sadder still, his ignorance persists while so many of his fellow-countrymen are awakening to the fact that the reasons for it are fundamental and can be overcome by the force of neither British legislation nor Irish terrorism.

Mr Gallagher's thesis is that partition has been wantonly carried through by Britain; that the British, "considering themselves secure only when Ireland is weak, used all the arts, influence and patronage at the disposal of a government to tear the uniting groups apart," and that the country has only to be left alone for amity and prosperity to be complete. This somewhat startling assumption he bases on nothing more than the alliance of Catholics and Protestants in the rebellion of 1798, the existence of some Protestant Home Rulers (among them the greatest leaders of Irish independence), the natural aversion shown by Southern Protestants to the dismemberment that left them in a minority in the Twenty-Six Counties, and Northern Ireland's own reluctance to accept self-government.

To "the honest necessities of the Ulster case" (the words are Sir Winston Churchill's), Mr Gallagher is almost perversely blind. Not once does he acknowledge the meaning of the British connection: unlike Cardinal D'Alton he has not begun to consider whether a united Ireland could or should be in the Commonwealth; nor does the book have anything to say about the future of Eire's neutralism or isolation or face openly the essential conflict between the two religious, and political, systems. Mr Gallagher gives more attention to economics, but only to seek to prove that the two parts of Ireland are complementary and not dissimilar in their state of development. In this also he is by no means up-to-date. The disparity in the financial condition of Eire and Northern Ireland is on record: the difference in living standards is becoming equally wide; and whether or not an element of British subsidy exists, the people of Northern Ireland, Unionist and Nationalist, are in no doubt of the material benefits of life within the United Kingdom.

Yet Mr Gallagher's approach is not devoid of objectivity. His well documented examination of local government in Northern Ireland shows that not all justice is on the Unionist side, and that for all the hostilities of a dual society greater representation on local councils must be conceded before Nationalists can be said fully to enjoy the rights and liberties of British citizenship. In the city of Londonderry, where Catholics are in a majority but almost excluded from the corporation, is a political problem that will soon prove a test case for Unionist democracy and the party's will to create a more united community.

But these internal frictions do not vitiate the effectiveness of the partition expedient, a view reflected in Mr de Valera's own belief that it can be ended only by an identity of wills. That implies an understanding of the Northern mind that Mr Gallagher has not begun to grasp. This could have been a timely and valuable book, presenting the Irish problem of today with the balance its literature has so often lacked. It shows only that in the writing of history patriotism is not enough.

the things they say!

My goodness, he's shifting!

But where's all this speed going to end? And where are we going to get the materials to stand up to it?

Some of them are just around the corner, some are already helping — titanium, for example.

What's special about titanium?

You can make alloys of titanium that are as strong as high-tensile steel, but only half the weight — and weight, as you know, is a critical matter today to people like the designers of the flying machines of the future.

Why didn't we have titanium before, then?

There were a lot of problems to solve. For example, molten titanium must not be allowed to absorb air, so melting must be carried out in a vacuum. Another headache is that it combines with any of the materials normally used to line a melting furnace.

Have these problems been overcome now?

Yes. I.C.I. are extracting 1,500 tons of raw titanium a year. Their melting and fabrication plant is the largest in Europe and additional rolling capacity is being laid down.

So titanium has really arrived?

Not just arrived. I.C.I.'s wrought titanium products are already flying in Britain's most advanced aircraft.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Less Information Please!

WASHINGTON, DC

At the very moment when the British Cabinet is looking into its overseas information services the American Administration is being compelled to make radical revisions in its propaganda abroad. In his Message on the State of the Union in January President Eisenhower devoted a whole paragraph to the great new opportunities for the United States Information Agency: "just as in recent months the voice of communism has become more shaken and confused, the voice of truth must be more clearly heard." As soon as Mr Arthur Larson, a former Rhodes scholar and professor of law, had finished writing campaign speeches for the President about the need to modernise the Republican party, he was placed in charge of the new drive to compound communist confusion. Eagerly he made plans to "pile it on," so as to exploit, not merely events in Hungary, but also American actions on the Suez affair, which dissociated the United States from colonialism. With vociferous and unusually sustained support from the President, Mr Larson asked Congress for an appropriation of $140 million in place of the $113 million which the USIA received last year. Last week the final version of the Appropriation Bill cleared Congress: Mr Larson got $96 million.

The President's judgment has been rejected even more definitely than the figures by themselves suggest. The USIA, whose morale has been damaged more than almost any other government department by repeated reorganisations and insecurity of tenure for its staff, has been given clearly to understand that it has forfeited the confidence of the Senate. The final appropriation was a compromise between the sum voted by the House of Representatives and the lower amount approved by the Senate, a marked contrast to the Senate's usual habit of restoring part of the funds knocked out by the House. In addition the Senate Appropriations Committee unanimously recommended, although this has no legal effect, that the agency be dissolved and that its functions be transferred to the State Department.

The first explanation for this fiasco is strictly political. The leading figures in both parties in the Senate Appropriations Committee, the Democratic Senator Johnson and the Republican Senator Bridges, are opponents of the President. Indeed, Senator Bridges is the most influential of the hard core of Republicans who have never wavered from their last-ditch opposition to the New Deal. Mr Larson, on the other hand, has explicitly committed to paper all, and perhaps rather more than all, of the President's shadowy political philosophy. Through Mr Larson Senators Johnson and Bridges were striking at his master, the Democrat because his party's liberal clothes had been stolen, the Republican because his party had been deprived of its true inheritance.

But the obvious political motives do not alone account for the USIA's difficulties. Mr Eisenhower has long had a frustrated feeling that there must be some fresh way of making America's palpable virtues more apparent in the vast areas where its policies and customs are being systematically traduced. But many Senators share the view of his expert advisers that "psychological warfare" cannot be thought of as an enterprise distinct from the substance of foreign policy. Against this background Mr Eisenhower's recent interest in the USIA's activities revived old fears of a "government-owned news agency" and of an autonomous propaganda machine generating its own private policy.

MR LARSON'S task in appearing before the subcommittees of the House and Senate might be compared to that of defending the BBC, the British Council, and the British Information Services before a Royal Commission dominated and largely staffed by Lord Beaverbrook. None of the questions would have seemed unfamiliar to readers of the *Evening Standard*. Did Mr Larson seriously think respect for American culture was increased by promoting the tours of Mr Dizzy Gillespie and his jazz band? Why should American taxpayers spend $16,000 a year on providing free copies of the *New York Times* and the *New York Herald Tribune* for 467 MPs and 177 peers? Why were there two American press officers in Ethiopia when there were only four newspapers in the country and two of them were weeklies? And, since there were six hundred libraries in London—the number was repeated *ad nauseam*—why did there have to be a special American library? To this, Mr Larson patiently answered that, as a student doing research in English libraries, he had "found almost no American books at all." Whereupon Mr Rooney, the hole-picking Irish American from Brooklyn who heads the House subcommittee, retorted that he had found only fifteen people in the American Library in London.

Neither side came to the encounter between USIA and the Senate subcommittee well prepared. Most of the questions were stabs in the dark or were inspired by a relentless press campaign waged by the American Lord Beaverbrook, Mr Roy Howard, through the innumerable papers of the Scripps-Howard chain and the biting pen of its editor-in-chief. Thanks to his efforts a large part of the hearings were taken up with allegations that the wireless service of the USIA, which consists very largely of press summaries and the full texts of official statements, was competing unfairly with the United Press, the languishing news agency which the Scripps-Howard chain controls. Unfortunately Mr Larson, who is, after all, very new to the job, was not provided with crisp responses to the more random shots. He was eloquent on the need to expand pilot schemes

that had proved their worth—such as the distribution of subsidised translations of American books, the making of films for countries just breaking into the television age, and the teaching of English. He even, when pressed, assayed the impossible task of listing tangible results of American propaganda, but he was not good at explaining why four people were needed at a particular post instead of two.

Now that the damage has been done, Mr Larson has indicated that he plans to rethink all of the information agency's diverse enterprises through from the ground upward. But Congress will certainly expect him to pay attention to the specific directions of its criticism. For this reason alone there will have to be very sharp cuts in Western Europe (which have already begun). It was no surprise to hear Senator Ellender pronounce that

> if, after the expenditure of nearly $5 billion in American aid, the British people have no basic understanding or appreciation of America's policies and efforts, the expenditures of further large sums for propaganda will serve no useful purpose.

But the most deadly blow came from Senator Fulbright, also a former Rhodes scholar, who maintained that, when speeches and policies were as damaging to the alliance as Mr Dulles's, the least said to try to explain them away the better. In Mr Fulbright's opinion, it was also "a little presumptuous" to try to tell "the facts of life" to "a highly developed and more sophisticated nation."

Despite Mr Larson's attempts to argue the merits of promoting the teaching of American history in English and French schools and of quietly reasoning with editors who printed one-sided reports of such matters as racial incidents in the South, the debate concluded with the impression that everyone would be better off all round if the United States Information Agency practically closed up shop in Western Europe. If the agency's work really is valued there, some striking demonstrations of this will be needed before next year's appropriations are debated.

Is the Atom Worth the Risk?

As this summer's American tests of nuclear devices began in Nevada, with almost exaggerated care being taken to confine the radio-active fall-out to the reserved area, Congress's Joint Committee on Atomic Energy opened its study of the dangers, present and future, which these tests present to the human race. The hearings were not expected to produce much new evidence but only to lay out the existing evidence, contradictory, inconclusive and confused by propaganda and emotion as it is, in a form which would enable the general public to discuss, even if not to decide, whether trials of atomic weapons are worth the risks which they involve. The hearings were also expected—and to some politicians this is perhaps their most important aspect—to underline for the public the obstinacy with which the Atomic Energy Commission refuses to recognise that its experiments may already be going too far.

The argument that this is the case was reinforced by a scientist who produced what was apparently a new theory that, wherever atomic explosions take place, radio-activity tends to collect dangerously over the northern hemisphere; the AEC has always maintained that it spreads evenly round the world. Another surprise was the willingness with which experts working for the AEC admitted that eventually atomic tests would bring a concentration of radio-activity which would endanger the health of people already alive and the development of their descendants. These scientists were ready to agree that, sooner or later, for the safety of mankind, some international limitation must be placed on the size and number of atomic explosions; they disagreed only with those witnesses who insisted that the time for this limitation had already come.

The basic question is whether there can in fact be such a thing as a safe dose of radiation. According to a petition signed during last week by 2,000 scientists from all over the United States, mainly biologists and chemists, there cannot be such a dose. They therefore appealed to "the governments and peoples of the world" for an immediate international agreement to stop nuclear tests. If anything resembling such an agreement comes out of the present disarmament talks in London, as President Eisenhower hopes it will, then the current discussion in America will ensure that it is welcomed with sympathy and understanding—and will help it on its way through Congress.

Shock for Big Business

By finding that the du Pont Company's ownership of shares in the General Motors Corporation violates the anti-trust laws, the Supreme Court has shocked the business community even more than did the Republican Administration when it decided to proceed with the charges. This suit was begun by the Democrats in 1949 and originally involved over a hundred members of the du Pont family, from the oldest to the youngest; it was dismissed in Chicago in 1954. This week, with three Justices abstaining, the Supreme Court reversed the dismissal by four votes to two, a narrow margin for such a far-reaching ruling. The majority included not only the two traditional liberals, Justices Black and Douglas, but two of President Eisenhower's nominees, Chief Justice Warren and Justice Brennan, to the distress of those who had hoped that the court's attitude to business would become more favourable as the men appointed by Democratic Presidents were replaced. The case has now been returned to Chicago, for the District Court there to order an equitable remedy. It may be a year or more before a final settlement is reached and not until then—if then—will it be possible to assess the full implications of this unprecedented decision.

Its importance, however, lies mainly in the two points emphasised by Justice Burton in his strongly dissenting opinion. This is the first time that the anti-merger section of the Clayton Anti-Trust Act has been applied to an acquisition which took place long before the suit was brought—it is forty years since du Pont bought 23 per cent of General Motors stock—or to a vertical acquisition—du Pont supplies General Motors with paint and upholstery fabrics. The Act was amended in 1950 to clarify its application to vertical mergers, in which suppliers and customers unite, as well as to horizontal mergers between companies in similar types of activity; but the majority of the court contended that the du Pont acquisition was illegal under the original Act.

Justice Brennan, who wrote the majority decision, argued that through its ownership of stock in General Motors, du Pont obtained an advantage in the market for automotive fabrics and finishes and that this tended to create a monopoly. In his view, which was contested in the minority opinion, du Pont's position as General Motors' Chief supplier for these products was not "gained solely by competitive merit" and the original purchase of stock was not made purely for investment, as the defendants and the Chicago judge had claimed, but "to pry open the General Motors market." Mr Brennan believes that "the fire that was kindled in 1917 continues to smoulder . . . and is likely at any time to blaze" and complete the fusion between du Pont and General Motors. What chiefly concerns businessmen is that the decision seems to allow the government to bring an anti-trust suit against an acquisition of stock many years after it has taken place, if there is a reasonable probability that subsequent changes in trading conditions have made an anti-trust violation likely.

Files and the Fifth

Justice Brennan wrote another decision for the Supreme Court this week, less sensational but more fundamental, requiring the government to make available to the defendant in a criminal trial the reports against him in the files of the Federal Bureau of Investigation. On this occasion all but two of the Justices were on Mr Brennan's side; the newcomer, Mr Whittaker, abstained and Mr Clark, once an Attorney General in a Democratic Administration, argued, as government officials responsible for security have always argued, that intelligence agencies might "as well close up shop" if they were forced to allow outsiders to see their confidential papers. But Mr Brennan insisted that justice could not be done unless the accused was allowed access to the FBI reports in order to determine how best to defend himself. So Mr Clinton Jencks, a trade union leader who was convicted of falsely swearing that he had never been a Communist, is to have a new trial—unless the government prefers to drop the charges.

A week earlier the Supreme Court, this time unanimously, had struck another effective blow for the rights of the citizen. In ordering a new trial for Mr Halperin, a lawyer who had been convicted of tax frauds, the court condemned what has become the national habit—and one which the President himself admits to sharing—of assuming that anyone who takes shelter behind the Fifth Amendment to the Constitution must have something to hide. Under this amendment "no person shall be compelled in any criminal case to be a witness against himself." Mr Halperin, knowing that he was likely later to be accused in his turn, had invoked his constitutional right against self-incrimination and had refused to answer when questioned by a grand jury. When he did come to court, the judge in his direction to the jury implied that Mr Halperin's credibility as a witness in his own defence was impaired by the fact that he had earlier "taken the Fifth." This, the Supreme Court held, prejudiced Mr Halperin's trial. As Justice Black wrote: "The value of these constitutional privileges is largely destroyed if persons can be penalised for relying on them."

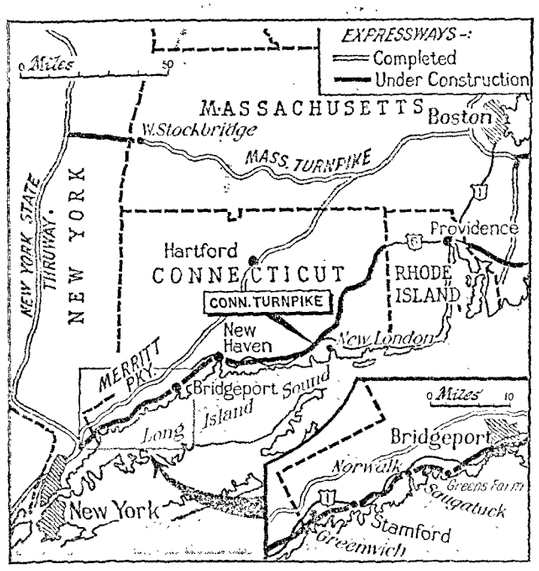
Turnpike Drives Through

FROM A CORRESPONDENT IN CONNECTICUT



Compared with the 41,000 miles of expressways which are contemplated in the Federal Aid Highway Act of 1956, the new Connecticut Turnpike, which will be open for traffic next January, is a modest stretch. But it does not look modest to the state which is bearing the cost and the disruptive effect of "the greatest construction project ever undertaken in Connecticut" in order to enable its citizens to travel farther faster. Unlike most modern roads of its kind, which avoid towns, the turnpike traverses one of the most heavily populated and industrialised areas in the United States. Starting as a project to reroute US 1, the old north-south coastal highway, which carried long-distance lorries and short-run housewives through a succession of suburbs and villages, the road quickly became a new and major enterprise in its own right. In the process it has slashed through crowded cities as well as open country with what, to the discommoded residents, looks like disregard for local interests and concern chiefly for the comfort of lorry drivers.

The turnpike begins on the west in a busy suburb at the line where New York State and Connecticut meet, and where it will receive heavy traffic from a thirteen-mile stretch connecting it with New York City. Thence it pushes eastward through towns and factory regions, cutting through a park in Greenwich, demolishing in Stamford a forty-year-old housing project, tearing down residential blocks in Norwalk, splitting the Italian section of Saugatuck, destroying marshland in Greens Farms, uprooting a mill population and mill buildings in busy Bridgeport, crossing streams at their widest points, and so on to the Rhode Island state line. There, in the peculiar pattern imposed by states' rights and reinforced here by the fact that Rhode Island cannot make up its mind to carry on the good work, it stops, and its speeding lorries will debouch on to an old two-lane highway.

In the turnpike's 129 miles there are being built 198 bridges and viaducts to carry it over railway lines, streets, rivers and other roads, while 76 more are needed to carry other transport routes over the turnpike. Entrance and exit ramps will swirl out at a hundred points. The right of way is generally 300 feet wide, with 180 feet the minimum, and 450 the maximum. Power shovels have bitten 17,720,000 cubic yards of earth, and explosives have blasted 9,459,243 cubic yards of rock, out of the landscape. Even this was not enough to fill the hollows; running as

the road does along marsh and tideland, 18,282,039 cubic yards of earth had to be "borrowed," some of it from neighbouring gravel hills, some by sucking mud and sand up from the bottom of Long Island Sound.

The peculiar difficulties which make this new Connecticut route so upsetting and expensive—the cost is expected to be $445 million, which averages almost $3½ million a mile—result from the state's position between two populous regions, its geologic structure and the way people live and work in it. The glaciers that in the last ice age slid slowly south to the sea carved out a series of river valleys running toward the Sound, and made the going hard from east to west. Anyone laying out a route from Boston to New York must either run it inland, up and down a series of hills as

sharp as the ridges of a washboard, or follow the flat and busy shore line. Connecticut has tried both, and both are expensive. Both ways also make enemies. The Merritt Parkway, slashed out of forest and farmland, and by-passing towns, upset farmers and nature lovers. The turnpike also bothered them, and upset town dwellers and factory owners as well, not to mention the New Haven Railroad which for years enjoyed a monopoly of carrying heavy freight along lines which run parallel to the new turnpike for miles.

Obviously a project of this magnitude is not undertaken lightly. The turnpike has been four years in the planning and the building, with eight or ten years of talking behind that. The Highway Department of Connecticut is supported by a tax on petrol and almost autonomous in itself, but this road was too big for its funds and faced too much opposition. Added authority was sought and won from the State Legislature; successive bond issues have already amounted to $250 million and there is more to come.

Few who live in towns between New York and New Haven doubt that some such road is needed to reduce congestion, save lives, preserve local commerce from extinction and speed heavy loads on their way. Yet so huge is the operation, so drastic the change in landscape and habits which it imposes on the towns in its path that only people who are moved by economic or engineering arguments accept it without a sigh. But if, when the turnpike is finished, the count through the Norwalk Toll Station, for example, shows that a daily average of "about 23,000 passenger cars, 400 light trucks, 900 medium trucks and 2,200 heavy trucks and semi-trailers" are in truth "diverted from the Norwalk street system" a sigh of relief will go up, and the leafy stretches of US 1 will revert to their long-lost quiet.

That hope is dependent on the toll charges, which have not yet been set. Unless towns take the drastic and unlikely step of forbidding lorries to use their streets, there is no means by which long-distance hauliers can be compelled to send their drivers over this road or that. The hope is to lure them from the free old road to the new toll road by better surfaces, by less time lost in costly traffic, and by better facilities for rest, repairs and food. As New York, New Jersey and Ohio have discovered in turn, if the charge is set too high the lorries will not move to the new road; if it is set too low, the bonds will not be serviced. If, a year from now, the homes lost and the habits uprooted are still remembered nostalgically and if, at the same time, lorry traffic still makes the main streets perilous, if property values near the turnpike have not risen, if income from the turnpike is lower than expected, the political repercussions then may be even louder than the roar of the bulldozers now.

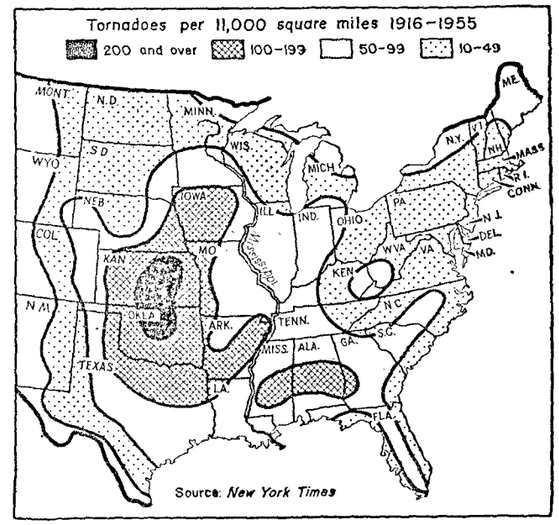
Open Season for Civil Rights

THIS week the House of Representatives at last began its debate on the Administration's proposals to protect the civil rights of Negroes, and particularly the right to vote. But there is a stiff gauntlet to run before the House and the even more unyielding Senate allow the Attorney General to ask for court injunctions to prevent Negroes from being deprived of their rights, and approve legislation specifically protecting their right to vote. The Virginian chairman of the House Rules Committee has sent the Bill to the floor under an "open rule," that permits and indeed encourages amendments which the South hopes may draw the teeth of the Bill or make it unacceptable to its friends. It would be more than some progressives could stomach if an amendment were tacked on to the Bill guaranteeing the "right" of workers not to join trade unions; they view this as a "union-busting" measure.

More dangerous is an amendment to require jury trials in contempt cases arising out of court injunctions forbidding interference with the right to vote. Juries are not used when the United States is a party to such equity proceedings and the Southerners have therefore been able to argue that the Bill opens the door to dictatorship by denying the right to trial by jury. The truth is that no jury in the South could be relied on to convict in a civil rights case. Yet the argument is sufficiently plausible and respectable to win three allies, one of them Senator Kefauver, for the four southern Democrats on the Senate Judiciary Committee; this week's vote, which may be reversed when the full committee can be assembled, was 7 to 3 to require trials by jury.

Civil rights Bills passed by the House have, up to now, always been talked to death in the Senate. By delaying a vote until other matters are pressing, the Southerners have put themselves in a strong position to do this again. But this year they may prefer to accept a Bill if they have succeeded in making it virtually impossible to enforce. There are risks in playing their trump card—the filibuster—too often when it frustrates the will of Congress. With Senator Clifford Case taking Senator McCarthy's place, there is now a clear majority on the Rules Committee for restricting debate and clipping the South's veto power. Fear that Congress may succumb to southern strategy and accept a Bill which pays only lip service to civil rights has prompted liberal Democrats in the House to appeal to the Republicans for a bipartisan front, and has led Mr James Roosevelt to ask the President and Mr Brownell, the Attorney General, for a clear stand against the trial by jury amendment. Letters contending that the proposal would nullify the whole civil rights programme were sent to key Republicans by Mr Brownell as the House debates began.

Baseball Strikes Out



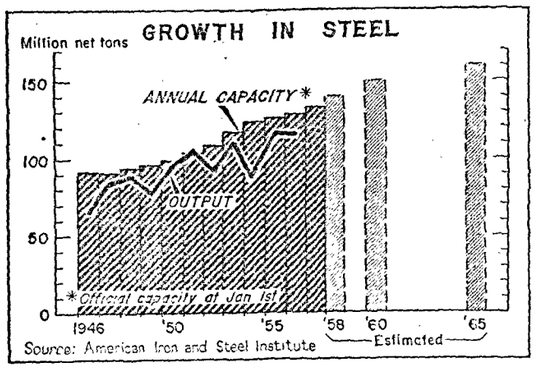
BEFORE next October the Brooklyn Dodgers and the New York Giants, two of New York's three professional baseball clubs, will have to decide whether to take advantage of the permission which the National League has given them to move west. But meanwhile they are sitting pretty, waiting for New York to match the bids of the Mayors of Los Angeles and San Francisco, who are panting to introduce top-notch professional baseball to the Pacific coast. New stadiums and a possible exemption from entertainments tax will be hard for New York to beat, quite apart from a rumoured guarantee of $2 million a year for ten years for each team's exclusive appearance on closed-circuit television. But Mayor Wagner, for all his determination not to be blackmailed, cannot, with an election in the autumn, wholly ignore the Committee to Keep the Dodgers in Brooklyn. If the Giants and the Dodgers emigrate, Chicago will be the only city with more than one major league team, and the whole baseball world may become more fluid.

The news that baseball was looking west came as no surprise. The national game is not what it was just after the war. Many minor teams and some major ones have been losing money, and even in New York, the baseball capital, attendances have slumped. The Giants are running at a loss and the Dodgers, with paid admissions of under 1.2 million, are hovering painfully just above the million which is required to qualify for major league standing. Before them, moreover, they have the example of the Boston Braves, whose spectators multiplied by seven when the team moved to Milwaukee and who are threatening to dominate the National League, much to the irritation of the Dodgers.

Trading with the enemy, Mayor Wagner is likely to remind the clubs, is part of the reason for empty seats. The Dodgers get $750,000 and the Giants $600,000 a year for their television appearances. But the teams also complain of antiquated and ill-placed stadiums, the lack of car parking facilities, and the competition of the races. Last year the Dodgers sold Ebbet Field and remain there only on a three-year lease. This year they bought the franchise of a Los Angeles club, the Angels. This will make it easier if they decide to move, but both clubs, in their calculations, must remember that compensation, which must be paid to local teams on the Pacific coast, may run as high as $7 million. It is financial considerations such as these which may have stimulated Representative Celler to revive his Bill declaring professional baseball a business and thus ending its unique immunity to the anti-trust acts.

Weather Does its Worst

IN Texas the worst recorded drought has been broken by the worst floods in history. There is talk of farmers who swim across their drowned fields to collect their drought relief cheques, while in the big cities such as Dallas and Fort Worth some families have been evacuated from their swamped homes three times in the past month. Farther



north, in "tornado alley"—Kansas, Oklahoma and Missouri—the storms have brought tornadoes in equally record-breaking numbers, fifty in a day, 173 in a week, a record total of 624 already this year, and the peak season goes on until the end of June. These terrifying and destructive funnels of whirling wind, travelling from ten to forty miles at a speed of about thirty miles an hour, splinter trees and flatten buildings along a path several hundred yards wide.

Tornadoes start, no one quite knows how, when warm moist air collides with cold dry air, as happens frequently, particularly in the afternoon, along the Mississippi Valley when winds from the Gulf of Mexico meet winds from the north. The number of tornadoes seems to have been increasing recently, suggesting some change in the pattern of atmospheric circulation; but in part the increase is explained by the Weather Bureau's improved system of detecting tornadoes by radar, which also means that adequate warning can prevent much of the loss of life, even if not of property. But in just one Kansas City suburb one day recently 39 people were killed and damage valued at $10 million was done. During April and May over 12,000 families were affected by tornadoes or floods, with 110 people being killed and 1,171 injured; more than 9,000 houses were damaged or destroyed. Relief is coming from both state and federal governments, with the Army and the Red Cross, as always, carrying much of the burden. But the record disasters of the last two years, during which there have also been floods on both the east and west coasts, have cost the Red Cross $50 million and have almost washed out its reserve funds.

Steel's Planned Economy

FROM A SPECIAL CORRESPONDENT

THE Republic Steel Corporation has just issued a book called "USA Tomorrow," in which it presents a view of the economy in 1965 and of the steel industry's place in this grand picture. Among other things, the steel companies are expected to spend, during the next decade, over a billion dollars a year on new plants and equipment, and to achieve a total capacity of 160 million ingot tons by 1965. But the exact figures are less significant than the fact that Republic—which in the nineteen-thirties fought the bitter "Little Steel" strike and has always represented hard-bitten middle-western conservatism—is now looking ten years ahead and enjoying the prospect.

The most important factor enabling steel companies to plan ahead is the new type of labour agreement signed last year, under which the steel workers will receive specified, gradual increases in wages over a three-year period. When a battle over wages had to be fought each year, it was clearly impossible to forecast the course of costs or profits, or to plan far ahead for capital investment. Moreover the fear of a strike generally caused steel consumers to build up stocks; when it was settled they lived on them, thus subjecting the industry to a severe cycle and making estimates of long term demand into a guessing game.

Now that both prices and demand are more predictable, the steel companies are basing their plans for new facilities on the long-term trends of population and steel consumption a head, and especially on trends in the use of steel by such important industries as automobiles, home appliances, oil field equipment, machinery and construction. Most of these steel-consuming industries have been planning ahead for some time. In fact, the metal-working industries generally have been expanding their capacity to meet targets set for 1960, while the metal-producing industries have grown more slowly and have just about kept up with existing demand.

The current programme of expansion will raise steel capacity from 128 million tons a year at the beginning of 1956 to around 140 million tons by the beginning of 1958. But new estimates already call for a further increase to 150 million tons by 1960, and some of the plans now going on to drawing boards may raise the figure even higher. It appears, therefore, that Republic Steel's forecast of a capacity of 160 million tons by 1965 may be conservative, since nearly that much is already in the planning stage.

The main hurdle the industry has to get over is the high cost of construction. The basic technique of steelmaking has not changed for many years, but the cost of building these giant facilities in crowded industrial centres has risen steadily. To duplicate the old blast furnaces or open hearths—many of them built in the nineteen-thirties—would cost several times as much today. In fact, it has been estimated that a completely new steel plant on a new site is three times as expensive as adding to an existing plant. Unfortunately, most of the old sites are getting so crowded that entirely new undertakings must be considered.

Another problem is that, while demand is likely to rise gradually during the next decade, capacity can only be added in very large blocks with present methods of construction. Thus both the physical expansion and the capital outlay may be far larger than immediate prospects warrant. Although all its facilities might be needed by 1960 or 1965, a plant completed in 1958 might prove unprofitable during the intervening years. There is now a widespread feeling in the industry that the giant Fairless Works of the US Steel Corporation, which was completed in 1953, will lose money for several years, despite its great long-term value as a highly modern plant in an admirable position. This is the only entirely new steel mill built since the war.

The industry is turning to research on new methods to help it to expand at a reasonable cost. Every major company has its engineers and laboratory scientists at work on problems ranging from better linings for furnaces to the molecular structure of steel itself. The aim is a revolution in steel-making which will reduce the need for large and costly facilities such as blast furnaces, coke ovens and open hearth furnaces, and which will eliminate some steps in the rolling mill process. If plants can be designed in terms of relatively small and inexpensive units, capacity can be expanded gradually each year.

Some of the smaller steel companies are already trying new versions of the electric furnace or the Linz-Donowitz process, which uses oxygen in a cupola furnace similar to the old Bessemer converter. Both of these processes are cheaper to install than the open hearth, but neither is yet adaptable to large-scale production. Research into ways of refining iron ore without the blast furnace, which has now reached a pilot plant stage, is much more revolutionary. One new process does this by passing a stream of hydrogen over the ore. A still newer magnetic process does not require hydrogen, and is said to produce a 90 per cent iron concentrate which can be fed directly to either electric or cupola furnaces or to the open hearth. The final objective is to move the whole treatment of ore back toward the mine which would then ship nearly-pure iron in uniform pellets to the steel-making centres. If these can be expanded mainly by adding the new, smaller furnaces, much of the capital investment problem will be solved.

Five to ten years of further research may be needed before such fundamental changes are possible. Meanwhile, the industry hopes to provide most of the new capacity now planned simply by adding to its present plants. Any completely new facilities will probably be built only where savings in freight offset much of the increased cost. But the future seems to hold out the prospect of steady growth and rapid changes in technology for an industry which in the past has been characterised by a stable technology and wild swings in consumer demand.

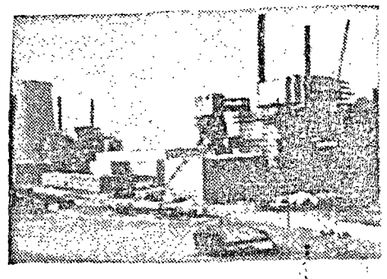
We take much pleasure in announcing that the three successor institutions of DRESDNER BANK,

Hamburger Kreditbank Aktiengesellschaft,
Rhein-Main Bank Aktiengesellschaft,
Rhein-Ruhr Bank Aktiengesellschaft,

resulting from the decentralisation in 1952, have merged as one bank under the style

DRESDNER BANK
AKTIENGESELLSCHAFT

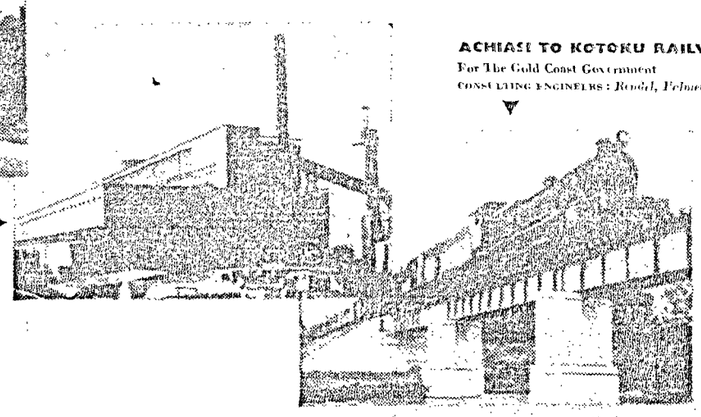
according to the resolutions adopted in the General Meetings of the aforenamed three banks. While the Registered Office of the re-united Bank is in Frankfurt a. M., Head Offices are maintained in Düsseldorf, Frankfurt a. M., and Hamburg, as heretofore, to which members of the General Management are attached.



After the amalgamation, and the decided capital increase having been executed, DRESDNER BANK Aktiengesellschaft has a nominal capital and open reserves aggregating DM 264 million and maintains 229 offices within the Federal Republic. Furthermore, it is represented in Berlin by its affiliate, Bank für Handel und Industrie AG.

May we take advantage of this opportunity to express our thanks for the confidence shown in our institutions during the preceding years. It need hardly be assured that, also in future, DRESDNER BANK Aktiengesellschaft will be endeavouring to foster the relations with its friends in the same manner, thus following the 85 years' tradition of DRESDNER BANK.

DRESDNER BANK
AKTIENGESELLSCHAFT
GENERAL MANAGEMENT



Representatives abroad:

Turkey, Iraq, Iran, Kuwait: Hans von Adlock, P.K. 824, Istanbul, Bahçekapi, Germania Han. Other Countries in the Near East: Helmut Hoeurgen, Cairo, 33, Rue Kasr el Nil, Immeuble Wahba. Spain and Portugal: Eduard R. Figgers, Madrid, Calle de Alcalá 32°. Latin America: Joint Representatives of the Dresdner Bank Aktiengesellschaft and the Deutsch-Südamerikanische Bank Aktiengesellschaft in Argentine (Buenos Aires), Brasil (Rio de Janeiro, São Paulo), Chile (Santiago), Colombia (Bogotá), Mexico (Mexico City), Paraguay (Asunción), Venezuela (Caracas).

THE WORLD OVERSEAS

Kiss and Cosh in the Fertile Crescent

FROM OUR MIDDLE EAST CORRESPONDENT

In the next few days, Arab eyes will be focused on Amman, where King Saud is due to confer with King Hussein. It is tempting to suggest that the meeting may be crucial for the future of inter-Arab relations, for with these two kings lies the decision for or against a realignment of forces in the Arab world. But past experience of such conferences shows that patience is one of the keynotes of Arab diplomacy; and the inherent difficulties of the situation now confronting the two kings are such that any tendency to temporise should be readily understood. The likeliest outcome is yet another communiqué announcing complete identity of views, together with a number of private understandings that can mean most things to all men.

King Saud has promised King Hussein his full support, and there is no doubt that he means it. His assurance is a substantial prop for the new regime in Amman. Both Egypt and Syria must hesitate to take any action that King Saud has set his face against. If they did, they would run a serious risk of destroying the Arab front, on which rests President Nasser's prestige in the Middle East and, far beyond it, in the councils of the Afro-Asian group. At the same time, King Saud must recognise the alarm which the change of regime in Amman has aroused in Syria and Egypt. A break with President Nasser could do him no good; and it might do him much harm. Thus, reluctance both in Cairo and Riyadh to force issues that, for the time being, are better left in abeyance is likely to rob the Amman meeting of lasting significance.

The danger attending too cautious a policy is that the wild men may take over. Some ominous signs of such a possibility can be seen in the deteriorating relations between Syria and Jordan. In Damascus, for instance, the Syrian government is observing its undertaking to prevent the Jordanian refugee politicians and soldiers from openly indulging in politics. But what goes on behind closed doors is beyond its control. There has been talk of the formation of a shadow government in exile. It may well be exaggerated. But there are influential elements in Syria that could give aid and comfort to the refugees from Jordan without having their actions aired in public. King Saud is pressing President Shukri Kuwatli of Syria to curb his extremists, though the power of the president to do so is doubtful in view of the military crisis in the spring, when the younger army officers successfully resisted the decisions of higher authority.

The present state of Syrian-Jordanian relations is a good reflection of Arab uncertainties. They take their course on three planes: official, unofficial and demi-official. On the official plane, the behaviour of both parties is correct. The Syrian government is at pains to assume that the change of regime in Amman has not affected Jordan's attitude to the Arab Solidarity Treaty, which allied Jordan with Egypt, Syria and Saudi Arabia, and replaced British aid by Arab aid. The Amman government, for its part, is equally at pains to lend colour to that assumption by royal, governmental and official statements, and by deeds. For instance, the Jordanian government has just deposited the instrument of ratification of the Arab Solidarity Treaty in Cairo, thus giving it, so far as Amman is concerned, full legal force. In the same way, the Syrian government, shortly after the change of regime in Jordan, gave an assurance that it would withdraw its troops from the Mafraq area whenever the Jordanian government asked it to do so. And when the Jordanians did ask, they thanked the Syrians for their timely aid.

As soon as the withdrawal of Syrian forces was complete there came the demi-official reaction—in rude contrast to the polite exchanges at government level. An anonymous spokesman of the Syrian High Command issued a violent statement, accusing the Jordanian army and government of hostile actions against the Syrian forces in Mafraq, and alleging violation of the tripartite military agreement which had placed the forces of Egypt, Syria and Jordan under a joint command headed by General Hakim Amer, the Egyptian Chief of Staff. It was argued that the matter should have been cleared with the joint command before any approach to the Syrian government. An immediate retort came from the Jordan army headquarters. Another anonymous spokesman charged the Syrians—the same Syrians for whose "timely aid" the Jordanian government had expressed thanks—with conspiracy against the regime. More specifically, they were accused of having given help to the plotters of Zerka.

Unofficial attitudes are more difficult to gauge, but if the press is a true mirror of public opinion, relations between the two countries are frankly bad. Moderate voices are heard now and then. *Falastin*, the influential Jerusalem daily, has deplored the open ventilation of grievances between the "sister states." But, by and large, press exchanges are acrimonious; unfortunately, they also reflect the private opinions of those dominant in government circles. A high Syrian official told your correspondent that, while the government was adopting a correct attitude towards the new regime in Jordan, "public opinion" in Syria had been "deeply shocked" by events south of the border, and the

pressure of such public opinion could not be ignored.

The fact is that both governments are profoundly suspicious of each other. The Syrians believe that the Jordanian government is deliberately backsliding into semi-colonial status, while the new regime in Amman accuses the Syrians of fomenting communism in the Middle East. Yet neither side is ready to take an irrevocable step, for fear of upsetting the delicate balance of forces to its own disadvantage. Of the Arab states, Iraq and Lebanon are committed to the West. Egypt and Syria are anti-western, though not necessarily committed to the Soviet camp. Jordan and Saudi Arabia, at the moment, are uncommitted; or perhaps it is more accurate to say that they are committed two ways. Both are signatories of the Arab Solidarity Treaty; both have interests that link them also with the West. In the case of Jordan, the link is dollar aid (outside the dangerous Eisenhower Doctrine—dangerous, that is, to the present regime in Jordan). In the case of Saudi Arabia, the links include the Dhahran air base and the supply of arms from America recently negotiated by King Saud.

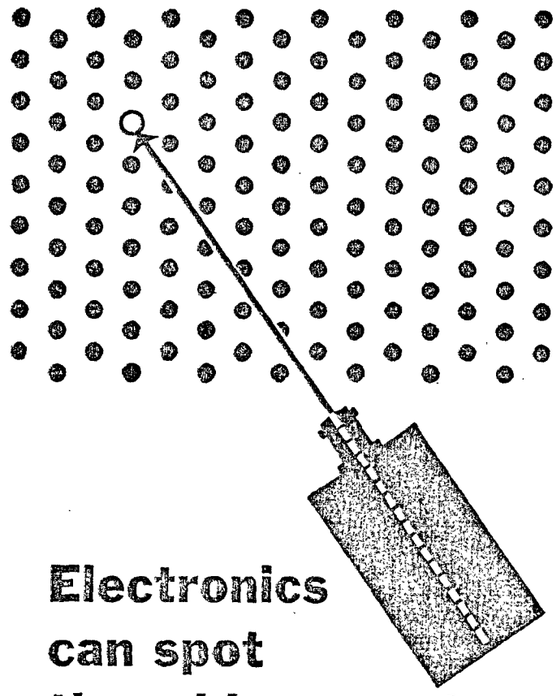
In such a situation, the Syrian government has no wish to drive King Hussein out of the Arab Solidarity picture; if pushed too hard, he might turn wholly towards Iraq and take Saudi Arabia at least some of the way with him. On the other hand, King Hussein cannot afford to provoke Egypt or Syria. His regime is too narrowly based to warrant risks. Thus the interest of all present is to keep the party clean, though none of them can suppress dirty looks.

A Rival for Uncle Louis

FROM OUR OTTAWA CORRESPONDENT

An eventual end to the Liberal party's long rule in Canada is at last beginning to seem possible. But the end will not come at the election next Monday. The opposition parties will do well if they gain 30 seats, and they may not gain more than a dozen. The Liberals, who had 170 seats out of 265 in the last Parliament, will form the next government. But the election campaign has shown two public reactions which foreshadow change. Both were utterly absent from Mr St Laurent's two previous campaigns in 1949 and 1953. A good many people may then have felt that the Liberals, in office since 1935, had been in power too long, but it was a passive feeling. Now more people are saying it, and in a different way; they have become actively convinced that power has made the Liberals arrogant and that they are becoming a threat to healthy parliamentary democracy. Mr John Diefenbaker, the new Conservative leader, has made this his main theme; and his prize example has been last summer's debate on the pipeline when the protests against closure almost disrupted the House of Commons.

But the Conservatives' main obstacle in the past has been the voters' belief that they could not form a better government; and Mr Diefenbaker's chief triumph has been to make a dent in the idea that there was no alternative to the Liberals. He is 61, and some Conservatives thought last December that they should have chosen a younger leader. But a man of his age in the Liberal camp would be counted among the younger coming men. He is a successful criminal lawyer from Saskatchewan, by no means a heavyweight intellectual, but possessing the lawyer's quick faculty for mastering a brief. On the platform he alternates in an old-fashioned way between heart-throbbing sincerity and bitter denunciation. He is reminiscent sometimes of a Hollywood small-town lawyer, with a smile of bitter sarcasm, a wagging forefinger of accusation and a short scornful laugh. But he does it all rather well, and it is proving effective.



The 75-year-old Mr St Laurent, in the role of Uncle Louis has, of course, dominated the Liberal campaign from the beginning. The Uncle's old fans are as devoted as ever, and they are numerous. But the audiences have never been as wholly captivated as they were in 1949 and 1953. Like many fading actors, Uncle Louis started overdoing the part. He kissed too many babies, patted too many little heads, propounded too many platitudes. The press and the crowds began to complain that a prime minister should have something positive to say about current problems. Latterly, Mr St Laurent has been trying to use more arguments about specific policy, but it is hard to elbow Uncle Louis's soothing platitudes off the stage.

The Conservatives use the slogan "It's time for a Diefenbaker government," and Mr St Laurent has been twitting them about it. But this is an ironic twist to an old story. It is the first time that the Conservatives have had a leader with comparable popular appeal to Mr St Laurent. The Liberal politicians have long been persuaded that they got elected on their leader's coat-tails, and 95 per cent of their candidates would be stumped for a peroration if they could not extol Uncle Louis. Now Mr Diefenbaker appears as a rival with something of the same personal impact. He has not played Uncle Louis off the stage, or anything like it; but he is making the same kind of appeal, and no ageing star likes that.

★

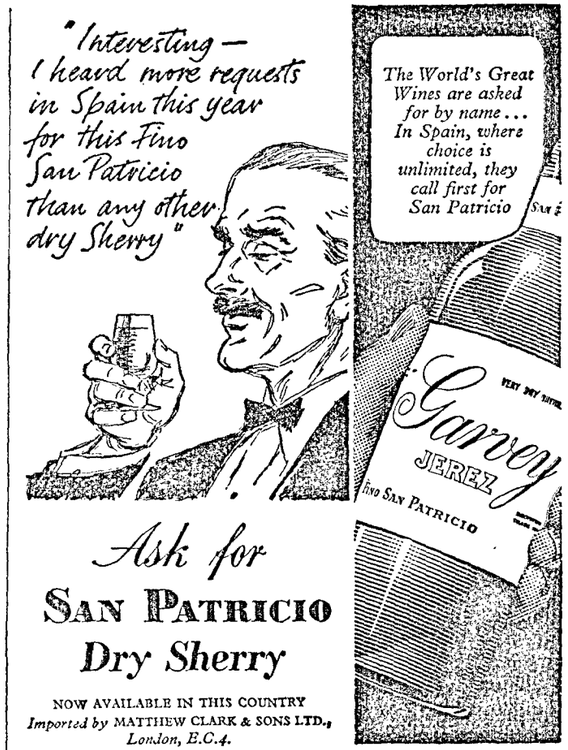
Mr St Laurent's most direct replies to Mr Diefenbaker have accused him of promising higher spending with less taxes and of selling out to Ontario at the expense of other provinces. (Mr Leslie Frost, the premier of Ontario, has thrown both his prestige and his political organisation behind Mr Diefenbaker.) The Conservatives have attacked the budget surplus, tight money and high taxes: nobody seems to have told them about inflation; and they have talked in a rather general way about better social services. But the promising has not been all on one side. The Liberals followed up their earlier bait to Ontario farmers—support prices for dried milk and poultry—with an import embargo on cheese. They have followed up their earlier bait to the Maritime Provinces—construction of power stations—with vaguer promises about more major public works. Lesser pledges have been made elsewhere, but these are the two regions they are worried about.

Quebec has been the most neglected province. The Conservatives have not wasted any special effort on this Liberal stronghold, though in a few places Mr Duplessis's local provincial organisation—traditionally at loggerheads with Liberal national headquarters—is helping their candidate. But the Liberals' rather offhand treatment has been even more striking. Mr St Laurent has ignored all native Quebec claimants to a post in his government, but he has brought back a former federal minister from Cornwall, Ontario, Mr Lionel Chevrier, who left the cabinet in 1954 to become president of the St Lawrence Seaway Authority.

Electronics can spot the odd man out

The one that's a little different, a little wrong, in size or shape or colour—electronics can spot it, infallibly.

Electronics can sort most types of material, deflecting the faulty, accepting the sound. It can sort into different grades.



Think of electronics as a superhuman power, one that co-ordinates brain and hand and eye as we do, but infinitely more quickly and surely. And because it is superhuman it never loses its efficiency towards the end of the day.

This is only one of the ways in which electricity is playing a vital part in the drive for higher productivity.

Electricity for Productivity

Ask your ELECTRICITY BOARD for advice and information, or get in touch with E.D.A. They can lend you, without charge, films about the uses of electricity in industry. E.D.A. are also publishing a series of books on Electricity and Productivity. Titles now available are: Electric Resistance Heating, Electric Motors and Controls, Higher Production, Lighting in Industry, Materials Handling, and the latest addition to the series, Induction and Dielectric Heating. Price 8/6, or 9/- post free.

TIME

TIME, THE WEEKLY NEWSMAGAZINE
Time & Life Building, New Bond Street, London W.1

This time, Mr Chevrier is standing for a Montreal riding, and is evidently intended to be one of Quebec's representatives in the cabinet. But it will be hard to persuade the people of Quebec that an Ontarian, however French, is really "*un des notres*."

Neither Quebec nor the Western provinces are going to turn conservative. The two small parties, Co-operative Commonwealth Federation (CCF) and Social Credit, seem to have been largely beaten back west of the Lakes, but in the West they are strong contenders. There are four candidates for nearly all the Western seats, and it is almost impossible to guess how fairly small changes in opinion may swing the balance of votes in each riding. In total the distribution of seats between the parties may not change very much.

The 85 Ontario seats will have a decisive effect on the relative strengths in the next House. Last time the Conservatives won only 33 of them. If they can gain 20, and add perhaps half a dozen from other parts of the country, they will have 75-80 seats in the new House. The Liberals might be down to 140, which would be only a narrow majority over all opposition parties combined. It would make a more balanced House, but the Opposition, being split three ways, will not be nearly as effective as if it were united.

France Faces its Dangers

FROM OUR PARIS CORRESPONDENT

For once a French parliamentary crisis deserves its name. M. Pleven's mission of inquiry as honest broker between the parties, and the abortive efforts of the Alsatian Catholic, M. Pflimlin, to form a government, have made political France aware of the gravity of the situation in Algeria and of the danger to the franc. Except for a minority on the Right, the leaders, alarmed at the bogging-down and cost of the war, and at the likely isolation of France at the September session of the United Nations, want to lance the Algerian boil ; they realise that the Mollet-Lacoste remedy has proved quite ineffective.

Unfortunately, it is clear that they are not prepared to operate now, even if one day they must. Suggestions multiply as cabinet-making proceeds. M. Pflimlin, who has the reputation of being a liberal on Algeria, had proposed to isolate the rebels by getting support for a provisional statute, probably federal but still undefined. The failure of the army to prevent horrors like the Melouza massacre makes it doubtful whether this is more practical, now that guerillas are scattered throughout the country, than M. Mollet's dream of elections after a cease-fire. M. Pflimlin had proposed to increase French forces in Algeria if need be ; M. Mollet before him found it was easier to do this than to cure the ailment. No premier at this stage will be able to go any way to meet the rebel terms on independence. This is not only because of the rebels' intransigence, but also because in the French Parliament, with 185 Communist and Poujadist votes sterilised in fruitless opposition, the "republican" parties supporting the regime must be almost unanimous to carry through a policy. Such near-unanimity exists on European integration but not on Algeria. Though the diehards are probably now a minority, especially with the Socialists visibly edging back to their normal modes of thought, French policy in Algeria is bound to move at the mental pace of the slowest conservative deputy whose vote is needed. This power of a minority was grotesquely demonstrated by M. Mollet's folly in suspending French aid to Tunisia, just before his fall, to gain a few right-wing votes. (The Tunisian situation is discussed on page 874.)

The present crisis is a stage in the slow ferment over Algeria ; it is not the end of a cycle. This makes it harder to close the trade gap, magnified if not wholly caused, by the inflationary effects of the Algerian war. The loss of foreign exchange in the first half of this year, $800 million, will equal the whole drain of last year's already alarming deficit. The early months of the year, because of Suez and the effects of last year's frosts, have been exceptionally bad. The gap narrowed in May (from $108 million in the EPU in April to $79 million), as the restrictions ordered in March and the export efforts began to tell ; it is expected to close to more bridgeable proportions this month. But to bridge it, excess demand at home must be cut. M. Pflimlin had proposed the investment cuts and credit restrictions to which the last government, which refused to choose between Algeria and expansion, would not resort. All will depend on the scope of the cuts, necessarily limited by the priorities for the export and power industries. Disinflation is the more urgent because the economic authorities seem to wish to avoid both devaluation, while the patient is feverish, and reimposing quotas on imports already freed: they may prefer simply to intensify last March's restrictions on speculative buying, such as the 25 per cent deposit importers lay down on applying for a licence ; it has just been raised to 50 per cent. Disinflation is also the only hope for obtaining foreign credits later.

Reluctance to rescind liberalisation measures is something new in French balance of payments crises. This is partly because the possible savings seem limited now that the bulk of imports are fuels and raw materials. But, above all, it seems due to the genuine concern of the economic authorities not to reverse the trend to freer trade and the common market. This has its political parallel. No prime minister has a chance of taking office unless he promises to ratify the European treaties before the summer holidays. Despite doubts raised among some right wing deputies by the trade crisis, it still looks as if they will be ratified. But on this, as on the franc—and even Algeria—some action quickly is essential. The parties, despite their divisions, know this. It is the strongest, perhaps the only strong card, in any prospective premier's hand.

French Africans Take Over

BY OUR SPECIAL CORRESPONDENT LATELY IN DAKAR

At the opening of the new Senegal assembly last month, M. Mamadou Dia, the vice-president—and by virtue of that office virtually premier—made two important points: first he warned the French federal government of French West Africa at Dakar not to trespass on Senegal's territorial sovereignty ; and secondly, he demanded that a "federal executive" should be set up at an early date. Senegal is one of the eight semi-autonomous territories loosely federated in French West Africa, having a large measure of control of their own affairs, but having only limited control at the centre, whither they each send five representatives

to the Grand Council. M. Mamadou Dia, in fact, was demanding more control by the Grand Council. To many French officials such a statement confirms their view that the elaborate division of powers between French and Africans under the *Loi Cadre* (the new constitution for French African territories passed last February) is largely theoretical; that in fact the newly elected African ministries in the territories will be able to exercise almost unfettered power over their own affairs, and that before long Africans will demand and get full control at the federal centre.

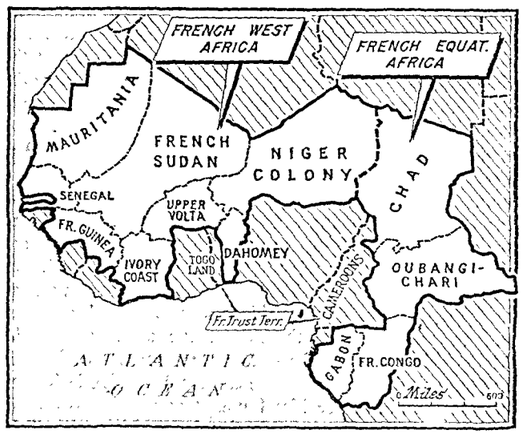
Upper Volta	37	...	...	5	26	...	...	2
Senegal	...	12	...	47	...	...	...	1
Grand Council	19	5	2	4	2	3	5	...

(1) Rassemblement Démocratique Africain. (2) Mouvement Socialiste Africain. (3) Mouvement Démocratique Dahomey. (4) Bloc Populaire Sénégalais and Convention Africaine. (5) Mouvement Démocratique Voltaique. (6) Parti Républicain Dahomey. (7) Union Progressiste Maurétanie.



This may well be true; but it will not come about at the behest of M. Mamadou Dia alone. For his party, the *Bloc Populaire Sénégalais,* controls only one territory. Six of the eight are under the control of the *Rassemblement Démocratique Africain,* whose leader, M. Houphouët-Boigny, is in far less of a hurry. Part of the reason for the Bloc's demands is the personal rivalry between its prophet and leader, M. Senghor, and M. Houphouët-Boigny. In the struggle which preceded the *Loi Cadre,* and in the elections which followed it, M. Houphouët-Boigny emerged victorious. Hitherto, Senegal (and to a lesser extent Dahomey) has taken the lead in French West African politics; but power now seems to be passing to the richer territories, the Ivory Coast and French Guinea, where M. Houphouët-Boigny and the Rassemblement are strong, and have been made stronger by the redivision of the revenues of French West Africa; this has given them control over the export and other taxes which were previously used and diffused in the territory as a whole. In opposing the "balkanisation of West Africa," M. Senghor is in a sense protesting at the loss of Senegal's power to draw on the resources of the coffee and cocoa belt; the Rassemblement, however, won even in poorer territories, like Upper Volta and French Sudan, by upholding the links with France which would make sure that these territories continued to get subventions to meet their budgetary deficits and their need for investment from abroad. In Niger, the *Mouvement Socialiste Africain* was successful in getting most of the seats, but, being bitterly opposed to the Bloc in Senegal, it is inevitably an ally of the Rassemblement.

The immediate future of French West Africa, therefore, depends on the policy of the Rassemblement and the leadership of M. Houphouët-Boigny. Its policy is the development of the "Franco-African Community," the maintenance of the increased territorial powers, and only a slow progress towards independence—which, indeed, must always in M. Houphouët-Boigny's view stop far short of that of Ghana or Nigeria in 1959. He is satisfied that in federal matters—security, and the preparation of the federal budget, for example—French officials should remain in control. Having achieved a very large measure of territorial self-government, he sees in French federal control the essential cement of French West Africa and the guarantee of continued French financial support.

M. Houphouët-Boigny, too, is extending his influence to other territories. The Mouvement, which accepts the Rassemblement's view, hopes to control French Congo, and M. Houphouët-Boigny is influential in the autonomous republic of the Cameroons and in Chad territory. In the Grand Council in Dakar the Rassemblement has 19 out of 40 seats which, with the help of the Mouvement's votes, gives it a majority. The Rassemblement's strength throughout the area itself reinforces federal ties. The French inevitably build most of their hopes on the moderation and widespread influence of M. Houphouët-Boigny.

He is undoubtedly in a strong position, and his personal influence is great, especially with the chiefs and older generation, for by origin he is an African aristocrat, although his development has been wholly French—and his political training communist. But he has his weak points. He is almost unique and is without any obvious heir. His personal magnetism depends on his remaining in Africa; while he was in Paris as a member of the Mollet ministry his power in Africa declined. Within his own party he has several rivals far more to the left, and far more ready to see eye-to-eye with M. Senghor. M. Sékou Touré vice-president of the Guinea assembly, and leader of the Rassemblement in that area, is almost certainly one of them. It is, moreover, doubtful if M. Houphouët-Boigny can continue to hold the allegiance of the young African intellectuals, who are returning from France in growing numbers, if he refuses to espouse a forward policy. M. Senghor and others may appeal to them over his head, and clearly intend, if they can, to infiltrate his party in the classic communist way.

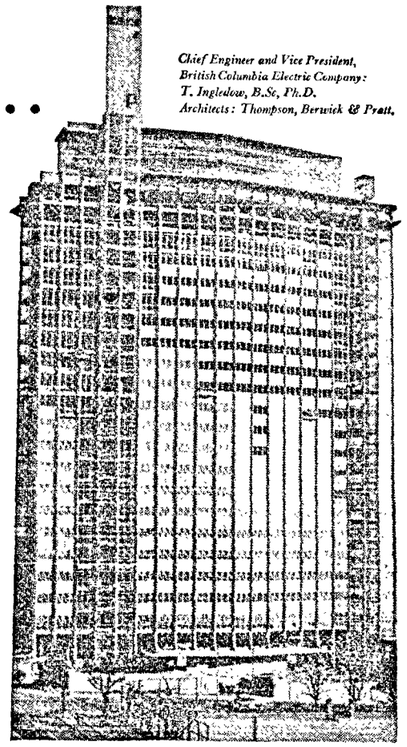
Moreover, the Rassemblement is a movement rather than a party, and now that it has attained power, its difficulty will

be to keep territories with such divergent interests together. The rank and file will expect results—but the first rule of the "Franco-African community" is to keep budgets balanced. The bitter bargaining for federal revenues which is the characteristic of federations is likely to be seen in the Grand Council. The obvious and popular solution to practical but unpalatable problems will always be to demand more power; and to divert attention by picking fights with the French. Against this, M. Houphouët-Boigny and the

Completion on time...

SPEEDY COMPLETION with high quality, and above all, completion on time: these are the real measures of the cost of new building. Time is money, and the lowest tender is not necessarily the cheapest. Construction hold-ups and delays mean to the building owner idle capital and business lost.

The resources of the Laing organization all contribute to speedier building. Co-ordinated planning control, facilities for site investigation and materials testing, maximum mechanisation, new operational techniques with new materials, and also a good reputation which we intend to keep—all these add up to efficient, economical on-time construction.



If you call us in while your scheme is at the planning stage, our experience of speedier methods and practical knowledge of building costs is available in consultation with your architects and engineers. Designing a scheme around the plant that will build it makes for economy in construction. Working these problems out together with your design team is the way to save time and money later on.

21 storeys in 20 months

This 21-storey office building for the British Columbia Electric Company in Vancouver is the tallest building in Canada west of Toronto. Construction in 20 months is a tribute not only to modern methods but also to the close co-operation and team work of all concerned with the project.

How to recognise fine Brandy

V·S·O·P

The finest brandy comes from the Grande and Petite Champagne districts of Cognac. Only Cognac originating from these two areas, at least half of which must be from the Grande Champagne, is entitled by French law to be called Fine Champagne Cognac.

Remy Martin produce Fine Champagne V.S.O.P. Cognac and *nothing less good.* They only offer for sale Brandy which has reached perfection. That is why when you insist on Remy Martin you can be sure of getting *a really fine Cognac.*

PRIDE OF COGNAC

REMY MARTIN

French have one important weapon: the fact that France contributes to French West Africa, by way of "le Fides" (grants in aid), subventions and the pay of the administrative civil service, something in the region of £40 million a year. "La communauté Franco-Africaine, c'est le Fides," one cynical French civil servant put it bluntly to your correspondent. But in spite of this considerable French financial help there will be a steady erosion of the remaining French control in the territories, and a growing demand for African control at Dakar.

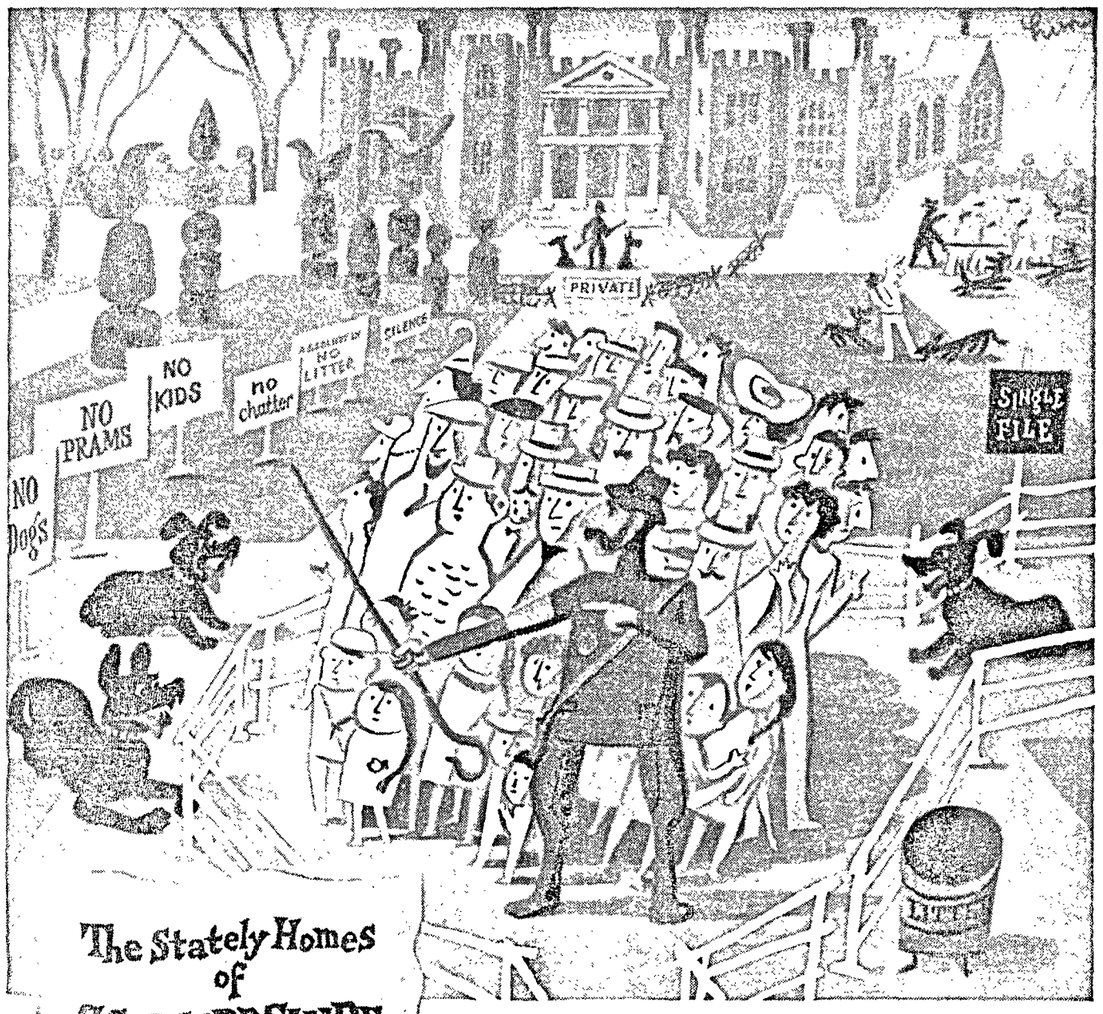
"Poland's Road to Socialism"

SEVEN months after his dramatic return to power Mr Gomulka once again took the rostrum at a plenary meeting of the central committee of the Polish United Workers' Party. Since there is so much speculation about the real intentions of the Polish leader, it is worth while summarising what he himself then said about "Poland's road to socialism."

Mr Gomulka sees no contradiction between the frequent use of this phrase and strong denials that the Polish experiment is at all tainted with "national communism." Communism, in his opinion, is by its very nature an international doctrine. Members of the so-called socialist camp must have certain essential principles in common, and among these he includes the existence of a Marxist party, exercising the dictatorship of the proletariat; a planned economy directing nationalised industries and gradually altering the structure of the countryside; and devotion to the cause of international socialism coupled with respect for the equality and sovereignty of all nations.

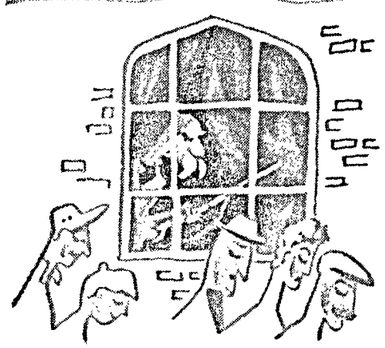
But within the framework of these general principles each country must evolve its own methods, suited to its historical conditions, and even taking national peculiarities into account. Poles, for instance, are individualists, resenting discipline, but capable of rallying against the foreigner and particularly sensitive about their country's sovereignty. According to Mr Gomulka, the Soviet model not only need not, but actually should not, be copied. This is not merely because of what is euphemistically called "the cult of the individual." Russia was a backward, isolated country, and its rulers had felt compelled to mortgage the present for the future, although "man's nature is such that he does not worry much about future generations." Hence, Mr Gomulka maintains, its road was bound to be hard, "the lofty socialist slogans could not find a full expression in life" and "measures of coercion had to be applied on a large scale." This passage, much more reasoned than Mr Khrushchev's indictment of Stalin, should give food for thought to Russian readers, who can now find the full text of the Polish leader's speech in the Moscow *Kommunist*.

Mr Gomulka goes on to describe three ways in which Poland can now usefully break away from servile imitation of the Soviet model: by spreading workers' councils; by granting a larger measure of local government; and last but not least, by slowing down the pace of social change in the countryside and therefore allowing milder methods. He does not claim any originality in reviving the idea of self-government by the workers, since the Jugoslavs have already done this. But last year in Poland these councils sprang up spontaneously, and to Mr Gomulka their growth is a healthy phenomenon. They can play an increasing role in running factories or other enterprises, in the selection of personnel and in all the problems of production and welfare. But, and the reservation is important, Mr Gomulka is not in favour of the workers taking over the factories—as they have done to a large extent in Jugoslavia. This, in his opinion, would lead to free competition, while wage-conscious workers would not devote enough attention to the importance of investment; the result would be chaos and bankruptcy. Workers' councils must be fitted into the solid framework of a planned economy.



Greater powers for local government are designed to arrest the steady advance of the over-centralised Leviathan. It has been realised that many functions now exercised from Warsaw (such as control over craft industries or small-scale production) can be entrusted to the national councils in the provinces without great risk but with important political gains for the regime. These concessions to democracy would be considered even safer if Communists could play a leading part in both local and workers' councils. They have been exhorted to do so by Mr Gomulka.

The new line in the countryside is probably the most important and the most controversial change. Poland never did proceed very far or very fast with collectivisation, and even this was only achieved with the help of the stick, while the constant threat of further forced collectivisation was a serious disincentive to increased production. When Mr Gomulka assumed power last October, he called for a reversal of this wasteful coercive policy. There was an immediate breaking up of most of the existing collective farms. Now the peasants are even to get some of the land hitherto belonging to the state farms. The government is relying on the price mechanism rather than on compulsory deliveries to get larger supplies of foodstuffs. Mr Gomulka has once again asserted his belief in the superiority of collective agriculture: all spontaneous forms of peasant co-operation, self-government or pooling of resources will be encouraged by tax reliefs and privileges in the hire of equipment.

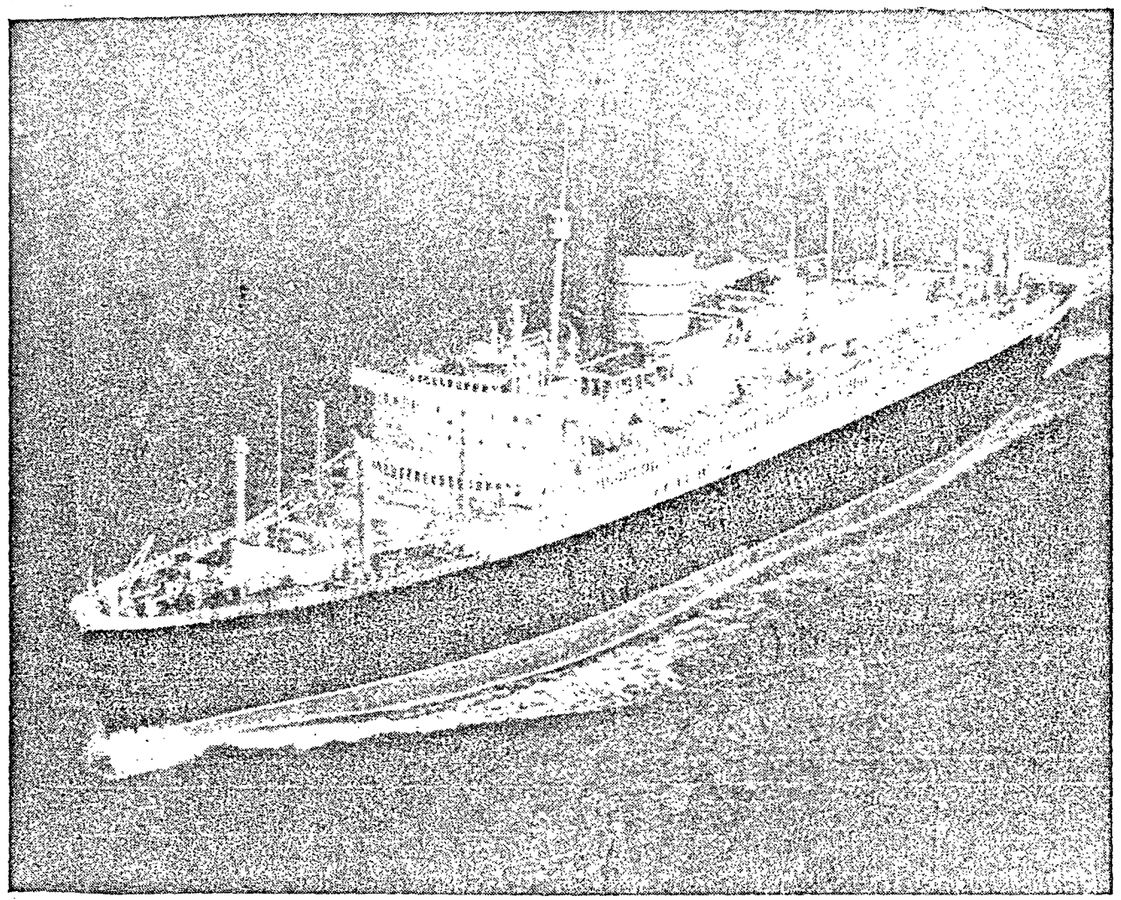


★

Spontaneous, however, is the operative word and it provides the key to the difference between the Polish programme and the Soviet performance. Otherwise the aims are the same. Even the chief instrument—a communist party exercising a dictatorship—is theoretically similar. But the Polish leaders seem to think that they can afford to go more slowly and that this is a price well worth paying to avoid the bloodshed of the Stalin regime.

What chances of success has this experiment in dictatorship tempered by the search for popular consent? In the next few critical months much will depend on food supplies and labour discipline, and on economic aid from the West as well as from the East; Moscow will keep a watchful eye. Mr Gomulka seems to think that a great deal will also depend on the performance of his party. He tried to rally its ranks, perturbed by all the recent revelations, by attacking the "revisionists" whom he accused of willy nilly opening the door to the bourgeoisie. According to persistent rumours, he was then accused of exactly the same sin by the Stalinists of the so-called Natolin group. He was stung into a bitter reply in which he listed the vices and crimes of the pre-October regime. This story shows that the instrument for carrying out Mr Gomulka's difficult experiment is still weak and divided.

The Stately Homes of SCHWEPPSHIRE



WETT CHAMBERLAYNE

We have decided to open part of the gardens and visitors are welcome. At the same time we have made it clear that we are not allowing strangers to wander everywhere. We want to share our pleasures with the People (children half price); but we have no intention of imitating some of the more "aristocratic" patrons of stately homes who allow people to amble round on their own. Visitors are welcome between 3.30 and 4.30 except at weekends and holidays unless there is a notice up to the contrary. No dogs are allowed though they may look quietly through the front gates if on a lead. Visitors will be searched for litter before entering, and again, before they leave, for seeds. Cars may drive to the gate but they must be parked inside the manure yard, *backs* to the wall. The dwelling quarters are barricaded off, but visitors are requested not to look at them and are particularly put on their honour not to raise their eyes above the level of the ground floor. And remember: ONE-WAY ONLY: *No Smoking, chewing or snuff:* E PERICOLOSO SPORGERSI: *Tenez la gauche:* GROUND UNDER REPAIR: *Do not Look:* LOOK ROUND AND READ GREAT NATURE'S OPEN BOOK *(Keep Moving):* KEEP OFF: *Do not disturb gardener's boy:* LOW CHATTER ALLOWED HERE: *All cameras will be confiscated here.* The penalties for stealing bulbs or for pulling the communication cord are printed on back of card.

SCHWEPPERVESCENCE LASTS THE WHOLE DRINK THROUGH

British Aluminium in Sylvania

Like her three sister ships—Saxonia, Ivernia and Carinthia—Sylvania was built by John Brown & Co. (Clydebank) Ltd., and like them, too, she has a funnel casing made from British Aluminium plate and sections.

Aluminium alloy to Lloyd's requirements is highly resistant to marine atmosphere and its use results in a considerable saving in top weight.

THE BUSINESS WORLD

Coal Must Compete

A NUMBER of things about the National Coal Board this year are the largest it has ever had since nationalisation—including the smile on the face of the chairman. Mr Bowman, the board, the management and the miners can be proud of the largest deep-mined output on their record, the highest productivity per man-shift in British coal-mining history, the greatest advance yet achieved in power-loading mechanisation at the face, and the biggest coal stocks for this time of year. Nonchalantly, they add that British mining productivity is in fact the highest in Western Europe, and British coal between fifteen and seventy shillings a ton cheaper than European. Financially, it may be added that miners' earnings are higher than ever before (which is routine) and that the Coal Board last year showed a surplus of £12.8 million after paying £21 million interest (which emphatically is not).

Mr Bowman this week was entitled to be gently amused at the mystery some outsiders found in the recovery of mining output since mid-November: it was as clear to him, obviously, as an enlarged photograph of a piece of coal a quarter of an inch high. It is to be hoped that the new chairman of the National Coal Board never has any less comfortable development to explain away; but the reasons he gave are encouraging ones as far as they go. Perhaps 20-25 per cent of the extra tonnage so far this year—output is roughly 3 million tons up on last year—seems to have come from getting more miners to the coal face, some 45 per cent from the highest output per manshift ever, and about 15 per cent from better attendance. That productivity has been raised by cutting more coal with power-loaders, which this year may produce nearly 50 million tons, twice as much as in 1955, at say 6 tons per manshift against 3½ tons per shift for coal mined by conventional means.

This new dynamism (which came from the top) in applying technical innovations in coal-getting—the power-loading machines themselves, the "prop-free front" for longwall mining, and now the props that move themselves forward as the face is cut away—has followed a long, arduous and often disappointing programme of developing different machines for diverse conditions that many more "advanced" industries may count themselves lucky to be spared. Much, at least, of this painful process of tailoring machines to fit seams (roughly as if one had to design an entirely new drilling rig for each oilfield) may now be over; Mr Bowman was able to say this week:

> The speed at which our power-loading programme will go ahead in future will not be conditioned by the rate at which we can make coal faces available. . . . It will be conditioned by the rate at which the various manufacturers can make available the machines we require.

And the industry is even able at last to see some measurable results from its major reconstruction programme; from 18 pits where major schemes will be completed this year, output in the first quarter of 1957 was already 8.3 per cent higher than a year before, against the increase of 3.2 per cent for the coal mines as a whole.

Less measurable, but quite as important to the industry at present, is the positive feedback of morale that has swelled and been swelled by this surge of output. This is unmistakable; Mr Bowman can sense it in the coalfields, there is a curious tinge of it in this week's jaunty report on a dismal last year, and the ordinary public are even, somewhat coincidentally, being treated to the same flourish of confidence in the board's lop-sided, cock-a-hoop advertising for young men to make themselves a career in "this age of opportunity in coal." The bonus shift went this week; manpower has begun its seasonal decline; one cannot expect the miners' health throughout this year to show the

same improvement as it did this spring; the economy may even start expanding again—all sorts of bad things can happen to coal. Nearly half-way through this year, the board is still not prepared to guess how much output will be up on 1956 during the year as a whole. But it is high time this industry had a run of luck, even if it were only a short one. The ranks of Tuscany should not forbear to cheer.

ONE obvious element of luck, and temporary luck, in this year's coal fortunes might however be taken as a pointer to a future problem that is by no means temporary. Good weather, plus reduced demand particularly from certain industries suffering minor recession, kept stocks of coal high throughout the winter. Total stocks are now about 22½ million tons of coal, 6 million tons more than at this time last year and indeed so high as to cause coal to be stocked at pitheads and opencast sites. Yet this year the Coal Board is still importing 3-4 million tons of coal—at probably £3 a ton *more than coal costs to mine at home.*

The reason is simple and awkward; in years to come it will become more so. Coal is not just coal; it is a wide variety of kinds of solid fuel of differing sizes and qualities; and the amounts of each size and quality that British consumers want are not exactly the quantities of each that the British coal industry finds it most convenient to produce. In particular, British Railways and British households want more large coal than the Coal Board is at present managing to produce; because of this, three-fifths of the coal imported last year was large coal, more than 3 million tons of it to put in the tender and the grate. The coal that the board was putting into stock last winter was what those most finicky of British consumers would not use: some of the large coal they do want has still to come from abroad, though they get it at British prices.

Unfortunately, the proportion of large coal raised in Britain has been steadily falling for years, and seems likely to go on doing so. In 1947, out of about 181 million tons of coal sold, 62 million tons were large coals; last year, out of some 208 million tons (apart from imported coal, miners' coal and coal used in collieries), less than 54 million tons were large. The growing element in British coal deliveries is at the other end of the scale of size. In 1947, only some 62 million tons were "slacks and smalls"; last year, about 92½ million tons were of these lowest grades. Whatever the eventual net increase in output that the Coal Board does achieve this year, it is long odds that practically all of it will be in these small coals that so few coal customers—primarily one customer, the Central Electricity Authority—are really equipped to burn economically.

The demand from that one customer in particular is no longer likely, on revised plans, to rise as fast as the tonnage of small coals and slack that increasingly mechanised mining in this country seems likely to produce. In 1955 the CEA took 38.7 million tons of coal, 35.9 million tons of it smalls and slack. Its revised oil and nuclear plans imply that coal requirements for electricity would still rise during the coming decade: to, say, 45 million tons by 1960, but not exceeding 50 million tons by 1965. After then, most of the extra power plant put in would be nuclear; as older plants were eventually retired, the power demand for other primary fuels, coal or oil, must be expected gradually to fall. And it seems doubtful whether other forms of industrial steam-raising will require much more small coal.

Understandably, the Coal Board is unwilling, publicly, to estimate how much of the output that it hopes to be increasing from now on may fall into these smaller-size grades; but unless it is able to reduce the "degradation" of coal from highly mechanised faces, tonnages of these grades seem likely to rise a good deal faster than its total output, and to make up a bigger proportion of coal supplies in future. At the top of the scale, output of large coals seems certain to decline further. Gradually, demand from the railways will ease, as steam locomotives end their working lives. But this is a slow process. The domestic consumer, moreover, is one for whose *custom* coal would welcome the chance once again to compete: the household still offers a market for possible expansion if the mines can offer coal in the sizes—and in future possibly in the smokeless qualities or forms—that he wants. At present, indeed, householders would gladly buy more large coal; whether they would pay for it what the Coal Board must to get it from abroad is another matter.

THE coal industry today, therefore, has over the coming years to carry its new-found confidence and its gathering energies into changing circumstances, more competitive though not necessarily unfavourable. These are not new problems for the board, though it has recently been emerging more clearly and apparently more closely. Technically, work is already in hand upon the conversion of small coals into large coals, by briquetting in new ways to produce smokeless and other fuels; some of these are costly, but the rising prices of fuel in general may eventually float them off into profitability, as "Phurnacite" has already begun to float. Economically, the board is again talking of "opening the concertina" by increasing the price of large coals and others that are difficult or costly to produce more than the smalls of which it can hardly stop producing more (though it appears unlikely that they will pursue this policy in their imminent price increase). There are possibly incentives that could be given in its internal accounting to pit managers to concentrate upon size as well as total output so long as imported coal has to be bought expensively from abroad.

Techniques that would turn enough small coal into large to satisfy these domestic consumers, however, could at best solve only the smaller of these problems. They would still probably leave for disposal large tonnages of what seems to be becoming the coal industry's basic product—small coal. In the coming years, one tempting political solution to this marketing problem would be one at which Mr Bowman seemed to be hinting when he said

> We shall seek to ensure that the indigenous fuel will have first place so far as consumption in power stations is concerned. We shall plug very hard to ensure that our small coals are used at the power stations instead of oil if the position is ever reached where we have any difficulty in disposing of them.

The use of substantial quantities of oil for power generation in such stations as Marchwood, which opened this week, is, however, the subject of binding ten-year contracts between CEA and the oil companies, both of which were bullied into this by the Government two years ago. Does the coal industry now propose that they should be bullied out of it? There remain export possibilities: and possibilities of complete gasification processes for these small coals, which might offer the best way for these coals to compete with oil in general industry. The solution should be sought in technical change and economic efficiency, not in "plugging" through any coal lobby. Coal must compete on even terms, if it can. The measure of the new men, new methods, and new energies it has now gathered to itself is that this no longer seems quite such a remote possibility.

What Price for Copper?

Against a background of surplus the Rhodesian copper companies are proposing a common policy on pricing

SEVERAL times in the past two and a half years the Rhodesian copper producers and their British customers have tried to agree on a common pricing policy. Late last month it was learned that the producing groups—Rhodesian Selection Trust and Anglo American Corporation—had reached agreement, and had sent their proposals to the consumers. Shortly afterwards RST announced that from June 1st it was cutting production at Roan Antelope and Mufulira by 10 per cent "to show the determination of some producers that the price shall not be forced through the floor by the existence of a marginal supply." Anglo American, on the other hand, stated that it is not planning to make any voluntary restriction of output. But Anglo American, like RST, has recently supported the market by buying copper in London.

The link between these developments is not a new relationship between the two big neighbours in the copper belt; it is the emergence of a substantial world surplus of copper. After touching £437 a ton in March last year the open market price in London fell almost uninterruptedly until March this year, and has since fluctuated around £236 a ton. In 1955 as a whole, when roughly 100,000 tons of production were lost through strikes, world output and consumption of virgin copper were almost balanced at about 3,050,000 tons. In 1956, when there were no major strikes, world production rose sharply to about 3.3 million tons, but consumption rose only slightly to about 3.1 million tons. The apparent surplus last year was thus about 200,000 tons, and it is still large.

There can be little doubt that this change in the balance of market forces has encouraged Anglo American's acceptance of a fixed price policy. In January, 1955, when it reaffirmed its policy of selling on the basis of the open market quotations established on the London Metal Exchange, it stated:

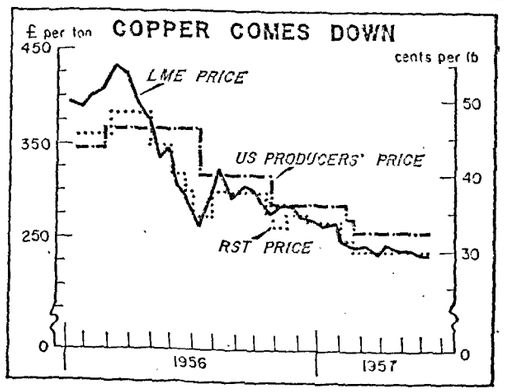
> The free operation of the laws of supply and demand is the safest, surest and most effective means of determining prices and any attempt arbitrarily to interfere with the operation of these laws may redound to the long-term disadvantage of the copper consuming and producing industries.

Rhodesian Selection Trust took the opposite view, and in May of that year it introduced a fixed price policy. The price was initially fixed for a minimum of thirty days, but subsequently no guarantee of stability was given and the price changed at 24 hours' notice. So for the last two years there have been two price bases for Rhodesian copper, and the actual prices charged have rarely been the same. At times the customers of RST have paid less than Anglo American's customers; at times they have paid more. These disparities have not only given each group of customers a sense of grievance by turn; they have also complicated the British fabricators' selling arrangements. Indeed, some individual rolling mills that are supplied by both groups have had to adopt the ludicrous expedient of selling the same products at different prices, according to whether the raw material came from RST or Anglo American. Consumers have therefore continued to press for a common pricing policy. What they have now been offered is a basis for discussion, and after their comments have been received in Salisbury there will have to be further meetings before the scheme can be introduced.

The producers have refused to publish the details of their proposals. It seems strange, and indeed indefensible, that they should have made no announcement at all on a subject of such wide public interest. Inspired reports from Salisbury have stated only that the common price would change less frequently than the London Metal Exchange price, but that it would be related to it over a period. It is thought, however,

that the common price would initially be fixed at the average of the LME price during a previous given period. It would be changed at the end of the period only if the average of the LME price in that period differed from the previous average by more than, say, one or two per cent. If it had so differed, the fixed price for the next period would be changed to the average LME price for the previous one.

ANGLO AMERICAN can thus claim that it has not completely given up using the LME price as its basis; it will be using a moving average of that price. Nor is there any escape in the lives of the copper mining companies from the LME yardstick. It remains the basis for determining both the royalty they pay to the British South Africa Company and the bonus to the European mineworkers, and these payments are the two big variable elements in their costs. The new pricing scheme need not affect turnover on the London Metal Exchange, and therefore the exchange's usefulness as an arbiter of prices. Although Anglo American now sells on the basis of the LME price its copper, like that of RST, does not generally pass through the exchange; it is sold direct to consumers on long-term contracts.



If there has to be a fixed price at all it is better that it should be formally related to the open market price than that the producers should take it upon themselves to decide the timing and extent of any changes in price, as RST does now. Many consumers will be attracted by a price that is fixed for some time ahead, and those who still have faith in the open market will be glad that the new policy does not throw the metal exchange overboard. Nor is it likely that a British fabricator's competitors here or abroad will pay significantly less for their copper in the long run. Chilean and Canadian copper is sold in Europe on the basis of LME prices, and United States copper is sold here on broadly that basis too.

But, while consumers seem more interested in stability than in the absolute level of prices, producers are anxious that prices should not fall much further. In recent months attempts to hold prices up have multiplied; output in some mines has been restricted (and a few small high-cost mines have closed), expansion schemes have been slowed down, and the Rhodesian producers have bought copper in London. The American producers are holding to a domestic price of 32 cents a lb (£256 a ton), and even if that level should be breached it is unlikely that they will come down to less than 30 cents a lb (£240 a ton). RST seems to be trying to make its present fixed price of £240 a ton the floor, and it looks as though Anglo American also thinks that copper is cheap enough.

Though the present price is still twice the average break-even point of about £120 a ton for the Rhodesian producers (with RST's mines slightly above the average and Anglo American's slightly below it) they have commercial and political reasons for trying to hold on to £240 a ton. At this price copper is no dearer than it was about four years ago, and can comfortably face competition from other metals. The Rhodesian producers need substantial profits to finance their expansion schemes (which have not been abandoned), and the Federal government needs a profitable mining industry to provide the bulk of its revenue. When Sir Roy Welensky, the Federal Prime Minister, said recently that copper would not fall much, if at all, below £240 a ton, he was not picking a number out of a hat.

Yet it may be wondered whether the Rhodesian companies, rich though they are, have been wise in starting to support the market at the present price level. So far they have bought perhaps 8,000 tons, with RST accounting for more than half the total. Those operations have not made much impression on the market, nor has the announcement of restriction of output at the Roan Antelope and Mufulira mines. The producers are facing a true surplus of production over consumption (as distinct from deliveries to fabricators) that may be as low as 100,000 tons or as high as 200,000 tons during the whole of this year. The indications are that American consumers have been buying less copper than they are using, and European consumers buying rather more. European consumption has recovered from last year's setback, but the expected improvement in American consumption has still to come. How these factors will balance out by the end of the year is anybody's guess.

The Rhodesian producers might have been wiser to let the surplus run its course, to squeeze their own profit margins and, incidentally, squeeze some of the inflation out of their own cost systems and out of the whole Rhodesian economy, too. It was not to be supposed that, when the big expansion schemes of recent years matured, world production would necessarily be matched by consumption. Such schemes are laid on projections of a long-term growth in world consumption of copper, not on forecasts of demand in a particular year. There is no reason to doubt that consumption will continue to grow, that the present surplus is temporary, and that the long-term outlook for Rhodesian copper is sound.

BUSINESS NOTES

IN THE MARKET

A Flutter in Gold Shares

INVESTMENT markets slid into the Whitsun holiday on a gentle downward slope. This week gilt-edged stocks have had the company of industrial shares in the decline. Neither has been heavily sold. The *Financial Times* government security index dropped from 84.28 to 83.56 in the week to Wednesday; *The Economist* indicator shows hardly any movement at 216.6 against 216.2, but that apparent firmness disguises the fact that prices rose at the end of last week and fell this week. The volume of business has been shrinking. Markings were 33,524 in the first half of this week against 37,251 in the first half of last. What little activity there was seemed to be moving over to gold shares. There after a long spell of inactivity some smart rises were seen. In general, stocks and shares, like sterling itself, were not strong, but escaped being obviously weak. The gold and dollar figures had assuredly given no grounds for a rise.

The case for kaffirs in these markets bears no resemblance to the big gold share scrambles of the past. It is neither an escape from a currency nor the reaction of the speculatively minded to new gold discoveries. It is based first on such of the June dividends as have so far been declared—which show broadly that the promising mines of the Orange Free State and the Klerksdorp area are fulfilling their promise—and secondly on the hopes that the plans to raise $10 million in America for the new Central Mining associate may be the forerunner of a larger flow of American capital into South Africa. The first of those reasons is solid; the second could be either premature or quite illfounded. The time does not look ripe for fireworks.

INDUSTRY'S CASH NEEDS

£16 Million for Guest Keen

INDUSTRY'S demands on the capital market are as strong as ever. For the top class issue, the supply of money to meet that demand is also large; applications, for example, for the £7½ million rights issue of English Electric ordinary shares amounted to £15 million. Guest, Keen and Nettlefolds, a much bigger issue, should command a similar success unless the market turns unexpectedly sour. It comprises 6,941,337 new £1 ordinary shares at 46s. per share as rights in the proportion of three for ten. The issue will raise about £16 million and is underwritten by Morgan Grenfell at 11d. per share (including 7½d. sub-underwriting commission). The rate looks high for an issue whose success seems assured, for even after the announcement Guest, Keen and Nettlefold's existing stock stood at 57s. But underwriters are at risk for a long period. Not until June 28th will the new capital have been authorised and the stock quoted "ex rights." At 57s. the rights are worth 2s. 6d. The directors hope to be able to maintain a dividend of 13½ per cent on the increased capital; thus the new shares are offered on a yield of 5⅞ per cent.

The accounts of Guest, Keen and Nettlefolds at the end of 1956 show about £10¾ million in net liquid assets. The company's subscription for 2,000,000 ordinary shares of Steel Company of Wales will have absorbed £4 million of those resources. And at the end of 1956 GKN, having spent £11½ million on capital account last year, was committed to £30.3 million of further expenditure. The need for new money is clear even though the group will set aside not less than £6½ million a year in depreciation alone in the coming years. About half of the group's commitments relate to the re-equipment and expansion of the two steel companies that it acquired from ISHRA at the end of 1955. About £13¾ million will be spent in the next three or four years to increase output at John Lysaght's Scunthorpe works (which entails building a new blast furnace and rolling mill) and another £1¾ million before the end of next year in turning the whole of the alloy steel production at Brymbo Steel over to electric furnaces.

This issue still leaves unresolved another of GKN's capital problems. A loan of £8 million from ISHRA is due for redemption in about a year's time, and the directors still intend to fund a substantial part of it by a debenture on the assets of John Lysaght's. In the meantime, this present issue from GKN, a prospective issue from Vickers (to which there was an unmistakable reference in Lord Knollys' statement) and an issue also in contemplation from Bristol Aeroplane Company may be read by some to imply that hopes of soon making the last big steel denationalisation offer—the resale of Richard Thomas and Baldwins—are not quite so high.

GOLD RESERVE

Not Good Enough

AFTER the shakiness displayed by sterling in the markets last month no high hopes could be placed on the gold figures for sterling's health and that of the British gold reserve are closely related. But the actual movement of the reserves during May remains disappointing, and after their publication the sterling rate dipped from $2.79\frac{3}{32}$ to $2.78\frac{15}{16}$. The rise of $35 million in the reserves was more than accounted for by the receipt of $34 million from the European Payments Union and that payment was in settlement of the £16 million surplus for April. In May itself the EPU balance was £7 million on the wrong side. It is believed

* Relates to balance in previous month. † Includes $177 mn. from sale of Trinidad Oil. ‡ Includes $30 mn. from official sale of US government bonds. $ Balance of drawing of $561 mn. from IMF, defence aid of $6 mn. and end-year instalments of $181 mn. on US and Canadian postwar loans. Includes drawings by India from IMF of $59 mn. in February and $67 mn. in March. ** Including the return of $104 mn. of deferred loan interest.

that this is attributable primarily, if not wholly, to further French *ratissage*—clawing back by the Bank of France for end-month window dressing of sterling held by the commercial banks. Great significance should never be read into the experience of a single month. In April and May together, the EPU surplus, after *ratissage*, averaged £4½ million, and the "true" dollar balance, counting the EPU settlement in the month to which it relates instead of the month in which it is paid, and excluding the small amount of defence aid, was a surplus of $10 million. In both months expenditure of dollars on oil was still heavy, though tailing off. In coming months, sterling will be more or less relieved of these extra burdens; and, unless India again reduces the statutory limit of its sterling holdings, it will be forced to call a halt to its drawings on those balances and thus to end its heavy calls on the central dollar reserves. But sterling is approaching its seasonal period of pressure. Much depends on the mood of international confidence in sterling, at present still in its post-Suez state of cautious neutrality.

OIL PRICES

Time to Break the Link?

ONE American oil company, the Gulf Oil Corporation, has followed the 13 cents a barrel increase in the f.o.b. price of crude oil in the Persian Gulf first posted by British Petroleum and followed by Shell Petroleum last week. As Gulf is the joint producer, with B.P., of the Kuwait oil fields, it could hardly quote a different price for the same oil. In Saudi Arabia, the Standard Oil Company of California has raised its prices by 17 cents a barrel, but, as *The Economist* went to press, the other three American partners in Aramco had still to decide what to do. If the new prices reflecting the reopening of the normal supply routes settle anywhere near this level, then at present freight rates, refineries on the eastern seaboard of the United States would be able to obtain their crude oil from the Middle East more cheaply than from Texas, where prices were increased by 25 to 35 cents a barrel during the Suez emergency. To restore the price differentials that existed before the Suez canal was blocked, Persian Gulf prices would have to be raised by at least 12 cents a barrel more than BP and Shell.

The question turns on whether more Middle East oil could be sold in the United States, even at lower prices than the domestic product. Clearly it would have no market if it were more expensive; but, equally, while the political opposition to imports remains as strong as it is at present, it seems unlikely that the share of the American market captured by Middle East oil can be significantly enlarged by keeping it cheaper.

In Europe, other considerations prevail. If sales of Middle East oil to the United States are artificially limited by political pressure, there is no longer any economic reason why the delivered prices there, less the transport cost from the Middle East, should also determine the fob prices for Middle East crude oil shipped to Europe and the rest of the Eastern Hemisphere. The price of Middle East crude oil cannot exceed that which allows Eastern Hemisphere refiners to sell their refined products locally at prices competitive with those of refined products imported from the Caribbean. Moreover, in Europe, the highly profitable sales of petrol are held down by high taxation, while the less profitable fuel oils form a larger portion of total sales than in the United States. In order to secure the same return on investment as his American counterpart, the European refiner therefore needs a wider spread between the cost of his crude oil and the prices of the refined products he sells. But as the European demand for Western Hemisphere products disappears with the emergency, except for fuel oil and a few special products, have the oil companies any justification for regarding the delivered price of Western Hemisphere products not only as the ceiling to European prices but as the floor as well?

RUBBER AND TEA SHARES

Those Takeover Bids

DIRECTORS of rubber and tea companies are evidently much alarmed by the outburst of takeover bids that assails them. Following the remarks of the chairman of the Rubber Growers' Association a week ago Mr Kenneth Warren, chairman of the James Warren tea management group, has now taken up the task of condemning the "speculators," many of whom make bids "for the purpose of liquidating and acquiring the current assets of the companies and enforcing a sale of the estates involved." Mr Warren claims that the Malayan government realises that this is having a disturbing effect on employment and "is contemplating steps to combat the menace." He adds that in tea the Indian government is "taking steps which should make such transactions unprofitable."

We are the cablemakers

but not that alone.

We are the masters of masts. Try this one for size—and for television. It's 750 feet high and rests on a steel ball two inches in diameter. What keeps it up? Guys and brains.

We are refiners of copper—producers of tough pitch copper, deoxidised copper, copper arsenical and silver bearing: makers of cadmium and tellurium alloys, brasses, phosphor bronzes.

Here are wire-bars horizontally cast in open copper mould
Here's cake for sheet production
Here are billets vertically cast for extrusion
Here are ingot-bars for remelting.

We are the cablemakers
but not that alone.

We are the ROAD UP men,
uncoiling a covered snake of copper
from a slow-turning drum
and laying it snug beneath your feet.

We are the overhead linesmen,
slinging power between towers
across field and forest and river.
We also build the towers.
DANGER 275,000 VOLTS!

Ever tried electrifying a railway?
There are problems. We know most of them.

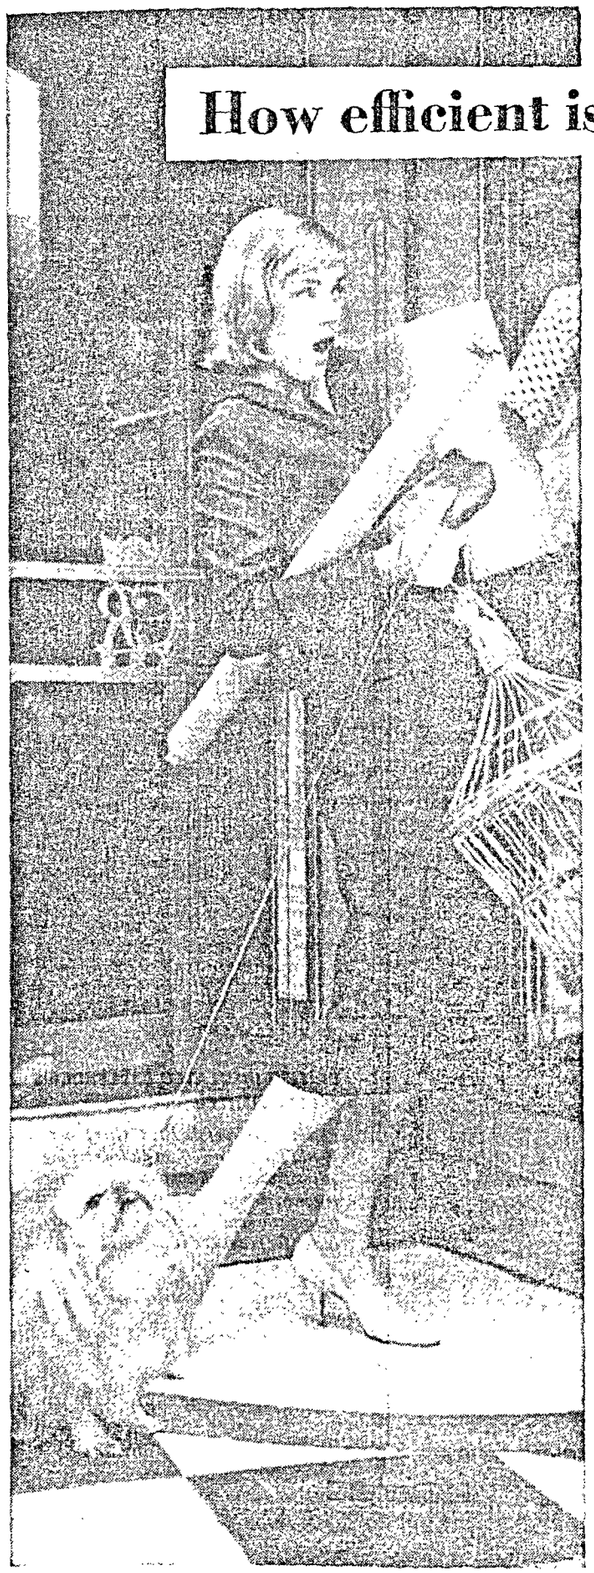
Ever tried bridging a gorge?
There are problems. We know most of them.

Ever tried paying out a cable in rough seas?
There are problems. We know some of them.

We who make and work cable
must think for the World on many lines.

we think for the World

on many lines



BICC

Head Office: Norfolk House, Norfolk Street, London W.C.2
International Sales Office: 21 Bloomsbury Street, London W.C.1 Museum 1600

BRITISH INSULATED CALLENDE CABLES LIMITED

Parent company of the BICC Group—t World's largest organization (compris 40 companies) with complete facilities research, manufacture and contracting transmission and distribution of electr energy for power and communication.

BI Callender's

How efficient is YOUR transport?

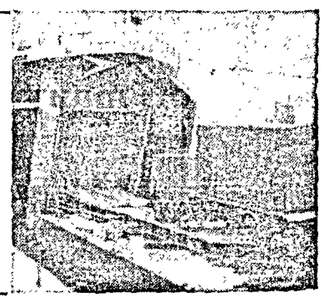
BRITISH ROAD SERVICES will carry your load to any destination — quickly, carefully and economically

WHAT DO *YOU* LOOK FOR FIRST in a transport service? Speed . . . punctuality . . . reliability? Detailed organization? Special vehicles for special loads? Careful treatment of valuable or perishable goods? Shrewd advice on handling and time-saving methods?

B.R.S. are capable of meeting all these requirements. And they are experienced in carrying them out. *They offer you an all-round efficient transport service.*

A stalwart organization

Let us consider for a moment what enables B.R.S. to give you this outstanding transport service: They are a closely-knit national organization, with large resources and a vast fleet of vehicles of all kinds. Their round-the-clock engineering service keeps all vehicles and equipment in tip-top condition. And they have a teleprinter network — unique in the road haulage field — which links the hundreds of B.R.S. depots throughout Britain, and ensures smooth, rapid communications. In addition, constant research provides B.R.S. with the most modern vehicles and equipment.



Prepared for any demand

Modern transport covers a wide field, and B.R.S. are equipped to handle all aspects of it — long distance or local hauls, warehousing or distribution, the supply of vehicles on contract, the carriage of liquids in bulk, furniture removals or moving some huge indivisible load. They will carry out your most ordinary everyday demands *and* your most extraordinary demands — with equal efficiency and enthusiasm.

B.R.S. take your problems to heart. Experienced men are eager to discuss your problems with you, and to save you time and money. Just telephone your local man. Action will follow immediately.

The most suitable vehicle.

This articulated vehicle, for instance, is most suitable on runs to Ireland in co-operation with B.R.S. associated ferry services. It reduces the handling of goods and avoids costly packing.

British Road Services Ltd

Look up your nearest depot in your local telephone directory

Mr Warren does *not say what* he expects the Malayan government to do. But it is a dangerous toy that he has chosen to play with. The approach to the Malayan government came in part at least from the trade unions who thought, probably rightly, that the breaking up of European estates into small holdings which is the result of some take-over bids was bad for employment. Some members of the trade in London gained the impression that the government's first reaction had been that the problem was not yet big enough to demand its intervention. If that is so, the rubber industry in Malaya can count itself lucky. The actions of the Indian government—and Ceylon is now apparently taking somewhat similar action—have hardly been such as private business could applaud. The transfer of tea estates in India to new owners requires official approval and both the price and the type of buyer are examined. The idea, it is understood, is to stop "fragmentation" of estates and one of the sanctions available to stop an undesired sale is to apply the infinite delays of Indian exchange control to the proceeds. Ceylon, too, is understood to be ready to use its exchange control to stop the sale of estates for subdivision. In Malaya on the other hand there is freedom of transfer and a government that welcomes British capital. Mr Warren might consider whether matters are not best left that way.

The take-over bid, as Sir John Hay pointed out in his United Sua Betong statement, depends in part on the lure of a tax free distribution in these heavily taxed days—but to company concerned it is a threat and can be disruptive. Sir John did not provide the answer, except by his own action which was to acquiesce in a small tax free distribution out of ample resources. The less wealthy companies whose surplus values are locked away in real estate will find the answer less easy.

PREMIUM BONDS

Ernie's First Job

THE first draw for the premium bonds started on Saturday and Ernie, the computor that makes the random draw of winning numbers, and the Post Office staff at Lytham St. Annes have been working hard this week in order to notify all the winners of all the 23,142 prizes before Whitsun. The £1 premium bonds ranking in this first draw numbered 48,487,854, comprising those bonds that were sold in November of last year and have not subsequently been withdrawn. The prize money—six months' interest at 4 per cent per annum on the ranking bonds—was £969,750. This is how it was distributed:

Number	Prizes £
96	1,000
192	500
384	250
960	100
1,920	50
19,590	25

The big doubt now is what will happen in subsequent monthly drawings. On the first draw the odds were roughly calculable. For holders of the full complement of 500 units the chance was roughly one to four against winning a tax-free prize of some sort. After November monthly sales of the bonds were much lower, and if the bulk of the £48 million of November money remains invested, the odds at the next drawing will be about 17 to 1; the odds are longer, but the drawings will in future be monthly.

CENTRAL MINING

Dollars for South Africa

THE capital reconstruction scheme for Central Mining and Investment Corporation was approved by an overwhelming majority at last week's meeting, and the promised bid for the shares by Glazer Brothers has, as this issue goes to press, still not been made. With the result of the meeting so strongly in line with the hopes of the merchant banking and mining finance syndicate that has acquired most of the preference shares, Mr Glazer's opportunity, if he ever had one, seems to have passed. Moreover a speech which Mr Charles W. Engelhard has made in Johannesburg seems to map out a bright new future for the "Corner House" group. It will be recalled that Mr Charles W. Engelhard and Mr Gordon Richdale, together with two mining finance groups and three merchant bankers, propose to hand over their investment in Central Mining to a new holding company in South Africa. Mr Engelhard now discloses that he and Mr Richdale are negotiating a $10 million loan in New York for the new and still unnamed South African company. The intention is to secure the control of Central Mining against any future attacks.

The shape of the new holding company now becomes clearer. It is to have a share capital of £3 million; the $10 million of American money will be loan capital; and it will invest outside the group and even outside Southern Africa. Increasing responsibility will fall on the Johannesburg end of the Central Mining-Rand Mines Group, and for this purpose the Rand Mines board will be strengthened. The new company also will have one of the strongest boards in the South African mining business. Mr Engelhard will be chairman, Mr R. B. Haggart, deputy chairman of Anglo American, will be deputy chairman, and Mr T. P. Stratton of Union Corporation will be managing director.

OIL DURING RATIONING

Rescued by the Weather

DURING the first quarter of 1957, when the full effects of rationing were being felt, Britain consumed nearly a million tons less oil than in the first quarter of 1956—a fall of nearly 15 per cent, compared with a rise of up to 10 per cent which might have been expected under normal conditions. Nearly half of the fall was accounted for by sales of petrol, which were down by nearly 30 per cent, with deliveries of the premium grades taking a larger cut than the standard grades. Commercial consumers, relying more on diesel lorries, consumed only 8 per cent less diesel fuel than last year, but nearly a third less petrol, while deliveries of petrol through dealers' pumps fell by 28 per cent.

Most of the rest of the decline was accounted for by gas, diesel and fuel oils. Fuel oil consumption fell by only 10 per cent, affected more by the exceptionally mild winter and higher prices than by the direct restrictions, which never became onerous, although it was touch and go in March whether stocks would last. This decline looks more significant, however, when compared with the 20 per cent increase recorded last year. The remaining restrictions on the consumption of fuel oil were removed last week, but fuel oil is still much dearer than it was last summer, and a key question for the oil companies is what rate of advance in

demand for fuel oil they can now expect from Suez-hardened consumers even in a free market.

Mild weather, and less need for space heating, especially in factories and offices, reinforced the restrictions and enabled the consumption of gas and diesel oils to be cut by 26 per cent without undue pain. Even deliveries of burning oil, which were not restricted at all, fell by over 20 per cent because of the exceptionally mild weather compared with the extremely cold snap at the same time last year. Throughout the rationing period total industrial production, which had stopped rising long before the Suez Canal was blocked, was able to be maintained at the same rate. But great as the achievements of the oil industry were in securing Europe's emergency supplies throughout the emergency, it is the weather that must be given most of the credit for making the burden of the Suez affair on British industry much lighter than anyone could have reasonably foreseen in October.

WOOL TEXTILES

Protest to America

BRITISH wool exporters are pleased that Britain has formally expressed its disappointment with the American government's decision to establish a tariff quota of only 14 million lb on imports of apparel wool fabrics this year. This quota is equivalent to that introduced in 1956 when the quota for imports in the last quarter was fixed at 3.5 million lb. When imports in a calendar year exceed 5 per cent of the average annual domestic production of these fabrics in the previous three years the President has discretion to raise the *ad valorem* duty on the excess by four-fifths, from 25 to 45 per cent. In the following year the duty reverts to 25 per cent until the new "peril point" has been exceeded. Britain had hoped that the effective quota would not be any more severe than in 1956, when total imports of these fabrics were equivalent to about 6½ per cent of average domestic production. There is at least a faint hope that Britain's protest may influence the American government's response to renewed pressure from the domestic industry. American mills are now seeking to restrict imports of items that are not affected by the tariff quota such as yarn, blankets and felt. Though these goods are of little interest to British exporters they have nevertheless taken issue with the American industry.

At hearings in Washington this week the American mills claimed that imports have been responsible for such a contraction in the industry's capacity that it could no longer provide for America's requirements in a war or other national emergency. The American clothing manufacturers and the British industry took a different view. They both argued that the American industry's troubles are attributable not to imports, but to competition from synthetic fibres and —the American manufacturers add—"a lack of initiative and enterprise." The British case is essentially that already presented against the imposition of a tariff quota. It considers that the domestic mills are suffering from a vigorous and growing synthetic fibres industry and the policy of protection to the domestic wool grower. To protect the grower the domestic mills have to pay a duty of 25½ cents a lb (clean weight) on imports of apparel-type raw wool. Then, to compensate the mills for having to buy raw wool at above world prices, a specific duty is levied on imports of wool manufactures; for fabrics this duty is 37½ cents a lb. Finally, to protect the mills against foreign competition, an *ad valorem* duty of 25 per cent is levied on imported manufactures. Although the mills are themselves users of synthetic fibres, there is no doubt that the growing production of these fibres has hurt many mills, and caused others to close down.

What Will China Buy?

BRITISH exporters will welcome unreservedly the abolition of the "China differential," whether or not it brings much new business. The list of goods which could not be exported to China was not only much longer than the list for the Soviet block; it was also less precisely defined. Freedom to ship to China all goods that are not embargoed for the Soviet block means that there is now only one list, and that exporters know where they stand. The goods freed for China are principally:

Some machine tools.
Some electric motors and generators.
Rubber working machinery.
Most motor vehicles and tractors.
Most railway locomotives and rolling stock.
Most internal combustion engines.
Iron and steel, aluminium and copper products, lead and zinc.
Some scientific instruments.
Raw rubber and most tyres.
Various chemicals.

The decision also brings to an end the exceptions procedure, whereby limited shipments to China were permitted of certain items that were in general embargoed for China though not for the Soviet block. Items shipped under this procedure included certain black steel and galvanised sheets, wire rope, small agricultural tractors, certain chemicals, and Malayan rubber.

The list of items now embargoed for export to the Soviet block, China, North Viet Nam, North Korea and Tibet is published in the *Board of Trade Journal* this week. Part I contains the items completely prohibited, part II the items subject to quantitative control. To take one example, the only types of internal combustion engine which cannot be shipped to China (or to the Soviet block) are aircraft engines, special purpose diesel engines of 50 bhp and over with "a non-magnetic content exceeding 50 per cent of their total weight," and diesel engines of 1,500 bhp and 600 rpm and over. The "watch" list, which may contain goods on open general licence as well as those on specific licence, has never been disclosed. Shipments of goods on this list were watched for evidence of trans-shipment from the Soviet block to China, and will still be watched to prevent their exceeding what are deemed to be normal peacetime needs.

Which of the goods now freed will be of most interest to China? Unlike Russia, China has never published a "shopping list" for British goods. China is probably interested in all of them, and has expressed particular interest in equipment for the manufacture of tyres, similar to that recently ordered by Russia. China's economic difficulties (which are described in an article on page 869) suggest that British exporters would be unwise to expect a substantial increase in business, for some time at least. Though China runs a large trade surplus with the sterling area, and receives substantial remittances from overseas Chinese, it uses that surplus to finance its trade with other countries in the transferable account area, including Russia, its main trading partner. After running down its sterling balance towards the end of last year—partly, it seems, in a post-Suez flight from the pound—China's balances are now believed to be somewhat below £100 million.

BRITISH RAILWAYS

Diesels for Test

NEITHER the past few months of fuel paring nor the present fashionable discussion about ways of setting limits to this country's dependence upon oil have caused British Railways to reconsider the sources of traction power upon which its present modernisation programme is based. It would be foolish to expect this. The case for contracting out of steam is irrefutable; and though conversion to electric traction is likely to proceed faster and further than was envisaged two years ago, no one can expect electric traction to prove itself more economic than diesel traction for every operating requirement. Nor can the long gap between the cessation of building steam locomotives—the last one will leave the railway workshops early next year—and the fruition of main-line electrification work be bridged economically and practically other than by using diesel locomotives.

Eighteen months ago British Railways ordered a pilot batch of 171 of these main-line diesels (later increased to 174) from British manufacturers. They were a widely varied batch: the basic specifications were laid down by the Transport Commission, but the manufacturers were encouraged to incorporate their own ideas. They were intended for an extensive scheme of two to three years' operating trials before final decisions upon the design of the remainder of the 2,500 main-line diesels in the modernisation programme.

Orders for 40 of these locomotives were placed with English Electric—20 of 800-1,000 hp for freight working, 10 of 1,000-1,250 hp for mixed traffics, and 10 of 2,000 hp or more for heavy duties—and the company has this week handed over to British Railways the first of its 40 (and, incidentally, the first of the 174 being made by all the manufacturers). It is a 1,000 hp diesel-electric locomotive to be used in the London area for hauling freight—which seems an odd place to put an engine that can reach a maximum speed of 75 mph. Delivery of the remaining 173 locomotives will be spread over the next 18 months, but contracts for a further 56 main-line diesels are about to be placed by the Transport Commission. This will make a total of 230 to be used in operating trials in 1959 and 1960.

NUCLEAR EXCHANGES

Calder Know How

DETAILS of the agreement between British and American atomic authorities to exchange more information about their nuclear reactors have not yet been published, but it would appear that some formula has been devised to clear up the outstanding point that had hitherto been inhibiting the supply of certain technical details of Britain's reactor at Calder Hall—the fear that these might be given free to American companies which could compete for export orders with the British commercial nuclear groups. In the first instance, the Atomic Energy Authority here is now going to let the Atomic Energy Commission there have the fuller information: if later AEC decides to pass them on to private American companies in the field, some royalty payment will have to be made by these companies to AEA.

Much of the general technical information about Calder Hall (and some about the reactor that powers the American submarine Nautilus) has already been published freely, but a number of constructional details and figures relating to the design of reactor components have not. In dealing with its own nuclear club of companies, AEA has given the general knowhow of nuclear engineering quite freely, but collects royalties on a commercial basis for those "inventions" it has been able to patent. It has at present about 200 of these, dealing mainly with elements in the actual reactors, such as loading methods.

HIRE PURCHASE

Motor Credit Sales Booming

AS a postscript to last week's decision by the Board of Trade to fix the minimum hire purchase deposits on motor vehicles at 33⅓ per cent (which meant an increase from 20 per cent for private cars and motor cycles) come the figures of numbers of transactions in May recorded by HP Information. They were a record for the month and, in fact, showed an enormous increase. The total of second hand cars sold on hire purchase in that month at over 66,000 was nearly double the figure for April last year. The total of contracts of all kinds at 130,190 compares with 105,083 in April and with 76,350 in May of last year.

NUMBERS OF CONTRACTS

		May, 1956	April, 1957	May, 1957
Private cars	New	8,290	8,399	10,335
	Used	36,015	50,336	66,008
Commercial vehicles	New	4,108	3,365	4,359
	Used	4,288	5,979	7,186
Motor cycles, includ. scooters	New	5,982	12,407	12,427
	Used	14,133	20,788	24,965

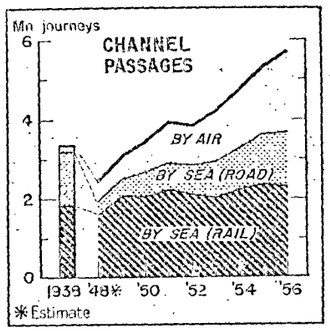
Source: H.P. Information.

Naturally the removal of petrol rationing and arrival of the summer motoring season have helped the motor figures, which are financed by finance houses, not by retailers. The Board of Trade's figures which show the hire purchase trading of both the retailers and the finance houses, and are expressed in value, lag much behind the monthly returns

of numbers of contracts only from HP Information. The latest index for the retailers is for March. This suggests that in the retail trade, too (although the special factor of the low initial deposit did not apply there), the trend was gently upwards. The index of value of goods sold on hire purchase (December, 1955=100) was 69 compared with 70 in February and 63 in March last year. The seasonal drop between February and March was only 2 per cent this year compared with 7 per cent in 1956.

GOING ABROAD

Dollars for Holidays

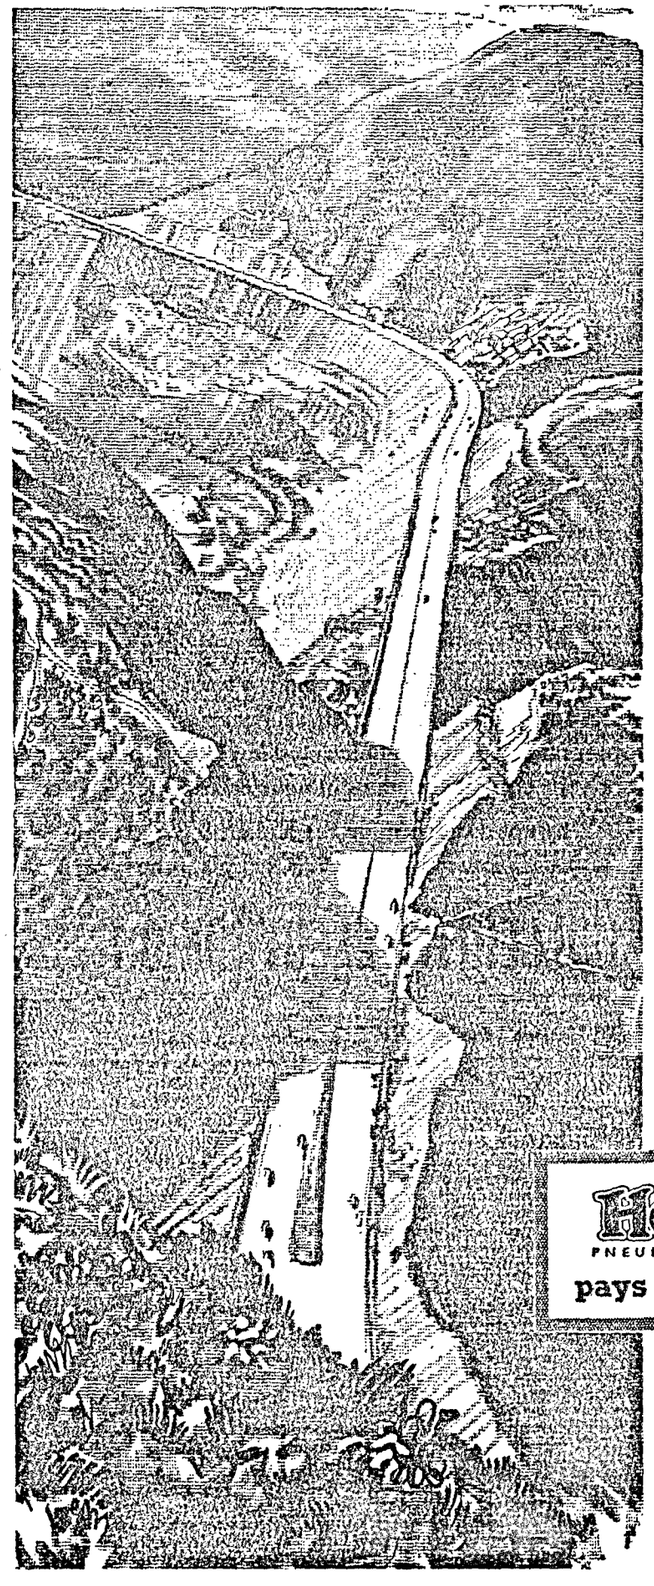


Two notable converts have been won in the last fortnight by those pressing for fewer restrictions on overseas holiday travel. Hard on the news that the Russians would soon be seeing foreign motorists on some of their roads came the Treasury's splendid capitulation to the pressure for a dollar tourist allowance. No one will begrudge Mr Thorneycroft's use, in defending his announcement on Tuesday, of the two principal arguments for such an allowance that had been unavailing with his predecessors during the last ten years: that the ban had been an undesirable barrier to ordinary movement between the three countries primarily concerned, even though it would help only a few individuals; and that—just because only a few would be able to afford to go—the total dollar cost would be very small.

The present dollar cost of the allowance for business trips (which is also increased) and for compassionate visits is about £5 million a year. This week's concessions, which will start during the present currency year, will hardly add enormously to that figure, particularly if they draw away holiday expenditure from Europe where, in effect, under the present EPU arrangements three-quarters has to be paid for in gold and dollars. Only 30,000 of the 1¾ million Britons that holidayed abroad last year went outside Europe and the average total expenditure was only £50 or so a head. Excepting the chances of working one's passage, a holiday trip across the Atlantic will cost £200-£250 at least. The cheapest fare for getting to New York and back is about £120 by sea and about £150 (off-season) by air. Once there, the holiday maker should allow about $15 a day for reasonable accommodation and meals, and up to $35 a day if he wants first class standards, though the frugal type could manage by staying in the unfashionable hotels and eating at corner drug stores for perhaps $8 a day. Inside the United States the cheapest way of moving around is by Greyhound bus, which costs roughly a dollar every 30 miles (which can be paid in advance in sterling). For an independent traveller paying first class rates the new allowance will probably permit a trip of about a week; by skimping, the holiday might be extended to two or three weeks; and for those with relatives or friends to stay with, rather longer visits should be possible.

Crossing the Channel

The continent, however, is still the only place abroad where most English people can afford a holiday, and passenger travel to and from there has risen in leaps and bounds since the war. About 5¾ million journeys either way were made last year, more than double the total for 1948, when the currency allowance was last restored, and about 70 per cent more than in 1938. The British Travel and Holidays Association estimates that about 3½ million of these journeys were made by Britons going and returning from holiday; about 1.1 million by foreigners spending their holidays here; and the bulk of the remaining 1¾ million trips presumably had some connection with business.



Much of this postwar increase in cross-channel traffic has, of course, been captured by the air-lines, but there has also been an impressive increase in the number going by coach or in their own transport. Last year the air-lines carried over a million passengers each way, or roughly seven in twenty against only one in twenty in 1938—when the continent was about as far as one could get by air. Rail journeys, on the other hand, now even more concentrated on the short sea routes via Dover, have grown in number by only about a quarter over the same period. And the rail share of the total has dropped from eleven in twenty to only eight in twenty. The advantage of speed in going by air is more persuasive the longer the journey, and the greater part of the increase in air traffic has come on the routes to Spain, Italy, Austria, Germany, and Switzerland. For shorter distances the railways can perhaps offer a more competitive service—even for businessmen in a hurry. The new summer time-tables that started last weekend contained a number of improvements, including a new London-Hamburg express that cuts 2½ hours off the previous journey of 17½ hours and a new night sleeper service to Brussels specially designed for the businessman. Departing from Victoria at ten in the evening and arriving at Brussels before nine the following morning, he can get a tolerably good night's sleep and make his journey for a cost of just under £19 first class return (£15 12s. if he shares his compartment). But, if he really is in a hurry, a BEA Viscount will still take him to Brussels in 3¼ hours (air terminal to air terminal) for a cost of only £15 3s. return—or just under £10 return if he takes the night plane. It will be difficult for the railways to improve on that.

EGYPT'S STERLING

The Rome Talks and After

It was announced from Egypt this week that agreement had been secured in the course of the recent Rome talks to free £6 million of the blocked Egyptian sterling balances. This appears to be a slight overstatement of Egypt's "achievement." Before the talks began the British Government had announced that it would be prepared to release out of the Egyptian No. 1 Account funds that might be needed to complete certain pre-zero transactions between British merchants and Egypt. For the most part these are orders for exports from Britain to Egypt for which all the necessary formalities except actual payment had been completed when the nationalisation of the Suez Canal and the blocking of Egyptian accounts in London put a sudden stop

What's the vibration in Venezuela?

VENEZUELA is booming. Men are carving fine smooth roads through the pointed mountains. They are drilling for oil near Lake Maracaibo. They are mining iron ore at Cerro Bolivar. They are building new airports. They are putting Venezuela on the map as a rich, busy country.

Have you noticed how much of this development depends on compressed air equipment? Holman supply a lot of it. From concrete vibrators to powerful road rippers that, amazingly, hardly vibrate at all.

Why Holman? Because Holman equipment works hard, long and unfalteringly. It cuts running cost down to rock bottom. And it's running cost that is the *real* cost of compressed air equipment.

Then there is the service which extends far beyond the supply and maintenance of machinery. In Caracas — and in the key towns of eighty-odd other countries — there is a Holman organisation staffed by consultants qualified in every industry where compressed air equipment can be used. This world-wide service is centred on Camborne where every tool made is rigorously tested in the industry's only experimental mine.

With all this behind it, is it any wonder that every Holman tool repays its initial cost many times over during its long life?

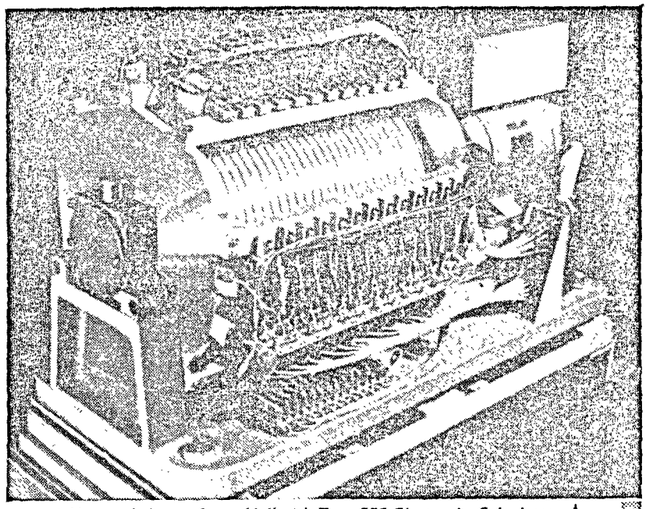
two electronic prodigies



'So these machines,' the visitor asked, 'will not only calculate at fantastic speeds. They have judgment and memory?'

'Once they are instructed,' the Accountant agreed, 'they will combine calculation with memory and they will even make logical decisions.'

'Any moment now you'll be saying they have personality!'

The Accountant shrugged. 'They have some very competitive characteristics,' he said. 'They are extremely flexible. Adaptable and very versatile. The real point is,' he went on emphatically, 'Hec General-Purpose Computers and the new Hollerith Type 555 Electronic Calculators are both ideal for commercial and industrial accounting. Electronic prodigies, I call them.'

to further commercial payments. A list of outstanding contracts has been drawn up and if the exporters and importers in each transaction are still prepared to proceed, it will be submitted to the Bank of England for approval.

The Egyptian authorities have added the total amounts involved in these transactions and published the resulting total as an agreed release. No unblocking has in fact been negotiated or agreed. Nor did the Rome talks break down. They were exploratory and went as far as they can conveniently be taken at the moment. No date has yet been fixed for their resumption. The atmosphere in which they will be resumed will, however, have been considerably improved if in the interval the Egyptians fulfil their promise to pay in sterling the pensions of British citizens who were previously employed in Egypt and were forced to leave during the recent troubles.

HOME EQUIPMENT

A Durable Recovery?

A HEFTY revival in household goods sales has been getting under way this year, and the Board of Trade's returns for retail trade in April suggest that the improvement is gathering pace, even after allowing for the usual Easter spending spree. All shops dealing in these lines appear to be enjoying a share in the recovery; their total volume of business in the first four months of this year is well above last year's and some are handling as much as they did in early 1955. Even the multiples who lost ground heavily a year ago have, in total at least, made a full recovery.

But the sun is not shining on all household articles. This year's radio and television sales, for example, are a good fifth better than last year, and sales of radiograms are up by two-fifths, but these sales are still substantially short of the level of business of two years ago. Television sales are an exception, but that market is under somewhat different influences. In April the Post Office issued the seven millionth TV licence, barely eight months after the six million mark was passed.

SALES OF RADIO & TELEVISION SETS

	Radios			TV Sets		
(Thousands)	1955	1956	1957	1955	1956	1957
January	98	66	86	103	85	119
February	99	66	78	98	81	94
March	95	72	83	85	71	79
April	79	65	78	75	62	66
Total	371	269	325	361	299	358

Furniture sales show perhaps the most marked recovery in sales of durable household goods this year. The buoyancy of sales in the first quarter of the year imparted a 12 per cent increase to the industry's output, which brought the manufacturers back to their level of activity of two years ago and actually above that of 1954, previously their best year. Washing machines and electric cookers are also selling well, though the evidence is somewhat more fragmentary. Gas and solid fuel appliances, on the other hand, do not

Transistors by the Million

THE first factory in this country to be given over entirely to the manufacture of the electronic components that fall under the umbrella heading of "semi-conductors" and to transistors in particular, is being built by Mullard Ltd. at Southampton. Transistors have been made in this country for several years, and by a variety of companies, but in what it would be fairer to describe as development batches rather than regular mass production. Mullard's move to centralise the company's own transistor production under one roof is a sign that the performance and design of these very new electronic gadgets is becoming sufficiently standardised to contemplate producing them on a scale approaching that of the conventional electronic valve that they replace.

A germanium transistor is not impressive to look at. It consists of a raggle-taggle assembly of bent wires and little blobs of metal ranging in size from a pin-head to a pin-point, the lot balanced uncertainly on three sturdier wire legs. Yet the pin-head of metal and the two pin-points alloyed on either side of it have between them the amplifying power of a fair-sized valve. Today's transistor is a highly sophisticated version of the original "cats-whisker." It works by deliberately exploiting the slight difference in physical behaviour between two fractionally impure forms of germanium, which make it possible to get a relatively large output of power from the battery for a relatively small input of power to the transistor.

The finished transistor in its glass envelope measures half an inch, and a dozen fit into a thimble. That these two properties, uncommonly small size and relatively insignificant power requirements, have not brought about the revolution in the design of electronic equipment that might have been expected is largely due to the limitations of the transistors themselves.

Present types cannot operate at frequencies above 10 megacycles, and may never exceed 100 megacycles with any ease. And they cannot work at ambient temperatures much above 55°C. This second limitation means that guided missiles and high-speed aircraft, which would benefit most by "transistorising" because the size of valves now carried and the power they need are both serious handicaps, must wait for the development of transistors using silicon rather than germanium. These can work at temperatures nearly three times as high as the germanium transistors, and 50 per cent higher than what can safely be allowed for valves, so that missile designers in particular could dispense with much of the cooling they have to provide today, as well as with space and current. But because of the difficulties of producing the silicon, it may be some time before these are available in anything but experimental batches.

Transistors are painstakingly assembled almost entirely by hand; they are developing too rapidly to justify a fully mechanised production line. Their immediate applications run from hearing aids to tape recorders, small radio-receivers and ultimately to computers whose appetite for valves, current to feed them, and cooling to keep operating temperatures within bounds, is quite an element in cost. Mullard intend to produce semi-conductors by the million at the Southampton factory: other producers have also been increasing their output. In 1955, before transistors had begun to make their mark, valve output was running at more than 64 million. Most electronic manufacturers would like to know how soon transistors will begin to make inroads into that total.

seem to have experienced much of the present upward swing—which came during mild weather, and anyway began after most people had completed their buying of heaters for the home.

UNION ACCEPTANCES

Money Market in South Africa

IMPORTANT stages in the creation of a money market in South Africa are covered in the first report of Union Acceptances from October, 1955, to the end of 1956 and in Sir Ernest Oppenheimer's accompanying statement. During these fifteen months Union Acceptances started to act as a discount house, acceptance house, and issuing house. During the period Dr de Kock, the governor of the Reserve Bank, decided to make South African Treasury bills negotiable and to split them into the still large minimum denomination of £50,000. Union Acceptances which was formed by the Anglo American group with Barclays (DCO) as junior partners and with technical assistance from Lazard Brothers has achieved much. The later decisions to raise the capital from £1 million to £2 million and to take participations in Rhodesian Acceptances and in Union Acceptances (Zurich) A.G. show the lines of progress; so does the first net profit figure of £50,607, from which no dividend has been paid.

The work that remains to be done before South Africa has a developed money market emerges from Sir Ernest's address as clearly as the progress already achieved. South Africa has no discount house independent of an acceptance house. Union Acceptances has been both buying and selling bills at the same annual rate of discount—3⅝ per cent—retaining some of its own accepted bills and therefore owing both the acceptance Commission and the discount, but also passing some on to local commercial banks. For much the same reason the balance sheet which shows £1.9 million of bills discounted and £3.3 million of acceptances contains no Treasury bills nor indeed any bills except some of the company's own acceptances. There is not yet a market in South African Treasury bills, even though they are available in bearer form, because of the absence of houses that could deal in them. Loans received also stand in the balance sheet at £2.8 million and Sir Ernest expresses the view that when a separate discount house exists the proportion both of bills held and loans received in the Union Acceptances balance sheet will be much lower.

COMPANY AFFAIRS

METAL BOX

THREE months ago, when the Metal Box Company made a £6 million issue of a 5½ per cent unsecured loan stock at 98, its directors said that sales were going up but that margins were difficult to maintain and that the profits earned in the year to March 31st last were unlikely to differ much from those earned in 1955-56. The group's preliminary statement now shows that while total sales went up from £61,225,000 to £68,687,000, gross profits came down slightly from £5,763,000 to £5,745,000 and net profits from £2,677,000 to £2,611,000. Sales at home (up from £47,422,000 to £53,130,000) and abroad (up from £13,803,000 to £15,557,000) have both risen, but while the gross profits of the home group came down from £4,055,000 to £3,883,000 those earned by the overseas group rose from £1,708,000 to £1,862,000.

The differing pressure on margins can be taken a stage further by comparing the ratio of gross profits to sales in six monthly periods. Beginning at the six months ended on September 30, 1955, the ratios for the home group run as follows: 8.8 per cent, 8.3 per cent, 7.9 per cent and 6.7 per cent. For the overseas group, the corresponding ratios are 12.1 per cent, 12.6 per cent, 11.5 per cent and 12.3 per cent. Thus the margins at home have been continuously falling but margins abroad (which are consistently higher than those earned at home) show some recovery in the winter months of both financial years. But sales of the overseas group represent only about a fifth of the total. These figures suggest why the group as well as adding to capacity at home is anxious to expand its business overseas.

The £6 million capital issue gave Metal Box the money needed for expansion. Some of the group's earlier expenditure must now be earning revenue, for although not less than £4 million is to be spent on capital account this year and although the new loan stock must be serviced, the directors have raised the ordinary dividend from 10 to 11 per cent. Investors seem equally confident, for the £1 units rose 2s. to 56s. 3d. after the figures were announced.

COURTAULDS

OF the British Celanese stockholders over 90 per cent have accepted the offer from Courtaulds, and Courtaulds' stockholders have approved the necessary increases in capital. The rayon merger and combine are now accomplished facts. In the course of the year and of the merger negotiations, stockholders learned almost exactly what they might expect, and Courtaulds profit and dividend statement for the year ended March 31st contains no surprises. Group profits before tax at £15.2 million are indeed a little better than the foreshadowed four-fifths of the previous year's figure. The final dividend, 6 per cent, is as expected, and again makes 10 per cent for the year. The figures show the parent company distributing £3 million net out of a net taxed profit attributable to the parent of £8.0 million (against £10.0 million), so that even after a difficult year Courtaulds has not been pushed into an over-liberal ratio of dividend to profit.

Most interest will centre round what the directors have to say about trade. It is not an ebullient report. "In the home market there was a reduction in profit mainly in the continuous filament section of the business; in particular, a material drop in demand for tyre yarn was coupled with increasing costs of production which were not passed on to

	Years ended March 31st, 1956	1957

customers in increased prices. Textile yarn prices were, however, increased early in 1957. The export markets were less profitable than in the previous year, especially as regards fabrics. The subsidiaries in the United States of America and Canada encountered increasingly severe competition and profits were seriously curtailed." Over-optimism has never been one of the vices of Courtaulds' board. Shareholders will assess their latest report in the light of a record of cautious assessment. They will make their own guesses about the probable effect of the 1957 rise in textile yarn prices which should affect roughly the whole of the current trading year and will hope that with better times now arriving in the motor industry there should be some recovery on the tyre yarn side too. Undoubtedly there has been, and still is, recession in rayon, but a market price of 35s. 7½d. and a yield of around 5.6 per cent may be a fair assessment for the leader of the textile share market.

UNITED SUA BETONG

SIR JOHN HAY, the chairman of United Sua Betong, has reluctantly sounded "retreat." His scheme to lock away surplus assets of the rubber companies in the Guthrie group out of reach of take-over bidders and of shareholders was withdrawn. On the £1 stock of United Sua Betong he has proposed a tax free distribution of 5s. per stock unit from the share premium account, requiring in all £337,500. Now in his statement to shareholders he says:

> With our outstanding record of earnings and distributions we were not without reason for believing that stockholders would be content to leave any apparent surplus with the company, available for profitable employment when the time was deemed right for further expansion. But such farsighted views could not contend against a strong trend of opinion in favour of the more immediate benefits of a cash payment now. The choice having been made, we propose, subject to the sanction of the court, to pay out of share premium account 5s. per £1 stock tax free. Stockholders will appreciate that future distributions must be dependent on revenue earnings.

Sir John has thus set a definite limit to his retreat: it is at 5s. per £1 stock. Some will argue that Sir John and his fellow directors, with nearly £2 million in investments and cash in the coffers of United Sua Betong, could have been more forthcoming. Sir John clearly thinks not, and it is presumably the incidence of taxation that he has in mind. But the decision leaves United Sua Betong—leader of the rubber share market—still over supplied with cash and in need of a definite project for expansion.

If future distributions are to depend upon revenue, what are the prospects? They are much improved. Last year, net profits fell from £511,809 to £436,291 but the dividend from trading was reduced by only 2½ per cent to 42½ per cent, absorbing £329,906. Malayan rubber companies are obvious beneficiaries for tax relief under the new rules for overseas trade corporations. Sir John welcomes this relief:

> This promise has been embodied in the draft Finance Bill now under discussion in Parliament and until that Bill has been enacted and its final terms studied I cannot say with any certainty to what extent this and similar companies will be affected. The indications so far given do encourage us to believe that the concessions likely to be granted are significant and a welcome lightening of the heavy burden of taxation. . . .

For such companies as United Sua Betong, the OTC concessions will effectively free dividends to shareholders (so long as they are not companies) from British profits tax and free retained profits from British income tax as well. The biggest gain is on retained profits and one of Sir John's concluding remarks emphasises that "the maintenance of ample financial resources" is "an indispensable condition" for the rubber industry.

LONDON AND OVERSEAS FREIGHTERS

ONE of the most active of speculative counters in recent months has been the stock of London and Overseas Freighters. The yield is low, taking small account of the depressed state of the tanker freight market and it heavily discounts the facts that the company has a Bermudian associate and that the creating of tonnage both here and in Bermuda out of retained profits is in progress. The yield also assumes that the directors will be generous in their dividend policy.

This year they have demonstrated their willingness, within limits, to be so. Quarterly statements from London and Overseas Freighters had already revealed the trend in profits last year. The preliminary statement now shows that in the year to March 31st the group's operating surplus was £3,515,346 (against £1,974,207) and its net income £1,560,910 (against £1,029,332). Interest in the statement was therefore concentrated upon the dividend. Effectively it has been raised from 9⅜ to 20 per cent. There is now to be a 25 per cent free scrip issue too, and this issue is the prelude to a bigger dividend for the current year. In the statement, the chairman, Mr B. M. Mavroleon, says:

> You will not be unaware of the depressed state of the tanker freight market at the present time and, indeed, I can see no prospect of an immediate improvement. Nevertheless, I take a very optimistic view of your company's future and, as last year, I am prepared to state that I confidently anticipate being in a position to maintain the increased rate of dividend on the increased capital.

The stock market was disappointed and the 5s. shares fell 3s. 3d. to 39s. 9d. The prospective yield is only 3⅛ per cent.

CONSOLIDATED ZINC

CONSOLIDATED ZINC drew up its accounts at the end of last year with about £8½ million in stocks and about £10 million in liquid assets. The average prices for lead and zinc concentrates realised by the corporation and its subsidiaries last year were higher than in 1955, thanks largely to American stockpile buying. But lead and zinc prices have since fallen and could fall further. The chairman, Mr L. B. Robinson, seems convinced however, that the lack of balance between production and demand will be temporary. He says that the corporation has ample cash resources "to face any vagaries in the markets."

Future income may vary, as it did last year when the consolidated trading surplus fell by £187,532 to £6,250,323 and the dividend was left unchanged at 22½ per cent. Last year the earnings of the British subsidiary fell, as the demand for its alloys and pigments was reduced (owing to the recession in the motor industry) and because its margins were reduced by higher costs. Profits from the Australian mining subsidiaries showed little change, as the increase in ore production was offset by lower grades and better prices were offset by higher ocean freight rates.

For some years ahead Consolidated Zinc will remain dependent on lead and zinc but it is broadening its base. It is active in the exploration and development of minerals other than base metals in Australia. And in particular it is actively considering a venture, probably in partnership with British Aluminium, to exploit the new deposits of bauxite discovered in Queensland. It will, Mr Robinson emphasises, take some years before these developments can produce any revenue. But he suggests that the corporation has sufficient resources not merely to ride out any squalls in the lead and zinc markets but also to "insure the uninterrupted progress" of these development plans. The yield is 6.2 per cent on the £1 units at 74s.

J. AND P. COATS

THE directors of J. and P. Coats remain convinced that their long established policy of conservative dividends is right for this strong, international company, selling its sewing cottons in almost every market in the world. Some of the shareholders disagree and have written to the company asking why the dividend could not be increased. Last year the gross profit of the group went up from £10,609,514 to £11,870,364 and that of the parent company (which includes the dividends received from subsidiaries) rose from £5,529,606 to £5,569,763. But the ordinary dividend remained at 8¾ per cent.

The chairman, Mr Robert Laidlaw, defends the dividend policy at length. His familiar argument is that money must be ploughed back so as to ensure that the parent and its subsidiaries can continue to hold their own in competitive markets. He points out that moneys cannot necessarily be transferred easily from one subsidiary to another or from one country to another; thus the group can hold about £9 million in cash and investments and still have £6 million outstanding in bank loans and acceptance credits. He goes on to say that overseas subsidiaries have been able to maintain their share of the market only by spending money (found either from local internal resources, or from local borrowings or from the parent company) on new mills, on replacing and extending productive capacity, and on additional working capital. Last year, he mentions, the group's stocks rose by about £4½ million to over £40½ million, about one third of that increase being due to higher cotton prices.

Mr Laidlaw therefore argues that the

need of the parent to conserve its resources is as strong as the need for the subsidiaries to do so. He also makes it clear that the effect of the tax relief to overseas trade corporations is likely to be only marginal for J. and P. Coats. Its overseas subsidiaries are managed abroad and dividends received from them come under the double taxation relief rules; thus the new OTC rules will not essentially change matters. Mr Laidlaw then adds: "the more complicated provisions which relate to the taxing of foreign profits derived from overseas trading from the United Kingdom are insufficiently clear to enable us to say what changes we might make in consequences." But the company will make changes if they lighten the burden of tax.

This is not encouraging to shareholders pining for a bigger dividend. Last year, the ordinary dividend cost under £1½ million net and about £3¾ million was retained from net profits. Shareholders can be forgiven if they argue that the balance should be tilted rather more in their favour.

ENGLISH SEWING COTTON

ENGLISH SEWING COTTON is a direct competitor of J. and P. Coats, but a much smaller company. It has made a large investment in the United States, owning practically all the common stock of American Thread. That investment has never seemed quite to fulfil its promise and last year American Thread's profits fell from £1,627,000 to £1,502,874. Fortunately profits earned elsewhere in the group expanded from £1,077,294 to £1,519,760, so that the consolidated surplus rose by £318,140 to £3,022,634. That improvement may owe a little (but certainly not everything) to the inclusion of the earnings of Hollins Mill, which English Sewing Cotton acquired in 1955.

The expansion in earnings in the group outside American Thread is encouraging, especially in view of the directors' interim report that though sales were rising profit margins were falling. The re-equipment policy has stood the company in good stead. Net profits have risen from £699,076 to £764,831 and the ordinary dividend has been maintained at 12½ per cent. But American Thread continues to provide a substantial portion of the group's consolidated earnings. That is perhaps one reason why the yield of 8½ per cent offered by the £1 units of English Sewing Cotton at 30s. 4½d. is higher than the yield of £7 offered by the £1 units, standing at 25s. xd. of the more broadly based concern J. and P. Coats.

HOUSE OF FRASER

THE names of Mr Hugh Fraser and the House of Fraser are associated with the take-over bid almost as closely as those of Mr Charles Clore and Sears Holdings. Yet the successful take-over bids made by the House of Fraser are more akin to those made by Mr Isaac Wolfson of Great Universal Stores than to those made by Mr Clore. They seem to be designed to expand and to strengthen the drapery and general store business of the House of Fraser, just as Mr Wolfson's bids seem to be designed to expand the multiple empire of GUS. They do not cover such a wide range of industries as do Mr Clore's bids, though two abortive bids by Mr Fraser last year (for Scottish Motor Traction and Lyle and Scott) suggest that he may have ambitions in that direction too.

The failure of these bids meant that little was added to the properties of the House of Fraser last year. Thus the increase of 11 per cent (against 20 per cent in the previous year) in gross profits by £199,769 to £1,972,498 seems to reflect largely the consolidation and trade expansion of established stores and businesses. It was a satisfactory increase for a group of drapery and household goods stores.

Net profits rose by £41,689 to £765,739, enabling the directors, as Throgmorton Street had expected, to raise the ordinary dividend effectively from 32½ to 35 per cent. This is the fifth successive increase in the full year's payment and had been discounted. The 5s. shares fell 1s. 3d. to 25s. 3d. on the news, and yield 6.9 per cent.

London Stock Exchange

FIRST DEALINGS:	May 29	June 19	July 3	
LAST DEALINGS:	June 18	July 2	July 16	
ACCOUNT DAY:	June 25	July 9	July 23	

FOLLOWING a sharp fall on Friday, gilt-edged stocks were steadier at the lower level and the publication of the gold and dollar reserve figures this week was accommodated with only small, scattered losses. Some of the longer-dated stocks fell to their lowest points for the year and the *Financial Times* index of Government securities sank to 83.56 on Wednesday, slightly above its lowest point this year of 83.43. Last Thursday's rise in industrial stocks following the Chancellor's statement on taxation was just sufficient to offset the persistent decline in share prices throughout this week and *The Economist* indicator improved a fraction to 216.6. After a steady rise Canadian gas and oil shares reacted sharply on Wednesday.

Bank shares were again lowered, but breweries showed further small gains. On the prospect of an increase in cement prices Associated Portland Cement rose 2s. 3d. to 47s. 6d. xd. Leyland rose to 52s. 6d. before easing later to 52s. Raleigh fell 3s. 3d. to 43s. 9d. on the introduction of some short-time working. Stewarts and Lloyds failed to respond to the small increase in the interim dividend and steel shares were generally unchanged on balance. Paper shares shed a few pence more, Bowater losing 1s. to 43s. 9d. London and Overseas Freighter fell 2s. 3d. to 39s. 9d. in spite of the dividend and scrip issue announcements.

There was renewed demand for oil shares; Shell and Royal Dutch reached fresh peaks before easing later, and British Petroleum advanced to 165s. Kaffirs became a firm market after their recent decline, the returns and dividend declarations sending prices up sharply. Hartebeestfontein jumped 4s. to 50s. 6d. and Western Holdings 4s. 4½d. to 63s. 1½d. Finance houses rose; Anglo American gained 3s. 9d. to 121s. 3d. but Central Mining fell a further 4s. 4½d. to 66s. 3d. Base metals were lower and teas and rubbers lost ground.

[1] Electricity production for New Zealand represents deliveries only. [2] Copper and tin refer to metal production. [3] General trade (including re-exports) except for Canada, which is special trade only. Imports are cif except for Australia, Canada and S. Africa which are fob; exports are fob. Trade for India includes that *going by land*; *annual figures* for India are for 12 months beginning April 1st of year stated and for Australia 12 months ended June 30th. [4] Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for S. Africa and S. Rhodesia relates to Europeans only and for S. Africa includes direct taxes. [5] Including foreign investments. [6] *Including semi-processed gold.* Beginning January, 1955, including South-West Africa. [7] In July, 1948, part of holdings was transferred to the State Bank of Pakistan. [8] April, 1948—March, 1949. [9] Including some long-term securities. [10] Average for fourth quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended June 1, 1957, there was an "above-line" surplus (after allowing for Sinking Funds) of £15,539,000 compared with a deficit of £1,909,000 in the previous week and a deficit of £851,000 in the corresponding period of last year. There was a net expenditure "below-line" last week of £5,943,000, leaving a total deficit from April 1st, of £874,000 (£44,295,000 in 1956–57).

THE MONEY MARKET

At the Treasury bill tender on Friday of last week the discount market maintained its bid unchanged at £99 0s. 5d. per cent. As outside tenderers had expected a further rise in the market's rate, and as total applications fell by £21 million while the offer was raised by £10 million, to £230 million, the allotted portion of the market's application rose from 37 to 57 per cent, its highest this year. The average rate of discount on the whole allotment rose by 2¼d. to £3 18s. 5.15d. per cent. At yesterday's tender, the offer was raised to £240 million, which will again exceed matching maturities by £10 million.

Credit supplies in Lombard Street have turned easy this week. On Tuesday some funds remained unlent, whilst on the following day the Bank entered the market as a seller; loans from outside sources were quoted at down to 2½ per cent. Before the weekend, end-month calling contributed to some difficulty in obtaining funds, and the Bank gave special help through purchases from the banks and direct from the market. On Monday, the market reborrowed a small amount at Bank rate, despite small official purchases.

The Bank return for the week to Wednesday shows a further pre-Whitsun outflow of notes into circulation of £12.4 million following that of 5.9 million in the previous week. To accommodate the latest efflux, the fiduciary issue has been raised by £25 million to £2,000 million, still £25 million below its Christmas peak.

"Some people still persist in taking a gloomy view of Great Britain's future—*I don't*"

Sir Eric Vansittart Bowater
Chairman, The Bowater Paper Corporation Ltd.

Extending a welcome to a record number of 2,400 shareholders from home and overseas, Sir Eric Vansittart Bowater (Chairman of the Corporation) said he hoped that the visit to Northfleet, Kent, would enable shareholders to realise something of the present-day magnitude of the Bowater Organisation and perhaps engender an even greater pride of ownership than before.

Highlights of the Year

Sir Eric continued: All in all, 1956 was a satisfactory and gratifying year for Bowaters. Overall production and earnings were both at a higher level than at any previous time in our history; this is true even after eliminating the added production and profits of the Mersey Paper Company of Nova Scotia, Canada, which we acquired with effect from April 30th last year. In the middle of the year the sixth large paper machine to be installed at the mills of our Kemsley Division in the United Kingdom came into operation; in Tennessee the third paper machine to be installed in those mills came into operation at the close of the year.

Other important highlights included the consummation in March of the negotiations that brought into partnership two famous names in the world's paper industry; I refer, of course, to the Bowater-Scott Corporation, as the joint venture is known. Then, in June, your Corporation's interests in the corrugated container field were merged with those of the Eburite Group of companies and the name of the Eburite Company was changed to Bowater-Eburite Limited, in which associated company we have a very substantial and important holding.

In short, I believe you may agree with me if I say with some pride that 1956 will go down in our history as a year of success and achievement.

Substantial Overseas Earnings

The consolidated revenues before depreciation and taxation amounted to just over £16 million, of which some £4¼ million were earned by the United Kingdom companies and almost £12 million by our main overseas companies. Thus the aggregate earnings of the overseas companies represented more than 70 per cent of our total consolidated revenues, and this lends emphasis to the ever-increasing importance of our overseas investments.

The total of Fixed Assets shown in the Consolidated Balance Sheet has increased by some £35 million to £117 million. The amount expended during the year on Fixed Assets and on trade investments totalled some £39 million, and considerable progress has been made with the various projects involved in our masterplan of development.

The new ocean dock at the Thames Division is all but completed and the new Transport Centre, Central Research and Development Laboratories, Development Engineering Centre and Water Tower are completed. The Bowater-Scott plant is now ready for operation. The new machine house of the Thames Division in which the fifth and sixth multi-purpose paper machines will be installed is now under way. The first of these machines is timed to come into operation in 1958.

On the Mersey Division site at Ellesmere Port the machine house for the fifth and sixth multi-purpose machines also nears completion and the first of these machines is due to start up this summer. Also on the Mersey site the important extension to our Multiwall Sack plant nears completion and the new Bowater-Eburite corrugated container plant there is due to come into operation in the next month or so.

Overseas we are expanding our paper conversion facilities in Australia, while in Canada the programme for the further speeding up and development of our mills at Corner Brook at Mersey, Nova Scotia, makes steady progress. In the United States work has commenced on the installation of the fourth machine at the Tennessee mills, which machine is scheduled to start up at the end of 1958. Then, too, work has commenced on the new sulphate pulp mill we are constructing at Catawba in South Carolina.

The most important of our overseas interests is our very big investment in North America, which is vested in the Bowater Corporation of North America. Of outstanding importance was the purchase by the North American Corporation of the assets of the Mersey Paper Company of Nova Scotia. As a result of this transaction we have acquired one of the most efficient and well-managed newsprint mills in North America.

Another of the principal operating subsidiaries of the North American Corporation is Bowaters Southern Paper Corporation, Tennessee. When the fourth machine at the Tennessee mills comes into operation the annual productive capacity will have been raised to 435,000 tons of paper. By 1959 we shall be making in North America alone a million tons of newsprint a year—moreover, we expect to sell it; indeed it has already been sold under long-term contracts.

Vast Demand in N. America

A study prepared for the American Newspaper Publishers' Association which looks forward to 1965 forecasts that the consumption of newsprint in the United States will then amount to over 8½ million tons, and that of Canada to 575,000 tons; overseas requirements to be drawn by other parts of the world will by then increase to 2 million tons; so that the overall demand for newsprint from the North American industry will by 1965 amount to 11,175,000 tons. According to this report planned capacity of the North American newsprint industry will by 1960 amount only to some 9½ million tons per annum.

Commenting on the recent offer made by the Corporation to acquire the Ordinary capital in Hunt Partners Limited in exchange, *inter alia*, for fully paid Ordinary Stock of the Corporation, Sir Eric said: If the offer made by the Corporation is accepted by the shareholders of Hunts, there will have been added to our Organisation one of the most efficient and modern units in the paper conversion field.

No Apology for Newsprint Prices

There is at the present time widespread comment—much of it, I fear, ill-informed—in relation to the whole matter of the cost of newspaper production in this country. It is not my belief that any British newspaper has—as some would have us believe—been put out of business or had to cease publication solely as the result of the cost of its newsprint from whatever source that newsprint may have been obtained.

I do not believe there to be any grounds for an apology in regard to the price of newsprint in the United Kingdom or North America and for my part I do not propose to offer one. It is an old human instinct to look for a scapegoat to explain failure, and the persistent statement about newsprint being six times more expensive than before the war, and made without any qualification whatsoever, is one of them.

Despite all that has been said in Parliament and elsewhere about the high cost of British newsprint to the British Press, the fact is, and it seems to have been overlooked—or indeed ignored—that when all the many relevant factors are taken into account the effective delivered cost of British newsprint to the consumer remains lower than the cost of newsprint imported from either Scandinavia or Canada.

Concluding his review, Sir Eric said: As you may well have gathered from our programme for the further development of our business in the United Kingdom and overseas, we have implicit confidence in the future of our industry and, therefore, of your Corporation. I know some people still persist in taking a gloomy view of Great Britain's future—I don't.

The Report and Accounts were adopted.

COMPANY MEETINGS

CAMMELL LAIRD & COMPANY LIMITED

EFFORTS TO INCREASE PRODUCTION NULLIFIED BY IRRESPONSIBLE STOPPAGES

VOLUME OF WORK ON HAND AUGURS WELL FOR THE FUTURE

NEED FOR FULL MEASURE OF CO-OPERATION

MAJOR SCHEME OF SHIPYARD RECONSTRUCTION COSTING £17 MILLION

The ninety-third annual general meeting of Cammell Laird & Company Limited was held on June 4th at Birkenhead.

The Chair was taken by Mr P. B. Hunter who, in the absence of Mr J. C. Mather, JP, through indisposition, will temporarily undertake the duties of Chairman.

The following is the Chairman's statement which had been circulated with the report and accounts for the year ended December 31, 1956:

I have to record with deep regret the recent and untimely death of Mr Bernard Marsh, Liverpool Partner of Messrs Cooper Brothers & Co., the Company's Auditors.

As stated in the Directors' Report, Messrs F. O. John, MICE, and P. Sydie have decided to retire from the Board and do not therefore seek re-election.

Mr John has had 45 years' service with the Company, during the major portion of which period he was Technical Manager and Naval Architect. Mr John is widely known and respected as a Naval Architect and amongst the many designs for which he has been responsible was that of the second "Mauretania" which underwent her sea trials a few months before the outbreak of the Second World War.

Mr Sydie joined this Company in 1922, and followed Mr John as Technical Manager and has rendered outstanding service, finally becoming Assistant Managing Director of our Shipbuilding Subsidiary and holding that position until he retired last year.

I wish to express to both these gentlemen our keen appreciation of the long service which they have given us and our best wishes for their retirement.

During the year Mr J. F. Douglas, a Director of Cammell Laird & Company (Shipbuilders & Engineers) Limited, was appointed General Manager of that Company and Mr R. B. Wight was appointed to that Board as Personnel Director.

I also refer with pleasure to awards by Her Majesty the Queen to two of our Staff. Mr J. A. Gilliland, one of our Ship Managers, was awarded the MBE in the Birthday Honours last year and Mr J. Naylor, our Boiler Shop Manager, was awarded the MBE in the New Year Honours this year.

The question of Staff Pension arrangements has for some time engaged the attention of your Board. We have found that continuing inflation was adversely affecting the level of pensions and involving increased premiums. After careful consideration we have decided to establish our own funded Pension Scheme in place of that previously operated.

In consequence, a large sum has been taken out of our profits this year, but we believe that in future the burden on the Group in respect of Pensions will be lightened, although the benefits to the staff will be improved.

Difficulties continue to beset our Industry but I think that Shareholders will agree that in spite of this, the accounts reveal satisfactory results for the past year. I wish to express to the Management, Staff and Workpeople of our Subsidiary and Associated Companies our grateful appreciation of all that they have done to produce these results.

ACCOUNTS

I think you will find the Accounts show the Company's position very clearly and I do not propose to comment except on one or two points in which the figures differ from last year.

PARENT COMPANY'S BALANCE SHEET

Investments in Subsidiary Companies reflect the acquisition of the 75 per cent shareholding in The Patent Shaft & Axletree Company Limited, to which I referred last year.

Holdings of British Government Stocks and Other Securities have declined by some £447,000 due mainly to transfers to the new Pension Scheme, to meet the Company's initial liability. Unquoted Securities consisting of a Corporation Mortgage Loan of £100,000 have also been transferred to the Trustees of the Cammell Laird (1956) Pension Scheme.

The reduction of over £2,200,000 in Cash is due to a variety of causes, chief of which is the acquisition, at a cost of £833,000, of the major portion of the freeholds of the North and South Shipyards, from the Corporation of Liverpool and the Mersey Docks and Harbour Board respectively. These properties have been transferred to our Shipbuilding Subsidiary and this is reflected in the reduced amount owing to that Subsidiary Company. Payment was also made to ISHRA of £675,000 for Patent Shaft shares, £217,500 has been advanced in loans to Patent Shaft and £200,000 expended in further purchases of investments for the new Pension Scheme.

The decrease of £137,000 in Capital Reserves is accounted for mainly by further provision against the decreased market value of investments at December 31, 1956.

The decrease in the Profit and Loss Account carry forward is due to the fact that for fiscal reasons we have not taken a Dividend from our Shipbuilding Subsidiary this year, while last year's figures were swollen by transfer of Taxation Reserves no longer required.

CONSOLIDATED BALANCE SHEET

Again, the acquisition of a majority interest in The Patent Shaft Company has affected the figures. (The 1955 figures are not strictly comparable as they do not include the Patent Shaft Company.) The Fixed Assets are increased on this account and also by the purchase of the North and South Yard freeholds. Stock-in-Trade and Work-in-Progress have both increased, but this is offset to some extent by the increase in Instalments received on account of Work-in-Progress from customers, carried forward on the Liabilities side of the Balance Sheet.

A new item, the Interests of Outside Shareholders, makes its appearance, this being the 25 per cent interest of Metropolitan-Cammell Carriage & Wagon Co. Ltd., in the Capital Reserves and Undistributed Profits of The Patent Shaft & Axletree Co Ltd., and the loans made by Metropolitan-Cammell Carriage & Wagon Co. Ltd. to The Patent Shaft Company.

You will also notice a considerable increase under Current Liabilities and Provisions in the figure of Provision for Current Taxation. This is due to later settlement of Taxation Liabilities.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

Group Operating Surplus shows an increase of £217,000 and includes the results of both Cammell Laird & Co. (Shipbuilders & Engineers) Ltd., and The Patent Shaft & Axletree Co. Ltd., whilst Other Investment Income and Interest is down by £40,000 on account of realisations of Investments as mentioned above. (As in the case of the Balance Sheets the 1955 figures do not include The Patent Shaft & Axletree figures.) Depreciation written off has increased by about £38,000 as a consequence of the increase in the Fixed Assets. We have felt it necessary to transfer £80,000 to Contingencies Reserve this year and have made no provision against depreciation of Trading Stocks in 1956 as against a figure of £150,000 in 1955. Taxation absorbs £1,008,000 as against £881,000 for the previous year as a result of the higher income of the Group and the inclusion of the Patent Shaft figures for 1956. This leaves us with a net profit of £877,000 for the year as against £874,000 for 1955, but of this a proportion is attributable to the minority interest, leaving net profit for the year, attributable to the Shareholders of Cammell Laird & Co. Ltd. of £859,734.

Deducting the Initial Contributions to Cammell Laird (1956) Pension Scheme, reduced by a transfer of £100,000 from Provision for Pensions and leaving Gratuities, and deducting appropriations by Subsidiary Companies, the Net Profit for the year available to the Shareholders of Cammell Laird & Co. Ltd. is £216,119. To this must be added the Balance of £470,778 brought forward from 1955, making available for appropriation £686,897. The Interim Dividend paid on October 27, 1956, at 4 per cent, less tax, absorbed £122,475 and your Board now

recommends a Final Dividend of 10 per cent, less tax, absorbing £306,188, leaving to be carried forward to next year in the books of the Parent Company £258,234.

CAPITAL COMMITMENTS

The net liquid assets included in the Consolidated Balance Sheet, taking Quoted Securities at their Market Values, at December 31, 1956, amount to about £6 million. After providing for Working Capital and the additional finance required by The Patent Shaft & Axletree Co., the balance, together with retentions from profits during the forthcoming years, will be required to finance the comprehensive programme for the reorganisation of the Shipyard to which I refer below. This programme includes £500,000 for the acquisition and extension of Rock Ferry Pier for the gas-freeing and cleaning of Ships' Tanks. Work has already commenced on this project and we hope that the installation will be completed and operating by the end of 1958.

CAMMELL LAIRD & CO. (SHIPBUILDERS & ENGINEERS) LTD.

Ship Construction.—During the year seven ships were launched totalling 77,375 gross tons, compared with eight vessels totalling 88,586 tons in 1955. The ships launched last year were as follows: m.v. *City of Wellington*, cargo liner for Ellerman Lines Ltd.; s.s. *Carrillo* and s.s. *Cartago*, refrigerated cargo vessels for Caraibische Scheepvaart Maatschappij NV; s.s. *San Flaviano*, tanker for Eagle Tanker Co. Ltd.; m.v. *Carnatic*, refrigerated cargo vessel for Shaw Savill & Albion Co. Ltd.; s.s. *Irish Poplar*, cargo vessel for Irish Shipping Ltd.; s.s. *Zenatia*, tanker for Shell Tankers Ltd.

The launching of the *Zenatia*, a vessel of approximately 38,000 tons deadweight, was a landmark in the Company's history, this ship being the largest tanker so far launched at our Shipyard.

Eight vessels, including four of those launched last year, were completed and delivered to their owners. Among the merchant vessels completed was the 34,000 tons deadweight bauxite ore carrier *Leader*. We also completed HM anti-submarine frigate *Whitby* for the Royal Navy, this vessel being the prototype of the class.

Engineering.—During the year eight sets of marine steam turbine double-reduction geared machinery were built and tested in our main Engine Shop, the total shaft horsepower being 89,000. In addition to the construction of propulsion machinery for merchant ships, we are also engaged on the construction of machinery for vessels building for the Royal Navy. Towards the end of the year the tanker *Auris* arrived at our Works to undergo machinery conversion. Three diesel-driven and one gas turbine-driven alternator sets together with one electrical propulsion motor were removed and these are being replaced by a single gas turbine set coupled to an hydraulically operated reverse reduction gear. The output of the main Boiler Shop for 1956 comprised 13 boilers, giving a total evaporation of 593,400 lbs of steam per hour.

Ship Repairing.—Our Ship Repairing Department has been actively employed throughout the year, carrying out repairs and refits aboard 158 vessels. In addition, work has continued on refit contracts which we have undertaken for the Royal Navy. This branch of our business continues to meet with keen competition, but we have been successful in gaining a satisfactory share of the business offering.

GENERAL

Although our Shipyard has been fully engaged on a big programme of new construction work, production was disappointing and below that of the previous year, due to dislocation caused by the prolonged strike of our joiners and other factors. The joiners' strike ended on April 3, 1956, but it resulted in considerable congestion in our fitting-out basin, and in spite of a determined effort to make up some of the lost ground, our building programme has suffered serious delays. During the strike we lost a good many of our skilled workpeople and we have experienced considerable difficulty in recruiting replacements. This factor, together with other difficulties such as delay in obtaining special steel at the right time to fit in with our building programme, and delay incurred by having to repair and in some cases return defective steel castings to the makers, have all contributed to retard production.

As far as orders for new tonnage are concerned, your Company has been successful during the year in obtaining contracts for several vessels of varying types and sizes; of special note is the order we received from the Union-Castle Mail Steamship Co., Ltd., for the construction of a twin-screw mail passenger and cargo liner which will be the largest ship of this type to be built at our works. The large number of vessels which we have under construction or on order, including some very big tankers, is a matter for satisfaction and, given the full co-operation of all in executing this programme of work expeditiously and economically, it augurs well for the future.

We are determined to consolidate our leading position in the world of shipbuilding and, accordingly, we have embarked on a major scheme of reconstruction in our Shipyard. It is anticipated that the complete programme will occupy about eight years and cost approximately £17 million. This scheme, which has already been reported in the Press, is designed to increase overall production and to enable us to build vessels of considerably greater tonnage than present facilities permit. The reconstruction will involve the building of a large combined Building Dock, Dry Dock and Fitting-out Basin suitable for building and fitting out the largest ships which can navigate the Mersey Channel, or alternatively, for dealing with a number of smaller ships. This Dock, which will be constructed in our South Yard, will augment our present fitting-out facilities and will accommodate ships for which our present fitting-out basin would be inadequate. In addition, we are also building a new Dry Dock on the site of the existing No. 5 Dry Dock in our North Yard. This Dock will cater for the repair and maintenance of large tankers using the tanker cleaning and gas-freeing installation we are constructing at Rock Ferry which latter will be operated in conjunction with our neighbours, Messrs Grayson, Rollo & Clover Docks, Ltd., who have taken a small interest.

Other features of our reconstruction scheme include the demolition of existing plating sheds and the erection of new sheds, and also the erection of new welding bays in our South Yard where we also propose to combine two of our slipways into a single slipway in order to enable us to build one large ship or, alternatively, two medium-size ships. Improved cranage facilities will also be provided. Our Engine, Boiler and various other Shops will undergo modernisation and provision will be made for improving our present electricity supply.

This new scheme is an indication that we intend to do all we can to ensure that our Company will continue to flourish in the future and thereby safeguard the well-being of all who depend upon its success for their livelihood.

You are all familiar with the problems which confront the shipbuilding industry and which hamper it in its efforts to step up production. These problems, unfortunately, do not seem to diminish and continue to be a matter for concern, particularly the problem of industrial relations. Each year we are faced with demands for increased wages which cause costs to spiral still higher, and each year efforts to improve the rate of production are nullified by the loss of working time through irresponsible stoppages. Such action inflicts serious injury on our Industry which is at present faced with perhaps the most serious challenge to its supremacy as world shipbuilders. When most shipyards have full order books it is easy to develop myopic tendencies, but our Industry can only continue to prosper in the future and rebuff the challenge of foreign competitors if there is a greater measure of co-operation in bringing about more stable conditions than has prevailed in recent years. Given such conditions, then we can all look to the future with greater confidence.

METROPOLITAN-CAMMELL CARRIAGE & WAGON CO. LTD.

Rail Transport: Four and a half million dollars were earned by Metropolitan-Cammell Carriage and Wagon Co. Ltd. last year in respect of shipments of wagons to India under a USA dollar-aid contract. Against other export orders the Company dispatched over 100 coaches for electric suburban service in Rio de Janeiro, and large numbers of wagons for Rhodesia, Malaya, Nigeria, Burma and Portuguese West Africa. More than 100 diesel railcars ordered under the Modernisation Plan were built for British Railways, to whom large numbers of standard steel coaches and wagons were also delivered. Prototypes of first and second class coaches with modern interiors and improved passenger amenities for steam hauled stock were also completed.

Although shortages of steel sections prevented complete fulfilment of the Company's delivery schedules, the value of output was greater than that of any previous year.

At the end of the year the British Transport Commission placed a contract with the Company for the design and construction of three 8-car and two 6-car high-speed de luxe diesel trains for main line services.

Important new export contracts received were for 2,300 wagons for New Zealand and 400 wagons for the Sudan. These were secured in the face of world-wide competition, which was intensified during the year as a result of fewer inquiries being issued. To maintain its competitive position the Company has expended considerable sums on new plant and equipment.

Road Transport.—A greater output of bus bodies also was attained by the Company last year. Many new orders were received for the Metro-Cammell light-weight body as a result of savings on fuel consumption obtained by operators who had previously adopted this form of construction. There were fewer inquiries from overseas, but the Company secured orders for more than 200 bodies from Persia and Spain against severe competition.

The Company was also concerned in the development of a new type of high-capacity double-deck bus providing seating for 78 passengers and incorporating many new features, including the location of the engine at the rear to facilitate low loading and maintenance. It is hoped these advantages, combined with reduced operating costs, will create a demand for this new vehicle.

ENGLISH STEEL CORPORATION LTD.

Considerable progress has been made in the English Steel Corporation Group of Companies with the development of the various sections of the business as independent companies. This segregation has given to the senior officials added interest and opportunities and is assisting in the maintenance of efficiency and the development of each unit.

All companies have maintained their position in their respective trades and have operated profitably and, with the exceptions mentioned later, all have had full order books and maximum production.

The steel output was 590,000 tons, a total 5 per cent higher than that of the previous year made from the same plant and a record for the Group. Another record was established in the value of direct exports, which showed a significant increase over the value of deliveries in any previous year, and particularly in dollar markets.

The demand for heavy forgings has remained high and the value of orders received was considerably in excess of the value of deliveries made. Full production is, therefore, assured for many months ahead. Many important orders for direct export have been received, including a number of large shafts for hydro-electric installations in the St Lawrence Seaway project. During the year 18 ingots exceeding 150 tons (including 10 of 270 tons each) in weight were produced for heavy forgings.

A substantial proportion of the capacity of the Drop Forge has always been devoted to the production of components for the motor car industry. The decline in motor car production has, therefore, reduced the load on this section. In part, this decline has been made good by an increased demand for drop forgings for the aircraft industry.

The Rolling Mills Corporation has maintained a high rate of output throughout the year. It has not been possible to meet all demands for special alloy steels, due to the shortage of nickel and nickel-bearing scrap and many customers have had to revert to the "emergency" steel specifications in use during the war period.

The capacity for production of large steel castings by the Castings Corporation will be fully engaged for a long period ahead. During the year the Corporation has again made some outstandingly large castings of complex design, maintaining its position as the foremost producer of heavy steel castings.

The demand on the Steel Foundry for railway "specialties" has continued, two important successes being the receipt of large contracts for the latest form of American type coupler to be used on Indian ore wagons and of orders for one-piece bogies forming part of the British Railways diesel programme.

The output of the Spring Corporation has been reduced due to the decline in motor car production, although a reasonable share of the work available has been obtained. The plant devoted to the manufacture of railway springs has been almost fully occupied throughout the year.

Taylor Bros. have fully maintained their pre-eminent position as suppliers of railway wheels, tyres and axles, in all of which products record outputs were established during the year.

At Darlington Forge, where forgings and heavy castings are made, order books are full and output has been maintained. A number of the largest cast steel rolls made in Great Britain were delivered to customers.

The demand for stainless and heat-resisting steels produced by Firth-Vickers Stainless Steels Ltd. has again been high and increased production facilities, which will come into operation during 1957, are expected to be fully occupied. The limitation of nickel supplies has again restricted the output of austenitic types of steel.

Although steel production increased by only 5 per cent, inflated costs arising partly from the higher cost of pig iron and scrap and increased levies paid to the Industry Fund of the British Iron and Steel Federation, have entailed a far larger percentage increase in working capital, with consequent effect on financial resources.

At the end of the year, work was commenced on preparing the site of the new Works at Tinsley for building operations. A complete survey has been made which has proved the suitability of the site for the heavy operations for which it was acquired. Due to the National shortage of structural steels, it is not anticipated that a commencement of the building work can take place until 1958.

THE PATENT SHAFT & AXLETREE CO. LTD.

As mentioned earlier a 75 per cent shareholding was acquired in The Patent Shaft & Axletree Co. Ltd. of Wednesbury, Staffordshire, on February 21, 1956, from the Iron and Steel Holding and Realisation Agency. For many years before the nationalisation of the Steel Industry, The Patent Shaft & Axletree Co. Ltd. had been a wholly owned Subsidiary of our Associated Company—Metropolitan-Cammell Carriage & Wagon Co. Ltd.

As I explained in my Report last year, this Company has embarked upon a very substantial reconstruction and modernisation scheme, the total cost of which will be in the neighbourhood of £8 million. Towards this sum Cammell Laird & Co. Ltd. has undertaken to provide finance of £1,200,000 (of which £217,500 had been advanced up to December 31, 1956) and arrangements have been made to enable The Patent Shaft Co. to borrow the remainder from the FCI and other sources.

The Company has been busy throughout the year and has worked to full capacity except in some of the smaller mills where output has been curtailed by shortage of labour.

The Profits of the Company for the twelve months to December 31, 1956, show a slight reduction on the previous year. This is due to the fact that the increase in steel prices authorised by the Iron and Steel Board on May 7, 1956, was an interim measure and did not cover the full increase in the cost of raw materials and transport.

Operations commenced during the year on the Development Scheme to which I have already referred and considerable progress has been made in the preliminary work of clearing the site, laying and extending railway lines and the laying of the foundations for the buildings. Construction work is proceeding according to schedule and it is expected that the new plant will be in production in 1959.

The report and accounts were adopted and the dividends, as recommended, were approved.

The retiring director, Mr E. Bernard Jones, OBE, was re-elected; the remuneration of the Auditors, Messrs Cooper Brothers & Co., was fixed, and special resolutions amending the Articles of Association having been duly sanctioned, the proceedings terminated.

TAYLOR WOODROW LIMITED

ANOTHER YEAR OF PROGRESS AND EXPANSION

The annual general meeting of Taylor Woodrow Limited was held on May 31st in London, Mr Francis Taylor (Chairman and Managing Director) presiding.

The following is an extract from his circulated review:

Profit and Loss Account: The balance of profit after providing for all Taxation and the interest of outside shareholders amounts to £335,379 compared with £228,794. In a business such as ours where contracts take several years to complete the results should be judged over a number of years rather than one year.

AT HOME

Building and Civil Engineering: Our Construction Company has enjoyed another active year. Priority of reference must be given to Britain's great achievement as the first country to complete a nuclear power station. This project for the use of the atom for peaceful purposes aroused world-wide interest. We take pride in the fact that our company built the structure at Calder Hall, which was opened by Her Majesty the Queen in October last. Our progress on the second station at Calder Hall is well ahead of schedule.

While on the subject of the development of national sources of power, I should mention that the two major contracts awarded to the Company in respect of the High Marnham and Northfleet Power Stations bring to a total of fourteen the number of power stations upon which the Company has been engaged in recent years.

I referred last year to the supply of complete atomic power stations and you may have seen press references to the fact that we are still active in this field with The English Electric Company and Babcock and Wilcox.

RESEARCH AND DEVELOPMENT

We have built and equipped new laboratories at Southall to enable the company to improve and expand in concrete and cement technology, ground exploration and soil mechanics, chemistry and metallurgy, and the facilities for general testing of materials. We now have all the essential facilities, and a full service including complete design is open to our clients.

BUILDING EXPORTS

The turnover in Arcon Structures during 1956 again showed an increase and was the highest so far achieved. Prospects for further expansion are excellent.

After reviewing the overseas activities, the statement continued:

I wish to express my thanks to the men and women of our organisation who has contributed so much to the success of the Taylor Woodrow Group. Into our staff training schemes come young people with initiative and the capacity to work hard and equip themselves for careers with the Company. Our executive and technical staff are the backbone of the organisation. Their hard work and effort is reflected in the Report and Accounts you have before you.

The report and accounts were adopted.

GALLAHER LIMITED

(Incorporated in Northern Ireland)

SUBSTANTIALLY INCREASED TURNOVER

POPULARITY OF BRANDED PRODUCTS

SIR EDWARD DE STEIN'S STATEMENT

The sixty-first Annual Ordinary General Meeting of Gallaher Limited was held on June 3rd at Winchester House, Old Broad Street, London, E.C., Sir Edward de Stein (Chairman of the Company) presiding.

The Secretary, Mr George Iliff, ACA, read the notice convening the meeting and the report of the auditors.

The following is the Statement by the Chairman, which had been circulated with the report and accounts for the year ended December 31, 1956:

You will have read in the Report of the Directors that Mr A. V. Maunder, who has been a Director of the Company since 1939 and who retires by rotation this year, has decided not to seek re-election. Mr Maunder joined the Company in 1931, and his wide knowledge of Leaf Tobacco has been invaluable to the Company in the expansion of its brands. He is at present paying a farewell visit to the Company's staff and to his many friends in Rhodesia and Nyasaland. We shall all miss him and wish him many happy years of retirement.

Since the last Annual General Meeting we have appointed two new Directors of the Company—Mr R. G. Knight, who has 31 years' service and has been Chief Accountant for the past 11 years, and Mr J. Young, who has been with us for 15 years and is our General Manager in Northern Ireland.

CURRENT ASSETS

During the year 1956 the Group's trade again expanded, with the result that the Current Assets (before deducting Current Liabilities) in the Consolidated Balance Sheet have increased during the year by £7,500,000 from £44,000,000 to £51,500,000. Of this increase the major part, namely, £6,250,000, arises in Stock in Trade. The principal item within this figure is Leaf Tobacco stock, where the increase is more or less proportionate to the expansion of the Group's business, excluding Dollar Leaf, with which I deal later. At December 31, 1956, our stocks of Leaf Tobacco cost us slightly more per lb on average than in 1955. So far as stocks of manufactured goods are concerned the increase in value, despite the advance in Duty rate of 3s. per lb, which took place in April, 1956, is not proportionate to our increased trade. This is partly accounted for by the abnormal depletion of our stocks in supplying the Christmas demand for the Group's products in December, 1956.

Debtors do not show an increase proportionate to the growth of the Group's business mainly because in December, 1956, sales requirements outstripped production and for a short time we had to cut some orders for our main brands owing to shortage of stock, but since January, 1957, all orders have been met in full.

FINANCE

You will recall that last year we issued to Ordinary Stockholders one new Ordinary Share of £1 at par for each £1 of Ordinary Stock held. At the same time we issued £8 million 6 per cent Unsecured Loan Stock 1976/81 also at par. Finally, 125,000 Ordinary Shares were issued at par to employees of the Group subject to certain restrictions. These issues provided a net sum of £13,381,881 after allowing for the expenses of the issues, amounting to £180,619, which latter sum has been charged to Share Premium Account. This additional finance, together with retained profits (including the exceptional profit arising from the Budget) and the increase in the provision for future taxation, enabled us to carry the additional assets we were employing and, in addition, to reduce our borrowings by way of Bank Overdrafts and Bills Negotiated by £8,500,000.

TRADING RESULTS

As a result of our substantially increased turnover the Consolidated Trading Profit for the year amounted to £5,061,000, compared with £4,033,000 in respect of 1955, excluding in 1956 the exceptional profit of £397,000 before tax arising from the increase in tobacco duty imposed in the 1956 Budget. Income Tax and the higher rates of Profits Tax on both distributed and undistributed profits (also imposed in the 1956 Budget) absorb a materially higher proportion of our Trading Profit in 1956 than they did in 1955. Consequently out of an increase in Trading Profit of £1,028,000 all except £195,500 is taken away in taxes. The heavy burden of taxation, of which the above is a good illustration, is making expansion in industry increasingly difficult.

We are recommending the payment of a final Ordinary Dividend of 12½ per cent—making with the interim distribution already made a total of 17½ per cent for the year, which is in line with the forecast we made in February last year when we announced that the Issued Ordinary Capital would be increased on a 1 for 1 basis at par.

RESERVES AND CARRY FORWARD

After providing for the proposed dividend allocation and transferring to Contingencies Reserve the exceptional profit above referred to, which, after tax, amounts to £216,000, the balance of profit for the year will be used to increase the Carry Forward by £850,006, from £1,963,206 to £2,813,212.

SUBSIDIARY COMPANIES

I am pleased to be able to report to you that all of the Company's subsidiaries have contributed to the successful year the Group has enjoyed.

In the last quarter of the year our Engineering subsidiary acquired all of the Issued Capital of Larmuth & Bulmer Limited, a company engaged in the manufacture of machinery for the cable-manufacturing industry. This part of the Group has also had another good year and we are satisfied with its progress.

GENERAL MATTERS

Last year I informed you that a factory we had purchased in the Manchester area in 1955 was being adapted for cigarette manufacture. This factory has now commenced production, but it will be some time yet before all of the machinery ordered for installation is delivered. It is anticipated that the factory will be in full production by the end of 1957. I also told you that site preparations were proceeding for the erection of a further Cigarette Factory in Northern Ireland under facilities provided by the Government of Northern Ireland. This project is proceeding according to plan and the first stage of the development should be ready to commence production in the early months of 1958 and the final stage towards the end of 1958. Overall our manufacturing capacity will be substantially increased. Nevertheless, the new factories will not provide an increase in manufacturing capacity proportionate to the investment in new buildings and machinery because the new facilities are required partly to replace a factory which has now become uneconomic to maintain for manufacturing purposes and partly to enable us to take some pressure off our existing factories in which considerable extra time is being worked. Consequently we must expect our manufacturing costs to rise in spite of the benefits to be derived from the use of new buildings and equipment.

Because of the increased Stocks of Leaf Tobacco which we now need to carry, an additional bond store with a capacity of 13 million lb is at present being erected adjacent to our existing bonds at Connswater, Belfast. We have also had to make arrangements for the storage of part of our Leaf Stocks in the Manchester area.

The expansion of our brands—notably "Senior Service" and "Park Drive" cigarettes and "Old Holborn" tobacco—has set us many manufacturing problems and despite all our efforts we were unable during two periods of 1956 fully to meet the demand for "Senior Service" cigarettes—during the summer holidays and in the month of December.

During 1956 we strengthened our position in the cigarette market by introducing a new Benson & Hedges brand—"Olivier"—to meet the growing demand for a tipped cigarette retailing at 3s. 3d. for 20. This brand has made a successful start.

We have also found it necessary to enlarge some of our Branch Distribution Depots to handle the greater volume of goods now being sold compared with previous years, and this process is still continuing.

LEAF SUPPLIES

In all markets we made a satisfactory purchase of Leaf Tobacco from the 1956 crops. Since the close of the financial year we have been able to purchase an additional quantity of American tobacco for sterling as a result of negotiations recently concluded between the Treasury and the United States Government. This purchase improves our stock position, but because of our increased usage we have a lower duration of Dollar tobacco than we consider desirable. We will, therefore, require to purchase not only a full twelve months' usage

in the American Auction Markets which will open at the end of July, but, if possible, additional leaf to improve our stock duration. Our other tobacco stocks are in a reasonably good position.

The Auction Markets in Southern Rhodesia opened about the middle of March: there the crop is estimated to be less than in 1956, but we expect to be able to secure the quantities we require of the particular types of Rhodesian tobacco which we use in our blends. Prices so far for tobacco sold in Southern Rhodesia are higher than a year ago.

The steady increase over the years in the cost of our raw material is a matter which causes us a good deal of concern.

COMPETITION

The past year has been one in which competition between manufacturers has grown keener. It is a matter of gratification to your Board that they have been able to report improved sales and profits in these circumstances. I attribute this to the great care which is taken by all employees in the business to ensure that the quality of our products is as high as possible and to a vigorous sales and advertising policy. We are also constantly striving to improve our service to the distributive trades whose goodwill and co-operation we greatly value.

In the current year we are facing even keener competition than at any time since 1939, but we shall watch closely the development of any new sales promotion methods used by our competitors and you may rest assured that we shall follow whatever policy we consider to be best in the long-term interests of our Stockholders and the public.

OUTLOOK

From what I have already said you will realise that we must expect to face higher costs from a number of different causes—higher prices for some Leaf Tobacco, the recent wage increase, the opening of additional factories to reduce overtime working and new forms of competition.

On the other hand I am pleased to be able to report that sales to April 30th this year show a steady improvement over the corresponding period of 1956, and, therefore, I feel we can view the prospects for the current year with reasonable confidence notwithstanding the adverse factors referred to above which will affect our profit margins. It would not, however, be reasonable to expect anything like the same rate of increase in profits as we have shown in recent years.

EMPLOYEES

I cannot finish without paying a special tribute to all our employees who have put in a great deal of hard work to enable us to cope with the increasing demand for our products. We were very glad to be able to recognise their loyalty and devotion to the Company's interests by distributing to all of them a bonus equal to six weeks' salary or wages—the same rate as we paid in 1955. To mark the Company's centenary year we also distributed in 1956 a special bonus equal to two weeks' pay.

The report and accounts were unanimously adopted and the dividend as recommended was approved.

The retiring directors, The Right Honourable Lord Ampthill, CBE, Mr R. G. Knight, ACA, and Mr John Young, were re-elected and the auditors, Messrs Hill, Vellacott & Bailey, having been reappointed, the proceedings terminated.

NATIONAL BANK OF NEW ZEALAND

CONTINUED EXTENSION OF FACILITIES

MR ARTHUR H. ENSOR'S REVIEW OF ECONOMIC AND INDUSTRIAL CONDITIONS

The eighty-fifth annual general meeting of The National Bank of New Zealand Limited will be held on June 27th in London.

The following are extracts from the circulated statement of the Chairman, Mr Arthur H. Ensor:

A scheme for reorganising the capital of the Bank was submitted to the shareholders, by whom it was approved in January last, and subsequently it was confirmed by the High Court. The Balance Sheet shows the capital in its new form:

Capital—*Authorised* 6 million shares of £1 each—£6 million.
Issued—3 million shares of £1 each fully paid—*£3 million.*

This reorganisation of the capital, embodying the cancellation of the uncalled liability on the shares, has been received with general approval and is undoubtedly advantageous both to the Bank and to the shareholders, by making the shares more readily marketable.

BALANCE SHEET AND PROFIT AND LOSS ACCOUNT

The Reserve Fund now stands at £2,500,000, having been increased to that figure by the transfer of £500,000 from Contingency Account.

Our Advances, as a result of the continued policy of credit restriction, have declined by £3,100,000 to £34,900,000. Since the peak of our lending in 1952, when our Advances were over £43 million, the reduction effected has been approximately 20 per cent, and this clearly indicates that we have striven to implement the Government's financial policy, however unpleasant for a banker it may be to restrict the use of funds in the Bank's principal earning asset.

Profits at £269,000 show a fall of £8,000 compared with last year, but a decline was inevitable with rising costs, a reduced volume of lending, and increased statutory balances with the Reserve Bank, earning nothing.

The total amount of the dividend for the year represents a rate of 10¼ per cent on the old capital, or 8 1-5 per cent on the capital at its present figure of £3 million.

The past year has once again shown a steady increase in the number of our customers and we have continued to extend our banking facilities.

GENERAL TRADING AND INDUSTRIAL CONDITIONS

Developments in the past year have drawn attention both to the fundamental strength of New Zealand's economy and to some of the difficulties which must be overcome to ensure the full and steady development of the country's resources.

The strength of the economy is reflected in the highly productive, well organised primary industries which, by utilising new techniques, such as aerial top-dressing, continue to expand their high output and earn over 95 per cent of the country's export income. The growth of new markets in Asia and the Far East for the products of New Zealand farming shows prospects of an expansion of trade in that region, which would help to relieve possible strains in New Zealand's traditional markets.

In recent months, Japan has begun to import modest shipments of New Zealand meat, in addition to worthwhile quantities of wool, and there are encouraging signs that Malaya, Singapore and the Philippines are also becoming interested in New Zealand meat. With Australia, too, trade has increased over the past year and the export of quantities of frozen vegetables and other frozen foods from New Zealand gives promise of further favourable development.

It is pleasing to see the growing volume of exports of paper and pulp from New Zealand's forest industry. This industry seems destined to play an increasingly important part in the economy of the country, and will provide a welcome addition to the rather limited range of New Zealand's export commodities.

BALANCE OF PAYMENTS

The potential weakness of New Zealand's present trade pattern lies in the fact that over 60 per cent of her total export earnings are derived from the single market of the United Kingdom. Indeed, something like 90 per cent of her total dairy produce and meat are sold here. The growth of the production of meat and dairy produce in the United Kingdom and the diversion to this country of dairy produce which in recent years has been sold in Europe, where there is at present no market, have caused wide fluctuations in the prices of these commodities and underline the difficulties which confront New Zealand in relying to such an extent upon the British market.

Nevertheless, despite these difficult marketing problems, the overall balance of payments position has shown a very substantial improvement in the past year. In the twelve months to the end of March there was a surplus of £800,000, compared with a deficit of £16,400,000 for the previous year.

However, as export receipts were up by only £2 million, this achievement must be attributed largely to the efficacy of the credit restriction policy in effecting a reduction in private imports of £7,800,000.

FINANCE

In the year to March, 1957, the net overseas assets of New Zealand's banking system increased by £4,500,000. While this is an encouraging improvement on the previous two years, in which there were falls of £35 million and £9 million, it does not give room for complacency. There is need for continued monetary restraint and, while sympathy can be felt with the Government in its problem of having to curtail urgent development projects in a young and vigorously growing country, everything points to the need for further restraint in Government spending.

UNION CORPORATION LIMITED

(Incorporated in the Union of South Africa)

RECORD OUTPUT

GREATLY INCREASED CONTRIBUTION FROM NEW MINES

Extract from the Speech by Viscount Bracken at the Annual General Meeting held in Johannesburg on 28th May, 1957

Before proceeding with the formal business of the meeting, I wish to refer to the sharp loss we sustained by the death during 1956 of two members of the Corporation's Management. Colonel C. E. Temperley, OBE, MC, joined the Corporation as a Sub-Manager in London in 1926 and, at the time of his death in June last, was an Executive Director. Mr J. S. Walker, who joined the Corporation in 1918, and was appointed a Manager in Johannesburg in January, 1945, died in September. Wise in counsel, in action enterprising and resourceful, they will not lightly be forgotten.

The Accounts of the Corporation for the year 1956, together with the Directors' Report, are submitted for your approval.

The gross profit for the year was £2,744,000 and the net profit, after providing £486,000 for taxation, was £1,973,000 compared with £1,120,000 in 1955.

As I have reminded you previously, the development of the Kinross area will require substantial expenditure by the Corporation over a period of years. Your Directors have therefore, appropriated £1 million to the General Reserve Account, which now stands at £2,300,000. £175,000 has been appropriated to Exploration Reserve Account, which, after deducting expenditure during the year, amounts to £1,069,000.

Dividends of 3s. gross per share were declared for the year (compared with 2s. 9d. for the previous year) and absorbed £802,000, leaving the Carry Forward virtually unchanged at £388,000.

UNITED KINGDOM TAXATION

The recent Budget Speech in the United Kingdom contained proposals to relieve the tax burden on certain United Kingdom controlled companies operating abroad. The Finance Bill as originally tabled gives no material benefit to the Corporation since, though it is resident in the United Kingdom and very largely operating abroad, the Corporation does not come within the framework of an Overseas Trading Corporation as therein defined. However, amendments to the Bill are now being debated; it remains to be seen whether this legislation in its final form will make possible some relief to the Corporation from the present burden of United Kingdom taxation.

Meantime, we are glad to note that the United Kingdom Government is attempting to give some assistance to Overseas Trading Corporations which are subject to United Kingdom tax.

Before turning to the affairs of the Gold Mining and other Companies under our administration and to our various other interests, I should like, as in the past, briefly to review the position of the South African Gold Mining Industry as a whole.

GOLD MINING INDUSTRY

The tonnage milled in 1956 was 67,524,700 tons, representing an increase of about 2½ per cent, over the tonnage for the previous year, and constituting a record. The average yield improved by 0.279 dwt. to 4.553 dwt. per ton so that the gold output increased by a little over 9 per cent, to 15,373,680 ounces fine, which is also the largest output achieved by the Gold Mining Industry of the Union in any year.

Although the average price received for gold declined by 7d. per ounce fine the greater output led to an increase of £15,800,000 in working revenue, which amounted to £193,214,000. Average working costs increased by 2s. 6d. per ton milled to 42s. 11d. per ton and amounted to £144,764,000 so that the working profit was £48,450,000. This is just over £4 million more than in the previous year. To this must be added the estimated profit from the production of Uranium which amounted to £24,662,000, or 40 per cent more than in 1955, giving a total working profit for the Industry of £73,112,000 or £11,300,000 more than in 1955.

Provision for capital expenditure, loan redemption including loans made available for Uranium production, and for other items amounted to just over £28,500,000. Due to the reduction in the Formula tax to which I referred last year it is estimated that taxation and the Government's share of profits will be reduced slightly and will absorb £16,371,000. Net dividends declared by the Industry increased by £5,815,000 to £28,177,000.

The total development footage driven was 2,716,000 feet, which is slightly less than in 1955.

An outstanding feature of these results is the greatly increased contribution of the new mines both in the Orange Free State and the Transvaal, that is to say, mines which have come into production since 1951. Thus the increases in the total tonnage milled, in the yield, gold output and working revenue from gold to which I have referred, are attributable entirely to the new producers, while for the first time these mines earned more than half of the working profits from gold of the whole industry.

On the other hand, many of the older producers are in a less happy position. In most cases the ore milled and working profits from gold decreased during the year. Since the average grade of the ore remaining in many of the older mines is much lower than that of the new producers their profit margins are smaller, and consequently it is these mines which are most sensitive to the effects of continued inflation. In spite of all efforts to restrain the rise in working costs these continue to increase as the value of money declines. This process, coupled with the fixed price of gold, led to the position during last year where no less than 17 mines, which produced over 21 per cent of the total gold output of the Industry, were operating on profits so precarious that they could be eliminated by any further small rise in costs. Three of these mines ceased operations, except for clean up, during the second half of the year. Although some of the remainder still have substantial ore reserves, amounting in aggregate at the end of last year to over 20 per cent of the total reserves of the Industry, it is apparent that many of these mines will be forced to close within a comparatively short period if the price of gold remains fixed at its present level and the upward trend of working costs continues.

Last year, in connection with the Pneumoconiosis Compensation Bill then before Parliament, I indicated that existing and future mines would have to bear the additional cost in respect of all future cases of pneumoconiosis and that this might be substantial. The Pneumoconiosis Act of 1956 came into force on August 1st of that year and the annual levy payable by the Gold Mining Industry for the twelve months ending March 31, 1957, in respect of pneumoconiosis compensation, including increased benefits under the new Act, amounted to £3,700,000 as compared with £2,400,000 for the previous twelve month period. It is estimated that the annual levy payable in respect of the current twelve month period will be of the order of £4 million.

Having reviewed the progress of the companies under the Corporation's administration, the Chairman continued:

Shareholders may have seen from a recent announcement in the Press that the Corporation is proposing to participate with Mr C. W. Engelhard and Mr G. V. R. Richdale of New York, the Anglo American Corporation of South Africa, Limited, and certain London Bankers in the formation of a large new South African finance company which, *inter alia*, will acquire a substantial block of shares in The Central Mining & Investment Corporation, Limited. The details connected with the flotation, management and programme of this company are at present under discussion and there is nothing that I can add in the meantime to the official announcement I have just mentioned.

EXPLORATION

As members were advised in the Directors' Report, exploration has continued in the Kinross area during the past twelve months and it is now possible to delineate fairly closely the area of mineral rights which it is desirable to hold. Excluding the ground already incorporated in the Winkelhaak Mine, this area amounts to some 26,000 morgen, over most of which mineral rights have already been purchased, the balance being still held under option. Some of this area is deep or appears to be of marginal value under present conditions but within it there is a smaller core of approximately 10,000 morgen, equivalent to 14,000 mining claims, forming a compact block which is of more immediate economic interest. Drilling results in much of this latter area have been satisfactory and indeed in some places most encouraging. Work is still proceeding.

Other exploration work continues to be carried out in the Union and elsewhere.

I know you would wish me on your behalf to thank the Staff of the Corporation in South Africa and in London and the Managers, Staff and employees of our affiliated Companies, for work well done in the past year.

VICKERS LIMITED

GROUP SALES IN 1956—£163 MILLION

A YEAR OF EXPANSION

LINKS WITH THE COMMONWEALTH

VISCOUNT KNOLLYS ON FORWARD POLICY

The ninetieth annual general meeting of Vickers Limited was held on June 3rd at 21 Tothill Street, Westminster, S.W.1.

The Viscount Knollys, GCMG, MBE, DFC (the Chairman), presided, and, in the course of his speech, said :

The sales of the Group in 1956 amounted to £163 million, an increase of £31 million over 1955. These were divided roughly as follows :

	£m	%
General Engineering (including Accounting Machines £7m.—4%)	42	25 (1955 32%)
Shipbuilding and Shiprepairing ...	24	15 (1955 14%)
Aircraft	64	40 (1955 32%)
Steel	33	20 (1955 22%)

Trading profits were higher than in 1955, even after heavier charges for depreciation and for development. Net profit, after taxation, which is what we have finally at our disposal, was very slightly lower. We have continued this year our policy of appropriating a considerable sum (£1,638,000 in 1956) to our reserves for the replacement of fixed assets, to take account of current costs. We have paid to our own stockholders the same dividends, costing £2 million, and have added to our carry forward, that most flexible of reserves, £1.1 million for the Group, including £383,000 in the balance sheet of Vickers Limited.

It might appear that our effective ratio of trading profit on the increased sales (7.8 per cent before tax, and 3.8 per cent after tax)—and to capital (13.5 per cent)—was unexpectedly lower in spite of the profits on Viscounts coming increasingly into the account. This is due to our efforts to diversify and develop for the future. £2.1 million was charged against profits on account of work done on future projects, very largely for the Vanguard and partly for new types of accounting machinery.

A YEAR OF EXPANSION

1956 was for the Vickers Group a Year of Expansion, realised and projected. Your board has had two objectives in view ; to diversify the Group's activities both in type of product and geographically, while at the same time developing and improving our existing well-established production. We must at all times be prepared to be in the forefront of the newest developments.

A recent venture in an important field—still virtually an American monopoly—our Industrial Tractor, of which we have now two models in production, has made good progress, both technically and in establishing a world market. We have been encouraged by the recent order awarded us by the Government of Pakistan in the face of much competition for 49 of our Vigor Tractors and 92 Scrapers.

OVERSEAS DEVELOPMENTS

The most important event of 1956 in our overseas development was our re-establishment in Canada through our purchase of a controlling interest in Canadian Vickers. I am sure that you will agree that Vickers should be in a position to take advantage over the years of such an attractive market as Canada must increasingly become.

In Australia also we acquired control of a well-known, well-established engineering Works in Perth, Western Australia—Hoskins Engineering & Foundry, now Vickers Hoskins.

India has obvious potentialities as a growing market for certain of our engineering products, immediately and in the future. In keeping, therefore, with our policy of spreading our interests we have recently completed negotiations for setting up a works, in West Bengal, with Associated Cement Companies, the leading company of its kind in India, and Babcock & Wilcox.

AIRCRAFT

On the Air side, we have also developed. While we have continued to produce and sell Viscounts and are in the course of producing the Navy's new carrier-borne fighter, the N.113, now christened the Scimitar, we have also been developing the Vanguard, our new and much larger turbo-prop airliner.

Ten days ago we received one of the most outstanding civil aircraft orders ever placed in this country. BOAC have placed an order for 35 of our new VC10s—a straight jet aircraft designed to carry 120 people. It will be for delivery from 1963. We are now, therefore, in a position to offer in the early 1960's two alternative types of airliners to suit the various needs of our customers throughout the world—the Vanguard beginning to be delivered in 1960 as a propeller turbine, and the VC10 as a pure jet, each with its special economic and passenger attractions.

In Vickers-Armstrongs (Aircraft) the return on the funds we employed in developing and building the Viscounts only began to be fully effective last year. Profits from this source should continue in 1957 and 1958 on our present order book. We shall continue to spend money on the development of the Vanguard. The costs of developing the VC10, due for delivery from 1963, will also be a significant factor during the next few years.

PRIVATE VENTURES

These are both wholly private ventures. We have felt justified in assuming the financial risks of development and are confident of our ability to sell sufficient aircraft to recoup our expenditure, and to make a fair profit in due course. This is truly "risk capital" which demands and is entitled to a reasonable return.

Powers-Samas is another member of the Group which needs finance for research and to develop its exciting new equipment. A special feature of its operations is that the more successful it is the more capital it needs, because a large proportion of the business of accounting machine companies is done on a rental basis. We have therefore for the time being allowed its profit to remain in the business.

SHIPBUILDING

In shipbuilding, the year has been one of demand for still larger tankers and of increasing interest in nuclear propulsion for ships.

We have recently delivered into service the passenger liner *Empress of England* for Canadian Pacific Steamships, and have received an order from the Orient Line for their new liner *Oriana*.

Building has continued throughout the year of cargo liners and cargo ships, also of tankers, at both our building yards.

Orders on the shipbuilding company remain high and include amongst tanker tonnage an order for a ship of 65,000 deadweight tons.

During the year we have continued to build frigates for the Royal Navy and the Indian Navy and the first of two destroyers on order for the Chilean Navy. At Barrow, the building of submarines continues and H.M. Submarine *Explorer*, which we have handed over may well hold the record for the fastest submerged speed of any submarine in the world.

FORWARD POLICY

I hope you will agree that the forward policy I have described is the right one for a Group such as ours to pursue. It keeps our eyes on the trends, the needs, the gaps of the future. It covers many fields where we can see new, greater or different demands. It covers developing bases of production.

This policy, despite its obvious benefits, naturally has its problems, particularly on the financial side. It costs money, it absorbs cash and its benefits are sometimes delayed.

A diversified group such as ours, however, has the advantage of being able to await these deferred profits while producing reasonable return from its well established products.

NUCLEAR PROPULSION

We have, as you know, now received the order for the hull and machinery of the first British nuclear-propelled Submarine *Dreadnought*, and with our partners are making progress in developing it. In view of our long and close connection with the Royal Navy, we are particularly proud to be building the vessel which will mark the beginning of a new era.

We are studying the development of this type of propulsion for merchant ships, a field in which we intend to maintain and develop our position.

Although, in common with other shipbuilding firms, we have an order book well filled for several years ahead, we are fully conscious of the need to improve our ability not only to build good ships, but also to complete them in shorter time and at competitive prices.

THE CALL TO BRITISH YOUTH

Earlier in my speech I told you what we were planning to make in the future. But the supply of competent people to make them is equally important.

We are trying to make every young man who wants to come to us feel that he has every chance to equip himself, at our expense, for a successful career, for his own benefit and for ours, that he will be well looked after and encouraged, and that he is working for a Company which will give him the opportunity of going ahead with it in helping to develop imaginative work fit for the future.

We believe that British youth will respond to this call. We rely on them—and I am sure we can—to take full advantage of the schemes provided to help them, and in so doing to feel that they are going to share in the exciting adventure of ensuring this country's future by keeping British industry where it has been and must be in the forefront of the technical and engineering development of the world.

You will wish me to refer to the position and prospects of the Vickers Group.

So far 1957 looks just about as good as its predecessor, and I think I had better leave it at that.

The report and accounts were adopted.

BANQUE DE PARIS ET DES PAYS-BAS

Paris

The Annual General Meeting of the Banque de Paris et des Pays-Bas was held in Paris on May 9th with Monsieur Emmanuel Monick in the Chair. The following is a summary of the Report presented by the Board of Directors.

REVIEW

The world economy, which had been expanding normally during the first part of 1956, was greatly affected by the consequences of the Suez crisis. Inflationary tendencies were felt in every sector of the economy: private consumption, industrial costs and Government expenditure. Prices of raw materials in world markets, however, remained steady, only crude oil prices and shipping charges being affected.

Economic expansion in the United States accelerated whilst Western European countries, especially France and Britain, bore the brunt of the crisis.

The Bank participated to a large extent in the development of industrial and natural resources by taking an active part in a variety of financial operations. Its activities in this field were not confined to Europe, but extended to Africa, North and South America.

Negotiations on the merger with the Banque des Pays de l'Europe Centrale were successfully concluded, and the proposals were adopted at an Extraordinary General Meeting which followed the Annual General Meeting.

PROFITS AND DIVIDENDS

The Balance Sheet at December 31, 1956, totalled Frs.138,959,905,276, as against Frs. 124,428,123,106 in the preceding year.

Net profits available for distribution amounted to Frs.971,986,976 as against Frs.785,529,400 for the previous year. It was proposed to distribute a dividend of Frs.600 net per share of Frs.5,000 nominal, equivalent to Frs.899,943,087.

The report and the proposals put forward by the Board were adopted.

HATTERSLEY (ORMSKIRK) LIMITED

(Specialists in the manufacture of Engineering Fittings for Locomotive, Steam, Heating, Petrol, Oil, Fire, Water and Air Services)

HIGHER TOTAL PRODUCTION AND SALES

PROGRESS OF MODERNISATION AND EXPANSION SCHEME

MR T. HEAP ON EFFECTS OF COPPER PRICE FLUCTUATIONS

The Thirty-fourth Annual General Meeting of Hattersley (Ormskirk) Limited will be held on June 28th at the Company's Registered Office, Ormskirk.

The following Review, by the Chairman and Managing Director, Mr T. Heap, has been circulated with the Report and Accounts for the year ended March 31, 1957:

The Consolidated Profit and Loss Account shows a total Profit before Taxation of £676,293, last year the comparable total was £758,526, and the Profit of Hattersley (Ormskirk) Limited after tax for the year ended March 31, 1957, is £240,728, compared with £284,847 last year.

Your Directors recommend the payment of a Final Dividend on the Ordinary Shares of 15 per cent, less tax, together with a Cash Bonus of 10 per cent, less tax, which, with the Interim Dividend of 7½ per cent, less tax, paid in December last, makes a total for the year of 32½ per cent (as last year).

After the allocations to which I refer in detail below, and the transfer of £100,000 to General Reserve, the balance remaining on Profit and Loss Account amounts to £186,775.

VALUATION OF FIXED ASSETS

The valuation of Fixed Assets in company accounts has been a vexed question for many years, and in view of the continued increase in costs of buildings and plant your Directors decided that an up-to-date professional valuation of the Company's Fixed Assets was necessary. As you will have seen from the Report and Accounts, a valuation on the basis of a fair going concern has been obtained and adopted, thus ensuring that Members have knowledge of the present-day value of their assets on this basis and that the Profit and Loss Account bears a charge for depreciation based upon such values. In addition, the Valuers prepared a valuation on the basis of current replacement costs, which proved to be substantially in excess of the going concern valuation and which has served a twofold purpose. In the first place the Company's fire insurances have been revised on the basis of this valuation, and secondly it has shown that the depreciation, calculated on conventional lines upon the fair going concern values, will not provide the funds required to replace the Assets at current costs. The deficiency to the date of valuation has been estimated at £100,000 and the annual deficiency at approximately £25,000. Your Directors have accordingly transferred the sum of £125,000 to a Reserve for Replacement of Fixed Assets, utilising the £100,000 previously standing to Obsolescence and Replacement Reserve and adding £25,000 from Profit and Loss Account this year.

I have pointed out on former occasions the effect of the copper market prices upon our Trading Profits and Stock valuations. Whereas in the years immediately preceding we benefited from the results of forward buying on a rising market and sales from accumulated stocks, this year the position has been reversed. The market has fluctuated considerably between £400 per ton at April 1, 1956, and £240 per ton at March 31, 1957. In these conditions your Directors have released £50,000 from the Stock Contingencies Reserve, leaving an amount of £150,000 to the credit of this Account, which sum is considered adequate to meet any contingency.

During the year the Non-Contributory Pension and Life Assurance Schemes for Works Employees have been established and expressions of appreciation have been recorded. The periodical review of the Staff Pension Scheme has shown that, due to the inflation of recent years, the pensions accruing to the older members who are approaching retirement age are now inadequate. To rectify this position, your Directors have decided to set aside the sum of £50,000 from the Profits of the year to supplement these pensions.

CAPITAL EXPENDITURE

Last year I mentioned that your Directors had under consideration a scheme for further modernisation and expansion which would involve a capital outlay, according to estimates, of not less than £250,000. Existing facilities at Halifax were inadequate to accommodate the major part of the scheme, which is to erect a fully mechanised non-ferrous foundry, and we have been fortunate in securing a suitable freehold site in close proximity to our existing Machine Shops. We have, for some considerable time, been renting outside storage accommodation which will no longer be necessary when the whole scheme of reorganisation is completed. During the year members of our executive have visited both the Continent of Europe and the United States of America to study modern production methods and equipment ; the layout of the buildings and plant is now being prepared, and we anticipate that we shall shortly be in a position to place contracts. In pursuance of the policy outlined in last year's Review, it was arranged that the executives should continue their journey to include a visit to our Associates, M. B. John & Hattersley Limited, at Ballarat, Australia. The interchange of opinions and the useful information supplied by the Australian executive is genuinely appreciated and will be put to service in our further developments.

WORKS FULLY OCCUPIED

I am pleased to report that the total production and sales figures are slightly in excess of the preceding year. In so far as the order book

position is concerned, we have been able to reduce the outstandings in some sections and improve our stock position, enabling us to give prompt delivery, which has always been the basic policy of the Company and has contributed largely to its success, in others the incoming orders have outstripped the rate of production. Both Works are kept fully occupied.

The latest published Accounts of M. B. John & Hattersley Limited, dated June 30, 1956, recorded a year of increased sales. The profits and dividend were maintained, and the Chairman stated the demand for valves of all types continued to be healthy and that orders on hand would enable a high tempo of production to be maintained. The Interim Dividend for the year ending June 30, 1957, has been paid at the same rate as the preceding year.

With regard to our Subsidiary Company, Beck & Company (Meters) Limited, although sales and production for the first eight months of the Company's financial year reached record figures, the combination of the international crisis, petrol rationing and credit restrictions has caused a serious setback in their activities. Prospects depend entirely upon an early recovery in the demand for their petrol pumps.

During the year a new design of pump, known as the "Beckmeter" Multi-Mix, has been placed on the market, which is specifically designed to serve two-stroke engines with mixtures of oil and petrol in predetermined proportions.

DIRECTORATE

This is the last occasion on which I shall have the honour of presiding at the Company's Annual General Meeting. As I shall attain the age of 70 in October this year, I propose to relinquish the position as Chairman and Managing Director and to resign from the Board on September 30 next, when I shall have completed 52 years' association with the business.

Continuity of that progressive policy hitherto pursued has been ensured by the appointment, as from October 1, 1957, of Mr Hubert C. Nicholson as Chairman and Mr Wilfred J. Lee as Managing Director. Both gentlemen possess full knowledge of the Company's affairs, gained during more than 20 years' association, and they will be supported by a Board of Directors who, equally, through long years of individual service, have accumulated an intimate and unrivalled knowledge of the business.

I wish to express my sincere thanks to everyone in the Company's service for their loyal support, which has ensured continued expansion and prosperity.

REED & SMITH, LTD

SATISFACTORY YEAR DESPITE DIFFICULTIES

SIR ARTHUR C. REED ON THE OUTLOOK

The forty-fifth annual general meeting of Reed & Smith, Limited, was held on May 31st, at Exeter.

Sir Arthur C. Reed, chairman, in the course of his speech, said:

For the year ended December 31, 1956, the Group's trading has resulted in a smaller profit than last year but your Directors consider the result satisfactory.

In my statement to the Members last year I drew attention to the difficulties which we had to face arising out of the Printing Trade dispute and the general tendency towards increased working costs. Since then as you are aware there have been events which have aggravated this trend, but our difficulties have been met as far as possible by increased efficiency.

Our total production fell not far short of that for 1955—which was a record—and in the case of two of the Mills production exceeded that for 1955.

While the profits are lower this year the reduction in the charge for taxation is not proportionate because of the increases in profits tax rates; altogether taxation absorbs almost 50 per cent—a very substantial burden.

Your Directors have felt it desirable to place a further sum of £150,000 to General Reserve which brings the Reserve up to £200,000 for the Group.

THE DIVIDEND

The interim dividend paid during the year was maintained at 7½ per cent, less tax, and the Directors recommend a final dividend of 12½ per cent, less tax, making a total of 20 per cent for the year. This is the same total payment as last year although then the final dividend was 7½ per cent with a bonus of 5 per cent.

Although over £220,000 has been expended during the year on additions to fixed assets, there has been an improvement in the liquid position, the surplus of current assets over current liabilities having increased by some £30,000 to the present figure of over £1,100,000. The Shareholders' Funds now approach £2 million.

The new machine of Fredk. Tremlett & Company Limited at Stoke Canon has not yet started up but is fully expected to do so this coming month. Satisfactory progress is being made on modernising and enlarging one of the machines of The Wansbrough Paper Company Limited at Watchet.

In view of our increasing production facilities, both present and potential, we have enlarged our Sales Staff and have opened a Sales Office in Manchester.

With regard to the current year our working figures show satisfactory results for the first four months.

EUROPEAN FREE TRADE SCHEME

Looking to the future I must mention the concern which both I and your Board feel regarding the proposed participation of Britain in the European Free Trade Area.

Some of us remember that period in the 1920's when we suffered greatly from dumping of foreign paper at ridiculously low prices. From the date of the introduction of even a limited amount of protection, the history of the paper industry in this Country has been one of steady progress and expansion to our present state of efficiency.

Now I feel that unless our participation in the proposed Free Trade Scheme is accompanied by proper safeguards, the British paper trade may again find itself in a difficult position.

The report and accounts were adopted.

At subsequent extraordinary general meetings the proposed conversion of the "A" Ordinary Shares into Ordinary Shares, the issue by way of capitalisation of reserves and the acquisition of the capital of The New Taplow Paper Mills Limited, were approved.

THE CHLORIDE ELECTRICAL STORAGE COMPANY

TOTAL SALES MATERIALLY INCREASED

The 66th ordinary general meeting of The Chloride Electrical Storage Company Limited was held on June 5th at Exide Works, Clifton Junction, nr. Manchester, Mr A. W. Browne, OBE, MIEE (chairman and managing director) presiding. The following is an extract from his circulated statement: The income from trading is higher than last year at £3,160,396, but after deductions for depreciation, pensions, taxation and minority interest the net income is lower than last year by some £70,000, at £1,032,406.

Under present-day conditions your directors consider it essential to be cautious in matters of finance and have therefore placed further sums to reserve, and continue to exercise moderation in dividend distribution which is the same as last year, viz. 17½ per cent for the year.

Whilst the total sales of the Group showed a material increase on last year, the sales and trading profit of the home companies which manufacture and market lead-acid batteries have been less satisfactory.

The available battery business in the car, bus, commercial vehicle, tractor and motorcycle fields was depressed largely by economic factors. Nevertheless, our principal brands —Silver Exide, Chloride and Dagenite—continued everywhere to enjoy the full confidence of the motoring public, commercial users and the trade.

INDUSTRIAL MARKET

In the Industrial market our sales of batteries continued to expand. Here the principal field is for battery-propelled factory trucks for the mechanical handling of goods. Our Exide-Ironclad, Kathanode and Tudor batteries, each with its own characteristics, are specially designed to meet the often onerous demands made on a battery for propulsion duty.

Our third main market for batteries is what is known in the industry as the "stationary" field. The major requirements are for power stations, telephone exchanges and "Keepalite" emergency lighting. The decision to press on more rapidly with the building of atomic power stations which require batteries will inevitably lead to an increase in available business for us.

The fourth or miscellaneous market covers hundreds of types of batteries for as many different uses, and is a source of considerable business. Some of the more important applications are for submarines, trains and aircraft. Whatever the purpose, we either have or are ready to make a battery to do the job.

A substantial increase in profits this year comes from the overseas battery companies. The policy in postwar years in extending the overseas sources of manufacture has been fully justified in the result.

It has been the policy of your Directors to broaden the base of our activities and to reach out beyond the battery trade. Where this has been done the companies concerned have continued to progress satisfactorily.

I believe that although the immediate future may be difficult, our organisation, which has steadily expanded over nearly 60 years, will continue to meet successfully the challenge of changing conditions.

The report was adopted.

THE BRITISH VACUUM CLEANER AND ENGINEERING COMPANY

EFFECTS OF CREDIT SQUEEZE AND TREASURY POLICY

DEVELOPMENT PROGRAMME TO WIDEN MARKETS

MR J. J. HAMBIDGE ON PROGRESSIVE RECOVERY IN CURRENT YEAR

The fifty-third ordinary general meeting of The British Vacuum Cleaner and Engineering Company, Limited, was held on May 30th at Goblin Works, Leatherhead.

Mr J. J. Hambidge (chairman and joint managing director), who presided, said:

Ladies and Gentlemen, this is the fifty-third Annual General Meeting and my Co-Directors join with me in expressing a welcome to all who are today in attendance.

As the Report and Accounts were circulated to all members more than 21 days ago I will, with your permission, proceed to take them as read.

There is no point in disguising the fact that the results for the year have been disappointing, both to the Directors—the Management—the Staff—and you as Shareholders.

When I addressed you in General Meeting a year ago I referred in some detail to the increasingly difficult conditions attaching to the Company's operations consequent on the uplift of Purchase Tax to a penal figure of 60 per cent and concurrent with heavy restrictions on customers' financial facilities known as Hire Purchase. On top of all were the general effects of the control on all forms of Loans, Bank advances and Capital Issues which were characterised as the Credit Squeeze and which together formed part of the Treasury machinery urgently designed to avert the threatened breakdown of the National Economy.

It is necessary that you should understand the danger that threatened us arising from the rapid change of Treasury policy in 1955 followed through by the stiffening up of all forms of Credit Control in the succeeding months. On these matters I dealt in my speech to you last year and in referring to the outlook made it clear that these and other factors were straining the economy of the Company and would inevitably and adversely find reflection in the year's results, the accounts covering which you now have before you.

I do not think there is more to add. We have had a bad time and a very anxious one—but we have certainly not idled our time or failed appropriately to use our resources.

DEVELOPMENT PROGRAMME

In this respect we struggled with current difficulties and, at the same time, invested in the years ahead. It seems to me, looking back that our policy and programme at the time was sound and sensible—to make the best of today and ensure an improved position tomorrow!

With this in mind, we set out a development programme—both to widen our markets—particularly the intensive opening up of new ones, as, for example, Western Germany, a Country of sound economic structure with a high-level market potential which we set out at heavy cost to explore. We are continuing still to make investment of personal effort and energy as well as funds in order to win a profitable and abiding place in that market.

We also directed and promoted a new and vigorous drive on our Home and other markets, knowing that the seed would not yield the harvest until the seasons had gone round, the processes of germination completed and the growth sustained. We also spent more than usually of our resources in time and money in product development, and both our Technical Staff and our Production Staff have good reason to feel that the year did not go by without an unusually significant contribution to the future. Some of this development of new products and processes whilst complementary and akin to our normal manufacture forms addition thereto.

The Directors regard this cost as only partly apportionable to 1956 and have therefore carried forward a sum of £65,000 as a special item of Development Expenditure. This figure is of small significance in relation to our Annual Turnover or even to our expenses.

There is, I think, little more for me to enlarge upon. The Accounts are in your hands and it will be seen that our profit is reduced by about £200,000, almost to the point of extinction. Nevertheless we have succeeded in weathering the worst tempest we have battled against for many years, and taking all in all we have avoided the perils and hazards that beset us.

LACK OF LIQUIDITY A MAJOR PROBLEM

Here let me tell you that we continue to work on the same subscribed capital as we had 20 years ago, and this was a factor of the greatest difficulty in the conditions of the Credit Squeeze operating last year. Lack of liquidity was, of itself, a major problem in maintaining our equilibrium and inevitably had its consequential effect on our production programme necessitating change and loss of rhythm which was extremely costly. But for this fact alone our drop in profits would have been much less or even wholly avoided.

In these circumstances your Directors recently decided to realise their Holding in an Associate Company in which an additional £5,000 was invested last year and which brought the total figure up to £15,000. As you will have noted in the Directors' Report, since the year end this investment has been sold and realised the sum of £52,500, which not only is of some further current assistance to our liquidity, but also provides a profit of £37,500 to be taken into the current year 1956-57.

I am glad to say that the strain on our Finances in the middle of last year has been progressively eased, but, of course, as you all know, the Inflationary conditions continue. The rapidity with which the Company's Capital is turned over is a matter providing a serious problem when a sudden change of market is brought about by Government action as was the case last year and your Directors are giving attention to this problem.

DIVIDEND POLICY

The Directors would, of course, have liked to follow a uniform Dividend policy notwithstanding the disappointing results of the year, and in the light of the very strong reserve position. Nevertheless the Directors felt this could only be justified if the outlook for the current year was so certain that normal average profits will be earned.

At the time of the Report there was insufficient evidence to guide the Directors to this conclusion and the Directors felt it incumbent on them to reduce the Distribution from 15 per cent to 10 per cent.

In the light of my forecast last year and the conditions which have been well known, I think the Shareholders may have congratulated themselves that the Directors have not felt it necessary to be more severe in their Distribution Policy.

In the result the Reserves and Surplus are virtually intact. After providing for Dividend, Profits Tax and Income Tax, these stand at £597,575 in support of the Capital of £150,000 Preference and £300,000 Ordinary. It will thus be seen that Shareholders Net Funds amount to £1,047,575.

In all the circumstances of a most difficult year I think we should express appreciation to all concerned that serious erosion of the Company's reserves has been avoided.

THE OUTLOOK

Touching now on the outlook. We are half way through the Financial Year and have made a progressive recovery. The effect of the measures taken to rebalance our economy have been effective and profitability of working restored.

So far—so good—and we hope to see all go well and in line with our efforts and intentions. But you all know that there is another spate of inflationary demands making inroads on the Industrial Economy of the Country. We are End Product manufacturers in a highly competitive field of Industry. It is therefore necessary for us to maintain a counter-pressure against the forces of inflation.

This is a warning note that I feel it necessary to sound, but I believe that with all that has been set in motion we shall have a reasonably satisfactory result to show for our endeavours this year.

I am sure you will join me in a warm expression of thanks to the Management and Staff for their co-operation and loyal service.

The report and accounts were unanimously adopted and the dividend of 10 per cent, less tax, was approved.

Mr R. C. Robson's appointment to the Board was confirmed, and Mr J. R. Phillipson, to whom the Chairman paid tribute for his strength and wise counsel, was re-elected a Director.

The proceedings terminated with a hearty vote of thanks to the Chairman, Directors, Staff and Employees.

UNITED SUA BETONG RUBBER ESTATES LIMITED

NEED FOR ACCEPTABLE TAXATION PRINCIPLE

SIR JOHN HAY ON MALAYAN GOVERNMENT'S OPPORTUNITY

The forty-eighth Annual General Meeting of the United Sua Betong Rubber Estates Limited will be held on June 12, 1957, at 19 Fenchurch Street, London, E.C.3.

Dealing with the domestic affairs of the Company, Sir John Hay pointed out that over the past seven years the distribution of the Company's profits was as to 64½ per cent in taxation to the Malayan and United Kingdom Governments, 17½ per cent (net) to Stockholders and 17½ per cent ploughed back into the business; the net dividend of 42½ per cent proposed for the year under review, if expressed in terms of a percentage of the capital actually employed in the business, would amount to only 8½ per cent. Sir John continued:

TAXATION AND THE FUTURE

Our accounts as now presented include provision for taxation in accordance with the law as it now exists. The Chancellor of the Exchequers's budget statement, however, contained the promise to overseas trading corporations of relief from United Kingdom taxation subject, of course, to certain conditions. This promise has been embodied in the draft Finance Bill now under discussion in Parliament and until that Bill has been enacted and its final terms studied I cannot say with any certainty to what extent this and similar companies will be affected.

The indications so far given do encourage us to believe that the concessions likely to be granted are significant and a welcome lightening of the heavy burden of taxation which companies such as this have been obliged to carry for so long. If the Malayan Government would signalise its new-found independence by removing discriminatory taxation on its main industry and require from us only the same rate of taxation as is imposed on other Malayan enterprises, then equity, now so seriously impaired, would be restored and for the first time we should enjoy fair conditions of competition with the rival product, synthetic rubber.

Any such action which encourages and supports the natural rubber industry in Malaya cannot fail to add strength to that country's economy. We have noted with appreciation the assurances given to overseas capital. But in the public mind Malaya is inseparably identified with rubber and the knowledge that in that country taxation follows the unusual method of putting a tax on rubber production, at present at the rate of 10 per cent, inevitably qualifies the confidence which these assurances seek to establish.

The advent of a new Government provides an opportunity of applying a form of taxation based on some acceptable principle and aimed at encouraging a ready flow of capital to Malayan enterprises, without which there cannot be that economic expansion which is necessary if the commendable aim to raise the standard of living is to be realised.

DISTRIBUTION

Of the industry's life blood the principal insured medium of distribution was not absent. Many of the associated companies which reached its jubilee last year I recorded an occasion when the investing public was willing to pay £15 for a £1 share which did not muster a higher dividend than 10 per cent.

Such were the extravagant hopes then entertained. These hopes, I need hardly say, were only very partially realised and never to such an extent as to justify the high price of £15 per share. This same company now pays dividends at the rate of 20 per cent. It has built a financial position never achieved in former years and conducts its affairs with the higher efficiency of modern times, yet its stock is now readily obtainable in the markets at or about par. To such extremes can sentiment run, eager at one time to buy on a yield basis of ¼ per cent, neglectful at another time of the opportunity to enjoy a yield of 20 per cent.

Past disappointments and present political risks no doubt combine to induce caution, but such considerations can hardly warrant share prices which are far remote from asset values and earnings. It is the continuance of this state which offers to the "take-over" bidder the rich opportunity for a quick profit, the realisation of which too often results in the disruption of an enterprise carefully developed over long years. In our particular case sentiment has expressed itself in a milder and less objectionable way, namely, for a payment out of what are deemed surplus funds.

In these heavily taxed days with their accompanying threats of still heavier imposts, a tax-free distribution has its special allurements. It is, however, an operation which, generally speaking, can only be performed once, involving a subtraction from resources that might otherwise be profitably employed. With our outstanding record of earnings and distributions we were not without reason for believing that Stockholders would be content to leave any apparent surplus with the company, available for profitable employment when the time was deemed right for further expansion.

But such farsighted views could not contend against a strong trend of opinion in favour of the more immediate benefits of a cash payment now. The choice having been thus made, we propose, subject to the sanction of the Court, to pay out of share premium account 5s. per £1 Stock tax free. Stockholders will appreciate that future distributions must be dependent on revenue earnings.

FIAT S.p.A.

TURIN, ITALY

(Motorcars, Aircraft, etc.)

GROWING SUCCESS IN ITALY AND ABROAD

The Annual General Meeting of the Fiat Company was held in Turin on April 29th, with Professor Dr Vittorio Valletta, Chairman and Managing Director, in the chair. The following are details of the report presented by Professor Valletta on behalf of the Board of Directors:

In reviewing the international situation, the Report draws attention to the fact that the political events and profound social upheavals of 1956 have led to a clarification of principles and trends. "In particular there is need for a more resolute determination of the West to co-ordinate its efforts and its defences, and to co-operate on the basis of the Atlantic Alliance in fostering the moral, political, economic and social values of the free world—values which are increasing their importance in peoples' minds, including those nations who still lack the opportunity of peacefully expressing their aspirations. They are the values of liberty and of human dignity. Equally important is the desired goal of free enterprise, subject only to such governmental supervision as is necessary to safeguard the public interest. The importance and desirability of these goals of Western civilisation are emphasised by the results everywhere apparent in dictatorial and collectivist regimes."

On the European Common Market and Euratom, the report states: "After the European Coal and Steel Community, they will be the proving grounds of European solidarity and wisdom. Fiat is now, and will always be, in the forefront of those who are tackling these big tasks. We shall co-operate with other Italian organisations and with those foreign organisations which are the pioneers of scientific, technical and economical progress, foremost among them being those in the United States."

The year 1956 once again showed a substantial growth in the Company's business, which resulted in sales totalling Lit.340,000 million, Lit.30,000 million more than in 1955. Motor vehicles sold totalled 291,743 (41,444 more than in 1955) and included exports of 80,383 units. Output further comprised 14,000 tractors and 605,000 tons of iron and steel. There was also an increase in the production of railway rolling stock, diesel engines, aircraft (F.86-K aircraft manufactured in co-operation with North American Aviation, Inc., and jet aircraft derived from the G 91, winner of an international contest). Fiat's total exports for 1956 amounted to Lit.77,000 million. Investments in new plants in 1956 accounted for a further Lit.50,000 million. The Central Mirafiori plant was enlarged during the year by the completion of the Southern Mirafiori extension (area 1.7 million sq. ft.).

Fiat's models 600, 1100, 1400, and 1900 continued to sell with growing success both in Italy and abroad. The new smaller economical Fiat model will be launched on the market before the end of the year. Utility models of types 600 and 1100 were introduced into the vast American market, backed by an efficient spare parts and service organisation.

The Company's present labour force amounts to more than 77,000 people, i.e., 2,431 more than in December 1955, a rise which was achieved in spite of the progress of automation. Labour-Management relations have reached an especially high level of co-operation within the Company. The Shop Steward elections of April 9, 1957, confirmed and strengthened the victory of the free, democratic Labour Unions. Fiat wages and salaries remain above the maximum national contract rates and are rising still further through increasing fringe benefits and social welfare assistance to the workers and their families.

The balance sheet showed a surplus of Lit.14,055 million, and it was accordingly decided to declare a dividend of Lit.80 per share.

The report, the accounts and the proposals put forward by the Board were adopted.

At an Extraordinary General Meeting immediately afterwards it was decided to approve an increase in the Company's capital from Lit.76,000 million to Lit.100,000 million, and the issue of a bond loan amounting to Lit.24,000 million.

THE CONSOLIDATED ZINC CORPORATION

PLANS FOR FUTURE DEVELOPMENT

MR L. B. ROBINSON'S REVIEW OF ACTIVITIES

The eighth annual general meeting of The Consolidated Zinc Corporation Limited will be held on June 26th at 37 Dover Street, London, W.1.

The following are extracts from the Statement of the Chairman, Mr L. B. Robinson:

The Trading Balance for 1956 of £6,250,323 was lower than the previous year by £187,532, the decrease being wholly due to the effect on the group's activities in the United Kingdom of the deterioration of trading conditions in this country.

The profits from our subsidiaries operating in Australia showed little change from the previous year.

Income from trade investments in associated companies showed a satisfactory increase mainly due to high dividends received from New Broken Hill Consolidated Limited and The Broken Hill Associated Smelters Proprietary Limited, and with additional interest on Government and other securities the consolidated profit of the group before mining royalty and taxation at £6,123,432 was only slightly lower than the figure for 1955, £6,186,534.

The consolidated net profit for the year amounts to £2,044,283 which is £300,545 lower than the net profit for 1955.

Transfers of £800,000 have been made to general reserves.

It is proposed that the final dividend should be at the same rate as last year, namely, 3s. per share, thus maintaining the same total for the year of 4s. 6d. per share.

PRODUCTION

The Zinc Corporation Mine at Broken Hill and that of New Broken Hill Consolidated showed a further expansion in ore production with a continued increase in mining efficiency.

The ore reserves of both mines were fully maintained by development work during the year.

The production of metal from the zinc plants of Imperial Smelting Corporation in the United Kingdom was maintained at virtually the same level.

The output of high purity anhydrous hydrofluoric acid increased with additional quantities being supplied to the Atomic Energy Authority and to some of the oil companies.

Other products based on fluorine made satisfactory progress and the new plant for the production of "Isceon," the registered name for a group of fluorine based refrigerants and aerosol propellants, came into operation in January, 1957.

In December last we announced the formation of the Commonwealth Aluminium Corporation to undertake the further investigation and planning for the development of the deposits of bauxite discovered on the West Coast of Cape York Peninsula.

LEAD AND ZINC MARKETS

During the past year the operations of the US Stockpile have dominated both markets. The setback in zinc consumption in the United States of America due to the mid-summer steel strike and the falling off in automobile production, coupled with a sharp down-turn in UK car production, caused deliveries to the Stockpile to reach very large tonnages. We have, therefore, constantly before us the problems that would emerge if there should be a change in US official policy. There is little doubt that current production, particularly of zinc, would be more than industry could immediately absorb, even if a return to the 1955 rate of consumption were to take place. We believe, however, that whilst the underlying tendency of world inflation continues and determined efforts are being pursued to raise the living standards of undeveloped countries, the position should in due course again be in balance. There may, however, be a period when this lack of balance will adversely affect metal prices and we must be prepared for the consequences. This situation is not a new one and has been faced successfully by the group in the past and we are therefore justified in facing the future with quiet confidence.

THE OUTLOOK

In looking to the future it must be borne in mind that our main source of income will for several years ahead be derived from our present interests in lead and zinc production in Australia and the United Kingdom. It must clearly be some time before the new projects can be developed to a revenue earning stage and our activities are more widely based. In the meantime, our cash resources place us in a strong position to face any vagaries in the markets for our present products and to insure the uninterrupted progress of our plans.

HIGHLANDS & LOWLANDS PARA RUBBER COMPANY LIMITED

MR T. B. BARLOW'S STATEMENT

The Fifty-First Annual General Meeting of the Highlands & Lowlands Para Rubber Company Limited was held in London on June 5th.

The following is an extract from the circulated statement made by the Chairman, Mr T. B. Barlow:

The profit for 1956 was £216,000, compared with £154,000 in the previous year. £118,000 is required for taxation, £75,000 has been transferred to replanting reserve and a dividend of 4s. per £1 stock unit will be paid. In addition, a capital distribution of 2½ per cent will be made, free of tax.

It is interesting to note the sources of the year's increased profit. The price of palm oil was £7 a ton higher and, with the larger crop, we doubled our profit from that cultivation. In addition, refunds of replanting cess and anti-inflationary cess increased by £27,000, and there was £7,000 more from interest and investment income.

The year 1956 has been one of progress and achievement. We planted 374 acres of rubber and 416 acres of oil palms. This year we expect to deal with 160 acres of rubber and 516 acres of oil palms. The time has now come when better crops and yields are materialising from improved stock of both cultivations, so that in future steadily increasing outputs may be expected, despite the fact that replantings or new planting are planned to continue at the rate of 700 acres a year.

During the last 10 years we have replanted 33 per cent of our acreage. This compares with an average of 28 per cent in Malaya. The Company now has 58 per cent of its total plantings under improved rubber or oil palms.

MALAYAN OUTLOOK

The continued progress in the improvement of our properties reflects the confidence which the Board have in the future of Malaya. This confidence is justified by the faith we have in the men who are to run the country after independence, and who have shown themselves ready to allow all interests to have a fair stake. Indeed, it is only recently that Tungku Abdul Rahman has reaffirmed the security of foreign capital and his wish to attract more.

Malaya is the most prosperous nation in South-East Asia. The country's two main commodities—rubber and tin—earn a large amount of dollars in the USA and are a great contribution to the Sterling Area's dollar earnings. Malayan dollar earnings in 1955 were £68 million. We all wish Tungku Abdul Rahman every success in leading his country as an independent nation in the Commonwealth after "Merdeka" on August 31, 1957.

On the very important aspect of labour relations, Trade Unionism in the Rubber Industry is developing on sound lines and there is a growing respect between the Malayan Planting Industries Employers' Association and the National Union of Plantation Workers.

WORLD DEMAND FOR RUBBER

The world rubber position is reasonably satisfactory, according to the following tables (in thousands of tons):

	Natural	Synthetic	Total
1956:			
Production....	1,925	1,211	3,136
Consumption..	1,900	1,135	3,035
Estimates 1957:			
Production....	1,900	1,265	3,165
Consumption..	1,890	1,225	3,115

But the above figures indicate the need for natural rubber to maintain its research work. Synthetic is slightly cheaper than natural and, broadly speaking, it is produced by the leading manufacturers of tyres and rubber goods, so that the main consumers of natural are likely to prefer synthetic when possible. But the more we know about the nature and reactions of natural rubber, the better will we be able to compete. As growers, we are doing are best to reduce costs by planting high yielding trees, but a small increase in the cess on rubber to safeguard research is most necessary.

1957 has started fairly well, but prices of both rubber and palm oil are lower and costs are not. With an estimated crop of 4,100,000 lb of rubber, 2,600 tons of palm oil and 650 tons of kernels, our turnover should increase and help our position. If, therefore, nothing unforeseen occurs, the current year should be viewed with cautious optimism.

The Report and Accounts were adopted.

UNIVERSAL PRINTERS LIMITED

(Controlling Bemrose & Sons Ltd., Derby, Alf Cooke Ltd., Leeds, and Norbury Printers Ltd., Manchester)

HIGHLY SATISFACTORY RESULTS

MR MAX BEMROSE'S REVIEW OF COMPANY'S HISTORY

The thirty-sixth annual general meeting of Universal Printers Limited was held on May 30th at Derby, Mr Max Bemrose, MA (the Chairman), presiding.

The following is his circulated statement:

It is thought that some details of the Company's history will be of interest to our Shareholders.

In 1921 Bemrose & Sons Limited, Alf Cooke Limited and Norbury, Natzio & Company Limited (now called Norbury Printers Limited) amalgamated and a new Company to control the Group was formed, called Universal Printers Limited.

The amalgamation has enabled each of the three Companies to specialise in a particular market, to assist each other financially, and to exchange information on technical and other matters. As a result resources have been greatly strengthened during the thirty-five years' existence of your Company.

SHAREHOLDING

The whole of the shares of each of the Unit Companies are owned by Universal Printers Limited whose capital is held by the general public. Incidentally, our Shareholders include some of the largest insurance companies, investment trusts, employees' pension funds and bodies associated with the Church and the Co-operative movement.

MANAGEMENT

Each Company is managed by a Board of Directors with freedom of action, subject to broad policy, to manage their own affairs. The Board of the Parent Company, which includes Directors of each Subsidiary, deals mainly with finance and policy.

PROGRESS

The Unit Companies are in the forefront of the printing industry in this country, and in order to keep that position modern developments and new markets are constantly under review. This means new plant and machinery, new buildings, new equipment, all of which, up to the present time, have been provided out of retained profits. During the ten years ended December 31, 1956, the Group has spent no less than £1,122,385 on new plant and machinery. In addition, profits make it possible to provide pensions and improved facilities in the Works.

The financial year under review, in spite of difficulties, proved highly successful, the profit of the Group, before providing for taxation, being £458,766, as compared with £421,150 for 1956. This result has been exceeded only once.

The dividends paid to the Shareholders and the amounts retained for development are relatively small as compared with the cost of materials, the services of those employed in the business and taxation.

The net amount of the Preference and Ordinary dividends provided in the accounts represents 3.84 per cent of the Shareholders' funds employed in the business at December 31, 1956, i.e., the total of Capital and Reserves, £1,679,173.

CAPITALISATION OF PROFITS

The Shareholders' stake in the business is increased by the retention of profits which might otherwise have been distributed in dividends, and it is proposed, out of the amount so retained, to issue to the holders of the Ordinary shares one new Ordinary share, credited as fully paid up, for every two shares held.

The issue of additional Ordinary shares does not necessarily imply that the aggregate amount distributed in dividends will be increased.

THE FUTURE

Competition during the first three months of the current year increased considerably. The present trend of business, however, indicates an improvement in trading conditions which we hope will be maintained.

DIRECTORS AND STAFF

Mr Arthur Walker, who retired on June 30, 1956, made an important contribution to the successful development of our Photogravure Wrappings Section. You will desire to join with the Board in expressing appreciation of his services to the Company and in wishing him every happiness in his retirement.

To fill the vacancy on the Board we have appointed Mr Harry Hall, a Director and General Manager of Bemrose & Sons Limited, with which Company he has been associated all his business life.

We are proud of the tradition of service and loyalty of the employees of the Group which has been maintained throughout the year. Our thanks are due to all concerned.

The report and accounts were adopted.

At a Subsequent Extraordinary General Meeting the proposed capitalisation of reserves and scrip issue of one new Ordinary share for every two held was approved, and the increase of the Authorised Capital from £1 million to £1,300,000 was sanctioned.

EXPERT TOOL GROUP

IMPROVED RESULTS

The Thirty-Sixth Ordinary General Meeting of The Expert Tool and Case Hardening Company Limited was held on June 4th in London, Mr A. H. Redfern, the Chairman, presiding.

The following is an extract from his circulated statement:

Your board decided to wind up and liquidate all the South African Companies as soon as existing contracts could be completed. This policy is being carried out, and practical work on the last of the contracts is expected to be concluded during the latter part of this year.

Turning to the home companies, I am pleased to be able to report a satisfactory state of affairs. Your companies have had a successful year, and the net available profits are substantially higher than those for either of the previous two years. The net profits before taxation amount to £107,096, as compared with £70,094 for 1955. Taxation absorbs £57,693, leaving a disposable surplus of £49,403, as compared with £24,571 for the previous year. After providing for the dividend on the Preference shares, a dividend of 12½ per cent on the Ordinary shares, and appropriating £20,000 to general reserve, the balance of undistributed profits carried forward is £23,041.

The improved results in 1956 have been contributed to by several of your subsidiary companies and Expert Tool Heat Treatments Limited, Herbert Hunt & Sons Limited, Sharp Control Gear Limited and Waddells (SSE) Limited have all earned increased profits.

Major reorganisation, expansion, and development plans were initiated during the year, and excellent progress has been made. Your subsidiary companies have served you well in the past, but the most modern techniques are required if they are to maintain and improve their places in the industries in which they are engaged. Considerable expenditures are being incurred in development work towards this end.

The report and accounts were adopted.

FOY, MORGAN AND COMPANY, LIMITED

SATISFACTORY RESULTS

The twenty-second annual general meeting of Foy, Morgan and Company, Limited, was held on May 30th at the offices of the company, 16 Eastcheap, London, E.C.3, Mr Peter Morgan (the chairman) presiding.

The following is the statement by the chairman which had been circulated with the report and accounts:

The Accounts for the year ended on December 31, 1956, which are now submitted, show that, although there was a fall in Trading Profit amounting to about £82,000, the balance of Profits to be carried forward has been increased.

It is, in the view of your Board, satisfactory that this result has been achieved in spite of the particularly difficult trading conditions encountered in 1956 which led to a very substantial drop in the total amount of wood goods imported into this country. I am glad to be able to report that the Company, in most spheres of its activity, increased its share in the total of sales recorded. I feel that great credit is due to the loyal efforts of our Staff and, accordingly, wish to record the Board's gratitude to them for their good work.

I have to report, with regret, that after many years of devoted service to the Company, both in junior and senior capacities Mr R. V. Cooper felt that his health compelled him to resign from the Board at the end of the year. We shall still be able to benefit by his advice when required, but we hope that his well-earned leisure will enable him to recover his well-being.

I wish to welcome Mr K. E. Nordstrom to the Board. I am sure that he will prove himself to be a valuable addition to its strength.

Finally, I would say that, although the year's trading so far has shown signs of improvement, it is too early to make a confident forecast in view of the political uncertainties which exist. I believe, however, that the future is promising.

The report and accounts were adopted.

BRITISH INSULATED CALLENDER'S CABLES

GROUP SALES £129 MILLION

The Twelfth Annual General Meeting of British Insulated Callender's Cables Limited will be held on June 25th, in London.

The following is an extract from the circulated Statement of the Chairman and Managing Director, Mr W. H. McFadzean, CA, Companion IEE:

Profit on Trading at £9,322,544 shows a decrease of £2,530,308, but some £560,000 of this is due to the inclusion in the 1955 figures of the Trading Profit of the Indian Cable Company, which ceased to be a subsidiary in 1956. On a strictly comparable basis Profit on Trading for 1956 is thus some £2 million less than 1955, which was a year of exceptionally favourable trading conditions.

The main reasons for the fall in Profit have been our inability to recover in full the substantial increases we have had to bear in salaries, wages, transport, fuel and many other costs, and the intensified competition being experienced both at home and abroad. These adverse factors have to some degree been offset by the benefits being obtained from recent capital expenditure and by an increase in sales but, on balance, profit rates are appreciably lower. Competition is a challenge always to be met, but the trend in 1956 for costs to increase at a greater rate than productivity is one that must be reversed soon in the interests of this country as a whole.

It is proposed to pay a Final Dividend of 8½ per cent, making, with the Interim Dividend already paid of 4 per cent, a total distribution for 1956 of 12½ per cent (all less income tax).

The Balance Sheet is a strong one, with assets shown at very conservative figures and Reserves now totalling over £29 million.

SALES

Sales of the BICC Group to outside customers amounted to £129 million, a new record and an increase of some £10 million or 8.3 per cent over 1955. The increase in volume of goods produced was even greater, for generally speaking lower selling prices applied during the year and the average price per ton of our principal raw material, copper, was also less than in 1955.

The two principal factors influencing sales in 1956 were the violent changes in the price of copper, and the impact of credit restrictions. One of the main features of home business has been the work we have carried out on railway electrification. Stockholders will already be aware of the very large contracts entrusted to the BICC Group by the British Transport Commission, and we are proud of the fact that we have been requested to prepare for the Commission the basic designs of the overhead equipment required. It is a tribute to our technical development work and to our reputation in the railway electrification field over more than forty years.

Having regard to the extremely disturbed conditions which have applied lately in this country and elsewhere, it is difficult to express definite views on 1957 prospects. All I feel I can say is that in total our orders received are up to our figures for the corresponding period last year: that the immediate trend of demand for some of our products is still uncertain; and that competition remains extremely keen.

From the longer term aspect I have every confidence.

DAVIS AND TIMMINS LIMITED

TURNOVER AGAIN A RECORD

The fifty-eighth annual general meeting of Davis and Timmins Limited, was held on June 3rd, in London.

Mr F. Le Neve Foster (the chairman) presided and, in the course of his speech, said:

The Group Trading Profit for 1956 is £352,424, as compared with £465,777 for the previous year, while the Net Profit, after depreciation, Directors' emoluments, etc., and Taxation, amounts to £136,694, compared with £197,651 for the previous year. In comparing these figures, however, it must be remembered that the figures for 1955 were record results, and a better perspective is obtained if the results of the preceding years are looked at. Under the difficult conditions with which we have had to contend and which, as is well known, have been common to the Engineering Industry, I regard the results as satisfactory. Turnover was in excess of that for 1955, and again constitutes a record, but increased costs of production, due to wage advances, have lowered profit margins.

The Directors recommend a Final Dividend of 15 per cent, making, with the Interim Dividend of 7½ per cent already paid, a total of 22½ per cent on the issued Ordinary Capital. The total requirements for the year for our Net Dividends amount to £60,986, which is covered with an ample margin by the Net Profit, after taxation, of £136,694.

In view of plans for further developments which the Board has under consideration, particularly in the expansion of the Datim Machine Tool business, it decided to increase the cash resources of the Company. Since the close of the year it has raised further capital by placing and issuing at par £300,000 6 per cent Unsecured Loan Stock 1978/80, which, after repayment of the existing 5 per cent 1960 Loan of £100,000 and the expenses of the issue, will provide us with a sum of about £197,000 additional cash. Our Subsidiary, the Datim Machine Tool Company Limited, has again made a valuable contribution to the Company's profits, both through its sales to outside markets and by the specialised technical services it has rendered to the main production units of the Company.

In spite of the record turnover, 1956 has been a difficult year for the screw and turned part industry. During the first part of the year excellent results were achieved, but in the second half, under the influence of events and trends, the demand for our products fell off, particularly in what we term "Specials" leading to price cutting from firms anxious to keep their autos running. It is gratifying, however, that on the Stock side of the business the position is more satisfactory. We now have six depots strategically sited throughout the country, London, Birmingham, Bristol, Manchester, Glasgow and Belfast. Through these depots we give a service which is unequalled in our trade and which is much appreciated by our customers.

At our last Meeting I referred to our policy of pegging prices and lowering them wherever possible. As to how much longer we can continue this policy in view of the further substantial Engineers' Wages Award just granted must be a matter of conjecture. Such increased costs can only be met by the expansion of efficient production, but this must be matched by a rising market and buoyant trade.

The report and accounts were adopted.

NEW BROKEN HILL CONSOLIDATED

RECORD ORE PRODUCTION

The twenty-first annual general meeting of New Broken Hill Consolidated Limited will be held on June 26th in London.

The Chairman, Mr L. B. Robinson, prefaced his circulated statement, from which extracts are set out below, with a tribute to the late Chairman, Mr J. R. Govett.

The results for 1956 show a profit before taxation of £1,991,129, compared with £1,850,449 for 1955, an increase of £140,680.

Production of ore reached a record figure and although the average grade of ore was lower than in 1955 the production of recoverable lead in lead concentrates was higher. The tonnage of lead realised in 1956 was higher than in the previous year but, due to the incidence of shipping, was 91 per cent of the production, compared with 98 per cent for 1955. The average realised prices for lead and zinc concentrates were higher than for 1955, but ocean freights were also considerably higher and absorbed much of the increased revenue from sales. The cost per ton of ore at Broken Hill—including milling cost—increased by approximately 7 per cent, which was almost entirely accounted for by an increase in the charge to revenue for mine development and an increase in production from square-set stopes.

The charge for taxation was much higher in 1956 and amounted to £1,116,000, compared with £903,386 for 1955. It is too soon to assess accurately the benefit which the company should derive from the provisions of the Finance Bill 1957, but, from an examination of the Bill as published, it appears that the company should qualify as an Overseas Trade Corporation. Due to the heavy taxation charge the net profit for the year, at £874,529, is £72,534 lower than for 1955. A transfer has been made to General Reserve of £150,000 compared with £300,000 for 1955. It is proposed that a final dividend of 3s. per share be paid, compared with 2s. 6d. per share for 1955, giving a total distribution for the year of 5s. per share compared with 4s. 6d. per share for 1955.

PRODUCTION

Ore production from the Company's leases in 1956 totalled 606,325 tons (lead averaging 8.7 per cent, silver 2.2 oz, and zinc 12.9 per cent), compared with 531,447 tons in 1955 (lead 8.9 per cent, silver 2.0 oz, and zinc 13.8 per cent), an average of 2,516 tons of crude ore per day, as against 2,252 tons per day for 1955.

Realisations as compared with 1955 were as follows: Recoverable lead, 44,044 tons (41,914); silver, 988,731 oz (787,030); zinc concentrate, 124,191 tons (117,811).

Total ore reserves fully outlined and developed ready for stoping or in the process of being stoped, as at December 31, 1956, are calculated at 3,200,000 tons assaying lead 10.7 per cent, silver 2.7 oz, and zinc 10.7 per cent, compared with 3,000,000 tons assaying lead 11.0 per cent, silver 2.7 oz, and zinc 12.0 per cent at December 31, 1955.

After reviewing the major items of underground development and drilling, the Chairman concluded: The increase in the output of the Mine to 606,000 tons as compared with the target figure of 540,000 tons is wholly attributable to the continued improvement in operating efficiencies, and this could not have come about without sustained effort and effective co-operation on the part of all concerned.

LONDON ELECTRIC WIRE COMPANY AND SMITHS

OUTPUT MAINTAINED

The forty-eighth annual general meeting of the London Electric Wire Company and Smiths, Limited, was held on May 30th in London, Mr A. Noel Smith, chairman, presiding.

The chairman, in the course of his speech, said: The profit for the year at £1,015,441, subject to taxation, is £388,626 less than last year. Because of the substantial balance of orders outstanding at the beginning of 1956, output was maintained, but during the year there was a fall in demand in certain sections, which unfortunately were those affording the highest profit. This was due in the main to the effect of the credit squeeze on the motor, radio and domestic appliance industries. Profit was further reduced by continually rising costs which were not passed on to our customers.

I have said before that every step was being taken throughout the organisation to offset rising costs by the use of improved methods and the most up-to-date equipment. This process is continuing, but it is a difficult task because a number of important items of cost beyond our control, such as transport, fuel and power and local taxation, are still increasing. Unless there is a halt to these rising costs it is inevitable that selling prices must rise, because there is a limit beyond which higher costs cannot be absorbed.

EUROPEAN FREE TRADE AREA

During the last few years our direct exports to many countries have been maintained in spite of increasing competition. The plan, now under way, for the free trade area of Western Europe which Her Majesty's Government advocates and has decided in principle to support is a daring and far-reaching plan and a challenge to British industry. It is my opinion that we should not fear Continental competition in the home market but that by efficiency and energy we should take advantage of the opportunity the greatly increased market will present.

During the year new products, resulting from the work of our technical staff, have been favourably received by our customers. In addition, several processes have been revised and remodelled to give better quality and more efficient production.

Although at present there is no marked improvement in the position, there are signs of increasing activity in the electrical and motor industries which is bound to result in greater demands for wires and cables and our factories are now in a position to meet any anticipated demands that may develop.

It is, however, certain that competition both at home and overseas will grow more intense and with this in view it is the continued policy of your Board to develop and acquire the most modern plant and equipment for our several factories in order to keep in the forefront of our industry. We have the resources to pursue this policy and thus to take advantage of any opportunities that may arise for further expansion. It must be expected, however, that profit margins will tend to diminish, and it will be necessary to increase our turnover both at home and overseas. With the growing use of electrical energy throughout the world the demand for your company's products is bound to increase and I am confident that we shall obtain our full share.

The report and accounts were adopted.

WORTHINGTON-SIMPSON

A RECORD YEAR

The sixty-sixth annual general meeting of Worthington-Simpson Limited was held on June 4th in London, Sir Samuel R. Beale, KBE, MIMechE, chairman, presiding.

The following are extracts from his circulated statement for the year 1956:

I am pleased to be able to submit the results of a record year. The trading profit of £1,050,971 shows an increase compared with last year of £163,253 and, after making provision for all charges, including taxation, the net profit for the year under review is £478,700 as against £405,977 for 1955. The rise in the profits was principally due to increased sales, although once again we have taken profits on certain large contracts which reached fulfilment during the year. We experienced an increasing demand for our products.

Your Board recommends that the final dividend on the Ordinary shares be 15 per cent less tax, making with the interim dividend of 10 per cent less tax, paid last December a total of 25 per cent, less tax, for the year; an increase of 5 per cent.

Your Directors had felt that, in view of the financial position of the company having been further consolidated, the issued capital of the company should reflect more accurately the actual amount of money invested in the business and had intended to recommend the issue to the company's Ordinary shareholders of one new 10s. Ordinary share, credited as fully paid, for every two Ordinary shares held. HM Treasury has however refused its consent to this issue.

The report and accounts were adopted.

INTERNATIONAL PAINTS

MR C. R. PETRIE ON PROGRESS AND EXPANSION

The forty-ninth annual general meeting of International Paints (Holdings) Limited was held on June 5th in London, Mr Charles R. Petrie, Chairman and Managing Director, presiding.

The following is an extract from his circulated statement: Our operating companies throughout the world achieved in 1956 record levels of turnover, factory output and profits. Our consolidated profit as a result is the highest ever reported to you.

It is perhaps of interest to note that the profits of our Subsidiaries in the United Kingdom have accounted for approximately 65 per cent of the Group's total earnings, the remaining 35 per cent. having been provided by our companies overseas.

In the United Kingdom our paint companies have increased their sales, factory output and profits. Our paint exports show an encouraging expansion and are the highest ever achieved. Our non-paint subsidiaries in this country show improved results and have made a valuable contribution to our United Kingdom profits. Our companies overseas continue to make progress, nearly all having reported increased profits.

Since the beginning of this year the progress made in 1956 is being well maintained, both at home and abroad, and there is every reason to expect that this year's results will be comparable with those now presented to you.

The report was adopted.

BARRY & STAINES LINOLEUM, LIMITED

The annual general meeting of this company will be held on June 27th in London

The following is an extract from the statement by the chairman, Mr T. J. Cavanagh circulated with the report and accounts for the year ended January 31, 1957:

Group profits have followed the downward trend of the linoleum industry and of the many other industries which found 1956 a difficult and disappointing year. The upward surge of all costs continued; but selling prices, which were increased in February, 1956, to cover only the then increased costs of raw materials, remained virtually unchanged. Sales both in volume and value were adversely affected by credit stringency at home and by restrictions of one kind or another in most of the export markets. All our manufacturing subsidiaries traded profitably, including our latest acquisition, Sheerloom Carpets Limited.

Future prospects are more encouraging than they were at this time a year ago. Profit margins are slender, but it is reasonable to expect an increased volume of business provided there is no major disturbance in international relations or national economies. Purchase Tax has been reduced from 30 per cent to 15 per cent. Linoleum can hold its own in the most luxurious surroundings, but nevertheless it is not a luxury article. Even at a 15 per cent Purchase Tax level it is still out of line with other furnishing commodities, the bulk of which are tax free. The price of linseed oil, although still too high, has eased a little; Australia has announced a forthcoming easing of its quota restrictions. These are all welcome moves in the right direction.

Subscriptions to most countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is either because the alternative is not available or not recommended.

ANNUAL AIR SUBSCRIPTION RATES

	Airmail	Air Freight		Airmail	Air Freight		Airmail	Air Freight
Australia	£8 5s. strlg.	—	India & Ceylon	£7 15s.	£6	Pakistan	£7 15s.	£6

APPOINTMENTS

ENGINEERING IN THE CHEMICAL INDUSTRY?

Why is the Chemical Industry of interest to the Engineer? Firstly, because it uses a wider selection of engineering plant and equipment than any other branch of industry; secondly, because the problems which it has to tackle are such that their solution depends as much on the Engineer as on the Chemist. The industry is expanding rapidly and at

IMPERIAL CHEMICAL INDUSTRIES LIMITED, WILTON WORKS,

over 4,700 men are working on the design and construction of the largest single project in Britain's chemical history. Wilton Works is a manufacturing centre, with its own Power Station, where any Division of I.C.I. can build and operate production units. Twenty-one plants are in operation today and included in these are "Perspex," "Terylene" and Titanium. The number of

MECHANICAL, ELECTRICAL and INSTRUMENTATION ENGINEERS

required for design, construction, operation and Work study is steadily increasing as the Works continue to grow. Salaries depend on ability and experience and are reviewed annually after appointment. Promotion is by merit alone and individuals are considered at regular intervals. Help will be given with housing and removing. The design offices are pleasantly situated in the parklands of Wilton Castle, which lies at the foot of the Cleveland Hills. Suitable applicants, who should possess an honours degree, will be invited for interview at the Company's expense.—Please write to the Staff Manager, Imperial Chemical Industries Limited, Wilton Works, Middlesbrough, Yorkshire, quoting 396/10D.

GLAXO LABORATORIES LIMITED require an EXECUTIVE at their Head Offices at Greenford to assist the Head of the Department dealing with their overseas subsidiary companies. Much of the work is concerned with the finances and administration of the subsidiary companies and the effects on their business of economic conditions in the countries in which they operate. The post would, therefore, be suitable for a graduate in economics or commerce, preferably 28 to 30 years of age, with some financial or commercial experience. A commencing salary of the order of £1,000 per annum is visualised. The Company has generous conditions of service, which include a pension scheme and the opportunity to participate in the Company's profit-sharing.—Apply to the Personnel Manager, GLAXO LABORATORIES LIMITED, Greenford, Middlesex.

THE DISTILLERS COMPANY LIMITED

ECONOMIST

The Company wish to appoint an Economist in their Economics and Statistical Department in London. Candidates must hold a good honours degree, preferably in Economics, and should be aged 30-35.

His primary duty will be to study overseas (particularly continental) markets for organic chemicals. Desirable, but not essential, qualifications are previous practical or academic study of competition in present-day markets, a knowledge of the chemical industry or of chemistry, an acquaintance with at least one West European language, and the ability to interpret international trade agreements, tariff schedules, and the like.

Salary according to qualifications and experience, but not less than £1,000 per annum. Non-contributory pension scheme.

Write Staff Manager, The Distillers Company Limited, 11 St. James's Square, London, S.W.1. Quote Ref. 25/57.

BRITISH IRON AND STEEL FEDERATION invites applications for the post of Principal or full-time Chairman to be responsible for the overall conduct and administration of residential Management Courses (normally each of nine weeks' duration) at Ashorne Hill, Nr. Leamington Spa, Warwickshire. He should preferably have been associated with the Iron and Steel Industry and will have the status of a Director.

Applications should be addressed to the Financial Director, British Iron and Steel Federation, Steel House, Tothill Street, Westminster, S.W.1, not later than June 30, 1957.

ORbit (Operational Research) Limited, pioneering in consulting O.R., is looking for Honours Scientists to join the group; the work has a high mathematical content.

Though nominally a limited company, ORbit operates as a professional partnership, is rapidly building up a connection with the best in Industry, and is organised to give its staff rewarding opportunities for pure research.

Talented people will find this work stimulating and financially rewarding.—Please write to Managing Partner, ORbit (Operational Research) Limited, Empire House, St. Martin's-le-Grand, London, E.C.1.

TRADES UNION CONGRESS invites applications for the post of Assistant in Research and Economic Department. Sound knowledge of economics and related subjects essential; industrial background an additional qualification. Further particulars may be obtained before June 25 from Sir Vincent Tewson, T.U.C., 23-28 Great Russell Street, W.C.1.

TELEPRINTER OPERATOR/CLERK (lady), competent typist, good at figures, fair knowledge German, city. Good pay and conditions.—Box 713.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of ASSISTANT LECTURER in AGRICULTURAL ECONOMICS. The salary scale is at present under review, and is expected to be £700 to £850 per annum. Membership of F.S.S.U. and Children's Allowance Scheme.—Applications should be sent not later than June 22, 1957, to the Registrar, The University, Manchester 13, from whom further particulars and forms of application may be obtained.

UNIVERSITY OF DURHAM

Applications are invited for the post of Assistant Appointments Officer. The person appointed will be chiefly concerned with students and graduates in Arts and cognate subjects. Possession of a degree and experience of work in a field in which Arts graduates are commonly employed is both essential. Starting salary will be within the scale for University Lecturers (initially £900 to £1,350) together with membership of F.S.S.U.—Further particulars of the post may be obtained from the Perpetual of the University at 46 North Bailey, Durham, with whom twelve sets of applications should be lodged not later than Saturday, June 15, 1957. Candidates outside the British Isles may submit one copy only.)

MARKET RESEARCH

A vacancy has arisen within the organisation of Gillette Industries Limited for a SENIOR MARKET RESEARCH OFFICER.

This is an important appointment carrying responsibility for marketing research functions in one of the marketing divisions of the Company and is likely to be of interest to those who already hold senior positions in market research or marketing, preferably in the consumer goods field.

The person appointed is required to plan and control surveys at all stages, to write marketing reports and to participate in the formulation of marketing policies. Applicants should have had at least two years' experience in this type of work.

Good initial remuneration will be offered related to the qualifications, experience and ability of the person selected; the Company operates a pension scheme.

Written applications, which should include a concise account of experience to date, together with details of age and present salary, should be addressed to Mr. P. G. Green, Gillette Industries Limited, Great West Road, Isleworth, Middlesex, and envelopes should be marked "Confidential." All replies will be answered and treated in strictest confidence.

COMMERCIAL MANAGER

The British Retrasil Co. Ltd., a Subsidiary of an expanding group of companies in North East England, and which is engaged in the manufacture of high quality light sheet metal components for use in the Aircraft Engineering and other precision industries, is about to appoint a Commercial Manager to assume responsibility for all the commercial activities of the Company, with particular emphasis on sales promotion and organisation.

The scope and responsibility of the post are such that it is envisaged that after a period of satisfactory probationary service the successful candidate would be considered for election to the Board.

Applications, which should be made to the Managing Director, The British Retrasil Co. Ltd., Stillington, Co. Durham, are invited from men between 35-45 who have had first-class commercial experience and possess outstanding drive and initiative.

OXFORD UNIVERSITY INSTITUTE OF STATISTICS

Applications are invited for a vacancy on the research staff. The candidate will be expected to undertake work in the field of applied economics, and should have a good degree in economics and statistics. Previous research experience will be an advantage, but is not essential. The appointment will be for two years in the first instance; the salary will be on the scale £550—£900, according to age and experience. Closing date for application June 30th. Forms can be obtained from the Secretary, Institute of Statistics, St. Cross Road, Oxford.

UNIVERSITY OF GLASGOW

LECTURESHIP IN POLITICAL ECONOMY

Applications are invited for a Lectureship in Political Economy, tenable from October 1, 1957. Salary scale: £900—£1,650. Initial salary according to experience and qualifications. F.S.S.U. and family allowance benefits.

Applications (six copies) should be lodged not later than June 21, 1957, with the undersigned, from whom further particulars may be obtained.

ROBT. T. HUTCHESON,
Secretary of University Court.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of Lecturer or Assistant Lecturer in Philosophy. Candidates must have special interest and qualifications for teaching Political Philosophy. The salary scales are at present under review, and are expected to be as follows: Lecturer, £900 to £1,650 per annum; Assistant Lecturer, £700 to £850 per annum. Initial salary and status according to qualifications and experience. Membership of the F.S.S.U. and Children's Allowance Scheme.—Applications must be sent not later than June 15, 1957, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained. Overseas candidates may apply by letter (no forms), giving qualifications and experience and names of three persons to whom reference may be made.

A SOLICITOR, aged about 30, is required for employment in the Secretariat of The Wellcome Foundation Limited. The duties include assisting the Secretary of the Company with both legal and general secretarial and administrative work and the appointment is likely to appeal to a young Solicitor who wishes to make a career in industry not exclusively on the legal side. A good salary is offered and there is a contributory pension fund in operation.—Applications, showing age, full details of education and experience since qualification, should be forwarded to the Secretary, The Wellcome Foundation Limited, The Wellcome Building, Euston Road, London, N.W.1.

OXFORD UNIVERSITY INSTITUTE OF STATISTICS

Graduate computer with a degree in mathematics or statistics, or with experience in computing, wanted for planning, programming, and processing of punched card applications, with eventual use of electronic digital machine. Salary on the scale £600—£750, according to age and experience.—Apply to the Secretary, Institute of Statistics, St. Cross Road, Oxford, giving details of age, qualifications and experience.

UNIVERSITY OF ST. ANDREWS

QUEEN'S COLLEGE, DUNDEE

LECTURESHIP IN STATISTICS

Applications are invited for the post of Lecturer in Statistics (specialising in economic and social statistics) in Queen's College, Dundee. Candidates should normally possess an Honours Degree in Statistics or in Mathematics. Salary scale £900 x £50 to £1,350 x £75 to £1,650, with efficiency bar at a point still to be determined; placing on scale according to experience and qualifications. F.S.S.U. and Family Allowance benefits; a grant towards removal expenses may be made. Eight copies of the application, which should contain the names of three referees, should be lodged with the undernoted not later than June 30, 1957.

PATRICK CUMMING,
Joint Clerk to the University Court.

UNIVERSITY COLLEGE OF WALES, ABERYSTWYTH

Applications are invited for the following posts in the Department of Economics and Political Science:

(a) Assistant Lecturer. Salary scale £700 x £50 to £850. A special interest in economic theory will be an advantage. Appointment will date from October 1, 1957.

(b) Two Research Assistants. Salary £700 per annum. The appointments are for one year in the first instance with a possibility of renewal for two further years. Previous research experience, particularly in the fields of statistics and econometrics an advantage. Appointments will date from September 1, 1957.

Three copies of application, together with the names of three referees, should be sent not later than June 30, 1957, to the undersigned from whom further particulars may be obtained.

T. MAELGWYN DAVIES,
Registrar.

UNIVERSITY COLLEGE OF RHODESIA AND NYASALAND

Applications are invited for Research Fellowship in the Institute of Education to investigate problems posed by the early development of technical education in the Federation.

Knowledge of technical education, of training schemes within industry and of research methods an advantage. Appointment for three years. Salary in range £1,450—£1,750 p.a. Superannuation Scheme. Return passages to Salisbury for appointee, wife and dependent children on appointment, with allowance for transport of effects.

Detailed applications (six copies), naming three referees, by July 15th to Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

STATISTICIAN required by leading West End Advertising Agency to work mainly on analysis of TV audience and press readership data.—Please 'phone the Research Director, Young & Rubicam Limited, Hyde Park 6757.

MANAGER–FOREIGN REPRESENTATIVE

Interested to relocate Europe, Africa, possibly China for expanding manufacturer of trade group. Broad background foreign markets, contact work. British, early 40's, multi-lingual. Capable, energetic. Presently trade promotion British imports in New York.—Box 714.

I AM a Market Research Executive with both commercial understanding and sound theoretical knowledge. I have wide experience and have proved my ability in a senior post. I now seek a new position which would offer me greater opportunity and prospects for the future. Write Box 715.

SUCCESSFUL TUITION FOR THE B.SC.(ECON) DEGREE

Wolsey Hall (Est. 1894) provides Postal Courses in a wide range of subjects for the two examinations for Lond. Univ. B.Sc.(Econ.) (three if Entrance is included). Moderate fees, instalments. Over 1,000 Wolsey Hall students have secured this valuable degree since 1925.—Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P.16, WOLSEY HALL, OXFORD.

SELLING AND DISTRIBUTION SERVICE

Old-established firm of manufacturers in the N.W., enjoying first-class connection with the domestic hardware trade (wholesale and retail), are interested in selling and distributing on a sole agency basis, a suitable consumer product offering a good volume of sales. Comprehensive sales force and own transport give national coverage in British Isles and Eire. Printing, packaging and manufacturing facilities available for suitable product. All inquiries treated in strict confidence.—Box 685.

HEAD OFFICE & WORKS:
KILMARNOCK SCOTLAND

Who are the most likely prospective customers for cars, washing machines, refrigerators and other durable goods?

A RECENT ARTICLE in The Financial Times* shows that expenditure on durable household goods and motor cars in 1956 amounted to £923 million. This is an increase of 37 per cent on 1952, when expenditure was £675 million. Moreover, only a small part of this increase is due to higher prices.

Who are the people responsible for this colossal rise in buying?

A table of ownership of certain durable goods gives this picture.

Obviously, but significantly, the upper and middle classes are far heavier buyers of durable goods than the working class.

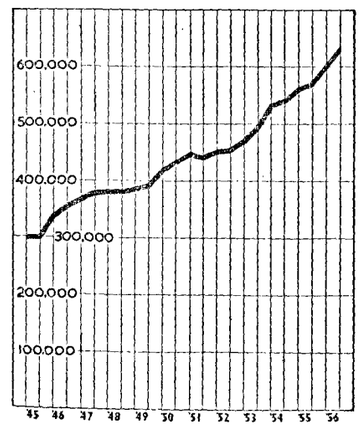
The figures on the right also suggest strongly that the upper and middle class market for these goods is far from saturated. And this market offers the most immediate likely prospects.

OWNERSHIP OF DURABLE GOODS BY CLASS

	Middle Class %	*Working Class* %
Lawn Mower	65	29
TV Set	55	45
Telephone	50	7
Car	41	12
Washing Machine	37	20
Refrigerator...	25	5
Motor Cycle	6	7

How to reach these prospects

The Hulton Readership Survey for 1956 and the I.P.A. National Readership Survey for 1956 give the *readership* of The Observer as 1,880,000 and 2,056,000 readers respectively.



Three-quarters of The Observer's readers belong to the middle classes as defined by The Financial Times, which contain 4,212,100 adults—the top 11% of the population.

Thus The Observer is an unexcelled advertising medium for durable household goods—not only those in the Financial Times' list but many other household goods traditionally thought of as mass-market rather than quality goods.

Not only does The Observer provide an audience of the most likely buyers, but it provides it most economically with a minimum wastage. Nor is this audience small—a glance back at the readership figures shows it to be surprisingly massive.

Manufacturers of durable household goods, motor cars and other automotive products, and their advertising agents, are cordially invited to write or phone for further details to Norman Berridge, The Observer, 22 Tudor Street, E.C.4. Fleet Street 9991.

** Taken from an article by Mark Abrams in The Financial Times of Saturday, March 16, 1957*

THE OBSERVER

The astonishing growth of The Observer's circulation

The circulation of The Observer has doubled since the war from 298,619 to 633,06 It is still increasing.

Last year alone, The Observer's circulation went up by 10.4%—the largest increa of *any* Sunday paper. And this was in a year when Sunday papers as a whole lo 1.2% of circulation.

The Hulton Readership survey for 1956 indicates that it has the highest number readers per copy of *any* national daily or Sunday paper.

According to the latest available Hulton figures, The Observer has a higher p centage of readers who read only one Sunday paper, than any other of the Sunda

The American trip that paid for itself —even before he arrived!

How could he, with business to do but few American contacts, hope to meet and sell to the most sought-after men in America? He decided to go to America personally; and, on the recommendation of an experienced friend, by United States Lines.

As soon as he stepped aboard, his problem was half solved: he found himself among the very businessmen he had sought so long to meet! In a relaxed, friendly shipboard atmosphere he struck up many acquaintances, each of whom became a valuable contact. His trip had paid for itself—before he even arrived!

A coincidence? You'll find that most of your fellow passengers aboard the "United States" or her running-mate the "America" are the very men you want to meet—American businessmen. Here, in an unhurried, unworried atmosphere—you'll find people who may make all the difference to your trip.

A "FIRST-CLASS" HOLIDAY
whichever class you choose

The "United States" holds the Blue Riband; her record for punctuality, like her standard of service, is unsurpassed.

Unexcelled food and wine, cinemas, top-grade orchestras, every "keep-fit" facility, well-stocked libraries, 25 cubic feet or 275 lb. of personal luggage FREE, whether you go FIRST, CABIN or TOURIST CLASS. Fares and dollar credits for on-board expenses payable in sterling.

If you are travelling on a budget but still want the best that money can buy, CABIN and TOURIST CLASS, with their gay informality, offer a perfect solution.

FARES June 1st to Oct. 31st from

	1st Class	Cabin Class	Tourist Class
s.s. UNITED STATES	£135.10.0	£85.10.0	£70.10.0
s.s. AMERICA	£119.10.0	£62. 0.0	£68. 0.0

The perfect company car...by Daimler

THE 100 MPH, 5-SEATER, FULLY AUTOMATIC DAIMLER ONE-O-FOUR IS DESIGNED TO A CONCEPT OF BALANCE

The Daimler Concept of Balance is the perfectly proportioned fusion of the four vital factors top management look for in a car. These are:—

1 PRESTIGE 2 PERFORMANCE *with economy*
3 CONTROL 4 PRICE

The Daimler One-O-Four is the very essence of this Concept of Balance.

1 A large, distinguished car. The One-O-Four is graceful and distinguished, in the Daimler tradition. On business or pleasure, it conveys prosperity without showiness. It has an *interior capacity that you would not suspect from* its slim elegance of line.

2 One of the world's fast cars. The One-O-Four has a most impressive build-up of speed and reaches 100 m.p.h. quickly and easily. Yet this performance is combined with a surprising fuel economy. A quiet engine, absence of wind noise and exceptional road holding achieve an unbelievable docility at the top end of the speedometer. With its powerful servo-assisted brakes, the One-O-Four is also one of the world's safest cars.

3 Fully Automatic Drive. The fully automatic transmission is positively human. Super-human, in fact, for it silently and efficiently changes gear, up or down, always at the right time and always more quickly, more smoothly, than one could do it oneself. Add an exceptionally small turning circle, and you have a large car that is actually very much easier to take through heavy traffic than many a smaller one.

4 An economic price—£2580. The nearest rivals to the automatic Daimler One-O-Four, in terms of all that it offers, are considerably more expensive. This car, created on a planned *concept of balance*, offers a very special amalgam of the right qualities at the economically reasonable figure of £2580 inclusive.

Drive Daimler

Discover for yourself the ways in which this remarkable car answers your special needs. Arrange for a demonstration with your nearest Daimler Distributor, whose address will be sent to you, with illustrated brochure and latest Road Test Report, on application to The Daimler Company Ltd., Radford Works, Coventry.

The cars in the current Daimler range are:—
The fully automatic One-O-Four 3½ litre, £2580 inc. P/T.
The fluid transmission One-O-Four 3½ litre, £2395 inc. P/T.
The fully automatic Century 2½ litre, £1680 inc. P/T.
The fluid transmission Century 2½ litre, £1495 inc. P/T.

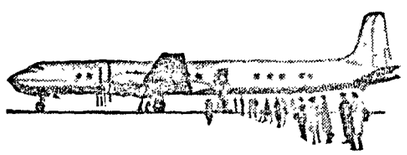
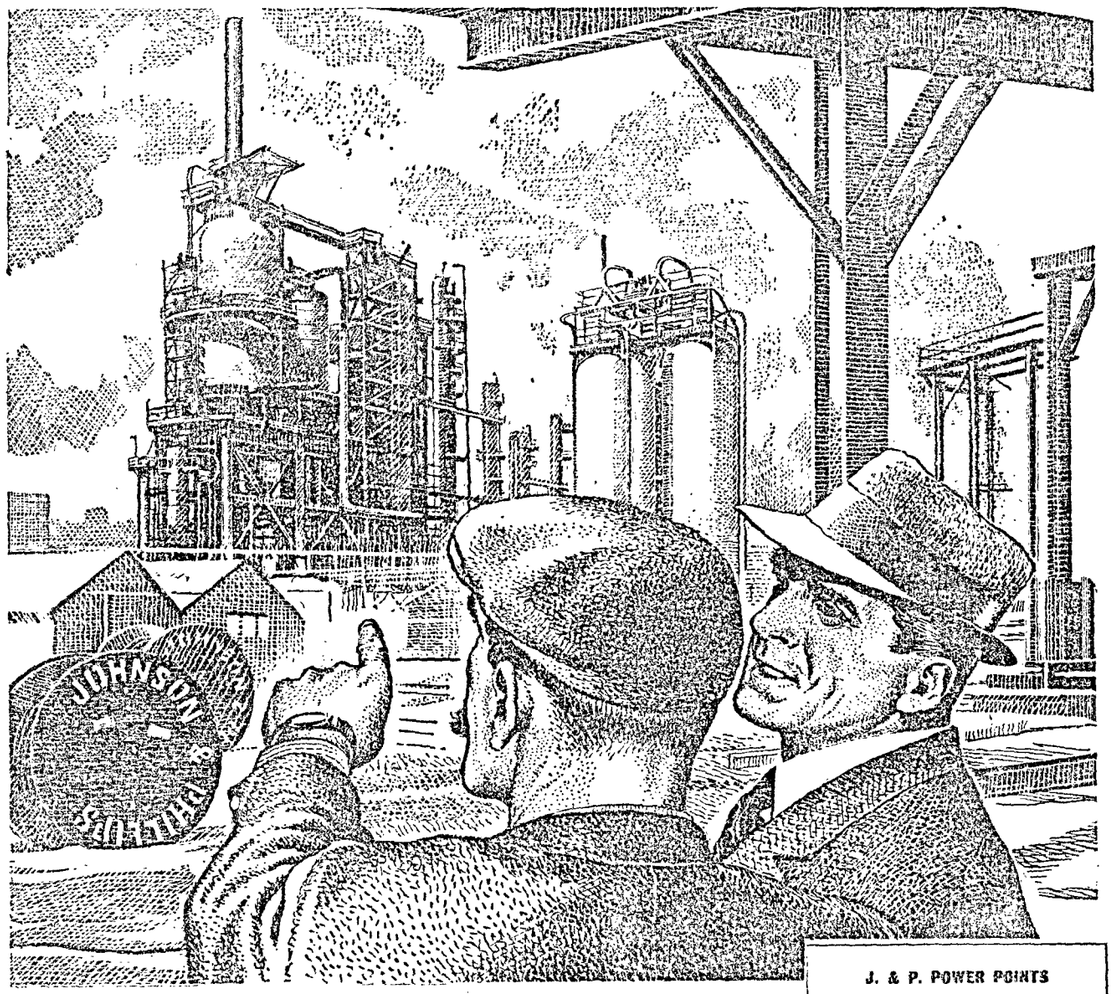
Your love is just around the corner when you fly by DC-7C



Whatever your reason for getting there sooner...

take the **DC-7C**—*world's fastest airliner*

With their top speed a remarkable 410 miles an hour, the famous DC-7 series of airliners—the DC-7C, DC-7B and DC-7—wing you in spacious comfort across oceans and continents . . . anywhere in the world.



The trans-ocean DC-7C saves travel time, not only by speed but by its ability to fly farther without refuelling than any other airliner. And its dependability is in the famous tradition of the Douglas-built DC-6 and DC-6B airliners, in service throughout the world.

On your next trip go Douglas. See why more people, more airlines fly Douglas than all other airplanes *combined.*

DOUGLAS

BUILDER OF THE DC-8 JETLINER

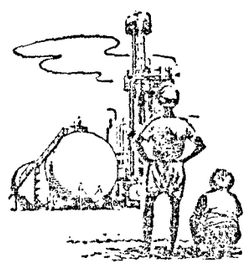
How does the cat-cracker get cracking?

'The technical term is catalytic cracker. Briefly, it processes a heavy oil product into a high quality motor spirit.'

'Powered through cables installed by Johnson & Phillips?'

'Yes indeed. J. & P. laid and jointed 74 miles of cabling when this BP Refinery on the Isle of Grain, Kent, was originally constructed. Now they're putting in all the cabling for the considerable extensions to the Refinery.'

'A case of work well done leading to a further contract?'

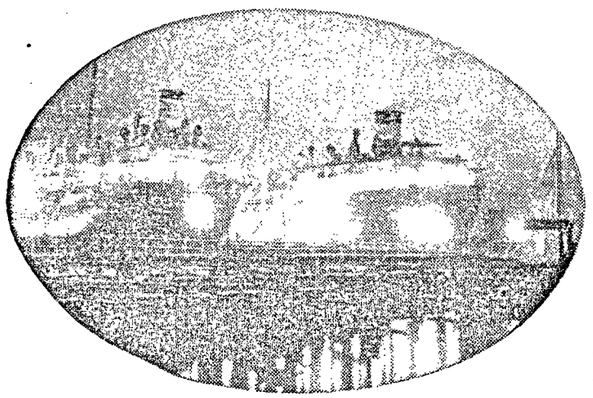


'A common experience for J. & P.'

JOHNSON & PHILLIPS

(P) A Power in the Electrical World

JOHNSON & PHILLIPS LTD., CHARLTON, LONDON, S.E.7



J. & P. POWER POINTS

SOMEWHERE EAST OF SUEZ

. . . at the Trombay Oil Refinery of Burmah Shell, J. & P. installed all the cabling and supplied much of the switchgear. India and the Isle of Grain are only two place names on contracts which J. & P. have carried out for the oil industry all over the world.

An Oil Company **REPORTS TO THE PUBLIC**

As it should.

We do so in the Annual Review*
for 1956, just published.

Take last things first. The Suez Canal was closed in November. We switched the tanker fleet to the Gulf of Mexico or round the Cape. With American help we obtained over 80% of our normal supplies of crude oil. No man or woman in the Company, of the 14,000 we employ, was laid off. We cancelled none of our plans for future development. We ordered larger tankers.

The country can do without crises, but not without oil.

Over the whole year, we paid nearly £5 million in Taxes and collected £70 million for the Government in Customs Duties. We helped the country's balance of payments with £19 million worth of Exports. Our refinery saved $120 million. We helped trade at home by buying £18 million worth of British equipment and materials. We paid over £9 million in employees' Wages and Benefits, and added nearly another £2 million to our employees' Pension Fund.

All told, we sold about 2,000 million gallons of products at a total net profit of £5,505,000 — not far short of £1 million less than last year, due to Suez.

How much profit is that in farthings per gallon?

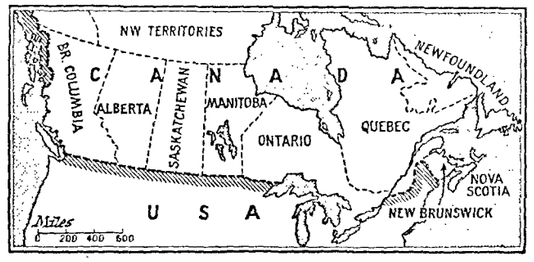
The Ottawa Stampede

CANADA may now be out of action, as a nation capable of vigorous initiatives on the international plane, for several months. This, admittedly, is always said when a long-entrenched government is dislodged by its unpractised rivals ; but the precarious nature of the narrow Conservative success makes a pause inevitable. And—quite apart from other possible implications of the change, bringing with it, as it may, a fresh breeze into Canadian politics—this is a disturbing prospect for Canada's friends in many parts of the world.

Since the war, Canada has come to occupy a unique international position. A keystone in the North Atlantic bridge, it has also helped to ease tensions between the West as a whole and those Asian and African countries that suspect both European colonialism and the new power of the United States. The Liberals' long tenure of office has enabled Mr St Laurent and his External Affairs minister, Mr Lester Pearson, to shape a foreign policy that is no longer just a matter of anxiously balancing between America and Britain. They have championed the idea of a true Atlantic community, taken an active part in the Colombo Plan, and striven for a more effective United Nations apparatus. Mr Pearson's initiative in the creation of the United Nations force now in Sinai, and his almost single-handed efforts—unfortunately unrewarded by success—to goad a sluggish UN Assembly into tackling the real problems of the Middle East, confirmed Canada's position not merely as a power with a mind of its own but also as an unusually constructive contributor to the world's councils.

There is no reason whatsoever for supposing that Mr Diefenbaker, the Progressive Conservatives' new and dynamic leader, would wish to reverse this trend. But, even if the Conservatives had won the clear majority that evaded them in Monday's elections, they would not have found it easy to sustain a vigorous external policy. The Quebec vote, predominantly Liberal since Laurier's day, counts for even more in Canada than does the Democratic "solid South" in the United States. This makes it possible for the Liberals to pile up, when fortune favours them, such massive parliamentary majorities as Mackenzie King's 177 in 1935 and Mr St Laurent's 170 in 1953 (in a House of Commons of 265 seats). The Conservatives can scarcely hope ever to secure such a handsome margin. The Quebec *habitant*, Canada's most truly conservative element, still tends to look askance at a party historically devoted to the British connection and today identified with the thrustful businessmen of Toronto. Diehard Quebec sectionalists may at times make tactical alliances with the Conservatives (that was how Laurier eventually fell) ; so may the smaller parties, Social Credit and even the left-wing Co-operative Commonwealth Federation (CCF). Mr St Laurent's government is not the first in Canadian history to be brought down because its middle-of-the-road policies failed to satisfy a rich variety of special interests and emotions. But the very richness of the

variety of the hostile groups makes it hard to found a stable government upon them.



As our Ottawa correspondent points out on page 987, Mr Diefenbaker may now be able to form a government and keep it in office for a time by drawing support on specific issues from the smaller parties. But the assumption is that he would soon call for elections, in the hope of gaining the additional seats that would give the Conservatives their own majority. Even then his government would almost certainly still depend on too narrow a parliamentary lead to permit any bold steps in international affairs, or indeed much attention to them. And the government of the next few months will be a wry-necked one, constantly glancing over its shoulder at its uncertain supporters.

IT must be admitted that this state of affairs is pretty well exactly what the electorate seemed to want. One voter in every twelve has swung from Liberal to Conservative, not so much because he liked the Conservatives' programme (he had, indeed, little idea that they would get a chance of putting it into practice), but because the Liberals' 22 years in office had endued them with a patina of benevolent (and complacent) despotism. Mr St Laurent could not be seriously compared to a Habsburg monarch, nor Mr C. D. Howe to a Metternich, but they and their colleagues exuded an air of established legitimism which made many Canadians itch to put them in their place. And that, to the electorate's own surprise, has been done. Now that the proud have been duly humbled, however, there remains the problem of creating a government and a policy which will reflect the country's new mood.

It is far from clear what that new mood is. Canada has not simply swung to the right. The sight of its Conservatives doubling their parliamentary representation and becoming the largest party might suggest that to a European observer, but matters are not so simple. A minority Conservative government might, indeed, have to look tenderly upon the CCF's socialist susceptibilities. But full-blooded socialism is no real issue in Canada, nor is even a moderate Left, comparable to the British or Australian Labour parties, to be reckoned with seriously. The CCF has admittedly improved its position during the Liberals' long reign, and on Monday one of its candidates made history by defeating the redoubtable Mr Howe in an Ontario constituency ; but its strength still lies in Saskatchewan and British Columbia, as Social Credits does in Alberta. The discontent of the farmer whose wheat cannot be sold or even shifted is a more real problem than that of the industrial worker, who has had his share of the great economic upsurge under Liberal rule.

A Conservative government could doubtless earn quick popularity by relaxing the tight-money policies with which the Liberals have sought to hold inflation in check ; but how long would its popularity last once prices began to rocket ? It could capitalise on the prevailing unease about the flood tide of American investment, which has brought half of Canada's manufacturing industry, three quarters of its mining activity, and nearly all its oil and natural gas under foreign ownership. The Conservatives' best chance of finding common ground both with the socialists and with the traditionalists in Quebec would seem to lie in this direction. All of them have accused Liberal ministers, in particular Mr Howe, of letting the national birthright go for a mess of pottage. But the difficulty here is that Canadians have acquired quite a taste for pottage. Electors may respond well to nationalistic exhortation from the hustings ; how will they react if the deliberate discouraging of American investment destroys the balance of payments and the boom ?

Small wonder that Canadian analysts are now being as cautious as the prophets were incautious before Monday's voting. It is barely possible to see the outlines of a new government, and harder still to predict what new policy, if any, it could initiate. One cannot be blamed for suspecting that a Diefenbaker government would soon be seen to be wearing Mr St Laurent's captured clothes, differing from its predecessor mainly in using milder language to the Canadian public and tougher language—but not all that much tougher—to the United States. The fact that any Canadian government, whatever label it carries, must

satisfy as best it can the same array of conflicting domestic interests, is in itself a pointer to a change of form rather than of substance. When the dust kicked up by the unexpected Ottawa stampede subsides, many things may look remarkably the same.

It would be needlessly gloomy to foresee an indefinite period of governmental instability such as besets, say, France and Italy ; and it would be unwise, and unfair, to underestimate the healthy effects upon politics and politicians of a release from the one-party rule that has lasted for the best part of a generation. But the fact remains that Canadian diplomacy looks like being disabled at a time when it is sorely needed ; and nobody can tell how long it will be before constructive initiatives and forceful long-term policies can again be expected from Ottawa. Such an interregnum may bring home to the Commonwealth, the West, and indeed the free world as a whole how much they have come to depend on Canada's mastery of its new role. It will be a salutary lesson—but a painful one.

Lend Whom Their Ears ?

There is room for disquiet and indignation about last week's revelations of official prying on the telephone, but it should be directed to the right number

THE first reaction to the tale of the telephone which was tapped by permission of last year's Home Secretary is that this sort of official eavesdropping should be stopped in its tracks. It is undoubtedly the right, liberal, emotional reaction. But if it is to make any headway with the authorities, it needs to be logically justified.

The power to listen-in derives from the normal definition of police or security powers obtaining in almost every country. In theory (or in law) there may not seem to be so very much difference between automated eavesdropping on the telephone and that pre-automation eavesdropping, perhaps in a false beard and from behind a hedge, which most people would probably regard as good detective or secret service procedure. But there are important differences in practice. One is that, rightly or not, the ordinary man thinks, or did think, that his telephone talks are under some seal of secrecy. Another is that evidence secured in this way can be quite misleading, which makes it essential that it should neither be bandied about nor used in court proceedings. Finally, and most important, automated eavesdropping is only too easy. One need not be quixotic about this: crime prevention is not cricket. But it would be entirely wrong, as a matter of fundamental public policy, if the easy reach of the telephone led to an almost accidental but perilously insidious extension of police and secret service supervision over the community. It is for this reason that opposition to wiretapping is rationally, not merely emotionally, justified. Even if the liberal's own second thoughts suggest, as they probably must do, that the abhorrent practice has to be held in reserve for use in certain circumstances, then attention must be firmly focused on the safeguards a free country should have to curb and control it. If the answer cannot be "not at all," it should be "as little as possible."

THE safeguard at present in operation is that the Home Secretary has personally to authorise each instance of wiretapping, so that each time officials want to indulge in it they have to run the gauntlet of a considerable administrative nuisance. This, together with the rules of evidence in open court, could be just about the right formal safeguard to have. It all depends on how it is applied. The proper liberal demand is that the Home Secretary should apply it in a libertarian—that is, in this case, a very restrictive and sceptical—way. One way to ensure this is to have a liberal Home Secretary, and a liberal Permanent Under-Secretary of the Home Office. Another way is through the unremitting force of public opinion ; the pressure that may be steadily put upon the Home Secretary by the police and MI5, who will both have a natural urge for more wiretapping, should be countered by public pressure against it.

The case recently discussed in Parliament has caused just such a welcome outburst of public feeling. But against which particular instances of wiretapping should this feeling be most strong ? Because official eavesdropping was obviously multiplied during the war, there is a temptation—which last week's case (concerning a criminal investigation) could conceivably intensify—to suppose that wiretapping is often right in cases of possible danger to security but always wrong in cases of possible crime. This can be supported by the argument that the only justification for covert means of gathering information is in cases where overt evidence cannot be obtained, and where decisions have to rest not on judicial proof but on clear presumption. But this is an argument of strong administrative convenience, not of libertarianism ; one's instinctive prejudice in peacetime might well be the other way round. Surely, however, the real line to draw should not primarily depend on who the instigator is. The vital distinction is between *ad hoc* wiretapping designed to ensure foreknowledge and forestalling of a particular criminal or espionage act (a practice which may be occasionally defensible) and the abhorrent prolonged extension of the public auricle into the homes of certain vague security or criminal suspects—with the intention, not of stopping any particular act, but mainly of compiling an interesting dossier about them.

THE general assumption is that the telephone tapped in the case before Parliament last week was that of a bookmaker whose name had been mentioned in court in connection with last year's knife-fighting disturbances. If so, many people may consider that, with knife fights between rival bookmakers' supporters having become a public menace and with the possibility that information about likely future knife fights could conceivably be picked up on the telephone and acted upon, this was a proper use of the procedure—providing the tapping was done with this one preventive purpose in view. But it was not the only purpose. The

case has been brought into public prominence because the police transmitted part of the record from the wiretapping to the private disciplinary committee of the Bar Council. And this raises very disturbing considerations indeed.

The clear implication of Government statements in the House last week was that the police wanted the Bar Council to consider disciplining a barrister who had been retained by (and who they thought might have been improperly associated with) a person whom Mr Butler described as a "notorious and self-confessed criminal"; and that they took the unprecedented and unsought step of revealing telephone-tapped material to this private body in order to further their purpose. Mr Butler defended his predecessor's action by saying that it was of the highest importance that "persons concerned with the administration of justice should not be associated with criminals in their criminal activities." But there are two objections to Major Lloyd George's action that should be at least equally as obvious. One arises from fear of where this transmission of telephone-tapped material to private bodies could extend to next: for example, the nearest professional equivalent of the disciplinary committee of the Bar Council is that of the General Medical Council, which investigates whether doctors have been sleeping with their patients. Perhaps if there were any immediate danger of the extension to private bodies of the gratuitous services of the public eavesdropper, last week's outcry about the Bar Council case will have scotched it. The listening public ear is temporarily redder than its most communist quarry.

But the second point is even more important. The nastiest people in the country have as much right as anybody else to legal representation; indeed, they obviously more often have need of it. The police should therefore lean over backwards to avoid giving any appearance of hostility to those who have defended notorious criminals in court; because the authorities have provided evidence to a private court which could not have been used in a public court, many people will now charge the police with having leaned over forward instead. And this criticism would deserve to stand whether the barrister concerned in last week's case had, say, been the perpetrator of the year's most nefarious piece of legal malpractice or merely the subject of the year's biggest privileged libel.

It is this misuse of powers within the Home Office which does most to justify public chariness about the powers granted to it. *Quis custodiet ipsos custodes?* Last week's revelation of yet another mistake by his predecessor seems unhappily to confirm the widespread view that within some branches of his new department, as well as from the vantage point provided by it, Mr Butler has a considerable job of administrative reform on his hands.

A Pact Within Limits

While the Karachi meeting claims growing strength for the Baghdad Pact, President Nasser's rival defence organisation is crumbling. But it is unwise to be confident in the future of the pact until it has more support from public opinion in Asia

WITH evident satisfaction, Mr Selwyn Lloyd declared on arrival in London that the Baghdad pact was getting better and stronger. He had grounds for satisfaction in the fidelity with which the British Government has held to the pact as the cornerstone of its Middle Eastern policy through many dismally unpromising months. And he was entitled to say that the alliance was in better shape; the conference of participants which he had just left in Karachi had noted its "constant strengthening and continued progress." The communiqué declared that

> events have proved the soundness of solidarity of its moral basis. With its roots deep in the region, the pact symbolises the spirit of association in equal partnership.

By contrast, the foundation of the counter-organisation fostered by Egypt—an interlocking group of "joint commands" embracing Saudi Arabia, Egypt, Syria and Jordan—is disintegrating rapidly. Portents of its collapse have been visible for two months in Saudi Arabia, where King Saud has been increasingly hobnobbing with countries critical of Egypt—Iran, the Sudan, Iraq. According to the Jordanian accusations last weekend, the free association of patriotic Arab States is worm-eaten with murderous conspiracies in which President Nasser's military attaché in Amman and his consul in Jerusalem were actively engaged. Diplomatic relations between Egypt and Jordan grew flimsy, and Egypt has petulantly finished them off for the moment by requesting the recall of the Jordan ambassador from Cairo; further, the Egyptian representative has been withdrawn from the military command council in Jordan. As Saudi Arabia's connection with the joint command is now, to say the least of it, equivocal, there is little left to interlock.

It is to be hoped, however, that when the Foreign Secretary met the British ambassadors to the Middle East states in Baghdad on his way home there was sober stocktaking rather than jubilation. The evolution of the situation in favour of the western powers can hardly be laid to the door of British wisdom. The British intervention at Port Said came near to wrecking the pact itself and forced it to hibernate for several months

in which Egypt, Syria and Russia had a field day. The architect of the pact's restoration to balance is President Nasser, who by excessive meddling in the affairs of his allies has driven them to turn away and consort with his adversaries. King Saud and now King Hussein have done so, and President Shamoun of Lebanon, who has for two years looked askance at the pattern of Egyptian policy, has been encouraged to stand up for his opinions; in last week's Lebanese elections the anti-Egyptian parties prevailed.

THE Baghdad pact cannot be called shapely in the sense that alliances founded on clear-cut common interests have shape. It includes four Asian countries, each of which has individual views about the main danger to its security, and three of which—Iraq, Iran and Pakistan—contain many inhabitants who regard it as a sell-out to imperialism because Britain is a member. A fuzzy arrangement, it must be judged not by standards of perfection, but by those of convenience.

Militarily speaking, it was founded by statesmen having personal acquaintance with Soviet expansion—Celal Bayar of Turkey, Nuri Pasha of Iraq, Sir Anthony Eden, the Shah of Iran, the President of Pakistan. But the motives directing the policies of the four indigenous states are by no means limited to resistance to Russia. To Iraq Israel, to Pakistan India, is the first enemy. As our correspondent in Karachi points out on page 988, Britain and the United States cannot welcome this diffusion of aim. They cannot prescribe solutions to the Israel and Kashmir problems that would satisfy Iraq or Pakistan. Britain went into the pact heedless of the repercussions on her relations with the Arab states, because it provided a strategic toehold in a region where bases were getting sparse; the United States regards it as a perfect vehicle for the Eisenhower doctrine. Neither has been let down. But each has been reminded by Nuri Pasha and Mr Suhrawardy that they might at some time have to face a snag that confronted the British in the Anglo-Jordanian treaty: the desire of an Asian ally to get (in return for his support against Russia) the assurance of help in quarrels of his own.

The pact members have therefore tended to drop purely military topics and to concentrate, with great good sense, on the matters on which there is real agreement. Most of these are economic, though some of the economic developments have a military twist. On the face of it the Asian members, mainly agricultural but all seeking to build up other industries, compete with rather than complement one another. But mutual services in some fields suit them all.

The notable field is communications: all the eastern members want overland routes—pipeline routes included—to their best markets, which are still in Europe and America; all want to reduce their dependence on the Suez Canal; all want to open up new production and new routes in rural areas at present inaccessible. All are keen, too, to co-operate in humanitarian or scientific work such as the organisation of a disaster relief pool, or the interchange of isotopes. All can pool some of their educational and training effort. All, therefore, are ready to see the rich members pay for the roads and telecommunications which will serve the business interests of this country or the military interests of that. Hence they could discuss in harmony how to spend the new British contribution of £1 million for agricultural training centres and the American grant of $12.5 million for communications projects.

Turkey, and no doubt also Iran, is content with this slightly hazy pattern. But it is reasonable to suppose that Nuri Pasha views the present situation in the Middle East in a very different light from that in which the Foreign Office or the State Department sees it. To him the crux of recent developments is the revolt of King Saud against the Nasser policy. For more than a decade it has been the weight of Saudi Arabia thrown on the Egyptian side that has kept Iraq on the defensive in Arab affairs. Now King Saud has shown his hand—declaring his adherence to the Eisenhower doctrine; encouraging President Shamoun to open resistance to Egypt; giving King Hussein the support that enabled him to fight the extremists intent on dragging Jordan into the Egyptian camp; and healing the breach in Iraqi-Saudi relations.

Iraq is, as it were, liberated by a Saudi change of heart; not liberated to forget the weight of nationalist opinion, but to carry it along more rationally and more wisely than did President Nasser. King Saud's long support for President Nasser shows how sensitive he is to the tide of Arab opinion; on the Israeli issue, in particular, he is a fervent Arab patriot. The emphasis which Nuri es-Said placed on Israel at the Karachi conference should not be lightly disregarded. For it is almost certainly symptomatic of the "new nationalism" in which Iraq and Saudi Arabia hope to lead the Arab world.

IT cannot be emphasised too much that the disintegration of President Nasser's policy in the Middle East is due to the methods he used, not to the purposes he pursued. The mass of Arab opinion was with him in his policy of neutrality and resistance to western dominance; even King Hussein and King Saud found no fault with him on that score. But he wilfully, and without consultation, endangered the financial stability of Saudi Arabia by his Suez policy. He deliberately—and, if the Jordan version of last week's events is true, evilly—attempted to impose his own regime upon Jordan. His military attaché in Libya so overreached himself as to instal himself on the roof of an embassy building and conduct a gun battle with the Libyan police.

It may well be that a great deal of common opinion may also criticise Nasser for blundering and may be dismayed by the mass of evidence that his embassies were used for dangerous subversion and murderous plotting; but that is not to say that the Arab has changed his

spots. Nationalism has more than seventy years of growth behind it; its ideas have been generated by many fine minds struggling from a morass of spiritual and social subjection. Their ideas are still at the core of much of the crazed and chaotic thinking of modern nationalism. This is important in considering the future of the Baghdad pact. It cannot spread except in depth, that is, southward into the Arab world; for Pakistan is an eastern frontier, and Turkey merges into Europe. Yet to bring in more Arab states would encumber the pact with a mass of national opinion at worst hostile, at best uncommitted, to the pact's policy; and that weight of opinion would endanger the leaders who took their countries in, and would distort the counsels of the pact itself.

The potential strength of the Baghdad pact lies, in fact, in its limits. As an "upper tier" defensive system it can be justified; even President Nasser was prepared at one time to admit that Iraq had special reason to take precautions against Russia outside the Arab group. The four Asian member states are not only opposed to international communism, but are willingly associated with the western powers. And the extent and complexity of their economic problems provide ample field for the western powers to show their good works. Co-operation and understanding between the four states have grown, giving evidence of common thinking—if not necessarily community of interests—among them. These are positive gains, but they cannot be extended beyond their natural bounds. To believe that the Baghdad pact can be a policy for the whole of the Middle East, that the failure of Egyptian policy means the success of Baghdad, is to make President Nasser's mistake: to go *va banque*.

Towards a Grammar of Graft

From dash to squeeze, corrupt practices are a permanent factor in politics in many countries. A plea is made for a more systematic analysis of this phenomenon by political scientists and others

It is curious how little notice has been taken of one of the most obvious gaps in general textbooks on economics or political science—the unwritten section on graft. Yet anyone reading the foreign, if not the home, news must be struck by the part which this basic human institution plays in affairs. One might have supposed that the economic theorist would discuss somewhere the extent to which graft, like gambling, merely transfers incomes rather than diverts resources from more to less economic forms of production. Studies abound of public taxation, direct and indirect, levied by the rulers of underdeveloped countries; why no study of the private taxation that everybody knows is levied by the same people? Again the influence of graft in forming, sustaining and undermining governments, and indeed whole regimes, is so well recognised that it is surprising that political scientists have not done more to work out a general theory of its action, toxic or tonic, in the body politic.

One reason for this neglect may be that the home of modern economic and political theory has been Britain—and Britain during and after the period of Victorian reform of public and private morality. This seems to have led to a general assumption that the elimination of graft was a necessary concomitant of the spread of democratic representative government and of increasing wealth, industrial organisation and technical progress through the world. But this, surely, has been disproved in modern times. It is clear that graft—bribery and extortion, squeeze or protection, wirepulling and nepotism—has persisted and found its place in the most complex twentieth-century political organisations. Not only have the corrupt foreign regimes which the long arm of Victorian imperial reform failed to reach continued to flourish, but power has been given back to dependent peoples long before they have abandoned what is conveniently known as "the custom of the country." They have asserted the right to govern themselves if they can, but misgovern themselves in any event—the right, that is, of the educated and organised minority to govern or misgovern the rest.

That right has been conceded to three very cogent arguments. The first is that while the top cadre of white administrators was undoubtedly clean-handed (being well-paid), lower down the scale the persistence of poverty has left the custom of the country intact; that, indeed, the low standards and poor expectations of the clerkly class created by the British (and other imperial) administrations have provided an incentive to corruption rather than otherwise—and that therefore the administration can carry on under new management. The second argument is that there are plenty of independent nations of all shapes and sizes which run their own affairs notwithstanding lower standards than exist in Britain. The third is that Britain itself won an empire, developed a worldwide trade, embarked on industrialisation and defeated Napoleon when its civil service was largely an organised system of sinecures and perquisites, its parliament often largely up to auction, and commissions in its army and navy bought and sold.

These arguments have been backed by the demonstrable fact that Asian and Middle Eastern countries, where graft has certainly not been suppressed, forge ahead economically—and sometimes politically. In Africa, the recent enquiries into financial irregularities in the Gold Coast and Eastern Nigeria were followed

by elections which were both won by the parties that had been indicted for those irregularities. Yet there have been other events which suggest that graft can play a very different role. The effect of corruption in discrediting and weakening the Chiang regime in China and opening the way to the communist victory is frequently cited. It played a major part in the overthrow of Farouk and the supremacy of Nasser in Egypt. It has helped the communists to win power in one Indian state. And in Africa there is the interesting case of the "disturbances" in northern Sierra Leone in 1955, when after the relaxation of control by the district commissioners as part of the policy of transferring power, the people rose against the exactions of the paramount chiefs, and the bizarre cry was raised: "Down with black government! We want white!"

It is, however, for the political theorists to impose a pattern on varied events like these; this article can do no more than raise the need for study and suggest a few starting points. One of these, surely, is that, whatever appearances may suggest, graft beyond a certain point really does become incompatible with efficiency. Where money or wirepulling decides promotion, and patient merit is denied advancement, trains really do not run to time, contracts do go to the wrong contractor, research produces no discoveries, plans are not fulfilled. Teamwork, loyalty to the job, disintegrate. The thing that sometimes disguises this in some territories is that the new and restless desire of the middle classes for money-making, which is one of the main reasons for graft, is also often in itself the main motive force behind the sudden growth of economic enterprise. Asians, Africans and others may repeat Bacon's apologia that he took bribes but never let them influence his judgment. It may serve for judges, or even for chiefs: the codification of customary payments (or "dashes") in Northern Nigeria was an attempt to apply Bacon generally. But it will not wash in engineering, contracting or the public services. When it becomes necessary to register a letter to ensure that the stamps will not be steamed off it by the postal authorities for personal use, commercial progress becomes difficult.

The next point is, surely, that so far from the growth of democracy sterilising graft, graft in the end tends to make democracy untenable. In theory, the party in opposition exposes any corruption in the party in office, and is subsequently returned to power with a mandate for reform. That this does not completely apply even in mature democracies is suggested by Belloc's lines on the general election of 1906:

> The accursèd power that stands on Privilege,
> And goes with women and champagne and bridge,
> Broke, and democracy resumed her reign
> (Which goes with bridge and women and champagne.)

When democratic institutions are imposed on countries too deeply imbued with the conviction that squeeze is part of human nature, all political parties are corrupt; this means that none is more efficient in administration than others, but the total cost is far heavier. As a supporter of one South American dictator put it:

> It is cheaper for the country that he should be president for life, because he has made his fortune and is satisfied. When we changed presidents every few years, the cost of presidential fortunes used to ruin us.

This is one reason why democracies as well as dynasties are superseded by dictatorships. But dictatorships of the South American or Asian type are not now the only alternative; communism offers to rid poor but ambitious countries of both graft and inefficiency. Graft is a factor in the cold war, and Marxist political scientists, if not bourgeois ones, are studying it. Much is made of the claim that communist China has a clean administration for the first time in history. But it is not so much the corruption as the impotence of a corrupt regime that communist propaganda emphasises when aimed at ardent young nationalists, frustrated in their desire alike to rise professionally and to get things done. It offers a new discipline to break the ancient matrix of loyalty to family, clan and tribe.

This by no means implies that communist countries are free of graft. There are no animals without their specialised parasites. Recent Russian literature makes this clear and Chinese self-criticism suggests that the communist claims are inflated. The "fixer," or contact man, who, for due reward, will help win the ear of authority or otherwise further his client's aims, is a prominent figure in Soviet life. In China, too, graft has seeped back under the pure surface of a puritanical regime, and senior communists have adopted a number of old habits, one of them being what the Peking newspapers prudishly term "a feudal attitude towards women." But communism has advantages over other dictatorships. Common grafting exists, but is better concealed. More important, however, is the fact that there is less need for it, because the granting of enormous differentials for the party caste produces the material results without the need for private enterprise. The party official's interest is power, not money; power gives him all he needs, and for it he ceaselessly intrigues within the party structure.

In conclusion, it may be suggested that the study of graft as a political factor must revolve round the concept of permissive limits: the limits at which graft does not detract intolerably from a country's economic progress or at which nepotism drives its growing professional and executive middle class to revolt. What a strong country like America can stand ruins a weak underdeveloped territory. And British readers should not dismiss the art of squeeze as of no relevance to them. The prospective loss of oversqueezed countries to the communist camp plainly is relevant; policy ought even to take account of it. And though the main interest for Britons may seem to be the beam in the foreigner's eye, they must always guard against being incommoded by catching a mote in their own.

NOTES OF THE WEEK

COMMONWEALTH PREMIERS

Empty Chairs

TEN delegations are due at the Commonwealth talks in London in ten days' time, but it is possible that only six may be led by prime ministers. Mr Holland of New Zealand is ill; Mr Strydom was not coming anyway; Mr Bandaranaike may be detained by Tamil trouble; it is uncertain whether a Canadian prime minister will be able to attend, and who he will be. As Sir Roy Welensky sits at the table only as a matter of personal invitation, there may be only five prime ministers at the meeting representing sovereign member states.

As a demonstration that the Commonwealth is once more united and functioning as a cross-section of world opinion, this would not be impressive. It is natural to assume that Mr Macmillan wanted the London conference to be a demonstration of that kind, and it is bad luck on him that a chapter of accidents in Canada, Ceylon and New Zealand, which could hardly be more unrelated to the Suez affair, should endanger his personal triumph. What the prime ministers' meeting can achieve in other directions is unclear. Dr Nkrumah, of course, must be inducted into the club—and here again it will be a pity if his reception is marred by too many absences. For the rest, such issues as Kashmir and race relations in Africa will suffer if there is a shortage of "neutral" and experienced prime ministers to arrange quiet, informal get-togethers.

Mr Strydom may have been near the mark when he expressed doubts about the suitability of these gatherings and suggested instead more regular meetings of departmental ministers. It is never easy to arrange a date convenient to a growing number of prime ministers, and even if Mr Menzies, Dr Nkrumah and Sir Roy were not already on their way to London, it would be a tricky business to postpone the meeting in hope of ensuring a fuller attendance later in the year. But even if this meeting does little to add to the prestige of the Commonwealth club, it will not imperil the continuity of the series of conferences, for after August there will be one more member, Malaya, to bring in, and that alone will necessitate a 1958 meeting. Meanwhile, it is possible that in a diminished gathering the voices of Dr Nkrumah and Sir Roy Welensky will be heard more clearly, and this may impart a new and valuable flavour to a still evolving institution.

FRANCE

An Issue Postponed

THE French National Assembly has remained true to its worst traditions. Elsewhere governments are brought down because a change in policy is demanded. In Paris, however, as our correspondent describes on page 988, crisis is fast becoming a synonym for continuity. France is threatened with creeping paralysis, which is spreading from Algeria. The deputies dismissed M. Mollet, ostensibly because they found his treatment of the case unsuitable. After three weeks of frenzied indecision, they now call to replace him his most faithful assistant, certain to prescribe the same medicine, though probably in more dangerous doses.

M. Bourgès-Maunoury, DSO, has a brilliant war record. He was parachuted many times from England into occupied France. He has not been less nimble in landing in office: at 42 he has been a minister in eleven different cabinets of various political complexion. Whatever his versatility, however, the man who, as minister of defence in the previous government, was the architect of the intervention in Egypt and the most eloquent defender of an uncompromising stand in Algeria, can hardly be expected to change his line now that he has reached the top.

Such, at least, must be the view of people who think that the policy followed hitherto offers no hope of winning Muslim sympathy and thus of preparing the ground for a peaceful solution. MM. Mitterrand and Defferre, who acted as the last government's conscience after the departure of M. Mendès-France, and functioned as a brake on its more extreme colonialist members, have refused to serve in the new team. Its composition is a triumph for M. Lacoste. He remains as minister-resident in Algiers, where so far he has shown a great deal of understanding for the French settlers but little comprehension for the mood of the Muslim majority. French settlers must feel confident that, even more than before, they will now be able to dictate the course of events in Algeria. A government that will seriously seek a negotiated settlement remains to be sought in another, perhaps more severe, political crisis.

Simply a Caretaker?

M. BOURGES-MAUNOURY takes over M. Mollet's heavy financial commitments and it is hard to see how he can balance his accounts without budgetary cuts and new taxes. His Algerian bill is likely to mount up. The retention of a Socialist as minister of social affairs is a sign that little pruning will be allowed on welfare expenditure. In the end the deputies will probably have to grant to M. Bourgès-Maunoury more money than they refused to M. Mollet.

Parliamentary distaste for higher taxes gives weight to the assurances of most observers that the new government will not last. Voted into office by only 240 deputies in an Assembly of 594, it is already described as a caretaker team likely to hand over in the autumn. Once the common market and Euratom treaties have been ratified, it is argued, many "European" deputies will have no hesitation in forcing a new crisis. But such prophecies have often proved wrong, and the situation can be greatly altered even within a few months. During the parliamentary recess, in particular, a government bent on a military solution for Algeria can do a lot to make other kinds of solution more difficult to find. It is also not beyond its powers to silence the voice of reason in France under the pretence that it is the voice of treason. M. Bourgès-Maunoury himself has shown in Egypt how much damage can be done how quickly. M. Mollet started his rule as the man who could solve the Algerian crisis. He failed; can his successor, starting under worse auspices, do better?

H-BOMB

Prime Minister's Business?

IN the last eight weeks before the Whitsun recess, the Prime Minister answered something like sixty questions, followed by supplementaries, about nuclear physics in the House of Commons. He has dealt with every technical aspect of the hydrogen bomb; he has given or refused information on its size, casing, height of detonation, and detectability; he has answered questions about fall-out and strontium in human bones *ad nauseam;* he has discussed the Medical Research Council, its procedure and whether it should make fresh reports; he has explained international law on the diversion of shipping; he has dealt with the question of ending, postponing and registering of tests and the production of fissile material; he has discussed, *inter alia,* the radiation hazards in Atomic Energy Authority establishments and the prospects of nuclear marine propulsion; he has defined the dangers of sea fish becoming radio-active and of radio-active eels up English rivers.

It has been a remarkable display of versatility, but does it really make sense? Many of the questions are endlessly reiterative; but if they must be asked—and the Opposition must decide at what point they are boring the nation as well as keeping the Prime Minister on his feet—surely more of them could be answered by other ministers. Mr Vosper could deal with the danger to health, as Mr Sandys did deal with questions of defence and fall-out in Lancashire. It is absurd to expect the Prime Minister to keep himself briefed on all aspects of thermonuclear technology and radiology he does so to the detriment of more important duties.

Labour's reply would no doubt be that he can have no more important duty, and nobody will deny that the Prime Minister must be the Overlord of the Bomb. Policy—to explode or not to explode—is supremely his. But this is a very different matter from letting himself be impelled—by Labour, by departmental overlapping or by personal interest (it should be remembered that Mr Macmillan chose to take over Lord Salisbury's responsibility for some atomic matters)—into becoming a one-man encyclopaedia on nuclear explosions and their attendant horrors. Encyclopaedic knowledge on any matter, as distinct from general supervision over all matters, is not a Prime Minister's job. Britain has suffered several times since the war from Prime Ministers' inclinations to devote too much study to particular King Charles's heads.

LABOUR DEMONSTRATION

Black Rod in Pickle

THE Parliamentary Labour Party's final melodramatic gesture of protest against the Rent Bill—a sit-down strike in face of Black Rod's traditional summons to attend the House of Lords to hear the Royal Assent—presented as nice an example as parliamentary records reveal of how not to stage-manage a political demonstration. In the first place, the demonstration has been regarded by some of Labour's sillier supporters as improper, and by many of its most balanced supporters as silly. The verbal hair-splitting by which Labour speakers sought to avoid creating the impression of a deliberate insult to the Queen (who, it was explained, had only "desired," not "commanded," the attendance of her faithful Commons), may perhaps be counted to them for virtue. It only added, however, to the ludicrousness of the total effect: this supposedly passionate and spontaneous surge of indignation, this refusal to countenance the Unclean Thing even by mere physical participation in established procedure, looks much less passionate and spontaneous when it turns out to depend on such distinctions as this.

In fact, of course, there was precious little passion or spontaneity behind the gesture; and this leads to the second political disadvantage of the demonstration—which is that it will be recognised by many floating voters as dishonest. In private, as anybody with any experience of politics knows, Labour members admit quite frankly that the right of the sitting tenant to perpetual and arbitrarily subsidised security, so far from being a palladium of social justice to be defended at all costs, is an anomalous nuisance overdue for removal. Labour's own municipalisation scheme, indeed, clearly seeks to remove it. The respective merits of municipalisation (with the implied power to raise rents and to evict) and the Conservative recipe of partial decontrol coupled with more realistic controlled rents, are questions, not of high morality, but of economic and administrative expediency and inexpediency; and of this Labour members, whatever the strength of their preference for the municipal solution, are perfectly well aware.

Their manly indignation, in short, is bogus; their generous championship of the masses against economic landlordism is bogus; and their demonstration that their indignation is so implacably profound that this championship must be maintained to the last gasp and beyond is the most nauseatingly bogus of all. But, having simulated their own emotions, they run the risk of uncorking other people's genuine ones. This sort of conduct will stick in a good many people's gullets when, faced with the realities of a general election, they have to ask themselves, not merely whether it would be agreeable to demonstrate that they are rather fed up with the Conservative Government, but whether they want Labour back in power. Why on earth did Mr Griffiths let Labour members do it?

LEGISLATIVE PROGRAMME

In Time for the Grouse

MEMBERS of Parliament are now enjoying two weeks' Whitsun holiday. One reason for the extra week's break has been the Government's success in pushing on with its legislative programme. This has not been as heavy as in many former years, but progress on it was severely delayed by all the time that had to be spent last autumn debating the invasion of Suez. The Government has so far introduced 43 bills. Thirty are already on the statute book and one—the Shops Bill—has been dropped overboard. Another four are through the Commons, while the Electricity Bill is only waiting for the Commons to deal with the Lords' amendments—including one passed against the

Government's wishes. The handful of bills still outstanding in the Commons include the Coal Mining Subsidence Bill (on which most of the detailed work has been done), the Superannuation Bill and, of course, the Finance Bill. Apart from legislation, time has still to be found for the rest of the Opposition's days and for one or two Government-sponsored debates on general subjects: they will probably be on mental health and foreign affairs.

As there will only be five weeks between the re-assembly after Whitsun and the beginning of the long summer recess, there will be no time for loitering. Presumably there will be the usual two weeks' postscript in the autumn, when the dregs of the present session can be flushed away before the next Queen's Speech, but the financial business must all be passed by the end of July. Barring the unexpected, however, Mr Butler should be able to go off to his grouse moor at the appropriate date with the knowledge that he has led the House of Commons safely through another programme.

PARLIAMENT

Standing Still Committee

RESTRICTIONS on parliamentary debate should always be kept to a minimum, but there seems to be a case for some review of the rules of procedure for the standing committees which do the detailed work on bills. The adequacy of the present rules has been called in question by the odd proceedings of Standing Committee C on the Local Government (Promotion of Bills) Bill, a private member's measure introduced by a Tory but mainly supported by Labour. It was, in point of fact, rather a beastly measure: it sought to abolish town meetings and town polls when local authorities want to promote Parliamentary bills, and thus paid too much regard to the convenience of the authorities and too little to the rights of the electorate. But its beastliness is not the present point.

The measure was not voted against on second reading in the Commons, which should have meant that the principle had been (in our view wrongly) accepted. But when it reached the standing committee, several root and branch Tory critics emerged and they proceeded to kill it by procedure. The committee spent five sittings on the bill, which should have given 12½ hours of debate. But 5 hours were lost because there was no quorum, 4¼ were devoted to an unfinished discussion of the first amendment, and the remaining 3¼ were entirely taken up with debating the dates of future meetings (for which there will not now be time this session).

Filibustering, in the strict American sense, is not possible at Westminster, because all speeches must be relevant to the subject under discussion. But few politicians are not able to speak at interminable length, with relevance and without "tedious repetition" (also forbidden), even on purely procedural points. When delaying actions are fought against Government bills, ministers can in the end apply the "guillotine" and impose a timetable. This is not done on private members' bills, nor would anyone want it to be. But are there too many aids for wreckers? Those on Standing Committee C were greatly assisted by the simple arithmetic of the rules. On a committee of only 35 MPs, 15 were needed for a quorum and 20 for the closure—equivalent to 43 per cent and 57 per cent respectively. In the whole House of 630 MPs, only 6 per cent are needed for a quorum, and 16 per cent for the closure. What is more, on private members' business there is no party whipping, and this makes absenteeism common. It was because some Labour MPs, who would have supported the bill if present, did not bother to turn up, that the Tory opponents of the bill were able to work the quorum dodge. If the same proportions for the whole House were applied to Standing Committee C, only two MPs would be needed for a quorum. This would obviously be too small, but there may well be a case for some reconsideration of the figures—and for a reminder from the two front benches to their followers that, if rules are to be kept reasonably liberal, a minority must not seize every procedural opportunity to cripple a majority.

IRAQ

Summer Shareout

BAGHDAD has for months been consumed with rumours that Nuri Pasha was about to reshuffle his cabinet. Now they have come true. Its successor is not announced as *The Economist* goes to press, but whether he heads the new team or not, it is unlikely to alter his foreign policy at all, or his home policy very greatly. For the serious aspirants to office, though highly critical of him when not holding a portfolio, have all served with him before now. They are "against" only when "out," and freely practise his policies and methods as soon as soberly "in."

He has resigned at a moment of his choosing—aglow with satisfaction at the shift in Arab alignments that is described in a leading article on page 956. Temporarily, few can gainsay his judgment in foreign affairs. But on the home front he has one or two immediate difficulties to contend with. The changes he is making reflect some real differences of opinion — not merely a desire to give others a turn because the present ministers have had an unusually long run.

One immediate trouble is money. Iraq's total oil revenue last year was ID 68.8 million (1 ID=£1 sterling) where ID 80 million had been expected, the difference being due to Syrian sabotage of the pipeline westward from Kirkuk. In the first quarter of this year the effect of this blow was at its most serious: oil revenue was only £5.8 million. For the first time for years, thoughts had to be bent to cutting coat according to cloth. Seventy per cent of the oil revenue goes to the Development Board, which is now spending at a rate in excess of the money coming in. Happily, its unspent balance (£70 million at the time of the Suez crisis) has been available as a more or less liquid reserve throughout the months of uncertainty about future earnings, so that no major works already authorised have had to be held up. But some of this unspent balance is regularly lent on long term to public authorities for good works. About £40 million is lying out in this form. Clearly, retrenchment on the lending front was indicated, but where was the axe to fall? The decision has been to lend only to two claimants: £2½ million to the Government Oil Refineries Administration for refinery extension, and the same sum to the Grain Board for badly needed silos at Basra. The decision to institute a standstill on all other loans until there is not only more cash, but a better procedure for granting them, was highly criticised by some ministers. The new cabinet will have to grin and bear it. Perhaps all will feel better about it when they have had their summer recess in cool climates.

EGYPT

Free and Safe Elections

THE National Union, created in accordance with the constitution which the Egyptian people approved by referendum last June, is busy examining the list of 2,508 people, including 15 women, who have registered as candidates for the forthcoming general election. The executive committee of the Union—and that is all it seems to consist of—is composed of Abdel Latif Baghdadi, Zakaria Mohieddin and Abdel Hakim Amer, the three members of the original junta who are still alongside President Nasser. They will screen the candidates to make sure that no one likely to contaminate the purity of the revolution, or tempt the public with free opinions, gets as far as the polls. Egyptian newspapers have stated that President Nasser will personally approve the final list. Voting in the first elections in Egypt since 1950 will be free because it will have been made safe.

Polling will take place in the 350 constituencies on July 3rd, and the National Assembly is due to meet on July 22nd, on the fifth anniversary of the *coup d'etat*. The elections should have taken place in October and the assembly should have met in November, but the Suez crisis halted President Nasser's constitutional plans. But whether then or now, the assembly cannot change the seat of power, which will remain with the President and the army. Hand-picked candidates are unlikely to enliven the parliamentary debates by vigorous dissent.

Nevertheless, the assembly is something more than a piece of window dressing. President Nasser once remarked that the Egyptian people would never like military rule but once military rule was established it was difficult to get out of it. He came to the conclusion that Egypt would be compelled to evolve its own system of democracy and he regards the constitution, under which this assembly will be elected, as a first, cautious step. The very mechanism of government, the relations between the President, the ministers and the assembly, will tend to put a brake upon the arbitrariness of his present method of ruling; and the assembly will presumably have something, however modest, to say.

ITALY

Fascist Kiss of Death

FOR lack of one vote, Signor Zoli has thrown in his hand. He made his decision after a rather Gilbertian episode in which it was belatedly discovered that, in the vote of confidence in the Chamber of Deputies on June 8th, the tellers had mistakenly counted two negative votes as abstentions. This meant that Signor Zoli had just failed to get a majority that did not depend on the votes of the neo-fascist MSI. In the previous Senate vote he had gained a majority without this unwelcome support; he had promised to resign if he did not get a similarly untainted majority in the Chamber.

But even if Signor Zoli had just scraped home on his own terms, his position would have been both paradoxical and uncertain. A staunch anti-fascist with a particularly distinguished wartime resistance record, he put forward an economic and social programme that was sufficiently progressive to appeal to the Left. Yet the only support he could get, apart from his own Christian Democrat party, came from the extreme Right; even if he had been able to repudiate the votes of the neo-fascists, he would still have depended on those of the National Monarchists, who are linked with the MSI. This support from the extreme Right was quite unsolicited and highly compromising. It was forced on to Signor Zoli because both neo-fascists and Monarchists hoped that by associating with the Christian Democrats they might gain a slight aura of respectability before the next elections. But whether specifically repudiated or tacitly accepted, it disgusted many Christian Democrats and threatened to disrupt the party. It also alienated those in the small centre parties who might otherwise have helped Signor Zoli to a majority by abstaining instead of voting against him.

At the time of writing, President Gronchi has not yet decided what to do next. He is confronted by a situation that is highly confusing even by Roman standards. Signor Zoli's monochrome experiment has, however, made one thing clear—that most Italian politicians still find any connection, however involuntary, with Mussolini's heirs extremely distasteful. If the prospects of a stable government for Italy are not good, this at least is encouraging.

MALTA

Disintegration?

THE long-drawn out negotiations with Malta still hang by a thread. The Colonial Office has made another offer, the details of which have not yet been revealed, to which Mr Mintoff's reaction is awaited. But it seems certain that the Maltese Prime Minister will still find that it does not yield his essential point: that, whatever the circumstances, Britain must bind itself to bring about equivalence in Maltese wages, social services and living standards within twelve years or so. Meanwhile it should be noted that in the interim period the Maltese budget shows that Mr Mintoff could not spend all the money given him by Britain in 1956-57, and which he complained was too little. He starts 1957-58 with £500,000 in hand, despite his claim that the £6,070,000 to be given him for the year ahead is still nearly £900,000 less than he deserves.

Everyone has been rightly patient with Mr Mintoff, but the time has come for new thinking about Malta and Britain. It is now doubtful if even half Malta's dockyard capacity is needed for the Royal Navy, and it is problematical how much use could be made of it by Nato. Nor are the Americans very keen on the services at the base. Probably Chatham could take over almost everything from Malta now—and Chatham workers, faced with a cut, will probably have views on the priorities. This merely deepens Mr Mintoff's view that it is for Britain to fill the gap with commercial ship-repairing or other industrial work—without prejudice to "equivalence," or considerations of cost levels. It seems possible that if the dockyard was used well below half its capacity, but Malta's wage and social service standards raised to the British level, the subsidising of Malta would cost the British taxpayer £20 million or more a year. A luxurious Jarrow indeed.

All this suggests the way that British policy should go if the present negotiations break down. The plain, frankly brutal question should then be asked: what is Malta worth to Britain, both in terms of a base facility and in terms of reasonable conscience-money? Once that figure has been

fixed (somewhere perhaps between £5 million and £10 million a year) Mr Mintoff should be told that, provided Britain can continue to use the base, he can have it—on any political terms he likes. He can have it and send his three Maltese MPs to Westminster (which would be a concession by Britain, not by him); or he can have it—why not?—and set up an autonomous Malta, pulling down the British flag and putting up any other flag he chooses. There is no obvious reason why Britain should make any political reservations in this European island; there is no equivalent here of the Greco-Turkish problem of Cyprus, and under any system Malta would be almost bound to let Britain use the base which is the foundation of Malta's economy. If the present negotiations break down, let Mr Mintoff be told in the friendliest manner that he can write his own constitution, but that Britain will write its own cheque.

ELECTRICITY BILL

Lordly Luddism

THE Lords last week chose a typical and not wholly unworthy occasion on which to inflict on the present Government its first defeat in either House of Parliament. The occasion was the third reading of the Electricity Bill, and the successful Lords' amendment requires local planning authorities to consult with amenity societies and other appropriate bodies before deciding whether or not to demand a public inquiry into some proposed development. The Government defeat may have been helped by the proximity of Whitsun, and the amendment itself is a minor one. Yet it displays a genuine lordly feeling in the shape of alarm at the aesthetic outrage which atomic power stations and the growing army of electric pylons may perpetrate on the countryside. In this there is also a whiff of lordly luddism; the power stations cannot be gainsaid and every site chosen spoils somebody's view—if indeed it really does destroy it as much as a scatter of modern housing. Yet, as so often, the Lords are speaking for a strongly-held and understandable viewpoint.

The Lords have a worthy aim, but their proposed remedy of "more consultation" is rather fuzzy and ineffective. Their complaint is that at present only the local planning authority can compel the Minister of Power to hold a public inquiry into a proposed development; but since the smaller local authorities must also be consulted and the larger amenity societies can—and do—protest to the Minister directly, it is most unlikely that objections to any major scheme will be overlooked. Local objections to minor developments are another matter, but (under the present system) the only foolproof way of airing them would be a public inquiry into each individual project. Lord Lucas's further objection that present arrangements allow Berkshire to sanction a power station on one bank of the Thames without Oxfordshire knowing amounts to an accusation (as yet fortunately unproven) that local authorities are incapable of any co-ordination whatever.

The basic evil in the present arrangements is the immunity from normal planning controls enjoyed by public corporations and Government departments. Whereas Imperial Chemicals must go through the mill of the planning machinery, local and central, and must comply with the provisions of the local development plans, the electricity boards get their sanction from Lord Mills—and, whether or not he orders a public inquiry, it would be strange if his final decisions were not strongly biased in their favour. If there is any justification for this preferential treatment (which is hard to believe), then at the very least public boards should be made to incorporate their proposals in local development plans, so that affected landlords and citizens could protest effectively on the right occasion—which is when these plans are submitted to a comprehensive public inquiry.

University Students—Actual and Potential

A PROFOUNDLY interesting report published this week answers some of the questions that people are now asking about British universities. It is the report of an inquiry, commissioned by the Committee of Vice-Chancellors and Principals, into applications made between May, 1954, and the autumn of 1955 for admission to the universities. The only pity is that many of the findings exclude Oxford and Cambridge, since not enough was known about those who applied there but were not admitted.

(1) *Numbers and distribution.* During the period under review 70,000 applications were received by the universities, but as nearly everyone applied to more than one university, these represented only 31,000 people—of whom 9,000 were women. British applicants were equal to about 4 per cent of all British 18-year-olds. Proportionately, women applicants were more successful than men, since women constituted less than a quarter of those who were not admitted. Proportionately, too, applicants from Scotland were more successful in gaining admission than those (in descending order of success) from England, Wales and Northern Ireland.

(2) *Background of successful candidates.* At the universities other than Oxford and Cambridge only 10 per cent of the successful applicants had been at boarding schools; at Oxford and Cambridge 40 per cent had. In the universities other than Oxford and Cambridge, about a third of the men, but only a fifth of the women applicants (successful and unsuccessful) were the children of manual workers; at Oxford and Cambridge the proportion of successful candidates whose fathers were manual workers was only 12 per cent of the men and 7 per cent of the women. Yet the manual working population comprises 72 per cent of all adult male workers.

These figures will no doubt be fastened on by left-wing propagandists to prove class prejudice in university selection. But much of the trouble lies lower down in the secondary schools, and—as was shown in a report of the Advisory Council for Education on "Early Leaving" two years ago—in class attitudes towards them. Parents who despise the education that they themselves never had, friends already earning high wages, crowded rooms, lights-out for the telly—these are the things that prevent many an able working-class boy from getting his required subjects at "A level." They keep him out of Oxford and Cambridge even more than elsewhere, because these universities get the first pick of promising applicants.

(3) *Fate of those who failed.* Excluding those who applied to Oxford and Cambridge, some 13,000 people, or 40 per cent of the applicants, had been refused entry to the universities at the beginning of the 1955-56 session. Of these 2,000 were overseas applicants, and information about them is not available. Of the remaining 11,000, about 25 per cent had not the necessary qualifications for entry, and for another 44 per cent the qualifications were uncertain. Another 21 per cent did have the qualifications but had not been offered a place. A final 10 per cent had been offered a place, but had not taken it up.

It is these last two categories—totalling 31 per cent—which raise the question of whether good university material is being wasted. Of the 21 per cent who were qualified on paper, some no doubt were rejected on the ground that they made a poor showing at an interview, or had clearly been unduly crammed to get their "A level." But others may just have been unlucky in where they lived, for some local authorities are much more ready to give major awards than others. Most of the 10 per cent who had been offered places, on the other hand, seem to have got to the university or university institution twelve months later. But no doubt there were a few where a boy or girl of middle-class parentage did not take a vacancy because his father's income was just too high to qualify for assistance, but too low to pay full fees without prejudice to the education of younger children.

★

The report is factual and does not discuss policy. It shows that there is a small reservoir—perhaps 2,000 or 3,000 people—who at least fulfilled London minimum entrance requirements (used in the report as a touchstone), but who failed to get a place anywhere. Yet, oddly, there were roughly an equivalent number of unfilled places at the universities. At first sight this looks like a problem of re-sorting. But places and applications are not completely interchangeable. It is evident from the survey that there are still relatively too many arts places in British universities, and too few for the demand in such subjects as physics, chemistry and engineering—as well as certain other scientific courses. But the problem of fitting square pegs into round holes is as nothing compared with the universities' task, beginning in 1958, of accommodating first the men no longer called up, then the Bulge and the many children now staying longer at school.

THE HEALTH SERVICE

Public Drugs and Private Patients

THE Minister of Health has promised to look again at a long-standing medical—and middle-class—grievance: that doctors cannot give their private patients health service prescriptions. In the white paper on the original National Health Service Bill in 1946 people were told that they could use part or all of the health service facilities, and many people have health service general practitioners, but pay for hospital and consultant services, or do it the other way round. The effect of the Act, however, and of the regulations made under it, is that if they pay their doctor a fee they must also pay the full cost of the drugs he prescribes them. This distinction has been justified on three grounds:

(1) Governments, of both parties, have justified it on the ground of cost. The effect of allowing private patients drugs under the health service has been variously estimated at from £500,000 to £3 million: the lower figure is tiny in relation to the nation's total drug bill of around £50 million, but the sum would almost certainly be higher if the length of their patients' purses ceased to be a factor influencing doctors in prescribing.

(2) Governments have sometimes argued that prescribing forms part of the treatment for which private patients have contracted out of the health service.

(3) The Labour party would not like to see private practice encouraged, and would even like to see what there is abolished—though this was not the official view of the Labour government.

The second and third arguments carry very little weight. The second was invented in order to square the Government's denial to private patients of part of the health service facilities with its pledge in the white paper. The third raises an issue that ought to be settled on its own merits—indeed, was settled in 1946-48—rather than by indirect pressure. No one wants to see a return to the two standards of practice of national health insurance days. But today, when general practice consists overwhelmingly of health service patients, the number of these who would want to start paying their doctors anything from a guinea upwards for each consultation would be tiny. A concession on health

The Economist

JUNE 13, 1857

MIDDLE-CLASS EDUCATION

"The University of Oxford, in whose bosom a certain deep intellectual democracy has long been brooding, has earnestly taken up the subject of middle-class education. Congregation has determined to establish two examinations for lads from schools in all parts of the kingdom—a first examination for lads of 15, a second for lads of 17, which would test the character of the education they have received, and give to those who pass creditably the diploma of Associate of Arts (AA), thereby distinguishing them as mere examinees of the University, from the graduates who have been trained within the atmosphere of her social influence, and who usually begin their residence at the time of life when this subordinate diploma would be conferred. We are sure that the University of Oxford will confer a great benefit on English society in thus establishing a high standard by which to test the education of our middle schools, and holding out prizes of honourable ambition for the competition of those who cannot afford either the time or the means to qualify themselves for a higher distinction by prolonged study within her walls. . . . But . . . we must call the attention to a side of the question which . . . we find everybody inclined to forget: and that is, that very large portions of the middle classes may and ought to aim at a much higher and completer kind of education than is commonly assumed as attainable by them in the discussions now going forward. . . . We contended strongly not many weeks ago that there is large room for a high middle-class education—as thorough intellectually, if not entirely of the same kind, as could be obtained at Oxford or Cambridge—and yet involving neither the very considerable expense of that education, nor the somewhat dangerous social attractions which might render men intended for business and practical life dissatisfied with their position, if educated at the older Universities. It is this want which the colleges affiliated to the University of London are so well adapted to supply. . . . We are quite sure that the kind of education which the middle classes most need—which they could gain in their own colleges without leaving their own class—would have a fresh character of its own—a breadth, a humanity, an energy which would distinguish it from all the present types of education, now mainly suited either to a literary class or a class of wealth and leisure.

service prescribing would help to preserve what private practice remains: it would not, of itself, make private practice bigger.

There remains the argument of cost. Here the responsibility lies squarely on the doctors, who are ultimately responsible for the size of the drugs bills. If they want to be allowed to write health service prescriptions for their private patients, they should produce convincing proof that they will be less carefree about their prescribing in general. In his talks with the British Medical Association on the issue, the Minister of Health should insist that *economy in prescribing* is a precondition of the Government's agreeing to the doctors' request.

BENELUX

A Union Matures

THE meeting of ministers this weekend from Belgium, Holland and Luxemburg to put the finishing touches to the Benelux economic union comes as a surprise to many people. Benelux has been with us so long and has been so overshadowed by grander projects that it is odd to be told that it is only now taking final shape.

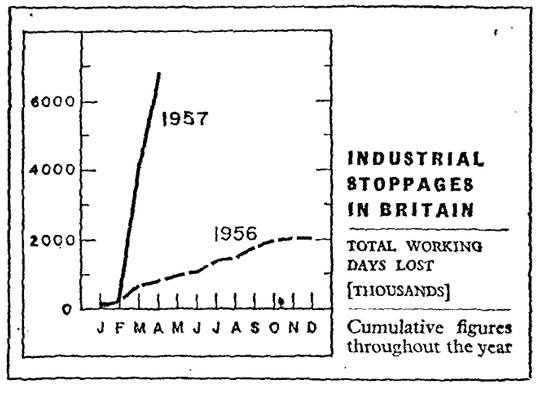
The new treaty, it seems, is unlikely to bring important changes. The committee of ministers from the three countries, the parliamentary body which met for the first time earlier this year, the council of economic experts and other executive bodies which already exist will merely be dignified with new titles and more precise powers and supplemented by a new court of justice. But the treaty is more remarkable for caution than for new departures. Decisions in the committee of ministers have to be unanimous. On agriculture, where the greatest problems have arisen and where complete economic union is still remote, no new decisions to force the pace seem likely. Indeed, the current talks have been somewhat marred by an outbreak of the perennial row over Belgian import restrictions on Dutch tomatoes. And all the deadlines now laid down can be postponed by the ruling committee of ministers.

Despite the differences in wage costs and industrial structure between the Benelux countries, they have succeeded in creating a customs union for industrial products. But they have done so, not by imposing supranational decisions on each other, but by the willingness of each national partner to make concessions and see the problems of the others, by a conscious modification of national economic policies in certain fundamentals—Dutch wages policy, for example—and by the patient devising of empirical answers for difficulties as they have cropped up. It has been a slow task.

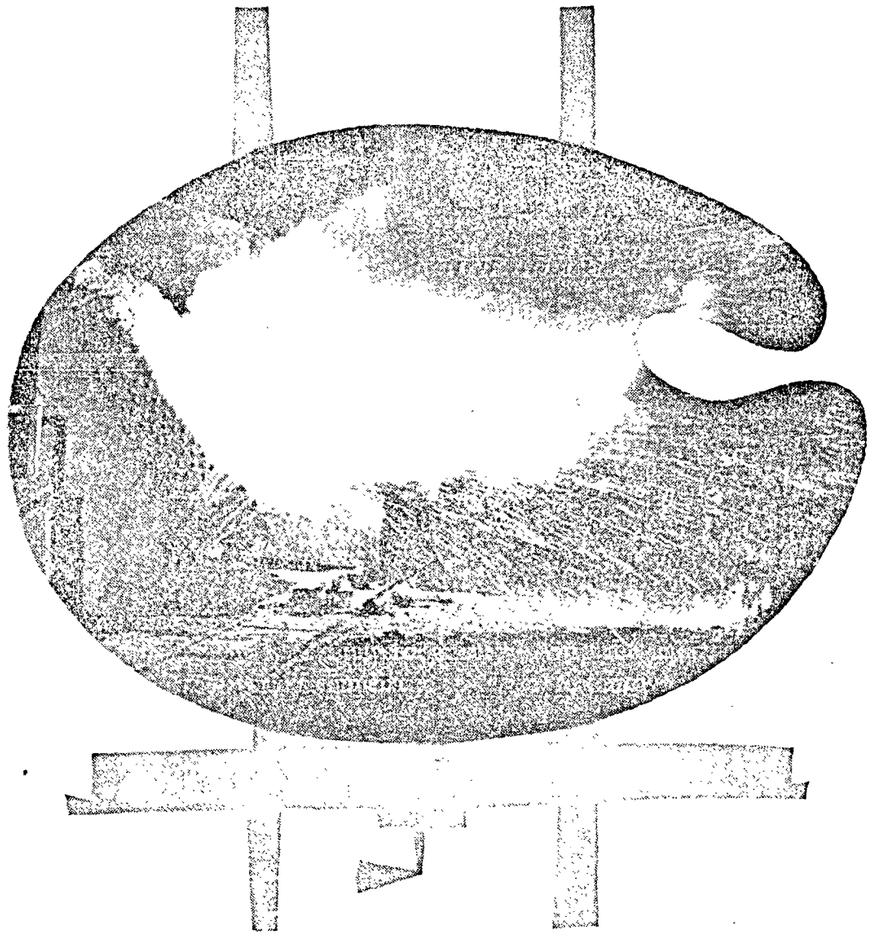
FINLAND

Finns Forbear to Cheer

THE visit of Mr Bulganin and Mr Khrushchev to Finland was arranged last summer as part of a tour of all the Scandinavian countries. The other invitations were tacitly withdrawn after the invasion of Hungary, and the Soviet leaders did their best to use their visit to thaw the arctic chill which has come over their relations with Scandinavia. They did not succeed, and the joint statement at the end contained polite platitudes only. The Finnish authorities did what they could for their guests, redecorating a villa, removing some sculptures which might have given offence, and providing a banquet for each night of the week. But the citizens of Helsinki, unwilling to co-operate, refused to Mr Bulganin and Mr Khrushchev the friendly welcome which they extended to Marshal Voroshilov last summer. The crowds in the streets have been small and usually silent; Soviet handwaving has been coldly ignored.



The Finnish prime minister, Hr Sukselainen, is in office largely as a result of the Soviet visit. He formed an uneasy coalition of the Farmers party and the bourgeois parties, which controls only 79 of the 200 seats in the diet, when it became apparent that the leading party, the Social Democrats, would not be able to compose their internal differences, or settle their disagreements with the Farmers, before the Russians arrived. The new government cannot last long without more support and it is in no position to push through the emergency measures which are needed to provide essential funds for the almost bankrupt administration. There is an immediate need for £12 million; family allowances have had to be suspended for a month because there is no money to meet them. The prime minister may have found it hard to give his full mind to the entertainment of his visitors.



GERMANY

Liberals look to Bismarck

THE shade of Bismarck was more than once conjured up by speakers at the German Free Democrat pre-election party congress at Hamburg. With more élan than ever the nationalist foreign policy, the goal of a reunited Germany balancing between east and west which has become the heart of the party's programme, was flourished before the electors. Like the Social Democrats, the liberals appeal for a new drive for reunification and bitterly attack Dr Adenauer for his failure to achieve it. They make great play with Russia's need for security and deride the west's lack of realism when it demands from Russia free elections in a reunited Germany which would be left free to decide its own military status. The need for Germany to build up better relations with Poland and other east European countries in its search for a settled place between east and west is also gaining importance in liberal, as in socialist, conceptions. But the Free Democrats spice their dish hotter than Herr Ollenhauer, as one of their new slogans, "Germany before Europe," shows.

Close as they now are to the Social Democrats in foreign policy, the liberal leaders reject socialism in domestic

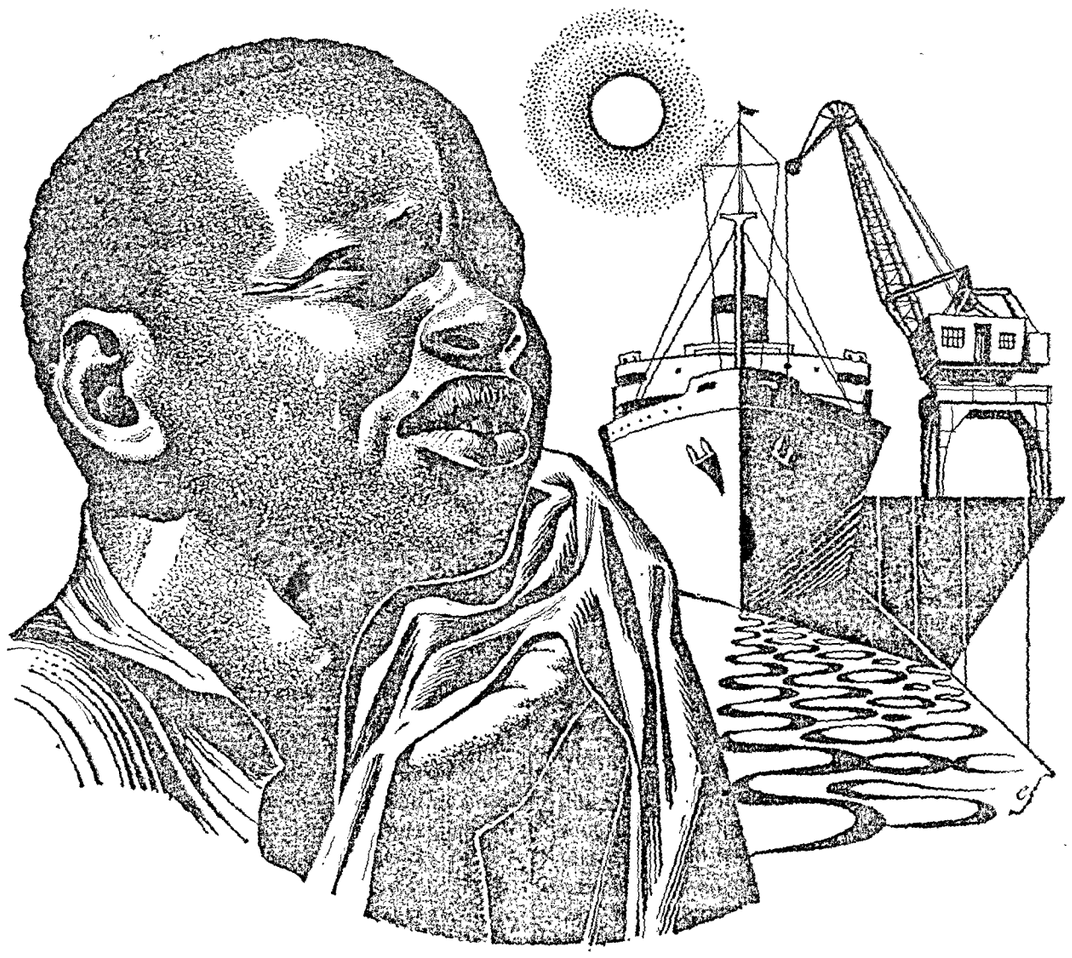
The modern art of steelmaking

STEELMAKING in Britain today is a highly complex operation which demands the co-ordination of many special skills. And it is an industry which is constantly and rapidly developing.

The new look in steel

The latest technical advances are lending their aid. The use of radio-active isotopes is replacing guesswork in estimating the internal wear of blast furnaces. Advanced instrumentation is speeding and smoothing production. Physical and chemical pre-processing of the raw materials used for steelmaking is reducing fuel bills and improving the end product. Thanks to new methods, fuel consumption per ton of steel has been reduced by 15% since the war.

At the same time, steel is contributing to progress in other fields. Thousands of tons of British steel have been built into our new atomic power stations—and many more thousands of tons will be used in the future. Stainless and heat-resisting steels are provided for the aircraft industry. New steels are constantly under development for a thousand and one special needs.



The whole industry is taking part in a great expansion and modernisation programme to meet the still growing demands for steel. The modern art of steelmaking depends on men with the will to work, with faith in their own abilities — and with vision.

Steel is judged by its performance

Cargoes sweat too

And when they do, rust, staining and other damage may be the result. "Cargo sweat" occurs when ships pass from cold to warm climates. A change from warm to cold can cause condensation on the ship's structure, known as "ship sweat". Shipowners have found the answer to both problems is Thermotank Drihold equipment. This maintains close control of ventilation and drying to ensure that condensation cannot occur. Control of the atmosphere for comfort or industrial processes is the business of Thermotank—on land, sea and in the air. The Company pioneered the first air conditioning of ships more than fifty years ago. Today Thermotank maintain an unequalled service covering every major shipping route throughout the world.

CLIMATE MADE TO MEASURE

natters as decidedly as ever. As far as future political alliances are concerned—a coalition with either right or left—they remain on the fence, their declared political goal being to hold the balance between the two great parties and thus enjoy a decisive voice in any future government. The voters may not grant their wish, but the party is more united in the pursuit of it than it was a year ago.

RHODESIA

Ominous Portent

THE result of the by-election for the seat of Mrewa in the Federal Rhodesian House of Parliament came too late to be discussed in last week's debate at Westminster on racial policy in East and Central Africa. But it provided an ominous portent. Mrewa was the third by-election lost by Sir Roy Welensky's Federal party in the present parliament, and the swing away from his moderate policies of partnership—much as they are criticised by British Labour MPs—was marked. Mr Winston Field, the leader of the Dominion party, whose policies are far more towards apartheid, converted a Federal party majority of 690 to a Dominion party majority of 132. On such tiny constituencies the normal rules of psephology may not apply—but such a swing in a general election would sweep Sir Roy into the discard.

It would therefore be unwise for Britain to make Sir Roy's position any more difficult, in the interest of the Africans themselves. In the debate, Mr Lennox-Boyd made it clear that he is opposed to racial discrimination, but took care to quote the approval of Labour members for some system of differential franchise in order to protect the white minority from being swamped by African votes. Labour in Britain, however, is now strongly opposed to Sir Roy's proposed method of achieving this: under his proposals African votes could not immediately be expected to account for more than about a third of the votes in any constituency. But it is pretty evident that the British Government is prepared to concede some such scheme; and then—having arranged for this sort of enfranchisement for "British protected" Africans in Nyasaland and Northern Rhodesia—to enter into a bargain to give the Federation more independence.

Labour members were no doubt right to point out that the whites in Central Africa have about three or four years to win the support of the Africans. Sir Roy Welensky knows this. The difficulty is to persuade the white electorate to think along the lines of British parliamentarians: as Mrewa should suggest, its thought is at present veering in precisely the opposite direction. If it discards Sir Roy Welensky, and sets out under some new government down the South African road, then it is nonsense to suggest that a Labour government in Britain—which obviously could never send troops and would merely find itself bleating piteously—could do anything positively "safeguarding" about it.

OXFORD APPEAL

Crumbling Spires

OXFORD UNIVERSITY has this week launched an appeal for £1,750,000 to save its historic buildings, and has proved its point with some grim photographs of the crumbling façades. Part of the trouble is that many of the colleges were built between the fourteenth and eighteenth centuries of Headington stone, which is very soft. A more contemporary mistake is the complete failure to agree on measures that will prevent the buildings from being shaken to pieces by heavy traffic. In these ways Oxford colleges are worse off than Cambridge; they are worse off, too, in that they are not on the whole so well endowed as Cambridge colleges, and they meet some of the salary payments for lecturing staff which at Cambridge fall on the university. Oxford colleges are thus starved of resources to maintain their buildings, and the University Grants Committee is unable to help; the money at its disposal is granted by Parliament for the maintenance of the universities as centres of advanced education and research, and it does not feel that it can stretch this definition to cover the upkeep of buildings solely because they are of historic interest. Common desperation has thus united the colleges in this appeal.

The appeal is addressed in the first place only to Oxford graduates, who are asked to contribute, either by capital sum, bequests or by a ten-year covenant, however small. But a wider response will probably be needed—and, on past form, is likely. One of the surprising features of this impoverished land is the ready response to appeals for preserving historic buildings, and Oxford, of all places, can surely be confident that its friends all over the world will not allow it to crumble away.

SHORTER NOTES

This week's wage settlement in the shipbuilding industry is designed to save some of Mr Ted Hill's face, but not very much of it. In effect, Mr Hill has decided after all to accept the 11s. offered by the employers in return for a wages standstill for one year and a promise to hold discussions about restrictive practices. Very similar conditions were accepted three weeks ago by the engineers, and were described by Mr Hill as an insult. But he lays great stress on a clause in his agreement promising a fresh review if "special factors" arise; he claims that this means that the standstill in shipbuilding will last only so long as the cost of living and profits are stable. The employers are not likely to agree with this interpretation, and plainly do not anticipate that they will give another rise until the engineering workers get one, too.

★

The Minister of Education and his Parliamentary Secretary announced in their respective Houses of Parliament last Thursday that a three-year training for teachers will be introduced in 1960. Is this the long sought-for graduate status for all? A memorandum of the Association of Teachers in Colleges and Departments of Education foresees only "a developing connection" between the three-year course and graduate status, but thinks that the course as a whole should reach pass degree standard. It should be composed, says the memorandum, of three elements. About a third of the time should be spent on the study of education, in theory and practice. The other two elements are research into methods of teaching and learning, and "curriculum courses" dealing with the content and importance of various subjects.

LETTERS

Mr Mboya Rampant

SIR—In your issue of June 1st you refer to the situation in Kenya and to myself in particular.

The attitude of the African elected members to the Lyttelton constitution is not demagogic. The Asian elected members and ministers, the Arab elected and nominated members, the Indian Congress and the Muslim League, all support our demand for increased representation without qualification. The Europeans are the only group who have not made their position known. The reason for this is not hard to guess, since for them a change such as we suggest will mean the end of many years of political domination.

It would seem from your article that you read into our demand a move towards black domination. This is far from true. We seek for Kenya a democratic state and society. We want to see in our country each individual accorded basic human dignity and equality. We have constantly stated that although this is our objective we accept that an interim period of constitutional change is inevitable. It is in this period that we accept the continuation of communal representation and communal rolls, later to be replaced by geographical constituencies and a common roll. How long this takes depends on local conditions and the political atmosphere. We insist, however, that the process of change must not depend solely on the European community. We must have a part, not only in the determination of its scope and content, but also in its implementation.

This we can only do when we have an effective voice in the legislative council. Standing orders, for instance, require that for a vote on a division a member requires the support of at least nine others, under which circumstances neither the Africans nor the Asians on their own would secure a division, let alone a majority vote on the unofficial side of the house, even when the two combine. Apart from this constitutional anomaly, there is the question of the effectiveness of African representation, in view of the population, size of constituency, mode of communications, etc. Are all these arguments to be regarded as demagoguery?

Your article further implies that some of my speeches have been directed at stirring up the Africans to violence, threatening the government or advocating non-co-operation with the administration. The European minister without portfolio (Group-Capt Briggs—elected member for Mount Kenya) recently made similar charges against me, but in the debate on May 30th the government failed, in my view, to substantiate its charges. I do not and have never advocated violence as the means to achieve the Africans' objective.

I hope that you agree that Kenya is primarily an African country. I have never suggested that anyone should be evicted because of his race or colour. I only state that white settler domination must go.—Yours faithfully,

Nairobi TOM MBOYA

China's Sorrows

SIR—The object of the author of your article of June 8th was no doubt to encourage the non-communist world by showing up the incompetence of the present government of China and exposing the utter mess which they are alleged to be making. Having quite recently spent some weeks in China, I am convinced that the general view given is distorted, and is as misleading and dangerous as the silly nonsense which similar pundits used in the thirties to produce about the inefficiency of technology and industry in the USSR. Those reports were often similarly documented with a partial use of official Russian material.

The fact of the matter is that, like the Russians, the modern Chinese are making a vigorous and not unsuccessful effort to bring their more or less mediaeval economy up to a twentieth-century standard. We ought not to allow our dislike of communism to blind us to this fact. In doing so they are no doubt making numerous mistakes, mistakes which in my experience they are at least as ready to admit as any western government. But I have not yet met anybody who knew the China of Chiang Kai-shek and who knows present-day China who does not agree that the living standards of the people as a whole have been raised appreciably, that substantial industrial progress has been made, and that even in agriculture unexpectedly larger crops are being produced. This latter achievement is in its way the most remarkable, because, as your correspondent points out, the population has increased by many millions. Yet in spite of flood difficulties and the absence of substantial assistance in the shape of grain, such as India has achieved, the people are obviously well nourished. Incidemally, the drive for birth control, at which your correspondent sneers, is obviously an encouraging and healthy sign.

It is of course true that a visitor sees what he is shown, and I may have brought away too rosy a picture. But one does see realities, not sentences picked out of speeches—the mile-long rail and road bridge over the Yang Tze River at Hankow, commenced in the autumn of 1953 and already nearing completion; the fine new cotton mills at Sian (working the clock round, too); the new buildings going up in the universities and technological institutes (a great deal of new building was going on everywhere we went), etc., etc. These things are, after all, of some significance, and if the visitor keeps his eyes open he sees many things which confirm the impression of energetic expansion in many aspects of the Chinese national life. For example, he sees that the shops are full of consumer goods, much fuller than the Russian shops, even if the quality is not always of the highest; and also that they are crowded with purchasers—possibly due in some degree to the inflation to which your correspondent draws attention, and which is not unknown in the West.

I am afraid that without a better attempt to show the other side of the medal your correspondent is only too likely to "induce complacency," against which, as a sort of afterthought, he warns us in his concluding paragraph.—Yours faithfully, CHORLEY

Stanmore, Middlesex

★

SIR—There is an aspect of the China trade decision which seems to have been ignored by both the Lords and Commons, yet is of vital concern to us in Australia. Economic deterioration in Communist China could result in disintegration and the increasing unrest lead to mass risings against Peking. Increased trade with Communist China, whose aggressive plans are constantly mentioned by our Minister of External Affairs, could assist the Communists to weather the storm.

No doubt, many items, hitherto on the embargo list, reach China from both Russia and South East Asia, but this is beside the point. It is no valid argument to give her more. Fifty per cent of the Shanghai factories are at present idle, owing to shortage of raw materials and machinery. Does Britain propose to supply these? Steep rises in living costs, ranging from 27 to 100 per cent, led to the dismissal of Commerce Minister Tseng Shan and to Vice-President Chen Yun's announcement of the austerity programme "Produce More—Eat Less." Peking press admits that food and fuel queues form at 4 a.m., and in the north railway carriages have been broken up by angry mobs in search of fuel. Communist officials are stationed in all banks to persuade people against withdrawing money. China will not be able to meet her commitments to Russia and East European countries this year.

Is it wise to supply Communist China with the means of carrying on? Would it not be a more statesmanlike policy to allow the Peking regime to destroy itself and thus remove the greatest potential threat to the future security of Australia? The present British policy may serve certain interests here, but it will alienate much Australian sympathy and turn the eyes of an increasing number of Australians towards America.—Yours faithfully, W. G. GODDARD

Coal Must Compete

SIR—The article in your issue of June 8th draws attention to the increasing proportion of small coals in the National Coal Board's production, and to the domestic demand for large coal.

There are four ways in which the resulting problem can be attacked. The Coal Board is taking steps to limit the extent to which coal is broken up in the process of mechanised mining; to divert large coal from other consumers to the domestic market; and to produce manufactured fuels from small coal. The fourth way, which is perhaps the simplest, is to encourage householders to put in modern appliances that will operate efficiently on smaller coals of the "doubles" type.

The reason for the domestic preference for large coal is that when it is in large lumps it burns slowly, because of the relatively small surface in proportion to weight, and that faster burning, when desired, can be secured by using a poker to break the lump and thus expose a greater surface. This is a very primitive and unscientific method of controlling combustion. A far better way is to adjust the air supply to the fire: not only can faster burning be secured by increasing the air flow, but the process can be reversed when, for example, a room is to be left empty for some time, during which only a small heat output is desired.

Appliances recommended by this council will burn small coal such as "doubles" very efficiently. The universal adoption of modern appliances, especially those of the convector type, would make a very great contribution towards the solution of the problems of house coal supply.—Yours faithfully,

J. S. WILLIAMS

Coal Utilisation Council, Director

London, S.W.1

New Town

SIR—May I comment on two points in your correspondent's report on Harlow.

If, as I believe, the "community centre idea" may be condensed into the statement that there should be a suitable building which is administered by the people through their voluntary organisation in order to help people to make friends and to realise themselves as part of a community, then I think the community centre idea in Harlow is working well.

Secondly, while I am, of course, flattered that I should be credited with being in the old garden city tradition, I wonder what is meant by "middle class." Apart from myself, at the Activities Committee which your correspondent attended, at least half of those present were manual workers or the wives of manual workers and the others certainly live in the same sort of accommodation as the "working classes."—Yours faithfully, E. SEWELL HARRIS

Mark Hall and Netteswell

Community Association, Harlow

BOOKS

The Springs of Industrial Progress

Industry and Technical Progress
By C. F. Carter and B. R. Williams.
Oxford University Press. 252 pages. 25s.

THIS book is as worthy as might have been expected, and a great deal more readable. It had its origins in a decision by the British Association nearly five years ago to set up a committee "to study the problem of speeding up in industry the application of the results of scientific research," a question to which more anxiety has been devoted by technologists in this country since the war than perhaps any other except the difference between British and American labour productivity. This committee first drew up a programme of study and obtained a promise of financial aid from the Board of Trade under the "conditional aid" scheme for spending against the counterpart accounts deriving from American economic aid to Britain. Subsequently Nuffield College and the Royal Society of Arts joined the "British Ass" as sponsors; a programme of research, based essentially upon "case studies" of 152 individual companies, was carried through; further money was obtained through the Department of Scientific and Industrial Research and later the Treasury; and the terms of reference of the inquiry were widened (though the present volume is concerned primarily with the original question that the committee was set up to consider).

No set of answers to this question could achieve finality; moreover, the case studies were chosen to enrich the committee's understanding rather than to offer any comprehensive statistical coverage. The only "authority" that can be sought in such matters is clear and qualified judgment without preconceptions, informed by constant access to experts and details of individual experience. This Professors Carter and Williams offer. What they have written is a good deal fresher and less hedged than a formal report; wisely, the committee left the writing and detailed responsibility for the conclusions to its two directors of research, and these in their turn have not confined themselves at all strictly to the necessarily limited results of the case studies.

Their main achievement here is to have sorted out the factors that may have a bearing upon the speed of application of technical progress in British industry—ranking these factors in order of importance rather than by the extent that it may be practicable to do something about them. They have not accepted at face value the assumption that British industry is backward or slow to apply the results of research. But they have concluded that it is uneven in its development, and that "although all countries must expect to have some unprogressive firms, we do not think that that justifies the parochialism of large tracts of British industry." Nor do they accept the generalisation that Britain excels in basic research and fails in applying it. Some of Britain's failures to exploit results originally achieved here have come, they think, from not carrying the basic research far enough. (This conclusion seems partly a matter of verbal nicety. The pursuance of "basic research" to the point where "applied research" takes over still seems rather often to have happened in the United States, and indeed inside industrial laboratories there.)

The authors, moreover, are inclined to dismiss as uncertain or unimportant certain of the factors commonly alleged to impede scientific and technical progressiveness: for example, particular forms of management structure, the size of firms (although it seems harder for small firms to keep technically lively than for large ones, some manage to), high taxation upon company resources or anyone's incentives, or the lack of scientists and technologists on the board. They are less anxious than some about improving the communication of research results, considering the receptiveness of different firms to be more important: a progressive firm is likely to find out fairly quickly anyway, and better abstracting, indexing, or simplification of language will not persuade a parochial firm to do anything about what it is told. Nor do they think that "the shortage of capital" seems in practice to affect technical advance in any but young and small firms—and these perhaps mainly because families are often unwilling to give up control in order to obtain fresh capital.

What factors, then, do they consider really matter? First, the general quality of a firm, in management and salesmanship as well as in research; science is not an optional extra, but one of the attributes of a good firm. Secondly—to some extent a counsel of perfection—the closest possible gearing of research to a firm's production and sales policy, really effective use of the research resources it can employ, and economic as well as technical assessment of new projects. Third, the extent to which firms rely on outside suppliers

(in particular upon the plant manufacturing industries); one parochial company may weaken technical progress in a whole chain of others. Fourth, the general climate of opinion; if a firm needs to be technically progressive to keep its reputation, this puts indirect pressure even upon industry's backwoodsmen. From their case studies the authors found, encouragingly, that the old saw about the advantage of being second, and letting someone else take the risk and cost of research, is an unwise one; financial success, in their small sample, did appear to be correlated with technical liveliness. But by the same token backwardness is self-perpetuating; in a host of ways—including the important one of being able to attract good minds—a technically backward firm finds it most difficult to pull its socks up.

Being able to educate, attract, and train the limited number of good minds to be had is inevitably selected by these authors as the key national problem, too. They find the British educational performance, on most counts, significantly inadequate, as so many other students of this question have done in recent years. Their assessment of the need for scientifically trained men—and women—looks beyond the laboratory. Whether or not he is needed on the board, they are convinced that the scientist is needed in production management and in sales before Britain can really count itself "a progressive economy." Progress among firms and perhaps in an economy, they have recognised, is all of a piece. They recognised, too, but have left aside for later consideration, the extent to which expansion in an economy makes innovation easier.

St Paul's Old and New

A History of St Paul's Cathedral

Edited by W. R. Matthews and W. M. Atkins.
Phoenix House. 403 pages. 50s.

ST PAUL'S has had many historians, for so many-sided a subject must always attract them, but the present team is the first to tackle what has usually been an individual's task. The result is inevitably uneven. Sir Ernest Barker's ten-page foreword is pleasantly evocative. Professor C. N. L. Brooke ("The Earliest Times to 1485") omits the shadowy story of Roman London to concentrate on the twelfth and fifteenth centuries, for which there is most material. Throughout his pages the cathedral is shown as a place of pilgrimage, with many shrines and an increasing number of chantries, a home of learning, if it developed no great school. The bishopric itself was not wealthy, but the attraction of a canonry at St Paul's was great. Some of the prebends were well endowed and London and Westminster were centres of power and patronage. The struggle of pope, king, bishop and magnate to reward their servants with nomination to a vacancy is a constant theme, matched by the success of the resident canons in reserving to themselves, as against such non-residents, the bulk of the revenues. Here Mr Brooke's own researches add much to a tale of notable as well as scholarly interest.

For the complicated years 1485-1660 the Rev. E. F. Carpenter faithfully follows the work of earlier historians. If the life of Dean Colet's cathedral is described in part from material which in fact concerns the following century, the description is graphic and possibly timeless. The temporal and spiritual disruption brought by the Reformation was followed in 1561 by the destruction, through lightning, of the famous spire and much of the roof. Thereafter the building was a financial white elephant, taking in repairs all that could be raised and still requiring more. Laud and Inigo Jones did much, but neglect in and after the Civil War left all to be done again.

This led in turn to the general problems of reconstruction, both of Anglican life and of the cathedral's fabric, treated by the Rev. A. Tindal Hart on the years 1660-1831. The ruin of the building by the Great Fire of 1666, the controversy over repair or a new building, Wren's appointment and the long years of his work—this is familiar ground trodden firm by older historians and here enhanced by occasional touches from modern works. Much is biographical with brief accounts of notable deans, but room is found for a slender sketch of the cathedral's officials in the eighteenth century.

For the years 1831-1934 the Rev. W. M. Atkins fills the gap left by the death of G. L. Prestige, skilfully summarising the latter's study and adding a section of his own covering 1911-1934. This century, when Canon Sydney Smith was the motive force in the difficult years brought by the Cathedrals Act of 1840, when the city gradually ceased to be a place of residence and the dean and chapter faced new problems with sincerity and success, provides one of the most stimulating of the book.

Of the last twenty years, the Dean writes vividly. Whether the whole book is as successful as his contribution may be questioned. A definitive history should, throughout, be up to date and stamped with authority. Yet though space is obviously precious, some sections are repetitive and few contain the references demanded by good sense as well as good scholarship. The bibliography can include a school book and ignore valuable primary material. Mistakes are distressing. Good, if mainly standard, illustrations include no plan of the cathedral precinct and no map to show its property. The frontispiece is the view condemned on page 350 as the least pleasing. The result is a convenient one-volume work, stimulating in places, pedestrian in others, much better than no work, and showing what a superb story there is to tell.

Paladin and Peer

Henry Brougham

By Frances Hawes. *Cape.* 325 pages. 25s.

IN a set of verses on the death of Henry Brougham in 1868, the editor of *Punch* called him the most faithful of all the paladins and peers of good causes in his age. It was a true comment, although it was in a very different vein from most of *Punch's* earlier judgments on him. Brougham, who never wished to be elevated to the House of Lords, would greatly have preferred to be called a paladin than a peer. Growing up with the century, he had identified himself with "the march of improvement" when it was still a topic of satire: by the time he died it was the orthodox philosophy of mid-Victorian Britain.

Mrs Hawes has produced a competent biography of Brougham without adding much to existing knowledge or illuminating the dark patches of his career. She rightly lays stress on the part he played in developing political propaganda, in encouraging the spread of popular education, in fighting for the abolition of slavery and in initiating legal reforms. She devotes only thirty-four pages, however, to the last thirty-eight years of his life, years when he was in the political wilderness. These years have a curious fascination and a far from insignificant place in his record of devotion to good causes. Brougham is one of those historical characters, along with Wordsworth, whose old age is quickly dismissed: in his case, however, there was no abandonment of earlier objectives, rather a restless and uncoordinated attempt to see them through. The Law Amendment Society and above all the Social Science Association deserve fuller treatment than they receive in this book; so do Brougham's own voluminous writings.

The enigma of Brougham—and there still is an enigma—rests in the relationship between his personality and his ideas. For every eulogy he received, posthumous or otherwise, there was a sneering condemnation. He was called "Wicked Stiffs," "Mr Facing-both-ways" and even "Beelzebub." The attacks made on him can partly be explained on social grounds—he was an interloper in the Whig household—but it needs psychology as well as sociology to explain his unsettled egoism and the distrust he inspired in so many of his contemporaries. "Somewhere in that complex nature," says Mrs Hawes, "there was a flaw." She is led to believe that the weakness lay in his overweighted mind rather than in his inner heart. As early as 1830 Grey believed him to be "mad" and the comment was repeated on many subsequent occasions. "I'm not mad, am I?" cried Brougham himself to Melbourne in 1835, "You don't think I'm mad?" It is a question which Mrs Hawes never fully and frankly answers, although she touches on it time and time again. It seems odd to ask for a medical report on a man who lived to a ripe old age, presided at the Social Science Association's meeting at the age of 87 and died quietly in Cannes, then a fashionable resort, which he had "discovered" as a small fishing village thirty years before. Yet a biography of Brougham involves an unrelenting exploration of oddities, and there is still much more to be found out than is covered in this useful biography.

The Scrolls Themselves

The Scriptures of the Dead Sea Sect

By Theodor H. Gaster.
Secker and Warburg. 359 pages. 30s. cloth, 10s. 6d. paperback.

NOW, at last, the layman can read the actual words of the Dead Sea scrolls instead of reading about them. He can advance on his own into that exalted and apocalyptic world of messianic expectations and sectarian fervour in which Christianity struck root. Not altogether on his own, for Professor Gaster surrounds his lucid translations with prefaces, notes and historical commentaries. In the welter of disputation, he takes a modest and latitudinarian stand. The texts were composed between 170 BC and AD 68; they are intimately associated with the rites and eschatology of the Essenes; they illuminate the complex and transitional spirituality whence arose the mission of John the Baptist; but they "contain no anticipation of or parallel to distinctive Christian doctrines, e.g., Incarnation, Vicarious Atonement or Communion."

It is on this last point, where he opposes the brilliant thesis of Edmund Wilson, that Professor Gaster is most controversial. But his translation scores heavily. It had been thought that the "Manual of Discipline for the Future Congregation of Israel" contained both an anticipation of the Eucharist and an allusion to a Messiah begotten of God. Professor Gaster argues with considerable weight of evidence that both notions were founded on unsound conjectures and positive misreadings of an incomplete original. He is similarly persuasive when he points out, by mere juxtaposition of citations, that parts of the Essene vocabulary which were thought to reflect a "pre-Christian" theology are contemporary commonplaces. No previous work on this fascinating subject has done as much to restore the Scrolls to their temporal context.

Professor Gaster seems, however, to be on shakier ground when he insists that the famous references in the Habakkuk scroll to the "house of Absalom," "the Kittaeans" and "the priest who rebelled" are to be taken in a generic and symbolic sense. The tone of the text, its graphic vehemence and obvious topicality simply do not bear him out. Behind the language of symbolism and Biblical reference there do seem to move specific personages and there do seem to burn specific indignations. In his appendix, moreover, Professor Gaster appears to be moving toward that point of view.

His work raises once again a fundamental question: are the Scrolls from the Dead Sea of literary value? Do they add to our scriptural heritage? The answer hinges on the Book of Hymns which Professor Gaster renders in a simple but slightly archaic language. At times, one feels that the passage could come straight from our Bible:

> My transgressions, my iniquities and sins, and the waywardness of my heart condemn me to communion with the worm and with all that walk in darkness.

But more often the original seems to have represented a declining tradition.

Whatever their literary merit, these translations make it possible for laymen to share in what has become one of the major adventures of modern scholarship. And the intensity of the original experience endures; perhaps because our own time has its part of apocalypse:

> What nation likes to be oppressed by a stronger power? Or who wants his property plundered unjustly? Yet, is there a single nation that has not oppressed its neighbour? Or where in the world will you find a people that has not plundered the property of another? Where indeed?

Hands and Mouths in Jamaica

The Population of Jamaica

By George W. Roberts.
Cambridge University Press. 378 pages. 40s.

THE subject-matter of this book is of critical importance in the modern world, since it deals with the malady that is now characteristic of most tropical areas: in Professor Kingsley Davis's words, "the combination of rapid population growth with widespread poverty." As vital statistics officer of the British West Indies Development and Welfare Organisation, Mr Roberts is able to analyse the Jamaican data in the light of information from other parts of the Caribbean region; furthermore, he brings to his tasks a scholarly mind, reinforced by professional contacts in Great Britain and the United States. The result is a penetrating work based on sound methods, in which, moreover, as much attention is paid to historical origins as to current trends.

Mr Roberts writes with an evident sense of responsibility, and an awareness of the significance of the problems with which he is confronted. This must be emphasised, as his conclusions will shatter the last shred of complacency concerning the future of the people of Jamaica, and the many others which display similar demographic characteristics. The facts speak for themselves. In brief, on the assumptions that fertility will remain constant, that mortality will decline, and that there will be no migration, the addition to the population between 1951 and 1971 (822,000) "is not far short of the total increase in the island's population during the century 1844-1943." If, on the other hand, declining mortality, declining fertility, and constant emigration from 1956 onwards are assumed, the increase would be reduced to 496,000, which represents, even so, an increase of 35 per cent.

Increasing industrialisation and urbanisation may be expected to reduce fertility quite substantially, unless they are counterbalanced by other influences. These other influences, however, are only too evident. A steep decline in the number of women in employment, together with the possibility that "the idea of marriage as a binding element of family life may spread," leads to the further possibility that "the fading of the institutional checks on fertility will attend rising industrialisation and offset any fertility declines that may be expected to develop." Both population projections "emphasise that the major problem of population growth in Jamaica is the growing numbers of potential workers."

It is to be hoped that Mr Roberts's temperate and exact statement of Jamaica's problems will receive the widest and most careful consideration.

Instinct versus *Conscience*

Segregation

By Robert Penn Warren.
Eyre and Spottiswoode. 88 pages. 9s. 6d.

THIS little book is the product of a journey through the South undertaken for *Life* magazine by an American novelist who came originally from the border state of Kentucky. Its value lies

entirely in its shrewd selection of interviews that bear the unquestionable marks of authenticity. The surrounding prose is breathless, hysterical and mercifully short. The comment after an expressive quotation is frequenty banal. The interview the author has with himself at the end is the only one that rings false. But the book should nevertheless be read by anyone interested in the South for the sake of the moving, pathetic and occasionally hopeful voices it records.

They reflect the fact that the white community is going through one of the most painful of social experiences, the imposition of law without consent. They display also the resentment of ordinary people that they should be forced out of the shadows of anonymity to become the battleground of conflicts of loyalties and instincts of classical intensity. Many of the people that appear in this book are harried by a guilty conscience about the treatment of the Negroes. At the same time they are repelled by instinct or experience from the conclusion that the Negroes they know about them can possibly be their equals. "I feel it's all happening inside of me, every bit of it," Mr Warren was told by a girl in Mississippi, and a small business man in Louisiana remarked: "You might say, it's the psychology of it you can't stand. Getting all split up."

Mr Warren has captured faithfully the variations in the moods of the whites. But, although he is sympathetic enough, he did not really penetrate the front which the Negroes offer. It is doubtful if any white man, whatever his views, now can. Certainly the only penetrating writing about the divisions, doubts and aspirations in the ranks of the oppressed has come from a handful of Negro journalists.

The most hopeful remark in the book comes from a school superintendent in Kentucky, about to face the practical problems of desegregation, who said: "A man can hate an idea but know it's right, and it takes a lot of thinking and praying to bring yourself around. You just have to uncover the unrecognised sympathy in the white man for the Negro humiliation." And the most pathetic is from a woman in Mississippi who gained comfort from the thought that a film being shot locally was "the only movie ever made here that didn't criticise Mississippi." The film was *Baby Doll*.

Landowners and Peasants

Land Reform and Development in the Middle East

By Doreen Warriner.
Royal Institute of International Affairs. 206 pages. 18s.

MISS WARRINER'S survey of the land problems of Egypt, Syria and Iraq subordinates political issues to her subject but cannot ignore them. She is constrained to point out that in Iraq, where the government wisely sets aside a major proportion of its oil revenues for development, the power and privilege of the landowners are untouched, except to the extent that development draws some of their labourers to the towns. Not even the radical governments of Syria have been able to break the oppressive power of the landowners in the old cultivated regions of the south and centre. But in Egypt, the Agrarian Reform law did greatly diminish the dominance of land-owning groups, which, in thirty years of parliamentary government, did not pass one measure to better the miserable lot of the *fellahin*.

The revolutionary dynamic came from Egypt because "it is the advanced agricultural country which has no oil, and no money for the big development it so urgently needs." Land reform could not alter the fundamental fact that *there were too many* people on too little land and that the situation was worsening. In that respect, as Miss Warriner states, the High Dam is vital to Egypt's future. Reform did, however, increase the net *income of more* than 4 million tenants, either by providing them with land to farm or by reducing their rents. It was, in short, a social as well as a political success.

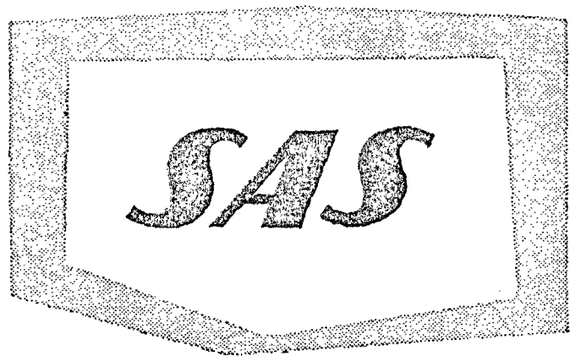
She does not suggest that the Egyptian method should necessarily be applied to Iraq or Syria. The problem of poverty, of the subjection of the peasants, is common to them and in all cases the land system is an obstacle to progress. There has been development; more than she thought possible ten years ago. She is essentially concerned with progress in the utilisation of the land. In Syria she found it was mainly private enterprise in the north which had made progress. The government has extended irrigation to a small extent and is to extend it further, but its legislation has failed to improve either the agriculture or the lot of the peasants in the older regions. The Iraq Development Board has, mainly on Lord Salter's advice, made greater efforts to distribute the immediate benefits of its massive plans; but "it is a change without direction or purpose"; an engineer's blueprint, not a combined social and economic evolution. By the deliberate intent of politicians and the operation of the land system, the power of the landowners has increased since the war. They *are* parliament, and "no legislation which could infringe on the property rights of the large landowners can secure parliamentary approval."

"There are in the Arab world," says Miss Warriner, "politicians who can speak, and some who can even act, for the fellahin." She points out that the Arab Resurrection Socialist Party, which is the hard core of the left-wing government in Syria, claims to speak for the peasants and is strongly supported by the serfs of the Homs-Hamma region, from whom the party leader, Akram Hourani, derived his earliest political dynamic. The Egyptian revolution touched off some landlord-peasant troubles in Iraq and General Neguib's picture was still to be seen in some of the hovels in the south last year.

Miss Warriner does not embark on prophecy, but she has done a useful service by showing in this context that Arab nationalism is not, as is widely believed, simply a xenophobic aberration regarding the West and Israel. There is an underlying social stimulus, and failure to give this due weight has done much to falsify British assessments of the situation. British policy, as she correctly states, still aims to shore up established positions; while Russia plays on the social "unbalances." The Egyptian regime might collapse. The West might then conclude that the conservatism of Iraq is right for the Middle East. There is danger in this. The radicalism of the area, with its roots in the oppressive and constrictive land systems, will remain potentially explosive. Even good conservatives should have a touch of revolutionary dynamism when they look at the Middle East, and Miss Warriner's study provides a justification for it.

SHORTER NOTICES

Capital: *Volume II*



By Karl Marx. Moscow: *Foreign Languages Publishing House.* London: *Lawrence and Wishart.*
556 pages. 7s. 6d.

Outside the Communist lands very few students, even among Party enthusiasts, go so far as actually to read "Capital" *in extenso*; some more or less sympathetically interpreted version of what-Marx-really-meant is the more normal pabulum. And for a hundred stalwarts who plough through Volume I there can hardly be one superstalwart who achieves Volume II. That anyone not already numbered among the faithful should actually undergo conversion as a result of reading Marx is improbable: but for the edification of those already in the fold, and for the doctrinal strengthening of missionaries, it is evidently essential that the sacred texts be freely, fully and cheaply available. Hence the activities, strictly comparable to those of the British and Foreign Bible Society, of the Foreign Languages Publishing House, whose costs of production may safely be guessed to be well above 7s. 6d. for 556 pages in hard covers. In typography, layout, binding, and every other visual attribute, this volume is a singularly poor advertisement for Soviet technical achievement; moreover, it quite literally smells awful. Still, anyone wanting to add to his library, private or public, a classic for consultation, may reflect that very-nearly-gift-horses should not be looked, or sniffed, too closely in the mouth.

South America

By Hans Mann.
Thames and Hudson. 246 photographs and 58 pages of text. 50s.

This is the latest volume in a lush photographic series of places and people. Latin America with its diversity of races and cultures, its exciting scenery and its strange contrasts of very old and very new is a wonderful subject for photography. Mr Mann, who is clearly more interested in faces than in mountains or churches, has selected some magnificent pictures. Most people have rather amorphous ideas about the republics of Latin America: a lot can be learnt as well as enjoyed from these photographs and from Mr Mann's admirably illustrated historical summary.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

China Differentials

WASHINGTON, DC

Too much should not be read into the President's casual remarks last week which seemed to dump overboard his State Department's policy on trade with China. On Monday, Mr Dulles took advantage of a question by a member of the House Foreign Affairs Committee to deny that there was any prospect of an early change on the larger question of diplomatic recognition. Nevertheless the Committee of One Million Against the Admission of Communist China into the United Nations had something to be worried about when it sounded the alarm three weeks ago against "a concerted effort to convince the American people" of the need for a new policy. There has been a remarkable demonstration of the swiftness with which the American political climate can change.

The transformation did not, of course, really take place over-night. Several months ago Mr Henry Ford in a speech at San Francisco called for a re-examination of American policy towards China. There have been increasing signs of restiveness on the west coast at the thought of fifty foreign vessels a month docking in Shanghai and not one of them American. There has been a parallel movement in the South—the area most exposed to competition from Japanese textiles—in favour of lifting the trade embargo at least for Japan, so that it might find its natural markets on the Chinese mainland.

But what really brought the issue out into the open was the coincidence of the British announcement that it was abandoning the "China differential" with the shock of the anti-American riot on Formosa. The noble friendship of the Nationalist Chinese had been contrasted too frequently with the "ingratitude" of other recipients of American aid for the sacking of the American Embassy and the trampling of the American flag not to have a profound impact. Moreover, since the Suez crisis, which brought Americans face to face with a genuine breach with Britain, they have been markedly anxious to play down differences and to acknowledge valid divergences of economic interest.

Senator Knowland's reaction to the British decision was surprisingly mild. He seemed merely concerned with "going on record" against it as unobtrusively as possible, although he implied that, by striking out alone, Britain had absolved America of any further responsibility for the future of Hongkong. The heavens did not fall on Senator Magnuson of Washington, a good friend of the West Coast shipping interests, when, as Chairman of the Senate Committee on Interstate and Foreign Commerce, he announced an investigation into the reasons why America seemed to be out of step with the rest of the world over trade with China. Representative Zablocki of Wisconsin was even able to declare with impunity that the time had perhaps come for a complete reappraisal of American policy. Although this is not the first time that distinguished commentators such as Mr Walter Lippmann and leader-writers in "eastern international" newspapers have questioned the "reality" of the State Department's assumptions on China, they have done so in the last fortnight with a new sense of being in harmony with a trend. Both for politicians and officials, many of whom have had private doubts about their seniors' orthodoxies, the Chinese problem no longer has to be dabbled with on the black market of ideas.

Understandably enough, a panicky sense that impregnable walls of public unanimity were mysteriously crumbling around him has overtaken Mr Walter Robertson, the Virginian banker who, as Assistant Secretary of State for Far Eastern Affairs, is the principal architect of the Administration's policy. The official counter-attack was just gathering momentum when President Eisenhower, in his favourite role of impartial mediator between the views of his government and those of its critics, observed that "frankly I don't see as much advantage in maintaining the [China] differential as some people do, although," he characteristically added, "I have never advocated its complete elimination."

In assessing how far the official shift is likely to go, important distinctions must be made between the trade embargo and the issue of diplomatic recognition, and between the different reasons that are given for withholding that recognition. As far as any short-term change of policy is concerned, only the trade embargo is in question and even here Mr Robertson and his colleagues, believing it to be of the utmost importance, contest the British case right down the line. They argue that it is more dangerous to sell precision machine tools to China than to ship strategic materials, since items on the "differential" list (which may be sent to the Soviet Union but not to China) would consolidate the present Communist leadership by helping to solve its economic problems. They believe it to be an advantage to force the Chinese into economic dependence on Russia, since this strengthens Russia's ability to prevent China landing it in total war for the sake of Chinese interests. And they say that the China differential is not farcical, because the shipping of western goods across Siberia to China creates delays, waste of China's scarce foreign currency and strains on Russia's communications system. They also claim that the United States has a duty to sustain the morale of its supporters in the Far East and that when, periodically, a wave of rumour spreads through the area that America is about to make a deal with Communist China friendly politicians find their following melting away.

In practical terms Mr Robertson is looking forward to the day when Mr Mao Tse-tung, with whom he has negotiated and whom he regards as a hard-core fanatic, is replaced, not by General Chiang Kai-shek, but by Gomulka-

type Communists with whom it would be possible to deal. He does not want to fritter away America's relatively few bargaining cards, including the trade embargo, beforehand. So even if the new tendency to think about trade concessions gains momentum, it would be quite wrong to conclude that there is the slightest prospect of American diplomatic recognition so long as Communist China continues to behave in a manner that fits Mr Robertson's analysis.

Only if Mr Mao and his men completely reversed themselves and gave satisfactory proofs that China was prepared to behave like an ordinary civilised power in its treatment of foreign persons and property, and to purge itself of its offences in Korea, would there be any likelihood of a major swing in American opinion. In that event American pragmatism might assert itself in a startlingly sudden manner over the American fondness for moral principle. But then the "realistic" critics might find some of their present easy assumptions put to a harsh test. They have advanced the concept of "the two Chinas" as an answer to an argument in the realm of power politics: the need to keep Formosa out of Communist hands and to support an anti-Communist government as a rallying point for the overseas Chinese. But if the United States did decide to recognise Communist China, is there any reason to believe that China would "recognise" the United States on Mr Lippmann's conditions, which include the indefinite separation of Formosa from the mainland? The developments of the last few weeks, significant though they are, should be soberly regarded as a healthy transition to open debate on an exceedingly intricate problem rather than as a portent of an early change in basic American policy.

Stand on the Platform

IT is one of the oldest of American political jokes that platforms—the statements of party principle adopted at the presidential conventions—are made to run on, not to stand on. Usually they are packed away with the bunting and the loud-speakers when the campaign is over, if not before. But President Eisenhower, sallying forth at last against the dissident right wing of his own party, has declared that the Republican platform adopted last year is a solemn commitment to the American people; that his $71.8 billion Budget is simply what it costs to carry out the party's pledges on collective security and social progress; and that Republicans in Congress and the party organisation are honour-bound, if party responsibility is to mean anything, to support the President's legislative programme. If they do, Mr Eisenhower says they will find him a strong ally. In the past his neutrality has puzzled and embittered the little band of Eisenhower Republicans in Congress.

The party platform, which Republicans light-heartedly approved at San Francisco, is to be thrust down their throats at breakfast, lunch, and dinner. After his picnic with Republican members of Congress last week, Mr Eisenhower, whose inaccessibility has been notorious, announced that he would return this hospitality at a series of White House breakfasts and dinners at which he can talk to small groups of Congressmen. There is probably nothing symbolic in the fact that it is the President who has already suffered a stomach-ache. But it is desperately late to try to influence this session of Congress.

The split in the Republican party between its popular President and its entrenched right-wing endangers the party's already slender chances of winning back control of Congress at next year's mid-term elections. But the President has served notice that unity must be achieved on his own terms. Complaints from regional conferences about the Budget and the drying-up of big contributions to the party funds have been met with the justified reminder that the Budget would have been much larger if the Democrats had remained in power. The President has also let it be known that he means to take a vigorous part in the 1958 elections, and it is said that he intends to exercise a veto over the party's choice of a presidential candidate in 1960. Mr Knowland, the party's rebellious leader in the Senate, was conspicuously absent from the party conference at which the President and Mr Nixon spoke, but he has had his warning. This is the kind of political leadership which is needed to make the American system work; the only question is whether the President is prepared to keep his shoulder to the wheel.

Encouraging the Poles

THE tenth anniversary of the Marshall Plan which brought down the Russian iron curtain between east and west was a suitable moment for the signature of the economic agreement with which Poland is putting a toe through that curtain. Admittedly the western welcome might have seemed a little warmer to the Poles if they had not been kept waiting in Washington for months for the agreement and if the $95 million which they are receiving had not been less than a third of what they asked. But it is more than at first they seemed likely to get and there is a possibility that still more may be offered eventually. For the present the Poles surely realise that the Administration has collected every available dollar and that much of the delay was due to Congress's dilatoriness in authorising further sales of government-held farm surpluses for foreign currencies. Moreover the generosity of private Americans has been demonstrated by grants of nearly $1 million from the Ford and Rockefeller Foundations to facilitate scientific and technical exchanges between Poland and the United States.

Poland needs wheat and cotton so that it can end forced deliveries of grain from its peasant farmers and keep its factories going and its townspeople fed—and thus lessen its dependence on the Soviet Union. In the end the agreement had to be signed with part of the deliveries subject to final action by the House of Representatives on an additional $1 billion of authority under the surplus disposal Bill; the present authority of $3 billion is exhausted. But the argument which has held up this Bill is over parliamentary procedure rather than over the principle of help for Poland; in any case the agreement as a whole does not need congressional approval. Some doubts have been expressed about the desirability of giving help, with no conditions attached, to a country which has not actually left the Communist camp, but at least Poland has not asked for gifts, only for the loans which are the popular form of foreign aid today. Opposition will also be dampened by Poland's promise to see that goods received under the agreement are not trans-shipped to Russia, by the provision in the agreement for easing commercial relations with Poland and by the negotiations which are to be undertaken to settle American claims against Poland. The Administration frankly regards the agreement as a gamble worth taking in order to encourage Poland to loosen its ties with the Soviet orbit. That the Polish people would welcome closer links with the American way of life is shown by their interest in the American pavilion—the first time there has been such an exhibit—at the trade fair at Poznan, where last year the first signs of revolt against Russia broke out.

Aid for Poland

The total of **$95 million** is made up as follows:

1. A credit of **$30 million** through the Export-Import Bank, to be repaid in dollars over 20 years, beginning in 1962, at 4½ per cent interest. $4 million of this will be spent on coal-mining machinery; the rest will be used for surplus farm commodities and transport costs.

2. **$18.9 million** for the purchase of surplus farm commodities, to be repaid in zlotys at 24 to the dollar.

3. A further **$46.1 million,** to be spent on surplus farm commodities and to be repaid in zlotys, when Congress passes the surplus disposal Bill.

With this money Poland will obtain:
500,000 tons of wheat,
50,000 tons of cotton,
60,000 tons of soyabeans,
17,500 tons of fats and oils.

A Case of National Pride

THE visit of Mr Kishi, the Prime Minister of Japan, is off to a bad start with the explosion of American indignation over the Girard case. Mr Kishi is seeking satisfaction of a number of grievances concerning apparent infringements of Japanese sovereignty which his Socialist opposition is exploiting. The question of jurisdiction in the Girard case—in which a young American soldier with the rank of specialist is accused of killing a Japanese woman on a range used by American troops—also involves Japanese national pride. Mr Dulles and Mr Wilson, the Secretary of Defence, who together decided to allow Japan to try Specialist Girard, no doubt felt it was in the interests of Japanese-American friendship to be magnanimous; the Formosan riots, only a fortnight earlier, which were set off by an American court-martial's acquittal of an American who had killed a Chinese, showed how deep feeling might run in Asia.

The protests from ex-servicemen and members of the armed forces committees and the petitions from Specialist Girard's home town in Illinois show it can run deep in the United States too. Specialist Girard may well feel he is out of his depth. His own lawyers in the United States concede that the Japanese courts would probably impose a lighter sentence than any court-martial would dare to do after the Formosan case. The Japanese charge, the least serious possible in the circumstances, carries, if proved, a sentence of two to fifteen years in prison. Yet both Specialist Girard's family and his lawyers insist that it is a matter of honour that he should not be tried by Japan and have petitioned the courts to order him brought home.

In Congress, indignation is rising against the status-of-forces agreements which the United States has concluded with most Nato countries and with Japan and against the Administration's decision not to prolong the deadlock in the Girard case by invoking the diplomatic procedures provided for when agreement cannot be reached on the spot. The point at issue is whether Specialist Girard was on duty at the time of the incident; if he was, the agreement provides for him to be tried by an American court-martial. Mr Dulles and Mr Wilson decided that his action was unauthorised and that America must demonstrate its good faith in carrying out its commitments. The anger against status-of-forces agreements as such, apart from the handling of the Girard case, has no substance. Without them, as a federal judge pointed out last year, Americans in Japan would still be subject to Japanese jurisdiction. President Eisenhower, who has already supported the Dulles-Wilson decision and expressed his faith in Japanese justice, may have to speak out more strongly still against what Senator Thruston Morton has called American "adolescence."

Jamestown 1607-1957

IT has been the fate of Jamestown, the Virginian cradle of American settlement, to have been overshadowed down the centuries by Puritan Plymouth. The Pilgrims proved to be a shrewder and hardier strain than the Cavaliers, whose traditions shaped the old South and perished with it. This very year, when the federal government and the State of Virginia, with the help of voluntary bodies and the British Government, combined to right the balance by celebrating the 350th anniversary of the founding of Jamestown, a new *Mayflower* stole the show. Few remember the tiny *Susan Constant*, the *Godspeed* and the *Recovery*, though replicas now swing at anchor in the James River and they landed the first permanent colonists at Jamestown in 1607, thirteen years before the Pilgrims sighted Plymouth Rock. Even the announcement that the Queen, on her trip to America, will visit Jamestown has unluckily coincided with the picturesque welcome to the *Mayflower* by descendants of the Pilgrim Fathers in fancy dress.

The low-lying island in the James River, which the settlers chose because it was easy to defend against Indians and Spaniards, has its immortals, Captain John Smith and Pocohontas; it also was the first site of representative government and commercial enterprise in America, and the first capital of Virginia, until 1699 when Williamsburg, six miles away, took its place. Famine, Indians and illness attacked the settlers; of 5,650 sent out, only a thousand were left after eighteen years. This historic ground is now part of the Colonial National Park, which includes Yorktown,

Welfare for Workers

FROM A SPECIAL CORRESPONDENT

ONE of the most distinctive features of American trade unions, when compared with those in Britain and Europe, is the extent to which they have made social welfare a matter for collective bargaining. As in Britain, many American unions were first constituted as "fraternal benefit societies," providing welfare services of one kind or another for their members, but these were limited, and they were paid for by the union members themselves. In recent years, while labour movements elsewhere have turned increasingly to the state for social security, American trade unions have taken it to the bargaining table. Exact figures are not available, but it is probable that some 14 million of the 17 million organised workers are now covered by negotiated welfare plans. The principal benefits provided are pensions, life insurance and insurance against accidents and temporary disabilities, wage guarantees and health services.

Pension Plans

Those negotiated by trade unions now cover some 7½ million members; about 23 million workers—organised and unorganised—are covered by pension plans set up unilaterally by employers. In most cases the employees do not contribute, but they are usually required to serve a minimum number of years, somewhere between ten and twenty, before becoming eligible for a pension. Retirement is generally automatic at 65. The levels of benefit vary among different occupational groups and frequently also with length of service; according to one recent study, benefits ranged from a median of 28 per cent of average compensation for those earning $4,200 annually to a median of about 38 per cent for those averaging $7,200 a year. With the addition of government old-age pensions, however, the median reaches 59 per cent in the former case, 54 per cent in the latter. Some unions are now attempting to link pensions automatically to changes in the cost of living.

Insurance

Life insurance is usually non-contributory with payments ranging from $500 to $20,000. Accidental death and dismemberment benefits are seldom more than $10,000, but they are usually paid for both occupational and non-occupational injuries. Temporary disability insurance is provided as either paid sick leave or as sickness and accident benefits. Paid sick leave is more prevalent among office employees than among manual workers and many contracts require that the employee be reimbursed for unused sick leave at the end of the year. These plans are often integrated with state programmes for disability insurance and workmen's compensation, providing additional benefits. Sickness and accident insurance payments are normally for periods of 13 to 26 weeks and range between 50 and 65 per cent of weekly wages.

Wage Guarantees

These or, to use the more accurate term, supplementary unemployment benefits (SUB) are relative newcomers to the family of "fringe benefits," as negotiated welfare payments are called. Although unilateral schemes have been in existence for many years in a few companies, the first major plans were those negotiated by the United Automobile Workers in 1955, which supplement state unemployment benefits to provide a combined payment equal to 65 per cent of straight pay after taxes for the first four weeks of unemployment and of 60 per cent for additional periods—depending upon the employee's eligibility—up to a total of 26 weeks. Some older SUB plans pay benefits up to 52 weeks and introduce such variations as disability insurance for extended periods, guaranteed employment for specific periods or generous severance pay.

Health Services

These have become the most popular as well as the most controversial fringe benefits. Today some 90 per cent of all members of trade unions—and many of their dependants—are entitled to some kind of medical, surgical or hospital care under labour-management agreements. Managements now probably contribute $5 or $6 billion a year to health plans—including those created unilaterally by employers. The financial obligation of the employer (few negotiated plans are financed jointly by employers and employees) is stated either as a fixed amount for each worker—say ten cents an hour or a dollar a shift—or as a given schedule of benefits. The coverage offered by most plans is limited and generally quite inadequate in the case of prolonged illness or expensive operations. More important for collective bargaining is the fact that, when increased benefits are negotiated, these are frequently countered by additional charges on the part of doctors and hospitals, on the theory that the individual can afford to pay at least part of his health bill. The result is a continuing spiral, with ill workers and harassed employers the principal sufferers.

As a result, many labour leaders are beginning to look harder at a form of organisation which provides relatively comprehensive health care at low and steady prices: the non-profit, group practice health centre. There are now some 40 such centres—financed by management but often administered in fact by unions—providing varying degrees of care for perhaps a million members of unions and their dependents. But this is a small fraction of the whole, and labour leaders also advocate an ambitious programme of federal aid for a wide range of health services, including the national health insurance for all which is for the present a dead issue, because of the violent opposition of the American Medical Association. The trade unions have also tried to alleviate some of their problems by local action—by negotiation with county and city medical societies to establish firm schedules of fees; by agreement with hospitals on uniform charges for identical services; and by inter-union co-operation to induce insurance companies and other health agencies to provide wider services at lower costs.

Corruption

This is much the most urgent and embarrassing problem in connection with negotiated welfare funds. Most of them are governed by the Taft-Hartley Act, which requires that both the union and the employers participate in administering the fund; however, company heads frequently leave administrative matters to union officials. Most cases of maladministration are simply the result of inexperience; but much of the abuse is straightforward graft, involving such practices as fee-splitting between insurance brokers and union officials, the purchase of insurance policies from companies in which the officials of the union have a financial interest, and the outright appropriation of welfare funds for personal use.

The national trade union organisation has recently acted with great vigour to drive the corrupt from its ranks; this is an attempt to counter the unfavourable publicity arising out of the revelations of the various congressional committees which are investigating corruption in the labour movement and particularly abuses of welfare funds. It now seems almost certain that these investigations will result in new laws to govern the internal operation of trade unions and the management of negotiated welfare funds, something which the national body itself has long advocated in some form.

man-on-the-spot *in Rome*

WHETHER IT'S in Rome or Osaka—Paris or Singapore—business transacted in *person* is usually transacted *best.*

Bank of America's International Department, through a world-wide network of branch offices, traveling representatives, and correspondents, can offer you this important advantage—wherever you do business.

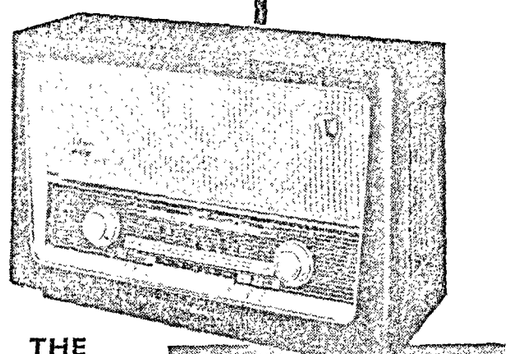
For the educated ear

V.H.F. transmission is of undeniable excellence—as any high-fidelity radio enthusiast will tell you. But its excellence is beyond the range of an ordinary radio.

It's as well you should know this if you are thinking of buying a new one.



In fact, the set must be capable of reproducing the more extended audio frequencies that V.H.F. makes available.

The Grundig 'Pembroke' V.H.F./F.M. table radio is designed for V.H.F. reception at its best. Designed to give you all the scope, subtlety, and depth of the whole audio frequency range.

It has two speakers, one bass and one treble, acoustically arranged to give three-dimensional sound reproduction and the inspired circuitry makes provision for four independently variable tone controls covering the entire sound spectrum.

With two built-in aerials and an interlocking control system for V.H.F. as well as standard reception, the 'Pembroke' is really two sets in one—and the performance of either is an experience.

DROP IN TO YOUR RADIO DEALER AS SOON AS YOU CAN AND ARRANGE TO HEAR IT FOR YOURSELF.

Strange things happen at sea

IN A LIFETIME of roving adventure, Edward Preble saw many a strange sight on land and sea. The strangest arose before his astonished eyes when as a midshipman he paced the deck of the privateer *Protector* one bright day in 1779. *"Sea serpent off the larboard bow!"* cried the lookout. Preble cast off in the ship's dinghy and rowed headlong towards the basking monster. Suddenly it plunged and was not seen again. In later years the old seadog would often tell the tale. "Head ten foot high . . . neck thick as a barrel . . . saw it with my own eyes . . ."

Strange things still happen at sea, and on land, to the world's goods as they go on their journeys. But they take the rough with the smooth when they are protected by cartons made from "Thames Board" and by stout "Fiberite" cases in solid or corrugated fibreboard. It is with good reason that so many leading manufacturers put their trust in the products of Thames Board Mills.

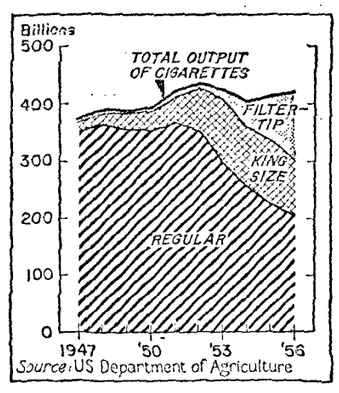
where Cornwallis surrendered in 1781, *and Williamsburg,* which has cost the Rockefeller family $40 million during the last thirty years to restore.

The federal government's contribution to this year's festivities has chiefly taken the form of a new Colonial Parkway linking the three ; Virginia has built a $1.5 million Festival Park, where priceless British exhibits—including a banner from Drake's ship, the *Golden Hind,* Queen Elizabeth's gloves, and an original copy of Magna Carta—are displayed. Visitors will also see a reproduction of the first settlement, with its wattle and daub houses, its glass factory and Powhatan's Lodge. In all, $26 million has been spent, much of it for the comfort as well as the inspiration of the three million visitors expected: there is a Mermaid Tavern, although it proves to be only an assembly-line cafeteria ; splendid information centres ; car parks ; and at Williamsburg two new VistaVision cinemas to show a patriotic film. In this country, a collection* of contemporary documents and illustrations, one of which has been reproduced by permission of the publisher, has appeared. For the opening ceremonies the British Government sent Lord Hailsham and a strong delegation. But perhaps the most useful stroke of all, in a year which has seen the alliance with America so strained, is the granting of dollar allowances for tourists so that the descendants of our heroic common ancestors can know each other better.

Little, Late and Leaden

ALTHOUGH the Administration has at last produced its long-promised, long-range programme to help the American mining industry, it is little more than a trial balloon so heavily weighted with lead and zinc that it may never get off the ground. The first reaction among Senators from mountain states, almost the only people in Congress who take an active interest in metal mining, is disappointment that their constituents are not offered either tax relief or direct subsidies or an extension of the stockpile purchases and bartering arrangements which have supported the domestic mining industry since the decline of the inflated demands generated by the 1939-45 and the Korean wars. Senators are also annoyed that the Administration, which ever since it came into power has been frustrating their various attempts to help the industry by promising a policy of its own, has now come out with one which they do not consider either constructive or comprehensive. However, the recent sustained refusal by the House of Representatives to provide $30 million for an existing subsidy programme does not suggest that it would be easy to obtain funds for any new scheme which involved heavy charges on the taxpayer.



Apart from special tariffs to protect lead and zinc, the Administration proposes only to add a little to its present spending on research into new uses for minerals, on finding new deposits, with commercial as well as defence needs now being taken into consideration, and on small bonuses for the production of beryl, chromite and columbium-tantalum, all still critically scarce. The Secretary of the Interior also promised Senators that further special help would be suggested if it was needed in individual cases ; the omission of any proposals for manganese, antimony or cobalt has been particularly criticised.

The Secretary has to admit, however, that special help is needed for lead and zinc at once ; presumably he feels that the sliding tariff, varying with market prices, which he suggests, is the least damaging way of aiding what is the most influential section of the domestic metal mining industry. The purpose is to stabilise prices at the levels prevailing until the recent drops—16 cents a pound for lead and 13½ cents for zinc. But this is not enough to satisfy domestic producers ; they also argue that imports would pour in during the three months' waiting period which is proposed before duties go up. On the other hand, there is doubt whether such an import tax is permissible under the General Agreement on Tariffs and Trade, and it seems certain that the duty would provoke retaliation from other countries ; four foreign suppliers—Canada, Australia, Mexico and Peru—have already protested. The result of all this will probably be endless controversy this year and congressional action next year, almost certainly more drastic than the Administration wants.

Filtering for Dear Life

LAST week the final report on the American Cancer Society's four-year study of the health and smoking habits of 188,000 men, 12,000 of whom had died during the period, confirmed the preliminary finding that there is a clear relationship, although not necessarily one of direct cause and effect, between death rates and cigarette smoking. This association was closest for those dying from cancer of the lung and throat and from gastric ulcers, and close for those dying from respiratory and heart diseases. Heavy smoking of cigarettes was found to have shortened the expectancy of life among the men studied by seven or eight years, while it was lengthened for those who stopped smoking during the study.

The tobacco industry replied, as it has done before, by criticising the methods and assumptions of the study, which does not pretend to be more than a statistical contribution to a final decision on the question. The stock market took the report very calmly and it seems likely that cigarette smokers will do the same, trusting their lives to the filter tips on which they have been relying with increasing confidence ever since the first alarm was sounded about cancer in 1953. Then cigarette consumption declined sharply for the first time in twenty years, with 1.5 million people giving up smoking altogether. But this year it is expected to get back to 1952's record levels, although consumption a head may not catch up.

Filter-tip cigarettes, which are now made by all the lead-

ing manufacturers, were entirely responsible for this recovery, although there is little medical evidence that they are in fact safer than ordinary cigarettes. Their popularity has not meant a corresponding recovery in the demand for tobacco, since less leaf goes into each filter-tipped cigarette than into the ordinary types. But filter-tips have stimulated the market for the strong-flavoured burley tobacco, which can be tasted through the filter and is therefore now preferred to the milder flue-cured leaf.

Keep Off the Beach!

FROM A CORRESPONDENT IN OREGON

THERE are still many wide-open spaces in the United States, but few of them are to be found, at least in the summer, along the 5,000 miles of coast. So great has been the rush to the beaches in the past two decades of greater leisure and growing interest in recreation, that almost all this vast seashore has passed into private hands, with the public being denied access to it. The situation has become so serious on the Atlantic seaboard and the Gulf of Mexico that the government is considering a multi-million-dollar purchase of land along the shore, so that it may be set aside in perpetuity for public recreation, wild life refuges and other purposes.

The National Park Service of the Department of the Interior, after surveying the 3,700 miles of the Atlantic and Gulf coasts, has reported that only 240 miles, or just over 6 per cent, remain in public ownership. The rest, including most of the choicest land, is privately owned and is either actually or figuratively posted with "No trespassing" signs. More than half of the 240 miles still open to the public is in three tracts, all relatively far from the big cities of the Atlantic seaboard and therefore inaccessible to many people living there. These are the Cape Hatteras National Seashore Recreation Area in North Carolina, the Acadia National Park in Maine and the Everglades National Park in Florida. Neither of the parks contains many beaches suitable for holiday-makers.

The conclusion of the Park Service is that the federal, state and local governments should begin immediately to buy up available land, with the aim of preserving 15 per cent of the shore along the Atlantic Ocean and the Gulf of Mexico for the public. This would mean the purchase of about 315 miles of property at prices that might be above *$100,000 a mile.* To underline the urgency of starting at once, the Park Service has pointed out that an undeveloped bit of sea coast 30 miles long, recommended for federal purchase in 1935, could have been had then for $260,000, about $9,000 a mile; today only nine miles remain undeveloped, and they are valued at $110,000 a mile—an increase of 1,100 per cent in twenty years. Inland, there is also the problem of preserving open spaces for future generations from the onslaughts of the highways and building development.

THE Pacific Coast, which was not included in the survey, is also filling up fast. The population of all three states, California, Oregon and Washington, is concentrated along their coasts, and the mild climate which makes year-around bathing possible is a great attraction to tourists. On the Pacific, however, there is an extraordinary example of conservation of the scenic and scientific resources of the sea coast which might serve as a model for state and national governments seeking to follow the recommendations of the National Park Service. This is in Oregon, the only state in the Union which has foresightedly reserved its entire shoreline for public use. Oregon achieved this more than forty years ago by a device as novel as it has been effective. The State Legislature, inspired by the emergence of the motor age, simply passed a law declaring the shore of the Pacific Ocean, from the Columbia River on the north to the Californian border on the south, to be "a public highway."

This does not mean that the Oregon beaches are speedways. It merely means that they belong to the state and cannot be sold to private owners. With the beaches as a starting point, the state has extended its ownership inland. These areas have been developed as parks and camping grounds. No other state has anything to compare with the forty such oceanside parks—some of them hundreds of acres in extent—which dot the Pacific shore and are accessible from the main coastal road. Many of them have overnight camping facilities, available to the public at a nominal charge. Elsewhere there are picnic areas for the use of temporary visitors. In most of the parks there are public cooking and bathing facilities.

At first, there was much criticism of Oregon's vast experiment in public ownership, which to some smacked of "socialism," but all such adverse comment has long since ceased. Oregonians can look to the south and to the north and count themselves lucky. California is staging perhaps the greatest of all human assaults on America's seacoast. New building estates are springing up almost everywhere south of San Francisco. Long stretches of beach have been cut off from public entry. To the north, in the state of Washington, with its incomparable island paradise in Puget Sound, the shores of both the mainland and the islands are becoming built-up. A mile of seashore converted into 100-foot lots can serve only about fifty families. Open to the public, it can give pleasure and recreation to thousands. Today the citizens of Oregon, as well as the several hundred thousand tourists who visit the state each year, can be thankful for the foresight of the Oregon Legislature two generations ago.

food for one in three

Rice is sap-green in its growing: a freshness, a slenderness of spears grass-bright in mud-swirled, mud-walled waters. Rice is moon-yellow at its harvest: many kernelled fruit of Eastern heat and mud and moisture. Rice is rough in the hull, rich and red in the bran, white and smooth polished, gold in the merchant's purse, food for a third of the world. *And prey to a host of insects.*

Of these, soundlessly swarming across the rice triangle of South East Asia, the most harmful and widespread are the lepidopterous stem borers. These insects, caterpillars of small moths, are of several species. Hatched on the leaves of the crop, they swiftly bore deep into the plant itself and so begin a cycle of destruction which expands as it continues, for each caterpillar may in turn attack several plants. For centuries, because of the hunger of stem borers, man's own rice bowl has been but partly filled.

Today, however, there is light on the rice horizon—shed by endrin, one of the advanced insecticides developed by Shell. Tests in the Philippines with endrin sprays over a 4 year treatment period have shown dramatic results—up to a 70% increase in yield in some cases. And the same story is spreading all over South East Asia. Add to this the fact that endrin also controls many other rice pests including leaf caterpillars, shield bugs, army worms and leaf hoppers and it is evident that this Shell development has a major part to play in safeguarding one of the world's major food crops.

There . . . she blows!

That piece of tissue in Daddy's hand has come a long way. It was once part of a tall pine tree in Canada or Scandinavia. Before it arrived at baby's nose it had to be pulped, shipped, processed, cut and packed: a transmogrification worthy of Merlin. Bowater wizards are expert at the transformation of timber. Some reappears as packaging, some as building boards, some as printing papers. Bowaters' many-sided activity, both here and in North America, is well suited to meet the world's changing and varied demands for timber-derived products. The new household tissue factory at Northfleet, Kent—a joint venture by Bowaters and the Scott Paper Company of U.S.A.—exemplifies this activity.

THE WORLD OVERSEAS

All Change in Canada

FROM OUR OTTAWA CORRESPONDENT

It will be a week or two before the future course of Canadian government is at all clear. Monday's amazing election surprised the victorious Conservatives as much as it humiliated the Liberals. Your correspondent frankly confesses the error of his report of last week, in which Mr John Diefenbaker's personal appeal and the upsurge of indignation against the ruling Liberals were correctly described, but in which the scope and sweep of public feeling was foreseen no more than by the Gallup Poll or by any political party.

Most political observers—and perhaps the parties themselves—had developed a rather desperate feeling that Liberal rule was almost permanent. As the government, increasingly dominated by two septuagenarians, Mr St Laurent and Mr Howe, became more and more blatantly assured of its own infallibility and indispensability, the public gave hardly any signs of concern. *Hubris* was obviously demanding its due price, but the voters appeared to be too prosperous to be interested in playing the fates. The pipeline debate last summer obviously stirred a few people, but the impact on the general public after a year of heady good times was very questionable. Monday's slaughter of Liberals was no slaughter of innocents: it was the reward of *hubris*, striking with appropriately dramatic suddenness.

It is entirely legitimate to question whether Canada will enjoy equally good government under a new dispensation. This week, nobody seems to mind much. Even a period of uncertain government seems to many people a small price to pay for the triumphant demonstration that Canada will let no government think itself master. The cause of the Liberal debacle was well expressed by a venerable Liberal senator, fresh from a visit to his native province. "I could not discover a specific public objection to any Liberal policies," he said; "all I heard was 'arrogance, arrogance, arrogance.'" In the simple vernacular: "It had become too bloody much."

The country is strewn from sea to sea with defeated cabinet ministers: no less than nine of them, nearly half the ministry and, in many cases, the better half. The most unexpected was the defeat of Mr Howe, who had won Port Arthur with great ease at every election from 1935 on. Characteristically, he refused to concede defeat on election night, but said merely that he was going to bed and that the nation seemed to be swept by some strange disease. In the new parliament, the Liberals appear as a Quebec party which has also managed to win some seats elsewhere. It has 62 Quebec seats, only 20 out of Ontario's 85, and another 20-odd scattered across the remaining provinces. Its top voting strength looks like being 106. That means that it could not secure a bare majority even if it could achieve a combination with the Co-operative Commonwealth Federation (CCF), which did well to win 25 seats.

The Conservatives, with perhaps 114 votes in all, can just scrape up a majority whenever they can secure the support of the CCF or of Social Credit, which will have 19 or 20 members. The socialist CCF will not give the Conservatives any regular support, though it might be manœuvred into supporting individual measures, particularly those of a kind which Social Credit would not accept. There is no love lost between the Conservatives and Social Credit, but Mr Solon Low, the Social Credit leader, has promised that his party will give the support necessary to maintain a government. This uneasy basis may be the best chance for maintaining a government until Mr Diefenbaker can find a good pretext for calling another election which might give him an absolute majority.

It will be hard to get used to a government of entirely new men with no previous experience. But, man for man, the standard of a Conservative ministry need be no lower than that of previous Liberal administrations, which carried some very second-rate passengers. Mr Diefenbaker's main personnel problem may be to use the talent available among newly elected young men without offending older party stalwarts.

He would hardly be able to form a full cabinet before leaving for London if, as is expected, he decides to go to the Commonwealth Prime Ministers' meeting. He is bound to appear there as a great contrast to the familiar figures of Mr St Laurent and Mr Pearson. At the risk of caricature, it might be said that he combines the manner of a Methodist minister with that of an oratorical jury lawyer, but the underlying character is one of deep personal sensitivity, which shows itself sometimes as sentimentality and sometimes as bitter animosity. During the election campaign he referred only once to the fact that he is the first leader of a major Canadian party whose ancestry is not wholly British or French. It would not have occurred to more than a handful of Canadians that this was of any importance. For more than a decade every Canadian child has belonged to a racial minority; not even the English, Scottish, Irish and Welsh taken together form half of the population. But in Mr Diefenbaker's childhood the British and French were more dominant, and it is possible to imagine that a sensitive child may have suffered considerably.

His television speech after victory on election night was a pledge of dedication with the quotation "let him that is greatest amongst you be the servant of all," coupled with a plea for the prayers of all Canadians. It clearly came from a man deeply moved. He had not failed also to have a short message translated into French, which he read with a newly acquired and execrable accent.

These may be useful clues to a character not yet tested by the responsibilities of government. In some political circles there is doubt about his ability to manage a difficult administration as well as he appealed to the electorate. But the native shrewdness which assured him a successful legal career, without unduly impressing more learned members of the bar, is not to be discounted.

A footnote should be added on Canada's best-known statesman, Mr Lester Pearson. He also faces a time of testing. He occupies the lonely eminence of "one who kept his seat when all around were losing theirs." He did more active campaigning than any other Liberal leader. His chief supposed rival for the party leadership, Mr Walter Harris, has been defeated. Mr St Laurent's retirement must be expected, not immediately, but sooner than if he had been returned to power. Mr Pearson at this moment seems to have the succession in his grasp if he wants it. But he will have to want it enough to apply himself to the daily routine of opposition, concentrating mainly on rather minor domestic questions in which he has never shown any natural interest. The question is whether he will find this role sufficiently tolerable or the goal of leadership sufficiently desirable to stick at the task, or whether he will yearn for new international fields to conquer.

Baghdad Pact Changes Form

FROM A SPECIAL CORRESPONDENT IN KARACHI

As a result of the meeting here last week the Baghdad pact has subtly changed its form. It used to be a sort of embryo Nato for the Middle East, waiting—as Western Union did—for American adherence. Now at last the United States has joined the military committee, but has made it quite clear that it will undertake no large military aid commitments; as a result, the emphasis of the pact has shifted to the economic side—it has become an embryo OEEC rather than Nato.

Another change, which contributed to this result, was that the senior partner, Britain, having lost its senior status at Suez, was not replaced, as expected, by America, but by the four Muslim powers, which rightly claimed that they had saved the pact last autumn. Nothing was more noticeable about the Council meeting than the fact that those four powers, with a new self-confidence, resolutely refused to accept Britain's or America's say-so. Both the western powers were extremely anxious to avoid any blurring of the target, which, in their opinion is Russian Communist aggression or subversion. But Iraq insisted that Israel was a greater danger, and Pakistan made it absolutely clear that the only aggression or subversion it feared was from India. It was partly as a result of this inability to agree on who was the common enemy that the United States and Britain decided that there was no future in building up a large military force which would be in danger of facing in several different directions.

The military potential of the area is not, therefore, likely to be greatly augmented as a result of the Karachi meeting. All that will happen is that the planning staff will be increased from about five to about fifteen. Their objective in the circumstances can only be to ensure that there is some sort of tripwire which will alert the free world in the unlikely event of an actual Russian invasion.

The real defence of the area against communism is to be directed against subversion, and the means are to be economic co-operation and propaganda. The sums of money allotted to the economic committee (less than £7 million in all) are not sufficient to make any impact on the general poverty of the people in the area, nor are they intended to be used primarily for that purpose. The projects approved are mostly designed to improve physical communications between the countries concerned by building roads, railroads and cable lines; they may be roughly described as the basis for closer integration.

The question is how much can be made of this by propaganda in favour of the pact and against the twin demons of communism and neutralism. The idea of Muslim co-operation has a certain appeal, but it can hardly compare in force with the competing cry of "Arab unity"; and it is doubtful whether any Iranian or Pakistani is going to feel more pro-western because an engineering firm is surveying the possibility of re-establishing some of the roads built by Alexander the Great.

It is therefore necessary to reserve judgment about the future of the pact. It may simply wither (as it seems in this area that Seato has done); it may become a quite useful organ of economic co-operation between four contiguous countries, which could ultimately result in a limited "common market." Or, if its dreams come true, it could become the main instrument of American aid in the Middle East, and so the standard to which all desirous of western help would repair. For the present it remains only an embryo.

No Change in France

FROM OUR PARIS CORRESPONDENT

M. BOURGES-MAUNOURY has been accepted as prime minister because everyone realises that Algeria, the finances and the ratification of the European treaties require a government. But the relative optimism that hoped, on the strength of the widespread public and parliamentary anxiety over Algeria, that the crisis would produce a government looking for a new approach, has been rudely shattered. M. Bourgès-Maunoury, the would-be hammer of Colonel Nasser at Suez, was not part of their hopes; still less was M. Lacoste's staying on in Algiers. After the manifest failure of both men's favourite policies, little could be less promising.

The group to whom parliamentary arithmetic gives the whip-hand over French politics, the conservatives and the Socialist party secretariat, have ensured that the old policy will continue. The new government simply marks a slight shift to the right. It was M. Mollet himself who cleared a path for M. Bourgès-Maunoury and, as he did so, pushed the Catholic leader, M. Pflimlin, aside. Radical-cum-

Continued on page 989

Continued from page 988

socialist, where M. Mollet's team was socialist-cum-radical, the new government looks merely like the old one turned upside down—and with the little-Napoleon element of the old one uppermost. The instinctive fear this arouses is of a blundering toughness in North Africa. This is possible. But M. Bourgès-Maunoury is a typical Radical and his party has a long tradition of opportunism in office—a tradition which M. Mendès-France has unsuccessfully tried to break. The new premier's situation is such that, in practice, lack of direction rather than excess of it, seems the danger.

True, M. Bourgès-Maunoury proposes, like M. Pflimlin before him, to make some gesture of climbing out of M. Mollet's rut by enforcing a provisional statute in Algeria without waiting for a cease-fire. This is the fashionable new long shot at a solution that ignores the rebels. But the repeated forced postponements of M. Lacoste's municipal reform do not encourage confidence in this method. Few really believe in it. And M. Bourgès-Maunoury has diverted his aim from the start by promising to prepare the statute with all the "national" parties. He also believes that most French troops should be withdrawn from Tunisia and Morocco to plug the holes in the Algerian border, which should ease the tension with Tunisia over the French army's movements there; but this is tactical rather than political. The temptation is to conclude that here is very much the mixture as before in the bad old tradition of French immobilism.

★

Though it has certainly not changed very much, the potentialities for change remain. Several socialists hesitated a long time before joining M. Bourgès-Maunoury's government. M. Defferre, the author of the colonial reform law, refused. He has a plan for an autonomous Algeria, federated with France, which he means to put to the Socialist congress at the end of the month. He could provide the Socialist minority with the leader they lack. The Catholics, smarting from M. Pflimlin's failure, are also reserved. M. Bourgès-Maunoury is not sustained, as M. Mollet was, by the myth of being "irreplaceable," and many politicians expect problems to rebound in the autumn. The conservatives hope the failure of the left-centre teams on finance will benefit them. Those in every party who clearly understand the need for more realism in Algeria know they are a minority; but the United Nations debate in the autumn may favour them.

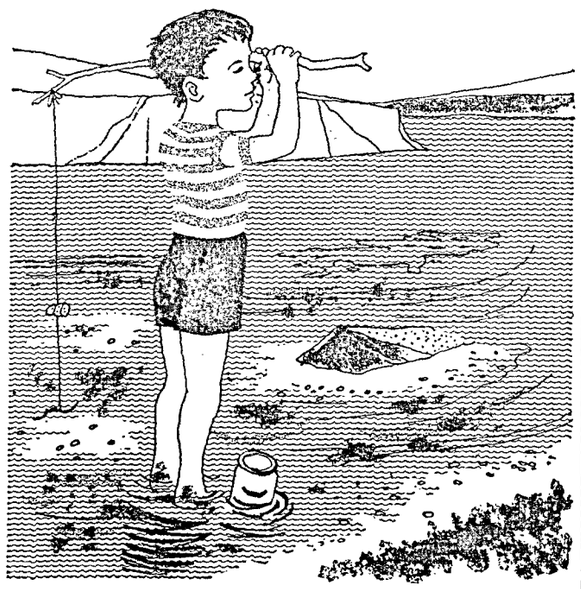
Meanwhile he takes office on a European ticket. The majority of the Assembly wants the treaties ratified quickly; that should be done by early July at the latest, before the debate in Bonn, to strengthen Dr. Adenauer's hand. He must also, in the brief honeymoon period allotted a new premier, introduce the taxes over which M. Mollet fell. The experts agree that he should in fact go further than M. Mollet's proposals, which might have sufficed last autumn, but not now. They think £250 million rather than £150 million are necessary and that effective budget cuts will have to extend to military spending outside Algeria. M. Bourgès-Maunoury was, as Minister of Defence, the ardent champion of the generals' accounts. He could, as gamekeeper turned poacher, put his knowledge to effective purpose. But, on the whole, it seems that M. Bourgès-Maunoury, like his predecessor, will try to do too little and hope it does not come too late.

Franco's Flabby Grip

FROM OUR CORRESPONDENT IN MADRID

THE present wave of arrests in Spain testifies to the withering away of loyalty to General Franco which set in two years ago. Since the end of May the security police have been rounding up monarchists, Christian democrats, and liberal Catholics, men who at one time supported General Franco and who now have turned against him. The extent of the rot can be measured by the names of some of the rightwingers whom the Caudillo's rightist regime has felt it necessary to detain: Francisco Herrera, brother of the Bishop of Malaga; Javier Satrustegui, scion of San Sebastian's wealthiest family; Victor Pradera, nephew of the ambassador in Beirut. Even a general officer is involved, at least to the extent of having been summoned to Madrid to submit to police interrogation: General Heli Rolando Tella, retired, formerly commander of the Spanish foreign legion, recipient of the Cruz Laureada de San Fernando with bar, the highest Spanish decoration for valour, and a man who has held senior and responsible posts.

Some of the arrested men have been let out on "conditional liberty." Others are being held in Madrid's Carabanchel prison, in company with another detainee, Dionesio Ridruejo, whose detention in mid-April was a preliminary to the arrests now in progress. Señor Ridruejo is a Falangist turned liberal and a poet turned pamphleteer. Blandly disregarding the fact that no political party except the Falange is permitted in Spain he announced last winter the formation of a "Social Party for Democratic Action." He produced and circulated to a select few a manifesto which said, in part:



> The Franco dictatorship has solved nothing. It has failed to restore harmony in the land. Nor has it resolved any conflict. Rather, it has limited itself to affirming a partisan victory as irrevocable. . . . The power of wealth, combined with political power, forms a single bloc to the detriment of the middle and working classes. . . . Systematic prohibition contributes to corruption and to the decadence of civic responsibility. Today Spaniards have no sense of responsibilities because they have no rights.

The newest batch of detainees represent, for the most part, another opposition approach to the Spanish problem. They are in trouble for having produced and circulated to important people in government posts an illegal publication called *Confidential Bulletin of National Information.* "Our purpose," the *Bulletin's* first issue announced, "is to give out serious, objective, and trustworthy information, thereby (with God's help) giving Spain back to the Spanish people."

The *Bulletin,* evidently intended for circulation only among what it called "las clases dirigentes"—the ruling class—said in an introductory article:

> You hold in your hand, Spaniard of the ruling class, a copy of the *Confidential Bulletin of National Information.* What is this Bulletin, you will ask; who put it out, what do they want, how trustworthy are they, how far are they to be believed? We shall do our best to satisfy this natural curiosity, starting off by stating what we definitely are not. We are neither communists nor separatists, neither professional agitators nor adventurers. We are not conspirators, or demagogues, or deadwood reactionaries, or thugs. Nor are we sceptics, pessimists, or guerilleros of the pen. We are simply a group of patriotic citizens deter-

Poison River?

Industry must not discharge effluent liquors which endanger human health and kill fish and plant life. But removing toxic constituents from industrial effluents can be no small problem. Simon-Carves have been studying effluent treatment at coke ovens, gasworks and the like for many years, and have now made available new, more efficient and more economical processes for which plants can be designed and built on a full commercial scale. The first such plant has already been built in Britain, and others have been ordered for installation both in Britain and overseas.

mined to meet, with maximum moderation and level-headedness, the obligations which devolve upon us with regard to the future of Spain.

What unites the dissident rightists and impatient liberals in opposition—and in jail—is concern for what will happen to Spain when General Franco, now 64, disappears. They feel that it is urgent to make ready now, through a relaxation of control over the expression of political opinions, for whatever type of government eventually takes over. Their argument is that evolution is necessary now to avoid revolution later. But the Franco government, whose cabinet includes royalists hoping for an authoritarian monarchy later, is unimpressed. It is charging the imprisoned men with turning out subversive propaganda and "maintaining relations with leading communist exiles in France with the object of subverting the regime." There is no sign around General Franco of any disposition to come to terms with the future.

TURKEY IN TRANSITION–I

Pressing on Regardless

BY OUR SPECIAL CORRESPONDENT LATELY IN ANKARA

THE Turkish economy is like a bus confronted with a swollen ford of uncertain depth. The driver is convinced that the best thing to do is to put his foot on the accelerator and keep going at all costs. But some of his more thoughtful passengers fear that the engine might stall in mid-stream; they maintain it would be better to proceed more slowly and cautiously and, if need be, to go round a longer way. At the moment the driver—that is, the present Turkish government—is having his way; it remains to be seen whether it is, in fact, the right way.

Turkey has in many ways identified itself so firmly with the western democracies that it is easy to forget that it is still an underdeveloped country where old customs still jostle modern habits. In Ankara there are arcades of modern shops, new hotels and blocks of flats. There are also, a stone's throw away, streets of dim, old-fashioned little shops where the peasants still go to buy the traditional implements and utensils that they and their forbears have used for generations. In the old town, one may still find a patriarchal merchant who is content to carry on in the old ways and who uses his profits, not to expand and modernise his business, but to build a new mosque in one of Ankara's rising suburbs. But far more significant and typical of the new Turkey is the young engineer in his early thirties, who sets out with a brand new passport, a thick wad of dollar notes, a fat English-Turkish dictionary and a very exiguous command of English, to spend six years in the United States in order to acquire the specialised knowledge that will allow him to set up his own factory back in Turkey.

Like its neighbours further to the east Turkey is in a state of transition; it has got further than they have, but since the ambitions of its present rulers are great, so is the task ahead. Most Turks share these ambitions, but there is acute controversy on how best to realise them. The present government maintains that if Turkey is to pay its way in the world and provide a steadily rising standard of living at home, it must expand its economy and develop its rich natural resources as rapidly as possible, whatever temporary domestic hardships and foreign indebtedness this may involve. Three years ago, when the Democratic Party was returned to power for the second time, the excitements of rapid expansion were uppermost; today, to many people, the snags and difficulties loom larger. The government, however, points proudly to new dams, new power stations, new factories, to increased production in many fields, to the possibility of striking oil in large quantities. Its critics, on the other hand, maintain that since 1953 the development of the economy has been slowing down and that, in real terms, the national income has fallen.

Eighteen months ago, after a revolt by members of his own party, the prime minister, Mr Menderes, promised that the government would draw in its horns. These promises have not noticeably been fulfilled. In the current budget, appropriations for investment are 33 per cent higher than in the previous one. (Allowance should, however, be made for rising prices.) Moreover, lack of co-ordination and detailed planning means that investment funds are not always used to the best advantage. In one district, two sugar factories are built where one would be enough; in another, a power station is erected but cannot function for lack of some vital material. The committee that was set up last year to fix investment priorities seems to have been more or less stillborn. And the government's persistent refusal to publish its investment plan suggests that no such plan exists; Mr Menderes, indeed, has suggested that the budget is in effect a development plan, and has implied that anything more detailed would hamper the dynamic economic policy that Turkey ought to pursue.

★

The price now being paid for this policy is shortages, inflation, a burden of foreign debt that remains large although some old commercial debts are being paid off, and a steadily depreciating currency; while the official rate remains at 7.8 Turkish liras to £1, the black market rate is 35 and over. Most things that have to be imported—the striking, and to the Turk most painful, example is coffee—are liable to disappear almost completely because of the shortage of foreign exchange. The efforts made last summer to force down prices by rigorously enforcing price controls did have some temporary success. But the upward trend is now continuing, and the main effect of these controls now seems to be to increase the number of empty shelves in the shops and to swell the black market. The recent shortage of meat in Ankara, for instance, is believed to be largely due to the hoarding of supplies by the peasants, although the effect of the long drought on fodder supplies and the government's comparative neglect of livestock (which it is now trying to remedy) must bear part of the blame.

The attempts so far made to halt inflation by damping down the increased demand seem to have been half-hearted and largely ineffective. The most obvious step—taxing the peasants, who at present get off practically scot free—is a political hot potato that the government is unlikely to touch. And it would be equally difficult politically for the Agricultural Bank to go any slower than it is already doing with its credits, especially after three hard years of drought.

The government did, however, succeed in cutting down the foreign trade deficit from TL516 million in 1955 to TL286.6 million in 1956. The stringent restrictions on imports are hampering the activities of many private firms

who may have to hold up production for months for lack of some essential imported equipment or raw material. On the other hand, the widespread shortages caused by the lack of foreign exchange have had the welcome effect of stimulating the development of local industries. Helped judiciously by the Industrial Development Bank with loans and enough foreign exchange to buy the necessary equipment and raw materials to get started, enterprising business men are making many things that have never before been made in Turkey. The outlook is uncertain, especially if they are at all dependent on imported materials, but in the meantime many are making good profits, and for the future are content to put their trust in the Turkish saying: "God is Great."

Perhaps that is indeed the best thing to do when contemplating the present state of the Turkish economy. It is an economist's nightmare. And many people unable to share the government's ebullient self-confidence feel that the only hope is a more powerful injection of American aid (in the 1956 US fiscal year Turkey got over $130 million) —which the government is unlikely to get if it persists in its present policies. But foreign business men, sitting in their palatial offices, with depleted staffs and sometimes with too much time on their hands, are curiously tolerant. They find the outlook baffling, but are reluctant to prophesy doom. They seem to feel that, perhaps more by luck than good driving, the Turkish bus may not after all stick in midstream.

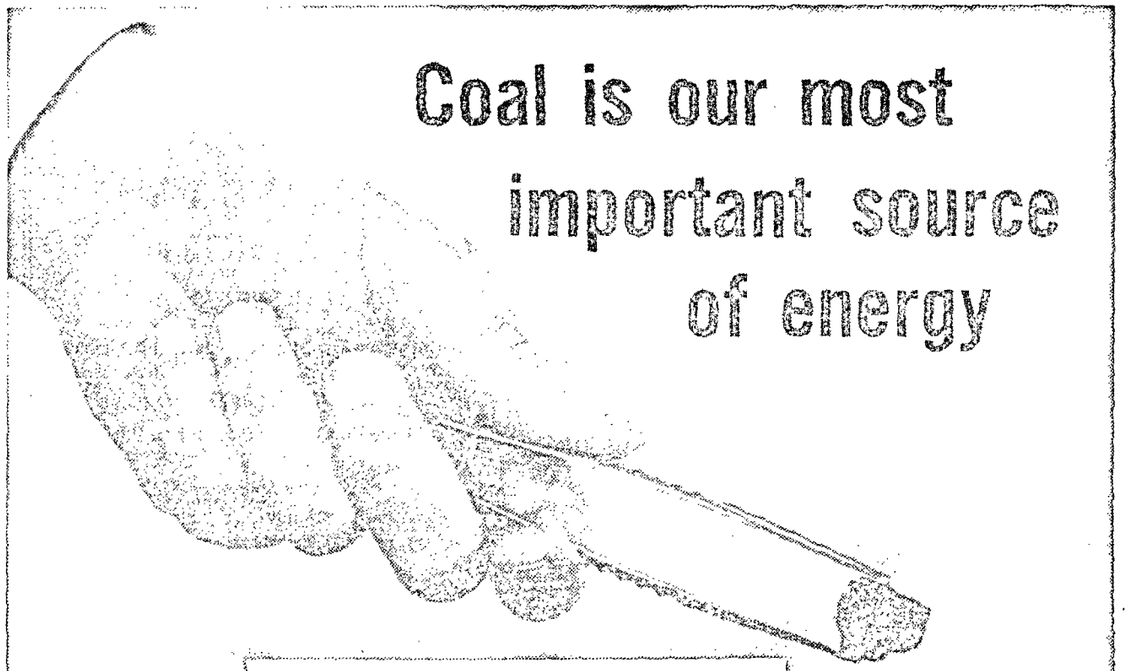
(To be concluded)

The Krupp Property

FROM OUR BONN CORRESPONDENT

It is now clear to most observers that Herr Alfried Krupp, egged on by ambitious retainers and covertly supported by the German Federal Government, has no serious intention of relinquishing any further part of the industrial empire of which he is sole owner. It is just as clear that, whatever disapproving noises they may make, the promulgators of Allied Control Commission Law No. 27, of May 20, 1950, are going to have to lump it.

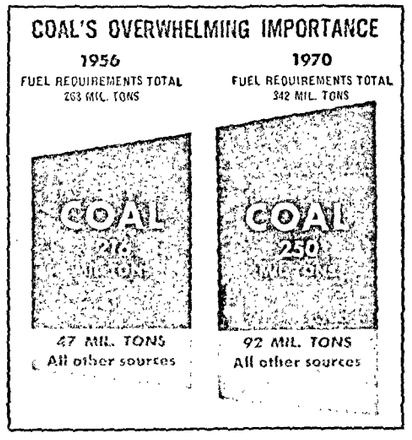
Law 27, which was taken over by the Federal Republic on attaining sovereignty, directed a group of German industrialists to sell their coal and steel assets by March 31, 1958. The object of the law, as stated in the preamble, was to prevent an excessive concentration of economic power, the development of a war potential, and the return to power of persons who had helped to advance the designs of National Socialism. Among the larger of the combines named were those of Friedrich Flick, Otto Wolff, Alfried Krupp, and the Thyssen heirs. Both Herr Flick and Herr Wolff have fulfilled their obligations. The Thyssen heirs, too, have more or less complied. Herr Krupp alone has got conspicuously stuck. Ordered (in the simplest terms) to sell three coalmines and one steel works, he has sold only two coal mines—the Emscher-Lippe and another with the engaging name of Constantin der Grosse. After two or three interested enquirers, among them the Italian State Railways, had shied off, Constantin der Grosse was sold to the Bochumer Verein, a combine controlled by Herr Krupp's friend, the Swedish industrialist Wenner-Gren. The steel combine at Rheinhausen and the Hannover-Hannibal coal mine in Lower Saxony are still supposedly waiting for a buyer. Rheinhausen is the apple of the Krupp boardroom's eye. Built fifty years ago, the plant has been completely modernised since the war, has an annual capacity of two million tons of crude steel, lies directly by the Rhine, and has room to expand. At Krupp headquarters they value Rheinhausen at £170 million and dismiss as "ridiculous" the offers hitherto received.



Without actually mentioning Herr Krupp's name, yet obviously thinking of none other, the Federal Chancellor wrote to the British, French, and United States governments last February, pointing out that certain "difficulties" had arisen in carrying out Law 27 in full, and suggesting that the three governments might now consider that enough had been done. It is possible that Dr Adenauer despatched his letter when he did in order to give the makers of Law 27 ample time to set up the apparatus envisaged for giving, if necessary, the industrialists concerned an extension of the term at first stipulated for getting rid of their coal and steel assets. The law permits two extensions, each of one year, on the recommendation of a committee of seven, composed of three Germans, three representatives of the former occupying Powers, and one neutral. But it is also possible that Dr Adenauer chose this moment to act with his mind largely on the coming elections. It is no secret that most of the big German firms, not excluding Krupp, subscribe handsomely to the campaigning expenses of the right-wing parties, and they like to see something for their money.

★

Pending their formal reply, the three governments have asked Dr Adenauer to specify the "difficulties" which he says have cropped up. They are not aware of any pains having been taken to sell Rheinhausen. And should the German answer be that no one seems to be able to lay his hands on £170 million, they might well ask whether, in view of the government's canvassing of the idea of "people's shares," Rheinhausen might not make just as admirable a piece of people's property as the Volkswagen works. It will not be easy for the Chancellor to give a straight reply; for the real answer is that Herr Krupp sees now that he can get away without fulfilling the whole law, and if there is any industrial group in Germany capable of raising the money for Rheinhausen it is not going to run the risk of offending so powerful a personage as its present owner by doing so.



Dr Adenauer can hardly be expected to cite these "difficulties"; but his reply will be firmly negative, and the three western governments must know it. They are faced with the alternative of letting Herr Krupp have his way now or postponing his pleasure for a year or two. Their problem is to prepare public opinion, particularly in Britain and France, for the inevitable outcome. The name of Krupp has come to have special symbolic associations for millions outside Germany who will deeply resent any mitigation of the original sentence.

For Alfried Krupp himself there is really only one "difficulty." He, alone of the compromised industrialists, has signed a statement undertaking never to go into the coal and steel producing business again. As seen in Essen—and probably also in Bonn—one solution would be for the four governments concerned in the existing agreement to concoct a statement releasing Herr Krupp from his bond.

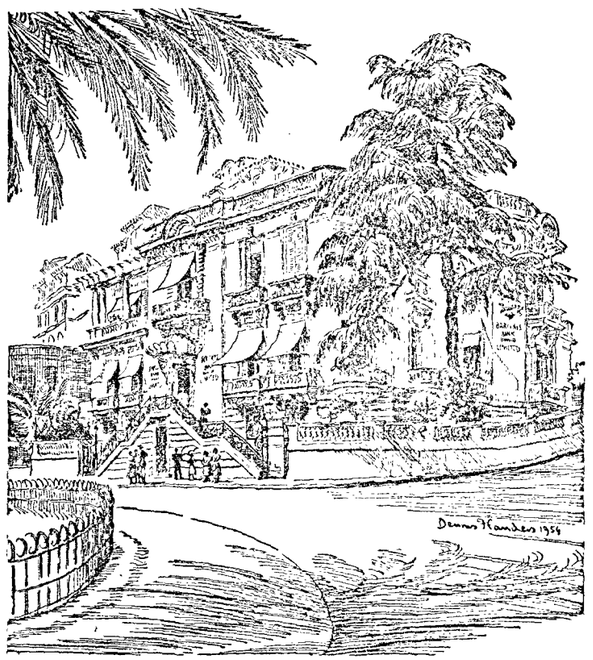
HANDLE WITH CARE. Not even the smallest piece of coal is unimportant today. For most of our energy comes from coal—and we need more and more energy. This is why the new machines, new techniques and new men in the coal industry are so important and so interesting. Why, in so many new ways, we handle coal with care.

Water heated, steam raised, wheels turned, electricity generated. This fundamental process makes Britain work: supplies us with the power to make goods and the power to use them—the means to live and enjoy life. *It starts with coal.*

As this chart shows, coal will not be replaced by other sources of power for generations. Oil and nuclear energy will supply more power every year: but our need for power will grow faster than they can meet it. This puts the main responsibility squarely on coal. Only by winning far more coal can we produce the power we shall need.

There are other sources of power: notably, oil and nuclear energy. They will contribute more and more power. But they will not replace coal. Whatever contribution they one day come to make, coal's importance will always be overwhelming.

Coal is, and will continue to be, our primary source of power



Coal faces an enormous responsibility. Everything implied in the phrase "a higher standard of living" is energy-consuming: the manufacture of goods, and their use; heat, light, clothes, comforts; all the material good things of our lives. Year by year we consume, as a nation, prodigiously more energy. Where shall we get it? Primarily from coal.

Britain sits on vast reserves of coal —more than enough for many generations yet. So there will be no shortage. But all the time our need for coal rises, it gets harder to win. In every pit, every coal face recedes with every ton we lift.

How can production rise?

By a far more highly developed mining technology. More machines must be used at the coal face and all stages behind. More research must go into the techniques for using them best. The whole operation of mining must become scientific: planned: ultra-modern. This means that more technologists of every kind must bring their skills to the winning of coal—and the immense size of the coal industry and of the task that faces it, and the immense variety of its technical needs, make coal one of the best jobs any technologist can have today.

THE BUSINESS WORLD

Friendless Gilt-Edged

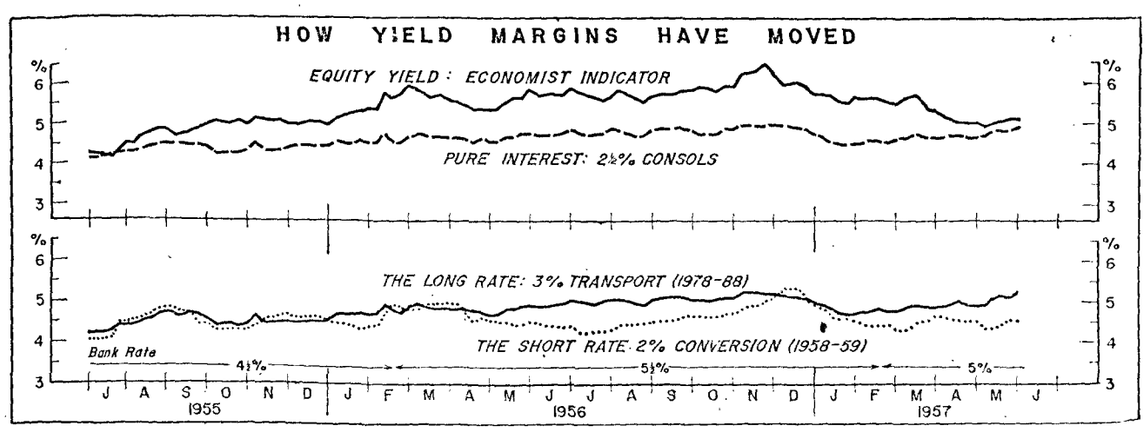
NEVER in history, surely, has the gilt-edged market suffered such disdain as it does today. Gilt-edged used to stand for substance and leadership, the reflection in stock market terms of the credit of a country that ran its currency honestly and pursued its commerce vigorously. Now it stands for a section of the market in which no private investor thinks of putting his money, unless he has to, and in which even the institutional investor is rapidly losing interest. The credit of the British Government used to speak for itself; now apprehensive questions are asked about it in Parliament. What action, they demand, does the Chancellor of the Exchequer propose to take to remedy the situation? They add the suggestion, with an inference as delicate as a hammer blow, that the Government itself can considerably influence the gilt-edged market. To such questions, the replies on behalf of the Government have been wholly proper and totally unencouraging. "I do not think," said Mr Birch, the Economic Secretary to the Treasury, "it would be likely to stimulate investment in gilt-edged stocks if we were to force the rate of interest down artificially," and he added that this policy had been tried in the past "with rather disastrous results."

It would want much more than a promise to abstain from poodle-faking (welcome though the promise is) to arrest the slide in gilt-edged stocks. This has lately taken 2½ per cent Consols within a quarter of a point of 50, and 3½ per cent War Loan to a point under 70. The "irredeemables" are thus on a 5 per cent yield basis, and no one is expecting them to improve in a hurry. These are levels not seen since last November, when the guns were firing and ultimatums were international currency. It was then possible that the blocking of the Suez Canal might seriously damage the British economy, and it was certain that even an indifferent settlement of the Suez issue would bring temporary relief. Today, there is no international crisis to take the blame, and no apparent attraction to buyers in the fact that gilt-edged yields have reached their traditional resistance point of 5 per cent.

To suggest that the Treasury should come to the rescue of its own stocks is a dishonest recipe for more inflation and for increased pressure on sterling. Who, then, can be expected to buy? To this question there are two sets of answers: one resting on technical and market factors, and the other on more fundamental considerations that affect the demand for, and the supply of, capital resources in the British economy. They can be distinguished in an analysis of this kind, but in essence they are interconnected, and in a largely free economy they cannot for long diverge.

OF the proximate forces in the market that affect gilt-edged prices, the banks and the assurance-cum-pensions funds are the most potent. If the banks were to come in as substantial buyers, they could materially affect the prices of stocks ranging from the shorts to the "short-middles." If the institutions were to revive their former interest in gilt-edged, they would transform the medium and long-dated range of the market. These are the dominant influences. At times, the discount market sways the short bond market, but it made the running there at the turn of the year, burned its fingers, and will be happier with bills until the bond market makes a convincing signal. Occasionally, big industrial groups invest large sums in short-dated stocks, but few of them now have spare cash awaiting investment in buildings and plant, and the pick-up of industrial investment confronts them with the need to find more finance from their own resources and from

the market. Wealthy individuals are no longer Forsytes investing in the funds ; they are sellers rather than buyers, and if they happen to be Lloyds' underwriters they have been switching up to half their deposits into equities. Even the special buying of the next maturing stock by individuals seeking to avoid death duty by the " disappearing trick " has now been stopped by the Finance Bill.



If the vital investors, the banks and the institutions, decide to stay out of the market, they can comfortably do so. The banks are in no hurry after their experiences in the gilt-edged market in the last two years. But even if they wanted to come back as buyers, their liberty of action would be closely confined by their liquidity. If bank credit was radically eased and their liquid assets increased, they would have funds to employ in the gilt-edged market ; but last summer, when their liquidity was a good deal higher than it is now, they were not enthusiastic in following official suggestions that they might put more of their spare cash into gilt-edged and today, with more business in advances, they would be even less so.

The assurance and pensions funds enjoy a higher income than ever, but their ideas on investing it (even those of the most conservative funds) are swinging away from gilt-edged towards industrial ordinary stocks and prior charges. They are doing so for two reasons: first, they seek to build into their participating contracts the element of growth that only equities can provide ; secondly, even in non-participating contracts they have to compete in premium rates and benefits, and with high-class industrial loan stocks again on a 6 per cent basis and good ordinary shares averaging nearly 5¼ per cent, there is correspondingly less attraction in long-dated gilt-edged stocks.

CAN this depressing spiral be broken without slipping into another bout of inflation ? Already there has been a venial accommodation with sin in recent changes of technique employed by the government broker in his selling operations in the market. On the plausible ground that he can sell far more stock from departmental holdings on a good market than on a bad one, he takes care not to make the market worse than need be. This may be a minor change, but it had much to do with the big rally in gilt-edged prices that extended from December until well into February. It had something to do, moreover, with the short-lived rally when the £100 million of 4½ per cent Conversion 1962 was issued six weeks ago. No change has been made in the basic policy that the government broker must be a seller on balance, but enough was done within those instructions to leave the inference open to investors that the authorities were not hostile to a rising market. Still determined to fund, they had become disposed to let the dog see a little more of the rabbit.

Yet it is surely doubtful whether buyers could be induced to return to the market in any volume merely because its technical handling had been made somewhat more adept. That conclusion leads naturally to the second answer to the original question. When technical adaptation is exhausted, the credit status of gilt-edged stocks is tied solely to the standing of the Government, the currency, and the country. Either the authorities must accept the disagreeable facts of dearer money and a sagging market until buyers are once again attracted by prices that they consider to be in line with economic necessity ; or they can seek so attract them at the cost of a real change of policy, including a further reduction in Bank rate and an easing of other financial controls. There is no doubt where the economics are pointing: towards a world *voracious in its demand for new capital. There is no* means, in a free economic system, of matching that demand to the available resources save through the mechanism of interest rates.

All countries are in the same boat ; throughout the world interest rates are rising, and they are rising most quickly in those countries that have lacked sufficient self-discipline in the past to keep inflation in check. That is why the current argument that a weak gilt-edged market does harm to British credit and to sterling is specious, save in a *post hoc* sense ; the weakness in gilt-edged has been caused both by the fact of inflation and by a discipline that seeks to get rid of it. It would be easy to arrange a recovery in gilt-edged, at the price

of provoking the very inflationary tendencies that monetary policy has been trying (with admittedly chequered success) to quell during the last two years. But that change of direction would deceive no foreign holder of sterling ; and while it would temporarily encourage speculative buying of gilt-edged, it would betray the genuine investor, and ruin for all time any prospect of a healthy, independent market.

If there were any sign, at home or abroad, of a significant economic setback, a policy of promoting lower interest rates and re-expanding credit would no longer be a risk, but a positive duty. But at present there ought to be no doubt in the mind of the authorities about their decision. They have no right to procure a better market for their own wares than is warranted by the underlying economic facts. Their job is to defend sterling abroad and the purchasing power of the pound at home. When they have convinced investors of their ability to do so, they will not need to worry about the gilt-edged market.

A Surplus of Tankers?

The world tanker fleet will nearly double during the next five years. The oil industry is having some second thoughts whether demand for oil will continue to grow as fast

BY the beginning of the nineteen sixties, the carrying capacity of the world's tanker fleet will be almost double what it is today—but major oil companies will own a considerably smaller proportion of it than they do now. Ought they to order more tankers now and reduce their dependence on the independent tanker owners ? Or are so many tankers already on order that they will be able to cover future requirements more cheaply by chartering in the market ? If, moreover, tanker freight rates fall further over the next few years, how can the vessels now on order be financed most economically ? These are among the most harassing questions in the somewhat agonising reappraisal that the oil companies have had to make during the last nine months. And because a ship ordered now will not be ready for service until 1962 at the earliest, these questions about the future tanker market have to be answered now, however great the uncertainties on which the decision has to be based.

At the end of 1956, there was a world tanker fleet of nearly 45 million deadweight tons. The probability that this would be far too small to carry all the oil required had been recognised, first by the independent tanker operators, and belatedly by the oil companies. By June, 1956, before the vulnerability of the supply routes through the Middle East had been demonstrated, 18 million deadweight tons of new tankers were on order. During the second half of 1956, when the tanker shortage had already become acute, orders were placed for a further 12 million deadweight tons, and in the first three months of this year it is estimated that a further 2½ million dwt have been added to the shipyards' order books. In about five years' time the world tanker fleet will be 75 per cent larger, in deadweight tonnage, than it is today. The new tankers will be faster than the average of the present fleet ; so their total carrying capacity will by then be almost doubled.

Before the war the oil companies owned over half of the world commercial tanker fleet. By the end of last year their share had dropped to 46 per cent, and the independents, with the Greek owners expanding most rapidly, had 54 per cent of the fleet, including most of the largest and most modern vessels. Of the 30 million tons deadweight on order at the end of 1956 nearly two-thirds were destined for the independents, and only a third for the oil companies. To regain their prewar share of the world fleet, the oil companies would have to go on ordering now. But if they did, their ships might merely intensify a depression in the tanker market when they were finally delivered. The independents have reaped the profits of the postwar tanker shortage with tankers ordered when the market was depressed ; but if the oil companies try to regain their lost dominance now they might find themselves merely sharing future losses.

ORDERS for delivery between now and 1962 are nearly all placed, and it is possible to estimate fairly accurately the probable deliveries of new tankers each year at least up to the end of 1961. The following figures, compiled by John I. Jacobs and Company, show the position at the end of each year, expressed in " T-2 equivalents "—with the new, faster tankers converted to the common denominator of a traditional T-2 tanker of specified speed and carrying capacity.

GROWTH OF TANKER CAPACITY

	Commercial tanker fleet at end of year expressed as T-2 tankers	Net increase on previous year assuming all vessels scrapped at 20 years of age expressed as T-2 tankers	Annual percentage increase
1956	2,376	...	...
1957	2,571	195	8·2
1958	2,937	366	14·2
1959	3,332	395	13·4
1960	3,724	392	11·8
1961	4,084	360	9·7

Source : John I. Jacobs and Company.

The total carrying capacity of tankers afloat would thus be increasing by about 11½ per cent—if all tankers were scrapped as they reach 20 years of age. Will world demand for tanker tonnage rise as fast ?

Two factors will settle this: how much oil is required in future, and how far it has to be shipped. Any estimates of either must in any case be subject to quite wide margins of error. But current political circumstances are widening these margins. The rate of increase in demand for oil, especially heavy oil, in Europe in the 1960's will be conditioned largely by the extent of government support for the development of nuclear power, and by the performance of the coal industry, both in production and—with the probable assistance of governments—in selling coal in competition with oil. It has recently been suggested that Britain will stabilise its rate of oil imports after 1960; though the Government will certainly not confirm this, it will not certainly deny it, either. And if the six members of Euratom (which, with Britain, account for nearly 90 per cent of Western Europe's oil consumption) could carry out the plans of their working party, they would stabilise oil imports after 1963. It is certainly on the cards that the rate of increase in demand for oil in Europe and the rest of the Eastern Hemisphere may begin to slow down in a few years' time—just as the tanker fleet reaches new heights of capacity. In the United States, although nuclear power is not expected to make any significant contribution to energy supply during the next decade, the recent growth in oil consumption has been slower than in Europe.

If consumption in Europe and the rest of the Eastern Hemisphere rose by, say, 10 per cent a year over the next five years, and consumption in America by, say, 6 per cent a year, it would mean an annual rise of some 8 per cent in world demand for oil. To employ all the tankers likely to become available, on that basis, the average tanker haul would have to lengthen by about $3\frac{1}{2}$ per cent a year during the next five years. What are the chances that this will happen? Europe was already fully committed to Middle East supplies before the Suez Canal was blocked, and is unlikely to be able to lessen that dependence. It cannot afford hard-currency alternatives; no large contribution from alternative soft-currency sources can be expected, at least during the next five years. Thus the source of the crude oil consumed in refineries in the Eastern Hemisphere is unlikely to be changed radically. If crude oil has to be shipped round the Cape, because the Suez Canal cannot handle the tanker traffic wanting to use it, or if the pipelines to the Mediterranean are sabotaged again, more tankers will be needed to move a given amount of oil. On the other hand, the average length of haul from the Middle East will be reduced if the oil companies' ambitious plans for new pipelines from the Persian Gulf to the Mediterranean are fulfilled. At their most ambitious, these plans provide for the movement of an additional 70 million tons of oil a year by pipeline to the Mediterranean. They would obviate the costly alternative of carrying Middle East oil round the Cape—for even supertankers round the Cape cannot compete with pipelines plus supertankers from the Levant. Nevertheless, much finally depends on the relative rates of expansion in world demand as a whole and in Western demand for Middle East oil. Contrive as anyone will, longer voyages are required from the Middle East than from most other oilfields throughout the world; and if this traffic grows faster than total demand, the average world tanker haul must lengthen.

It will certainly lengthen if the United States becomes more dependent on imports of oil from the Middle East. But recent new discoveries within the United States—in the "Four Corners" area of New Mexico, and offshore in the Gulf of Mexico, for example—are helping to offset declining output in other domestic fields. The Congressional lobby against imports of oil is as strong as ever; and where it has been defied, it has been defied mainly on behalf of imports from Venezuela, Canada, and other "safe" countries in the Western Hemisphere, where productive capacity has been rising sharply. This effective discrimination against imports of Middle East oil means that, although they may rise, they are unlikely to rise fast enough—for the next few years at least—to make a very large addition to the demand for tankers. Venezuela, on the other hand, which will probably supply the bulk of America's imports, is almost as close to the American consumer—even in terms of tanker voyages—as many of the domestic oilfields.

THE range of these interlocking possibilities has certainly widened in the last twelve months; and on balance there does now seem a stronger chance of a surplus of tankers for a few years in the early 'sixties. It would therefore be prudent to expect tankers launched in the early 1960s to start life in a world of low freight rates rather than high ones. This prospect, in turn, could decisively influence the availability of outside finance for tanker construction, and the arrangements that have to be made to secure it.

In the United States, where the banks play a much larger part in ship finance than in Britain, "combination loans" by banks and insurance companies are usually made against five- and seven-year time charter contracts with oil companies. Sometimes both lender and shipowner are protected against subsequent increases in shipbuilding and operating costs by escalation clauses in the time charter. Aided by the tax advantages of sailing under Panamanian and Liberian "flags of convenience," Messrs Niarchos and Onassis, the Greek shipowners, have found little difficulty in obtaining finance on favourable terms from American banks and insurance companies on the security represented by their ships, by time charter contracts with oil companies, and by a well-merited reputation for astuteness in tanker operation. The Niarchos group is now even able to obtain finance on the security of large period contracts with oil companies, without even specifying the names of the vessels to be used.

In Britain, financing arrangements for tankers have been made recently by both Shell Petroleum and British Petroleum. In each case loans from banks and

institutional investors have been secured not only by mortgages on the tankers, but also by bareboat charter contracts with the oil companies which fully cover the interest on the loan and the depreciation of the ships over a period of 23 or 24 years. The lenders have the satisfaction that under bareboat charter all increases in operating costs have to be borne by the oil company, and not—as under a time charter—by the shipping company or its backers. And in the last resort, the repayments are secured by the solvency of two of the largest oil companies in the world.

Whether the same method of financing can be repeated is now doubtful. Bareboat charters, which earn shipowners only a slender margin of profit, may be less unpopular with owners in a falling market. But under such conditions the oil companies might find bareboat charters an expensive commitment. Moreover, an essential ingredient of these financing arrangements is the participation of the banks, who take up the shorter portion of the loan, leaving a more attractive longer portion for the institutional investors. The Capital Issues Committee has now objected to the banks taking part—even for periods as short as five years—in tanker financing schemes of this sort; and if the banks are excluded in future, the institutions may no longer be interested.

The debentures placed earlier by London and Overseas Freighters, but not secured by long-term charter at fixed rates, enable the operator to secure the profits of consecutive voyage charters in a period of rising freight rates. These charters also give the shipowner the protection of a minimum below which his monthly earnings cannot fall. But they can rarely be arranged for periods longer than two years, and when freight rates fall, they entail greater risks for both borrower and lender. In practice, therefore, finance can be raised in this way only by shipping companies with large assets. For the smaller shipping companies, a bareboat or at least a time charter is a minimum security, and if freight rates are likely to fall, they will find the oil companies playing "hard to get" on any long-term charter. Many operators in the tanker market are now prepared to voice these misgivings about the future of freight rates. They have, of course, the flexibility that scrapping old vessels faster could give them. But the decisive signal that they are really affecting future plans would be the first cancellation of a tanker order. So far, none has occurred.

BUSINESS NOTES

STEEL LOCATION

No Place for Politics

IT was through political pressure in the thirties that the first continuous steel strip mill built by the Richard Thomas group, now Richard Thomas and Baldwins, was built in the wrong place. Today, twenty years later, political lobbying is again in full swing to have the steelworks that may form the basis of its second continuous mill (and the country's fourth) built in one of several wrong places. Different areas of Wales began by setting their MPs squabbling; now members from Scotland and from Lincolnshire are asking the Prime Minister to intervene (as one of his predecessors did so lamentably last time).

Comparatively little has been heard of the company's own view. About eighteen months ago RTB was talking confidently about building Britain's fourth strip mill, though it had not finally settled on a site. Since then it has put in its project for the integrated iron and steelworks, at any rate, for approval by the British Iron and Steel Federation and the Iron and Steel Board. It is no longer publicly committing itself to the finishing end of the works, and suggests that in the first instance this works, sited beside deep water at Newport, would supply steel to Ebbw Vale (which still, as a result of the wrong decision on siting in the thirties, has to "import" much of its steel from Scunthorpe). The federation has approved the project; the board, though it is still considering some technical details, has announced its approval of the location—perhaps in an endeavour to still the lobbying. This the announcement has notably not done.

Even formally, considerable responsibility for this decision does rest with the Government. The Board of Trade would have to issue an industrial development certificate, and the Ministry of Power, as the new "production department" for steel, is directly concerned. Moreover, Richard Thomas & Baldwins is owned by the State; it is the last great steel company still nationalised, and given the huge new financial commitment overhanging it plus the present state of the market for new issues, it now seems unlikely to be offered for sale this summer. So the Government has several kinds of say here. Nevertheless, denationalisation seemed at least in principle to commit it to taking the advice of the Iron and Steel Board in such matters. Economically, Newport may be the right location for a new strip mill—presuming that during its working life Britain does not have to import coking coal as well as iron ore. If that situation were to arise, it would strengthen the advantages of coastal locations nearer London—which so far have not been lobbying. Scotland, on the other hand, is a long way from the motor industry; and though the balanced development of Britain's

steel industry might well eventually require a new integrated works in Lincolnshire, sheet and strip do not look to be the natural finished products for such a plant.

IN THE MARKET

Kaffirs on Stage

KAFFIRS took the centre of the stage this week, but they did not quite dominate it, for there were other players in the act. Gilt-edged stocks remained in the shadows; with little business passing through that market, prices drifted lower and then staged a small technical rally. Industrial equities remained generally firm and Shell attracted heavy American buying. Other oil stocks, notably the Caribbean issues, followed this lead, and though Shell's advance was checked on Wednesday with a slackening of American buying, this week's jump in oil shares is primarily responsible for the smart rise in *The Economist* Indicator from 216.6 to 219.0. Canadian stocks, after so long enjoying the spotlight, were unsettled by the sudden reversal of political power in the Canadian general election.

	1956 High	1956 Low	May 31	June 7	June 12
Buffelsfontein	32/4½	21/7½	30/–	33/–	32/–
F.S. Geduld	95/3	68/1½	57/6	68/1½	70/–
Harmony	29/1½	22/9	19/7½	23/6	23/–
Loraine	7/3	4/–	3/10½	5/–	4/10½
President Brand	64/–	52/6	47/–	53/–	50/6
President Steyn	34/3	28/7½	24/1½	29/6	28/–
St. Helena	30/–	23/9	21/9	29/4½	28/–
West Driefontein	116/3	95/–	83/9	91/3	93/9
Western Holdings	81/9	64/4½	58/9	68/1½	67/6

Cons. Gold Fields	61/6	51/9	51/–	54/6	54/6

The scene has a familiar look and in the wings stand an army of industrial borrowers. Yet another reminder of their presence came with Vauxhall Motors announcement that it is raising £11 million. Of that sum, £6 million will come from the subscription by General Motors, the parent company, for six million £1 redeemable preference shares at par. The remainder will come from the private placing of a 6 per cent unsecured loan stock 1967-77 at 99, arranged by Morgan Grenfell with the institutions. This follows the pattern, though at a higher rate, of two earlier placings of unsecured loan stocks, both due for redemption at a premium between 1962 and 1969. The latest terms are steeper, and there has probably been hard bargaining over the borrower's option to redeem this high coupon stock in ten years' time.

To Be or Not to Be?

THAT uncertain, elusive Hamlet, the Kaffir market, posed the old question: Was a boomlet possible and would it last? Before the week-end the sudden advance in Kaffirs and especially in the OFS issues was led by professional buying from London, abetted (not it seems in any great strength) by Paris, Brussels and Zurich—though not from Johannesburg. Along came a good borehole result from St Helena and after the holiday the market broadened; investors outside the confines of the City had taken an interest. But then came a sudden change in mood. Johannesburg began to sell and London followed.

There have been sudden boomlets in Kaffirs before, and fingers have been burnt in them. Mining costs are still rising, and the chance of an increase in the price of gold is as remote as ever. The finance houses and other investors have plenty of stock on their books. These facts and the political situation in South Africa are threadbare in their familiarity to investors. There has been, as Sir Ernest Oppenheimer says in his latest statement to shareholders in Anglo-American, "an almost unrelieved depression" in the Kaffir market since 1954; he argues the need for institutional investment in that market and suggests that closer co-operation between the finance houses and some amelioration in taxation may help to secure that support. But there are some facts on the other side. Most of the OFS development is paid for; production there is rising rapidly; uranium profits are mounting; and at present prices the yields on the new producing shares are high. This might be a Hamlet not entirely clothed in black.

CONSUMPTION

Personal Spending Recovers

RECENT indications of a strong resurgence in consumption since the beginning of this year are amply confirmed by the latest estimates of the Central Statistical Office. These still do not give the full picture since over half of the items that normally comprise consumers' expenditure are not included—food and fuel and light, for example, are missing—but they show hefty increases of 7 per cent in value and 4 per cent in volume for the remaining items in the first quarter of this year compared with the same three months of 1956. This rate of spending comes after a year in which the volume of personal consumption hardly rose at all.

PERSONAL CONSUMPTION
(January—March)

£ mn.	At current prices 1955	1956	1957	Changes in volume 1956-57	1955-57
Food	942	1,028	...	...	...
Drink	176	187	196	+ 2·6	+ 9·4
Tobacco	201	214	229	+ 2·0	+ 6·8
Housing	255	263	278	+ 1·5	+ 2·5
Fuel and light	155	174	...	...	...
Household goods	210	208	235	+12·2	+ 2·2
Clothing	264	279	294	+ 3·6	+ 6·9
Other	697	724	...	...	...
Total	2,900	3,077	...	...	...

The most noticeable feature of this upward swing was the complete recovery of sales of durable household goods, which rose by a full 13 per cent at a time when prices increased by very little. Total sales of these goods have now more than made good their losses during last year's setback. Sales of beer and clothing also improved and even tobacco sales managed to reverse the slight decline that set in with the increase in duty in last year's budget. It is difficult to tell yet whether these increases have resulted partly from any shift in spending away from other items, as well as from an increase in total outlay, but the Board of Trade

What Will Atomic Power Cost?

THE Secretary-General of the United Nations is the latest in a long line who have tried and honourably failed to pin down with any precision the cost of producing electricity by atomic fission. Last weekend the first limited copies were issued of a 250-page *aide memoire* on the prospects for atomic energy prepared by him from questionnaires sent out to the main atomic powers. This admits frankly that it is pointless to compare costs offered for the atomic reactors being developed in different countries.

Two factors make the exercise impossible; one is temporal and the other actuarial. The first arises from the fact that the rate at which atomic power is being developed varies from country to country. Britain, the report notes, is the only country now producing atomic electricity which from time to time is actually sold; projects in other countries, some of which are listed in the table below, are due to be finished this year, next year, or as long as five years hence. It is never advisable to draw comparisons between data collected from a plant already working, and estimates prepared for one that will not be finished for several years. The rueful reappraisal of the construction costs of some of the American projects now being built or planned shows that in atomic engineering there can be many a slip 'twixt blueprint and commission. At Shippingport, for example, construction costs have already risen by at least $22 million above the original estimates, so that this power station is now expected to cost $70 million to complete. This has given some wry satisfaction to British engineers, who have frequently been baited by their American competitors for the high costs of Calder Hall type plants; these do at least represent incurred costs which, *pace* inflation, can be repeated.

Britain's atomic plan, providing for 6 million kW of atomic capacity by 1965 and a possible 12 to 16 million kW by 1970, is by far the largest projected. The Russians, who expect electricity consumption in the Soviet Union to rise from 211,000 million units this year to 320,000 million units in 1960, have plans for two big atomic power stations and one slightly smaller, with four relatively small plants, generating from 5,000 to 70,000 kW, to test advanced reactors.

France, which can still draw on an untapped reserve of hydro-electric power for the next seven or eight years, plans to put in 850,000 kW of atomic electricity by 1965 and 10 million kW by 1975. Canada and the United States, with adequate reserves of cheap fuels, are atomic dilettantes, interested in what are described as "power demonstration" programmes. Electricity from any of the plants completed in the United States before 1960 is expected to cost from 5 to 10 times as much as power from conventional stations, which runs from as low as 4 mills per unit (about one third of penny) in some regions up to about 9 mills in others. By 1965, unit costs should be down to roughly double conventional costs; by 1970, they might begin to look competitive with conventional stations in the high-cost districts of the United States.

THE real difficulty starts when cost estimates move from these broad trend patterns to a more precise breakdown of prices. Britain was the only country to offer the United Nations a really detailed cost estimate; and it is plain that some uneasiness is felt even in the Atomic Energy Authority about British cost estimates. The AEA has now adopted the practice of putting forward its cost estimates in two forms, one for British conditions and the other for foreign users. The results of the comparison is shown above. Such a qualification has become necessary because the main controversy over the British figures is over the allowance for amortisation. This is a critical matter; atomic construction costs, 60 per cent of which goes on the nuclear components, are roughly twice as high as those of conventional stations and account for half the cost of nuclear electricity. The Americans, in their answers to the United Nations questionnaire, said they had allowed a capital charge of 15 per cent per annum; the Euratom experts have worked on a capital charge of 13 per cent and so does Mr Jukes, the economic adviser of the AEA in his "foreign" figures; but for British costs he allows an annual charge of only 8 per cent for amortisation (interest charges plus depreciation). The difference this makes to the estimated cost of electricity is significant.

This figure of 8 per cent is based upon the fact that electricity authorities in Britain can raise their money at almost precisely Bank rate: they are less cossetted in other countries. Given such a rate of interest, AEA explains its low capital charges of only 8 per cent on the ground that this would write off the cost of a station in 20 years on a "sinking fund" basis. This is a perfectly feasible method for the amortisation of public utility equipment: it assumes that the value of the plant will be recovered by purchasing a hypothetical series of annuities; and it is a basis that the Central Electricity Authority has accepted for broad comparisons of these highly hypothetical costs with those of conventional stations. But the fact remains that this is not the method that the CEA accountants use themselves to amortise electric generating plant. They pay interest at close to Bank rate: since much of their capital was raised in times of cheap money, their average interest rate might be no more than 3¾ per cent. But having done so, they write off their plant on a straight line basis. It would have provided a more readily defensible comparison of atomic costs in the one country that has a right to speak on the basis of experience if AEA had itself followed exactly the same method.

returns for retail trade in the first quarter suggests that the recovery in the sales from food shops that began towards the end of last year was still going on.

CRUDE OIL PRICES

Higgling in the Persian Gulf

THERE are probably more changes to come in the current round of increases in the fob price of crude oil in the Persian Gulf. Four of the five major American oil companies with interests in the Middle East—Socony Mobil Oil Company being the sole exception—have now posted higher prices, following the lead first given by British Petroleum and Shell. In Kuwait, Iraq and Iran, all the increases so far announced are the same—13 cents a barrel. But in Saudi Arabia, two slightly greater increases in price have emerged. The Standard Oil Company of California, followed by the Texas Company, put up prices by 17 cents a barrel, but one of their partners in Aramco, Standard Oil (New Jersey), followed only part of the way with an increase of 15 cents a barrel. A week later the Middle East Sales company—owned by Standard of California and Texas—came into line with the Jersey increase of 15 cents a barrel. The fourth Aramco partner, Socony Mobil, has so far kept mum. An exception was made by all three companies for one Arabian crude oil, from the new Safaniya field, which was raised by 11 cents a barrel by Texas and Jersey, but only by 9 cents a barrel by Standard of California. The remaining difference is in Qatar, where Jersey raised its prices by only 10 cents a barrel in response to Shell and BP's 13 cents a barrel, making the Jersey posted price now a cent a barrel cheaper than its British competitors instead of 2 cents a barrel dearer as it was before.

It is difficult to see how different prices can be maintained very long for the same crude oil at the same point of loading. Nor is it yet clear whether the increase of 2 cents a barrel in the price differential between most Arabian and other Persian Gulf crudes is a considered reassessment of the value of their different qualities, or an attempt to establish a slightly higher level for Persian Gulf prices as a whole. Future price changes can always be made retroactive to the date of the first change of a competitor, and most companies are at times prepared to supply oil at a discount from posted prices. A conspicuous exception is the Standard Oil Company (New Jersey) which adopts a rigid policy of "arms length" trading—even with its own affiliated companies—and never departs from its posted prices. But for most buyers, the big question is whether there will soon be a second round of price increases in the Persian Gulf, to restore the price differentials between Middle East and Texas crude oils that existed before the Suez Canal was blocked.

BRITISH RAILWAYS

Down the Line

IT took a great many decades for the organisation of the railways, founded and built up piecemeal, to reach its apogee of centralisation ten years ago with the act of nationalisation. It will also be a long time before the process of decentralisation, set in motion by the 1953 Act, reaches its final state. But considerable progress has been made in the last four years. The initial step, that of devolving managerial authority to six area boards, was taken more than two years ago and the new structure has been running in very smoothly. But this was only the first stage: the new areas, to quote the 1954 White Paper, "are in themselves very large systems and there must be a definite measure of management decentralisation within them; functional decentralisation is not enough."

The Transport Commission rightly left it to these new area boards to decide how far managerial authority and responsibility was to be further delegated. The Eastern Region, possibly the area that lent itself most readily to this further process, was the first to announce plans, some eighteen months ago. A new assistant general manager was appointed at the region's headquarters to take general charge of its operating, motive power, and commercial policies, with day-to-day responsibility for these facets of railway management vested in separate traffic managers for each of three smaller districts. The scheme for the decentralisation of management authority announced by the London Midland Region this week takes a similar form and has the same objects. It will replace the present departmental system of control from the top with a single director of traffic services for the region and six divisional traffic managers, each running the business of his own area without recourse on detailed matters to the centre. Since London Midland is a more complex railway system, however, the region has been divided into geographical areas. In the case of the Eastern Region, the division was more suitably achieved by line—Great Northern, Great Eastern, and London, Tilbury and Southend—and the first two were further sub-divided into, respectively, four and three smaller areas.

Decentralisation is the necessary concomitant of the modernisation programme, now rapidly gathering pace, and of the new freight charges scheme, which starts on Monday fortnight and which will give local traffic managers a long-needed opportunity to compete more freely for traffic. All three will lead to quicker and better services, act as a further stimulus to the morale of the staff, and place the centre of responsibility closer to customer and employee. The new management structure, like the other two reforms, will take some time to mature, but this week's announcement from London Midland, the largest of the six regions, means that plans for further decentralisation, with attendant administrative savings, are now going ahead over almost half of British Railways.

UK TRADE

Exports Set a New Record

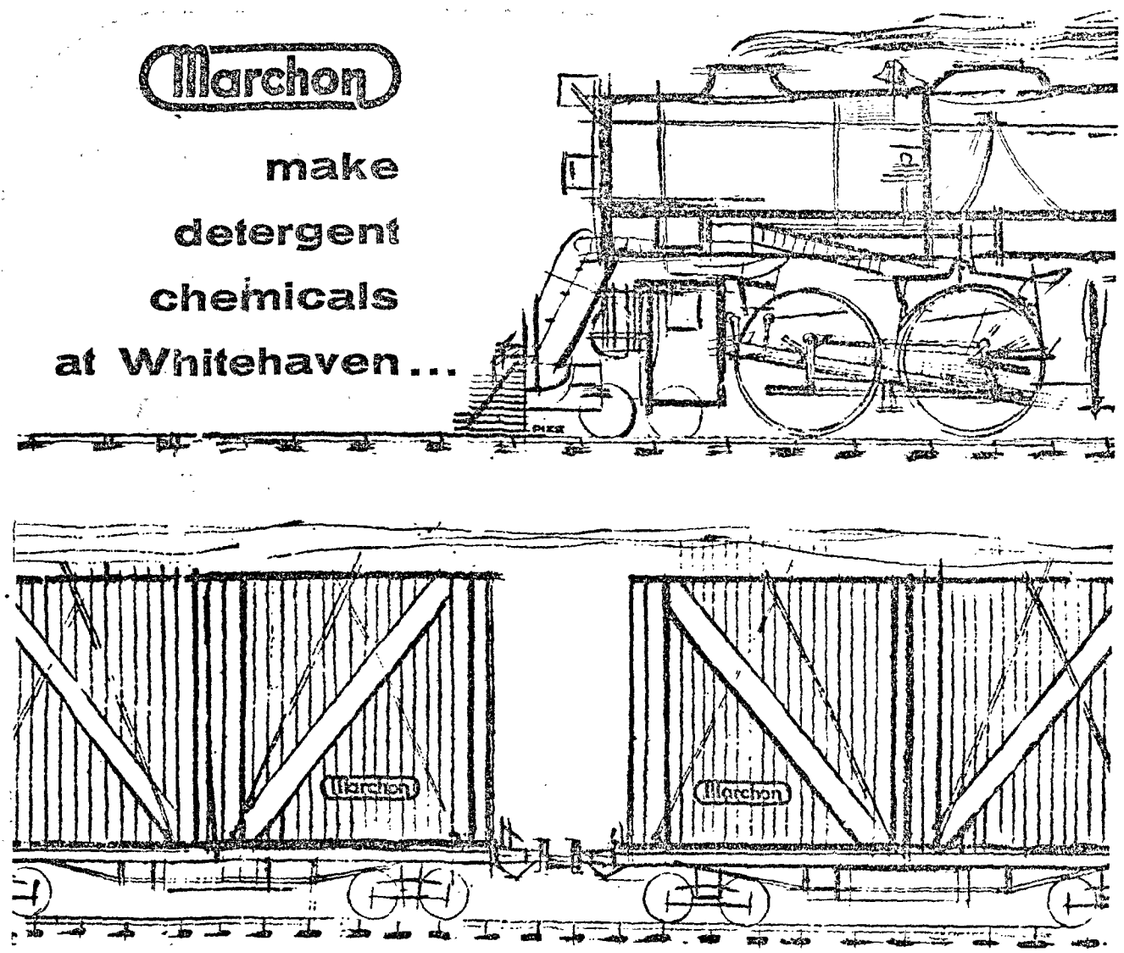
THE value of British exports reached a new record last month and imports were almost a record. Exports rose by £30.7 million to £302.9 million fob, the first time they have exceeded £300 million; the previous peak was £297 million in March. But the rate of expansion this year is still below that of 1956, when the value over the whole year was 10 per cent higher than in 1955. The average value of exports between January and May was £282.3 million a month, seven per cent higher than in the same period of 1956. Imports in May rose somewhat less sharply by £24.7 million to £374.4 million cif; this was just £2 million short of the January peak, when the figure was

The play's the thing...

"Producing the thriller 'DEAD ON NINE' was a very exciting experience for me. In addition to a perfect cast headed by Griffith Jones and Helen Cherry the play itself provided many wonderful opportunities for the really close quick camerawork that is such an essential part of television's power to grip an audience."

CYRIL COKE (DIRECTOR)

Did you know that Associated-Rediffusion had produced over 60 per cent of the plays that have appeared on ITV ?



Associated-Rediffusion have proved that popularity can be gained while maintaining high standards. Over half their contributions to the series PLAY OF THE WEEK and TELEVISION PLAYHOUSE have achieved an audience of over 50% of the people who are able to see ITV : and these are plays well worthy of the fine traditions of the English stage.

"DEAD ON NINE" an unusual thriller originally produced by Joan Kemp-Welch at the Westminster Theatre, was presented by Associated-Rediffusion as a "Play of the Week". GRIFFITH JONES, HELEN CHERRY, DAVID OMLEY and EDDIE BYRNE star in this story of the perfect murder which went wrong. The supporting cast included BARBARA SHELLEY, EDNA PETRIE and ANTHONY SMEE.

ASSOCIATED-REDIFFUSION *Monday to Friday in the London area.*

Advertisers gain a great deal when Associated-Rediffusion is on their advertising schedule.

swollen by arrivals that had been delayed by the closing of the Suez canal. The reopening of the canal last month will again swell the import figures for a time, for ships are arriving via Suez simultaneously with those arriving via the longer Cape route. But that doubling-up could hardly have had much effect on the import figures for May. In the first five months of this year the average value of imports was £356.1 million a month, 8½ per cent higher than in the same period of last year; about one-fifth of that increase is

estimated to represent arrivals carried over from last year. With re-exports £3.2 million higher at £11.8 million, the gross visible trade deficit in May fell by £9.2 million to £59.7 million. The average deficit in the first five months was £62 million a month, £11.1 million higher than in the same period of last year.

Shipments to North America, at £38.8 million, were £5.3 million lower than the previous month, but the April figure included the delivery of the *Empress of England* to Canada, valued at about £6 million, and the final repayment of £1.5 million worth of lease-lend silver to the United States.

FOREIGN EXCHANGES

D-mark Dominant

THIS week the strength of the Deutschmark has dominated the foreign exchanges. It has been strong against every other EPU currency. There has been persistent buying of marks by the Netherlands, Belgium and France, and some of these purchases have been made against sales of sterling. The mark rate in Paris remains jammed hard against its higher limit. Although the French franc and the French reserves continue to take part of the impact of the strength of the mark, sterling has also suffered and has been offered this week against a number of other Continental currencies. Against the dollar, sterling has been particularly steady in the official market—but steady at just under $2.79, a level uncomfortbaly low for this time of the year. There has, however, been a fairly good demand for transferable sterling, both from New York and Zurich. Some of it is said to have been on Japanese account and represents a belated building up of Japan's exceptionally depleted working balances in London. Transferable sterling which was around $2.7740 at the beginning of the week has since recovered to $2.7755.

Following the Canadian election results, the demand for Canadian dollars increased both against sterling and US dollars. On Tuesday the Canadian dollar reached a premium of just over 5 cents on the US dollar—a record figure—though it has since fallen back to 4.94 cents. Against sterling the Canadian rate is quoted at $2.65⅜.

BANK ADVANCES

Through the Squeeze

THE latest classified statement of advances by banks in Britain—still inexplicably issued to the public only one month in three—confirm that advances have turned fairly sharply upward, and that the rise has not been confined to the essential categories. In the three months to mid-May, total advances rose by £78 million; allowing for repayments by the nationalised industries the rise was nearly £89 million. This followed a comparable rise in November-February of £105 million; and the total expansion of £194 million in the six months compares with a small decline (of £3½ million) in 1955-56 and increases of £155 million and £73 million in the two preceding years.

Another indication that the latest expansion has been due to more than seasonal influences is contained in the detailed breakdown of advances by groups of borrowers. It seems significant that an increase was shown by every one of the five groups outside industry or trade. The most notable perhaps was that of £5¾ million, to £34 million, to hire purchase finance companies, bringing their total to nearly £34 million, compared with the November low point of £23 million. The large personal and professional group, which in the February quarter also showed its first upturn since the Butler request, rose only a trifle further, to £325 million—still a quarter below its level two years ago. Advances to stockbrokers rose by £3¾ million and to the "other financial" institutions by nearly £10 million, to £200 million; this seems to confirm Lord Piercy's intimation that the Industrial and Commercial Finance Corporation has lately succeeded in getting rather more funds from the banks.

In the industrial and trade groups, marked increases are shown by retail trade and food, drink and tobacco; and a further increase is recorded for the engineering group. At £241 million advances to this group are now up by more than £50 million on the year, and by nearly £110 million on their level three years ago. Much of this finance is in effect granted for medium terms, for export and other business of high priority. Appreciable increases on the year are shown also by the three textile groups, and by iron and steel—though in the latest quarter this group effected some repayments, presumably from the process of public issues.

ICFC REPORT

Less for Small Business

IN their general drive to curtail advances that the banks began two years ago they did not exempt their own institution, the Industrial and Commercial Finance Corporation, set up in 1945 to provide long-term finance for small and medium sized businesses. Lord Piercy's organisation has thus been obliged to draw in its horns and turn down some projects that it judges to be sound. In the financial year to end-March, the net volume of new business was under £2½ million—compared with £5 million in 1955-56 and nearly £5½ million in 1954-55. The bulk of last year's business, moreover, was financed from repayments and realisations (themselves down sharply, plainly as a result of financial pressure on customers); ICFC's calls on the bank were limited to £800,000. But there are now signs that the banks are being more accommodating.

The number of applications to the corporation in 1956-57 dropped by nearly a hundred to 345; and in the last five years together, applications have been more than one quarter below the level in the five years from 1946-47, that is before the first bout of monetary restrictions. Lord Piercy sees credit restriction having its sharpest effect on the small and medium sized companies—which, when the banks tighten up, cannot turn, as do their bigger brethren, to the capital market; and now ICFC cannot help them as much as it would like. Lord Piercy again reports little falling off in the past year in the demand for facilities, but in the latest few months his immediate impression is of "some drying up." Perhaps the interest rate is not so ineffective a regulator after all.

ROAD HAULAGE

Going Slow at 30 mph

The first formal agreement between road hauliers and their drivers to give effect to the lifting of the speed limit on heavy goods lorries on May 1st from 20 mph to 30 mph has been made by British Road Services. It is the smallest of the three main groups of lorry-owners concerned, but the one that is likely to reap most advantage from it, because long distance work forms a larger part of its operations than of those of its competitors. BRS owns only about 10,000 of the 140,000 lorries that are affected by the change; about two-thirds of the rest are operated by business under "C" licences and about 40,000 are owned by private hauliers. Previously BRS and the "C" licensees had been waiting for the unions to reach a settlement with the Road Haulage Association, which represents most private hauliers. But discussions between RHA and the unions have been trailing along for nearly twenty years. It was signs of general agreement on some broad principles last year that decided the Minister of Transport to bring in this long delayed reform.

After a further year of meetings, however, there is still no sign of detailed agreement between the unions and RHA. They are agreed that no driver shall be worse off for doing the same work and that any benefits of quicker working should be shared. But they have not managed to translate these general principles into an agreed precise formula that can be made part of the statutory wages structure of the industry. The hauliers want to increase wages only where quicker runs are actually possible, but the industry's wages are fixed according to the size of lorry driven, not according to the nature of the route used, and the unions would like the wage increases to be spread among all drivers operating the same size of lorry.

BRS has surmounted the hurdle by offering an all-round 15 per cent increase in basic wage rates (to drivers of vehicles previously limited to 20 mph) and a cut of one hour in the maximum number of hours worked a day, making ten hours, in return for a revision of duty schedules. Allowing for overtime payments, the general effect will be that drivers will get roughly the same pay for doing the same work in less time and BRS will get a better use of its vehicles. BRS has been able to do this by spreading the benefits and wage increases over all of its operations: shunting and feeder services will cost more, but long distance trunk services will cost less. Private hauliers, with relatively minute organisations, are not able to balance things out in this way. A system of mileage payments would be the best way out, but both sides appear to have rejected it. The most likely solution—in default of a negotiated settlement—may now be an empirical one, with broadly the same result as mileage payments, as hauliers get more impatient at delay and their drivers become more prepared to connive at differential wage increases.

Retail Business
MERCHANDISE TRENDS
Number 1

This new quarterly bulletin deals with the supply of consumer goods. Among the subjects dealt with in the first issue are:

Fibres
Processed Foods
Silicones
Soft Drinks
Convenience Goods

Regular features include a general economic review, trends in production and prices and a report from the United States.

Full particulars from:
THE ECONOMIST INTELLIGENCE UNIT LIMITED,
22 Ryder Street, London, S.W.1.
Whitehall 1511 Extension 144

AIR FARES

North Atlantic Dilemma

To the surprise of the airlines, the American Civil Aeronautics Board has uncompromisingly rejected proposals to increase air fares on the North Atlantic by five per cent—or rather it has refused to allow the American operators to raise their fares and by doing so has made it impracticable for any other North Atlantic operator to do so either. All the regulations about air fares, whether they are enforced by government exercising their rights to grant or withhold landing permission to foreign airlines or by the airlines themselves through the International Air Transport Association, are designed to prevent undercutting of prices on the same route by competing airlines. There is nothing in theory to stop any hard-pressed operator from raising fares—other than the belief that to do so alone would be tantamount to commercial suicide. If Pan American and TWA are forced by their government to leave fares unchanged, no other airlines are going to raise theirs and be undercut by the Americans.

The CAB took so long to reach its decision that the final rejection was unexpected; most operators thought the deliberations would end in some form of compromise suggestion. The airlines can now only reconsider the matter among themselves and come up with a new set of proposals in the hope that these will get American approval. They are in any case due to meet in September to review the general rate structure; this summer's proposed increase was an emergency surcharge to meet a sharp rise in costs. The September review is due to cover the final details of the new third-class Atlantic fares which are to begin next spring; it may therefore provide the opportunity for linking these in some way with fare increases in other directions, or even with the abolition of the tourist fare in the form in which it is known today.

A BANKING MERGER

Chartered and Eastern

The Chartered Bank, formerly the Chartered Bank of India, Australia and China, has made an offer to acquire the whole of the issued share capital of the Eastern Bank on the basis of £9 of fully paid stock of the Chartered Bank for every two shares of £10 each (£5 paid) of the Eastern Bank. At the time of the announcement the shares of the Chartered Bank stood at 35s. 6d., making the offer worth 159s. 9d. per Eastern Bank share, compared with a market price of 135s. The directors of the Eastern Bank recommend shareholders to accept the offer when it is formally made. On the assumption that Chartered Bank will maintain its dividend, shareholders in the Eastern Bank, if they accept the offer, will gain in income and will be relieved of the uncalled liability on their shares.

The Eastern Bank, a much smaller concern than the Chartered Bank, has a number of branches in the Middle East, an area in which the Chartered Bank has not had a large stake. The merger is recommended by the directors in the belief that it will provide for "improved opportunities of expansion and the establishment of a combined organisation to operate throughout the Middle East and the Far East." In these days of Middle Eastern and Asian nationalism there is strength for banks as for other institutions in geographical diversity and financial unity.

CANADIAN STOCKS

A Ruling on Edmonton

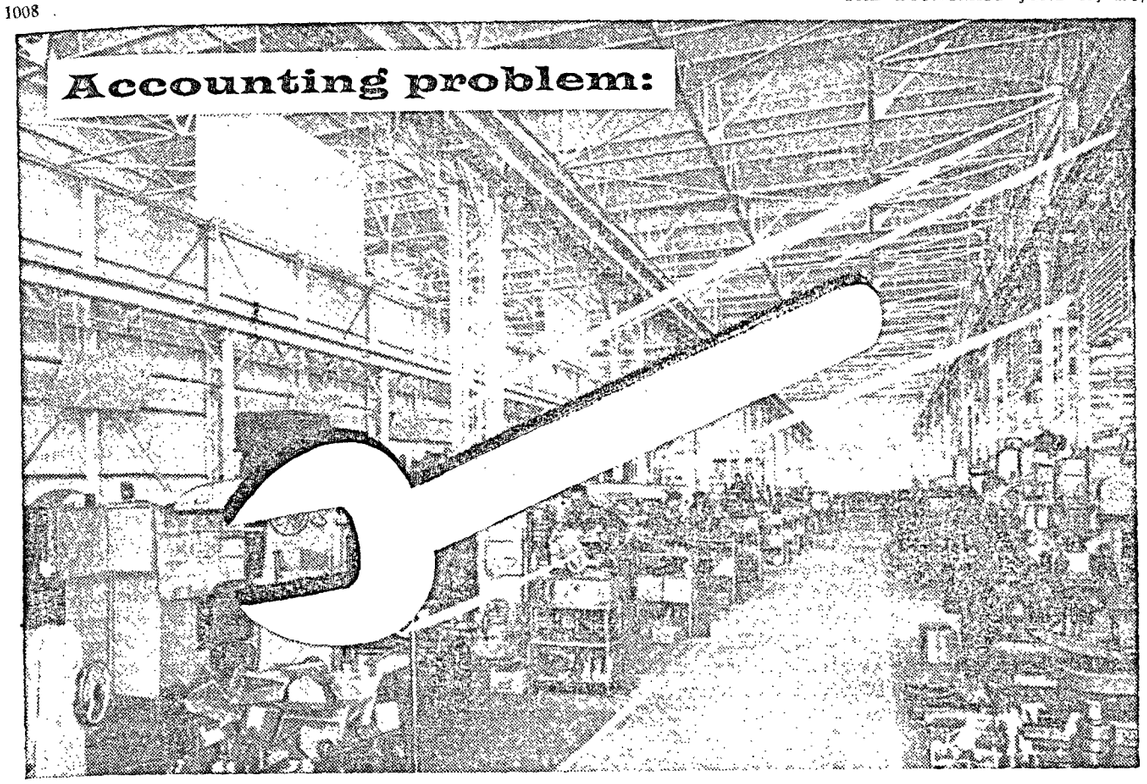
No great practical difference is likely to follow the removal by the London Stock Exchange of the Edmonton Stock Exchange from its recognised list under which dealings are permitted within the provisions of Rule 163 (i) (*e*). It will mean that stocks quoted only at Edmonton will no longer be eligible under the rule, but few of the Canadian speculative favourites are dealt in at Edmonton alone. Yet the announcement itself draws attention to the misgivings that many feel about the easy entry that the rule provides for certain overseas stocks into London dealings. In some sense, this is part of the price that London must accept if it is to be an effective international market. But the standards that London itself imposes before allowing dealings in domestic securities belong to a different world from those that prevail in some centres overseas. That is not necessarily to their discredit—what is speculative and unproven may still be an honestly marketable commodity. And if London were to insist on its own necessarily high standards for securities of every colour, many would be rejected not for lack of quality, necessarily, but solely for lack of facts.

In the general case, the speculator who buys Canadian issues under Rule 163 (i) (*e*) has a limited knowledge of the assets, management and profits of the venture. There is no London requirement that he should be told, even if he had the inclination to learn—though he may not learn anything material even if he takes the trouble to enquire in Canada. The contrast between glamour and information is one that the London and New York markets have, from bitter experience, long appreciated. The objection is not that many Canadian stocks dealt in here under the rule are bound to be speculative; it is rather that information about them is far more meagre than it need be.

BEER BOTTLES

Bottles Not for Returning

Although American packaging techniques are often about ten years ahead of British, the present widespread use in the United States of "non-returnable" beer containers may not necessarily be an equally good guide to the prospects for the specially designed "one-trip" beer bottle that has made its appearance in Britain this month. Of the four-fifths of American beer that is now packaged, rather more than half is sold in cans and a growing proportion of the rest is sold in bottles that are also not meant to be returned. But American methods of distributing beer are rather different to those here. Very much more beer is sold for drinking at home, through grocers and super-markets, and the proportion consumed on the premises, in bars where the collection of empties can be organised and made economic, is appreciably smaller.



Nevertheless much more beer is now sold in bottles in Britain than used to be. One estimate puts the proportion at about 40 per cent, and the habit of buying a few bottles to take home to watch television or to take on a car trip seems to be making the public slightly less zealous at returning the empties—though experience varies markedly from one brewer to another and in different parts of the country. The Glass Manufacturers' Federation is therefore hoping that its new bottle—at present available only for beer and in half pint sizes—will catch some of this "one-trip" traffic. But the proportion of bottles that are returned is still very high, though experience again varies between brewers. At their present price of 24s. a gross the new bottle could not really compete in this major part of the market. Although they are squatter in shape and only just over half the weight and should be easier and less expensive to carry and store, the conventional bottles cost only 28s. 3d. a gross and, since they are used on average six times (some may be used as many as forty times), they are still a more economic proposition even with the present costs of washing and cleaning. Moreover the customer will have to pay for bottles that are used only once and will get nothing back on empties.

But there should be a growing outlet for this new bottle, particularly on ships, aircraft, and places where empties are not collected. Here it will be competing with the can, which costs about 34s. a gross at present and has been making a little headway lately in beer marketing: it is smaller and can be stacked—which the new "one-trip" bottle can not. For the brewers and beer drinkers at least there should be some interesting prospects in this new competition between the can and glass manufacturer for their custom in non-returnable containers.

METAL PRICES

Holding Up Tin

Weakness in prices of non-ferrous metals has not spread to tin. In the past month cash tin has held steady within the narrow range of £762 10s. to £765 10s. a ton despite a big increase in metal exchange stocks. The apparent contradiction can be explained only by purchases

INACCURATE INFORMATION WAS THROWING A SPANNER INTO FRASER'S WORKS!

DOUGLAS FRASER AND SONS LTD., a firm of Scottish engineers specializing in the manufacture of textile machinery and machine tools, used to keep their Store Records on Bin Cards. These cards only showed the materials purchased and those issued to production. Every six months, stock was checked against these Bin Cards—there were always a number of discrepancies. Because no *net* balance was registered on the Bin Cards, Fraser's often found they didn't order enough new stock to cope with production requirements. This was happening at a time when demand was increasing and materials were taking longer to arrive anyway.

Like many firms, big and small, faced with this kind of problem they called in Burroughs

SOLUTION: In close co-operation with Fraser's own staff, the Burroughs representative worked out a system based on four machines—two Sensimatics, one Director Adding Machine and one Duplex Calculator. The firm now gets a daily balance of all its stock items. Also during the posting operation the order level is automatically registered. Re-ordering became mechanically accurate, production programmes go through smoothly, and no extra staff were taken on at all.

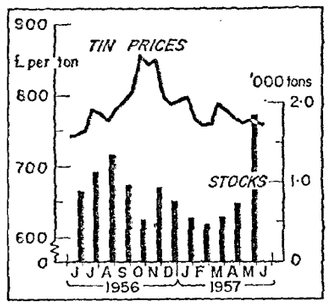
HOW BURROUGHS MIGHT BE ABLE TO HELP YOU

Ask yourself: How many of your staff are engaged in figure-work? How long does it take you to get the figures you want? Are the figures always accurate when you do get them?

Burroughs Accounting Machines will do this figure-work for you without tying down a lot of staff *and* do it far more speedily and far more accurately. Burroughs make machines suited to the needs of every size of business and you have everything to gain by consulting them.

They will advise *against* buying one of their machines if they don't think you need one. Their advice, of course, is free. The local Burroughs office is in the phone book.

Burroughs



The most experienced manufacturers of Adding, Calculating, Accounting, Multiplying, Typewriter-Accounting, Statistical Machines and Microfilm Equipment

BURROUGHS ADDING MACHINE LIMITED, 356-366 OXFORD STREET, LONDON, W.1

by the manager of the International Tin Agreement's buffer stock. With metal at his disposal the manager could now restrain an advance in prices beyond £800 a ton. The prospects, however, point to a surplus, not a shortage, of tin.

The Tin Council estimates that there will be a small surplus of 5,000 to 7,000 tons this year, including the quantity that the Board of Trade is expected to release from its strategic stock (up to 2,500 tons are to be sold, but only a part is expected to become available in 1957). Canada has now given the council the requisite six months' notice of its intention to dispose of about 3,000 tons from its strategic stock—though little, if any, could be released before the end of the year. But a new supplier, Russia, has now appeared, and its potential sales this year cannot be assessed. Russia's sales to Europe so far may be upward of 1,000 tons, and they could run into several thousand tons by the end of the year. Some of this tin may have been smelted from Chinese ores.

Lead and zinc fell further this week on the news that lead had been cut in New York by another cent to 14 cents a lb (£112 a ton); American zinc remained at 11 cents a lb (£88 a ton). Prompt lead closed in London on Thursday at £92 a ton, a fall of £1 on the week, and prompt zinc was £3 lower at £73 15s. a ton. London prices of both metals are now about £26 a ton cheaper than at the beginning of January; in the United States lead is 2 cents (£16) cheaper and zinc 2½ cents (£20 cheaper).

The weakness is attributable not only to the surplus of these metals but to changes in official methods of support in the United States. The Administration's revised programme for bartering surplus farm commodities for foreign lead and zinc is considered to be so restrictive that it can no longer take substantial quantities of foreign metal off the market. Domestic producers are also disappointed with the Administration's new proposals for stabilising domestic prices by a sliding scale of duties on imports instead of by direct purchases of surplus metal. Meanwhile copper prices in London have continued to sag, cash copper closing on Thursday at £232 a ton. Support buying by the Rhodesian producers has not been noticeable.

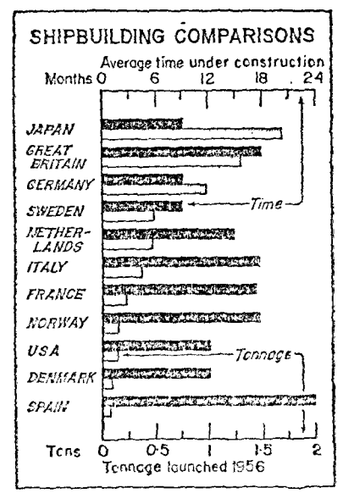
OILS AND FATS

Surplus in Sight

PRICES of most fats and oils have steadied in recent weeks though importers are still buying cautiously. World production last year grew faster than consumption, and the surplus was temporarily offset by heavy buying stimulated by the Suez crisis. When that exceptional demand was satisfied prices fell, and they are now generally below the pre-Suez levels. Stocks in Western Europe, the largest importing area, have increased and importers now face the prospect that world production will again exceed consumption. Olive oil crops have recovered and larger supplies of soya beans, groundnuts, copra and linseed are also expected. The main weakness is in linseed. The American government's agency, the Commodity Credit Corporation, recently cut its export prices of linseed, and Argentina has followed suit. Argentine linseed oil is now quoted at about £82 a ton cif Continent for July shipment, £16 less than at the end of May. But weakness in this commodity has had little effect on the market generally. Linseed is a drying oil, mainly used in the paint and linoleum industries, and does not directly compete with edible oils. Philippines copra, to point the distinction, has fallen only slightly this month to about $168 a ton cif.

ESTIMATES OF WORLD PRODUCTION
'000 metric tons

	Prewar	1956 Preliminary	1957 Forecast
'Edible' type	6,514	9,925	10,570
Cottonseed	1,453	1,858	1,830
Groundnut	1,755	2,231	2,285
Soya bean	1,263	2,756	3,050
Sunflower	435	1,397	1,705
Olive	950	768	1,030
'Palm' oils	2,659	3,634	3,655
Industrial type	2,832	3,247	3,510
Linseed	1,040	1,038	1,240
Rapeseed	1,273	1,585	1,640
Animal fats	8,752	10,706	10,645
Marine oils	830	858	830
Total	21,587	28,370	29,210



Source: Unilever Limited.

Speaking to the international seed crushers congress last week, Mr J. C. A. Faure, of Unilever, estimated that world production of oils and fats would rise by over 800,000 metric tons to a new record of 29.2 million tons in 1957, and that world stocks might increase by about 500,000 tons over the year. But he pointed out that his forecast assumed favourable weather in producing countries, and that this extra supply in one year need not give rise for concern as long as world consumption continued to grow.

SHIPBUILDING

Testing the Steel

AT the end of last year, about 4.6 million tons of shipping—about 57 per cent of all merchant shipping tonnage then under construction in the world—was being built with a view to classification with Lloyd's Register of Shipping. Outside the marine field, this registration society was responsible for inspection of the steel platework on a variety of oil refineries, hydro-electric plants—and, recently, atomic energy plants. Lloyd's Register was responsible for the final pressure testing and strain gauge investigation of the components of the Calder Hall gas circuit, as it is now

at Calder B and at Chapelcross; at Dounreay it will be testing the 135-foot sphere made of welded steel plate. Primarily, the society's concern is with the quality of steel plate used for shipbuilding and similar purposes. It does not lay down any rigid metallurgical and process specification for universal application, since various processes and methods give a reliable standard of quality. Traditionally, it has been very cautious about the use in ships of "Thomas steel" made in basic Bessemer convertors, generally specifying openhearth qualities, but in this year's report, published this week, it records that it has given provisional approval to two European works operating the oxygen-blown convertor process.

Two aspects of the society's work may eventually link up: Lloyd's Register is considering the safety aspects of the designs for nuclear propulsion of submarines, warships and eventually merchant ships, upon which the Admiralty and the British shipbuilding Research Association are working with the Atomic Energy Authority.

SHORTER NOTE

Holders of 2½ per cent Defence Bonds maturing between October 1st next and March 31, 1958, totalling £27½ million, are invited to convert into 4½ per cent Defence Bonds; a maturity premium of £1 per cent will be paid. Acceptances close on July 22nd.

COMPANY AFFAIRS

J. LYONS & COMPANY

"About time too" is the only possible conclusion on the decision of the directors of J. Lyons and Company to raise the ordinary dividend from 22½ to 25 per cent. In the past their conservative dividend policy was carried almost to a point of absurdity. For a decade before the war the dividend was pegged at 22½ per cent; during the war it was pegged at 20 per cent; and for a decade after the war it was again pegged at 22½ per cent. The reaction in the stock market was one of relief rather than of surprise; the non-voting "A" shares were marked up to 101s. 3d. and then reacted to 95s. (showing a small net loss since the announcement). The increased dividend had in fact been discounted in the rise in the price of the shares from 81s. 3d. in May.

	Year ended March 31, 1956	1957
Consolidated earnings:		
Trading profit	4,399,567	5,781,668
Depreciation	1,445,525	1,623,388
Taxation	1,121,135	1,915,647
Net profit	981,000	1,144,123
Prior charges	288,264	288,265
Equity dividends	406,922	452,135
Ordinary dividends (per cent.)	22½	25
Retained earnings	285,814	403,723
Consol. balance sheet:		
Net fixed assets	17,989,831	19,892,154
Stocks	10,826,928	12,766,034
Cash	2,140,993	1,625,193
Net liquid assets	1,518,483	383,833
Net current assets	10,178,127	9,739,218
Loan capital	2,688,246	3,653,305
Reserves	14,411,046	15,853,082
Preference and preferred capital	7,297,065	7,297,065
Ordinary capital	3,680,342	3,680,342

The actual increase in the dividend is itself conservative enough. It followed a jump in gross trading profits of £1,382,101 to £5,781,568 in the year to March 31st. This is an exceptionally good increase for a year when profit margins were being squeezed in the consumption trades as well as in industry. It owes something to the accumulation and employment of retained earnings in the past. And this year there is no real break with that policy. Net profits have risen by £163,123 to £1,144,123 and £57,152 (against £18,721) has been brought in as a non-recurring credit. Most of that increase has gone to swell reserves: the net equity dividends, covered nearly twice by earnings, absorb only £45,213 more at £452,135, while £403,723 (against £285,814) has been ploughed back into the business.

At 95s. the "A" shares yield 5.3 per cent, a yield which still looks forward. There seems to be no reason why this highly geared equity should not act like one. But that rests with the directors and with the pressure that shareholders can exert on them.

SIMON-CARVES

NUCLEAR power stocks have obvious attractions, but investors are now more conscious than they were when these stocks were booming that atomic power contracts will not produce quick results in profits and dividends. It will be a long haul, and the low yields offered by such stocks look far into the future. Progress will be sober and steady. That certainly is the impression given by Mr R. B. Potter, the chairman of Simon-Carves, who describes the next few years as "a period of consolidation."

Last year Simon-Carves earned a profit of £1,632,063 from a turnover of nearly £21 million. This was up by about 10 per cent, but the profit was only a few thousands above the 1955 figure of £1,601,225. Mr Potter describes the result as "very satisfactory," as the substantial development and administrative costs of the atomic power programme have been charged almost entirely against profits. A number of large contracts were completed, but orders in hand rose by about 30 per cent, giving an assurance of prosperity for some years ahead. But Mr Potter warns shareholders not to expect "any large immediate rise in profits." Simon-Carves, he says, "must expect continuing high expenditure on nuclear energy and to a lesser extent on other new processes" and that expenditure will be written off in the years in which it is incurred. As an additional precaution the company has again set aside £100,000 to a "nuclear power development reserve."

The future for Simon-Carves, with a nuclear power contract in addition to its other big contracts for large-scale plant for the iron, coal and electricity industries, is secure. Mr Potter draws particular attention to "the reasonable prospect of future security" in commenting on the effective increase in the ordinary dividend from 16⅔ to 20 per cent. The dividend, absorbing £172,500 net, is well covered by net earnings of £686,618. That fact and the company's nuclear power order explain why the yield is only 2.9 per cent on the 5s. shares, now standing at 33s. 9d. xd.

LONDON TIN

LONDON TIN CORPORATION is primarily and eponymously a tin mining finance company. But its portfolio contains stocks other than tin shares. Over a year ago it sold a majority interest in two tin dredging companies and it has abandoned an exploration programme in Nyasaland.

In its accounts for the eleven months to March 31st last it reveals in some detail the make-up of its portfolio. In the consolidated balance sheet the group's quoted investments are shown at £5,267,707 (with a market value of £9,487,176) and unquoted investments at £126,886. Almost exactly 75 per cent of these investments (at book value) are in tin mining concerns in Malaya, Nigeria and to a much smaller extent in Thailand and Burma. The rest of the portfolio is made up as to about 8 per cent in "other mining and oil," 2 per cent in public utilities and trust companies, and 10 per cent in "commercial and industrial" stocks. Just over 5 per cent of the portfolio is in dollar stocks.

That is a useful spread for a company which is exposed to the varying fortunes of the tin mining industry. In the latest financial period, the average price of tin was slightly higher than it had been in 1955-56, but production in Malaya and

ria was slightly reduced. Hence, alance, there was little change in the pany's investment income; in the n months to March 31st, it was 15,269 and in the preceding twelve ths it was £1,435,413. The big ge was in "profits on investments"; e came down from £478,602 (repre- ing the sale of the majority interests wo mines) to £17,732. Net profits from £883,642 to £714,726 and the tors left the ordinary dividend un- ged at 30 per cent (absorbing 4,146 net). On that dividend the 4s. es at 12s. yield 10 per cent.

The chairman, Mr J. Ivan Spens, s that the company will in no way efit from the tax reliefs given to over- trade corporations. While an ividual London controlled tin com- y wholly operating abroad may gain relief, the London controlled finance investment house may not.

UNITED DRAPERY STORES

THE growth of United Drapery Stores as a multiple empire, with over 720 oring, drapery, furniture and depart- nt stores in its domain, has been id. The appeal of these stores is ected to the pockets of the millions, of the select few. It has been re- arkably successful, even in the face of e purchase restrictions. Success is sed on firm management and control m the centre.

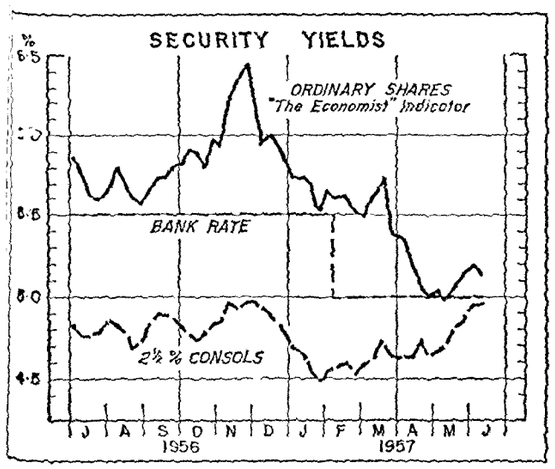
The chairman, Sir Brian Mountain, scribes the year to January 26th as rgely one of consolidation"; no new sinesses were acquired but a number shops were added to existing busi- sses within the group. Many of the ops have been converted and odernised; some have been turned er from one trade to another. That s resulted in a heavy bill for repairs d maintenance (charged against the ding account) and heavy capital penditure.

This expenditure, Sir Brian says, fluenced the directors in their decision leave the ordinary dividend un- anged at 32½ per cent. This pill was eetened for shareholders by a 10 per cent free scrip issue, small enough to suggest that the directors are unlikely to reduce the current year's dividend proportionately. The dividend was left unchanged in the face of an advance of £555,887 to £6,647,031 in trading profits. Costs were rising and Sir Brian attributes this advance to "a further substantial increase" in turnover. The hire purchase restrictions reduced the group's sales on HP terms (now representing only 4 per cent of total sales), but this was counterbalanced by increased sales on shorter credit terms. These short-term credit sales have been a boon to the multiples and so far in the current year the sales of United Drapery Stores show a further increase.

THOMAS DE LA RUE

PLASTICS, printing, pens and playing cards cover a wide range of activity, and to these Thomas De La Rue adds gas cookers too. But its two principal divisions are plastics and printing banknotes and postage stamps. The plastics division has been growing rapidly and perhaps has made a particular contribution to the rise in trading profits from £899,807 to £1,097,597 in the year to March 30th. The plastics division makes "Formica" under licensing agreements with a subsidiary of American Cyanamid. These agreements have eight years to run and arrangements have now been made to set up a new company controlling the manufacture of "Formica" in which Thomas De La Rue will have a majority interest; it will thus no longer have to pay royalties.

The directors state that they believe this arrangement will be of "very considerable benefit to stockholders in the expansion of the plastics business" which they are "sure will follow." Another sign of their confidence can be seen in their decision to raise the ordinary dividend from 30 to 35 per cent, which absorbs £186,357 from a net profit of £504,212. Net earnings are £184,909 higher on the year and the greater part of that increase has been retained. At 22s. the 5s. ordinary stock units yield nearly 8 per cent.



London Stock Exchange

FIRST DEALINGS:	May 29	June 19	July 3
LAST DEALINGS:	June 18	July 2	July 16
ACCOUNT DAY:	June 25	July 9	July 23

NEW low points for the year were recorded by longer-dated gilt-edged stocks this week. Small sales brought the Financial Times index of Government securities down to 83.02 on Tuesday, but prices hardened fractionally in front of the Bank rate announcement. Industrial stocks were little changed on balance, while the feature of the market was an acceleration in the upward movement of oil and gold shares, both of which were sharply lowered by profit-taking on Wednesday. The Economist indicator, which includes three oil stocks, rose 2.4 to 219.0.

Bank shares were steadier after the recent succession of small falls, but National Discount "B" lost a further 6d. to 33s. 6d. Following the increase in dividend, Walker Cain was 1s. higher at 43s. 3d., and other breweries continued to hold their recent gains. Stores were helped by the figures for personal spending during the first quarter of the year; Marks and Spencer "A" rose to a fresh peak of 52s. 3d. xd, and GUS "A" gained 9d. to 51s. 1½d. Estate Securities marketed last week at 36s. rose sharply to 57s. 6d., but came back to 53s. 6d. on Wednesday. Unilever gained 4s. 6d. to a new peak of 111s.

The buying of oil shares took Shell to 218s. 3d. before the price reacted to 213s. 6d. On rumours of a new oil strike TPD jumped at one time to 115s., before easing to 110s. Profit-taking in Kaffirs left sizeable gains on balance; St Helena's development results caused its shares to jump 5s. 7½d. last Friday and finance houses also made good gains on balance. The improvement extended to De Beers deferred, which rose 5s. 7½d. to 100s. Coppers tended to sag, but rallied on Thursday; Tanganyika Concessions fell 11s. 3d. to 163s. 9d. in the week to Wednesday's close. Weakness in metal prices depressed lead and zinc shares.

(1) Relates to wholesale prices in Athens and Piraeus only for Greece. Figures for Ireland from 1955 onwards are for home produced goods only. Figures for Germany, F.R. are producers' prices of industrial products. (2) July-December. (3) Relates to prices in capital cities only for Austria, France, Greece and Turkey. Austria and Belgium exclude rent. Denmark includes direct taxes. Figures for Ireland are based on August, 1953=100. (4) Including direct taxes. (5) Including trade with Faeroe Islands. (6) Index numbers of unit value which compare the current average value of trade with its value in 1953; they are influenced by changes in the composition of trade as well as price movements. (7) Deposit money and notes and coins held by business, individuals and foreigners. Except for Greece holdings of the issuing authority and other banks are excluded. (8) Holdings of the government and central bank at end of period. Foreign exchange figures for Norway exclude government holdings; Netherlands, Norway and Sweden include foreign investments. Ireland includes some long-term securities. (9) Beginning May, 1954, a new drachma equal to 1,000 old drachmas was introduced.

Financial Statistics

EXCHEQUER RETURNS

For the week ended June 8, 1957, there was an "above-line" deficit (after allowing for Sinking Funds) of £25,163,000 compared with a surplus of £15,539,000 in the previous week and a deficit of £46,384,000 in the corresponding period of last year. There was a net expenditure "below-line" last week of £19,301,000, leaving a total deficit from April 1st, of £45,338,000 (£98,095,000 in 1956-57).

THE MONEY MARKET

THE discount houses again maintained their common bid at £99 os. 5d. per cent at the Treasury bill tender on Friday of last week; but while the total allotment was up £10 million, to £240 million, total applications rose from £358 million to £451 million—their highest level for some years. Both the discount houses individually and outside tenderers may have been anxious to secure bills for reinvestment of the Exchequer and Funding stocks that mature today. The upshot was that the rate of allotment at the market's minimum price dropped sharply from 57 to 21 per cent; and the average rate of discount on all bills fell by nearly 3d. to £3 18s. 2½d. per cent. At yesterday's tender, the offer was again £240 million.

Credit conditions in Lombard Street have generally remained easy in the past week. Marked stringency was experienced only on Tuesday after the holiday, when the Bank gave large direct and indirect support through purchases of bills, but one or two houses had nonetheless to take a very small amount at Bank rate. Dealings in two months' maturities have been at 3⅛ and 3⅜ per cent.

The price of gold in the London market rose by 5½d. an ounce to 251s. 2½d. on Thursday before the weekend, reflecting not only a weakening of sterling but also a rise in the dollar price of gold above $35 an ounce. This week the dollar price has fallen, and with the slight strengthening of sterling the London price fell back to 250s. 10¼d. on Wednesday.

Sir Brian Mountain Reports Further Progress

The following are extracts from the statement by Sir Brian E. S. Mountain, Bart (the *Chairman*), circulated with the Report and Accounts for the year ended January 26, 1957:

The Report and Accounts for the year ended January 26, 1957, are submitted herewith. This period has been largely one of consolidation, and although we did not acquire any new businesses, we have added a number of units to the existing businesses within our Group.

Consolidated Profit and Loss Account

The Group Trading Profit amounts to £6,647,031, an increase of £555,887 over the previous year. These profits were achieved as a result of a further substantial increase in the turnover of the whole Group.

The increase in rates annually followed the new assessments which operated a year ago, and these have involved us in an additional expense of approximately £200,000. We may obtain some slight relief from this heavy burden in the current year consequent upon the reduction of 20 per cent in the valuation of shops which operates from April 1st, but it would appear that a large part of any saving we might have expected will be lost as the rate in the pound has increased in nearly every district.

The charge for repairs and depreciation on our shops, stores and factories must always be substantial, but this year it is very much higher than normal due partly to the continuation of our programme of modernisation in general, and partly to the conversion of the shops in the Prices Tailors group. I am pleased to report that more than 250 branches have now been converted and are trading as John Collier, while a number of other shops have been transferred to the use of other businesses within the Group. We have now completed approximately three-quarters of this conversion and renewal programme and the cost has been extremely heavy. In the past year we have written off against profits over £1 million in respect of repairs, renewals and depreciation. This year expenses under these headings should show a substantial saving.

The higher charge for Profits Tax amounting to £154,000 was expected and arises from the higher rates imposed by the Chancellor in the Autumn of 1955. This increase, added to the additional Income Tax payable on our larger profits, results in the fact that extra taxation has absorbed more than three-quarters of the increase in Group Profits before Taxation.

Reserves and Share Bonus

After the payment of the same dividend as last year we are retaining out of profits the substantial sum of £1,299,697, which is £146,121 higher than last year. Our dividend payments and recommendation being the same as last year, the proportion of profits retained is higher, and in recommending this your Board has been influenced by the heavy capital expenditure incurred in the past year which has been financed from our own resources.

We are proposing to fund part of this addition to capital assets in the form of a distribution of one Stock unit fully paid for every ten units held at the close of business on May 14th.

Capital and General Reserves. These now exceed £17 million, having increased by £1,600,000 in the year. In addition to reserves set aside out of profits and the increased provision for future taxation, profits which have arisen on the sale of surplus fixed assets amounting to £70,961 have been added direct to Capital Reserve.

Future Prospects

During the first quarter of the year business has been affected by the serious labour troubles in the shipbuilding and engineering industries as well as the petrol shortage. Despite this, however, the Group turnover to date shows an increase. Subject to events beyond our control, I am satisfied that your business is well organised and should progress.

I should again like to thank Mr Collier, the Executive Directors and Staff for the results we have achieved during the year.

TWELVE YEARS' SUMMARY

YEAR ENDED JANUARY	GROUP PROFIT BEFORE TAXATION	NET CURRENT ASSETS	FIXED ASSETS	TOTAL NET ASSETS

THE DAILY MIRROR NEWSPAPERS LTD

A record profit

CECIL H. KING DISCUSSES PRESENT DAY NEWSPAPER ECONOMICS

The Thirty-Seventh Annual General Meeting of The Daily Mirror Newspapers Ltd.

was held on June 7, at Brettenham House, Lancaster Place, London, W.C.2.

Mr. Cecil H. King, Chairman and Managing Director, said:—

The net profit after taxation, as you will have seen from the accounts already circulated, is £855,503—the highest in the company's history.

Income from our investments was in substance the same as last year.

The profit on trading after depreciation when compared with that of last year, the result of which was affected by strikes, shows an increase of £641,201.

Trading receipts reflected a full year's benefit from the retail price increase that took place late in 1955. In addition, due to larger sized papers we were able to carry a greater volume of advertising, the rate for which was raised by 10% in October last.

On the other hand, we had to bear a full year's costs of printing the northern editions of the Daily Mirror in Manchester and, with the price of newsprint higher and wage rates further advanced, overall costs of production were substantially greater than in previous years.

The major variations in balance sheet items have been dealt with in the Directors' Report. I therefore propose to confine my remarks on the balance sheet to the note attaching thereto dealing with capital commitments.

New building at Holborn Circus

You will see that the total cost of erecting the new building at Holborn and fully equipping it with the most up to date high speed presses is currently estimated at £6,600,000. This large expenditure will be spread over a period of 4 or 5 years. The cost will be met partly out of the company's own resources, but discussions are taking place on the most advantageous method of financing the balance.

Your board feels that the net results for the year fully justified recommending a final dividend of 10% on the equity capital as increased by the bonus issue made in December last, which in effect represents an increase of 2½% on the old capital.

Effect of newsprint rationing on newspaper economics

The economics of the newspaper industry since the war have depended to a large extent on the condition of world newsprint supplies. Supplies have now come into a state of balance and towards the close of last year newsprint rationing came to an end.

About two-thirds of all newsprint goes to the USA. At present it is being consumed. If there were a recession of demand, publishers over here would be flooded. Whatever happens, British publishers in 1957 will have as much newsprint as they need. You will all, I feel, want to hear how your own particular newspaper interests are likely to be affected by these developments in the industry.

The principal effect of newsprint rationing in the post-war period was to curtail competition. At first circulations were pegged. This prevented newspapers from competing for sales. In 1952, this system was finally abolished and rationing confined to a limit on paging. Publishers were allowed to step up their sales but had to restrict the size of their papers. This prevented them from competing freely for advertisements.

Advertising revenue rises rapidly

During all this time advertisers had more and more money to spend. Already by 1949 the total amount of money spent in one year on press advertising had reached £30,522,199.

In every subsequent year the total has increased. As paging rations were enlarged more advertising could be accommodated. Even so, the demand for space was always greater than the total amount of space available. Most newspapers and periodicals were therefore able to raise their advertising rates and had to, in order to cover the rising costs of wages and newsprint.

Those halcyon days of forced equality are now over. 1953 saw the largest increase in press advertising since the war—an increase of £12 million—25%—on 1952. 1954 followed with another increase of £12 million, 1955 with £13½ million. Last year came a notable change: 1956 was up on 1955—but only by £6½ million.

Moreover of the new money as much as 90%—easily a record proportion—went to newspapers and only 10% to periodicals. Two groups of newspaper media—London evenings and provincial weeklies—actually showed a decrease for the first time since the boom began. By far the largest share of the new money was taken by London mornings and national Sundays, and even this share was unevenly distributed—the bulk of it going to a few individual papers.

Commercial television enters the field

The reason is not hard to trace. In 1956 commercial television entered the field for the first time as a serious competitor and netted some £13 million. Advertisers had less new money to spend on the press and what money they did have they concentrated on the stronger papers. With increased paging allowances these were able to accommodate most of what was going. Other papers were so short of advertising that their full allowances of newsprint were superfluous.

What of our own position? This is rather different from the rest of the press. For some time, like other papers, we have not used all our newsprint allowance, but in our case the reason is not so much that we have been short of advertisements, as that printing so many copies per issue we find it uneconomic to extend paging beyond a certain point.

During the newspaper strike, as you know, we suffered more heavily than other papers. Our production costs were higher. It was unprofitable to make up for lost advertising by printing bigger papers after the strike. We lost all our revenue from sales—and sales, with our vast circulation, smaller advertising content and lower rates, provide a far greater proportion of total revenue for us than for any other paper.

Daily Mirror less vulnerable than competitors

But circumstances that were to our disadvantage then are very much in our favour now. The very fact that so large a part of our revenue comes from sales means that we are much less vulnerable to a recession in press advertising than other papers. This is not all. As commercial TV absorbs more money—estimates are that it will take about twice as much in 1957 as in 1956—the publications to be hit will be those which have no special coverage to offer or which compete least successfully in the mass-circulation field. The Daily Mirror and its associated papers have exceptional strength in offering unique opportunities to advertisers interested in reaching mass markets.

These opportunities are amply shown in the most recent national readership survey conducted by the Institute of Practitioners in Advertising. This survey shows that the Daily Mirror has a daily readership of 14,749,000, two million more than any other daily paper, and the Sunday Pictorial a weekly readership as high as 15,619,000. The two Reveilles are easily ahead of all their competitors, Weekend with 11,274,000 readers a week and Midweek with 7,908,000; Woman's Sunday Mirror, after only two years' publication, has climbed already to fourth place in the highly competitive women's field with a readership of 3,587,000 per issue.

Young readership valuable to advertisers

These figures speak for themselves. Broken down into age groups they are even more remarkable. The Daily Mirror, Sunday Pictorial and Woman's Sunday Mirror, for instance have a larger proportion of their total readership in the under 35 bracket than any other publications in their respective groups. This offers immense attraction to advertisers who realise that buying habits (as well as reading habits) are formed early in life.

Another characteristic of our papers that appeals to advertisers is the close relationship we keep with our readers. While some newspapers have spent large sums on competitions, we have chosen to encourage a project of more lasting benefit to our readers—the maintenance of a service bureau to answer calls for help or advice.

Readers' Service widely used

Often—notably in cases of fraud—prompt editorial investigation of a reader's grievance has lead to the exposure, conviction and imprisonment of some public trickster who would not otherwise have been brought so speedily to justice. Sometimes an itinerant husband is reluctantly compelled to support his wife and children, or a greedy landlord persuaded to moderate his terms.

Most appeals are less dramatic. Whatever the problem—housing, pensions, insurance, income-tax, children's welfare, legal and the rest—our bureau gives help to many people who may well have nowhere else to turn.

This bureau, by far the largest in Fleet Street, and the only one with such direct personal contact with individuals, began originally with John Noble's column in the Sunday Pictorial. Soon after the war it extended its activities to the Daily Mirror and now also covers queries from readers of Woman's Sunday Mirror and the Scottish papers. It employs a large staff which includes 18 full-time experts, gives about 1,500 interviews and answers some 100,000 queries a year. It has done enormous work for the public, thereby increasing the loyalty of the public to us.

The success of this scheme, together with the huge correspondence regularly aroused by our topical features and provocative editorial policy, tends to show that the readership of our papers is intensive as well as extensive.

Newspapers are bought for a variety of reasons. Some, like rolled umbrellas, are often bought as ornaments: like rolled umbrellas they often remain unopened. People who take the Daily Mirror take it because they want to see what is in it and tend to read it thoroughly. This is of unrivalled advantage to advertisers aiming to pervade rather than just skim the mass market.

Daily Mirror ready for challenge of TV

I think I have said enough to show how strong a position we are in to meet the challenge of TV. Some papers may soon be compelled to lower their advertising rates (as certain periodicals have done already). We, on the other hand, shall continue to concentrate on the editorial quality of our papers, to limit the amount of non-editorial space and to offer the largest circulation and the lowest rate per thousand readers to advertisers. This is the policy we have long pursued. The wisdom of it will be even more apparent in the future.

We have of course considerable interests in one of the commercial TV companies, Associated Television Ltd., and can look forward to a very satisfactory return from this investment in the future. We have in fact a foot planted quite securely in both camps.

Let me now close with a word of thanks to all staff at home and abroad who have helped your company to achieve a successful year.

The report and accounts were adopted.

COMPANY MEETING: ANGLO AMERICAN CORPORATION OF SOUTH AFRICA LIMITE

(Incorporated in the Union of South Africa)

STATEMENT BY THE CHAIRMAN, SIR ERNEST OPPENHEIMER

ANGLO AMERICAN CORPORATION'S WIDENING INTERESTS

SIR ERNEST OPPENHEIMER REVIEWS PROBLEMS OF GOLD MINING FINANCE AND TAXATION

TRANSPORT DIFFICULTIES IN THE FEDERATION

The following are extracts from the statement by the Chairman, Sir Ernest Oppenheimer, which has been circulated to members:—

IN all the main spheres of the Corporation's interests the dominant theme of the year's operations was one of rising production.

In gold mining, the operations of the newer mines administered by the Corporation continued to expand; and the output of uranium and the profits derived therefrom also rose above the preceding year's figures. In the diamond industry the companies in which the Corporation has large interests substantially increased their overall output of gem and industrial diamonds, but the industry as a whole was still unable to satisfy the large demand. In the copper mining industry of Northern Rhodesia the mines in which the Corporation has important interests increased their production. Furthermore, the new Bancroft mine was brought to production ahead of schedule. In the coal industry the collieries administered by the Corporation raised their output to a new high level just short of 18 million tons and made preparations to meet a further expansion of demand. In most of the other spheres of the Corporation's interests—in finance, in investment, in merchant banking, in prospecting—there was in 1956 a general expansion of activity.

The benefits flowing to the Corporation from this widespread and heightened activity are not fully reflected in the accounts for the year. Improved yields from associated operating and finance companies cannot always be passed on to the parent company in the same year. But another factor serves to hide the substantial improvement in recurrent investment income that accrued to the Corporation in 1956. As the figures stand in the accounts, income from investments, at £4,240,455 in 1956, was only £12,700 more than the £4,227,755 yield in 1955. But the 1955 figure included non-recurrent income which serves to invalidate comparison between the 1955 and the 1956 figures; and a better indication of the recent improvement in investment income can, perhaps, be obtained by comparing the 1954 figure of £2,761,848 with the 1956 figure of £4,240,455—an increase over the two years of no less than £1,478,607 or about 54 per cent.

The same non-recurrent income in 1955 also invalidates comparison between the Corporation's profit of £4,930,165 in 1956 and the £5,750,428 profit in 1955. The real measure of the inherent strength of the Corporation's general position can be gained from a study of other figures in the accounts. In 1954 the Corporation showed a surplus of £736,752 from its realisation of investments, after deducting amounts written off investments; in 1955 the net yield from this source fell sharply to £219,680; and in 1956 there was no surplus, but a net deficit of £450,074, which was the amount by which the sum applied to the writing down of investments exceeded the gross surplus derived from the sale of investments. In spite of this very sharp change in this particular aspect of the Corporation's business, the other sources of the Corporation's income more than compensated for the loss of what has in the past been a substantial contribution to total income.

NO SLACKENING OF MOMENTUM

There has been no slackening in the momentum of the Corporation's progress in the past twelve months.

The launching of a major new gold mining enterprise on the Far West Rand is foreshadowed by the arrangements which have been under discussion for some time between ourselves and our partners, Central Mining Finance, Limited, and New Consolidated Gold Fields, Limited, for the exploitation of the potentially valuable mining area lying immediately to the South of the existing Blyvooruitzicht and West Driefontein mines. This is an extensive property, calling for the establishment of a very large and costly mining unit. An important feature of the careful preliminary investigations already carried out is the indication that the operating life of the new mine will be unusually long.

The search for new business and new enterprises in the mining of minerals has continued. Prospecting operations have been intensified, and our geological teams are active in several parts of Southern and Central Africa, in some cases exploring largely unknown territory, as in the Western Rift area of Tanganyika where an exclusive prospecting licence covering approximately 34,000 square miles has been granted to one of the Corporation's associated companies.

WIDENING OF INTERESTS

Although our principal business is, and will remain, the mining of minerals, the financial resources that the Corporation and its associated companies command have made it possible for us to seek new outlets for investment and enterprise beyond the immediate production of gold, diamonds, copper and coal. In most of these new fields there is some association with our principal business. Thus we have acquired the controlling interest in a company which mines manganese ore in the Krugersdorp Randfontein district and has a long-term contract to supply manganese to the uranium industry.

Modern technology is effecting changes in the world's mineral requirements. Accordingly, we propose to take whatever opportunities arise of exploiting profitably those minerals for which new applications are found and new values established. There has been a practical application of this policy in our decision to acquire from Titanium Corporation of South Africa, Limited, property and rights relating to large deposits of titanium-bearing minerals in the district of Umgababa on the South Coast of Natal. Substantial quantities of rutile, ilmenite and zircon concentrates will be produced at Umgababa.

A further interesting development in the Corporation's activities is its recent acquisition of a large shareholding in Peak Timbers, Limited, which owns valuable pine tree plantations covering about 65,000 acres in the Piggs Peak area of Swaziland. This company has since negotiated a merger with a well-established company manufacturing plywoods and chipboards, Veneered Plywoods (S.A.) (Pty.), Limited, of Boksburg. A new holding company, Forest Industries and Veneers, Limited, has been formed with a capital of £3,500,000, and Peak Timbers and Veneered Plywoods will operate as wholly-owned subsidiaries of the new company.

Last year I referred to the formation of Union Acceptances, Limited. The success of this new enterprise in the field of merchant banking has encouraged us to extend our endeavours in this direction, and

ds the end of 1956, the Corporation sored the establishment of Rhodesian ptances, Limited, which has opened ess in Salisbury. Like its counterpart outh Africa, it has already proved its h by helping to create a short-term y market and to finance the movement oods. More recently, Union Accep- s and Rhodesian Acceptances have been linked with sources of large funds urope through the formation of a new h African-Swiss company, Union ptances (Zurich) AG. There is little t that in Switzerland and in other of the Continent there is a climate of on favourable to the investment of in Southern Africa.

ACTIVITIES IN THE FEDERATION

referring last year to the Corporation's with the Federation of Rhodesia and aland, I mentioned that an inherited ion as well as self-interest led the oration to take a leading part in assist- he progress of the Rhodesias.

r several years now this territory has developing rapidly. The basic indus- are well established or are in process ing so established. The coal industry een built up to provide all the needs whole Federation for many years to The iron and steel industry can dently be expected to keep output st of the Federation's needs. The progress of the Kariba hydro-electric ct, in spite of exceptional floods on the besi, will ensure that within a few years ies of power will be sufficient to meet mmediate demand.

ere is, however, one vital sphere in progress is lagging behind the needs country. Transportation facilities are ely restricted and until these are nded there must be a brake on develop- . Clearly there is need for courageous al expenditure on all communications. use of the importance of this matter, e country as a whole and thus also to own interests, we have provided sub- ial assistance in this direction. We nevertheless opposed to methods of ning major capital funds for railway lopment through the levying of puni- freight rates upon mineral traffic. In report the directors have drawn atten- to the anomaly that the increased ge rates for copper were calculated at a when copper prices were abnormally temporarily high; they have now fallen ry much lower levels. We have lodged mal appeal against these discriminatory ht rates.

his issue is of particular importance in of the fact that the maintenance of the present tempo of development in Federation requires a large and con- ng flow of new money into the Federa- and every possible encouragement be given to investment in the territory outside. Fortunately, general condi- s for investment in the Federation are urable. There is prosperity and expan- everywhere. The copper mining in- ry, which is basic to the Federal omy, is not as prosperous as it was copper prices were inflated by a large s of demand over available supply, but at current price levels, the industry s substantial profits, and its contribu- to the economy of the Federation is large indeed.

INVESTMENT SITUATION

The investment situation in South Africa deserves the close and anxious attention of all who are engaged in the business of mining and mining finance. It is common knowledge that the flow of money to the Union for investment and development has dwindled recently. There has been since 1954 almost unrelieved depression in the market for South African gold shares, and a measure of this depression has extended to other sections of the South African share market. This is a most serious situation for an industry which must constantly be developing new enterprises to replace its wasting assets. It is especially serious in view of the fact that capital costs and working costs continue to rise, with the result that new mining ventures require the provision of progressively larger amounts of capital.

It seems to me that we are confronted with a new situation and a new challenge.

Two lines of approach suggest themselves. There is an evident need for closer organisation of mining finance and indeed the trend has been in this direction for some time. Mining finance houses have tended to develop into large corporations that cannot only finance important mining ventures themselves but can also absorb the occasional loss encountered in the normal course of business by even the most successful and efficient mining groups. There is also, to an increasing degree, recourse to those forms of co-operative financing whereby a number of mining groups participate in agreed proportions in providing capital for new ventures.

These procedures, however, will not, in themselves, be sufficient to meet the full requirements of the situation. Mining companies and mining groups will always depend to some extent upon outside support in the provision of development capital. In my view, the mining industry is entitled to look increasingly for this support to the financial institutions, the traditional investment agencies of the general public. For while public interest in mining investment as such has declined in South Africa, there is every evidence that people have been placing their savings increasingly with building societies, insurance companies, trust bodies, pension fund organisations, mortgage businesses and banks. The accumulation of private funds in such institutions has reached immense proportions, and this in turn has meant that progressively less money has remained in the hands of individuals for personal investment. The argument that financial institutions have a fiduciary responsibility which cannot be reconciled with the placing of funds in ventures having a recognised risk element such as mining can no longer be upheld. In the United Kingdom, in Canada and in the United States of America the institutional investment houses are increasingly devoting a proportion of their funds to so-called risk ventures previously considered to fall outside their sphere of investment. Where such risks as may be involved are properly spread, they become sufficiently dispersed as to be innocuous, and any losses will be more than counter-balanced by the success of other similar ventures.

It may be that the one development will stimulate the other; that the growth of large mining corporations with substantial spreads of interests, and of mining investment trust companies with varied portfolios of mining shares, will in itself come to provide suitable channels for the investment of institutional funds.

GOLD MINING TAXATION

Before I conclude this review I should like to refer briefly to the question of gold mining taxation, for there is no doubt that this is a factor of material influence upon the investment status of the gold mining industry. The Government is well aware of this fact and has recently endeavoured to assist in a number of ways, but in view of the fact that State revenues from gold mining taxation will rise very considerably over the next few years as the newer mines reach full production, there is a strong case for further relief in the onerous and discriminatory burden that is still being imposed on the industry. It may not be generally realised that, in the case of a rich mine, amounts payable to the State by way of share of profits and taxation can amount to as much as two-thirds of the working profit.

Furthermore, I am inclined to think that the present situation requires in addition an examination of tax policy from the specific standpoint of the shareholder or investor in gold mining companies. For here one finds that something of an anomaly exists. The position is that the wasting character of gold mining has been recognised in so far as the taxation of the mining companies themselves is concerned—namely, in the capital redemption allowances that are made before tax is levied. But this same principle is not applied in respect of the dividend income of the individual investor where, as is common, he is liable to supertax. Yet, because of the wasting nature of the asset in question, the investor is obliged to treat a portion of the dividends he receives as a return of capital, and, in fact, should be encouraged to do so by having that portion of his dividend income accepted for tax purposes as a return of capital.

This is the pattern of taxation on individual mining investment income followed in Canada. In that country the return of capital element in mining dividends is officially recognised by exempting from tax a varying percentage of such dividends in the recipient's hands. It seems to me that if local and foreign investment interest in our gold mining industry is to be restored and capital for this purpose attracted, then we should give serious consideration to the introduction into our taxation system of some arrangement of the kind I have mentioned. If this suggestion were to be favourably received, it would be desirable for the South African tax authorities to discuss the matter with other Governments, notably the United Kingdom Government, in order that the overseas shareholder should not be unfairly penalised, which would be the case if corresponding arrangements were not made in those countries in recognition of the special nature of mining company dividends. It is my belief that the remissions of tax involved would be small in relation to the benefits that would accrue in the stimulus to the flow of investment funds and to the development of mining enterprise.

Copies of the complete statement and of the annual report and accounts may be obtained from the London office of the Corporation, 40 Holborn Viaduct, E.C.1.

ASSOCIATED NEWSPAPERS LIMITED

LORD ROTHERMERE'S STATEMENT

The Fifty-second Annual General Meeting of Associated Newspapers, Limited, will be held on Thursday, July 4, 1957, in the Memorial Hall, Farringdon Street, London, E.C.4. The following is from the statement by the Chairman:

Rising costs and world events have made trading conditions particularly difficult during the past year. Taking everything into account, the fact that our trading profits are only slightly below the previous year can be considered not unsatisfactory.

The two major costs in newspaper production, newsprint and wages, are so large a proportion of total costs that any movement —and in this inflationary age it is always upwards—produces a very marked result in terms of profit. So profits of newspapers tend to fluctuate to a marked degree. The beginning of last year saw the profits running at a fairly high rate, consequent upon a general increase in the prices of our papers to the public in 1955/56, but at the same time the effect of a £3 10s. per ton rise in the price of newsprint was beginning to be felt. In the summer another wage increase was negotiated at a cost in a full year of about £300,000. The effect of the continuing credit squeeze was such that for the first time since the war one of our three major papers was unable to use its full ration of newsprint. The Suez crisis and petrol rationing reduced to nil the advertising we normally carry from the oil industry. At the beginning of the calendar year newsprint increased by another £1 a ton and a further rise is expected in the near future.

ACCOUNTS

The very small reduction in profit on trading account cannot be attributed to any particular part of our business, almost all our newspapers, both National and Provincial, showing a slight fall in profits. Newspapers that still sell at 2d. are the only manufactured product not to have increased their price to more than twice the prewar level at a time when the general price rise is more like three to four times that of prewar. Our investment income however shows a further small increase which is due partly to favourable exchange rates on the unchanged Anglo-Newfoundland Development Company Limited dividend. Provision made for taxation in previous years but not required includes a considerable reserve accumulated over the last two or three years which is now freed as the result of agreement with the Revenue authorities. Taxation charged on the year's profits shows only an increase in the Profits Tax, due entirely, of course, to the effect of the higher rates charged in the last 18 months. The effect of all these variations is that the Group balance available at £1,529,407 is £82,000 higher than last year. The subsidiaries have retained £86,332 and your Directors have recommended that the £1,443,075 available to Associated Newspapers Limited be dealt with by transferring £850,000 to Reserve and paying the same Deferred dividend as last year.

You will see from the two Balance Sheets that your Company's financial resources remain strong, and you may be assured that we are constantly watching for opportunities to invest them profitably.

DAILY MAIL

Our pride in the *Daily Mail* continues to be increasingly justified. Objective news reporting of every category presented attractively together with a penetrating commentary on the events of the day and a firmly independent political approach have produced a circulation appreciably above that of last year.

World affairs have moved so swiftly that overseas correspondents have been constantly on the move and at times they have had to be reinforced substantially by home-based reporters. In the field they have shown initiative and taken considerable risks to get the news during a momentous year.

THE EVENING NEWS

During the year *The Evening News* has made even more secure its pre-eminent position as the largest selling evening newspaper in the world—it is read by more than four million people every day. We have further developed the service both to the advertiser and reader of classified advertisements. Our editorial columns reflect the success of our efforts to provide up-to-the-minute news and features in a way which can be quickly assimilated.

SUNDAY DISPATCH

Since the close of the financial year we have radically altered the appeal and layout of the *Sunday Dispatch*. The new *Sunday Dispatch* is directed towards people who, while enjoying the lighter moments of life, at the same time wish to be well-informed on more serious matters. We are confident that the paper in its new form will fill a need not being satisfied at present by the Sunday Press.

DAILY SKETCH

The circulation of the *Daily Sketch* continues to show the most heartening progress. I told you that in April, 1956, it was 1,135,000; last April it had reached 1,300,000. As the sale grows, the paper attracts to itself an increasing volume of first-class advertising. In consequence, the *Daily Sketch* advances steadily towards financial success and is not far away from standing on its own feet. Since the end of the year we have reached an agreement with the News of the World, Ltd., whereby we have taken over their 4 per cent of this venture. The newspaper is now owned by Daily Sketch and Daily Graphic, Ltd., a subsidiary of Associated Newspapers, Ltd. The fortunes of this bright newspaper are now bound up with your company, but we remain in close contact with News of the World, Ltd., who continue to print the newspaper for us.

WEEKEND

Since we started the *Weekend Mail* five years ago, labour costs have increased very considerably, and during the year it became a question of printing the paper in some other manner or not printing it at all. Early this year we transferred the printing to gravure, and after three experimental issues converted it to full colour on four pages. The initial public response to a magazine paper in colour has been very encouraging; we intend steadily to improve the form of this magazine and slowly to enter the women's market, under the new name *Weekend*. The advertiser has been quick to take advantage of this new development which enables him to put his message economically into the hands of six million readers.

PROVINCIAL NEWSPAPERS

Our provincial newspapers, each with its own separate identity, show continued increases in sales. Advertisement revenue has also improved, and although this has been offset by considerable increases of wages and other costs, there is a growing awareness of the effectiveness of advertising in these papers, especially on the part of the local traders.

TELEVISION

It will be recollected that as co-pioneers your company entered into heavy commitments in commercial television. Last summer your Board decided to reconsider their interests in the light of the resources of trained personnel and finance, and in consequence we very considerably reduced our interest in Associated-Rediffusion Limited. This decision does not indicate in any way our lack of confidence in the future of commercial television. Should favourable opportunities occur for investment in commercial television, we shall not hesitate to use available surplus funds for this purpose.

WAGES AND PRODUCTIVITY

The price of newsprint is about six times that of prewar and, as in every other sphere, wages in the newspaper industry have greatly increased. The rise in the cost of living has made higher wages necessary and it is right that all employed in the newspaper industry should be well paid.

Nevertheless, there have grown up some practices which do not help efficient production. There is, for example, an almost complete lack of co-operation when modern inventions are introduced. Nearly two years ago we bought new string-tying machines for packing our papers mechanically. They would have made for quicker and more efficient production, but we have been unable to use them owing to a failure as yet to come to any arrangement with the Union concerned, although we proposed that no member of our regular staff should lose his job. Had this state of affairs existed in Canada, our newsprint mill in Grand Falls would have been out of business by now. Since the war we have been able at Grand Falls, in co-operation with the Union, to more than double the output per man. The staff approve of every new mechanical device being employed because for one thing they get more money. Unless newspaper production is modernised, I fear that many more newspapers will cease to be published.

THE FUTURE

Turning to the future one must be cautious, for the Press as a whole is under great pressure. You may be assured, however, that we will not rest on our laurels; we believe that it is our first duty to make each of our papers prosperous, for if any paper is not able to pay its way, although it may be subsidised for a time, it will ultimately die. No newspaper can assume that society owes it an existence—especially

if it is unprofitable. We are conscious that here is apparently no common denominator of success in our kind of publishing; papers can prosper or fail irrespective of their circulation, their selling price, their seriousness or their frivolity.

Newspapers are a reflection of the public they serve and they must, without any lowering of standards, change as public interest and public taste change. The *Daily Mail* of Lord Northcliffe, brilliant as it was, would not be accepted by the *Daily Mail's* public of today and I am sure, too, that the *Daily Mail's* readers in 20 years' time would not for one moment accept this morning's paper which will be eagerly read by more than five million people. For ourselves, therefore, we will endeavour to sense the public taste and interest and to rely in the future as we have in the past on the greatest possible degree of journalistic enterprise and good management.

STAFF

In view of the difficult year through which we have passed, it is with particular pleasure that on your behalf and my own I thank the staff for all their continued and loyal efforts, without which such satisfactory results could not have been achieved.

RIO DE JANEIRO LAND, MORTGAGE & INVESTMENT AGENCY

YEAR OF DEVELOPMENTS

The forty-second annual general meeting of Rio de Janeiro Land, Mortgage and Investment Agency Company, Limited, was held on June 6th in London, Mr C. W. Black, JP, MP, FRICS, FAI, chairman, presiding.

The following are extracts from his circulated statement for 1956:

The past year has seen considerable developments in regard to your Company. During the year we formed a new subsidiary Company and acquired the whole of the issued Share Capital of three other property Companies. The Group now owns freehold and leasehold properties amounting, either at valuation or cost, to an aggregate of over £393,000.

The quoted investments held by the Group show a depreciation which is not surprising in view of the depressed condition of the Stock Exchange at the date of the Balance Sheet. Your Directors are fully persuaded of the soundness of these investments and anticipate that, with the return of better conditions, these investments will at least recover their value.

Through its shareholdings, your Company has a number of interests overseas in Australia, Canada, Rhodesia, South Africa and Eire. In particular we took the opportunity of securing a participation in a South African Company which has erected a block of flats and garages in central Cape Town. Replying to a question from a shareholder, the chairman stated that the current market value of the quoted investments showed an appreciation of nearly £3,000 compared with the balance sheet figure of £20,428.

The report was adopted.

At a subsequent extraordinary general meeting a resolution was passed increasing the capital to £150,000 by the creation of an additional 1,100,000 shares of 1s. each.

IMPERIAL CHEMICAL INDUSTRIES, LIMITED

CONSIDERABLY INCREASED TURNOVER

The thirtieth annual general meeting of Imperial Chemical Industries, Limited, was held on June 13th in London.

Sir Alexander Fleck, KBE, DSc, LLD, FRS, chairman, in the course of his speech, said:

The value of the Group's sales to external customers increased from £411 million in 1955 to £435 million in 1956, but despite this increase in turnover, the Group Manufacturing and Trading Profits, after charging depreciation, but before provision in respect of the Employees' Profit-Sharing Scheme and before taxation, fell from £56½ million to £53½ million. The Company was faced during the year with a continuation of the rise in costs caused principally by increases in salaries and wages, in transport charges, and in the price of fuel. Increased efficiency partially offset these higher costs; nevertheless, profit margins were reduced substantially.

The prices of some products were raised in the first half of 1956, but these increases did not outweigh the effects of the increased production costs.

BURDEN OF INCREASED COSTS

The burden of increased costs is especially serious in the export business. Conditions in markets overseas are now highly competitive, and competitors in some countries have not, in recent years, had to face such great pressure from rising costs as have manufacturers here. This is one of the factors that, despite the record levels achieved by our 1956 sales, made the manufacturing and trading profits of the Group, before taxation, about £3 million less than in 1955. Consolidated income of the Group after taxation was also about £3 million less than in 1955. The charge for taxation in 1956 represents a larger proportion of income than in 1955, due mainly to three causes—increases in the rates of Profits Tax, the withdrawal during 1956 of investment allowances on most new capital expenditure and their replacement by initial allowances, and a reduction in the credit for over-provisions in past years.

Undistributed income of Subsidiaries amounted to £6 million in 1956, compared with £4½ million in 1955. Over £5 million of the large sum retained by Subsidiaries related to profits to be used by overseas companies for the further development and expansion of their businesses, from which material benefits should flow in the future. The Company's net income for the year 1956 was £19½ million, as compared with nearly £24 million in 1955. Although the net income of the Company has decreased to this extent, the Board, having regard to the great strength of the Company and its prospects, have no hesitation in recommending that the final dividend for 1956 should be 6 per cent, making the total dividend for the year 10 per cent, the same as was paid for both 1954 and 1955.

It is your Board's intention to maintain their policy of a fair balance between the distribution of profits as dividends to Stockholders who can reasonably expect to participate in the Company's growing prosperity, to which their capital makes an essential contribution, and the retention of profits for the Company's business.

PRICE POLICY

On July 1, 1956, we announced that over the major range of our products we should not raise our prices in the Home Trade before July 1, 1957, unless some unexpected or exceptional event occurred in the interim. We did not treat the Suez crisis as such an event, although I think we might have been justified in so doing. Indeed during this period we reduced some prices in the home market.

For the future, we shall consider each product on its merits, and adjust prices up or down as demanded by cost and market conditions. In making changes, we shall, as in the past, do our best to keep prices down, balancing the need to provide the best possible service to our customers, a proper return to our stockholders and fair rates of wages and salaries to our employees. In those cases where we find it necessary to raise prices, we shall continue our policy of keeping the new prices stable for as long as possible.

CURRENT YEAR'S TRADING

In conclusion, I should like to say a little about the current year's trading. So far, turnover has been on a higher level than in 1956. In the middle of last year there was some noticeable hesitation in those parts of our business serving industries making durable consumer goods, such as motor-cars and household appliances. The marked recovery made this year by the motor-car industry in particular is helping us to overcome the setback experienced last year in those sections of our organisation.

The current year is, of course, bringing its own problems. Fortunately, the general level of activity is high, and in most cases new plants coming into production are immediately and fully occupied. The demand for "Terylene" in particular is most active. So far this year, exports have been of the same order as last year, but if costs of production in the United Kingdom continue to rise at a rate greater than those of our principal competitors, it will become more difficult to place our exports. Your Company is greatly dependent upon the export business —not only its own direct exports, but also indirectly through the exports of its customers in the United Kingdom. Unless the nation's competitive position in world markets can be strengthened, some of the great opportunities will be missed, and the country will fail to achieve its long-term objective of a healthy and expanding economy.

If no unforeseen international disturbances arise, 1957 should be a year of high activity in almost every branch of the Company, and I think we can look forward to a year of satisfactory progress. We also regard the longer term prospects with confidence. There are great possibilities for the profitable development of the chemical business throughout the world.

Further, we are engaged in an industry in which the native genius of our people can work to full advantage. It is our policy to plan for the future in the expectation that we shall not only maintain, but indeed improve, our place in the chemical industry of the world.

The report and accounts were adopted.

SUNDAY PICTORIAL NEWSPAPERS (1920) LTD

Improved profit and sales

CECIL H. KING REVIEWS COMPANY'S INVESTMENTS

The Thirty-Seventh Annual General Meeting of Sunday Pictorial Newspapers (1920) Ltd. was held on 7 June, at Brettenham House, Lancaster Place, London, W.C.2.

Mr. Cecil H. King, Chairman and Managing Director, said:—

The accounts have been in your hands for the requisite period and disclose a profit that before taxation is some £105,000 better than last year.

Profit on trading reflects a full year's benefit from the increase in the sale price of the Sunday Pictorial that took place in October 1955 and from the addition of 12½% in the advertisement rate that became effective 1 January 1956. Income from these two sources was in fact the highest in the company's history.

On the other hand, costs reached a new peak. Production in Manchester has necessitated some duplication of staffs; larger sized papers resulted in added consumption of newsprint, for which we had to pay over £3 per ton more than in the previous year. In addition wage rates, revised during the financial year 1956, rose in July last by a further 5½%. I should stress that the advantages of printing in Manchester accrue to the northern readers of the Sunday Pictorial who are now assured of as late a news and sports service as is provided by any other paper. The significant variations that have taken place during the year in balance sheet items are referred to in the Directors' Report and there is nothing further for me to add.

Sunday Pictorial sales reach new peak

The sales of your paper, the Sunday Pictorial, have continued to break records. In spite of an increase in selling price towards the end of 1955, the average sale per issue over the first six months of 1956 was 23,000 higher than for the last six months of the previous year.

The second half of the year showed a further rise of 86,000, bringing the average to 5,709,893—a total increase over the twelvemonth of 109,000. Sales have benefited from our recent move to print and distribute editions from Manchester, but the large overall increase can best be attributed to the growing interest that your paper continues to arouse throughout the country.

Steady rise for five years

During the last five years the audited net sale of the Sunday Pictorial has risen by 635,000. This rapid advance should be seen in the perspective of the rest of the national Sunday newspaper field. Ignoring amalgamations, over this period only two other popular papers have risen at all.

Some have declined. For instance, The People, which in the first half of 1951 was selling nearly as many copies as the Sunday Pictorial, has dropped nearly a quarter of a million: the News of the World, which exceeds us by a narrowing margin, well over a million.

In the first six months of 1951 the combined sale of the 10 national Sundays apart from the Sunday Pictorial was 25,294,000. In the last six months of 1956 the combined sale of these papers (now reduced to 9 by the amalgamation of the Sunday Chronicle) had dropped to 23,541,000. The total sale of all national Sundays, however, has remained at the same level after five years—almost 30½ million. The balance lost by other papers is almost exactly made up by the increased sales of the Sunday Pictorial and the sale of Woman's Sunday Mirror (1,179,679), a paper in which, as you know, you share an equal control with The Daily Mirror Newspapers Ltd.

Strength of Trade investments

In my annual review this year, I think that you would welcome an account of the strength of your company's various investments. I will accordingly deal very briefly with the major concerns in which your company has an interest, pointing out the share you hold in the equity of those concerns and the gross trading profit after depreciation, but before taxation, returned by them. You will understand that not all our associated companies date their financial years in the same period as our own. In all cases I have therefore taken the latest available trading figures.

The Daily Mirror Newspapers Limited

Your most important newspaper investment is in your sister company, The Daily Mirror Newspapers Ltd., in which you hold 15.5% of the total equity. In the financial year which ended on 28 February 1957, your sister company's profit on trading after depreciation amounted to £660,443.

Sales of the paper continued to climb. The most recent audited six-monthly average—for the latter half of 1956—was 4,723,131, about 29,000 up on the previous year.

Reveille Newspapers Limited profit ploughed back

Your other established newspaper interest in this country is in Reveille Newspapers Ltd., publishers of Weekend and Midweek Reveille, in which you and The Daily Mirror Newspapers Ltd. each own a 50% share. In the financial year which ended on 28 February the Reveille company traded at a profit, the whole of which it retained.

Scottish Daily Record and Sunday Mail Limited

Your company also shares a 50% interest in the Scottish Daily Record and Sunday Mail Ltd. In the financial year which ended on 31 December 1956, the company returned a loss on trading of £161,809. A considerable part of this loss was incurred on publishing the Glasgow Evening News. Under new management this paper made greater progress in circulation over the year than either of its two Glasgow evening competitors, but, as you know, advantage was taken recently of a favourable offer to sell the Copyright, Title and Goodwill to George Outram and Company Ltd. for £250,000.

The two remaining principal papers are progressing satisfactorily. The Sunday Mail continued to rise in circulation over the last six months of 1956 and attained an average net sale of 647,373. The Daily Record reached an average of 381,802, a rise of 34,000 on the previous year—the largest gain for many years. As sales of these papers increase further, we trust that the expectation of your investment will be fulfilled.

West African Newspapers Limited and subsidiaries

Let us now turn to your interests abroad. In West Africa you are concerned in a flourishing newspaper enterprise of great potential. Your company owns 50% of the equity of West African Newspapers Ltd.—a company that operates through subsidiaries in Nigeria, Ghana and Sierra Leone. The latest results of these subsidiaries disclose that after depreciation but before taxation the Nigerian company made a profit of over £70,000 and the Ghana company something in excess of £60.000. The Sierra Leone company is still in the progress of development and is currently operating at a small loss. The profits of this group are being ploughed back to finance the further expansion of these businesses.

A success story can also be told of the circulations of your West African publications. The Daily Times of Nigeria, with an average sale of 81,261 in the second half of last year, showed a 24% increase over the same period in 1955 and the Daily Graphic of Ghana with 74,202 a 35% increase.

The Sunday papers in these two countries also did very well last year. Increases gained were 29% for the Sunday Times of Nigeria with an average of 80,131, and 28% for the Sunday Mirror of Ghana with an average of 52,180.

The more recently acquired daily paper in Sierra Leone continued to hold its own, and increased its circulation to over 12,000.

I think you will agree with me that these figures speak for themselves and give grounds for satisfaction.

Advantageous Argus deal

You will remember that at the beginning of 1957 we sold our interest in the control of The Argus and Australasian Ltd. of Melbourne in exchange for a block of Ordinary shares in the Melbourne Herald and Weekly Times Ltd., but retained our profitable Australian radio and television investments. Your company's interest in the equity of the Herald company, which in its last financial year to 30 September returned a trading profit of £1,303,322, is 7.2%.

Our interest in commercial radio and television companies in Australia is held by M.P.A. Productions Pty. Ltd., 50% of the capital of which is owned by your company. That company disclosed a trading profit of £21,000 for its last financial year, a result which should be improved in the future.

Associated Television Limited improved results

Your investment in British television, amounting to a 13.2% share in the equity of Associated Television Ltd., is of more recent date. In its first 15 months of operations to 30 April 1956, that company returned a loss on trading of £602,715. Since then revenue from advertisements has greatly increased. It is estimated that the trading results for the year 1956-57 will show a profit. The time cannot be far off when your investment will be very satisfactorily rewarded.

Pulp and paper investments

You will now wish to hear of your investments in the pulp and paper making industry. Your interest in Anglo-Canadian Pulp and Paper Mills Ltd., with its subsidiary the Dryden Paper Co. of Ontario, is 14.05%. Trading profit of Anglo-Canadian in the year which ended on 31 December last was $9,796,663, which at $2.68 to the £ is equivalent to £3,655,471.

Your other interest in the industry is in the Reed group. Trading figures of Albert E. Reed and Co. Ltd., in which you own 10.9% of the total equity, for the financial year which ended on 31 March 1957 disclose a profit of £5,690,000.

Healthy backing to investment income

From this brief survey you will have formed a good idea of the strength of your investments. The sum of gross trading profit returned by each concern, during the most recent financial year for which figures are available, comes to nearly £11,000,000. If we calculate the proportion of each trading profit according to the share in the equity of the various concerns held by your company, we reach a total profit attributable to your overall trade investments of over £1,300,000.

You will realise that this is a substantial sum reflecting a very healthy backing to the income of £464,523 received by your company from trade investments during the year under review and that it provides additional cover for the dividends your board recommends be paid on the company's Ordinary stock.

It remains for me now to pay tribute to all personnel both at home and oversea whose efforts have contributed to the satisfactory result before you.

The report and accounts were adopted.

CENTRAL PROVINCES MANGANESE ORE

A SATISFACTORY RESULT

DEMAND WELL MAINTAINED

HAMPERING EFFECT OF TRANSPORT DIFFICULTIES

MR H. R. HOLMES'S REVIEW OF ACTIVITIES

The forty-ninth annual general meeting of The Central Provinces Manganese Ore Company Limited was held on June 12th, at Winchester House, Old Broad Street, London, EC2, Mr H. R. Holmes (the Chairman) presiding.

Mr T. D. de Deney, FCIS (the Secretary), read the notice convening the meeting and the report of the auditors.

The Chairman said: The Report and Accounts for the year ended December 31, 1956, have been in your hands for some time, and with your permission I will take them as read. (Agreed.)

With regard to the Accounts, I propose only to deal with those items which I consider of particular interest or which require some explanation.

The balance on trading, £1,695,935, I hope you will consider satisfactory, and you will notice that it is shown after transferring £225,622 to Ore Stock Reserve. The necessity for this transfer arises from the fact that although the demand for our ore has continued to be satisfactory, we were unable to deliver as much ore as we produced, owing to the lack of transport from the Mines to the Coast; consequently, you will notice from the Balance Sheet that the stock of ore rose during the year from £1,027,327 to £1,717,401. This is due in the main to an increase in the tonnage of ore in hand, but also, to a certain extent, to an increase in costs in respect of mining, railway and port charges. In view of this, the Directors have thought it essential to transfer the sum of £274,378 which has been standing to the credit of Reserve on Revaluation of Stock to an Ore Stock Reserve, and also to add to this the sum of £225,622 to make a total Ore Stock Reserve of £500,000, which sum has been deducted on the Balance Sheet from the item Stock of Manganese Ore. The major part of our stock lies at the Mines, and if we could transport it to the Coast there would be no difficulty in shipping it, but there is a limit to the extent that we can continue to produce ore in excess of that which we can deliver, as by so doing we should merely pile up a stock of ore and denude our cash resources. It must be remembered that, so long as our profits are represented to some extent by an increase in our ore stocks, our liquid situation must deteriorate, as we have to pay a heavy rate of taxation in cash on all profits.

We hope that the railing situation will improve, but if it does not the time may come when we shall be forced to reduce production, which will mean discharging part of our labour force, and the result would be an increase in the cost of production, a reduction in profits and a consequent smaller amount to be paid in taxation. We naturally should be very reluctant to take this step, and we hope that the necessity will not arise.

During the year under review there was a steady improvement in the price of manganese ore in the world's markets. There may, however, be a reversal of this tendency, owing to the introduction of new sources of supply from mines being opened up in other countries of the world, and also to fluctuations in the world's production of steel. Nevertheless, there is at the moment a good demand for our ore, but, as I said above, the outlook for the current year depends largely on railings, which at present are unsatisfactory, but which we hope will improve.

THE ACCOUNTS

Of the Profit, Taxation takes £1,080,000, all but £18,000 of which consists of Indian Taxes. On the debit side of the Profit and Loss Account, depreciation of fixed assets amounts to £171,271, against £129,428, and this, of course, is owing to the substantial expenditure we have made in recent years on plant, machinery, and buildings for the efficient working of the mines.

On the Assets Side of the Balance Sheet, under Trade Investment, appears the item £50,000 Shares in the United Kingdom Ferro Manganese Company, Limited. This was the position at the end of the year, but since then, these shares have been sold and our financial connection with this Ferro Manganese Company has come to an end, though our relations with them remain very good. For some years past the working of the Agreements has not been possible, and the association fulfils no useful purpose under present-day conditions.

You will notice that, on the liabilities side of the Balance Sheet, we have deducted from the Contingencies Reserve a sum of £42,091 paid in respect of Indian Estate Duty. This is the amount which has accumulated over a period of some three years, and to a large extent is represented by Estate Duty which arose on the death of our largest personal shareholder. However, such a large payment is not likely to occur again.

MINES IN SATISFACTORY CONDITION

As no doubt you know, the Government of India have established the Indian State Trading Corporation which is now operating, apart from other commodities, in the manganese ore business. During the year Mr Hardy, one of our Joint Managing Directors, paid two visits to India in July and August, and again in the early part of this year, to discuss with the Government of India officials in Delhi our connection with this Corporation which we trust may result in increased exports of our ore to our usual customers.

Mr Hardy also visited the Mines in India to make a thorough inspection of the properties. He submitted full and informative Reports to the Board and settled several outstanding matters regarding the future working of the Mines. I am pleased to say he found the Mines in satisfactory condition.

The Heavy Media Plant continued to operate successfully at Dongri Buzurg Mine, producing ore of good quality. Certain alterations to the Plant and the preliminary screening plant were undertaken which reduced the tonnage put through it, but, due to poor railings, this was not a matter of any consequence.

DIAMOND DRILLING PROGRAMME

Our Diamond Drilling programme continues, and drilling has taken place at Gutagson, Kandri, Munsar, Satuk and Ukwa Mines. This work, particularly at Ukwa and Kandri Mines, has indicated the existence of very considerable tonnages of ore of excellent quality at easily workable depths.

Construction on the Government Electricity grid supply has unfortunately been hampered by a shortage of materials and power is not expected to be supplied at our Tirodi and Balaghat Mines until late this year. These Mines are now equipped to take the power as soon as it becomes available. Shaft sinking at Balaghat continued during the year and the permanent head frame for the new shaft and the two hoists should be completed by the time power is available.

I am glad to say that our relations with the different Authorities in India continue on a satisfactory basis.

In November of last year your two Joint Managing Directors, Mr A. Linton and Mr W. A. Hardy, visited the United States of America to keep in touch with our very important customers there and to discuss with them several business matters. These customers are the largest producers of ferro manganese in the world and we have had very cordial relations with them for many years now.

I would not like this opportunity to pass without expressing our appreciation of the understanding of our problems by all our Buyers.

EFFECT OF FINANCE BILL

I expect many of you are wondering whether the provisions of the Finance Bill 1957, relating to Companies Trading Abroad, will be of material benefit to your Company. I am afraid that the answer to this is in the negative. The reason for this is that, owing to the very high rate of Indian Taxation, there is, to all intents and purposes, no margin for any benefit to your Company.

An Interim Dividend of 1s. 2d. per unit free of tax was paid on October 1st last, and your Directors now recommend that a Final Dividend of 1s. 8d. per unit, plus a bonus of 8d. per unit, both free of tax, should be paid, altogether absorbing £525,000. This will leave £281,197 to be carried forward as compared with £257,130 brought in.

TRIBUTE TO MANAGEMENT AND STAFF

On your behalf, I should like to record our thanks to the management and all employees, both in India and in London, for their efforts during what has not been an easy year. I would also like to mention the efficient and helpful work done by our Shipping Agents in India, Messrs James Finlay & Company, Limited.

I now beg to move:—"That the report of the Directors and Statement of Accounts as at December 31, 1956, be and are hereby approved and adopted, and that the profits be appropriated as recommended by the Directors." I will ask Major Herring to second the motion, and before putting it to the Meeting I shall be glad to deal with any questions which Stockholders may wish to ask.

Major A. C. Herring, VC, ACA, seconded the resolution which was carried unanimously.

The Board's proposal of a final dividend of 1s. 8d. per unit, free of tax, and a bonus of 8d. per unit, free of tax, was also approved.

The retiring director, Major A. C. Herring, VC, ACA, was re-elected and the remuneration of the auditors, Messrs W. A. Browne & Company, having been fixed, the proceedings terminated.

THE INSTITUTE OF COST AND WORKS ACCOUNTANTS

The thirty-eighth annual general meeting of The Institute of Cost and Works Accountants was held on June 1st at The Connaught Rooms, London, W.C.2. Mr Ian T. Morrow, CA, FCWA, President of the Institute, was in the chair.

Mr Stanley J. D. Berger, MC, FCIS, the Director and Secretary, read the notice convening the meeting and the auditors' report. The annual report showed that at the end of 1956 there were 5,352 members and 13,293 registered students in various stages of qualifying and that 8,478 students sat the 1956 examinations. Over 500 branch meetings were held in centres throughout the United Kingdom, Eire, Southern Rhodesia and South Africa. The first South African national cost conference was held in Pretoria; an address was given by the South African Minister of Economic Affairs. Research activities continued to increase. Special attention had been given to the training of registered students: three publications had aroused considerable interest: "The Cost Accountant, His Work and Training," "A Career in Cost Accountancy," and "Training for the Cost Accountant." There were over 70 firms which provided schemes of training for students.

After the adoption of the report and accounts, the President invested Mr James Borsay, FCWA, the new President, with the badge of office.

ECONOMIC PROGRESS

In his address at the twenty-eighth national cost conference on the previous day, the President, Mr Ian T. Morrow, CA, FCWA, said that it was the duty of the modern state to maintain a high and stable level of employment and to ensure a continuing rise in the standard of living. These, he said, "Can come only from a prospering industry; they cannot come from anywhere else; they cannot come from banking, law, diplomacy or the civil service. All these ancillary and subsidiary activities can assist or mar the process of production, but in the final analysis what we physically produce must provide the wherewithal to fulfil the politicians' promises. This means that it is in the interests of us all whatever our party, that industry should prosper. . . Perhaps, after this year, we can go forward as a nation clear in our purpose that if we are to discharge the obligations which democracy lays upon us . . . we must do everything in our power to increase the effectiveness of industry. . . . The Institute is equipped and prepared to play an increasingly important part in such a development."

PRESENTING INDUSTRY'S PROBLEMS

Mr Morrow referred to the recent conference held by the Royal Navy, attended by members of the Houses of Parliament and by industrialists, to give an idea of the navy's problems, organisation and outlook. "The idea should be extended. Let the higher Civil Service put on a similar show . . . it would give industry an understanding of the problems and organisation . . . which it sadly lacks. These conferences would inform industry, but the difficulty is that the 'Establishment' is not informed about industry. So let us do likewise; let us prepare for senior officers, Civil Servants and politicians a short course presenting industry . . . it should be demonstrated how specific problems are dealt with, such as the decision to develop a new product, the problems of exporting in a competitive world, the problems connected with deciding on heavy capital expenditure. . . . This would strengthen us in every possible way for the tasks that lie ahead, and perhaps accelerate that desirable increase in our national income."

RAMBUTAN RUBBER ESTATES

The twenty-sixth annual general meeting of Rambutan Rubber Estates Limited was held on June 11th in London, Mr R. F. Burt (the Chairman), presiding.

The following is an extract from his circulated statement:

The decrease in the estate working profit has been caused principally by a steep decline in the proceeds of our crop, which resulted from a sharp fall in output as well as the decline of 3.01d. per lb. in net sale value of our rubber. The latter is to be expected for the average gross sale price in 1956, as published, was nearly 5d. lower than 1955. The shortfall in output, however, requires explanation: most of it took place on our Rasa Estate, which suffered greatly from labour trouble in the middle of the year, causing a shortage of tappers and even now is not back at its best level. Our other estates were, fortunately, not so greatly affected by the Trade Union activity. Our current year's estimate for all three estates is 1,814,000 lb.

We have added to our plantations since the war 478 acres, and have a further 121 acres on the programme for 1957. By and large the stage is now set for increasing crops from 1958 onwards. Rubber trees do not produce at maximum capacity until about the tenth to twelfth year from planting but we already have good evidence to expect with confidence fine yields from the pedigree material we have planted since 1947 on 1,060 acres.

The report was adopted.

LA RINASCENTE

Milan, Italy

LARGEST ITALIAN DEPARTMENT STORE ORGANISATION

The Annual General Meeting of the La Rinascente concern, which runs department stores in Milan, Rome, Naples and Cagliari, as well as 58 popular chain stores in all the main towns of Italy, was held in Milan at the offices of the Banca Commerciale Italiana, on May 11th.

Cav. del Lav. Umberto Brustio was in the Chair, and 70 shareholders attended, who represented, directly or by proxy, 61,910,602 shares out of the 95 million shares constituting the Company's present share capital.

Dr Aldo Borletti, Deputy Chairman, read the report presented by the Board of Directors, which reviews in detail both assets and liabilities in the balance sheet. The balance sheet reflects a favourable position as regards the Company's liquidity and does not show any liabilities towards banks, in spite of the important commitments incurred to develop further the Company's organisation, which were met by an increase in the Company's capital and by a bond issue, both the subject of resolutions adopted at the previous year's Annual General Meeting.

The balance sheet closed with a net profit available for distribution totalling Lit. 542,543,799. The report explains how in spite of the rise in sales, which reached Lit. 45,000 million last year, the amount of profits available did not rise in proportion, as a result of an even more pronounced low-price policy followed by the stores of the Rinascente-Upim Group.

The balance sheet was adopted unanimously, and it was decided to distribute a dividend of Lit. 5 per share, payable through the Company's banks as from May 21st.

The Chairman, Mr Brustio, announced during the meeting that although he would continue his association with the Company's Board, he would relinquish the burden of the Chairmanship after directing the Company's development for 38 years. At the suggestion of Avv. Giussani, a shareholder, the meeting expressed its appreciation of Cav. del Lav. Umberto Brustio's valuable work on their behalf and resolved that this appreciation should be visibly expressed by electing him Honorary Chairman for life.

The Board of Directors, which met immediately after the meeting was over, accepted Mr Umberto Brustio's resignation from the post of Chairman, and elected him Honorary Chairman. It further decided to give tangible expression to its gratitude for his work by authorising an agreement with the Board of the Commercial College Luigi Bocconi of Milan for the establishment of a Chair for Statistical Science, and by providing bursaries with the Bocconi College and other institutions for the Company's employees and their children, in order to encourage and facilitate the growth of professional education and training.

Subsequently, the Board unanimously elected Dr Aldo Borletti as the new Chairman of the Company and elected Mr Cesare Brustio to the vacant post of Second Deputy Chairman. As a result, the Company's new Board is now constituted as follows:—

Dr Aldo Borletti, Chairman.
Dr Mario Luporini, Cesare Brustio } Deputy Chairmen
Ing. Roberto Brüschweiler, Rag. Mario Rossello } Directors

Avv. Adolfo Tino was confirmed in his post as Secretary to the Board.

BRITISH TIMKEN LIMITED

CONTINUED EXPANSION IN ALL FIELDS OF ENGINEERING

SIR JOHN PASCOE'S ADDRESS

Sir John Pascoe, Chairman and Managing Director of British Timken Limited, at the Annual General Meeting in Birmingham on June 6th said:

Dividends for 1956 absorb £195,500 whereas the Group has to pay the Inland Revenue over £750,000 out of its earnings.

CAPITAL EXPENDITURE

Last year I reported that the previous four years Capital Expenditure on expansion and re-equipment amounted to £2,500,000. Expenditure in 1956 was approximately £800,000, largely on the Daventry factory. We had Group Capital commitments outstanding at December 31st of £1,200,000.

This large expenditure has meant a continuing increase in our manufacturing facilities, particularly for the larger type of bearings and has enabled us to achieve a steadily rising turnover, and earn greater profits.

Our Capital commitments of £1,200,000 at the end of 1956 may be considered within our financial capacity, nevertheless, looking ahead, your Board sees not only the opportunity, but the necessity for further Capital expenditure, which it has every reason to believe will be profitable.

Consequently, as I forecast some two years ago, the time will arise when we must consider raising further Capital. Your Board now has under active consideration, an early approach to the Capital Issues Committee.

As to the form of new Capital, although your Board has reached no definite conclusion, it is inclined to the view that in all present circumstances, a redeemable note issue would be cheapest and most satisfactory.

ORDERS AND OUTPUT

During 1956, deliveries to the motor vehicle industry except those to the heavy commercial vehicles industry, showed a severe fall, but the demand from other industries, particularly for the heavier types of bearings, was such that we achieved the highest turnover in our history.

Railway bearings orders were received from 22 countries, and substantial orders were received from British Railways for our new wagon bearing units. Sales to the aircraft industry were well maintained, delivery of bearings for helicopters for instance, being doubled.

Our Direct Exports again showed a most satisfactory increase being approximately 22 per cent of our total turnover: and it is estimated that 45 per cent of our Home Sales were incorporated in goods sold abroad. Assisted by visits of the Management and Home Sales Staff, our Direct Exports are obtained by our Agents and Representatives almost all over the world. Our thanks are due to them. I am happy to say that our South African Company continues to play a most important part in our export drive.

RAW MATERIAL

The difficulties I mentioned last year of obtaining adequate supplies of the high grade nickel steel became even greater in 1956, these being accentuated by our increasing turnover. Irregular supplies affected our efficiency and reduced our possible output.

We use a nickel alloy steel, the percentage of nickel varying with the type of bearing. This steel evolved after very many years of research is, in our opinion, the best material for our purposes. We would not willingly supply tapered roller bearings made with steel to any other analysis.

We have promises of deliveries covering our 1957 needs, but as we learnt to our cost in 1956, promises are by no means equivalent to the steel itself.

Prices of steel increased in 1956. Apart from further increases which everyone will undoubtedly have to bear during the present year, the cost of obtaining nickel steel will mean an addition to our own costs until supplies of nickel to the steel-makers, at present inadequate, considerably improve.

TECHNOLOGICAL DEVELOPMENTS

We spare no effort to keep abreast of modern technical developments. We now have four fully mechanised automatic lines in three-shift production which are making a significant contribution to our turnover. Your Board is considering still further development in this direction.

Sales of our products start in the drawing offices of industry, whether the bearings are for vehicles, aeroplanes, rolling mills, axleboxes or any other use. The number of application enquiries being dealt with by our Technical Departments is increasing almost day by day.

The efforts of our Sales Engineers resulted in many more sales to other industries than the vehicle industry, and there is a definite broadening of the basis of our operations.

FUTURE PROSPECTS

Our output to date this year is larger than for the corresponding period of 1956, with an increasing demand from the motor-car industry. We are confident that great opportunities lie ahead of us. We welcome the suggestion that this country should enter the European Free Trade Area, and we look forward to accepting the challenge that this will mean to British Industry.

We find increasing difficulty in obtaining sufficient skilled labour. Realising that this cannot and should not be obtained from other industries, great attention is being paid to training schemes, particularly for apprentices who will be the skilled workers in the future.

No thought of the future would be complete, however, without reference to the ever-increasing costs of production. The "inflationary setting" appears to be with us without any definite indication at present that either the Government or Industry are prepared to pay the necessary price to alter this state of affairs.

Already before the latest wage award we have had to meet increased costs of electrical power and all types of steel, and with the further rise in wage rates, costs of manufacture will again increase.

With rising costs, to maintain its productive capacity, Industry must be able to set aside year after year additional sums for replacement; in other words, increasing costs of manufacture necessitate for healthy Industry, increasing profits.

The real problem before Industry in this Country is to increase productivity. Increasing productivity, among other things, means raising the efficiency of the use of labour. This calls for more and more attention to research and development and constant capital expenditure to take advantage of new developments in manufacturing.

FISCHER BEARINGS COMPANY LIMITED

Our main subsidiary, Fischer Bearings Company, Limited, had a satisfactory year with an appreciably higher turnover, a feature being the substantially higher sales of bearings to the aircraft and associated industries. This side of the business has continued to expand during the current year, but the order cover that the Company has for its more standard range of bearings decreased considerably during the latter half of last year and during the early months of this year, usage by many customers for these bearings being affected by the Credit Squeeze and Suez Crisis.

WORKERS AND STAFF

We have very many people who have been with us for 21 years and over, and we have still more approaching that service. We hope that the security of employment British Timken has offered them will encourage them and others to make their life's work with the Company. The accumulated experience and know-how of these long service employees form one of our most important assets. To them, as indeed to all our staff, we tender as usual, but not the less sincerely, our thanks for their loyalty.

ODHAMS PRESS, LIMITED

SALES MAINTAINED

The thirty-seventh annual general meeting of Odhams Press, Limited, was held on June 7th in London.

Mr A. C. Duncan, FCA, chairman, in the course of his speech, said: Our gross revenue, £34,363,900, as compared with that of the previous year, has increased by £3,326,898. Our production costs and other expenditure, however, have increased by £3,507,700, reflecting, *inter alia*, increases of £3 10s. per ton on paper and about 15 per cent on other charges. The trading profit, in consequence, has decreased by £180,802. The net profit for the year amounts to £2,327,436, a decrease of £175,467.

Taking into account the loss incurred as a result of the trade dispute in the early part of the year, I think you will agree that the net profit is satisfactory. The interim ordinary dividend of 5 per cent already paid and the final dividend of 12½ per cent now recommended total £283,763.

The *Daily Herald* has retained its place among the great national newspapers, with a sale of 1,650,000 copies daily and it is calculated, as a result of independent surveys, that its readership reaches a daily total of nearly six million.

The press has been giving the *Daily Herald* a great deal of publicity lately. Numerous ideas have been given an airing including mentions of a merger. All I can say at the moment is that we do not contemplate the paper closing down. On the contrary, we have put forward proposals to the TUC for improving its future prospects.

The report and accounts were adopted.

LONDON TIN CORPORATION

CHAIRMAN'S STATEMENT

The Thirty-First Annual General Meeting of London Tin Corporation Limited will be held on July 3rd at The Chartered Insurance Institute, 20 Aldermanbury, London, E.C.

The following is the statement by the Chairman, Mr J. Ivan Spens, OBE, which has been circulated with the report and accounts for the period of eleven months ended March 31, 1957:

ACCOUNTS

Shareholders have already been informed of the Board's decision to make up the Accounts of the Corporation to March 31st, in each year. Accordingly the Accounts now submitted cover the period of eleven months ended on March 31, 1957.

The net profit for the eleven months period after providing £652,000 for taxation was £714,726 compared with £883,642 in the previous year when substantial profits arose from the sale of part of our shareholdings in two then subsidiary companies to reduce such holdings to less than 50 per cent of the issued capital of each of those companies.

The gross income from investments and interest for the eleven months period was only very little short of that for the whole of the previous year and was sufficient, after taxation, to maintain the dividend of 30 per cent, less income tax at 8s. 6d. in the £, which took £624,146 leaving a balance for the period of £90,580 to be added to the amount carried forward, which now stands at £289,590.

Unless any unforeseen circumstances arise it will be the intention of the Directors to declare interim dividends in October and February in each financial year as has been done in the period under review. So far as can at present be seen the provisions of the Finance Bill now before Parliament will in no way benefit this Corporation.

PRICE OF TIN

The average London cash price of tin metal during the period under review was £781 per ton. The highest price reached during the period was £890 and the lowest £723 per ton. At the meeting of the International Tin Council held in London in March, 1957, the prices of tin for the purpose of the operations of the Buffer Stock management were revised. The floor price was increased from £640 to £730 per ton but the ceiling price remains at £880 per ton. Between £780 and £830 per ton the Buffer Stock management will not operate in the market.

MALAYA

Malaya should emerge as an independent member of the Commonwealth during 1957. Last year in my Statement I referred to the observations of His Excellency the High Commissioner as to the future policy of the Government. I can only say that we look forward to a continuance of successful mining operations under the new Constitution which may be assured of the support and close co-operation of the tin mining industry.

Of the forty dredges under the management of Anglo-Oriental (Malaya) Limited at the end of the period under review twenty-six were in operation, four were being reconstructed and ten were idle. The fact must be faced that the majority of these idle dredges will probably not work again. Most of them are of small treatment capacity and comparatively shallow digging depth; consequently they are not economical units in other than ground which is easy to work and where values are found at a shallow depth. Ground of this kind in Malaya is practically worked out, and a large part of Malaya's dredging production now comes from the deep low-grade deposits which of necessity require high-capacity deep-digging dredges for economic operation. Two of these idle dredges are already scheduled to be taken out of commission and dismantled, one is scheduled for reconstruction on another area, and one remains idle for security reasons, but the rest will remain on a care and maintenance basis for a reasonable time in case suitable employment can be found for them. Large-scale prospecting is becoming increasingly urgent but, although the security situation continues to improve, extensive prospecting cannot yet be undertaken in certain districts with confidence. The total output of tin concentrate from the mines managed by Anglo-Oriental (Malaya) Limited during the period under review was 14,943 tons which is at the rate of 16,301 tons per annum, compared with 17,003 tons produced during the previous year.

THAILAND

The output of tin concentrate from the dredges under Anglo-Oriental (Malaya) Limited's management in Thailand during the period was 1,610 tons, which is an annual rate of 1,756 tons, compared with 1,278 tons in the previous year.

BURMA

The efforts made by Anglo-Oriental (Malaya) Limited during last year to visit the mines and examine the plants, despite the difficult conditions, have been followed up during the period under review with the result that, by the end of March, 1957, two small dredges had been rehabilitated sufficiently to start trial running. The security situation, however, continues bad and effective full-time operations cannot be expected at present.

NIGERIA

The mines under the management of A. O. Nigeria Limited produced 4,181 tons of tin concentrate and 695 tons of columbite during the period under review, which is at an annual rate of 4,561 tons and 758 tons respectively, compared with the previous year's outputs of 4,707 tons of tin concentrate and 883 tons of columbite. Active prospecting was continued as well as research into the problems of ore dressing and suitable plant for the separation of rare earths for industrial use.

DIRECTORS

We welcome The Right Honourable Lord Colyton, PC, CMG, Sir Eric Mieville, GCIE, KCVO, CSI, CMG, and Mr G. J. A. Jamieson, who were recently appointed to the Board. In accordance with the Articles of Association they retire at the Annual General Meeting and offer themselves for re-election.

STAFF

Our thanks are due to the Management and Staff throughout the Organisation for the work carried out during the year.

PHILLIPS RUBBER SOLES LTD.

The 30th Annual General Meeting was held on 13th June, 1957, the Chairman, Mr. Peter Pettit, presiding.

THE ACCOUNTS for the year ended 28th February, 1957, showed :—

Group Profit for the year	£179,693
Add brought forward	86,898
	£266,591
Income Tax and Profits Tax	£100,000
Expenses written off	2,927
Transferred to Reserve	25,000
Net dividends	51,750
Amount carried forward	86,914
	£266,591

The Chairman's Review included the following points :—

PROFITS. Higher costs again reduced profit margins, but total profit after providing for taxation was less than £5,000 below last year's figure.

SALES. Home Sales again exceeded last year's record in both quantity and value, but exports were lower, due largely to restrictions or complete embargoes imposed by some countries.

PRICES. While prices have not been increased during the year, they may have to be reviewed as a result of further wage negotiations now in progress, but any advances will be kept to a minimum.

NEW PLANT. New electric power plant has now been installed at the Manchester Factory and the building of the new Mill and Press Room will commence during the next few months.

NEW SOLE. An attractive Extra Light Stick-a-Sole for Ladies' fashion footwear in an entirely new featherweight quality with amazing wearing properties will shortly be put on the market.

THE CURRENT YEAR has started well and Home Sales are a little higher than in the same period last year.

The final Dividend of 15% (making 20% for the year) was approved and the Report and Accounts were adopted.

WILMOT-BREEDEN (HOLDINGS)

POLICY OF DIVERSIFICATION JUSTIFIED

The eighth annual general meeting of Wilmot-Breeden (Holdings) Limited was held on June 12th in Birmingham, Mr D. L. Breeden, Chairman and Joint Managing Director, presiding.

The following is an extract from his circulated review:

The difficult trading conditions which have prevailed in the motor industry have received wide publicity. The decline in the sales of cars had already set in at the beginning of the year, and during the first eight months the sales turnover which the Company derived from motor-car components was down by no less than one quarter.

In spite of these adverse conditions the earnings for the Group have been maintained. Such a result has only been made possible by taking action ahead of events to adjust production costs and overheads in preparation for operations at lower levels of turnover; and our policy of diversification.

There has been a major redeployment of our activities in Birmingham. The object of this is to concentrate the manufacture of all motor-car products at the Tyseley factories and to release space at the Camden Street factories to meet the increasing demands for components for gas turbine aero engines.

CAR DIVISION

The concentration at our Tyseley factories of all motor-car activities has permitted a reduction in overhead expenses and has opened up new possibilities for further operating economies. Investment in new plant continued at a record level, but our major programme of expansion will not be completed until towards the end of 1957.

FLIGHT PRODUCT DIVISION

We have been greatly encouraged by the expansion of activity in this division, which is being concentrated mainly at two factories:

Camden Street, Birmingham.—The removal of car products from our Camden Street factories has enabled us to extend very considerably our resources for the manufacture of components for gas turbine engines.

Bridgwater.—This unit has emerged from its build-up period and is now making a profit. Total activity increased, and machining capacity has been extended in order to provide support for the aero engine work at Camden Street.

Telehoist Ltd.—This company achieved the highest sales in its history, and it is now leading the way in the design of hydraulic tipping gears for heavy duty operation.

Telehoist exports directly one-third of its output and indirectly, through vehicle manufacturers, a further one-third. Also it has been successful in opening up new markets in South Africa.

After reviewing the overseas activities, the statement continued:

RESEARCH AND DEVELOPMENT

The new research and development unit at Umberslade Park has now been operating for twelve months. Effort has been directed initially towards research into certain electro-chemical processes and further development of locking mechanisms. Two new mechanisms, which are known as the zero torque and the safety cam locks and which are the outcome of this work, have been exhibited in some of the main car producing countries and several overseas licences have already been granted.

The motor industry is still operating under artificial restraints, and in consequence it is difficult to forecast prospects for 1957. Sales in that industry are now rising, but account must be taken of increasing costs and intensified competition. It is hoped that some of these adverse conditions will be offset by the measures taken by the Company.

The report was adopted and the total distribution of 8½ per cent on the Capital as increased by the Rights and Capitalisation Issues made during the year, was approved.

UNION INSURANCE SOCIETY OF CANTON

The annual meeting of the Union Insurance Society of Canton Limited was held on May 24th, in Hongkong, the Honourable C. Blaker, MC, the chairman, presiding.

The following are extracts from the report and accounts and his circulated statement:

Marine.—The net premiums for the year amounted to £3,585,944.

Fire.—The net premiums for the year amounted to £3,955,085.

Accident and General.—The net premiums for the year amounted to £4,548,214.

Profit and Loss Account.—Interest and dividends amounted to £548,431 and transfers from underwriting accounts to £293,019. The profit for the year appertaining to the society is £354,727.

CHAIRMAN'S STATEMENT

The year under review was generally one of more than usual difficulty. Although our overall premium shows a healthy increase which testifies to the keenness of those concerned throughout our organisation, the results reflected in our revenue accounts are less satisfactory than those we have become accustomed to expect.

The income in the accident department at £4,548,214 is £953,095 higher than in 1955.

Your directors have decided to recommend that the existing capital structure of the society should be altered from 200,000 shares of £10 each to 2 million shares of £1 each.

At the present time our shares are one of the most expensive insurance shares in the world, and it is felt that a split of each £10 share into 10 £1 shares will enhance the popularity of the society and widen its list of shareholders. The report was adopted.

BENGUELA RAILWAY COMPANY

At the Annual General Meeting of the Company held in Lisbon on 28th May 1957 the following distribution of profits for the year 1956 was approved:—

	1956 Escudos	Comparative Figures 1955 Escudos	1954 Escudos
Net Revenue	221,811,958	146,096,217	127,163,195
Deduct:—			
Percentage to Portuguese Government	24,589,077		
Deductions in accordance with the Articles of Association	16,889,002		
	41,478,079	22,118,135	20,191,075
Balance available for distribution	180,333,879	123,975,082	106,972,120
Distributed as to:—Debenture Service:—			
Redemption of 4% Debentures	49,248,290	48,889,269	16,299,076
Interest on 4% Debentures for year 1956	11,033,345	15,888,915	14,940,901
Interest on 5% Debentures for year 1956	16,100,000	15,996,692	3,357,892
	76,381,635	77,771,797	33,597,869
Dividend of 16.5 Escudos per share on Share Capital	49,500,000	33,000,000	33,000,000
Transferred to General Reserve	53,452,244	13,203,285	40,074,251
	180,333,879	123,975,082	106,972,120

Tanganyika Concessions Limited owns all the Debentures and 20% of the Equity of the Benguela Railway 80.5 Escudos = £1

THE MUNICIPAL TRUST COMPANY LIMITED

HIGHER PERCENTAGE OF FUNDS IN DOLLAR SECURITIES

MR ROBERT ADEANE'S SPEECH

The Seventy-Seventh Annual General Meeting of The Municipal Trust Company Limited was held on June 12th in London.

Mr Robert Adeane, the chairman, who presided, said:

Before commencing my remarks on the Report and Accounts, I want to refer first to the untimely death in February last of Mr R. T. Outen, who had been a Director of this Company since June, 1955. Mr Outen was an outstanding man, able and charming, and both the Company and the Board will miss him greatly.

The Gross Revenue of the Company for the year amounted to £138,590, compared with £130,190, an increase of £8,400. Expenses at £33,428 showed a slight decrease of £613 over last year. Earnings this year amounted to 19.1 per cent on £500,000 of Ordinary capital and we increased the dividend to 12 per cent as compared with the earnings of last year which amounted to 20.6 per cent on the smaller Ordinary capital of £415,000 on which a dividend of 10 per cent was paid for the fifth year in succession. After payment of this dividend, £21,917 has been added to the carry forward, which now amounts to a total of £141,651, equivalent to 49.27 per cent on the Ordinary capital.

Turning to the Balance Sheet our investments had a value at the year's end of £2,246,035, against a book value of £1,388,440, and the percentage invested in the USA and Canada was increased from 4.47 per cent to 7.92 per cent of the total funds invested. Since the close of the financial year we have invested further funds in dollar securities, and the percentage now is probably to the order of 10 per cent. The net assets value of the £1 Ordinary Stock Units at 60s. 3d., as against 60s. 6d. last year, shows little change. Since the issue of our Annual Report and Accounts for 1950 the Ordinary capital has been increased by £332,892 by issues of Rights to Ordinary Stockholders at par and now stands at £500,000. In the same period earnings on the Ordinary Stock have advanced from 12.6 per cent to 19.1 per cent.

As to prospects for the current year, I think that we should earn at least as much as we have done in the year under review, and I anticipate no difficulty in maintaining the increased rate of dividend as paid for the past year.

The report was unanimously adopted.

APPOINTMENTS

UNITED KINGDOM ATOMIC ENERGY AUTHORITY

RESEARCH AND DEVELOPMENT LABORATORIES
LABORATORY MANAGEMENT POSTS

The Research and Development Branch of the Industrial Group of the United Kingdom Atomic Energy Authority have vacancies for Laboratory Secretaries at their Laboratories at Capenhurst, Cheshire; Dounreay, Caithness; and Windscale, Cumberland.

DUTIES:

The Laboratory secretary will be responsible directly to the Head of Laboratories for the organisation, direction and co-ordination of the various services supporting the purely scientific and experimental effort of the Laboratories. His chief duties will relate to:

Research Programme Planning and Progressing,
Technical Editing, Library and Information Services,
Training of Scientific, Technological, Administrative and Industrial Staff,
Financial Control,
Personnel Matters,
Supplies and Contracts,
Provision of Office Services.

QUALIFICATIONS:

Candidates must have had wide experience on similar duties with a scientific/technical organisation. Sound judgment and proved organising ability are essential qualifications. The possession of an Arts or Science degree would be an advantage. Successful performance of the duties involved will depend largely on the extent to which the selected candidates command the confidence of the scientific and technical staff with whom they will be required to work closely.

SALARY: £1,650 to £1,875 p.a.

A contributory pension Scheme is in operation.

Authority houses for rent or purchase by successful married candidates may be available in due course, or, alternatively, substantial assistance may be given towards legal expenses incurred in private purchase. In addition, the candidate appointed to Dounreay may be given financial assistance towards removal expenses.

Send a postcard for application form, quoting reference 3527, to the Recruitment Officer, United Kingdom Atomic Energy Authority, Industrial Group Headquarters, Risley, Warrington, Lancashire.

Closing Date—July 1, 1957.

PROJECT ENGINEER

Bell Punch Company Ltd. have a further vacancy for a project engineer possessing considerable experience of digital computer circuit design, to lead a group engaged in the development of a special purpose electronic digital computer. Starting salary will range from £1,200 to £2,600 per annum, dependent upon the experience of the selected candidate. Prospects for quick advancement are good and will be related to the individual's success in the work on which he will be engaged.—Applications, giving full particulars, should be addressed to the Administration Manager, Bell Punch Co., Ltd., Uxbridge, Middlesex.

FEDERATION OF RHODESIA AND NYASALAND

VACANCY: ASSISTANT DIRECTOR OF CENSUS AND STATISTICS

CENTRAL AFRICAN STATISTICAL OFFICE:
MINISTRY OF FINANCE

Candidates must be at least 35, and hold a degree with First or Second-Class Honours (or equivalent qualification) in Statistics, or in Mathematics, Economics or other appropriate subject, with a course in Statistics. A sound knowledge of National Accounts and modern sampling methods is required.

Salary: £2,250 p.a.

Application forms and further details from Secretary (K), Rhodesia House, 429 Strand, London, W.C.2.

Closing date July 13th.

CHARLES W. HOBSON LIMITED require a Marketing Executive. The successful applicant will probably have a good-class Honours Degree at a leading University and three or four years' experience of the co-ordination of advertising, merchandising and sales policies of nationally promoted consumer goods.

There will be a need for a capacity to prepare and present reports in a lucid and concise manner in basic English together with an ability to make well-considered recommendations, both for internal agency needs and for clients.

Applications, which will be treated in the strictest confidence, should be addressed to: The Managing Director, Charles W. Hobson Ltd., 2 Chandos Street, Cavendish Square, London, W.1.

THE National Institute of Economic and Social Research has vacancies in senior and junior posts for economists and statisticians, to develop a regular survey of current economic trends and to undertake connected research.—Further particulars from the Secretary, National Institute of Economic and Social Research, 2 Dean Trench Street, London, S.W.1, to whom applications should be sent. Closing date July 12th.

THE QUEEN'S COLLEGE, OXFORD

The Governing Body proposes, if a suitable candidate presents himself, to elect a Fellow and Praelector in Politics, to teach for the Honour School of P.P.E. He should be prepared to take up his duties on October 1, 1957. Applications are particularly invited from candidates with interests in the analysis of political institutions and in political theory.

The initial stipend will vary with the age of the candidate selected. It is possible that some of the Fellow's tutorial work will be undertaken outside the College. His total initial emoluments will be not less than £600 per annum, together with a room or rooms and the right to dine in College free of charge. The appointment is pensionable under the F.S.S.U. The College has power to pay housing and children's allowances in appropriate cases.

Applications should reach the Provost, The Queen's College, not later than June 29th, accompanied by a statement of the candidate's career and qualifications and by the names of three referees.

AN IMAGINATIVE GRADUATE in Economics or Commerce is invited to join a small team of economists and research workers who are helping a large and expanding company in a new industry to build up its home and export sales. The research staff are working under excellent conditions in the west country, within very easy reach of London. They are engaged on a varied set of problems, ranging from market research to business forecasting, and including studies of the implications of the formation of a European Free Trade Area. The successful applicant can be assured of a free hand to undertake this work, and prospects in every sense of the word are excellent. Applicants should have a First or Second-Class Degree in Economics or Commerce, several years' experience in industry, and should not be appalled at the prospects of acquiring a working knowledge of German, if necessary.—Box 716.

INDIA

A SENIOR CIVIL ENGINEER/SUB-AGENT is required to take charge of a section (value £2,000,000) of large foundations and site works contract in India. Applicants should have experience as a sub-agent on a large contract, or as agent on a medium-size contract in this country, and should preferably be qualified. Tours of 21 years with paid leave. A substantial salary is offered for this post which will provide the successful candidate with a wide range of civil engineering experience, and the possibility of further work overseas.

Apply giving full details of qualifications and experience to The Cementation Co., Ltd.,
DURGAPUR PROJECT,
20, Albert Embankment,
London, S.E.11.

UNIVERSITY OF SOUTHAMPTON

Applications are invited for the post of Lecturer in Accountancy. Salary scale £900 x £50—£1,350 x £75—£1,650. Appointment may be made at any point on the scale appropriate to the candidate's qualifications and experience. Duties to commence on October 1, 1957.—Further particulars should be obtained from the Secretary and Registrar, to whom applications (7 copies) should be sent not later than June 29, 1957.

NORTHAMPTON COLLEGE OF ADVANCED TECHNOLOGY, LONDON

Applications are invited for the position of SENIOR LECTURER in LIBERAL STUDIES—a new appointment, permanent, pensionable, offering considerable scope for a man of energy and wide interests. The successful candidate will be required to give courses of lectures in appropriate subjects and will be responsible for organising liberal studies throughout the college.

Salary on Burnham London Technical Scale, £1,386 by £50 to £1,598 p.a.

Forms and further particulars from the Secretary at St. John Street, London, E.C.1.

J. S. TAIT, Ph.D., B.Sc.(Eng.), M.I.E.E.,
Principal.

NEW SOUTH WALES UNIVERSITY OF TECHNOLOGY

The University invites applications for appointment to the following academic vacancies in the Faculty of Commerce.

SENIOR LECTURER IN ECONOMIC STATISTICS

The successful applicant will take charge of the planning and teaching of Economic Statistic for students undertaking the B.Com. degree course and planning course for those specialising in Economic Statistics.

SENIOR LECTURERS/LECTURERS IN ECONOMICS

Preference will be given to applicants specialising in one of the following fields:

International Economics,
Mathematical Economics,
Economic Theory,
Public Finance.

The Theory of Growth and Economic Development.

Applicants must possess a degree with honours or equivalent qualifications and previous university lecturing experience will be an advantage.

Salary: Senior Lecturers, £A1,865 range £A2,215 per annum.

Lecturers, £A1,265 range £A1,815 per annum.

Commencing salary according to qualifications and experience.

Successful applicants will be eligible, subject to medical fitness, to contribute to the New South Wales State Superannuation Fund, and shipping fares to Sydney, of appointees and families will be paid.

Five copies of applications (including the names of two referees) should be lodged with the Agent General for New South Wales, 56 Strand, London, W.C.2, and a copy airmailed (in an envelope marked "University Appointment") to the Bursar, N.S.W. University of Technology, Box 1, Post Office, Kensington, New South Wales, Australia, before July 20, 1957. There are no special forms of application.

NEW SOUTH WALES UNIVERSITY OF TECHNOLOGY

LECTURER IN ELECTRICAL ENGINEERING, Newcastle University College.

Salary: £A1,265 range £A1,815 per annum. Commencing salary according to qualifications and experience.

Applicants must possess a degree in Electrical Engineering preferably with honours or equivalent qualifications and should have gained practical experience in the power field.

Successful applicant will be eligible, subject to medical fitness, to contribute to the New South Wales State Superannuation Fund, and shipping fares to Sydney of himself and family will be paid.

Five copies of applications (including the names of two referees) should be lodged with the Agent General for New South Wales, 56 Strand, London, W.C.2, and a copy airmailed (in an envelope marked "University Appointment") to the Bursar, N.S.W. University of Technology, Box 1, Post Office, Kensington, New South Wales, Australia, before July 5, 1957. There are no special forms of application.

DIRECTOR of large ethical pharmaceutical company requires a pharmacist as personal assistant for administrative and commercial development work. For a man with intelligence, drive, good judgment and the ability to get on with people, this position should quickly lead to a senior managerial post. Starting salary would be according to experience and would not be ungenerous. —Applications in detail, which will be treated in confidence, to Box 712.

MATHEMATICAL STATISTICIAN with a good degree required in the Department of Economics for research on a variety of practical problems. Commencing salary £600—£750 (according to qualifications), with superannuation benefits.—Apply in writing, giving full details of qualifications and experience, to the Secretary, International Wool Secretariat, Dorland House, 18-20 Regent Street, London, S.W.1, marking envelope "EC Confidential."

UNIVERSITY OF GLASGOW

LECTURESHIP IN POLITICAL ECONOMY

Applications are invited for a Lectureship in Political Economy, tenable from October 1, 1957. Salary scale: £900-£1,650. Initial salary according to experience and qualifications. F.S.S.U. and family allowance benefits.

Applications (six copies) should be lodged, not later than June 21, 1957, with the undersigned, from whom further particulars may be obtained.

ROBT. T. HUTCHISON,
Secretary of University Court.

UNIVERSITY COLLEGE OF WALES, ABERYSTWYTH

Applications are invited for the following posts in the Department of Economics and Political Science:

(a) Assistant Lecturer. Salary scale £700 x £50 to £850. A special interest in economic theory will be an advantage. Appointment will date from October 1, 1957.

(b) Two Research Assistants. Salary £700 per annum. The appointments are for one year in the first instance, with a possibility of renewal for two further years. Previous research experience, particularly in the fields of statistics and econometrics, an advantage. Appointments will date from September 1, 1957.

Three copies of application, together with the names of three referees, should be sent not later than June 30, 1957, to the undersigned, from whom further particulars may be obtained.

T. MAELGWYN DAVIES,
Registrar.

SENIOR ARMY OFFICER (retired), with exceptionally varied staff experience, just completed Industrial Appreciation Course sponsored by F.B.I., seeks post in industry or commerce.—Box 717.

CANADIAN PACIFIC RAILWAY COMPANY (Incorporated in Canada with Limited Liability).—Dividend Notice. Preference Stock. At a meeting of the Board of Directors held today a dividend of two per cent on the Preference Stock was declared in respect of the year 1957 payable on August 1, 1957, to stockholders of record at 3.30 p.m. on June 21, 1957.—By order of the Board, T. F. TURNER, Secretary. Montreal, June 10, 1957.

CANADIAN PACIFIC RAILWAY COMPANY (Incorporated in Canada with Limited Liability).—Dividend Notice. Ordinary Capital Stock. At a meeting of the Board of Directors held today, a dividend of seventy-five cents per share on the Ordinary Capital Stock was declared in respect of the year 1957 payable in Canadian funds on August 1, 1957, to shareholders of record at 3.30 p.m. on June 21, 1957.—By order of the Board, T. F. TURNER, Secretary. Montreal, June 10, 1957.

B.Sc.(ECON.) LONDON UNIVERSITY

UNIVERSITY CORRESPONDENCE COLLEGE provides postal tuition for the above degree (obtainable without residence), which is a valuable qualification for those seeking executive appointments in commerce or industry, government or municipal posts. The College, established 1887, is an Educational Trust. Highly qualified Tutors. Low fees. Prospectus of U.C.C. Courses for London Degrees and Diplomas, G.C.E. free from the Registrar, 60 Burlington House, Cambridge.

FEELING FOGBOUND? Stand at your window with a glass of Duff Gordon's El Cid Sherry. Watch the mist turn rosy.

SECRETARIAL TRAINING, especially for university graduates and older students. Six-month and intensive 14-week courses.—Write Organising Secretary, DAVIES'S, 2 Addison Road, W.14. PARK 8892.

COUNTRY INDUSTRIES. Demonstrations by blacksmiths, wheelwrights, brickmakers, boatbuilders, potters, agricultural engineers, saddlers, etc. In Holland Park (off Kensington High Street) from June 1st to 15th. Open 11 a.m. (2.30 p.m. Sundays) to 9 p.m.

WORK STUDY. Part-time (evening), 20 weeks' Diploma Course starts September 9th. Enrolments open now.—Details of this and five other Courses, including full-time (six weeks) and Correspondence, from School of Time and Motion Study, 29 Cork Street, W.1. REGent 0516.

QUEEN'S HOUSE DAY SCHOOL FOR GIRLS, 69 Fitzjohns Avenue, N.W.3 (Tel. HAM 1306), provides a unique individual education from 5-18 years. General course to university entrance standard. Ballet, drama, fencing, skating, tennis. Special care given to each child's needs. Well-qualified staff. Small classes. Trained caterer. Pleasantly situated near the Heath. A few vacancies exist for Autumn Term for suitable candidates.

EXPERT POSTAL TUITION

for Examinations—University Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus—and/or advice, mentioning examination or subjects in which interested, to the Secretary (G912).

Britannia rules the air

The mighty Bristol Britannia, Britain's latest and greatest contribution to civil aviation, is rightly called the Whispering Giant. It is bigger, faster, and quieter than any other turboprop airliner in the world. Already in service on BOAC's South African and Australian flights, the Britannia will soon be covering many more international air-routes. The demand for it is high. Even before the first scheduled flight, as many as 65 Britannias were on the order books of Bristol Aircraft.

At the busy Bristol factories streamlined production methods are speeding the Britannias into service. On the assembly lines hundreds of Atlas Copco pneumatic tools are helping to fulfil the many orders placed for the new airliner and other Bristol aircraft. They include Atlas Copco riveters, screwdrivers, hand drills, chipping hammers and grinders. Light, powerful, and efficient, Atlas Copco pneumatic tools are the natural choice of leading aircraft manufacturers all over the world.

Lifting iron ore by air

Compressed air is versatile. Atlas Copco provide the means for all its many applications. During the disastrous days of April 1940 three ships with valuable cargoes of iron ore were sunk in Narvik Harbour. This ore has now been blown to the surface and reclaimed by use of air from an Atlas Copco AR-compressor.

The Atlas Copco Group of companies is responsible for the manufacture of compressed air equipment and its distribution in 90 countries throughout the world. Group Headquarters: Atlas Copco AB, Stockholm 1.

Atlas Copco puts compressed air to work for the world

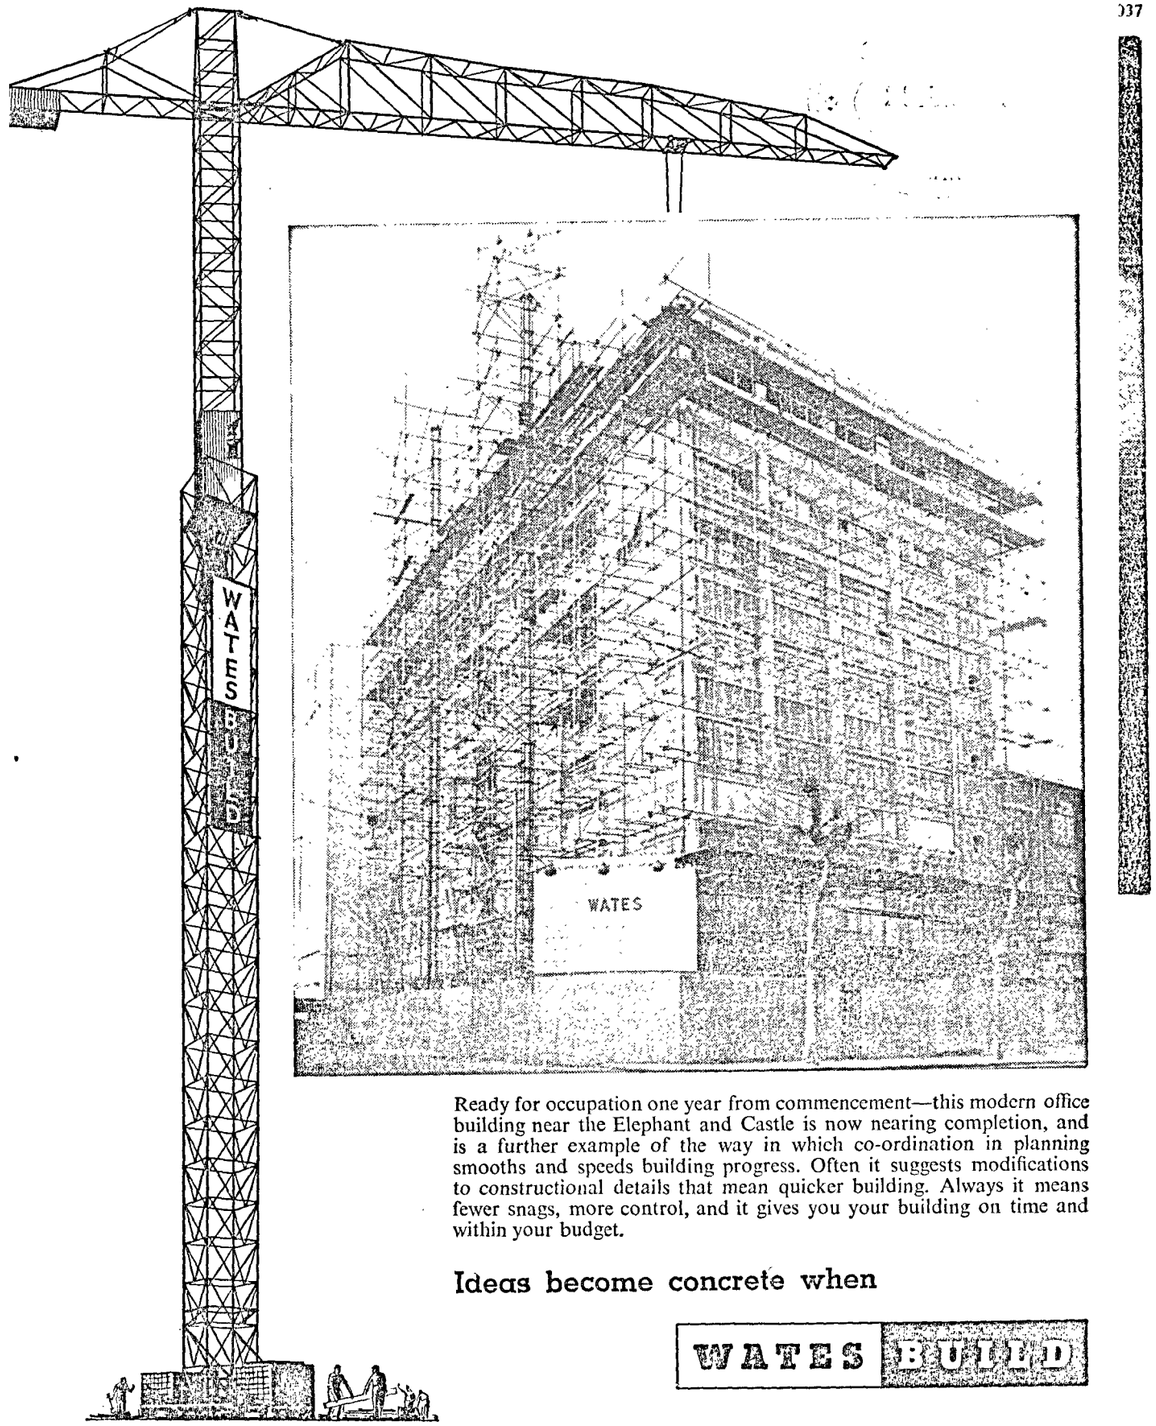
WEIR

PATENT CLOSED FEED SYSTEM

The Weir Closed Feed System is a practical and efficient method of providing pure de-aerated feed water for boilers, for both land and marine services.



Corrosive gases are removed by the Weir Regenerative De-Aerating Condenser, and as the condensate is under pressure in the system this prevents any re-entry of air or other gases to cause corrosion in the boilers, steam pipes and other surfaces.

For marine services, the Weir Closed Feed System protects the boiler against corrosion under all sea-going conditions and ensures that in port the boiler feed water is also fully de-aerated. The system is perfectly automatic at all powers, the various units responding automatically to changes of power without manual attention.

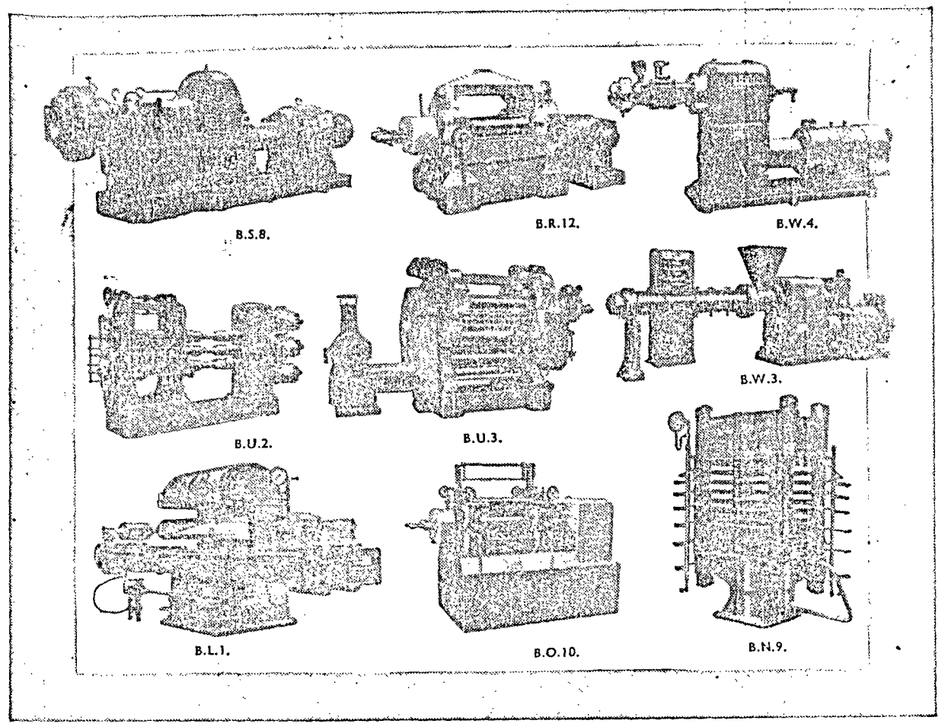
Ready for occupation one year from commencement—this modern office building near the Elephant and Castle is now nearing completion, and is a further example of the way in which co-ordination in planning smooths and speeds building progress. Often it suggests modifications to constructional details that mean quicker building. Always it means fewer snags, more control, and it gives you your building on time and within your budget.



Ideas become concrete when

The technique of steel furnace boosting with a jet of pure oxygen stabilizes quality and batch uniformity.

This principle, whether applied to Open Hearth, Blast or Bessemer, enables manufacturers to widen still further their range of specialised quality steels.

Growing demands of scientific and industrial progress require speedier delivery in the face of increasing competition. It is vital that manufacturers employ this latest technique which shows greater economy and is only made possible by employing the proven principle of the Butterley on-site Tonnage Generator.

This compact, efficient plant produces a continuous supply of Oxygen and/or Nitrogen at any desired purity and pressure, piped direct to the point of usage, in the exact quantity desired. Its efficiency eliminates production hold-ups by maintaining a constant supply, and maintenance costs are low.

The Butterley Company have acquired the sole production and sales rights of this, the most successful American Process, for the United Kingdom, British Commonwealth, and certain European countries.

If you can use oxygen, consult

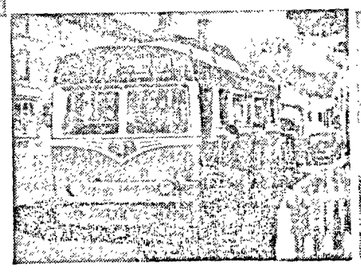
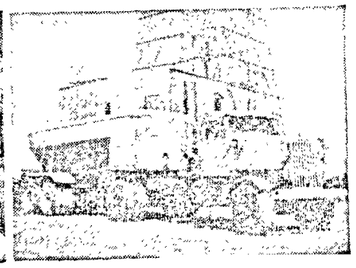
If road transport is essential to your business... *SO ARE WE!*





Today, trucks are just as much part and parcel of trade equipment as typewriters! Practically every firm employs them in some shape or form, scaling from small delivery vans to giant multi-wheelers.

The Leyland Group of commercial vehicle makers... incorporating the famous firms of Leyland, Albion and Scammell... is the only single organisation which makes almost every size of truck needed in industry. Their factories produce well over 100 types, ranging in capacity from 30 cwt. to 150 tons with every practicable size in between.

Within these wide limits, there is certain to be exactly the truck you want. It is equally certain that, like all vehicles made by these famous manufacturers, it will be supreme in performance and startlingly economical to run. AND IT WILL BE KEENLY COMPETITIVE IN PRICE!

(Top) The 30 cwt. Albion 'Cairn' is a wonderfully economical unit for short-distance work.
(Above) The most popular cruiser-weight truck in the world is the Leyland 7-8 ton 'Comet.'
(Adjoining right) The 'Tiger-Cub'—one of the range of Leyland buses which forms so great a proportion of public transport both at home and abroad.
(Outside right) This Scammell 4-wheel drive 'Mountaineer,' with a 25-ton drilling cement hopper, working in a Middle East oilfield.

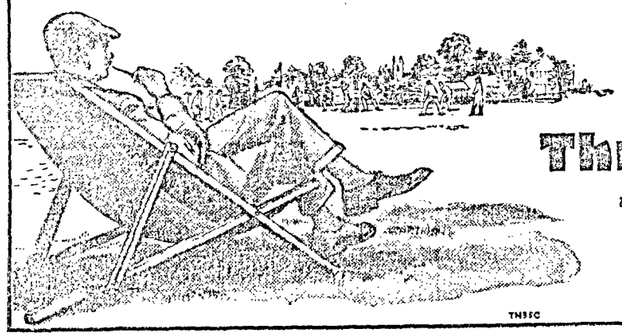
Pilot plant development is essential for the rapid, efficient and economical transition of research results from laboratory or bench scale to factory scale. But few firms have the facilities, the space or the trained personnel to undertake this work without dislocating normal production

Pilot plant development is one of the most important services offered to industry by Sondes Place Research Institute. Over 4,000 square feet of floor space are available in buildings supplied with steam, gas, water, compressed air, vacuum lines and electrical services. Removable roof sections and floor pits allow large units such as distillation columns and scrubbing towers to be accommodated

2 + 2 = 5



When chemists, chemical engineers and mechanical engineers work together (as they will for you at Sondes Place) their combined service to industrial research and development is greater than the sum of their isolated efforts... May we send you our booklet about our services?

PERIQUE—AND THE PIPE OF PEACE

Cricket—and Three Nuns

Settle yourself under the trees. Give a thought to the batsmen, fielders and umpires who are going to please you, or displease you, for the next few hours. And then light up your pipe of Three Nuns tobacco. Cricket may be full of glorious uncertainties—but Three Nuns is always a glorious certainty. The reason is Perique—that rare tobacco which once filled the American Indians' pipe of peace and is now so subtly blended in Three Nuns. Rich indeed is the pleasure of the Perique blend, as all Three Nuns smokers know.

Three Nuns
with the black heart of Perique

Encyclopaedia Britannica

announces

The 1957 Edition of the Authoritative Encyclopaedia of the English-speaking Peoples of the World

Over 5,600 authorities from 62 countries throughout the world have contributed to this great new 1957 Edition of the Encyclopaedia Britannica—the world's most modern, useful and practical encyclopaedia.
Since the last London Edition was published in 1955, over 4,400 articles involving nearly 7 million words have undergone major revision in the light of recent developments in all fields of knowledge.
Fifteen hundred world authorities formed the team who undertook this task of revision, necessitated to keep pace with a world changing at a pace never known before.

CONTINUOUS EDITORIAL REVISION

During the first 161 years of the Britannica's history 14 separate Editions were published. Many years were required to prepare all the articles published in those Editions, but for the modern world this leisurely editorial system was unsatisfactory. The present unique policy of continuous editorial revision was therefore introduced.

The 41,000 articles in Britannica are arranged in 34 major classifications—Art, Engineering, Geography, History, Industry for example. Whole classifications undergo complete revision in turn, thus ensuring that every article is reconsidered periodically in a scholarly way, but any article in any classification is subject to revision at any time. This system and this system alone enables Britannica to maintain a strong editorial staff in London and Chicago, capable of planning on a long and short term basis the most authoritative, readable, complete and up-to-date encyclopaedia published today.

A WHOLLY SATISFACTORY RESULT

Neither the writing and checking of the articles in continuous revision nor the mechanical processes that follow are hurried, because care is devoted at every stage to ensure at the end a wholly satisfactory result. Nevertheless, over twenty-six thousand articles involving more than 24 million words have been revised, and nearly four thousand new illustrations have been added, since 1950.

THE TEN-YEAR PROGRAMME

Unequalled in size, scope and scholarship, the 1957 Edition of Encyclopaedia Britannica contains 38 million words, 23,000 illustrations and over 600 maps in its 27,000 pages. There are 41 Nobel Prize winners among the 5,600 contributors. With more than 41,000 articles, Britannica is so well indexed that each reference takes the reader to the quarter of the page sought.

LIBRARY RESEARCH SERVICE

Under the Britannica Ten-Year Programme the 24 volumes of the encyclopaedia are supplemented by the Britannica Library Research Service and the Britannica Books of the Year. Membership of the Library Research Service is a privilege available only to those who own a set of Britannica and entitles them to ask up to fifty questions on matters of fact during the ten years. In reply reports are individually prepared from the best sources by university graduates.

KEEPING UP TO DATE

The Britannica Book of the Year is published each March. Men and women who from first hand knowledge are able to tell the story factually, accurately and with balanced judgment, view the year in retrospect. This volume contains approximately 700,000 words, 300 illustrations, 500 articles and scores of tables and charts. It is designed to keep subscribers up to date in encyclopaedic information and is available at a privilege price for ten years.

Arms Talks and Tests

WHEN it is said that the powers discussing disarmament a Lancaster House "are nearer to an agreement for the first step than we have been at any time in the last eleven years," the speaker (Mr Stassen, when he arrived back last week in London may very reasonably be listened to with sceptical reservations. In eleven years the talks have never appeared to be near agreement at all Still, simple persons might think that, if Mr Stassen was right in wha he said, then the allies of the United States would hear it cheerfully not with alarm and suspicion. In fact, precisely because of the newly hopeful American manner, disarmament has become the subject of much perplexity and polite dissension among the members of the Atlantic alliance.

This may be because we have all grown too accustomed to "living on the dead level of the cold war," as another American (Mr James Reston suggests: "The familiar, unsatisfactory as it is, has become preferable to fear of the unknown." Or perhaps it is that, living, as we all do, with the alternate hot and cold winds of irrational hope and obdurate pessimism, we have all failed to examine the possibility of a "first step" agreement on armaments coldly enough to see it for the limited, qualified humdrum, unimpressive thing that it is bound to be. For the state of world relations in 1957 does not justify any expectation of large magnanimous measures of disarmament. It may mean, simply, that seeking safety as we all do, we are suspicious of a trap.

Nato, its armaments and its infrastructure, and the stockpile of American nuclear striking power that lies stacked behind it, have not been built up for trifling reasons. The impelling motives of self preservation that caused them to be built up are still there to urge insistently, that they should be maintained. What, we may—indeed must—ask, has changed since 1949? One change has been recognised in the new British defence policy that seeks to offset the cost of the new weapons by savings in the numbers of men under arms—though admittedly, those reductions have so far been unilateral, without an disarmament agreements. Another change is that, the two super-powers having accumulated stocks of nuclear weapons, it has begun to be asked whether the further accumulation of their destructive devices will augment the security of either.

Britain has joined the race; if it goes on, how many other powers will join it? The two super-powers may be approaching the point at which they have a common interest (their interest still being, essentially their self-preservation) in calling a halt. If so, then they can safely defer to the pressure of general human opinion, alarmed by the uncharted dangers to the earth's atmosphere from unrestrained nuclear tests. But can they?

Obviously, neither of the changes in the climate of the armaments race would conceivably justify the western alliance in throwing away

or weakening in any essential, either its military strength or its strategic position. In conventional armaments the West is still very much the weaker side ; there is no case —whatever the validity of Mr Sandys's logic—for large demobilisations. In nuclear armaments the West is still almost certainly the stronger side. It needs to keep its preponderance ; and this requires swift improvement of the means of delivering nuclear explosives. The question is whether it also requires the indefinite accumulation of the explosives themselves in infinite quantities.

It may well be true that something could be done by way of limiting the quantitative scope of the armaments race without incurring grave new risks—if the Russians are sincere in desiring a limitation. Russian sincerity is in no sense proved by the suggestions of a change in the formal Soviet attitude to disarmament in the last few months. Yet the indications of such a change, whatever the motives or the implications, are striking enough to oblige the western governments to explore them further.

In particular, the Russians have ceased to oppose a blank negative to all serious suggestions of inspection and control. This was the great surprise about Mr Zorin's proposal to the United Nations sub-committee at Lancaster House when it resumed on June 14th. It was, on the face of it, a proposal in complete contrast to the "step into my parlour" Soviet plans of earlier days. Mr Zorin proposed that nuclear weapon tests should be stopped for two or three years, pending negotiations for their permanent prohibition ; that an international commission should observe and report to the Security Council ; and that control posts, technically equipped to detect infringements, should be set up in, among other places, the Soviet Union itself.

As an article on page 1063 indicates, the sudden apparent translation of Lancaster House from limbo to *terra firma* has caused apprehensions and dissension inside Washington as well as inside Nato. But it is also clear that President Eisenhower's set desire to see a first step in the limitation, if not the reduction, of armaments continues to govern American policy ; that Mr Stassen, who has been by no means disowned, still has proposals in his briefcase ; and that Washington is bound to test the worth of the latest Soviet initiative seriously. There are still very great difficulties, for these are life-and-death matters. American development of the longest-range missiles has entered the stage of tests. These may not involve nuclear explosions, but it has to be asked whether the Soviet wish is simply to hold up American missile development under cover of protecting mankind from strontium ?

Even if this is not the Soviet wish, the French government, the next prospective member of the nuclear club, may insist on preserving its right, as Mr Macmillan did for Britain, to hold tests when its first nuclear weapons become ready. And, inevitably, a demand for inspection in western Europe must come up against Dr Adenauer's objection to any international arrangements based on an acceptance of the *status quo* in Germany.

Mr Macmillan, speaking for a power that had begun its own first series of thermo-nuclear tests, but had not then completed them, covered some of this ground in his reply to the letter which Mr Bulganin sent him in April. As it happened, his reply was delivered in Moscow on the same day as Mr Zorin at Lancaster House made his proposal, which makes Mr Macmillan's earnest pressure for the advance registration of tests and "the presence of international observers on all such occasions," as immediate measures, look like small beer. Britain, having tested its thermo-nuclear bomb, will not be likely to stand out against an internationally agreed suspension of further tests. But the suspension of tests, as Mr Macmillan said, is not disarmament. His letter made clear the British view that sweeping reductions of armaments still lie at the end of a long road ; they would require political settlements as well, and "a diminution of the world tensions that obliged us to set up our defence system."

So they would. The western countries, however beguiling or sultry the weather, must never delude themselves with foolish hopes of defence burdens easily shed. The case for narrow agreements (for instance, to stop tests) lies most strongly in the hope that an agreement on something might conceivably set in motion the reduction of tension that could one day, on the purest basis of mutual self-interest, make disarmament possible. This appears to be Mr Eisenhower's hope, and it is the consideration that has enabled Mr Stassen, so far, to survive successfully the attacks from the defence planners in Washington. It is not a certainty, but it is certainly worth trying, if sensible pilot agreements can be found, if the new Russian attitude stands up to exploration, and if the progress offered requires the surrender of no real essentials of western self-defence.

Clearly the exploration involves disentangling the topic of disarmament, in certain strictly limited ways, from the differences of political substance that still divide, and will continue to divide, the Soviet Union and the West. If this disentanglement cannot be done, then every move at Lancaster House, every hint of a possibility of an approach to agreement between the Americans and the Russians, will inevitably throw the European allies of either side into alarm lest their vital interests are being sacrificed. Dr Adenauer's talks in Washington at the end of May performed one service by establishing—on American insistence, and against the inclination of the Bonn foreign office—that a "first stage" in disarmament could at any rate be contemplated in separation from the German question.

Mr Macmillan's letter was a temperate and reasonable document. Since it was, however, designed as an answer to a typical Muscovite mixed bag from Mr Bulganin, it is not surprising that it tended to treat the matters at issue between Moscow and the West—in Europe, particularly—as a mixed bag, entangled and inseparable : "All western proposals for European security are contingent on a reunified Germany with a freely elected all-German government free to choose its own foreign policy." Mr Macmillan was explaining that the Eden plan, which Mr Bulganin had exhumed, is not on offer just now ; well and good. It would be a pity if his letter were to be read as laying down an immutable priority. German unity, on western terms, is indeed a desirable end of policy. The western powers have promised not to make any agreement or set up any international system that recognises two German states or tends to perpetuate the division of Germany. They were right to make these promises. The division of Germany is against nature, and to build an international system upon it would be wrong—and perilous.

But it does not follow that there is nothing to discuss until the German question has been settled. Nor does it follow that the terms for a German settlement are immutable. One day, indeed, a government at Bonn will decide the terms for itself. The inter-zonal border in Germany is not a wall of Jericho that will fall with the blowing of a trumpet ; its demolition will come not at the beginning, but towards the end, and as the consummation and proof, of any real change in the relations between East and West.

Prime Ministers and the Pound

The Commonwealth countries have a common interest in the strength of sterling. They need co-ordination of policy to secure it

In their conference next week the Commonwealth Prime Ministers do not seem likely to talk very much about sterling. Diplomats will consider this to be understandable: at a meeting in which Mr Macmillan hopes to re-establish friendship with Mr Nehru, it will be inconvenient to say some of the things that ought to be said about money. But economists must regard it as a pity. For there are a number of matters affecting sterling—particularly in view of the disappointingly slow recovery of foreign confidence in the currency since the Suez crisis—that deserve to be threshed over now, and at a prime ministerial rather than a technical level.

Sir Winston Churchill used to require that when complicated matters were referred to the political summit, instead of to experts, they should be condensed, pray, on to a single sheet of paper. The best single sheet of paper to lay before the prime ministers might be some variant of the table on the next page, the first two columns of which reflect, in a deliberately simplified form, the two basic facts in the sterling area's recent experience. First, in each of the last six years except 1953 Britain's partners in the overseas sterling area have incurred an annual payments deficit, which has run steadily between a minimum of £93 million (1955), and a maximum of £197 million (1952).

Secondly, Britain—although achieving a surplus of £414 million in its external payments over the period as a whole—has consistently done better in each "even numbered year" than in the "odd year" that has followed. In each of the last three even years since devaluation it has run a surplus of a reasonably comfortable and remarkably stable size (£247 million in 1952, £228 million in 1954, and £233 million in 1956) ; in two of the three odd years it ran a deficit (£403 million in 1951, £77 million in 1955), although in 1953 it managed to maintain a slightly attenuated surplus of £188 million. This tidy but troublesome fluctuation seems to have been partly a symptom of a distinctive two year cycle in British industry's restocking, and recently also in British consumption of household durables.

From these two lessons of the table emerge the two problems of sterling that will deserve a place in the Commonwealth discussions next week. One is the fact that 1957 is another odd year, and each odd year since the war, except 1953, has seen a sterling crisis. The prime ministers should look at this cycle next week, not because it seems to be an immediate problem, but precisely because the welcome prospects are that it is not. Despite a renewed cyclical upsurge in durable consumption, and possibly a developing increase in restocking of raw materials, Britain seems reasonably set to maintain a surplus in external payments this year. Despite an unfavourable level of raw material prices, and the burden from Suez, the overseas sterling area's usual deficit may be smaller in 1957 than in 1956. If, therefore, there is a net addition to the gold reserves this year—and there ought to be—it will not be the usual addition while things are going well. It will be an unusual addition while most outside and cyclical things are going rather badly. Reasonable prospects could then be held out for a bigger addition to the reserves in 1958, and just the right springboard might be provided for a positive policy for the strengthening of sterling.

If that medium term opportunity is to be seized, however, something will have to be done about the other problem shown by the table: the underlying insufficiency, year in and year out, which seems, at first sight, to be mainly the fault of the overseas dominions. That, of course, is not really a fair picture. One of the continuing saps to sterling's strength is that foreigners

will be unwilling to hold it so long as it continually threatens to fall in value in terms of goods; since primary commodities have a world price, this fear of depreciating value really means depreciation in terms of manufactured goods—which means, in turn, that the foreign fundholders' fear is mainly of continuing cost inflation in Britain. But although Britain has here its share of the pillory to take, it is fair to point out that (even after the rise announced this week) retail prices in Britain are now only 2.1 per cent above their level of twelve months ago, which implies a rather smaller rate of depreciation than in almost any twelve month period since the war. The time is ripe to look at that other perennial scarecrow of the sterling scene—the long-continuing combined deficit of the overseas sterling area, or at any rate that part of it which is regularly financed from London.

It is traditional to explain this almost perennial drain by saying that countries at the overseas sterling area's stage of development should expect to run deficits, and countries at Britain's stage should expect to run surpluses; but this is a polite travesty of what has really been happening. The deficit of the overseas sterling area has not been due to a steady building up of the economies of the Commonwealth's younger sons; the deficit of the whole area has been due to different members, at different stages, going suddenly on a drunk. For the greater part of 1951 the main culprit in running a deficit far greater than the temporary trend in its stockbuilding or terms of trade justified was Britain; in 1951-52, and to some extent in 1955, it was Australia; and in 1956-57 it has been India.

THE LAST SEVEN YEARS
(£ million)

	Overseas sterling area's payments	Britain's payments	Total payments	Change in gold reserves and reserves at IMF
1951.....	−110	−403	−513	−344
1952.....	−197	+247	+ 50	−175
1953.....	+138	+188	+326	+296
1954.....	−102	+228	+126	+127
1955.....	− 93	− 79	−172	−229
1956.....	−162	+233	+ 71	−196
Total ..	−526	+414	−112	−521

Notes on Table:—Overseas Sterling Area's Payments are obtained by adding their current deficit with Britain to items 20 and 21 in the British balance of payments white paper; this gives the overseas sterling area credit for capital they have attracted from non-sterling countries in just the same way as if it were a current receipt (which will pain strict accountants but, in assessing the strain these countries have put on the area as a whole, seems to be fair).

The difference between the last two columns in the table depends on the extent to which non-sterling countries and institutions have been lending to the sterling area, or have been changing their willingness to hold sterling here. This varies with several factors but, broadly speaking and especially in the latter part of the period, when the reserves have made a much worse showing than the figure for "total payments" (e.g., in 1956), this can be read by the ordinary man as a sign of a flight from the pound.

The other members' reaction to these and other individual bouts of recklessness has been in the best tradition of family embarrassment. There has been no real attempt to agree that deficits must be held down to a level that can be financed by a reasonable drain on the common pool, plus any special funds that can be attracted from non-sterling bodies like the World Bank. There has been grudging toleration of swingeing import restrictions that are really against the traditions of the club. Only gradually has the country concerned returned to sobriety—just in time for the boat to be rocked by another member. Perhaps next time it will be one of the most sternly self-denying hitherto, like Malaya or Ghana.

It may be said that it is impolitic or impossible to do anything about this system; and admittedly, it is not sensible to suggest that there could be a complete return to the system whereby some sterling area countries used rigidly to agree that they would not draw down the balances they had accumulated here by more than a certain amount each year. But it is worth pausing to consider what the object of the sterling area is. What it really amounts to is an agreement that members will allow a freer flow of capital to each other in return for rather easier markets with each other, accompanied by an agreement for common banking of non-sterling exchange. It has recently been recognised that the right of access to easier markets can be too dearly bought; within the last year both the Anglo-Australian and the Anglo-New Zealand agreements have envisaged some whittling down of Commonwealth preferences on British goods, because Britain could not accept a suggested new obligation to buy Commonwealth agricultural products whether it wanted them or not. There are some other features of the sterling system that can be too dearly bought also.

Other economic associations of independent countries, for example in Europe, have central bodies that try to secure compliance with certain rules about managing individual balances of payments. They do much of their chivying in public—and, as France's retreat from European liberalisation this week shows, they do not always succeed. Within the recesses of the Treasury there are roughly analagous sterling area study groups; they work strictly in secret—and seem to the outsider to succeed almost never. Somewhere between the European system of more open chivying and the former sterling system of agreed maximum drafts on some individual balances, there should surely be means by which other members of the sterling club could bring some mild forms of pressure (perhaps particularly as concerns the controls they impose on capital movements) to bear on those of their colleagues whose policies are plainly likely to plunge them into excessive deficits. Nobody with a sense of realism will call for a precise annual "plan" for sterling area balances of payments, but there might be a case for publishing some chivying document like an annual and forward-looking Sterling Area Economic Survey. The Prime Ministers next week would not be the right body to make a snap decision about precisely what sort of mechanism is needed, but only an initiative at their level could free their technical experts to start thinking over the problem.

Engine Trouble in Italy

The breakdown of the four-party coalition in Rome brings out more clearly than ever Italy's need for a democratic party of the Left to provide a political alternative to Christian Democratic rule

The Italian political machine has developed serious engine trouble. If granted a clear, straight road, it may, with coaxing, stay the course until the next elections, now less than a year away. But if it is called upon to negotiate any corners that are at all tricky, it may break down—in which case the date of the general overhaul will have to be advanced to the coming autumn.

The present trouble began over six weeks ago, when Signor Segni resigned; the defection of his coalition partner, Signor Saragat, had deprived him of his majority in the Chamber. Signor Zoli, the president of the Christian Democrats, then tried to form a "monochrome" minority government, but, unable to disembarrass himself of the fatal attentions of the extreme Right, he, too, threw in his hand. President Gronchi thus found himself back where he started; after more thumbing through the possibilities, and a novel but largely abortive attempt to get the president of the Senate to carry out still further explorations, he has asked Signor Fanfani, the secretary-general of the Christian Democrats, to try his hand. At the time of writing, Signor Fanfani is cautiously investigating his chances.

Italian politicians are second to none in the occult skills of manœuvre behind the scenes; this makes analysis of what is going on at the Palazzo Montecitorio all the more difficult. On stage, parliamentary arithmetic gives the "democratic" politicians very little room for manœuvre. Both the extreme Left (the Communists, with 143 seats in the Chamber) and the extreme Right (the Monarchists and the neo-fascist MSI, with 69 seats between them) are, as it were, non-starters; since neither subscribes to the rules of the parliamentary game, neither can hope to have a place in the team. The Nenni Socialists (with 75 seats) have also forfeited their place since they either cannot, or will not, break clearly away from their association with the Communists. Only the centre parties are left from which to construct a stable government. Until 1953, the Christian Democrats, with over 300 seats (out of a total of 590) were able to form governments on their own. But for the last four years, with their numbers shrunk to 260-odd, they have had to rely on the support of the three small centre lay parties—the Social Democrats (with 19 seats), the Liberals (14), and the Republicans (5). The Republicans would not accept a seat in the Cabinet, although till a short time ago they could usually be relied upon to give the government their support.

Until a few months ago this four-party alliance (the *quadripartito*), considering the discordant elements within it, managed to get along reasonably well. Its critics accused it of *immobilismo*, but Italians always tend to hurl this charge at their governments. It is true that controversial measures have been seriously delayed or virtually shelved. The Constitutional Court, for instance, which is an important element in the postwar constitution, has only been functioning for just over a year; and the settlement of the land tenure problem proposed by Signor Segni seven years ago, when he was minister of agriculture, still remains perhaps the most explosive and controversial issue confronting the centre parties.

Yet under the *quadripartito* Italy's economic prospects (apart from a growing deficit in external trade) have steadily improved. Industrial production has risen persistently; and if comparatively few Italian roofs yet sprout television aerials, Italian roads swarm with motor-scooters. Even the South has begun to see the beginning of better things; under the *Cassa per il Mezzogiorno*, which was set up in 1950, a real start has been made with the creation of the conditions necessary to lift the people of southern Italy out of their ancient poverty and backwardness. In the international field, too, Italy has climbed back into a respectable niche; and its self-confidence finds expression in an increasingly vocal belief that it should make itself felt more forcefully in the councils of Nato and of Europe.

But in spite of the progress that the country as a whole has been making, the politicians of the centre have found life in a coalition increasingly hard to bear. Moreover, the frictions and compromises inevitable in a multi-party government have not lessened the internal discords that afflict all Italian parties; none is too small to deny itself the luxury of a split down the middle. And within the huge, amorphous Christian Democratic party one can find a reflection of every shade of the political spectrum which ranges from the right-wing Liberals (the staunch champions of the rights of landowners) to the socialist followers of Signor Saragat.

In a party that commands the allegiance both of reactionary southern landowners and of trade unionists from the big northern cities, the extra-political sentiment of religious conviction is the chief binding cement (although there are plenty of devout Roman Catholics in the other parties). And quite often

the cement comes unstuck. Any Christian Democratic premier is hobbled as much by the feuds and disagreements within his own party as by the demands of his small coalition partners. Exactly two years ago, Signor Scelba was forced to resign largely as a result of the dissensions within the party. His successor, Signor Segni, if he had decided to hang on last month and push through the land tenure bill, would probably have come to grief on the opposition of Christian trade unionists like Signor Pastore. Signor De Gasperi was big enough and strong enough to impose some political cohesion on his party. Since his death, there has been no outstanding leader ; the big shots of the party, like Signori Fanfani, Scelba and Pella, stalk each other remorselessly and do their best to shun thankless responsibilities.

Although there is a strong reforming left wing among the Christian Democrats, which has left its mark on the party's record, their connection with the Roman Catholic Church inevitably draws down on them the suspicions of progressive liberals with anti-clerical sympathies. With no concrete evidence to support their hunches, they persist in believing that the link with the Church and the influence of the uncompromising Catholic politicians will irresistibly draw the Christian Democratic party towards an authoritarian Salazar-type regime. The reconciliation between the clerical and lay parties, between the Guelphs and the Ghibellines—on which Signor De Gasperi laid such importance even when it was not necessary to his political position—has still to be accomplished.

MEANWHILE the lack of a strong, united, democratic socialist party deprives the Italian voter of a satisfactory third course between clericalism and communism. The vote-catching power of the Italian Communists since the war has been enhanced by their record of resistance to fascism and by their championship of Italy's postwar democratic constitution ; and, although they continue to lose ground steadily in trade union elections, it is by no means certain that the disillusion and defections brought about by the Hungarian revolution have seriously shaken their position in the country as a whole. Indeed, although in this week's Sardinian elections the Communists lost two seats, in the municipal elections last month they (and the Christian Democrats) made gains, while the Nenni Socialists and to a lesser extent the Saragat Socialists lost ground. In the local elections last year, the two Socialist parties both made gains at the expense of the Communists. Since then, socialist reunification has been much talked of ; and one may suspect that the voters' disgust at the failure to bring this appreciably nearer may be largely to blame for the Socialists' recent setback.

Sooner or later, the reunification of the two Socialist parties will probably be accomplished ; how soon, is anybody's guess. On grounds of ideology and policy there is little to prevent it, although there is a divergence between Signor Nenni's neutralism and Signor Saragat's support of Nato. The link between the Nenni Socialists and the Communists remains the chief stumbling block. Signor Nenni insists, categorically and repeatedly, that he has broken with the Communists ; but, as the Socialist congress in Venice last February showed, the financial advantages of the Communist connection, and the infiltration of Communist sympathisers into the local leadership of the party, make it difficult for him to carry his followers along with him. Indeed, the leaders of both socialist parties tend to be out of step with their rank and file on this issue. While Signor Nenni's followers are pulling him back by his coat-tails, Signor Saragat apparently found himself last month pushed so violently from behind towards the Nenni Socialists that he tried to steady himself within his own party by throwing off his compromising connection with Christian Democracy.

THE inability to find a democratic alternative to Christian Democratic rule handicaps Italian political life ; the virtual exclusion of the extreme Left and the extreme Right restricts it ; the persistence of the old clerical and lay antagonisms complicates it. So do the internal divisions within the parties and the agreements on specific policies that cut across party affiliations. There are some fears in Italy that the difficulty of producing a stable government out of this welter of complicating factors may discredit Italy's comparatively young and inexperienced parliamentary institutions, which may not yet be firmly set in their final form and which in any case have to contend with the largest communist party in Western Europe. It is unfortunate that the fate of governments should so often seem to depend more on the secret decisions of party executives than on a vote in parliament. But this danger should not be exaggerated ; Italian democracy has given plenty of evidence of its sturdiness.

President Gronchi has apparently taken upon himself to provide some compensation for the creaking of the parliamentary machinery. But it is unlikely that he will improve matters by reading more into his presidential functions than the authors of the constitution envisaged or than the general feeling in the country would be likely readily to accept. The complications of Italian politics will hardly be solved by turning the President into a controversial figure.

In the long run, the most healthy development would be the formation of a democratic party of the Left, which would include the present left wing of the Christian Democrats, together with both the Socialist parties ; thus it would be big enough and strong enough to form a real alternative to the Christian Democrats and to attract the votes of those who now vote Communist. This may appear a pipe-dream. But Italy has come a long way in the past ten years. There seems no good reason why its political institutions should not, in the years ahead, gradually evolve into a more accurate reflection of its political needs.

BRITAIN'S SCHOOLS—IV

Girls behind Glass

Our correspondent who wrote about different types of school on January 26th, March 9th and April 27th here describes one of London's new substitutes for the secondary modern school

THE new girls' county school is part of the London County Council's plan to blur the distinction between the grammar and technical schools, to which the brightest 25 per cent of children go, and the secondary modern schools which receive the rest. The building is the work of a very distinguished architect, and other members of the profession are forever coming to admire it. It consists of two tall blocks of glass and steel, connected by a single storey administrative building, against a background of trees, with lawns on three sides. It stands on a hill, and below it endless terraces of dim little brick houses stretch northwards towards central London. In the entrance hall the statue of a naked ballerina stands on points all day. But at night she is covered with a cloth, like a canary, to foil the local louts who used to come and peer at her through the glass doors.

She is not the only one who has found that living in one of these crystal palaces has its disadvantages. The classrooms, each with one wall of glass (and the others covered with the nicest new wall papers), are light but not airy ; the windows open only narrowly lest the county girls should hurl each other down from the fourth floor. In this week's weather, the south side of the building has been a furnace, and the venetian blinds exclude the glare but not the heat. But in a cold winter the rooms are not warm enough until the radiators are too hot to touch—you take your choice between chilblains and blisters. The glass, with its steel frame, is an excellent conductor of noise, and the other walls, too, are thin. "Opportunities for the girls are wide," said one teacher. "My class has the choice of five lessons: those in the rooms on either side, above and below, and the one I am giving myself." She was exaggerating; the ceilings are insulated.

There is a fine hall, complete with curtain and stage lighting. The architects call it multi-purpose, which means that at 12.15 p.m. every day all hell breaks out. At the end farthest from the stage the shutters are thrown up to reveal magnificent kitchens. The children swarm out of the six classrooms that lead off the hall, fling their books into lockers and swarm back into the classrooms with knives and forks and a plate of stew, which perfumes their lessons all afternoon.

Nor is lunch the only time when a thousand children are on the move. It happens every half hour. Secondary schoolchildren today do not sit all day at a particular desk awaiting the visit of successive teachers. The teachers have so much paraphernalia that it is they who stay put in specialist rooms and the pupils who rush about. Books and belongings are kept outside the classrooms in lockers, around whose feet satchels surge in a manner that the designer of this pin-neat decor cannot have foreseen.

BUT this was one of the earliest postwar secondary schools to be built in London and much has been learnt from experience. In any case, it contrasts so sharply with the grim gothic-windows-and-asphalt sort of secondary modern school that it seems absurd to class it in the same broad category. The parents certainly think it is rather special, and if the headmistress was not obliged by the London County Council to take a cross section of ability, it would become highly selective. The LCC's ultimate aim, in accordance with its Labour principles, is to organise all secondary education in London in "comprehensive schools" catering for all levels of ability ; but every one of the existing secondary schools will have to be used until 1960. Meanwhile, therefore, they offer courses of either four, five, six, or seven years. Some schools, already growing towards comprehensive status, offer courses of varying lengths, specialising in a variety of subjects.

The county school visited by your correspondent was one such school, but the glorious goal of comprehensiveness is reached by a different route than was at one time thought. Near the school is a well-established grammar school, "aided" by the LCC, but run by a voluntary body. In cases such as this it would be wasteful to build a comprehensive school ; so the LCC had thought to build a "county complement" (a secondary modern school) as near as possible to the grammar school. The idea was to mix the two schools in common playing fields and halls, and to allow for the easy movement of pupils from one to the other if they proved to be brighter or duller than was at first thought.

Alas, after the county school had been built, the grammar school turned up its nose. So the county school children cannot use the playing fields that are right outside their window, although these are empty most of the day ; and if any county school girl proved to be clever, pride demanded that she should go miles to a grammar school rather than risk being cold-shouldered round the corner. The county school—which, anyway, had as its nucleus a former "central school" with courses up to the age of sixteen—was then told to

develop its own grammar school stream. It now boasts a sixth form of thirteen and eight girls of over seventeen. This summer forty will take two or more subjects in the General Certificate of Education—*most of them in* English language and in technical subjects like cookery, needlework and shorthand-typing.

For technical subjects the school is magnificently equipped. The dressmaking room is full of trestle tables, sewing machines, and dummies festooned with ambitious creations. The domestic science room consists of a number of open kitchens, each with stove, sink and table; and in an elegantly furnished flat the girls do the cleaning, have a bath and serve a meal to friends. There are two commercial rooms, each with thirty brand-new typewriters. A pottery room has two wheels and a kiln. The academic subjects are well provided for, too. The laboratories are impressive; *the biology* room is alive with rabbits and hamsters and white mice. There is a cinema where your correspondent joined some *fourteen-year-olds for a film* about convection. Finally, there are two very large, well-equipped gymnasia.

★

CERTAIN doubts arose. First, is it all unnecessarily lavish? The average public school, with fees of £350 or £400 a year, has far less yet fills almost half the older universities. In particular, the county schools' laboratories were perhaps more elaborate than the ability of the children demands. At present these rooms see little, if anything, more advanced than pre-nursing courses and elementary general science, and it seems likely that parents of the cleverest girls will continue to prefer the old-established grammar school—unless they are dazzled by the look of the county school. On the other hand, it must be remembered that a school of a thousand pupils, though its size may bring some disadvantages, can provide expensive equipment cheaply, in terms of expenditure per head.

Secondly, is there too ready a flight in the new schools from academic subjects into pottery and cookery and dressmaking? *It is true that they* all do a general academic course for the first three years, and that what they learn afterwards is more useful than a lot of algebra or chemistry which they have little hope of understanding and none of retaining. *Your correspondent,* indeed, became rather starry-eyed at the thought of the skilled housewife of the next generation, even though the domestic science teacher was deflating. "Have no *illusions," she said*; "at home, if they wash out the cloth after drying up, Mum will shout 'None of your fancy school nonsense here.'" But the real point is that whereas practical skills can be picked up after school, the mind left untrained will remain so, and will be to that extent less able to master even the domestic arts, such as following a recipe.

A very special doubt must concern the flight into *typing. The aim is to* give point and purpose to the education of the non-academic child by linking it with vocational studies. But typing is no intellectual *discipline.* The fact that it bulks so large in the modern school curriculum seems a confession of defeat in using the extra year of compulsory schooling.

Finally, some doubt remains about the child of grammar school or nearly grammar school calibre. In theory, and certainly *in physical equipment,* she is catered for. She can follow an academic course and she does homework. But is the pace of work as fast as in a grammar school? Is the staff so "comprehensive-minded" that duty to the majority is all and a special effort with the bright ones thought rather unfair? The answer to outcry about the eleven plus is to make the alternative to grammar schools so good *that there can* be no sense of grievance. This county school has gone far in that direction. But the familiar view about its being better to be a happy craftsman than a struggling *professional worker* can be carried too far, and Britain's new schools must guard against using this argument to justify the malnutrition of minds.

The Economist

JUNE 20, 1857

ENGLISH CLASS CONSCIOUSNESS

"Society is tending more and more to spread into classes—and not merely classes, but localised classes, class-colonies. . . . It is not simply that lawyers dwell with lawyers in the Temple, publishers with publishers in the "Row," bankers with bankers in Lombard street, merchants with merchants in Mark lane, carriage-makers with carriage-makers in Long Acre, and weavers with weavers in Spitalfields. That is mere matter of professional convenience. . . . But there is a much deeper social principle involved in the present increasing tendency to class-colonies. It is the disposition to associate with equals—in some measure with those who have similar practical interests, in still greater measure with those who have similar tastes and culture, most of all with those with whom we judge ourselves on a moral equality, whatever our real standard may be. If we secretly regard wealth as the measure of importance, we are awkward in different ways with those either richer or poorer than ourselves; and with other, and in England, we fear, rarer "standards of value," there are other and proportionally rarer laws of social amalgamation and repulsion. *There is no doubt* that this tendency is on the increase, and to some extent that it is a good sign. . . . Education is beginning to give a large common basis to the intellectual life of all classes, and yet in spite of this, perhaps in consequence of this, they become more sensitive to the special distinctions which separate them in practice. The truth is, that the sense of social inequality cannot be completely felt without that amount of common culture which is needful to give a keen feeling of where the difference begins. . . . It is not the widening of any real social chasms, but rather the nearer approach which by rendering a passage between the two, formerly utterly impracticable, now at least conceivable, leads to the greater and greater spread of class-colonies. Those who would have been content to live together with an invisible but an impassable social gulf between to put them at their ease, withdraw voluntarily into different masses when a bridge of passage seems any way feasible. . . . The middle classes draw off for social purposes from the higher—the lower from the middle, not from any widening breach, but from a keener enjoyment of the sense of independence, and a keener dislike for the appearance of condescension; both of which are symptoms of really diminishing inequalities.

NOTES OF THE WEEK

HUNGARY

United Nations Inquest

NO doubt the people of Hungary, who are being treated daily by their rulers to a sickening farrago of nonsense about their October revolution, will get wind of the report just published by the United Nations committee appointed by the General Assembly to investigate the armed Soviet intervention in Hungary. This lengthy report is based on a thorough sifting, in New York, Geneva, Rome, Vienna and London, of all the available documentary and other evidence. The committee heard and cross-examined—evidently closely and exhaustively—111 witnesses who between them represented a complete cross-section of all who took part, either actively or passively, in the revolution. Its conclusions, presented in a dry, bland, precise style that is far more effective than any amount of emotion, are a devastating rebuttal of the Communist version of what took place in Hungary last October and November.

The Russians and Mr Kadar refused to cooperate with the committee, but *still they cannot* complain that their case has been allowed to go by default. Such as it is, it is conscientiously presented; and the committee does not believe that its main conclusions would have been modified by anything the Communists might have said. But it found *that their version conflicted* "at many points, and points of fundamental importance, with what the Committee believes to be the truth." The revolution was "a spontaneous national uprising" provoked by hatred of Russian domination and other long-standing grievances. The committee found no indication at all that it was planned in advance, but it did find evidence that the Russians were planning *armed intervention in* Hungary as early as October 20th (the revolution began on the 23rd); and that, in spite of the assurances given by the Russians to Mr Nagy after the first withdrawal, "there existed a definite plan for the reconquest and subjugation of Hungary." No evidence at all was found of any plot to restore the Horthy regime; nor was there any indication at all that any political personality connected *with* the prewar regime "exerted the slightest influence on events." As the committee remarks:

> The only counter-revolution which did take place was that effected by the Soviet authorities when, by the use of overwhelming armed force, they replaced a socialist but democratic regime in formation in Hungary by a police-State.

The committee makes no recommendations; it merely presents the facts. Its work cannot undo what has been done, nor can it prevent the same sort of thing from happening again. But the report, issued with the authority of the United Nations by a committee that included representatives from Ceylon and Tunisia as well as from Australia, Denmark and Uruguay, is certain of wide publicity in the neutral countries of Asia and Africa as well as in the West. The Russians will put a bold face on it; but few will be *impressed.*

CHINA

The Mao Doctrine

MAO-TSE-TUNG'S secret speech made in February was fast acquiring the reputation of a political bombshell, similar to Mr Khrushchev's famous indictment of Stalin. The official version, revised by the author, which has finally been published in Peking, leaves a first impression of anti-climax. It contains no striking disclosures, no wholesale condemnation of former policies. On closer scrutiny, however, it reveals itself as one of the milestones on the road that world communism has taken since Stalin's death.

The key to Mr Mao's argument lies in his distinction between the conflict with the "enemy" and *the conflict* "among the people." Contradictions, he holds, can exist even in a socialist society, and even between the people's government and the governed. But coercion should be reserved for the real enemies of the regime. Others must be persuaded; and they should be allowed to express their opinions instead of being bullied into line. Even last year's strikes and disturbances among China's workers, students and peasants are no longer attributed to foreign agents, but chiefly to "bureaucratic mistakes." This is an interpretation that closely resembles the Polish version of the Poznan riots.

One need not be a cynic to argue that the dividing line between the "people" and the "enemies" is elastic; any dissenter need only be branded as a counter-revolutionary to justify giving him the rough treatment. The speech does, however, contain other indications that the Chinese leaders now genuinely desire to avoid domestic conflicts, because "once the struggle starts it is liable to get out of hand." They seem even *inclined to relieve economic pressures for* this purpose. Mao Tse-tung gave several hints of a slow-down in industrialisation and in social change: it would not matter greatly whether collective farms are "consolidated" in five or in ten years time; forced saving for investment should not be "overdone"; higher priority might be given to agriculture and light industry. Like Mr Gomulka, Mr Mao apparently thinks that time is a price worth paying to avoid bloodshed.

Is it merely a pause? The Chinese communists, having nationalised industry and collectivised agriculture, may well need a temporary breather. But the change seems to be more than one of immediate tactics. References to Hungary are frequent in the Mao doctrine. Indeed, one may see Mr Khrushchev's secret speech of February, 1956, Poland's radical reforms, the Hungarian insurrection, and China's new line as a connected chain of events, still unfolding. In this chain the Mao doctrine is not the last link. Already its echoes in the communist world are louder than was probably intended. In China itself, *much as in eastern* Europe a year ago, the surge of criticism and complaint, unleashed by Mr Mao's speech, is now being sharply checked; reconciliation, like conflict, must not get out of hand.

PRIME MINISTERSHIP

Lord Attlee's Precepts

ONE of the most delightful political features of the last three months has been the resurrection, to something more than normal form, of Lord Attlee. His remarks to the Oxford University Law Society last Friday, on the subject of how to be a Prime Minister, must not be lost to history.

In Cabinet, he says that he soon learned that the "important thing is to stop people from talking." This required some delicate management, as well as constant and tart pointing out "that rhetoric is wasted on a Cabinet of hard-boiled politicians." After several experiments with Parkinson's second law, Lord Attlee came to the conclusion that the right number of members for an unloquacious Cabinet was 16. To get this body to work (and "we never took a vote in Cabinet that I can remember"), Lord Attlee believes that the committee system, developed during the war and since, can take a great deal of work off the Cabinet in "getting through the early stages of reaching a decision." But, once in Cabinet, the "most important of all the Prime Minister's functions is to give a firm lead . . . so that decisions can be taken quickly. The Prime Minister mustn't always listen to those who talk most." The extraordinary thing is that all the information that has become available since 1951 serves to confirm that it was by Lord Attlee practising then what he preaches now that the Labour Government largely functioned. It was thus that, eventually against the loquacious opposition of even Sir Stafford Cripps, this most underestimatedly domineering of British Prime Ministers nationalised steel.

With his remarks about his choice of Cabinet colleagues, Lord Attlee has caused many ears to prick up, and perhaps others to redden. "If there are two people who must be included but who obviously would not work happily together, it is not a bad idea to put one in a home ministry and the other in an overseas department" (which confirms why Mr Bevin was put in the Foreign Office, well out of Mr Morrison's hair, in 1945). Lord Attlee also believes that "often the experts make the worst possible ministers in their own fields . . . I never put a man in the job he thought he knew" (which could be read as confirming under whose direct patronage it was not that the expert Mr Gaitskell made his decisive personal advance to become Chancellor of the Exchequer). But although in installing ministers Lord Attlee may sometimes have compromised, he declares that in sacking plain incompetents a Prime Minister must always be quite ruthless (which he was).

As for the burden of office, Lord Attlee believes that the Prime Minister himself is not overworked and that the Cabinet can be relieved by "wisely constituted committees"—the machinery for which should constantly be kept up to date. "If you are wise, you will use the ministers who are not overburdened with administration as co-ordinating ministers between other departments—but not as super-ministers." Here, perhaps, one can venture a criticism. Could there not be as much danger in too powerless busybodies as in too powerful overlords? One other and minor query concerns Lord Attlee's view that his Parliamentary Private Secretary, rather than the Chief Whip, should be the Prime Minister's "political ears" with the "ordinary backbencher." There is something to be said for what [illegible] conservative system of keeping the Prime Minister's PPS as a mixture between social secretary and efficient personal dogsbody, rather than the Labour system of making him the leader's principal political nark.

TRADE UNIONS

Psychic Bid

THE decision of the executive of the Confederation of Shipbuilding and Engineering Unions to demand a reduction in the working week from 44 to 40 hours, as well as £2 a day holiday money (instead of basic rates as now) looks like a cynical and absurdly prompt evasion of its agreement to present no wage claim for twelve months. And so, to some extent, it is. Nevertheless it is true as the confederation's president, Mr Harry Brotherton, said that

> the claim for a shorter working week would have come inevitably because of the international movement in that direction.

The engineering and shipbuilding unions, indeed, are by no means the only ones who make this claim. All unions have their eyes on the United States, where the usual working week is 40 hours, and where some workers talk of demanding 34. This week the annual conference of building workers was told by its president that the claim is soon to be put forward on its behalf, and the annual conference of the National Union of General and Municipal Workers resolved to demand a 40-hour week for all workers in the public services and industry and to ask the TUC to take the necessary action. A 40-hour week, indeed, became official TUC policy at last year's congress.

At present the addition to the wages bill would be enormous. The average hours worked in manufacturing industry, according to the latest figures (for the six months ending October 1956), were 48.2. In engineering they were 49, in shipbuilding generally 50, and for Mr Ted Hill's boilermakers 51. Ten or eleven hours a week at time and a half would be fine. It can, therefore, be assumed that next winter, when a wage claim would normally have been under negotiation, the confederation leaders will be pressing with real earnestness for a shorter week, in the hope of showing those of their members who object to the standstill what keen Oliver Twists they are; and it seems equally certain that the employers will say No. But this does not necessarily mean that there will be a renewal of hostilities. A 40-hour week (or more hours at overtime rates) has not yet become a striking matter.

FRANCE

In Protectionist Armour

FRANCE'S European knights are going into battle in protectionist armour. The crucial debate on the ratification of the Euratom and common market treaties, sponsored by the government, is scheduled for the beginning of July. But this week the government was compelled to go back on its commitments to the OEEC by suspending all measures of trade liberalisation and reimposing quotas. The step, though drastic, was hardly surprising. For the last eighteen months French trade has been showing a deficit of over £35 million a month; recently the figure was getting nearer the £55 million mark. Foreign exchange reserves have been depleted, and next week the government will have to ask the Bank of France for a transfer of

£100 million from its gold stocks. The astonishing thing is that so little had been done so far to stop the drain. Measures taken recently to restrict imports proved insufficient to stop speculative buying, and it is hoped to achieve this aim now by the quota system.

The avowed purpose of the new restrictions is to cut French imports from the present level of about £150 million a month to somewhere around £110 million, that is, to their level of eighteen months ago. It will not be an easy task. Once before, in 1952, France went back on all its liberalisation measures under OEEC. Since then, however, quantitative restrictions have been progressively lifted on goods amounting to 82 per cent of the 1948 volume of private imports, or about half the present purchases from OEEC countries. French ability to reverse this trend and cut imports will be limited by the existence of long-term governmental agreements, the need for raw materials and, last but not least, the fear of retaliation. The axe will probably fall most heavily on semi-luxury goods.

M. Gaillard, the new minister of finance, presented the new measures as regrettable but merely provisional. He expressed his faith in freer trade and promised that the government will take advantage of the respite to get the economy fit to face its European partners. But will it? Throughout the postwar period France has been burdened with external conflicts and propped up by American aid. Now American aid has dwindled but the Algerian war is more costly than ever. Some people argue that peace in Algeria and an American loan—the two are intimately connected—are indispensable preliminary moves before France can set out on the road to financial recovery; others add devaluation as another precondition. In any case, solvency in foreign exchange is dependent on the general health of the economy. The new government will have to be judged on its proposals designed to restrain home consumption and stimulate exports. The programme will have to be both ambitious and realistic. Otherwise, the opponents of the Common Market will find it easy to clamour that France is being launched into European competition burdened with Algeria and with an over-valued franc.

The Gaullist Barometer

THE amount of attention that Frenchmen pay to the views of General de Gaulle is a good barometer of French political tensions. His postwar Rally was strongest when many Frenchmen saw it as the only barrier to a Communist victory. When inflation slowed down, social conflicts diminished, and the Republic refused to disintegrate, General de Gaulle withdrew with his disillusionment to the writing-table at Colombey-les-deux-Eglises. The limelight fell on him again briefly in 1954, when France was deeply divided by the battle over German rearmament. In recent months his name has been cropping up again in public discussion: the apparent hopelessness of the Algerian situation has brought the search for a saviour back into fashion. Every group naturally tends to attribute to General de Gaulle views which are close to its own. A Tunisian paper even argued recently that de Gaulle favours a federal solution for North Africa, resembling M. Bourguiba's own schemes.

Only the General keeps silent. His stock tends to rise in Paris as the view gains ground that the Algerian situation has become so entangled that only a man of the highest reputation could cut his way through to a solution. It used to be said that only a Socialist-backed government could carry out a policy of repression in Algeria without being accused of colonialism, and only a conservative one would be able to promise independence to Algeria without being branded as unpatriotic. The evidence that a growing number of French conservatives no longer consider the Algerian war as a paying proposition is reinforced by M. Raymond Aron's striking book published this week. M. Aron dares to attack the myth that it is Algeria that makes France great, that France without Algeria would be nothing. He argues that a constructive French policy must now include the promise of independence to Algeria.

Few non-Communist politicians would be prepared as yet to blurt this out, even if they share M. Aron's views in private. This is where General de Gaulle comes in: for a great number of people, only a man of his stature can now make acceptable proposals to Algerians and carry French opinion along. But would he, at 66, be willing to come out of retirement? If he did, would he promise independence to Algeria? Would the French parliament be willing to accept drastic changes in the regime, which the General would be bound to make a condition of his return? All this seems doubtful; yet the renewal of interest in Gaullism shows how great are the unresolved tensions in France.

CANADA

Preoccupied Premier

WHEN the full results of the Canadian elections came in, it emerged that the humbled Liberals had still secured more votes than the Conservatives. They obtained over 2.5 million votes out of a total poll of over six million; the Conservatives got 2.38 million, the smaller parties and the independents about 1.3 million. But Canada's Liberals share with the British Labour party the disadvantage of many votes being wasted in safe constituencies. Huge majorities piled up in Quebec scarcely console them for being beaten by a short head in many places in the Maritime provinces, Ontario and the west. The belated arrival of the armed services vote gave them one more seat, but they were still left with only 104 to the Conservatives' 110. So Mr St Laurent has bowed himself out of office, and Mr Diefenbaker is bound for London as prime minister.

Our Ottawa correspondent points out on page 1071 that Mr Diefenbaker could have wished for no more apt symbol of his inclinations than a Commonwealth gathering immediately after taking office. But during his stay in London part of his mind will inevitably be preoccupied with home thoughts. To keep his minority government in power he will have to devise a programme that will appeal to the smaller parties and, if possible, to dissident Liberals too. This will not be easy; the interests of the Ontario business man, the socialist-minded CCF, and the wheat-glutted prairie farmer are far from identical. A prolonged period of attempts to please first one group and then another would do neither Mr Diefenbaker nor Canada any good. The new premier's obvious strategy would thus seem to be to make friendly gestures in almost every direction, but not to commit himself to definite projects which might alienate potential allies; and to call for fresh elections as soon as possible, while the dismayed Liberals are still on the run, in hope of obtaining a clear majority and a free hand for his party.

LOCAL GOVERNMENT REFORM

Rates and Responsibility

WITH white papers suggesting reforms of local government areas and functions already published, and with the broad outlines already revealed of his coming white paper on suggested reforms in local government finance, Mr Henry Brooke is having no time to rest after his exertions over the Rent Act. He announced this week that he expects a parliamentary debate on local government before the end of July, and that he hopes to have his major Local Government Bill ready by the autumn. Meanwhile, he is discussing his batch of white papers with the local authority associations, and he is finding that some of them have loud objections. About his proposals for reform of local finance, in particular, two complaints are common.

One of them reflects the fear that education may suffer from the new arrangements, which will entail rolling up the large education grant, together with most of the other specific and smaller grants, into a large block grant that local councils will be free to spend as they choose. If the critics' complaint is that these arrangements will induce all local authorities to weigh the value of each penny more carefully, then the answer must be that this is wholly right and exactly what the Government intends. If it is that, although the "better" local authorities may experiment more freely, the worse ones may sink into greater lethargy—this is a charge that could be levied against any scheme for greater local freedom and economy. There is no specific penalisation of the education service in all this. Indeed, since local authorities will still have to comply with stricter national standards for education than for most services, there may actually be a tendency for them to allocate to this service a relatively higher proportion of total government aid. There may be more reasonable grounds for fears about the future of technical education, which at present attracts a specially high rate of grant and the national importance of which is acknowledged. The solution here might perhaps be to offer special inducements to local authorities that show themselves progressive and that set an example to other councils. In this, as in many other services, competition between local government authorities badly needs restimulating.

The second common complaint about Mr Brooke's financial proposals is that they may cause an increase in the rates—not so much immediately as in the long run when a new pattern of finance has become effective. But surely—though Ministers seemingly dare not say so—this is precisely what ought to happen. If local councils are to be given freedom (within limits) to decide whether and which services to develop, they should also take responsibility for meeting a rising proportion of their increased expenditure. This will not make local councillors more popular. But the incidence of rates is still a good deal less than before the war, and the incidence of national taxation much higher. If the shifting of more responsibility to the ratepayer makes possible a more than proportionate saving in national taxation, and if it also enables local expenditure to be laid out to better effect, then it will be amply justified. Those treasurers and councillors who resist Mr Brooke's policies should remember their heritage—and their position. A local government too shy of responsibility is not worth having.

STATIONERY OFFICE

Non Possumus

IT is possible to feel some sympathy both with the Select Committee on Estimates, which last January put forward all sorts of proposals for improving the efficiency of the Stationery Office, and with the Stationery Office itself, which has now tartly rejected them. The select committee, of course, was as horrified as most newcomers are when it learned of the restrictive practices that the Stationery Office, like other publishing houses, has to confront both as a purchaser of paper and as an employer of printing labour. It recommended that the Stationery Office should buy paper, by competitive tender, at rates appropriate to the size and predictability of its orders instead of tolerating manufacturers' common prices; the office should also "put its views before the unions" with the aim of securing an adequate intake of apprentices in place of the present trickle. This last aim, said the committee—hopefully believing that logic works in these matters—should not meet with the usual opposition from the unions because the security of established status offered by the Stationery Office provides special safeguards against redundancy. To these recommendations the Stationery Office has replied that it is already free to purchase paper, at home or abroad, as cheaply as possible; and that it could take a direct path in negotiations on recruitment only by joining the British Federation of Master Printers, which would be contrary to the policy rules controlling government departments in such matters.

This looks at first sight rather pusillanimous, and so to some extent it is. Of course, the Stationery Office should determinedly search for, and take advantage of, any special bargaining positions offered by its size, and without joining any association of employers either. But, except in this advantage of sheer size, a government department is not, in fact, a particularly well-qualified organisation to carry out a private trust-busting campaign; and after so many years of full employment it is about time to discard, with whatever regrets, the hopeful notion that the "extra" security enjoyed by workers for public bodies (whether the Stationery Office, the railways, or any others) will be accepted by the trade unions concerned as a reason for special concessions. It is all to the good that attention should be repeatedly drawn to the losses, inconvenience, and general nonsense resulting from restrictive practices; but it is from the Restrictive Practices Court, the Monopolies Commission, and whatever general machinery the Minister of Labour can set up that action is required. It cannot come primarily from those victims whose official standing happens to bring them within the purview of the Select Committee on Estimates.

EGYPT

A Submarine Menace?

WHETHER or not Egypt is to get the three Soviet submarines that have arrived in Egyptian waters, or any of them, a new uncertainty is created in Israeli-Egyptian relations, which have been relatively quiet since the Sinai campaign was wound up. The only likely Egyptian use for submarines is to reinforce the blockade of Israeli shipping and, in an extreme case, to close the Gulf of Aqaba to it.

It is doubtful whether the Egyptians will in fact use them to close the gulf. The maritime powers would look unkindly on submarine operations there, whatever rights of belligerency and blockade Egypt might claim; and if the Israeli Navy disposed of the submarines by depth charges—which should not be too difficult against so small a force—Egyptian protests would carry little weight. Russia, of course, can chalk up another propaganda gain at a time when its influence seems slightly on the wane in the Middle East; it remains to be shown that the submarines can serve any more substantial Soviet purpose.

IRAQ

Caretakers

THE French have a word for a man in the mind's eye for cabinet rank; he is *ministrable*. And few people in Baghdad, if asked three weeks ago for a list of the *ministrables* who might succeed Nuri Pasha, would have included in it Ali Jawdat, the elderly former ambassador in Washington who has this week taken on the premiership. It seems that he was not even on Nuri Pasha's own list.

Admittedly, it is now torridly hot in Baghdad and few people have a mind for politics in the quarter between June and October. Nuri's foreign policy, at a zenith at the moment of his retirement, and based on western aid, the Baghdad Pact and no truck with dependents of the Soviet Union, is likely to tick over throughout the silly season; the new prime minister has kept the foreign affairs portfolio for himself. But the same complacency ought not to be applied to home affairs. The supplement that is published with this number of *The Economist* suggests that these demand fresh thought, that development is passing from the stage of a technical to that of a social operation, and that even a summer doldrums in the hands of a man bred to be cautious could be a waste of precious time. The ministerial changes are of personality rather than of policy; a new martinet goes to the Interior; another experienced financier takes Finance; the ministry of Development, and—this time—that of Social Affairs are placed in the hands of young, forward-looking men.

In a week when Jordan's ruler has suspended parliament, and Egypt's has rejected, without right of appeal, about 1,210 out of 2,508 candidates for the coming elections, the change in Iraq looks almost democratic. What makes it undemocratic, however, is that it has no real support from the *demos* or people.

PAKISTAN

More Triumphs Needed

AMONG the new faces at the Commonwealth Conference, Mr Suhrawardy merits as much attention as Mr Diefenbaker or Dr Nkrumah. The prime minister of Pakistan comes to London fresh from two triumphs. The Karachi meeting of the Baghdad Pact council sealed his victory over those who, during the Suez crisis, demanded a break with the pact and with Britain. Then, in Dacca last week, the council of his own Bengal-based Awami League party gave him a thumping majority against his now bitter rival, Maulana Bhashani.

The prime minister's remarkable agility and vigour have been taxed to the utmost during his nine months in office. A former critic of the Baghdad alliance, he upheld it through the Suez storm, transmuting a surge of Islamic sympathy for Egypt into a general mood of irritation at President Nasser's behaviour. The Security Council vote on Kashmir in February strengthened his domestic position. So did his visit to Peking and reception of Chou En-lai, which confused his left-wing critics. He has just been to Kabul, and seems in a fair way to liquidate the feud with Afghanistan. The problem of Kashmir remains unsolved, and that of the Punjab river waters has begun to look menacing again; but Pakistanis have increasingly come to regard Mr Suhrawardy as the leader best equipped to discuss these issues with Delhi on equal terms. He is a veteran politician of Mr Nehru's own vintage; and he has taken particular pains to put his policies across to intellectuals, gaining support in quarters often inclined to opposition for its own sake.

But Mr Suhrawardy cannot yet relax in the saddle. The Republican party, on which his coalition government depends in West Pakistan, is in such trouble that the provincial assembly in the west has had to be suspended. In the east, Bengali hankerings for greater autonomy are still very much alive, and the food situation is again critical. Although control of the Awami party organisation has been wrested out of Maulana Bhashani's hands, he is now threatening to create a rival party, and remains a dangerous enemy, combining spiritual authority with the arts of the demagogue and appealing not merely to neutralist elements, but also to Bengali grievances against the central government. Mr Suhrawardy seems bent on the holding of the country's first truly national elections as soon as possible, but campaigning must presumably await the end of the rainy season. By then the Bhashani faction may have reorganised itself, and the impact of the prime minister's recent successes will have been blunted. He will face the electorate confidently only if he can win fresh laurels to replace fading ones. But he may yet do just that, if he keeps up his present pace.

NIGERIA

Delay in the Sun?

NOT much time remains to finish the work of the Nigerian constitutional conference. It is supposed to vacate Lancaster House by the middle of next week; the prospect of weekend sittings suggests that getting through the remainder of its agenda will be hard going. A great deal of time has been taken up over the definition of regional self-government to be granted to the Eastern and Western regions after the conference, and even more over the question of minorities. The problem of regional government is where the residual powers shall lie in the interim period—with the Governor-General, the federal government or the regional governors, and how much residual powers there should be. But the real trouble has come over the minorities, which, as Nigeria is now divided and the delegations are made up, are today the solid opposition groups of each region; in effect each demands an additional state for itself. Plainly the spokesmen of these "underdogs," whether under the heel of Hausas, Ibos or Yorubas, have had a lot of say, and have said it plainly.

It is evident, too, that the British Government has listened to them with sympathy; Mr Lennox-Boyd can hardly forget the shocks that he got last February when he visited

Ashanti to fix up the Ghana constitution at the last minute. But in Nigeria as in the Gold Coast, the British administrators are known to be opposed to undue breaking up of strong governments, and there has been no practical justification of the idea of creating three new regions with all the powers of the old ones. It looks as if an attempt will be made to write safeguards into the constitution of each region as they were into Ghana's—provincial autonomy, and, perhaps, provisions for constitutional change at the centre. This may not be enough to fend off for long the minority groups, who are increasingly critical of the entrenched tribes and tribal politicians.

All this would leave the main structure of Nigeria unaltered, as is indeed inevitable if independence is to be hurried through by 1959. But while Dr Azikiwe's attempts to weaken the regions may have failed, with British backing he may have his way against the North and the West in his demands that the police should remain a federal responsibility, and that the federation should retain most of its present fairly large financial powers and perhaps take over the judiciary from the regions. It is to be hoped so. Chief Awolowo's methodical preparation for this conference has probably won him many rounds—and nobody here should grudge them to him—but the British side would be unwise to let the centre itself become another mere minority voice in a Nigerian semi-federation.

BARRISTERS' PAY

Giving Devils their Due?

SOLICITORS and barristers have now agreed between themselves that the fees paid to junior counsel for "interlocutory" work done in connection with High Court litigation should be roughly doubled, and there is no reason to doubt that this proposal will be approved by the Lord Chancellor and by the Taxing Masters (the officials who pass bills of recoverable costs). Interlocutory work consists of all paper work, statements of claims, appearances before the Masters of the Queens Court division, and so forth done or made before a case reaches court. Such work is extremely badly paid ; the scale of fees is still much the same as that laid down in 1883. A high proportion of cases are settled out of court, and a busy barrister will perhaps spend a third of his time on such work—often taking most of it home at night. Though the scale at present ruling may be adequate for simple inquiries, it is completely out of relation to the cost of legal manpower when it involves anything more than a routine job.

This wage increase after 74 years is therefore a welcome advance towards paying the rate for the job in law. But what a terribly slow advance it is, in a profession where rates and duties are fixed partly in an imperfect market, partly by custom, and partly behind what rude outsiders might call a zareba of restrictive practices. The increase will not in itself greatly ease the position of young barristers, the number of whom taking up practice, according to the Bar Council's report this week, has been falling dramatically (172 in 1950-51, 29 in 1955-56). And it will therefore do little to rectify what seems to laymen to be the obvious distortion in the profession: that young barristers are desperately poorly paid for all the work they do, and that some senior legal luminaries are over-paid for a lot of work they do not do.

GERMANY AND POLAND

Gomulka Props up Ulbricht

MR GOMULKA'S visit to east Berlin is a stark reminder of the price he pays for a measure of independence in home policy. The German Democratic Republic, most Stalinist of eastern European regimes, has received a Polish blessing and the confirmation of the Polish government's friendship on the eve of the municipal elections, and almost on the anniversary of the rising of 1953. Poland, it is true, retains a basic interest in the preservation of the east German state, which, unlike the Bonn government, recognises the Polish frontier on the rivers Oder and Neisse. Yet the visit, no doubt on Russian insistence, to Herr Ulbricht, an enemy who has violently abused all the things for which he stands, cannot have been enjoyable for Mr Gomulka.

Herr Ulbricht badly needed his diplomatic coup. In the vain effort to recover his political position, so damaged by his dreary mimicry of the Russian version of events in Hungary, he has struck out clumsily in all directions, seeking to curb the Evangelical church and to impose conformity on managers and students. But the Ulbricht regime is now so discredited that its blows only arouse more bitterness, its efforts to conciliate, contempt. The ferment among students has grown ; and the attempt to impose party discipline on managers and administrators has merely driven more of them to flee to the West.

But while Herr Ulbricht's own efforts have failed, Mr Gomulka's visit is a slap in the face for east Germany's rebellious spirits. If Hungary set fire to their resentment, Poland's example is the inspiration of their constructive ideas for liberalising the east German state. Polish ideas and experiments are the talk of student hostels and workers' councils ; Poland's measure of independence, the main source of hope that Russia's grasp on eastern Europe may ease enough to let them breathe. The differences between Warsaw and east Berlin on domestic politics have in no way been bridged over ; still, the visit is a gesture of recognition for Herr Ulbricht.

AUSTRIA AND GERMANY

Property and Friendship

DR ADENAUER'S visit to Vienna, when he signed a treaty providing for the restoration of German assets in Austria, was a landmark in the reviving friendship between the two countries. For Austria the visit was an important occasion. Long at the mercy of its great northern neighbour, Austria relies more than ever on German friendship now that it is an exposed outpost of the western world. The problem of the disposal of German assets had marred relations from the moment when the occupying powers agreed to leave. Its 1955 treaty with them precluded the return to Germany of properties worth more than 260,000 schillings (about £3,600), but many smaller properties remained, and almost at once voices in Germany cried for the return of properties large as well as small. Austria, however, has itself had to pay £33½ *million to Russia* for the return of assets seized as German by the Russians. To fulfil this obligation as well as restore much of the property to Germany, represented a double burden.

It is to the credit of the West German government that after some initial sourness it has proved conciliatory. An amicable and rather elastic definition has been agreed for properties worth less than 260,000 schillings which will return to Germany ; and to help Austria in its payments to Russia, West Germany is to pay Austria a lump sum of £1.9 million and return Austrian assets worth some £13 million which have been held in Germany. A mixed commission will arbitrate in cases of dispute, and once the treaty is ratified the German properties will at last begin to invite new investment and resume their proper part in Austria's economic life. A nasty bone of contention will have been removed.

The Austrians celebrated by giving Dr Adenauer a warm welcome. Recollections of the "Anschluss" did not seem to mar the occasion. The German chancellor followed up the efforts of his negotiators by emphasising his pleasure in Austria's independence. After an awkward start, Bonn has accepted the value of a "good neighbour" policy towards its small German-speaking neighbour.

LABOUR POLICY

Euthanasia of the Non-Rentier?

MR GAITSKELL'S remarks last weekend on the uselessness of ordinary shareholders dovetail nicely with his known preference for a policy of state acquisition of the equity of existing large concerns, as opposed to crude nationalisation. They also set up for the faithful a splendid Aunt Sally. All that stands between Labour and public ownership of the 500 firms which "half control" British industry are these useless people who spend their time speculating while others do the managing. It is on them, and no longer on the bosses round the boardroom table, that socialist guns must be turned.

Speculators they may be, but there is one way whereby an incoming Labour government could read them a sharp lesson without buying a single share or nationalising a single insurance scheme. Indeed the party's pensions plan says "steps will be taken" to do it. It is simply to end inflation and restore the value of fixed interest securities. But, as Labour is now so decidedly expressing its preference for equities over trustee stocks, it is clear that what is so disreputable about ordinary shareholders is that they have been guessing right in putting their savings into shares instead of savings certificates or war loan. If they had massively bought government stocks, and passively accepted the loss —as indeed many unfortunate citizens did—there could be no complaint. The Labour dream world, at it seems to be envisaged by some of the faithful, would be one which would close this loophole that enables speculators to hedge against inflation in an age of socialism. By getting hold of all the growth stocks the state would ensure that the thriftless would get all the capital appreciation (through state pensions) while the thrifty would have nowhere to lay up their savings that the mice could not get at.

Of course, Mr Gaitskell knows all this. But he also knows that shareholders are the floating vote nowhere and have not a friend in the world. He is batting, with this vague knockabout stuff, on a splendid wicket. But he might have had the grace to admit that the loss by shareholders of their normal function—which is risk-taking—was not their own fault ; they are inevitably deprived of it, or some of it, if governments are sufficiently dishonest with the currency.

JAPAN

Mr Kishi in Washington

THE Japanese premier's visit to the United States is not intended to produce concrete solutions to the many economic, political and military problems which are bedevilling American-Japanese relations. He hopes to achieve a broad understanding on which later agreements can be based.

There is plenty to talk about. The embargo on trade with China should be easier to discuss now, and a relaxation of controls may deprive the Japanese neutralists of the support of a powerful business faction which was more interested in trade than in hypothetical dangers of communism. But the revision of the security pact, Japan's contribution to the support of American troops, the future of Okinawa, and the question of jurisdiction over Specialist Girard, are explosive subjects, and their discussion will be complicated by Japan's newly announced decision to increase its armed forces. Other problems are the recent alarming setback to Japan's balance of payments, American tariff policy, and Japan's idea of combining Japanese skill with American dollars to develop south-east Asia.

This last idea originally occurred to Mr Yoshida, when he was prime minister three years ago, but nothing came of it. It is now Mr Kishi's pipe dream, but the south-east Asian leaders with whom he discussed it on his tour there were markedly unenthusiastic.

INDONESIA

Dr Sukarno's Brainchild

PRESIDENT SUKARNO has at last published the names of the members of the new National Council, "the cream of society," who are to bridge the gap between the Indonesian government and people. They are government officials, the chiefs of staff of the armed forces and representatives of social groups and of the islands. Three (from the intellectuals, the press, and the island of Sumatra) have declined to serve. No political party is formally represented, but about a quarter of the 45 members are communists or communist sympathisers. The president took pains in a recent speech to make it clear that he does not regard himself as a communist, but his denials only showed how near the wind he is sailing. He said that it was China's achievements in construction, and not necessarily its ideology, which ought to be imitated, but that he envied the communist countries their one-party system where "there was no such thing as cabinet crises." A few days later, Mr Aidit, the secretary-general of the Indonesian Communist Party called the formation of the council "a success for the revolutionary struggle of progressive Indonesians."

The moderate Moslem party, Masjumi, continues to insist that the council is an unconstitutional body, but the orthodox Moslem party, Nahdatul Ulama, has allowed two of its members to join. The constitutional position is still very vague. The new council apparently has authority to veto cabinet decisions but not to enforce its own wishes. The cabinet itself, although appointed by President Sukarno during the state of emergency, which is still in force, is, according to the prime minister, now responsible to parliament ; the parliament, which has met again after the recess, seems unwilling to assume any authority at all.

LETTERS

Books and Bookmaking

SIR—Your reviewer's statement in your issue of June 8th that "the restrictive practices of the printing trade are one of the biggest single factors which delay the production and increase the cost of books" is difficult to refute because of its vagueness. That such practices exist is not denied. Some of them might reasonably be regarded as in the long run in the public interest (like the publishers' own net book agreement). Others are the selfish operations of groups or individuals. Despite them, productivity has increased substantially since the war and book-printing firms have been in the forefront with schemes for raising output in which managements and workers have co-operated.

Printing costs seldom account for more than a quarter of the published price of a book and are usually very much less. It is absurd to suggest that restrictive practices within the printing trade are responsible for a major part of recent increases. (Incidentally, what other commodities have shown such small rises since 1939 as books?) The reference to "delay" could probably be shown to be no less exaggerated.—Yours faithfully, BROOKE CRUTCHLEY
University Press, Cambridge

★

SIR—Your reviewer of "The Book World Today" does well to emphasise the delay and the exaggerated costs occasioned by restrictive practices in the printing industry today. Publishers will be grateful to you—and to your printers—for making even this passing reference to the subject.

Three years after the war, at the extremity of our frustration over the inadequate printing facilities of this country, I wrote an article for a weekly journal listing a few of these practices, such as consistent refusal to run up-to-date machines at their optimum speed, unnecessarily rigid demarcation between the duties of one worker and another, and severe restriction of the intake of apprentices in an industry which was crying out for more labour. My article was accepted for publication and actually set up in type, but the printers refused to machine the issue of the paper containing it. The article therefore remained unpublished.

Three effects of this continued adherence by the unions to their prewar outlook are that

1. The average minimum time needed for the manufacture of a new book is now about six months compared with three months before the war.

2. The minimum number it is practicable to print if a competitive published price is to be arrived at is now 2,500 instead of the prewar 1,500.

3. The margin by which printing costs here have been lower than those in the United States has narrowed rapidly, so that it is now of decreasing advantage to an American publisher to import editions of books printed over here.

—Yours faithfully, PHILIP UNWIN
George Allen and Unwin, Ltd.,
London, W.C.1

Public Drugs and Private Patients

SIR—With reference to your comment in *The Economist* of June 15th, may one be also permitted to record that quite a large number of people utilise the services of homœopathic physicians who are working outside the national service—not because such doctors have any particular bias against a state service *per se*, but because the Ministry of Health refuses to encourage the practice and development of that form of treatment known as homœopathy?

The result is we have to pay both fee and cost of the medicines if and when prescribed. Fortunately homœopathic medicines do not often cost a lot, but courses of treatment frequently require a long period of medical treatment and supervision.

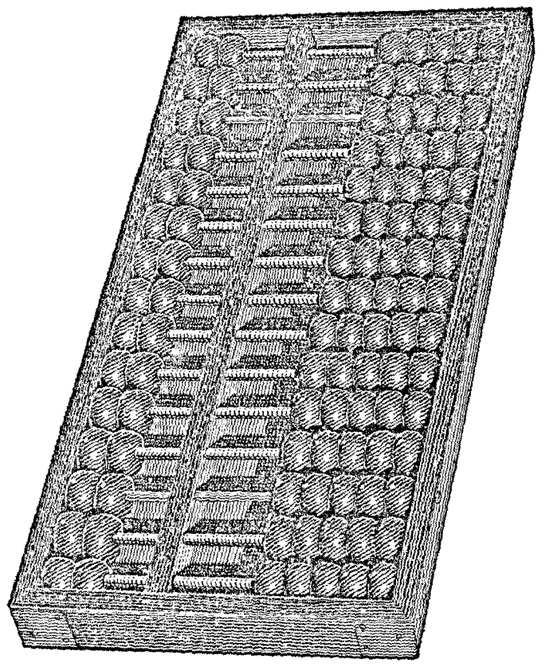
It is somewhat ironic that the state should so penalise those who prefer to get well than remain the uncertain protégés of the GP's surgery and finally develop into "chronics."—Yours faithfully, A. W. HOPKINS
Wheathampstead

A Snub for the Archbishop

SIR—In your comment of June 8th you justify the British Government's unrealistic rejection of Archbishop Makarios's proposals for bilateral talks, on the ground that there are "other and wider interests" than those represented by the Archbishop which will have to be consulted. I cannot, however, conceive any interests "wider" than those of the vast majority (82 per cent) of the people of Cyprus which, whether some like it or not, are represented only by Archbishop Makarios. Or do we have to start all over again explaining how and why Archbishop Makarios is the only elected national and religious leader of the Greek people of the island? The British Government themselves accepted him as such when they negotiated with him eighteen months ago.

The Archbishop has not ignored the rights of the Turkish minority in Cyprus at any time. He repeatedly declared that he is quite willing to sign an additional instrument providing for the strict observance of the Convention of Human Rights of the Council of Europe or of the Charter of the United Nations with regard to the vested rights of the Turkish minority. But to refer to the Turkish interests, or indeed to any other interests, as wider than those of the Greek majority is an unreal attitude—to say the least—that will lead nowhere, unless the British Government do not wish to settle the issue, which certainly does not mean that the Archbishop is to blame.—Yours faithfully,
SPYROS A. KYPRIANOS
Delegate of the Ethnarchy of Cyprus
London, W.1

Scottish Light Castings



SIR—In the press reports of the efforts to obtain the proposed steel strip mill for Scotland, reference has been made on several occasions to the depressed state of the light castings industry of East Stirlingshire and to the unemployment and redundancy amongst skilled moulders and other tradesmen.

I am in complete sympathy with the efforts to obtain the new steel project for Scotland, but I feel that a plea should be made for the needs of the existing staple industry of East Stirlingshire, which provides over 70 per cent of the domestic solid fuel appliances made in Great Britain.

Undoubtedly one of the factors which have reduced the prosperity of the industry is the Department of Health's housing memorandum, which limited the number of chimneys in local authority housing to one, or at most two. The consequence is that the responsibility of heating the other three or four rooms lies with the tenant. In some cases this is done by electric or gas convection heaters, although these are in many instances expensive in operation. More frequently oil-burning heaters are installed and as the Glasgow Firemaster stated in his annual report "the almost meteoric rise in the number of fires caused by such heaters in Glasgow homes is alarming and demands serious investigation."

In a climate as humid and as changeable as ours, where, for example, within a few recent weeks we have had an outside variation of midday temperature of 30° F, surely the necessity for a safe form of heating is obvious.

At a conference on domestic heating organised by the Institute of Fuel last year, the president, Sir Alfred Egerton, FRS, stated that the results of the DSIR research station had so far indicated that improved open fires with back boilers are probably the most universally suitable heating appliances for general domestic purposes in Great Britain. The wider acceptance of this fact by local and national housing authorities would restore the prosperity of an industry which is at present the victim of government policy.—Yours faithfully, JAMES FERGUSON
Managing Director,
Messrs Lane & Girvan Ltd.
Bonnybridge, Stirlingshire

Taking the East into account

Twenty-five years ago you would have found this 'adding machine' of antiquity in every eastern branch of The Chartered Bank. It was of particular use in calculating the intricacies of exchange rates which often fluctuated with great rapidity. Today, the abacus is being replaced by the slide rule and the electric computer. The East is changing but The Chartered Bank remains in step, so that its knowledge of eastern trade, travel and investment is always up-to-date. This knowledge and a century of experience sustain a complete banking service available throughout a branch system, which extends to most centres of commercial importance in Southern and South-East Asia and the Far East.

THE MARKET PLACE FOR Motoring IS THE REGIONAL PRESS

THE REGIONAL PRESS is the reference guide for car buyers. Kemsley regionals regularly carry, besides motoring editorial, columns of motor car advertising to which both private and company buyers automatically refer. Through these papers the advertiser—of cars, trucks, petrol, oil, tyres—reaches, economically, the largest number of genuine *buyers* at the point when they are looking for motoring advertisements and in the place where they expect to see them. For motor products, as for many other product groups, Kemsley regionals give maximum power for every inch of advertising bought.

KEMSLEY REGIONAL NEWSPA

Latest overseas orders for Marconi television equipment include a complete station for Poland worth over £200,000 and sound and vision transmitters for three new Danish stations valued at more than £90,000.
Czechoslovakia has also recently ordered Marconi television equipment. Sweden, Western Germany, Italy and Switzerland have already installed it. Marconi's have also supplied every one of the B.B.C. and I.T.A. stations.
Not only in Europe is Marconi broadcasting equipment pre-eminent. It is in use in 75% of the countries of the world.

BOOKS

Canada's Crashed Bulldozer

C.D.: *The Life of Clarence Decatur Howe*

By Leslie Roberts.
Toronto: *Clarke Irwin.* 246 pages. $5.00.

THIS interesting book is not really a biography. It is an essay on how a parliamentary democracy can manage a manager. C. D. Howe is a man whose only interest is "to get things done." Mr Roberts properly observes that the accusations of a lust for power are beside the mark: Mr Howe's characteristic was rather a zest in the exercise of power. The book documents the remarkable achievements, from 1935 to 1956, of a man who always treated the business of government like the management of a private company. His greatest success was to inspire and direct an industrial war effort far exceeding any 1939 dreams of Canada's capacity. He earned at the same time such confidence from business leaders that in 1951 when he organised a new Department of Defence Production he could still pick the presidents of almost any company he chose to serve as dollar-a-year men.

Mr Roberts does full justice to all this. But he also emphasises the cost at which managerial efficiency was won: the contemptuous treatment of parliamentary questioning, the carelessness about parliamentary answers which must have established a new record for corrections. (During one week in the last session Mr Howe gave no fewer than three answers which were easily demonstrated to be contrary to the facts.) Mr Howe has never made any pretence about his attitude. All the book's documentation says no more than he said himself in a radio interview when his request for an indefinite renewal of emergency powers was under debate in 1955. Why, he was asked, would he not agree to a renewal for two or three years, which could be further extended, if necessary, when the time came? He replied: "I don't have to spend my time amusing Parliament."

The culmination of this remarkable career is presented as occurring during last summer's "pipeline debate," which played a prominent part in Canada's recent election campaign. Mr Roberts's account of the debate and the events leading up to it is vivid and brings out the essential points. But it is here that his dependence on published sources betrays him most seriously. He overstates the extent to which Mr Howe was personally responsible for what the opposition called "the rape of Parliament," because he understates the successive failures of Mr Howe's personal and determinedly solitary attempts to solve a big national problem. There was a chance to present the untold story of Mr Howe's implicit belief in his ability to bend both oil tycoons and Cabinet colleagues to his wishes, and of how it broke down at one crucial point after another. But the story could be told only from inside: and Mr Roberts is writing from the outside. He could not get the real story from *Hansard*.

The debacle started when the Cabinet refused to implement Mr Howe's first plan in all its gay simplicity. It was to give a government guarantee for the promoters' bonds, and the promoters had no doubt about getting it. When it was refused in March, 1955, there followed a series of expedients of increasing complexity, worked out between Mr Howe and the tycoons without benefit of official advice or Cabinet consultation. Not until the late spring of 1956 did the Cabinet, as a group, determine that building must start in 1956 and that the fiasco of Mr Howe's private dealing with the tycoons should end. Hence the desperate last minute expedient of trying to push through Parliament in three weeks the only sort of scheme which, at that late stage, might get the line started in the 1956 summer season.

Little of this appears in Mr Roberts's book, which shows Mr Howe as bulldozing his colleagues into the parliamentary manœuvres that brought the Canadian House of Commons to its lowest point. This version obscures the repeated failures of Mr Howe's lonely efforts, and exaggerates his role as a "big, bad wolf." But it serves to present fairly enough the dilemma of democracy in trying to use men of the C. D. Howe type whose genius (though it slipped in the pipeline affair) is to get things done. The answer, he says, must be to adapt the men to the institutions of freedom, not the institutions to the men. But he has made no attempt to "get inside" Mr Howe enough to suggest how this may be done.

Newest Testament

Testament of Experience

By Vera Brittain.
Gollancz. 480 pages. 21s.

"AT this point," wrote Miss Dorothy Parker long ago, reviewing a well-known work of nursery whimsey, "Tonstant Weader fwowed up." Hers was a minority reaction; the nursery whimsey concerned continues to delight successive generations. To judge by the success of Miss Brittain's past autobiographical works, she has a similarly undeniable majority-appeal. The majority has, indeed, many good reasons for its admiration. "Testament of Youth" was genuinely heartrending; "Testament of Friendship" a genuinely living portrait of a subject—Winifred Holtby—well worth portraiture. And "Testament of Experience," which takes up Miss Brittain's story at her marriage to the shadowy "G." and carries it on to the year of her silver wedding, has its qualities too.

It is, from one aspect, the story of a marriage that succeeded brilliantly under conditions which could have been prophesied with near-certainty to guarantee failure; a relationship neither of old-style subordination nor of newer-style partnership but of a harmonious independence whose achievement is enormously to the credit of both parties. It is also, less sympathetically but illuminatingly, the story of the pilgrimage of a typical Soft-Centred Progressive through the twentieth-century wilderness, a concentrated essence of Left Book Club; and, as such, a highly significant contemporary document. It is fluently, sometimes vividly, written; there are occasional flashes of acute observation, moments of real poignancy, and some salutary reminders.

The general effect, however, is profoundly distasteful; a blend of exhibitionism, self-satisfaction, and intellectual squashiness. On the personal side, "Testament of Experience" presents neither the immediate impact of raw experience nor emotion recollected in tranquillity, but the self-dramatisation of a schoolgirl diary. On the public side it is predominantly a pacifist manifesto of a characteristically muddled kind. Pacifism can be justified morally as a special case of that imperative which sets the absolute duty of not resisting evil higher than the instinct of survival; an imperative which not one pacifist in a thousand would unconditionally obey in private life, but whose genuine acceptance compels the awed respect due to saints. It can be justified practically, to ordinary non-saints interested in their own and their children's survival on tolerable human terms, on Gandhi's assumption that non-resistance will eventually change the heart of the aggressor. Miss Brittain neither faces the frightful choice implicit in the first justification nor offers—were it possible to offer—the slightest evidence that Gandhi's assumption would have proved itself correct in 1939, *vis-à-vis* Hitlerite Germany, or would prove itself correct today, at the pinch, *vis-à-vis* Soviet Russia. Instead, she dwells on the horrors perpetrated in the course of war—in tones suggesting that only pacifists regard these otherwise than with perfect equanimity; and on the threat of further horrors, proving the vanity of victory, overhanging the postwar world—as if there were nothing to choose between the mere possibility of nuclear disaster and the actuality of a universal Thousand-Year Reich; which last can only be described as unmitigated nonsense.

But it is not this intellectual confusion, or even the total lack of saving humour and irony, which accounts for

the sour taste that "Testament of Experience" leaves in the mouth. It is something more personal. Miss Brittain displays a sincere and noble compassion for innocent sufferers on the enemy side, a charity even for those not innocent; but for persons by whom she herself has been thwarted or criticised, in matters large or small, she has the kind of slightly rancid sweetness that the French call *doucereuse*. She has a record of genuinely public-spirited and devoted service; but the impression is inescapable that the conspicuous role of a public-spirited and devoted person is at least as important to her as are the results achieved. She shows genuine love and admiration for her friends; but her practice of indefatigably recording and reproducing those friends' tributes to herself does more than hint at the object of her greatest admiration. This is, in fact, the record of an all-pervading, never-outgrown adolescent egotism; the sort of thing which is tolerable and even sympathetically entertaining when naked and unashamed, but which when robed for publication in the Christian and humane virtues will induce in some readers—not necessarily those who value those virtues least highly—a queasiness to which only Miss Dorothy Parker could do justice.

Industrial Pilgrimage

His Royal Highness the Duke of Edinburgh's Study Conference on the Human Problems of Industrial Communities within the Commonwealth and Empire, Oxford, 1956

Volume I, Report and Proceedings. 350 pages.
Volume II, Background Papers, Appendixes and Index. 354 pages.
Oxford University Press. 42s. for both volumes.

FROM the first, those who convened the Duke of Edinburgh's study conference on industry disclaimed any intention of trying to reach conclusions or putting forth conclusions or recommendations after the meeting. The whole object was a lesson in industrial anatomy; the dissection of a specimen by a gathering of young practitioners in industrialism, in all its many specialties, from various parts of the Commonwealth. These volumes do not, therefore, put forward any main thesis or agreed proposals. They consist simply of the documentation of the conference, reprints of the addresses given, and the brief reports of the groups which toured British industry. Insofar as any results are to be sought for, they must be sifted from this latter—extremely brief—part of these large volumes. They will be found somewhat disappointing, taken at their face value.

But they probably ought not to be taken at their face value. As the Duke of Edinburgh himself said, the results will not come in for a long time yet, and perhaps will never be assessed. The homework of the groups who toured industry for a week or so is fair average quality for "group reports" of this type of do-it-yourself field research. The only question that has to be asked is whether it was worth while to publish all this material in full. Many will think it a labour of piety. But at least it does show how study conferences with this vagueness of reference work, and as a textbook for study conference conveners, it may serve a very useful purpose.

The background papers are on a different level. Many distinguished authors are represented among them, and some have written thoughtful and provocative essays. As a book of essays on industrialism and its discontents it is readable and at times extremely enjoyable—especially at those points where the authors forgot their august company and became quite uninhibited. But the mixture of the speculative, the general and the specialist approach is not a happy one, and the careful exclusion from the whole conference (presumably at the instance of the trade unions) of any discussion of wages and wage-bargaining makes the whole atmosphere of the discussion unreal. Yet to have allowed this would inevitably have brought a horde of economists down upon the conference as well, and that, perhaps rightly, was something again which its sponsors wished to avoid. Professor Arthur Lewis, almost alone, was allowed to discuss pertinent questions of economic growth in well-chosen and admirably simplified terms.

The conference was seeking the human reaction to the industrial life of this country; and that is a very difficult thing to do. These papers give only the impression of blurred faces in a crowd, and that is perhaps all the conference members saw. This in itself perhaps predisposed them to think of the people of Britain as unduly mass-produced, mass-organised, and mass fed, cared for, and amused. It is not an impression readily compatible with the idea of the dignity of the person, which the conference so stressed, and the erosion of which seemed to worry the visitors so much. But perhaps there is more of it about than is visible from an aerial survey; to find out, however, the conference needed rather more time and rather more close-ups with their subject. That everyone had a wonderful time; that this was the study conference of the decade, the Empire party to write home about, need not be doubted.

Suing the Doctor

Medical Negligence

By the Right Honourable Lord Nathan with the collaboration of A. R. Barrowclough.
Butterworth. 249 pages. 35s.

IN the intervals of running a busy solicitors' practice and, *inter alia*, acting as chairman both of the Westminster Hospital and of the British Empire Cancer Campaign, Lord Nathan, with a member of the Bar, has written this admirably arranged book on the law of medical negligence. He must surely have the power of getting two days' work into one day's span.

It is an appropriate time to survey the judgments and to write the book. The stream of actions against doctors and hospitals appears, for the moment, to be slowing down; but until a year or so ago it was in spate. In 1948 the Ministry of Health paid out for claims against hospitals £7,500. In 1951 it paid out £38,500; in 1953, £152,000; in 1954, £159,000—figures that reflect the recent unhappy attitude of patients towards their doctors and correspond no doubt to the increase in recorded judgments. So modern, indeed, is the passion for having a go at the doctor that in Lord Nathan's synopsis of leading cases 124 out of 151 entries refer to actions adjudged within the last thirty years.

This means that there is now a considerable body of authority which did not exist before 1927; and it is this body that Lord Nathan dissects and discusses. The litigiousness of patients has had some deplorable results, but the judgments given in England have for the most part been sensible, and the case law may now be settling down.

One cannot read this book without acute sympathy for the medical man who has to decide (in very difficult circumstances) what is the right thing to do for the patient. The doctor's dilemma pops up on every other page. Here, for example, is a Canadian case, quoted by Lord Nathan, dating from 1949: A surgeon, doing a Cæsarian, found the patient had two tumours on her uterus, and knew they would make it dangerous for her to have another baby. She obviously could not be consulted, and the surgeon made a quick decision. He tied up the Fallopian tubes and rendered her sterile. He was sued and held liable for damages—not for negligence but for assault.

Almost one wonders why any man becomes a doctor; but the brave men who do take the plunge will be wise to have Nathan on Negligence always ready to hand.

America Grows Up

The Unquiet Years

By Herbert Agar.
Hart-Davis. 176 pages. 15s.

FOR those who would like to refresh their memories and clear their minds about the course of American affairs since the war, nothing could be more useful than Mr Agar's agreeably brief review. It is acute, fair-minded, and written with point and style. The starting point of this turbulent decade is the America of 1945, the America which imagined that wars could be won and victors could go home. Americans have learned, painfully, how mistaken they were; but Mr Agar rightly insists that the innocent belief that once the war was over, everything would be as it had been in the nineteen-twenties and thirties was responsible for the frustrations which exploded in McCarthyism and MacArthurism. The search for scapegoats, he suggests, was one of the unattractive symptoms of a political adolescence.

This is a book about foreign politics—for are not all politics foreign politics?—and if it has a hero it is Senator Vandenberg, the convert to internationalism who devoted the last years of his life to piloting the Marshall plan and the North Atlantic Treaty through Congress. His absence was to be felt keenly when the Senate—and Mr Dulles—cowered so mystifyingly before McCarthy. On Mr Truman the praise and blame are allotted with a nice sense of discrimination: "To us, there are at least three Mr Trumans, and we wonder how the historians of the future will squeeze them all into the same skin." The little man "with a taste for exceedingly commonplace company" may have failed to take advantage of Sir Winston Churchill's foresightedness in 1945; his politics were crude; but he stood like a rock against General MacArthur. In a brilliant analysis of the "China myth" Mr Agar pulls out a little-known strand: Roosevelt's deliberate build-up of China as one of the Big Four to offset his ancient Dutch suspicion of the British Empire. He pays belated justice to the "do-nothing" Republicans of the Eightieth Congress, who in foreign affairs met every challenge to the West.

A life-like portrait of Senator Taft underestimates "Mr Republican's" interest in social legislation, but Mr Agar has put his finger on the heart of the mystery surrounding President Eisenhower's reluctance to lead: his genuine conservatism, and his throwback to the Whig belief in a weak President. Whether Mr Agar would write as confidently today of the President having learned his lesson that power and popularity must be used is another matter. Short as it is, the book would have been better without its final chapter; to close with the Bandung conference and the end of the colonial era strikes an irrelevant note in a sketch of the years in which America showed the best and the worst of itself to the world.

Russian Steel

The Economics of Soviet Steel

By M. Gardner Clark.
Harvard University Press. London: *Oxford University Press.* 414 pages. 60s.

MR CLARK'S book is a critical appraisal of the Russian steel industry. He does not look at the Soviet steel industry in the way that most Europeans do, as already a close rival in productivity and as advancing rapidly. To Americans the Russian industry is still a lap behind. Although Russia is expanding its output at more than twice the American rate of between three and four per cent per annum, America is far enough ahead to look over the shoulder and judge the Russian performance critically and without real concern.

Mr Clark concentrates his study on what he considers to be the main weaknesses of the Russian steel industry: the inferior quality of the coking coal resources; the working out of the main deposits of high grade iron ore; and the over-emphasis on large-scale units as a result mainly of the ignoring of transport costs—the concern of another department of the planning machine. He quotes as "gigantomania" the upward revision in 1936 of the original American plan for Magnitogorsk so that the plant output was 75 per cent greater and the blast furnaces gave 1,500 tons a day in place of the original plan of 800 tons. But this figure has become commonplace in the United States and Russia today, and the No. 6 blast furnace at Magnitogorsk is now turning out 2,420 short tons a day.

By American standards, too, it seems a great handicap that Donbass coal has an average of about 1½ per cent sulphur, is high in ash and is obtained from seams averaging 2½ feet thick. These are difficulties that are only too common in Europe. Then the Kusbass coke is extremely friable; there is an increasing need to use lower grade ores and to pre-treat them extensively; and there is a rising sulphur content as some of the best ores get worked out. Mr Clark concludes that the Russians may well start to import high-grade ores for their plant, instead of attempting to smelt the "miserable ores of the Crimea" and to import Swedish ore through Poland. Even more "miserable" ores are smelted in the United Kingdom with great success, and there is no reason to suppose that the Russians, with their advanced use of sinter, will find any difficulty in using lean ores.

Mr Clark criticises the building of the new works at Cherepovets, some three hundred miles east of Leningrad. It is based on coking coal from Pechora nearly a thousand miles farther north-east in the Arctic Circle. This plant, he considers, should either have been built on a more moderate scale in the Leningrad area, where it would use local scrap, or it should have been placed hundreds of miles eastward so that it lay on the most economical transport line between the developing coal reserves of the Arctic north and the iron ore resources of the Urals.

The final section of the book, on productivity, is the nearest approach Mr Clark makes to a general summing up of the strength of the Russian steel industry. He emphasises that the Russians have concentrated primarily on capital productivity rather than labour productivity, so that while output per furnace is frequently higher than in America, labour productivity at the same furnaces is lower. The book does not attempt any assessment of the comparative economic strength of the Russian steel industry and those of western Europe and America. It is not possible therefore to compare his conclusions with those of the British team who visited Russia in the autumn of 1955. Its report assessed Russian costs in terms of labour units as about equal to British costs, but assessed the costs of a labour unit, in terms of real wages paid, as about half that in Britain. Nevertheless Mr Clark's book will be of great value to all concerned with the development of Russian industry.

Controlling the Cash

Central Banking After Bagehot

By R. S. Sayers.
Oxford University Press. 149 pages. 18s.

IN this collection of ten essays, only three of which have previously appeared in this country, Professor Sayers maintains his accustomed standard of technical excellence.

The historical study which gives the book its title traces the evolution of the Bank rate tradition from the publication of "Lombard Street" in 1873 to its culmination in "the textbook simplicity of the system described to the Cunliffe Committee in 1918." It could not last. Some relapse into complexity and doubt is discernible in those other contributions dealing with recent developments and which have acquired a fresh importance in the light of Professor Sayers's appointment to the Radcliffe committee.

Individually, all the pieces are of high quality but, having been written at various dates during a period of some heart-searching in monetary thought, they cannot be said to make an altogether harmonious whole. Especially is this so in relation to one of the basic issues of recent controversy, the question whether control of the supply of bank cash does in fact enable a central bank to exercise effective control over the volume of credit if there are too many Treasury bills about. In the eighth essay ("Determination of the Volume of Bank Deposits: England 1955-6") it is shown that "since the

OXFORD UNIVERSITY PRESS

banks can always turn bills or call money into cash, or vice versa, it is their total of bills and call money that we have to regard as the crucial factor." What matters, in other words, is the liquidity ratio ; the cash ratio will look after itself. There may be no real inconsistency, but this does not consort too happily with some of the exposition elsewhere, where it is implied, if not stated, that operation on cash reserves is the key to general monetary control and the efficacy of Bank-rate-cum-open-market operations is on the whole taken for granted.

On some other subjects of recent debate, Mr Sayers's position emerges clearly in the course of the book. Whether monetary policy should operate on advances or deposits is scarcely treated as an issue at all. Compression of bank cash reserves is designed to reduce, not the liquid holdings of the public, but the ability or willingness of the banks to lend to their customers. Indeed, the reason for deciding against the imposition of variable mandatory liquidity ratios is that this would still leave the banks free to sell investments as an alternative to reducing advances—and "this is a choice that ought to be made in Threadneedle Street." There are some for whom the great appeal of monetary as opposed to physical control lies precisely in its anonymous and all-pervading character, in the absence of interference with freedom of contract and in the diffusion of economic initiative throughout the system via the judgments of the market-place. Professor Sayers is not of their number. To rely upon interest rates to govern the pace of the economy is old-fashioned, for they may work too slowly in the "right" directions and have quick effects in the "wrong" directions ; hence the case for action specifically directed against particular activities such as Stock Exchange speculation or hire purchase. Indeed, under-developed countries are adjured that "the intention should be to be ready to establish analogous controls of any particular sector of a country's credit market that comes to have special influence on economic activity." However, one may appreciate Mr Sayers's scholarship without necessarily sharing his views.

Franco's Side of the Hill

Mine Were of Trouble

By Peter Kemp.
Cassell. 207 pages. 18s.

LIEUTENANT COLONEL PETER KEMP had one of the most extraordinarily varied and gallantly buccaneering war records of any British officer ; among other excitements he was dropped behind enemy lines into Albania, Poland and Siam. He also had a somewhat unusual prewar record : a few months after coming down from Cambridge he went to fight in the Spanish civil war—but on General Franco's side. Yet he was not a Roman Catholic, and certainly not a Falangist. Turning the usual bugle calls of class war inside out, he explains rather appealingly that he did not like the way the Republicans were shooting ordinary people "just because they happened to have a bit of money."

Politically, the message of this extraordinarily detached account is that Mr Kemp is still convinced that his was the better of two admittedly raw sides. Militarily, it is that the Spanish conflict could not sensibly be regarded as a rehearsal for the world war that followed : this struggle of attrition, patrols, rifle fire and the occasional machine-gun was strictly 1914-18 stuff. Humanly, the book has the usual fascination of any account written by the quite instinctively nerveless ; it was not at all surprising to hear that Mr Kemp had turned up again in Hungary last November, and that he was the last British newspaper correspondent out of Budapest. It is to be hoped that he will write further books about his post-Spanish activities ; he has the best, because the calmest, literary style for any man of action—it induces shudders at, for and about the author, broad grins, no rancour from political opponents, and a creepiness down the spine.

A Society Grows Old

Social Policies for Old Age

By B. E. Shenfield.
Routledge and Kegan Paul. 244 pages. 25s.

THE Labour plan for national superannuation can be seen as part of the stream of books, reports and pamphlets on the social, economic and other problems of our ageing society. Mrs. Barbara Shenfield has surveyed much of this field in a concise blend of academic learning and practical experience. She modestly describes it as "a general study of fact and argument" ; as a stimulus to fresh thinking and research it should take its place in the authoritative studies of the subject.

The chapter on pensions, which argues that the economic burden of the aged has been exaggerated, provokes the question whether the reaction against alarm is going too far. The numerous variables or unknowns—school-leaving and retirement ages, the number of women workers, the relative cost of supporting old and young, birth and mortality rates, the terms of trade, the increasing political power of older people, the competing calls on the public purse—should warn us against being too sure that the problem will be mainly that of transfer payments. Counting chickens is best left to politicians.

Mrs Shenfield makes too many concessions to the egalitarians, with their "badge of citizenship" mystique, their reluctance to distinguish between the relief of poverty and the redistribution of incomes, and their inability to debate the merits of rights and needs as the basis of pensions. Yet Hagenbuch, Ffrangcon-Davies and others who have made damaging criticisms of the theory and practice of the social services are not done justice.

We tend to judge the new ideas in pensions—the increments for continued work, the earnings rule, and the retirement condition—too much by our own experience. Many other countries besides the United States are experimenting with pension systems that will not provoke premature retirement : pension increments are based on deferment of retirement or of the pension. In Britain we insist on both ; we have a lot to learn.

It is knocking down an Aunt Sally to argue that it is wrong to "press" older people to go on working. The problem is rather to remove the many, often subtle, obstacles. Mrs Shenfield's estimate that only some 300,000 workers would be forthcoming is too low. Even this number would have greatly eased the strains of overfull employment. But the supply of older workers is a function of their price : how many might work on if monolithic collective bargaining over rigid wage structures did not prevent them from being paid what they are worth and would gladly accept ? No wonder they are now "marginal."

Mrs Shenfield's field studies in the Midlands produce sensible suggestions for improvements in welfare and health services and housing. Her concern is for the old folk, whose comfort and happiness she thinks may be sacrificed on the altar of administrative convenience. The neglect of old people by their families is an ugly by-product of state paternalism that requires a solution more than sympathy.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Mr Stassen's First Steps

WASHINGTON, DC

PRESIDENT EISENHOWER told his press conference on Wednesday that he would be "perfectly delighted" to agree to a temporary suspension of nuclear tests. This shows the earnestness with which the Administration is attempting to arrive at a constructive reply to the latest Russian proposals on disarmament. But, as Mr Stassen, the American representative at the London talks, has now learned, tripartite negotiations are required between the President, his military leaders, with their powerful friends in Congress, and the allies of the United States before any American move can be made. Americans are becoming resigned to having slower reflexes than their monolithic Russian opponents.

In his discussion with the press the President left two major points unclear : whether the United States would move from the suggested ten-month trial period for the suspension of nuclear tests towards the two or three years proposed by the Russians ; and whether the United States would still insist on linking the suspension of tests with a fixed date for cutting off the production of nuclear materials for military purposes. Many of the President's technical advisers oppose the longer suspension period because they fear that during it the American teams of scientists might be dispersed into private industry while Russia, being a dictatorship, could keep its teams intact. This objection might be partly overcome if the Secretary of Defence turns out to be right in his rather surprising view that the suspension of tests would not affect the development of long-range ballistic missiles because atomic warheads for them are available already.

On the question of linking the suspension of tests with that of nuclear production, Mr Eisenhower was at his vaguest, with the subsequent "clarification" from the White House only making the matter more obscure. He did say that controls, now that the Russians agreed that these should accompany the ending of tests, might be adaptable to some sort of check on whether nuclear output had also stopped. It seems that the President is most anxious not to lose any reasonable chance of finding out what will happen when a system of control is actually operating inside the Soviet Union. On the other hand he does not want to lose the support of America's allies, some of whom are insistent that tests and production must be linked.

Americans in general are clearly hoping for results from the disarmament conference. An indication of this is the quick backpedalling of Senator Lyndon Johnson from his gruff refusal to allow a representative group of Senators to attend the London talks before the end of the congressional session, for which he was sharply taken to task by the press. On Wednesday he announced that three from each party, headed by Senator Humphrey, who is chairman of the Senate disarmament committee, would fly to London this weekend as "observers" during the next stage. It is hoped that this will both help to restore Mr Stassen's diplomatic prestige after public reports that he has been "reprimanded" and begin the work of popular education which will be sorely needed if Communist inspectors are to be welcomed into the United States. Before they come, however, a two-thirds majority will have to be found in the Senate for the disarmament treaty.

EVEN before this week's developments, it was clear that the Americans were very serious about their effort to get a "first step" agreement on disarmament. President Eisenhower's principal remaining ambition is to make a great stroke for peace. Since he also regards the North Atlantic Treaty Organisation as his monument, he has never been prepared to suggest or to agree to anything that would damage it. This has in practice ruled out any solution of the German question which the Russians would be likely to accept. So long as the link between disarmament and political settlements was unbreakable, so was the deadlock unbreakable between East and West. If, however, a "small slice" of disarmament could be made to precede political discussions, some momentum towards major settlements might possibly be created. The stumbling block was Dr Adenauer, with his insistence that German reunification must have priority. It was only after he had agreed with the idea of a "first step" that the President felt free to order a new American initiative.

The Americans are convinced that the Russians now really do want some progress on disarmament. They have evidence that a report drawn up for the Soviet government by Marshal Zhukov painted an appalling picture of the carnage that would be created in Russia by a nuclear war and considerably affected the Soviet attitude. The Americans have therefore waived their original insistence on air inspection before all else and have reverted to two conceptions which had long been inherent in the western position within the United Nations disarmament commission. One is that some reliance on good faith is inevitable, so that the "first step" should not concern matters of vital importance. The second is that any "first step" must be one that will provide experience in testing the techniques of inspection and control.

The actual proposals which Mr Stassen took with him to London were a selection and refinement of numerous plans which have been circulated before, together with the idea that air inspection, instead of being total as between the two super-powers and a mandatory prelude to any other steps, might itself be tried experimentally in limited zones. The Administration does not even consider that a European test zone is altogether ruled out, although Mr Stassen has now been told that the Europeans themselves must now be left to propose it.

The freshness of Mr Stassen's response to the new Russian earnestness was to be found in his technique of negotiation. The American proposals were not, after being co-ordinated with other western ideas, to be presented as a "package" to the Russians. They were to be regarded as a series of devices which, together or separately, might make a suitable "first step." The decision on which should be formally presented as the American position was to await a serious effort to discover which would be likely to get the most favourable reception.

It was only after a great tug-of-war within the Administration that this position was established. Many of the military leaders feared that, if popular hopes were raised too high, the natural pacificism of the American people would assert itself before there was any real evidence of Russian good will. Moreover, any suggestion that the United States might accept limitations on perfecting its long-range missiles comes up against intense resistance. However, two factors aided President Eisenhower in making his ruling that Mr Stassen should go ahead. The first is the alarming projections which have been made by the fiscal experts in the Department of Defence, showing that if things go on as they are now, with unconventional weapons being produced in quantity, the costs of defence will rise so much during the next five years that tax cuts will be impossible and additional taxation will probably become essential. The second consideration is the mounting demand for something to be done to reduce the danger from atomic fall-out at nuclear tests.

THE President's decision was most reluctantly accepted by many in the Administration who had watched proceedings in London with a jaundiced eye, waiting for opportunities to convince the President that he was wrong. In addition Mr Stassen's enemies are alert for any opportunity to discredit him; they include practically everybody in official Washington except the President and probably Mr Dulles. The Secretary of State has been annoyed by some of Mr Stassen's tactics and does not altogether share his optimism. But, in principle, Mr Dulles has always favoured putting one enthusiastic individual in charge of apparently intractable negotiations, as he himself was put in charge of the Japanese Peace Treaty; and he recently spoke fervently and with evident sincerity about the urgent need to make some progress on some aspect of disarmament if the hopes of the people were not to be completely dashed.

Mr Stassen has many qualifications for his present task. He is a man of flair, imagination and ingenuity in an Administration not over-endowed with these qualities. He took charge of disarmament when it seemed a sterile and unglamorous job and has worked at it with great enthusiasm. On the other hand he has the grave disadvantage of being a spent political force and a man who, in the course of his devious political career, has acquired an extraordinary capacity for inspiring mistrust. When America's allies showed uneasiness at his private exchanges with Mr Zorin, Mr Stassen's critics saw their opportunity. Reports of a "reprimand" and gleeful predictions that he was on his last mission were given to American journalists by anonymous "high officials." He was indeed told by Mr Dulles that some of his actions had been unwise but, as Mr Eisenhower insisted to the press on Wednesday, Mr. Stassen's instructions remain substantially unaltered, and he retains the President's confidence. Despite certain setbacks there remains in Washington something of the afterglow of Mr Stassen's habitual optimism.

Freedom's Great Day

THE firm stand for civil liberties taken at this session of the Supreme Court reached its climax this week when in three important cases the court warned Congress, the executive and the lower courts not to encroach upon the individual rights guaranteed by the Constitution. Each of these rulings, unlike that in the controversial du Pont case a fortnight ago, was supported by at least six of the nine Justices. It is now clear that in Chief Justice Warren and Justice Brennan—two Eisenhower appointees—and Justices Black and Douglas—two Roosevelt ones—the court at last has a solid core determined to set limits, not only to McCarthyism, which is on the wane, but to the tendency of the state to seek its own security without too tender a regard for the rights of the individuals involved.

In acquitting Mr John Watkins of contempt of Congress, Mr Warren, who wrote the majority decision, declared that although the right to investigate was a broad one, being inherent in the legislative function, it was not unlimited. Congress and its committees had a duty to make the purpose of any investigation sufficiently clear and definite for a witness to be able to decide whether he was within his constitutional rights in refusing to answer its questions on the ground that they were irrelevant. This, wrote the Chief Justice, is "a small price to pay if it serves to uphold the principles of limited constitutional government," and he insisted that there was no congressional power to expose for the sake of exposure, to aggrandise the investigators, or to punish those investigated. Mr Watkins, a trade union organiser, had answered questions about himself, but had refused to give the Un-American Activities Committee the names of others who had once been Communists. This decision, which may be the most far-reaching of the three, almost certainly means the acquittal of Mr Arthur Miller.

In the case of Mr John Service, who was discharged from the State Department in 1951, it was the Administration, and the Truman Administration at that, which was rapped over the knuckles in an unanimous decision. The court ruled that the power of summary discharge given to Mr Acheson by Congress was subject to the procedures adopted in the State Department to safeguard the rights of those under investigation, and that Mr Acheson had no power to override them.

THE 6-1 decision on the Californian Communist leaders—five of whom were set free and nine of whom will be given a new trial—involves the Smith Act of 1940, the government's chief weapon against the Communist party, and seems the most controversial. In 1951 the Supreme Court upheld the constitutionality of the Smith Act, which makes it a crime to conspire to teach or advocate the violent overthrow of the government, or to organise or help to organise groups dedicated to this purpose. The court has not reversed itself, but it has made convictions very much more difficult to obtain.

By construing the word "organise" as applying only to the reconstruction of the Communist party in 1945, it has made this provision useless in view of the three-year statute of limitations. (The present indictment was not brought until 1951.) The court also drew a fundamental distinction between advocating action to overthrow the government by violence, which is illegal, and advocating belief in such a course, which is not. The court also found the evidence against the defendants seriously inadequate. Justice Clark, a former Attorney General and a perpetual dissenter in such cases, complained with more apparent cause than usual that to construe "organise" thus narrowly defeated the plain intention of Congress and that for the court to "usurp the function of the jury" in dealing with the facts of the case was unprecedented. His dissent will encourage those who are already complaining that the court is exceeding its judicial responsibilities.

Victory in the Senate—

PRESIDENT EISENHOWER has won a real triumph in the Senate over next year's foreign aid programme, the key front in his battle for his Budget. Not only was he given practically all he asked, with comparatively little argument and only token cuts, but his victory was organised co-operatively by the leaders of both parties, returning to the bipartisan approach which was responsible for the programme in its early days and without which the Republican President cannot get anything at all now that both Senate and House have Democratic majorities. Mr Eisenhower asked for $3.9 billion; the Senate authorised $3.6 billion, with most of the reduction falling on direct and indirect military assistance. Under the Senate Bill funds for this will in future be part of the Defence Department's Budget, but they are not authorised permanently, as the President had requested. The Senate took a step in this direction, however, by authorising money for the 1959 fiscal year, as well as for the coming 1958 one. Moreover, by approving a loan fund for economic development, and authorising the full first instalment of $500 million, the Senate made an important advance toward putting foreign aid on the continuing basis which would make long-term planning possible.

Senator Morse, the most left-wing of Democrats, was one of the leading opponents of this internationalist policy, which he might have been expected to welcome in principle. His objection was not to foreign aid as such, but to giving so much power and so much money to a President whom he does not trust. He found himself in a strange alliance with Senators Jenner and Malone, from the far right of the Republican party, as well as with conservative southern Democrats. But the extremists could only muster 25 votes against the 57 cast by moderates from both parties. This satisfactory majority means that the House of Representatives, to which the authorisation Bill now goes, will hesitate to make any substantial changes in it, particularly since there too it has the active backing of both party leaders. The struggle will now presumably be transferred to the appropriation Bill, which provides the actual money for spending. But it looks as if, even at that stage, the fight might be less bitter than has become usual in recent years.

—and in the House

THE President won another victory this week, over civil rights for Negroes, in the House of Representatives. But unfortunately it does little to help the Bill to become law, for only in the Senate does a victory on this question have any real meaning. Civil rights Bills have passed the House before, only to be talked to death by southern Democrats in the Senate where unlimited debate is almost impossible to check. In spite of the parliamentary manœuvres now going on, there seems little hope of avoiding a repetition of these filibustering tactics, which will almost certainly succeed once again, since the Bill is reaching the Senate floor so late in the session. But at least an effort, backed by Senator Knowland, the Republican leader, is now being made to get the Bill to the floor immediately, and in the version approved by the House, by by-passing the Senate Judiciary Committee where it has been held up for weeks. Here again, as on the question of foreign aid, Senator Morse finds himself allied with his habitual enemies against his natural sympathies; a strong supporter of Negro rights, he refuses to accept a move which is designed to circumvent part of the legislative process.

The Senate Judiciary Committee's Bill contains the provision for trial by jury which was first conceived by Senator Ervin of North Carolina and which was only defeated in the House with difficulty. The main provision of the Administration's Bill allows the Attorney General of the United States to go to the federal courts for an injunction against threatened violations of civil rights; it is intended for use when Negroes are prevented from voting. Anyone defying the injunction could be charged with contempt of court; since speed is essential in this process, which is designed to prevent a crime, not to punish one, these cases are not tried with a jury. But Senator Ervin argues, and his argument has an appeal which extends far beyond the South, that this is a denial of the constitutional right to trial by jury. To this the Administration replies that no southern jury is likely to convict in a case brought on behalf of a Negro and that therefore Senator Ervin, as he is well aware, is in fact destroying the whole point of the Bill. With strong support from the President himself and loyal backing from Republican leaders in the House, the Administration's view prevailed there and the Bill emerged, after an unusually long debate for that chamber, in unexpectedly sound condition.

Unspotted Garment Workers

NEW YORK

MADISON SQUARE GARDEN was borrowed from the Billy Graham Crusade for an afternoon last week by the workers who make women's clothes to mark—with a specially composed aria, orchestral selections, the wit of Mr Milton Berle, and emotional speeches in many variations of broken English—a highly significant jubilee. It was in praise of Mr David Dubinsky, the excitable Russian refugee who has headed the International Ladies' Garment Workers Union for exactly twenty-five years, and who is a most conspicuous contrast to the tarnished teamster, Mr Dave Beck. In 1932, when Mr Dubinsky took over, the trade union was bankrupt and its membership at rock bottom. The union was bleeding from a decade of ferocious internal struggles between communists and anti-communists. As luridly illustrated by a current film called "The Garment Jungle," gangsters had gained control of parts of the fiercely competitive clothing industry in the guise of providing non-union employers with "protection" and supplying intrusive trade union organisers with a violent brand of

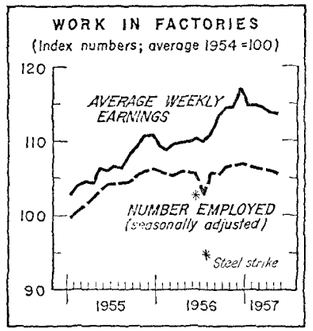
"education." The labour force consisted overwhelmingly of Jewish and Italian immigrant craftsmen, faltering in their command of English but highly proficient in the polemics of European socialism.

After twenty-five years, the "union welfare state" is accepted in 87 per cent of the workshops. The union's 450,000 members have a thirty-five-hour week, minimum wage scales, superannuation at sixty-five after twenty years' service, holiday funds and health insurance. There are eighteen union health centres—the one in New York occupying six storeys of a skyscraper, and employing a hundred and seventy doctors—and three "healthmobiles." At Unity House, in the Pennsylvanian hills, union families are provided with a superb but cheap holiday resort. In New York union members are given priority in great blocks of workers' co-operative flats which, with the aid of union funds, have risen above the cleared sites of slums and sweatshops.

There are other changes. The industry is no longer so completely concentrated in New York as it was and the work force has become overwhelmingly female. This means both a decline in ideological turmoil and a loss of interest in union work; there is now a very high turnover of membership. Many of the newer workers are Negroes, Puerto Ricans, and the Mexican-Spanish of Los Angeles. The leadership remains in the hands of those Jewish and Italian veterans who followed each other to Mr Billy Graham's flower-decked pulpit to choke out the forgotten names of the ILGWU's "apostles and martyrs." But there is great anxiety about where their successors are to be found. The union is hoping that its training institute, a pioneering "trade union college," will continue to attract promising recruits from outside as well as from within the ranks of the industry.

Academic courses in politics and economics are deftly combined with down-to-earth instruction in bargaining tactics and how to run a mimeograph machine. When a visiting lecturer finishes analysing "the dynamics of the American community," a staff instructor jumps up to explain how to make contact with the local powers-that-be. The graduate's zeal and staying power are tested by organising work on the "frontiers" of the South, Southwest and West, where clothing firms have fled in search of unorganised workers. Since most of the recruits come from New York they are first helped in the "speech workshop" to get rid of any local accent they may have and are advised that the styles of dress popular in New York need to be toned down for work in the field.

DESPITE their socialist origins the garment workers are no longer anti-capitalist. Symbolically, a few weeks ago $2.6 million of union funds were invested, in partnership with Mr Nelson Rockefeller, in a scheme to build workers' homes in Puerto Rico, where most of America's brassieres come from. But special bitterness against communists and gangsterism survives from the old days of internal conflict. In an office of the ILGWU headquarters, which houses Mr Dubinsky's private foreign office, sits Mr Jay Lovestone, who tried to seize control of the union when he was general secretary of the American Communist party. Dismissed from office by Stalin in person, he now devotes his conspiratorial talents to scheming for the downfall of communism and neutralism wherever they may raise their heads. Despite the dilution of its membership, the union's Jewish and Italian origins are not forgotten. A children's home and clinic have been built in Italy. A $1 million hospital is going up in Israel. The Israeli Government was given financial help when it was first constituted; and, at a crucial moment in recent Italian history, Signor Saragat's breakaway from the Nenni Socialists was encouraged and partially financed by Mr Dubinsky. At home, in labour's struggle to clean its own house, Mr Dubinsky was the first important labour leader to call for a purge, even if this involved bringing the government into labour's hitherto private affairs.



Although most of the ILGWU's local branches are affiliated with a third political party, the Liberals, and provide it with about a quarter of its funds, this paradoxically illustrates why American politics are most unlikely to follow the British pattern and produce a labour party. New York has a tradition of third, sometimes socialist parties. But their current incarnation, the Liberal Party, which was formed by Mr Dubinsky and others as a breakaway from the now defunct American Labour Party when its Marxist character became apparent, is undogmatic. Indeed, it has provided the means whereby a politically conscious trade union has shucked off its former doctrinaire associations. The party exercises its main influence on the choice of both Democratic and Republican candidates. The Liberals control enough votes in close contests to make their endorsements highly worthwhile.

THE presiding genius of all this activity is a restless, volatile man who can never sit still, who has a finger in every pie, and who talks by the hour at the top of his harsh, guttural voice. He can rule with the temper and tactics of a prima donna: when occasionally he is crossed at a meeting of the executive board Mr Dubinsky is likely to lie down on a couch and talk of retirement. But at Madison Square Garden he sang a very different song. The latest triennial report of the ILGWU, an intensely human document, is suffused with the "D.D." spirit. Its favourite expression is "dramatic." As events unfold in each successive region and trade, suddenly there is a verbal thunder clap, a cloud of sulphur, and "Pres. Dubinsky" is on the scene, taking over negotiations, rapping subordinates on the knuckles, deciding internal disputes or addressing "impressive" meetings.

If a recent federal indictment is sustained the union has one slight blot on its record. The manager of its lorrydrivers' branch, which Mr Dubinsky had kept in the union to police deliveries between manufacturers in New York and contractors outside the city to make sure the latter were not using non-union labour, has been accused of extorting bribes and has resigned. But the garment workers', stewardship of vast funds is in refreshing contrast to that of the main lorrydrivers' union, the teamsters. A central auditing department ensures that the ILGWU's welfare and pension funds, totalling $189 million, are rigidly segregated from normal trade union revenue and are invested only in government bonds or in equally safe government-guaranteed mortgages. However the contrast is not, as much recent discussion might suggest, one of "union democracy." Both the teamsters and the garment workers have democratic forms of organisation, but Mr Dubinsky has more personal power than Mr Beck ever had. He is never opposed for re-election, he is his own secretary-treasurer, and he has in his possession undated letters of resignation from all other officials of the union. The difference lies in the character and sense of dedication of the remarkable man whose silver jubilee has been so justly honoured.

Employment Paradox

THE present paradoxical economic situation in the United States, where a definite industrial recession has brought no more than a levelling off in the general prosperity, is reflected in the employment figures for May. The number of people working in factories—16,685,000 on the day of the count—continued to decline, as it has done for months, by more than the usual seasonal amount; the average time they worked was down to 39.7 hours a week, the lowest since September, 1954, with average weekly earnings therefore declining also, to $81.78. The fall was in the durable goods industries, particularly in factories producing heavy electrical equipment and other industrial machinery and in automobile plants. For this reason the industrial production index was also down slightly in May, for the third month, to 143 per cent of the 1947-1949 average.

Yet total civilian employment, at 65.2 million, went up during May by the 900,000 which is usual at this time of the year, when activity on the farms and in the building trade is rising. More significantly, even in spite of the decline in factory work, non-farm employment was at a record in May and was about half-a-million higher than in May, 1956, thanks largely to the service industries. This was offset by a similar decline in agricultural employment over the year, so that the total number of people at work remained almost the same. The number of unemployed, at 2,715,000 in May, four per cent of the labour force, was up by 107,000 and by .2 per cent over May, 1956. There are now 67,893,000 people in the civilian labour force (another 2,821,000 are in the armed services), just under 50,000 more than a year ago. But the increase between May, 1955, and May, 1956, was over 2.5 million; admittedly this was a record gain, but nevertheless the growth in the labour force has obviously levelled off markedly during the past year.

Defence Cuts Itself

THE problem which the Senate Appropriations Committee has to decide is whether it should restore some of the $2.6 billion the House cut from the President's defence budget for the year which begins next month. But what is troubling the armed services is how they can make do even on the $38 billion which Mr Eisenhower proposed last January before Congress decided that economy was the best policy. Spending on defence during this fiscal year has swollen alarmingly; in the last two or three months it has been running at a rate of $42 billion a year instead of the $36 billion it was estimated that it would cost. When the books are closed on June 30th, the services are likely to have spent $38.5 billion. Some of the increase will be offset by reductions in non-defence expenditures, but spending as a whole will be half a billion dollars higher, and the surplus about that much lower, than the Administration estimated in January. Unless the growth in defence spending can be checked, next year's budget surplus and any hope of a tax reduction the following year will fly out the window.

As the Director of the Budget recently pointed out, it is the Air Force which is primarily responsible for higher defence costs, partly because of the speeding-up of its ballistic missile programmes, and aircraft purchases, and partly because deliveries are quicker; this means contractors must be paid sooner. And it is the Air Force, which spends nearly half the defence budget, which has been the first to feel the sharp edge of the economies and controls that Mr Wilson, the Secretary of Defence, concludes are necessary. Much indignation has been caused in the Air Force by an order last month that it must conform to the practice of the other services and not embark on any buying programmes unless it has the spending authority to complete them. The Air Force has friends—notably Mr Symington—in the Senate, and for several days the Defence Department, which went to the Senate to plead for more money, had to defend itself against charges of sacrificing the national security to sordid considerations of economy.

Representatives of the Budget Bureau and of the services met at Quantico, Virginia, this month to see how the demands of security and economy could be reconciled, but the services have been understandably slow in producing detailed plans. As long as Mr Wilson is Secretary of Defence there will be no further measures of unification of the services, which some members of Congress feel is the royal road to efficient defence at a price the country can afford. His prescription is some postponement of purchases of arms, coupled with a reduction in the numbers of servicemen and civilians now attached to the services. But the final decision on how the defence coat is to be cut must be made by the President himself.

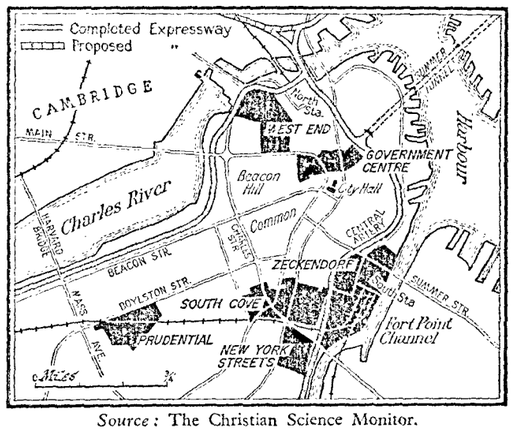
Atomic Partisans

THE President's choice of a Democrat, Mr John Graham, to succeed Mr Thomas Murray on the Atomic Energy Commission is not certain to allay Democratic indignation over the Administration's refusal to renew Mr Murray's appointment. He is a man of strong independent judgment who in their view has been a healthy thorn in the flesh of Mr Lewis Strauss, the chairman of the commission. To fill out the term of Dr von Neumann, who died earlier this year, the Administration has chosen Mr John Floberg, a political independent who served in Mr Truman's Administration as Assistant Secretary of the Navy. Neither Mr Floberg nor Mr Graham is well known in Washington, neither has much experience with the problems of atomic energy, and both will be given a "meticulous" review by Senators who suspect them of having been hand-picked by Mr Strauss.

Mr Murray spoke last week at the dedication in Dresden, Illinois, of a nuclear power reactor, the largest so far, which is being built by a group of private electricity companies; he welcomed their enterprise, which in his view will help

to make American industry a supplier of atomic plant to the world, but once more regretted that the government was not speeding this day by itself building plants to produce atomic power. Mr Murray's partisans in Congress have, however, apparently decided that the middle of an economy drive is not a propitious time to force the Atomic Energy Commission to spend more government money. But they have expressed their dissatisfaction with the Administration's "partnership" scheme, in which the initiative is left to private industry, and their displeasure with Mr Strauss, who is its strongest advocate, by another means. The Joint Committee has voted unanimously to force Mr Strauss to come to it for specific permission for each atomic partnership project.

On one atomic front, however, the Administration has won a qualified victory—over its own supporters. On Wednesday the Senate voted by 67—19, well over the necessary two-thirds majority, to approve American participation in the International Atomic Energy Agency. This victory was assured once the Administration had accepted an "understanding" proposed by Senators Knowland and Hickenlooper that the United States may withdraw if the Senate fails to approve any amendment to the agency's basic charter.



Boston Takes Heart

FROM A CORRESPONDENT IN MASSACHUSETTS

For thirty years Boston has been suffering from a building famine, but now at last a feast of future construction plans is being spread on drawing tables. Hardly a week goes by without significant progress being made in at least one of the ten major redevelopment projects now under consideration—and in some cases under way—in this historic city. The new era began when modern highways pierced through the central tangle of streets which still resembled cowpaths in planning, even if no longer in surface. Then came the federal government with liberal appropriations for urban renewal and, after that, a revival of faith in the city's economic future, stimulated by business interests from outside Boston. These moved in to dispel the miasma which has suffocated the city while buildings decayed, taxes rose, population declined, traffic strangled itself, and industry escaped to the airy suburbs.

Early this year the Prudential Insurance Company, with headquarters in Newark, New Jersey, and a rapidly expanding chain of regional offices, took over 31.3 acres of open space in the heart of Boston, a site which is unrivalled in any other large American city today. The new Prudential centre will be built on land which was already clear of everything except railway lines and a brick monstrosity of a convention hall. Already some of the lines have been taken up and architects and engineers are rushing plans for a 45 to 50-story office building—a steel and glass structure almost twice as high as Boston's present pride, the 26-story John Hancock building, which in turn dwarfs most of the city. Rounding out the centre will be residential flats, a new convention hall, a hotel, speciality shops, and restaurants—twelve structures in all which will take about five years to complete at a cost of some $75 million. Not accustomed to such grandiose planning, most Bostonians are almost beside themselves with gratitude.

Boston's decay is in part the outcome of the conservatism of its citizens where money is concerned. Many of them, for example, are bitterly opposed to the new Massachusetts toll road, which is intended eventually to connect with the Central Artery expressway ringing downtown Boston and will thus open up new avenues of commerce to the city; this opposition springs simply from dislike of paying the tolls. New England bankers have been reluctant to finance local expenditures, largely because as native Yankees they

distrusted a city government run by Irish-American politicians. But in recent years the Irish themselves have moved into the business world. More important, the present Irish mayor, Mr John Hynes, is not the buccaneer that Mr James Michael Curley, his predecessor, was. Furthermore, in the postwar climate of prosperity that is general in America, both businessmen and politicians have begun to take seriously the thought that they can do something to arrest the city's decay.

Once new highways were opened, industrial and real estate interests began to buy up nearby land. The city applied for federal aid to demolish buildings in two neglected districts, the New York Streets site and the West End. The New York Streets area has already been levelled and business interests are bidding for the land, while the West End project is in the offing. Where slums once festered, new blocks of flats overlooking the scenic Charles River will go up. After years of talk, the city finally decided to level the relic of a building called a city hall and began to plan a sixty-acre governmental centre nearby. This project was pushing ahead until the Administration in Washington withdrew its support in an effort to reduce what it regarded as inflationary spending. Planning for the South Cove area has now been slowed down for the same reason and the city fathers are protesting vigorously.

A New York financier, Mr William Zeckendorf, apparently seeing new life in a city which he once publicly stated was beyond hope as a business investment, has come up with the most dramatic and so far the least specific plan of all: a reconstruction which may eventually extend to as much as 886 acres of new facilities for commerce and industry across the Fort Point Channel. Boston is not quite ready to buy these huge ideas, largely because of qualifications put on them by the financier himself, but talk in Boston is big these days. Even the conservatives are beginning to admit that the city may have a future now that its face is being lifted.

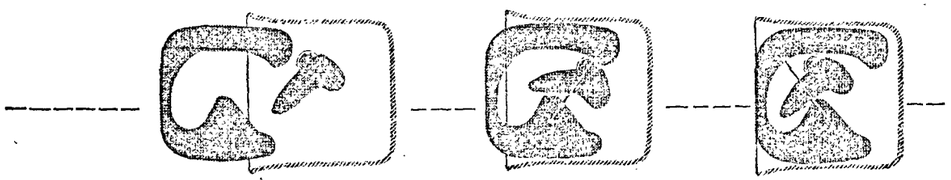
BRITISH OVERSEAS AIRWAYS CORPORATION WITH S.A.A., C.A.A., QANTAS AND TEAL



This is serious reading, a semi-technical statement about a new kind of Wilmot Breeden car-door lock now fast developing — so let nobody get ideas to the contrary.

The familiar rotary type of lock, by the nature of its mechanical principle is subject to 'torque' or twist when engaged, and needs special devices to counter up-and-down vibration.

The new Zero-Torque lock that Wilmot Breeden have originated, in their Research and Development Division, has the great advantage that the lock, when in the shut position, resists horizontal, to-and-fro motion without torque being induced: simultaneously a rotary wedging action cuts out all vertical movement. It is a principle employed by certain shellfish but not, hitherto, by man. (See diagram and note direction of force *through the centre of rotation* . . . and all will be clear.)

Wilmot Breeden, as you know, are specialists in car locks, window winders, handles, bumpers, steering wheels, etc. etc. Virtually every British car on the roads today carries Wilmot Breeden components.

Approach... Safety... Locked!

WILMOT BREEDEN are at Birmingham: *also at London, Manchester, Bridgwater, Glasgow, Melbourne, Toronto*

THE WORLD OVERSEAS

Canada and the Commonwealth

FROM OUR OTTAWA CORRESPONDENT

MR DIEFENBAKER will enjoy one weekend as Canadian prime minister before he leaves for the Commonwealth meeting in London. It is not his choice that this should be his first assignment; he would doubtless prefer to have time to look at some of the confidential files so long hidden from him. But when Mr St. Laurent accepted June 26th as the date for the London meeting, it never occurred to him that a change of government might have to be arranged after the election. Accidental as the timing is, many people both here and abroad will regard Mr Diefenbaker's immediate visit to London as symbolic. Neither Mr St. Laurent nor Mr Mackenzie King would have been quite happy about rushing off to London before they had had time to make some contact with Washington, or at least to arrange for a visit there immediately afterwards. The diplomatic service, brought up in these traditions, is not quite happy about Mr Diefenbaker doing it either. They would not mind if he promptly arranges to visit Washington, too, but they do not feel sure that he will.

It is easy to dramatise the opposing orientations of the Liberal and Conservative parties beyond all verisimilitude. But the difference is deep-rooted. The older generation of Liberals remains imbued with what Professor Donald Creighton (the biographer of John Macdonald, who shaped the Conservative party in the 1860s), has scathingly called the authorised version of history according to Mackenzie King. Its central theme was King's heroic and successful struggle to free Canada from the tenacious coils of British Imperialism. The Liberals found it politically profitable, says Professor Creighton, and propagated it for thirty years after it had lost either truth or utility. The result was that they went on fighting mythical encroachments from England through a long period when statesmanship should have been directed to the real threat of economic and financial encroachment from the United States. The persistence of the historic fear of British dominance was curiously demonstrated by Mr St Laurent during last November's Suez debate when he let forth an outburst about "the supermen of Europe." He would not have said it except in anger, but that made it the more revealing. A more deliberate example came in last month's election campaign from a well-educated Liberal candidate in a prosperous middle class English-speaking district of Montreal, who surprisingly solicited votes for "the party which had secured Canada's independence."

But by now most of the Liberal generation coming to the forefront, including members of the last cabinet, have largely lost interest in past struggles and are increasingly concerned about growing United States influence. They often found Mr Howe and Mr St Laurent too complacent in their dealings with the United States, and were growing to distrust private pow-wows which never seemed to produce any result but left senior ministers feeling good. And the Conservatives are most unlikely to adopt more anti-American policies than a younger Liberal government would have done. They do not want to scare American money away any more than Mr Howe did. But it is possible that they will sound more truculent and be less concerned to maintain a façade of "being buddies" with Washington. They would certainly like to find a better counterbalance in the Commonwealth against the growing preponderance of American interests here. Mr Diefenbaker, who has long advocated a Commonwealth trade conference for this purpose, is bound to raise this possibility in London. It will not be easy for him, because his officials have long been telling their former ministers that nothing could be gained from such a conference, they have not had time to prepare a brief on the other side, and Mr Diefenbaker still lacks official information on which to base his own brief.

The Conservatives' leaning toward the Commonwealth rather than the United States is based on a historical tradition which gets its inspiration from the 1870s. Its symbols are Macdonald's determination to build the Canadian Pacific railway, and his "national policy" of protection. They find here, as Professor Creighton has eloquently described, a true parallel to present day problems. Only the determined exercise of the state's power could create a viable national unit out of British North America's elongated transcontinental strip of territory, as Macdonald saw it. Only a similar determination, according to this view, can preserve it today; economic and financial forces left to themselves will end by submerging Canada.

This is the fundamental political philosophy of many Canadians who are not all Conservatives. But a government of whatever party will be very cautious about putting it into action. Certainly, Mr Diefenbaker's government has not begun to work out coherent plans in domestic or foreign policy. It would be quite unrealistic to expect any considered policy statements from him in London. But it will be an excellent opportunity for him to get a full briefing on the world situation as it appears to the other prime ministers. He has the quickest lawyer's ability to grasp a brief. He also has the jury lawyer's ability to make resounding speeches on a rather thin knowledge of the facts: but it is to be hoped that will not have to be exercised at the London conference.

New Zealand's Disillusion

FROM OUR CORRESPONDENT IN WELLINGTON

MOST of the members of the 17-man trade mission to London have now returned home. That the mission was heavily defeated (as was described in *The Economist* on June 1st) has been acknowledged by the press, and the public has agreed with the comment of the Leader of the Opposition, Mr Walter Nash: "Never have so many at such cost taken so long to achieve so little."

Although Mr Nash's comment sums up most people's feelings on the results of the mission, it is also realised that even if the delegation had been well organised, well led and small in numbers it might not have achieved much more. As it was, the amorphous unbalanced mission has brought political advantages to the government. A general election is due this year, and meat producers and dairy farmers are vocal political groups. While most of the farmers vote for the government (National) party and not for Labour, they can nevertheless alter the political atmosphere and make the party in office very uncomfortable.

The heavy fall in dairy produce prices in the British market earlier this year and the fall in meat prices a year ago, coupled with the threat of an expansion of Argentine meat supplies, alarmed the farmers and caused them to press energetically for the New Zealand government to intervene. Although the government probably realised that it would be difficult to achieve much because of Britain's interest in gestures about free trade and its need for cheap food, it arranged to send a delegation to London—but a majority of this delegation were farm leaders. It is unorthodox and generally unwise for pressure groups to be represented in a delegation discussing national policy with another government, but Mr Holland evidently thought that it was worth the risk and danger.

★

He has been amply justified. The skill and hard bargaining of the British officials have provided the leaders of the New Zealand farm groups with a very necessary understanding of the difficulties New Zealand's primary produce faces in what they thought was a preferential market. From now on farm leaders will be explaining to their conferences the facts of life as Britain sees them, and the New Zealand government will emerge in a much stronger political position. It was no use for a government delegation to be defeated; for political reasons, a delegation of primary producers had to feel defeat.

But the effect of the defeat has gone well beyond immediate political considerations. The New Zealand public has in the past been heavily sentimental about the connection with the home country and has warmly applauded reciprocal preferences between the two countries. This sentiment explains its support of Britain over the Suez venture. But the jolt that the British rejection has given New Zealand may be the beginning of a change; sentiment will slowly fade if there are further examples of Britain's businesslike attitude. The shock of defeat will increasingly produce a feeling that the Commonwealth is not what it was. Australia recognised this years ago, and New Zealand is recognising it now.

Today over four-fifths in value of the British goods imported by New Zealand have a tariff preference and a substantial proportion of these preferences are higher than New Zealand undertook at Ottawa to extend to Britain. Although his advisers may have pressed him to review this situation, Mr Holland hesitated, feeling that it might outrage public sentiment if New Zealand began to be businesslike in trade matters with Britain. Politically, he need worry no longer. For Britain itself has, through its hard bargaining, produced the inevitable reaction in New Zealand. The farmers, formerly the greatest proponents of preferences to Britain, are now the most eager for a heavy reduction.

Mr Kadar's Paternal Rule

BY A CORRESPONDENT

BUDAPEST intellectuals are maliciously rubbing their hands at the Kadar regime's recent pronouncements. As one of them put it: "At long last they have confessed to being Fascists. Alone amongst the world's Communist parties, the Hungarian party no longer pretends to be the executor of the will of the 'masses.'" Indeed, the peculiar etiquette obliging the party to claim popular support for its policies seems to be on the way out in Hungary. The frank arrogance of a paternalistic autocracy is gradually taking its place. In winding up the perfunctory May session of the Hungarian parliament, Mr Kadar refreshingly declared: "The Communist leader does not always do what the people would have him do; but he always does what serves their best interests." The inner core of the party, said to number 15,000 convinced "missionaries," regards itself as a besieged but resolute élite obeying the call of history.

This shift towards greater frankness is now visible in the tone of the whole propaganda machinery. The party's *Leitmotif* is self-congratulation at the "courage with which we are carrying out our seemingly unpopular policies." Illusions about the measure of their comrades' unpopularity are discouraged. Their utter dependence on the Soviet presence is impressed upon them. Inside the party, the feeling seems to be that the masses are almost incorrigibly reactionary; workers' councils are publicly condemned for hankering after the "support of the backward masses."

The conflicts within the party seem, on the whole, to be subordinated to the overriding need for unity in the face of the counter-revolutionary threat. But they flare up whenever the need to stick together in self-defence appears less pressing. Both Mr Kadar and the flamboyant Mr Marosan have admitted the existence of conflicts in recent speeches. Mr Marosan in particular made it clear that "revisionism," striking as it does against the party's monopoly of power, is regarded as a worse sin than "sectarian dogmatism" which merely perverts it. While admitting the right to ideological discussion within the party, he uttered a caution against "degrading it to a debating society." He also hinted that the Rakosites, by their sulking, are unwittingly aiding the counter-revolution, while Mr Kadar, in truly dialectical fashion, lashed out against the heresy of national communism.

The leaders, however, are fairly satisfied with the state of the party, which they regard as healthier than in Rakosi's day. No great pressure is put on the 400,000 or so members of the pre-October party who have not "yet" joined the

"*Making the world more vivid and comprehensible...*"

THESE words, used by Sir Kenneth Clark when he opened the new schools' television broadcasts by Associated-Rediffusion, describe exactly the purpose of these programmes. They set out to extend children's interest in the world around them, to train them to use their eyes.

It is a service at which television excels. Visual aids play a large part in teaching and now here is a visual aid which has movement and sound, immediacy and flexibility.

The teaching profession has been consulted at all stages in the planning of these schools' television programmes, and is now engaged in offering constructive criticism of the lessons. This co-operation is welcomed by Associated-Rediffusion who are equally eager that this experiment should be a success.

Kadar party. Some are genuinely disappointed in the creed, some are fence-sitters, and some deeply contemptuous of the Kadar clique, regarding them as weak-kneed amateurs unfit to clean the boots of such great professionals as Rakosi, Gerö and, on a smaller scale, themselves. Kadarites retort that it was the old party guard which blew hot and cold and cancelled itself out; the Kadar party boasts of a much more consistent toughness. As if to confirm the boast, Budapest is full of rumours of prominent revolutionaries being tortured or beaten to death.

But Mr Kadar's paternal government, while beating, bullying and threatening its subjects, allows them more material comforts and more market freedom than is enjoyed by inmates of the "socialist camp" elsewhere. In the past, consumption was a residual item in the social accounts. Today, it seems to have first claim on resources. In the current year, investment will reach no more than 9.3 per cent of the gross national product. Fully one quarter of it is to be devoted to housing compared to barely one-twentieth in the past five years. New industrial investment is at a virtual standstill and, with minor exceptions, unfinished projects get only care-and-maintenance expenditure. Defence outlay is cut from over 4,000 to a modest 1,900 million forints.

★

Wage and salary increases added 7 billion and the abolition of compulsory farm deliveries 4 billion forints to personal spending power. A 53 billion forint "merchandise fund" (consumption goods and services) is needed to match it. With the proceeds of the Soviet loan approved in April, 50 billion forints worth will in fact be available. To reduce the gap, 2,700 out of the 80,000 prices fixed by the State have now been raised. But the upsurge of demand for consumer goods continues. Stocks in State shops are three-quarters of what they were a year ago, and turnover is much larger. Russian and East German motorcycles, washing machines, tape recorders are sold before they are unpacked, though prices are very high by western standards. Woollen cloth, and quality textiles generally, are particularly dear and scarce, and smuggling them brings great profits to itinerant sportsmen and artists. State shops have become sensitive to consumer tastes, and the Ministry of Foreign Trade meets their requirements by importing more without batting an eyelid. This year's foreign trade plan provided for 10 per cent lower exports and 50 per cent higher imports than the 1956 levels; the import "plan" included $180 million worth of consumer goods, three times the 1956 volume. In fact, however, in the first five months of this year consumer goods imports were running at an annual rate of $350 million. Consequently, the Soviet loan was running out much faster than it was supposed to do.

In his latest speech, the Minister of Industry, Mr Apro, excused this state of affairs by saying that socialism must be built so that the present generation should also benefit from it; but he gave a warning that without the reintroduction of an incentive wage system the present standard of living cannot be held. The chairman of the Planning Board and others have also done some thinking aloud recently, to the effect that "if the present poor ratio between consumption and accumulation is maintained, the development of our people's economy will be slowed down for many years." The avowed aim is to "stabilise" (not to raise further) the standard of living, but even this is said to be a difficult task, because the regime wants to resume industrial investment in the 1958-60-three-year-plan period.

Opinion in Budapest is that the present economic laxity is but a brief honeymoon, and that the Kadar regime will before long stop "bribing the masses." In private, leading communists disclaim any wish to revert to the gigantomania of the Rakosi era, but insist on the imperative need to raise the ratio of investment in the national income. The higher rate of growth of the OEEC countries is giving rise to anxiety in the Planning Board, and Rakosi's famous dictum ("We must not eat up the future") is again being approvingly quoted in high quarters.

Between Bonn and Moscow

FROM OUR BONN CORRESPONDENT

CONSIDERING their professed long-term objectives, it is really not at all surprising how long it takes Soviet and German statesmen to get into position to do business with each other. On both sides the curiosity excited by the prospect of a close encounter is understandably great. So is the sense of the occasion's potential importance. So are the uncertainty and the wariness. And these various emotions are permeated with that peculiar fusion of contempt and respect which each has for the other..

It was on February 5th that Marshal Bulganin wrote to Dr Adenauer proposing that something "concrete" should be done to improve relations between federal Germany and the Soviet Union. He suggested holding talks in Moscow with the object of promoting trade between the two countries, fostering cultural and scientific collaboration, and establishing consulates. The consulates, Marshal Bulganin significantly hinted, might be able to expedite the repatriation of German and Russian citizens stranded by the war. Cautious as it was, the Chancellor's businesslike response encouraged the Soviet prime minister to propose, in March, that talks should begin in April. After some German boggling at subsequent shifts of emphasis in the prospective agenda, Marshal Bulganin, on May 23rd, named June 15th as a suitable day to start. June 15th has come and gone, and Dr Adenauer is still making sure. "Do not think," Mr Mikoyan is reported to have observed testily on hearing of the latest German reservations; "Do not think we have not noticed that Bonn wants to put off the negotiations. But, if they have time, so have we." That may well be. Yet until now the Russians have, in fact, seemed markedly eager to get a move on.

It is the belief of the west German foreign office that exigencies of face-saving, rather than of trade, have been chiefly spurring on the Russians—that their advances to Germany are part of a larger movement to break out of the isolation in which they have found themselves since they struck down the Hungarians. Dr Adenauer's easy initial concession to this presumed desire to cut a more respectable figure, at home as well as abroad, has been to dignify the prospective leader of the German delegation to Moscow, Herr Rolf Lahr, with the rank of ambassador-extraordinary. As for their stated aims, the Russians probably appreciate that they are not likely to persuade the Germans at present to commit themselves to a long-term trade agreement which would fit in nicely with long-term Soviet planning. Their negotiators are expected to press none the less for deliveries of certain kinds of machinery and precision instruments over a period of from five to ten years. They will also try to arrange, through an agreement for cultural exchanges

and scientific collaboration, for the fruits of German research and experience to become more readily available to the Soviet Union. And they will be all for posting approved Soviet observers in such useful places as Hamburg, Hanover, Düsseldorf, Munich and Stuttgart.

With less than three months to go to the Bundestag elections it would be unconvincing were Dr Adenauer and Herr von Brentano to pretend that their conception of the pending talks was not coloured to some extent also by hopes of enhancing their prestige. They know they will cut little ice in the beer halls by agreeing to some scheme for exchanging opera companies and laboratory findings, which most Germans would suspect of benefiting chiefly the Russians, both technically and politically. Nor will the Germans be easily persuaded they are getting a good bargain out of consulates in Leningrad and Kiev in return for Soviet consulates in Hamburg and Düsseldorf. An agreement to expand trade would sound more impressive. But, again, Russia has so little to offer Germany at present. Without the help of a formal agreement, trade between the two countries is already running smoothly enough; it increased by 50 per cent during the first five months of this year.

Reunification apart, what Germany wants now from Russia are the 80,000 to 100,000 Germans, mostly civilians, who are living today against their will somewhere or other in the Soviet Union. Many are former Reich citizens, deportees and stragglers of a lost war. The remainder include such self-conscious *Volksdeutsche* as were caught in the submergence of the Baltic States. Appealing letters from these would-be repatriates have been arriving in Bonn by the crate from the German embassy in Moscow, and vast pains are being taken to check the name, address, and German background of every writer. When they turn to this problem the Soviet negotiators will find Herr Lahr, (whose endurance has been tempered in the support costs tussle) embarrassingly well briefed. Dr Adenauer has made it quite plain that Germany will meet none of Russia's wishes before a satisfactory settlement of this matter has been arranged. This is naturally a popular line at home and it must please Dr Adenauer to hear the Social Democrats contesting its validity. Herr Ollenhauer may have his good reasons, but they are hardly vote-catching.

When all is said and done there can be little hope of a genuine improvement in Russo-German relations so long as Russia keeps Germany divided. At Helsinki last week Mr Khrushchev uncompromisingly repeated the familiar terms for reunification: the east and west regimes, he said, must sort it out by themselves. For Dr Adenauer's regime—or for any west German regime conceivable at the moment—Mr Khrushchev's advice continues to be unacceptable.

Can Saud Play Peacemaker?

FROM OUR MIDDLE EAST CORRESPONDENT

THE communiqué issued after the Saud-Hussein talks in Amman—in which both kings re-affirmed their adherence to the "solidarity" pact with Egypt and Syria—was a striking advertisement of King Saud's anxious wish to avoid a rupture with Egypt. The statement was issued when Jordan and Egypt were seriously at loggerheads, and not long after King Saud had pledged King Hussein his full support. But suggestions that Saudi support for King Hussein necessarily implied hostility to Egypt (which were enthusiastically put about in western circles) arose from a misreading of Saudi policy.

There is no hard evidence that King Saud has ever contemplated setting up a new Arab axis to oppose that of Cairo-Damascus. He is still wedded to Arab nationalist policies of which President Nasser is the most powerful exponent. Rather than trying to split the Arab block in an effort to undermine Colonel Nasser's prestige—a policy that could only benefit Israel—he is exerting himself to heal existing rifts and place Arab unity on a firmer, and perhaps broader, basis. It is held in Riyadh that a breach between Amman and Cairo would be a family tragedy, which all members of that family must try to avert.

The spectre haunting King Saud is the failure of the Arab block policy in Jordan. He, no less than Presidents Nasser and Shukri Quwatli, pressed Jordan to get rid of the British treaty and accept Arab, rather than foreign, aid. One of his main objectives now is to restore political conditions which would enable Egypt and Syria to meet their financial obligations towards Jordan—and with reasonable promptness. The essence of the problem is time. The longer Jordan remains at daggers drawn with Egypt and Syria, the more urgently and the more irrevocably will it be driven to seek aid from the West, thus making nonsense of the Cairo agreements, which specified neutrality and opposition to imperialism. Can Jordan make do long enough for a solution of present animosities to be found, and for the terms of the Arab Solidarity Treaty to be fully implemented? The answer is probably "Yes." But that answer can be given, paradoxically enough, only because of the speed with which the United States has rushed to the aid of the new regime in Jordan.

★

As a result of United States policy, the financial position of Jordan is not nearly so precarious as it seemed likely to be earlier this year. Under the terms of the Arab Solidarity Treaty concluded in February, the Jordanian government should have received by now, as the first six-monthly instalment of Arab aid, the equivalent in hard currencies of £2½ million from Saudi Arabia, £E2½ million from Egypt and £E250,000 from Syria. Only the Saudi contribution has actually been paid; and, in view of the bitter exchanges between Jordan and Egypt, and between Jordan and Syria, the payment of the other contributions is likely to be delayed, if not altogether withheld.

On the other hand, the Jordanian government has received a promise of $10 million from the United States, and the first dollar aid cheque—for half this sum—has been handed over. The amount of dollar aid already promised nearly equals the combined payments due from Egypt and Syria. In addition, the authorities in Amman have asked the United States for a further $13 million for development purposes. The only "string" attached to American aid is that it should not be devoted to military expenditure, but to development or to budgetary support. But there would appear to be nothing to prevent the Jordanian government from using it to finance general government expenditure, and transferring funds earmarked for that purpose to army account. The string, in short, is tied with a knot that can easily be slipped.

The Jordanian government is also pressing the British Government to make available rather more than £1 million,

Continued on page 1077

Continued from page 1076

representing the undrawn part of the interest-free development loan which a British Government representative declared willingness to advance last year. It appears that the British Government is under no legal obligation to meet the Jordanian request, but it is probable, in present circumstances, that it will take a sympathetic view. No official reaction from Whitehall has yet reached Amman.

There remains at the disposal of the Jordanian government a substantial cash reserve. According to published official figures, it stood at £8 million on December 31, 1956, of which about two-thirds was on deposit account. The stoppage of the British subsidy early this year led to withdrawals roughly estimated by informed observers at about £2 million. There remains, therefore, a fairly fat margin of about £6 million for use in emergency.

The strength of the financial position is shown by the recent history of the debt incurred by Jordan under the terms of the agreement that terminated the Anglo-Jordanian Treaty. The agreement provided for the payment by the Jordanian government, for the fixed installations left by the British forces in Amman, Mafraq and Aqaba, of a total sum of £4,250,000. £1,250,000 fell due on May 1st and the remainder in six annual instalments of £500,000 each. Of the first payment due last May, over £500,000 was offset against the instalment of the British subsidy which fell due last February, but which was actually withheld pending the conclusion of the agreement terminating the treaty. The sum due to Britain in May was thus just over £700,000. Owing to temporary financial stringency arising from the severe crisis that shook Jordan in April, the Amman government asked that payment should be deferred a month. The request, which was granted, gave rise to free speculation that the payment would be delayed indefinitely. In fact, however, the position was sufficiently retrieved within the month to enable the Jordanian government to meet its obligation on the date agreed; and on June 1st the cheque for £702,000 was handed over.

★

If, thanks to prompt American support, the financial position is fairly sound, why, it may be asked, should King Saud hark back to the position under the Arab Solidarity Treaty? The answer lies in the strength and nature of Arab nationalism. Whatever King Hussein and those close to him may think, the Arabs in general reject the idea of foreign aid, and no regime dependent on it is likely to last long. Jordanian public opinion, as expressed in the fairly conducted elections last October, rejected the British subsidy. There is no reason to suppose that, once recovered from the shock of the April crisis, it will tolerate indefinite dependence on dollar aid. The alternative is for King Saud to foot the whole bill himself. But what interest has he in financing single-handed so expensive a colony?

Cairo and Damascus, however, are not making his peacemaking role an easy one. Their first reactions to his efforts to act as a conciliator between them and the present regime in Amman suggest that he has failed. No formal government pronouncements have been made, but enough has been said to indicate that neither Egypt nor Syria intends to support Jordan financially. In the course of a strong speech, the Syrian deputy premier and acting defence minister, Khaled el Azm, has brushed the Amman communiqué aside as "words without deeds." That he singled out for special attack Samir el Rifai, is a pointer to Egyptian and Syrian thinking, for Samir Pasha is outstanding among politicians who held high office in the days of British influence, and who are regarded as lukewarm—at best—in hostility to imperialism. As long as such men remain in power, the word of the Amman government will count for nothing in Egypt and Syria.

King Saud, therefore, is in a dilemma—pledged to support King Hussein, yet pledged to Egypt and Syria. He will doubtless exert his influence in favour of moderation, but it is unclear as yet whether he is prepared to advise King Hussein to meet the Egyptians and Syrians half way by changing the complexion of his government. Past experience suggests that King Saud's approach to this problem will be neither hasty nor drastic.

TURKEY IN TRANSITION—II

Democracy in Trouble

BY OUR SPECIAL CORRESPONDENT LATELY IN ANKARA

TURKEY'S democracy is like a precocious child who is not fulfilling his early promise; if he had not done so well so early, his later lapses would not arouse nearly so much comment or disapproval. In 1950, Atatürk's party, the People's Republican Party, was overwhelmingly defeated by the Democratic Party in Turkey's first genuinely free elections. It accepted the popular verdict and retired into opposition. The world watched with gratified surprise the exemplary way in which a hitherto authoritarian state took to democracy. It assumed, without any very good reason, that Turkey would continue to learn in a few years what other countries had taken decades and even centuries to master.

At the moment the assumption seems ill-founded. Ever since the Democrats again swept the polls with an even larger majority three years ago, Mr Menderes, their leader, has beaten a steady retreat towards authoritarianism. True, Turkey is not in serious danger of abandoning democratic rule altogether. Most people would agree that there is a limit beyond which the prime minister cannot safely go; eighteen months ago he overstepped it and was checked—temporarily at any rate—by members of his own party. He could overstep it again and suffer a more lasting setback.

It is true that, by tending to fight with no holds barred, the opposition makes trouble for itself. But it is also true that Mr Menderes is a strong and dominating personality; he believes that he knows what to do for the best, and he is exceptionally intolerant of criticism. As a result, the opposition finds that its loyal duty to oppose is more and more circumscribed. Inside the single-chamber Grand National Assembly, it complains that its work is hampered by the government's frequent resort to automatic closure. (How much the opposition would, if it could, paralyse parliament by filibustering tactics, one does not know.) Yet the heated debates earlier this month, set off by the case of an Imam accused of making political propaganda in his mosque, demonstrated that the Turkish parliament is not just a rubber stamp; the government's proposal on this matter was defeated with the help of its own supporters.

Outside parliament, too, the opposition is strictly hedged about. Political meetings have been banned for the past year,

except during the period immediately before general elections, on the ground that the opposition had been trying to raise the political temperature of the country to fever-pitch. Local party organisations can hold only three meetings a year and the present electoral law, which has been introduced since the last elections, is, in the opposition's view, heavily weighted in favour of the party in power. One of the main aims of the opposition is to get this law amended before the elections which are due next year, but which, according to persistent rumours, may be held earlier.

Towards the end of the budget debate in March, Mr Menderes, moved perhaps by his growing economic difficulties, perhaps by a wish to divide and confuse the opposition or perhaps simply by a desire to lower the political temperature, made a conciliatory overture towards the opposition. Mr Inönü, the leader of the PRP, thinking no doubt that to return a dusty answer would be bad tactics, made a courteous response. The other two opposition parties, the Freedom Party, formed last year by a group of dissident Democrats, and the right-wing Nation Party, held that fine words were no substitute for reforms, although, in fact, Mr Inönü had coupled his courtesies with demands for specific reforms. They felt, moreover, that the PRP's unilateral action was a breach of the agreement on parliamentary collaboration that the three opposition parties had made last summer. In the event, however, nothing much has come of this truce beyond some unfortunate recriminations among the opposition parties.

★

In his reply to the prime minister, Mr Inönü stressed the importance of preserving the freedom of the press and the independence of the universities and the judiciary. All these are being undermined. Not long ago one prominent provincial journalist, who has fallen foul of the press law, described the habits of Arizona ants who march in column and when they come to a pit, pile into it until it is filled up ; the rest can then march safely on. The meaning behind this little parable was that some journalists must sacrifice themselves in order to keep alive the idea of a free press. It reflects the prevailing tense atmosphere but exaggerates the actual state of affairs. Although a steady trickle of journalists are landing in gaol or paying large fines, the press contains plenty of criticism. The government maintains indeed, that the freedom of the press has been so abused that the present restrictions on it are both necessary and justified. Under the press law introduced in 1954 (and amended in an illiberal direction last year) journalists accused of libel are not allowed to defend themselves with documentary and factual evidence. Moreover, the law is drafted in such vague and ill-defined terms that, in effect, the government has very wide powers to clamp down on journalists and newspapers. Reasoned and measured criticism usually gets by. But anything that is polemical or strongly worded, or in the nature of a definite campaign, usually does not. A newspaper can often get away with facts and figures about the country's economic difficulties—but not with a cartoon that satirises the difficulties in a popular way. It can probably safely risk printing a speech that is highly critical of the government ; but if it prints any of this speech in bold type or banner headlines it may find itself in hot water. In short, a sword of Damocles hangs poised over the Turkish press ; it is surprising, and commendable, that it has not had a more paralysing effect on those who must work under it.

In its attitude towards the press the government seems disposed to be fairly tolerant of serious "high-brow" criticism written by intellectuals and appealing primarily to their own kind—who, numerically, of course, are a very small proportion of Turkish voters. Yet it is extremely sensitive to even the most moderate and academic criticism made by university teachers to their students. Last year a lecturer in economics at Istanbul who suggested that Turkey needed proper economic planning only kept his post because his faculty refused the government's request that he should be expelled. Since then there have been several more or less forced resignations at Ankara university for equally tenuous reasons.

★

But the university teachers who have fallen foul of the government would be the first to agree that it is the threat to the independence of the judiciary that is the most serious aspect of the present situation. It is a threat that could affect ultimately every Turkish citizen and it is felt all the more keenly because Turkey, although it has not yet introduced trial by jury, has had good reason to feel proud of the quality and incorruptibility of its judicial system. Under a law passed soon after the 1954 elections, the government can retire any judge who has given 25 years' service, whether or not he has reached the retiring age. The law affects most of the higher court judges and it has not remained a dead letter. No reason has to be given for any forced retirements, but there is evidence that those judges whose decisions run counter to the government's wishes are running a serious risk.

Present trends are all the more regrettable since, even from the government's point of view, they appear to be quite unnecessary. Any serious danger from reactionaries who would like to overthrow the Atatürk reforms seems to be negligible ; nor, unless they queer their own pitch—as they might do if Mr Menderes pursues his present course—is it likely that the Democrats will be turned out of office. Many observers doubt whether a majority of Turkish voters have come round to the People's Party again, and the Freedom Party is as yet a dark horse. It is a party of quality but as yet without sufficient popular appeal. If, before the next elections, it could acquire a strong leadership and a more widely based organisation than it has at present, it might spring a surprise ; but few outside the party are optimistic of its chances.

The Democrats are still thought to enjoy the support of the peasants who make up about 80 per cent of the population and for whom the present government has done a great deal. The big question is whether it can keep this support if the peasants come to be seriously affected by the country's economic troubles. Opinions differ whether they are already. The peasant is better off than in 1950, but as his standard of living has risen, so have his aspirations. In 1950 he was asking for the barest necessities ; now he is asking for a new battery for his radio set. But what if he cannot obtain a battery? The argument that present frustrations and shortages are an acceptable price to pay for future greatness and well-being may eventually wear very thin with those who have already enjoyed the beginning of better things. Why, they may ask, should one generation bear the whole burden?

(Concluded)

No typewriter improves with age. Eventually you begin to pay more for its keep. Pay for endless maintenance: for the expensive typing skill it wastes: because, as well as wasting time and materials, it produces letters that harm your company's prestige.

Bring in a new Remington and things look up at once. For a fraction of your secretary's salary you get a machine that gives you letters you are proud to sign. You save money on retypes and time on maintenance. You soon find that the best typing in the world costs a lot less than the stuff you have been putting up with.

Remington make a complete range of superbly designed office typewriters: brilliantly engineered by Scottish craftsmen to incorporate all the latest time- and labour-saving ideas. One of them is exactly right for *your* office. During the whole of its long working life, it will save you money in a really *noticeable* way.

See, too, the Remington Ultravox dictating machine and its exclusive sound sheet. With Remington Ultravox, those costly, time consuming 'dictation bottlenecks' become a thing of the past.

THE BUSINESS WORLD

Fuel for the Switch

MONOPOLY power can seldom have been more blandly abused in modern times than it has been this week by one British nationalised industry against another, with the Government's connivance if not indeed at its insistence. For the National Coal Board is putting up the price of the small coals that power stations use at the same time that it is lobbying politically to curb the rate at which the Central Electricity Authority may switch to oil as an alternative fuel. Already—this summer, not in five or ten years' time—there is a potential surplus of these coals, and in future this may increase even though other coal, and fuel in general, remains short in Britain. Power stations are the only customers of the National Coal Board capable of using more of this duff over the years ; and the Coal Board is concerned to ensure that small coal from British mines does not go unsold while imported fuel is burned under British power station boilers. It takes some gall, in the face of this surplus, to raise this price. But the Board and the Government have not been willing to face the logic of raising the extra revenue they need by pricing the large coal at its true current cost.

The implications of the Suez troubles, and advances in nuclear engineering, made it inevitable that this issue would arise eventually ; an unexpected comeback in coal output, the broad stability of industrial production, and a warm winter have brought it up in months instead of years. Three years ago, fearing with every justification that during the next decade the demand for fuel in Britain would outstrip any possible increase in coal production, the then Minister of Fuel and Power persuaded the nationalised electricity industry and the major oil companies to contract for the use of growing quantities of fuel oil in power stations—some 5-6 million tons in a year by 1960, equivalent to 8-9 million tons of coal. In later years, he planned, the continued expansion of electricity should increasingly be supported by nuclear generation ; but he did not expect this to help much before about 1965.

Last year's breakdown in normal supplies of oil from the Middle East precipitated the Government's decision to accelerate this nuclear programme. By 1965, atomic electricity is now intended to save 8-10 million tons more coal a year than was originally intended ; by the end of 1965, nuclear stations are to supply the equivalent of 18 million tons of coal a year. The extra saving of conventional fuel is, probably not accidentally, just about equivalent to all the oil CEA has contracted to be using at that time ; and the total nuclear contribution expected then compares fairly neatly with the "shortage of coal for electricity purposes (by 1965) of about 17 million tons a year," of which Sir Josiah Eccles, deputy chairman of CEA, was talking this week. If that much less conventional fuel should be required for power generation by 1965, the obvious question is : "Less of which conventional fuel ?"

THE Central Electricity Authority had in fact told the Coal Board and the oil companies that over the coming decade it expected to require a good deal more of both fuels than the estimates (set out in the table on page 1082) now suggest. The choice is in fact arising almost before CEA has had any significant quantities of oil under the 1954 contracts, and well before completion of its plan to convert twelve power stations now working and four more still to be built to dual-firing. The final cost of electricity generated from coal or oil may not differ much under these particular contracts for cut-price fuel oil : indeed, CEA would get a fair proportion of the oil at a "coal parity" price.

Economically, therefore, further chopping and changing might not impose too great a cost on the electricity industry—if the oil companies were to consent. With the Coal Board, at least, CEA should now be in a strong position to bargain: it might turn the tables by demanding guaranteed amounts of power station coal in future at a "fuel oil parity" price. The oil companies, even, might find it worth reconsidering whether even an assured outlet for such quantities of fuel oil, at cut prices for steam-raising, is necessarily in their most profitable long-term interest. Quite amorally, from the sidelines of this impending exercise in countervailing power, one might count the good manners and sensitiveness to public relations of the major oil companies a bargaining asset on the side of the Coal Board.

WHETHER or not it has to learn to live with oil power stations, however, the Coal Board has to learn to live with a lot of nuclear ones. AEA has never needed good manners: its public relations are fine. Even if no more oil were to be used in British power stations from now on, the Coal Board would still meet this same problem with power station coal well within ten years, if it manages to raise its output according to plan. This time the collision would be with nuclear energy, a fuel that has a dynamism all its own. The extent to which the new power stations constructed after 1965 are nuclear will depend, not upon how much small coal is available, but upon what the coming years teach about the trend of conventional and nuclear costs. In particular, it will depend somewhat crucially upon how those costs compare for stations used less continuously than on the "base load" for which the nuclear stations likely to be commissioned between now and 1965 are destined.

Nuclear stations in the present programme are designed for use with a load factor of 75 per cent or more, which means that they will have to run for about 6,600 hours of every year, more or less 24 hours a day, apart from periods of overhaul. There may be technical reasons for this; but primarily they must be run as continuously as possible because they represent such a huge capital investment. These first nuclear stations are costing, with their "fuel inventory," about three and a half times as much to build as the best conventional stations now on order. Only nearly continuous running, spreading this capital cost over the maximum sales of power, can make their capital charges economic, even though their fuel costs will be so much lower than those of coal stations. So these nuclear stations will go into the base load—that block of capacity required throughout the whole 24 hours.

PRIMARY FUEL FOR POWER GENERATION: THE REVISED PLANS
(Expressed as million tons of "coal equivalent")

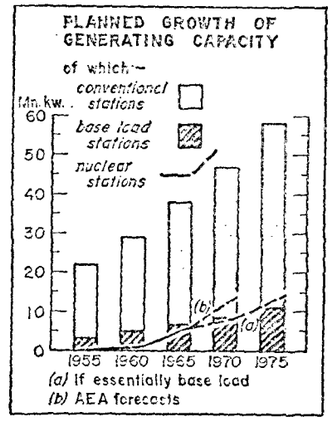
	1955	1960	1965	1970	1975
Total fuel required for electricity	42	57	71	85	104
Coal available	40	47	55	60	60
Nuclear power likely to be installed:					
Original plan	...	*1*	*6*	...	*40*
Revised plan	...	1	14	25* 40†	40
Planned use of oil	1	9	10?	...	...

* If restricted to base load use. † AEA estimate to United Nations.

Now the amount of base load plant required cannot grow much faster than total demand on the electricity system, even if the industry's load factor does improve moderately over the years. And it could be the size of that base load, rather than the rate at which CEA builds power stations of all kinds, that might set the ceiling on nuclear generation after 1965. In a communication to the United Nations in April, the Atomic Energy Authority suggested that Britain might have 12-16 million kilowatts of nuclear capacity installed by 1970, five years ahead of the time vaguely envisaged in the original programme. But at the end of that month the Paymaster-General, asked by Mr Alfred Robens if that was what acceleration of the programme implied, said cautiously:

> What the position will be by 1970-75 is extremely speculative. There is no reason to induce the Government to have an estimate different from that made in 1955. If anything, things are less certain today than they were then.

This week Sir Josiah Eccles added: "Since only about



15 per cent of the national electrical load is continuous, it would not be economically practicable at present to have much more than 20 per cent of the generating capacity energised by nuclear reactors." And CEA's nuclear expert, Mr Duckworth, put it into figures: "The amount of winter demand of 75 per cent load factor and above is expected to be about 8-9 million kilowatts by 1970."

Technically, there seems no reason to doubt that nuclear stations can be built to operate at lower load factors than this. Economically, Mr Duckworth is also confident that nuclear stations will be able to compete at load factors below 75 per cent by the late sixties. Primarily, this is a matter of how fast the capital costs of nuclear—and conventional—stations can be brought down. From the £145 per kW (apart from £30 per kW for "fuel inventory") of the first CEA stations, Sir Christopher Hinton has suggested the figure may approach £90 a kW by 1970.

But the capital costs of conventional generation are being slashed, too, as CEA gains advantages of scale and efficiency from this vast new coal-firing stations, where generating conditions are 20-25 years ahead of those designed for the early nuclear stations. About five years ago CEA was paying about close on £70 a kW for new conventional capacity. Now it is ordering stations such as the new 550,000 kilowatt generator for Thorpe Marsh, the biggest electrical machine planned anywhere in the world, for about £44 a kW. Over the years, the capital cost of nuclear stations seems certain to come down faster; but whether fast enough to compete with conventional stations at lower load factors is another matter. As Mr Duckworth observed

> It is far from certain that only nuclear stations will be built after the late 1960s: it may be that it will be economically desirable to build conventional stations for peak load operation for many decades yet to come.

NEW men will be responsible for this process of fitting the atom into the British electricity: under a bill likely to become law within seven or eight weeks, CEA is to be replaced by an advisory council, a generation and transmission board, and more autonomous area distribution boards with more autonomy. Some of the names being canvassed for the new appointments guarantee great technical expertise and strength of personality. Both will be essential; but both have been available within CEA for years. Something more is needed: a readiness and ability to think clearly through the economics of this great industry in transition. A nuclear engineer with a habit of talking about costs—even if his figures are sometimes a little difficult to understand—might do.

How the Rent Act Works

Mr Henry Brooke has urged landlords and tenants to study the Rent Act carefully and to avoid any precipitate action. The Economist *offers a short guide on how the Act may be expected to work.*

ON July 6th the new Rent Act comes into force. Some of its consequences will be delayed, but already certain tendencies are becoming evident. Vacant houses are being offered to let in several areas. Now that these houses are decontrolled, landlords are ready to let them unfurnished instead of holding them for sale. A reasonably free market in rented houses is in fact developing, at rents that appear to be within reason. Consideration is now being given to the improvement and conversion of large flats, as they become vacant, into smaller and more convenient flats, with the promise of more "dwelling units" as a result. Here are two signs that the primary object of the Act—to make fuller and better use of existing housing—is starting on its long and complicated road towards achievement.

It is not surprising that the explanatory booklet issued by the Ministry of Housing and Local Government * is enjoying a good sale. A new alphabet of forms has to be learned. These arise from the regulations that the Minister has promptly made to give effect to the Act and to ensure that all the safeguards it provides are fully appreciated by both sides. Forms A to C are to be used when a landlord notifies his intention to increase the rent payable by a controlled tenant. Forms D and E are notices to be inserted in rent books in respect of the letting of unfurnished controlled houses. Forms F to R are for use when a landlord undertakes the internal decorations, when a tenant notifies the landlord of defects of repair, when the landlord undertakes to remedy the defects, and when a local authority

* The Rent Act and You. HMSO 6d.

issues a certificate of disrepair to the landlord. Form S is the notice to be given to the tenant to end his possession of premises now decontrolled. Forms T and U are to be used by a controlled tenant who has made improvements and who claims that the rateable value of the premises should be reduced in his favour in deciding whether the house should remain controlled. The alphabet is barely long enough for the job.

SOME 4¼ million houses will remain under control; what increase of rent may landlords seek on them? Where a house remains under control (that is, if its rateable value does not exceed £40 in the Metropolitan Police District or £30 elsewhere in England and Wales) the landlord can increase the rent, if necessary by stages, after three months' notice, up to a new rent limit. This limit is set by the aggregate of (a) an appropriate multiple of the gross rateable value of the premises, (b) the rates, if the landlord bears them, and (c) a reasonable charge for services and for any furniture provided. Under (a), the standard multiplier is 2, but this can be reduced progressively to 1⅓ according to the extent to which the tenant bears responsibility for repairs other than internal decorations. If the landlord is already responsible for internal decorations, or undertakes to do them in future, the multiplier becomes 2⅓. Before the landlord can serve the three months' notice, therefore, he has first to decide whether he will become responsible for internal decoration, if he is not so liable already. Few landlords are expected so to elect. Next the landlord must seek agreement with the tenant about the appropriate multiplier of the gross value or failing agreement he can apply to the county court for a determination. But it seems much more likely that the majority of landlords will try to settle with tenants on a friendly basis, without going into too much detail or undertaking any large number of county court applications. A multiplier of, say, 1¾ may emerge as the general pattern. Charges for services must also be agreed with tenant, or referred to the county court, before notice can be served. But, for the time being, many landlords are likely to ask their tenants for no more than the cost of services in 1954 (as the Act of that year allows them) leaving until later the question of increases to meet the higher current costs of the services.

Increases in rents of houses that remain subject to control are not automatic. If a house is in a state of disrepair, serious complications have to be faced, and the wise landlord is likely to remedy the defects rather than run the gauntlet of the regulations. No increase in a controlled rent can take effect before three months have elapsed from the date of notice (that is, before October 6, 1957, at the earliest) and no increase can exceed 7s. 6d. a week during the first six months after the notice takes effect (that is, up to April 6, 1958, at the earliest).

From statistics prepared by the Ministry of Housing it is possible to make broad guesses about the possible range of increased rents for controlled houses. The Ministry's figures show that there are:

nearly one million houses with net weekly rents up to 5s.
two million houses at rents between 5s. and 10s.
835,000 houses at rents between 10s. and 15s.
325,000 houses with rents between 15s. and 20s.
and 43,000 houses with rents over 20s.

The possible increases in rents appear to be:

for one million houses, up to 5s.
another million 5s. to 7s. 6d.
a third million 7s. 6d. to 10s.
and a fourth million over 15s.

None of these controlled rents can be increased until the beginning of October at the earliest, and the actual increase in the average case is likely to be less than the landlord might secure if he were to pursue his rights under the Act to the last penny. Most landlords of controlled properties are likely to take the more practical line of reasonable agreement.

DECONTROLLED properties will present fewer administrative problems but no fewer occasions for the exercise of reason and equity. There is a standstill of fifteen months, until October 6, 1958, during which any tenant can stay on at the present level of rent, even if his tenancy expires before that date. (If the tenancy agreement has more than fifteen months unexpired, it will run its course.) If the landlord and tenant can agree to a new tenancy of not less than three years, it can take effect immediately. In many cases, therefore, there will be a strong inducement for both landlord and tenant to come to reasonable terms; the landlord can secure an immediate rise in rent and retain a good tenant, while the tenant will gain security of tenure. Such approaches are already being made. The terms of new tenancy agreements will depend upon the accommodation and amenities provided, but it need not be assumed that because landlords of decontrolled properties have so long been unaccustomed to freedom they will automatically attempt to exploit it unconscionably now. They are more likely to frame their demands according to what tenants can afford, and with the realisation, too, that excessive pressure for increased rents would be likely to prejudice the success of this first exercise towards freedom and make the acceptance of any further steps towards decontrol out of the question. This points to the likelihood that the terms offered by good landlords to good tenants will be fair and reasonable. Where there are bad tenants, or where the landlord wants to carry out a scheme of modernisation and conversion, he may well prefer to secure possession when the 15 months standstill period ends.

Some interesting proposals by landlords have come to notice. One important case covers a series of homogeneous blocks of flats in London, where the present recoverable rents are entirely haphazard. The owners propose to make a systematic classification of the various flats and to fix rents on a logical basis. There will be two scales, one for sitting tenants and the other, rather higher, for prospective tenants based on an estimate of the value in a free market. Sitting tenants are being offered a lease of seven years, with an optional break after five years, and a variation clause covering the cost of services. If the owners' offer is accepted within two months, the agreement will operate from August 1st in all cases. If not, the tenants can either leave in October, 1958, or take a new tenancy then at the estimated free market rent. Another landlord has investigated the rents that his tenants are likely to be able to pay—and what he has from time to time been offered—and has made conservative estimates of the economic rent of replacements. On the basis of these figures, he proposes to offer three-year tenancies, spreading any substantial increase in rent that may be called for over the whole period. The general manager of a third large property company proposes to examine each case individually, though it may take six to twelve months to complete his task.

Associations of property owners and their members have promised that they will work the Act with all fairness. It can be assumed that the tenants, as a body, will keep them up to it. These associations probably speak for the owners of 70 per cent of the houses affected in London and perhaps 60 per cent in the provinces. What will happen in cases involving small landlords owning, say, a couple of houses let in rooms, it is difficult to guess. That kind of owner belongs to no organisation, has no professional adviser, and ploughs his own furrow. His tenants are usually ignorant of their rights. It is here that education in responsibility and rights is likely to be most needed.

BUSINESS NOTES

THE ECONOMY

Reflation or What?

NOT for the first time, the indications about what is happening in the British economy that can be drawn from statistics reflecting the course of demand are quite significantly at variance with what one might conclude from those recording the level of output. On the short-term figures, consumption seems to have been up in the first quarter of this year; so does investment; so do exports; but industrial production does not. It is true that in manufacturing industry the rate of stockbuilding seems to have been a little less than in the first quarter of 1956 (and certain records of stocks of industrial materials outside manufacturing show a sharp, unexplained fall); there should have been some decline in the current expenditure of public authorities; and imports are up by perhaps 6 per cent in volume so far this year. But it is surprising that if all these elements in demand are continuing to grow, industrial production as a whole should remain as steady as it seems to have done.

Consumption figures so far published show a rise of some 4 per cent in volume over the first quarter of 1956 for expenditure on items covering about two-fifths of consumer spending. Food expenditure does not seem to have grown in volume, and spending on fuel and light may not have done so; expenditure on private motoring was probably down. In all, consumption may turn out to have been about 1-2 per cent up in the first quarter. Early estimates of investment by manufacturing industry in the first quarter of this year suggest that this was about 10 per cent greater in money terms than in January to March, 1956, which should represent a rise of about 5 per cent in real terms; investment by the public corporations should have been up considerably; and house building was up, suggesting a fairly significant rise in the volume of investment as a whole. Moreover, within the range of the industrial production index there has been an unexpected rise in coal output, building activity has benefited from better weather, and steel output is up (though not as much as it was at this time last year by comparison with 1955). But steel and coal consumption by other industries were still lower than a year before.

When Statistics Disagree

SPENDING on household equipment, and perhaps on cars, need not significantly have made extra calls on production in the first quarter of the year. There were large stocks of these hard consumer goods at various points in the economy, and in cars the recovery of hire purchase sales for some time had a limited effect outside the second-hand market. Over the first quarter, motor output was markedly below that of the first quarter of 1956; it did not begin to pick up until March, and its secondary demands upon the materials and component makers and on general engineering may have been delayed by the backlog of "work in progress" it had accumulated last year. There remain some patches of soft demand, too, in the machinery market. Not all plant makers have been as busy as, for example, the machine tool builders, and the running down of defence contracts has set quite a number of firms in general engineering looking for sub-contracts from the capital goods side. It is easy to over-estimate the effect upon the index of engineering output in general exerted by investment demand, when output of other engineering goods is not rising; much official analysis of the 1955 investment boom, for example, seems to have done so.

Certainly, this could be truer of the production index than of actual engineering output. Publication of the seasonally corrected production index happens to have begun at the end of 1955, just in time to show the levelling out of industrial production on to a plateau that has now stretched out uninterrupted for two years. The index notably did not agree with the quite substantial rise in national product calculated from figures of total expenditures in the Economic Survey for 1957: nor has it responded to increases in such expenditure series this spring. The ability to smell inflation in every fresh breeze has understandably become somewhat hypertrophied among students of the British economy since the war. One almost autonomous element of inflation, wage increases, is certainly spiralling merrily on—tempting people to feel that because the production index does not yet show any resurgence of inflation in output the production index must be wrong. Finally this argument comes down to setting certain statistics of demand (based on a mixed bag of reports and price indices) against other estimates based on a mixed bag of production and delivery figures. Any or all of these could be wrong. So could a sense of smell.

STEEL COMPANIES

New Outlook on Dividends?

In a firm market for equity stocks, in which *The Economist* indicator rose from 219.0 to 222.3, steel shares have been lively. For some weeks now these shares have been bought on the hope that the final dividends declared in the autumn would be higher. Profits in the industry have been rising; new plant is coming into production; and the earnings cover on current dividends is among the highest in British industry. Some interim dividends had already been raised in a cautious way. But this week brings a more positive indication that steel company directors may be changing their views about dividend policy.

This change has been inferred from the raising of the interim dividend on the £20 million of ordinary capital of United Steel Companies from 4 to 6 per cent, with a 50 per cent scrip issue to follow. On the increased capital and on the firm base of rising profits, the directors expect to be able to pay a final dividend of 6 per cent. Thus, the full year's payment is effectively to be raised from 8½ to 10 per cent. Another, though less positive, indication of changing heart is the increase in Colvilles interim dividend from 3 to 5 per cent. The directors describe the change as intended to spread the payments "more evenly" throughout the financial year. But on the evidence of six months' production and profits an optimist would read a little more into the decision. In the half year to March 31st, Colvilles produced 1,079,810 tons of steel ingots and castings (against 1,022,987 in the corresponding period), and earned a net profit of £3,021,000 (against £2,143,000).

The basic argument for "no change" dividends has been the capital cost of heavy development programmes, towards which major contributions from retained (and rising) profits were inescapable. It is an argument that easily overlooks the relatively small cost of giving the shareholder a more reasonable return. And it has also underrated the increasing importance in the future of raising equity money in the market to help to finance the next stages of expansion in the industry. Loan capital, even at present prices, is not easy to raise, and many steel companies have their full quota of prior charges. They may now be more beholden to their ordinary shareholders than they have seemed prepared to concede in the last year or two.

STEEL SUPPLIES

High Stocks of Plate

Consumption of steel in Britain in the first quarter of 1957 was still more than 2½ per cent lower than a year before, although activity in certain branches of engineering was beginning to pick up. Steel production, on the other hand, continued to rise steadily through the period of slight decline in engineering output last year, and is still rising: in May it was a record, 443,200 ingot tons a week, or just over 23 million tons a year. The result has been a significant reduction in the rate of imports combined with a small rise in exports, increasing the "net export" rate of this industry; plus a continued though slackening rate of stockbuilding by consumers of steel. During the first quarter of this year consumers' and merchants' stocks of steel rose by another 111,000 tons; about 40,000 tons of this increase was made up of steel plate stocks, which have been rising in the shipyards and elsewhere. During the first three months of the year, however, stocks of sheet steel declined by 55,000 tons; the motor industry, having cut its demand to the hand-to-mouth level during its period of recession, was beginning to increase production slightly, but finding that it took time to regain its former priority for supplies from the steel mills. Considered in terms of consumption, the stocks of finished steel in the hands of consuming industry at the end of March amounted to about 14 weeks' supplies.

ROADS

Speeding Up the Programme

Mr Watkinson's principal contribution to the roads programme he inherited from his predecessor as Minister of Transport has been a sensible sorting out of priorities—within the compass of the total sum he has been given to spend. He is quite right therefore not to allow himself to be side-tracked by recent outbursts from week-end motorists snarled up in long traffic queues to the coast, though not every politician might have had the courage to say so as bluntly and as repeatedly as he has.

But there are two features about the present programme, which was originally announced in 1955, that do need attention. The first is rather obvious: that it is not large enough. Priority in the present scale of expenditure has been given by Mr Watkinson to the development of a major network of motor roads between important cities. These are intended primarily to meet the needs of industry, to be adequate for the volume of future traffic that recent censuses lead one to expect, and to be complemented by some relief of congestion in the towns and cities they will be feeding. But the present and intended rate of construction of this admirable framework of commercial highways, ultimately determined by the total amount that can be spent a year, is ludicrously low, measured both against the rate of increase in traffic and against rates of construction in other countries. Present progress on the six routes involved is briefly as follows:

1. Great North Road. By next March it is expected that about 120 miles of dual-carriageway will have been authorised or built. Ultimately, 250 miles of the 270 miles between London and Newcastle will be made a dual-carriageway road.
2. London-Yorkshire Motorway. Work on the first section, to Birmingham, will start this year.
3. Birmingham-Shap Motorway. Nineteen miles under construction. The route of the 97-mile stretch from Birmingham to the Preston by-pass was published last April.
4. London-South Wales Motorway. The route is still being planned, but a number of by-passes it will use are being built.
5. Birmingham-South Wales road. The Ross Spur may be started this year.
6. Two trunk roads from London to the Kent Coast. A number of by-passes and other improvements are under construction.

At this rate, even a framework of modern highways will not be complete until well into the 1960s. Only about £30-£35 million of the £147 million expenditure that was to be authorised between April 1955 and March 1959 was actually spent in the first two years, and there is a clear economic case for fitting a larger road building programme on to the remaining years of the present one. There is still a need for the Ministry to examine the time taken on actual construction of major road schemes. This is not comparing at all favourably with similar work in other countries.

SHIPPING FREIGHTS

From Peak to Trough

Tramp shipping freight rates have been steadily falling since the peak of last December, when the Chamber of Shipping voyage index reached 189 (1952=100). The figure for May was 117, compared with 134 for April, and was the lowest figure for two years. Lack of employment in the coal and grain trades has been chiefly responsible for the fall, and these two commodities account for more than half the weight of the Chamber of Shipping index. Grain fixtures, for example, have declined to 107 from a peak of 206, and coal rates from 198 to 122. Rates for ore cargoes, now at 109, never reached more than 162 at the peak; while for timber cargoes the average rate in May (129) was actually higher than in February (125), and not much lower than the peak of 133 which occurred in March.

The position has now been reached where the owners of some ships, particularly the standard war-built types, can scarcely be assured of showing a profit on a voyage, and many owners are taking the opportunity of carrying out repairs and surveys which were deferred during the period of highly profitable freight rates. On the other hand, there is still no great rush to lay ships up or to scrap them, and the secondhand market is at an almost complete standstill, with owners preferring to ride out the doldrums in the hope of more favourable autumn weather. Here and there a fair wind springs up, and ships which happen to be favourably placed are able to take advantage of it. Slight increases, for example, have occurred recently in the Plate and North Pacific grain trades, and the opening of the Hudson Bay navigation season next month will provide work for some ships. The present fairly stable state of equilibrium may continue for a while, but the pressure of tonnage is building up much more rapidly than apparent demand. The continuing good weather in Europe is a foreboding of stormy weather for tramp shipping, as coal and grain stocks are built up for the winter.

ANGLO-SOVIET TRADE

Selling to Russia

Selling to Russia is usually a laborious, protracted and pernickety business. The prizes are sometimes great—and sometimes empty. Adventurous British firms may be attracted by the challenge that trade presents; others may decide, perhaps reluctantly, that they cannot afford to ignore its possibilities; but many firms may be dissuaded by the difficulties of making a start. To help such exporters, and importing firms, too, the Russian section of the London Chamber of Commerce has published a useful and commendably realistic guide, *Anglo-Soviet Trade*. Introducing the booklet last week Mr J. B. Scott, chairman of the Russian section, forecast that British exports to Russia would rise by 40 per cent to about £37 million this year; the forecast is based partly on the trend of British exports in the first four months of this year, and partly on orders that have already been placed and are likely to be delivered in the remainder of the year. He also drew attention to what

appeared to be several anomalies in the strategic embargo on exports to Russia. One was the prohibition on furnaces for the manufacture of carbon black, which is used in motor tyres. The Russians, who had recently ordered a British plant for the manufacture of tyres, were also interested in obtaining a plant for the production of carbon black. While British exporters were not allowed to supply a carbon black furnace, Mr Scott said, they could supply the carbon black itself. Despite the difficulties, British interest in selling to Russia appears to be growing ; Moscow is reported to be bristling with British businessmen this summer.

FINANCE CORPORATION FOR INDUSTRY

Bigger Commitments

In his valedictory statement as chairman of the Finance Corporation for Industry, Lord Bruce describes the creation of FCI as "an act of broad vision and wise statesmanship." Certainly it has played its part in providing money for large scale risk ventures and it has notably assisted the postwar development of the steel industry. It has made a few losses (Petrochemicals was one) but it has made profits (particularly on the conversion rights attached to some of the loans it has made). Its income, in view of some of the risks it has shouldered, is small; Lord Bruce estimates that its return on advances over the last few years has averaged only 0.7 per cent. But that fact was inherent in the very act of FCI's creation ; it charges only a small margin above the rates at which it can borrow from the lending bankers.

At the end of March, FCI held £42,339,000 in unquoted investments, which is not greatly different from the figure of £41,239,000 at the end of March, 1956. Similarly there is little change in its borrowings from the banks, which stand at £42,902,636, against £41,151,742. The credit squeeze was on and FCI went slow. Included in the £42 million of investments is £28 million lent to the Steel Company of Wales, which is due for repayment after the first debenture is paid off in July from the proceeds of the £40 million ordinary stock issue to the public. But FCI has a further part to play in the development programme of the steel industry. Its commitments to make further investments rose last year from £39.6 million (of which about half was in steel) to £51.9 million. Of that sum about £21 million is earmarked for the steel industry, and in particular for the Dorman Long schemes.

CANADIAN WHEAT

New Thoughts on the Surplus

Wheat buyers would give much to know how the policy of the Canadian Wheat Board will be affected by the change of government. The Conservative party promised to help the western wheat grower, though it is doubtful whether its plans yet have a definite shape. Some indication of the new government's thoughts on this problem, and possibly of ways in which Britain may be expected to help, may come from Mr Diefenbaker's visit to London next week for the meeting of Commonwealth Prime Ministers. The new premier is a westerner who knows that the farmers' complaint is not about price ; it is that they cannot sell all the wheat they are producing. Though world trade in wheat may reach a new record of over 1,100 million bushels this season, Canada has no share in the achievement ; its exports of wheat and flour between August 1st and June 5th amounted to 220 million bushels, 24 million bushels less than in the same period of 1955-1956. Shipments from the United States, in contrast, were nearly twice as high as last season and twice as large as Canada's. When the season ends Canada will probably have a record carry-over of well over 600 million bushels. Canada has suffered from the heavily subsidised sales, often under special disposal programmes, of the United States, a form of competition that Canada is not rich enough to meet. But even if American competition were less acute, Canada's need to reduce wheat production would remain. How is that to be done without causing political opposition and social distress ?

During the election campaign the Conservatives spoke of a new deal for the farmer, based on a "four-point policy of cash advances, a realistic grain storage programme, a domestic wheat price and a stepped-up selling programme." There was also talk of a flexible support price formula based on costs of production and the law of supply and demand—whatever that might mean. There is no question of the government abandoning the present marketing system operated by the wheat board. A single seller like the board cannot be as flexible in its pricing policy as private sellers, and no doubt the board forfeits some sales as a result. But it does not follow that sales would increase significantly if prices were cut drastically. And would farmers favour a drastic cut ? On the other hand, if the government seeks an increase in the farmers' income unrelated to sales of wheat it will tend to perpetuate overproduction. The experience of the United States is proof enough of that.

TRADE FAIRS

Fairs in a Free Market

In a timely, if in parts complacent, report published last week, Political and Economic Planning suggests that British firms might make more use of trade fairs to strengthen their position as they move gradually into a European free trade area. Large international exhibitions,

Third Year of Publication

"MOTOR BUSINESS"
EUROPEAN FREE TRADE ISSUE

The June issue—No. 11—of this quarterly research bulletin for the motor industry and allied trades is devoted to an analysis of the implications for the motor industry of the move towards free trade in Europe. The contents are:

1. The Plans for the Common Market and Free Trade Area.
2. The Present Pattern of Production and Trade in Europe.
3. The Possible Effects of the Freeing of Trade.
4. Conclusions.
5. Tables.
6. Charts.

JETSTREAM

A new concept of air travel. This magnificent Lockheed Starliner, the largest and longest-range transport of them all, flies high above the weather, can even reach and ride the swift winds of the jet stream, and is capable of flying Los Angeles-London *non-stop*. With exclusive synchrophased (anti-vibration) propellers, with engines placed far out on the wings, the Jetstream offers you the quietest transatlantic trip you can have.

NOW IN SERVICE! Daily non-stop Golden Banner tourist flights available now to New York by TWA Jetstream. Across the USA the Jetstream offers Ambassador luxury service as well as Golden Banner tourist flights between New York, Los Angeles, San Francisco and other major cities.

Save £34 on your U.S. holiday. TWA's low holiday fare is only £151.16.0 London/New York round trip. This is a saving of £34.13.0 on the *regular* tourist fare—*and* you get a full 15 days in the USA. Fly *now*—pay later with the TWA Time Pay Plan. See your local travel agent or nearest TWA Office.

such as the forthcoming Brussels Exhibition in 1958, are regulated by international convention and occur comparatively rarely. The British business man is more likely to be concerned with three rather more sober types of trade fair: overseas fairs in which a British firm can exhibit in its appropriate trade section; overseas fairs in which there are no trade sections, and British firms can take part only as a group in a British pavilion, if there is one; and fairs held in Britain, in only a few of which foreign exhibitors are at present allowed to take part.

If there are trade sections, as in most of the fairs held on the Continent, then private industry can decide for itself whether or not to take part, and bear the full cost of exhibiting. British firms hoping to develop markets in a European free trade area might note that their continental competitors normally put greater emphasis on selling through the medium of trade fairs. But government help is needed only for relatively small and separate "national prestige exhibits" to support the commercial exhibitors—a role that the Council of Industrial Design can help the government to perform most effectively. On the other hand, when there are only national pavilions, as in most of the fairs held in the less industrialised countries of Africa and Asia, the cost of making an effective display is generally quite prohibitive for any exhibitor, unless his government is prepared to contribute a large share of the cost of the pavilion. The British Government spends less on overseas fairs than do most of Britain's competitors, and there is a strong case for spending more. But whatever funds are made available, there is an even greater need for better machinery to decide where and how the money should be spent. A more powerful executive body, on which both industry and the government would be represented, is now needed in place of the present advisory committee to the President of the Board of Trade.

If fairs held in Britain are to help to promote exports they must attract overseas buyers, and it is now recognised that the best way of doing this is to make them genuinely international in character by inviting overseas exhibitors as well. If British goods are better and cheaper than foreign goods then they can only gain from showing side by side; if they are not competitive, then it may be best for them to find this out now, so that something can be done about it before the tariffs against continental goods begin to come down. Most buyers like to play as well as work; to have a successful international appeal, therefore, a British fair would have to be held near London, where the present accommodation for it may be inadequate. Some urgent thought should now be given, PEP suggests, to the proposals for the erection of new exhibition buildings on the site of the Crystal Palace or on disused airports in the London area.

ACCOUNTING MERGER

Loud if Reluctant Yes

IN his speech to the members of the Society of Incorporated Accountants at the Royal Festival Hall last Wednesday, to consider the proposals to integrate the

Where the Clerks Are

ONE of the most striking facts that the preliminary results of the 1951 Census revealed five years ago is that clerks and typists account for *one out* of every ten workers in the country. In England and Wales alone over 2 million of them were recorded, about 500,000 of these being typists or secretaries and the remainder cost and accounting clerks, book-keepers, office machine operators and a multitude of different categories of clerical workers. The preliminary results also showed that for every two male clerks there were *three female ones*; but only now, with the publication of the full industrial census (HMSO, £7 7s.), is it possible to see where this gigantic group of workers finds employment.

Not surprisingly, about three-fifths of clerical workers were shown to be employed in 1951 in the service industries—in transport, distribution, insurance, banking, public administration and the like. In insurance, banking and financial services they outnumber all other employees put together; elsewhere they are fewer than one in five. In manufacturing industries the proportion varies considerably; it is highest in the chemical industry, which, relative to its size, is the third largest employer of clerical workers in the country—classifying employers in the broad groups shown in the table. Next in the manufacturing list comes the paper and printing *industry*: since this and the chemical industry have expanded more than any other industrial group in the postwar period, statisticians might well chase a link between the growth of production and the size of the clerical force.

But what about one of the higher ranks of office work with which a considerable amount of clerical work is connected—accountancy? In this profession, which nearly doubled its size between 1931 and 1951, rather more than 32,000 qualified accountants were recorded in the last census for England and Wales. Nearly three-quarters are employed in professional service. Among industrial employers the chemical industry is again easily the largest—statistically it works out at 1.5 accountants among every thousand workers. At the other end of the scale the clothing industry, which employs the fewest clerks among its workers, also employs the fewest accountants. The census does not relate these findings to the size of firms in different industries, with which there is *obviously* a relationship. It is, of course, only the larger firms which employ their own accountants: at the other end of the scale in very small firms the clerical work must perforce often be performed by more senior staff.

Society with the Chartered Institutes the president, Sir Richard Yeabsley, quoted Congreve :

> Defer not till tomorrow to be wise,
> Tomorrow's sun to thee may never rise.

And it was perhaps in a spirit of reluctant acceptance of the inevitable weakening of the society that the members accepted the terms of the proposed integration.

There was some opposition, as was inevitable. The scheme splits the members of the society into two segments: most become full "chartered" members of the enlarged institute, but those not trained in a public accountant's office become "incorporated" members. The opposition, led by Mr B.V. Piggott, wanted to remove this distinction. If his amendment had been approved, it would not have been acceptable either to the society's council or to the institutes, and the scheme would have fallen to the ground. But the meeting, which grew a little restive as the opposition speakers continued to press their point, defeated his amendment decisively.

The special resolution to accept the integration proposals, which required a 75 per cent vote in favour, was comfortably approved by 972 votes to 111 votes. Thus almost exactly 90 per cent of those voting supported integration. This was a straw vote, and the resolution has still to be put to a postal poll. But it was convincing enough to suggest that the merger of the leading accounting bodies will now go through.

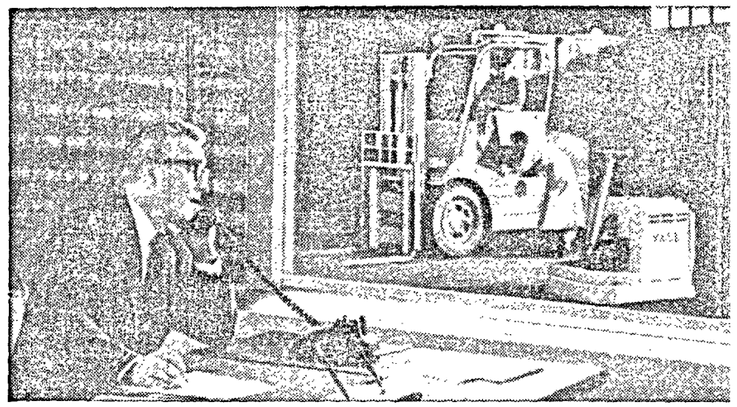
Office Machinery Can Compete

ONE British industry that welcomes direct comparisons between its products and those of its European competitors is the office equipment industry, which is now showing its latest developments at the Office Efficiency Exhibition at Olympia. This industry has grown so fast that its annual output, which was little more than £2 million before the war, now exceeds £65 million. About two-thirds of this, worth £45 million, consists of various types of office machinery, with the balance of £20 million added by stationery, furniture, safes and other office equipment. Deliveries of adding, listing, calculating and other accounting machinery alone exceeded £25 million in 1956.

Of the industry's total output, over a third—about £16 million worth of office machinery and over £8 million worth of other office equipment—was exported last year. Because of the very high value added by labour to the raw materials used in making office machinery, these exports—and the domestic sales which save imports—are particularly helpful to the balance of payments. But perhaps more significant than the total export figure, which is still rising rapidly, is its distribution. Last year Britain sold well over a million pounds' worth of office machinery to the United States, which before the war was Europe's chief and for much equipment sole supplier. It is also encouraging that several of the British industry's most active European competitors, such as Germany and France—but not Italy—are at the same time a good market for British machines, even for those of similar type to their own.

At the Business Efficiency Exhibition itself the large electronic data processing systems as usual steal much of the limelight. No less than six British-made systems are on display this year ; there has been a notable advance from the prototype stage to the production model, and more servicing facilities are now being offered, both at home and abroad. There are now several devices for preparing punched paper tape as a by-product of other office work, by means of small attachments to cash registers, electric typewriters and accounting machines. But so far there has been no appreciable reduction in the cost of these very elaborate and expensive systems. In most offices, therefore, much bigger opportunities for cost reduction still lie in the use of smaller and less elaborate calculating and book-keeping machines. Some of the most striking of these—such as accounting machines which combine the work of typewriting, adding, calculating and largely self-checking book-keeping machines—are also very expensive. Others, like the standard adding, listing and calculating machines, are becoming more versatile, simpler to use, and cheaper to buy. The saturation point for the employment of these standard types of machine in British offices is still nowhere in sight. It is therefore from them, and from comparable advances in duplicating, photocopying and recording equipment, and from better communications networks and filing systems, that most of the gain in efficiency in the office will come in the future as it has in the past.

COPPER



Prices Fall All Round

COPPER prices have fallen sharply this week. On Monday the Rhodesian Selection Trust companies cut their fixed price to British consumers by £10 to £230 a ton (cif UK). A reduction had been expected and the open market price in London dropped afterwards by only £2 10s. to £225 15s. a ton for cash metal. Late on Wednesday came the news that two leading American producers had cut prices by 2½ cents to 29½ cents a lb (£234 a ton) and that the custom smelters had cut prices by one cent to 29 cents a lb (£232 a ton) ; the reduction in the producers' price is the first for four months. The American zinc price was also reduced by half a cent to 10½ cents a lb (£84 a ton). Copper prices in London, which had rallied before the news, dropped again, to close on Thursday at £221 a ton for cash metal, the lowest price for nearly four years. Other American producers are expected to make the same reduction ; the Canadian producers have already done so and the Belgian Congo producer has cut its price by one franc to 32 francs a kilo, or about £231 10s. a ton cif.

The cut in the American producers' price, which was accompanied by announcements of further reductions in output, reflects the continuing surplus of copper. It had not been expected that the producers would go below 30 cents a lb, and it is not their practice to quote a price in fractions of a cent. Their reason for going to 29½ cents is presumably that at this price a larger quantity of copper can be delivered to the American government than at 30 cents. Under contracts for expanding capacity the producers obtained the right to deliver surplus metal to the government when the market price was below a certain level, which varies for the individual mines. An official American report recently stated that when the domestic market price was below 29 cents a lb, about 4,000 short tons of copper a month could be delivered to the government, and when the price was below 27 cents an additional quantity of about 6,000 tons a month could be delivered.

Persistent weakness in prices has naturally discouraged consumers from covering their requirements in full. A time must come when consumers have to replenish their stocks. How far will prices then recover ? How readily will the Rhodesian producers then sell the metal they have bought in supporting the market ?

DEVELOPING OUR RESOURCES

INCO NICKEL and the floating forests

In a typical year about forty-seven million board feet of lumber and timber are required for the mines of Inco—The International Nickel Company—in the Sudbury District of Ontario, Canada. To meet part of this huge demand the Company operates four lumber camps whose enormous output is floated downstream to the saw-mill at Cache Bay. Some of these 'floating forests' have to travel as far as 120 miles before they reach their destination.

Much of this lumber is used as supports in Inco's underground mining operations, the largest of their kind in the world. After each 'cube' of ore is blasted away, the space is framed up with stout posts and filled with sand to give a firm basis for operations on the level above.

The extensive forests which supply the Sudbury mines are among the many huge resources which help the Inco-Mond organization to meet industry's demand for large supplies of nickel at an economic price.

RAW WOOL

Boost for the Sterling Area

Raw wool has been a source of strength for the sterling area this season. World demand has outpaced supply, and prices have risen by roughly 20 per cent since the season began. The latest estimates published by the Commonwealth Economic Committee show that world consumption is still increasing. Consumption of virgin wool in eleven leading countries in the first quarter is put at 500 million lb clean weight), the highest quarterly total for seven years. The total was three per cent higher than in the last quarter of 1956 and five per cent higher than in the first. Britain, the largest consumer, used five per cent more wool than in the first quarter of 1956, while Japan used 34 per cent more and climbed to fourth place among consuming countries. But the remarkable expansion of the Japanese industry, which has strongly supported the wool market this season, appears to have levelled off; its consumption in the first quarter showed no increase compared with the last quarter of 1956.

THE DOMINIONS' WOOL CHEQUE

Sales	1955–56 mn. lb.	Average Price d. per lb.	Total £ mn.	1956–57 mn. lb.	Average Price d. per lb.	Total £ mn.
July to April : Australia	1,015	48·8	206	1,147	64·8	310
New Zealand	317	46·4	61	369	54·6	70
July to March : South Africa.	244	43.9	44	250	57.8	60

Prices reached a peak for the season in the second week of May. The average price of merino 64's was then 142d. a lb (clean weight, cif United Kingdom), the highest point for nearly four years; the average price of crossbred 56's was 110d. a lb, the highest point for nearly six years. The advance proved to have been overdone and prices subsequently fell, particularly for inferior wools. The decline has since been checked. Users generally have little unsold wool on hand and with the selling season ending this month they could not afford to stay out of the market for long. Last week prices were steady, with the average for 64's at 134d. a lb, 8d. below the peak, and crossbred 56's were 3d. a lb lower at a nominal price of 107d. a lb. Bigger earnings from wool have been largely responsible for the dramatic improvement in Australia's international reserves. In the first eleven months of the season its wool cheque totalled £357 million, £117 million more than in the same period of 1955-56 and second only to the Korean peak of 1950-51. British and other exporters are sharing in Australia's good fortune, for import restrictions have been greatly eased.

RADIO RESEARCH

Bouncing off the Troposphere

For 20 years, a collection of wooden huts strung across two low-lying fields has been the home of government-sponsored radio research in this country, research on which the BBC and the Post Office, as well as industry, draw heavily. This week, having almost reached its majority, the Radio Research Station of the Department of Scientific and Industrial Research has the first permanent building it has ever possessed. It has taken 2½ years to complete at a cost of between £300,000 and £400,000, and may almost compensate for the two decades of primitive working conditions; even so, some of the huts are still in use.

Some material sign of encouragement was necessary, for the radio research station is well below strength in face of a year of exceptionally heavy work. Apart from the International Geophysical Year, which brings its own problems, radio communications have reached something of an impasse with existing channels overcrowded and too liable to interference. The work done at the Radio Research Station governs the future lines of development of radio communications. For example, the objective examination of the working of "ionosphere scatter" conducted by the station has offset much of the enthusiasm aroused six months ago when the Ministry of Supply ordered a radio system based on it. This system was based on an ingenious technique of using very high frequencies (to combat interference and overcrowding) and overcoming their inherently short range by bouncing the radio waves on the layer of ionised gas that surrounds the earth's atmosphere, whence they would be reflected to hit the earth about a thousand miles from the original transmitter. Much was expected of this system but it has now been shown to suffer from the weakness that it can be thrown into chaos for long periods by sun-spots. Now the radio researchers are looking at the less ambitious system of "troposphere scatter," working over ranges of 100 to perhaps 300 miles.

Scatter systems need much more power than conventional radio and troposphere scatter calls for a chain of stations along which the signal will hop. But if it proves as reliable as even the sceptics at the Radio Research Station seem to expect, troposphere scatter opens up the prospect of interference-free communications in regions like the Middle East where direct telephone cables are only too liable to be either cut or stripped of their copper. Over the longer distances it gives the distant possibility of a trans-Atlantic television link—or, to those who view this possibility with limited enthusiasm—a channel capable of simultaneously carrying (on one estimate) 800 telephone calls.

SHORTER NOTES

Another round of price increases by the main car manufacturers was virtually completed this week when Vauxhall announced increases of between 2½ and 3 per cent for most of its models and also for its Bedford commercial vehicles. The new Victor saloon now costs £13 more, before tax. Only the prices of the Cresta and Velox were left as they were, but these were increased last August. BMC, which has had two hefty bites in the past 15 months, raised most of its car prices by 5 per cent in May; and Ford put up its prices in February.

* * *

The International Finance Corporation is to make its first investment in *Siemens do Brasil Companhia de Electricidade*. The company, which is a subsidiary of the Siemens

group, is building an integrated plant in Brazil for making heavy electrical apparatus. IFC will invest $2 million in 6 per cent 15-year notes; it will also receive a fifteen-year option on shares on terms equivalent to the complete conversion of its notes.

* * *

Great Universal Stores has made an offer for the 3,200,000 ordinary shares of 5s. each of Houndsditch Warehouse, general warehousemen and merchants in a wide range of consumer goods. One "A" ordinary share in Great Universal Stores is offered for every five units in Houndsditch Warehouse; on the basis of a price of 55s. 4½d. on the "A" GUS shares, the offer is worth about £1¾ million. Houndsditch Warehouse shares rose 2s. to 8s. 1½d. before the offer and then jumped to 10s. 6d.

* * *

The increase of 53,000 during April in the number of people in civil employment in Britain looks to have been purely seasonal: a rough correction for seasonal factors suggests that employment was quite stable between March and April, though it seems to have declined by about 160,000 since July last year. The number of people wholly unemployed, allowing for ordinary seasonal changes, has been stable since February.

COMPANY AFFAIRS

Long View for Rolls-Royce

ROLLS-ROYCE employs 42,000 people and its products may take up to six years to develop. Such a company cannot rapidly change the nature of its business. The shift in emphasis that it is now making from military to civil engines, from jets to rocket motors, and from conventional to nuclear engineering, can be said to date from the first warnings that defence expenditure would not indefinitely be maintained at the high levels of the post-Korea crisis to use its engines. The group's total sales to the British government have been static at £45 million for the past three years, but sales to other customers (which include some, but not many, military engines) have risen from £20 million in 1954 to £35 million in 1956. Thus the whole expansion in the group's turnover has come from its commercial sales, which are largely civil sales. Lord Hives (who retired from the chair last January, after a lifetime of service to

	Years to December 31st		
	1954	1955	1956

Ordinary capital	5,799,566	6,248,772	7,518,058

period. The transition is now about half completed, and the company's acounts for 1956 are reflecting the high cost.

Rolls-Royce has to make two sets of changes, one in the nature of its products and the other in the method of financing their development. The end of the market for the classical military jet engine is in sight; the military engines of the future are the big rocket motors for long-range ballistic missiles. Rolls-Royce has been developing such motors with the considerable help of North American Aviation, the manufacturer responsible for the motors for intercontinental and intermediate range missiles, Atlas and Thor in the United States.

If conventional jet engines are to find a growing market in future, it can only be for use in civil aircraft. Such growth for Rolls-Royce depends on getting foreign as well as British manufacturers Rolls-Royce) told the Select Committee on Estimates last summer that the group's civil sales then accounted for one-third of its turnover but provided two-thirds of its profits.

With orders of £100 million on its books, Rolls-Royce seems to be passing through its transition with remarkable success. Its technical work and commercial thrust are admirably combined. The company is one of the few in the British aircraft industry that can really stand comparison with the American giants and meet competition on their own ground. There remains the problem of finding huge sums for research and development. The government has provided much of the money, but in future its unqualified assistance will be confined to such exclusively military developments as rocket motors. Development costs run away with big money; a new engine could easily require £5 million to develop. The government is meeting roughly half the cost of developing the Tyne turbo-prop but Rolls-Royce still has its own substantial annual bill to meet on the development of this and other civil versions of its engines. Even the well-established Dart requires an annual expenditure of £750,000 to keep it up to the times. A high altitude test plant is costing more than £4 million and the new nuclear laboratories have been also costly to start.

The research and development contracts of the Ministry provided, according to Lord Hives, not the nominal margin of 7½ per cent profit but something nearer 2½ per cent. They also involve repayment out of the royalties earned on commercial sales; such repayments have cost Rolls-Royce £5 million since the war. But when all is said, such contracts provided cash on tap when it was needed. Now Rolls-Royce, expanding rapidly on several new fronts at once, and in the thick of the competitive market for civil engines, will have to find the money for itself.

A group that has to increase the book value of its fixed assets by more than a third in a year (the figure has jumped from £14¾ million to £20¼ million) to carry £2½ million more stock (the total has nearly doubled in two years and is now £16.3 million) and to find the best part of £6 million more for debtors (now £14.3 million) has major financial problems on its hands. In March 1956 Rolls-Royce raised roughly £4¼ million by a rights issue of ordinary shares; a month ago it arranged a further issue to raise about £10 million, with the expectation that earnings in 1957 would suffice to maintain the 1956 dividend rate on the increased capital. The foundations and longer run prospects of Rolls-Royce were never sounder. But there is the clearest warning in Lord Kindersley's statement that increasing turnover is not at present being matched by a corresponding increase in trading profits. The ordinary stock at 119s. yields no more than £3 7s. 3d. per cent at present but promises much for the future.

LONDON AND OVERSEAS FREIGHTERS

MR BASIL MAVROLEON, the chairman of London and Overseas Freighters, speaks from strength. The company has a tanker fleet worth over £10 million; its tanker building programme has been augmented by orders for six new vessels at a cost of £12¾ million; it has a 50 per cent interest in a Bermudian company which has placed orders worth about £10 million for six tankers; and through another half interest in another Bermudian company it has a stake in two new bulk carriers now on order. It has provided against the cost of its programme by an issue of £7½ million debentures, payable in instalments over four years. Such strength enables Mr Mavroleon to express independent views.

He is an advocate of consecutive voyage charters. As the fixed time charters expire, "every endeavour," Mr Mavroleon says, "is made to secure employment on a basis whereby the hire or freight is linked to the current market rate from time to time, subject to certain maxima and minima." By the end of this year, no less than 80 per cent of London and Overseas Freighters' fleet will be operating on that basis. Indeed, Mr Mavroleon expresses amazement that at a time when tankers are being built on a cost plus basis their owners are willing to fix forward tonnage at a fixed rate of hire or freight. Other owners are at the moment attempting without much success to secure time charters from the oil companies as a protection against a further fall in freight rates; they obviously do not share Mr Mavroleon's view that building costs are the only arbiter.

The risk, and it is one which can be shouldered only by a large company, is that consecutive voyage charters can be fixed only for short periods. And freight rates could fall further. Such an operator must therefore be prepared to seize what the market offers. This is perhaps one reason why London and Overseas Freighters has not ordered any giant tankers. Mr Mavroleon, who doubts whether the theoretical operating advantages of the largest tankers can be realised in practice, comments thus:

> The limited number of routes on which giant tankers may be used in the foreseeable future means that an owner of such a vessel is more dependent than ever upon the oil companies to provide employment. If for any reason there is no demand for giant tankers, other than those owned by the oil companies themselves, on one of the "crude oil ferry runs," no other employment would be obtainable, whereas the owner of vessels able to enter all but the smallest ports and able, if necessary, to pass fully loaded through the Suez Canal would not be so embarrassed . . . the time is not yet ripe for independent owners in this country to contemplate building tankers much over 40,000 tons.

Mr Mavroleon adds that the company is o return, if only in a modest way, to the operation of a dry cargo fleet. Four dry cargo ships, costing over £1 million each, are now on order. But it is still upon the prospective earnings of the tanker fleet that investors have their eye. The prospective yield, based on a 20 per cent dividend on a capital increased by a 25 per cent free scrip issue, is still only £3 3s. per cent.

DUNLOP RUBBER

IN his annual statement Lord Baillieu offers Dunlop shareholders the prospect of a happier year. The tyre factories in Britain are, in the main, back to normal working; more generally, the improvement in business reported in the second half of 1956, particularly in the company's overseas operations, has been well maintained. If this should continue shareholders may reasonably expect some recovery in the dividend, for the net trading balance of the group in the second half of 1956, at £9.36 million, was higher than in any of the three previous half-years.

As three-quarters of the total group profit last year was attributable to the company's overseas operations the chairman's survey of these is of particular interest. He pointed out that competition in overseas markets is intensifying through direct exports and through the setting up of more local manufacturing subsidiaries. Though the value of turnover again increased, this competition and higher costs resulted in slightly reduced margins. The experience of individual companies varied a good deal. The volume of sales and net profit of the Australian company were a record, and the Japanese company was able to pay its first ordinary dividend since the war. The American company, after modernising its plant, made a small profit but the Canadian company, despite record sales, managed only to make a smaller loss than in 1955.

At home, Lord Baillieu states that the tubeless tyre is now firmly established; 61 per cent of Dunlop's sales in the home market last year were of this type and sales to car manufacturers were almost entirely tubeless. The group is keeping closely in touch with developments in synthetic rubber and other materials and is also carrying out its own research on the production of new synthetic materials. Its own synthetic rubber plant came into operation last December and Dunlop is also part owner of the bigger plant that is being built at Fawley. Output of natural rubber is being expanded too.

ULTRAMAR

ULTRAMAR has always been a speculative stock. Its first oil wells did not come up to earlier expectations. FCI stepped in with new money and helped the company through a difficult time. That loan has been repaid and the various advances made to Ultramar's subsidiary and associate companies are gradually being extinguished. Recently American investors have become active buyers of the Ultramar stock and its price has been carried up to 84s. 6d., a new and historical "high."

That interest is tied to the development of new wells and areas in Venezuela. The chain between the producing well and the parent company is, however, a long one. Promising developments have been announced in the Oritupano Pooled Area and, in particular, the Oritu 14 Field is described in the Ultramar directors' report as "a major oil field with multiple oil sands." The field has an estimated potential production of 7,000 barrels a day but full exploitation has been held up thus far by the lack of an adequate pipeline outlet to the coast, and in December actual production averaged about 2,800 barrels a day. In this area S.A.P. Las Mercedes has a half interest with Venezuelan Atlantic Refining. Mercedes, in turn, is half owned by the Texas Company and half by Caracas Petroleum (which is the wholly owned subsidiary of Ultramar). Mercedes has also acquired an option from Shell to drill in the Unare-Zuron area; if these operations are successful, the area will be exploited jointly by the two companies. Elsewhere, the completion of a pipeline may eventually result in drilling and exploration by Caracas in the Barinas area. But neither Caracas nor Mercedes has bid for any of the new concessions offered by the Venezuelan Government in areas which other oil companies consider promising enough to justify the making of high bids.

Successful exploitation still lies in the future, though clearly some speculators are willing to believe that success is closer at hand than it once was. But, if and when it comes, earnings will be divided between a number of interests. In the meantime, Ultramar still has not paid a trading dividend from its royalty income, though it has repeated its tax free capital distribution of 10 per cent from the exchange surplus which emerges from the repayment of advances by Caracas to Ultramar.

SELECTION TRUST

SELECTION TRUST'S interests are widely spread among non-ferrous metals, gold and diamonds. Its gross revenue has more than doubled over the past two years. In the year to March 31st Selection Trust's gross revenue rose by £1,559,618 to £4,643,569, and its net profit rose by £788,556 to £2,221,878. As in the previous year the increase in revenue was mainly attributable to higher distributions from American Metal Company and Tsumeb Corporation. American Metal is a producer of non-ferrous metals and potash on the American continent and it also holds substantial investments in the Rhodesian copperbelt and in Tsumeb. This company, which mines lead, zinc and copper in South West Africa, sold more metal at higher prices last year, and contributed directly and indirectly about one-half of Selection Trust's gross income.

Though the market value of the

trust's investments fell to £21,216,519 they were still nearly six times higher than the book value. An arbitrary and possibly conservative value of £13 a share is placed on the holding in Tsumeb. The trust is endeavouring to spread its interests wider still, and is well supplied with cash to do so. One of the Canadian subsidiaries is conducting extensive exploration and another has taken an interest in Alberta oil. The chairman emphasises that last year's earnings were exceptional; nevertheless he thinks that the dividend can be maintained.

	Years to March 31, 1956	1957

BORAX (HOLDINGS)

AT 31s. 7½d. the 5s. Ordinary units of Borax (Holdings), which are largely governed by the views of American investors on the activities of U.S. Borax and Chemical Corporation, continue to run close to the year's highest levels. The price is geared to the increase in production which should result from the imminent completion of the development programme at Boron, California, and it heavily discounts the future. Certainly the interim report for the six months to March 31st last calls for no immediate change of view.

The six months' gross profit of £1,987,178 is in line with the estimated full year's profit in 1955-56 of £3,974,462, an estimate made on the assumption that the merger with U.S. Potash had been in operation throughout that period. It is also keeping with the chairman's comments in March that results thus far in the financial year were "satisfactory" and that no increase in the volume of production could be expected until the development programme was complete.

One aspect of the reorganisation of Borax is that earnings in the United States will be retained there for some time and that dividend payments by the British company will thus be made out of accumulated reserves. Hence the tax savings which follow on the reorganisation may have an important influence on future dividends.

BEECHAM GROUP

THE administrative reorganisation of the food division of the Beecham Group has evidently proved successful. Difficulties in its first year were responsible for a small fall in profits in 1955-56. Now the directors say that it was "largely" responsible for the advance in trading profits for the year to March 31st from £3,665,808 to £4,516,123. There was also a further increase in the total turnover of the group.

Net earnings rose from £1,579,419 to £1,863,126 and the ordinary dividend has been raised from 30 to 32½ per cent. The bigger sum of £806,034, against £629,015, has been retained in the business. The recent firmness of the 5s. ordinary shares, now standing at 24s. 9d. to yield 6.6 per cent, has thus been justified.

ALLIED IRONFOUNDERS

THE ordinary dividend of Allied Ironfounders has been reduced from 13¾ to 12½ per cent, following a decline in gross profits from £2,416,370 to £2,236,500 and in net profits from £1,008,123 to £745,429 in the year to March 31st last. Trading results of the British companies in the group improved in the second half of the financial year. But overseas "adverse trading conditions" caused "a sharp fall" in the profits of the South African company. And in Australia "manufacturing difficulties" have resulted in a loss of £268,000, "for which no tax relief is yet available." The directors add that "these difficulties have not yet been overcome."

London Stock Exchange

FIRST DEALINGS:	May 29	June 19	July 3
LAST DEALINGS:	June 18	July 2	July 16
ACCOUNT DAY:	June 25	July 9	July 23

FOLLOWING a small improvement before the week-end gilt-edged stocks settled down and showed little further change on balance, after fluctuating narrowly up to Wednesday. Last week's fall in the Treasury Bill rate was responsible for the firmness at the short end of the list. Industrial stocks made steady progress in a fairly quiet market; the persistent strength of store shares and the advance of steel shares (helped by the increase in United Steel's dividend) helped to raise *The Economist* indicator to 222.3—a gain of 3.3 on the week.

Insurance stocks weakened once more. Breweries made further gains following the recent fine weather, Watney deferred rising 2s. 9d. to 59s. 3d. Building shares were strong, APC and London Brick advancing to 50s. and 65s. 3d. respectively. GUS and Marks and Spencer led a new advance in store shares and both closed at new peaks on Wednesday. Dunlop rose 1s. 7½d. to 21s. 6d., Glaxo jumped to a fresh peak of 41s. and Unilever moved up to 114s. 6d. Calico Printers gained 2s. to 48s. 3d. on the prospect of the expansion of "Terylene" production. Tobacco shares recovered, Imperial Tobacco rising to 40s. 6d. from a low point of 37s. Shipping shares remained dull.

Oil stocks became stronger this week after receding earlier; Ultramar was outstanding, leaping 6s. 6d. to 81s. 7½d. ex the capital payment. Johnnies was a feature of the Kaffir market, gaining 3s. 6d. to 50s. On the lower dividend Crown Mines fell 2s. to 19s. 3d. xd and Rand Mines steadied to 67s. 6d. xd on the financing arrangements. Tin investment companies weakened, British Tin losing 3s. 3d. to 22s. and London Tin 1s. 1½d. to 10s. 10½d. Coppers fell on the producers' price cuts, RST losing 1s. to a new low point of 18s. 9d. The steady demand for rubber shares continued.

(1) This covers mining, manufacturing, electricity and manufactured gas with the following exceptions: Denmark excludes mining; Greece, mining and manufactured gas; Ireland and Sweden, electricity and manufactured gas; and Austria, manufactured gas. Germany excludes West Berlin. (2) Special *trade* (excluding re-exports) with the exception of Ireland which covers general trade with exports seasonally adjusted. Belgium includes Luxemburg. Italy includes Trieste. (3) New drachma introduced May 1, 1954 (1 new drachma=1,000 old drachmas). (4) Thousand million drachmas. (5) Bizonal area. (6) Average fourth quarter. (7) New series; *original* base 1956=100.

Financial Statistics

EXCHEQUER RETURNS

For the week ended June 15, 1957, there was an "above-line" deficit (after allowing for Sinking Funds) of £33,828,000 compared with a surplus of £25,163,000 in the previous week and a deficit of £30,860,000 in the corresponding period of last year. There was a net expenditure "below-line" last week of £5,670,000, leaving a total deficit from April 1st, of £94,836,000 (£151,351,000 in 1956-57).

THE MONEY MARKET

FOLLOWING two weeks of generally easy credit, and an unusually low allotment at the previous tender, the discount houses raised their common bid by 3d. to £99 0s. 8d. per cent at the Treasury bill tender on Friday of last week. Applications at this minimum received a 40 per cent allotment, compared with 21 per cent a week before. The reduction in the average rate of allotment of all bills moved in line with the reduction in the market's rate, falling by 11.33d. per cent to £5 17s. 3.26d. per cent; total applications fell by £41.3 million from the previous week's high level of £451.2 million.

That exceptional demand had been attributable partly to anticipation of the maturity on Saturday last of the Exchequer and Funding stocks remaining in private hands. In the event, the release of cash was offset by unusually heavy withdrawals from commercial sources, and stringency developed in some quarters. On the two preceding days, the Bank had given the market a very small amount of help through special purchases. On the first three days of this week, credit supplies have remained taut.

Sterling staged a sharp recovery against the US dollar—though not against continental currencies—around the week-end, rising from $2.78⅛ on Thursday last to $2.79⅜ on Tuesday; but the rate dropped later to $2.79⅛.

Right off the beaten track

Take one towpath. Lay rails on a foundation of ashes. Next, place one steam travelling crane on track. If you now begin loading and unloading, the chances are your crane will end up end-up. (See illustration.)

What Vulcan say about it

Poor track formation is too often the cause of accidents to travelling cranes. Once again, prevention of disaster means scrupulous inspection and maintenance of all temporary rail tracks. Once again, Vulcan are the experts to turn to.

Engineer-Surveyors from Vulcan Insurance spot the danger before the trouble starts, and industrial machinery is their happy hunting ground. Cranes, lifts, hoists, boilers, vacuum vessels—any and every plant comes under their eagle-eyed scrutiny, and gets the specialist going-over for which Vulcan is renowned. In a sentence, safety first is Vulcan first.

SIR SIMON MARKS REVIEWS PROGRESS

The thirty-first Annual General Meeting of Marks and Spencer, Limited was held on June 13th at 82 Baker Street, London, W.1.

Sir Simon Marks DSc (Chairman and Joint Managing Director) who presided said: Ladies and Gentlemen:

May I take it that in accordance with our usual practice the Directors' Report and Accounts may be taken as read? (Agreed.)

PROFIT AND LOSS ACCOUNT

Our Net Profit for the year has amounted to £5,606,000 compared with £4,955,000 last year, an increase of £651,000.

Provision for taxation required £7,200,000, an increase of £2,025,000 on last year. Income Tax at £5,350,000 compares with £4 million and Profits Tax at £1,850,000 compares with £1,175,000.

SCRIP ISSUE

The Ordinary Share Capital was increased in February last from £9,047,000 to £18,094,000 by a Scrip Issue of one "A" Ordinary Share for each Ordinary and "A" Ordinary Share held, and on this increased Capital the Board recommends a final dividend of 20 per cent bringing the total dividend for the year to the equivalent of 30 per cent or 1s 6d per share against a comparable distribution of 1s 3d per share last year.

RESERVES

We propose to transfer to the General Reserve the sum of £3,096,000. We have merged the Stock Contingency Reserve of £1 million and the Debenture Redemption Reserve of £399,000 with the General Reserve which removes a certain amount of detail from the Balance Sheet. The General Reserve will then stand at £6 million and with the balance of £1,762,000 in the Profit and Loss Account, the Revenue Reserves will amount to £7,762,000. The Capital Reserve still stands at £19,323,000.

GENERAL SURVEY

Our Turnover has exceeded £125 million against £118 million last year. We are reaping the benefits of the substantial investment we have made in the expansion and modernisation of our stores. We have particularly benefited from our policy of upgrading and widening the range of specialised goods we sell. The Profits we show are due not only to the increase in trading which we report but also to lower operating costs.

We were concerned with the constantly rising cost of operating our business. At the beginning of 1956 as a first step, we took the course of examining our systems and procedures. After due probing, we came to the conclusion that some of our methods had become cumbersome and were costly in time, effort, and money. Simplified methods were introduced which cut out unnecessary paper work on the part of large numbers of our staff who were diverted to more useful and productive tasks.

GREATER EFFICIENCY

By these means and by the "Good Housekeeping" campaign which we inaugurated in regard to our controllable domestic expenses, we checked the rise in our operating costs and have, in fact, effected considerable savings. I am glad to say that at the same time our operation is smoother and has gained in efficiency.

Another factor which led to increased Profits was the lower charge for Repairs and Maintenance. This is the item in our Accounts under which we charge the cost of keeping our Properties and Equipment in good repair and condition. It is an operating expense chargeable against the year's Profit and the sums required for this purpose may vary each year in accordance with the needs of particular stores. This year we have spent on Repairs and Maintenance £744,000 which is £537,000 less than a year ago and our Trading Profit has benefited by that amount.

STORE DEVELOPMENT

We have now completed the rebuilding of the bombed stores. This operation, extending over six years, has provided us with 15 splendid stores specially designed for the character of our business of today. The most impressive addition to our chain is the Birmingham Store. We have invested over £1 million in this unit which would indicate to you the scale on which it has been constructed.

I informed you in my speech of last year that we had decided to slow down our investment in store development in response to the Chancellor's appeal. In that year 1955-56, we had spent some £6,500,000 and there was a balance of work amounting to approximately £2,500,000 to be completed during this Financial Year. This programme has now been completed. The most important store of this series, Princes Street, Edinburgh opened yesterday. The actual building operation has taken over 2½ years to finish. This brings the number of stores we are operating to 237.

We have set in motion plans for rebuilding a number of stores and further expansions which will add valuable selling space in cities and towns where we are now successfully trading. This programme will cover a period of about 2 years, and will involve an estimated sum of between £5 million and £6 million.

INCREASED SELLING SPACE

Year after year I have given you an account of the progress of our efforts to provide greater selling space in our existing stores in order to display the growing range of goods more effectively. Progress has been particularly rapid in the last five years for in this period, we have increased our selling space from two million to three million square feet, a gain of 50 per cent. Our stores are becoming important shopping centres.

It is not easy to describe the transformation of so many of our stores which in the course of their evolution have assumed a distinctive character. It is clear, however, that our customers appreciate the new look of our stores and particularly do they welcome their more spacious and attractive setting which shows our goods to advantage and provides pleasant and convenient shopping conditions.

MERCHANDISING POLICY

The continued success of our business lies in the character, quality and wide range of special garments we sell, which cover some of the important needs of all members of the family.

Our brand name "St. Michael" has become a household word for value. It is the symbol of well-styled, well-finished, attractive garments, with wearing properties in which the customer can have every confidence. We seek to strengthen our goodwill with the community.

Our policy of up-grading our goods has been consistent throughout many years. This is a dynamic policy on which are engaged scientists, technologists, stylists, etc., who form part of our Merchandise Research and Development Division. The importance we attach to this phase of our work can be seen from the fact that the cost of operating our Technical Services amounts to well over £500,000. There are some sixty Scientists, Technologists and Technicians in a total staff of over 230 persons employed in these services.

Much of the progress we have made in the improvement of our goods stems from the systematic and continuous work of our scientists and technologists. Their task is to study ways and means of up-grading our goods, always bearing in mind value and price. Their duties are to keep abreast of any interesting developments in the textile field which can be speedily incorporated in our goods. Their work ranges from the yarn to the complete garment, and they are concerned with all the processes leading to the finished article.

QUALITY CONTROL

Quality control is a most important part of their functions. It is based on specifications and standards of quality which we have worked out, and which are agreed upon between our manufacturers and ourselves. This is essential in order to maintain uniformity and the standards we set for our goods. It is all the more essential as we employ many manufacturers producing similar types of goods whose techniques vary. It also demands an understanding co-operation between our Technicians, Buying Executives and Suppliers, for without such collaboration our objectives could not be achieved.

There have been rapid scientific and technical developments in the textile field which have provided us with a wealth of new fibres and techniques. Many of these developments can be used to impart novel properties to textile garments which will do much to ease the domestic burden of cleaning, washing and ironing.

I am glad to say that our Food Division is making good progress. Here again, our Food Technologists have an important role to play. Their services are made available to our suppliers who appreciate to the full the contribution they make to the up-grading of the quality of their products. The foodstuffs we sell are, in the main, specialised bakery goods and graded and selected fruit, which are much in demand.

TRIBUTE TO MANUFACTURERS

It is my pleasure once again to pay tribute to our suppliers. As you are aware, 99 per cent of the goods we sell are made in Great Britain. Our policy of concentrating on British Made goods could only have succeeded thanks to the close co-operation of our manufacturers. The improvement of our goods has been made possible by the understanding collaboration which exists between our buyers and technologists, and their opposite numbers in the factories. They work as a team.

Our suppliers are at one with us in our quest for ever improving values. The large quantities of goods we require each week enables them to plan their production systematically, and consequently economically.

We, for our part, have invested considerable sums in the development of our stores, which have become unique shopping centres.

They, for their part, have invested in new machinery and equipment, and in many cases, new factories. They have introduced many improvements in their production techniques which enables us to meet the needs of our public and the challenge of changing fashions and tastes.

We thank them for their most valuable collaboration and look forward to many more years of fruitful association.

TRIBUTE TO STAFF

It is with pleasure that I ask you to join me in expressing my appreciation and that of the Board of the work of all the members of the staff both at Head Office and in the Stores. We enjoy one of the greatest assets that any business can hope to possess, a loyal and devoted staff who carry out their duties efficiently and happily.

I have described on many occasions the character of the amenities we provide for the well-being of our employees. It has always been one of our basic aims to create a happy working atmosphere throughout the business.

In addressing myself to the members of the staff who come into contact with our customers, I would like to say how much we prize their high standard of service. It is both courteous and helpful to all who shop in our stores and it has gained for us an unrivalled reputation.

The numbers of those employed in our business who attain twenty-five years of service grows year by year which is a matter of much satisfaction to your Board. When the inevitable time comes for retirement they know that their well-being is still the concern of your Company and that they will continue to participate in many of the amenities which they enjoyed during their working life.

We provide appropriate pensions through our Pension Funds and Benevolent Trust. These material benefits are of course important but we attach considerable significance to making our pensioners feel that even on their retirement they are still members of the Marks and Spencer family.

The report and accounts were unanimously adopted.

ALLEN WEST & COMPANY

ANOTHER YEAR OF PROGRESS

The forty-eighth annual general meeting of Allen West and Company, Limited, was held on June 19th at Brighton, Mr M. W. H. Lancaster, MC, FCA (the chairman), presiding.

The following is his circulated address:

It is with regret that I must report the deaths during the year of Mr Allen West and Mr L. A. Stride. Mr West was the founder of this Company and Mr L. A. Stride had been a Director and my deputy from 1942 until his retirement last year.

TRADING RESULTS

I now have pleasure in putting before you our Balance Sheets at January 31, 1957, together with a Consolidated Profit and Loss Account. I feel I cannot improve on my remark last year when I said "We produced more, sold more and finished with a larger order book than last year and we have paid higher wages to more people."

The Group Trading Profits are £190,949 more than last year, largely due to No. 4 Factory getting into full production; price increases have also contributed to this result.

The larger provision for Depreciation was made in view of the ever-growing cost of maintaining our plant and equipping the factories with the most modern machine tools, a policy which, under present conditions, is essential. We are committed in the amount of £205,000 for further new plant and the cost of completing No. 5 Factory.

The current asset position is very satisfactory. You will note, however, that the figure for reserves, which as you know is made up of profits ploughed back into the business, has now reached £1,634,522. We propose therefore to bring the Issued Capital more into line with that employed in the business by making a distribution of 3 Stock Units for every 10 held, and we have applied to the Capital Issues Committee for the necessary permission. Our Issued Capital will even then be exceeded by the total of our Fixed Assets and Stock and Work in Progress.

Our South African Company continues its excellent trading record, and our Rhodesian Company which commenced operations in February, 1956, has been successful in making a profit in its first year.

TRIBUTE TO EXECUTIVES, STAFF AND WORKPEOPLE

Mr P. C. Jones, who was Sales Director retired from the Board in January of this year, having made a substantial contribution to the Company's success during his 45 years' service. Mr J. H. Hall, who has been connected with the sales of this Company for 31 years, now takes complete charge of our sales organisation. Mr R. M. Malloch, our Works Manager, who joined the Company 26 years ago, has been co-opted to the Board to fill the vacancy caused by Mr Jones's retirement.

I am happy to report that the co-operation between management and employees remains most satisfactory, and thank all those on the Staff and in the Works who have helped to make this another successful year.

Addressing the meeting the chairman said: I am pleased to inform you that we now hold the consent of the CIC to make the distribution of 3 stock units for every 10 that you now hold. The necessary notices will be posted as soon as possible.

The report and accounts were adopted.

THE INDUSTRIAL AND GENERAL TRUST

FURTHER REVENUE INCREASE

The sixty-ninth annual general meeting of The Industrial and General Trust, Limited, was held on June 13th, in London.

Sir Edwin Savory Herbert, KBE, LLB (the Chairman), presided and, in the course of his speech, said:

There has been a further increase in gross revenue this year. At £1,618,000 approximately it is some £86,000 more than last year. The bulk of this increase was provided by our income from investments, but our recoveries through double taxation relief also increased by over £14,000; reflecting largely our increased stake in North America.

The net revenue after taxes and all other expenses comes to £779,783 which, with £386,177 brought forward from last year, gives a total of £1,165,960 to be dealt with. From this sum we have transferred £200,000 to General Revenue Reserve against £150,000 last year. The dividend on the Preference Stock for the year has again absorbed £45,281 and, the interim dividend of 10 per cent on the Ordinary Stock, a further £201,250. Out of the £719,429 remaining we now propose a final dividend of 17½ per cent which will require £352,188 leaving £367,241 to be carried forward to next year.

If you agree to our recommendations as to the Ordinary dividend, we shall have paid 27½ per cent for this year against 25 per cent last year while, at the same time, increasing our reserves overall by a little more than £181,000.

The financial year which we are now considering has not been an easy one. Disagreements between Management and Labour in this country several times came close to causing a national crisis, but happily good sense prevailed and the worst did not happen.

ORDINARY STOCKHOLDERS' POSITION

It is interesting to consider to what extent a holder of Ordinary Stock in the Trust has protected himself against the continuous fall in the value of money of which, in recent years, we have become so acutely conscious. We are told that the value of money today is about 2/5ths of what it was twenty-five years ago. In those days the Industrial Ordinary Stock, on the basis of a 5s. Unit was 12s. 5d. The equivalent of that price to day in depreciated pounds would be approximately 31s. If the present market price of 29s. is adjusted to allow for the Bonus Issue of 1953, we arrive at a market price of 58s. to compare with the figure of 31s. mentioned above. Therefore the investor has fully protected his capital which he would not have done if he had invested in "gilt-edged" or other fixed interest securities.

If we look at the income position, we find that in 1932 a dividend of 14 per cent was paid on the Ordinary Stock. The equivalent dividend, in terms of the £ today, would be 35 per cent, whereas our recommendation for the year just ended, after allowing for the Bonus Issue in 1953, represents a dividend of 55 per cent. Thus as regards both capital and income, the Ordinary Stockholder has kept ahead of inflation. However, the point to remember is that this satisfactory position has been achieved by the exercise of considerable restraint by the Stockholders. During the whole period we are considering, they have agreed to plough back each year a large part of the revenue available for dividends.

The report and accounts were adopted.

C. C. WAKEFIELD AND COMPANY

A YEAR OF CONTINUED GROUP TRADING EXPANSION

GROUP SALES OF CASTROL REACH NEW PEAK

MR L. W. FARROW'S REVIEW

The Fortieth Annual General Meeting of C. C. Wakefield and Company Limited, will be held on Friday, July 12th, at Winchester House, Old Broad Street, London, E.C.2.

The following is an extract from the Statement by Mr L. W. Farrow, CBE, the Chairman, which has been circulated with the Report and Accounts for the year ended December 31, 1956.

Before I proceed to review the results and activities of the Group for the past year, I have to refer to certain changes that have taken place in the constitution of the Board of Directors.

In this respect the year that has elapsed since our last Annual General Meeting has been a sad one, and it is with profound regret that I have to record the passing of Mr H. Y. Blades, Mr Alonzo Limb and Mr W. H. Senneck, all of whom were former Managing Directors of the Company.

I am sure you will have welcomed the recent announcement in the Press that your Managing Director, Mr L. M. Broadway, had also been appointed Deputy Chairman of the Board. Mr Broadway, who joined the Company in 1920, was appointed to the Board in 1947, becoming Assistant Managing Director in 1951 and Managing Director in 1954. It gives me great personal pleasure to have him as my Deputy.

The sad losses to which I have referred led us to reconsider the constitution of the Board and it was decided to strengthen the marketing representation thereon by appointing Mr C. E. R. Millidge, Manager of the United Kingdom Castrol Division, and Mr A. A. Barr, Group Publicity Manager, as Directors of the Company. Both these new Directors are well qualified by ability and experience to make a valuable contribution to your Board's deliberations, which become increasingly responsible as the world-wide ramifications of the Group continue to expand. It is interesting to record that all the executive members of your Board have served the Company for what is virtually the whole of their working lives and this reflects our policy of promotion from within the Company, wherever possible.

Lastly, on the subject of Directors, I am proud to refer to the election of our Board colleague, Sir Cullum Welch, as Lord Mayor of London for the current civic year. Sir Cullum, who has been the Company's legal adviser for 27 years, joined the Board in 1954 and his mayoralty creates a unique record in the history of the Company in that he is the second member of its Board to hold this distinguished office, the late Viscount Wakefield having done so in 1915-1916.

GROUP TRADING

The Group Trading Profit of £3,353,882 represents a reduction of £488,845 compared with the previous year, a result not unsatisfactory having regard to the continued rise in costs, aggravated towards the end of the year by the Middle East crisis. To a large extent these additional costs have again been absorbed by the Company. I mentioned in my statement last year that for the first quarter of 1956 the sales of the Group showed an increase over the corresponding period of 1955, It now gives me pleasure to announce that this trend was maintained and the volume of Group Sales throughout the world in 1956 surpassed the record of the previous year. This achievement takes on a wider significance when viewed in relation to the highly competitive marketing conditions under which the Group operates, and the general economic situation. You will be pleased to know that notwithstanding these difficulties and the imposition of petrol rationing in the United Kingdom and other European countries towards the end of the year, the world-wide sales in 1956 of Castrol, your Company's principal product, were an all-time record for the Group.

Last year I referred to your Company's membership of the Motor Accessories Manufacturers Association, which was formed with the object of promoting the unrestricted sale and display at garages and service stations of motor accessories and lubricating oils. I am informed that during the past year the Association has repeatedly drawn attention to conditions introduced by petrol companies which have as their object the restriction of the sale and display of competitive lubricating oils. I understand that the Association has tested public feeling relating to these conditions and, of the many thousands of motorists whose views were sought, there was an overwhelming majority in favour of a free choice of lubricating oils. Your Company, along with the other member Companies, will continue to support the Association's activities

WAKEFIELD-DICK INDUSTRIAL OILS LIMITED

As from January 1, 1956, this principal Subsidiary Company became responsible for the marketing of the Group's Industrial Marine and Electrical Oils in the United Kingdom, and I am pleased to report that the integration of these trading activities has been an unqualified success in the beneficial interests of the Group.

	1945	1952	1953	1954	1955	1956
	%	%	%	%	%	%
Taxation	58	63	62	52	52	56
Retained in the Group	16	5	26	35	34	27
Net dividends	26	32	12	13	14	17
	100	100	100	100	100	100

Stockholders will be interested to learn that Wakefield-Dick Industrial Oils Limited will supply the lubricants for the turbines being installed at the Chapel Cross Atomic Power Station which is due to commence operations early next year, and has also been accepted as the sole supplier of the lubricating oil requirements of the Berkeley Nuclear Power Station in Gloucestershire. In addition, this Subsidiary retains its position as the foremost supplier of transformer and switch-gear oil to the Electrical Industry in the United Kingdom and its Ilo transformer oil is already in service at Calder Hall. In the marine field the recent development of the Group's international servicing facilities is proving of material benefit.

RESEARCH

The Research Department of your Group is continuously engaged, amongst other things, in maintaining the technical superiority of Castrol, which has been recognised for nearly forty years as the "Masterpiece in Oils." Recently, a report of the Co-ordinating Research Council in the United States of America described the results of extensive road tests on 295 cars of 16 makes. The object was to investigate cam and tappet wear which had become troublesome in the United States of America and elsewhere. The results of this elaborate investigation proved that zinc dialkyldithiophosphate is the best preventive of cam and tappet wear.

Your Company manufactures this additive and I am pleased to disclose that it has been used in a suitable proportion in Castrol for the last eight years, with consequent benefit to the motoring public.

OVERSEAS TRADING

It is with pleasure that I am able to report another year of outstanding achievement in sales overseas, which, in 1956 exceeded, both in volume and value, the record of the previous year. This increased business can be attributed in some measure to our policy of establishing Subsidiary Companies in certain selected overseas territories where we had previously operated through Agents, although we cannot yet expect a substantial benefit from the expansion of trading by the more recent of these Subsidiaries.

Since the last Annual General Meeting, Companies have been incorporated in Switzerland and Brazil, and the Group now controls 15 Overseas Subsidiaries. The Brazilian Company has been formed initially to operate our new blending and filling plant now in production at Rio de Janeiro and this step has been taken to further our trading interests in the Brazilian market.

During the year we have invested further capital in certain of these Overseas Companies where this has been deemed necessary as a means to marketing expansion and increased profits.

Having regard to the extent of the Group's overseas trading interests, we welcome the Government's proposals for tax concessions to Overseas Trade Corporations. Although at the moment these are somewhat obscure, it seems certain that they will be of some benefit to the Group and the fullest possible advantage will be taken of the eventual legislation in this respect.

ACCOUNTS AND DIVIDENDS

The Consolidated Profit and Loss Account of the Group shows a net profit, after taxation, of £1,121,237, as against £1,474,452 in 1955.

Your Directors recommend the payment of a Final Dividend on the Ordinary Stock of 20 per cent, less Income Tax, making a total for the year of 27½ per cent, the same as for

1955. Preference and Ordinary Dividends will, therefore, absorb a net amount of £430,207. Group transfers to Reserves total £687,274, which include an amount of £603,501 set aside to General Reserve (Parent Company, £500,000) to provide for the future development and expansion of the business. After taking into account these appropriations the balance of Group profits carried forward is £653,994 as against £650,238 in 1955.

This year I have produced a table showing approximately, taxation, amounts retained in the business and net dividends paid to stockholders of the Parent Company expressed respectively as percentages of the Consolidated Net Profits of the Group. This is in respect of 1945, the year for which we first published accounts as a Public Company, and the years 1952 to 1956.

In the Balance Sheet of the Parent Company you will notice that the amount shown as shares in Subsidiary Companies has increased by £279,430 over the 1955 figure. It is interesting to observe that since 1945 the amount of this asset has increased by more than £1,400,000.

It will be seen from the Consolidated Balance Sheet that the value of Fixed Assets again shows an appreciable advance over the previous year which is largely attributable to the Overseas developments already referred to. Capital Reserves are higher, principally because of the capitalisation of Revenue Reserves in our French Subsidiary Company. I am sure you will agree that this Balance Sheet indicates a healthy financial position notwithstanding the continued inflationary trend which is reflected in the increased figures for Stock-in-Trade, Sundry Debtors and Sundry Creditors.

PROSPECTS

It is difficult to attempt any forecast of Trading results for the current year as these will be affected by the recent petrol rationing in the United Kingdom and, to a lesser degree, in other European countries. They will also depend upon the extent to which profit margins can be maintained having regard to any possible further increase in costs.

Subject to these reservations, now the restrictions on motoring have been lifted, your Directors consider that there is good reason to anticipate that the results for 1957 will not be unsatisfactory. I would add that statistics so far available for this year indicate that the volume of Group sales throughout the world has been maintained notwithstanding the effects of Suez.

TRIBUTE TO EXECUTIVES AND STAFF

I know that stockholders will wish to be associated with the Board in a message of sincere thanks and appreciation to all grades of the Group's Staff throughout the world for their loyal co-operation and devotion to duty during a difficult year.

THE EVER READY COMPANY (GREAT BRITAIN) LIMITED

(Manufacturers of Dry Batteries)

SALES AND EARNINGS AT RECORD LEVELS

EXPANSION OF GROUP TRADING INTERESTS

MR E. N. ROWBOTHAM'S STATEMENT

The Annual General Meeting of The Ever Ready Company (Great Britain) Limited will be held on July 10th at the Head Office, Hercules Place, Holloway, London, N.7.

The following is the statement of the Chairman, Mr E. N. Rowbotham, which has been circulated with the report and accounts for the period from March 4, 1956, to March 2, 1957.

I would like at the outset to refer to Mr A. V. Perry who retired from the Board on March 2, 1957, having reached retirement age. Mr Perry has been associated with this Company over twenty-five years and was elected to the Board in 1944. I wish to record our gratitude for his wise counsel during his years of office and I hope he will have good health and happiness in his retirement.

RECORD SALES AND PROFITS

It gives me great pleasure to report to you on another year of successful and satisfactory trading. Sales and earnings have again increased and in fact are the highest since the inception of the Company. These favourable results have been achieved in a period in which rising costs of raw materials, wages and services have given your Directors considerable concern. Up to the present we have been able to meet these increased costs by reason of greater production, improved methods of manufacture and good factory management—and here I pay tribute to the work done by our Managers and their able staffs, supported by the loyal and efficient co-operation of all our employees without which such satisfactory results could not have been achieved.

EXPORT TURNOVER AGAIN INCREASED

Sales of the Company's products abroad were increased substantially during the period and again new record figures were set up although difficulties were encountered in many markets due to the dislocation caused by the Suez crisis. The dry battery powered radio set is still increasing in popularity and is now produced by all the leading radio manufacturers. In 1954 twenty-five per cent of the radio sets sold in this country were dry battery operated. By 1956 this had increased to forty per cent. On the export market the proportion is just as great and with the spread of broadcasting in the undeveloped countries of the world, we confidently expect the demand for dry battery radio sets will continue to increase. The continued expansion of the export volume is particularly gratifying because in the more distant markets our BEREC batteries are sold at prices which are higher generally than those ruling in this country. This expansion has been made possible by the increase in output contributed by our two new factories in the Midlands and Eastern Counties to which I referred last year. Both factories came into production last Autumn and this addition to our resources proved both timely and most necessary. I am of opinion that your Company is now equipped to meet all the demands for its products at any rate for the immediate future. Nevertheless your Directors constantly watch the trend of demand and are prepared to augment further the Company's facilities should this appear necessary.

INCREASED PROFITS AND DIVIDEND

The Consolidated Net Profit for the period after all charges including taxation is again a record figure at £892,624 compared with £878,720, an increase of £13,904. The total taxation charged amounts to £905,186 compared with £871,023 last year. Stockholders will notice that while Profits Tax has increased from £157,000 to £204,000 by reason of the increase in the rate of tax this year and the amount of the Final Dividend, the charge for Income Tax remains substantially the same. This is due to the fact that the very large capital expenditure made by the Company during this period has resulted in correspondingly large capital allowances.

Your Directors have given careful consideration to the amount of the dividend recommended. They consider it essential to maintain their policy of "ploughing back" substantial sums out of the profits to be retained in the business for its future development and expansion and for the maintenance and improvement of its capital assets especially as at the present time they are giving careful consideration to further important capital developments to which I will refer later. Nevertheless they feel that an increase in the distribution to Stockholders is justified by the good results achieved and they have therefore recommended that a final dividend of 27½ per cent be paid on the Ordinary Stock making 37½ per cent for the period compared with 35 per cent last year.

PROGRESS OF SUBSIDIARIES

Our wholly owned subsidiary, CRAMIC Engineering Company Limited, has again shown an increased turnover and profit. In addition to meeting the needs of our own group for specialised machinery, this Company carries on a substantial engineering business for other customers, mainly prototype and special machine building and the supply of spare parts for such machines. They have also during recent years developed special machines for "Sculpture Milling," that is to say the carving of intricate components out of solid metal. This form of structure is being increasingly adopted in aircraft manufacture and the Company has received substantial orders from many of the leading aircraft companies for air frame parts made by this process. In addition a number of these Sculpture Milling machines have been sold to aircraft companies for their own use. Your Directors view this new development with considerable optimism. Last year I reported to you an expansion of the facilities of this business. Currently the paid up capital of this Company amounts to £500,000.

Further expansion both of buildings and plant have been put in hand during the last year, and provided our present plans materialise, our investment in this Company will be at least doubled during the next year or two.

Our subsidiary companies on the Continent of Europe have continued the process of reorganisation to which I referred last year and have achieved considerable expansion of business. In February, 1957, we made a further investment in our subsidiary in Western Germany. This Company, DAIMON G.m.b.H., Cologne, is now our most important subsidiary on the Continent with a capital of DM2,300,000 of which your Company owns over 90 per cent. This capital is invested in modern buildings with up-to-date and efficient plant and machinery and the Company is now able to compete in continental markets. In this connection your Directors have been following with great interest the proposals now being put forward for the establishment of a European "Common Market" and a European "Free Trade Area." We are of opinion that your Company is in a good position either directly or through its continental subsidiaries, to take advantage of either proposal particularly as in our view the European market, once tariffs are removed or lowered, offers considerable scope for increased development of the dry battery demand.

STRONG FINANCIAL POSITION

As I warned you in my Comments last year it became apparent that the substantial development of our business together with the demands of our subsidiaries for capital extensions would make large inroads into this Company's liquid capital resources, and your Directors having carefully considered all the various possibilities decided that the most advantageous method for the Company was to make an issue of Debenture Stock to be placed privately with a number of City institutions. Accordingly the consent of H.M. Treasury having been obtained, the Company issued on October 29, 1956, £1,500,000 5¼ per cent Debenture Stock 1976/81 at the issue price of £97 10s. per £100 stock. The Stock is secured by a Trust Deed dated Februry 28, 1957, giving a floating charge on the Assets and undertaking of the Company and some details of the terms of repayment are shown in Note 4 of the "Notes on the Accounts." The Stock is quoted on the London Stock Exchange.

The Consolidated Balance Sheet shows that the Company's liquid financial position has been substantially strengthened. The surplus of Current Assets over Current Liabilities (including the Deferred Liability for future taxation) has increased from £1,599,989 to £2,951,085. There was a considerable increase in export sales during the last months of the period compared with the similar months of last year, which has resulted in a slight diminution in the value of "Stock in Trade" and an increase in Trade Debtors from £1,322,694 to £1,569,374. The total of Government Securities and Cash at Bank has risen from £1,069,232 to £1,854,413. Current Liabilities are reduced by £335,798 from £2,390,137 to £2,054,339.

After providing for taxation and the increased final dividend your Directors have allocated £510,165 to Reserves, and the Carry Forward in the Consolidated Profit and Loss Account is £223,791 compared with £193,634.

CAPITALISATION OF RESERVES

The Board have had under consideration for some time the advisability of bringing the Issued Ordinary Share Capital of the Company more into line with the Company's asset position which has steadily improved year by year. My letter to Stockholders on this subject, which accompanies this Report, sets out in full detail the arrangements we propose to make to capitalise a portion of the Company's Reserves. I shall not comment further here save to emphasise that Stockholders must not assume that on the Issued Ordinary Capital being doubled by the amount of the proposed issue, the total amount of dividend paid on the Ordinary Stock will be necessarily increased. Future dividends must depend on the course of future trading and also on the need for further capital investment which may arise from time to time.

THE FUTURE

In my Report to Stockholders in 1955 I made reference to the arrival commercially of the Transistor.

The use of equipment employing semiconductors is developing steadily and the dry battery is and will be used increasingly as a source of power for such devices. We have developed a range of "Power Packs" especially for use with equipment employing transistors.

The current trading year has started satisfactorily but in common with industry generally we are finding it increasingly difficult to maintain profit margins in the face of continually rising costs.

PHILIP HILL INVESTMENT TRUST

The twenty-fifth ordinary general meeting of Philip Hill Investment Trust Limited was held on June 17th, in London, Sir Brian Mountain, Bart (the Chairman), presiding.

The following are extracts from his circulated statement:

For the first time the consolidated trading profits have exceeded £1 million. Dividends and interest from investments have risen from £572,450 to £617,829. Taxation amounts to £208,678 (£171,520). The net profit, without taking account of profits retained in the subsidiaries, is little changed at £329,909 (£329,284). The operating Companies have had another successful year.

The Board recommend a total distribution of 16 per cent, less tax, for the year (15 per cent). This dividend is covered by the Trust's investment income with the substantial margin of £96,675.

The Statement then referred to the increase of capital and Rights Issue (an extraordinary meeting to sanction these proposals was held on May 27th), and to the issue of a further £2 million of Debenture Stock, to be made when conditions are considered propitious, and continued:

The investment of the new money arising from the share issue will naturally be a gradual process, but your Board have every intention of maintaining the dividend at the rate of 16 per cent on the increased capital, and have every hope that this can continue to be done out of the Trust's investment income.

The current year has started well, and your Board see no reason to expect that the results of the subsidiaries for the whole year will be other than satisfactory.

The report was adopted.

AMALGAMATED DENTAL COMPANY LIMITED

ANOTHER SATISFACTORY YEAR

The 52nd annual general meeting of The Amalgamated Dental Company Limited was held on June 14th at 26-40 Broadwick Street, London, W., Mr Aiken Watson, QC, chairman, presiding.

The following is an extract from his circulated statement:

I am happy to report another satisfactory year.

At home rising costs have been a main pre-occupation. The fight against inflation can only be won by all groups in industry striving by every means in their power to reduce costs. If such efforts are at once offset by rising wages, all attempts at creating a stable economy must fail. Over the past eighteen months, we have broadly succeeded in maintaining our prices. The recent wage increase of general application has so altered the basis of our price structure as to make some review inevitable

POLICY OF PRICE STABILISATION

Our policy of price stabilisation has longer term considerations. A free trade area in Europe is now gathering political momentum. Although the precise method of introduction of the scheme remains obscure its general impact on British industry is bound to be profound. In the fiercer competition likely to emerge, we regard our price policy as part insurance against a foreseeable risk.

Our sales of equipment indicate that we are on the right lines. The problem of fatigue of the dentist in practice does not appear to have received as much consideration as the subject deserves. This question we are actively pursuing for future development.

In the general field of design and research, we are seeking the assistance of specialists in every field. Our aim is to assure to the Profession the best that modern science and technology can offer

OVERSEAS INVESTMENT

Our policy of overseas investment where conditions argue such a course continues to prove a notable source of revenue. With that in mind our Australian Subsidiary has lately acquired on favourable terms modern premises in Melbourne. These new premises will not only enable the whole of the Company's operations in Australia to be conducted under one roof with greater efficiency and economy but in certain circumstances enable the Subsidiary to offset the recurring difficulties of import restrictions. The financing of this purchase will be met substantially out of the sale of existing property.

While it is too early to make an accurate forecast, current trading results to date lead us to believe that in the absence of any major set-backs the year promises to be satisfactory.

To all our staff at home and abroad I offer in your name our sincere thanks for work well done.

The report and accounts were adopted and the proceedings terminated with a vote of thanks to the chairman, directors and staff.

ROLLS-ROYCE LIMITED

RECORD ORDERS AND OUTPUT IN COMPANY'S FIFTIETH YEAR

LORD KINDERSLEY ON FUTURE LINES OF DEVELOPMENT

The fiftieth annual general meeting of Rolls-Royce Limited will be held on July 9th at the Midland Hotel, Derby.

The following are extracts from the circulated statement of the Chairman, The Right Honourable Lord Kindersley, CBE, MC.

On January 11, 1957, Lord Hives, CH, MBE, LLD, DSc, retired from the Chairmanship of Rolls-Royce Limited. It is fair to say that no individual in the company's fifty years of existence has made so great a contribution towards its success.

1956 marks the fiftieth anniversary of the company's incorporation, and it is perhaps the most fitting tribute to Lord Hives that output from our factories and orders taken reached record figures, and the company, which started in 1906 with a capital of less than £50,000, finished its fiftieth year with capital and reserves exceeding £23 million.

The growth of the company's activities in recent years and its stature on its fiftieth birthday can best be gathered from the following figures:

GROUP SALES

	Total £ mn.	British Government £ mn.	Other Customers £ mn.
1952	48	34	14
1954	65	45	20
1956	80	45	35

Position at 31st December, 1956

Backlog of orders	£90 mn.
Share and loan capital and reserves	£23 mn.
People employed	42,000
Number of ordinary stockholders	16,911
Number of workers stockholders	8,293

This increasing turnover is not at present matched by a corresponding increase in trading profits. We are at present having to expend substantial sums on the development of future products, particularly aero engines, and in addition we are making substantial payments to the Ministry of Supply in respect of development expenditure incurred by them in past years. Development for the future is however essential, and your Board are confident that in due course their policy will be reflected in still further increases in our business. Nevertheless, for the time being these charges must bear heavily upon the earnings from our present level of commercial sales

SHARE CAPITAL

On May 25, 1957, you were informed of your board's decision to raise further capital by an issue of 2,157,250 ordinary shares. This money is required to enable your company to grasp the opportunity of obtaining a substantially greater share of the world market for aero engines and at the same time maintaining, and indeed increasing, the diversification of products in our other divisions. During the next decade gas turbines will replace piston engines on all new aircraft coming into operation on the routes of the world. Your directors regard it as imperative that your company should be placed in possession of the facilities which will enable it to compete successfully for a substantial share of this new business.

IMPLICATIONS OF GOVERNMENT WHITE PAPER ON DEFENCE

The recent White Paper on Defence has now made clear the government's intentions, and the implementation of their policy will significantly change the character of the aircraft and aero engine industry in which the bulk of our business lies. The first effect will, of course, materialise in our development programmes, and here your company are fortunately placed in having their engines associated with continuing projects both for the Royal Air Force and the Royal Navy. This is, of course, in addition to the work which must continue for some time to come on the large variety of Rolls-Royce engines which are in use in current types of military equipment.

It is clear, however, that over the years ahead the volume of work on development of military engines will decrease. Your board had anticipated this situation in two ways: Firstly, by a greater allocation of technical capacity to the design and development of engines for transport aircraft and, secondly, by their association with North American Aviation Inc., who are in the forefront of rocket motor development in America. The latter is unlikely, as a purely military project, to produce a volume of production comparable to the fighter and bomber engines which are being replaced.

We are, therefore, dependent for our future turnover on obtaining a larger share of the world market for engines in transport aircraft, and this must be achieved in competition with American companies who enjoy the benefits of both government and civil demands for transport aircraft vastly in excess of anything which the total British market provides. In setting out on this formidable task—a task which virtually amounts to creating a new business—it is to be hoped that the government will assist by early and frequent consultation with the industry on the future requirements of Transport Command, the national corporations, and any other requirements that may arise from our obligations overseas, so that the limited funds available, whether they be government or private, may be directed to those projects which will command the widest possible markets. I am confident that your company can compete technically—the adoption by foreign airlines of the Dart, Avon, Conway and Tyne are eloquent proof of this. The cost will be substantial, but the prize is great.

AERO ENGINE DIVISION

The Avon engine predominated in our manufacturing programme for the Defence Services. Development of the Conway engine is exceeding expectations, and the performance achieved on the bench and confirmed in flight substantiates the claims which we have made for the by-pass principle. The development of this engine has great military significance in connection with the "V" bombers and a production order has been received. The provision of military equipment abroad continues to be an important outlet for our engines.

In civil aviation the Dart engine at present occupies the major place in our production programmes. In association with the Viscount it has accumulated well over 2 million hours of running; this is currently increasing at the rate of over 100,000 hours a month.

The increasing effort which we have been devoting to civil aviation has now put us in the position of being able to offer a range of engines covering the whole field of normal airline requirements. The Tyne will complement the Dart for propeller-driven aircraft, and the Avon and Conway will be in the forefront of pure jet propulsion. With the Conway significant success has been achieved in that it has been accepted by two of the leading American constructors of long range jet aircraft. We are confident that this engine will give a good account of itself when operating against its American competitors.

MOTOR CAR DIVISION

Exports were at a record level and it is gratifying to note that the value of those to the United States was almost double that of the best previous year since the war. There is every indication that the demand from America will be even higher during the current year. This is the direct outcome of developing a specification suited to that particular market by the embodiment of such features as automatic transmission, power assisted steering and full air conditioning, supported by an intense sales promotion campaign.

It is a matter for great regret that the government did not reduce purchase tax on cars in the recent Budget. There appears to be an impression in official circles that the troubles of the motor industry are behind them. Under present trading conditions in which costs continually rise, a purchase tax of 60 per cent is a burden which will profoundly influence our ability to maintain our present level of sales let alone achieve further expansion.

OIL ENGINE DIVISION

Our engines are currently powering earth-moving, oil field, transport, industrial, marine and railway equipment. The potential developments in this latter field have led us to create a Railway Traction Department for the purpose of co-ordinating and promoting sales of complete transmission units, control systems, engines and torque converters. As a result of successful trials by British Railways, instructions have been received to proceed with larger quantities, and in addition orders have been taken for railway equipment from overseas.

The oil engine business is at all times highly competitive and there is every indication that British manufacturers will have to face throughout the sterling area competition from American companies who are being encouraged to establish factories in Great Britain, with the added advantage of importing American-made components in the interim.

The statement then reviewed overseas activities and those of the Associated Companies, and concluded:

The state of your Company on this its fiftieth birthday has only been achieved by a great deal of hard thinking and hard work through the years. I welcome this opportunity of expressing on my own behalf and I am sure on behalf of the stockholders our appreciation of the efforts of all employees whose loyal and enthusiastic co-operation has contributed to our achievement.

DUNLOP RUBBER COMPANY LIMITED

A GRATIFYING RECOVERY

LORD BAILLIEU'S SPEECH

The Fifty-eighth Annual General Meeting of the Dunlop Rubber Company Limited was held on June 17th in London.

The Right Honourable Lord Baillieu, KBE, CMG, chairman, in the course of his speech said: The results for the full year 1956 reveal the gratifying recovery which occurred in the second half of the year. The difficulties in the first half-year were clearly indicated by the Directors in the statement which they issued on October 4, 1956, and the reasons for the considerable reduction in profit were stated at that time.

FLUCTUATIONS IN RUBBER PRICES

The principal reason was the steep rise immediately followed by a steep fall in the price of rubber, the latter occurring between September 1955 and June 1956. During this period the price fell from 43d. per lb. to 24d. per lb. Also throughout this time industry in general was being exhorted to hold selling prices despite increasing costs. In the past we have experienced the serious effect of the fluctuations in the price of rubber on our working capital position, but the combination of this with the other major difficulties all at the same time was unusual and unfortunate.

I would like to emphasise that our general buying policy, not only for rubber but for other raw materials, is based on the minimum quantities required to operate our factories. In other words, there has been no element of speculation in our rubber buying; but because of the drastic and unexpected cut-back in the requirements of the British motor industry in the early part of last year, our normal inventory and forward cover position inevitably became extended.

These excessive fluctuations in the price of natural rubber affect producers, the rubber manufacturers and the consuming public alike. However desirable it might be to try to formulate a scheme to prevent these fluctuations, there seems little prospect of doing so. On the other hand, the increasing need for synthetic rubber, to meet the world demand in total for rubber, considerably helps in stabilising and averaging the cost. With our increasing use of synthetic rubber we are benefiting from this.

CONSIDERABLE IMPROVEMENT

In our report we have illustrated the extent to which our fortunes improved in the second half of the year, and you will see that the Group trading balance for July/December 1956 was higher than for either of the two half-years in 1955. The net profit after all charges except taxation for this period in 1956 at 5 per cent was slightly lower than in 1955. This arises from the fact that in 1956 our depreciation provision was higher and we also had to meet the interest charge for a full year on the £12 million 4½ per cent Debenture Stock of the Parent Company and the interest on a new issue of debentures in a Subsidiary overseas. Thus, although there was a considerable improvement in the trading profit of the last six months of the year, we did not quite recover our 1955 net profit position.

I have already referred to the effect of the recession in the British motor industry on our rubber inventory and forward cover, but in addition the loss of sales volume adversely influenced our production costs and profit margin. This position continued for much of the year and affected not only tyres but also wheels, Dunlopillo, and other accessories which we supply to the motor industry.

For the reasons which I have already mentioned, our trading results in the United Kingdom were not satisfactory and the resultant profit was extremely low. In fact, had it not been for our widespread overseas activities resulting from the policy of our Board in building up this geographical diversification over the last thirty years, the picture I would have presented to you today would have been very different and far less satisfactory.

EXPANSION OVERSEAS

Our overseas trading has continued to expand and a great contribution to the Group results has been made both from our United Kingdom exports and from our manufacturing units overseas. Yet competition has not been any less severe in the overseas markets. In fact it is becoming intensified as our competitors both in this country and abroad seek more and more export business and set up more and more local manufacturing subsidiaries.

Despite this increasing competition the value of turnover was again higher although the effect of competition and higher costs resulted in slightly reduced margins. Economies were, however, effected and the return to the Parent Company compared not unfavourably with the return in recent years. The contribution to the total Group profit from our overseas operations was the highest yet recorded for the Group.

TAXATION BURDEN

I must again refer to taxation, the charge for which in 1956 was considerably lower than in the previous year because of the lower level of profit. Nevertheless it again represented 56 per cent of the profit before tax. In my speech last year I referred to the increase in profits tax which had then recently been announced, and the figures quoted in our Report this year very clearly indicate the unfair burden which this tax in general, and the increased rates in particular, have imposed. You will see that despite the fact that the Ordinary Shareholders will receive £444,000 less in the form of dividends, the gross amount of distributed profits tax payable by the Group is actually higher than in the previous year.

This cannot be regarded as just under any circumstances, particularly as the burden of this tax falls eventually on the Ordinary Shareholders, whereas Preference Shareholders and recipients of interest bear none of it. The Chancellor of the Exchequer has many demands for taxation relief, but such unfair discrimination and considerable burden clearly call for the abolition of profits tax, or if this is not possible, then for a flat rate on all profits in order to avoid the present discrimination. The Chancellor's recent proposals for the extension of earned income relief and for raising the level at which surtax commences in certain cases are welcome, and this will in some small measure help to restore the incentive to executives whose efforts and desire to stay in this country are absolutely vital to the Nation's economic welfare.

NEED FOR FURTHER RELIEF

You will remember that in a previous year's review I expressed the view that the point had been reached in taxation where the law of diminishing returns was applying; I hope this recent Budget is the forerunner of further relief and reductions which will remove that fault from our fiscal policy. The restoration of Investment Allowances is also necessary to industry, or alternatively a more forward-looking attitude towards wear and tear allowances. Some contribution towards the replacement cost of fixed assets is acknowledged in other industrial countries, and this country still requires encouragement for the modernisation and re-equipment of factories. With the increasing tempo of world competition and of technological developments it is imperative that the industries of this country should be maintained in the most efficient and modern condition and that our factories should install the most up-to-date equipment available.

You will expect me to make reference to the change announced by the Chancellor as regards the introduction of overseas trade corporations. The legislation which was recently published requires most careful study before all its implications can be assessed, but as it stands at present it does not appear that any great advantage will accrue to our Group. In the past we have established overseas control for most of our overseas companies, and accordingly the profits of these companies already are not subject to United Kingdom taxation unless and until dividends are declared. Certain minor changes in our overseas management arrangements may be desirable to enable us to benefit from the new legislation.

As a final point on our published accounts I suggest that the figures which show that over 70 per cent of Stockholders, that is some 41,000, hold less than £250 worth of stock are particularly interesting and indicative of the place your Company holds as an investment medium today.

The Company has continued to carry out a vigorous research policy during the last twelve months on new processes, products and raw materials.

TRIBUTE TO EMPLOYEES

It is customary for me to ask you, if I might send to all Dunlop employees a message of thanks for their work throughout the year. This is no mere formality. They are to be congratulated upon their achievements towards the past year's results which placed an unusually heavy burden on all concerned. May I, on your behalf, thank them? Your message will encourage them for their efforts in the year to come.

You will have appreciated that the year under review was a very difficult one for the Group—perhaps the most difficult one in the home market it has had for very many years. I am pleased to say, however, that the improvement already reported in the last half year of 1956, particularly in our overseas affairs, has been well maintained

The report and accounts were adopted.

SPILLERS LIMITED

(Flour Millers & Animal Feeding Stuffs Manufacturers)

IMPROVED RESULTS IN ANIMAL FOODS SECTION

DECLINE IN UK CONSUMPTION OF FLOUR & BREAD

LACK OF REALISATION OF OUTSTANDING NUTRITIONAL VALUE

CAMPAIGN TO STIMULATE DEMAND

MR WILFRED D. VERNON'S REVIEW OF ACTIVITIES

The seventieth annual general meeting of Spillers Limited was held on June 17th at the Abercorn Rooms, Great Eastern Hotel, London, E.C., Mr Wilfred D. Vernon, Chairman of the Company, presiding.

Mr C. R. Goulder, of Messrs Deloitte, Plender, Griffiths and Co., read the auditors' report.

The following is the Chairman's statement circulated with the report and accounts for the year to January 31, 1957:

In accordance with our usual custom the more detailed comments on the accounts are contained in the Directors' Report.

TRADING RESULTS

The result of the year's trading was a profit of £4,221,000 against the previous year's balance of £3,759,000. The increase was due in the main to improved results in the animal foods section and to earnings from the additional investment in the bakery section. Despite a relatively favourable experience in the wheat market, by reason largely of the rising trend of freight rates, the results on the flour milling side were unaffected as this benefit was effectively passed on to customers in the selling price of flour.

After providing for taxation the net profit remaining was £1,721,000 and of this it is proposed to absorb £726,000 in net dividends and retain in the business the balance of £995,000. This retention is in addition to £1,450,000 set aside for depreciation and obsolescence and some £500,000 received in settlement of matters not connected with the year's trading.

The Directors are glad that it has been possible to recommend that the total distribution on the Ordinary Stock be increased by 1 per cent to 13 per cent, thus giving some return on the stockholders' increased funds in the Company.

CAPITAL EXPENDITURE

During the year we added to our investment in the baking industry and carried out our normal programme of modernisation and development of existing works. This entailed an aggregate expenditure on fixed assets of some £4 million, and working capital requirements increased by some £2 million. We were able to finance all this expenditure internally, but since the end of the year some recourse to external sources has become necessary and some temporary borrowing has taken place. It is perhaps noteworthy that our conservative policy in the past has enabled us at once to expand and to meet the severe inflationary conditions of the last two decades without having had to draw on outside finance.

The landed cost of wheat and grain rose during the year mainly, as I have said, on account of increasing freight rates, which advanced particularly sharply in the later months. Since the beginning of the current year these rates have declined substantially and the resultant fall in the cost of the imported commodity has been reflected in a corresponding fall in the market price of home grown cereals. This situation has brought about a fall in the value of the substantial working stocks which we have to carry. I cannot predict the course of the freight market, but there are indications that the pressure of supplies may lead to some long delayed downward trend in world wheat prices.

EFFORTS TO ARREST DECLINE IN CONSUMPTION

As in all other highly developed countries, we, in the United Kingdom, face a continued decline in the consumption of flour and bread. In the main this is the outcome of the higher standard of living now prevailing, bringing in train a greater choice of foods; it is in part also due, in my view, to the apathy of the consumer and lack of realisation of the quite outstanding nutritional value of flour and bread.

Not only is bread the best and cheapest nutriment which the housewife can buy for her family, but its quality and palatability remain consistently high; and with the subsidy removed, a greater variety of bread is now available than for some twenty years.

Through the campaign launched by the Flour Advisory Bureau, the flour milling industry is doing its utmost to combat this decline and your company supports and makes substantial contributions to all the activities undertaken by the Bureau. In this field one cannot look for rapid results and it is clear that only by further sustained efforts on the widest scale can we hope to improve the demand.

CLOSING OF ELLESMERE PORT MILL

It is therefore not surprising that the total milling capacity is in excess of the current demand for flour with a resultant increase in competition and a narrowing of trading margins. I am glad to say that the small decline in our flour trade to which I referred in my last review was arrested during the year, and our deliveries for the past year were approximately on the same level as those in the previous year. Nevertheless, we decided to close down the Ellesmere Port Mill and concentrate output at our other mills in the North West Area. This step was taken with reluctance but I am sure it was necessary to achieve the maximum economy in operating costs at the present level of production. I am glad to say that we were able to offer alternative employment to all those of our employees who had been with us for any material time. The others we were able to compensate upon a generous basis, although there have been no cases, so far as we are aware, where other employment outside the industry was not secured immediately.

We have continued to play a significant part in the compound animal feeding stuffs trade. In point of fact our output during the year was an all-time record. In the current trading year, however, there has been a general decline in the consumption of manufactured cattle foods owing to the abnormally mild spring.

EXTENSIONS AT LONDON AND BIRKENHEAD

I referred last year to the extension of buildings and plant at London and Birkenhead. These are now almost complete; in fact, increased production has already started at Birkenhead, and the London extension will be in operation in a matter of weeks. In close co-operation with our merchant friends, we continue to play our part in the maximum use of home grown grain in all our rations.

It is the Company's endeavour to be of the utmost service to the farmer, and through our advisory service and our research laboratory and farm at Middle Aston we are able to keep in the forefront of development of every aspect of animal feeding.

Good progress has been made in the consolidation and rational expansion of our baking and allied interests, and they have made a significant contribution to the results of the year

ADDITIONS TO UNITED BAKERIES BOARD

Mr Rishworth, a Director of the Parent Company, and Mr George Blanchard, who has spent the whole of his business life in the baking industry, have been added to the Board of United Bakeries. Their knowledge and experience on the technical and production sides will be of considerable benefit to the organisation.

During the latter part of the year I paid a visit, with Mr Hosegood, to Australia, Canada and the United States in order that we might discuss buying arrangements and prospects with the wheat and grain authorities in those countries and also study the latest developments in the manufacturing and marketing of the products in which we are interested.

SIR ARCHIBALD FORBES

I should like to record our hearty congratulations to Sir Archibald Forbes upon the honour bestowed upon him by Her Majesty the Queen in the New Year's Honours List,

MILK MARKETING BOARD

EFFORTS TO INCREASE SALES

SIR THOMAS PEACOCK'S SPEECH

The Annual General Meeting of the Milk Marketing Board was held on June 14th in London.

Sir Thomas Peacock, CBE, JP, the Chairman, in the course of his speech, said:

Last year I discussed the course of milk supplies, which were at that time rising rapidly and reaching a very high level. We did not then anticipate, however, that the volume of supplies would continue to be so large for the remaining months of that year. But conditions for milk production in the autumn and, indeed, throughout the winter were most favourable in spite of some disappointment in the hay and corn harvests. In the event, supplies of milk during the year we are reviewing were 143 million gallons more than in the previous year—an annual increase only once previously exceeded.

We expect this trend to continue in the near future. Forecasting the level of milk output is hazardous—so many factors are involved and weather can upset the most careful estimates. For the immediate future, we have allowed in our 1957-8 budget for an increase of about 40 million gallons, which will bring total output of milk from farms to a very high figure, around 1,850 million gallons. The April and May totals are already available and they show that the spring peak has been higher than ever before.

PRODUCTION AND PRICES

Producers know that a higher total supply of milk will bring down producers' prices because the guaranteed price determined following the February Review is limited to a Standard Quantity of milk. This is now 1,654½ million gallons and all milk in excess of this brings into the Milk Fund only its realisation value in the butter and cheese markets.

In the light of our experience last year, the Board have now decided that prices for each month of the year are to be regarded as provisional. We shall adjust them as we go through the year according to the course of supplies and the realisations in the markets. There will be less need, therefore, for any substantial addition or reduction in prices as we move towards the close of each accounting period.

As a result of the 1957 Price Review the Government decided that the guaranteed price for the Standard Quantity could be increased by only ¼d. per gallon—in spite of the fact that it was agreed that costs of milk production had increased substantially. This brings the price guaranteed for the Standard Quantity to 3s. 2¼d. If output in 1957-8 is close to our forecast of 200 million gallons in excess of the Standard Quantity, then average pool earnings will be 3s. 0½d. per gallon.

HIGH LEVEL OF COSTS

The continuing high level of costs of labour and imported feeding stuffs themselves make it an urgent necessity to reduce the overall cost of milk production. There is no doubt that in recent years producers of milk have made great strides in the use of home grown foods for milk production. I must ask them to support the Minister by going further on these lines. This seems to be the only way in which producers can hope to maintain a reasonable net income.

To some extent it may be that our system of pooling receipts conceals the two-tier nature of the market for milk. This is our old problem—the difference in market realisation between liquid and manufacturing milk. The Milk Marketing Scheme from the outset tackled the problem by pooling receipts from these two markets so that no individual producer had an exclusive interest in either market. This is an arrangement which we have preserved to the present time, and the principle which the Board have always operated is that individual producers' prices should only vary significantly according to the service provided.

Meantime we must concentrate on the practical solution of our problems with the machinery which is already available to us. The Board's basic policy is to do everything possible to expand the market for liquid milk in this country. This is a policy which will benefit producers and distributors of milk; it is also very much in the national interest. It is disappointing that liquid sales are still showing a small decline compared with last year though we have to remember that even now the fall in consumption since the 1951-2 peak is no more than 3 per cent, and by far the greater part of this occurred before the National Milk Publicity Council took up its task.

We have, along with the distributors of milk, spent a great deal of money in publicity and advertising to promote sales. The National Milk Publicity Council, which has handled our joint funds, is now well under way.

SALES PROMOTION

In addition to the work of the National Milk Publicity Council, efforts have been made by the Board on their own account to promote sales of milk, particularly in markets outside the home. We have increased the number of our mobile milk bars to more than a dozen. We are making every endeavour to get milk into the factories. We are trying to develop, along with the leaders of the dairy trade, the sale of milk in cartons, and in many other ways we are exploring new avenues and using every opportunity to add to the size of this business. I have every confidence that if we continue to give support to their efforts we shall ultimately succeed. We are convinced that it can be done and we know that milk producers expect it to be done. Our product is excellent—its value is unrivalled in the markets today. I am sure that I voice the feelings of the milk producers today when I urge upon all who distribute our milk to press more actively with their sales programmes.

We know that the producers desire the Board to show even more enterprise in this direction and recently we decided that in addition to the usual May and December contributions for publicity, which are matched by contributions from the buyers of milk, a special additional levy of ¼d. per gallon should be made on producers' accounts for June milk to provide the Board with a Sales Development Fund. This will be used to continue and expand the promotion work which is now being developed by our staff. We shall seek out new markets—inside the home and outside it—and we will support fully the efforts of enterprising distributors who show a real desire to expand their sales of milk, fresh cream and other dairy products.

RISING SALES OF CREAM

Along with liquid milk I must also mention the market for fresh cream. Here progress has been made and sales continue to rise. But we are far from satisfied. Our total sales last year were still less than half the prewar level, although the population is higher and its prosperity much greater. Here again I must ask the distributors to do more to develop this most valuable market which we as producers cannot afford to neglect.

The quality of our product is very satisfactory and we regard this as an essential factor to the success of our campaign to expand sales.

We have also considered the compositional quality of milk and a special sub-Committee of the Board, aided by our scientific staff, have been advising on the steps that should be taken to deal with milk of poor compositional quality. The Board have adopted a scheme to improve the butterfat content of milk supplied by a small section of producers whose milk is persistently of a standard which the Board cannot regard as satisfactory.

We are being pressed by some producers to introduce a scheme to pay producers for their milk according to compositional quality. That may come, but encouraging a rise in the fat or total solids content of milk by means of a scheme of this kind is a very different matter from eliminating sub-standard milk from the market. We are making a most careful study of all the features of this complicated subject of composition, but we must keep in mind our general aim—which is to maintain the kind of quality standards that will preserve, at the most economic cost of production, consumers' confidence in our product.

IMPORTANCE OF MANUFACTURING MILK

Whilst our attention must be focused mainly upon our great liquid market, we have to realise that the second market in manufacturing milk is also very important. All the gains and improvements in our own dairy produce ultimately benefit your pool prices. Last year the Board realised £37 million sterling by sales of milk in this market, or nearly 15 per cent of the total turnover of the pool.

The increased volume of manufacturing milk obliges us to look closely at the flow of milk from farms to town dairies and creameries. We are also concerned with the siting and capacity of manufacturing plants. This is a matter which I mentioned at last year's Annual Meeting and though I cannot report rapid progress, I think I can say that we are a little nearer to the kind of arrangements which present-day supplies and markets require. We work closely with the buyers of milk in these matters and complicated questions of capital outlay and flexibility of operation are involved.

The report and accounts were adopted.

J. LYONS & COMPANY LIMITED

INCREASED DIVIDEND JUSTIFIED

ANOTHER YEAR OF TRADE EXPANSION

MR I. M. GLUCKSTEIN'S STATEMENT

The Annual General Meeting of J. Lyons & Company Limited will be held on July 10, 1957, at the Troccadero Restaurant, Piccadilly Circus, London, W.1.

The following is the statement by Mr I. M. Gluckstein, the chairman, which has been circulated with the report and accounts for the year ended March 31, 1957:

In July last, Mr Montague Gluckstein, who had been chairman for five years, and had served the company for 55, expressed the desire to resign his office as chairman and his seat on the board. In deference to his wishes, and with high appreciation of the eminent services he had rendered to the company, his resignation was accepted and he was appointed to the office of president. We thus continue to benefit from his invaluable experience and wisdom.

Early this month the company suffered a severe loss by the death of Dr L. H. Lampitt. He joined the company as chief chemist in 1919 and was appointed to the board in 1936. Under his direction our analytical and research laboratories, which were among the first to be established in our industry, grew rapidly and successfully. He was a man of great energy and wide interests and was held by us all in very high esteem. We shall sadly miss him. He had taken an active part in many scientific societies, in which also his loss will be keenly felt.

Mr Julian Salmon was appointed a Commander of the Order of the British Empire in the New Year Honours List. We share his pleasure in the award.

TRADING RESULTS

The year has not been without its difficulties but we are glad to be able to show a balance from trading account of £4,685,571 compared with £3,613,593 for the previous year, an increase of £1,071,978. We have reaped some benefit from the heavy expenditure which has been incurred in recent years and we have not been faced with the difficulties which arose in the two previous years from exceptional fluctuations in world market prices of certain of our commodities though these more favourable factors were, to some extent, offset by increases in various items of expenditure such as wages, local rates, and transport charges. Looking at the items to be deducted in arriving at the net profit, the only one that calls for comment is "estimated taxation" which shows a large increase over the previous year. This is due in part to the higher trading profit and the increase in the rate of profits tax and it has also to be remembered that the estimated tax charge for last year reflected the utilisation of special provisions made in the previous year.

The net profit for the year is £871,767 which compares with £762,261 and shows an increase of £109,506. We accordingly feel justified, as will be seen from the report, in proposing an increase in the final dividends of 6d. per unit on the Ordinary and "A" Ordinary stocks and of 1.2d. per unit or share on the Proportional Profit stocks and shares. This results in an even greater disparity between the interim and final payments and we shall bear this in mind with a view to adjusting it when the time comes to consider the next interim payment.

The proposed final dividends, together with the interim dividends paid in December last, will absorb £452,135. The dividends paid and accrued on Preference and Preferred Ordinary stocks amount to £288,265. The balance of the net profit for the year is £131,367; to this has to be added £226,718 brought forward from the previous year, £50,000 in respect of provisions no longer required, and £1,801 in respect of tax adjustments for earlier years, making a total of £409,886 to be carried forward.

CATERING

The teashops, with their white and gold fascias, are still the backbone of the company's catering business. There have, of course, been many changes in them and changes will continue to be made to keep them in tune with modern tastes; but their purpose remains the same—service to the many at the lowest prices consistent with quality and amenity. We have during the year opened three teashops, a new one at Windsor and two others replacing older establishments, one at Eastbourne and one in the City in Leadenhall Street on the site of a teashop which was destroyed by bombing. At the Coventry Street Corner House we have extended "The Grill and Cheese" and opened a further speciality restaurant "The Seven Stars." We have also opened two new speciality establishments of types which were formerly provided only at the Corner Houses, a "Bacon and Egg" at 190, Oxford Street, and a "Wimpy" at Hammersmith Broadway specialising in Wimpy Hamburgers.

The "Wimpy" originated in the United States and, in addition to introducing it to this country we have, as mentioned in the report, formed a subsidiary company to develop it abroad. The project is still in its early stages.

NEW ICE CREAM FACTORY

Mention was made last year of our plan to move some of our ice cream production from Cadby Hall to Greenford. The first part of the new factory there is nearing completion and pilot operations have started; we expect it to be in full operation before next year's season.

We are always conducting research with a view to introducing new lines and improving old ones. One of the new lines launched during the year is "Ready Brek," a hot breakfast cereal prepared in the plate; it has found an immediate welcome. We are also constantly looking for improvements at every stage of our production, however small they may seem to be in any particular case. We have, for example, for many years taken bulk deliveries of liquid chocolate and liquid sugar by tank wagon into pipe lines; more recently, with the ready assistance of our suppliers, we have been able to take by tanker and pipe line both flour and dry sugar, the handling of which formerly involved heavy manual labour.

The cuts in supplies of oil and petrol which started in November and the rationing which followed in December necessitated some rearrangement in our production and, naturally, gave us great difficulty in maintaining our distribution, so much of which is by road transport. The whole basis of our transport arrangements had to be changed from what was most economical in terms of money to what was most economical in use of fuel. The reduced mobility of many of the public had also some effect on our trading.

EFFECTIVE DISTRIBUTION

The wide range of products we sell through a variety of channels all over the country involves a complex pattern of distribution. To keep it both effective and economical requires careful organisation and planning combined with flexibility. In London constant vigilance and resource are called for to overcome the increasing congestion of the streets and the traffic delays which result from it. In this we co-operate closely with the transport authorities and we should like to take this opportunity of thanking them for their ready appreciation of our problems.

In our wholesale business we have at all times to weigh the economies of centralisation against the savings of transport costs generally secured by dispersal. The methods of distribution necessarily vary; some of our commodities are highly perishable, some not, some are bulky, some compact, and obviously it would not be economic to distribute them all in the same way. Generally, however, our cakes, tea, coffee, and ice cream are distributed through local depots to which bulk supplies are sent by road or rail, which ever is the more economical, from our central bakeries and factories at Cadby Hall and Greenford. From these local depots vans go out to sell and deliver to retailers in the neighbourhood. Bread requires immediate delivery and therefore cannot be sent over long distances and its production cannot be concentrated in one large unit. In consequence, in addition to the main bread bakery at Cadby Hall, there are others large enough to allow of mass production but geared to produce the needs of the locality.

PRODUCTION ECONOMIES

Cake production cannot be so readily dispersed. Our customers want a wide variety of cakes and to secure the economies of large-scale production it is necessary to concentrate this in Cadby Hall where there are highly specialised plants each producing one type of cake only, though there are one or two other cake bakeries producing a limited range. Some of our cake distribution is therefore direct to the retailer by rail. We are able, with the co-operation of British Railways and the use of passenger train service, to ensure that shops throughout the country have our cakes as fresh as they are in London.

To maintain our road distribution a large fleet of varied types of vehicles is required; the number of vehicles at present is some 2,750 ranging from salesmen's cars to refrigerated vans carrying 10 tons.

COMPETITION IN TEA

In January the Monopolies and Restrictive Practices Commission issued its report on the supply of tea. It said that the tea trade in

this country is "conducted on keenly competitive lines," and also that "in the tea trade, individual resale price maintenance does not operate, nor may it be expected to operate, against the public interest." In all our activities we face keen and stimulating competition, which calls for the maximum effort from us all and benefits the consumer whose good will is vital to the maintenance and development of the business. The constant search for new and attractive forms of service and standards of amenity in our catering establishments, the intensive efforts of our production and sales teams, and the continuance of our policy of giving the best possible value consistent with the quality we have always maintained, these things in combination give us confidence that we can meet whatever competition we may encounter.

31,000 EMPLOYEES

My colleagues and I have pride as well as pleasure in the devotion, going far beyond mere duty, shown to the company by all its employees now numbering over 31,000. It is significant that there are 83 of them with service of more than 50 years and some 3,250 with service of more than 25 years. We have many young men and women of ability, drive, and initiative who are being trained to fit themselves for positions of responsibility in the various branches of the business, and we have reason to feel confident that they will, like their elders, make a satisfactory contribution to the continued development of the company. We take a personal interest in all of them whatever their length of service and wherever they may be, and should like to express, on your behalf as well as our own, our gratitude to them for their good work and service during the year.

F. FRANCIS & SONS (HOLDINGS) LTD.

DIVERSE FIELDS OF ACTIVITY

The fifty-sixth annual general meeting was held on June 19th, in London, Mr Frank Fox (Chairman and Managing Director) presiding.

In his circulated statement the Chairman referred to the changed structure of the Group, and said that Shareholders of the Holdings Company were now the proprietors of F. Francis & Sons, Ltd., Keighley Lifts, Ltd., The Defiant Enamel Co., Ltd., The Defiant Crown Cork Co., Ltd., Newbury Cork Co., Ltd., and Robinson Bros. Cork Growers, Ltd., which Company owned the Share Capital of Pendle View Tin Printers, Ltd. and Marwood & Co. (Blackburn), Ltd.

After commenting on the financial results for the year, Mr Fox pointed out that the Board intended to use the substantial amounts which they were ploughing back into the business for the extension of the process of re-equipping and extending their facilities.

The Chairman continued: Regarding our order book, this is generally in a healthy state. We aim to make ourselves so efficient in every field of our activities, that wherever possible increased costs will be met by increased production. For the first four months of this year our sales show an increase over the corresponding period of last year. We work in diverse fields, and I am sure you will agree that in the developments in the packaging, closure and lift industries there is an expanding future for us.

The report was adopted and the total dividend of 20 per cent approved.

BARTON AND SONS

The ordinary general meeting of Barton & Sons Limited was held on June 13th in London, Mr A. H. Redfern (the Chairman) presiding. The following is an extract from his circulated review:

The Accounts for 1956 reveal trading results very similar to those achieved in 1955 and this is a source of satisfaction in view of the more difficult conditions which arose as a result of the policy of credit restriction.

During 1956 we disposed of our minority holding in Wright, Anderson (SA) Limited and acquired the balance of the shares in Bartons Tube & Conduits Limited, South Africa; we also purchased the whole of the issued capital of West Midland Refining Company Limited in October, 1956, and of A. A. James Limited in January, 1957.

The Group makes a fairly wide range of products. Our largest investment is in the production at home, in South Africa and in Canada, of steel tubes used extensively by the electrical, furnishing and motor industries. Our next largest investment is in structural steelwork for factory buildings, power houses, multi-storey buildings, tanks, bridges, etc. Next in importance are the subsidiaries which produce forgings, castings, bolts and nuts, abrasives, refined iron, springs, etc., for customers who are engaged in or connected with the motor, cycle and general engineering industries. The remaining subsidiaries cater for the requirements of customers covering a wide field of operations.

With regard to the future, present indications are that there must be a continued increase in sales if profits are to be maintained. The report was adopted and the total distribution of 20 per cent approved.

WEBB'S CRYSTAL GLASS

The Thirty-seventh Annual General Meeting of Webb's Crystal Glass Company Limited was held on June 19th, in London. Mr R. E. N. D'Abo, the Chairman, presided and said: Although sales have been expanded in most of our departments we have not been able to maintain our 1955 profits, owing to increasing costs of raw materials, fuel and labour, with which economic prices have not been able to keep pace.

The Group Profit amounts to £93,030 compared with £121,591 for the preceding year, and the net profit, after taxation, to £44,118, against £54,865.

The Balance Sheet shows a strong financial position—Current Assets exceeding Current Liabilities by £364,527.

Our factories and plant have been well maintained, and we have continued our policy of reconstructing and improving.

While the bulk of our business is at present in the home market, we have continued to give close attention to exports, as we believe there is still considerable scope in overseas markets, and we have under active consideration a scheme for establishing manufacturing interests in the Commonwealth. Our profits for the first five months are on a much lower level than for the same months last year, but your Directors have done a great deal of preliminary campaigning to find new outlets for our goods, and there are signs that their efforts will begin to show encouraging results in the coming months. Normally, the bulk of our business is obtained in the second six months of the year.

The report was adopted and the final ordinary dividend of 10 per cent, making 15 per cent for the year, was approved.

APPOINTMENTS

AN IMAGINATIVE GRADUATE in Economics or Commerce is invited to join a small team of economists and research workers who are helping a large and expanding company in a new industry to build up its home and export sales. The research staff are working under excellent conditions in the west country, within very easy reach of London. They are engaged on a varied set of problems, ranging from market research to business forecasting, and including studies of the implications of the formation of a European Free Trade Area. The successful applicant can be assured of a free hand to undertake this work, and prospects in every sense of the word are excellent. Applicants should have a First or Second-Class Degree in Economics or Commerce, several years' experience in industry, and should not be appalled at the prospects of acquiring a working knowledge of German, if necessary.—Box 716.

MARKET RESEARCH

A Company with world wide interests in many fields has vacancies in its Market Research Dept. for Executives/Assistants. These positions offer great scope to those able to handle research with little supervision. Knowledge of foreign languages is an asset but not essential. A good salary related to experience will be offered. A pension scheme is in operation. Staff of this department is aware of this advertisement.—Apply in writing, giving a concise account of experience so far, to Box 724.

MATHEMATICIANS, who although they never will be, but who are interested in jobs in the kingdom of the blind where the one-eyed man has to explain things, are invited to apply to a large business service organisation. The job involved demands an ability to explain in simple terms to the lay minds of top executives certain technical statistical problems.—If you feel this is your line of country, write full details to Box 723.

POWER PLANT SUPERINTENDENT

Applications are invited for the position of Power Plant Superintendent on a large Copper Mine on the Copperbelt in Northern Rhodesia. Applicants should have had at least five years' experience as a Superintendent of a Power Plant. The successful candidate will be responsible to the Resident Engineer for the operation and maintenance of a 30 MW steam generating station, direct fired and waste heat boilers, central coal pulverising plant, steam and electrically driven compressors and blowers, primary water supplies and domestic water purification plant, primary electrical distribution at 66, 11 and 3.3 kV. The commencing salary will be according to qualifications and experience. The minimum commencing basic salary will be in the region of £1,530 per annum, plus Cost of Living Allowance of approximately £80 per annum and a variable Copper Bonus, at present approximately 50 per cent. of basic salary. There is also a Group Pension and Life Assurance Scheme. Married accommodation is available on engagement—All applications, giving full details of qualifications, experience and marital status to be addressed to R.25 Mine Employment Department, Selection Trust Limited, Mason's Avenue, London, E.C.2.

EXPORT MANAGER, Pharmaceutical and cosmetic. Our previous advertisements have brought a large number of applications, many from excellent men, but we believe there is an outstanding man somewhere who will fit this important post even better and we would like to hear from him.

Essentials. High quality of leadership, effective personality, very good education, successful experience with good firms in ethical and lay pharmaceutical and cosmetic exports, thorough mastery of export trade and finance.

Desirable. Age about 40. First-hand knowledge of some foreign markets, preferably Commonwealth. Good experience in selling, medical promotion and lay advertising.

NOTE: The department will move to Eastleigh, Hampshire, at the end of August.—Send full particulars, marked "Confidential," to Chairman, William R. Warner & Co. Ltd., Power Road, London, W.4.

FERRANTI LIMITED

HOLLINWOOD, LANCS

A vacancy has arisen in the PATENTS DEPARTMENT which will provide the opportunity for a young GRADUATE in ELECTRICAL ENGINEERING or PHYSICS to pursue a career at a high level of technical interest.

The appointment is one which calls for close contact with the many research and development sections of the Ferranti organisation and will have particular reference to Electronics. Training will be given in the specialised work involved and the successful candidate will be encouraged to qualify as a Patent Agent.

This appointment carries an excellent salary and the Company operates a Pension Scheme and a Dependants' Insurance Scheme.

Application is by form obtainable from T. J. LUNT, Staff Manager, FERRANTI LTD., Hollinwood, Lancs. Please quote reference P.D.

FORD MOTOR COMPANY LIMITED offer an unusually interesting post involving the study of special commercial and financial problems. Selection will be made from candidates around 26 years of age with a broad educational background acquired either by way of a university degree, professional training or responsible service in industry, commerce or public service. The ability to think and the will to succeed are, however, more important than the precise nature of previous training and experience.—Please write to Salaried Personnel Department, Ford Motor Company Ltd., Dagenham, Essex, giving full details of age, education, training and experience, and quoting reference CFE.

DIRECTOR of large ethical pharmaceutical company requires a pharmacist as personal assistant for administrative and commercial development work. For a man with intelligence, drive, good judgment and the ability to get on with people, this position should quickly lead to a senior managerial post. Starting salary would be according to experience and would not be ungenerous. —Applications in detail, which will be treated in confidence, to Box 712

RETAIL DISTRIBUTORS' ASSOCIATION (the trade association of Department Stores in the United Kingdom) invite applications for the post of Director of the Association.

As principal official of the Association the Director is responsible for negotiations at high level with Government departments, trade associations, and other public bodies on matters of importance to the department store trade. He supervises studies of store operations and the preparation of statistics, and generally undertakes such work for the development of the department store trade as the Council of the Association may direct.

The post would carry a salary in the region of £2,000 per annum and superannuation.

Administration of the Association's offices, which are in London, is in the hands of the Secretary of the Association.

Applications should be made at once, to the Chairman, Council of Management, Retail Distributors' Association, 204 Ulster Chambers, 168 Regent Street, London, W.1, and marked "Director." The selection of a short list for interviews will be made on July 6th and applicants selected for interview will be informed shortly after that date.

COMMERCIAL MANAGER

THE PLESSEY COMPANY LIMITED WISHES TO APPOINT A HIGH LEVEL COMMERCIAL MANAGER TO ONE OF ITS LARGER DIVISIONS.

In the first instance he will be responsible for the organisation of the Division's sales, and for extending its scale of operations.

A man is wanted who has achieved a position of responsibility in the engineering industry on the commercial side and who feels confident that with further experience, and after a suitable period to become accustomed to the Company's methods, he would be able to play a leading part in the overall activities of the Division.

It will be seen that imagination and drive are required, and the specification has been purposely written broadly since in this case personal suitability is more important than the particular experience which the candidate has had so far.

The remuneration will be generous and there is the probability of material promotion for one who is determined to succeed.

Those interested in exploring the possibilities of this opportunity are asked to write to:—

The Group Director,
A Group,
The Plessey Company Limited,
Ilford, Essex,

so that in suitable cases a personal discussion can be arranged.

Replies will be handled personally by the Group Director and in the most complete confidence.

A LEADING ADVERTISING AGENCY requires a young graduate with a good statistical knowledge for work in the Research Section of the Media Department. Previous experience in the analysis of surveys and statistics and the presentation of conclusions in brief and lucid form is essential. The man we need will be keenly interested in helping to plan national advertising campaigns that will reach the required audience with maximum effect.—Please write, stating age, experience and salary required, to Personnel Manager, F. C. Pritchard Wood & Partners Ltd., 25 Savile Row, W.1.

ATOMIC ENERGY AUTHORITY

The United Kingdom Atomic Energy Authority wish to appoint a senior officer in London, under the Principal Economics and Programming Officer.

Duties will include the preparation of reports on broad policy questions and work on committees dealing with the co-ordination of the Authority's programmes. The successful candidate will be required to become thoroughly conversant with all aspects of the work of the Authority. Considerable administrative experience is desirable and a background which included science, mathematics or economics would be useful.

Salary will be commensurate with the responsibilities of the post and the abilities and experience of the successful candidate.

Send POSTCARD for application form to Establishments Officer, U.K.A.E.A., 14 Ormond Yard, London, S.W.1.

GOVERNMENT OF IRAQ.
BAGHDAD SEWERAGE BOARD.
Advertisement No. 7.
RESIDENT ENGINEER.

The Baghdad Sewerage Board wishes to appoint a suitably qualified person as Resident Engineer to supervise major construction works comprising sewage treatment works, trunk and subsidiary sewers for the city of Baghdad. The official appointed may be required to supervise up to three contracts and will work under the direction of the Board's Consulting Engineers, Messrs. John Taylor & Sons of London.

Applicants should be Corporate Members of the Institution of Civil Engineers or an equivalent foreign body and should have had wide experience in the construction, supervision and administration of similar projects. The successful candidate must be fluent in the English language and will be required to assume his duties in the London.

The appointment will be under terms similar to the Government of Iraq Standard Contract CF21 and the salary will be I.D.330/ per month (I.D.1=£1 Sterling). Allowances of from I.D.10 to I.D.24 per month are available according to circumstances. The Contract offered is for three years but subject to 6 months' probationary period. Free passages are paid for wife and up to two children not more than 13 years old and an allowance is payable towards the cost of passages for leave. Leave is one day per five days' effective service. Five per cent. of salary must be paid into a Provident Fund, to which the Board will contribute a further sum equivalent to 10 per cent. of the salary.—For application forms apply to the Consulting Engineers, Messrs. John Taylor & Sons, Artillery House, Artillery Row, London, S.W.1. before July 1, 1957.

Chairman of the Baghdad Sewerage Board.
Baghdad.

GERMANY.—A well-known periodical with an international readership will shortly appoint a representative responsible for obtaining industrial advertising in Germany. Candidates should have high-level contacts in present-day German industry and be able to speak and write fluent German. They should be prepared to live Cologne-Dusseldorf area and to travel throughout Western Germany. The appointment will be full or part-time, depending on contacts and existing commitments (if any) of successful applicant. Rewards commensurate with results on generous commission arrangement.—Applicants (aged 40-50) should give full details of experience and qualifications to Box 722.

MANAGEMENT SELECTION LIMITED
have been retained to advise on the appointment of a

MANAGER
(ORGANISATION AND METHODS DEPARTMENT)

for a company employing 5,000 on medium engineering in the Midlands, with manufacturing units overseas.

The successful candidate will be required to establish an Organisation and Methods Department under the general supervision of the General Manager, Administration (Director). This department will be responsible for reviewing and improving clerical and administrative procedures, as a service to other departments.

Candidates must have experience of O. and M. work, preferably in a mass-production industry, and should hold a university degree or professional qualification in a relevant subject.

Preferred age 35-45. Salary up to £2,000 according to experience. Pension and insurance schemes. Removal and house purchase can be assisted.

Please send brief details, in confidence, quoting reference S.452, to M. B. Berks, Management Selection Limited, 17 Stratton Street, London, W.1. No information will be disclosed to our clients until candidates know their identity and have given permission after personal discussion.

SECRETARY AND EDITOR of professional association with trade association and learned society experience offers similar services, part-time, to suitable small organisation.—Box 720.

SUCCESSFUL TUITION FOR THE B.Sc.(ECON.) DEGREE

General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus—and/or advice, mentioning examination or subjects in which interested, to the Secretary (G9/2).

METROPOLITAN COLLEGE, ST. ALBANS
or call at 30 Queen Victoria Street, London, E.C.4.

APPOINTMENTS

BRITISH INSTITUTE OF MANAGEMENT invites applications for the following senior appointments:

1) MANAGER OF THE HUMAN RELATIONS DEPARTMENT. The person holding this appointment will be responsible for advising upon a wide variety of problems including personnel management and management training and for supervising the work of a group already established within the Institute. He will be responsible for liaison with those working in the research field and with other professional bodies for maintaining contact with B.I.M. members and for advising on the development of training programmes and study groups organised by the Institute in his field. The department is also responsible for the initiation and preparation of information summaries and other published material. Applicants should be not less than 30 years of age and must have had practical experience either in the personnel management or management training fields at a senior level. A university degree is desirable and a qualification in business administration would be an added advantage. The commencing salary will be in the range of £1,250 to £1,700.

2) MANAGER OF THE MANAGEMENT ACCOUNTANCY DEPARTMENT. The person holding this appointment will be responsible for advising members on a wide variety of problems in the management accountancy field for liaison with the professional accountancy bodies and for maintaining contact with research and educational establishments. He will also advise the Institute on the Development of Study groups conferences and training programmes in his own field and supervise the preparation of written material for reports and publication. The Institute considers this to be a field of great importance and expects the holder of this appointment to be responsible for a considerable amount of development work. Applicants should be not less than 30 years of age and should possess either a professional qualification or university degree in Accountancy and must have had managerial experience. The commencing salary will be in the range of £1,250 to £1,700.

(4) MANAGER OF THE INFORMATION AND LIBRARY DEPARTMENT. The person holding this post is responsible for supervising a large and growing library and information service for maintaining contact with a wide variety of subscribers in a body of national importance for advising upon all questions concerning the collection, processing, and classifying of information; the preparation of information summaries, and other material for publication. The Manager is also responsible for liaison with other information services both in this country and overseas. Applicants, either men or women, should be not less than 30 years of age and must have had previous experience in a senior post of this nature. A university degree is desirable but not essential. The commencing salary will be in the range of £1,100 to £1,500.

Each of these posts provides an exceptional opportunity for personal development and a widening of interests. In each of the nature of the task a good personality drive and initiative are called for.

Applications should be addressed to Director, British Institute of Management, 80 Fetter Lane, London, E.C.4, marked with the appropriate reference number.

MARKETING RESEARCH

A senior London Advertising Agency has an opportunity for a young man with some practical sales or research experience to join its expanding Marketing and Research Department. The job will be to apply marketing principles to clients' problems. Familiarity with market research methods and their practical limitations is therefore essential although the successful applicant need not necessarily have become expert in carrying out field surveys in all their practical detail. The successful applicant will have sufficient business experience to understand marketing problems as they arise and to recognise where market research can contribute to their solution. —Write with full details to Box 719.

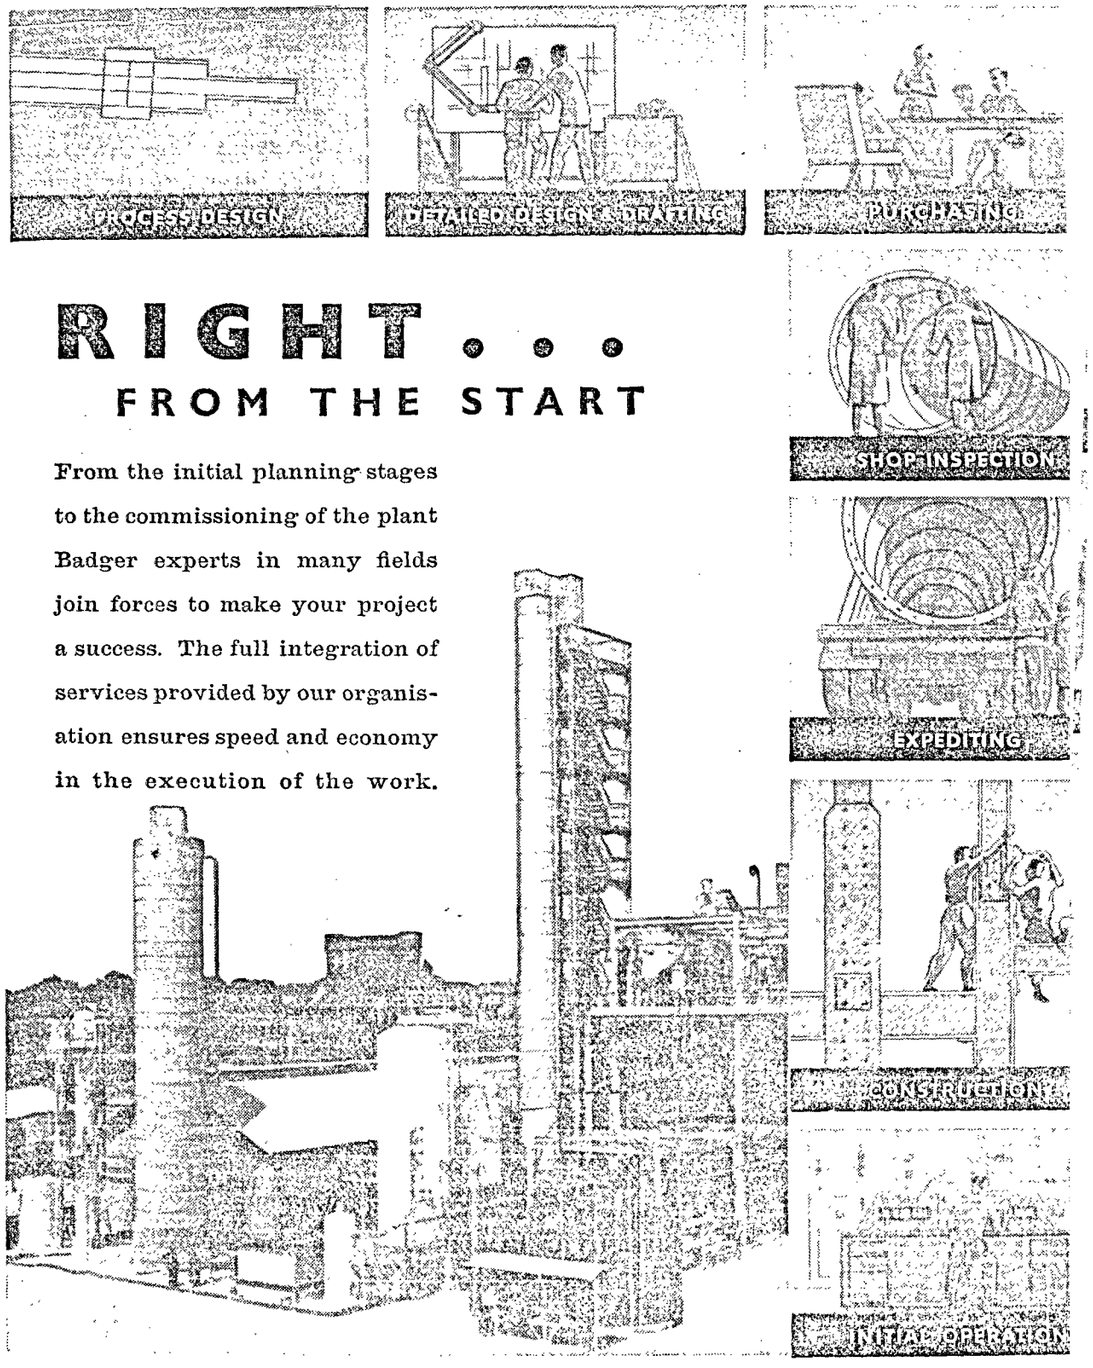
ASSISTANT STATISTICIAN

required by N.C.B.'s Statistics Branch at London Headquarters, with degree in economic statistics or economics with statistics as special subject. Post graduate experience in drafting reports and concise comments on statistical material is desirable. Post offers good opportunities for promotion. Appointment (superannuable), depending on qualifications and experience, within inclusive scale £784 to £912 (male), £708 to £824 (female).

Write, stating age, education, qualifications and experience, to National Coal Board, Staff Department, Hobart House, London, S.W.1, marking envelope X.673/2/D, before July 4, 1957.

UNIVERSITY OF CAMBRIDGE

DEPARTMENT OF APPLIED ECONOMICS



Applications are invited for a post as research worker in connexion with a social survey involving family budget inquiries. Duties will include the supervision of field staff and assistance with the analysis of the results of the survey. A university qualification in economics or social science, or practical experience of planning surveys, will be an advantage. Initial stipend in the range £500-£1,000 with family allowances.—Applications should be addressed to the Director, Department of Applied Economics, 7 West Road, Cambridge, to reach him not later than July 6, 1957.

ANNUAL AIR SUBSCRIPTION RATES

Subscriptions to most countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is either because the alternative is not available or not recommended.

	Airmail	Air Freight

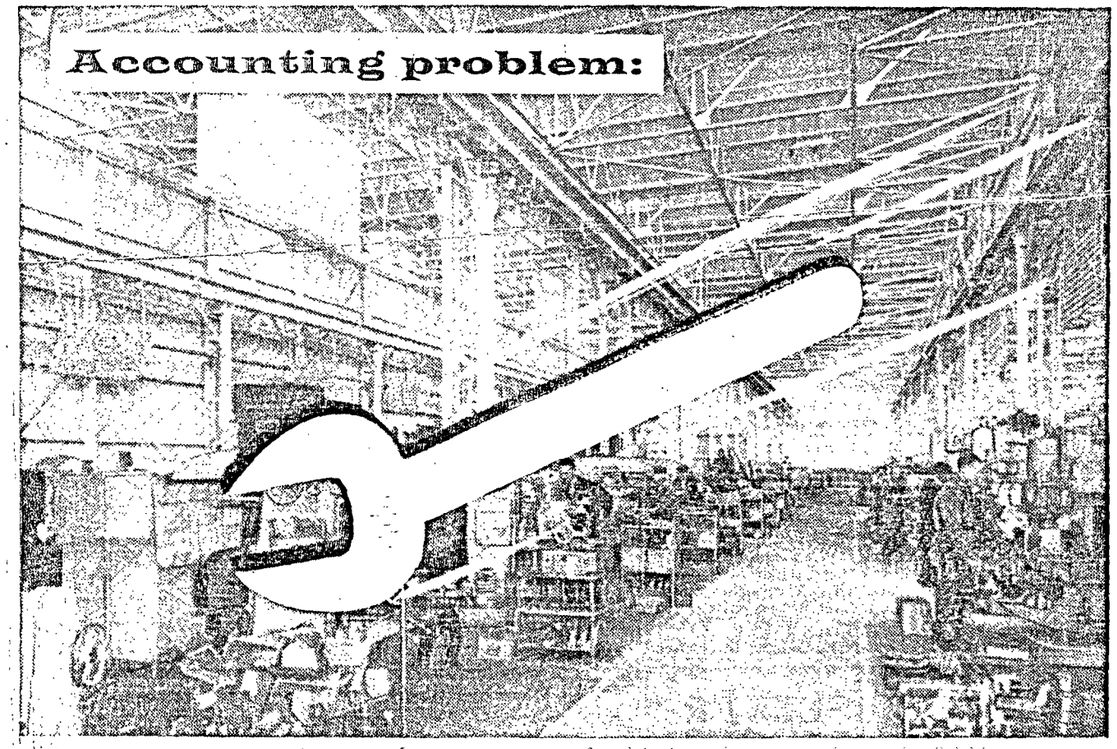
All is not Game In East Africa

There was a time when elephant ivory was the only major export from East Africa. Today the £177,000 earned annually by ivory pales into insignificance when compared with the £38,600,000 which comes from coffee or the £27,600,000 from cotton, and the total of £114,200,000 earned by all exports from the three mainland territories of East Africa—Kenya, Uganda and Tanganyika.

The day is long past, too, when the imports to the territories amounted to no more than could be carried by the bearers accompanying traders on their trips from the coast. In 1956 East Africa spent £133,800,000 in the markets of the world, and more and more United Kingdom manufacturers of consumer goods are setting up factories in East Africa to meet the increasing demand, coming largely from the 20 million African population, which is taking an increasing part in the new developments.

And just as the East African Railways and Harbours serves the export and import trade at the ports and along 12,000 miles of rail, road and inland water services, so it is serving these new industries by taking an active part in the establishment of industrial areas and in providing them with the necessary sidings and transport facilities.



For details of these industrial areas, and of other business opportunities in East Africa, write to the Commissioner, East African Office, Grand Buildings, Trafalgar Square, London, W.C.2.

INACCURATE INFORMATION WAS THROWING A SPANNER INTO FRASER'S WORKS!

DOUGLAS FRASER AND SONS LTD., a firm of Scottish engineers specializing in the manufacture of textile machinery and machine tools, used to keep their Stores Records on Bin Cards. These cards only showed the materials purchased and those issued to production. Every six months, stock was checked against these Bin Cards—there were always a number of discrepancies. Because no *net* balance was registered on the Bin Cards, Fraser's often found they didn't order enough new stock to cope with production requirements. This was happening at a time when demand was increasing and materials were taking longer to arrive anyway.

Like many firms, big and small, faced with this kind of problem they called in Burroughs

SOLUTION: In close co-operation with Fraser's own staff, the Burroughs representative worked out a system based on four machines—two Sensimatics, one Director Adding Machine and one Duplex Calculator. The firm now gets a daily balance of all its stock items. Also during the posting operation the order level is automatically registered. Re-ordering became mechanically accurate, production programmes go through smoothly, and no extra staff were taken on at all.

HOW BURROUGHS MIGHT BE ABLE TO HELP YOU

Ask yourself: How many of your staff are engaged in figure-work? How long does it take you to get the figures you want? Are the figures always accurate when you do get them?

Burroughs Accounting Machines will do this figure-work for you without tying down a lot of staff *and* do it far more speedily and far more accurately. Burroughs make machines suited to the needs of every size of business and you have everything to gain by consulting them.

They will advise *against* buying one of their machines if they don't think you need one. Their advice, of course, is free. The local Burroughs office is in the phone book.

Burroughs

The most experienced manufacturers of Adding, Calculating, Accounting, Multiplying, Typewriter-Accounting, Statistical Machines and Microfilm Equipment

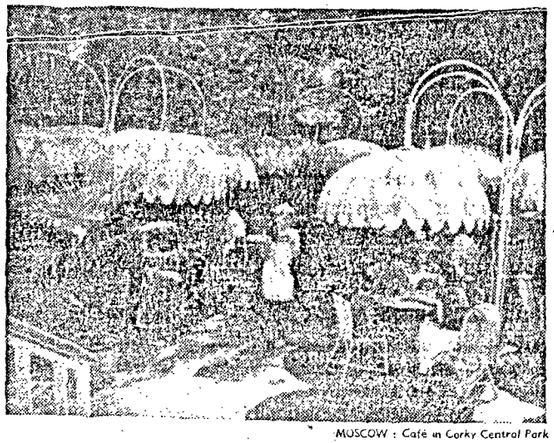
Walter Lippmann, the authentic voice of adult America.

America in the world today

BY WALTER LIPPMANN



MR. WALTER LIPPMANN is probably the most distinguished and influential journalist in the world.

In the United States, his own country, he has built up an authoritative reputation as a political observer of great shrewdness and a commentator with an exceptional gift of clarity. His reputation now spreads far beyond America, and his twice-weekly column is syndicated throughout the world and read by alert men in public life everywhere.

Mr. Lippmann has recently delivered his *obiter dictum* on America's role today, in a lecture given in a Mid-Western town. It is a major document of our times, remarkable for its simple lucidity and penetrating analysis of the world's problems. It will be published in The Observer in two parts starting this Sunday.

To make sure of your copy of The Observer order one today from your newsagent.

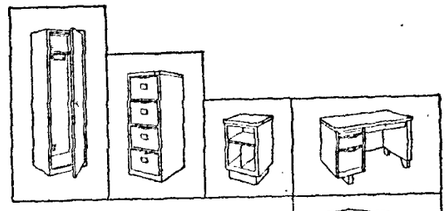
"Talking of Sound Barriers...."



"The Works Doctor came to see me the other day and put forward a strong case for some form of insulation to protect employees from excessive noise. Apparently most of the absenteeism and nervous illness in the place is due to sound irritation, although I believe he had another word for it. I must admit our re-equipment scheme has increased the noise level considerably—and absenteeism has increased likewise. Anyway I'm recommending to the Board that we call in Newalls to see what can be done about it. It will be a worthwhile investment to get back to something like peak efficiency."*

Pattern for paper development

The Reed Paper Group includes 19 separate major companies concerned with every aspect of making paper and paper products. *By what methods* can so diverse a Group ensure that these products are always the best and most suitable for *you*, the customer?

Certainly one of the most vital methods is the *enlightened use of economic and market research*—a factor which is of ever-increasing importance both in individual companies' marketing projects and in broad Group planning. The Reed formula for achieving this is both *flexible* and practical—it depends upon the informal, *personal* contacts which link together the Group and all the companies.

Thus, because of their long practical experience, the individual companies freely *take the initiative* in putting forward ideas for product developments and market investigations in their particular product fields. One of the most important roles of the Group Economic Research Department is to 'get together' with the companies and provide the specialist advice and service needed—it is essentially a first-rate central intelligence unit ready to go into action on behalf of any Reed company. Parallel with this, the Group conducts *long-term* economic research—into sources and supplies of raw materials and new or existing products and markets. This research is something new and progressive within the paper industry and is designed to benefit *all* Group members.

The underlying principle is this—each Reed company, while having access to Group resources, retains its individuality and independence, and understands the character and aims of the Group so well that it can think and act *for itself*.

This is why your every meeting with a Reed manager, salesman, technician or marketing expert can be so particularly satisfying and profitable. It is why your every dealing with a Reed company can give you the best and right materials for *your* needs.

"YOU profit from the initiative of each Company backed by the resources of the Group"

Together for What?

SINCE the last Commonwealth prime ministers' meeting just over a year ago, the political kaleidoscope in almost all the Commonwealth countries, including Britain, has been rudely shaken. Half the prime ministers attending the conference this week are doing so for the first time. Nearly all the others are in trouble of some sort, which either brings them to Downing Street in chastened mood or keeps them at home. This should greatly ease Mr Macmillan's first task : to rehabilitate the idea and value of top-level Commonwealth consultation. The degree of continuity in the personalities attending these meetings in the past ten years—shown in a table on the next page—did much to establish confidence in them. But if, this time, membership of this conference had coincided too closely with the last, there might have been too much unprofitable jobbing backwards. As it is, the months that have elapsed since the Suez affair and the reshuffling of Commonwealth governments recently may help the prime ministers to turn over a new leaf without being uncomfortably precise about what they want to write on it.

They have all of them, in fact, some interest in letting bygones be bygones. Mr Macmillan can carry his sackcloth folded over his arm. Looking round the table, he will find that most of the peacemaking he expected to have to do has been done for him by events. Canada, represented by Mr Diefenbaker, is no longer the censorious Canada of last November; it is a Canada falling over itself in the wish to be friendly, and the only embarrassment for London is that some of the manifestations of that desire are liable to be a little jejune. Mr Nehru is no longer the angry avenger of the Suez misadventure; following his recantation over Hungary, his economic crisis, and his political troubles with the United Nations on his own frontier, he is said (although it must not be said too loudly) to be in a restrained and receptive mood. Mr Suhrawardy, who feels he now has the initiative over Kashmir, can only be quietly glad that Britain is functioning again in the Baghdad pact, membership of which endows Pakistan with a bargaining power it would not otherwise have. Mr Bandaranaike, who showed signs of pressing racial issues to dangerous lengths last year, is by his absence advertising the estrangement of Ceylon's own racial minority. Sir Roy Welensky and Mr Louw (on behalf of Mr Strydom) will want to take advantage of this to show Dr Nkrumah that they are not quite ogres; and Dr Nkrumah, who needs capital on a huge scale and has his minority troubles just like anybody else, may well be in a mood to be charmed. Mr Menzies, who will not wish to dwell on his own attempts to settle the Suez dispute —and who, running his eye down the table from Mr Macmillan (in a hot seat for his next general election in 1959) to Mr Macdonald of New Zealand (in a still hotter one for his general election this year), must be feeling unwontedly secure politically and economically—may be relied on to a take practised advantage of the atmosphere of the conference to promote goodwill, and, incidentally, Australian trade.

This gives Mr Macmillan every chance to achieve his second Bermuda : to liquidate the Suez policy in Commonwealth conclave as he liquidated it *tête-à-tête* with President Eisenhower earlier this year. To be able to claim that the conference has confirmed Commonwealth harmony and studied world problems, and that confidence and accord have been established will be enough for the final communiqué. Will it also be enough for the conference as a whole ? Although the best answer should be " not quite," it may be wise to recognise that there could be disadvantages if the prime ministers try to do so very much more.

THE two main subjects on the agenda, apart from an exchange of views about individual foreign policies and the Middle East, are defence and economics. On defence the first hurdle to be surmounted will be to be diplomatic—but not accommodating—when Mr Nehru delivers his inevitable lecture about the iniquity of nuclear tests. It is not quite clear whether any second defence hurdle exists. Of the old reciprocal relationship in defence between Britain and its former imperium very little now remains. No doubt, from the military point of view, even if limited conventional wars can no longer be undertaken by Britain alone, the needs of colonial defence still impart to Britain a certain grand (if expensive) strategic reach. But Dr Nkrumah's presence in London is a further reminder that as more and more African, West Indian and Asian prime ministers come to London, there will be fewer and fewer colonies to police or defend. The argument over the position of strategic colonies—Cyprus or Singapore—has notably died down in the last year ; whatever arrangements Mr Sandys makes in, say, Kenya, the trend is towards fewer ships, fewer garrisons and a franker reliance on a centralised atomic deterrent to keep the peace.

But these are developments that call not so much for Commonwealth decisions as for decisions by each Commonwealth country. Each must decide for itself what part it would like the mobile atomic artillery of Britain as well as of America to play in the series of defence pacts to which it is linked. The questions of the less ostrich-like ones will be on the part atomic force can play in the practical tactical possibilities and dangers that face them. The old imperial defence goes out of one door ; they must consider how far they should bring in a new Anglo-American imperial defence at another.

THE discussions on economic prospects will be dominated by the shortage of capital, and here Mr Macmillan has a positive task to perform. He should tell his visitors frankly that, given Britain's own arrears of internal investment, there is not likely to be a large enough investible surplus on this country's balance of payments to finance all the development needs which some Commonwealth countries are talking about—and that everybody will suffer if Britain tries to meet more of those needs than it can. Not even defence economies—if there are any—will ease this squeeze. A degree of aid is both possible and desirable : Colombo plans, technical aid, development or finance corporations. Emigration, the ploughing back of profits by British overseas companies, a modest flow of new risk capital—these will, and they should, stimulate Commonwealth development. But there will be nothing like enough money available from British sources alone to make a reality of Dr Nkrumah's vision of the Volta, or Mr Diefenbaker's of a British investment in Canada that would look the American inflow in the face. Indeed, the establishment of some new machinery to co-ordinate—which mainly means to cut down—sterling area spending plans is one of the few specific projects that could most profitably be discussed at this conference.

There should be similar caution and realism about Mr Diefenbaker's proposal for a new Ottawa trade conference. The proposal can be discussed on its merits ; if it were regarded as a precautionary discussion of Canada's possible willingness to enter into special currency arrangements with the sterling area at any period of sudden re-opening of the world dollar gap—for example, during any American recession—those merits would be considerable. But if a new Ottawa conference were to aim merely at the regular channelling of more Canadian wheat, New Zealand meat or Australian fruit into a nearly static British market, it would be atavistic. Economic logic requires that the Commonwealth should expand its sales in a European common market where costs were being lowered, consumption increased, and a capital surplus engendered. It is ways of achieving this (and not fears of competition) that should interest the Commonwealth—but they are not matters that prime ministers can decide in a wide-ranging conference of ten days.

THUS Britain has a curiously inverted initiative at this conference : because Asian voices are muted and the sophistication of Canada's long experienced international leadership will be absent, and because Mr Macmillan must explain why Britain cannot perform roles in defence and development that were taken for granted long after the sovereign independence of Commonwealth nations was formally established. But Mr Macmillan's lead need by no means be wholly negative. In the presence of Dr Nkrumah he can invite the conference to offer all the technical and other aid their countries can spare to the string of new nations which Britain has got on the conveyor-belt of self-government. And he can urge that as a gateway to Europe Britain itself can offer far more opportunities and services than as a moated market. It will be for the Commonwealth to respond ; to consider how far its great and friendly network of associations, specialised agencies, and *un*usual channels can be further adapted to exploit the possibilities of new initiatives. But the initiatives should be designed to co-ordinate Commonwealth co-operation with the rest of the free world, not to cut ourselves off in an exclusive club which would lower all our standards of life ; this mainly new—and mainly interim ?—team of Commonwealth leaders should be welcomed with the reminder that the latter concept is not what Commonwealth means.

The Meaning of Mao

The people of China will want Mao Tse-tung's words to be reflected in his actions. But to people in other Communist countries the words may be another charge of dynamite under the foundations of Stalinist society

THE Communist world since Stalin's death has been in a state of continuous internal change. At times the pace of change has been barely perceptible, but each period of apparent immobility is followed by a lurch, throwing the various members of the block forward at varying speeds. Moscow is no longer the single pacemaker. From the very first leakages it could be gathered that the secret speech made by Mao Tse-tung in February might be one of those documents that affect the course of history. How much was expurgated, after an interval for reflection and consultation with allies, is unknown. But the authorised version published last week in Peking has flashed round the world to be scrutinised by western chanceries in search of clues to Chinese behaviour and, more important perhaps, to be studied anxiously, as something that may expand or restrict the horizon of their own lives, by the readers of *Pravda*, the *Trybuna Ludu*, or the *Nepszabadsag* of Budapest.

For the Chinese themselves the speech provides chiefly the theoretical justification of the less harsh party line which they have been experiencing for some time. A distinction is made between contradictions " with the enemy " and " within the people " ; this, if it means anything, must mean that, so long as they do and say nothing that could be said to be aimed at the overthrow of the existing regime, the Chinese are to have more freedom to speak their mind. The dictatorship remains, but within its framework they are promised persuasion rather than coercion. Workers and peasants may now claim the right to air grievances without being necessarily accused of " counter-revolutionary " activity. Intellectuals will see in Mao's words an official blessing for the ideological thaw started last year under the poetic title; itself an intriguing clue to the difference between the modes of thought of Communist Moscow and Communist Peking, " let a hundred flowers bloom."

It may seem strange that Communist China should move in this direction at a stage of its development comparable with that of Russia in, say, the late nineteen-twenties or early nineteen-thirties, when the foundations of the Stalinist system were being laid. Chinese industry is in its infancy ; its agriculture has only just been collectivised. Can Mao find a communist short-cut to industrialisation that does not, like the path taken in Russia, cross a terrain strewn with corpses ? He has the advantage that he is not a pioneer ; he can take advantage of the experience of Soviet mistakes. So far he has shown a practical awareness of what a rural upheaval could mean in a country with 500 million peasants, together with a notable feel for the peasantry's mood. The Hungarian insurrection raised the ghost of

Stalin and reminded China's leaders that the risk of revolt, when popular discontent passes a certain point, is more than theoretical.

A desire to avoid bloodshed is not by itself enough. The great volume of bloodshed in Russia did not flow from personal bloodthirstiness on Stalin's part, but from his determination—unqualified, it is true, by any humanitarian scruple—to drive the Soviet people to industrialisation much faster than they themselves wanted to go. If political relaxation is not to threaten an explosion, then it must be accompanied by a decrease in economic pressures. Backward China has the additional advantage of not standing alone ; Mao will have to ask his Soviet partners for more economic aid. He will also need to slow down the pace at home if he is to translate his principles into practice.

Some disturbing reports from western correspondents suggest that an attempt is being made already to put the relaxation of the political struggle into reverse. Some have even suggested that the whole "flowering" campaign was merely designed to provide easy targets for party gardeners waiting with a weed-killer. But it is still probably nearer the mark to suppose that Mao's speech, after the Hungarian warning which probably decided its timing, does indicate a willingness on the part of the Chinese leaders to make concessions in order to get as much of their own way as they can get through persuasion.

THE proof of the pudding is in the eating. What matters to the Chinese is how much their government's actions will correspond to its words. For the rest of the communist world, however, the words themselves have a tremendous importance. They invest what was until now the Polish heresy with an air of respectability. In all the quarrels among communist leaders since Stalin's death there was never any question of abandoning the "dictatorship of the proletariat." The difference between "liberals" and "Stalinists" concerned the amount of freedom that should be allowed within the limits of a communist society. Mao now gives his backing to what seemed a minority view. A single quotation from his speech will show that it is, on the face of it, more than a condemnation of Stalin's way :

> It is not only futile but harmful to use crude methods to deal with ideological questions . . . you can ban the expression of wrong ideas, but the ideas will still be there. . . . Correct ideas, if pampered in a hothouse without being exposed to the elements or immunised from disease, will not win out against wrong ones. That is why it is only by employing methods of discussion, criticism and reasoning that we can really . . . settle issues.

Mr Khrushchev, in his American television interview, had to hedge awkwardly when asked to comment on the Chinese doctrine that contradictions can exist in a socialist society. The Stalinist myth that Soviet society knew no contradictions had two important consequences : whoever departed from the orthodox line was an alien, an enemy ; there was no room for dissenting opinions. It is true that Stalin's heirs have made important changes in Soviet society. Mr Khrushchev himself, in his indictment before the twentieth party congress, set the pace of the campaign against "the cult of the individual," a pace which at first looked too hot for Mao Tse-tung. But the events precipitated by that very speech have helped to alter the relative positions. Since the Hungarian rising, the Soviet leaders have tried to channel the reforms into the field of economic administration. But Soviet writers and artists, students and scientists, now that the concentration camp no longer threatens them, have begun to clamour for greater freedom of expression—and they can quote chapter and verse from Mao in support of their demands.

MAO'S speech has been most enthusiastically received, naturally enough, in Poland. As soon as the news of a new Chinese doctrine came out, a Polish writer greeted it with Galileo's *E pur si muove* ("but the earth *does* move"): despite the Hungarian tragedy and the ideological retreat which the repression seemed to foreshadow, the movement away from Stalinism would not be halted ; it was getting fresh impetus from the East. Mr Gomulka himself has paid tribute to the Chinese for their great contribution to Marxism-Leninism. Of Mao's actual text, the Polish party paper says that, while each country should follow its own road, many Chinese ideas coincide with their Polish ideas and will inspire the Poles to press on. "Read Mao Tse-tung," it told its readers.

Mao Tse-tung, however, is not only preaching to the converted. His voice will reach Prague and Sofia, Bucharest and Berlin. In those countries of Communist Europe that are conducting a rearguard action in defence of Stalinist methods, the orthodox leaders could dismiss Mr Gomulka as a dangerous heretic, but Chairman Mao is too high a priest to be easily censored or censured. Diehard leaders clothed in the alleged authority of Moscow may soon find that Czech or Bulgarian reformers defend themselves by producing chapter and verse from Peking.

So China's weight is thrown on the reforming side of the communist scales. Too much, in western terms, should not be read into these proceedings. Nowhere has it been suggested that any opposition to communist rule will be borne. The fist that was shown in Hungary is still there, and in China and Poland as well, for the "enemy." Democracy, as we know it, is not sprouting in the communist world. But a wind is blowing ; and no communist country can now withdraw to cultivate its own garden. The wind carries ideological seeds from country to country over the vast lands between the Neisse river and the Pacific ; and the flowers or weeds that spring up are governed by the soil where they fall. Some plants may yet surprise Mao himself, and Moscow's once total monopoly of the gardener's craft has gone.

Colour Disharmony

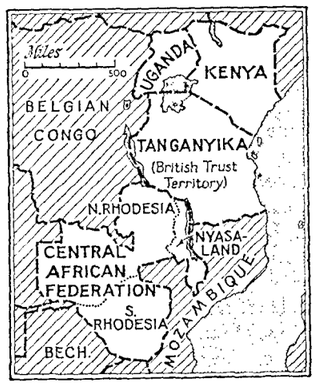
No British African territory has yet found a way for the black, white and brown races to share in government. Politically, Tanganyika is behind other multi-racial communities, but there is a chance that it could show the way.

THE absence of white settlers has made Ghana's evolution from a colony to an independent African state comparatively straightforward. It is for the same reason that Nigeria is now first in the queue for independence. But in those parts of East and Central Africa where Europeans have settled permanently, political development cannot be a straight course towards African rule ; it can only follow the much twistier path of multi-racialism. The term multi-racialism, as used in Africa, is associated more with pigment than anthropology ; it is a convenient way of describing a form of government in which neither black, brown nor white is in sole charge. A multi-racial policy is advanced as an alternative both to African nationalism and to white domination ; it can be either a grudged expedient or an ideal, according to the speaker. Perhaps this is why no African state has yet worked out a viable multi-racial policy ; the Central African Federation's franchise proposals, which ought to be a first step towards it, are criticised by an African contributor on page 1168. Tanganyika has been less acutely aware of the problems than has the Federation or Kenya. But, just because it is still politically at the starting post, and because its racial antagonisms are not developed, it might turn out to be the best testing ground.

The problem is to devise means, while there is yet time, by which the several races can live peaceably together, sharing the government. As things are now it is inevitable that the white minority in Kenya, the Federation, and Tanganyika should have a disproportionately large share of power. Eventually, the numbers and the growing skill and experience of the Africans must tell. The task is to move, by successive stages, to this goal ; and to treat the superior skill and experience of the white race as reasons for its permanent dominance would lead only in a circle to increasing racial stress. The test of policy in these countries, therefore, in the interests of white and black alike, is whether it genuinely leads along this multi-racial path. This is true of weighted franchise proposals such as those in the Federation ; and it is true of the so-called principle of parity—equal representation of races regardless of their relative numbers—applied in Tanganyika. These cannot be ends in themselves ; they can only serve as stages in the process of development and advance. Minority groups, white and brown, cannot carry indefinitely the same weight as the Africans who in Tanganyika outnumber them 80 to 1.

However steady and sensible the advance may be, and whatever minority safeguards may be raised on the way, Africans must come to count for most in an African state. The pace of the transition from white dominance to racial parity, and finally from racial parity to equal rights for all, is the decisive problem. It has to be recognised that the pace demanded by extreme African nationalists would be no less destructive to the concept of multi-racialism than the tortoise-like rate advocated by many white settlers. But if Africans in the three territories are to be drawn away from the policy of achieving African rule by ruinous forced marches, they will want from the white minority an earnest of their intention progressively to disperse distinctions between the races, and a clear sign of the pace at which those intentions will be carried out. The white man's own chance of ultimately retaining his share and say in government will depend upon this.

SOME of the circumstances in Tanganyika now are favourable for progress along the multi-racial path. The territory is well governed, both at the centre and in the regions ; its political future is still malleable, and relations between Europeans, Asians and Africans are still on the whole amiable. The proportion of Africans is so overwhelming that there has never been any question that the handful of Europeans should be in sole charge. There is already parity in representation among the unofficial nominated members of the Legislative Council. This could, indeed, be a blind alley, but African politicians are being gently educated in responsibility. The multi-racial United Tanganyika party, to which all but four of the unofficial members belong, recognises in its manifesto that Tanganyikan governments of the future will be largely African ; and the inadequacy of communications both with the neighbouring countries and within the territory itself (though this will not last) makes the organisation of an African nationalist movement difficult.



The sum of it is that Tanganyika has the opportunity to experiment in ways of government and to avoid the rigid pattern of black against white. The opportunity may be missed. Tanganyika's advantages are not permanent. If the 8 million Africans are one day to accept non-Africans as fellow Tanganyikans Europeans and Asians must give some earnest now of their belief in this common citizenship.

There is little indication that either Europeans or Asians are thinking along these lines. The small populations of settlers has not wakened to the fact that more than lip service to multi-racialism is needed if they

to retain a voice, though not the overriding voice, government. Many Europeans support the United ganyika party grudgingly and apathetically. The o or so settlers are still disposed to believe that they e a natural right in perpetuity to a part in the admin- ation of the country out of all proportion to their nbers. Only a few see how unrealistic this belief may ome in 10 or 20 years' time. The Indians do not re the European complacency. Their unenthusiastic tude towards multi-racialism derives rather from a xture of scepticism and expediency ; far less alarmed the prospect of African nationalism than the Euro- ns, they still do not want to compromise their future wearing the wrong label now. In Uganda, where re are no British settlers but where the proportion of lians to Africans is higher than in Tanganyika, there s been no suggestion that the Africans should not be control after the country becomes independent. In nganyika the Indians have staked their future there re firmly than the British, and most of them would oose to stay whatever government took over.

At government level, the impetus that had launched e country upon its multi-racial course has slowed wn in the last year or two. Sir Edward Twining's aginative paternalism has created a situation in which litical experiment is possible, though his term of office ds next year and he will be leaving before the experi- ents can be tried out. But his decision that there ould be multi-racial elections in all constituencies ring 1958 and 1959 was wise. His original pilot heme for limited elections was an inadequate gesture hich fell flat. The new scheme gives hope at last of nstitutional advance. Two years ago, in order to rn the territory's dawning political awareness into ulti-racial channels, the governor formed the United anganyika Party; but the party's programme has oved only a faint bugle call to the Africans—whose sponsibility for future co-operation among the races will be largest of all, because they are the largest of all, by far, in numbers.

The immigrant population's long-term interest lies in encouraging the Africans to think in terms of Tanganyikans, rather than in terms of black, white and brown. But this policy has no hope of success unless the Europeans give more evidence that they are thinking in the same way themselves. The rallying call of the African nationalists is their common grievance over the amount of land in non-African hands. Sisal, for instance, which is Tanganyika's main cash crop, is—not unnaturally as things are—grown entirely by non-Africans. Little more than one-tenth of the territory is cultivated at all. Although it is now in practice difficult for a non-African to acquire more land, non-Africans already hold nearly a fifth of the cultivated area, which in relation to their numbers is large. One of the first precepts of the multi-racial Capricorn Society, whose members stretch across East and Central Africa, is that land should not be reserved for ever for members of one race. A constructive and generous land policy would do more than any political pleading to take the wind out of the nationalists' sails. For the sake not only of the Europeans in Tanganyika but also of the white population in other parts of Africa, who will watch and learn from the experience, the initiative should not be delayed until it is too late.

Dining on the Deficit

Last year the British Transport Commission lost £679,000 on its railway restaurant cars, £120,000 more than the year before. Our correspondent has been trying to find out why

THE rump steak on the menu turned out to be fillet steak. Your correspondent would have been astonished at this good fortune, but for the fact that this was the Royal Scot Bar at Euston Station—and the host one of the senior executives of the British Transport Commission. But, in fairness, it must be said that the steaks at the neighbouring tables looked just as good and just as attractively served, and that for London they were very reasonably priced. As for the décor, it was quite new—not in a fly-away Festival-of-Britain sort of way, but in a sombre adaptation of the "contemporary" theme. It must not show the soot and it must also be easy to clean.

The Royal Scot Bar is one of the new restaurant bars which are being opened at the largest railway stations, and each station will also have a self-service cafeteria and a four-ale bar, thus catering for three levels of trade. The cafeteria at Euston (the old dining-room converted) is already doing a roaring trade amounting to more than the total turnover of all the other catering establishments on the station put together. It is equipped with cooled cabinets from which the traveller helps himself to cellophane-wrapped sandwiches, or cold meats and salads; and the satisfied customers seemed to your correspondent to present a contrast with the diners in restaurant cars on the trains themselves.

No topic, it seems, arouses such eloquence, such passion, as meals on British trains. It is a subject on which every man is an expert, about which everyone has a notable experience, good or bad, to recount. Usually, it must be confessed, it is bad—some bitter memory of half-a-guinea spent on a packet soup, boiled cod and parsley sauce, and a nondescript "sweet." Sometimes it is the stained jackets and dubious fingernails of the waiters that inspire the eloquence, or the difficulty of getting a drink. But the standard of restaurant cars varies very much, and against this censorious background some have had poetic experiences: the grilled chop on the train to Lyme Regis, the roast chicken on the Comet. One sentiment unites

all the customers: all are surprised that train catering, at present prices, loses money.

What has the Transport Commission to say about it all? First, that it is in the nature of restaurant cars to be uneconomic, that most European countries' railways make a large loss and with far less excuse. For British trains do not, as others do, merely carry restaurant cars on likely lines thronged with plutocratic passengers. Any decent train will carry one at meal times, and there are four meal times in Britain, let it be remembered, to every three in Europe. Whereas the poor Italians have a restaurant car for every 1,323,000 passenger miles, in Britain there is a car of some sort (buffet or dining) for every 243,000 passenger miles. Many of these cars are running on routes where they cannot hope to pay.

One reason why it is so difficult to make them pay is the high cost of labour. Chefs and waiters get the wages laid down by the Catering Wages Board, but they have to be paid special rates, not only for the night trains and for work at weekends and holidays (when they are particularly hard pressed), but also for frequent nights spent away from home. That touches on another of the railways' difficulties. Who would be a chef in a train, cooking for perhaps 200 diners (the average on "The Mancunian" is 224) in a space smaller than the kitchen of a council house? There is a general shortage of skilled cooks, so it is hardly surprising that the railways do not get the pick. And who for that matter would be a waiter, swaying down the gangway scores of times, till he gathers in the meagre tips of inexperienced or perhaps dissatisfied diners, and retires at last, stained with travel and soup, to some dreary railway lodging house?

IN your correspondent's experience, railway waiters may not be beautiful, but they are very nice. They inquire with real tenderness whether that is enough for you and whether you would like a second helping, and they usually strike the right note of friendly service, neither familiar nor obsequious. Their good manners are a credit not only to themselves but also to the railways' own training school at Marylebone. There is now talk of establishing a school for chefs also; this is surely an idea that should be energetically pursued, not only because cooking on trains is a specialised technique, but also because it is the only hope of getting enough good cooks. As for the appearance of restaurant car crews, serious thought is being given to this at the head office. They are to be issued with jackets for use when not serving. But the garb that would be most reassuring to the customers would be a white jacket; every waiter should go aboard with at least one spare one, and he should be encouraged to scrub his hands more often.

Alas, except on the postwar cars, the washing facilities are in the ordinary lavatories shared with the passengers. Your correspondent blenched at this. It is no use, however, to urge the Transport Commission to provide something better immediately. A modern kitchen-car costs £20,000 to build, and another £1,500 to equip with crockery, cutlery and glass. Cars like this are in fact being brought into service as fast as possible, and by 1960 very few cars of earlier vintage than 1950 will be used on regular trains. Meanwhile an effort has been made to modernise some of the old ones, by putting in plenty of stainless steel and plastic, more refrigeration space, and new ranges fired by gas cylinders carried beneath the car.

It is very good news that all this is being done, but is this development really on the lines most needed? In its annual report, published this week (the weightier topics in which are discussed on page 1171), the Transport Commission says that a survey has been carried out to see what is wanted. On the basis of this, four types of car are being provided. Sometimes a buffet car is provided as well as, sometimes instead of, the dining car. On a few holiday trains an experimental 5s. 6d. lunch has been served—with the result that more people were served, but the takings were about the same as at the ordinary price. On some trains, such as the "Starlight" weekend services to Scotland, and on outings arranged by firms, cold "compact meals" are served in plastic picnic boxes at from 6s. upwards. Ten thousand such meals were served in the first eight

months of last year on the London Midland Region only. But these are on the fringe ; eleven million meals were served in restaurant cars in 1956. In the main, the assumption is that most people are content to pay (since this month's price increase of 1s.) 9s. 6d. for both lunch and dinner.

PRESUMABLY some are content, but the standard meal at a standard price tends to divide the rest of the customers into two kinds. The first kind is horrified at having to pay so much more than the cost of a meal at home or in a provincial café. For them at long last some of the new buffets will be selling trays of cold ham and salad, roll and butter, a cake or cheese. This is the sort of thing that some airlines do so well, and the catering services have a big market among those who now bring their own sandwiches.

The other sort of customer is the restaurant habitué who, probably, is not paying his own bill—but is putting it down to his firm and the Chancellor of the Exchequer. What does he care about the price, so long as it is good ? On business trains most diners would quite happily pay 15s. 6d. if they could be safe from packet soups (even the best packet soups are recognisable), boiled cod and watery cabbage. The standard could be improved partly by making use of prefabricated hors d'œuvres like potted shrimps and paté ; and partly by cooking more off-stage. The railway caterers are proud of the fact that almost everything is cooked on the trains. But not all food suffers from being warmed up—casseroled dishes, for example ; and sauces and soups, already cooked at the depot, could be more ambitious. Above all, there ought to be more effort to push the drinks. Every restaurateur, except apparently those on the railways, knows that this is how to make your money.

These are some of the improvements that will suggest themselves to the layman. But the catering officers have a curious remedy—namely, to serve four courses at lunch and to charge an extra shilling for it. The arithmetic seems strange because if three courses do not pay at 8s. 6d., it is hard to see how four at 9s. 6d. can pay better. The domestic economics are strange too. The addition of another indifferently cooked course does not make a mediocre meal good, and a minute portion of fish does not seem to justify the serving and washing up. Few even of the best restaurants today offer a table d'hôte of more than three courses. The catering officers say, however, that where a four-course meal has been served it has proved very popular, and that the number of meals sold has risen in consequence. They also maintain that if they serve four courses they need not offer a choice of main course, and that this will make ordering much cheaper.

Your correspondent was not convinced by this argument, but certainly saw and heard enough to know that enormous and rapid strides are being made in improving the catering services of the railways. It is evident that the authorities' aim is above all to provide the public with a service, rather than to make a profit. But one could not help feeling that they rather too readily assumed that these aims were irreconcilably opposed.

NOTES OF THE WEEK

TELEPHONE TAPPING

Private Line?

THERE is not very much to be said for Mr Macmillan's proposal that the telephone-tapping controversy should be discussed in private by himself, Mr Gaitskell, Mr Butler and Mr Grimond ; if any wider and more formal inquiry is to follow from this discussion, privy councillors should certainly not be the principals on it. The previous privy councillors' conference on security procedure showed conclusively that, when civil servants proffer advice in secret to party leaders, about how civil servants and party leaders (when in office) should handle administrative powers which are exercised in secret, the people who assume that they are vicariously watching over the public's interests are the very people over whom the public wants to keep watch. What is needed at this stage is not a private meeting of official minds, but a continuance of the present coconut shy.

It is not a criticism of this continuing shy to say that the public is not very clear precisely what targets it is aiming at, because those targets are only gradually being revealed by the furore itself. Three things can be said about the present state of the campaign. First, one target that has been knocked down is the misuse of the transcript in the Marrinan case. Hardly anybody now defends the fact that the transcript was released to the Bar Council, and this sort of official malpractice is not now likely to happen again.

Secondly, it is not quite clear whether the use that has been made of the actual power to tap is yet a proper target for brickbats ; but one suspects that it will become clear quite soon. If the only telephone tapped in the present *cause célèbre* was that of Mr Billy Hill, then, in the circumstances of last year, this action may not have been one to keep every critic now determinedly throwing : but if his barrister's telephone was tapped too (and there have been allegations that some of the remarks in the transcript were not made either to Hill or on Hill's telephone), then the furore deserves to become immense. A third target that deserves at least some more sighting shots was revealed in a written parliamentary answer this week: it is Mr Butler's refusal not only to give the names of those whose telephones have at some time been tapped (which is understandable and proper), but also to publish the bare number of warrants issued in, say, the past five years. This unembellished figure would give precisely the sort of information that is needed to enable the public to find out how pervasive the police state is, but Mr Butler said that "it has always been the practice, in the public interest, not to disclose" it. On whose definition of the public interest, and why ?

KOREA

Anniversary Celebration?

ALMOST exactly seven years after the outbreak of the Korean war, the sixteen governments that fought on the United Nations side have decided, in spite of the armistice agreement, to import modern arms into the south. The announcement had been expected for some time. South Korean estimates of the arms build-up in the north may be exaggerated but even the Swiss and Swedish members of the Supervisory Commission agree that the communists have been importing modern arms ; the UN can only follow suit. The decision to withdraw American forces from Japan and to transfer the Far Eastern Command headquarters to Seoul provides another motive for keeping the divisions in Korea up to date.

President Eisenhower succeeded in persuading his allies that the decision was a necessary one, and he chose to announce it plainly and publicly instead of following the communists' example of rearming their forces on the quiet. The result is a challenge to the communists to prove their innocence, and they are finding it embarrassing—although they must have been expecting the UN announcement for some time. General Jung Kuk Rok spent most of his speech to the military armistice commission at Panmunjom on Sunday in saying how much better it would have been if the Americans, instead of bringing their equipment up to date, had withdrawn altogether. On Wednesday he proposed an international conference to discuss the withdrawal of all foreign troops from Korea—an obvious red herring. He reserved the right to comment later on the allegations made against North Korea, only mentioning in passing that his side had been doing everything "in strict observance of the provisions of the armistice."

The American authorities have been vague about their plans. It is not known what weapons will be imported or whether they will include nuclear warheads. President Rhee has not been as aggressive as might have been expected after the United Nations announcement ; still, the fear remains that, with the weapons at hand, he might be tempted into actions that would cause fighting to flare up again. What the Americans have done can be justified. But, since this is a time when the great powers are discussing disarmament, inspection and control, was it the most constructive thing they could do ? Might not Korea, the scene of a local armaments race under the eyes of the armistice commission, be the best place to propose a first experiment in arms inspection zones ?

NIGERIA

Sine Die

MR LENNOX-BOYD has avoided naming a date for Nigerian independence and the prime ministers of the Nigerian regions have taken it fairly quietly. They are, as had been promised, to have self-government for their own regions as soon as they want it ; and the communiqué issued at the end of the long constitutional conference (which will be followed in ten days' time by a white paper) shows that they have left themselves with a loophole for escape if they are too violently accused by their countrymen of having failed to honour their compact to win full federal independence in 1959. What is equally clear from the communiqué, however, is that they never had a hope of meeting this deadline: there are too many ticklish issues which have to be settled first and which they are keener to delegate or put into commission than to settle out of hand. Very little has in fact been settled in these discussions except (*a*) the form which regional self-government is to take for the Eastern and Western regions ; (*b*) the granting of more responsible regional government for the Southern Cameroons ; and (*c*) the wise decision to proceed to further stages of ministerial responsibility at the centre during an interim period which, it is clear, may now extend to 1961 or later.

Among the subjects not yet settled are whether, in a year or two, there are to be three, six, or more regions in Nigeria ; whether the police are to be wholly or only partially handed over to regional control ; and how revenues and financial powers are to be allocated. As expected, commissions are to be set up to examine these matters and also to delimit new federal constituencies for the next election. They will clearly take a considerable time to report, even after their membership has been agreed. The Northern Region has decided, while increasing the size of its elected Assembly, not to take regional self-government until 1959. To promise that the new federal house could fix the date for independence—irrespective of the reports of these commissions, of the experience of regional self-government and the state of affairs in the North—would have been to burden the Colonial Secretary (whoever he may be) in 1960 with a most onerous commitment. Mr Lennox-Boyd deserves congratulation for having avoided it.

It remains to be seen whether he has satisfied opinion in Nigeria, which is anxious to make a rendezvous with "freedom" even before it has decided which of many routes to take to get there. It is to be hoped that the regional prime ministers on their return will have the courage to defend the delay in final decisions, which is of their own making, to their parliaments. As in a stick of rock, the word tribalism runs right through it.

EGYPT

Egypt's Sense of Status

ANY Englishman in the Middle East last winter found when he met Egyptians that they all tackled him on the same sore point. Whether speaking in anger or in sorrow, for or against President Nasser, and whether merchant, schoolmaster, soldier or diplomat, each in his different way said the same thing: "We want to be treated as you treat Holland or Denmark, not as you have been wont to treat dependent peoples. Whatever the Dutch had said or done you would never have landed an army there nowadays, or bombed their radio."

This urge to establish a new status *vis-à-vis* a one-time paramount power seems to have been at the back of the spy trials that have just ended in Cairo. Eight Britons were on trial—four in their absence—on charges that were rated as capital. In the end five were acquitted altogether. Two —Mr James Swinburn and Mr James Zarb, a Briton of

Maltese descent—have been sentenced to penal servitude for five and ten years, respectively. The trials maintained the decent standards of Egyptian justice, but in their course Egypt has ranged itself among the countries that deliberately blur the distinction between "spying" and the common innocent action of a man of any nationality who, having picked up information when abroad, may communicate it in ordinary intercourse to some compatriot who is also an official.

Certainly in the days when British troops held positions in Egypt and were under attack, the distinction was particularly difficult to draw. But those days are over, and it is to be hoped that the Egyptian conviction that they bred a generation of Britons incapable of behaving as ordinary foreigners do will soon die, too. That Mr Swinburn and Mr Zarb should be penalised in order to prove this point to Egyptian satisfaction is a tragedy. Having made the point, will Egypt show a spirit of sufficient maturity to let its victims go before their lives are broken?

FRANCE

Six Months in a Tunnel

WITHOUT enthusiasm, the French parliament has now granted to M. Bourgès-Maunoury the money it had refused to M. Mollet: £130 million for 1957 and £300 million for next year. True, the nature of the new taxes has been somewhat altered. Less revenue is expected from the tax on stocks and more from the increased price of petrol, which goes up to 8s. 3d. a gallon. Through a combination of cuts in public spending and new taxes the government hopes, rather optimistically, to reduce the total budgetary deficit—including below-line expenditure—to about £850 million in the current year and just over £1,000 million in 1958. Clearly this will not stop the inflationary pressures. Higher transport costs and a round of wage increases, which now seems bound to come in the autumn, are most likely to be passed on to the consumers.

The prospects of closing the gap in external trade, the most urgent task of all, are not bright. Having reimposed import quotas, the government intends to act on the other side of the balance and raise exports to the level of £130 million by all kinds of guarantees and other aid. But all this will need time. The position was described by M. Gaillard, the minister of finance, in a curious metaphor: "For six months we shall be in a tunnel; then, for a year, in an ever-widening passageway; finally, we shall emerge to open skies."

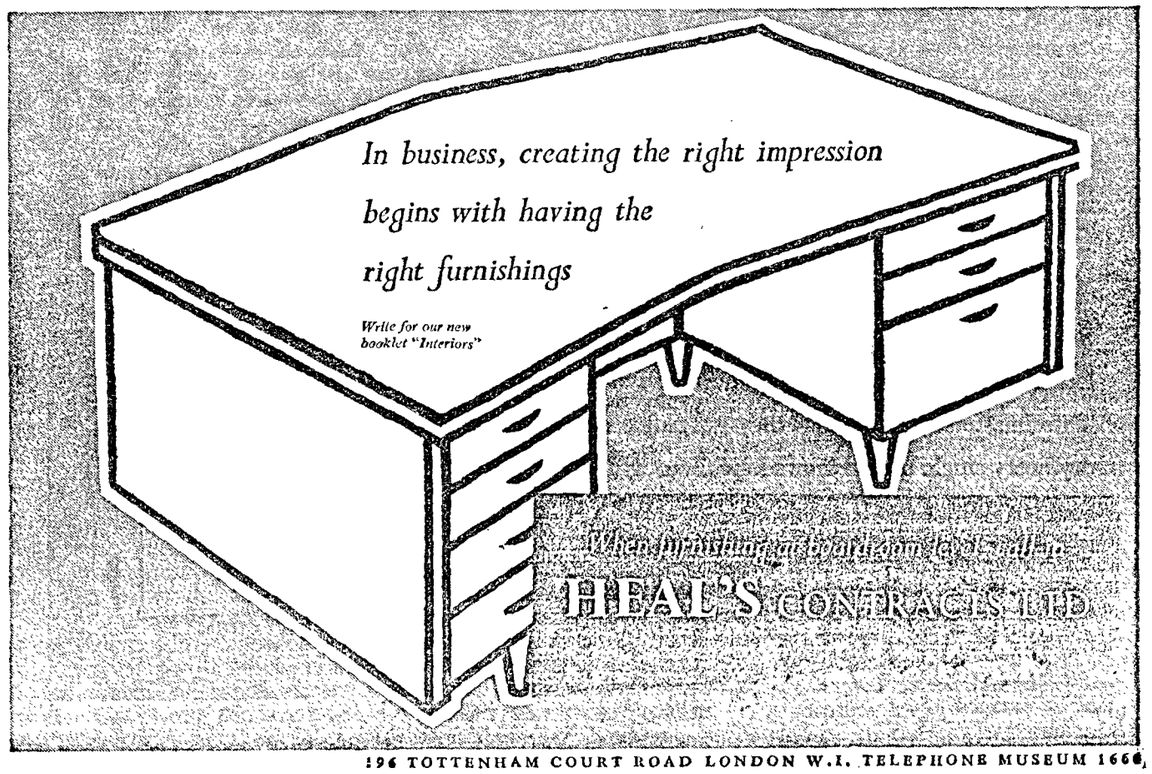
But one must pay one's way even in the dark. In addition to £100 million in foreign exchange, the Bank of France will now advance £350 million worth of francs to the government. Its governor, M. Baumgartner, has promised the "anti-toxin" of credit restriction to combat this inflationary dose. M. Gaillard announced that France will ask "its friends and allies" for a loan to get it over the critical period. The chances of getting one from the United States are not good so long as the Algerian war goes on. The Organisation for European Economic Co-operation is probably a better bet. The West German government, through its economics minister, Professor Erhard, has expressed readiness to take part in such a loan, provided the French recovery measures satisfy the OEEC; what this may mean is not clear. Altogether, the franc seems at this stage as unstable as the present French government; each may be heading for a fall in the autumn.

Thin End . . .

A BILL tabled by the French government to prolong its special powers in Algeria contains an innovation: it seeks to extend the powers to all persons born in Algeria, even if they now reside in metropolitan France. When the executive was first invested with such wide administrative powers—to search and deport, to assign people to forced residence or forced labour—the measure was not approved without apprehension. But it was defended on the ground that exceptional circumstances did prevail in Algeria. Can the same argument be applied to France itself?

A distinguished French lawyer, M. Lyon-Caen, has shown in closely reasoned terms that the new provision is contrary to all French constitutional principles, beginning with the Declaration of the Rights of Man. Indeed, he sees it as a first step on a road that might lead back to the Vichy regime, to concentration camps on French soil and to arrests of all non-conformists. He thus expresses the fear, shared by some of his compatriots, that the exceptional may soon be confused with the usual and what is good for Algeria may be considered as good for France.

Fundamentally the trouble arises from the legal fiction that all Algerians are Frenchmen. No one can guarantee that the new law will be applied only against Moslem rebels on French soil. A prominent writer, M. Camus, for instance, who happens to have been born in Algeria, could be sent back to be dealt with administratively in his place of origin, should his views give offence to authority. Many Frenchmen not only distrust the new law in principle, but have doubts whether the present team can be trusted to apply it with moderation. Some of the Christian Democrats (MRP), in particular, have suggested that the government of M. Bourgès-Maunoury should be brought down on this very issue immediately after the European debate, to guard against possible abuses of power in the parliamentary summer recess.



PROSTITUTION

Cry Wolfenden

THE Wolfenden committee, which is inquiring into the law relating to various kinds of sexual offences, was originally expected to publish its report this month. The fact that there has been a delay probably does not mean that there is too bitter disagreement about the liberal reform that is eventually likely on homosexuality: some advance towards making homosexual acts between consenting males no longer an offence, but with strict rules about the age of consent and the corruption of youth. But on prostitution the committee, like most other people who have studied the subject, may well be at odds, except for the view that more reclamation work needs to be done. (Even here the report is likely to cover only half the subject. Prostitution exists to supply a demand; no one tries to find out what creates the demand. The prostitutes have been surveyed, but not their clients.)

To the outsider, however, there seem to be two facts that have to be faced. The first is that laws restricting commercial prostitution will have to be kept in being—neither

public nor political opinion is willing to accept official licensing of houses—but that these laws are bound to be imperfectly enforced. The second fact, however, is that there are practical disadvantages in the present emphasis of British law. That emphasis is on action against all open forms of procurement, with less determined action against open forms of prostitution; the procurer is usually a much more despicable person than the prostitute. But one of the results is that London has become the most unsalubrious city to walk around at night in either North America or Europe. At present non-enforcement of the law is most transparent (and an approach to unofficial licensing of prostitutes, by means of periodic fines, most blatant) in the case of soliciting in the streets, which is the manifestation of the business that makes life most unpleasant for London's inhabitants and visitors; while enforcement is most strict against organised houses, undercover advertisement of telephone numbers, and other forms of third party pimping upon immoral earnings—even when it is pimping that keeps the nuisance off the streets.

From the public's point of view, if the object is to be to tackle the worst problem rather than merely to punish the worst people, the more convenient emphasis might be the other way round: for the police to clean up the streets without any discretion, and to keep discretion only in the off-the-street action they take—concentrating their first fire here on the empire-builders rather than the advertisers, on those who are actively spreading the trade rather than on those who are merely acting as nasty little middlemen and middlewomen in it. London's nightly spectacle is provoking a sentiment which, though depressing sociologically, had better be stated frankly, so that intelligent opinion can decide whether it will tolerate the undeniable cynicism in it: that the first step should be to try to shove some of this nuisance out of sight, provided that this is not in any way an excuse for shoving the real problem itself out of mind.

SHOPS BILL

A Game of Vice Versa

THE Parliamentary Labour party chose the first day after the Whitsun recess to demonstrate again that it has not outgrown its habit of putting its freedom of action excessively in pawn to the Trades Union Congress; it badly needs to take a leaf out of the Tories' book—*vide* the Restrictive Trade Practices Act and the proposals for freer trade in Europe—in learning how a national and democratic party should sometimes go out of its way to evince its independence from its paymasters. Labour spent this supply day debating and regretting the welcome demise of the Shops Bill, with its wildly restrictive and electorally unpopular proposals for compulsory earlier closing of shops. This debate had one minor advantage: in throwing more light on the Government's attitude to the departed bill. Mr Butler's general argument seemed to be that, leaving aside the controversy about earlier closing, the wretched thing had not been meant to be a great act of social reform, but just, in the main, a rather tedious tidying-up measure. He said that he has been studying other sections of the Gowers report, dealing with working conditions in shops and offices, and with the employment of young persons; the impression that emerged—a tolerable rather than an inspiring one—is that if there is any legislation next session it will deal with these other sections of the Gowers report, and not return to the earlier closing plan. Of any positive Government desire to roll back sectional trade union pressure, and bring in a consumers' charter, there is unfortunately no sign.

There, until the autumn, the matter rests. But the time and date of the debate inspire a midsummer reverie. Mr Robens droned on and on, making the point and threat—that the Government may be forfeiting the goodwill of the TUC in all other economic matters by this one act of dropping the Shops Bill, and that awful consequences may ensue. Suppose, in reverie, that British capitalists had asked a Labour government to bring in a bill to aid and abet certain monopoly practices; that that government had refused; and that a Tory MP had made Mr Robens's speech, substituting the initials "FBI" for "TUC" throughout. No prizes are awarded for estimating the number of times on which his speech would have been interrupted with cries of improper pressure, and of encroachment upon Parliament's sovereignty.

NORTH DORSET BY-ELECTION

Labour's Last Frontier

POLLING was taking place on Thursday in the by-election at North Dorset. This is the constituency which the Liberals (second in the poll last time, less than a 10 per cent swing from the Conservatives needed to get their candidate in) thought that they could win, and by the time that many readers have received this issue of *The Economist* it will be known whether or not they have done so. But two points emerge during the campaign which should be borne in mind when considering the result.

First, about organisation. North Dorset—a rambling, rolling constituency comprising half a dozen market towns and about a hundred villages in the countryside behind Bournemouth—was held by Mr Frank Byers for the Liberals up to 1950; even in 1951 the Conservative majority over Liberal was only 747. It is one of the very few constituencies in the country where up to now there has been no Labour party organisation worthy of the name; the story that the Liberals have a "great radical tradition" in this countryside mainly means that—because of this lack of a Labour organisation—a large number of people whom one would normally expect to vote Labour have hitherto voted Liberal there. But Labour has made a major organisational drive in South West England in the last two or three years (which has been reflected in local council election results). It now emerges as the third party, and at a good time for third parties; it is quite possible that the recent dulling of the feeling that one must never waste one's vote by voting for the weaker opponent of the party one most dislikes—a dulling which in other by-elections has helped the Liberals—may in North Dorset hurt the Liberals and help Labour.

Secondly, about candidates. The Conservatives have proffered a large, brisk, efficient colonel, who is a definite advance on some other Conservative candidates at some other recent by-elections. The Liberals have proffered a youthful revivalist; he may have been too revivalist—bumbling around in the heatwave getting more excited than most ordinary people about the iniquities of the hydrogen bomb—but he has made speeches in many villages that the other two candidates have not reached. Labour has proffered

the same schoolmaster as before, and he does not sound very exciting.

Over the country as a whole, a larger proportion of former Conservative voters are probably willing to drift into the Liberal camp than the 5 or 6 per cent who, on the evidence of other recent by-elections, at present seem willing to drift into Labour's. But (a) the Tories can still hope that the willingness to drift is less pronounced in marginal seats; (b) the Tories in North Dorset have some advantage over the other two parties in their local candidate; and (c) Labour's organisational improvement could split the anti-Conservative vote. By the pricking of one's thumbs, rather than by straight psephological comparisons with recent results elsewhere, the conclusion must be that the Conservatives will be in an even bigger mess than one had supposed if they really have lost this one.

DAILY HERALD

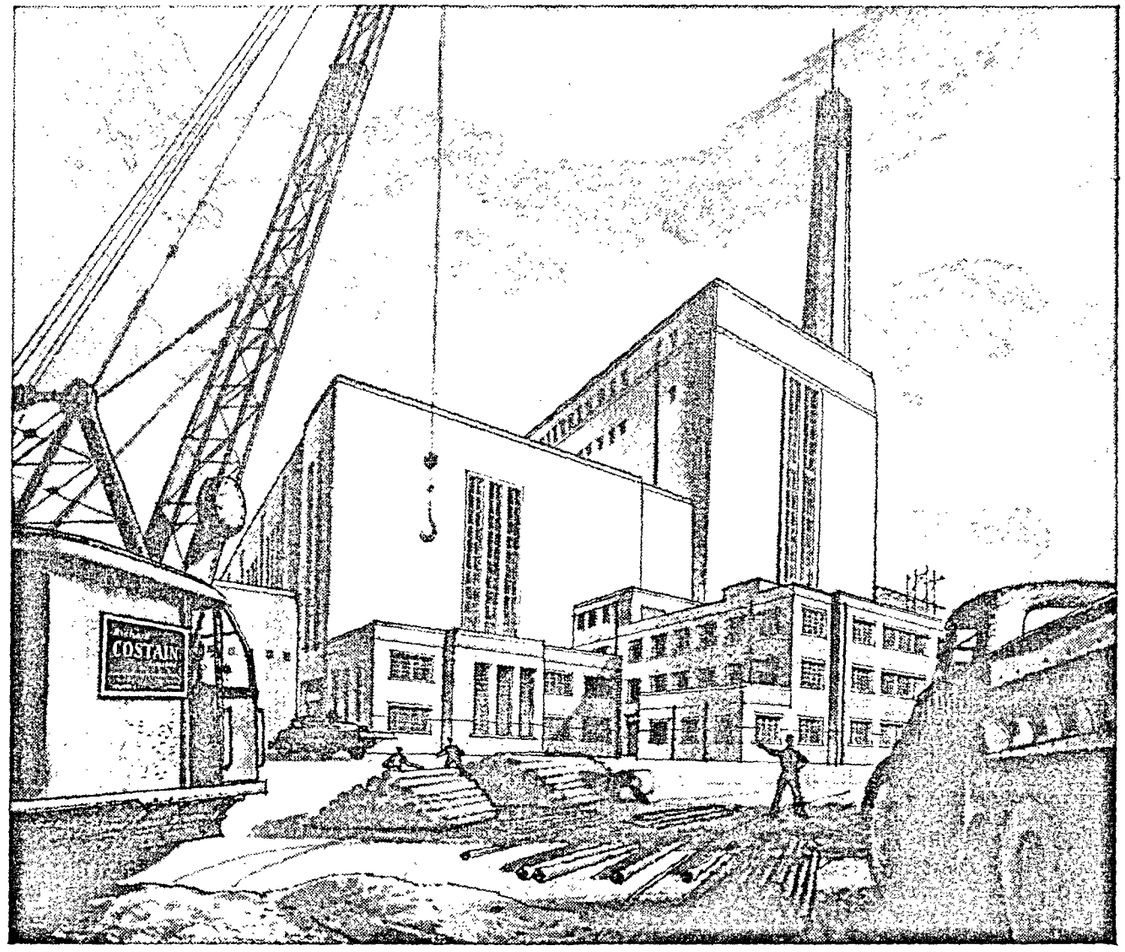
How Much Licence?

It is an appalling commentary on the present artificially high level of costs in Fleet Street (and on the conventionally low level of British newspaper prices that any "popular" national daily with a circulation of below two million seems at present fated to lose money. The trade union movement, which on its industrial side has a considerable responsibility for the level of costs, has now revealed some of its plans for making it possible to look for ways of meeting the problem on its newspaper magnate side. These transactions will be watched by all other newspaper men with interest. The first part of the new arrangements for the *Daily Herald* announced this week—with the TUC "granting a licence" to Odhams to publish the paper—is merely a sensible tax dodge: Odhams' accountants will now be able to set off the losses on the *Daily Herald* against its group profits on other ventures. It is surprising that this has not been done before. Secondly, however, discussions are to proceed on the "safeguards" under which this licence is to be granted: this means on how much of its present control over content the TUC is willing to cede. Presumably the TUC will not make too many difficulties about how much of the paper is to be concerned with Labour political news and views, and how much with what Odhams regards as more entertaining stuff; gradually, over the last few years, the TUC has already ceded a lot of this control over allotment of space. What will be interesting, however, is to see how far the TUC insists that the part which has remained as political content should continue to be so unvarying tied to its own orthodox views on every subject. By its insistence on this orthodoxy hitherto, the TUC has been cutting off its own nose. No editor or writer on current affairs can keep up verve and enthusiasm in his job if he feels that he has a committee looking over his shoulder at every sentence he writes; the result of the TUC's tight censorship has been that the battered political writers on the paper have gradually lost not only journalistic sparkle, but also some of their influence and inspiration within the paper to the Odhams "entertainment men"—which is precisely the reverse of what the TUC presumably wants.

If Transport House cannot shake off enough of these inhibitions, then the new arrangements will be of little avail. If, however, an editor with Labour views but with freedom to think for himself is allowed to start experimenting with the paper—in the same way as all Conservative papers, including the *Daily Telegraph*, veer off their party line at times—the *Daily Herald* will not stand to lose any of its faithful political readership; they have nowhere else to go. And such livelier journalism might just conceivably—although not by any means certainly start to attract enough new readers, and with them advertisers, to make the paper economic. But the plan so far is only the first sighting shot in the *Daily Herald's* struggle (in which it is not alone) for survival.

VIETNAM

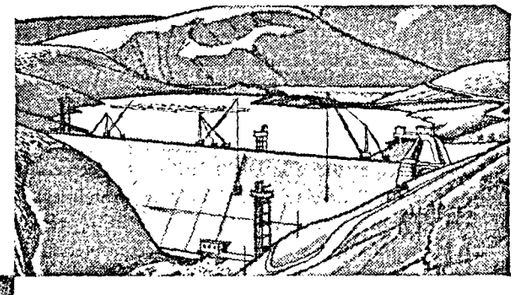
A Note from Hanoi



The government has not yet taken action on the Note from the north Vietnam prime minister, Pham Van Dong, calling for nation-wide elections, "as laid down" by the Geneva agreements of 1954; these were the agreements that put an end to the Indo-China war by dividing Vietnam in two. The Note, dated June 8th, was addressed to the co-chairmen of the Geneva conference—the foreign ministers of Britain and Russia.

Britain does not recognise the communist government in Hanoi and is not bound to take cognisance of its latest Note. But there are complicating factors. The Viet Minh Note, which again alleges violations of the Geneva agreements by the Diem regime in the south, refers to a letter from the three-nation commission charged with "supervising" the observance of the agreements in Indo-China. There has not yet been any official mention of a recent letter from the commission, but it is no secret that difficulties have arisen between the commission and President Diem's government.

The commission complains that the government has denied it facilities for investigating arrests of "subversives" in the south. The Viet Minh complains that such arrests violate the Geneva agreements. The southern government replies that most of the complaints are vexatious, and demands *prima facie* evidence before investigating specific cases. This demand is not unreasonable, as the dividing line between "legitimate" and "illegitimate" arrests is often tenuous. The determining factor is whether or not those arrested were fighting with the Viet Minh at the time of the Geneva agreements: if they were, victimisation is alleged.



If the commission has indeed written to the co-chairmen, the British Government is bound to reply. It may have been stirred at least to make its position clear by the pinpricking speeches of a party of Labour MPs who recently visited Hanoi by invitation of the Ho Chi Minh government. The statements they have made, in Hanoi and Moscow, in the press, and in the Commons, notably those of Mr Harold Davies and Mr William Warbey, cannot be distinguished from Hanoi's propaganda. Indeed, Hanoi's hospitality and its latest Note suggest that the Viet Minh is acting on its own, without prompting from either Peking or Moscow, in a matter which both consider secondary.

Further action on the Geneva agreements appears unrealistic and undesirable in the near future. The Diem government has always denounced the agreements, to which it was not a party. But it would improve its case in the eyes of the world if it allowed greater freedom to political opponents and refrained from reprisals against the press at the slightest hint of criticism.

ACHIEVEMENT

BEHIND THE ORGANISATION of Richard Costain Limited is a continuing history of more than 90 years of progress and expansion. The tradition of quality, service and rapid construction has been fostered throughout the years and has spread to the far corners of the earth, embracing every type of project in the contracting field.

There . . . she blows!

That piece of tissue in Daddy's hand has come a long way. It was once part of a tall pine tree in Canada or Scandinavia. Before it arrived at baby's nose it had to be pulped, shipped, processed, cut and packed: a transmogrification worthy of Merlin. Bowater wizards are expert at the transformation of timber. Some reappears as packaging, some as building boards, some as printing papers. Bowaters' many-sided activity, both here and in North America, is well suited to meet the world's changing and varied demands for timber-derived products. The new household tissue factory at Northfleet, Kent—a joint venture by Bowaters and the Scott Paper Company of U.S.A.—exemplifies this activity.

CHINA TRADE

Relaxing the Embargo

All the major west European governments have now followed the British lead and relaxed their embargoes on trade with China, bringing them roughly into line with that on trade with Russia. The Chinese have answered the British gesture by placing an order of £100,000 with the British Motor Corporation for Austin products; they had been dangling the possibility for some years. A delegation from west Germany is to visit China in a few weeks to negotiate terms of trade and payments; and Italy has eased the way for an expansion of exports to China by liberalising payments arrangements as well as by relaxing its embargo. Outside the United States, only Australia and Japan, of the nations most concerned with China trade, have not yet moved. But now that Mr Kishi's visit to Washington is over, Japan, too, is expected to follow the crowd. The schism in "Chincom" between the United States and its allies has become plain for all to see.

Now that it is complete, tempers can cool and realism reassert itself. China's economic difficulties may not permit the traders of Europe, after their first bout of orders, to get the big results from the relaxation of the embargo for which some of them once hoped. In the Chincom committee negotiations are now beginning to determine the size of quotas for the goods on "List 2," goods which may be exported in limited quantities under the embargo; the European members of the committee may reasonably make a friendly gesture to the United States by establishing fairly tight quotas. The United States, on the other hand, is showing an increased interest in trade with the rest of the Communist block, though not with China. Last week it relaxed formal restrictions on 200 non-strategic exports to the Soviet Union and other east European countries. And a spectacular American exhibit at the Poznan Fair this month marked the growth of American efforts to sell food and consumer goods to the Communist world. But on China trade, Washington is unlikely to budge, at least for the present; for the feeling is still strong that China, not Russia, is the greatest political and economic threat to stability in the world.

DENMARK AND NORWAY

Honest John Goes North

Denmark and Norway have now both accepted the American offer to equip their armies with two types of rocket missile. One of these, the Nike, is an anti-aircraft missile with a conventional warhead; the other, Honest John, is a ground-to-ground projectile with a range of 15 miles which can take either a conventional or a nuclear warhead. The defence ministers of both countries have emphasised that they are not accepting nuclear warheads, which in any case cannot be supplied by the United States under present American law. In consequence there has been little opposition to the decision and even the ultra-neutralist section of the Danish radical party apparently does not intend to push its demand that a referendum be held before Denmark accepts rockets or nuclear weapons. The public has not taken much interest in the issue; the defence minister, Hr P. Hansen, chose to make his announcement when public attention was focused on the government's compulsory savings scheme.

Moscow radio has reacted by reminding the Danes and Norwegians of the "friendly warning" against arming with atomic weapons which Marshal Bulganin gave in March; it added the comment that the decision was the thin end of the wedge—"rocket weapons now; atomic weapons next." But so far there have been no signs of a stronger protest from the Soviet Union.

GHANA

Circumstances Alter Appointments

Another ex-minister and former whip has achieved a governor-generalship. This time it is Lord Listowel—probably the first time that a Labour politician has been given such a job by a Conservative Government. Comparisons are inevitably invited—although in some Labour circles they will not be—with Lord Hailes's appointment to

The Economist

JUNE 27, 1857

WORKSHOP OR SCHOOL?

The great conclusion arrived at by the Educational Conference, which met on Monday, under the Presidency of Prince Albert, and closed on Wednesday, under the Presidency of Earl Granville, was that "the children of the working classes are removed from school too early"; and the great practical object aimed at by the general action of the Conference was to prolong for the children of the working classes the period of school education. By making the schools better, and by all other means, these children are to be kept longer at school than at present, and kept longer away from work. The influence of the school is to be augmented, and of the workshop diminished. We cannot place our individual experience in opposition to that of all the teachers of youth there assembled, and can only state our own convictions. But we have observed that there are many necessary trades—and probably all—such as those of firemen, engineers, smiths, miners, colliers, sailors, etc., etc., with which the mind must be familiarised in very early youth, or they can only be learned with great difficulty, or are disliked and never are well learned. To all these kinds of drudgery men are doomed. They can only live, and society can only be sustained, by such labours. Easier, pleasanter, lighter, more agreeable, mingled with various intellectual enjoyments they may be, but performed they must be; and to prevent boys from learning them when young and getting familiar with them, to teach them something else as of more importance than the proper fulfilment of these tasks, is to render them, in our judgment, proportionately less fit for the purposes of life and less happy in performing its duties. It is an avowed attempt to train up children, otherwise than in the way in which under the guidance of their parents they now go, and to train them in a way in which they cannot possibly continue to go. This is the avowed object. They are to be prevented for a season from learning their business. Work must be done, and those who have to do it should be trained to do it, and trained to do it well, and trained to like it. . . . Make these necessary occupations as remunerative, as little irksome, as delightful as possible, but do not teach the young that they are to be avoided. Do not counteract nature by making her necessary tasks, to which at least she reconciles man, difficult and hateful. Above all, do not teach youth, by throwing contempt on the business by which they must live, to despise it, and despise their parents who now perform it.

the West Indies. As a matter of fact, Lord Listowel's appointment in no way detracts from the criticism of the earlier appointment; although Lord Listowel is a former Secretary of State for India and Burma, and was once Minister for Colonial Affairs, both men lack the day-to-day administrative experience for the job that ideally ought to be done.

• Although Ghana is independent, while the West Indies are only on the way to becoming so, it ought to be apparent that the ideal governor-general for the new dominion would be one able to give rather more advice and guidance at this stage than is normal nowadays from a governor-general in, say, Australia or Canada. This it is doubtful if Lord Listowel has the experience to give, but his appointment is a frank recognition that such advice would be resented; African leaders are quick to forget their debt to Sir Charles Arden-Clarke. The sort of governor-general Dr Nkrumah wants is one who will not interfere with his determination—supported, among others, by the ex-Labour MP, Mr Geoffrey Bing, who is one of his unofficial constitutional advisers in Accra—to manage his new constitution "in an African way"; the sort of governor-general the Commonwealth Relations Office has wanted is one with a reasonable name, plumage and title. In the circumstances, this appointment gets over some awkward hurdles in Ghanaian and Commonwealth relations, and everyone concerned—Dr Nkrumah, the Commonwealth Relations Office, and Lord Listowel—should be congratulated in a subdued but hearty tone.

THE UNIVERSITIES

A Tripos for Executives

In a report of the Cambridge General Board issued last week a proposal is made for establishing a new tripos of honours standard, in which the undergraduate would spend two years on an arts subject and the final year on science. There will be many to oppose this idea (as they did the introduction of Modern Greats at Oxford) on the ground that a university is a place for specialisation. But the Cambridge idea is to make the separate fields of study narrower, not to make them superficial.

The proposal deserves a welcome. Throughout industry and the civil service, decisions with scientific implications are being made by arts men who are ignorant of the principles involved and completely in the hands of their experts. This used to be thought perfectly proper, because the expert himself would have too narrow a view; but it is absurd now that science has become so all-pervading and so incomprehensible to the layman. The employment of scientists in a managerial capacity is much more common than it was, but this is not always the right answer; even if they have the necessary breadth of vision it is a waste of their expertise. It may be argued that this course will not attract the best brains, and no doubt the more scholarly will continue to prefer unadulterated arts or science. But these are not necessarily the people who make the best administrators. Even if the new tripos does attract some of the dimmer sort of undergraduate, a course of wider scope will surely make of him a more useful citizen. That industry, at least, is likely to be impressed by the proposed new degree is foreshadowed by employers' interest in the products of North Staffordshire university, where some science is included in every degree course.

Not the least of the advantages of establishing this course at Cambridge would be to stop the schools' bad practice of making quite small boys and girls concentrate on three or four subjects only, their eyes fixed firmly on the scholarship requirements of Oxford and Cambridge.

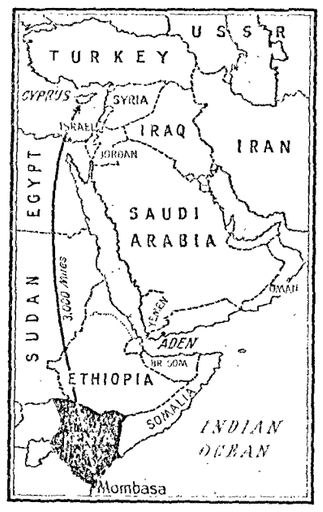
A Middle East Survey

The regional supplements in which the economic research staff of the United Nations add local colour to the annual World Economic Survey are useful documents because of their succinctness; nowhere else are so many composite tables so handily set out. But as a portrait of a region they leave much to be desired because they have to stick to the facts which member states provide. Written by the international servants of national masters, they can utter no warnings at points where figures fail to tell the whole story, so that a dam unstarted at A but scheduled to cost $100 million may bulk larger than a hundred finished artesian wells already supplying water to farmers at B.

For instance, the annual volume on the Middle East published this week* gives the following data about the settlement of peasant smallholders: in Iraq, 15,500 farmers on 550,000 hectares (up to the end of 1955); in Turkey, 252,000 farmers on 1,292,000 hectares (by the end of 1956); in Egypt, 90,000 farmers on 121,000 hectares (by September, 1956); in Iran, 8,251 farmers on 100,000 hectares of the Shah's estates (by the autumn of 1955). But nothing is said of the quality imparted to each venture by the kind of settler chosen, the amount of teaching made available to him and the accessibility of the credit without which he is unable to make his new start; these three criteria are important—far more important than any figures—to an assessment of the schemes most likely to increase the national product quickly.

One interesting point about the volume published this week is its survey of the effects of the Suez crisis on the area in which this took place. Just as a power cut hurts New York more than it would hurt Jericho, so it was industrialised Europe that was, with one exception, hardest hit by the canal closure. The local exception was Iraq. Whereas the other oil-exporting countries of the Middle East had all virtually recovered their pre-crisis rate of export by March, 1957, the Iraqis, for lack of the destroyed pumping stations on their Mediterranean pipeline, were still exporting less than half their September output.

An unusual and interesting table estimates the amount of dry cargo that each Middle Eastern country exports and imports via Suez. This shows that only countries to the east of the canal were much affected by the closure. Of these, Iran, Iraq, Saudi Arabia, the Sudan and the Persian Gulf sheikhdoms use it for more than 70 per cent of their imports but—apart from oil—the only countries that use it for exports in any quantity are the Sudan (70 per cent of total exports) and Iran (40 per cent). Both percentage figures are for 1955—a year in which cereal crops were exceptionally poor throughout the area. In a good barley year Iraq, too, would appear as a significant canal user.



Much has been made, in all recent comment on Middle Eastern trade, of the shift in balance from western Europe to eastern Europe and the Soviet Union for both exports and imports. In fact the shift (excluding that in armaments) is marked in three countries only, Egypt, Iran and Turkey—a selection that suggests that the trend is not wholly political. In the first half of 1956, there was an absolute decline in imports of the area from eastern Europe and from the Soviet Union—"the only area in which a decrease occurred."

*Economic Developments in the Middle East. Supplement to World Economic Survey, 1956. United Nations. New York. 1957.

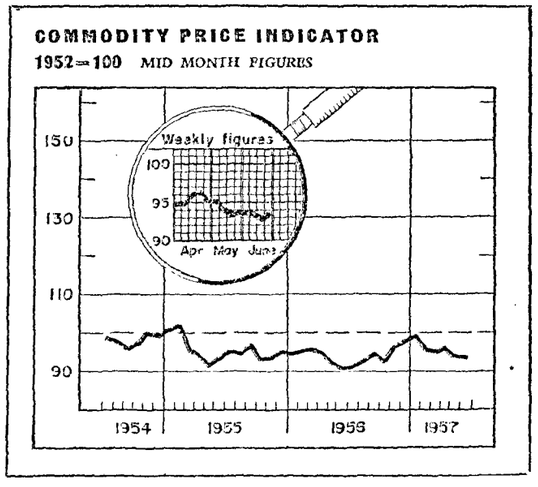
KENYA

Looking for a Base

Among the casualties of the Suez campaign was the entire structure of British ideas about bases in the middle east. Malta proved too far away for the air force; Cyprus proved inadequate for the navy; Aden proved to be impossible for everybody; and President Nasser wound up the agreement to activate the Suez base itself in any other sort of emergency and bagged at least £100 million worth of stores and installations. Mr Sandys, after stating in the defence white paper that some intermediate bases would be necessary under the new nuclear defence plan, has since been on an overseas tour to study the wreckage. It looks as if he is favourably impressed by the idea that all previous plans had better be scrapped and a new combined services base created in Kenya.

The advantage of Kenya is that it would be a good place to maintain and train the overseas army. But there are inadequate facilities for the navy in the hard-pressed port of Mombasa. From the RAF point of view, though Kenya would be adequate to train in, it is very far from the most likely scenes of operations; the RAF has always insisted that it needs Cyprus and Aden, though even these give inadequate flying room for modern fighters. This difficulty might be overcome by means of base usage agreements with the French. But the cost would be high—and one idea of the white paper was to economise. To retain all the bases on a reduced scale would be more expensive still—but some of the service commands are probably pressing for this.

Politically, the Europeans in Kenya would welcome the creation of a base, as this would in their view strengthen them politically and militarily—besides producing a new source of income. Accordingly, the African leaders must be expected to oppose it. But by the time they come anywhere near to achieving political power, the strategy of bases is likely to have changed again, and the British taxpayer will be shelling out somewhere else.



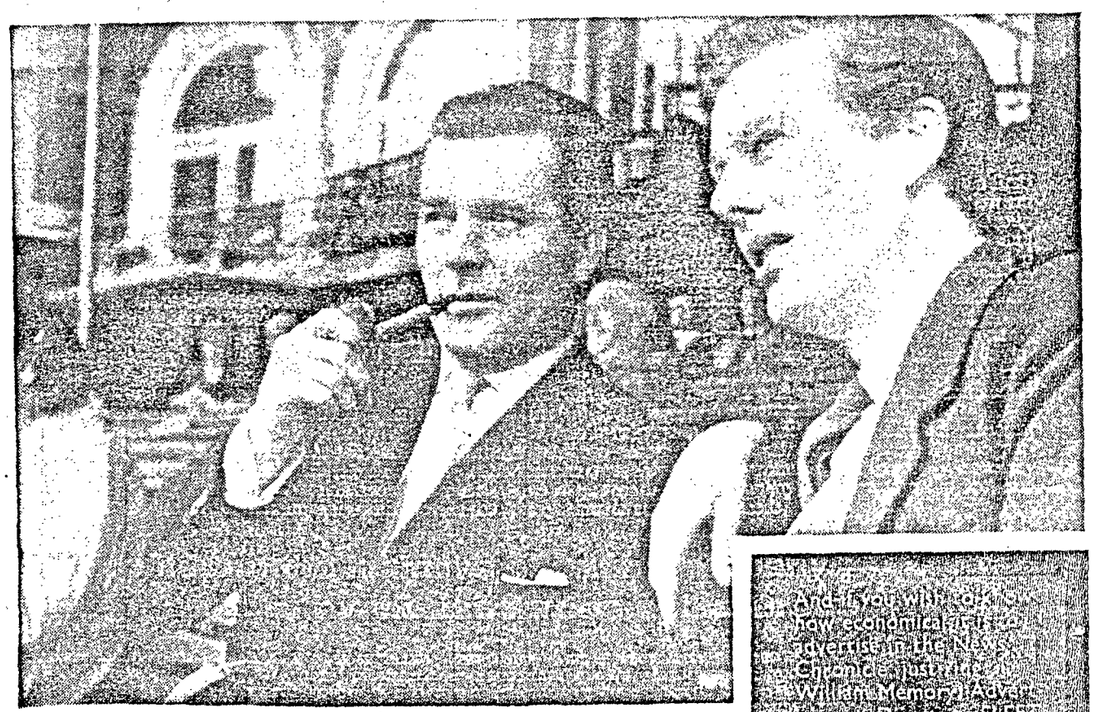
GERMANY

Socialist Champions of Competition

On foreign policy, the German socialists are appealing to the electors as the champions of a new approach. But in domestic affairs, the programme which their leaders have just proclaimed seeks, not to reverse Professor Erhard's liberal policies, but to go one better in the same direction. There is not a word about nationalisation; the nearest hints of greater state intervention are demands for a more vigorous atomic power programme, a more judicious anti-cyclic budget and a reorganisation of the "jungle" of social insurance. The socialists proclaim "free economic development and free competition"; they demand a more vigorous law against cartels, and, to hold down prices, not price controls, but greater imports and tariff cuts. They are appearing as the champions of liberal economic policies and mild reform.

This abandonment of the dogmas that still haunt much of the European left is not new. In parliament the Social Democrats have several times proved the heartiest supporters of Professor Erhard in his efforts to attack cartels and to free imports; it has been the farmers and industrialists on his own side who have flown protectionist colours. Encouraged by the obvious success of free market policies in western Germany and by the ugly spectacle of the state-run economy across the Elbe, socialist party congresses in the last few years have been marked by a growing approval for liberal notions in economic policy and a retreat from Marxism.

There is still a Marxist element, though dwindling in the party. And electoral considerations have no doubt helped finally to oust all mention of state-ownership even in its milder forms from the party's programme. The Social Democrats cannot hope to form a government alone next October. To attain office they will have to coalesce with others who cannot be expected to swallow the idea of a state-run economy. *Marktwirtschaft* has come to stay.



Overheard at the Oval

"That's what my advertising agent said."
"I didn't know he watched cricket."
"He doesn't. He was discussing my appropriation. He said it isn't the amount of expenditure which counts so much as spending it in the right place. For example, there are some parts in the country where people have more to spend than in others."
"The industrial areas? That's obvious I should have thought."
"But what aren't so obvious are the papers to advertise in to be sure of full coverage in these areas. Take the eight main industrial areas, for example, including Greater London."
"And what papers does your agent recommend to reach them?"
"The papers which come out top in the *I.P.A. Survey. The Mirror, the Express and the News Chronicle. Concentrate on those three and you can pretty well guarantee blanket coverage where you want it. The News Chronicle is an absolute 'must', of course, because it appeals to the type of reader who likes to make up his own mind and knows good value when he sees it."

"The secret, of course, is to place it where you want it"

NEWS CHRONICLE
AND DAILY DISPATCH

LETTERS

Giving Devils their Due?

SIR—Members of the Bar will be grateful to you for calling attention to the underpayment of interlocutory work and to the plight of the junior Bar, many of whom, even after years at the Bar, work for rates of pay (in a buyers' market) which an unskilled manual labourer would spurn. These are matters of public concern, since the high standards of the High Court Bench depend on recruitment from a small, hazardous and, generally, poorly paid profession. I read, however, with some surprise the concluding part of your note, asserting "that some senior legal luminaries are overpaid for a lot of work they do not do." I am puzzled to know the foundation for it. It has been true of the Bar, throughout its long history, that it comprises a relatively large number (possibly because entry is too easy) who make so little that many have to give up practice, some who, with luck, survive that stage, and the few at the top who are chronically overworked. It was Rufus Isaacs who said, "The Bar is never a bed of roses. It is either all bed and no roses, or all roses and no bed." His working day generally started around 4 a.m., the hour at which the late Sir Valentine Holmes, when at the Bar, often finished his day's work. Since the war, a number of leading "Silks" at the English Bar have had to give up practice on pressing medical advice that they could no longer sustain the pace required of those in heavy practice, and others have found salvation in elevation to the Bench.

The only way open to a "Silk" whose services are in excessive demand is to raise his fees, but the work he undertakes demands personal responsibility, which he can neither share nor delegate, intensive attention, and generally the sacrifice of sleep on a scale and for weeks on end, so far as I know, unparalleled in any other occupation. The suggestion that such members of the Bar are "overpaid for a lot of work they do not do" is mischievous and, in my opinion, unfounded. The respect in which I have held your paper (save over one recent public issue) is such that I consider it a matter of concern that such a statement should gain currency in your columns. For reasons of professional etiquette, I ask to be allowed to subscribe myself—Yours faithfully,

Temple QC

Poland's Road to Socialism

SIR—I have read with interest your balanced summary of Mr Gomulka's latest pronouncement. As far as I know conditions in Poland, you drew the right conclusions. Conferring the powers of the Yugoslav workers' councils, to which you made a passing reference, you did not. The workers in Yugoslavia are very far from having "taken over the factories," and for the following reasons:

1. All factories, mines and every other enterprise belong to the national community, i.e., to the state.

2. The relevant state authorities (mainly City and District People's Committees) have the statutory right to rescind any decision by a workers' council, if they deem it incorrect.

3. The councils and indeed the managements are severely restricted in their functioning by a plethora of federal or regional regulations, covering such important matters as wages and salaries, prices of raw materials and finished products. This limits the much-publicised power of the councils to distribute bonuses to no more than roughly 5 per cent of the value of wages.

4. Elections for workers' councils are held annually. This causes a rapid turnover of personnel and prevents the councils from establishing a permanent and effective control.

5. Both managements and councils have communist party members in executive and other key positions. No important matter is debated by the council unless it has been previously discussed and decided upon by the factory committee of the communist party. This practice turns the appointments of various executives, foremen, etc., officially controlled by the council, into an empty formality. The party is the real decisive factor here and elsewhere.

But despite all these limitations the Yugoslav workers' councils have come to stay and are playing a certain role in the economic life of the country (it must be stressed that they have not, and are not supposed to have, any political influence whatsoever). If a trend towards more genuine industrial and even political democracy should take place in Yugoslavia, they could easily become the focal points for the grouping and gathering of all those social elements who would be in the forefront of the struggle for more freedom. It should not be forgotten that the Hungarian workers' councils, which proved such an efficient and successful instrument in the Hungarian revolution, were modelled on the Yugoslav pattern.—Yours faithfully,

University of London GR. TSAMBLAK

Euthanasia of the Non-Rentier

SIR—One does not expect *The Economist* to sympathise with the socialist case for the euthanasia of the non-rentier, but you might at least refrain from distorting it. So far as I am aware, the Labour party has never rested its case for the state acquisition of equities upon the fact that at a time of inflation they provide a way of maintaining real income. Indeed Mr Gaitskell, despite occasional references to this fact, has always rested his case upon much wider grounds.

Thus he has argued that the present distribution of property results in disparities of income which are linked neither to need nor effort, that it bolsters a too rigid class structure, or that it provides some with a way of contracting out of their fair share of the tax burden, etc. In addition to which it has been increasingly maintained by socialists that the recent growth of internal finance and institutional investment has done away with the need for that mythical beast the rich and thrifty risk taker.

To all these arguments, of course, there are no doubt answers. One can only wish that *The Economist* would provide some of them—instead of attacking "a splendid aunt sally" which is largely its own invention.—Yours faithfully,

WILLIAM MCCARTHY

Merton College, Oxford

Rhodesia

SIR—It has become distressingly obvious to many people, both inside and outside Central Africa, that the cloak of liberalism donned by Sir Roy Welensky and the Federal Government has become increasingly threadbare and tattered. The Prime Minister's latest proposals

Canada's Immigration Policy

A CRITIQUE

DAVID C. CORBETT

Thousands of young people from Britain alone are eager to emigrate to Canada. But—what groups of persons are admitted as immigrants, and what groups are rejected? How is immigration policy administered? What effect does immigration have on Canada's economic development? These are some of the important questions discussed in this book.

University of Toronto Press 32s. *net*

Outline of Monetary Economics

A. C. L. DAY

The author provides a survey of modern macro-economic theory and British and international financial institutions, which is designed to give undergraduates the basic framework of this side of economics. Throughout, the attempt is made to relate theory and institutions to one another, and to present the theory in as dynamic a form as possible. 35s. *net*

OXFORD UNIVERSITY PRESS

for a franchise qualification of £700 a year are but a symptom of his retreat from liberalism. Indeed, Mr Garfield Todd, the bold and tolerant Southern Rhodesian Prime Minister, seems to be the one and only dominant personality in the Federation who is capable of standing up to right wing opposition. As one Federal MP said recently, Sir Roy appears to be adopting the Dominion (opposition) Party policy whilst Mr Todd "sticks to his guns" for partnership and a common roll. It may well be that the Government lost the recent Mrewa by-election more through insincerity than through any attraction that the Opposition has for the electorate.

Although you will appreciate that ill-informed overseas talk results in nothing but useless irritation here, it is also true that we do not resent honest intelligent criticism. Many of us consider that the British Government will be failing in its duty if it does not warn Sir Roy of its misgivings over the dangerous path that he is now following.—Yours faithfully,

Ndola, N. Rhodesia C. D. SMITH

★

SIR—In a note on June 15th, you remark that under Sir Roy Welensky's franchise proposals "African votes could not be expected to account for more than about a third of the votes in any constituency." In fact, with a roll based on an income qualification of £700 a year, Africans are unlikely to number a third of 1 per cent of the voters who would elect the ordinary members of the Federal Assembly. And they are the only members in practice eligible for a government post.

A wider electorate, with an income qualification of about £240 a year, would elect most of the remaining quarter of the Assembly. Southern Rhodesia has a common voters' roll on this basis now, and Africans on it are about 1 per cent of the total.—Yours faithfully,

R. J. D. ACHESON

Mufulira, N. Rhodesia

Mr Mboya Rampant

SIR—In his letter in your issue of June 15, 1957, Mr Mboya states:—

> Your article further implies that some of my speeches have been directed at stirring up the Africans to violence, threatening the Government or advocating non-co-operation with the administration.

and then he goes on to claim that such allegations have not been substantiated.

This is not entirely true. Kenya Hansard of May 23, 1957, pages 222 and 228, and of June 6, 1957, pages 489 to 491 and pages 495 and 496, refer to several inflammatory statements allegedly uttered by Mr Mboya, which he was invited to correct, withdraw or confirm. This invitation received little or no response from him and certainly left me with the clear impression that he is unrepentant and quite happy to leave on record the distasteful and harmful words attributed to him.—Yours faithfully,

Nairobi R. S. ALEXANDER

BOOKS

Their Lordships' Servants

The Development of the Treasury: *1660-1702*

By Stephen B. Baxter.
Longmans. 310 pages. 45s.

THE Restoration saw the beginnings of the Treasury as a modern department of state. Earlier Treasurers had carried out their functions with the help of their own servants. But from the reign of Charles II it became normal practice to put the office into commission, and the organisation could no longer rest on men hired by a single magnate. A regular staff of clerks grew up under the Secretary, responsible to the Lords Commissioners as a body. They did not change with their masters; and yet, as a new formation, they had not the freehold of their jobs or the rigid rule of seniority which reduced aged offices like the Exchequer to futility. New men, like Lowndes, could rise high by merit; and the incompetent or dishonest could sometimes be dismissed. The result was an agency that was primitive by our standards, but less primitive than many others that were still functioning; and its accumulation of experience of its own and everybody else's business (always the key to Treasury prepotency) enabled it to step to the front.

This is the story that Mr Baxter tells, with scholarship and in fascinating detail. At first one jibs at the care with which he follows the career of clerk after clerk. But as the facts accumulate the picture becomes constantly clearer; and to any contemporary student of the Lords Commissioners of HM Treasury and Their quaint ways, it is a fascinating story.

The substance may be different, but the technique is curiously familiar: the constant care to keep in touch with all that happens; the accumulation of power based on knowledge as much as purse-strings; the control of appointments; and, above all, the recognition that, in this country, public money and politics are almost synonymous. The Treasury loses battles with equanimity, but never surrenders: so, in those days, it did not flinch from opposing the King's desires, but never to the point where it must give in. Then, as now, it was a highly political department; then, as now, it controlled but did not execute. One difference of manners may be noted: the King used to come to the Treasury (it was said in one minute that he had been "called in"), whereas now the Chancellor of the Exchequer goes to Chequers for the weekend. But the Queen's chair is still in the Treasury, should she need it.

When one looks at the differences, one wonders whether life has greatly improved. Modern techniques have increased the power of government in two ways: we can run larger offices and we can create money. Are these benefits? In those days, when money was absolutely short, no one was hampered by the quaint and modern convention (now universally accepted in theory, but only since Mussolini reformed Albania by force of arms) that state debts are paid on the due date. The Government's activity was therefore controlled by the discount on their tallies: not a bad thing. Much of the revenue was dribbled off in places and pensions to those who wielded power; but at least they were so few that it could be done without crippling taxation, and many of them gave value for the bribe—they refrained from governing. Corruption and excessive fees flourished; but, as Keynes once said of the Stavisky scandals, in some states of society bribery is the most acceptable form of taxation.

Perhaps it is sentimental to look back on those times as an age of gold; but one can envy the narrow scope of their economic government. And, if many of our ancestors' assumptions seem extraordinary today, the current doctrine of the Public Accounts Committee may seem as queer and irrelevant to our descendants as the Ancient Course of the Exchequer.

Vicious and Virtuous Circles

Economic Theory and Under-developed Regions

By Gunnar Myrdal.
Duckworth. 180 pages. 18s.

THIS is less a consecutive book than a set of essays held together by two major strands; a socio-economic thesis and an ethical assumption. The thesis, broadly speaking, is that equilibrium is bunk; so far from economic events typically setting off corrective reactions they are typically cumulative, a matter of vicious or virtuous circles. Notably, the free play of market forces makes cumulatively for economic inequality; not necessarily, as in Marxist theory, between exploiting capitalists and exploited workers, but between the inhabitants of different regions. Within unified states, this inequality is countered by deliberate state action, through national social services, transport facilities, and so forth, and also by what Mr Myrdal calls the "spread effect," which is a generalised social version of the Keynesian multiplier. As between nations, however, inequality increases unimpeded, and will continue to do so until, in the teeth of market forces, some equivalent to intra-national equalising policy is adopted.

The ethical assumption is that inequality as such is immoral, regardless of any absolute levels of wealth or poverty or of any causal connection between them; the world's wealth is properly to be regarded not as the sum of individual or group production, accruing to the individuals or groups concerned, but as an undifferentiated quantity of welfare at the disposal of abstract Justice. This is, of course, the familiar socialist argument, according to which permission to retain one's own earnings is a free gift from the Chancellor of the Exchequer; Mr Myrdal is merely being logical, which national socialist parties rarely are. His logic, however, does not carry him to the point of advocating a redistributive world welfare state; his message to the richer countries is that they must, at whatever immediate inconvenience and loss to themselves, both help the poorer countries to develop and acquiesce in the necessarily damaging policies that development requires them to pursue.

This is the central argument; around it there cluster loosely a number of disquisitions on value judgments in economics, on colonialism, on the criteria of national planning, and on international trade. All are stimulating, all are valuable, and all display an almost comic duality between the ivory-tower idealist and the practical observer—the latter again and again demolishing in a single throw-away paragraph the contentions of the former, the former continuing majestically on his way without apparently noticing that he has been demolished. Had the balance been the other way a good book might have been very much better.

Presidential Blue Chip

Theodore Roosevelt and the Rise of America to World Power

By Howard K. Beale.
Johns Hopkins University Press. London: *Oxford University Press.* 621 pages. 48s.

THE stock of Theodore Roosevelt is rising. He is becoming something of a blue chip on the historical exchange and the nadir of his reputation, which was reached with the publication of Henry F. Pringle's life in 1932, followed by the transfer of the magic of the Roosevelt name to his nephew-by-marriage, is long past. This able book will help further to boost TR's reputation, though possibly not for the reasons given by Professor Beale.

One reason for the TR boom lies in the intrinsically attractive character of the man. His courage, versatility, readiness to take risks, to get out of the rut, to make a fool of himself, but on a big scale, recalls Sir Winston Churchill. The publication of his admirable letters has shown us the most versatile and cultivated President since John Quincy Adams or even since Jefferson (how TR would have detested the parallel). Compared with him, even Wilson and Hoover were narrow; FDR nearly illiterate.

But there is another reason for the favourable assessment of the first Roosevelt that deserves stress, for Professor Beale notes it but does not approve of it. In this iron age, an American politician who was a master of words but not a slave of them, who understood the primary importance of power, who, without despising moral issues or even moral platitudes, knew that domestic morality was not, in itself, an adequate guide for the conduct of foreign policy, is seen as a welcome change from political preachers, as a man who understood the necessities of his times better than a Presbyterian stickit minister like Wilson or—but no names no pack drill. This view gets neither adequate treatment nor adequate sympathy from Mr Beale. He acquits Roosevelt, rightly, of the charge of mere rashness; he talked and walked noisily, but unlike the ruler with whom contemporary opinion continually compared him, Wilhelm II, he was not really indiscreet or rash. And if Roosevelt's own claims have to be written down a bit, Mr Beale successfully asserts his right to be regarded as an important political force in the making of peace between Russia and Japan, in the Algeciras conference and even in destroying any delusions of omnipotence in Caribbean waters that the Germans may have held. Even the generally discredited "ultimatum" story is to some extent rehabilitated.

But Roosevelt did not believe in the genuine equality of states; some were more equal than others. He believed, if not consistently in racial superiority, in the combination of right and might. He would have held today that exploding an H-bomb was necessary for admission to the club of really sovereign states. He may have helped to make the world we live in so unpleasant, but he did not expect the world to be pleasant. On his positive achievements it is harder to make a positive judgment. His intervention in the Russo-Japanese war was attacked both for preventing Russia from having its necessary and beneficent revolution (Mark Twain's view) and for giving Japan delusions of grandeur (General Leonard Wood's view). His role at Algeciras was attacked as being too pro-French and as being, in any case, a departure from sound American policy. He bullied the decrepit Manchu rulers and yet was unsympathetic to the revolutionary movement personified in Sun Yat-sen.

This is the basis of Professor Beale's criticism; yet it could be argued that Roosevelt's hardboiled scepticism was just what the situation needed, that he would never have fallen for Madame Chiang or seen Kuomintang China as a serious great power. A world ruled by TRs is dangerous; so is a world ruled by people like President Eliot of Harvard or Andrew Carnegie. Anyway, it is easier to like TR than either of these critics. This is a timely book, even if it may convert some readers to views deplored by Mr Beale.

Question Unanswered

In the Court of Public Opinion

By Alger Hiss.
John Calder. 424 pages. 25s.

THIS is undoubtedly the least impassioned book that has been written on this fascinating but unsatisfactory case. It is likely to be a great disappointment to all those who have maintained their belief in Alger Hiss's innocence and have been waiting for the day when something would turn up to bring Whittaker Chambers and his whole story crashing to the ground.

But although at first Mr Hiss's professional detachment from his own story is intensely irritating, and the seventeen lines of "personal comment" that he allows himself at the end are intolerably prim, it is difficult to see, on reflection, how else he could have handled this effort to clear himself. In the absence of startling new evidence which would make it obvious to all that he had been wrongly convicted, the best he could do was to work his way through the mass of documents and transcripts, pointing out inconsistencies wherever they are to be found in the prosecution's case (which is uncomfortably often) and making the best he can of the disgraceful behaviour of the forces ranged against him. This method has, however, the disadvantage that Mr Hiss does not appear to be trying to demonstrate his innocence but only to prove that the evidence against him was not sufficient to justify a verdict of guilty. The only new evidence—the famous "forgery by typewriter"—is certainly ingenious, but the tests do not seem to the layman to have been taken far enough to justify the conclusions of his appeal counsel.

The best that this book can probably do for Mr Hiss is to increase to some extent the misgivings that those who followed the case closely, either in the court or in the press, felt about the verdict. These misgivings arose from the certainty that the social and political climate of the period—and the antics of the Committee on Un-American Activities—made a fair trial impossible. Things have been changing for the better, as recent Supreme Court decisions have proved, and it would be interesting to hear what the Vice President of the United States thinks today of Congressman Nixon's threat, after the first trial, to investigate the judge and the four jurors who voted for acquittal. But even today the doubts about this strange case remain. It is possible to pick many holes in the evidence of both Mr Whittaker Chambers and his wife and to be convinced that it did not justify the verdict, but one uncomfortable question remains. What was Alger Hiss doing in that galère anyway? Nothing in this book answers that question.

Uncommon Road from Nowhere

Emergence from Chaos

By Stuart Holroyd.
Gollancz. 222 pages. 18s.

THE blurb indicates that the publishers wish this book to be compared with their recent best-seller, "The Outsider," by the twenty-four-year-old Mr Colin Wilson. Mr Stuart Holroyd, they blandly announce, fascinated and surprised them by being only twenty-three. Perhaps it is salutary to remember, before we succumb in awe before these prodigies, that Gilbert Murray at twenty-three was appointed Professor of Greek at Glasgow. But maybe it is more awe-inspiring to tackle the chaos of contemporary culture than to win an early reputation as a fine scholar. In any case, Mr Holroyd's book does him credit. He has read more systematically than Mr Wilson; he has a better sense of construction; and he writes with greater lucidity.

Six poets have been chosen to exemplify different modes of reaction to the contemporary chaos. (Whitman, incidentally, seems a bit anachronistic). All of them, on Mr Holroyd's thesis, have found religious solutions to the problems of self-realisation and self-transcendence. But his definition of religion is a thoroughly pragmatic one. For him it is "anything a man can live by; and in being lived it finds its truth." Thus Dylan Thomas, Whitman, Yeats, Rimbaud, Rilke and Eliot are all presented as essentially religious men, for "a religious man is one who maintains his inner life at the highest possible pitch of intensity." Sinner and saint are merely obverse and reverse of the religious soul, and far closer to one another than they are to *l'homme moyen sensuel*.

But when all is said and read, we may wonder what precisely is the point of examining how these poets have resolved their personal predicaments. The book is not intended as an exercise in literary criticism so much as "a plea for the rediscovery of a religious standard of values." Now we may agree that such a rediscovery is most desirable and most urgent, without being convinced that poets are the best people to help an ordinary man to get his bearings. A poet may indeed be "the most sensitive register of contemporary sensibility." But a poet's solution has no universal validity; it is likely to be extremely personal and provisional. Only when a poet accepts a way out of chaos that other men have trodden can his findings be of very much relevance to the average thoughtful man. Indeed, Mr Holroyd has to admit that the solution found by Mr Eliot—a return to orthodox Christianity—is the soundest way to religious truth for "those of us who are not mystics."

In spite of occasional naïvetés, like the definition of heresy as "a nineteenth century movement which has been accelerated in the last fifty years," or the assertion that Rimbaud was "a being free from original sin . . . exempt from the common lot of mankind," this is a thoughtful book by an intelligent man, who seriously cares about spiritual values and reads his poets perceptively.

Canadian Staple

The Fur Trade in Canada: *An Introduction to Canadian Economic History. Revised Edition*

By Harold A. Innis.
University of Toronto Press. London: *Oxford University Press.* 474 pages. 68s.

THIS great book, first published in 1930, laid the foundations of Canadian economic history. In it the late Professor H. A. Innis developed those fundamental and fruitful concepts which a whole generation of economists and historians has used in analysing and interpreting the significant characteristics of the Canadian economy. His intensive study of Canada's first great continental export staple brought to light the key role common to all such staples, showing how both the entire economy and the political superstructure are geared to their demands.

The fur trade used a sophisticated European technology in combination with the indigenous technology of the Indians (canoe and paddle, snow shoe and sled) in exploiting the massive resources of the vast Canadian wilderness to satisfy the demands of European industrial centres. This meant correspondingly massive capital outlays and elaborate organisation. These in turn produced the rigid costs and unadaptable productive capacity leading to the centralised control and monopolistic tendencies characteristic of continental economies, in contrast to the flexibility and competition typical of maritime economies. Returns were unpredictable; they fluctuated violently, with the ups and downs of harvest and with human problems (such as Indian wars and smallpox epidemics); with the exhaustion of easily accessible resources and the spasmodic opening up of new resources; and with shifts in demand in the European markets. The decisive role of the Canadian Shield in Canada's development, and the competition of rival gateways to the continental interior (the Hudson River and Mohawk gap to the south and Hudson Bay to the north) with the St. Lawrence gateway, meant that "the present Dominion emerged, not in spite of geography, but because of it." The fur trade of the St. Lawrence reached clear across the continent, to the polar seas and to the Pacific. Its axis became the backbone of the Canadian nation. It endures in the transatlantic British connection. "The northern half of North America remained British because of the importance of fur as a staple product," which, like wheat, linked Canada across the ocean to European centres in contrast to the newer staples, such as pulp and paper, which forge links to the south with American centres within the continental system.

Professor Innis's untimely death prevented him from revising "The Fur Trade in Canada" himself for a new edition. Two colleagues have incorporated the marginal notes he made over a long period into footnotes and an appendix, which embodies additional material and notes of many stimulating generalisations and questions. To have the new material is useful. To have the book itself, so long out of print, once more available is invaluable.

SHORTER NOTICES

The Breakdown of Nations

By Leopold Kohr.
Routledge and Kegan Paul. 256 pages. 30s.

Professor Kohr, born a subject of the Habsburg Empire, now occupies a chair of Economics and Public Administration in the University of Puerto Rico. Perhaps there is here the germ of a biographical explanation for the simple and (to him) satisfying solution of all the world's problems, political, social and economic, which he propounds in this curiously maddening little book. Big states are bad and make wars; big business is bad and fails to make profits. Physics and biology show that big is bad and little is good. If we think we are better off than our forefathers in smaller societies—this too is an illusion; they had domestic servants, at least professors did. It all goes to show the possible impact of one good idea upon a jumble of miscellaneous learning when a complete absence of humour is added in. It is all like a long essay by one of those too-precocious sixth-formers any schoolmaster can recognise, complete with lovely maps to show what Europe would look like if turned into a federation of its (natural) small units and how the United States would be turned into a grim camp of contending *Grossmächte* if the regionalists got their way. Oh, happy Puerto Rico. . . .

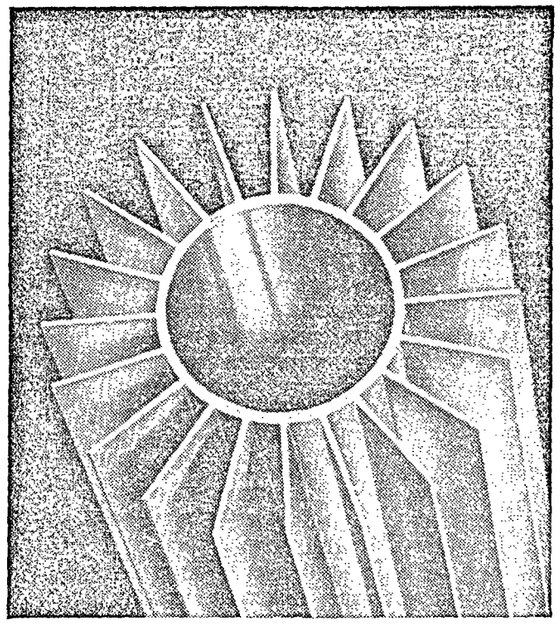
BOOKS RECEIVED

THE GREAT VILLAGE: *the economic and social welfare of Hanumabada, an Urban Community in Papua.*
By Cyril S. Belshaw. *Routledge and Kegan Paul.* 320 pages. 30s.

EXISTENTIALISM FROM DOSTOEVSKY TO SARTRE. Edited, selected and introduced by Walter Kaufmann. *Thames and Hudson.* 319 pages. 12s. 6d.

This is the latest publication in the Meridian books series.

THE COMMON LANDS OF HAMPSHIRE. By L. E. Tavener. *Hampshire County Council.* 130 pages and 3 maps. 21s.



THE GROWTH OF PUBLIC EMPLOYMENT IN GREAT BRITAIN. By Moses Abramovitz and Vera Eliasberg. *Princeton University Press.* London: *Oxford University Press.* 164 pages. 30s.

PROGRESS IN LAND REFORM. *Second report.* Prepared jointly by the Secretariats of the United Nations, the Food and Agriculture Organisation and the International Labour Organisation. London: *Her Majesty's Stationery Office.* 198 pages. 14s.

The book contains an analysis of replies by governments to a United Nations questionnaire.

A SHORT HISTORY OF INDIA. *Fourth edition.* By W. H. Moreland and Atul Chandra Chatterjee. *Longmans.* 606 pages. 30s.

Between you...

...and uranium

In the heart of nuclear reactors may be found TI products like this delicately-finned fuel element "can", with walls ten thousandths of an inch (·010") thick. Its principal purpose is to contain the dangerous fission products which result when the uranium fuel within it burns up: the fins facilitate the transfer of the great heat to the coolant surrounding the can.

Other TI nuclear components, some almost as thin as the page you are holding, are made in rare metals such as zirconium, niobium, vanadium, beryllium, tantalum. Until recent times these metals were available in little more than test-tube quantities. All presented new problems in working, but these were met by the skill and experience of TI's 45 engineering and allied companies, which already supply a wide range of reactor and heat exchanger components. One involves 100 miles of tubing. Another is a rolling mill for processing safely toxic materials.

Meanwhile, TI continues to serve many industries and the home—by the more conventional products of its seven Divisions:

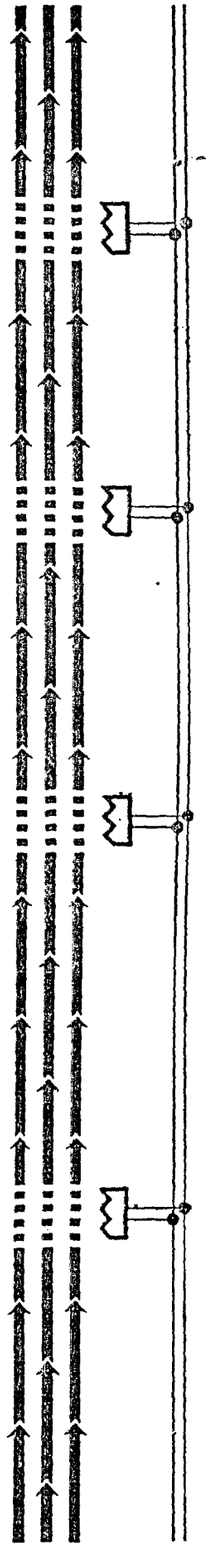
STEEL TUBE DIVISION · ENGINEERING DIVISION
ELECTRICAL DIVISION · ALUMINIUM DIVISION · CYCLE DIVISION
IRON AND STEEL DIVISION · GENERAL DIVISION

TUBE INVESTMENTS LIMITED
The Adelphi, London, W.C.2 · Trafalgar 5633

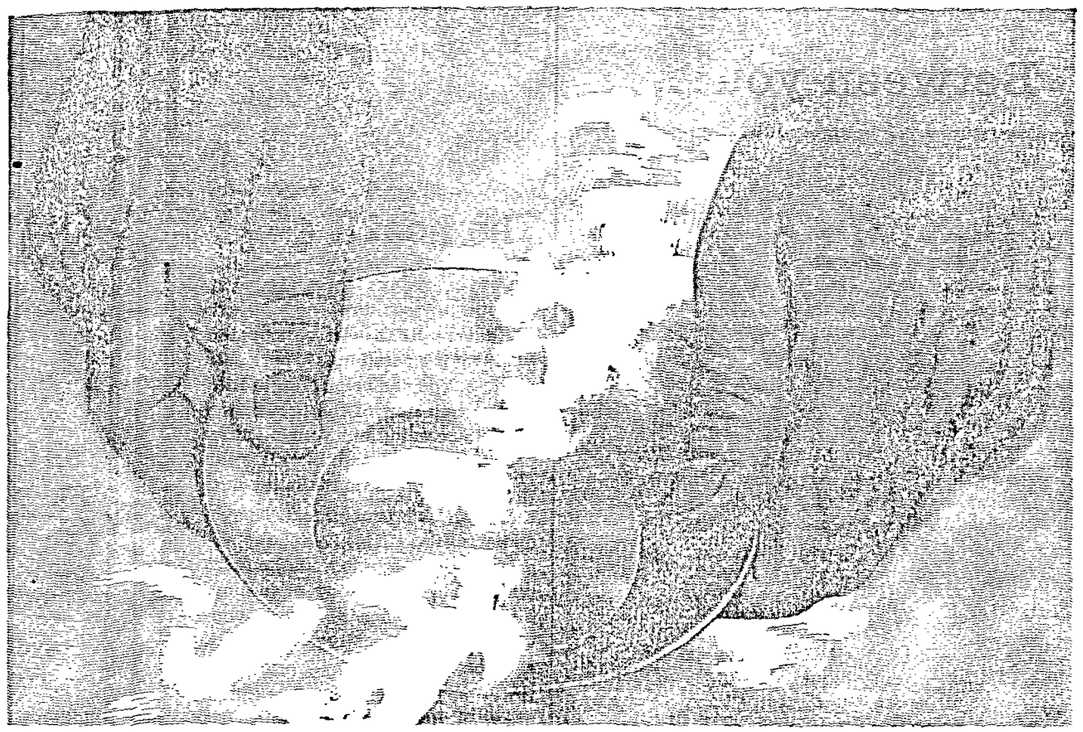
The heat joins the flow

Electric heat can be applied wherever it's possible to bring a pair of wires. You can bring it right into the smooth flow of the production line. You can lay out your plant as you think best and install your process heating to suit the lay-out.

Electro-heat is economical. There's no wastage at all. It gives the appropriate *kind* of heating, at the right temperature for as long, or as short a time, as you need. It can be controlled exactly, easily; better still, automatically.



It's quick, it's compact. The equipment is light, neat, simple. It's clean. It saves overheads in many directions. With electro-heat you get higher production, lower costs and better working conditions.



Electricity for Productivity

'Induction and Dielectric Heating', just published, is a very important addition to the E.D.A. series of books on Electricity and Productivity. Other titles available are Electric Motors and Controls, Higher Production, Lighting in Industry, Materials Handling, and Resistance Heating. Price 8/6, or 9/- post free.

If you would like further advice or information on how electricity can improve productivity, get in touch with your ELECTRICITY BOARD, or with E.D.A. They can lend you, without charge, films about the uses of electricity in industry.

Issued by the British Electrical Development Association 2 Savoy Hill, London, W.C.2

Mining the skies

Nitrogen from the air has become a key to a plentiful supply of stainless steel

BEAUTIFUL, enduring stainless steel owes its rust-free life to the alloying metal called chromium. Other alloying metals . . . manganese and nickel . . . are vital for added strength and endurance.

EVER-INCREASING DEMANDS for nickel have threatened the supply of stainless steel. But the people of Union Carbide have provided an answer. Nitrogen from the air—combined with chromium or manganese through metallurgy and added to the molten steel—helps nickel go twice as far . . . making it possible, with the same amount of nickel, to greatly expand the chromium-nickel stainless steel output.

THIS IS ONLY ONE in a long line of contributions from Union Carbide's metallurgists during a half century of alloy making. Fifty years ago there were only a few types of steel. Today, through the use of such alloys as chromium and manganese, there are tailor-made steels to meet every need.

THE FUTURE PROMISES even greater developments. The people of Union Carbide are constantly at work on new and improved alloys to make better metal products for all of us.

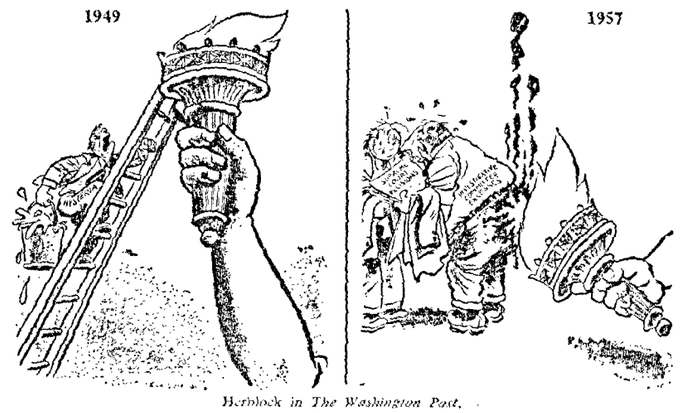
AMERICAN SURVEY



AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Court for Freedom

WASHINGTON, DC

THE United States Supreme Court does not relish the political limelight. Unlike congressional committees, which schedule their most colourful hearings with an eye on the deadlines of the *morning* and afternoon press, the court, with bland disregard for the machinery of modern newsgathering, still announces its decisions orally, from the bench, beginning at noon, an hour originally selected to permit lawyers to make their way to the courthouse on horseback. Mondays are decision days and the term runs from October usually until well into June. Towards the end of May, the delivery of opinions (read aloud or summarised, often with evident pride of authorship, but always from a prepared text) may last through most of the four hours that the court sits—punctuated only by an awkward half-hour recess for lunch at two o'clock. The most difficult decisions are frequently left for the last two or three weeks, since they require the greatest effort to secure agreement among at least a majority of the justices on the precise shape and content of the opinion—a process referred to irreverently by the Justices' law clerks as "*getting a court.*"

LIBERTY'S TORCH

Herblock in The Washington Post.

In the last few weeks, half a dozen decisions, sandwiched in among the routine cases on technical points of lawyers' law, have brought the court into the unwelcome limelight for the third time in the last generation. In the mid-thirties the court sought to veto the social legislation of the New Deal but only succeeded in checking it briefly, and came under threat of losing its independence in the process. More recently, the court has tried to speed up the process of racial integration in the South. Southern resentment was sharp and bitter, but the peak of that attack on the court, which was never more than regional in scope, has apparently passed. The current series of decisions, unrelated to each other except in their political effect, puts significant limitations on authoritarian trends in American government, which some have deplored as disturbing long-established traditions of individual freedom, and others have approved as essential to overcome what they regard as the serious dangers of ideological subversion.

That the court should play a part in the drama of American politics important enough to earn critical notices, both good and bad, is inevitable, despite its efforts to avoid the centre of the stage. Ever since Chief Justice John Marshall established the court as the oracle of constitutionality, in the early days of the Republic, it has possessed the power to affect the course of political decisions. This power cannot long go unexercised, although the court is genuinely reluctant to exercise it, realising that, unlike the legislative or the executive branch, it has neither the power of the purse nor of the sword nor a constituency to which it can turn for support. Any assertion of authority is likely to be met with more hisses than cheers.

As Mr Arthur Krock, the conservative commentator of the *New York Times*, points out, several of these recent cases state broad principles of law, which will have to be qualified as later decisions prick out the line of their practical application. In the Watkins case, perhaps the decision which has received the most publicity this term, the court called a halt to the roving inquisitorial activities of the notorious House Committee on Un-American Activities by deciding that each congressional committee must specify in advance, to a reasonable extent, the scope of each investigation that it undertakes, so that witnesses can decide whether questions put to them are pertinent to that inquiry, and so that the courts can, if necessary, review the propriety of a witness's refusal to answer. But decisions on later cases will have to spell out how specific an investigating committee must be.

Similarly, in the Jencks case, the court held that the now-famous reports of the Federal Bureau of Investigation are not exempt from the general rule in criminal cases that the defence may inspect previous written reports of information obtained from a witness for the prosecution, in order to look for possible inconsistencies with the testimony of the witness at the trial. If the trial judge agrees that these prior statements are in fact pertinent and inconsistent, they may be

introduced in evidence. But it will take a good many more cases to decide just how much of the FBI files must be made available and under what circumstances.

In a quite different area of the law, the court's decision to separate the twin industrial empires of the du Pont Chemical Company and the General Motors Corporation, it remains to be seen how the principles of the decision will be applied to smaller firms, in situations where the facts concerning size and marketing relationships are less clear-cut. Lastly, when the court overturns a statute, as it did in holding that dependents of military personnel accompanying them overseas cannot be tried by courts martial, at least in capital cases, it may leave a vacuum that only Congress can fill. The intervening confusion is troublesome, but inevitable in the tri-partite governmental process. By contrast, the court's decision in the Californian Communist cases represents an almost inevitable, limited retreat from the broad extension of congressional power in the Dennis case, in which the Smith Act was first held constitutional.

A PART of the responsibility for the court's bad press falls on the nine Justices themselves, not so much for what they have decided, as for the way they have expressed their decisions. It is more myth than reality that the law advances by imperceptible steps, never looking beyond the case in hand. Even the ancient common law developed unevenly by occasional bold moves, followed by cautious consolidation, and the court's role in shaping high policy, as well as its considerable freedom to decide which cases to accept for consideration and which to reject without deciding the merits, make its course even more irregular. The art of opinion writing has grown up, in part, to rationalise this development, and to minimise the swings. Unfortunately, the spokesmen for the present majority, and Mr Justice Brennan in particular, have not shown themselves masters of this art. Nor has their cause been helped by Mr Justice Clark, now the persistent dissenter. Justice Clark is generally regarded as the weakest member of the court, but his intemperate dissenting opinions have provided ammunition for even more intemperate critics.

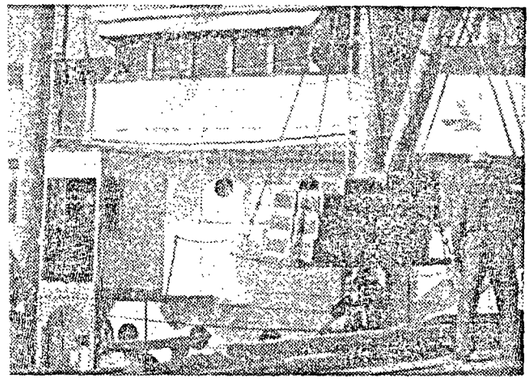
In the school desegregation cases the court was extraordinarily fortunate in reaching unanimity; in the court crisis of the nineteen-thirties, five-to-four divisions were almost the rule, and a shift of one vote could change the course of decision. The present majority on issues of individual rights and liberties is more solid by at least one vote, although the six Justices who tend to agree on the stand they should take cannot always see eye to eye on the reasoning by which that stand should be reached. Their internal differences are not surprising, since they are an oddly assorted lot: three Roosevelt-appointed Democrats, Justices Black, Douglas and Frankfurter, and three Eisenhower Republicans, Chief Justice Warren, and Justices Harlan and Brennan. What is encouraging is that six men drawn from both political parties, from the four corners of the United States, from grassroots politics, corporate law, and the academic world, have been able to reach substantial agreement on one of today's major political issues.

It is encouraging also because in the past the court's willingness to take a stand on these issues has generally marked the end of a period of hysteria over real and imagined threats to the national security. The court has not been prepared to lead the way back to saner attitudes, but it has been quick to perceive the first signs of a reversal of popular sentiment.

Mr Kishi Gets Results

THE communiqué issued after the Japanese prime minister's three-day visit to Washington contained one unexpectedly concrete announcement: that, as a result of Japan's growing military strength, the United States felt able to reduce its forces in Japan substantially during the next year, beginning with a prompt withdrawal of all ground combat troops (about 30,000 men). The decision fits the general trend of American defence planning, although no other similar withdrawals have as yet been fixed, and was apparently made some time ago; but it was not published until last week to give Mr Kishi something definite and pleasant to take home from his visit. Coupled with the establishment of a special intergovernmental committee to study the treaty, so irksome to the Japanese, which governs the position of American forces in Japan, this should reduce the heat generated by the argument over which country is to try Specialist Girard, the American serviceman who accidentally killed a Japanese woman. In any case, at the moment this is a more burning question in Washington than in Tokyo; the Supreme Court has postponed its summer recess in order to review the ruling of a lower court that this soldier is accountable only to the American authorities.

Mr Kishi did not achieve any satisfaction of his strong desire for a return of control over the Ryukyu and Bonin Islands, although Japan's "residual sovereignty" there was reaffirmed: On the other hand, the United States recognised even if reluctantly, Japan's determination to follow the example of Britain and liberalise controls on trade with Communist China. On the matter of American restrictions against imports of Japanese goods, the President could offer little except sympathy, but the present state of the disarmament talks enabled him to be more encouraging about the Japanese demand for an ending of nuclear tests.



Mr Kishi's proposals for economic development in other Asian countries are only being studied, but he seems to have been promised substantial help for his own economy, although this was not mentioned in the communiqué; altogether, it is said that he hopes to get credits amounting to about $500 million from various sources, mainly for the purchase of cotton and other farm surpluses. But the chief achievement of his visit, underlined by his golf match with the President and his visit to a baseball game in New York, was that Japan was welcomed as an independent ally, and Mr Kishi as a valuable friend, of the United States.

Tight Money's Worth

INTEREST rates last week obligingly rose to the highest levels in a generation as Senator Byrd and other Democrats on the Finance Committee opened their arraignment of the Administration's monetary and fiscal policies. The Treasury bill rate reached 3.4 per cent, the largest yield since the banking holiday of 1933; the prices of government bonds fell to new lows; and even corporations with impeccable credit ratings found lenders able to demand not only the highest interest rates in over twenty years, but concessions on prices and refunding arrangements as well. This week the Treasury offered $3 billion worth of 9-month tax-anticipation certificates for new money to tide it over July, when revenues are always low, and it has nearly $50 billion

IMPORTANT BANKING DVANTAGES

The long experience of The Hanover Bank offers important advantages to firms that engage in trade with the United States and other countries throughout the world.

New

West End branch

The First National City Bank of New York announces the opening of its new West End branch at 17 Bruton Street, Berkeley Square, London, W.1

The First National City Bank of New York is proud of its long service to American undertakings in this country. It is proud, too, of the part it has been able to play in assisting British business both in the export drive and in enterprises overseas.

The new branch will augment this service in an important business area. We look forward with pleasure to greeting old friends and clients in our new offices and to welcoming many new ones.

MORE POWER AT LOWER COST

*The **Eland** is a Turbo-prop aero engine type tested at 3,000 e.h.p., with even greater power being developed. It combines low weight, low fuel consumption and ease of maintenance. Napier have installed **Elands** in a Convair 340 airliner and the conversion has shown a handsome all-round efficiency increase. Similar conversions of other operational piston-engined airliners are being investigated. **Elands** will also power the Fairey Rotodyne 40-seater helicopter.*

*The **Eland** is an engine of great importance in world aviation and a fine example of the Napier principle: more power at lower cost.*

CRC 176

of refunding to do in the coming year. Unless private borrowing is choked off, money is likely to become tighter than ever and demands in the Federal Reserve System for a rise in the 3 per cent discount rate will become more insistent.

Nevertheless, the inquest which the Democrats had hoped to perform on the stewardship of Mr Humphrey, the retiring Secretary of the Treasury, has been impeded by the corpse's enthusiasm for fighting back. As the first witness

Mr Humphrey came armed with 50 pages of argument that high interest rates were due to the excessive demand for credit born of prosperity and that tight money's function of curbing that demand was worth every penny it cost in terms of higher interest on the government debt and private borrowing—if it kept prices stable as it has until the last year or so. Mr Humphrey had to make certain admissions, but he was an effective witness, the more so since his questioners are trying to prove such different themes : Senator Byrd that government spending should be cut, for example ; Senator Gore that private borrowing should be allowed to rise ; and still others that a free interest rate is an unsocial way of allocating available resources.

The vigour with which the Democrats have made off with the monetary inquiry which Mr Eisenhower proposed last January is due, indeed, to the fact that it is almost the only issue on which the progressives and the conservatives of the party can criticise the Administration without coming to blows among themselves. But with so many different axes to grind, the committee is not likely to compare even remotely with the Aldrich Commission of 1908 which is the model upon which both the President and Senator Byrd hoped the inquiry would be patterned. It may, however, last for months, or even years, if it seems to be paying political dividends.

More—but Fairer—Security?

WASHINGTON, DC

THE report of the commission on government security established by Congress, which has occupied the twelve commissioners and a professional staff of more than fifty for eighteen months, runs to 807 pages and cost three-quarters of a million dollars. Its style is ponderous, its analysis shallow and its most fundamental premises are taken for granted. Yet the wonder is that so many practical suggestions for improving the security system should have been made by little-known men appointed by politicians at a time when the political atmosphere was unfavourable. It is an encouraging demonstration of the democratic process at work, and is approved by the Civil Liberties Union.

The core of the report is the assumption that the screening of all government employees should continue indefinitely, and indeed should be applied more strictly and more widely. The commission proposes the establishment of a Central Security Office, with a corps of examiners and other apparatus for the application of Parkinson's Law to the security business. But it would provide several important new safeguards for the individual. Applicants for government jobs would be given an opportunity to hear and answer any security charges against them, instead of being told that the "opening is no longer available." A suspended employee's pay would be continued, so that he could afford to fight baseless charges. Hearing boards would be given the power to subpoena witnesses and informers would have to appear unless they were professionals in the pay of intelligence agencies. The report also recommends a return to the old system of treating loyalty and security—or suitability—cases separately ; this may draw attention to those accused of disloyalty, but it lifts an unjust stigma from the majority who may be guilty of nothing more than a wagging tongue. The industrial security programme, which deals with employees of private firms engaged on secret government contracts, would be confined to a smaller number of workers.

Two recommendations have, rightly, caused alarm. One would provide criminal penalties for the knowing disclosure of secret information, subjecting newspaper reporters, for the first time, to jail sentences for taking advantage of government leaks. The other, which Congress is unlikely to accept, would make evidence of subversion obtained from wire-tapping admissible in a court of law, provided that the Attorney-General had authorised it. The report also endorses the present passport controls for American citizens and the controls over alien visitors laid down in the McCarran-Walter Act, which is not surprising, since Mr Walter was one of the members of the commission. In general, however, the authors of the report have shown considerable ingenuity in settling their differences and their work holds out hopes of a fairer security system. But it offers very little encouragement to those who fear that the incubus of security investigation is here to stay.

Hell's Canyon Breaks Loose

AFTER three fruitless efforts to reverse the Administration's decision to let a private firm, the Idaho Power Company, build a series of small dams at Hell's Canyon in the northwest, the tide turned last week on this symbolic battlefield. The advocates of a single high federal dam for the country's greatest remaining source of water power won the approval of the Senate by 45 votes to 38. Last year the vote was 51 to 41 the other way. Since then voters in the northwest have spoken out against private development. But the Senate probably listened harder to Mr Kefauver's investigation of the tax privileges granted by the Administration to Idaho Power.

One of the arguments for private development is that it costs the taxpayer nothing. But Mr Gordon Gray, the defence mobiliser, sold this pass when he decided that Idaho

Power, like many other electricity firms before it, should be allowed, under the law adopted during the Korean war to stimulate industrial expansion, to deduct much of the cost of its Brownlee and Oxbow dams from its taxable income during the next five years. The normal practice with a dam is to spread such depreciation over fifty years. The firm stood to save $30 million at once, although in later years its taxes would be higher. But the interest on the postponed revenues makes the total cost to the government $83.5 million. Moreover the emergency for which rapid depreciation was designed is long over. For this and other reasons Mr Seaton, the Secretary of the Interior, advised Mr Gray not to give such tax privileges to Idaho Power. Mr Gray not only disregarded Mr Seaton's advice; he also tried to conceal it until the Administration decided to make a clean breast of the affair. Just before the Senate vote, the company also had a change of heart and renounced its embarrassing tax relief. But by then the appearance of favouritism to a controversial firm had already damaged the Administration's position.

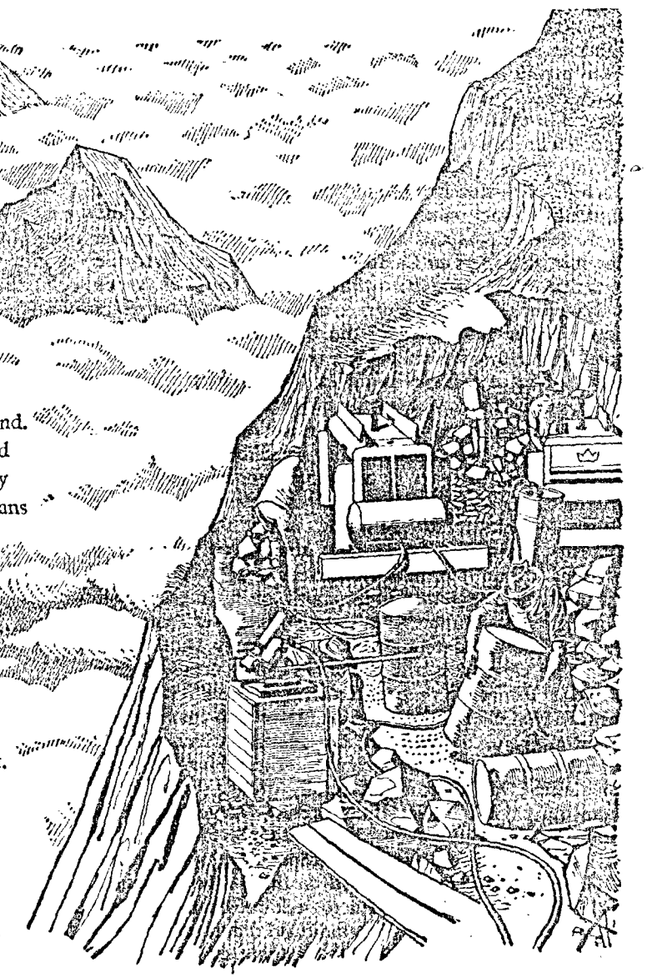
Hell's Canyon would still be firmly in private hands, however, if five Southerners had not switched their votes, and this story is just as embarrassing to progressives. Senator Morse indignantly denies that there was any deal "to sell Negro rights down the river," but he was one of six liberal Democrats who voted with the South, fruitlessly as it turned out, to send the House civil rights Bill to the Senate Judiciary Committee, its traditional burying ground. Partly because of this dubious manoeuvre, Hell's Canyon represents a political, rather than a true, victory. Moreover, it is doubtful whether the House will follow the Senate's example and virtually certain that neither could rally a two-thirds majority to over-ride a presidential veto. But Hell's Canyon will be kept on the boil for next year's congressional elections—which is what the Democrats want.

Frustrated Martyr

As more and more of America's new missiles reach the testing stage, there are naturally also more and more reports of failures, although there have been enough successes to keep the experts from feeling depressed, even about the most recent and spectacular of the failures, the explosion of the Atlas intercontinental missile. But none has fizzled out more completely than the court martial with which the Army was expected to shoot down the decision of the Secretary of Defence last November that the development of missiles with a range of over 200 miles should be reserved to the Air Force. By distributing to journalists and businessmen a secret memorandum protesting against this decision, Colonel John Nickerson, one of the Army's leading experts on missiles, deliberately exposed himself to arrest, in the belief that his gesture of patriotic desperation would be backed by his superiors in the Army.

He was only one of many soldiers who were seething with indignation at a decision that left the Air Force to choose which of the two most promising intermediate range (1,500 miles) ballistic missiles should be put into large-scale production; the Air Force's own Thor or the Army's Jupiter, which from trials, both at that time and since, seems to be at a more satisfactory stage of development. In these circumstances, Colonel Nickerson believes, the Air Force's preference for the Thor will mean the demoralisation and dispersal of the brilliant team of scientists which the Army has built up at its Redstone arsenal. Moreover he contends that the Army, since it suffers the greatest casualties in any war, is entitled to a weapon which can destroy the enemy at long-range and that technically and tactically the IRBM resembles artillery more than it does aircraft.

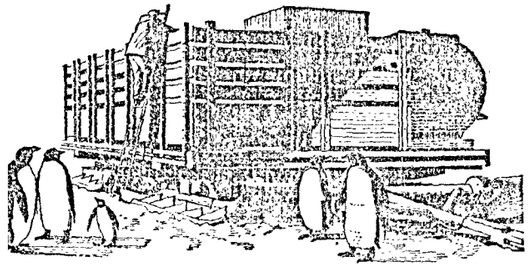
But when the court martial opened this week the hope that this inter-service controversy would be argued out in public—or as nearly in public as the secrecy necessarily surrounding it would allow—was frustrated. Colonel Nickerson's superiors felt that the Army had its chance of making its case before the Secretary of Defence announced his decision and that now loyalty to the country came before loyalty to the service. They apparently refused to allow evidence in support of the Colonel's arguments to be presented; the government withdrew its charge of espionage and Colonel Nickerson, disappointed of his martyrdom, then pleaded guilty to disobeying orders. The evidence being heard this week concerns only circumstances that might mitigate the seriousness of his offence. Liable to a maximum sentence of thirty years in prison and a dishonourable discharge, the Colonel expects no more than a reprimand; he can, however, hardly hope to reach high military office in the future. But it still seems possible that, if the Thor continues to disappoint, Congress may provide the public airing of the dispute which the court martial has failed to do.



Committee Takes its Cue

FROM A CORRESPONDENT IN SAN FRANCISCO

LAST week the Un-American Activities Committee of the House of Representatives, whose public hearings in various parts of the country have often been derided as a "travelling circus," played an engagement in San Francisco so inferior to its previous devastating performances as to suggest that the committee, even if it does not fold its tent entirely, may in the future appear as a more orthodox body of Congress. This possibility is suggested, not by the Supreme Court's sharp judgment on the committee on the eve of the San Francisco hearings, but by its own abrupt alteration of its show in response to the criticism. While the committee is as contemptuous as ever of any opposition, in San Francisco it acted in such a restrained way that it was seriously hampered in attaining what in the past has been the chief objective of its public hearings: the mobilisation of popular opinion against the "communist menace" by means of sensational disclosures and spectacular production, and the enhancement of the personal reputations of its members.



The committee reduced its proceedings almost to a judicial process; as a result it was able to question only about half of the witnesses it had summoned and heard them with such courtesy that little time was left for the usual

Mining above the clouds

In the high mountains of Bolivia tin has been mined for centuries. Mined laboriously, by hand. But today many of the 2,454 small privately-owned mines in the highlands have been re-equipped by the Government. This ambitious new project means using modern pneumatic equipment designed to operate at great altitudes. For the local miners, unaccustomed to mechanisation, and working miles from repair depots, it was essential to choose machines that were both reliable and foolproof. Atlas Copco provided the complete answer. Many of the 200 portable compressors supplied for this purpose are working at altitudes of over 16,000 ft. Complete air-cooling enables these machines to supply a steady flow of compressed air to the Atlas Copco rock drills and Sandvik Coromant drill steels engaged in the drilling operations. This increased efficiency has tremendous importance, both for the 30,000 miners employed and for the Bolivian economy.

'Operation Deepfreeze'

Compressed air is versatile. Atlas Copco provide the means for all its many applications. For example, the giant steel sleds used by the U.S. Navy in their expedition to the Antarctic—known as 'Operation Deepfreeze'—were built by the Canadian firm of Otaco Limited with the help of Atlas Copco pneumatic equipment.

The Atlas Copco Group of Companies is responsible for the manufacture of compressed air equipment and its distribution in 90 countries throughout the world. Group Headquarters: Atlas Copco AB., Stockholm 1, Sweden.

Atlas Copco puts compressed air to work for the world

revelations from the committee's counsel and its favourable witnesses. When the Californian hearings were planned, it was expected—correctly, as it turned out—that the committee would attack the august State Bar Association, which had condemned the committee's treatment of lawyers representing witnesses before its previous sessions. But when the hearings actually began, the committee had been put so much on the defensive that its opening censure of the Bar Association went almost unnoticed. Not only did the Supreme Court on that day reverse the conviction of the Communist leaders in California, but it also criticised the committee itself in another opinion written by Chief Justice Earl Warren, who was Governor of California for ten years before he was appointed to the court and was then the state's most powerful and popular political figure. No more respected voice than his could have condemned the committee on the front pages of the San Francisco newspapers.

Representative Walter, the chairman of the committee, dismissed the decisions merely as evidence that Congress would have to re-assert its authority to control subversive activities by passing legislation which "even the Supreme Court can understand." Nevertheless, it was soon apparent that the committee would now attempt to conduct its hearings within the new restrictions set by the court. Further, the committee spent much of its time in San Francisco on elaborate justifications of its existence, its purpose and its questions. The unfriendly witnesses in their turn, allowed to hold whispered conferences with their lawyers, demanded explanations of the relevance and legitimacy of all questions and then refused to answer them. They all invoked the Fifth Amendment, which protects witnesses against self-incrimination, except for one radio announcer; his statement, carefully drafted by a lawyer from the Civil Liberties Union, rested exclusively on the First Amendment, safeguarding freedom of speech, and invited an immediate test of the scope of the new Supreme Court decision which was based on this. The committee, which in the past has tended to seek prosecution of only the most vulnerable witnesses, indicated that it might accept the challenge by citing him for contempt of Congress.

THE most immediate effect of the committee's new concern for judicial correctness was the dullness of its proceedings, which therefore failed to attract the public attention they have received in the past. They dominated the news columns only briefly and inadvertently, as the result of the suicide of a prospective witness two days before his scheduled appearance. This did not produce any great expression of public indignation, or any remorse from the committee, which merely said it regretted the loss of an especially promising witness. But it was undoubtedly responsible for some of the committee's eagerness to avoid any appearance of persecuting the witnesses who did appear before it. The press in its turn was cautious about pursuing unco-operative witnesses beyond the committee's hearing rooms, and the only reported case of loss of employment concerned the radio announcer who undertook the test of the new court decision and was suspended, without loss of salary, until a further study of his position could be made.

There is still, of course, wide disapproval of the committee. Even so mild a performance cannot erase its past excesses and does not excuse what seems to many to be basically an ill-advised and even illegal activity of Congress. However, such criticism, even when buttressed by the Supreme Court, will not carry as much weight as the fact that, by its own standards, the committee's San Francisco hearings were a disappointment. The only effective restraint on such activities must come, as it has in the past, from Congress itself. This possibility, too, was enhanced by the San Francisco hearings, which the committee allowed to be televised in open defiance of the powerful Speaker of the House of Representatives, Mr Rayburn.

It's All Taped

FROM A SPECIAL CORRESPONDENT

FOR three days last month the trains streaking along the 406 mile stretch of the Seaboard Air Line Railroad's line between Jacksonville and Miami, Florida, were dispatched and controlled without any human supervision. An ordinary tape recording machine ran the railway—trains, switches, signals and all—safely, smoothly, efficiently and on time, while a three-ton control board and its operator were being moved to a new site. But this is nothing unusual for the tape recorder, which, in addition to its original and obvious uses in the recording and reproduction of music and speech, is also a device for storing up information. It thus becomes a machine which runs other machines and is therefore playing a major part in the development of automation, which is transforming industry in the United States.

The variations on this electronic device are infinite. The machines now range from those priced to suit the pocket of the average man, which exist primarily for the recording and reproduction of music and conversation, to $100,000 units designed to record dozens of pieces of different information beamed from the guided missiles and rockets which they are either tracking or directing through space. The principles employed in all these machines, from the smallest and simplest through the largest and most intricate, are the same. Sound waves are picked up by one or more magnetic recording heads through a microphone or some similar device and are then transferred, as magnetic impulses, to a moving strip of plastic tape coated with iron oxide. The tape varies in width, breadth, quality and the speed at which it moves according to the use it serves. To reproduce these impulses in exactly the form in which they were recorded, the tape is run back through the machine using a magnetic reproducing head. The sound is transmitted through electronic amplifiers and speakers.

THE scientific and industrial applications of the tape recorder still take second place to its uses in the home. But leaders of the industry feel that, within a few years, these positions will be reversed. Already radio and television stations, gramophone companies, and film studios have found tape recorders indispensable because of the absolute fidelity they provide in recording and reproduction. In factories where automation has gained a foothold tape recorders direct the machines according to instructions magnetically impressed on the tape. Those monster electronic brains such as Univac could not operate without the tape recorder. The "memories" of these computers are stored on tape; the problems they have to solve are fed into them on tape; and the answers come out through a tape recorder. In such highly secret fields as rocket and nuclear research the tape recorder and magnetic tape are essential tools in the gathering and classification of data.

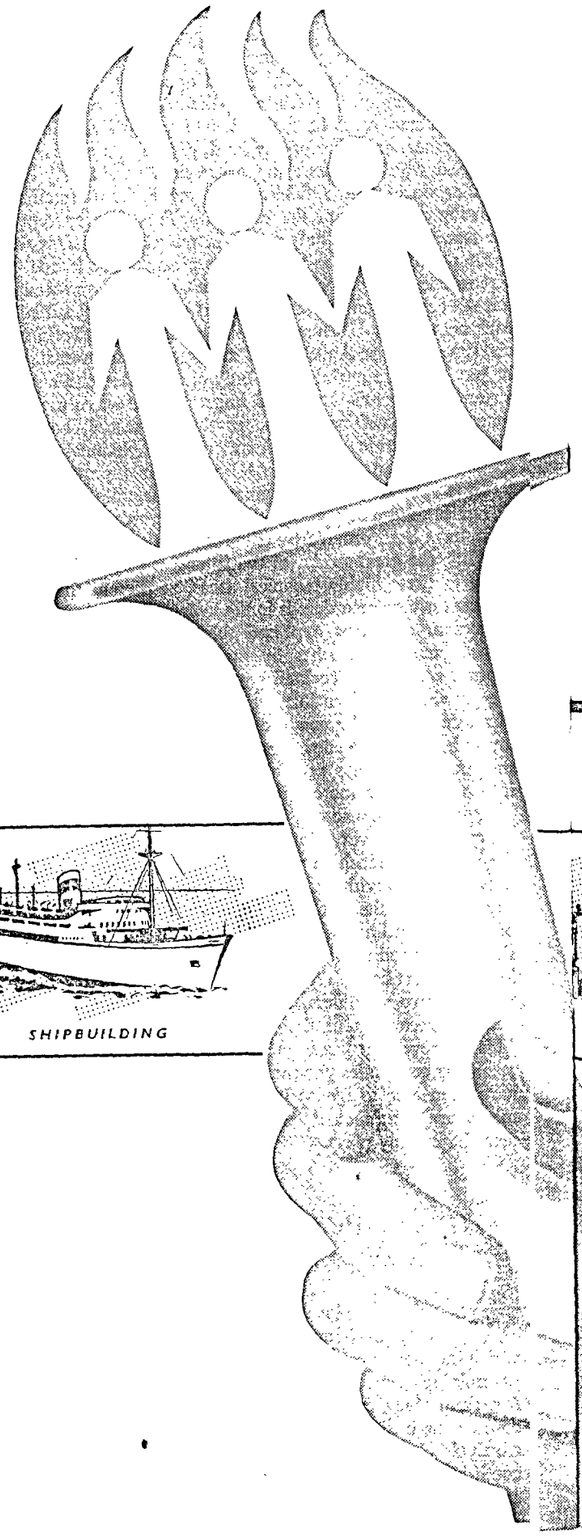
A year ago another fruitful field opened up. At a television convention in Chicago the Ampex Corporation showed a new machine which would record live television programmes, or action of any kind, directly on to magnetic tape and which, without any processing, would play them back at once with a fidelity that made them practically indistinguishable from the original. This development of the tape recorder not only means better television films than those produced by the kinescoping process then in use. It also means that network programmes can be shown throughout the country on the same night at the time best suited to each community. When it is nine p.m. in New York, it is six o'clock in Los Angeles, and at present a programme can be put on at the peak hour in only one of these cities. The assembled executives were so impressed with this machine that, without waiting for the production model, both the Columbia Broadcasting System and the National Broadcasting Company immediately bought three prototypes at $75,000 apiece. Now Ampex has begun commercial deliveries; more than 200 of these tape recorders, at $45,000 each, have been ordered by television stations.

While the great strides of the future will undoubtedly be made in these highly technical areas, at present the major market for tape recorders is in the average home. For some time after they first appeared they were used mainly to record amateur speeches by members of a family or to capture snatches of cocktail party conversation. However, the growing American interest in high-fidelity reproduction of music has found a new use for the tape recorder. Music lovers have discovered that not only does tape eliminate the surface noise always present on gramophone records, but it also provides a more faithful reproduction of the sound.

At first little music was available. Most of the big record companies were very slow to offer pre-recorded tapes and the owner of a machine was forced either to record his own music or to go without. But this is no longer so since the appearance in the last twelve months of stereophonic and binaural recording, which gives the music a three-dimensional effect and the listener the impression that he is sitting in the concert hall. This is accomplished by the use of two speakers, two amplifiers, two reproducing magnetic heads, and the recording of the sound on two adjacent tracks. This improvement has been so popular that neither the big recording companies nor the manufacturers of the machines have been able to ignore it. In many other fields experiments are continuously enlarging the role that the tape recorder already plays.

War Games for Business Men

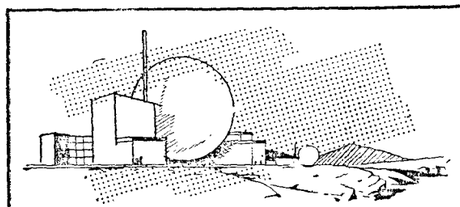
FROM A CORRESPONDENT WHO PLAYS THEM



WHEN chess was invented in the ancient East, it followed the pattern of contemporary warfare and today games which imitate the conditions of modern warfare are a feature of training courses at military staff colleges. Now the American Management Association, which conducts training courses for business men, has designed an ingenious game which simulates an economic war under competitive business conditions. It is based on the classical theories of economics and takes the form of "a mathematical model of business, a group of cause-and-effect formulae which determine the results of each move made by the players."

When a trial game was organised last week by the AMA, each of the five teams, made up of three business men, all leading officers of large corporations, was handed a large folio sheet which contained a statement of the assets of the company to be taken over and certain information about its competitors. Each of the five imaginary companies was presumed to be manufacturing the same product, to be in the same financial position to begin with and with the same choices available. The object was to see which team could make the greatest improvement in its standing over a fixed period. In the preliminary briefing it was explained that good business practices would be rewarded and that additional information about the firm's rivals could be obtained at a price. Whether to buy this was one of the nine decisions which each team was required to make during each period—initially twenty minutes—which represented a quarter of a financial year. Other decisions, to be selected from various alternatives offered, had to be made about levels of output during the quarter, expenditures on marketing and research, the price of the imaginary product and whether to buy new machinery or sell surplus plant to raise extra cash.

THE teams were completely isolated from one another, meeting only briefly at meal times during the course of play, which continued for two days. "Blue Team," consisting of the general manager of the Bendix Aviation Company, the manufacturing vice-president of the Gillette Safety Razor Company, and a vice-president of Distributors Group, a large Wall Street investment firm, tried to enlarge their share of the market by sharply cutting costs and prices, a strategy which quickly collapsed in the face of the increased advertising budgets of the other teams. "Blue Team" quite suddenly found itself operating in the red, but a change of tactics enabled it to raise prices without affecting demand. The team was under the constant scrutiny of a psychologist from the staff of the Imperial Oil Company of Canada, who carefully noted each move. As the speed of play was steadily increased, quarterly decisions were made in ten minutes or less, and scored almost instantaneously by an electronic brain. An hour of rapid play is thus the equivalent of a year of business experience. After two days of effort, the teams had undergone ten years of intense competition and gained valuable perspective on the mechanics of making decisions.



While the AMA stresses long-range planning in its training courses, the game tends to focus thinking on short-term factors. Nor do certain lines of action have the same consequences as they would in the outside world; the effect of price-cutting, for example, is artificially limited by the programming of the game on the electronic computer. The scoring seems always to favour conformity, rather than the sudden dramatic moves which often succeed in real life, and many decisive elements in the business environment, such as labour relations, have been eliminated altogether. Behind the development of this device is the naïve concept, punched into the magnetic "memory" of the computer, that economic factors, including human relations, are subject to skilful manipulation by business men, with results which can be accurately forecast and measured. But the project has value as part of the AMA's training, where it can be used to illustrate principles taught in the courses, and to emphasise the value of judgment in selecting business data.

THE CAPE ASBESTOS ORGANISATION
is a group of companies whose activities combine to provide certain co-ordinated services to industry.
The principal services are:—
The mining and world-wide distribution of raw asbestos from our own South African mines, principally Cape Blue Asbestos and Amosite Asbestos.
The manufacture, and distribution through an international sales organisation, of a complete range of those products in which asbestos is the basic raw material, and whose production depends upon asbestos technology.
The provision to the Thermal Insulation Industry, and to users of thermal insulation, of a comprehensive range of materials for hot and cold and acoustic insulation and for fire protection. In this function every advantage is taken of the special suitability of our own South African asbestos, but this is complemented by other basic materials produced or processed within the Group, such as Kieselguhr and Vermiculite. Recently yet another thermal insulation discovery has been made. In Scotland Cape Asbestos started quarrying a natural rock which forms the basis of a mineral wool now being specified, in one of its many forms, as heat insulation in several new installations, among them the fast-breeder reactor at Dounreay nuclear power station.

Some products

CAPOSITE—in the form of moulded blocks and pipe sections of Amosite asbestos: for thermal insulation.

MARINITE—non-combustible sheet, made from Amosite asbestos: for the construction of A & B bulkheads in ships, and industrial ovens, driers, etc.

ASBESTOLUX—non-combustible asbestos insulation board, made from Amosite asbestos: for structural insulation combined with maximum fire protection.

ROCKSIL—rock wool, processed from natural Scottish rock and available in a variety of different forms: for heat and acoustic insulation and refrigeration.

For over 60 years The Cape Asbestos Company Limited has been extending its activities and furthering the influence and use of asbestos products in the interests of efficiency, economy, and safety—a progressive enterprise with a sound history and a great future.
In many branches of industry as well as transportation, science, and the home, Cape Asbestos products are taken for granted. But their unquestioned excellence has been attained only by constant research and development, painstaking care and application, fierce enthusiasm and energy.
The standards set by Cape Asbestos in an age where thermal insulation products are indispensable are consistently in advance of their time and are setting tomorrow's pace *today*.

THE WORLD OVERSEAS

Refugee Hopes and Fears

BY OUR SPECIAL CORRESPONDENT

TYPICAL refugee camps do not exist, but there are similarities which one learns to recognise. In the camps for Hungarians it is mainly the smell, compounded of communal cooking, stone walls, overcrowded dormitories, and the indefinable atmosphere of an institution. In the camps of the "old" refugees, where people have been living for twelve years, the common factor is a persistent effort to make individual homes of the single square rooms in the long wooden huts. Despite the overcrowding, these rooms are bright and well kept, often with pot plants, a wireless and some religious pictures, and perhaps, if their tenants are in regular work, a suite of walnut veneer furniture, looking oddly incongruous in its surroundings. The children are the same in all the camps, lively, giggling, curious, and anxious to show off.

In Austria most of the "old" refugees in the two camps which your correspondent saw are able to get work, and have kept some of their initiative and hope. Many are frightened by the prospect of leaving the camps, which are scheduled for dissolution, and of living in an ordinary community where they will have to pay an economic rent; others are totally apathetic about the future. But most seem capable, with a little help, of recovering their independence and settling down. Less fortunate refugees who do not live near enough to an industrial centre to find work, or who cannot do the work available, have been living on public charity for so long that they have lost the capacity and the will to concentrate on anything. In Germany many have come to believe that because the Germans were responsible for their original plight it is the duty of the Germans to support them until they die. The visible effect of this "camp sickness" is terrifying. In one camp, a former barracks, near Ingolstadt in Bavaria, the passage walls were scrawled over and filthy, the washrooms were still swimming from a suspiciously recent flood of disinfectant which could not drown the smell, and the rooms, although large and not overcrowded, were dark and depressing. The women at least had some occupation in cooking and washing, but the men were squatting in groups along the walls and on the steps; they seemed content to do nothing for the rest of their lives.

For the old and the chronically sick, there are homes and institutions for those who will go to them, but they are not popular. An old peoples' home in Bavaria, in a building originally intended as a holiday centre for Hitler youth, is equipped more lavishly than most hotels and run by a large staff of maids, nurses and nursing sisters. Yet there are a number of vacant beds. Even after years in camps the yearning for some privacy and independence is so strong that some refugees simply lose the will to live after they are transferred to an institution.

The Hungarians are quite distinct from the "old" refugees, both in their characteristics and their problems. There are now about 15,000 still in camps in Austria and 14,000 in Jugoslavia. The Jugoslavs have done their best to cope with them and for a people with such poor resources have been generous in supplying the needs of their unwanted guests, who physically are better off than many Jugoslav peasants. The 600 unaccompanied children between 14 and 18 years old are especially well treated and have been quartered in an attractive, if primitive, building, which has served before as a hospital and barracks. There they can live a decent and ordered, though not, because of the shortage of teachers, very constructive life, while they wait for emigration.

At the other end of the scale is a camp at Gerovo in northern Jugoslavia, where refugees sleep, eat and live, two to a bunk, in rooms holding 70 people, where there is a dark and stinking prison and where stories are told, which may or may not be true, of beating and bullying by the camp police. These conditions are horrible, as the Jugoslavs admit, but they say it is not their fault, that the overcrowding in Gerovo is inevitable because the Adriatic hotels, where many refugees were quartered, have to be given up for the tourist season, because in a country of appalling roads and little transport it is impossible to shift refugees rapidly from place to place, and because refugees who want to emigrate to the same country have to be concentrated at the same camps so that they can be interviewed by the selection teams. The Jugoslavs feel that the Hungarians are outrageously ungrateful for what has been done for them and they make little effort to understand the Hungarians' psychological problems.

Part of the trouble arises because the voluntary agencies, which do much to reassure refugees in Austria by giving help, comfort and advice to individuals, are not allowed to work in Jugoslavia, and in consequence there is in the camps a tension that is always on the edge of hysteria. The refugees are terrified that they will be left behind and forgotten and that the Hungarians in Austria will be allowed to emigrate while those in Jugoslavia will be penalised for having been forced to escape into a communist country.

Like the Hungarians in Austria they are a very mixed lot. Some are freedom fighters or ex-political prisoners who held on until all hope of success was lost; some are women who hope to join husbands or fiancés from whom they got separated in the struggle; some are former farmers who were deprived of their lands and had been living as fugitives in the hills; some are under eighteen and came over without their parents' consent, looking for a better academic or technical education than they could get at home, or afraid of being deported to the Soviet Union. Some, it can be admitted, have come solely in order to better themselves economically. But they are all alike in their almost total ignorance of the outside world, their naivety and their pride—a pride perplexing to a west European, but genuine.

In Austria there was no atmosphere of hysterical depression in the camps which your correspondent was shown, and conditions were on the whole good, although there were some odd anomalies. At Traiskirchen, a large centre near Vienna which had once been an officer cadet school, immense trouble had been taken by the Swedish Red Cross, which was running the place, to set up a superbly well equipped and clean sick wing, a pleasantly decorated centre, including occupational therapy for the mentally sick, and a kindergarten for the children. Yet several families were sleeping in each room, with not even a blanket to give an illusion of privacy.

A great effort is being made in Austria to get the unaccompanied Hungarian children out of the camps and into technical or high schools according to their tastes. Many of the boys do not take kindly to renewed discipline after throwing Molotov cocktails in the streets of Budapest and living for months as adults in the camps; to persuade them, particularly those with hopes of emigrating, to go back to school is a task that needs some tact. But there are now nearly 2,000 unaccompanied Hungarian children at some kind of boarding school and they seem to be settling down reasonably well.

Mr Diefenbaker's Cabinet

FROM OUR OTTAWA CORRESPONDENT

THE new Canadian prime minister attending the Commonwealth conference in London is John Diefenbaker neat—unsullied or unimproved, as you choose to regard it, by experience of government; he rushed off to London forty-eight hours after his cabinet had its first meeting. Permanent officials, who have handled the unexpected transfer of power after 22 years with really magnificent *sang froid*, have given him concise background papers on many problems. But even if he has had time to read them, the mastering of them must have taken all his lawyer's talent.

He has left behind 15 cabinet ministers who have never held office before and who are learning a lot very fast. The cabinet has been meeting nearly every day, but has been wholly occupied with routine business—routine to civil servants, terrifyingly unfamiliar to new men. Mr Diefenbaker's colleagues have sent him one important cable resulting from the first businesslike meeting between the best brains of the permanent service and the key ministers. This meeting took place the day before Mr Diefenbaker left. He had meant to be there, but the hectic rush in which he has been carried forward ever since June 11th kept him away. In Mr Diefenbaker's absence the new finance minister, Mr Donald Fleming, presided at this meeting on the prospects for a Commonwealth trade conference. He was accompanied by Mr Gordon Churchill, the new minister of trade and commerce. As well as the top civil servants in Ottawa, Mr Norman Robertson came up from Washington, where he is now ambassador, to give advice based on his long experience as High Commissioner in London. The appraisal of Commonwealth trade prospects resulting from this session may have been the first realistic judgment the new government was able to make of the outlook for increased Commonwealth trade as seen from other parts of the Commonwealth. But this Fleming-Churchill report did not reach Mr Diefenbaker in time for his earliest London statements. In any case, nothing can change the Conservatives' commitment to assemble a trade conference in Ottawa as soon as can be arranged. This is a political necessity and the Conservatives rely on the Commonwealth tradition of mutual backscratching. The challenge to some experienced officials—in Whitehall or here—is to find some basis for the meeting which will prevent the discussion ending in frustration.

★

The acting prime minister during Mr Diefenbaker's absence is the Tory veteran Mr Howard Green, a ramrod figure of incorruptibility and almost equal inflexibility who has borne the whole 22 years of opposition. Mr Green's appointment is characteristic of the way Mr Diefenbaker chose the first large group of his cabinet. Canadian cabinets must always represent every province, every faction in the governing party, and even all the main religious groups. Mr Diefenbaker also owed a debt to those men of his party who supported him in the bids he made for its leadership in 1944, 1948 and, most important, last December, when he was successful.

The encouraging thing is that he showed little sign of personal favouritism and the various claimants were placed with shrewd skill. For example, Mr Green, sworn in at the head of the list, had his seniority recognised. But he did not get any of the important policy-making departments. He did not even get the department of transport, of which he had been the chief Conservative critic, and where he would have had to implement his long advocacy of subsidies for Canadian deep sea ships. He was made minister of public works, where efficiency and honesty fight a constant battle against patronage.

In a rather similar way Mr Leon Balcer, the young French-speaking Quebec lawyer who is the party's figurehead in French Canada, has only been given the post of solicitor-general—a sort of fifth wheel to the ministry of justice. One more French-speaking minister is promised for a later appointment, but it seems to have been made clear to Quebec in the nicest way that it can only get a larger voice in affairs by electing more Conservatives next time.

Mr Diefenbaker's decision to keep the external affairs post for himself at least temporarily is defended on the ground that it will help him to grasp Canada's problems in a world-wide context. The danger is that he exposes himself at the one point where his ministry must suffer by comparison with the previous one—because it has no Mr Pearson.

As external affairs was not on offer, the most vital posts were finance and Mr C. D. Howe's old department of trade and commerce. For finance Mr Diefenbaker has got the

ablest available man in Mr Donald Fleming, his own first-rival for the party leadership. Americans would call him chunky. He is short, tough and very earnest. He was once described as an "indignant scoutmaster." He has done much work with YMCA. He is an elder of his Toronto church and president of Bible societies His capacity for work is fabulous. All the extravagant promises the Conservatives made when they never imagined they would really gain power have landed in his lap. If he fulfils them all he will reduce taxation, increase pensions, approve civil service pay increases which would eat up most of the surplus projected in the Liberals' last budget, revise tax arrangements with provinces—something which has never been done without increasing federal spending—and finance whatever new wheat policy his colleagues can devise. All this is to be managed between now and the parliamentary session which is likely to start in mid-October when the Queen will be able to open it.

Mr Churchill, Mr Howe's successor as trade minister, a post which carries first responsibility for solving the problem of surplus wheat, is a little-known man. He was a schoolmaster for most of his life, but fought in both world wars; in 1946, with the rank of colonel, he represented the army in the Manitoba legislature. He then decided to switch to law at the age of 50. He duly qualified and was first elected to the federal house in 1951 at a by-election. Since then he has never spoken on trade or economic questions, though he has tried to follow them with the natural interest of an educated all-round man. His approach to the problems that have been dumped on him is that of a student: "I will have a lot of reading to do in the next few weeks." There is an advantage: the competent and skilled staff of his department find their energies released on fields of exploration which were outside Mr Howe's range of vision.

When Mr Diefenbaker returns he will not find any of his real problems solved. But he will find the whole machinery of government—which is far better than so small a country as Canada deserves—working to produce a sensible reconciliation between campaign promises, which may have been too lightly given, and actual possibilities as the permanent officials see them.

Europeans for Israel

Israel is receiving a new wave of immigration, mostly of professional people, from Europe—chiefly, though not entirely, from eastern Europe. Our correspondent in Tel Aviv describes their warm reception and their impact on Israel's economy:

"Five hundred immigrants arrived in Haifa today; they are being transferred to development areas." This is the stereotyped phrase which is repeated almost every day now over the Voice of Israel—the home service. Only the figure varies; sometimes it reaches a round thousand. Israel has started another chapter of mass-immigration and takes it as a matter of course. Estimates that put the number of immigrants this year at 100,000 already appear over-cautious.

For Israel this immigration marks an important turning point on two counts: first, here are people who have been grounded in the principles of a modern society, even though of a different order from that of the western world. They do not have to learn everything about modern working methods, modern hygiene and production as so many of the Oriental and North African immigrants of the last decade have had to do; secondly, this year's newcomers include a fair percentage of scientists, physicians and engineers who are urgently needed for the Israeli economy; the flow of professional workers stopped when the immigration from central Europe died down some years ago.

The supply of skilled workers and of scientists is supremely important to Israel. For years now, planners have been worried about the lack of them. It was feared that there would be no replacements for the generation of excellently trained physicians who came from Germany and Austria in the thirties; that there were not enough teachers for schools, instructors for agriculture, nurses for the many new hospitals, or skilled builders for the housing schemes. Now hundreds of physicians have arrived in the course of a few months. At the University and in all the other training centres, scientists, some with outstanding records, are asking for advice and employment. The Jewish Agency, which is responsible for the reception of the immigrants, has to contend with two main problems: lack of suitable housing, and the need to teach the newcomers Hebrew.

*

Despite huge housing schemes that have eaten up untold millions of dollars, the housing shortage has remained acute since mass immigration started nine years ago. Many of the new immigrants call for better accommodation than has been customary for newcomers during recent years. The Jewish Agency has therefore commandeered a number of hotels in the towns, to provide pieds-à-terre for a few weeks, and everywhere new housing schemes are being launched at a furious pace. All over the country, too, the newcomers are being directed to "Ulpanim," a sort of adult training school, where people who want to learn Hebrew quickly live for several months, spending the whole day and part of the night in language study. The courses are strenuous and compel the participants to frantic concentration. But they show results.

No less important is the proper distribution of jobs. People in Israel are well aware that the skill and scientific knowledge of this new immigration must on no account be wasted. Hence the unusual care with which individual cases are treated and the attempt—not always successful—to avoid putting square pegs into round holes. Some months ago when the immigration started, the task was easier than it is today, as more and more new people flow in.

The impact of this new wave of immigration on the economy is that of a new prosperity. Whether this is spurious or real is a matter of debate between economists. The tens of thousands who arrive give a new fillip to economic activity, for they start consuming at once. The home market, which was slack during the winter, is once more ready to absorb more goods, and manufacturers who were worried over sales are breathing more freely.

The demand for houses spells a good market for semi-durable goods; the pressure by the immigrants on the labour market is not yet felt. But it goes without saying that prosperity of this type depends on the influx of the money from abroad that finances the new immigration. The need for money is, in fact, staggering. The Minister of Finance revealed recently that settlement of a single immigrant family costs £I35,000. Everything will therefore depend on whether contributions from abroad keep pace with the capital needs of the new influx and whether plans for their economic integration can be realised smoothly and quickly enough.

There is some uncertainty about the plans themselves. Is it possible to create additional agricultural settlements? Experts are doubtful because both soil and water reserves are limited and unless new marketing possibilities are discovered abroad or new crops introduced the local market will soon become saturated. What about industry? In a country with few raw materials and no fuel of its own the question which new types of industry should be introduced is not easily answered. Ambitious new projects have proved both very expensive, and poor dollar earners. If they are to pay their way, there must be a reform in wage policy and more discrimination.

Visionaries do not like these arguments; they prefer to listen to Mr Ben Gurion's exhortations calling for the extraction of sweet water from the sea, speaking of atomic and solar energy and asserting his belief that the desert in the south will yet nourish millions of people. Many Israelis who a year ago looked on immigration from Europe as wishful thinking, and now see Jews arriving from there by tens of thousands, place their faith in him. Peering ahead, they discern Russian Jewry following in the footsteps of their brethren.

Budget Time in Ceylon

FROM A CORRESPONDENT IN COLOMBO

When Mr Bandaranaike's government introduced its first budget last year, government supporters apologetically explained that the new regime had not yet had time to draw up a budget fully reflecting its socialist objectives. This gives edge to the introduction of the second budget due on July 4th. The government has over the past year indicated its wish to hasten the process of economic development. Key ministers have shown greater awareness than their predecessors of the economic problems facing the country, and also more desire to solve them, although their socialist remedies—such as the heavy reliance on state initiative and participation—are controversial.

The government has the enthusiasm, but cold facts of economics, as well as political expediency, may check its ardour. Economically, foreign assets have been falling, and the fall has lately gathered momentum although the current level of the assets is still not perilously low. The trade surplus which reached record proportions in 1955 has been drastically narrowed, and by now may even be a deficit for no trade figures are yet available this year. The money supply is falling. So is revenue. The export industries—tea, rubber and coconut—are not faring well, and tea prices in particular have dropped sharply.

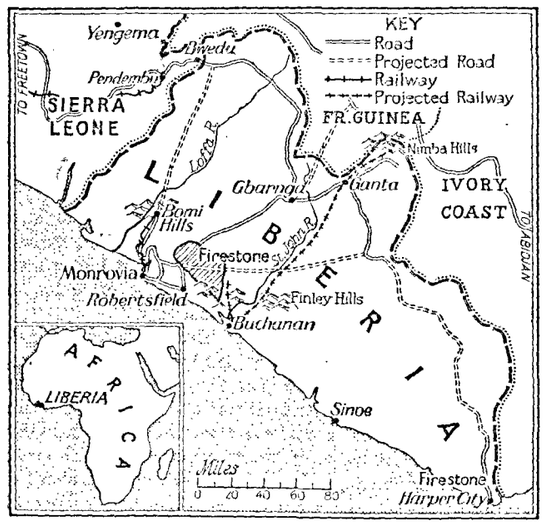
These factors will inevitably limit the finance minister's plans for new development. With income on current taxes likely to be lower than in a normally good year, he will be forced to think of new sources of revenue if he is to budget for a faster rate of economic advance.

Some people within the government have fallen under the spell of India's finance minister, Mr Krishnamachari, and would like Ceylon to adopt recent Indian expedients for getting more revenue. Mr Krishnamachari a month ago introduced the severest budget in Indian history, imposing both a wealth tax and an expenditure tax. But in Ceylon political considerations may prevent the government taking such steps.

The administration is facing opposition from extremists both among the Tamils and the Sinhalese over the issue of the state language, and the United National Party is apparently waiting for a chance to get itself back to power over this conflict. Any measure of taxation that would cost the government the support it receives from the middle classes, the workers, farmers or the business community, would need a considerable degree of political audacity. Austerity budgeting would be more than normally risky.

The same political considerations will influence any attempt to reduce the existing level of current expenditure, a large percentage of which goes on social services. It is therefore laudable that the government has already decided that there should be no fresh commitments on social services. This does not mean that expenditure will not be higher than in the current year, for allowance has to be made for an increase in population of 2½ per cent a year.

The chief remaining source of revenue is foreign aid. Assistance from western nations, led by the United States, is not likely to be much higher than last year. But the diplomatic Delhi-style neutralism of the Bandaranaike regime has prompted talk of substantial economic aid from the Soviet Union, the only communist country which could give Ceylon aid in any volume. However, no hard offer has yet been announced. Even if the nature and volume of Russian help is to be revealed on budget day, it is doubtful if Russian assistance to Ceylon will be sufficient to cure the finance minister's headache.



Too Few Liberians?

FROM OUR SPECIAL CORRESPONDENT LATELY IN MONROVIA

The visitor in Monrovia may still exclaim: "Is this the place that launched a thousand ships!" Nevertheless Liberia's capital has in recent years been given a considerable face-lift, and the operation has not by any means been wholly paid for by the proceeds of the Liberian mercantile registry. Money has been flowing into Monrovia down the iron-ore railway from the Bomi Hills, and through the jungle paths from diamondiferous Sierra Leone. It has also been coming along the main highway from the Firestone Rubber plantations, now tarmac and thronged with shiny new cars driven to their limit, mostly American but with an encouraging contingent of British Zephyrs, Bedfords and Landrovers.

Arrived from Robertsfield airport, the traveller can now stay in an air-conditioned hotel—at prices only slightly above those of the Dorchester—standing in a dual-carriageway boulevard blazing with scarlet-leaved flamboyants by day and, beginning to glow, with neon at night. Although Executive Mansion, or Government House by a republican name, is still the most imposing building, large blocks of flats and offices in the modern tropical cast-concrete style are going up everywhere, and the city limits are spreading

as the cosmopolitan diamond-dealing community puts part of its profits into suburban real estate. But enough of old Monrovia is in evidence—the crumbling brick and laterite houses, the typical battered wooden creole gabled cottages, the heeling shanties and vacant lots where tropical vegetation and naked children sprout among the litter of cans and corpses of trucks—to make Mr Richard Nixon, fresh from the independence celebrations in Accra, decide that his country must do something more solid for this African

republic that is tied to the United States by history, by the automobile industry and by a common currency.

This common currency is at once the advantage and the bane of the Liberian economy. As a hard-currency area it attracts both diamonds and entrepreneurs. But the complete freedom to transfer profits (after tax, official and unofficial) to the United States weakens the incentive to invest locally. The balance of payments—Liberia is ahead of most West African territories in calculating its balance of payments—shows that while in 1955, for example, there was an excess of exports of around $12 million, there was an outflow of $24 million in dividends and a further unknown outward capital movement of $7 million, offset by an inward capital movement of only $9.5 million. Liberia has no extensive government or marketing board reserves; it relies for development on current revenue, American aid and the pull of a free enterprise economy.

Fortunately, President Tubman is extraordinarily active, revenue is buoyant, and things are, in the Liberian way, getting done. Rubber planting is expanding not only because of Firestone and latterly Goodrich, but also because Liberians are themselves becoming planters. The Liberian Mining Corporation's iron ore output has risen to two million tons since 1945—thus outstripping languid Sierra Leone—and is expected to rise further. "Lamco"—the Liberian-American-Swedish Minerals Corporation—is planning to build a new port at Buchanan and a 160-mile railway to the enormous high-grade iron ore deposits in the Nimbo Hills on the French Guinea frontier, and speaks of an output of ten to twenty million tons a year; this would add another $5 to $10 million to Liberia's revenues, now around $17 million. The Stettinius group is planting cocoa, and a German group, the African Fruit Company, is growing bananas and building yet another port, at Sinoe, to ship them. President Tubman suffers from none of the phobias about land alienation that exist elsewhere in West Africa; he is ready to give concessions to planters and prospectors along with a "tax holiday" in the early stages of difficult enterprises. He relies on private enterprise to open up the country, to build the ports and towns, and to supplement Liberia's own modest programme of road building and social services.

There are, however, difficulties. Liberian state services are of limited capacity. The odds are distinctly against an unregistered letter being delivered at all. The Liberian tax authorities feel that a great deal of legitimate revenue slips through the net of their under-staffed and inexperienced department; but this is made up for by a variety of purely private levies which the foreign entrepreneur must learn to take into account in calculating his overheads. All Liberians, not merely officials and police, expect to benefit from the presence of foreigners in their midst, and have their own ways of pressing summary claims.

The main trouble, however, is that there are too few Liberians. Though the population is officially estimated at 1½ million, commercial firms believe it is little more than 800,000. All plantations suffer from a shortage of labour, some are experimenting with female tappers, and some have had to be abandoned. Firestone's policy is no longer to expand in area, but to replant with heavier-yielding varieties. Highly mechanised mineral extraction is favoured against plantation agriculture. When the discovery of diamonds in the Loffa River area threatened to denude mines and plantations of vital labour, President Tubman promptly cancelled many digging licences and sent his army to enforce the decree. Liberia lacks working population, and until social services and especially the medical services in which British commerce is taking a hand lead to an increase in population, economic possibilities will be limited and the vast areas of forest and shifting cultivation will remain undeveloped.

Race and Politics in Central Africa

BY AN AFRICAN CORRESPONDENT

AFRICANS expect that the constitutional amendment bill which was introduced into the Central African Federal House of Assembly this week will have an easy passage, as to them it seems entirely to benefit the Europeans. The number of European members will be raised from 29 to 47—including three who represent Africans—and the African members from 6 to 12. The three territorial assemblies also have to approve the bill, but this will be easy as in the Northern Rhodesian Legislative Council only the four African members are expected to oppose it, while against the five elected Africans on the Nyasaland Legislative Council there are six Europeans. The Southern Rhodesian parliament is all white.

The Africans cannot be expected to like the system of a two-tier electorate. Ordinary voters will have to have qualifications to which few Africans can aspire while special roll voters will never be allowed in any poll to have more than half the total votes of ordinary voters. The qualifications for the special voters' roll are, however, not too high. They

are an income of £15 a month, adequate knowledge of English and capacity to fill in the voters' enrolment form unaided.

In themselves, these standards may seem reasonable to those who distrust the head-counting system of democracy, but their true value can only be seen against the background of the entire racial policy in Central Africa. As in South Africa, the federal state recognises that there shall be no equality now between white and black. While paying lip service to "racial partnership" and piously protesting that the term "civilised people" does not mean "white people," the federal government unashamedly continues to grade people according to race.

As in South Africa, there are three grades of human beings in Central Africa. The top grade is the white or the "European," the medium is the brown, consisting of Asians and half-castes, and the bottom grade is the black. The government's policy is to protect this social pagoda. In the federal civil service only African doctors are deemed civilised or educated enough to be employed on the same scale as white, Asian or half-caste doctors. An African lawyer, schoolmaster, nurse or clerk is placed on a salary scale below not only that of the European but also that of the Asian and half-caste, even though he may hold higher qualifications. Colour seems to be the only criterion for this grading.

Yet the constitutional amendment bill envisages a state of affairs in which Africans will be elected as ordinary members (as are Europeans now) representing an ordinary constituency and chosen by all races. If the federal government is serious in this, it certainly ought to eschew the policy of racial discrimination and thus pave the way to racial understanding. Unless that is done, Sir Roy Welensky will find it hard to win the loyalty of Africans, especially in the north. It is not true that African dislike of federation in Northern Rhodesia and Nyasaland is only due to frustrated nationalism or the disappointed hope of setting up black states. It is also—and mainly—due to African resentment against the federal government for treating them as third-class citizens. Had the American constitution not guaranteed the equality of all its citizens, and had the American government not pursued an anti-segregation policy—despite fanatical opposition—the United States would not be able to count on the loyalty of the black tenth of its population today.

Third Year of Publication

"MOTOR BUSINESS"
EUROPEAN FREE TRADE ISSUE

The June issue—No. 11—of this quarterly research bulletin for the motor industry and allied trades is devoted to an analysis of the implications for the motor industry of the move towards free trade in Europe. The contents are:

1. The Plans for the Common Market and Free Trade Area.
2. The Present Pattern of Production and Trade in Europe.
3. The Possible Effects of the Freeing of Trade.
4. Conclusions.
5. Tables.
6. Charts.

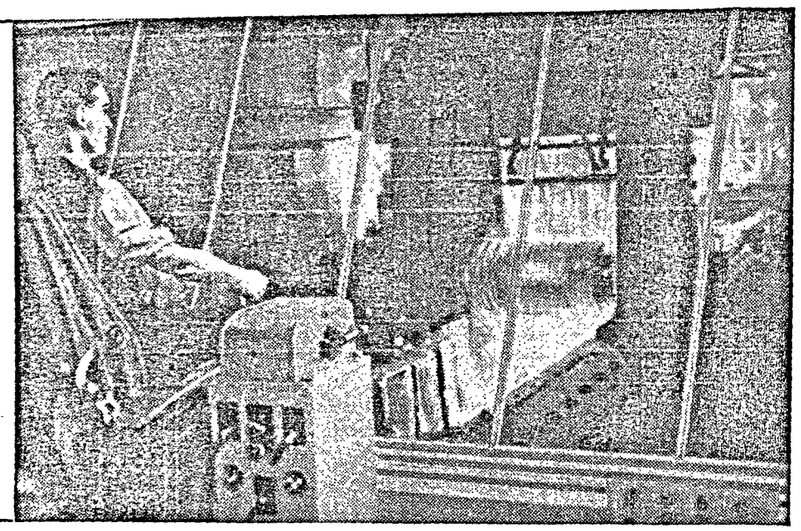
Tighter Belts for Danes

FROM OUR CORRESPONDENT IN COPENHAGEN

DANISH commentators note approvingly that Mr Nehru, who has just completed a three-day visit to Copenhagen, has demonstrated his concern about India's economic troubles by abandoning his Cadillac for a scooter and slashing ministerial salaries. They suggest that Hr Hansen, who heads the recently formed uneasy coalition of Social Democrats, Radicals and Single Tax Party, might well take a leaf from the Indian leader's book. For although the Danish government is blameless of personal profligacy, there is undoubtedly ample scope for government economies.

Hr Kampmann, the finance minister, presenting the government's crisis plan, scarcely emulated Indian austerity. His main proposal to staunch the disastrous drain on Denmark's foreign reserves (now showing a deficit of £22 million) was the introduction of compulsory saving for those with incomes exceeding £700 a year, or a tenth of all taxpayers. He estimated that this would produce an annual saving of £10 million during the first two years.



Higher indirect taxes should bring in a further £5 million; while government economies, perpetuation of the dollar premium on car purchases, dividend limitation, and stringent control of income tax returns, are calculated to raise the total saving to £20 million annually. After several days' acrimonious debate, the *Folketing* has approved two of Hr Kampmann's twelve bills—namely, those increasing taxes on beer, wine, spirits and tobacco. (The new imposts, despite labour protests, are to be excluded from the index on which wage increases are based.) Hotels and restaurants have threatened a token strike.

The Liberal and Conservative opposition maintain that the compulsory saving scheme would be discriminatory, and stifling to production. Abandoning their customary inscrutability, the opposition have produced an alternative plan which includes a "deposit scheme" for imports, full trade liberalisation, incentives to private saving, and less state spending. Denmark having few rich to soak, compulsory saving would mainly affect the struggling professional classes, many of whom voted for the Socialists' allies, trusting in promises of lower taxes and less bureaucracy. Their disillusion has found expression in 60,000 written protests, and even *Politiken*—an important Radical organ—has joined the campaign. The government has been urged to drop the plan, or at least, by lowering the income limit, to widen its incidence to include well-paid young people without family responsibilities. The wave of indignation seems to have taken it by surprise, and it has hinted at a compromise.

Denmark's first postwar majority government has produced a disappointing assortment of palliatives for Danish over-consumption and creeping inflation. A straight purchase tax on scooters, television sets and radios might prove more effective, and no more unpopular. The heterogeneous composition of the government renders resolute action difficult. For the government there is one ray of comfort: prices of agricultural exports have improved markedly, while fuel imports have become cheaper. The coalition's gamble on a further improvement in the terms of trade may afford some respite; but an end to the recurrent payment crises that have beset postwar Denmark is not in sight.

'ENGLISH ELECTRIC'

With an expert touch on delicate electrical controls, the operator guides a 20-ton ingot of white-hot steel under massive rollers—the first stage of its transformation into a racing, polished ribbon of metal no thicker than a card. ENGLISH ELECTRIC's industrial products include a wide range of motors, from 36,000 peak horsepower drives for mills like this to fractional horsepower types for light industries.

bringing you

Cookers and cars, refrigerators and washing machines—steel has proved as important in fields like these as in heavy industry. And everywhere electricity speeds production. Besides making motors, ENGLISH ELECTRIC helps to produce the power that drives them: it makes generating plant for power-stations, and transformers and switchgear to bring the current to the factory floor. These are only some of the contributions ENGLISH ELECTRIC makes to Britain's prosperity.

better living

THE BUSINESS WORLD

To Make Railways Pay

IT is a fact that the accounts of the British Transport Commission show a net revenue surplus of £3,069,982 for 1956. The reality to which this fact corresponds could not be more utterly different. It is the Transport (Railway Finances) Act of last February that enables such a good face to be put on these accounts—a contrivance on the grand scale to give the commission's balance sheet a veneer of respectability for the next ten years or so in the hope that by 1970 they will be meeting all the capital costs of a modernised railway system and have a genuine surplus of £50 million a year as well. And if this charitable faith in a hope is a gamble; the odds are not noticeably more outrageous than those on which the state has lent money in some other directions. The commission have been allowed by law not to charge to their current revenue accounts the financial burdens that are entailed during the period of reconstruction, but to defer them for ultimate settlement when, it is hoped, a modern railway system will be making good money.

The amounts that the commission can borrow and temporarily run as intangible assets are :

(a) the accumulated deficit at the end of 1955—£69,751,712.

(b) the deficit of British Railways for any of the years 1956 to 1962, up to a total of £250 million. The 1956 deficit so capitalised is £57,496,624.

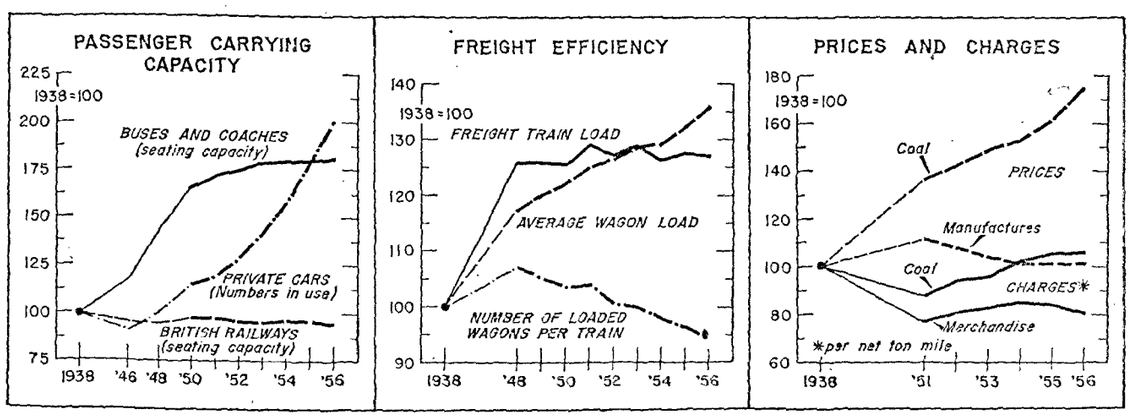
(c) interest on capital borrowed from the Exchequer. These advances totalled £40 million during 1956, and the capitalised interest amounted to £2[illegible]3,637.

So, against an apparent surplus of £3 million, the commission are carrying a "special account" of £127½ million which, with its additions during the next several years, they have undertaken eventually to expunge out of genuine revenue surpluses.

History records other examples of financial embellishment which, being of a free-lance character, did not attract the support of the law. The justification for what the commission are allowed to do rests on the desperation of their financial plight, coupled with the lively (and not altogether unfounded) expectation that the infusion of new capital, after a generation of under-investment, will produce a technically efficient and commercially aggressive railway system, run like the best of big business and earning good profits. The important thing about the commission's report for 1956 does not rest on this financial contrivance; and even within the contrivance there is room for argument, as for example in the apparently arbitrary division of the commission's central charges, of which £41 million, neither more nor less, is debited to the railways and £17,907,159 to "other activities," among which it seems doubtful if London Transport is carrying its fair load. It rests on the signs, where they can be found, that the contrivance is going to work out over the next decade.

IT is far too soon to be certain, but some signs are promising. Other things are less dependable. When the commission plead for "reasonable freedom and a period of stability to press on with reconstruction, and that the whole fabric of public transport will no longer be subjected to periodic and seismic upheaval on political account," it is talking from nine years' experience of party argument and inflation. Yet, if one gives the commission this major premise, a viable modernised railway system does remain a reasonable hope. The first encouraging thing, both for railway staffs and users, is that a noticeable amount of new hardware is actually going into service. The report is quite right to talk that up—even at the risk of irritating some of its customers who know what high-speed electric or diesel trains (and even the cross-country *micheline*) can do in other countries. Improvement is tangible, but

only in its earliest stage. Next year will see the end of new steam locomotives and the bulk of 220 main line diesels delivered. It ought to see two important sections of main line electrification, to the new standard of 25 k.v. A.C., on test between Manchester and Crewe and Colchester and Clacton. The completion before 1970 of most of the electrification included in the modernisation plan is now regarded as feasible. Orders have been placed, virtually for the first time in British railway history, on terms that encourage the positive co-operation of outside suppliers.



With all this goes much work in the improvement of track to fit it for high speed and safety, to improve the signalling (and to re-signal the lines that are being electrified) and introduce automatic train control. Electrification to the new 25,000 volt standard will involve the rebuilding of a large number of overbridges to provide the necessary clearance for the conductors: French experience has already demonstrated beyond doubt the advantages of this system of electric traction; it is cheaper in terms of lineside equipment and electrical supply. The cheerful descriptions of the passenger coaches of the future might have been written by a car salesman; the national scandal of grease-lubricated coal wagons will have been eliminated by the end of this year, and the freight train of the future—running at 60 miles an hour, with continuous brakes, close-coupled wagons, and roller bearings begins to be possible here. It is familiar enough in other countries.

No doubt it is a good thing for railwaymen to have new toys to play with. But the test of these expensive hobbies is not whether they give railwaymen pleasure, but whether they will be matched by a new enthusiasm on the part of the staff, whether they are exploited with a new determination by railway management, and whether the customer can be convinced that he is getting better service relatively cheaper than he did. The commission want to secure "a more sensitive and effective use of staff at all levels," and they have a rare opportunity, with modernisation on this large scale, of shaking off old ways of men and management. There are new chances for men to share in increased productivity through doing new jobs (though the commission themselves put an apparently modest figure of £5 million a year as the potential savings from improved efficiency by 1961).

Evidently there has been some improvement in the readiness of the unions to co-operate towards higher efficiency. But the report notes that "one of the major problems yet unresolved is the manning of diesel and electric locomotives"; in other words, the unions are still insisting that two men shall do the work of one on the new locomotives. There are other restrictive practices—on lodging turns, the rostering of staff, and demarcation in railway workshops—that will, if they are allowed to continue, rob the country of the full return that it has every right to expect from the large sums of money it is adventuring on the new railways.

Changes on the management side are equally necessary, and there are encouraging signs that they are afoot—decentralisation on the Eastern region has lately been followed by the London Midland. "The highly centralised and functional system of management which," the report says with the soft pedal hard down, "was at one time favoured on the railways is being gradually changed, and more managerial authority given to men in local charge." With new equipment capable of an infinitely greater transport effort, success lies in its most intensive use and the fullest exploitation of its commercial opportunities.

Last year, over the whole British Railways system, freight trains moved 1,183 ton miles an hour, with an average load of about 160 tons per train and an average load of 7½ tons per wagon. These are not shining performances, particularly if the comparatively efficient movement of block trains handling coal and mineral traffic is subtracted from them. What could be done ideally with diesel haulage and braked freight trains, assuming 20 hours locomotive service a day, for 300 days a year, at an average speed of 40 miles an hour, and with an average load of 400 tons (600 tons would be reasonably possible) prompts the hope of freight transport at a knock-out price. But real cheapness rests on squeezing the last effort from the equipment, on a co-operative staff prepared to share in the spoils on condition that they are earned, and on a new commercial

energy to demonstrate to customers how cheap railway freight transport can be if only it is exploited in the right way. Between the practical results of 1956 and what might be theoretically possible in a new railway age lies a gulf that can never be completely bridged. But the promise of what is possible provides the only present foundation for the necessary act of faith in modernisation.

TOWARDS this change of commercial heart, the new charges scheme for freight traffic that comes officially into effect on Monday cannot make much immediate contribution. It is unlikely, that is, to make much material difference to this year's results (which are bound to show another big deficit) and only the new scales for consignments of up to one ton will come immediately into effect. Wagon-load rates for mineral traffic that are now being charged will be retained, though they will be subject to a later review. Already rising costs are overtaking the new maximum charges. But the new freedom, within the limits that the charges scheme allows, will be used by the commission "to persuade consignors to offer traffic in loads and frequencies which make for economical working"—and in the economical working they can expect to get the appropriate benefit in really competitive rates. Charges must go with the standard of service, and if the latter can be improved the former can be profitably reduced.

That, in the end, is the only justification for the moderate ambition of giving Britain a railway service that can hold up its head in the same century as the French, the Dutch or the Italian. The railways have come nearly last in the queue for new capital, but the queue is continually re-mustering and the current demands it is now presenting—for power, transport, heavy industry, shipping, public investment, and overseas development—are truly frightening. The tangible gains that the commission's report is able to claim from its first experience of a new start on the railways are welcome; the commission fought aggressively for their plan and they will have to fight even harder to get the best return from it and thus to justify it to the public who are paying for it.

The New Explorers

Throughout the world, scientists are beginning a concerted, comprehensive study of the earth's atmosphere—in order to guide its invasion by applied scientists

NEW EXPLORERS are on the move. For months there has been a noticeable quickening of activity among certain scientific institutions the world over, like the murmuring of a hive about to swarm. New and elaborate equipment has been arriving on an unprecedented scale, teams have been formed, bases set up, a system of measurement and recording to be used by over 3,500 stations has been agreed among 63 nations, and next Monday this vast network comes officially to life. The International Geophysical Year begins. Only the name is unfamiliar and puzzling; the driving force behind the IGY is in the direct tradition of all the voyages of discovery that stretch down through history.

The traditional explorers, with their caravels, their mule trains, their dog teams and bearers, mapped out the surface of the earth fairly thoroughly over the centuries, continent by continent and ocean by ocean. They are responsible for the essentially two-dimensional picture of the world that most people carry in their mind, one where there is length and breadth but no depth. The new explorers seek after the missing third dimension, probing upwards and outwards through the atmosphere and into space, downwards and inwards into the earth's core.

The atmosphere, that thick, pliable belt that surrounds the world like the pith of an orange skin, is becoming of more and more practical importance as it is pressed into use to relieve congestion on the surface of the earth. Its lower reaches are already cluttered with aeroplanes, radio signals and communications of all kinds and engineers are beginning to eye its empty higher altitudes with much the same feelings as the pioneers of the West must have eyed the virgin prairies. It is at this point that the lack of any real fundamental knowledge of the atmosphere is driven home in a practical form.

One of the main objects of the International Geophysical Year is to collect a mass of data from readings, observations and measurements out of which a set of basic working rules about the atmosphere and its properties can be distilled. It is essentially a fact-finding operation, and the facts themselves may take months, years or even decades to digest. It has become more or less essential to carry this work out on an international scale, so that a 24-hour watch round the earth is kept on the atmosphere, and a series of standardised, co-ordinated and synchronised readings can be taken.

The behaviour of the atmosphere, from radio reception to the weather, is influenced by the sun's rays; and the best places for observing the effect of these rays are the two polar regions. This inconvenient fact explains why at least half the British government's £650,000 contribution to the venture has been spent in setting up and maintaining the Royal Society's base in the

Antarctic. The scientists have gone there not out of any predilection for polar wastes, but because this inclement place gives them the best conditions for their observations. The expedition into the Antarctic organised by Dr Fuchs, on the other hand, is the last of the old-style Polar voyages, a romantic, privately financed anachronism in the mechanised, heavily instrumented atmosphere of the IGY.

Earlier international surveys of the atmosphere—there was one towards the end of the last century and another during the depression years of 1932-1933—confined themselves to the two polar regions ; the IGY has set up a wider network. There is a ring of stations running roughly round the equator, and three further chains running between the poles through the main land masses, rather like segments of an orange. One lies along the Americas, a second through Russia, Japan and Australia, and a third through Western Europe and Africa.

THE best time to study the effect of the sun on the atmosphere is when there are sun-spots, since these cause all the most revealing phenomena such as magnetic storms, heavy cosmic rays, radio black-outs and magnificent aurora displays. Sun-spots are cool patches on the sun, detected by a darkening of the surface ; they tend to occur in cycles of roughly eleven years and the IGY was timed to coincide with one of these seasonal peaks. Provokingly enough, this peak arrived early ; the last six months before it opened have been marked by one of the biggest assemblies of sun-spots on record. Scientists have been watching sun-spots for years, but this is the first time that an international watch has been kept for them so that the sun is under continuous observation throughout the whole 24 hours from observatories strung across the world. This will make it possible for all stations to be warned when sun-spots show signs of building up to a significant size, and to take readings as the sun comes into their orbit.

This co-ordinated watch, with its checks and cross-checks, is the nerve system of the IGY and its real justification. Scientists would have done many of these observations on their own, but their results become immeasurably more useful when they can be fitted into a jigsaw of similar observations taken by their colleagues on every face of the globe. This applies not only to the studies of the atmosphere that will go on during the IGY but to all the other investigations into gravity, latitude and longitude, oceanography, glaciers and all the phenomena that make up the programme.

The handicap that the new explorers have still to overcome is the inaccessibility of the object they want to study. Oceans can be plumbed and tracks hacked through jungles, but the laws of gravity make it extremely difficult to position recording instruments among the various layers of the atmosphere. Three methods will be put to the test during the IGY. First, there is the established and largely proven radio and radar sonde techniques where instruments carried up in weird plastic balloons transmit their data back to the ground. These generally work up to altitudes of 10 miles ; it should be possible to get them up to about 20 miles but this barely carries them through the first layer of the atmosphere.

The second line of attack is with rockets. These carry instruments much higher than balloons : the British meteorological rockets that will be fired during the IGY are expected to reach 70 to 90 miles and the practical limit is probably about 200 miles. The disadvantage is that the instruments will remain at peak altitudes for not much more than a minute, and there is a limit to the amount of data that can be collected in so short a time.

Finally, there are the space satellites. Both the Americans and the Russians believe that if a small shell (roughly 21 inches in diameter) carrying instruments can be carried by brute rocket force 300 miles above the earth, it will then circle the earth for a time as a tiny artificial satellite before its waning speed draws it back towards the ground to be burnt up by friction with the atmosphere. It is easy to see how this idea has caught the imagination of scientists. Three hundred miles off the earth, such a sphere would be largely outside the atmosphere. It would record the sun's rays in almost the precise form in which they leave its surface, before they have become distorted by filtering through successively thickening layers of atmosphere. It would also give a wonderful bird's eye picture of the earth and hold this for much longer than rocket-borne instruments could. No one knows enough about conditions 300 miles above the earth to say how long a satellite could last ; some say days, some weeks and some as long as a year. But do the engineers yet know enough about rocket motors to get a satellite up to a height of 300 miles? The layman might be forgiven for doubting whether they do. Rocket motors of the necessary size are certainly under development, but rockets as a group have a vicious streak. They are liable to sulk smokily on their launching platforms without going up : once launched, they can still go berserk and destroy themselves. The satellite programme, therefore, faces a good many dangers on purely technical grounds. But the choice probably lies between attempting it now, before the motors and accessories are fully proved, or waiting another eleven or twelve years for the next sun-spot cycle.

ESTIMATES of the cost of the International Geophysical Year vary from £100 million to nearly £200 million. Britain's contribution, valued at £650,000, represents only those projects that were put in hand specifically because of the IGY, and it does not count in the cost of work that would have been done in any case and which has now been fitted into the IGY programme. Although this is not a programme directed to any practical end in the way that atomic research has a concrete objective, it is still likely to have several immediate practical results. This is one field in which applied science has been developing at a faster pace than pure science ; the airlines, the radio engineers, the communications specialists and the experts on ballistic weapons are jostling each other to get into and use successively higher layers of the atmosphere, and the academic scientist is able to tell them little about the conditions they are going to find if they get there.

The intensive work of the International Geophysical Year (only the scientists know why it has inexplicably been stretched to cover the 18 months to December 31, 1958) should correct this balance and open the way for a marked improvement in communications—even in the long distance transmission of television. It should improve weather forecasting and navigation, including navigation for trans-polar flights which is at present rather tricky. It may also yield data on two important points that at present trouble the designers of missiles. One is the position of the continents in relation to each other. So long as maps are restricted to land, they are reasonably accurate, but once they have to cross a span of water the margin of error becomes appreciable—too wide, for example, to be certain that a ballistic missile launched like an artillery shell from one continent would hit an exact target in another. But if the latitude and longitude measurements taken in the IGY help to put intercontinental missiles on course, the experience gained in using radio telescopes such as the mammoth built at Jodrell Bank may also point to a way of tracking them as they approach their target and suggest how to set up an anti-missile defence system.

The long-term results of a venture of this kind are as difficult to assess in advance as that of any project which aims to push back the frontiers of knowledge. When the IGY comes to an official end, will the watching, listening network of observatories come to an end with it ? There is a strong feeling that this special form of scientific co-operation is likely to continue ; for practical reasons it is better for observatories to work together on a standard system of measurement, rather than separately. If this happens, the benefits of the IGY may long outlast its immediate scientific usefulness.

BUSINESS NOTES

FUEL PRICES

How To Keep A Surplus

THIS week's increase in coal prices was not quite a flat rate increase—large coals have gone up 8½ per cent and the rest about 8 per cent. But it is no secret that the National Coal Board would have preferred to "open its concertina"

HOW COAL PRICES ARE GOING UP

	Average pithead price, end-1956	Increase, July, 1957

Domestic consumers	89 0	7 0
Gasworks	88 0	7 1
Coking Plants—NCB	85 0	6 10
" " other	83 3	6 8
Iron and steel*	81 10	6 8
Power stations	64 0	5 1
Other inland consumers	77 1	6 3
Average inland price	80 3	6 6

* Apart from coking plants

a good deal more, by charging the consumers of large coal something more nearly reflecting the cost today of bringing in the last few million tons of it, which still have to be imported in spite of the very high stocks of smaller coal. These consumers, however, happen to be householders and the railways: the Cabinet was not prepared to approve a much higher increase for them, which would have been politically so unpopular. The very small coals that are at present in surplus account for some 90 million tons out of the 205-210 million tons of coal a year that the NCB sells in Britain. If the price of these small coals had been held level, as logically it should have been since the board is producing more of them and finding them hard to sell, it would have required a swingeing increase on larger coal to find the extra revenue it needed.

Last year the board showed a surplus of £12 million after paying interest, and in the first, generally profitable quarter of this year it was again in surplus. But its costs have been rising steadily, and without these increases it was faced with a prospective deficit of the order of £20 million this year. The present price increases should bring in about £32 million in 1957 and £66 million in a full year ; the board ought now therefore to achieve a surplus for 1957 of much the same level as last year, and should be able completely to wipe out its accumulated deficit (at present £24 million) during 1958. This week the NCB said: "The increases will thus go but a little way towards financing the Board's capital expenditure out of profits." If one were to believe the fortuitously favourable figures in its latest report, it would appear to have "self-financed" some 85 per cent of its capital investment in 1956 ; the real proportion was probably nearer half. These are the peak years of expenditure under the Board's investment plan : the latest rise in its

revenue should enable it to keep just within the borrowing limit of £650 million during that five year period that it was granted last year.

Can Fuel Oil Compete?

COAL consumers smarting under an increase averaging 6s. 6d. a ton in the cost of their coal can console themselves with the thought that the consumers of heavy fuel oil are still paying £2 7s. 6d. a ton more for their oil than they were when the price of coal was last raised a year ago. The price of heavy fuel oil, which had already risen by nearly £1 a ton during the summer of 1956, jumped sharply by over £4 a ton, as a result of the Suez emergency, to about £14 5s. a ton by the spring of this year; since then it has been reduced by over £2 a ton, as some of the emergency costs have vanished and ocean freight rates have fallen, to its present level of £12 3s. 3d. a ton. This is the delivered price paid by small consumers in the oil companies' inner zones, where transport costs are low. Consumers in the outer zones pay about 10s. a ton more, and in the general zone a further 10s. a ton. On the other hand, large consumers receive quantity rebates on a sliding scale up to about £1 a ton, the rebate granted to consumers of over 25 million gallons (just under 110,000 tons) of fuel oil a year. Very large consumers, who help the oil companies to reduce their delivery costs by putting in extra storage, for example, may qualify for slightly more than £1 a ton rebate.

A large consumer of fuel oil, situated in the oil companies' inner zone, may therefore now be paying just over £11 a ton for his oil. Assuming a ton of oil will do the work of 1.7 tons of coal, this is equivalent to a coal price of £6 10s. to £7 a ton. How does this compare with the current price of coal? Private industrial consumers of coal, other than the steel industry, were paying an average pit-head price of £3 17s. 1d. at the end of 1956; they must now pay 6s. 3d. a ton more; and to the pit-head price must be added, say, 10s. to 15s. a ton on the average for transport—say, £4 15s. to £5 a ton in all. The steel industry, coking plants, gasworks and railways pay more than this, up to about £5 10s. a ton delivered; but the Central Electricity Authority's generating stations, using large quantities of untreated small coals of low quality, can now obtain supplies of coal at just over £4 a ton—nearly £3 a ton cheaper than its thermal equivalent in oil at ruling prices. This is a measure of the gain that would be reaped by generating stations where the future supply of oil has been arranged on a coal parity basis, as compared with those buying oil at the current fuel oil price.

This price disadvantage of oil can be reduced and even eliminated in the many cases where oil has special technical advantages over coal—and the oil industry is still gaining new customers for fuel oil. Moreover, the price of oil is unlikely to remain at its present level. Consumers can expect to benefit from the continuing fall in tanker freight rates, and, eventually, from lower import prices. Fuel oil is the one major product where British prices based on the delivered cost of Caribbean oil can still be justified, for European refineries operating on Middle East crude oil cannot supply the volume of fuel oil demanded in Europe without drawing substantial extra supplies from the Caribbean. The Caribbean price, although it lagged behind the price in the US Gulf, has not yet declined from the high point reached during the Suez emergency—even though the demand for fuel oil has now fallen from its winter peak and fuel oil is still selling at about 80 cents a ton above the coal parity price on the east coast of the United States.

IMF ON THE £

Towards Convertibility?

THE International Monetary Fund's eighth annual report on exchange restrictions takes a somewhat rosy, even wishful-thinking, view of its subject. The leaders on the road to exchange convertibility receive a full meed of praise and their performance is given what, on the face of it, seems over-generous commendation—intended, no doubt, to encourage the laggards. Under the articles of agreement of the IMF the member countries must now consult with the fund each year if they maintain any restrictions on payments and transfers for current transactions. With a new "Mr Gadfly" in the consultant's chair in Washington the exhortatory effect of this annual procedure should gain a great deal in its impact.

Of the sixty member countries of the IMF, eleven have convertible currencies and do not avail themselves of the transitional arrangements allowed under Article XIV. They are all in North and Central America and members of the dollar area. Of the Article XIV countries the report says that they made further progress in the relaxation of exchange restrictions "although the progress in the past year was not at the same rate as in preceding years." This note of disappointment vanishes when the report turns to some countries in Western Europe which have "so liberalised trade and payments that it appears they would be able, without any very significant readjustment, to participate in a general move to establish a regime of full convertibility." Among those on the threshold of salvation are "the United Kingdom and a number of Western European and sterling area countries in which stable unitary rates predominate but restrictions are applied to limit certain imports with a lessening but still significant distinction between currencies of payment."

To suggest that sterling and some of its related currencies are "gradually approaching" a regime of full convertibility appears decidedly fulsome. The compliment is perhaps deserved in negative terms because Britain resisted the temptation to retreat into restrictions during last year's pressure on the reserves. The report singles out for special praise Britain's decision to meet the crisis of confidence by mobilising foreign exchange reserves from the IMF in preference to intensifying its exchange restrictions. "The fact that the United Kingdom avoided a reimposition of trade and payments restrictions," it says, "played an important part in sustaining the momentum towards continued liberalisation of payments regimes in other countries throughout the world."

THE EXCHANGES

The Franc and the Pound

THE uncertainties of the French political situation have again been reflected in the foreign exchange market. The French franc in the early part of this week was quoted at 25 francs discount for one month "sellers only"—a figure equivalent to a rate of 30 per cent a year. There has been a slight improvement from this level, but the discount

on the one month forward franc rate is still at the abnormal figure of around 25 per cent a year. In the battle for the franc the French Government has this week succeeded in passing new tax proposals to bring in 150,000 million francs this year and about twice as much next year. Of more immediate import, a new convention between the Government and the Bank of France has been negotiated providing facilities for further "special" advances to the French Treasury to a total of 300,000 million francs and giving the French Government the right to draw on 100,000 million francs of the Bank's gold reserve. This incursion into the hitherto sacrosanct official reserves of the bank affects about a third of the bank's gold holding.

The strength of the mark continues to dominate the market in European currencies. Sterling has been weakening fractionally against most Continental currencies, the main influence being the seasonal demand on British tourist account. Against the dollar, sterling has been holding up well at just over $2.79. New York remains a steady buyer of sterling on commercial account while the demand for dollars from London, though persistent, is now being reduced by some diminution in the shipments of dollar oil. Transferable sterling is firm at $2.77⅞-¾. The demand has come from New York and Zurich, some of it of Japanese origin. Japan has been rebuilding its sterling balances in London by selling dollars against transferable sterling.

Sterling has stood up well to some decidedly bearish doses of recent comment. One of these comes from Sir Frederick Leith-Ross, now a bank director and formerly chief economic adviser to the Government, in the review "Optima." Sir Frederick writes that "the best thing that can be said for sterling today is that foreigners are so anxious to avoid holding it that the technical position of the exchange market is oversold." He further suggests that since the nationalisation of the Bank of England British currency policy "is no longer appropriate for an international medium of payments" and he reminds the world that some of the leaders of the Labour party "have made no secret of the fact that they regard monetary stability as less important than full employment."

These are views that Sir Frederick is not alone in holding. But exception must surely be taken to his contention that "the British economy has been supported by drawing resources from the sterling area countries and leaving them with an accumulated credit of inconvertible and depreciating sterling." There were years, notably 1950 and 1953, when the increase in the sterling area's holdings of sterling in London exceeded the investment of new money by the United Kingdom in those countries; but taking the period 1946-56 as a whole, or even the last half of it, the balance has fallen unquestionably and heavily on the other side of the account. It is British resources that have helped to develop and sustain the overseas sterling area countries, and some of the strain on sterling is due to this very factor.

VIEWS ON GILT-EDGED

A Cooler for Gilt-Edged

"DALTONS"—Treasury 2½ per cent stock, redeemable in 1975 or after—were issued at par in 1947 and can be bought at 50. Consols, always a shade less unpopular, command a middle price of 50. Market prices for British Government stocks are maintaining their hold on realism. They have certainly not been encouraged otherwise by the Chancellor's forthright replies on Tuesday to a series of questions designed to illustrate the wickedness of the credit squeeze and aimed at modifying the restrictions on bank loans and easier borrowing conditions for local authorities from the Public Works Loan Board. In one he said:

> Any attempt to conceal the shortage of capital which exists could only be inflationary and force up the cost of living.

That, investors seem to have felt, is that. Gilt-edged have been quietly bumping along while most investors have turned their attention elsewhere, to selected oil shares and industrials. But there has been no general rally in industrials; *The Economist* indicator over the week ended on Wednesday remained almost unchanged at 222.2 compared with 222.3. But the preference of investors who have money is still for securities other than gilt-edged.

Nevertheless, in this atmosphere of realism a nibble of new business was felt in the gilt-edged market. At the low prices, jobbers have seen a little more buying than of late, part of it arising from switching operations. Some of the institutions that hold the next maturity, the 2¼ per cent Serial Funding stock due for repayment in November, thought it reasonable to exchange into the 4½ per cent Conversion stock (1962). But there were also small amounts of new buying as well as of selling. Some investors, though at present very few, seem to feel that British funds have reached a reasonable level.

A Study of the Market

ALL investors in gilt-edged stocks are again indebted to a leading firm of brokers for the latest supplement to their classical work, "British Government Securities in the Twentieth Century." The supplement includes a new section examining the movement of gilt-edged prices in the light of Bank rate changes which *The Economist*, responding to the challenge of the authors, hopes to discuss in an early issue.

For the moment, we may perhaps be excused for some princely borrowing from the preface. First comes a diagnosis of the sad state of the market:

> . . . The whole problem is at present clouded by an almost complete sales resistance to government securities, which appear to be at the bottom of most investors' lists of posteriorities. Clearly, the main cause of the trouble lies in the barely checked progress of the creeping inflation, which for all the threat it offers to the economy and the hardships it inflicts on some sections of the community, draws nourishment from conditions of full employment and a welfare state, and appears, on balance, to be regarded by the majority as preferable to its antidote.

These views have caught hold and are promoting a general movement out of fixed-interest securities and into equities:

> The argument is, indeed, put forward that, since the pound has been depreciating in the past decade at an average rate of 4¾ per cent per annum, any investment likely to show a total net return on income and capital accounts over a given period of less than this amount is giving a negative yield and should be discarded.

Many investors, too, became unpremeditated holders of guaranteed stocks at boom levels through successive nationalisations, and "those of them who retained the cuckoos' eggs . . . have little cause for celebration or pride."

Indeed, it must be acknowledged that today the gilt-edged barometer appears to lack much of the opportunity and all of the ability to register the more pleasing changes, while recording the entire range of gloomier prognostications with maddening fidelity.

Tighter money and the diversion of short-term funds into local authority mortgage market have acted as a drag on prices.

The most serious threat to the gilt-edged market, however, lies in the insatiable and ever-growing appetite of industry for capital investment, and the onus, which in modern conditions falls largely on institutional funds, of feeding it. The units of borrowing are constantly growing and issues of five, ten or fifteen millions are becoming almost commonplace. . . . It is popular to say nowadays that the authorities should do something about the market. Do what? . . . To buy stock now in support of the market and to give it artificial strength would not only appear to be a negation of the government's own anti-inflationary policies, but might land official funds with embarrassingly large quantities of unwanted stock, to the prejudice rather than the benefit of orderly marketing.

That is not to say that a small intervention might not at times prevent a disproportionate movement from developing. And on the longer view, the preface finds room for guarded optimism :

. . . To one observer, at least, it appears to be pessimism gone mad to suppose that government credit will for ever be valued on a contemptuous basis, that redeemable gilt-edged stocks standing at discounts of 20-30 points have no virtue, and that the British people will never put their house in order. If all this is true, then the outlook for the whole country and for every type of investment is black indeed. We do not take this view.

May their faith be justified.

OIL TANKERS

BP Presses on Regardless

UNLIKE some other oil companies, which fear that the numerous tankers already on order may cause a surplus of tonnage when they are delivered in the early 1960's, the British Petroleum Company has had no second thoughts about its tanker building programme. The new orders, foreshadowed nearly two months ago in the company's annual report, are for a further 27 tankers, totalling about 1,150,000 tons deadweight, for delivery between 1960 and 1963. As BP already has on order 37 tankers totalling 1,150,000 dwt for delivery between now and 1960, it has doubled the scale of its building programme. With almost all of its production concentrated in the Middle East, BP has, on the average, longer hauls for its oil than almost any other major oil company. It may therefore feel more inclined than other oil companies to reduce its dependence on outside chartering, even though charter rates are expected to fall.

While other major oil companies have for the most part let the independent tanker owners make the running with super tankers of 65,000 tons deadweight and upwards, BP has included in its new programme no less than seven tankers of 65,000 dwt, as well as nine of 50,000 dwt. All of these are to be built in British yards, and the company's announcement confirms that there are now four British yards ready to offer delivery of 65,000 ton tankers between 1960 and 1963. Three of these large tankers will be built on the Clyde—two by John Brown and one by Fairfield Shipbuilding and Engineering; two are to be built by Cammell Laird at Birkenhead; and two on the Tyne by Swan Hunter and Wigham Richardson.

At present building prices the new programme will cost BP £80 million, on top of a similar sum that it is already committed to spend under its earlier tanker building programme. Banks and institutional investors are providing £40 million towards the cost of the earlier programme, but the company may not find it altogether easy to raise more finance by similar methods for the new one. As the chairman reminded shareholders two months ago, the tanker building programme and other capital expenditure "will necessitate the continued retention in the business of a very substantial proportion of the earnings."

UK TRADE

The Growing Adverse Balance

LATEST returns of British overseas trade provide no firmer evidence of renewed inflation than did the statistics of production discussed in these notes last week. They do indicate that Britain is still paying a heavy price for the dislocation of oil supplies following the Suez crisis, and that some industries—the timber industry for one—are building up stocks that were run down last year. But however qualified, the deterioration in the balance of trade is not pleasant. In April and May together imports averaged £362 million a month (cif), nearly £34 million more than in the same months of 1956; exports, at £287½ million a month (fob), were only £17½ million more. With re-exports £3½ million lower at just over £10 million a month, the gross visible deficit was £64½ million a month, nearly £20 million more than in April-May last year.

UNITED KINGDOM TRADE
(Monthly averages—£ million)

	Imports			Exports		
	April-May, 1956	1st qtr, 1957	April-May, 1957	April-May, 1956	1st qtr, 1957	April-May, 1957
Foods, etc.	120·9	136·5	129·4	14·6	15·2	18·0
Basic materials	92·4	100·1	103·0	9·8	11·4	11·1
Coal	4·2	2·6	2·9	5·1	6·7	5·1
Petroleum	31·7	34·7	42·4	8·0	8·0	7·7
Manufactures	78·0	77·4	80·5	226·5	230·9	239·4
Iron and steel	10·6	6·4	6·5	15·5	17·5	19·7
Total	328·3	352·7	362·1	270·1	278·8	287·5

One-third of the increase in imports is attributable to petroleum and petroleum products. Arrivals of oil from the Middle East are recovering, and prices are still high. Total imports of petroleum in the two months averaged £42.4 million; the quantity was only three per cent higher than in April-May last year, but the value was over one-third higher (last month, for the first time since the Suez crisis, the price index of imported fuels dropped—by seven points to 138 [1954=100]). Imports of foods and basic materials were each roughly £10 million higher than a year ago. The outstanding increase in the food group was in raw sugar, which at £17 million a month was 74 per cent higher in value and 18 per cent higher in volume. Among basic materials imports of raw wool were one-third higher in value, but only three per cent up in volume. Arrivals of woodpulp, at £9½ million a month, rose by 19 per cent compared with a year ago and arrivals of timber, at £11½ million a month, rose by 18 per cent. Among manufactured goods, arrivals of iron and steel were nearly 40 per cent lower than a year ago.

Exports in April and May showed an increase of seven per cent over the same months of last year. Engineering products, the largest group, totalled over £117 million a month, 4½ per cent higher than in April-May last year. Shipments of non-electric machinery, at £48½ million a month, were 9 per cent up and metals, at nearly £43 million a month, were 13 per cent up. Exports of cars and chassis were 28 per cent higher than a year ago, at £14 million a month; a sharp fall in shipments to Australia was more than offset by record shipments to the United States. Exports of commercial vehicles and chassis were recovering, but were still five per cent less than a year ago. The rise of imports needs to be watched, for exports are not keeping pace but it may not yet be time to sound an alarm.

MOTOR INDUSTRY

Cars at the Peak

IN any year the car industry should be doing well at about this time. But its rate of recovery in the past few months is much more than seasonal. Since January, when things first started to improve, the industry's daily rate of output has risen month by month until in May it topped the 4,000 mark for the first time and was nearly 50 per cent higher than in January. The industry's previous best month had been October, 1955, just before the market broke. These are encouraging figures and reports from manufacturers and dealers suggest that June will have been even better. But the question the industry is asking itself is how much of this recovery is permanent gain.

The stimulus home sales got from the cut in the minimum hire purchase deposit from 50 per cent to 20 per cent last December was clearly quite substantial. So far, however, last month's return to a 33⅓ per cent minimum does not appear to have made any noticeable impact. In fact, though registrations are known only up to April, it would seem that sales in May and June were probably better than in 1956—for the first time this year. In time the new deposit terms are bound to have some effect, if only by depressing the prices and trade-in values of second-hand models. The autumn and winter, too, are not very far away and they are again likely to have their usual chilling effect upon the home market. Even so, total sales by the end of the year are unlikely to be less than the 400,000 sold in 1956.

Exports look more hopeful and last year's total of 318,000 should be comfortably beaten. Shipments are already well above last year and are even higher than two years ago, with North American and European markets showing most improvement. Recent Australian import relaxations should also soon lead to higher sales there. But these gains are no better than those other car manufacturing countries are making. West German output is well set to reach a million this year, of which nearly a half will be exported; French

Australia Opens the Door to Japan

WHILE Canada is pressing for a Commonwealth trade conference Japan is prising open the door to the Australian market. The trade agreement between Australia and Japan, which is due to be signed in Tokyo next month, has already provoked an outcry from certain sections of the Lancashire cotton textile industry. The Rayon Weaving Association has sent a telegram to the Australian High Commissioner in London expressing "deep concern which cannot be over-emphasised," and urging the Commonwealth government to reconsider a step "so injurious" to Lancashire's exports.

Australia has been obliged to negotiate the agreement to safeguard its market for raw wool. Japan has become such a big buyer of Australian wool—second only to Britain this season—that the balance of trade is heavily in Australia's favour. Australia could not hope to maintain that one-sided balance indefinitely, and Japan has not been slow to exploit its bargaining power. (New Zealand is also considering a trade agreement with Japan.) To help towards redressing the balance Australia, it is understood, has offered to remove discriminatory tariff and quantitative restrictions against imports from Japan. In return, Japan undertakes to remove its own discriminations—by rationing foreign exchange and other more devious means—against Australian goods. Japan will be expected to practise restraint in selling to Australia—as it undertakes to do in certain other markets—but the Commonwealth government will use its existing powers to protect domestic industries in the last resort.

The new agreement will grant Japan the most-favoured-nation rate of import duty in place of the general rate. Examples of the difference between the general and MFN rates on certain items of interest to Britain and Japan are shown in the table. On many items in the Australian tariff the general and MFN rates are the same.

Prices of Japanese consumer goods are generally so much lower than British prices that the granting of MFN treatment is hardly crucial. Of more significance to British and other exporters—and Australian manufacturers too—is that Japan will in future compete freely for a share of the import quotas for non-dollar supplies. The existing quantitative restrictions on Japanese goods are severe; Japan's share of the Australian market in 1955-56 was less than 3 per cent. The new trade agreement will certainly intensify competition in this market, but whether Lancashire's worst fears are justified remains to be seen.

SOME AUSTRALIAN IMPORT DUTIES

production is still higher than Britain's and its overseas sales, though lower, have also been increasing.

Among car makers here the gains are unevenly spread. Ford is now producing 1,600 vehicles a day, of which a record 1,200 are cars compared with only 500 a day last December. Vauxhall does not say what its present rate actually is, except that it is 18 per cent higher than its previous best; the company's expansion programme, which will give it an annual capacity of 175,000 cars (including 100,000 Victors) and 75,000 vans and lorries, is now almost complete. Both BMC and Rootes are also producing more than a year ago; but while Rootes has reached a new peak BMC's output is still somewhat below its previous best two years ago. Standard's car output is up on last year, too, and production of the new Ferguson tractor is now about a seventh greater than the rate of 70,000 a year achieved with the old model before last year's strike. The firm's total labour force, now standing at 10,500, is still about 500 below what it was then, though it expects to reach its planned tractor capacity of 100,000 a year within a few months.

Racing and the United States

THE brightest feature of this year's performance by the car industry is its great success in the United States, which has now become its biggest single market. Already the 1956 level of sales, 38,000, has been passed, and it is mainly the family saloon type cars, like the Nash Metropolitan, the Ford and Hillman models, that are chalking up really large sales. Ford has recently put the distribution of its models into the hands of American Ford dealers and aims to sell 20,000 cars there this year against just over 4,000 last year.

The traditional market for British cars in the United States, however, has been in sports models, with MG and Jaguar in recent years competing for top place. MG has now leapt ahead, selling as many as Jaguar, Triumph, and Austin Healey put together. The new Triumph has met a good response and Jaguar sales should receive another fillip from the latest success at Le Mans. This company withdrew from sports car racing last year, leaving the door open for occasional reappearances in the future, as it found, like most other manufacturers here and on the Continent, that too much of its research and development effort was taken up preparing cars solely for competitive racing. Jaguar is still providing technical assistance to a select band of drivers racing its cars, and is fully seized of the prestige and sales value of winning events like Le Mans—and also of the technical improvements forced by competitive racing. But few manufacturers of cars for sale are now prepared to give continual support to works' entries.

SUEZ CANAL COMPANY

The Boys without the Jobs

THE Suez Canal Company has a valid and big claim to compensation. Nothing that has happened since the canal was expropriated and least of all the fact that the company's other assets make it a great and wealthy investment trust should be allowed to obscure that fact. Both the company's report presented on Monday and the speech of the President M. François Charles-Roux rightly did what was possible to prevent it being lost sight of. There will be sympathy for his suggestion that the British, French and American Government should earmark some of the blocked Egyptian assets for compensation. Whether it would now be practicable to dissociate canal compensation from the mass of other claims and counter claims is another matter. There is sense too in the directors' suggestion that when Egypt goes, as sooner or later it must, to America for capital, lenders will ask that Egypt should first settle its account with the company.

Shareholders can well have approved that line of argument. It is more difficult to understand their apparent approval of the company's plans for the future and extremely difficult to understand how the British Government's representatives on the board (and Britain holds 40 per cent of the shares though not of the voting power) can have accepted them. The obvious solution now is first to negotiate on compensation and then to liquidate. But "your board rejected this solution." Instead shareholders were asked to approve resolutions bringing the company wholly under French law and therefore to some extent abolishing its international appearance. They also authorised the board to employ its assets present and future on research projects, on acquiring holdings in companies and in participating in financial, commercial, industrial, mining and real estate ventures. In answer to a question M. Georges-Picot confirmed that the company is participating in the Channel Tunnel research project though, some shareholders may think fortunately, it is not yet committed to take part in the actual financing of the tunnel. The directors seem to envisage a canal company without a canal but with great wealth standing door keeper to an unbuilt Channel Tunnel. Is that what the shareholders want?

ATOMIC INSURANCE

New Kinds of Risk

IT is some time since the London insurance market has declared itself in principle ready to insure against the hazards of atomic energy; but its members remained uncertain about how to carry out this principle in practice. The report now published by the British Insurance Association therefore concentrates entirely on these detailed questions of procedure; it is written throughout on the assumption that the companies intend to do business and require guidance merely on the wisest way of setting about it.

The special risks attending a nuclear reactor are two-fold. A single accident may damage the reactor beyond repair, which is unusual in other plants, and it may also cause serious radio-active contamination of neighbouring land and buildings. Radioactive contamination, with heavy third party claims, need not necessarily follow an accident, but it is a possibility that has to be borne in mind. A curious aspect of such contamination is that it may do no physical damage, in the way that fire or explosion does. The claims that the insurers will have to face are not for repairs and reconstruction, but for the cost of decontamination (perhaps 5 to 10 per cent of the cost of a valuable building), of spoilt crops, unusable land and tainted water, over a region anything from one to five miles downwind of a nuclear power station. The report does not put any probable figure to the size of claim that insurers might have to meet, but the companies themselves are working on a rough estimate of perhaps £30 million for the total loss of a reactor in a

Why men leave home

Jane, aged 21, a native of Pinner, on why men leave home :—

"Cups and spotty saucers are like factories and offices, nobody would think of drinking out of a discoloured or cracked cup; I don't think folk like it any better when they pass a factory, office, hospital, school or home with the outside showing nobody cares much about its appearance. People guess the inside is probably worse still.

"Costs of decorating ?

"Why don't you ring BYRon 5555 and have a word with the people I work for, Abbott of Harrow. They are painting some of the largest factories in England and have just completed the spectacular new London Airport. Their specialists have been busy at Royal Ascot. Other skilled craftsmen are decorating the extensions at Grosvenor House, Park Lane, to an elegant colour scheme."

ABBOTT OF HARROW, the Painters and Decorators, Sherbourne House, Northolt Road, Harrow, Middlesex.

ABBOTT OF HARROW keep Britain Beautiful

power station, with a further £10 million to meet third party claims. The death roll in an atomic accident is not likely to be high ; provided people are moved quickly out of a contaminated area, they can tolerate fairly heavy doses of radiation.

Protection for Outsiders

WHAT premiums companies may charge in insuring nuclear reactors in power stations or elsewhere will depend on their own assessment of the risks inherent in a particular reactor, the site chosen (particularly if it is liable to earthquakes), the number of people living near it at any time and the strength and direction of the prevailing winds. But the report suggests two rules that should always be followed: the owner of the atomic plant should agree to be liable for all third party risks, and the companies themselves should set up a pool in order to meet the direct liabilities for possible destruction of reactors. They did in fact take steps to do so at the beginning of the year, when a special committee was set up nominally to deal with atomic inquiries, in fact to assess the size of the funds that might be contributed to the pool. It was really only after they had satisfied themselves about its size that the company decided to go out for atomic business.

There remains the problem raised in the report about existing fire insurance policies held by outside firms and individuals. In the opinion of counsel, some of these could be assumed to provide cover against radioactive risks, even though no such thing existed when they were first drawn up. Some swift re-wording is suggested to remove the ambiguity. If companies are to be liable for these peculiar atomic risks they should, the committee suggests, say so in black and white.

SELECTION TRUST SCHEME

Privileged Shareholders

AMONG all the plans to encourage employees to become shareholders in the business where they work the scheme propounded by Sir Ronald Prain for the Selection Trust group of copper companies seems the most novel and some would say the most progressive. There is no qualifying period for employment. All may enter at once provided they earn the qualifying minimum basic salary of £200 a year. That figure lets in all the 3,500 European employees of the group and about 500 Africans. All may pull out (under certain disabilities) at will and may vary the amount of their subscriptions and there is an apparently watertight guarantee against loss through any fall in the value of the shares bought. Tax liability cannot be avoided but the tax authorities have granted a concession.

Every eligible employee may choose to invest up to 10 per cent of his basic salary (excluding overtime and copper bonus and subject to a maximum of £25 a month) in either Rhodesian Selection Trust or Roan Antelope or any mixture of the two. The employing company will put £5 to each £10 that the employee puts in and the whole will be invested by trustees through the market according to the member's instructions. The trustees will pay him his dividends and vote his shares according to his wishes so far as the law allows. The employee may claim his shares at any time and if when he does so the market value of the shares he is entitled to receive is less than the money he himself has put up, the difference will be made up by the employing company in cash. When he withdraws the employee is liable to tax on the value of the shares that the company has paid for (naturally not on those he has paid for himself out of his owned taxed income) but the tax authority has agreed that he may reduce that liability by any depreciation he has suffered on the shares he has paid for himself.

The one restriction is that in order to obtain in full the shares bought on his behalf by the company the employee must allow his investment to "mature" with the trustees for five years. He can take away the shares he has paid for himself at any time. But if he does so before they have "matured" for five years he will not receive all the shares that the company has bought for him. A withdrawal in the second year entitles him to 20 per cent of the shares that the company has paid for ; in the third year the scale is 40 per cent. The scheme is generous ; it must have the effect of retaining labour because an employee who leaves the group is deemed to have withdrawn at that date. The ground for criticism, if there is one, must come not from the workers but from existing shareholders. Copper shares fluctuate widely. In guaranteeing against loss the employers have taken on an incalculable, and it might be a substantial, liability.

EXPORT CREDITS

Stand Against 7-year Credit

WITH commendable firmness the International Union of Credit Insurers has set its face against the use of export credit insurance to enable importing countries to secure extended credit from their overseas suppliers. The terms of years that some countries are now seeking, as the union pointed out in a statement after its annual conference in Edinburgh last week, are frequently longer than those generally accepted by the insurers of export credits and the union is not prepared to submit to pressure towards accepting them. The Indian government, which intends to set up an export credits insurance scheme and sent an observer to the conference, has a considerable interest in this matter. In an attempt to eke out its dwindling reserves India recently announced that import licences for a wide range of capital goods would be granted only if the importer secured seven years' credit from the supplier. That is a matter for the supplier to decide; but if he grants the credit he will not be able to insure it.

Outside the Soviet block, exporters generally appear to be holding to five years as the maximum credit period for large capital projects (except for some special projects such as the third Indian steel plant), and credits for consumer goods have been kept to six months or less. But between these limits there is some evidence that credit terms are being stretched, with two-year credits tending to become three-year, and so on down the line. If this trend continues it may be difficult to maintain the five-year limit for big capital goods.

At this year's conference the new Australian Export Payments Insurance Corporation was admitted to membership, and the Export-Import Bank, which has attended several conferences as an observer, was admitted to a specially devised associate membership. By the nature of its operations the bank is ineligible for ordinary membership. Associate status will bring the bank some benefits

through exchange of information, but is chiefly important as an earnest of the bank's goodwill. It may now be expected to draw still closer to the union's standard on credit terms where the bank's operations are similar to those of the other members.

BUILDING SOCIETIES

The Watchful Registrar

THERE need be no surprise, and certainly no alarm, among the general body of building society investors at the disclosure by the Chancellor of the Exchequer that the Chief Registrar of Friendly Societies "*is at present investigating* the affairs of some building societies to determine whether or not they should be directed to refrain from inviting further subscriptions from members of the public." In Sir Cecil Crabbe the public has a Chief Registrar of vigour who will use his powers in a way far more likely to uphold the investment status of the building societies than to damage it. The names of the societies he is investigating are not disclosed unless he makes an order restraining them from advertising for subscriptions or deposits ; but in the movement it is believed that they do not include any member of the Building Societies Association.

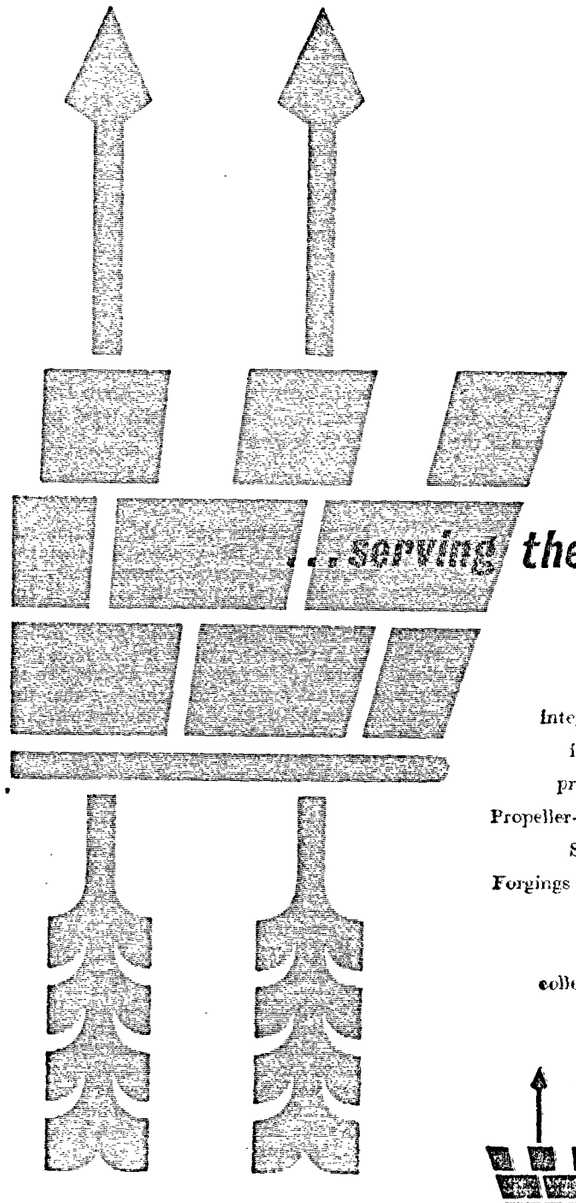
In his report for 1956 the Registrar disclosed three grounds upon which he initiated eleven investigations started last year: (1) unsatisfactory financial position ; (2) lending of the societies' funds on doubtful security ; (3) use of the societies' funds for financing companies with which the societies' directors are connected. At the date of his last report orders were in force on ten societies, all of them small. Nine investigations were in progress at the end of 1956.

The Chief Registrar's power to prevent, with Treasury consent, an unstable society from advertising for further money is a valid protection for investors both existing and potential. It discourages the new investor from coming in. The existing investor, if he wants his money out, may have to wait, but should gradually be able to get it as the repayment of existing mortgages puts the society in funds. The fact that the Registrar is active might make investors wary of very small societies that spend a high proportion of their income on advertising. But it should do nothing to discourage the regular saver from using the well-established societies. It is on regular savers that the well-established societies are now increasingly concentrating. This week the Co-operative Permanent, which already has ten-year and four-year plans for regular monthly savings, announces a seven-year scheme. Subscriptions may be in multiples of £1 per month up to £6 a month. The rate offered is £4 5s. per cent net if the subscriptions continue regularly for the full seven years ; £3 per cent if the account is closed between the fifth and seventh anniversary ; £2 10s. between the first and fifth anniversaries, and nothing if it is closed within a year.

GOLD MINING

The Industry and the Union

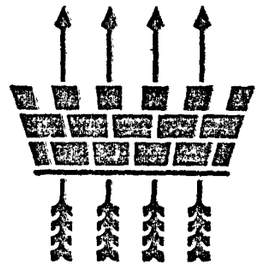
FROM the figures of the South African goldmining industry's performance in 1956 produced by Mr C. B. Anderson in his Presidential address to the Transvaal and Orange Free State Chamber of Mines on Monday, it is clear that gold mining has many blessings to count as well as a few troubles. Its production is rising. In 1956 it topped 15 million ounces for the first time, amounting to 15.4 million against 14.1 million in 1955. Its revenue amounted to £193 million against £177 million and profit per ton milled at 14s. 4d. compared with 13s. 5d. in 1955 was the best since 1951. Gold mining is not an industry in which profit margins are being squeezed. Working costs are rising. They amounted to a record figure of 42s. 11d. per ton milled against 40s. 5d. in 1955, but they are being offset by the higher grade of ore coming from the newer mining areas of the Orange Free State and the Klerksdorp areas, and, as Mr Anderson showed, less than 55 per cent of South Africa's gold production now comes from the older areas of the Rand.



That may answer the industry's oft repeated plea for a higher price for gold. Gold does indeed suffer from a fixed price that has not risen with other commodities, but it also enjoys an insatiable demand at that price and the opening of a rich new area like the Orange Free State carries no risk of bringing prices down. Indeed, Mr Anderson wrote off any hopes of an early change in the gold price. The figures, however, do provide a formidable reply on behalf of the industry to the demand of the government that the so-called "vulnerable mines" (the older mines on the Rand) should be kept in production beyond their economic limit, in order to cushion the impact of their closure on local economies. For the good of the industry and indeed of South Africa, the job is to move from the vulnerable mines as they become exhausted and to press on with the development of the richer new areas. A government request to prolong the lives of these vulnerable mines beyond the stage of profitability has been met, Mr Anderson discloses, by counter proposals from the gold producers committee of the Chamber. He hinted that closure might be postponed but that any such postponement "cannot be unduly prolonged."

SHORTER NOTES

The Minister of Power this week gave his consent to the construction of a nuclear power station at Hinkley Point, Somerset, observing that sites as suitable as this one were hard to find and that he did not think a power station there "would seriously affect the amenities in this sparsely populated area or be unduly conspicuous when seen from neighbouring viewpoints such as the Quantock Hills and Brean Down." The station at Hinkley is to have a capacity of 500,000 kilowatts, seven times that of Calder Hall.



* * *

Fuller details of the latest agreement on exchange of information between Britain's Atomic Energy Authority and America's Atomic Energy Commission, announced in the Commons this week, confirm that AEC is to be given details of the Calder Hall reactor including developments up to January 1, 1957. American firms holding "access permits" from AEC will be able to have "a body of information that is adequate, in the view of AEA, for the evaluation of the gas-cooled graphite-moderated power reactor." If they want more, they can negotiate licensing arrangements with the British groups of contractors now building power reactors for the Central Electricity Authority.

...serving the Automotive industry

With the specialist knowledge of so many famous companies integrated within the concept and compass of the Birfield Group, it is hardly surprising that each newly announced automotive project inevitably features Birfield products in its specification. Propeller-shafts by Hardy Spicer; Laycock de Normanville Overdrive; Salisbury Hypoid axles; connecting-rod and other forgings by Forgings and Presswork . . . Filters and Strainers by Intermit Ltd . . . these are but a few of the automotive products of Birfield Group experience and resources which, separately or collectively, enhance the performance of almost every British car currently in production.

Mr R. W. Tolson, who lost his seat on the Board of the Halifax Building Society when Mr Fred Bentley was elected to it on April 1st, has been reappointed a director of that society. Mr T. B. Simpson, a Leeds solicitor and company director, has also been appointed to the society's board.

* * *

Airwork and Hunting-Clan, the independent British airline operators now running "colonial coach services" to Africa, are to be allowed to use more modern airliners such as Viscounts on their services to Nairobi and Salisbury (though the frequency of these services will be slightly reduced to allow for the greater capacity of the newer aircraft); and when the cheap T34 type tourist services begin to Ghana, they will be allowed 30 per cent of the British capacity for such services, with no restrictions on aircraft. But BOAC will still have 70 per cent of the British aircraft capacity needed for this air traffic to Ghana.

Cinemas in Britain last year sold 7 per cent fewer seats than in 1955, and though they increased seat prices, their gross box-office takings were about 1½ per cent down—lower than in any year since 1950, when total takings began to be recorded officially. Because prices were up, so was entertainments duty: after paying for the hire of films, exhibitors were left with just over £44 million from the box-office, about £1¼ million less than the year before. Total wages and salaries, which continued to rise though employment declined, were taking about 42 per cent of this at the end of last year.

* * *

Freer Trade in Europe, published by the Treasury at 2s., describes the proposals for a common market and a free trade area; answers some of the questions raised by these proposals; provides some basic facts about Western Europe and the free trade area; and summarises the tariff provisions of the common market treaty.

COMPANY AFFAIRS

COURTAULDS

COURTAULDS' preliminary statement showed a drop of £3 million in trading profits. Indeed the order of the year's figures had been disclosed in April when the merger proposals with British Celanese were first announced and the 10 per cent total dividend had also been foreshadowed. The balance sheet and profit and loss account cover the year to March 31st, before the merger was announced. In view of the merger, the chairman, Sir John Hanbury-Williams, is leaving his statement to be made at the meeting on July 17th instead of circulating it with the report. In these circumstances the full accounts can scarcely excite shareholders. But they can glean much of interest from the directors' exceptionally full report.

They will learn of important off-sets to the leaner times through which the rayon industry and much of Courtaulds' business has been passing. One of these is British Cellophane which showed "very satisfactory results." It is now working to capacity; the new plant at Barrow-in-Furness, still in the early stages of construction, is to be ready for production early in 1959.

Evidently, too, the board is determined, despite narrow margins, to remain in the forefront of textile development. Group capital commitments at March 31st were £5,050,000 though the figure means little partly because it naturally excludes anything that British Celanese may have on its books, and because it does not cover plans for capital development, including those for the acrylic fibre, for which orders have not yet been placed. The directors state that the total will involve "very large sums over and above the actual commitments to date." Plans for the production of the acrylic fibre "Courtelle" are well advanced and steps are being taken to deal with the increasing demand for the triacetate fibre "Courpleta." Shareholders cannot fail to draw the obvious inference from the fact that though the prices of staple fibre and industrial yarns remain unchanged as they have for six years the prices of textile yarns were raised about 10 per cent in January, which is quite late in Courtaulds' financial year. The higher prices will presumably affect the whole of this current year. For the first time it has been possible to consolidate the accounts of "Saicor" (South African Industrial Cellulose Corporation) in which Courtaulds holds two-thirds and the Industrial Development Corporation of South Africa the minority. That change explains a rise of £3.8 million to £27.7 million in group stocks, while interest on CDFC's £2 million 6 per cent loan to Saicor becomes a charge against group earnings.

Again this year the company is allotting to trustees a sum equal to 6 per cent of the gross cost of the ordinary dividend which will be used to buy shares for employees. The cost will be £289,232. Closely comparable sums were used in 1954-5 and in 1955-6 and the number of participants has also remained nearly steady at a little over 14,000. But the price of the shares has moved widely: it was 52s. 6d. in 1955 and 33s. 10d. in 1956, so that the nominal amount of stock bought rose from £79,453 to £125,940. This year the investment has still to be made. At a guess the number of shares bought should be about the same as in 1956.

BRITISH NYLON SPINNERS

TO have an unsatisfied demand, a virtual monopoly and a shortage of raw material is a fate shared by few textile companies in this country. British Nylon Spinners was in this position last year. As the table shows, the company experienced somewhat lower profits but the directors' report shows that it enjoyed sharply rising turnover. Indeed the fall in earnings from £11.8 million to £10.2 million, while it reflects in part increased wages and welfare costs, resulted mainly from the fact that the price reduction of 1955 affected earnings for the whole of 1956 against only the last quarter of 1955. The reduction in earnings was cushioned by rising turnover. Now the factory extensions at Pontypool have been completed. So has

	Years to Dec. 31, 1955	1956
Consolidated earnings:	£	£
Gross profit	11,825,751	10,217,549
Depreciation and replacement provisions	1,175,116	1,410,225
Taxation	5,445,000	5,040,000
Net profit	5,392,966	4,125,019
Ordinary dividends	1,380,000	1,656,000

the rebuilding of the former British Bemberg factory at Doncaster, and it is from Doncaster, where increases in the labour force can be more easily secured, that much of the future expansion must come. Good progress is also being made with the Australian subsidiary's factory at Melbourne.

By implication the two equal partners of British Nylon Spinners—ICI and Courtaulds—feel sure that they could sell much more nylon yarn and staple to the weaving, hosiery and warp knitting industries if they had it. They feel at least confident enough to draw out a bigger dividend from the smaller earnings of 1956. The issued capital, all in ordinary shares, was increased during last year from £12 million to £18 million by a scrip issue and this year's dividends are equivalent to 16 per cent on the new figure, the previous year's payments of 20 per cent on the old capital being the equivalent of 13⅓ per cent.

The immediate future seems to depend on how soon ICI can supply in increased volume the polymer that Doncaster needs; the prospects are reasonable. If the demand holds the raw material

should be flowing well towards the end of this year. That implies that 1958 rather than this year should see a further jump forward in output. By then Australia too should be showing a rising output.

BRITISH AND COMMONWEALTH SHIPPING

THERE is a sprightly air about the full accounts of British and Commonwealth Shipping Company, the child of the Clan Line and Union Castle merger. Perhaps the merger has blown away some of the conservatism of the past. As well as the formal accounts and directors' report there is a chatty (though not especially informative) description of the passenger and cargo trades, embellished with photographs and cartoons. But there are still shortcomings. The accounts are drawn up in keeping with the Companies (Shipping Companies Exemption) Order, 1948, thus keeping some information from shareholders as

	Years to Dec. 31, 1955	1956

Ordinary capital	6,430,000	6,430,000

On the 17½ per cent. dividend the 10s. units at 43s. 9d. xd yield £4 per cent.

well as competitors; secondly, there is no chairman's statement with the report.

That omission is to be regretted, for though shipping was booming last year the rise in profits from £8,265,433 to £10,943,636 seems to call for some comment. So do the current year's prospects now that freights have fallen sharply. That is all the more regrettable because the directors have followed the declaration of an ordinary dividend of 17½ per cent (1½ per cent bigger than the original forecast) with a 5 per cent scrip issue. Given the company's big shipbuilding programme, they can hardly have done so except in the belief that this year's profits would justify the maintenance of this rate on the increased capital. For guidance on this particular point, shareholders have to await the annual meeting.

But they can attend it with the knowledge that the company has an immense shipbuilding programme in front of it. Its capital commitments are estimated at £34½ million, of which £10.3 million is in respect of vessels for which berths have been reserved but for which formal contracts have not been exchanged. That programme is not far short of the written down value of £37½ million on the present fleet. To meet its costs, the group has £14.8 million in quoted securities and £13.7 million in other liquid assets. But on the liabilities side future tax reserves amount to nearly £10 million.

METAL BOX

THE pressure on the domestic profit margins of Metal Box was discussed in these columns on June 8th. The full accounts of the company for the year to March 31st now reveal the source of that pressure. The turnover of the home group rose from £47.4 million to £53.1 million, but its trading profit came down from £4,055,000 to £3,883,000. Yet wages and salaries (up in total from £9,170,000 to £10,268,000) took exactly the same proportion—19.3 per cent—from the gross trading account. On the other hand, the cost of materials took 68.5 per cent (or £36.4 million), compared with 67.5 per cent (or £31.9 million) in 1955-56.

Metal Box kept its own prices down, but within the last twelve months the price of its principal raw material, tinplate, was raised twice. Moreover, the group had to buy hand mill plate, which the chairman, Sir Robert Barlow, describes as "inferior in quality, expensive in price and inefficient in utilisation." The successful start to production at the Steel Company of Wales's plant at Velindre has ensured an "adequate supply of good quality cold reduced plate" and Metal Box's orders for hand mill plate are being tapered off. But Sir Robert is afraid that another increase in the price of tinplate is imminent. Thus though he expects sales to increase again this year, costs will continue to rise and he does not expect "any considerable advance" in profits during the year. But Metal Box (Overseas) continues to do well and both at home and overseas new plant is coming into production. And the directors have indicated a belief in the soundness of current prospects and in the brightness of more distant ones by raising the ordinary dividend from 10 to 11 per cent.

BOOTS PURE DRUG

MR J. P. SAVAGE, the chairman of Boots Pure Drug Company, describes the year to March 31st as difficult. But his statement also shows that it was a year in which the difficulties were squarely met and overcome. Sales rose by over 8 per cent to £72¼ million; gross profits, thanks in particular to the activities of the chemical division, rose from £4,390,637 to £4,754,998; operating costs were rising but total expenses represented a smaller percentage of turnover than in the previous year; and the ordinary dividend was raised from 14 to 16 per cent. Although sales rose by £5½ million, stocks, thanks to a careful review of the group's investment in working capital, were reduced by about £1 million to under £14.4 million. And although £2.4 million was spent on capital account, a bank overdraft of £300,000 was turned into a cash balance of £757,000. Over the year, fourteen shops were closed and twelve new ones were opened and 35 major schemes to modernise and extend the group's shop premises were completed.

These are all creditable achievements. Nor do they represent the end of the road. Mr Savage says that "further progress" in stock control is possible; that the company will continue to close unprofitable shops in unsatisfactory locations and will continue to open new ones in developing areas; and that the aim is to modernise (and if necessary to enlarge) about 65 shops a year. Moreover, he describes the current year as being "much brighter" in prospect, as there has already been "a clear improvement in the level of trade." Thus it seems Boots is another chain of multiple shops which is keeping abreast of the times. One further indication of this is the directors' proposal to revalue the group's freehold and long leasehold properties. Shareholders will then gain some idea of the up-to-date worth of the business. And they may ask whether Boots will follow another fashionable trend in the multiple empires of following a property revaluation with a scrip issue.

	Years to March 31, 1956	1957
Consolidated earnings:	£	£

5s. ordinary shares at 22s. 6d. yield £3 11s. per cent.

ALBERT E. REED

CONSOLIDATION against a background of less favourable trading conditions, is the way the chairman, Lord Cornwallis, sums up the experience of the Reed Paper Group in the year to March 31st. Evidence of consolidation can be found in the acquisition of Colthrop Board and Paper Mills, Cropper and Company and Cut-Outs (Cartons) during the year and in the spending of £5½ million on capital account. Evidence of less favourable trading conditions can be found in the drop in trading profits from £6,671,182 to £5,691,434 despite an increase in turnover from £53.6 million to £58.5 million; the newly acquired subsidiaries contributed £3.8 million to sales and £316,877 to profits. The fall in profit margins was due to increases in the cost of wages, transport and fuel.

There was some improvement in trade in the last quarter of the financial year but the chairman says "the paper industry is bound to feel the effects of diffi-

culties in the international situation and continuation of the credit squeeze." He detects "an element of caution apparent throughout the whole economy" which "must affect many sections of the Reed Group's activity." But the Reed group is well diversified: its sales were split as to 36 per cent in converted packaging products, 34½ per cent in wrapping paper, 16 per cent in printing papers, 8 per cent in newsprint and 5½ per cent in miscellaneous products. That is the background to the qualified, cautious welcome given by Lord Cornwallis to the European free trade area, in which, he insists, there must be such safeguards as an "equal opportunity of access to the area's raw materials and elimination of unfair competitive practices."

On the nearer prospect, Lord Cornwallis suggests that the volume of new capacity now being installed in the paper industry (and the Reed group is not behind its competitors in installing new capacity) may mean that in the next two or three years "the demand for paper products will be temporarily overtaken." Investors are aware of this possibility and paper shares are not now as popular as they were. The £1 ordinary units of Albert E. Reed stand at 44s. 6d. xd. and on the latest full year's dividend of 16 per cent yield 7.2 per cent.

BRITISH PLASTER BOARD

THE fortunes of British Plaster Board are partly tied to those of the building industry. But the interests of the group also spread beyond plaster board and gypsum to engineering and paper; indeed, a year ago the chairman revealed that about 40 per cent of the group's profits arose outside the building industry. Diversification has been linked with an attempt to reduce operating costs. These policies have obviously stood the company in good stead, for in the year to March 31st the total income of the group expanded from £2,801,395 to £3,263,294.

Bigger charges for taxation (up from £1,199,932 to £1,503,871) and for depreciation (up from £596,346 to £679,154) have cut into this increase. But net profits have risen slightly, from £1,005,117 to £1,080,269, and the directors have left the ordinary dividend at 12½ per cent (absorbing £474,505 net). Since the trading results were announced, the 10s. ordinary units have gained 3d., to 17s. 9d., to yield £7 1s. per cent.

BLACKWOOD HODGE (HOLDINGS)

IN the year to October 31st last, the consolidated gross profits of Blackwood Hodge (Holdings), the distributors of earth-moving equipment, jumped from £745,528 to £1,278,806 and the chairman, Mr Bernard Sunley, forecasts a "satisfactory" result for the current financial year. Yet the directors are content to leave the ordinary dividend unchanged at 10 per cent.

The reason for this decision is that the group has a capital financing problem. It is not of the usual kind, for the physical development programme is practically complete. But the company's working capital commitments have risen steeply and are likely to rise still more. And on October 31st, bank overdrafts of £2,169,001 swamped a cash balance of £307,725. Hence the directors' intentions of changing the name of the company, reorganising the board and capitalising £700,000 from reserves later in the year do not seem to imply any radical change in their distribution policy.

C. C. WAKEFIELD

THE sales of C. C. Wakefield, the leading independent distributor of lubricating oils, which buys its raw material from its leading competitors, the giant oil companies, advanced last year, but its trading profits fell from £3,842,727 to £3,353,382 and its ordinary dividend was left unchanged at 27½ per cent. Costs were rising and the company absorbed most of the increase. So far this year sales have been maintained. But if the terms governing the trade of "tied garages" became more restrictive, the independent company would have to fight hard to keep its place in the sun.

London Stock Exchange

FIRST DEALINGS: June 19 July 3 July 17
LAST DEALINGS: July 2 July 16 Aug. 6
ACCOUNT DAY: July 9 July 23 Aug. 13

MANY new low points for the year were recorded by gilt-edged stocks this week as prices drifted to within a fraction of the lowest level reached at the time of the Suez operation. During the week Old Consols and 2½ per cent Treasury both fell below 50, and losses in the nationalisation stocks ranged between ½ and ⅞. Although industrial stocks were affected by the weakness of gilt-edged and the earlier decline on Wall Street, some sharp rises were registered. The advance of 3s. 3d. to 22s. 6d. in Boots, on the proposed revaluation of its properties, helped to maintain the level of *The Economist* indicator at 222.2.

Banks again showed small losses, Barclays losing 1s. to 42s. 6d., while Union Discount weakened to 44s. 6d. Insurance shares strengthened, Victory Insurance jumping 6s. 3d. to 67s. 6d. on the doubling of the dividend. Stores again edged upwards, Hope Brothers rising 1s. 7½d. to 32s. 1½d. after the increase in dividend, while John Barker leapt a further 18s. 3d. to 86s. British Oxygen gained 2s. 3d. to 37s. 9d. Paper shares weakened following the chairman's statement at the meeting of A. E. Reed, whose shares dropped 1s. 6d. to 44s. xd. before recovering to 44s. 6d. xd. Tobaccos declined in anticipation of the Minister's statement. Hudson's Bay gained 21s. 6d. to 261s. 6d. on the plan to offer shares in the Oil and Gas Company.

Oils were generally lower on balance, in spite of a rally on Wednesday. Ultramar, however, advanced another 6s. 1½d. to 87s. 9d. ex the capital distribution and Attock Oil rose 3s. 9d. to 56s. 3d. following the increase in dividend before easing to 53s. 9d. Kaffirs rallied to finish higher on balance at Wednesday's close and Ashanti rose 2s. 3d. to 22s. 3d. Coppers recovered after falling sharply with the weakness in the metal. Rubbers were again consistently firm.

[1] For a rough conversion to basis of June, 1947, multiply throughout by 1·554. [2] The inactive index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the London and Cambridge Economic Service. [3] For a rough conversion to basis of June, 1947, multiply throughout by 1·561 [4] Surveys made twice a year; annual figures relate to October survey. [5] Revised figures, for May 28th: food 96·7 and items 96·9.

US Statistics

[1] 1939 figures calculated on the basis of a smaller sample. From January, 1957, as a result of a change in definition some 200,000 to 300,000 persons temporarily laid off or waiting to start new jobs formerly classed as employed are subsequently classed as unemployed. [2] 1939 figures not strictly comparable with rest of series; stocks are at end of period. [3] All commercial banks. [4] Annual figures are totals for the fiscal year ended June 30th. [5] Figure for fourth quarter. [6] Revised series; 1939 not strictly comparable with rest of series.

Financial Statistics

EXCHEQUER RETURNS

For the week ended June 22, 1957, there was an "above-line" deficit (after allowing for Sinking Funds) of £26,462,000 compared with a deficit of £33,828,000 in the previous week and a deficit of £13,802,000 in the corresponding period of last year. There was a net expenditure "below-line" last week of £3,652,000, leaving a total deficit from April 1st, of £124,951,000 (£168,739,000 in 1956–57).

THE MONEY MARKET

THE approach of the half-year end, when banks and other institutions still call loans for "window dressing," contributed to a tightening of credit in Lombard Street in the middle of the week. On Wednesday heavy withdrawals of funds were made, and despite fairly large special help one or two discount houses had to take loans at Bank rate, though for a very small amount. Rates on overnight loans ranged up to 3⅞ per cent; two months' maturities changed hands at 3 13/16 and 3¾ per cent. The market had also been in the Bank for a very small amount on Monday.

The Treasury bill rate fell again slightly at the tender on Friday of last week. The discount houses raised their common bid by 1d. to £99 0s. 9d. per cent. This move does not appear to have been followed by most outside applicants; and as total applications dropped further, by £15 million to £395 million, whilst the offer was raised by £10 million to £250 million, the allotted portion of the market's bid rose from 40 to 59 per cent, its highest this year. At yesterday's tender the offer was £260 million, £10 million more than matching maturities.

The Treasury bill rate in New York this week dropped back from 3.404 per cent, its highest since the early thirties, to 3.231 per cent.

The Bank return shows an outflow of notes of £5.0 million in the week to Wednesday.

We are all individuals

but some are more individual than others

That's just as true of business houses as it is of people. Martins Bank is a case in point, for it's a bank with a definite personality of its own. Although there are over 600 branches, Martins' system of decentralization—with District Offices acting as local Head Offices—fosters particularly close and friendly relations with its customers and also makes for quick decisions.

COMPANY MEETINGS

BOOTS PURE DRUG COMPANY LIMITED

69th ANNUAL GENERAL MEETING JULY 17, 1957

CHAIRMAN: J. P. SAVAGE

FURTHER INCREASE IN TURNOVER AND PROFITS

REVALUATION OF PROPERTIES AND CONTINUED RETAIL DEVELOPMENT

MR J. P. SAVAGE STRESSES THE HARMFUL EFFECTS OF THE PROFITS TAX

The sixty-ninth Annual General Meeting of Boots Pure Drug Company Limited will be held on July 17th at Nottingham. The following, in an abridged form, is the Statement by the Chairman, Mr J. P. Savage, which has been circulated with the Report and Accounts for the year ending March 31, 1957:

TURNOVER AND PROFITS

Our sales exceeded £72¼ million, an increase of over 8 per cent.

Our profits for the year amounted to £4,754,998 compared with £4,390,637. In addition we received certain payments under the National Health Scheme relating to previous years which after provision for tax amounted to £135,869. Despite the difficulties of the last year we have once again—for the seventh year in succession—been able to show an increase in our profits.

The provision for tax shows an increase from £2,309,661 to £2,643,671. The net profit of the group, including the back payments to which I have referred, is £2,191,828 compared with £2,029,454. The net profit of Boots Pure Drug Company Limited amounts to £1,994,377, compared with £1,736,015.

The balance brought forward amounts to £256,596 and tax provision no longer required to £34,154. This makes a total available of £2,285,127.

DIVIDEND AND RESERVES

We propose paying a final dividend of 10 per cent making a total of 16 per cent for the year compared with 14 per cent last year. This absorbs in all £942,080 net, compared with £824,320 last year.

We recommend that £900,000 should be placed to general reserve and £140,000 appropriated for Depreciation on freehold properties. We propose as before placing to capital reserve the tax relief in respect of Investment Allowances amounting to £23,200 for the Parent Company and £36,450 for the Subsidiaries. After deducting dividends paid and proposed, this leaves £224,216 to be carried forward to next year. Profits retained by the Subsidiaries amounted to £197,451.

PROSPERITY BONUS

We have always felt that both staff and shareholders ought to share in the prosperity of the business. We propose increasing the ordinary dividend paid to the shareholders and we propose repeating and extending the Prosperity Bonus paid to the staff. For staff with more than 30 years' service the bonus will be two weeks' pay and for the rest of the staff one week's pay. More than 2,500 of the staff have completed 30 years' service and will benefit from the additional payment.

It is a source of real personal pleasure to myself and my colleagues that we are able to express in this tangible form our appreciation of the way the staff have worked to build up the business and I am sure that our shareholders join us in this appreciation.

STOCK INVESTMENT

It is inevitable in a business so widespread and varied as ours that a very large amount of capital is required to finance our trading stocks. The figure at the end of the year was £14,365,459. This is £1 million less than last year although our sales increased by £5½ million. This represents an important advance in the constant effort we make to improve the use and return we get from the money invested in stocks.

EXPENDITURE

We have been faced with substantial increases in our running costs, but I am happy to say that our total expenses expressed as a percentage to turnover were lower in 1956-57 than for the previous year.

We set ourselves a target at the beginning of the year of £2,500,000 for our expenditure on buildings, plant and fittings as we felt that we could finance this sume out of our own resources. Our actual expenditure at £2,400,000 has come very close to this target. With the improvement in our profits and the reductions in our stocks we have been able both to provide the money to finance this development and to improve our cash position very substantially. On March 31st our cash balances amounted to £757,000; at the same time last year, taking the group as a whole, we were overdrawn by £300,000.

We regard it as a matter of the highest priority that we should bring our older shops up to date and that we should employ the most modern and effective techniques of display and selling. We are equally determined to extend our facilities where there is a public demand to be met. We have, therefore, drawn up a programme which envisages modernising all our shops over a period of years.

On the Manufacturing and Wholesale side of the business we have in the period since the end of the war considerably extended our activities. Our objective is to ensure that all our production resources are brought fully up to date and that our administrative facilities are modern and efficient.

We only wish we could set our sights even higher because it would be better for the development of the business and would result in greater economies from the point of view of the customer. Unfortunately a very strict limit is set to necessary capital development by the heavy burden of taxation which this Company like others has to bear. Sufficient capital development is one of the conditions of stable prices and there is probably no single factor which contributes more to the present inflationary pressure than the high level of company taxation. Whatever political justification may have existed at the time for the recent increases in the Profits Tax, the continued existence of that tax is now doing nothing but harm and the sooner the Government removes it the sooner it will be able to realise its aim of checking inflation.

REVALUATION OF PROPERTIES

We propose revaluing our freehold and long leasehold properties. Many of our properties were bought before 1939 and some before 1914. They stand in our books at a figure much below their real value. Our shareholders are entitled to know the true value of the Company's properties. In relation to the actual capital employed in the business our profits are just and reasonable, and it is important that this should be generally understood. There is great and proper public interest in the National Health Service, but many of the criticisms, which are made from time to time about the level of profits in the pharmaceutical industry, are not justified. We hope to have the preliminary results of the revaluation available by the late Autumn, and the full figures by the end of the year.

RETAIL DEVELOPMENT

In spite of a poor summer and unusually mild winter (conditions which are always unfavourable to the Chemist's trade) our retail sales increased in every department of our business. Our dispensing business was considerable affected by the imposition of the new levy in December, but I am satisfied that the service we give will ensure that we maintain our eminent position in this field.

During the year we closed fourteen shops and opened twelve new ones in districts where we had not previously been represented. We completed thirty-five major schemes involving the rebuilding, extensions or modernisation of our premises.

We are fully alive to the changes which are taking place in the pattern of retail distribution, particularly the increase in self-service and self-selection in certain trades, and we have ourselves embarked on a limited series of experiments in modified shop layout and shopfittings, the progress of which we shall watch with interest. We have always taken special pride in the standard of personal service given in our shops, and we shall continue to do so, making only those changes which will help us to improve this service and keep it up to date.

EXPORT

I have spent over six months on a visit to all our Subsidiary Overseas Companies and I have returned with a very deep appreciation of the high quality of the management in all of them. I was also impressed with the very excellent standard of the staff we have been able to recruit in Australia, New Zealand, Fiji, South Africa, India, Pakistan and the Far East. The improvement in the profit position in all these countries has been most encouraging, and already there are indications that the present year will break all records.

Sales made by the International Division have proved to be the highest we have ever achieved. The increase over the previous year was more than 20 per cent.

More proprietary specialities than in any previous year have been manufactured in our factories and supplied through the Wholesale Division to other Companies. We still have manufacturing capacity which we can place at the disposal of other firms who would like to avail themselves of our mass production facilities.

Sales to the British Government on special contracts made a substantial increase and wholesale sales of Chemicals and Specialities have also made good progress.

EUROPEAN FREE TRADE

We are giving much thought to the prospective free trading area project in Europe. t will undoubtedly call for a flexible pproach to our manufacturing operations, ut its value to us as an exporting Company ill be very much impaired unless the counies in the free trade area are persuaded to enounce their discriminatory practices in ddition to their customs duties.

PROSPECTS FOR THE COMING YEAR

The year which has just ended was a fficult one. The general policy of the overnment was to increase taxes and reduce nsumer expenditure. Despite this we were le to show a sizeable increase in our sales d report a higher profit. The coming year oks much brighter. There is already a ar improvement in the level of trade and hope that as the year progresses indusal production will increase. All this should can that people will have more money to end and we hope they will spend more at ots.

THE ASSOCIATED PORTLAND CEMENT MANUFACTURERS LIMITED

DELIVERIES CONSTITUTE A NEW RECORD

CONTINUING EXPANSION IN OVERSEAS MARKETS

The Annual General Meeting of The Associated Portland Cement Manufacturers Limited was held on June 26th in London, Mr J. A. E. Reiss, B.E.M. (Chairman and Managing Director), presiding.

The following is an extract from the Chairman's statement which accompanied the Report and Accounts sent to stockholders:

In the early part of last year Sir George Earle expressed his wish to retire from the position of Chairman. His association with the Company extends for over 45 years, and the last 11 years during which he has been Chairman has been a period of unprecedented expansion and profitability for the Group. We are indeed fortunate to be able to draw upon his wealth of experience in his position as President which he took up at the beginning of this year

ACCOUNTS AND DIVIDENDS

In the Consolidated Accounts the Surplus on Trading is £13,672,867, an increase of £599,186. This is due to the expansion in the trade of those Companies in which we are interested overseas and more than offsets the decrease in this Company's Surplus on Trading which fell by £328,348 to £4,461,753, mainly owing to decreased sales at lower prices in our export markets.

The total capital expenditure of our Group during 1956 was £4,749,282, and during the 11 years since the last war we have expended on capital account the very considerable sum of £36,592,581—this has been done without our issuing fresh capital.

The Associated Portland Cement Manufacturers Limited holds over 80 per cent of the equity of The British Portland Cement Manufacturers Limited and 100 per cent of the Alpha Cement Limited equity, so a clearer picture of our past year's working in the United Kingdom is produced by combining the results of these three Companies than is shown in the Consolidated Accounts which include our overseas interests. The figures to the nearest thousand pounds are as follows:

The trading surplus decreased by £464,000 to £10,891,000. After various provisions including depreciation we are left with £7,712,000. Provision for Taxation increased by £418,000 to £4,370,000. Directors' and Trustees' emoluments, Debenture Service, Subvention payments to Subsidiary Companies and transfers to General, Contingencies and Staff Pension Fund Reserves together absorbed £2,031,000—a decrease of £1,017,000, leaving for distribution £16,000 less than last year. It is proposed that the quantum to be paid as dividends shall remain the same as in the case of 1955.

In view of the difficulties towards the end of the year in certain export markets brought about by the Suez Canal crisis, I think that these results should be considered very satisfactory. I am sure I have your approval in thanking all those who work for the Company in making them possible.

PAST YEAR

Last year our deliveries of cement from both home and associated works overseas constituted a new record at 7,994,753 and 1,984,479 tons respectively. Our export trade was, however, slightly down partly owing to the difficulty in securing adequate shipping space and partly to severe competition from Eastern Europe whence nearly a million tons were exported last year. These exports had a political basis and were often sold at prices well below the cost of production. We are hopeful that the changing political conditions in that part of Europe may lead to a diminution of this kind of trading.

The lead was taken last year by the Cement Industry in giving an undertaking not to increase home prices during the six months to June 30, 1956. At the end of that period prices were advanced by 3s. a ton to offset increases in coal and freight costs, but at the same time manufacturers gave a promise that the new prices would not be raised for a further period of 12 months unless something quite unexpected and exceptional happened.

In spite of such circumstances arising from the Suez Canal crisis, the Cement Industry decided in the autumn to maintain existing prices until the date originally fixed by which time they would have a clearer picture of the actual extra costs incurred through increases in the prices of diesel oil and petrol, together with the effect of the rationing of these two products on laid-up transport.

The impact on costs did not turn out to be as high as was at one time expected, but the extra cost incurred, together with increases in wages and the expected rise in the price of coal this year, must inevitably lead to a rise in the home prices for cement during the next few months. This has already occurred in all the major cement-producing countries of Western Europe since the beginning of this year.

Our expenditure on research and development of new products and processes again amounted to a substantial sum, £274,814 having been spent during the year for these purposes.

OVERSEAS WORKS

The story from overseas generally is one of continuing expansion and satisfactory results.

In Australia, the Company ended the year with a profit and there are good prospects of a satisfactory year's trading in 1957.

In British Columbia, output, sales and profits established new records.

In Ontario, we have acquired extensive limestone deposits with the object of building a works when conditions are considered opportune.

Construction of the new works in which we are interested in Kenya has been held up by delays in deliveries of steel and the plant is unlikely to be in operation before next spring.

The Company in Malaya recorded another satisfactory year's working. Demand in the Federation continues to grow and the decision has been taken to instal an additional kiln which will more than double the present capacity.

In Mexico, record deliveries and profits were achieved.

The New Zealand Company continues to operate satisfactorily, with increased sales and earnings.

The Company in South Africa benefited from a full year's run of the new kiln at Lichtenburg and again established new sales and profits records.

In Southern Rhodesia, the construction of the new works of the Salisbury Portland Cement Company Limited is nearing completion, and production is expected to begin within the next few weeks.

Our investigations into the prospects of establishing a cement manufacturing industry in the Western Region of Nigeria, together with other interests, have continued, and prospects are regarded as very encouraging.

1957

The new works at Cauldon Low in Staffordshire came into production at the beginning of May. As a dry process works, the only one of its kind in England at the present time, it should prove remarkably economical in fuel consumption.

Up till the end of April our deliveries at home are rather above those of last year, but our export figures are still affected by the fact that the Suez Canal is closed at the time of writing. When the Canal opens we hope to make up some of the leeway in our shipments overseas.

The indications are that at home the annual rate of increase in the demand for cement that has been experienced since the war will not be maintained this year, but in spite of the increasing effects of the present deflationary policy of the Government, we do not expect any significant reduction in demand as compared with 1956.

The report and accounts were adopted.

ROCK INVESTMENT

FURTHER SOLID PROGRESS

The thirty-eighth annual general meeting of The Rock Investment Company, Limited, was held on June 20th in London, Mr C. W. Black, JP, MP, FRICS, FAI (the chairman), presiding.

The following is an extract from his circulated Statement for 1956:

The past year has seen yet further solid progress in the rebuilding of both the income and capital position of your Company. This progress has made it possible for your Directors to recommend an increased Dividend for the year of 5 per cent, less income tax, which compares with 4½ per cent in the previous year.

In addition to the steadily improving income position of the Group, which your Directors hope and believe will continue, the capital position also continues to show a welcome strengthening. During the year, the capital reserve has increased by a net addition of no less than £41,704 from £180,596 to £222,300.

The "credit squeeze" and the limitation upon borrowings have obviously had an effect upon the rate of progress in rebuilding the fortunes of the Group, and, in particular, have curtailed somewhat substantially the volume of building development work we are able to undertake.

It is proposed to increase the present authorised capital of £550,400 to £650,000, which will mean that we shall have Stock available for issue amounting to £120,790. Your Directors have no immediate plans for the issue of further Stock.

The report and accounts were adopted.

NORTH CENTRAL WAGON & FINANCE COMPANY LIMITED

MR E. DUNCAN TAYLOR'S REVIEW

The Ninety-seventh annual general meeting of North Central Wagon & Finance Company Limited was held on June 25, 1957, in Rotherham, Mr E. Duncan Taylor, FCA, the Chairman, presiding.

The following is an abstract from his circulated address:

As a result of hire purchase restrictions new business accepted during 1956 declined by 29 per cent, resulting in a reduction of £3,248,638 in the book value of our assets which were £16,482,550 at December 31, 1956. As earnings on hire purchase business are spread over the life of the agreements the substantial business accepted in 1954 and 1955 resulted in a record profit for the year. A total dividend on the Ordinary Shares of 1s. 6d. per Share is recommended as compared with 1s. for 1955. In addition, the distribution of 7½d. per Ordinary Share, not subject to tax, out of realised accretions to capital is to be repeated.

Taxation, including £258,400 in respect of Profits Tax non-distribution relief absorbs £924,249 or 14s. in the £ on all our earnings. Profits Tax in its present form discourages the raising of permanent capital by the issue of shares, dividends on which are subject to a penal distribution charge of 30 per cent as compared with 3 per cent on retained profits, and encourages the issue of loan capital, the interest on which is not subject to Profits Tax, and is a serious obstacle to the creation and movement of voluntary savings. The Royal Commission on the Taxation of Profits and Income recommended the substitution of a flat rate tax on total profits and it is to be hoped that this recommendation will be implemented during the life of the present Parliament and that potential liabilities in respect of non-distribution relief will be cancelled.

PROSPECTS FOR 1957

For the first four months of 1957 the Group turnover increased by 55 per cent as compared with the corresponding months of 1956. As our earnings depend more upon the business on our books at the commencement of the year than upon new business accepted during the year and in view of the decline in new business during 1956 it would be unrealistic to expect the net profit for 1957 to be maintained at the record level of 1956.

SHARE CAPITAL

In September, 1956, we acquired the minority interest in A. J. Stanton & Company Limited in exchange for the issue of 14,000 6½ per cent Cumulative Preference Shares of £1 each fully paid and 79,000 Ordinary Shares of £1 each, 10s. paid. The present issued Ordinary Share Capital consists of 1,579,000 Shares of £1 each, 10s. paid. The Directors propose, subject to the consent of the Capital Issues Committee, to eliminate the uncalled liability on the Ordinary Shares by capitalising £789,500 of the accumulated profits of the Group in paying the uncalled liability of 10s. on each Ordinary Share. In view of the important part in the growth of the Company's business which is played by ploughing back a substantial part of our profit, especially when we are not permitted to raise additional permanent capital, it is likely that the Board will be able to recommend any further increase in the amount distributed to our Ordinary Shareholders in the near future.

The Share Capital of Modern Telephone Company Limited has been sold for the sum of £300,000. The surplus arising from the sale has been credited to Profit and Loss Account. Since the end of our financial year a merger has taken place between Seligman Brothers and S. G. Warburg & Company Limited and agreement has been reached for the disposal of our interest in the firm.

The extensions of our Head Office and of the Head Office of A. J. Stanton & Company Limited at Canterbury have been finished and plans for the erection of new offices for our Subsidiary Companies at London and Brighton have been approved. Since the last Annual General Meeting additional Branches have been opened at Birmingham, Bolton, Dunstable, Guildford, Halifax, Leamington and Wakefield.

During the past year our managers and representatives have been faced with many difficult problems and our shareholders will, I know, wish to be associated with the Directors in expressing appreciation of the loyal and efficient services of our executives, representatives and employees generally throughout the Group.

The retiring Directors, Mr F. E. Bovill and Mr P. J. Greaves, were re-elected, the remuneration of the Auditors was fixed and the Report and Accounts were adopted.

NORTH CENTRAL WAGON & FINANCE COMPANY LIMITED

Summarised Group Balance Sheet at December 31, 1956

Share Capital, Reserves and Liabilities	£
Paid-up share capital	1,053,500
Reserves (including amounts set aside for future taxation and pensions)	3,060,433

METROPOLITAN RAILWAY SURPLUS LANDS COMPANY LIMITED

SIR BERNARD DOCKER'S STATEMENT

The twenty-fourth annual general meeting of the Metropolitan Railway Surplus Lands Company Limited will be held on July 10th at Winchester House, Old Broad Street, London, E.C.

The following is an extract from the statement by the Chairman, Sir Bernard Docker, KBE, accompanying the Report and Accounts for the year ended March 31, 1957:

I am glad to be able to report continued progress. Gross rents of the parent Company have increased by £20,129 to £302,283 and after charging repairs and other expenses, net rents at £231,896 showed an increase of £15,585 over the figure for the previous year. The profits earned by our trading subsidiary, Ortem Estates Limited, have enabled us to increase the amount obtained from that source to £70,000 compared with £50,000 in 1956. In fact, our net profit before tax for the past financial year at £259,645 shows an increase of £24,487. We recommend a modest increase in dividend to 6½ per cent, against last year's 6 per cent. After providing £98,704 for the payment of this dividend and £158,600 for Income Tax and Profits Tax, we shall be left with £60,404 carried forward compared with £58,063 brought forward from last year.

The Consolidated Balance Sheet discloses a small increase in assets of £46,371 to £3,321,055.

After referring in greater detail to the affairs of the subsidiary companies including the realisation on satisfactory terms of about one half of the Littlehampton Estate, Sussex, by Ortem Estates and to certain staff changes, the statement continues:

VALUATION OF PROPERTY ASSETS

Shortly after the last Annual General Meeting, it was brought to our notice that strong rumours were circulating in the City that an offer had been or was about to be made for the Company's shares. We thought it proper to notify all shareholders immediately that no such offer had been made to us (nor indeed has any such offer been made since) but that we proposed to put in hand a valuation of the Company's properties. Our object was that if any such offer should be made, we should be in a position to advise shareholders whether or not it was an adequate offer. In order to keep the cost of the valuation to a minimum it is being made by our Managing Director, one of the other Directors and the Manager—all of them very experienced in the valuation of properties such as we own.

Before our colleagues had proceeded very far in their valuation, the Rent Bill was introduced and we have thought it prudent to direct them to delay the completion of their work in respect of residential properties until this measure secures the Royal Assent and its effect on values can be more nearly estimated. It is a precautionary valuation, as I have indicated. It is not our present intention to publish it but to use it for our own purpose in connection with the management of the estate, unless some special need arises which we deem calls for its publication.

Revaluation of our capital assets of itself adds nothing to our revenue; it is made at a moment of time and in relation to conditions at that time. It is of doubtful validity at a later date under different conditions. As I have said before it is our policy progressively to expand the Company's business and a basic requirement of this policy will be the reorganisation of our capital structure. Unfortunately, conditions are still not favourable for the raising of substantial loan capital nor indeed would present restrictions enable us to do so. When the moment is opportune, however, a revaluation will be necessary and will then serve the double purpose of assisting us to raise the loan capital we want and of informing shareholders of the value which at that time may be fairly placed upon our estate.

GENERAL OBSERVATIONS

In conclusion, I can tell you that rents already agreed with our tenants, in respect of properties, the leases of which recently fell in, will swell our rent roll for the current year by about £45,000. This represents the major falling in of our commercial ground leases. Other ground leases will expire over the years to come, but not again on this scale in one year. Our general policy has been, however, for some years to grant leases at rack rents with rent revision clauses at appropriate intervals in order to recover for the benefit of the shareholders over a reasonable period any improvement in the rental value of our properties. Apart altogether from the reversions of ground leases, therefore, we can look forward to an expanding rental income if, as we expect, real property holds its own in an inflationary world. We are still dependent to some extent on our earnings from Ortem Estates to maintain and improve on the current rate of dividend, but the increase in the rent roll gives us a firm foundation on which to build, and with further expansion I am, as I was last year, hopeful that from time to time we shall be able to make modest increases in the dividend.

UNITED PATANI (MALAYA) RUBBER ESTATES

HIGHER CROP PROSPECTS

MR W. ANDERSON'S STATEMENT

The thirty-seventh annual general meeting of United Patani (Malaya) Rubber Estates Limited was held on June 25th in London, Mr W. Anderson (the chairman) presiding.

The following is an extract from his circulated statement:

The crop harvested for the year after all adjustments was 3,810,829 lb compared with an estimate of 3,794,000 lb. The target set for this year is 4,250,000 lb and both the estate manager and the directors are reasonably confident this will be achieved.

Owing to the lower price of rubber our income from rubber sales for 1956 at £386,011 was lower by £98,842. The net profit is £105,955. The Board recommends a Final Dividend of 10 per cent, less tax, making 15 per cent for the year. The various appropriations and the Dividends exceed the year's surplus by some £4,176, so that our carry forward will be reduced to £26,786, which is about the same as we carried forward in 1954.

At this juncture I think it opportune for me to mention that although the Board has just declared an interim dividend of 5 per cent, less tax, for the year 1957, it would like it to be known this distribution is on account of profits so far earned and should not be taken as an indication of what might be the final dividend for the current year.

Last year I mentioned that Government was proposing to acquire an area of 260 acres of our most valuable young rubber and that an alternative area had been suggested to the Authorities. Government has agreed to our suggestion but it is now interested in a much larger area and has actually been granted an option on some 1,400 acres of prewar seedling rubber. This area has been valued by an expert at £75 per acre and we are now waiting confirmation of Government acceptance of such valuation being inserted in the option agreement.

From recent happenings affecting the Company's future I am inclined to think that many stockholders might be glad to see the total acreage trimmed and capital returned to them from the trimmings. Your Board would propose to review the position but feel that it must await Government's decision with regard to the 1,400 acres and this we will press for as far as it may be possible.

PLANTING PROGRAMME

Our planting programme for 1956 which consisted of 140 acres of virgin jungle and 233 acres replantings, was duly completed on schedule. During the current year it has been arranged to plant up about 50 acres of virgin land and replant some 415 acres and when this has been completed the whole of Abubakar Division extending over 1,450 acres will contain a compact block of high yielding rubber.

In his last Budget Statement the Chancellor made proposals for substantial tax concessions to "Overseas Trade Corporations." Rubber Plantation Companies such as United Patani are within this category. When these proposals become law it is confidently expected that the proportion of trading profits available for dividends will be considerably increased.

The report was adopted.

GENERAL MINING AND FINANCE CORPORATION LIMITED

(Incorporated in the Union of South Africa)

CHAIRMAN'S ADDRESS TO SHAREHOLDERS

At the Fifty-Seventh Annual General Meeting of Shareholders held on June 20th at the Corporation's Offices in Johannesburg, Mr J Scott, Deputy Chairman, presiding at the meeting, said that the net income for the year 1956 was £975,468, an increase of £68,976 compared with the previous year. It had again been necessary to write a substantial amount off Investments, including Subsidiary Companies, the total amount written off being £442,716, of which £150,000 had been taken from Investment Reserve and the balance from Profit and Loss Account. At the end of the year quoted investments had a market value of £14,402,519, compared with a book value of £9,888,929, whilst the value of unquoted investments was greatly in excess of their book value. The Directors had considered it prudent to reduce the final dividend on the Ordinary shares for the year to 2s. per share in view of the Corporation's financial position and the continued depressed state of the Stock Exchanges during and since 1956, with its consequential adverse effect upon the Corporation's revenue reserves.

During the year the Corporation had exercised its right to a substantial participation in the flotation of the Riebeeck Company, and had effected other investments which had absorbed approximately £250,000, these factors having been largely responsible for the decline of £1,642,000 in the Corporation's net cash position. Investments formerly held indirectly through a subsidiary company had been taken over at cost, but this had involved no outlay of cash.

In the past two financial years active Stock Exchange conditions had unfortunately not existed, and the Corporation had been unable to turn over its working capital in the normal way with a view to investment in new enterprises and to the earning of share-dealing profits with which to strengthen reserves. In these circumstances loan facilities of £2 million had been negotiated with Anglo American Corporation of South Africa Limited expiring on December 31, 1959. The Corporation had availed itself of £1 million of these facilities, but had repaid £500,000 of this sum since the end of the year.

Dividend income should improve in the years ahead as the newer mines in which the Corporation had substantial holdings improved their dividend declarations or reached the dividend-paying stage.

The Gold Mining Industry as a whole had shown a working profit £4 million greater than that for the previous year, and new records had been achieved both for tonnage milled and for gold output. For the first time, more than half of the working profit had been contributed by the newer mines, but he could not emphasise too highly the vulnerability of some of the older mines: high-level consultations had been held in an endeavour to find a solution to this problem. Uranium was becoming of increasing importance to the industry, the estimated profit realised for the year having been 40 per cent above the previous year, with some mines being primarily uranium producers. World demand should be maintained for many years to come, and the resources of uranium in the country were very large. At the conclusion of their existing contracts many of the uranium producers would be able to compete favourably in the world market.

There had been a noticeable decline in overseas interest in South African gold shares, which had had the result of substantial declines in the quoted prices of mining shares to a point at which the high returns offering on sound mining investments in this country showed a remarkable disparity compared with the low rates obtainable on investments in the North American and United Kingdom financial markets.

One of the factors in the situation was the fact that the Gold Mining Industry was being squeezed between the fixed price for gold and rising working costs, but there was little doubt also that the values of mining shares of this country had been depressed through fears of overseas investors that despite the soundness of the country's economy, some of the internal political policies might in the future give rise to disturbances undermining the safety of investments. It was important that the country should endeavour to create a stable political atmosphere which, with the basic soundness of the South African economy, would again attract a flow of capital funds. It should be recognised that statements made by politicians and other leading South Africans, together with events which took place within the country, could from time to time adversely affect, as they had in the past, the popularity of the country as a field for investment.

The Chairman then referred to the list of Investments attached to the Directors' Report, and informed shareholders that the majority of the mining companies included did not fall within the group of vulnerable mines. The Corporation also had interests in coal, copper, diamonds and platinum, and in industry all the companies concerned having made satisfactory progress in 1956. The Corporation's Subsidiary Companies had also made steady progress.

Since the close of the year the gold and uranium mines of the group had progressed satisfactorily, the dividend declarations by the Stilfontein and West Rand Companies having been higher than those of a year before, whilst Buffelsfontein Gold Mining Company had commenced gold production in January and had reached a milling rate of over 100,000 tons per month, with steadily increasing profits, those for May being £151,000. Maiden dividends had been declared by Eastern Rand Extensions Limited and Southern van Ryn Reef Gold Mining Company Limited, and the New Pioneer Company had resumed dividend declarations.

Finally, the Chairman expressed his confidence that the Union of South Africa faced a remarkable future with tremendous opportunities for further mining and industrial developments, provided that they could look forward to a period of good government giving rise to stable political conditions.

JOHN BRIGHT AND BROTHERS

CAUSES OF SET-BACK

The thirty-fourth annual general meeting of John Bright and Brothers Limited was held on June 26th in London.

Dr E. P. Andreae, chairman, in the course of his speech, said:

At our last Meeting I drew attention to a falling trend in price margins, which was making itself increasingly felt towards the end of the financial year. Since then, our trade, particularly in the heavy canvas sections, suffered further very severe cuts and the persistence of this trend throughout the year is reflected in the lower profits shown.

RESULT OF YEAR'S TRADING

The Trading Profit amounted to £740,310 as against £1,069,323 for the previous year, which included only approximately a four and a half months' contribution from the Subsidiary. The reduction of £329,013 would have been greater but for the benefits derived from the joint operations.

After charging Taxation of £325,000 the combined Net Profit totals £302,423 as compared with £482,566 for last year. Your Directors again recommend a final dividend of 15 per cent on the Ordinary Stock, making a total of 25 per cent for the year. £100,000 has been allocated to General Reserve.

The strength of the Consolidated Balance Sheet has not only been maintained but has been added to by an increase of £116,017 in the total of Share Capital and Reserves, which now stand at £4,610,995.

Fluctuations experienced in recent years by Spinners and Piece Goods Manufacturers, who had to face a lengthy and very serious recession, had a secondary but marked influence on our business and largely were responsible for touching off the very rapid drop in Profit Margins that we have experienced.

These factors applied chiefly to heavy canvas and belting ducks but we, as large manufacturers of Cord Fabrics, have had to face additional troubles, accentuated by the recession in the motor car industry.

In the past we have been able to offset temporary difficulties by minimising their effect through the medium of economies in operating methods. This year the fall was altogether too drastic and too rapid to be countered in such manner.

We are financially strong enough and sufficiently well-equipped to meet any competition and we are, in spite of prices, strictly maintaining the high quality of our goods for which we are renowned.

JAMES STOTT LIMITED

Speaking of our Subsidiary, James Stott Limited, they of course, have had to contend with exactly the same difficulties as the Parent Company. Fortunately we have been able to benefit materially from the association. I can say that even in the circumstances prevailing the acquisition of the Stott business has proved to be an asset of very great value to your Company.

Looking ahead, your Directors take the view that the demand for industrial yarns and fabrics will be one of gradual, but continued expansion but that it would be unrealistic to forecast a return to the high profit margins ruling in recent years.

Speaking of the more immediate future, I feel justified in saying that the contraction in volume and the reduction in margins, appear to have been arrested.

GREAT BOULDER PROPRIETARY GOLD

TRANSFER TO AUSTRALIAN COMPANY APPROVED

The sixty-first annual general meeting of The Great Boulder Proprietary Gold Mines Limited was held on June 12th in Melbourne, Mr A. M. Coulson, Chairman and Managing Director, presiding.

The Chairman said: From the Directors' Report and Statement of Accounts already in your hands you will have noted that the results for 1956 disclose a satisfactory position, the net profit for the year after providing £70,015 for Depreciation and writing off £16,075 New Share Issue Expenses rising to £258,512, an increase of £42,143 compared with 1955.

The Profit and Loss Appropriation Account shows that dividends totalling 1s. 3d. (Aust.) have been paid, and £49,954 written off Mining Leases and Development.

489,494 tons of ore were treated for a recovery of 124,604 ounces of gold, both figures showing increases compared with the previous year. Mine Development was satisfactory and Ore Reserves at 2,071,500 tons averaging 5.50 dwts are higher than in 1955 both in tonnage and grade.

Constant improvements in efficiency by the mine staff in their efforts to combat rising costs could not wholly offset the combined effect of increases in the basic wage marginal rates for tradesmen; penalty rates for overtime and shift work, and prices of mining stores; consequently Working Costs per ton of ore treated rose by 12.86d compared with 1955. Of this increase 11.75d was due to increased cost of mining stores.

Expenditure on Capital Account during the year amounted to £127,236, the principal items being the deepening of Hamilton Shaft a further 528 feet and the installation of a Marcy Rod Mill. The issue of one million shares to provide funds for capital expenditure was a success and all shares have now been paid up in full.

REASONS FOR PROPOSED TRANSFER

The control and management of the Company has been carried out wholly in Australia since 1948; over 80 per cent of the Company's stock is held by residents of Australia, and the Directors feel that it would be in the best interests of stockholders to transfer the whole of the Company's undertaking to an Australian company.

Accordingly, immediately after this meeting an Extraordinary General Meeting will be held for the purpose of considering and, if thought fit, passing the necessary resolutions for the voluntary winding up of the present Company and the disposal of the whole of its undertaking to a company which will be incorporated in Victoria, Australia, under the name of Great Boulder Gold Mines Limited.

The operating results for this year so far show an increase over last year and there should be no difficulty in maintaining the current rate of dividend on the increased share capital.

In conclusion I would like to thank the General Manager, the executive staff and employees of the Company for their efforts during the year under review.

The report and accounts were adopted.

At a subsequent extraordinary general meeting resolutions were passed approving the voluntary winding up of the company and the disposal of the whole of its undertaking to a company to be named Great Boulder Gold Mines Limited, incorporated in Victoria, Australia.

RANGALLA CONSOLIDATED

The thirty-fourth annual general meeting of Rangalla Consolidated Limited was held on June 20th in London.

The following is an extract from the circulated review of the Chairman, Mr Eric Davenport, ACA:

The 1956 season's Accounts show a net profit before tax of £60,065, compared with £39,508 in 1955, which can be considered satisfactory. The crop harvested at 1,567,229 lb shows an increase of 17,541 lb over 1955. The cost of production at 2/5.99d increased by 2.95d, while the net average sale price increased by 5.74d per lb.

From the total sum available of £68,746, taxation absorbs £36,054, and £5,000 has been appropriated to General Reserve.

The estimated crop for this current season is 1,540,000 lb, and the crop harvested to the end of April was 699,156 lb, against 594,409 lb for the corresponding period in 1956, which augurs well for the crop prospects in the current season.

The total dividend the proprietors have received from our operations during 1956 is equal to the highest ever declared by the Company. We have thought that the proprietors should have their full share in our prosperity, even though on austere calculations we may have made a pretty full distribution of our earnings. But our financial position is sound and we are not a Bank but a Company engaged in tropical agriculture. If you do well in prosperity, I trust you will take the lean years without too great a grumble.

The report was adopted and the total distribution of 20 per cent approved.

BRITISH BORNEO TIMBER

The annual general meeting of The British Borneo Timber Company Limited will be held on July 18th in London. The following is an extract from the circulated address of the Chairman, Mr H. W. Horner:

Log output exceeded that for the previous year by 37 per cent, whilst the unit cost of production was reduced.

In contrast, our sawmilling operations, in common with those of other large-scale timber operators in North Borneo, were far from profitable and losses offset quite reasonable profits on logging. We are under obligation to the Government to mill a certain minimum proportion of our annual production, and the necessary large-scale operation of sawmills in Borneo has proved to be a costly drain on resources.

Shipments of logs and sales of sawn timber each increased by 27 per cent compared with 1955.

The demand for our timber continues to be generally satisfactory, but we are encountering serious competition from Borneo timbers which are being milled in Hongkong. The Board feel that the Government of North Borneo is bound to recognise in the very near future that substantial relief must be given to large-scale producers, such as this company, from much unfair competition to which they are subjected; otherwise the future for the large-scale producers (not only ourselves) may become precarious. The accounts show a net loss for the year of £37,865. To the balance £47,301 brought forward from the previous year the Board have added £10,000 from General Revenue Reserve. A dividend of 8 per cent is recommended, leaving £5,636 to carry forward to next year.

ARTHUR BALFOUR AND COMPANY

SUBSTANTIALLY IMPROVED RESULTS

The fifty-eighth annual general meeting of Arthur Balfour and Company Limited was held on June 24th at Sheffield, The Honour, able Robert Arthur Balfour, JP (Chairman and Managing Director), presiding.

The following is an extract from his circulated statement:

I am pleased to report a substantial improvement in the results achieved over the previous year, which were much better than forecast in the last statement. All the manufacturing divisions have worked at an effective level throughout the period. Costs have continued to increase and competitive conditions have tightened up, but the resulting narrower margins have been offset by increased turnover. It is realistic, however, to point out that the improved results have been assisted by better trading results from subsidiary companies at home and overseas.

Shortages of supplies and fluctuations in the prices of alloys have had no marked effect on the trading profits of the year.

The profits of the Group are £526,853 before taxation and after exchange adjustments, and compare with £350,287. Taxation, however, is increased from £170,506 to £258,484, and I am only endorsing the remarks of numerous authorities when I say that the present rate of taxation is too high. If continued, we shall be placed at a great disadvantage in re-equipment and in undertaking advisable business risks and ventures as against overseas competitors.

Satisfactory progress has been made in research, standard of quality and methods of manufacture. Plant and premises have been well maintained. There have been further calls on our cash resources by the progress of re-equipment programmes and the financing of stocks and trading operations. We have considerable capital commitments. The expenditure of previous years on the tool division now shows signs of yielding beneficial results. The main present commitment is for the increase and modernisation of the steel melting and manufacturing divisions.

The Board, after careful review and consideration of all the factors involved, have no hesitation in recommending the same rate of dividend as for the year 1955: 2½ per cent Interim Dividend already paid £13,669 and 5½ per cent Final Dividend now proposed £30,072. It is proposed to appropriate £200,000 to General Reserve, and this will leave a carry forward of £147,709 as compared with £175,717 in 1955.

We again face increased costs and the effect of wage awards, at present uncertain, and here I would like to make an appeal:

As a Company we are now subject to the provisions of the Restrictive Trade Practices Act. Whatever the long-term effects may be, such control, if desirable at all, should surely not be so selective as at present. It is high time that a new, realistic, and constructive approach to this problem should be made by all concerned and at all levels. The standard of living and welfare of the whole population is threatened.

In the early months of 1957 the level of turnover has been maintained, but it is difficult to forecast the second half of the year. Any improvement or decline depends perhaps more than usual on world politics. I incline to the forecast that we could maintain this year's results but that we shall need good fortune to do so.

The report was adopted.

PLATT BROTHERS AND COMPANY (HOLDINGS)

MR K. H. PRESTON'S REVIEW

The fifty-ninth Annual General Meeting of Platt Brothers and Company (Holdings) Limited was held on June 26th at Oldham.

The following is an extract from the Statement by the Chairman, Mr K. H. Preston, which has been circulated with the Report and Accounts:

As you will see from the Directors' Report, we are recommending a final dividend of 8½ per cent on the Ordinary Stock which, with the interim dividend of 4 per cent paid on October 24, 1956, makes a total distribution of 12½ per cent, the same as last year.

Total aggregate sales were down as compared with the previous year, and the lower consolidated profit was due partly to this reduced turnover but a major factor was narrower profit margins occasioned by rising costs of wages, materials and services. A very large proportion of the machinery produced by the Subsidiary Companies is exported and, by reason of continued competition from foreign manufacturers of textile machinery, it has not been found possible to recover fully these increased costs by means of higher selling prices.

In August last, the Directors of Textile Machinery Makers Limited decided, in view of excess manufacturing capacity, not to renew the lease of the Barton Works which expires in July of this year. The business formerly carried on by Platts (Barton) Limited, has been transferred to Platt Brothers & Company Limited, but the full benefit of the transfer will not be felt until the latter part of the current year.

In arriving at the decision to close the Barton Works, the Directors were in no small measure influenced by the fact that they had in 1954 decided to effect a major rebuilding of the Oldham Works.

The policy of the Board is to diversify its activities wherever possible by introducing in its Works the manufacture of machinery for fields outside textile markets. In this respect Textile Machinery Makers Limited is establishing a noteworthy business in the manufacture of brewery machinery, is expanding its activities in the production of packaging machinery and can offer a range of machinery for the production of transparent paper.

Tweedales & Smalley Limited, like Textile Machinery Makers Limited, had a disappointing year. Increased labour and material costs which could not be recovered by higher selling prices owing to foreign competition, was the main cause for the reduction in profit. Since May, 1956, there has been a material improvement in the Company's order book, both for home and export.

Last year I reported that the turnover of Prince-Smith & Stells Limited in 1955 was the highest in the Company's long history. This year I am pleased to be able to tell you that improvements in manufacturing technique and the continued demand for the New Bradford system worsted machinery have led to a new record turnover by this Subsidiary.

The Longclose Engineering Company Limited had another good year. The forward order position is satisfactory, and the actual orders already booked should ensure that the Works are fully occupied up to the end of the year.

The textile industries both in this country and overseas, particularly the cotton sections, are liable to sudden fluctuations, and demands for textile machinery are similarly affected We felt it wise, therefore, to extend the Parent Company's interests outside the textile machinery industry and in January, 1957, we purchased control of two engineering concerns—Hayward Tyler & Company Limited, and Le Grand, Sutcliff & Gell Limited.

Hayward Tyler & Company, Limited, founded in 1815, manufacture pumping equipment, including pumps for oil tankers and refineries and special pumps for atomic power plants.

Le Grand, Sutcliff & Gell Limited, founded in 1872, are hydraulic engineers, making pumping equipment for the Oil and Water industries which, however, does not in any way compete with Hayward Tyler.

Both the above Companies have well-filled order books and are making satisfactory profits which will be reflected for the first time in the Parent Company's accounts for 1957.

Taking the Group as a whole, the order position at the moment is better than last year and provided the wage increase just agreed can be largely offset by increased productivity, the trading results for the year should show an improvement over 1956.

The report and accounts were adopted.

RUBBER PLANTATIONS INVESTMENT TRUST

The Forty-eighth Annual General Meeting of The Rubber Plantations Investment Trust, Limited, was held on June 26th in London.

Sir Eric Macfadyen, the Chairman, said the Accounts for the year to March 31, 1957, show gross revenue of £272,162, compared with £278,263 for the previous year; this latter figure, however, included a non-recurring sum of £5,087 not related to that year's earnings. The gross yield represented 15.74 per cent (16.10 per cent) on the issued Capital. After taxation and expenses, net revenue is £147,842, and including the balance of £107,725 brought forward from the last accounts we have £255,567 available for appropriation; £25,000 has been transferred to General Reserve, and the Directors recommend a dividend of 12½ per cent (the same), absorbing £124,241 (net) and leaving £106,326 to be carried forward.

It is gratifying to be able to record continued improvement in the valuation of the portfolio; since 1953 the upward trend has been unbroken, and in four years the net asset value of the Trust has increased by £630,512, equivalent to 8¾d. per 2s. unit or 36 per cent on our issued Capital.

The period under review has been extremely active for the Trust and numerous changes have taken place in the portfolio; the policy of giving a wider spread to our investments has resulted in the cost of industrial and commercial holdings being increased by £115,888 to £354,723; this section now represents 18.5 per cent of all investments.

The accounts disclose a strong liquid position in the form of Treasury Bills and near-dated Government Bonds, and these funds are readily available for investment when market conditions appear attractive.

The report and accounts were adopted.

APPOINTMENTS

APPLICATIONS ARE INVITED from Graduates in Economics, with some knowledge of statistics or practice in handling figures for employment as a whole-time research assistant for a period of three years. Some knowledge of public finance, especially local government finance, and of foreign languages, would be an advantage. A certain amount of travelling may be required, but in general the successful applicant will be expected to work in London. The research is part of a comparative enquiry into local government finance in various countries which is being undertaken by a research group, sponsored jointly by the Society of Incorporated Accountants and the Institute of Municipal Treasurers and Accountants. Salary according to experience, but in the range of £750 by £50 per annum to £850.

Applications, giving details of age, sex, qualifications, training and any published work, should be sent by July 12 to:—

The Research Committee Secretary, The Society of Incorporated Accountants, Incorporated Accountants' Hall, Temple Place, Victoria Embankment, London, W.C.2

FEDERATION OF RHODESIA AND NYASALAND

Vacancy: Secretary, Federal Agricultural Marketing Council, Department of Economics and Markets, Federal Ministry of Agriculture.

The successful applicant will be a member of the staff of the Chief Agricultural Economist. Starting salary will be £1,700 p.a. on the scale £1,700 x £75 — £1,850 p.a. Applicants must possess a degree in Agriculture or in Economics with either specialist qualifications in agricultural economics or not less than 5 years' experience in this field.

Duties: The successful candidate will be required to carry out various inquiries into agricultural marketing conditions and the prices of agricultural commodities throughout the Federation, as required by the Marketing Council, under the general supervision of the Chief Agricultural Economist. Whilst his principal duties will be those of the Secretary of the Council, he will be required to assist with the general activities of the Department and to perform such other duties as may be allotted to him from time to time. The post calls for a high degree of initiative and an ability to draft clearly and concisely, not only the results of investigations into problems, but also the proposed solutions.

Application forms and further details from the Secretary (R), Rhodesia House, 429 Strand, London, W.C.2 Closing date: July 27th.

LIVERPOOL REGIONAL HOSPITAL BOARD

Applications are invited from suitably qualified candidates for the post of Deputy Secretary to the Board.

Present salary scale, £1,163 to £1,521 *per annum*.

Candidates should have had wide administrative experience and have held posts of responsibility, preferably within the National Health Service or other Public Service.

Preference will be given to applicants with suitable professional or *administrative* qualifications or holding an *appropriate* University degree.

Applications, stating age, experience and qualifications, present post and salary, together with the names of three referees, should reach the undersigned not later than July 10, 1957.

19 James Street, Liverpool, 2.

VINCENT COLLINGE, Secretary to the Board.

AUSTRALIA—UNIVERSITY OF ADELAIDE

Applications are invited for appointment as READER OR SENIOR LECTURER IN SOCIAL STUDIES.

The Senior Lecturer-in-Charge of the Department of Social Studies will be on leave during 1958 and will retire at the end of the year. The successful candidate will be required to act as Head of the Department during 1958 and will become Head in 1959. It is desirable that the successful candidate should assume duty on or as soon as possible after January 1, 1958.

Status and salary will be determined in relation to the *qualifications and experience* of the successful candidate. The salary scale of a Reader is £A2,200-£50-£2,400; that of a Senior Lecturer is £A1,800-£70-£2,150.

A copy of the formal terms of appointment and a statement about the Department, with particulars of the *information to be supplied* by candidates, may be had on request to the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1, or to the Registrar.

Applications should reach the Registrar, University of Adelaide, Adelaide, South Australia, by July 31, 1957.

RARE AND EXCITING OPPORTUNITY FOR WOMAN ECONOMICS GRADUATE TO ENTER ADVERTISING

A vacancy occurs in the Intelligence Unit of the London office of a famous world-wide *advertising organisation*. Generous starting salary; excellent working conditions. Prospects of advancement are limited only by the industry and ability of the successful candidate. Selection will be rigorous. First judgment will be made on the quality of letter of application, which should be typed, if possible, and should attempt to do more than list qualifications and ambitions. Interview will follow if these are successful. Essential qualifications: good Economics Degree, lively mind, plenty of common sense, flair for good English, enterprise, initiative, ability to get on with people, good nerves, good *nature* and a well-developed inclination for hard work *plus* about two years of second business experience—preferably in advertising, public relations, market research, newspapers, or journalism work. Languages, if of a fair standard, will be an advantage and so will wide interests, news sense, lively curiosity, high working speed and organising skill. Applicants aged under 30 will be preferred.—Box 726.

THE UNITED LIVERPOOL HOSPITALS

Applications are invited for the post of ASSISTANT SECRETARY to the Board of Governors. The duties of the post are to assist the Secretary in the administration of the Board's group of hospitals including in particular the *patients' records services*. *Candidates should have* a knowledge of statistics and of office organisation and methods. The salary is in accordance with Grade G of the Administrative Staff scales (£802—£983 per annum), the conditions of service will be those laid down by the appropriate Health Service Whitley Council, and the appointment is subject to the National Health Service (Superannuation) Regulations.—Applications together with the names of three persons to whom reference may be made should reach the undersigned not later than Saturday, July 20, 1957.

A. V. J. Hinds, Secretary, The United Liverpool Hospitals, 80 Rodney Street, Liverpool, 1.

THE ECONOMIST JUNE 29, 1957

APPOINTMENTS

FEDERATION OF BRITISH INDUSTRIES

Assistant Economist will shortly be required in the Economic Advisory Department. The duties of the post will be mainly to assist in the preparation of papers on industrial economic problems but there will also be some interesting work of administration. Candidates should have a good honours degree in economics or economic statistics and possess skill in economic analysis and the handling of statistics. Commencing salary £650-£850 per annum according to age and experience, with superannuation and excellent prospects of advancement. Candidates just graduating will be considered if academic qualifications are high.—Apply not later than July 13th to The Secretary, F.B.I., 21 Tothill Street, London, S.W.1.

MANAGEMENT SELECTION LIMITED have been retained to advise on the appointment of a

MARKETING MANAGER

for a British company manufacturing and distributing a range of consumer goods, many of which are established as household names. Advertising appropriation is nearly £400,000 p.a. The company has an ambitious programme of expansion into other fields and seeks a man of outstanding ability to plan and co-ordinate its marketing effort including advertising.

Candidates must have had responsible experience of marketing nationally advertised consumer goods through grocer or chemist outlets. They *should* be accustomed to working with market research data and a degree in statistics or economics would form a useful background. Probable age mid-thirties. Initial salary not less than £2,500, plus car and generous pension benefits.

Please send brief details in confidence, quoting reference S.458, to P. J. H. Fryer, Management Selection Limited, 17 Stratton Street, London, W.1. No preparatory work will be disclosed to our clients until candidates know their identity and have given *permission after personal discussion*.

KUMASI COLLEGE OF TECHNOLOGY

Principal: W. E. Duncanson, Ph.D., D.Sc., F.Inst.P., A.M.I.E.E.)

Applications are invited for the posts of

(a) SENIOR LECTURER AND/OR LECTURER IN LAW

(b) SENIOR LECTURER AND LECTURER IN ECONOMICS

in the Department of Commerce.

The College prepares students for the B.Sc. (Estate Management) London University External and Inter. and Final Examinations of Professional Accountancy and Secretarial bodies.

QUALIFICATIONS:

(a) A good honours degree in Law and qualifications as a Solicitor or Barrister-at-Law. Teaching, and Professional experience essential for appointment at Senior Lectureship level.

(b) A good honours degree in Economics with, in the case of the Senior Lectureship, considerable teaching and/or practical experience. Ability to lecture in Banking and Finance an advantage.

SALARY SCALE:

SENIOR LECTURER: £1,500 x £60 to £1,850 per annum (pensionable) plus a 5 per cent non-pensionable temporary increase.

LECTURER: £880 x £50 to £1,560 *per annum* (pensionable) plus a 5 per cent non-pensionable temporary increase.

Children's allowances are paid up to a maximum of three at the rate of £50 p.a. per child up to the age of 16 years and £100 p.a. per child over 16 years of age in full-time education up to a maximum of 21 years.

The posts are pensionable but contract appointments carrying 10 per cent higher salary and a gratuity of £150 p.a. may be accepted as an alternative, or arrangements to continue policies initiated under the F.S.S.U. *Scheme might be made by the College.*

Conditions of service include annual leave with free return first-class passages for the member of staff, his wife and up to three children under 17 years. Bungalows with basic furniture at nominal rental are provided. Income tax is low.

Applications (six copies) should be submitted to the Advisory Committee on Colonial Colleges, 1 Woburn *Square, London*, W.C.1, *giving age, education, qualifications*, experience and the names of three referees. Closing date July 25, 1957.

THE PERUVIAN CORPORATION LIMITED require for the Perene Colony a fully trained accountant, preferably qualified and with some years experience. Must have a knowledge of Spanish and be 30 years of age or older. Salary offered: £1,150/£1,330 according to experience, plus approximately 20 per cent cost of living allowance.—Apply in writing: Peruvian Transport Purchasing Co. Ltd., Rex House, 38 King William Street, London, E.C.4.

FARMER AND STOCK-BREEDER has editorial vacancy for young economist with agricultural background and ability to interpret facts and figures clearly. Pension scheme. Good prospects. Live in or near London.—Managing Editor, Farmer and Stock-Breeder, *Dorset House, Stamford Street, London, S.E.1.*

CENTRAL ELECTRICITY AUTHORITY

HEADQUARTERS

require Engineers in the Station Planning and Development Branch in London, S.E.1. The Branch is responsible for: (a) investigation and selection of sites for nuclear power stations; co-ordination of investigations and selection of sites for orthodox stations; negotiations for statutory and other consents for both classes of stations; (b) formulation of initial basic designs of new orthodox power stations, including layout of sites and stations; railway sidings; circulating water systems; development of works power supply schemes; plant contract schemes.

All candidates should have an Honours Degree or *qualifications for membership* of the I.Mech.E., I.C.E. or I.E.E. and for (a) preferably experience of economic studies of one or more of the problems arising in *the siting of power stations, e.g., geology* and ground exploration; thermal and hydraulic aspects of the use of river and sea water for cooling purposes; discharge and dispersal of *chimney emissions*; questions of town and country *planning*. Candidates for (b) must be experienced in the design and layout of large, modern power stations and associated plant, and experience of the construction or operation of such stations would be an advantage.

Salaries within scales: Senior Assistant Engineer, £1,435-£1,795 per annum; Second Assistant Engineer, £1,210-£1,570 per annum; Third Assistant Engineer, £1,105-£1,315 per annum; Fourth Assistant Engineer, £870-£1,045 per annum.

Application forms, obtainable from D. Moffat, Director of Establishments, *Winsley Street, London*, W.1, should be completed and returned by July 11th. Quote Ref. E.1281.

ENGINEERING IN THE CHEMICAL INDUSTRY?

Why is the Chemical Industry of interest to the Engineer? *Firstly*, because it uses a wider selection of engineering plant and equipment than any other branch of industry; secondly, because the problems which it has to tackle are such that their solution depends as much on the Engineer as on the Chemist. *The industry is* expanding rapidly and at

IMPERIAL CHEMICAL INDUSTRIES LIMITED, WILTON WORKS,

over 4,700 men are working on the design and construction of the largest single project in Britain's chemical history. Wilton Works is a manufacturing centre, with its own Power Station, where any Division of I.C.I. can *build and operate* production units. Twenty-one plants are in operation today and included in these are "Perspex," "Terylene" and Titanium. The number of

MECHANICAL, ELECTRICAL and INSTRUMENTATION ENGINEERS

required for design, construction, operation and Work *Study is steadily increasing* as the Works continue to grow.

Salaries depend on ability and experience and are reviewed annually after appointment. Promotion is by merit alone and individuals are considered at regular intervals. Help will be given with housing and removing. The design offices are pleasantly *situated in the parklands* of Wilton Castle, which lies at the foot of the Cleveland Hills. Suitable applicants, who should possess an honours degree, will be invited for interview at the Company's expense.—*Please write to the Staff Manager, Imperial* Chemical Industries Limited, Wilton Works, Middlesbrough, Yorkshire, quoting 400/101.

COMMERCIAL MANAGER

THE PLESSEY COMPANY LIMITED WISHES TO APPOINT A HIGH LEVEL COMMERCIAL MANAGER TO ONE OF ITS LARGER DIVISIONS.

In the first instance he will be responsible for the organisation of the Division's sales, and for extending its scale of operations.

A man is wanted who has achieved a position of responsibility in the engineering *industry* on the commercial side and who feels confident that with further experience, and after a suitable *period to become accustomed* to the Company's methods, he could be able to play a leading part in the overall activities of the Division.

It will be seen that imagination and drive are *required, and the specification* has been purposely written broadly since in this case personal suitability is more important than the particular *experience which the candidate* has had so far.

The remuneration will be generous and there is the probability of material promotion for one who *is determined to succeed.*

Those interested in exploring the possibilities of this opportunity are asked to write to:—

The Group Director,
A Group,
The Plessey Company Limited,
Ilford, Essex,

so that in suitable cases a personal discussion can be arranged.

Replies will be handled personally by the Group Director and in the most complete confidence.

PRIVATE SECRETARY required in London by international television executive. Should be thoroughly experienced, able take rapid dictation, produce perfect letters, also handle simple bookkeeping. Must exercise *initiative, accept responsibility*. Preference to Dutch or Swiss national with work permit, able write fluently in French or German or both as well as English. Permanent position with starting salary £835 p.a.—Box 727.

PUBLIC RELATIONS OFFICER

A well-known Engineering Company with International *ramifications* invites applications from Candidates with the necessary qualifications and experience to take full responsibility for Public Relations, Advertising and Domestic Relations within the Organisation.

The appointment is one of considerable importance with good prospects of advancement and will carry with it the status of an Officer of the Company who will *have a close* relationship with the Board of Directors.

Domicile Glasgow. Please state Salary expected. All applications will be treated as strictly confidential.—Apply Box 726, Woolward Advertising, 86a George Street, Edinburgh.

FOREIGN OFFICE: PASSPORT CONTROL EXAMINER. The Civil Service Commissioners invite applications from men for three pensionable posts Passport Control Examiners are employed abroad in *Europe and the Middle East.* Duties consist of interviewing applicants for visas.

Age at least 30 and under 45 on May 1, 1957. Candidates must have had a good general education and have a thorough *command* of two foreign languages (including *French or German or Spanish*) with a substantial language qualification, e.g. University degree or long residence abroad.

Salary £719 to £30 to £890 with additional overseas allowance. Promotion prospects.

Particulars and application forms from the Secretary, *Civil Service Commission*, 6 Burlington Gardens, London, W.1, quoting No. 4724/57/7. Completed application forms should be returned by July 26, 1957.

CAREER opening available London merchant bankers, for experienced security analyst with wide knowledge American stocks.—Write Box JN/78, c/o 95 Bishopsgate, E.C.2.

THE UNIVERSITY OF MANCHESTER

Applications are invited for a Research post in Social Statistics, for a period of one year from October 1, 1957, carrying the status of either Temporary Lecturer or Temporary Assistant Lecturer in the University. The salary scales are at present under review, and are expected *to be as follows*: *Temporary Lecturer*, £900 to £1,350 per annum; Temporary Assistant Lecturer, £700 to £850 per annum. The initial salary will be according to qualifications and experience. Membership of Children's Allowance Scheme.—*Applications should* be sent not later than July 8, 1957, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

THE following Punched Card Accounting Machines are *shortly* available for sale, as a result of changeover to Powers Equipment of a greater capacity:

POWERS 4-36 Columns: 4 Tabulator and Summary Card Punch; Multiplier; Sorter; Auto/Verifier; four Automatic Key Punches; one Hand Punch.

These machines are in full working order and, at present, in operation as an installation.

Inspection and demonstration invited. Price by mutual agreement.—Reply Box 728.

WOOLWICH POLYTECHNIC LONDON, S.E.18

B.Sc. (ECON.) DEGREE COURSE

An EVENING COURSE for the London University External B.Sc. (Econ.) Degree. Part I will commence in September, 1957.

Students qualified for admission to the course should write NOW for PROVISIONAL ENROLMENT to the Department of Commerce and Management Studies.

ST. GODRIC'S SECRETARIAL COLLEGE

offers a choice of comprehensive courses of training for educated girls who wish to become *Private Secretaries*, Company Secretaries or Secretary-Linguists. Specialised trainings in Journalism, Political, Hotel or Hospital work. Intensive Courses for university graduates. Day and resident students. New Courses, September 3 and October 1, 1957. *Prospectus from the Principal*, J. W. Loveridge, M.A.(Cantab.), St. Godric's College, 2 Arkwright Road, London, N.W.3. Telephone Hampstead 9831.

VETERAN VINOPHILES: don't dissipate your energies *now, Specialise*. One branch of study we can recommend is that of Duff Gordon's El Cid Sherry. One of the *rewards* of scholarship.

SECRETARIAL TRAINING, especially for *university* graduates and older students. Six-month and intensive 14-week courses.—Write Organising Secretary, DAVIES'S, 2 Addison Road, W.14. FARR 8292.

COME and TEACH at the Working Men's College (non-political) next session. Wide *range* of subjects and social activities. Evenings only. Unpaid and enjoyable.—Please write to the College, Crowndale Road, N.W.1.

EXPERT POSTAL TUITION

for Examinations—University Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial. General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus—and/or *advice*, mentioning examination or subjects in which interested, to the Secretary (G9/2).

METROPOLITAN COLLEGE, ST. ALBANS

or call at 30 Queen Victoria Street, London, E.C.4.

REVISED ANNUAL AIR SUBSCRIPTION RATES EFFECTIVE FROM 1st JULY, 1957*

Subscriptions to most countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is because the alternative is either not available or not recommended.

	Airmail	Air Freight		Airmail	Air Freight		Airmail	Air Freight
Australia	£9 strlg.	—	India, Ceylon	£7 15s.	£6 5s.	Pakistan	£7 15s.	—
Canada	—	$21.50 or £7 14s.	Indonesia	£7 15s.	—	Philippines	£9	—
			Iran and Iraq	£8 10s.	—	Rhodesia(N.&S.)	£7 15s.	—
China	£9	—	Israel	£6 10s.	—	South Africa	£7 15s.	£6 5s.
East Africa	£7 15s.	£6 5s.	Japan	£9	—	South America	£7 15s.	—
Egypt	£6 10s.	£5 5s.	Lebanon	£6 10s.	—	Sudan	£6 10s.	£5 10s, or £7 14s.
Europe	£4 15s.	—	Malaya	£7 15s.	—	USA	—	$21.50 or £7 14s.
Gibraltar, Malta	£3 15s.		New Zealand	£9	—			
Hong Kong	—	£7 10s.	Nigeria, Ghana	£7 15s.	£5 5s.	West Indies	£7 15s.	—

*Increases in costs of postage and air freight in recent years have now made it necessary to increase some subscription rates. Where adjustments have been made the new rates are shown in bold type. Other rates remain unchanged. In some cases the increase in air freight costs, and in the handling charges that this method involves, have made the continuance of an air freight service uneconomic; new air subscriptions will therefore be sent by airmail to the countries affected.

Old and Rare

BY comparison with pictures, silver, porcelain, jewellery or furniture, the market in rare books is small potatoes. It is true that the £29,000 paid at Sotheby's last summer for Mr Jocelyn Beauchamp's glorious Poussin was a record for the artist, as was the £27,000 given in the same rooms in November for the Corot nude from the collection of Jakob Goldschmidt of New York, or the 20,000 guineas for a pair of Guardis at Christie's; it is also true, on the other hand, that the only copy of "The Bay Psalm Book" to be sold at auction in seventy years reached $151,000 in 1947 and that a couple of other exceptional books have recently changed hands in private trading for sums reputedly in the neighbourhood of £40,000—the rediscovered Shuckburgh copy of the Gutenberg Bible and the Stirling copy (the only one coloured by the artist) of Blake's "Jerusalem." The fact remains that four-figure prices are not common, and five-figure prices very uncommon indeed, for rare books or manuscripts; whereas the former at least are not at all uncommon in other departments of the fine art trades.

Nevertheless, this more sophisticated branch of connoisseurship has a vitality, and a range of interest among non-addicts, out of proportion to its less spectacular annual turnover. It also offers, by comparison with most other forms of collecting, more and harder evidence to the outside world of the movements of taste among its practitioners and of prices among their quarry. For the hundreds of antiquarian booksellers' catalogues issued every year show, with varying degrees of sensitivity, how the current winds are blowing; and whereas no two gouache drawings or marquetry commodes or Georgian salvers are precisely alike, there is a fundamental identity between copies of the same edition of the same book. This identity, however widely it may in practice be modified by differences in condition, makes comparisons less hazardous and provides more specific evidence for graph-makers and trend-spotters than in the more subjective fields of connoisseurship.

The interaction of trends of collecting taste and the flow of rare books into the market has produced, over the past few years, some interesting effects on prices. The general level has been rising steadily since the late thirties, and in some categories prices have jumped sharply within the last five years, though there has not been, fortunately, more than a very occasional example of those frenetic spasms that characterised the late twenties. But while really outstanding books in the field of pure literature (and especially the very early books) have kept more than up to the average, largely because they are getting increasingly scarce, prices in the middle and lower ranges for first editions of works of the imagination have lagged by comparison with some other departments of bibliophily: departments less obvious to the man in the street, who is apt to equate "book-collecting" with literary first editions in the English language, whether of Shakespeare or Shelley or Shaw. The headline writer will pick on Blake's "Book of Urizen" (£6,800) or the Harlech copy of Henry Howard's "Songes and Sonettes," 1559 (£3,400, though imperfect) or the original MS of "John Bull's Other Island" (£2,800). But if anyone were compiling a Dow Jones average chart for the rare book business over the past decade, he would find the steepest increases registered in four categories: first editions of science and medicine; colourplate books of ornithology and botany; fine bindings; and renaissance manuscripts of really fine quality.

★

The first of these categories represents a belated, but now general, recognition that although the milestones of human progress will never tug at the heart like the outpourings of the human spirit, they are nevertheless proper objects of bibliophile enthusiasm. Consequently, names like Vesalius and Kepler, Newton and Descartes, Lavoisier and Darwin, are nowadays quoted among the gilt-edged stocks; and a bookseller fortunate enough to be able to catalogue a first edition of Harvey's "De Motu Cordis" or of "Das Manifest der kommunistischen Partei" would get ten times as many orders as he would for a First Folio. In the quarter century when this conception was being established, it has been found that some of these first editions are very rare, such as, for instance, the *chefs d'œuvre* of Malpighi, Linnæus, Scheele, Oersted, Mendel and Ohm.

In the last category—renaissance manuscripts—mediocre Books of Hours, turned out by the hundred in French and

CAMBRIDGE UNIVERSITY PRESS

Flemish scriptoria, have been found to be still common enough (even if they do now cost £200 instead of £75). But the number of distinguished renaissance, let alone medieval, manuscripts, especially Italian manuscripts, still in private hands and thefore potentially available, has now become very small indeed. In consequence, when an authentic plum turns up, like the thirteenth century illuminated Bolognese Bible sold last year by Denstone College, it is apt to realise 50 per cent above even sanguine estimates: £6,600, to a Paris dealer bidding for a New York collector. And it will be interesting to see how the market reacts to the dispersal, at Sotheby's next week, of a group of nineteen highly distinguished medieval and renaissance MSS consigned, from one of the very few private collections left in this country, by Sir Sydney Cockerell, for many years director of the Fitzwilliam Museum at Cambridge.

Thus, as far as the two categories of books just discussed are concerned, the element of increasing rarity plays a large part in their rising prices. But this cannot be said of many of those flower and bird books which seem to realise higher prices whenever, and no matter how often, they appear. It is a commonplace of biblio-economists that the consumption rate of originally expensive folios and quartos, even if not well bound, is negligible compared with that of novels or poetry, let alone plays or technology or children's books; so that even if the original editions of Redouté or Gould were not large, most of the copies produced are still safely shelved somewhere today.

It is equally a commonplace experience that a few high prices soon bring more copies, even of much rarer books than these, off the shelves and on to the market. (It is one difference between the rare book market and the stock market that neither shareholders nor brokers in bibliomania can know—except with specifically limited editions—how many units are potentially available.) Yet in this case the market has responded buoyantly to a generous supply of many three-figure books. Twenty-five years ago veterans shuddered at the buyer's rashness when Audubon's "Birds of America," the largest and handsomest ornithological work ever published, first reached a thousand pounds. The last complete copy sold at auction brought over nine thousand, and the next will undoubtedly bring over ten thousand pounds.

★

The revival of interest, in England and America, in the third category—fine bindings—will make an interesting chapter in a new history of book-collecting, if only because the historian will know how it happened instead of having to piece it together. The scholarly study, documentation and illustration of a field of collecting, which in earlier days was uncritically (however briskly) cultivated, have been provided, in the single generation since Weale and Gottlieb, by a handful of English scholars and one Frenchman. Three of the Englishmen, being in the rare book business, have been particularly well placed to work hand in hand both with the hardly larger group of private collectors initially responsive to this flowering of expertise and with the two or three institutional libraries whose directors proved alert to the same opportunity.

This combination has without doubt effected a minor revolution: for if the number of binding collectors in the class of Major Abbey, Mr Ehrman, Mr Henry Davis, and Mr Esmerian of New York, is still very small, they now have a host of more modest followers. And, significantly, the rare book trade as a whole has endorsed the trend. This was publicly demonstrated at the sale a year ago of the first of these recently formed collections to be dispersed, that of Mr J. W. Hely-Hutchinson. Minor as well as major specimens were then put on to a still half-fledged market in much larger quantities than some good judges believed it could absorb without sagging. In the event, high prices all down the line, given by a wide range of dealers buying for stock, showed that the regular infantry were right in behind the tanks.

★

Relaxed currency restrictions and the resumption by London of its place as the principal entrepot of the world market in rare books and manuscripts have already gone some way to restoring the disequilibrium, particularly between London and New York, that characterised the postwar decade. There are seldom less than half a dozen Continental booksellers at any reasonably important Sotheby sale; and owners of American collections are again taking advantage of London's substantially lower auction charges, stable prices and capacity for attracting international competition. More would do so were it not for the inducements offered by the United States fiscal regulations to any owner or inheritor with a big income to present a collection to *alma mater* and take a "charitable deduction," instead of selling it and paying a capital gains tax.

A similar pattern seems to be forming in Britain; and though few would dispute the propriety of arrangements for the preservation *in situ*, or for institutional lodgement, of the remaining great country house libraries, the rare book market cannot but suffer, and will suffer more severely with every passing year, from a diminution in the supply of the established *desiderata*. But book-collecting is a versatile pursuit, and as Mr John Carter has observed in his latest contribution* to its current literature, "history has shown (so far) that for every section of obvious foreground that becomes hopelessly overrun, at least two enticing vistas open up in the middle distance."

A Culture in Peril

THE USES OF LITERACY.
By Richard Hoggart.
Chatto and Windus. 319 pages. 25s.

"WHEN I was a tadpole," said the frog, "I had no tail." "Just as I thought," said the tadpole. "You never were a tadpole." Thus, in a couple of dozen words, Robert Louis Stevenson crystallised the mutual incomprehension of the generations. Much of the more general debate between pessimistic and optimistic observers of contemporary society could be couched in the same terms. Necessarily, each such observer belongs to an age-group; fifteen years ago he was fifteen years younger, and the colour of any given decade is, to him, that of his childhood, his youth, his maturity, of his peculiar pieties or rebellions. Far more than the historian or the anthropologist studying remote primitives, the student of his own community—and especially of changes in that community during his own lifetime—must make a tremendous effort to abstract from his own point of view.

Mr Hoggart's effort is conscious and heroic. His book was presumably conceived as a fairly narrow study, accurately described by its now thoroughly inadequate title. (Subtitle: "Aspects of Working-Class Life, with special reference to publications and entertainments.") It has emerged as a portrait of a northern working-class neighbourhood, a reminiscent apologia, a social diagnosis and warning. It is an attempt to show the world of his youth both as the growing boy saw it—in particular, in close-up, in terms of sights, smells, shapes, voices, characters—and as the detached and articulate observer sees it today, in terms of social process, as the product of a past tradition, evolving under the pressure of present influences, having certain powers of resistance and certain crucial weaknesses. It is also a highly self-conscious and explicit effort to get over the frog-and-tadpole difficulty, a difficulty more formidable for the author than for most, since he has to allow not only for the particular perspective of an age-group but also for a migration from working to professional class. (The chapter in which he diverges from his main theme to describe the serio-comic tribulations of the "scholarship boy" has the makings of a book in itself.)

His scope is limited. He writes of what he has experienced as participant, at first hand—family and neighbourhood life in the back streets of a northern town—and of what he has especially studied—popular entertainment. He does not touch on the possibly very different cultures of the corresponding back streets of London or Cardiff, or the countryside, or the "New Estates"; more important, he has nothing to say about the working community of factory or mine. There is missing from his picture of the working-class culture, with its warm family sense, its astonishingly limited time-horizon, its admirable but unco-ordinated ethics and judgments, anything that would account for the dogged solidarity and forward-looking patience of the Labour movement. He pays tribute, indeed, to the "earnest minority" who initiated it; but it is hard to see, on his showing, how that minority ever managed to get anything done. Such a criticism may appear remote from his main theme—the impact, on the culture which he describes, of twentieth-century commercial entertainment—but it is not entirely irrelevant, since it points to the neglect of an important element of constructive toughness. His contention is that working-class culture is, by its qualities no less than by its defects, appallingly vulnerable to deliberate debasement. It values the heart above the head. It condemns hypocrisy and pretentiousness. It is tolerant and uncensorious. So when popular publicists sneer at any mental activity above the Epsilon Semi-Moron level, and hold up to hatred and ridicule any curiosity more consecutive than that of a chimpanzee, any discrimination keener than that of a pig, and any stirrings of a morality more generous than that of a dog in the manger, they meet a ready response. The way is short and straight from uncritical tolerance to uncritical cynicism and thence, paradoxically, to an intolerant equalitarianism of the spirit—since a mere private preference for other diets than sewage-flavoured butterscotch is an implicit criticism of the sewage-and-butterscotch fanciers.

It would be unfair to leave the impression that Mr Hoggart has written a jeremiad. He sees strong forces of resilience opposing the forces of decay; he sees the family decencies reasserting themselves generation after generation; he notes "the enormous ability of people silently to ignore, only to appear to be affected, to let things 'slide off their backs.'" And others even more acutely nauseated than he may possibly add, to the fable of the frog and the tadpole, the rider that the fashion in tails, those temporary things, is liable to change quite literally beyond recognition.

The Enemy's Naval War

SEA WARFARE 1939-45: *A German Viewpoint.*
By Friedrich Ruge. Translated by M. G. Saunders.
Cassell. 351 pages. 42s.

DEATH OF A NAVY.
By Andrieu d'Albas. Translated by Anthony Rippon.
Robert Hale 224 pages. 18s.

ALTHOUGH the bibliography of the last war at sea is already extensive, and appears to be increasing as each month passes, Admiral Ruge's scholarly work merits a permanent place in every library with claims to comprehensiveness on the subject; for the very varied appointments held by the author between 1939 and 1945 have enabled him to look

Living from the Land

A GUIDE TO FARM MANAGEMENT

This vital new book, by a highly successful farmer who explains his methods, is critical, controversial and constructive. It is written for the layman as well as for the expert. ILLUSTRATED PLANS 21s

R. N. Carew Hunt

The Theory and Practice of Communism (5th rev.ed.)

'This is the best short account of Marxism and the Russian consequences, written from a highly critical standpoint, that has ever come my way.'—EDWARD CRANKSHAW *in the* OBSERVER. 18s

GEOFFREY BLES

beyond his own immediate responsibilities and to view the war as a whole. With a knowledge of history, an understanding of strategy and a gift of terse and clear expression added to such wide experience, it is not surprising that a book of unusual interest should result. Moreover, Admiral Ruge and his British publisher have been extremely fortunate in finding in Commander Saunders a translator who is plainly very well acquainted with the subject, including its technicalities.

Some of the most interesting pages deal with German operations in the Baltic and Black Sea, about which little has previously been written; and it is the author's view that had the German Supreme Command possessed the vision to use its military and air forces to secure local superiority in the "inland seas" (in which he includes the eastern Mediterranean) the results of the main campaigns might well have been different. But Hitler's "continental" outlook and strategy—and in particular his attack on Russia—frustrated any such possibility, even though in 1941 success was almost within German grasp.

Throughout almost the whole of his book Admiral Ruge displays a judicial impartiality. His defence of Dönitz over the *Laconia* incident thus now seems reasonable; but his conclusion that "the Wehrmacht fought the war without hatred . . . and its escutcheon remained untarnished" will surely convince no one outside his own country.

CAPTAIN D'ALBAS'S book might have been complementary to Admiral Ruge's, for there is certainly room for a careful study of the Pacific War from the Japanese point of view. Unfortunately, it has many of the faults which the German writer has so successfully avoided. It is not only diffuse and journalistic, but is also so badly translated that at times the meaning becomes quite obscure. Moreover, the book contains some false implications, as well as not a few obvious factual inaccuracies. Guam, for example, is on one page placed "in the Malayan Peninsula." A more serious matter is that it is quite untrue to imply that Britain made peace proposals in February, 1942. Yet there are, embedded in the somewhat turgid stream of Mr Rippon's prose, some interesting points, such as the reason why the attack on Pearl Harbour was not at once repeated, and the extent to which fortune favoured the Allies in the Coral Sea Battle. Although the author is certainly correct in classing the Japanese failure to protect and preserve their merchant shipping as a cardinal error, the fact that Captain d'Albas writes entirely from the Japanese angle—constantly commending their courage and fanaticism without once condemning or even criticising their brutality and treachery—vitiates the value of the book as a contribution to history. Finally, the book lacks tactical diagrams such as embellish Admiral Ruge's text; this makes it impossible to follow the course of the many battles intelligently.

Father of the Man

WILLIAM WORDSWORTH: *A Biography. The Early Years:* 1770-1803. By Mary Moorman.
Oxford University Press. 648 pages. 50s.

THIS is the first instalment of what is evidently intended to be the standard life of Wordsworth. A biography on this scale could not have been undertaken before the great scholarly labours of Professor de Selincourt and Miss Helen Darbishire, to whom Mrs Moorman acknowledges her profound debt. She does not claim to have thrown much new light on the obscurer episodes in Wordsworth's life, nor is hers an interpretative biography. She has no original thesis to advance, no arresting new portrait to offer. What she has done is to make full use, with self-effacing care, of the poetical texts, the letters and journals and other available data; and the result is an extremely well-documented and unbiased account of Wordsworth's formative years.

The second volume, which will cover the rest of his long life, can scarcely be expected to match the first in interest: for not only did Wordsworth's creative powers decline very sharply after 1807; the years of his youth were of paramount importance to the poet *himself*. What other writer has returned with equal persistence and intensity to the experiences of childhood and boyhood in order to account for his mature attitudes to man and the universe?

Wordsworth's untiring concern with his own spiritual development has provided such a mass of material in *The Prelude* that any biographer primarily interested, as Mrs Moorman is, in his mind and soul is obliged to draw on it perpetually. Her chapters dealing with the poet's childhood and schooling in Cumberland are done with a particularly sympathetic and knowledgeable touch. Her resolute refusal to indulge in psychological speculation, however, sometimes makes her comments a little banal, and her attitude to Wordsworth is as consistently benevolent as was that of his own wife. William certainly seems to have had the power of inspiring feminine devotion in his lifetime, yet how much more attractive in retrospect is his sister Dorothy, with her spontaneity and boundless capacity for loving. Wordsworth's moral earnestness and high-minded egocentricity often give his utterances a portentous tone, and the exhaustive biography of a man who took himself not merely seriously but also solemnly has its portentous aspects too. All the more welcome are the occasional glimpses of a Wordsworth capable of humour, for instance when he writes to Josiah Wedgwood of the teacher whom he and Dorothy had acquired at Goslar:

> He is so miserably deaf that we can only play with him games of cross-purposes and he likewise labours under a common German infirmity, the loss of teeth, so that with bad German, bad English, bad French, bad hearing, and bad utterance you will imagine that we have had very pretty dialogues, but the creature is all kindness and benevolence, and I shall never forget him.

Unity in India

PARLIAMENT IN INDIA.
By W. H. Morris-Jones.
Longmans. 429 pages 35s.

TO the free countries, the existence of a prosperous, independent and democratic India is politically and economically a source of strength, and ideologically a matter for rejoicing, whereas to the Soviet and Chinese neo-Imperialists the existence of such an India is politically and economically a barrier to further expansion and ideologically sheer anathema. To the west, the $64 question is: can India point the way out of the morass in which so many of Asia's millions are bogged down?

Professor Morris-Jones elaborates provisional answers that make for sober optimism. He describes India's unitary constitution, which gives the Union Parliament the right not merely to override State laws in many ways but to take over direct rule in the States and even to make or unmake them at will. Such central bias must, he argues, flow from some profound experience of unity. This he finds in, first, the strong unitary system of government experienced in the century that ended on August 15, 1947. The steel framework of the old Indian Civil Service has been retained in the new Indian Administrative Service, which thinks in terms of national administrative unity far more than would any State-recruited service. Secondly, political unity, and continuity of political experience, are embodied in the Congress party. Although the absence of an effective Opposition is obviously a weakness, it remains true that were the Congress electorally defeated, there is no other party with the experience of administration and of office that the Congress has accumulated in the seventy-two years of its existence.

This book is a work of outstanding scholarship, quickened by experience of men and affairs, sympathetic insight into human nature, apt anecdote and dry wit. Professor Morris-Jones picks his way with tact, and with generous and realistic recognition of the good faith of both sides, through the opportunities for wounding Indian and British sensibilities with which his subject abounds. He offers a wide variety of firsthand evidence in support of his broad conclusion that India is adapting to its own needs its inheritance from British rule and that parliamentary institutions are more firmly established in India than in many a European country. To the suggestion that disasters may befall when the existing generation of Indian politicians and civil servants, nurtured in British ways, dies out, he replies that Indian experience in parliament and civil service has been so continuous since the embryo of a legislative council was created in 1861 that the pre-1947 ways of thought and government are being passed on from one generation to the next—and passed on as Indian, not British.

This book is, what its publishers claim it to be, a major contribution to the literature on modern India as well as to the study of political processes. It is also extremely readable.

A Savage Noble

LORD LOVAT OF THE '45.
By Moray McLaren.
Jarrolds. 229 pages. 18s.

LORD LOVAT exemplifies a type which, in any country, can only occur in a time of transition: a man rooted in savagery, with the vices and some of the virtues of the primitive people that surrounded him, but capable of putting on the graces of the civilised society in which he spent much of his life. He was the type of the graduate who is still a member of the leopard society. Where such a man is a dullard or holds no place in his native society, one writes him off as a failed mission-boy. But occasionally a man arises, like Lovat, far above the ordinary in intelligence and character, a native chief who is educated but still a savage; and there you have the highest contrast and the makings of the best picaresque story in the world.

Lovat gained his great position in the Highlands by double dealing, violence, rape, treachery and oppression; but also by boldness, fluency, charm and loyalty to his clan; the whole founded on a considerable position of birth, which he consolidated by eliminating his competitors. His life makes a pattern in terms of tribal intrigue; without that background it scarcely makes sense at all. Outside the Highlands, his inconsequential treacheries and manœuvres, some of which seem almost purposeless, leave one dizzy—till the moment comes when, discredited and hunted by the law, he is suddenly found at the head of a powerful and loyal clan. Then the pattern becomes clear again.

Mr McLaren has written a spirited life, in which he makes the best of his villain, from the point of view of a fellow-Gael and a fellow-Catholic. He tries to dip his brush in whitewash, but he is far too honest and sensible to lay it on. No one can make Lovat into anything but a villain. One must either hold up one's hands in horror or amorally enjoy the story of a clever, bold, tortuous rogue, who lived long and died bravely. Mr McLaren always tries to see the best in him, and this slightly blurs the picture without redeeming Lovat's character: the effort to combine honest biography with Highland nationalism leads to rather too much nostalgic sentiment. Hill Burton's honest whig biography (which Mr McLaren quotes often and with praise) gives a more convincing picture.

Nevertheless, this is a very readable book, and Mr McLaren never confuses his views and hypotheses with his facts. He will perhaps forgive one patriotic North Briton who, after reading his book with great pleasure, is more firmly convinced than ever that the Union, Marshal Wade and guided missiles are very useful things.

HEINEMANN

The Precursors

WILLIAM WETMORE STORY AND HIS FRIENDS.
By Henry James.
Thames and Hudson. 716 pages. 35s.

STORY was the son of a New England judge and was himself following the law when, in 1846 and at the age of 27, he was asked to execute a public monument and statue which had been decreed to his deceased father. This homely request—which is itself very much what Henry James would call a "note" in the social history of the time—threw the young man into reasonable doubt, since his artistic pursuits had hitherto been confined to early-morning painting and modelling before settling down to labour at his authoritative "Treatise on the Law of Contracts."

"I finally consented," he records, "on condition that I should come abroad first and see what had been done in these ways." He and his bride accordingly sailed for Italy—where the works of Michelangelo and other competent professionals were known to be located—and thus began an expatriation that was to last, with very short intermissions, until Story's death. Some American sculptors, notably Hiram Powers, had preceded him to Rome, and whole flights were to follow—including, James tells us, "the odd phenomenon" of Miss Harriet Hosmer and her "strange sisterhood of American 'lady sculptors' who at one time settled upon the seven hills in a white, marmorean flock." These and other artistic pilgrims together made up an important section of the "precursors" — pioneer cultivated Americans abroad, "artless seekers of knowledge, would-be haunters of the fountainhead," sacred to James as having created for him that theatre in which were to be played out his own great comedies of the international situation.

James's memoir of Story is thus essentially a work of piety. It was originally published in 1903, and has all the leisurely elaborateness that one might expect of a year that saw, too, the appearance of "The Ambassadors." It is constantly with the air of one carrying out deep but delicate excavations that James turns over for us the letters and papers of those who were, after all, his own elder contemporaries. "Ghosts" is a word that constantly turns up, and we are made very conscious of being in the presence of "stray, pale testimonies" to the "combination of their undeveloped standards and their enlightened interest." But James has a profound and genuine nostalgia for this Italy of the Storys and the Brownings and the aged Landor, an Italy that seems to him so pristine, so primitive, and so very, very remote. Nowadays—in 1903—we are all "with our elbows in each other's ribs," and "it has really ceased to be feasible . . . to get away from America." How different that Arcadian time when "'Art,' in the easy view of the age, was to be picked up in the favouring air . . . hung in clusters and could be eaten from the tree, so that to be free of the mystery one had but to set sail and partake."

It is certainly true that the precursors, as James reveals them, are rich in this *sancta simplicitas.* Yet what in James's own apprehension was to become generalised as a mere glory exists often for them in a sharp particularity which their letters wonderfully preserve. The great charm of this book—the reprinting of which is to be welcomed warmly—consists in the juxtaposition of James's maturest conjuring with journals and correspondence of great vigour, freshness and charm. Story's description of the illumination of St Peter's on Easter Sunday, 1849, and his account of the arrival of Landor in Siena ten years later, suggest that he might have been a better writer than sculptor. As it is, his finest monuments are not his own. His Cleopatra lives only in Hawthorne's "Marble Faun." And it was shortly after being introduced to him in Rome that James retired to Florence and wrote "Roderick Hudson." Story was not at all like the unfortunate hero of that novel. But there can be no doubt that he inspired the book.

Parnellism Explained

PARNELL AND HIS PARTY 1880-90.
By Conor Cruise O'Brien.
Oxford University Press. 385 pages. 45s.

THE tumultuous disputes about Parnell that raged in Ireland in his lifetime, and raged more furiously than ever after his death, were tainted by ignorance alike of his aims and of his character. Gradually the mystery in which he deliberately wrapped his actions has been dispelled and his true stature is becoming clear; his faults can now be seen in perspective beside his greatness. What Henry Harrison's books did a generation ago for his private life, this excellent book does for his political career: fresh evidence has been assessed with scholarly acumen, in the light of what was known already, to build up a new and more convincing historical picture.

With the help of archives in Dublin, including the minute books of the Irish parliamentary party of the eighties, Dr O'Brien has produced a telling analysis of the party's composition and given an authentic account of its working and policies. Parnell's supremacy in the party was due, in the author's opinion, partly to genuine qualities of leadership, and partly to a profound understanding of Ireland's needs and troubles, but partly also to Parnell's superior social status: this is one of the ways in which Dr O'Brien shows that he appreciates the temper of the times. He explains skilfully the ways in which Parnell used, and subdued, revolutionary forces in Ireland in order to pursue a policy that was, for all the intemperance of language that sometimes disguised it, essentially conservative. Indeed the greatest achievement of Parnell's party was, he maintains, to draw the worst venom out of the sting of fenianism:

> For the adherence of Ireland to parliamentary democracy, we have to thank . . . the example and conduct of the party which he formed. . . . [Its members] were upright and consistent, faithful to their pledges, disciplined in action, and courageous in defence of the principles on which they were elected. They served Ireland well, and might have served her better if they had not—mainly through his own fault—lost their leader.

The Irish party's discipline was much more strict than the discipline of the then comparatively loose-knit Conservative, Liberal, and Liberal Unionist parties; most Irish nationalist members pledged themselves always to sit and vote with their colleagues, and with hardly an exception they all obeyed the pledge. Other parties have not failed to follow the example, with results that are becoming only too familiar. But there has never again, in a parliamentary country, been anything quite like Parnell's extraordinary domination over his followers. In his frequent absences, the inner committee—an unofficial body, largely of his own choosing—that ran the party in his stead made all its decisions conditional on his later approval; and his opinion, on policies or on personalities, was only once subjected to serious challenge before the final disaster. This challenge came over his imposition of O'Shea as candidate for the Galway City by-election early in 1886. The ease with which he overcame it tended, as Dr O'Brien shows, to increase his habitual self-assurance, which was still more inflated by the results of the special commission's inquiry into the Pigott forgeries: hence the catastrophe of December 1890.

Premier of Europe

A WORLD RESTORED: *Metternich, Castlereagh and the Problems of Peace,* 1812-1822.
By Henry Kissinger.
Weidenfeld and Nicolson. 365 pages. 36s.

DIPLOMATIC history can be fascinating as well as boring. For some people it is insufficiently human, for others insufficiently mechanical and scientific, but few will not find some intellectual excitement in the complex and deceptive manœuvres of a major diplomatic conference. Mr Kissinger has selected the classic period 1812-22 for a detailed study of diplomatic method. It is familiar ground, and the author does not put forward the fruits of any new research or any radically new interpretation. But he is quite remarkably penetrating on the psychology of statesmen and the workings of international politics. This is a reflective and subtle book, written with great care and with great concentration of meaning. It is diplomatic history at its best.

The chief interest is in the finesse and deviousness by which Metternich managed to secure the stability of Europe. Metternich was for a time virtually the prime minister of Europe and the continent was near to feeling a unity. This Austrian statesman was to suffer from having his history written by opponents who were unable to explain his success. Today he is in vogue again, and we are better able to appreciate his masterly inactivity or the way in which he duped others by himself appearing to be the dupe. We can learn from Metternich that the aim of diplomacy is to win the greatest possible freedom of action and a greater range of choice than is open to any potential opponent. He himself gave a virtuoso performance in this respect, and in so doing he also showed how diplomatic skill can achieve what may be impossible by force.

Mr Kissinger is so successful in sympathising with Metternich that just occasionally he provokes a feeling of doubt. It is always a temptation to make out that statesmen are more conscious and deliberate than in fact they are, and one sometimes suspects that Metternich's ruses and delaying tactics rather reflect indecision or even outright incomprehension. Another temptation is to suggest that where Metternich failed the cards must have been stacked against him, but where he succeeded it was his own good play. The author sometimes

Catastrophe and Imagination
JOHN McCORMICK
In this impressive study, John McCormick holds that the novel has a unique relationship to society, and he sets out to define this in relation to the many 'catastrophies'—wars, revolutions and other outrages on sensibility—that have marked recent history.
'Mr. McCormick knows exactly what a novel should be and do.' *Listener.* 25s. net.

Parliament in India
W. H. MORRIS-JONES
This book is the first full-scale study of a modern Indian political institution. It is based on direct investigation of Indian central and state legislatures at work, as well as on an extensive survey of reports and proceedings. It is a contribution to the literature on modern India as well as to the study of political processes. 35s. net.

LONGMANS

PITMAN

THE PATTERN OF MANAGEMENT

By Lt.-Col. L. F. Urwick. In this compact yet comprehensive book the author carries his philosophy of the subject of management a long step forward. Everyone interested in the subject and its application to government and industry will find this book illuminating and rewarding. 20/- net.

MANAGEMENT, LABOUR AND COMMUNITY

Edited by D. Cleghorn Thomson. A symposium of the writings of 22 of the nation's experts in management and human relations. The major portion of the book deals with the various methods of training those who may be called upon to fill positions of responsibility within the present-day economic system. A book for teachers and students of management subjects and also for those in management. 35/- net.

TOP-MANAGEMENT ACCOUNTING

By T. G. Rose. This new book has been written for company directors, management accountants and students. It gives a clear and simple explanation of what the managing director of today should know about the continually changing financial structure of his company, and tells the management accountant how best to obtain the information as well as supply it in the form required. 9/- net.

COAL-MINING ECONOMICS :
Organization and Management

By J. Sinclair. This book traces the development of the industry and deals with present-day organization, conditions of marketing, transport, finance, etc., and also plans for the future. The author then describes the application of management techniques to the industry, the role of the N.U.M., wages structure, and other features. A book for the student and the practical mine worker. 45/- net.

assumes rather than demonstrates this good play, and he can make Napoleon by comparison appear something of a zany. The picture of a pathetic Napoleon trapped by a man of greater *insight and* elusiveness is overdone.

Exaggeration aside, Metternich is still one of the giants. He was the architect of a settlement which helped to keep Europe out of any major war for a century. Mr Kissinger recognises that he was fighting for a losing cause and that he was outside and against "the spirit of the age." Metternich himself was aware not so much of his success as of impending disaster, and of the fact that the attempt to preserve the *ancien régime* in Austria might ultimately prove futile and sterile. For him, statesmanship was not the art of making concessions at the proper time, but of avoiding any concessions at all and hoping for the best. Other statesmen today, faced with the same question, can learn *from his own* mixture of success and failure.

Bursting at the Seams

PARIS A LA MODE.
By Célia Bertin. Translated by Marjorie Deans.
Gollancz. 255 pages. 21s.

DIOR.
By Dior. Translated by Antonia Fraser.
Weidenfeld and Nicolson. 229 pages. 21s.

THIS is a study of the Paris *haute couture* industry, by a French novelist. It is enthusiastic, emotional and pious, and copiously illustrated with drawings of the type reproduced here; but for those who know nothing of this most irrational business, it is a titillating introduction. It does convey the nervous, theatrical tension, and the "collective creativeness" and pride in craftsmanship informing a fashion house on every floor; also why the industry's poorly paid, badly housed workers prefer to serve in an *haute couture* heaven than reign in a well-appointed ready-made factory. (One section, describing typical firms handmaking buttons and feathers and luxurious accessories, will specially please sentimental Francophiles, as almost all the firms work in a few sleazy back rooms, inspired and controlled by a dowdy figure who would normally be taken for the concierge.)

Unhappily, this is told at the level of shrewd gossip, in what might be called peignoir prose —vapid dressing-room chats among mannequins, verbatim accounts of crises over a zip-fastener. Statistics, historical and economic comment are seeded through these daily dramas, but hard to piece together; page 119, for instance, squarely says "women's clothes can be imported free into the United States" though page 52 has said that the duty on clothes entering the United States "may go up to 90 per cent of the cost of the models."

The translator tries gamely to match Mlle Bertin's raciness, but is often outpaced: nothing quite excuses a translation that uses more exclamation marks than the original.

M. DIOR believes in fortune tellers, and no wonder. When he was a boy a gipsy told him "women are lucky for you and through them you will achieve success. You will make a great deal of money out of them." But this prophecy did not begin to be fulfilled until he was thirty. After studying political economy, of all improbable things, he was the director of an art gallery until the slump, when he went to stay with a friend who was a freelance dress designer. Then it was that, for want of anything better to do, he tried his own hand at a few sketches and found his *métier*. It was not until December 1946 that, with the backing of the textile manufacturer and racehorse owner M. Marcel Boussac, he set up the House of Dior. The "New Look," the return to femininity that rocked the world after the austerity of wartime clothes, was his very first collection.

We have now had several biographies and autobiographies of couturiers, and it is interesting to see how they account for that mysterious thing, the "Trend" of fashion. The favourite explanation is that each couturier, like any artist, expresses the inarticulate desires and attitudes of his time; and that this explains why, in spite of all the care they take to guard their secrets, the several *couturiers* in any one season will show much the same features. M. Dior's explanation is less romantic and less self-important. The Trend, he says, is largely the creation of the ladies of the press. With their passion for pigeon-holing and classifying, they detect uniformity where none exists, selecting for their descriptions those models that have a common feature. It is with reluctance that he himself panders to their lust for classification by giving each collection a generic title.

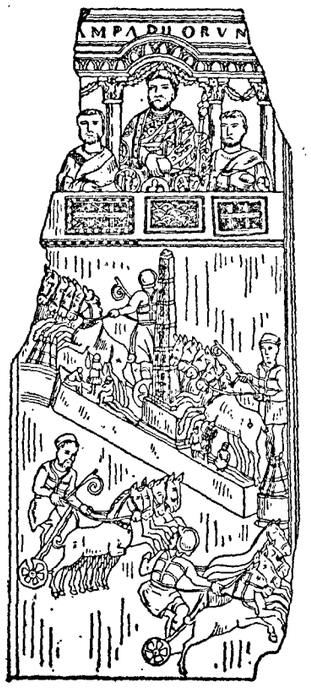
Honesty and lack of self-aggrandisement seem to be among the author's qualities. The young man from Normandy still looks in startled wonder at the other Dior, the showman, of necessity the poseur, the world figure. Kindness seems to be another of his qualities. The only people who earn harsh words in his book are the buyers, whose habits at shows are apparently deplorable. But if he is bitter about buyers, he is full of warmth for his *premières,* vendeuses and mannequins. And he is so very kind about English women. "Personally," he says, "I find them among the most beautiful and distinguished women in the world." Let us *hope* that this gratifying sentence is in the French edition of this book.

The Pleasures of Translation

THE ART OF TRANSLATION.
By Theodore H. Savory.
Cape. 159 pages. 16s.

TO a surprisingly large number of people translation appears as a mechanical or at best ancillary job with an aroma of distasteful school tasks. *This is the pen of my aunt; Balbus built a wall; thence he marched three parasangs.* There are, of course, the professionals; the interpreters in glass booths at international conferences, miraculously keeping pace with the orator, and the people thanks to whom one can read M. Simenon's detective stories in English, and the drafters of communiqués and news reports. But the idea that translation may be a pleasurable *pursuit,* as delightfully exasperating as golf, as challenging to the creative faculties as portraiture, is rarely entertained by those who have never themselves suffered from translator's itch. "No one," says Mr Savory, "who is interested in language can for long confine his interest to his native language only. . . ." There, with all due respect, speaks the enthusiast. But his enthusiasm is catching; and in this opening sentence of his preface there is implicit the strongest argument for translation, both as a tool of teaching and as an amateur pursuit. No other kind of play with words gives so keen a sense of the peculiar genius of language, of its precisions and vaguenesses, of the connotations, associations and colour of words, of the architectural quality of sentences, nor so usefully forces the writer to look behind the word or phrase for the thing, the thought or the feeling which may have fossilised into cliché.

Mr Savory, however, is not concerned to recruit enthusiasts; he takes enthusiasm for granted and goes on from there. His book is, as he describes it, "not a treatise, but it is planned on the lines, if not on the scale, of one." He classifies the chief types of translation: the purely informative—as in airport notices—in which perfection is easy; the adequate, rendering ordinary readable prose into ordinary readable prose without concern for fine shades; the scientific and technical, calling not merely for linguistic skill, but for expert knowledge of the matter concerned; and—his chief subject-matter—translation as a fine art, the attempt to produce with the utmost precision, on the reader of the translated version, the same impact as the original would make on anyone qualified to read it. He discusses various principles followed, explicitly or implicitly, by translators past and present. Should translation read like translation, reminding the reader of its origins, or like an original work? Should the author's or the translator's style be uppermost? In translations of the classics or of historical works, should archaic or contemporary language be used? How literal, or how free, should be the rendering? Should verse be translated as verse or as prose? He concludes, after acute and humane examination plentifully illustrated with examples, that there is room for almost every principle, even the most grotesquely literal construe having its justification as an aid to the rusty or not-quite-competent reader of the original.



One would like a lot more: not only of such famous cruxes as Horace's sweetly smiling, sweetly speaking Lalage and of scientific prose, but also of the weird, the private, the magical—what, for instance, has anyone contrived to do with Gérard de Nerval's "prince d'Aquitaine à la tour abolie"?—and, in general, of the whole question of word music, which, on the evidence of this book, ranks rather low in Mr Savory's hierarchy of preoccupations. One would like to know what he thinks of Mr Scott-Moncrieff; and of Basic English and Esperanto; and of innumerable other things. But to say of a hundred-and-fifty-page book that it rouses curiosities which four times that number would hardly satisfy is not criticism; it is high praise.

The Eastern Empire

THE BYZANTINE WORLD.
By J. M. Hussey.
Hutchinson's. University Library. 191 *pages.* 10s. 6d.

BYZANTIUM: *its Triumphs and Tragedy.*
By René Guerdan. Translated by D. L. B. Hartley.
Allen and Unwin. 228 pages. 25s.

THE stream of literature on the history of the Byzantine Empire shows no sign of drying up, and these two books are attempts to bring the results of modern work to the attention of a wide public. They could scarcely be more different in the way they set about doing this. Professor Hussey's brief introduction is a work of admirable lucidity and compression. The first half contains a political survey of the fortunes of the Empire from the foundation of Constantinople in 330 AD to its destruction in 1453. Then follow chapters on various aspects of the Byzantine achievement in government, religion, learning, literature and art.

Since all this is accomplished in less than 200 pages, it might well seem that an extreme desiccation must result. This apprehension is happily not fulfilled. The book appeals to the mind more than to the imagination; it must be read with concentration, but it is alive. The reason for this lies in the author's complete integrity and absorption in the subject. Although she is, for the most part, describing familiar scenes and landmarks, she finds time to linger over the sources of our knowledge, and to point out lines of future research. However familiar the country may be, we see it under the guidance of one who has explored its limits and knows how much is still to be known. The few pages on learning and literature are especially impressive from this point of view; but the whole book contains a wealth of experience out of proportion to its size.

M. GUERDAN'S book is a very different affair. Its appeal is entirely to the imagination. There is no attempt at a connected treatment. Instead, we have a series of vignettes connected more or less adroitly and recorded with considerable vivacity. It is true that the gestures and animation of the French original are sometimes strangely frozen in this English version, but in the main the transformation is made without much awkwardness. Perhaps the author claims a little too much in offering the book "as something more than a popularisation," and his work scarcely deserves the eulogy of the French scholar Charles Diehl, with which it is prefaced. It is not in any sense, as Professor Hussey's smaller book is, a work of learning: it is an exploitation of picturesque incidents to convey a series of forcible impressions of popular and imperial life, of war, peace, religion and diplomacy at various periods of Byzantine history, with the reign of the tenth century Emperor Nicephorus Phocas as the central piece. This is a kind of journalism at which the French excel; and M. Guerdan's book (an illustration from which is reproduced here) will doubtless draw to a passing interest in Byzantium many more new readers than the more sober volume with which it is linked in this review. It is to be hoped that some of these readers will be encouraged to pass on, first to Professor Hussey's book and then to the wider fields which it opens up.

HART-DAVIS

Cheerful Atheist

IT'S ME, O LORD!
By A. E. Coppard.
Methuen. 252 pages. 22s. 6d.

COPPARD'S first master was the Thomas Hardy of "Life's Little Ironies," and there is some affinity between the writers. But while Hardy was a sad agnostic Coppard was a cheerful atheist; and it is unlikely that Hardy would have hit on, or approved, such a title as Coppard here chooses for this initial, and now posthumously published, instalment of autobiography. Both men liked churches and disliked parsons. The first of Coppard's stories to see print was about a vicar who flew into a rage with a homeless boy he had found one morning sleeping in his church wrapped in the altar carpet. Kind Mrs Evans of North Oxford disapproved of this tale, assuring Coppard that no clergyman would behave like that. But years later—Coppard tells us—he heard of "a real vicar who actually prosecuted a boy for a similar misdemeanour." His satisfaction in this corroboration is that of a man tenacious of such faiths as are in him. The existence of the soul, he writes near the end, is an astounding assumption that no rational being could accept, and of anything of that sort he is

> content to have no more than as much as a contented tree, which grows and grows without promise of reward, disdaining no virtue, vaunting no spurious ancestry, achieving no vice, and has no other observable aim but to conceive in flowers that turn to husks containing dusty seeds, all to promote the vicarious continuity for which it has a reckless passion.

This comes in a context about parsons; and "disdaining" has something of Hardy's salt.

As a boy Coppard knew intimately the life of both the urban and the rural poor; as a young married man he lived for twelve years in or near Oxford, where he was employed as a clerk in an ironworks. His sense of the learned world surrounding him was sufficiently keen and sequacious to suggest to us irresistibly a comparison between his position and that of Hardy's Jude Fawley. But Coppard—perhaps because of the joy that was in him—was far better received. Bodley's Librarian gave him permission to read in the Radcliffe Camera for six months—and although he named this period with the air of a magistrate speaking from the bench, the sentence was tacitly allowed to run on indefinitely. An authentic magistrate fined Coppard for poaching—unjustly, he swears, and simply because he had a habit of exercising whippets indiscreetly. But all his other relations with Oxford appear to have been entirely happy. A way was opened for him by T. W. Chaundy, later a mathematical don at Christ Church, and thereafter he was free of much lively society.

For this reasonable state of affairs most of the credit was clearly Coppard's own; his interests and enthusiasms were wide-ranging and unaffected, and he must have been very attractive to those intellectual undergraduates with whom *Angst* was already conducting preliminary skirmishes. He emerges from his own simple but far from artless narrative as a man of great courage and resilience. And he emerges, above all, as a natural writer, who achieved his *métier* in the face of almost overwhelming difficulties and preserved always an exact sense of what was within his compass. Coppard died in his eightieth year. But we are here obliged to take leave of him at forty-four—a professional writer at last, living in the Chilterns in a two-roomed cottage which he has christened 'Chop Cherry' from the song in Peele's "Old Wives' Tale."

The Audience is the Thing

PARIS THEATRE AUDIENCES: *in the Seventeenth and Eighteenth Centuries.*
By John Lough.
Oxford University Press. 300 pages. 45s.

HOW much does the audience matter in the theatre? An actor will say that it matters more than any other single factor except the quality of that particular actor's part. Any manager will assert that "word of mouth" (that is, what members of an audience say about the play when they have seen it) matters more than advertising or the opinion of critics. How odd then that so little is written in a serious way about the audience. Professor Lough has certainly made up for much neglect in this book, though it deals with Paris, a city whose theatres bear the minimum of resemblance, in every way, to ours. Still his scholarly work might inspire somebody to start a similar study on London playhouses. There is another answer to "does the audience matter?" and Mr Lough provides it quickly and clearly. As audiences in Paris became less crude, less pestered by drunks and harlots, so the quality of the plays presented to them changed. This fact alone justifies what is, for the ordinary reader, pretty heavy going in the analysis of French reactions to French plays (all the crucial passages being in French). Another line of inquiry is immediately opened up for domestic students: we keep asking what is wrong with the English theatre. Why are our dramatists so dull and unenterprising compared with Americans (this, of course, not only asks but begs a question)?

May not the answer be that everybody is looking in the wrong direction? Although it does not appear to be his thesis Mr Lough puts up a most convincing proof that if we want to know what is wrong, or what is right, with the theatre anywhere in the world at any time the answer is to study the audience. He apologises for introducing graphs; why apologise? His graphs say a great deal and maybe something of the same

sort might be discovered about the English theatre by examining fluctuations in the size of audiences. It was evident that during the war it was easier to fill a theatre than at any time since the previous war. Is there anything to be learned from this and if so how can the lesson be applied?

These are vague and complicated questions; that they can be asked profitably and answered with some precision is the main burden of Lough on Paris audiences. The sooner a survey just as detailed and written with as little pomposity is available of the London theatre in the same century or any other the better informed we shall be about what is, after all, the principal influence in the theatre at any time.

China's Female Stalin

LADY WU: *A true story.*
By Lin Yutang.
Heinemann. 258 pages. 15s.

THE ordinary reader's profound ignorance of China's rich and immense history gives an added freshness to Dr Lin Yutang's latest book. If he had not taken the precaution of warning us that his story was true, and of revealing his sources in a learned and graceful preface, we should be inclined to complain of a feverish imagination. The usual reference books are indeed less lavish with the details of Empress Wu's life than her present biographer.

Lady Wu was one of the women attendants of the aged Emperor Taitsung, in the seventh century A.D. She was not even a high-ranking one, belonging to the sixth of the nine grades that constituted the emperor's harem. Ambitious and intelligent, she broke with protocol and precedent by becoming the mistress of the weak-willed Gowtsung when he came to the throne after his father's death. Thereafter she proceeded with the coolest efficiency to dispose of every possible rival, sparing neither friends nor relatives, including her own sons, whipping to death, poisoning, torturing, inventing conspiracies against the throne so that the "plotters" could be liquidated, until she herself was not only *de facto* but also *de jure* empress of China.

Her murders, which are carefully listed, make the Medicis look like fumbling amateurs. Indeed, Dr Lin suggests, in a not altogether fanciful passage, that Stalin provides a more valid parallel. For as the author points out: "Her killing of generals and elderly statesmen was the same, her purges and trials and techniques of tortures were the same, the reliance on 'confessions' the same. . . . Even the method of extracting confessions by nervous exhaustion was the same."

It remains only to say that Dr Lin puts his extraordinary story into the mouth of one of the few princely survivors of Lady Wu's reign of terror, and tells it in novel form. His engaging simplicity and lucidity never desert him, and the book has some at least of the elements of a best-seller.

The Distaff Side

THE ENGLISH WOMAN IN HISTORY.
By Doris Mary Stenton.
Allen and Unwin. 371 pages. 35s.

THE author prefaces her work with the startling assertion that there seemed little that she could say with advantage about women artists, writers or players; likewise, she wastes no space on the political influence of the great ladies of the nineteenth century whose activities are already well known. She concentrates instead on woman as property owner, woman dispossessed, and woman resurgent.

The earliest evidence comes from wills, lawsuits and proceedings in manorial courts; and these innumerable transactions, interspersed by deductions about the daily life of their participants, make rather plodding reading. But the pace quickens with the diarist and letter-writing vogue that began in the fifteenth century. Thereafter, the author's method of generalisation, necessitated by the meagre data of bequests, charters, and court rolls, becomes impossible in the face of the wide difference in outlook and circumstances shown by the lively, studious or naughty revelations of ladies of high degree or earnest avocation.

The conclusion reached from the well authenticated evidence is that women before the Norman Conquest enjoyed a rough equality with men, sharing both dangers and protection, and fighting in a husband's cause (and sometimes against it); but that the independent status of the noblewoman in England declined after 1066. Nevertheless, in spite of the inequalities of medieval days when women were relegated to an honourable but essentially unimportant position, and of the Reformation when they were conditioned by St Paul's views on subjection, dominant characters continued to emerge in every generation, and Lady Stenton's book is in reality a salute to their achievement in history.

In less exalted circles a good wife was always necessary to a farmer's prosperity; and whatever the prevalent social idiom, she had her own prestige and privileges from the time when Adam delved to the present day. Throughout the middle ages widows of "a certain age" seemed to be very well found indeed, though the younger ones had much ado to escape unwelcome suitors pressed upon them by whichever feudal lord benefited by the tax on their remarriage. After the hard years of the Civil War, when domesticity was of necessity augmented with administrative and soldierly aptitudes, the puritan view of the relation between husband and wife affected wives throughout the land, and the laxity of the Restoration shocked many back into a discipline that was beginning to be irksome.

But since the days of the first Elizabeth there had been growing concern with the legal and social position of women, and the latter part of the book is concerned with the growth of their struggle for equality and their evergreen determination to be "free, happy and famous as men."

Spring Books

A History of the Council of Trent
HUBERT JEDIN
translated by DOM ERNEST GRAF OSB
The first volume of the translation into English of *Geschichte des Konzils von Trient* by Hubert Jedin, Professor of Medieval and Modern Church History at the University of Bonn—the first comprehensive work on this subject for some 300 years. The *History* will be completed in 8 Books—Books 1 and 2 of which are contained in the present volume. With 8 half-tone plates of contemporary portraits.
xii + 620 pp 70s

Practical Reason and Morality
A study of Kant's Foundations for the Metaphysics of Morals
A. R. C. DUNCAN
A new and original examination of the content of Kant's *Foundations for the Metaphysics of Morals*, showing that it is not an ethical treatise (as so often mistakenly assumed), but a critique of practical reason by the man who had already produced the *Critique of Pure Reason*.
xviii + 182 pp 18s

GHANA
the autobiography of
KWAME NKRUMAH
Prime Minister of Ghana
This is the life story of the Prime Minister of the Gold Coast, which became a Sovereign State under the name of Ghana on 6 March 1957. The dramatic events of Dr. Nkrumah's life are inextricably woven with the struggle for self-government, in which he has proved himself a most resolute and dynamic leader. Born the son of a village goldsmith, he is now the most important figure in Africa today. With 40 pages of half-tones.
xvi + 312 pp 21s

Meister Eckhart
An introduction to the study of his works with an anthology of his sermons, selected, annotated and translated by
JAMES M. CLARK
Eckhart, one of the greatest of speculative mystics, has been greatly misunderstood since most of the studies of his works have been previously based in part on MSS now proved to be spurious or faulty. The latest research by Continental scholars has done much to clear up the earlier confusion, and this study, which has taken advantage of their findings, gives the English reader a balanced introduction hitherto unobtainable.
xii + 268 pp *April 4* 25s

Fritz Saxl 1890-1948
A volume of memorial essays from his friends in England edited by
D. J. GORDON
Fritz Saxl was Director of the Warburg Institute and Professor of the History of the Classical Tradition, University of London. The growth of the study of the history of art in this country was due to him and he was one of the first to show its importance in the wider field of humane studies in general. These essays, contributed by experts in the different fields, are representative of the many facets of his interests.

"Lord, What Fools . . ."

FRAUDS.
By Richard Aldington.
Heinemann. 244 pages. 21s.

IMPOSTURES, deceits and swindles—all dictionary equivalents, as Mr Aldington points out, of his monosyllabic title—are a class of subject which different authors have handled in very different ways. There is the Awful Warning style, an elaboration of the beware-of-pickpockets notices in public places; here are some of the ways in which fools and innocents can be parted from their money, or, as a variant, here are a few dreadful examples of the moral decline that leads to the dock and to worse things. At the other extreme there is the callously lighthearted style; three cheers for Tyl Eulenspiegel and his merry japes. Between the two there is the natural historian's approach, the near-scientific classification by motive, by method, by social setting; here greed, there spite, elsewhere vanity, is at work, here is the weakness on which the impostor played, the chink in the victim's defences, the favourable climate. And, whatever the method, there is the pure story-telling element, with detection, evasion, ingenuity and counter-ingenuity each receiving a varying share of the author's attention by comparison with the presentation of character.

Mr Aldington is, on the whole, a natural historian; but a natural historian of a special, misanthropic kind. He has no affection for his "frauds"—Psalmanazar the fake "Formosan," Wainewright the poisoner, Arthur Orton the Tichborne claimant, "Dr" Graham with his Miraculous Bed, Maundy Gregory the go-between in the honours traffic, and other shady characters treated briefly and apparently chosen, with few exceptions, more for their odiousness than for their ingenuity; he has hardly more sympathy for their victims and precious little respect for their adversaries. His pages are peopled with Yahoos and Tartuffes; his detestation of the deceivers is matched by his contempt for the deceived; and he rarely misses an opportunity for a sidelong snap at any character, however remotely concerned with the matter in hand, who figures on his private and extensive list of *bêtes noires.* (It is surprising how often he manages to bring in T. E. Lawrence.) His book is well written, his cases are well presented, his thesis that mankind in general and the English in particular are remarkably gullible is proved to the hilt, and his skill as an entertainer is considerable; but he leaves a singularly rancid taste in the mouth.

Metropolitan Birds

THE BIRDS OF THE LONDON AREA SINCE 1900.
By a Committee of the London Natural History Society. A New Naturalist Special Volume.
Collins. 315 pages. 30s.

SINCE the Authorised Version of the Bible there have been remarkably few instances of a good book written by a committee; but this has claims to rank as one of them, and indeed it may well rank as a kind of bible to the considerable and devoted sect of Londoners for whom birdwatching is a kind of religion.

Mr R. C. Homes and his dozen or so co-authors have most succinctly described the recent history and status of the 245 full species (including over 100 breeding species) authentically recorded this century within the 1,200 square miles included by their mystic circle of 20 miles around St Paul's. Contrary to former practice, great rarities such as the crested lark and Sabine's gull are treated briefly, with the references to fuller accounts published at the time of occurrence, while species which bulk large in the bird population, such as the house sparrow and tufted duck, get much more space. Aided by the exceptionally dense coverage of observers, and by the copious records fed into the society's archives by its thousand-strong ornithological membership, the editors have shown great skill in summarising population trends and changes in local distribution and status during the half-century. In this period two new British breeding species, the black redstart and the little ringed plover, have made the area their main centre of dispersal, and such wintering species as the smew and the lesser black-backed gull have made Greater London one of their main strongholds. There are six important heronries, some within a mile of densely built-up areas.

The first hundred pages give highly readable surveys of the physical setting in general and of the main habitats, together with reviews of migration and of roosts and flylines. These describe how the outer London starlings stream daily into the centre to roost as the human tide flows out towards dusk, and how little these flylines have altered since they were first traced thirty years ago. Since 1870 reservoirs have grown to cover over 3,000 acres within their concrete banks, and to provide incidental hospitality for between 5,000 and 10,000 ducks, less than half of which are mallard, and up to about 100,000 gulls, the majority black-headed. A large amount of background information about land use, freshwater biology, vegetation and social history is incidentally recorded. The book is excellently illustrated with photographs and maps, and well provided with references and index. As a product entirely of non-professional ornithologists, it provides impressive evidence of the high competence of the amateur element in one of the few branches of biology in which the amateur, with the aid of first-class teamwork, is still able to hold his own.

Men from Beasts

THE STORY OF LIFE.
By H. E. L. Mellersh.
Hutchinson. 263 pages. 21s.
MAN AS AN ANIMAL.
By W. C. Osman Hill.
Hutchinson's University Library. 176 pages. 10s. 6d.

EVEN now, nearly a hundred years since the "Origin of Species" was published, undergraduate biologists are still occasionally assailed at the doors of their laboratories by anti-evolutionary canvassers. Although such extremists are in the minority, there is still much ignorance about the evidence for evolution—an ignorance that is often associated with an emotional reaction against the view of man as an animal. The problem is threefold. First, has evolution taken place at all? Second, if so, what courses has it followed? Third, what factors have controlled its course? On the first point, the evidence has been conclusive for many years and can be disregarded only by the cranky and the ignorant.

It is the evidence concerning the second and third that are summarised by Mr Mellersh in "The Story of Life." The major part of the book consists in an outline of the principal routes of animal evolution. Starting from the current views on the earliest beginnings of life, the author shows how the complexity of organisation within the animal kingdom gradually increased; he follows up several side-branches of the evolutionary tree besides giving a detailed discussion of the evolution of man. In later chapters a discussion of a number of general problems, such as sex and heredity, is concluded by a consideration of the mechanism of evolution itself. The author deals with his comprehensive subject in such a way as to make it comprehensible to the ordinary reader; he has a robust attitude to scientific jargon, and although his jocularity is at times irritating, his exposition of such technical material is remarkably lucid.

MR OSMAN HILL's book, another fine addition to Hutchinson's University Library, is concerned with only a small portion of this story—the evolution of man from his pre-human ancestors. Describing his scope as "some of the more outstanding phenomena in the natural history of man," Mr Osman Hill is primarily concerned to demonstrate affinities between man and other primates. In successive chapters he reviews evidence drawn from such diverse fields as anatomy and ethnology, parasitology and psychology, showing not only the similarities between man and other species, but also the nature of the differences. This book is slightly more serious and considerably more detailed than "The Story of Life," but it too will be enjoyed by a wide public—and not the less so because the author is content to let the facts speak for themselves. It is particularly to be recommended to those who, while accepting the occurrence of animal evolution, want to reserve man as a special case.

Neo-Romantic Poets

THE ROMANTIC SURVIVAL.
By John Bayley.
Constable. 238 pages. 18s.

IN this book Mr Bayley considers the work of three poets who at first glance do not appear to have very much in common: Yeats, Auden and Dylan Thomas. By placing them firmly within the context of Romantic theories about the nature and scope of poetry, however, he seeks to illuminate the quality of their achievement and to demonstrate that each, in his own way, has rediscovered the basic assumptions of Romanticism. These assumptions the author considers more liberating and enriching than the classical doctrines of T. E. Hulme and T. S. Eliot.

About Yeats there can scarcely be much contention. He so clearly belongs to the great tradition of those whose trust is in the power of the creative imagination to absorb the dailinesses of life and transform them into material for poetry. He is linked to Wordsworth by his recognition of the mystery and the high significance of the poet's function, and to Keats by his conception of the Mask. Against Wordsworth's idea of the poet as interpreter and guide, Keats suggested that his special task was not to philosophise, but to subordinate his own personality to the creative process and to discover, by imaginative penetration, the significant quality of what he "felt upon his pulses."

Dylan Thomas, with his obsessive emphasis on sensory experience and his joy in the very feel of words, is recognisably a Romantic poet of the Keatsian kind, though what Wordsworth would have thought of his poems defeats conjecture. Auden, however, can only with difficulty be fitted into the Romantic category, unless alongside his admired Byron, who took a far less transcendental view of poetry than Wordsworth, Coleridge, Shelley or Keats. Mr Bayley nevertheless makes out a good case for connecting him with Yeats, claiming that he has followed him in showing

> how the intense private world of symbolism can be brought right out into the open, eclecticised and pegged down to every point of contemporary interest and everyday life, while remaining none the less a private and even a substitute world.

This is a stimulating book. The survey of the decline of Romanticism, which constitutes its first section, is done with perception and good sense, and the studies of the individual poets gain from being related to a central theme, the survival of Romantic preconceptions and poetic values. Not the least valuable chapter is that which deals with contemporary analytical criticism, arguing that disciplined readers of poetry nowadays are so anxious to take the machine to pieces and see how it works that they are likely to ignore "the unexplained vitality which makes the poem a living thing, and which the poet himself cannot account for or justify."

than social. Its grumbling is directed at the muzzle of censorship, and the way it has been elbowed out of seats in Parliament. It would do much as Nuri has done were it in power. The other is a younger, poorer group of genuine socialists who now despair of land reform except at the hands of some leader sprung from the people—a Gamal Abdel Nasser.

The social aspect of the Development Board's work, reduced to its simplest terms, is a straight issue between haves and have nots—landed gentry and landless peasants. Over the next few years, the matter that must command attention, in a country one of whose only two great natural resources is agriculture, is whether the relationship between them is to jog on in its present uneasy and uneconomic shape, or, if not, by what means it is to be changed.

The problem of easing social tensions is beyond the scope of the Development Board and in the realm only of cabinet and Parliament. Will a parliament composed chiefly of landlords ever agree to alter the pattern, or must it be altered violently, as in Egypt? Some dispassionate outside observers think that an imposed land reform is the only way of making the irrigation programme pay its way, since to settle peasants at £300 a head on second-best land is financially as well as socially unsound. Others contend that if existing laws were only applied, and landlords paid the taxes for which they have voted, all would be well. Yet others believe that owing to development works, the landlord's position is crumbling anyway, and that even if brusque land reform is shirked, change will happen, without tears, in this generation.

A growing number of factors bear out the last view. One is the increasing availability of alternative employment. Sheikhs in the Amara area were complaining this spring that they had no one to row them to market, and no beaters, because "their" peasants had gone off to work for the American builders of the Kut-Basra road. Another such factor is the very existence of new smallholdings, however expensively created; once peasants know they can put their name down for a plot and a house, their relationship to a master alters. And if, to replace them, he has to resort to machinery and pay a tractor driver 1½ dinars (30s.) per day, who will stick to share-cropping? Yet another factor that is undermining the landlords' old supremacy is the growth of communications. When peasants who were once confined to poor, disease-ridden surroundings are able to reach a town and a labour exchange by bus, landlords will need either to make rural conditions attractive or else will find themselves bereft of labour and income. The exodus from Amara to Baghdad is already proverbial; more would be disastrous:

> As a long-term policy, Iraq cannot abandon cultivation and live entirely on canned food. A country which is undertaking investment in irrigation on a large scale is indirectly investing in agriculture, and must make some provision for the future of the agricultural population. But by the time that perennial irrigation allows intensive cultivation, the cultivators may not be there.*

There are faint signs that the mind of some landlords is moving towards a grasp of the need to forestall this awful contingency. In 1952, for instance, Parliament passed without demur a shortsighted law—the Amara land law—which, nominally, gave peasants title to claim land, but was in fact so worded and executed that sheikhs and their families grabbed most of the lands available. By 1954, the lower house had passed a bill which entitled the government to recover by instalments from landlords the cost of drainage of their lands undertaken by the Development Board; but the landed gentry in the Senate threw it out. By 1956, a law passed by both houses rendered income from the rent of agricultural land liable to income tax. In 1957-1958, to meet an anticipated deficit in the ordinary budget, the proposal is to tax the capital value of landed estates. If that measure is passed by both houses, if the assessment is just, and if landlords begin to surrender acres in exchange for services or in order to meet their obligations, a corner will have been turned in Iraq's social history.

Whether social change will happen gradually or after an upheaval is still an open question. By contrast, it is certain that unless some means is devised of breaking up the many estates at present doomed to perpetual inefficiency, Iraq's productivity will never be what it could be, however great and efficient its investment in irrigation and training.

A point never to be forgotten is that this fortunate nation has not merely water but good human material in which to invest. Often, Iraqis may seem to be lacking in initiative and inclined to wait for orders, but on the whole the evidence is that they warm to responsibility. Give them a co-operative and a budget, prizes for the efficient farmer and a keen instructor to teach them how to work the new apparatus, and—Arab and Kurd alike—they forge ahead. "I joined the Iraqis for a year" says the man from Leicester or Utah, "and that's six years ago, and here I still am because I like them." There is something compelling about helping with the fortunes of this eager people.

IRAQ: THE NATIONAL INCOME

The Iraq Central Statistical Office has recently completed a series of census enquiries on agriculture, livestock, housing and distribution. These, with the departmental data published in the annual Statistical Abstracts, permit a preliminary estimate of national income and product. Pending the completion of work now being done on the figures in the Office, the unofficial figures given below have been produced by the Government's chief statistical expert. In 1951, the International Bank estimated national income per head at "probably at most ID 30"; on the basis of the table below, it is now ID 53.

	Million Dinars	% Total
Forms of Income :—		
Wages and salaries	65·2	22
Earnings in kind	38·2	13
Rents	21·4	7
Profits and interest	98·8	34
Net oil revenues	68·8	24
Net National Income	292·4	100
By Industry :—		
Oil	78·2	27
Agriculture	70·0	24
Manufacturing and building	33·7	12
Distributive trades	31·0	11
Transport	11·5	4
Ownership of houses and other buildings	18·9	6
Services	49·1	17
National Product	292·4	100

Writers in Conference

THE AUTHOR AND THE PUBLIC.
Hutchinson. 201 pages. 15s.

THE PEN Congress held in London in July, 1956, was attended by over 700 writers from 48 different PEN Centres. "The Author and the Public —Problems of Communication" was the chosen theme, and this volume is in effect a report. It consists entirely of speeches. Nearly all are so short that we may suppose the delegates to have taken to heart Mr Binod Rao's early reminder that "a master of the art of communication needs but few words to tell his tale." When a speaker shows signs of developing a substantial critical argument we are apt to be told that Mr X or Mr Y "intervened," and then that Miss Z was visited by this thought or that, so that we end up with rather a scrappy debate in which the original speaker is not heard again. This appears to have happened to Mr L. P. Hartley when he was well launched upon a discussion of the novel which is the best thing in the book.

Yet one supposes that the proceedings, although unimpressive on paper, must have been amusing enough for the majority of the participants. Eminent persons bob up and offer characteristic remarks: Mr J. B. Priestley that the writer should go after his audience wherever that audience may be; Professor Empson that the business of the critic lies in interpreting the unconsciousness of the author to the unconsciousness of the public. Mr V. S. Pritchett announces his discovery that "quite often averagely and conventionally well-educated people are completely insensitive to the arts." M. Denis Saurat, perhaps detecting some slight inclination to treat the "public" a little *de haut en bas,* declares that "in England and in France there are perhaps two or three thousand cultured people among the public who are more cultured than the writers generally." On the whole, the speakers seem to have felt that in England one behaves as Englishmen do. Passion, controversy, wholesome acrimony are absent, and one is left with a feeling that gatherings of this sort are among the matters they order better in France.

Great Occasions

EXTRA-SPECIAL CORRESPONDENT.
By G. Ward Price.
Harrop. 346 pages. 21s.

MR WARD PRICE has been a special correspondent for the *Daily Mail* for nearly fifty years. From 1912, when he covered the first Balkan War—"the last of the old-fashioned wars" as he calls it—until 1950 in Korea he was present on every great occasion. And he admits to having enjoyed every minute of it.

He has every reason to be happy. He is one of those rare and lucky men who are born at exactly the right moment, who come to maturity at the time when their talents can be used to greatest advantage, and who realise, in old age, that their day is over and that they are missing nothing because they can no longer move as jauntily as they once did.

One can sense that Mr Price would like to have been born half a century earlier at the time when William Howard Russell could get his account of Balaclava to *The Times* days before anyone else in London knew about the battle. But he should not worry. He had similar triumphs, even if they were only measured by hours; twenty-four hours, after all, was always enough for any newspaper.

And Mr Price belongs essentially to the era of the popular press. He is a reporter of events and not an interpreter of ideas. His comments, even when he makes them with hindsight, are uncomplicated to the point sometimes of naïveté. Nor has he probably worried much about style. He deals in "melting pots" and "maelstroms"; wars "loom upon the horizon," menaces "rumble" and aeroplanes "soar."

Mr Price's job was to persuade people who buy popular newspapers for a variety of frivolous reasons to read also about events that were likely to alter the whole course of their lives. He always treated serious matters seriously and he never spared himself when there was a story to be told. No newspaper can ask more of a correspondent—even an "extra-special" one.

Money is our business

As our customers know well, we do many things besides handling money. But the whole business of banking is founded on notes and coin, and it is still essential that cash should be available wherever it is needed. On an average working day our own cash reserve, spread throughout our more than 2,000 branches, weighs about 2,200 tons, a reasonable enough figure; for after all, money is our business.

Barclays Bank Limited

BRITISH BANKING

A Radcliffe Retrospect

AFTER nearly two and a half years, the most significant controversies over the policy of monetary restriction are not whether its effects are desirable but what they are. That is the justification for the technical enquiry being undertaken by the Radcliffe Committee. It is remarkably difficult to gauge the respective impact on the banks of high short-term rates, changes in the supply of liquid assets, price movements in gilt-edged, and the official requests and controls on their lending—to say nothing of the impact of the banks' actions on the public. To a large extent, Lord Radcliffe and his colleagues have to construct their own modern appendix to the classical monetary manual.

The experience of this past year has emphasised the complex inter-linking of the inner sectors of the financial system—the gilt-edged market, the bond market, the money market, the banks. It has confirmed the general proposition that the restriction of bank credit depends not so much on the level of short term rates as on the supply of liquid assets—which in turn depends to a large degree on operations in the gilt-edged market. This appears to have been broadly recognised by the authorities; but their drive for a reduction of liquidity, while it has achieved a very significant reduction in the floating debt, has not been pursued to the point at which it has restored a close control of the activities of the banks.

Early in 1955 the rise in short-term rates itself produced a sharp contraction in bank liquidity; for the first time in many years, a substantial margin was then opened up between the interest offered on bank deposit accounts and the yield on Treasury bills, and this provoked large withdrawals of deposits for direct investment in bills. It was only when the impetus of this movement appeared to be waning that the authorities found it necessary to reinforce it vigorously by selling gilt-edged securities on a market already depressed by enforced bank selling. The further increase in Bank rate to 5½ per cent in February 1956, and the sharp rise in market rates that ensued, gave rise to renewed switching of deposits into bills, though on a much smaller scale than a year before.

Because of the practical limits to both the size of the yield margin and the volume of idle funds available for switching, this pressure on bank liquidity tends to be of diminishing force. Even so, during the first quarter of 1956, the modest switching process, combined with the seasonal surplus of the Treasury, did reduce the clearing banks' total liquid assets by £459 millions, or by almost as much as in the first quarter of 1955. But the average liquidity ratio at the end of 1955 was 37.4 per cent, compared with 34.3 per cent at the end of 1954; so that by March 1956, the lowest point of the year, it was still at a comfortable 33.1 per cent compared with 29.9 per cent a year earlier. The seasonal rise in advances had been restricted to £54 million, compared with £127 million in the first quarter of 1955; and sales of investments amounted to only £23 million, compared with £72 million.

DURING the rest of 1956, bank liquidity never came under perceptible strain. Official sales of stock in the gilt-edged market were markedly smaller than a year before; and in July, faced with a further prospective increase in floating debt as a result of the new arrangements for financing the nationalised industries direct from the Exchequer and with the redemption in mid-August of the unconverted portion of the 1954-56 War Bonds, the authorities endeavoured to persuade the banks to re-enter the gilt-edged market as a voluntary move to reduce excess liquidity. The banks, however, being unable to gauge the success of the new savings certificates (introduced in August) and the premium bonds (introduced in November), were naturally reluctant to decide to what extent their liquidity was excessive.

The response to the official prompting was modest. In July three clearing banks increased their investments, raising their total portfolios by £30 million, the first significant increase since the phase of major sales in 1955. Even this movement, however, was not long sustained. Two of the banks—the Midland and Westminster—did not accept the Conversion Stock offered in exchange for maturing War Bonds and abstained from reinvestment. The August figures indicated that the clearing banks as a whole, encouraged by a yield of over 5 per cent on Treasury bills, had indulged their liquidity preference to the tune of some £119 million.

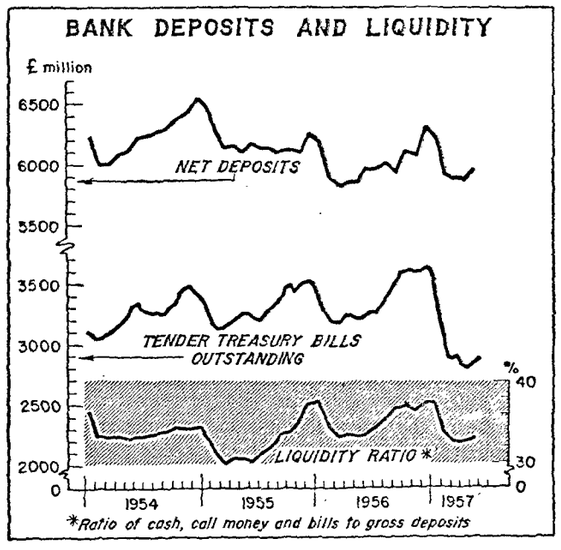
Subsequently investment portfolios did rise somewhat, but they did not keep pace with liquid assets and in mid-October the liquidity ratio topped 37 per cent. The new savings certificates met with considerable success, but the effect on the Exchequer was offset by the demands of the

nationalised industries and other official claimants. The seasonally adjusted index of net deposits compiled by Lloyds Bank, which had fallen from 112.0 (1948 = 100) in February, 1955, to 104.6 in the second quarter of 1956, turned upward in the summer and reached 105.6 at the October make-up.

In November, the deterioration in the credit trend was checked: the Lloyds Bank index dropped back to 105.0 and the banks' liquid assets fell sharply, against the seasonal pattern. This improvement was attributable partly to the first flush of sales of premium bonds; but a much bigger influence was the large accruals of sterling to the Exchequer

as a result of the Suez drain on the gold reserves. But whilst the gold loss continued unabated through at least the first half of December, the end-year accounts of the banks showed a more than seasonal rise in liquid assets, lifting liquidity ratios to 37.4 per cent, their high level of the previous December. With this cushion, it appeared the banks would again have little difficulty in riding out the seasonal pressure ahead.



In the event, however, the decline in the banks' liquid assets reached record proportions; and there was an unusually sharp upturn in advances. Two of the big banks dipped momentarily below the conventional minimum liquidity ratio of 30 per cent, notwithstanding some sales of investments. By far the biggest influence in this re-emergence of the liquidity sanction was the large volume of funding sales in the gilt-edged market made in the last few days of 1956 and the first weeks of the new year.

THESE sales were achieved not by aggressive cut-price tactics but by adroit use of the opportunity provided by a buoyant market. This buoyancy was induced not only by the cooling of the international temperature but also by the easing of rates in the money market. That easing, which continued with some interruptions (notably during the March labour disputes) until early May, reflected in part speculation about reductions in Bank rate, but important technical factors were also at work.

The immediate cause of the initial falling away of the Treasury bill rate in early December, from about 5 1/16 per cent, seems to have been the increased demand for bills by the discount houses. Following the precedent established in 1955, the Treasury had split the weekly offerings for the eight weeks following end-October between 91-day and 63-day bills, in order to concentrate maturities in the heavy tax-gathering weeks of early 1957. The 63-day maturities, issued in greater volume than in 1955, held little attraction for the "outside" tenderers and these offerings, which were largely taken up by the discount houses, had the effect of reducing abnormally their holdings of 91-day bills. Consequently they were particularly anxious to obtain good allotments of these longer bills when the shorter issues ceased.

To enable the market syndicate to obtain an adequate supply, an important liberalisation was made in the procedure of tendering. The tender by the syndicate at a common price, introduced in the 'thirties, was maintained; but each discount house was permitted to tender for a small proportion of its requirements independently at a slightly higher price, at which its application would be allotted in full. The market was thus better placed to face the growing competition from the general investing public, including savings banks and industrial companies.

Encouraged by hopes of a general easing of rates, competition from these sources became more acute and the discount houses were obliged to increase their tenders week by week, until by the beginning of February the average rate of allotment had fallen to 4½ per cent. The authorities did not resist the downward movement but instead took advantage of the revival in gilt-edged prices to allow the public departments to sell marketable securities from their holdings and to carry out a certain amount of switching into early maturities—notably the £400 million of stocks maturing in mid-June. On balance, however, the departments were large net sellers, and their receipts enabled them to reinforce very considerably the seasonal decline in the tender issue. By mid-February, the issue had been reduced by £700 million since the beginning of the year, a rate of contraction over twice that of 1955, which carried the total outstanding below £3,000 million for the first time since spring 1953. This extraordinary contraction in the supply

of bills—very much larger than that in the banks' liquid assets, suggesting that outside holders were running their bills off—thus became an additional influence in the downward movement of the rate.

WHEN Bank rate was reduced to 5 per cent in February, official statements emphasised that the move was not intended as a green light, but was a technical adjust-

Martins Bank

Bankers since 1831, Martins now operates over 600 branches throughout England, Wales, the Isle of Man, and the Channel Isles, and has agents and correspondents throughout the world.

ent designed "to enable the Bank of England to maintain ie full effectiveness of monetary policy." This acceptance : the view that a reduction of Bank rate can be disinflaonary was presumably based on the reasoning that the educed attractiveness of rates in the short market would ster demand, and hence facilitate funding, in the gilt-dged market. But in practice funding sales virtually ceased fter the Bank rate reduction. The authorities have been eluctant to press sales ; and while the bond and bill markets ere until recently stimulated by renewed hopes of a fall a Bank rate, medium-term and long-term stocks have been epressed, first by the damping issue of a further £300 illion of "Eternities," the 3½ per cent Funding Stock, 999-2004, and subsequently by the apparent strengthening of inflationary pressures.

The tender bill issue has consequently resumed its rise albeit at a modest pace); and in their statements for mid-May, the clearing banks showed a reversal of the contracting rend of deposits and liquid assets achieved from mid-January to mid-April: no more bank sales of investments were recorded, and indeed the Midland and Westminster increased their portfolios (though still not quite to their level before the encashment of the '54-56 War Bonds). The average liquidity ratio, at 32.9 per cent, was still slightly lower than a year before—but it compared with 30.5 per cent in May, 1955.

Except in the early months of this year, therefore, the liquidity rein on the banks has been allowed to grow slack. Moreover, the evident reluctance of the authorities to pursue funding to the point at which it forces gilt-edged prices down has probably made any future prospect of having to reinforce liquidity by selling investments a rather less disturbing one for the banks. As a check on advances, certainly, the sanction of liquidity has recently been considerably weaker than in the early stages of the credit squeeze.

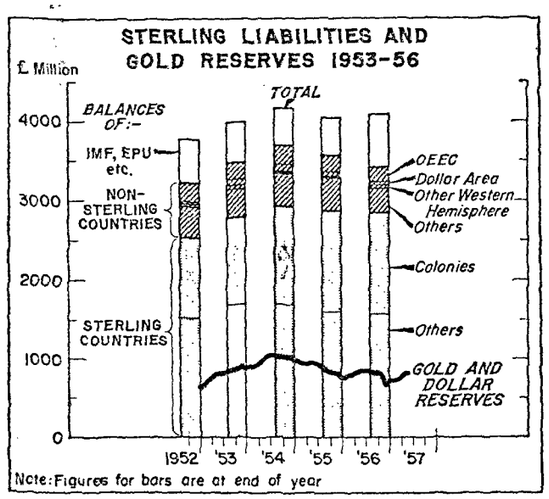
This must be presumed to have contributed to the loosening of the banks' grip on advances, evidenced not only in the upward trend of the total but also in the recent slight recovery in advances to the least "essential" categories, the personal and professional borrowers and the hire purchase finance companies. This is not to say that the banks are disregarding the official requests ; but merely that they might have regarded them more if commercial considerations also pointed that way. The official restraints have in fact been reiterated, and in one respect tightened.

In July, 1956, the Chancellor of the Exchequer, Mr Macmillan, departed from the customary procedure of conveying his instructions to the banks through the Governor of the Bank of England, and with the Governor met the chairmen of the clearing banks and representatives of other banks at the Treasury. He urged that there should be "no relaxation in the present critical attitude towards applications for bank finance." This directive was observed throughout the year and is still in force. But in the three months to mid-February advances to borrowers, other than the nationalised industries rose by £102 million—among the largest quarterly increases ever recorded even at this season, the first significant increase since Mr Butler's initial request of July, 1955, and nearly half as large again as the reduction effected in February-November, 1956.

The monthly statements of the clearing banks showed a further large increase in the advances item in March, despite further repayments by the State boards ; in the two subsequent monthly periods the rise tapered off, confirming that part of the earlier increase had reflected seasonal and other temporary influences. But the expansion had induced the new Chancellor, Mr Thorneycroft, to add his own reiteration of the need for continued restraint. While conceding in his budget speech that "some increase in the level of advances may result from the provision of bank finance for purposes of the highest priority," he reinforced the official hold over those bank advances subject to statutory control—advances in excess of £10,000 made outside the ordinary course of business.

Mr Thorneycroft restored the practice operated between December, 1951, and December, 1953, whereby the Capital Issues Committee concerned itself not only with the purpose for which the money would be used, but also with the necessity of bank finance, in the light of the possibility of raising funds from market sources, and the term of the advance. The Chancellor intimated, moreover, that the CIC would exercise its scrutiny rigorously. Thus, in a sense, the shortcomings of Government funding, by the measure of bank liquidity insufficiently taut to exert its own check on advances, has led the authorities to enforce by regulation funding on private industry.

Sterling Area and the Strain



One cause of the strain on the sterling area is the voracious appetite of its members for capital. Last year Britain lent beyond its powers, but the sterling countries together did not reduce their sterling holdings. What happens when they do ?

IN 1956 the gold and dollars in the Exchange Equalisation Account remained almost unchanged—£757 million at the beginning of the year and £762 million at the end. What happened in between was a different story—a steady rise in the first half of the year, followed in the Suez months by a massive gold drain, only partly offset by the drawing of dollars equivalent to £201 million from the International Monetary Fund. The table shows the reason for the strain: capital commitments of £429 million and only £233 million with which to meet them. How far were the overseas members of the sterling area, which bank in London, responsible ?

The United Kingdom itself had a total surplus of £233 million on current account. Current transactions between the United Kingdom and the dollar area resulted in a deficit of £22 million, a modest figure indeed compared with the deficits of £205 million in 1955 and of £68 million in 1954. Similar improvement was shown in the balance of pay-

ments between the rest of the sterling area and other dollar countries. Including the proceeds of sales of gold, the transactions of the overseas sterling area with the dollar area yielded a surplus of £219 million in 1956, of £199 million in 1955, of £166 million in 1954, and of £165 million in 1953.

Direct pressure by the rest of the sterling area on the gold reserve has occurred on various occasions in the past, commonly marked by a correlation between movements in the central gold and dollar reserves and parallel changes in the sterling liabilities owed by Britain to members of the sterling area. When members of the sterling area earn surpluses in dollars or other hard currencies, they bank them in London; hence the sterling balances of those countries move up automatically with the rise in the gold and dollar reserve in the Exchange Equalisation Account. When sterling comes under strain, it may be because those balances are being drawn upon and in part used for dollar expenditure.

That was not the main trouble in 1956. The sterling balances of the colonies increased in the year as a whole from £1,280 million to £1,286 million (the long postwar rise to a peak of £1,301 million having been halted in the second half of the year). The balances of the dominions (except Canada) fell from £1,599 million to £1,574 million. The total sterling balances held by sterling area countries thus declined only slightly, by £19 million to £2,860 million.

A much bigger influence in the strain on Britain was the investment of long-term capital by the United Kingdom in the rest of the sterling area. In 1956 this net investment amounted to £150 million compared with £119 million in 1955 and £191 million in 1954. This investment, like the much smaller reduction in the sterling area's sterling balances last year, made possible expenditure by the overseas sterling countries that was in part incurred outside the sterling area, and notably on the continent of Europe. And through EPU, expenditure in Europe helped to swell the drain on the gold and dollar reserve.

But the main explanation for the strain on the reserves lies in the running down of sterling balances by countries other than those of the sterling area. During 1956 American sterling accounts fell by £21 million. Those of OEEC countries fell by £20 million and those of "other non-sterling countries" by £114 million. These movements are in large part the reflection of the run on sterling which followed the Middle East crisis in the second half of the year. The most striking reduction in sterling balances was that shown by "other non-sterling countries," a group that includes China, Japan and the non-sterling Middle East countries. All these drew heavily on their sterling assets, partly for political reasons but also on fears of de-

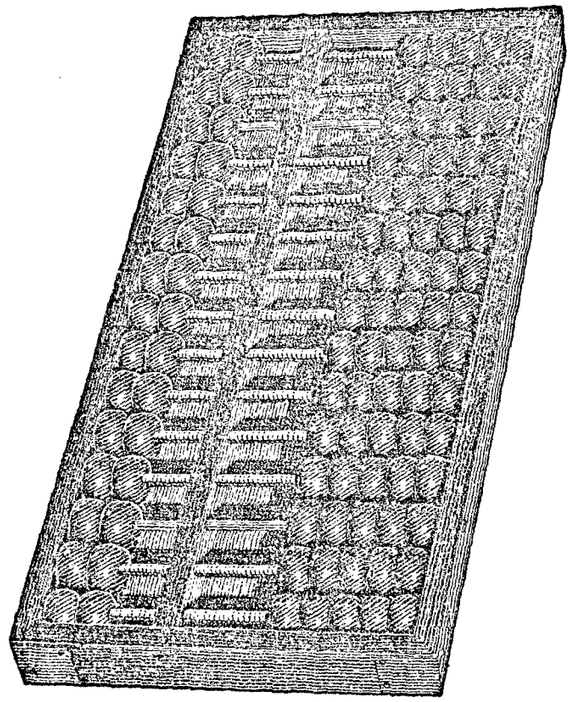
valuation. In the past two years of depletion of sterling balances, it is this miscellaneous group that has shown the largest reduction—£430 million at end-1954 to £303 million; holdings of dollar countries in this period fell from £97 million to £37 million and of OEEC countries from £244 million to £193 million. In 1956 alone, the total reduction in sterling holdings by these three groups was £155 million. On the other hand, holdings of non-dollar western hemisphere countries rose from £9 million to £32 million. Other important influences on the final reserve figures include the notorious "leads and lags" in the timing of commercial payments (recorded partly as "miscellaneous capital outflow").

In one respect, so far from bringing strain to the central gold and dollar reserves, the sterling area has brought important new relief to them. Gold sales from sterling countries have acquired great importance. In 1956 sterling area gold sales in the London market amounted to £222 million as compared with £176 million in 1955 (nearly offsetting the deterioration in the balance of the overseas sterling area in payments with the dollar area and Western Europe) and with sales of £138 million in 1954 and only £78 million in 1953.



The steady expansion reflects both the growing importance of the London market and the disappearance of the premium on the free gold price that used to deflect gold to other markets. The unofficial gold sales previously brought in their quota of dollars or other hard currency to the gold producing countries concerned, but probably a large part of the proceeds escaped the net of exchange control and therefore did not sustain the central gold and dollar pool. Now that "free gold" shows no premium and London is clearly re-established as the most important and flexible of the free markets for gold, most newly mined gold from the sterling area finds its way to hoards or to monetary reserves via St Swithin's Lane. Gold is sold in the London market only against registered sterling, which must be created by way of dollars or of gold itself. Such sales cannot involve a loss of gold or dollars. The gold so bought on foreign account can, however, be freely removed, so that London's dollar account does not necessarily retain more than the commission. But on balance the market is proving to be a good source of strength.

CERTAINLY the overseas sterling area does not bear any collective responsibility for the pressure on sterling and the drain on the gold and dollar reserve last year. Bu

Taking the East into account

Twenty-five years ago you would have found this 'adding machine' of antiquity in every eastern branch of The Chartered Bank. It was of particular use in calculating the intricacies of exchange rates which often fluctuated with great rapidity. Today, the abacus is being replaced by the slide rule and the electric computer. The East is changing but The Chartered Bank remains in step, so that its knowledge of eastern trade, travel and investment is always up-to-date. This knowledge and a century of experience sustain a complete banking service available throughout a branch system, which extends to most centres of commercial importance in Southern and South-East Asia and the Far East.

among its members some have been pulling against the reserve while others have contributed to it. The most important of the debtor countries using the reserve is unquestionably India. Within the calendar year 1956 it drew down its sterling balances by just over £150 million. In the year to April 1, 1957, the first year of India's second five year plan, the net loss of sterling reserves amounts to nearly £200 million. This is after allowing for drawings from the International Monetary Fund amounting to $127 million. The $127 million was banked in London and therefore brought momentary relief to the gold and dollar figures, but was quickly drawn out again in the form of sterling. India's drawing on sterling balances is known to have been used not merely to pay for goods delivered from the sterling area but also to finance imports from the United States and from the Continent of Europe. These either involved the conversion of sterling into dollars or (when cleared through the European Payments Union) helped to swell Britain's deficit with the Union; in practice that means an immediate gold loss equal to 75 per cent of the amount so cleared and the addition of 25 per cent of the amount to Britain's debt to the Union.

The main compensation for India's pressure on the gold and dollar reserve probably came from Australia, which within the last six months has achieved a spectacular reconstitution of its sterling balances and has been helped in this by large sales of wool at favourable prices to the dollar world, Japan and the Continent of Europe. Earnings from the other traditional dollar commodities of the sterling area have not been so favourable. Tin on balance showed higher prices in 1956 than in 1955. But the cocoa of West Africa, the rubber of Malaya and the copper of Rhodesia, all fell in price in 1956.

More recently, the fall in commodity prices must account for the much reduced height of this year's peak commercial demand for sterling. Fortunately, however, the shortfall in these dollar earnings of the sterling area has to some extent been made good by the impressive expansion of Britain's own exports to North America. In 1956, such exports showed an increase of £97.1 million, just 30 per cent, above 1955 and their progression has persisted in the early months of 1957.

LOOKING ahead at the calls that the overseas sterling area may make on the gold and dollar reserve, the main source is the voracious appetite for industrial development that so many of its members have acquired. India has in the past year provided the warning example of what may be expected—though now its own balance of payments crisis has at length imposed restraints on the five year plan.

Development in Rhodesia and Nyasaland, centring around the Kariba scheme, but including also a large body of private investment by British industrial companies and a smaller volume by British property companies, will make heavy calls on Britain's capital resources and to some extent on the gold and dollar reserves. If decisions are taken to go forward with the Volta scheme in Ghana, another and even greater drain on real resources and reserves will be set up. There are indications that before long Australia, Malaya and the proposed West Indian Federation will appear in the capital markets of the world. These capital developments will for years introduce a strong capital transfer element into the sterling area's balance of payments. The World Bank and the new International Finance Corporation will find no lack of opportunity to provide dollar resources. Perhaps direct investments from the United States will also play their part. That, in effect, they did last year when the sale of the Trinidad Oil company to the Texas company transferred a British investment into American hands and thereby increased the dollar resources available for other investments in the sterling area. Even if all such hopes are fulfilled the obligation on the United Kingdom to go on providing a large contribution towards the overseas sterling area's demand for capital will not be removed. And only by having a surplus and investing it in the Commonwealth can Britain in the long run remain the centre of financial and political responsibility within the Commonwealth.

The Cost of an Account

BY A CORRESPONDENT

Banking costs—salaries, rent, overheads—are going up on the one hand; electronics are coming in on the other. Can bank charges be held steady?

WHEN the clearing banks recently disclosed, *sotto voce*, that their consideration of the use of electronic methods had reached the stage of practical exploration of an agreed hypothetical system, the primary question in the minds of the public seems to have been: will electronic banking reduce bank charges? That, certainly, was the reaction the banks feared. In an inflationary age, the banks will be quite satisfied if automation prevents charges increasing as much as they otherwise might. There is little enough chance that its introduction, necessarily over an extended period, can reduce the half guinea a quarter that some small customers find so irksome.

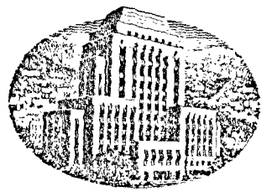
The main impact of electronic methods in banking will be upon the salary bill, by far the largest item in the banks' running costs. Not so long after the announcement in March that electronic methods were being explored, there came a round of new salary increases; these were of the order of six per cent and probably put between two and three million pounds on to the banks' salary bill, involving in addition significant increases, present and "retrospective," in the provisions to pension funds. In banking as in other sectors of the economy, rising labour costs have had to be accepted as a permanent postwar phenomenon. Mechanisation on the conventional pattern has helped the banks to increase the proportion of women staff, and the introduction of electronics might help to maintain that tendency. The turnover in women's jobs is high,

but that keeps the average age very low and reduces the career element to a minimum. But economies of this sort have never been adequate to offset the burden of rising costs. Hence the need to pass on some of those costs to the banks' credit customers.

Bank charges are always provoking controversy in which more heat than light is usually generated. A customer complains of excessively high charges on his account; someone else suggests that he ought to change over to a Trustee Savings Bank or the Post Office; somebody else again, signing himself "Bank Manager," contributes a comment from the other side of the counter; more disgruntled bank customers join in. The argument can go on for some time, but it never really gets anywhere. In part this is because the banks do not join in; but it is also because few people have any precise knowledge of the real profits of the banks, and they are not in the habit of joining in newspaper discussions; thirdly it is because the man in the street does not appreciate that the banks are selling two quite different things, and that the profits on two different types of sale are mixed up together in the till. Charges on customers' accounts cannot be considered in isolation from the banks' "trading" earnings—interest on loans and overdrafts, and dividends on their gilt-edged securities. Rising or falling interest rates powerfully affect the banks' earning capacity; but in all the clatter of occasional controversy on charges the rates charged for loans are seldom called in question. Interest rates seem to be widely accepted as being outside the banks' control—acts if not of God at least of the Government.

One obvious inference from this is that the grumblers are in the main small customers with small credit balances. Carrying that inference a little further one may guess that they are often people who do not really need a full-dress banking account at all. It may be that conventional banking has already reached saturation point and that before the vast untapped moneys of the increasingly prosperous wage earning class can be tapped by the banks, a new kind of "bare bones" service will have to be evolved. That is one of the question marks over the future of banking; the point appertaining to charges is that if the banks divorced their dual functions of provision of loans and provision of a cheque system, the charges for the latter service in its present form would surely be higher than they are now.

The view that the present level of charges is unjustifiably high can rest logically on only two broad contentions: that the banks' earnings are exorbitant or that their administration is inefficient. Few people would hold that bank staffs are paid excessively large salaries; still less can extravagance be imputed to treatment of shareholders. Bank dividends are still remarkably little—generally less than one quarter—above their prewar level. That leaves hidden reserves, the secret allocations from true profits that the Companies Acts allow the banks to accumulate. These inner reserves are indeed an embarrassment for the banks in more ways than one, for their staffs too make much of them in their claims for higher salaries—misled by some extravagant guesses at the amount of the reserves. Yet the sharp depreciation in the market value of the banks' gilt-edged investments inflicted by the recent policy of dear money has provided a pointed indication of the necessity for such reserves; few bankers could now agree that their cushion is over-padded.



What of bank management? For most people the only criterion of bank management must be their personal observation; and the accusation of bad management is seldom heard. Equally, many travellers are not impressed with banking methods as seen abroad. A more reliable testimony to banking efficiency is the fact of competition. There are some who obstinately refuse to believe that there is any true competition at all amongst the English banks. But anyone who is at all near to banking knows better. The old days of cut-throat touting have passed; but every bank watches the others with a jealous eye. It is competition amongst the banks that keeps bank charges reasonably uniform; for competition is certainly keen enough to ensure that any bank that could profitably cut charges would be very glad to do so.

That the bankers are silent on these matters—and indeed on practically all matters concerning the business of banking—is of course a large part of the trouble; customers are often irritated primarily because they do not understand the basis of their charges. But even explanations in person will not always resolve the problem. English banks have no fixed scale of charges. The charge is on turnover in some parts of the country, and on the number of entries in others—and both are liable to vary even between branches of the same bank. Charging, like banking, is an art rather than a science. But published scales of charges might be more satisfactory for public relations.

Fixed and published charges are the rule in the American banks—and indeed in Scottish banks too. There is room for research into the real effect of English charging practice, which so long as it is based on "professional" rounded-off guineas and fractions of guineas is open to criticism by those who do not accept that their bank manager and their solicitor can properly charge in the same way. But it seems likely that those most vocal in complaints would suffer from the introduction of fixed scales. Most managers must be inclined to temper the wind to their shorn lambs.

Even today, however, there does seem to be some general basis of charging, suitably adjusted to special circumstances. The manager, when he assesses the charges on a private account, may have to bear a whole complex of factors in mind: the balance maintained on the account; the value of connected accounts; the possibility of future profit if a presently unprofitable account is "nursed"; the number of "free" services the customer is using (that unwieldy deedbox, perhaps, visited at great inconvenience to the staff once a month on the busiest day of the week); even, perhaps, the fact that the customer is having a particularly hard time, with two boys at public school and an invalid wife. But these disparate considerations are likely to be operating upon a starting figure something like one shilling per entry. Ten years ago the figure might have been ninepence.

All things considered, that is not a bad record. The right and proper answer to complaints (though no banker will ever make it) may after all be that of the second letter in our typical correspondence: go to the Post Office Savings Bank, which provides an excellent deposit-and-withdrawal service and at least the essentials of a transfer service—and pays interest, too. It represents a challenge to the banking system, for it offers a choice of economy against quality of service. The electronic computer thrives on quantity. Perhaps its main contribution to the evolution of banking—and bank charges—will come when it enables the banks to produce a small man's cheap utility model of a banking account.

Be a jump ahead
in the Australian market...

From a 'Manchester Guardian' leader of April 2, 1957:—

"In many cases, the only real hope that British firms have of capturing a good share in the Australian market is to establish branches in that country. Several advantages follow automatically. Not only will there be a supply of spare parts available immediately, but there will be a better chance, through shorter shipping distance, of supplying customers in New Zealand and South-East Asia. Some firms have already jumped to this opportunity, but far too few."

The views expressed by the Manchester Guardian are worthy of consideration by many manufacturers who wish to maintain or develop sales in the growing markets of Australia and New Zealand.

The Bank of New South Wales will gladly assist you with information about local conditions in Australia.

As a first step we invite you to write for our booklet "Establishing a Business in Australia".

Clearer Skies in Australia

Australia's external payments are now in better trim; but a country subject to such wide fluctuations of economic fortune needs strong weapons of central bank control. The problem is to create them in a form acceptable to the trading banks

During the past year Australia's balance of payments has passed through one of those sharp fluctuations of ortune that have characterised the Commonwealth's economy throughout the postwar period. Out of the post-Korea export boom in 1950-51 developed the import spree of 1951-52—a spending orgy of such intensity that could be quelled only by the imposition of general import restrictions. These have been more or less intensively applied ever since. In 1953-54 they restored a state of internal and external balance in the Australian economy; but then came lower wool prices and a new upsurge of domestic inflation, with the attendant balance of payments deficits of 1954-55 and 1955-56, and import controls had again to be sharply tightened. By the time that they were beginning to show their effects, in the third quarter of 1956, wool prices had again started to stage a sharp rise, and this has continued throughout the current season. A bigger wool clip, growing exports of manufactures, semi-manufactured goods and minerals, and a temporary increase in wheat exports following last year's bad harvests in Europe are together producing a big rise in Australia's export earnings for 1956-57. These are likely to be at least as big as the exceptional figures recorded in 1950-51.

Could the sequence of events that followed that boom be repeated now? Higher wool prices seem now to be much more soundly based than were the much higher prices of 1950-51; but there is also good reason to believe that Australian monetary policy has benefited from lessons learned in earlier years. The previous boom was allowed to result in a multiple expansion of bank credit, and this, in conjunction with artificially low interest rates, successive increases in the basic wage and higher governmental and private spending, provoked an increase in imports that could not be sustained when exports fell, and could only be brought in check by the imposition of severe import controls after a dangerous depletion of Australia's external reserves.

By contrast, the corrective measures taken in the face of the 1956 deficit included strong monetary, as well as budgetary, measures. A general upward movement of interest rates occurred, in part because the large measure of official support that had hitherto been given to the bond market was withdrawn. Certain increases of indirect taxation in the "Little Budget" of March, 1956, did something to curtail private spending, especially on consumer durable goods and on cars in particular. These measures helped to remove most or all of the excess of demand that had been the root cause of the balance of payments deficits of the two previous years. They reinforced the corrective effect on the balance of payments of the severe import controls imposed in 1955 and 1956. When exports began considerably to improve late in 1956 and early this year the Australian government felt that it could go a fair way in relaxing import controls. If export receipts and the inflow of capital continue to run as favourably as they are now running, it ought to be possible to carry much further the process of removing the import controls. One essential condition will be that credit must be kept reasonably tight in Australia; if not, the removal of more import controls might lead yet again to an unmanageable rise in imports.

The difficulties of keeping credit tight have been increased by the considerable rise in the liquidity of the trading banks in Australia. This follows from the improved export surplus of the past nine months or so, for rising exports and falling imports have enabled both exporters and importers to repay advances on a considerable scale. Part of the rise that would otherwise have occurred in the banks' liquidity has been offset by very large calls by the Commonwealth Bank to their Special ("frozen") Accounts with that institution; these calls amounted to £A12 million in November and totalled as much as £A50 million in the first quarter of 1957. Despite this immobilisation for the time being of much of the rise in their liquid resources, the banking system's "LGS ratio" (the ratio of liquid assets and government securities to deposits) recovered from a low point of 17½ per cent in May, 1956, to 24½ per cent in March this year, and though it fell in April to 21 per cent, presumably for seasonal reasons, that was well above the uncomfortably low figure of 18 per cent of the previous April. The trading banks would normally feel that with such an easy liquid position they could allow some expansion in advances; their customers' demands for credit are likely to become strong, for a rise in imports is following the relaxation of import controls, and it may be further encouraged by recent increases in the basic wage for workers on Federal awards.

To discourage such a rise in advances the Commonwealth Bank instructed the trading banks last month that although they need make no further contraction in their advances they should avoid any general expansion, apart from seasonal variations. Even though monetary and budgetary policy—in combination with the favourable movement of wool prices—has accomplished the first task of improving the balance of payments and arresting domestic inflation, the need now is to ensure that higher export incomes do not bring about the sort of violent increase in domestic demand that occurred in 1950-51. Australia's monetary authorities take the view that the economy is now in a state of balance that would be imperilled by any further expansion of credit. For this they have been criticised as being unduly cautious; but past experience shows good ground for erring on the side of caution. It is important that Australia's external reserves should be at least maintained at their present level of slightly above £A500 million, keeping their rise of £A150 million in the past year. They are the only buffer against the possibility of a future fall in

export receipts. If the amazing run of ten good seasons were to be interrupted there could be real trouble. Many areas are now threatened with drought conditions, though the effects are not uniformly serious. Weather conditions as well as wool prices may well be among the factors that will guide the Commonwealth Government later this year on any further relaxation of import restrictions and any expansion of bank advances.

The efficacy of the control of bank advances in Australia by use of the Special Accounts has been qualified by the readiness of individual banks to allow wide variations in the ratio of their liquid assets to deposits, as well as by the absolute differences in this ratio maintained by different banks. Between 1953 and 1955 the Commonwealth Bank tried to secure the banks' adherence to a convention that they would keep an average ratio of 25 per cent, subject to seasonal variations, between cash and treasury bills plus government securities and total deposits ; and it made considerable releases from Special Accounts in the hope that they would do this. In the event, the liquidity of the trading banks fell well below the 25 per cent ratio partly because of the unforeseen use of previously unexercised overdraft facilities by bank customers which offset the restriction that the banks imposed on new advances and partly because the banks were unwilling to hold such a large volume of liquid resources in relation to deposits. During 1956 the Commonwealth Bank therefore abandoned its earlier policy and secured instead the banks' agreement to a much weaker conventional ratio. They have undertaken to maintain a minimum " LGS " ratio (as distinct from a seasonal average) at a much lower level ; this minimum level has not been published, but is believed to be somewhere near 14 per cent. Most of the banks would not wish their ratios to fall to so low a figure, but it is at least higher than the level to which several banks allowed their ratios to fall during the period of maximum strain on their liquidity a year or so ago. The adoption of this minimum ratio policy does not amount to a new and sensitive weapon of central bank control in Australia, but it may represent a minimum agreement from which some advance towards common banking policy will be possible. The noticeably closer co-operation between the Commonwealth Bank and the trading banks in recent months points in this direction. There is, moreover, a wider acceptance of the principle that banks that have to borrow from the central bank because they find themselves uncomfortably illiquid after meeting calls to Special Accounts imposed by the Commonwealth Bank to bring about a contraction in the banking system as a whole, must be prepared to pay a penal rate.

CURRENT proposals to amend the banking legislation (now accepted by the government) must be considered *against this background. The new amendments are not* expected to be introduced in Parliament until August or September. The main effect will be to complete the separation of the Commonwealth Bank from the Commonwealth Trading Bank by removing the two links that the 1953 Act preserved between them—both remained under the authority of the same Governor and Bank Board, and exchanges of staff between the two institutions could readily take place. The private trading banks have long felt that the Commonwealth Trading Bank has enjoyed a specially favoured position. But it is conceivable that the complete severing of its links with the central bank would lead it to compete more strongly with the trading banks ; it has in fact felt under some restraint by its relation with the Commonwealth Bank from fighting too fiercely for business. It is not yet known whether the Commonwealth Savings Bank will be placed under the control of the Commonwealth Bank or the Commonwealth Trading Bank.

The other amendment sought by the private trading banks is the replacing of the Special Accounts system by statutory minimum reserve ratios. The implications of any such change would depend upon the ability of the central bank to raise the banks' statutory minimum reserve ratio ; certainly the trading banks would gain little if the Commonwealth Bank were to be given a virtually unlimited power in fixing reserve ratios of the kind that has been introduced in New Zealand. It is not going to be easy to reconcile the desire of the trading banks to curb the powers of the central bank with the manifest need for strong weapons of central bank control in a country subject to such sharp fluctuations of fortune as Australia.

The Union Makes its Way

The inflow of foreign capital has fallen to a trickle, but thanks to past development South Africa is able to keep its accounts in good shape. Even if foreign capital remains coy, economic progress seems assured

SOUTH AFRICA has preserved its economic health over the past few years in face of the severe pressures on external and internal finances arising from events beyond its shores. That achievement lies partly to the credit of the care with which the Union authorities have devised and implemented their policies. But it also demonstrates the striking progress towards financial independence that the country has achieved and the tremendous efforts that have been made in capital development since the end of the war.

Any economist looking at South Africa at the beginning of the fifties might have deduced that there were two events almost certain to plunge the country into severe economic crisis in the years immediately ahead—a substantial advance in world merchandise prices without a corresponding increase in the official price of gold, and the interruption of the inflow of capital from other countries. With almost half of the Union's foreign exchange income coming from newly mined gold, the first of these apprehensions pointed to a potential deterioration in South Africa's terms of trade that would widen in a crippling way the deficit that the Union had since the end of the war constantly shown on current account with the rest of the world—a gap that was

Scotland's First Bank • Established 1695

being bridged through the late forties with a large inflow of external capital.

It happens that during the past few years, South Africa has suffered both misfortunes simultaneously. World merchandise prices have been rising steadily under the stimulus of inflation, with the result that the country's imports now cost in foreign exchange terms—item for item—about a third more than they cost in 1950 and almost 50 per cent more than they cost in 1948. Yet South Africa's pleas for a higher international gold price have fallen on deaf American ears. Gold remains at $35 per ounce and the Union's export prices have risen much less than the prices of the goods it imports.

The capital account in the Union's balance of payments has been hit by a combination of adverse developments. Fears in many countries that the Nationalist government's racial policy would eventually produce serious political unrest have made investors in other countries less willing to use their funds in South Africa. Simultaneously, the rooted American objection to a higher gold price turned investors away from gold shares, for rising costs were plainly making their mark. And the decision of many foreign governments to embark on dearer and tighter monetary policies from the beginning of 1955 meant that the pull of the Union's capital market on overseas money supplies was materially reduced. South African interest rates have ceased to look as attractive as they did in the early fifties. And the amount of money available for foreign investment in the countries that traditionally finance South Africa has dwindled. For example, earlier in the 1950s it used to be possible to draw substantial capital each year from Britain and Switzerland. But over the past year or two the flow of funds from those countries has been negligible. Indeed, for a time in 1956 interest rates in London were higher than in South Africa, and there was a tendency for short-term funds to leave the Union in volume.

The net result of these developments has been that the shrinkage in the flow of capital into the Union, already evident in the early 1950s, has been accentuated. In 1956 the inflow of private funds into the country was a mere £5 million. And as there was some net repayment of official borrowing, there must have been a small net movement of money from the Union to other countries. In the preceding year the net inflow of private capital had been limited to £14 million, compared with an average of just under £40 million for 1953 and 1954.

YET although South Africa's terms of trade have worsened and although the inflow of capital has virtually stopped, the country's economy has been maintained in better shape than have the economies of countries that have not suffered those misfortunes. Externally, the Union ran into a little trouble towards the close of 1955 and in the early months of 1956, owing to the outflow of capital. The official gold and foreign exchange reserve, which stood at £130 million at the end of 1955, had dropped to £110 million by the middle of last year. By the end of 1956 however it rallied to the end-1955 figure and since the beginning of this year it has risen a little further. Internally, there are few signs of the inflation with which so many other countries are still struggling.

Official policy has been sensible. In the external sector, the authorities have moved carefully in the direction of relaxing import restrictions; the country was not encouraged to buy more than its foreign exchange income would stand. For a time, limited restrictions on the flow of short-term money out of the country were imposed to counter the pull of high interest rates abroad on local funds. Internally, care was taken to keep economic activity damped down sufficiently to ensure that resources were not overstrained. Monetary, fiscal and other weapons have all been used.

BUT it is hardly conceivable that the Union would have emerged in such good shape from the trials of the past two years had it not been that during this period the intensive capital development of earlier years began to bear fruit. Externally, the fruits are being reaped in several directions. First, the heavy spending on the new goldfields in the Orange Free State, the Klerksdorp area and the Far West Rand has brought material expansion to South Africa's gold exports despite the rising costs and the dwindling production of the older areas of the Rand. Last year South Africa's sales of gold all but reached £200 million, a rise of a third compared with three years earlier. Secondly, uranium is producing an increasing overseas income, and this combined with an increase in other exports has raised the total sales abroad of merchandise exports in roughly the same proportion as exports of gold. Finally, the development of a wide range of secondary industries within the Union has reduced the country's dependence upon foreign manufactures, so that the increase in imports has been relatively modest notwithstanding the considerable increase in spending power within the country.

Thanks to the increase in domestic production of consumer goods, broad equilibrium has been maintained between the supply of goods and public spending power. So smoothly has this aspect of policy worked that recently the Governor of the Reserve Bank, Dr de Kock, felt it safe to relax the restrictions on bank lending imposed in 1955-56 and also to make "a change of emphasis from restriction to encouragement of private initiative and private enterprise."

The clear implication in the changes in South Africa's economy over the past few years is that the country is now within sight of financial independence. The outlook for the balance of payments remains favourable, for it is expected that export earnings from both gold and uranium will continue to rise during the next few years. It should therefore be possible for the Union to maintain its economic health without any appreciable net inflow of money from overseas, though foreign capital will naturally still be welcomed. South Africa's economic resources are not yet fully tapped and, with the aid of more foreign capital, it would be possible to develop this much faster. But whether such capital is forthcoming or not, a reasonable rate of economic development could be maintained.

The period that has seen the Union moving towards financial independence has also seen important moves to improve the country's internal financial machinery. Towards the end of 1955 a new institution—Union Acceptances—was set up by private interests for the purpose of laying the foundations for a domestic money market. More recently, the Reserve Bank Governor has revealed that, as a sequel to the official decision to give the "green light" for capital spending, steps were being taken to create a new industrial finance corporation. Its task will be to mobilise local short-term funds to promote a stronger industrial structure.

India's Payments Predicament

Shortage of foreign exchange threatens to retard, if not halt, India's five-year plan. More foreign credit and capital are essential; but the lenders are nervous of India's socialist innovations and not convinced that the plan is within its capacity.

DURING the past year the Indian banking system has fully reflected the increasing pressure which the second five-year plan is placing upon India's economy. It would be an exaggeration to say that by mid-1957 the country's resources were stretched to the absolute limit; but certain unmistakable danger signs have appeared at intervals throughout 1956-57. In particular rising prices and growing strain on the balance of payments provide strong indications that the pace of the plan has been too hot and that the economy is being required to do too much in too short a time. This fact seems to have been tacitly recognised in the first budget of the new parliament, introduced by Mr Krishnamachari on May 15th. Indeed, the budget white paper made no bones about it, and the Finance Minister himself spoke of the need for "some re-phasing of the Plan"—though he indicated that there could be no abandonment of what he called its "core" *i.e.* the steel, coal, transport and ancillary power projects.

But even the core of the plan, whether measured in money or real resources, represents a formidable figure and on this only the initial down payments have been made during the past year. The further instalments that become due as the plan proceeds have yet to be arranged; it is not surprising that the present atmosphere in Indian banking and finance should be rather tense and anxious.

Broadly, India's problem can be divided into two parts: the first is to mobilise sufficient internal resources to carry the plan to completion without breaking the back of the economy and setting up unmanageable inflationary pressures; the second is to acquire sufficient foreign exchange to finance a high and increasing level of imports of capital goods from the West for the rest of the plan period, which runs until 1961. While the banks may be said to be directly interested in both halves of the problem they are a good deal more involved in the first than in the second—that, by and large, is a matter for the Indian Government to solve. Meanwhile they can only view with anxiety the progressive using up of India's foreign assets, which has been rapidly accelerating since March, 1956.

In token of a protracted period of monetary strain, the Reserve Bank of India announced an increase in bank rate from 3½ per cent to 4 per cent with effect from May 16th last. In former, easier going days, the Indian money market ended its "busy season" by about the middle of April in each year; by that date banks and shroffs, and the chain of miscellaneous middle men who join the agriculturist to consuming markets at home and abroad, lowered their rate for financial accommodation. This traditional pattern of lending and borrowing, which persisted for the best part of a hundred years, has now disappeared and the so-called "busy season" (*i.e.* December to April) is tending to become longer and longer. This may mark the fact that the Indian economy is moving rapidly forward. But inevitably it calls for some redeployment of banking resources, not only to finance seasonal crop movements but in addition to make a substantial credit contribution to the import of capital equipment and the cost of an ambitious state development programme. It is not surprising that the resources of the commercial banks have been strained to the utmost during the past year. During 1956 the expansion of bank credit to the public and private sectors of the economy was considerably larger than in the previous year; net credit extended by the Indian banking system to the government increased by Rs 243.6 crores* in 1956 against an increase of Rs 146.1 crores in 1955, whilst the private sector received a net increase of Rs 49.8 crores in 1955. The private sector is moving into the position of junior partner, and the government has become the major spender making the largest demands on the country's credit mechanism.

BUT apart from appropriating to itself the lion's share of the expanded bank credit, the Indian Government has proceeded by a series of fiscal innovations to apply the biblical paradox to them that have shall be given and from them that have not shall be taken away. The Finance (No.3) Act of 1956 requires certain deposits to be made by specific classes of companies representing a percentage of income plus depreciation allowances. Though banking companies, general insurers and electric supply companies are exempt, practically all industrial and trading concerns of any size fall within the scope of the legislation. Rules for the enforcement of the act have been drafted and redrafted, the latter process being to make the government's intention "clearer" than it was last autumn when a spokesman of the Finance Ministry said it was expected that the new impost would produce between Rs 25 crores and Rs 30 crores of deposits in a year. As their surplus funds are usually committed to stocks or plant or other trading needs, companies will inevitably have to borrow from their bankers to make the prescribed deposits on the due date and thus the government will drain off a further proportion of the finance that ought to be available to trade and industry as working capital. Now, to crown this, comes the Wealth Tax, applicable to both companies and individuals though banking, insurance and certain finance companies are excluded from its operation. For companies a flat rate of ½ per cent will be charged on net wealth in excess of Rs 5 lakhs and the whole tax is expected to yield Rs 15 crores of revenue in a year. It represents, in fact, an annual capital levy, the cumulative effect of which must be to contract the resources of companies and increase their recourse to bank finance.

Commending last month's budget to the Indian Parliament Mr Krishnamachari defined his dual responsibility: "The task before us is not merely of raising resources for the immediate needs of the plan—we are pledged to move in the direction of a socialist society." If government

* One crore = 10 million rupees = £750,000; one lakh = 100,000 rupees = £7,500.

Exporting?

...then we can help you!

India, Pakistan, Ceylon, Kenya, Uganda, Tanganyika, Aden, Zanzibar and Somaliland Protectorate . . . these are all markets for British goods; but only for the *right* goods at the *right* price. The National Bank of India has branches in all these territories, and the British Exporter is thus provided not only with a full range of banking services but also with vital information on such subjects as the local demand for his product and the buying habits of his potential customers. For importers, too, the bank provides a comprehensive information service based on 'on-the-spot' reports from its branches.

Similar services are also available in Northern and Southern Rhodesia at branches of Grindlay's Bank, with whom amalgamation will shortly take place.

spending is any criterion, India would seem to be moving rapidly in the direction of the desired goal. Combined expenditure of the union and state governments increased from Rs 1,019 crores in 1953-54 to Rs 1,234 crores 1954-55 and Rs 1,430 crores in 1955-56. Estimated expenditure in 1956-57 on both union and states account is put at Rs 1,894 crores. For 1957-58, the total will almost certainly exceed Rs 2,000 crores. This doubling of public expenditure over a period of four years is a measure of the rising tempo of the plan and of the risks, calculated or not, which the administration are prepared to take to implement it. Every sector of the Indian economy is now being hurried along a course prescribed by government, and the banking system of the country is no exception.

But one extraneous factor may well apply a brake to the heavy momentum which the plan has now attained. This is the ever-widening gap between foreign exchange needs and resources. "It is fairly clear," says the budget white paper, "that the gap in foreign exchange resources over the plan period [1956-61] will be substantially larger than the original estimate of Rs 1,100 crores. Foreign exchange reserves have already been drawn down to an extent which leaves little scope for a further draft upon them. . . . The external resources available to the public and private sectors will now have to be much more than the Rs 900 crores envisaged if the plans of both the sectors are to go through without endangering the external viability of the country." The Reserve Bank's holdings of foreign securities and the balances it holds abroad (for the most part in sterling) totalled Rs 477.6 crores on May 17th, compared with Rs 716.9 crores on the corresponding date of 1956. Thus, some Rs 239.3 crores of external assets have been spent during the past twelve months.

THE original second plan calculations provided for drawing upon the sterling balances to the extent of Rs 200 crores during the period 1956 to 1961, at the end of which India's sterling holdings, which also serve as part of the backing for the note issue, were expected to be approximately Rs 500 crores. But already, in the first fourteen months of the plan, the sterling balances have been drawn down by more than the prescribed Rs 200 crores and have fallen below the floor of Rs 500 crores. When these estimates were made, sterling reserves of the order of Rs 500 crores represented the normal cost of about seven months' imports, and this figure was regarded as the essential minimum to tide India over temporary balance of payments difficulties if they arose. Unfortunately, serious strain on India's external payments has occurred much sooner than was supposed, but not before India's first line of defence had already been much weakened against the day of real need. The Reserve Bank of India Act was amended as recently as July 20, 1956, to provide for a statutory holding by the bank of Rs 400 crores of foreign assets as backing for the note issue. It is clear that the reduction of India's foreign assets towards this minimum is proceeding at a much quicker pace than the Indian authorities can have contemplated when they amended the Act; if present trends are not quickly reversed they will be compelled once more to fix a new and even lower minimum holding of foreign assets. Needless to say, such a step would be bad for India's credit in the eyes of the world and inimical to the self-discipline of other members of the sterling area.

Ultimately, India looks to neighbouring south and south-east Asian countries to provide new and expanding markets for her steel—and perhaps oil. But this is essentially a long term prospect; even if it is well founded, it cannot bring relief in the next four or five years which will be of crucial importance for the plan. At present, the scope for increasing foreign exchange earnings is largely limited to the established staple lines—cotton textiles, jute manufactures, tea, manganese, and perhaps in spices and sugar. Greater attention is being given to export promotion, but none of these manufactures or commodities is capable of making any real impact on the present deficit in the balance of payments. The main corrective can only be further resort to purely negative and restrictive measures such as closer scrutiny and licensing of imports and the elimination of non-essential foreign exchange expenditure. The private sector of the economy is an easy first target for the application of such controls; already import quotas have been slashed to achieve a saving of Rs 40 crores of foreign exchange in the first six months of 1957, and an even tougher policy is promised for the second half of the year.

FOR many British and Continental manufacturers India has been, and still is, a valuable market; but those trading in consumer goods and intermediate products are likely to encounter increasing difficulties in future. Already there are signs that the once heady inflow of imports is easing, with the result that less bank finance is tied up in such trade. To facilitate the purchase of capital goods the Indian authorities have decreed that the private sector must seek long-term credits. A period of seven years has been mentioned in an official directive to business associations, but initial reactions in exporting countries have been so unenthusiastic that New Delhi is probably already beginning to realise that five-year credits are about the limit of what can reasonably be expected, and that not so many of those are likely to be forthcoming either. At best, long term credits for capital goods can provide no more than marginal aid towards India's balance of payments. And they can only postpone the day of settlement, adding to the mounting total of India's foreign liabilities.

In present circumstances few courses of action are open to India to relieve the shortage of foreign exchange which threatens to retard, if not completely to halt, her second five-year plan. One of the major assumptions of the planners is now about to be put to the test. This assumption is that India's past record and future prospects should be good enough to entitle her to receive perhaps Rs 1,200 crores of credit from the rest of the world in the period 1956-61; either she gets this or she must prune the plan severely. Paradoxically, these are complementary courses. In the few centres which might provide credit for India the opinion is strongly held that the plan is considerably beyond the country's capacity and that external balance first rests on the effective recognition of that unpalatable fact. Some of India's joint stock bank chairmen have been saying just this for a long time past; their speeches over the last two years show a rare note of unanimity in their demand that India should cut her new coat out of her limited supplies of new cloth. But there is singularly little recognition—at least among the Indian public—that India is only one of many would be borrowers of development capital in the world today, that the supply is limited, and that if India is to attract her share, her plans and policies must look at least feasible to those who are asked to lend.

CANADA

Looking ahead to:

1980

- **Forest industry production will double by 1980**
- **Aluminium production five times present output**
- **Uranium production will double**

Now that some authoritative estimates of Canada's future growth have been established by the Gordon Royal Commission, it is obvious that the country will be undergoing constant economic changes during the next 25 years. Any period of change demands constant attention. And with our hundreds of branches in Canada maintaining close association with all phases of Canada's economic life, we will be in an excellent position to offer any manufacturer with market expansion plans in Canada such accurate and valuable information as:

- **MARKET STATISTICS**
- **INFORMATION ON PLANT SITES**
- **DATA ON MARKET DISTRIBUTION**
- **INCORPORATION PROCEDURE**

DEVELOPMENT IN IRAQ

Into Action

All over Asia and Africa, underdeveloped countries have plans for development. All are fingering estimates and blue prints, but only a few can display finished works that are already raising *productivity*. Some have drive but no capital (Egypt), others money but no scope for creating productive enterprises (Kuwait), yet others resources but, through nationalism, no mind to borrow the capital or hire the advice to develop them quickly (Syria). Only nations that have both resources and either investment capital of their own, or else enough stability to be thought a good investment risk by outsiders, have the means to execute their plans. Even these sometimes pause out of mistrust of the foreign technical advice without which, for the present, they cannot get on (Iran).

Of the thrusters, Iraq and India are the two nations that have accomplished most and Iraq is the better placed for forging still farther ahead. For the Iraqis have capital and need not operate on credit, or worry, as India has to do, over shortages of ready cash, and balance of payments crises. Indeed, they have far more money than they can as yet effectively spend, as the table on page 2 reveals.

Their direct revenue from oil, 73.7 million Iraqi dinars in its peak year (1955), was ID 68.8 million in 1956 and, but for the Suez crisis, had been expected to reach ID 80 million in that year. The Iraqi dinar is at par with sterling and the £ sign will be used henceforth. The source of this wealth—the oil production industry—is not covered in this review, which deals only with the way the Iraqis handle the proceeds.*

The Iraqis enjoy several advantages other than money, some of them gifts of nature, others the result of effort or heredity. Their greatest national asset is plentiful and accessible water. The length of Iraq from its northern mountains to its featureless southern river mouth is 600 miles—about the distance from the source to the mouth of the Rhine. At the northern end, the hardy Kurds in the highlands and the rolling plains at their foot have the benefits of snow and rain, while in the south, there is compensation for the torrid summer heat of Mesopotamia in the everlasting flow of the Tigris and Euphrates; indeed, a large tract in the south of the land between the rivers is undrained marsh.

A second asset is demographic. Unlike Egypt or India with their nightmare problem of a birthrate that is outstripping resources, Iraq is underpopulated. Its population of 2.8 million in 1930 has risen to about 5.5 million today, but results obtainable by irrigation and drainage can produce more living space; there is room for expansion.

Among man-made, self-made advantages must be reckoned relative efficiency over the management of money. The Iraqis have kept a much more effective check on the expenditure of their oil revenue than any of their neighbours. Their accounting system is good (though their Development Board is sadly behindhand with published audits) and it is possible to trace virtually every penny they have spent from the early days of their "Projects Section" of the Ministry of Communications and Works to their Development Board of today. At present the allocation of oil revenue is 70 per cent to the Board and 30 per cent to ministries for ordinary budget expenditure. The Board spends some of its share through ministries. It also uses its unspent balances as a cash reserve from which to make loans to public authorities for local developments of importance; about £40 million is lying out in this form at present. Some of this is likely to be irrecoverable, but municipal power stations in most small towns, silos breaking the monotonous line of the Mesopotamian horizon—more romantically—the silver water tanks that now rise like the golden domes of pilgrimage cities, are a testimony to its usefulness. The Board's estimates are embodied in successive Development Laws sanctioned by Parliament.

Another Iraqi merit is a sense of continuity. This is Nuri Pasha's gift to his country and his critics hold that he has furnished it at the expense of the liberty of the individual. Originally, he intended the Development Board to be a body of permanent members, plus one or two cabinet ministers. But after experiment he was defeated on this issue and for some years the Board has been a ministry; in other words, its directing spirit changes with a change of

* For the impact of the oil companies see "Oil and Social Change in the Middle East," supplement to *The Economist*, July 2, 1955.

cabinet. Nuri's answering expedient has been to organise a stacked parliament and to render cabinet upsets a matter of control. When they occur, as one has done this week, they make no difference to the economic and social pattern that is described in the following chapters. So that whereas for some years the Board hesitated inordinately over what to do, and kept changing its membership and filling cupboards with unused reports submitted by expensive specialists, in the two years 1955-1957 it has finished many jobs.

This sudden flowering is partly the outcome of old work coming to a head, but partly, also, that of a new state of mind that is illustrated by the invention of "Development Week." This gala was instituted last year and, held in March, is an orgy of inaugurations that forces the pace of completion. The new attitude of mind was illustrated when an Iraqi criticised the 1957 programme: "Next year's performance must not be padded with so much laying of foundation stones," he said, "Development Week is the time for cutting tapes."

WHAT produces this purposeful outlook? Why did Iraq opt for business as usual both at the time of Abadan, despite the emotional inducements to copy Dr Mossadegh, and again during the Suez crisis? Some say: "Because of Nuri" and think that when he finally quits, the country will disintegrate into factions as quarrelsome as those in Syria. But there are deeper reasons—reasons of temperament—for thinking that this fate may be avoided.

The Iraqis have in their blood a more dogged strain than is usual among Arabs. It may owe something to centuries of admixture with mountain races. Some hold that it owes a little to the British mandate; certainly, the notion among older civil servants that their calling is hard work and not a repaying sinecure dates from those years. Whatever its origin, this strain imparts a strength to the national fabric which is increased by another national characteristic: the endearing quality of humility. ("Of course Ali has written the best essay," says the class, "didn't you know? He has an Armenian (or a Turkish . . .) mother.") An Iraqi, unlike an Iranian, does not mind admitting that he does not know. Alone among the "developing" Asian nations, he has appointed two foreigners to full voting membership of his Development Board. "We shall be able to do things for ourselves in due course," he says, "but meanwhile we prefer to pay for the best work that is to be had." And when they have paid for the advice, they nowadays tend to take it. Alone in Asia they have commissioned a single report to end reports and then acted upon it—as they have done with considerable parts of Lord Salter's masterly "Plan of Action" of 1955. In it, the Iraqis own a document worth study by any country engaged on development.

TABLE I—DEVELOPMENT BOARD

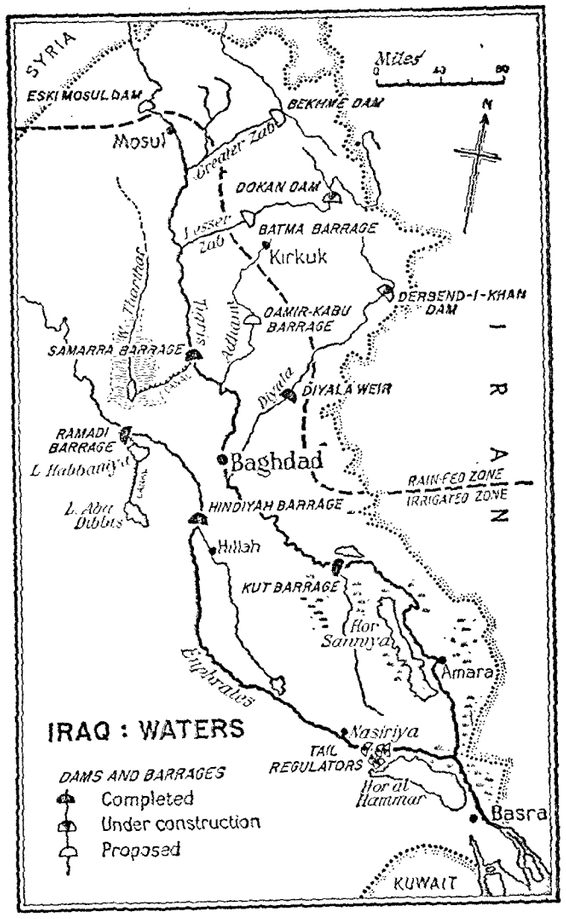
†† ID 5 million transferred to ordinary budget.

Is this dependence on foreigners a weakness? Many Asian nationalists think so, and brand present practices as a "sell-out to the imperialists." But the criterion, surely, is whether or no Iraqis are training themselves to fill all the foreigners' shoes. Their country's only two major natural resources are its oil, offering the basis of a petrochemical industry, and its agriculture, on which many processing industries could be based. Already educated men are beginning to conquer their prejudice against dirty hands and are advising their sons to qualify in engineering. Accomplishment will not be complete until the same can be said of scientific farming.

The Management of Water

THE Tigris and Euphrates are "always abrupt" by comparison with the "gentlemanly" Nile. Sir William Willcocks used the words when, fifty years ago, he arrived from Egypt to advise the Ottoman government about controlling the two rivers. Happily for the modern Iraqi who is continuing the struggle (and who has more money than ever before to wage it with) they offer one advantage to compensate for their chronic drawbacks; they flood different areas and their peak moments never coincide. For centuries both have set common problems: rising without warning, producing their maximum flow too late for the winter and too early for the summer crops, and carrying their mass of silt on to the flats of Mesopotamia, where an ex-seabed, a hot summer sun and a high water table between them produce the optimum conditions for rendering land too saline for cultivation. But at least they stagger the calamities they inflict; the Tigris also often staggers its flood with those of the four great tributaries that pour into it from the mountains on the Iranian frontier—the two Zabs, the Adhaim and the Diyala.



The Development Board, therefore, has not had to ward against simultaneous, 100 per cent disaster. To do so would have cost unjustifiable amounts, and have retarded other work. But the two basic jobs of flood control that it had finished by the spring of 1956 are still its most spectacular attainments. These are the Habbaniya scheme, whereby the Euphrates can be turned into Lake Habbaniya and stored there (and, if necessary, pushed on into the Abu Dibbis lake beyond) and the bigger Wadi Tharthar scheme, whereby the Tigris can be diverted into a depression capable of holding a lake 2,100 square kilometres in area which, engagingly says one Development Board publication, "will give a nice opportunity for recreation." The cost of these two operations was £4½ million for the first and £16 million for the second—together less than the total loss of £25 million inflicted by the disastrous "last flood" of 1954.

Floods are, like painful illnesses, soon forgotten once they stop happening. So that flood-control—at first the main target of the Development Board—has now become merely part of the process of water conservation, and storage is the big word that has taken its place. On the Euphrates, Lake Habbaniya is as yet the only store, and is already regarded as much too small. On the Tigris, the first assumption was that the bed of the Wadi Tharthar was porous, and might prove salty, and so would serve only as a soak-away. Therefore plans were laid for an expensive ring of dams upstream and on the tributaries. Two of these major works are well on the way; one is at Dokan, on the Lesser Zab, and is to be the great curve of concrete in the (page 4; over-optimists still hope this may be opened at next year's Development Week. The other is the Derbend-i-Khan dam on the Diyala, due to be providing summer water for the lower Diyala area by 1960.

But the rest of the major dam programme has sensibly been postponed because of the discovery that the Wadi Tharthar, after all, may be neither porous nor over-salty. Its bottom has proved water-tight, and if its sides are the same, it would offer a storage unit large enough to feed out all the summer water the south can use for years, and would be cheaper to instal than a multitude of big storage dams upstream. Three sets of consultants—Dutch for Tharthar, British for the Eski Mosul dam project and American for the Bekhme one—are busy bringing three studies of pros and cons to the same level of information. If, as seems likely, their evidence points to using Tharthar, its lake can be fed into both rivers; indeed, it would be possible, though expensive because of the problem of levels, to turn Euphrates water into Tharthar also, and make it do double duty at both intake and outlet.

It is much easier to build a reservoir than to be sure of using its contents for the best. The first is simply a feat of engineering, and the civil engineer's heyday when his skill is all that Iraq needs is almost over. The new age is that of the irrigation officer's tussle with ministries that need to move in step and do not do so, politicians who contend for benefits for their own constituencies, landlords who will not change their habits, settlers who resent dictation, and a whole range of theorists, human diseases propagated by irrigation, and crop pests. At the "use" stage the Development Board has to marry its major construction work with the job of the future maintenance men—the officials of the Directorate General of Irrigation in the Ministry of Agriculture. Ultimately, these will take over altogether, so that they need a say in the many decisions of principle that arise before the constructions that feed the water to users are undertaken. Happily, the Board's water section and the Directorate seem well disposed to work in harness. "Yes, we sit in together" each of them assures the inquirer. "If we can't get on well enough to organise overall management, what is there to say about the future of Iraq?"

A MAJOR decision that dogs them both from now on is whether their first job is to improve first-class, settled lands that are already under cultivation, or to open up new lands that are second-class but would increase the area available for settlement and production. The sociologist cries out against the former course: "Why stoke the fires of class hatred by using the oil money only on land that already belongs to the rich?" The economist condemns the undue cost of the latter: "We can't afford to settle new farmers at such prices." The landlord, who is also the politician, adjures them not to disturb the *status quo* by focusing attention on the need for land reform: "Can't you see that what you need for your waterworks is some years of continuity, not a political upheaval."

Zab and main river water to irrigate the Adhaim and Diyala areas, and will revive the ancient Nahrwan canal that once watered fields down a long line from Samarra to Kut.

But, whichever type of land is watered, the work will give only a fraction of the potential results without drainage. Iraqis have heard this home truth from every expert since Willcocks, but it went in at one ear and out at the other. A big change of the last year or two is general, widespread acceptance of the need to drain, which becomes more imperative than ever now that farmers are going to be fixed by housing and community-building, and can no longer simply move on once the land salts up. Drainage is now rated paramount in Baghdad, though its importance has not yet been conveyed to the farmer. No new lands will be irrigated without installing it. Since the outfalls must run back to the rivers, it will be economic to let it also improve the richer landlord's lands on the river banks. Already, at

the one or two points where main trunk line drains have been opened, the crops are higher and less uneven. Yet unless these richer farmers come in on the main drainage system, contribute to its cost and dig the ancillary canals that the new smallholder is to be compelled to dig, the system cannot yield full results. Is the line of least resistance to be taken here also ?

A subject less complicated politically, but extremely complex technically, is the synchromeshing of water supply and demand all down the long ribbon of both rivers. A variety of users and crops do not all need the same flow at once ; for instance, a sudden diversion of a Tigris flood to save Baghdad can denude the Amara rice grower of water just when his crop will fail without it. Who is to say which need comes first ? Or to see that the sudden pull of a lever to do duty at A does not stop navigation at B or fill a mosquito breeding ground with stagnant water at C ? Who is to have the last word on what crops the flow is to cater for ? " There must be a properly equipped operations room . . . " advised Lord Salter in 1955, " where instructions to the engineers living on the sluices can be worked out." To run that room well is as far as the water engineer can get. The rest of the road must be travelled by other ministries—notably of Agriculture but also of Health and Education. Even a civil service machine of high calibre would find the task daunting, an Iraq has not got one yet. The Iraqi civil service, thoug it contains some well-trained stalwarts at high levels, an is (now that pay has been raised) beginning to recruit som good young graduates, is still a weak vessel because i middle and lower layers g their jobs in days when thes went to trustworthy relative or dependants and no on inquired about aptitude fo administrative work.

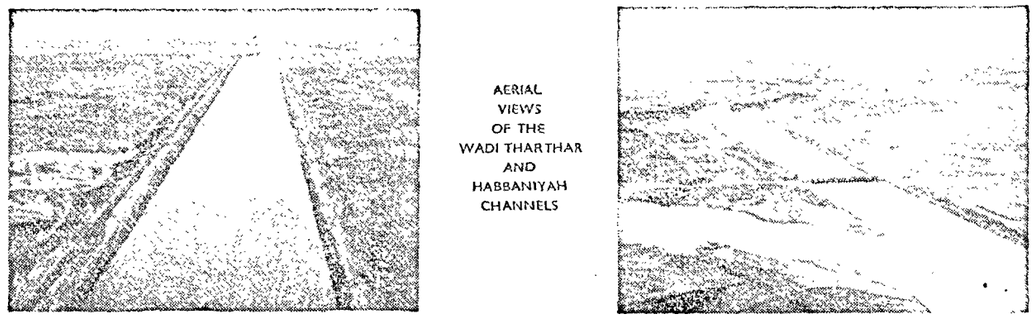
Having tampered wit nature, and spent a lot o money on doing it, Iraqis ar bound to be critical of, an criticised for, every short coming in the management o their water. But even an im perfect new system will b better than the unsystemati wastefulness of today. Th lessons learnt on early settle ments have as yet scarcel been acted on. Patches of on expensive experiment, th Dujaila settlement scheme o 1946 near Kut, have salted u and had to be abandoned fo lack of drains. Yet the rest o the farmers there—far though they lag behind optimum crop levels—are better off than the share-cropper next door. A cheering new feature in Baghdad today is a growing acceptance that everything cannot happen at once, that effort a improvement has begun, and that the important point is no longer to wait on Allah, but to profit by experience and remedy mistakes as one goes along.

The Drive for Variety

DIAGONALLY across a wall in the office of the Iraqis' Greek housing consultant runs a huge and unusual map of Iraq, dotted with red circles of varying sizes denoting the present distribution of communities throughout the country. In the rainfed north, they make a " normal " sprinkled pattern of cities, market towns and villages. But south of Baghdad, the grouping changes and the whole of life is thickly clustered along the two rivers, with wide empty spaces in between. No wonder that the flyer from Baghdad to Basra sees nothing (except where the plane crosses the fertile ribbon of the rivers) but sand, salt and marshy emptiness that looks like the surface of some sodden moon. This is the pattern that must be altered before there can be an adequate increase in productivity.

Irrigation and drainage will help to disperse the clusters, but cannot do it unaided. The Development Board's other main sections are each contributing to the job.

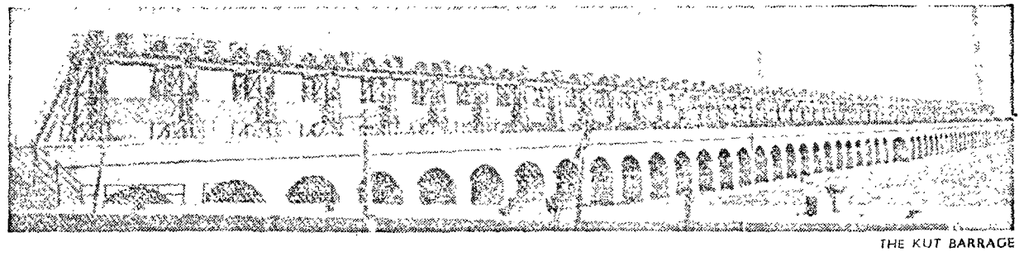
Railway, port, roads, a power grid: once these four are available the people can fan out from the rivers, though the spinal cord of all communications—Basra to Mosul—must clearly be the main line of each system. From 1958 or '59, there will be two railway lines from one end of the spine to the other, instead of one as at present ; the lines will meet at Baghdad, but elsewhere will serve new centres, such as Kut, and remedy missing links such as that between Erbil and Mosul. The State Railways are to get £24 million of Board money in the six years 1955-1960, but cannot do the spectacular part of their construction work till some new bridges are built. Meantime, their principal loading point, which is the Port of Basra, deserves more attention from the Board than it had until last year.



Iraqis are not sea-minded ; they get abroad by land or air. Their port and gateway at Basra is many miles up their river and—because they do not use it much for personal exits or for oil export—they forget its importance as a point of intake when they are importing six times as much as they export, excluding oil. Only in 1956 did Basra gets its first belated grant of Board money (£4

Balfour Beatty & Co. Limited

CIVIL, MECHANICAL AND ELECTRICAL ENGINEERING CONTRACTORS



IRAQ

During the past 25 years Balfour Beatty has been privileged to carry out extensive contracts in Iraq. Works include the Kut Barrage and Wadi Tharthar Channel on the River Tigris, and the Habbaniyah Inlet Channel and Regulator on the River Euphrates.

AERIAL VIEWS OF THE WADI THARTHAR AND HABBANIYAH CHANNELS

Current contracts include a Regulator at Faisaliyah on the western branch of the Euphrates, and a further irrigation project at Sungasur in the northern mountains of Iraq

million) for improvements. Happily, it had meantime helped itself. Run by a semi-independent Port Authority, it is self-supporting and well managed ; indeed, in the years of pinch and scrape, it saved on its port services enough to lend money to keep Basra city going on electric light. It is up to date by port standards anywhere else in the Persian Gulf, but needs more capital for investment in port facilities if it is to do its bit in the diversification of the economy by handling the output of some export industries that are to be sited near it. It deserves more tributes, as well as more money, that it has had.

New trunk roads and main bridges are handled directly by the Board. The map on this page shows that its bridging work has gone ahead, but the road map is a disappointing display after six years of work ; only a few small sectors of main road are finished. Admittedly, there were many roads in the south on which it was not worth starting till the floods were mastered ; at other points bridges had to come first. But there is no good reason why the traveller of March, 1957, should still have to bump all the way from just outside Baghdad to Mosul or Kirkuk in the classic discomfort of ruts and dust, or mud. Two years hence, he will purr along the tarmac, but he ought to be doing it now.

The trouble seems to have been an assumption that whereas it takes a foreign expert to design a dam, anyone can build a road. The programme has been disorganised by bad estimating and arguments over specifications, by contractors preferring to pay their penalty clause and pull out, and disagreements over the value of work part done. (One of the contractors' difficulties has been the local prejudice that has obliged them to shed unskilled labour and take on new men each time a road enters new tribal territory.) Some of the snags were unforeseeable, or at any rate unforeseen, by the world's most experienced firms, one or two of whom are completing their contracts only at heavy loss. A combination of such setbacks has left the main Baghdad-Kirkuk road untouched for a year. Now, however, push is being applied to the road network. Two years hence, places that are backwaters will be on trunk lines to market and in process of transformation from a non-monetised to a cash economy.

Cheap electric power is also within sight. Two of the three main power stations—at Dibbis in the north and at Baghdad—are under construction now, and the third, at Basra, is due to be started next year. Those near oilfields will run on natural gas ; both the dams now building have been equipped to generate hydro-electric power, but for the present gas or oil is a cheaper source of energy.

Now that these networks are on their way, the Board is beginning to make its main contribution to another Iraqi target—diversification of the economy by the establishment of industry ; for its principal role in this field is to provide the services that will cause Iraqis to start industries for themselves. As elsewhere in the "underdeveloped" world, they are slow starters except in light industry—soft drinks, pasteurisation, matches and the like—because they are reluctant to plough big sums into ventures that may not yield returns for some years. Furthermore, they are mistrustful of organising mergers, except within a family, with the object of accumulating funds for an investment of magnitude. The Board has therefore itself undertaken the establishment of various major industries, but on the basis that there is as soon as possible to be some private stake in

the operation, and that private management is to be encouraged to take over once the industries are on their feet. (The precise form of ultimate government participation has yet to be determined ; in one or two cases construction costs have been so high that private enterprise could scarcely take over unless capital costs are largely written off.)

On the advice of its American consultants, the Board has concentrated chiefly on industries which process Iraq's two main raw materials—agricultural products and the by-products of the natural gas and oil industries. These it has spread all over the country as far as is compatible with availability of materials, and of markets both at home and abroad. Large bitumen, cement and cotton textile plants are already operating in the north, with sugar to follow. For oil refining, the Board has granted £6 million to an independent Government Oil Refineries Administration which has its principal plant just south of Baghdad, and is lending a further £2½ million this year. So far, the South feels neglected ; but its turn will come in the next year or two when it will get plant for processing its marsh reeds into paper for export, and its dates into date syrup and cattlecake. In the field of petroleum-chemicals, fertiliser and rayon textile plants are also scheduled to start at Basra ; a sulphur processing plant at Kirkuk is out to tender.

A step that the Board has not yet taken, but plans to take, is improvement of industrial credit facilities for the private

entrepreneur. In its concentration on big business, it has forgotten the little man whom it could help to start with enterprises, such as jam and canning factories in the fruit and meat-producing valleys of the north. Till now, the small entrepreneur's only means of borrowing is from an Industrial Bank that is run on an old-boy basis over cups of coffee, and without relation to the return on the investment, or to national need. The Board's idea now is to funnel loans out to would-be industrialists through an Industrial Finance Corporation which would scrutinise their plans from the angle of value to national development as well as of relationship to imported goods of the same quality.

THERE is much grumbling among white-collar liberals about the Board's lag over making a good showing in industrial expansion; in fact, once it gets credit facilities going, it will be moving at a pace and along lines that ought to enable the private entrepreneur to get an early share of the cake. But to the Iraqi's mind it is only wheels actually humming that count as accomplishment.

The grumbler likes results he can see, and it was partly to pacify him that Lord Salter advised in 1955 that housing financed by the Board should be on a much larger scale. Another reason for pressing on with it was that providing houses is a quick way of spreading the population, reducing the drift to the towns and making workers available where they are needed. This piece of his advice was at once taken and the allocation for housing raised from £6 million (1955-1959) to £24 million (1955-1960). In addition to the private building that is in full swing in all main towns, therefore, and to much Oil Company building of employees' houses on a home-ownership basis in Basra and Kirkuk, Development Board housing on a community basis has started all over the country; it is well advanced just outside Baghdad and round the northern factories; a big estate is out to tender at Basra.

The idea is to build communities, not mere shelters. "School here, market there, no road to cross to the playground and here is the gossip square." The enthusiasm of the Greek firm that is laying the plans is infectious. Town dwellers are at once delighted with their work, and the envy of all the unhoused; so will farmers be in the districts where they have always returned to villages at night for security. But the Middle Euphrates farmer who has liked living on his farm does not yet want to be herded into the kind of community that makes overheads cheap. Only when he has seen what happens—that is, when a pilot project has played its essential role—will accessibility to drinking water, sewage, electricity, a store, a school and, perhaps, even a cinema make him change his conservative mind.

Need Farming be Ignoble?

IF, in talk with students in Baghdad, you mention that Iraq is an agricultural country, or deplore the lowness of the Development Board's current allocation for agriculture (£14 million for 1955-1960) as opposed to industry (£67 million), you are shouted down. The much-too-glib assumption is that your idea is to keep a backward people pinned down to manual labour, and to thwart modernisation. You answer that agriculture *is an industry*, and that Australian farming is just as modern as dark Satanic mills in England, but your point is not easily accepted. Many young Iraqis who work in the Farm Extension Service tell you with a sigh that they would far rather have been a doctor, or an engineer, because these careers are not only better paid but are rated "more dignified."

Yet, apart from oil, Iraq's main source of wealth present and future is its agriculture. The proportions as they are today are set out in a tentative table on page 14. To give peasants the incentive to remain farmers, and cause the educated youth to stop sighing for a desk, is the first corollary of spending £153 million on water works in the next six years. Why, then, is the Agricultural Section of the Development Board the Cinderella financially?

Is its money allocation supposed to reflect the fact that rural Iraq will be first beneficiary under other expensive heads—notably irrigation and communications? Or is agriculture low in priority because the Board reckons the job a maintenance and educational matter which is the province of Ministries? Or is the more backward and passive part of the electorate neglected to permit window dressing in the more vociferous towns? Agriculture is underweighted for such reasons in the development budgets of other countries, notably India. Or is the reason political? Is it that major changes in the agricultural pattern of Iraq undermine the power and wealth of the landlord class that still dominates politics, and so are pursued only gingerly by a Board that is under the control of Parliament?

Whatever the reason, the Agricultural Section of the Board is confining its work to the *Miri Sirf* (pure state) lands where new small-holder settlements can be organised without a political fuss. And, indeed, to get these new areas to yield the results they are capable of yielding will absorb all its capacities for the present. Two main impressions are left on a visitor to established *Miri Sirf* experiments in the north, south and middle of the country. One (which may well escape a visitor who is unfamiliar with traditional Iraqi farming) is that they are a tremendous advance, both

Road making, Middle Euphrates '57

tatistically and to the naked eye, on any other form of easant life. The other is that, nevertheless, they fall epressingly far below the level they could attain. They are elow it for causes that it would be within the Board's apacity to prevent and cure.

ONE important step that the Board is beginning to take is to make a better choice of settler ; families that already ave a bent for farming will both produce more crops and dvertise the Board better than intransigent nomads (chosen t Hawija in the north as part of the government's settle- ent policy) or retired government servants (chosen for ertain holdings at Latifiyah near Baghdad, and apt to lease heir plot to some more menial worker).

A second step as yet untaken is to see that the Ministries o which services are transferred when the projects get to he running stage—Agriculture, Health, Education—do not reat them as step-children, and fail to mother them, let lone act in unison. This dovetailing will not materialise nless the Board organises one of two developments. The hoice would be either to vest its Agricultural Section with he prestige and authority and cabinet support that would nable it to chivvy ministries, or else to set up local com- nittees of the representatives of the various ministries in ach province so that each project manager could get them o help him push for services. The farther afield one goes, he wider yawns the gap between the desk in Baghdad and he man on the project. Even at the project nearest to the ity, a visit on a bitter day last January revealed 437 families athered to be vaccinated ; as a result of a great publicity ffort they had ridden, walked and carried their babies niles through the winter mud only to find that, without ven telephoning to let them know, the Ministry had eglected or forgotten to send the van.

Instruction, supervision, encouragement, attention—all re in short supply and yet applications, many thousands in xcess of the number of holdings available, pour in each ime new plots are distributed. A tribute should be paid o the training staff who, by living on the job, set the example hat creates this demand. They are, as yet, only a handful f Iraqis and two notable American stayers whom an raqi on the Board described to your correspondent as three points of Point IV."

Perhaps the hope is that if—in the existing *Miri Sirf* ettlements and the huge new one inaugurated this March n land between the rivers just below Baghdad—these ailings are set right, a precedent will be set for carrying aged crop-patterns into that Old Tom Tiddler's round, the large estates.

Some of these are very well farmed already by owners who are quick to see the virtue of new methods, and who would react at once to visible evidence of rising yields whether of crops or—in the north—of better fed and bred animals. A few such men already admit that if government expenditure causes less land to yield more money, it might be just to pay for the services by surrendering some acres. For other more crustacean types, particularly on the enormous estates in the Kut and Amara area, acres good or bad have an intrinsic worth that still makes them prize-worthy, even if lying idle because uselessly salty.

Seeing is believing. Successful pilot projects are one of the keys to social change. Even the following impressive figures—all available in published reports submitted to the Development Board—have made no mark on most Iraqi minds:

(*a*) In Iraq as a whole, 20 to 30 per cent of cultivable land has been abandoned in recent years as a result of salination due to irrigation without drainage. Where land has more than ½ per cent salt content it grows no wheat ; more than 1 per cent, no barley ; more than 2 per cent, no dates.

(*b*) Much of this land is recoverable. During a recent experiment at Dujaila forty days of "laundering" removed 65 metric tons of salt per meshara (.62 acre) and reduced the salt content of a trial area of 200 mesharas from 5 to 0.1 per cent.

(*c*) Drainage alone would increase the average yield of grain by 72 per cent, rice by 36 per cent, and dates and citrus by 60 per cent.

(*d*) All Iraq uses the fallow system ; only half the cultivable land is cropped each year. On land for which expensive irrigation works have been installed, the cost of these works per unit is double what it would be if the land were continuously cropped. The Board's American water consultants estimate that the introduction of crop rotation and managed summer cropping could raise the three figures given above to 190 per cent, 129 per cent and 200 per cent respectively.

(*e*) By introducing pest control and improved irrigation methods, and less hidebound practices about dates of planting, it could be doubled again.

(*f*) It could be further increased by improvement of varieties, seed selection and the use of fertilisers. "There is 4 dinars profit on each dinar invested in fertiliser."

Who on reading of such possibilities can contest that farming is a noble profession and that this ever-renewable resource deserves to be a first call on Iraqi brains as well as Iraqi hands ?

Flaws in a Good Plan

WHEN an underdeveloped country is galloping to catch up with Europe and America, critics are apt to find fault with it to an extent that would only be justifiable if all "developed" countries worked without a hitch. Before commenting on the shortcomings of Iraqi development, perspective must be sought by making comparisons only with other countries in the same boat. Thanks to more continuity of effort than anywhere except India, and more readiness to speed matters by trusting experienced foreigners than anyone else, Iraq has made more of a start than any of its neighbours towards creating productivity; admittedly, it has worked in more favourable conditions than any of them except Iran.

The Development Board's effort is on the whole so estimable that some of its weaknesses are worth mentioning if only because the cure lies well within its reach.

The first is a failure to encourage the expansion of credit for people ready to help themselves. Iraq has for years had three banks that perform this function, an Industrial Bank, a Mortgage Bank and an Agricultural Bank. The first will do better than hitherto if it is transformed into the new Industrial Finance Corporation that is mentioned on page 8; the second (which is the most efficient of the three) lately had from the Board a £5 million loan at ½ per cent and the benefit it is bringing to the middle-class income group wishing to build houses in city suburbs is visible. But the third, the Agricultural Bank, is Cinderella over again. How can a peasant better himself, even if he is granted land and a house, if he starts in arrears of debt and has no money to buy seed or fertiliser? Unless credit on easy terms is available to him, he either farms in the bad old way or else borrows at the old usurious rate from a money-lender or his former employer. Even a loan at low interest from a government organisation will not convert him into a solvent farmer if he simply uses it to pay old debts.

Supervised co-operative credit, of the kind that the British instituted in Cyprus and Jordan, or that the Ford Foundation is beginning to promote with a pilot programme in both Iraq and Iran, is one of Iraq's main needs. "Such associations, to be sound and successful, must have substantial support and guidance during their early years," says a Ford Foundation report. To attain this level, Iraq's Agricultural Bank would need reformation, much money from the Development Board and much more trained staff than it has got. Experience of well-run co-operative credit systems suggests that, given considerate terms, peasants are good payers. In Jordan, 75 to 80 per cent of the money due for repayment is wont to arrive on the dot. Why should Iraq be any worse at making a revolving fund stimulate initiative and in time turn peasants into minor capitalists?

A second sin of omission by the Board is underestimation of the need for training. Trainees for the new Mosul textile factory were sent abroad well ahead of time, but at the opening of the factory they were only a sprinkling in great halls of French machinery. Agricultural training is given far less forethought. If peasants accustomed only to the fallow system are to use all the water that big investment is making available for intensive farming, they will need to be given at least enough instruction to realise how badly they need more of it. In a country developing as fast as Iraq, training "on the job" is the only possible recourse for some years to come. Doubtless it will take place in industry, since machines cannot be handled by the light of nature, but there are not nearly enough arrangements for giving it on the farm. Even in the north, where the merchant landowner of Mosul or Erbil has or his own taken to tractor farming and has increased production, the way he is doing it is from lack of knowledge not increasing yield per acre. And, further north still, afforestation proceeds only in patches of a size that can be wired, because no one has undertaken the kind of teaching about stopping the ravages of goats that has been such a success in Cyprus.

TABLE 2—ECONOMIC AND SOCIAL PROGRESS IN IRAQ

Source: Central Statistical Department, Ministry of Economics, Baghdad.
* First six months. † Provisional.

Next — decentralisation. The depressing insistence that every decision be referred back to Baghdad blights many improvements that would take place at once if the job were entrusted to local initiative. The manager on the project could do much better with a little more authority; what he wants is a budget of his own and a right to encourage his farmers to help him manage the show and penalise or evict the failures.

A striking example of the initiative that flowers when local authorities are given incentives and responsibility is shown by the Municipalities Department of the Ministry of the Interior—the body responsible for light and water in the country towns of Iraq. There are 152 of these municipalities. They get their revenue from local taxation, and the enterprising ones have had cash loans from the Development Board and much technical help from the ministry. In 1945, 33 of them had electric light and 31 pure water. By 1956, the figures are 95 and 109 respectively, with 27 extensions to electric plant and 54 to water. A good agricultural project manager could match their strides if he were given the same chances; as things stand, he even sows on the day designated by Baghdad, instead of on that ordained by the weather.

Within the very precincts of the Board improvements are possible that could hasten every end it is seeking. Incredibly it has no professional publicity section. It lacks even the straight information section that would save its technicians from the importunities of journalists; it has more aptitude than it had, though is still lacking in capacity, for telling the Iraqi public what it is doing, so that few northerners have any idea what the flat and palmy south is like, and few southerners have ever seen a relief model of a hill, let alone a dam. It ran good exhibitions in Baghdad during Development Week, and these ought to travel the country for the rest of the year. The same department could with advantage keep students informed of the technical openings that lie ahead and save them from the quite needless restlessness and anxiety they feel about getting a job.

But more than either of these does the Board need to conduct a publicity function of another, subtler, kind. One of the obstacles in the way of development is conservatism; landlord as well as peasant is set in ways he does not want to change. Unless both are acquainted insistently, yet subtly, with what they are missing by failing to co-operate in new schemes, those schemes will never wholly succeed. For instance, cannot a landlord learn through articles, pilot projects, television and other media that he would make more money per acre were he to cease preferring private pumps under his personal control, and instead to hook on to the main canals and drainage outfalls. Unless he is confronted with inducements to join the national water-grid, this will prove unduly costly per acre watered and drained, and the gap between large landowners and the rest of Iraq will remain as wide as ever.

Next, if the Board is to go on lending from its liquid reserve for long-term projects undertaken by other public authorities, it needs a finance officer with experience of public lending, so that it may be advised consistently about what to write off or convert to grants, or what to convert into investments by means of stock or bond issues. The falling off in oil revenues since the Suez crisis, and the Board's consequent need to use its unspent balance for keeping going, has been a lesson to it to watch, though not necessarily to curtail, its lending policy.

Last, but not least, the Board needs to tune up the economic advice it gets from day to day. Its economic section is only a fact-finding unit. In 1955, it employed Lord Salter to sift all the propositions before it and to advise it what weight to attach to each, and in what order to deal with them. He advised; much of his advice has been taken. But what is needed is a permanent Board member of the Salter stamp. Were such a character to be added to its strength, it might pay more attention to the two topics which should from now on govern all its judgments: Does this or that piece of expenditure arrest the alarming flow of manpower away from the land and into the towns, and does it quickly create productivity? As things stand, credits are being voted without demur for high-cost public buildings that retain in Baghdad building operatives desperately needed for low-cost rural building, and peasants are being planted on to land before there is the credit system without which they cannot be brought to produce more than they consume.

People and Productivity

Is development moving fast enough to satisfy the growing demand for social change? Is it bringing people enough of what they want to give them a foretaste, if not a taste, of benefits they have so far lacked—an education, a steady job, a house, a bit of property? When a member of the Development Board remarked that he envied bridge builders, because their work, once completed, was put to full use right away, and without discrimination between the users, he put his finger on the most sensitive nerve in the Board's frame: the relative simplicity of its technical feats by comparison with the daunting complexity of its social and political task. Every observer of Iraqi development, from Lord Salter down, has emphasised that "the nation's economy exists for man, not man for the economy." Once the fine flush of dam and bridge building is over, Iraqis will no longer be able to live in an engineer's paradise, generating great works without need to reflect on their social effects.

As yet this thought is rather a warning than a criticism, but it could with ease become the latter. So far, the Board has catered in generous measure for human welfare; its building of schools, hospitals, and dispensaries is illustrated in the table on page 12; its start with housing illustrates a concern for improving life at all levels. Has it satisfied its public, or merely increased their craving for more?

At first, it rendered everyone impatient. The years between 1952 and 1955 resounded with grumbling at its apparently interminable preoccupation with blue-prints and surveys. In 1956-1957, there has been a change of outlook but one stimulated chiefly by spectacle. The public is excited at feats of engineering such as the Baghdad bridges and the Mosul textile factory. There is now a risk that this excitement will pall and will be followed by disillusionment.

Iraqi society still divides, roughly, into two classes: a rich one growing nervous at hints of a threat to privilege, a poor one awakening to chances of advancement. The precedent in Egypt is in both their minds. (In between them two groups seethe and argue; one is a small, educated, urban class, but its aims and discontents are rather political

than social. Its grumbling is directed at the muzzle of censorship, and the way it has been elbowed out of seats in Parliament. It would do much as Nuri has done were it in power. The other is a younger, poorer group of genuine socialists who now despair of land reform except at the hands of some leader sprung from the people—a Gamal Abdel Nasser.

The social aspect of the Development Board's work, reduced to its simplest terms, is a straight issue between haves and have nots—landed gentry and landless peasants. Over the next few years, the matter that must command attention, in a country one of whose only two great natural resources is agriculture, is whether the relationship between them is to jog on in its present uneasy and uneconomic shape, or, if not, by what means it is to be changed.

The problem of easing social tensions is beyond the scope of the Development Board and in the realm only of cabinet and Parliament. Will a parliament composed chiefly of landlords ever agree to alter the pattern, or must it be altered *violently*, as in Egypt? Some dispassionate outside observers think that an imposed land reform is the only way of making the irrigation programme pay its way, since to settle peasants at £300 a head on second-best land is financially as well as socially unsound. Others contend that if existing laws were only applied, and landlords paid the taxes for which they have voted, all would be well. Yet others believe that owing to development works, the landlord's position is crumbling anyway, and that even if brusque land reform is shirked, change will happen, without tears, *in this generation*.

A growing number of factors bear out the last view. One is the increasing availability of alternative employment. Sheikhs in the Amara area were complaining this spring that they had no one to row them to market, and no beaters, because "their" peasants had gone off to work for the American builders of the Kut-Basra road. Another such factor is the very existence of new smallholdings, however expensively created; once peasants know they can put their name down for a plot and a house, their relationship to a master alters. And if, to replace them, he has to resort to machinery and pay a tractor driver 1½ dinars (30s.) per day, who will stick to share-cropping? Yet another factor that is undermining the landlords' old supremacy is the growth of communications. When peasants who were once confined to poor, disease-ridden surroundings are able to reach a town and a labour exchange by bus, landlords will need either to make rural conditions attractive or else will find themselves bereft of labour and income. The exodus from Amara to Baghdad is already proverbial; more would be disastrous:

> As a long-term policy, Iraq cannot abandon cultivation and live entirely on canned food. A country which is undertaking investment in irrigation on a large scale is indirectly investing in agriculture, and must make some provision for the future of the agricultural population. But by the time that perennial irrigation allows intensive cultivation, the cultivators may not be there.*

There are faint signs that the mind of some landlords is moving towards a grasp of the need to forestall this awful contingency. In 1952, for instance, Parliament passed without demur a shortsighted law—the Amara land law—which, nominally, gave peasants title to claim land, but was in fact so worded and executed that sheikhs and their families grabbed most of the lands available. By 1954, the lower house had passed a bill which entitled the government to recover by instalments from landlords the cost of drainage of their lands undertaken by the Development Board; but the landed gentry in the Senate threw it out. By 1956, a law passed by both houses rendered income from the rent of agricultural land liable to income tax. In 1957-1958, to meet an anticipated deficit in the ordinary budget, the proposal is to tax the capital value of landed estates. If that measure is passed by both houses, if the assessment is just, and if landlords begin to surrender acres in exchange for services or in order to meet their obligations, a corner will have been turned in Iraq's social history.

Whether social change will happen gradually or after an upheaval is still an open question. By contrast, it is certain that unless some means is devised of breaking up the many estates at present doomed to perpetual inefficiency, Iraq's productivity will never be what it could be, however great and efficient its investment in irrigation and training.

A point never to be forgotten is that this fortunate nation has not merely water but good human material in which to invest. Often, Iraqis may seem to be lacking in initiative and inclined to wait for orders, but on the whole the evidence is that they warm to responsibility. Give them a co-operative and a budget, prizes for the efficient farmer and a keen instructor to teach them how to work the new apparatus, and—Arab and Kurd alike—they forge ahead. "I joined the Iraqis for a year" says the man from Leicester or Utah, "and that's six years ago, and here I still am because I like them." There is something compelling about helping with the fortunes of this eager people.

IRAQ: THE NATIONAL INCOME

The Iraq Central Statistical Office has recently completed a series of census enquiries on agriculture, livestock, housing and distribution. These, with the departmental data published in the annual Statistical Abstracts, permit a preliminary estimate of national income and product. Pending the completion of work now being done on the figures in the Office, the unofficial figures given below have been produced by the Government's chief statistical expert. In 1951, the *International Bank estimated* national income per head at "probably at most ID 30"; on the basis of the table below, it is now ID 53.

	Million Dinars	% Total
Forms of Income :—		
Wages and salaries	65·2	22
Earnings in kind	38·2	13
Rents	21·4	7
Profits and interest	98·8	34
Net oil revenues	68·8	24
Net National Income	292·4	100
By Industry :—		
Oil	78·2	27
Agriculture	70·0	24
Manufacturing and building	33·7	12
Distributive trades	31·0	11
Transport	11·5	4
Ownership of houses and other buildings	18·9	6
Services	49·1	17
National Product	292·4	100
