First let us give you this pre-season glimpse of Soking Old Place, open to the public this year. Bits of it really are quite stately, and when we scraped the beam in the scullery and found a sort of lumpy pattern, *Palimpschwest* had a paragraph about our "carved soffit" with its "genuine ham and eggs moulding". And if the new tenants of Wett Chamberlayne can "throw open their gardens" (half an acre of weeds and a strong smell of fermenting grass clippings) why not us? To make it more "for the people" there is the suit of genuine stage armour, which we bought specially at Yarmouth, to go with the two Roman pots; and the taxi which took us to the coronation is preserved in the stables and may be sat in for an extra threepence.

In the picture we are planning not to cut out the tool shed but put *To the Armoury* on it in Gothic type. Old Mr. Carter has taken the split infinitives out of our Guide, which should show a profit now that the back page has been bought by Chez Maison Doris, the Soking dress shop, though the picture they have chosen for their advertisement is rather a curious one. There is a genuinely newly discovered secret panel which turns out to have been put in to supply the telephone extension to the top floor, sub-let to Mr. Carter. As he is only seen occasionally at windows we are thinking of saying that that part of the house is shut off, slightly suggesting a family curse, if not an Old Soking Monster.

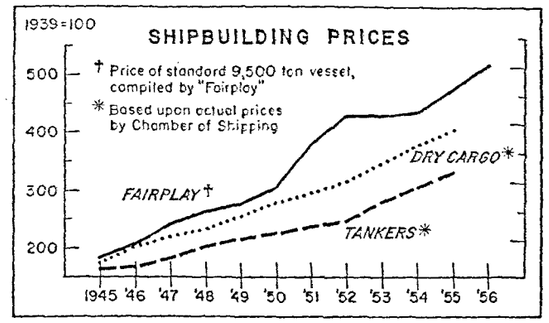
SCHWEPPERVESCENCE LASTS THE WHOLE DRINK THROUGH



ments agreement is unnecessary now that Japan is a full member of the transferable sterling account area. It is also evident that Japan has failed to obtain the substantial relaxation of British import restrictions that it sought. The new agreement merely provides for a small increase in trade in both directions; last year Britain's imports from Japan amounted to no more than £24.2 million cif and its exports to £21.6 million fob.

Few details of the quotas in the trade arrangements are given; is this secrecy desired by both countries or is it enjoined by one? The Board of Trade states that all the quotas previously available to United Kingdom exporters are maintained with very minor exceptions. The quota for wool textiles remains at £2.8 million a year. Some new and unspecified quotas, worth over £1 million a year, have also been introduced. The quotas available to Japanese manufacturers have been maintained; a few of these, including artificial pearls, canned salmon and peaches, have been increased, and a previous cut in the quota for apparel has been restored. Provision is made for substantial imports from Japan of canned tuna, and small new quotas have been granted for a number of manufactures, including cameras, tiles, needles and certain chemicals. Unrestricted import facilities have been extended "to a wide range of relatively minor items." Finally, the Japanese government will allow the profits of British film companies blocked in non-resident accounts to be remitted.

Suez, Ships and Prices

THE latest annual report of the Chamber of Shipping is naturally heavily preoccupied with the Suez Canal closure and questions relating to its reopening. It may be only a matter of weeks before a temporary passage is cleared for shipping, though Egyptian intransigence has prevented General Wheeler from keeping to his original timetable, which set the date for the completion of this first stage as early this month. If the process of switching shipping schedules back through the canal is to be smooth, shipowners ought to have several weeks' notice. They will also be wanting to know very soon what towage, repair, lighting and mooring facilities they can expect; what dues will be paid and to whom they should pay them; and various other points of detail. The Suez Canal Users' Association, an organisation of governments, has been considering on its own whether some system of priorities will be needed while the canal is only partially restored to traffic, and it has sought the views of shipowners; but the Chamber is somewhat indignant that the International Chamber of Shipping, whose members owned or controlled four-fifths of the canal's traffic, has not been consulted by Uno despite its being accredited to that organisation.

The remainder of the report covers ground traversed in earlier ones. The Chamber launches another broadside at flags of convenience, including that of the latest maritime power—San Marino. One new feature is an index of shipbuilding prices which is reproduced in the chart together with one regularly compiled by the "Fairplay" shipping journal. Long delivery dates, caused by plate steel shortages and labour problems, are not the only reason why the British share of the world shipbuilding output has been steadily falling. Costs and methods of construction also need scrutiny, and Sir Donald Anderson, this year's president of the Institute of Marine Engineers, asked some of the customers' questions last week at Glasgow when he invited shipbuilders to consider whether their system of building much

of their marine machinery and components themselves was more appropriate than fostering greater specialisation. Is it purely chance that this alternative pattern of production, coupled of course with a concentration upon tanker building, has now put Japan in the top place of shipbuilding nations?

Heavy Engineering for India

TWO alternative proposals for the building of heavy engineering capacity, British and Russian, are now being considered by the Indian government. One set of recommendations, made by the British heavy engineering mission that visited India last year, envisages the construction of at least four self-contained plants. These would include: a heavy machine tool works; one or two heavy machine shops; one or two heavy plate and vessel works; and a heavy structural fabricating works. A separate mining machinery factory is also recommended. The British mission feels that this capacity should not be too concentrated, either in size or in one place, but should be built in standard units flexible enough to be erected wherever they will best meet the needs of the plants they will serve.

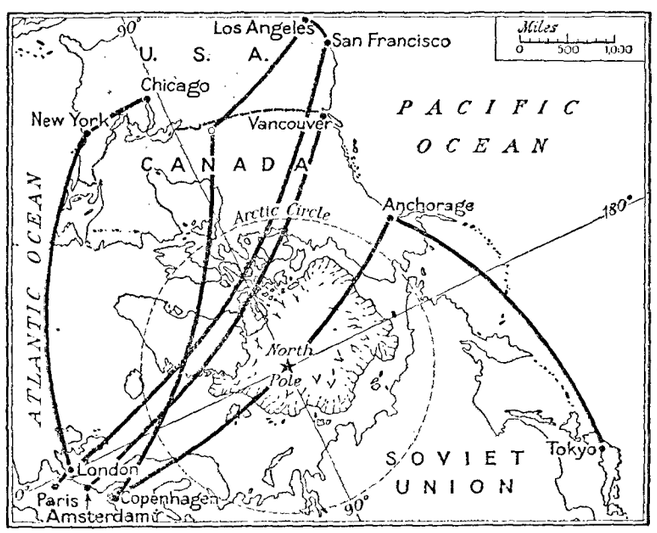
The other report, prepared by a Russian mission, takes the opposite view. Although it covers roughly the same ground, it envisages one massive factory which would achieve economies by centralising the production of the various heavy engineering plants. In the short run, the location of heavy engineering plant may depend primarily upon where the other heavy industrial plant for which they are intended to make the machinery, in the country's third five-year plan, is to be put. But in the longer run this poses a major question of principle for the Indian planning authorities who are normally inclined to favour dispersal to concentration wherever possible.

A second question, and a vital one because of India's balance of payments difficulties, is the kind of financial assistance that may be offered to help implement the recommendations. No doubt some sort of credit will be offered by the Russians, from Britain the Indian government would be most likely to welcome offers of participation in the equity of any new plants constructed in India by British

firms. The report also poses the question of the capacity of British plant manufacturers to fulfil such massive orders during India's second five-year plan without further delaying deliveries of plant for the heavy engineering industry in Britain.

The Offer from Euratom

ALL this week the Three Wise Men of Euratom have been in London discussing possible British participation in the scheme. They are already convinced that Western Europe should begin as soon as it can to install 3,000 megawatts of atomic electricity each year, about half the new plant required to keep pace with demand. Their sense of urgency has grown with the realisation that the only alternative source of energy is imported American coal which would make electricity generated from it cost more than 1d. a unit. The earliest British atomic power stations are designed to give electricity at only two-thirds of this cost. Active British co-operation could therefore mean a great deal to the speed with which the programme can be put in hand.



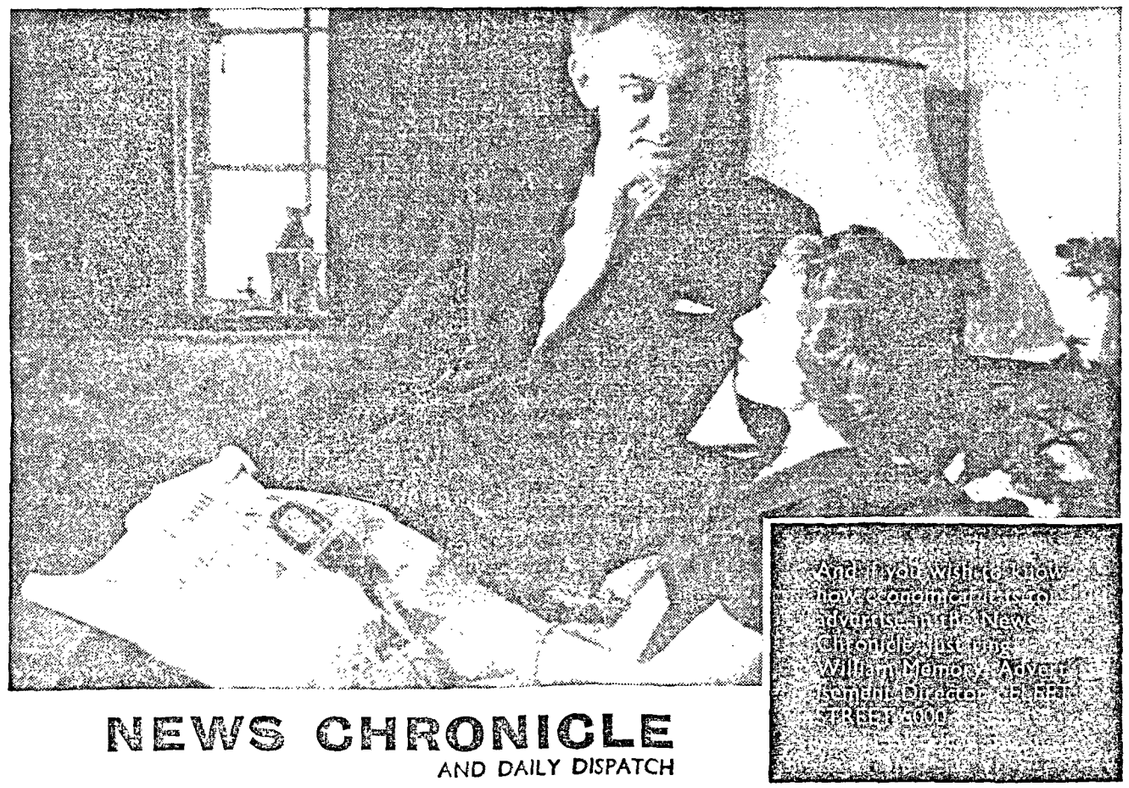
In return for this technical help, Britain is being offered the chance to try out types of atomic power stations not being built in this country. The Three Wise Men still have mental reservations about whether it is right to standardise, as Britain has done, on one basic type of atomic power station and are certain to suggest that Europe should give a trial, although probably on a smaller scale, to other designs. The most promising candidates are two American designs using enriched uranium, namely the boiling water and pressurised water reactors, and the sometimes overlooked Canadian development of a natural uranium reactor cooled by heavy water in place of the gas used by Calder Hall. A refusal by Britain to join Euratom would not at this stage affect the Three Wise Men's belief that a really big Calder type station should be built in Western Europe. But it would lay the area open to the full blast of American salesmanship, and as the size of the atomic programme holds out the prospect of more business, in blue prints if not in actual hardware, to British and American firms than at one time seemed possible, the effect on British industry is a factor in the British Government's decision.

Sterling for the Sudan

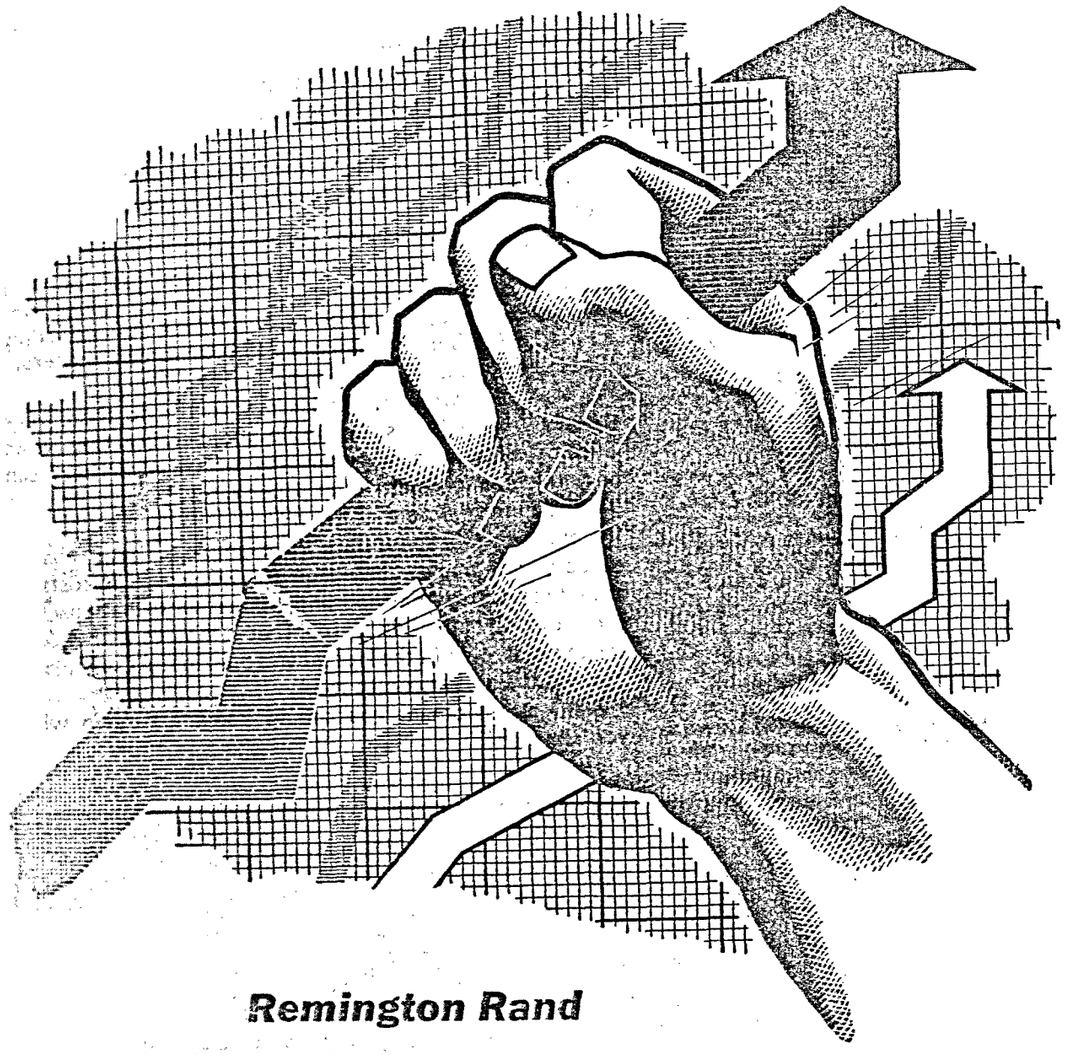
BRITAIN is considering making a substantial release from Egypt's blocked sterling balances—but not to Egypt. Since the Sudan became an independent republic at the beginning of 1956 it has been engaged in replacing Egyptian currency with its own, and it has requested that redemption shall in part be in foreign exchange. This demand is based on the fact that under the condominium the Sudan's earnings of foreign exchange, and especially its war-time earnings of sterling, accrued to the balances of Egypt. The amount of Egyptian currency in the Sudan that is due to be redeemed is now about £20 million, and Britain has been asked to release this sum from Egypt's sterling balances if Egypt

Flying Over the Pole

THE Scandinavian airline, SAS, which is jointly owned by Denmark, Norway and Sweden, has its headquarters farther north than those of other airlines and has therefore been the natural pioneer of civil flying through the Arctic circle. The map, gazing down at the North Pole, shows how an aircraft that flies over the flat top of the earth instead of all the way round its fat middle cuts as much as 2,000 miles off the journey between Europe and the east and west Pacific seaboards. Development of these routes has been held up until aircraft with sufficiently long range, and reliable radio communications across a region where nearness to the magnetic pole plays havoc with normal instruments could both be developed. Military interests in the Arctic have seen to the provision of radio stations; the arrival of the Douglas Seven Seas, and the even longer range Lockheed 1649, with which TWA hopes to fly non-stop from Los Angeles to London and Paris in at least one direction, have provided the aircraft. SAS could have avoided the zig-zag route to Tokyo via a refuelling stop at Anchorage on the service that started last weekend if the Soviet Union was prepared to let foreign airlines across its Northern territories. Negotiations are now going on between the British and American governments to complete arrangements for a polar route (shown on the map) between Western America and London. The SAS fare, incidentally is the same as for the longer route via India. The services shown as starting from Copenhagen are provided by SAS, and those between Vancouver and Amsterdam by Canadian Pacific Airlines.



Overheard in a West End flat.



"So you read the News Chronicle too!"

**The Independent Survey conducted by the Institute of Practitioners in Advertising.*

"Of course. Are you surprised?"
"Not really, I suppose. It just bears out what my advertising agent was telling me."
"And what was that?"
"That more and more women are reading the News Chronicle these days, particularly the more intelligent women."
"I'm flattered."
"No need to be. I'm not marrying you just for your looks, you know. But to get back to my advertising agent and the News Chronicle, he told me that according to the I.P.A.* Survey, it has 2,215,000 women readers."
"It sounds like a lot of women."
"It is a lot of women. You can advertise to them very cheaply in the News Chronicle too because the News Chronicle has an arrangement by which advertisers can have any size space at run of paper rates."
"What exactly does that mean?"
"Well, take this space here for example. That's what is called an 11" triple. Based on this survey all it costs an advertiser to reach a thousand women with that space in the News Chronicle is 3/11d. That compares with 4/6d in the Express, 4/7d in the Herald and 5/6d in the Daily Mail."
"Sounds like a bargain to me."
"Well, as a woman, you should know a bargain when you see one."

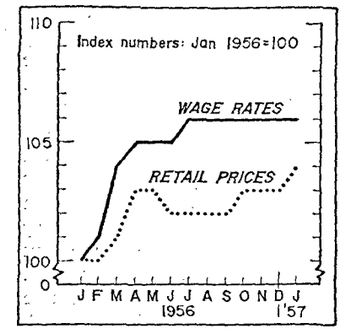
agrees to its doing so. Britain's answer is that it can make no commitment until it has seen the terms of Egypt's reply to the Sudan.

Trade Talks with New Zealand



FARMERS and the government in New Zealand are becoming increasingly anxious about the British market, their only major outlet for meat and dairy produce. Butter prices have fallen ; New Zealand butter is now fetching only about 260s. a cwt ex-store in Britain, 90s. below the guaranteed price to the farmer. Prices of chilled and frozen beef have also declined. If this setback were only temporary New Zealand would have little cause for concern. The dairy farmers have a sizeable reserve fund, built up from past surpluses, to tide them over periods of bad trade. Cheese is still fetching more than the guaranteed price ; mutton and lamb prices are holding up well and wool prices have risen sharply. The long-term prospect for butter and meat prices is not easily assessed. Will competition from other butter producers remain acute ? Will shipments of chilled beef from Argentina, which have made a remarkable recovery, increase still more ? The potentialities for increased production in Argentina are great, and a further fall in beef prices would in time probably depress mutton and lamb prices, too.

To discuss these prospects, and possible ways of meeting the marketing problems that it might face, the New Zealand government is sending a mission to Britain ; the date of departure has not yet been announced. Several forms of assistance might be suggested by New Zealand: the revival of the prewar quota restrictions on British imports of foreign meat, a tariff on foreign meat, a meat agreement such as Australia has with Britain, and an increase in the British preference on butter which, fixed at the specific rate of 15s. a cwt in 1932, has since lost much of its value. All such suggestions would present difficulties to the British Government, domestically or in its relations with other producing countries and with its obligations under the General Agreement on Tariffs and Trade. Unlike Australia, New Zealand does not appear to be keen to reduce the margin of preference that it grants on British goods, though it might revise its attitude if it felt that Britain was being less than sympathetic to its proposals. But the first step in the discussions is the joint examination of how bleak New Zealand's prospects for certain exports really are.

A New Index of Wages

A NEW index of weekly wage rates has been started by the Ministry of Labour based, like the retail price index, on 100 in January 1956. It replaces the old index based on 1947 but it introduces no change of concept: this new series still measures the average movements in minimum, or standard, wage rates paid to manual wage-earners (including shop assistants) in a representative selection of industries and services. But these now number 80 instead of 75 and the separate index numbers for these various industries are combined together or "weighted" according to each industry's contribution to the total wages bill in October 1955 instead of in 1946.

The new index, therefore, is a better one in that it has a somewhat wider scope and a more up-to-date starting point. But its introduction entails no re-thinking about the course of wage rates in recent months. The new and the old series can be compared over last year and within the degree of accuracy with which these figures are presented — to the nearest whole number—they followed a similar course. Each series finished the year 6 per cent higher than it started and each showed juveniles to have done rather better than other workers. In January the new index was unchanged but, as the chart shows, wage rates were still ahead of prices compared with twelve months before.

Wage rates are what the trade unions bargain about, but the men are more concerned with the size of their take-home packets after overtime and any bonuses have been added in. In the early months of last year earnings rose slightly less than rates: the statistical evidence of what has happened since then must await the results of the all-too-infrequent surveys of earnings, those for October 1956 being promised later this month.

Bargains in Grain

To some people in the grain trade Suez has had a painful aftermath ; business in feed grains is particularly depressed. The post-Suez rise in freight rates tempted many consumers to buy well ahead, and some shippers booked freight for grain that they had not sold. Until consumers had worked off their stocks demand was bound to be slack, and in feed grains that slackening has been aggravated by the mild winter which has reduced the consumption of feeding-stuffs. Recently freight rates have eased and are, as buyers see them, still headed downwards. The result is that a good deal of grain now on the way to Europe has yet to be sold.

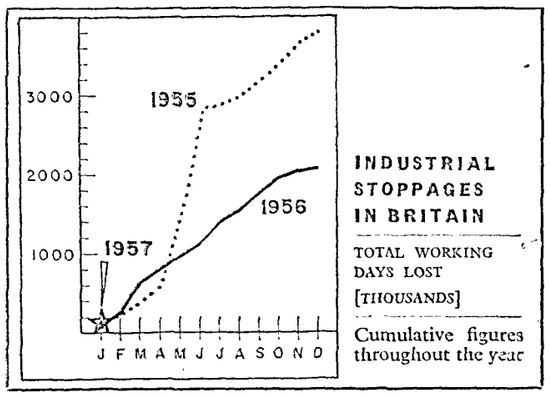
Some shippers are putting their barley into store and selling barley futures in London as a hedge. Business in the London futures market, the only feed grain market that can protect users against changes in freight rates, has set a new record. But storage space is short and some shippers are having to accept low prices. Canadian No. 2 feed barley was sold this week for £24 a ton, about £3 below the current replacement price. Canadian barley is also facing strong competition from American and Argentine feed grains, but cheap offers of Russian barley have diminished. A spell of cold weather, bringing with it the prospect of a bigger consumption of feeding-stuffs, would be welcomed by many traders.

Titanium Sells Slowly

IT is taking as long to develop a steady market for titanium in Britain as it did in the United States—and military aircraft cuts are not helping. The reduction plant that Imperial Chemical Industries brought into commission at Wilton some 18 months ago, which had an initial capacity of 1,500 tons a year, has been kept in production "at a reasonably economic level," because the Ministry of Supply is under contract to buy up to 75 per cent of its first five years' output, and has been stockpiling crude titanium. But the processing of raw titanium granules into forged and rolled products, which is carried out by the company's Metals Division at Witton, Birmingham, is entirely an ICI venture. So far ICI has sold about 300-400 tons: but demand for these wrought products has not been as high as was hoped, and has moreover been fluctuating widely and suddenly during the last year, disorganising output and employment at the small but very costly melting plant.

This hectic fluctuation in orders occurs primarily because ICI, like other titanium producers elsewhere in the world, sells the great bulk of its output to one customer industry—aircraft. Few other industries can take enough advantage of titanium's qualities of lightness, strength, and resistance to corrosion and moderate heat to be able to afford about £4-£5 10s.a lb for wrought titanium products. The raw titanium ICI sells from Wilton is sold more cheaply than any produced in the United States (its sodium reduction process, indeed, should when operated to capacity be cheaper than the conventional Kroll reduction with magnesium). But output of mill products here is only about 400 tons a year, no more than is made in the United States in a month; and though ICI cut the prices of its wrought products by about 10 per cent last week, they are still dearer than the American. The British company hopes to reach parity with American prices by 1959-60—and "would expect that the price of ICI titanium products generally might, by 1960, be something like half of what they are today."

Record Consumption of Wool



THE persistent rise in wool prices this season, in face of a larger clip, points clearly to a growth in world consumption. The rate of growth is shown in the latest figures published by the Commonwealth Economic Committee. Consumption of virgin wool in the fourth quarter of last year in the eleven countries that together account for about two-thirds of the world total is provisionally estimated at 491 million lb (clean weight); that was nine per cent higher than in the fourth quarter of 1955, and fully maintained the rate of increase shown in the three preceding quarters. For the whole year consumption in these countries is put at 1,835 million lb, nine per cent higher than in 1955. The Japanese industry, which has been buying heavily in world markets, showed the largest gains, its consumption rising by 41 per cent last year to a record 171 million lb. Britain, which remains the largest consumer, was the only major industry that failed to show an increase; it used 475 million lb, nearly 45 million lb below the 1950 peak. The United States, the next largest, increased its consumption by six per cent to 408 million lb, an achievement that scarcely lends weight to its successful claim for a higher tariff on imported wool goods. Consumption in France rose by 12 per cent to a postwar peak of 275 million lb and West Germany's rose by five per cent to a record 176 million lb. With consumption in the rest of the world, including Communist countries, estimated at 1,000 million lb, eight per cent more than in 1955, the world total reached a new record of 2,835 million lb.

The advance in wool prices now seems to have been checked, and medium crossbred wools have eased slightly. But no radical fall in prices is in sight, and the Commonwealth producers can count on bigger wool cheques than in the past season. In the first seven months (July to January) of the season Australia sold 776 million lb, 10 per cent more than in the same period of 1955-56, but its receipts went up by 40 per cent to £198 million. New Zealand sold 135 million lb in the first six months of the season, six per cent more than in the same period of 1955-56, and its receipts rose by 20 per cent to £29.5 million.

Sharp Fall in Wolfram

THE market in wolfram (tungsten ore) is undergoing one of its periodic bouts of instability. The market is thin; hence a moderate change in supply or demand has an immoderate effect on prices. During the second half of last year wolfram prices gradually declined by about 40s. to 220s.-225s. a unit (of 22.4 lb) cif; since then prices have fallen sharply, and business has recently been done between 160s.-170s. a unit. The main reason is that free supplies have increased. In the second half of last year a number of contracts for deliveries to the American strategic stock expired. Some high-cost mines which could only operate at the premium prices paid by the American authorities went out of production, but others, such as the Bolivian mines, were obliged to sell on the open market, and this extra tonnage has recently made itself felt. Further contracts with the American government are due to expire this year.

In addition some West European demand for wolfram has been met by sales of ferro-tungsten—the concentrated form of tungsten used in the manufacture of high-speed steel and other cutting tools—from Communist countries; and consumers in Britain, who in the past were able to draw on the Board of Trade's surplus trading stock of wolfram, are now obtaining material released from its strategic stock. The fall in prices has prompted the South Korean government to suspend its auctions of tungsten ore in Korea and New York. Some small mines in other countries have already been forced out of production and more are expected to follow suit.

SHORTER NOTES

The last day for registering the first batch of trade practices "called up" under last year's Restrictive Trade Practices Act was last Thursday, February 28th. The order specifying which arrangements were liable for registration by then was made last August. Although industry was given three months from November 30th to furnish details to the Registrar of Restrictive Trading Agreements, the flow of registrations was very small until the last week or so.

★

The South African Finance Minister has announced the immediate withdrawal of the restrictions on the transfer of funds out of South Africa imposed about a year ago. They were imposed to protect the South African economy after interest rates in this country had been raised sharply.

★

The capital reorganisation scheme of Northern Assurance became operative this week and the terms of the proposed rights issue were fixed. The company will raise about £3,850,000 by offering 1,465,000 £1 ordinary shares at 52s. 6d. each, one fifth of the issue—293,000 shares—being offered to holders of the old participating preference shares. The ratios are approximately that 4.37 new ordinary shares will be offered to the holder of every one £7 10s. old preference share and 2.93 new ordinary shares to the holder of every one £10 (£1 paid) old ordinary share. Fractions will go into the excess share pools.

★

The Austin 55 unveiled this week is a logical development of the Austin 50. The rear end has been re-modelled so that the rear edge of the car's silhouette no longer gives the appearance of being snubbed-in; and access to the boot is no longer obstructed by a vertical wall carrying the number plate and lights. The rear axle ratio is changed from 4.875 to 1 to 4.3 to 1, to give better fuel economy at expense of top-gear performance, though the numerically higher ratio is available with the overdrive as an optional extra.

★

In an interim report the directors of Triplex Safety Glass tell shareholders: (1) that the troubles of the motor industry will have repercussions on this year's profits, which will not reach last year's record; (2) that the company has been spreading its risks by expanding into the safety glass side of the aircraft and television industries; (3) that the expansion schemes launched one or two years ago will be needed in full, and (4) that there is no ground for pessimism. The four-page report for the half year ended December 31st gives no figure of profits or turnover.

Company Notes

MONSANTO CHEMICALS. The 5s. ordinary shares of Monsanto Chemicals, two-thirds of which are held by the American parent, have persistently offered a yield below that of the general run of leading equities. The company is young and growing and it now proposes to finance a further stage of its growth, the erection of a £8½ million petrochemical plant next door to the Esso refinery at Fawley. Just over £2 million will come from a "rights" issue of ordinary shares, another £3 million by an issue of loan capital, the remainder from retained profits.

The "rights" issue, which will not be underwritten, is one new 5s. share at 7s. 6d. for every two held, the American parent subscribing for its proportion. This is a most attractive offer, for the existing shares stand at 23s.; it will bring in £2,025,000. A 50 per cent free scrip issue will follow the "rights" issue and on the ordinary capital thus doubled the directors propose to declare a dividend of 13½ per cent. The 1956 dividend of 22½ per cent on the old capital is equivalent to 11¼ per cent on the new. Thus the 5s. units "ex all" have been put on a yield basis of £5 1s. per cent; the existing units currently yield £4 18s. per cent.

The new plant at Fawley will make a big addition to Monsanto's productive capacity, but its contribution to earnings is hidden in the future. In the meanwhile, the company's preliminary trading results for 1956 are not exciting. Sales rose by 4 per cent, from £13,499,986 to £14,034,947, but trading profits, squeezed between increased costs and lower selling prices, fell from £2,818,568 to £2,596,773 and net profits from £1,062,138 to £884,458. The maintained ordinary dividend of 22½ per cent absorbed £349,313. To buy the company's equity on its indicated yield is to buy still on growth potentialities and on a good earnings yield—not on current dividends.

★

LEWIS'S INVESTMENT TRUST AND HARRODS. The bigger companies in the retail trade have in recent years spent heavily on capital account, extending and modernising their stores. The department stores as well as the multiples have been big investors in bricks and mortar and though their programmes are not yet complete some return on their investment is making its appearance in profit and loss accounts.

Last year the department stores were hit less hard than the multiples by hire purchase restrictions but, as with other retailers, their costs were rising. Good—perhaps surprisingly good—is the adjective that must be awarded to the trading results of the Lewis Investment Trust group and of Harrods. Before tax the gross profits of Harrods have risen by nearly 14 per cent; those of Lewis's Investment Trust by 7 per cent and those of its two subsidiaries, Lewis's and Selfridges, by 10 per cent and 9 per cent respectively.

Earnings:	Years to end January, 1956 £	1957 £
Lewis's Investment Trust		
Gross profit	4,828,355	5,167,606
Net profit	1,869,109	2,002,077
Ordinary dividends	525,870	558,726
Ordinary dividends (per cent)	*16*	*17*
Lewis's		
Gross profit	2,601,156	2,856,921
Net profit	1,271,018	1,347,020
Ordinary dividends	71,875	71,875
Selfridges		
Gross profit	1,111,680	1,212,370
Net profit	510,765	538,991
Ordinary dividends	230,000	230,000
Harrods		
Gross profit	2,163,396	2,462,798
Net profit	979,788	1,049,361
Ordinary dividends (per cent)	*17½*	*17½*

The directors of Harrods have left the ordinary dividend unchanged at 17½ per cent, so that at the current price of 52s. 3d. the £1 stock units yield £6 14s. per cent. The directors of Lewis's Investment Trust have been bolder. They have consolidated the 1955-56 centenary bonus of 2½ per cent into the dividend and the full year's payment has been raised from 16 to 17 per cent. On that dividend the 4s. units yield £4 16s. per cent at 14s. 1½d.

★

HOOVER. A fall in profits before tax from £3,838,233 to £2,790,077 looks alarming. Yet the preliminary statement of Hoover for the year to December 31st in which these figures appear is on closer examination encouraging. An interim report in July showed that profits in the first six months of the year came to £1,028,000, compared with £2,230,000 in the first six months of 1955. Thus profits earned in the last six months of 1956 came to £1,762,000, a higher figure than the £1,608,000 earned in the corresponding period of 1955. The hire purchase restrictions may have lost some of their bite on the sales of domestic appliances.

In view of this slight recovery in earning power it is not surprising that the directors, in spite of the decline in the full year's net profits from £2,005,069 to £1,225,082, have decided to leave the dividend on the 5s. ordinary and 5s. "A" ordinary shares unchanged at 2s. 6d. a share (or 50 per cent). These dividends absorb just over £700,000. After these results were published the 5s. "A" ordinary shares jumped from 26s. 3d. to 30s. 4½d., to yield 8¼ per cent.

★

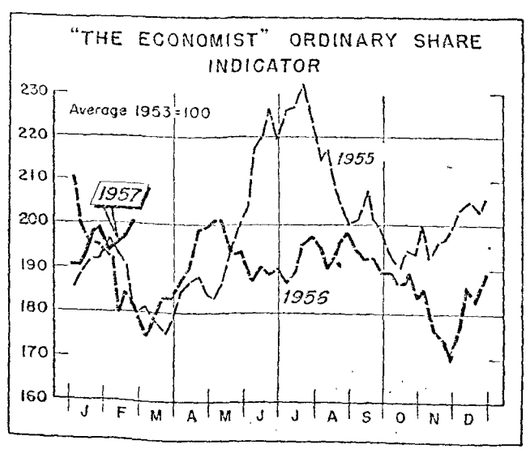
ILFORD. The market in photographic materials is both growing and competitive. In the year to October 31st Ilford's sales rose to a record level while its trading profits declined slightly—from £1,782,141 to £1,755,798. But to the repeated ordinary dividend of 15 per cent has been added a bonus of 2½ per cent representing "a distribution of part of the previous taxation provision now released."

Ilford's firm capital commitments at the end of the financial year came to over £450,000, but the chairman, Mr James Philipps, points out that much more, coming from accumulated liquid resources and ploughed back profits, will be spent in the next few years. In October the company made an abortive bid for another manufacturer of photographic papers, Ozalid. That was a sign that expansion was in the air and Mr Philipps's statement now gives some indication of the scope of the development plans. They include further penetration into the market in the United States and in this country the concentration of part of the group's productive capacity now scattered in a number of small factories on a newly acquired site in Basildon. This particular operation will be completed by 1960; it was decided upon because of the "difficulty of expanding production in the old premises through lack of space." With these plans in mind it is not surprising that the chairman of a company whose most important export market is Western Europe expresses hope that Britain will enter the proposed European common market.

★

BRITISH HOME STORES. On January 5th, British Home Stores had a cash balance of £2,471,459 and fixed assets worth at cost £3,181,193. It also had capital commitments of £1,711,000, as the group is still busy opening new stores and extending its present ones. The size of that programme may be one reason why the directors have been content to leave the ordinary dividend unchanged at 33⅓ per cent after a year which witnessed another record in sales and an advance in trading profits from £1,590,791 to £1,652,455. This dividend, which absorbs £285,484 from a net profit of £701,194, might look small if it were expressed as a return on the present value of the group's sites and shop properties. It is perhaps these undisclosed asset values as much as the prospect of better earnings as more stores are opened which explains why the 1s. ordinary shares command a price of 7s. 3d. xd and yield only £4 12s. per cent.

LONDON STOCK EXCHANGE



First dealings:	Feb. 13	Feb. 27	Mar. 13
Last dealings:	Feb. 26	Mar. 12	Mar. 26
Account Day:	Mar. 5	Mar. 19	Apr. 2

FOLLOWING the further fall in the Treasury bill rate, prices of long-dated and irredeemable Government securities which had been drifting downwards became buoyant and gains ranged up to ⅛ in 3½ per cent War Loan and ⅜ in 3 per cent Transport 1978/88. *The Economist* indicator of industrial ordinary shares rose 3.8 over the week to 200.6 and the new account opened on Wednesday with many bright features. The ACV loan stock started at 2½ premium on Monday and touched 3 premium at one time. The Bowater convertible loan stock, in which dealings started on Wednesday, touched 9½ premium before easing to 7¾ premium.

Atomic power shares advanced again; Clarke Chapman gained 5s. 7½d. to 14cs. 7½d., Babcock and Wilcox rose 1s. 6d. to 81s. 6d. and C. A. Parsons were 2s. 9d. higher at 65s. Decca recovered to 28s. 7½d. xr and the new "A" shares rose 1s. 1½d. to 6s. 3d. premium on Wednesday. Hoover leapt up on Thursday. Stores were active, Harrods and GUS "A" being respectively 2s. 9d. and 2s. 1½d. higher on balance while Whiteley jumped 3s. 3d. to 29s. 6d. and Steinberg 1s. 10½d. to 6s. 3d. on Wednesday. Morrisons Holdings rose to 10s. following the bid by GUS. Among textiles, R. P. Lawson jumped 11s. on the bid by Lancashire Cotton, while Wolsey fell 4s. 6d. to 27s. 4½d. xd on the disappointing results. Motors were very firm, Rover gaining 1s. to 15s. 7½d., while Ford rose to 34s. 10½d. Steel shares improved with the new account.

Oils were generally better, due to the more favourable political situation, but Lobitos lost 7½d. to 19s. 3d. on the sale of part of its Peruvian concession. Central Mining, up 9s. 6d. at 62s. 6d., and Sub Nigel with a gain of 1s. to 17s. 3d. were outstanding among gold mines. Rubbers attracted support and tea shares were often higher. On the bid by Dekhari for Balijan and Rajah Alli, their prices improved.

(1) The Alexandria spot quotations for *Karnak and Ashmouni* cotton have been replaced by the current month futures quotation at Alexandria. (2) Figures up to July, 1953, relate to delivered prices and subsequently to ex-warehouse prices of U.C. electrolytic copper; from May, 1955, onwards the proportion of copper sold at fixed prices has been taken into account. (3) The interim index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the London and Cambridge Economic Service. (4) New series based on January 17, 1956=100. (5) Surveys are made twice a year; annual figures relate to October survey. (6) Revised series based on Liverpool spot market prices, as from July 1, 1954. (7) Latest figures which are for April, 1956. (8) Figures for October, 1955. (9) Revised figures for Jan. 29th: all items 97, food 100·7 and fibres 92·7.

THE MONEY MARKET

THE fall in the Treasury bill rate was resumed at the tender on Friday of last week. The discount market raised its bid by the large step of 9d., to £98 19s. 3d. per cent, and succeeded in raising the allotment rates on the common tender from 10 to 30 per cent; as in previous weeks, individual houses succeeded in raising their total allotments by submitting additional bids at higher prices. Total applications rose by £59.3 million to £407.3 million; the offer of £200 million was fully allotted—whereas at the previous tender only £170 million was allotted of the offer of £190 million. The average rate of discount last week dropped by 2s. 6½d. per cent (notably less than the market's rate) to £4 2s. 11½d. per cent. This was within 3d. of the rate when Bank rate was still at 4½ per cent.

There has been neither marked stringency nor undue ease in credit conditions. On the first two days of this week market supplies of credit were easily adequate for demands, though there was no surplus of funds; on Wednesday, when repayments to the Bank were again due, conditions tightened, and the Bank gave small special help.

Throughout the week the clearing banks have been lending to the market on the new flexible basis; loans have ranged from the minimum of 3½ per cent to 4 per cent. Dealings in May maturities have generally been at $4\frac{1}{16}$–$\frac{3}{32}$ per cent.

We are all individuals

but some are more individual than others

That's just as true of business houses as it is of people. Martins Bank is a case in point, for it's a bank with a definite personality of its own. Although there are over 600 branches, Martins' system of decentralization—with District Offices acting as local Head Offices—fosters particularly close and friendly relations with its customers and also makes for quick decisions.

What blows up must come down

And what blew up in this instance was an autoclave. Installed in a chemical works, it took the roof off the building, and flung 235 lb. of metal sixty yards with fatal effect.

What Vulcan say about it

The foregoing proves, if proof be needed, that danger can lurk undetected in every kind of factory plant. Boilers, lifts, hoists, cranes—all are liable to accident.

That's why regular and competent inspection by specialist engineers is essential. And Vulcan's Engineer-Surveyors are the experts. It's their job to detect the defects, to ferret out the flaws, to point out whatsoever is wrong and how to put it right. Always remember: safety first is Vulcan first.

FREE For news of industrial accidents and ways to avoid them, ask us now for 'Vulcan'—a quarterly journal for Power Users. Please write to Dept. 17.

RECORD SALES BUT LOWER PROFIT MARGIN

PLANT EXTENSIONS TO MEET INCREASING DEMAND

PROGRESS IN OVERSEA MARKETS

THE HONOURABLE JAMES P. PHILIPPS ON IMPORTANCE OF RESEARCH

The Annual General Meeting of Ilford Limited will be held on March 21st at the Ilford Gallery, 106, 107, High Holborn, London, W.C.

The following is the address by the Chairman, The Honourable James P. Philipps, copies of which have been circulated for the convenience of shareholders with the report and accounts for the year ended October 31, 1956:

Ladies and Gentlemen,

During the year under review we again increased our sales to a record figure, although the rate of increase this time was lower than in some recent years. I told you last March that our profit margin during 1956 was likely to be smaller and this has proved to be the case. Trading was more difficult, both in the earlier months and again in the summer when our home sales in the amateur section would have been better had it not been for the exceptionally bad holiday weather. In all the circumstances I think you will agree it is satisfactory that profits, before charging taxation, came out substantially the same as in 1955.

DIVIDEND AND SPECIAL BONUS

It will be seen from the Profit and Loss Account that whilst the Parent Company's Aggregate Net Profit before taxation is £13,133 higher, and the Net Profit for the year after taxation is £37,490 lower than in the previous year, the consolidated figures are £25,531 lower and £79,309 lower respectively. Your Directors are, therefore, not recommending any change in the rate of Ordinary Dividend.

You will, however, be glad to hear that a substantial measure of agreement has at last been reached on the Company's tax computations of earlier years. This, together with the establishment of the Industrial Buildings Allowances over a period of some years, has now made possible the release from our parent Company's provisions for taxation of the sum of £150,000 which we have transferred to the credit of Profit and Loss Account.

As part of this £150,000 could have been distributed to Ordinary shareholders in earlier years, the Directors are now recommending the distribution out of this sum of a special cash bonus at the rate of 2½ per cent less Income Tax on the Issued Ordinary share capital. While it is shown in the Profit Appropriation Account that this special bonus will cost the Company £48,875 net, it must be borne in mind that provision has also had to be made for Distribution Profits Tax payable on the gross amount of this bonus, so that the estimated total cost to the Company of paying this bonus is £71,825.

Further, taking into account the increases in the rates of Profits Tax in November, 1955, and April, 1956, a provision for this tax increased by £35,500 would have been necessary this time even should no increased distribution have been recommended.

PURCHASE TAX

I have on a number of occasions commented on the adverse effects of the Purchase Tax with its unequal and unfair incidence on certain industries and commodities. I hope the opportunity has at last arrived for the Chancellor to abolish it altogether or at least to replace it with a broadly based sales tax on modern lines.

CAPITAL EXPENDITURE PROGRAMME

Although many of our plans were originally based on the assumption that the Investment Allowances were going to be continued for a reasonably long period (and I sincerely hope the Chancellor will see his way to restore them in the very near future), we have, as usual, worked to keep our plant and premises up to a high standard. The office block at Ilford, which I mentioned in my last Address, is nearing completion and will provide much better conditions for our Head Office staff. The new laboratories at Brentwood are progressing well and will be occupied by the middle of the year. Still further extensions to our film production plant at Brentwood have been started to meet the increasing demands for film.

In addition, we have acquired a large site at the new town of Basildon, Essex, which is conveniently situated in relation to our Brentwood and Ilford Works. It is our intention to concentrate there the production now carried on in a number of smaller factories in the London area. This should ultimately lead to considerable economies and simplify administration. The decision to make this move was dictated by the difficulty of expanding production in our old premises through lack of space. The capital expenditure involved is likely to be considerable but it will be offset to some extent by the sale of the older properties. It is hoped that the first section will be moved in two years' time, and that the operation will be completed by 1960. The work to be undertaken at Basildon is mainly in connection with the light engineering and chemical sections of our business, but it is also intended to transfer the departments processing colour film and making colour prints from their present crowded sites where further expansion will soon become physically impossible.

You will see in the notes on the Balance Sheet that firm capital commitments at the time of closing the books amounted to £457,749, but it will be appreciated that the work now commenced or planned will entail expenditure over a period of years greatly exceeding this figure, though it should be possible to finance it largely from existing liquid resources and profits ploughed back.

ENTRY INTO U.S. MARKET

I told you last year that we had formed a sales company—Ilford Inc.—in the United States to handle the sales of our products in that country. We have made a satisfactory start although, as anticipated, expenditure has been high in the early stages and our operations up to October 31, 1956, resulted in a loss which is reflected, of course, in the Profit and Loss Account in the reduced excess of the Consolidated Aggregate Profit over that of the Parent Company compared with previous years. We have, however, confidence in the management of Ilford Inc, and believe that in a year or two the business will be on a remunerative basis. It is not possible to obtain a foothold in this highly competitive market without a considerable outlay of money. In the other main North American market, Canada, our sales continue to make good progress.

WIDE RANGE OF PRODUCTS

We have during the year continued our policy of developing equipment for the Photofinishing trade and for Industrial Photography. I think it is true to say that we have become recognised as leaders in the field of photofinishing equipment of advanced design, and particularly in automatic printers. We now have in production an excellent line of both Ilford and Kennington & Bourlet machines. The latter company has proved a most successful and remunerative acquisition.

Last year I called attention to the advantages offered by our Azoflex process for the reproduction of documents in commercial and drawing offices. I am pleased to tell you that the expansion of the sales of this division has continued.

As you know, X-ray film is one of our important lines of production. As people are becoming more radiation-conscious, the advantages are being widely recognised of an outstandingly fast X-ray film such as our "Red Seal" type, which makes it unnecessary to expose the patient to so large a dose of X-rays. "Red Seal" film, especially when used in conjunction with a fast screen such as our HV screen, can make a useful contribution to reducing the hazards of radiation. The HV intensifying screen which uses lead barium sulphate as the phosphor was the invention of our late Research Director, Mr F. F. Renwick. The manufacture of this screen is now carried on under licence abroad as well as in England. In

connection with X-ray film a useful saving in dollars could be effected if Government Departments would consider favouring or recommending the use of film made from home-produced film base. The base is a substantial item in the cost of the finished film. Ilford films of all types are made on base produced in the United Kingdom and so are without the large dollar element of competing products.

VALUE OF RESEARCH

Although the importance of research is now becoming generally recognised throughout industry, it has of course been an essential part of the photographic industry since its earliest days. It is only by the work of our laboratories that we are able to advance the quality of our products to keep them in the forefront of world markets and to develop new fields such as colour photography. The new laboratory building at Brentwood, which I have already mentioned, is part of a plan to modernise our laboratories and to allow for expansion as the old buildings have in the past few years become inadequate for the increased work necessary for our expanding business.

ATOMIC ENERGY

At this time when atomic energy is much in the news I am frequently asked if there is likely to be a rapidly increasing demand for our nuclear plates in the near future. Whilst our nuclear research emulsions have a world-wide reputation, their use, which is still increasing, is generally confined to Universities and other establishments where they are playing an important part in fundamental research into the secrets of the atomic nucleus. They do not, however, at present seem likely to find more than minor applications in the practical utilisation of atomic energy.

CUSTOMS UNION

In common with other manufacturers we have given a good deal of consideration to the probable effect on the Company's trading of the proposed European Customs Union should this come into being in the next few years. We have come to the conclusion that if Britain enters this Customs Union it could benefit the Company substantially. A large proportion of our business is abroad, so any lowering of barriers to trade should help us to expand our markets. At the present time the countries of Western Europe are a most important export market for Ilford goods. On the other hand, if Britain remained outside the Customs Union while Germany and Belgium were in it, we should almost inevitably lose our European market.

THE OUTLOOK

In the conditions following the Middle East crisis it is most difficult to make any useful forecast of prospects for 1957. The reduction in supplies of fuel oil has caused inconvenience in our factories which are in almost all cases oil-fired, but by strict economy we have managed so far to maintain full production. The rationing of petrol makes the distribution of our goods in the home market difficult and we shall not be able to give our customers as good a service as in more normal times. Nor can our representatives call on our customers as frequently to take orders or give technical aid, and this we very much regret, but I feel sure our temporary difficulties will be understood. Our normal service will be restored as soon as conditions permit. Meanwhile, I should like to thank our customers for the way in which they are co-operating by ordering in larger quantities at less frequent intervals.

Pleasure motoring is naturally being greatly restricted by petrol rationing at present. If this rationing is continued into the summer months, so that normal recreational activities are substantially reduced, it may well have an adverse effect on the amount of picture making done by the public.

I would like to remind you again that you can help your Company and the country by using and recommending our products wherever possible.

TRIBUTE TO STAFF AND EMPLOYEES

In conclusion, I feel sure you would wish me to thank on your behalf all our staff and employees, both at home and overseas, for the part they have played in making the year under review again a record one both in volume of production and in sales turnover.

VOSPER LIMITED
(Shipbuilders and Engineers)

MR OWEN R. GUARD'S REVIEW OF ACTIVITIES

The twentieth Annual General Meeting of Vosper Limited will be held on March 7th in Portsmouth.

The following is an extract from the circulated statement of the chairman, Mr Owen R. Guard: During the year under review we have earned a net profit of £103,199, after writing down the value of the remaining trawler by a further £10,000. The trawler has operated at a slightly increased profit.

Your Directors recommend a Dividend of 15 per cent and the allocation of the sum of £50,000 to a General Reserve Account.

Work for our two shipyards still continues at a moderately satisfactory level and some interesting new contracts have been obtained during the course of the past year.

In the Portchester Shipyard constructional work is mainly for the Service Departments, much of it being of a prototype nature constituting specialised development work in which we have become increasingly occupied during recent years.

We continue to be well employed in the construction of welded tanks in aluminium and steel for a wide number of uses.

Recent public statements lead to the conclusion that a considerable effort will be made to reduce defence expenditure. The exact effect on this Company is difficult to forecast, but, by virtue of our concentration on research and development, there seems at least to be a good possibility that these facilities will continue to be adequately employed.

We are already associated in projects involving novel propulsion machinery developing very high power outputs for low weight. So rapid have been the developments in the field of power generation that but little imagination is required to see that there may be shortly available for installation in our types of craft units capable of producing very high powers indeed. In all such cases, however, there is a considerable problem presented by propulsion and it is here that our Cavitation Tunnel, which has been specially designed to study the high-speed problems, will be of outstanding value. It is already employed on valuable research contracts.

The anti-rolling devices developed more particularly for small craft are attaining success in operation and the future in this field is most promising.

MITCHELL COTTS & COMPANY

RECORD RESULTS

The Thirty-seventh Ordinary General Meeting of Mitchell Cotts & Company Limited was held on February 22nd in London.

Mr H. C. Drayton, the chairman, presided, and in the course of his speech said:

For the year under review the combined gross profits were £2,289,000, as compared with a figure for the previous year of £1,809,000. After providing for income tax due in this country and reserve for future taxation on overseas profits and providing £295,000 for writing down interests in Egypt and Saudi Arabia, we are left with a consolidated net profit of £702,000, as against £675,000. We have paid a dividend of 25 per cent on the Ordinary shares and after deducting that there will be a sum of £1,995,000 to be carried forward, as against £1,575,000 brought in.

The profits under review constitute a record, but shareholders must not expect a record profit every year. Ours is a business which requires a great deal of thought and planning two or three years ahead, and therefore profits must be taken over a period and not looked at from the narrow angle of one year.

CONSOLIDATED BALANCE-SHEET

An item in the balance-sheet to which I must draw your attention is that our stocks and work in progress have gone up from £6,009,000 to £8,191,000 and our debtors from £5,793,000 to £6,899,000. These increases fall under two headings. The first is the increased capital required to finance our engineering and manufacturing concerns and the increase in the expansion of trade which they are undertaking. Under the second heading we have the new acquisitions made during the year, one being the buying out of our partner in the Pyrethrum Extract Corporation, which now becomes a subsidiary of ours in East Africa. Debtors and work in progress are in respect of our Reinforcing Steel Company in Canada and generally to the increased stocks we have to carry for our expanding trade. London itself, where our produce department has increased its turnover, happened at the end of the year to have more than the usual amount of stock which was unsold.

Our exports from this country for the year were £10,800,000, a figure of which we are particularly proud and compares with £6,250,000 for 1954 and £7,100,000 for 1955. We do not expect these export figures to reach those proportions this year as you will realise that the Suez Canal has made some difference to our export business.

The interests of your Company extend throughout the whole of Africa, with the exception of the West Coast, certain parts of the Middle East, Canada, the United States of America, Hongkong and Ceylon.

Although seven months of our current year have gone and we know roughly our trading profits, I cannot give you an actual estimate as you will realise that carrying £8 million stocks and work in progress, any variation up and down in that valuation can make quite a considerable difference. However, when we come to present the accounts for the year ended June, 1957, shareholders will not be disappointed with the results of that year.

The report was adopted.

STATE BANK OF INDIA

GOVERNMENT OBSERVE ASSURANCE OF NON-INTERFERENCE

DEPOSITS STEADILY RISING

MR H. V. R. IENGAR ON HELP FOR INDUSTRY

The second annual general meeting of the State Bank of India was held on February 28th at Bombay.

The following is the statement by the Chairman, Mr H. V. R. Iengar:

I have much pleasure in welcoming you to the second annual general meeting of the State Bank of India. When Dr Matthai addressed the shareholders at the meeting held in February, 1956, the report which he presented covered a period of only six months, viz., from July 1, 1955, when the Imperial Bank of India was converted to the State Bank of India, to December 31st, 1955. The report which has been circulated to the shareholders for discussion today covers a whole year's working of the Bank in 1956 and provides a fuller opportunity than my predecessor had for considering to what extent, in its actual functioning, the Bank is fulfilling the purposes for which it was nationalised.

NO DISCRIMINATION

When it was decided that the Government of India should take up the effective ownership and control of the Imperial Bank of India, several voices were raised against the step, principally on the ground that the role of this great institution, which has played so dominant a part in the field of commercial banking in the country, would be somehow distorted by the intervention of the Government. Little comfort was taken from the assurance that the Government would not interfere in its day-to-day operations and that in fact it would operate on sound commercial lines with due regard to public interest. Immediately after the announcement about the Government of India taking over the controlling interest in the Bank, the volume of deposits decreased, possibly by transfer to other Scheduled Banks.

The working of the Bank since nationalisation has made it clear that the assurance given by the Government and embodied in the State Bank of India Act is being scrupulously observed. There has been no interference whatever by the State in the day-to-day operations of the Bank. Certain State enterprises have applied to the Bank for advances and all these have been accepted in full but on normal commercial terms. No discrimination in favour of such enterprises, such as, for instance, in the rates of interest, has been asked for. It would be relevant to point out in this connection that the sanction of advances to State enterprises has not restricted in range or volume the sanction of advances to enterprises in the private sector. On the contrary, consistently with the rising tempo of economic activity, our advances to the private sector of commerce and industry have increased very substantially from Rs. 72 crores in December 1955 to approximately Rs. 100 crores in December 1956.

APPREHENSIONS UNJUSTIFIED

I think the public has fully realised that the apprehensions expressed at the time of announcement of the taking over of the ownership of the Imperial Bank of India by the State are unjustified. The consequence of it has been that our deposits have been steadily rising. As stated in the report the increase in deposits during 1956 was 8.8 per cent against 7.8 per cent in the case of other Scheduled Banks. A perusal of the mere percentage increases does not, however, give a full picture of the actual developments that have taken place.

During 1956, on account of the tightness of the money market, Scheduled Banks generally raised rates of interest on deposits, in many cases quite substantially. The State Bank maintained its old rates unchanged at a traditionally low level for the first 11 months of the year. The increase in deposits therefore took place in spite of the fact that interest rates in other Scheduled Banks were much more attractive. Even the changes made with effect from December 1, 1956, may be described as mere readjustments to a rapidly changing situation and in no sense an attempt to catch up with other Scheduled Banks.

A STEADYING INFLUENCE

This seems to be an appropriate moment to refer to the criticism sometimes made about the State Bank, viz., that because it is a State Bank operating in the commercial field it has certain inherent advantages over the other Scheduled Banks and that it is using its privileged position to attract business to itself. If it were, indeed, to be the policy of the State Bank to operate flat out as a commercial institution irrespective of the consequences to other Scheduled Banks, it would have been quite easy to increase its interest rates still further and I have little doubt that thereby a much larger volume of deposits would have accrued to us, some of it perhaps in the form of fresh deposits but a larger proportion as diversions from other Banks. As a matter of deliberate policy the State Bank has declined to pursue such a step.

We cannot forget the historical traditions of this ancient institution. Moreover, although the Statute authorises us to operate as a commercial bank, it enjoins on us due regard to the public interest and we have interpreted this to include our obligations to the banking structure as a whole. It is not our intention to enter into a race, as we could easily do if we were merely concerned with swelling our profits.

On the contrary, it is our hope that by pursuing a policy of moderation in our rates both for deposits and advances, we may act as a steadying influence, more particularly during a period of great stringency when runaway conditions are so easy. Even so the shareholders will observe that our profits have increased substantially, principally by the larger turnover of our funds.

STAFF WELFARE FUND

I would like to refer to a new item in the balance sheet, viz., allocation of Rs. 10 lacs to the Staff Welfare Fund. It is my view, with which the directors are in complete agreement, that steps should be taken for the purpose of improving the working conditions of the staff employed by the Bank. Some of the items about which representations have been made by the staff, for example, housing in the big cities, raise problems of resources which can be handled only gradually. An attractive solution that has been suggested is the formation of co-operative housing societies for members of the staff, such societies to be assisted by the Bank both by the provision of long term credits on easy terms as well as possibly in other ways.

Such schemes have been tried elsewhere and have the great merit that the staff not merely get houses for living in but will also, in due course, own them. Discussions on these lines have been held with the office-bearers of the Federation of the employees' associations and I hope it will be possible to take concrete measures in the near future. In the meanwhile, the sum of Rs. 10 lacs will enable us to deal with pressing items such as the improvement of canteens and the provision of recreational facilities.

ASSISTANCE FOR SMALL-SCALE INDUSTRIES

It is not necessary for me to comment in any detail on the programme of assistance to the small-scale industries and the branch expansion programme, these being the programmes which may be regarded as fulfilling the requirements in our charter to operate "with due regard to the public interest." In the field of small-scale industries our activities are still somewhat exploratory in character. But for a Bank with our traditions it has been a big step to break away from the concept of security of property as the main criterion for making an advance and to be prepared to give credit on the basis of mere capacity to produce and sell.

The extent to which we can increase our advances to small-scale industrialists is not, however, a matter solely of relaxing conventional assessments of credit worthiness. It is much more a question of the improvement of techniques, with a consequent improvement in the quality of products and their saleability. In fact, credit and the improvement of techniques have to go side by side. The latter is however a matter which is outside the normal sphere of a banking institution. I know that the Government of India are keenly alive to this problem and hope that the steps which they have initiated in this field will acquire increasing momentum during the Plan period.

RELATIONS WITH CO-OPERATIVE INSTITUTIONS

In the report which has been circulated reference has been made to the relations of the State Bank with co-operative institutions. Here again is a field in which we are only making a beginning. In the Second Five Year Plan a new impetus is being given to the co-operative movement in the country. The possibilities of progress are immense and it will be no exaggeration to say that co-operative institutions could form a dominant part in the country's economy.

The State Bank will always be ready to play a helpful and constructive part in the development of such institutions. The exact form and pace of such assistance as well as the structure of the relations between co-operative banking and the State Bank are a

matter requiring further thought and perhaps experimentation as we go along.

TRIBUTE TO DR MATTHAI

In concluding this speech, I should be failing in my duty if I did not pay a tribute to all those who helped in making the transition from a shareholders' bank to a predominantly government owned bank smooth and easy. Most of the initial difficulties were solved during the Chairmanship of Dr Matthai; to him the Bank owes a great deal for the strong position in which it finds itself today.

Some problems had been left over when I took charge from him on October 1, 1956. These related principally to staff emoluments at higher levels and more particularly to the payment of bonus. Government felt that, consistently with their obligations to the widening network of the public sector of the economy, they had to ask the State Bank to conform to certain principles. I am glad to say that these difficulties have since been solved by mutual discussion and I would like to take this opportunity of expressing my obligations to Government for the understanding that they have shown in the matter.

THANKS TO OFFICERS AND STAFF

One last word, but from my personal point of view, a very important one. This is my last official function in the State Bank for tomorrow I am handing over charge to Shri Bhattacharyya. I have greatly enjoyed working in this institution and I am sure the experience I have gained, short as it is, will be of real help to me in my new responsibilities. I would like to express my gratitude to the officers and the rest of the staff for their unfailing assistance and I am sure they will give it in equal measure to my successor.

SUN LIFE ASSURANCE SOCIETY

TOTAL FUNDS EXCEED £120 MILLION

MR C. G. RANDOLPH'S STATEMENT

The annual general meeting of the Sun Life Assurance Society will be held at 63 Threadneedle Street, London, E.C.2, on Tuesday, March 26, 1957. Mr C. G. Randolph, Chairman of the Society, has issued a statement to shareholders, which in outline is as follows:

DIRECTORS

Owing to advancing years Mr W. M. Pryor has decided not to seek re-election as a Director at the forthcoming General Meeting. I wish to take this opportunity to pay tribute to Mr Pryor, who was elected to the Board in 1920, was Vice-Chairman from 1923 until 1943, and Chairman from 1943 to 1952.

Since the last General Meeting Sir Miles Thomas and Lord Rupert Nevill were appointed Directors, and you will be asked to consider their re-election at the General Meeting.

FUNDS, INCOME AND OUTGO

The total funds increased by £8,300,000 during the year and now stand at over £120 million. The premium income of the Life Assurance Fund and the consideration for annuities granted reached the record totals of £15,062,000 and £1,974,000 respectively, and together were £1,412,000 more than in 1955.

The gross interest yield on the Assurance and Annuity Funds was £4 18s. 5d. per cent, which is 3s. 8d. higher than in the previous year.

I am glad to be able to report that, although the claims by death at £2,916,000 show an increase of £569,000 over those for 1955, the number of such claims was considerably less than the number expected according to the mortality tables employed in our calculations.

NEW BUSINESS

Last year I reported an increase during 1955 of no less than 25 per cent in the amount of new life sums assured, and I am pleased to be able to say that during 1956 we maintained our new business at the enhanced level and, in fact, slightly exceeded the 1955 total, giving us another record year at £56,136,000.

In addition to life assurances, we granted last year annuities for £1,049,000 per annum.

I would like to express our thanks to all our connections for their valued support.

HOUSE PURCHASE

As a result of the general financial stringency the demand for advances under our house purchase scheme has continued to be greater than we feel able to meet, and we have therefore maintained the quota system to which I referred last year.

PENSION SCHEMES

The Finance Act, 1956, represents a notable milestone in the history of pension scheme business. In accordance with that Act, life assurance societies operating pension schemes approved under Section 379 of the Income Tax Act, 1952, now obtain freedom from income tax on the interest earned on that part of their funds which represents the accumulated contributions under such schemes, and are thus able to offer more attractive terms than in the past.

I am glad to be able to state that our "with profits" group pension scheme is becoming increasingly popular. There is little doubt that this flexible and attractive scheme meets a real need and that employers welcome the opportunity to participate in the prosperity of the Society.

RETIREMENT ANNUITIES

I drew attention last year to the fact that it was impossible for many persons to provide adequately for old age out of taxed income, and we were therefore particularly pleased that the 1956 Finance Act provided that the premiums for approved retirement annuity policies effected by self-employed persons and persons in non-pensionable employment should rank (within certain limits) as charges on income for income tax and surtax purposes, and that the interest earned by the assurance offices on the accumulated contributions should be free from income tax. We have designed a number of attractive policies to enable eligible persons to take advantage of the taxation concessions, including policies with the right to share in the Society's profits.

PURCHASED LIFE ANNUITIES

I may perhaps refer here to the further provision of the 1956 Finance Act, whereby, subject to certain exceptions, payments under purchased life annuities are now regarded for tax purposes as containing a capital element which is not assessable to income tax or surtax. This provision greatly increases the attractions of purchasing an annuity as a method of securing an income for life without incurring the risks inherent in many forms of investment.

NATIONAL SAVINGS

In these days the public is constantly being urged to increase savings in the interests of the nation as a whole, and new and attractive forms of investment are being offered from time to time by the Government. There can be no doubt that an increased level of savings is essential for the well-being of the national economy, and I venture to suggest that for most people there is no more attractive vehicle for savings than an endowment assurance policy entitled to share in the profits of an old-established office, such as the "Sun Life." An endowment assurance not only provides life assurance cover, but also may be expected to show a very satisfactory yield at maturity, especially if allowance is made for the relief from income tax claimable in respect of the premiums.

NEW PUBLICATIONS

We have added to our wide range of publications a prospectus relating to the new retirement annuities and an illustrated booklet entitled "For everyone under the Sun." The latter describes the various types of policy which are available to meet the needs of modern life, and copies of both publications will gladly be forwarded on request.

INVESTMENTS

The principal features of investment conditions during 1956 were the continuation of the fall in the prices of fixed interest securities, and substantial depreciation in the values of ordinary shares following several years of increasing values. Having regard to these features, your Directors decided to augment the Investment Reserve Fund by the transfer from the Assurance Funds of amounts aggregating £1,250,000, bringing the total of that Fund up to £4,500,000.

FORTHCOMING VALUATION

This is the last year of the current triennium, and a valuation with a view to a declaration of bonuses on "with profits" policies is due to be made as at the end of December next. In view of the improvement in the rate of interest earned on the funds and the favourable mortality experience we look forward to the results with confidence.

TRIBUTE TO STAFF

The new business total of £56 million is a testimony to the zeal of our Branch Managers and Inspectors, and it has been the pride of our indoor staff to cope with that record figure with efficiency.

I should like to thank the Executive and the whole staff on the excellence of the year's results.

THE WEST INDIES SUGAR COMPANY LIMITED

PRODUCTION DOWN BUT TRADING PROFIT LARGER

INTERNATIONAL AGREEMENT RENEWED

MR PETER RUNGE ON PRICES

The annual general meeting of The West Indies Sugar Company, Limited, will be held on March 20th at Devonshire House, Mayfair Place, London, W.1.

The following is the statement by the chairman, Mr Peter Runge, which has been circulated with the report and accounts:

Although production of sugar was down for the year under review, the Trading Profit increased by £133,448 to £833,662. The increase arose from selling the 1955 carry-over sugar stocks and from increased rum production.

The net profit was reduced by £23,388 to £405,766. This, however, is a misleading comparison because in 1955 we had an exceptional credit of £103,564 resulting from an adjustment of taxation in respect of previous periods.

Your Directors recommend payment of a Final Ordinary Dividend at the rate of 9d. per share, free of tax, which with the Interim Dividend of 3d. per share paid on October 31, 1956, makes a total distribution of 1s. per share, free of tax, on the increased Ordinary capital of £3 million. The total amount distributed remains unchanged. After providing for the dividend, setting aside £35,017 for Debenture Stock Redemption and transferring £200,000 to Future Crops Expenditure Reserve, the balance to be carried forward is increased from £194,912 to £215,661.

	£	£	%	%
Charges in Jamaica:				
Wages, Salaries and Employees' Benefits ...	6,790,629		39·9	
Payments to Cane Farmers	3,620,333		21·3	
All Other Materials, Supplies, Services and Expenses	2,981,147		17·5	
Payments into Capital Rehabilitation Fund ...	264,371		1·6	
Taxation	909,631		5·4	
		14,566,111		85·7
Charges in United Kingdom:				
London Office Expenses	250,188		1·4	
Debenture Stock Service	101,540		0·6	
Taxation	266,031		1·6	
		617,759		3·6

Dividends to Shareholders...		**444,125**		**2·6**
Total = Income from Sugar, Rum and Molasses (97%) and Sundries (3%)		**£16,999,045**		**100·0%**

Note.—Total Capital Expenditure in Jamaica during the same period was £1,467,293.

PRODUCTION FIGURES

Total sugar production from the 1956 crop at Frome and Monymusk amounted to 139,674 tons. It compares with last year as shown below:—

1955 Tons		1956 Tons
75,556	Frome	69,713
76,397	Monymusk ...	69,961
151,953		139,674

Last year I explained that we were left at the end of 1955 with about 20,000 tons of sugar which had to be held in store until it could be shipped as 1956 quota. Based on the statistical information available at that time it seemed likely that carry-over stocks at the end of 1956 would be even higher. In the event, however, we were able to sell during 1956 the whole of the carry-over from 1955. This was because certain Commonwealth territories for various reasons were unable to produce their full export quotas in 1956 and Jamaica was able to take advantage of this.

ALLOCATION OF INCOME

I think it will be of interest to consumers in the United Kingdom and in Canada—our other special market—to see figures showing how we dispose of our income. For the three years 1954 to 1956 they were as shown in the table in the following columns.

WAGES AND PRICES

There are two conclusions to be drawn from these figures. The first is that the money being paid by United Kingdom and Canadian consumers is going to the islands where the sugar is being produced. The second is that the cost of sugar is very largely being determined by the Company's wages bill and the price which is paid to cane farmers, which in its turn is largely spent on wages.

Consumers have no wish to eat cheaply at the expense of Jamaica, but it would be living in a fool's paradise to ignore the fact that the Negotiated Price* for raw sugar, after freights have been added, does not now-a-days fall far short of the cost of producing raw sugar in England from beetroots. Farmers at home have made prodigious and successful efforts to improve efficiency in every sphere of agriculture. New methods of cultivating the land, planting, harvesting, and fighting disease have all contributed to larger yields and greater productivity. The British consumer, while willingly helping to maintain the standard of living of Jamaica, will look for some assurance that we are not standing still and are not content with outmoded methods. We can give them that assurance; we intend, as in the past, energetically to pursue all means of improving agricultural efficiency and productivity; and we shall continue to plough back profits to finance those projects which need capital.

INTERNATIONAL SUGAR AGREEMENT

After protracted negotiations in New York and Geneva, agreement has been reached for the continuation of the International Sugar Agreement. Under its terms the members of the Commonwealth Sugar Agreement will limit their exports of sugar in 1957 to 2,450,000 tons and in 1958 to 2,500,000 tons; the United Kingdom undertakes severely to restrict imports from non-signatory countries, even if such imports are destined to be re-exported; other signatories have export quotas which fluctuate in accordance with the ruling price level. The object of the Agreement is to stabilise prices and maintain them at levels equitable to both producers and consumers. This object is important to us as producers.

I am glad that the principle of expanding production by the Commonwealth has been recognised. The modest increase of 50,000 tons in 1958 does no more than take care of the expected growth of consumption in Canada and the United Kingdom, let alone other parts of the Empire. Without the acceptance of this principle I doubt whether the U.K. Government would be justified in supporting the Agreement, particularly because other signatory countries, notably Cuba, have the right under United States legislation to share (at special prices and outside the Agreement) in the growth of consumption in the United States from whose markets Empire producers are completely excluded.

BANANAS

Last year I described the banana situation in some detail. I said that although we could not expect to make a profit in the early stages of a change in crop such as we were carrying out, we hoped to break even in 1956. Our hopes, however, were not quite fulfilled and there was a small deficit, after charging in the 1956 accounts the cost of new plantings which will not yield until 1957. With 2,500 acres in bananas we have now reached the limit of our intended expansion and, subject to the hazards of agriculture, will start to reap a return on our investment. You will be pleased to hear that our banana walks have the reputation of being amongst the finest in the island.

Our investment in Sugar Line, of which we are 25 per cent shareholders in partnership with Tate & Lyle and United Molasses, is going well. Four of the specially designed bulk carriers traded last year and two further ships will be commissioned early this year. They are well known at our bulk loading port in Jamaica, and have proved admirably suited for quick loading. The Board of Sugar Line has adopted a policy of financing the later ships with the profits earned on those delivered first. In consequence, only two-thirds of the equity capital has been called.

DIRECTORIAL CHANGES

Since my last statement to you there have been some changes on the Board. During the year, Mr. C. G. Allott, Deputy Managing Director of United Molasses, accepted our invitation to join the Board, and this appoint-

ment will be before you for confirmation at the Annual General Meeting. In May, 1956, Mr. J. A. C. Hugill was appointed Managing Director of the Company. The day-to-day management of the affairs of the Company will continue to be in the hands of the Managing Director and his colleagues, Messrs. W. J. Blanchard, W. A. Coupland and A. Gillies, who are full-time Executive Directors.

Prospects for the 1957 crop are not unreasonable and our staff and workpeople at Frome and Monymusk are in good heart. I should like to take this opportunity of paying tribute to Mr. Michelin and Mr. Cahusac, the General Managers of Monymusk and Frome, and to all our employees, whether in London or in Jamaica, and to convey to them our good wishes for the future.

---

* *Note :—*

Under the Commonwealth Sugar Agreement the British Government each year negotiates with the Commonwealth exporting territories a fixed price for a proportion of their sugar exports. This price is arrived at by applying a formula which takes account of cost factors involved in producing sugar. The price so arrived at is known as the "Negotiated Price." It is applied at present to approximately 1,535,000 tons for shipment to the United Kingdom, of which Jamaica's share is 180,000 tons. About half our crop is sold at the negotiated price. The following are the prices which have been negotiated for the past five years :—

	£ per Ton.
1953	42 6 8
1954	41 0 0
1955	40 15 0
1956	40 15 0
1957	42 3 4

SOUTH ESSEX WATERWORKS

INCREASED REVENUE

The Annual General Meeting of the South Essex Waterworks Company was held on February 22nd, in London, Mr G. Francis Stringer, OBE, chairman, presiding.

The following is an extract from his statement for 1956 :

A further sum of £433,199 was spent on the Hanningfield Works during the year. After nearly six years of continuous effort a supply of wholesome water suitable for the use of the public became available from Hanningfield last August and a constant and reliable supply from this source has been maintained. The work is not yet finished and there are further commitments to the extent of £90,608.

Further increases of wage rates and costs of material contributed towards the heavy increase in pumping charges and general repairs. Industrial demand continued to rise during the early part of the year but some slight decline in demand occurred towards the end of the year and results for the current year will depend on the trend of industrial demand consequent upon the effect of existing conditions on industry. New supplies were afforded for 5,175 domestic dwellings. The Company's assessment to General Rates is the subject of an appeal which when settled will give effect to the assessment for the new works at Hanningfield. Before payment of dividends at statutory maximum rates £50,000 has been appropriated to the Contingency Fund to provide for the replacement and improvement of existing works.

CARRERAS LIMITED

A MORE FAVOURABLE YEAR

The fifty-third annual general meeting of Carreras, Limited, was held on February 26th at Arcadia Works, Hampstead Road, London.

Sir Edward Baron (Chairman and Managing Director) presided and, in the course of his speech, said: In the Profit and Loss Account of the Parent Company you will have observed that the balance from Trading shows an improvement, and I must tell you that there have been several factors contributing to this result apart from the savings arising from the reorganisation and economies inaugurated in the previous year.

For one thing, we had the benefit for the whole twelve months of the increase in retail prices which came into effect in October, 1955, although these were barely sufficient to cover the increased costs and higher wages which we had to meet.

Furthermore, while the additional tobacco duty which was imposed on April 17th last was, of course, regretted by the industry, one of its effects was to give us a small extra profit on the normal quantity of duty-paid stocks which we held at that date in our factory. In addition, the fact that we disposed of further quantities of leaf tobacco which were surplus to our requirements relieved us of carrying charges and interest which we would otherwise have had to bear.

Turning to the Consolidated Profit and Loss Account, the Balance from Trading likewise shows an increase, and here I would mention that our United Kingdom Subsidiary Companies also had a more favourable year. The overall picture is a better one, and with the combined Carry Forward increased by more than £400,000, I am sure you will agree with our recommendation that the Dividend of 8¼ per cent on the Ordinary and "B" Ordinary Shares should be repeated this year.

Our Balance Sheet is eminently sound, and the figures at which our properties and investments stand in our books are conservative.

THE YEAR'S TRADING

We continued to be faced with severe and intensified competition in the Home Trade, and it was not without difficulty that we maintained our relative position. The sales of Baron's Filter Tip Cigarettes, selling at 3s. 2d. for 20, have steadily increased and continue to show progress.

In May last we launched Dunhill Filter Tip Cigarettes, retailing at 3s. 8d. for 20, in a new style packing. While this brand has not yet achieved great volume, it is making steady progress.

All our best-known pipe tobaccos continue in favour and we have brands and packings to meet all demands, whether they be in regard either to price or to taste.

Our Export Trade was fully maintained during the twelve months. In fact, despite all the difficulties encountered in overseas markets in these days we actually increased the volume of our exports from this country, and even improved our relative position in regard to that section of the industry.

I cannot be expected to forecast what the result for the current financial year is likely to be. We know that many difficulties and problems lie ahead of us, but none the less I should like to think that when we meet next year I shall again be able to record some improvement.

The report and accounts were adopted.

ABBEY NATIONAL BUILDING SOCIETY

ANNUAL GENERAL MEETING

SIR HAROLD BELLMAN'S SPEECH

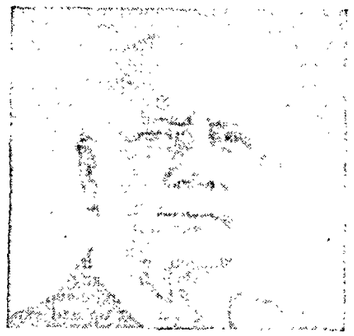
The Annual Meeting of the Abbey National Building Society was held on February 27th at the Wigmore Hall, Wigmore Street, London, W1.

Sir Harold Bellman, DL, JP, LLD, Chairman of the Society, in moving the adoption of the report and accounts, said:

The year 1956 has passed away unlamented against a background of international tension, with political turmoil, economic upsets and an unpleasant credit squeeze. The Abbey National Society suffered no setbacks and is able to report further orderly progress.

The Society's total assets increased by £21 million to £258 million in 1956. This reflects the confidence and support of both old and new investing members during the year. In shares and deposits the Society received £49.4 million in 1956, substantially the same total as in 1955. This is particularly noteworthy having regard to the intensive competition for small savings throughout the year.

Turning to the mortgage side, it will be seen that new advances to assist home ownership in 1956 actually showed an increase: £40.3 million was lent as compared with £39.3 million in 1955. The demand for mortgage accommodation throughout the year was exceedingly heavy. Having regard to the volume of mortgage business offered, there was neither the need nor the inclination to relax the high standards associated with the acceptance of applications for loans.



The building of new houses for sale by private enterprise continued at a high level during 1956. Nevertheless, the Society also continued to offer substantial assistance to those buying older houses.

In a year which was crowded with incident, it is practicable to single out only the more important for reference. I need hardly remind you of the rise in Bank Rate to 5½ per cent in February, 1956, but it is necessary to remember that this, though not itself the decisive factor, symbolised the conditions in which we worked.

As the year advanced it became clear that societies were once more faced with a problem of much the same kind as arose during 1955. With the increasing disparity between building society yields and those on other comparable investments, the Building Societies' Association, of which Abbey National is a member, recommended in July that share rates of interest should be raised to 3½ per cent and deposit rates to 3 per cent with income tax paid in both cases, with effect from October 1st. Accordingly, the Abbey National increased its share rate of interest to 3½ per cent and its deposit rate to 3 per cent as from October 1, 1956. The rate of interest charged to new applicants for loans was raised to 6 per cent from July 23rd.

In the light of these events, it is opportune to pose the question : is there any way in which the building societies can cushion their existing borrowers in a period of dear money? So long as a society must pay the market price to investors for the use of their money—and there is no practicable alternative to this—so long must borrowers be charged rates which are in due relationship.

I have already reminded you that Abbey National is a member of the Building Societies Association, the central organisation for British building societies. It is concerned to promote the interests of building societies, to assist them with technical advice, and generally to advance good standards in regard to both policy and practice. Three hundred and fifty-two societies whose assets exceed £1,735 million are members of the Association, and we believe that membership now is, and will become increasingly, a hall-mark for the security of the investor and the guidance of the borrower.

Sir Harold Bellman, the Chairman

The Abbey National adds its voice to the continued protest of the Association against the incidence of the Profits Tax. That tax, inappropriate in its application to building societies from the outset, is a burden now long overdue for removal. As a Profits Tax, it is manifestly inequitable, since building societies do not seek to make profit as an end in itself. Last year Abbey National paid over £220,000 in respect of Profits Tax, this in addition to £3,245,000 for Income Tax. The case for relieving all societies of this imposition was clearly recognised in the recent report of the Royal Commission on Taxation. I hope the new Chancellor of the Exchequer will find time, amid his many preoccupations at this season of the year, to weigh the arguments and propose relief.

In a period of so many and such far-reaching problems, the Board has been required to devote much care and thought to the affairs of the Society. With this in mind, it decided during the year to appoint an additional Director, especially with a view to assisting the work of the Technical Committee. Accordingly, the Directors invited Sir Herbert Butcher, MP, to join them and I am very glad to say he accepted the invitation.

I share the gratitude of my colleagues to the Deputy Chairman, Mr Stanley C. Ramsey, for his wise counsel and co-operation. The Managing Director, Sir Bruce Wycherley, has once more been called upon to bear a particularly heavy burden, since he has been concerned both in the formulation of policy and in supervising its translation into practice. We now go on with the tasks of 1957 in the confidence that we shall be able to give a good account of our stewardship twelve months hence.

Mr Stanley C. Ramsey, FRIBA, Deputy Chairman, in seconding the adoption of the report and accounts, said:

The background against which your Society has worked for the past year may be defined as one of house-hunger, though on a diminished scale as compared with a few years ago. This, of course, is no new condition ; it obtained in an equally, if no more acute form, after the first World War. This demand for new houses affects all sections of the community.

COST OF HOUSES

One of the more disturbing factors in connection with the building of new houses has been the continued rise in the cost. This condition is not limited to houses, but applies generally to all types of building. Figures published by the Ministry of Works show a rise of thirty-five per cent for the cost of new building, including housing, in 1956, as compared with the cost of building in 1950.

The continued rise in the price does not seem to have appreciably affected the demand, and the Society's funds have been fully employed in meeting this demand.

Another interesting fact in connection with house building has been a noticeable improvement in organisation by the builders. What has been called "phased operations" obtains in a wide degree not only with the larger building firms, but also amongst those of moderate size.

The report and accounts were adopted.

THE MANAGING DIRECTOR'S REMARKS

Sir Bruce Wycherley, MC, FCIS, managing director of the society, said:

My first duty is to express, on behalf of my colleagues Mr William Cash, Mr H. L. Roy Matthews and Sir Geoffrey Shakespeare, their appreciation of the further opportunity, following their re-election to the Board, to serve the Society. Sir Herbert Butcher also asks me to express his appreciation of your confirmation of his appointment as a Director of the Society.

Last year was yet again a period of all-round change in our terms of business, with all the added volume of work which that entailed. If problems are the irritants which are said to keep us alive, then I can only say that as building society men we should be alert in every fibre of our being in these days.

The Society looks back to 1956 as a year of progress—of solid and purposeful progress. It looks forward in 1957 to further progress of the same kind. We shall seek no short cuts, neither shall we resort to doubtful expedients.

Since size as an end in itself is not our objective, we shall deliberately seek to preserve our individual identity. We want the Abbey National to stand for something definite and distinctive in our type of business. In the field of saving our hall-mark is security, whilst in promoting home-ownership our aim is service.

In the new age, with the possibility of shorter working hours and still greater social security, the home will become even more important in the lives of all of us, and it should be the aim of the building societies to help this forward in every way that is possible. We have a long past, whether as a Society or as a movement, and we hope we may look forward to a long future, with continuing opportunities of service to the community.

MANCHESTER SHIP CANAL COMPANY

SIR LESLIE ROBERTS'S ADDRESS

The ninety-ninth ordinary general meeting of the Manchester Ship Canal Company was held on February 28th at Manchester.

Sir Leslie Roberts, CBE, the chairman, in the course of his speech said:

The total net revenue of the Company was £1,134,316 compared with £1,086,301 in 1955. To this must be added £27,716 brought forward from the previous year. £587,680 has to be deducted for Loan and Debenture Interest, £40,000 set aside to the Sinking Fund for Redeemable Loan Capital and £80,000 appropriated for Taxation. The balance available for dividends and reserve thus amounts to £454,352.

As in previous years, £35,000 has been appropriated to the Reserve for Contingencies and it is proposed that out of the balance of £419,352 the following dividends, amounting to £387,587, should be paid:

5 per cent on the Preference Shares,
5 per cent on the Ordinary Shares,
and that £31,765 should be carried forward.

The principal receipts are derived from Tolls, Ship Dues, Traffic Rents and Towage and they exceeded those of the previous year by £228,000. On the other hand, expenditure rose by £161,000. This increase was due, in the main, to the exceptionally large amount of maintenance work, the cost of which more than offset a decrease of £138,000 in the expenditure on dredging. The cost of dredging at nearly £1½ million was again a heavy burden and represented almost one half of the total expenditure on the working of the Ship Canal.

Cash at Bankers, in hand and at short call, together with our holding of Tax Reserve Certificates amounts to £2,121,000, an increase of £204,000.

The total cargo handled at the Port last year amounted to 18½ million tons, or nearly three times the tonnage handled at the end of the war. Since that date, the total capital expenditure incurred, including the cost of Queen Elizabeth II Dock, amounts to upwards of £7 million.

While these improvements have been taking place, the Company's Reserves and Provisions have, since the end of war, been built up from a little over £2 million to nearly £3¾ million. We have also made a useful start on the formation of a Sinking Fund for the redemption of loan capital and we have redeemed or procured the release of certain rent charges to an extent equivalent to a capital redemption of approximately £500,000. The significance of these figures is enhanced by the fact that during the same period, over £4¾ million has been spent on the renewal and replacement of our plant, equipment and works, quite apart from the capital expenditure of £7 million to which I have referred.

To Shareholders it should be an additional satisfaction that during the period I have mentioned, the dividend on the Ordinary Shares—if you approve the Resolution which is about to be put to you—will have been increased from 1½ per cent to 5 per cent.

When I tell you that the generality of our charges for Ship Dues and Canal Tolls are no more than 75 to 80 per cent above the prewar figures, it is possible you may think that your Board have as yet not been unsuccessful in holding the scales evenly between all the various interests concerned in the working and prosperity of the Port.

The report and accounts were adopted.

LEEK & MOORLANDS BUILDING SOCIETY

CENTENARY YEAR—A WONDERFUL RECORD

The one hundredth annual general meeting of Leek & Moorlands Building Society was held on February 25th at Leek, Staffs.

In his printed address, the President, Sir Ernest Johnson, JP, reviewed the political and economic events of the past year and continued: The effect on our economy of the curtailment of oil supplies from the Middle East and the purchasing elsewhere of oil for dollars is beginning to reveal itself. It is to be hoped that we can control our economy and prevent further inflationary trends.

Meanwhile the run on Sterling has stopped. That is not to say that Sterling does not need defending further. Already as we know the last reserves via the International Monetary Fund have been called upon. What next? The real answer must lie in Government policy as well as in Government spending.

A reduction in Bank Rate may well be justified. Any further reduction would and should depend upon the true state of our economy—a reduction in Government expenditure and freedom from any crisis in Sterling. We must still save more and spend less. Reserves need building up and export surpluses are paramount if we are to contain a sound economic approach to our problems. The one sure way to abolish our anxieties is to see to it that we insist on huge reductions in public expenditure and finally substantial reductions in taxation. It is for the Government to show the way. They can decide that Great Britain can still be great.

Finance—Commerce—Industry—Labour—will all respond to a serious lead for national prosperity. The world is still in need of our production. Let us go forward in 1957 to a more prosperous period in our history not because of our difficulties but in spite of them.

CHAIRMAN'S ADDRESS

Councillor Gilbert Tatton, the Chairman, presided, and in the course of his speech, said: Shareholders and Depositors taken together show a total of £34,157,909—a measure—and a striking one—of the confidence of the investing and saving public in this Leek and Moorlands Building Society.

Our Balance Sheet total at £36,057,063 is impressive, not for its size alone but for its absolute soundness. I am satisfied that it portrays all that is best in security, stability, spread of risk and unquestionably, in financial strength. It is a wonderful record of one hundred years as a safe and sound financial home of the people's savings.

DEPUTY CHAIRMAN'S REMARKS

In the course of his address, Sir Bernard White, KBE, the Deputy Chairman, said: Looking ahead, it may well happen that once the Rent Bill becomes law, tenants of good houses may consider it worth their while to buy their homes. If this happens—as it may well do—building societies will be called upon to try to make extra funds available for mortgages. The Government should be considering what assistance it can give to all home owners who continue to provide their houses at no cost to the nation. I make a plea therefore for the recognition of building society deposits as a Trustee Investment.

The Report and Accounts were adopted.

CHELTENHAM & GLOUCESTER BUILDING SOCIETY

The annual general meeting of Cheltenham & Gloucester Building Society was held on February 20th at Cheltenham.

Mr Leslie W. Bayley, CC, FAI (President and Chairman), presided and, in the course of his speech, said:

It is remarkable how closely monetary conditions during 1956 followed the pattern of 1955. In each of these years there was an increase in Bank Rate in February, followed, as the months unfolded, by a corresponding increase in long term rates. New investments began to fall off and withdrawals began to rise, and there was less available for assisting house purchase.

In the summer of each year the Building Societies' Association, of which we are members, recommended a ½ per cent increase to shareholders and depositors, and in both years this was effective in bringing about an improvement. Last year, however, Building Societies had to face increased competition for funds from the National Savings Movement and from Local Authorities, and it is not surprising that our rate of growth has been somewhat slowed down.

Working as we do on a very small surplus, any increase in the rate paid to investors must be passed on to borrowers if reserves are to be maintained. Although our borrowers' rate was raised to 5 per cent from January 1, 1956, the further increase to our investors in September, 1956, together with the increased composite rate of tax, more than wiped out our margin, and it became necessary to notify our borrowers of a further increase to 6 per cent taking effect from April 1, 1957.

Here I must emphasise that the recent reduction of ½ per cent in Bank Rate will not mean an immediate reduction in Building Society rates. The rate at which we lend depends entirely on the rate at which we can attract and retain investments, and this, in turn, depends upon the rates offered by other bodies, including the Government itself, which compete for savings. Whether a fall in these rates will follow, we shall know in due course, but there must inevitably be a considerable time lag.

Turning to the Accounts, and taking the Share and Deposit Departments together, there was an increase of £1,600,000 during the year, and whilst this increase is less than last year, having regard to all the circumstances we can regard this as satisfactory. We advanced £3,700,000 to assist house purchase during the year, and this is also considerably less than the record figure we established in 1955, and is mainly accounted for by the fall in net receipts from investors.

We have increased our liquidity to some 14 per cent of assets and we are now in a position to entertain an increased amount of mortgage business during 1957 and I hope that we shall be able to lend well over 4 Million to assist house purchase during the present year. We are able to transfer some £71,000 to Reserves, a figure slightly lower than last year, due to the interval before increased rates to investors were passed on to borrowers. Our Assets are now £28,671,000, an increase of £1,822,000, and our total reserves amount to £1,691,000, representing 5.9 per cent of our assets.

The report and accounts were adopted.

Clarence Street, Cheltenham. Tel: 3054.

APPOINTMENTS

NUFFIELD COLLEGE STUDENTSHIPS

Applications are invited from graduates (men and women) who wish to undertake research in any branch of economics or politics (including political theory, government and public administration, and international relations); statistics; sociology; constitutional, public and international law; recent social, economic and political history. The College is also interested in the application of these disciplines to the problems of colonial and under-developed societies. Recently the College has received grants to further the study of European politics and government and of trade union policy and industrial relations.

Further particulars and the necessary forms are obtainable from the Warden. Applications should reach him by May 13, 1957.

STATISTICIAN required for Market Research Department at Norwich. The position is a senior one within the Department, the successful candidate working directly with the Research Manager. The work is concerned with the design, analysis and interpretation of surveys covering retail consumer and product research. If you have a qualification in statistics such as the B.Sc. Economics, the Certificate of the Royal Statistical Society or have passed the Finals of the Association of Incorporated Statisticians or some similar qualification, please apply in writing, giving full particulars of education, qualifications, experience and salary required, to Secretary, Reckitt & Colman, Ltd., Norwich.

INDUSTRIAL ACCOUNTANT

A Large Engineering Company of international repute requires, at one of its heavy engineering works in the South Midlands, an Accountant with experience in engineering.

Commencing salary not less than £1,600 p.a. Good pension scheme.—*Full details to Box E587*, IPE, 55 St. Martin's Lane, W.C.2.

FISONS LIMITED have a senior position vacant in the newly formed Group Methods Study Department at their Head Office, Felixstowe, Suffolk. It offers an opportunity to do original work on the application of mathematical techniques to the solution of industrial and managerial problems. Applications are invited from men who have a sound mathematical background and are able to express their ideas with clarity and tact and either have been or would like to work on this type of applied research. Experience of electronic computers would be an advantage.—Applications to the Personnel Officer (E.O.D.), Fisons Limited, Harvest House, Felixstowe, Suffolk.

HOOVER (WASHING MACHINES) LIMITED

MERTHYR TYDFIL, SOUTH WALES,

invite applications for the post of:

PERSONNEL ASSISTANT

This post is particularly suited to a young man who has begun his career in Personnel Management and who wishes to widen his experience in a Department which is fully integrated into the managerial structure of the Company. The Personnel Assistant is given personal responsibility for the department's functions in a defined area of the Factory and is concerned extensively with employment, wages structure, employee services, Factory Acts, liaison with Trade Unions and the investigation of industrial personnel problems.

Candidates should have had a University education and preferably training in Personnel Management.—Applications should be made to the Employment Officer, giving full details of age, experience and qualifications.

APPLICATIONS are invited for the post of Lady Secretary at the Technical Bureau of the Persian Plan Organization, Tehran, under a contract with the International Bank for Reconstruction and Development. Applicants between ages 25 and 40 must be able to take dictation in German and translate technical material from German into English with speed and accuracy. University degree an advantage. Duration one year in the first instance with possibility of renewal. Salary between £102 and £125 a month tax free according to qualifications and experience plus a settlement allowance to cover expenses incurred at the commencement and termination of contract. Medical examination will be required.—Apply in writing only to Miss M. R. Bruce, Treasury Chambers, Great George Street, London, S.W.1.

GREETING CARDS.—Leading House in West London Area wishes to appoint a BUYER. Preference will be given to applicants who have had sound experience in buying Lithography and Allied materials. The post will carry a good commencing salary and we are looking for a man with a sound responsible outlook and the highest integrity. For the right individual there are very real prospects. Applications, in writing, will be treated in strict confidence and should give full details of qualifications, experience, age and salary required.—Box 638.

RESEARCH ASSISTANT. Opportunity for appointment in economics department of large financial institution in London to man or woman with good economics degree, aged 23-30. Starting remuneration varies with age: at 25 (subject to short probation): £650 (men), £600 (women). Non-contributory pension, Ltd., Gateway House, London, E.C.4.

AUSTRALIAN NATIONAL UNIVERSITY

CANBERRA

RESEARCH SCHOOL OF PACIFIC STUDIES

Applications are invited for an appointment either as SENIOR FELLOW or as FELLOW in the DEPARTMENT OF INTERNATIONAL RELATIONS.

The qualifications desired include a knowledge of the area north of Australia from Pakistan to Japan and/or experience, either academic or practical, related to research on current international problems.

The salaries and ranges of Senior Fellows and Fellows are determined within the limits £A2,224-£A2,674 and £A1,574-£A2,224 respectively, and these appointments are made for an initial period of five years; thereafter they may be made permanent.

Superannuation on the F.S.S.U. pattern will be provided and reasonable removal expenses will be paid.

Further details are available from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close, in Australia and London, on April 15, 1957.

NEW SOUTH WALES UNIVERSITY OF TECHNOLOGY, AUSTRALIA

The New South Wales University of Technology invites applicants for appointment to the position of Senior Lecturer/Lecturer in Economics in the newly established Faculty of Commerce.

Applicants must possess a University degree with honours or equivalent qualifications, and previous University experience will be an advantage.

Salary:

Senior Lecturer: £A1,881 range £A2,231 per annum.
Lecturer: £A1,281 range £A1,831 per annum.

Commencing salary according to qualifications and experience.

Applicants should specify main area of interest and preference will be given to applicants experienced in field of Industrial Relations.

Subject to passing a medical examination, appointee will be eligible to contribute to the New South Wales Superannuation Fund.

First-class ship fares to Sydney of appointee and family will be paid.

Five copies of applications (including the names of two referees) should be lodged with the Agent General for New South Wales, 56-57 Strand, London, W.C.2, and a copy forwarded by airmail to the Registrar, New South Wales University of Technology, Kensington, New South Wales, Australia, before March 18, 1957.

UNIVERSITY COLLEGE OF RHODESIA AND NYASALAND

Applications are invited for the

CHAIR OF ECONOMICS

Salary scale £2,000 x £100 to £2,300 p.a. Superannuation scheme. Passages to Salisbury for appointee, wife and dependent children on appointment with allowance for transport of effects. Unfurnished accommodation provided at rent of up to 15 per cent of salary.

Detailed applications (six copies), naming three referees, by April 6, 1957, to Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

AN INVITATION TO:

UNIVERSITY GRADUATES

ALSO THOSE WHO EXPECT TO QUALIFY DURING 1957

An already large and still rapidly expanding engineering group with factories and research establishments in various parts of the United Kingdom and numerous overseas connections, is anxious to establish contact with a number of men in respect of training for senior managerial, sales, production and technical appointments.

The company seeks enthusiastic, energetic and talented men who have capacity to assume ultimately positions of considerable responsibility.

Graduates with Engineering, Science or Arts Degrees, and those expecting to qualify this year, who are interested to receive further information, should write as soon as possible to Box 642.

THE ENGLISH ELECTRIC COMPANY LIMITED

This Company is expanding its Organisation and Methods Division both at the Stafford Head Office and at its works in various parts of the country.

Applications are invited from young men between 23 and 35 years of age preferably with experience in office routines and systems who are interested in pioneering O & M work in industry. Preference will be given to men with a degree or professional qualification. There are also a limited number of vacancies for men with experience in the installation of punched card equipment who are interested in the application of electronic computers to clerical work. Enthusiasm and the ability to deal with people at all levels are essential qualities. Interesting and permanent employment is offered with excellent opportunities for advancement.

If you feel you have the necessary experience and qualifications, send details of age, present salary, experience and qualifications, to Dept. C.P.S., 336-7 Strand, W.C.2, quoting Ref. E 1289A.

TOP LEVEL EXECUTIVE

Applicants for this appointment advertised in December are advised that the vacancy has been filled. (Box 584.)

STATISTICIAN with good knowledge of sales analysis, & market research and business organisation needed by firm of international repute in the food industry. Good scope for successful applicant. Age 26-35 years.—Reply to Box 601.

AN important Belgian distributing company of machine tools, small tools and abrasive products, invites applications for the post of Commercial Manager.

The applicant will be required to have some experience in the field of mechanical engineering. Must speak French fluently and have some knowledge of German. Should have held a responsible executive post, preferably in a technical selling capacity.

This is a senior appointment and will carry a salary commensurate with experience and qualifications.

Applications to the Managing Director: Etablissements Henri Benedictus, 34-36 rue Melsens, Brussels, Belgium.

VENEZUELA. Export Manager, long experience engineering, linguist, economist, proceeding shortly to Venezuela. Prepared act as agent or factory representative, or effect market survey.—Box 635.

UNIVERSITY OF CAMBRIDGE

DEPARTMENT OF ENGINEERING

POST-GRADUATE COURSE IN STRUCTURES AND MATERIALS

The 1957-58 Post-Graduate Course in Theory of Structures and Strength of Materials will be held in the Department of Engineering, Cambridge University, beginning on October 8, 1957, and finishing in June, 1958.

The latest advances made in the understanding of the behaviour of metallic structures under static, repeated or fatigue loading will be the principal subject of the course, with particular emphasis on welding as a method of fabrication. No attempt will be made to teach conventional methods of design, but present-day practice and possible future developments will form the subject of critical study.

The object of the course is not to train research workers, but to help engineers to apply the latest advances in knowledge. The course will include lectures, colloquial and laboratory work, and each student will be encouraged to make a detailed study of some problem of particular interest to him.

The course is open to university graduates with industrial experience, and to others with suitable equivalent qualifications.

Further details and forms of application for admission may be obtained from the Secretary, Cambridge University Engineering Laboratory, Trumpington Street, Cambridge.

Applications should be sent in not later than June 1, 1957.

TRAIN FOR TECHNICAL TEACHING

EXCELLENT CAREER PROSPECTS

Applications are invited for training as FULL-TIME TEACHERS of General, Commercial and Professional subjects, and/or Office Arts (shorthand, typewriting, Secretarial work) in Technical Colleges and Schools. The next course of training will begin in September, 1957, and end in June, 1958.

Applicants should normally

1. be between about 25 and about 45 years of age,
2. have good commercial experience,
3. possess one of the following: Professional qualification or degree, Higher National Certificate in Commerce, Advanced Certificates in Shorthand and Typewriting.

MAINTENANCE GRANTS AVAILABLE
NO TUITION FEES

Write for full details and an application form to one of these colleges:—

BOLTON.—The Director (S/11/25), Bolton Training College, Manchester Road, Bolton, Lancs.

HUDDERSFIELD.—The Director (S/11/25), Huddersfield Training College, Queen Street South, Huddersfield, Yorks.

LONDON.—The Principal (S/11/25), Garnett College, 83 New Kent Road, London, S.E.1.

B.Sc.(ECON.) LONDON UNIVERSITY

UNIVERSITY CORRESPONDENCE COLLEGE

provides postal tuition for the above degree (obtainable without residence), which is a valuable qualification for those seeking executive appointments in commerce or industry, government or municipal posts. The College, established 1887, is an Educational Trust. Highly qualified Tutors. Low fees. Prospectus of U.C.C. Courses for London Degrees and Diplomas, G.C.E. free from the Registrar, 60 Burlington House, Cambridge.

A UNIQUE OPPORTUNITY EXISTS FOR ACQUIRING AN EXCELLENT AND DIGNIFIED SELF-CONTAINED OFFICE BUILDING COMPRISING GROUND FLOOR AND UPPER PART IN ST. JAMES'S, VACANT POSSESSION. FOR SALE OR TO LET.—FOR DETAILS APPLY BOX 640.

DON'T have a coming-out ball this season. Have a staying-in party, with a few bottles of Duff Gordon's El Cid Sherry. You'll never be home.

THE ECONOMIST and Hansard available fortnight after publication. Offers.—372 Wandsworth Road, S.W.8.

SAVILE ROW CLOTHES. Cancelled export orders direct from eminent tailors. Lesley & Roberts, Sandon, Huntsman, Kilgour, etc. Lounge, Dress Suits, Overcoats, etc., from 10 gns.—Regent Dress Co. (2nd floor), 17 Shaftesbury Avenue, Piccadilly Circus, W.1. GER 7180 (next to Café Monico). Est. 1922.

JERSEY IN SPRINGTIME. Come south for the sun and stay at Hotel L'Horizon, St. Brelade's Bay. The hotel, facing south across the Bay, is in an ideal setting for a perfect spring holiday. Continental cuisine. Good wine cellar. Cocktail bar. Drinks and cigarettes at low Jersey prices. Sixty bedrooms; some with private bathrooms, many with private sun balconies. Resident dance band.—Write for tariff, or telephone Southern 887.

EXPERT POSTAL TUITION

for Examinations—University Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus—and/or advice, mentioning examination or subjects in which interested, to the Secretary (G9/21),

METROPOLITAN COLLEGE, ST. ALBANS

or call at 30 Queen Victoria Street, London, E.C.4.

ANNUAL AIR SUBSCRIPTION RATES

Subscriptions to most countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is either because the alternative is not available or not recommended.

"So often do the spirits
Of great events stride on before
And in today already walks tomorrow"

COLERIDGE

At *no* previous time in our industrial history has there been such a sense of exhilaration in the scientific promises of the future. Those who experienced the first industrial revolution were stirred by the same surging spirit, but their visions of the shape of things to come were clouded by nameless fears which their scientific knowledge was not great enough to dispel. After two centuries of industrial progress we are in the throes of a new scientific revolution. Academic theories of yesterday have become accepted processes of today, and tomorrow's secrets are already being uncovered.

Consolidated Zinc seeks to play its part in these tremendous advances; to pioneer more efficient ways of producing the raw materials needed by modern industry; and to evolve new chemicals to meet the urgent demands of industrial scientists and engineers. This international group, with its roots deep in the Commonwealth, is ready to meet the most exciting challenges that the future may bring. It continues to probe, with all the devices that modern science has developed, the mineral secrets still locked away in the bowels of Earth. Whether buried in unexplored forests or hidden in remote mountain ranges, they still tantalise the modern mining venturer. All this, and more that we can only see through a glass darkly, make up an exciting and impressive prospect.

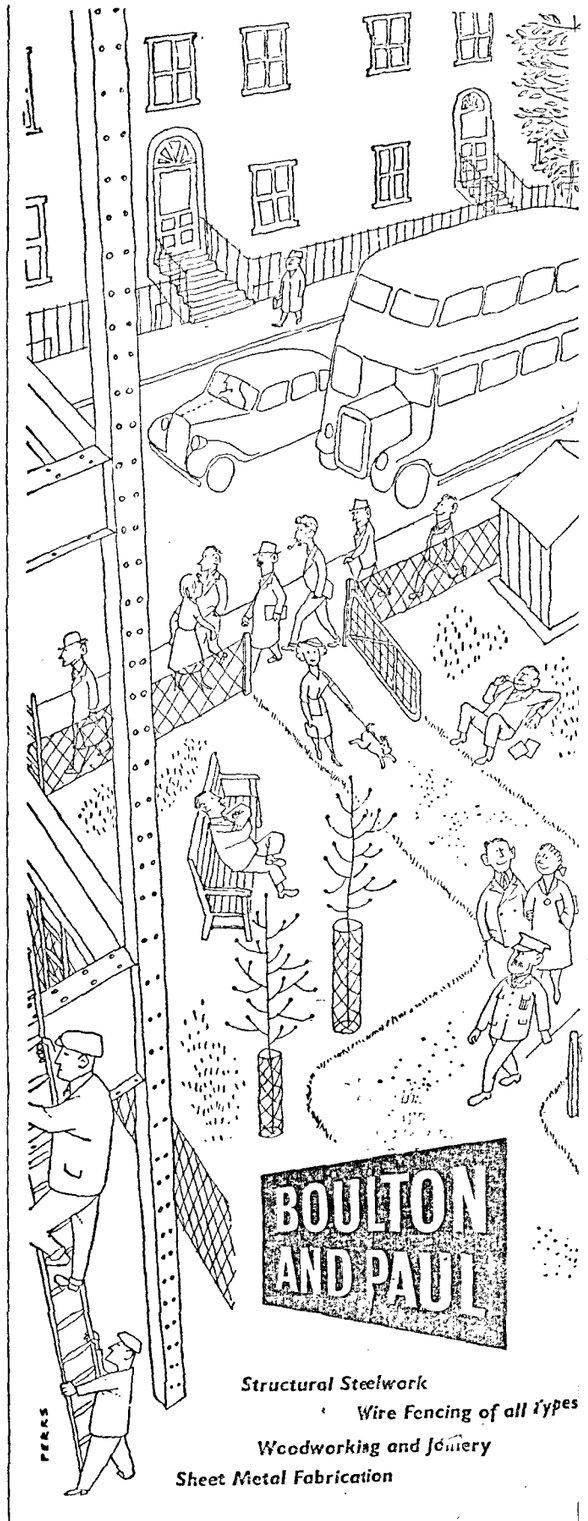
AIR CONTROL
for VAUXHALL MOTORS

In their factories at Luton and at Dunstable Vauxhall Motors Ltd have installed a considerable amount of ACI plant and equipment. There you will find ACI dust and fume control, ACI filters, and over one hundred ACI heavy duty fans—all making their contribution towards quality control, *speedier production* and better working conditions.



All over the world ACI plant is supplying better air for every type and size of project. In all air treatment matters ACI's experience and resources are at your disposal.

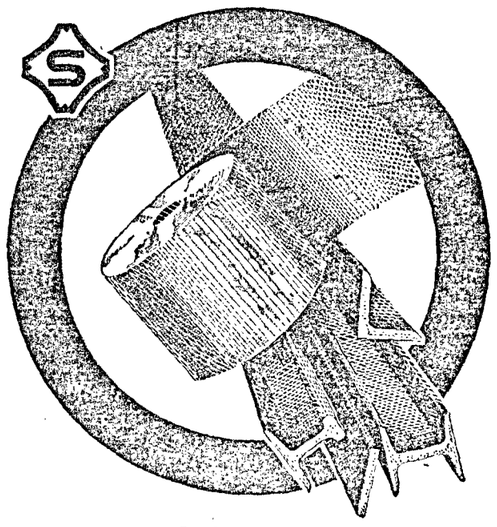
2,300 Degrees of Experience

BIG FIGURES in Fahrenheit may not mean much to many of us. Minus 300 degrees means more than ten times colder than that winter last year when the car broke down ten miles from home. 2,000 degrees means some twenty times hotter than that day last summer when the tarmacadam pavement actually bubbled. That's as far as we can, or want to, go. Temperatures like those are best left to people like Newalls.

These figures of minus 300°F to over 2,000°F do, in fact, represent the wide horizon of temperatures within which Newalls work. For more than fifty years, heat —and its control—has been a Newalls speciality, and during that time a wide range of materials has been produced to offer effective insulation for every need within this temperature range.



Newalls (Reg'd Brand) 85% Magnesia, Nicosil, Newtempheit, E.H.T., Amosite Asbestos and Newparex and Nonpareil insulating bricks provide every form of heat control; Nonpareil corkboard provides cold insulation to meet all requirements; Paxtiles, Paxboard, Paxfelt, Paxmarine and Sprayed 'Limpet' Asbestos provide sound and thermal insulation combined with fire protection.

But there's much more to Newalls than the manufacture of materials to control extreme temperatures. There's a wealth of knowledge and practical experience to go into every contract Newalls handle. There's a know-how which you can use to advantage if you have any trouble in keeping heat—and cold—in their proper places, and making them work to the last degree. To seek Newalls advice will cost you nothing.

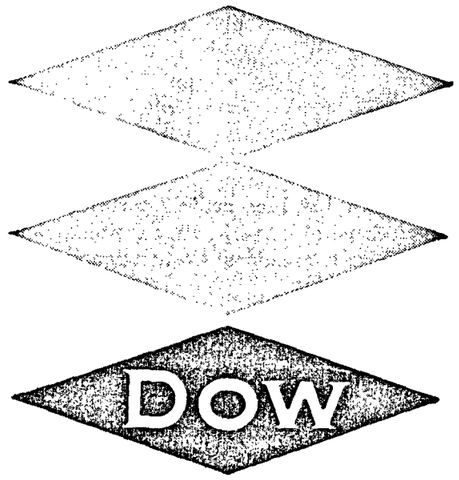
that if you have a vacancy to fill, junior or senior, skilled or unskilled, you should get in touch with The Officers' Association. This organisation is an Employment Bureau, and it has on its books much promising material. If The Officers' Association introduces a man, you may be sure that he is a candidate of complete integrity, potentially suited for that particular job, and well worth interviewing. Next time you have any vacancy whatsoever, why not first try The Officers' Association? Ring them at ABBey 2556, or write to Dept. P.2, The Officers' Association, Windsor House, Victoria Street, London, S.W.1.

problems in management:



Maintaining quality of product

Quality control can be a difficult problem in manufacturing. Or it can be a routine operation that causes little or no concern. Your own quality control depends upon the uniform quality of the material you purchase from others. Dow latex is a good example.

Manufacturers know that every can of paint must be of consistently high quality. Dow makes certain they can depend on uniformity of the basic material—latex.

Continuous batch testing with the latest scientific equipment is just one of the many ways in which Dow assures dependable quality. This uniformity has helped latex claim much of the credit for the rapid increase in paint sales. Painters like it because it's fast and easy to apply, has beauty, wears well and is easily washed.

Whether you are using latex in the manufacture of paint, paper or textiles, make sure your high standards are maintained. Get in touch with your local Dow representative or the nearest Dow branch office for your latex requirements.

PROPOSALS...

A proposal from the Kellogg International Corporation is the solution and recommendation to a specific problem confronting executives and engineers charged with supervising large capital expenditure for petroleum refineries and petrochemical plants. KIC proposals often require hundreds of engineering man hours to prepare and contain economic studies, process schemes, estimates of labour and material, engineering and construction schedules and other technical data. Of equal importance—Kellogg International Corporation proposals embody the experience and knowledge of a world-wide organization, which has been actively participating in engineering and construction for the petroleum and petrochemical industries since their inception. When planning a capital investment in these fields, a Kellogg International Corporation proposal is usually the most economic approach to solving your problems.

No Peace in Palestine

LIKE earlier prophets of Israel, Mr Ben-Gurion, having scourged his people's enemies, has had to turn about and face the anger of the people themselves. From January 22nd to March 1st he had fought a dogged rearguard action to get, in return for giving up the two captured strips of land left in his hands outside Israel, concrete gains for Israel's future security and its future communications. But when in the end he had to agree to withdraw his invading forces, he still had no concrete guarantees, but only "hopes and expectations," to show. It is true that the hope and expectations have the explicit approval of the President of the United States; but the President in his letter of March 2nd, the document which finally clinched the decision to order a withdrawal, spoke as the friend, not merely of Israel, but "of all the countries of the area."

Most of those countries are Israel's bitter enemies; and the United States is in course of embarking on a concerted diplomatic action in the Middle East designed to win their friendship in order to steer them clear of the influence of Soviet Russia. This is the overriding general aim of American policy; and though the pursuit of it in the Arab world takes forms that Britain cannot be expected to like, in the world at large we have reason to be thankful that it is being resolutely pursued. Mr Dulles, the chief executant of that policy, has made it clear that in his eyes such local questions as the security of Israel's frontiers, navigation in the Gulf of Aqaba, and even the control of the Suez Canal, are of minor importance in the world struggle against communist power. The rift that opened last summer between London and Washington and the contest of wills between Washington and Tel Aviv have both reflected this difference of proportions; so, curiously enough, did the tragedy of errors with Cairo over the financing of the Aswan Dam. It is, in fact, a standard and recurring problem of American policy: how to persuade the governments of smaller countries to accept that their national concerns are secondary.

Mr Ben-Gurion, in wresting a vote of confidence from the Knesset after the decision to withdraw, stressed the "informal promises" he had received, presumably from Washington, about the future of Gaza and the free use of the Gulf of Aqaba. But the United States government itself has been categorical that there are no promises that cannot be read in the documents that are public: the American note to Israel of February 11th, Mr Lodge's statement to the United Nations General Assembly on March 1st, and President Eisenhower's personal letter of March 2nd to Mr Ben-Gurion. The first of these documents was evasive on the vital points; the second nearly shocked the Israelis into calling off the withdrawal altogether; the third, Mr Eisenhower's letter, simply avoided the pitfalls of detail by being wholly and frankly general in its terms.

In sum, Mr Ben-Gurion can count it a gain that he has forced the issue of the Arab blockade and boycott of Israel into the open as issues of international law and conduct by which, as everyone must now

realise, peace in the Middle East is likely to stand or fall. He cannot with any certainty count the entry of the United Nations Emergency Force into Gaza and Sinai as a gain for Israel—since the force has gone there, not to protect Israeli rights, but simply to get the invaders out. Its presence becomes a gain, and not only for Israel, if the force stays there indefinitely after Egypt has recovered its damaged military strength, and if it assumes, among its other functions, that of restraining Egypt from hostile acts. There is no evidence whatever that a spontaneous majority can be found for that positive purpose in the General Assembly. In the last analysis, this new role can only be imposed on the United Nations against the preferences of its members—and probably by nothing less than the declared Israeli readiness to go to war again if the United Nations hands over Gaza to Egypt, or if the Egyptians again close the straits of Tiran.

Israel's successful invasion of Sinai has given weight to any declarations that its government may make in that sense. It is indeed a sad reflection that this should now be the principal stabilising factor in a region which has occupied the peacemaking energies of the United Nations for, off and on, ten years, but it is so. This is the balance-sheet, too, of the triple military adventure of October. France has cut its losses and returned to its Algerian preoccupation. Britain, as a consequence of its own folly, has retired for the present into an inactive part, its influence in the vital lands of oil transit—Egypt, Jordan, Syria and Lebanon—obliterated. Israel remains ready to fight again.

★

None of the Arab countries has made the slightest concession or declared any readiness to modify the boycott of Israel ; Egypt has not renounced belligerent rights against Israel or accepted any qualification of possession or sovereign rights in the Suez Canal, the Gulf of Aqaba, or anywhere else. American attention is now focused on the Middle East, and American diplomacy will become more active there than it has ever been in the past. But American diplomacy will be handicapped in handling the internal disputes of the Middle East by the danger that any Arab country that feels itself aggrieved may look to Russia for support.

Pacified only in the most superficial sense, the Middle East remains dangerous and unstable. The pipelines and the Suez Canal may soon reopen now, but Britain and most of Europe must continue to harbour the fear that their oil supplies may again be interrupted. And, since all the conditions of disunion, pent-up violence, juridical obscurity, and high strategic stakes exist in the Middle East, the world cannot rest free from the worse menace of a chain reaction that might lead to world war. Uno, with patience, skill, and the application of sedatives, may keep the danger damped down and provide a welcome interval of peace and quiet, but because of the disunity and conflicts of its members it can probably not do more. A working arrangement between the United States and Russia might remove the danger, but that is still far off. Only one other hope remains : that the Middle Eastern countries might compose their own conflicts.

★ ★ ★

The Arab states have won a diplomatic victory, in the teeth of Israel's military strength and their own total military weakness, by securing the Israeli withdrawal (in itself both right and necessary) without themselves renouncing the blockade, the boycott, or the state of war—without, that is, accepting a Palestine settlement in any shape or form. A settlement—recognition ; the juridical acceptance of frontiers ; the dropping of the boycott and the renunciation of belligerency —was the highest Israeli war aim. None of it has been achieved ; instead, the United Nations is saddled once more with supervising a patched-up truce.

Some Arabs realise that this precarious state of things is not in their interest, and that the pan-Arab movement need not necessarily, or always, be dominated by hatred of Israel. The existing convention in the Arab world is against them ; to admit to such views is a form of treason. President Nasser himself has consolidated his hold on Arab sentiment by accepting the convention, which at the outset of his rule in Egypt had seemed to make little appeal to him. But if security is denied to Israel it is denied, equally, to Israel's Arab neighbours. By merely keeping alive the dream of a counter-crusade which will one day remove the state of Israel from the map, the Arabs keep alive and foster in Israel the very characteristics that they fear: Old Testament irredentism, the military virtues, the implacable Zionist spirit, and the watchfulness of a beleaguered force ready to anticipate any blow before it is struck.

Egypt can no more benefit by keeping this spirit alive than by the other malignant aspect of pan-Arab nationalism in its existing form: the shutting of doors and turning away from the West. On the contrary, Egypt, for its own stability and the good of its people, needs a period of conciliation, with quiet on the frontiers, a relief from military urgency, the Suez Canal working profitably on terms that Egypt and the users can accept, trade flowing between the Nile delta and the western trading countries, and a return to development and improvement at home. Emotions have gone too far for an Egyptian government to make peace with Israel at one stroke, but President Nasser could begin now by accepting a breathing-space. He could set about gradually opening the doors that have been closed, and allowing the Egyptians and the Arabs a relief from the burden of high national tension. So relieved, they might in time come to see peace in Palestine as a good thing to be sought, not a danger to be fought against. To set such a course President Nasser would need to begin to lead his country instead of following his extremists ; he would have to be ready, as Mr Ben-Gurion has been, to confront anger at home.

On the Fringe of Planning

A GOVERNMENT bill is expected shortly to make permanent the power to apply hire purchase controls, if not the present controls themselves. It will be worth having a careful debate about it. It is being widely alleged that the most successful cuts in demand in the past eighteen months have been achieved by these and other measures "on the fringe of planning" ; and the sharp increase in motor sales since hire purchase controls on them were relaxed in December is being taken as proof that these weapons must not only be among the last to be abandoned when balance of payments stability is being restored, but must be regarded as a regular part of the Treasury's armoury. How far is this argument justified ?

The chief consequence of tight hire purchase controls, since their imposition in 1955, has been to ensure that the cut in demand that has taken place has fallen largely on cars and other consumer durables, instead of on other parts of the economy. This was deliberate, in so far as these particular demands were regarded as putting a special strain on scarce resources and on the balance of payments. But the effect has been that the cut in demand has occurred in those industries that were expanding most rapidly up to 1955, instead of in the industries which up to then (in a free market) had seemed most meet to decline, like cotton.

The short-term reasons why it seemed desirable that the cut should be diverted in this way must be accepted. Hire purchase represents internal "consumption," which all postwar Chancellors have learned (and with justice) to regard as the first thing that should be cut ; many of the goods that are bought on hire purchase are either goods that could be exported or are made by workers who could find other employment in similar export trades ; they also absorb a lot of scarce steel. But one truth must never be forgotten. It is that these short-term arguments, whatever their worth, still do not vitiate the long-term principle that specific controls, applied to forms of demand that bureaucrats find inconvenient, are much less desirable than general disinflation, based on consumers' preferences. And one of the reasons why hire purchase controls are liable to be used too much in modern Britain, in defiance of this principle, is that they happen to accord too well with certain parts of the mistaken attitudes of both political parties. Socially, some Tories still need to be told that the pre-1955 tendency for better-off members of the working class to increase their spending on cars, television sets and washing machines—at the expense of pools and pubs—was not a bad thing ; it was a very good one. And, economically, many Socialists need to be told that when demand runs ahead of productive resources in particular industries, this does not provide a long-term case for perpetually restricting demand in those industries ; it, in fact, provides a case for attracting more resources into them.

Both these points were made in *The Economist* when new hire purchase controls were imposed in 1955. Experience since then has surely confirmed the long-term social argument, and strengthened the long-term economic one. When resources have moved as a result of hire purchase controls, they have usually moved out of the industries which—if one believes in an expanding economy, and takes one's line about the likely future course of British expansion from American experience—should soon want those resources back again. Much more frequently, however, since producers of motors and other durables have until lately been prosperous and believe that they will be prosperous again, employers have held on to their men by instituting three- or four-day working weeks. In so far as the major diversionary effect of hire purchase controls has been to ensure that the cut in working hours has taken place in the most uneconomic ways, and in industries where workers' earnings and marginal productivity were previously highest, they hardly seem to have been on the right fringe of planning.

★

Moreover, since the money that consumers would otherwise have spent on hire purchased goods is freed to chase other things, the controls do not bring about any lasting cut in *total* demand. It is of the essence of these controls, like other physical controls, that they do not reduce consumers' total and eventual purchasing power by one penny. But there is a complicating factor here. When a hire purchase contract is opened, the purchaser pays out a small part of his disposable income but makes an immediate demand upon a greater volume of real resources ; later, when he is paying the rest of the purchase price, and (because of interest charges) slightly more than the original purchase price, he makes no demand upon any new resources at all—and the instalment payments are, in fact, counted in the national income figures as savings. Thus an increase in hire purchase contracts leads to a more than proportionate immediate increase in consumer demand, and this is followed by a natural—and slightly more than offsetting —fall in consumer demand later on. Thus, when hire purchase becomes an important factor in an economy, it sets up a minor trade cycle of its own.

What the imposition of hire purchase controls in 1955, and their strengthening in 1956, have done is to intensify a downward swing of that cycle ; 1956 was likely to have been a quiescent year for hire purchase anyway, and it is partly because of this that some of the figures now being quoted to show the "success" of the controls last year can be misleading ; 1957 is likely, by

the same token, to be a year of increasing new contracts, and if the controls were removed, the increase in new contracts—and the more than proportionate increase in demand that they would bring—would be greater than the economy could afford this year. There is now so much water stored behind the dam. This, surely, suggests the shape that the new bill should take.

It is desirable to be dogmatic about this. There are certain types of control—such as prohibitions on hire purchase companies raising new capital on loans—which must be wrong. Why discriminate against something that is socially valuable? There are others—such as limitations on minimum deposits and maximum periods of repayment—which are bad only when they are applied (as they were in 1955 and in a strengthened form in 1956) in such a way as to amount to virtual prohibitions on certain types of transaction. What is needed is not a bill to give the Government powers but to define which, and within what limits, are the legitimate controls; they should be used, when they have to be used, like Bank rate—gradually and at no stage amounting to prohibition. If the Government introduced a bill on these lines, it should command support. If—as one rather suspects—it introduces legislation designed to make stiff restrictions on hire purchase a normal, instead of an emergency, feature of our inflation-minded economy, then Tory backbenchers (who ought to be opposed to specific controls) and the Labour party (which once called hire purchase controls "class legislation") should stand ready to make a fuss.

A Ministry on Which the Sun Sets

GHANA joined the Commonwealth this week as its ninth member state, and its first with a black African government. The celebrations in Accra, to which every country on either side of the iron curtain sent representatives, have demonstrated the genuineness—though not the arduousness—of the British effort to turn colonies into self-governing states. Ghana leads a new round of promotions. Has the time not come to start making changes in the dual organisation in London which deals with an expanding Commonwealth and a contracting colonial empire? Sooner or later the Colonial Office will have to be wound up. Might it not be as well, it is being asked, to recognise that the Colonial Office's present and most honourable function is to work itself out of a job; and to transfer responsibility for the emergent, and even pre-emergent, Commonwealth countries to the Commonwealth Relations Office?

The timetable, after all, is getting filled in. It is true that it is not possible to run one's eye down the list of thirty-odd colonies of every size and sort, and set a date for independence day against each. The only positive fixture after Ghana is Malaya, for next August. But it is clear that there will be strong pressure for the transfer of other territories to the CRO even this year. The dividing line between dependence and independence is getting very thin. Thus both the Eastern and Western Regions of Nigeria are expected to become independent this year, and though, in default of the Northern Region following suit, this will not automatically confer full independence on Nigeria as such, the handling of its affairs at a "higher level" than the Colonial Office may well be put forward as a compromise in the delicate constitutional negotiations in May. The Federation of Rhodesia and Nyasaland is also asking for "higher status," though the remaining limit on its sovereignty lies in Colonial Office responsibility for the protectorates of Northern Rhodesia and Nyasaland; the Federation itself comes under the CRO already. When the Federation of the West Indies is completed next year, it too will at first not be fully sovereign, but it is already evident that it will demand higher status than that of a territory for which the Colonial Office has formal responsibility. Again, though control over the base at Singapore is to be secured to Britain, the Singapore delegation now in London may well bargain for a degree of independence which will involve transfer from the Colonial Office to the CRO. All these countries expect a change.

★

At the beginning of this week the Colonial Office was formally responsible for territories with a combined population of about 80 million. Ghana and Malaya will subtract only 12 million of these; but if all the countries demanding higher status, mentioned above, were added (and including Malta, which may go to the Home Office) the population of territories left within the Colonial Office orbit by 1959 would be only 25 to 30 million. This would be shrinkage indeed. All that would then be left in the way of sizeable territories would be East Africa; the rest would be small enclaves and some hundreds of islands dispersed in every ocean. Even from this reduced colonial dominion, Sierra Leone, Uganda and perhaps Mauritius might be removed by the early 1960s. Before then, the future of Cyprus, as one of the Mediterranean fortress-colonies will, it must be assumed, be settled—and what British control is exercised is more likely to be done through the CRO or Foreign Office than the Colonial Office. There is not much time to take decisions about the future of the Colonial Office before it becomes a mere shell of its present active self. This has not escaped attention in the Colonial Office itself, but the difficulties are considerable, and could too easily prevent anything being done.

The principal difficulty in the way of an early amalgamation between the Colonial and Commonwealth Relations Offices is that the two departments claim that they need different types of expertise. The Colonial Office probably feels that its activity in preparing colonies for independence makes any immediate merger almost impossible. For the next year or more, it says with some force, no single minister could perform both the functions of negotiating the independence of a whole series of colonies and then making them feel at home in the Commonwealth family. Latter-day dominions are giving more trouble at their birth than earlier ones; there is a case for separate specialists to deal with the prenatal and antenatal crises. Nor is the CRO inclined to minimise the arduousness of its own special task. Its functions are entirely different from those of the Colonial Office; but though they are essentially diplomatic, it thinks of them as diplomatic to a point of delicacy that the Foreign Office hardly dreams of. To send out the telegrams, to see that everyone is kept informed—the telegrams went on flowing to the Commonwealth throughout the Suez crisis—to keep the party together without treading on anyone's toes, is the CRO's speciality; it argues that it is simply not equipped to supply and control a cadre of administrators and technicians, to deal in constitutional change, to lay on financial and other aid for development. It is highly reluctant to take on the affairs of any colony until it has set hard as an independent state.

★

Up to a point—but only up to a point—these arguments are cogent. Yet the CRO administers Bechuanaland, Basutoland and Swaziland like colonies; there seems no reason why it could not temporarily carry semi-colonial functions *vis-a-vis* Northern Rhodesia, Nyasaland or Northern Nigeria. If it did, the final transition of these territories might be eased. To the practical administrator it is false to make a sharp division where independence falls. There is a graduated scale of degrees of independence from the most colonial of colonies to the most republican of sovereign Commonwealth states. After independence, Colonial Development and Welfare has to be replaced by the Colombo Plan or something like it (there will have to be some new sort of Commonwealth finance corporation or co-ordinating committee soon); but the administrators stay on for some time, the technicians even increase. The new independent ministers find themselves telling their sovereign parliaments just what are the real limits on sovereign freedom of action in the modern world.

Nevertheless, the CRO has practical reasons for arguing that there must be a formal break between the last of the colonial stages of a country's development and the first of the stages of adult nationhood. One of these is the reluctance of the existing Commonwealth countries to have anything to do with Britain *qua* colonial power, to seem to condone colonialism by accepting a colony as a partner in their company. It remains to be seen if the partial exception made for Rhodesia would form a precedent even for Nigeria. To press for a premature transfer to the CRO might merely provoke a request from India (perhaps even from Canada) to have its affairs handled by the Foreign Office—which is, indeed, an issue sure to be posed, though it would be a disadvantage to incoming Commonwealth states. "Near dominions" may desire to be upgraded, but existing dominions do not want the CRO to be diluted.

It might have been far easier to have overcome this difficulty if the original proposals for a Commonwealth civil service had been imaginatively carried out—if the Commonwealth countries had been prepared to send more technicians and administrators of their own to serve the colonies in their transitional stages. Even so, there is no reason at all why, with the example of Ghana to go by, Commonwealth member states should not be asked to join with Britain in overcoming the last obstacles to the independence of so many emergent territories in the next few years. Put rightly, the request would be hard to refuse.

The first objective should surely be to bring as many new territories as possible into relations with the CRO

The Overseas Service

Few topics have been more thoroughly winnowed and sifted than . . . our present quarrel with China. . . . There can be no doubt that our diplomatic representatives abroad ought to be chosen with the utmost care and from the most pure and single-minded motives. They should be selected from the most firm, temperate, prudent, courageous and conciliatory men the country can afford. The more distant the station and the more peculiar the people in question, the more anxiously conscientious should be the selection—since greater qualifications are required and wider latitude of discretion must be given. There can be no doubt, unfortunately, that this rule has not always—nor generally—been followed. Further, it is true that our usual wise and chivalrous custom of backing the remonstrances and ratifying the proceedings of our representatives in all quarters of the world, may occasionally induce these gentlemen to act with undue peremptoriness and precipitation, and virtually bestow upon them a power of getting us into disputes and keeping us in hot water, which, rightly and constitutionally, should be vested in the deliberate decision of the Home Government alone. But after allowing the fullest weight to these pleas, it still remains undeniable that the disavowal or the discountenancing of our diplomatic representatives in remote places (whether they be naval men or civilians) is a practice fraught with danger of the gravest nature, and should only be done in the rarest cases and on the clearest grounds. . . . On the weight which their representations and remonstrances carry with them may at any moment depend the lives and property of British citizens and the honour of the British flag and name. We do not say that rash and headstrong envoys—if any such have been, unhappily, sent out—should in *all* cases be sustained and backed; but we do say that before we decide upon such a questionable and perilous proceeding as disclaiming and recalling them, the evidence of their injustice and indiscretion should be very clear, very strong, and indisputably *complete*.

The Economist

March 7, 1857

by agreement. What then remains of the Colonial Office should certainly be renamed; it should indeed be renamed at once, for the name does not describe its modern functions, and perpetuates prejudice needlessly. By 1960, or not very long afterwards, the Ministry for Overseas (or Associated?) Territories could be a fairly small office, dealing with the remaining colonies and those smaller ex-colonies that, for reasons of defence and economy, wanted Britain to continue to represent them abroad. The number could be cut down if existing groupings could be widened—for instance if Malaya could federate with Sarawak and Borneo, British Guiana with the West Indies. Somaliland might go in with a greater Somalia; the Gambia might merge with an independent Senegal; in a variety of ways, and by means of reciprocal rights, however, traditional ties could be maintained.

This is looking ahead and disposing of difficulties very lightly. But it is necessary to look ahead and see beyond difficulties. The department that needs strengthening is the CRO, and perhaps it is the department that should now do most of the forward thinking. Ghana is not just a milestone; it is the point of no return for both ministries.

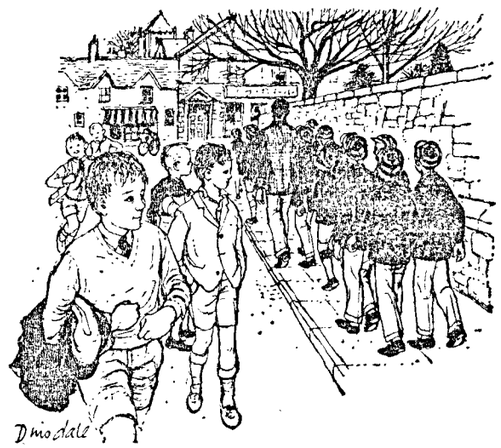
BRITAIN'S SCHOOLS—II

Preparatory School

"PLEASE drive slowly pending repairs to the drive" read the weather-stained notice at the gates of the preparatory school. The board had obviously been there for years. But the school itself—a country house in Edwardian-Jacobean—was well kept; its lawns were mown, its yew hedges clipped, its huge cedars carefully tended and majestic. Within, the parquet was well polished, the paint new enough, and the panelling in good repair. "We can just about afford to keep it decent," said the headmaster, "but the cost of maintaining a place like this, even at this standard, is formidable. For last term alone the bill was £1,000."

Maintenance, he went on to explain, is not the only rising cost which embarrasses his, as well as many other, "prep schools." In the last two or three years the staff have become much more expensive. "To get masters worth having we have to pay as much as the state schools pay their teachers," he said, as if masters and teachers were of quite different species:

> It's true that by and large we aren't competing for the same people. Prep school masters are almost always ex-public schoolboys. But obviously if the gap between prep school salaries and the Burnham scale got too wide we should find it very difficult to get anybody.



It is difficult enough now. For every post that is advertised there are plenty of applications, but nearly all these are from people whom a good prep school would not look at. This school, like others outside the state system, does not expect any training in the technique of teaching from masters, although mistresses are nearly always Froebel-trained. But it does want men with some sort of degree. Most prep schools, it is true, are staffed at the lower end by young men waiting to do national service or to go up to a university, or else tiding themselves over while they look for something else. This is not quite as bad as it sounds; they are good with the games, they can still remember how they were taught themselves, and if they are going to a university they are usually literate. But the rapid turnover is bad for the youngest forms.

Young graduates of the "right type" who are prepared to make a career in prep schools are hard to find. One headmaster whom your correspondent visited said that the applicants he had any hope of keeping were always over forty; the post-1948 influx from India and of ex-regular officers was a great help. Another head, on the other hand, thought that the shortage would not get worse. The career prospects for prep school masters (as well as the schools themselves) are improving, he pointed out, now that more and more headmasters are salaried. The owners of prep schools do not always have a son who wants to inherit the business, and they tend to pass on their schools to a board of trustees which appoints a headmaster—an arrangement which reduces the tax that is payable and does away with the suspicion that the headmaster has a vested interest in feeding the boys as cheaply as possible. Alternatively, a group of old boys or others may be invited to take shares in the school as a limited company. And prep school teaching will always have its attractions for those who like small boys—as well as four months' holiday in the year. It is on the whole a bull point for these schools that the staff are there because they like it. They do not work by the clock, or hold protest meetings about their pension scheme (if any), or see themselves as martyrs to the stinginess of an ungrateful community. They are delighted with their little world.

That being so, the prep schools can usually lag a bit behind the Burnham scale (though a few exceed it), but they cannot escape its upward thrust. Another rise in fees seems inevitable. The good prep schools do not lack customers—indeed, their waiting lists are longer than ever. But parents' resources are already strained. There is an increasing use of endowment policies which spread the cost of private education over 18 years. The headmaster told your correspondent that several of his fathers take jobs abroad simply in order to earn enough to give their sons this kind of education.

Or it may be paid for by grandfather, who may set up an educational trust under covenant, or pay a once-for-all capital sum to cover five years of preparatory schooling. The school transfers this sum to a firm of insurance brokers which pays the fees as they fall due. The advantages are that grandfather (or anyone else) may, if he pays eight years in advance, put down only £880 for fees that would otherwise total £1,380; and that the sum is not liable for death duties. But the difference must be paid if the fees go up. Whether the next generation of grandfathers will be in a position to do this sort of thing is doubtful.

Grandfather's money is not the only favourable wind that might change. One that will certainly disappear is the Bulge, the rush of births that took place after the war, in which the upper middle and upper classes played their modest part. The children at the peak of the Bulge (such is the jargon) are now eleven, so the supply of prep school boys will not start to decline for another two years.

A development that would cost the prep schools dear would be a change in the attitude of prep school type parents to the primary schools. More and more of them are sending their children there between the ages of five and eight and then to a prep school until they are thirteen; but the instinctive middle class attitude is still to regard primary schools as places where the children, in classes of forty or fifty, learn bad manners for certain and the three Rs only with luck. They do not worry because none of the staff in the independent system has a teacher's training certificate; they are only mildly enthusiastic about arts and crafts; and they care not at all for "free activity." They are not in the least moved by educationists' indictments of the "straitjacket of examinations," and are not afraid that their children will have nervous breakdowns at the thought of taking the common entrance examination for the public schools.

But it would become less worth while to pay £300 a year for four years if something nearly as good could be had free. In the next few years the primary schools should greatly improve. The Bulge is beginning to move out of them now, and their classes will be shrinking—although at 35 the average primary school class is still three times as big as that of the prep school. The new primary schools have buildings and equipment that the prep schools cannot emulate. One big advantage, however, will remain: the prep school curriculum with its Latin and Greek, its Mathematics and French, fits on to the public school curriculum.

Even that might change. What if the public schools were to adapt themselves to take boys direct from the primary schools? Those schools which already get boys from state schools find that after about a year they can cope with the ordinary curriculum; at an age when they can learn much faster they soon catch up with all the Latin, Greek, Algebra and French that their contemporaries acquired in their prep school years.

The public schools might go further. Many of them are worried because such people as clergymen, dons and civil servants cannot afford ten years of schooling at an average of £350 per year per son. They are also sensitive to accusations about a "class education," and apprehensive about their future under a Labour government. Sooner or later, therefore, they may decide to ditch their old friends, and to take boys at eleven, instead of at thirteen or fourteen. It would be a most difficult and reluctant adaptation, but all the same, it might come, and if it did the prep schools would lose their *raison d'être*.

It would then be a case of the survival of the fittest. A weeding-out of the least satisfactory schools is already going on, for each year two or three prep schools go out of business, and the process may be slightly hastened from next September when Part III of the Education Act comes into force. This provides for the compulsory registration and inspection of all independent schools; henceforth a school which is not recognised as efficient will be branded in a way that it is not at present, when independent schools voluntarily apply to be inspected. The 480 schools that are members of the Incorporated Association of Preparatory Schools are supposed to be "recognised" as a condition of membership—although they are not immediately expelled if recognition is withdrawn. Sporadic press revelations—about a school staffed entirely by convicted homosexuals, or a headmaster starting successive schools on credit and flitting when his debts caught up with him—give a false impression of the importance of the fringe beyond the pale.

It is rather the dim schools, with poorly qualified staff and no triumphs in public school scholarships, that will go out of business. It is not hard, on the other hand, to guess which schools will survive. The lists of scholarship winners in the Public Schools Year Book show the same prep schools appearing again and again. They will survive anything short of a complete abolition of the public schools. They will do so because they are very good schools, and because there will always be parents who would rather spend their money on their children's education than on mink and drink.

Notes of the Week

Mr Macmillan's Host

MR MACMILLAN goes to Paris this weekend for the first meeting between the prime ministers of the two countries since the intervention in Egypt. Arranged before M. Mollet went to Washington, the meeting forms part of the general attempt to put the vital lines of the Atlantic triangle back into shape. On the eve of his own journey to Bermuda, Mr Macmillan will naturally want to exchange impressions and collate ideas with the French prime minister, particularly on the future of the Suez canal. Franco-British relations are close, but there is need for the two heads of government to clarify their relative views on such topics as atomic co-operation and the European common market, particularly as it concerns the overseas territories. Mr Macmillan will take the opportunity to dispel the impression that the wish to cut military commitments means that Britain is moving away from Europe.

M. Mollet, with customary exuberance, described his American journey as "a complete victory." Certainly he scored a success. Misunderstandings were cleared up, and French stock rose in the United States, particularly as, by a happy coincidence, M. Pineau, his foreign minister, managed to act as an important go-between in the vital negotiations between Mr Dulles and Mrs Meir. A closer look at the *communiqué* published at the end of the visit does not suggest the French achieved anything substantial: the Americans show no inclination to seek western partners for their Middle Eastern policy; and on Algeria the statement expresses agreement about vague ends, not about the means to carry them out. The French success lies more in the field of public relations.

Foreign affairs are not M. Mollet's only preoccupation. While he has been away his finance minister, M. Ramadier, has run into parliamentary troubles over price controls and over government financial policy. In next week's general debate in the assembly the French government may be compelled to define its economic programme. Everybody agrees that M. Mollet must make a fresh start in this domain, just as he must seize the initiative in Algeria; but nobody seems to know what he can in fact do.

Welcome, Ghana

LET there be trumpets, and good advice, for Ghana. Congratulations are due equally to Dr Nkrumah and the Colonial Office for finding the compromises that enable the new state to start life without challenge to its authority from the once seccessionist, and still doubtful, minority communities. Everything now depends on Dr Nkrumah carrying over into the new regime the spirit of accommodation that saved the situation in the last days of the old. If he is to carry out the big plans for Ghana that he has in mind—and to avoid any repetition of the sorrows of Indonesia and the Sudan—scrupulous care for the rights of the minorities will be essential.

Dr Nkrumah makes it clear that he sees Ghana as the rallying point for all Africans still under colonial rule, and especially for Africans in South Africa and Rhodesia. He has hinted that Ghana's membership of the Commonwealth is conditional, resting on the belief that the Commonwealth stands for the peaceful settlement of disputes. This is no doubt a reference to the Suez affair; it has yet to be seen what line, if any, Ghana will take on Kashmir, in view of the strong pro-Indian feeling in its ruling classes.

This is fair enough, though it may introduce some new stresses into Commonwealth relations. But Dr Nkrumah has shown that he realises the limitations of independence for a country with a weak economy. He wants (and may still get) a Commonwealth-run substitute for the Colonial Development Corporation, and he has shown a new awareness of the opportunity the country would lose if the Volta scheme were finally to fade into thin air. He has also made a vague but significant proposal that the sterling area should in some way "insure" Ghana against a prolonged depression in cocoa prices, which are now down to £175 a ton, a level at which the grower is being supported from the reserves piled up in the days of high prices; those reserves would have been higher if part of the cocoa-growers' money had not been spent on development. He emphasises that cocoa is a dollar earner. Dr Nkrumah, however, will have to earn any concessions Ghana is to get as an independent state, dollar-earner or not. He has now little nuisance-value; to attract investment he must show efficient administration, creditworthiness and ability to keep the country together.

Suez Canal Prospect

THE Syrian Prime Minister told the Iraq Petroleum Company on Wednesday that it could start repairing the pumping stations, sabotaged in November by the Syrian army, on the Kirkuk-Mediterranean pipeline system. To restore the pumps will take a year, but the company can by-pass the stations with a week's work. By that means it hopes to restore in as little as ten days a flow of 11 million tons of oil a year, as against the normal 25 million tons when the pumps are working.

As the Egyptian government must have approved the Syrian decision, it is presumably ready to permit the reopening of the Suez Canal. Mr Dulles said on Tuesday that he hoped Egypt's tendency to "drag its feet" in this respect would now disappear. The removal of the sunken tug *Edgar Bonnet* from the channel will free it for ships up to 10,000 tons and that should take about a fortnight. Perhaps the Israeli withdrawal will, by a kind of political magnetism, extract from the tug the explosives which the Egyptians declare to be there, but which they are slow to remove.

While waiting for permission to work on the *Edgar Bonnet*, the UN salvage fleet has apparently been busy with other obstacles scheduled for removal later. The canal can therefore be fully open by early April instead of early May. Oil supplies from the Persian Gulf could then start climbing to normal levels, except for the shortfall of 1,200,000 tons a month in the flow through the IPC pipelines.

This does not mean that political difficulties are at an end or that Mr Dulles is right to assume that Egypt will not again close the canal to Israeli shipping. Egyptians recently come from Egypt are sure he will.

Going Independent and Left

MAKING every allowance for Liberals, Welsh Nationalists and Independents, the arithmetic of Wednesbury and Carmarthen clearly confirms the trend of North Lewisham: there is a sizeable revulsion from the Tories, and a smaller drift towards Labour. Carmarthen (an 8.3 per cent swing against a right-wing Liberal, of which the Welsh Nationalist picked up 3.7 per cent and Labour the 4.6 per cent that got Lady Megan Lloyd George in) might not be a significant straw by itself. The astonishingly high poll (87½ per cent) suggests that the rural Welsh take their politics with a pre-television, even pre-radio, fervour: in such elections personalities, rather than parties, still count.

But Wednesbury provided the most startling result yet. The Conservative share of the vote fell by over 11½ per cent (a bigger loss than at Tonbridge), but Labour's share rose by less than 2 per cent. Very nearly 10 per cent went to an Independent who had his nomination papers signed by casual passers-by in the street, mounted virtually no campaign, and was regarded by many people as having proffered his candidacy partly as a good-natured joke. Here, surely, were all the elements making up the current political scene: middle-class and artisan disillusion with the Tories, some rallying to Labour (but possibly through better organisation rather than any new political appeal), and a significant irritation with both the big parties. It is noteworthy that each of the first three battles in the "little election" should see a third candidate polling far more votes than expected.

On Thursday straight fights were in progress for Sir Anthony Eden's former seat at Warwick and Leamington (a 14½ per cent swing needed for Labour to win it) and Lord Monckton's former seat at Bristol West (a 25 per cent swing needed). It will be a major political sensation if either of these Tory strongholds have fallen, but at Warwick and Leamington the local Conservative organisation seemed to be very nervous indeed.

No Leaks from Sir David

JUST when their hopes of achieving office are legitimately rising, the Labour party leaders scarcely added to their claims by devoting the greater part of Parliament's time on Monday to dissecting, well past the point of tedium, just what Sir David did or did not say about the cinema tax. What Sir David was authorised to say (or rather to repeat) was that the Chancellor will take account in his budget of the fact that the levy which cinema exhibitors pay to film producers is being increased by £1¼ million a year, and is being made compulsory: that (to quote Mr Thorneycroft) this increased levy "will be thrown into the balance to the credit of the cinema industry . . . in the weighing up of the pros and cons of any increase or decrease in the (entertainments) duty." Since not many people have suggested that there are many "pros" this year for increasing the duty (which brings in a total of £33 million a year), it seems a plausible deduction that the duty is likely to be cut next month by at least this £1¼ million. Under questioning, Sir David made that deduction, and it is open to Mr Thorneycroft and the Cabinet to be cross with him for exceeding his brief.

It was also open to Labour to tease the Government and Sir David about this, but it was not open to them (least of all to Mr Dalton) to pretend portentously that a statement to the House of Commons can be a "budget leak." The essence of a "leak," as exemplified by the Thomas and Dalton affairs, is that the recipient is placed in a position where he could take special advantage of his advance knowledge. When advance hints of tax changes are made in Parliament, they may cause confusion and uncertainty (as did Sir David's), but they are published to the whole world and there is no question of anyone beating the pistol to his brokers. The suggestion that there is something wicked in a minister's words putting up share prices is absurd; many Government statements—and even Opposition moves, at times—can influence the market.

The upshot of Monday's affair was that Mr Gaitskell has again shown his tendency to misjudge which point of the Parliamentary front is the best point at which to launch a battle; he has done this at least twice before, and it seems to be one of his minor weaknesses as a party leader. Some Tory backbenchers, who would have rallied more enthusiastically to the Government's support but for a private desire to have a dig at Sir David, have not added to their reputations either. It was left to the Prime Minister to put the affair in its true, and trivial, perspective, although even he could not resist a final, theatrical declaration of loyalty, which only helped in the gross over-dramatisation of the affair. No marks, from this debate, to anybody.

"Espionage" Unlimited

THE Egyptian court of first instance on Monday committed for trial on charges of spying eight British subjects, a Jugoslav and eleven Egyptians. Four of the British accused are safely out of Egypt. Two of those

in custody, Mr Stanley and Mr Pittuck, have pleaded not guilty; the other two, Mr Swinburn and Mr Zarb, for whom the Public Prosecutor has demanded the death penalty, have left it to their lawyers to enter their pleas.

When Mr Swinburn was arrested in August the Department of Information published extracts from his alleged confessions. To a court in October, which sanctioned the remand in custody of all the accused, Mr Swinburn is reported to have said (the hearing was in camera) that "what he did, he did from patriotism and not for money." In a television programme of the National Broadcasting Corporation of America, President Nasser said the whole case did not involve a plot; the accused were only gathering information.

No one yet knows, or (since the trial will be secret) is likely to know with any certainty in the end, what the case is all about; but it does seem clear that, whatever actions Mr Swinburn may have confessed to under intensive interrogation at the outset, he is not prepared to accept that they amounted to espionage before his lawyer has had a chance to argue the matter. The boundary between espionage and the innocent collection of information is differently drawn by different types of regime, and in some countries the boundary is sometimes arbitrarily shifted. By the more extreme definitions there must be huge numbers of harmless people throughout the world who could be accused of spying. Does anyone imagine that Egyptians in England who came across confidential titbits did not pass them on to their embassy if they were in a position to do so? Leading members of many communities in foreign countries pass on information as a matter of course, often to the general good; they would be surprised to be called spies.

Neither the earlier publicity nor the secret trial are likely to carry conviction in the world outside Egypt; perhaps they will not carry much inside Egypt either. There have been too many spy trials behind the iron curtain. Death sentences in this case would be unthinkable; the men are simply victims of the disastrous change for the worse in relations between Britain and Egypt. President Nasser, who has not been a bloodthirsty leader, must surely see this. There are precedents for expelling, not for killing, foreigners caught in such a trap.

Rhine Army Economics

ALTHOUGH their original objective was the whole £65 million or so required to pay the armed services' bills in Germany, the British negotiators in Bonn are on the whole, and rightly, satisfied with the £50 million which they have extracted from the Federal Government. Theirs was not an agreeable task, and they are relieved that it was accompanied by so few unfriendly noises "on" and "off." In theory the Germans are offering to pay only £17 million —half of last year's contribution—towards the upkeep of Rhine Army, the second Tactical Air Force, and the Rhine Flotilla during the next twelve months; and that sounds comforting to the sensitive German taxpayer. In practice they have agreed to make it £16 million more than last year by allotting another £33 million for the same purpose under the more palatable title of Defence Aid.

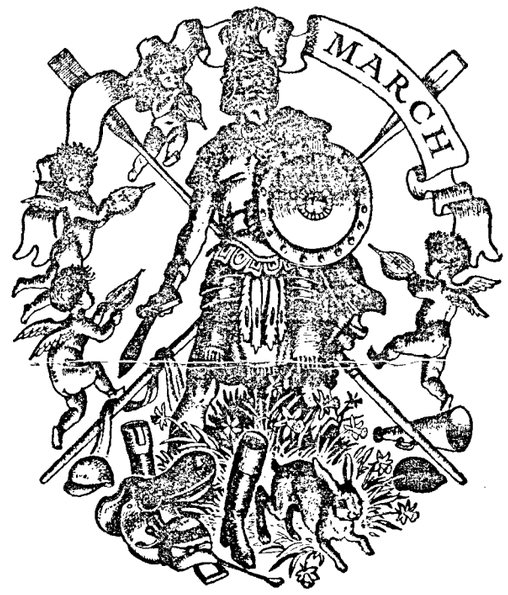
Naturally enough, they have emphasised that the agreement should not be considered to have set a precedent. It does, however, set a good precedent in two ways—first, by transferring the whole question of defence support in Germany from the old framework of the relationship between an occupied country and the occupying power, to the new framework of the Nato alliance; and, second, by substituting the rule of what is right and necessary for the rule of thumb by which occupation costs were formerly shared out between the three allied governments.

A clause in the agreement allows Germany to call for a review after December 1st "in the light of any changes in the situation" which may bear on the level of payments now agreed. This need not mean that cuts in the British forces, if Nato agrees to them, will automatically lead to cuts in the German payments; any review should now be made in the context of Nato's whole burden-sharing exercise.

The bulk of the British forces' spending in Germany is on labour, transport and hard fuel. In the official view, the maximum economies compatible with the maintenance of efficiency and morale are already in force. The frequent criticism that Rhine Army is served by too ample a German civilian tail is countered with the claim that the proportion of operational to non-operational soldiers is much larger in Rhine Army than it is in Britain.

Behind the recommendation that Germany's arms purchasing account with the Bank of England should be increased lie some striking figures of German defence procurement from Britain. In the last three weeks, after months of hesitant negotiation, the Bundeswehr has finally placed hard contracts with British firms for equipment worth £50 million. Deliveries will take place over a longish period. The British negotiators hope that the German arms orders from this country will approach £100 million.

Husbands in Default



MISS JOAN VICKERS'S Maintenance Orders (Attachment of Income) Bill got its second reading last week, with the blessing of the Home Office and without as much opposition from trade union MPs as its principle of encroachment upon the "inviolability of wages" has tended to excite from them before. It is to be hoped that this private bill has an equally fair wind in the remaining stages of its still-hazardous journey towards the statute book. At present, the only way of dealing with a man who refuses the order of a magistrate to pay maintenance to the wife (or the mother of his child) whom he has deserted, is to put him in prison. The fantastic number of 5,000 men a year (or one in ten of all prison entrants) are in fact committed for this offence. The defaulter is usually imprisoned for up to three months; this wipes out his existing debt, and meanwhile the woman is dependent on national assistance payments. If, on coming out of prison, he still refuses to pay, he merely goes back there; at least one such man is known to have been in and out of prison for sixteen years, until his child was old enough to start earning, and until he himself had served longer than the average murderer. Further, the police are not allowed to help the deserted

A welcome to Ghana

Barclays Bank D.C.O. offers its warm congratulations to the State of Ghana on the attainment of its independence. For the last forty years the Bank has played an active part in the economic development of the country. In June, 1956, as an expression of faith in the future of the State, the Bank established a Local Head Office at Accra which has been entrusted with the control of its 37 offices in Ghana and with assisting in the advancement of the commerce, industry and agriculture of the new State.

54 LOMBARD STREET, LONDON, E.C.3

The name of the month derives from Mars, the Roman god of war. The Saxons, more prosaically, called it Rough Month (Hreth Monath), which seems to indicate that the climate hasn't changed as much as one might think.

Because in March the hare sheds a few inhibitions, is it altogether fair to label him 'mad'? Others welcome the spring with equal abandon, yet incur no similar slur. Even *homo sapiens* is not entirely blameless. Go down among the boat-race crowds at Putney; drop in to your local Cup Tie; or watch the man next door laying up for himself lumbago in the garden — what, one wonders, would the hare think of all these goings-on? But let us not forget, as we mark the coming of Spring, that the season is notably one for planning, for looking ahead. And, if your own plans concern the future welfare of your dependants, the most profitable way for you to celebrate the Spring is to take counsel now with the . . .

woman to find the defaulter if he takes a job in another part of the country.

Under Miss Vickers's bill magistrates would be enabled to order that employers take the right amount from the man's salary or wages, and pay it into court for the benefit of the wife. In Scotland, where this has for long been the practice, there are only about thirty men now in default on maintenance orders. Admittedly, defaulting Scotsmen may be getting away with it by absconding to England. Admittedly, too, the bill will not solve all problems in this sphere. One group of distressed wives it should help are those whose husbands refuse to pay because they are feckless and try to live at a rate which does not allow for weekly payments, or because they are determined to have nothing at all to do with those with whom they have quarrelled. If the payments are deducted at source, these men will have no chance of getting used to living at too high a standard; and the payment of money into court will enable them to avoid having direct dealings with their wives. The hardest cases that will remain are those men who now go determinedly in and out of prison, usually of course because they firmly believe that a child for whom a maintenance order has been granted is not theirs. After Miss Vickers's bill they are likely to try to avoid attachment of their wages by changing from job to job, and perhaps from name to name, instead. But it does not seem to be a sensible point to make against this measure, which could bring relief to thousands of deserted wives, that it would also deprive this group of embittered unfortunates of the privilege of unnecessarily filling Britain's overcrowded prisons.

Mr De Valera Wins

As we go to press, our Dublin correspondent reports that with 69 seats won, and another 5 or 6 reasonable certainties to come, Mr de Valera's party, *Fianna Fail*, seems certain of a clear majority over all other parties combined in a Dail of 147. Under proportional representation, the later counts often tend to close the gap between the leaders and the rest of the field, so his working majority may not be a particularly comfortable one. But the new Dail should have a longer life than has been usual in the last decade.

The increase in Mr de Valera's vote was not, however, in any way spectacular, and his big gain in seats was the result of the calamitous fall in the *Fine Gael* and Labour vote. Mr McBride has lost his seat and his Popular Republican party is down to a single deputy. It is clear that the coalition has collapsed because so many *Fine Gael* voters have abstained, on principles that are familiar in England. Labour's losses reduce that party to little more than a combination of deputies who command a personal rather than a party vote. *Fine Gael* cannot expect to end up with much more than 37 seats, and Labour with perhaps 12.

The *Sinn Fein* candidates did better than expected and seem to have secured 4 or 5 seats. These have been obtained almost entirely at the expense of *Fianna Fail*; the size of Mr de Valera's working majority will depend partly on whether their deputies stick to their announced intention of not attending the Dail. It must be counted a gain that the *Sinn Fein* vote should have been tested in an open election, even though the results show that old passions are still either fashionable or deep. The real implication of the election, however, is that it is a vote for party rather than coalition government, and it restores stability to Irish politics in the short term. But in the next couple of years the major parties will clearly have to take stock of their policies and of the future, and to face the difficult question—in Ireland—of what interests exactly they are trying to represent.

Helping Euratom

A START, at least, has been made in creating a partnership between Britain and Euratom, the proposed European atomic community of the Six. The "three wise men" from Euratom who came here last week went home fairly well satisfied. To Euratom, the link with Britain is less vital than that with the United States, which will be its main supplier of enriched uranium fuel. But the British knowledge and experience of atomic energy are very important to the Continent. Euratom has been promised not only knowledge, but help in training scientists; and as in the United States, a joint technical group is being set up to work out the details of further co-operation.

The visit, too, was encouraging for the sections of British industry concerned with atomic development. What they saw in this country made it clearer to the Euratom experts that if the six countries are to instal atomic power stations quickly they will have to make a start with the Calder Hall type, which the British can build. So a prospect of European orders for British construction groups is opening up.

But the problem remains to devise a form of association which will endure beyond the immediate future, during which Euratom's need of knowledge and construction teams from Britain is obvious. In part this is a technical problem, which can be tackled by the joint technical group. But it is also political, and a clear statement by the Government that it seeks a special and permanent relationship with Euratom for Britain, closer in certain respects than that between Euratom and the United States, would make clear what the task force has to do. Much will depend on the spirit in which negotiations are carried on—whether, for instance, Britain takes the initiative in proposing concrete forms of partnership without waiting for Euratom to come and ask for them. One of these might be a joint programme of power reactor prototypes which could supplement our own programme at home. On a narrow view such efforts depart from the Government's declared policy of keeping its work with Europe in the nuclear field within the framework of OEEC. But there is no reason why the efforts of the Six and of the larger group of countries should not complement each other rather than compete.

Timetable for Tanganyika?

ONCE again Britain has been prodded by the United Nations to set a time limit to its guardianship of Tanganyika. The General Assembly last month passed two resolutions: an umbrella demand for independence at

an "early date" for all trust territories; and a specific call to Britain to explain the steps it is taking to guide Tanganyika towards democratic self-government. Britain has always dismissed these UN demands for a timetable as impracticable and trouble-making, and in defence has said that it is impossible to judge in advance when a territory will be ripe for independence.

The aloof self-satisfaction of British colonial policy in Tanganyika has, in the past, rankled more in the UN than in the politically placid territory itself. The arid and harsh character of much of the land, and the primitive life of most of the people, have encouraged a passive acceptance of an administration which is liberal by East African standards. The nominated unofficial members of the Legislative Council are European, Asian and African in equal numbers (there are 31 official members and 30 unofficial). Next year, there is to be a cautious experiment in qualitative common roll elections: selected constituencies will elect three members of each race. Two years ago all unofficial members of the council (except for four Africans) pledged themselves to work for the political and social integration of all races through the United Tanganyika Party: an anti-apartheid movement, strongly supported by the governor, and designed to take the wind out of racialist and nationalist sails.

But multi-racialism is being challenged by a growing and assertive band of African nationalists. Mr Julius Nyerere, the president of the Tanganyika African National Union which claims large membership and influence, campaigns on the line that Tanganyika is "primarily African and must be regarded as such." He made three points to the General Assembly committee in December. He queried whether equal racial representation was a fair doctrine when the people represented were some 25,000 Europeans, 70,000 Asians and over 8 million Africans. He doubted the democracy of a qualitative common roll and called for universal suffrage. And he requested that a time limit should be set to trusteeship, suggesting a period of 10 to 12 years. The last point is the one which, naturally enough, has been taken up most vigorously by the United Nations. And the Colonial Office may be forgetting the lessons of other territories in refusing to discuss a date. Tanganyika will not remain placid indefinitely.

The Briggs Inquiry

OUR special correspondent, who has been attending the Court of Inquiry into the labour troubles at Briggs Motor Bodies factory, writes:

There are three major points over which the inquiry has ranged so far. The first concerns the circumstances of Mr McLoughlin's dismissal, whether it was victimisation or a punishment for indiscipline. Mr McLoughlin told the court that the "best way to pacify" his foreman at the works "is to ignore him." When his foreman told him not to ring the bell that summoned the meeting that started the strike, all Mr McLoughlin said to the foreman was "Leave it alone, Ted; give yourself a rest," and went on ringing. Mr McLoughlin is convinced that he has been victimised.

The second point is that Mr Blakeman, labour relations manager of Ford Motors (the owners of Briggs), has concentrated his attack, not so much on indiscipline at the factory as—wisely or unwisely—on the national trade union officials for not controlling the shop stewards in their own unions. The difference between the methods of approach of the national and the factory officials was epitomised by their physical characteristics. Mr Beard, chairman of the trade union side of the Ford National Joint Negotiating Committee, is a big, rather ponderous north countryman—in strong contrast to the Cockney smallness and quickness of the shop-stewards' convenor, Mr Mitchell, and of Mr McLoughlin himself, who gave a nice little demonstration of the survival of rhyming slang. Mr Mitchell emerged as a striking figure at this inquiry. He and his fellow shop stewards have plainly built up a union within a union, and he gave evidence about it with impressive efficiency. His shop-stewards' committee has funds (a lottery brought in the incredible sum of £16,155, minus £9,339 in prizes, in six months), an office and a newspaper. The official of the AEU who is responsible for the area, Mr Claude Berridge, disclaimed knowledge of many of the activities of this committee. Mr Berridge said that he was too hard worked to pay attention to everything that goes on in his area: this seems very likely, since he is also on the executive council of the AEU, is responsible for the activities of the Confederation of Shipbuilding and Engineering Unions in the area, and is chairman of the London Communist party.

The third point at issue is the unions' charges that the management has not co-operated with them on suggested improvements in working conditions. The inquiry stands adjourned until next Monday, while the employers prepare a reply to these charges. Undoubtedly, the union officials are now very angry with Mr Blakeman. Whether or not some of their grounds for complaint are justified, one ground cited this week is not. Mr Beard said that the employers had made certain moves with the deliberate object of gaining publicity for the state of affairs at Briggs. If this is so, the company is to be praised rather than blamed: the evidence from this inquiry will be, indeed already is, an invaluable document for all those concerned with labour relations.

Culture Down and Out

It was revealed last week that the Sadler's Wells Trust, which controls the operation of the opera and ballet companies of that name, had run up an accumulated deficit of about £40,000; that the Governors of the Sadler's Wells Foundation, its landlords, had pledged their investments against the bank overdraft and the freehold of the theatre for a loan from the City Parochial Foundation; and that at one point the board resigned in despair. This pauper's tale prompted *The Times* to protest that the constant clamour of the various cultural organisations for more money was "deplorable and degrading," and to revive its earlier proposal that a Royal Commission be appointed "to review, inquire into, and make recommendations on the whole field of Government patronage of the arts."

It is reluctantly that one supports the idea of yet another royal commission, but there is a good case for this one. The trouble is not so much that the competition for resources is "degrading," as that it may lead to the wrong priorities. The Arts Council has a grant of £1 million a year (and is demanding £2½ million), and does itself decide what to do with it. But there are all sorts of other grants—some of which, like the grants to the National and Tate Galleries, come direct from the Treasury, while the grants to museums, for example, are paid by the Ministry of Education. It is not clear that either department is advised by people able to take a synoptic view of the cultural value of the claimants for aid, and of their relative financial needs. It is also not clear why some of the most popular of these penurious organisations should not raise their admission charges to a level that the market could bear. There is much here to inquire into, and a royal commission might well be able to recommend a more orderly way of deciding how to lay out the money available. If it is set up, it would be wise to include the ordinary living theatre in its terms of reference; this is certain to join the queue of claimants when it is realised that even a total remission of entertainments duty upon it will not reverse its present unprofitable trend.

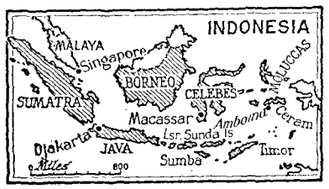
The Indonesian Turmoil

THE revolt of the military commander of East Indonesia, Colonel Sumual, has added the final touch to the chaos of Indonesian affairs. The government now controls only Java, north Sumatra and the Indonesian part of Borneo. With the prime minister, Dr Sastroamidjojo, helpless and discredited, and the President, Dr Sukarno, struggling to force the Moslem parties to sit in an all-party cabinet with the communists, it may indeed be doubted whether much control can be said to exist over even this limited area. Colonel Sumual appears to be following the example set in Central Sumatra by Colonel Hussein. Claiming the support of the civilian population, who want local autonomy, he is allowing only 30 per cent of the revenues under his control to go to Java. He is demanding the dismissal of Dr Sastroamidjojo, the release of the officers arrested for an attempted *coup d'état* last autumn, and a government composed of respected national leaders—without any communists.

Focus on William Carron

IN Camberwell Green there is a large Victorian house with a splash of metal letters across its frontage:

AMALGAMATED ENGINEERING UNION 1851-1951
A HUNDRED YEARS OF TRADE UNIONISM



The AEU is justly proud of being the oldest trade union in Britain, the direct descendant of the Associated Society of Engineers, Machinists, Smiths, Wheelwrights and Patternmakers. The ASE, as it was more compactly called, led the trade union movement away from the grandiloquent and unpractical idealism of Robert Owen, and built instead the tightly organised "new model unionism" of the mid-nineteenth century—a group of skilled engineering workers, with high affiliation fees, concentrating on improving living standards and leaving politics alone. But after it became the AEU in 1917, it brought in unskilled engineering workers, women and workers in the colonies. And no one could say that the AEU has kept clear of political influences.

This week's trade union limelight falls on the President of the AEU, Mr W. J. Carron. He it was who presented the AEU's case to the court of inquiry into the Briggs dispute. He is also one of the leaders of the Confederation of Shipbuilding and Engineering Unions (of which the AEU is the largest single constituent) which on Thursday said it would call a strike in the shipyards on March 16th because its claim for a wage increase of 10 per cent for shipbuilding workers had been turned down flat for the third time. Next week he is to make a new approach to the engineering employers. It was thought better to see the shipbuilders first this time, so that the precedent should be set by those who, in the union's view, can best afford to grant a wage increase. Not that Mr Carron doubts that most of the engineering firms can too—"Look at their profits last year," he says, "the workers must have their share." But however that may be, as the shipbuilding employers have said No, the engineering employers are sure to do likewise. Mr Carron still seems resolutely cheerful, and will no doubt remain cheerful even if the matter swells to a major national strike.

His general attitude to life, indeed, is one of unruffled geniality, tempered by shrewdness. He is new to his big job. His election last year was enlivened by a television broadcast of Mr Woodrow Wyatt, who showed up the communists' tactics with the result that Mr Carron wiped the floor with his communist opponent. Some of the union's executive must have joined only formally in the official protest at this interference in its affairs.

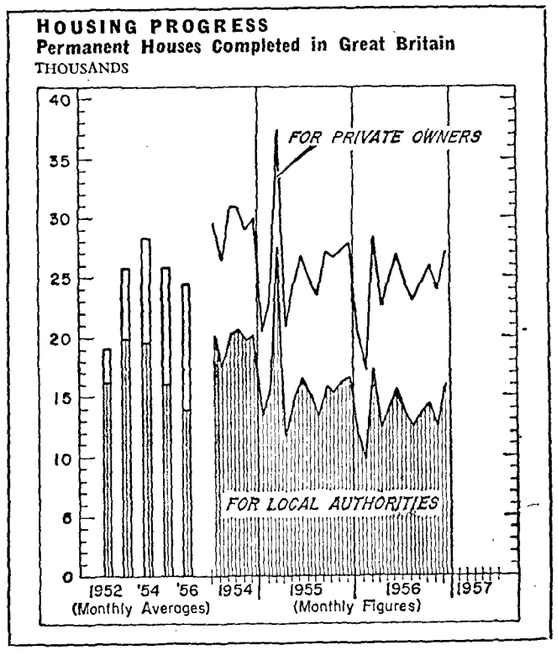
Communist influence in the union is still out of all proportion to its numerical strength, even though there are now only two communists (Messrs Ambrose and Berridge) on the executive. Mr Carron, tubby and good tempered, is not the man to trounce them in the manner of a Deakin. Some have felt that he and his executive have dealt too kindly with the comrades at Briggs, by supporting the reinstatement of Mr McLoughlin, by issuing a ballot paper which showed a bias towards a strike, and by allowing a communist, Mr Berridge, to be the union's spokesman to the men. Mr Carron's answer to this is, first, that the union stepped in early in the dispute in the hope of getting a settlement before attitudes hardened; secondly, that Mr Berridge is the area officer concerned and must do the job for which he was appointed; thirdly, that the Briggs management built up the shop stewards by negotiating direct with them instead of with union officials, so it is no use their protesting now that the union should have kept them in better order; and fourthly, that Mr McLoughlin, a newly appointed shop steward, was only doing what others had got away with for years. And is Mr McLoughlin grateful? "They've been weak as kittens," he says. The trouble is that to deal with political agitators you have to be rather political. And William Carron, like William Allan and William Newton a hundred years ago, just wants to get on with the union's business and to keep clear of politics. A significant part of the immediate industrial future of Britain will depend on whether he is allowed to do so.

This aggravates President Sukarno's dilemma. He could still, if he chose, proclaim a state of emergency and rule the country for a time as commander-in-chief through the army. He may even choose this way. But there is no necessity for it, unless perhaps to further President Sukarno's personal aims. The alternative, which is urged both by the rebel military commanders and by the civilian authorities in South Sumatra, is to grant a large measure of local autonomy and to appoint Dr Hatta, the former vice-president, as prime minister. There are reports that President Sukarno may be taking the first steps towards a reconciliation with Dr Hatta. If so, this is an admission of defeat, since any collaboration with Dr Hatta means dropping the idea of bringing the communists into the government and probably a drastic modification of the plans for a National Council, by which the president would try to bring the cabinet into closer relationship with the people. The dangers of this idea were apparent from the first. To abandon it may cost Dr Sukarno some prestige. But he will earn much greater respect as a statesman, and in the long run strengthen his position, if he shows himself prepared to co-operate with Dr Hatta in working out a better method of keeping the Indonesian islands together.

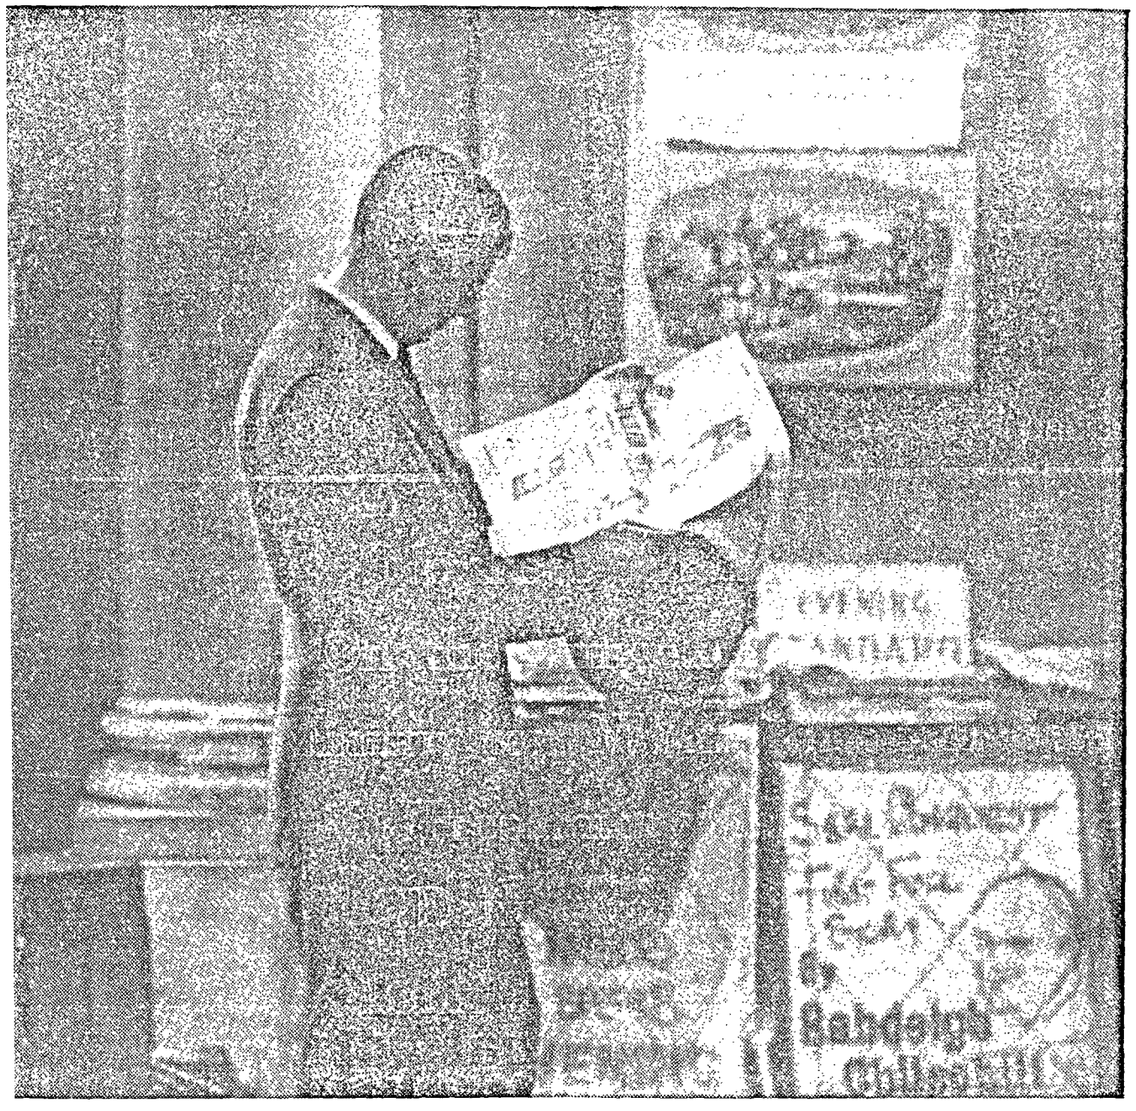
Siamese Enigma

THE proclamation of a state of emergency in Siam, four days after the general elections of February 26th, does not mean that the country faces a situation anything like as serious as that in Indonesia. Despite its appurtenances of democracy, Siam normally changes its governments by *coup d'état*, and with tanks out in Bangkok, a *coup d'état*, though unlikely, cannot be ruled out as impossible. What is obscure in this instance is, who is trying to oust whom; but this obscurity is as traditional as the mode of bringing about a change.

The prime minister, Field-Marshal Pibul, gave little away on Sunday when he proclaimed the emergency and said that "organised groups of people with foreign support" were causing subversion and unrest with the object of taking over the country. He later let it be known that he meant the communists and not, as some observers had feared, the Democratic party of his rival and former schoolmate, Nai Khuang. The student demonstration that followed, though impressive in numbers, was mild enough and dispersed peacefully after being told that its three demands could not be granted. These were that the state of emergency be rescinded, that those guilty of malpractices in the elections be punished, and that fresh elections be held.



It seems unlikely that Siam's underground communists are powerful enough for the government to credit them with the ability to take over the country. Recent labour troubles have certainly, on the other hand, been exploited for their own ends by the tolerated Economists' party, whose leanings are sufficiently leftward for it to be regarded in government circles as crypto-communist. The "malpractices" of which the students complained are equally difficult to assess; if the ruling Seri Manangasila party had been "cooking" the election results, it is fair to assume that the early returns would have been more favourable to it than they have been. The Democrats won 16 of the first 105 seats contested, against 60 for the ruling party; a majority is in the making, but not an indecently large one.

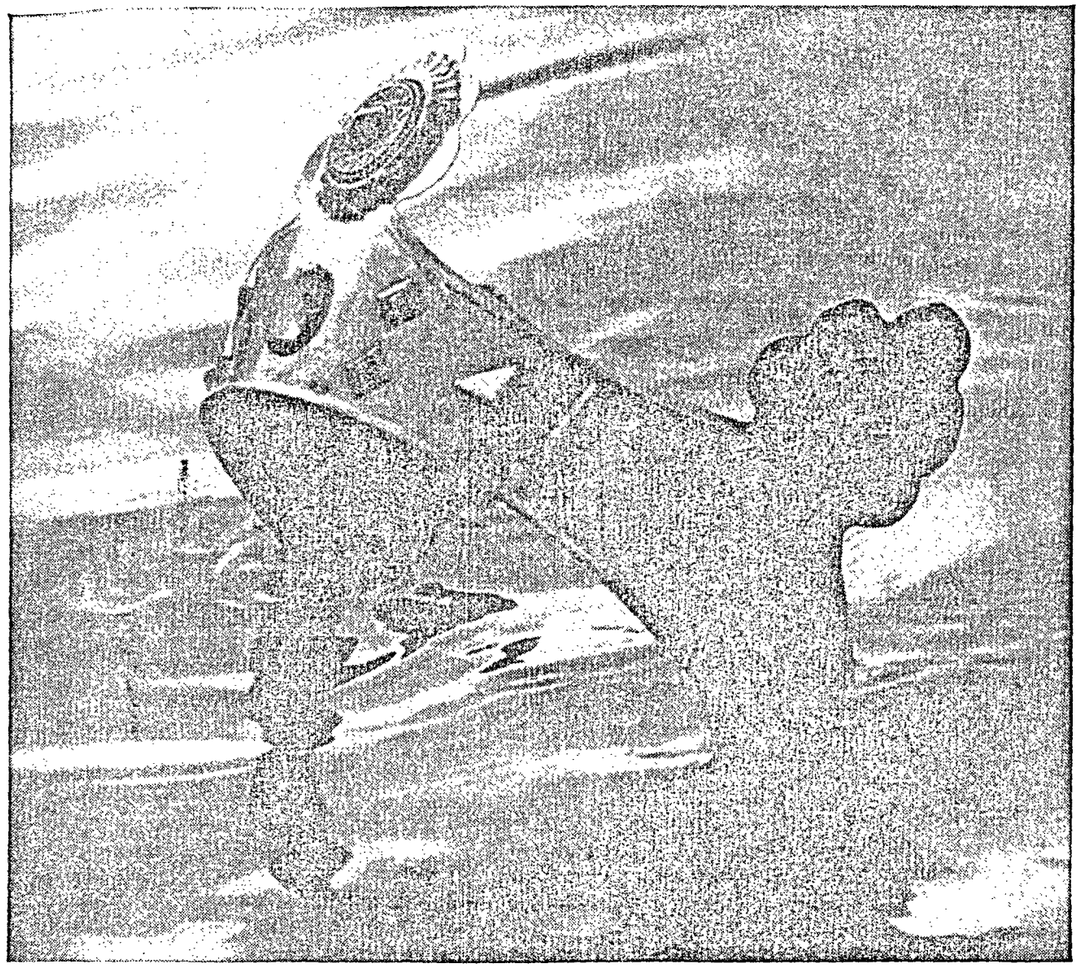


Marshal Pibul has been under criticism lately for his handling of the labour troubles, on the ground that his obsession with democracy has made him side with the workers rather than the employers. Even if his proffered resignation is not accepted, it would be surprising if he emerged from the present crisis unscathed.

End of an Affair

"WE do not want to join the (socialist) camp," Mr Popovic told the Jugoslav National Assembly last week. The foreign minister's statement will have surprised nobody—not even Mr Khrushchev, who must by now have realised that his efforts to woo Jugoslavia back within Moscow's orbit have failed. Instead of encouraging the Jugoslavs to return to the Soviet block, his endorsement of more than one "road to socialism" has merely encouraged the Poles to put one foot outside.

The Jugoslavs, for their part, can no longer hope (as they appeared to hope in June, after Marshal Tito's visit to Moscow) to have the best of both worlds, remaining independent of the Soviet block and yet influencing the development of its members. Mr Popovic admits that what began (when the Jugoslavs disapproved of the Soviet intervention in Hungary) as purely ideological differences have developed by now into "different views on what . . . inter-



Man reads... tree

Rustle your paper and hear, beyond the noise of headlines, a tree falling in a forest of pine. The Bowater axe bites as clean on Scandinavian hills as it does in Canada and Tennessee. A paper bridge has been thrown across the world. A strong span links this country with North America where Bowater planning and Bowater plant now match their British counterpart in size, output and development. From these twin sources, whose capacity grows with every month that passes, paper and paper products flow out to world markets in increasing volume. Demand is still setting a cracking pace. Bowaters are in vigorous pursuit, on both sides of the Atlantic.

THE BOWATER PAPER CORPORATION LIMITED *Great Britain United States of America Canada Australia South Africa Republic of Ireland Norway Sweden*

The crown that got lost in the Wash

In a way, it is a pity that King John's crown was made of gold; for it was heavy enough to sink irretrievably to the depths of the Wash.

Suppose the crown had been lighter? Might it have been washed ashore uncorroded—gleaming and unmarked? Yes . . . if it had been made of TITANIUM.

But TITANIUM belongs, not to history, but to the future.

Outstanding resistance to corrosion is only one of the invaluable properties of TITANIUM. It has a very high strength-to-weight ratio; it retains useful properties at quite high operating temperatures. It can be welded, forged and machined—in fact, almost any conventional fabricating technique can be applied to TITANIUM and its alloys.

I.C.I. Metals Division is now producing TITANIUM and its alloys in all the usual wrought forms—sheet, strip, rod, tube, wire, plate, billet and forging stock.

I.C.I. Titanium—
TOMORROW'S METAL TODAY.

IMPERIAL CHEMICAL INDUSTRIES LIMITED, LONDON, S.W.I.

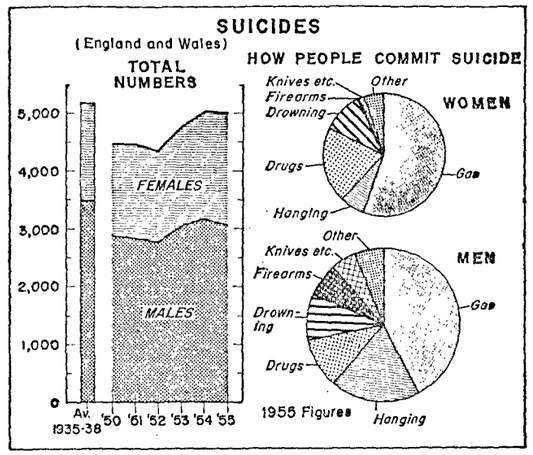
TM5

State relations should really be." The Jugoslavs argue that the "socialist camp" in its present form is not an "inevitably necessary" form of socialist co-operation; but grave political consequences would flow from their argument if it were accepted, and all the spokesmen and leader-writers of the block, with the notable exception of the Poles, are being mobilised to make sure it will not be.

The Rumanian paper *Scinteia* asserts that Mr Popovic's viewpoint "denies the very basis of the policy of the socialist countries." And in Albania, Enver Hoxha (who according to Marshal Tito, "knows only how to say Marxism-Leninism and not a word more") has denounced the Jugoslav leaders' "rotten theories" and declared that the Soviet Union "is the only country in the socialist camp which through its experience and its material possibilities can help other socialist countries." Although deference is still paid to the special circumstances of different countries, it looks very much as if the different roads to socialism—all except one—are being sealed off.

The Russians are also trying to make their displeasure felt in Belgrade through economic pressure; they have threatened to postpone the credits promised last August for developing Jugoslavia's aluminium industry. This is bad psychology; it will not influence the Jugoslavs but merely disillusion them further. Not surprisingly in the circumstances, Mr Popovic told the Jugoslav parliament that "the field of mutual interests with the capitalist world is wide"; and he had some civil things to say about his country's long-suffering friends in the West.

European Misgivings at Bonn



Our correspondent in Germany writes :—

MISGIVINGS about German participation in the projected European common market and nuclear energy pool are not confined to the opposition parties. Confronted with the details of the plan—which calls on Germany to invest 200 million dollars in other people's oversea territories over a period of five years—most members of the Bundestag are wondering why it is only now that, in response to Social Democratic prodding, they have got round to setting up a sub-committee of the standing committee for foreign affairs to examine the arrangements more closely. Deputies feel that an uncommunicative government has put the Bundestag in the position of having to say Yes or No to an unsatisfactory partnership; and they can hardly say No for vital foreign political reasons.

The Free Democrats are apparently bracing themselves none the less to vote against the treaties, which, they object, will not only further complicate the business of German reunification, but also ossify the six states concerned into a perpetually exclusive Little Europe. In the absence of their leader, Herr Ollenhauer, who has been in the United States and Canada making his bow as a respectable potential Chancellor, the Social Democrats have not made their views clear. But their deputy chairman, Herr Mellies, has declared that Germany has much to gain by keeping out of obscure "colonial commitments." Opinion is strengthening that it would be wiser to leave ratification of the treaties to the new Bundestag that is to be elected in September.

Suicide

THE number of suicides usually falls in wartime, and did, in fact, fall in 1939-45. It is therefore misleading to cite, as is often done, the postwar rise as evidence that the increased prescription of barbiturate drugs has caused more suicides. The accompanying chart, based on figures recently published, shows that in 1955 in England and Wales

the number of suicides had in fact not quite returned to the prewar level, in spite of an increase in the number of elderly people, who are most prone to suicide. Thus, although the number of suicides by drugs has increased considerably—sixfold—over the past twenty years, this has been offset by a fall in other methods of killing oneself, particularly poisoning by "other solid and liquid substances" and cutting and stabbing. The increased prescription of barbiturates has influenced the method of suicide but not the act itself. Indeed, it can be argued that since barbiturates are less certainly lethal than other poisons, the wider use of this method has tended to keep the number of successful suicides down.

SHORTER NOTE

Now that the amounts of prize money in the first three drawings of premium bonds are known, it is possible to work out the chances of an early win on them. For the investor who bought the full £500 worth of bonds last November, the odds against drawing a prize (mainly, of course, a £25 prize) in the first draw in June will be slightly worse than four to one against—4.2 to 1, to be precise. In the next draw in July, assuming that there are no withdrawals after the first lucky dip, the odds against the £500 investor, whether he bought the bonds in November or December, will have lengthened to between sixteen and seventeen to one against. In the August draw, when the January buyers also have an equal chance, the odds are just slightly worse—between seventeen and eighteen to one against. In subsequent monthly draws, unless there is a sudden change in the trend of investment in the bonds, the odds against winning a prize seem likely to rise slowly but steadily above the last-named figure.

Letters to the Editor

Non-U Airlines

SIR—I was puzzled by your comment on February 23rd when you said:—

> Because the big international airlines exercise a tight control over international air fares through their own cartel, the International Air Transport Association, and because this control is endorsed by almost all governments, the field for these services [the third-class services of British independent airlines] was limited from the outset to British territories.

IATA is a piece of machinery used by governments to work out world-wide fares and rates in connection with bilateral governmental agreements which condition exchanges of commercial rights.

The big international airlines do not exercise a tight control over international air fares. The ten big ones work harmoniously with nearly seventy smaller ones and everyone in IATA has one vote, one equal voice, one equally effective veto in the conferences. Every international fare requires 200 votes before it even becomes a firm recommendation. Thereafter it requires the approval of over 40 governments before it can become effective. How can such a mechanism be called a cartel by any *responsible writer*?

Both Hunting-Clan and Airwork are members of IATA. They are authorised by HM Government to operate scheduled services which is their entitlement to membership. If any restrictions have been placed on their ability to propose third-class fares they arise solely from the stipulations of their own government, and not from any action of the IATA conference.—Yours faithfully,

WILLIAM P. HILDRED
International Air Transport Association, Montreal

New Age Banking

SIR—Your article last week regrets the banks' shortcomings in public relations on electronic banking, likening their attitude to that of the quill-pen era. No more up to date or enlightened is the attitude of the committee of London clearing bankers towards bank staffs. Only an oblique intimation of pending developments in connection with automation has been given to the world, and bank staffs, upon whose intelligent co-operation so much depends, know nothing more than has reached them through the press.

Individual staff associations have been kept more or less informed in a general way of what is developing, but as automation is something on which the banks must act together, and have decided to act through the committee of London clearing bankers, it is deplorable that this body in a matter of such importance should be indifferent to staff reactions.

Before the press announcement the staff associations of some of the clearing banks had set up their own automation sub-committees. Perhaps even yet the employers collectively will realise that much could be gained from closer relations with their staffs on matters of this sort, and agree to some form of joint consultative arrangement.—Yours faithfully,

A. W. B. PAYNE
Central Council of Bank Staff Associations

O and M and More Pay

SIR—The likening of the structure of the Treasury classes of the civil service to a pyramid is an error. In the administrative class there are about 2,500; in the executive class, 35,000; in the clerical officer class, 67,000 and in the clerical assistant class, 30,000.

The proposal put by the CSCA to the Treasury is to bring the clerical officers into better balance with the much smaller class of clerical assistants. The latter class, which is open to girl school-leavers only and adults over 40 years of age, suffers a continual turnover of staff among the new young entrants. The scheme for the recruitment of adults over 40 is only two years old, and the intake has not so far been great. The bulk of the class consists of adult extemporary clerks who have acquired established status since the war, and at present 5 per cent of the clerical assistant class is under 25, compared with approximately 40 per cent before the war. The figures for the clerical officer class are somewhat different. Prior to the war, after ten years of normal open competition recruitment, 28 per cent of the clerical officers had been recruited under the age of 25. After the recent war and in the first ten years of open competition recruitment, there were only 10 per cent of the clerical officers under 25 years of age.

The association's view is that if adults are to be employed for many years on work which was once considered more appropriate for young girls who did not stay long in the civil service because of the existence of a marriage bar, it is sensible, now that there is no marriage bar and reliance is being placed on adult recruitment to man the clerical classes of the civil service, to try to ensure a fuller use of their abilities.

It so happens that a combination of circumstances makes that feasible in the next five to ten years with the co-operation of the association concerned. In any other circumstances such a proposal might have met with the deepest hostility of the union. The scheme proposed by the CSCA is aimed primarily at saving manpower and not money. New wage claims are on the way in any case. What is in issue is whether those wage claims should be accompanied by a better use and ultimate saving of manpower, or whether they should merely add to the existing inflationary pressures.

Your note comments that too much work is fed in at a low level of the hierarchy and suggests that much of it could be cut out altogether. That is also the view of many members of the CSCA whose official life consists of an unending stream of triviata, the necessity of which they also sometimes doubt. Much of such work owes its origin to the exacting requirements of Parliament for service and for financial exactitude. What political party will sponsor the subordination of citizen rights to the convenience of an impeccably efficient state machine?

What work can be cut out is a matter for balanced judgment. What the CSCA has suggested to the Treasury is a combined operation that could lead to a smaller and better-paid clerical structure of the civil service in which the staff's abilities were fully stretched, and give to Organisation and Methods divisions in departments an opportunity to cut down the dead wood which would not be open to them if the union were completely opposed to such reforms. Is that a bad thing? And who else if not the civil service do you think could attempt and satisfactorily complete the task?—Yours faithfully,

G. F. GREEN
Civil Service Clerical Association

Economy and Electronics

SIR—The author of the comment in your issue of February 23rd, suggesting that economies could be made if the RASC used electronics, is shinning up the wrong tree.

The RASC is responsible for food, but blankets and clothing belong to the RAOC. Almost unbelievably, RASC is responsible for toilet paper for troops in barracks and RAOC for the same article in the field.

If economies are to be effected, all stores, including artillery, rifles and ammunition, should be the responsibility of one branch of the service, instead of being the province of the RASC, RAOC, RAMC and REME. After all, world-wide industrial organisations run only one purchasing and supply department for the heterogeneous goods they use.—Yours faithfully,

Quantity and Quality

DANGEROUS ESTATE: *The Anatomy of Newspapers.*
By Francis Williams.
Longmans. 304 pages. 24s.

> *I don't want to go up to Heaven,*
> *I don't want to go down below,*
> *Surely there's a place in the middle*
> *For a poor little fellow like me.*

THIS old (maybe misremembered) jingle sums up the burden of Mr Williams's shrewd analytical account of how the present predicament of the British press has come about. The most popular newspapers, founded upon the marriage of mass circulation with mass advertising and reflecting all the characteristics of mass culture after fifty years and more of popular education, for the most part thrive, even in the face of a massive rise in costs. The "unpopular" newspapers on weekdays and on Sundays, higher-priced and still bent in a more modern manner on "the informative and interpretative function" of a so-called "quality" press, are bearing up very well—mainly because, apart from their peculiar editorial virtues, advertisers attach a disproportionate worth to their readership. The putative victims, squeezed between the upper millstone of quantity and the nether millstone of quality (or should this be the other way round?), are the "unpopular populars": the papers which, in Mr Williams's words, "have been forced by the economic pressures in the newspaper industry to adopt a pattern contrary to their real function," so that "instead of seeking to satisfy a particular public they find themselves forced to follow the purveyors to the mass in a fanatical search for a readership of millions."

Mr Williams has put together the best and most connected general story of the British press since the days when the first John Walter launched *The Times*. It should be very widely read. The upshot of his crowded tale—no doubt the lapses in it will be discovered by Mr Stanley Morison and other knowledgeable folk—is that the press is at or near the end of a road. It has been a headlong, wreck-strewn, record-breaking race. It was summarised with characteristic dryness by that great editor, A. P. Wadsworth, to the Manchester Statistical Society two years ago;

> In 1800 no paper had a daily circulation of more than 5,000. In 1850 no daily had more than 50,000. In 1905 none had more than 750,000. In 1955 there is one with getting on for 5 million.

Nearly 30 million newspapers of all kinds are now sold to British readers—over 70 per cent of these by the *Daily Mirror* group, the Beaverbrook press, and Associated Newspapers, of which Lord Rothermere is chairman. Going on for 90 per cent of the adult population of these islands reads at least one morning paper. More copies of fewer newspapers are sold in this country than anywhere else in the world. But "we are very close to saturation point, if not already there."

The lodestone of journalistic enterprise since the eighteenth-century pioneers has been how many can (and will) read—and buy—newspapers. The turning point, which ushered in the new journalism, was the new education of the last quarter of the nineteenth century and the new mass market for the sale and advertising of goods; this growth has now reached something like the limits of literacy. There is no longer a large untapped reservoir of readers or of advertising. But there is a steeply rising bill for paper, printing and wages. What will emerge when the flood is dammed?

Mr Williams does not believe that "responsible" journalism is, now any more than in Cobbett's day, the only right recipe. The vices of the mass press today are the vices of today's mass entertainment: it is "superficial, trivial, ill-balanced"; it is addicted to "misreporting, malice, unfairness and gross exaggeration." Often one can only say, as Sir Walter Scott said, "I would rather sell gin and poison them that way." But its virtues, when they are honestly displayed, stand in the true tradition: "*to explore injustices* (as the Press Council has put it), *to right wrongs, to give advice, to befriend the friendless, and to help the helpless*"; "to look at the face of authority from below" and, in its own understandable idiom, "to shout, protest, expose and play hell" against Cobbett's Thing of established convention.

For half a century, no doubt, that is, since Northcliffe's foundation of a new daily press upon the experience of his *Answers* and *Home Chat* and Newnes's *Tit-Bits*, the pull of mass circulation and mass advertising has given the devil the best songs. Even so, and Mr Williams is both trenchant and cogent on this point, those on the angels' side have not done well. During Northcliffe's Edwardian advance, the "quality" papers were content to be good, without being profitable—even though the whole nineteenth-century pioneering story of *The Times* itself had proved that independence and success had to be won by commercial and technical skill and innovation. And, more recently, the "middle" papers, trying to combine the virtues of quality and quantity, have come in danger of losing their soul and their economic security together: "As a result they neither get those millions nor satisfy the smaller public that is naturally theirs."

By every comparison, British newspapers are today too cheap, and too dependent therefore on the mere multiplier of mass circulation and advertising revenue. One daily paper, the *Daily Telegraph*, has succeeded, by its pricing and its editing, in marrying, profitably, the "million" with the "informative and interpretative" function of the best journalism; two Sundays are on the same path. Mr Williams's lament, in a very good book, is that others are not.

What Next?

GHANA: *the autobiography of Kwame Nkrumah.*
By Kwame Nkrumah.
Nelson. 325 pages. 21s.

RUMOUR has it that when the prime minister of Ghana, Kwame Nkrumah, was a student at the London School of Economics, Professor Laski dismissed him as "a nice young man, but quite unremarkable." Laski did not usually take swans for geese, but on this occasion, if the story is correct, he was badly out. Kwame Nkrumah is a very remarkable man indeed, of magnetic personality, strong capacious intellect, tenacity and vigour, something more than a great black demagogue—though he is that too—and something less than the Nehru of West Africa, though he is often taken for it.

Yet it is easy to see how Laski could be misled. Mr Nkrumah's ten-year struggle to turn the Gold Coast into the independent state of Ghana has taken place in the full glare of publicity—in Africa itself, Europe, America, India. There is no privacy for him. Yet he retains complete mental privacy. He possesses the most unlikely faculty of being able to switch off his personality, to withdraw the power of his mind, to appear as a very nice young man. In the more personal chapters of his autobiography, he builds up a picture of himself as a man who makes friends with a mongoose, is grateful to his gaolers for a bar of chocolate, and keeps a spaniel called Topsy. So English. So nice—gentle, unassuming, polite.

And so wrong. Mr Nkrumah's intellect is non-cerebral; and what is missing in his autobiography is the part of him that thinks and feels, not with his mind, but with his skin and colour. The passion of his struggle does not emerge. This is a nice but unremarkable book, filling in the portrait of the public Nkrumah, but leaving it two-dimensional. Something else is missing too; what of the future? Discussing with Mr Nkrumah the date fixed for independence, March 6th, the Governor said, "This is a great day for you. It is the end of what you have struggled for."

This may pass in the delight of the moment, but independence for Ghana is less the end of the struggle than the achievement of an opportunity. The book ends with the words, "There is so much more beyond." What?

Suez in Retrospect

MIDDLE EAST CRISIS.
By Guy Wint and Peter Calvocoressi.
Penguin Special. 141 pages. 2s.
THE SUEZ WAR.
By Paul Johnson.
MacGibbon and Kee. 157 pages. 10s. 6d.

"MIDDLE East Crisis" is a dispassionate study of the Suez affair and the events and policies leading to it. It sees the landings at Port Said last November as a disaster for Britain, mitigated only by the chance it gives to British policy of a fresh start; and, looking beyond the many explanations for them given by the British Government, sees the real motives to be a desire to bring down President Nasser and establish international control of the canal. It shows the part played by Sir Anthony Eden's personal animus towards President Nasser. But it correctly relates motives and personal feelings to years of bad policy which, in the end, produced them. In this context, President Nasser no longer appears an evil djinn, as he has so often been presented, but a vital and difficult part in the jigsaw of Middle Eastern politics.

Britain, it is argued, failed to learn the good and bad postwar lessons of Burma, India, Ceylon, the nationalisation crisis and its solution in Iran, the failure of the Middle East Defence Organisation proposal put forward in 1951, and the earlier and abortive negotiations for an Anglo-Egyptian settlement. In the Middle East, Britain persisted in its determination to retain military bases, underestimating the force which nationalism had in the region and the deep-rooted desire of the Arabs "to get the whole military machine off their backs." The lesson of the evacuation of India was forgotten. The Baghdad Pact, too, meant that the old policy was being clung to, although it gave no more security against Russia than would have been achieved by a warning against interference issued by America.

The invasion of Egypt was the last ill-managed throw in the policy. The authors rightly say that the choice is between exercising dominion over the Middle East or securing co-operation. "Britain has no choice but to withdraw from the Middle East as a prerequisite to finding friends there." Further, the Russians could continue to make mischief successfully in the Middle East "as long as the West played the cold war in terms of bases and pacts." While warning the Russians against physical intrusion in the region, the West should bring the Soviet Government into the diplomatic game there.

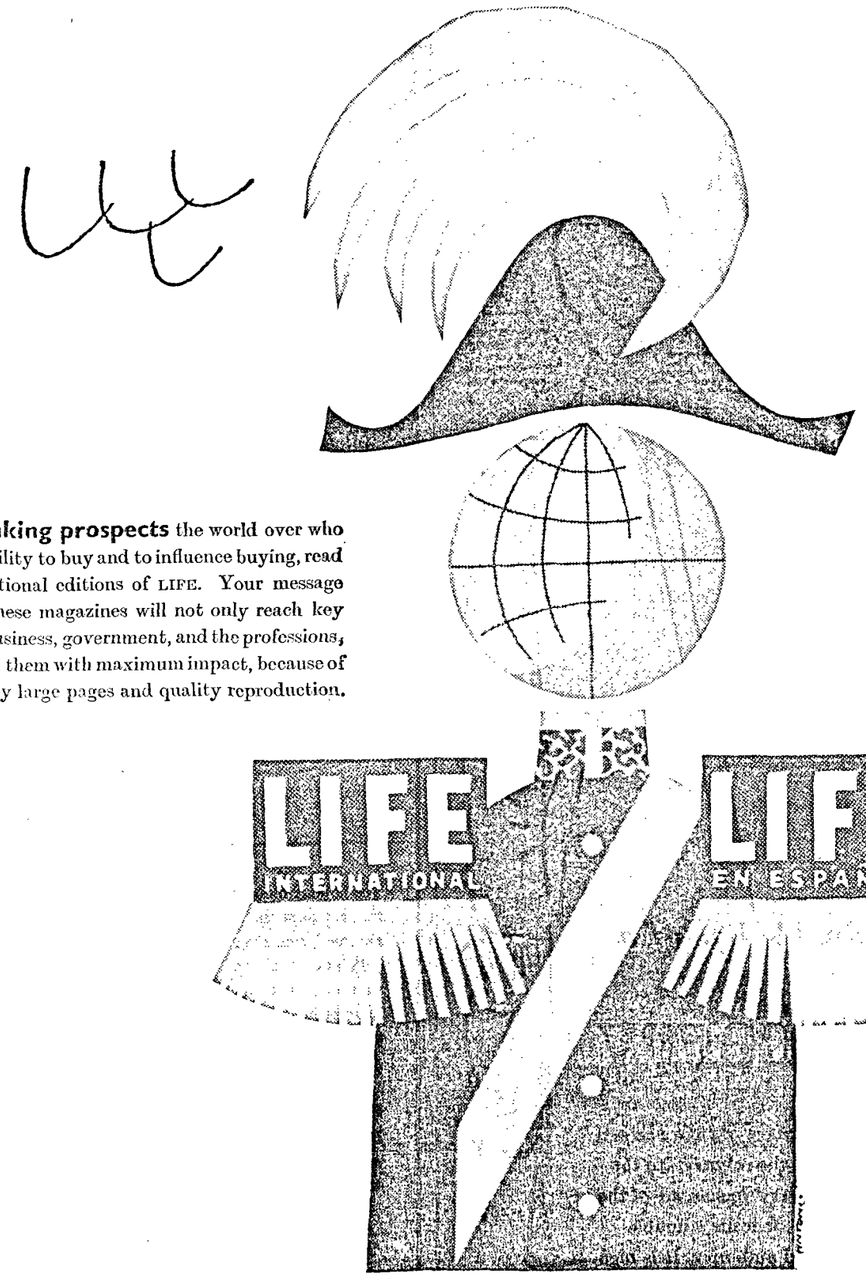
Israel is another major part of the pattern and, with the Arabs determined to destroy the Israeli state and more arms going into the area, the authors foresee more instability in the future. But they do not consider it impossible to bring Russia into a Western guarantee of Arab-Israeli frontiers; together the Americans and the Russians could enforce peace. It is also suggested that a United Nations air force should be formed, perhaps with bases on Cyprus, to intervene against any aggressor. The issue "touches the very continuance of Israel . . . no state can survive if it has to fight against superior numbers every five or six years."

Mr Wint and Mr Calvocoressi have written a thoughtful, closely knit book that deserves more permanent binding. Mr Johnson attempts much the same task, but his book, written closer to the passions of November and more concerned to indict the Eden government, misses much of the significance of events, even though its general verdict on the crisis is much the same. "Our leaders are guilty men," it concludes; but the Labour Government also had its part in the bad policy of past years. The book contains many factual errors.

Uncle Tom's Aftermath

GOODBYE TO UNCLE TOM.
By J. C. Furnas.
Secker and Warburg. 435 pages. 30s.

A HUNDRED AND FIVE years ago (unfortunate for Mr Furnas to have missed the centenary) Harriet Beecher Stowe launched "Uncle Tom's Cabin" upon an avidly receptive world, and was greeted by the thundering applause of liberals on both sides of the Atlantic. In 1945, when a musical version of her book was projected for the American stage, Negro leaders and liberal New England parsons (almost one might say, Henry Ward Beecher's spiritual progeny) raised so effective a protest that the show never reached the public; the protest was not æsthetic, but social, directed against the stereotype of the "good nigger," the meek slave entitled to the white man's pity and the Almighty's blessing, but not to the equal enjoyment of the American way of life. Within a century liberal and negro ideals had been turned inside out and the emancipator's tract had become the freedman's bane. What had happened?



Mr Furnas's book is a lively (sometimes too lively—how one sighs for just one factual and descriptive chapter heading) attempt to answer this question in terms both of the history of the book and of the nature of the negro. He demonstrates unsparingly how inadequate and even perverted was Mrs Stowe's image of the negro even in its original form, and how grotesque and positively vicious were the popular parodies of the various stage versions that flourished throughout the nineteenth century. He then displays the facts of slavery and analyses the evidence for regarding the American negro as identical to and equal with the American white. While his researches in none of these fields lay claim to originality (anyone wanting an up-to-date account of American slavery, for example, would do better to turn to Mr Kenneth Stammp's "The Peculiar Institution"), his distinctive achievement is to have brought the three themes together in a way that brings out not only the paradoxical effects of Mrs Stowe's propaganding, but, more important, the problems and present position of the liberated but not yet integrated American negro. An historian's judgment may well be that Mr Furnas is too hard—as well as too equivocal—on Mrs Stowe. He has not decided whether to make her the mirror or the maker of the "good negro" myth; and he has certainly failed to set her in the context of her times. But the driving force of his book is not primarily an interest in literary and intellectual history; it is a warm and very human concern over the crying contemporary problem of race relations. Mr Furnas, no less than Mrs Stowe, is a propagandist—and a very effective one.

India Reported

AS I SEE INDIA.
By Robert Trumbull.
Cassell. 256 pages. 18s.
THE RIDE TO CHANDIGARH.
By Harold Elvin.
Macmillan. 335 pages. 25s.

THE *New York Times* is one of the world's greatest and most responsible daily newspapers. One therefore approaches with a prejudice of respect and high expectation in its favour a book written by one who was its New Delhi correspondent for seven important and pulsating years. Mr Trumbull's book is like the conversation of a distinguished guest in a relaxed mood after a good dinner, who knows that he is expected to hold forth interestingly, with reminiscences of the events in which he has participated, laced with intimate anecdotes of celebrities in their slippered or climactic moments. In such circumstances, he must naturally rely on his memory alone; and if he recalls, for example, that the British abolished *suti* in the 1880s, retells the stories of Pandit Nehru's fastidious father sending his laundry to Paris and giving champagne parties in prison, ascribes the course of Indian history largely to Gandhi, Patel and Mr Nehru, and mentions that the Indian National Congress was founded as a freedom movement in 1885, only a churl would interrupt to put him right on the historical facts and point out that in his autobiography Mr Nehru indignantly denies the laundry and champagne stories.

Read in the cold light of the morning after, Mr Trumbull's talk reveals him as a first-rate descriptive reporter of scenes that he has actually witnessed, but his understanding of their significance, or of their perspective in history, is too often superficial, because of what one deduces to have been the occasional and unsystematic nature of his reading in Indian history and sociology. Mr Trumbull has many interesting, and some historically important, facts to report, but it takes a reader versed in Indian affairs to sift what is new and authoritative

High ranking prospects the world over who have the ability to buy and to influence buying, read the international editions of LIFE. Your message placed in these magazines will not only reach key people in business, government, and the professions, it will reach them with maximum impact, because of the uniquely large pages and quality reproduction.

Wise move...

Nice flying!

The holiday mood came over them. The holiday move was the next question. 'Let's start to enjoy it', said he. '*Let's enjoy the start*', said she . . . 'Let's fly KLM!' So that was agreed.

Point of departure . . . and they're feeling better already! KLM travel is the most soothing, most reassuring experience in this small world. The comfort is perfect. The food is perfect. The service is perfect. The schedules fast, frequent, dependable.

And you can move to any European pleasure ground. Holland? Scandinavia? Switzerland? Austria? Germany? Italy? France? There's a gaily coloured KLM Holiday folder waiting for you now at your Travel Agent (or direct from KLM — see below).

You reserve your seats on KLM flights through your Travel Agent or through KLM *Royal Dutch Airlines, Time & Life Building, New Bond Street, W.1. Tel:* MAY 8803 *and at Birmingham, Manchester, Glasgow and Dublin.*

KLM
ROYAL DUTCH AIRLINES

out of much that is cheerfully roughly true, half true, or wholly inaccurate.

Mr Elvin's book describes a tour of India on a bicycle, named "Sir Walter." He displays an outstanding ability for the emotional phrase ("... oh yes, wondrous is life and wondrous the feast in it: if only we can find the path. . . ."). The book is illustrated by eighteen beautiful photographs, mostly by Frank Horvat, a camera-man of whom more will obviously be heard.

Neutrals and the Allies

THE WAR AND THE NEUTRALS: *Survey of International Affairs*, 1939-1946. Edited by Arnold Toynbee and Veronica M. Toynbee.
Issued under the auspices of the *Royal Institute of International Affairs*. *Oxford University Press*. 388 pages. 50s.

CHATHAM House has laboured nobly to complete its series of "Toynbee" Surveys interrupted by the war. Here is the missing piece of the jigsaw, a detailed and documented analysis of the problems set by the neutral states and how they were handled. The pattern is well contrived: a first part, from the pen of Professor W. N. Medlicott, recounts the story and explains the special conditions of economic warfare in the second world war; then follow separate sections by various hands on the individual regions or countries—the Latin American republics as well as the European neutrals—Sweden, Switzerland, Eire, Spain, Portugal and Turkey; and the whole is rounded off by three world maps showing the change that has come about in the shape of the arena of international affairs. Dr Toynbee rates this change in the "geo-political" map a first-class revolution in international affairs; that may well be, but one does not quite see its relevance to the subject of this book.

The salient characteristic that emerges from Mr Medlicott's analysis is that the technical legal issues which had occupied the foreground, as regards the treatment of neutrals, in previous wars gave place in 1939-46 to a complex variety of expedients befitting the individual case. The "statutory list," the navicert system, ships' navicerts and ship warrants, together with compulsory rationing, all this amounted to a new technique of economic warfare: "control at source" rather than contraband control by the traditional blockade weapons. But, as the author observes, the ultimate sanction of control by the Royal Navy remained, and so the British, not the Americans, had to bear the brunt of neutral dissatisfaction.

Miss Agnes Hicks shows how Sweden sought to combine neutrality proper with the active policy of rendering generous help to other Scandinavian countries: for instance, all aid short of military assistance to Finland, amounting to non-belligerent interventionism. Miss Katharine Duff supplies a fascinating and well-balanced account of the "conditional assistance" for Spain's economy and of General Franco's consummate stalling. Lady Constance Howard is extremely percipient about Eire (she also writes about the Latin American Republics and Switzerland). Mr G. E. Kirk describes admirably Turkey's tight-rope act, consisting in a continual "external regard for equipoise."

The volume shows clearly that, just as, for geographical reasons, Turkey's main preoccupation throughout its jockeying for position was with Soviet Russia, so the policy of Spain, Portugal and Eire was, in an ideological context, largely motivated by fear of the Communist realm and its likely postwar strength.

The Winning of the West

THE FAR WESTERN FRONTIER 1830-1860.
By Ray Allen Billington.
Hamish Hamilton. 343 pages. 30s.

THOSE who heard the inaugural lecture given at Oxford (and effectively re-broadcast) by Professor Billington, when he held the Harmsworth Chair of American History, will not need to be told that he was the obvious authority to write this volume in the New American Nation Series. The accents that rang out with such gusto and vividness in describing the Mountain Men are no less authentically audible when Mr Billington extends his compass to cover the whole history of the American frontier in the rousing generation between 1830 and 1860. What an enviable subject he has—the Santa Fé trade route, the overland trails, the Texas revolution, the Mexican war, the Mormon trek, the California gold rush, the transcontinental stage-coaching. The names themselves are a Comstock Lode of adventure and romance—John Sutter, the Donner Party, the Alamo, Kit Carson, Brigham Young, Hasting's Cut-Off, Butterfield's Overland Mail. Familiar to us in every fictional form, from the pages of R. M. Ballantyne to the latest wide-screen epic from Hollywood, they lose not a whit of their freshness and charm when winnowed by a historian keen to sift fact from legend. The reason is a simple one—Mr Billington loves his American West and knows it through and through.

In doing justice to the individual, the colourful and the romantic, however, Mr Billington has not overlooked those elements in the story to which a different set of epithets applies—the national, the economic and the calculating. His opening sentence is a brusque reminder that the winning of the American West was an imperialistic enterprise that involved "the expulsion of well-established European peoples"—the English and the Spanish-Mexicans. This does not make him apologetic about the triumphs of American filibustering, colonisation and diplomacy—not even about the Mexican war, on which he concedes surprisingly little to latter-day liberal critics. Nor does it lead him to go deeply into the diplomatic background: readers who want the full international story of the Mexican, Californian and Oregonian annexations will have to go elsewhere. But it protects him against sentimentality and hero-worship and gives to his whole treatment an excellent balance between the contingent and the scientific. Finally (in line with the practice for other volumes in the series) he appends an excellent, full, analytic bibliography from which one omission is too notable to be accidental; no reference is made anywhere to the works of that celebrated amateur historian of the West, himself a Westerner, the late Mr Bernard De Voto.

China's Champion

CHINA AND SOVIET RUSSIA.
By Henry Wei. Introduction by Quincy Wright.
Macmillan. 379 pages. 45s.

DR WEI, a Chinese living in America, has set out to write a history of Russo-Chinese relations from 1917 to 1956. Apparently under the impression that such an enterprise needs some practical justification, he tells his readers that his book "represents a modest attempt to discover a sound and factual basis for the building of peace in the Far East." In fact, he has no recommendations to make to this end, and his work is a straightforward outline narrative of events written from the point of view of a patriotic non-Communist Chinese, but with no particular axe to grind in favour of the Kuomintang or any of its factions. In view of the violence of controversy in his country of emigration between the detractors and defenders of the Truman Administration's policy towards China, Dr Wei is very wary in his comments on the American connection with the story he relates, but as Professor Quincy Wright, of Chicago, remarks in his foreword to the book, "the answers can be found in his materials." Indirectly, he condemns the American government of 1945 for treating the civil war in China as a purely internal affair in spite of the aid given by Russia to the Chinese Communists in Manchuria, and he claims with justice that this aid "should no longer be subject to dispute, inasmuch as both the Russians and the Chinese Communists have admitted it." Mao Tse-tung declared in 1949 that without aid from the Soviet Union and the people's democracies Communist victory in China would not have been possible, and the facts of the record in Manchuria show that this was no mere empty flattery of foreign comrades.

There can be no doubt that the anti-imperialist slogans of the Karakhan declaration of 1919 made an impression on the younger generation of the Chinese intelligentsia which subsequent events never entirely effaced. The idea of the Soviet Union as China's champion and protector against the western powers and Japan, bent on maintaining or extending

the syystem of the "unequal treaties," became an *idée fixe* for many Chinese. The Russians overreached themselves in trying to direct the course of the Chinese revolution in 1927, and for some years their influence was greatly reduced; but it grew again in the late thirties, when Soviet policy was to sustain Chinese resistance to Japanese domination as an indirect protection for Siberia, even at the cost of subordinating purely Communist interests to the national alignment. When Japan was defeated, this policy naturally changed, but Soviet aims in 1945 do not seem to have reached beyond the creation of a satellite Communist state in Manchuria; Communist conquest of the whole of China was probably not foreseen, or even desired.

When the Chinese People's Republic had come into being, however, Moscow made the most of this great accession of strength to the Communist block and, as Dr Wei shows, exerted itself to gain as much influence as possible over the new regime. The great instrument of the carefully fostered friendship of the two Communist-ruled nations is the Sino-Soviet Friendship Association, which is, in Dr Wei's words, "a ubiquitous organisation, with a branch in every locality and with influence reaching down to the humblest peasant in the remotest village." Yet recent developments in Eastern Europe suggest that the systematic praise of all things Russian can be carried to the point where people have had too much of it.

Shorter Notices

LABORATORY ADMINISTRATION.
By E. S. Hiscocks.
Macmillan. 408 pages. 36s.

From a book with this title and some 300 pages and 22 appendices the reader would expect details of administration fitted to laboratory management in contrast to the more familiar managerial tasks in other walks of life. Mr Hiscocks has tried another approach. He has mainly described the workings of one research laboratory in the United Kingdom, added to this his personal experience and quoted a number of figures from other laboratories. Some of the difficulties of laboratory management are outlined and in a number of instances very useful advice is given.

Unfortunately, Mr Hiscocks relies too much on his experience in this one institution; he also conceals many good statements and some useful figures are hidden among banalities such as "Any large group of people working together must possess the knowledge and skills necessary to cover the range of jobs to be done and there must be reasonable order in the doing of them." The book would gain a lot if it were compressed.

The selection of photographs is not very impressive. Among the eight plates are lecture halls; a workshop; services of a radiochemical laboratory (ten pipes); the flow of information by printed word (books, reports and pamphlets lying on the table) and the flow of information by sound and vision, which shows some twenty people facing the author making a broadcast from the laboratory.

It is one thing for a secretary of an organisation to publish his experiences; the danger is that some future laboratory administrator may think that what this book describes, sometimes rather dogmatically, must be the best way to administer a laboratory.

★

UNITED STATES FOREIGN POLICY, 1945-1955.
By William Reitzel, Morton A. Kaplan and Constance G. Coblenz.
USA: *The Brookings Institution.* London: *Faber.* 535 pages. 32s. 6d.

The annual series of the Brookings Institution, "Major Problems of United States Foreign Policy," which began in 1947, has been a great aid to the student of international relations, and perhaps some small help to the practitioner also. This volume is not of the series, although the senior author, Mr Reitzel, supervised the last four surveys. He now attempts a "re-examination of the assumptions and evaluations" of American diplomacy in order to prepare the way for "the formulation of more effective policies during future years." The result is an almost indispensable reference work on American foreign policy. But it is no more than that, though it could have been among the most important political writings of the last few years. The bulk of the narrative is accurate and does, indeed, show well how the energies of both the United States and Russia are increasingly concerned, not directly with each other, but with influencing the uncommitted, or the reluctant or touchy ally; it is no longer possible, as it was four years ago, to regard "the international system as essentially bipolar in structure." But the authors conclude by demanding "*new judgments and new decisions*," as if either power can hope to find some magic formula of applied social science that will set all the messy variables in order.

The weakness of the book's matter is made worse by its manner. Reading it is like trying to push mud through a sieve with one's glasses. Much of the book is common sense, but common sense on stilts, and the stilts are more prized than the sense. It is hard to see how the book can have any effect on policy at all, even an indirect effect; it is institutional research at its worst. There is a generation of great American historians alive today that can write in a plain and bold style on important matters; they are scholars second to none; it would be a pity if the Brookings Institution began to prefer the jargon of social scientists who confuse theory with knowledge.

★

THE USSR ECONOMY: *A Statistical Abstract.*
USSR Council of Ministers, Central Statistical Administration.
Lawrence and Wishart. 264 pages. 21s.

This is a translation from the new Soviet statistical handbook published in Moscow last year—the first for seventeen years. Its statistics range over population, health, industry, agriculture, labour, investment, transport, trade and social services. The latest figures are for 1955 with comparative figures for earlier years, including 1913, 1928 and 1940.

As a mark of the ending of statistical rationing this handbook is very welcome. But, alas, much of the figuring is of dubious value in western eyes—particularly that which should give the best indication of the growth in activity. The brief notes give only the barest idea of the coverage of these statistics. But the index numbers of both national income and industrial production are constructed on conceptions that differ radically from those of western countries. The reader will find the proportions of total workers in different industries, but not the numbers; the proportions of total trade in different commodities, but not the value or volume; the area of land under crops, but not the actual yields. It is like getting so far with a jigsaw puzzle and then finding the key piece missing. On the other hand, there are useful output series for individual *industrial materials* and products, including consumer goods.

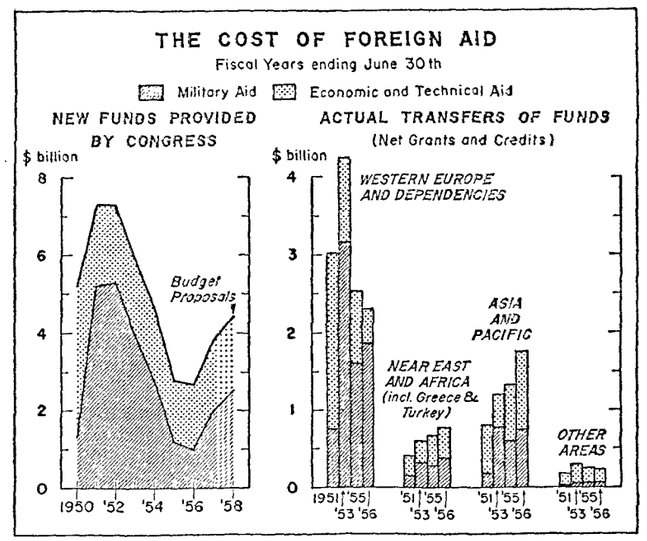
American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.



Justifying Foreign Aid

Washington D.C.

THE *dirty linen* of many countries will be washed in public before this year's rethinking of American foreign aid is over. In this, as in other, respects the report of the Fairless Committee to the President, which was published on Wednesday, was circumspection itself. In casting its tart but generalised aspersions on the "military and economic arrangements" of certain countries, it avoided naming any names. But a little cross-reference to the detailed volumes of expert regional studies which are pouring from the Senate Foreign Relations Committee will supply most of the detail. The world *now knows*, for example, just how dim a view Mr Norman Armour, a former Ambassador, takes of the state of the Turkish economy.

All this activity stems from last year's exasperation in Congress at hearing the same old arguments trotted out to do service for one more twelvemonth in justification of a foreign aid programme of the same old shape, even though world conditions seemed to be rapidly changing. The President promised that if he *was given* a year's grace he would try to be more imaginative next time, with the help of a special commission appointed jointly by the Executive and by the Legislature. Each House of Congress promptly set up *its own review committee* and left President Eisenhower to appoint Mr Fairless and various other worthies, including Mr John L. Lewis, to work separately for the White House. If by this device the President *was hoping* to produce a dynamic new approach to stir the imagination of the meanest legislator, he will be disappointed in his committee's labours, for the Fairless Report is a limp document. If, on the other hand, as may well have been the case, the President's object was to clothe the existing programme in a protective covering of conservative *clichés* subscribed to by impeccable paragons of private enterprise, he must be very satisfied. There is no stricter man with a dollar than the former president of the United States Steel Corporation, and Mr *Fairless, after inspecting* the work on the spot, has signed the statement that: "The American taxpayers have received a fair return for their money."

The Fairless Committee believes that straight grants to provide capital for development should be "severely limited," but it agrees that there "may be unusual cases in which they are warranted." On the other hand, it finds that to have American loans repayable in foreign currencies is "undesirable." Private investment rather than public should be the rule, but, in the understatement of the Fairless report, this "will not suffice in certain crucial areas, such as Korea, Taiwan, Vietnam, Pakistan and Turkey." Since by far the largest part of American economic aid is in fact invested in these areas, the exception restores the previous position. After reviewing the individual items rather sourly, the committee concludes that the total sum spent abroad is about right and, with a final flourish, that "the United States must resolve to stay the course and must abandon the false hope that collective security costs are temporary."

In view of some of the heavy artillery being loaded in Congress for discharge against the President's foreign aid proposals for 1958, which have not yet been published in detail, the value of this endorsement is not to be scorned. The debate over the Eisenhower doctrine, which the Senate at last approved this week, gave the opponents a trial run; it would be a mistake to write off their strength because of their apparently poor showing in the final vote of 58 to 28 against Senator Russell's amendment, which would have eliminated all economic aid from the Middle Eastern Resolution. In fact, 23 Democrats voted in favour of the amendment, including many usual friends of foreign aid,

and only 20 against. The appearance of a lop-sided victory for the President was given by an unusual display of Republican solidarity, as the result of exceptionally heavy whipping. It is unlikely that such a vote could be repeated on regular appropriations for mutual security.

Though the Fairless report may help to keep a few conservatives in line, it is unlikely to have much impact on the hearings which will be conducted by the Senate Foreign Relations Committee now that the Eisenhower Doctrine is out of the way. The Senators are more likely to be preoccupied with the bulky product of eleven major research projects which they commissioned from private organisations and of nine special missions they despatched to the various ends of the earth. In some respects the missions whose reports have so far been published tend to substantiate by specific example some of the general criticisms of the Fairless report. In Turkey and Iran, for example, there are instances of too many projects too ambitiously started. A strong case is made for concentrating American aid on advancing only the most worthy of them.

But the first of the Senate's research projects to appear represents a clear antithesis to the whole approach of the President's Committee. This originates in the International Studies Centre of the Massachusetts Institute of Technology, and most of the judgments contained or implied in the Fairless report appear in its first chapter, under the heading of "Fallacies and Pitfalls." These include the idea that Americans should be forever pushing the virtues of private enterprise in the countries they help, that in the allocation of economic aid a favoured position should be given to countries which have joined a military pact with the United States, and that Americans should judge the success of a programme by the gratitude it evokes.

★

The essence of the MIT's view is that there is at present no true American assistance scheme which concentrates positively on the development of backward economies. What there is in fact is a holding operation : practically all money which is voted each year after so much dialectical pain goes to support armies in countries that could not otherwise afford them and the economies of countries that are wilting under the support of large armies. Short of a decision to change radically the policy of maintaining such forces, there is really very little leeway for change in the annual pattern of expenditure, which is probably why conservatives who look into the programme usually end up by endorsing it.

But the professors from Boston boldly propose an increase in American spending on foreign aid to enable the industrially advanced countries to commit themselves to make up the deficit in capital and technical assistance in underdeveloped countries over a long period. This deficit would be defined according to rather rigid standards of the feasibility of schemes and of the co-operation of the recipients and their technical absorptive capacity. The type of aid would be related to the stage in the growth of the recipient's economy, and there would need to be some generally respected international body, possibly associated with the World Bank, to interpret the criteria. The authors, who include Professors Millikan and Rostow, recommend that the American contribution should be an appropriation of $10 billion, to be used in loans and grants over a five-year period.

Substantial support for this line of approach is building up in influential bodies outside Congress, and the policy planning staff of the State Department is reported to be thinking on the same lines. Unfortunately for such dreams this year's Budget is the largest ever presented in peacetime and the Secretary of the Treasury accompanied it with some odd remarks to the effect that it ought to be cut if only someone in Congress could find out how. This has not unnaturally provoked Senator Russell to retort that a professor can say that foreign aid spending is not inflationary and hold his job, but "there are not many members of Congress who are strong enough in their bailiwicks to vote for increased foreign aid spending and then vote against all the domestic programmes."

Eisenhower's Fourth Justice

IN choosing Judge Whittaker, of Missouri, to succeed Mr Justice Reed, President Eisenhower has stuck to his recent determination to require judicial experience in the men he appoints to the Supreme Court. Judge Whittaker has sat on the federal bench since 1954. He meets the other urgent qualification by coming from the great area between Ohio and the Pacific coast which is represented on the court only by a Texan. Judge Whittaker's other virtues are that he is 56 and a Republican ; there will now be four Republicans to five Democrats on the court for the first time since the nineteen thirties.

Mr Justice Reed's retirement left only three Justices appointed by Franklin Roosevelt: Messrs Black, Frankfurter and Douglas. Mr Reed was appointed just after the President's court-packing plan failed ; he came in as a liberal, but nineteen years of devotion to the letter of the law had brought him over to the right wing. However, Justice Reed had spent nine years in government service, three of them as Solicitor General, fighting for many New Deal causes ; having had the experience to appreciate its problems, he was inclined to give the government the benefit of the doubt. In this respect Judge Whittaker will be a change, but he is not expected to alter the balance of the court.

Judge Whittaker's appointment was not announced until it was certain that Mr Justice Brennan, a Democrat appointed just before the election, would be confirmed by the Senate. This became a foregone conclusion when Senatory McCarthy slipped away to the bigger headlines of the labour inquiry after insinuating that Mr Brennan was unsympathetic to congressional investigations into Communism. On the court, Justices Brennan and Whittaker will be alone in having had substantial judicial experience. The background of most of the other Justices lies in politics and government service, which many observers consider to be a better forcing ground for the breadth of vision and statesmanship required on the Supreme Court. The President, however, seems to have abandoned this view after he appointed, as Chief Justice, Mr Warren, the former Governor of California. Judge Whittaker, whose life is said to be the law, is more devoted to what have been called the niceties of legal needlework. Such a narrow outlook in the newest Justice is not altogether a good omen for the other appointments Mr Eisenhower may have to make when Justices Frankfurter and Black, both of whom are over 70, decide to retire.

Project: Growth

INTRODUCING ONE OF THE

USI BILLION DOLLAR BOARD

GEORGES F. DORIOT, President, American Research and Development Corp.; Professor of Industrial Management, Harvard Graduate School of Business Administration; Director, John Hancock Mutual Life Insurance Co.; Director, National Shawmut Bank of Boston.

Top-management experience in transportation, chemicals, finance, precision tools, research and government planning: that's USI's Board. It has already led USI into a host of new products from giant presses to cookware. And now it creates USI's new technical center, devoted to improving these products and developing still newer ones. With twelve vigorous divisions, USI has come a long way since 1948 . . . will go a long way.

Fresh fields
and foreign markets

Beef on the hoof is pretty difficult to judge, whether for meat or for hides, but banking on the spot can bring that extra local "know-how" to the business in hand.

Facts about the language, the people, the customs, all play such a vital part in commercial undertakings overseas.

This is where The First National City Bank of New York can be of special service for businessmen with foreign interests.

The extensive organization is based on a network of 70 branches, offices and affiliates, strategically located in 24 countries outside the United States. In addition, the world's markets are covered by over 3,500 banking correspondents reporting current trading conditions from every important centre of commerce.

Wherever your interests lie, and whatever they may be, this world-wide organization is at your service. Our two London branches are anxious to be of assistance.

The **FIRST**
NATIONAL CITY BANK

Whose Restraint?

THE index of consumer prices, again at a record level in January and expected to continue its steady rise of the last five months, highlights what was in any case the most interesting, and the most criticised, point in President Eisenhower's Economic Report: his request to businessmen and trade unionists alike to refrain from increasing prices and wages—a "do-it-yourself" programme against inflation, in the words of the National City Bank of New York's monthly letter. While Congress has no intention of doing the job professionally, by imposing legal controls, its Joint Economic Committee, in its statutory report on the President's report, suggests that his request is unrealistic. The committee thinks that the government must provide some standards by which to assess whether increases are justified; it should at least analyse its statistics in order to show the relationships between productivity, wages, prices and profits for the benefit of those trying to practise voluntary restraint.

But the rise in the consumer price index means that some trade unionists must not only practise restraint but actually make sacrifices if wages are not to go up. For nearly four million workers are now covered by contracts which provide for automatic rises in wages with each rise in the cost of living. A good many more—about five million in all—are entitled to regular annual increases. It is too much for even the President to expect that those unions which will be bargaining on wages this year—in the oil, rubber, textile, paper and chemical industries among others—will be willing to ask their members to forgo gains which are coming without question to other workers.

Businessmen, on their side, argue that it is for the government to set a good example by restraining its spending. With this the Joint Committee agrees, although it makes an exception for capital expenditures, on school building and water development, for example, which would eliminate barriers to future economic expansion. But the committee is as aware as are ordinary members of Congress that there is little, if any, room for effective cutting in President Eisenhower's Budget. Nevertheless this year constituents are unusually insistent in their demands that their representatives should force the Administration to economise.

This popular pressure is thought to come from dismay that government spending is still going up, from disappointment that tax reductions are not yet in sight and from fear of both inflation and recession. The Joint Committee apparently regards only inflation as a real danger in 1957. But, as Senator Douglas, the only economist on the committee, has pointed out, what its members really think might have been clearer and their guidance might have been more helpful to the public if, in their desire to approach unanimity, they had not concealed disagreement in generalities and obscurities of language.

Pinning Down the Teamsters

THE well-planned investigation which is putting "improper activities in the labour or management field" under floodlights in the Senate's crowded marble hall naturally opened with the most sensational allegations. Newspaper headlines and television screens have been filled by a vice operator "telling all," followed by a brothel keeper explaining why she decided not to add to her establishments and a trade union official refusing to testify because he might incriminate himself. At the end of last week the chairman of the committee, Senator McClellan, was able to say that the hearings had shown "rather conclusively" that there was some connection between gambling interests, public officials and leaders of the teamsters' (lorry-drivers') union in Oregon.

The chief charge is that a monopoly in pinball machines —500 of these betting devices net one operator about $50,000 a year—was set up in Portland with the help, and to the financial benefit, of union officials; by picketing, or by forbidding union members to make deliveries, they cut off bread and other supplies from cafés which tried to exercise freedom in the choice of the amusement they offered their patrons. According to other charges, union funds have been used to finance bars and gambling houses and union officials have conspired with convicted criminals to share in the profits of brothels and to control law enforcement in Portland.

The leaders of the teamsters' union on the west coast were expected to defend themselves this week. The union's president, Mr Dave Beck, has now no excuse not to appear, since he is no longer required in Europe to represent the United States at next Monday's meeting of the International Labour Organisation; the Secretary of Labour has refused to approve his nomination. The committee has plans to investigate several other unions and to move its inquiry round the country, visiting New York, Los Angeles and a number of other cities, in some of which grand juries are already conducting independent researches. It seems fairly certain that the investigation will continue through most of 1958 and that, as a result, voters may go to the polls in that autumn's congressional elections with some prejudice against the labour movement. What this might mean has just been illustrated in Indiana, where the State Legislature has unexpectedly passed a "right-to-work law"; this forbids contracts with employers which require workers to belong to a union. While these laws, anathema to trade unionists, already exist in seventeen other state Indiana, which contains some of the country's largest ! mills, is the first industrial state in the north to pass such a law.

Buried in State

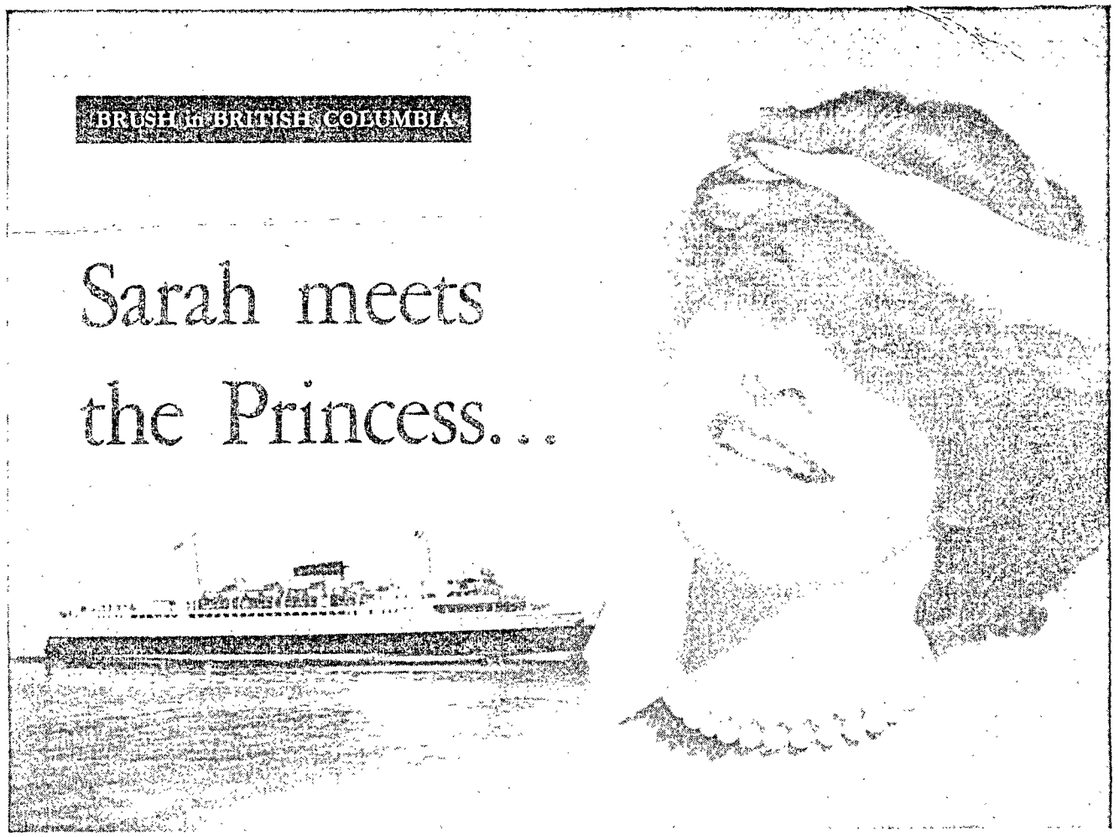
EVER since last summer Washington has been wondering why President Eisenhower kept Mr Harold Stassen in his Cabinet, after his futile campaign to prevent Mr Nixon's renomination for the Vice Presidency. Now, after another attack by Mr Stassen on Mr Nixon, the President, while still not prepared to dismiss his special adviser on disarmament, is no longer defending him against Mr Dulles's desire to have responsibility for this as well as for most other foreign affairs. Mr Stassen is to remain in the Cabinet, although his successor will probably not be a member, but he is to report to Mr Dulles instead of directly to the President, and on policy matters he is to be subordinate to the Secretary of State. The reason given is that the ground plan for disarmament has been laid and it is now a matter of negotiation with foreign governments. Obviously it is administratively efficient that the State Department should be in charge, but its involvement in the regular daily round of difficulties abroad may inhibit the flexibility and imagination which have characterised Mr Stassen's independent work for disarmament.

He will lead the American delegation to the disarmament talks opening in London in ten days' time, but it is thought that he may resign soon after that. With his administrative career buried in the State Department, he apparently hopes to revive the political career which began when he became Governor of Minnesota eighteen years ago at the age of thirty-one. Now it is reported that in 1958 he wants to be the Republican candidate for Governor of Pennsylvania; he moved to this state in 1948. The Republican party there certainly needs some rebuilding on Mr Stassen's modern lines, but his chance of being allowed to do it are slight. But if by any chance he should become Governor of Pennsylvania, then he would be in an excellent position to exhume his presidential ambitions yet again in 1960, probably with Mr Nixon as his chief rival. Mr Stassen's belief that his political career can be brought back to life may be obstinate and unrealistic, but there is no doubt that he believes sincerely and enthusiastically in his mission to save the Republican party from its right wing.

Knowland's Home Fires

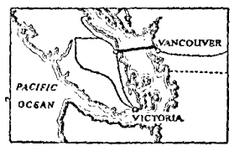
FROM A CORRESPONDENT IN CALIFORNIA

WHEN Senator William Knowland, the 48-year-old Republican from California, who is his party's leader in the Senate, announced that he would not stand for re-election in 1958, he touched off a fever of speculation and added an unusual sense of urgency to the important political gatherings which both parties held in the state during February. On the Republican side, his withdrawal shakes the already uneasy balance of forces between three ambitious leaders, all from California—Governor Knight, Vice President Nixon, and Senator Knowland himself. On the Democratic side, the chances of capturing a Senate seat in California in 1958 are vastly improved now that the party will not have an incumbent Senator of Mr Knowland's rank and influence to beat.



At the meeting of the Democratic National Committee in San Francisco last month, the thoughts of Californian leaders were naturally occupied with possible candidates for the Senate. But equally heartening to the Democrats is the fact that since last November's election they control the State Senate for the first time since 1889. Now their local aim is to capture the lower house in the State Legislature in 1960, if not before, since then the decennial Census will bring reapportionment of the seats in the national Congress, and California, with its booming population, seems certain to get several more. On the way in which the constituency boundaries are redrawn by the State Legislature depend the Democratic chances of winning these new seats, and probably some of the old ones as well. Meanwhile, at the committee meeting, the first to be held in the far west, the party's national leaders took steps to consolidate the Democratic gains made in the region at the last election, by concentrating the public discussions on the problems of the west and by establishing a special group to stimulate congressional concern about these problems.

For the Republicans, what is chiefly at stake is the leadership of the huge Californian delegation to the Republican convention which will nominate a new presidential candidate in 1960. Control of that delegation could make or break Mr Nixon's chances of becoming President, a fact of which his followers are acutely aware. Until now, and particularly at last year's nominating convention, Senator Knowland, in the interests of party unity, has combined his forces with those of Mr Nixon to swing the Californian delegation behind the Vice President. Governor Knight, however, was unable and unwilling to help Mr Nixon for one vital reason: he has binding commitments to the labour movement in California, and so far the trade unions there are strongly anti-Nixon. Moreover, Mr Knight's own presidential ambitions conflict with those of both Mr Nixon and Mr Knowland.



★

Now, with the imminent return to the Californian scene of the senior Senator, the Governor is threatened from another direction. He has been a great disappointment to the right wing of his own party, with which he was closely identified during the eleven years that he was Lieutenant Governor under the progressive Governor Warren. But since he became Governor, Mr Knight has himself adopted a bipartisan approach to state affairs; for example, he never misses a chance these days to emphasise his close friendship for the trade unions. This shift of position has left his former champions, particularly the powerful *Los Angeles Times*, almost apoplectic—but not speechless—with disappointment and chagrin. Their difficulty, until the day of Mr Knowland's announcement, had been that they had nobody else to follow, but it is now evident that they hope for more dependable and old-fashioned Republican leadership from the retiring Senator.

Some among them believe that it was their entreaties to Mr Knowland to break with the Eisenhower Administration and return to save Republicanism in California which did, in fact, persuade him to come home. The Senator's discretion makes it possible for them to believe this. Yet one of his statements seems to indicate plainly a different reason for his decision: "I am primarily a newspaperman." He is heir apparent to the *Oakland Tribune*, an important daily paper in one of the state's most heavily populated areas. As he has clearly stated, Mr Knowland faces the necessity of

T.S.M.V. "Princess of Vancouver" built by Alexander Stephen and Sons Ltd., Glasgow. Consulting Naval Architects: Milne, Gilmore and Germon, Montreal.

Most Saturday mornings you'd find Sarah waiting on the jetty at Nanaimo on Vancouver Island for her husband, Roger. He's one of the many business men who make regular – and very comfortable – trips to the mainland on the new car and train ferry, The Princess of Vancouver. This twin-screw diesel engined ship, which was launched on the Clyde has been built for the Canadian Pacific Railway Company to operate across the 36-mile Strait of Georgia at the far end of CPR's trans-continental route across Canada.

LARGEST TRAIN FERRY IN THE WORLD

The ship is 416 feet long, and powered by four National B4AUM seven cylinder turbo-charged diesel engines —the largest car, truck and train ferry in the world. Two National engines are geared by Hindmarch/National transmission (including Fluidrive hydraulic couplings) to each propeller shaft. These engines operate on heavy fuel with a saving in operating costs of some 66⅔ per cent on ordinary diesel fuel. A feature of the installation is that any one engine can be isolated from its main gear box for overhaul while the vessel continues in daily service throughout the year. Both propelling machinery and auxiliary diesel units have been supplied by associate companies of the Brush Group. All auxiliary power units are coupled to Brush alternators.

WORLD WIDE EXPORTS

The Brush Group produces about a third of the total U.K. output of industrial diesel engines and generating sets – and is, in fact, the world's largest exporter of this type of equipment. The Group constantly exports over fifty per cent of its entire production and, in the past few years, it has exported as much as seventy per cent. In British Columbia the Brush Group has in Vivian Diesels and Munitions Ltd. of Vancouver, a subsidiary with first class sales, service and manufacturing facilities.

assuming the mantle of his distinguished but aged father, the present publisher, if this valuable family property and powerful political weapon is not to go out of his control.

Because of this simple fact, the more practical Republican leaders in the state do not believe that the Senator intends to challenge Governor Knight when the latter runs for re-election in 1958, although this is the interpretation that Washington observers have put on the Senator's retirement. They argue that in the Senate he is inevitably overshadowed by his fellow-Californian, the Vice President, who presides there, and that his position as leader of the Republicans restricts his ability to criticise the President's foreign policy; furthermore, if Mr Knowland does criticise, he lays himself open to charges of disloyalty to his party's hero. Finally, the Senate has never been a good starting point for a presidential aspirant, while, as Governor of California, Mr Knowland would be in a strong position to further his presidential hopes. Not only would he control the party machine in the state, but he would be able to prove by deed as well as by word that he could provide the conservative leadership for which many Republicans are still looking. But there are those who maintain that, just because of this strictly orthodox approach to party affairs, Mr Knowland would lose if he did decide to challenge Mr Knight in 1958. It is in the Tribune Tower in Oakland rather than in the State Capitol in Sacramento that Mr Knowland seems most likely to keep his political fires burning.

Governor Knight is already rallying his New Republicans against this political threat. He called for vigorous action "to make room for Democrats and independents" at a recent gathering of the Republican Assembly, an unofficial organisation of 12,000 volunteers for party work, which was held in a sympathetically untraditional setting, the Disneyland Amusement Park. A special resolution urged the party to bring into its flock "an ever growing number of working men and women" and young people are also being enthusiastically wooed by the New Republicans. They are sponsoring organisations of "Teen Age Republicans of California" in the high schools, an idea which could have a direct impact on electoral patterns if the State Legislature approves a current Bill which would lower the voting age to eighteen. Even without this, the party system has been visibly rejuvenated in California and a new political fire has been kindled in a state which has never lacked complications of this kind.

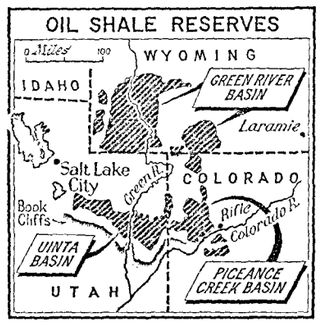
Conscience over Colour

EVEN in the states where there has never been any legal colour bar there is a great deal of segregation in the public schools simply because the different residential areas are usually black or white, seldom mixed. A recent inquiry in New York City, which has 132,000 Negroes and 101,000 Puerto Ricans among the 724,000 children in its elementary and junior high schools, showed that almost three-quarters of the schools were either nine-tenths white or nine-tenths coloured. A combination of conscience—aroused when the Supreme Court held that it was unjust to Negro children to segregate them—and pressure from the Negro organisations has led New York City, the original melting pot, to make a positive assault on this "accidental" segregation. Other big cities in the North with large Negro populations may soon be forced to show whether they are willing to practise what their liberals preach.

It is, of course, no accident that New York's Negroes and Puerto Ricans live huddled together in the slums of Harlem and Brooklyn. The school authorities by themselves cannot eliminate the effects of segregated housing. But the New York City Board of Education is trying to overcome it as far as this is compatible with the welfare of the children. Since last October buses have been taking children from Negro neighbourhoods to all-white schools and vice versa, and new schools are deliberately being built on the fringes of coloured districts, so that integration may come naturally and without making small children travel long distances.

Last week the board accepted the most controversial recommendations of its commission on integration. These authorise the redrawing of the boundaries of school districts, to increase the number of mixed schools, and the transfer of teachers to difficult schools in underprivileged parts of the city. The teachers, who are strongly organised, naturally prefer easier assignments; the result has been that in the Negro schools almost all the posts are held by teachers still on probation. Next autumn, when the new programme begins, about a thousand teachers will be transferred; it will be in full swing by 1959 unless too much opposition develops. So far, most of the objections have come from the teachers, while community organisations and trade unions support the move. If it is successful, some of New York's children will grow up without being conscious of race; and in time the South may lose its legitimate complaint that the North condones segregation in fact even when it prohibits discrimination by law.

Shale After Suez



FROM A CORRESPONDENT IN COLORADO

FOR millions of years the Colorado River and its subsidiaries have gnawed their way down through a high plateau where Colorado, Wyoming and Utah meet. Travellers on the road along the river now see cliffs half a mile high, with thin horizontal stripes as uniform as the leaves of a book; their name is, in fact, the "Book Cliffs." These layers mark the deposit, some 50 million years ago, of the organic matter which is, after coal, the country's largest store of hydrocarbon energy. They are the famed oil shale deposits which cover some 16,500 square miles and which, according to the United States Geological Survey, contain the energy equivalent of nearly 1,000 billion barrels of petroleum. And this takes account only of the richer shales, which produce at least 15 gallons of oil to the ton. The survey carefully adds that not all can be classed as "recoverable" under present economic circumstances.

The richest deposits, those of the Piceance Creek Basin, in the "mahogany ledge" named for its colour, are estimated to contain 90 to 125 billion barrels. It is this reserve, averaging 25 to 30 gallons of oil for each ton of shale, which is now quickening the pulses of officials of some of the largest American oil companies. Before 1920, oil shale lands could be sold to private owners and the richest were. Under an Act passed in that year, the remaining

deposits can only be leased. In the past year or so a brisk trade in the private lands has resulted in most of them coming into the hands of the large oil companies. The biggest reserve is owned by the Standard Oil Company of California, with the Union Oil Company next.

Countries poor in oil have long secured part of their requirements from leaner oil shales than these. But the United States, rich in liquid petroleum reserves and with access to even richer world reserves, has never had to bother with them. During the last war, however, with Hitler's submarines sinking tankers within sight of the east coast, Congress authorised an emergency programme to develop liquid fuels from solid hydrocarbons, both oil shale and coal. The coal hydrogenation programme was shut down as soon as the Eisenhower Administration came into office, but the oil shale programme hung on until last June when the big experimental mine and the extraction plant at Rifle, Colorado, which were run by the Bureau of Mines, were closed.

Source: US Bureau of Mines.

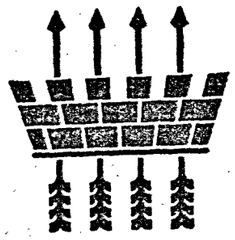
For the $17 million spent, the bureau had made tremendous advances in rapid, large-scale methods of mining shale and had reduced the cost of delivering crushed shale at the processing plant to less than 50 cents a ton. It had also greatly increased the efficiency of extraction, with a retort which could handle 240 tons of shale a day without using water, which is very scarce in western Colorado, for cooling. Both the bureau and the industry estimated that on this basis, petrol could be produced from shale at a cost of 14 to 16 cents a gallon, compared with 12 cents a gallon for petrol and petroleum. Nevertheless the hostility of the private oil companies finally succeeded in choking off all of the government programme except some laboratory work in Wyoming.

In recent months, the Suez crisis, coupled with reports that the Soviet Union has built vast numbers of submarines, have reminded the United States that it once more stands in danger of being cut off from imports, which today provide 10 per cent of the oil it consumes. The Rifle plant was handed over to the Navy last year, and is being kept in standby condition. But now the Navy is thinking of asking Congress to provide the money to reopen it, and attention is also being focused on the work of certain private oil companies towards making use of the shale.

The commercial advantages of shale have been succinctly summed up by one of their officials:

> No finding cost, which is now approaching $1.25 a barrel for petroleum; no hostile Arabs lurking around to cut your pipelines and burn your refineries.

Its disadvantages are that it is found in a water-short area far from the refineries; that shale is 90 per cent ash or slag, which must be disposed of (it has been estimated that complete exploitation of the shales could cover Colorado six feet deep in ash); and that raw shale oil, as it comes from the extraction plant, is, from the refiner's standpoint, a dreadful sludge high in sulphur, nitrogen and other impurities, and of a jelly-like consistency at ordinary temperatures. In other words, much must be done with it before it will even flow through a pipeline. However, Dr Schroeder, of the University of Maryland, has estimated that the capital cost of producing a barrel a day of shale oil is only about $9,000 compared with about $8,000 for a barrel of liquid petroleum. When costs of the one fall or of the other rise enough to make them equal, a shale oil industry will be born—probably not long after 1960.



The Union Oil Company, which has had much experience in refining low-grade Californian crude oil, has the most ambitious shale programme of any private company. It is investing $5 million in a mine and an extraction plant on its 5 billion barrel reserve of shale oil, and began operations this winter with a retort of an improved design. Another programme is that of the Oil Shale Corporation, which is investing $250,000 at the Denver Research Institute on experiments with a new method of extraction. In this process the crushed shale is tumbled in a revolving steel cylinder with ceramic balls heated to 1,000 degrees Fahrenheit to free the oil from the rock in the form of vapour.

Football Caught

THE six Justices of the Supreme Court who ruled last week that professional football is a business subject to the anti-trust laws conceded that they might seem inconsistent: they left standing the decision handed down in 1922 and reaffirmed in 1953 which specifically exempted professional baseball, another team sport, from the anti-trust laws. Chief Justice Holmes had argued that the interstate aspects of baseball were too slight to constitute commerce, and the majority was reluctant to remove an exemption, under which baseball has flourished for more than thirty years, without congressional sanction. But the Justices left no doubt that if they were considering baseball for the first time they would put it in the anti-trust net.

The three dissenting Justices were equally unable to see any difference, legally, that is, between baseball and football, but they were unwilling to disregard the earlier decision. Boxing, which was brought under the anti-trust laws in 1955, does not provide a precedent, in that it is not a team sport. The upshot is that baseball will continue to enjoy unique privileges unless Congress takes up the court's challenge and wipes out this illogical discrimination.

Now that it has been established that baseball is no guide to football, the lower courts will proceed to try a suit against the National Football League. It is brought by Mr William Radovich, a former player with the Detroit Lions, of that League. His request for a transfer to the Pacific coast was turned down; when he went anyway, he was deemed to have broken his contract which, like all those in professional team sports, contained a "reserve clause" binding a player to a team unless he is sold or exchanged. This clause makes it unnecessary for teams to bid against each other for players. Because he had broken his contract, Mr Radovich was unable to get a job with an affiliated league in California. He is asking for $35,000, which under the trebled damages granted in anti-trust cases, may become $100,000, but he insists that his real aim is to show the leagues that they cannot treat a player "like a piece of furniture."

...symbol of quality and service

From concept to finished product, the precise standards demanded to-day depend on the efficient co-ordination of all available knowledge, experience and manufacturing facilities. The BIRFIELD Group of Companies, serving particularly the Automotive, Railways, Aviation and General Engineering fields, applies its collective knowledge and resources to all projects undertaken within the Group. BIRFIELD service to industry is comprehensive, expert and dependable.

Uganda: Next on the List?

FROM A SPECIAL CORRESPONDENT

"AFTER Ghana freedom for Uganda," runs the chalked slogan on the walls of Kampala; "No more British Governors," was the poster which greeted Sir Frederick Crawford as he landed at Entebbe airfield, to take up his duties as Governor of the Protectorate. Such political demonstrations probably represent only a small minority of opinion in Uganda, but they do show the passionate interest with which this week's independence celebrations in Accra are being watched by Africans everywhere.

Uganda has long felt a certain link with the fate of the Gold Coast because both countries are purely African states with virtually no white settlers to complicate their political future. When self-government for the Gold Coast came into the news it was therefore not surprising that Uganda should demand similar treatment. Last month the Lukiko, the Parliament of the Baganda people, formally decided to petition the Queen for "a definite policy which will lead us to self-government in a fixed time within the Commonwealth." Yet in spite of these demands and demonstrations, and in spite of the pace at which the last governor, Sir Andrew Cohen, bustled the country along the road of political advancement, actual self-government still seems a relatively distant prospect. There will be direct elections to the Legislative Council on a common roll in Buganda this year (if the Secretary of State agrees), and throughout Uganda in 1961; but officials make it clear that these steps are not intended as the prelude to self-government in the early 1960's. The African political leaders find it hard to understand the delay.

Yet the reasons which the British colonial officials put forward in private cannot easily be brushed aside, though they are even less easily discussed in public. First of all there is the disparity between the state of Buganda and the rest of Uganda. The Kabaka's government in Kampala is far more advanced, and controls a far more advanced people, than are found in any of the other states which make up Uganda. These less advanced states fear that self-government will really only mean domination by the Baganda, and that they utterly refuse to accept. The Kabaka's government, since his triumphant return from exile, has not given grounds for confidence that it would be tolerant or democratic. At this moment it faces a crisis because the courts have awarded a seat in the Lukiko to a properly elected member whom the Kabaka has so far excluded on the frivolous ground that he is politically unfriendly. There are also real grounds for fear that if self-government were granted in the next five or six years Africans simply could not be found to man either the ministerial or higher civil posts, since educational opportunity has been slower to develop in Uganda than on the west coast.

The new governor is therefore likely to face some difficult tests in his first few months. There is no doubt that there will be a rising agitation for an early promise of self-government. If he simply rejects it on the grounds that the country is not yet ready to govern itself, his words will not carry conviction to the few but vocal political leaders who feel that they personally are ready to rule, and who cannot believe that their country is far behind Ghana. If, on the other hand, he accedes too readily to such demands (though of that there is no sign) trouble might well start between the Baganda and the other tribes; there might also be a catastrophic collapse of the country's administration.

There are some indications that the governor's brief from London is to try and keep the African political leaders happy by frequent small moves along the road to self-government, while training up a cadre of African officials from all tribes, who can begin to take over the civil service. This sensible plan will only succeed if there is a proper realisation (which seems generally lacking amongst East African Europeans) that events in Ghana and Nigeria are making political demands by Africans elsewhere vastly more urgent.

China's Change of Pace

FROM OUR CORRESPONDENT IN *HONGKONG*

ALL the available evidence from Peking indicates that the State Council is now holding down the pace of the current five-year plan, which ends this year. The plan, which got out of hand in an exuberant gallop last year, will finish the course at a steadier trot, easing down as it passes the post. There have been frank and repeated admissions of waste, inefficiency and extravagance in 1956. In particular, the recruitment of labour, based on inordinate demands by ambitious local enterprises, has been denounced by the regime as grossly excessive. According to the State Statistical Bureau:

> The total number of workers increased by nearly 2½ million during 1956, swelling China's labour force to

24,730,000. Because of the lack of investigation and study of the actual needs of the national economy, the army of newly added workers represented double actual requirements. . . . Personnel not directly engaged *in production* grew to such proportions as to be intolerable. There were more employees than jobs and the nation's resources were squandered.

Shortage of coal has become another serious problem. The production of coal rose from 66 million tons in 1953 to 106 million tons in 1956, but in the same period industrial demands for coal rose from 27.9 million to 48 million tons and domestic demands from 30.8 million to 50 million tons. *Since the last quarter of 1956* the supply has not been equal to the demand. Electric power has been tightly rationed ; and the State Council was forced to order all coalminers (who get no annual leave of any kind) to "volunteer" to work on two of the three traditional and sacrosanct New Year holidays. According to the newspapers, all Chinese miners "joyfully greeted" this "glorious task," some "postponing planned marriages," others "eagerly quitting vacation trains *en route* to their native homes to hasten back to the pits."

Announced changes in the plan to cut waste and costs include "appropriate" reductions in capital construction and industrial production ; more intensive development of arable land and improvement in existing farming methods (instead of earlier plans for large-scale construction and import of heavy tractors and other modern farming machinery); a bold but bald pledge to cut back "spending on the army by one-third" (whatever that may mean) ; curtailed expenditure on "cultural, educational and public health enterprise" ; and—above all—strong action to discourage the tendency to achieve and surpass *quantity* targets at the reckless sacrifice of *quality* standards.

Inflationary Demand

The five-year plan originally set the ratio between heavy industry and light industry investment at 88.8 to 11.2 per cent, or about eight to one. In last year's budget the ratio was quietly altered to 87.5 to 12.5 per cent, or about seven to one. The expected revision this year will further modify the ratio to nearer six to one. Wage increases in the headstrong mood of 1956 stimulated an inflationary demand for short supply consumer goods, which was checked only by throwing in meagre stockpiles. This situation will be corrected this year. On the swollen labour front the policy has been sternly laid down: "Increase tasks but do not increase personnel ; where newly established units need increased personnel, they should be transferred from old units." Another interesting development has been Peking's decision to lighten the burden of "voluntary" purchases of government bonds this year for industrialists and merchants and to transfer the increased liability to workers and peasants, thereby helping to take care of the latter's increased wages.

As the last year of the first plan begins, there is obviously some official doubt and anxiety, muffled in party jargon, about organisation and discipline in the agricultural producer co-operatives (APC's) and among students generally. "Among the masses," says Peking's *Jen Min Jih Pao*, "ultra-democracy has emerged. In some places, if the cadres speak a little loudly, the masses call it commandism ; if popular but erroneous views are not at once accepted, they call it bureaucratism. Promotion of democracy does not mean the abandonment of leadership."

At a recent Peking party conference on "student work in higher institutes," there were complaints, also, that some students "showed a tendency to ignore politics," that others had been confused between "socialist democracy and bourgeois democracy" *in considering* "some of the events that happened recently in the international communist movement," and that "certain newspapers and publications had given one-sided publicity to the question of fostering individuality, liberalism and individual wishes." All schools and universities have been ordered to intensify courses in political theory. If the change in pace of the five-year plan stresses *once more the flexibility* of the Peking regime's methods, this concurrent reaction to doctrinal misgivings makes it just as clear that there are real, hard and unyielding limits to basic party elasticity and tolerance.

"People's Power" in Hungary

BY A CORRESPONDENT

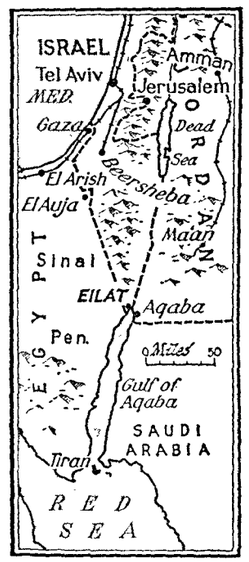
MR KADAR's "reform" of his government and of the party hierarchy will not bring much cheer to the Hungarian people. In both government and party, control rests firmly in the hands of Mr Kadar and his closest associates ; Dr Muennich, formerly defence minister, has been promoted to be first vice-premier ; the key-post of minister of the interior has been given to Mr Bela Biszkar, a hitherto little-known party stalwart who is believed to be a close friend of Mr Kadar. No one tainted with sympathy for Mr Nagy is admitted to the new 37-member central committee of the party ; it contains twelve men reckoned to be "Rakosists," and six labelled as "Rajkists" ; the rest are nonentities who will do what Kadar tells them.

The basis of what Mr Kadar, with fine contempt for semantics, calls "People's Power" in Hungary remains the Soviet army (upwards of ten divisions) stationed in the country and the native apparatus of control through the security police and the party. The basis of the security police (the AVH) has been duly resurrected, and thanks to the incorporation of thousands of army officers, it may be stronger numerically now than before the revolution. The regime is stressing that it must be further strengthened. The threat of selective dismissals in office and factory has swollen the number of party members from 20,000 to 170,000 since the New Year. Most of the members of the old communist party apparatus are back in service. But many of them are uncertain and some frankly afraid. The ultimate dangers—another open rebellion, or the haunting spectre of a neutral belt across Europe, implying Soviet withdrawal from Hungary—seem remote enough now. Minor dangers, however, are more imminent. Opposition to communist power in Hungary is still legal if it takes the form of opposition to minor individual repositories of that power. Complaints about the "abuses" of Comrade X or the "arbitrary methods" of Comrade Y, though more muted than in the months preceding the revolution, are again out in the open. Only the AVH and cabinet ministers are immune. Tongue-in-cheek "criticism from below" has recently reached as high as a deputy minister of the food industry who would not curb a high-handed functionary.

The native apparatus is thus caught between the upper millstone of the imperatives of its own survival on top of the Hungarian powder keg, and the nether one of legalised criticism of personalities. Functionaries are accordingly vacillating between weakness and bouts of brutality. They are to "restore order and discipline," but if they take this literally enough, they may find themselves out on a limb, more hated than their colleagues, singled out by popular criticism as "Rakosists," and dropped. This is destructive of party morale, and to stop the rot, the regime is making frequent promises that it will "protect" its servants.

Side by side with total political repression, in the economic sphere many of the revolution's *faits accomplis* have been accepted. The most portentous is the redistribution of the national income in favour of the peasantry. Compulsory deliveries to the State are to remain abolished. All produce can now be freely sold either direct to consumers or to State purchasing agencies. This should raise the income of the agricultural sector from about 13 to about 18 milliard forints a year. Moreover, official repentance has been made for major madnesses such as compulsory cotton-growing at a cost of production of 700 forints per lb (about $17 per lb at the "grey" rate of exchange used by State foreign trading concerns). Collectivisation, too, must henceforth be "really" voluntary. As a counterweight to the revolutionary working class, the inherently conservative peasantry is meant to have a vested interest in Mr Kadar's established order.

How many Unemployed?

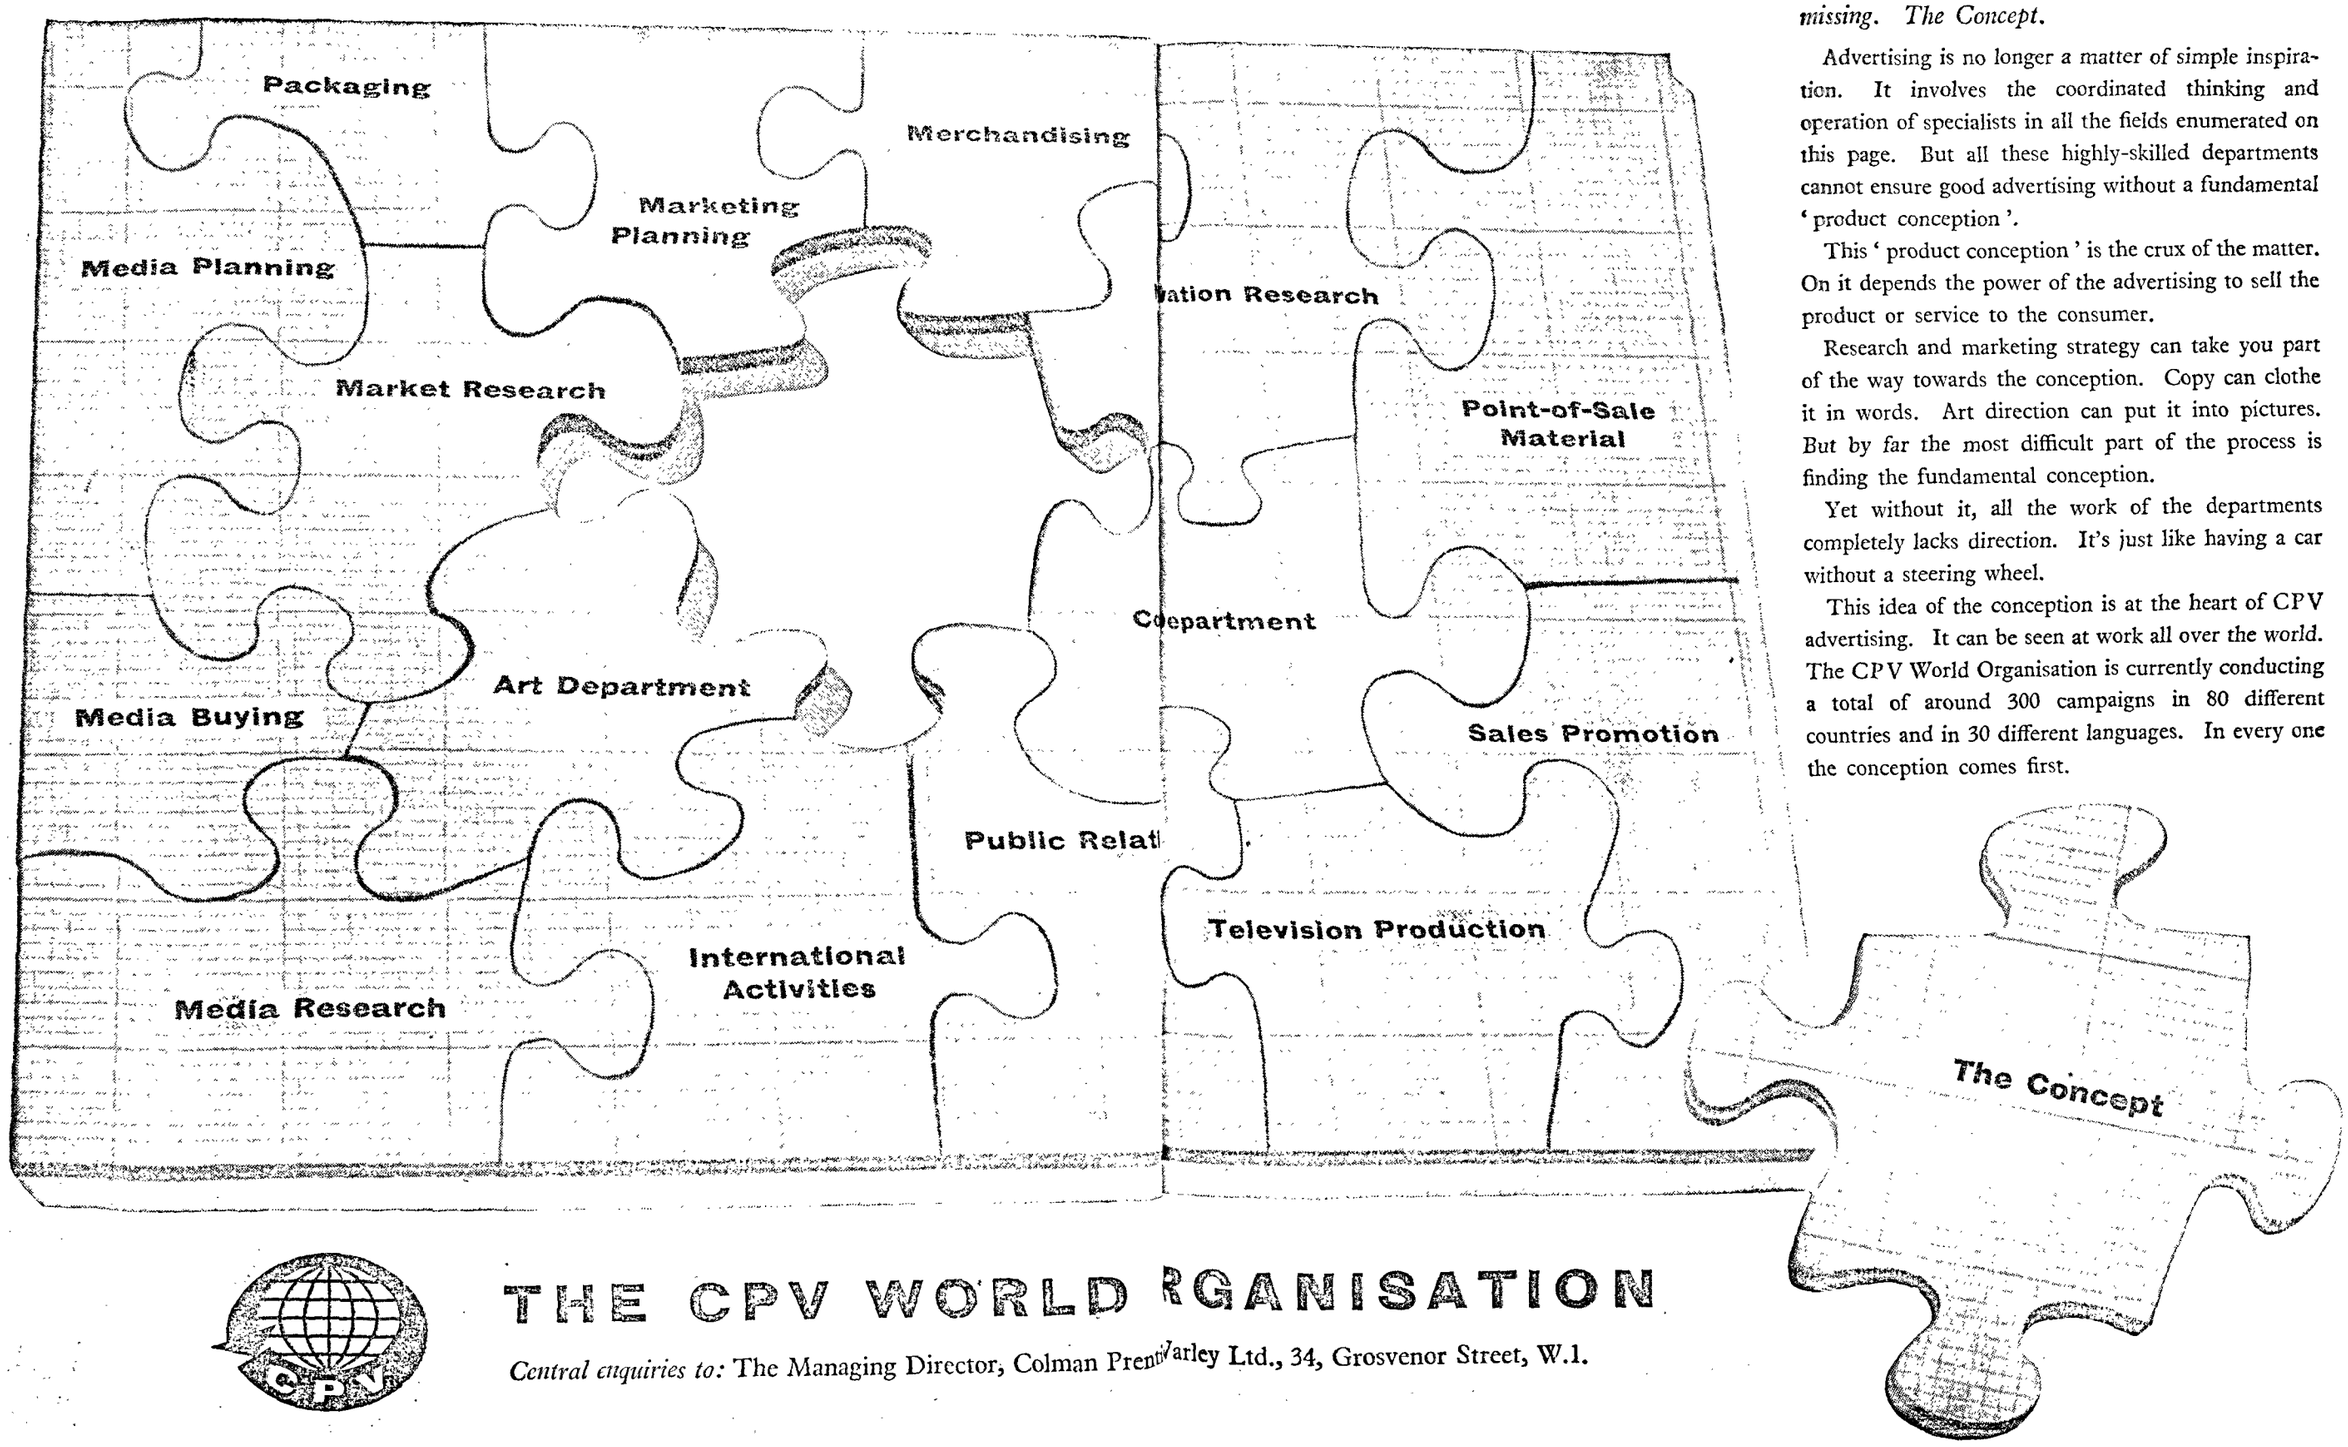


Wage adjustments in industry and mining should increase the money income of these sectors by at least 3 milliard forints. In addition, workers' councils contrive to disburse various "unlawful payments" to employees. Thus, even if real output were not less than before the revolution, an inflationary gap of at least 8 milliard forints, roughly a tenth of the gross national product, would be opened up. In fact, the gap is larger, because current output in manufacturing and mining is still about 40 per cent below the pre-revolutionary rate. Labour productivity is low because most workers' councils, even in their present intimidated and purged state, sullenly resist the reintroduction of piecework rates which they regard as the thin end of the wedge. Flat wage rates are now the rule rather than the exception. They work out at about 1,100 forints a month, while unemployment pay varies between 300 and 600 forints.

The number of industrial unemployed is not disclosed, but despite the demobilisation of a quarter of a million soldiers, it is probably rather smaller than the 200,000 originally forecast. White-collar unemployment seems proportionately more severe, though there are signs that the proposed radical pruning of the bureaucracy will end by the eventual re-employment of much the same number of bureaucrats in a reshuffled set of planning and control posts. As the government has put it, "exaggerated centralism is harmful, but socialist planning implies central direction." The audacious demand of the workers' councils, that each enterprise should plan independently and face a free market, would have drained off rather too much "people's power."

The material damage "caused by the counter-revolution," that is by the brief and bloody war the Soviet Union waged against Hungary last November, is now put at 14 milliard forints. This is $1,200 million at the official and $350 million at the more realistic grey rate of exchange. For reasons of its own, the Soviet government is about to make good some of the loss it caused ; after giving a stopgap loan of $50 million in convertible currencies, it is now holding out the prospect of another 800 million roubles. Negotiations are still going on in Budapest, but agreement in principle seems to have been reached. The loan is intended to finance Hungarian imports from the Soviet Union. The shopping list for the current quarter, allegedly agreed to by the Russians, subject to railway capacity, includes 250,000 tons of breadgrains, 150,000 tons of feedgrains 600,000 tons of coal, 150,000 tons of oil, 100,000 tons of pitprops, 10,000 tons of synthetic and 1,200 tons of natural rubber, 4,500 tons of aluminium ingots, 1,800 tons of copper and 1,200 tons of lead. This is an impressive list and if the goods are in fact delivered, the embarrassment of inflation and economic breakdown might be averted.

Faith and Works at Eilat



EILAT today catches the Israeli imagination as does no other name. The small desert outpost on the Gulf of Aqaba is seen as the thriving port of King Solomon's day, Israel's door to the East, and a trading link between the Mediterranean and the Indian Ocean. Israel considers it a new gateway to world trade and a crack in the Arab economic blockade ; for that reason it has fought stubbornly at the UN to ensure freedom for its shipping in the gulf. What in fact is the trading potentiality of the port, how far have the Israelis developed it already and what are the main difficulties in in their way ?

By land, Eilat can only be reached across miles of desert by a road that is still partly unsurfaced ; food has to be brought from the north ; sweet water is very scarce and the heat in summer is terrific. As there is only a small harbour jetty, ships over 4,000 tons have to anchor offshore ; in consequence, handling charges are exceptionally heavy. Trade would have to be two-way and although various bulky export commodities are produced near Eilat, there is as yet no cheap way of carrying imported goods to the north. And, most important of all, unless the political climate becomes less stormy, it is unlikely that Israel will obtain the long-term foreign investments essential for development.

Despite these problems, Israel has gone steadily ahead with its plans since November. The most important single project so far started is the 8-inch pipeline, and the most ambitious plan is the 30-inch pipeline, both of which

What vital ɒce is missing?

Here you have a picture of the services a big advertising agency offers. But we at CPV wouldn't call this picture complete. For one vital thing is missing. The Concept.

Advertising is no longer a matter of simple inspiration. It involves the coordinated thinking and operation of specialists in all the fields enumerated on this page. But all these highly-skilled departments cannot ensure good advertising without a fundamental 'product conception'.

This 'product conception' is the crux of the matter. On it depends the power of the advertising to sell the product or service to the consumer.

Research and marketing strategy can take you part of the way towards the conception. Copy can clothe it in words. Art direction can put it into pictures. But by far the most difficult part of the process is finding the fundamental conception.

Yet without it, all the work of the departments completely lacks direction. It's just like having a car without a steering wheel.

This idea of the conception is at the heart of CPV advertising. It can be seen at work all over the world. The CPV World Organisation is currently conducting a total of around 300 campaigns in 80 different countries and in 30 different languages. In every one the conception comes first.

THE CPV WORLD RGANISATION

Central enquiries to: The Managing Director, Colman Prentarley Ltd., 34, Grosvenor Street, W.1.

were described in *The Economist* of last week. But apart from schemes dealing with oil, a lot has been going on. In four months the population has risen from 600 to 1,600: a batch of new immigrants to Israel was flown straight to Eilat, people from the north have been braving the desert (permanent settlers in Eilat are given exemption from income tax) and there are two or three internal flights to the port daily. Houses are going up fast, service industries have been started and the enlargement of the hotel is completed. The road between Beersheba and Eilat should be entirely asphalted by the middle of next month. A few trial export shipments have sailed and there have been one or two tentative experiments in transit trade: coffee from Ethiopia and hides to Cyprus have passed through the port. There are two big projects still in the planning stage: the enlargement of the harbour (a French firm has produced a detailed survey) and the extension of the Haifa-Beersheba railway down to the gulf.

How far will the use of Eilat justify the money and energy that is being spent on its development? Eilat scores over Haifa as an export port for bulky raw materials produced in the Negev. An obvious example of this type of product is potash from Sodom near the Dead Sea. The potash works is planning to raise its production from 50,000 tons to 130,000 tons within a year. Japan and other Asian countries are eager customers, but in the past it has been too expensive to carry the potash to Haifa and then round the Cape. Salt, the by-product of potash manufacture, could be sold to countries in south east Asia. The phosphate deposits in Negev are nearer to Eilat than to any other port. Copper and cement are also produced near Eilat, and a granite works is starting production this month.

The snag to all this is that until the railway is built, Eilat will not be an efficient two-way trading port. It would not be economic for ships to unload at Haifa and then travel in ballast to Eilat. Communications between the Red Sea and the Mediterranean are again the key to the harbour's importance for transit trade: unless goods can be carried across Israel more swiftly and more cheaply than through the Suez Canal, Eilat is unlikely to compete significantly in this type of trade. A lot of money will have to be sunk in the enlargement of the port and the building of the railway. Unless there is some guarantee that the gulf of Aqaba will remain open to ships bound to and from Israel, this money may be hard to find.

Enlightenment in Burma

BY A CORRESPONDENT

BURMA is so far the only one of the South Asian group of countries that has accepted the necessity of a drastic revision of its national development programme. The former premier, U Nu, and his successor, U Ba Shwe, have been able to do this partly under the sheer compulsion of events and partly because the philosophy of planning is of much less significance to the political programme of the governing Anti-Fascist People's Freedom League (AFPFL) than it is, for example, to the Congress Party in India.

Encouraged by a wildly optimistic picture of development opportunities, prepared by a private firm of American consultants in 1953, the Burmese government set about creating the new Jerusalem only to find itself soon afterwards in serious difficulties over foreign exchange and technical manpower. U Nu and his colleagues had the good sense quickly to call a halt and to scale down, or abandon, the more fanciful projects, some of which had fortunately not got beyond their initial stages. But by the end of 1955 the substantial post-independence sterling assets which Burma had inherited had dwindled to £32 million, as against £97 million in 1953. At the same time, the long sellers' market in rice came to an abrupt end. Stocks on hand at the end of June, 1955, were estimated at 1,300,000 tons, of which more than 500,000 tons had been carried over from past seasons. Thus Burma was confronted with the problem of disposing of a large backlog of its chief export commodity in the face of rapidly contracting world demand.

To some extent this glut of rice was due to the unrealistic policies previously pursued by the State Agricultural Marketing Board, a government monopoly, which held out for export prices that could not be realised on a falling market. But wherever the fault lay, the result was that the Burmese were forced to conclude a series of barter transactions with Russia and China and other communist countries on terms which have since proved increasingly disadvantageous to them. At the same time, import licences were cut to shreds and "development" slowed down to first gear. By these stern methods the government was able to hold the line until the balance of payments position began to improve, and, as by a miracle, towards the end of last year world demand for rice once again swung sharply in Burma's favour. At the end of the third quarter of 1956 foreign exchange held by the Union Bank of Burma had increased to approximately £44½ million, though some part of the improvement is due to a draft on the International Monetary Fund (approximately £5½ million), and it is not known what proportion of the increased reserves of foreign exchange is represented by blocked unused credits with the communist countries. A probable figure would be K 10 crores, or, say, £7½ million.

Barter Deals Unpopular

Preliminary data issued by the State Agricultural Marketing Board shows that in the period for January to September, 1956, 1,435,000 tons of rice were exported against 1,197,000 tons in the same period of 1955. Shipments to barter countries accounted for 17.9 per cent of the whole against 17.2 per cent in the first nine months of 1955. Shipments to China have declined sharply, but those to Russia have risen. But the broad picture is one of expanding demand from the "cash" customers, and Burmese ministers have several times indicated in public that they have no great liking for barter deals as such and would be glad to break away from them. The 1957 exportable surplus of rice is estimated to be of the order of 1.3 million tons, and well-authenticated reports suggest that Burma could sell rather more than a million tons of this for cash. It is known that it would probably like to keep barter sales down to not more than 200,000 or 250,000 tons. If it could do this, it would be in a fair way to re-establishing the rice trade on a cash basis.

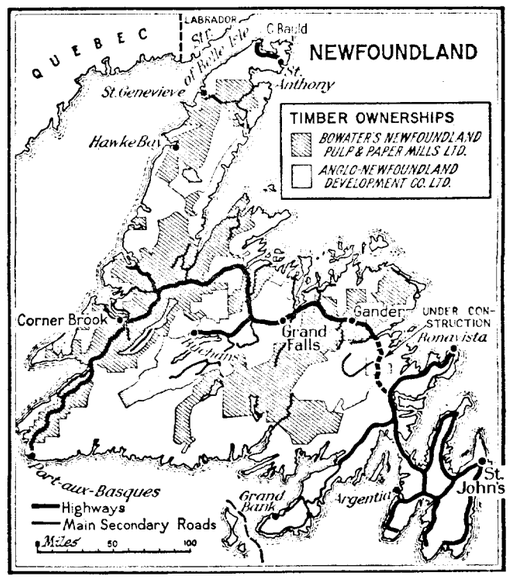
★

Correction. In the article "Israel Faces Isolation" in *The Economist* of February 23rd, the Israeli budget was given as £1,850 million and the proposed cuts in expenditure as £1,110 million. These figures should have read: I£850 million and I£110 million.

In Newfoundland's Forests

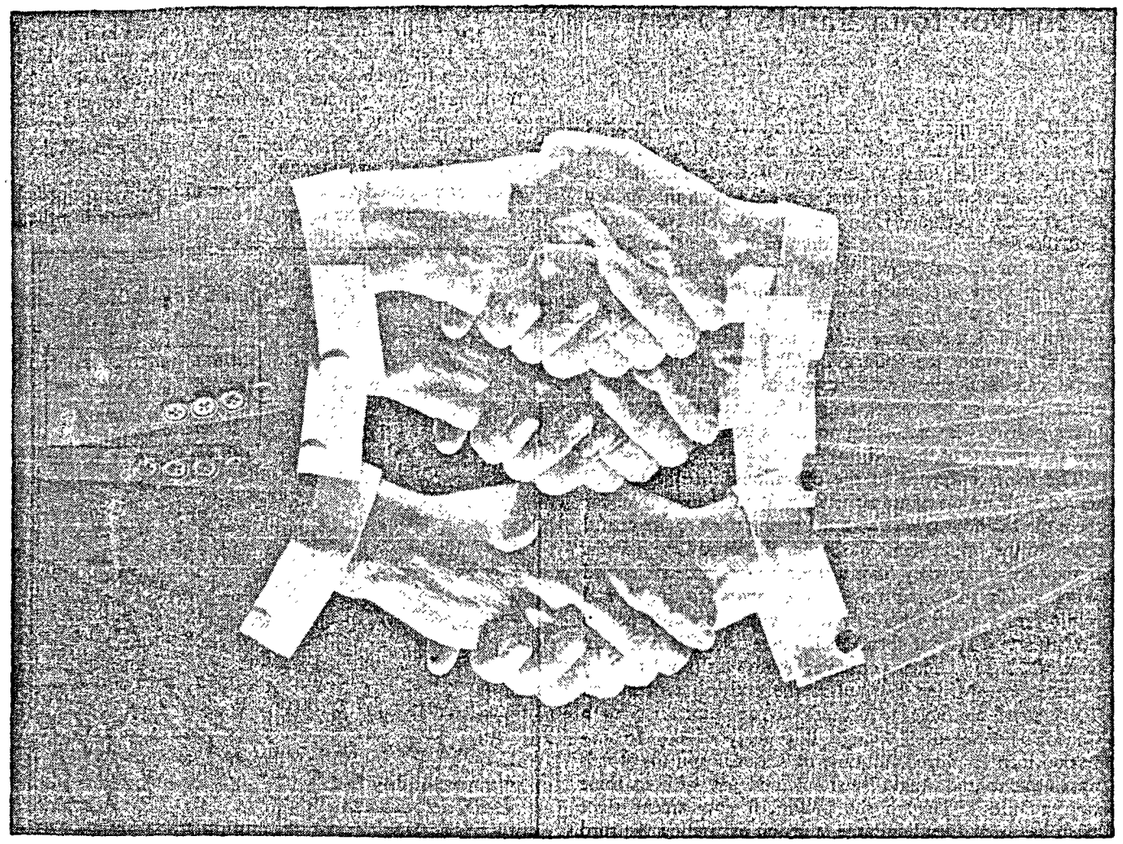
FROM A CORRESPONDENT

THERE are many in Newfoundland today making more money than they know what to do with. In all other contexts but this, such a statement is never intended to be taken literally. It means that they are so rich that money at least can be excluded from their worries. In Newfoundland the people in question seldom earn more than $45 a day and for several weeks of the year may earn nothing. They are those who work in the virgin forests for one of the two pulp and paper companies, Bowaters and Anglo-Newfoundland. A glance at the accompanying map will help to illustrate the anomaly. All Newfoundland pulpwood can—and most does—travel to its mill by water, either coastwise by barges tugged for anything up to 36 hours or riverwise according to the speed of the current and the appetite of the mill.



The men concerned in the operations are not so well served with means of transportation as their logs. Not for them the hilarious *schuss* with the spring thaw or the restful cruise to the bright lights of Corner Brook or Grand Falls. If they are lucky, they have a more or less accessible road along which they can travel in comparative speed and comfort to a town where, if they cannot or wish not to live, they can at least spend their money; and it is a town from which the bulkier consumer goods can travel quickly to meet the growing demand in the outlying settlements. Thus some are able to acquire an approximation to a Canadian standard of living. But many of the 10,000-12,000 men employed full-time or seasonally in the woods by Bowaters and Anglo-Newfoundland are without these opportunities. Though the provincial government since 1949 has been spending large sums on expanding the road system with laudable application and efficiency, it so happens that much of the forest now being cut over or scheduled for cutting soon is without those means of transportation which well-paid men expect.

It is perhaps fortunate that almost all the men in question are accustomed to isolation and know far better than most Canadians how not to be frustrated by the simple life. They are fishermen and sons of fishermen from the outports, and it is amazing how quickly a fine Newfoundland fisherman becomes a fine woodsman. And a fine woodsman in those northern forests is not only a feller of trees. He takes to anything from cost-accountancy at the depot to handling a gigantic tracklaying bulldozer on the company road with a readiness that forcibly reminds one that geographically he belongs to the most advanced technological continent in the world.



Everything that can be done by machine is done by machine. Output per man-hour is the prime consideration, and the trees tumble with formidable speed. Two interesting developments have recently come about from this feverish sense of urgency: the power saw and the insect repellent. The former is estimated to increase the cutter's output by one-third and the latter to keep him in the woods when otherwise he would rather die than go near them. The long-term economic consequence is less fishing and more wages, but at the moment what is more noticeable is the absence of purchasing power owing to lack of roads.

A 30-year-old cutter, working with his power saw fifteen miles into the forest from the Bowater depot at Hawk Bay, earns $45 when the going is good—some days last summer he hit $50—and seldom less than $30. It costs him $1.50 to eat and sleep in the company camp near the cutting. He is forbidden to touch alcohol during the working week, and it is dangerous to smoke. He finds it hard to use his money when he gets back to the depot community at weekends. "One day," he says, "there'll be a road, and I'll get myself a wife and an automobile."

A contractor, aged 32, employing up to 90 men on woods operations, occupies one of two houses (his brother has the other) at St. Genevieve, within 20 miles of the Labrador coast. His earnings for himself, his wife and two small children amount to about $5,000 a year, net. He owns four guns and six wireless sets. He and his wife listen to radio commercials and read the advertisements in the glossy Canadian and American magazines. He talks with authority about the standard of living, and his wife wonders about what the advertisements call "gracious living." They could afford it, they think.

St. Anthony, a sizeable town, is as the crow flies, 50 miles away. By sea, in winter, it can be reached, not very comfortably, in their snowmobile. In summer there is no road through the woods, and the seaway up the Strait of Belle Isle and round Cape Bauld is too hazardous for family outings. The contractor dreams often, he says, of how the road, when it comes through in a year or two, will affect the lives of his own and his brother's family. For him, too, the big car figures large in his dreams. But as he works hard and earns high, and as he ponders over the barrage of advertising which attacks him in his isolation, he finds his imagination being drawn more and more to the south. Some time soon, he thinks, the ferry service linking Newfoundland with the mainland will run at least once daily, instead of every other day, will run even at weekends, will run at reasonable charge, will begin to recognise that Newfoundlanders are now Canadians and anxious to "mix in." *His* road will run to it straight and fast. St. Genevieve will be on a direct and easy line from Halifax, Montreal, New York . . . the whole world.

Theme for profitable business – with variations

Can size be reconciled with efficiency? . . . it's an old, old problem to which there is no easy answer. But by basing its whole approach to business on informal, *personal* dealings, the Reed Paper Group has found a very practical yet flexible formula — one that varies according to the business in hand.

The Group, which is concerned with every aspect of making paper and paper products, is an efficient whole . . . but it is also 19 separate major companies. Each of these, while having access to Group resources, retains its individuality and independence, and understands the character and aims of the Group so well that it can think and act *for itself*. What makes this possible? Simply the *people* who work within the Reed Group — people who are encouraged to vary their way of working according to your needs. The men-on-the-spot have the responsibility — and the initiative to see any job through to your best advantage. Yet should need arise, they have only to pick up their telephones to draw upon the central resources and specialised knowledge of the Group.

Informal efficiency is the keynote. It is why your every meeting with a Reed manager, salesman or technician can be so refreshingly satisfying and profitable. It is why your every dealing with a Reed company can give you the best and right materials for *your* needs.

"YOU profit from the initiative of each Company backed by the resources of the Group"

THE BUSINESS WORLD

Dark Atomic Mills

AMID the oracular confusion with which the Government's decision to treble the nuclear power programme was finally made public this week, citizens may well wonder whether the Cabinet was any more competent to make this decision than official spokesmen proved themselves able to explain it. This is not a joking question; involving, as it does, hundreds of millions of pounds of public money, it is a frightening one. It would be unfair, for example, to cavil at the slip of the tongue in Lord Mills's statement to the House of Lords, as recorded in *Hansard*, that "the power stations to generate 6,000 kilowatts (*sic*) of nuclear power will cost £1,460 million," which suggested that the capital cost of nuclear stations approaches a quarter of a million pounds a kilowatt; but unfortunately the sum of money seems to have been wrong, too. This suggested that to treble the nuclear capacity Britain would have to invest five times the money; and though at a technical press conference later Lord Mills seemed quite happy with such a price, it soon appeared that the country is getting a much better bargain than that. The huge figure of £1,460 million, it seems, relates not to the main subject under discussion—the cost of the nuclear electricity programme from 1957 to 1965—but to the combined investment in conventional and nuclear stations, plus transmission lines, though not distribution, during part of the period, from 1961 to 1965. The revised bill for nuclear stations is in fact £900 million; this will bring the total electricity investment in England up to about £2,900 million during the nine-year period. Over ten years, this programme would cost some £700-£800 million more than a purely conventional power programme would have cost.

This is not the most auspicious way to launch the largest single investment programme that any industry has ever announced in Britain, for most of which the taxpayer will have to provide the capital. The electricity supply industry is already probably the biggest single claimant on capital resources in this country; any project that adds to its demand for capital requires the closest scrutiny. There is an exceedingly strong economic case for Britain to invest in atomic power, but there is also a real danger of falling into the easy belief that in atomic power one cannot have too much of a good thing. An atomic power station costs three times as much to build, allowing for its initial charge of fuel, as a conventional coal-fired station; thereafter its running costs are likely to be low, but by no means negligible. The cost of electricity from either type of station, at ruling rates of interest (and in the present state of technology), is expected to be roughly the same. So any decision on the part of the government for a big increase in expenditure on the more costly type of station should have been fully explained, and accompanied by a statement of the convincing reasons that led to it.

When the first atomic power programme was announced just over two years ago, the government was at pains to explain the probable trend of the demand for energy in this country, the shortage of conventional fuels that this was likely to create, and the part that atomic power might play in relieving that strain. The programme was presented as part of a rational plan to meet future energy requirements, and a rough timetable of atomic construction was given. Since then there have been big advances in atomic engineering—plus some painful reassessments of the probable trend in the supply and price of conventional fuels, and most particularly oil. In deciding to treble the atomic power programme, the government has aimed, by all accounts, at the highest figure that its technical advisers said was practicable, but it has missed the opportunity for explaining what led it to take such a decision. This cannot have been due to lack of time. The new programme has been under discussion for several months, and the intervening change of ministers does not appear to have altered its details significantly. The government's failure to explain its programme, its reasons, and

its hopes has done a disservice, not only to itself, but to everyone interested in seeing atomic power properly developed.

The new programme is a perfectly rational one ; the case for it has been set out already in these columns and elsewhere. The first atomic plan allowed for the expenditure over 10 years of £300 million up to 1965, on 12 atomic power stations with a maximum capacity of 2 million kilowatts. Improvements in engineering methods which doubled the electricity output possible from reactors of a given rating later made it plain that this programme, if carried through unaltered, could in fact give 4 million kilowatts of nuclear electricity at a capital cost that was probably not much more than 80 per cent above the original figure of £300 million. Ultimately the government decided to increase this amended programme by another 2 million kilowatts, giving a total of 6 million kilowatts by 1965.

The cost of the programme seems to have been reached in this way: building costs of the stations were put at an average of £124 per kilowatt of capacity. The first two nuclear stations being built for the CEA in England cost £145 per kilowatt, but the station to be built on a rather easier site in Scotland by GEC will cost about £100 per kilowatt ; some of the difference is due to site advantages, some to design. The figure chosen is therefore a reasonably conservative guess that leaves some scope for reducing capital costs over the programme. The " working capital " tied up in nuclear fuel inside each reactor, and in any extensions that the Atomic Energy Authority may have to make to its facilities for processing fuel, is taken at an average of £29 per kilowatt, giving a total for the programme of 6 million kilowatts of £742 million for building costs and £177 million for fuel costs, which include about £70 million for additional building by the Atomic Energy Authority ; these figures are rounded off to a total of £900 million.

This expenditure will only build up gradually over the period. The following table offers a rough guess at the rate at which atomic plant might be commissioned and the probable capital cost of the stations coming in :

1961	900,000 kW	costing	£144 million
1963	1,300,000 kW	„	£195 „
1964	1,800,000 kW	„	£270 „
1965	1,800,000 kW	„	£270 „

A total of 6 million kW, costing £900 million is the maximum thought possible by 1965. The Central Electricity Authority is now installing nearly 2 million kilowatts of new capacity annually. From 1961 to 1965 the total installed each year is likely to be nearer 2,500 mW a year: but by 1964, nuclear power will be meeting the greater part of this increase in plant each year, with a sharp decline in investment in conventional plant. The second table gives a rough estimate of the balance between conventional and nuclear investment. It covers the amounts invested in plant during the period whether or not it is completed by 1965. But it excludes the Scottish atomic power station because this does not fall within the province of the CEA.

By 1965, the 6 million kilowatts of base load atomic power stations will represent about 15 per cent of the country's total generating capacity ; because they are working on " base load," close on 24 hours a day, they will probably be supplying about a quarter of the country's electricity. If building then continues at the same rate, by 1970 atomic power should be supplying 40 per cent of the country's electricity capacity. Lord Mills's statement in the House of

CEA OUTPUT CAPACITY, IN MEGAWATTS

Years	New Generating Plant			Plant shut down	Total capacity at end-period
	Conventional	Nuclear	Total		
1956	...	...	...	...	20,500
1957–60	6,400	...	6,400	200	26,700
1961–65	6,500	6,000	12,500	400	38,800
1957–65	12,900	6,000	18,900	600	38,800

ESTIMATES OF CEA INVESTMENT
(£ million)

Years	New Generating Plant			Transmission & distribution	Total investment
	Conventional	Nuclear	Total		
1957–60	320	90 *	410	400	810
1961–65	310	780 *	1,090	800	1,890
1957–65	630	870 †	1,500	1,200	2,700

* 6,000 mW of nuclear capacity will also require £177 million for fuel elements and their processing : CEA considers these working stocks of fuel as operating costs.

† For building nuclear power stations alone : i.e. some £740 million for the 6,000 mW of stations completed by end-1965, plus about £150 million for stations then under construction.

lords confirmed that one of the main reasons behind the government's decision was the fear of increasing dependence on imported oil. He offered no estimates to suggest how much the growth of oil imports might be moderated by atomic power. Nor did he give any hints about a problem that is becoming increasingly important to the British economy—the net cost of fuel imports after crediting fuel exports and invisible earnings on the British balance of payments as we approach the era of atomic power. Output from the atomic stations by 1965 has been estimated at the equivalent of 18 million tons of coal a year—or 12 million tons of oil. The difficulty of increasing coal deliveries much above their present figure means that for every extra ton burned by the power stations another ton of coal, or its equivalent in oil, will have to be imported. Is the prospect of saving fuel imports of this order the clinching reason for accelerating the atomic programme and embarking on an investment project of this size ? This is the only atomic power programme in the world in hand rather than on paper, and it deserves to be spelled out to this country and to the world with the maximum of clarity. If a detailed estimate of its advantages has been made, then it should be made public. A government that muffs the launching of a new atomic programme as badly as it did this week, cannot altogether avoid the suspicion that it does not fully understand the implications of what it is doing.

Bank Rate Background

WHEN Bank rate was reduced to 5 per cent on February 7th, the Governor of the Bank of England described the change as a " minor adjustment to market conditions." It was, he implied, a move designed to re-establish a more normal relation between the official rediscount rate and market discount rates. In the preceding two months the average allotment rate for Treasury bills at the weekly tenders had fallen by almost exactly ½ per cent, to 4 19/16 per cent, practically one per cent below the 5½ per cent Bank rate. The Governor's explanation clearly showed that he thought it desirable for Bank rate to conform broadly to the movement of the market—except at times " when we here should wish to use Bank rate more positively, to mark a change of policy or a reinforcement of policy."

In these past four weeks the bill rate has fallen even more steeply than it did in December and January. At last week's tender the average allotment rate dropped by rather more than ⅛ per cent to almost precisely 4 per cent, so that the gap between the bill rate and Bank rate is now actually a little wider than it was just before Bank rate came down. Does this mean that another Bank rate reduction should now be envisaged ? The reduction a month ago had long been discounted by market hopes and rising prices, and was quickly followed by the issue of a further tranche of " Eternity " 3½ per cent Funding stock at the precise level of the market ; the result was an abrupt check to activity in the gilt-edged market, profit-taking and falling prices.

Most investors in gilt-edged would probably agree that the terms on which the new " Eternity " stock was placed were intended as a peg to restrain long-dated stocks from taking a new jump, rather than a new datum level from which such a jump might take place. But the fall in bill rates has put some heart into those sections of the market that argue that they must have " something to go for " again. This movement, and the associated assumption that the falling tendency in interest rates in general will now be resumed, explains the recovery in gilt-edged stocks up to this week. But, as the gilt-edged market has since shown, it is a view that is held with a good deal less than full conviction.

Yet the course of the bill market presents close resemblances to the movement the Governor thought it right to " follow " four weeks ago. The one significant difference is that before Bank rate was reduced, active buying of gilt-edged stocks enabled the " departments " to sell very large lines from their internal portfolios, providing cash for the Treasury to repay more Treasury bills than it would normally expect to do at that season ; since the Bank rate reduction this important but unobtrusive funding process has virtually ceased. This difference, as some would argue, provides an added reason for a further reduction of Bank rate now—as the means of re-stimulating the " funding " demand for gilt-edged.

There are, then, two quite distinct technical approaches to the question whether Bank rate should be further reduced, just as there were two quite distinct explanations officially given for last month's reduction. The Governor thought it desirable to follow the short-term market downwards, provided there were no objections to doing so on wider grounds—that is, provided the reduction was not likely to have adverse repercussions upon sterling or to be construed, prematurely, as a " green light " for the economy. The Treasury spokesmen in Parliament put the matter rather differently : they saw the reduction not as a relaxation that could be afforded or risked, but actually as the means of keeping a fully effective restraint on credit. Taut control over the total volume of credit—that is, over the amount of bank deposits—requires taut control of the volume of the banks' liquid assets. These will be reduced, or prevented from rising unduly, if the Treasury can sell gilt-edged stocks rather than bills, and it will be the better able to do this if short money rates become relatively less attractive and longer rates relatively more attractive. Therefore a lower Bank rate, so far from easing monetary restraint, may be the means of sustaining or even tightening it. It was on such grounds that the Chancellor, and more particularly the Economic Secretary to the Treasury, justified and explained last month's reduction. They were anxious that the disinflationary action of monetary policy should not be in any way diminished.

★

So long as that objective remains—and it seems no less important now than it seemed a month ago—any case for a further reduction of Bank rate would surely have to rest upon the argument that it would encourage funding (and thus help to keep money taut), rather than upon the principle of " following " the short-term market. The implications of any such principle are very different now from what they were in the classical age of monetary control, when the rise and fall of short-term rates could be regarded as a dependable barometer measuring the pressure of commercial demands for money. Nowadays, even on those occasions when the Bank of England does not seek to use its day-to-day management of credit to determine the course of the money market, and genuinely tries (as it apparently sometimes does) to let the market find its " natural " level, the behaviour of the market will always be profoundly influenced, if not dominated, by the borrowing needs of the Treasury and by the particular tactics that the authorities adopt at the moment to meet them. However " neutral " the Bank of England tries to be,

the market's action will be shaped very largely by its expectations about official policy.

If this is so, the principle of "following" the market can claim little virtue. If at a particular time the Bank appears to follow the market, that should mean no more than that the Bank judged the market movement desirable in the interests of economic policy as a whole, and so thought it better to conform to it than to resist it. There is not, in fact, any compelling technical reason why the bill rate should not diverge considerably from Bank rate for a time; but any sustained and wide divergence makes for confusion about (and even in) official policy. Because official influences on the market are so dominant, any significant fall in market rates is deemed to accord with official wishes, and expectations that the authorities will "follow" then accentuate the market fall. Moreover, if that fall in short rates creates any substantial demand for gilt-edged, the resultant increase in official sales of stock coupled with the corresponding decrease in official sales of bills tends to cause a shortage of bills and so encourages a further fall.

All these influences have been present in the past three months, and together they lead to one clear conclusion. If the Bank does not want the market to get the bit between its teeth and run away too fast, it must grip the reins more tightly from the outset and handle them more surely and consistently than it has lately done. Since the Bank rate reduction it has apparently wanted to keep the market in hand; yet its resistance has taken the form of a series of spasmodic and rather half-hearted jerks.

This behaviour could be consistent with the other argument on which the February reduction of Bank rate depended—upon the desire to fund bills. The Bank may be trying to get the best of both worlds. By letting bill rates fall while putting up some show of resistance to the movement it may be hoping to encourage the revival of gilt-edged while trying to avoid giving the impression that any further major fall in interest rates is in prospect—offering a tiny carrot to go with a slightly shorter stick. But if the over-riding purpose of monetary policy is still to maintain the pressure of disinflation as a whole, is that purpose really attained by such tactics? The atmosphere created in the gilt-edged market by the "Eternity" issue and by the Chancellor's speeches in Parliament certainly helped to save the February Bank rate reduction from becoming a "green light." But would a revival in the gilt-edged market, apparently with official encouragement in this fashion, undo the good that was done by those restraining tactics? Such a revival might restart the funding process and so help to keep bank liquidity taut. But that tautening would have less effect on the economy if the gilt-edged market staged such a revival that the public was encouraged to feel that the need for monetary restraint was diminishing.

Restrictions on the Register

MOST people manage to leave any unwelcome duty to the last possible minute; and clearly many of the British businesses that were given three months from the end of November to register their agreements to limit competition with the new Registrar of Restrictive Practices were determined that copies of their agreements should not reach him until the very last day allowed by the law. At the beginning of last week about 200 agreements had been received in the registrar's office in the new building of the Chancery Lane Safe Deposit just off Holborn. By Wednesday night there were 600. On Thursday, formally the last day, and on Friday, as many agreements arrived as had come in the rest of the whole three months; by the end of last week about 1,200 restrictive agreements had been sent in for registration. Only a few arrived this week—though the office continues to be asked for copies of the official forms that have to be sent along with an agreement for registration. The task of compiling a public register of these agreements has begun; copies of the agreements on file, indexed by the products that they concern, will be open to public inspection before the middle of April.

British business has thus admitted to something over 1,200 agreements to restrict competition in its dealings, which the new Restrictive Practices Tribunal—eventually—will have to consider in relation to the public interest. The question "Are these all?" will obviously be asked. At present, at least, there is no way to answer it. Up to the end of 1955 about 150 products had been suggested to the Board of Trade* as being covered by arrangements to restrict competition, and 22 instances had been studied and reported upon by the Monopolies Commission. In its report on "collective discrimination" last year, the commission listed about 75 products as being affected by restrictive arrangements of that particular kind, and it added that from 290 trade associations with which it had been in touch it had received 164 agreements describing such practices. In the study of trade associations that it published this week†, PEP (Political and Economic Planning) records that in 1955 and early 1956 it found about 240 products were covered more or less effectively by common price agreements alone, though fewer than 1 quarter of Britain's 1,300 trade associations appeared to be engaged in price-fixing.

* Its report on the work of the Monopolies Commission in 1956, published this week, excluded agreements that might be registered under the 1956 Act.

† Industrial Trade Associations. Political and Economic Planning. 340 pages. 30s.

Until the public register is opened, there will be no way of comparing these various and partial assessments of the extent of restrictive practices in British business. The nature of an agreement itself may vary considerably; many, for example, comprise separate agreements for different regions of the country, and some may go down as far as individual agreements with particular dealers and retailers. Since the Restrictive Trade Practices Act became law last year, there have been many reports of such agreements being dropped. These are in the nature of things difficult to verify; nor is it known how many of them would have concerned the collective enforcement of resale price maintenance, which became illegal under the Act (though agreements between suppliers that price maintenance should be individually enforced, or for a trade association to maintain a "policing" service to inform its members about breaches of price maintenance, still appear legal, if subject to registration).

Nor can anyone guess whether some restrictive agreements have simply not been registered. The registrar has powers to take parties to such agreements, if he learns of any, before the High Court, which may order registration, forbid performance of the agreement, and impose fines. But it will hardly have required legal advice to suggest to some business men that such penalties—when and if the registrar might get around to them—would be little worse than registering an agreement and having the Restrictive Practices Tribunal declare it against the public interest. One rather less defiant way of avoiding the registration of agreements during the first three months remained. New agreements have not to be registered until three months after they are made; and some cynics have suggested that a surprising number of old ones may have been abolished and replaced by new ones on that very Thursday, February 28th. If so, the registrar may receive another wave for registration later.

★

How the registrar will proceed to his second and more important duty—that of bringing every agreement registered before the Restrictive Practices Court, for a declaration whether it is against the public interest or not—will depend upon the rules of procedure of this new court. The Lord Chancellor has not yet laid down these rules; nor has he appointed any of the ten lay members who may be appointed to the tribunal, though he has appointed four of the five judges. The Board of Trade, also, can and almost certainly will direct the registrar on which agreements he should take to the tribunal first.

Until the rules of procedure are laid down, no one can say exactly how an agreement will be brought before the tribunal. The Act makes provision for these rules to allow the tribunal to order "discovery" of all the relevant documents, as in commercial actions. This rule clearly seems crucial if the registrar is to be able to place all the facts about the constitution and operation of any restrictive agreement before the tribunal. If it is included, one might envisage that the registrar would formally bring an agreement before the tribunal, which would then order the parties to it to "discover" all the documents relating to it to the registrar. On receiving the documents, he would then have a period to consider them before placing the facts, with supporting or expert evidence if he thought fit, before the tribunal. The business concerned must equally have a full opportunity to place before the court its contention that the agreement was justified under any of the seven counts laid down in the Act and, moreover, was not on balance unreasonable. For under this Act the onus of proof lies upon the "defence."

If one takes the analogy of a complex commercial case in the courts, the interval for digesting the documents (perhaps several thousand of them) and for preparing the case against an agreement might easily run into many months, particularly in early cases when no precedents exist. The commercial ramifications of such agreements, and their bitterly disputed economic implications, may mean that the registrar will have to obtain staff with economic and accounting training, as the Monopolies Commission did, quite apart from possibly drawing upon academic economists as expert witnesses in the actual hearings. It took the Monopolies Commission some time to get a staff able to tackle these inquiries, and each inquiry took some time to complete. Moreover, critics are still not lacking to argue that the understanding of commercial restriction in certain industries to which the commission did finally attain was much less than perfect.

The Registrar of Restrictive Practices, for some of his early cases, may indeed be able to draw upon the results of lengthy and detailed inquiries begun by the Monopolies Commission before last year's Act was ever thought of: no action has been taken on several of the commission's recent reports because the practices concerned now fall to be ruled upon by the tribunal. But in major cases upon which his own office has to digest, assemble, and present all the facts about restrictive trade agreements, it would be unwise to expect very rapid litigation in this new commercial court—and the registrar will probably have to keep it occupied with quite a succession of cases at any one time.

BUSINESS WITH EUROPE

Business Notes

Steel of Wales Offer

THE public offer of £1 ordinary shares at 20s. in Steel Company of Wales is effectively of 37 million shares, for Guest, Keen and Nettlefolds are taking two million shares and Metal Box one million. The bold industrial endeavour that carried SCOW through its first stage is succeeded by a bold financial operation to attract private investors to interest themselves in it. But they are entitled to be hard-headed in relating the good hopes that the prospectus holds out for future years with the current yield and asset and dividend cover on the shares. This operation is bound to dominate investment markets until the lists have closed next Thursday—and after, for the £40 million will not be paid up in full until July 3rd and a lot of money has to be found for calls on recent issues.

The shares offer an 8 per cent yield which, as the table shows, is at the top end of a list of steel share yields now running from 6.1 per cent to 8.1 per cent. Rather over half the anticipated net profit will be needed to pay an 8 per cent dividend, and that is a high scale of distribution for a steel company. But this offer can be differentiated from other steel issues by the potential growth in profits as stage two of the company's capital programme (costing about £54 million) bears fruit and as stage three (costing about £50 million) gets under way, even though the full benefits of these schemes will not materialise until the early sixties.

SCOW is almost entirely a postwar entity; its old parts are insignificant. The investor is buying into a modern integrated group rather more than half-way through its development; about £115 million out of the projected £177 million has been spent. It was started in good time after the war and important stages of the development were done at prices that look cheap today; no major expansion beyond stage three is visualised. The company is not nearly so dependent on the fortunes of the motor trade as many suppose; the tin-plate industry is its biggest customer; less than one-third of its output is steel sheet and less than half of this sheet goes to the car industry.

Trading profits rose from about £1½ million in 1948 to £18.3 million in 1955 but fell back owing to the overtime ban to £14.2 million in the year ended September 29th last. Future dividends and the future service of the £65 million of debentures and of up to £40 million of short-term loans will not rest on the profits of the past. The company is now at a point where stage two of its programme is beginning to make profits, and the chairman's estimate of profits in 1957-58, before it is fully profitable, is £20 million, which would leave after depreciation and interest £5,040,000 for the 8 per cent dividend and distributed profits tax thereon, costing £2,704,000. Nothing has been allowed for profits from stage three of the plan, though that is intended to raise ingot output from 2.4 million tons to 3 million tons a year, and the directors hope that it will bring a more than proportionate increase in earnings.

STEEL PRICES AND YIELDS COMPARED

£1 Ordinary Stock	At Issue		Current	
	Price	Yield%	Price	Yield%
Colvilles	26s. 0d.	6·9	30s. 7½d.	7·2
Dorman Long	22s. 6d.	7·1	24s. 6d.	6·5
Lancashire Steel	22s. 0d.	7·3	29s. 3d.	7·5
Stewarts & Lloyds	17s. 6d.	7·1	28s. 9d.	6·1
John Summers	24s. 6d.	7·3	32s. 3d.	7·4
United Steel	25s. 0d.	7·2	30s. 9d.	8·1
Steel of Wales	20s. 0d.	8·0	...	...

The Prize and the Hazards

THOUGH big, the ordinary capital of Steel Company of Wales is highly geared. As much as £105 million of prior charges may at one stage rank ahead of the £40 million of equity capital. There is a long dated £40 million of 5½ per cent first debenture 1980-85 and an optionally much shorter dated £25 million of 5¾ per cent second debenture 1964-87. Both are being issued at £98 per cent to the Iron and Steel Realisation Agency and £50 per cent has already been paid up on the first debenture. The money that ISHRA is putting into these stocks, plus what it has subscribed to raise the ordinary capital from just under £17 million to £40 million, will meet the repayment on July 16th of the outstanding £15 million of 3⅓ per cent first debenture stock held by the public, and of advances totalling £28.2 million from Finance Corporation for Industry; at the same time £40 million of loans from the Agency to the company will be funded. The Agency will also provide or procure £40 million of temporary advances which are expected to reach their peak in 1959 and will run down thereafter. ISHRA will thus be the only prior charge lender.

Steel of Wales offers risk capital in the true sense—limited security based on past performance, reasonable risks and calculable prizes if the future turns out well. These are geared up for ordinary shareholders to make them mildly exciting, and the shares are sold on a high dividend yield without as yet any wide margin of earnings cover. Investors who buy Steel of Wales ordinary on an estimated distribution of more than half the available profit are entitled to assume that the company will not model its dividend policy on that, for example, of Dorman Long. They will expect a share in prosperity when it comes and in the meantime, since the shares are likely to keep within range of the issue price, to enjoy a qualified hedge against re-nationalisation.

Whether this is an offer for the stag or for the widows and orphans is another matter. It is too big an issue to justify any confidence in a quick premium. SCOW's capital structure has been drawn to make possible the biggest ordinary share issue that the market could absorb and the consortium of eight leading issuing houses have again used the familiar technique to ensure that if the worst happens the issue will enjoy a token success. Underwriters have had to flank their underwriting with firm applications for the same amount of stock. Earlier steel issues showed that the consortium cannot eat its cake and have it. The underwriters are largely the same institutions that might buy stock in the market. If their allotments as firm applicants are large their buying potential after the market opens will be limited.

Budget Day will be Tuesday, April 9th. This was announced by the Prime Minister on Thursday.

Improving Dollar Balance

STERLING'S steadiness just below the $2.80 parity over the past six weeks is being interpreted by some as a sign that the post-Suez recovery is already spent. That could be true of the sterling rate; it is certainly not true of the sterling area's dollar balance. The central gold reserves rose in February by $63 million. Admittedly, the whole of that rise is just accounted for by special receipts—$4 million from defence aid and $59 million from India's first drawing on its recently negotiated $200 million line of credit with the International Monetary Fund. But even the bare balance in commercial dollar-sterling transactions contrasts reasonably well with persistent deficits incurred since July last. The balance was achieved only by dint of the receipt of $20 million from the European Payments Union, in settlement of Britain's January surplus of £9 million. But the EPU surplus was nearly maintained last month, at £8 million, and will next week bring in a gold receipt of $17 million. Thus, reckoning the EPU settlement in the month to which it relates, there was still a small commercial dollar deficit in February, of $3 million, compared with the January deficit on the same basis of $16 million.

THE DIMINISHING DEFICIT

($ million)	EPU settlement*	Direct dollar balance	Aid and Special payments or credits	Change in reserves	Reserves at end of period

Confidence is Neutral

UNDER the burden of heavy dollar payments for oil this is no bad result. The Chancellor stated in the House of Commons this week that the additional dollar expenditure on importing oil to Britain in the three months to the end of January reached £30 million—confirming the unofficial guesses of the monthly drain. There must be added the loss of invisible earnings of the Middle East oil companies: last week, Mr R. Gillespie of British Petroleum put the total dollar loss from the dislocation at between $40 and $50 million a month.

Plainly, the close balance in February's commercial dollar accounts reflects an appreciable surplus in transactions other than oil. The seasonal sales of sterling area produce are at last making their mark. It seems unrealistic at present to hope that the current surplus (excluding oil) should be reinforced by a further general move to cover speculative bear accounts. The incentive to do so has been diminished not only by the narrowing in the forward discounts on sterling (this week to ¾ cent three months forward) but also by the halt in the rise in the spot rate—itself attributable largely to the swing to neutral in the capital accounts. Here is a circle that is likely to remain unbroken for some time—perhaps until foreign dealers can see the end of the present emergency and are satisfied about sterling's ability to meet the short-term debts that are being incurred to support it.

The published reserves should however be strengthened by a number of factors in coming months—use of the Ex-Im credit to cover oil purchases; further drawings on India's IMF credit now completed ($67½ million is due to be drawn this month, the remaining $73 million being in the form of a stand-by credit); and the release of $104 million from the holding account once Congress has finally sanctioned the redrafting of the waiver clause.

The Waiver Replaced

THE British Government, the United States Administration and the Canadian Government have announced their agreement on the replacement of the waiver clause in the provisions governing the postwar loans. As foreshadowed in these columns last week, the right to a waiver of annual interest payments is being dropped; instead, Britain is given the facility of postponing, into the early years of the twenty-first century, the annual payments of both interest and principal. Deferred instalments will, however, bear interest at 2 per cent, the rate being paid on the principal of the loans.

To exercise its right, Britain need no longer satisfy a complicated and in present circumstances meaningless

formula relating to the purchasing power of its exports and to repayment of sterling balances; it has the option of making a deferment if it finds that this is necessary "in view of the present and prospective conditions of international exchange and the level of its gold and foreign exchange reserves." The one limitation is that the number of deferments may not exceed seven. And Britain has given an assurance that "it is not its intention" to avail itself of "the major part" of the potential deferments in the years "immediately following" this new agreement.

Mr Macmillan's request for a waiver on last December's instalment has thus served a useful function in provoking a re-writing of the waiver clause in a precise and usable form. The interest for 1956, which was paid into a special holding account pending the American decision, will be postponed on the new terms when Congress ratifies, but the $104 million involved is not likely to be returned to the reserves until the new agreement is ratified by Congress.

Progress on the Railways

THE railways' modernisation programme has now run for two of its fifteen years. It is a long-term programme, designed to yield its major benefits later rather than sooner. No doubt the Transport Commission could spend large sums on improvements that would be more visible to the passenger or trader much earlier, by expensive rebuilding of main-line termini, for example, but the programme would not be a balanced one or offer genuine operating gains or real improvements in service.

But the programme is now reaching the stage when rather more physical progress may be seen. More than a third of the total sum of £1,200 million has now been committed, and the rate of new annual investment is nearing its maximum, £120 million this year, £135 million next year and £140 million afterwards, twice the rate of railway investment four years ago. In the freight services, which earn the railways most of their money and where improvement was needed most urgently, there has already been some improvement in transit times and greater progress is expected this year. The programme of fitting continuous vacuum brakes to all existing and new wagon stock, which allows much higher average speeds, has been hastened; and new freight terminals, marshalling yards, goods train relief lines and "flyovers" to avoid congested routes are being built or soon will be.

On the passenger side, the commission's plans for 1957 and 1958 include the construction of five diesel-electric deluxe main line trains, 22 experimental lightweight diesel rail-buses, 2,200 more multiple-unit diesel vehicles and 2,000 new passenger coaches. The first of the 230 main-line diesel locomotives ordered last year for intensive operating trials should be delivered in May and 50 by the end of the year. Other work is in progress on track and signalling, and the commission is preparing to instal "automatic train control" now that the Minister of Transport has approved this safety device. The one new feature in the commission's report of progress is the prospect of rather more electrification than it originally planned; this part of the programme is not without its problems but the commission now hopes to complete it ahead of schedule and have capacity to spare to do more.

Bank Deposits' Biggest Fall

BANK deposits regularly experience their biggest decline of the year in the period covered by the clearing banks' make-up for February when tax-gathering exerts its strongest effect—first upon deposits and then upon the banks' liquid assets because of the Treasury's repayments of floating debt. This year the contraction of both was more than seasonal: in the five weeks to February 20th net deposits dropped by £294 million to £5,929 million, and liquid assets by £370 million to £2,077 million. Both these declines are the biggest ever experienced (apart from the compulsory funding operation of 1951), though the fall, especially in deposits, was rather smaller than might have been expected after the abnormally sharp reduction in the total outstanding volume of tender Treasury bills this year. At the February make-up last year, covering a period of only four weeks, the fall in deposits was almost as large as this year's; in the last five-week period at this season, in 1952, deposits fell by £262 million.

All other	1,866·0		+ 97·1	...

* After deducting items in course of collection. † Ratio of assets to published deposits.

Deposits have fallen so much less steeply than liquid assets mainly because of the sharp upturn in bank advances. Although the overdrafts of the State boards were reduced by £37.6 million to £57.5 million, total advances rose by £59.5 million. This is partly a seasonal movement arising from the tax payments, but last year, although the State boards were then increasing their borrowings, total advances rose by only £39 million; the corresponding movements in the three preceding years (all in four-week periods) were £107 million, £46 million and £19 million. There seems no reason to suppose that this year's movement was abnormally distorted by the extraneous items that are—so regrettably—grouped with advances, and the increase was well spread through the several banks.

The impact upon deposits of the contraction of floating debt has been cushioned, too, by the fact that some of the banks—notably the Midland and Barclays—have been venturing a little further into the gilt-edged market. Total investment portfolios have risen by £19 million. The disparity between the falls in deposits and in liquid assets has naturally intensified the pressure on liquidity ratios: the average ratio declined from 37.4 to 33.6 per cent, and is now slightly less than at the corresponding date a year ago. With one exception, however, each of the big banks still has a stronger ratio than two years ago, when the maximum squeeze on bank liquidity was beginning.

One day the Wilsons will have given up the tennis court for the bowling green and the deck chair. This will be about the time that Mr. Wilson retires and, thanks to Life Assurance, they can look forward to a retirement free of financial worry.

Through endowment and pension policies, and through staff pension schemes, Life Assurance is making provision now for the eventual retirement of an ever-increasing number of people. Money paid in premiums is shrewdly invested by the Life Offices; hence the attractive terms they are able to offer.

And Britain's export industries benefit too—from the regular flow of capital that these investments provide.

Life Assurance

part of the British way of life

Issued by The Life Offices' Association, London. Established 1889

SOME FACTS ABOUT ATOMIC POWER . . .

[for peaceful use]

▸ ELECTRICITY — The electricity produced by atomic power stations is exactly the same as electricity produced by any other means. The nuclear reactor simply replaces the conventional coal or oil burning plant which produces heat in thermal stations.

▸ EFFICIENCY — Uranium 235 is theoretically capable of producing 3 million times the energy obtained from an equal weight of coal. At the same time it can save the cost of haulage, storage and handling and plant maintenance as well as the cost of ash disposal.

▸ SUPPLY — The world's store of atomic fuel is virtually inexhaustible — whereas coal and oil supplies are limited and insufficient to meet future world needs.

▸ CONVENIENCE — Nuclear fuel is compact and easily transportable. It can be carried to parts of the world where the transport of conventional fuels is impossible or where means of transport do not exist.

▸ SAFETY — Boiling water reactors are safe and in the United States are being built in centres of population. There, they are also being erected at various universities for training students in this all-important development.

MITCHELL DEVELOPMENTS in the field of atomic power are the logical outcome of 35 years' exceptionally wide experience in all branches of engineering and electrical supply.
The agreement between Mitchell Engineering Ltd and AMF Atomics Inc of New York will undoubtedly have far-reaching effects in applying atomic power for the benefit of mankind.

MITCHELL COMPANIES are at present engaged on three important contracts for the United Kingdom Atomic Energy Authority.

German Help for Sterling

BEFORE long the British gold and dollar reserve should benefit from the recently agreed German contribution towards British defence costs. The contribution of £50 million in the twelve months to April, 1957, will obviate payments that would otherwise have had to be made over the exchanges. Of more immediate import are the agreements under which the Bank Deutscher Länder will deposit £75 million with the Bank of England to meet future instalments on the post-war debt due from Germany to the United Kingdom and the further undertaking to add £10 million to the existing sterling Arms Purchase Account. Whether these deposits are canalised through the European Payments Union or made through a bilateral deal between the Bank Deutscher Länder and the Bank of England has not been announced, but they must in any event involve a transfer of gold from Germany to the United Kingdom.

These undertakings by the German Central Bank can be ranked with the British drawings from the International Monetary Fund and the line of credit from the Export-Import Bank as devices to put into the shop window some of Britain's second line of reserves. The £75 million deposit with the Bank of England is in effect a conversion into immediate cash of part of the £120 million sterling debt owing by Germany to the United Kingdom and due, under the debt settlement, to be repaid by annual instalments of £7½ million. Ten of those instalments have, in fact, been deposited with the Bank. Similarly the £10 million increase in the Arms Purchase Account is an advance for deliveries that would normally have been paid for later.

The most important aspect of these German deposits is the gesture of confidence in sterling that they imply. By making them the German authorities have gone out of their way to show the world that they are prepared to buy sterling at the existing rate to cover liabilities which if either the pound were likely to be devalued or the mark up-valued could with profit be left open.

Easier Freight Rates

A MILD winter in Europe has recently reduced the demand for coal and grain imports and strengthened the hand of charterers in the shipping markets. The weather on the North Atlantic, on the contrary, has been exceptionally bad for shipowners. Apart from physical damage, some ships have been so delayed in recent weeks when ballasting towards the United States for coal that they have missed their loading dates and been compelled to make new fixtures, at lower rates, without having the alternative of offering for cargoes of grain or scrap, the export of which has been temporarily stopped. As a consequence, the voyage rate for American coal has been reduced to below 80s., compared with about 100s. ruling during the first two months of the year. Voyage rates are thus about back to the levels of before Suez, which they had reached after a steady rise over about 18 months. Time charter rates, too, have been declining; but their rate of fall has been much more gradual than that of spot rates, indicating a firm undertone to the market.

Even in the dry-cargo tramp shipping section, much of the fleets are employed on long-term charter at rates fixed many months ago, and their earnings can in no way be affected by fluctuations in spot rates. Furthermore, most tramp shipping companies still have to report their earnings for the last financial year, which are likely to show substantial advances; and the current financial year's eventual earnings are not likely to be any lower, provided that rates stabilise at anything like current levels.

The Twelve Pound Look

MEN employed in manual jobs in manufacturing and some other industries were earning on the average nearly £12 a week last October: the average for men, women, boys and girls in these jobs reached £10 a week, for the first time. Last year's failure of output to rise, and the recession in certain industries, did not check the steady rise of earnings: between October, 1955, and October, 1956, these rose by 7 per cent in money and by 3 per cent in purchasing power. This was a little less than wage rates rose over the year; but in the last six months of it, though slightly fewer hours a week were being worked, earnings rose a little more than rates of wages.

WOMEN'S & YOUNG PEOPLE'S EARNINGS COMPARED WITH MEN'S
(% of men's hourly earnings)

	Boys	Women	Girls
1938	39·0	51·7	28·7
1950	45·4	62·3	39·6
1951	44·6	62·4	39·6
1952	45·0	61·7	38·1
1953	44·7	61·8	38·4
1954	45.3	61.3	38.5
1955	45.9	60.5	38.9
1956	46.3	60.4	39.0

In October, men's earnings were about 94 per cent higher than in 1947 and nearly three and a half times as much as in 1938: but it is the other manual workers who have had the biggest increases. As the table shows, women, boys, and girls have vied with each other in catching up with their husbands' and fathers' wages: women and boys now earn not much less than four times their average earnings in 1938, while girls' wages are about 4½ times as high as they were then.

The Halifax and Mr Bentley

THE annual meeting of the Halifax Building Society in Halifax on April 1st should be a lively affair. On the one hand members will be considering a year of great progress and the passing of the £300 million mark. On the other a motion will come from an influential group of members to elect Mr Fred Bentley to the Board. That issue because of an antiquated voting system which forbids proxy votes will be decided on the basis of one member one vote by the few hundred members who can be in Halifax on that day—decided on behalf of about 700,000 shareholding and borrowing members entitled to vote. It is to be regretted

at the Board of the Halifax society has not used the :casion for sinking the conflict, partly of personalities, that d to Mr Bentley after long service ceasing to be general ıanager of the Halifax almost as soon as he became chair- ıan of the Building Societies Association. Mr Bentley is ıe chairman of the Association without a job in any society ; Halifax is the largest society and is outside the Association. t is a situation repugnant to common sense. The Board had ts opportunity in the fact that after the resignation of Mr ohn Hunter owing to ill health it has five fewer than its permitted maximum number but it is unanimously sup- porting the re-election of the other retiring directors and ıot of Mr Bentley. It will now be for those who can attend to decide.

Last year the Halifax raised its interest rates so that it was paying the standard 3½ per cent net to shareholders and an overstandard 3¾ per cent to depositors. This move has helped to bring total assets at January 31st up to £297.3

HALIFAX BUILDING SOCIETY PROGRESS

	Years ended January 31,	
	1956 £ million	1957 £ million
Mortgage Assets	223·3	243·3
Liquid Assets	40·5	53·2
Liquidity Ratio	15·3	17·9
Other Assets	0·7	0·8
Total Assets	264·5	297·3
Reserves	11·8	12·6
Reserve Ratio	4·5	4·2
Mortgage advance	48·7	46·1
Receipts from Investors	63·7	70·6
Withdrawals by Investors	42·8	46·9

million (against £264.5 million a year earlier)—a record increase of £32.8 million. Since the end of the financial year the society has passed the £300 million mark—easily the first building society to do so. Its restrictions on lending on mortgage have now been withdrawn ; reserves have been heavily reinforced by over £700,000 but as always happens in a time of rapid growth the ratio of reserves to total assets has fallen. It is down from 4.5 per cent to 4.2 per cent which is probably a lower figure than the directors like. The liquidity ratio on the other hand has greatly improved—it has risen from 15.3 per cent to 17.9 per cent, and the society, which used £700,000 to write down its gilt edged holdings to market prices a year ago, is now in the happy state of having an appreciation over book values of £1,050,040.

More Machine Tool Output Wanted

THE two-year boom in machine tool orders—and orders for many other types of industrial equipment—quite clearly came to an end towards the close of 1956. For last year as a whole machine tool makers took only £86½ million worth of new business, against £96½ million in 1955, and this drop was more than accounted for by the decline in orders from its customers in this country. But though the industry's total order book fell below £100 million for the first time for a year, it still represented 14 months' work at the present rate of output.

The industry can in fact have no cause for self-congratulation in this slight drop in the weight of its order book or in its increased output. Allowing for the change in prices in the past year, which is difficult to calculate precisely, the physical growth in production can only have been about 3 per cent. Indeed, since 1953 the expansion of real output

MACHINE TOOLS : ORDERS AND DELIVERIES

	Orders in hand end year	New orders booked (net)	Average monthly output	Order book, in terms of deliveries
	£'000	£'000	£'000	Months
1951	98,897	...	4,049	24·4
1952	96,996	60,113	5,167	18·1
1953	72,251	41,435	5,515	13·1
1954	81,011	74,352	5,466	14·8
1955	100,186	94,559	6,282	16·0
1956	98,000	81,514	6,975	14·0

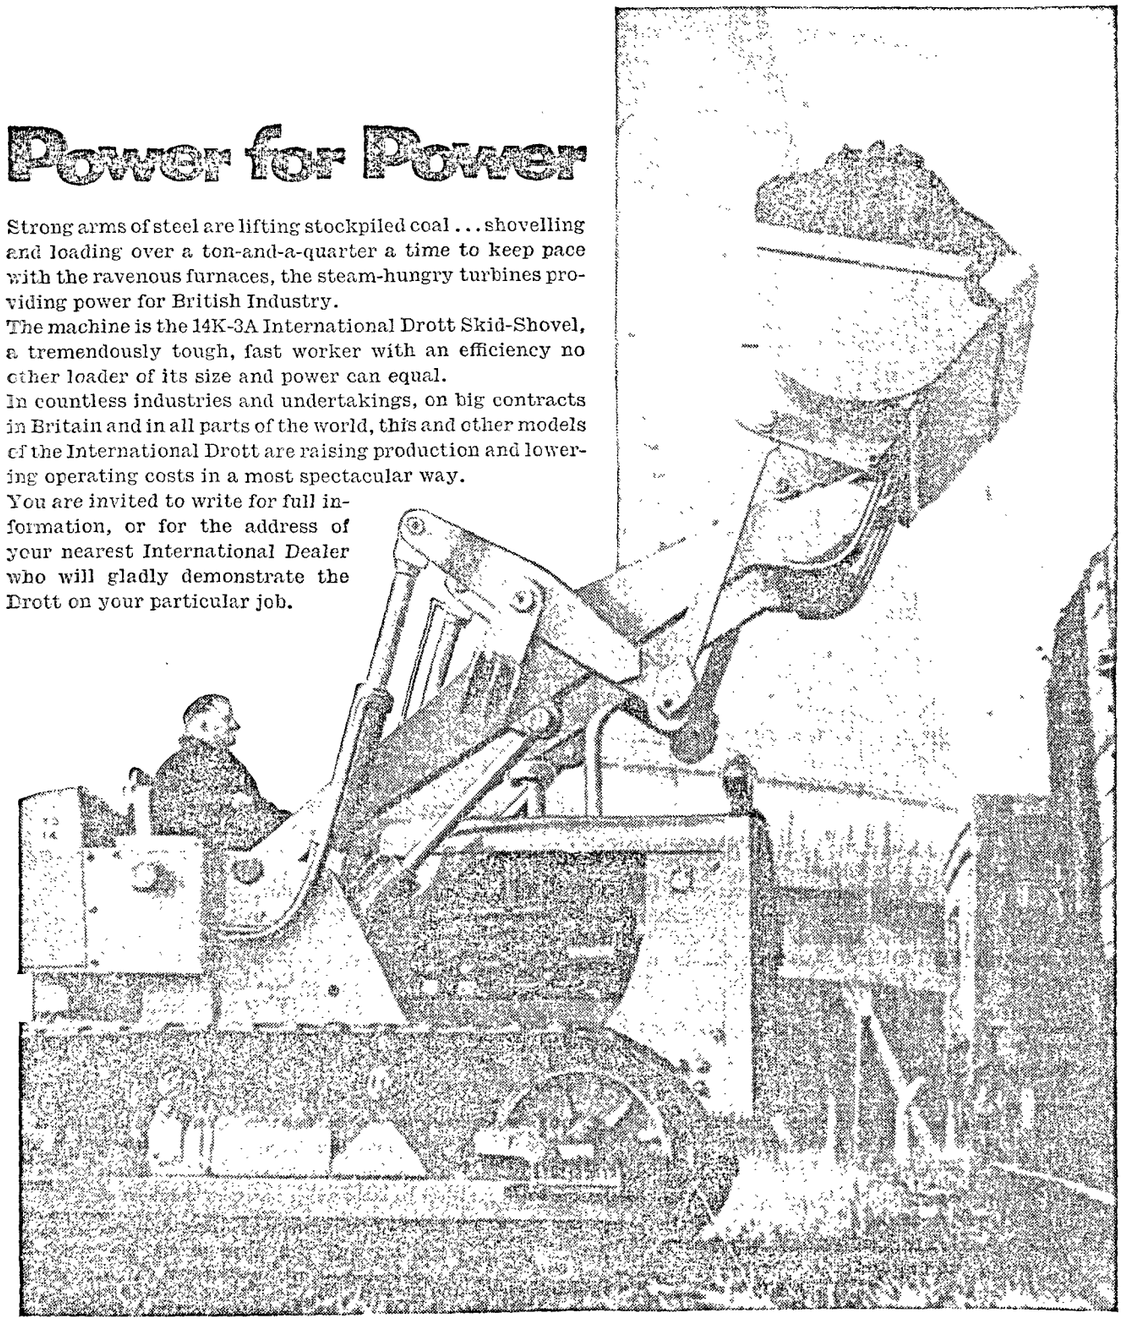
does not seem to have been considerably more than that. Perhaps now that machine tool makers have been able to attract some labour from other industries, its performance will be a little better. Its customers at home had to import £25 million worth of tools last year, more than the industry itself exported, and the flow of imports is still running at a high rate.

Jets and the Ministry

DEVELOPMENT in airframes and in aero-engines has been badly out of balance for several years ; there are more good aero-engines on the test beds in this country today than there are aircraft for them to fly. This leaves the Ministry of Supply with no option but to stop financing any further development work on engines for which there are no suitable aircraft. Two candidates under review are the Mark 6 version of the Bristol Olympus engine and the big Gyron developed by de Havilland. Government support for the former is likely to be dropped because the aircraft for which it was planned, an advanced version of the Javelin all-weather fighter, did not come up to expectations and was scrapped.

Official support for the Gyron was given in the first place simply because of the huge power of the engine. It began as a private venture by de Havilland to provide an engine for fighters flying at two to three times the speed of sound and it is not really suitable for any other use. It has recently been tested at 20,000 pounds of thrust, or 25,000 pounds with re-heat, and is one of the most powerful engines in the world, if not the most powerful, with the Olympus treading fast on its heels. But no application was ever specified for the Gyron, and from it was developed a scaled-down version, the Gyron Junior, suitable for the type of small interceptor fighter (as distinct from a big fighter like the P.1) powered by a combination of jets and rockets as, for example, the aircraft now being developed by Saunders-Roe. Government support for this junior version is likely to go on so long as the appropriate fighters are being developed.

These cancellations are something quite apart from the fate of the Swift. This fighter, it appears, will cost the tax-payer £46 million. The Comptroller and Auditor-General now reveals in his latest report that in 1950 the



Power for Power

Strong arms of steel are lifting stockpiled coal . . . shovelling and loading over a ton-and-a-quarter a time to keep pace with the ravenous furnaces, the steam-hungry turbines providing power for British Industry.

The machine is the 14K-3A International Drott Skid-Shovel, a tremendously tough, fast worker with an efficiency no other loader of its size and power can equal.

In countless industries and undertakings, on big contracts in Britain and in all parts of the world, this and other models of the International Drott are raising production and lowering operating costs in a most spectacular way.

You are invited to write for full information, or for the address of your nearest International Dealer who will gladly demonstrate the Drott on your particular job.

INTERNATIONAL HARVESTER

Power for Power and size for size, no other front-end loader comes up to the 14K-3A International Drott . . . • 95 b.h.p. diesel engine • 2¼ cu. yds. bucket • 17,000 lb. digging force, *plus* high bucket lift and far bucket pitch.
Other models: B-6-K3 (1 or 1½ cu. yds.); 9K-3A (1¾ cu. yds.); 18K-3A (3 cu. yds.)

International

INTERNATIONAL HARVESTER COMPANY OF GREAT BRITAIN LIMITED, HARVESTER HOUSE, 259 CITY ROAD, LONDON, E.C.1

'I refer,' said the Robin with quiet pride,
'to the superb record of British farming. Let me reel off some figures.'

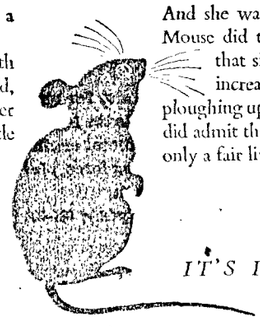
BUT TOWN MOUSE SAID

Oh, reel off to bed!

'For,' said he, 'your figures will leave me quite overwhelmed with apathy.'

ROBIN (*most disturbed*) 'But surely you cannot know! Look! Farm subsidies static since 1951, but production up 10% . . . a 90-hour week 52 weeks a year, and 90% of farmers making only £500 or so a year . . .'

TOWN MOUSE (*unimpressed*) 'And should this move me a whisker?'



ROBIN 'It should make your mouth water . . . with British vegetables quite the tastiest in the world, with our corn crops three times as heavy per acre as they are in America, our cattle unequalled for quality . . .'

TOWN MOUSE (*maliciously*) 'You do not mention eggs, I see.'

ROBIN (*suddenly cast down*) 'Ah yes—those eggs. Those big eggs. How can I hope to please a husband when he keeps seeing monsters like those all over the place!'

* * *

And she was quite inconsolable until Town Mouse did two things. He reminded Robin that since 1939 there has been a 400% increase in the number of tractors ploughing up worms for robins. And he finally did admit that the British farmer, in return for only a fair living, does us really proud.

IT'S FISONS FOR THE FARMER

Royal Aircraft Establishment at Farnborough, and in 1952 an American evaluation team placing orders for fighters for Nato, both reported unfavourably on the Swift. But orders from the Air Ministry continued to mount and were not cancelled until the Swift was finally rejected by the RAF and the Ministry's own flight test centre at Boscombe Down in 1955—five years after the first adverse report and for precisely the reasons outlined in it.

The engines now under the axe are among the best of their kind in the world. The greater part of their development work has been completed at government expense, and there is nothing to prevent either of the manufacturers concerned from financing any further work needed to make the engines for sale abroad, where there are potential foreign buyers for both.

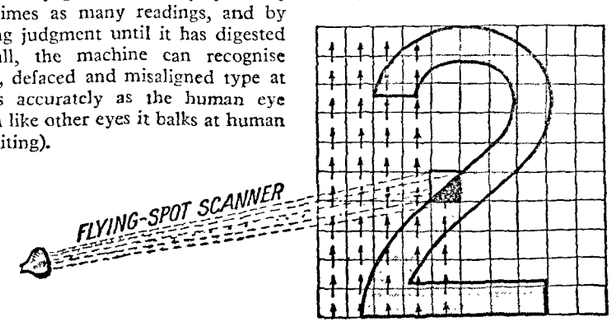
More Cars on Hire Purchase

A CONSIDERABLE recovery in hire purchase trading is in progress. The Board of Trade's figures to the end of last year showed that the nation's hire purchase debt was still slightly falling, though the volume of new business was gently on the upgrade. But two further months' figures of numbers of contracts are now available from HP Information. These returns relating chiefly to the motor trade point to a vigorous recovery in the first two months of 1957 in second-hand vehicles and a smaller, but distinct rally in hire purchase sales of new cars.

NUMBER OF CONTRACTS

	1956 *First Two Months*	1956 *Last Two Months*	1957 *First Two Months*
Cars, new	12,917	7,742	9,260
" used	46,583	38,565	69,840
Commercial vehicles, new	8,226	5,442	6,004
" " used	7,356	6,541	9,650
Total contracts*	103,260	80,667	125,461

Source : HP Information. * Including other articles.



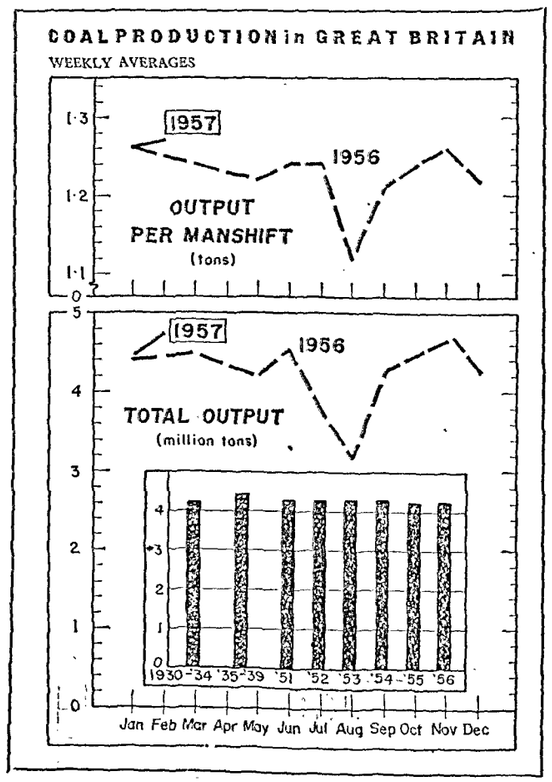
The sharp cut at the end of the year in the minimum initial deposits on most motor vehicles helped the recovery. It will be necessary to wait for the Board of Trade figures for firm guidance on whether the other branches of hire purchase trading, that did not receive that assistance, have also recovered. But the omens suggest that they did. Latest figures (relating to January) of radio and television sales indicate a slight increase in the percentage of total sales done on hire purchase.

Seeing Eye Machines

ONE glaringly weak link in the chain of economies that can be achieved by installing electronic data processing systems in offices is that the information fed into a computer must first be coded into a form, such as punched cards, or punched or magnetic tape, that the computer can use. This is still, essentially, a hand operation. The computer can digest its food up to 1,000 times as fast as its statistical meal can be prepared, and the only way to avoid keeping such a costly machine idle for the greater part of the time is to employ hundreds of punch-card operators—and verifiers—for each machine.

There are two ways in which this difficulty may be overcome. One is to reorganise office work so that information is collected in a form in which it can be fed directly into the computer. Bills made out on punched cards, and cheques printed in magnetic ink, are examples of this method. The alternative is to produce a machine that can read directly from ordinary printed or type-written material, and translate it automatically into the computer's own language. The pilot model of one of these machines, which was described last week by the Solartron electronic group, can read 120 characters a second. The company has also apparently achieved flexibility in this machine. Earlier machines could read accurately only from a single, simple and perfect type face. The Solartron model can be programmed without a proportionate increase in cost to read a wide variety of type founts. More important, it can read several common type faces, and even second carbon copies from a typewriter, without being reprogrammed.

This flexibility and accuracy is achieved by taking a prodigious number of readings of each character. Each figure is, in effect, divided into 100 squares, each of which will contain either more black than white, or more white than black ; these squares are then scanned by a "flying spot scanner"—a specialised sort of cathode tube ; the machine then sorts out the pattern of black and white squares it has recorded and, by a process of elimination, finally "recognises" and records the number it has read. If the type were perfect, it would require only four readings to recognise any given number ; by taking many times as many readings, and by reserving judgment until it has digested them all, the machine can recognise blurred, defaced and misaligned type at least as accurately as the human eye (though like other eyes it balks at human handwriting).



The economics of the operation are based on the production model, which is designed to operate at 240 characters a second. It reads only figures ; though the technique can be extended to include letters, it becomes more expensive, and most business data can be kept fairly conveniently in figures. One of these machines, which will cost between £22,000 and £50,000, could, if operated continuously, do the work of 150 to 300 punch card operators and verifiers—a saving (including overheads but not counting savings on punch card machinery) of over £200,000 a year. If used only during normal office working hours it is claimed still to save enough in wages and overheads to write off its capital cost in less than a year. Built in standardised units, the machine can be tailored to suit the requirements of any main computer equipment, and is expected to prove its worth first in dealing with the cash transactions of a large multiple store.

More Oil for Europe

Now that the Iraq Petroleum Company can begin repairing the trans-Syrian pipelines a flow of about 220,000 barrels of crude oil a day—about 40 per cent of the full capacity of these pipelines—is expected to be available for loading at the Mediterranean terminals by the end of this month. This will permit the world's scarce tanker tonnage to be used much more effectively. A given number of tankers can shuttle at least three times as much oil across the Mediterranean to southern European ports as they can bring across the Atlantic from the Caribbean, and more than seven times as much as they can haul from the Persian Gulf to Europe round the Cape. Thus the net increase in Europe's supplies will range from about 150,000 barrels a day (if all the diverted tankers are taken from the Caribbean run) to about 190,000 barrels a day (if they are all taken from the Cape run). If supplies from the Western hemisphere are cut, the saving in dollars will be greater, but at the cost of a smaller net increase in total supplies.

How much difference will this make to Europe's supply prospects? The OEEC Petroleum Emergency Group estimated this week that Europe would receive 94 per cent of its normal requirements of petroleum products in the second quarter of 1957—even if both the Suez Canal and the trans-Syrian pipelines remained closed. For the current quarter, supplies are now estimated at 85 per cent of normal requirements, a steady improvement on earlier estimates. The net addition of 150,000 to 190,000 barrels a day of Iraq crude (say 7½ to 10 million tons a year) would raise the level of expected supplies in the second quarter to not far short of 100 per cent of normal requirements. But at the end of March total stocks of petroleum products in Europe are expected to amount to about 5.1 million tons, some 700,000 tons less than they were at the beginning of the year, leaving stocks equivalent to about 3½ weeks' supply. The need to rebuild depleted stocks, especially stocks of black oils to which it is hoped to add some 2 million tons during the second quarter, still means that not much more than 90 per cent of normal supplies will be available for distribution to consumers—unless Egypt takes a leaf from the Syrian book and allows Suez Canal traffic to be resumed quickly.

Records in Rice

The main rice-exporting countries fared well last year. Prices rose; almost certainly more rice was shipped abroad than the previous postwar record of 4,843,000 milled tons in 1955, and stocks in most countries were cleared. Burma, the largest exporter, shipped 1,834,000 tons, an increase of 220,000 tons compared with 1955 and the highest figure reached since the war. The United States, which has become the third largest exporter, made the biggest gains; its shipments rose by 300,000 tons to a record 804,000 tons. That increase resulted largely from special sales under foreign aid programmes, notably to India, Indonesia and Pakistan. Shipments from Thailand, exceptionally, were only slightly higher, at 1,217,000 tons, but the official statistics may be misleading; substantial quantities of Thai rice are believed to have been smuggled into Laos.

What of the prospect for 1957? The Food and Agriculture Organisation, in its latest annual report on rice, considers that international supply and demand "may well be fairly balanced" this year. "Uncommitted stocks in exporting countries are low, while reserve stocks in some importing countries rose during 1956." The new crops in the main producing countries, apart from Japan, are expected to be larger than last season's. Though Japan has a smaller harvest supplies are ample and imports are to be reduced. Pakistan, normally an exporter, had to import large quantities last year, but it is now harvesting a bigger crop and imports are likely to fall. Indonesia, on the other hand, has been importing heavily. Prices in eastern markets are holding steady and seem in little danger at least for the next few months.

Progress in Latin America

Sir Francis Glyn, chairman of the Bank of London and South America since 1948, announces that he proposes "in due course" to hand over the chairmanship to Sir George Bolton—who has just given up his post of executive director of the Bank of England to become deputy-chairman. Sir Francis has a cheerful story to tell of the bank's affairs in South America and of the opportunities open for

1,957,000 HOMES—5,394,000 VIEWERS

IN THE MIDLANDS **403,000** homes **887,000** viewers
IN LONDON **777,000** homes **2,098,000** viewers
IN THE NORTH **777,000** homes **2,409,000** viewers

Here is what the papers said about HOME OF THE BRAVE:

Daily Sketch: "... electrifying in its effect on the nerves and masterly for its attention to detail."

Manchester Evening News: "Granada's HOME OF THE BRAVE had the impact of a sledge hammer."

Daily Mail: "... remarkably well done ... a portrayal hard to forget."

Liverpool Echo: "... it romped home a winner."

Yorkshire Post: "War play with a difference ... never faltered once."

Daily Herald: "... one of the most gripping plays ever presented on TV."

The Star: "... worth every one of its 90 minutes ... the clearest piece of psychological drama I have seen."

Granada's next Play of the Week on Wednesday 20th March will be *Arthur Miller's* adaptation of Ibsen's AN ENEMY OF THE PEOPLE.

GRANADA TV NETWORK

LONDON & MANCHESTER

Company Notes

BORAX (HOLDINGS). The yield of £1 16s. 3d. per cent offered by Borax ordinary stock puts an extreme valuation on future growth. That the company's assets and earnings will grow is not open to doubt. But there are two other subsidiary reasons for the low yield. First, American investors are interested in the stock and they tend habitually to discount future earnings more heavily in stock prices than investors here. Indeed, the operating subsidiary's shares are traded in New York on a lower yield basis than the parent company's shares in London. Secondly, while Borax's new capital investments are maturing, there will be big tax savings following last year's reorganisation. These can have a significant influence on the payment of dividends out of accumulated reserves in this country at a time when reserves are being built up in the United States.

The chairman, Mr Desmond Abel Smith, has this to say about tax:

1. Total taxes in 1955-56 represent 35.8 per cent of profits, against 52.9 per cent before the reorganisation.
2. In 1955-56, British taxes represented 20.8 per cent of the total charge, against 57.4 per cent.
3. The provision for British tax is only £4,423, representing a liability on investment income only.
4. Current liabilities are £798,104 for British taxes and £490,634 for overseas taxes.
5. These largely represent taxes on profits earned before the reorganisation and "it is probable that a substantial portion" of them will not be required, though they should not be released until agreement has been reached with the Inland Revenue.

Another product of the reorganisation is the revaluation of the company's American assets. At the end of September, 1955, the book value of fixed assets was £6.4 million. A year later their value is revealed at £24.3 million. Of the increase, about £3.4 million represented new investment; another £5.2 million the absorption of US Potash into the American subsidiary, United States Borax and Chemical; and about £8 million the surplus arising on the revaluation.

In the new form, the net worth attributable to the equity is about £17.1 million, equal to just under 9s. 6d. per 5s. unit. The market price 22s. 10½d.xd is more than twice as big; growth must be rapid and remarkable to justify the difference.

In California alone capital development will cost $20 million but this programme will be completed in July and will immediately add to productive capacity. Firm capital commitments for the group are put at £7¼ million (against £105,000). Over £2.7 million has already been borrowed on unsecured notes in the United States and the American subsidiary (in which Borax holds 74¼ per cent) can borrow another £3.7 million in this form. From these figures alone it is apparent that profits will have to be accumulated in the United States to help to pay for development. Hence remittances are still some way off.

ASSOCIATED ELECTRICAL INDUSTRIES. English Electric has done better than can have been expected; Associated Electrical Industries which gave its stockholders a half-yearly preview has nevertheless done worse than was feared. That judgment emerges from a comparison of AEI's preliminary figures for 1956 with those of English Electric. English Electric's profits went up from £8.8 million to nearly £9.5 million; AEI's profits fell by about £5 million to £10.3 million. Moreover, it is apparent that the decline in earnings was accentuated in the last six months of 1956. English Electric's interests in aircraft production may have helped while AEI was affected, no doubt, by higher costs, fiercer competition in the sale of capital goods abroad and the drop in sales of consumer goods at home.

The directors of AEI have kept last year's promise when they made the rights issue of ordinary shares and have maintained the dividend at 15 per cent on the increased capital. But the cover has been materially reduced. Retentions by subsidiaries have been cut severely, from over £3 million to under £300,000, without any corresponding increase in the parent company's appropriations. The directors have also put into reverse their policy on replacement reserves. In 1955 they made an appropriation to these reserves before striking net profits and in the first half of 1956 they published a profit figure after allowing for a further appropriation to these reserves. Now they say these reserves are "free" and the accumulated balance of nearly £8 million has been transferred to a general reserve. Moreover, for 1956 no appropriation has been made specifically to replacement reserves. If net profits last year had been computed after setting aside nearly £2 million to replacement reserves, as was done in 1955, the net dividend would not have been fully covered.

Consolidated earnings:	1955	1956
	£	£
Gross profit	17,601,790	13,243,070
Depreciation	2,281,010	2,940,456
Taxation	7,370,653	5,847,901
Replacement reserve	1,987,249	...
Net income	*6,301,804*	*4,372,325*
Ordinary dividends	2,081,896	2,645,000
Retained by subsidiaries	3,076,242	290,610
Retained by parent	1,041,995	1,320,711

★

THE BRITISH SOUTH AFRICA COMPANY. When the "Chartered" company increased its dividend from 30 to 35 per cent it was estimated in these columns that royalty income in 1955-56 would come to over £12 million and investment income to over £2 million. The full report shows royalty income up from £10,154,158 to £12,262,909 and investment income from £1,806,145 to £2,289,407.

Because of the lower copper prices, income from royalties will shrink this year and unless copper prices take an unexpected turn for the better royalties may also be below the 1954-55 figure. But the directors of the "Chartered" company can hardly have raised the dividend without having this year's expected decline in mind.

This is a short-term consideration. The long-term view is that the company must build and diversify its portfolio, against the day in 1986 when mineral royalties revert to the Rhodesian government. At the end of September the book value of the company's investments was £19.6 million; the market value of quoted investments (excluding shares in Rhodesia Railways Trust) was *£15.1 million higher* than the book value of £10.4 million. The major changes in the portfolio over the year include a new loan to Bancroft and an investment in Mufulira, and further investments in the South African finance houses, Anglo American and Consolidated Goldfields, and in the mines in which those finance houses are interested. Such investments are in keeping with the intention of spreading the portfolio outside Rhodesia. Another strand in this policy is to spread investments outside Africa; it is shown by the increase in the gilt-edged portfolio—a stepping-stone, perhaps, to other investments.

The "Chartered" company owns 81 per cent of the £2,005,767 capital of Rhodesia Railways Trust, with a portfolio worth £7.3 million at market values on September 30th. The market value of the "Chartered" company's holding in the trust was £3,960,937 and it has offered £3 each for the minority shares—a fair price in view of the value of the trust's portfolio, which has a much wider spread than that of "Chartered" itself. Over a quarter of the trust's investments (at market prices) is in North America.

★

ROOTES MOTORS. In the year to July 31st the profits of Rootes Motors tumbled from £3,557,325 to £2,031,129. In December the chairman, Sir William Rootes, warned shareholders not to be too optimistic about the current year's results. Now the directors, in announcing the interim payment on the preference shares, have revealed that the group made losses in the first six months of the current financial year which ends on July 31st.

On this news the 4s. ordinary shares fell from 5s. 6d. to 5s. 1¾d. But within a few days they recovered to 5s. 4½d. for investors, now that Ford Motor has gone back to five days' working, are looking ahead to better prospects for the motor industry. In doing so they must look beyond the current year's results.

★

LEYLAND MOTORS. Shareholders of Leyland Motors must remember that the rights issue in November merely paid for the purchase of the tank arsenal at Farington. It did not provide any balance to finance further capital developments or an increase in working capital. And, if only because production at Farington has to be switched from tanks to vehicles, Leyland Motors will have to spend more on capital account. So the group is short of liquid assets. Stocks over the year to September 30th grew from £13.9 million to £18.2 million and the cash balance of just over £1 million is more than matched by a bank overdraft of £1.3 million.

Thus capital is likely to make its claim on earnings this year and this may well influence dividends. Sales and profits seem likely to expand again as they did in 1955-56 but again the story may be one of smaller profit margins on bigger sales. The yield of 5.4 per cent on the £1 units at 46s. 3d.xd and on a dividend of 12½ per cent (for which the new shares rank) seems to put an adequate discount on these prospects.

★

RUGBY PORTLAND CEMENT. The person who is most conscious of the dynamic quality of Rugby Portland Cement is its chairman, Mr Halford Reddish. One product of his mixture of dynamism, reforming zeal and financial astuteness was the introduction of "A" ordinary shares, half of which are owned by employees. They are one of the most highly geared equities in the London market. According to a complicated formula, the amount attributable to these "A" shares in 1956 was £108,687 gross but only £62,500 gross was distributed, since an ear-marked reserve is being built up as an equalisation account—a hedge against any decline in earnings in the future. The £62,500 represents a dividend of 1s. 3d. per "A" share, compared with 1s. in 1955. The dividend on the conventional ordinary shares is also increased—from 1s. to 1s. 1½d. per 5s. unit. These units, at 24s., yield 4.7 per cent and the "A" units, at 26s. 3d., 4¾ per cent.

Bigger dividends are the product of another year of record production, deliveries and profits. Gross profits have risen from £1,295,072 to £1,433,727 and net profits from £584,915 to £729,436. This is a smaller rate of advance than was achieved in 1955 but it is a satisfactory result for a year in which higher costs trimmed profit margins.

A. W. GAMAGE. Unlike most other department stores, Gamage's shop in Holborn caters more for the boy and the man than for the girl and woman. But it is widening its range of appeal and it always has had a big mail order business. Like the other department stores, its gross profits have risen, from £295,533 to £309,514 in the year to January 31st. Profits after tax at £134,989 show little change on the 1955-56 figure of £133,211 but the ordinary dividend has been increased. To the dividend of 25 per cent has been added a bonus of 5 per cent (making 30 per cent in all and absorbing £86,250 net); the year before a bonus of 2½ per cent was added to the 25 per cent dividend (making 27½ per cent and absorbing £79,062 net). On the new dividend the 10s. shares yield 8.4 per cent at 35s. 9d.

★

BRITISH OXYGEN. Less than twelve months ago British Oxygen published a full report in a conservative format—no better and no worse than many others. Since then the Monopolies Commission has published a critical report on the company and its operations. The latest full report is almost a model of what is best in modern accounting practice. It includes for the first time a 10 years record of profits and capital; a diagram of an oxygen cylinder showing the distribution per £1 of the group's income; charts of turnover and capital expenditure and a list of the group's principal works.

In 1955-56, the group's sales came to about £37 million and the gross profit to £5.2 million; in 1954-55, when only nine months' trading of the parent company was included, a profit of nearly £4.3 million was earned on sales of £29 million. In the last financial year the group spent nearly £9 million (against £4 million) on capital account. As a result bank overdrafts came to over £4 million, a sum which has now been repaid out of the proceeds of the £10 million debenture issue. The company's accounts put a value of £41 million on "average capital employed," and setting gross profits against this figure they calculate the return on capital at 14 per cent.

LONDON STOCK EXCHANGE

First dealings:	Feb. 27	Mar. 13	Mar. 27
Last dealings:	Mar. 12	Mar. 26	Apr. 9
Account Day:	Mar. 19	Apr. 2	Apr. 16

GAINS made by gilt-edged stocks following the further fall in the Treasury bill rate were eliminated on Tuesday and heavier falls occurred on Wednesday when 2½ per cent Consols, 2¾ per cent Savings 1964/67 and 3½ per cent Treasury 1979/81 all fell 7/8. Short-dated stocks improved, however, 3 per cent War Loan 1955/59 rising ⅛ to 96 23/32 and 2 per cent Conversion 3½ to 95 23/32. Industrial shares were mainly better due to evidence of a revival in retail sales and *The Economist* indicator gained a point to 201.6, but the weight of the projected issue of Steel Company of Wales was a restraining influence in all sectors.

Although easing on Wednesday, power shares were higher on balance following details on the revised building programme. Clarke Chapman gained 5s. to 145s. 7½d. on the increased dividend and profit. Hoover continued to recover after the profit figures, the ordinary reaching 34s. 3d. and the "A" 33s. 6d. Rootes were little changed on the half-yearly report, but other motors were mainly a few pence weaker. Leyland rose 2s. 9d. to 46s. 3d. helped by confirmation of its participation in the German defence programme. Steel shares were a little easier and shipbuilders were often lower on Wednesday following the rejection of the wage-claim, William Denny losing 1s. 6d. to 44s. Staveley slumped 6s. to 40s. 3d. on the reduced interim dividend. Shipping shares tumbled this week on the fall in freight rates; Stanhope lost 6s. 9d. to 35s. 9d. and Reardon Smith 4s. 3d. to 45s. 3d. from their week-end levels. British and Commonwealth rose to a peak of 41s. 3d. before easing to 40s.

Oil shares were strong on hopes of the early opening of the Suez Canal, and the early repair of the Iraqi Petroleum Company's pipeline, Shell jumping 3s. 3d. to 167s. 9d. on Thursday. Gold mines were dull until Wednesday. Older mines reflected hopes of local budget concessions, City Deep rising 1s. 4½d. to 12s. 10½d. Central Mining gained 2s. 6d. to 65s. Beralt Tin was again weak and North Broken Hill fell 8s. 9d. to 112s. 6d.

[1] Electricity production for New Zealand represents about 87 per cent of total generation. [2] Copper and tin refer to metal production. [3] General trade (including re-exports) except for Canada, which is special trade only. Imports are cif except for Australia, Canada and S. Africa which are fob; exports are fob. Trade for India includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia 12 months ended June 30th. [4] Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for S. Africa and S. Rhodesia relates to Europeans only and for S. Africa includes direct taxes. [5] Including foreign investments. [6] Including semi-processed gold. Beginning January, 1955, including South-West Africa. [7] In July, 1948, part of holdings was transferred to the State Bank of Pakistan. [8] April, 1948—March, 1949. [9] Including some long-term securities. [10] Average for third quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended March 2nd, 1957, there was an "above-line" surplus (after allowing for Sinking Funds) of £4,117,000 compared with a surplus of £1,528,000 in the previous week and a deficit of £1,644,000 in the corresponding period of last year. There was a net deficit "below-line" last week of £26,752,000, bringing the total deficit to £243,871,000 (£94,187,000 in 1955-56).

THE MONEY MARKET

THE Treasury bill rate on Friday of last week dropped to a shade over 4 per cent—its lowest since August, 1955 (when Bank rate was 4½ per cent). The discount market raised its common bid by 9d. per cent, bringing it to £99 per cent, equivalent to a discount rate of just 4 per cent. It thus succeeded in raising its allotment rate from 30 to 50 per cent of its application. The total allotment was up by £20 million to £220 million, total applications rising fractionally, to £408.2 million.

Credit supplies in Lombard Street have been taut in the past week. On Thursday before the week-end considerable stringency was produced by end of month's calling of funds combined with the usual tax transfers; and despite fairly large special help from the Bank, three or four houses had to take loans at the penal rate, for the second day in succession. In the first three days of this week credit was again in keen demand, partly on account of the market's large take-up of bills. The Bank made moderate special purchases on Monday, and again on Tuesday—but three or four houses had to make further small penal borrowing.

Sterling dipped to $2.79\frac{15}{32}$ on Monday but recovered by mid-week to $2.79\frac{3}{4}$.

The Bank return shows a further increase in the active note circulation of £12.8 million in the week to Wednesday, following that of £14.3 million in the previous week from the seasonal low point.

"Something worrying you, Williams?"

"Worrying me? Nothing, Sir, thank you."

But—his thoughts are twenty years ahead. Twenty years on to the day when he leaves the office for the last time with little more than his last pay envelope and a State pension. As time passes, he will think increasingly of the day he retires and the inevitable drop in his standard of living if no additional provision is made.

The present, too, is worrying him; how would his wife fare with two growing children on her hands if he should die?

With these worries on his mind no man can work satisfactorily. The wise employer knows that efficiency depends on a contented and happy staff and, if he has not already done so, will give serious consideration to a Pension and Life Assurance Scheme. For tax purposes his contributions will be recognized as a business expense.

Ask for details of a Scheme planned to meet your specific requirements.

UNILEVER LIMITED AND UNILEVER N.V.

The Boards of Unilever Limited and Unilever N.V. announce the provisional results for the year ended 31st December, 1956. Although these results are subject to completion of the consolidated accounts and audit, the Boards are satisfied that any difference beween the provisional and final figures will be relatively unimportant.

The value of turnover at £1,671,000,000 compares with £1,515,000,000 for 1955.

The combined trading profits throughout the world are estimated at £98,977,000 (1955, £85,455,000), taxation at £52,081,000 (1955, £43,905,000) and consolidated net profit at £47,182,000 (1955, £45,118,000). The consolidated net profit includes £2,769,000 (1955, £6,099,000) of exceptional items and profits relating to previous years.

The estimated results for the groups separately are:

Consolidated Net Profit

Unilever Limited .. £25,253,000 (1955, £22,915,000)
Unilever N.V. £21,929,000 (1955, £22,203,000)

Profit of Parent Company

Unilever Limited .. £11,609,000 (1955, £10,347,000)
Unilever N.V. £8,512,000 (1955, £8,073,000)

The N.V. figures have been converted to sterling, as for 1955, at the official parity of Fl.10.64=£1.

The Boards, assuming the existing rate of exchange between the £ sterling and the guilder, intend to resolve on 19th March, 1957, to recommend to the Annual General Meetings to be held on 25th April, 1957, final dividends for 1956 on the Ordinary capitals payable in May, 1957, as follows:

1. In the case of Unilever Limited a dividend of 11¼% actual (2/3.6d. per £1 of stock) before deducting income tax, (1955—9¼%), making 17½% for the year ended 31st December, 1956 (1955—15¼%).
2. In the case of Unilever N.V. a dividend of 10¼% actual (Fl.102.5 per share of Fl.1,000) (1955—8¼%), being the equivalent of the Unilever Limited dividend calculated in accordance with the Equalisation Agreement between the two companies, making 15½% for the year ended 31st December, 1956 (1955—14%).

It is intended to send the Report and Accounts for 1956 to stockholders on 3rd April, 1957.

28th February, 1957.

COMPANY MEETINGS

EQUITY & LAW LIFE ASSURANCE SOCIETY LIMITED

HIGH INTERIM BONUS RATES PAID AND EARNED

MR G. GODFREY PHILLIPS'S STATEMENT

The Annual General Meeting of Equity & Law Life Assurance Society Limited will be held at 12.15 p.m. on March 27, 1957, at 29 Lincoln's Inn Fields, London, W.C.2. Policyholders and Agents are welcome to attend but only shareholders are entitled to vote. The following is the statement by the Chairman, Mr G. Godfrey Phillips, CBE, circulated with the Report and Accounts for 1956 :

The present Report and Accounts are the first to appear in a new form, and I hope that all who are interested in the Society will find them helpful in understanding our affairs. The Accounts themselves are unaltered, but the Directors' Report has been changed substantially and a comparative Summary added. The other major change is that I am attaching this statement to the Report and Accounts in lieu of embodying my remarks in a speech at the Annual General Meeting.

Earlier this year we elected Lord Bridges to a seat on the Board, and your Directors feel it a great honour that so distinguished a servant of the State has agreed to join them. During 1956 we were saddened by the news of the death of our old friend Sir Geoffrey Ellis, to whom our Society owes so much ; he was a Director for sixteen years and Chairman from 1941 to 1950.

As foreshadowed in my speech at the Annual General Meeting last year, an Extraordinary General Meeting was held in November, and the re-registration of the Society as a Limited Company under Section 16 of the Companies' Act, 1948, was duly effected on December 10, 1956.

NEW BUSINESS

First I wish to draw attention to the new business figures set out on page five of the Report and Accounts. One of the facts which is worth noticing is the substantial amount of new business which we receive each year under existing group life assurance and group pension policies—in 1956, sums assured of over £7 million ; annuities of over £1 million per annum. These figures illustrate a salient feature of these classes of business—indeed, it is perhaps the most important feature—namely, *the need to* provide good service. We like to feel that in this field of service, and this includes advice on keeping schemes up to date, the Society is second to none.

I would like here to record our sincere thanks to Mr M. D. W. *Elphinstone, who,* on his return from the war, became Secretary of the Society and devoted himself to creating and developing our group pensions and group life assurance organisation. Later he also took under his guidance part of the investment work of the Society. Mr Elphinstone left our service at the end of the year to become a partner in a firm of stockbrokers on the London Stock Exchange, and our warm, good wishes go with him.

PERSONAL PENSIONS

I turn now to the Finance Act, 1956. As Chairman of a Society which has from its inception had a close connection with one of the great professions I feel entitled to express great pleasure at the concessions made in the last Finance Act in regard to retirement benefits for the self-employed. I have always had faith that in this country social injustices which can be removed by legislation will ultimately be removed. The privileged position in regard to retirement benefits of the employed (however wealthy) as compared with the self-employed (however poor) was a glaring social injustice which has now in large measure been removed. It is too soon to say with any certainty what particular form of savings for retirement will prove most attractive to the self-employed. I do, however, state with confidence that the merits of a with-profits personal pensions policy with a life office such as our own deserve the most careful consideration. Such a policy provides the certainty of a fixed sum together with a measure of *protection against* the risks of inflation through a stake in the surplus earned by the Society's funds as a whole.

Before I leave the question of personal pensions I must stress one point which, I suspect, is all too frequently forgotten, namely that these contracts once entered into cannot be surrendered or dealt with in any way. Any man making provision for his financial future must bear this fact in mind. Over a century or more members of the public have come to regard, and rightly come to regard, life assurance policies as having great value because they can be freely dealt with in so many ways. This is not so in respect of contracts approved under the 1956 Finance Act—these contracts cannot be surrendered, they cannot be deposited as security for an overdraft, they have no "loan value." Thus the importance of the traditional forms of life assurance has in no way been diminished, and a wise man will think carefully and seek advice before determining how much of his savings should be placed in personal pensions policies and how much in life assurance.

IMMEDIATE ANNUITIES

Next, I would like to say a few words on the change that has been made in the taxation of immediate annuities. Hitherto, all immediate life annuities, although admittedly part capital and part interest, have been taxed as though they were wholly income. This anomaly has now been rectified and where a man or woman has purchased an annuity for themselves these contracts are now much more attractive. It must be remembered, however, that in certain circumstances, as for instance when an annuity has been purchased by an executor under a Will or by an employer in connection with a pension scheme, the whole of that annuity is treated as income for the purposes of taxation.

RESULTS OF YEAR

I come now to the results of the year under review, and I would first draw attention to the fact that the gross rate of interest earned on the funds was £6 11s. per cent—a rate which we may hope at least to maintain during the current year. This rate was earned after the transfer at the end of the preceding year of £1 million from the Investment Reserve to the Life Funds ; without that transfer the rate of interest would have been £6 13s. 10d. per cent. This transfer also accounts for the sharp rise in the funds during 1955 which you will observe from the table "Funds" on page seven.

The Actuarial Valuation which we make for our own guidance at the end of each year showed that during 1956 we continued to earn the high rates of interim bonus which we are at present paying.

In the Balance Sheet itself there is only one figure to which I wish to direct attention, namely, the increase in our holding of ordinary stocks and shares. This increase is due in part to the fact that during 1956 we began to invest a portion of *our funds direct* in the USA and Canada—we already have an indirect stake in these two countries through our substantial holdings of ordinary stocks in British Investments Trusts.

Last year in my speech at the Annual General Meeting I said that during 1955 the margin by which the market values of our assets exceeded their Balance Sheet values had fallen slightly ; with the general fall in stock markets during the year under review you will not be surprised to learn that there was a further decrease in this margin during 1956. What is very satisfactory, however, is that at the end of 1956 the major portion of the margin which existed at the end of 1954 was still intact.

STAFF

Over the last three decades the business of an office such as ours has changed greatly—thirty years ago endowment assurances and whole life assurances formed almost the whole of our business. Now pension funds of various kinds and personal pension contracts occupy much of our time ; but I would repeat what I said earlier in this statement—namely, that the importance of the traditional forms of ordinary life assurance has in no way *diminished.* In all these spheres your Society actively seeks business ; in all of them we have attractive contracts to offer ; in many of them we believe our contracts to be of outstanding value. The growing complexity of our business requires a very high quality of work at all levels ; we have a really first-class staff, and that has never been more clearly shown than by the way in which they have dealt with the problems arising from the 1956 Finance Act—actuarial, administrative, legal, and last, but not least, the explaining and selling of these policies to the public.

And so once again I want on behalf of my colleagues and myself to thank the General Manager and all the staff of the Society for their work during the past year. The Board is proud of being associated with the Society's officers and staff and is grateful to them.

REPORT OF THE AUDITORS TO THE MEMBERS

We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit. In our opinion proper books of account have been kept by the Bank so far as appears from our examination of those books and proper returns adequate for the purposes of our audit have been received from Branches not visited by us. We have examined the above Balance Sheet which is in agreement with the books of account and returns. In our opinion and to the best of our information and according to the explanations given to us the said Balance Sheet gives the information required by the Companies Act, 1948, in the manner thereby authorised for Banking Companies and, on such basis, the Balance Sheet gives a true and fair view of the state of the Bank's affairs as at 31st December, 1956.

We have also examined the annexed Consolidated Balance Sheet and Consolidated Profit and Loss Account of the Bank and its Subsidiaries dealt with thereby with the audited accounts of those Companies. In our opinion such Consolidated Balance Sheet and Consolidated Profit and Loss Account have been properly prepared from such accounts in accordance with the provisions of the Companies Act, 1948, in the manner thereby authorised for Banking Companies and, on this basis, give a true and fair view of the state of affairs and of the profit ascertained in the manner therein indicated of the Bank and its Subsidiaries so far as concerns members of the National Bank of India, Limited.

THE NATIONAL BANK OF INDIA, LIMITED

NET PROFIT LARGER : DIVIDEND MAINTAINED

PROPOSED AMALGAMATION WITH GRINDLAYS BANK

MR J. K. MICHIE'S STATEMENT

The annual general meeting of The National Bank of India, Limited, will be held on March 26th at 24 Bishopsgate, London, E.C.

The following are extracts from the statement by the chairman, Mr J. K. Michie, circulated with the report and accounts for the year to December 31, 1956:

Before turning to the Accounts I have a matter of more than ordinary interest to report. Ever since we acquired from the National Provincial Bank Limited the total capital of Grindlays Bank Limited the interests and managements of Grindlays Bank and ourselves have naturally grown more closely together and it has become increasingly clear as experience accumulated that to ensure the full benefits of this association a physical fusion of resources and Staff must be the ultimate step. The Boards of both Banks have now decided that the time is ripe for an amalgamation and the necessary preliminaries have been set in motion. It is hoped that the fusion can be effected as from January 1, 1958, and every effort will be made to achieve this. Opportunity will be taken to make a change in our name and, despite the long and honourable associations attaching to the present titles there are a number of good reasons for doing this. Until certain legal formalities are completed it is not possible to announce a name but it is hoped to preserve in the one adopted associations with both now in use.

What is important to our shareholders is that the two Boards are strongly and unanimously of the opinion that taking this action will solidify and strengthen our structure and enable us to progress both more soundly and more rapidly than would otherwise be the case. A public announcement of our intentions will be made at the earliest possible date. Any necessary resolutions will be put before you in due course.

THE ACCOUNTS

Our consolidated Balance Sheet total at £163,635,741 shows the contraction anticipated in my last Statement, the comparable figure a year ago being £168,653,013. Our Net Profit figure is somewhat larger and after full provisions for taxation, bad and doubtful debts and other necessary reservations comes out at £432,835 against £421,839 the previous year. Dividends declared are unchanged at 15 per cent for the year. £100,000 has been transferred to Premises Account against £75,000 and £75,000 to Contingencies Reserve Account against £85,000 in 1955. The balance carried forward is increased by £11,888.

The fall in the value of Sterling Securities was arrested before the end of 1956 and an upward movement has since taken place. As I have previously reported all temporary depreciations in our holdings have been fully provided for ex interior reserves.

INDIA

All Indian economic activity is being dominated by the Second "Five-year Plan" which has recently been widely commented on in the financial press and our own Quarterly Review published in January carried an interesting article on the subject.

Despite legitimate mental reservations as to the timing and correlation of certain sections of the plan and some doubt, having regard to the country's apparent resources—the significant reduction in her sterling balances has to be taken into account—whether too much is being attempted too quickly, it is generally agreed that the plan is imaginative and certainly reflects a dynamic outlook and determination on the part of the Government. All people of goodwill will wish the plan the greatest possible success.

LARGER CALLS ON BANKS

In such circumstances of stretched resources it is inevitable that larger calls are made on the banking system of the country. But Banks, while assisting their customers to the greatest possible extent, have the mundane and paramount duty of maintaining a reasonable liquidity and that can be achieved only by finding more deposits or by restricting their lendings. While the total of deposits with the Banking system in India showed a moderate rise over the year most recent figures available show that aggregate advances stand at over 70 per cent of deposits ; and in spite of an unchanged Bank rate money commands about 1 per cent per annum more than a year ago. On this showing Banks can hardly be accused of underlending, particularly in comparison with the ratio of lendings to deposits in the United Kingdom. Perhaps both reflect exaggerations of opposite policies.

This situation has been created partly by the Government's policy and partly by circumstances. To take the second first, the blocking of the Suez Canal automatically meant and still means that shipments have to be financed for considerably longer periods than normal, while a great deal of capital imports eventually are paid for by Government departments whose machinery for so doing works slowly. Secondly there is so much pressure on the private sector of industry to expand that its reserves previously built up are rapidly being spent, plus very large additional sums, and that at a time when Government is keeping an extremely tight rein on the capital market as well as on money rates. The proposal that part of Company reserves should be deposited with the Reserve Bank would mean a depletion of ordinary banking deposits.

TAX BURDENS INCREASED

Commerce and industry have recently had their tax burdens materially increased and there have been official indications that these possibilities are considered not yet to be exhausted.

It is satisfactory to see that a fresh trade agreement between India and Pakistan has just been signed which should facilitate the natural transactions between the two countries. For the benefit of both it is to be hoped that this trade will steadily expand.

PAKISTAN

The recently published Budget for 1957-58 indicates that Pakistan expects to finish this financial year with a favourable trade balance of just under £1 million against a surplus of £24 million in the previous year.

Industrial expansion continues and during the year there was an increase of one-third in the number of looms in operation in the jute mills of East Pakistan. The target of the existing Companies is 8,500 looms which will mean an increase of nearly 60 per cent on present capacity. At 1,750,000 bales the cotton crop of West Pakistan, though larger than that of the previous year, was affected by adverse weather. The requirements of local mills are now estimated at 1 million bales which is an increase of 30 per cent over the previous year.

CEYLON

Economically Ceylon's experience in 1956 was a satisfactory one and in the year ending October 31, 1956, her accumulated surplus rose by £6,500,000 to nearly £90 million. Money rates were easy, tea prices were good and rubber prices moderately so. Her efforts to grow more food continue to expand.

In certain respects the prospects for investors in Ceylon are in weather forecasting parlance "uncertain." Some sections of the present Government have recently advocated the nationalisation of industry and specific suggestions have been made that the tea estates could be taken over at an average valuation of £69 per acre. Those competent to know state that tea cannot be brought into production and manufactured at a cost of less than £400 per acre. Some put it much higher, so there is little reality about the figure that has been named and estate owners cannot be blamed for feeling apprehensive. A policy involving a large measure of expropriation would be damaging to Ceylon's good name and to her prospects of obtaining outside capital for new projects and I hope the idea will not be pursued.

BURMA

Throughout 1956 rice prices and demand both remained very steady and previously accumulated crop balances were largely disposed of, exports reaching nearly 1,950,000 against an estimated exportable surplus of 1,500,000 tons. This year's exportable surplus is estimated at 1,575,000 tons.

In these respects the position is sound and the country's financial resources have benefited. At December 31, 1956, her sterling balances stood at £39½ million against £32 million a year earlier.

EAST AFRICA

Since I last addressed you we have opened three Branches and sub-Branches in these territories and have closed one. In Kenya it is good to be able to report that the Mau Mau problem has now reached the constructive stage of rehabilitation, the destructive force of the movement to all intents and purposes being exhausted. The Government of Kenya is to be congratulated on the enlightened way it has planned and is tackling the all important question of the resettlement of those who were involved in Mau Mau and even more on the success of their efforts.

Rightly much financial help has been given to Kenya by Her Majesty's Government but a remarkable feature since the unfortunate movement began has been the resilience of its economy and the rate at which the inflow of capital has continued. The success of the internal loan of £2½ million issued a few weeks ago is another encouraging sign.

ADEN

The closing of the Suez Canal naturally has considerably affected Aden as a bunkering port and as a tourist shopping centre, the number of vessels entering the port having fallen by 60 per cent but otherwise its trade has shown remarkable life.

In July last we occupied our fine new office at Crater—which also houses the Currency Office—and an official opening ceremony was kindly performed by Sir Tom Hickinbotham, just prior to his retirement from the Governorship of the Colony.

We have recently sanctioned the rebuilding of our Steamer Point office, the present one being inadequate for our needs.

Somaliland Protectorate. — No large developments have taken place during the year. The use of our banking facilities continues to grow if slowly.

GRINDLAYS BANK LIMITED

I have already dealt with our proposals for the fusion of this business with our own. I am glad to report another successful year's operations which is reflected in the profit figure shown in their accounts attached to this report and as you will see the growth in the volume of the Bank's deposits has been well maintained. As in our own case all necessary provisions have been internally made including any depreciation on the Bank's holding of Government securities.

During the year two further Branches have been opened in the Rhodesias and results of operations there show a considerable improvement and are encouraging.

Our *Finance & Development Corporation* again operated at a profit which is being retained in the business.

GENERAL

When I last addressed you we had just had a rise in the Bank rate to 5½ per cent in a further attempt to curb inflationary tendencies. The situation was apparently improving when the economic results of the Suez crisis fell upon us. By dint of calling up our reserves the critical phase has been by-passed and money has been plentiful enough to justify an adjustment of the Bank of England rate to 5 per cent. I say adjustment advisedly for on the authority of the Governor of the Bank of England that is all it is and we shall have to work hard for any further improvement in our monetary situation, whether expressed in gold and dollar balances or interest rates, and obviously they go together.

This is no time to attempt prophecy ; the imponderables are too many and certainties too few but as has been said before no one owes this country a living and it can only be through the wisdom of our Government and the efforts of all our people that our present economic difficulties will be resolved ; and surely there is nothing insurmountable about them so long as we do not spend as if we still had a large unearned income behind us.

Last year I remarked on the disparity between interest rates in London and those current in certain other countries. This gap has since been narrowed but in today's relative circumstances it is in some cases still too wide. Supply and demand will doubtless have their way in due course.

As to our own prospects, given reasonable operational conditions I feel sure our forward progress will continue.

Staff.—I wish again to thank our Staff throughout our widespread organisation. Banking is a service and it is in its quality that the seeds of success lie. From my observation we have nothing to fear on that score.

NATIONAL BANK OF INDIA LIMITED AND GRINDLAYS BANK LIMITED

The Boards of Directors of the National Bank of India Limited and of Grindlays Bank Limited have decided it is in the interests of both Banks that the two institutions should be amalgamated. They have accordingly taken preliminary steps to give effect to this unanimous decision. Both concerns have a long history in overseas banking, the National Bank of India Limited having been founded in 1863 and Grindlays Bank Limited in 1828. The entire share capital of Grindlays Bank Limited has been owned by the National Bank of India Limited since 1948.

The necessary legal procedure may take some time to complete but unless unforeseen difficulties arise it is hoped to make the merger effective as from January 1, 1958. Thereafter the amalgamated Bank will operate under a new name which will be announced in due course.

THE STERLING TRUST LIMITED

The Fortieth Annual General Meeting of The Sterling Trust Limited was held on March 5th in London.

Mr Michael F. Berry, the chairman, presided. The following is an extract from his circulated statement:

For some 14 years now the income of investment trust companies has shown a steady increase, and for the year 1956 that is again the feature of your company's report, although the increase in the normal income over the previous year is some £16,932, or 4 per cent, which is considerably less than the increase of 1955 over 1954. The signs are, therefore, that the rate of increase in income is diminishing and such economic difficulties as the shortage of fuel oil could very easily destroy any hopes of even a small increase for next year.

Your directors recommend a final dividend of 10 per cent, making 14 per cent, which involves a distribution of 72½ per cent of the available net revenue compared with a distribution of 71½ per cent for 1955 on the same basis.

We have continued our policy of acquiring a bigger proportion of equities and the company now has, on valuation, 27 per cent in the United States and Canada, compared with 18 per cent, and it has 81 per cent in equities compared with 75.8 per cent a year ago.

Although one can no longer look for a substantial increase in income, our distribution is sufficiently conservative to encourage hopes that the dividend can be maintained for the year 1957.

The report was adopted.

UNIVERSAL ASBESTOS MANUFACTURING

TURNOVER AGAIN LARGER

The annual general meeting of The Universal Asbestos Manufacturing Company, Limited, will be held on March 28th in London.

The following is an extract from the statement by the chairman, Mr Frank W. R. Douglas, circulated to the stockholders:

I am indeed pleased to be able to present, once again, another satisfactory trading result for the financial year which ended September 30, 1956. We have achieved a further increase in turnover and reached a profit figure, after depreciation and all other charges, but before taxation, of £340,135, being some £10,000 higher than in the previous record year.

IMPROVED EXPORT ORDERS

The general distribution of our goods was satisfactory, and, in particular, in the export field, orders taken showed an improvement on the previous year, although profit margins were very small.

Shareholders will be interested to hear of our establishment of a new wholly-owned subsidiary to make pitch fibre pipes. Union Fibre Pipes (Great Britain) Limited, with a Works at Harefield, Middlesex, started production only in October, 1956. Demand for its products is already large, and we are looking forward to good results from this first step in our diversification programme. As you doubtless know, pitch fibre pipes are made from cellulose pulp, impregnated with pitch, and are used as drainpipes for industrial effluvient disposal and electric conduits.

The Universal Asbestos Manufacturing Company (East Africa) Limited, the new Company in East Africa in which we have a substantial capital interest, commenced its operations in May, 1956, but is only now beginning to approach the production expected of it. The start has been slower than we anticipated, due to many local problems encountered, particularly in the training of native labour. However, with only a small production, a trading profit is being made, and I hope next year I shall be able to report a major improvement. The Company has, in our opinion, a considerable future.

ACCOUNTS

The Trading Profit of the Group, after making provision for depreciation, amounts to £340,135, compared with £330,117 for the previous year, and the Group profit, after making full provision for taxation, is £164,073. Your Board has decided to recommend a final dividend of 12½ per cent on the Ordinary Share Capital, making a total of 20 per cent for the year. This proposed total distribution is at the same rate as for the previous year but is, of course, payable on an increased Ordinary Share Capital.

It is proposed to capitalise a sum of £104,000 being the balance standing to the credit of the Capital Reserve. Treasury consent has been obtained to the proposed capitalisation and the £104,000 will be applied in paying up in full 416,000 5s. Ordinary shares, which will be distributed to existing Ordinary shareholders on the basis of one new Ordinary share for each four Ordinary shares now held.

Demand for all our products continues to be not disappointing and I think it may be reasonably hoped that with our increased manufacturing facilities we shall in the current year once again produce results which will do us credit.

THE MERCANTILE BANK OF INDIA

CONTINUED EXPANSION OF GENERAL BUSINESS

SIR KENNETH W. MEALING'S REVIEW

The sixty-fourth annual general meeting of The Mercantile Bank of India, Limited, will be held on March 26th in London.

The following is an extract from the statement by the chairman, Sir Kenneth W. Mealing:

The expansion recorded last year in the Bank's general business continued during 1956. The Balance Sheet total at nearly £75 million is higher by £3 million. Deposits are higher by £2½ million, whilst on the Assets side there are increases of over £5 million in Loans and Advances and nearly £1 million in Bills Receivable. These higher figures indicate the increased share we are taking in World trade with the East, and are in part responsible for the decrease in our holding of Government Securities by nearly £3 million.

The net profit of £236,484 is slightly higher than the previous year, and your Directors recommend a final dividend of 7 per cent. If this recommendation is approved the dividend for the year will be 14 per cent, the same as last year. From the balance the usual allocations have been made to the Officers' Pension Fund, Premises Account and Contingencies Reserve Account, leaving the balance carried forward at £224,521 against £219,372 from the previous year.

During the year the Board authorised the transfer of £250,000 from Inner Contingencies Account to the Reserve Fund, which now stands at £2 million.

The two significant events of 1956 were the strain put upon Anglo-American relations and the reimposition of Stalinism throughout Communist Countries. The former resulted from the chain reaction starting with America's sudden withdrawal from the Aswan Dam project, the nationalisation of the Suez Canal Company, the attack by Israel on Egypt and the Franco-British intervention. The second resulted from the attempt by the workers and people of Hungary to secure the freedom which the new anti-Stalin policy of Russia seemed to promise.

In the former case the British and French obeyed the resolutions of the United Nations and withdrew. The Canal was blocked by the Egyptians and only the future will show whether any Nations (other than Britain and France) are willing to obey the edicts of the United Nations to which so much political lip service is rendered. So far as the Hungarians are concerned the answer is clear: that Russian imperialism is not prepared to permit United Nations observers even to investigate the facts. I can only repeat my statement of a year ago, when I said "there is little or no prospect of a real relaxation of tension or of ending the 'Cold War' until a real disarmament agreement can be brought into effect"—and this seems now, if anything, still further away.

In Britain the Government's fiscal policy was beginning to be effective without resulting in unemployment, but the events in the Middle East checked the progress anticipated and the change in Government in January, 1957, resulting from the Prime Minister's illness and the re-entry into World affairs of the USA following the Presidential Election, may be expected to open a new era of Anglo-American co-operation and economic prosperity throughout the Western World.

INDIA

One of the principal events of the year in India was the introduction of the States Reorganisation Bill which after some modification, resulting from troubles in Bombay and Bengal, came into effect throughout India on November 1, 1956. Under this new Act the State of Bombay becomes one of the largest in India and with the final extinction of the Princely States the map of India takes on a rational and logical appearance such as it has never had in the past.

The Foreign Policy continued to be directed by the Prime Minister, Pandit Nehru, who continues to maintain his policy of neutrality and non-alignment. During the Suez crisis he was under much pressure to sever India's connection with the Commonwealth, but stoutly refused to do so. During the year a British Consortium signed a contract with the Government of India for the erection of a steel plant at Durgapur. This plant is designed to produce ultimately a million tons of steel per annum and is the third such plant, the other two being respectively German and Russian, to be under construction in India at this time.

The second Five Year Plan to which I referred last year is already rapidly getting under way and is estimated to have a total cost of some 5,300 crores of Rupees. Inevitably this vast project will have repercussions on many aspects of Indian life. Initially it is almost inevitable that a degree of inflation and high taxation must be anticipated and indeed is already taking place. It must be hoped that the ultimate effects of the great production and employment that this Plan is hoped to produce will justify this great undertaking.

Towards the close of the year some anxiety has been caused regarding the country's economy following a continued rise in price levels, continued substantial dwindling of foreign exchange resources and the monetary stringency in the Banking system. It is unfortunate that at this time the Indian jute trade, which is one of India's principal earners of foreign exchange, is passing through a time of economic crisis and heavy losses. The tea and cotton industries have both had a fairly successful year and on the whole labour relations throughout India have been reasonably harmonious.

PAKISTAN

On March 23, 1956, the new Constitution was adopted and the Islamic Republic of Pakistan with Major General Iskander Mirza, who had been Governor General, as the first President came into being. Pakistan, however, remains a member of the Commonwealth.

In May, 1956, a draft five year plan was published envisaging the expenditure of Rs. 800 crores in the public, and Rs. 360 crores in the private sectors, estimated to increase National Income by 12 per cent, food grain production by 13 per cent, provide employment for two million people and increases in electric output, irrigation, etc. The Plan relies upon foreign aid for some Rs.300 crores of finance. It is regarded as being moderate and realistic and has been well received in the country but it has been criticised as putting far too little emphasis on agriculture and communications including port facilities.

There is no doubt that Pakistan will continue to need foreign aid for some time to come notwithstanding the strenuous efforts she is making, by severe restrictions in imports at the expense of some degree of inflation, coupled with an industrial programme designed further to reduce imports and to increase her income from exports.

CEYLON

Economically the year 1956 proved less prosperous for Ceylon than the preceding year. This was largely due to circumstances outside Ceylon's own control. Adverse weather conditions, including the severest drought in 50 years, caused deterioration in the quality of tea and a falling off in coconut production. Delays in Colombo due to dock labour unrest and towards the end of the year the diversion of shipping round the Cape all had adverse effects on Ceylon's balance of trade. The Port development scheme was completed and ships are now able to go alongside for loading and discharging cargo. Given freedom from labour disputes, Colombo Harbour should regain efficiency and cease to handicap the Island's trade as it has of recent years.

BURMA

The problem of dealing with the insurgents has not yet been solved in Burma and until it is, the establishment of the rule of law and order throughout the land will remain unsolved.

In the financial field it is satisfactory to report that Burma's foreign exchange reserves which at the beginning of the year stood at K.405.5 million rose by the end of December, 1956, to K.569.6 million. This improvement is most welcome and is largely due to the strict limitation of imports.

During the year, loans were obtained from the World Bank, the Government of India, and the United States Government primarily to be used in the development of the Port of Rangoon and the railway system.

Disturbing features are the gradual elimination of private enterprise by State organisations and the infiltration of Communism into the Rangoon Universities Students' Union, which may present the Government with serious problems in the future if it is permitted to continue.

FEDERATION OF MALAYA

The Federation of Malaya has enjoyed a successful and prosperous year in 1956. Both imports and exports made a substantial increase and the prices of Malaya's two main exports—rubber and tin—have maintained a satisfactory level, averaging around 96 cents a lb. for the former and $386 a picul for the latter.

By an Agreement signed by Her Majesty's Government on February 8, 1956, a considerable degree of self government was brought into immediate effect and it is understood that there is every probability of full independence by the end of August, 1957.

SINGAPORE

1956 proved to be another prosperous and successful trading year for Singapore. Rubber averaged about 95 cents over the year, and tin was obtaining good prices. The outlook for 1957 appears also to be favourable.

INDONESIA

The re-emergence of this important country to a state of fiscal integrity and domestic stability is a matter desired by all countries with whom her trade and commerce can be of mutual benefit. Teething troubles in a young country are inevitable and the recent Sumatra troubles may be the prelude to progress resulting, in due course, to Indonesia taking its rightful place in the trade and commerce of South-East Asia.

THAILAND

Thailand continues to be one of the most prosperous and contented countries in South-East Asia, under the able Premiership of Marshal Pibul Songgram.

Economically, Thailand had a good year.

HONGKONG

Hongkong has had another successful and prosperous year. Both imports and exports show increases in excess of 25 per cent over the 1955 figures.

MAURITIUS

The 1956 sugar crop in Mauritius was an all-time record at the figure of 571,893 metric tons produced at an average extraction rate of 12.94 per cent which is also a record. The Commonwealth Sugar Agreement has been extended for a further year, i.e. up to and including the year 1964 and under the terms of the International Sugar Agreement the export quota for Mauritius remains the same at 470,000 long tons. Of this 335,000 tons will be purchased by the Ministry of Food at an increased price of £42 3s. 4d. per ton against £40 15s. 0d. per ton for the previous crop. The balance of 135,000 tons will therefore be offered for sale in the preferential markets in the United Kingdom and Canada.

It is estimated that the Cyclone and Drought Insurance Fund exceeded the sum of Rs. 95 million by the end of 1956.

The finances of the Island continue to be sound. For the year ended June 30th there were increases both in revenue and in expenditure. Revenue exceeded expenditure by some Rs. 10 million and draft estimates for 1956-57 reveal that 35.7 per cent of the revenue is to be derived from direct taxation with a further 23.4 per cent accruing from Customs duties. On the expenditure side the largest items are again education and health which will account for 28.9 per cent.

JAPAN

1956 has proved to be by far the best year for Japan since the war. Exports rose by a further 25 per cent, domestic trade showed a healthy expansion, productivity improved and the harvest although not quite so large as the previous year was still exceptionally good. Moreover, these benefits have not been diminished by inflation, for prices remained stable and so all sections of the Nation enjoyed conditions of prosperity with better living standards than for nearly 30 years.

There is every reason to believe that given normal conditions the present era of prosperity for Japan should continue throughout the coming year.

SCOTTISH WIDOWS' FUND & LIFE ASSURANCE SOCIETY

A RECORD YEAR

SATISFACTORY PROGRESS OF CURRENT QUINQUENNIUM

MR F. H. N. WALKER ON POPULARITY OF NEW POLICY

The one hundred and forty-third Stated Annual Meeting of the Society was held in the Society's Head Office, Edinburgh, on Tuesday, March 5, 1957. Mr F. H. N. Walker (Chairman of the Ordinary Court of Directors), presiding.

In moving the adoption of the report and accounts, which were taken as read, the Chairman said:

New life assurance business generally was on a higher level in 1956 than in the preceding year but even against this background the Society's increase was a notable one—representing a considerably higher percentage than the average of all the British offices.

Our total new assurance business at over £26 million was the highest ever recorded by the Society and was £6 million higher than in 1955. The gross ordinary life assurance business at over £15½ million was a record for the eleventh successive year. Of this sum £600,000 was reassured with other offices and the net amount, together with more than £5½ million of new group insurances and increments of almost exactly the same amount under existing group insurances makes up the £26 million I have mentioned. The Society's with-profits contract for group pensions continues to meet with much success and deferred annuities were taken out under pension schemes for nearly £1¾ million per annum.

THE FINANCE ACT 1956

A measure of far-reaching consequence to life offices, the Finance Act 1956, did belated justice to professional and business people in non-pensionable occupations who are now able to make provision for retirement pensions by payments which, within limits, are treated as a charge on income for tax purposes, the pensions themselves being fully taxed as earned income. Thus by receiving relief of tax on their contributions those concerned do not escape tax but bear it on the pension eventually enjoyed instead of on the income which is set aside to provide it.

The Society quickly introduced contracts to meet the requirements under the new provisions and a considerable amount of the business is now being transacted. It was slow to start, probably because many professional men and others eligible, who have incomes which vary from year to year, naturally hesitated to commit themselves to a fixed annual premium. The Society's new policy with premiums which can be varied each year and even discontinued for a year or two and resumed again at the policy-holder's option is expressly designed for these people and is already proving most popular.

Of course, there will always be those—especially those who do not bear a high rate of surtax—who will not like the restrictions against assignment and commutation which have to be included in the new contract to comply with the Act and will wish to have their savings under their own unfettered control. These people may prefer to take out an ordinary endowment assurance under which the proceeds can be applied at the maturity date to buy an ordinary life annuity, especially, as under another provision of the 1956 Finance Act, only the interest portion of such an annuity will be taxed. This removes what has long been regarded as an injustice by purchasers of immediate annuities, namely, that the whole of the annuity—much of which is in effect a return of capital—has hitherto been taxed in full.

The interest income was again higher owing to the growth of the funds, to the favourable terms on which our new money could be invested and to the increases in dividends received on many of our holdings of first-class ordinary stocks. The interest represents a gross rate on the whole of the invested funds of £6 0s. 9d. per cent as compared with £5 18s. 7d. per cent in the previous year. Bearing in mind that we transferred the sum of £5 million from inner reserves to the funds in 1955 to cover the cost of the special additional bonus to with-profit policies, members will agree that this is a most satisfactory rate. It augurs well for the future of the Society's with-profit policies.

INVESTMENT PORTFOLIO

As a result of the year's operations, our total funds have increased by almost £9 million to over £93 million. As usual, our stock exchange securities shown in each separate category stood below their market values at the date of the balance sheet. There was general depreciation in securities of all classes during the year except in common stocks in the USA and, in view of the considerable fall in the values of fixed interest securities, a larger part than last year of the substantial margin between the market values and balance sheet values of our stock exchange investments has been set against the values of fixed interest securities and a smaller part against our ordinary shares. As a result of this, and of the investment of some £3 million in ordinary stocks during the year, our investments in this category now appear in the balance sheet at nearly £36¼ million, that is, about £6¼ million more than at the end of 1955. Despite the depreciation in the market values of stock exchange securities generally there was still a large margin between the total market values of the Society's securities and the values at which they stood in the balance sheet—a margin which it is so important to have in these uncertain times when values can fluctuate so widely and so quickly. You will be interested to know that since the date of the balance sheet much of the depreciation which took place during 1956 has been recovered, and our margin is now not far short of the figure at which it stood at the end of 1955.

In conclusion I would only add that the outcome of the first three years of the Society's current quinquennial period has been eminently satisfactory, and the Directors believe that, notwithstanding all the uncertainties that lie ahead, the results for the five years ending on December 31, 1958, will give much satisfaction to members.

The Directors' report and the accounts as audited were adopted unanimously.

THE WHITEHEAD IRON AND STEEL COMPANY

AN EXCEPTIONALLY GOOD YEAR

IMPORTANCE OF ADEQUATE RETENTION OF PROFITS

MAJOR DEVELOPMENT PLAN UNDER CONSIDERATION

MR G. H. LATHAM ON FUTURE PROSPECTS

The fiftieth annual general meeting of The Whitehead Iron and Steel Company Limited will be held on March 25th at the Westgate Hotel, Newport, Mon.

The following is the statement of Mr G. H. Latham, LLD, JP (Chairman and Managing Director), which has been circulated with the report and accounts: The Annual Report and Statement of Accounts are so straightforward that I think it unnecessary for me to comment on them in detail. You will observe that the Group trading profit amounts to £1,387,349, which compares with last year's figure of £1,330,056. This result was achieved in spite of the fact that all sections of the Steel Industry, including ourselves, have had to carry increases in the price of coal, power, labour, freights, etc. It has only been achieved by increased efficiency and by having available plant maintained to highest modern standards.

In the past your Board has, in distribution of profits, followed a prudent policy, which has enabled the Company to keep its plant at maximum efficiency and to finance developments. The Board has carefully considered the rate of final dividend to be recommended for the year under review, but has come to the conclusion that it is today more important than ever to adhere to the same policy of adequate retention of profits in the business, first because of the uncertain outlook for our Cold Rolling Department and, secondly, because of the need for conserving resources to contribute to the cost of developments, which the Board has under consideration and which I will mention again later in this Report.

CRIPPLING EFFECT OF TAXATION

I have referred on previous occasions to the crippling effect of taxation, but I think it is again desirable for me to emphasise how difficult it is for this Company, in common with others, to accumulate funds for replacement of plant and for future development when, as in our case, nearly half the amount which would otherwise be available for this purpose is taken from the Company in the form of taxation. In view of recent pronouncements by the Government that it is their intention to encourage initiative and efficiency, Industry is hopeful of some alleviation in this respect. Indeed, it is essential that something be done if the Industry of this country is to increase its exports or even hold its own in the markets of the world.

Last year I gave you an analysis of our trading results and also showed how each £1 of our income was spent. I believe these figures proved of interest to shareholders and, for this reason, am repeating the information this year.

During the early part of the year under review there was a strong demand for all our products, but with restrictions on hire-purchase, which were introduced in April, and the subsequent credit squeeze, a number of our customers experienced a rapid recession in trade.

The year has been one of great activity in our Hot Rolling Mills, and so far the demand for their products has been unaffected by recession experienced in some industries. At the moment our order book for hot rolled material is in a very healthy condition and it seems safe to predict that we shall be operating to full capacity so far ahead as it is reasonable to prophesy in these difficult times.

ANALYSIS OF GROUP TRADING RESULTS FOR THE YEAR ENDED SEPTEMBER 29, 1956

	To nearest £000	% of total income
Purchase of raw materials...	10,855	72.7
Wages and salaries	1,405	9.5

FUTURE PROSPECTS

The Iron and Steel Board, the British Iron and Steel Federation and representatives of the appropriate Government Departments have been occupied of late in an attempt to estimate what the future demand for steel will be, and their reports all indicate that the demand for the type of material produced in our Hot Rolling Departments is likely to be greater than the present production.

The material classed under the heading Cold Rolled Strip, which is produced in one of our most important departments, is extensively used in the manufacture of motor car components and in the production of washing machines, refrigerators and similar domestic appliances. It is in these branches of trade that we, in common with our colleagues in the Steel Industry, have encountered a serious falling off of orders. The reduced output through our Cold Rolling Department, which followed this change in our order book position, did not affect the trading profit of the year under review, but has adversely affected trading results since the end of September, 1956, and is likely to do so for some time to come.

In December 1956 the prices of iron and steel products were raised to meet the higher landed cost of imported materials, wages, freights, etc. In general, the prices of the finished products of our Cold Rolling Department have kept pace with the increased prices of raw materials, but revisions in the price structure for Cold Rolled Strip have, broadly speaking, been of such a nature as to benefit the small producer to a greater extent than the high production and more efficient plants.

WHOLLY OWNED SUBSIDIARY COMPANIES

WHITEHEAD HILL AND COMPANY LIMITED

Our wire works operated to approximately the same capacity as last year. Since the end of the year, however, although supplies of wire rods have been easier, the demand for our finished products has been adversely affected by recessions in some of the Finishing Industries.

The output of bricks at Cwmbran has again reached a satisfactory level, and the difficulty of maintaining an adequate labour force has very largely disappeared.

W. A. BAKER AND COMPANY, LIMITED

Activities have been maintained at the Westgate Works on a high scale and the extensions to meet the increased demand for paper-making machinery from our friends, Black-Clawson International, Limited, are beginning to bear fruit. These extensions have increased the rate of flow of finished machines passing through the engineering shops. The fact, however, that the production from this Company is almost exclusively planned to meet the needs of Black-Clawson International, Limited, constitutes a problem which our Board has very much in mind, and the future relationship between our Company and theirs has for some time past been under review on both sides.

GODINS 'THE ROLLERS OF STEEL SECTIONS' LIMITED

The demand for the special sections produced in this factory is not so good as it was when I addressed you at this time last year, but the recession in orders is the direct and natural consequence of the difficult conditions now being experienced by the automobile and automobile accessory industries.

DEVELOPMENT

The Joint Committee set up by the Government, the Iron and Steel Board and the British Iron and Steel Federation, to which I have referred, forecasts a deficiency in the early 1960's in light sections and bars, which are the main product of our Company. As one of the largest re-rollers in the industry we are examining the position to see what part your Company can and should play in helping to make good this shortage. The Board has under consideration a major development plan, which will involve substantial capital expenditure. Until the scheme has been studied in greater detail and until it has been approved in principle by the appropriate authorities, I am not in a position to give you any worthwhile information.

The year proved to be an exceptionally good one for your Company from most points of view. Difficulties, however, are continually encountered in running a business and the steel-making business is no exception to this rule. The year upon which we have now started will, in my opinion, be fraught with problems and, if they are to be surmounted, we shall rely more than ever on the efficiency, adaptability and loyalty of our staff and workpeople, on which we have never counted in vain. I am sure you would wish to join me in paying tribute to them for the part they played in the very satisfactory results which I am able to present to you in this Report.

I would like to mention that Mr G. I. Rushton, OBE, who has been our Production Director and General Works Manager for many years, retires on March 31, 1957, after a very distinguished career with the Company. I should like to express my personal thanks for the excellent work he has done for the Company. Mr Rushton enters into a well-earned retirement with the best wishes of myself, my colleagues and all the many friends he made throughout his long association with our Company.

In consequence of Mr Rushton's retirement, two senior executive appointments have been made. Mr E. G. Spooner, CIE, who was until the end of 1956 Commercial Manager, has now been promoted to General Manager of our Group of Companies to date from January 1, 1957. Since Mr Spooner has been on the Board of the Company we have all recognised his administrative ability. He has spent most of his business career in India where he became Deputy Iron and Steel Controller in 1941 and Controller three years later. In recognition of his services in this capacity the Government of India made him a Companion of the Indian Empire in 1946. I am sure you will join me in wishing Mr Spooner well in his new appointment.

We have also appointed Dr Brynmor Jones, FRIC, as Production Director of the Company. Dr Jones is a scientist, who has had considerable works experience and we are sure he will make a success of his new responsibilities.

I should also like to take this opportunity of welcoming Mr C. H. G. Millis, DSO, OBE, MC, who has joined our Board. Mr Millis is so well known in the City that it is only necessary for me to say his long experience in the financial world will be of supreme value to the Company.

RALLI BROTHERS LIMITED

BETTER RESULTS BUT PROSPECTS DISAPPOINTING

MR JACK VLASTO ON CURRENT YEAR

The annual general meeting of Ralli Brothers Limited will be held on March 27th in London.

The following is the statement by the President, Mr Jack Vlasto, which has been circulated with the report and accounts:

While the results now before you are by no means good, they are better by far than I had reason to hope when giving my somewhat gloomy indication a year ago. Just subsequently, our fortunes in merchanting began to improve and, with price movements favourable to our article positions, we enjoyed a steady flow of satisfactory earnings for several months. The leeway was gradually made up and, at the finish, merchanting earnings from a turnover of about £56 million were ahead of those of the previous year. There was not, however, any relaxation in the intensity of competition, about which I have grumbled so often.

The tax provision necessary for the Group was £485,276 against £168,330 the previous year. This increase is due not only to the higher consolidated trading profit, but also to the fact that in the previous year we brought back substantial taxed provisions no longer required. After setting aside £50,000 to increase amounts written off trade investments, the final outcome was much the same; however, it was achieved in a more satisfactory manner.

The increase in our investment in subsidiaries is referred to in the Directors' Report. I would also refer to the respective figures for debtors and loans from bankers in our balance sheet, both of which are about £1 million higher. In comparing these items with previous years, it has to be borne in mind that we close our accounts at August 31st because stocks, debtors and loans from bankers are then about at their lowest. A few months before or after that date, these items are at far higher levels. On account of our increased participation in the grain trade and a tendency towards greater spread in shipments of East African and Sudan cotton, the seasonal run-down does not now dip so far as formerly. This trend may well continue, with quite wide variations from year to year.

SUBSIDIARY COMPANIES

Our subsidiary companies, taken as a whole, have made satisfactory progress.

The Maritime Shipping & Trading Company Limited enjoyed a splendid year. Its current year should be even better. The policy throughout these periods of keeping fixture commitments very light has paid handsomely. The fleet was restored to six vessels with the delivery last December of the 11,130-ton s.s. *Castledore*.

In Tanganyika, Ralli Estates Limited made an increased profit and produced 5,762 tons of sisal fibre. If labour is sufficient, 6,000 tons should be produced this year, but sale prices, to date, average £7 per ton lower. *Dindira Tea Estates Limited*, in its first year of operation as a separate entity, made a loss of £11,848, which was no surprise for this still developing enterprise.

In Uganda, it looks as though Margach & Margach Limited have overcome their difficulties and will show a satisfactory profit.

In South Africa, Berg River Textiles Limited made a loss of £27,065. This was disappointing. The next closing, favoured by cheap cotton purchases, promises much better, but it is, as yet, too early to say whether the efforts now in progress to achieve increased technical efficiency will also bring improvement.

ASSOCIATED COMPANIES

As regards our associated companies, Rallis India Limited, with overheads now down to a more reasonable level, was able to earn a small profit. The deficiency carried forward is now Rs. 4.4 million.

The Crescent Jute Mills Company of East Pakistan made a profit of Rs. ½ million and cannot have found business at all easy. The mill is first class and the machinery is running well, but labour efficiency is low, labour loadings are higher than they should be and labour troubles are a constant headache. A further £50,000 has been provided against this investment and the book value of our shareholding is now £336,328, equivalent to par at current exchange.

Our Investment in The Orion Insurance Company Limited continues to give us full satisfaction.

THE CURRENT YEAR

It will be a joy to me when I am again able to give a cheerful indication for the coming year, but that prospect is once more deferred. Our current year, in merchanting, looks not only poor, but a good deal worse than its predecessor at this time. A bad start was worsened by the effects of the Middle East crisis. All outstanding sale contracts, then on our books, which would have been implemented by shipment through the Suez Canal, became subject to a variety of unforeseen additional costs on account of diversion round the Cape. After some recovery, the trend of results is again unfavourable on account of the recent decline in commodity prices. Although the profits of subsidiary companies look like being higher, the overall prospects for the year are, at present, disappointing.

In Egypt, a sequestrator was appointed by the Egyptian Government to take over the operation of our branch in Alexandria. Since November 4th we have had neither control over nor knowledge of what has been done there. Our British manager, after three days in jail, was released and expelled. Stocks of cotton were over £E.800,000 in value. Nearly half had been sold to "Iron Curtain" countries and we believe that shipment of such contracts has been effected. The balance was mostly unsold. The liabilities of our branch, mainly to banks in Egypt, were comparable to the value of cotton stocks. At August 31st cotton stocks and bank liabilities in Egypt were negligible and all we have considered appropriate at this stage is to write off other assets, amounting to about £20,000, which were in our books at our closing date.

In contrast to the foregoing, I am pleased to refer to the successful conclusion of negotiations with the Japanese Government, under which we have received the sum of Yen 244 million as compensation for our pre-war subsidiary, Showa Menka Kabushiki Kaisha of Osaka. These Yen are blocked. We are, at present, allowed to draw on them

to meet the running expenses of our two small offices in Japan and recoveries will accordingly be brought into our books as and when they accrue.

Our thanks are again due to all in our organisation for another year of hard work. We are indeed fortunate in the loyalty and devotion to the interests of the Company so consistently displayed by our staff.

THE OMNIUM INVESTMENT COMPANY

POSTWAR RECORD OF PROGRESS

The seventieth annual general meeting of The Omnium Investment Company, Limited, was held on February 26th in London.

Mr H. C. Drayton (the Chairman) presided, and in the course of his speech said: The revenue for the year was £330,879, or an increase of £24,367. After deducting our expenses, including income tax, there is a net amount available of £151,354, as against £137,493 last year. Your Directors are recommending a dividend of 12 per cent on the Deferred Stock, as against 10 per cent last year, and if you agree to that we shall carry forward £167,051, as against £118,069 brought in from last year.

Last year we made an issue to you of 200,000 Deferred £1 Shares at par. Those of you who took them up have received 12 per cent on your money; those who could not take them up were able to sell them at a substantial premium. We are now making another rights issue of one share in ten to the Deferred Stockholders, i.e., £120,000, again at par.

If you turn to the Balance Sheet you will see that our investments stand in the books at £3,469,836 and the valuation is £5,233,272.

I have gone back to 1946 to try and give you a picture of what has happened in this Company. In that year the Company's Deferred capital was £632,225, it earned 7.1 per cent on the Deferred and it paid 6 per cent, giving a price yield of 6 per cent. In 1956 the Company's Deferred capital had grown to £1,200,000 of stock, it earned 19.1 per cent, it paid 12 per cent, and the price yield had gone up to 6.6 per cent.

It is interesting to see the changes in the investment classification. In 1946 Bonds and Debentures accounted for 16.57 per cent of our portfolio, and today Bonds and Debentures are 12.09 per cent; Preference Stocks and Shares accounted for 13.11 per cent, and today 11.81 per cent; Ordinary and Deferred accounted for 70.32 per cent, and today 76.1 per cent.

The other interesting factor is where the money was invested. In 1946 the amount invested in the United Kingdom and Empire was 79.7 per cent, as against 91.9 per cent today; in the United States of America it was .78 per cent, as against 5.17 per cent today; in South America—a relic from those days when South American Railways were thought to be a good investment—in 1946 it was 11.97 per cent, and today they account for only 2.2 per cent; elsewhere we had 7.55 per cent invested in 1946, as against .72 per cent today.

Current year: I do not look for a big increase in revenue, or in any event not such a rate of increase as we have had in the past four or five years. However, I do not think you need worry about your dividend for next year—the Directors have every confidence that they will be able to pay you the same dividend.

The report and accounts were adopted.

BAJOE KIDOEL RUBBER AND PRODUCE

SIR ERIC MILLER'S SPEECH

The Forty-fifth Annual General Meeting of The Bajoe Kidoel Rubber and Produce Company, Limited, was held on February 28th in London.

Sir Eric Miller, the chairman, in the course of his speech, said: Owing to the disturbed conditions in Celebes the rubber crop of 879,000 lb was little more than one-half of the previous year's, and the coffee crop of 76,000 kg just over one-third. Our East Java crops of rubber and coffee were slightly higher than in the previous year, despite the sale of Bajoe Kidoel estate with effect from January 1, 1956, and extremely adverse weather conditions.

Profits remittances are credited in the Parent Company's profit and loss account in the year in which they are received here and we bring into the accounts now before you £55,715 received out of profits earned in previous years, making our profit before taxation £57,827 as against £3,016. If approved, the recommended dividend of 7.2 pence per 2s. share less income tax at 8s. 6d. in the £ will absorb £21,473 net, leaving £83,257 (£52,127) to be carried forward. For the year now current, we have so far received only £581 in respect of past years' profits out of some £12,800 (before UK taxation) which we are entitled to expect. Since last we met you have received a capital repayment of 10s. per £1 stock and for each 10s. stock remaining you now hold five two-shilling shares.

In East Java security conditions have been reasonably good, but coffee thieving continues to be a serious and intractable problem. In Celebes we have to deplore the fact that during intermittent raids two members of our Asian staff with their families have been kidnapped, a head mandoor murdered and estate factories and buildings destroyed by arson. Our buildings were prudently covered by insurance.

The crop figures for the first ten months of the current book year compared with the previous similar period are:

	Rubber lb	Coffee kg	Kapok kg
E. Java ..	1,443,469	265,073	—
Celebes ...	1,042,663	58,999	—
	2,486,132	324,072	—
	(1955/56) lb	(1955/56) kg	(1955/56) kg
E. Java ..	1,704,517*	393,848	—
Celebes ...	749,421	75,794	13,137
	2,453,938	469,642	13,137

* Includes 391,226 lb. from Bajoe Kidoel estate.

Costs have risen as inflationary conditions in Indonesia persist.

You will have read in the papers that President Sukarno has put forward his new political conception for the restoration of national peace in Indonesia and the leaders of the several parliamentary parties have been asked to give him their views by today. It will be interesting to see their reaction to a proposal which would bring the Communists into a national council.

The report and accounts were adopted and the proposed dividend of 7.2 pence per 2s. share, less tax, was approved.

MUTUAL FINANCE LIMITED

EFFECT OF HIRE PURCHASE RESTRICTIONS

LORD LIMERICK'S STATEMENT

The twenty-ninth ordinary general meeting of Mutual Finance Limited will be held on March 25th in London.

Gross profit for 12 months ended December 31, 1956, was £125,150 compared with £125,830 in the previous 15 months. Taxation required £69,397 compared with £67,398. The Directors recommend a final dividend of 12½ per cent less tax on the Ordinary Stock, making 17½ per cent less tax for the 12 months, compared with 20 per cent less tax for the previous 15 months. If the recommendation is approved, after transferring £30,000 to General Reserve, the amount carried forward will be £40,357 compared with £41,269.

THE CONTROL ORDER

In his review, circulated with the Accounts, the Chairman, The Earl of Limerick, GBE, KCB, DSO, TD, said:

Owing to the Control Order of February, 1956, which prescribed a minimum down-payment of 50 per cent of the cash price of goods hired, the income from business arising in 1956 was lower than in 1955, though higher than in any previous year. During 1956, the Company felt the benefit of the high level of business in late 1954 and 1955 by reason of the charges deferred on business transacted in those years and brought into account in 1956.

If, as is proposed, borrowing by Hire Purchase Companies is to be controlled by legislation, it should take the form of giving to the Registrar of Friendly Societies the same power he has in relation to Building Societies.

A liquidity ratio for Hire Purchase Companies would be unrealistic as the bulk of their business is undertaken on borrowed money. If part of their assets had to be held in cash or Treasury Bills, they would have to borrow money at a high rate to hold it at a lower rate of interest and so be statutorily required to suffer a loss. The assets of most Hire Purchase Companies consist almost entirely of amounts payable by customers by regular weekly or monthly instalments. At present it is common experience for approximately 10 per cent of the total amount payable by customers to be received each month, which demonstrates the liquidity of hire purchase business.

PROSPECTS

As to the future, with so many factors in restraint of business, it would be unwise to offer any short-term opinion. Taking a long view, your Directors believe that much potential business is held up by restrictions and so have started a policy of expansion, to be ready to handle the extra volume of business when restrictions are removed. New Branch Offices have been opened at Exeter and Southampton and it is intended to open other Branch Offices in 1957.

Our subsidiary company, Sales Intermediate Credit Limited, which finances credit granted by manufacturers and wholesalers to their customers, continues to make satisfactory progress

BANK OF LONDON AND SOUTH AMERICA LIMITED

IMPORTANCE OF LATIN AMERICAN MARKETS

SIR FRANCIS M. G. GLYN'S VIEWS

The annual general meeting of the Bank of London and South America Limited will be held on April 2, at 6-8 Tokenhouse Yard, London, E.C.

The following are extracts from the address by the Chairman, Sir Francis M. G. Glyn, KCMG, including a statement on the 95th Annual Report of the Directors and Statement of Accounts for the year ended December 31, 1956, which will be submitted at the meeting:

No doubt your interest has been aroused by the substantial increase in the profits figure, which, at £560,047, is £168,353 higher than last year. Many factors have contributed to this increase. Greater activity in Argentina and larger turnover figures both in Exchange and Documentary Credit business have contributed materially to the profit figure, and we have also benefited considerably from the rise in interest rates both in London and New York.

Your Board feels that they are in a position to reward the patience which members have exercised for many years in the past. Consequently, we have pleasure in recommending a final dividend of 7 per cent, making a total of 9 per cent for the year.

A GENERAL REVIEW

Last year I raised the question whether the bilateral agreements that had been a characteristic of the trading practices of a number of the Latin American republics in the years since the war had not outlived their usefulness, and I expressed the hope that Brazil's experiment in 1955 in establishing an "area of limited convertibility" would be followed by other countries and begin a progressive elimination of artificial barriers to trade. Further important steps towards multilateral trade have in fact been taken during the past year and, although the bilateral agreement is not yet extinct in Latin America, it has come to be regarded as something of an anachronism, and few voices are now raised in support of bilateralism as a trading principle.

The significance of this partial removal of currency discrimination is, in brief, that it gives the South American republics the opportunity to make better use of their exchange earnings and provides, for the United Kingdom and other European countries, a wider potential market for their exports. On the Latin American side there had been a growing dissatisfaction with the workings of bilateral agreements as debts arose on one side or the other that proved difficult to liquidate; it became apparent that imports had been made more expensive, and that an overall expansion of trade might be expected on a more natural multilateral basis. The progress made by Western European countries towards liberalising their trade and payments, through the gradual elimination of quantitative restrictions on imports and the extension of areas over which currencies are freely transferable, made it more difficult for Latin American republics to carry out policies of strict bilateralism and provided both the example and the opportunity for them to create areas of multilateral settlement. For certain currencies, principally sterling, this merely involved taking advantage of their wide transferability in the non-dollar world; other European countries whose currencies are not normally transferable outside the EPU area, and which have perhaps less to hope for immediately from access on a competitive basis to a wider market, have also joined in these multilateral arrangements and have in fact been encouraged to do so by the Latin American countries that are now discarding their bilateral agreements.

MOVEMENT TOWARDS MULTILATERALISM

The stronghold of bilateralism in Latin America was a group of countries—Argentina, Brazil, Uruguay and Paraguay—which, together with Chile, accounted for over 40 per cent of the region's foreign trade in 1955 and were signatories of four fifths of the bilateral agreements then in force in that area. The Brazilian multilateral payments system—usually referred to in this country as the Hague Club—has now been extended to include Italy, Austria and France. At a meeting held in Rio de Janeiro in October, 1956, there was general agreement among the participating countries that the system had decided advantages over bilateral trading.

As the result of developments during the past year, Argentina has now gone further than Brazil towards the removal of currency discrimination. Following the recommendations of the Prebisch Plan on the desirability of revising bilateral agreements and making arrangements to settle outstanding debts to supplying countries—which included most West European countries, with the notable exception of Spain—negotiations in Paris and elsewhere resulted in agreement being reached in principle on the settlement of trade debts and on the creation of a multilateral payments system.

NEW EXCHANGE SYSTEMS

The movement towards multilateralism in South America has not been confined to Brazil and Argentina. The remaining countries of the group I have mentioned—Chile, Uruguay and Paraguay—have not established any special multilateral payments system, but similar effects have been or are being achieved by a reduction in the number of their bilateral agreements or by the adoption of new exchange systems which involve increasing use of the transferable facilities provided by the major trading currencies. These countries are, of course, all in the transferable sterling area; Germany has, during the past year and a half, terminated its bilateral agreements with them as well as with Ecuador, while the transferable guilder area now covers a number of the South American republics. The Chilean exchange reform of April, 1956, abolished the licensing of imports within a permitted list, and Uruguay, though it has not yet been able to achieve so admirably simple an exchange system as Chile, has likewise abolished quota restrictions on some of the most important classes of imports. With the abolition of individual licensing bilateral trading becomes more difficult to sustain and it becomes more than ever to the interest of these countries that the currency earned by their exports should be widely available to meet the demand for imports.

This movement towards multilateralism in Latin America is one aspect of a more general change of attitude towards control on foreign trade and payments. There is a widespread awareness of the desirability of relaxing controls as far as the balance of payments permits.

CONCLUSION

On this annual occasion I have in recent years several times referred to the importance of Latin America, both now and especially in the future, as a market for British exports, and the growing attention that is being paid to this subject provides ample justification, if indeed any were needed, for returning to it again this year. Those who have made a close study of the importing capacity of the various countries are better placed than I am to judge which of their various requirements the United Kingdom is best able to supply.

I would go no further in offering advice to British exporters than to remind any who have had unfortunate experiences on their first venture into this area that the powers of economic recovery of these countries are remarkable.

The other point I would make in this connection is to renew the plea that cannot be made too often, especially to those who do not know this continent well, and that is not to judge any one of these republics by the changes in fortune of any other.

FINANCE FOR IMPORTS

The prevalence of the demand for capital as opposed to consumer goods immediately raises the important question of finance. The banks in this country, with the valuable and essential co-operation of the Export Credits Guarantee Department, have always been anxious to do what they could to provide finance for medium-term credit projects, and it is satisfactory to be able to record that in recent times they have shown even less reluctance than before to abandon traditional requirements of liquidity which, as I suggested two years ago, might prove an obstacle to their investing deposits to any appreciable extent in illiquid assets. Whilst there is good reason to believe that the banks will be prepared to go even further in this direction, the demand from the Latin American importer for long-term credit might quite easily outstrip the resources that the banks could prudently make available for this type of business.

If we are not to be ousted from a market which in the not-too-distant future may well prove of far greater importance than the more traditional ones of the sterling area and elsewhere—and recent events in the Middle East will have served to emphasise this point—it will be necessary to draw on a far larger source of lendable funds, and other institutions who can dispose of a substantial volume of national savings should be invited to play their part in assisting British exports to Latin America by providing the necessary finance. An assurance from such a quarter that funds would be made available, together perhaps with the creation of the necessary machinery to channel them in the directions where they could be used with the greatest advantage, would go a long way towards enabling the British exporter to meet the competition of, at any rate, those countries where the nationalisation of credit in one form or another has placed the responsibility for financial support firmly on the shoulders of the State.

JUTE INDUSTRIES LIMITED

RAW JUTE PRICE FLUCTUATIONS

PROBLEMS FACING THE INDUSTRY

EXPANDING EXPORTS

MR W. G. N. WALKER'S STATEMENT

The thirty-sixth annual general meeting of Jute Industries Limited was held on March 4th, at Meadow Place Buildings, Dundee, Mr W. G. N. Walker (chairman and joint managing director) presiding.

The Secretary (Mr W. A. Jeffray, CA) read the notice convening the meeting and the report of the auditors.

Addressing the meeting, the Chairman said: With your permission I will take the accounts and the report of the directors as read. (Agreed.)

RAW JUTE

In my short preliminary statement sent out with the Accounts I said that at that stage I could not forecast what effect the rapid rise in raw jute prices, in the months immediately following the end of the financial year under review, would have on the current year's results. It is still too early to make any forecast, but it must be realised that with raw material accounting for about 50 per cent of the final price of our jute products, wide fluctuations in price can materially affect trading results, quite apart from the unsettling effect they have on the market and the demand for jute goods. Since this time last year raw jute prices have followed the same pattern as they did in the previous year. Mill Firsts at this time last year were at their peak, namely approximately £108 per ton; the price dropped to £91 (the Pakistan minimum) in June and July, rising again to £100 at the end of September: by mid-December the price had risen to £135, since when they have fallen back and are now quoted at approximately £114 per ton. Other qualities have not had the same wide fluctuations, but showed a 30 per cent rise at their highest levels.

Flooding again affected this year's crop before maturity, and in consequence the quality of the white variety is poor and present arrivals of all grades contain an excessive moisture content which is serious from our point of view. These annual floods, in conjunction with Pakistan's policy of crop restriction, prevent a sufficient carry-over from crop to crop and cause extreme and undesirable fluctuations in prices.

An additional unfortunate factor occurred this year, namely, the disruption in the autumn of inland transport caused by abnormally heavy imports of rice, the movement of which caused serious delays in the export of raw jute. The shipments of raw jute ex-Pakistan were six weeks late at the end of October when the Suez crisis broke upon us, and it was not until the arrival of shipping by the longer voyage round the Cape in the middle of January that the supply position could be described as satisfactory.

Pakistan authorities have still much to do to improve inland transport facilities in order to allow the best use to be made of ocean-going tonnage calling at her ports. In the autumn a number of vessels left Chalna with little or no cargo on board.

There are numerous reports that the East Pakistan Provincial Government is pressing the Central Government to establish a Jute Marketing Corporation, the primary objects being, firstly, to ensure fair prices to the grower, and, secondly, to regulate all exports. The first objective would be welcomed by all sections of the trade if it did not upset the free movement of the crop and if it led to more stable world prices at a level considerably below that ruling today. With regard to the second objective, exports today are already regulated by the Pakistan State Bank Export Control. Any additional control might well disrupt or restrict the present commercial relations as between buyer and seller—relations which have been built up by negotiation and agreement since the end of the last century and which have proved equitable to both sides. It is understood that the aim is to channel all export business through a central control which would seem to deny buyers the privilege of the selection of their sellers, the mainstay of established world trade. It would also tend to regiment sellers, which surely would destroy the incentive for their continuing in business—a state of affairs which must be deprecated by all the countries of the world who are buyers of raw jute.

Moves such as these could have serious long-term effects on the trade. The Central Government would be well advised to study all the implications before arriving at any conclusions.

PROBLEMS FACING THE INDUSTRY

Your Board of Directors subscribes to the view that in the national interest two alternative sources of supply of jute goods should be available. By "alternative sources" I mean goods manufactured in the United Kingdom from raw jute ex-Pakistan, and goods imported in their manufactured state from India and/or Pakistan. Your Directors are making it their constant endeavour to play their part in building up a stable, virile, and flexible home industry capable of producing the specialty requirements of consuming industries, and the requisite quantity of standard goods indispensable to the economical production and development of these specialties. Your Board is of the opinion that, although the present production of the United Kingdom jute industry is still below the pre-war production level, it should continue to concentrate upon the development of specialties rather than go out of its way to cater for an undue proportion of the home demand for standard goods.

Large quantities of imported standard goods will be required, but these goods should still only be available to meet the demands which cannot be met by the home-producing industry, rather than home production meeting the demands not satisfied by imported goods. It was this latter alternative, when the home industry had no safeguards, that caused widespread depression, instability, and serious unemployment in the Dundee area in the inter-war years.

In this connection you will recall that in February, 1954, the following announcement was made in both Houses of Parliament:

"Public trading in imported jute goods must continue meanwhile until appropriate measures to safeguard the United Kingdom jute manufacturing industry under conditions conducive to efficiency can be worked out and introduced. The Government is giving full consideration to this problem, but cannot promise any early solution."

This announcement, as I said at the time, is of vital importance to your Company, since it is on the continuing implementation of the pledge given then that the earning capacity of your Company and the prosperity of the city of Dundee depend. HM Government has not yet found a solution, but since I last addressed you, two events have occurred which have a material bearing on the problem.

I refer, firstly, to HM Government's announced intention of entering into negotiations which may lead to the inclusion of the United Kingdom in a proposed European Free Trade area; and, secondly, to the Restrictive Trade Practices Act, 1956: both of these pose problems to which answers will have to be found. The first problem is: how can the European Free Trade Area proposals be reconciled with the continued implementation of HM Government's pledge to the jute industry without disturbing Commonwealth relations; the second is: what effect will the Restrictive Trade Practices Act, 1956, have on the price structure which has operated in the jute industry for some years past? It is difficult to see how the present form of protection carried out by the Government, through whom the Jute Control remains the sole purchaser of imported Asiatic goods, could operate smoothly without it.

There are no clear-cut answers to these problems, but your Board of Directors will, as in the past, give every assistance to HM Government in order to make it as easy as possible for the pledge given to the industry in 1954 to be implemented. The importance of this pledge and its effects on the prosperity of your Company and the citizens of Dundee cannot be over-emphasised.

CAPITAL EXPENDITURE

The Accounts show that capital expenditure of approximately £1 million was incurred during the past year, and also that on September 30, 1956, further capital commitments of approximately £750,000 had been entered into. Your Board of Directors has entered into these commitments, as well as those incurred over previous years, in order that your Company can be as competitive as possible and, incidentally, that it—along with the remainder of the jute industry—can continue to justify the safeguarding afforded to it by HM Government. Your Board fully appreciates that capital expenditure on this scale carries with it the inevitable implication of increased depreciation and obsolescence charges, and that profits can only be realised after these charges have been met.

In this age of modern development it is not only necessary to take into account depreciation due to wear and tear, but also to look ahead to the replacement of machinery and perhaps buildings, due to obsolescence. Obsolescence can arise not only from machinery development, but also from the switching of demands made upon us by consuming industries. Jute is often regarded merely as a packaging material, and it is perhaps not generally appreciated by stockholders that almost half of your Company's sales find their way to the floor covering industries of the world.

Our spinning mills are fully employed, and our new Douglasfield Mill—although not yet in full production—is providing a valuable addition to our yarn production. Our weaving factories on the whole are busy and the demand for our products continues. The future activity of both these sections—which comprise the major part of our business—depends just as much on the activity of the consuming industries which we serve as on the quality and competitiveness of our products.

EXPORTS

I told you last year that the volume of our exports in 1955 was more than twice what it was in 1951, when restrictions by export licensing were removed, and also that in 1955 we earned in dollars the equivalent of over £1 million sterling by our exports to the dollar countries. I am glad to be able to inform you that we exported in 1956 10 per cent more in volume than we did in 1955. During 1956, 25 per cent of our total cloth production went for export, three quarters of this going to dollar markets. Our total exports to the dollar countries in 1956 earned in dollars the equivalent of more than £1,250,000 sterling. Your Company will continue to make every effort to play its part in the export trade of the country, but competition in world markets is increasing, with the inevitable reduction in profit margins.

MANAGEMENT

Finally, I am sure you would wish me to convey to all executives, management, staff and employees at home and overseas your most sincere thanks for their work over the past year. This thanks expressed on your behalf is no formality on my part—any success that your Company may have had over the past few years has not been due to the enterprise and initiative of a few individuals: it has been the result of the fine spirit of co-operation and loyalty to the Company which exists at all levels.

The report and accounts were adopted.

OLDS DISCOUNT

Extract from the Circulated Statement of the Chairman, Mr. Wm. A. Olds.

It appears that a good deal of the old fashioned antipathy to Hire Purchase and other new methods of providing commercial credit is receding, and it is being realized that these can be the MOST POWERFUL means of regulating the distribution of large quantities of both capital and consumer goods.

Observation of the effect of the use by commercial organizations of methods of acquiring CAPITAL GOODS by regular time payments (instead of the often unsuitable and much abused ordinary credit) make it clear that much longer periods for settlement can be arranged for which finance is available, without danger of loss to suppliers; and during these periods profits can be confidently expected to accrue for the required payments as a result of using the latest plant and equipment.

With regard to CONSUMER GOODS it is readily conceded that more effective credit control was desirable to avoid the danger of overloading rash and careless people, but this is now well looked after by experienced traders, ably assisted by the established Finance Companies.

It is almost impossible to exaggerate the importance to the happiness of workers of the ownership of real assets which at the present high cost, are so very difficult to acquire by other means than this very safe and effective system!

DEPOSITS

Increasing use is being made of the service provided by our Banking Department for Depositors.

RECORD OF PROGRESS

in stages during last seven years:

	Profit before Taxation	Ordinary Dividends Paid (net)	Profit Retained after Taxation
	£	£	£
1950	185,317	32,062	31,855
1952	282,273	43,875	52,648
1954	474,180*	91,300	99,095
1956	748,069*	144,900	175,224

* Reduced by amount for Minority Interests.

The above Ordinary Dividend for 1956 represents 10.9 per cent. (gross) on the Ordinary Stock and Reserves.

BRITISH TYRE & RUBBER COMPANY LIMITED

SATISFACTORY TRADING RESULTS

SIR GRAHAM HAYMAN'S ADDRESS

The thirty-third annual general meeting of British Tyre & Rubber Company Limited will be held on March 27th in London.

In the course of his circulated statement the chairman, Sir Graham Hayman, said that despite the impact of the anti-inflationary measures, which had resulted in a substantial decline in the normal demand made upon the Group by many industries, he was glad to report that the total Group sales compared favourably with those of the previous year.

The Chairman continued: The Group profit for the year before taxation totalled £1,752,812 as against £2,146,717. Taxation calls for £899,038, leaving a net profit of £853,774. Your Directors have allocated an additional £250,000 to General Reserve and £100,000 to Plant Replacement and Development Reserve, and recommend a final dividend on the Ordinary Stock of 10 per cent, making a total of 15 per cent, being the same as last year.

LIQUID POSITION

The liquid position of the Group continues to be very sound, but our cash resources are not too large for the expansion programme upon which we are now actively engaged. The heavy cost of your Company's replacements and expansion in recent years clearly illustrates the serious burden which industry is obliged to carry in the face of which the existing structure of taxation is excessive and depreciation allowances inadequate. The Government must therefore adopt a new approach to this vital question if industry is to continue to provide the expansion which is essential to our national progress.

As I have pointed out on previous occasions, as Engineers in Rubber, our growth in the manufacture and sale of industrial rubber products has been such that, over the years, Tyres have ceased to be a major factor in our total business. After the fullest consideration, your Board decided that it would be to the greater advantage of the Company to apply its efforts and capital resources to the newer developments of thermo-plastic and rubber products in the industrial field. Arrangements were accordingly made to discontinue the manufacture of Car, Giant and Cycle Tyres in November last.

During the year, new manufacturing processes enabled us to make still further progress in the Belting field. BTR "Pluvicor" Fire Resistant Conveyor Belting continues to enjoy a high reputation in the coal fields and we have maintained our position as a leading supplier of belting to industry as a whole.

BTR "Plastidry" Fire Fighting Hose, introduced last year and now available with nylon reinforcement, is being supplied for Civil Defence and to the Public Fire Fighting Services. It is at present undergoing extended trials by the Admiralty, Air Ministry, Atomic Research Authority in the United Kingdom and Fire Services in Commonwealth countries.

Among our comprehensive list of special products, BTR Cutless Rubber Bearings for ocean going vessels of all kinds, Rubber and Plastic Linings for the Chemical and Allied Industries, Vibro-Insulators to meet complex anti-vibration problems, all made good sales progress.

I am glad to report that in the face of severe competition we have made encouraging progress in the export field.

I believe your Company is well equipped with resources and experience to play its part in these challenging times, and I feel there are good grounds for confidence in its future growth and prosperity.

MARTINS BANK LIMITED

PROPOSED CAPITAL REORGANISATION

Separate Class Meetings of the £20 shareholders and £1 shareholders and an Extraordinary General Meeting were held on Wednesday, March 6th, at Head Office, 4, Water Street, Liverpool, 2.

Sir A. Harold Bibby, DSO, DL, Chairman of the Bank, presided.

Resolutions agreeing to the Scheme of Arrangement for the reorganisation of the Bank's capital were duly carried. The Scheme requires to be sanctioned and the reduction of capital confirmed by the High Court before taking effect.

TEMPERANCE PERMANENT BUILDING SOCIETY

MR CYRIL W. BLACK'S REVIEW OF 1956

The hundred and third Annual Meeting of the Temperance Permanent Building Society was held on Friday, March 1st, at the Caxton Hall, London.

INTEREST RATES

Mr Cyril W. Black, JP, MP, FRICS, chairman of the Society, in the course of his speech, said: *The year 1956 opened on a* note of restrained optimism so far as Building Societies were concerned; but there had already been signs that the earlier measures taken by the Government to stem the tide of *inflation* would have to be strengthened, and *shortly before we last met the Bank Rate* had been increased from 4½ per cent to 5½ per cent. Our hopes that the resultant rise in the general level of interest rates might prove to be of short duration were not to be realised.

We have always before us the necessity of maintaining a just balance between the two correlated forms of thrift which it is our purpose to encourage—savings and home-ownership. But in these days of intense competition for funds we are inevitably affected by outside influences, particularly by the Government's measures of financial control; and so, with the continuance during the year of the high level of interest rates generally, we eventually increased as from October 1st the rates payable to Shareholders and Depositors to 3½ per cent and 3 per cent respectively, income tax paid by the Society in each case. It was a matter of great regret that we had to give notice to our borrowers of an increase in the rate of interest on their mortgages to, in general, 6 per cent. As on the previous occasion, we did what we could to ease matters by deferring the increase until January 1st of this year.

NEW SAVINGS

We do all we can to encourage the small saver and the introduction last year of our Savings Shares resulted in the opening of nearly 2,000 accounts of this class. With interest at 3½ per cent and a bonus of ½ per cent added at the end of four years, this is proving to be an attractive form of systematic saving of amounts of from 10s. to £10 a month. To an investor who is liable to income tax at the standard rate, the gross equivalent is nearly 7 per cent.

Total assets have passed the *£36 million* mark. Inevitably we had severely to restrict new mortgage business, but during the year we advanced £3,232,445. The total outstanding on mortgages on December 31st was *£30,031,529, of which only £492,000* was in respect of mortgages where the debt exceeded £5,000. We have continued our policy of maintaining liquid funds adequate to meet all likely requirements. The ratio has been increased to approximately 16 per cent of total assets, which is more than double the minimum of 7½ per cent laid down by the Building Societies Association as a condition of membership.

RESERVES

The very narrow margins of profit on which Building Societies are operating today is evidenced by the general fall in the ratios of reserves to Share and Deposit capital in *recent years.* Your Board strongly holds the view that we have a duty so to regulate the expansion of our business as to make sure that at all times our strength and our ability to meet our obligations are not impaired. It will be encouraging to you to know that at the end of 1950 our reserve ratio was 6.1 per *cent, and at the end of 1956 it was almost* unchanged at 6.09 per cent, although our *total assets had increased in the period from* £25 to £36 million.

It is difficult indeed in present uncertain and changing conditions to make a reliable forecast of the future course of events. There are indications, however, that *inflation is* beginning to burn itself out, and that interest rates are more likely to fall than to rise during 1957. I am confident that this is a time in which we should be seeking to consolidate and strengthen our great Society, so that we may continue to give to our investors a security for their savings which is literally second to none, while at the same time providing to house purchasers mortgage facilities on as large a scale as this policy permits.

The Report and Statement of Accounts were adopted.

BRADFORD EQUITABLE BUILDING SOCIETY

The annual general meeting of the Bradford Equitable Building Society was held at the Mechanics' Institute, Bradford, on March 4th.

Presenting the Annual Report and Statement of Accounts for the year ended December 31, 1956, the President, Brigadier Sir A. Maxwell Ramsden, CB, OBE, TD, DL, gave the following report:

It is my duty as President of the Society to submit to you for your consideration and acceptance the Annual Report of the Directors and the Statement of Accounts and Balance Sheet for the year ended December 31, 1956.

The policy of your Board for that year may be properly summed up in the one word "consolidation."

As in 1955, so in 1956, the most important matter to which your Board has given consideration was the effect of the changes in national monetary policy. In February, 1956, the Bank Rate was increased from 4½ per cent to 5½ per cent. From September, 1956, the Society increased its rate of interest to Paid-Up shareholders from 3 per cent to 3½ per cent, but it was not until October, 1956, that existing borrowers were called upon to pay an increased rate of interest.

These increases to Paid-Up shareholders were necessary in order to retain existing funds and to attract additional monies.

The rates which Building Societies pay to their investors and savers can only be determined from time to time, not by the Societies themselves, but by their competitors in the *investment and savings market.* Of these there are many, including Government agencies, local authorities, industrial bankers and the whole range of industry and commerce. It is in face of all this competition that Building Societies must adjust their rates of interest.

Notices were posted a few days ago to existing borrowers increasing their rates of interest to 6 per cent for houses for own occupation and to 6½ per cent for other securities. The Directors very much regret having had to do this, but they do claim to have given every possible consideration to their existing borrowers.

In the opinion of your Board, the reduction in the Bank Rate of ½ per cent announced last month can have no immediate effect on Building Society interest rates.

SHARES AND DEPOSITS

Receipts from shareholders and depositors during the year were maintained at a high figure—£5,280,000. Withdrawals were also at a high level. The reasons for the reduced income and the high level of withdrawals (*which has been the general experience of* Building Societies) are—(*a*) the results of the credit squeeze and (*b*) the intense competition by other savings and investment media.

Your Directors support the efforts *made* to defeat inflation, even when those efforts mean reduced investment income for the Society, for it is only by defeating inflation that savings and investments can be expected *to continue.*

MORTGAGES

Mortgage activity has been *somewhat* restrained during the year, advances having been made to 2,600 borrowers for a total of *£4,334,000, a decrease of £519,000 on the* previous year.

Losses on realisation were again negligible, *and I am happy to state that the mortgage* accounts are in a very healthy condition.

INVESTMENTS AND LIQUIDITY

The total liquid funds of the Society in Trustee Securities and Cash at Banks and in *Hand amount to £4,619,000, representing* approximately 14.7 per cent of the Society's Assets, a *slight* increase on the figure of twelve months ago.

The Report was adopted.

Subscriptions to most countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is either because the alternative is not available or not recommended.

A knowledge of national income statistics is also required. Applications for post (b) will be considered from those having a sound knowledge of sampling theory and national *income statistics.* Age for (a) 28-45, and for (b) 22-45. Candidates must be fully literate in either Arabic or English. Appointments will be on Short Term Contracts without bonus for a period of two years. Salary ranges for post (a) £S.1,866-£S.2,106 and for (b) £S.1,146-£S.1,786 (one Sudanese pound equals one pound and sixpence sterling). A Cost of Living Allowance is payable and an Initial Outfit Allowance of £S.50.

Write, preferably on a postcard, for application forms and further information, to the Sudan Embassy, Personnel Section, Cleveland Row, St. James's, London, S.W.1, quoting "Senior Statistician 4/912" or "Statistician 4/913" *Closing date March 29, 1957.*

MANAGEMENT SELECTION LIMITED have been retained to advise on the selection of the

GENERAL SALES MANAGER

for an expanding international company near London manufacturing light electro mechanical *equipment and fractional h.p. motors.* A substantial turnover has been trebled in four years and gives rise to this new appointment which will carry responsibility for all sales on the home market. Company policy is to delegate authority to men who have the drive and initiative to take full *advantage of their opportunities.*

Previous experience of managing a consumer goods sales organisation in a highly competitive market is essential. *Candidates should preferably* be University graduates and should have some practical knowledge of engineering. Starting *salary of £4,000 to £6,000, according to experi*ence. Preferred age 35 to 45.

Please send brief details, in strict confidence, to R. L. Rolf, *Management Selection Ltd.*, 17 Stratton St., London, W.1, quoting reference S339. No information will be passed to our clients until candidates have been told their identity and have given permission after full discussion.

LARGE Commercial Company has vacancy at a Regional Office for Public Relations Officer. Successful applicant will be responsible to the Regional Manager for all aspects of the Company's public relations policy throughout the area of England concerned. Applicants must have a good press background, and organising skill and personality to promote the Company's interests. Salary will be in line with qualifications, experience and ability, with full scope for promotion on all sides of the Company's business. Excellent pension scheme, with dependants cover for married employees. The Company will also assist successful married applicants, if it is necessary for them to move to take up their appointment. Please apply in writing, giving full details of age, qualifications and experience, to Box No. 647. Replies can only be sent to those selected for interview.

UNIVERSITY OF CAMBRIDGE

DEPARTMENT OF ESTATE MANAGEMENT

The Appointments Committee of the Department of Estate Management intend to appoint as from October 1, 1957, a University Assistant Lecturer in the Department of Estate Management. Applicants should *hold a degree* in Economics or Estate Management. The person appointed will be required to lecture on imperial and local taxation and fiscal policy. The appointment will be subject to the Statutes and Ordinances of the University.

Pensionable stipend £700 to £800 a year, with a possible *supplement not exceeding £120 a year depending upon* the fulfilment of certain conditions. Non-pensionable allowance of £50 a year for each child.—Further information on duties and stipend from the Secretary of the Appointments Committee, Department of Estate Management, 74 Trumpington Street, Cambridge. Closing date *for applications March 20, 1957.*

UNIVERSITY OF LONDON

The Senate invite applications for the Readership in Social Institutions tenable at the London School of *Economics and Political Science (salary £1,300—£1,550—* £1,800 a year). Applications (10 copies) must be received not later than April 12, 1957, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars may be obtained.

UNIVERSITY COLLEGE OF NORTH STAFFORDSHIRE

Applications are invited for the post of Assistant Lecturer or Lecturer in Statistics. Salary scale £600 x £25 —£650 (Assistant Lecturer), or £650 x £50—£1,350 (Lecturer). F.S.S.U. and children's allowances.—Applications should reach the Registrar, The College, Keele, Staffs, from whom further particulars and application forms may be obtained, not later than March 15, 1957.

MARKETING RESEARCH

EXPANDING GROUP MARKETING AND RESEARCH

A Company within the Rank Organisation has *further vacancies for Marketing Research Execu*tives/Assistants. The positions offer considerable scope to those able to handle research with little supervision and also able to display imagination in dealing with problems in which they are unlikely to have had direct experience. A good *salary related to experience will be offered.*

The Rank Organisation has world-wide and growing interests in many fields. There is a pension scheme in operation.—Apply, in writing, *giving* a concise account of experience so far, to the Personnel Adviser, A107, The Rank Organisation, 11 Belgrave Road, S.W.1.

EXPORT. The extension of activities in the Export Department of an important manufacturing organisation necessitates the appointment of a Senior Executive to take *responsibility for one group of markets.* The position will carry a high starting salary and offers an attractive career for an energetic man who can draw upon sound experience of competitive selling in the export field. Ideally candidates should be aged *30 to 40* and have a fluent knowledge of French and German. Preference may be given to those with a University degree. Applications should contain full career details and will be treated in strict confidence.—Box 644.

MANAGEMENT SELECTION LIMITED have been retained to advise on the selection of a

SALES MANAGER

to be responsible for the proprietary division of an expanding and progressive pharmaceutical *company situated in the South of England.* The Company is directed by a young and energetic team, none of whom is over 40.

Candidates should have sales management experience at senior level and a successful record of marketing consumer products in a highly *competitive field—preferably through chemist* outlets.

A degree or similar qualification in chemistry or pharmacy would be an advantage. Age not over 40. Salary not less than £2,400 with a generous non-contributory pension scheme.

Please send brief details in strict confidence to P. H. Fryer, Management Selection Limited, 17 Stratton Street, London, W.1, quoting reference (S352). No information will be disclosed to our clients until candidates have been told their identity and have given permission.

LONDON COUNTY COUNCIL

Balham and Tooting College of Commerce, September 1, 1957. (1) Grade II Head of Social and General *Studies Department.* Should possess degree in some aspect of Social Studies, preferably have had tutorial experience in secondary and further education, undertaken some *administrative work, and be able to offer Government,* Commerce, Geography, Economic History and Economics as teaching subjects. Ability to develop a cultural and recreational programme for full-time, *part-time day and evening students,* and to contribute to the general welfare of the College is essential. (2) Lecturer in Management *Studies* for full-time, part-time day and short courses. Should possess degree or appropriate professional qualifications, together with suitable industrial or commercial experience. Preferably *undertaken some* lecturing or tutorial work. (3) Lecturer in Economics and Related Subjects for courses with full-time, part-time day and *evening students* preparing for *Professional,* National Certificate, Management and Advanced Level Examinations. Should possess degree in Economics, have had extensive tutorial experience, willing and able to take part in, and contribute to, the auxiliary activities and general welfare of the College. (4) Assistant Grade B for Stenography, Typewriting, Office Routines and related subjects for courses involving full-time, part-time day and evening students. Should have had teaching and commercial experience, and capable of *making a contribution* to the organisation and control of the courses concerned. Burnham F.E. Salary scales, (1) Women's rate subject to equal pay adjustments, £1,400 x £50—£1,600, (2 *and* 3) £1,200 x £30—£1,350, (4) £650 x £25—£1,025 with additions for qualifications and training; increments within the salary scale for experience. *All posts plus London allowance of either £36* or £48 p.a. Application forms from Secretary at College, Tooting Broadway, S.W.17, returnable by March 23, 1957. (314.)

AN important Belgian distributing company of machine tools, small tools and abrasive products, invites applications for the post of Commercial Manager.

The applicant will be required to have some experience in the field of mechanical engineering. Must speak French fluently and have some knowledge of German. Should *have held a responsible executive post, preferably in a* technical selling capacity.

This is a senior appointment and will carry a salary *commensurate with experience and qualifications.*

Applications to the Managing Director: Etablissements *Henri Benedictus, 34-36 rue Melsens, Brussels, Belgium.*

B.Sc. (2nd Cl., 1st Div., Hons. Chemistry), graduating with B.Sc. (Econ.) (Industry and Trade) in June, single, aged 28, no industrial experience, seeks employment with chemical firm in Canada.—Box 650.

TO Managing Directors. Do you wish to *lighten your load? Young executive of* proven ability, Cambridge Graduate, offers his services as Personal Assistant and is prepared to invest up to £12,000 in a business of good reputation. Advertiser has carried heavy responsibilities and enjoys hard work.—Box 648.

Australia doubles car output in eight years

The Australian car industry is steadily expanding to meet the needs of the home market from its own resources. The extent of the demand can be gauged from Australia's car ownership rate—now the third highest in the world. Since 1948, output has more than doubled, and Australia is becoming more and more independent of car imports.
In the big drive for increased production the Australian car industry—like others throughout the world—is making more and more use of Atlas Copco air compressors, hand tools and a wide range of other compressed air equipment. One Australian car manufacturer alone has installed or ordered no less than sixteen Atlas Copco heavy duty air compressors to meet the requirements of still wider expansion in this booming industry.

A truck-ride for a salmon

Compressed air is versatile. Atlas Copco provide the means for all its many applications. In some northern European countries, dams for power stations block the way of salmon swimming to the spawning grounds. Now they are caught below the dams, placed in open tanks of water on lorries and driven upstream. To keep them alive the lorries are fitted with small Atlas Copco air compressors to supply the salmon with all the oxygen they require.
The Atlas Copco Group of Companies is responsible for the manufacture of compressed air equipment and its distribution and servicing in 90 countries throughout the world. Group Headquarters: Atlas Copco AB, Stockholm 1, Sweden.

Atlas Copco puts compressed air to work for the world

What does the big circulation rise of "quality" papers mean to advertisers?

NEVER have people in the upper socio-economic classes been so easy to reach as now. This large, continuing increase in circulation of the "class" publications—Dailies, Sundays and Weekly Magazines—has important implication for 3 main groups of advertisers.

1. Those selling consumer goods and services directly to the AB market.
2. Those who need to influence business executives who buy capital goods.
3. Those who wish to influence opinion leaders.

Of the papers calculated to reach this audience, The Observer has gained the most significant increase in circulation. The Observer's circulation has doubled since the war and now stands at 633,064.

Last year alone The Observer's circulation went up by 10.4%—the largest increase of *any* Sunday paper. And this was in a year when Sunday papers as a whole lost 1.2% of circulation.

The Hulton and I.P.A. readership surveys* give it a readership of 1,880,000 and 2,056,000 respectively. This is the highest number of readers per copy of any national Daily or Sunday newspaper. Both surveys give over half The Observer's readership as in the AB classes.

Not only does The Observer provide a concentrated, unwasteful, receptive audience: it provides a massive audience. It is also extremely economic.

If you would like to know in detail and at leisure how The Observer can help you, or your clients, please write or phone to Norman Berridge, The Observer, 22 Tudor Street, E.C.4, Fleet Street 9991.

they saw this man—

found new £140,000 export market

In 1951 a firm of specialized commodity merchants who were doing a small cash-before-shipment trade decided it was high time they exported more. The question was how? They thought of the Export Credits Guarantee Department—and they thought of red tape and form filling. Then the man from E.C.G.D. called, and they soon discovered there was no red tape about him. He told them in plain straightforward language what E.C.G.D. could do for them. He showed them how an E.C.G.D. insurance policy would give them the security they needed to go after business in new markets on credit terms. They took out a policy,—and they've never looked back since. In 1952 they exported £6,500 worth of goods to one European country, the next year this business went up to over £43,000, the year after that it increased to £90,000, and in 1955 the turnover was above £140,000! How much did it cost them in premiums to build this credit business? *Less than 55/- a day over the four years.* If you're an exporter, the E.C.G.D. man will be calling on you. Don't you think you'd better see him—and listen to what he's got to say?

With acknowledgment to John Bartholomew & Son Limited

● *This is a true story, but because business between E.C.G.D. and exporters is strictly confidential any details which could identify the exporter have been left out.*

The birth of New Techniques

Continually the frontiers of science advance, and our knowledge becomes more exact. At the same time the result is that new techniques are developed, used and discarded in favour of those yet newer. In steel structures it is now possible to take advantage of the economies possible when rigid designs are made. Welding has made many of these designs possible. Cleveland's important contribution has been in helping to make fabrication for such structures practicable and economic. Manipulators and handling equipment have been specially designed to reap full benefit of the automatic welding in which the Company specialises.

AN INVITATION Our services are always available in design, in detailing, and in the costing and construction of all types of structures.

Britons never shall be slaves?

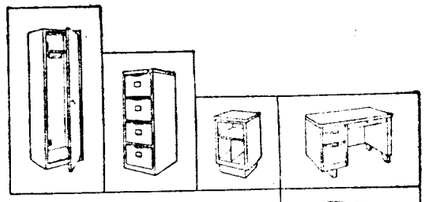
It is odd that the most enslaved nation of all should so sing of its freedom. For the average Briton is a slave to everything — a slave to convention, a slave to tradition, a slave to habit. A slave, in particular, to whichever is his daily newspaper—much as he may theoretically prefer the Manchester Guardian.

Those who *have* thrown off their thraldom, who *have* brought themselves to make a change, will welcome the breeze of freedom blowing through the columns of the Manchester Guardian. Freedom to report and comment fearlessly; freedom to laugh at the ludicrous; freedom to lash out at the harmful.

The Manchester Guardian touches its cap to no particular party, is sworn to no set creed or programme. It is written by intelligent men, for intelligent readers. We invite you to join those ranks.

SAVE MONEY by building in REINFORCED CONCRETE

REINFORCED CONCRETE is being used increasingly in Great Britain for offices, factories, warehouses, flats, schools and similar building and industrial projects, as it has proved itself *the cheapest form of construction*. For the building frame, external cladding, staircases, floors and roof, reinforced concrete offers many advantages—in addition to that of low cost.



Modern concrete technology, aided by research—The Blue Circle Group of Companies alone spend over £300,000 each year on research and development — and the availability of the range of Blue Circle Products for structural and decorative concrete, have placed concrete in the forefront of modern constructional materials.

PERIQUE—AND THE PIPE OF PEACE

Perique—the subtle secret of Three Nuns

When next you fill your pipe with Three Nuns Tobacco, consider the dark centre which those curious curly discs possess. This is the black heart of Perique. Long before the Boston Tea Party, Indian Braves were cultivating Perique in a small ten-mile area not more than 50 miles north of New Orleans. The first white man to join them was Pierre Chenet, known as 'Perique', and it was he who gave this unique tobacco its name. He found, like others after him, that only in this tiny plot of land can the exacting conditions necessary for the successful growth of Perique be fulfilled. And so, with an ancestry that reaches back to the untutored Brave and his pipe of peace, Perique, expertly blended, bestows upon today's Three Nuns smoker perfect tranquillity.

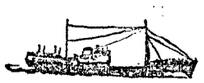
Bill Turner of the Hull Trawler "Lancella" wins Silver Cod Trophy for landing 2,871 tons of first-class fish in 1956

Britain's Fishing Industry is as old as her Monarchy, as old as Agriculture, older than her once great staple industry, Wool, older far than Coal or Iron—yet today as up to date as any, with Diesel-Electric Trawlers, Electronic Fish Finders and every type of modern equipment.

Throughout the centuries our Royal House has fostered our Fishing Industry as the Nursery from which our Merchant Navy and the Royal Navy grew to the world leadership on which the British Empire and Commonwealth was founded.



Many of our Monarchs have been professional Sailors. All have delighted to identify themselves with and to honour our Seamen. What more fitting than that this year the Supreme Trophy for the Champion Trawler, landing the heaviest catch for the year, should be presented at Fishmongers' Hall to the British Distant Water Fleet's Top Skipper by His Royal Highness The Duke of Edinburgh—himself a trained and tried Sailor.

When the Duke hands over the Silver Model of a Leaping Cod presented by the British Trawlers' Federation to the 1956 winner, Skipper William Turner of the "Lancella" of Hull, he will be giving National recognition to an Industry which, by striving to its uttermost to provide more, better and cheaper fish in the face of the hazards and hardship of the Cruel Sea, is proving itself worthy of a great National Tradition.

We, the British Trawlermen, are deeply honoured by this Royal Gesture on behalf of the Nation. We shall do all we can to remain worthy of it.

Middle Class Reliefs Within Reason

THERE is strong Conservative pressure that Mr Thorneycroft should give away any money that he has got on April 9th—and probably also some that he has not got—in aid of the "middle class." The economist's concern with this campaign is twofold. First, some Labour supporters need to be told that—even though it is not true that every potential surtax payer is on the verge of emigrating to Canada—the discriminatory pinch upon the professional and managerial classes since 1938 really has set up strains that *it is worth removing* in the interests of the community as a whole. Secondly, the leaders of the campaign need to be told that those who want to suggest practical reforms for this year will have a much better chance of being listened to if they try to fit them into a very modest framework—a framework that would cost, say, £30 million or less. The two desiderata for directing any such reliefs should surely be that some of the money needs to go to the places where *disincentives* to work are most obvious, and some should go where the shoe pinches most hardly. The recipe should be a little for the most discouraged, and a little for the most depressed. Here, as Mr Thorneycroft enters his three weeks of principal purdah to decide upon the shape of his coming budget, are some positive suggestions.

For the part of the money that he should use in order to remove disincentives to work, the Chancellor can probably do no better than base his changes in this field on two recommendations made by the Royal Commission.

First, in order to remove the "kink" in the tax curve that arises from the fact that a man now loses the benefit of earned income relief almost *immediately after he starts paying surtax,* the commission suggested that the present earned income relief of two-ninths should continue up to an income of £2,500 a year, and that income between £2,500 and £3,000 should attract earned income relief at one-ninth. This proposal would cost the revenue around £10 million a year.

Secondly, in order to give greater incentives to wives who go out to work, or could go out to work, but whose incomes when combined with their husband's exceed the lower limit for surtax and the upper limit for earned income allowance, the commission suggested that a working wife and her husband should receive earned income allowances until their joint incomes exceeded £4,000 or £5,000; if married couples who chose to take advantage of this dispensation were not allowed to take advantage of the present net marriage allowance as well, the cost would be quite derisory—under £1 million a year. There is everything to be said for encouraging professional women to go out to work in this way, and it is extraordinary that Chancellors have not implemented this recommendation before.

The obvious alternatives to these two reliefs—such as raising the starting limit for surtax to a flat £3,000 a year (annual cost probably about £25 million), and allowing earned income and dependants' allowance right up the surtax side (annual cost about £35 million)—

both seem less attainable than these reforms, because they would be more expensive.

So much, if one is to be limited to £10 million or so, for the money that might be afforded for increasing middle-class incentives to work. In suggesting that some money might be afforded for reliefs that are not quite so directly tied to incentives, the proponent of tax reform for the middle classes must be careful to justify his case. It is an economic, as well as a political, mistake to be continually pleading for class, instead of for community, interests. Yet in so far as there is any truth—and there is a little—in the story that professional people with scarce skills are being tempted to emigrate from this country, it is because they feel unduly pinched at certain periods of their career, rather than because of the effect of high taxes upon incentives to work; and this general pinch is also inhibiting some of the middle classes from doing things that are socially desirable—especially, of course, from financing the best possible education for their children. It is these points that should be borne in mind in considering whether any middle-class reliefs, other than on the earned income allowance, should be accorded.

The royal commission had two proposals in this field: (1) That child allowances for income tax purposes should vary with the taxpayers' incomes—that, instead of being £100 per child as now, they should be "£100 plus 6 per cent of the excess of income over £1,000, but subject to a maximum of £160" (which would be reached, of course, at £2,000 a year). As far as can be seen, the cost of this relief, at present tax rates, would be between £10 million and £15 million a year. (2) That "the starting point for surtax (now uniformly £2,000) should . . . become £1,500 for a single man and £2,000 for a married man without children, increased by £160 for each child in respect of whom the taxpayer is entitled to receive a child allowance." This proposal would be approximately self-balancing in revenue. Although these reliefs would be better than no reliefs, they are not the best for this year. There are certain criticisms that can be levelled against them. One is that it would be very difficult to lower the surtax limit for single men except in a year when the general rate of income tax or surtax was going down, and 1957 is not likely to be such a year. Another is that the main benefit of these proposals would be directed at surtax payers with children of any age; yet those who have been hardest hit by the social revolution are probably not surtax payers with small children, but those middle-class people (parsons, dons, and so on), who are not in the surtax class, but who would be if their incomes had risen in line with the cost of living since 1938—and particularly at that period of their careers when their children cost most to educate. A third objection is that the recommendation does nothing to increase the incentive—which needs to be increased for all classes, not just for the bourgeoisie—to keep children on at school after the age of fifteen.

The alternative relief which we would suggest is one which, so far as we are aware, has not been published before. But it seems a fairly obvious one, and it is worth recommending to the Chancellor's attention. At the moment the income tax allowance for children is a flat £100 for each child, either up to the age of fifteen, or up to the age of 21 if the child remains in full-time education. Yet the child over fifteen costs much more to keep in education—for the lower income groups because the child is then kept back from work, and for the middle classes because fees are then higher (especially if the parent is means-tested out of enjoyment of university awards). Why not recognise this disparity? If the income tax allowance for all children under fifteen were kept at £100, but that for children in full-time education over the age of fifteen were doubled, the cost—so far as we can work out—would be somewhere between £10 and £20 million a year. It is these income tax allowances—£100 for each child under fifteen, and £200 for each above fifteen—which could then be used to raise the starting point for surtax for the family man; this would be less expensive than the royal commission's suggestion that the starting point should be raised by a flat £160 for each child.

★

There, then, is a possible programme for reform that should cost less than £35 million, and probably less than £30 million, in a full year—and considerably less in the year immediately ahead. The reliefs suggested would bring less benefit to the surtax payer with small children than the royal commission's proposals; but they would bring more benefit to people with older children all the way up and down the income scale. To take one example. The family man with an income of £2,750, two children at a public school and one at university would pay some £185 less tax under these proposals; if his wife went out to work and earned, say, £900 a year, she would keep some £50 more of it than she would under the present dispensation. Even then the family would be paying some £940 in tax, or some £800 more than a single person with one-fifth their income but also with only one-fifth as many people to support. But can anybody think of any way whereby incentives and reliefs could be directed more economically and more cheaply to those people in the middle class who seem to need them most?

MIDDLE EAST TENSION

The continuing crisis in the Middle East is discussed in several places in this issue of The Economist:

Notes of the Week ..... page **893**

A summary of Egypt's position in the Gaza Strip ..... page **894**

A message on the Eisenhower doctrine from our Washington Correspondent ... page **909**

Despatches from Saudi Arabia and Israel pages **917** & **919**

What Hope for Uno?

PINNED in the glare of the arc lamps for five dramatic months, the United Nations has undergone the most searching scrutiny of its eleven-year life. In the merciless white light, its values and limitations have been seen and defined more accurately than ever before. So, too, have the circumstances in which it may be so misused as actually to endanger the peace it is meant to help keep.

To those who did not choose to shut their eyes, some of Uno's essential characteristics have of course been quite clear for a very long time. No sane man has ever regarded it as a world government or a court of justice. It may be more plausibly depicted as a kind of Vatican City built into a latter-day Rome, where temporal powers seek benisons for their rival policies; but oddly enough, its main function in today's world is set forth in its Charter, though it scarcely catches the eye. It is a diplomatic mechanism, "a centre for harmonising the actions of nations in the attainment of common ends."

When agreement on common ends, or inclination to do something about them, falls short, the mechanism will not work. The glass walls of Uno's headquarters mirror the confused conflicts of the world outside, and it cannot be all things to all men. It is human and natural for any nation to identify its own policy of the day with the ultimate good of mankind, and to expect mankind to recognise the coincidence; but rarely is the expectation fulfilled. Hence India's and Pakistan's indignation that the United Nations will not satisfy either of them over Kashmir; British and French complaints of its failure to settle Suez the way they wanted; the Arab states' insistence that it should browbeat Israel but keep out of their hair (and vice versa). At this moment, when the UN Emergency Force is poised in the Gaza strip, its effectiveness as an insurance against a fresh conflict depends not on Mr Hammarskjöld, not on the force's military capacity, but on the extent to which member nations are prepared to insist that the force should see its job through to the end.

To make these points is neither to condemn Uno nor to defend it. Discussion of Uno is bedevilled by the common feeling that one must necessarily be "for" or "against" it—"for" implying uncritical support, "against" unthinking denunciation. People who would never dream of discussing, say, the London County Council, in these terms fall into them naturally when discussing the United Nations. No doubt the trouble is partly due to the way Uno was originally oversold in order to get it started at all. To the American public, in particular, it was sold as a "package"; and now the gift wrappings have been stripped away, revealing a do-it-yourself kit with some defective parts. But Americans have no monopoly in this respect. The tendency to expect great things of Uno, without any corresponding sense of obligation towards it, is far stronger in other countries. Some of the "new" nations of Asia and Africa come to it with a faith that would be touching if their attitude were less selfish; and Arab spokesmen see no incongruity in their demands that Uno should be lion-strong for their protection but kitten-weak against them.

All such illusions end sooner or later in bitter disillusion and revulsion. They serve the cause of peace badly. Constructive thinking has to begin with an attempt to see the United Nations for what it presently is, not what each of us would like it to be—nor what we dismiss it as in moments of disappointment. In Uno, as elsewhere, politics is the art of the possible. Given its present condition, what use of its mechanism is possible?

To begin with, the mere fact of confrontation in an Assembly which now, with the admission of Ghana, counts 81 members, can be a salutary reminder to all parties that in the jostling world of today they cannot afford to forget the interests of others. The Assembly has power to embarrass if not to command. Thus, at the time of the attack on Egypt, many people in Britain sought to show that only Mr Nehru, Mr Dulles, and President Nasser's immediate friends were really angered or alarmed. The UN nose-count, rough and ready though it is, effectively destroyed these claims when Canadians and Norwegians, Turks and Pakistanis were seen lined up to demand a withdrawal.

★

The UN system forces governments to "stand up and be counted" (even an abstention amounts to a public indication of attitude) when they would often prefer to turn their backs. It is sometimes argued that the world would be a calmer place if it did not. Why should Chile vote on Suez, or Finland on the fate of western New Guinea? The answer is surely that one can aim either at isolationism, or at a comity of nations, but one cannot pick and choose. Americans can hardly argue that India ought to speak up on Hungary but be silent on the question of the Chinese seat. Arabs cannot very well call in the whole world to check Israel and then deny it any right to check Egypt. Demands for nose-counts can certainly be overdone. But, assuming that it is important to discourage political escapism in a troubled world, is not this sometimes painful process one means to that end?

Nevertheless, Uno's costly and wearisome existence could scarcely be justified if it were doomed to remain nothing much more than a combination of sounding-board and litmus paper. Its chances of survival as an effective instrument depend on the possibility of its development into something with more body to it. What hope is there of that?

On paper, none. Frankness is essential here. Last month the Secretary-General rightly described the United Nations as "an organisation based on voluntary co-operation and respect for the general opinion to which the organisation gives expression." Even when such an opinion exists in a form definable enough to command respect, it is often defied. The powers assigned to the Security Council in the Charter have scant relevance to the actual problems of a divided world (indeed, the Suez conflict has shown that the council can be paralysed even when America and Russia are agreed) and the Charter gives the Assembly no mandatory power at all. Against this background there may seem little point in trying to build up a body of international precept and precedent, or to strengthen Uno by creating "policing" forces or other devices which can be put to good effect only when there is no opposition. What happens when an international force meets an immovable object? And the prospects of getting the Charter amended in a positive sense seem today as negligible as the likelihood that a sterner text, once signed and sealed, would command any more obedience than the present one.

★

Yet the possibility remains of using Uno, as an instrument of political education, to encourage new behaviour patterns rather than to impose legal codes. As long as fear of war persists, nations have at least some incentive to restrain both themselves and each other. And the real guts of Uno, now and in the foreseeable future, is and will be not an unenforceable code but the reciprocal pressures its members exercise on each other. A paper code, indeed, risks discredit whenever it gets too far ahead of the best international behaviour that can be expected in the circumstances of the day.

The outstanding circumstances of our day are the strength of communist powers that have a vested interest in other people's troubles, and the heady nationalism of much of the Asian-African world. The Bandung countries' suspicious attitude towards the West extends to any western initiatives in the direction of curbing the anarchy of nations. To urge these ideas upon the free Asians too forcefully must widen the gap between them and free westerners, to Moscow's joy, without obtaining worthwhile results. A solid and enduring system for keeping the peace must have an organic basis. It cannot be created in opposition to natural human forces, but must seek to harness them. Thus, those who long for such a system must to some extent resign themselves to merely holding the line, with Uno in its present unhappy state, until the "new nations" come to recognise their own interest in a strong system for world peace.

The ugly fact has to be faced that as long as international institutions remain half built the effect is liable to be lopsided. The maxim that Uno should not be overstrained unfortunately implies that the really ruthless evildoer will get away with it, while the more scrupulous offender reluctantly heeds the "general opinion." Lopsidedness may in the long run be a price worth paying for progress towards a more peaceful world. But it takes a far-sighted man to recognise that; and for most people, the natural reaction is that of a motorist who finds himself being badgered about parking offences when his newspaper is full of stories about stolen mailbags.

It is here that the operations of Uno in its present form can, with horrid ease, work against peace rather than for it; and it is to the Asian-African members that the warning needs to be most clearly directed. While the West must allow for their vibrant nationalism, they for their part must realise that the most patient, elderly western nation, apparently resigned to the loss of its place in the sun and tolerant of endless baiting, can yet be nagged to the point of madness. They can, if they wish, press on regardless; but they will thereby destroy the organic basis of world peace; and it is they, being weak, who will suffer most.

★

Mercifully, there are signs of at least some growth of awareness of these dangers both in the West and in the Asian-African world. If it continues to grow, there is hope for Uno. It does not need, as is sometimes insisted, to take the tremendous jump to world government in order to survive; its present task is rather to evolve more effective pressures and incentives to get the member nations to abide by the undertakings they have freely made. The saddest episodes in its history have been not setbacks on the road to world government, but failures to secure fulfilment of pledges already given.

Vital to any improvement in this respect is the presence and activity within Uno of a ginger group—a group of members of more than negligible weight, with enough detachment to win widespread confidence, enough concern for the general good to break out of the parochial pattern of geographical and racial blocks, enough imagination to put forward new techniques, and enough generosity to set an example by contributing physically to the development of those techniques. Today, the potential membership of this group is sadly limited. Neither great powers, nor satellites, nor those Asian-African countries that are content to acclaim President Nasser whatever he does, can qualify.

Yet the ginger group is not confined to "uncommitted" any more than to "committed" countries, in the cold-war terminology. Canada and the Scandinavian countries at present provide it with a hard core, not only as contributors to the UN force but also as independent-minded advocates of constructive sanity. Unless the group's pleas for positive action are heeded, Uno will miss the great opportunity for evolving new peacemaking techniques which the alarms and excursions of the past five months have given it. At the moment, there are not enough Scandinavians to go round.

Shipyard Before the Strike

One of the major competitive disadvantages of British shipbuilding is the plethora of restrictive practices and demarcation disputes in British yards compared with those of Germany and Japan. The best settlement of the present dispute (examined on page 934) would be a wage increase in return for an agreement with the unions about some abatement of these practices. Our special correspondent has this week visited a shipyard in the North-West.

THE shipyard was humming with the last burst of activity before the silence which, at the time of writing, is due to fall upon it as this week ends. Men were putting the final touches to a fruit ship which was to go to sea that afternoon on its trials. Some, it is true, were less busy; they were sloping off for the tea break which they take each morning and afternoon, though neither is really permitted by the management.

In the hold of the fruit ship were metal panels like those that caused the long strike at this yard last autumn. That dispute, it will be remembered, was between the sheet metal workers and the joiners about who should screw the panels into place. At the moment (according to arrangements made by the two unions, after a court of enquiry had knocked their heads together) the sheet metal worker makes the sheet and brings it to the ship, and puts just enough screws to hold it in place; then along comes the joiner and puts in the rest of the screws. It is a crazy arrangement, of course, because the change-over to a different operative wastes time.

"Demarcation" disputes, arising from the introduction of new materials that require a different type of operative, are the shipyards' biggest headache. The trouble has become particularly acute recently with the development of plastics, light metals and other new materials. There is a stoppage at this shipyard at the moment. A new material called "dexion" is used for making shelves and partitions in a store. It has ready-punched holes into which nuts and bolts are screwed, and any small boy who owns a Meccano set could assemble it quite easily. Earlier this year the management gave similar work to skilled sheet metal workers; but, having belatedly come to the conclusion that this was a foolish use of scarce skill, they gave the next job to semi-skilled workers called "sheeters." Thereupon the joiners decided that, as they had put up partitions and shelves in the past and as they were allowed to put up dexion in the building trade, the work was rightfully theirs. Now the sheet metal workers say that they and not unskilled workers should be doing the job, and they have all walked out. The battle between the joiners and other unions is particularly acute, because their union (the Amalgamated Society of Woodworkers) is determined to extend its empire, even though (or perhaps because) the amount of timber used in shipbuilding grows less and less.

Nevertheless, the ASW is not the union most often involved in demarcation disputes. That distinction belongs to the United Society of Boilermakers—whose general secretary, Mr Ted Hill, has made all those fighting speeches in connection with the wage claim and the pending strike. The reasons for the boilermakers' bad record are partly historical. Most of the unions in shipbuilding are parties to an agreement signed with the employers' federation in 1912. This provides that a demarcation dispute is first discussed by the rival unions and the management at a yard conference. If no agreement is reached the management gives a temporary decision, and if either party feels aggrieved it can take the matter to a demarcation court, consisting of three representatives from each union and from other employers in the district. Meanwhile the work goes on.

That is the theory. In perhaps a third of the yards it has also been the practice. In others it is a dead letter, and for one reason above all: the boilermakers are not, and never were, a party to the 1912 agreement. Including, as they do, the platers, riveters and welders, they form much the largest union in shipbuilding. Probably they think that it is better for them to rely on weight of numbers. If they are involved in a demarcation argument they just walk out.

★

This, of course, is liable to interfere with other people's earnings. So the boilermakers have made agreements not with the employers, but with the two unions most likely to clash with their own members. One agreement was with the shipwrights; the shipwright is responsible for seeing that the lines of a ship are right, but platers do local "fairing-up" if the ship's lines are not involved. It was agreed between the two unions that any demarcation dispute should be referred first to the shop steward and then to union officials at other higher levels until finally it reached the national executives. This can take months. Meanwhile work will stop or an expensive new machine stand idle. A dispute on the Clyde between shipwrights and boilermakers as to who should do certain work was crawling through the unions' own procedure from September, 1955, until April, 1956. Significantly, the Amalgamated Engineering Union, with which the other boilermakers' agreement was made, has withdrawn and reverted to the 1912 procedure.

When the 1955 wage claim was discussed the employers argued that the Confederation of Shipbuilders and Engineering Unions should appoint a

joint committee to look with them into questions of demarcation and restrictive practices. Mr Ted Hill replied that the employers must take it up with individual unions. The employers thought it hard that the unions should mass together to make wage claims but disperse again as soon as anything was asked of them. Nevertheless a start was made by approaching the boilermakers, who after considering the matter for some months agreed to talks. As the matter was quickly superseded by a new wage claim the talks have never taken place.

★

Your correspondent tried to discuss some of these questions with shop stewards at the shipyards. As at Briggs, shop stewards are persons of great power and resent the intrusion, without their permission, of local union officials into their affairs. They also resent the intrusion of the press; after some of last year's newspaper headlines about the "screwy strike" and the "boring strike," they resolved never to speak to such low types as journalists again. But one steward, a boilermaker, permitted himself to say that his wife would not like it if her neighbour were to use her kitchen, and so started a discussion:

(1) *Why didn't the boilermakers like the 1912 agreement?* "Well, this is 1957, isn't it?"

(2) *Why did the sheet metal workers strike to get the work on dexion when there weren't enough of them to go round the yard anyway?* "Jobs might become scarcer. If a slump came they'd need work. Prosperity could vanish. Look at the motor industry. The grass could soon grow on the slipway, as it did between the wars."

(3) *What about Japanese competition?* After their managing director had visited Japan they were shown a film of a Japanese shipyard; they were quite unimpressed, except by the fact that the workers there had safety helmets and better wages than they had imagined. "They say it takes only five weeks for Japs to build a ship. Yes, but what kind of ship? It is not just a matter of building, it's got to last. The Japs might build to last five years; we build to last thirty. British ships are the best in the world."

(4) *What about the Germans, then?* "Well, the Germans had empty yards and all new machinery, so, of course, they could build quicker. But as their order books fill up customers will come back to us. Anyway, we have got orders for five years. And if the managements were as interested in productivity as they say, they would replace some of the inadequate machinery and stop working to the cost-plus system." (The management later said that they had not used that system for years. They are putting up an extension to the works worth £17 million; the men must surely know this, but they say that no one had told them what degree of modernisation this was going to provide.)

Despite this string of depressing answers, there was no real sign of a class war in this shipyard. The shop stewards admitted that the management was more considerate than before the war; they were good chaps individually and foremen were quite a different type from what they used to be. The stewards went on, however, to air a number of grievances. Some were matters of welfare: the wash-rooms were inadequate; the management would not lend them a room to store overalls. Some were more important: there was no joint consultative committee and the only time management was keen was after the strike about the screws; the chargehand still told them to stop that and do this, without explaining why; and even in these days they could be dismissed at two hours' notice.

Your correspondent later raised this point with the management and was not convinced that there was any reason why shipbuilding labour should be casual except that it always has been so. No doubt there are other things, too, that could be done to improve relations in the yard. The problem of communication between office and ten thousand workers predisposed to misunderstand has evidently not been solved. Inevitably, too, one wondered why the management had allowed matters to reach a pass where in some ways they were no longer masters in their own house. In fairness to this shipyard it should be said that the rot set in during the war, when the only thing that mattered was to get the ships built; and after the war when they tried to restore discipline by sacking men who went home early they were prosecuted under the Essential Workers Order, and made to reinstate them. But no doubt there has been less justifiable capitulation.

On the unions' side much could obviously be done, and it would be worth offering some wage increase in return for a firm promise to start attempting to do it. For example, if the unions are not prepared to work to the 1912 agreement (which operates perfectly satisfactorily from their point of view), they should give a quite clear indication of what sort of agreement for settling demarcation disputes they are prepared to follow. It would be better still if the shipbuilding side would form itself into fewer unions than the twenty-one or so which now war with each other in the shipyards. To remould the chaotic structure, to bring each separate empire builder into line, and to break up the rigidly divided compartments would, alas, need an Ernest Bevin. But there is no earthly reason why the present leaders should not at least get together to make the effort.

BUSINESS WITH EUROPE

Our three-monthly reports on business conditions and prospects in the countries which may become associated in a common market and free trade area have been grouped in *two new REGIONAL SUBSCRIPTIONS* at specially reduced rates.

COMMON MARKET COUNTRIES
FREE TRADE AREA COUNTRIES

The Unit has also prepared two useful reports on developments in Europe. Copies of these two reports will be sent free of charge on request.

Peaceful Co-prosperity?

JAPAN'S new prime minister, Mr Kishi, has come to power at a critical period in Japanese, and Asian, history. With their industries and their population both expanding at an explosive rate, the Japanese must find new markets for their products in Asia. Conversely, the underdeveloped countries of Asia need to make use of Japanese capital goods and technical knowledge. But the fear and distrust created by the "co-prosperity sphere" of Japan's still recent phase of expansion continue to poison its relations with its neighbours. While Germany has become a member of the North Atlantic Treaty Organisation, and is now joining a common market with its traditional enemy, Japan has not lived down its reputation in east Asia. It is natural that the countries which suffered greatly from Japanese occupation find it hard to forget the war years; but their fear and resentment only tend to increase their present burdens and slow down down their rate of development. No doubt many practical difficulties have to be solved before satisfactory two-way trade can be established, but given good-will they would not be insuperable; and failure to solve them could bring unpleasant political consequences in the Asian countries where development is struggling to keep pace with popular demand. In Japan itself the consequences could be still more serious; a slackening in the present rate of growth could mean, some years hence, an abandonment of parliamentary democracy, which is still only shallowly rooted, for a renewed militarism or for communism.

Mr Kishi knows well enough the need to find new markets for Japanese goods, although as a member of the administration that was responsible for the war he is not perhaps the most suitable person to win the confidence of the Asian countries. Unlike his predecessor and rival, Mr Ishibashi, he appears to place little hope in the possibilities of trade with China or the Soviet block. In spite of pressure from some powerful business factions, he has emphasised that he will not seek to establish diplomatic relations with Peking. Instead, he is working for American help and co-operation in establishing trade relations with the Asian countries and is careful to do nothing to obstruct the flow of American technical assistance, military procurement orders and commodity loans on which Japanese solvency still depends. This is a test of the skill of even so agile a politician as Mr Kishi since he has, simultaneously, to convince the Americans of his loyalty and political popularity, and to induce the electorate to believe that Japan is progressing towards greater independence in its relations with the United States.

At the moment, the prime minister looks fairly secure. Mr Ishibashi's illness has removed his nearest rival from the scene, and the Socialist party, although growing steadily more popular, is deeply split between its right and left wings. Even the trade union movement is divided between moderates, who hope to raise both production and pay by negotiating and co-operating with the employers, and extremists, who profess to see in all efforts to increase production only a plot to raise profits for the capitalists. Mr Kishi will not be greatly hampered by the labour movement while the present boom continues.

Outwardly, Japan looks prosperous. Scarcely a village street lacks its radio shop and camera shop, and there is a fast-growing nucleus of 350,000 television-viewing families. The Japanese spend £350 million on *pachinko*—a gambling game which is one of the national passions; 115 million gallons of beer flow down Japanese gullets annually; cinemas are going up at a rate of two a day to entertain one billion customers a year. Yet there is no inflation, for wages are rising more slowly than national product. This has been achieved by a prodigious effort; industrial production increased by 11 per cent last year, and Japan is selling abroad seven times more ships and four times more textiles than in 1952. But the population is also increasing at a rate of well over a million a year, and if national product is to continue to keep pace with it, Japanese business men must concentrate increasingly on the manufacture of heavy industrial goods, and find markets to sell them in. At the moment, too much of Japan's trade is dependent on the export of consumer goods of the kind whose sales would be disproportionately hard hit by any world recession.

Japanese efforts to develop new markets for capital goods in Asia have been disappointing for other reasons besides the bitterness engendered by the war. The ex-colonial countries have tried to do too much, too fast, on too little capital. But now that the foundations of industrialisation are being more carefully laid, the market for capital goods could expand rapidly with the help of Japanese reparations, which are to be principally used to provide economic and technical assistance. There are still many difficulties, apart from the slowness of development, to be worked out in the payment and use of reparations; Japan is determined that they shall be in addition to, and not a substitute for, normal trade; Burma wants consumer goods which Japan, fearing that Burma would substitute reparations for normal trade, does not want to give; Indonesia has not yet even agreed with Japan on the total to be paid; some Philippine politicians now seem to be thinking that they made a poor bargain. Even so, the payment of reparations could give Japanese industrialists the opportunity to restore

confidence in Japan and bring home to the underdeveloped countries the advantages of encouraging a flow of Japanese capital. The chief obstacle to this is the reluctance of the ex-colonial countries, who are very jealous of their sovereignty, to allow any foreign power to acquire control of their industries by buying a majority of the shares. In mining and agricultural projects, however, it is often possible to give the industrialists who provide plant, or other capital assistance, facilities for buying the raw materials produced on special terms.

No Japanese prime minister, whatever his faction or party, has much room for manœuvre in foreign policy. This was made particularly clear when Mr Ishibashi, with his reputation for hostility to the United States, became exceedingly non-committal on the subject as soon as he reached the premiership. Whether they like it or not, the Japanese are dependent on the United States for economic and military protection. Most of them dislike it. They resent their indebtedness to the Americans. They are impressed by Russian hints that an American evacuation of Okinawa might induce Russia to give back the Southern Kuriles. Above all, they remember the atom bomb, and they fear that if Japan remains the American forward base in the Pacific it will be an obvious target for a hydrogen bomb. Between the emotion of the electorate on the one hand, and the hard economic facts on the other, only a limited political mobility is possible. Japan can hope to recover its importance in Asia, and ensure its economic future, only by the "economic diplomacy" of which so much has been heard lately. Its purpose is to convince both industrialists and diplomats that only through trade relations can the "face" lost in the last war be recovered and Japan established as the leading power in the non-communist east. This is Japan's natural role—provided it is filled, this time, by peaceful commercial means.

Notes of the Week

THE STRIKE

Shadow Over the Shipyards

THE shipbuilding and the engineering disputes present the country with essentially differing problems. The broad mass of the public, as it settles down wearily to await possible damage by strike, should remember this; and it will be useful if Mr Macleod, as he brings forward his offers of various sorts of arbitration and conciliation, will remember it too. The obviously desirable end of the shipbuilding dispute would be a wage increase in return for a union promise to abandon some of the demarcation disputes and other restrictive labour practices which at present cripple productivity in British shipyards. Many of the employers and some of the union leaders would like to move towards such a settlement; an arbitrator, if he were allowed to set to work with really open terms of reference, would seem likely to feel bound in common-sense to recommend it.

The minister's offer of the services of Lord Evershed as a special sort of arbitrator this week was therefore certainly right; the offer should be kept open in the hope that both sides will agree to come and face him in the end. The trouble is that the end is quite likely to be after a protracted and damaging strike. All experience suggests that shipyard strikes can unfortunately be protracted, partly because some shipyard workers are peculiarly able to drift away into other forms of temporary work; the Germans recently had a wide-ranging shipyard strike that lasted three months.

Uneasy Balance in Engineering

THE problem in engineering is different. The employers are eager to stop the inflationary round of automatic annual wage increases, and they believe that they will never have a better chance to do this than in 1957. The ideal result for the public will be, bluntly, if the employers succeed. But the unions have a democratic right to try to baulk them of success; the time when outside criticism of the union leaders becomes justified will be if and when it appears that they are dragging out a dispute, not because dragging it out would help their own members, but because it might help to save the leaders' own faces. It will be very odd of the union leaders if they decide on a national engineering strike; they surely could not afford strike pay for two and a half million men for long, and some workers would be likely to flout their authority by not obeying the call to stop work. At midday on Thursday, their most likely course seemed to be to threaten "selective" or guerilla strikes in the most strategic places—in the hope that these, combined with a national shipyard strike, would eventually bring them an offer of at least 3 or 4 per cent rise for both shipbuilding and engineering workers—"to compensate for increases in the cost of living."

It may be, if there are strikes that get a full response and look like lasting, that it will be worth while for the losses to the country to be cut by some such offer. But it is a sober appraisal of the economic dangers ahead, not black reaction, which prompts one to say that it should be left to the employers to make the awkward calculation: whether, at any one moment, their long-term industrial prospects will be served better by surrendering a wage increase, or better by standing fast. In any strike—or any inflationary settlement—the country's losses and the employers' own are likely to be almost synonymous. Mr Macleod's best course in the engineering dispute—as distinct from in the shipbuilding dispute—may therefore be to stand, for the time being, somewhat ingloriously impassive. Any official intervention likely to lead to recommendations for an early settlement on the basis of a flat "cost of living increase"—made straight across the board in this heterogeneous export industry—should not, in the national interest, be appreciated.

Gaza at Flash Point

THE Egyptian government this week appointed a governor for the Gaza strip, and its intention to take over the administration is hardly to be doubted. Dr Ralph Bunche said on Wednesday that the United Nations Emergency Force would "most certainly" co-operate with Egyptian administrators. Mr Ben-Gurion told the Knesset in Jerusalem the same day that Israel reserved freedom of action in the event of the Egyptians returning to the strip and would not give prior notice should action become "appropriate and necessary."

Dr Bunche's statement accords with Mr Hammarskjöld's view that Egypt acquired a right to *de facto* control of the strip by the armistice, and that this could not be altered except by permission of Egypt. But he gave the impression to the General Assembly, and the Israeli Foreign Minister assumed him to mean, that Egypt had agreed to a United Nations agency entering with the United Nations forces and administering Gaza on its own. Israeli troops were withdrawn on that assumption; Mr Ben-Gurion has now given more than a broad hint that they might return if the assumption proves wrong. Mr Hammarskjöld may believe that by conceding the administration to Egypt he will prevent President Nasser from demanding the withdrawal of Unef, and that the presence of Unef will deter Israel from armed action. That seems the slender thread on which peace is suspended at the moment.

The record published on page 894 indicates, and Mr Ben-Gurion admitted to the Knesset last week, that there has never been any Egyptian undertaking not to return to the strip. Everything was "assumed"—by President Eisenhower, by Mr Dulles, by a large part of the assembly, even by Mr Ben-Gurion. But not by Egypt. Dr Fawzi promised the Assembly nothing. The Egyptian public has been led to understand that President Nasser would yield neither control of Gaza nor freedom for Israeli shipping to pass through the Suez Canal or the Gulf of Aqaba. Dr Abdel Kader Hatem, Egyptian Director of Information, stated explicitly last Saturday that Egypt would bar the canal and the gulf to Israeli ships.

In arguing for prior withdrawal by Israeli forces from Egypt, Mr Hammarskjöld envisaged in his report of February 11th "parallel progress towards peaceful conditions" by both Egypt and Israel. Of this there is no sign. Instead, everything points to the old, dangerous conditions on the frontier—with this difference, that Israel now knows that if it goes in fighting it can win, hands down.

The restoration of the Israeli-Egyptian armistice was the starting point of all UN decisions on the question: but the meaning of the armistice was the real issue. Israel denies its continuing existence. Egypt justifies by the armistice, as distinct from a peace, its right to blockade Israel. The aggregate of self-justified infringements by both sides led to war, and the restoration of the armistice looks like leading to war again. Uno should say what it means by the armistice; let that much be clear, at least. As it stands, there is nothing apparently to deny Egypt the rights it claims in the gulf, the canal and the Gaza strip; except, of course, that it might lead to a breach of the peace—and even then, Israel could be arraigned as an aggressor.

Saudi Oil in the Suez Crisis

TWO deductions can be drawn from the adventures of Saudi Arabian oil through lands of transit during the four months between the Suez crisis and today. The first is that past western policies towards Israel, no matter whether European or American, are the chief offence of the west in Arab eyes. This was patent in the lightning reaction of the Saudi government to the news of Israel's retirement from Gaza and the Sinai coast. No sooner was this on the air than it had given permission to resume pumping Saudi oil to the refinery on Bahrain Island in the Persian Gulf. Though this refinery is American-owned, it had presumably been rated as British for purposes of the ban because of the Bahraini connection with Britain.

The second deduction is that the Saudis had always intended to be in a position to resume a full flow of oil at a moment's notice. The Arabs had, of course, no valid grievance against an American company; still, sabotage was in the air and the Saudis evidently wished to take no chances. Either by using their ban on shipments to Britain as an insurance against sabotage, or else by paying saboteurs to keep out, they contrived to preserve all their pipelines during the Suez crisis. The TAPline, which crosses Jordan and Syria on its way to the Mediterranean, was kept intact, whereas Iraq's was blown up; similarly on the Persian Gulf, there was no sabotage on the pipe from the Saudi fields to Bahrain, whereas explosions were organised in both the neighbouring oil sheikhdoms, Kuwait and Qatar.

One motive for both the promptitude and the precautions was shortage of cash, unlikely though this sounds in a state that earns so much and spends so little on serious things. For four months, the Saudis, though deeply in debt, have been denying themselves nearly 40 per cent of their revenue as a political gesture. They could ill afford to keep on doing so. Lately, they are said to have been so short of foreign exchange that their first payment of their new subsidy to Jordan represented a strain on their Monetary Agency. Certainly Saudi merchants in the flourishing oil province on the Persian Gulf seaboard, who are accustomed to making large purchases from Bahrain, have found that Agency unhelpful about foreign exchange for these purchases; in consequence, they are having to buy their dollars from American employees of Aramco and the neighbouring US air base. Over the last four months the Saudi rial has depreciated from 130 to 110 rupees per 100 rials.

The Tories and the Budget

MR MACMILLAN has made an apparently successful attempt to calm the nerves of his backbench supporters. Only a few hours before the result of the Warwick and Leamington by-election, he gave the 1922 Committee a pep talk which seems to have inoculated most Tory MPs against the shock even of that remarkable 12.2 per cent swing. Whether he gave the right inoculation is more debatable. His main thesis seems to have been that, as the Government has every intention of running its full term, present discontents have little relevance to the next election. This is admirable advice, and it was accompanied by even more admirable emphasis on the Conservative aim of an "opportunity state." Unfortunately, however, the Prime Minister phrased his speech so ebulliently that some Tory MPs, at any rate, came hurrying out of the room alleging that he had given the strong impression that the budget on April 9th will be easier than most economists think it should be. It is most unlikely that Mr Macmillan intended to give any such impression. As the price of stiffening the party's backbone in March, therefore, he may have risked the possibility of fresh disappointment in April.

It is interesting, however, to note the form which backbench Tory pressure about the budget is now assuming. The explanation of the result at Warwick and Leamington, with its high poll, is clearly not to be found in mass Tory abstentions. The explanation, apart from the retirement of Sir Anthony Eden from the constituency, is fairly obviously that in this rapidly industrialising offshoot of the Coventry and Birmingham areas, many of the better-paid industrial workers, who voted Conservative in 1955, have trickled back to voting Labour now that so much of the shine has gone off their regional boom. It might have been expected, therefore, that Tory pressure now would be in favour of building up the boom again, possibly to dangerous proportions. Perhaps fortunately, this does not seem to be the backbenchers' main concern. Their complaint is that when they visit their constituency associations they find that their most loyal and hard-working supporters are often the most bitter critics of the Government. Their campaign, therefore, is not so much for a reflationary budget as for a middle-class one. Within limits, discussed in a leading article this week, it may be more possible for Mr Thorneycroft to satisfy this.

Egypt and the Gaza Strip

THE Egyptian government has re-asserted its right to control the Gaza strip by appointing a military governor. This action is in conflict with the general assumption that Egypt had agreed to give the United Nations a free hand in the strip for the time being. It has been described, by the *New York Times* for example, as "a flagrant violation" of previous Egyptian assurances.

Provisional control of the strip was implicitly conceded to Egypt by the Egyptian-Israeli Armistice Agreement but it did not become a part of Egyptian territory. Article V of the agreement states that the armistice line "is not to be construed as a political or territorial boundary, and is delineated without prejudice to rights, claims and positions of either party to the armistice as regards ultimate settlement of the Palestine question." Mr Hammarskjöld advised the General Assembly in his report of January 19th that the *de facto* situation "can be legally changed only through settlement between the parties"; deployment of the United Nations Emergency Force or the widening of Uno's administrative responsibilities in the strip would therefore require the consent of Egypt.

What did Egypt consent to? On this question, the General Assembly's cease-fire resolution of November 2nd, from which all subsequent action flowed, simply urged both parties "to observe scrupulously the provisions of the armistice agreement." Uno has consistently sought to re-establish the armistice conditions; Egypt is not acting in conflict with that broad intention when it claims its right to the Gaza strip.

The United Nations Emergency Force was established in accordance with an Assembly resolution of November 5th "to secure and supervise the cessation of hostilities in accordance with the resolution . . . of November 2nd." The Secretary-General advised on January 25th that the force could not be used to settle juridical issues. It followed that any functions in the strip were temporary.

How temporary were they? After the withdrawal of British and French troops from Egypt in late December, the Assembly was concerned to secure the withdrawal of Israel; and its resolution of February 2nd recognised that "the withdrawal of Israel must be followed by action which would assure progress towards the creation of peaceful conditions." This resolution "considered that" the maintenance of the armistice agreement required "the placing of the United Nations Emergency Force on the Egyptian-Israeli armistice demarcation line." The stated intention was to create conditions "conducive to the maintenance of peaceful conditions in the area."

It was clearly the intention also to encourage Israeli withdrawal by hinting at future security on the frontier; but the Egyptian Foreign Minister, in the debate, was firm that Unef's presence was subject to the consent of Egypt and "for the sole purpose of giving expression to the determination of the UN to put an end to aggression against Egypt."

Nor did Mr Hammarskjöld's report of February 2nd show any wider commitment on Egypt's part, for it merely said that in exercising its sovereign rights regarding Unef, Egypt would be guided by its acceptance of the resolution of November 5th (which committed it only to secure and supervise the cessation of hostilities).

At no time did Egypt assure the Assembly that it would permit UN administration and control of the strip, and there is no resolution of the Assembly which specifically provides for it. But Mr Hammarskjöld told the Assembly on February 22nd of his confidence that the Egyptian government desired "that the take-over of Gaza from the military and civilian control of Israel—which . . . in the first instance would be exclusively by Unef—will be orderly and safe as it has been elsewhere"; and "has the willingness and readiness to make special and helpful arrangements with the United Nations and some of its auxiliary bodies, such as UNWRA and Unef."

Mr Hammarskjöld further said that "with reference to the period of transition, such other arrangements with the UN may be made as will contribute towards safeguarding life and property in the area by providing efficient and effective police protection; as will guarantee good civilian administration; as will assure maximum assistance to the UN refugee programme; and will foster the economic development of the territory and its people."

What was meant by "the period of transition" or the "other arrangements"? It is not clear, but Mr Hammarskjöld clearly believed, and sought to assure the Assembly, that Egypt had agreed that the UN should play a dominant part in the strip for some time. Mrs Meir, in announcing the withdrawal on March 1st, told the General Assembly that her government assumed that the functions which Mr Hammarskjöld mentioned would be carried out by the United Nations and no one else. She further said that this United Nations responsibility would have to last until there was either a peace settlement, or a definitive agreement on the future of Gaza. However, the Egyptian Foreign Minister told the assembly on March 1st that "nothing said by anyone here or elsewhere could . . . affect the fullness and the lawfulness of Egypt's rights and those of the Arab people in the Gaza strip."

Israel has throughout denied the continuing validity of the armistice agreement, and therefore of Egypt's rights in the strip; it withdrew on the explicit assumption that Egypt would not be allowed to return there.

Brief Encounter in Paris

THE brief encounter in Paris of Mr Macmillan and Mr Selwyn Lloyd with their French counterparts seems to have been more cordial than effective. Complete agreement was reached only on the Suez Canal question. M. Mollet had no difficulty in convincing his guests of the need to stand firm in negotiations with President Nasser, and not to accept unfavourable conditions merely because of the wish to rush the ships through. It now remains for the Prime Minister to see what American support he can get for this Franco-British waiting game; with the Eisenhower doctrine uppermost in American minds, his task in Bermuda will not be easy.

On European matters the two prime ministers could not make much progress. The British seem as resolved to reduce their troops in Germany as the French are to include their overseas territories in the European common market. As Mr Macmillan has rightly said, the French are concerned largely with the psychological aspect of a partial reduction of British troops on the Continent: "They are anxious that anything we should do should not appear to be the beginning of a walk-out." The French Assembly accepted German rearmament under the Paris Agreements only because of the British guarantee not to leave France alone with a rearmed Germany. Much diplomatic skill will be required if even a mere reduction in the number of British troops stationed in Germany is not to conjure up again in Paris the ghost of German domination, particularly with so many French troops bogged down in Algeria.

The relationship between the European market and overseas territories must be viewed in the same political context. The misgivings in Britain will now be played up on the Continent by the opponents of European integration, echoing the warning of M. Mendès-France that the common market would keep Britain out of Europe. To counter this argument M. Mollet apparently asked Mr Macmillan to agree that the British African territories should be linked with the common market for a start; the whole complicated question has been left in the hands of the experts. These questions may impede French ratification of the treaties unless some reassurance can quickly be offered to the French critics. In any event the import taxes and restrictions announced by the French government on Thursday are an adverse portent for the common market at a critical time.

Tiptoeing into Eurafrica?

"IT would be possible to pay too high a price for the free trade area." These tart words of the Economic Secretary to the Treasury last weekend are a symptom of British displeasure at the essentially one-way bargain under which the overseas territories of the Six, above all those of France, are to get duty-free or preferential treatment for their exports to European common market countries. It is difficult to disentangle how much of the British displeasure stems from economic concern, and how much from administrative huff. As our Paris correspondent writes on page 920, as much as one quarter of the export trade of British dependencies overseas is with Europe. The part of this trade which could suffer from the new provision is, of course, only that part which is directly competitive in Europe with exports from French overseas territories. It is difficult to work out a figure; but Ghana and some British territories in Africa could undoubtedly be put at a disadvantage.

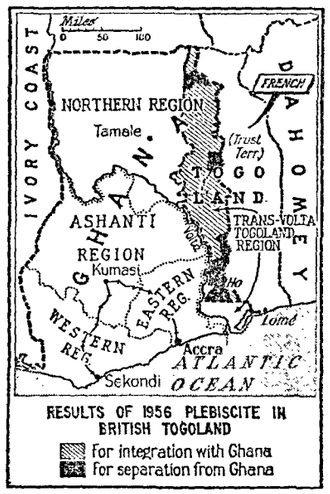
Overlaying this economic calculation, however, is British resentment at the lack of prior consultation on the matter. Britain at first assumed that overseas territories would not be included. It was on that assumption that the British Government discussed the free trade project with the Commonwealth countries and gained their approval to British association with the common market. When the possibility of "Eurafrica" emerged in recent months Britain continually pressed the Six to consult before far-reaching and detailed decisions were made. The British fear, too, that Gatt might be less willing to grant a waiver of its most-favoured-nation rule to the proposed common market now that it is going to create an entirely new preferential system.

The best advice to give to the British Government is to forget its administrative huff and concentrate on mitigating the economic difficulties. The best way might be to work out some special association for trade between Commonwealth territories in Africa and the common market, but this will not be easy. If the European countries demand a *quid pro quo* in British African territories in return for opening their markets to them, the Government's wish to preserve Commonwealth preferences, despite the free trade area, will be in jeopardy. No impasse has yet been reached in the discussion of this matter, but Europe is nearer to it than it would have been if the Six had been less prone to play their cards in these negotiations so close to their chests. "Take it or leave it" is not the attitude out of which the Afro-Euro-market will be built.

Happy Ending in Amman

THE Anglo-Jordanian Treaty of 1948 was terminated in friendly fashion on Wednesday. The negotiations, which began on February 3rd, were mainly concerned with terms for the sale or removal of stores and equipment and

the payment by Jordan for those it wished to keep. ı sides were as one in wanting to be rid of the tie. ritain has already begun to withdraw stores from Jordan. troops must be out of Jordan six months from now, ɔpt for a few who might stay for another six months upervise the disposal of equipment. Jordan has promised lities for the evacuation and the payment of £4,250,000 the equipment and stocks it will retain. The first ment of £1,250,000 is due on May 1st, but Jordan has redit of £598,000, the unpaid subsidy for February, to against it. Jordan will pay the balance in instalments of 00,000 a year until 1963. A residual subsidy payment of 40,000 is being held by Britain in a special fund to meet ɔh outstanding liabilities as claims by British subjects ıose service with the Jordan government now ends.



In the present tense state of Arab-Israeli relations there ıy be some anxiety about the military strength Jordan rives from the agreement. In fact, Jordan had already, fore the talks began, seized about three-quarters of the ɔres and equipment which it now undertakes to buy, and e rest would almost certainly have been available to the ɔrdan army when they were wanted. The point is not nportant. Jordan is weaker by the loss of the British comıitment to defend its territory against any aggressor, includ-ıael; and the campaign in Sinai has left no doubt that ɔe Israeli army would be more than a match for that of ordan.

The ending of the treaty means a real loss of security or Jordan, but nationalist opinion preferred the loss to a ontinuing dependence on Britain. Relations should mprove now that the treaty, a bone of contention, is ended; ıut it would be over-optimistic to expect warm-hearted riendship. The existence of Israel, of half a million Palesinian refugees on the west bank, and of the Baghdad Pact, for all of which the Jordanians hold Britain mainly responsible, stands between the two countries.

Trouble in Togoland

WHEN the United Kingdom bowed itself out of responsibility for British Togoland in December, even the anti-colonial ranks at the United Nations could scarce forbear to cheer. British Togoland is the first of the eleven territories to graduate from UN trusteeship; Mr Krishna Menon proclaimed it an "epoch-making occasion" and the resolution joining Togoland to Ghana was passed by 63-0. But last week, in the middle of its celebrations, Ghana had to send a light artillery battery to quell riots in southern Togoland in which several people were killed or hurt and many more arrested.

The trouble in Togoland, as in other African territories, is that the frontiers arbitrarily carved out by colonial powers cut across tribal areas. The political boundaries run north and south; the cultural zones run east and west. The powerful Ewe tribe was split in three, half living in Ghana, the remainder divided roughly in the ratio of three to two between French and British Togoland. The Ewe, who are articulate and active, dominate the opposition parties in both trust territories (though they are also represented in the Ghanian government). The opposition parties in Togoland have persistently badgered Uno, first for a united Ewe, and later raising their stakes, for a united Togoland. The United Nations was inclined to sympathise until about two years ago, when it switched its support to the British plan for integrating Togoland with Ghana. The plebiscite held last May showed nearly three-fifths in favour of integration. But in southern Togoland, 55 per cent voted against it.

The Togoland Congress, the main opposition party in British Togoland, is now demanding a separate southern state. But southern Togoland is already administratively linked with the Trans-Volta region, which is the traditionally Ewe-speaking area of Ghana. This will give them a degree of regional autonomy. The Ewes in British Togoland are really dangling the bait for their French brothers. The governing party in Ghana has added a tempting official lure with the statement of a local party spokesman: "We want union between the Ewe—and we hope eventually to incorporate the Ewe of French Togoland." French Togoland is firmly set on another course, but trouble among the Ghana Ewe may prove contagious.

Wait for It

THE debate on the army vote on account this week was not quite as frustrating as the previous debates on the "blank cheques" presented by the Admiralty and Air Ministry. Mr Amery at least made an announcement of the size and composition of the "brigade group" as the main army formation of the future—the light, and presumably "streamlined," division of 5,000 men. Why he thought it was not a target for an atom bomb was less clear.

Any army debate, however, inevitably turns on manpower; and the facts stuck out like a sore thumb. The navy and air force debates revealed that both these services can now almost dispense with national service; higher pay has put up recruiting, and manpower adjustments, together with savings on national service men's training, should almost cover their gap. But unless Mr Hare's promised decisions "which will determine the structure of the army for a generation to come" show how a regular can do the work of three or more national service men, it is impossible to match army requirements against recruiting. Even Labour members thought that Britain needed an army of 175,000 regulars; but as Mr Wigg pointed out—his claims to be a prophet on recruiting are not entirely without foundation—85,000 of the present "regular forces" of 190,000 are on

three-year engagements, probably mostly undertaken as a better paid alternative to national service. Mr Wigg doubted if it was possible to raise an army of 130,000 regulars at most.

Clearly the Government's first job is to find out just how many of the three-year men are national service men, and how many would take the extra pay to engage for five or six years; and for this exercise the abolition of the three-year engagement is a reasonable bet. Until the Government does know more precisely how many regulars it can get, it would be very unwise to make any premature decisions about national service, or commit itself not to try selective service.

★

One subsidiary point that emerged from the debate is that the run-down in manpower and commitments is to lead to an immense disposals programme of "more than 70,000 vehicles, 250,000 tons of ammunition and over 120,000 tons of engineer stores." A suggestion should be made to the Government about these. Several select committees have shown that the army is simply not equipped to assess, value or place such vast quantities on the market; disposal sales can easily become commercial ramps, and the taxpayers' goods be sold for a song. Could not the Government recruit a supervisory committee to keep a special watch upon the mammoth cut-price sales now in prospect, and put some very experienced retired business men upon it?

Doctors and Their Like

THE dispute over doctors' pay seems no nearer a solution, despite the meeting on Tuesday between Mr Macmillan and the joint chairmen of the doctors' negotiating committee. All that has been clarified is the amount of the immediate increase in the pay of junior hospital staffs up to and including senior registrars. They are to get 10 per cent more from April 1st.

In the meantime, the members of the royal commission, which is to determine doctors' earnings in the long term, have been appointed. Since, in deciding what doctors and dentists should earn in the health service, they have to take into account remuneration in other professions, it is interesting to compare the new scales announced this week for university staffs with doctors' present earnings. Among the non-medical academic posts below professorial rank, only university readers will, at their maximum, reach the average general practitioner's earnings. If intangible factors are left aside in this comparison—whether, for instance, the particular intellectual ability needed for a readership should weigh more in the monetary balance than the heavier responsibilities and smaller leisure of the general practitioner—there are two material points to be made. First, university staffs receive children's allowances of £50 a year for each child. Secondly, the university salaries do not, of course, show the extramural earnings of the staffs. But the general practitioner's "average" earnings of £2,222 (assumed for the purposes of the estimates) include an allowance for medical earnings outside his strict health service practice. A doctor with 2,000 patients (a normal sized practice), who lived solely on his capitation fees for them, would earn, net of expenses, only £1,400 to £1,500.

It is also worth pointing out that compared with the present scales the new university salaries will show percentage increases of between 20 and 30 per cent, except for the top professorial salaries and the top clinical salaries (that is, for posts in the teaching hospitals). Since October, 1954, when the present scales came into force, the cost of living has increased by only 11 per cent. The new scales are, in fact, intended to maintain the standard of recruitment to the university staffs. But how far cost of living adjustments and incentives to recruitment can be disentangled is debatable, and the doctors' spokesmen will doubtless make propaganda of the fact that they are asking for a 24 per cent increase on a level of earnings laid down for 1950-51.

DOCTORS' EARNINGS*	£
House Officers	467–577
Senior House Officers	820
Junior Hospital Medical Officers	852–1,182
Registrars, incl. Senior Registrars	935–1,540
General Practitioners	Ave. 2,222
Senior Hospital Medical Officers	1,500–1,950
Consultants (whole-time)	2,100–3,100

UNIVERSITY SALARIES† (from August 1st)	£
Non-Medical Posts:	
Assistant Lecturers	700–850
Lecturers	900–1,650
Readers, Senior Lecturers	Up to 2,250
Professors	2,300–3,000‡
Medical Posts (Clinical):	
Lecturers	900–1,750 to 2,550
Readers	1,750–2,550
Professors	2,500–3,100‡

* Including 10 per cent. increase for junior hospital staffs from April 1st.
† Oxford and Cambridge have their own scales and London University gives additional allowances of up to £100, within a maximum of £3,000.
‡ According to post. Clinical professors, like consultants, can receive merit awards in addition to their salaries.

Rocking Signor Segni's Boat

SIGNOR SEGNI, the Italian prime minister, is having an increasingly hazardous passage. His crew have been shipmates for too long. Their relations have become strained. Twice in a fortnight their differences and dissatisfactions have nearly capsized the boat. But there is little sign that these narrow escapes have induced more than a temporary awareness that rocking the boat is risky.

Signor Segni seems to be faced with the gradual break-up of the four-party coalition which has governed Italy for the greater part of the last nine years. The Republicans, who were not actually in the government though they were pledged to support it, have already decided to resume their freedom; the coalition's exiguous majority of ten over all the other parties combined has thereby been reduced by half. Last weekend the 19 Social Democrats nearly went the same way. Signor Matteotti offered his resignation as their party secretary ostensibly because he was outraged by the prime minister's failure to inform him officially of the controversial appointment of Signor Togni, a right-wing Christian Democrat, as head of the new ministry of state investment. But a more important reason was his conviction (shared by many Social Democrats, but not by their leader, Signor Saragat) that the time has come for the party to cut loose from the Christian Democrats and to apply itself seriously to the problem of joining forces with the Nenni Socialists. Signor Matteotti's action provoked a stormy crisis within his party's

executive ; eventually it rejected his resignation and resolved to stay in the coalition till a party congress decides future policy in June.

Signor Segni has gained only a doubtful respite. He can almost certainly count on enough votes (the Republicans will help him here) to pass the Euratom and common market treaties. But the land tenancy bill, for years an apple of discord among the coalition partners, is also coming up for debate. The principles of the government's compromise bill have received a vote of confidence. But the Social Democrats and the left wing of the Christian Democrats on the one side, and the right-wing Liberal party on the other, disagree strongly about some clauses ; if Signor Segni is forced to make each clause a matter of confidence, he might well come to grief. Some influential members of his own party are believed to feel that such an end to the coalition would be a good riddance, and to be ready to try their luck as a minority government.

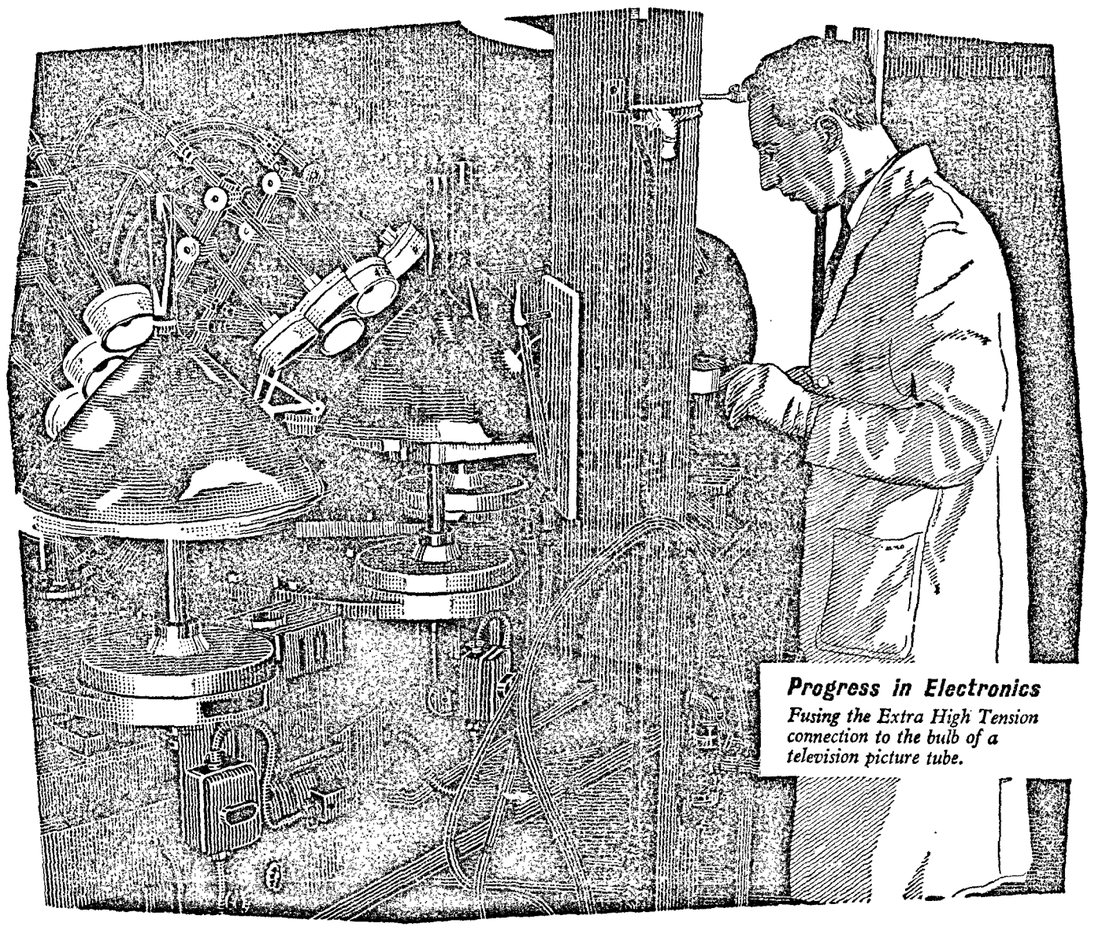
A Status for Singapore

THE year that has passed since the failure of Mr David Marshall's mission to obtain merdeka ("freedom") for Singapore should make it easier to reach agreement on self-government for the island in the next two weeks. Mr Marshall interpreted merdeka to mean independence, which he must have in advance to win the island's support for a democratic regime, law and order. Mr Lim has shown that he could win support for a determined government which has put down communist-inspired riots, stopped disorder in the Chinese middle schools, dissolved communist-led unions and bundled political undesirables off into detention. He has shown that Singapore can be ruled by its own leaders ; but his authority would probably now dissolve if he failed to get ninety-five per cent merdeka.

On the British side, both the Suez affair and the determination to cut overseas commitments have led to some scaling down of the value placed by the Chiefs of Staff on the naval base and on the need to ensure its absolute security against an internal coup. In view of the agreement with the Federation of Malaya on defence, however, it should be possible to concede Mr Lim's demand that the casting vote on the proposed security council (which would have power to call in British troops) should rest with a Malayan chairman ; especially if he could be the Federation's minister of defence, or his nominee. Tengku Abdul Rahman has shown that he wants no disorder in Singapore ; and he clearly sees that whatever the value of the base to the West, it is imperative to deny its use to anyone else. Developments in Indonesia are likely to strengthen that Malayan view.

It is a pity the Federation still cannot consider the question of bringing Singapore in as a unit in the foreseeable future. But the provisions that permit this exist in its constitution, and many people believe that once Singapore has attained near-merdeka, the Federation will be bound to bring Singapore in on terms that fall short of swamping the Malay mainland vote with Singapore Chinese. The Tengku is continually being dragged into Singapore affairs, and it was only his intervention that enabled Mr Lim to lead a delegation to London with Singapore-Malay support. Meanwhile everybody must realise—the Tengku, Mr Lim and the Colonial Secretary alike—that the communist threat to Singapore has not been disposed of. And nobody knows how Mr Lim's Labour Front coalition will fare in the elections that will follow merdeka for Singapore. He, like Mr Marshall, wants some kind of lifeline kept intact.

Enter Mr Mboya



THE new African electorate in Kenya has voted heavily nationalist in the elections for the Legislative Council. Only two of those who served previously on the governor's nomination have held their seats—despite the fact that, under the Coutts franchise, there was a heavy weighting in favour of the "big potatoes" (electors of age, wealth, education and experience) against the "little potatoes" (who possessed only the minimum qualification for a single vote, such as bare literacy). Even Mr Ohanga, the first African minister to take office in Kenya under the Lyttelton settlement, has been defeated by the slogan that he was a "white man's stooge" ; so has the veteran Kikuyu leader, Mr Eliud Mathu ; and all the Capricorn Society candidates have failed.

The best known of the successful candidates is Mr Tom Mboya, who won Nairobi. The other constituencies seem to have voted on strict tribal lines. Mr Mboya is an able westernised trade union politician, and he should quickly emerge as the leader of the African elected members. At the outset, however, the difficulty arises that under the Lyttelton settlement there must be at least one African minister (this was recently raised to two by agreement) as well as two under-secretaries. Yet none of the new members has any parliamentary experience at all ; even the two former members who were elected were added to the House only last October to balance the two new "Corporate" members representing agriculture and industries. To make the African nominated members ministers might cause trouble ; Mr Mboya is the obvious choice.

	Elected	Corporate	Nominated*	Ex-officio†	Total
European....	14 (4)	2‡	15 (2)‡	7 (6)	38
Hindu.....	3 (1)	...	1	...	4
Moslem	3 (1)	...	1	...	4

African.....	8 (2)	...	2	...	10
Total.....	29	2	20	8	59

* By the governor. † Officials, including the Speaker. ‡ Open to all races, but at present European held.
Figures in brackets show members who are also ministers.

In the complicated pattern of the Kenya assembly, as the accompanying table shows, white faces still strongly predominate. Kenya moderates realise that the racial balance cannot long remain as it is, and the best hope would be now to put into operation the long-neglected proposal to let all races vote on a common roll in some constituencies. It remains to be seen whether Mr Mboya's advent will persuade the white settlers to this step—or whether it will merely scare them still further off.

Progress in Electronics
Fusing the Extra High Tension connection to the bulb of a television picture tube.

Which is the end product?

The great new Mullard TV Tube factory at Simonstone in Lancashire is probably the most advanced in the world. In it is machinery and equipment so revolutionary in conception that visitors are startled by its Wellsian appearance.

The greater part of this machinery was designed, developed and built by Mullard's own engineering department. It is, in effect, an end-product in itself.

Plants such as this are typical of the Mullard attitude towards production. Constant research into manufacturing techniques and progressive development of plant and machinery are among the reasons why Mullard products enjoy a world-wide reputation for performance and reliability.

* See a Mullard factory one day, and you'll see the end-products of industrial team-work—from research to manufacture.

** If you are interested in visiting a Mullard factory, and if you belong to an organisation concerned with the application of electronics, write to the address below on your official letter heading mentioning your position in the organisation.*

Seato Makes Haste Slowly

THE third annual meeting of the South East Asia Treaty Organisation, held in Canberra this week, marks a steady but undramatic progress. Seato is not, and is never likely to be, a military alliance on the lines of Nato, although its members are making some efforts to improve their military co-ordination by setting up a permanent planning staff in Bangkok, and by making arrangements for a new combined exercise (the last one, militarily and diplomatically, was not an unqualified success). Seato's armed strength comes from the United States, and Mr Dulles was really patting himself on the back when he told members that the organisation "is an effective force against aggression."

The conference was more concerned with the success of the fight against communist subversion, both in member countries and in South Vietnam, Laos and Cambodia, than with purely military preparations. This reflects the fact that an overt military attack now seems less likely than when the Seato treaty was signed on the morrow of the Viet Minh victory in Indo-China. Some progress has been made in co-ordinating methods and exchanging experience; collaboration between the police forces of the area has been developed—particularly in putting down border banditry between Siam and Malaya—and a seminar on countering subversion is to be held in the Philippines later this year. Economic aid will continue to be given to the Seato countries through the Colombo Plan (in which Seato members enjoy no special privileges) and American bilateral deals (in which they do).

★

In view of the allied differences about China, it may be doubted whether the Seato conference was the ideal place for a statement by Mr Dulles reaffirming the United States' determination not to recognise Peking. Indeed, Lord Home, the British delegate, was quick to point out that this was a purely American attitude and had nothing to do with Seato. (Formosa is, of course, specifically excluded from Seato's area of operations.) Mr Dulles's statement, which cannot have pleased the Asian neutrals any more than it did the British, was presumably meant to bolster the determination of the majority of Seato members who recognise Chiang Kai-shek's government.

Argentine Paradox

ARGENTINA is being led in a high-handed manner towards democratic government. The military caretakers under President Aramburu have promised to hand over to a representative government by June, 1958. A constituent assembly is to be elected by universal suffrage in July this year. When it has prepared a new constitution, it should then dissolve, though there are precedents in Argentinian history of a constituent assembly eventually taking over government itself. With elections approaching, the buzz of plots and counter plots has intensified. The most spectacular was the rumour of a Perón-inspired plan (reputedly also supported by those strange companions, the communists and the right-wing Catholic nationalists) to invade Argentina from all its five frontiers at once, after weakening resistance by a comprehensive programme of economic subversion.

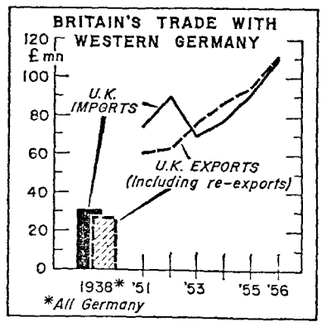
This rumour was probably more of a tribute to the vision of ex-president Perón's press agent in Caracas than a serious menace to the government. But President Aramburu is taking no chances. The navy is guiding the country to democracy on a tight rein. Talkative generals are clapped into prison to cool their tongues for a month or so. The indiscreet publication of some letters last week showed that the under-secretary of the navy, himself a naval officer, had been reporting to the President on the conduct of civilian ministers. The minister of trade, whom he criticised for his favourable attitude towards foreign electricity companies —as well as for resting too much at weekends—has since resigned. The naval officer has been put under arrest for a month for his carelessness, but does not yet appear to have been relieved of his government post.

★

Strong-arm methods will probably keep Argentina's military rulers in the saddle until they are ready to step down. Their problem then is a familiar paradox: while determined to give the country free elections, they are equally determined that the country shall choose a democratically minded government. And at present the most popular candidate for the presidency is Dr Frondizi, the leader of the left-wing of the Radicals; no less than seven Radical factions are registered with the electoral tribunal. Dr Frondizi is able and courageous and has a fairly clear-cut political programme of state control and extensive nationalisation; he has also the makings of a caudillo. The nationalists, who might run the Radicals close at an election, have no presidential candidate; their obvious leader, General Bengoa, is in prison for conspiracy. The traditional conservatives under Dr Solano Lima will probably not count for much. The elections to the constituent assembly will provide a useful trial run: if the people's favourites are not considered democratic enough, the government may be tempted to postpone parliamentary elections for a time.

Fishy Subsidy

IN 1950 a subsidy was granted for the catching of white fish in near and middle waters around Britain as a temporary expedient "pending the application of long-term measures." An act of 1953 redefined the position, and laid down that the subsidy was to expire in 1958. A new bill read for the second time last week extends the subsidy until 1961 or 1963, allows further grants for the improvement of old but sound ships, and also introduces a new subsidy for herrings.



The reason for this latter extension is that catches of herrings have been reduced by nearly a third in the last two years. Partly this is because herrings have moved away from waters off the east coast of England, a process that can hardly be reversed by legislation. Partly, however, it is because Scottish fishermen—whose boats are equally suit-

able for catching herrings or white fish—have had the commercial sense to see that, if they concentrate on catching white fish, they will qualify for the subsidy payments. The first subsidy—however well intentioned—distorted the pattern of production, so that the new one is needed to put it back into shape. Sir Robert Boothby was even moved by the thought of his seafaring constituents to plead that the herring subsidy should be paid on the basis of hours spent at sea, regardless of the numbers of herrings caught—thus, presumably, encouraging people to go on fishing for herring after nature herself has persuaded them to depart from the fishing grounds.

Amid all the protestations made from his own side of the house that the subsidy (which will be limited to £17 million all told during the life of this bill) was only a short-term measure, Sir Robert at least had the honest pessimism to admit that he thought Britain would never get rid of subsidies on fishing or farming. Unless enough querulous eyebrows are raised after debates like that last Tuesday, this may prove to be sadly true.

Growing Trade with Germany

BRITISH trade with Germany continues to show proof that some of the most lucrative markets for an industrial exporter like Britain are to be found, not in the deserts or backwoods of undeveloped countries, but in the cities of the highly developed economies which are our chief competitors. The trade agreement renewed this week is relatively unimportant in itself, for it is concerned only with the 4 per cent of British exports to Germany and the 6 per cent of British imports to which quotas still apply. But it deserves celebrating, for British exports to Germany, driven by the boom and helped by Professor Erhard's tariff cuts, continue to grow with a steadiness and rapidity unrivalled elsewhere. They grew by more than a fifth last year alone, despite the German credit squeeze; this year with a further upsurge in prospect in Germany, and with the promise of more tariff cuts, there is no reason why the growth should falter. British exports to west Germany are now about as large as to the whole of South America; they have grown more since 1938 than have British exports as a whole.

Trade in both directions has been growing, not only in volume, but also in variety. The expansion has been composed not only of traditional products—woollens from Britain, chemicals and certain types of machinery from Germany—but of a broadening range of the other goods needed by wealthy developed economies—consumer durables like washing machines and electric irons, and a limitless range of machinery and industrial equipment. In the investment booms in both countries, indeed, the exchange of capital goods—special tools from Germany, fork-lift trucks from Britain—has provided an invaluable element of flexibility, stopping gaps when delivery dates at home are long, supplementing the technical resources of each economy with the latest devices and special products of the other.

Partnerships between producers, like the recent agreement which the British Motor Corporation has concluded to supply engines to a German truck manufacturer or the contract for Rolls-Royce engines for German troop-carriers, are playing a growing part as a supplement to normal trade. And though British firms have not perhaps been so active since the war as the Americans have been in seeking technical tie-ups with German firms, here, too, plenty of fruitful arrangements already exist. The satisfactory growth of trade and business relations between industrial Britain and Germany is a good augury for British industry's chances if the barriers drop and the European free trade area comes into being.

Appeal to the Country

Now, let us see what are Lord Palmerston's claims to the support and confidence of the constituencies. In the first place, he is indispensable. He is, for the moment, if not the one possible Premier, at least the one possible leader of the House of Commons—among Liberals we mean, for we may safely ignore the remote chimera of a Tory Ministry. This is a most grave consideration. No one else has either weight, popularity, public confidence, or experience enough, for that delicate and exacting position. Lord John Russell's tactics of late years have bewildered the country and entirely shaken the confidence of the party which he once led; and though many might desire to see him again in office, those who would venture to entrust him with the *lead* are few indeed. . . . Mr Gladstone, unquestionably the ablest and most formidable orator in the House, is we fear the most unpopular with all sides;—with all his wonderful powers he is deficient in the special qualities needed for the post; he wants the tact, the moderation, the persuasive sagacity, the forbearing and conciliating temper indispensable in a leader; he is too fierce, combative and merciless. He is very formidable to his enemies, but he has a singular faculty for making them. His tongue, which is his grand weapon, is also his grand danger. The ability of Sir James Graham none will dispute; but few men have a smaller following, or would be less cordially welcomed to the highest place. Mr Sidney Herbert might answer; but he has scarcely made himself prominent enough to be considered as a candidate for the leadership. Yet in these four men we have named, we believe, all Lord Palmerston's possible competitors. In the second place, it is undeniable that to Lord Palmerston's Government, and in a considerable measure to Lord Palmerston himself, we owe mainly the honourable termination of the war and the satisfactory terms of peace. . . . Since the conclusion of peace, the conduct of Government has only been seriously impugned on two occasions—the dispute with China and the hostilities in Persia. Here the issue is clear and narrow. The very policy on which Lord Palmerston demands the acquitting and applauding verdict of the country, is precisely that on which his antagonists call for his condemnation. They complain that he is prompt to resent insults to the British representatives and extend his protection over British citizens. His friends affirm that this is his greatest merit and a sign of his true wisdom.

Letters to the Editor

Bank Rate Background

SIR—You refer to the official defence of the recent reduction of Bank rate on the ground that it would favour funding, and allow a "taut control of the volume of the banks' liquid assets." And you infer that "any case for a further reduction of Bank rate" would rest on this argument, rather than on the principle of "following" the short-term market.

That there is no case for this latter principle, I entirely agree. The market rate of discount has only a very limited influence on short-term borrowing. For the great majority of borrowers it is the overdraft rate that matters, and so long as overdraft rates are determined by Bank rate, a drop in the discount rate causes no considerable relaxation of credit. As you point out, there is not "any compelling technical reason why the bill rate should not diverge considerably from Bank rate for a time." One of the objections frequently urged against a high Bank rate is that the cost to the Treasury of the floating debt is increased. But, if the bill rate can be lowered by funding operations, while the Bank rate and overdraft rates are kept up, this objection is removed, or at any rate its force is diminished.

It is, of course, true that the link between Bank rate and overdraft rates is a mere convention. In the nineteen-thirties the banks reduced their overdraft rates below what had been the conventional minimum when discount rates fell very low. But they were then concerned to extend the volume of their advances when other earning assets had become unremunerative. So long as they have regard to their liquidity ratio (to say nothing of the credit squeeze), that motive will not operate.

A low discount rate, it may be said, does nothing to stimulate the gilt-edged market, so long as overdraft rates are high. But is not the idea of stimulating the market by cheap money itself misconceived? Easy borrowing favours funding because it encourages the purchase of securities with borrowed money—surely a poor way of helping "to keep money taut." In the present state of the investment market funding is expensive, because investors prefer to hedge against inflation by buying shares rather than fixed interest securities. The best way to improve the market is by dispelling the fear of inflation.

Undoubtedly a continuance of funding measures is desirable. But if it is associated with reductions of Bank rate "following the market," it will defeat its own ends.—Yours faithfully,

London, W.8 RALPH HAWTREY

On the Fringe of Planning

SIR—Control over hire purchase is based on the common-sense argument that the anticipation of future ability to consume is, in an inflationary situation, socially one of the less objectionable expenditures to postpone. Your argument that the throttling back of hire purchase frees the *same amount of money* "to chase other things" is totally fallacious. It frees only the instalments due—i.e., a fraction of the total. A fall of hire purchase credit brings about a cut in demand.

In the Britain of the nineteen-fifties, where imports of steel and machine-tools have played an important part in causing balance of payments crises, the cut in durable goods consumption is the only alternative to a cut in investment. Surely *The Economist* does not advocate a cut in investment, the increase of which is the only way to escape from the continuous recurrence of our international economic malaise. The most terrible danger we face now is that in the name of an "incentive Budget" we shall dissipate our last nest-egg, the cut in our overblown arms expenditure—on an increase of luxury consumption.—Yours faithfully, T. BALOGH

Balliol College, Oxford

From Shadow to Substance

SIR—In your article entitled "From Shadow to Substance," as indeed in most other articles published by *The Economist* on Arab-Israeli tensions, I notice a regrettable bias in favour of the Jews. A similar bias on the part of the New York *Daily News* or *Evening Post* is usually explained by aversion to kill the goose that lays the golden eggs. I hate to think that a like criterion is dominating your attitude.

Egypt was invaded by Britain, France and Israel. You rightly denounced your own government for her part in the game. When the United Nations urged the invaders to pull out you saw fit to recommend obedience. You did not object to British and French withdrawal from Suez, without guarantees or conditions. But when seventy nations, including your own, called upon Israel to quit Egyptian territory you call this "unconditional surrender," and you call "the refusal to admit that Israel could properly seek conditions" a mistake. You, therefore, line up with Israel and France against the judgment of humanity as represented by the General Assembly of the United Nations.

You accuse Egypt of "quietly breaching the international order" but forget about Israel's defiance of United Nations' orders over the last nine years, including the order relating to the internationalisation of Jerusalem.

I think that it is high time your readers were told that Israel is a cancerous growth in the most sensitive part of the Arab body; that the Palestine Jews are a bunch of European invaders who captured a piece of Arab territory dear to their hearts and threw one million innocent people out of their homes into refugee tents; and that no Arab will ever accept the existence of Israel as a permanent fact.—Yours faithfully, ABDUL AMIR KUBBAH

Ministry of Economics, Baghdad, Iraq

Education Costs

SIR—A newly appointed secondary modern master on £450 per annum could be forgiven some wry thoughts on contemplating his "flock" of 40 who are allegedly costing the country £3,080 per annum. Even a primary master on the £900 maximum could have similar reflections about the £1,880 cost of his class of 40.

Could it be that education has become top heavy with administrative costs when so much more is spent *outside* the classroom than in it?

Your figures presumably include the cost of school meals, medical and dental services; are these not social services rather than educational?

Side by side with an apparent prodigal expenditure on education goes a niggardly allowance system for classroom essentials. Most authorities allow about 16s. per year per primary child; this has to cover text books, exercise books, chalk, pencils, pens, ink, rulers, art materials, craft materials, toilet rolls, etc., etc.

We spend more on the child's mid-morning milk.—Yours faithfully,

Liverpool CHARLES MURPHY

Amalgam of Accountants

SIR—The following suggestions are given with a view to raising the standard of the accountancy profession as a whole.

1. Assuming the integration scheme goes through, the Association of Certified and Corporate Accountants to absorb the remaining bodies of accountants.

2. Unqualified practising accountants as at a specified date to be listed and called "registered accountants."

3. As from that date no one to be allowed to practise as a public accountant unless he is a member:—

(*a*) of the Institute,

(*b*) of the Association who has had a minimum service of (say) five years in a professional accountant's office, or

(*c*) a "registered accountant."

Eventually group (*c*) would disappear and the Institute and the Association would be left to represent the accountancy profession.—Yours faithfully,

Books & Publications

German Destiny

THE HITLER I KNEW.
By Otto Dietrich.
Methuen. 286 pages. 18s.

THE DEVELOPMENT OF THE GERMAN MIND.
By Frederick Hertz.
Allen and Unwin. 524 pages. 35s.

FROM 1931 until within four weeks of the end Otto Dietrich was one of the twenty or so stock functionaries whom Hitler liked to have permanently at his beck and call, sometimes to do a job of work, at others to ward off loneliness. For the chosen it meant unfailing attendance day and night, either on the stage or in the wings, wherever the Fuehrer set up his headquarters. And it usually meant travelling with the Fuehrer, as on that macabre expedition to Munich in the early hours of June 30, 1934, the object of which was to murder Roehm and company. "We who were in his party" (they had just left a wedding celebration at Essen) "had no idea what was up until his adjutant told us, while we were sitting in the plane, that we had better release the safety catches on our guns."

It was as an admiring young journalist that Dietrich was first brought into contact with the leader of the Nazi party. Having performed what was expected of him by writing "With Hitler to Power," he was rewarded before 1933 was out with the post of Reich Press Chief. But, as he modestly points out, Hitler had already made Goebbels the real boss, though "this did not stop him from installing a 'Reich Head of the Press' (Amann) and a 'Reich Press Chief' (Dietrich)." It seems that Dietrich's unenviable and consequently undisputed prerogative was to sprint to the Fuehrer with any piece of hot news picked up from foreign broadcasts. He is not one of the titillating raconteurs of the "I was Hitler's Toothbrush" school, whose stories have found a gaping market since the war. He writes only of what he saw himself and does not pretend always to have had a good view. He put his manuscript away when he had finished, with instructions that it should not be published until after his death. He died in 1952.

So long as he sticks to what he calls "Scenes from Hitler's Life," Dietrich is on firm ground. But when he takes to philosophising the result is this sort of nonsense:

> It was not ill will, not criminal desires, which brought the nation to its present pass and which won for Germans the base reputation of being politically amoral. This nation followed Hitler in good faith and, alas, all too credulously; the blame is not the nation's but his alone. . . . Hitler will not have lived in vain for the German people, for he was obviously sent by Dark Powers as the executor of an unknown destiny.

Most Germans, when they are being honest with themselves, do not pass the buck so readily. They acknowledge the existence of another frequent mischief-maker—*der innere Schweinhund.*

★

"We Germans," wrote Luther, "are Germans and remain Germans, that is swine and beasts without reason"; we are "a wild and furious people, half devil, half man." How are we to explain, how are we to evaluate such judgments? Mr Hertz's massive book, as full of facts as an egg is full of meat, sets out to give us, if not an answer, at least the factual basis for an answer, by probing what he calls "the German public mind." Since the "public mind" is not "a uniform and persistent force," but "a variety of divergent trends," his solution in this history of Germany from the earliest times to the middle of the seventeenth century is to seek out "the political and social feelings, opinions and aspirations of the various groups forming the German people."

Mr Hertz's idea is plausible enough, its execution more difficult. After the invention of printing, evidence runs fairly freely; but over half of Mr Hertz's book deals with the Middle Ages, for which we know singularly little of most of the "groups forming the German people." Only the clergy, with its near-monopoly of writing, was able to express its views adequately; but clerical views were only one aspect of the "public mind." For the rest, a hint here and a hint there make inferences and tentative conclusions possible; but the direct evidence is little more than bare bones, which only historical insight and imagination can clothe in flesh.

Mr Hertz, on the other hand, has taken the view that the facts speak for themselves, and the more facts, the more clearly. His book is erudite, well-informed and encyclopædic; but its method tends also to make it arid and indigestible. To multiply the detail of political history by the detail of literary and intellectual history, by "potted" summaries of tracts, treatises, pamphlets and poems, doubles the size and provides a vast quarry of miscellaneous information, but it does not necessarily double the insight. Whether anything so intangible as feelings, opinions, aspirations, states of mind can be captured by direct assault in this way is at least dubious. Most of the treatises Mr Hertz so painstakingly analyses circulated in a narrow circle; it would be hard to demonstrate that they were "widely read" or "reflected public opinion" or interested "the great mass of the people." As Mr Hertz admits of Luther's controversial writings, "it cannot be assumed that the public mind was able to follow the intricate arguments." What, then, is the relevance of the fact to the theme?

Fact without interpretation, Mr Hertz appears to think, is a guarantee of empiricism and objectivity. In reality, like other historians, he writes with a thesis—the thesis that the curse of German history was particularism and the early failure, by contrast with France or England, to establish a national state. Frederick I is criticised because he "failed to develop the forces making for national unity." Why he should have developed them remains obscure. There is something incongruous, in the mid-twentieth century, in the view that everything which made for national unity was "progressive," and everything that hindered it regressive—particularly where Germany is concerned. The Austrian poet, Grillparzer, wrote a century ago that the path of western civilisation leads from humanity through nationality to bestiality. It was the particular destiny of Germany, under Hitler, to prove him right, and, after four centuries, to justify Luther's diagnosis.

Socialist Satire

A VOYAGE FROM UTOPIA.
By John Francis Bray. Edited by M. F. Lloyd-Prichard.
Lawrence and Wishart. 192 pages. 21s.

J. F. BRAY, the early English socialist, wrote this satirical account of an imaginary voyage to Brydone, Franco and Amrico as an answer to those critics of "Labour's Wrongs" (1839) who had declared him to be too Utopian. The critics, including Samuel Smiles, complained that his earlier analysis was "visionary" and impracticable and that he saw no redeeming features of any kind in the British social system. Bray's reply (1840-41) was never published in his long lifetime. He moved to the United States in 1842 and stayed there until his death in 1897. Only the untiring research of an American socialist brought the manuscript to light, and Dr Lloyd-Prichard now prints it for the first time with an interesting and useful introduction.

It deserves reprinting, although it is a rather heavy-handed and repetitive piece of work, inferior in style and forcefulness to the relatively well-known "Labour's Wrongs," and certainly no answer to the critics. Bray's occasional glimpses of Utopia in the book—a Utopia endowed not only with a perfect social system, but with mysterious and undivulged new sources of light and power (even with a flying machine)—are still more impelling than his completely one-sided account of contemporary British society. The sections on America and France are patchy and completely uninformed, for at that time he knew nothing of either country. The value of the book lies in its intricate interweaving of some of the main strands in early socialist thought—the labour theory of value, the "reserve army," the stress on abiding class antagonisms, the division of history into phases and the prophecy of impending revolution. In addition, Bray violently attacks the doctrines and practices of the "pestos" of both church and chapel, the insolence and idleness of the "aristos," the parasitism of the "sharkos" or lawyers, and the debasement of women.

All students of early socialism will welcome this passionate and on rare occasions genuinely powerful addition to existing literature. Other readers will find in it a half-successful imaginative statement of a carefully considered point of view, which contrasts sharply with conventional contemporary statements about society and about British society in particular. All Bray's hopes were grounded in the future, and it is more illuminating today to consider why the future is different from that which he anticipated than to try to enter the frontiers of his Utopia.

Keeping Them Out

BARRIERS TO NEW COMPETITION: *Their Character and Consequences in Manufacturing Industries.*
By Joe S. Bain.
Harvard University Press. London: *Oxford University Press.* 339 pages. 45s.

HOW difficult is it for a new firm to enter an industry and to establish itself as a viable competitor? This is an important question for all concerned with the structure of manufacturing industry or with the problems of monopoly. Professor Bain, of the University of California, presents his answers in this useful book.

Apart from difficulties to entry that might be caused by "strong-arm" tactics of the established firms, Professor Bain distinguishes three types of "barrier" that may make it difficult for the newcomer. "Economies of scale" may be so marked that an additional firm, of efficient size, could not be accommodated in the market without affecting prices so much as to deter new entrants; that is, there is a barrier when the optimum size of firm is large relatively to the market. Secondly, advertising and experience will have accustomed buyers to the products of established firms. Thirdly, established firms may control the "know-how" of key processes, and strategic sources of materials for the industry. The very large initial investment required in some industries for an outsider to start anew may also deter him: if an established firm wants to expand production, it is likely to have easier access to the capital market. After a somewhat drawn-out general discussion, Mr Bain examines these barriers in a group of twenty industries in America, including the manufacture of products as diverse as tractors, fountain pens, gypsum and meat. This major part of the book is excellent, and skilful use has been made of information and estimates supplied by businessmen and of detailed studies of particular industries.

The results of his enquiry can be expressed broadly as follows. "Economies of scale" make entry hard for a newcomer in only two of the twenty industries, automobiles and typewriters; in these, new firms would find it unattractive to enter even if ruling prices were up to 10 per cent above the competitive level. But "the main culprit in establishing excessive or very high barriers to entry would appear to be product differentiation." The preference of customers for established brands, that is, would make the entry of new competitors very thorny in the industries producing tractors, typewriters, cigarettes, liquor, "quality" or high-priced fountain pens, and automobiles; and "brand-consciousness" is also important, though to a smaller extent, in several of the other industries such as soap, higher-priced men's shoes and petroleum refining. Advantages for established firms stemming from control of patents, key resources, and know-how are found to be slight or small. But the large amount of capital required to start in five of the twenty industries—steel, automobiles, petroleum refining, tractors, cigarettes—does seem to form an obstacle over which a newcomer may find it hard to climb.

This bald summary does not do justice to the author's painstaking examination of the data and commendably careful presentation of his findings. It also cannot indicate the wide range of topics that are considered in the course of the discussion and analysis. Should a similar study of a group of industries in this country be attempted, the standard set by Mr Bain would be a worthy one to work towards.

Art and Economics

RUSKIN AND THE ECONOMISTS
By J. T. Fain.
USA: *Vanderbilt University Press.* 164 pages. $4.00.

THE old wisecrack was that art critics said Ruskin was a fine economist, and economists that he was a fine art critic; but neither was right. He was in fact—like Carlyle, Mill, Edmund Gosse and others—the child of a father who heard duty as the stern voice of God, and was unable to show his son normal animal affection. It warped Ruskin permanently, made him more inflexible after his father's death, and turned him Messianic; the misfit projects upon society his ideal father-figure. Yet much good for a later form of society can come from so warped a personality, though the person himself never may know happiness.

Poor Ruskin first clearly separated out social from commercial costs; he drove the *Economic Journal* in 1898 to warn economists about ignoring social costs; he became a master of English prose and art and architectural criticism, as well as no mean social critic. Yet the American economist Stimson's dictum in 1888—that the bricks for the future building of economic science would rather be made with "Ruskin's earth than with Ricardo's straw"—turned out wide of the mark. Ruskin's supporter, J. A. Hobson, had more influence on Keynes through under-consumption than had Ruskin, with his Messianic rhetoric and social ethics. Ruskin was a psychopath—he could scarcely have been otherwise with such parentage—and like many intellectual social reformers from a privileged class, he knew nothing of the psychology of the workers. He thought this was that of modest children, recognising authority and always ready to ask questions—the right questions. He thought the franchise should be loaded to accord with age, property and education. He confused pure and applied economics—which as early an economist as Nassau Senior distinguished in his introductory lecture at Oxford in 1826. He turned a rigid back on value-in-exchange.

But what an iconoclast, and how necessary, even if the effort blighted him. "Who had not rather have been the Good Thief than Pontius Pilate?" Who had not rather have written "Unto This Last" or "The Stones of Venice" than been, say, Carlyle, or even John

A Critique of Welfare Economics
I. M. D. LITTLE
The first edition (1950) provoked extensive academic discussion, and as a result, there has been some development in its ideas. The author has partly re-written some chapters, either in response to criticism or in defence against it. But the main theme and scope of the book remains unaltered.
Second edition 30s. *net*

The British Tinplate Industry
A HISTORY
W. E. MINCHINTON
Tinplate has been manufactured since the beginning of the eighteenth century. This book is a history of the industry in all its aspects down to the present day. 35s. *net* 21 MARCH
OXFORD UNIVERSITY PRESS

Stuart Mill? In the very political economy of a Kaldor or a Balogh, in the criticism of Ian Little, in the socio-economic idealism of Barbara Wootton or Joan Robinson there is something of the vital romanticism of Ruskin, however abstract and academic their exercises; whereas Carlyle is very dead now. Professor Fain has put economists in his debt by a short, packed, perceptive work which should be published over here. We have had a bit too much lately of other aspects of Ruskin, his literature, criticism and psychopathology. There was much more to him and his life work than that; and Professor Fain's book is an eminently readable corrective.

Canadian Suburbia

CRESTWOOD HEIGHTS: *A North American Suburb.*
By John R. Seeley, R. Alexander Sim and Elizabeth W. Loosley.
Constable. 511 pages. 50s.

"CRESTWOOD HEIGHTS" is about suburbia; it is a study of conditions, values and aspirations in a prosperous suburb of a Canadian city, whose identity remains disingenuously hidden. Here is a successful modern society in evolution, whose problems may be similar to ours because the background is Canada, where powerful British traditions impinge on the standard American way of life.

The book was not planned as a conventional social survey. It was initiated by the National Committee for Mental Hygiene, with the aim of developing a mental health policy for children: from the pursuit of this special objective there emerged a more general study of a community. Comparison with those prewar American classics of the Lynds, "*Middletown*" and "Middletown in Transition," is inevitable. It is worth recalling Robert Lynd's scepticism about general surveys, including his own "Middletown," which raked only the topsoil of society: he believed social research could gain more from vertical digging. Although the "Crestwood Heights" project used this intensive method, it has been unable to avoid falling between the two stools of a community-survey and a treatise on the mental health of children. In part, this uneasy dichotomy may arise from the methods used for the inquiry. The sample was not strictly controlled; the informants were "picked or welcomed" . . . in terms of "availability" as well as of "suitability." This may have been unavoidable, but it has unfortunately inhibited the authors from furnishing statistical data. The qualitative, rather than the quantitative, approach in social studies may lead to greater vividness, as in Dr Zweig's "Labour, Life and Poverty"; but this book lacks that spontaneous imagery which is nevertheless preserved in the relatively scientific studies of the Lynds.

The book is heavy going. Footnotes—very necessary to the text—are banished to a large appendix; the style is ponderous; and there are too many of those *pontifical statements of the obvious, formulated as world-shattering discoveries*, which set the layman against social research. We find, for example, that ". . . the relationship of the Crestwood child to his mother is of particular importance, especially in the earliest phases of his development . . ." or ". . . sex differences between siblings may also open up possibilities of strain within the family, since a girl cannot be treated in exactly the same way as a boy. . . ." By contrast, generalisations of great moment are sometimes made with very little supporting evidence.

Despite these faults, this is an important work. It pinpoints the increasing isolation of the individual family within society, the conflicts that competitiveness may bring both for the child at school and for his parents in their struggle for social establishment, the anxieties of parents and children in a society where, physically at least, almost ideal conditions prevail. If the "Crestwood Heights" residents who collaborated in this inquiry resemble their neighbours, and if this community is typical of the North American scene, we must ruefully conclude that for all man's success in satisfying his material wants, happiness can still elude him.

Land in Israel

CHANGING PATTERNS IN ISRAEL AGRICULTURE.
By Haim Halperin.
Routledge and Kegan Paul. 302 pages. 28s.
AGRARIAN REFORM AND THE RECORD OF ISRAEL.
By A. Granott.
Eyre and Spottiswoode. 301 pages. 21s.

MR HALPERIN'S book gives a most useful survey of Israel's agriculture as it is today, clearly placed in both its geographical and social setting. The author succeeds admirably in clarifying the distinctions between the various forms of co-operative and collective settlement, often a stumbling-block to the foreign reader. One wishes, however, that he had discussed rather more thoroughly the economic, as distinct from the technical, problems that Israel's agriculture is facing today. Its present structure is one of predominantly small farm units producing high-value products: much animal fodder, and most of the grain for animal consumption, have to be imported. It is questionable whether this policy makes the best contribution to the solution of Israel's foreign trade difficulties. Nor is there a critical discussion of the very high capital and current costs of irrigating new areas. One is also left with an unsatisfied curiosity about the relative economic efficiency of the various types of farm settlement.

Dr Granott's volume is intended as a comparative survey of land tenure problems in Israel and abroad. His account of land tenure in Israel brings his former study, "The Land System in Palestine," up to date by describing events ince 1948. The connection of the present Israeli land law with ancient Jewish law, and with the Moslem codes which stemmed from it, is of particular interest. The book, however, is written entirely from the viewpoint of the lawyer, and there is little attempt to relate land tenure to land use. This makes for arid reading and is, at times, misleading. We are told, for instance, that "neither agriculture nor the farmers in Syria have advanced from the low standard of 30 or 40 years ago." This statement appears to be a simple deduction from the fact that Syria is still a country of very large landowners, and no mention is made of the striking advance in mechanical cultivation carried through by the new class of agricultural machinery contractors, within the framework of the old tenure system.

The book's other defect is complacency. It may be very satisfactory for the principle of land nationalisation to be so firmly accepted in Israel, but it is curious to laud this acceptance as a commendably painless process when, as Dr Granott makes clear, it owes so much to the flight of the former Arab landowners. Other countries with agrarian problems cannot ignore those whom land reform would dispossess, yet leave within their borders.

Atomic Power Station for Northern Ireland

Building Britain's first Atomic Power Station at Calder Hall, Cumberland

Further boost to industrial progress in Northern Ireland

On March 5th, 1957, joint announcements were made in the Westminster and Belfast Parliaments of the decision of the Northern Ireland Government to proceed with plans for **an Atomic Power Station of 150 megawatts to be brought into operation in 1963-4.**

The provision of this additional source of power has become necessary to match the rate of industrial growth in Northern Ireland, where 120 new firms have set up since the war. The latest industrial developments announced are those of the Du Pont Company (United Kingdom) Ltd., the British Oxygen Co. Ltd., Chemstrand Ltd., and Light Alloy Construction Ltd.

To Industrialists determined to expand production, Northern Ireland now offers

CAPITAL GRANTS for plant, machinery and new buildings. Other financial assistance available.
12 FACTORIES PLANNED OR BUILDING TO RENT (average 9d. per sq. ft. per annum). Also factories on repayment.
MALE LABOUR IN PLENTY and trainable. Shifts possible. Low labour turnover. High output per man.
NUCLEAR POWER to take care of future needs.

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an *indication to* that effect; all others are the work of the editorial staff in London.

Doctrine on the Books

Washington, D.C.

THE Eisenhower Doctrine is now law, nine weeks after its unveiling by the President in an atmosphere of the utmost haste and urgency. And Mr James Richards, the President's Special Assistant, left for the Middle East on Tuesday to find out what can be accomplished with its economic provisions. But as the middle eastern crisis entered a new phase this week with the substantive issues of the Suez Canal and the Israeli frontier still demanding solutions, the President planned a slow sea voyage to recover his health before the Bermuda Conference, while the Secretary of State was in the Far East. In a sense this was symbolic, since United States policy in the Middle East is at present being defined not by Mr Dulles, but by Mr Hammarskjöld.

Yet it would not be fair to conclude that the Eisenhower Doctrine is meaningless and that, now Israel has withdrawn, the United States has become indifferent to its problems. The Administration is acutely conscious that, although the "assumptions" expressed about Israel's "hopes and aspirations" not being "in vain" are not legally binding, any undue softness towards Egypt might provoke a new round of Anglo-American recriminations that would be a sad preliminary to the meeting with Mr Macmillan in Bermuda. But the President is determined to achieve his objectives by slow, long-range pressure and manoeuvre rather than by dramatic gestures. The essence of his approach was contained in his remark at a recent news conference that it would be a mistake for America to

> try to stand up above the world, flex its muscles, say "I am the policeman," and go everywhere and try to compel people to follow its own dictates including its form of government and everything else.

This Administration believes that one result of the great powers having nuclear weapons which they dare not use except in great extremity is that small powers are in a relatively stronger position than before. Israel was especially vulnerable, but normally such powers cannot be cuffed into compliance. The United States wants to develop new techniques and evolve new precedents for the resolution of conflicts that are peripheral to the cold war.

The Administration has had a good sample in the last few months of the problems it is up against. Senator Knowland's attack on the "double standard" that the United Nations—and the President—were applying to Russia over Hungary and to Israel over Gaza had strong emotional force. The Administration's real case was that no one ever seriously supposed that the United Nations could do anything about a conflict which threatened the Soviet position in Eastern Europe, but that the organisation ought to be used to keep other potential conflicts from being entangled in the East-West battle lines. Even after the Russian arms deliveries, the United States believed that the Arab-Israeli dispute could be kept in the category of issues capable of being solved through the United Nations.

This is too subtle an argument to be easy to present in public, especially by a President fond of expressing himself in homely moral aphorisms. The explanation was made still more difficult because the Eisenhower Doctrine, in so far as it proposes American intervention in the Middle East for the one purpose of fighting communism, seemed to run quite contrary to the idea of insulating the area from the cold war. In fact, the doctrine was the direct result of the Anglo-French intervention. The President and Mr Dulles, who began by being outraged because it offered the Russians an opportunity to intervene in their turn in the Middle East, ended by becoming worried that the very vehemence of American dissociation from Britain and France might have the same result.

★

The doctrine was intended to restore the balance and by so doing to repudiate the extreme pacifist conclusions that were being drawn from the President's pronouncements during the Suez intervention. But the constitutional limitations on the President's power have so often been pleaded as reasons for avoiding American commitments that foreign countries have learned to be sceptical unless Congress is associated with the Administration. Since Mr Eisenhower did not want to appear to be thinking only of force there had to be economic provisions, however sketchy; to win the assent of Congress quickly, it was announced at the outset that Mr Richards would handle the money. The main qualification of Mr Richards, an amiable plodding South Carolinian with practically no experience of diplomacy, was that, in his last year as Chairman of the House Foreign Affairs Committee, he was responsible for cutting $1 billion off the bill for foreign aid.

This technique worked like a charm in the House of Representatives, but fell very flat in the Senate. The foremost reasons for this were the disappearance of Senator George from the chairmanship of the Foreign Relations Committee and the hamhanded way in which the scheme was leaked to the press before being shown to the congressional leaders. Senator George had been the embodi-

ment of nonpartisanship in foreign policy. He frankly admired Mr Dulles, was flattered by the reverent treatment he received from him and the President, and inspired equal awe among most of his colleagues in the Senate. Two years ago he got the Formosa resolution through in three days; the President expected the Eisenhower Doctrine to take no longer. But Senator George's retirement at 79 had made way for older blood. Senator Green, the new chairman, is nearing ninety and, though his faculties are alert, the dominant tone of the committee has been set by Senator Fulbright, a great admirer of the parliamentary system of responsibility, who tried to use the hearings to force Mr Dulles to resign.

The situation was brought under control only when Senator Lyndon Johnson, the Democratic leader in the Senate, who is not a member of the Foreign Relations Committee, asserted himself. Becoming seriously worried at the impression of division and impotence that the Senate's desultory procedures might be presenting to the world, he moved with his habitual deftness from his customary domestic field into the unfamiliar one of foreign affairs. On the one hand, with the full support of Senator Knowland, the Republican minority leader, he made it absolutely plain that the President would have no middle eastern resolution until the Senate knew there would be no sanctions against Israel. On the other, he divided the opposition and built up a coalition that could guarantee the doctrine an impressive majority whenever he gave the word.

In practice it is doubtful if Mr Dulles ever expected to have to use sanctions. But Senator Johnson has obviously acquired a new influence over the Administration's policy, which will be more independently exerted than that formerly exercised by Mr George. The weakening of the President's position in Congress can, however, be exaggerated. The Israeli withdrawal was obtained without the United States ever publicly threatening sanctions in so many words and without the Administration ever publicly retracting its willingness to implement sanctions if they were voted. This, after all, was its aim.

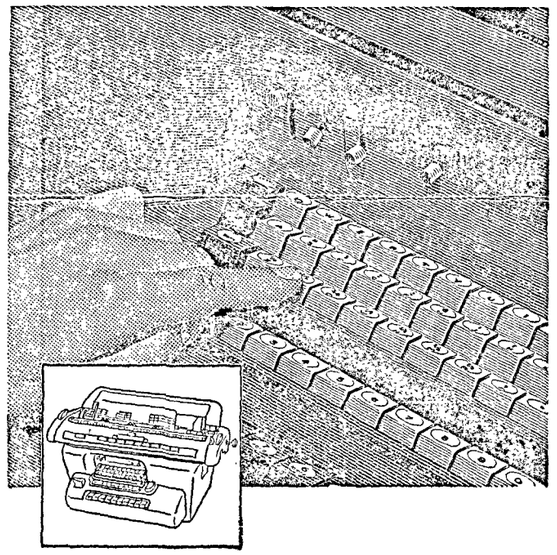
Whatever the British public may hope for from the Bermuda meeting, it should be emphatically aware that the President is likely to go on conducting policy in the present way. Congress is not in a position to change anything radically. The President has conceded that in the past the United States, like other nations, was insufficiently alert to Egypt's defiance of the United Nations. The task before him is to pursue his chosen policy of working unobtrusively through the machinery of the United Nations without insensibly falling into the old sin of immobility. No one in Congress, for all the criticism, has yet asked him to do anything more forceful.

Poles Apart

THE Polish mission which arrived in Washington a fortnight ago with a shopping list $300 million long has presented the Administration with the delicate and difficult problem of how to avoid a dangerous disappointment to hopes the Administration itself raised. This is an inauspicious year for foreign assistance of any kind, particularly to a communist state which has caught Senator Knowland's disapproving eye. Yet to send the Poles away with too small a return for the political risks they have taken—a figure as low as $30 million has been mentioned—might force Poland back into dependence on Soviet Russia and frustrate the progress toward liberation which Mr Dulles has sought so ardently.

Americans of Polish extraction are behind Senator Kennedy's plea that any step should be taken which promises to lessen Soviet domination over Poland. This view is shared by the experts, otherwise the National Security Council would not have approved the invitation to the Polish mission. Mr Gomulka needs what the impeccably respectable Fairless committee called "a demonstration that a free system is far superior to an authoritarian one in providing better living conditions." The other satellites will be watching to see if he succeeds.

The agricultural surpluses of cotton, wheat, fats and oils which America wants to dispose of and which the Poles are seeking to the tune of $200 million are not legally out of reach; Mr Dulles's finding that Poland is not under Soviet domination means that Poland can pay for them in its own currency. The difficulty, which may be got round by stretching out deliveries, is that virtually all the $3 billion appropriated to finance such sales has been used up and Congress has yet to give the President the additional $1 billion for which he has asked.



It is Poland's request for loans—$100 million from the Export-Import Bank and $30 million in government-guaranteed loans from private banks for machinery and fertiliser—which seems to fall under the ban of the Battle Act. The President has power to make an exception from the Act's prohibition of economic or financial aid to countries selling goods to nations threatening the security of the United States, but not when war materials are involved. The last resource is the President's own emergency fund, but it so demonstrated its value, during the Hungarian crisis, that very little is left. If the Administration re-reads the Battle Act, which was passed in 1951 before the Polish problem was foreseen, it may be surprised to find that one of its announced purposes is "to assist the people of the nations under the domination of foreign aggressors to re-establish their freedom." Unfortunately that is the letter, not the spirit, of the Act.

Time to Buy?

FROM A SPECIAL CORRESPONDENT

THESE are anxious weeks for the manufacturers of consumers' goods. The period from March 1st to Easter is usually regarded as the testing time for the new year's styles in items as diverse as automobiles and women's hats, and the vigour of the "spring upturn" in consumer buying is viewed as an indication of the strength of demand in the months to come. Some manufacturers have tried to arouse interest with "1957" models brought out as early as last October. But a new season's buying generally does not begin until after people have recovered from their Christmas shopping and March income tax payments, and until the weather is good enough to encourage a trip to the shops or a trial spin in one of the new cars.

• For new ideas in business...

THE KEYS

that electrify accountancy

To mechanise your accounts department with Foremost is an electrifying experience in more ways than one.

Not merely does this simplest and most advanced of all accounting machines save time, labour and money... it is tailored to your exact requirements. That is to say, you don't just buy a Foremost. You first call in the Man from Remington Rand. He analyses your problem. Submits a plan. Once that is agreed, Remington Rand help you with the work leading up to the installation: then send an expert demonstrator to ensure the ease, flexibility and versatility of its operation.

Foremost is merely one of the many modern methods devised by Remington to stream-line the day-by-day efficiency of business operations. The Man from Remington Rand will gladly call upon you to discuss their application to your own problems — without obligation.

Send for the man from

Heat where you want it

Use electricity and bring the heat to the job instead of having to bring the job to the heat. Heat can be applied wherever it is possible to bring a pair of wires—and so the heating process can be right in the line of production.

You get much finer control with electricity, too. Temperatures can be controlled automatically—and the constant heat value of electricity means that you know that the treatment is precisely what is required. Not only temperatures but the operation of a complete heating unit can be controlled automatically. Electric heating equipment can be arranged to start, run and shut down to any process requirement or time and temperature cycle.

Heat where you want it, perfect control, cleanliness, lower labour costs and better working conditions are some of the advantages of using electricity for heating.

Heating is just one of the many ways in which electricity plays a vital part in the drive for greater productivity.

Electricity increases Productivity

Ask your ELECTRICITY BOARD for advice and information or get in touch with E.D.A. They can lend you, without charge, films about the uses of electricity in industry. E.D.A. are also publishing a series of books on Electricity and Productivity. Titles now available are: Electric Motors and Controls, Higher Production, Lighting in Industry, Materials Handling, and Resistance Heating. Price 8/6, or 9/- post free.

Upstream!

Most people watching a salmon swim upstream wonder how he does it. Seems like a lot of exertion to move from one wet spot to another. To the salmon, though, the compulsive drive upstream cannot be denied.

The titanium industry also has been fighting upstream these past five years. A succession of production rapids and metallurgical waterfalls have been surmounted. The dangerous hydrogen whirlpool was successfully skirted. The industry has now moved through the less white headwaters to fully competitive equality with other structural metals.

Titanium alloys of high strength, light weight and outstanding corrosion resistance are available from T.M.C.A. in all mill forms and in a full range of sizes and gages — sheet, bar, billet, extrusions, tubing and wire. Special heat-treated sheet of very close gage and flatness tolerances is in production for advanced aircraft and missiles.

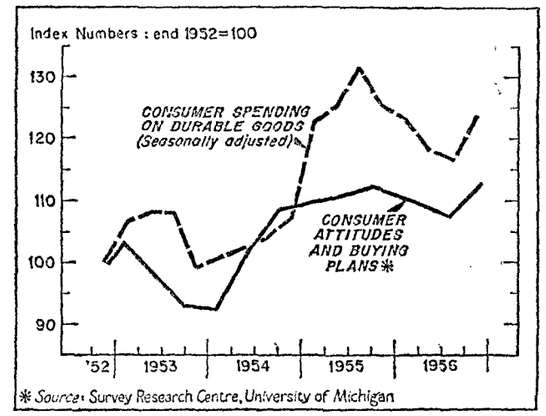
Further expansions of sponge production and metal finishing facilities at T.M.C.A. are bringing titanium within reach of an ever-expanding market. Technical information and specialized engineering services are available for solving those applications having a strength, weight or corrosion challenge.

. . . FIRST IN Titanium

TITANIUM METALS CORPORATION OF AMERICA, 233 Broadway, New York 7, N.Y.

To manufacturing companies burdened with large amounts of extra capacity, and anxious about the levels of their own and their dealers' stocks, the test of consumers' intentions is perhaps more important this year than in any since the war. In the automobile industry, for example, a normal spring increase of 20 per cent in monthly retail sales would indicate that 6.5 million of the 1957 models would be needed. Anything less would cause the factories to revise their estimates downward toward 6 million, cut production plans, and order smaller quantities of steel, glass and other materials. To the textile and clothing industries, brisk sales this Easter could mean a highly profitable year, instead of one of continuing doldrums. Manufacturers now have the capacity, which they lacked just after the war, to vary their output widely according to demand. But they cannot decide between different schedules of production, with all this implies for stocks and for possible further expansion, until reports from the shopkeepers come in.

It is amazing that so little is known about how to forecast consumer buying. An enormous amount of statistical work has failed to reveal any reliable seasonal pattern that can be used to predict spring purchases of cars and other durable goods. There are established relationships between spending and the disposable income of consumers that hold good over long periods of time. But in any one year there may be sharp variations from them. Therefore, any forecast made before the results of Easter buying are in is largely a guess about the consumer's mood.



In order to improve the accuracy of such guesses, manufacturers have sponsored a considerable amount of research on consumer psychology. The most notable work has been done by the Survey Research Centre of the University of Michigan, which, in addition to its annual report for the Federal Reserve Board, each year makes three surveys of consumers' attitudes.* In these surveys, people are asked how they feel about their own financial situation, about business conditions in general, about the prices and styles of new models and about their plans to buy specific goods. The answers have proved fairly accurate in forecasting the share of their income people are prepared to spend, and the centre's index of consumer attitudes, based on the ratio of favourable to unfavourable responses, can be correlated with the total sales of durable goods from 1952 to 1956, although it does not work as well for specific items.

One of the great achievements of these surveys has been to establish the normal attitudes of consumers; in general, they have shown that American families believe that the United States is having "good times" and are not much worried about their own financial situation at present or in the future. It would evidently take a serious and prolonged recession in business, accompanied by widespread unemployment, to change this attitude. Statements by economists and businessmen about declines in the stock market, the brief recession of 1954, or such events as the Suez crisis had no significant effect on the attitudes of consumers.

There is no evidence, either, that people feel that they have enough durable goods. In fact, the families that own the most household appliances are the ones that most frequently express the desire to have more. In general, therefore, there is every reason to believe that consumers today are as optimistic as at any time in the postwar period, as much interested in new products, and as willing to borrow if necessary to acquire them.

* The Centre's work on consumer opinion was described in two articles in *The Economist* of July 21, 1956, and August 4, 1956.

The real question is whether the present attitudes of consumers favour the sort of strong upswing in buying that occurred in 1955, or a gradual increase such as took place in 1956; at many manufacturing plants this would make the difference between capacity operations and relatively slack times. On this point, the latest report of the Survey Research Centre indicates that buying in 1957, while more vigorous than in 1956, is not apt to surge upward as it did two years ago, chiefly because so many families say that

prices are "too high." There are more people who intend to buy new cars than there were twelve months ago, but the number is still much lower than it was in 1955.

Manufacturers do not regard these surveys as decisive. They are waiting for the actual figures on spring sales. Moreover, there is still time for merchants to tempt the public with special price concessions and, in items such as clothing, with new styles. But unless the next few weeks show a pronounced uptrend, the rest of 1957 must be expected to be just average (by recent standards) for consumers' goods. The suspicion is growing that it will take another year of growth in consumers' income, with a chance that prices meanwhile can be held more stable, before really large gains are made in the sales of durable goods. Another year also will increase the chance that new styles may catch on. The motor industry, which for two years has failed to tempt buyers with its new models, is not likely to fall down a third time. For this reason, a failure to achieve more than modest gains in sales this year would not be regarded as a disaster. It would, in fact, increase the chances of a "big year" in 1958.

Partnership Against Drought

As President Eisenhower sent Congress his proposals for the relief of the drought in the Great Plains, it was already being relieved in the southwest by a heavy rainfall. But three million acres of land had been damaged by wind erosion during this season's gales and another 29 million acres were ready to blow because they had no cover of growing plants to hold down the soil. The present rains will help this year's pastures and crops but it will take a lot

more to build up the moisture in the subsoil and to restore the fertility which has been drying out of the soil for years. The proposals, amplified in an accompanying letter from the Secretary of Agriculture to the President and in the report on the special conference of experts held in Kansas two months ago, fall into two categories: emergency help, mainly a continuation and extension of existing programmes, and long-range plans to prevent future droughts from becoming disasters.

In the first category is repeated the President's budget request for $76 million to provide feed for livestock, to refinance farm indebtedness and to expand soil conservation measures. For the last purpose, particularly in connection with the deferred grazing scheme, under which farmers are paid to allow the grass to grow by keeping their herds off it, legislative changes are needed, as they are also to improve the credit services which the government offers to farmers. More money is also wanted for the control of grasshoppers. This is a less ambitious programme than that which has already passed the House under Democratic sponsorship and which is opposed by the Administration because it would cost about $25 million a year.

The most controversial of the Administration's ideas is that in certain, so far unspecified, cases, state governments would be required to put up 25 per cent of the cost. In the past three and a half years, government drought relief has cost $658 million, all but one per cent provided by the federal taxpayer, although some states have additional schemes of their own. State authorities certainly agree with the President that the emergency should be dealt with at the local level as far as possible, but they are much less certain about paying their way in the partnership which he proposes.

Partnership seems sure also to enter into the long-term remedies, which deal with stabilising the economy of the region in order to make it less dependent on water. So far these proposals are necessarily vague, although constructive. They include tax changes which would encourage a better use of land and relieve financial burdens during bad years; research into water supplies, in order that what is available may be utilised better, into weather prospects and into crops and land uses, so that the resources of the region may be more satisfactorily employed; and encouragement of industrial development, to provide alternative jobs for farmers and alternative sources of income for the shopkeepers and other local businessmen who are now equally, although less directly, dependent on agriculture.

Atomic Friction

FEWER sparks than usual have flown, in public at least, at this year's regular congressional hearings on the atomic energy programme. In part this is because Mr Durham, the new chairman of the Joint Committee on Atomic Energy, has replaced Senator Anderson, a strong believer in governmental development of commercial power from the atom. He is one of the most vigorous of the Democratic critics of the Atomic Energy Commission's policy of leaving private enterprise to develop peaceful atomic energy. Moreover, Mr Strauss, the chairman of the AEC, took much of the wind out of the Democrats' sails just before Congress reassembled by promising that if private industry did not do the job quickly enough, the government would build the plants.

Deep differences of opinion still exist, however, between Mr Strauss, who puts progress in nuclear technology before the race for kilowatts, and the Democrats, who believe that without experience of large-scale atomic electricity plants American technical progress will be slowed up. Their doubts about the willingness of industry to invest sufficient sums have received some reinforcement from the unwelcome news that the actual costs of building civilian reactors are exceeding the original estimates by 20 to 40 per cent. Some scepticism has therefore been expressed about the immediacy of plans, announced very conveniently for Mr Strauss, for three new groups of companies to build atomic power plants in Ohio and on the Pacific coast, thus invading the homes of cheap hydro-electric power and coal.

There may yet be fireworks when the committee, now considering insurance against accidents in atomic plants, moves on to the Gore Bill, which the Senate passed last year and which authorises government construction of several big atomic power plants. But the "three wise men" of Euratom, on their recent visit, provided a way out for both sides with their suggestion that America should use Europe, with its high costs for conventional electric power, as a proving ground for its designs for atomic plants. This promising idea will not get far, however, unless the committee is less jealous of American atomic secrets. There have been complaints about Britain's failure to provide America with detailed information about Calder Hall. But the chief reason the AEC has been slow to carry out its intention of sharing with Britain the secrets of the Nautilus, the atomic submarine, is the committee's own dislike of this loosening of security.

Scientists—Scare about Scarcity

FROM A SPECIAL CORRESPONDENT

FOR some time now there has been deep concern in the United States about the country's alleged shortage of trained scientists and engineers, which is supposed to be threatening its defence, progress and prosperity. This concern has been evoked by reports of the numbers being trained in the Soviet Union—126,000 graduates in these fields each year, compared with 59,000 from American universities, according to one estimate; by warnings from industrialists, educational leaders and government officials; by the almost unbelievably attractive offers made to college students by companies competing for the privilege of being allowed to employ them after they graduate; and by the newspaper columns filled with "help wanted" advertisements, which read like guidebooks to fairyland. It is therefore a little surprising to discover that in fact there is no general or widespread scarcity of scientists or engineers in the United States.

An analysis of this apparent contradiction must begin with a definition of terms. By scientist, in this context, the census takers and the various commissions which have studied manpower difficulties have agreed to mean someone who has had special training in the discipline of one or more of the natural sciences—mathematics, chemistry, geology, biology and physics—who has at least a bachelor's degree from a recognised college or university, and who is working at a level loosely described as professional in an area broadly defined as scientific. The level at which the professional label is applied varies with the science concerned—in chemistry a bachelor's degree is enough, in physics several more years of study are needed. The statistics take account of this difference, as accurately as is possible when attempting to record the individual activities of a population of 170 million.

But the lack of reliable and up-to-date data has added to the alarm and confusion over possible shortages, especially in the light of the Russian figures, startling both for their size and seeming precision. The best estimates suggest that there are about 700,000 qualified scientists in the United States and that less than a third of these specialists are occupied in the work for which they were trained.

The amount of inspired guesswork involved in defining and counting scientists suffers a geometric factor of increase in dealing with engineers. Even the first coarse filter, a college degree, used to separate out scientific sheep from goats, is unavailing. The kind of work done is some guide, but there are no legal and few professional sanctions to prevent a man describing his work as engineering, and himself as an engineer. Nor is the individual concerned alone in his terminological inexactitude. Not many years ago the United States Army estimated that it would need 900 more engineers during the next twelve months. Closer inspection showed that the actual requirement was about 10 engineers and 890 technicians and draftsmen. Professor Eli Ginzberg of Columbia University, director of staff studies for the National Manpower Council, who tells this story of military miscalculation, believes that industry is as guilty as the armed services of this type of error. This belief is also held by the president of the American Society of Engineering Education, who told a meeting last year that "much hysteria" had surrounded the alleged shortage of engineers. Referring to industry's estimated need for 68,000 more of them, he declared that, if this number were provided, "they wouldn't know what to do with them." As he is also the manager of technical personnel development for the General Electric Company, he is in a position to know what he is talking about.

Both employers and employed have other habits which make statistical confusion worse confounded. In some industries—the aircraft trade is one—there is a constant movement of technical personnel from one company to the next. This is partly due to the fluctuations in the demand for different skills at different stages of a project in any one firm, and between firms at any one time. The preference of scientists and engineers, and especially their families, for life in the gayer and more equable climate of the southwest rather than in the inclement northeast of the country further distorts the pattern of supply and demand, as does the current fancy for engineers as company executives. The vacancy, as advertised, demands an engineer, while the work calls for general administrative ability only, with no occasion for technical skill.

The cries of "shortage" have accelerated a tendency to stockpile scientists and engineers in considerable excess of current or foreseeable demands, a trend encouraged by cost-plus research contracts, generous tax concessions for establishing or expanding a "research" programme, a desire for prestige, and the simple determination to get or keep a good man away from trade rivals. Whether or not a firm is given a government contract may depend, among other things, on the number of scientists on its payroll available to work on the new project. Only last month a congressional committee was criticising defence contractors for the excessive amounts they spend on recruiting engineers and scientists, amounts which can then be charged as expenses on the bills which are presented to the taxpayer.

Such prodigality in hiring young graduates was condemned last summer by the Congressional Committee on Atomic Energy, which went on to say that industry should also make greater efforts to see that the full talents of its engineers and scientists are used and that routine jobs are left to less skilled workers. The same point was made again this year by two government officials. Earlier, another expert group attached to the Department of Defence had concluded that the effectiveness and efficiency of military research might be increased by 25 per cent, although it admitted this would take "five years of diligent effort."

It seems to be assumed by the prophets of doom that America lacks either the means or the intention, or both, to increase the number of scientific graduates. In fact there is a substantial rise in the total college population—a conservative estimate by the Commission on Human Resources and Advanced Training forecasts 326,000 graduates in 1960 and 608,000 in 1969, against approximately 285,000 in 1956—as well as a climb in the percentage of science and engineering students. It is officially forecast that in about ten years' time the supply of such graduates should have caught up with demand. There are many problems in education, particularly in scientific training at the high school level, but a lack of students does not seem to be one of them.

Finally, Professor Ginzberg has pointed out that, in a world of limited resources, there is never enough of everything all at once. There is a shortage, he said, of "good baseball players" and of "beautiful women." But in the circumstances, the supply of scientists and the demand for them are within a reasonable margin of balance. There is, however, a problem of maldistribution which is hard to solve without some direction of labour, unthinkable in peacetime. Some specialists are unable to find work appropriate to their taste and talent; there is an absolute lack of a few, very highly qualified types, mostly applied physicists and usually in places too secret to mention; there is a need for more men of sufficient experience to head research projects in certain fields, again mostly in physics and sometimes in the sort of work where there has not yet been time for anyone to acquire that kind of experience. Finally, there is a long felt want for more geniuses—Einsteins are scarcer than hen's teeth.

SHORTER NOTE

The Army and the National Guard have signed a peace treaty; for the rest of this year boys between 17 and 18½ years old who join the National Guard will be required to take only eleven weeks active training. This means that they can fulfil their obligation during their vacation from school or college. The six months' training period, which the Army wanted but which the Guard felt would hamper recruitment, will now only be required for boys in this age group if they volunteer after the beginning of next year.

Winter Wisdom

WHEN chills are in the air the way to keep the cold out is to be warm within. Towards bed-time take a little White Horse with hot lemon and sugar or in hot milk. Let sound sleep and the soothing glow of this fine Scotch whisky drive off the questing germs of colds and influenza. There is no more pleasant precaution.

The World Overseas

King Saud, Nasser and the West

FROM OUR SPECIAL CORRESPONDENT IN RIYADH

THROUGHOUT the acute phase of the Middle Eastern crisis the Saudi Arabian government has kept in the background. It subscribed to the Arab policy declarations issued after the summit conferences in Beirut and Cairo; otherwise, unlike the governments of Egypt and Syria, it has said little. The government's reticence has not been filled in by publicity organs like the press and radio, which are still in an early stage of development. There is only one daily newspaper published in Jedda for the whole country; three periodicals are published in Mecca, Medina and Riyadh; the Riyadh broadcasting station is still under construction.

The absence of news from Saudi Arabia has encouraged speculation in the West—much of it wishful. It has been suggested that Saudi Arabia as a wealthy autocracy must fear the spread of radical extremism, not to mention communism, from Egypt and Syria; and that the blandishments lavished on King Saud by President Eisenhower and the United States government must have strengthened American, and therefore western, influence in Riyadh. On both counts it has been argued that Saudi ties with the Egyptian-led Arab block must have been worn threadbare.

Inquiry in Riyadh does not lend support to such speculations. It is true that both temperament and interest incline King Saud towards caution and that at least twice in recent weeks he has urged moderation on his allies. But in all essential respects he and his government stand firmly behind President Nasser in his quarrel with Israel and with its western backers. The actions of Israel, Britain and France are roundly condemned with a conviction so deep that it will certainly endure for years. And even though King Saud may disagree with his allies on matters of tactical detail, it is most unlikely that he will carry disagreement beyond the stage of private admonition.

The acts of the Saudi government since the emergency began bear witness to its steady support for Egypt. It has backed Egypt vigorously in the United Nations. It has broken off diplomatic relations with Britain and France. It has supported President Nasser's refusal to allow clearance of the canal until the complete withdrawal of the Israelis, even though that meant a loss to the Saudi exchequer of about 20 per cent of its oil revenue. It even added to that loss by closing the submarine pipeline from the Saudi oilfields to the Bahrain refinery, thereby depriving itself of another 16 per cent of that revenue. Saudi support for "the free Arab states" (Egypt, Syria, Jordan, and Saudi Arabia) is also visible in the sympathy shown to Syria in its quarrels with Lebanon—the latter state is regarded as too western in outlook—and in the strong Saudi dislike of the Baghdad Pact. Attempts to improve relations between Saudi Arabia and Iraq have made no progress since King Saud and King Faisal met on the Persian Gulf last autumn. Too much should not be read into King Saud's forthcoming meeting with President Chamoun of Lebanon and King Faisal of Iraq. President Chamoun's visit to Riyadh is certainly regarded by King Saud as a courtesy call and he possibly looks on his proposed visit to Baghdad in the same way.

The place of Saudi Arabia in foreign affairs is conditioned by the problem of Israel, which dominates Arab thinking in Riyadh no less than in Cairo, Damascus and Amman. Those standing closest to the King, like his uncle and chief adviser, Emir Abdullah ibn Abdurrahman, the premier and foreign minister, Emir Faisal, and the deputy foreign minister, Sheikh Yusuf Yasin, can see no chance of a permanent settlement between the Arab states and Israel. They concede that the elimination of Israel is not a practical proposition in the immediate future. But they regard its recognition as a lasting feature of the Middle Eastern scene as even more unthinkable. There lies the root of the dilemma of the Arabs: in the refusal to accept the existence of a state which they have not the power to destroy.

Much of the odium hitherto reserved exclusively for Israel now falls on Britain and France. Sheikh Yusuf Yasin said that a straightforward quarrel between Britain and Egypt leading to war might have been understood by the Arabs. But collusion with Israel, however indirect, was something that Arabs could never forget, much less forgive. It made the prospect of a return to cordial relations between Britain and Saudi Arabia exceedingly remote. But a resumption of formally correct diplomatic relations is not thereby excluded. The view prevalent in Riyadh is that such a resumption must be conditional on reparation being made to Egypt in addition to the restoration of Egyptian control over the Gaza strip and the Sharm el-Shaikh area. Some would like to make a further condition, namely, the

withdrawal of British-led forces from the Buraimi Oasis.

The Saudi attitude to Britain is, if anything, firmer than that of Egypt. The attack on the Canal Zone is regarded as being of a piece with the occupation of Buraimi and the attacks against what Yemen regards as its territory. Emir Faisal remarked bluntly that it seemed evident that the British were intent on "destroying the Arabs." There is little doubt that the Imam of Yemen will receive full Saudi support for whatever course the quarrel with the Aden government may take.

Saudi feeling towards the United States government is difficult to gauge. Perhaps it is best described as "friendly reserve." King Saud was certainly delighted with the warm reception given him in Washington, and both he and his advisers are satisfied that the President will try to curb the immoderate influence of Zionism on American politics. They are also well content with the agreements on the Dhahran air base and the supply of American arms for Saudi forces.

Neutrality the Keystone

Nevertheless, the Saudis are watchful for American attempts to edge them out of their policy of neutrality between the two blocks—a neutrality which, like Egypt and Syria, they have made the keystone of their foreign policy. Many leading figures deplored the terms in which the military proposals of the Eisenhower doctrine are couched. In Saudi eyes, the restriction on the offer of military aid to cases of communist aggression seriously reduces its value. They see no reason to fear a Russian attack, but many reasons to fear an attack from Israel, Britain and France. Your correspondent has often been asked in Riyadh, more or less rhetorically, why the offer of aid was not made to cover aggression from any quarter.

The Saudis themselves explain the terms of the American proposals by reference to America's desire to influence the Arab states in an anti-communist direction. That influence they are determined to resist. Grateful as they are for the efforts made by the United States to secure the withdrawal of Israeli forces from Gaza and Sinai, they are at least equally grateful to the Soviet Union for its energetic stand in support of Egypt. They have no intention of being cajoled or forced into anti-Soviet postures that would hinder them from asking for Soviet help in similar emergencies in the future. Commenting on the military proposals, Sheikh Yasuf Yasin said: "If the communists attack us, we shall certainly ask the Americans for help." Emir Abdullah quoted with approval Sir Winston Churchill's wartime dictum about Hitler and the Devil.

Saudi feelings for the eastern block, like those of many uncommitted peoples, are mixed. They reject communism on social and religious grounds, and, having no great immediate need for Soviet help, they would probably prefer to keep the Soviet government at arm's length. But they see no reason why other Arab governments should refuse help from communist sources if they are unable to get it elsewhere. President Nasser's arms deal, for example, is warmly defended in Riyadh on the grounds that he has no other course open in view of the West's refusal to supply his needs. The plain fact of the matter, in the Saudi official view, is that the Arabs have been forced into dealing with the communists by western hostility to their national aspirations. So the West, it is argued, has no valid ground for complaint.

Dr Wassenaar's Bombshell

FROM OUR CORRESPONDENT IN SOUTH AFRICA

EVER since the days of the Jameson Raid and the Boer War, the relations between the English and Afrikaans-speaking groups have been a cardinal issue of South African politics. This issue has now caused a new minor eruption which has introduced some fluidity into a situation that has remained rigidly unchanged for nine years. When he resigned as Nationalist leader in the Transvaal Provincial Council, Dr Theo Wassenaar, one of Mr Strydom's oldest and most outspoken associates, did more than shock his party and bring hope to an opposition sadly in need of it: he gave expression to a political ideal of most white South Africans—the dream of a united European nation free to devote its attention to the really big race issue in South Africa, white-black relations.

Although he has the deserved reputation of being an extremist, Dr Wassenaar has for years spoken about the necessity of closer association between the two white language groups; and he has always justified this by referring to the "black peril." He chose the composition of school boards in the Transvaal as the occasion on which to test the sincerity of the party leadership's attitude on co-operation with the English-speaking section. When he failed to persuade his colleagues to agree to a degree of minority representation which he considered equitable, he resigned his leadership—without leaving the party. But it was his blistering indictment of the extremist leadership of the party that really attracted public attention. He said that he no longer had any faith that under the present leadership the high principle of equal language rights for the two language groups would be able to struggle free from the impotence in which the extreme elements in the party held it prisoner. He talked about dishonesty in politics becoming the basis of our public life, and gave a warning of the imminence of a one-party state and dictatorship.

Apartheid and No Nonsense

Mr Havenga's newspaper, which a month earlier had taken a firm stand against the Nationalist party's persistence in compulsorily segregating white children at school, rallied to Dr Wassenaar's aid. "Remember," it told Dr Wassenaar's successor, "Hitler is dead." The rest of the well-drilled Nationalist machine tried desperately to play down the affair, but it was patently upset by the description of the prime minister as the prisoner of party extremists—a picture only partly in focus because Mr Strydom has become the victim of his own sectional philosophy taken to its logical conclusion.

While it is impossible at this stage to gauge the extent of the Nationalist rank-and-file's sympathy for Dr Wassenaar's stand, there is no doubt that the repercussions of his decision will continue to be felt. Yet while the Nationalist party will suffer as a result, South Africans who appreciate the vital necessity of finding a formula for peaceful co-existence between white and non-white will derive little real comfort from it. Shorn of its trappings, Dr Wassenaar's philosophy comes down to this: the whites must by hook or by crook get together and stay together in order to present a united front to the non-whites. And if Dr Wassenaar has any say, the handling of the non-whites under the new dispensation will be pretty harsh and uncompromising. No "shared society" for him, or partnership: he believes in apartheid, and no nonsense.

It is a doleful philosophy, but it appeals to scores of thousands of non-Nationalists. For this reason Dr Wassenaar's dramatic resignation may herald the beginning of the long-anticipated realignment of political forces about which many non-Nationalists talk: a regrouping of the so-called moderates in the Nationalist party with the Centre and Right of the United party to form a conservative block which would leave isolated the lunatic fringe of the Nationalist party on the one hand and the Liberals and left-wing elements on the other. This prospect might well appeal to many in the United party. Under Sir de Villiers Graaff the party has walked warily during the current parliamentary session. At one stage a member of the Strydom Cabinet felt constrained to stigmatise as unfair the Opposition's willingness to agree to government proposals. But it took a more vigorous stand on the African bus boycott issue and fought the bill that enables the government to stop transport undertakings from operating on the boycott routes. On the private bill abolishing the Union Jack as one of South Africa's official flags, the party found itself in something of a quandary, because of its own racial composition; it ended by opposing the measure although voting for the clause which makes the Union flag the country's only flag—a piece of political subtlety likely to be lost on its opponents and to puzzle its followers.

Dr Wassenaar's resignation will encourage the United party's tendency to shift gradually to the Right and to try, consciously if unobtrusively, to find common ground with moderate Nationalists. It will perhaps also increase the pressure on Sir de Villiers Graaff to make contact with such of his opponents as can be weaned from their party. The likelihood of any political regrouping depends largely on the Nationalists' success in retaining an iron grip on the rank and file of their party. The next six months will tell.

Israel's Balance Sheet

FROM OUR CORRESPONDENT

Tel Aviv, March 11th

IN the Israeli settlements near the Gaza strip, frontier searchlights are again playing at night on the approaches to the enclosure, watch towers are manned and rifles have been taken once more out of their storerooms. The settlers have resigned themselves to the old, agonising round of work and night-watches which they hoped the Sinai campaign would end.

Theirs is the most acute disappointment at the withdrawal from Sharm el-Sheikh and Gaza. The activist, opposition party Heruth tells the Israeli public that a brilliant military victory has been wasted by the government; that only the victorious Israeli army can guarantee the freedom of the Gulf of Aqaba and prevent fedayeen raids. The government, especially Mr Ben-Gurion's party, Mapai, vigorously justifies the campaign and the withdrawal.

The aims proclaimed during the drive into Sinai were twofold: the removal of the threat of the Egyptian army and peace with Egypt. The first aim has been achieved, at least for a considerable time. It will take President Nasser many months, perhaps years, to rebuild the huge stores which the Israelis captured in the desert. Part of his military strength has been broken. But peace with Egypt is today farther away than ever. There are no signs that the Egyptian ruler is inclined to talk peace. Moreover, fear and hate of the Israelis have grown stronger among the Arabs and both are bad counsellors for a long-term settlement.

In the United Nations, the breaking of the Arab blockade and freedom from fedayeen raids became the pivot of negotiations. On both points some progress can be recorded. With the stationing of United Nations forces near the Gulf of Aqaba and in the Gaza strip there is reasonable hope that Israeli ships will be able to use the gulf and that guerilla warfare in the Egyptian border region will be less savage than before. Israel will put the freedom of passage to the test in a few weeks time when a ship is expected at the gulf port of Eilat from South Africa. There is some feeling of uneasiness about the Gaza strip. It is feared that the United Nations troops will not be able to prevent infiltration, as they do not know the desert, do not speak Arabic and are not versed in the devious ways of the Arab infiltrator.

To the removal of the military threat from Egypt, a partial breaking of the Arab blockade and a partial removal of the fedayeen threat, some people in Israel add to the credit side of the balance sheet a better understanding of the Israeli position by the world public and in the United Nations. Others argue that relations with the United States have been strained almost to breaking point, that the campaign has aroused violent opposition among the Bandung block, and that the vigorous political campaign launched to ward off the danger of sanctions has only repaired some of the damage.

Mr Ben-Gurion's Task

Economic damage has been considerable: no American grant in aid and no surplus food, the total loss of one tourist season, war costs, dislocation of the economy caused by mobilisation, and uncertainty about the future. There is some compensation for these negative factors in the breaking of the blockade, which will enable shipping to use Eilat; but it remains to be seen how valuable will be the export trade to Africa and Asia.

Any final assessment of the Sinai campaign and its results depends to a large extent on future policy. What is Israel to do if the United Nations Emergency Force stays only for a limited period? What will be Israel's proposals should the United States try to evolve a long-term settlement? There is a world of difference between the often-repeated declarations that Israel is ready to talk peace and detailed and well-defined proposals for a definite settlement.

Two main lessons emerge from the bitter experiences of the last four months: first, military victory does not suffice to solve the problems which have beset Israel since its inception; secondly, Israel, which is surrounded by hostile Arab states, cannot fight for its survival without the backing of that western power which is beginning to play the leading role in the Middle East since the French and British positions deteriorated. Mr Ben-Gurion recognised this basic fact and therefore brought about the withdrawal of the army in the teeth of opposition not only by Heruth but by members of his own coalition cabinet. He now has the task of persuading the public to co-operate with Unef and to work hand-in-hand with the United States if plans emerge for a long-term settlement. This will not be easy especially if the Egyptians return to Gaza in any guise.

Talking Turkey in Kashmir

FROM A CORRESPONDENT

SENIOR officials in the Indian government have been profoundly disturbed by the outcome of the United Nations debates on Kashmir. They do not admit their case to be any the less righteous, but the idea has penetrated that virtually all world opinion is hostile to them and that this lowers the authority of India's moral leadership in international affairs, by which they set great store. They are therefore more receptive today towards the suggestions that foreign friends in New Delhi have been making for some time past.

These friends argue that India should point out that in 1947-48 when large areas of Northern India were given over to Hindu-Muslim fury, any tensions added by a plebiscite in Kashmir might perhaps have been borne without intolerable strain. But today, after ten years of a communal truce, which has in places been uneasy, a plebiscite would risk setting off a new outburst. They argue that India should cease to labour its legal and moral claims because these, when confronted by Pakistan's counter claims, merely maintain an insoluble deadlock; moreover, far from winning world opinion to India, they merely antagonise it. Indian officials reply that public admission of fears of Hindu-Muslim clashes might well provide hotheads, of whom there is no dearth, with an excuse to let trouble loose. Very well, reply their foreign friends, do not admit this in public but initiate quiet negotiations with Pakistan, based on expediency rather than on outraged principle.

No one suggests that such talks would be quickly and easily successful, but such an approach at least offers a chance of breaking the vicious circle of self-righteousness (whence there is no exit without loss of prestige for the side that appears to have yielded) and of substituting give-and-take about concrete realities. For example, the Indian General Staff, on the assumption that in any partition Ladakh would go to India, maintains that it cannot be defended against Chinese infiltration unless lines of communication are kept through the Srinagar valley. Here is a practical point which might lead the Pakistanis to think up a practical answer in face of a common danger.

The ice having thus been broken the conversation might elaborate India's views about China. Senior officials in New Delhi have now reached a point at which they have written off the Panch Shila (professions of mutual non-interference signed with China and the Soviet Union) as scraps of paper. It came as a tremendous shock when Chou En-lai refused to reason with the Russians over Hungary and, on the contrary, maintained that Soviet action there was the only way to hold the communist world together. And China's attitude towards the Burmese frontier, as towards Nepal's internal affairs, has dimmed the faith of the external affairs ministry in neutralism—at any rate as far as South East Asia is concerned.

If legalities were ruled out of the talks, the Pakistanis would feel free bluntly to reveal their basic fear about Kashmir, a fear which, although expressed in confidence by responsible people in Karachi, has never, as far as your correspondent is aware, been admitted in public. This fear is that Kashmir held by India would constitute a threat to Pakistan because it outflanks the whole of the Punjab, whereas Kashmir held by Pakistan is no threat to India, for if Pakistan wished to attack India it would not waste energy deviating eastwards into a Kashmir "side-show" but would strike due south at India's heart. Why, then, does India insist on occupying Kashmir? This would give India an opening to reassure Pakistan with another argument that is only admitted in private—that a weak Pakistan makes a suspicious and uncomfortable neighbour. Therefore India has every interest in seeing Pakistan strong, prosperous, and independent of that foreign military aid which arouses the anxiety of the Indian General Staff.

If Mr Jarring, the president of the Security Council, attempts on his arrival in New Delhi to mediate on the legal and moral plane, the shadow boxing between India and Pakistan will continue. But neutral observers in New Delhi believe that if he could persuade the two parties to initiate strictly "unrighteous" and practical discussions on Kashmir, he might start a chain reaction. Some genuinely neutral member of the UN might help to keep the talks sweet. For this purpose, Britain, the United States and any "colonial" power would be useless, but Canada might well fill the bill.

Cordiality Without Entente

FROM OUR PARIS CORRESPONDENT

THE weekend talks between Mr Macmillan and M. Mollet have shown that they must do some sturdy climbing to surmount the obstacles to European co-operation raised between them by the "Eurafrican" schemes of the Six and Britain's determination to reduce its forces in Germany. It is much, in the circumstances, that they maintain such a resolute cordiality. For the moment the difficulties of the terrain are more apparent than the meeting-points.

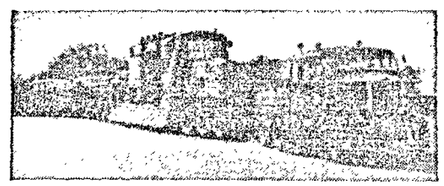
The more confused problem is probably "Eurafrica." To meet the French refusal to be separated from the French Union by the common market, the six Messina powers have agreed to set up a preferential area linking their overseas territories with the common market. If it enters fully into force, their bananas, cocoa, coffee, groundnuts (the list is not exclusive) would enjoy preferential tariffs in Europe—as high as 20 per cent for bananas against nothing in Germany today.

The non-self-governing countries of the Commonwealth, including Malaya and Hongkong, have a surprisingly big trade with the Six, who take about a quarter of their exports. It seems that the products of the British African territories and Ghana will be placed at a disadvantage in competing with those of the French colonies.

The first British reaction to this, in view of the known reluctance of France's partners to endorse "Eurafrica," was to oppose the preferential system, invoking Gatt. This did not deter the Six (who tend to suspect the British of obstruction even when their objections are genuine) from meeting France's equally genuine requirements. Mr Macmillan, who believes in his free trade area, now seems to be trying another approach: to see whether the British territories hardest hit by "Eurafrica," can through the

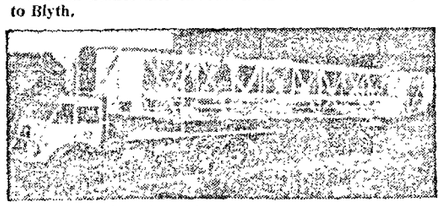
How adaptable is YOUR transport?

Even in this period of fuel rationing, BRITISH ROAD SERVICES remain eager to investigate and advise you on your new or difficult transport problems.



TO BE OUTSTANDING in the field of road haulage, a transport service must be flexible. It must be able to adapt itself to your individual needs. To provide the vehicles best suited to your loads. To carry out the smallest, most routine assignments, or to satisfy the biggest, most difficult demands. And it must provide punctuality, speed and reliability. All these requirements are met by British Road Services.

Further, during this difficult time of fuel rationing, British Road Services are endeavouring in every way to adapt themselves to serving your interests, and the interests of the Nation, as befits the largest and *most adaptable road haulage operator in the British Isles.*



The facts. Consider for yourself these facts: British Road Services are a nationwide organization with vast, widespread resources. They are staffed with experienced, enthusiastic men and sound administrators. At the present time, they are working in close collaboration with British Railways who are handling, on their behalf, the long distance hauls which can no longer be covered by direct road services.

Furthermore, their round-the-clock skilled engineering service keeps the large B.R.S. fleet in the most economical running condition. And with the help of their teleprinter network, B.R.S. can rapidly transmit their traffic plans down to the last careful detail — thus avoiding waste of time, money and resources. *Your time and your money, too.*

Economical methods. Sound knowledge and careful planning result not only in good transport, but also in economies to you. B.R.S. are eager to advise you on improved handling techniques, new types of vehicles, and new ideas in transport. Constant research keeps B.R.S. thoroughly up-to-date. Just telephone your local man. Action will follow immediately.

Pickfords heavy haulage vehicles are renowned for their adaptability in moving indivisible loads. This example shows a 165-ton transformer en route from Newcastle upon Tyne to Blyth.

This illustration shows how a B.R.S. general haulage branch carried a light but lengthy girder from Radley to Wales by adapting a normal vehicle for this special journey.

free trade area obtain as favourable terms as the French territories on the common market.

This could be a difficult decision to take. It breaches, though in a limited range of tropical produce, the principle that agriculture remains outside the free trade area. It would presumably also breach, even if slightly, imperial preference in the affected territories and blur the frontiers between Europe and the Commonwealth. In practice, the extent of the confusion will depend, above all, on the number of interested territories and also, on what equal treatment with "Eurafrica" means; the Six themselves have not fully defined their plans.

About defence the British and French spoke still more widely different languages. The British talked economics; the experts are convinced that it is not just a matter of modifying a British defence programme that would, unless modified, lead to the spending of over £2,000 million by 1960. The whole problem of the ever-growing enormity of modern defence burdens is involved, which other European countries fail to appreciate only because their arms efforts are not far enough advanced. The French talked politics: Germany must not dominate European defence; America must not be tempted to withdraw its forces; confidence in the British pledge to stay abroad must not be undermined. There was no agreement over the weekend.

The best chance of obtaining continental, and especially French, consent to a reduction of British forces seems to be to breathe some life into the WEU arms pool, set up to supervise German armaments and to co-ordinate defence production. There is certainly, today, a new willingness for dovetailed arms programmes in Europe. But the road bristles with obstacles. At the outset there is the "ABC agreement" between America, Britain and Canada, for the exchange of defence information. Though the Americans want more productive, integrated European programmes the agreement still prevents Britain from playing its part in Europe. An American waiver will have to be sought. The risk is of a further drying-up of American information. But this has never flowed well and it is now generally admitted that even Mr Sandys's visit to Washington did not achieve much.

Delicate Problem of Hardware

Nevertheless, the first timid approaches to integrated programmes are under way. The British and French governments have exchanged lists of fundamental research projects (on high temperature alloys, for instance) which they could co-ordinate, and are seeking German co-operation. The problem of finished weapons—expertly known as "hardware"—which could be produced soon, is far more delicate. The British are sure, for example, that they are years ahead in guided missiles. The continental members of WEU have worked together on defining the criteria for weapon production in the nineteen-sixties, in response to the recent Nato "political directive to the military." The Americans have kept their counsel, and the British, tied by the ABC agreements, also. Britain would have to join soon to get in on this before ideas harden. Some people hope that agreement to co-operate effectively between Europeans could be reached, gradually and piecemeal, in the next six months.

The immediate prospect for the *Entente Cordiale*, and for Nato and Europe, is of more difficult, complex relationships. There is, perhaps, a danger of exaggerating the "Eurafrican" imbroglio, though that is not certain; and more co-ordinated European arms production holds promise of political as well as technical progress. But there is no doubt that Britain's decision on defence puts a strain on Nato, and France's on Eurafrica puts a strain on the British notion of a free trade area. In Europe, free traders will be tempted to press for amendments to common market texts already agreed through the free trade area negotiations. In France itself, those like M. Mendès-France, who fear the common market may draw France away from Britain, may be strengthened. And finally, the outside world will be watchful in Gatt. The troubles of Messrs Macmillan and Mollet as good Europeans are far from over.

Disunited Indonesia

FROM OUR CORRESPONDENT IN JAKARTA

THE resignation of Dr Sastroamidjojo's government on Wednesday was a belated recognition of the fact that it had lost all authority. The process of disintegration began last January, when the coalition was deserted by the moderate Islamic party, Masjumi, and two minor Moslem parties. But the chain of events really began in December with the rebellion of two military commanders in Sumatra.

For a time the authority of the government was restored, but in the past fortnight a further crop of rebellions made the end inevitable. The latest of these are in South Sumatra, where Lieutenant-Colonel Barlian, the military commander, has seized power, and in Borneo, where Lieutenant-Colonel Hasan Basry has put himself at the head of a new revolutionary council.

None of these rebellions has been marked by bloodshed, but in East Indonesia, at the beginning of the month, civil war was only narrowly averted. On March 2nd civilian leaders met at the residence of the governor of Celebes in Macassar, and agreed on a demand for local autonomy. But the danger came from rival army factions. Colonel Sumual, the thirty-five year old military commander of East Indonesia, endorsed the rebels' demands, took over the administration and proclaimed a state of siege. But he was faced with opposition from nine Javanese battalions in Celebes under the command of Colonel Sudirman, a staunch supporter of the central government. He has been prevented from using his troops to attack Sumual only by the prompt action of General Nasution, the chief of staff, who has maintained constant contact with both men, used all his influence to restrain them and announced that it was still too early to condemn or justify Sumual's action.

General Nasution's effective command has been steadily shrinking since the first military rebellions in Sumatra last December—a government newspaper has remarked that he would wake up one morning to find that he was only commanding the driver of his car—but the tact with which he is handling his rebellious officers may have averted open fighting. It remains to be seen how he will deal with the further threats to his authority that have now emerged.

The East Indonesian rebels' attitude to President Sukarno's "concept" is determined, like that of the Sumatrans, by their desire for local autonomy and their dislike of communism. They would welcome the formation of a national council if it had the powers of a senate and if 70 per cent of its members came from outside Java, whose dominant position in national politics is greatly resented.

The idea of an all-party cabinet is also acceptable, provided that it does not include the communists and is led by Dr Hatta, the former vice president, whose co-operation with President Sukarno is essential if the Indonesian republic is not to disintegrate. The President has succumbed to rebel pressure sufficiently to invite Dr Hatta to meet him but he will have to make some substantial concessions if he is to persuade him to lead the government. Dr Hatta has said that President Sukarno's plan was good and idealistic, but impractical; the communists' aim was world revolution and not a prosperous Indonesian national state.

It is rumoured that President Sukarno would be prepared to drop his determination to include the communists in his all-party cabinet but that he would continue to insist on their inclusion in the projected national council. This solution would only be accepted by the party leaders who have rejected the plan if the council's advice was not binding. But the communists are jubilant over their recognition by the head of the state and they will find it difficult to reconcile themselves to anything less than the full participation in the government which the President's formula originally promised them.

Toymakers at Nuremberg

FROM OUR SPECIAL CORRESPONDENT

THOSE who regret in November that the shops try so early to kindle "the Christmas spirit" will have a twinge of compassion for the singular fraternity whose Christmas shopping begins perforce in March. Thousands of these far forward-looking buyers have been present at the Nuremberg Toy Fair, which closed on March 12th, gravely inspecting a full-dress parade of pretty well every kind of model and means of diversion for the young. Appropriately refreshing themselves with draughts of milk peddled by genial Bavarian lasses, they have soberly set about the responsible task of spotting now what will be certain winners with other people's children in nine months' time.

They travelled to Nuremberg from many countries because the Germans still have the reputation of being the world's masters at making toys. Before the war, the German toymakers, who worked mostly in Thuringia and Saxony, displayed their wares at Leipzig. But since 1949 the West German toymakers have set up shop in Nuremberg. It is the second largest city in Bavaria; and the greater part of the West German toymaking industry, which employs some 22,000 full-time craftsmen, is settled in Bavaria and the neighbouring southern state of Baden-Württemberg. Between them, the West German toymakers sell some $72 million (£25 million) worth of toys every year, nearly half of which (45 per cent in 1956) are exported.

Goethe's mother was shocked when the toymakers of 1793 came out with model guillotines as the latest novelty for the nursery. That was, perhaps, pandering too fondly to the grisly instincts of the little ones. But models of objects that engage the mind, either through their permanent intrinsic interest or through their mere newness, have always been the toymaker's principal stock-in-trade. They have been so this year at Nuremberg. Models of one sort or another composed by far the greater part of the show. And the bulk of them did not rely on their novelty, topicality, or superficial ingenuity. If not always aircraft and locomotives, at any rate houses, babies, soldiers, animals, ships and rolling stock go on looking much the same year in year out. It is the quality of the materials used, the skill and imagination of execution, that make the difference.

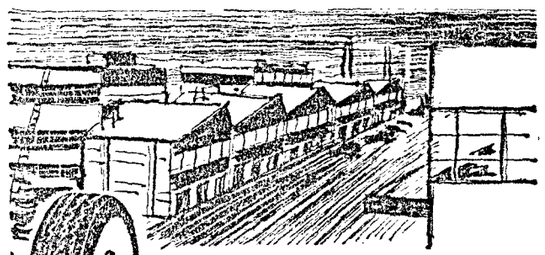
Buyers in search of novelty were skilfully but not numerously catered for. An Alweg mono-rail train could be seen buzzing busily around one solitary stand. There were dolls the spit of Bardot, Monroe, or Lollobrigida. A few special showpieces, including even a walking doll, could be put through their paces by remote control. But even in the carefully prepared conditions of an exhibition, this kind of authority, it seemed, was exercised rather tenuously, and then only with much brow-knitting and laborious manœuvring. Heaven knows what would happen in the nursery or the bath under less resourceful direction. Obviously the German toymakers reckon that electrification has its drawbacks, for reasons both technical and humane.

Masks and Stink Bombs

Knowing from centuries of experience that children's tastes in toys are collectively the same and yet individually unpredictable the German toymakers pin their faith largely on the unsophisticated toys and amusements that have stood the test of time. Sitting in their modest cubby-holes, with an air of quiet confidence, and apparently doing very nicely, were the representatives of the makers of such venerable standbys as fireworks, rubber balls, spinning tops, chess-sets, crackers, masks, stink bombs, and sneezing powder (1d. a bag. Extra strong, 2½d. a bottle).

Beyond supplying the usual demand for building bricks, engineering sets, and the like, some German manufacturers are paying special attention to the present-day tendency to encourage boys and girls to think of a technical career. Experimental kits of remarkably generous content and high finish are being produced in Germany under such labels as "The Technical Kid—170 experiments in elementary physics," "The Radio Technician—80 experiments concerned with the technicalities of modern radio," or "The Young Optician and Photographer—120 experiments with mirrors and lenses."

So long as the German toymakers continue to provide this kind of quality, value, and imaginative touch they will have no cause to fear the intensifying foreign competition. German toy exports increased by only 1.4 per cent last year, compared with 9.68 per cent in 1955 and 31.72 per cent in 1954. Of last year's exports over 22 per cent went to the United States, the next best customers being Sweden, Holland, Italy, and Switzerland; some £650,000 worth were sold to Britain.



Germany's most serious competitor in the toy market is Japan. It is the familiar story of cheaper production costs and consequently lower prices. The challenge is considered all the more serious now that the 45-hour week is coming into force throughout western Germany. The German manufacturers are so disturbed by it that they are resisting the proposal to expand the German Toy Fair at Nuremberg into an International Toy Fair. In consequence groups of east German, Austrian, Japanese and British toy manufacturers have been displaying their wares this year in the disadvantageous isolation of Nuremberg hotels and offices. In his opening address the broadminded Federal Minister of Economics scolded the German exhibitors for their timidity, assuring them they had nothing to fear if they only stuck faithfully to the traditions of their craft. There are promising signs that they intend to do this.

A gracious welcome to your guests

THE BUSINESS WORLD

Money for Public Industries

IT takes a dramatic announcement, such as the trebling of the nuclear power programme, to attract much public attention to the investment programmes of the nationalised industries ; in fact, they were already so vast that even the big increase in nuclear investment announced last week added only about 10 per cent to the total cost of them. Capital expenditure in the four main nationalised industries—coal, electricity, gas, and transport—was probably of the order of £500 million last year, and is likely to continue at about that rate until 1960. Between 1961 and 1965, counting in last week's addition to the nuclear programme, these industries expect to be investing about £700 million a year.

A national commitment of some £6,000 million in the decade to 1965 raises two obvious questions for the government at present responsible for it. How can any demonstration prove whether these investment programmes are too small, too large, or just right ? Here the politically correct answer for any government is to keep a stiff upper lip and behave as if it knew. And how should the money be raised to finance these huge investment programmes ? This second question, formally, is at present in suspense. Most of these industries used to raise most of their money on the capital market by issuing fixed-interest stock with a Treasury guarantee. When Mr Macmillan brought them " into the Budget " last year to join coal, which already financed its investment by direct borrowing from the Government, this new arrangement was described as temporary, in the first instance for two years only. The new electricity bill now before Parliament provides for this industry to borrow either in the new way or the old, but some Tory backbenchers are now arguing that it should be amended to send the new electricity generating board and area boards to the market without a guarantee. For one of the smaller nationalised industries, air transport, there are persistent rumours of some new " square deal " arrangement to bring private capital back into the nationalised corporations ; and of late there has been some vague talk of " a Capital Issues Committee for the nationalised industries."

★

It is clearly essential to get nationalised investment into perspective ; the tables on this and the next page attempt to do so. These big fuel and transport industries now account for about 16 per cent of the country's capital investment. But they are only part of the public corporations of all kinds, which since the war have accounted for about 19 per cent of total investment ;

ESTIMATES OF NATIONALISED INDUSTRIES' CAPITAL EXPENDITURE TO END 1955, & INVESTMENT PROGRAMMES, 1956–65 (£ mn.)

* Working Capital reduced by £12 mn. during period. † "Net Current Assets" reduced by £127 mn. during period.

and these in turn are only part of the whole public sector, which between 1948 and 1955 accounted for almost exactly half the country's fixed capital investment, though its share is now slightly below 45 per cent.

The shares of the nationalised industries, the public corporations, and the public sector as a whole in the country's fixed capital investment since the war have not been matched by their contribution to national output. The Government is responsible for nearly all the social capital, for the vast bulk of fuel and power investment, and for roads and much of land and air transport. But with the exception of private house-building, practically all fixed investment in the private sector has been in directly productive capital; taking only about half the total fixed investment, private industry contributes about 75 per cent of the country's gross domestic product each year.

It is only by accounting convention that the "output" of houses, schools and hospitals is given any measurable meaning. But public productive capital, in the nationalised industries, seems to make inherently greater demands on capital resources, in relation to its output, than do most private industries. Comparisons of "capital-output ratios," on the conflicting figures so far available, need to be taken with the strongest of reservations. But it does appear that the fuel processing industries, such as electricity, gas, oil refining, and coke ovens, along with certain transport industries, such as railways and shipping, are by nature much more highly capitalised even than the private industries processing bulk materials, such as chemicals, steel, rayon and sugar; and that these in their turn need more capital for a given unit of output than those other manufacturing industries that shape materials and put them together, such as engineering.

Such comparisons offer no guidance to whether the highly capitalised industries, nationalised or private, have had "fair" or "unfair" shares of the country's fixed investment since the war. It is tempting to remark that for £100 invested in manufacturing industry one can get about £40-£50 worth of goods a year, while the same £100 invested in electricity would supply only about £6 worth of power a year; by the same token one could conclude that the nation could invest more "profitably" in motor assembly works than in strip mills or oil refineries. But this is a highly interdependent economy: the motor works would look as silly without enough steel sheet as a steelworks without enough fuel and electricity. This interdependence, as a succeeding article suggests, is indeed worth exploring further. But so far such studies offer little assistance one way or the other, in deciding whether the nation is getting the best value for the capital it invests.

Nor would anyone intimately concerned pretend that the painstaking scrutiny of capital programmes that goes on steadily each year by the Ministry of Power and later by the Treasury proves the point. The civil servants and the politicians whom they serve are still, as they have always been, almost completely at the mercy of the technicians on whose say-so these programmes are based. The technicians, on grounds of "the national interest" as well as sheer prudence, dovetail their plans into the demands and promises of the other big industries that go in for similar long-range investment planning; but this formal consistency is disarming because it makes any section of the whole harder and not easier to check. Even given complete technical competence and economic information, the task would be a formidable one.

In practice, Whitehall cannot command such technical competence: having desperately tried for eight years to cope with electrical engineers, it now finds itself surrounded by physicists. Nor is the economic information with which these programmes are presented really meaningful. The prices upon which any estimates of return are based are political prices, not prices based upon relative costs; and in such circumstances it is inevitable that nationalised investment priorities will veer according to politics and fashion, not according to economics.

★

In such circumstances, moreover, the way in which money is raised for these industries is largely irrelevant to any check upon the profitability they can offer on its investment. The Treasury guarantee is implicit in their nationalised status, whether made explicit or not. Issues of stock on the market have only the effect of making the industries pay the going rate of interest at exactly the time they want the money, while "financing like the Coal Board" gives them the chance to borrow money at short-term rates and fund the loans when convenient. It is difficult to put practical meaning and method into "a CIC for the nationalised industries"; nor has anyone yet thought of a politically acceptable way to re-introduce some form of equity element into the capital structure of the public industries. The shift from financing by market issues to financing by Treasury advances was made purely for the convenience of the Treasury in managing the public debt; it is open to serious reservations in principle and over the last year it seems questionable whether its convenience to the Exchequer has in fact been material.

The public industries are semi-monopolies by statute. Following the example of some, though not all, privately owned companies in a similarly dominant position, they have tended to sell their products too cheaply. All have moreover been subject to more or less political pressure to keep these prices low. Nobody knows how elastic demand for fuel and transport may be to price; but since the war there has certainly been every attempt not to find out. There is at least the suspicion that the growth of demand for particular fuels, if not for fuel as a whole, has been distorted by selling fuel too cheap; and that the railways have hitherto been prevented by their own price stability and averaging of fares for cheap and costly services from concentrating on those that they can offer really cheaply.

★

It is very tempting, therefore, to suggest that the Government should choose the solution that would in part answer both of its costly questions about nationalised investment—self-financing. Since the war, the four main nationalised industries have self-financed from depreciation and other internal resources a third of their total capital expenditure: the rest has come from borrowing. By contrast, a survey of 3,000 public companies suggests that these have provided about two-thirds of their expansion in net assets from internal resources, raising only a third from the market. In their plans from 1956-65, the four main nationalised industries are still proposing to finance only about a third of their extra capital from internal resources. They will thus continue to rely much more upon the outside investor than private industry seems to do; but in their case the private investor's response is to a gilt-edged stock, and not in any sense to the likely profitability of their vast industrial ventures. It is fascinating that the nationalised industries justify drawing so much of their capital from the market, on the ground that they need far too much capital for the consumer to be asked to provide; one is reminded, as by a mirror image, of the oil industry's conviction that it needs far too much capital for the capital market to supply.

Ought these nationalised industries to be pushed by the Government in the direction that the oil industry is already pursuing—out of the capital market altogether, raising almost all of its capital through its prices? Much more self-financing by the nationalised fuel industries, at any rate, is perfectly practicable—and in the current circumstances of unreally low prices, probably expedient. Yet it is dangerous to accept self-financing as a permanent solution for any big and monopolistic industry, even ones as insulated from the classic checks of the capital market as the public industries are. The financing of investment in large, highly capitalised industrial organisations where the technology is becoming increasingly difficult for the supplier of capital to understand—whether these organisations are private or nationalised—is a wider question, which deserves more study. But the practical question for this government in the short run is whether it can introduce any more objective economic tests and disciplines into nationalised investment now, through financing if not by scrutiny. If its influence were exerted towards self-financing—in the first place by pushing prices in these industries closer towards the relative costs of supply—it would have such an effect. But that would be a precise reversal of the political pressure that Governments have hitherto exerted upon prices in the nationalised industries.

THE "INPUT-OUTPUT" TECHNIQUE—I

A Tool for Forecasting

IT is many years since an accountant wrote that "most economists and statisticians regard double-entry book-keeping as a monument to be admired from afar rather than a technique to be acquired. They are less attracted by its humble virtues than by the dangerous charms of extrapolation." Be this as it may, Government and business are today, of necessity, being forced into more and more forecasting (which is considered politically respectable so long as it is not called "planning"). There is no such animal as a good method of forecasting, only better or worse methods depending on the nature of the particular problem. During recent years, interest has been aroused in Britain and elsewhere in a new technique of economic research—input-output analysis—that is simultaneously social accounting and economic forecasting rolled into one—and which incidentally is based on a kind of double-entry book-keeping for the economy as a whole. When this technique was discussed in *The Economist* three years ago, in our issues of September 19, 1953, and September 26, 1953, only very small input-output tables had ever been produced for this country. Today much more ambitious tabulations exist, and a good deal of experience has been accumulated to show what "inter-industry" study can and cannot do to assist forecasting in the economy as a whole and within industry in particular.

Put very simply, an input-output table is a double-entry statement, showing current transactions in goods and services between industries—how much each industry sells to and buys from all others. Sales of each industry's products to every other are shown as horizontal rows of figures across a grid; the corresponding purchases by other industries thus come out as vertical columns in the table. At the end of each row of an input-output table an industry's sales to other industries and to final buyers are totalled. This total at the end of a row automatically amounts to the total shown for the same industry at the bottom of its vertical column—its total purchases from other industries, plus "original inputs," after allowing for changes in stocks on both sides. The other "final buyers" listed in an input-output table, apart from industrial customers, are household and government consumption, exports and gross capital formation; and the term "original inputs" signifies the imported raw materials that an industry uses, plus the other factors of production measured by wages, salaries, and payment for capital.

*

The scale of any input-output table depends on the purpose for which it is constructed, and on the extent to which detailed statistics indicating purchases of materials by industries exist. A complete Census of Production is obviously a *sine qua non* of any initial attempt to set out the structural interdependence of the whole economy, which helps to explain why the 450 row and 450 column input-output table that has now been constructed by the Department of Applied Economics, Cambridge University* and the Board of Trade relates to the year 1948, the last year for which a full census is available. The Central Statistical Office has however, already included in more than one issue of its annual Blue Book on National Income and Expenditure a much smaller but still valuable set of calculations based on 1950. The second full census of production was taken in 1954: as preliminary figures from this census have now been available for just on a year, it is to be hoped that the next Blue Book will contain an input-output table for 1954 that can be compared, cell by cell, with the one constructed for 1950.

"Input-output" has two distinct aspects. First it offers a means of bringing information on current purchases and sales into focus, showing a breakdown of sales and costs for the whole economy, for a group of related industries or even for one industry, no matter how the word "industry" may be defined. The rows of the table represent sales analyses, showing in any given period, for example, the proportions sold in the home versus the export market. The columns which show every item an industry buys represent cost structures. They also show, *inter alia*, the proportions of imported and home-produced materials used by any industry, or, for example, the relative dependence of any selected industry on various fuels. The conventions of the input-output technique require that the rows and columns of the account must balance, leaving no loose ends. But this does not prevent the tabulation being much more detailed as regards some sectors than in others. A very detailed study of the inter-relations of the engineering industries, for example, could be carried out, with sales and purchases outside the really relevant groups being lumped under "non-engineering" labels. Flexibility in application is not the least of the many "humble virtues" that this method appears to possess.

The allegedly "dangerous charms of extrapolation" of this technique are less easily set out. The accepted method of forecasting by means of an input-output "model" is first of all to express each item in each column of costs as a percentage of total cost for that industry column, and to assume that these patterns of cost to output remain the same over the period for which a forecast is to be made. The whole set of input ratios or "coefficients" is then, as it were, turned

* The project has been one of several financed by means of Conditional Aid Funds during the past three years.

inside out by an algebraic process called "matrix inversion." This is done in order to calculate not only the direct demands this industry makes on others in producing its own output, but also the indirect demands those industries pass on to their own suppliers (possibly including itself) to produce the products it buys from them. To satisfy a demand for motor vehicles, for example, the motor industry has to buy large amounts of steel, and some coal, among other things: the steel industry requires large amounts of coal: and both coal and steel, in their operations, buy some lorries.

The kind of forecast that this method is usually expected to yield is thus a conditional statement about general levels of production and material requirements. It will answer such questions as this:

> If consumption expenditures plus exports plus capital formation are going to be 50 per cent higher in real terms in 1965 than in 1948, then with unchanged cost ratios, how much will imports and other original inputs have to increase proportionally?

Given the information about demands in a form that corresponds to the industrial classification used in an input-output table, it is a relatively simple calculation to answer such a question about supplies from say 50 industrial groupings. Beyond that degree of detail, the calculation of indirect as well as direct requirements probably becomes more trouble than it is worth.

This kind of prediction is in itself little more than an exercise in economic algebra, and the accuracy of the answers it gives will obviously diminish if very significant changes in technology and productivity should take place between the base year and the year forecast. To predict the output of petroleum in 1958 on the assumption that the cost ratios of refineries will be the same then as in 1948, for example, would obviously ask for trouble, unless "prediction" were here interpreted to mean that x million barrels is "the output in 1958 that the industry would have had to produce to satisfy all the demands of 1958 if it has not by then become a very different industry from what it was in 1948." That might be an interesting academic exercise: and academic or not, it is sometimes about as much as business forecasters have to work on. But if input-output analysis is to gain acceptance as a realistic method of economic prediction, then much more sophisticated ways of applying the technique than this will be required. These indeed exist: a second article will examine how industry may make use of some of them.

Business Notes

SCOW's Result

IN the few days before a new Stock Exchange account begins there is often a little buying for "new time." There was hardly any this week, and there are even reports of a tiny volume of selling for new time. That was certainly not large enough to be a noticeable contributor to the downward movement of the market but perhaps just big enough to pin-point the change in investment attitudes. *The Economist* indicator has come down in the week ended on Wednesday from 201.6 to 197.3 and the *Financial Times* index of government stocks has fallen from 88.45 to 88.25. On the gilt-edged side of the market the problem is one of indigestion. The discount market has been a seller of short-dated government stocks, an aftermath no doubt of the heavy buying a few weeks earlier. The funding by sales of gilt-edged stocks through the market has therefore been brought almost to a halt at the short-dated end of the list as well as at the long. While this indigestion continues and sterling remains under pressure, it is difficult to expect anything but stagnant markets.

On the industrial side of the market the fall has been much steeper, as was natural in the face of threatened strikes in shipbuilding and engineering. Investors who had been building up some hopes on the Budget had to consider whether if the stoppages materialised, and if sterling was to be defended, the Budget hopes could be fulfilled. The result of these cogitations seems to have been an unwillingness to buy this side of the Budget.

It was not the happiest of weeks for the Steel of Wales £40 million offer. In the circumstances the result was not bad. Applications numbered about 23,000 for about 45½ million £1 shares. That figure includes the firm applications for two million shares from Guest, Keen and Nettlefolds and one million from the Metal Box Company; it also includes the firm applications from the underwriters for the whole of their commitments so that free applications from the public must have amounted to five and half million shares. Full allotment has been made on the 1,800 applications for about 25,000 shares from employees and on the special applications from Guest Keen and Metal Box. Other applicants, both underwriters and others, were allotted in full up to and including 2,000 shares, while the larger applicants received about 85 per cent of their applications with a minimum of 2,000 shares.

Investors meanwhile have been moving out of the main stream of industrial issues and towards the specialities. Some of them have bought Wall Street stocks, some have followed American investors into Canadian stocks and the official dollar premium (based on the rate of the day) has

risen from 7 per cent to 8¼ per cent in a week. Some of them have bought oil shares which enjoyed a good rise on Wednesday and Thursday. The lure here has been the listing on Wall Street of "Shell" Transport which started on Wednesday at 22⅜ dollars. Substantial American buying in London accompanied the listing and there was British buying too, so that Shell registered shows a rise of 15s. 6d. to 180s. during the week.

Strike Threats and Sterling

News from the Middle East and the threat of impending strikes in this country have unsettled sterling, more than counterbalancing any reassurance that might have been derived from the impressive trade figures for February. But the pound has stood up reasonably well against Continental currencies. Continental, and particularly German speculators, are as short of sterling as they conveniently can be, so that they have little opportunity for further short selling. The confidence factor has had a noticeable effect on the sterling rate against the dollar, but it is still being supplemented by the additional commercial demand for dollars to finance oil from dollar suppliers. The rate on New York has eased over the past week from $2.79⅞ to $2.79½, while the three months discount on sterling against US dollars has widened from ¼ of a cent to 1 cent—a rate which rather more than straddles the margin between short-term money rates in New York and London. Transferable sterling has also been weak, falling during the week from $2.76¼ to $2.76 and there is evidence that more Middle East sterling has been converted into dollars through the transferable market.

The feature of the foreign exchange market this week has not, however, been the weakness of sterling so much as the exceptional strength of the Canadian dollar. It has risen to a premium of 4¾ cents on the US dollar, is the highest premium not only since the Canadian dollar rate was freed from its official parity in 1950 but actually since 1933 when the US dollar was being depreciated towards its present official gold parity. This strength of the Canadian dollar runs counter both to the trade figures which show an inordinate increase of imports into Canada, and to the well advertised fears about inflationary developments in Canada—which underlie the recent amendments in Canadian banking legislation. The capital movement from the United States into Canada is forcing the Canadian dollar upwards for the moment, and the Canadian authorities are using the flexibility of exchange rates to cushion its impact.

Trade Deficit Drops

By February British overseas trade—oil shipments apart—had largely made its adjustment to the closing of the Suez Canal. Time will also be needed for the reverse adjustment when the canal reopens. In February exports recovered by £17.2 million to £278.2 million fob; the main reason must be that cargoes previously held back by shipping difficulties were got away. Was the backlog fully cleared last month? Perhaps not: during the four months November to February since the canal was closed exports have averaged £271 million a month, an increase of 6½ per cent on the same period of 1955-56, whereas during the whole of 1956 the average value was 10 per cent higher than in 1955.

UNITED KINGDOM TRADE
£ million—monthly averages or calendar months

	Imports cif	Exports fob	Re-exports fob	Trade deficit
Year 1955	323·6	242·1	9·9	71·6
Year 1956	324·1	264·3	12·2	47·6
November	319·6	291·9	14·8	12·9
December	307·9	253·7	11·2	42·9
January, 1957	276·5	261·0	11·7	103·9
February*	320·8	278·2	10·9	31·7
Nov.—Feb., 1955-56	330·4	254·5	12·2	63·7
Nov.—Feb., 1956-57*	330·3	271·0	12·2	47·1

* Provisional.

Imports, which were abnormally high in January, fell by £55.7 million to £320.8 million cif last month; the average value for the four months was £330.3 million, the same as in the corresponding period of 1955-56, and only £6 million higher than the average for the whole of 1956.

Shipments to the United States last month fell by £1.8 million to £17.9 million (excluding the repayment of £2.1 million worth of lease-lend silver), while shipments to Canada, which are always low at this time of the year, fell by £900,000 to £11.4 million. Shipments to North America have suffered little from shipping delays, and the average in January and February (again excluding silver bullion) was £30.6 million, 11 per cent more than in the same period of 1956.

Still Not Enough Petrol

Many motorists are ready to believe that all garages are swamped with unsaleable stocks of petrol, while a rapacious government prolongs rationing so that it can continue to enjoy the extra shilling a gallon tax. Garage proprietors, apprehensive of losing a shilling a gallon on all the tax-paid petrol they may have on hand when rationing is formally abandoned, are anxious to reduce stocks—although torn by the opposite desire to hold stocks in case the oil companies' applications for a price increase are sanctioned by the Government. Because some motorists have been hoarding coupons or consider petrol too dear, consumption during the first rationing period has been less than the 75 per cent of normal requirements on which the ration was based, and stocks of petrol are therefore now higher than had been expected. But petrol stocks are usually built up during the winter and reach their peak just before the spring outburst of motoring. The stocks built up this winter, although higher than expected, are still not as high as they would have been at this time of year under normal conditions.

The OEEC oil committee now estimates that, allowing for the partial resumption of deliveries through the trans-Syrian pipelines, but placing no reliance on the reopening of the Suez canal to regular tanker traffic, the total arrivals

of petroleum products in the second quarter will just cover Europe's normal requirements. But this does not take into account the normal summer stock build of distillates and fuel oils which is equivalent to about 6 per cent of consumption, and this year these stocks have first to be rebuilt from the dangerously low level to which they will have fallen by the end of March. The supplies of black oils, in relation to the reduced summer demand, should be enough to allow the addition of some 2 million tons of black oils to stock. But in an unrestricted market the consumption of petrol in Britain in the second quarter of the year is about 25 per cent higher than in the first quarter, and on the Continent the seasonal rise is even greater. Europe's supplies of petrol in the second quarter are unlikely to exceed 90 per cent of this free market demand, unless price increases dampen the seasonal increase this year.

As supplies are being shared equally, Britain's share will also be only 90 per cent of normal requirements and a sharp surge in demand must be expected when the extra shilling tax comes off. Refineries in Britain must still emphasise their production of fuel oil and distillates, in order to build up stocks of these vital industrial products to a safe level before the winter, so the proportion of petrol refined from each barrel of crude oil, although possibly a little higher than it has been in recent months, will still be below normal. If only 10 per cent of free market demand remains unsatisfied at present prices there is a clear case for a substantial increase in the petrol ration next month; but until tankers start moving regularly through the Suez canal the retention of some form of rationing—whether by coupon or by price—seems unavoidable.

More Men than Jobs

Though the motor industry has lately run into slightly less unfavourable waters, no amount of scrutiny of the latest employment figures will reveal whether activity has yet begun to pick up on a wider scale. In January and the first half of February the number of persons known to be on short time fell by 40,000 to about 115,000 while the number registered as jobless rose by 14,000 to 380,000—or 1.8 per cent of the total working population. Most of this improvement in short-time working and the fractional worsening of unemployment, however, was accounted for by the Ministry of Labour's tentative estimates of the changes caused by fuel restrictions. Seasonal factors would also have been at work and at this time of the year, when unemployment usually reaches its annual peak, much depends in a number of trades upon the state of the weather. Making reasonable allowances for this, it would seem that the "true," or adjusted, level of unemployment rose by a fifth between December and last month, whereas the number of notified vacancies fell by a tenth. Those looking for jobs now outnumber the number of jobs known to be going in most parts of the country. Only in the North Midlands and in the East and West Ridings of Yorkshire are there more vacancies than seekers; in Scotland and Wales the ratio is four to five unemployed for every job unfilled.

The standstill in the economy last year reversed the broad shifts in civil employment that had been going on in earlier years. The drift of labour from the basic industries was sharply checked, while the manufacturing industries lost 150,000, or 1½ per cent of their labour force.

Sharp Rise in Bank Advances

The latest quarterly classification of bank advances shows, as expected, that aggregate lendings have turned upwards again—and more sharply than had been suggested by the not very dependable monthly figures of the clearing banks (which include various extraneous items in their advances totals). Total advances made in Great Britain by all members of the British Bankers' Association rose in the three months to February by £69.8 million, to £2,000.3 million, or £39.2 million more than at the corresponding date last year. This is the first increase on the annual comparison since Mr Butler's squeeze-by-request began to take effect. To some extent the movement is seasonal, but advances to the private sector of the economy appear to have risen a good deal more than seasonally. During the quarter the borrowings by the public utilities from the Exchequer enabled them to reduce their bank indebtedness by £35.2 million; advances to all other borrowers therefore rose by £105.0 million. This is an exceptionally large expansion; the nearest approach to it in the past five years was the £99 million rise recorded during the boom two years ago. In the similar period last year, at the beginning of the squeeze, the increase was less than £4 million.

★

The expansion has been widely spread through the categories. Except for a tiny contraction (by £1.7 million to £124.9 million) in the "unclassifiable" group of industry and trade, and one of £3.4 million in chemicals (presumably attributable to new capital issues), all the industrial and commercial categories have increased their borrowings. A substantial proportion of the new money has gone to the heavy industries—£20.7 million to iron and steel (raising its total to £60 million), £17.1 million to the massive engineering group (now taking 11½ per cent of all bank advances), £4.4 million to non-ferrous metals and £2 million to shipping and shipbuilding. Other noteworthy industrial increases are those in the three textile groups. The three financial categories have also expanded—hire purchase finance companies by £5 million to £28¾ million and "other" financial by £13 million to £190 million. The personal and professional group, which includes a good deal of small businesses, has turned upwards for the first time since May, 1955, rising by £8.8 million to £324 million.

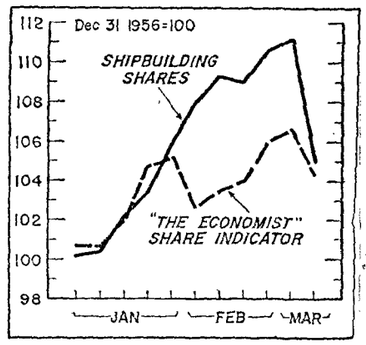
An interesting feature is the high proportion of new lending that has been done by non-clearing banks. The clearing banks increased their total by £45.9 million, to £1,728.9 million, or by slightly less than two-thirds of the aggregate increase—but those banks received the bulk of the repayments made by the nationalised industries. Excluding their loans to the state boards, the clearing banks' advances rose by £76 million.

A Limited Windfall

By now the switch in traffic to the railways must be reaching its peak. Although the possibility of more petrol next month may at first take care of only the seasonal jump in private motoring and the slight spring swell in road goods traffic, it will put to the crucial test British Railways' hopes of winning permanently some of the windfall business that fuel restrictions have brought it. Already the Commission claims to have received assurances to that effect from some of the traders it has been canvassing. But on the figures that are so far available, there does not appear to be all that much extra traffic for it to hold on to. In January and February railway receipts were £10 million, or 15 per cent, higher than in 1956, but it is possible to guess that about a third of that, or roughly £3.4 million, came from earlier increases in charges and not from diverted traffics. For London Transport, fuel restrictions on its customers' own transport were responsible for only just over half the £1.6 million increase in receipts (also about 15 per cent) during the two months.

THE GROWTH IN RAILWAY TRAFFICS

(Previous year = 100)	Freight					Passengers	
	Total receipts	Ton mileage				Total receipts	No. of journeys
		Total	Merch.	Minerals	Coal		
1956 :—							
Jan.-Sept. ..	105·6	101·4	98·7	104·2	101·6	107·8	103·8
Oct.	97·9	95·7	94·7	99·1	94·6	104·2	101·3
Nov.	101·6	97·6	97·2	97·1	98·2	103·6	103·9
Dec.	104·3	100·1	103·7	98·0	99·0	111·2	101·7
1957 :—							
Jan.	110·7	103·1	110·1	101·5	99·9	122·2	110·6
Feb.....	115·0	...	...	...	...	123·2	...



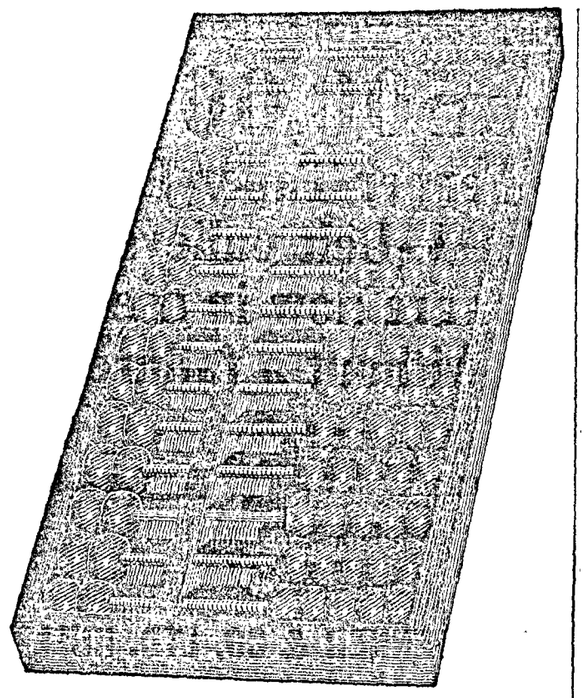
In actual volume these gains seem even smaller. Railway passenger journeys, which responded sharply to the cut in private motoring, were about a tenth heavier in both

Shipbuilding Shares Now

SHARES of the shipbuilding companies were forging bravely ahead when the strike notices went out. The chart sets an index of those shipbuilding shares quoted in the table against *The Economist* indicator. Shipbuilding shares rose side by side with the industrial market at the beginning of the year, and went on rising while the rest of the market hesitated. They have fallen sharply since, as was inevitable, and have now almost lost their lead. Share markets usually make their main adjustment to a strike before rather than during the event.

Can the shipbuilding industry claim economic justification for the behaviour of its leading shares in breaking away from the market trend? Will the rise be resumed if the industry is saddled with a higher wage bill, or the cost of a stoppage, or both? At least investors are entitled to assume that one of the lessons of the Suez dispute is that the country must not be short of ships. More ships and bigger tankers are a high priority. The tanker financing plans of the two big oil groups will finance only tankers that have already been ordered but they have caught the public imagination. The bid by London and Overseas Freighters and others for the share capital of Austin and Pickersgill has reminded investors that some of the smaller shipbuilding companies have conservatively valued assets that make them attractive to bidders. The market in most shipbuilding shares is narrow and prices are easily moved.

The industry was running at a high rate of output allowing for its supplies of steel and of labour even before these recent events. The strike, if it happens, will interrupt the yards but it will not permanently destroy the fact that they are assured of ample orders with the added possibility that some of them may be able to tackle bigger ships. Within limitations shipbuilders were being paid on a cost plus basis and are still being paid that way, and larger ships may bring higher gross profits to some of them. Order books were already long and have lengthened. They rose from 48 months' work at the current rate of completion at the end of 1955 to 53 months' at the end of last year, and have probably risen further since. The last factor is important. It seems to assure the activity of the industry some distance ahead and to buttress the investment status of the shares.



ORDERS AND OUTPUT

Taking the East into account

Twenty-five years ago you would have found this 'adding machine' of antiquity in every eastern branch of The Chartered Bank. It was of particular use in calculating the intricacies of exchange rates which often fluctuated with great rapidity. Today, the abacus is being replaced by the slide rule and the electric computer. The East is changing but The Chartered Bank remains in step, so that its knowledge of eastern trade, travel and investment is always up-to-date. This knowledge and a century of experience sustain a complete banking service available throughout a branch system, which extends to most centres of commercial importance in Southern and South-East Asia and the Far East.

Portrait of a man who invested in SAFETY...

with ABBEY NATIONAL naturally!

As a Civil Servant he has done well for himself and his family—worked his way up from executive grade to departmental chief. He is in comfortable retirement now; for he has augmented his pension by investing in Safety with the Abbey National Building Society, with a tax-paid 3½ per cent return—whatever the state of the market. That's equal to £6.1.9 per cent where Income Tax is paid at the standard rate.

"Let other people go for the bigger profits at the greater risk," he says, "but *I'm* for Abbey National — and *safety*." Any amount from £1 to £5,000 is accepted.

what is a Stacatruc?

No doubt you know that a fork lift truck is a machine designed to do many of the backbreaking tasks of heaving, humping, hoisting, and hauling heavy loads which are so inefficiently performed by men trying to emulate horses. Perhaps you also know that these trucks will not only aid your labour but will save money, improve production, eliminate bottlenecks in the flow of goods, cut down delivery times, use practically the whole of the space in a storehouse—right up to the roof, make stocktaking a pleasure, cut down breakages and accidents due to manhandling, and generally rank as the most versatile tool that modern industry can possibly employ in its drive for greater productivity. In this age of atoms and automation it is the machine which will take up the burden of man's productive tasks, and in this field there is no better machine made than the famous Stacatruc fork lift—part of Britain's best mobile materials handling system.

months ; but freight traffics—which are much more important—have been slower to shift, possibly because traders and hauliers were more dilatory in cutting their fuel consumption, but more probably because there was far more room than was thought for greater efficiency in lorry operations. In January the railways ran about 3 per cent more ton miles than they might otherwise have done, and in February between 5 and 10 per cent more. This month's gain so far appears to be only slightly better than February's.

Gordon Hotels and Mr Jackson

GORDON HOTELS, owner of the May Fair Hotel, was in low water when Mr Leonard P. Jackson gained control and the chairmanship in 1953 ; it has been torn with dissent since then and at December 31, 1955, it still owed almost £1.3 million of gross preference dividend arrears. The acrimonious dispute seems now to be reaching its climax. A Board of Trade inquiry has been made by Mr Melford Stevenson, QC, and Mr Donald House, and their report has now been issued. A requisitioned meeting for the purpose of removing Mr Jackson and his co-directors from the board happens to have been convened for March 27th. And offers have been announced for the ordinary shares of the company—7s. 6d. per share from a syndicate in which Mr Jackson is interested ; this bid was later raised to 8s. 6d. a share in reply to a bid at that price from the opposition side.

Shareholders thus have the benefit of the Board of Trade report before they have to cast their votes or to decide between the offers. They also have the advantage of Mr Jackson's own verdict on that report. He regards it "as completely vindicating his position." Four matters and the inspectors' findings on them are relevant to Mr Jackson's conclusion :

(1) It was charged that 10 million francs had been received by Mr Jackson in the course of the negotiations for the sale of the Hotel Bristol.
Finding : "We are unable to express any conclusion."

(2) Was there a leakage of information when National Securities Corporation offered to buy the debenture stock of the company at £104 at about the time when its redemption was under discussion ?
Finding : "No."

(3) The benefits received by Mr Jackson at the May Fair Hotel.
Finding : Mr Jackson enjoys "primarily as an office" a suite in the May Fair Hotel. No account is rendered. He had also expenses from the company rising from £1,029 in 1953 to £1,646 in 1955 and draws director's fees at the rate of £1,000 a year ; he receives no salary for running the company.

It is on the other matter—the relation between the company and the Cascade restaurant—that shareholders may find the inspectors' report most revealing. Cascade is leased by Restaurant Investments, a private company controlled by Mr Jackson. It has been handed to Gordon Hotels for management on the basis that Gordon Hotels provides management and executive staff free of charge, that if there is a profit Gordon Hotels takes a quarter and Restaurant Investments three-quarters, while if there is a loss Restaurant Investments should repay it. Restaurant Investments was to repay Gordon Hotels for any expenditure of redecorations and improvements to Cascade. The hard facts are that the Cascade has lost money and Gordon Hotels has spent money on redecorations and improvements. But Restaurant Investments has not repaid: £67,211 was the sum unpaid at December 31st (Mr Jackson now claims that "for practical purposes the Cascade matter has been cleared up" since the inquiry). The inspectors, however, used the word "unfortunate" in describing Gordon Hotels' failure to secure performance of the agreement.

Better Terms for Credit Insurance

THE Export Credits Guarantee Department is taking another enterprising step. Following the reduction of premiums last April the department is improving the terms on which it insures exporters against the risk of loss on short-term business—goods sold on up to two years' credit. The new "comprehensive guarantees," which take effect on April 1st, offer three main improvements:

1. Once the goods have been shipped, the exporter will be paid 95 per cent, instead of 90 per cent, of all specified losses (other than insolvency or default of the buyer, against which he will continue to be paid 85 per cent).
2. Claims arising from political or transfer risks, such as a government's refusal to permit transfer of the exchange, will be paid after four months instead of six ; and claims arising from default after acceptance of the goods will be paid after six months instead of twelve.
3. The seller will for the first time be given limited cover against default before the buyer has accepted the goods.

On the third risk the seller must bear the first loss of £20 on every £100 of the invoice price, and he can be required to sue the buyer ; the department then bears 85 per cent of any loss within the next £40 of every £100, and the seller bears the remaining loss if he cannot find another buyer for the goods. These terms, it is hoped, will neither diminish the exporter's zeal to fulfil his part of the contract, nor encourage default by the buyer.

The department's trading surplus on commercial account for the year that ends with this month is expected to be about £2½ million, bringing the cumulative surplus to about £7 million. The reduction in premiums has encouraged business: in the ten months to February 1st the number of current short-term policies rose by 4½ per cent and the average premium for covering up to six months' credit fell by 2s. 3d. to 9s. 3d. per £100 insured, the lowest figure reached. Short-term policies account for about four-fifths of the total business insured by the ECGD though the medium-term policies, usually for credit cover of up to five years, are now providing over half the premium income. Part of the trading surplus can be used to provide better cover, but the necessity for adequate reserves to meet claims is illustrated by the fact that over £1 million of claims were paid in January alone. Claims from the Suez crisis, which mainly result from the British Government's refusal to permit transfers out of Egyptian sterling accounts, may amount to "a few million." The department is now studying its medium-term policies, and revised terms will be announced later this year.

Bidding for SWACO

THE air is clear. The British Treasury has given the "necessary consents" for the American controlled company, Tsumeb, to make its bid for the 531,807 shares of 13s. 4d. in the South West Africa Company, a British concern. Shareholders in SWACO are now free to make their choice, uncoloured by the political consideration that SWACO is one of few producers of the strategic metal vanadium in the Commonwealth.

The choice is between the offer by Tsumeb and that made by a group headed by New Consolidated Gold Fields. This second offer, in which Anglo American and the "Chartered" company are associated, is of £5 per share for two out of every three SWACO shares; it is open until March 19th and would leave SWACO shareholders with a continuing, though minority, interest in the company. The Tsumeb offer, which is open until March 29th, is of one 5s. Tsumeb share (as yet unquoted) plus 20s. in cash for every four SWACO shares. A London quotation for all the Tsumeb shares (and not, as seemed to be the original intention, merely of those shares released by the bid) will then be sought. Guesses at the market price of Tsumeb shares, which have received dividends of 35s. already and on which the final payment is expected to be 7s. 6d., range between £18 and £22 per share.

Arithmetically there is little to choose between the two bids, but the Tsumeb directors do not now seek, as they appear originally to have done, to transfer SWACO'S residence out of the United Kingdom. They estimate Tsumeb's profits in the year to June 30th at £7.3 million and in the subsequent year at £7 million; that would permit a dividend of not less than 30s. Control over vanadium has coloured the struggle. But both bidders are interested in SWACO's prospecting and exploration rights. Tsumeb say they are willing to spend up to £2 million on the development of the SWACO properties over the next few years. The rival group could no doubt match such a programme if it gained control. The final choice for SWACO shareholders is between cash plus a minority interest in SWACO alone, or less cash plus a stake in the properties both of Tsumeb and of SWACO. Tsumeb is earning handsome profits from copper, lead, zinc and other metals, and its present ore reserves indicate a life of at least 16 years. The SWACO directors intend to accept the Tsumeb offer for their own personal holdings, but they have made no recommendation to shareholders.

A Bank Returns to China

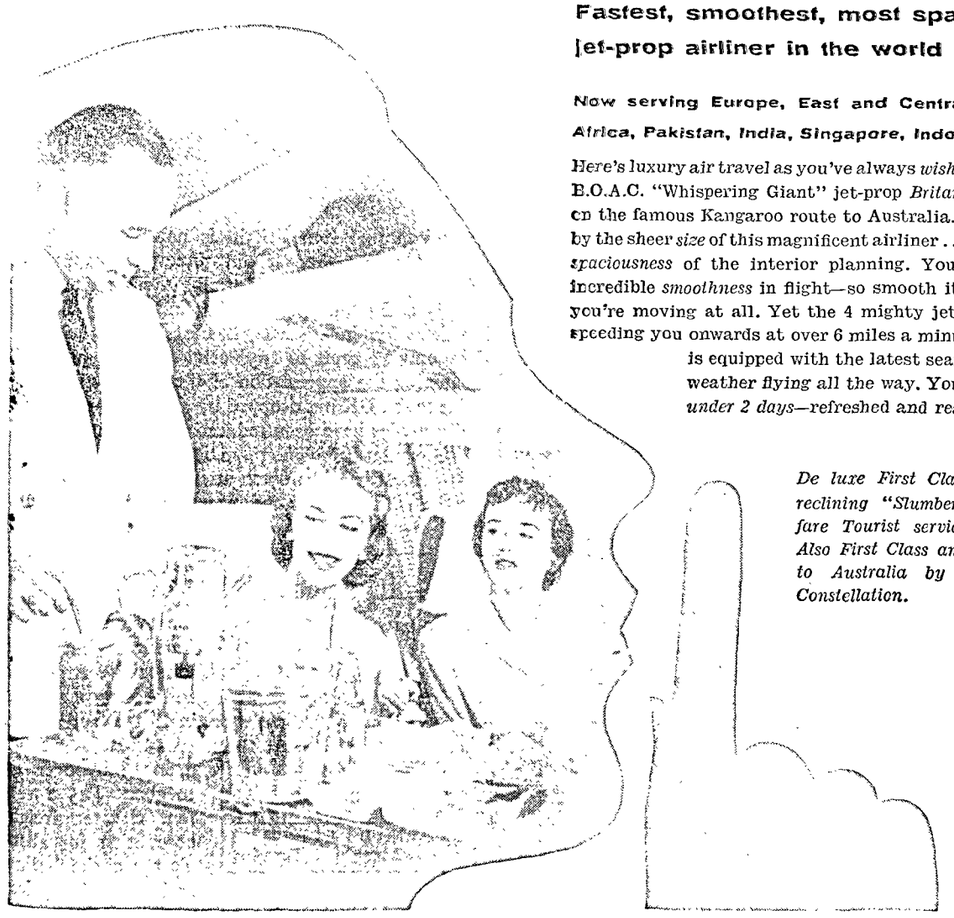
THE accounts of four of the eastern exchange banks all show little change in deposits and unchanged dividends; three of the banks also show increases in profits. The Chartered Bank (formerly the Chartered Bank of India, Australia and China) shows an increase in profits from £759,340 to £800,808. "Full use" of the higher interest earnings available in London in 1956 is the explanation offered by the chairman, Mr Vincent Grantham. Owing to "insistent demands" for finance in the developing countries of Asia in which the bank operates, advances rose by £12 million to nearly £104 million (compared with current and fixed deposits of £198 million); this increase was financed largely by not reinvesting the government securities that matured. Ironically in a year in which the "Chartered" Bank has dropped "China" from its title, it has re-established operations there. The bank's share in China's trade is small, but it cannot pass unnoticed that the Chinese Government finds it advisable to supplement the activities of its own Bank of China.

The consolidated profit of the National Bank of India and its subsidiaries (including Grindlays Bank, which is this year to be formally merged with its parent) rose from £421,839 to £432,835. Advances rose only slightly, but the chairman, Mr J. K. Michie, finds two new influences tending to increase the demand for finance: the first is Suez—the longer time needed for shipments round the Cape; the second is largely India's five-year plan—the pressure on industry's liquidity as development is speeded up. Mr Michie also points to the special threat to bank deposits in India of the proposal that part of company reserves should be deposited with the Reserve Bank.

Progress from Shanghai is reported also by the Mercantile Bank of India—but towards the final settlement of the winding up of its affairs there. This bank shows an increase in advances by nearly one quarter, by £5.4 million to £28.8 million; this was partially offset by a fall of nearly £3 million, to £18.2 million, in investments. Disclosed profit is up only fractionally, at £236,383. The Eastern Bank shows a small decline in profits—from £132,536 to £129,940. Its business is heavily concentrated in the Middle East, and the chairman, Sir Evan Jenkins, states that in view of conditions which were "in some respects specially difficult" the result is considered satisfactory.

A Frisky Baby

AT the end of the war, Henry Meadows of Wolverhampton found themselves possessed of a magnificent plant for the production of Diesel engines for large vehicles, and a great reputation earned by the work they had done in building engines and other armaments—but no commensurate peace-time market. The management, worn out by unstinted war efforts, picked some losers in its search for peace-time products, had more than its share of labour trouble, and failed to find significant room for its proprietary engines in a market dominated at one end by the superlative products of Gardners of Patricroft, and at the other by the world-beating prices of Perkins of Peterborough. Now a member of the Associated British Engineering group—part of the complex built up by the late A. P. Good—Meadows has this week announced the production of what looks to be the most promising British attempt on the minimal car market.



The Meadows "Frisky" is very much on the lines of the German Goggomobil, which is the most successful of the miniature cars hitherto produced. The engine is a Villiers 2-cylinder, two-stroke of 250 cc, a little less powerful than the Goggo's 293 cc. By using an established proprietary engine already in substantial production, initial savings in

NOW-whisper your way to AUSTRALIA

B·O·A·C Whispering Giant

Britannia

Fastest, smoothest, most spacious jet-prop airliner in the world

Now serving Europe, East and Central Africa, South Africa, Pakistan, India, Singapore, Indonesia, Australia.

Here's luxury air travel as you've always *wished* it could be! The B.O.A.C. "Whispering Giant" jet-prop *Britannia* is now flying on the famous Kangaroo route to Australia. You'll be amazed by the sheer *size* of this magnificent airliner ... by the luxurious *spaciousness* of the interior planning. You'll marvel at its incredible *smoothness* in flight—so smooth it's hard to realise you're moving at all. Yet the 4 mighty jet-prop engines are speeding you onwards at over 6 miles a minute. The *Britannia* is equipped with the latest search radar for fair-weather flying all the way. You reach Sydney in *under 2 days*—refreshed and ready for anything!

De luxe First Class services (fully-reclining "Slumberettes") and low-fare Tourist services by Britannia. Also First Class and Tourist services to Australia by Qantas Super-G Constellation.

Consult your local B.O.A.C. Appointed Travel Agent or B.O.A.C. Airways Terminal, Victoria, S.W.1 (VIC 2323); 75 Regent St., W.1 (MAY 6611); Qantas, 69 Piccadilly, W.1 (MAY 9200); or B.O.A.C. offices in Birmingham, Leeds, Manchester, Liverpool and Glasgow.

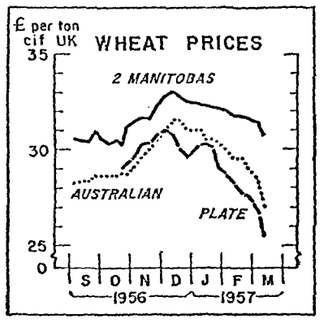
FLY BY B·O·A·C AND QANTAS

BRITISH OVERSEAS AIRWAYS CORPORATION WITH QANTAS EMPIRE AIRWAYS LIMITED AND TEAL

cost are achieved and development headaches obviated; but for the quantities in which the Goggo is produced (said to be 200 a day), the neat, combined engine and gear box unit of the latter is likely to give a saving, while avoiding the final chain drive of the Frisky, to which exception might be taken. The Frisky has its doors hinged at the centre-line of the roof in "gull-wing" fashion, which gives some structural advantages. The body-panels of the production run are intended to be in fibre glass—an apparent reversal of the generally accepted view that fibre glass is the more economic answer in small quantities, but more expensive than sheet steel when production quantities are great enough to justify the much heavier investment in dies. The weight of 6 cwt attributed to the Frisky is nearly 200 lb below that claimed for the Goggo. And the appearance of the Frisky seems to be more attractive than that of the by no means ugly Goggo.

A retail price of £260—or including PT nearly £400—would give 90d. a lb for the Frisky at 690 lb kerb weight—to compare with 50-60d. a lb for mass-production cars, or about 75d. a lb for quality cars made in smaller volume. If the vehicle does what can reasonably be expected of it, in behaviour and in reliability, its price should win it a large enough market to justify the project, and earn enough profit to warrant the investment needed for production in substantial volume, leading in due course to lower selling prices. The Frisky is very far from being the sort of product which the Meadows plant was designed to produce. If despite this Meadows makes a success of it, it will show once again that in manufacture, nothing matters in the end but making a product that fulfils the customers' requirements.

Russia's Bullionists



SAMUEL MONTAGU & COMPANY, the bullion and foreign exchange house can be relied upon to provide close estimates of Russian gold sales; the company's annual bullion review suggests that in 1956 these amounted to some 4,300,000 ounces, the largest amount sold by the USSR in any year since the war. More than half the sales were made on the Continent, principally in Switzerland, although the greater part of the gold eventually found its way to London. Reports from Continental centres suggest that the considerable offerings towards the end of the year were to meet the payments difficulties of Poland, Hungary and other countries in the Communist block. The review shows that Russia has a special interest in the maintenance of gold as a basis for the settlement of international balances, quoting from an official Soviet publication *Vneshniaia Torgovlia* which describes the role of gold as a world currency and points out that this is why Russia is accumulating reserves consisting mainly of gold.

The review estimates that during 1956 more than 10 million ounces of the world's gold production was absorbed into hoards and that in addition about 3 million ounces were taken by the arts and industries. Europe was again responsible for the biggest private hoarding demand. Some four million ounces disappeared there, mainly on French account; the Middle East absorbed about 3 million ounces in private hoards, much of which was sent to Beirut for distribution in that area and also in the forbidden territories of India; Macao, which imported 2¼ million ounces last year acted as the main distribution centre for the Far East.

In spite of political turmoils the world price of gold, expressed in dollars, remained exceptionally stable last year, showing a range of only one third of one per cent between the highest and lowest prices. The operations of the central banks in the gold markets provided the main reason for this stability. Buying orders were received from European debtor countries before the monthly EPU settlements whenever gold prices fell below the dollar parity of $35 per ounce. Conversely the central banks of creditor countries sold whenever the price rose above $35 per ounce. The Bank of England was by far the largest seller but it was acting as the handler of South Africa's sales of newly mined gold. Messrs. Samuel Montagu estimate that the activities of central banks, other than the Bank of England, probably account for about a third of the total turnover in the London market. Most of these transactions were arranged outside the daily "fixing."

Cheaper Wheat

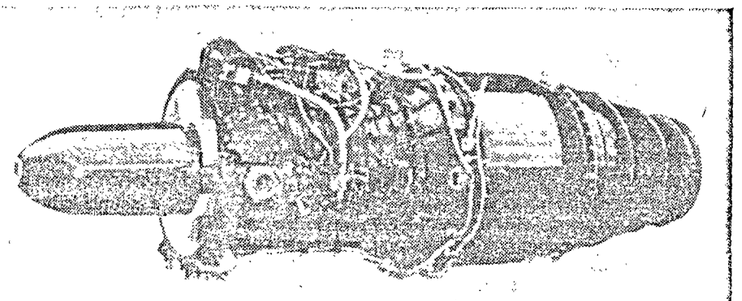
WHEAT imported into Britain is now costing up to £5 a ton less than it did three months ago at the post-Suez peak. As in feed grains, freight rates have fallen sharply and selling pressure has increased. Though No. 2 Northern Manitoba wheat, ex-Fort William, has been reduced by only 1¼ cents to 165¼ cents a bushel (approximately matching the appreciation of the Canadian dollar), the cif price to the UK has dropped by £2 to £31 a ton, and No. 3 and 4 grades have been reduced by 4¼ cents to 157¼ and 151¼ cents a bushel. The reduction in the lower grades of Canadian wheat is evidently an attempt to meet competition from the United States and Argentina. Argentina has much more wheat to sell on world markets this year; the new crop is bigger, and concessional sales of American wheat are squeezing Argentina out of its local markets in Brazil and Chile. Plate wheat has dropped by over £5 to about £25 15s. a ton, cheaper freight accounting for about £3 15s. of the decline, and Australian prices have been forced down to £27 a ton, a fall of £4 10s., of which about £3 5s. represents lower freights.

For three exporters, the United States, Canada and Australia, the recent fall in prices is tempered by an increase in the volume of sales in the season that began on August 1st. The misfortune of other countries has been their good fortune. France, their new competitor in the export race, has been obliged to turn importer after a bad harvest; other West European countries have had to buy more imported wheat to offset the poor quality of their own crops; and

HUNTING PERCIVAL JET PROVOST

ARMSTRONG SIDDELEY

VIPERS



FOR FIRST ALL-THROUGH JET TRAINERS

ROYAL AIR FORCE FIRST IN THE WORLD TO ADOPT ALL-THROUGH JET TRAINING

In the House of Commons on February 8th. the Secretary of State for Air said—

..."The evaluation trials have shown that ab initio flying training on jet aircraft has definite advantages.... A production order is being placed for the Jet Provost which I am satisfied is the best aircraft for the purpose".

Much of the HUNTING PERCIVAL JET PROVOST'S success as an all-through jet trainer may be attributed to the excellent handling characteristics and reliable performance of the Viper Turbojet. This engine has been developed by Armstrong Siddeley, the makers of the Sapphire Turbojet of which over 10,000 have been built in England and the U.S.A.

COVENTRY AND BROCKWORTH

Members of the Hawker Siddeley Group

Argentina, the other major exporter, has until recently been handicapped by a small crop. American shipments, stimulated also by concessional sales, have jumped. Between August 1st and March 2nd, United States shipments of wheat and flour are estimated by Broomhall at 7,931,000 tons, more than twice as much as in the same period of 1955-56, and total American exports this season are officially expected to reach 11 million tons. American competition partly explains why Canada's shipments rose by only one-sixth to 4,217,000 tons during the same period of this season. Shipments from Australia, on the other hand, have increased by nearly two-thirds to 2,232,000 tons ; from the beginning of 1957 Australia has benefited from Britain's undertaking to buy from it at least 750,000 tons of wheat and flour a year.

Increasing competition from American flour, which is even more heavily subsidised than American wheat, has now driven the Canadian Wheat Board into the unprecedented step of selling wheat for export as flour at less than the price charged for wheat. Flour sold by Canadian millers to all markets except Britain and Europe will qualify for subsidy, which ranges from 3 to 7 cents a bushel (wheat basis) according to port of shipment. The cost of subsidy will fall, not on the government, but on all wheat farmers, and will be reflected in their annual receipts from the board.

How Decca Won Through

WITH the full accounts of the Decca Record Company for the year ended March 31st, 1956 comes "No CIC" by Mr E. R. Lewis, the tireless man who left Throgmorton Street to become managing director of a seemingly hopeless enterprise. The hopeless enterprise won through. Decca's turnover reached £1 million in 1946 ; it reached £12.86 million in 1955-56, and for the ten months to January this year was running at the rate of £16¾ million per annum. Mr Lewis, who will shortly become chairman of the company, records in his short history the early struggles of the Decca company, the arrival of the bailiffs, the debtors who waited for payment, and the sentence—passed by the National Provincial Bank but happily commuted—to hand Decca over to its breaking up department. "No CIC" is a company history of success won from a desperately near failure. The author draws a moral. "This story could never have been written if in the thirties controls of the Capital Issues Committee and the Bank of England had existed as they do today . . . under these conditions Decca would not have survived . . . the business could never have weathered the storms when new finance had to be found from day to day, when dollars had to be found at a moment's notice to finance the American venture." Mr Lewis records that it took ten years of continuous struggle against heavy odds before the company could pay a preference dividend, and even then the payment amounted only to £2,088 net.

Retail Business

CUSTOMER TRENDS

Number 2

This new quarterly bulletin deals with the demand for consumer goods in the home market. It includes short and long-term forecasts of sales by different outlets and merchandise groups, regional surveys and reports on special investigations.

Among the special subjects in the second issue are: the growth of mail order business ; the women's clothing trade ; motivation research.

Full particulars from the compilers:

Slot Machine Neuroses

PATRONS of the public baths at Fulham can now buy five minutes with an electric razor by putting sixpence in a slot, and at that price few of the stubbly-faced football fans that go there on Saturdays after an all-night train journey are likely to demand change. But most of the customers of the 35,000 to 40,000 slots that have been appearing about the country with great rapidity since 1953 do, since the prices of the packs they now want to buy have been lifted well above the standard sixpenny and shilling range of prewar vending machines. Most of today's slot machines are built around the sixpence and the florin. One can still buy a packet of gum for a penny, but cigarettes, sea-side souvenirs, camera film, soups—and all the other varied items now or soon to be on sale—cost more than sixpence, and no manufacturer can be certain that these prices will hold steady.

The prospect of rising prices in fact now dominates the makers' planning. Although a halfpenny on the insurance contribution may defeat accounting machines, there is no technical bar to the design and manufacture of change-giving mechanisms or coin selectors of any kind or size in slot machines (except for paper money, though the industry is not without its confident prophets for even that). The higher initial outlay and servicing costs are willingly borne if periodic adjustments are thereby made simpler and if the midnight railway traveller can get his cigarettes more easily when he wants them (or the smoker who arrives at his tobacconist after the new statutory hours). The operators may have to choose between mechanisms that are too selective, and reject coins that are merely badly worn or bent, and those that give fraudulent customers too easy a chance of making away with free articles and change ; but a simple adjustment can see to that once experience has been gained of the type of custom met at each site.

Flexibility is indeed the major aim of present design, and at least one manufacturer has mechanisms that cater for all prices and change up to 4s. The makers of machines selling merchandise have the edge here on the Post Office and others who did not have to start again from scratch four years ago with most of their existing equipment rusty and useless. London Transport, for example, are now finding most of their ticket machines hopelessly submerged under the continual rise in fares. They like their machines to last for 15 or 20 years, but many of the 465 that do give

change have had to be blocked up and can now cope only with the exact fare, while nearly half of the 275 that do not have had to be taken out of service as the new minimum charge of 3d. is beyond their designed powers. The Post Office, with the new local call charge of 4d. and coin boxes that take pennies, sixpences, and shillings, is rather better off. Perhaps a little belatedly, it has recently been experimenting with a coin selector for the twelve-sided threepenny bit ; the vending machine makers were well prepared for that one, but what can you buy now for 3d.—apart from a small slab of chocolate or a piece of gum ?

Central Mining Plans

FOLLOWING the breakdown of the merger negotiations between Central Mining and Investment Corporation and Consolidated Gold Fields, Central Mining announces a scheme for reorganising its capital structure. A new subsidiary called Central Mining Finance will be formed, of which the capital will all be held by the parent company which will become a holding company. At present Central Mining is taxed as a finance house. Under the new arrangement the new subsidiary will be taxed as a finance house while the parent will become an investment trust. It follows that the group will also need to make a substantial investment in some part of the world, presumably absorbing the bulk of the £8.3 million surplus that Central Mining drew from the take-over of its investment in Trinidad Oil. A doubt has arisen as to whether the profit on that take-over is taxable, even in the hands of a financial company. Central Mining is contending that it is not a normal profit and should not attract tax. There is no intention, in any event, of distributing any large part of it to shareholders, but the company is fully conscious that while most of it remains uninvested it is a lure likely to attract share bidders.

SHORTER NOTES

Following the increase in the ordinary dividend from $1.50 per share (6 per cent) to $1.75 (7 per cent) the Canadian Pacific Railway announces higher earnings in 1956. Railway revenue increased by $56.9 million to $505.3 million and the net railway operating profit by $4.2 million to $41.3 million, while income from other sources rose by $2.3 million to $30 million.

★

Sir Raymond Streat, for seventeen years chairman of the Cotton Board, is resigning at the end of this month, but will continue to serve until arrangements have been made for a successor.

Company Notes

P AND O. Last July when Colonel Nasser seized the Suez Canal, Peninsular and Oriental deferred stock stood at 32s. to yield just 5 per cent. Now with an unchanged dividend of 8 per cent and a largely increased profit, but with the company's main trade artery still cut, the stock units stand at 34s. 6d. to yield £4 12s. 9d. per cent. Investors must have realised that since the company's financial year ends on September 30th almost the whole of the costs to the group of the Suez affair will have to come into the financial year now current. They must have assumed that the impetus behind P and O is strong enough to make the stock a high-ranking investment even when immediate circumstances are adverse. That would be a fair assumption for those ready to take a longish view. But that there are adverse circumstances such as the dislocation, the loss of intermediate freight on Far Eastern routes, and the high cost of oil picked up at unusual ports, can hardly be doubted.

	Years ended Sept. 30, 1955	1956
Consolidated earnings :—	£	£
Gross profit	21,922,650	24,197,996
Investment income	1,007,218	1,451,677
Depreciation	9,615,069	9,866,890
Surveys	1,810,014	1,964,291
Taxation	5,216,209	6,306,412
Net profit	4,756,431	5,228,446
Preferred dividends	87,400	87,400
Ord. dividends	1,267,535	1,267,534
Retained earnings	3,401,496	3,873,511

Net profit, after tax, for the year to September 30th rose from £5.6 million to £6.3 million. The net cost of the preferred and deferred dividends is only about £1.3 million. The factors that made for the increase in earnings were higher tramp freight rates and the rationalisation of some services in eastern waters. The glamour of the great passenger liner should never cause investors to forget that P and O is also a great tramp steamship concern. This year it was the tramps that brought home the profits. One other factor will arouse interest. Debenture interest is up by nearly £400,000 and earnings on government stocks and Treasury bills by over £400,000. It would be a neat assumption that the £10 million 5 per cent debenture stock issued in September, 1955, had been invested to show a profit while the company is waiting for its tankers. But these are the group figures which include various other items.

The deduction that stockholders can draw is that the group must by now have some indication of how the additional costs of Suez are running and that nevertheless the directors are facing them on the basis of a maintained, and amply covered, dividend.

★

FORD MOTOR. The Ford Motor ordinary dividend for 1956 is maintained at 7½ per cent. It absorbs £1,682,921 from a net profit of £5,614,866—down £2,936,783 on the year. Thus even in the most difficult of the postwar years for the motor industry, the cover on Ford's dividend is ample. Gross profits before tax fell by 44 per cent, from £17,907,600 to £9,989,842. But total sales fell in value by only 4 per cent, from £151.5 million to £145.7 million ; within this total exports were down by only £400,000 to £68.2 million. The number of vehicles sold, a figure which covers a changing range of vehicles at different prices, fell by 8½ per cent, from 350,650 to 320,742 units. Most of the decline occurred in the last six months of the year. The gulf between a large profit and a small one is narrow in an industry that uses capital as heavily as motor manufacture does. A small fall in production can have a shattering effect on earnings.

Sales and earnings :	Jan.–June, 1955	July–Dec., 1955*	Jan.–June, 1956	July–Dec., 1956*
Sales	£'000 77,980	£'000 73,569	£'000 77,779	£'000 67,921
Gross profit	11,382	6,526	5,629	4,361
Taxation	4,237	3,919	2,422	2,217
Net profit	6,024	2,528	3,424	2,191
Vehicles sold	*182,502*	*168,148*	*178,379*	*142,363*
Sales value per vehicle	£ 427	£ 437	£ 436	£ 477
Gross profit per vehicle	62½ %	38¾ %	31½ %	30½ %
Gross profit/ sales	14·6	7·9	7·2	6·4

*Estimated from full year figures.

Profit margins fell further in the last half of the year, declining from 7.2 to 6.4 per cent on sales. The average profit earned on each vehicle also fell, though only by £1 per vehicle. But these smaller

profits were earned on vehicles which fetched on the average much higher prices. The increase in the average value of vehicles sold must reflect the introduction of the new and higher-priced range of cars early in the year, a big cut in the demand for the cheapest vehicles and, perhaps, the fact that sales of commercial vehicles did not fall as steeply as did sales of small cars to private motorists.

Investors, seeing the danger, have realised that it is their opportunity too. Ford's earnings can climb as quickly as they have fallen and with some recovery in motor business in the air, they have been buying motor equities. Ford £1 ordinary units now stand at 34s. xd, compared with the 1956 "low" of 25s. 9d. They yield £4 8s. per cent, which clearly looks beyond the troubles of this year.

★

ASSOCIATED ELECTRICAL INDUSTRIES. The directors of AEI make no comment in the full report on the sharp decline in trading profits. They might well have done so, since not all units in the electrical industry have been similarly affected. But one new fact emerges: the decline in profits occurred while sales were rising and the order book lengthening. In 1955 the value of the group's sales can be estimated at about £120 million; in 1956 the directors say sales came to just over £133 million. Over the year orders received were £137 million, against £143 million in 1955, and at the end of the year orders in hand were £152 million, against £145 million. Firm

Consolidated earnings :	1955 £	1956 £
Trading profit	17,077,584	12,957,272
Other income	776,623	472,701
Depreciation	2,281,010	2,940,456
Taxation	7,370,653	5,847,901
Replacement reserves	1,987,249	...
Net income	6,301,804	4,372,325
Ordinary dividends	2,081,896	2,645,000
Retained by subsidiaries	3,076,242	290,610
Retained by parent	1,041,895	1,320,711
Cons. balance sheet :		
Net fixed assets	23,103,342	33,733,693
Net current assets	64,114,550	76,791,053
Stocks	54,966,021	64,937,866
Liquid assets	5,919,893	10,268,237
Revenue reserves	28,853,050	38,357,228
Capital reserves	19,657,824	27,052,119
Ordinary capital	25,000,000	33,639,483

capital commitments at the same date were estimated at £20.2 million (against £13.2 million) and the group held nearly £10.3 million in liquid assets.

The current year is likely to witness an increase in fixed and working capital comparable with that of 1956, when fixed assets (at gross values) went up from £36 million to £59 million and stocks (less receipts on account) from £55 million to £65 million. Last year's additional investment was financed in part out of the proceeds of the rights issue of ordinary shares. This year's investment, if profit margins remain narrow, will make a heavy call on internal resources. An order received for a nuclear power station was not included in the orders in hand. The current dividend of 15 per cent and the yield of £4 14s. on the stock at 63s. 9d. xd doubtless makes some allowance for nuclear power station orders and for the extra capital investment that the electrical companies will have to undertake. The companies will have to make further appeals for new capital, and to generate a further large slice of their own new capital too.

★

HUDSON'S BAY. On the news that the Governor and Company of Adventurers of England Trading into Hudson's Bay had left the ordinary dividend from trading unchanged at 15 per cent and the tax free dividend from the land account unchanged at 2½ per cent, the £1 ordinary stock units of the oldest of all companies quoted on the London Stock Exchange fell 2s. 6d. At 198s. they yield just under 2 per cent. That yield is not a reflection of the company's current trading experience, in retailing, wholesaling and furs in Canada, but of the present attractions of Canada to British investors and particularly of their hopes from the company's oil interests.

Yet this perhaps is the time for investors to become a little attentive to the company's dividend policy. Income from the land account is declining—the surplus fell from £130,000 to £97,000 in the year to January 31st—but there is still a big accumulated balance and a tax free dividend of 2½ per cent seems assured from this source for about another decade. But earnings on trading have been expanding and are likely to go on expanding as the Canadian economy grows. In the latest year trading profits crossed the £4 million mark for the first time, rising from £3,641,000 to £4,024,000, and net profits went up from £1,935,000 to £2,170,000. Yet for the third year running the trading dividend, now covered nearly four times, remains unchanged. There is room, it would seem, for a slightly freer hand.

★

INTERNATIONAL NICKEL. Last year International Nickel Company of Canada sold slightly less nickel and slightly more copper, both at higher average prices than in 1955. Nickel deliveries went down from 290 million lb to 286 million lb and copper deliveries went up from 263 million lb to 271 million lb. The better average price for copper made an important contribution to earnings. Net earnings per common share went up from $6.14 to $6.50 (a new record figure) but the common dividend was left unchanged at $3.75 a share. On that dividend the common shares at $198 yield 3.4 per cent.

This is a low yield for a mining equity which, however good, remains a wasting asset. But it is not low for Canadian growth stocks, among which Nickel must also be placed. The company's plans for growth are now centred upon the opening up of the Manitoba nickel field. This development, together with further progress at the established field at Sudbury, will give International Nickel an annual production capacity by 1961 of 385 million lb of nickel—100 million lb more than its deliveries last year. The Manitoba development will cost the company at least $115 million; this year alone it intends to spend about $50 million on capital account. This is almost entirely a project for more nickel, for the chairman, Mr John F. Thompson, tells shareholders: "The average nickel content of the Moak Lake and Thompson ores thus far discovered compares favourably with the average of our Sudbury ores, though the copper content is so small as to be almost a metallurgical

Sales and earnings :	1955 $	1956 $
Net sales	416,323,000	444,740,000
Operating profit	176,429,000	180,428,000
Other income	3,064,000	5,512,000
Net income	91,566,000	96,296,000
Common dividends	54,690,000	54,690,000
Earnings per share	6·14	6·50
Dividends per share	3·75	3·75

disadvantage. The gold, silver and platinum metals content, though lower than that at Sudbury, nevertheless has value."

An investment of this order cannot be made unless there are grounds for believing that the extra nickel can be sold at a profitable price. There are such grounds as the fact that in recent years the company has never had to try to sell its metal. Nickel has always been short, but Mr Thompson warns shareholders that "what the supply and demand situation in the nickel market will be at the time these mines come into production cannot be forecast at the present time."

★

HOOVER. At the begining of this month, before the preliminary report revealed an unexpected increase in earnings on the last six months of 1956, Hoover "A" ordinary shares stood at 26s. 3d. The "A" shares now stand at 32s. 9d. xd, to yield 7¾ per cent on the maintained dividend of 50 per cent. The annual review sent out with the full accounts helps to justify investors' renewed confidence in the company's future. It shows that the group's financial strength remained unimpaired, with cash and other liquid resources standing at more than £3 million.

It also displays the strength and virility of the company's management. The recovery in earnings that began in the last months of 1956 is attributed to the improvement in exports, especially to dollar markets, to the introduction of new vacuum cleaners and to the fact that the directors, after a critical review of the group's operations, "effected economies and increased efficiency and generally toned up the entire organisation."

Over the whole year profits fell by 27 per cent, from £3,838,233 to £2,790,077, and total turnover by 14 per cent. But, while sales at home fell by 22 per cent, sales overseas rose by 16 per cent. Sales in North America went up by 62 per cent. Looking ahead, the directors are optimistic. In North America, where "prospects for 1957 look very bright indeed," they expect another increase in sales. More generally they expect a further expansion both at home and overseas and, looking just a little further ahead, they say that any reduction or elimination in duty following on the establishment of a European common market will give the Hoover group "a preferential position in these countries."

★

DE HAVILLAND HOLDINGS. In announcing an ordinary dividend of 7½ per cent, the directors of de Havilland Holdings have restored the rate to where it stood before the Comet disasters. In the previous year the dividend was 5 per cent and in 1953-54 no payment was made. This news was immediately followed by a rise in the price of the £1 ordinary stock units by 1s. 4½d. to 23s., at which they yield 6½ per cent.

The bigger dividend followed an improvement in earnings. Group profits before tax in the year to September 30th advanced from £2,570,954 to £3,846,338, net profits after tax rising from £958,575 to £1,659,238. The ordinary dividend absorbs £378,246. The directors say that "the increased surplus of the group has, to a considerable extent, been due to the excellent results of the Canadian subsidiary."

★

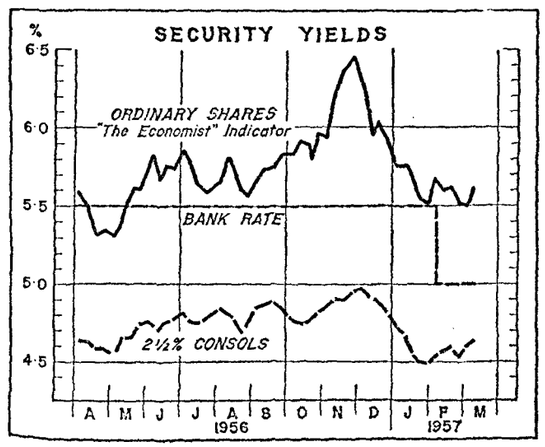
DE BEERS CONSOLIDATED MINES. The preliminary report of De Beers contains not one consolidated figure. It is therefore old fashioned, and could even be misinterpreted. As expected, the deferred dividend is 10s. per 5s. deferred share (or 200 per cent), a rate that has remained unchanged through the five previous years, so that at 98s. 9d. the 5s. shares yield 10⅛ per cent. The net profit for 1956 is shown at £9,574,847 after providing £1,290,000 for taxation; the year before the net profit was £10,042,640 after charging £1,420,000 for tax. Thus in a year of record diamond sales, profits in this report are shown to have fallen. But these figures relate to the parent company only and therefore only to the mines that it operates plus the dividends—not the total earnings—from the subsidiaries and the dividends from the investment portfolio of the parent. They thus exclude, for instance, the almost wholly owned Consolidated Diamond Mines, whose gem production makes a notable contribution to the earnings of the group. It may well be that when the full accounts are published the consolidated income will show an increase over the year.

Through De Beers Investment Trust, the group is an important investor in the gold and copper mines of Southern Africa to say nothing of its standing in the diamond industry. Cannot its directors, then, publish a preliminary statement which provides a suitable résumé of the income accounts in the full report?

★

BRADFORD DYERS. The Egyptian subsidiary of the Bradford Dyers Association was known to be highly profitable but exactly how profitable was never made clear in the company's reports. BDA sold control of this company to Egyptian interests last June and in BDA's latest accounts for 1956 its trading results are not included in the consolidated figures. Hence the 1956 and 1955 figures are not directly comparable. Moreover as the Egyptian Government has sequestrated all British properties in Egypt, no credit is taken in the 1956 accounts for any dividend payable on BDA's minority interests in the Egyptian concern or for the interest accruing on bank deposits of £1,126,021 in Egypt.

The preliminary statement shows that trading profits of overseas subsidiary companies in 1956 came to £259,645, compared with £1,066,016 in 1955. This disparity indicates but does not measure the profitability of the Egyptian company. The trading profits of the parent company and its British subsidiaries, which work on a commission basis, have fallen from £1,083,039 to £791,448. Hence combined trading profits in 1956 came to £1,051,093, against £2,149,055, and net profits to £277,231, against £538,378. The ordinary dividend was left unchanged at 10 per cent. This is a disappointing result, following not long after an announcement that BDA was to close its Paisley branch. The £1 ordinary stock units have fallen by 1s. 6d. to 20s. 1½d., at which they yield £9 19s. per cent.



LONDON STOCK EXCHANGE

First dealings:	Feb. 27	Mar. 13	Mar. 27
Last dealings:	Mar. 12	Mar. 26	Apr. 9
Account Day:	Mar. 19	Apr. 2	Apr. 16

In the face of the obviously adverse factors—the threatened strike and the political confusion in the Middle East—prices have given ground, but only slowly. Gilt-edged withstood the deterioration in sterling, which occurred on Wednesday; the *Financial Times* index of Government securities showed a slight decline over the week from 88.45 to 88.25. Dollar stocks rose and the dollar premium advanced to 8¾ per cent over the rate for the day.

Shipbuilding shares fell heavily; Swan Hunter lost 6s. to 65s. 6d., Vickers 3s. 1½d. to 41s. 9d., Harland and Wolff 3s. 7½d. to 32s. 3d. and William Doxford 2s. 9d. to 77s. Engineering stocks were affected to a lesser degree, Babcock and Wilcox falling 3s. to 79s. and Guest, Keen and Nettlefolds 1s. 4½d. to 46s. 6d. Steel shares weakened further, but were steadier by Wednesday. United Steel made a small advance to 31s., John Summers was 1s. 9d. lower at 30s., and Stewarts and Lloyds lost a few pence. Motors were undecided with Standard up 3d. to 7s. 6d., while BMC receded 4½d. to 7s. 10½d. Bristol Aeroplane rose 6d. to 19s. on the helicopter order and De Havilland responded to the increased dividend. Dowty gained 1s. 1½d. to 32s. 9d. xd on the bigger interim dividend. Stores eased generally, Army and Navy and John Barker being particularly weak after the results, losing 5s. and 1s. respectively to 55s. 10½d. xd and 13s. xd. Mappin and Webb "A" declined 3s. 1½d. to 25s. Shipping shares were firmer.

Following the official listing of Shell in America, the stock reached 180s. on Thursday; Royal Dutch followed the movement, but British Petroleum and Burmah fell. Among the gold mines, President Brand recovered to 51s. 9d. on the increase in dividend and other OFS issues improved. Anglo-American Corporation gained 5s. to 141s. 3d. Platinums eased, but Nigerian tins improved and coppers recovered on Wednesday.

(1) Annual figures are for June of each year. (2) Engineering, shipbuilding, electrical goods, vehicles, metal goods, precision instruments and jewellery. (3) Textiles, leather goods, clothing, food, drink and tobacco, manufactures of wood and cork, paper and printing. (4) Number registered as unemployed expressed as a percentage of the estimated number of employees. (5) From June, 1956, onwards comparison with earlier figures is affected by the revocation of the Notification of Vacancies Order, 1952. (6) United Kingdom.

(1) Relates to wholesale prices in Athens and Piraeus only for Greece. Figures for Ireland from 1953 onwards are for home produced goods only. (2) July-December. (3) *Relates to prices in capital cities only* for Austria, France, Greece and Turkey. Belgium and Austria exclude rent. Denmark includes direct taxes. Figures for Ireland are based on August, 1953=100. (4) Including direct taxes. (5) Including trade with Faeroe Islands. (6) Index numbers of unit value which compare the current average value of trade with its value in 1953; they are influenced by changes in the composition of trade as well as price movements. (7) Deposit money and notes and coins held by business, individuals and foreigners. Except for Greece holdings of *the issuing authority and other banks* are excluded. (8) Holdings of the government and central bank at end of period. Figures for Greece are gold reserves only. Foreign exchange figures for Norway exclude government holdings; Netherlands, Norway and Sweden include foreign investments. Ireland includes some long-term securities. (9) Beginning May, 1954, a new drachma equal to 1,000 old drachmas introduced.

Financial Statistics

EXCHEQUER RETURNS

For the week ended March 9th, 1957, there was in "above-line" surplus (after allowing for Sinking Funds) of £55,822,000 compared with a surplus of £4,117,000 in the previous week and a surplus of £5,932,000 in the corresponding period of last year. There was a net deficit "below-line" last week of £37,793,000, bringing the total deficit to £225,842,000 (£90,888,000 in 1955-56).

THE MONEY MARKET

THE discount houses moved to check the fall in the Treasury bill rate at last week's tender—and in doing so suffered a sharp decline in their allotment. For the 91-day bills on offer the common bid was reduced by 2d. (equivalent to a rise in the discount rate of 8d. per cent) to £98 19s. 10d. per cent; this move does not appear to have been wholly followed by outside tenderers; and as total applications rose by £34·5 million, to £442·7 million—the highest since July last—the market's allotment rate for these bills was only 12 per cent. This is explained partly by the full allotment of the offer of 92-day bills, necessitated owing to the incidence of Whit Monday; but the market's average allotment on both maturities was only 21 per cent, compared with 50 per cent at the preceding tender. The discount houses are, however, supplementing their allotments through individual bids. The average rate of discount on last week's tender as a whole rose by less than 4½d. per cent, to £4 0s. 5.2d. per cent.

Credit conditions have been difficult. On Tuesday the market balanced its books without official intervention, but on Wednesday difficulties returned and in the absence of any special help the market was in the Bank for a small amount—for the third time in the week. However, the fall of £11·9 million in discounts and advances shown in the Bank return suggests that the market reduced its indebtedness.

Homes and the Halifax

In 1957 thousands of people will own their own homes free of mortgage, having made their last payment to the Halifax Building Society. Many thousands more will, with the help of this famous organization, start to achieve the security and independence which home-ownership brings.

The society is anxious and willing to help such people. With its background of strength and stability, it has unexcelled facilities to offer both to those who wish to buy a home of their own and to those who seek a safe depository for their investments.

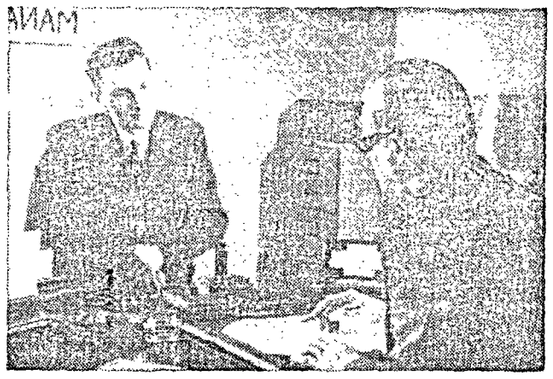
IN TO-DAY'S TRAFFIC, a step off the pavement is too often a step into hospital. That's why every walker—and aren't we all?—should carry a London Assurance Personal Accident Policy in his knapsack. He won't have to worry about loss of earnings and medical expenses—and he doesn't throw a financial spanner in the family works.

OPEN FIRE!

You never know when a red-hot coal may shoot out on to your carpet; fires have such an unhappy knack of spitting behind one's back. But with our Householders Comprehensive Policy, the accident will not burn a hole in *your* pocket.

LOOK FORWARD TO IT.



Old age seems a long way off—until you get there. After a lifetime's labours, it's good to know you can start your new life on *your* own two feet. A regular investment in one of our Retirement Policies helps you to look forward to your retirement with equanimity and aplomb.

★ ★ ★

These are three policies from a wide selection. Should you want to know more about us, our other policies, or insurance problems generally, our address is 1, King William Street, Dept. 6, London, E.C.4.

MR V. A GRANTHAM'S REVIEW OF ECONOMIC CONDITIONS IN THE EAST

The ONE HUNDRED AND THIRD ORDINARY GENERAL MEETING of The Chartered Bank will be held on April 3rd at 38 Bishopsgate, London, E.C.

The following is an extract from the statement by the Chairman, Mr V. A. Grantham, which has been circulated with the report and accounts for the year 1956:

THE CONSTITUTION OF THE BANK

Following the adjournment of the one hundred and second annual general meeting of the stockholders held on April 4th last an extraordinary general meeting was held to adopt the draft of a supplemental and consolidating Royal Charter which was the subject of a petition from the Court of Directors to Her Majesty the Queen in Council. The new charter was granted by Letters Patent issued under the Great Seal on June 25, 1956, when the provisions of the charter and the annexed bye-laws and rules became effective.

Clause 3 of the new charter empowered the Bank to change its name, and advantage of this provision was taken on December 5th when a special resolution, passed by an extraordinary general meeting of the stockholders and subsequently sanctioned by the Lords Commissioners of Her Majesty's Treasury, shortened the name of The Chartered Bank of India, Australia and China to The Chartered Bank. The change was brought about with a minimum of difficulty and it has been warmly welcomed by the stockholders, our customers, our banking correspondents and our friends everywhere.

THE GENERAL MANAGEMENT

Mr David Stewart, the senior of the joint general managers, retired on January 31, 1957, and I take this opportunity of acknowledging with gratitude the valuable services he rendered to the Bank over a period of thirty-seven years. He joined the Head Office Executive from the eastern service in 1945 and was a trusted adviser of the Court of Directors on matters of high policy and administration, particularly with regard to the affairs of India and Pakistan, Burma and Ceylon. We are not to lose entirely the benefit of his experience as I am glad to say that he agreed to accept a seat on the Board of The CBI Development Corporation Limited, in which capacity he will be able to play an active part.

Mr G. A. Leiper, until recently manager of our branch in Manila, has been appointed an Assistant General Manager.

NEW BRANCHES

The Bank has purchased the goodwill of the business in Pakistan conducted by the Allahabad Bank Limited and on January 1st last the branches of the latter institution at Lahore and Lyallpur were incorporated in the branch system of The Chartered Bank. The branch of the Allahabad Bank Limited at Karachi has been merged with our own branch in that city.

To meet the growing need for banking services in North Borneo new branches have been opened during the past twelve months at Lahad Datu and Tenom. The former mercantile agency at Kudat has been replaced by a branch of the Bank.

A new branch has been opened in Ampang Road, Kuala Lumpur, to serve expanding commercial development in that district of the federal capital.

THE CBI DEVELOPMENT CORPORATION LIMITED

A year ago I intimated that the Bank had promoted a wholly-owned subsidiary company, The CBI Development Corporation Limited, to engage in medium-term and similar credit operations connected with economic development in the eastern countries to which the oversea representation of the Bank extends. During the first year of the Corporation's existence much time has been spent in research, investigation and the formulation of policy. The intensification of credit control in the United Kingdom has inevitably curtailed some of the opportunities open to the Corporation for lending in sterling. This and other factors, notably the necessity in most territories for registering the Corporation as a financial institution, have tended to circumscribe the framework within which the Corporation can function but it is now possible to discern the pattern of future operations and I am quite sure that our new venture will fulfil a useful and creative function and bridge the gap between the short-term financing of trade and industry by overdraft, and the raising of capital from the public. I would like to say that I am quite satisfied with the initial experience of our Development Corporation.

THE BANK'S BALANCE SHEET

The Balance Sheet total is very slightly lower than last year. Due to higher rates available in the London market, our Fixed Deposits are £8 million lower. This is set off by a smaller holding of bills of exchange and a reduction in our Cash in hand and at call.

Owing to the insistent demand for finance in those countries where in the rapid course of their development the pressure on local resources is much in evidence our advances to customers have increased by £12 million and this has been largely met by the non-investment of maturing government securities.

A part of the increase under the heading of Advances is represented by pre-payments under American Aid programmes.

Our Acceptances now exceed £10 million and indicate the growing popularity of this form of finance by Far Eastern merchants and bankers. We continue to show our investments in government securities at *market rates.*

For the first time we are publishing a consolidated balance sheet which includes the figures of our wholly-owned subsidiary companies.

PROFIT AND LOSS ACCOUNT

Despite the continued upward trend of working costs, especially salaries and wages, our earning capacity improved. The Bank's policy has always been to keep a liquid money position in London and we have made full use of the higher interest earnings available in 1956. This explains the increase in our net profits from £759,340 in 1955 to £800,808.

The Bank paid an interim dividend in September last of 7½ per cent less Income Tax, absorbing £150,937 and it is now proposed that out of the balance available a final dividend of 7½ per cent be paid, costing £150,938 making a total distribution of 15 per cent.

It is proposed to repeat the allocation made in each of the past six years to Bank Premises and Furniture Account, the Pension Fund and the Widows' and Orphans' Fund of £200,000, £125,000 and £20,000 respectively. It is proposed to transfer £150,000 to Contingencies Account and to carry forward a balance of £409,308

OVERSEA SURVEY

In most of the statements I have circulated to the stockholders since the end of the war I have referred to the surge of Asian nationalism and to the significance of this for the Bank. The trend continues: Malaya and Singapore are moving rapidly towards political independence within the Commonwealth and a general election in Ceylon has returned to power a government pledged to lead the island to a more clearly defined sovereignty. The repercussions of such political movements are felt at every point in our extensive system of branches. They affect vitally our relations with our Asian employees; they influence the selection of business risks and circumscribe the deployment of our resources.

Although our representation in the Middle East does not extend west of Aden Colony there have been throughout the territories further east reactions to the crisis which arose in Egypt a few months ago. Fortunately Britain has accumulated down the years a large fund of goodwill in the minds and hearts of the peoples of Asia and it would

appear that notwithstanding widespread expressions of sympathy with Egypt that fund has been drawn upon to a much smaller extent than many critics of the British Government may have feared. The inner history has yet to be written but it is clear even now that there is a greater understanding in the world of what may have been behind our country's action.

In the East our political role is obviously changing but we can take credit for having created a defensive framework within which political independence, economic freedom, personal liberty and respect for human rights can take root.

Quite surely British endeavour in the East is nowhere at an end; it is everywhere in progress.

I now propose to review developments during 1956 in the territories served by our branches and to give some account of the contribution we are making to the promotion of economic interests common to East and West.

ADEN

When the Canal re-opens and given reasonable stability in the Middle East, there are grounds for hoping that the steady consolidation of our business in Aden, which has been taking place ever since the Bank opened there a few years ago, will show satisfactory results.

INDIA

Last year I commented on the draft outline of the Indian second Five Year Plan, whose major objectives are rapid industrialisation—particularly the development of heavy industry—and the expansion of opportunities for employment.

Additional taxation is being imposed to help finance the plan, but it would be well to recognise that more and more penal taxation may defeat its own ends for so many limitations surround the private investor today in India that it is, unfortunately, no longer clear how the skill and enterprise which is so necessary can be rewarded. Without fair rewards private enterprise cannot be expected to function or to provide the very large sums of money that the plan expects from the private sector. Heavy taxation too in itself is going to do little to halt the steady inflationary tendency, for although the money supply rose less in 1956 than in the previous year the wholesale price index went up 13 per cent on the year. Continued and increasing inflation could endanger the whole plan. That the authorities are aware of this is encouraging for, commenting in the draft plan on the difficulties of financing in part such an ambitious programme by deficit financing, the sponsors admitted that the stepping up of investment might have an inflationary impact, particularly if a relatively high proportion of the expenditure were found by an increase in the creation and supply of money.

As savings are not keeping pace with industrial expenditure there is already a woeful shortage of investment capital and more and more strain is being put on the banks who, whilst unable to attract sufficient extra deposits, are being faced with demands for fresh or increased facilities, and we for one have reluctantly been unable to entertain many of the propositions placed before us. The advances of the scheduled banks in India have already reached unprecedented levels and the average ratio of advances to deposits of all the scheduled banks is now in the region of 70 per cent. This has necessitated increasing use being made of the facilities provided by the Reserve Bank of India under the Bill Market Scheme introduced by them in 1952. Discussions have recently taken place in Bombay and Calcutta between the banks and the Finance Minister to find other means of alleviating the situation but the problem is extremely difficult as the Indian authorities have stated that the tightening of bank credit is one of their anti-inflationary measures.

PAKISTAN

The predominant feature of the past year in Pakistan has been the shortage of foreign exchange and without assistance from the United States the country's position would be far from happy. Early in the year it had appeared reasonable to assume that after an extended period in which the balance of payments had been under continuous pressure as a result of the industrial development programme, Pakistan had at last turned the corner.

By October, however, it was clear that the country was once again facing a severe food crisis owing to deficiencies in the rice and wheat crops. This necessitated considerable imports of food grains into both East and West Pakistan and it will clearly be necessary for the authorities to take steps to encourage an increase in food production if this is to be avoided in future. The government, however, are fully alive to this need as the recently published Five Year Plan gives priority to agriculture and to an extension of irrigation facilities, drainage and flood control, whereas in the past the emphasis has tended to be more on industrialisation.

Meanwhile encouraging features have been the substantial rises in the value and volume of exports of Pakistan's raw jute and raw cotton during the past season. The country's new manufacturing industries have also expanded their sales oversea and there have been notable increases in exports of cotton yarn and cloth and jute goods. It is estimated that by 1960 Pakistan should be in a position to supply about one-third of the world's total requirements of jute goods, and the cotton industry is already taking advantage of the absence of export duty on its cloth and yarn to widen the range of its foreign markets. On the other hand the continued restrictions on imports have led to price rises in domestic markets as stocks of imported goods have run down. The country has undoubtedly been passing through a most difficult period, but it is encouraging to learn from the Finance Minister's recent speech introducing the budget for the coming fiscal year, that there was a small surplus on the balance of payments for 1956 as a whole.

BURMA

It is pleasing to report that last year Burma succeeded in disposing of practically all its surplus stocks of rice, part of which had been carried forward from as far back as 1953. Rice exports for the year amounted to some two million tons, the highest total recorded since the war, although well below the pre-war level of shipments. Apart from increased rice shipments, exports of timber and non-ferrous metals have improved slightly, but not sufficiently to make any significant contribution to the country's exchange reserves.

Hopes were entertained that capital goods and equipment would be forthcoming from those countries of the Soviet block with which Burma concluded barter agreements for the disposal of its rice. So far these agreements have not proved a success and on the whole Burma has received in exchange for its rice, goods of inferior quality, expensive in comparison with similar merchandise supplied by the free world and representing in the aggregate only part of the value of the rice supplied. In theory half Burma's exportable surplus of rice during the present year, which is expected to be much the same tonnage as in 1956, is committed for shipment on barter account, but efforts are being made to scale down this commitment in order to supply the requirements of buyers in the free world, who pay for their supplies with exchange which the Burmese authorities can use to finance their purchases in competitive international markets.

CEYLON

The latest figures available show that last year the surplus on Ceylon's oversea trade was running at a substantially lower level than in 1955. Imports were higher in aggregate value owing largely to increased purchases of capital goods, while exports declined in value, much the same volume being shipped abroad as in 1955, but in the case of tea, which accounts for the bulk of Ceylon's export earnings, at a lower average price.

Introducing the new government's first budget in July, the Finance Minister indicated that as domestic saving and investment were insufficient to ensure a progressive improvement in the population's living standards, foreign capital would be welcomed. An assurance was also given to private enterprise that it would receive full support from the government in the role assigned to it. However, the recent proposal by a member of the government to nationalise the tea plantations on what the owners consider to be harsh terms, although it has not so far been formally adopted as government policy, must inevitably impair the confidence of the potential oversea investor, and thus seriously impede the future economic development of Ceylon, on which the raising of the living standards of the population depends.

MALAYA

Once again both the Federation of Malaya and Singapore have enjoyed a prosperous year. Taking both territories together, oversea trade rose in value to a level only previously exceeded in 1951 at the height of the Korean war boom. However, owing largely to the increased quantities of capital equipment and building materials purchased abroad in connection with development schemes, imports rose at a higher rate than exports and in consequence the favourable trade balance at M$12.6 million was substantially lower than in the previous year. It also has to be recognised that although the continued improvement in the level of oversea trade is impressive, expansion in trade and industry, particularly in Singapore, has to some extent been curtailed during the year owing to political uncertainty and labour unrest.

One important matter which still gives rise to uncertainty is the question of the future of the currency. This is linked to a large extent with the recommendation, made by the World Bank mission in their report on the economic development of Malaya, that a central banking system should be established. I mentioned last year that preliminary inquiries into the project had been initiated by the two governments.

A report which was published in June, set out the advantages and disadvantages of establishing separate central banks in both Singapore and the Federation, but, as might be expected, it clearly favoured a joint central bank covering both territories. In the light of the report, the two governments have agreed that a "central banking mechanism

should be established, but have not yet decided the form it is to take. It is possible that a final decision will await the outcome of the constitutional changes which are impending this year, but already the governments of North Borneo, Sarawak and Brunei have decided to establish in due course a currency of their own which is to be independent of the Malayan dollar. It is to be hoped that there will be no further fragmentation of the existing currency area in which first the Straits dollar and subsequently the Malayan dollar have provided a stable and effective medium of exchange.

With the Federation of Malaya attaining political autonomy within the Commonwealth on August 31st next and with Singapore looking forward to similar independence, we are, of course, already giving serious thought to the effect upon the present banking system of the changed conditions, and to the steps which may be necessary to meet them. I believe that we shall be able to rely upon a realistic approach by the two governments to economic and political problems and the banks can draw upon their experience in other territories where independent governments have been set up. Whatever the future may bring, it will be this Bank's policy to continue its long years of service to the two countries and to assist to the greatest extent possible in their economic progress.

NORTH BORNEO

North Borneo has now fully emerged from the postwar rehabilitation period and there is evidence in many directions of a well co-ordinated policy to develop within its means a well based economy which, given continuing peaceful conditions, augurs well for the future.

The latest figures available show that North Borneo's external trade last year may well reach a record level, although the trade surplus for the year as a whole is likely to be less than in 1955.

SARAWAK

A significant step forward in political development was taken in Sarawak during the year by the grant by Her Majesty the Queen of a new constitution under which the new Council Negri will have an unofficial majority and by the holding of the first Municipal election in the Colony in Kuching.

Last year the Colony's principal exports, rubber, pepper and timber, fetched less remunerative prices in international markets than in 1955 and, despite an increase in the volume of exports, external trade fell in aggregate value. Although imports were slightly lower, the favourable trade balance at M$12 million was substantially less than in the previous year.

INDONESIA

This time last year it seemed reasonable to take an optimistic view of the immediate future in Indonesia. There was optimistic talk in some governmental circles of moving towards a free economy, but once again hopes have been dashed by a coalition government unable or unwilling to take realistic steps to come to grips with major problems. The result has been a rapid deterioration in the economy which has finally resulted in political unrest of a magnitude which might yet prove a serious threat to the structure of the constitution.

In the general setback that Indonesia has sustained it is very difficult to separate cause and effect. Perhaps in some ways the new coalition government was unfortunate in inheriting labour problems which should have been dealt with by preceding governments, but nevertheless it did nothing to keep the demands of the labour unions, particularly the estate unions, within reasonable bounds, and the resultant unrest and strikes must seriously have affected the volume of exports. That volume too was probably even more seriously affected by the smuggling of rubber and copra and it was not surprising, therefore, that 1956 turned out to be a disastrous trading year for the Republic even at a time when high world prices for its prime exports should have produced the opposite result.

Notwithstanding all I have said I am still optimistic regarding the long-term prospects of the Republic, for we do not believe its people will allow their rich heritage to deteriorate and disintegrate, and we are going steadily on with our own business in Java and Sumatra.

THAILAND

Last year I drew attention to Thailand's return to a free economy. In a world in which governments, to solve their economic problems, appear in general to put increasing faith in exchange control and import licensing it required courage on the part of the authorities in Thailand to initiate what many regarded in the first place as a somewhat perilous experiment.

It is pleasing to report that the whole experiment has so far worked well. It was anticipated that following the lifting of import controls in September, 1955, there would be an immediate and considerable increase in imports. Such proved to be the case, and according to the latest figures available the country appeared to be running a trade deficit well into 1956. However, as a substantial proportion of Thailand's imports are shipped under American Aid and exports have been running at a higher level than in 1955, it is reasonable to assume that, except for the period immediately after the raising of import restrictions, the country's balance of trade has been favourable.

VIETNAM

Since last year, when I told you of the difficulties, both political and economic, confronting Vietnam, there has been steady progress in both fields, to an extent that allows one to be quietly optimistic about the future and perhaps the greatest encouragement in this view is the gradual strengthening of the country in relation to communist-held northern Vietnam.

That this improvement in strength has been made is largely due to the forceful personality of President Ngo Dinh Diem, whose outstanding achievement was the promulgation of the Vietnam constitution in October last.

Although the country depends almost entirely upon American Aid, which provides the greater part of the government's budgetary revenue and pays for all but 20 per cent of the country's imports, there are signs that an early revival of exports may change drastically the extent of this dependence on external support.

CAMBODIA

Cambodia, by accepting aid from China and Soviet Russia as well as the United States, has demonstrated that it wishes to be completely independent of any international political grouping and to be free to welcome investment and assistance from any foreign source, provided that it is offered without political conditions attached to it.

The bulk of the country's imports continue to be financed by American Aid, but in order to assist its declared policy of lowering prices in the domestic market the government has released part of its own foreign exchange holdings to pay for certain specified imports. This cautious but commendable spending policy will undoubtedly assist in building up the country's economy on sound lines and we can look for further steady progress even in the absence of much needed investment capital.

THE PHILIPPINES

The Philippines would appear to have been successful in one major battle during 1956, that is defending the value of the peso. The rapid fall which took place in the Republic's international reserves during 1955 was halted and, mainly owing to drastic import control, there was a slow but steady increase in the foreign currency holdings during the year under review. As exports are tending to rise in value and American Aid has proved more than sufficient to cover the trade deficit the peso should be in no immediate danger.

The determination and realism that have played such a large part in readjusting the balance of trade and saving the peso will be needed by the administration in their second major struggle, that is the fight against inflation. If the Philippines succeed in halting inflation over the coming year a major economic victory will have been gained, but the task is not an easy one. To succeed it may be necessary to postpone some of the capital development programme and reduce deficit financing. Efforts will have to be made to see that local production is increased to offset import cuts and this would seem to indicate a temporary switch at least from industrialisation to investment in indigenous activities such as mining, tobacco, desiccated coconut and paper production and to the purely agricultural industries of coconut-oil, sugar, hemp and lumber.

HONGKONG

Notwithstanding Hongkong having better trading figures for the year, due no doubt more to higher prices than to increased volume, it is becoming increasingly clear that its importance as an entrepot is decreasing and that much of that business has probably gone for ever.

That China will trade through Hongkong when expedient was fully demonstrated by the modification of policy in the middle of the year which brought Hongkong's merchants to an increased degree into China's pattern of trade. Unfortunately, because of China's dependence on the Soviet block for the bulk of its supplies, it is unlikely that an increased use of Hongkong for inward and outward shipments will be a permanent feature.

Fortunately, industrial development in the Colony has done much to offset its loss of entrepot trade and the various industries, particularly cotton spinning, can look forward optimistically into 1957, provided there is no change in Imperial preference. The mills and other industries are fortunate in having, partly through refugees, a seemingly inexhaustible reservoir of good labour which enables them to keep costs steady and competitive.

The political scene during the year was dominated by the riots commencing with the celebration of the anniversary of the foundation of the Nationalist Republic of China. Unruly elements seized their opportunity to indulge in looting, arson, stone

throwing and intimidation but a reassuring feature is that a government enquiry has confirmed that political motives were to all intent and purpose absent.

CHINA

My report on China this year is in marked contrast to my remarks over the last few years inasmuch as, under encouragement from the authorities, your bank is again participating, if only to a small extent, directly in mainland China's oversea trade.

It would appear that the authorities in Peking consider that it is useful to have trade links throughout the world additional to those provided by their own Bank of China and, as this change coincides with China's further progress towards normal commercial trading terms, it is hoped that we shall be in a position to handle useful and remunerative business.

JAPAN

Three main and interrelated political events took place in Japan during the latter half of 1956: firstly, the state of war with the Soviet Union was ended and normal diplomatic relations resumed; secondly, Japan was admitted to membership of the United Nations; and thirdly, the Liberal-Democratic Party in power elected a new premier who reshuffled the more important cabinet posts.

Possibly the greatest advantage from these developments is an addition to the country's international bargaining power, and this it may well need if it is to succeed in consolidating and ensuring the continuance of the great economic strength that it has built up over the past two or three years, for the authorities are obviously trying to hedge against the disastrous effects that a recession in the United States could have on Japan's economy. To do this they must make certain of larger participation in the China market, which involves delicate negotiation with the United States, and an increase in the country's trade with South East Asia countries and the sterling area which, too, may necessitate much hard bargaining.

It is perhaps surprising at the end of a most prosperous year when the economy expanded much more than could have been anticipated and a net gain on foreign exchange holdings was registered, that Japan should be worried about the future but, due possibly to a liberalisation of its import policy, not unconnected with negotiations on exports, the terms of trade turned rather quickly against the country in the second half of the year. I do not wish to give an impression that I feel alarmed about Japan's future for, on the contrary, the country enters 1957 on a very optimistic note and the fact that the weaknesses and possible dangers I have pointed out are well known to the authorities probably means that they will be well taken care of by sound fiscal and monetary policies.

NEW YORK

In 1956 we have had the interesting spectacle of the United States' authorities in their turn resorting to credit restraint to counteract the sharp rise in the demand for loans and the excess demand for capital investment over the supply of current savings. The result has been tight money market conditions and an increase in interest rates, but, notwithstanding this and a cut in profit margins, the economy looks as sound as ever at the moment. In these conditions our New York office, which progressively increases in importance in our branch system, has had perhaps more than usual demands made upon its resources.

HAMBURG

Our Hamburg agency continues to increase its business and as an active link between our branches in the East and trade and industry in West Germany it occupies a position of growing importance in our organisation.

CONCLUSION

With the industrial skill, mercantile capacity and administrative ability that is at our disposal, and a proper realisation of the fact that our endeavours in the East must in future be related to common economic interest rather than to politics and strategy, there is no reason for despondency.

To that I would only add that we see everywhere throughout the East a steadily increasing competition for business, which is not likely to become less as the years go by and we must realise that the selling prices of our manufactured goods will be set by the world at large and not by ourselves. We cannot expect, indefinitely, to absorb increases in the cost of living in our selling prices or to get increased prosperity without increased production, which must entail an end to restrictive practices. Our income will be related to our output and our present standard of living will only be maintained if we are prepared to match the output of other countries. If we do not do so we shall find ourselves priced out of the world's markets.

Copies of the full text of the Statement will be sent on application to the Secretary of the Bank at 38 Bishopsgate, London, E.C.2.

ARISTON GOLD MINES

The twenty-seventh annual general meeting of Ariston Gold Mines (1929) Limited was held on March 12th, in London, Major-General W. W. Richards, CB, CBE, MC, Chairman, presiding. The following are extracts from his circulated statement and the report for the year ended September 30, 1956:

Following the strike of African labour from November 20, 1955, to February 27, 1956, full-scale operations were resumed as speedily as possible, but the total cessation of production during that period and the difficulties met with in regaining full production resulted in a reduced bullion revenue of £1,132,920, compared with £1,668,179 for the previous year. 327,050 tons of ore of an average grade of 6.313 dwts were milled during the year, against 455,730 tons of 6.588 dwts average grade milled for the previous year. 619 oz of gold were produced from the special treatment of slags.

Mine operating expenditure amounted to £805,791. The net profit amounted to £50,316. The Board recommend a dividend of 1½d. per Unit, less tax, and has declared an interim dividend of 1½d. per Unit, less tax, on account of the current year.

Ore Reserves at September 30, 1956, were computed at 2,562,298 tons of an average value of 6.57 dwts, an increase of 95,969 tons and 0.1 dwt in the average value as compared with the preceding year.

Operating results for the current year so far are proving most satisfactory; in fact the tonnage and revenue for November, 1956, were records.

The report and accounts were adopted.

CABLE AND WIRELESS (HOLDING)

ANOTHER RECORD YEAR

The twenty-eighth annual general meeting of Cable and Wireless (Holding) Limited was held on March 8th in London.

Sir Edward Wilshaw, KCMG, DL, JP, LLD, FCIS (the Governor), in the course of his speech said:

Again we have had a record year. Our gross income from Investments has reached a new peak at £1,392,572, and the value of the Investments shows an increase of £189,176, the total being £22,810,335, a very satisfactory state of affairs.

Our earnings have again increased; this year by £56,033 to £1,093,865. This increase continues the consistent growth of our earnings for the past few years, as follows: 1953, £583,000; 1954, £744,000; 1955, £1,037,000; and 1956, £1,093,000. We have paid three quarterly interim dividends, each of three halfpence per 5s. unit of Stock, and a final dividend of three halfpence is recommended, making a total of sixpence per 5s. unit for the year.

Since we met last year we have, as you may know, made the Ordinary Stock transferable in units of 5s.; we feel that this innovation, and the payment of dividends quarterly, must have stimulated an additional interest in our Stock by reason of the fact that there has been a considerable increase in the number of accounts on our Register.

Last year I mentioned certain proposals we had in mind for enabling the officials and staff to share in the prosperity of the Company. We had decided that they should participate in like manner to the Stockowners in having a similar "dividend" on their salaries as the Stockowners receive on their Stock. In other words, just as the business cannot be carried on without capital from the Stockowners neither can it be carried on successfully without a contented, efficient and loyal staff. The former therefore receive a dividend on the capital they put up and the staff a similar "dividend" on the work they do, such "dividend" being paid to them as a bonus based on the salary they receive.

In furtherance of the policy of ensuring that the Staff have some financial interest in the prosperity of the Company we have granted interest-free loans to officials and staff, repayable within the year, to enable them to purchase the Company's Ordinary Stock up to 5 per cent of their annual salary.

You must know by now that I am an unrepentant optimist, but I am bound to admit that the immediate future is somewhat obscure. I feel I must reiterate my optimism still further, for in these days there are many people willing to decry our great country and Commonwealth. We have had much to our past that the world has emulated and in my view there is still so much that we can offer by way of standards of human behaviour and industrial progress. Our manufacturers are still able to hold their place in the world's markets. It may be that a lot of trouble is occasioned by the fact that we do not sufficiently publicise our efforts and attainments.

However, provided there is no major international complication, we should be able to pay four quarterly dividends of three halfpence per 5s. unit of stock for the year 195[illegible] and I remain reasonably confident that we shall be able to continue the payment of dividends of at least that amount for some years. The report was adopted.

HOOVER LIMITED

A GRATIFYING PROFIT

SUBSTANTIALLY IMPROVED EXPORTS

The Annual General Meeting of Hoover Limited will be held on April 2nd at the company's office, Perivale. Mr S. Roberts, managing director, is to preside.

The following is an extract from the annual review, which has been circulated to the shareholders with the report and accounts:

In the interim statement covering the first six months' trading it was clearly evident that the restrictions on hire purchase facilities, the higher rate of purchase tax, together with the imposition of the new tax on irons, were having a serious effect upon our profit-earning capacity.

It is, therefore, gratifying to report a profit figure considerably greater than could have been anticipated at that time.

UPLIFT IN EXPORT TRADE

This substantial improvement is the result of a considerable uplift in our export trade, particularly to dollar markets, and by the introduction, in the last quarter of the year, of the new Constellation Cleaner and the new Hoover Junior Cleaner, both of which have had an excellent reception.

The restrictions imposed on the home market are most serious and affect our overall development plans for both home and overseas. Without question a freer home market would assist materially in our endeavours overseas. We trust those responsible for legislation will consider these aspects and review favourably the removal of some, if not all, the present restrictions.

Great efforts have been made to increase our business overseas. The result of these efforts has been an increase of 16 per cent over 1955, which is most satisfactory. To the American Continent we succeeded in selling merchandise to the value of nearly $3 million.

We have maintained our position as the largest British exporter of cleaners and washing machines, and our percentages of the total British exports, according to the latest figures available, are 71 per cent and 72 per cent respectively. With the new products we have introduced and the development of designs we believe we shall continue to hold that position.

DEVELOPMENT OF PRODUCTS

In October the new Constellation Cleaner was introduced, both to home and overseas markets, and had an excellent reception.

Following surveys of the washing machine market it was evident that there was a need for a heated machine, and in the latter months of 1955 this model was launched. It has proved most successful.

During the year turnover of washing machines was greatly in excess of our cleaner sales. We believe that there are unlimited possibilities in this direction.

In this connection a further extension of our South Wales factories was completed in September, giving an additional floor area of 30,000 square feet. We are negotiating with the Board of Trade for an additional extension of 150,000 square feet.

During the past two years design work has been concentrated upon the development of a new Fractional Horse Power Motor. The reception accorded to this redesigned motor, particularly in overseas markets, has been good and we consider it will contribute largely to the expansion of our motor exports.

In the belief that the Hoover Steam or Dry Iron had many advantages over the conventional iron, and that high production would result in considerable cost reductions, the price was appreciably reduced.

This belief proved to be well founded and sales reached new records in the last six months of the year. We are more than satisfied with our penetration into this highly competitive field.

FINANCIAL RESULTS

The consolidated net profit, before taxation, was £2,790,077, a reduction of just over £1 million as compared with £3,838,233 for 1955.

This profit was arrived at after deducting £997,979 for depreciation, against £920,761 last year. The liability for taxation, after deducting £19,024 overprovided in previous years, is £1,564,995.

From the profit after taxation of £1,225,082 has to be deducted £61,423 in respect of the interests of outside shareholders and £155,624 profits retained by subsidiaries to strengthen their financial position. After adding £2,391,471, the balance brought forward from last year, the balance available for appropriation is £3,399,506. We have again transferred £250,000 to the general reserve and £100,000 to reserve for the employees' superannuation scheme.

The board, after very full consideration, have decided to recommend a final dividend of 40 per cent, less tax, on the Ordinary and "A" Ordinary shares, making a total for the year of 50 per cent, the same as for the year 1955. The balance of profit carried forward to 1957 is £2,326,156.

Last year we considered it advisable to cut our total Ordinary dividend from 70 per cent to 50 per cent.

The company's policy of ploughing back profits has increased general reserves and the unappropriated balances on profit and loss accounts by over £2,500,000 during the past three years.

The strong financial position has remained unimpaired, with cash and bank balances consistently in excess of £3 million.

FUTURE PROSPECTS

Perhaps the most important development of the moment is the possibility, now almost a probability, of a European Common Market.

Our trade with the Messina countries has now assumed significant proportions, despite the high import duties. The reduction or elimination of duty would give us a preferential position in these countries, one which we are not slow to recognise.

It will take some time before plans come to fruition, but we are in an enviable position in that we have established organisations in these countries capable of development.

We believe that the year 1957 will witness further expansion of our activities.

THE EASTERN BANK, LIMITED

SATISFACTORY RESULTS

The forty-seventh annual general meeting of The Eastern Bank, Limited, will be held on April 3rd, in London.

The following is an extract from the statement by the chairman, Sir Evan M. Jenkins, GCIE, KCSI, circulated with the report and accounts for the year 1956:

The Balance Sheet for 1956 shows on the liabilities side an increase of £879,680 in Current, Deposit and other accounts and a decrease of £579,724 in Bills Payable. On the assets side there is an increase of £731,922 in Cash on Hand at Call and at Bankers, and of £1,005,674 in Bills Receivable. Advances have fallen by £597,846. The Balance Sheet Total is £44,173,237 against £43,558,711 for 1955.

The considerable increase, from £720,953 to £871,521 under Bank Premises, Furniture and Equipment, is due mainly to the completion of our new premises at Baghdad, and to payments for work on the building we have acquired at Kuala Lumpur. The figure in the Balance Sheet takes into account the appropriation of £35,000 referred to below. Outstanding commitments amount to about £110,000, largely for housing; building is very expensive throughout the East, and it is unfortunately difficult in many centres to rent suitable premises and houses for staff.

The published profit is £129,940 against £132,536 for 1955. The appropriations from profit are £50,000 to Contingencies, £35,000 to Premises, and £28,750 to the final dividend of 5s. per Share, the total dividend of 8s. per Share for the year remaining unchanged. The carry forward is reduced from £112,656 to £111,596. In spite of the reduction in profit, the results may be considered satisfactory in conditions which were in some respects specially difficult.

CLOSING OF SUEZ CANAL

The year was darkened by the crisis in the Middle East. With branches in Iraq, Beirut, the Persian Gulf and the Aden Region we have had an anxious time, but thanks to the firmness of the Governments concerned our business was not interrupted, except at Bahrain, where disorders caused the Banks, like all other offices, to close for about one week. Iraq in particular deserves special sympathy and respect. The cutting of the pipe-lines which connect her northern oilfields with the Mediterranean was a grievous blow to her economy, and was the result of disputes with which she had no direct concern. That she was able to withstand the shock without serious trouble was due to the sound use of oil revenue in the past, and to the determination of her Government to prevent the emotions aroused by the crisis from being exploited for purposes damaging to the real interests of the country.

The effects of the crisis are by no means confined to the Middle East; the closure of the Suez Canal has so dislocated shipping that almost every country with which we are concerned is suffering inconvenience or worse from delays in the arrival of imports and the despatch of exports. In Aden in particular the loss of shipping opportunities must seriously affect the traditional entrepot trade.

Sir Tom Hickinbotham, who has long experience of the Middle East, joined the Board on October 31st, and in January and February, 1957, visited our Branches at Beirut, in Iraq and in the Persian Gulf. The General Manager, Mr Barden, has also visited our Branches in Karachi, Calcutta and Bombay.

THE MONOTYPE CORPORATION

A YEAR OF STEADY PROGRESS

The forty-ninth Annual General Meeting of The Monotype Corporation Limited was held on March 12th in London.

Brigadier Sir George Harvie-Watt, Bart, TD, ADC, QC, MP (the chairman), presided and, in the course of his speech, said:

This past year has been one of steady progress. The Ministry of Supply contract work was completed late in 1955, but sales of "Monotype" products were higher than the previous year by about 20 per cent.

Our newly acquired Company, Pictorial Machinery Limited, is a welcome addition to our activity and reflects our wider interest in the rapidly expanding photo-lithographic field. More and more of our goods are being exported and the year's figures show that 71 per cent were sold abroad. This we consider to be due not only to the dependability of our products but also to our long-established reputation for service.

The profit for the period dealt with in the Parent Company's accounts is £141,705. The Directors propose that £50,000 be transferred to General Reserve, and recommend a Final dividend of 7 per cent, making 9 per cent for the year.

Costs have continued to rise throughout the year, and owing to the further National Wage Award in March last year, we were forced to increase our prices yet again. This continuing spiral of wages and prices inevitably harms the country's economy for, although the rise in costs may be small in any one year, the effect is cumulative and over a period of years this becomes serious, significant, and of pressing urgency alike to employer and employee.

OVERSEAS ACTIVITIES

Sales in both West and East Europe have developed steadily throughout the year, in spite of licence difficulties, which still prevail in some countries. In October last, India re-introduced Import licensing. This will, undoubtedly, affect our trade with that country, where our prospects seemed good. We continue to extend our market in the Far East. Trading conditions in the Home market have been difficult. The protracted wage negotiations and the disputes between Master Printers and the Unions culminated in a six weeks' stoppage of work in the London area during February and March of last year, during which time much important printing work found its way to the Continent.

The restriction of credit since the autumn of 1955 has retarded the placing of orders for our equipment. The volume of printing has fallen considerably and for the first time since the war firms have ceased overtime working. Nevertheless, the current prospects for the Home market are not discouraging.

The development of our photo-typesetting machine—known under the Trade Mark Monophoto—has reached a commercial stage. One of these machines was despatched last summer to America for exhibition and demonstration purposes, so far with encouraging results. Other machines are being despatched to South Africa and France.

With the troubles now besetting the Middle East and the consequent repercussions all over the world, no reliable forecast can be offered regarding the future prospects of the Company. Given more stable world-wide conditions, we have every confidence in our ability to increase our share in the Home and Overseas markets.

The report and accounts were adopted.

THE SCOTTISH PROVIDENT INSTITUTION

MUTUAL LIFE ASSURANCE

MR C. G. M. PEARSON'S REVIEW

In presenting the Report and Accounts to the one hundred and nineteenth Annual General Meeting held in Edinburgh on March 12, 1957, the Chairman, Mr C. G. M. Pearson, CA, drew attention to the continued progress of the "Scottish Provident," of which the results for 1956 gave ample proof. The New Sums Assured, over eleven million pounds, were again a record, the gross rate of interest earned on the Funds, £5 18s. 6d. per cent, was larger than ever before, and the mortality experience continued to be favourable.

The Funds increased by more than £2,750,000, and by the end of the year exceeded £41,500,000. The investments were well spread, and the margin by which the market values of the Stock Exchange securities exceeded the values in the Balance Sheet was large.

The increase during the year in the sum invested in Mortgages was the result mainly of an expansion in loans for "house-purchase." The scope for lending in this way had grown rapidly and care had been taken to exercise the most stringent selection alike in the properties considered suitable securities and in the acceptability for life assurance of the applicants.

PENSIONS FOR THE SELF-EMPLOYED

Until the passing of the 1956 Finance Act, the self-employed had received little encouragement from the State to make adequate provision for their own retirement. That Act had gone some way towards rectifying the anomaly whereby they had been much less generously treated in this respect than many employees had been, and its provisions had been generally welcomed. The "Scottish Provident" had not been behindhand in offering attractive contracts; a considerable amount of new business had already been obtained and there was every confidence it would increase. The needs of individuals varied and the pension contracts offered to the self-employed had been specially designed to be as flexible as possible, not only at the outset but right up to the time when the actual pension commenced to be payable.

In concluding his remarks, Mr Pearson dwelt on the effect of inflation on the economy and stressed the need for more savings so that the need of industry for capital equipment could be met. Capital accumulation by the individual had become practically impossible and it was to institutional investors such as the "Scottish Provident" that the capital market looked to provide the tools for industry and to rebuild our overseas assets. The importance to the nation that savings for such purposes should not be lacking gave a very real sense of mission to those engaged in life assurance business.

The Report and Accounts were adopted.

APPOINTMENTS

THE QUEEN'S COLLEGE, OXFORD

BURSARSHIP.

The Governing Body of The Queen's College invites applications for the office of Bursar from persons under 50 years of age. The successful candidate will be elected to an Official Fellowship of the College.

The initial stipend will depend on age and experience, but will not be less than £1,500, and will rise on the present scale to a maximum of £2,000. There are certain allowances, and the office is pensionable under the F.S.S.U.

The elected candidate will be expected to assume office not later than January 1, 1958. Forms of application are obtainable from the College Secretary. Completed forms of application should reach the College by May 1, 1957.

UNIVERSITY OF KHARTOUM

Applications are invited for (a) Senior Lectureship or (b) Lectureship in Economics.

Salary scales: (a) £S1,602 x £75—£S1,977 per annum; (b) £S1,152 x £75—£S1,677 per annum.

Entry point according to qualifications and experience. Cost-of-living allowance approximately £S95 per annum. Outfit allowance £S50. Family allowances: Wife, £S60 per annum; first child, £S90 per annum; second and third child, £S30 per annum each. Passages for appointee and family on appointment, termination and annual leave. Appointments on contract for five years, with possibility of renewal. Superannuation Scheme.

Detailed applications (eight copies), naming three referees, by April 20, 1957, to Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

THE REED PAPER GROUP

have a vacancy for a

MATHEMATICIAN

for

ELECTRONIC COMPUTER PROGRAMMING.

A graduate with first- or second-class honours degree in mathematics is required to fill a new post as Senior Programmer in their Electronic Computer Department. The Group has embarked on a large-scale electronic digital computer project and desires to establish a Programming Section for commercial and scientific applications.

Facilities will be available for comprehensive training, and will include working with expert advisory programmers for some time.

This post will provide an excellent opportunity in a new and expanding field for the right man.

Commencing salary will be according to age, qualifications and experience. The Group operates a non-contributory pension scheme, annual bonus and, in approved cases, assistance with house purchase.

Applicants, preferably aged 27-34 years, should write, giving full details of education, age, qualifications, experience and salary required, etc., to The Group Personnel Officer, Albert E. Reed and Co. Ltd., Larkfield, near Maidstone, Kent.

UNIVERSITY OF CAMBRIDGE

DEPARTMENT OF APPLIED ECONOMICS.

Applications are invited for appointments from October 1, 1957, in connection with the Department's programme of economic and statistical research. Applicants should normally have at least a good second-class honours degree in economics or in statistics, and experience of research in one of these fields is desirable for appointments in senior grades. Appointments will be for a limited period in connection with specific research projects. Salaries will be on scales ranging from £500 to £1,450 a year, and will be pensionable. The pensionable salaries are subject to deductions in certain circumstances. A non-pensionable allowance of £50 a year is paid for each dependent child who is under the age of 16 or is in receipt of full-time education.

Applications, giving particulars of academic qualifications, experience, and any special research interests, together with names of two referees, should be sent to the Director, Department of Applied Economics, 7 West Road, Cambridge, so as to reach him not later than April 13, 1957.

LARGE Commercial Company has vacancy at a Regional Office for Public Relations Officer. Successful applicant will be responsible to the Regional Manager for all aspects of the company's public relations policy throughout the area of England concerned. Applicants must have a good press background, and organising skill and personality to promote the Company's interests. Salary will be in line with qualifications, experience and ability, with full scope for promotion on all sides of the Company's business. Excellent pension scheme, with dependants cover for married employee. The Company will also assist successful married applicants, if it is necessary for them to move to take up their appointment.—Please apply in writing, giving full details of age, qualifications and experience, to Box No. 6547. Replies can only be sent to those selected for interview.

OFFICE Organisation and Methods Specialist is required by Petfoods Limited, Melton Mowbray, Leicestershire, with responsibility for all clerical methods used throughout the Company. Effective O. and M. experience is essential and a degree in Commerce, Economics or Statistics would be preferred. A man or woman aged 28-35 is sought. The starting salary will be not less than £1,500 per year together with exceptional additional Social Security benefits. Applications with full details of education and experience should be sent to the Chief Personnel Officer, Petfoods Limited, Melton Mowbray, Leicestershire.

ECONOMICS GRADUATE (male, mid-20's) with statistical ability as sales and marketing analyst. Good salary, prospects and amenities. Write, stating age, qualifications and experience, to Personnel Manager, Nabisco Foods Ltd. (formerly the Shredded Wheat Co., Ltd.), Welwyn Garden City, Herts.

MANAGEMENT SELECTION LIMITED
have been retained to advise on the selection of a

JOINT MANAGING DIRECTOR

for a British subsidiary of a leading American company manufacturing proprietary pharmaceutical and ethical products sold throughout the world. The output of the British factory is substantial and still growing, and is presently distributed in practically all countries in the eastern hemisphere.

The appointment carries responsibility for co-ordinating all the British Company's activities and for promoting further growth. It is intended that the man selected will in due course take over from the present Managing Director, who is planning to retire in the near future.

Candidates should have had similar executive experience in the consumer goods industry. A wide knowledge and practical experience in marketing and selling consumer products is essential, preferably in the pharmaceutical industry.

Starting salary about £4,000 per annum. Age 40-50. Location in London.

Please send brief details, quoting Reference S342, to H. E. Roff, Management Selection Ltd., 17 Stratton Street, London, W.1. No information will be passed to our clients until candidates have been told their identity and have given permission after personal discussion.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of ASSISTANT LECTURER IN SOCIAL ADMINISTRATION. Candidates should have a particular interest and also experience in housing policy and administration. Salary not less than £550 per annum, with membership of the F.S.S.U. and Children's Allowance Scheme. The person appointed will be required to undertake research and to assist in the supervision of practical work as well as in the ordinary teaching duties of the department.—Applications should be sent, not later than March 30, 1957, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the full-time posts of RESEARCH ASSISTANT in SOCIAL ANTHROPOLOGY and SOCIOLOGY in the Faculty of Economic and Social Studies. The persons appointed will carry out research in factories and in rural areas. Salary within range of £550 to £750 per annum, according to qualifications and experience, with membership of Children's Allowance Scheme and F.S.S.U. Applications should be sent not later than March 21, 1957, to the Registrar, The University, Manchester 13, from whom further particulars and forms of application may be obtained.

TOP-LEVEL EXECUTIVE, BOARD LEVEL, with wide experience in industry and successful record in Accounting, Secretarial and Commercial posts, seeks fresh appointment. Intimate knowledge of Works and Commercial practice, organisation and control. Positive personality, personal initiative, administrative capacity. Scottish Chartered Accountant, age 42.—Apply Box 659.

PH.D., RECENTLY RETIRED, lively brain, unwilling to let it rust; experienced in administration and research, seeks really interesting work/project, full or part time. Modest expectations.—Box 655.

CANADIAN PACIFIC RAILWAY COMPANY (Incorporated in Canada with Limited Liability).—Notice to Shareholders: The Seventy-sixth Annual General Meeting of the Shareholders of this Company, for the election of Directors to take the places of the retiring Directors and for the transaction of business generally, will be held on Wednesday, the first day of May next, at the principal office of the Company, at Montreal, at twelve o'clock noon (daylight saving time, if operative). The Ordinary Stock Transfer Books will be closed in Montreal, Toronto, New York and London, at 3.30 p.m. on Tuesday, the ninth day of April, 1957. The Preference Stock Books will be closed in London at the same time. All books will be re-opened on Thursday, the second day of May, 1957.—By Order of the Board. T. F. TURNER, Secretary. Montreal, March 11, 1957.

FRESH AS FANDANGOES.—Nothing makes your tootsies tingle more than a few glasses of Duff Gordon's El Cid Sherry. Out with the bottles! On with the dance! Ole!

SAVILE ROW CLOTHES.—Cancelled export orders direct from eminent tailors. Lesley and Roberts, Sandon, Huntsman, Kilgour, Davies, etc. Lounge, Dress Suits, Overcoats, etc., from 10 gns.—Regent Dress Co. (2nd floor), 17 Shaftesbury Avenue, Piccadilly Circus, W.1. GER. 7180 (next to Café Monico). Est. 1922.

"BRILLIANT REPORTING," says Stanley Maxted, of James Michener's book, "Bridge at Andau." Moving personal stories of Hungarian youth in revolt. Not yet published, but now condensed in March Reader's Digest, 1s. 6d.

EDITOR OF SMALLISH PUBLISHING HOUSE. Linguist, Cambridge, author of several books on modern history, seeks administrative/research position in industry or commerce, offering more scope and prospects than book-publishing.—Box 654.

B.Sc.(ECON) LONDON UNIVERSITY

UNIVERSITY CORRESPONDENCE COLLEGE provides postal tuition for the above degree (obtainable without residence), which is a valuable qualification for those seeking executive appointments in commerce or industry, government or municipal posts. The College, established 1887, is an Educational Trust. Highly qualified Tutors. Low fees. Prospectus of B.Sc.(Econ.) Courses for London Degrees and Diplomas, G.C.E. free from the Registrar, 60 Burlington House, Cambridge.

WORK STUDY.—Next six-weeks' full-time course starts April 23rd. Details of this and eight others, including part-time, evening and correspondence, from The School of Time and Motion Study, 29 Cork Street, Piccadilly, London, W.1.

SUCCESSFUL TUITION FOR THE B.Sc.(ECON.) DEGREE

Wolsey Hall (Est. 1894) provides Postal Courses in a wide range of subjects for the two examinations for Lond. Univ. B.Sc.(Econ.) (three if Entrance is included). Moderate fees, instalments. Over 1,000 Wolsey Hall students have secured this valuable degree since 1925.—Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P.6, WOLSEY HALL, OXFORD.

THE EASTERN BANK LIMITED

The Transfer Books and Register of Members will be closed from March 20 to April 3, 1957, both days inclusive.

By Order of the Board,
V. C. W. RAMPTON, Secretary.
2 and 3 Crosby Square, London, E.C.3.
March 6, 1957.

EXPERT POSTAL TUITION for Examinations—University Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus—and/or advice, mentioning examination or subjects in which interested, to The Secretary (G9/2),
METROPOLITAN COLLEGE, ST. ALBANS
or call at 30 Queen Victoria Street, London, E.C.4.

APPOINTMENTS

THE SOUTH WALES ELECTRICITY BOARD

Applications are invited for the position of Assistant Statistician in the Department of the Chief Commercial Officer at the Head Office of the Board, St. Mellons, Cardiff.

Candidates should be over 30 years of age and hold a degree in statistics.

The salary for the post will be within the range of Grades 6-7 (£855-£1,025) of the National Joint Council (Administrative and Clerical Grades) for the Electricity Supply Industry, the commencing salary being determined according to qualifications and experience.

Applications, stating age, present position, present salary, qualifications, experience and three references, should be addressed to the Secretary (Establishments Section), to arrive not later than April 1, 1957.

St. Mellons, Cardiff. R. G. WILLIAMS, Secretary.

SOUTH AFRICA.—Assistant Manager required for Union Acceptances a private finance house, resident in Johannesburg and associated with Anglo-American Corporation of South Africa. Wide experience of City of London financial methods and tradition required, including knowledge of acceptance credits and discount market. Age preferred, about 35 years. Starting salary £3,000 per annum.—Apply, in writing, to Appointments Officer, Anglo-American Corporation of South Africa Limited, 40 Holborn Viaduct, London, E.C.1.

A PROGRESSIVE FIRM of Paper Merchants, selling Nationally advertised branded lines, require a well-educated and intelligent young man to foster sales by contacting print buyers and others who specify paper for print. Knowledge of print and paper an advantage, but not essential. A good personality, intelligence and determination are required to make this a successful career.—Reply to Box 686.

AN EXCEPTIONAL OPPORTUNITY occurs in a large group, with Head Offices in Manchester, for a man of character, with a good education and some industrial background in a junior or intermediate executive capacity, to train quickly for a higher management post. To a suitable applicant two years' intensive training will be offered at a commencing salary of £2,500 per annum, followed by either the offer of an exacting executive appointment at substantially more salary or a definite indication of non-compliance with anticipated standard. Applicants should reply in confidence, stating precisely what they have done so far, not what they could do, given the appropriate opportunity. Personal selling of personality not interesting. Only facts will be assessed.—Box 653.

MARKETING RESEARCH

EXPANDING GROUP MARKETING AND RESEARCH

A Company within the Rank Organisation has further vacancies for Marketing Research Executives/Assistants. The positions offer considerable scope to those able to handle research with little supervision and also able to display imagination in dealing with problems in which they are unlikely to have had direct experience. A good salary related to experience will be offered.

The Rank Organisation has world-wide and growing interests in many fields. There is a pension scheme in operation.—Apply, in writing, giving a concise account of experience so far, to the Personnel Adviser, A/87, The Rank Organisation, 11 Belgrave Road, S.W.1.

GENERAL MANAGER REQUIRED by progressive Injection Moulding Company, near Cardiff, now employing over 200. This is a top-level appointment and calls for a man of outstanding ability; he should preferably have a Plastics and Engineering background with wide administrative experience (including Trade Union practice).—Please reply to Secretary, Box 657.

A VACANCY occurs in a Midlands textile firm for a young accountant, capable of taking complete responsibility for cost control, including estimating, budgetary control and the preparation of statements. This is a senior appointment, with excellent opportunity for advancement to executive level.—Write, in strict confidence, giving full particulars of experience and remuneration expected, to Rundles Advertising Agency, Lower Parliament Street, Nottingham.

MANAGEMENT ACCOUNTANT

Applications are invited for an appointment in the Department responsible for economics and statistics in the London Headquarters of a large Industrial Group.

Candidates, preferably under 35, must be Chartered or Incorporated Accountants and must hold an Honours degree preferably in Economics or Maths. Industrial experience with specialised knowledge of management accountancy or industrial economics is desirable. Salary depending on qualifications and experience. Apply Box 649.

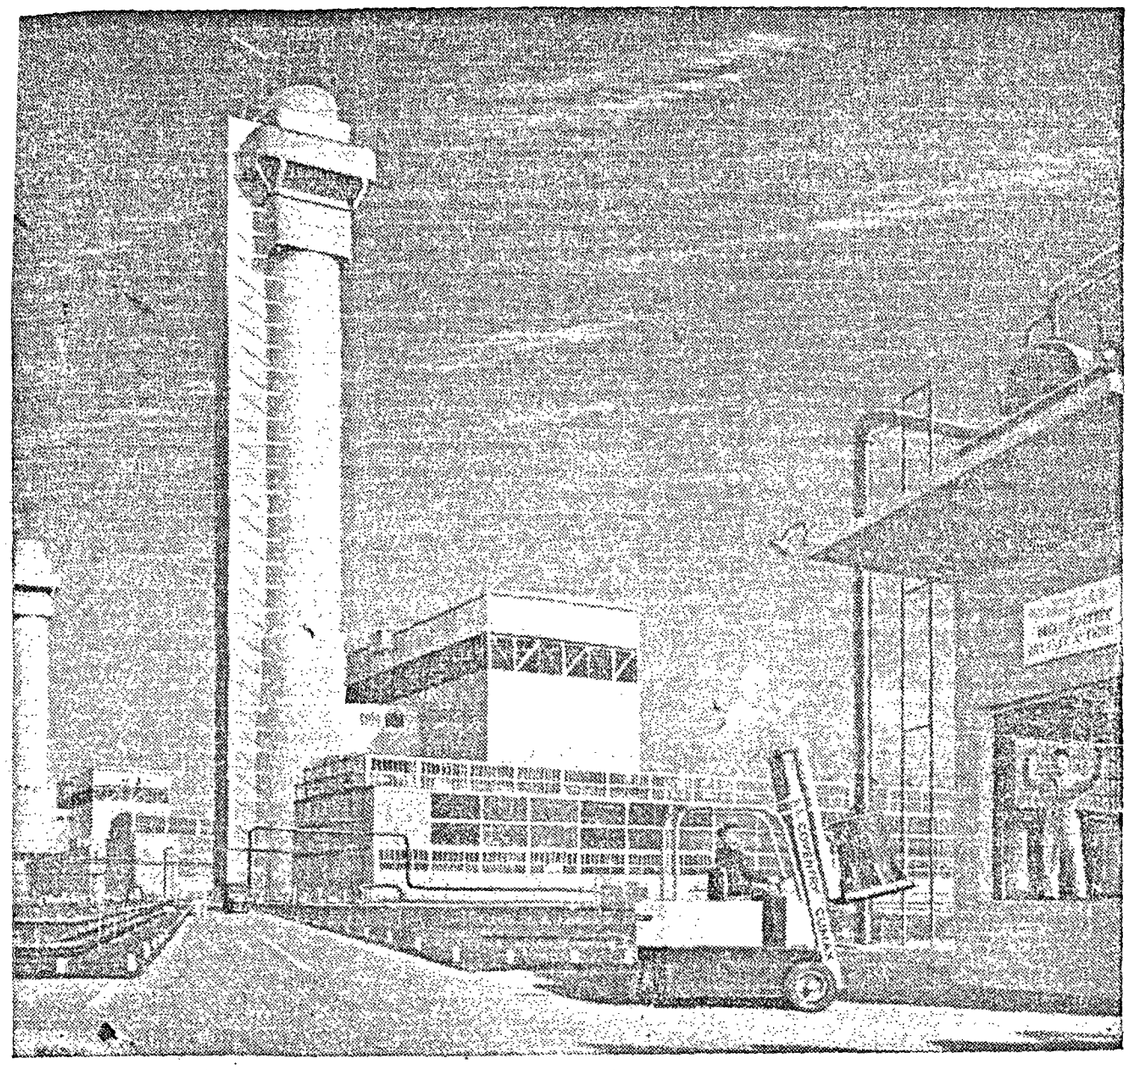
A LARGE MANUFACTURING COMPANY in the West Country has vacancies in its expanding Market Research Section for women graduates, age under 25, with good degrees in Economics. The work which is in a new and interesting field, involves interviewing members of the public and assisting in analysis and treatment of the data collected. Retail surveys are also undertaken. About six months in the year is spent interviewing both in London and the provinces. A full training will be given.—Apply to Box 651.

MONTHLY Oil Journal, London, City, requires young editorial assistant, preferably economics graduate. Some experience of press make up, languages, an advantage. Five-day week, pension fund, luncheon vouchers. Box FE/122, c/o 95 Bishopsgate, E.C.2.

MALE or female Graduate (under 35) in Economics or Statistics required by marketing organisation. The person appointed will be expected, after collation and analysis of the relevant information, to make market appraisals (including forecasts) for many products, both at home and overseas. A knowledge of French or German is desirable but not essential.

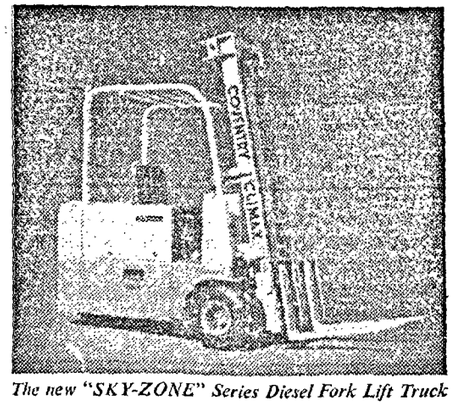
There is considerable scope for the person selected (both in terms of work and advancement) as the appointment is with a unit of the organisation which is likely to expand rapidly.

Salary will be commensurate with age and experience. Apply in writing to the Personnel Officer, L.P.E., 110 St. Martin's Lane, W.C.2.



ADVERTISING MANAGER required by Nabisco Foods Ltd. (formerly The Shredded Wheat Co. Ltd.), Welwyn Garden City, Herts. Applicants should be in mid 30's, have comprehensive knowledge advertising practices and extensive successful agency experience with grocery products. Some industry background desirable. Commencing salary £1,500-£2,000 per annum. Excellent prospects for right man in expanding organisation. Attractive amenities.—Applicants invited to write, stating age, educational background and present salary, and giving full details of qualifications and positions held, in confidence to the Managing Director.

ANNUAL AIR SUBSCRIPTION RATES



Subscriptions to most countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is either because the alternative is not available or not recommended.

Production wasn't in unison with sales

ACCOUNTING PROBLEM FOR OLDHAM BATTERIES LTD

Oldham's accounting system didn't show the balance of outstanding orders, consequently production planning wasn't in step with sales commitments. This, in turn, made future budget calculations difficult. Could a new system be worked out that would give Oldham's the information they needed?

Like so many firms, big and small, faced with this kind of problem they called in Burroughs—the experts in accounting methods.

The Burroughs representative and Oldham's accounting staff *did* work out a system. It was based on the famous Burroughs Sensimatic machines. So effectively did this new system work that when the Sensimatic concerned listed a certain component in the monthly requirements column and there was no outstanding order to explain it the machine was proved right—someone had forgotten to place the necessary order! Also, as a result of the new system, Oldham' were able to transfer the highly experienced staff, who' worked the old system, to more important work, and re place them with untrained seventeen-year-old girls.

HOW BURROUGHS MIGHT BE ABLE TO HELP YOU

Ask yourself: How many of your staff are engaged in figure-work? How long does it take to get the figures you want? Are the figures alway: accurate when you get them?

Burroughs *Accounting Machines will do this figure-work for you with* out tying down a lot of staff *and* do it far more speedily and far mor accurately. Burroughs make machines suited to the needs of every siz of business and you have everything to gain by consulting them.

They will advise against buying one of their machines if they don' think you need one. Their advice, of course, is free. The local Burrough office is in the phone book. Or you can write direct to London if you prefe

Albion Leyland Scammell

World Headquarters for road transport

The Companies of Leyland, Albion and Scammell supply road vehicles and industrial engines in vast numbers to practically every part of the world. No other organisation offers so wide a range of trucks, which extends from short-haul 30 cwt. vehicles to giant freighters of 150 tons for big engineering and land development works. It also makes buses from single-deck 26-seaters to double deckers seating 78 people. Permanent service and maintenance is provided for them by fully-equipped depots and agents in all parts of the world, supplemented by a team of mobile field engineers flying from Britain or based on the Group's depots abroad.

There is a Leyland, Albion or Scammell truck exactly suited to YOUR job. State your requirements and we will advise you on the right vehicle and the address of our nearest agent.

Focus on Lightweight Strength

The phenomenal strength possessed by many of nature's smaller creatures has often been envied by man. In engineering, particularly aircraft engineering, his striving for greater strength for less weight has resulted in the development of a new metal—TITANIUM. Until recently this metal has been expensive owing to the scarcity of an essential raw material TITANIUM TETRACHLORIDE. Now, however, titanium tetrachloride is being produced in bulk and titanium will soon be available to larger sections of industry. Titanium tetrachloride is produced by

HIGHER PRODUCTIVITY — GREATER FUEL EFFICIENCY

whatever your business

at each Area Gas Board you will find engineers with a surprising knowledge of it. Through a National Committee they pool their experience with their colleagues up and down the country. They have access to International information on gas for all purposes through a comprehensive Information Bureau in London.

Behind them highly qualified research and development teams maintained by the Gas Industry constantly increase fundamental knowledge on the smokeless and efficient usage of gas.

So it is that these Industrial Gas Engineers at the Area Gas Boards do not walk alone!—

You can benefit from this exceptional technical service organisation of which they are a part.

The Gas Council, 1 Grosvenor Place, London, S.W.1

QANTAS believes in spoiling its passengers. QANTAS has spent 36 fruitful years patiently learning how to spoil them more. And since 'being spoilt', as some of us learnt across our mothers' knees, is really nothing much more or less than having things *your* way for once, QANTAS believes its passengers have every right to be spoilt. What do you feel would spoil you *most*—in a flight across the world? Physical comfort? We promise you that. Comfort that lets you relax by day, that lulls you to sleep at night and to sleep all night. Good food and drink—and intelligent interest in your likes and dislikes? We think we can surprise you there—and pleasantly. Or would it be just the sense of general friendly readiness on our part, to do things *your* way—at the drop of a hint? *If you don't know what it is to be spoilt a* QANTAS *crew can show you!*

THE GREAT CASES OF SIR NORMAN BIRKETT

By A. E. Bowker

Lord Justice Birkett

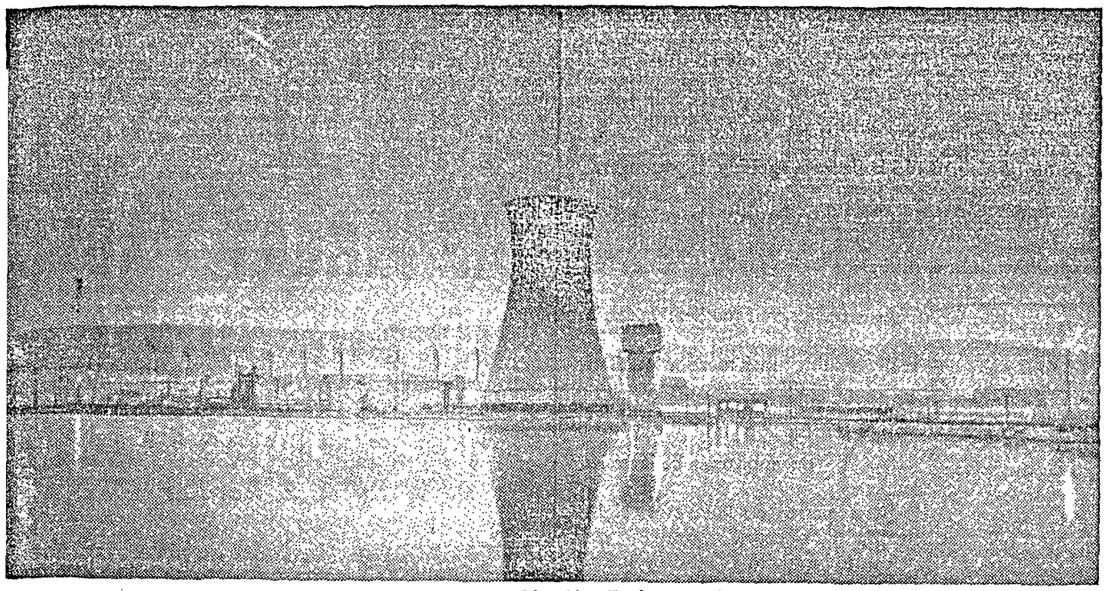
He held in his grasp the life-or-death power which is shared only by the world's great surgeons.

What was the secret of that power?

What was the skill which enabled Norman Birkett to save so many men and women from the hangman?

What made him so deadly as a prosecutor?

These are questions that have intrigued many minds. Now they can be answered.



The Sunday Express is to tell the story of the dramas that occurred behind the scenes in the famous cases with which Birkett was associated.

It has been written by the man who was closest to Sir Norman Birkett during all his years in courts.

BEGINS THIS WEEK-END IN THE

SUNDAY EXPRESS

The Abbey Works of The Steel Company of Wales at Port Talbot, Glamorgan

THE CITY WHOSE SOLE CONCERN IS STEEL

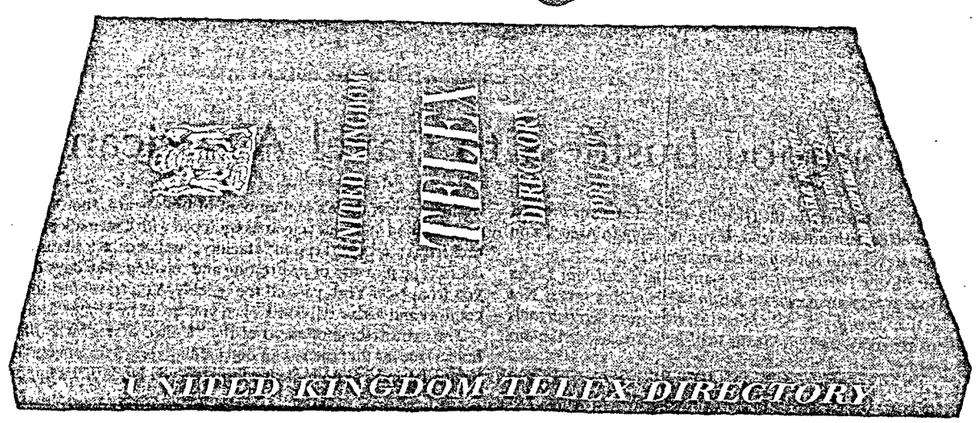
. . . to make steel, to make tinplate from steel, for Britain and abroad

WITHOUT STEEL, Britain could build no ships, no cars, no industrial machinery. Less recognized, Britain could make no tinplate. And tinplate is no less vital to Britain than steel itself.

Since the end of the war, the steel industry in this country has made dramatic and continuous progress. Every year Britain is making more steel; is selling more steel abroad; is making more steel into tinplate. To experiment, to modernize, to expand: these are the aims, urgent and incessant, of Britain's steelmakers.

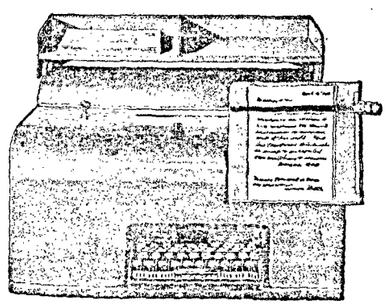
Fast as the whole industry is growing, The Steel Company of Wales grows faster still. No ordinary steelworks, this, but a city of steel stretching for 4½ miles along the coast of Wales. From here, at Port Talbot, comes a third of Britain's sheet steel. From the Orb Works at Newport comes one-half of the special sheet steel used by the electrical industry. And from two great tinplate works, one at Trostre and one at Velindre, comes two-thirds of Britain's modern tinplate. Both works are new, have been built since the war; Velindre has been opened so recently that the full effect of its production is yet to be felt.

Day and night, this city is at work. Its one concern is simple: to make steel, to make tinplate from steel, for Britain and abroad.



Opportunities for graduates and technicians

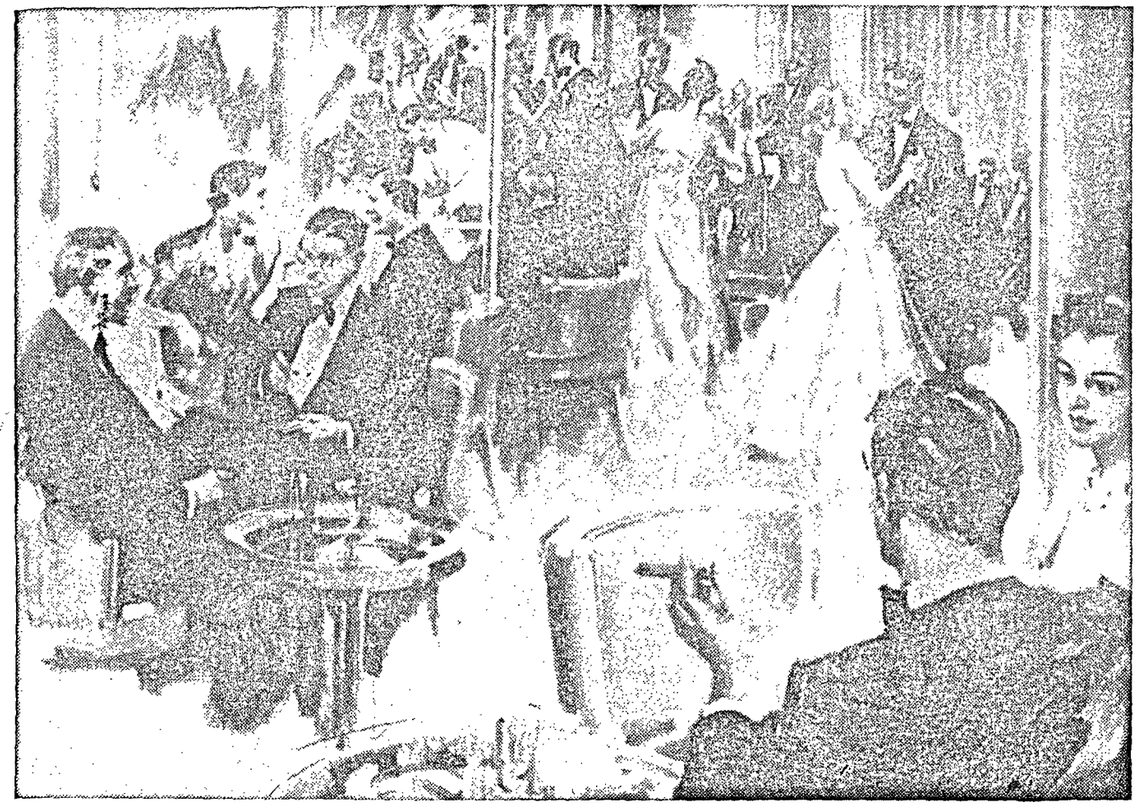
If you are a graduate—or likely to be one soon—in mechanical or electrical engineering, physics, metallurgy or mathematics, we would be very pleased to hear from you. Just send a postcard to: The Personnel Superintendent, Abbey Works, Port Talbot, Glamorgan, and in return we will send you information about the Company.



THE STEEL COMPANY OF WALES LIMITED

Why not you?

Modern business needs Telex . . .



. . . and this is the book that proves it. Listed here are more than 3,500 of the most progressive firms in the country who already use this 24-hour Post Office service. They have full teleprinter communication with each other and with 75,000 more Telex users overseas.

Why do they use it? Because Telex combines the speed of the telephone with the authority of the printed word. Because it is cheap—a Telex call between exchanges over 25 miles apart is about half the cost of a telephone call. Because it is easy—no special staff is needed; a good typist soon becomes a skilled operator.

See Telex in action. Contact your Telephone Manager or the address below and ask for . . . **a demonstration, a descriptive booklet, further information and advice.**

It's good business to travel American

OFTEN IT's easier to do business in the friendly, relaxed atmosphere of a ship than over an office desk on dry land. If you're going to America on business, why not travel with American businessmen?

Take the case of one passenger, for instance—let's call him James *MacGregor. He is a Scotsman*, whose job in life is selling socks. Not ordinary socks; they are the product of Scottish sheep and Scottish mills —the kind of luxury goods that have made British craftsmanship famous all over the world.

A great deal of Mr. MacGregor's business is done with America. And he has discovered that the ideal way to travel there is by U.S. Lines. For there, in the friendly, informal surroundings of the famed "United States" or her running-mate the "America," he meets *American* businessmen.

If you're a businessman travelling to North America, remember that here is the perfect atmosphere in which to begin a really successful business trip.

Business aside, there's any amount of fun aboard, too. You'll find unexcelled *food and wine*; cinemas equipped with CinemaScope; top-grade orchestras; every "keep-fit" facility; well-stocked libraries, and, of course, the pleasure of just resting and relaxing. The days that separate you from New York pass *all too quickly. You travel fast in the utmost* comfort and arrive refreshed when you travel by United States Lines.

The extra reserve of speed of the "United States" (the Blue Riband holder) means that she has an outstanding record for punctuality. If you have a *business appointment soon after you land*, that's important!

***THRIFT SEASON FARES** for sailings during April & May, 1957*

WEIR

PATENT CLOSED FEED SYSTEM

The Weir Closed Feed System is a practical and efficient method of providing pure de-aerated feed water for boilers, for both land and marine services.

Corrosive gases are removed by the Weir Regenerative De-Aerating Condenser, and as the condensate is under pressure in the system this prevents any re-entry of air or other gases to cause corrosion in the boilers, steam pipes and other surfaces.

For marine services, the Weir Closed Feed System protects the boiler against corrosion under all sea-going conditions and ensures that in port the boiler feed water is also fully de-aerated. The system is perfectly automatic at all powers, the various units responding automatically to changes of power without manual attention.

By Appointment
to Her Majesty Queen Elizabeth II
Manufacturers of Land-Rovers.
The Rover Co. Ltd.

...this is a ROVER year

THE ROVER 105/R

"In heavy traffic, the R type Rover is perhaps the most restful car that it is possible to own ... likewise, the way in which the car surges along the open road will be a source of great pleasure to those who have never hitherto experienced this type of work-free motoring". (*The Motor. 13.2.57.*)

Rover's own fully automatic transmission both eliminates normal gear-changing and incorporates an overdrive that comes in automatically at cruising speeds to give silent, effortless and economical travel.

Prices: £1,649.17.0. including Purchase Tax;
Special de luxe version: £1,696.7.0. incl. Purchase Tax.

THE ROVER 105/S

"There was a fine feeling of luxurious isolation in the way this Rover 105/S covered the ground ... cruising speed is virtually what one cares to make it. The amount of equipment making for comfort or ease of control is lavish ... everything to make the occupants feel that they are rather special people. Rover comfort and quality are now allied without compromise to decidedly high performance". (*The Autocar. 22.2.57.*)

The 105/S has automatic overdrive and is impressively equipped throughout.

Price: £1,595.17.0. including Purchase Tax.

Both the 105/R and the 105/S are surprisingly economical in petrol consumption. Like the well-established 2-litre 60, the 75 and the 90—all available with automatic overdrive—they offer the true Rover economy of low maintenance costs and high re-sale value.

Collective Bludgeoning

THE easy attitude to adopt this week, in the face of the strike crisis, has been to call an equal plague on both the trade unions and the employers concerned: to pretend that if only the two sides would sit down round a table with each other, and arrange any sort of settlement, at the expense of increasing costs, then everything would be all right. This is an attitude that ignores the simplest of the economic facts now before the country.

The threat to the national economy, and to the pound sterling, this week-end does not arise solely from the possibility of widespread industrial stoppages. It arises, too, from the possibility of inflationary settlements of these disputes. The alternatives, at Thursday midday, seemed fairly clear. On the one hand the stoppages could probably be averted by settlements that added between 4½ and 5 per cent to wage costs for the coming year. On the other, the loss of production from strikes would be considerable in money terms, but also finite. (It does not require more than the knowledge that there are fifty-two weeks in a year to see that the effect of a total shut-down for one week in all industry and commerce would be to cut the gross national product for 1957 by some 2 per cent; even if the stoppages that are now threatened in engineering, shipbuilding and the railways lasted for a month, the gross national product for 1957 would be unlikely to be cut by quite as much as that.) There would be more serious indirect effects from strikes, on some firms' export order books and also in less tangible, but grievous and regrettable, ways on future labour relations. Nevertheless, it is just untrue to suppose that these facts and effects self-evidently outbalance the longer-term danger of pricing this country out of its export markets. The two threats need to be dispassionately weighed one against the other.

In the three disputes now before the country, a balance can be roughly struck between these alternative disadvantages. The clearest line can be drawn on the railways; it should be a line that puts every emphasis on the dangers of further retreat. It has been recommended, by a majority of the railways tribunal, that railwaymen should be given an increase of 3 per cent, to compensate for last year's rise in the cost of living. As this rise in the cost of living was due to the fact that general wage increases in 1956 (largely triggered off by a railway wage increase of 7 per cent) were much greater than the general increase in production, the award is generous.

The pressures upon the Transport Commission to forget this, and offer up to 4½ or 5 per cent, are considerable. It had already tentatively offered the railwaymen an increase of between 3.3 and 3.9 per cent, when the cost of living index stood a point lower than now; but this offer the railwaymen themselves refused. Usually the tribunal suggests a compromise figure between a higher award suggested by its union member and a lower one suggested by the others; but this time the union member has submitted a minority report recommending an

unnamed higher figure. It is also true that, by suggesting that the railways can pay for increases in the cost of living, but not for increases in productivity, the tribunal has got things precisely the wrong way round; but this does not mean that the commission should pay for both.

★

The situation in engineering is more complicated, and is likely to be powerfully affected by what happens on the railways. But here again there is no reason to be mealy-mouthed. Like many other British industries, engineering has hitherto operated under an absurd wage bargaining practice. Every year the national unions put in a claim which even they themselves at heart recognise to be absurdly high; the employers reply with a counter-offer; and then, when trouble brews at the due season of the year, the Government produces a court of inquiry or other arbitrating body which bases its recommendation on one plank only—it recommends the least amount that should still avoid a strike. Regularly in recent years, this amount has been in excess of the increase in productivity; regularly, therefore, it has put the cost of living (and the cost of exporting) up. The major change that once seemed in prospect in engineering this year was not the employers' change from a small counter-offer to a flat counter-non-offer, but the stirring hope among some of them that this year the whole inflationary process might be stopped.

This was a very sensible hope; the west country employer who has incurred so much criticism for saying that this year the Government should not interfere was expressing a perfectly sound economic viewpoint. It probably would have been better for the economy to stand an engineering strike this year rather than another wage increase. The danger, however, is that it now looks likely to have to stand both. Unless the unions are very stupid—unless, for example, they call strikes in their snowball campaign that are not supported—it seems probable that once again this year's wage increase in engineering will be decided by some sort of court of inquiry, and that once again it will be higher than last year's increase in production. That increase, taking the so-called industry with all its disparate parts as a whole, was nil; and that is what the wage increase in the industry—in so far as it is an industry—should have been also.

If the engineering employers really are going to stand up to the snowball strike, then one suggestion should certainly be offered to them. They should offer no resistance to attempts by individual firms prosperous to make separate bargains with their employees; that trend is already in progress, and the fact that the unions are opposed to separate bargains is causing proper annoyance among the workers concerned. Just conceivably, it might also be worth the employers' while to offer a 3 or 4 per cent rise now to their minority of (lower-paid) timeworkers only; this would make the timeworkers less willing to strike for the sake of the better-off pieceworkers' beautiful eyes.

The situation in shipbuilding is different. There was a case here for Mr Macleod to try to knock heads together by offering prompt arbitration—if only he could have offered arbitration with the right terms of reference. The basic point about British shipbuilding is that it ought to be a rapidly expanding industry. Although it is securing a progressively smaller share of new shipbuilding orders on the world market, it has enough work on hand to keep it fully employed for more than four years. The aim should patently be to work through this order book more quickly, to attract new orders, to instal new machinery and employ more men. If the object of a wage increase were to attract those men, there would be an unanswerable case for it. But few outsiders will believe that the main impediment to faster production in the shipyards is a shortage of men; it is a proliferation of restrictive practices and demarcation disputes. The obviously desirable end to the strike would be a wage increase tied to a reduction in these practices.

The best way to do this would not necessarily be through the system that was being mooted on Thursday: a flat wage increase now, in return for a promise of a conference about restrictive practices later—although this, of course, would be a much better solution than the "less complicated" one of an unconditional offer for which Mr Macleod had seemed previously to be angling. Nor does it seem to be a hopeful line to say that the employers should demand agreement about two or three specific practices before offering any wage increase at all. The best method would surely be to offer a wage increase in the form of an unlimited reversionary bonus for higher production: say, a quarterly bonus of 4 or 5 per cent in the first instance, on the understanding that the bonus would be smaller in the second quarter (or whatever other production period were chosen) if output had failed to rise by 4 or 5 per cent, but could be much higher if all union barriers to production were removed. Had the employers been more enlightened and imaginative, they would have offered a bargain on some such lines at the very beginning of the wage dispute.

★

The issue in all these industries, surely, is simple enough. To stop inflation, to keep down both costs and prices, to push up output: these are the bed-rock interests of all sections of the community, industrial workers no less than anyone else. If solutions could only be reached that furthered these ends, the anxieties of the past week would have been abundantly worthwhile. But if, under pressure of an unconditional retreat by the Transport Commission or anybody else, these stoppages are now called off on the old familiar terms, let nobody suppose that this will necessarily be "a victory for commonsense"—or for labour. It is much more likely to be a surrender to inflation—and another blow to everybody's standard of life.

New Phase of Soviet Policy

PHASES in world affairs overlap; they cannot be timed with a stop-watch; but their overlapping still leaves it possible to distinguish when a new one has begun. International relations are now clearly entering their fourth postwar phase. The disintegration of the war alliance became complete with the Berlin blockade; the cold war, which had set in by then, lasted until Stalin's death. His successors initiated a more flexible policy which took its name from the fashionable slogan of "peaceful coexistence." This, too, collapsed under the combined shocks of the Budapest rising and the Anglo-French intervention in Egypt. Neither of those two crises is over; but the shooting has stopped and it is time to peer through the dispersing smoke at the shape of things to come, to ponder what form international relations are now likely to take. The answer to half of the question, but to one half only, is to be sought in the directives given to Mr Gromyko, the new foreign minister, by Moscow's collective leadership.

Not everything is new in Mr Gromyko's brief. To spread communism throughout the world remains the final aim of Soviet policy; the less distant objectives—to prise the Americans out of Europe and out of their bases elsewhere—are certainly also unchanged. In Asia and the Middle East, Soviet strategy has suffered no setback; its momentum continues undiminished. Mr Gromyko's immediate task is to organise a tactical recovery on the European front from the awkward position in which Russia has been placed by the vagaries of Mr Khrushchev or, to put it more charitably, by the forces with which Mr Khrushchev's maladroit attempts at flexibility were unable to cope. Indeed, the recent diplomatic activity—the notes on disarmament, on European co-operation or on relations with Germany—seem to be part of a general effort to restore the balance in Europe to where it stood last autumn.

Tactics, however, must be adapted to the reality of the situation; and this is no longer as it was. For one thing, the political climate has changed within the countries of western Europe themselves. Previously, the possibility of popular fronts in France and Italy was an important factor in Russian negotiations with western governments; the Atlantic alliance was at the mercy of corrosion in one of its two weakest links. This threat has been temporarily removed by the effects of the Soviet intervention in Hungary. Even the fellow-travelling intellectuals who saw in communist parties the only salvation of their countries and, for this reason, swallowed all Stalin's crimes, have now rebelled against the Hungarian repression. The French Communist party was saved from a greater disaster by the presence of a Socialist government saddled with a public policy of repression in Algeria; nevertheless, it is condemned to isolation. The Italian party is beginning to taste the same bitter fruit now that Signor Nenni's Socialists have broken away. Russia can no longer rely on the strength of its big western battalions; it must wait for time to heal the rifts in international communism.

Russia also needs a breather to restore the crumbling system of the Warsaw pact. The Hungarian revolt has been crushed and the Russians are now trying to dispel the impression, at one time gaining ground in eastern Europe, that everybody is out of step except the fiery Poles. As a price for continuing his experiment within Poland's frontiers, Mr Gomulka had to curb the proselytising zeal of his younger followers and also to give his own blessing to the Kadar regime. (The Jugoslavs, unwilling to pay such a price, are at odds with Moscow again.) Efforts are being made to put the east European clock back, though there can be no question of putting it right back to Stalin time. To forestall further explosions, the Russians had to make substantial economic concessions, which have turned eastern Europe from an economic asset into a temporary liability for the Soviet Union. The leaders in the Kremlin need time to turn it again into a going concern.

An agreement was signed last week extending the stay of Soviet divisions in Germany, with some modifications of the terms on which they are there. Simultaneously, an east Berlin court passed a ten-year sentence on Professor Harich, whose heresy drew inspiration from the recent manifestos in Hungary and Poland. This was additional proof that the Russians are less inclined than ever to move out even from their western outpost. Moscow has few cards left in the European game, and control over eastern Germany is its trump. It is a dangerous card, both to those who hold it and to those who do not. One day the ferment of dissent in east Germany may lead to another outbreak like the riots of 1953, but with a difference; next time there may be a west German army on the border. The west German government might find it hard not to become embroiled. A second Berlin rising might shake the world more dangerously than did the Hungarian insurrection.

★

The theme that Nato is the chief obstacle to German unity will be drummed with increasing intensity into German ears by the Russians between now and the elections in September. Marshal Bulganin was probably setting the pattern when he commented, after the latest exchange of Notes, that relations between Moscow and Bonn were "hostile" and that their improvement would be a step towards reunification; he also mentioned prospects of better trade relations. Perhaps the Russians have no intention of moving out of Germany, let alone eastern Europe, whatever they are offered in return. The idea of a far-reaching bargain, however, involving on the western side the scrapping or radical

modification of Nato, will probably haunt German minds until—perhaps even after—it is shown round a conference table that the Russians are not willing to accept any terms at present. The Russians are well aware what a powerful lever their possession of a third of Germany gives them ; there will be more Notes playing on the theme of reunification.

Altogether, then, Russia needs a respite in Europe. But in the meantime the Soviet leaders can harass their opponents through minor skirmishes. They can make things awkward for Dr Adenauer in an election year and foster European isolationism, based on anti-American feelings ; and the latest Russian proposal for European co-operation in the field of atomic energy and electric power looks like a half-hearted and belated attempt to hinder the ratification of the Euratom and common market treaties. How long this interlude will last must depend on the success of the Soviet spoiling tactics. Moscow has not yet given up hope of getting something for nothing, of seeing the structure of Nato and the various west European organisations crumble under the pulls of national economic interests.

The Middle Class Vote

There never was such an opportunity as that now offered to the middle classes and the reforming classes to obtain their avowed ends and to fulfil their own demands. It is a common complaint with them that the men they specially send up have not the influence they desire and are not admitted to a participation in official power. With themselves lies the fault—with themselves lies the remedy. Let them elect men who do them credit, and they will be respected. . . . They have no doubt in many instances selected representatives of good sense, good character, and steady politics. But they have rarely chosen the best men even among their own body—scarcely ever those well fitted to make their way in a critical, acute, and exacting assembly like the House of Commons. . . . It is a most disappointing fact for those who hoped so much from the great organic measure of 1832, that, of the members of the House of Commons who hold or have held office, or whom any one would deem fit to hold office, or who have attained any position of influence or reputation in the House, or who have at all "gained its ear,"—scarcely three can be mentioned who do not belong to the same classes that shared the Government of the State prior to the Reform Bill. . . . It *was* hoped that the enfranchisement of the energetic and sagacious populations of Lancashire and Yorkshire, of Cheshire, Durham and Northumberland, of Finsbury, Southwark, and Lambeth, would have enriched the lower House of Parliament with a fair infusion of that sober enterprise and sterling sense which are known to be possessed in so large a measure by these new constituencies. It was expected that men who had clamoured so long and loudly for representation, and who, by insisting on it, had obtained it, would have determined to be represented well, and would have justified their demand for the right of returning members by the irreproachable and admirable character of the members they returned. Has it been so ? . . . Do they think in sober earnest that their members either are good specimens of themselves, or would make good rulers for the country ?

The Economist

March 21, 1857

Outside Europe, Russia's position is not shaken ; no drastic changes are required there. Increased demand at home and in the Soviet block will make it difficult to back rouble diplomacy with exportable commodities. (The failure to supply Jugoslavia with the goods that had been promised may have an economic cause as well as a political motive.) In the Middle East, on the other hand, the Eisenhower doctrine has proved an even easier target than it looked at first, and the Russians are firing at it with charges of "American-Israeli collusion." The Israel-Arab conflict continues to offer them golden opportunities. It is difficult to see what, short of an invitation to join the concert of powers interested in the Middle East, can stop them from sending arms to some of the Arab states. To spread their influence they need not match American economic aid ton for ton.

*

The Soviet course in the Middle East may be set, but the vigour with which it is pursued and the risks that Moscow is willing to run on the way will be partly determined by the international climate in other parts of the world. What can be done, at present, to come to terms with the Russians if they seem little inclined to seek an understanding over Germany ? Disarmament is one field for exploration. The Soviet leaders have very strong incentives, not only to streamline their armed forces, but also to make drastic cuts in their outlay on defence, in order to release men and materials for other purposes. Last but not least, the Russian leaders really do believe that a big dose of disarmament might precipitate the economic crisis in the West on which they rely to further their international ends. For all these reasons their interest in the topic may now be genuine, and the disarmament sub-committee of the United Nations may have resumed its session in London at an opportune moment. At any rate, the opportunity should be seized to probe Russia's intentions, and in particular to find out from the Soviet delegate, Mr Zorin—now a deputy foreign minister, until recently ambassador at Bonn—what effect the last Russian project of aerial inspection in a limited zone in Europe would have on the future of Germany. Thus the two crucial questions might be linked.

It seems impossible to foresee what final conclusions Moscow will draw from recent events in eastern Europe. The immediate effect was to bind the collective leadership together in self-defence. Differences, however, have only been patched up, and western policies cannot be without their effect on the relative strengths of the factions in the Kremlin. Although the Soviet tanks have done their worst to the cause of international communism, the Soviet position of strength in eastern Europe remains ; and it seems an illusion to expect that the Russians will move out of their own accord if the West just waits. Waiting will not be enough. During the period of "peaceful co-existence," Moscow made the running. Can the West take over the initiative in the new phase ?

Gentlemen and Players in the Lords?

REFORM of the House of Lords is a subject that is best discussed in a way customary in that House itself—by throwing out suggestions rather than by pretending to be a fount of incontrovertible truth. Probably the right time to throw out suggestions is now. It is expected that Lord Salisbury will shortly initiate a debate in the Lords, revealing the Government's own provisional proposals and asking for peers' opinions about them. Before they engage in this debate some peers may like to consider as many germinating ideas as possible from outside.

A primary question, which is worrying some Labour people and needs to be cleared out of the way, is this: if the House of Lords is made less obviously undemocratic than it now is, should some of its previous powers and functions be restored ? The best answer for the Tories to give to that is "No." The House of Lords has worked surprisingly well since the war, under both Labour and Conservative governments, largely because voting in it has not usually been important ; odd votes such as those on capital punishment and commercial television have been the exceptions that proved the rule. In general, the right way for the Lords to exert their influence is through specific suggestions thrown out about particular bills at the committee stage, but rarely pressed to divisions. In the last ten years, on one technical bill after another, the House of Lords has in fact fulfilled its "revisionist" function in this way—with considerable efficiency.

Why, then, does the House need to be reformed at all ? The answer is to be found in two essential features of its composition. The House is, and needs to be, composed of two elements: a small band of regulars—ideally, perhaps, about twenty or thirty, plus ministers, in each of the major parties—who do much of the main day-to-day work ; and a larger group of occasionals who generally speak only on subjects in which they have a special interest. The main reason why the House now needs to be reformed is to prevent the regular element from getting worse. A subsidiary reason is that it would be a good thing—there is no need to put it any higher than that—if the quality of the "occasionals" should be still further improved.

The reason why the regular element is in danger of deteriorating is that most Labour people cannot afford to become "regulars" of the House unless peers are paid. At the moment the genuine regular element on the Labour benches consists (on a strict definition of "regular") of only about a dozen ageing peers, with some sort of outside private income. Their task is not enviable ; and there is no sign that many younger (or even middle-aged) Labour spokesmen are willing or financially able to succeed them as they retire. On the Conservative side the regular element consists of the dozen peers with ministerial posts (who, of course, are paid) and perhaps three or four times that number of genuinely regular Conservative backbench peers. (The numbers cited here, and those for Labour peers, depend, of course, on one's definition of "regular," about which there can be argument.) Even among Conservative backbench peers, the question of payment is not irrelevant. Ideally, they should include many younger peers aspiring to become ministers ; in fact, however, those who can afford to come regularly have reached the age of dignity rather than of aspiration.

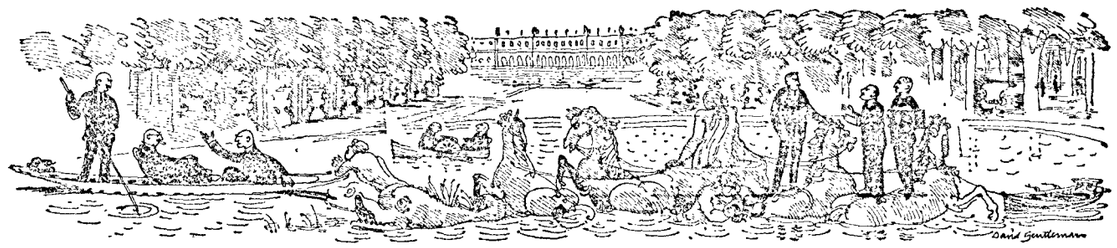
It is to meet these problems that the Government is believed to be about to propose a system of payments for peers. The general assumption is that Lord Salisbury will propose a sessional allowance—a certain sum which each peer could draw on any day that he attended the House. The difficulty of this suggestion should be apparent. If the sessional allowance is to be high enough to allow any regular peer of any party to live according to decent bourgeois standards, the allowance would have to be quite high ; if one assumes about a hundred sitting days per year for the House, a sessional allowance of £15 a day would be barely sufficient. But if it was as high as this, then a backwoodsman peer, coming up from rural Gloucestershire for a night at the theatre, could simply sign a book at the House and draw £15 a day from public funds to finance his excursion.

*

Two expedients are usually suggested to meet this difficulty. One is that the system of sessional allowances for peers should incorporate a provision that only after a peer had attended the House for a certain number of days a year should he draw the full allowance. One's instinctive reaction is that this undignified variant of the miners' bonus shift system would be singularly undesirable ; regular members of the House should be free to travel abroad on Parliamentary missions, and so forth, instead of dutifully clocking in. The second expedient is sharply to cut the number of backwoodsmen peers allowed to attend the House ; although backwoodsmen are accommodating people, the more savage the cut in their numbers, the greater is the danger of their opposing the whole project for reform.

Why not recognise, indeed establish, a difference between regular or "representative" attenders of the House (who would be paid a salary) and occasional attenders (who would not) ? Any specific suggestion is obviously capable of amendment, but here is one. Suppose that each political party with more than a hundred seats in the House of Commons were allowed to nominate (or elect through some sort of intra-Parliamentary party poll) twenty-five people whom it would like to be its "representative" members of the Lords. Let the slate from which they choose be as open as possible ; if some of those nominated were not peers at present, a petition could be presented to Her Majesty to make them barons or life peers. All these "representative" peers could then receive a salary equal

to that received by MPs in the House of Commons. But other peers—while retaining their voting rights during their spare-time visits to the House as now—need not, also as now, get any pay at all. This would clear the way for injecting some new blood among these "unrepresentative" peers, among these occasional attendants at the House. If the principle of payments only for a limited slate of professionals were accepted, there is no clear reason why an increase in the number of occasionals would have to be counteracted by a cut in the number of backwoodsmen with a right to attend the House. The more crowded the chamber, on special occasions, the merrier.



From where should the new blood among the "occasionals" be drawn? The House of Lords has never been quite such an illogical forum as some of its detractors pretend. It already has a strong strain of expertise on legal matters through the attendance of the judges, on church matters through the bishops, on city matters through the bank chairmen, and on agriculture through the large number of farmer-peers. It has a growing body of scientific expertise (which should, however, be much further increased) and a fair number of active industrialists (though it could afford more). The principal deficiencies are perhaps in trade union leaders and professors. Many more retired trade union leaders, such as Mr Tanner, would certainly be very valuable members of the House. Indeed, why confine this to the retired? Many radicals will believe that it would be an advantage if the most prominent *active* trade union leaders (such as Mr Cousins) could come down and use the House as a sounding board for their *opinions*, just as the judges do now. Similarly the holders of some university chairs might profitably become, almost *ex-officio*, members of the House.

The appointment of these new members of the House would, as now, be a Royal prerogative; the suggestion is that only for the very limited slate of professional "representative" members should party recommendations, as distinct from governmental recommendations, be made to the sovereign. Presumably, in order to avoid swelling the ranks of the hereditary nobility and not to deter those who do not believe in a hereditary principle, many (if not all) of the new members should be life peers. The difficulty about accepting even life titles would sometimes be a genuine one, especially for active trade union members of the House; but why create the difficulty by insisting upon titles? If a Mr Smith can become a Lord of the Admiralty, and remain plain Mr Smith, why should he not become a Lord of Parliament, still as plain Mr Smith if he wants to be? There could be provisions for the admission of life peeresses to the House, for Lords of Parliament to resign from that dignity (though not from their title) if they want to stand for the Lower House, and perhaps for the Liberals to have one or two professional "representative" members. Other tidying measures to suit: to detail them would be to give a spurious air of definitiveness to this article. The main idea is that, rather than resort to some sort of peers' bonus shift system and to an unnecessary cutting out of backwoodsmen, it seems wiser to establish a differentiation between the very useful gentlemen and the very necessary players in the Lords.

A Palace for Europe

FROM the Valhalla where good Europeans at last lay down their tired heads, Henry IV of France and Navarre, and the Duc de Sully his minister, should be looking with gratification upon Mr Selwyn Lloyd. Henry, after his death, was said by the Duke to be the father of the first plan for a united Europe, a "Grand Design" for a confederation of fifteen Christian states governed by a great assembly. Now Mr Selwyn Lloyd has paid him the compliment of borrowing both the title of his scheme and something of its spirit for a sensible plan to bring some order to the multitude of European organisations which are mushrooming all over Europe, by gathering them under one roof and under the control of one parliamentary assembly. The practical king might have liked a recent French suggestion that the new "Grand Design" might find a home in the Palace of Versailles. So far the great assembly exists only in Mr Lloyd's imagination, but here at least is the very roof he needs. The palace itself could house the great assembly, the sprawling stables the secretariat. The Six could hatch their schemes in the seclusion of the Grand Trianon; in the more rustic Petit Trianon Benelux could quietly meet. For jaded parliamentarians, punting on the Grand Canal could provide a wholesome substitute for the wine feasts of Strasbourg, and the hall of mirrors a visual bonus for those who visit European assemblies to hear their own voices.

Yet the vision of a Palace of Europe just falls short of emulating on a continental scale the glories of the court of Louis XIV. One vital element is missing: the Sun King himself and his great ministers whose policies were the hard diamond beneath the glitter of Versailles. Mr Selwyn Lloyd may combine the Council of Europe, Western European Union, the Organisation for European Economic Co-operation, the European Coal and Steel Community, the common market, the free trade area, Euratom (and perhaps any other bodies he can think of, like the European commissions for inland transport, plant protection and foot and mouth disease), give them new names and house them in any palace under the sun; it is doubtful whether there will be any new sparkle of constructive life unless there is a driving force behind them. Indeed, with so many "good Europeans" gathered together in

one place, it is easy to imagine their vices growing worse, not better—the empire builders, like royal mistresses who have lost their patron, expanding their little domains in the park more jealously than ever, the sectarians and cranks waging a new battle of the books among the trees, hurling at each other those frightful abstract epithets of which they are so fond. Parkinson's law is bad enough at home; on a European scale it is multiplied by a special factor B derived from the tower of Babel. If the European bureaucracies are to be, in all seriousness, not idle retainers but disciplined servants with a practical job, they need to be directed with a firm hand by something like a European cabinet.

★

In form most of the plethora of European institutions are already headed by councils of ministers from the member countries; the trouble has been that there are too many councils and that some of them have done little or nothing at all. Most of them consist of the very same men, hopping from meeting to meeting and capital to capital. But if the Grand Design is to prove more than another empty sketch, the new grand council which emerges must become something more than the sum of these parts. It must be a policy-making body, dovetailing, say, the collective effort in atomic development, defence and economic policy; evolving common European policies towards the world outside the realm of Europe. Some questions will interest only six of the countries, or a dozen, or perhaps only three; the ministers who do not wish to be involved can drop out without fuss or formality. The same can apply to the parliamentary delegates when the Assembly discusses matters which are taboo to them. Thus, the Swedes will want to keep clear of military topics. But though the council might vary in size, it should remain in permanent session and have permanent cabinet offices.

Already the ministers are being given new specific tasks—to run the common market and Euratom, for instance; these will force them into a more continuous activity. But there is one institutional change which could greatly enhance their stature in a valuable broader sense. The titular heads of the council should be the prime ministers of Western Europe, who have never met together since the war. Their deputies, the ministers of finance or foreign affairs, can execute a policy, steer it to port, as Mr Thorneycroft's group is doing in Paris for the free trade area. But only the heads of governments can set the course. Only they, meeting regularly, can carry into the separate national cabinets an authoritative European voice; only they can frankly discuss and quickly overcome the deeper policy differences, as M. Mollet and Dr Adenauer have done with the common market. A council of premiers could ensure that the great problems before Western Europe, like the Suez Canal and the twisting pattern in Eastern Europe, are met by a common European policy, within the broad Atlantic framework. Common policies are wanted before, not after, an individual member of the partnership runs amok to the loss of all.

So much for the ministers; what about a king? There are some unkind people who hold that M. Monnet was altogether too much like the Grand Monarch when he slipped from his role of grey eminence of Europe to the throne of its first shadow state, the coal and steel community. The truth is that at present an autocratic supranational boss ("L'Europe, c'est moi") could achieve less lasting and solid progress towards greater unity in Europe than more flexible and modest bodies. But the Grand Design might well have a constitutional monarch, a secretary-general of considerable power as well as tact. His first job as top civil servant will be to pull together and discipline the sprawling European "ministries"; to wrestle with the inexorable Parkinson. His second task, still more important, will be to keep the ministers on the go, to formulate the details of new plans within Europe, to suggest the compromises which may form the basis of a common foreign policy. He must be able to beard any foreign minister in Europe in his national den. A Hammarskjöld of Europe, but with more effective power because representing a true community of interest, he must play the sort of part M. Spaak hopes for in Nato.

Once council and secretary-general take on a real importance, Mr Selwyn Lloyd's assembly may become more than a mere debating society emitting fine resolutions into the blue. It will have policies to criticise, an active executive to push and pull. Ministers and Assembly will in turn reflect importance on each other, until in time national electorates may even wish to exercise a better control over them through direct votes. This is a distant prospect. A palace of Europe could still prove as much of a white elephant as the lovely museum piece beside Lake Geneva. Yet a new tide of awareness of the need for strength through greater unity is in flood in all the separate European countries. It would be a tragedy if it were dissipated. The setting up of a permanent council of the heads of European Governments might canalise it to lasting purpose.

Notes of the Week

Handshake at Bermuda

THE talks at Bermuda, which were beginning as this issue of *The Economist* went to press, will undoubtedly close an unhappy chapter in Anglo-American relations. Mr Eisenhower and Mr Macmillan have met to reconcile, not to recriminate. But when the warm handshakes, and perhaps a reference to a royal visit to the United States, have been exchanged, what follows? It is one thing to write "finis" at the end of a chapter, and to turn the page; it is another to compose the paragraphs that should follow. Two men who can look back to a wartime period of working partnership are well placed to share their views with each other in friendly frankness. But it does not follow that their meeting will bring British and American policies any closer together than the present trend of events is bringing them in any event.

The Prime Minister arrived at the Mid-Ocean Club with a briefcase which, according to most reports, bulged with requests—requests that the United States should relax its attitude toward China and toward trade with China; should accept the reduction of British manpower in Germany and do more to help reshape Britain's armed forces for use in the age of nuclear weapons and missiles; and should link itself more closely with the military side of the Baghdad Pact. It may seem cruel to ask what Mr Macmillan for his part intends to offer (the President, bent on restoring the transatlantic partnership, is unlikely to press any such question); but the question presents itself, nevertheless. There is talk of the value to America of British advice and experience in Middle Eastern matters, but scant sign of a positive and clear-cut British thesis on the re-emerging problems of the area. On the contrary, while the Government's supporters criticise Mr Eisenhower for leaving too much to the United Nations, Ministers themselves are showing a similar disinclination to take the responsibility of suggesting any course of action, even to their friends. There is a good case for tackling matters at a steady pace rather than at a gallop; but there is no case for merely lying back and expecting a cure-all from an ally of whom the Government is so concerned to show itself independent.

Back to "Burden-Sharing"

NOT tiptoeing but slow marching, to the beat of allied groans, the British Army is to begin its partial withdrawal from the Continent. The statement issued by the seven-nation Western European Union after Monday night's flurried meeting of foreign ministers was remarkable for the omission of any phrase connoting continental agreement to the withdrawal. It recorded merely that Britain will go ahead with its plans until October, by which time WEU hopes to have received and digested a "new overall review of the resources of the alliance" which it is asking Nato to prepare.

In practice it seems that the French, Germans, Italians and Beneluxers, while unconvinced by arguments that Rhine Army's manpower can be reduced without any loss of fighting power, are resigned to the prospect of a first cut of about ten per cent and hopeful that by October Britain may be induced to forgo or moderate its firmly proclaimed intention of cutting a further twenty per cent. "Hopeful" is perhaps too strong a word. The continental allies have discovered that Britain's pledge, given at the time of the Paris agreements, not to weaken its forces on the Continent against their will, cannot in practice be invoked by a Germany which has failed to raise its promised troops and a France which has taken most of its troops away to Algeria. At Dr Adenauer's prompting, they are to plunge once more into the intricacies of "burden-sharing." But if the experience of Nato's earlier years is anything to go by, it will be a long time before clear formulae for the distribution of the defence burden are worked out, and an indefinite one before most governments take any notice of them. Thus the proposed "overall review" looks remarkably like a mere means of clothing the nakedness of the British action—although there is admittedly a case for a more comprehensive review of resources and goals than Nato's annual routine provided, at a time when so many member countries are planning to change the structure of their defences.

Probably it is from Bermuda rather than from the Atlantic Council that both Britain and its continental partners will really hope for some easing of their difficulties. After the brisk bout on Monday night in London, Mr Macmillan can confront Mr Eisenhower with a fact which, if not accomplished, is at least accepted. There will be more power to the elbow with which he intends, according to all reports, to have another shove at the door that Mr Sandys pushed against in February—the door to fuller co-operation over atomic weapons.

Tory Horizons

ECONOMICALLY, there were not many hints of policy to come in the Prime Minister's long-awaited speech at Leicester. To give opportunity to "the bold, the strong, the adventurous," Mr Macmillan said, it is necessary to leave industry enough to invest in the future, to give individuals the chance, not only to save, but to know that their savings will keep their value, and to make the Government "pay as we go." For what it is worth, these phrases would not clash with a budget that gave very little away on April 9th, concentrated what there was in so-called "middle-class reliefs," and possibly made some start on the reform of company taxation. But Leicester—very properly—was not really an evening out for the budget clue-hunter.

Politically, the speech was undoubtedly a success. Mr Macmillan is obviously hugely enjoying his new job. His insistence that "this Britain of ours cannot live on a kind of sloppy socialised basis" and that "there is no difference between Socialism and Communism except this—Socialism is soft, Communism is hard" was the knockabout stuff some Tories had missed since their last leader but one. He also made an effective defence of the Rents Bill, by recalling that the protests now being made were also levelled at the steps taken in the last Parliament to end food rationing. As it happens, his remarks on social policy were supplemented by an unexpected Tory propagandist success in Westminster itself the next day. In reply to Labour's censure motion on the social services, Mr Boyd-Carpenter, not hitherto regarded as one of the party's best orators, struck a bright patch of form. His exposition of where the Tories want to go was really simple enough: they believe in concentrating social benefits on those who need them, and not giving general subsidies to all, rich and poor alike. But Mr Boyd-Carpenter not only made this point with great effect; he also exposed the Labour party's failure to work out a social policy of their own—at any rate in terms which make financial sense.

The Pensions Minister gave Tory MPs more to cheer about than for a long time past, and these speeches, following Mr Butler's ambitious approach to prison reform, should remind the Tory party that there are wider horizons than Clause 9, petrol rationing and endless post-mortems on Suez. Unfortunately, over these horizons there are also such things as nationalised industries, and strike threats, and possible retreats before strike threats; it will be interesting to see what the reaction of Tory backbenchers will be if there should be a "railway surrender" this weekend.

Selective Withdrawal for Doctors

WHATEVER the final outcome of the dispute over doctors' pay, it will not be a negotiated agreement. In fact, Mr Macmillan seems to be going out of his way to be as firm and peremptory with them as he can be. The increase in pay for junior hospital staffs was not negotiated in the appropriate Whitley council, as was promised by Lord Salisbury; the ten per cent was decided on by the Government. And this week Mr Macmillan said that the Government had not yet decided on the amount of the interim adjustment for general practitioners, but he would announce it in due course. Again, there is no question of negotiation, much less arbitration which the Government is so strongly urging for other pay claims.

The doctors are plainly as incensed by this treatment as they are by what they regard as the repudiation of the Spens reports. The general practitioners, as represented by their General Medical Services Committee, are accordingly going ahead with their plans for resigning from the health service, and the local medical committees will be asked to approve them at a conference to be held on April 30th. Briefly, it is proposed that after that date the British Medical Guild should try to obtain the resignation of all health service general practitioners. These resignations will be put into effect initially in certain selected areas (presumably those with a high percentage of resignations) and will come into force on October 2nd, three months' notice having been given. In October no fees will be charged—the Government in effect being given a last chance—but in November standard token fees of 5s. a consultation and 7s. 6d. a visit will be charged, except where they would cause hardship, and patients will be advised to take the receipts for these fees to national insurance offices to give the Government "an opportunity of refunding the sums involved." If a settlement is not reached "in a reasonable time," doctors will charge full economic fees and the areas of withdrawal will be extended.

The doctors are assured that they will suffer no financial loss. There are apparently adequate funds in the "defence trusts," financed by voluntary levies from doctors from national health insurance days onwards, to give them at least for the early months their usual health service incomes; and the plan does not appear to envisage a prolonged or permanent withdrawal. Even so, it would be a drastic and unpleasant step for doctors to take. They and their patients will hope that the long notice of withdrawal, and an intervening budget that may give some surtax relief, will enable the Government to come to an acceptable decision before the step is due to be taken.

The Cypriot Log-Jam

THE British Government's readiness to accept Nato conciliation over Cyprus could prove to be the beginning of the break-up of the Cypriot log-jam. Lord Ismay's offer was made in accordance with the new powers granted to its secretary-general by the Nato Council last December; if his good offices are accepted, he can appoint a three-man conciliation tribunal from among the heads of delegations to Nato. The organisation's interest in the Cyprus problem is clear; the disagreement between Greece and Turkey over the future of the island makes nonsense of Nato's defence arrangements in the eastern Mediterranean. Moreover, this disagreement stems primarily from Turkey's fears for the defence of its southern ports should Cyprus come under Greek sovereignty; those ports are of strategic value not only to Turkey but also to Nato as a whole. Unfortunately the Greek government has immediately rejected Lord Ismay's suggestion, taking its stand on a quite arbitrary and indefensible interpretation of the latest UN resolution on Cyprus. It is to be hoped that Nato will not be deterred from approaching the Greeks all the same and inducing them to think again.

Nato, if it gets the chance, will presumably exert itself in the first instance to reconcile in some way the (at present, totally opposed) attitudes of the Greek and Turkish governments. If that attempt showed signs of being successful, Mr Lennox-Boyd must hope that it would smooth the way towards agreement with the Cypriots themselves. The hope is reasonable; but in the meantime the Government's response to Eoka's new truce offer, and to the problem of

Archbishop Makarios, remains extremely guarded. Mr Lennox-Boyd was content to say of the *truce offer* that Eoka had only offered to "suspend" hostilities. He gave a "solemn undertaking" that the Archbishop would be set free to go anywhere except Cyprus if he "would make a public statement calling for the cessation of violence." At first sight this does not seem to break much new ground; the Government's attitude has always been that it could neither release the Archbishop nor negotiate with him until he had renounced violence. But if Archbishop Makarios has hitherto been deterred from making this renunciation by the lack of a firm assurance that it would in fact lead to his release, Mr Lennox-Boyd's statement may have opened the Archbishop's prison door wide enough for him to emerge. Whether the British Government would then negotiate with him remains, for the Cypriots themselves, the crucial question.

For Whom the Canal Tolls

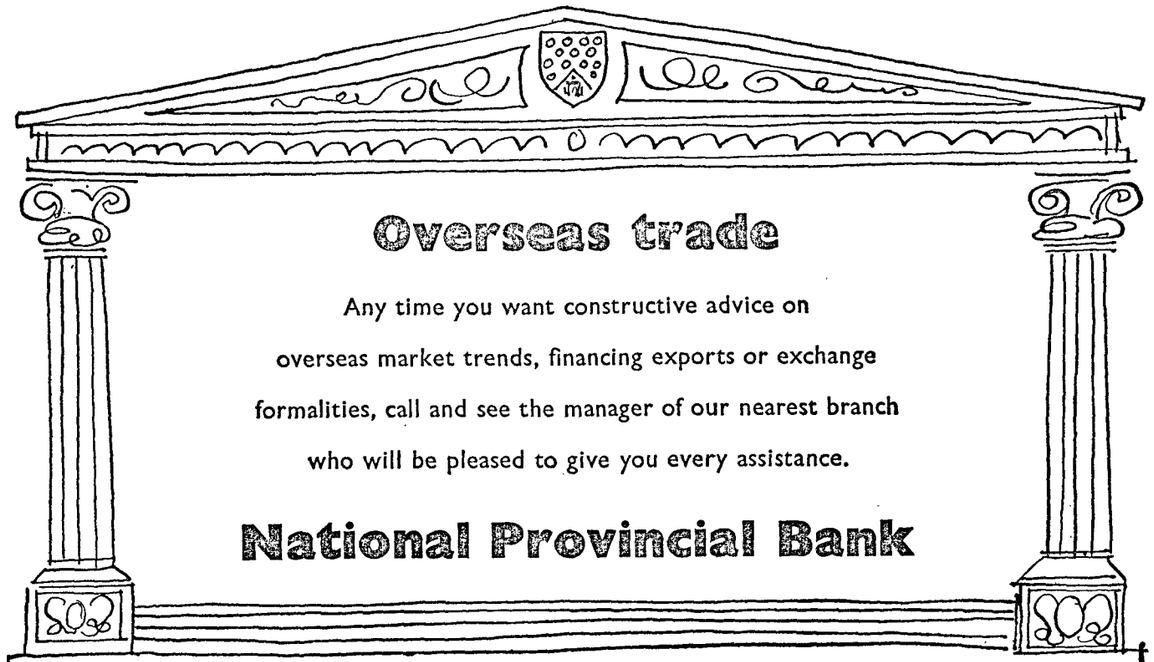
THERE is a pattern in the behaviour of President Nasser. He makes no promises to modify his full claims; he leaves an "assumption" of reasonableness in the air. Only at the decisive moment, for example when the Israeli forces have withdrawn or the *Edgar Bonnet* is being raised, does he present his terms. And then they are usually stiff.

As Mr Hammarskjöld was about to step on the plane at New York to visit Egypt, the Egyptian government issued a Note to embassies in Cairo, stating what Egypt had "decided" regarding the Suez Canal. The matter was urgent. The United States, Britain, France and Norway had for three weeks been awaiting his reply to their proposal, transmitted through Mr Hammarskjöld, that the dues be paid to the World Bank or to Uno, which would remit half to Egypt. The Egyptian Note states clearly that the dues must be paid in advance to Egypt "or its nominees" and it will allot a proportion, based on former Suez Canal Company practice, for canal development. "Or its nominees" could mean the world bank or Uno; but in the pattern of President Nasser's behaviour, this is unlikely.

Nor does the Egyptian Note mention the six principles which the Security Council approved as a basis for a Suez Canal settlement on October 13th. What has happened to these? Mr Hammarskjöld wrote to Dr Fawzi on October 24th, expressing what he took them to mean in practice. This was before the Anglo-French ultimatum. Dr Fawzi replied on November 2nd that Mr Hammarskjöld's framework was "sufficiently wide to make a further exploration for a possible basis for negotiation . . . worth trying"; he only excepted a sub-clause by which any party to the canal agreement would be given the right to redress its own wrongs if arbitration failed to ensure its rights. This reply was taken to mean that the six principles provided a basis for a settlement; but reports from Egypt suggest that President Nasser considers that the Anglo-French invasion wiped out the Uno efforts at settlement, despite the fact that Dr Fawzi replied after the bombing had started.

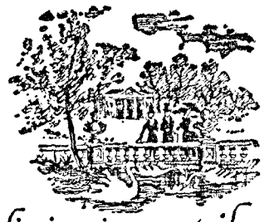
It is in keeping with this view that President Nasser should now have "decided" what to do about the canal. Nor is there much left to decide, once the canal dues are paid to Egypt. It will have the pilots, the administration and the dues; and as for freedom of navigation, this is simply promised once more. The maritime powers must decide what they will do about it quickly, because the canal is open to small ships already, and may be open to all shipping on April 10th. The only weapons available against Egypt, if President Nasser does consider the whole matter settled on his terms, are a boycott of the canal, or a general economic and financial boycott. It is unlikely that even the 18 nations of SCUA would agree to forgo the use of the canal indefinitely. And would President Eisenhower, with his "doctrine" in mind, be willing to keep Egypt's dollars in the deep freeze? Mr Macmillan should be putting this question at Bermuda.

Kuwait Pipelines and Frontiers



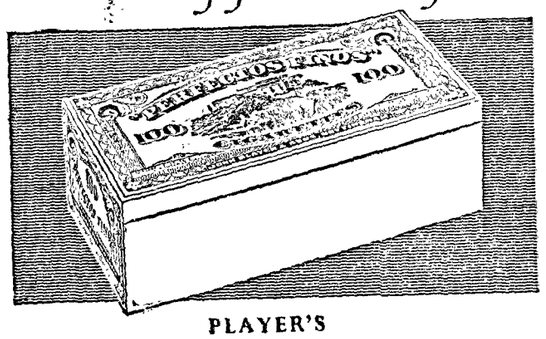
THE Iraq Petroleum Company and the Iraqi government want a pipeline to Kuwait to take oil from Zubair, on the Basra oilfield, to the sea near Mina el-Ahmadi. The Kuwait government wants a pipeline to bring it fresh water from the Shatt-el-Arab in Iraq. In these circumstances it would seem reasonable to assume that agreement can be reached between the company and Kuwait for the oil pipe, and between the Iraq government and Kuwait for the water, and that the agreements will be reached simultaneously. This may happen. It is, however, premature to assume that Kuwaiti approval for the oil pipeline is just around the corner.

The draft agreement prepared by IPC has not yet been negotiated, and there is no certainty that its terms will be readily acceptable to the Sheikh of Kuwait and his Supreme Council of his relatives. If they are not accepted by the end of the month, the "dead" month-long period of the Moslem fast of Ramadan will have arrived; and after it half the council is likely to leave Kuwait to avoid the heat of the summer.



There is also the very old dispute between Iraq and Kuwait regarding frontier demarcation. If there are to be pipelines, the two states need to know just where their respective responsibilities for the pipelines begin and end. Presumably, too, in the case of the oil pipe the transit dues will depend on the length of line inside Kuwait. So far it has not been possible to draw a frontier acceptable to both states. The matter is under discussion; some sort of settlement on this point must have priority over the pipeline agreements.

Changed Outlook for Prisons?



NOT very long ago, debates on prison reform could be read only with despair: not only because so much needs to be done and there is so little money to do it with, but also because there has seemed to be so little realisation by the Government of what is needed. Last summer, however, in a House of Lords debate, Lord Mancroft showed that at last the Home Office had a junior Minister who was taking a personal interest in prison conditions and

who realised that statistical replies to criticisms were not enough. Last week, a House of Commons debate showed that this changed official attitude towards the subject was even more apparent in the new Secretary of State.

Mr Butler did not avoid hard facts and figures: the reduction in the number of prisoners sleeping three in a cell; the prison building programme, which in five years' time will provide 1,500 places; the improved recruiting of prison staff. But much more important was his appreciation of less tangible factors. For instance, he pronounced himself shocked by the small amount—£12,000—spent in the last nine years on research into the penal system and its effects. Scientific assessment of the present tendency to impose longer sentences, of the value of corrective training and preventive detention, is badly needed. A similar assessment is also needed whenever experiments are undertaken in individual prisons. Mr Butler mentioned Norwich prison, where the prison officers are assigned to small groups of prisoners and encouraged to look upon them in much the same way as social workers do their problem cases. This individual casework approach may be extended to other small prisons; but it would clearly be an advantage if its value in preventing recidivism could be established—or disproved—before the experiment is generally adopted.

The blend of idealism and realism that prevailed throughout Mr Butler's speech was perhaps shown to best effect in his reference to prisoners' earnings. Some increase is about to be made: the "beginner's rate" of 10d. a week for the first eight weeks is to be doubled, and the maximum will be raised. But Mr Butler looked much farther forward than this. He visualised a prisoner being able to earn enough to save a sum for his discharge, and even to pay for his keep and maintain his family. This was looking very far ahead indeed; but the distinction of the debate was that it was the Home Secretary, not a backbencher, who was being idealistic and wondering whether in this matter England should not "give an example to others."

Zik Wins Under Pressure

DR AZIKIWE has led his party, the National Council of Nigeria and the Cameroons, to its expected victory in the Eastern Region elections. But he has not done nearly as well as most people had anticipated. He will probably have 64 seats in a House of 84, against 72 previously; though he may hope that after the elections some successful opposition candidates may join, or rejoin, the NCNC.

But it is clear that Mr Awolowo's Action Group party, based on the Western Region and bitterly opposed to Dr Azikiwe, has done well; with thirteen members it is now an effective opposition which has made good its claim to be an all-Nigeria national party. The voting has, however, been significantly tribal; the NCNC has lost seats in non-Ibo areas, and is even more than before an Ibo party; the Action Group has mainly won support where the Yoruba influence is effective and anti-Ibo feeling intense. Part of the NCNC losses may be attributed to the deal by which Dr Azikiwe, to get his supporters to agree to a general election rather than resign himself after the Foster-Sutton report had criticised him, forced the constituencies to accept again the existing NCNC sitting members, however unpopular they had become personally with their constituents.

The bank report, which condemned Dr Azikiwe's behaviour as a minister, has in reality had little effect, except in Mr Eyo's constituency. There the NCNC was soundly thrashed, and Mr Eyo, who started the crisis by his attacks on Dr Azikiwe for his dealings with the African Continental bank, has been triumphantly returned. Here and there, perhaps, easterners have felt uneasy about the report's strictures on the public morality of their region. But Dr Azikiwe made great play in his speeches and manifestos with the admission in the report that his "main object was to liberalise credit." What this conveyed to voters who only heard it translated into Ibo, and indeed into far more limited local vernaculars, baffles conjecture.

The Law and the Obscene

IN London it is perfectly easy to buy really smutty books: more than any city it is the home of those specialised bookshops in which the works of Zola lie next to Histories of Flagellation, and the Decameron rubs bare shoulders with what the trade calls "Art Photos." But every now and again magistrates order the destruction as obscene of famous classics, and only recently works of the well-known French playwright Jean Genêt were seized by the customs.

In 1954 five publishers were prosecuted for obscene libel, the legal name for disseminating dirty books. Two were fined, two were acquitted, and in the other case two juries failed to agree on the vital question whether the book had a tendency to corrupt.

The present law of obscenity is an outdated muddle, making no distinction between literature and plain pornography. Magistrates, confronted with the contents of a dirty bookshop, have to order the destruction of the good along with the bad, and in the confusion bookshops which are evidently breaking the law are unmolested. At the same time printers and publishers, uncertain whether the law is to be applied, are over-cautious about what they bring out, so that good books are either lost to the English reader or smuggled in from France. There are respectable arguments for doing away with the censorship altogether, since there is no particular evidence that those who buy "corrupting" literature are any more corrupt after reading it than before; but, if there is to be a censorship, it must be both workable and not too far behind public opinion.

Yet another private member's bill on the subject—prepared by the Society of Authors with the help of Sir Alan Herbert—is to be introduced into the Commons this session. It would make it necessary for the producers of a book to know it to be obscene, and "wilfully and knowingly" to disseminate it, before they could be convicted. The courts would receive expert evidence about its quality, which would help the judges provided that the critics refrained from squabbling. These provisions would protect those who publish erotic books in the belief that they are of literary or other merit. All prosecutions would be subject to the approval of the Attorney-General, which would standardise practice throughout the country; authors and publishers would be entitled to be represented when booksellers

are charged with selling their books ; and no book could be destroyed by the customs without a magistrate's order. The coming of new and liberal voices to the Home Office gives the society hope that their bill may have a smooth passage, and their hopes are increased by the fact that the new Under-Secretary was a sponsor of an earlier version of the bill.

Family Planning for China

UNTIL fairly recently the family was the main exception to the communist predilection for planning. The Chinese did not differ in this respect from the Russians. When the startling results of the previous year's census were published in 1954 (claiming a total population of 601.9 million, of whom 582.6 million lived on the mainland ; 7.6 million in Formosa ; and 11.7 million abroad) the Chinese dismissed as " Malthusian nonesense " any outside suggestions that such a pressure of population might be an obstacle on the road to prosperity ; they even argued that fertility must be encouraged. Now, however, the line has changed completely. At the last meeting of the People's Consultative Conference Mrs Li Teh-chuan, the minister of health, made an impassioned plea for birth control. If the campaign begun a year ago for disseminating contraceptive measures was not rapidly expanded, she argued, many women would resort to abortion and sterilisation, which are now freely permitted.

Probably the *volte-face* was inevitable, granted the stupendous fertility rate in China, where the " passion of the sexes " is as formidable in its statistical effects as when Malthus used the phrase. A sample survey in a Shanghai factory showed that 17 per cent of the women were pregnant twice within a year, and 53 per cent once a year. " In one Shanghai mill of 7,000 male and female workers, the women workers of the factory produced 7,000 children in seven years." As the improvement in the health services has reduced " natural checks," it is claimed that China's population is increasing at the rate of about 15 million, or 2.5 per cent, a year.

The Chinese communists have not abandoned Marx for Malthus. But they have had to realise what a barrier this pressure of population places in the path of the rapid economic development which they seek. Hence Mrs Li Teh-chuan is now permitted to proclaim in flat contradiction of earlier Chinese declarations of faith, that without the planning of childbirth China cannot " free itself from poverty, become prosperous, rich and strong.".

Hungary's Un-anniversary

THE Hungarian national day, March 15th, was celebrated by the Kadar regime, by the police, the armed forces and the official press—but not by the Hungarian people. In the circumstances, their abstention was the most effective demonstration they could give of their support for the ideals proclaimed by Kossuth 109 years ago.

For days before March 15th the regime had been twitching nervously and preparing for the worst. Thousands of potential troublemakers were arrested. (The large concentration camp at Kistarcsa, near Budapest, which was closed down in 1953, has been reopened.) Soldiers, police and armed workers' guards patrolled Budapest and stood about at street corners. The day was officially a national holiday, but in order to frustrate plans for silent demonstrations, it was proclaimed a normal working day in factories and offices. The citizens of Budapest retaliated by ostentatiously keeping themselves to themselves. The elaborate display of the regime's armed strength was reduced to ludicrous anticlimax. Celebrations in which the whole country should have joined shrank to three brief, virtually secret and closely guarded ceremonies at which none of the communist leaders dared to make a speech.

March 15th is safely past, but there is no plain sailing in front of Mr Kadar. The gulf between his government and the mass of the Hungarian people has been demonstrated once more. Although the regime is trying hard to win over the peasants, in other ways it is drifting back to a policy of pure repression. The sudden appearance of an article by an old stalinist, Joszef Revai, in which he maintained that Mr Rakosi and Mr Geroe deserved much less blame than Mr Imre Nagy, and the subsequent appearance of articles criticising Mr Revai, may be signs of the conflict over what to do next that is now going on inside the regime. In any case, the real decision will be taken in Moscow where Mr Kadar is now having talks with the Russians. If he returns with promises of substantial Russian economic aid, his efforts to rebuild the shattered Hungarian economy may still be seriously hamstrung by the passive hostility of the Hungarian people. He may try to overcome that hostility by including some unimpressive non-communists in his government. Negotiations to that effect are believed to be going on ; but more would be needed to reconcile Mr Kadar and the Hungarians.

Closer Look at Graduates' Salaries

THE *PEP* study, published last autumn, of the employment of graduates has now been supplemented by a closer inquiry* into the salaries paid to a sample of graduates in industrial jobs. Starting salaries have risen substantially over the period covered ; for arts graduates from an average of £444 per annum in 1950-51 to £500-£760 in 1954, for scientists and technologists from £500 and £434 respectively to £550-£775. A less obvious but significant development is the change in the relative earning positions of arts graduates and others during the years following recruitment. Those arts graduates who remained with their first employer suffered, on average, a relative loss, their average salaries being £715 as against £733 for scientists and £719 for technicians ; these figures, however, conceal a wide spread, the higher-paid arts men doing better than their counterparts in science and technology and the lower-paid doing worse. When there had been a change of employment, the arts graduates did considerably better than others. For promotion in the managerial hierarchy, the evidence

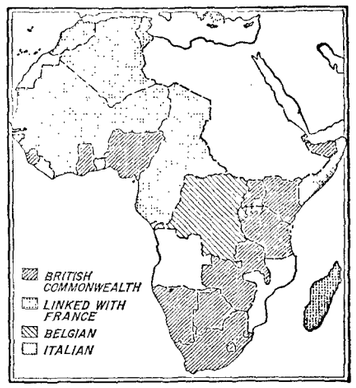
Eurafrica and the Commonwealth

THE British desire for freer trade in Europe has always been conditioned by the wish to preserve traditional trade ties with the Commonwealth. To do this the British plan for the free trade area was from the start attended by two vital qualifications: that both the Commonwealth and agriculture should be excluded from the scheme. With the Commonwealth left out, British industry would retain intact the preferences it enjoyed in Commonwealth markets. With agriculture out, the Commonwealth would keep in turn its preferences in Britain, for most of these applied to food and drink—New Zealand cheese and butter, South African wine. These conditions preserved the substance of the Ottawa system.

Today the British Government is once more in anxious consultation with some of the Commonwealth countries, for both principles have been put in question by the decision of the six countries which are setting up a common market to bring their own overseas territories into the scheme. The Italian and Dutch territories, Algeria, the French colonies and probably the newly independent states of Morocco and Tunisia will be linked with the common market in three ways. They will benefit from investment capital, mainly from Germany ; they will extend the preferences which they already give to the mother country to the other five members of the Union ; and finally they and the Belgian Congo will benefit in turn from a system of new preferences in the European market. The Europeans now plan to do in their own territories what Britain and the Commonwealth did at Ottawa.

This new development makes the original solution—to omit the Commonwealth—an unhappy one for many Commonwealth exporters. Some 17 per cent of the exports of the whole Commonwealth in 1955 went to European countries other than Britain—mostly to the common market countries;

THE EUROPEAN MARKET



and over a fifth of the exports of Britain's remaining colonies and dependencies normally do so. The new preferences will be a painful new handicap to these exports. Not all of them will suffer. Hongkong's light industries are unlikely to feel African competition for some time. Jute and cotton, the staple exports of Pakistan, may escape tariffs ; so may most metals and minerals. But there are to be severe preferential tariffs on a number of vegetable products —9 per cent on cocoa, for instance, others on coffee and vegetable oils, and perhaps even rubber ; these will certainly hit those British African territories whose exports are directly competitive with the equatorial territories of France and Belgium. As much as 21 per cent of the exports of Ghana, Nigeria, Tanganyika, Kenya and Uganda together went to the six countries in 1955. Most of this total consisted of the key vegetable products, like coffee, cocoa, and vegetable oils to which preferences will apply. Ghana, in particular, sent over a quarter of its exports to the six countries ; most of this was cocoa.

There will be other lesser sufferers outside this equatorial belt. South African fruit may feel the competition of North Africa ; West Indian bananas that of the Congo ; even Malayan rubber may be at a disadvantage. Commonwealth concern is less, perhaps, with the present—when Africa, for instance, produces only a sixth as much rubber as Malaya—than with the future, when both the needs of Europe and the output of French and Belgian Africa may have grown enormously.

The Liberal Solution

The most obvious liberal solution for the problem is to include the Commonwealth in the free trade area after all. But this is hardly practical politics. Canada, for one, would certainly not be willing to establish a preference in favour of all Europe against the United States. New Zealand is hardly likely to surrender the security of its market in Britain in return for a dog-fight with the Danes in Europe. The number of Commonwealth countries who may wish to join may be severely limited.

The " broad " solution has another snag. It would extinguish the preferences which Britain enjoys in the Commonwealth, or extend them, at any rate, to our European competitors. As it happens, if the main Dominions, especially Australia and New Zealand, stay outside the free trade area, the bulk of preferences will be preserved, for the preferences which Britain is given by the

THE AFRICAN TERRITORIES

colonies are insignificant. But it will not be easy to draw a line between " insiders " and " outsiders." It can hardly run between colonies and dominions, for the dominion of Ghana, for one, will be one of the chief sufferers from the new preferences and might wish to come inside a broader free trade area.

Even if only a few Commonwealth countries join the area without conditions, there will still be one great drawback. The second principle designed to preserve imperial preference—the exclusion of agriculture—will have been jettisoned. The Dutch, Italians and French are already loudly attacking the British stand on agriculture. And the Danes are anxious for agriculture to be in the free trade area, not only because they provide the British breakfast but because they may otherwise be shut out from the German market by the high common market tariff wall. Britain can hardly continue to protect New Zealand butter from the Danes and Dutch, when the common market is opening its doors to Ghanian cocoa.

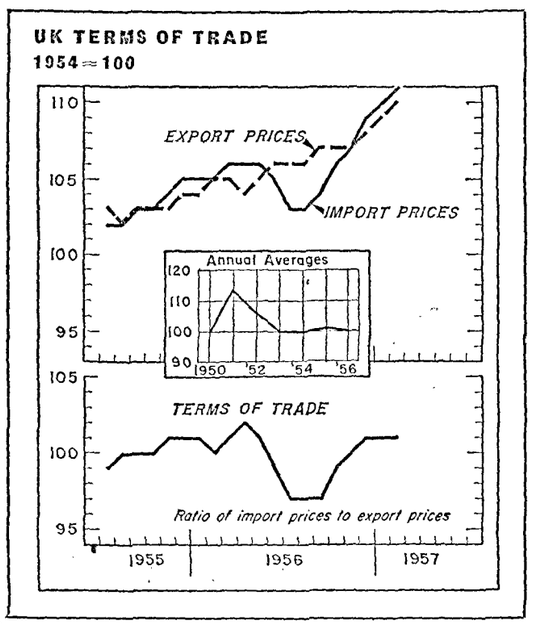
Bilateral Agreements

If the substance of imperial preference is to be preserved in both Britain and the Commonwealth, the two first principles—exclusion of agriculture and of the Commonwealth—may have to be retained after all. Bilateral agreements with Britain, say, to ease the way for Dutch and Italian fruit and vegetables when those from the southern hemisphere are out of season, might assuage the European farmers a little. And bilateral arrangements between the six and the chief Commonwealth sufferers, like Ghana, may go some way to resolve the new problems created by Eurafrica. But parts of the Commonwealth will still suffer from it, and European farmers are far from reconciled to Britain's stubborn stand on agriculture.

(*Continued from page 986*)

suggests, the arts man is better placed than the scientist or technologist. One must say "suggests" rather than "demonstrates"; the sample is small, the period short, and there is no analysis of positions held to match that of earnings. The authors, however, feel justified in uttering the warning that current salary and promotion policy "is not well calculated to encourage" that influx of able students to the science and technical faculties that industry so badly needs.

Salary policy and promotion policy are, however, two different questions. More light may be thrown in *PEP's* forthcoming book, "Graduates in Industry," on a matter not touched on here, except remotely by implication: that is, the relative capacities of the technically-trained and the arts-trained graduates for the essentially human job of management. It is a constant theme of current management study that interest in people and a capacity to deal with them is—especially in conditions of full employment—a *sine qua non* of managerial success. Do science and technology perhaps selectively attract those less gifted in human relations? Or—a likelier guess—does the ferocious, nose-to-the-grindstone concentration of scientific and technical training produce, in those undergoing it, an atrophy of the social skills not suffered by the easier-going arts man? Either way, a remedy for the troubles treated in this pamphlet needs to be sought less in industry itself than in the educational process—to produce within either kind of discipline well-rounded human beings.



Votes and Shares in Central Africa

TWO-THIRDS of the vote at elections, and copper shares at two-thirds of their market price, seems to be the new formula for African advancement in the Federation of Rhodesia and Nyasaland. The proposal about votes—a scheme for a "fractional franchise"—has been put forward by the Tredgold Commission; it is recommended for Southern Rhodesia only, but it is clearly the prototype of a more liberal franchise for the federation. It is designed to give the Africans greater influence in elections conducted on a common roll, but insufficient voting power either to put in an all-black parliament or to dictate which of two white candidates shall get in. This is to be done by dividing the common roll into two tiers, one with high qualifications for registration, one with low. Electors on both would vote for the same candidates, but the number of votes cast by the low-qualification roll would never be allowed to exceed half the number cast on the high-qualification roll; if they did, these special votes would be proportionately scaled down between the candidates. The only way that African votes could amount to more than a third of the total would be for Africans to qualify for the high-qualification as well as the low-qualification roll. This must await the spread of wealth and education among Africans. Thus it is intended to secure a breathing space for white supremacy at the polls.

The spread of such an African propertied class could be helped by the employee share-purchase scheme now proposed by the Rhodesian Selection Trust. The firm offers to pay half of any sum invested in its ordinary shares bought by its employees (white or black) who are above a certain salary level—which would include its better-off and upgraded African mineworkers and staff. (Presumably they would agree not to resell.) It is another ingenious and forward-looking scheme, and in philosophy fits well into the Tredgold concept of gradually increasing African influence. But it is vital that neither scheme should set the qualification for African participation too high. The schemes must offer a real chance to Africans to draw level with Europeans in wealth and citizenship. If they do not, they play into the hands of the African extremists.

Mr Sukarno Plays for Time

PRESIDENT SUKARNO is apparently determined not to admit defeat. With all the Indonesian islands except Java in revolt even Dr Sastroamidjojo, who had clung so tenaciously to the premiership, resigned last week. But the president, instead of seizing the moment to attempt a settlement that would check the disintegration of Indonesia and give some hope of stable government, asked Mr Suwirjo—like Mr Sastroamidjojo, a left-wing member of the Nationalist party (PNI)—to form a government that would either include the communists or exclude both the communists and the moderate Moslem party, Masjumi. Mr Suwirjo, who is chairman of the PNI and a veteran of the revolutionary period, has refused the premiership on grounds of ill-health, but he has agreed to try to arrange a workable coalition. His task seems to be impossible unless the president will give him a free hand. The Masjumi have refused to serve

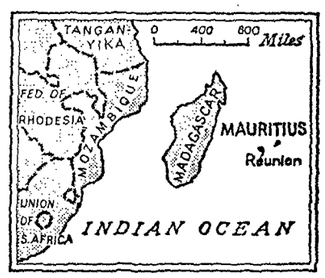
with the communists, and unless the Masjumi are included, the fourth major party, Nahdatul Ulama, will not join the government.

★

Possibly President Sukarno is merely playing for time in which to reach a settlement with the rebel military leaders. These, with the exception of Colonel Hussein, the ruler of Central Sumatra, have come to Jakarta to discuss the situation with General Nasution, the chief of staff, and to agree on what terms they will return to their allegiance. Their official spokesman is reported to have said that the army was prepared to extend its influence from matters purely military to the political field—a belated announcement in view of its activities over the past five years, but still a sinister portent for the future. It seems clear that whatever instructions the president may give Mr Suwirjo, it is the rebel army leaders who hold the key. If they succeed in agreeing among themselves on the government and constitution that they want, it is hard to see how President Sukarno can stand against them.

Young Revolutionaries in Cuba

THE comic-opera gallantry of student revolutionaries has been seriously harassing Cuba's military rulers for some months. Last week's attempt by university students to storm the presidential palace in Havana and kidnap President Batista was brutally crushed. But other youth movements have been wilier. A few months ago a former law student, Fidel Castro, sailed from Mexico with 82 companions in a private yacht and invaded the south east tip of Cuba. Although his band was almost wiped out, Señor Castro and a few survivors went to ground in the swampy jungle of Sierra Maestra near Santiago de Cuba. From there he has been directing a *maquis* operation fierce enough to keep a large part of President Batista's army busy 500 miles from Havana. As well as these spectacular gestures, revolutionaries keep Cuba in a state of unpleasant tension by bomb explosions and sabotage in the towns and by arson in the sugar fields. A tight press censorship has boomeranged on the government by producing exaggerated rumours of revolt.



The young men say that they are fighting for democracy, a new deal for Cuba, and better jobs for themselves. President Batista, though he retains the trappings of democracy, came to power by a very slick military coup before the 1952 elections, when he feared that if he fought constitutionally he might lose. Until the young men started to harass him, the President was not expected to have any trouble in holding office until the next elections at the end of 1958. Indeed, his position was strong. Backed by the Cuban army, he has the cordial support of business interests in the United States; the high price of sugar is making the island unusually prosperous; the political opposition is divided and its leaders discredited or in exile. He has even patched up the quarrel with his old enemy General Trujillo of the Dominican Republic. But the forces against him are getting stronger. Admittedly he cannot be overthrown while he has army support, but it has begun to appear possible that the army itself may decide that it would be politic to choose a more popular leader.

A Swiss System for Mauritius?

THE half-million heterogeneous people of Mauritius are edging towards self-government, and the Colonial Office is landed with the usual thankless job of trying to make the two and two of democracy and minority protection add up to a peaceful five. The island was originally a French possession, and French traditions and culture are jealously preserved by the Franco-Mauritians and Creoles. But the Indians, first imported as indentured labour, now outnumber other racial groups by two to one, and dominate the Mauritian Labour party.

The first elections with universal adult suffrage are due in August, 1958. A year ago, the Colonial Secretary proposed that voting should be by proportional representation with the single transferable vote, which would have ensured that the smaller groups were adequately represented in the Legislative Council. The Labour party, being the one really well-organised big political party in the island, was against the idea; and by boycotting the Executive Council (or cabinet) elections last September, hinted heavily at a future policy of non co-operation. As this would have been a hopeless start along the road to self-government the Colonial Secretary has revised his proposals.

Under the new proposals, Mauritians are to vote by the ordinary British method if an independent three-man commission finds that it is possible to demarcate 40 single member constituencies, so drawn as to ensure adequate representation for the minorities. If the commission finds that Mauritius cannot be split in this way—and the Colonial Office is very sceptical—the Swiss method of multi-member party list voting is to be adopted instead. This system is a fair compromise between the PR method proposed last year and the simple majority system; votes are counted both for parties and for individuals, so that an efficient minority can secure good representation. The right-wing *Parti Mauricien* has grudgingly agreed to the Swiss system. The Labour party has not yet committed itself; after its success in making the Colonial Secretary change his mind, it may be feeling a little cocksure.

Letters to the Editor

Motor Industry's Profits

SIR—Your company note last week on Ford Motor profits refers to "an industry that uses capital as heavily as motor manufacture does." The motor industry indeed uses a great deal of capital, but in relation to its turnover uses much less than most. The following figures are illuminating:

	Ford	Vauxhall	
	1955	1954	1955
Sales £000's.....	151,548	66,631	75,113
Total net assets used in operations £000's	34,632	15,609	21,431
Ratio of sales to net assets used	4.39	4.26	3.52

The capital account of both companies, and particularly that of Vauxhall at the end of 1955, included large expenditures not yet in production. It is clear that the ratio of sales to capital is much higher than in most heavy capital industries. Even if the capital used by the component suppliers is added, the ratio is still impressive.

This important characteristic of motor car production, which it shares with other mass-production industries, is not generally appreciated.—Yours faithfully,
London, S.W.1 GEORGE WANSBROUGH

Erosion of the Tax Base

SIR—One acknowledges the justice of much that was said in your two recent articles, but they contained little recognition of the powerful reverse process which, operating continuously over the past two decades, has more than counteracted this type of erosion and leaves the true tax base much more widely spread than it was immediately before the war.

I refer to the great erosion of disposable incomes caused by the operation of inflation in conjunction with wholly inadequate adjustments of the tax exemptions and allowances. In 1938-39, the minimum exemption for earnings (single personal allowance plus earned income relief) was £125; in 1956-57, it is £180. In 1938-39, the surtax exemption was £2,000; today, it is the same. If the present-day pound is worth about 6s. 8d. only in terms of 1938-39 money, then by prewar standards we now begin to pay income tax when we earn more than about 23s. weekly, and surtax when our incomes rise beyond some £670.

If prewar standards were real standards, we shall not get back to reality until the single personal allowance approaches £400 (with proportionate increases in the other allowances), and the surtax exemption rises from £2,000 to £5,000-£6,000. If adjustments of this order were made, one trembles to think what rates of income tax and surtax would be required to maintain the present yield. But it might then be realised that Government expenditure needs pruning by more than a £100 million or so.—Yours faithfullly,
London, E.C.2 J. E. TALBOT

Doctors and Their Like

SIR—In the interests of accuracy may I point out that the sum which you give as the average earnings of a general practitioner, namely, £2,222 per annum, includes the 8 per cent which the government pays towards the doctors' pension funds? I do not think that any of the figures for other salaries include a similar amount, and therefore, in order to make them comparable, about £160 should be deducted from the GP's total, bringing it to around £2,060.—Yours faithfully,
W. N. LEAK
Winsford, Cheshire

Preparatory School

SIR—In your article of March 9th you stated that schools in membership with the Incorporated Association of Preparatory Schools were not expelled immediately after their recognition as efficient by the minister had been withdrawn.

I think, therefore, I should explain that the ministry is not willing to inform the secretary of our association in the event of the minister's withdrawal of recognition from schools in our membership. The list of independent schools recognised by the ministry is published only every two years, which again is a great handicap in ensuring that all our members' schools continue to receive the minister's recognition.—Yours faithfully, R. J. S. CURTIS,
Incorporated Association
Hastings of Preparatory Schools

★

SIR—Your fair appraisal of the preparatory school will have been read with much agreement by many preparatory school headmasters. We are all concerned about the future of our schools, and we realise that only the best will survive.

By and large we ourselves know what are the best schools. We meet regularly at conferences, both local and general, and we are not slow to distinguish the better of our colleagues. Schools, however, will survive, not because they are good schools, but because they are thought to be good by the fee-paying parents. How can they decide? Here lies my only criticism of your article, which suggests that those schools are best which win the most scholarships.

I write as the headmaster of a school which does appear frequently in the scholarship lists of the Public Schools Year Book. It is not, therefore, a case of sour grapes which leads me to assert that this is but one of many criteria, and one which may well be misleading. Readers of *The Economist* will presumably relate numbers of scholarships to the size of the school: others may not. It is at least possible that some schools make a point of producing scholars to the detriment of the average boy. There are less obvious pitfalls. Schools with a good "scholarship record" tend to attract the more able boy, who might easily be equally successful elsewhere. Much depends on the geography of the school's normal catchment area, and the profession of its typical parent; a learned clientele is likely to have intelligent and academically minded children.

Payment (of salaries) by result went out of the educational system many years ago; it would be a pity if it were replaced by payment (of fees) by examination results. A public school scholar is indeed a silk purse, and we are to blame if we try to make one of unsuitable material—not if we fail to do so.—Yours faithfully, HEADMASTER

Black and White

SIR—The emphasis of the article in your issue of March 2nd was on the situation in South Africa, but its conclusions have a particular application to the Central African Federation.

The discrimination which already exists here has led the Africans to organise themselves into several distinct bodies, which are in no way united but which are seen by many Europeans as indicating, in their several ways, the desire of the African to achieve domination. Though some of these organisations have liberal leaders, others are led by men to whom compromise and conciliation mean little, and power a great deal. Their activities have caused the emergence of organised racialist groups among the Europeans, which have small representation as yet in legislatures, but will eventually appeal to the electorate on platforms of continued white authority, with small concessions. It is unfortunate, but by no means unusual, that the calibre of the absolute extremist on either side is incredibly low. The effect of this situation must be greatest on existing governments which may feel compelled, whatever the liberal nature of their personal beliefs or public programmes, to consider that to remain in power they must modify their liberalism.

It is the dedicated task of the Capricorn Africa Society to combat these tendencies now, to induce habits of co-operation and tolerance in every sphere and to create an atmosphere in which politics can be conducted on a multi-racial basis. Without the aid of demagogy, we have already achieved a great deal: liberal opinion of all races is with us and we consider ourselves to be the one means by which the "stark black and white contest" can be eased.—Yours faithfully, P. C. JACKSON
The Capricorn Africa Society

Books & Publications

Transport Control in the War

INLAND TRANSPORT: *History of the Second World War, United Kingdom Civil Series.*
By C. I. Savage.
Her Majesty's Stationery Office. 695 pages. 47s. 6d.

BY ten years' digging in Ministry files, the official historian has extracted everything that can throw light upon the development of transport policy and organisation during the war. Such a volume about the first world war would have saved us from serious misconceptions and errors. Mr Savage has arranged this immense mass of detail in a form that makes his book both a narrative of important events and a record of many minor impacts of war on ordinary life. Matters so diverse as the attempt to prohibit the carriage of cut flowers by rail and the training of women to man canal barges find their place. The scheme of the series treats coastwise shipping as part of inland transport and tankers as part of oil supply. Shipping men may regret this dictate of logic, cutting across the unity of shipping, but they will find generous recognition of the achievement of coastwise shipping.

The central theme round which Mr Savage groups his comments and arranges his narrative is the growth of a double control: over the machine of inland transport; and over a planning machinery for matching demands with resources. Before the war the Government had accepted the assurances of the railway companies that they could cope with doubled traffic in war conditions, including the diversion of shipping to the west coast ports. Individually, the ports in the west coast could receive a large influx of traffic and it was not realised that any aggregate of theoretically possible movement through ports or by rail should be heavily discounted. Everyone allowed for damage by enemy action (repaired with astonishing speed and resourcefulness by the railway engineers); but no one allowed sufficiently for the delays and congestion at junctions and in marshalling yards likely to result from changes, or (as in South Wales) reversals, of normal traffic flows.

For some time the assumption of a surplus of railway carrying capacity was accepted by the Ministry of Transport and by the Government, whose financial agreement of February 1940 with the railways was based on the supposed advantages of providing the companies with an incentive to attract traffic. The companies had indeed rejected proposals that additional facilities should be provided in anticipation of war. Experience soon began to expose this fallacy. Mr Savage is rightly critical of the continued hesitation to believe that a major war would create a shortage of transport and that, in conditions of scarcity, it was imperative to take effective control over the means of inland transport, and to plan centrally their most efficient employment. He traces in clear sequence the transition from this hesitation to the grip on the situation achieved in both respects before D-day.

The need for control was realised by the Ministry of Shipping as soon as it was formed in the late autumn of 1939, and ocean-going shipping was soon requisitioned. Moreover, that ministry regarded it as cardinal that the shipping men who operated the tonnage for them and many who remained in their own offices should feel themselves an integral part of the ministry, forming a single team with the civil servants. The railway problem was different. For many reasons the Ministry of Transport could neither get the Railway Executive Committee to regard itself as part and parcel of the department nor "sit in" effectively with the committee. Yet more was required than directives on policy. It seemed that, with only four amalgamated companies, British railways would be automatically operated as a single system, but, after fifteen months, this had not been achieved. It was not until after the merger of the Ministry of Transport with that of Shipping, and the appointment of Sir Alan Anderson in the dual capacity of Controller of Railways and Chairman of the Railway Executive Committee, that the much-needed closer relations between Government and companies were provided.

Mr Savage is puzzled at finding in the files no record of the reasons for the merger of the two Ministries. As the Editor says in his note, shipping and transport meet in the ports and the threat of congestion there led to the amalgamation. That was reason enough. But the experience of the winter of 1940 had convinced many people that shipping arrangements for overseas imports, coastal movements, control of the ports and internal distribution would be best handled in one department, under one roof and responsible to one ministerial head. Was that not the only way to ensure that the use of transport resources was looked at as one economic problem, calling not so much for high level interventions and *ad hoc* decisions to meet special crises as for centralised and comprehensive control of policy?

Space makes it impossible to refer to all the vast network of services covered by this volume. An excellent feature is its treatment of road haulage. All along the Ministry had seen the eventual need for a positive control of this industry, and the evolution of such control is an interesting study. There was a reluctance to interfere with small men or to tie up this flexible means of movement too rigidly save in the last resort. The regional transport commissioners disliked the creation of a separate operational organisation under the ministry parallel to the more general control, exercised successfully by themselves through fuel rationing, both over road passenger transport and over retail and local distribution.

Nevertheless a trial run before the real emergency came was useful in convincing the responsible section of the industry that something more would be required. Concentrating on long-distance haulage and taking selected undertakings into full control, the subsequent Road Haulage Organisation was able to operate its fleet through experienced managers and existing drivers.

Running parallel with the better organisation of transport was the growth of machinery for programming the demand for essential movements. This task was not attempted in the early days. The Railways Communications Committee, intended to deal with priorities, only met four times in the first year of the war. It was replaced early in 1941 by a Central Transport Committee, which in time was able to secure forecasts of all departmental and other important demands and to put them in relation to realistic estimates of available carrying capacity.

The book ends on a note very different from that which its author felt bound to strike at the beginning of his fair and well-balanced survey. During the years 1941 to 1945, inland transport "groaned but did not collapse." The task fulfilled by all branches in the summer of 1944 "marked the climax of all previous experience and effort of the war years. The traffic planning . . . was only possible because all branches of the transport system were now tightly controlled. These controls, together with the . . . allocation machinery, enabled the Ministry of War Transport to meet the military demands with the minimum of disorganisation to other traffic" and "withstand most successfully its greatest task."

Labour's Eastward Look

BRITISH LABOUR AND THE RUSSIAN REVOLUTION, 1917-1924.
By Stephen Richards Graubard.
Harvard University Press. London: *Oxford University Press.* 305 pages. 30s.

THE most significant event in the life of the adolescent Labour party was unquestionably the Russian Revolution. Immediately, instinctively, Labour moved to protect the new socialist state from the danger of extinction by the capitalist entente. The party—especially

the trade unionists who formed its core—fully appreciated the vast gulf that separated the British socialist parliamentarian from the Russian Marxist revolutionary; yet it never ceased its work to ensure that Russia was given the same rights as any other state. At the same time, with ruthless vigour, it acted to destroy communism at home.

The paradox of this dual policy is the thread that binds the separate sections of Mr Graubard's addition to the excellent series of Harvard Historical Monographs. Labour saw no inconsistency here. The British Communist party regarded Labour as its arch-enemy, even after the "united front" directives of the third congress of the Comintern, and no tactics were too underhand for the communists to use in their efforts to woo the working class. Further, the smear techniques of the Conservative and coalitionist opposition drove Labour to even greater lengths to keep it from being linked with communism in the public mind. In every statement, Labour repudiated the very fundamentals of Lenin's Russia.

Yet these same pronouncements, despite sharply critical reports from Labour adherents who went to Moscow, continued to stress the need for normal relations with the Soviet state. As Mr Graubard points out, Labour's initial position as a pariah in domestic politics resembled that of the Bolsheviks in the community of nations. Moreover, they faced a common enemy:

> The forces which engineered Khaki elections, and published posters with slogans of "red menace" attached to gory images, were now involved in creating and ostracizing a foreign "foe." The Labour party's adversary was also Russia's enemy; how sensible, therefore, that the party should be Russia's friend.

Mr Graubard's volume is more a series of sharply drawn sketches than a coherent whole. Those dealing with domestic politics are uniformly good. From the minutes of countless conferences and the sprawling but pitiful left-wing press, the author has assembled what is by far the best existing picture of early Labour-Communist relations. His account of the collapse of Labour's brief 1924 Government, weighed down by its recognition of the Soviets, the blown-up Campbell case, and the Zinoviev letter, is masterful. The amount of information Mr Graubard can squeeze from the 1924 election statistics alone, in his attempt to prove that the Zinoviev letter was not the political disaster it has been held to be, is as amazing as his analysis is entertaining.

But the book is disappointing because it does not fully live up to its title; in failing, it illustrates the real dangers of writing a history of one aspect of a total event. Mr Graubard skilfully summarises the influence of Russian events on the Labour party and of Labour's protest on the Government. But just as important in the complex web of Anglo-Soviet relations was the positive role Labour at times played in the actual process of policy formation, and, in turn, the effect this participation had on the party. A turning point in these relations came in January, 1920, when British pressure caused the Allied Supreme Council to end the Russian blockade and initiate trade through the Russian co-operative societies. The British co-operatives, with their close ties to the Labour movement, played a not inconsiderable part in the formation of this policy, yet Mr Graubard does not even mention these events. And when Lloyd-George appointed James O'Grady, a Labour MP and trade union official, to carry on prolonged negotiations with Litvinov for an exchange of prisoners, what effect did O'Grady's participation have on Labour thinking towards Russia? It is a pity that Mr Graubard did not find time to consult the diplomatic record; another dimension would have been added to his admirable study, and its usefulness in illuminating a too little known part of Labour's history would have been considerably increased.

Hitting Back

IN DEFENCE OF COLONIES.
By Alan Burns.
Allen and Unwin. 338 pages. 25s.

WITH most of the world using the word "colonialism" only as a term of abuse, a firm statement defending British policy in the colonies is welcome. Sir Alan Burns, who was in the Colonial Service for many years before he became Britain's permanent representative on the Trusteeship Council of the United Nations, has all the experience to write such a book. But ten years in the United Nations arena, parrying arguments, which were often not only ill-informed but malicious, seems to have made him too touchily sensitive to present a reasoned case. The barren sparring of the Trusteeship Council and Committee is reflected to a certain extent in his writing. Sir Alan carries the war into his hecklers' camp, vigorously but to little purpose. The United States and Russia are shown up as colonial powers; and the Latin Americans, who fall over themselves to dig thorns into British imperialism, are attacked for their oppressive policy towards the Indians in their own countries. Most of these points are true enough, but counselling glasshouse dwellers to stay quiet does not carry Sir Alan's case much further.

There is much interesting information in this book, but it is scattered about and often embedded in minor points that are over-documented. The briefly told story of Britain's motive for acquiring some of its colonies is fascinating: a mixture of material self-interest and the humane desire to stamp out the slave trade. The author is also good in his description of the birth pangs of self-government. His long experience in backward countries has made him cynical of the secret ballot box, so beloved by democratic countries:

> There is, however, no need to rush at once to democratic excesses and to require illiterates to cope in the first instance with the mysteries of the ballot box. They have their own methods of indirect election which, in the conditions existing in some colonial territories, are not necessarily less democratic than adult suffrage and the secret vote.

But the author's own comments are often buried under rather indiscriminate quotation. Some of these quotations have no worth except that they support his own line of argument; others bear dubious relation to present-day thinking.

The central theme of the book is the quarrel in the United Nations. Sir Alan's advice is that Britain should go on guiding its colonies towards self-government at its own pace, unbothered by the 57 nations which, according to his calculations, make up the anti-colonial block. Although Britain is under no obligation to listen to advice on the running of its colonies (as distinct from its trust territories), it has often done so in the past. Sir Alan believes that the British delegation should in future refuse to listen to comments which induce hard feelings but do no good. He describes the Trusteeship Council as "a political forum in which ideologies can be aired and propaganda broadcast." His frustration after ten years in this forum is understandable, but the same kind of sparring has weakened his case for the defence.

Struggling Giant

THE AFRICAN GIANT.
By Stuart Cloete.
Collins. 448 pages. 21s.

THE eponymous hero of Mr Cloete's book is the great body of African people who, so he had heard, were throwing off their chains. The author's search for the giant took him to those places where the links were said to be weakest, and to do this he and his wife travelled from their home in South Africa, through the Rhodesias, across the Belgian Congo to Nigeria, the Gold Coast and Liberia, and then back home via Uganda, Kenya and Tanganyika. Like John Gunther he collected innumerable facts and then wedged them into over 400 pages; but an important difference is that, whereas John Gunther looked at Africa as an outsider, Stuart Cloete comes of Boer stock and has spent most of his life inside Africa.

But he is a South African who does not seem to carry the stigma of racial hate. The fact that he made this trip through the blacker and then the blackest parts of Africa is significant in itself. But he is a South African in that he has far less fear than most American and European writers of criticising the Africans. He scoffs at them when he feels like it and he also laughs at them. He wonders why he should have to tolerate the arm of a drunken African round his neck in a bar when he would certainly not tolerate such an arm if white. He says back-handedly that he is always impressed by meeting intelligent Africans and he wonders very often into what state things are going to sink when the Africans govern themselves. "Now, as it is being handed over to the black, it will not be done" is a sentence that recurs in various forms like a theme throughout the book.

At times, for Mr Cloete has made his name as a novelist, he fondles situations; he lets the old walls of a slave market give rise to colourful imaginings and he "feels the ancient pulse" of Africa still beating. But for the most part the book is of facts, interesting, lighthearted and well observed, but rather too jerkily put together. As for the giant, the fettered African struggling to get free, it is claimed that his hands are at his own throat, that his feet trip each other up and that his brain is deranged, fevered by a dream. The African's problem, Mr Cloete concludes, is not the white man, but to learn how to get on without him.

The Juryman

TRIAL BY JURY.
By Patrick Devlin.
Stevens. 187 pages. 15s.

THIS is another book from the Hamlyn Trust, which arranges lectures on jurisprudence for the education of the lay public. It contains six lectures delivered by Sir Patrick Devlin, the High Court judge.

Sir Patrick gives the layman a good deal of information that will surprise him. It is, for example, generally thought that jurymen are drawn from a very wide range of citizens. But that is not true. The range is really narrow. It is almost a middle-class reserve, and inside the main reserve there are secondary reserves from which jurymen cannot be drawn. The list of these persons who do not serve is long. It includes MPs, sailors, clergymen, and men who have been convicted of a particular sexual crime. Some people must be exempted on more grounds than one.

Another popular belief is that juries deal always with facts, and judges only with the law. That is true only with severe qualifications. The commonest defence of the system is that twelve ordinary men and women, pooling their intelligence, are the best judges of facts. But, in truth, there are some facts that the law regards as outside the range of a jury's capacity—and on these facts the judge is supreme. The truth is that the juryman is an evolutionary freak. He has evolved from a witness on fact to a judge of fact, and the apparent contradictions in his duties mark the steps of his evolution, much as the gills of a human embryo marks mankind's.

This book is packed with learning and common sense; and the ordinary man, though he may find some of the learning a shade too subtle, will delight in the common sense. The last lecture is a beautiful piece of writing and contains one splendid sentence:

> The malady that sooner or later affects most men of a profession is that they construct a mystique that cuts them off from the common man.

Economists, historians, civil servants, clergymen, scientists—Please Note.

Campaigner

WHAT I SAID ABOUT THE PRESS.
By Randolph Churchill.
Weidenfeld and Nicolson. 112 pages. 7s. 6d.

THERE is nothing new in this booklet. It reprints three speeches made by Mr Churchill over three years ago, together with the proceedings in his successful action for libel last October against the editor of the *People* and Odhams Press, for calling him a paid party "hack." Its publication continues Mr Churchill's very personal campaign of invective against the "high pornographic content" of certain newspapers, by which he means the attention they pay to sex and crime; and against the reluctance of other newspapers to criticise the offenders by name.

It is "the handful of men who control the great national newspapers" that Mr Churchill is chiefly bombarding; and his favourite Aunt Sally, though others come under fire, is Lord Rothermere. But the publication of these reprints has since given him another target for his campaigning in W. H. Smith and Sons which, with its near-monopoly of distribution, is not handling the booklet apparently on the ground that the old speeches may now turn out to be libellous.

Books Received

INTERNATIONAL TAX AGREEMENTS: Volume VI.
United Nations, New York.
London: *Her Majesty's Stationery Office.* 269 pages. 14s.
This, the sixth volume in a series prepared by the Bureau of Economic Affairs, contains the texts of agreements concluded since June, 1953.

BASIC ACCOUNTING AND COST ACCOUNTING.
By Eugene L. Grant. *McGraw-Hill Publishing Company.* 382 pages. 45s. $6.00.

THE THEORY AND WORKING OF UNION FINANCE IN INDIA.
By R. N. Bhargava. *Allen and Unwin.* 308 pages. 30s.

INTERMEDIATE PRICE AND INCOME THEORY.
By M. M. Bober. *Bowes and Bowes.* 526 pages. 35s.

THE SOCIAL CONTRACT: *a critical study of its development. Second edition.*
By J. W. Gough. *Oxford University Press.* 267 pages. 30s.

THE FRUIT ANNUAL 1956-57: *year-book and directory of the world fruit trade.*
Edited by H. F. Tysser. *British-Continental Trade Press.* 589 pages. 20s.

THE STOCK EXCHANGE OFFICIAL YEAR BOOK, 1957: *Volume 1.*
Thomas Skinner. 1,934 pages in Volume 1. £8 for both volumes.
To maintain the balance in size between the two volumes of this invaluable book of reference, the mines section has been transferred to Volume 1 now published, leaving Volume 2, published in September, to contain only the commercial and industrial companies. The Investment Trust section, also in Volume 1, contains a table showing, where possible, the book value, valuation, and distribution of the investments of each trust.

WHO'S WHO 1957

A profitable and revealing companion in the study of public and private affairs, in the reading of the daily and weekly press, and in all business and recreational pursuits.

To rely on an out-of-date edition may prove expensive. Each entry is subject to annual revision and some 1,000 new biographies are added.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Whose Budget?

Washington, DC

THE controversy over the Budget provides a perfect illustration of why President Eisenhower is the despair of those American political theorists who believe that the country's salvation in the modern world rests with a strong executive. Of all the President's proposals to Congress, none is more completely the expression of his judgment and will than the Budget. And yet Mr Eisenhower, almost from the day he submitted it, has let Congress and the country know that he is not happy about his own spending programme and has indirectly invited Congress to reject an indeterminate and unspecified number of items in the Budget. If this seems fantastic to a European accustomed to parliamentary government, it is little less unusual for the United States. Indeed, such a thing has never happened since the federal government became a major force in the society at the beginning of the nineteen-thirties. Presidents Roosevelt and Truman would never have dreamed of making the kind of remarks that Mr Eisenhower has been making since January.

The President denies that he has "urged" Congress to cut the Budget. Yet he has said that the reason for its size is a large number of programmes approved by Congress (which, if literally true, would lay at the feet of Congress responsibility for the cold war), and that if Congress wants to reduce the Budget substantially it must decide which programmes it does not want. This is equally mystifying. With the possible exception of certain benefits for ex-servicemen, all the major spending programmes in the Budget and most of the minor ones have been specifically endorsed by the President or members of his cabinet. At no time—fortunately—has the President retreated an inch in his insistence on the spending for foreign aid, atomic energy and defence, which accounts for nearly two-thirds of the total.

Aside from Mr Eisenhower's personal awe of Congress, which has put him in two minds on the crucial question of executive leadership, the real reason for the present astonishing situation is the divided soul of "modern Republicanism." The contradictions inherent in being "liberal" in human matters and "conservative" in fiscal ones were successfully disguised during the President's first four years, but they could not be buried forever. They have burst into view in the shape of a spending estimate of $71.8 billion for the year ending in June, 1958. This is a record for peacetime. Although many of the reasons for the increase in spending have nothing to do with Mr Eisenhower's philosophy of government, conservatives who are dismayed by this huge total angrily point out that the largest increases since the Eisenhower budget low of the fiscal year 1955 have been in civil benefits, which include money spent on housing, agriculture, the development of natural resources and schools. Many conservatives have concluded in despair that under Mr Eisenhower the party is far more "modern" than "Republican" and they are undoubtedly right.

★

The results of all this become, as Alice said, curiouser and curiouser. The Chairman of the House Republican Campaign Committee, Representative Simpson, lashes out at his own President's Budget on every possible occasion. Mr Martin, the Republican leader in the House, says the people are "alarmed" by the Budget. The Democrats gleefully contributed most of the votes for the unprecedented resolution passed by the House requesting the President to indicate where cuts could best be made—an embarrassing request which he turned down. But they have found no real way of both opposing the large Budget and maintaining their treasured reputation of being the truly liberal party.

This is no problem for the conservatives in the one-party South, but for the northern Democrats who have to fight elections the situation is exceedingly awkward. Most of them, being men of considerable intellectual integrity, have simply held their peace on the Budget—the one issue on which public discontent with Mr Eisenhower is clearly manifest—and have continued to support a wide variety of programmes which would require even greater spending, such as the development of hydro-electric power in the west and aid for the nation's areas of chronic unemployment. Finally, the President's own malaise at the bitter fruits of his philosophy effectively bars him from adopting the one possible new initiative in foreign policy that is available—a major new programme of aid for the under-developed countries. He has already rejected, for this year, the proposal of his International Development Advisory Board for just such a programme.

Underlying the whole affair is a phenomenon sometimes overlooked abroad. This is the deep-rooted conservatism of American society. After listening to the National Association of Manufacturers one would conclude that socialism is right around the corner, that the people are "soft" and looking for federal handouts everywhere. The truth, on the contrary, is that the American working man is probably nearly as disturbed about the high level of spending and taxation as the Wall Street banker or the Texas tycoon.

There is no sign that those groups, such as farmers and ex-servicemen and the needy aged, who are getting benefits from the current system, want them cut off; but there should be no mistaking the pervasiveness of the discontent at the heavy taxes which are the inevitable result of piling welfare spending on top of the necessary costs of the cold war. Economists and intelligent liberals can argue until they are blue in the face that federal domestic programmes are in fact just keeping pace with the expanding national income, but this makes almost no impression on Congress or on the public at large.

EXPENDITURES AND NATIONAL INCOME
Fiscal years ($ billions)

	1955 actual	1956 actual	1957 estd.	1958 estd.
Protection (defence, mutual security, atomic energy, etc.)	42·7	42·4	42·7	45·3
Civil benefits	13·7	15·3	16·5	16·9
Interest	6·4	6·8	7·3	7·4
Administration, etc.	1·7	2·0	2·4	2·2
Total	64·6	66·5	68·9	71·8
National income	308·5	334·1	353*	
Civil benefits as % of National Income	4·4	4·6	4·7	

* Unofficial estimate.

The upshot of this topsy-turvy situation is not to be taken lightly. The actual estimate for spending in the next fiscal year, which begins in July, probably cannot be reduced much. All Congress can do is to reduce appropriations, which have only the remotest relationship to current expenditures. Most of these are either financed by appropriations passed in earlier years, or are required by law. Moreover, the reversal of the momentum of rising expenditure is an extremely difficult process. But if the actual figures of expenditure are relatively inviolable, at least in the immediate future, the programmes which have led to them are not. What many people consider to be a desperately necessary programme of federal aid for construction of schools is in serious jeopardy because of the demand for economy. Already the House has rejected a programme for extending the promising "soil bank" in agriculture to the worrisome problem of feed grains. The foreign aid appropriation—always the item that can be cut without fear of political retaliation at home—is endangered. Because the present foreign aid programme is in the nature of a "holding operation," the possibilities for reducing appropriations for it are not unlimited. But the cuts are likely to go deeper than they have gone in recent years. Even the defence appropriations, which for two years have been attacked solely on the grounds that they were not large enough and that the President had taken too many risks to save money, are no longer sacred. The air force, which feels that its deterrent power has already been endangered by economy, finds the prospect frightening. To the army it is even worse.

Nobody complained much about the Budget in the first four Eisenhower years, except to object that individual items in it were too low. Now practically everybody is complaining, except a lonely band of liberals. This sharp reversal of public sentiment is likely to achieve its major objective—a tax cut next year. But the victory may well be gained at the expense of taking serious chances with the country's security and with urgently needed development at home.

Teamsters Overturned

MR DAVE BECK, the president of the Brotherhood of Teamsters, who returned from Europe to face the music of the Senate select committee investigating "improper activities," has promised to sing—at least a little. He has voluntarily agreed, under the threat of a subpoena, to produce himself and at least some of his records for the committee. But if its questions about his personal finances and the interest-free loans of $300,000 and more which he received from the union become too embarrassing, he may plead his constitutional rights under the Fifth Amendment and refuse to answer on the grounds that he cannot be forced to incriminate himself. Such a silence would itself seem suggestive, but as a sensation it would not compare with the arrest of Mr James Hoffa, the vice president of the lorry-drivers' union who is the power behind the presidential throne and Mr Beck's heir-apparent. Mr Hoffa was arrested on charges that he gave $18,000 to a lawyer of the investigating committee to provide him with its confidential files. Unfortunately for Mr Hoffa, the lawyer, Mr Cheasty, was a former FBI man who went straight to the authorities.

With Mr Hoffa in the hands of the law, the committee has not yet been able to question him. But other witnesses have put the teamsters in a steadily worsening light. The union's chief official on the west coast seems to suffer from amnesia every time he is asked about the use of union funds, and other officers have testified, with unconscious humour, that vital financial records were destroyed "as a fire hazard." The state officials who are alleged to have conspired with certain officers of the union to protect the vice business in Portland and debauch law enforcement in Oregon have not done much better. One took refuge behind the Fifth Amendment and another refused to undergo a lie detector test.

The American Federation of Labour and Congress of Industrial Organisations cannot be sorry to see the arrogant officers of its most powerful and most trouble-making member brought low. Mr Beck insists that his rank and file will not forget the economic benefits he has brought them, but this probably is whistling in the dark; most observers think the days of Messrs Beck and Hoffa are numbered. Under new officials the teamsters may be more co-operative and less of a disruptive danger to the labour movement. But the other side of the coin is that the sight of all these rotten apples in labour's barrel may bear fruit in laws fastening harassing controls over the funds and political activities and internal running of honest and dishonest unions alike.

Steel Steels Itself

IN a month in which the seasonal trend of steel output is usually upward, the steel industry is breaking records—downward. Production last week, at 93.8 per cent of capacity, was the lowest for the year and if, as forecast, it falls to 93.5 per cent this week, output will be less than in any full working week since last August. A year ago the industry was running at over 100 per cent of capacity but

that, as steel men are comforting themselves by pointing out, is too high a rate to be efficient. Producers are steeling themselves for a further decline in output, for orders for April are disappointing. They maintain, however, that more steel is being used than is being bought; now that the supply situation is easier, customers are living off their reserves. On this theory, the industry is expecting that new orders will mount again in May, when stocks should be exhausted; some optimists even prophesy a "scramble" for supplies in that month.

In particular it is hoped that by then automobile manufacturers will be needing more steel. It is because of the decline in the demand for steel sheets, used in making cars and household appliances, that both the United States and the National Steel Corporations shut down furnaces last week—seven altogether. But the pressure on other steel products is also easing; some oil companies are reducing their orders for the steel pipe which has until now been one of the scarcest types and even structural steel is in better supply, although heavy plates are still hard to come by. Meanwhile, not all companies have as yet been affected by the decline in new orders. But the industry, and the economy in general, have just had an unpleasant, although not entirely unexpected, shock: the government's latest survey of capital spending shows that during 1957 business men plan to spend only $37.4 billion on new plant and equipment. This is an increase of less than 7 per cent over last year, compared with a rise of 22 per cent between 1955 and 1956, which was the chief force behind last year's boom. However, the survey does not bear out fears that capital spending will taper off as the year advances. It finds that about $18.5 billion is expected to be spent in the first half and $18.9 billion in the second.

Vote for a Glut

IN the House last week the farm block, an ancient bipartisan interest group, split so many ways over the Administration's emergency scheme for maize that it was unable to pass any Bill at all. Unless the Senate is able to find an acceptable compromise in the few weeks left before planting time maize, the second greatest generator of surpluses, will race into a new season free of all effective controls. By next year it may not only be the maize farmers of the Republican middle west who are suffering from overproduction and depressed prices. The contagion, with all its political overtones, may have spread to producers of livestock and dairy products.

The original request of Mr Benson, the Secretary of Agriculture, had an Alice-in-Wonderland quality: he wanted Congress to raise the permitted plantings for maize in order to reduce production. When acreage allotments are as low as they will be if Congress fails to act, farmers prefer to run the risk of going without price supports rather than conform to their allotments. If these were increased, the Administration thinks farmers would observe them; then they would qualify for price supports and could participate in the soil bank, the scheme for reducing production of certain crops by paying farmers to withdraw their land from use.

The southern Democrats who suspect that soil bank payments were rushed into the middle west last year to put out a prairie fire of discontent among Republican farmers scented more political favouritism; their Bill would have rescued the maize farmers only if Mr Benson would open the soil bank to other feed grains. These are being grown increasingly in the south and south-west as they shift from cotton and tobacco to more diversified farming.

Such an extension of agricultural subsidies would be costly in a year when all spending is under fire, and President Eisenhower threatened to veto the Democratic Bill. But the Democrats from the big cities in the north, searching for a way to economise which their constituents would approve, did the job for him. This is one more sign of the rifts in the Democratic party between north and south. If Democrat defeated Democrat, the Republicans, in their turn, fell through the cracks in the farm block when they tried to satisfy Mr Benson. Representatives of livestock and dairy interests wanted cheap grain and therefore no Bill; the Republicans' old allies in the south—once the home of non-competitive crops—refused to co-operate if there was nothing in it for them. If Congress cannot do better, Mr Benson will have little choice but to support the price of maize whether farmers comply with their acreage allotments or not. But this, too, means encouraging more surpluses just when the Administration at last seemed to be beginning to master them.

Oil in a Quandary

WITH a "we told you so" to its former critics, the Texas Railroad Commission this week reduced the output from Texas oilfields which it will allow during April by 225,000 barrels a day. The main purchasing companies had notified it that they would need less extra production next month to meet their commitments. According to the commission, Europe, after screaming its head off for more oil from Texas, has turned down the extra shipments as soon as they were offered. In time there may be some truth in this complaint, but it is still too soon for Europe to make any significant reduction in its emergency purchases of American oil. A more reasonable explanation of the reduced demand is that, because of the seasonal decline in the American consumption of fuel oil and distillates and the very large stocks of petrol in hand there, the oil companies can now supply the emergency needs of Europe without needing as much extra production from Texas as they did in March. Even when output in Texas goes down next month, America will still be producing about 400,000 more barrels of crude oil a day than it was at this time last year, while American refineries are using less than 100,000 barrels a day more.

As the supply routes from the Middle East are gradually reopened, the American domestic producers are faced with a dilemma. On the one hand, they want to ensure that American crude oil is readily available, so that the refiners on the east coast cannot plead shortages as an excuse for resuming imports from the Middle East; but, on the other, any glut in crude oil supplies might force down prices,

which recently were raised by between 25 cents and 45 cents a barrel to cover the rising costs of finding oil in the United States.

Unless the price of middle eastern oil rises as well, imported oil will have a greater price advantage over domestic production than it had before the Suez Canal was blocked. The Office of Defence Mobilisation, which has resumed its study of the need for restrictions on imports, will therefore find the pressure for controls more difficult to resist than ever. And the new Eisenhower doctrine for the Middle East, together with the need of middle eastern producers to recoup the revenues they have lost during the last few months, may make it difficult for the Administration to discriminate on strategic grounds against the Middle East and in favour of Venezuelan oil, which is being imported into the United States in larger quantities than before.

From Farm to Factory

FROM A CORRESPONDENT IN DALLAS

THE traditional wide open spaces of Texas are growing more open, reversing a long-term trend, even though the number of people in the state is rising. From the time when the Spanish conquistadores explored the pine forests and prairies, until about a generation ago, an increasingly complex lace-work of barbed-wire fences spread across Texas. By 1930, some counties in the older parts of the state had an average of less than 100 acres to each farm, although in some western counties the average ranch had more than 10,000 acres. But after 1930 the trend was reversed, with each successive census showing an increase in the average for the whole state. Since 1930, also, the number of farm people has been almost halved, although the total population of Texas has gone up by about a third. Thus in the last twenty-five years there has been a steady decline in the number of people living in the rural districts which make up about 85 per cent of the land area of Texas, while in the remaining 15 per cent of the state there has been a rapid increase in population. In 1930, only 41 per cent of the state's population lived in places with 2,500 or more inhabitants; by the time the 1950 census was taken, the state's urban population had increased to 67.3 per cent and 44 per cent of Texans were living in cities of 10,000 or more.

TEXAS FARMS

	1930	1954
Land in farms (acres)	124,707,130	145,962,287
Average size (acres)	251·7	484·4
Number of farms	495,489	292,946
Farms with tractors	37,348	174,040
People on farms	2,342,553	1,265,000 (estimate)
Percentage of people in state in rural areas	59	33

There have been similar changes in a number of other farming states, notably in the south and west, but probably nowhere have they been so marked as in Texas. This is because from the time of the Civil War in the eighteen-sixties until the early part of the present century the state developed in a way which led to agricultural instability. Planters streamed out from the Old South on to the plains of Texas to find themselves in an entirely new agricultural environment; but since they knew how to grow cotton, they planted cotton. To begin with the virgin soils, often of medium or shallow depth above their subsoils, produced good crops, encouraging the planting of more cotton. The cattle ranges and the big ranches retreated before the onslaught of the man with a hoe—and much of the top soil disappeared soon after he arrived.

The prairies were better adapted to mechanisation than the timbered lands of the Old South, and this hastened the soil erosion that came with hurried cultivation. In 1955, it was estimated that about a third, 11 million acres, of the cultivated lands in Texas had been badly damaged, and that another 50 million acres, largely livestock range, had lost as much as 25 per cent of its topsoil from over-grazing. Today, however, over half the farms in Texas are engaged in co-ordinated soil, water and plant conservation programmes, with the help of both the state and the federal government.

But the migration to the cities has come only partly because of soil erosion. There is still enough good soil to keep the farmer in the country if, at the other end of the road, there were not the attraction provided by the recent development of industry in Texas. Between 1939 and 1954, the number of Texans employed in manufacturing industry increased from 163,978 to 414,113; this increase roughly equals the number of adult workers who left the farms during the same period. Of course, the movement was not always a direct one; some of the new factory workers came from other states, and from the natural increase in the population; some of the farm families moved to the booming Pacific coast. But, by and large, it can be said that the change was one of Texan farm tenant into Texan factory worker.

★

The economic and political effects of this shift have been marked in both town and country. In the rural areas social conditions have improved greatly. Family incomes have risen as the number of tenants has declined and as the amount of land actually owned and worked by the farmer himself has gone up. Equally, the standard of living of the tenant farmers who are now industrial workers in the cities has shown a healthy improvement. Politically, the great shift in population has made the rural areas more conservative. There has been no change in sentiment among those remaining on the farms, but many of the more progressive have been drained away. After the agrarian Populist movement in Texas in the latter part of the last century, the tenant farmers were the principal radical element in the state, while the farm owners tended to be reactionary. However, because of the decline in the total number of voters in rural areas, this increase in conservative strength there has not meant that it has increased in the state as a whole. But the effect has been felt in the State Legislature, whose members are, in a high proportion of cases, elected from predominantly rural districts.

The trade unions have taken full advantage of the situation by organising the migrating farmers almost as rapidly as they have entered urban industry, especially in the huge aircraft factories. These are largely assembly plants, more suitable for the untrained farm worker than are more highly specialised types of industry. The trade union leaders are liberal in their political outlook, while the business community is conservative. These conservatives, organised in chambers of commerce and similar groups,

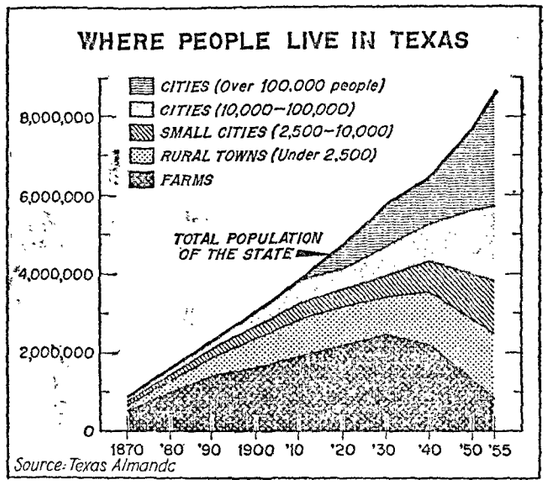
Nuclear power
for the nation's future



AN EXAMPLE of industry pooling its resources to prepare for a mighty project is the linking of the A.E.I.—John Thompson Nuclear Energy Company with two important firms of Civil Engineering Contractors—Balfour, Beatty and Co. Ltd. and John Laing and Son Ltd.

To the strength of the A.E.I.—John Thompson Nuclear Energy Company and its constituents (British Thomson-Houston, Metropolitan-Vickers and John Thompson) is added a fund of knowledge in the civil engineering field.

The Balfour Beatty Group has a world-wide reputation in all forms of engineering and construction work and is at present carrying out major contracts for the Central Electricity Authority. John Laing and Son Ltd. has carried out building and civil engineering work at the first Government Atomic Energy Establishment at Windscale and is at present engaged in the construction of power stations in the United Kingdom, as well as in major development schemes in Canada.

RADBROKE HALL · KNUTSFORD · CHESHIRE

are themselves largely responsible for their present political difficulties; long urging industrial expansion in order that the potential prosperity of the state might be developed, they have now got their industrialisation—but with it has come organised labour.

The trade unions are still far from being strong enough to control Texas at the polls, but they can be very effective within the Democratic party at local levels. In past elections they have sometimes found themselves on the same side as rural voters, many of whom still have progressive instincts left. There is no reason why such a coalition should not sooner or later capture the state. Meanwhile, the middle-of-the-road voter holds the balance of power. The confusion which all this brings to Texas politics, where the one party system resulting from the perennial Democratic dominance is just beginning to be challenged by the Republicans, was demonstrated last summer by the complicated manoeuvres over the appointment of the state's delegation to the Democratic national convention at Chicago and over the nomination of a Democratic candidate for Governor. The winner was Senator Price Daniel, and the campaign to elect a new Senator to succeed him in Washington is now providing an even more striking demonstration of political confusion.

★

There are about twenty Democratic candidates in the field since, in this type of election, there is no provision for a preliminary round to knock out the intraparty contenders; an attempt to amend the law so that there would have to be a second poll if no candidate had a clear majority has apparently been defeated in the State Legislature. Only a few of these Democrats are taking this free-for-all seriously, but among them are several from each wing of the party, including Mr Ralph Yarborough, an experienced liberal campaigner, popular with labour, who nearly won the Governorship last year, and Representative Martin Dies, a rabid anti-Communist, who has wealthy conservative backing. Mr Dies and the other right-wing Democrats among the candidates will take away from Mr Thad Hutcheson, the lone Republican, the conservative Democratic support which helped to give the state to Mr Eisenhower in the last two presidential elections. Nevertheless, there is still a chance that the Democratic vote will be so splintered that Mr Hutcheson will win on April 2nd. If he does, there will be 48 Republicans in the Senate in Washington, instead of 47 as at present, 48 Democrats instead of 49, and the Republican Vice-President will have the casting vote. This would enable the Republicans to take over control from the Democrats, so it is not surprising that this contest in Texas is being watched by the whole country.

Shield Against Sickness

FROM A SPECIAL CORRESPONDENT

VOLUNTARY health insurance has been the medical success story of this generation. Since 1939, the number of people voluntarily insured against hospital costs has risen from 5 million to over 110 million, those insured for surgical treatment from 2½ million to over 90 million, and those with general medical coverage from 1 million to over 55 million. The population grew during this period by about 23 per cent to 166 million, but even so these are phenomenal figures. The increase in insurance against ill-health is due largely to three factors: the acceptance since the war of health insurance as a proper subject for collective bargaining between employers and trade unions; the deep fear of state-controlled insurance felt by the medical profession and the insurance companies; and the simple need of families to protect themselves against the high costs of sickness in the United States.

About a quarter of all privately insured persons are covered by individual or family insurance policies. These, however, usually provide only limited cash benefits under strict conditions. They have been far outdistanced in sales by group insurance plans, which are sold to employers, trade unions, trade associations and community organisations of various kinds acting as agents for groups of individuals or families. Because they insure on a group basis, allowing the "poor risks" to be offset in any average group by the "good risks," group plans cost less, provide more protection and impose fewer restrictions than do individual and single-family plans. Group plans, however, take a variety of forms. Some offer cash benefits, the patient paying the difference between what he receives and the actual charge. Others undertake to provide certain services to the subscriber at no charge apart from his regular premiums. Many plans incorporate both features.

Most of the service benefit plans are offered by two non-profit organisations, Blue Cross and Blue Shield. Blue Cross, which is a creation of the American Hospital Association, specialises in providing bed, board and certain services for subscribers while they are in hospital. Blue Shield is a network of non-profit corporations sponsored by state and local medical societies, offering protection against the cost of medical and surgical care; it is met in full for specific kinds of treatment if the subscriber's income falls below a certain level, and if his doctor has agreed to be satisfied with the Blue Shield scale of fees. Otherwise, the subscriber must pay the doctor the difference. In most states combined Blue Cross-Blue Shield plans are sold as a "package."

These schemes are all based on a strong tradition: the individual practice of medicine. However, a minor but important type of service benefit plan is linked with group practice in medical centres. These centres, sponsored by lay or medical groups or combinations of both, provide relatively comprehensive care to about 5 million people. Unfortunately, the centres are losing ground because of the opposition of the medical profession, which argues that linking insurance with group practice impairs the relationship between doctor and patient, encourages abuses and lowers the quality of medical care. There is little evidence that it does. In fact, a number of highly reputable surveys suggest that group practice centres provide not only more comprehensive but frequently better care, because of the pooling of manpower, experience and resources.

★

The hostility to group practice schemes is regrettable since most other health insurance plans suffer from substantial drawbacks. Many occupational groups—such as farm labourers, the self-employed, domestic servants and employees of very small firms—are virtually excluded from group insurance, and usually find that the individual policies available to them cost too much and lay down too many conditions to provide adequate protection. The exclusions and limitations of group plans are also numerous and often severe. Many come to an end when the subscriber retires, transfers to another industry, or is out of work. The dependents of the breadwinner are frequently only very sketchily covered. For certain kinds of care—dentistry, preventive medicine, psychiatric treatment, eye care, drugs, appliances and chronic diseases—there is little or no provision.

The greatest failing of most private plans, however, is their inability to meet the full costs of "covered" treatment. Fixed scales of compensation, time limits on benefits, "co-insurance" provisions requiring the patient to pay a percentage of the bill, "deductible" clauses prohibiting benefits for initial or low-cost treatment, together with constantly rising medical costs, impose a heavy burden on the average family. The proportion of the total individual medical bill met by voluntary health insurance varies widely, of course, with the type of policy taken out. Including, however, those not insured at all, voluntary health insurance still meets less than a quarter of the privately paid health bill of over 10 billion dollars a year.

Nevertheless, there is little agitation for a broader shield against the costs of ill-health, which so daunt visitors to America. Sickness, after all, is not evenly distributed, and most families manage to weather the storm. Also, the insuring agencies are constantly broadening their coverage, increasing benefits, and providing such special services as "catastrophe" insurance to meet part of the costs of major illnesses. This, together with the extensive public provision for workmen's compensation, for public health services, and for ex-servicemen, has been enough to prevent any great demand for radical change.

The real alternative, of course, is government insurance. But the onslaught of the American Medical Association on President Truman's proposal for national health insurance in 1949 was so ferocious and so effective that hardly anyone has seriously discussed the matter since. The main exception is organised labour. The American Federation of Labour and Congress of Industrial Organisations is committed to compulsory health insurance. But, despite the stand of the national federation, many individual unions are indifferent—to say the least—to the nationalisation of a service which they themselves provide, however imperfectly, for their members through collective bargaining.

Bills to create a system of natio... been placed before Congress this year, past, but this is only keeping the flag flying. ... is the indifference of the public that not even Eisenhower could persuade Congress in 1954 to pa... extremely mild proposal to create a Federal Hea... Reinsurance Service to "encourage private and non-profit health insurance organisations to offer broader health protection to more families." A proposal by Mr Stevenson during the recent campaign to offer federal aid to states wishing to supplement voluntary health insurance caused hardly a ripple. Public health insurance may be a good idea, but the vast majority of Americans seem neither sick enough nor—while prosperity lasts—poor enough to care. The vulnerability of all mortals to sudden illness may be a most familiar fact. But, as the election of President Eisenhower showed, a remarkable number of Americans are prepared to gamble with health.

Measuring the Market

SHEPHERDED by attractive girl guides, visitors to the New York Stock Exchange may now see, on an animated board, how shares are bought and sold, watch a free film show in colour to learn how to invest their money, and even have their names inscribed on ticker tape to drop on someone at the next Broadway parade. For those who think they know all of these things already there is another development: a new index of share price movements on the New York Stock Exchange prepared by Standard and Poor's.

The new index, which is calculated by electronic computer, is published every hour when the Exchange is open for trading. The first hourly—or even daily—index to include more than a small, and inevitably biased, sample of the stocks dealt in on the Exchange, it records the average price movements of 500 separate stocks, which together make up nearly 90 per cent of the total value of all the ordinary shares listed. As in earlier Standard and Poor's indexes, each company included is weighted according to the number of shares it has issued, and the pitfalls caused by stock splits are thus deftly avoided. For those who like to think in dollars, the new index has been so constructed that a movement of a single point is, very roughly, equivalent to a change of a dollar in the price of the average share. If the index rises or falls by a single point it represents a rise or fall of over $4 billion in the aggregate value—now just over $200 billion—of the ordinary shares listed on the Exchange.

Because of its comprehensiveness, the speed with which it is published, and its freedom from the absurd statistical anomalies still contained in the market averages prepared by Dow Jones and Company and by other experts, the new Standard and Poor's index should quickly earn a reputation of being, for most purposes, the most useful market indicator. Its victory would be complete if the management of the New York Stock Exchange, which has hitherto indirectly pointed out the deceptiveness of many of the most popular indicators by refusing to sanction any of them, were now prepared to accord the new index official recognition.

The World Overseas

France's Choice in Algeria

FROM OUR PARIS CORRESPONDENT

EVERY few months there is, as now, a "renewal of contract" between M. Mollet and the Assembly. The motive is always Algeria, the ritual always the same. First, newspapers hint that because UNO will soon meet or has just met (or for whatever other reason), France must redefine its policy. New departures are necessary, and M. Mollet means them to be spectacular. Then the cabinet meets, and M. Lacoste, coming post-haste from Algiers, explains that Colonel Nasser must be beaten first, or that war-weary villages have recently sought official protection, or that the army command believes that three months more will tip the balance. Reports circulate that the cabinet is deeply impressed by these statements, though one minister and two under-secretaries demur. M. Mollet, it turns out, agrees with M. Lacoste, and will make a new and important offer to the rebels. The Assembly, despite individual—and mutually contradictory—doubts, endorses this. M. Mollet then makes significant, but minor, glosses on his previous statements, to which the rebels do not respond. And policy marks time until the next "renewal of contract," hastened by left-wing journalists' reports of repression, and by party leaders' appeals for "new steps" in Algeria.

This week's "renewal" follows the party truce during the UN Assembly debate. A lead is more urgent than usual, because American help saved the day in the United Nations and will, no doubt, be needed again if France is to surmount its balance of payments troubles. America clearly expected the "liberal" solutions that M. Mollet has promised in Algeria, and so do a growing number of politically minded Frenchmen. Unfortunately, M. Mollet's recent consultations with the party leaders have again shown that, short of accepting rebel terms, liberal solutions are more easily preached than practised. The many plans (especially federal ones) recently proposed for an autonomous Algeria, like M. Mollet's policy itself, skip the question of Moslem assent. A few leaders do suggest ways of renewing contact with the Moslems—M. Mendès-France by spectacular pledges, M. Pleven by a round table conference—which assume they can be weaned from the rebels. The present signs are contrary. The pathetic letter of fifty French Moslem officers to the President of the Republic shows how even their loyalties are desperately divided. To turn the difficulty, M. Soustelle, the Gaullist ex-governor of Algeria, suggested that the government should immediately begin to create its autonomous Algerian republic without awaiting a cease-fire. The fate of the municipal reform, much publicised but hardly broached, shows how impractical this is. Moslem councillors would be sure targets for assassination if the government were to nominate them. As for an election, no candidates will be found so long as the rebels withhold their co-operation.

There seems to be no way now, if there ever was one, of setting the rebels aside. This makes it harder to avert the clear-cut choice which the government's critics always feared M. Lacoste's one-sided "pacification" of Moslems would make inevitable: either the rebels give up their "right to independence" or the French recognise it. French opinion is not resigned to this option. This is perhaps why speakers in this week's debate have been more precise on side-issues than on Algeria. Well-intentioned members of the MRP press constitutional reform on the government in order to strengthen ministerial stability; the conservatives attack it on inflation, disowning the consequences of the North African policies which they have themselves encouraged.

There are, however, signs that the very strains of the struggle may be tiring both French and rebel attitudes. In Algeria the French army seems to have hit the rebels hard. First it drove them from operations in the open country to urban terrorism; now it has punched holes in their organisation in Algiers. Whether this really undermines the rebellion, whose indefinite leadership has always been a political curse but a military strength, is not clear. It also seems that the Sultan of Morocco and M. Bourguiba are again, as before the capture of the Cairo leaders last October, counselling moderation to the rebels.

In France the moral strain is telling on Christian opinion and on the Left, while the economic strain is affecting the Right: witness M. Reynaud's new maxim that "the financial question dominates all others, including Algeria." The French will probably not be prepared to throw prosperity to the Algerian winds. On the other side, charges of blindness in the army's repression of the rebels and of police tortures are multiplying. The Catholic hierarchy has insisted that the best cause does not justify intrinsically evil means. The government's stupid attempts to suppress criticism mainly serve the critics.

All this gives the impression that, despite disappearing hopes of circumventing the rebels, very slowly things must move towards a loosening of the present implacable deadlock. In immediate parliamentary terms, the effect is that M. Mollet, though still irreplaceable, no longer holds his former sway over the deputies. His majority will probably be reduced in the vote that ends the debate.

King Saud's Finances

FROM OUR SPECIAL CORRESPONDENT
LATELY IN RIYADH

KING SAUD may go down in Arabian history as Saud, "the Masterbuilder." The population of his capital, Riyadh, already exceeds 250,000, having quintupled itself in ten years. The crooked lanes winding through mud-brick walls have gone; in their place are broad boulevards and handsome dual carriageways, along which the King travels from palace to palace, escorted by motor-cycles, jeeps and staff cars, gleaming bright in their pillar-box red coatings. Most of the palm groves that used to grace the city have gone, and the steady drone of the donkey-wells that watered them, recalling the singing ox-carts of the Douro valley, has given way to the blare of motor-horns and the phut-phut of mechanical pumps.

Concrete is springing up where the palms once grew—taking shape as schools, hospitals, hotels, ministries and palaces. The problem is how to staff them. The crown and glory of them all is the new Nasiriyeh palace, into which the King hopes to move any day. It is a vast complex of pink cement buildings, hinting here at Granada, there at the Riviera, set in gardens and tamarisk groves against a desert background. It is a £10 million project, started on the foundations of a comparatively new £4 million palace that was demolished to make room for it. Responsibility for its construction lies with the director-general of public works, a brilliant arithmetician from the Hadhramaut who can neither read nor write. But the King himself supervises the work in minute detail.

Ruthless elimination of the past, with its memories of poverty and struggle, is not confined to Riyadh. The new world is thrusting in at the seaport of Dammam with its fabulous jetty, in the great oasis of Al Kharj and in the western cities of Mecca, Medina, Jidda and Taif. Yet the rate of construction, breakneck as it is, cannot keep pace with the demand. Building sites in the centre of Riyadh are changing hands at £5,000 a square metre.

It is difficult to write with precision about Saudi finances. The financial year runs from August to August, yet the budget for the current year is still under consideration. Provisional estimates, worked out before the attack on Egypt, put the figures for revenue and expenditure at about £150 million, against £120 million in the last published budget—that of 1954-55. But the dislocation of the oil industry brought about by the closure of the Bahrain pipeline and of the Suez Canal has raised doubts about the revenue figure.

Before the attack on Egypt, Saudi Arabian oil production was running at the rate of about 135,000 tons daily. About 16 per cent (some 22,000 tons) was piped into Bahrain, about a quarter (some 34,000 tons) passed through the Suez Canal, another quarter was shipped from Ras Tanura by other routes, while the remaining 34 per cent (some 45,000 tons) was piped through the TAPline to Sidon. The closing of the Bahrain pipeline meant a 16 per cent loss to the Saudi treasury for a period of about four and a half months. The loss due to the blocking of the canal is more difficult to assess. Part of the oil formerly passing through the canal found other outlets—in the Far East, for instance—so the fall in revenue was somewhat less than 25 per cent. On the other hand, it will be some time before the canal is open to normal traffic. It seems reasonable to expect that the closure of the canal will mean a loss of oil production averaging between 20 and 25 per cent for about six months. If that is correct, the estimate made by Shaikh Muhammad Surur, the Saudi minister of finance—that oil revenue for the whole year will be down by 20 per cent—seems a fairly safe one.

On that estimate, oil revenue for the current year will come to about £75 million, as against about £90 million. The other principal sources of revenue are income tax and customs duties, which are expected to yield about £20 million and £10 million respectively. (The Saudi government abolished this year all duties on imported foodstuffs.) It is clear that miscellaneous items of revenue, such as licences and fees, will not suffice to cover the budget deficit. Nevertheless, the Saudi government has decided not to reduce its expenditure for the year as a result of the Suez crisis. Instead, some £20 million will be drawn from the general reserve to meet the gap between revenue and expenditure. This is not the first time that the Saudi government has resorted to deficit financing; the year 1954-55 also saw a figure of nearly £20 million drawn from the general reserve. The government is confident that the steady rise in the world demand for oil will enable it to pay its way.

There is no reason to suppose that Saudi oil output will be slow to get back to the pre-crisis rate of 135,000 tons a day. Output fell to 87,000 tons in January, but rose again to 95,000 tons in February. Estimates made before the decision to reopen the Bahrain pipeline put the figure for March at about the same level as February; but the resumption of the flow to Bahrain will almost certainly bring it above the 100,000 mark. Where the oil will go is another matter. Aramco officials are wary of predicting the future shape of the trade, though it is thought in Dhahran that it is unlikely to go back to its pre-crisis pattern. Supply lines and markets are notoriously sensitive to change, and it may well be that the dislocation of the past few months will impose new trading habits. But there is no suggestion that output will stand still, far less that it will fall.

About a third of the estimated annual expenditure of £150 million is earmarked for the defence forces. These include not only the khaki-clad regular army, but also the *Jihad*, the irregular levies that still wear traditional costume and look remarkably fierce; they certainly stole the show when King Saud returned from the United States. About a fifth of the total is being spent on development projects, including such items as roads, schools, hospitals, the extension of wireless communications and water supply, the construction of the new broadcasting station near Riyadh, and the enlargement of the great mosque at Mecca. Owing to the general financial situation, the project for extending the Dammam-Riyadh railway via Anaiza and Medina to Jidda on the Red Sea coast has been held over until next year. The extension is expected to cost at least $140 million.

Other major items of expenditure for the current year

include nearly £10 million for public security, nearly £7 million for educational expenses (excluding the construction of new schools, which comes under the heading of "development projects"), nearly £5 million for the health services (again excluding the construction of hospitals and clinics), and, in addition, about £10 million set aside for unforeseen charges. The expense of keeping up the Royal Household must also account for a large sum, having regard to the dignity and state that surrounds the persons of the King and his family. With all this expenditure to finance, the Saudis have greeted the Israeli withdrawal behind the armistice lines, and the return to a normal flow of oil which it foreshadows, with relief.

Vacuum in the Philippines

THE tragic death of the president of the Philippines, Mr Magsaysay, in an aeroplane crash, has left a political vacuum which will be hard to fill. Personality is the dominant force in Filipino politics and the death of any important politician would have involved a political general post. But Mr Magsaysay was more than an important politician; he was, in the eyes of the Filipino peasants, a champion and a saviour. It was he who destroyed the threat of the communist terrorists, who made a bull-headed onslaught against corruption, and who constantly travelled through remote villages listening to grievances and promising reforms. Mr Magsaysay's political opponents complained that his methods of dealing with accused officials were too rough for justice, that he devoted to vote-catching operations money which would have been better spent on less spectacular projects, and that while he was touring the remote islands administration was neglected. Nevertheless it was generally admitted that the president's position was unassailable and his re-election a foregone conclusion.

Now the winner is anybody's guess. The political parties are groups of cliques divided by personal ambitions and, less definitely, by economic interests. Although the vice-president, Mr Garcia, who has become president until the end of Mr Magsaysay's term of office next autumn, will be in a good position to make useful friends and build up his popularity, he will have some powerful rivals inside the *Nacionalista* party. The most influential of these is Senator Laurel, an elder statesman who has been ostentatiously yearning for directorships and the joys of retirement but is now expected to take his last chance of running for the presidency. Mr Laurel would have a considerable chance of success, not only because of his political influence but also because he enjoys a high reputation with the army; and that, in a country where the army supervises the polls, is a matter of major importance. Another competitor is Senator Recto, a lawyer of great ability who had already undertaken the hopeless task of running against Mr Magsaysay and who has some influential backers amongst business men and industrialists dissatisfied with the former president's economic policy; his chances of success seem to be greatly improved.

One major unknown factor is the attitude of the Americans. Mr Magsaysay, with his anti-communist and anti-corruption drive, enjoyed American approval, and he had American financial backing when he first ran against the shamelessly corrupt administration of Mr Quirino in 1953. But the present president, Mr Garcia, is one of the many Filipino politicians who resent the stranglehold which America still has over the economic—and to some extent the political—life of its ex-colony. If he is elected this autumn he is likely to do what he can to reduce American influence. Senator Recto, who was imprisoned by the Americans for collaborating with the Japanese, is even more outspoken. He and his associates believe that the $550 million of Japanese reparations is inadequate and that the Americans, anxious to have Japan as a strong ally in the Pacific, forced the Filipinos to accept this sum. They feel that Philippine trade is too firmly tied to American business interests, and they seem prepared to blow up the problem of the future of the American bases into a popular issue in order to foment national feeling. But, as in Japan, whoever eventually wins power is likely to find that whether he likes it or not, the United States must remain the main source of trade, aid and technical assistance.

Mr Magsaysay's death will probably mean that Philippine plans for economic development are again thrown into the melting pot. The clash of economic interests and the differing views of economic experts have hitherto made it impossible to get long-term development started. Just before his death the president outlined a five-year plan to Congress and emphasised the soberly realistic spirit in which it had been drawn up. But although arithmetically tidy, the plan at best seemed to have only a card-castle stability and it might have set the Philippines off on a dizzy inflationary spiral.

Progress, economic and political, which looked like being slow for some time to come, will probably be reduced to a crawl by Mr Magsaysay's death. The war spoilt the Americans' scheme for training administrators over a period of qualified independence and the Filipinos are having to learn democracy and administration by trial and error. Corruption, although negligible compared to what it was under the Quirino regime, is still serious, and although the press is no longer kept in order by government control of newsprint there is scarcely a paper or a journalist not in the pay of some political or economic faction. The parties are, as yet, only a collection of personal cliques and the army, which had been revitalised by Mr Magsaysay and was devoted to him, may prove a powerful political force. But the Philippine islands are not overcrowded, they have great natural resources and the Filipinos have a relatively high standard of living and education. They should be able to surmount the crisis caused by their president's sudden death, shake up their political kaleidoscope into a new pattern, and return to the attack on their economic and administrative difficulties.

Opportunity for Sierra Leone

FROM A CORRESPONDENT IN FREETOWN

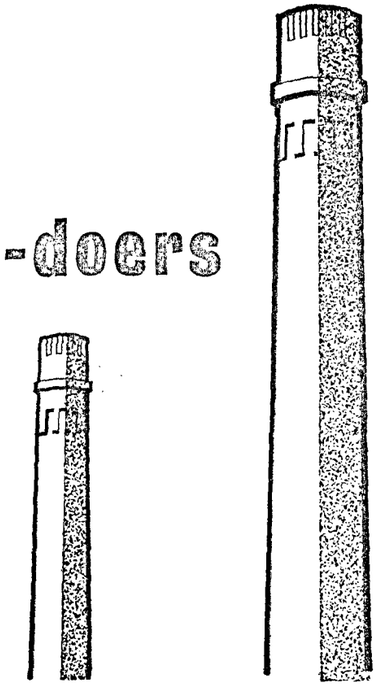
SIERRA LEONE is approaching its first general elections in which a majority of the members of the new House of Representatives will be elected by the direct vote of the people, instead of by district councils and similar bodies. Polling day is expected to be at the end of April, and already political meetings are getting noisier and more crowded, the first party manifesto has been published, and the immense task of registering a largely illiterate population

but no scare beetle . . .

There are primroses in the hedge bottom. Cuckoo pint. Young leaf. A growing forest of fresh grasses. *And flea beetles.* Flea beetles by the million; a hungry horde unscareable and unseen, but active in the welcome April warmth, voracious after winter hibernation, moving steadily out into the rich pastures of the turnip field. Soon, when it is too late, the farmer will see—and roundly curse—the signs of their feeding.

For by the time flea beetle attack is obvious, damage to a brassica crop is frequently too extensive for the crop to be saved and the farmer must re-sow. In a bad spring—before modern methods of control were discovered—a farmer might re-sow cabbage, kale, turnips, swedes, broccoli or other brassicas three or four times; and the later the sowing, the lighter the crop.

Today a highly efficient Shell insecticide, dieldrin, is saving such crops in all parts of Britain. Applied in the form of a seed-dressing known as Dieldrex B which combines a fungicide to counteract "damping off", this powerful preventive is at once easy to use and economical *in* use. At a sowing rate of 4 lb. of seed per acre, *only 3 ounces of seed-dressing protects that acre completely at a cost of just over 7/-.* A very worthwhile saving, compared with conventional spraying or dusting *after* attack, with minimum material costs of 10/- an acre plus time, trouble and tractor. And even then, the possibility of total loss.



dieldrin

DIELDRIN, ENDRIN AND ALDRIN ARE SHELL INSECTICIDES FOR WORLD-WIDE USE

The evil-doers

in power station chimney gases are oxides of sulphur from coal combustion. These react with moisture in the air to form sulphuric acid, which wreaks costly damage to buildings and property and gives city fogs their throat-stinging quality. The Fulham-Simon-Carves flue gas washing process removes 90 to 95 per cent of the sulphur and is the only known process that contributes to its own cost by recovering saleable sulphur and ammonium sulphate. An experimental plant on a semi-commercial scale has now been built at North Wilford power station, and first results are awaited with cautious optimism.

Fractional Horsepower MOTORS

BTH fractional horsepower motors are second to none in quality and proved performance. All types are available in sizes to meet every domestic, commercial, and industrial need. Precision-built of highest grade components, and fully tested, they will give long and trouble-free service.
No manufacturer can offer a wider choice in fractional horsepower motors. Whatever the conditions of service or type of drive, there is a BTH motor well suited to the job.

Pyrene TRADE MARK

AN INVESTMENT IN PEACE OF MIND

and checking individual voting qualifications has been nearly completed.

The importance of the election is not merely that it is the first worthy of the name. It will bring into being a House of Representatives of fifty-seven members which will, in effect, determine the length of the next constitutional step. Constitutional progress has been slow in Sierra Leone, and even the advance which has made possible this election was long delayed by the inability of political leaders to agree on the allocation of seats in the new House between colony and protectorate (the small area round the Freetown peninsula is administered as a colony; the rest of Sierra Leone is a protectorate). The leaders of the Creole party, the National Council for Sierra Leone, having nailed their flag to the mast of Creole domination, must now be prepared to sink with it, for the colony area, in which the Creoles are strongest, and which formerly had seven seats against the protectorate's 14, now is to have 14 out of 38 contested seats; and in any event, the Creole voting strength in the colony, too, is declining.

The task of opposing the well-established Sierra Leone People's party must fall on the more recently formed United People's party, which, making plenty of noise and spending plenty of money, should win more seats than the National Council. But it lacks a well-defined policy and is tarred by its slightly shady connections with last year's disturbances in the protectorate. It was from the SLP party that the six African ministers were chosen in 1953, and with the wise leadership of Dr M. A. S. Margai and plenty of backing in both colony and protectorate, it is likely to win the elections and conduct the country safely towards self-government.

Two Chiefs in Trouble

If his party gets its expected overwhelming majority, Dr Margai may hope to be soon promoted from chief minister to prime minister, and his colleagues may expect to be given a further share of the responsibility for the considerable developments which are taking place in the country. Their opponents will certainly load them with this responsibility if things go wrong. Nobody believes that they have any under the present interim constitution which reserves considerable power to the governor—although the previous governor did all he could, and perhaps too much, to hasten the transfer of power. If it were believed that the SLP was responsible for all that has gone wrong in the last two years, it could hardly hope for victory now. But party politics in Sierra Leone are at present well protected from hard political and economic facts. The SLP leaders have demonstrated their impartiality in tribal rivalries by requiring the resignation from office of two important paramount chiefs who were in the government and who were accused of "unbecoming" behaviour in the unrest last year.

Most of these troubles are now happily past, although it remains to be seen how much the evil of them will live on. Labour relations are mostly good; extortion in the protectorate will henceforth be much more difficult to practise (though the voluntary offering of bribes is another matter); and the enforced departure of some 30,000 "strangers" from the mining areas has helped to dry up the outward flow of illicitly mined diamonds at source. This last measure was taken none too soon, for the loss to the country through diamond smuggling last year is put at £6 million—and this in a country whose total exports in 1955 were worth only a little more than £10 million.

The big question mark is rice production. The country should be able to grow all it needs, and have plenty left over to export. Instead it imports heavily, in spite of real efforts to increase production by swamp cultivation and planting with selected seed. But why should a man slave away in a swamp growing rice when he can make his fortune picking up diamonds? The answer is, of course, that smuggled diamonds do not pay for new schools, more qualified teachers, new hospitals, new roads and bridges, all of which are desperately needed. The country has the mineral resources and the agricultural potential to provide all these things. What it lacks is human resources.

Kenya Africans at the Poll

FROM A CORRESPONDENT IN EAST AFRICA

THE result of the Kenya African elections has been the rejection of the government's nominated members and the arrival of a mildly nationalist group in the Legislature; but it is a group that is already threatening to overturn the Lyttelton constitution by refusing to take office unless promises are made about a considerable increase in African representation before long. The Lyttelton settlement was based upon a proper balance between all three races, and the refusal of the Africans to join will, besides filling the Europeans with suspicions, probably complicate relations between Europeans and Asians in the Council of Ministers. Thus from the outset elected Africans, with a direct mandate from the people (however it is interpreted) have shown their new power.

As yet, however, they speak only for a minority of the Africans. Out of 400,000 to 450,000 Africans who were, under the Coutts franchise, supposed to be eligible to vote, the administrative net succeeded in hauling in only 125,000 for the registries. Registration varies from area to area with the drive and efficiency of the individual district commissioner on whose shoulders, of course, the whole business devolved. Some were not over-enthusiastic; but bearing in mind the load thrown at the time on the district commissioners by the preparations for the tour of Princess Margaret, to secure about a third of the potential electorate was not discreditable. The Africans were suspicious; there were the inevitable rumours that registration forms would be used to increase taxes or draft Africans to fight Egypt, or to put through unpopular land consolidation measures. After an elaborate public relations campaign, registration picked up towards the end and if there had been another fortnight, the number of registrations might have doubled: at the next election there will be many more voters even on the present franchise.

Once registered, a creditably high proportion of voters voted—something like 80 per cent. At the time of registration, however, they did not know who the candidates were, which at one *baraza* caused an old man to exclaim "I think the whole thing is stuff and nonsense," and march off waving his stick. The qualification for candidates included an English language test for those who had not already got a degree or diploma from Makerere college—and one would-be candidate is said to have been disqualified by his inability to explain what he meant by the phrase "ploughing back profits into agriculture."

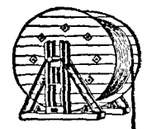
The successful candidates are all reasonably competent men, and some of them should be as effective as men like Mr Mathu and Mr Ohanga, who have lost their seats. Mr Tom Mboya now emerges as the most important figure in Kenya African politics after defeating Mr Argwings Kodhek by 400 votes in Nairobi—though three supporters of the "A-K plan—Africa for the Africans" were elected elsewhere. Whether Mr Mboya will be able to find time to act as secretary-general of the Kenya Federation of Labour in addition to his parliamentary duties remains to be seen. Reasonable European opinion welcomed his election; many settlers say they prefer to see him in the Legislature rather than making mischief outside it.

Though Europeans may hardly call the nationalism of the present African members "mild," a more virulent brand may soon appear when the ban on Kenya-wide political parties is lifted; it remains to be seen whether the limits of political manœuvrability will be quickly overrun or whether wiser counsels will prevail. There is more goodwill in Kenya towards African aspirations than is realised; more can be generated if the new members acquit themselves well. It is vital that this should happen if the forces generated by the economic revolution in the African areas are to be directed into healthy development; rigid barriers to these forces within the present political framework would lead to a new eruption of some kind. The African must be trained to wield the power he begins to command. And there is not much time before, in 1960, Kenya goes to the polls again.

Inflation in Canada

FROM OUR OTTAWA CORRESPONDENT

MR WALTER HARRIS, the Canadian finance minister, made a compromise between the requirements of the forthcoming general election and the needs of an inflationary economy when he presented his 1957 budget last week. But, on the whole, it was a courageous compromise. He admitted a surplus of $282 million for the year just ending. For the new year, he budgeted for a surplus of $152 million and gave away $148 million in increased social welfare payments and minor tax cuts. Such concessions can be at least partly reconciled with Mr Harris's stress on inflationary dangers by the argument that the pressure lies most heavily on capital goods industries and that a small increase in pensioners' purchasing power will not increase this. But a better defence, if he could use it, lies in juggling with the budget figures. The declared surplus of $282 million for the year just ending should have been $388 million; $106 million has been tucked away into various government funds. In the year just opening he has done even better, including in the year's expenditure $200 million which cannot be regarded as a normal budgetary charge. He is really budgeting for a surplus of $350 million in the coming year, and from an economist's point of view that is the figure which should be compared with the political package of $148 million in new concessions.



Mr Harris presented his budget hard on the heels of the annual report of Mr J. E. Coyne, the Governor of the Bank of Canada, which stresses the inflationary state of the Canadian economy. Mr Harris mentioned the "possibility that inflationary pressure might be moderating," but otherwise fully supported Mr Coyne's diagnosis. The inflationary pressures are all too clear, though the public has been very slow to notice them. Yet the general price increase, as reflected in the gross national expenditure for 1956 came to 4 per cent between the beginning and end of the year. A gross national product estimated at $29,700 million for 1956 represents a real increase of about 7 per cent over 1955; the rise in prices accounts for a further increase of 3 or 4 per cent in money terms.

Even more vivid evidence of the effort to accomplish too much too quickly lies in the balance of payments deficit. The deficit on current account last year came to $1,400 million, far more than twice what it has ever been before. The capital inflow, which covered it more than adequately, included $750 million from the sale of Canadian securities to foreigners. Again, this is twice as high as in any previous year. The inflow of funds for new direct investment in foreign-owned subsidiaries also reached a new record. The offset in new Canadian direct investment abroad, at $100 million, was also greater than in previous years. But there remains a formidable increase of $425 million in direct ownership by foreigners in Canadian productive enterprise. The new foreign investment was largely responsible for stimulating the burst of capital development which has helped to produce inflation.

Two Escape Hatches

Mr Coyne believes that any sharper curb on loanable funds would have caused such a sharp rise in interest rates that it would have upset the financial markets. He also finds two other reasons for the way in which credit expansion has defied all the central bank's efforts to restrain it. The first is the way Canada's twelve chartered banks combine the functions of commercial banks and savings banks. As a result the steadily rising deposits of personal savings have been diverted into loans, while long-term investments by the banks (specially in Government of Canada securities) have fallen sharply. The second, and more bothersome escape hatch from monetary control is provided by the ever-growing and largely unregulated "instalment finance companies." Ever since 1950 their lending has been growing considerably faster than that of the banks, and by the end of last year it is estimated that they had outstanding about $1,200 million of loans, or about one-quarter of the banks' loans. Even if their operations were restricted to the field of consumer credit, they could be most upsetting to a stable monetary policy. But increasingly they are lending money to business enterprises.

The process of exhortation, which Britain and other countries have found it necessary to use in support of monetary policy, was tried here in private—at meetings between the Bank of Canada and various key financial groups. It worked moderately well (though not without some friction) with the chartered banks and even more moderately with the stock exchanges, when margin requirements were under examination. It did not work at all with the instalment finance companies. If they are to be regulated, it will only be by legislation. Probably before very long such government action is inevitable. But it is not certain that it will be taken in the present fast-decaying session of Parliament.

We are the cablemakers

but not that alone.

We thread power through the worried earth of
cities, steeple-high across the fields,
in channels sunk in the ooze of river beds.

We bring together copper and paper and lead and oil and metal tape and jute and steel wire and rubber and cambric and polyvinyl chloride and polyethylene and polytetrafluoroethylene and nylon and brains.

Here is a cable to cross a wilderness.
A meal for termites once. Not now.
It's poisoned.

We who make cable must be chemists, physicists, geologists, metallurgists, electrical engineers, mechanical engineers, civil engineers, mathematicians, as well as toxicologists.

Here is a cable for a jet plane not yet
built. Melt it if you can.

We who make cable work with Nature and only change it when we must. We had to change the arrangement of the molecules in polyethylene, otherwise it would liquefy at 100°C.

This is not a cable at all.
It's a cord for deaf-aid. Tiny, isn't it?

We who make cable must think on many lines.
And we must work for the World.

the Wonder of Plastics

The Heron Direction Finder is used for position fixing for small craft. It incorporates parts moulded from Beetle—a B.I.P. product—and the coils are 'potted' in Beetle resins.

The new 6-seater Vauxhall Velox Dormobile Estate Car is a conversion of the standard saloon body, by the addition of a polyester/glass fibre extension. Beetle polyester resin—a B.I.P. product—is used in moulding the light, strong extension and lift-up rear door.

The versatile Regna Cash Register is used in self-service stores, departmental stores and small shops throughout Europe. The attractive, strong housing is moulded from Beetle—a B.I.P. product—by Norsk Teknisk Porselens A/S, Norway.

In ships and shops, in cars and catering, plastics to-day play their part. Their role may be contributory, it may be fundamental, but the wonder of plastics is in their versatility, their infinite possibilities. Types and grades are innumerable, each with its own properties—and limitations—presenting a wide field of choice to the intending user. The leading plastics materials manufacturers maintain extensive consultative and development services and none is better qualified to advise and assist than B.I.P.

B.I.P. SERVICES:

The full resources of the B.I.P. Research, Technical Development and Design services are at the disposal of manufacturers interested in the possibilities of plastics. Advice will gladly be given on any problem concerning plastics applications, irrespective of the type of material involved.

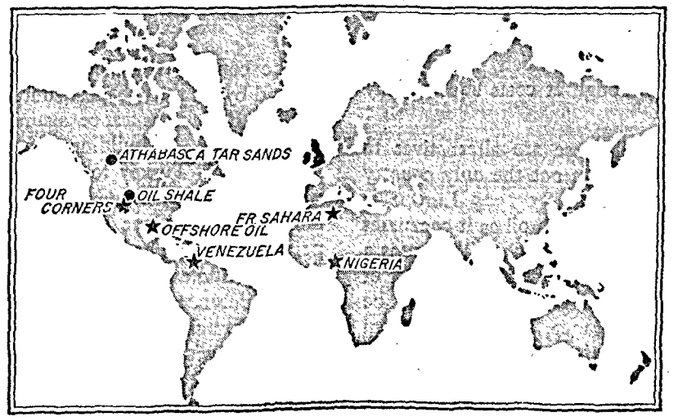
THE BUSINESS WORLD



Insurance Policy for Oil

EVEN if the conditions under which Britain used to obtain and transport its oil from the Middle East are now restored unchanged in some deal over the use of the Suez Canal, they would still offer no guarantee of a regular supply. Clearly, an insurance policy for energy is needed. But what form should it take? Can Britain rely even more on coal and nuclear energy and less on imported oil than is now planned? Could sufficient new oil reserves be economically developed in places more dependable than the Middle East? If we still have to rely on the Middle East, how far should we go in developing less vulnerable supply routes? And, finally, is there no possibility of bringing about a change in the political conditions under which oil is produced and transported in the Middle East? The shock of recent events in Egypt and Syria has produced in Britain an overwhelming desire to reduce the country's dependence on Middle East oil, almost regardless of cost. But the best insurance policy is one that provides the most cover for the lowest premium. The strategic position of Britain depends as much on low industrial costs and a more healthy balance of payments as it does on the safety and regularity of oil supplies. There is a price above which this country could not afford to purchase "safety" in oil.

One initial premise must be accepted if the British economy is to continue expanding and ever to become solvent: that its total consumption of energy is bound to continue to rise, at a rate of perhaps 3 per cent a year. Coal is the only really indigenous fuel; and it is already close to the limit of output that can conceivably be expected at anything like present costs. But the import cost of uranium for nuclear power is so small in relation to its output of energy that atomic power, too, might almost be considered indigenous. In the short run the limit to the expansion of nuclear power stations is set by the infant stage of the technology, and by the amount of investment resources that the country can afford to divert to such a highly capitalised industry. In the long run it is now safe to assume that all new power stations will eventually be nuclear. And if the cost of nuclear power can be reduced to anywhere near the figures quoted by Sir Christopher Hinton last week, electricity can be expected to take over much more of the industrial work now done by oil.

Yet unless a striking break-through in the economic scale of nuclear technology is achieved, there will still be no economic replacement for oil in most forms of propulsion—on the road, in the air, and even at sea until much smaller nuclear reactors are feasible. Britain will still need to import considerably more oil in 1965 and 1975 than it does today. By far the most prolific source for this extra oil that is at present economic is the Middle East. But is there any possibility of obtaining alternative sup-

ALTERNATIVES TO MIDDLE EAST OIL?

plies—at the cost of some tolerable insurance premium ?

There are at present about half a dozen possibilities outside the Middle East worth discussing. Nearest to Britain are those in the Eastern Hemisphere—Europe itself, the Sahara desert, and Nigeria. The Organisation for European Economic Co-operation has estimated, perhaps optimistically, that the current production of oil in Europe—some 10 million tons a year—could be doubled by 1960 and quadrupled by 1975. In the Sahara, two promising fields have been found so far, both in Southern Algeria, one about 240 miles and the other about 560 miles from the Tunisian coast. If a pipeline were laid to the coast, the nearer of these deposits could produce over 5 million tons a year. This may be conservative, but it would still be wildly optimistic to predict at this stage that the Sahara will become another Middle East. And it is a moot point whether oil produced in Algeria would be any more dependable than oil produced in Kuwait. Perhaps Nigeria might be conceded an advantage, if a thin one, over Algeria on grounds of reliability of supply. But although prospecting there has shown some highly promising results, it is too soon to measure the extent of the oilfields found in Nigeria by the Shell group.

★

In the Western Hemisphere today, only one country, Venezuela, produces more oil than it consumes. British companies have a substantial interest in Venezuelan production, and it could be quite sharply increased ; even so it would probably remain the cheapest oil in the Western Hemisphere. In the United States itself, promising discoveries have been made recently in the "Four Corners" area in northern New Mexico, and offshore in the Gulf of Mexico, but even these finds would not match production with the expected rise in American consumption, except for a brief period and at sharply increasing costs. Canada now has proved reserves of nearly 3 billion barrels of oil, as well as the "fabulous" Athabasca tar sands which, if they could all be economically developed, would virtually double the world's proved oil reserves, including those in the Middle East. The United States, Brazil and Canada also have huge shale deposits, which would yield abundant supplies of oil, though at costs substantially above current prices.

In terms of quantity, all these are alternatives to the Middle East. But Britain is not the only country that wants more and safer oil. By 1975 Europe is expected to need four times as much oil as it consumes today—so for Europe alone another 300 million tons a year will have to be found from somewhere. Most of the production expected from the Sahara must be regarded as earmarked for France, and the increased indigenous output on the continent of Europe will be consumed locally ; Britain might have first claim on Nigeria, but that is still a claim on an unknown quantity. Oil demand in the United States increases each year by more than the total annual consumption in Britain, and Venezuela is the logical supplier. But there is a limit to the capacity of Western Hemisphere oilfields as a whole and unless the United States is willing to assume the strategic cost of developing its oil shale reserves it must inevitably become increasingly dependent on the Middle East, like Europe.

If Britain draws more of its supplies from Venezuela, therefore, it can do so only at the expense of the net dollar earnings on sales of oil by British companies to the United States. There is really only one adequate alternative source—the conventional oilfields, tar sands, and shale deposits in Canada. But what of the cost, and the dollars ? The cheapest Canadian oil now produced in Alberta cannot even compete with Venezuelan oil shipped up the St. Lawrence to Montreal ; and the cost of oil from the tar sands and shale, even on the most fashionably optimistic assumptions, would be much greater. The cost figures produced recently for a relatively small development of the tar sands by a Canadian company, which claims that its products will be able to compete in Alberta with oil from wells have yet to be confirmed in operation. In any case, the market for Canadian oil is where its transport advantage is greatest : eastwards to the rest of Canada and the north-central United States, and westwards to the Pacific states of the North-West and to California. A "crash programme" to develop Canadian oil specifically for the British market might produce the oil, but only at a prohibitive cost and almost entirely in dollars. Nor is it relevant, even if it could be demonstrated, that Canadian oil could be delivered to Britain as cheaply as Middle East oil shipped in super tankers round the Cape. For the extra costs of the Cape route would be incurred only if the shorter supply lines were cut again. The extra cost of Canadian oil, once the development there had been undertaken, would be more permanent. If more British capital enters the Canadian oil industry it would be better business to earn dollars by selling Canadian oil to the nearest markets in the United States—if necessary to pay for imports from Venezuela.

★

The conclusion is inescapable. Britain must have oil, and by far the cheapest source for that oil is still the Middle East. Insurance against the blocking of the supply routes—by building new pipelines from northern Iraq through Turkey to the Mediterranean, or southwards to the Persian Gulf, or by building more super tankers for the Cape run—may be expensive, but the premium would be much less than it would cost to replace Middle East oil from elsewhere. At an exploratory conference, now being held in London between the British, Dutch, French and American international oil companies with interests in the Middle East, these new pipeline projects and other plans for diversifying the means of transport from the Middle East are being jointly considered. It may be asked at this stage whether the western governments should share with the companies the additional cost of providing this insurance.

What is not being so openly discussed is a much more fundamental problem : the security of the oil companies' whole operations in the Middle East producing countries. It is on the assumption that operating conditions there, as well as transit from there, will become impossible that the advocates of alternative sources of supply base their case for paying the higher costs of development elsewhere. Certainly it cannot be assumed that there is anything immutable in the formula now generally adopted for an equal sharing of profits between the foreign oil companies and the Arab governments from which they have obtained their concessions. Any solution in the Middle East is bound to involve higher costs in the long run, and probably a higher proportion of these costs would have to be incurred in dollars. But practically the whole cost of the more expensive Venezuelan or Canadian oil would have to be paid in dollars. The Middle East "dollar component" could never rise to a similar level while sterling continues to be used there at all ; and if more stable conditions could be achieved, British oil producers in the Middle East could earn dollars from sales of oil to the Western Hemisphere.

Economically, moreover, there could hardly be a case where the interests of the two sides to a bargain were more coincident. The Middle East producing countries must have a market for their oil in the West ; and the West—including the United States—must have oil from the Middle East. If the rising nationalism of the peoples of the Middle East could be constrained by economics, there would always be some price at which a bargain could be struck. But so little of the oil revenues has yet filtered down to raise the general standard of the living in the oil producing countries of the Middle East that their rulers are not subject to much political pressure if they choose periodically to act according to nationalist caprice rather than their economic interest ; while the interest of the countries lacking oil but crossed by pipelines tends automatically towards intransigent blackmail. The irresistible pressure in the Arab world is nationalism. Economic bargains are necessary, but by themselves they are no longer sufficient because they do not guarantee performance. International consultation over production and the supply routes may sound utopian, but could anything less than this endure ? The Arabs must come to feel that they are exploiting their own oil resources, with the help of the foreign companies ; the companies, for their part, must retain sufficient flexibility and margin of profit to make their operations commercially worth while. Only in this way could the security of tenure of the oil companies in the Middle East be assured. Not all oil men and not all Arabs are so buried under their present preoccupations that they fail to see this.

THE "INPUT-OUTPUT" TECHNIQUE—II

Focusing Business Forecasts

THE main theoretical basis of the input-output approach to national accounting statistics and business forecasting, described in these columns last week, is that in the last resort all economic activity is interdependent. But some branches of production are commonly believed to be more interdependent than others ; and an input-output table can give some quantitative, if not precise, indications of how much more important these interconnections between industries and services are in some sectors of the economy than in others. One naturally expects the "coefficients" that show how much the current output of steel sheets and pressings corresponds with the current output of, say, motor cars and refrigerators, to be relatively high, compared with those expressing the links between, say, engineering output and Lancashire's current production of cotton goods. And if we want to forecast the effect of the steel industry's sales of recession in the motor vehicles and electrical appliances industries, coupled with continuing expansion in structural engineering and shipbuilding, a table of input-output coefficients ought to give an appropriate set of weights for estimating whether this shift of emphasis in engineering will cause total demand for steel products as a whole to rise or fall.

The input-output "map" of the country's economic structure moreover indicates where such interdependence is least important—the links that a would-be forecaster can with the least risk of error lump into "other things being equal." This kind of "ready reckoning" requires only a set of direct input coefficients, showing the direct demands each industry ordinarily makes on all others. Additional information about the secondary demands that are indirectly "fed back" to other industries as a result of changes in the requirements of the industries which supply a "primary" demand—which can be calculated by a mathematical exercise called "inverting the coefficients"—is scarcely worth the effort if one's purpose is only to predict the output of particular products. Its value lies in forecasts of how the total volume and pattern of production, industry by industry, may be affected.

It may seem paradoxical to use an input-output table to focus upon parts of the economic structure : claims for the input-output technique have usually rested exclusively on its merits as a model of "general equilibrium" and interdependence throughout the economy. Nevertheless, there is good reason to think that for practical business forecasting the appropriate

use of input-output analysis should be first, to indicate which sectors of the economy are worth considering simultaneously for any particular problem; and secondly, to provide a quantitative "grid" for calculating the changes in supply that given demands will generate within these sectors.

What might be required of general input-output studies for the whole economy therefore, is that the official or unofficial economic research groups working on them—the first major table for Britain has been prepared by the Department of Applied Economics at Cambridge and by the Board of Trade—should prepare similar detailed charts at intervals of, say, every ten years. The object would be to provide bench-marks for the business forecaster, with analysis of particular sectors—much as a census of distribution provides basic data for consumer market research. Parts of the input-output map can be brought up to date and expanded: the interconnections of the metals and engineering sector, for example, would probably repay study through a much more finely divided "grid" than is possible even in the large table now completed. Such tables can then be used in conjunction with other data for business forecasting. In this way it may be possible to resolve the dilemma that an input-output table is either sufficiently detailed but out-of-date, or else up-to-date but with too few sectors to be of any real practical value in particular industries.

That is one purpose for which the input-output method can be adapted to fit in with and supplement existing techniques of practical business economics. Another way in which the technique can be improved, this time for more general and long-range predictions of industrial production or the level of import requirements, is by constructing much less detailed input-output tables (say with between twelve and thirty-five sectors) for two or more years, say, 1950 and 1955. From such tables, instead of expressing the transactions between industries in each year as separate sets of input-output coefficients, it is an equally simple procedure to express the *difference* between the transactions as one set of *difference* coefficients. These would indicate the changes generated in supply by changes in demand, over a period, instead of the absolute amounts in particular years. With this refinement it may be possible to forecast more accurately changes in output requirements over a similar interval of time in the future.

★

Such developments of the basic input-output procedure devised by Professor Leontief represent ways of making better use of the central assumptions of his technique—that during any period under study no shifts take place within industries as a result of substituting one input that has become cheaper than another or of varying the scale or composition of production. The emphasis of input-output analysis so far has been on constant technological ratios, irrespective of changes in relative prices. But instead of regarding prices as "neutral" and taking quantities as the data to be calculated the method can be applied in reverse; for example, if industry's technical and quantitative demands for materials are inelastic, the effect on prices of changes in costs can be studied against a background of "neutral" quantities. A topical example would be the effect of increased freight rates on the prices of fuel to different industries, assuming that the same amounts of fuel continued to be carried in each type of transport. Input-output analysis is subject to the same limitations as the compilation of index numbers. One can either keep the quantities concerned constant to study the changes in price or keep the prices constant to achieve an index of "volume." One necessary step in the development of input-output technique into a tool of practical forecasting must be to try to relax the rigidity of this dilemma.

Business Notes

Strength for the Trial

In the British engineering industries as a whole last year labour costs rose sharply, because earnings were substantially higher and labour productivity actually fell; and last year the engineering employers decided that the time had come to dig in their heels and turn down wage claims flat. They had ample and accumulated cause for a showdown. The time they picked was perhaps as favourable as they could ever expect, in the postwar meaning of the word—workers in many parts of engineering, that is to say, have had a whiff of short time during the past year, and the labour market is slightly softer (with all of 1.8 per cent of unemployment). Nevertheless, the positions upon which employers in the diverse sections of engineering chose to make their stand varied greatly in bargaining strength. Shipbuilding has seldom been more firmly placed—either to withstand a strike, or to pass on the cost of a wage increase. But no other engineering industry stands four-square upon nearly so hard a market.

The bargaining strength of the shipbuilding employers today does not rest so much on the length of their own order book as upon the length of other people's. The British yards have today about 4½ years' work on their books; but most of the major yards abroad are also booked up until after 1960. Moreover, whether or not shipbuilders like to hear their methods of pricing described as "cost-plus," that is what they look like in practice to shipowners as well as to shop stewards. Various types of shipbuilding contract are in use today; but all include provisions to cover rises in the costs of labour and materials between the dates of ordering and delivery, and most include some form of corresponding adjustment in margins for overheads and profit. Last year British shipyard prices rose by about 5-10 per cent—and they still booked more new orders than for years past.

So if the shipbuilders eventually have to concede higher rates, most can pass the cost straight on to shipowner customers without significantly affecting their margin of profit. But by the same token they can stand a strike for a time. Their customers are hardly likely to be unsympathetic to an attempt to moderate the ever-rising price of ships; and even if anxiety to get the ship earning should outweigh this sympathy, customers well placed in the British order queue have now no chance to cancel and get tonnage built more quickly elsewhere. If the yards book no new orders for a few weeks of the slack spring season, that will hardly worry them. Ship repairers, however, are worse placed; much of the business they lose through a stoppage—about £1-1½ million a week—must go elsewhere.

The Choice in Engineering

In the strong market for capital goods last year, many machine builders seem to have been able to pass on increased costs in higher prices. From the official estimates of capital investment, the prices of the mixed bag of plant and equipment installed in British factories seem to have risen on average by about 7 per cent. It is doubtful whether their total costs could have risen at a much higher rate. Earnings in engineering factories last spring were about 9 per cent higher than a year before, but the factories building capital equipment ought to have been busy enough to achieve some slight increase in labour productivity; prices of materials used in mechanical engineering were up by about 5 per cent over 1955, but those used in electrical engineering went up only about 2 per cent. From these crude indications of costs and prices total profits in the manufacture of capital goods ought certainly to have risen, and one might expect unit profits on the average to have been maintained; in practice, however, some companies making capital goods have been reporting rather spotty results.

In the vehicle industries and those making metal consumer goods, as well as their suppliers of intermediate engineering products, fortunes were far different. Output fell; employment did not fall as much; so to the increase in prices of materials there was added a large rise in labour costs. Moreover, these industries were employed well below capacity, so overheads will have risen; and the recession sharply limited such increases in prices as some of these manufacturers still managed to make.

Today, this balance is shifting. Order books in the capital goods industries are being shortened as the home investment boom passes its peak; competition abroad is concentrating rather more upon prices than upon delivery dates. Most of the heavy plant builders, catering for major industries with large and comparatively steady investment programmes, are guaranteed a substantial nucleus of business, though harder put to book orders overseas. But makers of lighter machinery cannot hope for as good a market in 1957 as they had in 1956; certainly not to pass on increased costs so readily. Makers of durable consumer goods are gaining confidence that this year will be better than last; it needs to be. But until they begin to make full use of their increased capacity—and few of them hope for this until 1958—their unit profits are certain to remain low. Delivery dates still matter in securing export orders, but in many companies throughout engineering there would be spare capacity to hasten output after an interruption. These employers could stand a strike that promised some chance of minimising the wage increase and weakening the unions better than they could stand an immediate addition to wages.

Black Monday and After

A typical reaction of investment markets to an industrial dispute is a sharp fall before the event, and then steady, stagnant markets as the strike begins. At the beginning of this week markets were not confronted with a single industrial dispute, but with a complex chain of them—a shipbuilding strike in being, an engineering strike ominously near, and the louder rumblings of a possible storm on the railways. The typical pattern could not be reproduced. Markets had already been adjusted downwards in the previous week but they fell again sharply on Monday both on the fixed interest and equity sides. The drop of 4.1 to 180.4 in the *Financial Times* industrial index, was the sharpest for a single day since the beginning of last June. Sterling took the strain immediately and visibly and the supporting sales of dollars by the Exchange Equalisation Account caused credit stringency in the short loan market notwithstanding some help by way of special purchases of bills by the Bank of England. On the commodity markets the direction of the pull was less obvious; the weakening of the sterling rate tends to raise the prices of the "dollar" commodities while industrial dislocation reduces consumption and therefore pull prices downwards. Strikes and fears of them seem to have contributed to the weakness of copper.

At no point was selling of securities heavy but it was widespread and jobbers were disinclined to take stock on their books. The bareness of their cupboards became most obvious on Wednesday evening when a sudden wave of buying stimulated by hopes of an early settlement in shipbuilding caught them with almost level books and as ineffective a cushion against the rally as against the fall. Ship-

building shares rose sharply and there was some closing of bear accounts in the oil market. On balance *The Economist* indicator has fallen 3.8 to 193.5 in the week ended on Wednesday while the *Financial Times* government securities index has dropped 1.69 to 86.56. The improvement in the markets went further on Thursday when a little buying for "new time" come in. Sales of stock from the official portfolio have naturally been brought to a stop and it appears that the Government broker has this week been on occasion prepared to sell the stocks he has to offer on the basis of a level switch; previously his policy (apart from acquiring the next maturing stock) has been to switch only when the transaction brought cash into the official portfolio.

The new Steel of Wales £1 ordinary shares (5s. paid) have stood up well in the circumstances. A discount was inevitable for underwriters had been required to take up 85 per cent of their firm applications. But in active first dealings on Friday last week, half a million shares changed hands and the discount did not extend beyond 7½d. On Monday it widened to 9d. and has remained near that point since. It is known that the consortium of issuing houses would have been willing to intervene to check the fall at a figure believed in the market to be about a shilling discount. That help has not been required.

Sterling on the Slipways

THE shipbuilding strike and the threat of still wider industrial strife has weighed heavily on sterling. Bear covering was making satisfactory progress earlier this year and had carried the rate on New York beyond the official parity; it has now stopped suddenly. This week on the contrary there has been clear evidence of renewed short sales of sterling, particularly from Continental centres. Germany has been the main seller but sterling has declined against almost every Continental currency. North America, however, has hardly come in as a seller of sterling save for genuine commercial operations. Nor has the rate for sterling declined unduly in the forward market. Against the US dollar the three months discount on sterling represents a rate of interest of about 1½ per cent, which is only a little wider than the spread between bill rates in London and New York. The main demand for dollars has been domestic and has represented partly anticipation of future commercial requirements and partly the current commercial need, now swollen by abnormal purchases of dollar oil. The official dollar rate, which was $2.79⅞ at the beginning of the week dipped quickly on Monday to $2.79⅞ and was held there only by considerable supporting operations from the Exchange Equalisation Account. When it was felt that the pressure was too great the rate was allowed to slip and fell to $2.78⅞ at which it grounded and made an unassisted recovery to $2.78⅞.

This experience was repeated in broad outline on the three following days. There was substantial recovery on Thursday when the note rate rallied to $2.79⅛. But the official support for sterling this week has probably been heavy enough to wipe out any gains of gold and dollars secured in the earlier part of the month. The damage to the reserve may, however, be superficially veiled by drawings on the Export-Import Bank line of credit.

That Extra Shilling on Petrol

WHEN the extra shilling a gallon tax on petrol, aviation fuel, and diesel fuel for road vehicles was imposed last December the Government regarded it partly as an economic reinforcement of the rationing scheme, and partly as a means of recouping the £30 million revenue which would be lost if sales were cut to about 70 per cent of normal and taxes were left unchanged. Ministers also recognised the emergency character of their decision by providing in the Act that the extra shilling tax would be taken off again within a month of the end of petrol rationing. Now the reckoning has begun. The prospect of improved supplies has enabled the Government to increase the basic ration for private motorists by half; to promise to grant supplementary allowances for private cars on a more generous scale; to promise petrol-driven lorries, coaches and buses enough petrol to meet their normal seasonal requirements; and to take the "calculated risk" of abandoning the rationing of diesel fuel altogether. As supplies of petrol during the next rationing period are expected to cover 90 per cent of normal requirements—even without allowing for the resumption of any shipments through the Suez Canal—the Government can take the risk of operating the rationing scheme in such a way that only ten per cent of normal demand will go unsatisfied—with virtually all of the remaining cut being borne by the private motorist.

The Government cannot possibly now justify the retention of the full shilling of extra tax on the grounds that it is needed to safeguard the revenue. If a tax increase of 40 per cent (from 2s. 6d. to 3s. 6d. a gallon) was needed to bring the revenue back to normal when sales were expected to fall by 30 per cent, then the extra tax needed to bring it to normal when consumption is down by only 10 per cent would be about 3d. a gallon.

There may be an economic argument that while there is still some shortage of petrol, and also an urgent need to rebuild stocks of diesel fuel, the full extra tax should be retained to impose on consumers a financial discipline towards economy. For a short period, the Government may be given the benefit of the doubt, but others besides irate motorists will hold very strongly that this temporary impost ought to be scaled down and withdrawn as soon as possible—or given a new justification on grounds very different from those that led to its imposition. Petrol has gone up another penny a gallon this week. The further increase in fuel oil prices of ¾d. a gallon, or 15s. a ton, will also speed up the summer addition to stocks, just as the earlier increase of £3 10s. a ton certainly helped to keep fuel oil demand below normal during the winter. But one might speculate on the language of the Coal Board's customers if they were asked to pay £4 5s. a ton more for coal.

The Whitbread Technique

WHITBREAD AND COMPANY is in the top flight of brewery companies and has recently been carrying the torch of rationalisation and modern management into the board rooms of other breweries. Merger and rationalisation schemes are common in the brewery industry. The special Whitbread technique is to buy a minority interest (seldom less than 10 per cent) in the XXX Brewery Company and to associate that investment with a trading arrangement that opens an additional market through XXX's tied houses for Whitbread's bottled beers. Secondly, it improves that market by supplying the new associate with improved management and know-how: sometimes Whitbread takes a management fee; sometimes it supplies staff; and sometimes it trains the staff of the new associate. This looks like managerial reform from which both Whitbread and its ten new associates should benefit. But by the time Whitbread's chairman, Col. W. H. Whitbread, had explained and defended his policy to a gathering of financial writers this week it appeared that issues of principle were at stake.

Whitbread and Company uses its cash resources to buy blocks of shares through the market. To get them it often pays a few shillings over the market price and when the buying stops it is not unusual for the shares to fall back again. Secondly, Whitbread never acts without the knowledge and approval of the management of the company in which it is investing; indeed it has far more proposals from would-be associates than it accepts. It is not difficult to see why. Companies where management needs strengthening, especially if management is not itself a big shareholder, are natural targets for a bidder who might hope to employ the assets more effectively. Add a ten per cent holding by Whitbread and Company to the management's existing voting power and the bidder's task is made more difficult, though not necessarily impossible. The directors therefore sit more securely at their desks, while those shareholders and stock jobbers who have assessed the shares on the values that might have resulted from a take-over by another brewery are disappointed.

Those who believe that the freedom of the market is to be desired and that the take-over bidder does good quite as often as he does harm can hardly argue that Whitbread and Company should not invest its money as it thinks best. If it can secure its aims through a minority investment and association instead of a majority holding and domination it can hardly be condemned. Anyone who can find a seller can buy a bigger controlling block. But the Whitbread technique of buying a substantial block of shares at rather better than the market price is something that shareholders seem entitled to know about. It is right that the directors of these junior associates should inform their own shareholders; some of them have done so.

Pensions Preserved

MIDDLE age, for an increasing number of men, is marked by the turning down of an attractive new job for fear of losing pension rights that have accrued from an existing job. This drag on labour mobility comes under the scrutiny of a joint study group of the Institute of Actuaries and the Faculty of Actuaries, in a report by Messrs F. H. Spratling, F. W. Bacon and A. E. Bromfield on the "Preservation of Pension Rights."

To make pensions portable from one job to the next is generally regarded as desirable. Trade unions and professional associations have been at work on the problem for years; the techniques of transfer have been worked out; and in the public services they stand practical test. In this country some minor tax difficulties still obstruct the full transfer of pension rights; in other countries the preservation of these rights on a change in employment has been made an essential condition for tax relief. Regrettably few private schemes make provision for the transfer of rights, and even where provision is made, employees usually opt for the cash surrender value of their rights, which must be taken to reflect their own short-sightedness, because they then forgo the benefits accruing from the contributions made by their employers. Some of the big brokers recommend employers who are intending to start schemes to make them non-contributory so that the employer retains fuller control.

There are two basic methods of making pensions fully portable. The first and most common is the "cold storage" method. Under this method, when a man changes his job his accrued pension benefits (including those provided by his employer) are locked away as they stand at the date of the change until he retires; thus on retirement he may draw two pensions, one coming from his original service and the other from his later employment. The second is the "transfer value" method. On a change in employment, under this method, a sum of money related to the value of his interest in the pension scheme (again taking account of his employer's contributions) is paid over from the old scheme to the new one; thus on retirement the pension comes from one source. The study group has suggested a method combining the "cold storage" and "transfer value" principles.

Whichever method is adopted, it clearly adds to the costs of the scheme for the employer, whose contribution normally takes account of lapses when employees leave. The study group suggests that this burden may not be so large as appears at first sight. If pensions are really to be made more portable, the study group argues that there must be a willingness by employees not to demand payment of withdrawal benefits in cash; that the few tax difficulties standing in the way of the "transfer value" method should be removed; and that the latter method should be adopted in life office as well as in privately administered schemes. But these problems are really the frills. It is first necessary to get employers to accept the principle of full transferability and that may not appeal to those of them who want to combine relatively generous pension schemes with relatively low salaries.

Road Spending in the Dark

THE Minister of Transport never misses an opportunity of stressing just how much he intends to spend on Britain's roads once his programme gets into top gear, nor is he ever backward in recounting how many new road improvements have already started or have been authorised. But this continual barrage of partial information always omits the key fact that really matters—just how much is actually being spent on the roads now by the government and local authorities. Traditionally, this information has always been published only once a year, and a year

in arrears—in the annual reports on the administration of the Road Fund. The next report, due in a month or so, will say what was spent in the year 1955-56. And that, incidentally, will be the last Road Fund report; the fund was abolished last March.

Certainly the total amount of spending on the roads has been rising. Government expenditure provided for in next year's Civil Estimates reaches the handsome sum of £68

ROAD EXPEND. : NEW CONSTRUCTION & MAJOR IMPROVEMENT

£ mn.	Government				Local author.	Total
	Commitments		Voted	Spent	Spent	Spent
	Existing	New				
1952-53.....	6·8	3·5	5·1	2·8	2·6	5·4
1953-54.....	7·0	3·5	5·0	3·0	4·1	7·1
1954-55.....	9·0	19·4	5·0	3·7	4·6	8·3
1955-56.....	25·1	29·8	8·3	8·7*	4·8*	13·5*
1956-57.....	47·4	39·7	15·7	14·5*	5·0*	19·5*
1957-58.....	62·7	68·7	26·3	...	...	...

* Estimated.

million against £40 million in 1954-55; with local authority appropriations from loans and the rate funds total expenditure next year should be £130-£140 million, compared with £100 million in 1954-55. But this covers all heads of expenditure, including maintenance, cleaning, lighting, administration, road safety and the cost of collecting motor vehicle duties. Nor, moreover, are the budgeted sums always actually spent. But of the total road budget in 1954-55, £8.3 million, about a twelfth, was spent on new roads and major improvements (the share for new roads being £2½ million). That is the latest official figure available; from various parliamentary replies given a year or more ago it is possible to guess that the comparable sum spent in the current financial year may have been about £19½ million, more than twice as much. This is not quite as much as the previous Minister of Transport forecast two years ago when the first details of the current road programme were spelled out, but the commitments that have now been made in authorised schemes assure a hefty increase in spending in the next few years. Why, therefore, is the present minister reluctant to reveal his estimates of this impending rate of spending by all authorities and, more particularly, to say what they have actually spent in the last two years?

Car Output Improves

THE recent improvement in car sales, both home and export, began early enough to be reflected in the industry's output figures for February. Both dealers and manufacturers had been keeping their stocks to the minimum, so the sudden burst of buying was felt almost immediately right through the distribution pipeline back to the factories. The weekly rate of output in February, at 11,910, was nearly 15 per cent better than in January, though it was still 30 per cent or more worse than in February of 1956 or 1955. Exports, at 28,400 for the month, were nearly a tenth heavier than in January and last February, but home deliveries—even with the improvement—were still sagging at less than half last year's level. Car

factories started to cut back their rate of production at about this time last year, so if this present revival—which seems to have gained more pace this month—is the beginning of a real summer recovery and not just an idle swallow or two, then the industry should soon start to overhaul its 1956 rate of production.

Xenophobia and Coal Bargaining

DO British miners dislike foreigners more than they like money? On the face of it, that might be the explanation of their decision last week to refuse the National Coal Board's offer to abolish the attendance condition for payment of the extra "bonus shift" in mining because the offer was conditional upon acceptance of Hungarian miners in British pits. Xenophobia at this price—which amounts to a rise of 20 per cent in daily pay—would be something to be reckoned with, wrongheadedness of a certain bitter quality. It does exist; but the rejection of the Coal Board's offer may have come at least as much from the miners' refusal to accept any conditions, face-saving or real, on pay that they believe they are entitled to anyway, and moreover now strongly suspect that they can get without conditions. Miners who normally work a full week already get this extra pay—though they too would like it unconditionally.

The attendance condition, by which a miner who works five days a week is paid for six, but loses two days' pay if he only works four days, was introduced in 1947 as one of the conditions of giving the miners a five-day week; in practice many of them still work on Saturdays. The attendance condition has remained a grievance, and has been raised every year as agreements for the extension of hours to permit Saturday working have been arrived at. The Coal Board suddenly made an offer to abolish it about a month ago, though formal negotiations over the bonus shift were in abeyance until June. It may well have finessed on the chance of attaching further conditions to a concession it would have had to make anyway. But the miners hold the master cards. Next week the two sides meet to consider the miners' current wage claim—for 3s. 3d. a shift, or slightly over 10 per cent on present basic wages. Late in April, the board has to ask the NUM to accept Saturday working for another year. The miners have plenty of opportunities to press for their point.

Post-Suez Trade

ONE comforting feature of British trade since the Suez crisis is that the increased deficit with the dollar area has been more than offset by a fall in the deficit with other non-sterling countries, particularly the OEEC area. During the four months November to February, total exports to OEEC countries averaged £81 million a month, £11 million more than in the same period of 1955-56. Imports from these countries fell by £5 million to £77 million a month, and the trade balance changed from a deficit of £12 million a month in 1955-56 to a surplus of £4 million a month.

The increase in exports was chiefly in ships and boats to Norway; the fall in imports occurred in iron and steel and timber.

Imports from other non-sterling countries (apart from the dollar area) fell more sharply than exports, and the deficit was £3 million smaller at £10 million a month. Imports from the dollar area, on the other hand, rose by £11 million to £83 million a month, reflecting heavier arrivals of oil, cotton and grain; exports to dollar countries (excluding repayments of lease-lend silver to the United States) rose by £4 million to £42 million a month and the deficit rose by £7 million to £41 million a month. The deficit with the whole non-sterling world fell by £12 million to £47 million a month. There was little change in trade with the sterling area: total exports and imports, at £124 million and £127 million a month respectively, were slightly lower than in the same period of 1955-56, and the deficit fell by a half to £2 million a month.

The fall in the volume of petroleum imports was offset by higher prices and freight rates, so that imports between

OIL IMPORTS BEFORE AND AFTER SUEZ
(million gallons)

	Average Jan.-Oct., 1956	Nov., 1956	Dec., 1956	Jan., 1957	Feb., 1957
Total crude.....	651	419	508	424	465
of which:					
Middle East.....	544	294	305	234	311
W. Hemisphere....	83	117	179	184	150
Total products.....	216	160	181	209	240
of which:					
Middle East.....	19	5	6	16	8
W. Hemisphere....	116	101	143	149	185

November and February cost £28.9 million a month, as much as in the same period of 1955-56. The proportion of dollar oil rose from less than one-fifth to two-fifths of the total value. Arrivals of crude oil fell by 25 per cent in volume but the value fell by only nine per cent; imports of dollar crude more than doubled, and formed one-third of the total. Arrivals of oil products were slightly lower in volume, but 16 per cent higher in value. In February alone the index of imported fuel prices rose by another nine per cent to 143 (1954=100) and it was 33 per cent higher than a year ago. With prices of raw sugar also higher, the composite index of import prices rose by one point to 111. Export prices also rose by one point to 110, leaving the terms of trade unchanged at 101.

Insurance Dividends

THE two biggest insurance companies in this country both declared increased dividends this week. The dividend from Legal and General Assurance was indeed an occasion; with a final payment of 17s. 6d. (against 7s. 6d.) the year's dividend was doubled, from 10s. to 20s. per £1 share. These shares immediately gained £3 to £32. The less spectacular companion to this dividend came from the Prudential, the company which invests not far short of £1 million a week. The tax free dividend on the Prudential "A" shares, which is derived from the profits of the ordinary, industrial and general branches, has been raised from 25s. to 26s. 6d. per £1 unit. But the tax free dividend on the "B" shares, derived from the profits of the general

branch alone, has been left unchanged at 3s. 6d. per £1 (4s. paid) unit.

These dividends represent an allocation of 7.4 per cent of the distributable surplus (against 7.7 per cent). As a corollary of this decline in the shareholders' proportion, the allocation to Prudential policyholders has risen, from 92.3 to 92.6 per cent. The bonus on ordinary participating policies written in this country is left unchanged (at £2 2s. per £100 assured) and so, too, is the bonus on current premium-paying industrial policies (at £1 12s.). The rates on the special bonuses introduced last year on industrial and ordinary policies falling due for payment in the current year have been maintained. Significant increases are declared on participating group pension policies in which the companies are now competing keenly.

£7½ Million for Tube Investments

MARKETS are far from inviting to those seeking to launch big capital issues, but several are hatching and one has come out of its shell this week. Tube Investments is to issue to ordinary and preference stockholders, not as rights, £7½ million of 5¼ per cent unsecured loan stock (1977-82) at £95 10s. The main purpose of the issue is to pay ISHRA the balance of the consideration (around £4.6 million) for Park Gate Iron and Steel Company, Renishaw Iron Company and half of Byfield Ironstone Company. It is an open secret in the market that this issue had to stand aside to make way for Steel of Wales and that with the delay its price has had to be trimmed. It was apparently originally intended to make it about £1 per cent higher. Even so, it is arguable that it has not been trimmed enough. The gross redemption yield of £5 11s. 9d. per cent looks narrow in relation to the yield of £5 13s. 1d. per cent obtainable on the Metal Box unsecured loan stock 1977-82 now on offer to stockholders at £98. It should look slightly less narrow to the underwriters who receive 1¼ per cent commission, and doubtless do not object to taking up a fair proportion of it as a permanent holding. If 50 per cent were left with the underwriters the effective price to them would be £93 and the yield £5 15s. 9d. per cent. Moreover, the offer remains open until the day before the budget, which allows a chance for a strike settlement and a brighter market before the lists close.

Car Fashions at Geneva

IN 1957 some 60,000 foreign cars are likely to be sold in Switzerland. There is no competition from a protected domestic industry—only General Motors has an assembly plant there—and products have to stand completely free competition. This year more than 80 manufacturers of cars have selected the Geneva *Salon de l'Auto* as a testing ground. Switzerland has long been a commercial laboratory as well as a prosperous market; this year its interest may be enhanced by the resemblance of the Swiss market to the proposed Free Trade Area. Moreover, with

the Turin Motor Show postponed to the autumn and the Brussels show cancelled, Geneva offers the only major car show until the autumn.

In 1956 the Germans increased their Swiss sales to 30,492, more than half of the total car imports. They were followed by the French with 10,097 cars, the Italians with 5,944 cars, the British with 5,923 cars and the USA with 4,627 cars. Half of the British cars sold were Fords; a third of the German sales were Volkswagen. With 9,780 units sold, the Volkswagen works sold nearly double as many cars in Switzerland as all British makers. But one important Swiss agent commented on this year's British effort at the Geneva Salon, "It looks as if the British might just manage to pull out of their nose-dive in time." Jaguar has chosen the Salon for the world première of its "3.4," which is the smaller saloon introduced last year with the firm's famous 3½-litre engine. The Vauxhall "Victor" is shown for the first time on the Continent, and a number of other firms have introduced models to the Swiss market for the first time, such as the Austin A.55, which has been favourably commented on for its "Continental" lines.

As far as the eye is concerned, the Italians have stolen the show: at this exhibition they demonstrate, in particular, that very small cars can be handsome. The British contribution to the show reflects a continuing concentration on the medium-sized car. Swiss reactions to this are reflected in the action of one agent of a major manufacturer of medium-sized British cars, who has taken on an additional agency for a 450 cc German car. Whether the British industry can afford to disregard this particular section of the Continental market or not, it needs to consider trends in European motoring, and its decline in sales in recent years to an insignificant share of this richest car market in Europe does not indicate an unerring assessment.

For Want of a Bolt?

THE sequence of events that led to the crash of the Viscount 701 airliner last week a quarter of a mile from the runway of Manchester's airport seems to be fairly well established. The flaps along the trailing edge of the wing, which provide much of the braking force for landing, are divided into four sections on the Viscount. The bolt that holds the guide bracket on the second section to the right wing broke, and air pressure forced up this section of the flap; it was seen to buckle by a witness on the ground. This failure by itself might not have been disastrous, but it is thought that the loose bracket, driven up by the movement of the flap, then did irreparable damage to the controls, which made the crash inevitable.

The cause of the failure of the bolt is under investigation. Both bolt and bracket are fixed and do not move with the flap. It has been assumed hitherto that the life of these components would be as long as that of the main structure of the aircraft. As soon as the broken bolt had been established as the prime cause of the crash, British European Airways examined the bolts on the rest of its Viscount 701 aircraft and of the first eight aircraft examined and cleared for service, five were found to have loose bolts. This set up a presumption of a link between looseness and fracture that has been shaken by subsequent findings.

Wreckage of the left wing of the crashed Viscount, the oldest in service, recovered on Tuesday was found to contain a badly cracked bracket bolt, although the bracket was still tightly in position. The airlines have therefore decided to replace all eight flap bolts, regardless of their condition, after the aircraft has flown a certain number of hours and carried out a certain number of landings. Changing of bolts is a simple matter, and the interval between replacement can be chosen to give a wide margin of safety. This is as well, because the investigation into the failure of the bolts may take some time. It cannot yet be regarded with certainty as a case of metal fatigue; but if investigation should suggest that this was the root cause, some fresh thinking about the conditions in which fatigue can occur will be needed.

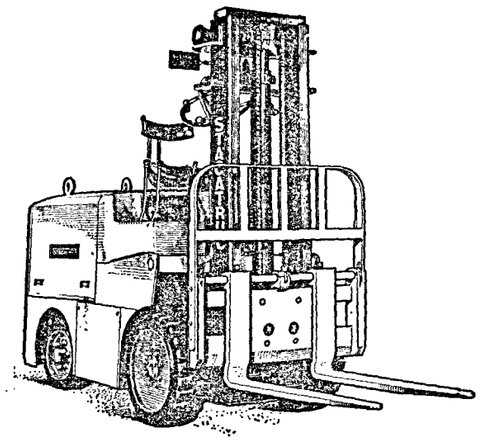
India's Sterling Reserves

THE Indian Finance Minister, Mr T. T. Krishnamachari, presenting his Budget estimates in New Delhi this week, commented on India's balance of payments and plans to cover her yawning external deficit. These matters command attention in this country. On the budget estimates themselves the notable announcement was that defence expenditure would increase by the equivalent of £38 million in the coming year, and that on present indications there would be an overall deficit of £280 million—a figure based on existing taxes, but counting on a considerable increase in yields, notably in excise duties. Here is an unmistakable reflection of India's domestic boom and of the growth in consumption which is being fed by domestic expenditure on the Second Five-Year Plan and by the extent to which that expenditure is being financed by direct borrowing from the Reserve Bank.

Yet foreign exchange difficulties remain the chief concern of the Finance Minister. Although India has ruthlessly cut imports of consumer goods and has more recently reduced the licences for import of capital goods, the deficit in the balance of payments continues to run ominously large. Since April, 1956, the gap has been of the order of £200 million. The original estimate of the external deficit for the whole Second Five-Year Plan was £825 million, but it is now thought that this figure will be exceeded by £300 million. The Minister admitted that, taking into account available credits and promises, only half of these total requirements were so far covered. He added that negotiations with the World Bank were proceeding to cover the foreign exchange needs of a wide array of development projects. He is also "exploring the possibilities of deferring payments for capital goods from various countries"—a possible reference to second thoughts on India's recent decisions to make immediate cash payment for the German steel plant.

The tardiness with which external assistance is coming forward is compelling India to fall back on its sterling balances. These were reinforced in February by more than £21 million as a result of the deposit in London of about $60 million withdrawn by India from the International

Aluminium in Road Transport



Chassis and Engine—Albion Motors Ltd.
Operator—Highland Omnibuses Ltd.
Coachwork—Walter Alexander & Co. (Coachbuilders) Ltd.

Profitable coach operation in the Highlands depends upon ability to negotiate economically some of the most testing country in Britain. This 29-seater Albion Nimbus coach has an aluminium alloy body which, with seating and full equipment, weighs only 32 cwt., little more than one-third of the total unladen weight of 4 tons.
As a result the Nimbus has fast climbing and efficient braking characteristics, combined with a low fuel consumption.

what is a Stacatruc?

No doubt you know that a fork lift truck is a machine designed to do many of the backbreaking tasks of heaving, humping, hoisting, and hauling heavy loads which are so inefficiently performed by men trying to emulate horses. Perhaps you also know that these trucks will not only aid your labour but will save money, improve production, eliminate bottlenecks in the flow of goods, cut down delivery times, use practically the whole of the space in a storehouse—right up to the roof, make stocktaking a pleasure, cut down breakages and accidents due to manhandling, and generally rank as the most versatile tool that modern industry can possibly employ in its drive for greater productivity. In this age of atoms and automation it is the machine which will take up the burden of man's productive tasks, and in this field there is no better machine made than the famous Stacatruc fork lift—part of Britain's best mobile materials handling system.

How to recognise fine Brandy

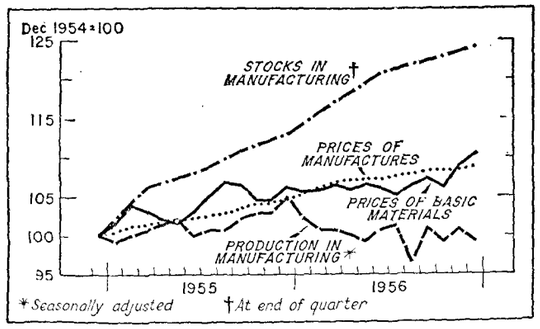
V·S·O·P

The finest brandy comes from the Grande and Petite Champagne districts of Cognac. Only Cognac originating from these two areas, at least half of which must be from the Grande Champagne, is entitled by French law to be called Fine Champagne Cognac.

Remy Martin produce Fine Champagne V.S.O.P. Cognac and *nothing less good*. They only offer for sale Brandy which has reached perfection. That is why when you insist on Remy Martin you can be sure of getting *a really fine Cognac*.

PRIDE OF COGNAC

REMY MARTIN



Monetary Fund. In spite of that reinforcement, India's sterling balances fell between February 8th and March 8th by a further £18 million.

Higher Prices for Whale Oil

THE whaling companies have had some compensation for the reduction in the total permissible catch of baleen whales in the Antarctic this season: prices of oil have risen. Hector Whaling has announced that its whale oil has been sold for £90 a ton, £2 10s. more than last season. A year ago this company was unlucky, production of whale oil amounting to only 11,600 tons; this season it has recovered to 16,940 tons. Output of sperm oil, however, has fallen from 5,770 tons to 2,300 tons, but the price realised has risen by £16 to £85 a ton. Other companies also caught fewer sperm whales this season. Most of the other expeditions have obtained £90 a ton for their whale oil, though Union Whaling Company of South Africa, which fixed a price before the season began, obtained a little more. This was the company's last expedition before its fleet passed into Japanese hands. Of the total catch of whale oil this season about 50,000 tons remains to be sold.

How Much Have Stocks Changed?

ESTIMATES of changes in the value of stocks and work in progress in manufacturing industry derived from the provisional results of the 1955 Census of Production now available in the Board of Trade differ quite significantly from those that the Board calculates quarterly on the basis of a sample inquiry among the larger companies. For 1955 the sample inquiries suggested a rise of 13 per cent in manufacturing stocks; the estimates from the census of production, covering a much more representative selection of companies, put the rise at only about 10½ per cent.

This has no doubt already given rise to yet another round of revision in the Central Statistical Office's estimates of national income and expenditure—their preliminary White Paper on the figures for 1956 is due for publication within a fortnight. But accepting their margin of error, the quarterly inquiries give a useful indication of the trend of stock levels within a relatively short time. Last week, for example, the Board of Trade was able to publish its preliminary estimates for the last quarter of 1956. These suggested an increase of about 1 per cent in the value of stocks and work in progress, roughly the same as in the third quarter. Over the year, the sample inquiries suggest that manufacturing stocks would have increased in value by about 9½ per cent—though manufacturing output seems actually to have declined. On the face of it this does not say a lot for the average quality of British management of stocks; but the conversion of stocks of materials into stocks of finished goods will have been responsible for a large proportion of this addition to the total value.

Egyptian Held Securities

BRITISH banks have this week been informed by the Bank of England of new restrictions on security transactions by residents of the Egyptian monetary area. These restrictions are not intended as part of the financial blockade of Egypt. They are to protect the evacuees from Egypt. On March 15th all sales and exports of securities by or on behalf of residents of Egypt were made subject to the permission of the Bank of England. The true ownership of such securities is now often in question and the change is designed to prevent dealings in London without the consent of the true owner. But although the first intention is to protect evacuees, the protection could work in the other direction too. It might, for example, prevent the sale in London of securities serving as collateral against loans granted by local banks in Egypt. It therefore also forms part of the plan to immobilise financial relations between the two countries until the grand operation of claim and counterclaim can begin.

Pennies from Heaven

A STATISTICIAN with time on his hands might well set about measuring the economic consequences of the exceptional period of mild weather in Europe. The effect on the international grain trade and the freight market has been dramatic. The mild weather stimulated grass crops, so cattle required less compound feeding stuffs. Demand dropped, prices of feed grains declined and freight rates fell further. American maize now costs about £25 a ton cif UK, £4 10s. a ton below the post-Suez peak and nearly two-thirds of that fall represents cheaper freight. Some sellers of feed grains have had to accept prices well below replacement value. Weakness in Atlantic grain freights spread to freights for other commodities and other routes. Atlantic coal rates, for example, have now dropped by nearly a half to 65s. a ton. Since the beginning of the year Britain has used about 1¼ million tons less coal than in the same period of last year, in spite of switching from fuel oil; the weather has had a good deal to do with this. Industry's ration of fuel oil has gone farther than was expected.

Hens thought Spring had come and stepped up production. Egg prices fell, and British consumers are now paying only half as much for eggs as at the same time last year. In this case, however, the consumers' gain is the taxpayers' loss. The egg subsidy for the year ending this month was originally estimated at £12½ million; now it has gone up to £33½ million. Some enterprising merchants started an export trade in eggs—and the Danes are still smarting from the shock.

The Hermes Crash

LAST November a Hermes airliner owned by Britavia and carrying service families home from Tripoli was coming in to land at Blackbushe airport just before midnight. There were misty patches about the airfield; the pilot had asked for a "talk-down" landing and been told there would be a 30 minute delay. He decided to land without waiting since visibility reports from the ground were encouraging, but he came in so far below the correct glide path that one of the aircraft's wings sheared 10 feet off the top of a beech tree 3,600 yards from the runway. In the crash that followed, three of the crew were killed, and four children who had been passed out on to the wing by their mothers died in the subsequent fire.

The report of the court of investigation into the accident was published this week, and found no evidence to show why the pilot should have been flying so low. He might have been deceived by the patchy mist and the old-fashioned lighting at Blackbushe and failed to check his altitude with sufficient care but, says the assessor, "if any of these errors were made, it was probably due at least in part to some loss of alertness brought about by fatigue." The crew had been on duty for two periods totalling roughly 30 hours with a very uncomfortable 10 hour break at Tripoli airport between. These were exceptional conditions caused by the Suez operations; but they re-emphasise the real dangers of air crew fatigue.

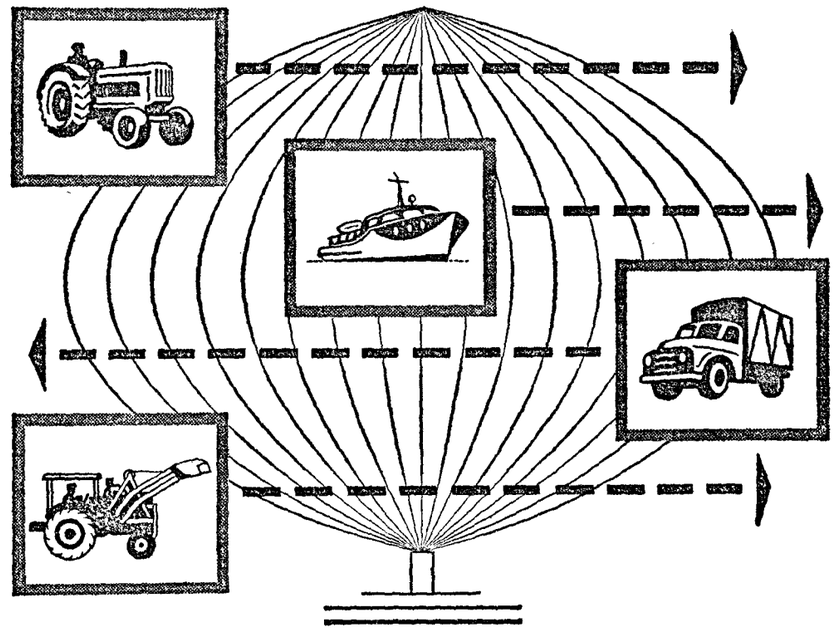
Report on the East

MR C. BLAKER'S annual statement to the shareholders of the Hongkong and Shanghai Banking Corporation is the most comprehensive of this season's reports from the eastern banks. Two points from it may command special attention. One is the bank's own experience. Advances and discounts of commercial bills rose sharply, and as deposits showed only a small increase, the bank had to make a considerable reduction in its portfolios of government securities and Treasury bills. This, he points out, partly reflects the impact of credit restriction in the United Kingdom, which increased demands on the bank and at the same time attracted deposits away from it to the high rates offered in London.

Mr Blaker is concerned also about the effect on the bank of recent legislation in India. The Reserve Bank of India has recently been given two disturbing powers—to vary the cash reserves that the scheduled banks are required to maintain with it; and to approve the appointment of their managers. These powers are said to be held only in reserve; but "circumstances change and policies with them"—as an example of which Mr Blaker cites India's State Trading Corporation, set up recently as a counterpart to the trade delegations of Communist countries, but now to some extent replacing private importers in trade with non-Communist countries.

Distillers in Pictures

AT the annual meeting of Distillers last September the chairman, Sir Henry J. Ross, reaffirmed the board's decision not to disclose any breakdown of the group's profit between its whisky and gin business and its rapidly expanding industrial sections. Instead he promised to give shareholders a clearer picture of the background and progress of the group's industrial enterprises. In that aim, the brochure illustrating the industrial activities of the Distillers Company succeeds. It tells shareholders the industries in which the Distillers Company is engaged and, within strict limits, the other companies with which it is associated in those enterprises. But only those companies in the United Kingdom in which Distillers holds 50 per cent or more are brought into the picture—a line so drawn that it excludes the relation between Distillers and United Molasses. Broadly the brochure does not tell shareholders anything about the earnings of those industrial enterprises, the extent of the group's investment in them, or which of them are profit makers. This is a handsomely produced brochure, but few hard financial facts shine through its glossy pages.



There are four main groups of the industrial products: (1) Chemicals, including solvents, industrial alcohol, carbon dioxide and salt; (2) biochemicals; (3) food, with yeast as one of the principal products; and (4) plastics, which includes British Geon, jointly owned with the American B. F. Goodrich Chemical Company and which produced 27,000 tons of polyvinyl chloride in 1956.

There is one other big group—British Hydrocarbon Chemicals, which Distillers owns jointly with British Petroleum. This has two offshoots: Forth Chemicals, in which Monsanto has a minority interest; and Grange Chemicals, in which the Oronite Chemical Company holds a minority. British Hydrocarbon Chemicals permits itself the distinction of a figure in the brochure. When its programme of expansion is complete the total investment will be about £22 million.

Too Much Sisal

SISAL is now steady at £72 a ton (cif UK) for the top grade of British East African fibre. The "Suez" advance of £4 a ton has been lost; the present price is only a little above the postwar trough of 1954 and it is £8 lower than a year ago. There is too much sisal.

ROUND THE WORLD WITH PERKINS DIESELS

In the depths of Canada's forests, or in the Australian bush, high up in the Chilean Andes or in the busy streets of India's cities, you'll find Perkins Diesel engines at work. Tropic heat or arctic cold—its all one to Perkins Diesel engines, for these rugged economical power units, are designed specially to stand up to the toughest conditions. Whatever the job, wherever it may be, every Perkins engine is backed by the famous Perkins world-wide service and spares organization. For vehicle, industrial, agricultural or marine use Perkins Diesel engines are unsurpassed.

***

World production has risen steadily. In 1956 output reached a new record of about 475,000 tons. Output in British East Africa, the largest producer, rose by nearly 11,000 tons to 226,000 tons and in Brazil a heavily subsidised industry is producing at an annual rate of about 100,000 tons. Production of henequen, a competitive fibre, is also growing. The bulk of it comes from Mexico, where cultivation enjoys government support, and is exported either as fibre or twine to the United States; that country is also the biggest single outlet for sisal.

World consumption in 1956 did not quite keep pace with production. Consumption in the United States declined with the cutback in motor car production; America now uses as much sisal for padding in car upholstery as for twine. European consumption suffered from the poor crops of hay and certain grains. Demand from the United States and Europe should improve this year, and there is a chance that sisal may benefit from the sharp rise in prices of manila hemp, with which it competes in the manufacture of certain small diameter maritime ropes. Demand for manila ropes from a flourishing shipping trade still exceeds the supply, despite the growth in output of manila hemp in the Philippines. Though prices have declined from the recent peaks most grades still cost more than twice as much as sisal, and this should encourage rope manufacturers to use more sisal whenever possible.

SHORTER NOTES

The directors of Lombard Banking are giving shareholders a true bonus issue. For every 16 ordinary shares held they propose to issue four 5s. ordinary shares and three £1 six per cent cumulative preference shares. This issue follows on an increase in the ordinary dividend from 25 to 27½ per cent and an advance in gross profits from £374,224 to £410,021.

★

The first British export business for an atomic power station has been won not by one of the five big design groups working for the Central Electricity Authority but by Mitchell Engineering. This company has undertaken work for the Atomic Energy Authority and is associated with American Machine and Foundary Inc. The order placed with the two companies by Rheinisch-Westfalisches Elektrizitatswerk is for a 15,000 kW power station with research facilities included in its reactor. It is worth $5.3 million, of which two-fifths goes to the American company for the reactor core and fuel, and the rest to Mitchell Engineering for heat exchangers and reactor vessel.

★

A coreless induction melting furnace that runs on current at 50-cycle frequency—taken direct from the mains—has been installed at Birmingham by Birlec, Ltd. This particular furnace has a capacity of 5 tons and is the first of this size and type to be installed in Britain—though they have been developed and used before in other countries. Birlec has been working for some time on induction furnaces with capacities larger than 15 cwt that will run on mains frequency; at these larger sizes they can be cheaper to operate than high-frequency furnaces. Birlec has orders for 14 more, ranging in size up to 15 tons, which will be among the largest induction melting furnaces ever built.

Company Notes

SWAN, HUNTER & WIGHAM RICHARDSON.—The broker in Throgmorton Street and the striker on Tyneside both know that shipbuilding profits are rising. But both may be surprised by the steepness of the rise achieved by Swan, Hunter and Wigham Richardson. Unaudited figures show that in the year to December 31st group income tax rose by nearly 32 per cent, from £2,579,666 to £3,398,860. Taxes went up accordingly, from £1,097,139 to £1,636,353.

But net profits attributable to the parent company still went up by 17½ per cent, from £1,380,100 to £1,622,472. The ordinary dividend was left unchanged at 14 per cent and absorbs £275,481. The shipbuilding strike may have ruled out the possibility of a dividend increase but the dividend decision also indicates that the board is still impressed by the need for investment in the group's modernisation and development programme—a programme made all the more necessary by the big order books of the shipbuilders. Ultimately investors expect some increase in the dividend, and since the jobbers had refused to accumulate stock when shipbuilding shares were being sold on Monday and Tuesday, the profit statement found them without much stock and produced a rise of 2s. 6d. in the £1 ordinary units, which now stand at 66s. 6d. and yield about 4.3 per cent.

IMPERIAL TOBACCO. Lord Sinclair's speech to the shareholders of Imperial Tobacco Company brought the price of "Imps" down from 44s. to 42s. 6d.; he made it clear that a reduction in the dividend is a serious possibility. The directors cannot yet forecast whether total profits in the current year will be such as to compel some reduction in the rate of the ordinary dividend; but, they say "in the circumstances of this year, so far as we can foresee them now, it is a possibility that cannot be ruled out." Trading profits in the current year will, Lord Sinclair foresees, be lower, despite "some further improvement in the return from trade investments"—a reference presumably to the group's holdings in British American Tobacco Company. These are the reasons he gave for expecting lower profits:

(1) Increases in tobacco duty have restricted consumption.

(2) So far this year sales have been maintained, but this may reflect some stocking up by distributors in anticipation of transport difficulties.

(3) Competition will be keener than ever and this will "entail appreciable increase in our selling expenses."

(4) There are no grounds for expecting manufacturing costs to be lower.

Last year the 21 per cent ordinary dividend was paid out of earnings of nearly 35 per cent.

THE BRUSH GROUP. This group never seems able to get out of the wood. The legacy of over-rapid expansion in the immediate post war years clings to its back like the old man of the sea. A comprehensive range of diesel manufacturing units was built up at the cost of big bank overdrafts that still overshadow the group's finances.

Again Brush provides cause for disappointment. In November, the directors passed the interim dividend. Now they have passed the final dividend also. In 1955 the ordinary dividend was 10 per cent. On this announcement, the 5s shares fell 6d. to 4s. 7½d. In explanation the directors say that "during 195[illegible] deliveries fell short of expectations and costs including wages, salaries and materials increased sharply. In addition there was a heavy increase in bank charges." The preliminary figures do not show whether this is purely the result of financing that leaves the company at the mercy of bank rate or means that it has actually borrowed more.

Much of the group's production is sold abroad. In these competitive markets, some trimming of margins last year was to be expected, and it indeed occurred. The group's turnover went up slightly, from £22,094,389 to £22,488,981, but gross trading profits fell from £2,339,959 to £1,878,104, so that the margin of profits on sales came down from 10.6 to 8.4 per cent. This is not the whole of the story. "Bank, mortgage and other interest" rose from £442,009 to £628,486 and, though the depreciation provision was reduced from £795,673 to £751,737, gross profits liable for tax were reduced from £1,123,346 to £521,149. That is one of the penalties of a highly geared and largely unfunded capital structure.

After tax, net profits were cut savagely, from £479,836 to £174,101. In 1955 the 10 per cent ordinary dividend absorbed £161,874 net. A maintained dividend was clearly not on the cards for a company that is so heavily in debt to the banks as Brush. What may have disappointed some investors is that the directors decided against any payment at all (if only a token one) on the ordinary capital. Such a decision hardly promises to bring the solution of Brush's capital problems any nearer.

★

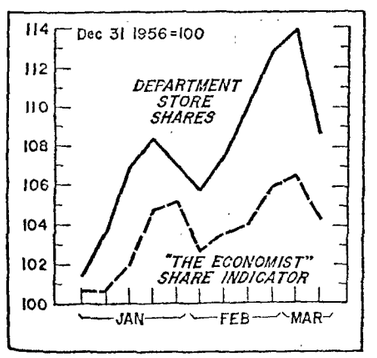
PRESSED STEEL. The convertible debenture is fashionable, and appropriate enough for the raising of money to finance growth. Whatever the immediate past or the near prospect of the car industry, growth over the next few years seems assured and Pressed Steel will play its full part in supplying bodies. That is perhaps the basis of the decision by the directors and their financial advisers, J. Henry Schroder, to issue £2 million of a 5½ per cent convertible debenture (1977-82) at par.

This debenture can be converted into 5s. ordinary shares between June 1, 1958, and June 1, 1961. The approximate conversion prices on the ordinary units are 14s. 3d. in 1958, 14s. 8½d. in 1959, 15s. 1d. in 1960 and 15s. 7½d. in 1961. If it were all converted on the earliest date it would enlarge the ordinary capital by £700,000. Currently, the 5s. ordinary units stand at 13s. 9d.; last year they touched a "high" of 20s. 1½d. and a "low" of 10s. The present price reflects the course of current trade and profits and not the ultimate potentialities of the motor industry. In

(*Continued on page* 1028)

Department Store Results

The key to department store trading is to sell a wide range of goods at a wide range of prices under the same roof and to offer the ancillary inducements of credit sales, delivery, and after-sales service. The rate of stock-turn is slower in these stores than in the multiples and the percentage mark-up is usually higher. But because of stock wastage, slow turnover of some lines, and mark-downs at sales, the gross profit earned by the department stores per £ of sales does not differ much from the average profit margins of the multiples. The department stores have been losing ground to the multiples (though less so than have the independent retailers). This trend may have been checked last year, simply because the department stores were less dependent on the hire-purchase trade. Department store managements have faced the fact and the prospect of strong competition by modernising the stores, improving their facilities and, in some cases, by switching their range of stocks to appeal to customers in the lower-middle range of income rather than to those in the middle-upper income brackets. All department stores faced increased costs last year and the patchwork pattern of their trading results largely reflects two factors: sites and management.



The most impressive result so far has come from the **Harrods** group (whose gross profits rose by 13¾ per cent). The parent store at Knightsbridge and the London subsidiaries, **Dickins and Jones** and **D. H. Evans**, made a useful contribution; here the sale of fashion goods which usually carry a higher mark-up has probably played a significant part. In the Liverpool and Sheffield stores results were also better; these stores are perhaps tied more closely to the custom of the wage-earner than some of the London stores. But in Manchester, **Kendal Milne**, which does a big business in hardware and furniture, was hit by the hire-purchase restrictions. A comparable result has come from another store, specialising in the fashion trade. The profits of **Bourne and Hollingsworth** have risen by 13½ per cent

Not far behind these results come those from the **Lewis's Investment Trust** group. The gross profits of the subsidiary, **Lewis's**, whose shops appeal for the custom of the wage-earners of the North and Midlands, rose by nearly 9½ per cent. Profits earned by the London subsidiary, **Selfridges**, went up by nearly 9 per cent.

The results of **Bentalls**, whose profits are up by about 7 per cent, is not much less satisfactory. Here the site in a growing suburban area is the key to success; it is a good example of the trend towards "taking the shop to the customer." The results of **A. W. Gamage**, which, while broadening its appeal, caters for the trade of the office worker and for the man and boy rather than the woman shopper, are not unsatisfactory. Its profits have gone up by about 3½ per cent, not out of line with last year's increase of 4 per cent in department stores' sales.

In view of this increase in sales, some of the other results are disappointing. The sales of the **John Lewis Partnership** group went up from £26.4 million to £27.7 million, but gross profits rose by only about 1 per cent, from £1,324,000 to £1,339,000. The directors attribute this result to an increase in expenses and to the effect of large-scale rebuilding. The interruption to trade caused by rebuilding may also help to explain why the profits of **John Barker** have fallen by over 8 per cent. A slightly smaller decline in profits—of 6 per cent—has been reported by the **Army and Navy Stores** in Victoria. But another store nearby, **Frederick Gorringe**, has reported an increase in gross profits from £64,996 to £74,937; its directors have held the ordinary dividend at 12½ per cent.

These results and the few dividend increases justify the slight premium that equity shares in department stores command at the moment over the general run of ordinary shares. But there is a patchiness in the results and the thrust of the multiples is vigorous.

STORE RESULTS—YEARS TO END JANUARY

Ordinary Shares	Gross profit (£'000s)		Net profit (£'000s)		Ordinary dividend (%)		Current price	Yield (%)
	1956	1957	1956	1957	1956	1957

Selfridges	1,274	1,387	511	539				

* Ex dividend. † Excluding capital distribution of 3½ per cent, tax free.

the prospectus gross profits last year are shown to have fallen from £2,582,064 to £2,190,160, and the full year's ordinary dividend has been reduced from 22½ to 15 per cent. A cut in the total payment of this order has been expected since the interim dividend was reduced from 7½ to 5 per cent in October.

The new issue will bring in £1,938,200 net, of which about £630,000 will be spent on increasing the company's facilities for making tools necessary for the pressing and assembly of motor car bodies; the balance will be used to reduce bank overdrafts, which at the end of February came to £1,784,550. From its own internal resources, Pressed Steel will find the £900,000 needed for a programme of rearranging and increasing factory space.

★

ENGLISH ELECTRIC. This year English Electric has done better than others in the electrical industry, and the chairman, Sir George Nelson, had a message of achievement and of hope for stockholders at the meeting. The order book for the home companies of the group at the end of the year was £180 million, compared with £163 million at the end of 1955. In 1956 the production of turbines and alternators at Rugby and Stafford had risen by 12 per cent to a new record, and the 480,000 kW of generating plant commissioned by the group for the Central Electricity Authority was also a record. The chairman is convinced that productive capacity is adequate to fulfil all the outstanding orders on due dates and believes that there is still immense scope for bringing electric power to all countries.

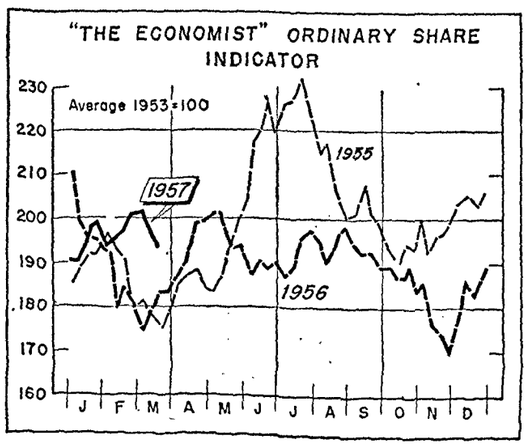
That hopeful review does not mean that he sees no clouds on the horizon. One of those *clouds is the report of the* Monopolies Commission which passed strictures on the electrical manufacturing industry. Sir George meets those criticisms in a spirit that seems quite unbending: "We shall endeavour to ensure that the stability of this great industry . . . is preserved." Another problem is the European free trade area. Here he finds himself on the horns of a dilemma—in favour of the idea yet afraid of what may develop from it. He fears that some of the countries adhering to it may continue to use open or concealed subsidy or differential export pricing amounting to dumping, and that British electrical manufacturers may not have as genuine a chance of tendering to continental utilities as continental manufacturers will have in this country. The crux is clearly in the words "amounting to dumping." *Do British* manufacturers, who complain bitterly of narrow profit margins on export business, claim that they never quote differential prices for export orders?

★

BRADFORD DYERS. The chairman of Bradford Dyers, Mr James Ewing, does not tell shareholders what contribution to group profits Beida Dyers used to make, but he does give an idea of the capital sums which should have accrued to Bradford Dyers from the sale of control of this Egyptian company, but which are now sequestered by Egypt.

Bradford Dyers held about 55 per cent of capital of Beida Dyers. Last June it sold 80,000 shares in that company for £E20 each to the Bank Misr and its associates. The profit on this sale was £1,305,432. Of the sales proceeds of £E1,600,000, £E220,000 was deposited with the Bank Misr in connection with a proposed issue of capital (as yet, it seems, unimplemented); £E500,000 was paid over at once to the British account; the remaining £E880,000 was deposited in Egypt pending transfer in two instalments. These now seem blocked and the Bradford Dyers naturally cannot say when they will be received in sterling.

In addition to these blocked deposits, Bradford Dyers still owns a minority interest of 54,740 shares of £E4 each in Beida Dyers. At the price at which control was sold, this interest was worth £E1,094,800, but just before the Suez hostilities the stock exchange value of this interest was £E1,861,160. This interest plus the blocked deposits give Bradford Dyers a total claim in Egypt of about £3¼ million for sequestrated property.



LONDON STOCK EXCHANGE

First dealings:	Mar. 13	Mar. 27	Apr. 10
Last dealings:	Mar. 26	Apr. 9	Apr. 30
Account Day:	Apr. 2	Apr. 16	May 7

BIGGEST losses in stock market prices were recorded on Monday. Falls in gilt-edged stocks that day sometimes exceeded one point; 2½ per cent Savings 1964-67 and 3 per cent Gas 1990-95 were both that amount lower, while 3½ per cent War Loan and 4 per cent Consols fell 1¼. Swan Hunter dropped 2s. 3d., Vickers 1s. 6d., and William Doxford, Harland and Wolff, and Hawthorn Leslie all lost 1s. 3d. Clarke Chapman fell 3s. 1½d., Babcock and Wilcox 2s. 9d. and Rolls-Royce 4s. 1½d. The volume of business contracted on Tuesday and Wednesday, allowing prices to settle and in later dealings on Wednesday when there was talk of a possible settlement in shipbuilding some of the lost ground was recovered by industrial shares, and some buying of gilt-edged also took place and improved in quality on Thursday. Over the week the *Financial Times* index of Government stocks fell from 88.25 to 86.56. *The Economist* indicator lost 3.9 to 197.3.

Although insurance shares were predominantly lower on balance, Legal and General jumped £3 to £32 on Wednesday, following the increase in dividend. Motors improved on Wednesday, regaining most of the earlier losses. Dowty rose a further 1s. 3d. to 34s. xd. Monsanto were quoted at 17s. xr, a fall of 1s. 3d. over the week. Parsons Marine jumped to 88s. 9d. on the bid by Richardsons Westgarth, and Swan Hunter after the profit statement rallied to 66s. 6d. Steel Company of Wales was steady at 9d. discount on the shares, 5s. paid. Among textiles, Howard Ford fell 1s. 7½d. to 5s. 9d. on the reduction in dividend. The buying of industrials expanded on Thursday.

Oils lost part of last week's improvement, but Shell was on balance 5s. higher at 174s. 3d. after touching 180s. Kaffirs rose on Monday, but turned dull again after the South African budget. Union Corporation rose after the dividend announcement. Coppers recovered to show scattered gains by Wednesday.

(1) This covers mining, manufacturing, electricity and manufactured gas with the following exceptions: Denmark excludes mining; Greece, mining and manufactured gas; Ireland and Sweden, electricity and manufactured gas; and Austria, manufactured gas. *Germany* excludes West Berlin. (2) Special trade (excluding re-exports) with the exception of Ireland which covers general trade with exports seasonally adjusted. Belgium includes Luxemburg. *Italy* includes Trieste. (3) New drachma introduced May 1, 1954 (1 new drachma = 1,000 old drachmas). (4) Thousand million drachmas. (5) Bizonal area. (6) Average for third quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended March 16th, 1957, there was an "above-line" surplus (after allowing for Sinking Funds) of £7,144,000 compared with a surplus of £55,822,000 in the previous week and a deficit of £21,687,000 in the corresponding period of last year. There was a net deficit "below-line" last week of £22,067,000, bringing the total deficit to £240,765,000 (£123,050,000 in 1955-56).

THE MONEY MARKET

The Treasury bill rate rose again at the tender on Friday of last week, following the reversal of the downward movement at the previous tender. The move was partly due to the strike threats, but it was also a tactical change in preparation for yesterday's tender, which includes the popular end-June maturities.

The discount houses cut their concerted bid by 6d. per cent last week (following the cut of 2d. the week before) to £98 19s. 4d. per cent; yet applications at this rate secured allotments of 34 per cent, compared with 21 per cent on the split tender of the previous week. Total applications were down by £67·4 million to £375·3 million, and the offer was up by £20 million, to £250 million. It appears that the discount houses may themselves have cut their individual applications, so that the rise in the allotment rate on the common bid exaggerates the movement in the market's portfolio.

Credit conditions in Lombard Street have continued stringent. On Wednesday the market faced not only calling for the monthly make-up of the clearing banks but also a drain of funds resulting from Monday's substantial purchases of sterling by the Exchange Account; the shortage necessitated large official purchases. Moreover, on the preceding day, before the impact of the exchange support was widely felt, credit was also very short, and despite fairly large official help most of the houses were "in" the Bank.

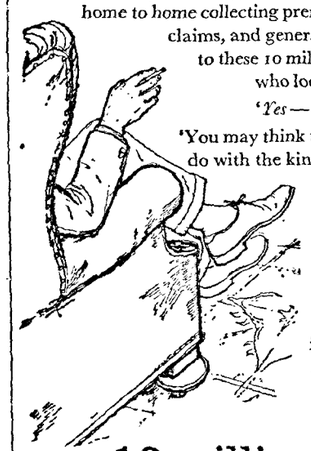
Who on earth can save?

'Save . . . save . . . save! That's all you hear these days. I ask you, who can save?'

'We all can, George. And we do; through our life assurances. And so do at least 10 million British families — through Home Service Insurance'.

'Ah! You mean this "man at the door" business?'

'Exactly, George. And do you realise that this "business" — Home Service Insurance — invests enormous sums in the country's economic welfare? Over £300,000,000 has already been invested in Industry and Commerce alone, while probably twice that amount has gone into Government Securities, Mortgages and the like'.



'Really? You astonish . . .'

'And these savings are now increasing at the rate of about £60,000,000 a year, which I think you'll admit is pretty good'

'Yes — but . . .'

'And all this comes about through that well known personality, the Insurance Man, who goes from home to home collecting premiums, paying claims, and generally being counsellor and guide to these 10 million families who look on him as a personal friend'.

'Yes — but how . . .'

'You may think that all this has nothing to do with the kind of insurances you and I hold. You couldn't be more wrong. The Home Service Insurance Man also does a substantial proportion of the "ordinary" life assurance business in this country, as well as a lot of fire and accident insurance. All in all, George, as an instrument of our economic survival, the Insurance Man is doing a good job of work'.

10 million families save through HOME SERVICE INSURANCE

FREE TRADE AREA—A MOST ENCOURAGING DEVELOPMENT

MR C. BLAKER ON NOTABLE EVENTS IN INTERNATIONAL SITUATION

The Ordinary Yearly General Meeting of The Hongkong and Shanghai Banking Corporation was held on March 15th at the Head Office, 1 Queen's Road, Central, Hong Kong.

Mr C. Blaker, MC, ED, the Chairman, who presided, said: Ladies and Gentlemen, the hour for which this Meeting was called having now passed, I will call upon the Chief Manager to read the Notice convening the Meeting.

Mr Michael W. Turner having read the Notice convening the Meeting and a representative of the auditors having read their report, the Chairman continued:

Ladies and Gentlemen, as you will see from the accounts before you the profit for the year amounts to $20,635,421, which represents a small increase over last year's figure. In accordance with our normal practice this profit has been arrived at after making transfers to the credit of our inner reserves out of which full provision has been made for all realised losses, the depreciation in value of our investments and all known doubtful debts and contingencies.

It is proposed that a sum of $4 million should again be written off Bank Premises and, after allowing for this transfer and the interim dividend of £2 per share, the directors recommend the payment of a final dividend of £3 per share leaving a balance of just over $11 million to be carried forward to next year.

Turning to our balance sheet, it will be seen that the total of our liabilities has remained virtually unchanged; a small increase in Current, Deposit and Other Accounts having been offset by a slight decrease in the total of Acceptances on behalf of Customers. In this connection arrangements were completed during the year for the establishment of a separate trust to administer the Staff Retirement Scheme and the funds of this scheme, which were previously included among the Current, Deposit and Other Accounts, were transferred to the trust during the year.

On the Assets side of the balance sheet, the main changes are increases of $144 million in Advances to Customers and Other Accounts and of $39 million in Trade Bills Discounted. As a result of the larger facilities granted to our constituents, the total of cash, call money and government treasury bills has decreased by just over $105 million. Investments have also fallen by $66 million due partly to the drop in the market value of British Government securities but also as a result of sales of investments, which were mainly in connection with the transfer of the funds of the Staff Retirement Scheme to the separate trust to which I have already referred.

The investment in an Associated Company, which is a new item in the balance sheet, represents our one-third interest in Bowmaker (CA) (Private) Limited in which we are equal shareholders with Bowmaker Limited and Tozer, Kemsley and Millbourn Limited. This Company was incorporated on May 29, 1956, to trade in Central Africa, including the Rhodesias and Nyasaland, but for the present it will be mainly concerned with the granting of hire-purchase facilities in these territories.

These are the main changes in our balance sheet, but I should like to say a little more about the rise in advances and trade bills which, as you have seen, has resulted in a drop in the total of cash, call money and government treasury bills. This rise is to a large extent due to the growing industrial and commercial expansion in South-East Asia, but that is not the only reason. It was not until the end of 1955 that the credit squeeze in the United Kingdom began to make itself felt in the eastern territories in which we operate, but during 1956 the shortage of credit to a greater or lesser degree became a matter of increasing concern to merchants and bankers alike. This was aggravated in our case by the fact that some concerns which had previously obtained a large part of their finance in London now turned to us, while on the other side, depositors took advantage of the high rates obtainable in the United Kingdom to transfer some of their funds there.

Governments also were not slow to follow suit and as a result the banking system in a number of territories was deprived of substantial sums at a time when the demand for advances, mainly for productive purposes, was very active. Even from a purely revenue-producing angle I wonder whether this action was wise. Has not the lure of higher interest rates caused them to lose sight of the increased revenue that would have accrued to them through taxation had the funds been available for local development? For the future growth of these territories an over-investment of government funds abroad must result in a slowing down of the pace, as this deprives the banking system of what is almost its life-blood.

I am afraid that as a result of the increasing demand for credit the standing of the borrower and the security offered are not the only considerations which have to be taken into account by our managers when approached for new facilities. The necessity to turn away business, which at other times would be most suitable, has, I am afraid, been forced on bankers in many parts of the world and we could hardly expect to escape. Nevertheless it is not a pleasant task and I hope that many of you in this room will realise—to quote a saying from our school-days—"that it hurts me more than it hurts you." In the interests of depositors and shareholders alike it would be most imprudent not to maintain a suitable degree of liquidity and, spread as our activities are over so many territories, this liquidity should, in our opinion, be higher than may be considered necessary by bankers whose interests are mainly confined to one single country. At December 31, 1956, the ratio of the Bank's readily realisable assets to its total liabilities was just under 45 per cent and, while your directors are satisfied that this is a safe margin, the drop over the last few years is a reminder that our ability to finance the capital and current requirements of our customers and friends must of necessity have some limitation.

The printed statement which is in your hands deals as usual with the political and economic situation in the Asian countries in which we are represented. We have tried in this statement to pick out the main developments which we thought would be of interest to shareholders but with the increasing activity that is taking place in all these territories, a great deal must of necessity be left out. On the whole the year was one of steady progress with an improvement in trade and your directors are very satisfied with the results, which would have been even better if it were not for a series of unfortunate losses which we suffered in Calcutta.

Since the time of the formation of the Bank the shareholders have been liable, in the event of the Bank being dissolved, for the full amount of the notes issued by the Bank; and have also been liable to contribute to the Bank's debts to the extent of the nominal value of each share. At that time such a liability was a usual condition for the establishment of a new bank in the Colonies in order to afford protection to the holders of notes and to the depositors. The growth of banks since these days has made such a protection unnecessary and recently in a number of instances arrangements have been made to do away with such a liability. In our case an amendment of the Ordinance is necessary and we have recently made representations to the government that this should be done. In fact, although there is provision for a small fiduciary issue of under $7 million, the note issue is fully covered by Certificates of Indebtedness and approved securities, while the depositors are protected by the very substantial reserves which have been built up.

I should like to take this opportunity of expressing our thanks to the Chief Manager, the Branch Managers and all our staff for their loyalty and efficient service to the Bank during the year.

Ladies and Gentlemen, The Report and Statement of Accounts having been in your hands for the required period I will now formally propose their adoption as presented.

After the proposal has been seconded I shall be pleased to answer to the best of my ability any questions which shareholders may wish to ask.

The resolution having been seconded the Report and Accounts were adopted.

CHAIRMAN'S STATEMENT

The following is the Statement referred to by the Chairman.

When our annual review was prepared last year there seemed hope that we could look forward to a slow but gradual improvement in international relations. True, many problems remained unsolved but a degree of stabilisation appeared to have been reached, sufficient at least to prevent any major disturbances from breaking out. The destalinisation policy gave evidence of a change of emphasis, if not a change of heart, in Russia and the benefit of co-existence was the theme of many of her leaders' speeches while the rest of the world seemed quiet. Unfortunately, these hopes were not realised and at one time during the year the world seemed very near to the calamity of a global war with all the destruction of life and treasure which such a catastrophe would have caused in this thermo-nuclear age. Dissension in Eastern Europe, due to dissatisfaction with living conditions caused to a large extent by the over-concentration of resources in the production of heavy industry, resulted in reforms in Poland and an armed uprising in Hungary: and in the Middle East the nationalisation of the Suez Canal by the Egyptian Government, coupled with their deteriorating relations with the State of Israel, set in train a series of events the results of which cannot yet be foreseen. Indeed, we have to go back many years to find an issue which raised so much controversy in the United Kingdom and elsewhere as the intervention of the British and French forces in the fighting between Israel and Egypt, and the passions raised by that intervention have not yet died down. On the whole, little pleasure can be found in looking back on the events of the past year. Some of the legacies, which will be with us for some time to come, are the damage which has been done to Anglo-American relations, the closing of the Suez Canal and the difficulties which the shortage of oil has caused to the economies of Western Europe; but there are many others. There is, however, a little comfort to be gained from the fact that shattering though some of the incidents were, causing as they did misery to many helpless people, the disturbances were to a great extent localised, and the fear of starting a world conflagration seemed to prevent action reaching the point of no return.

Economically industrial production continued to increase, although at a slower speed than in 1955, and a growing intensification of the restriction of credit began to make itself felt. In the United Kingdom the first six months showed a steady improvement in the gold and dollar reserves—evidence that the deflationary measures imposed were proving successful—but from July onwards external factors began to come into play and economic conditions were dominated by events in the Middle East which culminated in a loss of nearly £100 millions in the sterling area reserves during November. Steps taken in December to mobilise all available resources seem to have been successful in stopping this drain and the technical position of sterling has since been greatly improved thus enabling the inherent strength of the economy to reassert itself. The stability of a currency is not, however, decided by technical considerations—important though these are in the case of sterling, in which currency such a large part of world trade is financed—and, while the short-term outlook is reassuring, it is only by a steady and substantial increase in the reserves that a permanent solution can be found. If it has done nothing else, the Suez crisis has clearly shown that the United Kingdom has been endeavouring to undertake larger responsibilities than the economy can bear. The present size of the armed forces is a case in point and recent announcements show that a determined effort is now being made to tackle this problem and this should do more than anything else to reduce the level of government expenditure, the need for which has been stressed from so many platforms.

Since the war there has been considerable support for the proposal that some form of integration of the economies of western Europe should be evolved, which, by the pooling of resources, would enable this area, with its large internal market, to compete on more equal terms with the United States and with the growing economic strength of Russia. Such an area would be immeasurably strengthened by the addition of the United Kingdom, but the difficulty of combining her Commonwealth obligations with the membership of a European union has always in the past proved a stumbling block. Opinion in the United Kingdom has, however, changed, and in a recent White Paper the Government recommended to the Organisation for European Economic Co-operation that subject to reservations on agriculture, general approval be given to the creation of a "European Industrial Free Trade Area" which would associate with the European common market composed of France, Western Germany, Italy and the Benelux countries. At a meeting held in Paris shortly after the issue of this White Paper, seventeen western European nations agreed to enter into the necessary negotiations and Mr Thorneycroft was appointed chief co-ordinator. In this proposed free trade area tariffs and quotas, against imports from countries within the area, will be abolished progressively over a period of years but each country will be permitted to retain its own individual tariffs against the outside world as opposed to the common market, where there will be a standardised tariff with non-members. Although a number of differences have still to be ironed out a great step forward has been taken towards the setting up of this free trade area which, if it comes into being, will be one of the most encouraging developments in world trade that has been evolved since the war.

Another important event, which took place in the United Kingdom during the year, was the formal opening by Her Majesty the Queen, in October, of the world's first large scale nuclear power station at Calder Hall. This project is a considerable achievement which not only marks the beginning of the generation on a large scale of electricity from the atom but may also result in the development of an export market with tremendous possibilities. Already there are reports that the Japanese are showing interest in the purchase of a power reactor of the British Calder Hall type.

In Asia the international situation has remained quiet and although, as I pointed out last year, a number of problems remain unsolved there were no developments, apart from several internal incidents, which disturbed the peace of the area. The disruption of shipping through the Suez Canal delayed and increased the cost of many of their imports from western Europe but so far this has not caused any undue strain on the economies of the various countries, while on the short view at least, Japan has benefited. In many of our annual reviews since the war the importance of agriculture has been stressed and we have tried to point out the dangers of a too speedy move towards industrialisation; but the desire to bring about an increase in the standards of living of the people has caused governments to draw up plans which, if successful (and some of them so far have been fairly successful) will result in an extremely rapid enlargement of industrial resources. The increase of consumer demand which a large capital investment is bound to create and which precedes—often by some considerable time—the wealth generated by that investment, presses most heavily moreover on food prices and it is for this reason that the improvement in agricultural production at such a time is so necessary. As the report by the Council for Technical Co-operation in South and South-East Asia 1955/56 puts it "food is the basic sector of production" and this is borne out by a study of conditions in various countries where it is usually found that a favourable harvest is the best tonic for their general economic health. Recent events in Eastern Europe have shown that, even where the whole economy of a country is ruthlessly planned to the accumulation of fixed capital, there is a limit to the extent to which industrialisation can be pushed forward unless agriculture keeps pace. Unfortunately during the year under review agricultural production did not show any marked increase in Asia and while not in any way overlooking the part that weather conditions can play, particularly sudden natural disasters such as floods, one is left with the feeling that in many countries insufficient resources are being allocated to the agricultural sector. These remarks of mine will, I hope, not be misunderstood. The need for rapid industrialisation in this day and age cannot be questioned and enlightened self-interest alone would lead us to give this movement every encouragement: but this does not get away from the fact that under conditions which exist in most of Asia, with growing populations, the increase in industrial development should not move at such a high speed that the production of basic food-stuffs and other necessities of life is unable to keep pace.

AID FOR UNDERDEVELOPED COUNTRIES

The Colombo Plan continued to play a large part in furthering development in South East Asia and it is encouraging to see how mutual aid has increased particularly in the provision of training facilities. The Consultative Committee in its report, published after its annual meeting in Wellington in December, stresses the desirability of flexibility in development programmes, the importance of providing "sufficient opportunities for productively employing the ever-increasing human resources of the area" and the need to maintain a proper balance between consumption and investment. The Committee also expressed the hope that "increased opportunities may develop for drawing on foreign private investment." This is certainly true and I trust that a suitable climate will be created to encourage this investment. United Nations agencies continued to play their part while aid has been provided by the United States of America on a generous scale through various channels. The International Bank for re-

construction and Development also made substantial loans including one of US$75 million to the Tata Iron and Steel Company Limited of India which is the largest loan for an industrial project so far made by that bank; and its offspring, the International Finance Corporation, came into being in July and announced its intention of concentrating upon investment in less developed countries in association with private investors. The International Bank has proved itself one of the most successful international organisations set up since the war and I hope that, with the experience of its parent at its disposal, the International Finance Corporation will be able to make a useful and increasing contribution towards the economic development of its members in the private sector in which it will specialise. In our own small way we are doing our part and we have interests in two development corporations, one in India and the other in Ceylon, while consideration is being given to the setting up of a similar organisation in the Federation of Malaya. These corporations are intended to grant finance on a rather longer term basis than banks normally provide.

HONG KONG

Hong Kong has been fortunate in recent years in avoiding any serious internal disturbances and for this a great deal of the credit is due to our efficient police force. Unfortunately in October an incident, which started as a comparatively minor dispute in one of the resettlement areas, was exploited by criminals and gangster members of the Triad Societies to develop into the most serious riots the Colony has experienced since the war. The Governor in a memorandum to the Secretary of State for the Colonies, stated that "there is no evidence whatsoever to suggest that the riots in Kowloon were planned beforehand. On the contrary, all the indications are that they started spontaneously" and he went on to show that the crowded resettlement blocks, which it was necessary to build in urban areas in order to enable the inhabitants to be housed near their work "explains the dryness of the timber which was waiting to be ignited by any suitable spark."

The continuing rise in the population due to the large influx from China and the natural increase—excess of births over deaths—influences every sector of the community's life and it compelled the government in September to reintroduce the quota system for Chinese entering the Colony. That this move was inevitable was borne out by the fact that during the six-and-half months when these restrictions were lifted there were over fifty thousand immigrants and this, if allowed to continue, coupled with the natural increase of about seventy-five thousand persons, would have imposed a strain on the Colony's resources which it would be quite unable to bear. The interim report of the Special Committee on Housing in Hong Kong, which I mentioned last year, estimates that even to prevent living standards from deteriorating it will be necessary to build "the equivalent of one new town, not much smaller than York, each year" which gives some idea of the magnitude of the task. This problem was dealt with at considerable length by the Governor in his recent speech in the Legislative Council and the progress so far made in resettlement and in the construction of new housing generally is, I think, remarkable. It is nevertheless not enough. Hong Kong has prided itself since the war on what has been achieved by its own efforts and I hope that we shall be able to continue to be self-reliant for our normal development but the task of resettlement is something quite different. The time is rapidly approaching—if it is not already here—when assistance from some outside agency will become essential and the riots emphasised how urgent this problem is. It is, therefore, all the more encouraging that the executive committee of the United Nations Refugee Fund recently agreed to ask the General Assembly to consider the problem.

When we look at the year as a whole, however, we find that once again there has been an improvement in practically every field of economic endeavour as some of the figures I shall give will show. The Tai Lam Chung reservoir project was inaugurated this month by Lady Patricia Lennox-Boyd; progress on the airport is reported to be up to schedule; a development plan has been announced for the Hung Hom district of Kowloon; and building activity continues to be seen in every part of the Colony. The proposal to construct a tunnel or a bridge across the harbour has been the subject of a considerable amount of discussion during the year but the government has decided that the cost of either of these projects is not at present justified.

The competition which the United Kingdom cotton industry is facing from imports of piece-goods from India and Hong Kong has been the subject of numerous statements in the press and questions in the House of Commons. Led by Sir Cuthbert Clegg, a delegation from the industry visited both India and Hong Kong at the beginning of this year to discuss this problem. It was proposed that the local industry should voluntarily agree to limitation of exports of cotton cloth to the United Kingdom at an agreed figure and this suggestion is being examined. Even if certain sections of the industry are willing to co-operate, however, there seems little chance of bringing the garment-making industry into the scheme. This is very much of the cottage type of industry with no organised form of association and this makes any limitation unworkable. In view of the publicity that has been given to the competition from Hong Kong it is, I think, worthy of mention that the spinning industry here comprises just over three hundred thousand spindles while in the United Kingdom there are reported to be something in the region of 25 million spindles in active operation.

HONG KONG'S TRADE

Hong Kong's trade in 1956 increased by 24 per cent in value while volume rose by 12 per cent. Exports showed a greater improvement than imports with Indonesia moving into first place, while exports to Japan and Thailand were substantially higher. The increase in imports was fairly well spread with Japan and China making the most progress. Imports from China at just over $1,000 million were the highest since the war and although the trend continued for exports to that country to be lower, the drop was not so severe as in 1955.

Exports of Hong Kong products increased by 7 per cent and comprised about a quarter of the Colony's total exports. The United Kingdom continued to be our best customer for local products, but total exports to that country are still only 60 per cent of our imports from there, a point which some people in the United Kingdom seem to overlook. These figures illustrate the importance to Hong Kong of its local industries, which continue to play a growing part in the Colony's economy. No less than 488 new factories were registered during the year, as opposed to 372 in 1955.

Business on the Stock Exchange showed a fall of about one-third compared with 1955, but the market was in a much more healthy state and the boom seemed to have spent itself. Land values continued to rise, although the number of properties that changed hands was considerably lower with buyers becoming more selective in their purchases.

The bank clearing figures for the year increased by 10 per cent to around the equivalent of £950 million, which has only been exceeded once before, in the year 1951.

FINANCES OF HONG KONG

Once again the Financial Secretary, Mr A. G. Clarke, in his speech in the Legislative Council when he presented the Budget, was able to report a very satisfactory state of affairs. A surplus of just under HK$15 million is expected for the current year as revenue on what he describes as "luxury taxation" has been particularly buoyant while expenditure is again below the estimate. For the financial year 1957/58 a deficit of HK$54 million is estimated, but shareholders, who have followed the trend of the Colony's finances and observed how conservative these estimates seem to be, will perhaps feel, as I do, that this gives no cause for alarm. It is interesting that the government is considering dealing with capital items in a separate Budget as an amount of HK$150 million in next year's estimates represents this type of expenditure. The airport and Tai Lam Chung reservoir comprise 40 per cent of this amount. There is also an allocation for the preliminary work on a new reservoir which is to be built on Lantao Island and this will take about six years to complete. For the first time since the war details are given of the assets held by the government against their liability for the Certificates of Indebtedness held by us and the two other note-issuing banks as security for our respective note issues. These assets on December 31, 1955, were 108 per cent of the liability with 37 per cent in the form of cash, money at call or short notice.

CHINA

Conditions in China are a matter of considerable interest to all the countries in South East Asia and nowhere is this more so than here in Hong Kong. Unfortunately, information until recently has been scanty and reliance has had to be placed to a large extent on official publications and on impressions of returning visitors whose movements have in some cases been limited; but lately there has been a welcome increase both in the number of visitors permitted to enter the country and in the extent of their travel when there which is enabling us in Hong Kong to hear eye-witness accounts of what is happening. There has also been a certain amount of criticism from China's own leaders, which has shown up where some of the weaknesses lie, and statistical information has been considerably improved. In fact a great deal of literature is available; but the achievements of the present administration are still so much a subject of controversy that much of this takes a partisan view, giving credit or awarding blame according to the ideology of the writer. In spite of these qualifications on any opinion which is formed there seems no doubt whatever that the progress in industrial development that has been made in the last few years is substantial and that the first stages of the welding of farms into collective units have been, to a large extent, completed. To what degree this has reflected the wishes of the people, or how lasting the collective pattern will be, is difficult to estimate but the speed with which this has been brought about must have exceeded expectations.

The construction of new railways has also been particularly impressive and it is claimed that over 2,500 miles have already been completed. One of the most ambitious of these projects is the line linking Lanchow with the Soviet network some 1,700 miles away. This has already passed the oil fields of Yumen. It may be more difficult to get these new lines into full operation, as there are reports of breakdowns and a lack of maintenance on existing railways, but this does not in anyway diminish the credit due for what has already been achieved.

The first National Congress of the Chinese Communist Party since the Yenan Congress in 1945 was held in Peking in September. At this meeting progress in the first five-year plan was discussed and many errors were admitted by the official spokesman. These covered the setting of higher targets for capital projects than the production of building materials warranted, the neglect of industry along the coast (it was pointed out that this area still produced over 60 per cent of China's consumer goods), and too low a wage structure. In considering the second five-year plan Mr Chou En Lai stated that it was their policy to build "with heavy industry as its core" a comprehensive industrial system within three five-year plans. Special emphasis would be given to the metallurgical industry and it was hoped to raise the national income by 50 per cent by 1962. This was, however, before the disturbances in Eastern Europe; and since that time there is evidence that the lesson of these events, coupled with a less satisfactory agricultural output than was expected, has resulted in the targets of the plan being revised. It is significant also that free enterprise has been given greater scope in minor industries and handicrafts and a free market has been permitted in many items in daily use, both of which seem likely to benefit the consumer. During the year certain other relaxations have been made such as the campaign to employ "intellectuals" without too much inquiry into their political activities and the permission for the circulation of text-books published in the West. These are all signs that some of their original plans require modification but it would, I think, be a great mistake to assume that any real change has occurred in the basic policy of the regime, which is to increase the industrialisation of the country at as rapid a pace as the economy will bear. It seems likely, however, that the trend in Eastern Europe of diverting production towards consumer goods may slow up, or even halt, deliveries of heavy industrial equipment to China, and this may necessitate some adjustment. No doubt Mr Chou En Lai's interruption of his Asian tour to visit these countries was not only concerned with political matters.

Trade with China continues to be restricted by the embargo but it was announced in the House of Commons in May that more use would be made "of the exceptions procedure to permit reasonable exports in appropriate cases to China of goods which are not on the Soviet lists." While this move is welcome as far as it goes it has not proved so helpful as it was hoped, due to the absence of precise lists and the delay in dealing with applications.

An exhibition of China produce and manufactures was held in Canton from November to January and was visited by many Hong Kong merchants. The layout was excellent and not only showed the wide range of products, which we all here know so well, but also included examples of what their new industries are turning out. Many of these items were for export and there is plenty of evidence, here in Hong Kong, of the increase in the range of goods available from China.

JAPAN

In Japan the year was marked by steadily increasing economic expansion with continuing instability on the political scene. The index of industrial production in November was higher by over 25 per cent compared with the figure for the previous year but internally this does not seem as yet to have caused serious overstrain. While the cost of metals and machinery rose and there were bottlenecks in both transportation and electric power the prices of basic cloth and food-stuffs remained steady but in January the consumer goods index moved up sharply. Unless this is temporary it may be a sign that demand is beginning to press where it can do most harm. Interest rates continued high but bank advances have steadily increased, resulting in a rise in the level of borrowing from the Bank of Japan.

Shipbuilding in particular has been extremely prosperous and, aided by their early delivery dates, the industry has taken advantage of the world demand for shipping, particularly tankers, and Japan last year turned out 1,746,000 tons of shipping, double the previous year's total. Output of textiles also increased and exports have been rising which has not been welcomed by the competing industries in the importing countries, particularly in the United States of America. As a result of protests from that country the Japanese have agreed to a voluntary limitation of textile exports to 235 million square yards per annum. An interesting innovation to encourage exports has been the floating fair of Japanese machinery which is moving round various ports in South East Asia. This fair is housed on board a freighter which will spend a few days in each city.

The demands of industry caused a higher level of imports, mainly of raw materials, but, helped by another good rice crop and a world demand for her exports, it was still found possible to maintain a favourable balance of payments. As usual this was mainly due to invisible items as payments for exports, and imports were almost in balance at US$2,400 million but the foreign exchange surplus was just under US$300 million as opposed to US$500 million in 1955.

In spite of Japan's favourable overall balance her holdings of sterling have shown a considerable drop during the year and negotiations, which have been in progress in London since October, have recently concluded with the signing of a new trade agreement. It seems that the delay in reaching this agreement was caused by the different approach of the two Governments. Japan considered the drop in her sterling holdings as justification for requesting increased imports by the sterling area of her goods; but the United Kingdom argued that, as sterling could now be used for many types of payment outside the sterling area, balanced trade with individual countries was a relic of bilateralism and was now out of date. For the same reason the United Kingdom does not want to enter into a new payments agreement.

The budget which has recently been presented in the Diet shows increased expenditure of around Yen 100 billion. In view of the favourable conditions enjoyed by industry it is proposed to reduce personal income tax but it is anticipated that this will be more than covered by higher revenue from other taxes.

When we turn from a survey of economic conditions and look at the political picture the outlook is not so promising. The emergence of the two-party system, which I mentioned last year, has not brought with it any feeling of party cohesion and politics are still bedevilled by the rivalry of numerous factions. This party strife did nothing to improve the Japanese prospects in their negotiations with Russia, where the dissensions and rivalry of the various political groups at home weakened a hand which was never particularly strong. The Japanese also found, as others have found before them, that the Russians were hard bargainers and the talks, which in the summer were resumed in Moscow, seemed for a long time to be making little progress. Finally in October an agreement was signed, and in December, at a ceremony in Tokyo, the ratification instruments were exchanged and the restoration of diplomatic relations became an accomplished fact. A few days later Japan was elected the eightieth member of the United Nations. This entry into the international organisation has given great satisfaction to the Japanese and has, to a large extent, tempered their disappointment over the failure to obtain satisfaction over their territorial claims. In this connection it seems unlikely that any progress will be made over the return of the Southern Kuriles, and while the islands of the Habomai group and Shikotan are to be returned on the signing of the Peace Treaty there is no indication as to when this will be. In the minds of many Japanese a reappraisal of future relations with China seems to be the next step but a settlement of this problem is likely to require a high degree of diplomatic skill.

While these events were taking place the Liberal-Democratic Party was endeavouring to find a new leader as Mr Hatoyama had announced his intention of retiring. The personal rivalry between the various leaders made agreement difficult and it was not until a second ballot that Mr Tanzan Ishibashi was elected and later formed a government. This government was short-lived as Mr Ishibashi was obliged to resign due to ill-health. Mr Kishi became the new Prime Minister but continued to retain the portfolio of Foreign Affairs while the Cabinet was practically unchanged. Recent developments unfortunately have not provided any evidence that the members of the party have buried their quarrels and the factional affiliations still seem as strong as ever. Although so far the political instability has not had a damaging effect on the country's economy there are many problems both in the domestic and international fields requiring attention which is unlikely to be given as long as the present dissensions remain.

PHILIPPINES

The year 1956 was, on the whole, a good one for the Philippines. The political situation remained unchanged and President Magsaysay personally continued to enjoy the support of the majority of the nation, although this does not extend to all members of the administration. There was general satisfaction that the country became a member of the Security Council and that Governor Miguel Cuaderno of the Central Bank was elected Chairman of the Board of Governors of both the International Monetary Fund and the International Bank.

Economically there was general prosperity and, from such statistics as are available at the time of writing, it appears that activity in most sectors was at a higher level than in 1955. Exports were larger, which was mainly due to increases in shipments to Europe and Asia as trade with the traditional market of the United States showed a slight fall. Due to curtailment of licences, imports were on the whole lower, particularly consumer goods, but there was an increase in the purchases of machinery. As a result the foreign exchange reserves showed a slight increase, but this was still dependent to a large extent on United States Government expenditure. The expansion of the economy, coupled with the reduction in the imports of consumer goods, had its effect on prices which tended to rise while a considerable increase in the supply of money gave warning of the inflationary dangers ahead. These

were referred to by the President in his State of the Nation Address, in which he stated that "we will continue to adjust our foreign exchange allocations to the demand for essential consumer goods without impairing the requirements of high priority projects." To achieve this balance will not be easy, and the President dismissed suggestions that the time was ripe for the removal of economic controls. On the contrary, he recommended that Congress reconsider the "No Dollar Import Law," which permitted a considerable amount of barter trade, as this measure was being abused. The suggestion that the peso should be devalued has been heard again from many quarters, but this proposal is strongly opposed by the Governor of the Central Bank, who does not feel that it would be in the best interests of the country.

The agreement covering reparations was made with Japan during the year which provides for the supply of capital goods to a total of US$500 million over a period of 20 years. Detailed implementation of this agreement seems to be making little headway and the Philippines are anxious to terminate the trade agreement with Japan and substitute payment on a cash basis. Although relations with the United States continued to be friendly, little progress seems to be being made over the revision of the military bases agreement.

VIETNAM

Although many of the difficulties facing the Republic of Vietnam, which I mentioned last year, still remain, considerable progress has in fact been made. The war against the sects has been brought to a successful conclusion, a large number of the refugees have been effectively resettled and the area under law and order is being rapidly enlarged.

The new constitution has been drawn up and, although this gives the President of the Republic very strong veto powers, for a time at least, in a country which has suffered from so much dissension, such powers are probably necessary. Steps are being taken, although possibly not fast enough, to introduce land reform. This will restrict the area of land suitable for growing rice which may be held by one individual. These are all considerable achievements, but the economic situation still gives cause for concern. Production of rice is still very low, in spite of efforts to develop hitherto unproductive areas and to replant rice fields abandoned during the hostilities, and exports of rice were not found possible in 1956. These have since been resumed on a small scale, but the price may make any large increase difficult. Little progress has been made in industrial development, and inflation has become a serious threat, in spite of the large amount of American aid. The recent reorganisation of the import trade, by reducing the number of those engaged in it and the fixing of profit margins, at both wholesale and retail level, is aimed at lowering prices, but this can only have a limited effect. Moreover, the decision that all Chinese born in Vietnam would henceforth be Vietnamese nationals, and that non-Vietnamese nationals would be prohibited from participation in the retail trade has had a damaging effect on the confidence of the Chinese, who are particularly interested in this trade. For a long-term solution to their economic difficulties it would seem to be necessary to press ahead with increasing the area under rice cultivation and the setting up of secondary industries; but the most immediate problem is to bring down the cost of living.

CAMBODIA

Prince Sihanouk continues to retain the confidence of the people and to wield considerable influence whether he has been in office or out of it. Strict neutrality is the declared policy of the country and the two-year capital investment plan is being largely financed by aid from abroad. Rice exports, which were banned early in the year, are to be resumed, as this year's harvest is reported to be excellent. Progress is being made in the construction of the road to Kompong Som, and when this is opened it will enable this new port to serve the capital.

THAILAND

The cautious optimism I expressed last year regarding the future of Thailand appeared to be borne out by events in 1956. There were signs of more political stability, and the differences between rival personalities, which had in the past hampered the administration, seemed to be less marked. Unfortunately the elections, which were held at the end of last month, resulted in a certain amount of unrest and it was necessary to declare a state of emergency. These disturbances seem to have been brought under control, but the fact that they occurred shows that "caution" is necessary in any appraisal of events in this country. Economic conditions were satisfactory and the operation of the Stabilisation Fund ironed out excessive fluctuations in exchange rates, while the over-stocked condition of the consumer goods markets showed considerable improvement. The balance of trade, however, was slightly adverse during most of the year as imports continued at a high level, which had a beneficial effect on the revenue. This was considerably higher than expected and resulted in income exceeding ordinary expenditure in the revised estimates for 1956, while a small surplus is estimated for 1957. Capital expenditure will remain at about the same level and the overall shortfall will as usual be financed by loans and American aid. This aid is most beneficial to the economy of the country, enabling deficit financing to be avoided, and has kept the cost of living and money supply comparatively stable; while a large appropriation is being used in the construction of strategic roads which will be of great commercial value. Shipments of rice, which earlier were lagging behind the level of 1955, increased during the last two months, due to reductions in export premiums, which enabled the total for the year to be some 13,000 tons more than for the previous year. Rubber exports were a little higher, and estimated figures for both production and exports of tin indicate an increase of some 15 per cent. As can be seen, Thailand seems to be in a very happy position which should continue during the current year provided there is no further internal disturbance.

FEDERATION OF MALAYA

The Alliance Government has now been in office for over a year and steady progress has been made, both in the conduct of the day-to-day administration and in the movement towards full independence, while many of the changes agreed upon at the Constitutional Conference in London last year have already been brought into force. The Chief Minister, Tengku Abdul Rahman, who also holds the portfolio of Internal Defence and Security, became chairman of the Emergency Operations Council and in July the Federation Armed Forces Council was inaugurated and has already set about the establishment of a self-contained local force. A Constitutional Commission was appointed early in the year under the chairmanship of Lord Reid and toured the country receiving recommendations from various interested bodies. Their report has recently been published, but it is not possible to do more than touch on it here. A strong central government with a common nationality for the whole of the Federation and "a measure of autonomy" for the States and Settlements are among the recommendations. Provision is made for a constitutional Head of State for the Federation and for the Settlements becoming States in the new Federation. The need for safeguarding the special position of the Malays has been recognised and the qualifications for citizenship follow the proposals of the main parties.

At a further meeting between the Governments of the United Kingdom and the Federation of Malaya, held in London over the end of the year, negotiations were satisfactorily concluded on the terms of the defence agreement "under which Her Majesty's Government will undertake to assist the Federation Government in the external defence of its territory and in the training and development of its own armed forces while the Federation Government will confer on Her Majesty's Government the right to maintain in the Federation the forces, including a Commonwealth strategic reserve, necessary for the fulfilment of Commonwealth and international obligations."

As a result of this preparatory work the scene is now set for the transference of power on August 31st and the Federation of Malaya will then take its place as a self-governing member of the Commonwealth. On the whole their future prospects look favourable. The Alliance Government retains the support of the majority of the population and the economic outlook seems bright with a continuing world demand for their primary products. The Emergency continues as a dark cloud on the horizon as, although much success has been achieved, the terrorists remain active and the cost continues to be a heavy drain. Other problems spring to mind, such as the adjustment of racial interests and the relations between the Federation and Singapore, but the present government has built up a considerable store of goodwill which should, provided tolerance is shown on all sides, enable them to get off to a good start.

The present position of the finances of the Federation was dealt with clearly and concisely by Colonel H. S. Lee, the Minister of Finance, when he introduced his first budget. The estimates showed a prospective deficit of M$145 million for 1957 which would reduce the realisable general revenue balance to M$136 million by the end of that year. This was considered to be below the safety margin and, for this reason, changes in direct and indirect taxation were brought into force. Briefly these covered increases in income tax in the higher income brackets, new taxation affecting motor cars, the raising of certain import duties and an excise duty on locally grown tobacco. This increased revenue was expected to reduce the deficit to M$110 million. The estimates for capital projects already approved show that a little over M$200 million will be required in 1957 with not far short of M$400 million thereafter. This finance is being provided at present by advances from the treasury but a funding operation will require to be undertaken sooner or later. Many other schemes for development are in course of preparation and it was in the light of this heavy expenditure that the financial discussions were held in London concurrently with those on defence which I mentioned above. It was agreed that the United Kingdom Government would provide some financial assistance towards the continued cost of the Emergency and would help in the expansion of the armed forces. These arrangements, although perhaps on a smaller scale than was hoped for, should assist the Federation in their development

plans and, before leaving London, Tengku Abdul Rahman stated that "every encouragement would be given for the flow of foreign capital to Malaya to help the country's economic development." This is a very welcome statement as foreign capital investment and, what is perhaps more important, the technical assistance which is likely to come with it, will be essential to the Federation for many years to come.

TIN AND RUBBER

In the first six months of the year the price of both these commodities moved gradually downwards, but this trend was halted in July due to developments in the Middle East. For the rest of the year there were considerable fluctuations with a sharp increase in both prices during November and December. This rise has, however, not been maintained.

The International Tin Agreement came into force on July 1, 1956, and contributions have already been made by members, all of them so far in cash. At the meeting in December of the International Tin Council it was agreed to review the present floor and ceiling prices and a report is expected to be submitted to the next meeting, which will be held this month. While the introduction of this scheme should, on the whole, have a stabilising influence, to operate efficiently the buffer stock should hold both cash and tin, but, as the manager of the buffer stock is not permitted to buy until the price is below £720 per ton, there is little prospect of acquiring any tin at the present time. From January 31, 1957, the buying of tin by the United States Government for stockpile purposes ceased and the smelter in Texas was sold to a private concern.

Tin production in Malaya increased by a little over one thousand tons compared with 1955, while exports were the highest since 1950.

The rubber-replanting scheme, which is so vital for the future of the industry, is making progress, although the smallholders are moving slower than the estates. This is understandable as, to quote from the Federation of Malaya Annual Report for 1955, "to the smallholder, lacking mechanical aids, the task of replanting calls for hard and sustained physical labour" and considerable publicity with sufficient inducements is necessary to encourage the smallholder to undertake this work. Production was slightly below the high level of 1955 and exports at 983,000 tons showed a drop of about 1 per cent.

SINGAPORE

The conference to decide the future constitution for Singapore was held in London in April, but in spite of three weeks of negotiation it was found impossible to reach agreement. The main issue on which the discussions foundered was the extent of the powers to be retained by the British Government to enable them to discharge their responsibilities for external affairs and defence. After his return, Mr Marshall resigned in June and Mr Lim Yew Hock became Chief Minister. His task seemed a far from enviable one, as there was considerable disappointment over the failure to reach agreement in London, although in many quarters there was a feeling of relief that a period of quiet on the political scene seemed likely. In September the Chief Minister obtained a unanimous vote of confidence in the Legislative Assembly, which greatly strengthened his position, and enabled him to take stronger measures to stamp out subversive activities. One of these was an order dissolving the Chinese Middle Schools Students Union. For some time past many of the pupils in these schools had become extremely unruly and neither their teachers nor their parents seemed to have any authority over them and evidence was obtained which showed the extent of Communist infiltration in the union. The determined stand taken by the government unfortunately resulted in serious riots, but no further disturbances have taken place since and there is every indication that the power of the Communists in the union has been severely weakened, if not entirely broken. This is an important achievement and particularly significant when it is remembered that over half the population is under twenty-one years of age. On the whole the position in Singapore at the end of the year seemed more stable than it had been for some time and, with the added authority which this improvement gave him, Mr Lim Yew Hock paid a visit to London to discuss the agenda for the resumption of the constitutional talks this month. Although it is always dangerous to prophesy, there seems ground for hope that this time he will not come back empty handed.

The estimates for 1957 showed a deficit of M$36 million but new taxation similar to the Federation's reduced this figure to under M$20 million. On the whole this is not an unsatisfactory state of affairs but the calls for capital development are heavy and are expected to amount to M$750 million for the period 1958 to 1962, of which projects totalling M$570 million are considered essential. To meet this heavy expenditure it is intended to increase revenue over the next three years to yield at least an additional M$50 million and to mobilise local capital resources to the full. A bill was introduced imposing a tax "at wholesale level on any luxury goods which it may be decided to tax in the future." This proposal has been severely criticised as likely to endanger Singapore's free port status and the bill has been referred to a Select Committee. The necessity to maintain a suitable climate for investment, in the face of mounting expenditure for social services, is the difficult problem which faces Singapore's government and a suitable balance will not be easy to find.

MALAYA

It has always been the practice in these statements to include comments on developments in the Federation of Malaya and Singapore under the same heading but, with the recent constitutional changes, this seems no longer suitable and this year I have tried as far as possible to separate them. Geography and their complementary economies are facts which cannot be ignored, whatever the political differences may be, and it is no more easy for us to draw a line between the two territories in our summary of events than it is for one territory to ignore the effects on the other of the policy they adopt. Before I leave this peninsula, therefore, I wish to touch on a few matters of general interest to the area as a whole.

One of the recommendations of the International Bank Mission was the establishment of a central bank and last year the two Governments requested Mr Watson of the Bank of England and Sir Sydney Caine to make an examination of the present position and to submit a report on what form that central bank should take. Under their terms of reference they were required, among other things, to advise on the desirability of separate central banks as opposed to one for both territories. This question is linked with that of the currency for the two territories, the Governments of Sarawak, North Borneo and the State of Brunei having decided to adopt a currency of their own, and the report favours the continuance of one currency, which presupposes a joint central bank. This is a conclusion with which we agree but the efficient working of a joint central bank would only be possible—to quote from the report—"if the two Governments co-ordinated their policies in the fiscal, monetary and economic fields." Other recommendations cover the retention of the sterling link and the desirability of banking legislation.

The importance of the provision of low cost housing as a deterrent to Communism is as great in Malaya as it is elsewhere and I am glad to be able to report that the Malaya Borneo Building Society, formerly Federal and Colonial Building Society Limited, for which, as I mentioned two years ago, we are providing finance, has made considerable progress. Already this society has assisted many families throughout Malaya to purchase their own homes and its activities are being extended to Borneo.

Plans for the gradual Malayanisation of the public services have been approved in both territories. There has been a considerable amount of ill-informed discussion on this subject and it is satisfactory that the schemes adopted have avoided the danger of too much haste and that the retiring officials have been treated fairly.

The Malayan trade figures showed a favourable balance of M$13 million as against M$335 million in 1955. This considerable reduction was mainly due to the large increase in imports while the level of exports was about the same. The total value of external trade was higher than in any other year except 1951.

The above are a few of the many important developments that have taken place in Malaya during the last year and on the whole, in this part of the world, we can look back on 1956 with a considerable degree of satisfaction. The end of one chapter is in sight and we shall soon be turning to the next. What this chapter will contain we cannot yet tell, but the events which it will record will cover the early developments of these two territories under their own elected rulers. It appears that the transfer will take place peacefully with little rancour on either side and as long as merdeka is regarded as a challenge to progress and not as an end in itself the new chapter should make pleasant reading.

NORTH BORNEO

We now turn to Borneo, a country which is blessed with considerable natural resources but which is lacking in both capital and labour. Here also there is the urge to move forward in expanding the economy and over the last three years M$53 million have been invested in development. Half of this was obtained from revenue with the balance from loans and external aid. Labour has also shown a welcome increase as a result of immigrants from Indonesia, but arrivals under the recent agreement with the Philippines have been disappointing. The importance of communications at the present stage of development needs no elaboration and, although progress has been made, the lack of trained personnel has resulted, as in so much else, in the pace being slower than it might be. These difficulties can in time be overcome and there is no doubt that over the last year there has been a feeling of greater confidence in the future.

Trade has improved and the totals of both imports and exports seem likely to be higher than in 1955. Rubber still continues to be the mainstay but the timber industry showed an increase in the volume of exports of about 24 per cent and this industry is generally on

a more stable basis. The decision that Labuan should revert to its prewar free port status became effective from September 1st. For many years Harrisons and Crosfield have acted as our agents in Labuan and this has been a satisfactory arrangement to our mutual benefit. In view of the change of status of this port, however, your directors considered that the time had come to open our own office which commenced business at the beginning of this year. Due to its geographical position Labuan has considerable future possibilities but a great deal remains to be done and I do not expect a rapid development.

BRUNEI

Progress continues to be made in the carrying out of the five-year development plan and this State remains in a very happy financial position. The surplus for 1957 is estimated to be M$75 million, a slight increase over last year. The construction of the road from the capital to the oilfields at Seria is well under way and should be of considerable benefit to the State and the industry on which so much depends. A start has been made in drilling for oil offshore.

INDONESIA

Events in Indonesia have recently been changing with such rapidity that it is extremely difficult in a review of this nature to be entirely up to date. The elections held at the beginning of the year resulted in the formation of a coalition government under Mr Sastroamidjojo with ministers mainly drawn from three parties but with others being represented. This government suffered from the stresses inherent in all coalitions and the rivalries of personalities and the groups they represent dominated the political scene. In the background there was the army—another factor to be reckoned with—which had interposed before and which it was felt might do so again. It is against this background that the numerous incidents reported in the press must be viewed. The position at the moment seems confused with the revolts in Sumatra, which started in December, still continuing and the future of the present government uncertain. Dr Hatta, the Vice President, has already resigned and the influential Masjumi Party withdrawn from the government. This places a great responsibility on the President who is actively engaged in attempting to find a solution.

The economic situation has naturally suffered as a result of this instability and the reduction of the statutory gold and foreign exchange reserves from 20 per cent to 15 per cent was announced last month. A similar reduction was made for three months in 1956 when assistance was obtained from the International Monetary Fund. The deteriorating position of government finance can be seen from the advances obtained from the Bank Indonesia which have risen to over 7,000 million rupiahs, while notes in circulation have also increased. This state of affairs is unlikely to improve as long as the present dissension continues with the difficulty of collecting revenue in the disturbed areas. It seems, therefore, that a return to economic health must await a settlement of the political differences and the restoration of law and order throughout the islands.

INDIA

India in recent years has built up for herself a position of considerable influence in world affairs and this is particularly so in Asia where many of the smaller countries look to her for leadership and watch with anxious eyes to see how her industrial development is proceeding—a development they are all trying to emulate to a greater or lesser degree. In particular her declared policy of neutrality is one which many others wish to follow and, although the dispute over Kashmir has soured relations with her near neighbour, and may, as a result of recent events, lower her own prestige, the interest in her progress is unlikely to be much diminished. The second five-year plan has, in particular, attracted considerable attention with its emphasis on heavy industry. In India this is considered vital to enable her to improve, or perhaps only to maintain, the standard of living of her growing population and all reports indicate that the government is determined to achieve the targets even if this is not found possible within the stipulated period. China, as we have seen, is also moving in the same direction, although under a very different form of government but with the same emphasis on speed. Whether either will be successful in this rapid move towards industrialisation, the future alone can show but the success of one over the other would be viewed by many as a triumph for that form of government. The determination of India to retain her parliamentary institutions can be seen from the elections recently held—a massive piece of organisation—in which it is estimated that 200 million people have had an opportunity to vote at 200,000 polling booths. Success in her economic aspirations would strengthen such institutions not only in India but in many other countries as well, and these aspirations are at the moment centred round the second five-year plan.

This plan has been the subject of much comment and criticism both in India and abroad and fears have been expressed that the dangers of inflation have not been sufficiently guarded against. Many doubt whether large enough resources have been allocated to raise the level of production of food and cloth to meet the increase in the supply of money, which the deficit financing will cause, while the adequacy of the transport system and port facilities is questioned. The estimate of the foreign exchange requirements of the plan is considered to be unduly optimistic and this has already resulted in a more general realisation of the necessity to attract foreign investment, but is the present treatment of the private sector the way to achieve this? These are some of the criticisms levelled at the plan and recent developments show that there is a good deal of substance in them.

During 1956 sterling balances dropped by about £150 million, the wholesale price index rose by 13 per cent while the cost of living went up by about 10 per cent. These were danger signals that could not be ignored and an interim budget was introduced in November. This imposed a tax on capital gains, increased super tax on dividends and gave the government control over the reserve funds of companies to insure that they "are put to uses which promote industrial development in accordance with the plan." Customs duties were also raised. To protect the external balances severe cuts were made in imports, particularly consumer goods, and a ceiling was fixed on foreign exchange expenditure for the next six months. New projects in both the public and private sectors, which involve expenditure in foreign exchange, were postponed if no commitment had been made.

These and other measures, which there is not space to mention here, should have their effect but it remains to be seen whether they will be sufficient to halt inflation and reduce the drain on the foreign exchange reserves without any major adjustment of the plan. Meanwhile the International Bank is considering making loans for a number of projects and a survey of transportation is being carried out by a mission from that bank while arrangements have been made to purchase US$200 million from the International Monetary Fund.

These difficulties, which it is only proper I should mention, do not detract in any way from the considerable progress that has already been made or the magnitude of what is being attempted. Recently, for example, the Hirakud dam was opened which is claimed to be the longest in the world. This dam, mainly the work of Indian engineers, extends for about three miles with dykes on the flank to a total of thirteen miles. For the future it is hoped to increase steel production during the period of the plan by four million tons a year which will mean doubling the capacity of two existing plants and building three new ones. Construction of heavy machinery is also planned and a mission from the United Kingdom has recently visited the country to advise on what is required.

These are only a few of the many interesting developments that are taking place but before I leave India there are two matters of interest to our offices there which I should like to mention. The first is the Reserve Bank of India (Amendment) Act 1956 which gives that bank power to vary the cash reserves which scheduled banks are required to maintain with it. The second is the Banking Companies (Amendment) Act 1956, which *inter alia* requires the appointment of managers of banks to be approved by the Reserve Bank of India. Although I understand that the powers given under both these measures are only intended to be held in reserve, they are none the less disturbing. Circumstances change and policies with them and a very recent example of this is the State Trading Corporation. This was set up to carry on trade with the Communist countries, where a government organisation was considered advantageous, but the corporation is now competing to quite a large extent in imports from other countries which were formerly handled by the private sector.

BURMA

In Burma the elections in April resulted in the expected victory for the government party although the size of the opposition vote was greater than expected. The government was faced with a considerable number of problems, of which the most important was to establish and maintain law and order, and it is disappointing that very little progress seems to have been made in stamping out insurgency. Economically the misgivings I expressed last year regarding the success of the disposal of rice under barter agreements were unfortunately proving only too well founded; and the failure to maintain a level distribution of commodities was evidence of the weakness of the administrative machine. There has been some improvement since then as rice shipments, on which so much depends, have increased, which combined with continued restriction of imports has resulted in the foreign exchange reserves rising by about 25 per cent. Unfortunately, there has been a disturbing increase in the cost of living which rose sharply by 20 per cent in the first six months of the year, but has since come back to about 10 per cent higher at the end of the year. In an effort to improve the distribution of essential goods five import corporations, with capital subscribed jointly by the government and the public, were set up towards the end of the year. Four of these corporations will be issued with import licences for general consumer goods while the fifth will concentrate on the requirements of industry. Capital expenditure was considerably reduced during the year and was limited to carrying out projects which were already started and it was estimated that the deficit would be only half of what was originally expected, while a small surplus is hoped for in the coming financial year. A long-term loan of US$25 million was recently made by the United States of America which will be used in various ways, ranging from the establishment of a medical centre to the expansion of the local air line and funds obtained from the International Bank will assist in the rehabilitation of the port of Rangoon and the railways. On the whole Burma seems to have overcome the difficulties caused by the fall in the price of rice since the end of 1953 and the over-ambitious development projects which were planned in the anticipation of a high price continuing. An improvement in internal security and a reduction in the cost of living are two important problems that still remain.

During the year a number of discussions took place with China regarding the line of the frontier between the two countries. This has been a subject of dispute for many years as the exact line of demarcation has never been settled. A joint statement issued in December indicated that no decision had been reached although it seems likely that the Chinese will withdraw from the Wa States in return for the secession of three villages in the Kachin States.

CEYLON

The general elections held in April resulted in a sweeping victory for the People's United Front and Mr Bandaranaike became Prime Minister of a government which was pledged to institute a Ceylonese Republic and adopt a socialist programme including nationalisation of certain industries. So far the government has proceeded slowly and no very drastic steps have yet been taken. Discussions on the British bases were held during the year and in the House of Commons in December it was announced that "the United Kingdom Government will hand over the bases of Trincomalee and Katunayake to Ceylon in 1957 on a date to be agreed between the two governments." At the end of the year the People's United Front suffered a defeat in the Colombo Municipal elections and last month Mr Dudley Senanayake, who has considerable popular following, announced his return to active political life. These developments can be construed as a sign of a swing back to the United National Party although it is true to say that the People's United Front have relied to a great extent for their support on the rural areas. The Official Language Bill was passed in July prescribing Sinhala as the official language of Ceylon and this has resulted in considerable dissension among the Tamil community. In this controversy I hope that the recent remarks made by the Indian Prime Minister on the importance of the English language are not being overlooked.

The favourable balance of trade has shown a considerable reduction over the record surplus obtained last year but external assets were little changed at the end of the year from 1955. A further agreement with China to supply rubber in exchange for rice was signed in December and Ceylon will continue to receive a price above the average monthly Singapore market price, although the premium is a little lower.

The budget presented in July brought only minor changes in taxation comprising rises affecting those in the higher income brackets and a small increase in company rates of taxation. It appears that the development programme I referred to last year has not been found acceptable to the present government and a National Planning Council has been formed to prepare a new overall plan for economic development. This will inevitably result in delay as it is not so much in the planning that the weakness lies as in the lack of technical personnel to carry out the tasks. It was stated in June by the Auditor General that two-thirds of the funds put up by Commonwealth countries under the Colombo Plan remain unused which seems to bear out this contention.

On the whole the emergence of a government with such different views from the previous one has resulted in a period of reflection with so far little change.

GENERAL

As usual I have tried to give shareholders a brief review of the political and economic conditions in the Asian countries in which we are represented. This can of necessity only touch on the main developments in these large areas, in many of which considerable changes are taking place. On the whole this has been a satisfactory year and, notwithstanding setbacks, has been marked by general political stability with growing economic expansion.

Before I close I should like to devote a little space to our offices outside these areas and to our subsidiaries.

Sterling is still the medium for the finance of a large part of eastern trade and for this reason our office in London plays an important part in all our activities. Business there continues to increase and a further enlargement of our premises is becoming necessary. This we shall do by taking over the second floor of our building when the present lease expires.

New York office has naturally benefited from the increasing use of United States dollars in world trade since the war and has greatly extended its operations in recent years.

Our office in France was transferred from Lyons to Paris in 1953 at the time when the economy of Indo-China relied to a large extent on trade with France. This is no longer the case, and with the dwindling of the traditional business which has been previously handled, it was necessary to explore other avenues. In this I am glad to say we have been quite successful and I hope that this office will continue to build up satisfactory connections on its own.

Germany's increasing trade has been reflected in the turnover of our Hamburg office, which continues to prove a most valuable link for our offices in the east.

To turn to our subsidiaries, the Hongkong and Shanghai Banking Corporation of California has made a good beginning and I hope that it will be able very shortly to contribute to the profits of the Bank as a whole. The possibilities in the west coast of America are so extensive that the directors have decided to open also in Los Angeles, and permission to do this has recently been obtained from the American authorities.

The three Trustee Companies in Hong Kong, London and Singapore continue to expand. These companies are all now self-supporting, but apart from this I am sure the service they are able to give indirectly increases the business of the Bank.

I hope that these brief comments on some of the Bank's activities, which have not usually been mentioned in these annual statements, will be of interest to shareholders. While the main function of the Bank will continue, I trust, to be the financing of eastern trade, your directors will not be slow in taking advantage of promising openings elsewhere.

THE POWER-GAS CORPORATION LIMITED

CONTINUED PROGRESS

The fifty-seventh Annual General Meeting of The Power-Gas Corporation Limited was held on March 21st, in London, Major W. R. Brown, DSO, Vice-Chairman presiding in the absence of the Chairman, Mr N. E. Rambush, DSc (Hon), MIChemE, FRSA. The following is an extract from the circulated Statement to Shareholders.

The profit of the Group before providing for depreciation, loan stock interest and taxation amounts to £859,714. This slightly exceeds the previous year's total of £827,933 though the latter included eighteen months' trading for the Rosedowns companies, following the change in their accounting date.

The value of orders received by the Group during the year amounts to £12½ million which is well above the average for recent years.

Your directors have decided to put in hand phase III of the South Works development programme. This consists of extending the heavy machine shop, erected in 1953, alongside which medium and light machine shops, with space for fitting assembly, maintenance services and stores, will now be built. A bay for heavy structural work will be added to the constructional shops.

The Blast Furnace Division, which trades under the name of Ashmore, Benson, Pease and Company, has during the year received orders for blast furnaces, sinter plants, ore-bridges and other iron-making equipment to an extent exceeding our forecasts. It is pleasing to record that the Division has registered its first major success in Australia. Negotiations, which had been in train for some while, ended in our obtaining large orders just after the end of the financial year.

Our opportunities in large-scale chemical engineering are continually being widened and supplemented by licences to use processes developed by others; a recent example is the Texaco partial oxidation process for the production of gases used in the Chemical Industry. An agreement has been concluded with C. F. Braun & Company, California, by which the Works Division is enabled to manufacture and sell Braun heat exchangers.

Gasholder contracts are handled by the General Contracts Division and a considerable volume of business has been done. Especially encouraging is the growing popularity of the new Wiggins gasholder.

SUBSIDIARY COMPANIES

Sales for the year of Rose, Downs & Thompson Ltd., Hull, have been well maintained; many orders have been booked for export against exceedingly keen competition.

The services of The Power-Gas Corporation (Australasia) Pty. Ltd., Melbourne, will be of great help in connection with the Australian blast furnace contract referred to earlier.

During the year Ashmore, Benson, Pease & Co. Africa (Pty.) Ltd., Johannesburg, received a contract from the South African Iron & Steel Industrial Corporation, Pretoria, for the largest blast furnace yet to be erected on the continent of Africa.

Power-Gas France, S.A.R.L., Paris, has been actively engaged on chemical plant contracts, and the past year has been much more active for Power-Gas Canada Ltd., Montreal.

The Report and Accounts were adopted.

THE HONGKONG AND SHANGHAI BANKING CORPORATION

(INCORPORATED IN THE COLONY OF HONG KONG)

(The liability of members is limited to the extent and in manner prescribed in Chapter 70 of the Laws of Hong Kong)

REPORT OF THE DIRECTORS PRESENTED TO THE MEMBERS AT THE ORDINARY YEARLY GENERAL MEETING HELD AT THE HEAD OFFICE, HONG KONG, ON FRIDAY, 15th MARCH, 1957

The Directors have pleasure in submitting the Balance Sheet at 31st December, 1956, together with the Profit and Loss Account for the year ended at that date.

	Hong Kong Dollars
The profit for the year, after providing for taxation on profits earned to date and after making transfers to the credit of Reserves for Contingencies, out of which provision for diminution in value of assets has been made, amounts to	$ 20,635,421
To this must be added the undistributed profit brought forward from the previous year	10,606,689
	31,242,110
An Interim Dividend of £2 per share was paid on 13th August, 1956, amounting to £400,000 at 1/2-13/16	6,481,013
leaving a balance available for distribution of	24,761,097
This balance the Directors recommend be appropriated as follows :—	
Amount to be written off Bank Premises	$ 4,000,000
A Final Dividend of £3 per share, £600,000 at 1/2-13/16	9,721,519
	13,721,519
leaving a balance to be carried forward to next year of	$ 11,039,578

The above appropriations have been incorporated in the Accounts.

DIRECTORS. During the year Mr. H. D. Benham resigned his seat and Mr. L. Kadoorie and Mr. L. B. Stone joined the Board. Mr. B. T. Flanagan, Mr. H. D. M. Barton, M.B.E., and Mr. R. J. Sheppard retire by rotation, but, being eligible, offer themselves for re-election.

AUDITORS. The Accounts have been audited by Messrs. Peat Marwick Mitchell & Co. and Messrs. Lowe Bingham & Matthews, who are eligible for re-appointment.

Hong Kong, 25th February, 1957.

By Order of the Board,
C. BLAKER, Chairman.

BALANCE SHEET AT 31st DECEMBER, 1956

	Hong Kong Dollars	Sterling Equivalent
SHARE CAPITAL		
Authorised and Issued 200,000 Shares of HK$125 each, fully paid	$25 000.000	£ 1,562,500
RESERVE LIABILITY OF MEMBERS HK$125 per share on 200,000 Shares	$ 25,000,000	
RESERVE FUND	128,000,000	8,000,000
PROFIT AND LOSS ACCOUNT	11 039,578	689,974
	164 039,578	10 252,474
HONG KONG CURRENCY NOTES IN CIRCULATION		
Authorised Note Issue	$ 30,000 000	
Excess Note Issue	645,742,000	675,742,000 42,233,875
CURRENT, DEPOSIT AND OTHER ACCOUNTS, including Reserves and Provisions for Contingencies and Taxation	$2.564,287,832	
AMOUNTS DUE TO SUBSIDIARY COMPANIES	378,395	
ACCEPTANCES ON BEHALF OF CUSTOMERS	16,130,379	
PROPOSED FINAL DIVIDEND in respect of the year ended 31st December 1956	9,721,519	2,590,518,125 161,907.382
	$ 3,430,299.703	£214,393,731

NOTES

1. Confirmed Credits Guarantees and Endorsements amount to HK$382,971,778 in addition to which there are commitments in respect of outstanding Forward Exchange Contracts
2. Foreign Currency Balances have been converted into Hong Kong Dollars at approximately the rates ruling at 31st December, 1956. The Sterling equivalents of the figures shown in the above Balance Sheet have been converted at the rate of HK$1 = 1/3d.
3. Investments having a market value of HK$34,677,504 are deposited with the Crown Agents to cover the liability in respect of the Authorised Note Issue to the extent of HK$23,333,333.

	Hong Kong Dollars	Sterling Equivalent
CASH IN HAND AND BALANCES WITH OTHER BANKS	$ 200,966,739	£12,560,421
MONEY AT CALL AND SHORT NOTICE	149,986.529	9,374,158
BRITISH AND OTHER GOVERNMENT TREASURY BILLS	220,746,319	13,796,645
TRADE BILLS DISCOUNTED	600,015,157	37 500,947
HONG KONG GOVERNMENT CERTIFICATES OF INDEBTEDNESS issued in respect of funds deposited as security for the Excess Note Issue	645,883,047	40,367.690
INVESTMENTS, at under market values :		
British, Colonial and Other Government Securities :		
Quoted in Great Britain	$211,303,280	
Quoted outside Great Britain	105,741,011	
Other Investments :		
Quoted in Great Britain	18,096,610	
Quoted outside Great Britain	13,944,029	
	349,084,930	21,817,808
ADVANCES TO CUSTOMERS AND OTHER ACCOUNTS, less provision for Bad and Doubtful Debts	1,213,501,940	75,843,871
AMOUNTS DUE BY SUBSIDIARY COMPANIES	5,497,165	343,573

REPORT OF THE AUDITORS TO THE MEMBERS OF THE HONGKONG AND SHANGHAI BANKING CORPORATION

We have examined the above Balance Sheet with the books of the Corporation kept in Hong Kong, with the audited Accounts of the London Office and with the Returns received from the other Offices. We have obtained all the information and explanations we have required for the purposes of our examination. The above Balance Sheet gives the information required by the United Kingdom Companies Act, 1948, in the manner prescribed for a Banking Company and on that basis, in our opinion, is a full and fair Balance Sheet properly drawn up so as to exhibit a true and correct view of the state of the Bank's affairs at 31st December, 1956, according to the best of our information and the explanations given to us and as shown by the books kept in Hong Kong and the Returns received from the other Offices.

Hong Kong, 25th February, 1957.

PEAT, MARWICK, MITCHELL & CO.
LOWE, BINGHAM & MATTHEWS } *Chartered Accountants, Auditors.*

PROFIT AND LOSS ACCOUNT FOR THE YEAR ENDED 31st DECEMBER, 1956

		Hong Kong Dollars
Interim Dividend of £2 per Share, paid 13th August, 1956, £400,000 at 1/2-13/16		$ 6,481,013
Appropriations recommended by the Directors :		
Amount to be written off Bank Premises	$ 4,000,000	
Final Dividend of £3 per Share, £600,000 at 1/2-13/16	9,721,519	
		13,721,519
Balance carried forward to next year		11,039,578
		$ 31,242,110
Special Administrative Expenses, including Chief Manager's emoluments, Directors' Fees and London Committee Fees amounted to HK$964,015.		

	Hong Kong Dollars
Balance brought forward from 31st December, 1955	$ 10,606,689
Profit for the year, after providing for taxation on profits earned to date and after making transfers to the credit of Reserves for Contingencies, out of which provision for diminution in value of assets has been made	20,635,421
	$ 31,242,110

THE HONGKONG AND SHANGHAI BANKING CORPORATION—*continued*

STATEMENT IN CONNECTION WITH SUBSIDIARY COMPANIES

1. The Investments in Subsidiary Companies appearing in the annexed Balance Sheet represent 9,975 Shares of the Capital Stock of The Hongkong and Shanghai Banking Corporation of California and the whole of the Issued Share Capital of three Trustee Companies and three Nominee Companies. The Balance Sheet of The Hongkong and Shanghai Banking Corporation of California at 31st December, 1956, is annexed. The Accounts of the three Trustee Companies and the three Nominee Companies have not been submitted as the Directors are of the opinion that such Accounts would be of no real value to the members of the Bank.
2. No part of the profits earned by the Subsidiary Companies has been dealt with in the Accounts of the Bank. The net aggregate amounts of the Subsidiaries' profits, after deducting the Subsidiaries' losses, so far as they concern the Bank, are as follows :—

	Hong Kong Dollars
(i) For the year ended 31st December, 1956	$25,615
(ii) For previous financial years	376,019
	$401,634

THE HONGKONG AND SHANGHAI BANKING CORPORATION OF CALIFORNIA

		US$ 9,620,310

MICHAEL W. TURNER, Chairman of the Board. S. J. H. FOX, President. R. M. ROCHE, Treasurer.

ACCOUNTANTS' REPORT TO THE BOARD OF DIRECTORS OF THE HONGKONG AND SHANGHAI BANKING CORPORATION OF CALIFORNIA

We have examined the Balance Sheet of The Hongkong and Shanghai Banking Corporation of California as of December 31st, 1956. Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances. Our confirmation of the principal assets and liabilities was made as of November 30th 1956, with subsequent review and selective verifications as of December 31st, 1956.

The Bank recognizes income as collected. This practice has no material effect on the financial position as disclosed by the Balance Sheet at December 31st, 1956.

In our opinion, the accompanying Balance Sheet presents fairly the financial position of The Hongkong and Shanghai Banking Corporation of California at December 31st, 1956, in conformity, in all material respects, with generally accepted accounting principles applied on a basis consistent with that of the preceding period.

San Francisco, California,
January 31st, 1957.

PEAT, MARWICK, MITCHELL & CO.
Certified Public Accountants.

BANK OF SCOTLAND

A STRONG AND SATISFACTORY POSITION

The Annual General Meeting of the Proprietors of the Bank of Scotland will be held on April 2nd within the Head Office, Edinburgh.

The following is an extract from the statement by the Governor of the Bank, The Right Honourable Lord Bilsland, KT, MC, DL, LLD, which has been circulated with the Report and Accounts:

The past financial year of the Bank commenced under the influence of the raising of the Bank Rate to 5½ per cent in February, 1956. The Rate remained at this level for almost exactly a year, being reduced to 5 per cent in February, 1957. This reduction followed upon a downward tendency in short-term market rates of interest which had developed over the preceding two months, and it is to be welcomed as an indication of growing confidence in the strength of sterling. It has other favourable effects in the form of reducing the cost of Government borrowing and making easier the funding of short-term debt as well as decreasing the cost of servicing foreign-owned sterling balances.

Doubts have been frequently expressed as to whether the raising of the Bank Rate to 5½ per cent was necessary or desirable. As a factor in reducing the demand for credit it has certainly taken second place in importance to credit restriction. At the same time it has served to emphasise the need for credit restriction and the downward trend of short-term interest rates which we have witnessed cannot but tend to reduce that emphasis and must therefore make more difficult the continuance of credit restriction as a necessary measure.

It is difficult to reject the conclusion that so long as Government expenditure remains at a level which together with the needs of industry is in excess of the Nation's savings there can be no real check to inflation. A substantial cut in Government expenditure therefore remains the most effective answer to the country's present difficulties.

EFFECTS OF SUEZ INCIDENT

In the earlier part of last year attempts were being made following upon the promise of the 1956 Budget to devise means whereby a cut in Government expenditure could be effected. The Suez incident, however, has in the meantime seriously affected the Nation's economy and nullified the progress made.

The long-term effects of Suez cannot as yet be accurately assessed. The best that can be hoped for the future, so far as this country is concerned, is that the challenge presented by the Suez incident will prove the spur necessary to an all-round increase in production which we are constantly assured is well within the country's capacity.

In face of this situation it is not possible to be optimistic on the likelihood of a material reduction in taxation, yet the time is long overdue when the burden of taxation which this country carries and which is higher than any of its competitors in world markets, should be reduced. It is remarkable that in spite of this taxation burden, with its damaging effect on incentive and its adverse effect on manufacturing costs, the volume of exports from this country has over the past nine years nearly doubled. We cannot expect a continuance of this trend unless something is done to give relief and reward to those by whose efforts this has proved possible.

For Scotland generally the past year has been one, if not of outstanding success, at least of maintenance of activity in relation to the rest of the United Kingdom and of definite prospects for increased future prosperity.

BALANCE SHEET

Dealing with the Balance Sheet, the main features are the increase in deposits, the further substantial rise in note circulation, the reduction of approximately £2,700,000 in advances and the high liquidity position.

The net profit for the year of £638,984 shows a reduction of approximately £4,000, and after making the same appropriations of £200,000 to Contingencies and £80,000 to Pension Fund, the maintenance of the dividend of 14 per cent for the year is recommended. This will require £362,250 and along with the foregoing appropriations will reduce the balance of unappropriated profit to be carried forward by £3,266 to £253,545.

The Bank's liquidity position is this year exceptionally strong, there being held in cash balances with other banks, cheques, etc., in collection, money at call and bills discounted, 37 per cent of all liabilities to the public. The Bank's investments are of a value in excess of the figure at which they appear in the Balance Sheet and taking into account all the unusual difficulties affecting banking in present conditions the Balance Sheet presents a position which is both satisfactory and strong.

THE IMPERIAL TOBACCO COMPANY (OF GREAT BRITAIN AND IRELAND) LIMITED

ANNUAL GENERAL MEETING

LORD SINCLAIR OF CLEEVE'S REVIEW

The Fifty-fifth Annual General Meeting of The Imperial Tobacco Company (of Great Britain and Ireland) Limited was held on March 19th at the recreation hall of the W. D. & H. O. Wills branch of the Company, Regent Road, East Street, Bedminster, Bristol.

The Right Honourable Lord Sinclair of Cleeve, KCB, KBE, the Chairman, who presided, said:

Ladies and Gentlemen,

Before we proceed to the formal business of this meeting it would, I think, be your wish that I should refer to the deep sense of loss we all feel in the death last December of our President. Lord Dulverton was Chairman of the Company for 23 years and, since his retirement from that office in 1947, he was our President. His wide experience of men and affairs, his great qualities of character, his intense interest in and knowledge of the Company's business, his sure instinct, and his wise judgment combined to make his long period of office memorable in our annals. To a quite extraordinary degree he won the respect and affection of all who were privileged to work with him, and those of you who attended these meetings under his Chairmanship will, I am sure, vividly remember the graciousness, good humour and dignity with which he conducted them. His memory will indeed be an inspiration to all who knew him.

I will now turn to the business of the meeting. I presume it will be your wish to take the notice convening the meeting as read and I will ask the Secretary to read the Auditors' Report.

Mr E. J. Partridge (Director and Secretary) then read the Report of the Auditors.

The Chairman continued: The Directors' Report records the fact that the Board have accepted with regret the resignation of Mr R. M. E. Reeves. Mr Reeves joined the Company in 1919 and was our Solicitor for a number of years. His experience of our business and his wise counsel were of great value to the Company, and I am sure we would all desire to extend to him in his retirement our very warm regards and good wishes.

Since the Directors' Report was issued, we have heard with deepest sorrow of the death of Mr J. C. Gascoigne, who had been a member of our Board for the last nine years. He joined the Company in 1926 and—with the exception of the war years when he served with the Grenadier Guards, rose to the rank of Major, was wounded, and was awarded the MC for gallantry in the fighting in France—the whole of his service was with the W. D. & H. O. Wills Branch. His uprightness, his humanity, and his ability were outstanding, and he will be sadly missed by a wide circle of friends in the Branch, and throughout the Company.

SUMMARY OF THE YEAR'S RESULTS

As you will have seen, the Parent Company's Trading Profit—excluding the exceptional profit which arose following the increase in the United Kingdom Tobacco Duty last April—was £19,895,000, very slightly higher than in 1955. In the difficult circumstances of trading last year this was a not unsatisfactory result. It was indeed in line with the forecast I gave a year ago, but I confess not quite as good as we might have hoped. While we foresaw last year most of the conditions with which we have had to contend—including heavier manufacturing and selling costs, higher interest rates and strong competition—we certainly did not reckon on a further increase in the Tobacco Duty half-way through the year.

The Group Trading Profit was £23,363,000, which includes the profits of our Subsidiary Companies engaged in the paper and board and printing industries. As you know, each of these Companies has a substantial trade outside the Group, and the fact that, in a time of some difficulty in these industries, they collectively did rather better than hold their own is a mark of their efficiency and enterprise.

STOCK-IN-TRADE

The value of the Parent Company's Stock-in-Trade increased by £6,779,000. The Explanatory Statement gives the reasons for this.

The process of building up our leaf tobacco stocks to a more satisfactory level has gone on but not without some difficulties, and I am afraid that in the nature of things we cannot expect progress to be uniform. The USA flue-cured crop last year contained much tobacco that was not suitable for the British market, but thanks to the experience and skill of our American buying organisation our purchases from the crop were relatively satisfactory in quality.

In Canada tobacco cultivation has been steadily but surely developed over the past thirty years, and although the growing and harvesting season there is of relatively short duration, the quality is now for the most part excellent. The bulk of the crop is absorbed by the domestic market, but we are glad to be able to buy some for use in our brands in this country, and we made a good purchase last season.

In Rhodesia—our other main source of supply—our African Organisation experienced a difficult buying season. The Rhodesian crop rose from 126 million lb in 1955 to 171 million lb last year—an increase which appreciably exceeded the growers' handling and curing capacity. The result was that far too great a proportion of the tobacco offered for sale at the auctions was of very poor quality. The amount suitable for use in this country was a correspondingly reduced proportion of the crop, and our buyers worked under considerable difficulties. Nevertheless, they did well to come as near to filling our orders as they did.

CAPITAL AND RESERVES

The capital employed by the Group rose during the year by a further £10,200,000. The main factor in this increase was the larger value of the Parent Company's Stock-in-Trade, which of course was partly accounted for by the higher Duty that we had to bear on our factory stocks.

As you know, the problem of how best to finance our continually rising capital requirements has been one of our major preoccupations. It is interesting in this respect to review the course of events in the last ten years. At October 31, 1946, the capital employed by the Group was £132 million. At October 31, 1956, the figure was £240 million. This is the outcome of a number of factors—the considerably higher level of Duty; the building up of our leaf tobacco stocks from the dangerously low wartime level to a point where we have some reasonable insurance against comparative crop failures; replacements of plant and equipment and extensions of manufacturing capacity; and, of course, the substantial advance in price of all the stocks we have to carry. The increase in requirements of £108 million has been met in the following manner: £55 million has been raised in Loan Capital at rates which by today's standard are certainly not high; £44 million has been transferred out of profits to Reserve; and the balance of £9 million is accounted for almost entirely by the increase in amounts set aside from profits for future Income Tax.

This year the total transfer to Group Reserves out of profits amounts to some £6 million; but this sum includes an amount of approximately £1,200,000 representing the exceptional profit, after tax, which accrued on stocks following the Duty increase last April. Incidentally, that figure (of £1,200,000) is about one quarter of the additional capital we have to find solely by reason of the extra Duty, so you will appreciate that it is far from being the windfall it is sometimes made out to be.

In the last two years we have transferred out of profits to the Reserves of the Group close on £12 million; and we can be glad that that has been done since under existing and prospective conditions the capital requirements of the Company remain very great, not only because of the Parent Company's needs but also because more money will be required to finance the expansion of some of our Subsidiaries.

GIFT TO EMPLOYEES

As stated in the Directors' Report, a Gift will again be made to Employees this year. It will be at the rate of 12 per cent of earnings during the financial year ended October 31, 1956. This is 1 per cent less than in recent years. Wages and salaries, however, were at a higher level in 1956, and the total amount to be distributed in Gift will be almost exactly the same as it was a year ago.

It has been a long-established tradition of the Company to pay a Gift of this kind, and thus to recognise in a tangible way the contribution made by employees of all ranks towards the Company's trading results. While the Gift is not geared in any precise way to our profits it clearly is very much dependent on them; and whether it will be possible a year hence to maintain the Gift distribution at the level of recent years, will, of course, have to be determined in the light of the results that we shall then show.

NET PROFIT AND DIVIDEND

When dividends and interest from Subsidiary Companies and Trade Investments—£5,314,000, an increase of £326,000 over 1955—are included the total profit of the Parent Company for the year (before tax) was £348,000 more at £25,209,000. Taxation, however, took £13,870,000—55 per cent of our total profit and £1,030,000 more than in the previous year. After the appropriation to General Reserve the net profit of the Parent Company available for distribution amounts to £7,839,000, out of which it is proposed to pay a Final Dividend on the Ordinary Stock at the same rate as last year, namely, 12½ per cent. This, together with the Interim Ordinary Dividend and the Preference Dividends, will absorb £7,747,000, leaving £92,000 to be carried forward.

Those, I think, are the main features in the Accounts before you. I would like now to turn to certain more general matters.

TAXATION

A good deal has been said and written recently about the bearing which the present high level of taxation has on the economic health of the country, but some of these things cannot, I think, be said too often or too strongly. Since we in this country must export to live, since our export trade must be based on a sound economy at home, and since Industry is the very life blood of that economy, I need make no apology for referring to certain aspects of our economic situation which concern Industry in general and this industry in particular. As regards Industry in general two things, I believe, stand out. The first is the need for a reduction in the general level of taxation, and the second is the need for some changes in the particular application of taxation which would encourage expansion of production, would promote some stability in the value of money, and would improve our competitive power in world markets.

During the last two years, there have been signs that the inflationary tendencies in our economy were being brought under control. There were indications of some checks to rising costs and there seemed to be a real chance of achieving something like stability in prices—primarily and perhaps mainly by monetary measures, but also in part through putting a temporary brake on industrial expansion in order that we might establish a firmer base for the future. Nevertheless, if we are to maintain our position as a great trading nation, that brake cannot be kept on for long. Indeed, it is vital that restraints on industrial expansion should be relaxed at the earliest possible moment, provided it is not done under the artificial stimulus of inflationary conditions.

From the point of view of our national economy—indeed, from the point of view of our survival as a trading nation—the case for a reduction in the total burden of taxation (which, of course, predicates a reduction in the proportion of the national income absorbed by Government expenditure) is abundantly clear, and, I believe, generally accepted. But in our present situation some positive encouragement should be given to Industry.

In the field of corporate taxation, a reform of the profits tax is long overdue. This tax—with its discriminatory rates as between distributed and undistributed profits—affects certain classes of stockholder differently and indeed falls almost entirely on the equity shareholder whose capital is at risk. There can be no industrial expansion without risk, and to penalise risk-capital in this way is completely at variance with the idea of a dynamic and expanding economy. Moreover, it is not only the method by which profits tax is levied that needs drastic revision: its total incidence is far too high and it adds too much to the difficulties which Companies have in providing funds from their own resources to maintain their assets in an efficient state and to finance development, research and expansion.

In the field of personal taxation, I think that in recent years something of a fetish has been made of "egalitarianism." Some people seem to think that equality and fairness mean the same thing. We certainly want equality of opportunity but we ought to have fairness in the recognition of the uses that are made of the opportunities. Fairness indeed demands that individuals who have developed special skill, knowledge, or administrative ability (including of course scientists and professional men of all kinds) and those carrying the greater responsibilities or taking the greater risks, should be able to receive rewards that are in some degree commensurate with the contributions they make. Under present conditions, that does not happen. One of the most frustrating things which those who are running a business today experience is to find it virtually impossible to give a worthwhile reward to those with special qualifications who are called on to undertake increased responsibility, frequently, I may add, involving change of location which in turn brings additional burdens and complications quite outside the ordinary removal expenses. These cases are of course relatively few in number but the people concerned count for much in the material progress and efficient administration of this country.

It has been said that the frustration I have referred to is overstated because in fact Industry does not fail to persuade people to assume these responsibilities. To the extent that that is true, it is largely because we are trading on ingrained habits of loyalty. I realise, of course, that this situation cannot be changed overnight, but it can be quickly alleviated in two ways, namely by an extension of earned income relief, and by a raising of the point at which surtax starts—thus recognising the fact that a Sterling limit fixed thirty-six years ago is quite inappropriate today when the value of the £ is about one third of what it was then.

I therefore most strongly support the representations which have been made to the Chancellor to alleviate in some such ways the burden of personal taxation and to reconsider the whole incidence of profits tax. These things, of course, cannot be done without cost to the Revenue, but they can contribute in no small degree to the "dynamic society" which is so badly needed. It has been said that when men are free and able to build for the future they hope for it and furnish the means to make it come about—that is, the production of tools fashioned out of present effort, saving and abstinence. Does not past history and present experience (for example, in North America) suggest that it is by working for those conditions that we can best hope for the continuing provision of productive capital on the scale that the country needs if it is to maintain its position as a trading nation?

THE TOBACCO DUTY

Now I come to another kind of taxation, which affects this industry in particular, where the problem is the protection and, if possible, the expansion of one of the largest Revenue-producers in the field of indirect taxation, namely the tobacco Duty. It has been claimed that a higher rate of tobacco Duty is disinflationary because of its capacity to absorb surplus purchasing power. That, I think, has proved to be nonsense. It has got to a point where it is much more inflationary in its effect than disinflationary.

The 3s. per lb. increase imposed by the April, 1956, Budget brought the UK Tobacco Duty to 6ls. 2d. per lb.—over six times the pre-war rate. The argument was, I believe, advanced in some quarters that it was time the Duty went up again because it had remained unchanged for eight years. I thought it was a poor argument then, and I still think it a poor argument—the more so when it is remembered that in 1947 the rate of Duty was raised by over 50 per cent, and that, apart from this last advance, tobacco has had much heavier Duty increases to bear than any other commodity in general use.

It is not in the least surprising that this latest rise has had an effect upon consumption. It is difficult to assess exactly how much effect, but it has certainly halted a slightly rising tendency; and it now looks virtually certain that the Duty yield during the current fiscal year will fall short of the Chancellor's estimate. The level of the Duty here is much higher than in any other country of the world: it is now in fact the equivalent of a Purchase Tax on tobacco goods of over 450 per cent. Is it to be wondered at that UK tobacco consumption per head is significantly lower than in other countries with corresponding standards of living?

It is very plain to us that the interests both of the Revenue and the industry require a reduction in the United Kingdom Duty at the earliest practicable date. I can only hope that it is equally plain to the Chancellor and his advisers.

In the Republic of Ireland also the Duty was raised last May. The increase was 7s. 11d. per lb, bringing the rate to 42s. 9d. per lb—much higher than it had ever been before. The detrimental effect on consumption has been so marked that the Revenue yield in this current fiscal year is likely to be well below the Finance Ministry's estimate and indeed to show very little increase over the yield of the old level of Duty. Here is another case where a reduction of Duty is clearly necessary if serious damage to future Revenue and trade prospects is to be avoided.

SMOKING AND HEALTH

Some three years ago the leading British Manufacturers joined in placing at the disposal of the Medical Research Council for research into the causes of lung cancer a fund of £250,000—of which some £70,000, we are informed, has so far been spent. In 1956 this group of Manufacturers set up the Tobacco Manufacturers' Standing Committee for the express purpose of furthering, and keeping in touch with, research in the field of smoking and health. Sir Alexander Maxwell is Chairman of the Committee, and Sir Alfred Egerton, FRS, and Sir Ronald Fisher, FRS, are Scientific Consultants to it.

This Committee has, I think, already served a most useful purpose in developing

contacts with scientific workers in this field in various parts of the world, as well as with the industry's own chemical research into the constituents of tobacco and tobacco smoke, the results of which are freely available to the medical authorities.

LEAF TOBACCO SUPPLIES

Earlier in my statement I spoke of some of our difficulties last year in acquiring adequate supplies of suitable quality tobacco, particularly from Rhodesia. I revert to this question now because against the background of recent discussion in both Parliament and the Press it deserves some elaboration.

It is not perhaps as widely appreciated as it should be that in these postwar years the usings of dollar area tobacco by UK Manufacturers have been very substantially reduced, while sterling area tobacco usings have been correspondingly increased. The USA now supplies only about half the UK's tobacco needs (compared with nearly 90 per cent before the war); Canada supplies about 10 per cent; and the remainder comes from the sterling area. This very marked change in the pattern of tobacco supplies has been brought about partly by dollar shortage, but also because the UK Manufacturers have done everything in their power to encourage within the sterling area sources of supply that gave promise of being able to produce tobacco of quality reasonably suitable for our market here, and because by great care and skill in manufacture they have gradually increased the using of such tobacco without too drastically altering the smoking characteristics of their blends.

The principal source of this increased supply has been Rhodesia, and the great expansion of tobacco production in that country has been largely founded on the Agreement which the leading Manufacturers of this country entered into with the growers in 1947. It is, I think, no overstatement to say that the growth of Rhodesia's tobacco production and exports in the past ten years provides a notable example of Commonwealth co-operation and development. The growers themselves have of course played a great part in this development and deserve all praise for their efforts; but they would, I think, acknowledge that the UK Manufacturers have also played their part.

As will be clear, however, from my earlier comments, Rhodesian production has unfortunately expanded in part at least at the expense of the general quality standards of the crop. The wiser growers know that this is so, and they know that much the best policy for Rhodesia's tobacco growing industry in these next few years is to strive for improvement in quality rather than greater volume. If this is done—and knowing something of the growers and of the capabilities of the Rhodesian Tobacco Research Board, I have every faith that it will be done—the future usings of Rhodesian tobacco in this country, as well as in other world markets, should be well secured.

THE OUTLOOK

As I have explained, the increases in rates of Duty last year both in the United Kingdom and in the Republic of Ireland have had the effect of restricting consumption. Our sales so far in the current year are being broadly maintained, but there was undoubtedly, in view of anticipated transport difficulties, a certain amount of stocking up of tobacco goods by distributors and some account of this must be taken when assessing the trend of trade in that period. In present circumstances we must expect competition to be keener than ever, but we are determined to meet it although this will entail some appreciable increase in our selling expenses. Moreover, there are unfortunately no grounds for anticipating that manufacturing costs will be lower. For these reasons I think it is inevitable that the results of the current year will show a reduction in trading profit. On the other hand, from results that have already been declared we can look forward to some further improvement in the return from our Trade Investments. In the light of all these factors I cannot at this time forecast whether our total profits in the current year will be such as to compel some reduction in the rate of Ordinary Dividend; but in the circumstances of this year, so far as we can foresee them now, it is a possibility that cannot be ruled out.

That, Ladies and Gentlemen, is as fair and faithful a picture as I can at this point of time present to you. The Company has in addition to its financial resources three great assets—the justly earned reputation of its brands for quality and value, the skill and experience which can and will maintain that reputation, and a spirit of loyalty and determination throughout the organisation to leave nothing undone that can be done to maintain efficiency and to earn success.

I now have pleasure in moving: "That the Report and Accounts for the year to October 31, 1956, now presented, be received and adopted" and I will ask the Deputy Chairman to second the Resolution.

Sir Wilfrid Anson, Deputy Chairman, seconded the resolution, which was carried.

The payment of 5½ per cent on the "A" 5½ per cent cumulative preference stock, 6 per cent on the "B" 6 per cent non-cumulative preference stock, 10 per cent on the "C" 10 per cent non-cumulative preference stock, and the interim dividend of 8½ per cent on the ordinary stock were approved and confirmed, and a final dividend of 12½ per cent on the ordinary stock for the year to October 31, 1956, was declared.

The retiring directors were re-elected and the other formal business having been transacted, the proceedings terminated with a vote of thanks to the Chair moved by Mr H. C. Williams and seconded by The Right Honourable Sir James Grigg, KCB, KCSI, and the Chairman's brief acknowledgment.

BRITISH INDUSTRIAL PLASTICS

TURNOVER AGAIN A RECORD

The annual general meeting of British Industrial Plastics Limited was held on March 14th in London, Mr E. R. Crammond, the chairman, presiding.

The following is an extract from his circulated statement:

The Group Net Profit, before taxation, is £616,349 compared with £669,464 for the previous year. Having regard to the fact that the Directors throughout the year adhered to their intention to maintain, as far as practicable, the existing price levels of the products of the chemical factories, this result can be regarded as very satisfactory.

Your Directors recommend a final dividend of 12½ per cent, making a total of 20 per cent for the year.

A sum of £300,000 has been transferred to General Reserves, bringing the total up to £500,000 for the Group. As the result of this transfer the Balance Carried Forward in the Group's Profit and Loss Account now amounts to £256,126.

In this connection a survey has been made of the disposal of the Profits earned by the Group over the past eight years. During that period taxation absorbed £1,688,000 and dividends £767,000; capital expenditure accounted for £2,064,000 and, apart from an issue of Ordinary Shares in 1951 which raised £625,000 this expenditure has been financed out of earnings. It will be seen that the average capital expenditure over this period of eight years was approximately £260,000 per annum. In view of the foregoing it will be clear that the maintenance of substantial reserves is essential.

For the year to September 30, 1956, the Group Turnover was again a record, showing an increase of approximately 6½ per cent over that of the previous year. Our exports were well maintained and, in this connection, during the year a number of your Directors and other representatives visited most countries in the world outside the iron curtain.

All the Subsidiary Companies show satisfactory profits and the decline of £53,115 in the total amount earned by the Group occurred mainly in BIP Chemicals Limited and was attributable to the policy of holding prices.

At the date of the Balance Sheet capital commitments amounted to £164,000. In the light of past experience and of further projected expenditure it is anticipated that this amount will be considerably increased as the year progresses.

Plastics Exhibition in USA: In June, 1956, we exhibited our Bipel Presses and Pelleting Equipment at the Plastics Exhibition in New York. As a result, sales which were developing somewhat slowly in the USA have since shown a noticeable improvement.

DEVELOPMENTS

As you would expect we are continuing to develop new products and, among other things, the stage has now been reached when ample supplies of melamine moulding powder in a wide variety of attractive colours are available to meet the growing demand in this country for moulded tableware. Similar melamine products made in the United States have already achieved a wide popularity there.

At present most of the plastic raw materials which we produce are used by others to manufacture products for the ultimate user and, to a very large extent, this situation must always be the case. However, opportunity will from time to time arise which will enable us properly to develop certain specialised end products; in our engineering businesses this has already been achieved and it is our intention to extend our activities in this direction in the chemical field.

OUTLOOK

In the unsettled state in which the world finds itself today you will not expect any firm expression of opinion as to the outlook for the year to September, 1957. Let it suffice to say that, so far, sales generally have been well maintained; that we are continuing to make satisfactory progress and that every effort will be made to keep things that way.

The report and accounts were adopted.

THE MESSINA (TRANSVAAL) DEVELOPMENT COMPANY LIMITED

RECORD TRADING RESULTS

CONSIDERABLE EXPANSION OF RHODESIAN INTERESTS

FAVOURABLE LONG-TERM OUTLOOK FOR COPPER

COMMANDER H. F. P. GRENFELL ON A YEAR OF EXCEPTIONAL ACTIVITY

The seventh Annual General Meeting of stockholders of The Messina (Transvaal) Development Company Limited was held in Johannesburg on March 13, 1957, Commander H. F. P. Grenfell, DSC, RN (Ret'd.), presiding.

The Chairman addressed the meeting as follows: Ladies and Gentlemen, it gives me great pleasure to welcome you to the Seventh Annual General Meeting of your Company, and on behalf of the Board of Directors to present for your approval their report and the Audited Accounts of your Company for the financial year ended September 30, 1956. Both these and the Notice convening the meeting have been in your hands for some time and with your permission I propose to take them as read. (Agreed.)

OPTIMISM JUSTIFIED

This time last year I was in the happy position of being able to tell you with some confidence that we could anticipate results for the current year to be as good as those achieved in 1955.

You will have seen from the accounts now presented to you that my optimism was justified, and that in fact our profits were higher by over £300,000, and established a new record for your Company. They enabled us not only to pay dividends totalling 21s. per share, but also to strengthen our General Reserve by £420,000, which I think you will agree was very satisfactory.

I am sorry to say that I cannot give you as optimistic a forecast for the year in which we are now operating. Although once again we have sold forward a part of our production, there has been a downward trend in the price of copper for the past few months and I cannot, at the moment, see any particular reason to expect appreciably higher prices during the remainder of this financial year.

It seems that supply has, for the time being, caught up with demand, and that we may have arrived at that state of equilibrium between the two to which I have referred on previous occasions. However, with an increasing world population, the trend towards higher standards of living in all countries and the consequent continual expansion of industry, I cannot but feel that the present is only a temporary phase, and that the long-term outlook is favourable for a substantial increase in world consumption of copper which, failing large new discoveries, it will be difficult to meet.

FACTORS AFFECTING RESULTS

The results submitted to you today would have been even better but for two factors, the first of which was another increase in operating costs which rose to 37s. per long ton of ore. The equivalent figure per long ton of copper was just over £119—an increase of about £4 15s. over the previous year. The reasons for this increase are given in detail in the General Manager's Report, and in general reflect the present trend throughout the mining industry.

The second factor was a somewhat reduced smelting rate due to the treatment of an increased quantity of concentrates from Umkondo, the copper contents per ton of which are lower than those of Messina mines. There was also an abnormal shut-down for rebuilding the converter which resulted in a loss of 14 days' production.

In the last few months the overall grade of concentrates has improved and, unless anything unforeseen happens, the smelter should achieve an appreciably higher output for the current year.

INCREASED ORE RESERVES

During the year mining operations at Messina proceeded normally in all sections and it is satisfactory to be able to report that once again we are able to show increased ore reserves which now amount to over 5 million tons of an average grade of 1.82 per cent copper.

I am also glad to mention once more the happy relationship we continue to enjoy with all our employees—a state of affairs which has materially contributed to the success of your Company.

INTERESTS IN SOUTHERN RHODESIA

I should now like to give you some account of our interests in Southern Rhodesia where our geologists have been actively engaged in the examination of mining prospects offered to us. We have a number still under investigation and reports on them are not yet available, so I propose to deal today only with those in which we already have a financial interest or which we have recently acquired.

The first is Umkondo, for which for the first time, results of a full year's work are available. We have a small but happy community there under Mr Chandler, the Resident Manager, and operations have now settled down to a normal routine basis with regular weekly shipments of concentrates arriving at Messina for treatment.

About 75 miles to the north-west along the road to Fort Victoria is the Beardmore Scheclite Mine which we have recently bought. It is quite a small affair but there is a good demand for tungsten, the metal contained in the ore, and I have no doubt it will be a profitable venture. Construction of a treatment plant to produce high grade concentrates for export will soon begin—meanwhile the mine is being prepared for production.

Going further north we come to Mangula where the pre-production programme to which I referred last year is well under way. Under energetic and able leadership first by Mr van Aardt, as Acting Manager, and since the close of the year, by Mr Wilson, who has been appointed Resident Manager, progress both on the surface and underground has been extremely satisfactory, and the programme is well up to schedule. In this connection I direct your attention to the Manager's Report which gives details of the work accomplished by the end of September.

All the shares held in reserve, amounting to £1 million, have recently been issued, bringing the total issued capital to £2,500,000, of which your Company holds 84 per cent. In accordance with our original circular to Members, arrangements have been made for the provision of further funds by your Company.

HOPES REALISED

I am pleased to be able to tell you that the hopes I expressed last year of an increase in ore reserves in the Molly Section have been realised as a result of further exploratory drilling to the south of the Molly Shaft. Our latest results have proved, to a depth of 500 feet, a continuous ore body 30-50 feet wide for a distance of 1,300 feet further to the southward. In addition borehole intersections 2,300 feet south of the Molly Shaft have disclosed the presence of ore at a vertical depth of 800 feet. Further drilling is in progress in this area.

These results undoubtedly indicate that our estimate of ore reserves can be revised upwards, but we prefer to wait until further work has been carried out underground before issuing new figures.

I think you will agree with me that Mangula promises to be a valuable new source of revenue to your Company, and that you will wish me to convey your thanks to the Resident Manager and his Staff and employees for their excellent work in the past year.

I would now like to take you about 50 miles to the south-west of Mangula, where, after an intensive exploration programme by our geologists, we have recently exercised our option to buy a property called Alaska, which is within four miles of the railway to Salisbury and about 13 miles by road from Sinoia.

In essence, this copper deposit consists of a main body of oxide ore which is estimated to contain aproximately 1,140,000 tons assaying 2.17 per cent copper down to a depth of 80 feet. Surrounding this body are other lesser ore bodies which also carry oxidic copper to a depth of 80 feet. Below these, down to what appears to be a maximum depth of 500 feet, sulphides of copper, predominantly chalcocite, have been located.

The smaller oxidic ore bodies are estimated to contain approximately 1 million tons, assaying 2.17 per cent copper, and the sulphides 3 million tons, assaying 1.55 per cent copper, which, together with the main ore body, gives a grand total of about 5 million tons.

It is our opinion that this deposit, although limited in extent, can be exploited on a profitable basis, and an investigation into the best method of achieving this is now being carried out by our technical staff.

ENCOURAGING DEVELOPMENTS

Still further to the west, along the road from Alaska, we come to Sanyati, which is situated 65 miles from Alaska siding, the nearest point on rail, and about 80 miles north-west of Gatooma. Extensive gossan outcrops have been known to exist in this area for a long time, and over the past 30 years a considerable amount of prospecting work has been carried out by various individuals and companies.

These gossans occur over a total strike length of some 12 miles and form lenses, or groups of lenses, which vary in width up to a maximum of 200 feet, and in some cases outcrop continuously for a strike length of 5,000 feet. Where mineralised they carry copper, lead and zinc in appreciable amounts, and extend in depth to approximately 100 feet. Underlying them are narrower bodies varying in width from 3 to 60 feet containing copper, lead and zinc sulphides which have been proved in places to a depth of 700 feet from the surface.

Since July, 1955, when we obtained an option to acquire the property, our geologists have been engaged in an active programme of exploration, which included a geophysical survey and a diamond drilling campaign. Out of 50 boreholes, which were put down, no less than 31 intersected ore of encouraging grade. In addition, we were fortunate in having access to the results obtained by another Company which explored the area between 1953 and 1955 after it had lain dormant for many years. In addition to geophysical and geochemical work they also put down 62 boreholes with a total footage of over 36,000 feet. All these results were available to us and, added to our own, provided data sufficiently encouraging for us to exercise our option in December, 1956.

By that date we had proved reserves amounting to 3,500,000 tons of oxide ore averaging 1.64 per cent copper, 1.68 per cent lead and 1.66 per cent zinc, and 9,250,000 tons of sulphide ore averaging 1.29 per cent copper, 1.07 per cent lead and 3.49 per cent zinc. Recent drilling results have increased these figures and indicate a total of 4 million tons of oxide ore and 10 million tons of sulphide ore with an average overall grade of 1.4 per cent copper, 1.25 per cent lead and 3.3 per cent zinc.

In the opinion of our geologists there are good reasons for expecting a further increase in this total when more drilling has been carried out and underground development put in hand.

We are now engaged in an investigation of the mining and metallurgical problems involved, and it is unlikely that this work will be complete before the end of the current year. In my opinion we have here an asset of great potential value, and you may be assured that we will acquaint you with our proposals for its exploitation as soon as we can.

"RISCO'S" VITAL ROLE

My review of our Rhodesian interests would be incomplete without a reference to our iron ore deposit at Bukwe, and our discussions with the Government and other parties on the reorganisation of the iron and steel industry in Southern Rhodesia.

It was in August, 1955, that discussions began between Mr Ellman Brown, the Minister in charge of RISCO, and ourselves. Negotiations have been continuous since that date and I should like to take this opportunity of paying tribute to the part played by Mr Ellman Brown throughout.

The matter has now been brought to a successful conclusion and a great deal of the credit for this satisfactory outcome should go to him.

A new company to be known as The Rhodesian Iron and Steel Company Limited (short title RISCO) has been formed to take over and operate the existing undertaking subject to ratification by Parliament. Details of the capital structure of this Company and its programme were recently sent to all Members by circular and you will not want me to repeat them today.

You will have noted that the acquisition by RISCO of the Bukwe Iron Deposit assures it of ample reserves for many years to come. As a result of further drilling our latest estimate of reserves is 134,500,000 tons of proved and probable ore.

The new Company has also taken over certain limestone claims, and on these and the Bukwe ore we shall receive royalty payments at the rate of sixpence per short ton for 99 years after effective mining operations begin.

Our total holding in RISCO, including those shares for which we are subscribing, will amount to 850,000 £1 shares, which, after allowing for full conversion rights by the holders of Debenture Stock, represents just over 23 per cent of the ordinary capital of the Company. In addition we shall receive £250,000 in cash payable by instalments between the years 1962 and 1964.

My colleagues have done me the honour of asking me to represent your Company on the Board. In accepting I have done so with a real sense of responsibility, as I am convinced that RISCO is destined to play a vital part in the development of Southern Rhodesia and the Federation.

Before ending my speech there is one other important matter I should mention. You may have read in the papers of the formation, by a group of prominent banking and financial houses, of the Merchant Bank of Central Africa. We appreciated being invited to take a participation as one of the founder members of this new bank.

This brings me to the end of my review of our operations during the past year. You will, I think, agree that it has been one of exceptional activity and has resulted in a further considerable expansion of our interests in Southern Rhodesia, all of which show promise for the future.

TRIBUTE TO STAFF

It only remains for me to express the thanks of the Board, and I am sure yours also, to Mr Frost, our General Manager, and all who serve under him wherever they may be, and to the staffs of our offices in London, Johannesburg, and Salisbury, for all their loyalty and hard work which have been largely responsible for the results submitted to you today.

The Directors' Report and Balance Sheet and Accounts for the year ended September 30, 1956, were adopted.

The retiring Directors, Mr R. P. Grenfell and Mr C. M. Stuart, were re-elected and the remuneration of the Auditors for the past year's audit was fixed.

There being no further business, the Chairman declared the meeting at an end.

BRITISH HOME STORES LIMITED

RECORD SALES

The twenty-ninth annual general meeting of British Home Stores Limited was held on March 20th in London, Mr Harold Hindley presiding in the absence of the chairman, Mr Horace Moore, through illness.

The following are extracts from the chairman's circulated Statement:

The Profit for the Period covering 52 weeks to January 5, 1957, against 53 weeks in the previous year, before taxation, was £1,530,194 against £1,468,223. Bank and Sundry Interest shows an increase of £23,211, following a more liquid position during the year, and the higher interest yields which have prevailed. Provision for Taxation takes £829,000 against £785,000 and with £190,426 brought forward from last year, there is a total of £891,620 available for disposal. A sum of £400,000 has been transferred to General Reserve, and the final dividend recommended on the Ordinary and "A" Ordinary Stock Units is 3d. per Unit, the same as last year.

TRADING CONDITIONS

Sales for the past year were again the highest in our history, and more customers were served than in any previous year. During the year we continued to strive for better qualities and values and to hold selling prices as far as possible in the face of increased costs of raw materials and labour. We also extended ranges in many Departments as part of a general policy to widen assortment.

Your Directors are constantly studying methods of producing economies and higher efficiency in all departments of the business and every effort will continue to be made in this direction. We are closely in touch with developments on Self-Service in the Retailing Trade Field.

A year ago I reported the opening of our important new Stores at Coventry, Cardiff and Plymouth in 1955. We have now had the experience of these Stores over a whole calendar year and results have been satisfactory and fully up to expectations. During the year no new Stores were opened, but two of the existing Stores, Great Yarmouth and Wakefield, were extended, and results so far have proved satisfactory.

INCREASED COSTS

Our results were again affected by increased costs of operation. In the year also we were faced with heavy increases in local rates which applied from the end of March onwards. The Government's recent announcement to the effect that there will be, as from April 1st next, a derating to the extent of 20 per cent is greatly welcomed and will go a considerable way towards reducing the inequality of the position.

In a few months' time we shall be opening new Stores at Blackpool and at Swansea in both of which towns we are very well located. Later in the year a new Store in Coney Street, York, will be open. Work is proceeding upon a new Store at Middlesbrough. Construction proceeds also in Central Birmingham.

Again, especially in view of the unsettled conditions at home and abroad, I cannot forecast what trading will bring this year. We shall continue to do our best to place before you a satisfactory report in a year's time.

The report and accounts were adopted.

LINGGI PLANTATIONS LIMITED

STRONG FINANCIAL POSITION THE BASIS OF SUCCESS

SIR JOHN HAY'S STATEMENT

The Sixty-first Annual General Meeting of Linggi Plantations Limited will be held on March 28th at 19 Fenchurch Street, London, E.C.3.

The following is the Statement by the Chairman, Sir John Hay:

At the general meeting of stockholders held in 1939 my predecessor in the Chair had the unpleasant duty of presenting a Report and Accounts containing no recommendation for the payment of any dividend on the Ordinary Stock and showing a Debenture liability of over a quarter of a million pounds. At the same time he had to submit resolutions authorising the writing down of the Ordinary Stock by £224,000, on the ground that much of the Company's rubber was then regarded as obsolete and below the value placed on it in the balance sheet. If we had been able then to foresee future events we must have regarded our prospects with dismay and entertained serious doubts regarding the Company's survival. The disaster of another world war overtook us that year, and in its course engulfed the territories in which we operated and dispossessed us of all our estates. When we regained possession after the war our estates and their equipment were in a serious state of disrepair through prolonged neglect and positive destruction, our organisation had been completely disrupted, labour was scattered and ill-nourished, whilst our trusted and experienced staff had for the most part suffered all the rigours of years of cruel and inhuman imprisonment and were in no fit state to resume work.

The road to recovery was no easy one and in our case was rendered specially difficult. Our debenture debt fell due for repayment at the end of 1945, before we had regained access to our estates. Despite the need to husband our resources, we had never failed to meet our obligations and to pay promptly each instalment of interest as it became due. But that was not sufficient, in the circumstances, to dispose lenders to make further advances except on what we regarded as onerous terms. By offering a fresh Debenture with attractive convertible rights—a device which has recently been adopted by certain industrial giants—we were successful not only in resisting demands for high rates of interest but were able to borrow, at a lower rate, more than sufficient to pay off past debts. With our financial resources thus renewed and strengthened we were free to apply ourselves to the task of rehabilitation. Our aim at the outset was not merely to restore but also to improve. As soon as labour, staff and materials could be mustered we resumed replanting. From that early resumption we have since carried steadily on, and today only 3 per cent to 4 per cent of our planted area consists of old seedling rubber. New and modern equipment has been added, enabling us to process our product in the forms that are most profitable. We have not been so engrossed in these activities as to be neglectful of the welfare of our labour in such matters as housing, medical and social services.

It is the steady pursuance of such measures, backed by sound finance, that has contributed to the Company's remarkable recovery. Our debenture debt has been eliminated by conversion and redemption. The capital originally written off in 1939 is now about to be restored and from past accumulations and present profits we feel justified in recommending a high rate of dividend supplemented by a bonus payment which together amount to the equivalent of over 60 per cent, subject to tax. If these recommendations are accepted, as I have no doubt they will be, our dividend distributions over the last seven years will have amounted to over 200 per cent. The basis of our success has been the building up and maintenance of a strong financial position. It is only from this secure foundation that we can with certainty pursue a forward policy in an industry the fortunes of which are notoriously variable and in which one of the essential requirements of efficiency is continuing long-term, costly replacement. I emphasise this point because this feature of strength, hitherto regarded with favour, has tended latterly to be considered in some quarters as something to be dissipated in favour of a tax-free distribution of assets. As a means of escape from present heavy personal taxation such expedients have their allurements. But the tendency to resort to them should be held in check, otherwise they run to excess, leading to the disruption or crippling of sound enterprises, depriving stockholders of the improving benefits which may be their future lot. I hope that our record in this instance will be regarded by stockholders as one deserving of their full confidence and favouring the continued conduct of our business along lines well proved.

Since I have had occasion to emphasise our dividend rate it is more than ever important that I should not omit the usual table which shows how our profits are distributed.

	£	£	%
Profit for year to 31.10.56 before taxation		461,222	100.00
Tax on Profits	229,882		
Tax on Exports (net)	101,049		
		330,931	71.75
		130,291	
Dividends		215,977	46.83
Drawn back from Reserves		£85,686	18.58

You will observe that our liability for taxes amounts to 71¾ per cent of our profits and that to make the proposed distribution to stockholders we entrench on our reserves by over £85,000. This, of course, is not the sort of operation that can well be repeated. Future dividends must bear a closer relation to earnings.

REPLANTING PAYMENTS

Whilst on the subject of taxation I might usefully deal with one of its aspects which apparently is not understood in some places. Malayan tax on the rubber industry consists of income tax at the standard rate prevailing and a duty on exports which in effect is a tax on output, since all rubber is exported. Export duty had its origin in the happy condition of no income tax and the duty was the main source from which the Malayan Government derived its revenue from the rubber industry. The traditional rate was regarded as one that fluctuated between 2½ per cent and 5 per cent and the belief, officially encouraged, was entertained that when income tax was imposed export duty would be abolished. Events did not follow that happy course. Export duty was a too easy source of revenue to be readily surrendered. It was not only retained, but at successive stages in the postwar period the scale of duty was sharply increased. Thus, in addition to the liability for income tax at the standard rate, the rubber industry was burdened by a heavy tax on output. The scale of duty was last revised in June, 1955, and was so steeply graded to the price of rubber as to provide for a rebate in favour of replanting whilst at the same time ensuring to Government the same high rate of revenue as formerly as long as rubber was profitable.

Our own experience under the present scale is this: since June, 1955, we have paid to Government duty and cesses amounting to £294,618. We have received back £89,361, leaving a balance in favour of Government of £205,257. Payments and receipts do not, of course, coincide and, therefore, these figures are liable to alterations at some future date, but our total payments under the present scheme will substantially exceed any rebate that we may receive. I have shown earlier in this statement that, after crediting all rebates received, our taxation for the current year amounts to the equivalent of 71¾ per cent on profits, a higher rate of tax than that levied on any other industry in Malaya and probably rarely equalled in any other country. To suggest, as some have done, that the rubber industry in Malaya is subsidised or assisted is indeed a quaint use of language. The industry would welcome a return to a 5 per cent export duty with no rebate. At present prices the rate is the equivalent of over 10 per cent.

FUTURE DEVELOPMENT

Our report records the purchase of Kombok Estate and we entered into possession on November 1st last. Its proximity to our Rantau Division and our close association with its management rendered it a natural and desirable acquisition and one that can be conveniently incorporated into our existing organisation. Of its planted area of 2,240 acres only about a quarter is seedling rubber, which we plan to replace over the next two or three years. On our Mantin property of 1,200 acres the old rubber has been removed and will be replaced by tea, the planting of which should commence in the latter part of this calendar year. As you know, in addition to our rubber interests we have a substantial

stake in oil palms. Tea will be the third product, in addition to which we have a small interest in coffee. We hope that by this extension into more varied products we may attain a greater stability than can be found by exclusive reliance on one. When these plans have reached an advanced stage it will be time to begin with the replanting of Sembrong Estate (3,200 acres). This estate consists for the most part of budded rubber but much of it is 30 years old and the planting stock then used is, judged by contemporary standards considered obsolete although yields have for long been at a high level and the estate has served us well when older divisions were in the course of replacement. All these operations will involve considerable outlay over the coming years. It is very necessary, therefore, that there should be no deviation from sound financial practice.

RUBBER PROSPECTS

It has become the custom to include in my annual statement some forecast of probable production and consumption for the current year. Rubber, sensitive to many influences, is liable to upset the most cautious predictions and in present circumstances a forecast, even for a year already advanced by over two months, is a hazardous exercise. Political instability and civil disturbance in some producing areas make it more than usually difficult to calculate production, whilst on the consumption side the increase in the relative importance of China and countries in Eastern Europe, with none of which are there the usual facilities for a free exchange of information, all adds to the normal uncertainties inherent in any forecast. But making the best guess we can, it would seem that over the year the production and consumption of natural rubber are likely to be in close balance, with the figures on both sides approximating to 1,900,000 tons. During the years 1955 and 1956 the world's purchases of natural rubber reached its highest peak at a total of 3,795,000 tons, at an average price of 2s. 7d. per lb. landed. Of that amount 1,198,000 tons were taken by the USA, in which country there were readily available supplies of synthetic rubber at a basically constant price of the equivalent of 1s. 9d. per lb. The significance of these facts appears to have been generally overlooked and they seem to belie the unqualified statement, made too often, to the effect that there is a particular price at which synthetic and natural come into direct competition and that any rise above that line in the price of the latter must result in a decrease in demand. The experience of the last two years has demonstrated that the prices of the two products may, in some circumstances, diverge widely without any significant change in their comparative use. I would not wish these remarks to be so interpreted as to induce a complacent disregard of competition. Our constant aim must continue to be a higher efficiency expressed in a lower cost of production. Pursuing that aim there seems no reason why we should not entertain a hopeful view for the future of natural rubber.

STAFF

It gives me much pleasure to acknowledge again the loyal and efficient services of our staff and all who serve under them.

NATIONAL PROVIDENT INSTITUTION

GOOD RESULTS OF INVESTMENT POLICY

The One Hundred and Twenty-first Annual Meeting of the National Provident Institution will be held on April 16th at 48 Gracechurch Street, London, E.C.

The following is an extract from the address which will be submitted by the Chairman, Mr L E. D. Bevan:

It has become the practice for the public to attach a special importance to the new business figures of a Life Office and to take these as an indication of its prosperity, despite the fact that all offices do not calculate their new business totals on the same basis. It is perhaps more correct to judge it as a standard of vitality. The substance of our business can be seen when I tell you that some 90 per cent represents ordinary whole life and endowment assurance, and it is evidence of our activities during the year that we set up a new record figure at £6,906,914 after deducting amounts reassured.

COMPETITIVE TERMS

We feel that, provided we quote terms for life assurance which are adequate to cover the risks and expenses involved and to provide some reasonable margin for profit, we gain in strength by maintaining and increasing our new business total, and we look for the help of our policyholders in seeking to extend our membership.

Our record total new business, also, must indicate that our terms are competitive; and in addition to the increased bonus rate to which I referred in my speech last year, we reviewed our tables of premium in the light of up-to-date mortality and, in most cases, were able to reduce premium rates for new policies.

Life assurance does not, however, represent the whole sum of our business, and in addition to deferred annuities for self-employed, we have issued immediate annuities for purchase money of £438,000; and also a number of deferred annuities in connection with pension schemes. The amount of annuity business transacted has increased steadily over recent years and seems likely to increase further owing to the more favourable basis of taxation to which purchased life annuities are now subject. The effect of this is that only the interest content in each year's payment is subject to tax, and that the part which represents a return of capital invested is free of tax, so that the disability under which this form of contract has always suffered in the past has at last been removed.

PENSIONS FOR SELF-EMPLOYED

I have just mentioned pension policies for self-employed—a wide category of men and women, including many of the professional classes and of those in business on their own account or in partnership with others. Provision for these, including favourable treatment as regards taxation both in respect of contributions and the terms under which they are accumulated, was included in the Finance Act, 1956

We have issued a satisfactory number of these policies so far and our with-profit contract is evidently popular. It did not surprise us, however, that many of those interested are anxious to examine the alternative possibilities. In spite of the taxation advantages many hesitate to tie up a substantial part of their savings in a benefit which can only be realised in the form of a pension and cannot be used in an emergency in the way in which a normal life policy can. There are alternative ways of making provision for an income in old age in combination with that element of protection for dependants that is so important. Our staff are only too willing to give full information to those who are interested, and to discuss in detail the various courses open. We have issued a number of endowment assurances for substantial amounts under which the assured can draw upon his savings should the need unfortunately arise; he will be able to use the proceeds to buy an annuity of which only a part is taxable following the revised basis of taxation of annuities set out in the last Finance Act; and in the meantime he can provide substantial life assurance protection for his dependants.

INVESTMENTS

Our internal investment reserves are spread over the various groups of securities in the balance sheet, being applied year by year according to the conditions affecting different groups. Our assets appear in the balance sheet on a conservative basis and, as a result of this, we have been able to face the material depreciation which took place in the market value of securities during last year without qualms as to the security afforded by our funds. The valuation made at the end of the year showed that in the aggregate the market value of our assets as a whole was still well in excess of the figures at which they stand in the balance sheet.

Once again we have increased our holding of Ordinary shares, in accordance with our policy to which I have referred in past years. During the course of 1956, the high yields obtainable on fixed interest securities enabled us to turn our attention more particularly to this field. You will see that we have substantially increased our holdings in this type of investment both on the Stock Exchange and in mortgages on property.

The rate of interest earned on our funds further increased to £7 1s. per cent before the deduction of income tax; and to £5 6s. 10d. per cent after tax. I am sure that you will consider this to be most satisfactory even when allowance is made for the fact that these rates are calculated on a fund which corresponds to the written-down value of the assets, and not to their market value. As in previous years, our holding of Ordinary shares has made a notable contribution to these good results.

You may remember that we and one or two other Life Offices were early in the field of Ordinary share investment—both at home and abroad—and in part our excellent yield today arises from increases in income from this source over the years.

CONTRIBUTIONS TO PROFIT

Economy in management is a feature with which we are closely concerned, and contributes towards the profit accruing to the participating policyholders.

There is a natural relationship between the amount of new business in the year, and the expenses of running the business. The expenses and commission incurred in the first year of a policy are heavier than those in subsequent years of its life. I am pleased, therefore, to point out that in spite of considerable increase in new business in 1956, the ratio of expenses and commission to the premium income was practically unchanged from the 1955 ratio.

We are now in the third year of our triennium and the next valuation will take place as at December 31st. I am not, naturally, in a position to forecast what rates of bonus we shall declare, but twelve months ago our confidence in the future was expressed in the announcement of increased rates of interim bonus.

ORIENT STEAM NAVIGATION COMPANY

EFFORTS TO COMBAT FOREIGN COMPETITION

The Fifty-seventh Annual General Meeting of Orient Steam Navigation Company, Limited, will be held on April 16th in London.

In his review of the year, the Chairman, Sir Austin Anderson, said the operating profit, after providing for depreciation and a transfer to contingencies, was £708,662. This was £287,906 less than last year. Even before the losses resulting from the closure of the Suez Canal which, in one round voyage alone, might amount to as much as £50,000, results had been disappointing; passenger load factors were lower than last year and past increases in fares and freights had been more than offset by increased costs.

Further increases in passage money and freights had, therefore, been necessary but at the same time reduced fare return tickets had been introduced to counter the competition of "casual" foreign migrant ships. These ships did not normally serve the Australian passenger trade and, because they could secure on the open market from an internationally financed organisation, and even from the Australian Government itself, fares for carrying migrants which were higher than those obtaining in ships regularly in the trade, they had been able to charge artificially low homeward fares. These had attracted passengers from the regular Lines and had exaggerated the lack of balance which, owing to the demand for outward berths for migrants, had since the war existed between the outward and homeward traffic. The effect of this was naturally to increase the cost of carrying outward traffic.

In spite of the present difficulties a new 40,000 ton passenger ship *Oriana* had been ordered and at today's prices would cost about £12½ million. Although this was a formidable venture it was justified by the steady increase in the popularity of sea travel which offered, quite apart from its "travel" aspect, a particularly pleasurable kind of holiday in itself. The two tankers ordered were to be of 37,000 and 47,000 dwt due for delivery in 1959 and 1960 respectively, and the increase to their size over that originally planned was in accordance with the modern trend.

It was useless, however, to spend large sums on increasingly complex and efficient ships without ensuring they were manned efficiently. Extra expenses were, therefore, inevitable in increased training and welfare schemes. The present expansion of Pacific traffic and a firm belief in the future of the development of the South Pacific as an area to attract Tourists from the North American Continent had led to an increase in the number of Pacific sailings at the expense for the time being of the usual cruising programme from the United Kingdom.

THE ENGLISH ELECTRIC COMPANY

OUTSTANDING ORDERS FOR BRITISH FACTORIES TOTAL £180 MILLION

SIR GEORGE NELSON'S CONFIDENCE IN THE FUTURE

Sir George Nelson, Bt (Chairman), presiding at the thirty-eighth Annual General Meeting held on March 14th in London, said:

I must first express our grief at the death of General Wade Hayes in September last who, for 26 years had given invaluable service in building up this great business. I would refer also to the changes the Board made on July 1, 1956, to meet the needs of the continuing growth of the business in consequence of which Mr H. G. Nelson was appointed Managing Director to take over the day-to-day duties of executive and technical direction.

THE YEAR'S RESULTS

I am able to report that we have again increased our turnover by approximately £10 million. The trading surplus before charging depreciation, taxation and other charges is £9,468,796 which is £677,100 higher than in the previous year. After charging depreciation, loan interest and provisions for contingencies and crediting dividends on trade investments, the balance is £6,735,195, which showed an increase of £164,594 over the previous year. Taxation was £3,446,480 and, after transferring taxation relief of £409,000 to capital reserve, the profit is £2,911,812, an increase of £158,510 over 1955. The total revenue reserves are now £14.4 million, capital reserves £4¼ million and share premium account £8¼ million, making total reserves of £27.4 million.

We are recommending an increase in the Ordinary Dividend to 14 per cent for the year but on the total money invested by the shareholders this represents a return of only 5 per cent.

The orders remaining in hand at the end of the year were £180 million for the Companies in the Group in Great Britain and there is adequate productive capacity to fulfil them on due delivery date. I look forward with confidence to the future.

We welcome the Government's policy of reducing defence expenditure which has added so much to taxation thereby imposing an extremely heavy burden on industry, and we hope this policy will enable the Government to raise the present levels of earned income relief and that at which surtax commences.

In referring to exports, I must mention the very highly competitive character of this side of the heavy engineering business which makes it extremely difficult to obtain orders on a reasonable profit basis. Notwithstanding the difficulties, we have appreciably increased our orders received and have shipped a greater tonnage overseas than ever before in one year. We can attribute this success to our policy maintained over a long period of spreading as widely as possible both the area and scope of our overseas activities. In this connection it is interesting to note that the business has come from 137 different countries.

INTEGRATION OF EUROPEAN TRADE

We are naturally deeply interested in the Prime Minister's statement on the Government's policy in relation to the integration of European trade. Any arrangements which can be made to stimulate the growing market in Europe would be to the benefit of some manufacturers in this country.

Industry and commerce as a whole, and rightly in my opinion, have given a positive though guarded welcome to these proposals, but it cannot be denied that there are dangers in them. The plan cannot work satisfactorily if any of the countries adhering to the proposed Free Trade Area should adopt or continue practices of open or concealed subsidy or differential export pricing amounting to dumping. If it cannot be ensured that British engineering manufacturers are likely to have a genuine chance of tendering to Continental Utilities as the Continental manufacturers would have in this country, the plan cannot succeed. The point which especially concerns me is the possible effect of the plan on the trading relations between this country and other Commonwealth countries. I am particularly glad to see that HM Government has insisted on excluding from these arrangements basic agricultural products, and on remaining free in the negotiation of tariff arrangements with the countries outside the Free Trade Area. If the countries of the Commonwealth work together to develop their resources, then great advantages would accrue to all.

MONOPOLIES

Certain sections of our Industry have been under investigation by the Monopolies Commission and in spite of the fact that it gave no evidence of exploitation or excessive prices, it says that various price agreements may be expected to operate against public interest. We recall very clearly the chaotic conditions which prevailed over very many years before such agreements existed and we are concerned lest changes from a proved system may endanger stability of employment in our industry.

The tremendous facilities afforded by our research laboratories had given, and would continue to give, enormous service to the country for peaceful uses and for defence.

OUTSTANDING ACHIEVEMENTS

The statistics of the Central Electricity Authority show that for the year 1956 the first, third and fourth most efficient stations operated by the Authority are equipped with English Electric steam turbines and alternators.

480,000 kW of generating plant for the Central Electricity Authority was commissioned by the Company during the year, being the highest figure so far in the history of the Company.

Negotiations with our partners, Babcock Wilcox and Taylor Woodrow, for the construction of a Nuclear Power station, Somerset are proceeding satisfactorily.

During the year output of traction equipment has been increased and we have shipped diesel electric shunters, diesel electric train equipments and electric multiple unit train equipments to the British Railways, diesel electric locomotives to Rhodesia,

Zealand, Argentina and the Jamaica, as, and electrical traction equipment Net Australia and India, and we take an optimistic view of the possibility of this business in the future both at home and overseas.

We have received substantial orders from British Railways which we greatly appreciate, but our capacity is by no means fully occupied and we are in a position to undertake further substantial orders should we be called upon to do so.

Our work in the Hydro-Electric power generating field continues to grow. I feel that I should mention one particularly important order which has resulted from the skill and perseverance of the individuals concerned in our Export department, namely, for hydro-electric generating plant and transformers for the Grant County Administration in the State of Washington to the value of approximately $25 million.

Production of our wonderful Canberra has continued during the year both for the Royal Air Force and for overseas countries namely India, Peru and Venezuela.

Intensive development of our P.1 fighter aircraft has proceeded and has resulted in a considerable production order for early delivery.

Throughout the year our work on guided weapons has made the most excellent progress, and through the years we have laid the strongest of foundations. We can now reasonably claim to be in a position of major standing, some would say of pre-eminence, both as designers and manufacturers of guided weapons.

The Report was adopted and a final dividend of 10 per cent (making 14 per cent for the year) was declared on the Ordinary Stock.

R. B. PULLIN & CO. LTD.

The twentieth annual general meeting of R. B. Pullin & Company Limited was held on March 21st in London, Mr R. B. Pullin, OBE, chairman, presiding.

The following are extracts from his circulated Statement:

The Consolidated Trading Profit of £151,927 is an increase of £10,706 and your Directors feel that this result can be accepted with every reason for satisfaction.

I am glad to be able to report that we have secured an exclusive licence to produce in this country a selected range of units manufactured by the Kearfott Company Inc., a subsidiary of the well-known General Precision Equipment Corporation of America.

The components chosen were Synchros, Servomotors, Tacho-Generators, and allied equipment.

Your Board has agreed to acquire the well-known optical business of Aldis Brothers Limited at Birmingham, which will bring about a most desirable balance as between Services and commercial outlets for the products of the Group.

It has been decided that part of the additional capital required for extensions to the factory, plant for Kearfott production and modernisation should be raised by an issue of £200,000 6½ per cent Convertible Unsecured Notes which are being placed. A further £218,750 is to be raised by a Rights Issue to Shareholders of 875,000 Ordinary Shares of 2s. each at 5s. per Share on the basis of one new Share for every two held.

The report was adopted and the increase of capital approved.

SCOTTISH EQUITABLE LIFE ASSURANCE SOCIETY

FURTHER SUBSTANTIAL PROGRESS

Sir Ewan G. Macpherson-Grant of Ballindalloch, Bt, Chairman of the Board of Directors, presided at the Annual Meeting held on March 14th in Edinburgh.

In the course of his remarks Sir Ewan said:

An important and very welcome development in 1956 was the decision of the Government to adopt certain of the recommendations of the Millard Tucker Committee on the taxation treatment of provisions for retirement. Self-employed persons and others in non-pensionable employment have been at a considerable disadvantage and it is very satisfactory that this anomaly has been largely eliminated. Premiums paid to provide pensions are now allowed as deductions from earned income before calculating income tax and surtax. The pension has the advantage of being treated as earned income for tax purposes. The Society has evolved an attractive scheme of "Pension Annuities" which is available either on a with-profits or a without-profits basis. The second point to which I would draw attention is the alteration in the basis of taxation of purchased life annuities. The injustice of taxing the whole of each payment of a purchased life annuity has been removed and the capital content which represents a substantial proportion of each payment will in future be exempt from tax. The Society's immediate annuity rates have recently been materially improved and purchasers wishing to buy higher income, security for life, and consequent freedom from anxiety will find that these rates are fully competitive.

REVENUE ACCOUNT AND BALANCE SHEET

Our premium income continues to expand and is in excess of £2 million for the first time. At the Annual Meeting a year ago, my predecessor, after commenting on the steady increase in the Society's rate of interest on the Life Assurance Fund, felt it advisable to issue a note of warning to the effect that we must anticipate a slowing down in the rate of increase in future. The figures for the last three years are as follows:

	1954	1955	1956
Gross Rate	£5.14.11%	£5.19.5%	£6. 1. 5%
Net Rate	£4.11. 0%	£4.15.1%	£4.15.11%

While the figures for 1956 confirm the forecast they are eminently satisfactory, and for the first time in the history of the Society the gross rate has exceeded 6 per cent.

The Society's mortality experience for 1956 was not quite so favourable as in the previous three years, but these were extremely good years. Notwithstanding the slight adverse swing the 1956 experience has produced a considerable contribution to the profits earned in the year. Claims by maturity are up by over £230,000 as compared with 1955—these, of course, are fully allowed for in advance in our calculations.

As a result of the year's operations the funds have increased by over £1 million. A complete valuation of liabilities has been carried out and I am pleased to say that the position disclosed is very satisfactory indeed. In view of the favourable results the Directors recommend that the rate of intermediate bonus on participating life assurances be increased from 40s. per cent to 45s. per cent per annum in respect of premiums payable after December 31, 1956. This bonus, like declared bonuses under the Society's compound bonus system, is calculated on the sum assured and existing bonus. I said earlier that we were now issuing pension annuity policies on a with-profits basis and it has been decided to recommend that under this new class of policy the rate of intermediate bonus be 40s. per cent per annum compound. This bonus will be allocated in the form of an addition to the amount of pension provided under the Policy.

It is very gratifying to record further substantial progress and solid achievement. The position of the Society is as strong today as it has ever been in the past and we can face the future with confidence.

We are now almost one quarter of the way through the last year of the current quinquennium and an actuarial investigation and declaration of bonus is due as at December 31st next. The increase in intermediate bonus affords convincing evidence of the profit-earning power of the Society, and I would, therefore, urge everyone who is thinking of effecting a policy to take out a with-profits assurance now and so ensure participation in the profits of the quinquennium.

The adoption of the Report and Accounts was carried unanimously.

HEAD OFFICE:
28 St. Andrew Square, Edinburgh, 2.
LONDON OFFICE: 13 Cornhill, E.C.3.

COBALT DEVELOPMENT INSTITUTE

BRUSSELS, BELGIUM

The first General Meeting of the Cobalt Development Institute, which was set up on January 16th, was held in Brussels on February 27th. In the course of the meeting, Mr Robiliart, Managing Director of Union Minière du Haut-Katanga, was elected Chairman of the Institute. Mr E. C. Baring of the Rhokana Corporation Limited and Mr Ch. Piedboeuf, Chairman of the Centre d'Information du Cobalt, were elected Vice-Chairmen.

The Cobalt Development Institute is a technical and scientific organisation, grouping the world's major cobalt producers. Its object is to develop, in all countries, the existing uses of cobalt and to continue search into new ones. It has no commercial activity.

The Belgian limited liability company "Centre d'Information du Cobalt" has been entrusted by the Institute with the execution of its programme. The Centre is established in Brussels, at 35, rue des Colonies, and is represented in the US by the "Cobalt Information Center" installed at the Battelle Memorial Institute at Columbus (Ohio).

Basic studies and research work on the applications of cobalt are commissioned by the Centre d'Information du Cobalt with specialised laboratories in Belgium and other countries on behalf of the Institute.

By widely distributing technical information, the Centre endeavours to give assistance to the users of cobalt and to anyone who might be interested in this metal.

It also aims at creating new outlets for cobalt, many of whose properties are unique, and to dispel any doubt about the continued availability of supplies.

Cobalt reserves and production capacity are amply sufficient nowadays to give consumers the assurance of a regular and abundant supply, on the basis of which new manufacturing programmes can safely be undertaken and existing programmes expanded.

THE VULCAN FOUNDRY LIMITED

RE-EQUIPMENT AND MODERNISATION CONTINUED

SIR GEORGE H. NELSON'S REVIEW OF ACTIVITIES

The ninety-fourth Annual General Meeting of The Vulcan Foundry Limited was held in London on March 14th. The following is an extract from the statement by the Chairman, Sir George H. Nelson, Bt, FCGI, MIMechE, MIEE:

The work of re-equipment and modernisation of the Company's Workshops, largely initiated during 1955, was continued and consolidated in the past year. Expanded capacity has been created for the production of diesel and electric locomotives, and this has been closely integrated within the English Electric Group as a whole. The contraction of steam orders has, of course, reduced the earning power of the Works during the year, as seen in the Report and Accounts. The earnings, however, during 1956 were fully in line with the estimates which were framed when the development programme was planned. Taking into consideration the healthy prospects of further orders from overseas, and our hopes of an increased and steady demand for locomotives for British Railways, your Directors are confident that our substantial programme of development will show steadily improving returns in future years.

ACCOUNTS

The Group trading profits, after charging £62,689 for depreciation, amount to £139,469. The provision for taxation on the profits of the year amounts to £64,662, and £30,000 has been transferred to Capital Reserve in respect of taxation relief on the excess of capital allowances over depreciation; the greater part of this relief is in respect of Investment allowances. The net profits amount to £44,807 compared with £302,290 for the previous year.

The profits available for appropriation amount to £43,846 after deducting £961 retained by Robert Stephenson & Hawthorns Limited. After adding the balance brought forward from last year, £100,100, and providing £2,875 for the dividend on the Preference Stock, there is an available balance of £141,071. The Directors recommend the payment of a dividend of 10 per cent on the Ordinary Stock, absorbing £48,593, leaving a balance of £92,478 to be carried forward. The reduction in the balance of profits carried forward, £7,622, must be viewed in conjunction with the transfer of £30,000 to Capital Reserve, giving a net addition to reserves during the year of £22,378.

The reorganisation has brought an increase in the Group's fixed assets of £266,295 after full provision for depreciation. This increase, together with capital expenditure commitments estimated at £250,000 at the date of the balance sheet, reflects the progress in re-equipment which has been made.

PRODUCTION

During the year the Company's building programme for locomotive mechanical parts included locomotives for the Netherlands, New Zealand, the Argentine and South Africa, while production is well advanced at Newton-le-Willows on parts for the diesel-electric locomotive "pilot" orders for British Railways. In addition, the new facilities for production of diesel engines have made a valuable contribution to the English Electric Group's output in this field. Our activities in the steam locomotive field have not entirely ceased but have been concerned mainly with the manufacture of boilers and spare parts, and no complete steam locomotives were built during the year. This was not the result of any reluctance on our part to remain in the steam locomotive market, but of the continued impact of very severe foreign competition in the few remaining main line steam locomotive markets. Some capacity for steam locomotive manufacture is still available within the Vulcan Group.

FUTURE PROSPECTS

The Vulcan Foundry's future inevitably lies in integrating its production within the English Electric Group of mechanical parts for diesel-electric and electric locomotives, the completion for delivery of such locomotives, and their final testing. In recent months several substantial orders have been received by the Group from overseas Railways, and the mechanical parts for these locomotives will be produced, and their erection carried out at Newton-le-Willows or at the Darlington Works of our subsidiary, Robert Stephenson & Hawthorns Limited.

BRITISH RAILWAYS

For many years the Locomotive Industry in this country has suffered the handicap of having no steady home market for its products. With the initiation of the British Railways Modernisation Programme, this handicap has been to some extent eased, and we hope it may be completely eliminated when the Railways place orders in implementation of the Programme's ultimate requirements. I would like to emphasise that, within the resources of the English Electric Group, ample capacity is available to cope with large-scale orders from British Railways, in addition to those from the many overseas Railways with which we have built up such a strong connection over a long period of years.

ROBERT STEPHENSON & HAWTHORNS LIMITED

Turning to Robert Stephenson & Hawthorns Limited, earnings have been low in a period of transition between different types of production, and a programme of re-equipment and modernisation has been put in hand to increase the capacity of the Darlington Works for locomotive mechanical parts.

At the Newcastle-upon-Tyne Works—where the "Rocket" was built in the earliest pioneer days of Railways—the first models of the Clayton Steam Generator are being manufactured under licence from the USA. Business continues in the traditional steam shunting locomotive for industrial purposes, in the diesel-mechanical shunters built in conjunction with The Drewry Car Company Limited, and in the Spencer-Hopwood Boiler. A new "austerity" diesel-mechanical locomotive, called the "Husky," has been developed to meet the demand for a simple and robust shunter at a low price, and it is hoped that this addition to the Group's already wide range of locomotives will quickly establish itself in the industrial market.

THE DIRECTORATE AND EMPLOYEES

I have to report that, owing to the pressure of his other commitments, Sir George Binney, DSO, tendered his resignation from the Board, which was accepted with regret, in February of last year. I would like to record the thanks of his colleagues and of the Stockholders for the valuable service he rendered to the Company, particularly in connection with export matters, during his four years as a Director.

I know, too, that you would not wish me to conclude this statement without a reference to the Company's Management, Staff, and workpeople, who have earned our gratitude by their hard work and the determination and efficiency with which they have carried out their tasks and overcome their difficulties during the past year.

The report and accounts were adopted.

LEICESTER PERMANENT BUILDING SOCIETY

ASSETS REACH NEW HIGH RECORD

The one hundred and fourth Annual General Meeting of the Leicester Permanent Building Society was held on March 14th at Leicester.

Mr A. D. Carmichael, CBE (the Chairman), presided and, in the course of his speech, said: The Society's Report and Statement of Accounts show the total assets of the Society at a new high record. During the year they increased by £2,382,069, and now stand at a total of £41,514,803.

Throughout the year we were able to continue making advances on a large scale to potential home owners. The total sum advanced was £6,366,390, a figure only surpassed three times before in our history. The mortgage assets increased by £1,488,670, and now stand at £35,056,854.

SOUND LIQUID POSITION

The Society once again presents a very strong balance sheet with outstanding Reserves amounting to £2,622,905, and a sound liquid position with £6,010,386 in cash or assets immediately realisable.

We have included our British Government and Public Board Securities at the prices at which they could have been sold on December 31, 1956. These Securities, consisting wholly of short or medium-dated stocks thus stand at £3,728,731, and when held until their payment becomes due by the Government, will realise a surplus of over £800,000.

Following a clearly defined policy, we extended our nation-wide service by opening new Branches at Cardiff, Hinckley, and Norwich, and we are satisfied they will contribute to the successful development of the Society's activities.

INTEREST RATES

As a result of the general upward trend of interest rates which took place in the first half of last year, we increased our rates to our investors and paid 3½ per cent from

September 1st to our paid-up shareholders. This increased rate means that a person paying income tax at 8s. 6d. is now receiving the equivalent of £6 1s. 9d. per cent and a person paying at the rate of 6s. 9d. the equivalent of £5 5s. 8d. per cent.

The future trend of interest rates is very much in the minds of Building Society investors and borrowers at the present time. I would, therefore, emphasise that Building Society rates are governed by the general level of long-term interest rates, and it is not until these change materially that we change our rates, up or down.

Present indications show a strong demand for mortgages for new houses, as well as for modern houses built in recent years, and with reasonable stability in the country, we look forward to another successful and useful year of work.

The report was adopted.

MARCONI'S WIRELESS TELEGRAPH

The fifty-ninth annual general meeting was held on March 14th, in London.

Sir George H. Nelson, Bt, FCGI, MIMechE, MIEE, chairman, in the course of his speech, said: It is with pleasure that I report a record turnover. The net profit is £490,102, an increase of £4,488 and the dividend recommended is 10 per cent, less tax.

During the year, we revealed that we were in the forefront in developing and manufacturing a revolutionary airborne navigational aid of great accuracy, known as the "Doppler Navigator." This has given outstanding operational service with the RAF and orders for it have been received from Commonwealth Air Forces.

The outstanding event of the year in television was the inauguration of television services in Australia. This great task was completed in time for the Olympic Games and all reports speak of the high quality of the pictures transmitted. Marconi's were responsible for four of the first six stations, two in Sydney and two in Melbourne, the total value of these contracts amounting to approximately £1 million.

In the BBC's recent colour television demonstration for the Houses of Parliament the transmitting and camera equipment were of Marconi design and manufacture as also were those used for the regular trial transmissions during the year.

Our new range of VHF FM sound broadcasting transmitters has put us in a strong position in this field, and we have installed no less than 40 of these for the BBC.

The reports and accounts were adopted.

SCOTTISH AMICABLE BUILDING SOCIETY

ANNUAL GENERAL MEETING

At the sixty-fifth Annual General Meeting held on March 19th in Edinburgh, the President, the Right Honourable Lord Inverclyde, KStJ, DL, said in the course of his speech:

The new savings in the Shares and Deposit Departments amount to £5,248,523, and the total at the credit of Shareholders and Depositors is now £22,868,408.

After charging all expenses, interest on Deposits, Income Tax and Profits Tax, the Directors have provided for the interest to Unadvanced Shareholders of £578,686 13s. 7d. The balance available for appropriation amounts to £94,487 7s. 1d. Of this amount £74,000 has been allocated to Reserves and a balance of £20,487 7s. 1d. has been carried forward. The Reserve Funds now stand at £954,828.

The Directors' policy has always been and always will be to hold a substantial sum in Trustee and Government Securities. The Society holds such Securities as at January 15, 1957, including interest, to the extent of £5,722,642, which with Cash at the Bank and in hand of £786,667 provides a total liquidity of £6,509,309, an increase of £264,339 on the previous year, and 26.45 per cent of the total assets.

These securities have been carefully staggered so far as maturity dates are concerned, apart from a small percentage of undated stocks. Owing to the fall in Government and other Trustee Securities, the Society, in common with other financial institutions, has experienced depreciation between the book value and the market value.

The Directors are, of course, retaining these securities against maturity dates, but have decided to write down their book value by £100,000. This, in effect, is the creation of a special reserve.

The Directors decided to have a valuation taken of all their properties before the close of the Balance Sheet and these properties were valued at £858,000, whilst they stood in the Books at £308,000. They therefore decided to appreciate these properties by £275,000 and to place that amount to the credit of the investment Reserve Fund. The total assets amount to £24,604,619 showing an increase of £578,547.

While we do not underestimate the difficulties arising from the general economic problems of the Country, we go forward with every confidence in our ability to meet any position which may arise in the future. The dominant policy of the Board has always been based on a consolidation of the Society's financial position, to ensure that at all times our strength and our ability to meet all obligations are not impaired, and the accounts for the past year fully bear out at once the wisdom and the success of the policy which the Board has followed. This policy has indeed been so successful that the Society is in a strong position, as the Annual Report indicates, to meet applications from prospective borrowers, and this is a vital feature which I specially stress. Our mortgage policy will, of course, continue to be one of careful selection.

I would like to compliment our thousands of borrowers on the manner in which they have maintained their payments. When we consider that since the end of the last war the Society has lent over £32½ million to enable thousands of families to become owners of their own homes, and that the total Mortgage assets now stand at £17,365,532 with an average of £969 per Borrower, we can regard these facts as proving the absolute soundness of the Society and the strong sense of responsibility of all connected with it.

The Report was unanimously adopted.

APPOINTMENTS

THE ECONOMIST INTELLIGENCE UNIT LIMITED invites applications from men aged 25-35 for a post as senior research assistant in the Unit's Industries Department; good academic qualifications and experience in industry or commerce are essential. Starting salary according to qualifications but not less than £800.—Please send full particulars to "Industries," 22, Ryder Street, London, S.W.1.

DEVELOPMENT ENGINEERS

Vacancies for Graduates or persons with equivalent qualifications in Mechanical Engineering, Physics, Mathematics—in the Research and Development Division of WILMOT BREEDEN LABORATORIES.

Posts involve a wide range of problems: Analyses and Design of Mechanisms, Stress Analyses, Resonance and Analyses of Motion, Spring Design, Optical Developments, etc. Experience is desirable, but not essential.

The Division is located in ideal surroundings at Umberslade Park, near Hockley Heath. Working conditions and prospects are excellent and transport is provided to and from the Establishment.

The posts carry monthly staff status, good salaries, staff pension scheme, etc.

Applications, which will be treated in strict confidence, should be addressed to the Chief Development Engineer, Research and Development Division, Wilmot Breeden Laboratories, Umberslade Park, Solihull, Warwickshire, stating age and full details of qualifications and experience.

STOCK CONTROL.—A large firm of photographic manufacturers near London requires a man aged 25-30 for supervisory duties. This is an appointment which could lead to progressive positions in the Company Planning Organisation. Candidates should have had fairly wide commercial experience, but not necessarily of stock control work. They should be of high educational standard with some ability and interest in figure work. Salary by arrangement according to qualifications and previous experience.—Apply, Box 662.

FEDERATION OF RHODESIA AND NYASALAND

VACANCY : ECONOMIST.
DEPARTMENT OF THE FEDERAL PRIME MINISTER AND CABINET OFFICE.

Applications are invited from candidates, under 45, with a good Honours Degree in Economics and who have had experience in an economic advisory capacity, or in lecturing in Economics, for the post of ECONOMIST in the Economic Section of the Department of the Prime Minister and Cabinet Office, Salisbury. The post is permanent and pensionable.

Salary $2,150 per annum. (Fixed.)

Duties of the Section include advice to the Government on economic questions, development planning and the preparation of memoranda on these and other allied topics. The successful applicant will work as Deputy to the Chief Economist who is head of the Section.

Applications, in duplicate, giving details of nationality, age, marital status, qualifications, experience, date available, together with the names and addresses of two referees, should reach the Secretary(R), Rhodesia House, 429, Strand, London, W.C.2, by April 26th.

RECKITT & COLMAN LIMITED offer two interesting appointments for statisticians.

1. As Assistant to the Head of the Statistical Department. The services of this department are very widely sought within the business on both technical and commercial problems. There is plenty of opportunity to use statistical methods in a varied range of situations and great emphasis is laid on the development of new research methods.

2. As Assistant to the Manager of a Market Research Department, in the design, analysis and interpretation of surveys covering retail consumer and product research.

Applicants for the first appointment should have graduated in mathematics or statistics. Applicants for the second appointment should possess the Certificate of the Royal Statistical Society or an equivalent qualification. Experience in the use of statistical methods, whether in industry or elsewhere, would be an advantage in either appointment and would command a higher starting salary. The company has a staff pension fund and a prosperity bonus.

Applications will be treated in confidence and should be addressed to the Personnel Adviser, Reckitt & Colman Limited, 40 Bedford Square, London, W.C.1.

MATHEMATICIAN

A modern manufacturing company, pleasantly situated in a rural area has a new vacancy in its expanding statistical department for a Mathematician. Male or female applicants under 30 years of age should be graduates in mathematics who have some statistical training.

The job consists of dealing with a wide variety of problems covering many aspects of the consumer goods field.

The starting salary will not be less than £1,000 per annum and the Company will give assistance in housing.

The successful applicant would become a member of the Company's non-contributory pension plan which in addition embrace other benefits.—All applications, which will be treated in strict confidence, should be addressed to the Chief Personnel Officer, Box 660.

AN organiser of executive status is being appointed by leading market promotion research concerns. He will (1) plan and prepare client service operations, (2) plan and progress provision of routine and special data, (3) maintain necessary records, schedules, procedures and communications, (4) provide liaison between client contact and service departments, (5) establish and give practical effect to a common purpose between different functions. This interesting work would appeal especially to men with experience in a Production Control capacity in industry, or an administrative post in advertising, marketing or commerce.—Applications, fully detailing age, education, experience, present salary, should be addressed to P.C., The Wallace Atwood Company, Management Consultants, Chantrey House, Eccleston Street, London, S.W.1.

ACCOUNTANT required in Costs Development Branch of N.C.B.'s Finance Department at London H.Q. A recognised accountancy qualification, or good degree, is required with a genuine interest in the development of techniques providing financial information as an aid to management. Practical experience in the application of Standard Costs would be an advantage. Some travelling to the coalfields and visits underground are involved. Age preferably not more than 35. Appointment (superannuable) according to qualifications and experience within inclusive scale £1,213-£1,550 male.

Write, with full particulars of age, education, qualifications and experience, to National Coal Board, Staff Dept., Hobart House, London, S.W.1, marking envelope X655/D, before April 3, 1957.

APPOINTMENTS

THE QUEEN'S COLLEGE, OXFORD

BURSARSHIP.

The Governing Body of The Queen's College invite applications for the office of Bursar from persons under 40 years of age. The successful candidate will be elected to an Official Fellowship of the College.

The initial stipend will depend on age and experience, but will not be less than £1,500, and will rise on the current scale to a maximum of £2,000. There are certain emoluments, and the office is pensionable under the F.S.S.U.

The successful candidate will be expected to assume office not later than January 1, 1958. Forms of application are obtainable from the College Secretary. Completed forms of application should reach the College by May 1, 1957.

MANAGEMENT ACCOUNTANT

Applications are invited for an appointment in the Department responsible for economics and statistics in the London Headquarters of a large Industrial Group.

Candidates, preferably under 35, must be Chartered or Incorporated Accountants and must hold an Honours degree preferably in Economics or Maths. Industrial experience with specialised knowledge of management accountancy or industrial economics is desirable. Salary depending on qualifications and experience. Apply Box 649.

A LARGE MANUFACTURING COMPANY in the West Country has vacancies in its expanding Market Research Section for women university graduates, aged under 25, with good degrees in Economics. The work, which is in a new and interesting field, involves interviewing members of the public and assisting in analysis and reporting of the data collected. Retail surveys are also undertaken. About six months in the year is spent interviewing both in London and the provinces. A full training will be given.—Apply to Box 651.

SHELL CHEMICAL COMPANY LIMITED

has a vacancy in London for a male

TECHNICAL ASSISTANT

age 25-30 with honours degree in Economics or Statistics.

This is a specialist post for a man who is good at applied mathematics and the use of mathematical reference would be given aid to Management. Some experience of the to a man who has Chemical Industry.

Generous pension scheme and other benefits. Salary according to age, qualifications and experience. Write with full details, to Shell Chemical Company Limited, Personnel Department, 170, Piccadilly, London, W.1.

EXPORT.—Leading U.K. Manufacturers of Electrical Equipment wish to appoint Export Sales Executive. Previous experience of overseas trading essential, and a knowledge of electrical products desirable.—Write, with full particulars, including salary required, to Box S.13 c/o Central News, Ltd., 43, London Wall, E.C.2.

REQUIRED IMMEDIATELY by large and expanding commercial organisation handling well-known food product, Chief Accountant/Secretary with full professional qualifications, to take complete financial responsibility for overall operations.

SENIOR EXECUTIVE OFFICER, with proved organising and administrative ability, to be responsible for Head Office and Regional organisation, development, etc.

SENIOR ECONOMIST/STATISTICIAN.

The above appointments call for men of the highest ability and commercial experience and will command commensurate salaries. Pension scheme.—Full details to Box 665.

A MAJOR light/medium engineering concern in the Midlands invites applications for a new senior executive post. The wide scope and opportunity offered may be inferred from the major responsibilities to be undertaken:

1. To keep organisational structures under constant review, analysing their effectiveness and the controls, procedures and routines operated; to formulate proposals for improvement and to submit periodic reports to management written in clear and concise terms;

2. To discuss proposals and secure agreement at all levels; to design procedural documentation, as appropriate; to supervise the implementation of agreed proposals;

3. To assess executive qualities related to the operations under review, to submit proposals on measures required to improve performance.

This work obviously calls for a man with wide, practical knowledge of industry and with proven executive experience which has covered direct responsibility for O & M work, including Work Study techniques. The O & M controller will deal with executives at all levels and must be a "good mixer." A salary commensurate with the qualities demanded and the responsibilities involved, plus profit sharing and contributory pension scheme, will be offered. No age bracket is stipulated but the post should mainly attract academically qualified and experienced men around the age of 40 to whom it would offer a big opportunity.—Fully detailed letters of application should be addressed to The Wallace Atwood Company, Management Consultants, Chantrey House, Eccleston Street, London, S.W.1.

CHRIST CHURCH AND MAGDALEN COLLEGE OXFORD

LECTURESHIP IN POLITICS

Christ Church and Magdalen College propose to appoint a Joint Lecturer in Politics if a suitable candidate offers himself. The stipend will be not less than £600 per annum with rooms and dining rights.

The appointment will be for three years in the first instance and will begin in Michaelmas Term 1957; the successful candidate will be expected to teach for the Preliminary and Final Examinations in the Honour School of Philosophy, Politics and Economics.

Applications, with the names of three referees, should be sent to the President of Magdalen College, to arrive by May 4th.

MANAGEMENT SELECTION LIMITED

have been retained to advise on the selection of the

GENERAL MANAGER

for a recently formed subsidiary of a large Engineering and Manufacturing Group to develop and market on a world-wide basis equipment for a new and important process.

This appointment carries responsibility for the development and direction of all activities in the new Company. Particular emphasis involve laid on Export trading, and this quarters are periodic travel. The Company's in London.

Experience of management and commercial experience marketing and sales, both a successful record as. A technical background at home and or not essential. Preferred age is desirable rating salary subject to negotiation, 40-50. less than £4,000, with possibility of but, seat on Board.

Please send brief details, in strict confidence, to H. E. Rolf, Management Selection Ltd., 17 Stratton Street, London, W.1, quoting Reference S338. No information will be disclosed to our clients until candidates have been told their identity and have given permission after full discussion.

ASSISTANT LIBRARIAN required for Research Station at Walton Oaks, Tadworth, Surrey. The duties will be as follows: clerical routine in connection with the ordering, recording, circulating, storing and arranging for binding of periodicals, abstracting scientific and general articles. Candidates, male or female, should be over 20 years of age, of good educational background and be able to type accurately. A good knowledge of one language in addition to good English would be an advantage.—Applications should be addressed to The Personnel Manager, Vitamins Group, Upper Mall, Hammersmith, London, W.6.

MANAGEMENT SELECTION LIMITED have been retained to advise on the appointment of a

MANAGING DIRECTOR

aged 30-35 for a company in

CANADA

The appointment offers a young man the chance of taking full responsibility for the control and development of a British company in Canada.

The Chairman, who is resident in England, is a man of unusual capacity and by unconventional ideas in a traditional industry—sand and gravel—has raised his British company's turnover forty-fold in eight years. He has now bought a gravel company in Canada with the same sort of development in mind. New quarries and reserves have to be found and developed.

This is an unusual and exciting opportunity for men with industrial management experience, preferably in civil engineering. They must have a good knowledge of all management functions, preferably with specific experience in the control side, but a narrow specialist would be useless. Other desirable qualifications are Public School education, degree in Economics or statistics or an accountancy qualification.

Fringe benefits are above average, tax well below British level and salary will give a standard of life equivalent to £2,500 in England.

Please send brief details, in strict confidence, to P. J. H. Fryer, Management Selection Limited, 17, Stratton Street, London, W.1, quoting reference (S.2272). No information will be disclosed to our clients until candidates have been told their identity and have given permission.

AN EXCEPTIONAL OPPORTUNITY occurs in a large group, with Head Offices in Manchester, for a man of character, with a good education and some industrial background in a junior or intermediate executive capacity, to train quickly for a higher management post. To a suitable applicant two years' intensive training will be offered at a commencing salary of £2,500 per annum, followed by either the offer of an exacting executive appointment at substantially more salary or a definite indication of non-compliance with anticipated standard. Applicants should reply (in confidence), stating precisely what they have done so far, not what they could do, given the appropriate opportunity. Personal selling of personality not interesting. Only facts will be assessed.—Box 653.

UNIVERSITY OF CAMBRIDGE

ASSISTANT IN STATISTICAL RESEARCH IN THE FACULTY OF ECONOMICS AND POLITICS.

The Faculty Board of Economics and Politics intend to appoint an Assistant in Statistical Research whose duties will be to assist the teaching staff of the Faculty with their statistical work. Applicants should possess either an honours degree in economics with some training in statistics or appropriate statistical experience in a government office or other organisation. The appointment will be for two years in the first instance, from October 1, 1957.

The pensionable stipend of the Assistant in Research is £500 a year rising by annual increments of £25 to £700 a year. The starting point in the scale will depend on age and experience.

Further particulars can be obtained from the Secretary of the Faculty Board of Economics and Politics, to whom candidates should send five copies of their applications, including the names of two referees, so as to reach him at the Marshall Library, Downing Street, Cambridge, not later than April 20, 1957.

AUSTRALIA—UNIVERSITY OF ADELAIDE

Applications are invited for appointment as SENIOR LECTURER OR LECTURER IN COMPARATIVE GOVERNMENT AND PUBLIC ADMINISTRATION.

The appointment, which is in the Department of History and Political Science, will be made as Senior Lecturer or Lecturer level according to the qualifications and experience of the successful candidate.

Professor W. G. K. Duncan is at present in the United Kingdom; potential candidates may communicate with him by letter addressed c/o Bank of New South Wales, 47, Berkeley Square, London, W.1.

Salary Scales: Senior Lecturer—£A1,800-70-2,150 p.a.
Lecturer—£A1,200-80(70)-1,750 p.a.

Superannuation: On the F.S.S.U. basis.

General terms of appointment, including particulars of the information to be included in applications, may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36, Gordon Square, London, W.C.1, or from the undersigned*.

Applications should be lodged in duplicate with the undersigned* not later than APRIL 30, 1957.

*V. A. EDGELOE,
Registrar,
University of Adelaide,
Adelaide, South Australia.

DUNDEE TECHNICAL COLLEGE

DEPARTMENT OF MANAGEMENT AND HIGHER COMMERCIAL STUDIES.

Applications are invited for the post of LECTURER IN FINANCIAL AND COST ACCOUNTANCY and allied subjects for the above Department. Applicants must be graduates and/or hold a suitable professional qualification and have appropriate industrial or commercial experience. Duties will commence in September, 1957. Salary (at present under revision) either £685 x 37–£963 (Grade III(b)) or £770 x 35–£1,124 (Grade II (a)), according to qualifications and experience.

Further particulars and application form can be obtained from the Clerk and Treasurer, Institute of Art and Technology, 40, Bell Street, Dundee, to whom the completed form should be returned not later than two weeks after the appearance of this advertisement.

DIRECTOR OF COMPANIES

Shortly relinquishing position with companies in South Africa, Age 39 years. Thorough knowledge of Production Control, Sales Promotion, Budget and Commercial Control.

Holds executive position in companies dealing with Packaging, Engineering (general and motor) Chemical Products. Seeks senior position with company in Southern Africa or other part of Commonwealth.—Write Box E 574, c/o 191, Gresham House, E.C.2.

INTELLIGENT lady personal assistant seeks responsible post. Professional and commercial experience. Minimum salary £676 per annum.—Box 664.

APPROXIMATELY 5 years Economist for disposal to anyone prepared to collect or pay carriage only.—Box 667.

TRY going to a fancy dress ball disguised as a bottle of Duff Gordon's El Cid Sherry. You may not win a prize but you'll be in constant demand.

THE Economists' Bookshop has the world's widest range of books on Economics, Politics, History, Anthropology and the Social Sciences. World-wide mailing service. Second-hand books bought.—11-12 Clement's Inn Passage, Aldwych, London, W.C.2.

WORK STUDY.—Next six-weeks' full-time course starts April 23rd. Details of this and eight others, including part-time, evening and correspondence, from The School of Time and Motion Study, 29 Cork Street, Piccadilly, London, W.1.

TAPE TRANSCRIPTION of conferences, reports or letters undertaken on your premises or ours, in this country or abroad. Service by post to provinces. The Palantype Agency, 229/231 High Holborn, W.C.1. (CHAncery 3460.)

TUITION

EXPERT POSTAL tuition in Law, Accountancy, Costing, for Examinations—University, Management, Export, Commercial, Secretarial, Civil Service, Education, etc. Also Commercial, General Certificate courses in business practical (non-examination) courses in many subjects.—Write today for free prospectus—and/or advice, mentioning examination or subjects in which interested, to the Secretary (G9/2),
METROPOLITAN COLLEGE, ST. ALBANS
or call at 30 Queen Victoria Street, London, E.C.4.

ANNUAL AIR SUBSCRIPTION RATES

Subscriptions to most countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is either because the alternative is not available or not recommended.

	Airmail	Air Freight

Wednesday was the 71st Annual General Meeting of British Oxygen

In his speech, the Chairman, Mr. J. S. Hutchison, reviewed the aims and achievements of the Company, and he said ...

"Today the Company picture is one of vigorous expansion in capital investment, in the application of modern techniques, and of development and research projected on a broad front.

Our research teams are active in such subjects as liquid oxygen in aircraft and missile propellents; liquid nitrogen for atomic energy; transportation of liquid acetylene and methane; oxygen methods of steel making, and the investigation of new products.

Sales of liquid oxygen in the United Kingdom increased four times since the war. Two years from now our oxygen capacity will have trebled. Altogether a record of vigour, enterprise and progress which gives us the right to look forward with confidence, as we do."

IN THE YEAR'S WORK

Britain's First Tonnage Oxygen Plant

This big new plant at Margam was opened in August by the Home Secretary. It makes oxygen in tonnage quantities and supplies by direct pipe-line to the Steel Company of Wales. Similar plants to increase steel output are being built at Consett, Ebbw Vale, Middlesbrough and Scunthorpe.

Melamine Production Doubled

In 1956 British Oxygen extended their melamine plant at Chester-le-Street at a cost of £500,000 to meet the demand for this versatile chemical used in decorative laminates, tableware and stoving enamels.

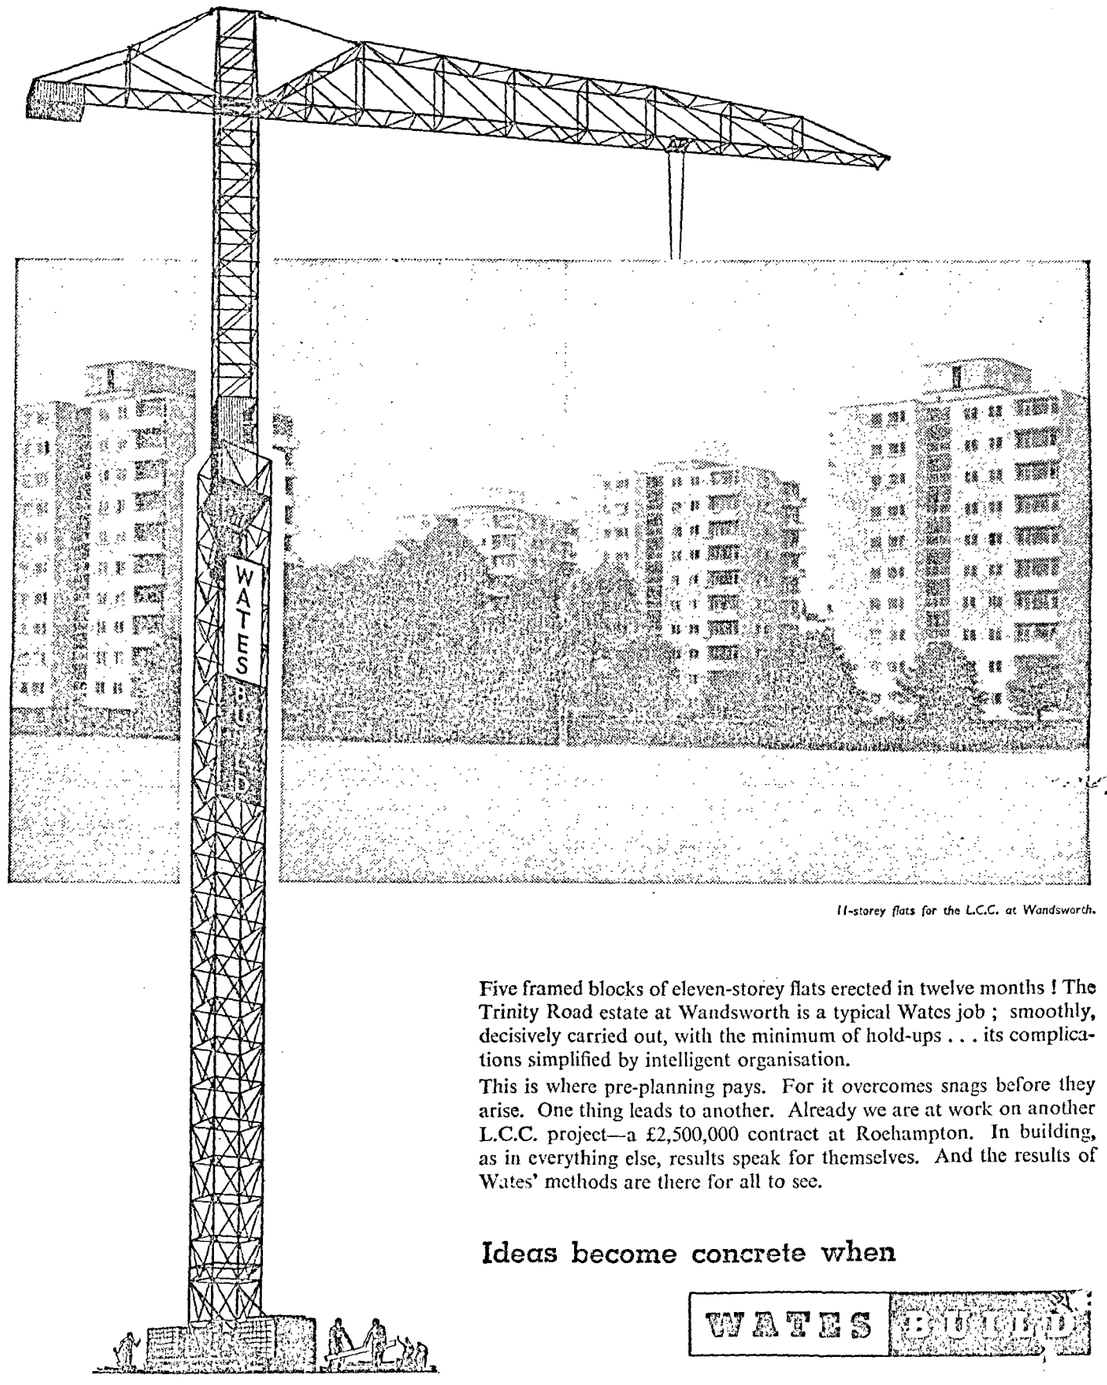
In the Service of Medicine

Main effort has been development of a new range of assisted breathing machines. The year also saw the introduction of anaesthetic apparatus and gas cylinders fitted with new Pin Index valve system conforming to international standard. This prevents wrong coupling of a cylinder. In the next 2 to 3 years thousands of existing equipments will, in the interests of safety, be converted.

New Automatic Arc Welding Processes

Great advances have been made in processes and equipment for welding nuclear energy power plants, ships and storage tanks. The new FUSARC/CO_2 process welds faster and cheaper.

More Progress at British Oxygen Engineering



As the sequel to major reorganisation at Edmonton in 1955, B.O.E. added bigger shops for air separation plant. Started the construction of a new engineering unit at Harlow to cater for aircraft equipment. Extended their apprenticeship scheme by building a new apprentice school with every facility.

Research

First Rescol air separation plant at Margam (see 1) and text book 'Oxygen in Iron and Steel Making' by our research staff typified Company's full support to steel industry. Research programme included acetylene derivation, synthetic blood plasma, oxygen for aircraft and missile propellents.

11-storey flats for the L.C.C. at Wandsworth.

Five framed blocks of eleven-storey flats erected in twelve months ! The Trinity Road estate at Wandsworth is a typical Wates job ; smoothly, decisively carried out, with the minimum of hold-ups . . . its complications simplified by intelligent organisation.

This is where pre-planning pays. For it overcomes snags before they arise. One thing leads to another. Already we are at work on another L.C.C. project—a £2,500,000 contract at Roehampton. In building, as in everything else, results speak for themselves. And the results of Wates' methods are there for all to see.

Ideas become concrete when

File "S"—For Sonorosis

COME and spend a few minutes in the factory hospital—the small cream and green room where a doctor and nurse minister to the needs of five hundred machinists, operators, typists and backroom boys. A room well away from the scream and crash of the factory floor.

Look round the rows of bottles, winds of bandages, walls of books and alphabets of files. A well equipped little room you think—but wait till the doctor tells you about his patients. Wait till he tells you that most of the men and women who come through his door don't suffer from a bleeding hand or a crushed foot—they don't come seeking his bandages or medicines. They come to rest, to beg something for a headache, and to escape from the eternal noise of the machines.

One thick file holds all their names: File "S"—for Sonorosis. Listen to the doctor on Sonorosis.

"Nowadays, modern machines with automatic safety devices have cut our accident rate to practically nothing. I rarely see so much as a cut finger these days. On the other hand, more and more workers are suffering from nervous complaints—Sonorosis (that's *sound-irritation anxiety*) *is playing havoc with our* work potential. Absenteeism is a direct result—and, apart from handing out a few sedatives, I can't do anything about it".

He's right, of course, *he* can't do anything about it. The only answer is to mute those huge machines, bring noise down to a bearable level, and reduce the wear and tear on nerves. And that's a job for Newalls.

Newalls have a long record of success in dealing with acoustic insulation 'headaches.' For more than fifty years they have led the way in this specialised field, and offer the benefit of this experience to any firms interested in improving working conditions and efficiency. To seek Newalls advice will cost you nothing.

A guide to your character

As much as your gait, your expression, your clothes—the newspaper which you take reveals you. The silly man reads a silly newspaper. The solemn man reads a solemn newspaper. The prejudiced man reads the newspaper whose prejudices coincide with his own.

What kind of person reads the Manchester Guardian? The typical reader is intelligent. He has a sense of values—otherwise he would not bother with a newspaper which is so singularly free from vulgar 'journalism'. He is fair-minded—prepared to read a non-party paper. He is literate—he likes a well-turned phrase, a wry remark, a penetrating point of view.

Do we give too flattering a picture of readers of the Manchester Guardian? Not at all. We simply credit them with sufficient strength of intellectual character to know the good from the bad; the false from the true; the sincere opinion from the party line.

Safe journey. One of life's minor annoyances in business is the kind of envelope which arrives at its destination tattered and torn and partly or wholly dis-contented. One of Spicers major services in the world of paper of all kinds, is to suit the material precisely, functionally, to its purpose. That is why, among Spicers wide range of envelopes, you will find without much searching at least one variety to answer your own need—all present and correct, Sir.

Looking Ahead

This country grasped the lead in the manufacturing age and held it for generations. Today, if we are to hold and add to that lead—in an age of striking scientific developments—we have to think again.

The Government and Industry are investing millions in Universities, Colleges and Schools. But all this money can be so much waste if it does not produce the technologists and technicians vital to the advance of British enterprise.

To this end, *The Times* has brought out TECHNOLOGY, the monthly review of training and education for industry. TECHNOLOGY is the journal of an expanding partnership, the partnership between teachers and industrialists on which Britain's industrial future depends.

Through TECHNOLOGY *industrialists* are able to declare their objectives and needs to teachers. At the same time *teachers* are able to explain their aims and difficulties to industry.

TECHNOLOGY provides a bridge across which will flow a constant stream of ideas, comments and opinions affecting the whole field of training for young men and women to take their place as technologists and technicians.

Contents of the April issue include:

What Was Decided?

WHAT do our leaders talk about in places like Bermuda? As after so many conferences, the world is left to puzzle over a series of enigmatic forms of words: the statesmen were agreed on the need for this and on the importance of that; but were they agreed on what was likely to happen, and on what they would do if it did? The Bermuda meeting between the heads of the United States and British governments was of the highest importance for Britain, because it is vital for this country that its government should work in harmony and co-operation with the government of the United States; and it is of no mean importance for the United States itself, and for the western world, that these two countries should not be at cross-purposes, as they have been in the past year on major questions of policy in the Middle East. Has the breach been healed?

With reasonable confidence it can be said to have been healed in the general sense that resentments for bygone things have been written off, urbanity restored, and the habits of good manners and mutual consideration, proper to two governments whose countries have such great interests in common, resumed. Everything about the Bermuda meeting—the President's gesture in holding it on British soil, his personal treatment of Mr Macmillan as an old friend, the readiness without haggling to supply the important intermediate-range guided missile for British use—reflected an American determination to spare no helpful gesture that may ease the passage back to a relationship of cordiality and trust. Nor, luckily, now that the high temperatures of November have subsided, is there any need to doubt the British desire to get back to such a relationship.

Does this mean that all is well again? It would be hasty to assume it. The crux of the matter does not lie in the spirit of free, frank and friendly relations which the Bermuda communiqué underlined, but rather in a responsibility which it went on to recognise:

> their responsibility to seek to co-ordinate their foreign policies in the interests of peace with justice.

It was the failure of that co-ordination that led to the breach between London and Washington. Agreed desiderata do not automatically, by themselves, produce a working partnership; there must be a common view of ways and means as well. At almost any time from July to October last year it would have been possible for the British and United States governments to produce an impressive list of points of agreement about things that they would like to see happen; but whenever a decision had to be taken on what to do, they were divided, so that in the end Washington found itself successfully frustrating a British course of action in the Middle East (admittedly, a thoroughly misguided course) without having devised any kind of course of action of its own. So far, President Nasser and the anti-western nationalists in every Arab country are the only gainers.

With its way cleared by the Anglo-American disunity about things to be done, the anti-western current of events in the Middle East

was not deflected by the repeated assertions (first in the two London conferences on the Suez Canal, then in the Security Council in October) of agreement about what ought to happen. This has been a period in which both governments have been not forming events but reacting to them, and reacting unsuccessfully. Probably nothing less than a united working partnership can reverse the current; but the Bermuda communiqué gives little indication of the chances of getting it. Of the eleven points listed on which "agreements and conclusions" were reached, eight merely enumerate desiderata. The three exceptions are the Baghdad Pact, nuclear tests, and guided missiles, on each of which the communiqué does state a specific intention.

Most urgent among the matters discussed were two other topics, the Suez Canal and the Palestine conflict; on neither does the communiqué give any hint of an agreement on what to do. Indeed, even considered merely as aspirations, the desires expressed by the two governments on these vital questions are almost meaningless. They are agreed on "the importance of compliance both in letter and in spirit" with the Security Council resolution of October 12th. That resolution laid down the six principles for a canal settlement, including the highly elastic principle that the operation of the canal "should be insulated from the politics of any country." The British Government believed at the time that this meant an international operating authority for the canal; the Egyptians thought not. It laid down that a fair proportion of dues should be allotted to development.

Under the western proposals which Mr Hammarskjöld is believed to have been discussing this week with President Nasser, the part of the dues to be used to develop the canal would be paid not to Egypt but to a special fund in independent hands. But the October clause could bear another construction, as the Egyptians, no doubt, have pointed out; and although they then accepted the six points, since the reopening of the canal came in sight they have been saying plainly that it will be for them to receive and allot the money. At the point at which the October resolution did become specific—the point at which it went on to relate the six principles to the plan drawn up by the 18 powers in London—the Soviet veto chopped it short.

★

Conceivably, when the British and American governments now talk of "compliance both in letter and in spirit," they mean that the vetoed part of the resolution should be taken into account in the negotiations; if so, it is hard to see how they will get the Egyptians to agree now that the Egyptian hand has, since October, been so greatly strengthened. What is their next step if, as seems certain, President Nasser refuses to entertain their interpretation of the six principles? If American and British foreign policies on the Suez Canal are to be co-ordinated, this is the vital and immediate question; but Mr Dulles when he got back to Washington said plainly that no agreement had been reached upon it.

What was decided at Bermuda about the conflict between Egypt and Israel? None of the grievances that prompted the Israeli attack on Egypt has been remedied yet; the Palestine war may flare up again. In these circumstances, the President and the Prime Minister were agreed on "the need for speedy implementation" of recent General Assembly resolutions about the Gaza strip and the Gulf of Aqaba. Many people have supposed this to mean that they are thinking of insisting on free passage through the Straits of Tiran and on the administration of the Gaza strip by the United Nations. But a hunt through the Assembly resolutions does not support that belief. The Assembly's firmest pronouncement on the subject, its second resolution of February 2nd, did call on Egypt and Israel "scrupulously to observe" the armistice; it recommended the "placing" of the United Nations Emergency Force on the armistice line and "the implementation of the other measures as proposed in the secretary-general's report." This was the Assembly edging its way towards a constructive effort; its wishes, however, reached no greater state of definition than had been provided by Mr Hammarskjöld's report of January 28th.

★

But that report pointed out that, while the Assembly could certainly recommend that the United Nations should administer Gaza, a United Nations administration could only operate there (just as the UN force could only patrol there) by grace of the Egyptian government. As to the right of passage through the Gulf of Aqaba, the secretary-general indicated, rather than said, that an Israeli withdrawal would weaken the Egyptian claim to belligerent rights in those waters. If the armistice were once again observed in full—and particularly Articles VII and VIII, which deal with the stationing of forces in the Negev and Sinai and with the demilitarisation of El Auja—then "the case against all acts of belligerency . . . would gain full cogency." Fairly clearly, these words imply that in Mr Hammarskjöld's opinion the case lacks full cogency until the armistice can be restored in other respects to a degree of observance which it has not enjoyed, on either side, for many years.

Can this be all that the President and the Prime Minister intended to say? What do statesmen talk about when the gas main is leaking? If western policy is to recover a formative influence in Middle Eastern affairs, the need is for co-ordination in its conduct, not merely for the common expression of desires and hopes. The American decision to join the military committee of the Baghdad Pact is the one piece of news from Bermuda to point in that direction; it is, however, a decision to be assessed with the greatest caution. In the northern group of Middle Eastern countries that adhere to the Baghdad Pact, it will be good news. These countries have stood by their friendship with the West in an admirable way through a severely trying year, and if they want a renewal of American backing in a more decided form, they deserve it.

Yet it would probably be a mistake to assume that this further American step in the direction of full membership of the Baghdad Pact diminishes the existing danger of war. The danger is in the Arab South of the Middle East, among the neighbours of Israel, who refused to join the Baghdad Pact and who have reacted bitterly against it since its inception, treating the one Arab member of the pact, Iraq, as an enemy and a traitor. Led by President Nasser, the majority of the Arab League states have acquired by now the fixed habit of combining a vendetta against Israel with an attitude of defiant hostility to the West. An alliance directed against Russia and associated with the western interest can clearly not attract them or influence them, unless adversely. How, then, are they to be influenced? Not, it is to be hoped, by the blind eye that would allow the state of war against Israel to continue, as the convenience of Arab politics requires; for that would put a heavier weight on Uno's protecting shield than it can possibly carry.

A Nation of Peacemakers

THOSE who had darkly suspected that the Government might use the nationalised industries to influence national wage policy this year must now have a queer picture of what the Government's wage policy is. Last weekend the nationalised Transport Commission put an original interpretation upon Mr Macmillan's exhortation from Leicester: it shot the umpire to avert the duel. This flouting of the railway arbitration award has made the settlement of the other outstanding disputes on any basis that will not be undesirably inflationary quite impossible, and their settlement on any basis that will not be grievously inflationary very difficult. It has also displayed again the principal difference between Britain, which has managed the course of its industrial costs pretty badly in the last few years, and some of its competitor countries, which have managed the course of theirs pretty well.

This difference, as anybody who has looked at international labour statistics will know, is not that Britain is more plagued by strikes; it may be more plagued by the threat of strikes, but that is because, although it has never been conclusively proved in postwar Britain that big strikes pay, it has been shown again and again that the threat of big strikes does. Instead, the main difference is that there is an instinctive and widespread assumption in Britain that it is better to tolerate annual increases in wages far in excess of annual increases in productivity than to be plunged into "disastrous stoppages." The strikes now dragging on in engineering are disastrous enough in all conscience, especially as they are obviously going to be followed by wage inflation as well; but the mystery is why they, rather than the wage inflation, were generally regarded as the prime danger to be avoided. Experience in the United States, which regularly loses more man days in official strikes than Britain, suggests a quite contrary assumption for policy. Strikes exert their ill effect on an economy by cutting back production; but the increase in production in the United States, despite its greater willingness to absorb cyclical recessions, has recently been greater than here. And the rise in prices and costs, of course, has been much smaller.

Why then—in a reasonably free economy where one would expect economic self-interest to assert itself in the end—does Britain seem annually to choose to try to march as hurriedly and meekly as possible down the primrose path to the always transitory settlement? One argument that is sometimes put forward is that Britain cannot afford strikes because, unlike the United States, it is an exporting and banking nation, operating on a small gold reserve. This is very hard to follow. Why an exporting and banking nation should be able to bear unremitting inflation more easily than the occasional loss of output from strikes has never been made clear; the truth would seem to be precisely opposite. And, indeed, the other principal explanation that has often been put forward for the annual willingness to surrender to wage inflation has been on this precisely opposite tack. The argument has been that so long as production was kept so close to capacity, employers would always find it worthwhile to grant wage increases and pass the cost on to domestic consumers; as soon as the boom was taken off the boil, there would be a prompt diminution in employers' readiness to grant wage claims and in trade unions' importunity in presenting them.

The past week has shown that this, too, was a vain analysis. It had better be frankly recognised that the hope that last year's damping of demand, for labour as well as for goods, would make it possible to "give a miss" to this year's round of inflationary wage increases has flatly failed. The general wage increase for 1957 has now been fixed at at least 5 per cent, after a year in which there has been no general increase in productivity. The immediate increase in labour costs per unit of output (which is the index that matters most when restarting an inflation) has therefore been greater after this year of restricted internal demand than after any of the years of less restricted demand that preceded it.

It can, of course, be argued that the squeeze should have been carried much farther in order to achieve the desired effect on wage-bargaining. But this is to ignore the fact that, industrially, restriction

has already led to an expensive eighteen-month-long check on the growth of production—and that, politically, to make its effect on employment penal is evidently impossible. The truth is that there are certain built-in reasons why Britain is more plagued than its competitors by inflationary settlements with the trade unions ; and it is these that, sooner or later, will surely have to be re-appraised by the country.

The experience of the past week suggests three of these differences. One is the innate revulsion of the postwar British mind against anything which smacks of civil strife. Any employer's statement which soberly suggests that it might be better for the country to stand up to a strike than to lie down to a wage increase is liable to be regarded as *ipso facto* irresponsible ; the Archbishop of Canterbury is quite likely to write a diocesan letter against it. A second difference—although too much should not be made of this—is that most of our competitors do not have nationalised industries operating, on the unprinciples of deficit finance, in *quite such strategic places in their labour markets* ; when Sir Brian Robertson announces that he is going " ungrudgingly " to give to his workers money which his industry has not earned, the taxpayer automatically stumps up for them. A third, and more intractable, difference is the British Ministry of Labour ; the spectacle of Mr Macleod and Sir Wilfred Neden, spending their working week hurrying between employers and unions in separate rooms, urging them to reach almost any settlement rather than have a strike, is a phenomenon almost peculiar to St. James's.

It seems likely that this attitude of mind, this sort of nationalised industry, and this Ministry of eager brokers (rather than a policy-making department of state) are what the British people want. But they need to be told all the time that if they are to keep these cosy forces for peace through inflation in the present form, then they cannot also have a stable pound.

Pax Americana

WHEN Mr Dulles reaffirmed the American attitude to Communist China at the annual conference of the Seato council, to the embarrassment of the British Government, he was not merely fortifying the spirits of the nations that, following the American lead, refuse to recognise the Peking government. He was replying to a speech by Chou En-lai, at the meeting of the cumbrously named Chinese People's Political Consultative Conference. Mr Chou had accused the Americans of plotting to turn Formosa into another American outpost like Honolulu, displacing the regime of Chiang Kai-shek.

Since the purpose of Mr Chou's speech was the familiar one of driving a wedge of mistrust between the Americans and the Chinese Nationalists, Mr Dulles naturally sought to reassure the Nationalists on Formosa. But in so doing, he drew fresh attention to the continuing divergence between British and American policies towards China—which was illustrated by the absence of any reference to the subject in the Bermuda communiqué. This divergence stands in the way of a concerted western policy in the Far East. Seato, the expression of the western alliance in south-east Asia, excludes Formosa from its operations.

British and American policies towards China diverged from the moment of the British decision in January, 1950, to recognise the Chinese People's Republic led by Mao Tse-tung. There were good reasons for the decision ; it was, and it remains, the recognition of an indisputable fact. It is even conceivable that if the Chinese Communists had been more conciliatory the Americans might, however reluctantly, have followed suit. The critics of American policy in the Far East often overlook how it was born.

When the Chinese Communists were overrunning China, President Truman's Administration was torn between resentment at the Communist victories and disgust at the Nationalists' shoddy performance: both facts were reflected in the failure of the Marshall mission. Disappointment with the Nationalists seemed to dominate thinking at the State Department. The Americans announced as early as August, 1949, that they would continue to recognise the Nationalist government, and that they intended to withdraw their diplomatic and consular representatives from the mainland. It was by no means certain that this was their final decision. All aid to the Chinese Nationalists had been suspended. The Americans seemed in no hurry to withdraw their officials from China.

Even before Mao Tse-tung had proclaimed the Chinese People's Republic, however, the Communists had launched a vituperative propaganda campaign against the United States, marked by the arrest of the American consul-general in Mukden in October, 1949. From that day forward, the Chinese Communists could not reasonably expect good relations—or, indeed, any relations—with the American government. Yet Washington continued to treat the opposing regime, in its refuge on Formosa, with coolness. The United States might continue to recognise the Nationalist government, but it did not appear to be prepared at that time to lift a finger to protect Formosa against a Communist attack, which, in 1950, seemed probable. The Korean war, though it confirmed the American government in its opposition to Communist China, did not immediately change the American attitude to the Nationalists. President Truman's policy of the " two-way shield," proclaimed in June, 1950, two days after the Communist attacks in Korea, tacitly admitted the importance of Formosa as a piece of " real estate " to be kept out of Communist hands. But it lent no countenance to Nationalist dreams of a return to the Chinese mainland. The " two-way shield "—the US Seventh Fleet—had the task of protecting the Communists as well as the Nationalists from invasion.

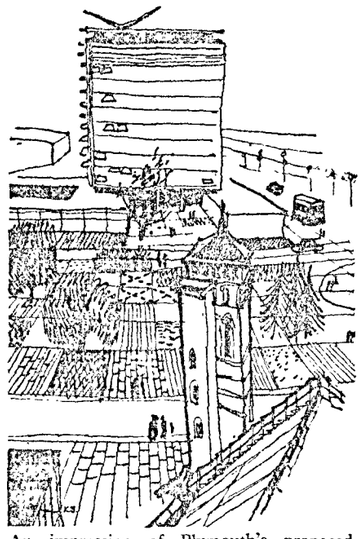
Indeed, the importance of Formosa and its place in the Far East were among the issues that divided General MacArthur from President Truman. General MacArthur wanted to remove restrictions on the Nationalist forces and to include Formosa in the American chain of island defences. Neither concept was acceptable to the American government of the day. It was not until President Eisenhower announced a new policy in February, 1953, that the outlines of the present American attitude emerged. By then the Kuomintang, revitalised, had pushed through its bloodless land reform scheme and transformed its army with American help from a beaten rabble into a fighting force. The new American policy (described as the " one-way shield ") dropped the idea that the Seventh Fleet would prevent a Nationalist attack on the Communist mainland. But President Eisenhower's declaration was dangerously imprecise at a time when weapons of mass destruction were beginning to make big wars suicidal and small wars more dangerous than before. Washington's preoccupation with military readiness has helped Communist propaganda to obscure the fact that the Americans are equally concerned to prevent a war of any kind in the Far East.

★

The mutual defence treaty of 1954 between the United States and Nationalist China was followed by an exchange of notes, in which the Nationalists agreed not to attack the mainland without prior American approval. Simultaneously, President Eisenhower obtained Congressional authority to resist any Communist attempt to secure the " related positions "—that is, the offshore islands of Quemoy and the Matsus. And a few months later, in the relaxed atmosphere of the " summit " conference at Geneva, the Americans felt able to start diplomatic talks with the Chinese Communists, with the aim of reducing tension in the Formosan area. But the Communists have refused to renounce force as a means of settling the Formosan dispute, and these apparently interminable talks, which are still going on in Geneva, have therefore made no perceptible progress in recent months. As it now stands, American policy in the Far East is at least consistent : to oppose Communist expansion everywhere and to help all governments that are willing to resist it. Military pacts of various kinds link the United States with Japan, South Korea, Nationalist China, the Philippines, Siam, Pakistan and, indirectly, South Vietnam. Economic aid supplements the military pacts.

At a time when the American government is groping towards a policy in the troubled Middle East, it can claim substantial local successes in East Asia. The contrast is striking between the state of the countries that accept American aid, and the plight of those that reject it. To the rejuvenation of the Nationalist regime in Formosa (described in *The Economist* on February 2nd and February 9th) must be added the emergence of South Vietnam from chaos. Siam, despite the symptoms of discontent that accompanied the recent general election, is still somewhat more stable and decidedly more prosperous than, for instance, Burma, which rejected American aid in 1953, but has now requested, and been granted, an American loan. Indonesia, ignoring the Communist danger while chasing the moonbeam of anti-colonialism, is disintegrating before our eyes.

★



It would be foolish, on the other hand, to belittle the corrosive force of Communism against even the most stable of Asian regimes, or to expect the Far East to remain quiet for very long. For one thing, the present lull is only partly the product of American firmness. It is also the product of a change in Communist tactics, which have turned away from outright aggression, influenced in part by the emergence of a general Asian opinion hostile to conventional power politics that found expression in the Bandung conference. Added to this is a realisation on both sides of the suicidal nature of nuclear war.

East of Singapore, British policy plays a secondary part. What is far too little admitted in Britain, however, is that, even in the narrowest terms of British self-interest, American policy in the Far East, and the British attitude towards it, are nevertheless important. Formosa, in fact, has an importance unrelated to the moral issue whether to protect the Chinese Nationalists, or to the strategic issue whether to defend the United States at a shorter or a longer distance. Many of the 12 million or so overseas Chinese consider Peking as their capital already ; if Formosa changed hands, countries with Chinese minorities, including Malaya, would become more unreliable than ever. If the Americans were to abandon the Nationalists to their fate—of which there is no sign—the other anti-Communist governments of Asia would feel that they could place no reliance on American promises. The connection between the survival of Hongkong and that of Formosa has long been evident, though it is customary to talk of it only in whispers. If the Americans allowed Formosa to pass into Communist hands, the Communists could be expected to put pressure on Britain for the " return " of the colony ; and they would then no longer be deterred by the possibility that a British refusal might find the backing of American power. Whether we like it or not, Formosa is a key component of the *status quo* in the Far East ; and a change there would be followed by a succession of other changes which Britain could neither desire, nor be able to arrest.

City of Docks and Drake

On page 1092, an American correspondent describes the preparations in Plymouth, Massachusetts, for the coming of the new Mayflower. *One of our staff correspondents describes below current problems before the mother city of Plymouth in England.*

THIS week the city of Plymouth has brought before Parliament a private bill that would enable it to build a toll bridge over the River Tamar ; it has everything to recommend it except the doctrinal opposition of some Labour members to the levying of tolls. When the bridge is built, the road A38 from Exeter to Penzance will no longer suddenly slow down to a lumbering old ferry as it crosses the border from Devonshire into Cornwall, and many motorists who have hitherto taken the more northerly route will think it worth while to come this way. There is plenty for them to see : the Hoe and Drake's bowling green ; the old harbour called the Barbican, where the Pilgrim Fathers embarked in the *Mayflower*, and the Tolpuddle Martyrs regained English soil after their long deportation ; the magnificent estuary between green Cornish hills and rolling Devonshire farmland ; and the spiky clutter of the naval dockyard. Last but not least there is the proud new shopping centre that has risen from the bombed ruins.

An impression of Plymouth's proposed civic centre, with the nineteenth-century Guildhall in the foreground and an administrative block behind.

Plymouth should be much busier once the bridge has made it less remote. Few ocean liners—particularly British ones—now call at Plymouth, mainly because of the long journey to London. It is almost two hours, with two engines blowing and straining up Brunel's railway bank, before Exeter is reached and the train is able to break into a gallop.

Its physical remoteness is the key both to Plymouth's history and to its present preoccupations. It was strategic remoteness, as well as fine natural advantages, that brought the navy to Plymouth and created the great dockyard on which the town still subsists. But though it has now over 230,000 citizens, Plymouth—well removed from the main currents of modern urban life—does not feel or behave like a large city. Its citizens, metaphorically, still have mud on their boots ; they move leisurely and speak with the soft, gentle burr of a Devon farmer. Compared with the more brash and mercurial Londoner or Midlander, Plymouth folk are repositories of old-fashioned virtue. They are more prone to church—and particularly chapel—going, have less use for mass entertainment, still delight in amateur theatricals, and are, for the present age, remarkably thrifty. (Last year they saved an average of 15s. 8d. a head.) They make slow but very steady workers.

All this makes Plymouth a refreshing and unusual town. Yet the remoteness—emotional and physical—has its drawbacks. Some feel that it is high time that Drake stopped sleeping there below: that Plymouth possesses too few of the facilities and amenities of a big city, that it has neglected its tourist opportunities—for example, the magnificent Hoe is hideously cluttered with miscellaneous masonry (and a large monument to the 300th anniversary of the Armada raises the spectre of clutter without end). A more positive worry is the dependence of the town upon a single big employer (the Admiralty), and the associated criticism that for skilled workers wages are low and promotion slow and uncertain. Many of the town's brighter sons, it is complained, leave home for lusher economic pastures.

These complaints are not unheeded. Paradoxically perhaps, Plymouth has an energetic and imaginative local authority. At present Labour has a majority of six in the city council, but the pendulum has swung once each way since the war, and will some day swing again. Narrow party majorities seem to keep the chief officers on their toes, while a bipartisan approach to the problems of postwar redevelopment has been a great boon—when compared with, say, the squabbles which for a time held up action in the equally bombed port of Southampton.

At all events, the city has a good postwar record. The large new shopping centre already built lights no architectural torch, but it is a comprehensive, dignified and finished whole as well as a commercial success, and no other city (bar, perhaps, Coventry) has done better. Greater modernity is being attempted in the plan for a new civic centre, which will include, if the plan goes through, an oblong building like that of the United Nations in New York, raised on stilts above an open forecourt. Its new star-shaped flats, built remarkably cheaply, have effectively renewed the dark dignity of Devonport and, in a setting like Plymouth's, offer for once an attractive alternative to the lure of suburbia—which, however, is very much present in the form of booming, slightly above-average housing estates to the north of the city.

But the toughest task which Plymouth has set itself is that of attracting new industries. The great naval dockyard, with its ancillary establishments at present employs 23,000 workers. Here there is a naval atmosphere of orderliness, paternalism, and cheerful discipline. By convention, the men do not strike, but if engineers elsewhere secure a rise, the dockyard workers get one too. As a result, perhaps, of lack of competition, earnings are relatively low—only £9 to £10 a week, all-in, for skilled workers. On the other hand, there is a good deal of security. Once a man is "established," he is sure of a permanent job and pension, though he may be required to move to another dockyard. Plymouth, as the navy's premier yard, seems certain—so long as there is a navy at all—to be fairly busy. For all that, workers were laid off during the prewar disarmament era, and the exigencies of a cut-price atomic defence might well have the same effect. Concealed "redundancies" may already exist in the yard, awaiting Mr Sandys's attention, but no outside observer would ever spot them. The dockyard is a great straggling empire to itself which, to find room for technological developments, is now gobbling up still more of Devonport. But here, too, is a source of uneasiness. In about 1960, when the present large building programme in yard and city is completed, 3,000 or more building workers may be laid off.

★

Thus, Plymouth would be more prosperous in the present and much more confident about the future if it had more industries. Unemployment there, at 3.2 per cent of the insured population, is already getting on for twice the national average, and would be a good deal higher than its present level of 2,000 if three big firms had not settled there since the war. The largest of these came to Plymouth simply because sufficient labour was not available anywhere else in southern England. But this firm has been pleasantly surprised at the higher productivity of local workers, untempted by higher wages in less attractive parts of the country. Contented and plentiful labour, especially female labour (for besides 1,000 unemployed women there are probably as many housewives who would be glad to have jobs if there were any) is Plymouth's chief bait for industrialists. The main snags are long transport hauls and difficulties over sites, since land within the city boundaries is very bumpy. There is neighbourly opposition to the idea of Plymouth spreading on to the flatter land east of the Plym, but the council is hard at work trying to develop suitable sites. Another obstacle that might stand in the way of Plymouth's industrial development is the Admiralty's distaste for anything that threatens its own supply of skilled labour. Some Plymouth citizens allege that when the Board of Trade advises industrialists where to build their factories, it bears Admiralty opposition to competition in mind.

It would be a pity if Plymouth lost its present compactness, and became just another piece of sprawling industrial jigsaw. Already there must be some regrets at seeing its outlying hills covered with new housing, admirable and necessary as this is. But Plymouth, though some may criticise its eagerness to sweep away and build anew, is conscious enough of æsthetic considerations, and such development as has taken place inspires confidence that more industry could be brought within reach of its population without spoiling its character. If the drive to attract industry did introduce eyesores, it would to some extent defeat its own ends. For, beside the special qualities of its labour force, the other main attraction of Plymouth for industrialists is that it is such a pleasant place to live and work in.

Secretary-Generalship

SINCE October, the cartoonists have made Mr Hammarskjöld's face familiar to a public which had previously known little of the Secretary-General of the United Nations. He has been depicted in many guises : interposing himself between belligerents, chastising Israel, Britain and France, while blandly overlooking Russia's reconquest of Hungary ; handing Gaza trustfully over to Egypt ; and—this week—going rather despairingly to consult the Sphinx. The cartoonists, of course, need a symbol to personify Uno, and only "Dag" fills the bill. But his appearance, in caricature or commentary, in the part often assigned to him is sadly misleading. It was inevitable that some angry Britons, casting about for scapegoats after the November débâcle, should include him in their fat black books ; but it has been disturbing to find many otherwise well-informed people apparently convinced that UN policy is determined by the Secretary-General.

Uno is neither a family firm run by a rugged tycoon, nor a trade union dominated by a bull-throated boss. Its Secretary-General, far from laying down policy, is its prisoner. Whether the resolutions passed by the Assembly or Security Council are sane or silly, he has to play the part allotted to him. A glance at the Charter will show that only one specific right of initiative is given him: he may draw the Council's attention to any matter which he sees as a threat to peace. He has no other rights: only duties. He has to recruit and direct the Secretariat which serves the various UN organs,

and to "perform such other functions as are entrusted to him by these organs."

"Other functions" in plenty have been loaded on Mr Hammarskjöld since October. The Assembly, having voted for cease-fires, withdrawals, and the admission of observers into Egypt and Hungary, for the creation of an emergency international force in Egypt, and for UN participation in reopening the Suez Canal, asked him to do all he could to these ends, and he has done his duty with notable energy, patience and skill. The lopsided results are not his responsibility. He can no more be blamed for the rejection of every UN approach by Russia and its Budapest puppets than he can be hailed as the creator of the UN force.

The force exists because Canada suggested it and other nations were willing to send contingents. It has neither seized the canal nor held Gaza, because its joint masters, the member nations, never attempted to assign it such tasks. Its activities have been limited by the Assembly's resolutions, by the caution of the contributing governments, and by the degree of co-operation obtained from the belligerents. Uno's canal-clearing work has faced similar limitations. The Secretary-General, doing his job as Uno's chief organiser, liaison man, and "progress chaser," steering his subordinates along lines which he did not lay down and cannot change, is in fact not a bus but a tram driver.

But even trams have been known to go off the rails and overturn. Something of that kind might well have happened to Uno if Mr Hammarskjöld had been less patient and prudent. Instinctively, he related his every move to some existing text—Assembly resolutions, the 1949 armistice terms, the Charter itself—and thus shielded himself from charges of arbitrary partisanship; and he made so much use of private conversations and correspondence that at times he was attacked for cold-shouldering delegates with whom he was in fact in almost daily, though subterraneous, contact.

Inevitably, newspapermen in search of stories have been aggrieved by these mole-like methods, and by his grey, tediously non-emotive "reports" to the Assembly, which, being as delicately balanced as any mobile, defy summary treatment and have at times been interpreted by the press in diametrically opposite senses. But to study these documents is to be struck by the skill with which the Secretary-General, having been invited merely to report progress, has used the opportunity to remind the Assembly, over and over again, of its own duty. Far from retreating into legalisms, he has continually pointed out that to restore respect for past pledges should be a first step towards constructive settlement. With his tram in danger of getting stuck halfway to its destination, he has politely but persistently invited the passengers to get out of their seats and push.

Has even this oblique exhortation amounted to an abuse of his powers? If so, he has got away with it so far; even those who are most reluctant to do the actual pushing have not complained about having it suggested that they might try. But it is arguable that, given a palsied Security Council and a sluggard Assembly, the Secretary-General's inherent duty is to remind delegates of theirs. Assembly or Council may rebuff him if he misjudges their mood or if they have any better ideas; their failure to do so is itself eloquent.

He has been accused in some quarters of trying to play president in a sort of world government. That image could scarcely fit either the man or the situation more clumsily. One function, indeed, he shares with constitutional monarchs—that of giving warning of dangers ahead and of the consequences of foolish action or inaction. But the sovereign whose "right to warn" was analysed by Bagehot confronted a powerful executive. The Secretary-General's position resembles rather that of a titular feudal monarch, ringed by quarrelling barons whose followers' loyalty is to each of them, not to the throne. He can try to cushion their collisions, coax them into agreement, remind them again and again of their joint responsibilities, sketch out possible courses and submit them for approval. More he cannot do.

New Uses for Old Words

For ourselves, we never were fond of watchwords, and it is with the greatest reluctance and misgiving that we either sign articles or repeat formulas. The very same words may, at different epochs, have the most opposite significations, according to the men who use them and the circumstances in which they are applied. At one time they may embody and express sacred and indisputable principles. At another they may signify mere shallow, popular, and vicious fallacies. *Peace*, when proclaimed in opposition to a Ministry which interferes in the internal affairs of foreign states to uphold an alliance of despots or to maintain a hated tyrant on his throne, is a bond of party union and a principle of party action of which no party need be ashamed. *Peace*, when thrown in the teeth of a Government who have been involved in hostilities simply by protecting British rights or defending endangered allies, may mean nothing but national humiliation. *Retrenchment*, adopted as a motto at a period when scandalous sinecures and undeserved pensions were the order of the day, was a worthy and honourable cry. *Retrenchment*, clamoured for when all sinecures have been abolished and all establishments cut down, and when the tendency and the danger lie rather in pushing reduction and parsimony too far, is almost as discreditable a pandering to mob prejudice as the "No-Popery" howl. *Reform* (*i.e.*, Parliamentary Reform)—in those dark days when Gatton returned two members and when Manchester returned none, when the members for Liverpool were elected by drunken freemen and when wealthy and wise merchants were refused the franchise . . . was a noble object and a grand reality. *Reform*, now means nothing but the speculative unsettlement of an altered system which works well, for the sake of engrafting upon it modifications which may or may not turn out to be improvements, but which certainly are not necessary nor even imperiously wished for. . . . It is very like repeating a dose of medicine long after the disease for which it was prescribed has given way to to the efficacy of the dose originally administered.

The Economist

March 28, 1857

Notes of the Week

Strikes, Survey and Budget

THERE will be two main points to look for when the Economic Survey for 1957 is published next week. One is by how much the Government thinks that demand would rise this year in the absence of any tax reliefs; it is the difference between this figure and the figure for the maximum possible increase in output that should determine the amount of money, if any, which Mr Thorneycroft has available to give away. Unfortunately, this figure for prospective demand is likely to have been affected by the industrial disputes. Some of the export orders that have not been met during the strikes will have to be met by production in the new financial year; and the wage increases themselves will add initially to real domestic demand (at any rate until the increase in wage earners' purchasing power is mopped up by price increases), particularly as Britain may now be at the start of a new hire purchase boom. Some outside analysts have suggested that real personal consumption, on present trends and without any tax reliefs, might rise by up to £300 million this year; it is generally assumed that the small prospective rise in real fixed investment (and possibly in stockbuilding) should be just about offset by the fall in real Government expenditure on current goods and services (including defence); the only other source of demand is export demand, in which some unofficial optimists have been foreshadowing a rise of £200 million or more. All these figures, added together, could cause a rise in demand of over £500 million this year; some—but not all—analysts believe that this is the most by which production could economically be allowed to rise in 1957.

The other main point that will be looked for in the survey, however, is what sort of figure the Government has in mind for this maximum possible increase in output this year. This will depend partly on how much under-utilised capacity it thinks that there is in the industrial system—many outside observers consider that there is quite a lot; and partly on whether it thinks that too easy re-utilisation of this capacity to satisfy the domestic market would distract manufacturers from searching more diligently for export markets—a matter on which this Government has been commendably stern. It would be a mistake, however, for the Government to conclude that the recent industrial troubles mean that, on this point of judging how much extra output should be aimed at, it should now be sterner still. The policy of checking wage increases by checking the demand for labour has failed, and the best way of mitigating the effect of the new increases in wage costs per unit of output will be by spreading them across the greatest output in 1957 that is physically possible and commercially safe. Britain may now have forfeited the possibility of making this a year of more production more cheaply; but if the policy is to be one of aiming at only about the same amount of production more expensively, then the prospect will be bleak indeed.

★

At least two other bits of economic news—apart from the defence white paper—are likely to hit the headlines in the coming week. On Sunday, the day before April Fools Day, the end-year Exchequer returns will be published; unless there have been unusual special outgoings or receipts in the last week of March, they should show an above-the-line surplus of over £300 million and an overall deficit of not much more than £300 million (which would be £240 million better than in 1956-57). But these figures are unlikely to have much influence on what Mr Thorneycroft does on April 9th. Some false optimism is also likely to be aroused next week by the news that Britain had a sizeable balance of payments surplus in 1956. This has been known for some time. It was speculation against the pound, and the adverse current balance of India and some other overseas sterling area countries, which caused the drop in the gold reserves last year.

Red Letter Day for Shoppers

MONDAY, March 25, 1957, the date when the treaty to set up a common market in Europe was signed in Rome, may be variously celebrated in future years. Politicians may feast it as the founding day of a united Europe, industrialists as the start of a new phase of expanding sales, economists as the dawn of a new era of growth and competition. But if there is anyone who should put out flags it is the housewife with the shopping bag, the neglected consumer. Exhortation to invest more and consume less, to raise production but be content with the same pay packet, to export more but buy less foreign goods, is so often thrust down her throat that a scheme directed to the only purpose of her husband's daily work—wealthier, lazier, pleasanter living—is a refreshing novelty.

The common market is in essence a scheme to knock down the barriers which force her to buy things made at home that are made cheaper and better abroad; to make the pay packet (and the national income) go further without extra effort by letting her shop in the cheapest market in Europe. In twelve years' time, if things go well, seventeen if not, Italians will be able to buy a Volkswagen a third cheaper, Germans Italian cottons an eighth cheaper, French businessmen cheaper German machinery, than if the closed

national markets were retained. British mouths may water for the day when the free trade area brings similar advantages, slashing the price of Italian motor scooters, French clothes and German cameras.

The common market has still to be ratified; and it can still break down in practice if governments fail to act in a European spirit—for instance by pursuing inflationary policies on their own. Free trade, too, will hurt some producers, especially in Lancashire and Coventry. But it can also accelerate Britain's economic growth, spurring on new industries, forcing others to put their houses in order, making better use of limited resources. Indeed, the main trouble with the voluminous common market treaty is that it is so full of anodynes intended to make economic change painless that there is too little left of the healthy medicine of free trade. Seventeen years is a long time for the European housewife to wait for the certainty that she can buy manufactured goods from neighbouring countries duty free. Even then, the day when she can buy an American refrigerator or a Chevrolet may be as remote as ever; and the bacon and eggs may be dearer than today. The protectionist elements in the treaty underline the need for a liberal British influence within a broader free trade area.

Apostles of Free Trade

PROFESSOR ERHARD'S visit to London to meet Mr Thorneycroft has the air of a conclave between a latter-day Cobden and Bright. Plenty of politicians have been concerned to set up the many institutions, the embryonic European government, as some believe, of the common market. But these two, who have led the discussions in OEEC in a broader free trade area, have been apostles of free trade for its own sake. Both are deeply concerned to lessen the protectionist elements in the common market, and they will now have the opportunity to concert their efforts on two specific points: first, to ensure that the broader free trade area is in fact set up around it and, second, to minimise the new preferences in favour of French overseas territories.

West Germany is as interested as Britain in these two matters. Last week the German Bundestag gave a general endorsement to the common market treaty, encouraged by the fact that careful allowance has been made in the treaty for the special place of trade with east Germany. But on all sides critics questioned the protectionist features of the treaty, urged the need for a broader free trade area to include Britain and other European countries, and were gloomy about Germany's extraordinary commitments to invest $200 million in overseas territories, mainly those of France. By successive tariff cuts designed to keep prices steady, despite the boom, Professor Erhard has been converting Germany from a high into a low tariff country, to the great benefit of German consumers and foreign exporters. But when a common outside tariff is formed round the common market, these cuts will have to stop, and the new preferences for overseas territories may raise the cost of German food. Professor Erhard has criticised the protective elements in the common market with such vehemence that he had difficulty in explaining in the debate last week why he supported it at all. And he plans soon to slash German industrial tariffs by a further 30 per cent, in a final fling designed to bring down the future external tariff of the common market; this will be based on a weighted average of the tariffs of its members.

Two Pieces to Pick Up

IT requires diligent searching to find any rays of comfort in the current labour situation, but there have been two features of the recent negotiations that have emitted a faint glimmer of hope for the future. One has been the greater readiness of the unions to discuss measures to improve productivity at the same time as discussing increases in wages. The Transport Commission's main internal justification for giving the railwaymen an extra 5 per cent—apart from their strictly commercial determination not to lose, through strike interruptions, some of the traffic they have gained from the roads during the petrol shortage—is that they want to reward the NUR for its co-operative attitude about manning schedules during the past year; they believe that they may be able to arrange that the new diesel and electric trains carry only one man on the footplate, which would make their operation as economic as it is in Switzerland, and much more economic than in Canada or the United States. To do this they will have to get agreement from the less co-operative ASLEF, but the right target has been set. It is also important that every effort should be made to see that the forthcoming discussions about limitations on apprenticeship and other restrictive practices in engineering and shipbuilding get down to the brassiest tacks. The employers should at least consider offering decasualisation of labour as part of the bargain.

★

The second glimmer of hope has been the attempt by the employers, met by bargaining rather than by too bitter resistance from the unions, to extend the interval between this round of wage increases and the next one. As in so many matters, when this country becomes richer, the proper course may well be to move towards American practice; and American trade union practice is now generally for wage settlements to run for a fixed contract period of more than a year. It is important that, as a very small advance towards this system, the eventual settlement in shipbuilding and engineering should incorporate the provision that the next wage claim should not be tabled until a full twelve months' time. The Transport Commission's formula for trying to stop one wage claim following so soon upon another is vaguer. The railwaymen's union is "to give formal and sympathetic consideration" to the feeling that "it would make for harmony if periodical reviews at agreed intervals took place," but it has been "recognised that exceptional factors outside the control both of the commission and the unions might require a special consideration of wage levels." Nobody will be able to interpret precisely what that means. Nobody is meant to. But the burgeoning idea is clearly the same.

It is an idea that ought surely to be followed up. Whether or not a half-advance can be made to breaking the too frequent cycle this year, employers might be wise to try to turn negotiations for the 1958 increase, in as many industries as possible, into negotiations for three or four year wage contracts. The nearest model to aim at is, perhaps, the three year agreement already operative in the printing trade. If such contracts become a more general rule, cost of living escalator clauses will almost certainly have to be attached to them; but that is not a major problem. The most intractable reason why the cost of living has continually risen is that wages have increased by more than productivity; if that problem could be solved, escalator clauses would not continually be coming into effect.

Representing Whom?

THE part played by the Parliamentary Labour party in the shipbuilding and engineering strikes has been one better suited to supporters of a corporative state. There *can be no complaint that Labour members should* be instinctively on the side of higher wages, but there should be real democratic anger at the way in which the party's official views have been represented. Every day and on every issue—including, of course, the main one of negotiation versus arbitration—Mr Robens has come down to the Commons as the straightforward spokesman of the union leaders concerned and, while urging Mr Macleod forward in his efforts at conciliation and saying that his main aim is not to exacerbate feeling, has made Parliament a sounding-board for Transport House. There must, indeed, be a suspicion that he co-ordinated his briefs beforehand with the unions. That is the obvious implication of the treatment accorded to Mr Bevan when he made the one individualist suggestion (not, as a matter of fact, a very good one) from Labour's side. The party enquired whether the unions approved of Mr Bevan's suggestion, found that they did not, and accordingly rebuked him for ignoring the shadow cabinet's demarcation lines.

This implicit assumption that Labour front benchers must always be the unions' official spokesman was also shown last week in the debate about whether short-time workers should get unemployment benefit for their Saturdays off. It reached its apogée, however, in Mr Robens's attitude in the use of Admiralty tugs to get the Queen Mary to sea. The implication of this row—of this latest and most remarkable extension of the class of "black" transactions—is that in Labour's view it is not only impermissible to try to get anyone else to do work that strikers would normally do; it is also impermissible to try to carry on without getting the work completed—the strikers being the sole judge of whether it has been completed—and the proper penalty, which on Mr. Robens's argument the Government of the day should presumably approve and enforce rather than circumvent, is a total boycott of the offenders and all their work by every sort of organised labour. Presumably Mr Robens hopes at no remote date to fill Mr Macleod's shoes; he may then regret having argued that anything done by the Government to minimise the dislocating effects of a strike is "provocation." It is high time that he differentiated between arguments that may seem expedient within Labour's union-dominated national executive and arguments that cannot sensibly be used by a future Minister of Labour nor supported by a future Government.

The Stricken and the Swung

THE North Newcastle by-election produced the smallest swing to the left since Mr Macmillan became Prime Minister—only 3.6 per cent. Beckenham, on the other hand, polling on the same day, returned a swing well up to the 1957 average, if not a little above it—6.1 per cent. The explanation seems fairly obvious. While south suburban Beckenham was still preoccupied with the woes of the middle classes, North Newcastle found itself in the middle of a shipbuilding and engineering area affected by a major strike, with the threat of more to come. The constituency serves as a middle-class dormitory for many professional people, office workers and tradesmen whose main topic of conversation just now is the wickedness of the local trade unions.

There has been less reaction than might have been expected among Conservative MPs at Westminster to this campaign issue—an issue, incidentally, that may have had more effect than was generally realised at the time on the last general election, which took place two days before a railway strike. The average Tory backbencher is not inclined to launch an emotional campaign against the trade unions. He is, however, inclined to launch such a campaign against the nationalised industries, as a party committee's rough handling of Lord Mills on the Electricity Bill has shown; and this makes it rather surprising that there has been merely below-surface disquiet, not an above-surface explosion, in the party as the Transport Commission has performed its annual rite of undermining the wage-price balance of the economy. One explanation may be that many Tory MPs' eyes are now fixed firmly, and longingly, on the coming budget. Some of the instinctive rebels feel that dark warnings of galloping inflation would not accord very well with their campaign for tax reliefs.

Fumbling with Bombs

MR ZORIN'S behaviour at the London disarmament talks, where the testing of nuclear weapons is now being discussed, has been described as "workmanlike." It is difficult to be so complimentary about the latest British and American statements on tests. London and Washington may well call Tuesday's Soviet proposal a propaganda move; it was altogether too slickly timed, right on the heels of the Bermuda communiqué and of Britain's rejection of Japan's appeal against the Christmas Island tests; and the suggestion of an "immediate and temporary" suspension of tests was heavy with irony, coming as it did from a government that has lately carried out a series of large-scale explosions and doubtless needs time to prepare its next series. The Japanese may also be asked, not unreasonably, why their protests against British tests 4,000 miles away are so much louder than anything evoked by Soviet tests carried out nearer to Japan and without any advance warning or precautionary steps. But it must still be said that the position of Britain and the United States seems uncertain and its expression unhappy.

In the second annexe to the Bermuda communiqué, the

President and the Prime Minister declared that in present circumstances breaches of an agreement to limit tests could not be surely detected, and invited Russia to join their countries in "self-imposed restraint" to ensure that radiation caused by tests stayed well below the danger level. If their premiss is correct, their invitation seems meaningless; if, as some argue, it is of doubtful validity, one would like to have more light shed on it. If it is true that tests of what are now called "clean bombs" cannot be detected at a distance because there is relatively little radio-active fall-out, it is presumably also the case that these explosions will not seriously endanger human health. Why, then, could not Sir Anthony Eden's concept of a "rationing" of thermonuclear explosions still be applied to the "dirty" bombs which remain a serious health hazard?

Algeria in the Accounts

DURING the first part of the French assembly's marathon debate most of the government's critics concentrated on its economic performance; during the second, they talked of Algeria. It was left to M. Mendès-France to insist on the intimate connection between the two problems. He pointed out that the budgetary burden of the Algerian war may soon reach £1.5 million a day; but he drew particular attention to the part played by the Algerian conflict in France's most urgent difficulty—the critical position of its balance of payments. Imports of military equipment have risen from almost nothing in 1955 to £60 million last year and will exceed £90 million in the current one. The drain on the engineering industries hinders vital exports. To this must be added the effects of mobilisation on manpower and the cost of the Suez expedition, which in France can only be viewed in its Algerian context.

The Algerian war is much more costly than was the Indo-Chinese one, for which the Americans were footing more than half the bill. Now foreign aid is dwindling. M. Mendès-France does not conclude that an Algerian settlement would solve all economic problems, nor that French policy should be dictated by financial considerations alone. His plea was merely that political decisions should be reached in full consciousness of their economic consequences and that the appropriate economic measures could follow. Many deputies who manage to treat the two issues with a perfectly split mind needed such a reminder.

France's Last Radical?

THE death of M. Herriot deprives French politics of its grand old man and symbolises the eclipse of the party which in his heyday was its driving force. He alone seemed unchanged while the gap steadily widened between the verbally radical slogans of his party, inherited from the French Revolution, and the increasingly conservative outlook of its supporters: a gap which gave rise to the jest that the Radical party had its heart on the Left and its wallet on the Right. M. Herriot, however, seemed beyond the reproach of hypocrisy, and in his mouth the old-fashioned slogans had the ring of truth. Indeed, his political attitudes were often conditioned by a hankering after the glorious past. As one who had led the *Cartel des Gauches* in 1924 and headed the government which granted *de jure* recognition to the Soviet Union, he still tried, even after the second world war, to avoid making enemies on the Left, and he hoped that all European problems could be solved by agreement with Russia. Hence his passionate opposition to German rearmament.

His prestige was based on personal rather than party grounds. Few people dared to question the integrity of an elder statesman of such renown. But he lived long enough to see the full difficulty of reviving his cherished party, of reconciling its programme and its practice. He gave his blessing to M. Mendès-France's attempts to transform the loose-knit Radical club into a disciplined party, but ended by resigning his honorary functions as a protest against the schisms that followed this attempt. From his deathbed he could see his successor in the paradoxical position of controlling the party machine while deserted by most of the Radical deputies. A congress of the party, which was to be held this weekend, will now probably be postponed. If, in the near future, the experiment of M. Mendès-France meets with no greater success than hitherto, M. Herriot's funeral will take on a sombre political meaning, and he will go down in history as the last Mohican of French Radicalism.

Strict with the Farmers?

THE Government claims to have been "strict" with the farmers this year. What this means is that it has not given them much more than it was bound to do under the terms of its new long-term guarantees. These required an increase in the total value of the agricultural guarantees of £8 million—a figure which is reached by deducting the maximum permissible cut of 2½ per cent (£30 million) from the estimated increase of farming costs (£38 million). But Mr Heathcoat-Amory plainly felt that to stick at this figure would impart a nasty Scrooge-like note into the harmonious atmosphere which now prevails between Whitehall and Knightsbridge. Accordingly, the farmers have been given an increased award of £14 million, and the adjective "very strict" presumably stays in reserve for future use. The result of this and of present market trends is that the cost of the agricultural subsidies, which has risen from £205 million in 1955-56 to some £245 million in 1956-57, will probably be appreciably higher in the coming year.

As it did a year ago, the Government has tried to achieve a more rational distribution of its support, and in particular to check the uneconomic expansion of milk, pigs and eggs. It has been only partially successful. The very real difficulties of small dairy farmers were vigorously championed by Sir James Turner and the Minister has eventually conceded a token increase of ¼d. a gallon on milk. He has tried to counter the flush of cheap, heavily subsidised eggs by making a basic cut of 1¼d. a dozen, and he has left the pig guarantee unchanged. On the other hand, both egg and pig producers get automatic compensation for the rising cost

of feedingstuffs, so that the actual burden of these subsidies seems unlikely to fall. The wheat price has been cut in anticipation of a large world wheat surplus. Price increases have once again been heavily concentrated on meat production and on stimulating greater domestic self-sufficiency in feedingstuffs.

One danger of the new system is going to arise from the need to find "economic" outlets each year for the obligatory volume of Government support; the result could be that these temporarily "economic" products are encouraged too much. At the moment, for example, the Government is increasingly concentrating its support upon beef production as the safest economic bet under present conditions. Is it quite certain that it is not thereby running the risk of eventually precipitating among beef-producers the same cycle of inflated prices and over-production, followed by sudden retrenchment and disillusionment among small producers, that has already afflicted milk and pigs?

The Shops Bill Limps On

LORD HAILSHAM'S affirmation on Wednesday that the Government still intends to go on with the Shops Bill was hesitant enough to confirm that it is increasingly embarrassed with this misjudged measure; and he was encouragingly equivocal in his reply to a question about whether the Government will accept an amendment to maintain the closing hour at the present statutory 8 pm, instead of making it an hour earlier. The blunt truth is that this bill was the fruit of some of Sir Anthony Eden's private discussions with trade union leaders, who said that they wanted a shopworkers' charter. Now that the charter is in draft legislative form, it turns out to be a charter for compulsory restrictive practices.

If Lord Hailsham feels defensive about the bill—and the spleen of some of his remarks last Wednesday suggests it—the Lords are hugely enjoying themselves making merry with the anomalies created by the bill's attempt to reduce the range of articles exempted from the ban on after-hours retailing. Is a currant loaf bread, which may be sold on closing days, or is it flour confectionery, which may not? If that distinction can be made, why cannot a distinction be made between a postcard and a photograph, both of which may be sold? Is the consumption of a bun, legal by a *bona fide* long-distance (how long?) traveller in a motor coach, illegal by anyone else in a tram? These, and many more, threatened anomalies arise out of the slavish attempt to follow the recommendation of the Gowers committee that to end the evasion that was bringing the shop hours law into contempt the right thing to do was to cut down the list of exemptions to the restrictions. What should be done instead, of course, is to cut down the restrictions themselves.

The Government should not be bound by Sir Anthony Eden's expression of intent to the unions, which was never a binding promise. That being so, there are two courses it could sensibly follow. One is to continue with the present bill, but to allow it to be turned on its head by amendments. The other—and better—course would be to drop the bill, and introduce another one, with almost precisely opposite intent, next session. The public should be set free to buy when and where it wants, as opportunity offers. The protection of shopworkers should be left, in conditions of full employment, to competition, the Shop Workers' Union, and (if this is considered necessary) legislation defining maximum permitted hours of work for shop employees but not maximum permitted hours during which any shop can remain open.

Imbroglio in Tunis

THE celebration of the first anniversary of Tunisian independence spotlighted the complications created throughout North Africa by the unfinished Algerian struggle. M. Bourguiba, the Tunisian premier, took pains to praise France and to be nice to its representative, M. Mitterrand. But the simultaneous presence in Tunis of the delegates of the Algerian National Liberation Front compelled the organisers to stage a game of hide-and-seek at the airport and of musical chairs at all receptions so that their warring guests would not meet; it also brought about the early departure of M. Mitterrand. As a result it was Mr Nixon who stole the show, his main competitor being another American, the trade union leader, Mr Irving Brown, whose violent speech against "colonialism" gained him a tremendous ovation.

This imbroglio was not of M. Bourguiba's choosing. He genuinely believes in a North African federation closely linked with France, and his vigorous attacks on French actions in Algeria always include a note of regret that France should be wasting such an opportunity of preserving its influence on his side of the Mediterranean. His faith in the virtues of negotiation has not been destroyed by experience, and he is still counselling moderation to the Algerian leaders. Such is the effect of repression, however, that the extremists have gained the upper hand within the Algerian leadership; they declare that they will accept nothing short of immediate independence. M. Bourguiba is reputed to favour the recognition of "a right to independence" as a compromise formula.

French opponents of a compromise will find new arguments in this Algerian intransigence. Yet France's opportunity in North Africa largely depends on M. Bourguiba's success in selling his federal ideas to his fellow-Arabs. It is in France's interest that the Tunisian leader and the Sultan of Morocco should succeed in softening the Algerian stand at the present talks in Rabat. Even the wealth of the Sahara, which at present looks like a fresh bone of contention between France and the North African states, could cement a new alliance.

Neutrality and the Sudan

A SUDANESE goodwill mission to Iraq ended on Monday in "complete agreement" on political, economic and cultural relations. A joint statement issued in Baghdad said that the two countries would strengthen trade and encourage the flow of Iraq capital to the Sudan for economic

development. Iraqi banks will open branches in Khartoum to encourage the movement. Certainly the Sudan can use any capital that comes its way; but it is early to expect much of it to come from Baghdad.

Two countries with such closely similar problems can probably render each other only limited material help. The visit has, however, given further evidence of the independent spirit of the Sudanese coalition government. Neither Egyptian propaganda against the Baghdad Pact and all things Iraqi nor the resurgent pro-Egyptian policy of the opposition in Khartoum has deterred it from talking to Nuri es-Said. The joint statement criticised Egyptian policy by implication when it mentioned the need for Arab countries to stop interfering in each other's internal affairs; both Iraq and the Sudan have suffered from Egypt in this respect.

No question arose of Sudan joining the Baghdad Pact. Mohamed Ahmed Mahgoub, its Foreign Minister, had made this clear long before he went to Baghdad. The reference to foreign aid—that it should be judged by the "special circumstances" of each country—could fit the case of Egypt's sales of cotton to the Soviet block. But the known sentiments of the two Sudanese ministers, and the very fact that the statement was made in Baghdad, can only mean that they are not willing to take their attitude to possible American aid ready-made from Egypt or Syria. The Sudan seems to interpret neutrality in the ordinary meaning of the word, and to be applying it in its relations with Iraq and Egypt as well as in its attitude to the big powers.

The Leaking Embargo

TRADE with China was one of the two themes on which there was little "meeting of minds" at Bermuda. The gulf between Britain's commercial-minded wish to bring the embargo on China into line with that on Russia and the Americans' stern political negative still seems wide. America's concern to avoid a gesture that might enhance China's prestige is supported by a powerful economic argument. The Soviet block is in critical economic difficulties. There are not enough investment goods to carry out its plans. It hardly seems the moment for the west to help it out, aiding China in its economic race with India.

Britain, however, can also muster strong arguments. The economic one can simply be turned upside down. Britain has always sought to lever China and Russia apart, and the block's economic difficulties might be used to serve that end. In January the Chinese leaders bought continuing Russian aid with a political obeisance, but they have no more liking than the Poles for this dependence. An easing of the embargo, the China hand can argue, would strengthen China's bargaining position in Moscow.

The embargo is in any case leaking more and more. Embargoed goods are not only shipped to China via eastern Europe; the exceptions procedure, which was designed to let through a trickle of samples and small orders, has become the channel for a stream of goods. It is difficult to substantiate the view of many British business men that the Japanese, French and German authorities apply the procedure more generously than the Board of Trade. But French exports to China more than trebled last year, with embargoed steel and tractors playing an important part, and the Japanese, who have held a trade fair in China and sent many technical missions there, doubled their exports.

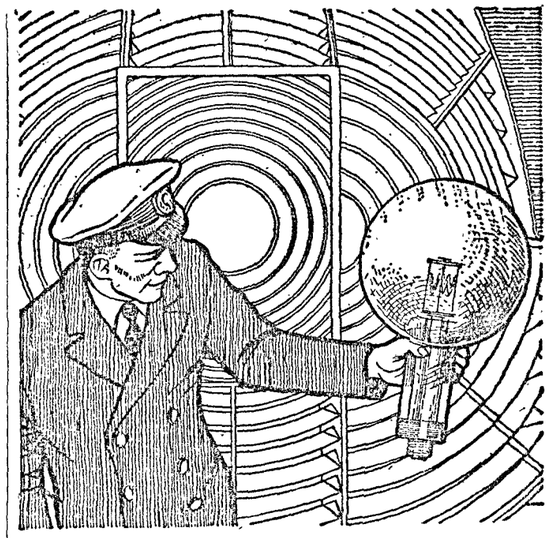
Even American manufacturers, like Mr Henry Ford, have begun to criticise the embargo, tempted by the prospects. China, unlike many communist countries, can afford to pay. Its trade with western Europe was in deficit last year, but its export drive in south-east Asia is piling up sterling reserves. In the first eight months of last year it had a trade surplus with the free world of over £50 million. If it cannot spend this direct in western Europe, it can use it to buy embargoed goods through eastern Europe and south-east Asia. The embargo may or may not be prudent, but it is clearly anomalous

Breaking-Point on Malta

THE talks between the Colonial Secretary and Mr Mintoff, the Maltese Prime Minister, are on the point of breakdown. Agreement on ends remains—the ultimate integration of Malta with the United Kingdom—but on means the two parties are still far apart. It was always clear that integration would be expensive for Britain; in the new mood induced by defence cuts and an economy drive, the British Government is evidently trying to trim its liabilities to its proposed Mediterranean Ulster. It is proposing—what on the economics of Malta's position is reasonable—that the rate at which Malta shall become eligible for "equivalence" with British wage rates, social services and welfare state amenities shall be tightly geared to the rate at which its productivity increases—under rather vague promises of considerable stimulus from British industrial investment in the island.

Mr Mintoff considers this a complete abrogation of the principle of the original agreement on integration; the Maltese government sticks firmly to the view that, politically the only meaning of integration is that there must be equal benefits for equal taxation within a specified period and by specified steps. "Equal" here, of course, means "equivalent" in terms of local conditions; furthermore, the Maltese negotiators admit that there must be some correspondence between the rate at which Maltese taxation and welfare benefits are increased on the one hand and Maltese productivity grows on the other. But they see this simply as a matter of setting out a period, during which Britain will be expected to pump capital into Malta, and they believe (in accordance with their Labour convictions) that growing social expenditure will of itself tend to generate higher productivity. But they argue that the essence of the bargain is that, if at the end of the agreed period (twelve or fifteen years) for jacking up Maltese productivity the island should still be a deficit area (like Scapa Flow), Malta's equal status as part of the United Kingdom implies that Britain will carry the island at the current British standard of living.

Indeed, Mr Mintoff has now so far pledged himself to his own supporters that he cannot offer them anything less than some such "promise" of equivalence at a target date. His opponents are making rapid headway with the argument that integration will not bring Malta the benefits advertised in Mr Mintoff's prospectuses and will cost the island its precious freedom of action. There is therefore



Twenty-three years before "Coffee from Brazil"

Brazil today is the world's largest single coffee grower, yet her coffee industry only goes back to 1885—twenty-three years after the Bank of London and South America opened its doors in Brazil. Since then, commerce with Latin America has increased enormously, and with it have grown the influence and interests of the Bank. Today, the Bank holds a unique position as the *only* British bank in Latin America. Up-to-date reports on local markets, trading regulations and general economic conditions are received regularly from Branches overseas and are summarised in the Bank's *Fortnightly Review*, which is distributed to customers and made available to those who have business in Latin America, Portugal or Spain.

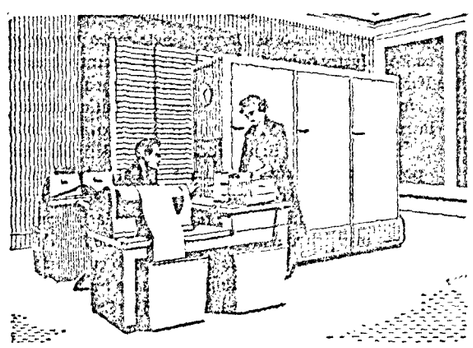
Are you a good mixer?

Do you make Dyes, Drugs, Detergents or Drinks—Oils, Ointments, Emulsions or Inks?
Do you produce Paints, Polish, Plastics or Petrol Products — Lotions, Lacquers or Liqueurs — Cereals or Soaps?
Do you manufacture Food, Fodder, Pharmaceuticals or Fertilizers?

Whatever your final product, it will be composed of ingredients that must be mixed in certain proportions.
There may be a thousand and one ways of choosing these percentages, all consistent with your customer's requirements.
But only one of these mixtures will satisfy YOU: the one that costs less to make than any of the thousand others.



FERRANTI

How can you determine the exact composition of this

LEAST COST MIX?

The answer is:
By using a modern mathematical method, suitable for electronic computation.

There is such a method.
The economists have a word for it:
LINEAR PROGRAMMING
Ferranti have a computer for it:
The PEGASUS at Portland Place.
It will find your Least Cost Mix
quickly — accurately — unfailingly.

Phone or write to us for details of our Computing Service. You may find, as others have, that your investment in Least Cost Mix Computations gives you a hundredfold return.

DC 42

not much time to bridge the gap between what the British Government think fair to the British taxpayer, and what Mr Mintoff can sell to his people. The fact must, however, be faced that the failure of the talks will, in many ways, amount to a reappraisal by Britain of its need to secure for all time a naval base in the Mediterranean.

Planning Oil Routes

THE major world oil companies have been meeting in London to discuss new pipelines for the increased oil production of the Middle East expected during the next decade. They formed committees to study routes, capacities and construction problems; the availability of materials and equipment; and, of course, a small matter of about £200 million likely to be needed to execute the eventual plans. This exploratory stage will take "a few weeks" before the committees report back to the main conference.

The aim is to expand and diversify the means of transporting oil; this would have been necessary even if the Suez Canal had not been blocked and the oil pipelines sabotaged in Syria. About 400 million tons of oil will be moving from the Middle Eastern fields by 1967; a wider and deeper Suez Canal, 100,000-ton tankers, all the existing pipelines, and new pipelines will all be needed by that time. It is not simply a question of insuring against the political idiosyncrasies of Egypt and Syria; despite all the alternative means of transport, those countries can hit a bigger jackpot than ever if they choose to be co-operative.

The discussions are specifically concerned with enabling the pipeline system to move an additional 60 million tons of oil a year to the Mediterranean and the Atlantic with the greatest safety, speed and economy. Other questions of oil transport, such as giant tankers, are in the background but do not enter into the discussions. The American companies, with the anti-trust laws in mind, are keeping carefully within the limits of their clearance from the United States government; and this extends to pipeline questions only. The most obvious next move for the oil industry is to build pipelines through southern Turkey to the Mediterranean. The Iraq Petroleum Company, having gone over the possible route, is satisfied that it is feasible. The London conference may favour the duplication of the IPC project, but whether it will choose Iskanderun—the most obvious choice—as the Mediterranean terminal is debatable. Iskanderun is the subject of territorial dispute between Syria and Turkey, and the companies do not want any political friction they can avoid. There may be no reasonable alternative.

In planning development, account will be taken of the existing IPC network and its schemes, such as the pipeline from the Basra field to Kuwait and the plan, sponsored by the Iraq government, for a line from the northern fields to Basra, Fao and Kuwait. The arrangement (discussed further on page 1112) between the Iranian National Oil Company and Eni-Agip, an Italian state-controlled corporation, for exploiting the Iranian field at Qum, may eventually come into the picture. There are reports of a scheme to pipe Qum oil to the Mediterranean via Turkey, but so far there is nothing firm about this.

Guarantees for Pipelines

MR MACMILLAN apparently secured benevolent United States interest at Bermuda in the idea that pipeline routes should, if possible, be secured by international convention and not simply by commercial agreements between the oil companies and the transit countries. It is a matter which the London conference of the companies is bound to consider; for in planning new pipelines, their security is of primary importance both for the oil markets and for the shareholders. It acquired greater cogency by reason of the Syrian sabotage of pumping stations last November.

The companies have in the past preferred purely commercial arrangements, seeking the ideal—unattainable in a product of such immense concern to nations—of insulation from politics. They like to be business men doing a straight deal on cash and carry terms. They do not like the idea of being too closely associated with the disputes of governments, which usually complicate the situation by their many-sidedness. A commercial deal is perfectly compatible with "neutralism" or "positive coexistence," or whatever other name some Arab governments give to their unco-operative policies. This attitude has a lot to justify it; for example, the Iraq Petroleum Company has been able to go back into Syria although diplomatic relations between Britain and Syria are still broken.

The Government has come to the conclusion that commercial arrangements are too much at the mercy of the transit governments. Oil is politics now; it is vital to the strategy of great nations and to their economic survival. An oil pipeline is a sort of specialised "Suez Canal," having a fair degree of the real canal's importance; there is therefore a case for getting it guaranteed by international convention. Until the invasion of Egypt gave him a military excuse to block the canal President Nasser was at pains to show that he was fulfilling the terms of the 1888 convention which guarantees free navigation. International guarantees could in the same way provide some deterrent against interference with the oil flow, and the basis for international action to prevent or remove the obstruction.

These arguments may well outweigh the old attitude of the companies. They cannot lightly reject anything which might strengthen the security of costly pipelines. But they would almost certainly still negotiate the pipeline agreement direct with the transit countries. An international convention would be a political umbrella negotiated at government level. It could in theory be extended to the existing pipelines through the Levant—if Syria and the Lebanon agreed. But what would induce them to agree?

West Germany's Choice of Tank

AFTER months of trial on the ground and argument in the conference room the west German defence minister and his technical advisers have decided to buy American M48 tanks to complete the tank fleet of the new German army. This has understandably disappointed the team of Britons who have been trying hard to persuade Herr Strauss

to take the Centurion. They believe the Centurion to be the better tank; they know it to be the cheaper; and they hoped that the prospect of a sterling transaction might have put its qualities in an even more favourable light. The Germans explain plausibly enough that they have based their decision largely on the consideration that they already have 1,000 M47's and that consequently by introducing the M48, which is a development of the M47, training and maintenance will continue more smoothly. This would be more convincing had they not experienced difficulties in obtaining spare parts for the M47 and turned to the British for help. But, it must be remembered, the M47's were a gift and the Germans feel under some moral obligation to satisfy the American salesmen, who have been just as keen as their British rivals to do a deal.

It is still not clear just how many M48's the Germans intend to order. The highest figure officially mentioned yet has been 700. An order for that number of Centurions would have earned some £30 million of foreign exchange holdings for this country. It is possible that the final order will come to less. The Germans are frankly not happy about the M48. They are pressing ahead with plans for a tank of their own design which they consider will suit their needs better than anything the Allies have to offer.

British hopes of booking orders for some £100 million of equipment by May 1st have now been dashed. At the end of the first phase of German buying, Britain's share is in the neighbourhood of £60 million. It is unlikely that this figure will be substantially increased during the next twelve months, when the Germans will be making up their minds how they want to fit out the really "modern" armed forces which they are resolved to have. During this period they will continue to examine what Britain has to offer, particularly in fighter aircraft and guided weapons.

Whale Inspectors

WHALING is a highly competitive industry in which each factory ship does its utmost to get the biggest share of the limited total of blue whale units that may be caught; the temptation to gain an advantage by breaking the rules is strong, and lapses are difficult to prove. The Norwegians, who have been finding it difficult to obtain their former profit from whaling, are particularly anxious to ensure that the rules are kept, and have even threatened to withdraw from the International Whaling Commission (which annually decides how many units may be caught) if nothing is done to reduce opportunities for poaching.

A conference was therefore summoned in Oslo last week to discuss the possibility of sending out "neutral" observers with each factory ship to see that no hunting took place before the start of the season, or after the permitted total had been killed, and that under-sized whales were not being caught. A draft plan was agreed on by Norway, Japan, Great Britain and the Netherlands, but Russia, the most seriously suspected of poaching, refused to attend. This may mean that the Russians will not co-operate at all, which could wreck the whole scheme, or it might simply imply that they prefer to wait until the whole matter can be settled through the commission. This will take some time, as the commission's convention debars it from considering the appointment of inspectors and the procedure for altering its powers is long and complicated; a protocol has, however, been signed by its members and ratification is going through.

The Oslo agreement is as yet only in draft form, and its details have not been published. It is expected to provide for the setting up of a board which would appoint inspectors from countries with no direct interest in whale hunting and allot them to factory ships; this would be only a stop-gap arrangement pending the decision of the Whaling Commission. It is to be hoped that it succeeds in its object and that the Russians find it possible to agree to it, for if the system of control breaks down the danger of hunting whales to extinction is very great.

Occupational Prodigies

THE following piece of social research was prompted by a small news item that appeared in the *Lancet* earlier this month. It was there pointed out that according to the Occupation Tables of the 1951 census of England and Wales, which were published in January, there are—or were—four registered medical practitioners aged 15, three aged 16, one aged 17 and four aged 18-19. There were half as many equally young doctors in Scotland. This revelation made us wonder what other prodigies were lying buried and unsung among the Registrar-General's 672 pages of statistics.

The results of the research, which was restricted to England and Wales, provide plenty of food for curiosity. To begin with, it was found that the *Lancet's* correspondent had overlooked the girl doctors—numbering three aged 15, four aged 16 and seven aged 18-19. But the prodigies are not confined to the medical profession. The following table will give some idea of how widely they are distributed, and in what unexpected places.

	Males aged		Females aged	
	15	16	15	16
Locomotive engine drivers	9	21	...	...
Guards	31	39	...	...
Drivers:				
Trolleybus	1	...	...	...
Bus and coach	1	1	...	...
Other passenger vehicles	3	3	1	...
Secretaries of companies	3	...	...	2
Managers, heads of departments	13	30	11	22
Company directors (so returned)	...	...	1	...
Stock brokers or jobbers	1	2	1	...
Clergymen (C. of E.)	2	...	...	...
Dentists	1	1	...	...
Business managers, etc., of cinemas, etc.	2	1	1	1
Proprietors and managers of restaurants	7	15	9	17
Publicans	1	2	...	1

This list of occupations where youth has reached the helm does not claim to be exhaustive: it ignores, for instance, the sixteen year-old boy and girl who are returned as higher civil servants, and two sixteen year-old girls who are "bankers, bank manageresses, inspectors." And impressive as all these prodigies are, their achievement has been surpassed by others. There are 36 fifteen-year-old boys and 22 girls who are listed by the Registrar-General as having already "retired from gainful occupation."

Letters to the Editor

Free Trade

SIR—The project for a European Common Market and associated Free Trade Zone has already stimulated or strengthened public interest in the free trade question. At this turning point in international affairs it would be a tragedy if, for lack of money and after a famous history of 54 years, the Free Trade Union, a non-party organisation, were compelled to close down or even to curtail its activities. That stark predicament will confront us early in 1959 unless we succeed in raising new sources of revenue. Our needs are extremely modest since to carry on, on our present basis, we need an additional income of approximately £2,500 per year. Our present activities, propagandist and educational, include the maintenance of a small office pursuing a large correspondence at home and abroad, a voluntary speakers' panel available for public meetings of all kinds, and the bi-monthly publication of *The Free Trader*, a highly respected journal with an influential circulation, whose features are often reproduced at home and overseas. We address this appeal to the readers of *The Economist* (leading spokesman, as it has been, ever since 1843 of fiscal liberty and the free economy) in the confident aspiration that they may be willing to help us.—Yours faithfully,

ANDREW MCFADYEAN
TENBY

Free Trade Union and Cobden Club, London, S.W.1

Eisenhower's Fourth Justice

SIR—I hope that I speak for the majority of the American legal profession when I say that I am appalled by your article in your issue of March 9th. There you seem to say that statesmen and policy makers are better material for the United States Supreme Court than are technical lawyers and judges. Of course it is true that because of the institution of judicial review the Supreme Court is required to make decisions which have profound political implications. It is arguable that the institution is an unfortunate one because legal materials are seldom definite enough in this area to indicate a given result with certainty, and therefore the political views of the justices are bound to affect the result. In other words, a decision is purportedly rested on legal grounds (which you would perhaps call "niceties of legal needlework") which are not necessarily the real ones; the real ones may be in fact the political views of the justices. Surely this is no reason for abandoning the "pretence," if such it be, altogether, and substituting a frankly political judgment for a purportedly legal one.

I can think of no institution more dangerous to a democracy than a group of men appointed for life and designedly without political responsibility whose function would be to make political decisions. Yet it is into such a body that you apparently wish to transform the United States Supreme Court. Judges do not and cannot be politically responsible if they are to remain judges. Their responsibility is a legal one, to statutes, precedents, and the judicial process. It is only this responsibility which makes their enormous power tolerable to a democracy.

In short, although it is arguable that judicial review is a defective institution and that judges should not do politicians' work, no one who understands the problem would argue that politicians should do judges' work.—Yours faithfully,

EDWARD S. REID
St Antony's College, Oxford

Motor Industry's Profits

SIR—Mr George Wansbrough makes the interesting and important suggestion that the ratio of sales to capital is high in mass production industries. Unfortunately it is doubtful if evidence from the motor industry, which he quotes, can be relied on to support or to refute his contention. Conventions about depreciation vary from one industry to another and, within an industry, from one firm to another. Hence big discrepancies can arise between the capital actually employed in an enterprise and the capital that appears, from published figures, to be employed. Discrepancies of this kind are likely to be exceptionally large, and exceptionally prone to vary from one firm to another, in the motor industry. The conditions in its markets, and especially the belief that the product is highly susceptible to the influences of fashion, lead many managements to adopt a prudent policy of writing off assets very rapidly.—Yours faithfully,

H. S. RICH
Luton, Beds

Insurance Policy for Oil

SIR—Your article in the issue of March 23rd could more appropriately be called: No Insurance Policy for Oil, since you come to the conclusion that any substantial extension of non-Middle East sources would be too expensive in terms of investment and dollars. You are right in saying that Middle East oil is cheaper than any other, but can we be guided only by such economic facts when the world in which we live is dominated by straight politics? Are you sure that (if Europe gets it at all) Middle East oil will in fact be cheap if there is no visible alternative to it? Investment in pipelines and supertankers increases the likelihood of our having access to some Middle East oil provided always that the producer countries don't form a solid block. Yet only crude oil in *other* areas provides a genuine alternative.

Again you are right to give a warning against a costly "crash programme" for developing Canadian oil, but there is need for study of possibilities to lay down buffer-stocks in Europe and to develop more capacity in Venezuela. Surely additional developments in the western hemisphere need not be a straight dollar burden—Venezuela is concerned about its impending total dependency on the US market and should welcome an imaginative scheme based on increased mutual trade with Europe. Unless it plans and prepares alternative sources of oil, Europe will be at the mercy of another round of pressure politics from the Middle East.—Yours faithfully,

PAUL H. FRANKEL
London, W.1

Local Revenues

SIR—I was amazed by your statement that "The . . . vitality of the rating system will never be restored . . . until . . . all classes of property are contributing equitably to the pool of rate revenues." It is open to grave doubts whether it is equitable at all that property should be used as a basis for raising rate revenues. It may be convenient, but justice hardly goes hand in hand with convenience.

To find an equitable basis upon which to raise local revenues, it is essential to recognise the changed purposes for which the funds are now used. The environmental services, which account for approximately one-third of the expenditure, are a true charge to commercial and industrial premises, as well as to private residential property. The remaining two-thirds is spent on personal services, and should be raised by an equal charge on every adult—equal, because incomes have already been equated by the graduated national taxes. For this same reason a local income tax can have no virtue except to appease egalitarians.

Local authorities could be given an unlimited source of income, quite free from Treasury control, if they were empowered to cover their requirements by a direct charge on their residents. Ratepayers can hardly object, in theory anyhow, to the exact cost of their local services being charged directly to them. They will themselves place a limit on what their councillors can spend by their action at the ballot box, which will assume a new importance.

The abolition of rating valuation would save the nation much purposeless expenditure of time, labour and money. It penalises those who spend their income on the provision of adequate

homes for their families. The fallacy in the system today is that the occupation of a house of any given size is no longer evidence of the taxable, or rateable, capacity of its occupants.—Yours faithfully, JOHN HARLEY
London, N.W.4

On the Fringe of Planning

SIR—The position taken on hire purchase controls by your paper on March 9th, stirs me to comment. I hope that the value of a different perspective will be worth the risk of seeming presumptuous by commenting as an American on Britain's internal affairs.

I have no disagreement with your statements about the short-term effects of hire purchase controls. Nor do I take issue with your conclusion that mistaken attitudes in both political parties (about which I know very little) tend to breed heavy reliance upon this form of control. Yet I sharply disagree with your statement that, in the long run, application of this form of control is "much less desirable than general disinflation, based on consumer preferences."

On this last point our American experience may be illustrative. Since 1952 we have approached the problem of disinflation without consumer credit controls by using traditional monetary policies inherited from earlier British experience. Yet we have found that the pursuit of general disinflation by these means exerted little restraint upon consumer credit. Down payments became smaller and maturities longer during the very times general restraints were applied. Also, the proportion of consumer debt to total private debt has continued to grow. This suggests that we have tended to discriminate in favour of the consumer borrower in the United States in recent years and against other borrowers.

In your article you overlook the point that hire purchase controls, which you refer to as "physical" controls, are also *monetary* controls. To the extent that they are effective, they lower the aggregate demand for money. Thus, your statement that these controls "do not reduce consumers' total and eventual purchasing power by one penny" is not true, unless your central bankers have found a way to keep the supply of money perfectly inelastic and its velocity constant. Second, is it not wise to utilise hire purchase restraints to accompany strong general monetary restraints in order to broaden the total impact and to lessen discrimination? Otherwise, you may find hire purchase credit cutting more deeply into a restricted volume of loanable funds. Third, as you suggest, are your restrictions on new capital offerings by hire purchase companies really needed? If the down payment and maturity restrictions are effective, the capital restrictions seem unnecessary. In short, cannot a middle ground policy be made up of permanent but moderate restrictions combined with close co-operation with monetary policy decisions?—Yours faithfully,
ROBERT P. SHAY
Zürich, Switzerland

[An article on page 1090 summarises the findings of a Federal Reserve Board report on consumer credit in the United States.]

Middle Class Reliefs Within Reason

SIR—To your suggestions may I add an idea that would cost very little and that might be a really important step towards a new general dynamic? Let the Government cease to tax company profits settled irrevocably upon the workers. In such cases the tax, though plainly intended by Parliament to fall upon owners of capital, falls in fact upon the workers. Many of them belong to the middle class. More and more will do so.

Profit goes at present in the main to the managers. The managed need it more, and will not be content until they get it, as, sooner or later, their political power being what it is, they will.—Yours faithfully, J. SPEDAN LEWIS
Stockbridge, Hants

Seeing Eye Machines

SIR—The Solartron device for the high-speed reading of numerals (which you described briefly on p. 843 of your issue dated March 9th) is a notable technical achievement, and the elimination of manual key-punching is a worthy aim. It is said to be able to replace 150 to 300 punch operators. But an electronic computer in accounting work is usually fed by a mere handful of operators, and the computer itself is claimed to replace 200 clerks. Therefore the reading machine would be worked to capacity only if used in conjunction with, say, 20 computers, which would be equivalent to the work of 4,000 clerks. Such applications are surely rare. If used to replace only 20 operators the saving could be of the order of £10,000 per annum, which would cover the capital charges and reasonable obsolescence on an investment of £50,000, but would not give a spectacular recovery of capital cost.

Another problem concerns the physical form and treatment of the original data necessary to keep the reading machine running at full speed. Punched cards can be read and moved on in approximately half a second, but is the same true of pieces of paper, possibly flimsy and of various shapes? The requirement of a specified style of character makes it essential for the characters to be machine-printed, and if in addition it is necessary to print on dockets of standard shape and texture, one is very nearly back to the punched card.

In fact it seems logical that if one is limited to machine-printed characters, the machine might just as well print simultaneously in machine-language as well as in ordinary numerals and letters. Attachments to various kinds of machines for producing such a record in perforated tape have been available for some time, though not at an attractive price. Alternatively, a technique of marking with magnetic ink could be used by putting the magnetic imprint either on the back or between the lines of legible type. Choice of recording method will depend largely on the extent to which dockets are required to be handled separately.

We wish to draw three general conclusions.

(1) It is difficult to justify by strict economic test the purchase of ultra-fast machines.

(2) If one is willing to regard such a purchase as a speculative investment, there is a good chance that profit will accrue because the fast machine can provide services which were previously impossible.

(3) Where most of the information originates within the organisation, an important policy decision is whether to rely on translation of human language or to install bilingual recorders at the points where information originates.—Yours faithfully, D. A. BELL
PAMELA HADDY
The University, Birmingham

H-Bombs and Morals

SIR—One of the most disturbing facts about the current discussion of future defence policy is the absence of any consideration of the moral factors involved in the manufacture and use of thermo-nuclear weapons. We believe that many people are, in fact, still very reluctant to accept the use of these weapons as a basis for defence strategy, and that particularly young people facing their military service are worried at becoming the mere instruments of this, to them abhorrent, policy. We feel that in this connection our own past experience may be of interest to them.

There appears to be a general view that in order to register as a conscientious objector one must be an "absolute pacifist," and that this pacifism must normally be based on religious conviction of one sort or another. Such a view is completely unfounded; the National Service Act does not exclude any grounds whatever as a basis for objection, but provides for tribunals whose sole function is to satisfy themselves that any objections put forward are a genuine expression of conscience. In fact, we have both appeared before CO tribunals, and have based our objections on the fact that the armed forces are today the servants of a policy which accepts the view that the use of thermo-nuclear weapons is in certain circumstances justifiable—a policy which we utterly reject, since it implies the belief that there exist evils greater than *the destruction of civilisation itself*. The tribunal accepted our arguments, in both cases, as constituting a conscientious objection to military service.

We are sure that there are many others who regard the nuclear arms race with a similar abhorrence, but who cannot find a way of making an effective stand against a policy they consider so utterly wrong.—Yours faithfully, R. BARRY
London, N.W.6 S. M. NEUFELD

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Labour's Black Sheep

Washington, D.C.

WITH his habitual sense of occasion, Mr Walter Reuther, President of the United Automobile Workers, announced on Sunday that he will ask his union's convention to set up a public review board of seven distinguished and completely independent citizens empowered to originate investigations of the "ethical and moral conduct" of all the UAW's leaders, up to and including Mr Reuther himself. Such a move came none too soon. For the fifth week in succession the capitalist sins of the country's largest union, the teamsters, displayed on all the front pages of the newspapers, had given the public a jaundiced view of the American labour movement.

The first instalment of the drama staged by the Senate's select committee on labour and management practices culminated on Tuesday in the appearance of the much travelled Mr Dave Beck, the president of the teamsters (as lorry drivers are still called). For this eagerly awaited confrontation the select committee's full complement of Senators was hunched diminutively under the surrealistic equipment of the television networks. Along one side of the polished table were Senator McClellan, the implacably upright lawyer from Arkansas, Mr Robert Kennedy, the keen, eager and startlingly boyish Bostonian counsel and the supporting cast, including Senator McCarthy, now yellow faced, black-eyed and, like Dorian Gray, increasingly resembling the wickedest cartoons drawn of him during his prime. In the witness chair was Mr Dave Beck, pudgy, with his bald head turning successive shades of pink as he shouted at enormous length his self-righteous reasons for saying nothing. In between crouched the photographers, like a chorus of frogs poised to capture the moment of truth. The caucus room, with its marble chandelier, was packed beyond capacity.

The $320,000 question—which is the amount the committee thinks Mr Beck has taken from the teamsters' till—was whether the witness would answer questions about his personal finances. He would not, and called to witness practically every clause in the Constitution. His colleagues in the leadership of the American Federation of Labour and Congress of Industrial Organisations were no more impressed by this than the Senators. Since the federation recently resolved that a union official who fails to co-operate with a congressional committee "has not the right to continue to hold office in his union," Mr Meany, the President of the AFL-CIO, instantly summoned a meeting of the executive council for Friday to consider the case of Mr Dave Beck.

There is much more to come. Senator McClellan and Mr Kennedy claim to have at least a year's worth of material on crookedness in unions from twenty-six cities. The form of the hearings and the type of evidence that is being given are all too ironically reminiscent, for the comfort of the labour movement, of the famous investigations of the thirties into the practices and standards of big business which led to restrictive legislation.

★

Now that the boot is on the other foot, the senior figures in the AFL-CIO, such as Mr Meany and Mr Reuther, are putting on a brave front. They have, after all, a good record for fighting corruption and crime. The cleansing of the labour movement was one of the main planks of the platform on which the two federations came together. The teamsters, on the other hand, with their imperialist ambitions to spread their "jurisdiction" over other unions' backyards, have been the main obstacle to the extension of the merger to the state and local labour councils in many of the principal industrial states. Mr James Hoffa, the teamsters' dynamic ninth vice president, who has just been indicted for trying to bribe an investigator on the Senate Committee, is personally responsible for blocking labour unity in Mr Reuther's own home city of Detroit.

Moreover, the AFL-CIO had already given an earnest of its good intentions last January when its executive council adopted a stringent "code of ethics," including the banning from union office of men "commonly known to be crooks or racketeers even if they have not been legally convicted." It also threatened three small unions with expulsion from the federation if they did not completely rid themselves of guilty officers and crime-ridden local branches within ninety days. However, there are practical limitations on labour's ability to "clean its own house." The AFL-CIO is almost as loose a federation as the TUC. The three small unions were tackled first, partly because they were small and therefore relatively easy to coerce, and partly, as Mr Meany openly conceded, because an earlier congressional committee, had developed the full sordid story of their mishandling of welfare funds.

It would be difficult for the federation to tackle so mighty a member as the teamsters without the preliminary of prolonged public exposure to undermine its leadership in the eyes of its own rank and file. Although there are some sanctions that could be taken against Mr Beck person-

Late Spring in Detroit

THE automobile industry, which is waiting for the spring upturn in sales to come to its aid, has experienced nothing like the blizzard which struck America this week, but it is growing anxious. Last year spring never came to Detroit and the industry was condemned to produce a mere 5,800,000 cars, compared with the record 7,900,000 it had made in 1955. This year in spite of the vast sums spent on re-tooling to tickle the motorist's jaded palate with the glittering 1957 models output is only slightly ahead of last year's. Sales have even fallen slightly behind so that stocks of new cars, while still below the menacing heights of 1956, rose by more than usual during February to a rather worrying 730,000 at the end of the month. Already some manufacturers have curtailed output to bring stocks into better balance with demand, and there is the usual talk of even easier hire purchase terms, and a host of special inducements to customers.

Whether it finally decides to buy this year or not, the public has become more fickle in its choice of makes. Ford expects to sell nearly 20 per cent more cars in the first quarter of this year than last, and Chrysler has heaved itself valiantly out of its earlier troubles. Its sales were 11 per cent greater during January and February than they were last year. The company now claims to be within shooting distance of the 20 per cent share of the market on which it had set its sights. General Motors, on the other hand, no longer apparently invincible, has lost ground. Unofficial estimates put its sales at 15 per cent below last year's, and its share of the market at 47 per cent, compared with 53 per cent in 1956.

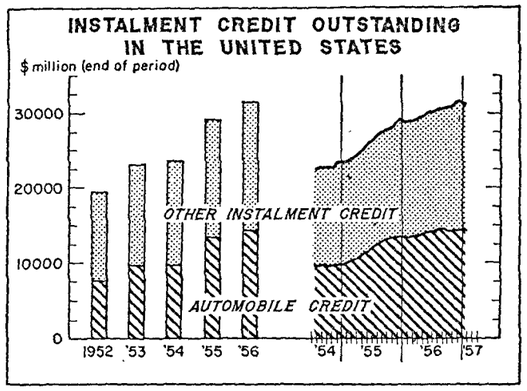
The Chevrolet, General Motors' most popular car, had only a "face lift" last year, while both Ford and Chrysler's Plymouth spent longer in the beauty parlour and were completely restyled. This expenditure is now paying dividends. For some reason the design of the new General Motors' Buick, which did have the full treatment, has failed to make a hit. Part of the trouble in its case is the general shift of demand away from the medium priced cars and into the so-called "low price range" of the Chevrolet, Ford and Plymouth cars which together account for some 60 per cent of all the cars sold in the United States. The scattered production cuts made so far have, as a result, been concentrated mainly in the General Motors' factories turning out the higher priced Buicks, Oldsmobiles, and Pontiacs, and to a lesser extent in the Ford plants where the expensive Mercury and Lincoln models are made.

Awakening to Africa

THE tireless Vice-President arrived back in Washington last week after a 20,000-mile tour of eight African countries which seems to have been a successful combination of official good-will tour and diplomatic mission, garnished with all the techniques of an American election campaign which Mr Nixon finds surprise and delight backward peoples. Some of Mr Nixon's duties were representational: to be present at Ghana's independence celebrations and to return the calls of the Emperor of Abyssinia, the President of Liberia, and M. Bourguiba of Tunisia. Some were specific: to prepare the ground in Morocco for new agreements over the air bases and in Abyssinia to press the desire of the United States for a military communications centre. Some were general: to express the interest of the United States in the national aspirations of Africans, and to carry expressions of American friendship to countries encircling Egypt. Only in the Sudan, which must live with Egypt, did Mr Nixon encounter coolness, though enthusiasm elsewhere also carried risks; he must have had to walk carefully to avoid the frustration and resentment which would follow if he promised more aid than America is likely to deliver.

Mr Nixon is to report to the President, but he has already let it be known that he feels America must take a greater part in solving the problem of Arab refugees, that it must strengthen and increase its diplomatic representatives in Africa; improve its information services; and bring more African students to the United States. But the importance of Mr Nixon's journey may lie less in what he brought back than what sent him: the awakening of America to the importance of Africa as a decisive battleground of ideas. Even before the Nixons took off a month ago, it had been decided to open four new consulates in Africa, and a Bill to authorise a new Bureau of African Affairs in the State Department, with its own Assistant Secretary, is awaiting Congressional approval. Americans who feel they missed the nationalist tide in the Far East do not want the pattern to be repeated.

Mr Nixon has always been keenly aware that how America solves its own race problems affects its relations with the coloured nations. On this trip, with almost half of his thirty accompanying newspapermen representing the Negro press in the United States, Mr Nixon is not likely to have overlooked the fact that this truth can be reversed and that handshakes in Ghana and Liberia may in 1960 be translated into more votes for the Republican candidate—who may well be Mr Nixon.



No Controls for Consumers

Washington, D.C.

THE staff of the Federal Reserve Board has produced a mountainous study* of the economics of consumer credit, but it might be a mouse as far as the purpose for which it was undertaken is concerned. This was to produce the evidence needed to decide whether the government should have the power, in peacetime, to control the terms on which instalment credit is granted to consumers. Although the staff was not expected to produce an answer to this main question, it had been thought that at least the study could dispose of some or all of the underlying subsidiary questions, such as whether this type of credit is peculiarly volatile and therefore tends to exaggerate booms and depressions; whether it is, as alleged, unresponsive to general monetary restraint; whether it is creating an excessive burden of consumer debt in relation to consumer incomes, and so forth. The study's timid "conclusions" on these points are so hedged with qualifications that they could scarcely be used with much conviction by either the friends or the foes of standby controls. Indeed, in summing up the arguments, the staff is able to cite elements of its own findings to support both sides.

* Consumer Instalment Credit. Board of Governors of the Federal Reserve System. US Government Printing Office, Washington, D.C. Six volumes $1.25 each.

The effect of these labours will, in the nature of things, almost certainly be to help the critics of controls, simply because American governments seldom launch new regulatory ventures unless the case is most compelling and public pressure is strong. In this case, apparently, the case is far

from compelling, and public and Congressional sentiment is overwhelming against control. The sudden interest of the public and the government in the problem arose from the tremendous increase of $5.5 billion in instalment credit—mainly automobile credit—in the boom year of 1955. It was argued that credit was financing a level of sales that could not be maintained and was laying the groundwork for a slump. The staff study confirms that this was the case; sales of cars slumped sharply in 1956. But the real point is that the economy rode out the automobile slump in 1956 without the slightest difficulty. Consumer credit huffed and puffed, as it were, and failed even to shake the house, let alone blow it down. In 1956 the increase in instalment debt was only $2.5 billion, and interest in the means of controlling it evaporated.

The study shows that about two out of three married couples now have either mortgage or instalment debt, and no doubt many of the one-third without debt have had some in the past. The Federal Reserve staff concludes that this form of debt is now thoroughly respectable and has become "deeply imbedded among the habits and customs of American consumers and businessmen." It also makes a point which is often overlooked—that the monthly payments needed to retire this debt are frequently a substitute for payments that otherwise would have been made. Thus mortgage payments are made in place of rent, payments on a car instead of spending on public transport, payments on washing machines and electric dishwashers in place of laundry bills and domestic servants.

The staff refuses to conclude, on the basis of what happened last year, that fluctuations in consumer credit can never be a dangerous source of economic instability, but it does say that past experience shows that this kind of credit has never been the "principal" cause of movements in the business cycle. While the staff does not commit itself on whether general credit restraint "sufficiently" checks the growth of consumer credit, it does conclude that some restraint is felt and that consumer credit is by no means completely insulated from general conditions in the money market. All of these "findings" (if they can be called that) are likely to reinforce the traditional reluctance of the Reserve Board itself to launch into selective credit control unless there is an overriding need for it.

If the consumer credit study is likely to have the effect of smothering the issue of legal authority for standby control over hire-purchase terms, there is keen legislative interest in a different phase of the subject—certain alleged abuses of the system by dealers and finance companies, which result in overcharges to consumers. The New York state legislature is about to pass a strict Bill on this subject, following a milder one last year, and in Washington a committee of the Senate is also investigating the subject. In general, the abuses centre around hidden charges, contracts that "can never be paid off," and "padded" fees for the insurance which usually must be purchased with an automobile. It is impossible to say how widespread these abuses are, but it is quite clear that buyers who care to take trouble need not suffer them. In all probability the necessary regulatory legislation will be adopted by the states over a period of time; Congress is unlikely to be asked to legislate on this phase of the problem, either.

Advice on Aid

Washington, D.C.

WHEN the Senate's Select Committee on Foreign Aid began last week to hear evidence on its host of specially commissioned studies it could scarcely help noticing that the hardest knocks had been directed at the procedures of Congress. Indeed the overwhelming impression of all this research is that between them the Administration and Congress have got the mutual security programme into a thorough muddle. The Administration's disingenuous salesmanship has provoked impractical restrictions from Congress. The result has been confusion among domestic taxpayers and loss of goodwill among foreign recipients.

As Mr Eric Johnston's International Development Advisory Board has told the President, the general public has the mistaken impression that, with $3.8 billion appropriated for mutual security in the current year, the United States is already engaged in a massive programme of promoting economic development overseas. In fact, only ten per cent, or $385 million, is openly assigned to stimulating economic growth, while 54 per cent, or just over $2 billion, is strictly military aid.

This leaves a further $1.2 billion of "defence support" which goes to countries which have military pacts with the United States. In this mysterious category, aid to advance the growth of such countries as South Korea, Formosa, Vietnam, Turkey, Iran and Pakistan is mixed up with civil expenditures directly connected with allied forces. But the confusion was intentional. Camouflaging economic aid as part of the Administration's military programme was thought to make mutual security more palatable. But, according to the bulk of this year's evidence this scheme has doubly miscarried. Instead of the military element in mutual security supplying a protective coloration for the

whole programme, it is prejudicing its political chances by inflating the totals of "foreign aid" with items that more logically belong in the defence estimates. And the mingling together of all types of aid has created the impression abroad that military factors are paramount. Practically all the present advice calls for the complete administrative separation of the military and economic programmes, with "defence support" divided between them.

Confronted with confused programmes, Congress has attached brakes in inappropriate places. Everyone has been condemning the practice of authorising foreign aid for only one year at a time. At present, half the current fiscal year is over before the Administration has sorted out the changes Congress has made in its plans and has conducted negotiations with recipient governments. Since eighty per cent of the year's funds must be spent in the first ten months and any funds left over automatically lapse, there has to be a furious spending spree between January and April. Negotiators' hands are further tied by the proviso that eighty per cent of non-military aid must be in the form of loans. The Johnston Board proposes an International Development Fund, with at least three years' appropriations from Congress at a time. All the Senate's advisers tell it to allow the Administration more leeway for long-range plans and commitments. With Congress's economy drive in full swing, the Administration can hardly hope that economic aid will qualify this year for extra money. But it does hope that the time may possibly be ripe for it to receive more discretion.

Air-minded Joint Chiefs

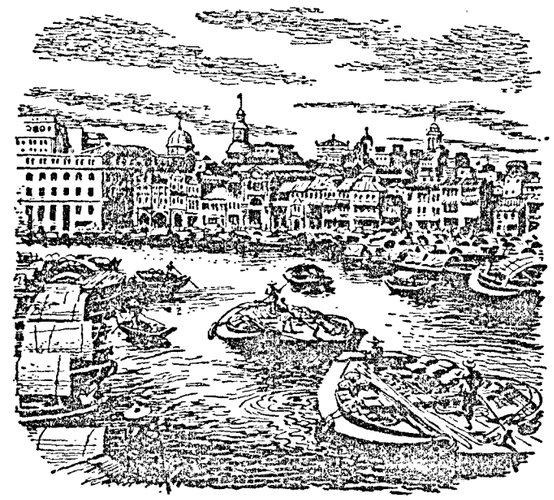
THE appointment of General Twining as the next chairman of the Joint Chiefs of Staff, which was announced this week, brings an airman to this post for the first time since it was created in 1949. General Bradley, its first occupant, was an army man; he was succeeded in 1953 by Admiral Radford. Some relief is being expressed in Washington that the Administration has not, as at one time seemed possible, asked Congress to allow the brilliant but somewhat flamboyant admiral to serve a third two-year term. Unlike Admiral Radford, General Twining opposed taking the risk of involving the United States in hostilities with China, first over Indo-China and later over Quemoy and the Matsus.

Rotation of the chairmanship of the Joint Chiefs among the three services is not required by law, but it is normal practice. If the Air Force speaks with more authority after next August, it will be due, not to the deliberate choice of General Twining as chairman, but to the air-mindedness of the representatives of the Army and Navy, and the acknowledged abilities of General White, who succeeds General Twining as Chief of Staff of the Air Force.

In another nomination, the President this week chose Mr Quarles, the Secretary of the Air Force, to be Deputy Secretary of Defence. This is considered to be a stepping-stone to Mr Wilson's job when the Secretary of Defence decides, as it is believed he will in June when the defence budget is approved, to return to General Motors. This would be the first change in the Cabinet since the election; before it Mr McKay, the former Secretary of the Interior, resigned to run against Senator Morse. In all, there have been only three replacements in the Cabinet since Mr Eisenhower became President in 1953, a remarkable record.

Plymouth Ho!

FROM A CORRESPONDENT IN MASSACHUSETTS



ON May 25th a new *Mayflower*, a replica of the vessel which took the Pilgrim Fathers from Plymouth, England to America in 1620, is supposed to arrive in Plymouth, Massachusetts, a town south of Boston in the shelter of Cape Cod. Then should begin ten days of celebration, including parades and a "Pilgrim operetta." The ship, which has been built at Brixham in Devonshire, is being paid for by private subscription in Britain and will be presented to the American people in order to publicise Anglo-American friendship. It will eventually become one of the chief tourist attractions at another replica, that of the Plymouth the Pilgrim Fathers founded over three centuries ago in the New World, which is being reconstructed in its original state just as the Plymouth in the Old World is being turned into a modern city.

The site chosen for a reproduction of the first Pilgrim village—and for the ultimate berth of the *Mayflower*—is about two miles south of the original village. This is because it is impractical to wipe out half the existing town of Plymouth. The plans for the village only came to real life when Great Britain's good will gift of the *Mayflower* began to materialise. The advantage of dovetailing the two projects was apparent to the backers of both and a sense of urgency now grips Plimoth Plantation, the American group which has long endeavoured to make the most of Plymouth as a national shrine.

The new *Mayflower* will be moored in the Eel River, which is one of the boundaries of the site. In time the vessel's popularity with sightseers may equal that of the Statue of Liberty which stands in New York harbour as a symbol of the friendship of Frenchmen of an earlier generation. Already it is not unusual for 500,000 people to visit Plymouth every year just to see the weather-worn Plymouth Rock where the Pilgrims landed after their arduous journey from the Old World, and the reproduction of the first house and the fort erected nearby several years ago by Plimoth Plantation. When these are moved to Eel River, the rock will remain in its singular isolation at the sea-side foot of downtown Plymouth in a setting of souvenir shops, which most Americans first deplore and later patronise. Enclosed in bars to guard it against the souvenir hunters who persisted in chipping off bits, the rock will continue to be free to all visitors.

The sponsors of the scheme to reproduce the original village expect that a nominal admission fee will have to be charged for its maintenance. The struggling Pilgrims of 1620 would be startled to learn that $1 million will be needed to reconstruct their primitive homesteads. A country-wide appeal for funds will probably be made to

Serving Commerce Around the World

Wherever you are, wherever you go, wherever you do business—Bank of America's global facilities are available to assist you with every international banking problem. Through its network of overseas correspondents throughout the world, and through its traveling representatives, this bank collects on-the-spot information to keep its customers up-to-date on all questions of credit, foreign exchange, new regulations.

ıpplement the $100,000 already received, some of it from :hoolchildren in many states. Compared, however, with ıe millions poured into the reconstruction of Williamsburg, irginia, the $1 million for Plymouth is small indeed. The el River tract was willed in 1955 to the Plimoth Plantation y Mrs Henry Hornblower, the grandmother of Henry fornblower II of Boston, who is the chairman of the board governors of the group.

The *Mayflower* will make land at Plymouth after its tlantic crossing, then sail to New York City and perhaps e exhibited at other cities before returning to Eel River November for Thanksgiving Day. The river runs under low lying roadway and New Englanders may be treated the spectacle of the 180-ton vessel being lifted over the oad on the way to its berth. Other attractions will include ineteen thatched dwellings, laid out as they were in the eginning, the meeting house and the fort, where the town ssembled and prepared to defend itself, a trading post, a rist mill, an Indian village, and a museum which will house elics of the past. Sheep and goats will graze on nearby nd.

Pilgrim houses were much alike. They consisted of one r two rooms 14 by 18 feet, with half of the space overhead oored for sleeping quarters. If the family was large, a an-to room was added. A big stone fireplace completely ook up one end of the house. The width of each plot was etermined by the number in the family, just over 8 feet eing allowed for each person. It took some years for the illage to be stabilised after it was first settled in 1620, nd 1627 was chosen by Plimoth Plantation as the most ppropriate year of the village's history to reproduce. A ensus taken at that time reveals there were 99 people, xactly the same as in December of 1620, living in lymouth.

An effort will be made to prevent the village from lapsing nto a museum atmosphere. Men and boys will work in ıe gardens, the grist mill, and in the sawpit. They will se the crude implements of earlier times. Women and girls ill spin, weave, and dip candles as the Pilgrim housewives nce did. While the buildings are under construction isitors will be permitted to watch the work. The canny ankee residents of Massachusetts will have a monetary, as ell as an historical, interest in it. Mr Hornblower stimates—perhaps over-enthusiastically—that, with the *layflower* on permanent exhibition, the Pilgrim Village ay double the number of visitors, who already spend $425 illion a year in this historic state.

Uncompetitive Shipbuilding

THE lowest bid submitted by an American shipyard for the construction of a 53,000 ton sister ship to the liner *S. United States* was reported last week to be $111.6 million. If the bid is accepted, about 60 per cent of the ost, or over $60 million, will probably have to be paid by he American government; when the vessel goes to sea, ell over half of its operating costs will probably have to e borne by the government as well. This is one measure f the bills that have to be paid by a country's taxpayers to eep their national merchant marine and civilian shipbuilding industry alive when both have allowed their costs to rise hopelessly above those of their foreign competitors.

To obtain operating subsidies and tax deferment on sums set aside for replacement, the American shipping lines have to accept restrictions affecting, among other things, the trade routes on which they operate, and the size of their profits, and undertake to replace their ships in American yards. Of the non-subsidised tonnage, about half is employed in the coastal trades which can afford to pay the higher cost of American-built ships because they are protected against competition from cheaper foreign vessels. The only really large orders for ships built in American yards which are not subsidised are those for oil tankers. This is so partly because oil companies in general want no part in "conditional" subsidies from the government. But they are also now inclined to favour American yards because rising costs and lengthening delivery dates in Europe and Japan have reduced the advantages of building abroad.

This trend is reinforced by the government's refusal to allow oil companies and tanker operators to transfer vessels from their existing American-flag fleets to foreign-flag operation, which is much cheaper, unless they undertake to replace their tankers in American yards. Coupled with more favourable mortgage terms, this helps to explain why the American shipyards are now able to report that 103 ships of 2,364,000 tons gross are under construction or on order—more than three times as many as a year ago—and that there are good prospects for more orders later this year, especially from the subsidised shipping lines which are still negotiating their replacement programmes with the government. But to achieve this the government will probably have to spend in future years considerably more than the $240 million it first requested for shipbuilding and operating subsidies for the fiscal year 1957-1958.

SHORTER NOTES

It will be about two months before President Eisenhower begins to take off from the White House lawn in a helicopter; the aircraft will be used to carry him to the main airport but, in spite of reports which made him so angry at his press conference this week, he will not go to the golf course by this form of transport, to begin with, at least. The police welcome the idea, since it will relieve the traffic congestion caused by their efforts to ensure him a safe and clear passage when he travels by road.

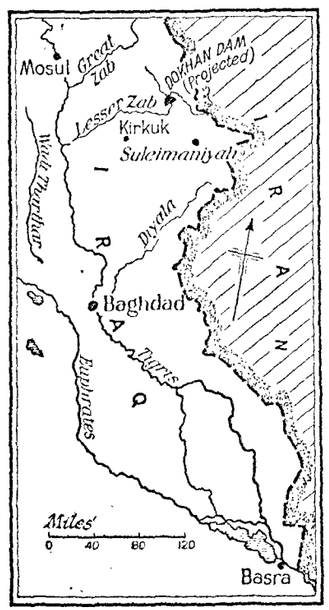
Two of New York City's three evening newspapers are to raise their prices from five to ten cents a copy. They are the *World-Telegram and Sun* and the *Journal-American*. Two morning newspapers, the *New York Times* and the *New York Herald Tribune* have been considering changing their prices, in the light of increasing labour costs and the rise in newsprint prices to $134 a ton which went into effect on March 1st. The *New York Times* last month raised the price of its Sunday edition from twenty-five to thirty-five cents for papers sold more than a hundred miles outside New York City.

The World Overseas

Gala in Iraq

FROM OUR SPECIAL CORRESPONDENT IN BAGHDAD



FOR fifty-one weeks out of the fifty-two, the Iraq Development Board pays far too little attention to publicity about its job—the spending of oil revenue on capital works. But in the fifty-second week it makes amends and runs Development Week—a gala during which King, Crown Prince and Prime Minister spend seven days cutting tapes, unlocking doors, opening sluices and laying foundation stones. This week is Development Week and it got off to a gay start last Saturday, when the opening day coincided not only with word of the first tankers carrying away Iraqi oil from the far end of the newly-mended pipeline on the short Mediterranean haul to Europe, but with the welcome news that the United States was ready to join the military committee of the Baghdad Pact.

This year, the board's most spectacular accomplishments are two new bridges in Baghdad and two large new factories in the north—one for textiles at Mosul and one for cement near Suleimaniyah—each of which has its attendant workers' housing estate. Next year must be the turn of the south, which is somewhat injured at what is considers to be neglect of its claims to attention. ("Imperialism in this country," grumbles your host in Basra, "is Mosul imperialism.") Basrawis need to take heart from the thought that, in earlier years, Baghdad felt the same. This year, by contrast, it had first taste of the excitement and the benefits.

On the opening morning, a Baghdadi crowd that must have approached 50,000 lined the new roundabout at the city's south gate from which the larger of the two new bridges spans the Tigris. People were everywhere; men in silhouette along the rooftops, boys in the trees, both sexes ten or fifteen deep on the pavements. Good-humoured, chattering like starlings and controlled by a police force that cannot have numbered more than one to every two hundred spectators, they gave Nuri Pasha a good clap and the King a rousing cheer, and broke ranks only when he was into his car and moving off to his next assignment. Then, thousands strong, they poured in a free-for-all on to the bridge and into a race 60 feet wide for the glory of first across—past the television cameras, under the triumphal arch, up the fairway and over the hump out of sight.

Anyone who knows Baghdad will realise what a boon to traffic is this bridge, named after the late Queen Aliyah. In a town where the business section has been the shape of a long H, with two bars (the old bridges) close together in the middle, the visitor has for years been forced to make all his appointments consecutively at one end of the town unless he wants to spend the bulk of his time in a stationary taxi that is hooting fruitlessly. From this week the H has other joins at top and bottom.

Less spectacular than the bridges, but of far more moment to the wellbeing of the nation as a whole, is the other piece of handiwork officially inaugurated on the opening day—the drainage channel that is the start of a trunk network of agricultural drainage designed to restore ancient Mesopotamia's fertility. Iraq is an agricultural country. Apart from oil and its possible derivatives, its greatest potential wealth lies in its agricultural industry. Yet for centuries its potentially fertile central plain has been in large part uncultivable because, for lack of drainage, evaporation has carried the salts in its soil to the surface, where they have crystallised. From the air, these deposits look like snow in huge patches; from the ground, they provide the traveller on a gusty day with the occasional strange sight of a whirling column that is (like Lot's wife?) pure white. Washing out the deposit by means of drainage and faster-moving water may take years, but little land is wholly irrecoverable. Meantime, good land will be improved, and marginal land saved from deterioration; already, the farms on the edges of the new drain are carrying higher and noticeably more even crops of barley.

The week's programme comprises promise as well as fulfilment. Foundation stones have been laid, among them that of the first of three big power stations that will power the national grid (in Baghdad) and that for the spectacular Dokham Dam on the lesser Zab river—a £13 million affair that is already begun and will be finished next February. In a realm more immediately affecting the general public, the King has laid the foundation stone for the first really big low-income housing estate in the Baghdad area and Nuri Pasha has distributed the first title deeds to small holdings on a "recovered" area between the rivers.

The Iraqis are great at eleventh hour hustle. Three or four days before the ceremonies opened, no one would have said the works could be finished on time; bulldozers were still charging piles of rubble, tanks being loaded on to the bridges to test their strength and foremen were gesticulating in apparent desperation, no flags were up, no arches ready. But hey presto! all was right by the appointed day; there were flowers in the flowerbeds, a new standard for the flagpost, a new brush for the royal carpet; the whole, including a three-day trip to the north for planeloads of visitors, was a very considerable feat of organisation.

Yet, all in all, it was Nature, not man, that provided the most startling tribute of the week to the Development Board's operations. March has been particularly rainy. Earlier in the month, rain in unusual amounts caused an immense and unexpected rise in the rivers. A flood less prolonged but more sudden than the cataclysm of 1954 might have caused another £25 million of damage but for the escape channel opened at last year's Development Week from the Tigris into the Wadi Tharthar. Thanks to this, two-thirds of the Tigris flow was diverted into that monster catchment, and, downstream, the ordinary river bed was able to accommodate the whole swollen flow of its great tributary, the Diyala, without danger to Baghdad and points south. The Tharthar project cost £16 million, but "already," says the Minister of Development, "one can say that it has paid its way." This year's undertakings can scarcely earn so rapid a dividend, but they may be equally rewarding in the long run.

Russia and the Two Germanys

FROM OUR BONN CORRESPONDENT

WHILE Dr Adenauer is away cultivating friends and sightseeing in Persia (March 28th to April 2nd), departmental specialists at Bonn are brooding over the gist of an appropriate reply to Mr Bulganin's latest letter to the Chancellor. The Soviet prime minister sounds as though he is in a hurry; not, it need scarcely be said, to help ease the inevitable process of German reunification but to develop trade between Russia and the larger and richer segment of Germany west of the Elbe. Mr Bulganin has proposed that trade talks should begin as early as April. Mr Mikoyan's presence in Vienna in the same month, and the opening on April 28th of the west German industrial fair at Hanover, in which the Russians are keenly interested, may well have something to do with the attempt to get things moving quickly. But, even in election year, Dr Adenauer is in no such hurry.

In his own good time the Chancellor will reply, and in due course trade talks will begin. But the Germans will enter into them resolved to achieve more than an extension of trade. Mr Bulganin cannot expect to get away with distorting or entirely ignoring the two major obstacles singled out by Dr Adenauer in his letter of February 27th as standing in the way of an improvement in German-Russian relations: *the political servitude of the 17 million Germans* east of the Elbe, and the continued detention of some 70,000 German civilians in the Soviet Union.

In a restatement of half-truths and evasions that makes melancholy reading, Mr Bulganin has appealed to Dr Adenauer to be a realist—to recognise that for seven years there have been two sovereign German states, each with its own constitution, parliament, and government. Naturally, he argues, when the day of reunification comes, the German Democratic Republic will not want all its institutions, laws and achievements to be overlaid by those of the German Federal Republic. Once again Dr Adenauer will be obliged to reply that such an involuntary and annihilating amalgamation is not, and never has been, contemplated. Federal Germany is quite ready to submit to the test of free all-German elections for a parliament which, in the name of the majority of the German people, would adopt or discard by majority vote the various features and practices that have developed separately in east and west since the war.

But Mr Bulganin's letter shows that the Russians have still no intention whatever of permitting Germany to unite except on communist terms. Confident that time is on their side, they are prepared to let the German issue wait while world power politics are fought out in other fields. Unless they are willing to accept communist terms, the Germans on both sides of the Elbe must wait just as long.

70,000 Expatriates

With the Russians in this mood the Germans obviously cannot hope to get any nearer reunification by way of trade talks. But they can hope to use the occasion to press for attention to the second major obstacle mentioned by Dr Adenauer and completely ignored by Mr Bulganin in his reply—the unfulfilled repatriation of some 70,000 Germans. These are mostly East Prussians who were evicted from the northern half of the province in 1945. This now being under Soviet administration, the former inhabitants have become Soviet nationals, say the Russians. The wish to help these expatriates, most of whom seem to be employed as labourers in various parts of the Soviet Union, is largely behind the German request for an extension of consular activities. In the matter of commercial relations the Germans are sufficiently disinterested at the moment to be able to take the line: no repatriation, no trade agreement.

Trade between the two countries has been developing quite nicely for some years without an agreement. German imports from the Soviet Union rose from DM 93 million in 1954 to DM 186 million in the first eleven months of 1956. During the same periods German exports to the Soviet Union rose from DM 53 million to DM 276 million. (Of the latter figure DM 200 million are accounted for by the 24 fishery vessels built for Russia at the state-owned Howaldt shipyard at Kiel). Old German hands at the game admit that the time has probably come to make harder and faster arrangements, and they reckon that an exchange of goods worth 1,000 million marks annually is now practicable. One of the problems is that so much of the heavy material the Russians would like from the Germans comes under the Western strategic embargo. But it is expected that the Russians will be willing to take leather goods, textiles, and household equipment. In their turn the Germans could take 250,000 tons of grain annually and considerable quantities of timber, asbestos, and flax. But they will be in no hurry to do a deal that does not bring them some political advantages as well.

Australia's Boom

FROM OUR SYDNEY CORRESPONDENT

AUSTRALIAN external trade is on one of its truly great periodic upswings. Domestically, the present Spartan refusal to let this go to anybody's head is something previously unheard-of. Some four months ago the prime minister, Mr Menzies, watching the rapid pick-up in the overseas currency reserves, did allow himself an exultant cry that the danger of a devaluation had "been averted for a very, very long time." That has since become a truism. Whereas, a year ago, people were nervously wondering if the reserves would even reach the sober official forecast of £A288 million by the end of June, 1956 (in fact, they comfortably exceeded it), now it is assumed that the reserves should be within striking distance of £A500 million by the end of June, 1957. And the vista stretches on: or so it seems, for Canberra officials are already venturing forecasts that, given reasonable weather, the export receipts for the next financial year should be pretty well a repetition of this year's estimated £A920-£A950 million. The key assumption here is that there will be yet another increase in the physical size of the wool clip, sufficient to take care of any drift in prices.

Exports are only one of three factors in the rise in Australia's currency reserves and in estimating the chances of its continuance. The others are the strong capital inflow and the intensive controls on imports. But to begin with exports, a cheque of the order of £A950 million would be close to the freak record of £A988 million produced by the Korean war in 1950-51. Australians have not been slow to note the lesson in that. A slump of £A310 million followed hard on the Korean boom in the following year's exports. Could this latest surf-breaker drop Australians with an equal bump? Presumably not; the wool element in this export boom is healthier because increased clip quantities are playing a bigger part in relation to prices. Australia is selling some 35 per cent more wool now than six years ago, while the peak prices for this season have been scarcely half as high as the peaks touched in the Korean war. Though very good, the current auction values are not violently out of line with the averages of recent years. Secondly, wool does not account for as big a share of this year's total export cheque as it did in previous booms. The drive for manufactured exports has not, indeed, so far produced striking results, but wheat, sugar and metals (including steel) have been gaining some ground.

Australian policy makers have to recognise, however, that if the currency reserves rise, as expected, by some £A150 million this financial year, about £A100 million of it will represent the net capital inflow of various kinds (most notably the unpredictable inflow of private capital) and that the balance represents a surplus on current account which would be non-existent if it were not for the strict licensing of imports. The two phenomena are connected. While Australians believe that their expanding country has enhanced its investment status in the eyes of overseas investors, especially since the narrowing of British economic influence and scope in the Middle East, it is also clear that many new manufacturing projects are being established by overseas companies as a deliberate counter to the threatened loss of Australian markets because of the import barriers. Thus, the import controls, in stimulating the capital flow, are setting up somewhat larger dividend commitments for remittance abroad in the future.

The importance of that can be exaggerated. But one wonders just how far the authorities realise that a high and inflexible rate of national development and immigration may be causing them to pass up a golden opportunity to move decisively towards a complete dismantling of the import controls. Their policy looks correct on the surface: a very tight rein on bank credit, plus a gradual increase in the supply of goods through periodic increases in the import quotas. Credit is so tight that business is ticking over less strongly than twelve or six months ago. But the sector most severely hit is house building. While too much has been made of this fact in some quarters, a fall of ten per cent in the rate of house building is undoubtedly at odds with a migrant programme that creates a need for 40 per cent more dwellings a year than the natural increase in population would require.

But it is over the second plank of import relaxations that the government is in danger of practising the worst deception on itself. Since the hasty and unnecessary tightening of the import controls last June, there have been some corrective adjustments—but always with an important difference. What was snatched away in June, 1956, was a great part of the already diminished range of free consumer's choice. This has not been coming back in the subsequent relaxations, nor, according to Canberra rumours, is it likely to come back to any great extent when the quotas are further increased next month. The new quotas mainly affect imports of capital goods and materials for the factories.

Mr Menzies is said to favour a further large increase in the quotas as a counter to inflation. But clearly that reasoning applies if the goods admitted are finished goods which satisfy demands and introduce an element of competition. It does not apply to machinery and equipment, which create new constructional demands on the economy by opening the way for autarkic industrial development.

National industrial expansion is rightly held by most Australians to be an article of faith for non-economic reasons. That, however, need not silence questions as to what is a practicable rate. And even if a continuing trend towards self-sufficiency could be accepted as a worthwhile price to pay for expansion, that would be no excuse for self-delusion that the process is anti-inflationary. This subject is all the more tantalising because, with the splendid opportunities now at its feet and a widening horizon for rural and mineral development, Australia might stand a real chance of shaking off the import controls within a twelvemonth or so. The longer they stay, experience shows, the more of a morass do they become.

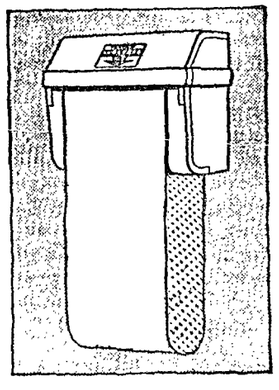
"Motor Business"

The March issue of this quarterly research bulletin for the motor and allied industries is now available and includes:

The long-term growth in domestic commercial vehicle demand.
Prospects for buses and coaches.
The Swiss market for vehicles and tractors.
Notes on the Russian motor industry.

The Bulletin is fully illustrated by charts, amongst which are:

Price indices of used vehicles.
World exports of vehicles.



For full particulars of this Bulletin, apply to:

WHitehall 1511, Ext. 49.

"You'd think they'd have Towelmasters by now!"

Poor chap—left high and wet! And to add insult to injury he knows that a Towelmaster would guarantee him a good, clean dry every single time he washed his hands. He knows how efficient and hygienic it is. Moreover he knows that the Advance Towelmaster Service costs only 5/- for each roll of towelling used—and a roll is enough to give 180 pairs of hands a real, honest-to-goodness dry. Can you wonder that a man's not happy without a Towelmaster!

ADVANCE Towelmaster

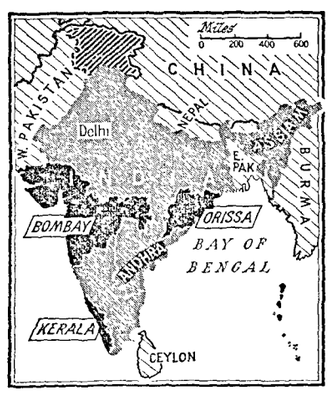
Soul-Searching in India

FROM OUR CORRESPONDENT IN INDIA

THE Indian electorate has given the Congress party its walkover. Congress candidates have won three out of every four seats in parliament, and two out of every three in the state assemblies. They got half of all the votes polled (a higher percentage than in 1952) and nearly three times as many as the combined vote of their two main opponents, the Communists and the Praja Socialists. Only in Kerala and Orissa did they fail to get an absolute majority; and they got nearly twice as many votes as the Communists in the old communist stronghold of Telengana now absorbed into Andhra. Despite the tension with Pakistan, the Hindu communal parties have been reduced to complete impotence, with their vote important only in a few northern areas and their leaders routed everywhere. Finally, the absorption of the Akali Sikhs has given Congress an impregnable hold in the Punjab. It might seem an occasion for hosannas. Instead, there has been soul-searching.



Nobody is very worried about Orissa, where the reasons for defeat were local: old squabbles within the Congress party, Orissa's boundary dispute with Bihar, the popularity of some ex-princes in their old states. Either the Congress or the princes' party, the Ganatantra Parishad, will form a coalition with the independents and minor parties, or the two will join together; whatever happens, policy is likely to be much the same.

There is more concern about Kerala. New Delhi cannot be very intimate with a communist state government, especially in intelligence matters. On the other hand, the Kerala Communists are bound to be on their best behaviour. Their majority is only two. They have none of the devotion to violence of their colleagues in Telengana. They know all India will be watching them, and that President's rule will be imposed if New Delhi finds them behaving unconstitutionally. They may well choose to make a reputation by such solid measures as land reform, and avoid clashes with Delhi over such extreme measures as trying to nationalise foreign-owned plantations.

But Congress's real worry is Bombay. It won a safe majority in the state as a whole, but was heavily defeated both in the north around Ahmedabad, and in the Mahratta south; even in Bombay city, it got rather less than half the votes. Half the Bombay cabinet and three ministers in the central cabinet went down. In Ahmedabad, the late Mr Patel's old stronghold in Gujerat, Congress is so shattered it is not even contesting the coming municipal elections. The explanation is simple. Mahrattas and Gujeratis alike resent the cavalier way in which Delhi treated them in the linguistic controversies of last year, and resent even more the refusal to hold judicial enquiries into the police firings in the resultant riots. The result was an electoral alliance embracing Hindu communalists, Communists, Socialists, independents, and the Scheduled Caste Federation. Now Congress is in a dilemma. It can hardly break up the bilingual state when there is no overall majority against it, and it is in fact a good solution; yet the Mahrattas, especially, are so pleased with their victory that Bombay may be very difficult to govern.

The opposition parties seem hardly more pleased with themselves than the Congress. They remain basically local. The Communists fought many more seats than in 1952 and increased their vote from five to ten per cent. But nearly half their votes still come from Kerala and Andhra; outside the South, Bombay and Calcutta they have won only a handful of seats, and their representation in parliament has hardly increased. The Praja Socialists did well in their old north-central strongholds and reasonably in Bombay, but suffered a severe defeat in the south, and saw their percentage of the total vote nearly halved. The communalist parties have been virtually confined to the Punjab towns.

Indian politics have in fact settled into a pattern. The Congress vote in the various states has mostly varied very little from 1952; the biggest change has been the increase from 44 to 57 per cent in Assam; the worst drop was from 48 to 42 per cent in Uttar Pradesh. Even in Kerala, Congress generally held its voters, and the Communists' victory was achieved at the expense of the smaller left-wing parties; the Revolutionary Socialists, for instance, were wiped out. And in Assam, the Congress party's weakness in the hills, always pronounced, has become more pronounced still; it did not win a seat.

This settling down of the electorate always happens in a mature democracy. Most electors acquire fixed opinions and elections turn on the floaters. That is why the Congress can face a future that will one day be without Mr Nehru with optimism. But it is a very sober optimism. The public has rejected enough ministers and party bosses to make clear its dissatisfactions; and many a successful candidate has come back with stories of how his electorate are recording his promises. The Congress has won because it has five good years behind it. If it is to win again next time, it must have five even better years in front of it.

Developing British Columbia

FROM A SPECIAL CORRESPONDENT

HOW can a Canadian province best develop its idle natural resources without pledging away too much of its future capital to the group that makes the original effort? The old question has been raised again, this time in British Columbia, where the provincial government has concluded a preliminary agreement with a corporation headed by the Swedish financier, Mr Axel Wenner-Gren, for the exploration and development of some 40,000 square miles in the northern section of the province. The agreement calls for the survey of the area by the concessionaires, at a cost of some $5 million; the building of over 400 miles of railway

(*Continued on page* 1101)

(*Continued from page* 1100)

(monorail track) northward from the existing Canadian National transcontinental line at Fort McLeod, and the construction of at least one wood pulp and paper mill with a planned output of 100,000 tons a year. It would also put under the control of the concessionaires all the mineral rights in an area that has not yet even been fully surveyed on the ground, but is likely to contain extensive deposits of most of the base metals.

The proposal has come under a certain amount of fire. The questions it raises have also been debated in Newfoundland and Quebec over the concessions (in Labrador and Northern Quebec) granted for minerals and power development. In British Columbia the argument is heightened by the political complexion—Social Credit—of the provincial government, which, however uncertain we may be about what it is for, is certainly against too much state interference in profitable private enterprise. It is further heightened by the fact that the former provincial treasurer has now become an active director of both the government-owned railway to the north, the Pacific Great Eastern, and of the British Columbian corporation formed to hold the concession, as well as by the personality and history of Mr Wenner-Gren himself.

The area in which this development is planned to take place is part of the Rocky Mountain Trench, a remarkable natural feature which extends the whole length of the Rockies in Canada, immediately to the west of the main range. It is a heavily timbered country, dotted with lakes, and contains the headwaters of the Peace River, but there are no serious land barriers across its length. All it needs for development is the means of transportation. It has been surveyed by various parties since the war, both for minerals and oil. It contains excellent sources of hydro-electric power. It is within comparatively easy reach of the natural gas in the Peace River area of Alberta. Any development within it is something of a gamble, and one for high stakes, as the cost of the preliminary survey shows, but once there is a highway and a railroad along the length of the Trench, some venture is certain to succeed.

The main risk of failure that faces the individual entrepreneur is that his own capital resources may run out before he can achieve and establish his own success. The British Columbia government proposes one check on the dangers, and the criticism, that would arise if any considerable concessionaire, having secured his title, made no more than a start and then suspended operations, thereby excluding a possible newcomer. It has said that it will make the validity of the concessionary rights dependent upon continued progress in the work of development.

Criticism of the whole plan within British Columbia centres at the moment around two points: first, that the Wenner-Gren interests are being given too many rights, particularly over minerals, for the amount of capital they are required to spend, and second (an old cry) that this is yet another instance of Canada's natural resources being signed away to a foreign-owned group. But amongst the more sceptically minded there is also a certain amount of speculation that perhaps the whole project has been devised, or at least encouraged, at this moment in order to draw attention away from an older problem in the province—namely the development and use of the hydro-electric power still latent in the section of the Columbia River within Canada. Only about one-sixth of the potential within Canada is used now, while the Americans to the south are nearing the end of what they can develop from the Columbia watershed that lies south of the 49th Parallel.

There is a continuing pressure on Canada, and on the British Columbian government, both from the power companies and the power users in the Pacific north-west states, to make available to them some of the unused power of the Columbia in Canada. Two years ago the British Columbian government would have sold some of its birthright in the Columbia to the Kaiser interests in the United States for cash. The federal government in Ottawa blocked this scheme by taking it out of the power of a province to alienate power from an international stream; it has not, however, converted the provincial government to its point of view.

On the face of it, rapid development of the Columbia within Canada would appear to be to the advantage of the province, but before the provincial government can act it must settle two problems that are awkward politically. The first is whether the power should be developed by the province-owned Power Commission or by the privately owned British Columbia Electric Company. The second is how it can be done without seriously damaging the established salmon fishing industry. Full development of the Columbia within Canada, as planned, would involve the diversion of its surplus water—the spring floods—over into the Fraser River watershed and the building of power dams on the rivers of that system as well.

Salmon in the Turbines

This would annoy the Americans, though their annoyance would fall more heavily on Ottawa than on British Columbia. But it would also split opinion within British Columbia, since power dams on the Fraser and the Thompson Rivers would seriously interfere with, if not ruin, the salmon fishing interests centred at Vancouver. Mature salmon can be helped upstream past the power dams; it is much harder to keep the first-year fish, the fingerlings, from swimming into the turbines on their way downstream to the sea. Central British Columbia may look to the Columbia power for growth; Vancouver has a salmon fishing and canning industry worth some $50 million a year, and it will fight any development that might jeopardise it. In this it would have some American support, for the salmon fishing based on the Fraser is shared by the fishermen of the two countries and is regulated by a Canadian-American commission.

In consequence, there are those who say that the British Columbia government has many reasons for wishing to see the northern development by the Wenner-Gren interests make an early start. It could then argue that no one could expect to see both plans—the northern development and the Columbia River—tackled at the same time; the simultaneous starting of the two would be dangerously inflationary, and the pause over the Columbia plan would

give more time in which to find a way to protect the salmon (and the fishermen and the canners) from the turbine blades. Conceivably the British Columbian government might go on from there to claim that it would be fair, on a good neighbourly basis, to allow some American interests access to a section of the Columbia within Canada for the winning of additional power—purely on a temporary basis, of course. In the past, development priorities in Canada have been determined by less difficult political situations than those that face British Columbia today.

Mr Diem Tackles His Chinese

FROM OUR CORRESPONDENT IN SAIGON

THE "Chinese situation" in South Vietnam has been simmering for six months and is now capable of boiling over. It arose out of a decree issued by the Vietnamese government last August which imposed Vietnamese nationality without option on all Chinese born in Vietnam. The decree was peculiar—indeed unprecedented—in that it was retrospective. This meant that Chinese of quite advanced age whose families had been living in Vietnam for several generations suddenly found themselves saddled with a new nationality in their declining years. The blow was a mortifying one for the Chinese, and seemed a victory for the Vietnamese. It has involved both sides in a face-saving operation ever since—for the Vietnamese not to withdraw, and for the Chinese not to submit.

The first edict was followed last September by another, drafted on more familiar lines, which reserved eleven professions—broadly speaking the retail trades and the rice trade—to persons of Vietnamese nationality. This, though it partly affected some of the other minorities such as the Indians, was mainly aimed at the Chinese. According to the law, seven out of the eleven professions had to be given up by March 6th; this deadline has just been extended by one month, to give the Chinese time "for reflection"—and thus expires next Saturday. The tradesmen affected were butchers, and fishmongers, grocers, charcoal and firewood sellers, petrol and oil merchants, brokers, cloth merchants holding stocks of less than 10,000, and dealers in scrap iron. The other four professions—which concern mainly the milling and transport of rice—have a further six months' latitude. About 10,000 small Chinese merchants, involving nearly 200,000 persons (including families), are reported to be affected by the first deadline.

At bottom the Vietnamese government is moved by national pride rather than economic sense. If the Chinese can be dragooned into taking Vietnamese papers, they may remain in their jobs, and the polite fiction would thus be established that the Vietnamese had "taken over" the economy so long in Chinese hands. In this way the conflict between Vietnamese nationalism and Chinese commercial interests would be resolved. So far the Chinese have refused to connive at this fiction. Only about 600 out of the 500,000 or so Vietnam-born Chinese have taken Vietnamese names; and by a curious reaction, 2,000 or so Chinese per day have been registering as Chinese at their own legation. Interviewed recently (by your correspondent accompanied by a Chinese interpreter) the tradesmen of Cholon—the Chinese city—appeared quite unexcited, quite philosophic. "We know nothing. We are waiting to see what happens. If we have to shut down, we shut down." At the same time they are remarkably intransigent. "We will never become Vietnamese simply in order to carry on our business." Sanctions for disobedience are severe—up to £100 fine or six months' imprisonment for failure to change names or for doing so improperly; much larger fines of £50,000 or expulsion from the country for failure to give up the banned professions. None of these penalties has yet been applied by the Vietnamese authorities.

The Chinese embassy in Saigon (which represents the government of Formosa) is at grips with the Vietnamese government on this question. Clearly a strong effort is being made on both sides to save face, and particularly the other party's face. The month's delay "for reflection" is made very necessary by the simple fact that there are nothing like enough Vietnamese butchers and grocers to replace the Chinese. To prevent a breakdown of food supplies the Vietnamese authorities have been obliged to ask the Chinese tradesmen to continue in business.

It seems that one important problem, that of the Chinese secondary schools, has been solved, at least for the time being. Last autumn, 4,000 Chinese students were prevented from working because the schools were kept shut. Under the French colonial regime the Chinese schools were autonomous, but the Vietnamese government ordained that they should conform to the Vietnamese schools and have Vietnamese headmasters. It has, however, now agreed to the appointment of Vietnam-born Chinese as headmasters (and not true Vietnamese as it previously insisted) and the schools are likely to reopen shortly for the spring term. On this issue common sense has prevailed.

Commercial Pressure

It may not do so for long. One very high Vietnamese official recently said to me: "Come what may, even if it ruins our economy, we shall get the Chinese out." The viewpoint is understandable when it is remembered that all the most lucrative portions of the Vietnamese economy have for long been in Chinese (or French) hands, and that the Vietnamese have been peasants in their own country. But one does not play chess by upsetting the board. On the Chinese side, too, there is much talk of "our national pride." (What the Chinese particularly detest is the idea of doing military service.) Being nearly a million strong in the South, and having over two-thirds of all the commerce, including the vital rice trade, in their grip, they could, by a commercial *satyagraha*, paralyse the country and bring it to starvation. But it is doubtful whether the Chinese will take this concerted action.

The predilection of President Ngo Dinh Diem (whom many regard as the prime mover in this action against the Chinese) has been for the frontal attack. He used this technique successfully against the sects in 1955, and doubtless feels it pays. But the Chinese, in their commercial stronghold, are probably more powerful than the sects, with all their private armies, ever were. The inflexible Mr Diem may find it wise to conciliate his adversaries.

American influence may affect Mr Diem's attitude. The Americans are reported to be sorely vexed at this serious dispute between their two Asian protégés—South Vietnam and Nationalist China. They fear, with reason, that a failure on the part of Chiang Kai-shek to defend their interests may turn the Chinese of South Vietnam towards another leader—further north than Formosa.

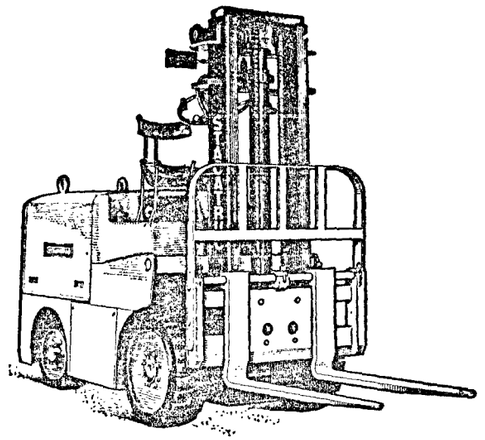
MARTELL

What is a BOOMERANG voyage?

Let P & O tell you. A Boomerang Voyage is an opportunity to visit Australia at a moderate cost. You can travel there and back, first class, for £290, a saving of £140 or more on the ordinary fare.

When can you go? You sail outwards between February 1st and May 31st and return between September 1st and December 31st of the same year or next, giving you between 6 and 18 month in Australia.



Are there other advantages? Yes, the voyage itself is a holiday. It's comfortable — nothing's more so than a P & O liner — it's exciting, with colourful places to visit, like Aden, Bombay and Colombo yet you can relax in sunshine and sea air, enjoy the best of food prepared by an expert chef. You will not only like Australia — you will enjoy getting there by P & O.

Ask your Local Travel Agent for details
or apply direct to:

what is a Stacatruc?

No doubt you know that a fork lift truck is a machine designed to do many of the backbreaking tasks of heaving, humping, hoisting, and hauling heavy loads which are so inefficiently performed by men trying to emulate horses. Perhaps you also know that these trucks will not only aid your labour but will save money, improve production, eliminate bottlenecks in the flow of goods, cut down delivery times, use practically the whole of the space in a storehouse—right up to the roof, make stocktaking a pleasure, cut down breakages and accidents due to manhandling, and generally rank as the most versatile tool that modern industry can possibly employ in its drive for greater productivity. In this age of atoms and automation it is the machine which will take up the burden of man's productive tasks, and in this field there is no better machine made than the famous Stacatruc fork lift—part of Britain's best mobile materials handling system.

Carrington power station. Equipment includes Babcock boilers, coal-pulverizing mills, ash and dust-handling plant.

"Industry depends on STEAM"

MOST of the world's electricity is steam-generated, and Industry, largely dependent upon electricity from steam power stations, is itself an enormous user of steam for processing and heating and, in some large industries, for both power-generation and processing. Babcock & Wilcox are the world's largest manufacturers of steam-raising equipment for both land and marine applications, and offer to steam-users *large or small*, a comprehensive, world-wide service embracing everything from fuel-handling and boiler plant, for every kind of fuel, to complete systems of ash and dust disposal. They are also large makers of welded pressure-vessels, heat-exchangers, separately-fired superheaters and other plant for the oil and chemical industries, and of a whole range of general equipment such as cranes and conveyors, steel chimneys and fabricated steel structures. The Babcock organisation serves Industry at every level.

Boiler house of H. J. Heinz Co. (Pty.) Ltd. factory in Australia; equipped with Babcock boilers, coal, ash and dust-handling plant and steel self-supporting chimneys.

'Steambloc' automatic, oil-fired 'packaged' boiler for industrial steam or hot-water supply. (Spencer - Bonecourt - Clarkson Ltd.)

THE BUSINESS WORLD

Halifax Special

ON Monday, a special train from London will pull into the cleft in the Pennine moors where Halifax huddles between the imprisoning hills. Into that industrial no man's land, where the woollen and cotton industries meet and Yorkshiremen turn an honest penny by doubling Lancashire's cotton yarns, about 150 Southerners will step out—employees, agents and surveyors and other members of the Halifax Building Society who own precious votes for the annual meeting. The special train is the highlight in the struggle between two tough Yorkshiremen. Mr Fred Bentley, a councillor of the borough, a former general manager of the society and now chairman of the Building Societies Association, seeks a seat on the board of the society to which he has given most of his working life. Mr Algernon Denham, the president who led the Halifax Society out of the Association of which his ex-colleague had just become chairman, is determined to resist the nomination.

The struggle is bitter : it has much to do with personalities and a little with policy, and whether or not Mr Bentley is in the right, Mr Denham, despite his great knowledge of building society affairs, seems to be in the wrong. He was keen that the building society movement should ferret out and limit the large temporary deposits which he believed some societies had received from limited companies. Such money is too likely to be withdrawn at short notice to be a sound basis for long-term lending for house purchase, and he wanted the Association to get a return of all such investments from its members. The Association, replying that it had no such compulsory power, refused to fix a ceiling and published a voluntary (and incomplete) sample, and the Halifax Society walked out. The issue —the only logical reason for the quarrel—is now settled, not by the Association, not by Mr Denham, nor even because of the breach he created, but by Sir Cecil Crabbe, the Registrar of Friendly Societies, who last autumn laid rules before Parliament requiring societies to show the number and amount of their share investments and deposits exceeding £5,000. Hard words were used. The latest statement of the Halifax directors claims that Mr Bentley accused them of "dishonourable conduct." But it would cost nothing but pride now to heal the breach. The Halifax board incidentally is down to its permissible minimum of ten members out of a maximum of fifteen. To many of the citizens of South Yorkshire who, despite the special train, will make the bulk of the votes at the meeting, it must seem that the issue on which they are voting is small and that, whichever vote they give, the Halifax Society, and the movement so deeply rooted in Yorkshire, is the poorer for the squabble.

★

But that is not the whole story. Thrift and independence as sturdy as the building society movement itself run in the veins of the men and women who will cast their votes on Monday, and the format of democracy is written into the rules of the Halifax Society. The biggest hall in the town has been hired to accommodate the members. It will be bursting full, with overflow accommodation provided elsewhere. One man one vote, whether he be a borrowing or a lending shareholder, is the rule—no bludgeoning by big investors, no fat wads of proxies in the hands of the board. It is either personal attendance or no vote. That looks like nearly perfect democracy—on paper. It was nearly perfect when the society was founded over a hundred years ago. Today, when the Halifax is the biggest society in the world, with a nation-wide spread of small investors and small borrowers, it is the hollow shell of a democratic system.

In the Halifax society there are 421,000 share investors and 310,000 holders of borrowers' shares—a total of 731,000 (for the 151,000 depositors are not members). Allowances must be made for the under 21 year olds and for some duplication by members who are both borrowers and investors, but still have only one vote each. The number of potential votes is still

about 700,000. The figure dwarfs the voting power of the other building societies and of the great industrial companies. But less than 3,000 votes—less than one-half of one per cent of the strength—can get to Halifax, be accommodated, and cast their votes.

Of the share investors and mortgage borrowers up and down the country who, in this non-profit-making mutual society, are entitled to decide this issue, it is possible that some still do not know what it is all about. Their directors have informed them of the date of the meeting—in accordance with the rules—by advertisement in the press and of course there has been a mass of press comment. But the advertisement did not tell them who the candidates were or even that there was a contested election. They have had no personal communication from the board. Shareholders never do, mortgage borrowers only when their rate of interest is changed—and they have heard that on a few occasions in the last two years. Naturally, if a shareholder likes to instruct the society to send his interest to him regularly, it will be done ; if he likes to apply for the report and accounts, he can have them ; and the balance sheet is on view at each of the company's offices. But if he makes no special request, his interest will just be added to his account until he comes to ask for it, for the society works on the passbook system common among the Northern societies. He is not even informed, save by advertisement in the press, when his rate of share interest is changed.

Those are the rules, and the society claims that if an exception were made and a letter circulated it would cost £25,000. But a £300 million society ought to be able to face a £25,000 bill. Other societies not so much smaller face a charge of several thousand pounds a year to send each member regularly an abridged balance sheet and either a dividend warrant or a statement of the addition to his account. Indeed, of the five in the £100 million plus class, only the two Yorkshire societies, Leeds Permanent and Halifax, do not send a regular communication to shareholders. Others again admit and actually encourage postal voting ; Leeds Permanent and Co-operative Permanent do so. Great industrial companies think nothing of spending sums up to £15,000 a year on printing and posting their reports and accounts.

This annual general meeting will be held under the Halifax Society's own rules. If it had been a statutory meeting (for a " transfer of engagements," for example), held under the Registrar's rules, a three-fourth's majority of those present and entitled to vote would then have been required, but the Registrar does not allow proxy voting at such meetings. Building society voting rules differ widely. Some—the Woolwich Equitable is one—disfranchise the borrowers, some fix a minimum voting qualification—a £25 stake in the Abbey National, a £100 stake in the Leeds Permanent, twelve months' status as a shareholder in the Co-operative Permanent.

*

What the Halifax squabble has brought to light has been the remarkable state of the law and the diversity of building society practice about meetings. The very fact that most societies have been well and honestly run and that there has been no really big failure since the "Liberator" scandal of the 1890s means that the great advances in company law have passed by the building societies. The 1939 Act and the Building Societies Miscellaneous Provisions Act of 1940 did some useful tidying up, but in the main the societies are still governed by the Acts of 1874 and 1894. It surprises many building society shareholders to learn that only by implication are the societies ordered to have annual meetings at all. It distresses some managements that they cannot do business outside this country—not even in the Channel Islands—and that they cannot have subsidiaries.

The antiquities of the law are partly masked by the Registrar's powers of persuasion, and in the last resort of action. He can often talk a society out of adopting a bad set of rules. He can, and sometimes does, clamp down on a precarious one with a stop order on borrowing. His new rules for the form of accounts tabled in Parliament last autumn, and now affecting the December 31st accounts of the societies, are proving most revealing. How many subscribers to the Bradford Permanent can have realised that that society's mortgage loans included one of £1¼ million to a single concern? How many shareholders in the Leicester Permanent and the Alliance have realised that that Leicester society had £2.6 million (7.5 per cent of mortgage assets) and the Alliance £1.8 million (4.1 per cent of the mortgage assets) out on large multiple mortgages ?

Great progress has been made, and the building society movement is sound and honest, even if really high (and expensive) managerial capacity is the exception among the many small societies ; the practice of many societies runs far ahead of the minimum requirements of the law. But these facts should not be allowed to obscure the need for reform. If Monday's fight focuses attention on those anachronisms, the Halifax special may have made a useful journey.

Where Plutonium Comes In

PLUTONIUM, for a long time, has been one of the back-room mysteries of the atomic energy programme. A vaguely sinister metal, which scientists describe as " poisonous," it is roughly interchangeable with the fissile portion of natural uranium. But it only appears in the conditions set up inside an atomic reactor and is never found " wild " in nature. Putting two and two together, the layman may deduce that here is a valuable asset to any atomic power programme, an atomic fuel " grown " in the power stations of the atomic grid, a miniature uranium mine inside each reactor. He is indeed told this on every side, by people who are in a better position than he is to calculate the probable output of this strange metal, but who have so far kept this information to themselves. Lacking it, he is largely unable to follow the calculations that scientists make about the probable market price of plutonium, when a market for it comes into being, and he is expected to take on trust their estimate of the effect this price will have on the cost of atomic electricity.

The Atomic Energy Authority has filled this gap by making its own estimates of the tonnage of plutonium likely to be produced in the British atomic power programme. This goes a long way towards making good some of the omissions in the recent announcement of the trebling of that programme ; it is in line with AEA's liberal policy of disclosing developments as soon as any logical reason for secrecy has gone. Until now, only the French atomic authorities have been prepared to discuss plutonium output.

The Authority calculates that, when all 6 million kilowatts of atomic capacity are installed, the country's atomic power stations will have an annual output of 4 tons of plutonium. This is the fuel equivalent of about 600 tons of natural uranium. A 300,000 kW atomic power station today needs an initial loading of 500 tons of natural uranium which may last three years. So one could say, again very roughly, that this 4 tons of plutonium could keep a station of that size operating for about four years.

This output will not be reached immediately. Although the plutonium is coming into being inside the reactor all the time, it can be extracted only when the spent fuel rods are removed from the reactor and sent away for chemical processing. Unless the rod breaks or develops a leak, this is not likely to happen for two or three years ; and only when a power station has been in commission for that time will any output of plutonium be recovered from it. The total output from all the stations during the period up to 1965 is put no higher than one ton, although from that date it will build up rapidly to the rate of 4 tons a year.

These figures need a word of explanation. The 20-odd power stations of the atomic grid could at any one time contain up to 10,000 tons of natural uranium in their fuel charges. In calculating how much of this will be turned into plutonium, the Authority has made two assumptions. First, that the stations will be used for base load, operating to 75 per cent of their annual capacity. Secondly, that each ton of natural uranium in the reactors will give 3,000 megawatt days' heat. This is the amount of heat expected from fuel charges in the first power stations now being built. If, however, between now and 1965 the efficiency of reactor design improves so that more heat is extracted from a given ton of fuel—5,000 megawatt days is considered quite a reasonable target—the reactor would burn up a higher proportion of the plutonium it has manufactured during the " life " of the fuel charge. It would then leave a smaller amount to be extracted from the spent fuel rods when they were finally removed—perhaps not more than 2½ to 3 tons a year for 6 million kW of capacity.

It is much more economic for the power stations to consume much of their own plutonium in this manner than to go through the elaborate process of separating it chemically from the spent fuel elements and manufacturing it into new fuel rods. So it would not be

surprising to find that saleable plutonium output would not rise as fast over the years as the atomic electricity output may grow. A shift in the design of power stations, towards those using fuel that had been enriched with some of this plutonium, would also tend to depress the rate of growth for technical reasons.

These atomic electricity stations will not be the only new source of plutonium produced in this country. The Atomic Energy Authority is building two additional reactors at Calder Hall, on the Calder "B" site, and four at Chapel Cross in Scotland. These are intended primarily for "weapon-grade" plutonium; the fact that the two sites will each generate about 200,000 kW of atomic electricity is in the nature of an afterthought.

The system on which these installations work would be highly uneconomic for a civil power station. The fuel rods are removed as soon as they have built up a useful content of plutonium, partly to prevent it from being burnt up inside the reactor, partly to prevent a deterioration in quality that occurs as some of the plutonium loses its fissile properties through over-long exposure in the reactor.

The plutonium from the civil power stations can therefore be assumed to have a purely civil value and to fetch a price calculated on its civil uses. These are varied. The first trickle will doubtless be used in experimental reactors that the Atomic Energy Authority will build at its new site in Dorset. As output rises, it will probably be used to enrich fuels for special reactors like those in submarine engines, and ultimately for "enriched" power stations. Towards 1970, there will be a demand for plutonium to provide the initial fuel charge for breeder reactors, which need a highly concentrated, highly expensive core of fissile material to start them working, after which they will breed as much of their own fuel as they need with a surplus over for other reactors. The distinction between these "breeder" reactors and those producing plutonium today lies in this ability to produce more fuel than the reactor consumes. This wide and widening market and the damping effect of technical developments on supplies, suggests that plutonium prices might be expected to remain fairly steady until an appreciable volume of fuel begins to come from a chain of breeder reactors, which would not be before the mid-1970s.

*

The price that the Atomic Energy Authority will pay the power stations for plutonium extracted from the spent fuel is now being negotiated. It has been assumed within the Authority that £5 per gram is fairly near to a true market price: on this valuation, the annual output of plutonium by the end of 1965 would have a value of £20 million at current prices. This British price is slightly higher than the price of $12 a gram which the American Atomic Energy Commission has said it will credit for plutonium produced in reactors using American fuel.

Various estimates have been made of the effect that "crediting" this price for the plutonium by-product would have on electricity costs. The Authority's economist, Mr. J. A. Jukes, said last autumn that a price of £5 a gram would work out at 0.1d. per kilowatt sent out; and Sir Christopher Hinton recently carried this calculation to two decimal places, suggesting a credit of 0.07 pence per unit sent out. Indeed, Sir Christopher was prepared to predict that this credit would decline by about 0.02d. every decade. He was tracing a trend rather than fixing a hard price. In doing so he assumed that the net cost of electricity after allowing this credit for plutonium in 1960 (a hypothetical price because no civil atomic power station will be working in Britain by that date) would be 0.66 pence and suggested it would fall gently to 0.32d. per unit by 1990. There is very little difference between his estimate for 1960 and the 0.6d. suggested by Mr Jukes.

*

These calculations are enlightening, so long as they are not taken too seriously. They clarify the make-up of atomic power costs, with the high capital charges on the stations, the interest on the valuable "working capital" of fuel and the relatively modest fuel costs—less this teasing element of credit for plutonium. But they are not hard cost figures and they are often based on assumptions that are left unexplained. The layman has been told by Mr Maudling that, without atomic power, the country would need 70 million tons of coal to meet its electricity requirements by 1965 and 85 million by 1970. By installing 6 million kilowatts of atomic electricity by 1965, annual coal requirements for electricity in that year will be reduced to the more manageable figure of 56 million. Those are figures that the layman can understand, just as he can appreciate Mr Maudling's reluctance to predict what coal savings might be made after 1965 by an expanded atomic energy programme.

It is much more difficult for the layman to understand how the cost of power from those stations can be reduced by crediting the value of a plutonium by-product of which practically none will be actually recovered before 1965. Every estimate of the cost of atomic power from the early stations persists in allowing a credit for plutonium: in practice this credit can be realised only after the stations have been in full production for several years. But equally, say the scientists, the stations will be spending nothing on fuel. When they begin to buy fresh fuel, they will also start to get plutonium out of the spent rods that the new fuel replaces. Does one then assume that the two exactly cancel each other out? This poses a nice problem for the cost accountants of the electricity undertakings. In the meantime, it might be kinder to the public that pays electricity bills to make it plain that, while there will be a plutonium credit one day, it will not be much to sing about in the early days—and that it will certainly not average 0.1 pence per unit sent out until after 1965, when the whole 6 million kilowatts are delivering power into the grid.

Business Notes

Output Beneath the Surface

COMPLETE production indices for 1956, released this week by the Central Statistical Office, emphasise how much the pattern of industrial production has changed during the last two years, a period during which the actual level of total industrial output has changed almost not at all. In 1955, manufacturing industry drove the boom, expanding its output by 7 per cent, while output in mining and construction hardly changed; and within manufacture the engineering and vehicles industries accounted for the biggest single share in expansion. In 1956, the pattern was reversed. Manufacturing output fell fractionally: the metals and engineering industries, in spite of a substantial increase in steel output and some expansion in plant and machinery building, fell rather more: mining managed a tiny increase in output, while building and contracting showed a 6 per cent rise, helping to hold the "all industries" index dead level.

But even these detailed component indices of the official production index leave some mysteries about output in 1955 and 1956—particularly in the key sector of metals and engineering, pressure of demand upon which was taken as one of the signals that disinflation was overdue late in 1955. The lengthening of order books in some machinery industries, and the growth of capital spending and planning by manufacturing industries reporting to the Board of Trade, then suggested that plant and machinery builders were overstrained with orders, while expansion in output of cars and metal consumer goods was pre-empting the resources that engineering industries needed in common—steel, labour, and some intermediate capacity.

Output figures for 1956 suggest that, however true this was, the boom in plant and machinery building last year was a comparatively modest affair. Output in these industries certainly rose, but probably not more than about 2-3 per cent roughly; and their relative weight in total engineering output was not enough to offset declines in motor and metal consumer goods and possibly in engineering work for defence.

Output for Investment

IN 1956 and the two previous years, which very roughly span the recent investment boom in industrial investment, about £3,000 million was spent on machinery and plant in Britain. The annual rate of expenditure on this category of capital equipment rose last year to about 40 per cent more than in 1953 though only 8 per cent greater than in 1955. The bulk of this came from British factories: but there was an increase in imports as well. Since 1948 normally only about a twelfth of this country's annual requirements have been imported, mainly from the United States and more recently from Federal Germany. Even during the period of rearmament at the time of the Korean war, imports accounted for no more than an eighth or so of total spending; last year, when the pace of the investment boom began to slacken, the proportion edged up a little, but it was still less than a tenth. For some items of plant imports are more significant; more than a quarter of new machine tools installed in 1956 came from abroad, and they cost more than the tool makers earned from their exports. But exports of plant and machinery generally have been growing steadily; a regular 35-40 per cent of total output has been sold overseas since 1948.

This "output" figure for plant and machinery, however, is a residual item, derived by adding exports and deducting imports from the value of plant currently installed.

PLANT AND MACHINERY

£ mn	Installed in UK	Net imports	Exports	Residual estimate of "output"
1948	495	40	250	705
1949	550	46	297	801
1950	629	42	346	933
1951	742	52	406	1,096
1952	778	105	465	1,138
1953	806	90	450	1,166
1954	901	74	470	1,297
1955	1,052	91	525	1,486
1956	1,135	107	570	1,598

Unfortunately there is no better way of measuring home production of plant and machinery. A measure of these increases by volume is even more difficult. The official estimates of gross investment in plant and machinery suggest that last year's expenditure was about 60 per cent more than in 1948, but only about 2-3 per cent more than in 1955. A tentative calculation of the volume of production, derived again by working backwards from these figures of plant installed, indicates increases of very roughly the same order—though other estimates would suggest a somewhat higher increase in the output of these industries last year.

An Untimely Boomlet?

WEDNESDAY was the start of a new Stock Exchange Account. For many firms in the House it was also the start of a new trading year. Investors and jobbers could have been pardoned if they had felt that the opening of this account that ends on budget day was almost wholly inauspicious. The indications from Suez were certainly

not favourable to the British point of view; the strike and wage bargaining struggle on the home front looked far from settlement; and results from more big engineering groups arrived as if to emphasise how hard it will be either to grant substantial wage increases or face a prolonged stoppage. North British Locomotive showed a group net loss for 1956 of £508,083, against a net profit of £101,510. David Brown Corporation reported a net loss for the year to June 30th of £1,615, against a net profit of £612,684.

Yet Wednesday was a day when the Stock Exchange staged a smart rally affecting most sections of the market. Engineering shares, oil shares and even gilt edged were prominent in the advance. Over the week ended on Wednesday *The Economist* ordinary share indicator showed a rise of 11.4 to 204.9, the biggest weekly rise since its inception; *The Financial Times* index of government securities at 87.48 showed a rise of 0.92 over the same week. In gilt-edged the volume of business has remained small. At the other extreme the buying—presumably semi-speculative—of oil shares was on Wednesday at least fairly heavy. But price movements were sharp because the market was not prepared; 2½ per cent Consols rose ½ to £74 and Shell Trinidad rose 5s. 7½d. to 91s. 3d., while Anglo-Egyptian "B" rose 5s. to 38s. 1½d.

It is impossible to explain a movement so widespread on any other hypothesis than that a section of investors has decided that inflation must take the upper hand again. It is not yet apparently a big nor probably a stable section of the investing public, but in one form or another its thesis has become the subject of Stock Exchange discussion.

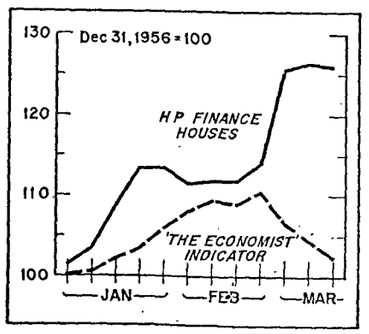
The Exchequer Improvement

THE shape of a modern budget is determined primarily by the requirements of the national economy—and of national politics. Chancellors have been taught that Exchequer surpluses earned from inflated income and spending are not "available" to give away, and that revenue shortfalls may reflect under-capacity in the economy that calls, not for new tax burdens, but for reliefs. Thus in these pre-budget weeks Mr Thorneycroft should have been more influenced by the consequences of the 5 per cent rail settlement and by what is happening in engineering and shipbuilding than by the rather remarkable improvement in the Exchequer accounts. Nonetheless, that improvement will undoubtedly play some part in his considerations.

The final outturn of the 1956-57 budget still seems certain to be significantly worse (in the accounting sense) than Mr Macmillan anticipated last April; but the shortfall should be much smaller than appeared likely a few months ago. Receipts have flowed into the Exchequer particularly late this year. But the enabling authority for this year's big batch of supplementaries was enacted only at the end of that week, so that big expenditures may have been postponed until this final week of the fiscal year. At March 23rd, total ordinary expenditure was £308 million up on the year—an excess of £46 million over the increase budgeted in the original estimates, which, however, is notably smaller than the excess at the end of the calendar year. Moreover—before the final week—supply expenditure was almost exactly on target, £226 million above 1955-56; the unexpectedly large increase in debt interest is attributable largely to the technical effect on the accounts of the considerable switch from old to new issues of national savings certificates.

The seasonal spate into the inland revenue has raised its total receipts to within £10 million of the target of £141 million more than last year, despite a marked lag in profits tax. But total tax revenue has been held down by the still larger shortfall in receipts from customs and excise—up £88 million compared with the budgeted £144 million. The upshot is that the surplus above the line, at £344 million, is smaller by £75 million than a year ago, whereas Mr Macmillan budgeted for an increase in his surplus of £43 million to £440 million (before counting any of his notorious "economies"). The Exchequer's net capital outlays have been considerably smaller than projected. By March 23rd they had reached £659 million; this represented an increase on the year of £102 million, compared with the expected increase of £265 million. Moreover, the payments included £52 million in the latest week to cover the 1956 deficit of the Transport Commission, under the new procedure for which no provision was made in the budget. The explanation is first a lag in the Exchequer's capital advances to the nationalised industries, a new procedure for which was introduced in the last budget, and secondly to a still larger shortfall in loans to local authorities. But the Chancellor is likely to be influenced least of all by this improvement "below line." To the extent that local authority borrowing has been transferred from the Public Works Loans Board to the market, the transfer, though beneficial in other ways, does nothing to free real resources.

Finance Houses for Consumer Credit



THIS is a significant and perhaps auspicious time for the hire purchase and consumer credit finance houses. Certainly that is the way Throgmorton Street has read the signs. An index constructed from the ordinary share prices of some of the leading finance houses has since the beginning of this year run consistently higher than *The Economist* indicator. Within the last few weeks the margin in its favour has widened substantially.

What, then, are the portents? First, though the total hire purchase debt was falling last year, the profits of the leading houses were not much impaired, because HP contracts made earlier were passing off to a good profit. And some of these companies have had sufficient confidence in their own strength to raise their ordinary dividends, even though their financial results this year will begin to reflect the fall in new HP business that occurred in 1956.

That has not deterred investors. They have to balance the prospect of a secular growth in hire purchase business against the sudden fluctuations in that business which are caused by changes in the Government's attitude towards consumer credit. Taking a narrow view, they may argue that the Government's decision to cut the minimum HP deposit on vehicles from 50 to 20 per cent is of greater importance than the more recent move to block a small loophole. This move effectively prevents a dealer, manufacturer or finance house from lending money to cover an initial deposit or the payment of a nine months' rental in advance.

But investors can base their valuations on facts as well as surmises. In January there was a rise of about one per cent in the total hire purchase debt, thanks to greatly increased advances by the finance houses on motor vehicles. In February HP sales of motor vehicles went up again. Furniture sales, too, have risen and recently the proportion of radio and television sets sold on HP has begun to creep up again.

Some investors may be hoping, wildly perhaps, for concessions on HP restrictions on budget day, and some are prepared to argue that, because of the bunching of HP contracts, this year is likely in any case to produce a fresh spurt in new HP business.

Cross Currents in Sterling

STERLING has been stronger during the past week. The expectation early in the week that there would soon be a settlement of the strikes led to considerable bear covering from the continent. Probably during those days the Exchange Equalisation Account gained substantial amounts of EPU currencies as a consequence. This should be reflected in the March EPU figures to be published next week. The covering operations stopped suddenly when the strike outlook took a turn for the worse on Wednesday. German and Swiss operators began to sell sterling forward for three and six months again. The 5 per cent wage concession pattern set by the British Transport Commission has been interpreted on the Continent as an unmistakable bear point for sterling.

Against the dollar, the sterling rate has been much less a prey to speculative operations. There has been a persistent commercial demand for sterling in New York and the dollars involved have nearly sufficed to meet the demand for dollars in London. The balance has not, however, been exact and the official market rate has moved against sterling to $2.79 as against a rate of $2.79¼ at the beginning of this week. In the forward market, however, sterling has been stronger and the premium on three months' dollars which was 1⅛ cent a week ago has narrowed to ⅛ cent—a figure not far removed from the interest rate parity. Transferable sterling has also been stronger, the rate rising during the week from $2.76 to $2.76¼. There are some substantial buyers of transferable sterling on the Continent, some of whose operations have been linked with reports of further Russian gold sales.

A Rocket from Bermuda

MR MACMILLAN brought home with him an outsize souvenir in the form of the ballistic rocket, Thor. Provided that the development trials of this weapon go better than its first flight a few weeks ago, when it exploded 200 feet off the ground, this rocket should be capable of carrying a hydrogen warhead approximately 1,500 miles. With such a range, it could not hit Russia from the United States but could do so very effectively from launching sites in Britain. There are, therefore, advantages to both sides in the arrangement by which the Americans send the weapon to this country free. It has been said that it might be maintained and serviced by British technicians. The letter of American legislation that prohibits the export of atomic warheads might be observed by sending American armourers to set its nuclear fuses: how far the spirit of this embarrassing law would survive would depend upon whose orders these American armourers would take.

When he arrived at London Airport on Wednesday afternoon, Mr Macmillan said frankly that even if Britain spent the immense sums needed to develop a similar weapon, it could not deliver any until five or six years after American factories could. Since Thor itself can hardly be described as fully developed, although it is the most advanced of the American intermediate-range missiles, this would imply that without American aid, Britain would have no long-range rocket striking power before the mid-sixties. Although the promised shipment of Thor is one outcome of the Defence Minister's earlier talks in Washington, which covered understandings on a much wider range of missiles, it is in this particular field of ballistic weapons that Britain lags so far behind the United States. It is only a year since it was announced work had been ordered in this country on a 1,500 mile-range guided weapon. Missiles take as long to develop as manned aircraft, so it might require 10 years of development to get this into service. Reports suggest that weapons of at least 1,000 miles range were being test-fired inside Russia at the rate of about five a month as far back as last year.

It is not expected that work on long-range ballistic rockets will be stopped entirely now that a supply of American-built weapons has been promised. But it may well mean that the work is shifted back from the development engineering shop (where costs are astronomical) into the labora-

tory (where costs are lower) with instructions to modify the weapon so that it provides a more advanced successor for Thor. But Mr Sandys will need to have been promised a great deal of technical help from the United States, if British industry is to be able to design a tuppence-coloured ballistic rocket for the late 1960s without ever having gone through the penny-plain stage with a weapon like Thor.

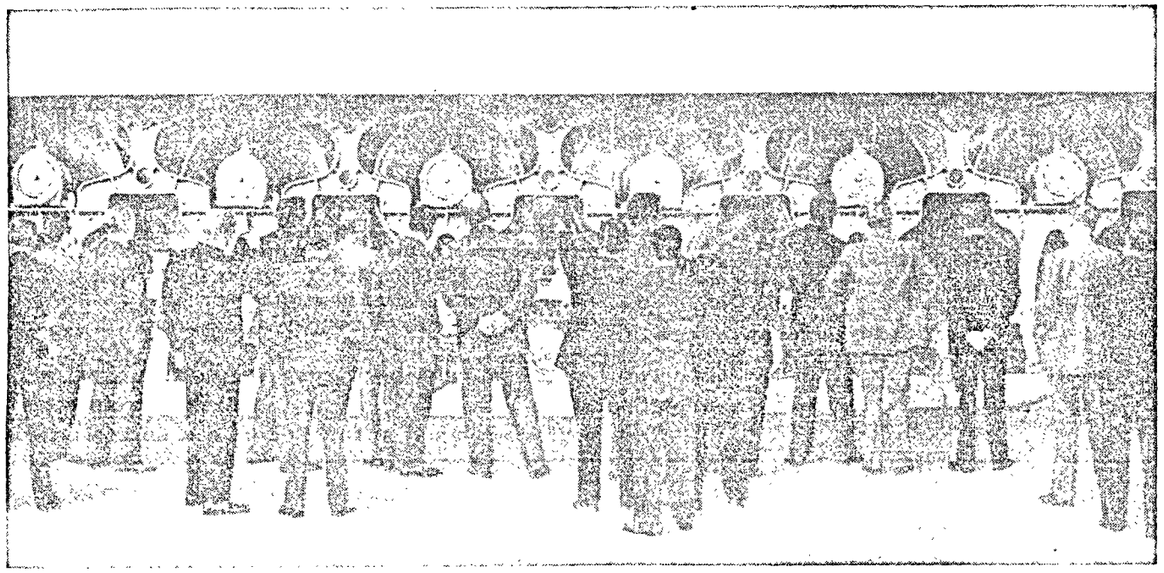
Accountants' Ayes

THE first and biggest obstacle in the path of the proposed integration of the Institute of Chartered Accountants and the Society of Incorporated Accountants has been cleared—but only just. Of the 19,000 odd members of the English institute, 14,582 (or just over 75 per cent) voted in the postal poll. Of those voting 10,242 were for and 4,340 against the integration scheme. Thus with about 70 per cent of those voting in favour, the scheme gained the requisite two-thirds majority. Many of those voting against and perhaps some of those abstaining must be provincial accountants who believed that the word "chartered" gave them a definite competitive advantage over the incorporated accountant practising in the same town.

A two-thirds majority of the vote of the Scottish institute, a bare majority of the vote in the Irish institute, approval by the Privy Council, and finally a three-quarters majority of the vote of the society in favour of liquidation have all still to be obtained before the merger can take place. Formal integration cannot take place before the autumn. There are only a small number of incorporated accountants in Scotland and Ireland and, now the members of the English institute have given a favourable vote, it must be hoped that parochial prejudices will not block the implementation of the scheme. It is thus encouraging that the integration proposals gained an overwhelming majority of support on a show of hands and that there was little vocal opposition to them at the meeting of members of the Scottish institute; but here too there is still a postal poll to come.

"Mr ENI" in Persia

FEW men are more like the traditional picture of the buccaneering oil tycoon than Mr Enrico Mattei, president of ENI, the Italian state corporation for oil and natural gas: and few are more disliked by the more sedate branches of the international oil industry. Not for the first time, the major companies' big problem at the moment is to find out just what "Mr ENI" is up to. Last week he let it be known that he was "finalising" an agreement with the Persian government under which ENI would form a joint company with the National Iranian Oil Company to exploit the rich recently discovered oilfield at Qum, about 100 miles south of Teheran, which falls outside the scope of the international oil consortium. It was suggested that 49 per cent of the capital would be put up by Persia and 51 per cent by ENI. Royalty payments on production would be so adjusted that the Persian 49 per cent share would yield them 70 per cent of the profits, leaving 30 per cent for ENI. An agreement on these lines would stick out like a sore thumb among all other oil concessions in the Middle East, where profits are shared in principle equally between the oil companies and the government granting the concession. But there is no confirmation of a report that Mr Mattei offered to call off the 70:30 deal if the international oil companies would let him into the consortium that operates Abadan.



To develop the Qum oilfield, ENI would apparently be prepared to build a pipeline about 1,000 miles long across difficult country through Turkey to the Mediterranean. Such a line would be as long as TAPline from Saudi-Arabia, and nearly twice as long as the suggested new pipeline from northern Iraq through Turkey to the Mediterranean; if of the same capacity, it could hardly be built for much less than £200 million. Where is the money to come from? ENI, a state corporation which has a profitable monopoly of the natural gas deposits in the Po Valley, may be virtually in a position to pledge the full credit of the Italian government in obtaining foreign loans. But whether Italy could afford foreign investment of this order, part of which would have to be made in dollars, is another matter. The Persian government, for its part, has few free funds to contribute as its share of the capital either to develop the oilfield or to construct the pipeline. Conceivably its share could be provided with the help of a loan from ENI or some other source, such as Japan, which has been showing an interest in the same field. Such a loan could be secured against future royalties, or even written off against the paper capitalisation of the oil reserves being exploited. If the Persians were in a position to invest their own resources in a joint undertaking with a foreign oil company, thus identifying themselves directly with the success of the venture, that aspect of the scheme, at least, might have something to commend it. But if in practice all of the money for development has to come, as usual, from outside, then the arrangement would have little to distinguish it from existing practice—except that Mr ENI the Western partner, would be paying far more for this concession than the West has ever had to yet.

Britain's Share of Trade

LAST year a larger part of British manufacturing output went abroad than in any of the three previous years, and although output went down slightly, the volume of manufactures exported rose 6 per cent. But world exports expanded even more rapidly. There was no sign of any change in the rate at which, in recent years, the British share of world exports of manufactures has been falling. An article in the current issue of the *Board of Trade Journal* examines some of the figures behind this declining trend.

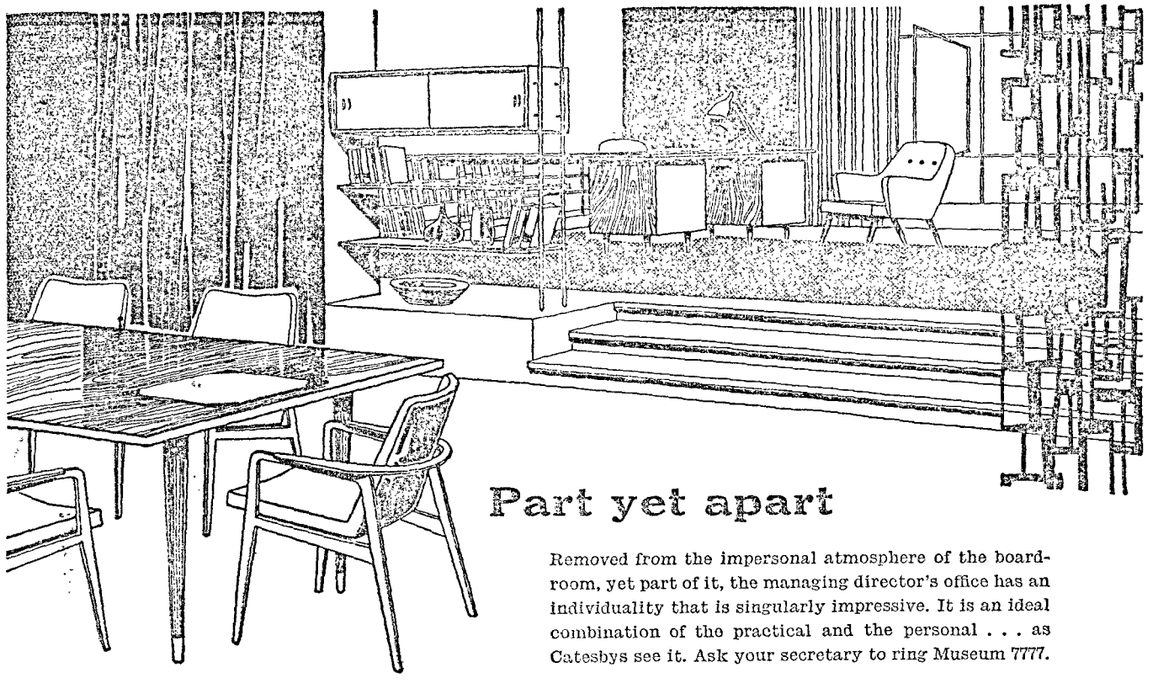
Between 1951 and 1955 Britain's share in the world trade in manufactures fell from 21.3 per cent to 19.0 per cent. Most other European exporters and the United States, too, felt the upsurge of competition from Germany, and to a lesser extent from Japan, in these years. But they could afford it better. In 1951 these countries had been enjoying a larger share of the total trade than they did before the war. But Britain, the traditional textile exporter, had

Portrait of a team of 19 company heads

They're men with an interest in common — the Reed Paper Group, an integrated, efficient industrial body which deals with every aspect of making paper and paper products. But they're also the managers of 19 separate yet major companies in the Group. Each of these, while having access to Group resources, retains its individuality and independence, and understands the character and aims of the Group so well that it can think and act *for itself*.

What makes this possible? . . . it is that Reed has based its whole approach to business on informal, *personal* dealings. Management Training Courses — held from time to time to enable executives of the various companies to appreciate one another's problems and get to know one another socially — are merely one concrete example of this personal, flexible way of working.

In fact, it applies *all the time* at all levels in the Group. The men-on-the-spot have the responsibility — and the initiative to see any job through to your best advantage. Yet should need arise, they have only to pick up their telephones to draw upon the central resources and specialised knowledge of the Group.



Informal efficiency is the keynote. It is why your every meeting with a Reed manager, salesman or technician can be so refreshingly satisfying and profitable. It is why your every dealing with a Reed company can give you the best and right materials for *your* needs.

"YOU profit from the initiative of each Company backed by the resources of the Group"

already suffered a setback. What has caused the further deterioration? Between 1951 and 1955 the British share of trade fell in every selling area except one—the non-sterling Middle East and Far East—and in every group of exports except one—metals and their manufactures. The continued decline cannot therefore be blamed only on bad luck in the pattern of trade. Indeed, the Board of Trade reckons that out of the British loss of 2.3 per cent in the share of world trade over those four years, only 0.6 per cent might have been expected because of any concentration of British exports on goods and markets that have been less buoyant than the average.

EFFECTS OF THE PATTERN OF TRADE

Exporter	Actual percentage share of exports of manufactures		Change (in percentage points) in share between 1951 and 1955	
	1951	1955	Actual	Due to pattern* of trade
United Kingdom...	21·3	19·0	−2·3	−0·6
Germany	9·7	14·9	+5·2	+0·7
Other continental:				
OEEC	33·8	31·5	−2·3	+0·6
United States.....	25·6	23·6	−2·0	−0·6
Canada	5·4	5·9	+0·5	+0·6
Japan	4·1	5·0	+0·9	−0·6

*This column shows the changes that might have been expected on account of each country's pattern of trade in relation to the expansion of world trade. This has been done by calculating what each country's share would have been in 1955 if it had retained the same relative share as in 1951 in each commodity group within each market, e.g., in the market for chemicals in North America.

Unfortunately, the Board of Trade goes little further in interpreting these figures. The effect on exports of delivery dates, packaging, sales promotion, and the like may defy statistical treatment. But surely it should be possible for the Government to make a comparative study of export prices from the major exporting competitors? Prices of British manufacturing exports seem, on the average, to have moved much in line with world prices, but a more detailed analysis is badly needed.

Dollar Loan for Schumania

NEXT month the European Coal and Steel Community will come of age in the world's capital markets. It will make its first public issue in the United States. It tested its standing last summer when it made a successful public issue of 50 million francs (at 4¼ per cent for 18 years) in Switzerland. And before then (in 1954) it had received its first dollar loan—$100 million from the United States Government through the Export-Import Bank. The details of the new issue, to be handled by a group of leading issuing houses in the United States, have yet to be negotiated. But the intention is to raise $35 million in two tranches: one of $10 million on bonds repayable in five years and the other of $25 million repayable in 18 years. Thus the terms of the loan may be tailored to appeal to two different kinds of institutional lenders.

So far the Coal and Steel Community has borrowed about $130 million, relending an equivalent sum to members of the community to finance their economic and social investment programmes. In this sense, the community acts as a broker. Because of its standing (which ultimately rests on the levy on steel production and on accumulated reserves from that source of about $100 million) the High Authority can borrow more readily and more cheaply than its members individually could. The High Authority lends out at rates that on the average cover the service on its own borrowings; but it nevertheless trims the terms of these loans to the individual borrower's ability to pay. Members will borrow the more readily from the dollar resources now being provided because dollars so drawn must pass through the member countries' exchange reserves though some of them are no doubt earmarked for purchases of American equipment.

A Bank's Egyptian Losses

EGYPT'S sequestration of British and French banks operating in that country affected four British-owned banks—Barclays DCO, with forty branches and agencies in Egypt out of a total of over a thousand; the Ottoman Bank, with ten Egyptian branches out of seventy; the Ionian Bank, with eight out of forty; and the Commercial Bank of the Near East, with two of its three branches in Egypt. The report of the Ionian Bank issued this week now gives some indication of the effect of the take over—for which compensation has been claimed and promised, but not yet granted; meanwhile full provision for the amounts involved has been made. The bank excludes all figures relating to Egyptian business in the balance sheet of December 31st. Therefore "it is hardly surprising" that deposits fell by £1.7 million to £9.5 million, advances by £2.1 million to £5.1 million, and documentary credits by £1.6 million to £2.7 million. These are sharp movements. But the bank succeeded in maintaining its profits, at £37,664, and is paying an unchanged dividend of 4 per cent.

Uranium for Power

THE British Government's five-year contract to buy £43 million worth of uranium ore from Canada is part of a series of similar deals that began last year with negotiations to take the output of Rio Tinto's new Mary Kathleen mine in Australia, and are designed to back up fuel supplies for the British atomic power programme. Until the size of the programme was decided, it was not easy to predict its fuel requirements. Canada is now emerging as one of the world's major uranium producers, and last year there were some signs that the country was heading for a uranium glut.

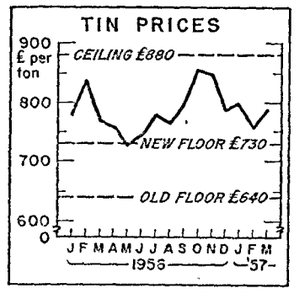
Producers have in any case become so cautious about the future trend of uranium prices that neither in Canada nor in any other country will they contemplate opening up new deposits without a firm contract to recoup the whole of the mine's development cost. This is reflected in the offer made by the Atomic Energy Authority to prospectors in Rhodesia and Nyasaland, where useful deposits of uranium exist. This provides for the purchase of up to 500 tons of uranium oxide annually from the region, on the basis of

10-year contracts at prices in line with those negotiated elsewhere. The last proviso is an indication that while the AEA would like to see the development of Commonwealth uranium resources, it does not intend that the British atomic electricity programme should be asked to subsidise the development of uneconomically low-grade reserves.

Tin Prices Jump

On the news that the Tin Council had raised the price range in the International Tin Agreement cash tin on Monday touched £795 a ton; that price was not held, and on Thursday cash tin closed at £781 a ton, an advance of £9 on the week. The changes in the price range are summarised below:

The floor price, formerly £640 a ton, becomes £730; when the cash price on the London Metal Exchange is at or below the floor the manager of the buffer stock must, if he has funds, offer to buy at the floor price until the market price is above the floor or his funds are exhausted.



The lower third of the range, formerly £640 to £720 a ton, becomes £730 to £780; when the price is within this range the manager may buy at the market price to prevent the price from falling too steeply.

The middle third, formerly £720 to £800 a ton, becomes £780 to £830; when the market price is within this range the manager will neither buy nor sell unless the tin council decides otherwise.

The upper third, formerly £800 to £880 a ton, becomes £830 to £880; when the market price is within this range the manager may sell at the market price to prevent the price from rising too steeply.

The ceiling price remains at £880 a ton; when the price is at or above the ceiling the manager must, if he has tin, offer to sell at the ceiling price until the market price is below the ceiling or his stock is exhausted.

Some producers, led by Bolivia, the highest-cost producer, initially sought an increase of £80 a ton throughout the range. They argued that the prices agreed on in 1953 had been made unrealistic by the subsequent rise in mining costs. Any further decline in the market price would force some high cost mines out of production and lead to the abandonment of low-grade deposits. As world consumption was rising, a higher range of prices was necessary to ensure adequate supplies in future years. The consumers, three of whom—Britain, Holland and Belgium—have producing interests too, accepted that there was some merit in these arguments, but they were firmly opposed to an increase in the ceiling price. Eventually the producers gave way on the ceiling to gain an increase of £45 a ton in the mean point between the floor and ceiling prices.

The immediate significance of the changes should not be exaggerated, as the market soon realised. The manager of the buffer stock will not necessarily buy when the market price falls below £780 a ton. But as his funds are large he will be able to support the market, and thereby acquire metal, at higher prices than before. By anticipating his actions the market will actually do most of his work for him. The surplus this year is small: it is put at between 5,000 and 7,000 tons, equal to three or four per cent of world consumption. Once forward tin commands a premium merchants should easily take the surplus into their stocks, and larger stocks should help to stabilise prices.

British Oxygen Replies

Few other companies or trade associations whose mono poly power or trading practices have been held by th Monopolies Commission to operate against the publ interest have ever produced quite as moderate and concili tory a reply as the British Oxygen Company published la week. The company recognises that the existence of th commission reflects public opinion,

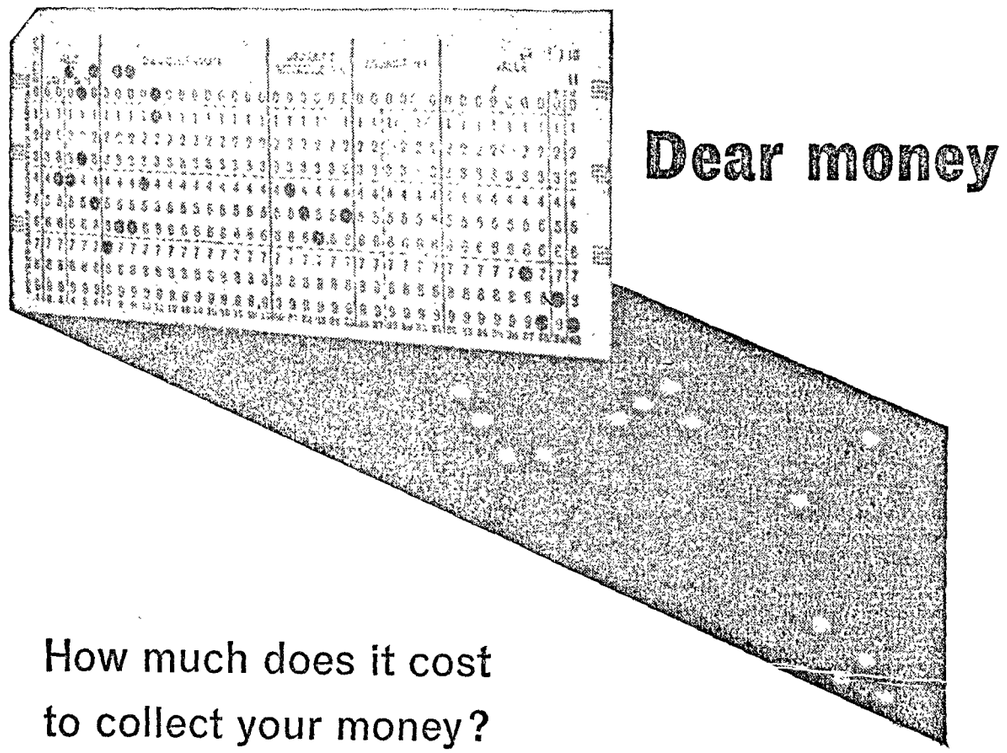
> an instinctive wish to know that where a monopoly situ tion has developed the companies involved in it are "pla ing fair," that they are efficient and have a clear sense responsibility to the public

and welcomes the commission's examination and criticisn It broadly accepts four of these criticisms: it is no longe controlling the provision of oxygen-making plant to othe suppliers or consumers who want to make their own gas, has abandoned the use of "fighting companies" in compe tition, it is giving up the conditions of exclusive dealin attached to the use of certain apparatus, and it proposes t accept the commission's recommendation that it shoul prepare new scales of oxygen prices related to costs and applicable to all ordinary users.

One major point remains at issue. The majority of the Monopolies Commission thought that BOC's rate of profit —calculated as 23 per cent for 1954, or 17 per cent if the capital employed is valued at current replacement costs— were "unjustifiably high" for "an almost complete monopoly facing a limited financial risk." The company does not feel protected from competition when it goes to the market

Retail Business

CUSTOMER TRENDS



Number 2

This new quarterly bulletin deals with the demand for consumer goods in the home market. It includes short and long-term forecasts of sales by different outlets and merchandise groups, regional surveys and reports on special investigations.

Among the special subjects in the second issue are: the growth of mail order business; the women's clothing trade; motivation research.

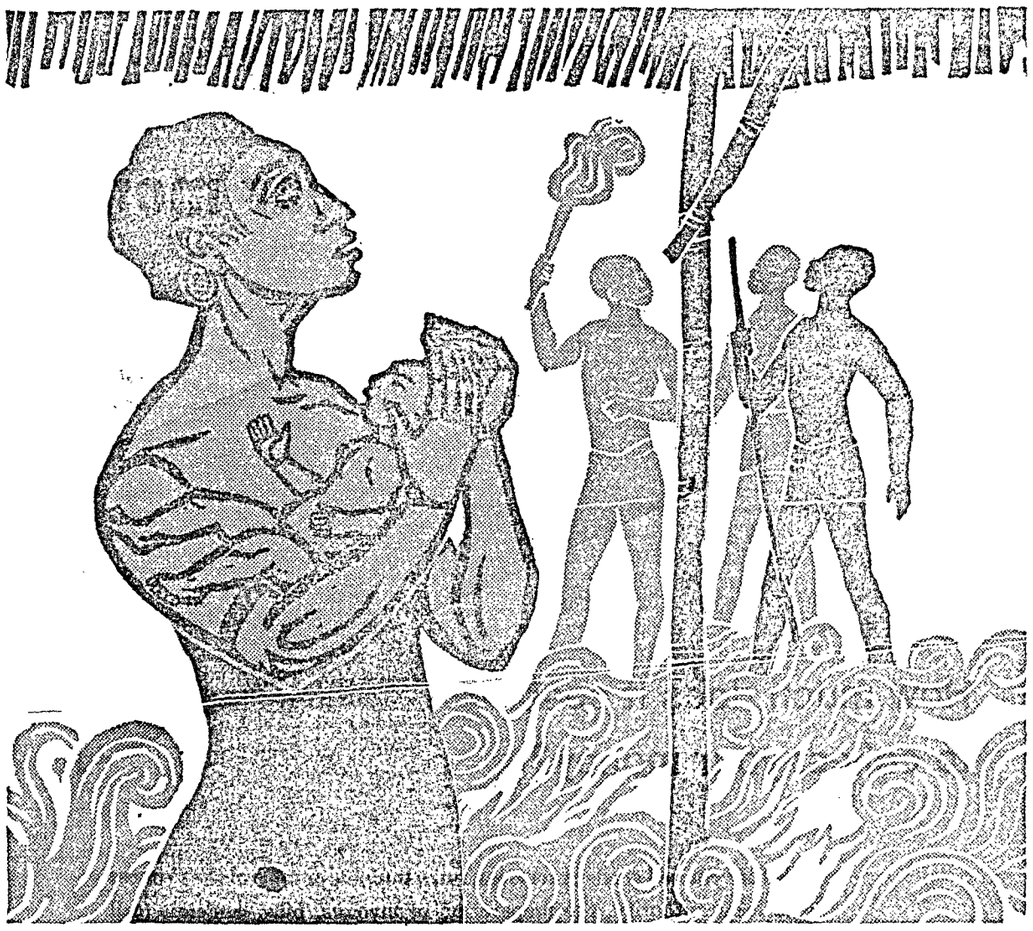
Dear money

How much does it cost to collect your money?

Whether you sell goods or services, run a business or control the finances of a local authority, the preparation of invoices, bills, demands (call them what you will) involves costly clerical effort.



Powers-Samas punched card methods make light work of the job. Machines do the arithmetic and produce the finished bills — swiftly, at low cost and with machine accuracy. Then they fill in their time with other accounting, costing and statistical tasks.

What does punched card equipment cost? Powers-Samas have matched their ranges of machines to the needs and budgets of the small, the medium and the large organisation.

POWERS-SAMAS

mechanical, electro-mechanical and electronic accounting machines

Powers-Samas Accounting Machines (Sales) Ltd., Powers-Samas House, Holborn Bars, London, E.C.1.

In the Hills of Madagascar . . .

IN MADAGASCAR they believed man's fortune was determined by his date of birth. For instance, it was ordained that a man born in February would have his house burned down before he came of age. But Fate was cheated by a strange protection. A mock calamity was substituted for the real one. Friends of the infant erected a small house and destroyed it by fire. So time was anticipated and the catastrophe averted. To ensure that the ceremony was truly effective the mother and infant were placed in the house and plucked from the blazing wreckage at the last moment. Risky insurance!

Modern manufacturers circumvent calamity and safeguard their goods by placing them in the care of "Fiberite" cases, and cartons made from "Thames Board". They know from experience that these stout packaging materials afford ample protection, and that they are backed by the reputation of Thames Board Mills Limited, the largest manufacturers of packaging materials in this country.

THAMES BOARD MILLS LIMITED

THE LARGEST MANUFACTURERS OF BOARD AND PACKING CASES IN BRITAIN

to raise capital, and argues that since the timing of some of its own capital expenditure is dictated by the needs of its major customers such as steel, it needs a rate of profit "not less favourable than those heavy industries it particularly serves" or than "the average of industry." This comparison may recall the company's remark, in discussions with the commission, that in its 1952 accounts the nationalised Iron and Steel Corporation revalued its capital employed at replacement costs and showed a profit of 17 per cent on that basis—a statement which impressed the two members of the commission who dissented from its majority view on BOC profits.

Nobody seems to have checked this statement at the time. In fact, the 1951-52 report of the nationalised corporation does not contain any such figure, nor did the defunct steel corporation ever completely revalue its assets at replacement costs; though it did set aside from its profits in 1951-52 (which were inflated by stock appreciation and export premiums) an extra £10 million as a rough and ready provision against the higher costs of replacement. The rate of profit now allowed on home sales of steel, moreover, is certainly not as high as 14-16 per cent on a replacement cost basis. Nor are comparisons of BOC profits on a replacement basis with the "average of industry" practicable; only a small proportion of British companies use the replacement cost basis. However, it is difficult to come to any objective conclusion about the adequacy or "justification" of profits; and hard to believe that this Government would be ill-advised enough to put into effect the Monopoly Commission's recommendation to hold down BOC profits by price control.

Shells of Companies

THE ordinary shares (1s. 3d. nominal) of Pinoya Holdings have been the subject of a Stock Exchange introduction this week. The former Pindenioya Rubber and Tea Estates (1934) reappears as a chemical and detergent manufacturer. This is not an isolated example of the purchase of the shell of a company from the plantation industries and the refurnishing of it into some quite different form. Glendon Rubber recently became Silkolene Lubricants business. Chota Rubber Estates has been successfully bid for; its quotation is in abeyance. Soon it will reappear—as who knows what?

What is the mystique of this trade in the shells of companies? Why does it suit owners of private businesses that want to become public to buy the name of a company with a quotation and its cash after it has disposed of its rubber or tea estates and fill the old shell with a new body? And why does it suit the owners of such company shells to sell them rather than to liquidate? Each example is different but whether there is much or little cash in the shell is usually immaterial; it merely affects the price. The existence of a Stock Exchange quotation is hardly material now that the Council insists on the particulars being readvertised when the basis of the business is altered. The Stock Exchange charge for a quotation is saved out of capital duty on the formation of a new company, but stamp duty has to be paid on the shares of the shell company that are bought. These are not material considerations on balance. The true advantages seem to be threefold:

1. The vendors of the shell save the expense and, more particularly, the time that would be involved in liquidation.
2. The purchaser of the shell avoids the necessity of going to the Capital Issues Committee.
3. There is a tax saving on distributed profits tax on future profits.

This last gain arises in this way; the owner of a private business is buying control of the shell, and the shell is to buy his business, but his private business normally has a price greater than the shell can immediately pay. The new owner therefore ends up with shares in the shell company plus a loan from himself to the shell company, and the loan can be paid off gradually out of earnings without attracting distributed profits tax. As an alternative shares can later be issued as rights at a favourable price.

There is a limit, however, to the traffic in shells. The limit is fixed by the attitude of the minority shareholders—those who do not accept when the bid comes along. Recent experience has shown that when a bid is made the shares tend to rise above the bid price, an appreciable percentage of holders fancying the gamble of staying on as minority holders though in what sort of company they have no idea. The buyer who usually hopes to hold over 80 per cent of the company into which he is going to put his private business finds it hard to obtain the necessary percentage holding without paying a premium price for it.

Higher Prices for American Cotton

FOR weeks the cotton trade has been anxiously waiting to learn what prices the American government would accept for cotton sold for export out of the surplus from the 1955-56 crop. There are two selling programmes running side by side. The first, under which the Administration has already sold 6.4 million bales (of which nearly 5½ million have been exported this season so far), requires the cotton to be shipped abroad by August 15th; cotton sold under the second programme cannot be shipped abroad before that date. Earlier sales had almost exhausted the old stock; the new stock amounts to six million bales, half of which has now been made available for sale under both programmes.

The results announced this week show that under the first programme bids were accepted for 582,000 bales, at an average price for 1-inch middling staple of 27.42 cents a lb. Compared with the domestic market price that represents a subsidy to exporters of about 6½ cents a lb. Compared with the previous sale of 15,000 bales on March 6th, the average price has risen by 0.22 cents a lb. The large quantity sold, and the increase in prices, indicates the strength of demand for middling 1-inch cotton. Not much more than half a million bales out of the three million bales available at present are of this grade or higher. The lower grades may be more difficult to sell. At the first sale under the second programme 237,000 bales were sold at an average price for middling 1-inch staple of 27.47 cents a lb, equivalent to 27½d. a lb on the Liverpool market. That makes October-November futures in Liverpool look cheap at 26d. a lb, but by October the United States may face more competition from other producers and be obliged to lower its prices.

Extraordinary Meeting

THE May Fair Hotel, the Grosvenor Hotel and the Hotel Metropole are names not readily associated with anything but sobriety. But their parent company, Gordon Hotels, has by now almost a tradition of dispute. The extraordinary proceedings at that company's extraordinary meeting, called on Wednesday to vote on the replacement of the chairman, Mr Leonard Jackson, and three other directors, showed that these are far from finished. A shareholders' committee, associated with the name of Miss Zena Daniels, attacked over familiar ground. The findings of the recent Board of Trade inquiry were bandied back and forth.

Mr Jackson claimed and held the chair at the meeting against the opposition's demand for an independent chairman. One voice interjected: "Why not Gilbert Harding?" The board's case was put by the company's solicitor, Mr Ralph Freeman, who made a plea for a short, clean contest and who proposed a quick vote with the minimum of talk. The challengers avoided a quick decision and went on to press their charges against the chairman. Amid the welter of procedural quibbles and heated voices and a confusion about the voting procedure, Mr Jackson more than once promised a "sensational" statement.

With the tactical timing of one of his namesakes, Stonewall Jackson, he called back the press, announced a record poll, declared that the sitting board had a "substantial majority," and said that the opposition's proxies, said by Miss Daniels to be in excess of 500,000 votes, had been obtained as a result of "scandalous, libellous misrepresentations" in the opposition's circulars sent out since March 1st and were thereby disqualified. Both sides claimed that they had a majority in the event of the disqualified votes being allowed. The opposition questioned the legality of the disqualification, and has now secured an *ex parte* injunction to restrain the company from declaring the result of the poll. Amid the uproar one clear fact emerged: Guildhall Investment Trust, in which Mr Jackson has some interest, has raised its bid for the Gordon Hotel shares to 9s. a share.

SHORTER NOTES

Steel Company of Wales states that the number of shares of the recent offer applied for by employees was about 250,000 and not about 25,000 as stated in these columns.

An organisation with the splendid title of the International Society of Air Travellers and Air Transport Users was launched rather shakily last week by eleven individuals, two of whom proved to be the wife of the chairman and a lady employee of a member of the committee, with the rest of the committee consisting largely of publishers and advertising agents, with one free-lance artist. Lord Brabazon, who is the president, provided an imposing figurehead for this new organisation whose ambitions are to provide for air travellers the services that the AA or the RAC provide for those who own cars. Oddly enough, there is already a statutory body whose function it is to represent the air traveller and hear his complaints. This is the Air Transport Advisory Council whose complaint-hearing machine is so rarely made use of that it now spends most of its time hearing applications from the airlines for new routes.

★

The slight fall in prices of merino wool has been checked. The firmer trend in the Dominion markets was confirmed at the London auctions on Wednesday, the first of the new series, when merinos sold at prices on a par with current values in the Dominions; that was also true of prices of crossbred wools. Meanwhile the Board of Trade has announced that it expects to sell between 80,000 and 100,000 bales of wool from the strategic stock in the year beginning on April 1st. This quantity, which is tiny in relation to world production, compares with about 50,000 bales sold from the strategic stock in the current year.

★

Although the gross profits of Crosse and Blackwell rose steeply from £884,074 to £1,105,633 and its net profits from £428,796 to £520,912 last year, the ordinary dividend was left unchanged at 12½ per cent. A one for five rights issue of £1 ordinary shares is proposed at 30s. a share; the existing shares stand at 58s. 6d.

★

Last year the Savoy Hotel earned the biggest profit since its foundation in 1889; its gross income rose by £89,200 to £814,781. But the ordinary dividend on the "A" and "B" shares remains unaltered at 17 per cent, including a bonus of 7 per cent.

Company Notes

P & O. Peninsular and Oriental Steam Navigation Company showed a fine achievement for the year ended September 30th in its preliminary figures—a group net profit after tax of £6.3 million, compared with £5.6 million, and a maintained dividend of 8 per cent. As in recent years the balance sheet is free from any resort to the Shipping Companies Exemption Order which would allow of the creation and maintenance of hidden reserves. These fine figures are now supported by a full report, which not only gives stockholders a clearer presentation of the structure of the group and its history than they have had before, but presents them in a form that should not bewilder the non-expert stockholder.

From that point on stockholders will try to probe the future, remembering that these accounts are drawn at a point when the dislocations of Suez had barely begun to produce an effect. The good figures of 1955-56 sprang from the earlier rise in tramp freights and the elimination of losses by a rationalisation of the group's eastern services. The rising costs shown in the accompanying table are drawn at a point before the Suez crisis and exclude an additional 30s. a ton that the group is now paying for its oil bunkers taken in the unaccustomed ports. Results for the year now current will reflect Suez, which must indeed affect the whole year, for with the best of luck the group will not be able to drop back into its pre-Suez routine immediately. How serious will that effect be? The directors do not attempt to put a figure on it. They say: "The re-routing of ships . . . dislocation of sailing programmes, lengthening of the voyage times . . . and the increased cost of fuel and diesel oil and loss of wayport earnings have had and still have a most serious effect on the operating results for the current year of a number of group companies."

Stockholders will also want to know about what is happening following the decision to build tankers. And how far the £10 million that was raised on debenture a year ago is going to cover cost of the building programme. The tanker programme has been revised to consist of fewer vessels of a larger average size at about the same total cost. Whereas the original plan was for 25 tankers mainly of 18,000 tons, it is now planned to build about 18, including some of 18,000-19,000

Shipowners' Costs:	1938	1950	1956
Shipbuilding costs ..	100	319	545
Stevedoring costs...	100	220	393

tons, some of 36,000-37,000 tons and some of 47,000-49,000 tons—with possibly just a few still bigger. The final date for the programme has been pushed forward from 1960 to 1962. P & O is building big passenger liners, too, and its capital requirement is enormous. The consolidated balance sheet shows £10.7 million (against £11.6 million) of commitments for ships under construction and £27.9 million (against £9.9 million) for tonnage ordered but not laid down. It appears that all the tankers and all but one of the liners are excluded from these figures because they were not firm orders at the date of the balance sheet. The group has in total £59.6 million, against £48.6 million of cash and quoted investments. It will not need money yet. But it will need it before the building programme is finished.

★

ANGLO AMERICAN. In announcing a 10 per cent free scrip issue the directors of Anglo American Corporation of South Africa have used cautious words. But they will be interpreted as indicating a change in policy—a change that investors have been expecting. After announcing the maintained ordinary dividend of 7s. per stock unit (70 per cent) for 1956 and the capitalisation of £391,767 from reserves to make the free scrip issue the directors add: "It is confidently anticipated that provided no unforeseen circumstances arise the present rate of dividend can be maintained on the increased ordinary share capital. It will be the aim of your directors from time to time in the future, when the situation warrants, to capitalise further reserves along the same lines as the present capitalisation."

The Group's big investments in the OFS gold mines are beginning to produce dividends. Thus the time is opportune for bringing the finance house's issued ordinary capital (at the moment it is only £3,917,671) in line with the assets and investments in gold, copper, diamonds and in industry that it controls. Ploughing back will still be needed to extend the investment portfolio and to make good wastage, for mining is always the exploitation of wasting assets, but shareholders can now expect a gradually growing return from the group's growing portfolio. It was in anticipation of just such a decision that the 10s. units were valued in the stock market on a low yield basis. At 135s. the yield is 5⅜ per cent; at the equivalent ex-capitalisation price the yield is 5.7 per cent.

The device of scrip issues instead of increases in rates of dividend has the advantage that it should gradually make the price of the shares less heavy and, therefore, broaden the range of potential holders. The tax angle is hardly significant; a scrip issue attracts super-tax for South African residents as well as a tax for non-resident shareholders.

Increases in equity disbursements, however, cannot be postulated unless increased earnings are also foreseen. For Anglo American that increase over the coming years seems a near certainty. For 1956 the actual increase in earnings is obscured by the fact that the 1955 profit before tax of £5,048,726 included at nominal value (that is £1 per share) the bonus distribution of preference shares received from Anglo American Investment Trust. The total value of this issue has not been revealed, as this would in turn reveal Anglo American's equity holding in the trust. Thus, in looking at the 1956 profit of £4,419,000, shareholders cannot tell by how much true profits have risen; it might be as much as 10 per cent.

★

BRITISH MOTOR CORPORATION. The half yearly report of the British Motor Corporation is terse and to the point. It states that the Corporation made a loss in the six months to January 31st; that the interim dividend is passed; and that the half yearly preference dividend will be paid out of accumulated reserves. It does not contain figures; but the fact that there is no interim dividend disappointed the stock market. The 5s. ordinary shares fell from 8s. to 7s. 5¼d.

The directors confirm Throgmorton Street's impression that there has been some recovery in motor trade in the last few weeks by saying: "although universal demand for the company's products during the last few weeks has shown a most encouraging improvement, which promises every likelihood of being maintained, no forecast of the results for the year ending July 31, 1957, can at present be made."

Whether there will be a final dividend and, if so, what it will be is now anyone's guess; for 1955-56 the total dividend was 12½ per cent, of which 4 per cent was declared as an interim payment. Yet for anyone investing in motor shares now the current year's dividends are unimportant; it is the coming financial years to which they are looking.

★

FORD MOTOR. Last year, when its gross profits fell by about £8 million, Ford Motor Company quietly went on spending another £14 million on capital account and at the end of the year it still had capital commitments of over £16½ million. It has the liquid assets to finance that programme; last year as profit retentions and the depreciation provision came to just under £9 million these liquid resources were reduced (from £47 million to £31¾ million) in meeting the extra investment in fixed and working assets.

This programme indicates, as Sir Patrick Hennessy says, that the group's "confidence in the future growth of demand for vehicles remains firmly based, following a thorough restudy of prospects

	1955	1956

in world markets." Confidence must have been reinforced last year by the fact that in the shrunken market for vehicles at home Ford's share of this market rose from 26 to 30½ per cent in vehicles and from 33 to 35 per cent in tractors. Sir Patrick agrees with other motor manufacturers that an export trade can be built up only on the base of a healthy home market and here, he says, the British manufacturers, competing in a European common market, will be handicapped by "the penal rate of purchase tax" and "the increasing inadequacy of British roads."

★

ALUMINIUM RESULTS. In his statement to shareholders in **Aluminium Limited,** the president, Mr Nathaneal V. Davis, said that in the closing months of last year the supply of primary aluminium caught up with demand in Britain and the United States. Since the end of the year sales have been running slightly below production but Mr Davis regards the consequent accumulation of stock as "a healthy and desirable development" for he confidently expects a further growth in consumption. It is against this background that the results and development programmes of the aluminium producers must be set.

The results for the year to December 31st of **British Aluminium** disappointed the stock market. The ordinary dividend, as forecast when the rights issue of £2 million was made, was left unchanged at a rate of 12 per cent. But earnings also show little change. Gross profits edged up from £3,248,463 to £3,294,439 and net profits moved up more robustly from £1,371,972 to £1,493,959. The net ordinary dividend absorbs £483,000. The £1 stock units came down after this

announcement from 67s. 9d. to 66s. 3d. At this price the yield is only 3⅜ per cent—a yield which put a big discount on the expectations from the company's development programme in Canada.

An even bigger programme in Canada has been set in train by **Aluminium Limited.** This company spent about $125 million on capital account last year, much of it on the Kitimat development which is already making a contribution to earnings, and it intends to spend even more this year. It is this prospect of growth which has put a price of $240 on its shares setting the yield at only 1⅔ per cent on a dividend of $2.40 a share. Last year the sales of Aluminium Limited, of which the **Aluminum Company of Canada** is a subsidiary, rose from $371 million to $425 million and the net income attributable to its equity from $48 million (or $4.83 a share) to over $55½ million (or $5.56 a share). Dividends are well covered but in accepting low yields on aluminium shares investors must firmly believe that the consumption of the metal will rise to meet the big increases in production planned.

★

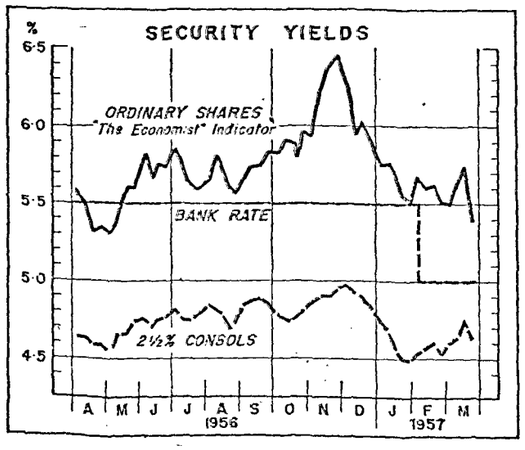
SHELL OIL COMPANY. "Strength in Diversity," which might well be the Royal Dutch-Shell group's new motto, is well illustrated by the benefits accruing to its operations in the Western Hemisphere as a result of calamities in the Middle East. Nearly two-thirds of the equity of the Shell Oil Company, which is responsible with its affiliates for all of the group's activities in the United States, and, through a 50 per cent owned affiliate, in Canada too, is held by the Royal Dutch-Shell group. Helped towards the end of the year by the higher demand and higher prices in the United States resulting from the blocking of the supply routes in the Middle East, Shell Oil achieved in 1956 a 10 per cent. increase in sales and other operating revenue, and an 8 per cent. rise in its consolidated net income. In 1955, its two-thirds interest in Shell Oil contributed about 19 per cent of the group's total income, and its other operations in the Western Hemisphere, mainly in Venezuela, another 34 per cent. As these have both flourished to some extent at the expense of the group's operations in the Eastern Hemisphere, their share of the group's 1956 income will almost certainly be higher than in 1955, although in the fourth quarter, at least, it would be optimistic to expect the gain in the west to offset the loss in the east.

The "Four Corners" area of northern New Mexico and Southern Utah, where Shell is well represented, is the first major oil field to be found in the United States since the Willesden basin was discovered in 1951, and the company has a quarter share in the pipeline that will be built from New Mexico to southern California. Offshore operations in the Gulf of Mexico, in which Shell also has a large stake, were hampered in 1956 by the dispute between the state and federal authorities, but this did not prevent some highly successful discoveries of both oil and natural gas reserves. In comparison with these two areas, the company's recent operations in the Willesden basin and in western Canada appear to have been less encouraging.

★

ALBRIGHT AND WILSON. As forecast when the rights issue made to finance the purchase of Marchon Products was made, the 1956 ordinary dividend on the increased capital of Albright and Wilson is 18 per cent, the same rate as for 1955. Last year this chemical group earned a trading profit of £4,416,000; in 1955 the profit was £3,200,000 but if the pre-acquisition profits of Marchon Products are included the latter figure becomes £3,764,000. A healthy growth in earnings and in net profits has ensued. Last year net profits came to £1,203,000; in 1955 they came to £859,000 (excluding Marchon) and to £1,089,000 (including Marchon).

The parent company is both a trading and manufacturing concern and a holding company for subsidiaries in this country and overseas. The directors now consider the growth of the group justifies the transfer of the parent company's manufacturing activities to a new subsidiary, making the parent simply a holding company. At 19s. 3d. the 5s. ordinary units yield 4⅓ per cent.



LONDON STOCK EXCHANGE

First dealings:	Mar. 13	Mar. 27	Apr. 10
Last dealings:	Mar. 26	Apr. 9	Apr. 30
Account Day:	Apr. 2	Apr. 16	May 7

A strong advance in industrial shares took place this week despite the fact that neither the Canal dispute nor the shipbuilding and engineering strikes were cleared up. Dealings recorded on the first three days of this week averaged almost 12,000, and the gain in *The Economist* indicator—up 11.4 to 204.9—was the steepest weekly rise since its inception. The advance actually ceased momentarily on Tuesday, when attempts at a strike settlement failed and again on Thursday, when A. Reyrolle fell to 103s. following the results, and other electricals turned dull. Gilt-edged securities recovered part of last week's fall; 3½ per cent War Loan gained 1¼ to 73⅛ and 2½ per cent Consols ⅞ to 53⅛ xd.

Martins Bank issues jumped on the court's sanction of the capital reorganisation scheme; the partly paid stock gained 8s. 9d. to 171s. 3d. and the fully paid stock 2s. 6d. to 71s. 6d. Prudential Assurance "B" fell 7s. 6d. to 155s. on the unchanged dividend, but the "A" stock improved further. Large gains were made by leading industrial stocks; Associated Portland Cement rose by 4s., Bowater 3s. 9d., ICI 3s. 3d., Tube Investments 6s. 3d., Turner and Newall 7s. 4½d., Unilever 5s. and Rolls-Royce 4s. Murex gained 4s. 9d. to 73s. 3d. and Clarke Chapman 15s. to 157s. 6d. Cinema shares were again firm on hopes of a reduction in entertainment tax and Stoll Theatres steadied after the closing of the theatre was announced. North British Locomotive and David Brown preference were lowered following the disappointing results. London and Overseas Freighters gained 5s. 3d. to 44s. 9d.

Apart from the large rise in leading oil shares, with Burmah advancing 9s. 3d. to 98s. 9d., Anglo-Egyptian "B" gained 8s. 4½d. to 37s. 1½d., Shell Trinidad 3s. to 91s. 3d. and British-Borneo 2s. 3d. to 55s. 6d. Kaffirs were weak, but tins responded to the higher support price for the commodity. Coppers were lower, Rhodesia-Katanga losing 1s. 9d. to 36s. 3d.

THE MONEY MARKET

The Treasury bill rate rose for the third successive week at the tender on Friday of last week. The discount market made no change in its common bid, at £98 19s. 4d. per cent, but the average rate of allotment rose by 3d. to £4 2s. 6.73d. per cent, and the allotted proportion of the market's bid rose from 34 to 44 per cent. The total allotment was raised by £20 million to £250 million, and total applications were up correspondingly, to £395.2 million—though a substantial part of this increase was attributed to market houses.

Credit in Lombard Street has been notably easier than of late. After large special help given directly and through the banks on Thursday of last week, the authorities neither made further special purchases nor gave loans at the penal rate. Indeed, on Saturday and Monday there was a marked surplus of funds, attributable partly to official disbursements; and conditions remained comfortable on Tuesday despite the moderate repayments of seven-day loans due at the Bank.

The London gold market has experienced a good turnover of funds this week. The price at the fixing rose from 250s. 1½d. an ounce on Monday to 250s. 4d. on Wednesday. This reflected not only the relapse in sterling but also a rise in the dollar price in response to the keen demand.

The Bank return for the week to Wednesday shows a quickening in the seasonal outflow of notes, to £8.8 million.

COMPANY MEETINGS

ASQUITH MACHINE TOOL CORPORATION

INCREASED GROUP PROFIT

STRUCTURE EXPANDED AND BROADENED

MR ROBERT W. ASQUITH'S REVIEW

The thirty-sixth annual general meeting of Asquith Machine Tool Corporation Limited was held on March 25th at Halifax, Mr Robert W. Asquith, MIPE (the chairman), presiding.

The following is an extract from his circulated Review for the year ended September 30, 1956:

It will be noted that the net profit of the group has increased from £294,031 to £333,675, but it must be borne in mind the present year's figures include the results of George Swift & Sons Limited and Swift-Summerskill Limited.

I consider this result satisfactory, bearing in mind that for the first time in its history the group had to provide for premiums for a staff retirement pension scheme, which was instituted as from January 1, 1956. There is no question as to the desirability of such an arrangement, as apart from any other consideration, under modern conditions such a scheme was long overdue if your Company is to retain and recruit personnel of the calibre required. This charge, of course, will be a recurring one on the Company's profits.

INTERNATIONAL MACHINE TOOL EXHIBITION

In addition, during the year under review, the Home-Selling Organisation, Drummond-Asquith (Sales) Limited, on behalf of their overseas principals and the manufacturing members of the group, took space in the International Machine Tool Exhibition at Olympia, London, sponsored by the Machine Tool Trades Association.

This exhibition takes place every four years, and is an expensive item as far as the group is concerned. Moreover, this expense is charged in the year when the exhibition is held although the benefits accrue in the future. Apart from the direct cost, there is a very definite interference with production occasioned by the preparation for this important sales effort.

I would like to stress that I consider it most important to support this Machine Tool Exhibition. I would also like to report that the products, embodying new developments, exhibited by your Company received favourable comments both from engineers in this country and from overseas.

WAGES AND SELLING PRICES

In my review last year I referred to the 11s. wage advance in April, 1955, which was absorbed by the group with an evident reflection on profits, and it was only after another advance of 12s. 6d. per week in March, 1956, that the selling prices of your Company's products were adjusted in order to maintain a reasonable margin of profit.

I think I should indicate once more that the Engineering Industry has arrived at a point where further wage advances can only have a detrimental effect on full employment in the industry.

I am pleased to report that all your subsidiary companies operated at a profit during the year under review, and I comment on them individually as follows:

William Asquith Limited.—This Company maintained a high volume of business. Although, as indicated in my last report, the quantity of special machines was higher than previously, the profit margin one can expect from this type of machine is very much more speculative than from standard running lines.

Drummond Brothers Limited.—This Company has maintained a high standard of activity, and their contribution to the results is in every way satisfactory. However, the major users of the products of this Company are the Automobile Industry, and it does not require me to stress the problems which that particular industry is facing at the moment. It is to be hoped that the difficulties in that direction are only of a temporary nature, but with a view to broadening the basis of the Drummond business I am pleased to advise you that we have acquired a manufacturing licence from Batignolles-Chatillon, France, for their Pilot Copying Lathe, a satisfactory market for which already exists for machines now imported from France.

George Swift & Sons Limited and Swift-Summerskill Limited.—These Companies also have maintained a high level of activity during the year under review, and have fully justified your Board's decision to acquire them. Your Directors, however, are concerned with the limited manufacturing facilities available, and to some extent their dependence on sub-contracting, bearing in mind the volume of orders to which they are committed, and also the amount of business which they are not able to accept because of these limitations.

Modern Foundries Limited.—This Company continues to be of great value to the group, but as reported previously, lack of skilled labour is a major problem. We are still too dependent on outside foundries.

Rotadop Limited.—During the year under review, this Company became a wholly owned subsidiary, as your Directors considered that the facilities available at Rotadop Limited should be devoted more to their engineering activities for the benefit of the group, at the expense of their mechanical diamond polishing speciality. I am pleased to report that this policy has shown every indication of fulfilling what your Directors had in mind, particularly as regards their specialisation of certain products, which are important accessories to our main machine tool activities.

Drummond-Asquith (Sales) Limited.—Your selling Company continues to give a good account of itself, and maintains that close liaison with users of Machine Tools, which is so important if they are to be acquainted with the developments which are constantly taking place.

Your Directors' policy is still to import machine tools from overseas which are complementary to your Company's products, so that we are in a position to offer the Engineering Industry a wide range of machine tools.

Associated Machine Tool Corporation.—This American subsidiary continues to serve its purpose in the United States.

MANUFACTURE IN AUSTRALIA

During the course of the year the Corporation concluded an agreement with Vickers Australia (Pty) Limited by which that organisation are at liberty to manufacture the products of the Asquith group at any of their plants in Australia, as and when they consider industrial development in Australia will justify it.

Anybody who knows the scene will realise that nothing can stop the advance of Australian Industry, and Machine Tool Manufacture must play a leading part in this. I feel that such an agreement can only, in the long run, benefit the Commonwealth, Vickers and your own Company.

This trend towards local manufacture and the establishment of indigenous machine tool industries in what were our traditional markets is an inevitable development which we must face. At first sight it is disturbing, but I am confident that industrial advancement in those areas will create a demand for other and more advanced products from your Company for which we are fully prepared to cater.

This trend, moreover, underlines the vital importance of our being in a position, not only to take full advantage of existing markets, but to develop new ones.

In this connection, it is hoped that the day is not far distant when HM Government will be in a position to reconsider their relationship to the so-called strategic list, which controls the types of machines which can be shipped, not only to the USSR, but to Eastern Europe and China. In my opinion the existing list has little bearing on the purpose for which one presumes it exists, whilst it certainly has a very detrimental effect on our trading prospects and good relations in these important markets; moreover the differentiation in the strategic ban as applied to "Iron Curtain" and "Bamboo Curtain" countries is as ludicrous as it is purposeless and will cost us dearly in Far Eastern trade if it is not soon abandoned.

POLICY OF EXPANSION

Your group has expanded and broadened its structure during the last five years and I am confident that this policy has been correct.

I am equally confident that subject to no major economic setbacks, we must consider even further expansion during the years ahead of us. I base my assumption on the fact that during the 12 months under review exports of Machine Tools from this country were £19,847,000 whilst imports were £22,390,000. It seems to me that if we are to maintain and/or increase our direct contribution to the balance of payment problems by direct

exports, and at the same time make available the latest developments to our vital exporting engineering industry at home, then the industry should expand.

I have been told many times by important users of Machine Tools of their distress at having to buy foreign machines because of their inability to obtain the British equivalents at reasonable delivery dates.

CRAMPING EFFECT OF TAXATION

In the matter of expansion, however, the Machine Tool Industry, in common with all engineering producers and exporters, suffers from the cramping effect of the cancellation of the Investment Allowances. It should, however, be realised that anything which hinders the expansion of our industry, as suppliers of the basic means of production, must in turn have a hampering effect on the whole of industry, so that machine tool users are doubly affected.

It follows that if the ideal of the total restoration of the investment allowances cannot be achieved at one stroke, there may well be strong justification for gradual restoration, industry by industry.

In his last Budget the Chancellor subscribed to this theory by making certain exceptions. If in the next Budget that principle can be extended, it would be in the interest of industry as a whole that top priority should be given to the machine tool industry in any list of further exemptions which might be introduced.

This is no plea for special help for a "lame dog"—we are anything but that. It is a call for securing the widest benefits from any limited concessions the Exchequer can afford to make. Of course, as has been so often stated, one of the major handicaps as regards any expansion programme is the lack of skilled or even semi-skilled labour. This problem is still with us, and is one which eventually can only be resolved by so arranging training schemes that we attract more and more young men at school-leaving age.

An equally difficult problem is the supply of engineering and designing staff. As labour rates increase, so will the demand for specialised machines tend to increase also, and this will put an even greater load on our engineering departments.

INCREASED DESIGNING ACCOMMODATION

We have considerably increased our Designing Offices at Drummond Brothers Limited in Guildford, and we have just completed a major extension at Halifax, which will approximately double the floor area and accommodation for this type of personnel. At the same time we have created in the Birmingham office of our Sales Company a large-sized engineering office, which is specialising in the needs of the automobile industry. The Shrewsbury Works of William Asquith Limited are also on the point of completing their own Engineering Department.

I consider the increase of these engineering facilities most important if we are to maintain a proper rate of development, and at the same time enable the manufacturing plants to achieve the output which should eventually be possible with their production facilities.

For the next financial year, I am happy to report that all your companies have full order books, and subject to no unforeseen circumstances, I see no reason why the standard of profit should not be maintained, and I look forward to at least the same rate of dividend as for the year under review.

The Report and Accounts were adopted.

FORD MOTOR COMPANY

COMPETITIVE POSITION IMPROVED DESPITE GROWING DIFFICULTIES

MARKED INCREASE IN DOLLAR AREA SALES

SIR PATRICK HENNESSY'S STATEMENT

The twenty-eighth Annual General Meeting of Ford Motor Company Limited will be held on April 17th in London.

The following is an extract from the circulated statement of the chairman, Sir Patrick Hennessy, which opened with a tribute to the late Lord Perry.

As forecast at last year's Meeting, I have to report a year of growing difficulties but one in which your Company improved its competitive position.

In the home market purchase tax on cars was increased in late 1955 to 60 per cent, which penal rate was effective throughout the entire year, and still remains an unfair and crippling burden. The credit squeeze and hire purchase restrictions in particular affected our industry. Abroad Australia and New Zealand substantially reduced their import quotas for vehicles. Finally the Suez crisis brought petrol rationing and with it a drastic reduction in demand for cars in the home and other markets, and the almost complete loss of business in the Near and Middle East.

The final result was that, as against a fall in sales for the rest of the industry of 18 per cent in 1956 compared with 1955, our Company's sales declined by only 8½ per cent; 320,742 cars, trucks and tractors in all were sold.

STRENUOUS EXPORT EFFORT

A year of most strenuous export effort, during which our representatives travelled over half a million miles to every corner of the globe, produced sales of 153,939 units, and earnings of over £68 million. Dagenham provided one out of every four vehicles exported from Britain, including nearly half the British cars shipped to the major markets of Europe where international competition is most intense.

Another most encouraging feature was the marked increase in sales to dollar area countries—from $19¼ million in 1955 to $29¾ million last year. To USA alone three times as many cars were shipped as in the previous year. Shipping difficulties were overcome by special chartering and ingenious crating.

At home Ford dealers helped to increase our share of the vehicle market from 26 per cent in 1955 to 30¾ per cent. In the last two months the announcement of petrol rationing had an immediate and extreme effect which still persists at the time of writing this report.

Most tractor markets declined but good sales organisation and intensive effort increased our share of British tractors sold from 33 per cent to 35 per cent at home, and from 33⅓ per cent to 34¾ per cent abroad. Applications of the Fordson Major Tractor in the industrial field were further developed with satisfactory results.

TRADING RESULTS

Total income for the year was £145,678,493, only 4 per cent less than in 1955, but operating profits fell from £17,907,600 to £9,989,842. Recovery in the market values of securities brought the total profit, before tax, to £10,253,866. Taxation of £4,639,000 left a net profit for the year of £5,614,866.

A final dividend of 5 per cent less tax makes, with the interim dividend of 2½ per cent less tax, 7½ per cent for the year, the same as for the previous year.

Our confidence in the future growth of demand for vehicles remains firmly based, following a thorough re-study of prospects in world markets. Plans go ahead for keeping our entire range of products up-to-date and for the necessary expansion and modernisation of factories and equipment.

HANDICAPS CONFRONTING INDUSTRY

Our industry remains handicapped, as against its Continental competitors, in two important respects, the penal rate of purchase tax and the increasing inadequacy of British roads.

The German motor industry increased its sales last year by one-fifth. In the UK the intention was that a high rate of purchase tax would divert home sales to export. Not only has it failed in this but it has so reduced the volume of sales in the home market that costs have been increased and the ability to compete in export markets has been thereby impaired. Early and progressive relief is necessary to remove this serious handicap which purchase tax indirectly imposes upon the export effort of the motor industry.

Reduced usage of our roads during recent months because of petrol rationing has tended to obscure the fact that our road system remains gravely deficient for the transport needs of a modern economy. From time to time, plans are announced of road developments for completion years ahead, but little visible progress has been made. In this respect also our future is prejudiced, and I urge again that increasing and urgent Government attention be given to this all-important problem.

INDUSTRIAL RELATIONS

This statement would not be complete without some reference to industrial relations, particularly to the affairs of our Briggs subsidiary. Our earnest desire is to establish good relations with the Trade Unions at all levels and with our employees at Briggs, based on the acceptance and observance of agreements by all concerned. Management and employees have a common interest in the development of harmonious working: without it we cannot hope to compete efficiently in world markets or to maintain full employment.

In conclusion, it is my great pleasure to thank our staff and employees who have worked so hard in the Company's interest during this most difficult year. We have had the wholehearted co-operation of our Suppliers, Associated Companies overseas, and the Dealer organisations at home and abroad and I would like to acknowledge their efforts. Such fine support will help us to overcome the difficulties of the present time and meet the challenge which lies ahead.

LEWIS'S INVESTMENT TRUST

RECORD RESULTS IN CENTENARY YEAR

MR S. H. LEAKE ON A VIGOROUS AND STEADILY EXPANDING ORGANISATION

The Twenty-eighth Annual General Meeting of Lewis's Investment Trust Limited will be held on April 16th, in Liverpool.

The following are extracts from the statement of the Chairman, Mr S. H. Leake, OBE, to be delivered at the annual general meeting with the report and accounts: I am again privileged to report to you profit results exceeding any previously achieved by the Group, and it is appropriate that this should be so in our Centenary year. They arise from a percentage increase in trade of more than 6 per cent, which is greater than can be ascribed solely to inflationary trends.

Our organisation operates in widely separated parts of the country, and each area has contributed to these improved results. The increasing support of the shopping public which we have enjoyed is evidenced not only by greater turnover but also by the rise in the number of transactions handled during the year.

We celebrated the Centenary of our principal subsidiary, Lewis's Limited, on May 29th, and whereas trading conditions prior to that date had proved difficult, thereafter we experienced an upsurge in trade which has been more or less maintained ever since. It was as though all ranks had drawn inspiration from the fact that they belonged to an organisation which had successfully completed its first 100 years of service. I can only express my belief that our results reflect a high level of morale in the business.

PROFIT AND LOSS ACCOUNT

In the Consolidated Profit and Loss Account of the Trust you will see that our total revenue before tax and depreciation has increased by £436,100, or 8.7 per cent, to £5,464,026. The corresponding percentage figures for our principal subsidiaries, Lewis's Limited and Selfridges Limited, do not materially differ from the Group as a whole, and as the results of the other subsidiaries were broadly similar, there seems to be some common foundation for the prosperity enjoyed by the Group during the year under review. Apart from the satisfactory increase in Trading Profit, Miscellaneous Revenue has almost doubled. This reflects the profitable short term use of a high level of liquid assets at rewarding rates of interest.

On the other hand, the provision we have had to make for taxation has increased by £279,302 to £2,713,502, so that the net profit of £2,271,437 shows only an increase of £113,470, or 5.3 per cent. In other words, we shall be paying out in tax £442,065 more than is left to distribute as a reward for our efforts. Surely the tax-gatherer can be too exacting for the economic health and progress of industry.

The amount retained in the Group is £1,369,740, and including Lewis's Bank Limited this represents 60.98 per cent (60.42 per cent last year) leaving for distribution 39.02 per cent (39.58 per cent last year). Our Capital Commitments reach a total of £3,139,000 made up of approximately two-thirds to complete our Liverpool and Bristol stores and one-third to meet the cost of the developments on which we have now embarked at Selfridges. This figure, however, should be compared with the total of two items of Current Assets in the Consolidated Balance Sheet of the Trust, i.e., General Investments and Short Term Investments which together are £3,069,309. Thus we are already in a position to pay out of easily realisable assets for the capital commitments into which we have so far entered. Moreover our purchases of tax reserve certificates in the Group now total £2,725,000 which compares with our total Tax Provision for the Group of £2,713,502.

It has given the Board much pleasure to be able not only to recommend the consolidation of last year's Centenary bonus of 2½ per cent but to increase the equity distribution by a further 1 per cent.

As I pointed out in my speech last year, this question of distribution should always be related to the real capital employed in a business as opposed to its issued capital which in the case of the Trust appears in the Balance Sheet as £7,742,368. Shareholders should also be satisfied that the real capital employed, which rises steadily as a result of annual retentions from profits, is being profitably used.

This is proved by the fact that the profit earned on the capital employed in the business, which now reaches £28,297,731, has risen from 15.28 per cent in 1952 to 17.87 per cent last year, an increase of over 2½ per cent.

Apart from the heavy increase in taxation, we have also shared the common experience that the expenses of doing business continue to rise steadily year by year, and of that increase, wage advances account for a large proportion. Accordingly we are once again in the happy position of being able to report that staff, stockholders and the business itself have each shared in the increased prosperity of the Group. That concludes what I have to say about the Accounts, which I hope gives you a picture of a vigorous and steadily expanding organisation.

INDIRECT TAXATION

In addition to National taxation, there are two forms of indirect taxation which continue to bear heavily on our business. As a result of the property revaluation which occurred two years ago, our payment for local rates increased by £107,322 in the year under review.

Although the Government have recognised the unfair burden which these new assessments placed on retailers, and have given this recognition practical form by proposing a percentage reduction, we view with concern the tendency for the rate per £ to increase sharply in the areas where we operate, to the extent that such increases may well cancel out any future benefit we may enjoy from reduced assessments.

PURCHASE TAX

Purchase Tax was introduced in September, 1941, primarily to discourage consumption of goods, the making of which used labour and materials that could be used for war work, and to absorb consumer purchasing power in order to reduce inflationary pressure. Subsequently it has also been regarded by the Chancellors of both Parties as an extensive source of Revenue, reaching now towards £500 million a year. Retailers pay Purchase Tax as and when they pay for goods and the tax is therefore part of the cost price of a very wide range of consumer goods, and is subject to the hazards of retail trading and particularly to sudden Budgetary changes.

It is our experience that Purchase Tax does not "mop up spending power." In very few cases in our business is there any evidence that Purchase Tax has slowed down consumption, except temporarily and with high priced goods subject to the highest rates of tax. If the public want goods they will buy them: that, after all, is the expression of a rising standard of living.

Far from reducing inflationary pressure, Purchase Tax increases prices. If tax additions, such as the following, are made to the cost price, then the selling prices of consumer goods, which affect the cost of living of every grade of the community, rise beyond their real economic worth:

Article	Cost (ex tax)	Tax
Man's raincoat	138/–	6/9
Handbag	9/1	5/4
Clock (alarm)	9/11	3/–
Umbrella	16/9	4/10½
Lino (yard)	5/1	1/4
Kettle	3/6	1/3
Suitcase	13/6	9/9
Earthenware mixing bowl	3/7	1/1
Tea-pot	6/8	2/–
Galvanised pail	4/1	1/3
Galvanised dustbin	24/3	7/3
Table knives, ½ doz.	13/–	4/2

In my opinion, the Government should further explore the effects of Purchase Tax with a view to reducing the cost of living and restoring the value of the currency. We cannot accept the view that £500 million a year must continually be collected from consumer goods, and would welcome the restoration of intrinsic value in the prices of those everyday goods that are required not as luxuries but as necessities by ordinary men and women, and particularly by young people setting up new homes.

SELFRIDGES

The improvement in the physical appearance of this store has been accompanied by a steady increase in its profit-earning capacity. Its profit, before tax, has now risen to £1,386,785 and its financial position has greatly improved. It was, therefore, with some confidence that we launched a long-term development scheme which is now taking shape.

The contract to cover the first stage amounting to £1,167,000 was placed after the end of the financial year.

BRISTOL

The building of our Bristol Store is proceeding apace, and we hope to begin trading

In the Autumn. As the building takes shape we become increasingly proud of this addition to our chain of stores.

When completed, the building will have cost over £2 million, and after providing for fixtures, stock, and other contingencies, our total investment is not likely to be much less than £3 million. That investment will have been wholly financed out of our own resources, and while it would be unrealistic to expect any quick substantial return, our experience of similar ventures leaves us in no doubt about its long-term value.

OTHER BUILDING DEVELOPMENTS

This last year has seen some of our many building plans brought to fruition. The extensions to our Leicester Store were completed during the year and we enjoyed an almost immediate return both in trade and profit-earning capacity. We have also made improvements in the delivery facilities of the Leeds Store by constructing a transport depot on the outskirts of the town.

Finally, we anticipate that the third section of the Liverpool Store will be ready for trading in the Autumn. The cost of rebuilding and equipping this Store as a consequence of the disaster of May 3, 1941, has proved heavy. The total will be about £3,140,000, of which nearly £1,990,000 ranks as War Damage claims.

In all respects our staff relations continue to be cordial and with great sincerity, I ask you to authorise me to convey from this meeting a message of your appreciation to all ranks of our staff for their loyalty and for the contribution they have made to our achievements of the past year.

EASTBOURNE MUTUAL BUILDING SOCIETY

The eightieth Annual General Meeting of the Eastbourne Mutual Building Society was held on March 27th at Eastbourne.

Mr Laurence A. Caffyn, chairman, in the course of his speech, said:

This is the eightieth Annual General Meeting of this Society and I am very pleased to welcome you once more. It is only natural that on an occasion such as this one tends to look back over this comparatively long period. This Society has played a very big part in the development of Eastbourne, and it is an effort in which we can well be proud to have participated. The Society continues to attract members who wish to build up a proper reserve of savings for future contingencies.

During the year interest rates continued to rise, and the rate of 3 per cent the Society was paying to shareholders became unrealistic. Accordingly, it was decided to increase the rate as at August 1st to 3½ per cent and other investment rates were increased proportionately. This increase meant that, in due course, the Society had to increase its rate to old borrowers as well as to new. It was necessary to delay this decision until your Board was aware of its liability to Tax for the year. In view of a further increase in the composite rate paid by the Society, your Directors had no alternative but to advise borrowers that as from January, 1957, the rate payable would be 6 per cent. You will observe, however, that old borrowers did have the benefit of a lower rate for a period of five months.

The report and accounts were adopted.

PATALING RUBBER ESTATES LIMITED

SIR ERIC MILLER'S ADDRESS

The thirty-seventh annual general meeting of The Pataling Rubber Estates, Limited, was held on March 25th, at the registered office of the company, 1-4 Great Tower Street, London, E.C.
