PREPARATIONS to complete the British £100 million thermo-nuclear research project by testing a fission-fusion-fission bomb in the megaton ranges (as well as some " clean " atomic warheads) are proceeding, and a large area of ocean in the vicinity of Christmas Island has been scheduled as closed to shipping in the months ahead. Already the Japanese have begun complaining that this not only reduces their normal fishery in the south seas, but involves their catching large quantities of unsaleable and unprofitable radioactive fish elsewhere. Nor will the British test be particularly welcome in the United Nations bodies embroiled with disarmament, though it may heighten the sense of urgency in getting such tests rationed or banned. The report of the UN scientists' committee on the effect of the tests so far made is not expected until 1958.

Recent Russian tests have rated only small headlines in the western press. The British test may produce rather more excitement. There is, however, no sign that the government will be deflected from completing the decision made in 1955 to have the hydrogen bomb and announced by Sir Winston Churchill at that time. Having it, and being seen to have it, may offset some of the impression given by the expected defence cuts. For though the possession of the supreme deterrent may be useless in day-to-day British diplomacy, it is a warning and guarantee that if the worst came to the worst the country's dying sting would be not merely dangerous but lethal.

Rents in the Rents Bill?

THE Rents Bill is making very slow progress through Standing Committee upstairs in the House of Commons ; the only amendment accepted so far is one ensuring that certain controlled tenancies covered by leases or special agreements should not have their rents raised with the rest. But the Government's general intentions are becoming clearer. It looks as if it is going to stand commendably firm about rises in the rents of houses that will remain under control, despite the political furore this is causing. Great play is being made with the fact that up to two-thirds of the 4¼ million houses remaining controlled will have their rents doubled, and that some 2½ million of them may suffer increases of more than 7s. 6d. a week ; but both these points are reflections of the extraordinary fact that almost threequarters of these houses at present have rents below 10s. a week. If the bill receives the Royal Assent somewhere around June, then —since the bill will become operative a month after receiving the Royal Assent, and since all rent increases will require three months' notice and increases over 7s. 6d. a week nine months' notice—the impact should be felt between about October of this year and late spring of next year. This will approximately coincide with the period of settlement of the next round of wage demands, but it should also be something like eighteen months to two years before the date of the next general election.

The one place where the Government is going to beat a retreat was indicated when Mr Henry Brooke told a Kensington audience this week that it is "thinking out the best method of easing the transition from control to decontrol" of the 800,000 middle-class houses and flats which, under the bill as it stands, would be thrown on to the free market on six months' notice from the landlord. Any yielding to pressure here will be deplorable, but there can be differing degrees of deplorability in whatever is to be done:

(1) The worst course would be to reduce the number of houses to be freed; that would make the rise in rents of the remainder much steeper. Fortunately, there is no sign that the Government is considering this course.

(2) One possibility is that the Government may limit the rise in rents that will be allowed, at any rate for a period; it might limit the new rent to twice the gross rateable value plus service charges, so that the main difference between these houses and fully controlled houses would be that the tenants of them would still be deprived of security of tenure. Oddly, some of the property-owning companies would not greatly object to such a decision; their main immediate eagerness is to be allowed to get rid of bad tenants, and they (although apparently not the protesting tenants) know quite well that in a free market most of these 800,000 rents will not rise above twice the gross rateable value anyway. But, in that case, why impose the restriction and thus prevent some flats and houses in exceptional demand from being shaken out on to the free market?

(3) The Government's most likely course is perhaps to say that the full new rents, and the ending of security of tenure, cannot become operative until, say, twelve or eighteen months after the operative day of the bill, so that tenants should be able to try to negotiate longer leases giving them varying degrees of security of tenure.

Of these three courses, the third—despite all the disadvantages discussed in *The Economist* last week—would nevertheless be, by a short head, the least deplorable. It would also, however, delay until nearer the next general election a storm which has some day simply got to be faced.

Two Attitudes Struck

THREE points each can be made about two individual Labour displays of deep emotion in the past week, beginning with Dr Summerskill's charges against the conduct of British operations at Port Said. First, all independent evidence—including especially Sir Edwin Herbert's admirably reasoned account—suggests that some of Dr Summerskill's original charges were inaccurate both in imputation and fact. What she said on television on Monday really carried a very different *nuance* from what she said when she first got off her aeroplane. Secondly, if she believed these charges to be true, she should not be attacked for having uttered them; there has even been a queer, though deplorably self-excited, sort of courage in what she has done. Thirdly, when a Cabinet Minister says that "Dr Summerskill has given ammunition to this country's enemies," he must expect to arouse wry smiles from Labour members; for everybody at Westminster knows that she has really given ammunition to the Conservatives. After certain demonstrations in favour of female emancipation in a previous visit to the Middle East, Dr Summerskill's evidence is likely to be regarded in the Arab world as that of a very strange lady; the damage she has done there is not great. Domestically, however, like Mr Bevan's long-remembered lapse about vermin, the stigma of this piece of bad reporting and worse politics is likely to stick.

There should be an electoral stigma attaching to another private Labour initiative in the past week, but unfortunately there will not be. A number of Labour MPs have signed a motion protesting against the projected appointment of the German General Speidel to command Nato ground forces in Central Europe. The reasoned argument against this appointment is that he will be a German general without very many German soldiers; the even more reasoned reply to that, however, is that his appointment is more likely to ensure that there will be more German soldiers, which is what Nato wants. A protest could also be understood if General Speidel were the sort of man to whom personal exception could be taken; he is not, although it is quite probable that less desirable sorts of German military leaders may come on to the scene later—because exceptionable people of all nationalities sometimes make very good generals. But the real basis of the private Labour motion is to be found in neither of these arguments. It is to be found in pure racialism; and anti-German racialism in Europe can be just as unpleasant a thing as anti-black racialism in South Africa.

Step by Step

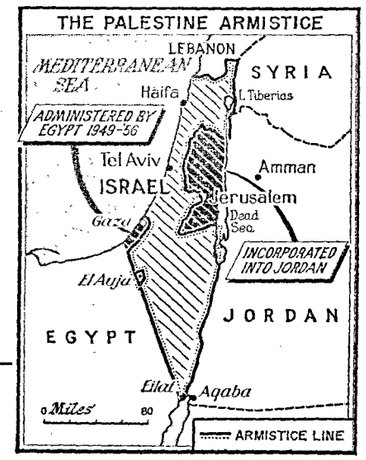
THE outline of Mr Hammarskjöld's report to the General Assembly on the opposite page shows that he is neither so vague nor so evasive about the problem of Israeli-Egyptian relations, and the United Nations' duty in regard to them, as many accounts of the report have suggested. The Assembly must, in his opinion, call upon both countries to adhere once again to the armistice agreement, observance of which is the essence of the November 2nd resolution from which UN action and the creation of the emergency force developed. And, to re-establish the armistice agreement, Israel must complete its withdrawal from Egypt. His aim is to restore the *status juris*, not the *status quo ante*, a distinction important to his concept of progressive action towards a settlement.

At this stage his recommendations do not go beyond the demand for assurances from Egypt and Israel that they will keep to the armistice agreement; there are no concrete guarantees of the sort Israel seeks. It is, however, implied in his report that the guarantee should be the assembly's grip on the problem. Uno is at present tied to the agreement, as much as the two parties, by the fact that the Security Council approved it, but if the agreement is destroyed by the refusal of either or both countries to restore it in practice, then presumably the assembly will be free to consider new action. Mr Hammarskjöld, in his step-by-step approach, might then be expected to point to the action that should be taken.

By refusing to withdraw completely and by claiming that the armistice agreement is dead, Israel is restoring the assembly's right to consider the situation as a whole. As

The Hammarskjöld Policy

THE Secretary General, in his report of January 25th to the UN General Assembly on Israel's failure to complete its withdrawal from Egypt, makes clear his view that scrupulous observance of the armistice agreement is the essence of the Assembly's resolution of November 2nd, and the proper starting-point for all action to pacify the Egyptian-Israeli frontier. Further, the armistice agreement was approved by the Security Council and must be respected "whatever new arrangements the UN may now wish to make." Therefore the UN cannot accept Israeli control over the area "even if it were of non-military character."



Gaza Strip. Mr Hammarskjöld considers that the Israeli proposals for the Gaza strip are incompatible with the armistice agreement. To broaden the functions of the UN emergency force in Gaza would need the consent of Egypt. So would any widening of UN administrative responsibilities in Gaza; the Assembly could recommend it but could not demand compliance. Nevertheless, he concludes that the Assembly might have to face "added responsibilities" in the strip.

Access to Aqaba Gulf. He gives quasi-legal advice against Egypt's right to blockade the Gulf, though he points out that the International Law Commission refused to define the legal position of straits such as Tiran ("straits forming part of the territorial sea of one or more states and constituting the sole means of access to the port of another state.") He argues that claims to belligerent rights in the straits should be limited to "clearly non-controversial situations" and that in any case the international significance of the gulf might justify the right of innocent passage.

The Suez Canal. Mr Hammarskjöld points out that the Security Council's resolution of September 1, 1951, which ruled against the belligerent rights claimed by Egypt against Israel in the Suez Canal, was based on the "permanent character" of the armistice agreement. If Israel withdrew behind the armistice lines the Assembly could then conclude that the agreement was still in force and that neither side had belligerent rights (which would mean Egypt had no right to close the canal to Israeli shipping).

Action. He likens the armistice agreement to a non-aggression pact and considers that progress towards a solution of problems would only be impeded if the agreement were by-passed. He therefore calls for scrupulous observance by Israel and Egypt particularly of Article I, which rules out aggressive action, and Articles VII and VIII; these restrict the deployment of forces on both sides of the armistice lines and limit Egypt and Israel to "defensive forces" in their respective areas of the front. He suggests that if El Auja were demilitarised in accordance with the armistice agreement, the UN emergency force might be stationed on the Israeli side of the Armistice line, at least in that zone.

His report clearly directs the Assembly to the view that the Egyptian blockade of the gulf is wrong and the denial of the Suez Canal to Israeli shipping is also wrong; but the essential prerequisite is to re-establish the validity of the armistice agreement by the withdrawal of Israeli forces completely behind the demarcation lines. Implicit throughout the report is the Secretary General's view that this would be the starting point for fresh action, not the end of the Assembly's responsibilities. He concludes that by securing observance of the armistice agreement the Assembly would have made "a significant step in preparation for further constructive action" and would then "be able to turn to constructive tasks."

The Palestine Armistice

MR HAMMARSKJÖLD'S sheet-anchor as he manœuvres between Israel and Egypt is the 1949 armistice agreement between the two countries. This, in common with the other three agreements which Israel signed later that year with Lebanon, Jordan and Syria, was engineered by the United Nations mediator, Dr Ralph Bunche, to bridge the period between the cease-fire and the formal ending of the Palestine war by peace treaty. Since the agreements have never been replaced by peace settlements, revised, or abrogated, they are still legally in force however much their conditions have been violated in the past eight years.

The Israel-Egypt agreement, which set the pattern for the others, was an attempt to freeze the military situation. The signatories affirmed the cease-fire (fighting was supposed to have stopped about six months earlier but through the winter of 1948-49 both sides were still skirmishing for position), forswore hostile acts against each other and agreed, at least temporarily, to a frontier.

Since the United Nations had given up their attempts to partition Palestine by criteria other than military victory, the demarcation line, with very few deviations, cut between the two armies. But the Israelis, resenting the loop round the Gaza strip, had a qualifying clause written into the Egyptian agreement (but not into the others) stating that the armistice line was not to be construed as a political boundary and did not prejudice the ultimate rights of either party.

In an attempt to immunise the frontier between Israel and Egypt, the agreement limited the strength of the armed forces which could be stationed on either side of it. The area round the village of El Auja on the Israeli side of the border was to be completely demilitarised and used as the headquarters of the truce supervision organisation.

Both the letter and the spirit of the agreement have been consistently broken. The most flagrant abuses were the double blockade of Israel, the never-ending raids across the border and the Israeli attack last October. Although the Security Council on several occasions called the two sides to order, the provisions of the agreement were never enforced and consequently mainly ignored. The peace settlement has never materialised, and a situation which is intrinsically at boiling point could not be kept on ice.

The armistice agreement contains the provisions for peaceful coexistence. But it can only be respected if all its conditions are fulfilled: blockades, boycotts and guerrilla warfare are hostile acts as much the seizure of territory. The Israelis claim that the agreement is in ruins: it needs some powerful scaffolding if it is to be rebuilt.

this is what the Israeli government wants, it can be expected to continue to refuse; but it is also probable that its conditions for withdrawal—such as the demand for the demilitarisation of Sinai—need not be taken at their full face value.

The president of the Assembly has adjourned the formal debate while the Secretary General's report is discussed in the lobbies. This is no doubt necessary if enough support is to be rallied to give any new resolution the required two-thirds majority. But, if the speech of the Soviet delegate on Tuesday is any guide, he will be at work to perpetuate the unrest in the Middle East by obstructing any constructive use of the UN emergency force.

Double-Headed King

KING SAUD, who is at present visiting Washington, must present an interesting problem for the State Department as it restudies Middle East policy. On one side he is unquestionably anti-communist, for his antique and absolute monarchy cannot stomach even a hint of reform from anywhere but itself. On the other side his policy is completely identified with that of Egypt and Syria, the two countries whose false neutrality has allowed the very communist penetration that the United States now seeks to combat.

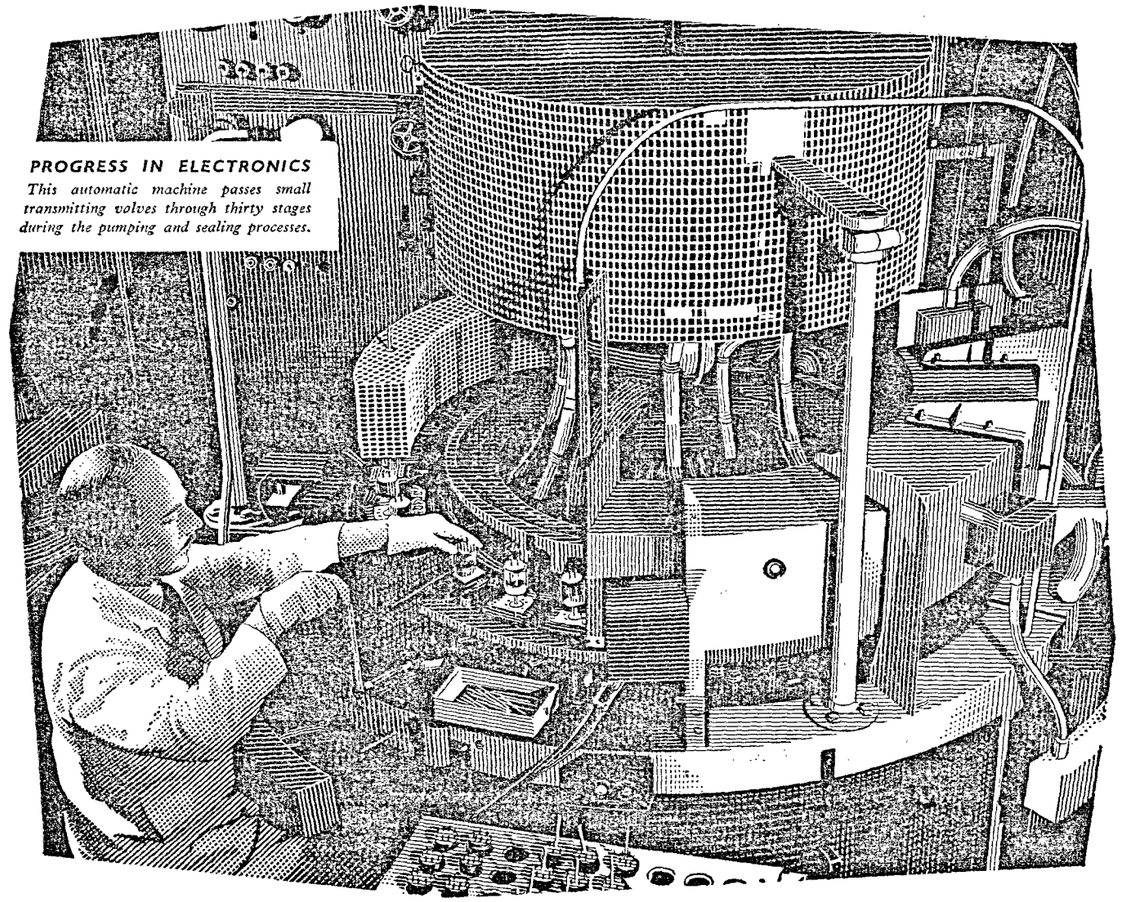
Probably he is permitting himself in Washington a few grimaces at the policies of the Egyptian and Syrian governments. The association, one can be sure, is being presented as a marriage of convenience forced upon the faithful of Arabia by the wicked imperialism of the British. ("Now if only the United States would do something about his rights in Buraimi and be more tactful about the Baghdad Pact which upsets that nuisance of a fellow Nasser . . .") This must seem an appropriate time for King Saud to tell the President and Mr Dulles what a warm place awaits America in the hearts of the Arabs if only Britain is ditched.

One must hope that those American diplomats who are not readily deceived by this approach are in action; for the mainspring of Saudi Arabian activity for years has been the determination to isolate Iraq, not because that country is friendly to the West, but because of the enmity of the two royal families. In his single-minded pursuit of this end, King Saud has muddied the broad stream of Arab nationalism with his money, and has without hesitation made common cause with communism when it suited. To no small extent he has been paymaster for President Nasser in other Arab countries.

He is reported to want money and arms from the United States; these requests must be seen against his agreement with Egypt and Syria on January 19th to finance Jordan's rejection of the treaty with Britain. By this agreement the three countries undertook to arm Jordan; and it seems clear that aid to Saudi Arabia will release other funds and money for this purpose. King Saud's oil income last year was about £82 million.

His strongest card is the United States air base at Dhahran on the Persian Gulf. The five-year agreement by which America holds this base expired in June, and King Saud is taking his time about renewing it, knowing perfectly well its strategic importance since the United States gave up the wartime airfields in Iran and Egypt.

The Railwaymen's "No"



THE National Union of Railwaymen, in rejecting the latest offer of the British Transport Commission, threatens to renew the old and costly strife between the railway unions. Three weeks ago the Associated Society of Locomotive Engineers and Firemen decided to accept the increase of 3 per cent awarded to them by the railways' arbitration tribunal, although they had claimed as much as 15 per cent. The National Union of Railwaymen, meanwhile, which was engaged in separate negotiations with the Transport Commission, had rejected an offer of 3 per cent. Mr Campbell, the general secretary, argued that this would give only 4s. to the lowest paid, a sum which he claimed (according to his arithmetic) would not compensate them for the higher prices of necessities. The transport commission then raised its offer to 5s. 6d. at the bottom of the scale, and to 7s. instead of 6s. 6d. at the top. This would have given an average increase of about 3½ per cent since the railwaymen's last increase. But the negotiating committee was still not satisfied, and the union's executive confirmed the rejection. They want a percentage increase, but one nearer to their claim of 10 per cent—which they will now take to arbitration.

What do they expect the tribunal to say? They hope that it will be impressed by their argument (which the ASLEF did not use) that they are hardly treated compared with other nationalised industries. The railways tribunal has not always been notable for its consistency, but could it, after making its award to the locomotive men expressly and solely on the basis of the cost of living, now act on some entirely different principle? The NUR may find itself offered only the same 3 per cent—less than the transport commission's offer, which has now been withdrawn. What then? The railwaymen would find the nation very unsympathetic towards any attempt to exploit the present dependence on their services.

Middlemen Vindicated

IT is a favourite theme of both the National Farmers' Union and the Labour Party that the honest toiler and the hard-pressed housewife are being jointly exploited by inefficient "middlemen." This claim seems particularly plausible in the case of fruit and vegetables: commodities suffering from widely fluctuating prices and periodic unsaleable surpluses, together with a highly intricate marketing system whose chief feature appears to be long, slow hauls to and from the appalling maelstrom of Covent Garden. It is therefore very remarkable—and to anyone who still believes in genuine competition most refreshing—to discover how well the despised middleman emerges from the careful and detailed investigations of the Committee on Horticultural Marketing (Cmd 61):

> (a) *Is the present system of horticultural marketing basically inefficient?* Definitely not. Multiple handling and long hauls are not evidence of waste but essential elements in meeting the rapidly changing pattern of supply and demand for a large number of partially inter-changeable products.

This machine is part of the product

In the final stages of manufacture, Mullard valves and television tubes part company with the machines on which they are processed. But until they do, the machines are virtually part of the product.

Machines on which electronic valves and tubes are manufactured can be used for no other purpose. Their design is so closely related to the design of the product that the introduction of a development in one is rarely possible without a modification or adjustment in the construction of the other. In many cases, the valves or tubes are activated while still on the machines which process them.

That is why the greater part of Mullard machinery and equipment is designed, developed and built in Mullard's own engineering department. Constant research into manufacturing techniques and progressive development of plant and machinery are among the reasons why Mullard products enjoy a world-wide reputation for performance and reliability.

Overheard at Half-time at a Flood-lit Soccer Match.

So I said to my Chairman . . .

**The Independent Survey conducted by the Institute of Practitioners in Advertising.*

"So I said to my Chairman, it's all very well to talk about big readerships, but when it comes to selecting the papers to advertise in you've got to reckon where those readers live."

"And what did he say?"

"He said he couldn't care less where they lived as long as they had the money to buy our goods, which gave me the perfect opening to tell him about the eight major conurbations in the I.P.A. Survey.*"

"Conurbations? That's a very high-falutin' word."

"It's quite simple, really. They are the eight largest industrialised areas in the country. The areas where the big wages and salaries are earned, and I told him that to be sure of getting our goods talked about in those areas we should advertise in the papers which are read there. And the top three, of course, are the Daily Mirror, Daily Express and the News Chronicle. He was particularly pleased about the Chronicle, because he reads it himself. He says it's the one popular daily which encourages its readers to think for themselves, and therefore must appeal to the intelligent type of person, irrespective of his social or income group."

"So those are the papers you're going to advertise in?"

"Certainly. There's no point in his having an Advertising Manager if he doesn't take his advice, is there?"

NEWS CHRONICLE
AND DAILY DISPATCH

(b) *Are middlemen's profits excessive?* Generally speaking—No. Distributive costs absorb about one-third of the total value of horticultural sales, which compares reasonably well with European countries and is much lower than the distributive margin in the United States.

(c) *Do retailers keep up prices unfairly in times of glut?* Not on the whole. Retail margins are relatively rigid, but they do move in sympathy with the prices received by producers. Drastic price-cutting in a glut is usually no solution, because of the public's limited capacity suddenly to stuff itself with fruit and vegetables.

(d) *Could producers go into horticultural marketing with advantage?* In a sphere where flexibility is the first and basic essential, the creation of compulsory marketing boards would be a major blunder. Producers' co-operatives may naturally develop, but there is no point in subsidising them, and there are "no easy pickings" to be had in the wholesale trade—it is far too competitive.

(e) *Is there sharp practice by unscrupulous wholesalers?* Many producers are convinced that there is, and the committee concedes that it sometimes occurs, although primarily at the expense of the Chancellor of the Exchequer. Its recipe is an Institute of Salesmen, which would control by public censure the few disreputable firms and individuals.

(f) *Should imports be limited in order to protect the home crop?* Definitely not. Other considerations apart, since both supply and demand of most fruits and vegetables are fairly erratic, such protection could only work by permanently under-budgeting for imports—to the consumers' great disadvantage.

These are all negative conclusions. There is of course also much scope for improvement—but in the direction of lubricating the present system (by way of improved market intelligence, better grading schemes, etc.), not of compulsory marketing. The committee recommends that a Horticultural Marketing Council should be set up, to promote development, research, and publicity. It also offers proposals for some decentralisation from, and more improvements at, Covent Garden.

Soviet Show in Cairo

RUSSIA is working hard to establish a pre-eminent position for the eastern block in Egyptian trade. The latest move is the Soviet industrial exhibition now being held in Cairo, where people are flocking to see the products that Russia can offer. The range is wide, covering everything from gramophone records to helicopters. Particular attention has been paid to agricultural machinery and tractors.

Britain and France have dropped out of the Egyptian market; the communist countries are stepping in. This situation was made worse by the Suez crisis but not created by it. British trade, which before the war constituted over a quarter of Egypt's foreign dealings, has steadily declined to the point at which the National Bank of Egypt can refer to it as of "secondary" importance. In the first half of 1956—that is, before the crisis—Egypt sold goods worth only £4.4 million to Britain; and although Britain sold £14 million worth of goods to Egypt, this was because of the £20 million released by Britain from the sterling balances. Czechoslovakia, on the other hand, bought £11.8 million as compared with only £2.8 million in the corresponding half of the year before. Iron Curtain trade, including that of China, now constitutes about 38 per cent of Egypt's foreign business.

In the concentration upon President Nasser's politics, it is not always remembered in this country that Soviet influence in Egypt can almost exactly be dated from the start of closer trading with the Soviet block in 1954. In combating Soviet influence in Egypt, a revival of western trade, when the time is opportune, is more important than Eisenhower aid

Light and Shade in Kashmir

AS entertainment for the connoisseur, some of last week's developments in the Kashmir dispute rivalled the hearings on Bernard Shaw's will. Mr Krishna Menon, in the course of an eight-hour filibuster, assured the Security Council that no "zero hour" was approaching. Just two days later, India announced that the new Kashmir constitution had come into force. Mr Menon insisted that the new constitution made "no difference." The Soviet delegate insisted that it made all the difference; by its adoption, he said, "the question of Kashmir has been settled by the people of Kashmir themselves." (Mr Sobolev thus deviated both from the Moscow and from the Peking lines; for while Mr Khrushchev declared the question settled in 1955, before the constitution had been adopted, Mr Chou still reserves judgment.)

The Council, however, got in under the wire with a resolution recalling its previous rulings, accepted by both India and Pakistan, that Kashmir's fate should be decided by a plebiscite under UN supervision. Ten of the eleven members supported the resolution. Russia, which could have vetoed it, abstained. This looked decidedly odd after Mr Sobolev had denounced the resolution so strongly. One explanation offered is that Russia was paying Mr Nehru out for his unbrotherly remarks about Hungary; another, that it did not want Kashmir to come before the UN Assembly and thereby further embarrass both Russia and India. Moscow is unlikely to explain the enigma, but its present eagerness to court Moslem opinion may well be explanation enough.

Unfortunately, behind these intriguing antics lie some sad realities, of which Pakistan reminded the Council by such vivid means as circulating an appeal addressed to Uno by Sheikh Abdullah, the deposed premier of Kashmir, from the jail where India has kept him without trial since 1953. The coming elections in Indian-held Kashmir (open only to pro-Indian parties) seem no more likely to resolve the real problem than did the accession to India of a fugitive maharaja in 1947. On a real view of its own interests,

Delhi would surely be wise to welcome and explore Mr Suhrawardy's offer to let Pakistan troops in Kashmir be replaced by a UN force. That withdrawal would remove what Mr Menon, Mr Bakshi and other spokesmen for India call "the only issue," and provide new hopes of ending a quarrel which only Russia—not even China—finds profitable.

The Strike at Briggs

Our Special Correspondent visited Dagenham to report on the complicated strike which sprang up there this week. He writes:

THREE shop stewards at Briggs Bodies, a subsidiary and neighbour of the Ford Motor Company's factory, wanted to attend a meeting of the Ford national joint negotiating committee on January 24th. An official of their union, the Amalgamated Engineering Union, had asked the employers to allow them to attend: the employers asked the secretary of the committee, Mr Hallett, also of the AEU, whether their presence was necessary, and he said it was not. The three were then warned not to take time off in this way, but they went to the meeting and were therefore suspended from their employment for three days. Two of their fellow stewards organised small protest strikes: one of these was also suspended for three days, and the other was at first suspended and later sacked. By Wednesday the whole of the Briggs factory had come to a halt because of the strike, and the stoppage of Briggs caused the stoppage of Fords. Speeches at the mass meetings on Wednesday were scattered with phrases like "Our patience is running out" or "The workers are always under duress." An "Open Letter to the Public" issued by their committee speaks of the prospect, if the management win this struggle, of a return to "sweated labour and horrible working conditions."

The company pointed out that, had they wanted to get rid of these men, they could have done so along with the 1,750 men dismissed in January. They say that the reason for suspending the stewards was simply that they absented themselves without leave and failed to abide by the agreed negotiating machinery. But they must have been pleased, after years of trouble, to enforce procedural agreements (although they have no backlog of cars to keep up their flow of exports), and they must have been glad to have a chance to get rid of at least one trouble-maker. This shop-stewards' committee has for long been dominated by extreme militants, and Briggs has a record of continuous strikes and stoppages which are always amply covered and encouraged in the *Daily Worker*. Opportunities for making trouble have been increased by the fact that Fords took over Briggs in 1953, and the attempt to bring conditions of service in the two factories into line has caused some inevitable friction. The management may to some extent be responsible for increasing its own troubles, for employers throughout the motor industry have tended to build up the shop stewards, as the men on the spot, at the expense of the union officials.

More than half the labour force at Briggs directly joined the strike. At the mass meetings there was plenty of disagreement as to the right time and place for the next meeting, but none was voiced about the rightness of the strike action: all speakers professed determination that the shop stewards—the men who make a fuss on their behalf—should not be "victimised." As this goes to press the AEU and Fords, unable to meet officially until work is resumed, are having unofficial meetings which may help to solve the present deadlock. But it will not be easy to bring long-term peace to Briggs.

Screening Civil Servants

THE Three Advisers who have to judge the reliability of civil servants who are "employed in connection with work the nature of which is vital to the security of the state" have been given new terms of reference; they were set out this week in reply to a parliamentary question by Mr Powell, the new Financial Secretary to the Treasury, and it is right that they should cause some initial concern. The meaning of "having been associated with communists" or of "being susceptible to communist pressure" leads tautologically back to being unreliable in the view of the Three Advisers; and the onus of proving that he is not unreliable lies on the accused, who will be told of the charges that have been laid against him, but not so fully that he can guess by whom the charges have been laid. On legalistic and libertarian grounds, it is possible to think up many criticisms of this procedure; unfortunately, it is not so easy to suggest a better system if security is to be preserved.

Probably the most sensible—if slightly cynical—view is that the best salve for uneasiness can be found in the unofficial checks and balances which an alert public conscience has caused to be built up. Britain's witch hunt is a gentlemanly one. The penalty of being found unreliable is not usually crushing. Genuine efforts are made to see if the man so judged can be transferred to another job; if it is less to his liking, well, the communist sympathiser who takes up physics cannot complain if his field of research is changed from atomics to fish manure. Promotion may be prejudiced, and the man accused (even when accused only of being "susceptible to pressure") cannot but become in closed circles a subject of gossip—but he risked that in the nature of the private life he is adjudged to have chosen to live. What if he is wrongly adjudged? The best safeguard against this probably does not lie in the rules, but in Ministers' knowledge that every doubtful action they take—*together with some certainly correct ones*—will set the watchdogs of civil liberty barking. More power to their barking, but do not let it have too hysterical a ring.

Common Market Nearly Home

THE treaties of the Common Market and Euratom seem to be nearly home, to signature at any rate, if not to the final haven of ratification. In Brussels this week the ministers of the six countries had some difficult moments, but their differences were not fundamental. The Dutch were indignant at the rather small weight they seem to have been given in the voting system and they still fear that the highly qualified form of common market in agriculture may not give their exports proper scope. But neither this, nor even the vexed issue of the overseas territories, seems likely to thwart the signing of the treaties this month.

In the French and even perhaps the German parliaments, however, the vague formula found for the overseas territories may still cause trouble. The whole political interest of the treaties, indeed, will soon be turning from the green table in Brussels to national assemblies, above all the French. Good public relations rather than diplomacy will be needed then; and here the British Government has a part to play. It is remarkable how little French opinion has yet appreciated the genuineness of the change in British policy towards Europe. Some opponents of the common market are still arguing that there is no point going into it because Britain is trying to sabotage it; others, like M. Mendès-France, seem to hold that France ought to sabotage it, because a loose free trade area with Britain would be preferable. They seem to forget that Britain's initiative towards free trade in Europe has been partly prompted by the common market scheme. The OEEC council meeting in Paris later this month will be a good opportunity for Britain to make clear once more to French opinion the seriousness of its new European policy.

M. Poujade's Eclipse

PARISIANS voted last Sunday in the second ballot of a by-election which was the most important test of French opinion since M. Mollet came to power a year ago. More than half a million voters are registered in the big constituency on the Left Bank. Admittedly, the results did not give an undistorted picture of the national mood. Fewer people vote in a by-election (nearly 42 per cent abstained on Sunday, against only 18 per cent in the general election a year ago). The centre of Paris—in contrast to its red belt—is predominantly middle class and rather conservative. Yet the comparatively good showing of the parties that back M. Mollet's Algerian policy must comfort him.

The collapse of the Radicals, a Communist setback and the success of conservative candidates were the chief features of the first ballot. The right-wing *Indépendants*, the main beneficiaries of the nationalism which has swept the middle classes, have now pocketed the one seat which is all that was at stake. The Radicals, associated with the less jingo stand of M. Mendès-France, seem to have been victims of the same mood, though the ambiguous position of this ever-divided party must have contributed. The Communist share of the total vote did not drop as much as some expected; but it fell, reflecting the uneasiness provoked by recent events among its usually faithful supporters.

Most significant in the second ballot, however, was the defeat of M. Poujade. The wave which swept more than 50 Poujadist deputies into parliament has been receding; discontented shopkeepers could see no return for their support; the deputies themselves were getting restless in uneasy isolation. To redress the position, the Poujadist chief himself decided on a trial of strength, and put forward his own candidature at the last moment in a district where his chances were in any case slender. The result was disastrous: he kept hardly more than half the votes which one of his followers won a year ago. This failure is bound to bring to a head the ferment which has been at work in the Poujadist group ever since the Suez expedition.

Ireland on Election Eve?

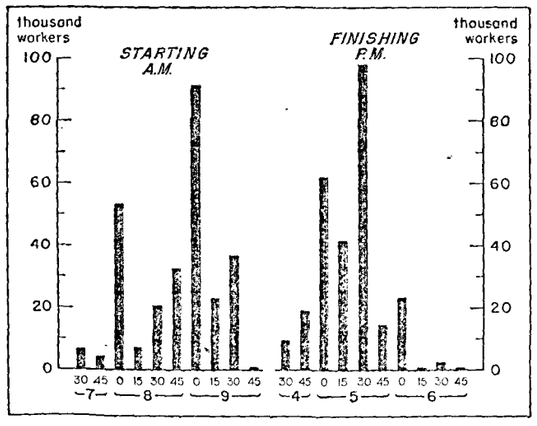
Our correspondent in Dublin writes: It seems almost certain that there will have to be an early general election in the Irish Republic. By and large, as a result of that election, most people will expect to see Mr de Valera and his *Fianna Fail* come back to power again. Mr Costello's coalition government, made up mainly of *Fine Gael* and Labour supporters, has recently had a majority of six in the Dail; it came down to that figure after two net *Fianna Fail* gains in by-elections. This week Mr MacBride's three *Clann na Poblachta* members, who have hitherto voted with Mr Costello, have announced that they will withdraw their support from him. If they vote with *Fianna Fail*, that would nominally leave a dead-heat in the Dail. One can make various niggling and possible corrections to this estimate: the Speaker, who is a Labour member, could have a casting vote; there is a by-election pending, which on form should certainly be won by *Fianna Fail*; one Labour supporter of Mr Costello might not vote on an early no-confidence motion, because his solvency is at present a matter for the courts. But Mr Costello can hardly hope to hang on to power by hair's breadths of this kind; his wisest course would probably be to seek an immediate dissolution.

In withdrawing his support from Mr Costello, and tabling a motion of no confidence, Mr MacBride spoke in the first place of his dissatisfaction with the economic situation. This is a bit hard. The programme laid down at the meeting of the parties supporting the government in October last is being implemented. A capital budget, on which the programme largely depends, will be presented to the Dail in some weeks' time. In the meantime, the trade figures for 1956 were rather more favourable than might have been expected, and it seems probable that the deficit in the balance of payments has been reduced from £35 million in 1955 to between £13 million and £15 million. On the other hand, unemployment now runs at about 90,000. It can be argued that such figures reflect the inability of

INDEX

The Index to *The Economist* is published quarterly. The subscription rate is 5/- a year; single copies are priced at 2/- each. The Index to Volume CLXXXI (October to December, 1956) is now available from:

The Publisher, 22 Ryder St., St. James's, London, S.W.1.



a number of artificially fostered industries to stand up to changes in trade, or that Irish labour has helped to price itself out of its own market. These are not attractive electoral arguments.

Many people, however, will feel that Mr MacBride's statement is to be judged on that passage which refers to the "unnecessary and provocative measures of a coercive nature" taken by the government in recent weeks. In other words, he is cross with Mr Costello for trying to do what he thought he politically could to stop the Ulster border raids. The *Sinn Fein* party, which may be taken as the political front of the IRA, has announced its intention of putting forward candidates at the general election. The poll is therefore unlikely to take place under propitious conditions, but its results may clear the air.

Rush Hour and Crush Hour

THAT unpleasant London phenomenon, the rush hour, makes the average worker's daily travel a penance far more exhausting than an equal period spent on the job; it also raises the cost of travel by making it necessary to provide an extra fleet of vehicles, to handle peak hour traffic, which stands expensively idle for the rest of the day. Because the crowding is so familiar, there is cynicism about proposed remedies for it: and cynicism in full measure has greeted the report of the Committee for the Staggering of Working Hours in Central London.

But the cynicism is wrong. For the report reveals an important new fact. Replies to a questionnaire sent to the 2,000 biggest employers in Central London have disclosed inside the familiar "rush hours" (extending roughly from 8 to 9.30 in the morning, and from 4.30 to 6 in the evening) a succession of well-marked super-rush-hours or "crush

hours" which far exceed, in intensity of traffic, the periods immediately preceding and following them. The 8 o'clock morning influx is some ten times as great as that due a quarter of an hour earlier, and eight times as great as that due a quarter of an hour later; nearly three times as many workers arrive at 9 as at 8.45; the 9.15 contingent is down again to a quarter; at 9.30 the arrivals rise again steeply, and by 9.45 they have fallen to an insignificant figure. The evening pattern also has two well-marked peaks, one at 5, the other (considerably worse) at 5.30; from 5.30 to 5.45 there is a precipitous drop of five-sixths or more, followed by a slight but perceptible rise at 6.

At a rough calculation, the charted figures show that, even within the present limits of the rush periods, a smooth distribution of arrivals and departures between the quarter-hour intervals shown would cut the worst crush-hour crowds by a half. The committee now intends to work out detailed proposals, taking the geography and communications of central London into account, and to ask for voluntary co-operation. It should be much easier to persuade employers, on the basis of these figures, to shift their hours ten or twenty minutes either way, than to induce the more drastic staggering needed to spread the rush hour itself beyond its present limits. For the first time, there is hope on the straphanger's horizon.

South African Universities

ONE by one the anomalies in apartheid society are being expunged. Now it is the turn of the universities. During the present session the South African parliament will be asked to vote large sums for the creation of purely non-European universities. Later, the Minister of Education will probably ask for the power to exclude Africans, Coloureds and Indians from the two universities that are now non-racial, once alternative facilities are available. For several years the government's slogan has been "separate but equal" university training for non-Europeans, but now that educational specialists have roundly declared that there can be no question of equality in separation, the more flexible expression "comparable facilities" is being used.

There are nine universities and colleges in South Africa, five of which are for whites only. Natal University is segregated into sections for the two groups, and Fort Hare is for non-Europeans only. The remaining two, Witwatersrand and Cape Town, are open to any race, and about 5 per cent of their student bodies are non-European. For the white population of approximately 2¾ million, there are about 19,000 students: for the other 10¾ millions, only 1,000. The education provided at Fort Hare and Natal is, by and large, of a lower standard than at either of the open universities: the teaching staff are paid less and there are not enough of them. South Africa is no longer attracting competent lecturers from abroad and its own resources are already over-stretched.

The great majority of staff and students at Witwatersrand and Cape Town are united against the government's proposals, which are considered an invasion of university autonomy, a retrograde step for race relations and a waste of limited staff and money. Mixed education has worked well in the two universities for over forty years and provides almost the only equal meeting ground for the two groups. Moreover, since all existing universities are very poor, the public money to be spent on the new establishments is bitterly grudged. But their protest, however authoritatively backed, has as weak a chance as Canute against the wave of Nationalist policy.

Letters to the Editor

Mr Head's Last Cuts

SIR—You imply that in the event of the outbreak of world war we would have no opportunity to use the Auxiliary Air Force squadrons because of the time that would be required to train, or "re-train," the pilots and ground crews of these squadrons up to the necessary state of operational efficiency.

But these pilots and ground crews are already trained up to a high degree of operational efficiency in terms of flying skill, tactics, aircraft maintenance and so on. Their "re-training," or, rather, their conversion to more advanced types of aircraft, would in fact take only a very short time, and indeed could well largely be accomplished before an outbreak of hostilities occurred.

However, assuming that it be true that it would take too long to "re-train" these already highly trained units for their retention to be justified, then surely the logical extension of this argument is that it would equally be a complete waste of time for the Government to call up any reservists at all—or to adopt any form of conscription for the armed forces. For, after all, the great mass of men of military age in this country would be in an infinitely less advanced state of training for modern warfare than would our auxiliary forces.

Are you, then, implying that the next war will see a return to the state of affairs of a century and more ago, when small and mainly volunteer armed forces only were employed, with the great majority of our citizenry remaining free to follow their normal occupations? In other words, may we expect that there will be no conscription for military service and no recall of reservists to the colours in a future conflict? If that is not to be the case, then surely your argument in favour of the disbandment of reserve units is completely erroneous.—Yours faithfully, E. L. BURNE

Chelmsford, Essex

Sir Roy's Politics

SIR—You imply in your Note of January 12th that nothing has happened with regard to the Central African Federal Government's plans for the franchise since "Lord Malvern blurted out something about a two-tier franchise." This is not quite true. Recently discussions were held between the four heads of government, but no agreement was reached. After that Sir Roy Welensky described to the press the scheme which he had been backing: two "common" rolls, one to elect the ordinary members requiring a higher qualification than the present Southern Rhodesian common roll and thus disqualifying a large proportion of Africans now eligible, the other for the "special representatives" on a lower roll which would be mainly African. This scheme horrified many liberals in the country even more than Lord Malvern's earlier remarks had done. Control of government would still be in the hands of the ordinary members, who would, under this scheme, be in even less danger of having to consider the African voters in their constituencies than they are under the present Southern Rhodesian system. Moreover, any system of two rolls, one mainly black, the other mainly white, is little better than communal representation and could only lead towards increasing extremism among candidates on both sides.

Meanwhile, a lot has been heard in recent months from unofficial organisations and individuals about alternative franchise schemes. The Capricorn Africa Society wants a multiple voting scheme, but would probably compromise on another system which would give all an equal opportunity of "earning" a vote, would permit Africans to have some political say and would not encourage racialism in politics. There is one scheme which satisfies these criteria and which at the same time might be fairly widely acceptable, and that is "cross-voting": constituencies to have two members, one white, one black, each appealing to all voters on a single roll with financial or educational qualifications, or both. Unfortunately, the Federal Party leadership is unlikely to accept any scheme as liberal as this.—Yours faithfully, R. J. D. ACHESON

Mufulira Copper Mines

The Rent Bill

SIR—Under the Rent Bill 92 per cent of rented houses will remain under control in Scotland.

In striking contrast to the position in England and Wales, many of the owners, most of whose houses have been continuously under control since 1914, will in terms of this bill actually have less rent than in 1914. In the City of Edinburgh (the most favoured area) the increase over 1914 rents will be only 57 per cent. Modifications to the disrepair certificate procedure do not extend to Scotland, where owners are being left at the mercy of local authorities.

This grotesque situation is brought about by the failure of the Government to allow for the effect of the interaction of the (about-to-be-amended) rating system and of the Rent Acts in terms of which owners in Scotland have, since 1920, been debarred from passing on to tenants increases in rates. The Valuation and Rating (Scotland) Act, 1956, provides that owners of controlled houses must reduce rents in 1957 by the amount of rates paid by them in the present year. These rates are in fact the highest ever. It is to the rents thus reduced that the 25 per cent increase (on rents before they were reduced) is to be added.—Yours faithfully,

Glasgow, C.2 W. J. I. MUIR

South African Trial

SIR—The arrest and trial in South Africa of the 150 and more opponents of apartheid on charges of subversive activities against the safety of the state is already responsible for great hardships, particularly to the many Africans involved. For example, it is reported from Port Elizabeth that 10 of the accused from that city have lost their jobs, including one man who had held the same post for seventeen years. But before the trial is over matters will get worse.

The preliminary hearings have been resumed and will probably continue for a couple of months or so; then will follow the preparation of the cases for the defence and, afterwards, the trial itself—the whole process can hardly end for at least six months. But the counsel for the defence will not all be able to appear at the preliminary hearings because the funds available in the Defence Fund in South Africa, of which the Bishop of Johannesburg, Mr Alan Paton, the Hon Frank Lucas and Mrs Ellen Hellman of the Institute of Race Relations are trustees, are insufficient and will have to be conserved for the trial itself and to maintain the hard-pressed families.

Christian Action invites subscriptions to the special Christian Action fund, whose purposes are (a) to provide for legal defence of the accused; (b) to aid their families and dependants; and (c) to help ensure that the conscience of the world is alive to the issues at stake. A very large amount of money will be required if the legal defence of the accused and the necessary aid to their families is to be adequately provided for.

Christian Action is keeping in the closest touch with the committee responsible for the Bishop of Johannesburg's Defence Fund in South Africa. Money subscribed in Britain to the Christian Action fund will be distributed through and in consultation with this committee.

Please send your gift, made payable to Christian Action and earmarked for this special South African fund, to the Secretary, Christian Action, 2, Amen Court, London, E.C.4.—Yours faithfully,

Amen Court, E.C.4 L. J. COLLINS

Books & Publications

Queen and Commons

ELIZABETH I AND HER PARLIAMENTS, 1584-1601.
By J. E. Neale.
Cape. 452 pages. 30s.

WITH this volume Sir John Neale completes his trilogy on the Elizabethan Parliaments. It is a major achievement, distinguished both for its scholarship and its humanity. His first volume gave a brilliant analysis of the House of Commons, a body predominantly composed of the gentry, rooted in local and family interests but exposed to the influence of the great men and to the urgent pressure of the Puritans. Now, with the story of the last six Parliaments of the reign, he completes his narrative. It is a period crowded with drama and incident: the last great Puritan campaign of the eighties; the execution of Mary Queen of Scots; the deliverance from the Armada and the successive alarms of Spanish invasion; the struggle for power between Cecil and Essex; and the mounting economic discontents of the nineties. Throughout this period the government depended on Parliament for supplies to carry on the war; and though Elizabeth preferred to part with lands rather than with her prerogative, her continual political ascendancy over both Council and Commons remains an astonishing achievement. As before, Sir John Neale makes the queen's tenacious defence of her prerogative his main theme; and, as before, he pays tribute to her skill by giving all her speeches in full.

The volume is enriched by much new material and by the freshness and vigour of Sir John's interpretations. He is not afraid to use modern analogies freely: expressions such as "cold war," "revolutionary conspiracy," "party discipline," "witch-hunting" and "the welfare state" frequently recur. He is particularly concerned to lay stress on the formidable nature of the Puritan movement in the eighties, when the zealots in the Commons were supported by an elaborate organisation in the country, using all the weapons of propaganda and lobbying. He holds that by 1587 this movement, which had threatened "revolution in both Church and State," had been exposed and defeated; and he argues that the last Parliaments of the reign were much more quiescent than their predecessors, and that the queen did not share Robert Cecil's alarm over the monopolies campaign. There are difficulties in stating the contrast so sharply, and perhaps Sir John Neale has been unduly influenced by the queen's own views and by the decline in the quality of the sources for the later period. Burghley himself and other councillors showed themselves surprisingly sympathetic to the so-called revolutionary conspirators. Sir John represents the Tudor constitution resting, even after the defeat of the Puritans, "on little more than the masterful nature and unique personality of an ageing Queen"; and in 1597 the initiative in social and economic legislation was taken by committees of the Commons, not by the government. Sir John has a curiously ambivalent attitude towards the Puritans: for him they were fanatics engaged in a subversive conspiracy, and yet he feels that with their defeat or silence "the House of Commons had lost something of its old virtue." Certainly he has no sympathy for the Puritans' great opponent, Whitgift, on whom he fastens the adjectives "repellent," "sinister" and "noxious."

But if Sir John's interpretations are not always clear and consistent, it is largely because of the range and sensitivity of his sympathies: he has become too much of a "parliament man" himself to analyse the institution dispassionately. The quality of the book lies in its wonderfully vivid and careful reconstruction of the debates, committees, manœuvres and of the sudden changes in the mood and temper of the Commons. Considered as a portrait gallery alone this is an exceptionally rewarding book. The newly discovered speeches of Sir Christopher Hatton reveal him as a remarkably effective and weighty government spokesman. The discovery of three speeches by Job Throckmorton, full of vigorous vituperation, allows Sir John to strengthen the suggestion of Throckmorton's identity with Martin Marprelate. Burghley's cautious but firm sympathy with the radicals emerges very clearly. And, at the end of the reign, when men were wearying of the war and the war controls, there are interesting expressions of economic liberalism. "Men," said the merchant Henry Jackman bluntly, "are not to be compelled by penalties, but allured by profit, to any good exercise." Raleigh had an effective trick of deflating proposals for paternalistic legislation by using statistics to demonstrate their impracticability.

Something has been lost by separating the analysis of the first volume from the narrative of the second and third. "There were no party politics in the Elizabethan period," we were told in the first volume; and yet much of the present narrative turns on the struggle between "the extremist or root and branch party" and "the Church party, under Whitgift's leadership." In the first volume Sir John laid great stress on patronage in determining the composition of the Commons. In this volume he is only occasionally able to hint at this as a factor in political action, as in the suggestion of Leicester's influence on the Commons' agitation of 1586-87. But if it is only professional historians who will recognise fully just how much Sir John Neale has enlarged and corrected our knowledge of parliamentary and Elizabethan history, all readers will recognise the richness and interest of the material, and the skill and enthusiasm with which it is here displayed.

Champion and Impresario

THE LIFE OF HILAIRE BELLOC.
By Robert Speaight.
Hollis and Carter. 567 pages. 30s.

HILAIRE BELLOC died in July 1953. He had outlived his reputation; to a new generation, he was simply the author of the Bad Child's Book of Beasts and of a few over-quoted verses about Sussex, laughter and the love of friends—or, at best, half of that engaging monster the Chesterbelloc. Such lapses are usual enough. Whatever elements in a writer's or thinker's work are most closely related to the *Zeitgeist* of his productive years lose interest as that *Zeitgeist* is succeeded by another—and involve in that loss, for the time being, even those other elements which owe nothing to modishness. This is as true of the rebels, the Angry Young Men of their day, as of the *Zeitgeist's* most enthusiastic spokesmen; and the more they are of their time, the more complete is their neglect.

Belloc suffers doubly from this process. He was a contemporary, only slightly younger, of Wells, Shaw, and the Webbs. Their reputations too have ebbed, but their protest was practically effective; of them it can be said (in whatever tone the speaker finds appropriate), *si monumentum requiris, circumspice*. Belloc's protest was in vain. As eager as any to shape and reform his time, he failed entirely. Nothing of what he worked for came to pass. If his name is to live, it must be by reason of his personal character and for those qualities in his work which are independent of politics, economics and propaganda—an idea that he would certainly have detested.

Mr Speaight's official biography does full justice both to these timeless qualities and to the political and religious master-themes of Belloc's life. Vivid, well-constructed, and absorbing to a degree that makes it seem half its length, it presents a living picture of a formidable, complex and psychologically fascinating personality. The picture is not uncritically drawn and is not entirely pleasant. Belloc's championships and polemics had something in common with those of his *bête noire*, Rudyard Kipling: an attribute, hard to define, for

which the adjective "bogus" would be too unkind and "bumptious" too crude, but which suggests a never-quite-outgrown schoolboy self-consciousness. Behind the champion of medieval Christendom, as behind the tribal bard of the Island Race, one is aware of a shadowy impresario insistently calling attention to a creditable performance. This is how a Man should live, says the Belloc *impresario, this is what a Man should be*: full-blooded in his loves and hates, quaffing wine, striding over the hills, making songs and singing them loudly, valorously upholding his faith, wielding words like a sword; an heir of the paladins, sounding Roland's horn in a degenerate age; watch this Man. No one with an atom of perception would accuse Belloc of insincerity. His heart is *in every role; that of Belloc the demolisher of Whig historical fallacies*, Belloc the European patriot, Belloc the master of a Sussex homestead, Belloc the scourge of the Party System and the Money Power, above all Belloc the pilgrim. If only the impresario would shut up and turn off the stage lighting . . . But he sticks closer than a brother, he is an *alter ego*, hardly, indeed, even *alter*. Under the limelight, the Man becomes a caricature—to be further caricatured by that frightful crowd of imitators, exhibitionist ballad-bawlers, conscientious swillers, Sussex-fanciers, Pyrenee-snobs and Merrie Englanders, whose mutual admiration Mr Kingsley Amis's portrait of the Welch family may with luck have finally punctured.

It is a major merit of Mr Speaight's book that it does switch off the impresario's distorting limelight and discloses a much more dignified and human figure; subject to frankly admitted errors, capable of absurdities and blind spots, but a great artist and a lovable man. No non-Catholic can, indeed, accept outright Mr Speaight's evaluation of the "good things" for which Belloc fought. But one can feel for the fighter, with all his schoolboy defects—the streak of callousness, the sentimental violence, the inveterate self-projection—more respect than is won by many an ally; as Belloc himself felt for Saladin. Whichever side he is on, the champion is a more attractive figure than the crassly indifferent neutral.

The Hungarian Rising

LA TRAGÉDIE HONGROISE.
By François Fejtö.
Editions Pierre Horay. 314 pages. 690 frs.

IN some ways it is a pity that Mr Fejtö should have risked his reputation by rushing a mainly secondhand account of the recent history of Hungary into print—and misprints. Yet his readers will probably decide that it is well worth while to have this analysis from someone so intensely aware of the Hungarian past and at the same time so closely associated with the formerly Communist writers who inspired the revolution of October, 1956. It was on November 10, 1955 (although it did not become public until eleven months later), that the Writers' Union drew up a memorandum demanding from the authorities the abandonment of the oppressive system in force which, the writers declared, paralysed intellectual life and destroyed the prestige and influence of the party.

Mr Fejtö has named the national uprising "une révolution d'uranium." For last June it became known in Hungary that uranium had been discovered near Pécs, and that Rákosi had promised the Russians the exclusive right to mine it. Mr Fejtö believes that Rákosi's fall from power in July was directly caused by his betrayal of the country's uranium. "La conscience collective hongroise," writes Mr Fejtö,

> se cristallisa autour de cette richesse susceptible de fournir une base matérielle à l'indépendance du pays. C'est bien cette conscience qui donne au nationalisme hongrois un aspect très moderne . . . digne d l'ère atomique.

Mr Fejtö writes with pride and with anguish but never loses his equilibrium; his statement tallies with those made by competent eye-witnesses. No one, however, has explained quite satisfactorily why the demands in Budapest for the restoration of several political parties proved fatal. Why will the Russians allow to Finland what they will not allow to Hungary? Was the real crux the Hungarian demand for neutrality? Did the uranium mines affect the Kremlin's decision?

A Progressive's Folly

THE FRIGHTENED GIANT.
By Cedric Belfrage.
Secker and Warburg. 235 pages. 18s.

MR BELFRAGE is an Englishman who lived for nearly thirty years in the United States and was deported in 1955 as a "subversive alien." He could probably have stayed for the rest of his life if he had not drawn the attention of the authorities to himself and his views by starting a weekly magazine called the *National Guardian*. Begun in 1948 to promote the presidential candidacy of Mr Henry Wallace, it continued to be, in Mr Belfrage's own modest phrase, "against the government." This book is an account, interspersed with routine left-wing reflections on the decay of American liberalism, of the four months he spent in gaol before leaving.

Mr Belfrage asserts that he is not a Communist but a progressive. It hardly seems to matter, however, because he thinks that "the Communist Party is a political organisation that is trying in its own way to advance the cause of socialism"; he calls Russia and the *satellites* "the socialist countries"; he admits to "fellow-travelling . . . because Communist parties are moving in the direction of history"; and about the only criticism he has to make of the party is that it has become "too compromised with capitalism" and has forgotten its objective of "revolutionary change." After reading him for an hour or two one begins to feel something almost akin to sympathy for Senator McCarthy.

But Mr Belfrage should not be taken too seriously. He is only a romantic adolescent with a certain vulgar facility for sentimental journalism. He is still in love with Walt Whitman and what he calls "Walt's America," which he thinks will somehow return. He has no glimmer of understanding that Whitman was the product and the prophet of a country still reaching out towards its frontiers and that he ceased to have any *political relevance fifty years ago*. He knows nothing of the economic reasons why the United States can no longer welcome unreservedly "your tired, your poor, your huddled masses yearning to be free" (the standard use is made of the unfortunate Emma Lazarus). And he has fallen for the Republican Party's propaganda about the New Deal being a programme for leading the United States to socialism.

The editorial policy of the *National Guardian*, we are solemnly told, was "to *work for the return of America to the* path it followed under Franklin D. Roosevelt," a policy the paper pursued by supporting the Communist line on Korea, the Rosenbergs and nearly every other important occasion. It is possible, however, to recommend unreservedly, in its application to Mr Belfrage, one sentence in the book—the first. "One is supposed," it runs, "to develop a little wisdom as one goes along, but it begins to seem hopeless."

505,586,029

Quite a vast figure, and it is hard to imagine that this is, in fact, the number of coins struck for circulation in the Royal Mint during 1955. Only about half of this amount comprises United Kingdom currency, the remainder being for various Commonwealth and foreign countries. The annual report of the Deputy Master and Comptroller gives many interesting details of the work of the Royal Mint providing fascinating reading for both collector and layman alike. Illustrated. 5s. (*post* 4*d*.)

Atomic Arms Race

ATOMIC WEAPONS AND EAST-WEST RELATIONS.
By P. M. S. Blackett.
Cambridge University Press. 113 pages. 8s. 6d.

PROFESSOR BLACKETT'S thesis is twofold: first, that it was wholly erroneous to suppose that unilateral possession of nuclear weapons secured peace until the Soviet tested their own in 1949, but that, on the contrary, there is much more chance of it under the present "H"-bomb stalemate; second, that the arguments for graduated deterrence should be reviewed because the policy of massive retaliation is a futile answer to minor aggressions. Looking back over the course of atomic developments, one can dissent strongly from some of the miscalculations of official thinking—both British and American—without, however, accepting all of Mr Blackett's logic.

It is true that there has been peace during the period when both sides had atom bombs, just as there was peace during the period when only the Americans had them (1945-1949). It is also true that during the first period the cold war was colder than it was when Professor Blackett was giving these lectures; and it is undoubtedly true that Russia, despite not having atomic weapons, secured a good many political gains. But it is very doubtful if Professor Blackett's deductions can be fairly drawn from these facts. The Russians were not cowed by the west's possession of bombs—though they were careful not to risk war over Berlin, or a major war over Korea (when they had bombs, but only a few). But it is arguable that this was because the Russians very well knew that unless really powerful provocation were offered over a major western interest, western public opinion ensured that the bombs would not be used—as a minority urged they should be used—in a preventive war. If, however, Russia had had the bombs, would the west have stood out against aggression or atomic blackmail; would, indeed, Russia have refrained from a preventive war against capitalism? But it is, of course, true that the west would have sought to catch up, as Russia caught up—far ahead of predictions by people supposedly in the know. Mr Blackett may perhaps be on rather better ground in asserting that Sir Winston Churchill was wrong in saying that only America's A-bombs stood between the west and its destruction by Russia in 1945-49, for if that bomb had not existed perhaps neither America nor Britain would have disarmed or withdrawn from Europe so fast; but, in view of popular feeling about Russia at the war's end, it is doubtful if they would have been so cautious. In practice, Sir Winston may have been perfectly right.

Today, as Mr Blackett declares, there is a temporary and perhaps permanent stalemate; but the *détente*, which he said was the direct result of Russia's greater sense of security in having the massive deterrent equally with the west, seems not to have lasted as well as he expected. He is right in pointing out that, caught up by Russia, the west is now much more amenable to ideas of disarmament—but then the west always had to face the possibility that it would be caught up, and knew that until it was, or nearly was, caught up, there was no chance of Russia coming empty-handed to the disarmament table. It is still far from certain that the *détente* (such as it is) between east and west will produce disarmament; the search for some means to deliver a surprise attack that would smash the other side so completely that it could not retaliate may go on—especially in the technology of missiles—for some time yet. Until it is definitely clear that in any circumstances to make global war with atomic weapons is to blow oneself up along with the enemy, the "stalemate" cannot be assumed to be complete.

But all that Mr Blackett says about the absurdity *now* of prescribing the massive deterrent as the only answer to a challenge from Russia anywhere and everywhere is well taken—in fact, it is no longer current military doctrine except in the outmoded pages of the 1956 defence white paper. Graduated deterrence is in fact the basic, even if unstated, Nato policy. Nor is it necessarily wrong that the policy is unstated—for how far it is practicable with the weapons available is not certain. Mr Blackett is less than fair to the "brass hats" who live today in a strategist's nightmare; but this book deserves to be read and pondered by everyone, including the Strategic Air Force. Until more is known about tactical weapons, however, some of its arguments must remain simply unproved assertions.

Canada in a Capsule

CANADA LOOKS AHEAD.
By Grace Laugharne.
London and New York: *The Royal Institute of International Affairs. Oxford University Press.* 167 pages. 11s.

THIS little book is a gallant attempt to compress into fewer than 200 pages an account of the spectacular economic developments going on in contemporary Canada in their historical and political setting. It contains much that is revealing and interesting, bringing together a mass of material and raising a number of important problems, such as the proper policy on conservation of non-renewable resources.

Unfortunately, there are some fundamental omissions and a certain lack of perspective. For example, the basic role of the Canadian Shield and the significance of the St Lawrence axis as opposed to the "natural" north-south pull of other geographic features are neglected. Repeated emphasis is given to the idea that Canada has too few people and that there "is still plenty of land" without examination of the technical and other factors which limit the rate at which a larger population can be absorbed. Characteristically Canadian resources can be developed only by the application of highly sophisticated techniques which require massive investment in proportion to manpower. The summary treatment of complex problems, such as the supply of power, and of some individual developments, such as that of the Columbia River, involves questionable generalisations and omissions of crucial factors. There are a number of inaccuracies, some verbal and some factual: the comparative importance of the pulp and paper industry, great as this is, is exaggerated, and the British Columbia Electric Company must be surprised to find its operations listed among "projects recently undertaken by government authorities." Some of the maps are inadequate. For example, in the general map the Saskatchewan River never reaches the sea and the Mackenzie system has a gap between Lake Athabasca and Great Slave Lake. It is surprising not to find any reference in the reading list to the work of D. G. Creighton or H. A. Innis.

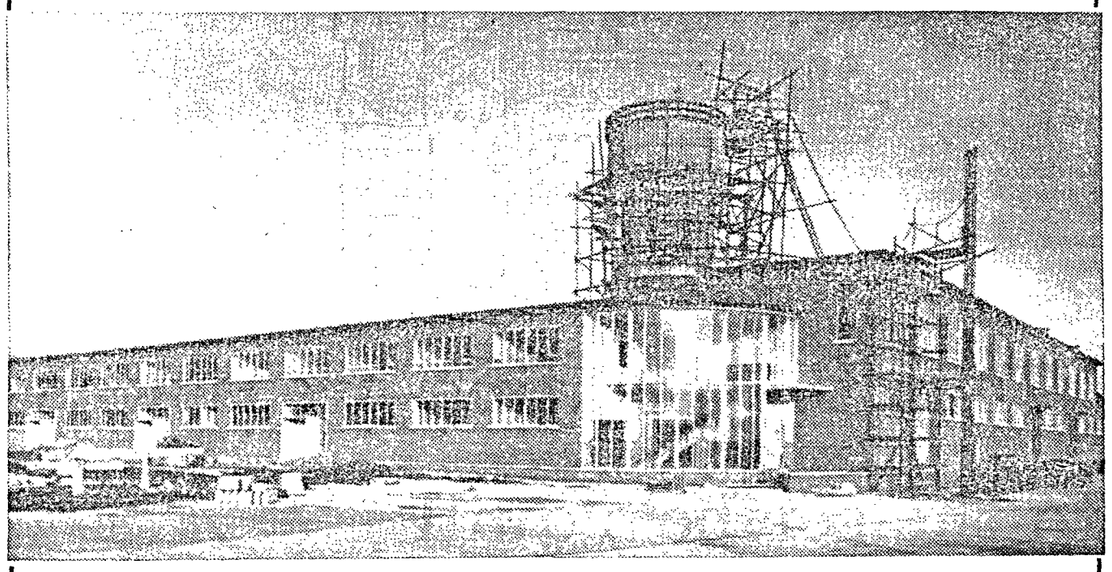
This is all a great pity as this is very nearly an exceedingly useful publication.

Books Received

URBAN MORTGAGE LENDING.
By J. E. Morton. *Princeton University Press.* London. *Oxford University Press.* 207 pages. 32s.
A review of the American edition of this book was published in our issue of September 15, 1956.

THE LAW RELATING TO MONOPOLIES, RESTRICTIVE TRADE PRACTICES AND RESALE PRICE MAINTENANCE.
By The Right Hon The Viscount Hailsham and Robin McEwen. *Butterworth.* 117 pages. 22s. 6d.
This book is reprinted from "Butterworth's Annotated Legislation Service."

AMERICAN POLITICS IN A REVOLUTIONARY WORLD.
By Chester Bowles. *Harvard University Press.* London: *Oxford University Press.* 140 pages. 15s.



PHILADELPHIA WORKERS IN A CHANGING ECONOMY: *Industrial Research Studies.*
By Gladys L. Palmer. *Pennsylvania University Press.* London: *Oxford University Press.* 203 pages. 48s.

ECONOMY AND SOCIETY: *a Study in the Integration of Economic and Social Theory.*
By Talcott Parsons and Neil J. Smelser. *Routledge and Kegan Paul.* 343 pages. 35s.

SURVEY OF EDUCATIONAL TRAVEL.
Fourth Publication. *Central Bureau for Educational Visits and Exchanges.* 3s.
Under the auspices of Unesco, this bureau is concerned to foster travel abroad by British young people and others, in the interests of their wider education. In this pamphlet is an extensive list of bodies which can help in organising such travel, and of suggestions for teachers and others whose job it might be to do so. It is helpfully indexed.

FBI REGISTER OF BRITISH MANUFACTURERS, 1957: *29th edition.*
Published for the Federation of British Industries by *Kelly's Directories and Iliffe.* 1,129 pages. 42s.

Another new firm for Northern Ireland

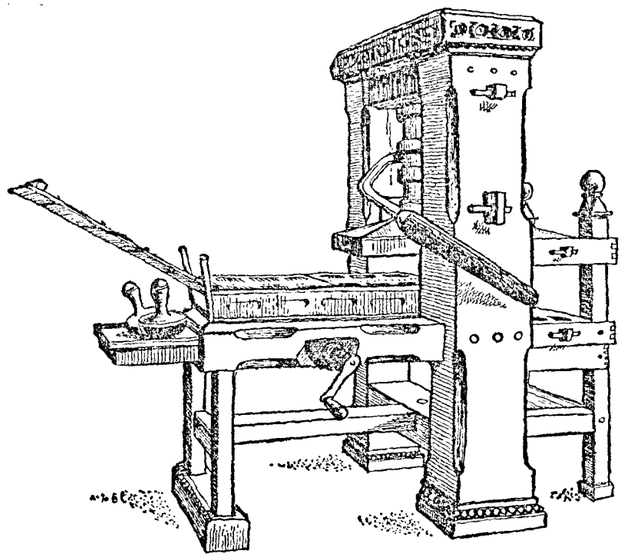
Summerson's announce new enterprise

Mr. H. P. R. Scott, Managing Director of Summerson Holdings, Ltd. and Light Alloy Construction, Ltd., says:—
"By midsummer we shall be producing Tracon collapsible freight containers in Belfast in a magnificent Government-built factory of 73,000 sq. ft. Within the first year of production we shall employ up to 300 men and we shall expand.

Why did we select Northern Ireland for this important development to the Summerson Group of Companies? We had a good idea for a new product for home and overseas including dollar markets. We wanted to get into production quickly. The Northern Ireland Government offered a new factory on a new industrial estate, with all services including housing. The rent for the first ten years is attractive. We know from the new firms already expanding in Northern Ireland that the labour is suitable and trainable.

We have had every help with the minimum of red tape. Summerson's, who have been concerned with the moving of goods from the days of George Stephenson, are delighted to be joining the many industries* which are setting up in Northern Ireland."

✳ ✳ ✳



***Announcements of new developments in Northern Ireland have been made in recent months by**
CHEMSTRAND LTD. · FLEXIBOX LTD.
BESSBROOK PRODUCTS LTD.
BALLANTYNE SPORTSWEAR CO. LTD.
F. N. ASPIN (TOOLS) LTD.
They will join over 100 new firms which have set up there since the war.

Titanium

is to the metals of to-day

ONCE IN A WHILE, an unexpected development writes a new page in the history of man's progress. Today, titanium—at last harnessed to the needs of industry—is beginning a new chapter in the story of engineering.

Aircraft designers were among the first to employ titanium's special properties. Its high strength-to-weight ratio and outstanding resistance to corrosion have provided the answer to some of their most exacting problems. I.C.I. are now producing titanium as a raw metal, and are also making sheet, strip, rod, tube, wire, plate, and forging stock from titanium and its alloys. For full technical information about this remarkable new metal, write for the booklet "Wrought Titanium".

American Survey

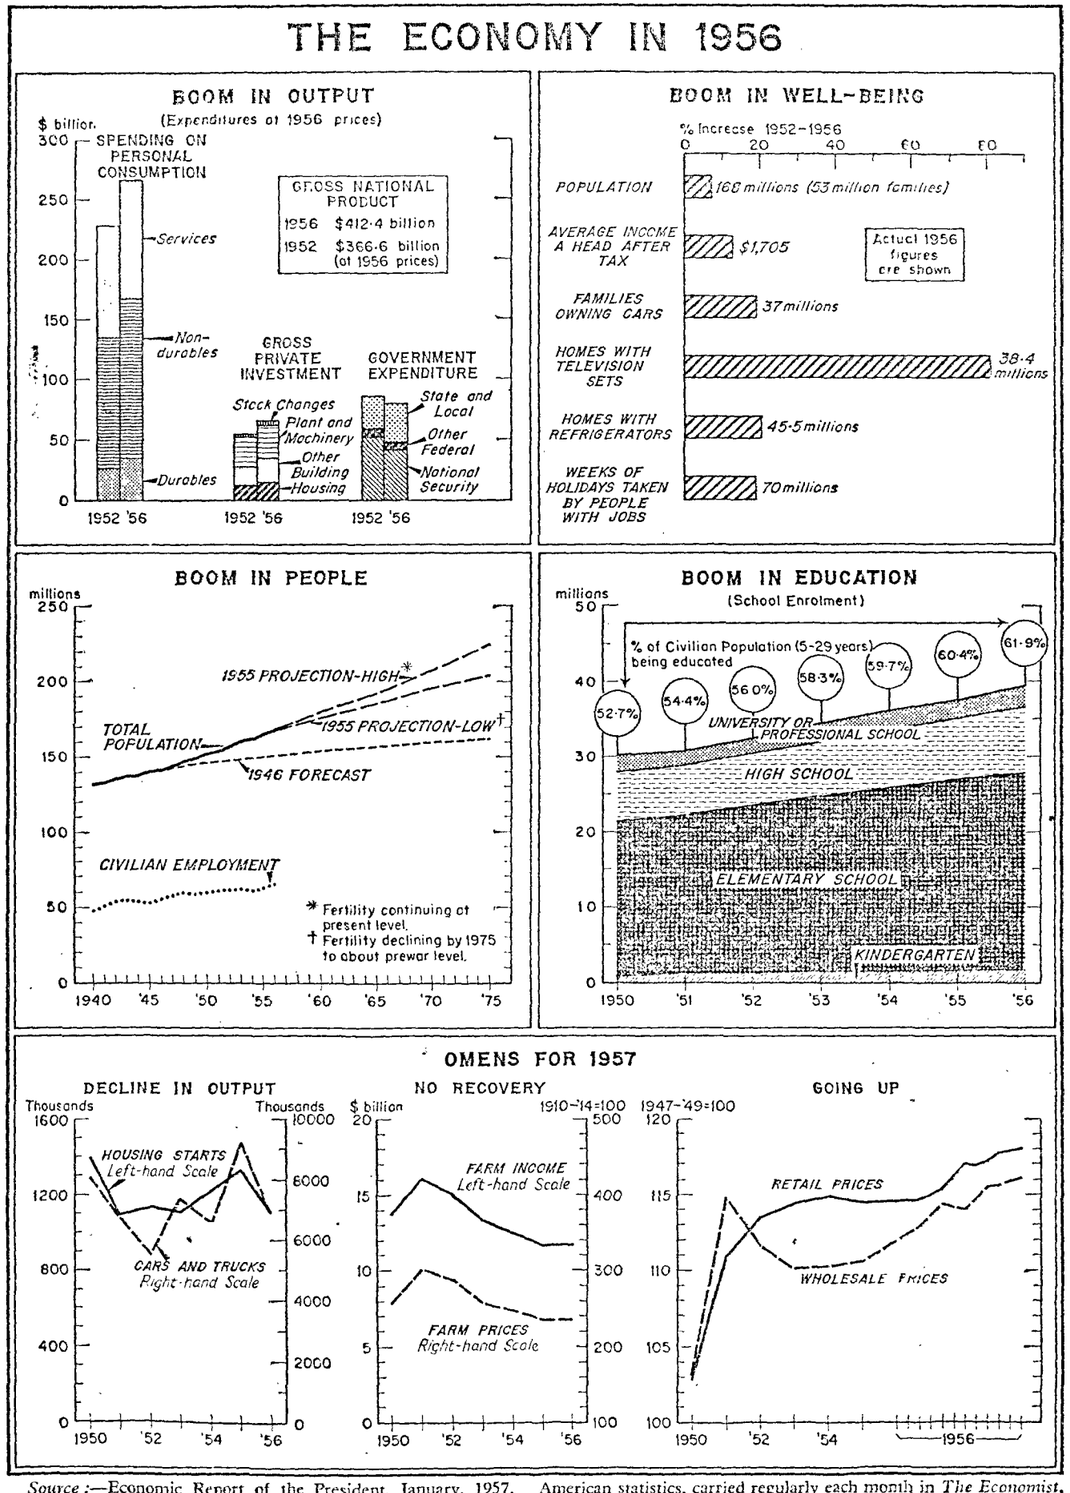
AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Facts of Economic Life

Washington, D.C.

BETWEEN the lines of the President's two major economic messages in January two disquieting admissions stand out. The first is that government spending cannot and will not be reduced except in the unlikely possibility of a disarmament settlement with the Russians. The second, perhaps worse, is that the tools available to the government to halt rising prices cannot do the job, unless they are used so vigorously that they may create an evil greater than the one they are curing.

The more the Budget message, which conveyed the first of these glum tidings, is analysed, the more it becomes obvious that all the significant items of expenditure are, in varying degrees, beyond the control of the government. It is not laxity in the drive for economy that has produced a spending estimate, a record for peacetime, of $71.8 billion; nor is it even the extensions of the welfare state which have been adopted by this Administration over the angry protests of its more conservative supporters. All the new spending on welfare, health and education put together comes to much less than $1 billion (though in future years these programmes will have a somewhat greater financial impact). Six things have caused the main rise in spending over the past three years: the revolution in military technology; the inevitable effect of an otherwise desirable policy of monetary restraint on the interest charges on the national debt; the need for the government, like everyone else, to pay higher salaries; the pressing demands of a growing and aging population on previously established schemes, such as old age assistance and ex-servicemen's pensions; the political obligation to do something about the farm slump; and the delayed effect on the Budget of certain financing devices adopted in the early nineteen-fifties to make spending on housing appear to be lower.



Over a long period of time, the cost of aid for farmers may quite possibly be reduced and, with the total of the national debt now declining modestly, there is a good chance that interest costs will at least be stabilised. But the other items seem headed nowhere but up. This, indeed, is specifically indicated in the Budget by the request for total appropriations for future use somewhat higher than estimated spending next year—particularly for defence. Although the unreconstructed Secretary of the Treasury, Mr Humphrey, will not concede as much, the Budget has demonstrated for all to see that the facts of life, not the degree of dedication to "economy in government," determine federal spending; and the facts of life argue convincingly that the trend in the future must be upward. *Fortunately this picture does not absolutely rule out future* tax cuts, inasmuch as the increase in revenue produced by the growing economy may well exceed the future growth in federal expenditures. But it certainly limits the optimism with which American taxpayers, whose burdens are high, too, can view the years ahead.

★

The discussion of inflation in the President's Economic Report was somewhat elliptical, but the gloomy message was apparent there as well. The President paid high tribute to the effectiveness of the central government's restrictive monetary and fiscal policy in halting the "excesses that often accompany prosperity." But then he continued with a surprising admission:

> At the same time, this experience [of recent years] suggests that fiscal and monetary policies must be supported by appropriate private policies to assure both a high level of economic activity and a stable dollar. When production, sales and employment are high, wage and price increases in important industries create upward pressures on costs and prices generally. To depend exclusively on monetary and fiscal restraints as a means of containing the upward movement of prices would raise serious obstacles to the maintenance of economic growth and stability. In the face of a continuous upward pressure on costs and prices, moderate restraints would not be sufficient; yet stronger restraints would bear with undue severity on sectors of the economy having little if any responsibility for the movement toward a higher cost-price level, and would court the risk of being excessively restrictive for the economy generally.

Behind that statement are two conclusions which his Administration has accepted. The first is that present taxes are, on the whole, too high for safety: this means that the small surplus in the Budget cannot safely be increased by raising taxes (even if that were politically feasible). Thus, with spending more or less uncontrollable, fiscal policy cannot properly be made a stronger weapon against inflation. The second—more revealing, given the reputation of Republicans for conservatism—is that there is some merit in the complaints of those who, to an increasing extent, have been criticising general monetary restraint. These complaints centre around the allegedly unfair and socially undesirable impacts of the impartial rationing of a limited supply of credit through market forces. Small businesses, the housing industry, and school building are said to have suffered disproportionately, with bad social and

Source :—Economic Report of the President, January, 1957. American statistics, carried regularly each month in *The Economist*, are to be found on page 417.

economic effects. The Administration makes no excuses for the present degree of stringency, but it has apparently decided that enough is enough. There is good reason to believe that the central bank would agree with this, but mainly on the ground that more severe restraint might curb business activity unduly.

The disturbing corollary is, of course, that a large part of the burden of keeping prices stable is being shifted to people—management and labour—who in the nature of human beings and of prosperity are not likely to assume it. The President points out that productivity does not seem to have risen much last year ; the reason, though he did not say so, was apparently that an economy straining at capacity tends to employ marginal labour and machinery. He then urges trade unions and business men to reach wage agreements "consistent with productivity prospects and with the maintenance of a stable dollar." But this argument is unlikely to carry much weight with individual negotiators. To many of the unions in the industries that set the wage pace, every penny of recent increases has appeared to be deserved on the basis of productivity. Business managements are scarcely likely to prefer a costly strike to the less disagreeable alternative of higher prices which, in prosperous times, are not likely to harm sales much. Perhaps most important of all, many of the service industries are forced to raise wages to keep workers, even though there may be little possibility of increasing their productivity through additional capital investment.

This problem has surged to the forefront of economic discussion because of the rather sharp increase of nearly 3 per cent in living costs last year. Food prices went up for reasons largely unconnected with the wage-price spiral ; but prices of manufactured goods rose for the first time in four years, and service prices continued a steady increase that began during the last world war. Indeed, it is now clear that much of the price stability during the past four years was artificial to the extent that food prices were, from the farmers' point of view, too low, and that prices of manufactured goods were merely resting momentarily after the upsurge associated with the Korean war. What the President's report foresees and warns Americans against is inflation of costs, as distinct from the inflation of demand which was induced in the past by perpetually easy money and the Budget deficits of wartime. But cost inflation can be just as painful to the saver—and to the unorganised worker and consumer—as any other kind.

Starting with a Post-mortem

PRESIDENT EISENHOWER'S tribute to Mr Dulles—"an outstanding, dedicated man, doing a terrific job under difficulties"—shows how mistaken Senator Fulbright and Senator Humphrey were if they imagined that their attacks on the Secretary of State would lead him to resign or the President to dismiss him. Like Mr Truman, the President does not abandon his subordinates when they are under fire. And Mr Dulles's trials this week have been legion. All the warmth of Mr Eisenhower's personal welcome to King Saud at the airport in Washington could not make up for the chilly reception this medieval monarch had been given in New York by a mayor who saw an opportunity to advance both his principles and his political interests. Hard on King Saud's heels comes Prince Abdul Illah, of Iraq, from the other end of the middle eastern spectrum. Mr Dulles is having to start the intricate negotiations to implement the Eisenhower doctrine before it has even been accepted by the Senate and under the clearest notice that powerful and ambitious Democrats on the Senate Foreign Relations Committee have declared war on him.

Senator Fulbright's demand that the Secretary of State should justify the whole course of his middle eastern policy before the Senate voted on the President's request for new military and economic powers never had much likelihood of success. But the Senator's allegations of the damage done by Mr Dulles to Britain, France, and western unity, his scepticism about the need of the oil-rich Middle East for financial help, and the Democrats' resentment at being unable to reject the new initiative have commanded a price. Anxious to choke off the attack and avoid further delay, the Administration and the Republican members of the Senate Foreign Relations and Armed Services Committees have agreed to a full-scale review of middle eastern policy, provided it goes back through the Truman Administrations to 1946 and does not hold up a vote on the Eisenhower doctrine.

The House this week voted overwhelmingly to give the President all he wants, and Mr Eisenhower has probably saved the day in the Senate by insisting that, without a freer hand to use some of this year's foreign aid money in the Middle East, the military authority will be useless. Moreover, the promise wrung from Mr Dulles that he would give Congress notice of where and how the money was to be spent goes part of the way to overcome a major objection. But a vendetta against the Secretary of State bitter enough to call his good faith as well as his competence into question is no cheerful augury either of future appropriations for the Middle East or of an effective foreign policy in other parts of the world. Mr Dulles is in danger of becoming the Republicans' Mr Acheson.

Priority for Schools

THE emphasis which the House of Representatives gave to federal aid for school construction by putting it first on the list of pending bills has been repeated by the President, who has made it the subject of his first detailed request to Congress on a domestic matter. The two proposals are very similar, as they were last year. The Democratic sponsors in Congress offer more federal money to the states over a longer period than does the President—$3.6 billion to be spread over six years instead of $1.3 billion over four years, and the Democrats do not relate their offer so directly to varying local needs as does the President. But there is no responsible argument over the growing emergency presented by the shortage of classrooms and other school facilities or over the principle that federal aid is the only answer.

Mr Eisenhower pointed out that the number of children in publicly financed elementary and secondary schools has been increasing by over a million a year for the past five years and is expected to go on rising at the same rate for another five years. Already there are in these schools over two million children in excess of the normal capacity of the

buildings and local authorities are failing to make adequate progress in reducing the shortage, even though they are breaking all records for classroom construction. During the past year the rising costs of borrowing money and of building have made it noticeably more difficult for state governments and local school boards to carry out their programmes and have given new urgency to proposals, put forward by both the President and the Democrats in Congress, under which local borrowing for school construction would be supported by federal funds.

These arguments for aid from Washington were underlined during last autumn's election meetings by the almost universal concern then shown by the public at the country's educational weaknesses and at Congress's failure to remedy them. The chances are therefore good that the legislators will at last be firm enough to cut through the prejudices which have strangled school bills in the past. But the President will also have to use all his influence on behalf of his programme. Already, in spite of his plea that the Bill should not again be complicated by attempts to deal in it with racial problems, Mr Powell, the Negro Representative from New York, is pressing once more for the denial of federal funds to schools where racial segregation is practised. But less may perhaps now be heard from those who fear that federal grants would be an attack on the historic freedom of states and local communities to control education. The President reiterated that there would be no federal interference with this responsibility and that federal aid would end with the emergency, as soon as the accumulated shortage of classrooms was overcome.

Fears in Panama

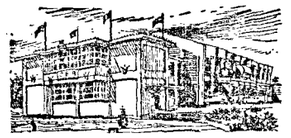
FROM A CORRESPONDENT IN PANAMA

THE Panama Canal is far more vulnerable than Suez. A single ship sunk at a strategic point in or near one of the three twin locks could close the canal indefinitely. American sensitivity on this point has been illustrated by the special treatment accorded to Russian ships going through the canal. These are not usually routed through Panama, but the closing of Suez has made a change necessary. About twenty ships are expected to pass through the canal in the near future, compared with the normal rate of about one a year. The Americans are bound by treaty to allow free passage to ships of all nations, but they are making it clear that the Russian vessels are not only unwelcome, but suspect. They are prohibited from refuelling in the canal zone, charts and maps are refused them, crews are not allowed ashore, cameras are impounded, armed American marines are placed aboard each ship for the duration of the passage and American soldiers are stationed on each of the locks. The Russians are offended by this behaviour: as one disgruntled captain asked half-jokingly: "Are we at war with the United States already?"

The Suez emergency has also stimulated American thinking about a new sea level waterway through Central America. This plan has been mooted for over half a century but it was discussed with new interest when the directors of the Panama Canal Company met last Monday, particularly since freighters and tankers now being built will be too wide for the existing canal. The construction of a sea level canal is estimated to cost $4½ billion, but security reasons make this project more attractive than the far cheaper expedient of widening the present channel. If a new canal were built, it would probably run through Nicaragua, which has already offered to give up all sovereignty over the necessary strip of land from the Atlantic to the Pacific. It would, in fact, become American territory.

The alternative is a canal close to the existing one. This is in disfavour for two reasons. On security grounds the authorities dislike the idea of two canals side by side, while the rising tide of Panamanian nationalism suggests that a canal in another country might be advisable. President Nasser's apparently successful coup in taking over the Suez Canal was not lost upon violent nationalists in Panama. At present they are demanding that Panama should have a say in the administration of the canal and a share of profits rather than an annual rent. There is no likelihood that the United States will comply with these demands. But the American position is weakened by the fact that Congress has not acted to implement certain supplementary provisions of the treaty with Panama signed in 1955. These would involve the transfer of some territory from the United States to Panama and the construction of a $20 million bridge. Extreme nationalists, alleging bad faith, are using these shortcomings as a pretext for trying to abrogate the whole treaty.

Mr Wilson Off Guard



THE cause of creating a more effective system of ready reserves for the armed forces suffered a setback this week when the Secretary of Defence once more showed how hard it is for him to avoid slipping into the offensive. Mr Wilson's ill-chosen remarks about the National Guard being a sanctuary for conscription-dodgers during the Korean War have angered the Guard's powerful friends in Congress to whom it was already looking to preserve its privileged position. The National Guard is made up of state units which are subject to control from Washington only when they are mobilised for federal duty.

The President himself, though he deplored Mr Wilson's indiscretion, stands firmly behind the programme to provide ready reserves of 2.5 million men by 1959. It requires, among other things, that after April 1st new members of the National Guard must, like other reservists, undergo six months of basic training. Four-fifths of them have never done so. The Guard, which has 405,000 members, protests that recruiting will fall off disastrously if its members have to spend more than three months on active duty. The Department of Defence has also now decided that men between the ages of 18½ and 25 may discharge their military obligations by volunteering for a six-month enlistment followed by service in the ready reserves for seven and a half years. Since 1955 youths below the call-up age have been able to avoid conscription in this way. However, the proportion of men between 18½ and 26 being called up is now so low that some escape doing any military service at all.

Mr Wilson, author of the famous antithesis between "bird-dogs and kennel-dogs" among the unemployed, will need to keep a more careful watch on his tongue if Congress

BRUSH to MAURITIUS

Future Bright on Sugar Island

Little Maria is a child of Mauritius — island of sugar far out in the Indian Ocean. Maria's mother wants her baby to grow up healthy and happy and to enjoy some of the comforts of life. But the fruits of civilisation seem a long way off, for Mauritius has only limited resources. Projects like the 10-year development programme of the island's Central Electricity Board with its new power station at Port Louis, the capital, are a hope and an inspiration to the people of Mauritius. Perhaps the future is bright for little Maria.

BRUSH IN ACTION

Once the problem at Port Louis was urgent. The designs for the new station were completed in March 1954 and building began in May. The first set was running *before the end of that year*.

Equipment for the Port Louis power station is designed for continuous operation, especially during the drought season from September to December. It comprises four Mirrlees 12-cylinder diesel engines, two KVS 12 and two KVSS 12, with Brush Alternators and Brush Switchgear.

The Brush Group produces about a third of the U.K. output of industrial diesel engines and generating sets — and is, in fact, the world's largest exporter of this type of equipment. The Group constantly exports over fifty per cent of its entire production and, in the past few years, it has exported as much as seventy per cent.

PLANT LOCATION FACTS

Pin-pointing your markets . . . present and potential

New York State is the world's greatest market. And it is adjacent to other major markets.

If being close to your markets is a major factor in your plant site analysis, you will want complete marketing facts on which to base your locational decision. Supplying such facts is our business.

For consumer goods, we will provide the data with which you can appraise markets that can be reached competitively from any specific location in New York State. If your customers are industrial, we will provide you with summaries of types, size and distribution of the industries in which you are interested within the New York State marketing area.

Markets won't be your only problem in deciding on a new plant location. You will want complete facts on labor, water, available sites or buildings, power, fuel, transportation and raw materials. And you will want information on these as they apply to the successful operation of a specific plant..

A tailor-made report

Any or all of the factors important to your consideration will be covered in a confidential report to you—tailored to your needs. It will be prepared by a professional and experienced staff to cover either New York State locations of your choice, or, if you wish, sites which we will select on the basis of your needs.

Our booklet, "Industrial Location Services," explains what we can do for you. To get your free copy, write me at the New York State Department of Commerce, Room 691, 112 State Street, Albany 7, N.Y.

is to approve proposals which have just been submitted to him for improving the efficiency of the forces by relating pay to productivity. According to the Cordiner committee, the antiquated system of payment according to length of service is responsible for the expensive loss of Army-trained technicians to industry. Most of the men who re-enlist are those doing "soft" jobs. With the services more and more dependent on technicians, the committee recommends a system of pay increases according to skill, which would apply to about 15 per cent of the men who re-enlist.

Hunting Snarks

BRAZIL has at last accepted an agreement with the United States for the establishment of a much-needed base on the island of Fernando de Noronha, about 125 miles off the north-east coast of Brazil. From here American technicians will be able to track the guided weapons which will, it is hoped, fly 5,000 miles over the sea along the experimental range from Patrick Air Force Base, near the tip of Florida, to Britain's Ascension Island in the middle of the South Atlantic. That negotiations for the Brazilian base had been going on for nearly a year was discovered early in December when an American misguided missile, the long-range pilotless Snark, disappeared untracked into either the ocean or the Amazon jungles instead of returning to Florida on its scheduled boomerang course. Then came a special letter from President Eisenhower to President Kubitschek of Brazil, quickly followed by reports of an agreement. But in fact it took another month to overcome the opposition of the Brazilian nationalists and communists—or perhaps for Mr Kubitschek to make up his mind to override that opposition.

The agreement meets one of the nationalist objections—that Snarks are merely the latest instruments of Yankee imperialism—by providing that the installations on the island shall be under Brazilian command and Brazilian flags. But the American negotiators firmly refused to promise additional economic aid to Brazil in return for the right to build the base. This, they felt, should be part of Brazil's contribution to the defence of the western hemisphere under the mutual assistance pacts signed in 1947 and 1952. But Brazilians will certainly now expect even more sympathetic attention than usual from Washington for their economic needs—though it is said to be only coincidental that, on the day after the agreement was signed, Brazil requested that part of last year's loan from the American Export-Import Bank, for railway equipment, should be made available immediately.

Television's Guinea-Pig

WITH annual sales valued at over $1 billion for the last two years, the Radio Corporation of America is rather large for a guinea-pig. Yet, according to its chairman, it was partly because it was filling this experimental function for its competitors in the television industry that the company's earnings fell in 1956, by about one sixth, to $2.60 a common share; the main explanation, however, was higher costs and lower prices. During 1956 RCA, the pioneer of colour on the air, lost almost $7 million on developing and promoting colour television sets and programmes. The company actually sold just over 100,000 colour receivers during the year, instead of the 250,000 which had been predicted. The prediction and the hope that colour will become profitable have now been transferred to 1957, but their chances of coming true do not seem much better. Even in Chicago, where a station owned by RCA's subsidiary, the National Broadcasting Company, has been putting out programmes in colour for as much as 42 hours a week for many months, customers, it is reported, have shown little interest in colour sets. The poor quality of both pictures and programmes is partly to blame, while high prices—about $500 a set with additional heavy service charges—are also a serious deterrent. Last year's real successes, from the buyer's point of view, were the portable black and white receivers, which accounted for over 20 per cent of the year's sales of 7 million television sets But this portable equipment sells at under $100, which means an unsatisfactorily small margin of profit for both manufacturer and retailer.

The Department of Justice also seems to be making RCA act as guinea-pig in a different type of experiment. For the first anti-trust suit ever filed in connection with television broadcasting has been brought against RCA and NBC. They are charged with restraining trade by squeezing out competition; in particular they are said to have brought pressure to bear on the Westinghouse Broadcasting Company to induce it to hand over its Philadelphia station in exchange for two NBC stations in Cleveland, a less important centre in terms of the population and retail trade on which depend the advertising profits of a television station. The exchange had been authorised, as required by law, by the Federal Communications Commission and the significance of this suit may lie in the argument over whether one government agency can undo what has been approved by another. It has also been suggested that, if the Department of Justice succeeds in this case, it may then try to break up the television broadcasting industry as it did the film industry, by separating station ownership from production facilities. The monopolistic aspects of television have already been interesting Congress for some time.

Postponed Take-off

FROM A SPECIAL CORRESPONDENT

OVER-EXPOSURE to solar radiation ended the career of an early birdman, Icarus of Crete, while he was testing an experimental prototype over the Aegean. But his father, Daedalus, an exponent of research and development, successfully completed the scheduled run to Italy where, according to Virgil, he hung up his wings in the Temple of Apollo. Protecting modern airmen from excessive radiation of a different and more lethal kind is only one of the many knotty problems that confront the eleven large companies now actively engaged in the development of a nuclear-powered aircraft in the United States.

During the election campaign, the Administration's plans for the industrial application of atomic power were heatedly debated and the argument seems sure to be revived in the

hearings to be held by the Joint Committee on Atomic Energy. But professional interest in the laboratories and in the Department of Defence is occupied with the sluggish progress of the programme for nuclear aircraft. In January last year, the McKinney panel, in its report to the Joint Congressional Committee on Atomic Energy, fixed the cost of developing military aircraft propelled by atomic energy at between half a billion and one billion dollars. It has become commonplace in this progress-conscious and dollar-minded country to attach a convenient price tag to hypothetical scientific accomplishments, including the prevention of cancer, lengthening the span of human life, and harnessing nuclear fission. But in the present case, the forecast has an appearance of accuracy. The atomic aircraft programme has already cost $300 million; it is now absorbing $100 million a year, and the rate is rising.

★

The best informed guess today is that it will take five or six years to produce a nuclear aircraft; thus, it should make its debut in 1962 or 1963. By that time, well over three-quarters of a billion dollars will have been invested in the project; by comparison, the total cost of developing the successful atomic submarine *Nautilus* was about $150 million. Many of the top officers of the Air Force take a more pessimistic view; they feel that at least ten years will be required to get the aircraft off the ground, and fear that the Russians may fly one earlier. They point out that the date for completion of the project has been put off twice, with greater priority now being given to the development of so-called "chemical fuels." But some nuclear scientists who guessed right about the hydrogen bomb and the submarine programme go to the other extreme; they say that two or three years may be enough to develop a reactor adaptable to existing aircraft, such as the giant Martin Seamaster.

The project, which has become more, rather than less, subject to secrecy as it progresses, is largely a joint venture of the Air Force and the Atomic Energy Commission, with the nuclear-conscious Navy playing, at present, a subordinate part. The commission is charged with primary responsibility for developing the reactor. This will employ highly enriched fuel, that is, uranium containing an artificially increased number of isotopes of U-235, the only naturally fissionable material known. Thus a smaller amount of fuel will be required to start the chain reaction in which atomic nuclei are split and heat released. Furthermore, it will have to be a "fast reactor," with little attempt being made to slow down the speed of the neutrons by the use of heavy moderators.

There are two parallel Air Force programmes (both bearing the cryptic designation WS-125A) for the development of the structure of the aircraft and its engines. In one, the General Dynamics Corporation is working on the air frame with the General Electric Company responsible for the reactor; in the other, the Lockheed Aircraft Corporation is teamed with the United Aircraft Corporation's Pratt and Whitney Division.

Out of this work has come a singular procession. The Convair Division of General Dynamics has recently been flying a modified version of its now outmoded B-36 over isolated areas of the vast State of Texas. This is the first airborne nuclear test, for the giant bomber contains a one megawatt atomic installation far back in its fuselage, marked on the outside by two huge airscoops. On the tail of the oddly shaped "XB-36H" is painted a strange bright symbol —the three-vaned device heralding the presence of radiation. If the programme is successful, this device will become more familiar in the airlanes of the world, for good or ill. A few miles behind and above the converted bomber flies a C-97 transport; its personnel includes ten engineers trained in two seemingly disparate modern disciplines—nuclear physics and parachuting. In the event of an accident affecting the reactor, their job is to jump near the disaster area and cordon it off from the public. Their presence underlines a danger which will accompany all nuclear propelled transport, by land, sea or air, and will unquestionably limit its future usefulness.

Even when confined to a reactor, radiation constitutes a threat to the surrounding environment. Invisible alpha and beta particles, gamma rays and neutrons can kill or injure men and do severe damage to the materials ordinarily found in aircraft. Conventional instruments are useless in the presence of the lethal emanation. The problems of Icarus were simple compared to this; he had only to cruise at a proper altitude. Today's designers must safeguard the crew without making a nuclear-powered aircraft too heavy or unwieldy. It will probably have an extremely long cigar-shaped fuselage with the power plant at one end and the crew at the other. Closed circuit television systems will be used to monitor the reactor controls. To achieve better aerodynamic balance, the bulk of the shielding may be divided between the reactor and the crew compartment; to save weight it may also be severely attenuated on the sides and toward the tail assembly. Instead of attempting to cut off all radiation from the reactor, some designers are concentrating on the rather easier task of providing a radiation proof cabin for the crew.

★

The limits of human tolerance to radiation are now being studied at the aero-medical centre at Wright Field. There has even been discussion of a "one-shot crew" policy, an entire crew which would fly only a single wartime mission and then be shifted to non-atomic duties. In this way higher doses of radiation would be permissible. But this concept, however dramatic, does not jibe with strategic thinking. The Air Force views the atomic plane as an unexcelled retaliatory weapon, capable of staying aloft indefinitely, and serving as a powerful deterrent to a sneak attack. For a task of this kind, as the Navy has been quick to point out, a large water-based aircraft has many advantages; there are two seaplanes now in production which may be convertible to nuclear power. Among the companies doing preliminary work for this project are Glenn L. Martin, Curtiss-Wright and General Dynamics.

The fruits of the more rigorous research programme have begun to appear. Last autumn the General Electric Company achieved what was termed a "breakthrough of the thermal barrier," by developing equipment which can withstand intense radiation and high temperatures. Ceramics, titanium, lead pellets and ceramic-coated wire are some of the new materials being used. General Electric probably also designed the turbojet aircraft engine which was successfully powered by heat applied directly from an experimental reactor at Arco, Idaho, earlier last year. The problems still to be solved before the engineers and scientists now engaged on the project can hang up their wings are tremendous, but so would be the achievement of a supersonic bomber of unlimited range—the goal of their effort.

The World Overseas

Germany Raises an Army

FROM OUR BONN CORRESPONDENT

IT would be wide of the mark to suppose that the new Federal Defence Minister has abruptly reduced the whole tempo of German rearmament. Certainly Herr Strauss has halted the improvident stampede to get 500,000 men into uniform, any old how, by 1959 for the sake of an approving nod from Mistress Nato. But at the same time he has actually expedited preparations for raising a force of real military value, relatively small though it will be at first. The Soviet intervention in Hungary roused those responsible for security to contemplate the possible consequences of Federal Germany's present military impotence. Disconcerted, they have quickly adopted a workable plan of action. This is to have three grenadier divisions and two armoured divisions, each composed of some 13,000 regulars, ready for assignment to Nato by the end of the year. They will not have developed by then beyond the stage of battalion training. But they could be useful straight away; and by the middle of 1958, if they have not been sifted to provide new cadres, these five German divisions will be in fighting trim as divisions.

While these preparations are urgently afoot only some 10,000 conscripts out of a pool of 100,000 are being called up. They are being singled out now at leisurely medicals and the chosen will report to their training depots in April. The defence minister's plans for 1957, which in addition include forming cadres for one mountain division and one airborne, are thus on the whole clear and businesslike.

Moving-in Day

The scale, character, and pace of German rearmament after 1957 are still so obscured by the mists of inaugural debate and strategic procrastination as to be more or less indeterminable. The young ex-officer who complained four years ago of bedlam in the "Office of the Federal Chancellor's Commissioner for Questions connected with the Augmentation of Allied Troops" would probably reach for the same word were he in the expanding Ministry of Defence today. The visitor still gets a decided impression of having called on moving-in day. Within the bleak precincts youngish men in civilian suits, aspirants for commissioned rank, can still be seen standing stiffly to attention before some remembered senior, similarly clad and similarly aspiring, whom chance has brought to the Ministry at the same hour. Many decisions, affecting many fortunes, have yet to be made. Herr Strauss makes no bones about it. He is waiting to see which way the wind of "reappraisal" blows before he commits the Bundeswehr to long-term establishments, timetables, and contracts.

Once common western strategy has been clarified, and the domestic uncertainties arising from election year have been dispelled, it is not improbable that Federal Germany will impressively accelerate the business of rearming. With such an end in mind some seasoned staff officers have already proposed that the Bundeswehr might profitably revive the old Reichswehr's device of duplicating every unit within the training battalion. Under this arrangement the commander alone has no counterpart. And lest he should come to favour one at the expense of the other he is not told which of the twin battalions he himself will be given ultimately to keep. This proven system of multiplication would undoubtedly be seriously considered should it be thought imperative to breed soldiers quickly.

The Blessing of the Brass

While Herr Strauss and his advisers are waiting to see whether it is ever going to be necessary to put as many as 500,000 Germans at Nato's disposal they seem to have made up their minds to go ahead with plans for raising a force of 100,000 that will not come under the command of Nato at all. An integral part of the Bundeswehr, it is a force earmarked for anti-aircraft, pioneering, and other strictly defensive duties within the frontiers of the Federal Republic. Germany has undertaken to consult Western European Union before raising independent troops of this kind and has already brought the subject up without encountering significant opposition. But it will be a year or so before the first of the home defence contingents are visible.

Many developments depend upon the passing of the armed forces' organisation bill, which Herr Strauss has yet to submit to parliament. One such is the exercise of authority at the top. At present a rather awkwardly-pulling military council, composed of five equals, comes after the civilian Minister of Defence, who is commander-in-chief, and his civilian State Secretary. The quinquevirs today are Lt.-Gen. Heusinger (chairman), Lt.-Gen. Speidel (chief of the armed forces branch of the Defence Ministry), Lt.-Gen. Roettiger (army), Lt.-Gen. Kammhuber (air force), and Vice-Admiral Ruge (navy). With the blessing of all Brass, past and present, Herr Strauss proposes to introduce an Inspector-General, with the rank of full General, as the senior military personage. The moment is propitious.

General Speidel will shortly be off to Paris to command

Nato land forces, Central Europe, and General Heusinger may soon be translated to the highest Nato regions in Washington. The anomalous posts these two seniors hold now will be abolished. General Heusinger might yet become the first Inspector-General. But it is objected in some quarters that he has never held high command in action, and it is known that Herr Strauss would prefer to give the job to General Wenck, the commander of the hastily assembled Twelfth Army which failed to relieve Berlin in 1945; General Wenck made a good name for himself as a fighting general on the eastern front. Herr Wenck, however, may turn the post down. In industry he is earning more than would ever come his way as Inspector-General. Moreover, he is said to be uneasy at the prospect of the civilian controls to which he anticipates he would be subjected, and to doubt whether he would last long should a different government take over in September. Herr Erler, the Social Democrat exponent of defence policy, has expressed himself as doubtful of the wisdom of appointing "Hitler's last general" as the first soldier of the Federal Republic. Until the Inspector-General has been nominated many Bundeswehr projects are bound to hang fire.

Admirable Gusto

Confused and tentative as the picture of Germany's military revival still is, some noteworthy features can be discerned. The whole painful process has become markedly less contentious. The Bundeswehr, for better or worse an established fact, is playing a smaller part in internal politics. The dissent of the Social Democrats becomes less vociferous as it becomes less confident. Simultaneously there is a conspicuous slackening of the reins of civilian control. The board set up by the Bundestag to approve the first senior military appointments has almost completed its task and will disappear in due course. On January 9th the Bundestag defence committee abolished the four sub-committees which it established in April in order to be able to cope more thoroughly with particular problems. The sub-committees tackled their work with admirable gusto, travelling hither and thither to see and hear for themselves. It was they who called attention to the lack of accommodation for the number of troops planned and to the imprudence of hastily placing large orders for obsolescent arms. The chairmen of the two most active sub-committees were members of opposition parties. The parent committee called in its four children on the ground they were making an obstructive nuisance of themselves. It is a disquieting move.

British observers cannot but note the extent of American influence on the development of the Bundeswehr. There are now no fewer than thirty first-class United States army companies on federal territory training the Bundeswehr in the use of American equipment, and there is a constant coming and going of Bundeswehr officers across the Atlantic. Whether the association will continue to be as close as the Pentagon would like, remains to be seen. There are signs of an awakening desire among the Germans to shake off foreign tutelage. Thus, while the Bundeswehr is being virtually compelled to take either M48 or Centurion tanks (probably both) for its first three armoured divisions, Messrs Henschel of Kassel are already far advanced with prototypes of a tank which the defence ministry considers superior to anything the British or the Americans have to offer.

Haute Couture's Shoestring

FROM A CORRESPONDENT IN PARIS

PARIS fashion houses are now showing their spring collections. Occult rumour says that Dior may insist on longer skirts and be "resisted"—which would apparently be serious, as he was "resisted" when he insisted on shorter skirts, a few collections ago. Dior, though, is one of the few couturiers whose status—as opposed, maybe, to inspiration—is not threatened by the ten-year cycle that eclipses the average house. He began in 1946, with the backing of Marcel Boussac, the textile magnate and race-horse owner; today twenty companies, based on New York, London and Caracas, sell his ready-made clothes, scents and stockings. He is not the same kind of thoroughbred as Balenciaga, whose name brings, even among fashion experts, a moment's silence; but he is almost the only runner safely attuned to modern conditions.

High fashion, and its dependent trades, face the problem of all luxury industries based on the artisan: inability to meet rising costs by higher productivity. Nothing can industrialise the fact that it takes 80 hours to make a *couture* dress, and that under 5 per cent of the work is done by machines. Labour accounts for two-thirds of costs. The wages of the 6,000 women in the Paris workshops remain low—round 2s. an hour—but social security now adds 44 per cent to them, as against 15 per cent prewar. Taxation adds 20 to 25 per cent to the final cost price. A leading house gave us an estimate for an afternoon dress priced at £85. The material cost £9; the net profit was £4 10s.

Meanwhile the number of women rich enough to pay these prices steadily decreases. Official estimates claim 5,000 survivors from slumps, wars and social revolution. Only America still supplies private custom in strength. The industry estimates that the leading 32 houses earn only £6 million a year from their models, which means many are working on a very thinly gilded shoestring.

The couturiers have tried to compound with these facts. Some have contracts with ready-made firms; virtually all have boutiques selling ready-made clothes, accessories and the pervasive scent. These help to aliment the twice-yearly collections (costing round £15,000 each) which are the industry's real show-window, chiefly designed for commercial buyers. Relations with foreign buyers have become steadily more important—60 per cent of the industry's trade now is overseas—and defining them has taken up much, perhaps too much, of the industry's organised efforts.

These relations are chronically complicated by copyright problems. Using a couturier's name is obviously dishonest. (At the moment, three Swiss are awaiting trial for making and selling 40,000 hats bearing the "griffe," the house trade mark, of Balenciaga, Dior and Fath; with almost disarming insolence, they apparently had ribbons of the sacred symbols run off by the kilometre.) Using a couturier's ideas is legally more complex. It is, of course, expert copying he fears (a woman making a dress from a photograph is not copying but paying a compliment), and there is a good deal of clamour about the industry's inadequate protection against it. French law since 1952 has put a couturier's rights alongside other artistic copyright; but elsewhere the battle continues—and will probably never be settled outside law-courts so long as the addition of a button or bow makes "copying" disputable. A great advance in America was hailed last year when a New York court found in favour of four Paris houses against a Mr Milton who had been sending wholesalers sketches of new models during the collections. But Mr Milton had been at work for over five years, and the four couturiers are suing him for only £1,350,000 jointly; which points up the relatively small economic stakes. Perhaps the *haute couture's* organised efforts have gone too much into these politico-legal sorties, and not enough into trying to rationalise the industry's whole basis.

It would be wrong to talk of crisis; but the industry's economy has a hectic flush. The risk is that the gulf between costs and prices may one day grow too wide to be bridged by small ready-made and boutique expedients. Its leaders acknowledge this uneasiness in their current, well-drilled slogan: "We must become a laboratory." A clinical laboratory, selling its research in world markets? Or a commercial laboratory, attached to some kind of productive machinery? The industry at present tends towards the first, which merely extends present practice. It is integrated into the world fashion scheme; but has no sound roots in large-scale production in France itself. Private contracts between houses and ready-made firms are small, and relatively undeveloped. This is partly because the French ready-made trade itself is sadly under-developed. Traditionally, most Frenchwomen wear dressmaker or home-made clothes. The success of good design in cheap English chain-store experiments has no parallel—though Boussac may be hatching one. At higher levels, "*prêt à porter*" still has a stigma.

Alliance With Ready-Made Trade?

One idea canvassed by the *haute couture's* organisers has been that the couturiers themselves start a jointly owned ready-made chain. It hardly seems practicable: who would dare apportion profits—and inevitable losses—among such highly strung partners? Another idea is of an alliance between the *haute couture* and the new, self-assertive high-quality (and highly priced) French ready-made trade that is rapidly emerging. The leaders of the latter think in terms of the unexploited French market rather than of export; and express impatience with the *haute couture's* business methods and mentality. Both sides are imaginative, proud and independent; an alliance would need long and patient negotiation. But it seems the *haute couture's* best promise of compromise; and there are signs that the ready-made leaders might, with dignity, welcome it.

The *haute couture* naturally feels reserve. Are too few prosperous houses sheltering too many weak ones, that neither initiate nor dominate but honourably make ends meet till their span is run? Well—with a shrug—it was always so. Must the *haute couture* commercialise itself? That might endanger its standards. There are more gestures here; plump men pluck at their suits and smooth their hips to show the mystical relation of Balenciaga clothes to the body. For everyone agrees, once the protectionist talk is over, that a Paris model is inimitable; it is only to the uninitiate that a good copy still looks good. Paris is supreme; any Parisian pundit can persuade you of it. Italian competition is a trivial, meridional breeze. America proved during the war it could not create a fashion at all. Why? "Our buildings . . . history . . . tradition . . . look at our women. . . ." But it is not the quality of French *haute couture* that is in question; it is its commercial enterprise.

The Treaties of the Six—II

Atomic Bridge to Europe?

FROM OUR SPECIAL CORRESPONDENT LATELY IN BRUSSELS

A FRENCH expert on energy, a German politician and an Italian scientist will be visiting Britain next week on a mission important for both Britain and Europe. As the representatives of "Euratom," the atomic agency which six continental countries are preparing to set up beside the common market, their purpose is to see how much Britain is prepared to help the venture. They are at present on a similar quest in the United States. Both visits are a crucial part of the wider task entrusted to the "three wise men," as they have been called—to sketch out the broad dimensions of Europe's needs for nuclear power and to suggest priorities for research and development in the first stage of Euratom's existence. For Euratom, generous help from Britain and the United States might bring forward its power programme by some three years. For Britain, a close relationship with the agency may enable it to play a leading commercial role in Europe's nuclear developments.

The wise men's visit is only one sign of the swift practical progress which the Euratom project has made in the last few months. The treaty itself, which was torn for so long between the French desire for a strong political body to control Germany and German resistance to this, has been swept to completion a good deal quicker than the common market; for the Middle East crisis has lent a new urgency to nuclear power development in Europe as well as in Britain. In negotiation, the new atomic agency has been shorn of some of the political status which the French originally conceived for it, but it has been given practical powers and tasks in research and planning which should make it the pilot of Europe's voyage into the nuclear age.

A European Harwell

The treaty has reached the stage of a probably final draft. In research, it provides for the setting up of a common centre, with at least five reactors for a start—a European Harwell. An initial research budget of some $250 million has been agreed, to cover costs in the first five years. An atomic university will be set up as well. Research can still go on outside these bodies, in private industry and government laboratories for instance, but the Euratom agency will have a technical committee entrusted with co-ordinating outside research, and it may keep outside projects more effectively within its orbit by sharing in their finance. Above all, the Euratom centre will take on a capital importance in western Europe through the simple fact that it is first in an almost virgin field.

Its importance will be further enhanced by its powers over atomic knowledge. Euratom has a monopoly right to make agreements with countries outside the community for acquiring this knowledge; and all members which have agreements with outside powers—Belgium, for instance, gets classified information from the United States—are obliged to seek a transfer of their rights to Euratom. Inside the community Euratom can require any government to surrender a patent or specific piece of knowledge. There is no practical way of compelling a private laboratory to give Euratom the daily results of its research, but it is an essential

principle of the treaty that those who draw on the centre's great fund of imported or discovered knowledge, should contribute to the pool what they learn themselves. A private patents pool is established, too ; firms depositing patents in it may use others in the pool under non-exclusive licences. Euratom, leading research itself, will also be the custodian and centre of a growing pool of common knowledge.

In production, the role of Euratom is not so great. Power production will be mainly undertaken by the separate countries, though investment should be fitted into the framework of plans and estimates drawn up by the agency. Common installations are also envisaged in the treaty, but it will be some time before it becomes clear which installations are needed most. The chief project, which both OEEC and Euratom are at present considering, is an isotopic separation plant to produce enriched uranium as fuel. France has long pressed for this, since it would both reduce Europe's dependence on the United States for fuel and give Euratom greater importance in the community. But the economic value of this costly plant is a subject of argument ; and if the United States will guarantee long term fuel supplies, it may be found unnecessary.

Military Aspects

In one vital sector of production, however—atomic weapons—Euratom may take on an importance unforeseen by its original creators. The agency was originally designed for peaceful purposes alone and it was hoped that the exclusion of arms might provide a simple answer to the nasty political problems associated with their manufacture in Germany or France. To France, however, the right to manufacture atomic weapons if it wishes, however costly or useless, is apparently a political necessity, and the other powers have had to agree to a French military programme. This could not be outside Euratom, for in German eyes at least it would have destroyed the whole principle of a community of knowledge. France, if it wants to make the bomb, will do it under all the Euratom rules—including those about exchange of knowledge—and Euratom will have to take any security measures needed. The agency's powers have thus been preserved, but only by extending them into a new and hazardous domain. The French example might one day encourage a German request to make atomic arms and Euratom might then be forced to find a more radical solution.

The military aspect gives an unexpected political significance to the great powers of control over fissile material and those who use it which Euratom has been given. It has sweeping rights to inspect all installations which use fissile material, a monopoly of its purchase from outside the community and a first claim on any sold within. Under German pressure, the rules about material have been made flexible enough to protect the consumer from any arbitrary planning. In normal times, Euratom cannot use its monopoly of material as a means of pressure on users to alter their plans, for instance. It is merely an agent selling on commission at world prices. But its monopoly and powers of control remain highly effective sanctions behind the treaty, an insurance that members behave. Some of Euratom's creators hoped to give it still greater theoretical power, by making it the owner of all fissile material as well, but in practice this would be a superfluous addition to the powers of control it has already been given.

(Concluded)

Moscow-Belgrade Fall-Out

FROM A CORRESPONDENT IN BELGRADE

THE "minor differences" between the Jugoslavs and the Russians, mentioned by Marshal Tito when he set out for Moscow last summer, have proved not to be so minor after all. Public controversy about "proletarian internationalism" and the "dictatorship of the proletariat" has replaced the mutual admiration and back slapping, the vodka drinking, and the recognition of "differing roads to socialism." Moreover, Russian criticism has been aimed not only at Jugoslavia's foreign policy—its attitude to the West, its dependence on Western "imperialist" aid—but at domestic trends too ; the Kremlin has been pouring scorn on the "discrepancy" between Jugoslav words about "democratisation" and the "withering away of the state" and Jugoslav practice as demonstrated in the trial and imprisonment of Mr Djilas.

The missionary role which the Jugoslavs took upon themselves in eastern Europe is encountering serious obstacles and the Jugoslavs find themselves once again excluded from the Soviet "family" ; this time, however, they have one friend, Poland. But the Poles are so preoccupied with their own difficulties that they can only sympathise mildly and somewhat surreptitiously. The Jugoslavs, however, though privately admitting that Russia's present aim is to isolate their country and insulate the satellites against its influences, still profess their incurable optimism about the ultimate triumph of their own conceptions ; they still regard the present hardening of the Soviet line and the reintroduction of a firmer centralism within the Soviet block as purely temporary phenomena.

Ever since the sudden visit of Mr Khrushchev to Belgrade last autumn and the subsequent trip of Marshal Tito to the Crimea—even before these two visits—it was clear that the "honeymoon" between Belgrade and Moscow was ended. The Jugoslavs insist that the trouble lay in the Russians' persistent efforts to persuade them to rejoin the Eastern block so that Soviet supremacy over a "disciplined" Jugoslavia could be re-established and the impact of the reopened links between Belgrade and the east Europeans could be neutralised. They maintain that their country's special position encouraged others to agitate for similar recognition and the Russians began to realise the dangers of having a separate policy for Belgrade.

For some time, the Jugoslavs exercised considerable restraint. Their press was directed to avoid giving offence to Moscow and indeed observed the injunction to an extent

Now in its second year

The Paper Bulletin

This is a bulletin service for paper users and makers. It deals with the supply, demand and price trends for paper, paper products and raw materials. The eighth quarterly issue will shortly be available. Full details from:

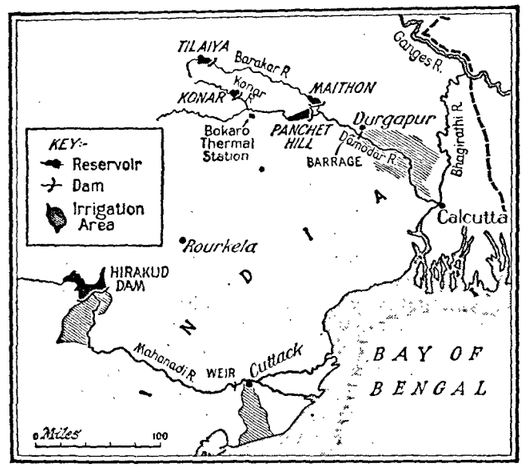
THE ECONOMIST INTELLIGENCE UNIT LTD.
22 Ryder Street, London, S.W.1. Whitehall 1511, Extension 144.

that was difficult to understand. Since early last year Jugoslav newspapers exercised their "freedom" to the utmost in attacking western policies, but were singularly "unfree" when it came to handling Russia. This restraint was justified on the dubious argument—dubious, at least in the extent to which the Jugoslavs carried it—that were they to express openly their disagreements and criticisms of the Russians they would only strengthen the "opposition"—i.e., of the diehard Stalinists—in the Kremlin. This, the Jugoslavs argued, would prevent them from exerting further influence in eastern Europe and would instead strengthen the Stalinists' position there.

The decision to publish Marshal Tito's Pula speech last November was the first spectacular departure from this stand—a move prompted, it is said, by a realisation that with so many points of controversy piling up it was no longer either possible or useful to keep silent and, furthermore, that the old "Stalinist methods" were again being injected into the relations between Jugoslavia and the Soviet Union. There were also compelling internal considerations—above all, Marshal Tito's own prestige which had suffered through his acceptance and support of Mr Gerö on the very eve, as it turned out, of the Hungarian uprising and the fact that Gerö was then so rapidly overthrown. His explanation of how and why he came to lend his backing to Gerö was, in essence, a defence of his own reputation and judgment.

Unholy Glee

Although, however, the Jugoslavs are again isolated, there is as yet no evidence that the members of the Soviet block are going to follow up with all-out campaigns against the Jugoslavs as in the rancorous years after 1948. At this stage, it looks as though the Russians are content, once they feel confident that Jugoslav influences on the satellites and their internal "Tito-ists" have been adequately checked, to conduct their policy along general ideological lines. Trade arrangements between the Jugoslavs and the Russians are proceeding largely according to plan. There is a certain delay in the matter of the atomic reactor promised by the Russians and the joint Russian-East German plan for the development of Jugoslavia's aluminium industry (a subject which Marshal Tito may well care to discuss if he goes to Washington). But a Jugoslav trade delegation is now in Moscow and might well come away with an agreement to increase trade exchanges in 1957 above the $110 million level reached last year. The delay over these talks seemed to arise from changes in Russia's own internal planning, rather than from any wish to inconvenience the Jugoslavs. But it would not be surprising if the Russians, with their increased commitments in eastern Europe, no longer felt so enthusiastic about helping Marshal Tito with loans and credits as they were less than a year ago. For economic assistance, the Marshal will certainly continue to rely chiefly on the United States.



If, in their isolation, the Jugoslavs feel one disappointment more bitterly than any other it is the stand taken by the Chinese—however much they now insist they had not "expected" support from Peking. But behind this mortification, a typically unholy glee is apparent—that Moscow, though gratified at the Chinese reaffirmation of faith, cannot be happy that the Chinese have emerged as the arbiter in the conflict between the Kremlin and Belgrade.

NOTES FROM INDIA

BY OUR SPECIAL CORRESPONDENT LATELY IN INDIA

Dams, Dams, Dams

ANYONE who collected a dozen dams last year must be allowed his personal favourite ; it is Flumendosa in Sardinia, impressive as all dams are, but beautiful without being overpowering. Indeed it is modest by comparison with the Hirakud dam in Orissa which Mr Nehru opened three weeks ago. The Mahanadi (Big River) which Hirakud has broken in for useful work is a maverick that has hitherto run 500 unpredictable and wasteful miles through Orissa to expend itself in a delta below Cuttack that is drowned by its flood waters. At Hirakud there are sixteen miles of dam and earth dykes to hold back the Mahanadi ; they contain a spread of nearly 300 square miles of water ; some 2½ million acres will eventually be irrigated below the dam and at the delta ; generating capacity of nearly 200,000 kW is being installed at two hydro-electric power houses ; all told, the cost of the full schemes will exceed Rs 100 crores or £75 million.

Hirakud has a spiritual significance for Orissa and India that matches its physical ambitions. It is the first in a string of big projects that is within sight of full achievement. Orissa compares itself with the backward Ukraine before the Dneiper dam was built 25 years ago. It sees Hirakud as the focus of an industrial complex, feeding power to a new aluminium factory to be built alongside the dam, to the new steel plant that the Germans are building at Rourkela, to coal mines, a ferro-manganese factory, cement and paper plants. The State of Orissa does not attempt, at this stage, to work out any clear estimate of return on this gigantic scheme. Any such calculation, it seems to suggest, would at this moment be almost sordid ; what has finance to do with the immense achievement of delivering a dam from such travail ?

There is no doubt about the travail. It is questionable whether Hirakud is ideally sited ; the project was altered (and improved) in important ways after work had started ;

there were miscalculations about plant and stores, noisy scandals, a fight for discipline and an endless struggle to get engineering staff, and an ambiguous control split between Orissa and New Delhi. The substance of the Hirakud scheme is now in being. But its construction has taught many lessons, and in some respects it compares unfavourably with what is being done in the complex of schemes on the Damodar River to the north.

And Damodar

THE Damodar schemes themselves have not been trouble-free. (They are not now ; where else in the world would workers protest against redundancy by hunger strike ?) Yet in terms of value for money the returns from the Damodar Valley Corporation's investment (about the same as Hirakud) seem more assured. Its constitution as an autonomous body on the lines of the Tennessee Valley Authority has been an unmistakable advantage, producing better (though not perfect) planning, clearer responsibility, and a more precise matching of returns against costs.

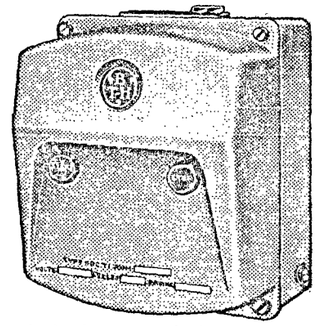
The DVC has built two smaller dams at Tilaiya and Konar, the Maithon scheme is well on the way to completion, and Panchet Hill, until recently starved of large scale concrete batching and earth moving plant, is now going ahead faster. Self-loading strippers fill Euclid trucks, which move in endless procession carrying their loads to the dam site. They are a portent of the new India, but on their way they pass evidence of the old—symmetrical heaps of granite that has been cut, trimmed and graded entirely by hand. These schemes when completed will irrigate a million acres, serve over 100,000 kW of generating capacity, and buttress the Bokaro thermal power station which has been in service for nearly four years. This has three 50,000 kW units and a fourth is being installed ; it burns coal of remarkably low grade with equally remarkable efficiency.

These essays in large-scale construction with the bare minimum of outside help have given India valuable experience which may be worth the cost. But perhaps the most dramatic project of all is the Bhakra-Nangal scheme 200 miles north of Delhi. The Nangal dam was completed 2½ years ago ; but the Bhakra dam a few miles up the Sutlej river is still pushing up its vertical concrete face towards the 700 feet limit. By any measure, this is among the most challenging enterprises undertaken by man in harnessing nature. It is the biggest concrete pouring job ever known outside the United States—10,000 tons a day for several years on end, with the prospect of power and completed irrigation works early in the 'sixties. Here the driving force behind the construction comes from Mr Harvey Slocum, an American engineer. Between them Bhakra and Maithon will go a good way towards founding a school of Indian dam builders that can build fast with modern machinery. In the Bhakra gorge there is no option but to use big machines ; in other projects it is not clear that they have yet established a decisive advantage over ancient methods using low-paid men and women.

The New Engineers

AT the Sindri fertiliser plant, one of India's new industrial showpieces, a notice alongside an instrument panel says " Go and look at the gasholder "; there was, apparently, one regrettable occasion when the needle failed to tell the truth. In a continuous process plant of this kind, engineering maintenance is of imperative importance, and Sindri is looking after its own needs, and those of other industries, by running a comprehensive training centre for young engineers and tradesmen. India, developing in a rush, is having to learn its engineering in a rush too ; fortunately it is uncovering considerable engineering talent that has hitherto been latent.

Foreign technical aid has played some part in unearthing and bringing along these new skills. At the Chittaranjan Locomotive Works the management (which is among the most impressive in India) acknowledges the part that the North British Locomotive Company played in helping to found a plant that is clearly efficient by any standards. Here Indian productivity runs British standards pretty close—1 to 1.4, with wages comparing 1 to 4. A locomotive that cost 535,000 rupees to import in 1949 can now be made for 450,000 rupees at Chittaranjan. Already the senior engineers there are beginning to talk of the possibilities of electric traction at 25,000 volts, on the most modern French standard.



German co-operation is to be seen at Tata Locomotive and Engineering where a link with the Mercedes-Benz company for the assembly of diesel trucks is being extended in a new plant to manufacture 12,000 trucks on the spot, with locally made engines. Such ambitions would be impossible unless there were the prospect of an expanding supply of skilled engineering manpower. Where jobs can be broken down into component operations, training is relatively easy. Men who have gained more comprehensive experience at the machine bench sometimes show a marked inventive ability of their own. One such example, to be seen in a sewing machine factory near Calcutta, is a prototype automatic machine doing seven milling operations in 1 minute 40 seconds that had previously taken 3½ minutes as separate jobs. The inventor spent six months on this problem and has come up with a radical technical solution.

Sacred Cows

THREE lines of hooting traffic oppose each other in Calcutta's busiest streets, separated as likely as not by cows in each lane. At night it takes a powerful headlight to pick them out asleep in the middle of the roads. On the country roads they will start to cross from one over-cropped verge to the other at the precisely critical distance from an approaching car, confident, it seems, in their sacred security and wholly unconcerned at the nerve strain they inflict on the motorist. Scrawny in Bengal, they seem much better bred and cared for in the south. But for the most part they are skeletal miseries, stripping what herbage there is and barely able to keep themselves alive.

The miracle that will cull the worst third of these useless herds has yet to occur. Before partition it was possible to square religious principles with commercial opportunities by droving cows to the Muslim areas ; what happened to them thereafter was not the concern of the Hindu. There are still remnants of the trade on which blind eyes and backs are turned. But it is impossible to make real headway on the scientific elimination of the bad animals and up-breeding from the good. What is the use of developing artificial insemination, using stud bulls, if their offspring are allowed in turn to breed with scrub animals ? Pitiful as a producer of milk, prohibited for meat, unreliable for transport and unfruitful for the land (for its dung is used as a staple fuel), the cow is a sacred diseconomy that India cannot afford. If India is to have a modern industry and a modern agriculture, how long can this tabu survive ?

Serving Europe, all Canada, the U.S.A., Bermuda, Nassau and the Caribbean

NAIROBI: Less than 60 years ago wild animals roamed the plain on which the city of Nairobi now stands, and a multitude of birds screeched in the reeds where the Nairobi river spread itself out into a vast green swamp. Masai warriors occasionally hunted lion over the ground. They called it Nairobi—"the place of the cold water". Nairobi began its life in 1899 as a mere railhead camp on the line to Uganda. Today it is the capital of Kenya, a modern city with wide streets, fine buildings and a population of over 200,000. It received its City Charter from the Duke of Gloucester in 1950. Nairobi is also the principal commercial centre for the whole of East Africa. New industries are encouraged and important building and industrial developments are in progress. The Royal National Park, on the outskirts of the city, is an interesting link with the past. Covering some 40 square miles it contains lion, hippo, giraffe and a surprising variety of game, all living in their natural environment.

Business men who require information on current commercial conditions in East Africa are invited to get into touch with our Intelligence Department, 54 Lombard Street, London, E.C.3. Up-to-date reports from our branches in Nairobi and elsewhere are readily obtainable on request.

THE BUSINESS WORLD

Economics of Super-tankers

There are more ways than one, technically, in which the West can try to moderate the future growth of its dependence upon oil sailed through the Suez Canal. No one of them, and perhaps no combination, can in the medium run offer complete insurance against that political risk—certainly not against the underlying risk inherent in drawing more oil from Middle Eastern sources, however we may arrange to collect it. None, that is to say, makes a political solution less vital.

All the technical expedients involve extra investment: this is the political insurance premium. Commercial considerations only decide which expedient, or which mixture of them, may offer the margin of insurance most economically. More nuclear electricity; more oil storage capacity and dual-firing equipment: more exploration for new oil and secondary recovery from depleted reserves in safer places; more research to bring down the cost of distilling oil from shale, tar sands, or cheap coal; more pipeline capacity—all these have to be assessed.

But one particular form of "Suez insurance" deserves separate assessment—the super-tanker. If they have to, these big crude carriers can move oil comparatively cheaply round the Cape. The building of super-tankers, by the oil industry or even by governments, today seems to many people a panacea. How far would it be?

COLONEL NASSER did not create the political risk of reliance upon the Suez Canal; he merely, but brutally, advertised it. Nor did he create the need to consider alternative ways of moving more oil to the West than the canal, as it exists and was in any case likely to be developed, could handle; but he may have brought forward the date when it must be expected to become inadequate.

Early last year, well before nationalisation of the canal, the oil companies were considering the alternatives after that date arrived. The Suez Canal Company's "Plan VIII" offered, by the sixties, transit capacity for, say, 160-180 million tons of oil a year; and pipeline capacity from Iraq and Arabia to the Mediterranean, in 1956 some 40 million tons a year, might by then have been up to 60 million tons a year or more. Guesses about exactly when the West might want more than 200-240 million tons of Middle East oil a year varied from a year or so before 1965 to a year or two after.

The alternatives, in mid-1956, were various:

The Suez Canal could be further widened or deepened, or doubled up with extra canals along the same route or from the Gulf of Akaba to the Mediterranean;

Further pipelines could be laid from the Persian Gulf and Iraq to the Mediterranean; from the Gulf of Akaba to the Mediterranean; or alongside the canal; or

Oil could be carried round the Cape, in the least uneconomical size of tanker available;

From the standpoint of early 1957, and assuming no permanent political solution, some of these alternatives look less practicable. Extra pipeline capacity from the Gulf to the Mediterranean—which would certainly be the most economic way to expand oil transit capacity to the West—may look rather riskier now.

Moreover, it now looks more uncertain whether existing plans for expanding the capacity of the canal or the pipelines can be counted upon. Thus the date when that existing transit capacity must be expected to become inadequate for oil needs may have been brought some years nearer. The possibility that significant tonnages of oil may have to be moved round the Cape in the normal run of things, beginning in about five years' time, has to be faced now—even if the existing canal and pipelines are kept open. And the cheapest way to sail that oil would be in very large tankers.

Unless the possibility of a sane political solution were quite to disappear, and with it the chance of substantially increasing pipeline and canal capacity to the Mediterranean, the oil companies must inevitably seek a compromise—the best vessel for both canal and Cape routes. What is the best compromise tanker with which the oil companies can hedge these political risks?

Compromise at 65,000 Tons?

Economics of scale in the building and operation of tankers are discussed in detail on page 399. Here it need be said only that the major oil companies operating in Britain now broadly agree on the size of tanker that will give the best compromise and most economical insurance. If Plan VIII of canal development is carried out fully, the biggest tanker that will be able to pass through the canal fully loaded will be in the 38,000-42,000 tons deadweight range. The biggest tanker that will be able to pass partly loaded or in ballast will be in the 65,000-70,000-ton range. But it fortunately so happens that from about 38,000 tons right up to 60,000-65,000 tons deadweight, the total cost per ton of moving oil *via* Suez does not much differ.

Such a 60,000-65,000-ton tanker has to sacrifice about a third of its potential load to pass the canal, and "topping up" at pipeline terminals in the Mediterranean may not justify the extra delay. On the other hand, the journey round the Cape to Western Europe and back to the Gulf (even *via* Suez in ballast) adds roughly 50 per cent to the mileage *via* Suez both ways. So such a tanker can carry roughly as much oil in a year going either way.

Here, then, is the tanker for the compromise. It is true that no oil terminal in Britain and few in the Western world can today handle such a tanker regularly. Its draught of about 40 feet would be too much for anchorages or harbour bars at most existing British oil ports except Finnart on Loch Long which serves Grangemouth. But British Petroleum is building a pipeline terminal at Milford Haven, which could handle up to 100,000 tonners, and Esso has leased the land for a possible refinery there; Shell plans to build an oil terminal near Tranmere that will be able to handle 65,000 tonners to serve Stanlow.

How many of these 65,000-ton tankers ought tanker operators to be building? To provide against the limitations of routes *via* the Mediterranean in the sixties, it could include increasing numbers of such tankers in its plans for tonnage to be delivered in 1961 and 1962 onwards. To provide, in the meantime, against the risks attached to the existing canal and pipelines might in theory require the shifting of tanker orders for earlier delivery into the 60,000-65,000-ton range—or even the building of some additional "reserve fleet of super-tankers" during the next few years. In practice, it seems that very few more big tankers than are already on order could be had before 1961-62 anyway.

At the end of 1955 the world tanker fleet totalled about 40 million tons deadweight; and an expert from one of the oil companies, contributing to a symposium upon future oil demand last summer, guessed that by 1965 about 60 million tons dw of tankers would be needed to move the world's oil. Allowing for replacement of tonnage reaching the end of its useful life, he estimated that about 25 million tons dw of new tankers would have to be built during the decade 1956-65.

Today, the world fleet totals about 45 million tons dw, and nearly another 30 million tons are on order: orders for some 12 million tons dw were placed in the last six months of 1956 alone. The world's shipyards have experienced their biggest boom of tanker orders ever in the last two years. As a result, it is impossible to get delivery of a tanker ordered now from any European yard before 1961-62; even from Japan and the United States, one cannot get delivery before 1960.

Capacity for Tankers

Today, only two tankers of 50,000 tons dw or more are afloat; and in the 30 million tons to be delivered between now and 1962-63, there are only about 40 more, totalling about 2¼ million tons dw. None of the major shipbuilding countries has more than a handful of yards prepared to build such vast crude carriers. By the early sixties it may be possible to build vessels of 65,000 tons dw, if not more, at about five or six yards in Britain, three in Germany, one each in France, Holland and Italy, the big American-owned yard in Japan, and two of the established yards in the United States. Even this will call for considerable re-arrangement and development of shipbuilding capacity.

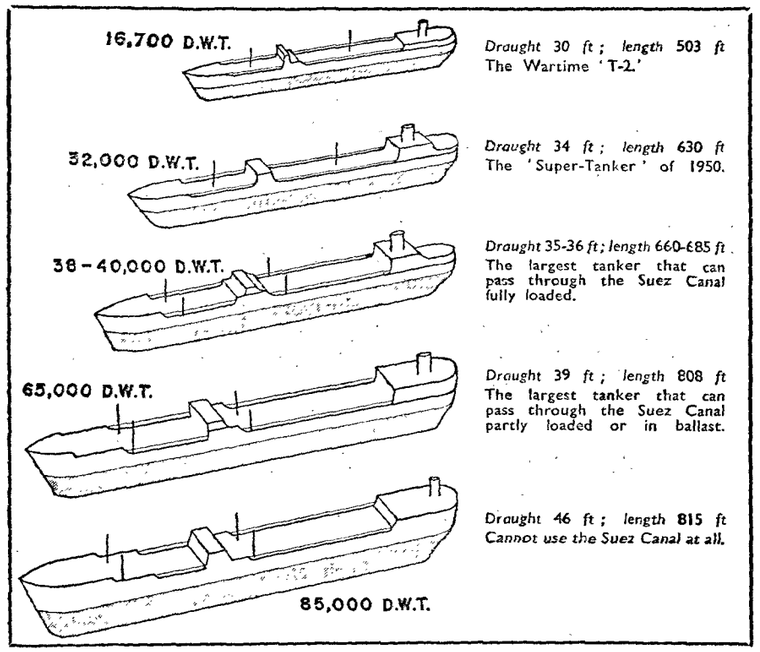
Expansion of shipbuilding capacity is generally said to be limited, in Britain and nowadays in other major shipbuilding countries, by supplies of steel plate. Certainly, plate output has not expanded as much as total demand from the shipyards and from many newer customers. In Britain, the shipbuilders have sometimes blamed lack of labour and sometimes lack of steel for preventing them from increasing output more; their delivery periods lengthened before those of any other country; and certainly this has lost them some orders in the latest tanker boom. Limits on effective capacity in British yards, possibly due to lack of plate, may therefore have reduced Britain's share of the existing tanker order-book throughout the world.

But there is not much evidence that lack of shipbuilding capacity throughout the world has seriously limited the building programmes of the world's oil companies and the tanker operators who serve them; existing orders, after all, offer additions to the tanker fleet of about 10 per cent each year up to 1960-62.

Within the existing tanker order book, there is no doubt that plate supplies will be strained if shipbuilders are to keep their delivery promises, from now until about 1962, even with the extra plate from new mills coming into commission in Britain and elsewhere. But those promises to deliver were made against forward estimates of plate deliveries. Nor would steel plate supplies necessarily affect the size of tankers that could be built in the shipyards. Out of a given amount of steel plate, one can get more deadweight carrying capa-

The Advantages of Very Big Tankers

THE case for the super-tanker rests almost entirely on the economies of scale. Broadly speaking, the bigger the tanker the less it costs to build and to operate—per ton mile of oil carried. Beyond a certain structural size problems begin to offset any further gain in building costs, and running costs turn sharply upward. Even before this point, when by increasing size lower building and running costs could still be achieved, such gains may be offset because tankers become less flexible in operation as they grow larger, or require more ancillary investment on shore.



It requires less than twice as much labour, steel and other materials to build one tanker to carry 60,000 tons of crude oil as it takes to build two tankers to carry 30,000 tons each. This reduction in construction costs per ton holds good over a wide range, but becomes less marked after about 50,000 tons. The stresses that have to be borne by the very largest ships are so great that stronger steel plate is required to make the ship safe; and when the ship exceeds the size that can be driven by a single screw, the extra cost of machinery may even cause construction costs per ton to rise.

THE WORLD TANKER FLEET

Percentage of total deadweight tonnage in each size	In Service end-June 1956	On Order*	Total Fleet (exist'g + orders)
2,000 to 23,999 dwt.	80·0	22	55
24,000 to 37,999 "	18·0	39	27
38,000 to 44,999 "	1·3	17	8
45,000 to 49,999 "	0·7	14	6
50,000 dw and over	—	9	4
	100·0	100	100

* Including launchings since June, 1956

It requires less than twice as much shaft-horsepower to drive one 60,000-ton ship at a given speed as it takes to drive two 30,000-ton ships at the same speed; thus less fuel oil is burned per ton of cargo as the ship is increased in size. The crew needed on a 60,000 tonner is little larger than on a 30,000 tonner, and—up to a point—insurance costs per ton of cargo also fall as size is increased. The need to use twin-screw engines after a certain point, with a corresponding increase in fuel consumption, would limit this reduction of running costs. The maximum shaft-horsepower that can be obtained from a single screw is not much more than 20,000—sufficient to propel a 60-65,000-ton ship at 17-18 knots. If a single screw is used in larger ships, then the speed has to be correspondingly reduced—to 14½ knots in an 84,000 tonner.

On these considerations alone, the optimum size of tanker, given present methods of propulsion, would appear to be between 60-65,000 tons and 80-85,000 tons. But ideally, a tanker should be able to load anywhere, discharge its cargo anywhere, be overhauled in any existing dry dock, and follow any sea route between its loading and discharging points. When ships are larger the number of loading and discharging points is limited and sea-routes are restricted, and it becomes more difficult to arrange an economic programme for the operation of the tanker fleet.

Flexibility can be maintained by enlarging ports and terminals; by building new dry docks; by building submarine lines so that tankers can discharge from an offshore anchorage; by discharging into lighters or small coastal tankers; or by discharging into a few very large terminals from which redistribution is made either by pipeline or coastal tanker. But all of these methods of regaining flexibility cost money. And the larger the tanker, the more ancillary investment in shore facilities it is likely to need per ton of oil carried.

The limit to the size of ship that can use the Suez Canal is set partly by the draught, which at present is only 35 feet; and partly by the cross-sectional area of a ship (its draught times its beam) in relation to the cross-sectional area (depth times width) of the canal. If the cross-sectional area of the ship exceeds a quarter of that of the canal, then so much water becomes piled up at the sides of the ship that it cannot be propelled through the canal and tends to "sit down on the bottom."

If the canal were certain to stay open, and certain to be able to handle any volume of shipping likely to want to use it, then it seems clear that tankers of 38,000 to 42,000 tons dw would be the most economic on the Persian Gulf-Western Europe haul. Counting the additional investment required in terminals for tankers larger than this, it seems doubtful whether any larger tanker could operate as cheaply, whether it went through the canal both ways partly loaded or round the Cape fully loaded and back through the canal in ballast. But if the canal were clogged with shipping, or arbitrarily closed, the larger ships would be more economic on the enforced haul round the Cape.

These considerations have led the oil companies to regard the 60-65,000 tonner as the most suitable compromise for the Persian Gulf-Western Europe run. On the route from the Persian Gulf to the Eastern seaboard of the United States the mileage saved by going through the canal is much less; and oil shipped from the Persian Gulf or from the Far East to California would not go through the Suez Canal in any case. On these routes, therefore, the 85,000 and 100,000 tons dw giants may have the advantage.

city by building 65,000-ton tankers than by building 38,000-tonners.

Shipbuilding capacity, and plate supplies, certainly impose a limit on the building of extra super-tankers between now and 1960 as a reserve against further interruption to transit *via* Suez. In the United States it might be possible to build some vessels for such a reserve by a "crash programme." In Britain, steel plate could be rationed more tightly, exports banned, and the steel industry ordered to invest in more plate mills than they are already committed to; the yards might be forced to rearrange their capacity more rapidly. But it seems highly doubtful whether such a plunge back into priorities would yield much extra super-tanker tonnage in the next two or three years.

Political Insurance Premium

Tankers now on order for the world oil industry represent at current prices a capital investment of the order of £1,750-£2,000 million. Such amounts of capital are a problem even for an industry as vast as oil—it has, in any case, even larger capital requirements elsewhere. In Britain, as abroad, the oil companies are now seeking the co-operation of financial institutions in financing these tankers. Such co-operation may take various forms, apart from the straight ship mortgage. A loan may be raised at the time of launching, secured on a ship that is given a charter covering the whole period of its useful life; this releases the capital used in its building to be "circulated" in the construction of further ships.

These tankers now on order, moreover, already represent more tonnage than the industry recently supposed that it would need delivered between now and 1965. Its guesses may have been conservative; but the latest surge of orders, particularly since the Suez Canal was nationalised, might thus be said already to include some element of insurance, in the form of extra tonnage. It is understandable that the oil companies should be reluctant to tie down even more capital to obtain further political insurance.

The oil companies are therefore far from enthusiastic about any new and over-riding programme of priorities aimed at getting more super-tankers earlier than they, the shipbuilders, and the steel industry are contemplating. Some tanker experts in the companies, indeed, are predicting that with the huge volume of new tonnage coming on to the tanker market during the next few years there will be a temporary surplus, a dip in rates, and a wave of scrapping before the next great wave of ordering—assuming that the canal remains open. So they are doubly reluctant to have the market overshadowed by some American or British reserve of Government super-tanker tonnage.

The number of tankers of 50,000 tons or more that the oil industry is building (or governments might be able to add) will form only about 4-5 per cent of the world tanker fleet ten years from now. Super-tankers offer a margin of insurance, but it is a fairly costly one. If alternatives such as the multiplying of pipelines from the Persian Gulf to the Mediterranean should seem practicable once more by the early sixties, the routeing of oil round the Cape to Europe, whatever the size of tanker, will still be uneconomic; there will be better routes on which to take advantage of the economies of scale of monster tankers. The 65,000-ton tanker sailing part-loaded through the canal is essentially only a 40,000-45,000-ton tanker with excessive capital charges; and the 100,000-tonner moving oil round the Cape could not compete with itself moving oil from Mediterranean pipeline terminals.

The super-tanker is one of the West's best bets in the next ten years; but it does not in some way suddenly make it shorter to go round two sides of a triangle, if all other things are equal. Economically, those other elements in the supply of oil from the Middle East could be "made equal." Whether they will be remains a political question.

Business Notes

A Sketch of 1956

NEW information about national expenditure coincided this week with customary information about industrial production to present an official sketch of the British economy during 1956 with rather more shading in of the background than Whitehall hitherto has been able to offer so soon after any year ended. In broad outlines, the picture is of an economy in which both general and specific monetary controls were succeeding in restraining the growth of total internal demand, enabling a continued and slightly faster growth of exports to be achieved without any real growth at all in imports. Total industrial output remained unchanged during the first nine months of the year at about the level it has been during the last nine months of 1955; by the last quarter it was dropping off very slightly. This steadiness of total output during a year

in which output of metal consumer goods, in particular, was sharply cut by discriminating monetary controls shows that some effective switching of effort was taking place during the year into capital goods production and into exports. But until the end of the year there were few signs of much net movement of labour into these industries. Broadly, the policy of credit restraint was working, though some disconcerting features remained; for example, the very dubious estimates of stock changes suggest that these were continuing to rise during the first nine months of 1955, and steel imports last year stayed obstinately as high as the year before. It may be inferred from the estimates of spending, moreover, that consumers were not saving much more of their higher incomes.

The new quarterly estimates of national expenditure in the first nine months of 1956, which are discussed in detail on page 407 show that total internal spending in the economy had risen in real terms by only about 2 per cent over the same months of 1955, although increases in prices brought the increase in actual money spent to more than 8 per cent. The money spent for personal consumption rose by 5 per cent, but there was little change in the volume of goods bought. Total investment throughout the economy was about 3 per cent up, in real terms, though investment in manufacturing rose far more than this; by the third quarter of last year the upward curve of investment was flattening off. Government expenditure rose by 9 per cent in money. The small increase in total output throughout the economy will have come entirely from the non-industrial trades and services. Within industry, there was some shift of emphasis from manufacturing into the construction and utilities industries; manufacturing output seems indeed to have fallen very slightly between the two years.

Fixed Interest Stocks in Demand

THE rise in gilt edged prices and steady investment buying spreading towards the longer dates remain the features on the Stock Exchange which a second deferment of the widespread expectations of a reduction in Bank rate has not checked. Indeed it can momentarily be argued that a small reduction in Bank rate could be the event most likely to check the advance. Prices must now discount something more than a reduction of a half per cent. For more than three weeks the *Financial Times* index of Government securities has risen on every trading day. At 89.27 on Wednesday it compared with 82.38 at the end of November. The market has been wondering how much longer official portfolios will be able to supply the "steel" stock (Treasury 3½ per cent 1979-81); its price has been edged upwards to 79$\frac{13}{16}$. That is a far call from the first tentative purchases of the 4 per cent Conversion stock 1957-58 in December.

The strength of the gilt edged market overshadows a reasonably steady performance by ordinary shares which advanced a little on balance with the start of a new Stock Exchange account on Wednesday. The *Economist* Indicator shows another small rise of 0.9 at 189.9. A steady demand for fixed interest stocks other than gilt-edged has also been obscured by the activity of gilt edged. Debenture stocks, preference shares and loan stocks have been in strong demand. Price comparisons for these stocks are slightly erratic because of the much smaller and more uneven supply,

INDUSTRIAL PRIOR CHARGES

but the table indicates that the losses of the second half of last year have been roughly recovered, and among the recent issues the recent advance has been sharp.

Issues in Flood

INVESTMENT markets have recently been active enough to absorb easily the flow of new issues. That flow is worth closer inspection, for two reasons. Its very existence draws attention to the safety valve through which the head of steam now pressing some sections of the market upwards may be released—it draws attention to it, but it does not measure it. The massive sales by the government broker in the last few weeks must greatly exceed the amount of stock sold on the published prospectuses of gilt-edged borrowers and industrial companies together. Secondly, the type of new issue that has succeeded sheds some light on what both investors and issuing houses are expecting from the market. Thanks to a modest rights value, 95 per cent of the issue to shareholders in United Steel Companies of 6 million £1 ordinary shares at 30s. was taken up and applications for 3,220,000 excess shares made the issue a notable success. But there is little evidence yet of a demand for ordinary share issues without some additional bait.

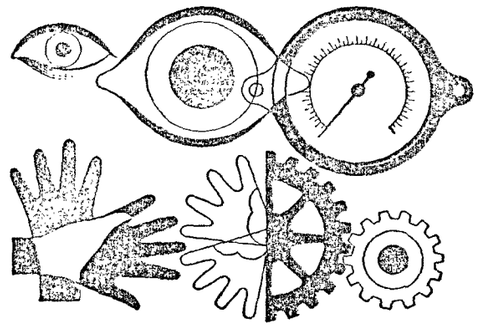
Investors like fixed interest stocks. They liked the *Hertfordshire* 5¾ *per cent stock so well that applicants* for up to £2,500 stock received only £100 stock; from £2,600 to £10,000 the basis was £400 and above that figure 2.44 per cent of the amount applied for. A premium of 1¾ points over the issue price of £98¼ was established at the opening. They also like North Riding of Yorkshire's £1 million of 5¾ per cent stock 1966 placed at £98.

The flat yield of £5 7s. 2d. per cent and the gross redemption yield of £5 10s. 8d. per cent recognise the further rise in the market since the Hertfordshire terms were fixed, but it opened at 1½ premium.

But investors like best a two-way option—a fixed interest stock with a spice of equity in it on the ICI model. That is what makes the issue of £15 million 5¾ per cent convertible unsecured loan stock 1978-82 in the Bowater Paper Corporation much the most exciting issue in the market this week. It is offered to holders registered on January 18th of the company's debenture, loan, preference and ordinary stocks (not as rights) at £97 10s., and it carries the option to convert into ordinary shares at 46s. 6d. per share in July, 1959, at 48s. 9d. per share in July, 1960, and at 54s. 3d. in July, 1961. With Bowater ordinary at 45s. 3d. the conversion option is, allowing for stamp duty, already of interest. Shareholders who might in less favourable markets have thought twice about following the rapid growth of the Bowater capital structure further, will rush for it. With a flat yield of £5 18s. per cent and a gross redemption yield to 1982 of £5 18s. 9d. per cent the stock has investment merits without the conversion option. It is most unfortunate, since there are many American shareholders that the American law will not allow them to post application forms.

The Missing £200 Million

THE Treasury bill rate, the fall in which has played so large a part in stoking up the gilt edged boom, eased further at last week's tender—by almost ⅛ per cent, to an average of slightly under 4 9/16 per cent. Seven weeks previously it had almost touched 5 1/16 per cent. A big contributory factor in the acceleration of this movement in the past few weeks has been the wholly abnormal contraction of the supply of bills. It is usual for maturities of bills to exceed new issues in the big tax-gathering weeks, because the Treasury employs part of its seasonal cash surplus to repay floating debt carried in this form. The seasonal contraction of the tender bill issue, however, was normally much less than the surplus, partly because it was technically difficult for the authorities to arrange a sufficient concentration of maturities of such bills in the few weeks affected. In the past two years this difficulty has been met by the device of issuing 63-day as well as 91-day bills in the last quarter of each (calendar) year; in consequence, the maturities squeezed into the five weeks now ending reached the extraordinary total of £1,680 million.



A big reduction of the tender issue this month thus became technically possible; but the surprising fact about the reduction that has actually occurred is that it has far surpassed the amount of cash visibly available to the Treasury to finance it. In the first four weeks of 1956, when the technical concentration of tender bill maturities was first achieved, the total outstanding issue declined by £180 million. But in the corresponding period this year, the contraction has amounted to no less than £390 million, carrying the outstanding issue down to £3,210 million by January 26th. Yet in the first twenty-six days of January the Treasury's above line surplus was some £45 million smaller than in the most nearly comparable period of 1956, and its below-line deficit was some £55 million larger—a total deterioration of £100 million that was offset to the extent of £40 million by a reduction in net repayments of tax reserve certificates. After allowing for small savings (including an estimate for savings deposits, which do not figure in the Exchequer return) the final deterioration appears to have amounted to about £45 million, making the total net sum "visibly" available to the Treasury roughly £215 million—before taking account of the reduction of the fiduciary note issue.

This big discrepancy between the decline in the tender bill supply and the Treasury's apparent surplus is evidently, to a very substantial extent, a reflection of the recent success of the "departments" in selling gilt edged stocks from internal portfolios. It is impossible to say how much of the disparity is attributable to this cause, because the periods covered by the two sets of figures cannot be precisely aligned, and because the Exchequer return does not necessarily indicate exactly the flow of funds to or from the public sector within the precise periods stated. Aside from the possibility of statistical distortions of this sort, the only other major source through which the discrepancy could be explained would be the Exchange Account—but even if there was a further net loss of gold and dollars in this period (thus providing the Treasury with an equivalent sum in sterling) it certainly could not amount to more than a modest part of the sum involved. The conclusion, therefore, is that the departmental net sales of stock must have been very large: behind the scenes a substantial funding of Treasury bills has been in progress.

A Risk Worth Taking

LORD MILLS has extended for one month—until the end of March—the promise that no additional restrictions will be imposed on the consumers of fuel oil. This implies dangerously rapid drawings upon the civilian stocks of fuel oil held in this country during February and March, but there are convincing reasons why the government felt justified in taking the risk. Consumption of fuel oil by the steel industry has already been cut by 15 per cent; in other industries there has been a 10 per cent reduction; central heating has taken a 25 per cent cut; and the Central Electricity Authority has reduced its relatively small fuel oil consumption by 80 per cent. The effect of these cuts has been mitigated by the ingenuity of consumers in switching to other less scarce fuels, such as creosote pitch for steel-making and coal for electricity production, so successfully that the Federation of British Industries was able to say this week that industrial output had not been significantly affected by the present level of restrictions (although industry is by no means operating at full capacity). But there is a limit to industry's flexibility; and any additional cuts would begin to affect output and employment more seriously.

At the present rate of withdrawal from stocks Europe as a whole may soon be down to a bare two weeks' supply of fuel oil, but the position in Britain is not as critical as this. What the decision not to impose additional restrictions now does mean is that the existing restrictions will have to be kept on longer in order to rebuild stocks. A more severe cut now, even if it meant that restrictions could be lifted

How Automatic Can You Get?

In modern production processes it is normal to control automatically a number of related variables. The eventual product is analysed. If it is found that there could have been a more effective setting of the process controllers, they are changed for the next day's run.

But imagine that, as the product comes off the production line or out of the pipe line, it *is immediately analysed and the process controllers automatically* re-set to the optimum settings to produce an even better product.

Although this cannot yet be realised, it is no pipe dream. It is something which Sunvic Controls have been working on for many years—and is just one example of the extra facilities they will be offering in the course of time towards increased production efficiency in industry. This kind of research naturally attracts some of the best brains in industry, and there is always room at Sunvic for younger men with scientific or technical qualifications who are interested in joining a fast-expanding Company engaged in absorbing and important work.

BRANCHES AND AGENCIES THROUGHOUT THE COUNTRY

A Time for Greatness

Times of crisis are times for greatness. In this country, nuclear power must play its part in meeting the critical shortage of fuel, and therefore the building of a nuclear power station becomes an urgent as well as a thrilling task.

Work began on the nuclear power station at Berkeley in Gloucestershire on January 7th and was planned with all the care of a military operation. The preparation of the foundations for the first reactor has already started and the site from the air looked like a Normandy beachhead. Men and heavy vehicles were moving everywhere, building this great nuclear power station.

John Thompson Nuclear Energy Company Limited

Balfour Beatty and Co Limited

John Laing and Son Limited

completely at an earlier date, would still damage output more.

On the supply side it is certainly premature to predict that the rate of fuel oil arrivals will improve substantially even by April, but there are a few straws in the wind. The government is apparently banking on the Suez Canal being open to small tankers of 10,000 dw by some time in March; more important is how soon larger tankers will be able to use it partly loaded or in ballast (which would save the Cape trip at least in one direction). In Syria the Iraq Petroleum Company has paid £4.9 million in pipeline royalties covering the period up to November 2nd, when the pumping stations were blown up, without waiting for its claims for compensation to be met. But it is a moot point whether the gesture of putting money in the Syrian exchequer will make that government more or less intractable in its refusal to permit repair work on the pipelines to commence.

Building Prospects

THE building industry is easily the largest capital goods industry. In the last five years new building has accounted for almost half of all new capital investment in this country—and house building for about a quarter. As it is an industry where the production line moves along from product to product it is also a "labour-intensive" industry, its capacity being very largely accounted for by its large labour force—now more than a million men. So building has probably the most flexibility, for periods of expansion or restraint, of any capital goods industry.

Last year, however, building work as a whole showed no sign of slackening, even though the number of new houses that were put up fell from 317,000 to about 300,000. Final figures are not yet available, but during the first nine months new construction rose by 15 per cent and repair work by 6 per cent. Allowing for the rise in the cost of labour and materials and for a slightly higher labour force, this meant a physical expansion of about 6 per cent in all forms of work and a welcome rise in productivity. Some builders, particularly in rural areas, are now growing short of work however and another significant sign is that there is now noticeably less work in preparation in architects' and surveyors' offices. The National Federation of Building Trades Employers, which issued its annual report last week, feels that if total demands on the industry in 1957 are not more than 10 per cent lower than last year, there would be "no justification for pessimism or drastic measures." It recognises that some reduction in the pressure of demand on the industry would be beneficial for the country—and for the industry, too, since it would help builders to complete their contracts on time and to give more attention to preparation and planning and to the efficiency of their site activities.

But is building work likely to fall by 10 per cent this year? The number of new houses built may decline by that amount, to 270,000, and defence work will also decline again. But these now account for only a third of its total output whereas the industry has two years' factory building on its order book, the volume of school building under construction is at a record level, and the road programme is slowly expanding. For the small jobbing builder, too, the Rents Bill holds out the prospect of more house repair work. The federation might perhaps be more justifiably concerned about the outlook for 1958. The time-lag between the conception and execution of a building project is such that if the credit squeeze lasts for most of 1957, the industry could be faced with marked redundancy in a year or two.

Aircraft Re-shuffled

THE de Havilland Aircraft Company and the British Overseas Airways Corporation must share a mutual relief that the scheme by which de Havilland would produce a multi-purpose jet airliner for BOAC has been dropped. It has always been difficult to see how the corporation could effectively employ an aircraft poised uncomfortably between the medium-range requirements of BOAC's Commonwealth routes and the exacting non-stop performance needed for the North Atlantic. With an eye to the big world market for medium range aircraft of all types, de Havilland has already been showing a tendency for limiting, rather than increasing, the range of its Comets in order to boost their carrying capacity.

This leaves the Bristol Britannia as the only North Atlantic aircraft being built in this country—indeed it will be the only turbo-prop aircraft capable of the non-stop crossing. The long-range prototype left for North America this week. The medium range Britannia goes into passenger service on Friday. The project originally conceived at the Royal Aircraft Establishment at Farnborough for a supersonic airliner may, however, lead to a new process of concentration in the aircraft industry. The Ministry of Supply has made no secret of its views that individual British manufacturers no longer had the resources to handle big development projects singlehanded. Its success in bringing the leading manufacturers in the industry round a table to discuss this project is therefore a tactical victory. No good aircraft ever emerged from a committee, but out of such a committee might come a design team capable of building one.

Credit Still Expanding

THE heavy tax gatherings of the early weeks of the new year failed to check the disappointing credit trend evident in the closing weeks of 1956. During November the Treasury's receipts from premium bonds and the large amounts of sterling accruing to it from sales of gold had produced a contra-seasonal contraction of bank deposits. But in the last six weeks of the year, in spite of further large gold sales in the first half of that period, the rise in deposits was resumed—and even accentuated. Aggregate net deposits of the clearing banks rose in those six weeks by £217 million, in contrast with increases of only £149 million and £126 million in the corresponding weeks of 1955 and 1954. Now, in the first sixteen days of January, net deposits have contracted less than seasonally, by £81 million. This is a somewhat larger movement than occurred

in the early weeks of last year, but an appreciably smaller one than that of the average for 1953-55; Lloyds Bank's index (1948 = 100), which had jumped from 105.0 to 106.3 at the end of 1956, rose further, to 106.8.

† Ratio of assets to published deposits.

Up to mid-January, therefore, no reflection of the exceptionally rapid reduction achieved since the turn of the year in the supply of tender Treasury bills was to be found in the banking figures. During the sixteen days the banks' aggregate liquid assets contracted by only £44 million—a slightly bigger movement than in 1956, but a much smaller one than in either 1955 or 1954—while their holdings of Treasury bills rose by £28 million. Advances to the state boards, which rose by £21 million, to £109 million at the end of 1956, declined by £14 million. Other advances thus appear to have fallen by nearly £35 million, but this movement, like the apparent rise of £9½ million in the preceding period, was distorted by extraneous influences at the year-end. The only safe conclusion from these figures is that, over the whole period from November 21, there was a further perceptible decline in borrowings by the private sector. Thanks mainly to purchases by the Midland Bank (which at the year-end had shown an abnormally high liquidity ratio), total investment portfolios have expanded by £12 million. The combined liquidity ratio is unchanged at 37.4 per cent, which is fractionally less than the January figure last year, but substantially higher than that for any of the four preceding years.

Third Class Flying

On Monday the airlines confer at a meeting of the International Air Transport Association in London to decide how, when and at what price they are to introduce third class fares on the North Atlantic. The principle of third class fares was approved last summer after long and stormy meetings at which for some time an incongruously matched pair of airlines, British Overseas Airways Corporation and Pan American World Airways, were lone supporters of the scheme. Many airlines remain unhappy about the decision that was then reached. Next week's London meeting faces the difficult task of differentiation between tourist (or second class) and third class fares and of fixing the gap between them. The fiercest complications arise on the North Atlantic services. Unless some existing type of service is dropped, four different charges might result—luxury first class, a standard first class, a tourist fare and the new third class rates, the last three separated from each other by prices differences of about 16 per cent, and physical differences of several inches of leg room.

The setting of physical standards (for seating or for sandwiches) has always been the trickiest matter for IATA to solve. Its members show a subversive tendency to push standards of comfort higher than was originally intended; this happened when tourist fares were first introduced in 1952. Great diplomacy will be needed if the London meetings are not to bog down in wrangles about the size and composition of the lunchboxes the new passengers will carry and how little room they can be expected to occupy.

Five Shilling Bank Shares

The first five shilling shares in the bank share market will be those of Martins Bank and they may be expected to open somewhere near 14s. 6d. The bank's capital reorganisation plan also cancels all uncalled liability, and foreshadows a small increase in dividend and a small free scrip issue. The existing issued capital comprises 939,556 £20 shares, £2 10s. paid, and 1,966,206 fully paid £1 shares, a total paid up capital of £4,315,096. This is to be replaced by £5,276,425 in a single class of 5s. shares, entailing the capitalisation of £961,329 from published reserves (to be restored in part by a transfer from inner reserves). There will be a scrip issue of one for five for the holders of the existing £2 10s. shares (on which the uncalled liability of £17 10s. is to be cancelled), so that each existing £2 10s. share, standing in the market at about 172s. 6d., will be exchanged for twelve 5s. shares. For holders of the £1 shares fully paid, which stand at 72s., the scrip issue is one for four, so that the eventual holding will be five 5s. shares. The directors announce their intention of paying a dividend of 15 per cent for the year; this would be equivalent, on the present capital, to 18 per cent on the £2 10s. shares and to 18¾ per cent on the £1 shares. The payment for 1956 was 17½ per cent.

Wages at 30 mph

The order raising the legal speed limit for heavy lorries from 20 mph to 30 mph is now before Parliament and, if it is passed, will come into force on May 1st. But discussions on the revisions this may involve for drivers' schedules and the way their wages are calculated seem to have languished for the time being while hauliers and the unions consider the more immediate problems arising from fuel rationing. These consequent changes have been the rock upon which previous attempts at raising the

The New Bradshaw

With the publication this week of the first quarterly estimates of national expenditure, Mr Macmillan's Bradshaw is beginning to take on its new look. Much of the recent improvement in economic statistics has been directed towards filling in the gaps which have prevented any quarterly assessment of changes in supply and demand. Some of these gaps have now been closed.

By adding the different kinds of domestic expenditure on goods and services to the value of exports of goods and services and then deducting imports, a total is built up which represents the value of all the goods and services produced by the nation—the gross domestic product. This differs only from the usual conception of national income in that it excludes income received from abroad in the form of interest and dividends. The new series on this basis has been calculated from the beginning of 1954 until the third quarter of last year and is published in a supplement to the January issue of "Economic Trends" (HMSO, 2s. 6d.); the main figures are reproduced in the table at the foot of the page. According to this reckoning, Britain's output rose from £12,196 million in the first nine months of 1955 to £13,226 million in the same period of 1956, that is, by £1,030 million, or about 8½ per cent. About three-quarters of this increase is said to reflect higher costs, leaving a rise of 2 per cent in real terms.

But this is only one way of measuring national income. The total is a sum of expenditures; it is also a sum of the nation's output; it is also a sum of incomes. There are still some links missing before full quarterly statistics can be produced on either the production or income side, but a preliminary estimate from direct output data suggests that the gross domestic product rose in real terms by no more than one per cent in the first nine months of last year.

Why the discrepancy between these two sets of estimates which leaves in the air some £100 million or £150 million? It reflects not only the errors which cannot be avoided in these complicated accounts, but also the difficult concept of a measure in real terms which eliminates the changing value of money. Clearly too much must not be read into small differences and certainly not into changes from one quarter to another; in the official phrasing "only guarded conclusions should be drawn." Quarterly figures will be less accurate than annual ones and movements will be influenced by seasonal factors which, until the series has been running for a longer time, Whitehall is not prepared to iron out. With what awe, therefore, mingled with some inescapable doubt, does one look at the unofficial quarterly estimates of national income and expenditure recently started by the *London and Cambridge Economic Service* which stop at nothing and not only purport to eliminate price changes but also seasonal influences.

But with all these hedged-in warnings a lot can be learnt from the new indicators about general trends. In the first nine months of last year, consumption, current expenditure by public authorities on goods and services, and fixed investment all apparently increased

GOVERNMENT EXPENDITURE

(Central Government + National Insurance Funds)—£ million	First Three Quarters 1955	1956
Goods and services	1,763	1,912
Of which: *Defence*	*1,125*	*1,218*
Health	*371*	*408*
National Insurance benefits	*448*	*500*
Other current grants to persons	326	327
Debt interest	492	530
Subsidies	234	249
Grants to local authorities	352	385
Current grants abroad	49	46
Transfers to capital account	85	86
Total	**3,749**	**4,035**

in real terms—and probably each by around £50 million in 1955 prices. But by the third quarter any increase over twelve months before had disappeared in both consumption and investment; only government expenditure seemed to be still expanding, although much of the increase at current prices was due to higher pay for the armed forces. In spite of the credit squeeze stocks were being built up last year, but by the third quarter the rate had slackened.

These new estimates are an important addition to the statistical arsenal and their quality will improve. The national accounting now most needs reinforcement on the income side, and here profits have been the main stumbling block; the Inland Revenue has now begun to collect quarterly information from a sample of companies and industry is believed to be co-operating well. It can also presumably supply a quarterly national wage and salary bill. But is this enough? Could not monthly payroll figures be collected? It will be a pity if Bradshaw fails here.

* Total domestic expenditure on goods and services plus exports of goods and services less imports of goods and services less taxes on expenditure plus subsidies.

limit have foundered, but the Minister of Transport decided last year that it would be silly to postpone this particular piece of reform any longer. The unions and the hauliers have been able to agree that there shall be no reduction in pay for doing the same work (that is the same distance even though it is covered in less time) and that where productivity is higher the benefit should be shared; but have made no headway yet in translating these general principles into detailed arrangements. It is this lack of agreement that has led the Labour party—rather unnecessarily—to oppose the order.

The difficulty is that not every haulier and lorry driver may benefit from the higher legal speed limit—for example those running short hauls in built-up areas or operating lorries of less than 3 tons unladen weight which can already travel legally at speeds of up to 30 mph. The suggestion made by General Russell of British Road Services recently that some mileage element should be introduced into wages calculations ("hauliers sell ton-miles so why should they not buy miles from their drivers?") would still not meet this difficulty—if it is in fact a real stumbling-block. A large organisation such as BRS might be able to make adjustments to the pay of drivers not affected by the change in speed limits, but small private hauliers would be less able to do so. Another complication is that the private hauliers alone are governed by the statutory wages machinery for the industry, though both BRS and traders with C licence fleets usually fall into line. It is quite possible that May 1st may come and go before the hauliers and the unions reach agreement, but when it is reached it seems clear that some mileage element may have to be incorporated in the new arrangements and some widening of differentials between grades of drivers accepted. The latest wage claim from the unions would in fact mean a considerable widening of present differentials; and this might give the employers an opportunity to secure some compromise settlement on arrangements for the new speed limit.

Conclusions about the Vulcan Crash

A VERDICT of accidental death was given at the inquest on the four men who died in the Vulcan crash at London Airport last October. In evidence, the two pilots asserted that their two altimeters showed the bomber as being much higher than in fact it was, so that it touched the ground sooner than they had expected. Altimeters are known to be prone to errors for which pilots have to make due allowances. A witness from the RAF experimental establishment at Boscombe Down explained that when an aircraft was near the ground, the "normal" error of 70 feet in the altimeter reading was almost doubled, and on top of this there was a possible manufacturer's error of anything up to another 70 feet. This could explain why, when the Vulcan was about to hit the ground, the cockpit altimeters showed it to be 150 feet up. Two official reports on the crash, one military and the other civil, emphasised that both the pilot and the ground controller had taken risks in neglecting the precise height of the aircraft. The pilots' account of peering through raincloud searching for approach lights that were found too late to be on their left instead of beneath the bomber leads to a conclusion that neither report has mentioned. Responsibility for the crash rests in part on the men in the cockpit and the controller on the ground; but those who instructed the pilots to bring an aircraft of advanced design into a civil airport strange to them, with a control system that had not been designed for machines of that kind, cannot escape blame. Sometimes such risks come off; in this case they did not.

Small-Scale Atom Power

AN agreement signed this week between a British firm of consulting chemical engineers, Humphreys and Glasgow, and the American Locomotive Company covers the manufacture in this country of the small so-called "packaged" atomic power unit that Alco is developing for the US army. Small atomic reactors cannot produce electricity as cheaply as big reactors. Costs at the first 300,000 kilowatt British power stations are likely to lie between 0.6 and 0.7 pence per unit; the best costs that Alco can promise range between 1½d. and 2d. per unit from a 10,000 kW installation and at least 2½d. a unit from small plants of 1,000 to 2,000 kW. (This is half what power from the first prototype is likely to cost.) The capital cost of a 10,000 kilowatt installation is put at £2 million, or £200 per kilowatt capacity compared with £100 to £120 for a full-sized station: costs rise progressively as size declines.

In isolated regions, the generation of electricity in limited quantities from atomic plants needing a minute weight of enriched uranium may have advantages, though diesel generating sets can probably produce power for roughly the same cost.

Contraction in Lombard Street

THE onset of dear money in 1955 brought hard knocks to the dealers in money; faced with its continuance through 1956 the discount houses drew in their horns. The profits statements of the Union Discount Company, the National Discount and Alexanders showed that profit had been restored to current trading; and dividends were maintained. The full balance sheets now show the measure of the consolidation—enforced mainly by the fall in bond prices, the increasing competition for bills and the consequent depletion of bill portfolios.

The sharpest contraction is that shown by Alexanders. This house shows a further reduction in loans and deposits of £39.8 million, to £89.1 million—compared with £149.6 million at end-1954; holdings of bills are down by £19.1 million to £60.2 million, whilst the bond portfolio is slashed from £53.1 million to £32.2 million, barely two-fifths of the portfolio two years ago. The chairman, Sir Eric Gore Browne, states that the reduction in short-dated bonds "involved a realised loss but enabled us to increase our income"; however, the company shows virtually no reduction in its book depreciation, at £2.6 million, now equivalent to over 8 per cent of the reduced holding. The Union Discount, the giant of the market, also shows a big drop in

Human Values in Construction

However scientifically a construction job may be organised, however widely its operations may be mechanised, successful completion depends on human factors—on the skill, loyalty and morale of the men to whom the work has been entrusted

LAING

THIS VITAL ASPECT of construction has always been fully recognised by John Laing and Son Limited. Although the Company's operations are widely spread over a large number of frequently isolated sites, every care is taken not only to promote the wellbeing of workers on these sites but to keep alive the sense of a common objective, of being part of a team.

It is this sense of team spirit — fostered from the first moment of joining the organisation — which calls forth personal loyalty and gives a creative purpose to the exercise of individual skills. On construction sites throughout the country, regard for human values is reflected in the willing effort, mutual reliance and quality of work by those on whom the Company's reputation has been established.

the things they say!

I.C.I. exported £71 million of products in 1955, I see.

Yes, they've been doing well.

How do they manage it, I wonder?

One reason is that they've built up a sales organisation all over the world. Indeed, they have subsidiary companies in 42 countries, and agents in nearly all the rest.

And what's the other reason?

Well, foreigners have come to trust the quality of I.C.I. products and the technical service that goes with them.

Is Britain, then, a force to be reckoned with in the chemical field?

Yes. And high quality isn't the only reason. Thanks to our research workers, we in Britain now have hundreds of outstanding chemical products to sell to the world.

Such as?

Polythene, for instance, and the powerful 'Gammexane' range of insecticides, brilliant new dyes like 'Alcian' Blue, and drugs like 'Paludrine' and 'Antrycide'. They're all I.C.I. discoveries, you know.

And they're helping us in world markets?

They are, indeed. What's more, I.C.I. are spending over £9 million a year on research and development. So far as they can, they mean to ensure that British chemicals stay in the lead.

ICI

bills, by £34.3 million to £163.6 million, but this follows an increase of £24.4 million in 1955; its bond portfolio is slightly increased, following the big 1955 drop. The National Discount is alone in showing a substantial increase in bill holdings, by £22.9 million to £101.0 million, but this was still not sufficient to make good the big depletion of the previous year. The running down of £19.0 million in its bonds is more than accounted for by the maturity of its 1954-56 War Bonds, stated at end-1955 to be £32¾ million.

The chairman of the Union Discount, Lord Kennet—who is chairman also of the Capital Issues Committee—states that the business has now settled down to "conditions which are stable in relation to a high Bank rate." Lord Kennet does not consider it appropriate to pronounce upon national financial policy, but suggests that monetary policy alone is not enough and needs to be accompanied in particular by economy in public expenditure. But his fellow-chairmen, Commander Coke, of the National, and Sir Eric Gore Browne, of Alexanders, give strong emphasis to the pain and cost of dear money. Commander Coke argues that it is becoming increasingly clear that "high interest rates, by themselves, have comparatively little effect nowadays either in restricting domestic credit demands or in attracting foreign deposits"; whilst Sir Eric makes much of the effect of high rates in increasing the cost of servicing the external debt.

Heat Saving by Compulsion?

PRESENT government policy for promoting fuel efficiency in industry is a blend of exhortation and incentives, to which there has lately been added a dose of coercion in the form of the Clean Air Act which indirectly should

Costly Airports

THE trenchant criticisms of the Ministry of Transport by the Select Committee on Estimates for consistent losses on the 28 government-owned civil airports are not unmerited. Since the Select Committee's report at the end of 1955 (which gave for the first time an idea of how much airports were costing), the annual rate of loss has risen further by 11 per cent and at the end of the financial year 1955-56 it was running nearly £2 million a year. Nor is consolation to be drawn from a point made by the Minister of Transport last Tuesday that in 1951 airports lost £2 million, but handled only half the number of passengers; the Select Committee had earlier been told by Ministry of Transport witnesses that losses would go down as traffic rose and traffic is now up by 18 per cent. The Select Committee concluded with a certain brusqueness that "the operation of the aerodromes is either so inefficient or so financially insolvent that the more traffic there is . . . the greater the loss becomes."

The report does not demand that the airport should cover their expenses fully; if that were the policy, allowance for interest and amortisation on the £30 million invested in airports would raise the annual loss to a notional £7 million. But it does expect them to cover current outgoings. So by all accounts does the Ministry, yet its intentions seem to be continually defeated by circumstances. A case in point is the big jump in the bill for London airport last year. By April, 1955, the terminal buildings in the central area were brought into commission piecemeal and so were not pulling their weight in handling passengers or producing rents from concessions for the full financial year. On top of this, the technical services provided from London in the way of regional traffic control were becoming more expensive.

The result was a loss of £400,000 on operations at London airport—nearly three times as big as the year before. But what brought down the wrath of the Select Committee was the "incomprehensible" inaction of the Ministry in face of rising costs. The Minister can increase revenue at any time by raising the landing fees; these have not changed significantly since 1948.

Strong opposition from the airlines to any increase is only to be expected. The Ministry seems to have given far too much weight to arguments that higher charges would divert traffic from London, and so has held its hand for far too long. Mr Watkinson has now promised an increase in landing charges, having postponed one until a report on the whole subject of airport charges was published by the International Civil Aviation Organisation. London airport is expensive to run because it is technically efficient. There is no reason why airlines should not pay for the extra cost of up-to-date technical services.

secure a more efficient use of fuel burning plant. The National Industrial Fuel Efficiency Service provides the main element of exhortation, and investment allowances and the revolving fund of loans to help instal fuel saving equipment are the incentives. But this is not enough for one private promoter of fuel efficiency. Mr Gerald Nabarro wants to widen the sphere of coercion and his Thermal Insulation (Industrial Buildings) Bill, which he introduced in the Commons on Wednesday under the ten minute rule for private members' bills, would make it compulsory for occupiers of all industrial buildings using space heating to comply with certain minimum standards of thermal insulation to be devised and laid down by the Minister of Housing—on pain of paying a fine of up to £500 if they default.

The national interest in the current and prospective fuel situation might well be used to argue for more compulsion, and the classic method of raising prices does not seem to be very practical in the case of fuel since fuel costs form a heavy proportion of total costs for some industries and a minute element for others, even though these small consumers, between them, have a significant share of total industrial consumption. But is Mr Nabarro's method a more practical or desirable alternative? The bill suggests that enforcement should be undertaken by local authorities (many of whom have adopted the Ministry's model by-law on thermal insulation of new houses) and it would give occupiers of existing buildings a period of grace of four years or more before they had to comply. Certainly it would be easier to apply the bill to new factories (few of them are properly insulated at present) and local planning machinery could be used to administer it. But its application to existing buildings would be fraught with difficulties and special cases. Devising a workable and equitable code of regulations for different types of buildings and space heating methods would not be a pleasant task.

"Free" Sugar Set Free

On Thursday the International Sugar Council, which administers the International Sugar Agreement, announced for the first time in the agreement's history the removal of all restrictions on exports. As the average spot price for seventeen consecutive market days had been far above the point at which restrictions must lapse (4.0 cents a lb) this was a foregone conclusion. By itself this action cannot increase the supply available to the market. But at anything like present prices importing countries with a little sugar to spare are tempted to sell, and even that is of some help.

Prices of raw sugar in the "free" world market continue to fluctuate at a high level. Early this week the spot price dropped sharply by 0.85 cents to 5.50 cents a lb fas Cuba. Only a tiny business was done at that figure, however, and the price rallied later. The relapse was mainly the result of speculative operations in New York; physical supplies of sugar remain tight. The real strength of the market was indicated by the sale of 100,000 tons of Cuban sugar to the German government at 5.65 cents a lb.

A Kite in Ceylon

CEYLON'S minister of agriculture and food, Mr Gunewardena, is one of the small marxist group in Mr Bandaranaike's cabinet which is trying to jolly the prime minister along the road of nationalisation, without as the prime minister's latest statement suggests forcing the pace very successfully. Mr Gunewardena believes in nationalisation but not in excessive compensation. His plan for nationalisation of the European tea estates—an acreage of 260,000 out of 456,000 tea acres in Ceylon—is so devised. He would pay the owner Rs 925 (£69 7s. 6d.) an acre spread apparently over four years, and raise the money by requiring the nationalised estates to pay a special tax of 5½ cents (1d. per lb on their exports).

Ceylon tea shares fell sharply on this announcement—not because of heavy selling, but because the jobbers were determined not to buy stock; at the lower prices there was a little buying from the agency houses that manage the tea companies. They were betting fifty to one against the present nationalisation plan being adopted, and now that the prime minister has come out clearly against precipitate action the odds seem reasonable. Such a monstrous hybrid as a tea industry (far the biggest item in Ceylon's economy), half nationalised and half in private ownership, half paying a special tax which its competitor escapes, would surely be a first-class blunder, and Mr Gunewardena's compensation proposals are certainly not calculated to stimulate a flow of foreign capital into Ceylon.

Tea acres, highland or lowland, neglected or well tended, are not all worth a single price of £69, or any other figure. The market price of the shares values some tea gardens below £69 an acre and others at more than £160 an acre. Some experts would argue that, for example, Nuwara Eliya, standing in the market 28s. 6d., might break up between 16s. and 17s., while Consolidated Estates at the same price might break up above 40s. Upwards of £200 an acre has been paid by Ceylonese buyers for European-owned tea acreage and this is not necessarily dear; to bring a tea garden to maturity now costs about £300 an acre or almost £500 an acre if the factory and equipment are included. Investors and managers must now assume that nationalisation is not rejected but merely postponed. Therefore so far as the hitherto liberal Ceylon exchange control permits it, dividends are likely to be liberal. And bids for estates by Ceylonese will be much more likely to be accepted.

Standard Month for Exports

BEGINNING with the January returns of overseas trade, the Board of Trade is adopting a "standard" month for exports of 25 or 26 port working days. Since the civil service went on to a five-day week last July the Customs Department has been unable to clear export documents as rapidly as before. To conform with the timetable for the import returns, which cover a calendar month, it therefore became necessary about every other month to close the export returns one day earlier. The number of working days covered by the export returns, which formerly varied between 24 and 27, was stretched to between 23 and 28. As the volume of exports handled is fairly closely related to the number of working days the recorded figures showed sharp fluctuations unconnected with changes in the actual flow of trade. To get over these anomalies the "export" month will be adjusted so that there will be 26 working days in each of the 31-day calendar months, and 25 in the other five months. (The "import" month remains a calendar month.) Comparison between quarters will also be improved.

Fall in Cocoa

LAST year cocoa prices became stable at around £200 a ton. Since then prices have dropped by over £15 a ton. In the London market Accra cocoa for March-May shipment is now about £181 a ton cif UK, and the British West African marketing boards are asking £190 a ton for Accra cocoa and £182 10s. a ton for Nigerian for April-June shipment. At these prices the Gold Coast board is losing about £28 a ton and the Nigerian board about £16 a ton. The guaranteed price to producers in Nigeria this season was reduced by £50 to £150 a ton, the same as in the Gold Coast. Allowing for export duty and marketing expenses, the Gold Coast board needs £248 a ton cif to break even, and the Nigerian board about £206 a ton.

There is little prospect of such a recovery. The weakness in prices reflects the expansion in world production, assisted by favourable weather. The main crop in the Gold Coast may well exceed 255,000 tons this season, compared with an official estimate of 225,000 tons and with a crop of about 220,000 tons in 1955-56. The Nigerian main and light crops together promise to be at least 135,000 tons, or more than 20,000 tons higher than last year. Barring bad weather world production is likely to remain high, for prices are still extremely profitable to the growers. Hence the outlook turns mainly on the growth in world consumption. Manufacturers have frequently urged the producing countries to expand production; now that expansion has come, too few manufacturers seem ready to absorb it.

SHORTER NOTES

Cable and Wireless (Holdings) is to pay an ordinary dividend of 10 per cent for 1956; this rate was foreshadowed nearly twelve months ago by Sir Edward Wilshaw. The group's earnings after tax have risen from £575,442 to £620,000.

★

The consolidated balance sheet of Carreras, the tobacco manufacturers, shows stocks to have fallen from £17 million to just over £14½ million in the year to October 31st, with a consequent reduction in bank loans and overdrafts from £10¼ million to £7¼ million.

★

Copper prices are drifting downwards. On Thursday cash copper closed at £253 a ton, a decline of £15 a ton on the month.

Company Notes

JOHN SUMMERS. Steel company chairmen speak with differing voices about dividends. The attitude of the chairman and board of Dorman Long was discussed last week. Now Mr Richard Summers, chairman of John Summers, says of the financing of that company's expansion plans: "It should be possible to pursue a policy which will provide a substantial amount for this expansion out of the industry's own resources, and which will at the same time make investment in the steel industry worth while. We are not unmindful of the shareholders' legitimate claims, and in due course I hope that it will be possible to give tangible proof of these sentiments."

For 1955-56, John Summers left its ordinary dividend unchanged at 12 per cent and retained about £5 million of its profits. The group's current development programme—due to be completed in 1959, somewhat later than had originally been thought—will cost another £16½ million and the directors have under review arrangements for financing it.

Mr Summers is also reassuring about the immediate prospects for sheet steel. Although sheet steel stocks are "substantially above normal" and demand has fallen, the directors are not unduly worried about their ability to keep the plants working somewhere near maximum capacity. This view is based on three facts. First, the industry will be allowed to export more sheet steel this year; secondly, up to this year Britain had still to import sheet; and thirdly some of Britain's own domestic production has come from old-fashioned hand mills. With a modern works at Shotton, the directors of John Summers are not being unreasonable in implying that any slack is likely to be taken up elsewhere. On the 12 per cent dividend the £1 ordinary shares at 34s. yield 7 per cent.

★

Stewarts and Lloyds will spend about £28½ million on its development programme in the next four years or so. Last year the company had on occasion to borrow from the banks, and it will probably have to do so again this year. It has made a 100 per cent free scrip issue and has increased its authorised capital to 10 million £1 ordinary shares. Clearly a cash issue some day is not ruled out, but the company will not, as many expected, follow United Steel's example and make an immediate offer. The chairman, Mr A. G. Stewart, like other steel spokesmen, argues that the group must finance most of the development programme out of retained profits. "It is difficult," he concludes, "to forecast the cash needs of a large business, but it does still appear that it will not be necessary to raise fresh capital in the immediate future."

★

Hadfields secured control of Millspaugh last year after a stiff battle. This acquisition seems to have had some influence on the company's dividend policy. The company formerly paid an interim of 3½ per cent; after the purchase and after the issues made in connection with it the final payment was 4 per cent. Now, for 1955-56, the company's ordinary dividend is 9 per cent on the enlarged capital. Unfortunately the announcement of this dividend (on which the £1 shares at 25s. 6d. yield 7 per cent) is accompanied by only a meagre reference to earnings. "Before taxation and ascertainment of pre-acquisition profits and the minority interests of Millspaugh" the group's profits were £1,335,549, of which £923,887 came from Hadfields and £411,662 from Millspaugh. The comparative figures for 1954-55 were £826,663 for Hadfields and £408,419 for Millspaugh.

Whitehead Iron and Steel is not a big participant in the development programme of the steel industry. But like the majority of the steel makers it has left its dividend unchanged—at 20 per cent—in spite of an increase in profits, from £1,227,567 to £1,345,857—a satisfactory increase for a company which as a producer of strip steel cannot have been unaffected by the ban on overtime working and by rising costs. At 61s. 6d. the £1 ordinary shares yield 6½ per cent.

★

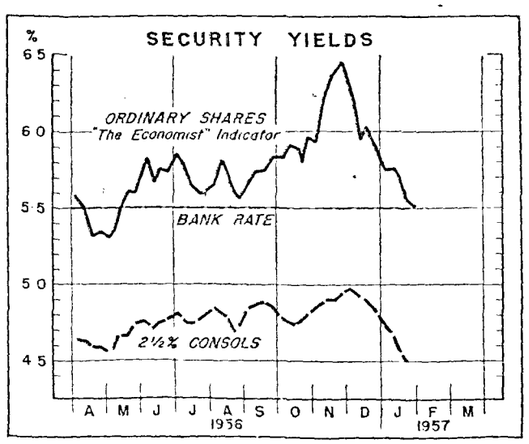
TEXTILE BIDS. It is ironical but not paradoxical that at the time when **Bradford Dyers** has decided to close down one of its branches in Paisley there should be a sudden crop of take-over bids in the textile industry, including one for a Glasgow company. It is possible for an industry to feel the need of concentration and even—as with cotton—to be suffering a long-term shrinkage and yet for a small number of big units, with cash in hand, to need new investment outlets. Not all the textile industry is on the decline but within it there are a number of small concerns with plants and sites attractive to bidders with money to spare. And if there is trade recovery in the air, as there now is in textiles, the time is ripe for bids.

Lancashire Cotton has gone outside its normal area of operations and has bought a small concern in Glasgow, Tullialan Fabrics, manufacturers of chenille cloths. This, Mr R. M. Lee claims, is in keeping with the "policy of seeking new and profitable outlets for financial resources." **Fine Spinners and Doublers** has made an offer of £576,000 for Moorfield Spinning of Oldham; the bid is worth 4s. 6d. per ordinary share, compared with the recent Oldham market price of 3s. Moorfield Spinning produces rayon yarn. **Patons and Baldwins** has acquired William Thompson, the oldest spun silk spinners in this country. The directors of Patons and Baldwins intend to continue the spinning and processing of spun silk yarns at the Galgate mill but it is also intended to develop and extend the new subsidiary's activities in spinning yarns from synthetic fibres, a side of the textile business in which Patons and Baldwins is taking a growing interest.

The bid for **Lyle and Scott,** the Hawick firm making high quality knitwear, falls into a different category. It is the recurrent tragedy of the paternal family business where the "proprietors" have worked largely for their employees, taking little for themselves, and have failed to realise that outside capital demands adequate remuneration. The directors of Lyle and Scott, who claim that the firm has been built up "for the benefit of employees and shareholders," have asked for the support of Scottish MPs against the bid, with which the name of Mr Hugh Fraser is now associated. This suggests a parochialism reminiscent of the Scottish Motor Traction struggle. The irony is that the particular shareholders that have requisitioned an extraordinary general meeting and propose to unseat some of the present board and to put Mr Fraser on the new one, happen to be a group of eight Scottish investment trusts which became shareholders in 1949.

★

F. W. WOOLWORTH. There was some disappointment when the announcement of Woolworth's results and dividend for 1956—discussed in *The Economist* of January 19th—was not accompanied by free scrip issue proposals. The 5s. shares fell back from 63s. to 60s. They recovered subsequently to 63s. 6d. The announcement of a free scrip issue has duly been made. The issue of one new 5s. share for each two held requires the capitalisation of £11,250,000, of which £6,250,000 will come from the general reserve and £5 million from a capital reserve of £13,081,474 "created as a result of a recent revaluation of freehold and leasehold properties by the directors based on an interim certificate given by valuers now engaged in revaluing the whole of the company's properties." At the current price of 62s. xd. the 5s. units in their old form yield 4¼ per cent.



LONDON STOCK EXCHANGE

Next Account begins: February 13th
Next Contango Day: February 13th
Next Settlement Day: February 5th

GAINS among dated gilt-edged stocks have again been considerable, but the advance has not been uniform; on both Tuesday and Wednesday the market has reacted only to recover once more. On Thursday there was a further strong advance. 2½ per cent Funding 1956/61 rose ⅝ to 92⅜, 4½ per cent Electricity 1967/69 1⅞ to 95⅛ xd, 4 per cent Transport 1972/77 rose the same amount to 88⅛, and 3½ per cent Funding 1999/2004 1⅛ to 80⅜. Victory bonds gained 2⅛ to 94⅛ xd and 4 per cent Consols led the undated stocks with a rise of ¾ to 81½ xd.

Industrial stocks were firm up to the start of the new account; stores and tobacco shares showed sharp rises, as did domestic appliance suppliers, whose shares were affected by indications of an expansion in hire-purchase business. Motor shares were mainly firmer, although easing on the labour disputes, and accessory producers improved; Birfield gained 2s. 4½d. to 58s., Chloride Electrical "A" 3s. 3d. to 65s. 9d. and Triplex Safety Glass 3s 6d. to 34s. 9d. Aircraft shares lost ground. Westinghouse Brake jumped 4s. to 80s. 6d. and Enfield Cables rose on rumours of a bid, although electrical shares were generally lower. Express Dairy "A" gained 2s. 4½d. to 21s. 1½d. and Ranks put on 1s. 3d. to 18s. 9d. on the rights issue. Part of the 3s. 6d. rise in GUS "A" to 42s. was attributable to expectations of a scrip issue and Debenhams and Montague Burton were similarly affected. Bradford Dyers lost 1s. 9d. to 20s. 10½d. on the closing of one of its factories.

Oil shares recovered strongly on Thursday, Shell reaching 158s. 3d. and BP 134s. Kaffirs were again quiet, Western Holdings slipping back 1s. 3d. to 72s. 6d. Ceylon tea shares were weak following the nationalisation proposals, but recovered some ground later. Consolidated Zinc jumped to 81s. 6d. but coppers weakened.

[1] The Alexandria spot quotations for Karnak and Ashmouni cotton have been replaced by the current month futures quotation at Alexandria. [2] Figures up to July, 1953, relate to delivered prices and subsequently to ex-warehouse prices of H.C. electrolytic copper; from May, 1955, onwards the proportion of copper sold at fixed prices has been taken into account. [3] The interim index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the London and Cambridge Economic Service. [4] New series based on January 17, 1956=100. [5] Surveys made twice a year; annual figures relate to October survey. [6] Revised series based on Liverpool spot market prices, as from July 1, 1954. [7] Latest figures which are for April 1956

THE MONEY MARKET

ANOTHER fall in the Treasury bill rate at the tender on Friday of last week brought it to £4 11s. 0.81d. per cent; the total reduction since early December amounts to only a shade under ½ per cent. The discount houses raised their bid by 6d. per cent, to £98 17s. 3d. But the offer was under-allotted by £10 million, to £190 million; this was £50 million below the previous week, whilst total applications were up by £22.8 million, to £414 million. The upshot was that the market's allotment fell to 36 per cent, compared with the previous week's average, including the special 92-day bills, of 58 per cent. Yesterday the offer was £190 million.

Credit in Lombard Street was again difficult at the beginning of this week; on Monday the market had to repay a moderate amount of seven-day loans, and despite moderate special aid, given mainly through purchases from the banks, the market had to re-borrow a small sum. No official intervention was needed on Tuesday or Wednesday, but dealing margins were kept tight, the banks' purchases being made at between 4 13/32 and 4½ per cent. Before the weekend, Thursday's tax transfers were again aided by the large surplus of maturities, but the Bank gave some small special help, mainly indirectly through the banks.

Sterling has remained at around $2.79 13/32–7/16 in the past week, following its momentary scaling of the parity of $2.80.

Australian Opportunities

It is our business to know about Australia. For nearly a century the National has been associated with the commercial and industrial expansion of this great new continent.

Immense natural resources and a rapidly increasing population offer sound opportunities for development.

The information Department of the Bank is able to supply reliable and up-to-date information on all aspects of Australian affairs.

The National Bank of Australasia Ltd
(Incorporated in Victoria)

Head Office: 271-279 Collins Street, Melbourne.
London Office: 7 Lothbury, E.C.2.
Information Department: 8 Princes Street, E.C.2.
Over 800 branches and offices throughout Australia.

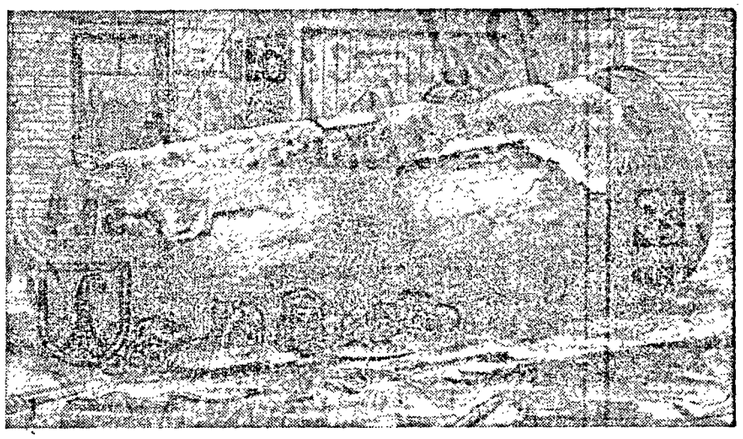
Your best introduction to Australia

Perhaps you didn't know that

BASLE

held its first Trade Fair in 1471, where products of mediæval handicraft were displayed to admiring visitors from France and Germany. This was the forerunner of the great trade fairs of modern times.

But everybody knows



that Basle is famous for its chemical and pharmaceutical products, its industry manufacturing ribbons for the fashion trade and heavy metal goods. It is also a centre of international banking and insurance.
Needless to say, the Basle Branch of the Union Bank of Switzerland plays an important part in the financial life of this prosperous city. Its vast experience is at all times at your disposal.

THIS BROUGHT THE HOUSE DOWN!

Before it blew up, taking 51 feet of chimney with it, this devastating object was a vertical cross-tube boiler supplying steam-heat for a dyeing works. Post-explosion investigations revealed three main causes of failure : shortage of water, which caused overheating and collapse of heating surface; excessive pressure brought about by a defective safety valve; and latent flaws in the boiler plates.

What **Vulcan** *say about it* . . . The most innocent-looking boiler plant can still be a potential danger. From boiler house to baker's oven, it should always be safety first, not second. That means regular and competent inspection by specialist engineers. And for that exacting job, there's Vulcan.

Vulcan's Engineer-Surveyors know all there is to know about boiler plants. If there's a flaw in the flue they'll find it. If there's a defect, they'll detect it. If there's anything wrong whatsoever, they'll point it out. And not just boilers : lifts, hoists, cranes — if there's an accident coming up for any of them, their job is to spot it before it starts. Safety first is Vulcan first.

FREE. For news of industrial accidents and ways to avoid them, ask us now for 'Vulcan'—a quarterly journal for Power users. Please write to Dept. 17.

BAY HALL TRUST LIMITED

Summary of Directors' Report for the year ended 31st December, 1956, and of the accompanying Statement by the Chairman, Sir Charles Hambro, K.B.E., M.C.

The gross revenue amounted to **£251,950** compared with **£228,042** in 1955. After charging Debenture Interest, Taxation, Directors' Fees, Management and General Expenses amounting to **£119,533** the net profit is **£132,417.** Adding **£119,727** brought forward, the total available for appropriation is **£252,144.** The Directors have placed **£25,000** to General Reserve and recommend a dividend of 16 per cent. less tax, which will absorb **£97,000,** leaving **£130,144** to be carried forward.

Full provision has been made in the Profit and Loss Account for United Kingdom taxation in respect of all income to 31st December, 1956. Double taxation relief allowable to the Company amounting to 4s. 6d. in the £ has been taken into account in arriving at this provision.

At market prices on 31st December, 1956 (or where no market price existed at the valuations by the Directors at that date amounting to **£292,938**), the Share and Debenture Holdings and British and Foreign Government Securities had an aggregate value of **£2,811,209** as compared with their book value of **£1,921,831.** There is thus an indicated appreciation of **£889,378** over book cost.

At the valuations taken at 31st December last, over 89 per cent. of the investments are situated in the United Kingdom, Union of South Africa and other parts of the British Commonwealth. About 89 per cent. of the investments are in ordinary stocks and shares and the balance in fixed-interest bearing securities.

COMPANY MEETINGS

STEWARTS AND LLOYDS, LIMITED

INCREASED TRADING PROFIT

FULL BENEFIT OBTAINED FROM NEW PLANT

CONTINUALLY RISING COST OF RAW MATERIALS

POLITICAL THREAT A SERIOUS HANDICAP TO INDUSTRY'S DEVELOPMENT

MR A. G. STEWART'S CONFIDENCE IN LONG-TERM OUTLOOK

The Sixty-Seventh Annual General Meeting of Stewarts and Lloyds, Limited, was held on January 29, 1957, in the Merchants' Hall, 30 George Square, Glasgow, Mr A. G. Stewart (the Chairman) presiding.

The Chairman said: Ladies and Gentlemen, further improvements have been made in the layout of the Accounts. The Profit and Loss Account now shows the value of Turnover, and it is interesting to note that the consolidated Sales to Customers amount to rather more than £114 million. The charges against these sales are shown and form, together with the sales, a summarised Trading Account.

In the notes on the Balance Sheets we have shown, in addition to commitments on Capital Expenditure, the unexpended balance of schemes approved by the Directors at the close of the financial year. There is also shown the estimated amount required for further investment in The Indian Tube Company. These three items together amount to approximately £28,500,000, which is a large amount of money, but expenditure will be spread over the next four years or over an even longer period.

During the year under review the cash position of the UK Companies improved, as compared with the previous year, by £986,000, after deducting increased borrowings from associated companies. This clearly indicates that over the year the Companies were self-financing, although some £11,300,000 in all had to be found for assets of one form or another.

For some months in the year an overdraft was necessary, principally to meet taxation payments, and overdraft conditions will, no doubt, recur during 1957. In these uncertain times it is difficult to forecast the cash needs of a large business, but it does still appear that it will not be necessary to raise fresh capital in the immediate future.

PROFITS AND DIVIDENDS

It will have been observed that the major contribution to the increase in the group trading profit was Stewarts and Lloyds, Limited, but I must caution shareholders against taking too optimistic a view of the 4 per cent increase in the profit of Stewarts and Lloyds, Limited, as shown in the Directors' Report.

I suggest that it would be a mistake to consider Stewarts and Lloyds, Limited's profits for 1956 in isolation. In the previous year, Stewarts and Lloyds, Limited's outputs were substantially up, and the increase in profit was only 5 per cent. In 1956 we obtained the full benefit of some new plants which had outgrown the teething troubles of earlier years and had reached a profit-making stage. At the same time the proportion of new plant brought into operation for the first time in 1956 was comparatively small, with the result that initial running-in expenses and losses were low.

Shareholders should recall that the dividend, including the 2½ per cent cash bonus, was increased by 5 per cent last year. This year it is proposed to consolidate the cash bonus, leaving the total distribution on the Ordinary Shares unchanged at 17½ per cent.

At an Extraordinary General Meeting which will follow this meeting, it will be proposed that a one for one bonus should be issued to the Ordinary shareholders, and the Directors consider that this proposal is the natural consequence of the policy of ploughing back profits. It will also be proposed that the Authorised Capital be increased by 10 million Ordinary Shares of £1 each.

We are certain that the policy of ploughing back profits is correct and that with the large capital expenditure programme before us it is desirable to continue to provide a large proportion of our Capital from our own resources. It would not be prudent to rely on always being able to raise new Capital just when we needed it.

Shareholders from time to time have expressed anxieties about the political risks involved in investing in the Steel Industry, but this is a question which each must judge for himself. I can only say that it would be a most irresponsible step for any Government to take action which would throw this great and growing industry back into the melting pot of party politics, with all the uncertainties that would be created, which, in turn, could only have the effect of holding up development and damping initiative.

It cannot be too strongly stressed that the Iron and Steel Corporation which was set up at the time of nationalisation had neither the knowledge nor a sufficiently long term of office to assume active control of the industry. Little damage was done at the time because development plans were well under way and were completed without interference. But there is little doubt that in the end the Corporation would have felt compelled to interfere more and more in all the details of management.

I am quite sure that under the present Iron and Steel Act and with a strong Iron and Steel Board acting in co-operation with the British Iron and Steel Federation there is sufficient general supervision of the industry. Why should any Government, with all its many responsibilities, wish to add one further, extraneous, responsibility — one which, in my view, Government is not equipped to carry and which would lead to the establishment of a huge bureaucratic machine? This would seem to be just one further step towards Totalitarian Government to which the country, at the moment, seems to be almost unanimously opposed.

It is certain that this political threat increases the cost of raising new capital. This threat is also a serious handicap to the industry in its commercial and technical arrangements all over the World.

TRADING POSITION

Stewarts and Lloyds, Limited.—I gave you last year figures from the Board of Trade indices illustrating the relative increases between 1950 and October 1955 in the prices of steel tubes, iron and steel generally, and coal. These showed that the prices of steel tubes had risen proportionately by considerably less than the prices of iron and steel generally, and of coal. This trend has continued. The Board of Trade indices show that between October 1955 and September 1956, steel tube prices rose by 5.2 per cent compared with an increase for iron and steel in general of 5.6 per cent, and an increase in coal prices of 9.2 per cent.

In May 1956 there were increases in home trade steel and tube prices to take account of increased costs of imported raw materials and semi-finished steel, and of scrap; but we also had to bear increased wages awards in the early part of the year; increased freight charges on iron and steel in April 1956; and an increase of about 8 per cent in the price of coal in June 1956. These increased costs were not recovered in home trade prices until, after the end of the year under review, in December 1956 a general price increase was authorised by the Iron and Steel Board.

In 1956 the tube works of Stewarts and Lloyds, Limited, were operating at 101 per cent of rated capacity. It is important that this should be taken into account when reviewing the results.

In today's circumstances it is, perhaps, easier to take a long-term look ahead than to forecast trading conditions for the immediate future. I am confident that in the long-term, the requirements of our customers at home and overseas will justify the capacity we have installed and are planning.

In the short-term the position is not so clear cut. You might like to know that the oil shortage has not interfered with our production or sales up to date. Apart from this, there has been some falling off in demand in the largest single section of our trade which consists of general purpose tubes in sizes up to 4 in. diameter. At the beginning of the financial year 1956 our order book for this class of material in the home trade had swollen to an unprecedented size. Owing to increased outputs we have been able to reduce the home order book substantially and, at the present time, the rate of supply is greater than the rate at which new orders are coming in.

As against the relative slackening in demand in the home trade for general purpose tubes in these sizes, the demand for quality tubes in this size range and for all tubes of larger diameter continues to increase, reflecting in particular the requirements of the shipbuilding and general engineering industries and those concerned with power generation, and we are finding difficulty at the present time in meeting these requirements.

Demand from the Oil Industry, our deliveries to which in 1956 increased by 16 per cent over the figures for the previous year, continues at a very high level and still exceeds our capacity to supply.

I referred last year to our recognition of the home trade demand as having the chief claim on our resources. Our effort to meet home trade demand in 1956 is shown by the fact that the whole of the increase over 1955 in supplies of tubes, other than for the Oil Industry, was delivered in the home market. As a result, our deliveries of general purpose tubes for export amounted to no more than those in 1955. There continues to be a steady overseas demand for general purpose tubes, but this market is subject to severe competition.

Manipulated pressure pipework supplied by the Company during the year reached a record total and there is a heavy order book in hand.

The high standard of quality which it has always been our object to maintain and the research work which is continually carried on make us well able to deal with the still increasing temperatures and pressures for Power Station work.

We are equipped to supply the pipework requirements of nuclear power plants and orders are in hand for these projects.

Substantial progress has again been made by our Subsidiary, Tubewrights Limited, despatches showing an increase of 50 per cent over the preceding year.

The use of the steel tube is now firmly established with structural engineers, and Tubewrights are now one of the largest makers of conveyor gantries, and also important suppliers of large factory buildings.

Recent developments which seem to be of interest to users include collapsible crates and tubular steel drums for rope or cable.

Further orders have been received for tubular jibs for large walking draglines, and an order has been received from the National Coal Board for a second, and larger, coal-boring tower for exploratory drilling in the North Sea, two to three miles off the Durham coast.

In a disused quarry at Wirksworth, known as the Monkey Hole, we have developed a fully mechanised structures testing station capable of testing towers up to 150 feet high. Heretofore, there has been a lack in this country of adequate facilities for testing tall masts and towers. The primary purpose of installing this testing station is to assist Tubewrights Limited, in the development of tubular structures, but the station will be made available for other organisations wishing to conduct tests.

Stanton.—Sales of foundry pig iron to customers suffered a reduction, but this was more than offset by the increased tonnage of basic iron supplied for steelworks use.

Deliveries of pipes and special castings showed a slight reduction as compared with the previous year and the pattern of markets showed a substantial change. Home deliveries were some 37,000 tons lower, mainly as a result of the Government's economic policy in the restriction of capital expenditure. Despite increased sales in export markets, deliveries to which in 1956 constituted a record, the effect of reduced overall orders at the end of the financial year is now being felt and Stanton have been obliged to cut back production of pipes and special castings by approximately 25 per cent, and at the present time capacity for pipe production exceeds demand.

Deliveries of concrete products, including lighting columns, exceeded 100,000 tons for the first time, though here again the effect of the Credit Squeeze is now being felt. The first orders for prestressed concrete pipes were satisfactorily executed during the year.

PRODUCTION AND DEVELOPMENT

Ironstone.—Our production of ironstone during the year was practically unchanged at 5.2 million tons.

Whilst the use of imported ore in this country has been increasing at a greater rate than home ore, our own blast furnaces are almost entirely dependent upon home ore and provision has been made to increase our production to meet their future requirements. The Company controls large areas of ironstone-bearing land on which an increasing programme of exploratory boring work has to be carried out to keep pace with these demands.

Before development can begin, permission has to be obtained from various authorities and persons, and the whole undertaking is subject to many statutory requirements. The development of large scale opencast or underground operations is a lengthy process. For example, in certain circumstances it may be 10 years before a new mine can be brought up to full capacity. It will be clear from this that a quick expansion of home ore production is not easily obtainable and any increase in production involves much forward planning.

Production of ironstone in this country now involves working stone at a greater depth as the shallower beds become exhausted, and this means a heavier capital outlay. Recently we have had to order two large walking draglines for removing overburden, each costing £750,000. Compared with this, 20 years ago the largest excavating machine required for our opencast quarries cost less than £50,000.

During the past year the development of the new underground mine to which I referred last year has proceeded steadily.

Limestone.—The limestone quarries of Bowne and Shaw at Wirksworth, which supply some 300,000 tons per annum of limestone to our iron and steel works, have recently been mechanised and this has resulted in increased production with a considerable saving in labour.

Iron and Steel.—The steel production of the Company now amounts to 1½ million tons per annum. It is perhaps of interest to note that the annual steel production of Corby Works alone now closely approaches one million tons.

The progressive programme of extension to the present capacity of our iron and steel works, and measures to increase technical and operating efficiency, continued throughout the year.

At Corby, the installation at the blast furnaces of new blowing equipment of greater capacity has been started, together with schemes of extension to the gas cleaning plant and water supply. Good progress has been made towards the completion of the additional ore preparation plant, which should be available for service by the end of the present year. A start has been made on the installation of 50 new coke ovens. These ovens are designed to keep pace with the increased coke requirements of the blast furnaces and to provide an opportunity to rebuild the original coke oven batteries. This coke oven programme represents nine to ten years' work. The plant to produce oxygen in bulk is well advanced and should be available for full service in the current year. Development trials are already taking place. Progress continues in the reconstruction of the heavy rolling mills and the new ingot reheating furnace has been brought into operation. Work has commenced on the second stage of modernising these mills.

At Bilston, full benefit from the pressurised blast furnace has been obtained throughout the year, and steel production exceeded 300,000 tons for the first time. Work has now been started on the installation of another open hearth furnace, and the existing furnaces are being redesigned and rebuilt as opportunity permits. Plans are now under consideration to increase still further the steelmaking capacity at Bilston and to replace the existing rolling mills by modern equipment.

At Clydesdale, the installation of an additional open hearth furnace, making five furnaces in all, has been completed, and the output of round ingots required by the rotary forge tube plants was a record.

In the early summer of 1956, the steel industry as a whole lost some tonnage, due to the craftsmen's embargo on overtime, and, in some instances, the total withdrawal of their labour. Your Company was fortunate in that while Bilston was not implicated, a splendid effort by the works staff at Corby and Clydesdale avoided any appreciable interruption of full production.

At Stanton, the blast furnace capacity will be further increased by enlarging the hearths of the smaller furnaces when they come off for relining. A new ore preparation plant is being installed, and when completed a more consistent quality of pig iron and an important reduction in coke consumption will be achieved.

Steel Tubes and Pipes.—As I have already said, the tubeworks operated at a high rate throughout the year, producing a record output of 973,000 tons, an increase of 126,000 tons over the previous year.

The new rotary forge tube mill at Clydesdale Works, to which I referred last year, was recently brought into commission and the additional tonnage from this plant from now on will contribute substantially towards alleviating present shortages and give an augmented supply of casing and linepipe.

It has now been decided to proceed with the second stand for this mill, which when completed in about one year's time will

increase the capacity to almost twice the present rating.

To meet the ever increasing demand for small size seamless tubes, and to replace certain obsolete plants, plans are now under consideration to install an extrusion plant and a new rotary forge tube mill at our Works in the Midlands, and to recondition the existing Tollcross plug mill, adding new cold draw equipment.

RESEARCH

Our immediate post-war plans included the construction of new laboratories at Corby for our Department of Research and Technical Development.

Preference, however, had to be given to schemes more directly concerned with the creation of new steel and tube capacity, so the expansion of the Research Department—which has had to match our increased scale of operation—was dealt with by the use of temporary hutments.

It is now necessary to provide adequate accommodation for this important department of the Company, and work has recently commenced at Corby on a modern building specially designed to meet our needs. It is expected that this will be completed by the spring of 1958.

OVERSEAS COMPANIES

India.—As you know, The Tata Iron & Steel Company and ourselves formed The Indian Tube Company (1953) Limited to make steel tubes in India from Tata's steel.

Last year I informed you that The Indian Tube Company's first plant—a continuous weld plant for the production of commercial quality tubes—had just started to operate.

It was officially opened by the Chief Minister of Bihar on March 7, 1956.

A good start was made and 17,000 tons of tubes had been produced by the end of September.

Our prior training of Indian personnel in this country enables the plant to work with Indian operators only, and chiefly under Indian supervision.

The continuous weld plant can, of course, produce a much greater tonnage and the Company therefore has the capacity to satisfy the expanding Indian demand for this class of tube for some time to come.

Satisfactory progress has also been made with the electric resistance weld tube plant and ancillary cold strip mill, and it is expected that these plants will start operation early in 1957 as I forecast in my speech last year. The Government of India have also sanctioned the installation of the seamless tube plant to which I referred last year. Orders have been placed for the buildings, plant and equipment and it is hoped that it will be completed towards the end of 1958.

The Indian Tube Company also acts as our selling agents in India for certain of our products, in particular those which it is likely to make in the future.

Our subsidiary Stewarts and Lloyds of India, Private Limited, continues to represent us for our other products and to fabricate and manipulate pipework in Calcutta of which it also undertakes the erection. The Company has had a successful year. Business in fabricated and manipulated pipework has substantially increased and it has been decided to extend facilities for this work.

South Africa. — Stewarts and Lloyds of South Africa, Limited, had a record year. Their turnover was £13 million, as compared with £11,700,000 in the previous year.

Southern Rhodesia.—The South African Company has a subsidiary in Southern Rhodesia which makes tubes from steel produced at the Iron and Steel Works near Que Que. Whilst supplies during the year were better than previously they were well short of what could have been used. These Steel Works are at present owned by the Government of Southern Rhodesia. A Company has been formed to take over, reconstruct and develop the Works. Amongst others, Stewarts and Lloyds, Limited, and The Lancashire Steel Corporation, Limited, have been invited to take up shares on the basis that these two Companies will be jointly responsible for the reconstruction and modernisation of the Works with the object of increasing the ingot tonnage from 53,000 tons per annum to 150,000 tons per annum. The site is capable of producing up to 500,000 tons per annum. Stewarts and Lloyds, Limited, have been asked to take up for cash 500,000 £1 Ordinary Shares, and whilst no quick return is expected on this outlay, your Directors are satisfied that a modernised Steel Works in this fast-developing Federation cannot be other than a good long-term investment, and they welcome the action of the Southern Rhodesian Government in offering this business to Private Enterprise. Negotiations are proceeding.

Australia.—Our associated Companies in Australia had another good year and production in terms of steel consumed rose to a figure of 270,800 tons. However, a definite down turn in the demand became apparent during the closing months of their financial year and the new period opened quietly.

Considerable additions to plant and distributing facilities were made during the year and all the Companies are well equipped to meet and satisfy any likely requirements of their markets.

Canada.—The first full year of operation of Stewarts and Lloyds' and Stanton's Canadian subsidiaries has proved satisfactory. Sales into Canada increased during the year and we are satisfied that the establishing of these Companies in Canada has strengthened our position in the market.

New Zealand.—The Steel and Tube Company of New Zealand Limited has had another satisfactory year. Trading conditions in New Zealand have been somewhat difficult in comparison with the previous year, due to credit restrictions, but demand for steel products has been reasonably well maintained.

Eire.—The Dublin Warehouse for stocking, finishing and fabrication of tubes is now in operation, having been opened on November 1, 1956, by Mr William Norton, Minister of Industry and Commerce.

RECRUITMENT AND TRAINING

Your Directors have continued to pay the greatest attention to the training of employees, and the various schemes in operation are doing much to improve their quality. We also play our part in contributing to the funds of organisations which are concerned in one way or another with Training or Education.

The need to step up the numbers of technical men, referred to recently in the Government White Paper on Technical Education, and to provide the managers of the future, has turned our attention to further ways and means of achieving this.

We feel that an important source of talent which has not been fully tapped lies in the older school leaver from the public schools and the grammar schools. Not all of these young men will wish or be able to go to a university and the qualities possessed by many of them are those which can best be developed by company training in which the practical goes along with the theoretical, to the end that they should make first-class members of the management.

We are now in the process of building new training centres and workshops to cater for these young men.

We hope by so doing to be able to attract them to the Company, give them a thorough training along the lines best suited to them and to find later on that they are strong candidates for important and responsible posts in the Company.

We shall also be the better placed by these facilities to play our part in receiving into industry the increasing numbers, commonly called "the bulge," of young people to be expected from the schools in the next five or six years, an economic and social problem of which the full implications have yet to be worked out.

THE BOARD

As you will see in the Directors' Report, Mr S. W. Kaye has been appointed to the Board. Mr Kaye joined the Company in 1936 and has held several senior appointments both in India and at home. His knowledge and experience will, I am sure, add to the strength of the Board.

STAFF AND EMPLOYEES

As you will have seen from the notes on the Profit and Loss Account, a Works Pension Fund was introduced during last year. For many years your Company has operated what was known as the Employees' Benefit Fund, under which pensions to workmen and widows were paid, entirely at the Directors' discretion. These payments were greatly appreciated, and will continue to the present recipients, but they had become virtually fixed pensions, and your Directors felt that the time had come to institute a Fund for future pensions. The basic pension is non-contributory, but provision is made for the voluntary purchase of additional pension by the individuals. Life Assurance cover is provided by the Company. The scheme has been well received by the workers. It may interest shareholders to know that pensions under the old schemes are presently being paid to 1,800 retired workmen and to 1,650 widows of workmen. Your Company was one of the pioneers in introducing any form of pension benefits for its workmen.

Improvements have also been made to the Staff Pension Fund.

I am happy to be able to record again our appreciation of the efforts of our employees. We consider ourselves fortunate in the quality and loyalty of our staff and workpeople at all levels. Any difficulties which do arise can usually be traced to the activities of pure troublemakers who show no loyalty to anyone, but these, happily for us all, are rare.

The Report and Accounts were adopted and the dividend recommendations were approved. The retiring Directors, Mr A. G. Stewart, Mr F. Le Neve-Foster, Mr J. C. Lloyd and Mr S. W. Kaye, were re-elected. The remuneration of the Auditors (Messrs Cooper Brothers and Company) having been approved, the proceedings terminated.

At the Extraordinary General Meeting which followed, resolutions were passed approving an increase in the Authorised Capital of 10 million Ordinary Shares of £1 each, and the issue of 10 million fully paid Ordinary Shares of £1 each.

POTGIETERSRUST PLATINUMS LIMITED

(Incorporated in the Union of South Africa)

STATEMENT TO MEMBERS BY THE CHAIRMAN, MR D. A. B. WATSON, ON THE DIRECTORS' REPORT AND ACCOUNTS FOR THE YEAR ENDED AUGUST 31, 1956

(Issued to Members prior to the Thirty-second Annual General Meeting, held in the Board Room, Consolidated Building, corner of Fox and Harrison Streets, Johannesburg, on January 31, 1957.)

The Report and Accounts for the year ended August 31, 1956, have been in the hands of members for some time, and there is nothing that I can usefully add to the information contained therein.

In accordance with usual practice, members also received as annexures to this Company's Report and Accounts copies of the Annual Report and Accounts of Rustenburg Platinum Mines Limited. A statement by the Chairman of Rustenburg Platinum Mines Limited has been issued to the members of that Company, and it has been decided that that Statement should be made available to the members of this Company before the Annual General Meeting to be held on January 31, 1957. The Statement is accordingly annexed hereto.

January 22, 1957.

RUSTENBURG PLATINUM MINES LIMITED

(Incorporated in the Union of South Africa)

STATEMENT TO MEMBERS BY THE CHAIRMAN, MR D. A. B. WATSON, ON THE DIRECTORS' REPORT AND ACCOUNTS FOR THE YEAR ENDED AUGUST 31, 1956

(Issued to Members prior to the Twenty-fifth Annual General Meeting, held in the Board Room, Consolidated Building, corner of Fox and Harrison Streets, Johannesburg, on Thursday, January 31, 1957, at 9.15 a.m.)

CURRENT OPERATIONS

PRODUCTION

The 1955-56 expansion programme proceeded satisfactorily, and by the end of December, 1956, milling was at the rate of approximately two million tons per annum. Small quantities of additional platinum arising from the increased scale of operations are now beginning to reach the market, and these quantities will increase steadily during 1957.

Labour charges and the cost of stores and materials have suffered the same inflationary trends as those which have affected other industrial undertakings in recent years, and the costs incurred in production have again increased during the year.

SALES AND REVENUE

The demand for platinum remains strong, and all available quantities of refined metal are being sold. Upward revisions of price were made during the year, the latest being in February, 1956. The average price received during the financial year was approximately £3 per ounce higher than that received in the previous year. Revenue derived from the sales of platinum amounted to approximately 75 per cent of the total gross revenue from the sales of all metals.

The total production of refined copper and nickel was sold, the revenue from the sale of these two metals representing approximately 15 per cent of the total gross revenue from the sale of all metals. The average price received for copper during the year under review was £357, which was about £50 per ton higher than that received in 1955, while the price of nickel remained unchanged.

Sales of the other associated metals, which accounted for the remaining 10 per cent of the gross revenue, were less than in the financial year 1955, during which year your company was able to dispose of the major portion of the previously accumulated stocks of palladium. The current market value of the quantity of refined associated metals added to stocks during the year represented about 4 per cent of the total revenue derived from the sales of all metals during the same period.

PROFIT AND APPROPRIATIONS

The profit from the year's operations, after providing for the State's share of profits and taxation, and after adjusting the Stock Realisation Reserve, amounted to £2,277,035, compared with £2,258,681 in the previous year. The increase in revenue from the sales of metals was offset by an increase in expenditure which arose partly from the general rising trend of costs referred to above, and partly from the cost of increasing the scale of operations at the mine, the effect of which is felt prior to the receipt of revenue from such an increase.

The unappropriated profit brought forward from the previous year amounted to £593,110 and this, together with the current year's profit of £2,277,035, gave a total of £2,870,145 which was dealt with as follows:

Appropriated for capital expenditure	£ 688,233
Transferred to General Reserve to finance the increase in the value of stores and materials (other than capital equipment)	£ 173,897
Dividends totalling 40s. per share	£1,694,780
Total	£2,556,910

leaving an unappropriated profit of £313,235. It is satisfactory to note that dividend payments were again increased during the year despite the increase in the number of shares issued.

CAPITAL EXPENDITURE

The cost of the 1955-56 programme has been in accordance with the estimates. Capital expenditure during the year amounted to £1,368,433, which amount included £1,285,620 spent on plant and equipment, buildings, etc., whilst the balance was made up by the cost of an increase in the stocks of stores and materials required for the capital expansion programme, and by the amount of a loan repayment. Of the total expenditure, the sum of £680,200 was financed out of funds raised by the issue of new shares during the financial year, whilst the balance of £688,233 was appropriated from profits as mentioned above. At August 31, 1956, an amount of £350,000 remained from the proceeds of the new share issue and will be utilised to provide part of the funds required to meet capital expenditure during the year ending August, 1957.

STOCK REALISATION RESERVE

It was decided during the year to change the method used to determine the cost of and therefore the value of platinum and other metals on hand and the consequential appropriations to the Stock Realisation Reserve. Since 1942, when this accounting procedure was inaugurated, the total mine costs had been allocated equally over all metals without making a distinction between platinum and the associated metals. Until recently, this basis has been satisfactory, but with the gradual increase in the overall cost of production, the cost allocated against certain of the associated metals has in some cases exceeded their current market prices and any sales of such metals therefore resulted in an apparent book loss. In deciding upon the new method

of allocating cost, due consideration was given to the fact that the associated metals arise as inevitable by-products of the process of mining, recovering and refining platinum, and it is only at the very last stage of their ultimate refinement and preparation for market that there is any choice as to whether or not to produce these metals. The cost of this final operation is small and, in consequence, the saving in expenditure which would flow from a decision not to complete the refining process would be negligible. Having regard to these facts, it is reasonable that, with the exception of a notional amount of £1 per ounce in the case of the associated platinum group metals and gold and £1 per ton in the case of nickel and copper, the whole cost of mine production should be charged against the production of platinum. This procedure was put into effect during the financial year ended August 31, 1956.

A schedule has been included in the Directors' Report showing the net revenue from sales of metals and the transfer to Stock Realisation Reserve calculated both on the old and the new bases. As will be seen from that schedule, although on the new basis the net revenue from sales is some £703,000 less than on the old basis, the transfer to the Stock Realisation Reserve is reduced by an equal amount and the amount of profit available for appropriation remains the same in each case. It is considered that the new method provides a more realistic picture of the results of trading operations.

FUTURE OPERATIONS

MARKET OUTLOOK

The demand for platinum during the past year exceeded supplies, and during the coming year this position is likely to continue. The amount of metal offered from Russian sources and the prices paid for such offerings cannot be accurately determined, but these do not seem to have been such as to affect the market materially during the past year. It is difficult to forecast future trends in the price of platinum, but it appears at present that no major variations are likely to take place during the current financial year, ending August, 1957. This statement must be accepted with reserve as the position could change rapidly under the influence of unforeseen factors.

Demand for the associated platinum group metals remains unchanged. The entire output of some of the metals is sold while stocks of others continue to accumulate. In order that these accumulations may be viewed in their proper perspective, it should be noted that approximately 94 per cent of the total weight of all platinum group metals brought into a refined state during recent years has been regularly and readily sold. The balance of 6 per cent includes associated metals which are not readily saleable, though sales of such metals are effected from time to time.

The demand for copper and nickel is such as to absorb the whole of the output and it is expected that this position will be maintained. The average price for copper for the financial year was £357 with a peak of about £436 in March, 1956. At the end of December, 1956, the price had declined to approximately £273 and it appears unlikely that the high prices ruling in the last financial year will be obtained during the current year. On the other hand, the price of nickel was increased from £519 to £600 on December 6, 1956. Variations in the accepted world price of this metal are infrequent and it may be assumed that the present price is unlikely to be reduced in the near future.

SCALE OF OPERATIONS

Towards the end of the financial year it became apparent that the indicated demand for platinum during the next few years was such that consideration should be given to the desirability of again increasing production.

Current demand, and the estimated future demand, arise chiefly from the expanding industrial uses of platinum, the most important of which at the present time is as a catalyst in the process of refining petrol. The policy of this company has in the past been to endeavour to meet the requirements of industrial users to an extent which will enable them to plan ahead on the basis of a steady supply at steady prices, although the rapid increase in the use of platinum by the Oil Refining Companies during recent years has to an extent overtaken our efforts to make adequate supplies available.

In considering the question of further expansion, due consideration has been given to the fact that the needs of the Oil Industry are of a capital nature and that, on completion of the refineries which are at present being built or which have been planned, there is likely to be a decline in the demand for platinum by this particular branch of industry. The present estimated requirements over the next few years are, however, such that it has been decided that further production beyond that contemplated in the 1955-56 programme is desirable, and a further expansion scheme, known as the 1956-57 programme, has been put in hand. On the completion of this programme the combined milling rate at the two mines will be approximately 2,500,000 tons per annum and the rate of production of platinum will be approximately 80 per cent greater than the rate for 1955. It is of interest to note that when this programme is finished, the rate of production will be almost eight times as great as that obtained ten years ago.

The additional milling capacity required will be obtained by erecting a second reduction plant at the Rustenburg Section. This has been placed some distance from the existing plant with a view to balancing operations between the eastern and western sections of the mine, thus minimising the transport required to handle the ore mined over the eight miles which comprise the strike length of the present mining area. Numerous ancillary items of plant, such as compressors, smelters, converters, etc., will be required, and it is necessary to increase accommodation both for Europeans and for Natives. Work on the scheme has already started and it is expected that milling will reach the full designed rate during the second half of the calendar year 1957. Some additional refined platinum arising from this programme should begin to reach the market from the beginning of 1958.

In view of the increasing scale of operations, steps have been and are being taken to increase still further the mining areas available to the company.

FINANCE

The cost of the 1956-57 scheme will be of the order of £1.8 million and the greater proportion of this will be spent during the current financial year.

After considering the means by which this could be financed, the Board has decided that under present conditions the expenditure involved can reasonably be met from the company's resources. It is realised that the continuing schemes of expansion which have been undertaken during recent years have necessitated large appropriations from current profits. As a result of the length of time required for the treatment and refining processes there is considerable delay between the expenditure involved in the completion of the expansion programmes on the mine and the receipt of the additional revenue and profits which ultimately arise from such expansion. In order to meet this position to some extent, the present intention of the Board is to take cognizance of the fact that, in determining the profits available for distribution during the next two years, the whole of the capital expenditure incurred during any one year or any one period need not necessarily be met by appropriations from the profits earned during that period. Consideration will be given to the possibility that, in order to relieve to an extent the burdens placed on present shareholders, some portion of the appropriation necessary to meet the cost of the 1956-57 expansion scheme may reasonably be carried over into the period during which the benefits of this scheme will begin to be felt.

If necessary, the advisability of arranging temporary loan facilities will be considered; such facilities, if required, are unlikely to be extensive and would be of short duration.

MATTE SMELTERS

The plant of Matte Smelters (Pty.) Limited, continues to operate very satisfactorily and is being increased to deal with approximately 50 per cent of the total matte production which is expected to arise on the completion of the 1956-57 expansion scheme.

CONCLUSION

It is estimated that by the end of 1957 the annual working expenditure in South Africa both on the mines and at the plant of Matte Smelters will be approximately £6 million, and that approximately 1,600 Europeans and 15,000 non-Europeans will be employed at these mines. The operations of your company are, therefore, on a scale which is of importance not only to the districts in which the mines are situated, but also to the country as a whole.

As has been stated in the past, it is difficult accurately to forecast the future demand for platinum. With the assistance of our refiners and marketing agents, Messrs Johnson, Matthey & Company, Limited, the developing requirements of the world are closely watched, and your company will continue in its endeavours to further the use of platinum by ensuring that the needs of industry are met in so far as may be possible and by following a price policy which will inspire the confidence of our customers.

January 22, 1957.

UNION PLATINUM MINING COMPANY LIMITED

MR E. S. HALLETT'S STATEMENT

Statement by the Chairman, Mr E. Stanley Hallett, on the Directors' Report and Accounts for the year ended August 31, 1956, which was circulated to members prior to the Annual General Meeting held in Johannesburg on January 31, 1957.

The Annual Report and Accounts of Rustenburg Platinum Mines Limited for the year ended August 31, 1956, were incorporated in this company's Annual Report and gave details of the affairs of that company.

Satisfactory progress was made with the 1955-56 expansion programme during the year, and by the end of December, 1956, the combined rate of milling at the Rustenburg and Union Sections had been increased to approximately 2 million tons per annum.

The profit of the Rustenburg Company for the year ended August 31, 1956, after providing for State's share of profits and taxation and adjustment of Stock Realisation Reserve, amounted to £2,277,035 compared with £2,258,681 for the previous year.

After allowing for a transfer to general reserve and an appropriation for capital expenditure, two dividends were paid totalling £1,694,780, equivalent to a rate of 40s. per share.

This compares with a rate of 34s. per share for the previous year. The profit unappropriated at August 31, 1956, was £313,235.

The Union Company exercised its rights in the offers of shares made by Potgietersrust Platinums Limited and Rustenburg Platinum Mines Limited and, at August 31, 1956, the shareholdings in these companies were 88,000 shares and 151,933 shares respectively.

THE YEAR'S RESULTS

During the twelve months ended August 31, 1956, the Union Company received revenue from dividends and interest amounting to £302,192 which is £71,422 less than the revenue earned during the fourteen-month period ended August 31, 1955. With regard to this decrease in revenue, Members are reminded that during the latter period, due to the financial year having been changed to coincide with the financial year of Rustenburg Platinum Mines Limited this company received three half-yearly dividends on its shareholdings as against only two half-yearly dividends during the year under review.

The net profit for the year, after deducting Administration and General Expenses of £4,174 and Directors' Fees of £2,000, amounted to £296,018, to which must be added the unappropriated profit brought forward of £4,238 and a transfer from Investment Reserve of £1,285, making a total of £301,541. Of this amount Taxation accounted for £193, while Dividends Nos. 11 and 12 of 8d. per share and 1s. 2½d. per share respectively, together absorbed £299,375, leaving an unappropriated balance of £1,973.

EXPANSION PROGRAMME

Towards the end of the financial year it became apparent that the rate of output expected to arise as a result of the recent programme of expansion at Rustenburg will still be inadequate to satisfy the estimated requirements of the market during the next few years. In consequence the Board of the Rustenburg Company decided to expand still further the scale of operations, and work in connection with this expansion has already been put in hand. On the completion of this programme, the combined milling rate of the two mines will be approximately 2,500,000 tons per annum and the rate of production 80 per cent greater than the rate in 1955.

The cost of the 1956/57 scheme will be of the order of £1.8 million, and the greater portion of this will be spent during the current financial year.

The Board of the Rustenburg Company has decided that under present conditions the expenditure involved can reasonably be met from the company's resources. However, it is realised that the schemes of expansion which have been undertaken during recent years have necessitated large appropriations from current profits, and accordingly, in order to relieve to some extent the burden placed on present shareholders, consideration will be given to the possibility that some portion of the appropriation necessary to meet the cost of the 1956/57 expansion scheme may reasonably be carried over into the period during which the benefits of the scheme will begin to be felt. If necessary, the advisability of arranging temporary loan facilities will be considered. Such facilities, if required, are not expected to be extensive and would be of short duration

WATERVAL (RUSTENBURG) PLATINUM MINING COMPANY LIMITED

MR E. S. HALLETT'S STATEMENT

Statement by the Chairman, Mr E. Stanley Hallett, on the Directors' Report and Accounts for the year ended August 31, 1956, which was circulated to members prior to the Annual General Meeting held in Johannesburg on January 31, 1957.

The Annual Report and Accounts of Rustenburg Platinum Mines Limited for the year ended August 31, 1956, were incorporated in this company's Annual Report and gave details of the affairs of that company.

Satisfactory progress was made with the 1955-56 expansion programme during the year and by the end of December, 1956, the combined rate of milling at the Rustenburg and Union Sections had been increased to approximately 2 million tons per annum.

The profit of the Rustenburg Company for the year ended August 31, 1956, after providing for State's share of profits and taxation and adjustment of Stock Realisation Reserve, amounted to £2,277,035, compared with £2,258,681 for the previous year.

After allowing for a transfer to general reserve and an appropriation for capital expenditure, two dividends were paid totalling £1,694,780, equivalent to a rate of 40s. per share. This compares with a rate of 34s. per share for the previous year. The profit unappropriated at August 31, 1956, was £313,235.

The Waterval Company exercised its rights in the offers of shares made by Potgietersrust Platinums Limited, Rustenburg Platinum Mines Limited and Union Platinum Mining Company Limited and at August 31, 1956, the shareholdings in these companies were 647,625 shares, 340,417 shares and 165,000 shares respectively.

THE YEAR'S RESULTS

During the twelve months ended August 31, 1956, the Waterval Company received revenue from dividends and interest amounting to £717,379 which is £168,843 less than the revenue earned during the fourteen-month period ended August 31, 1955. With regard to this decrease in revenue Members are reminded that during the latter period, due to the financial year having been changed to coincide with the financial year of Rustenburg Platinum Mines Limited, this company received three half-yearly dividends on its shareholdings as against only two half-yearly dividends during the year under review.

The net profit for the year, after deducting Administration and General Expenses of £5,589 and Directors' Fees of £2,000, amounted to £709,790, to which must be added the unappropriated profit brought forward of £5,886 and a transfer from Investment Reserve of £4,684, making a total of £720,360. Of this amount Taxation accounted for £414, while Dividends Nos. 14 and 15 of 8½d. per share and 1s. 3½d. per share respectively, together absorbed £718,594, leaving an unappropriated balance of £1,352.

FURTHER EXPANSION

Towards the end of the financial year it became apparent that the rate of output expected to arise as a result of the recent programme of expansion at Rustenburg will still be inadequate to satisfy the estimated requirements of the market during the next few years. In consequence the Board of the Rustenburg Company decided to expand still further the scale of operations and work in connection with this expansion has already been put in hand. On the completion of this programme, the combined milling rate at the two mines will be approximately 2,500,000 tons per annum and the rate of production 80 per cent greater than the rate in 1955.

The cost of the 1956-57 scheme will be of the order of £1.8 million, and the greater portion of this will be spent during the current financial year.

The Board of the Rustenburg Company has decided that under present conditions the expenditure involved can reasonably be met from the Company's resources. However, it is realised that the schemes of expansion which have been undertaken during recent years have necessitated large appropriations from current profits and, accordingly, in order to relieve to some extent the burden placed on present shareholders, consideration will be given to the possibility that some portion of the appropriation necessary to meet the cost of the 1956-57 expansion scheme may reasonably be carried over into the period during which the benefit of this scheme will begin to be felt. If necessary, the advisability of arranging temporary loan facilities will be considered. Such facilities, if required, are not expected to be extensive and would be of short duration.

THE STANDARD TRUST

INCREASED REVENUE

The fifty-fourth Annual General Meeting of The Standard Trust Limited will be held on February 22nd in London.

The following is the circulated statement by the Chairman, Mr Basil G. Ivory, CA :

The issue of £100,000 additional Ordinary Capital last year contributed in some measure to the increase of £19,625 in our gross revenue, and after all charges, including taxation, the net revenue is higher by £12,778 at £137,802. The deduction of the Preference dividend leaves an amount of £118,828, equivalent to earnings of 22.96 per cent on the £900,000 Ordinary Stock, compared with earnings of 23.05 per cent on £800,000 Stock last year.

After transferring £25,000 to General Reserve, bringing this to £350,000 and providing for the increased Ordinary dividend of 17 per cent the balance of Revenue carried forward is £79,952, an increase of £6,070.

The Balance Sheet calls for little comment except perhaps to mention the appreciation of our investments, which is shown to amount to 61.71 per cent, compared with 66 per cent last year. It should be noted that this year the London premium, equivalent at December 31st to 6¼ per cent over the official exchange rates, has been added to the valuation of our dollar securities, as it was felt that this gives a more realistic figure for valuation than by omitting the premium as in past years.

If allowance is made for the new Ordinary capital issued last year the " break-up " value of the Ordinary Stock as at December 31st last differed but little from that of a year ago.

From the classification of the investments it will be seen that our holdings in the USA and Canada have been further increased in accordance with the policy outlined in my statement last year.

The present international situation, clouded by Suez and Middle East complexities, and the economic problems of this country make it difficult to assess future prospects, but in spite of these problems it is confidently anticipated that earnings for the current year will provide adequate cover for maintenance of the present rate of dividend.

THE ELY BREWERY COMPANY LIMITED

FOUNDED *1896*

ENCOURAGING OUTLOOK

The sixtieth annual general meeting of The Ely Brewery Co., Ltd., was held on January 21 at the New Inn Hotel, Pontypridd, Mr. L. Nidditch, F.F.S.(Eng.), F.R.Econ.S., F.V.I. (chairman and managing director, financial director) presiding.

The following are extracts from the Directors' Report for the year ended August 31, 1956 :—

In the opinion of the Directors, the licensed properties of the company, based on calculations by the Inland Revenue and Customs and Excise for monopoly value and their state of repair, are approximately half a million pounds in excess of present book values.

Stockholders will have received an income on their holding of Ordinary Stock after the confirmation of the accounts and resolutions, 3½% tax free and 8½% less tax for the year under review, compared with 8½% less tax for the previous year. When the reconstructed Board took over almost ten years ago under the present Chairman, Mr. L. Nidditch, the Company was in a position of difficulty as to liquidity for its liabilities, reparation of the brewery plant and its 256 licensed houses in a distressing condition. Since 1947, the Board has approved the proposals of the Chairman for the re-opening of 600 various dilapidated rooms unoccupied for 20 or 30 years. There were also about 200 rooms in which takings amounted to only £2 to £5 per week per room. All these have been repaired, modernised and refurnished during the period and are now successful licensed lounges with a good regular patronage comparable with the best licensed bars and rooms in the country.

As a consequence of these improvements, it has been essential to minimise dividend payments and plough back sufficient working capital to ensure consolidation of assets. For these reasons your Board has felt it equitable that stockholders should receive bonus issues to compensate them and consolidate their holdings approximating to the ploughed back undistributed capital and improved asset values arising from the successful reorganisation, trading and enhanced reputation of the Company.

The board feel confident, based on the explanations which the Chairman pointed out in his Review last year, which have now been confirmed by successful trading, that the profits for the current year, subject to no unforeseen or extraordinary happenings, should at least be maintained and probably show some increase. Your board are encouraged by the profits showing such improvements, and dividend allocations will reflect these results in future years.

CHAIRMAN'S REMARKS

Addressing the meeting, the Chairman said:—I am happy to present to you today accounts that indicate, I believe, the greatest percentage increase of profits comparable in relation to the number of licensed houses and capital employed, with any brewery in Great Britain.

A year ago, under our own direct control, we engaged musicians, M.C., etc., for running dances at certain premises. This policy has proved successful, and it is intended to widen the sphere of this policy.

Two years ago we erected larger garage facilities. Next week we are starting on the foundations of another garage providing for a further 6-8 lorries and a general store for furniture, etc We must keep pace with rising costs, but not at the expense of our quality product savings. We have only this week drawn plans for two very up-to-date motels on the lines of American motels, each of which will also include a dance and banqueting hall to help overheads and area amenity.

The report and accounts were unanimously adopted without question or comment, and the other formal business transacted.

The proceedings terminated with a cordial vote of thanks to the chairman, directors, staff and employees.

JOHN SUMMERS & SONS LIMITED

SATISFACTORY RESULTS

EFFECTS OF RESTRICTIONS AND CREDIT SQUEEZE

FUTURE OUTLOOK FOR SHEET STEEL

MR RICHARD F. SUMMERS ON THE YEAR'S PROGRESS

The annual general meeting of John Summers & Sons Limited will be held on February 20th at The Iron and Steel Institute, 4 Grosvenor Gardens, London, S.W.

The following is the statement of Mr Richard F. Summers, chairman of the company, circulated with the report and accounts for the fifty-two weeks ended September 29, 1956:

The Balance Sheet this year has been produced on substantially the same lines as on previous occasions, and I hope you will agree that it sets out the Company's financial position in as simple a way as possible under modern conditions. I personally hold the view that it is unnecessary for a Chairman in his remarks to go over all the various items in a Balance Sheet. These should for the most part speak for themselves ; where they do not they should be amplified in the Directors' Report, and this is the policy which we have adopted.

There is, however, one item to which I should like to refer, and that is the net surplus available for distribution of £2,759,244. When comparing this with last year's figure of £2,856,743 there are a number of factors which must be taken into account. Firstly, the increased depreciation required to cover those items of plant and equipment which came into operation during the year under review. Secondly, the effect that the ban on overtime by the Craft Unions had on our production figures and on the efficiency of our operations, and thirdly, the increased costs that we had to bear in wages, transport and fuel, which were not covered by the increase in prices fixed by the Iron and Steel Board in May. Taking these factors into consideration I think we can consider the results as satisfactory, and as an indication of what we can expect from our expansion programme.

DIVIDEND

From the report you will see that we are recommending the same dividend as last year. I am well aware that there has been much comment in the press about the conservative dividend policy pursued by the steel industry, but at the same time we are being urged to increase production and expand our plants. Clearly if the nation needs increased quantities of steel, then it is up to us to see that the necessary additional productive capacity is provided ; but there is a limit to the amount of money that can be raised from outside sources, and I am sure all will agree that a substantial part of this development must be met out of retained profits. I personally hold the view that it should be possible to pursue a policy which will provide a substantial amount for this expansion out of the industry's own resources, and which will at the same time make investment in the steel industry worth while. Last year I made it clear that we were not unmindful of the shareholders' legitimate claims, and in due course I hope that it will be possible to give tangible proof of these sentiments. As you know, at the moment we are committed to a large amount of capital expenditure to increase our output still further, and it is for this reason that we are once more retaining in the business approximately £5 million by Depreciation and transfers to Reserves.

PROGRESS OF DEVELOPMENT SCHEMES

During the year two of the last large units of the second part of the postwar development scheme came into production, and we expect that in the next few months the whole of this part of the scheme will be completed.

Since the end of the craftsmen's ban on overtime practically every department at Shotton has created new output records, and we were hoping that the current year would show a still further improvement, but a new uncertainty has been introduced by the difficulties in the Middle East. So far I am glad to say that we have not been seriously affected by the rationing of oil and petrol, as satisfactory arrangements had been made to substitute home produced fuel in place of imported fuel oil, but we have yet to learn what effect the reduction in supplies may have on some of our customers, and how far deliveries by road will have to be curtailed.

DEMAND

During the past year demand remained at a high level, and in many instances we were unable, in spite of higher production, to supply all our customers' needs. There were signs towards the end of the financial year that the restrictions on hire purchase and the credit squeeze were adversely affecting a number of our consumers. The position was further complicated by the fact that there were still substantial quantities of sheets being imported by some of the consuming industries under contracts placed before the slowing up in home consumption. These imports in 1956 amounted to approximately 200,000 tons with the result that at the moment we are faced with the fact that the stocks of sheets in the hands of consumers are substantially above normal. It may be, as sometimes happens, that during the period of acute shortage the estimates of the requirements were somewhat exaggerated. This increase in stocks and the fall in demand seems likely to suggest that the most difficult period might lie immediately ahead.

So far as this Company is concerned we are not unduly worried about our ability to keep our plants working somewhere near their maximum capacity because, as I have said on a number of occasions, we have always tried to treat all our customers fairly, to maintain our quality and technical services, and to sell our product in the widest possible field, so that we do not become too dependent on any one industry. I think it is apparent that this established policy is standing us in good stead now that the pressure of demand is not quite so great. A further factor that is going to help us is that the Board of Trade, as a result of representations by the industry, has agreed that there shall be somewhat greater flexibility in the licensing of exports of sheets, and has authorised an increase in the permissible tonnage for the first half of 1957. This increase, though perhaps not quite as much as we had hoped for, will, we feel sure, be welcomed by our many overseas customers.

COATED SHEETS

Once more I should like to refer to the fact that we have been pioneers in this country of the continuous galvanising of steel strip, and the application of zinc and other metals by the electrolytic process. These coated sheets, sold under such names as Galvatite, Zintec, Nitec, etc., possess for some uses many advantages over uncoated sheets. We are firmly convinced that there is a great future for the steel sheet coated with various materials, and that there is much scope for development in this direction. We have carried out a good deal of research into the matter, and before long we hope to be in a position to have a new product to offer, which we feel will again widen the field in which we can be of service to our customers.

PRODUCTION FIGURES

In the past I have refrained from quoting any figures of production, as these can in certain instances be somewhat misleading, especially during a period when large schemes of alterations and additions are in progress. I feel now, however, that perhaps I might quote some figures which may be of interest to shareholders. Below I give the totals for the year under review of the main items for the Shotton and Shelton works combined:

	Tons
Coke	1,078,000
Pig Iron	855,000
Steel Ingots	1,209,000

FUTURE OUTLOOK

The recession in demand to which I have already referred does of course bring up the question of the future policy, not only for this Company, but for the industry as a whole. There have been many statements made as to the likely total future demand for steel in this country ; the question now is whether these are in fact reliable both as to the total quantity and the dates by which such quantities will be required. I have said on previous occasions that the demand for sheets is bound to increase throughout the world so long as the standard of living is on the upgrade, because such a large quantity of sheet steel is used by the industries providing articles which make life easier and more pleasant. But these are the very articles which are largely controlled by political and economic expediencies ; if the balance of payments is going the wrong way, one of the corrective measures is to control the consumption of consumer goods in the home market, either by the tightening up of hire purchase arrangements, by a higher

purchase tax, or by the credit squeeze or by a combination of all three. Nevertheless, I think it is safe to assume that these set-backs, by their very nature, must be of a temporary character, and that the rise in the standard of living throughout the world will continue.

My personal view is that the happenings of the last twelve months have shown that the original estimate of the speed at which this expansion will take place has been exaggerated, and whereas I think that the ultimate figures of demand that have been mentioned may very well be achieved, I would expect to see the achievement come somewhat later than it was originally thought would be the case. If this assumption is correct, it could turn out as a blessing in disguise, as I think there has always been some doubt as to whether in fact it would have been possible for the industry to have reached the output envisaged in the comparatively short time available. It must be remembered that the engineering trade, on which we have to rely for a very large part of this expansion, is still very heavily committed in many directions other than steel.

When assessing the outlook for the sheet industry, the fact must not be overlooked that during the peak year of consumption (1955) imports amounted to no less than 457,000 tons, and a considerable tonnage was still being produced on the old-fashioned hand mills. These facts I think should enable one to view in its proper perspective the effect that the present falling off in demand for sheets is likely to have on the output of the strip mills. We have in no way altered our views on the desirability of increasing the production at Shotton. We still look upon this as fully justified, and in fact vitally important from the national point of view, but unfortunately I am afraid that the scheme is going to take rather longer to complete than we had originally hoped. We are, however, doing all we can to speed up progress, and the present temporary slackening in demand has not lessened our anxiety to get it finished at the earliest possible moment, as it is obviously desirable that the importation of sheets at considerably higher prices than those prevailing at home should be avoided.

SUBSIDIARY COMPANIES

At our Shelton works at Stoke-on-Trent, where they roll sections, joists and rails, there has been no diminution in demand, and pressure there is as high as ever. Once more they have made a satisfactory contribution to the overall results of the Group; their works have been well maintained, and their operations have been conducted with the usual efficiency.

The Castle Fire Brick Company has had a successful year, although the level of demand for building bricks has not been quite so high. The Company continues to make progress in the development of the refractory side of the business, and those of its products which have been used in our steelworks have given excellent results. During the year two further brick works in the Buckley area were acquired.

In October last year we purchased from the Iron and Steel Holding and Realisation Agency for £350,000 the whole of the share capital of Burnell & Company, Limited, black and galvanised sheet manufacturers. We are satisfied that the Burnell works, which are situated in Ellesmere Port, Widnes and Liverpool, are efficiently run and well maintained, and it is our intention that they should continue to produce sheets so long as they can get raw materials and labour, and so long as they can dispose of their output on a reasonable basis.

TRIBUTE TO EMPLOYEES

In conclusion I would once more like to pay tribute to all those employed in the Companies of the Group for their loyal service during the past year, and for the contribution that they have made to the results achieved. I feel that the somewhat changed conditions present a challenge to all of us to increase our efficiency, and to spare no effort in providing such a service to our customers as will ensure that we retain their goodwill.

KOLOK MANUFACTURING COMPANY LIMITED

(Typewriter Ribbon and Carbon Paper Makers)

NEW RECORDS

The forty-eighth annual general meeting of the Kolok Manufacturing Company Limited was held on January 25th at the registered office, Rochester Works, Tottenham, N.17, Mr E. S. Dumont, chairman and managing director, presiding.

The following is an extract from his circulated statement:

The net profit of the company for the year under review is £169,318 and the net profit of the group is £195,251 as compared with £134,912 and £160,796 respectively for the previous year. This result you will agree is very satisfactory. Nevertheless, I must point out that whilst the demand for your company's products has continued at a high level, a part of the increase in the net profit is due to exceptional circumstances which may not be repeated during the current year.

DIVIDEND INCREASED

Your Directors propose to recommend the increase of the normal Ordinary dividend by 2½ per cent, making 25 per cent for the year, and to mark the very satisfactory results of the year by the recommendation of an additional special dividend of 5 per cent. The final dividends, if approved, will then be 17½ per cent plus the special dividend of 5 per cent mentioned above.

The financial strength of the group has again been improved, the surplus current assets over current liabilities amounting to £420,266 as compared with £375,808 for the preceding year.

CURRENT YEAR'S OUTLOOK

The prospect for the current year is impossible to forecast in view of many uncertain factors. So far, incoming orders are at a satisfactory level and although competition in export markets continues to be severe and costs are higher, we believe that we can meet the challenge in export markets by means of the improved methods and increased manufacturing resources applied and installed during recent years.

It is customary on your behalf to express in formal terms an appreciation of the services rendered by your executives, staff and all other employees in the service of the company. In doing so I want to emphasise that our thanks are not a formality but very sincerely recognise their loyalty, conscientiousness and the excellent manner in which they have carried out their duties. Also, I thank my colleagues on the Board for their support.

The report and accounts were adopted.

AVELING-BARFORD LIMITED

INCREASED EXPORT TURNOVER

The sixty-second annual general meeting of Aveling-Barford, Limited, was held on January 24th at Grantham, Mr Edward Barford, MC (Executive Chairman), presiding. The following is an extract from his circulated statement:

The profits of the Group for the year ended September 30th last, amounted to £687,934 against £734,600 in the previous year. The net profit after taxation is £283,872 against £361,941.

Having regard to the trading conditions prevailing during the year, your Directors consider the results not unsatisfactory.

SLIM PROFIT MARGINS

We were successful in increasing turnover for the year by over 20 per cent—all for export. Notwithstanding this great effort overall profit margins were so slim that no benefit accrued to the company. Approximately 75 per cent of the output is now exported and this has been achieved at no small expense, and with the wholehearted co-operation of our overseas sales staff and service engineers, who have worked, often in uncomfortable and sometimes in dangerous circumstances.

Our subsidiary companies in France and South Africa are developing faster than our expectations, fully justifying forming these companies. Our interests in Australia have suffered severely from the economic conditions now operating in that country. Our sales into the dollar areas have been greatly increased.

In the latter part of the year, credit squeezes in this country and abroad had a serious effect upon our sales and it became necessary to cut back production programmes.

Since our manufacturing cycle is approximately fifteen months, it will be some months yet before the measures taken become fully operative. In the meantime, the company is undergoing a period of abnormally heavy stocks, destined principally for export. It is anticipated that the heavy bank overdraft will be substantially reduced during the next few months, if business continues at its present level.

ORDER BOOK POSITION

In regard to the future, the order book position has weakened during the past four or five months, but appears to have levelled off at a figure which, while not regarded as satisfactory, does not give reason for despondency. The international situation is affecting our overseas trade and any improvement would undoubtedly be of great benefit to the company.

The manufacturing facilities receive constant attention, and are kept in first-rate order. The plant is modern and working conditions are good.

It is now two years since the fine old-established business of Goodwin-Barsby and Company, Limited, became a member of our Group. Its reputation is second to none in its own particular sphere, and we foresee increasing advantages in the association as time goes on.

The Directors recommend that the final dividend should be 7½ per cent as against 10 per cent for last year, making a total of 12½ per cent for the year.

The report and accounts were adopted.

ILLINGWORTH, MORRIS & COMPANY

(Worsted Spinners)

STRONG DEMAND DESPITE DIFFICULTIES

LORD WILMOT ON HIGH LEVEL OF ACTIVITY

The thirty-seventh annual general meeting of Illingworth, Morris & Company, Limited, was held on January 24th in Bradford, The Right Honourable Lord Wilmot of Selmeston, PC, JP (the Chairman), presiding.

The following are extracts from his circulated statement:

The net profit of the group for the year after taxation is £345,309. This compares with a profit of £177,969 for the previous year. To this year's profit has been added the £472,741 balance of profit brought forward from last year, making a group total available for appropriation of £818,050. The dividends for the year, including the recommended 7½ per cent final dividend on the Ordinary Stock, absorb £132,250, and £142,625 has been transferred to General Reserve. This leaves a group balance to be carried forward of £543,175.

The Group Current Assets amount to £5,167,134, showing an excess over Current Liabilities and Dividend of £3,931,587, and the Group Revenue Reserves are now shown at £1,443,175

During the year there has been much variation in wool prices. Since the middle of March there has been a continuous rise, caused in the main by abnormal circumstances such as the Australian Dock Strike, which disorganised our buying programmes at the beginning of the year and also by the threatened cancellation of wool auctions owing to the shearers' strike in the Brisbane area. There were other minor disputes in Australia which led to shipping doubts and finally came the Suez crisis, with all its attendant uncertainties which are still with us.

These influences have all tended towards higher prices, though some of these uncertainties have been removed. High prices are by no means welcome; they can easily result in demands shifting to lower qualities, to the detriment of the sale of our fine quality production.

PROBLEM OF LABOUR SHORTAGE

Despite these difficulties the demand for our products throughout the year has been strong. At all our factories we have worked full hours and at many of them overtime and evening shifts were possible, and this is continuing. Our main problem is that of securing sufficient labour to operate our plants. We are trying all we can to recruit more workers.

Just before the end of the financial year there was imposed an increased American tariff on wool cloth, which if continued in its present form could have an effect on our industry, particularly to the high class trade in which we are pre-eminent. So far, however, our customers report very good orders from America for this Autumn Season and there is evidence that our very best qualities still have a ready market there.

Good progress is being made in the reorganisation of our subsidiary company John Smith (Field Head) Limited and this year this Company has made a valuable contribution to our results.

Work has continued on the extension of our James Tankard branch as part of the scheme of re-organisation there which I mentioned last year.

As to the future, our Order Book is as full as we could wish; indeed we are having great difficulty in keeping our delivery time down to our customers' requirements. We can certainly see full work ahead for a longer period than twelve months ago. In these circumstances I think we can confidently look forward to a good year.

The report was adopted and the total distribution of 10 per cent was approved.

TANGANYIKA CONCESSIONS LIMITED

SIR ULICK ALEXANDER'S REVIEW

INCREASED USE OF TRANSPORT FACILITIES IN CENTRAL AFRICA

The Annual General Meeting of Tanganyika Concessions Limited was held on January 24, 1957 at the Head Office of the Company, Tanganyika House, Salisbury, Southern Rhodesia, the Right Honourable Sir Ulick Alexander, GCB, GCVO, CMG, OBE, the Chairman, presiding.

The following is an extract from his circulated Review:

The accounts in respect of the year ended July 31, 1956, show a record profit of £3,982,612 and the Directors have been pleased to propose for the consideration of Stockholders at the Annual General Meeting a Final Dividend on the Ordinary Stock of 7s. 6d. per unit, which, if approved, will make a total dividend of 9s. 0d. per unit for the year.

Once again the Union Miniere du Haut-Katanga has been the main source of the Company's revenue, while the Benguela Railway Company has also made an important and substantial contribution. The excellent results achieved by the Union Miniere du Haut-Katanga enabled that Company to increase its total net dividend from Belgian Francs 1,600 to Belgian Francs 2,200. The Benguela Railway Company has not only paid the interest for the year on both series of debentures, effected the normal redemption payment and again distributed a dividend of Esc. 11 per share, but has also redeemed a further £404,900 of the 4 per cent Income Debentures.

CHAIRMAN'S ADDRESS

The Chairman addressed the Meeting as follows:

It is with regret I refer in my Review to the resignation of Mr Harry B. Lake due to the difficulty he finds in dealing with the Company's affairs owing to his residence in the United States of America, and I should like to take this opportunity to thank Mr Lake for his services to the Company.

The Board were very pleased that Sir Mark Turner was able to accept their invitation to fill the vacancy.

I am glad to be able to report that since the publication of my Review the Union Miniere du Haut-Katanga has declared an Interim Dividend of 700 francs per share in respect of the year 1956, which compared with the previous year is an increase of 100 francs. That Company has also indicated they are likely to pay a further Interim in February and that the Final will be declared in May.

During July, 1956, the Union Miniere du Haut-Katanga, in which your Company holds a 14 per cent interest, celebrated its 50th anniversary in the Belgian Congo, together with the Bas-Congo Railway Company and the Forminiere Diamond Company, both of which were formed at the same time.

At the official opening of these celebrations, tributes were paid to the great pioneer work carried out in the Katanga by Tanganyika Concessions Limited, and its founder, Sir Robert Williams.

Representatives of your Board of Directors who attended these celebrations returned much impressed, not only by the enormous scope of the mining effort and technical progress made in the Katanga region of the Belgian Congo during the past fifty years, but also by the great achievements of civilisation and social progress which stood to the credit of the three companies concerned. From a remote area of bush, depopulated by famine, disease and tribal warfare, a thriving community with its own industrial resources, a mining production of world importance, and railway communications linking it with the principal African ports, has been developed. Today a healthy, peaceful and native population [illegible] same region and enjoy the opportunities of worthwhile employment and technical training offered by the great Belgian companies such as the Union Miniere. In addition, native employees are provided with free education, medical and welfare services, and are given every opportunity to increase their social status by the company for whom they work. Tanganyika Concessions Limited is proud to have been associated with the Union Miniere du Haut-Katanga in this development and progress.

HYDRO-ELECTRIC POWER

An impressive achievement of the Union Miniere during this period has been the progressive harnessing of the Lufira and Lualaba rivers to provide hydro-electric power for their mining and industrial effort. At the end of July last year, the first turbine group of their fourth hydro-electric power plant, recently erected on the Lualaba river and named Le Marinel, was inaugurated. Le Marinel will have an installed capacity of 248,000 kW. to be provided by four groups of 62,000 kW. each, and, when completed during 1957, will double the previously available power in the upper Katanga bringing it to about 500,000 kW.

As this will provide a surplus during the immediate future, arrangements have been made to transmit some of this power to the Rhodesian Copper Belt under a five-year agreement, thus filling the gap until the completion of the first stage of the Kariba project. A high-voltage transmission line between Le Marinel and Kitwe has been constructed, and the supply of power began last September. The existence of this power link should prove of great importance to Rhodesia in the immediate future, as it will alleviate fuel problems on the Copper Belt will reduce the tonnage of coal required for the generation of electric power, and in con-

sequence the demand on the hard-pressed Rhodesian Railways. It is an excellent example of the spirit of friendly co-operation existing between neighbouring African territories.

The valuable services to the British Commonwealth and to our Company of Monsieur Edgar Sengier, Chairman of the Permanent Committee of the Union Miniere, were signally recognised at the time of these cefebrations by the award of an Honorary Knight Commander of the Order of the British Empire, conferred on him by the Queen.

BENGUELA RAILWAY'S SUCCESS

You will have seen from my Review the highly successful results in 1955 of our subsidiary company, the Benguela Railway. These show a Net Revenue from the working of approximately £235,000 in excess of 1954, and it would seem from the figures now available the excess in 1956 will be appreciably larger. I am sure shareholders would wish me, to express to the Chairman, Dr Pinto Basto, and the Board of the Benguela Railway Company their appreciation and thanks for these very satisfactory figures.

LINK FEDERATION AND WEST COAST

You will remember that last year I discussed the important part which this railway could, and should, play in serving the Federation, particularly the Copper Belt areas, and in assisting the Rhodesia Railways. At the same time, I gave a brief history of the reasons why this had not been made possible in the past.

It is therefore with particular gratification [illegible] to report that, as a result of discussions which have taken place during this last year between the Rhodesia Railways, the Chemin de Fer du Bas Congo au Katanga and the Benguela Railway, an agreement has now been concluded and ratified by the Governments concerned by which a reasonable and practical through rating system between Lobito and the Federation came into force on January 1st of this year.

The first link between the Federation and the West Coast of Africa has thus, at long last, been formally established, and by the use of the Port of Lobito, Northern Rhodesia has been brought over 2,500 miles nearer to Europe. The effect of this agreement on the economy and future development of the Federation and Central Africa needs no emphasis.

I am very happy to refer to these arrangements as they could only have been reached by the desire on the part of the three railways concerned to co-operate together, and to co-ordinate their efforts, and they mark an important step forward in the development of the Central African Federation.

During the year 1956 your Company has also been pleased to participate in the formation of the Merchant Bank of Central Africa and in the flotation of the Rhodesian Iron and Steel Company Limited, formed to take over the responsibilities of controlling and developing the Rhodesian Iron and Steel Industry, with effect from January 1, 1957. We are always pleased to participate in suitable investments in the Federation.

Before concluding I should like to pay a well-deserved tribute to the staff for the efficiency they have displayed in rendering valuable services during the year, and I am sure shareholders would wish me to express on their behalf grateful thanks for their untiring efforts.

The Report and Accounts were adopted, the payment of the final dividend was approved, and the retiring Directors were re-elected.

SAN FRANCISCO MINES OF MEXICO

CONTINUED IMPROVEMENT IN EARNINGS

MR A. V. CONRAD ON STAGGERING BURDEN OF TAXATION

The forty-fourth annual general meeting of San Francisco Mines of Mexico, Limited, will be held on February 21st, at the Chartered Insurance Institute, 20 Aldermanbury, London, E.C.2.

The following is the statement by the chairman, Mr A. V. Conrad :

It is my sad duty to report the death, last June, of our former Chairman, Colonel Clive E. Temperley. He played a great part in the affairs of our Company, having been associated with its management for 30 years, for most of this period as a Director and latterly as Chairman. The Company has lost an able servant, and your Directors have lost a loyal colleague and friend.

For the year ended September 30, 1956, we have done rather better than in the previous year. Earnings before taxes rose from £3,433,000 to £4,070,000 and net profit from £490,000 to £609,000. After taking into account the amount of £405,000 Brought Forward, £1,014,000 is available for distribution. From this sum, the Directors have appropriated £50,000 to Contingencies Reserve. Stockholders are aware that the Board decided last September to return to the prewar practice of declaring an interim dividend. It is the intention of the Board in future to declare a modest interim dividend towards the close of the Company's financial year whenever conditions permit. Stockholders will appreciate, however, that in lean years it may be necessary to eliminate interim payments. Your Directors now recommend the payment of a final dividend of 3s. 3d. per unit, less tax, making with the interim of 1s. 3d. per unit, less tax already paid, a total for the year of 4s. 6d. per unit, less tax. This total distribution, together with the Directors' Additional Remuneration thereon, will absorb £537,000, leaving £22,000 to be added to the Balance Carried Forward, which becomes £427,000.

The improvement in the results for the year is largely due to the higher prices received for our products. In December, 1955, the New York price of lead rose to 16 c. per lb. and the following month the East St. Louis price of zinc rose to 13½ c. per lb. Thanks to stockpiling by the United States Government (including the so-called "Barter Programme," whereby lead and zinc are exchanged for surplus agricultural products), these prices have since been maintained. The Company also benefited from the higher prices received for copper, although the price weakened towards the end of the year.

As a result of shortage of railway waggons we were unable during the year to sell our full output of lead and zinc. Accordingly, notwithstanding increased production of these metals, sales of lead declined and sales of zinc were only slightly higher than in the previous year. Sales of copper, on the other hand, increased owing to our temporarily forgoing the right to receive returnable copper from the smelter with the consequent reduction in the quantity of our copper tied-up in process. On balance, the benefits of the increase in production and the improvement in metallurgy, to which I refer below, are not fully reflected in the Accounts.

TAXATION

The most striking feature of our Accounts continues to be the staggering burden of taxation suffered by the Company. Last year this amounted to £3,461,000—85 per cent, or 17s. in the £, of our earnings! Practically the whole of this is Mexican taxation. Much of it consists of taxes on gross revenue and includes the heavy Export Tax, increased from approximately 18 per cent to 28 per cent in April, 1954, when the peso was devalued, but still retained notwithstanding that peso operating costs in terms of United States dollars have again risen almost to the pre-devaluation level. The attention of the Mexican Government has been repeatedly drawn to the serious effects of this penal taxation on the future of the Mining Industry in Mexico. Government action to date has been restricted to granting relief of taxation for a limited period of years only to new mines and to old mines which have been re-opened after having been closed down for more than ten years. These are palliatives which merely tackle the fringe of the problem. So far from tackling the heart of the problem, as from January 1, 1956 the rate of Mexican Income Tax on our profits was actually increased from 33 per cent to 39 per cent and the incidence of Excess Profits Tax was also increased. The fact that this Company still makes a return on the capital invested is due to the richness of the deposit and the fact that the investment was made at a very much lower cost than would be practicable today.

There are other ways in which the larger mining companies in Mexico are penalised. For example, we are now paying very high rates for our electric power, largely because the Power Company is precluded by the Government from charging economic rates to small consumers.

Turning now to the technical side of our operations, there are three aspects on which I would like to comment, namely, Tonnage Milled, Metallurgy and Development.

TONNAGE MILLED

As stated in the Directors' Report, the tonnage of ore milled reached a new high record for the fifth year running. The higher output of recent years has in turn accelerated the need to stope from deeper levels. These two factors are placing undue strain on our present hoisting capacity at the North Shaft. We have accordingly acquired a larger hoist to replace the existing one. By the end of the year the necessary excavation work for the hoist and the new transformer house had been completed.

METALLURGY

When I visited the mine three months ago I was particularly impressed with the changes effected in the mill and the consequential improvements in metallurgy. The outstanding feature was the increased percentage of zinc recovered notwithstanding the reduction in the zinc assay of the millhead. The improvement is reflected in the reduction of approximately one-third in the zinc assay of the tailings, which were reduced to less than 1 per cent zinc. Of course, in a mill such as ours, producing three different kinds of concentrate, it is desirable that the recovered metals should be distributed between the concentrates in such a way, having due regard to costs, as to maximise the payment we receive. Thus, it is important that the zinc should be recovered in the zinc concentrate where it is paid for and not in the lead concentrate where it is not. In this respect, too, mill results improved. Finally, by increasing the assay of lead in the lead concentrate and of zinc in the zinc concentrate, we were enabled to make significant savings in freight costs.

DEVELOPMENT

The results of our underground development work—so important to our future—were again very satisfactory. 6,365 metres were driven on veins of which 47 per cent was in ore, the corresponding figures in the previous year were 6,024 metres and 33 per cent respectively. These results are particularly encouraging as so much of the work has been done on the new veins, such as the Don Pablo discovered in 1955. A satisfactory feature of the new veins being developed is that they are in the main situated in the Frisco Mine fairly close to the existing shaft system, thereby facilitating the extraction of the ore contained in them. Despite the record tonnage milled during the year, the favourable development work enabled the ore reserves to be further increased by some 60,000 tons to 5,073,000 tons—over six years' supply for the mill.

THE OUTLOOK

European demand for lead and zinc has recently slackened, while apart from declaring its readiness to continue the Barter Programme for the time being the United States Government's plans for future stockpiling of these metals has not been made public. Further, this year we must expect a lower income from copper and we are faced with negotiating the renewal of our Collective Labour Contract. However, provided United States Government stockpiling of lead and zinc at present prices continues and provided our operations proceed without interruption, we may reasonably expect within the limits imposed by Mexican taxation to enjoy a satisfactory year.

I am pleased to have this opportunity of paying tribute to my colleague on the Board, Mr Henry Hanson, who is also our General Manager in Mexico and on whose shoulders falls the responsibility of handling our affairs there. He is assisted by Mr A. B. O'Neel, Assistant General Manager, Mr H. G. Dudley, General Superintendent, and a loyal and efficient staff. On your behalf I send them congratulations and thanks on the results which they have achieved together with our best wishes for the future.

THE UNION DISCOUNT COMPANY

IMPROVED RESULTS

LORD KENNET ON STEPS TO MEET PREVAILING CONDITIONS

The annual general meeting of The Union Discount Company of London, Limited, will be held on February 21st at the offices of the company, 39 Cornhill, London, E.C.3.

The following is the statement by the chairman, The Right Honourable Lord Kennet of the Dene, PC, GBE, DSO, which has been circulated with the report and accounts:

In my statement last year I dealt with the earlier history of the effect upon the business of our Company of the sharp rise in bank rate from 3 per cent to 4½ per cent in January and February, and of the attendant restriction of credit and rise in money rates ; and I referred to our initial measures to deal with the new conditions by limiting our holding of bonds, especially those of longer maturity, and promoting business in bills.

The year under review has seen the further rise in bank rate, on February 16th, to 5½ per cent, and further pursuit by the authorities of measures to reduce the creation of new short-term debt, by economies, by a savings drive, and by funding. Thus, during the year, having had full warning of the restrictions thought necessary, we have been engaged in the process of completing the accommodation of our current business to the prevailing conditions, in such a manner as to be prepared either for the relaxation of restrictions, or their increase, in any measure probable.

It may be said that the process of accommodation has been achieved with success, and that we have settled down, as it were, to conditions which are stable in relation to a high bank rate, and to restrictions on credit.

THE ACCOUNTS

The following are in this respect the significant comparative figures in our accounts.

The high Treasury Bill rate prevailing through the past year has attracted money away from us and consequently our figure of Loans secured on assets of the Company is reduced by £24,748,569 to £225,984,255. This reduction is reflected in the balance sheet by a substantial fall in our holding of Bills discounted.

Our holding of quoted Securities, shown at less than Market Value, and which continue to be in the main of the shorter dates, is £7,599,146 higher at £71,027,312.

In Note 1 you will observe the contingent liability on Commercial Bills rediscounted is £11,138,314 lower at £21,344,758, but the actual volume of our Commercial Bill business was higher than in the previous year.

The unexpected year-end ease of money is indicated to some extent by an increase of £5,905,189 in Loans on Securities and Amounts Receivable.

Despite the reduction of £19,863,039 in the Balance Sheet total to £252,566,712, our Company has traded successfully, as indicated by the increased profit figure of £420,769, compared with a balance figure for 1955 of £390,937.

NATIONAL FINANCIAL POLICY

The interests of a trading company are particular and not general ; and I do not think it appropriate for me to address you about national financial policy in general. The stability of our currency is, however, a matter of general concern which is also of particular interest to the discount market, and we follow its fortunes from a good viewpoint. I may say then that recent experience suggests that monetary policy alone is not enough to maintain that stability. It is prudent to use it, and it has been of service for the purpose. But it is prudent also to recognise that it needs to be accompanied by other measures, of which the chief is economy in public expenditure.

Mr M. R. Norman, OBE, has, since the last Annual General Meeting, been appointed a Director, and your Board commends the appointment for your confirmation.

Let me lastly thank our staff [illegible] industrial times, and all good work in [illegible] friends and customers for their co-operation.

The Union Discount Company of London Ltd.

The Rt. Hon. LORD KENNET OF THE DENE, PC, GBE, DSO (Chairman)
ERIC O. FAULKNER, MBE (Deputy Chairman)
The Hon. Sir GEOFFREY C. GIBBS, KCMG J. IVAN SPENS, OBE
DAVID JOHN ROBARTS MARK R. NORMAN, OBE Sir ARCHIBALD JAMIESON, KBE

STATEMENT OF ACCOUNTS AT 31st DECEMBER, 1956

39 CORNHILL, LONDON, E.C.3

BIRD & COMPANY (AFRICA), LIMITED

SIR ELDRED HITCHCOCK ON THE SISAL OUTLOOK

The Thirty-ninth Annual General Meeting of Bird and Company (Africa), Limited, will be held on February 23rd, at Tanga, Tanganyika.

The following is an extract from the circulated statement of the Chairman and Managing Director, Sir Eldred Hitchcock:

The net profit for the year was £386,831 compared with £246,015 in 1954-55, and after taxation £315,331 against £198,515. This result followed increased production, and intensive management and control of costs and expenditure, and without reducing salary or wage rates.

PRODUCTION

Production for the year to June 30, 1956, was 17,044 tons against 14,455 tons and 12,772 tons in the two previous years. During the current year we should again achieve that output. Our six months' production to the end of 1956 was over 9,000 tons, but owing to the prolongation of serious drought —the rains of October entirely failed—the sisal production of the territory, including our own, is likely to decline in 1957.

Since 1950, the company exported just under £10 million value of sisal to all markets of the world.

DIVIDEND AND BONUS ISSUE

During the year the board announced two interim dividends of 7½ per cent and 10 per cent, making 17½ per cent, less tax, for the year, and are not recommending any final dividend. They propose to maintain this procedure in the future. The board propose the issue of a free bonus share of one in five Ordinary stock, and it is their intention to maintain the dividend rate of 17½ per cent on the capital, increased from £750,000 to £900,000 (or 3,600,000 Ordinary shares of 5s. each), which compares with the total capital now employed in the business of £3,021,386, the bulk of which over the years has been put back into the business from so-called profits.

THE SISAL OUTLOOK

The economic strength of sisal depends, apart from its intrinsic natural qualities, upon its relative cheapness. Last year we exported at an average price at East African port of 6d. per lb. No competitive fibre or synthetic of similar quality can be successfully produced at this price level. The highly efficient and large scale plantation industry in Tanganyika is competitive with any country in the world apart from artificial factors such as exchange manipulation. I have little apprehension concerning the commercial future of sisal in meeting the growing agricultural, industrial, and transport needs of the world for twines, cordage, and rope, and a growing variety of other purposes.

TEA DEVELOPMENT

Whilst our sisal development is now more or less stabilised and is unlikely to be substantially increased unless special circumstances arise, we propose to accelerate our tea development programme. Our Ngua estate consists of 1,200 acres, of which 300 acres are planted with tea.

We have now acquired on a 99-year lease the adjoining Kwamkoro estate of 1,100 acres, with some possible extension.

It is proposed as the first part of our programme up to 1960 to plant, in addition to the 300 acres already planted at Ngua, 200 acres per annum at a capital cost, including factory of £200,000. That will give a total planted area of 1,100 acres which should produce 1,250,000 pounds of tea. Our tea interests should in course of time be a valuable and growing asset to this business.

EAST AFRICAN TAXATION COMMISSION

We have welcomed the Taxation Commission, which recently visited East Africa, to examine the system and scale of taxation, which supports public spending which is out of gear with the viable economy of the country and its orderly economic expansion. The terms of reference of the Commission are, however, disappointingly narrow. An important issue pivots on the scale of public expenditure, which is too high. The test of sound policy on public expenditure is its relation to resources, and their use for expanding private enterprise upon which the real prosperity of the country has always depended. One of the prime causes of "under-saving" is inflation, while a main cause of "under-investment" is taxation.

PERSONAL

I have been associated with the business, as a founder member shareholder and director—since 1920. That is a large part of a man's life. For years I have carried the responsibilities of management, over the lean and difficult as well as the more prosperous times. On June 30, 1955, I completed a 10-year agreement as managing director—one of a series—and contemplated retirement then, at least as far as day-to-day responsibilities were concerned. At the request of my colleagues I agreed, however, to continue for a further five years, after which it is my intention to shed the burden of management, although I would be glad to continue the responsibilities of chairman. Your directors continually have in mind the question of continuity of good management.

RAMBUTAN LIMITED

MR D. W. THOMAS'S STATEMENT

The Fifty-first Annual General Meeting of Rambutan Limited was held at the Registered Office of the Company, Station Hill, Redruth, on January 23, 1957.

Mr D. W. Thomas (Chairman), presided.

The Reports and Accounts for the year ended June 30, 1956, having been circulated for the prescribed time, were taken as read, as was also the Chairman's Statement, circulated with the Reports and Accounts, which was as follows:

The Accounts for the financial year ended June 30, 1956, show a profit of £21,797 after payment of Royalty of £16,806 to the Malayan Government in respect of Tin-ore sold during the year and the provision of £27,624 for United Kingdom and Malayan Taxation.

The decreased output was due to a reduction in the volume of ground treated, 415,400 cubic yards as compared with 840,700 cubic yards in the previous year when, owing to favourable conditions, the yardage treated was exceptional. The average recovery was higher at 0.81 kati per cubic yard as compared with 0.47 kati per cubic yard in 1954-55.

Dividends totalling 6s. 6d. per share were paid in respect of profits for the year and absorbed a net amount of £18,688.

A sum of £1,426 has been written off Capital Expenditure and the balance standing to the credit of Profit and Loss Account is increased from £15,098 to £16,973, which the Directors propose to carry forward.

PROSPECTS FOR CURRENT YEAR

The attention of Members is drawn to the Report of our General Managers, Messrs Osborne and Chappel, circulated with the Accounts which gives particulars of work done at the Mine during the period under review. Shareholders will note that it is stated that prospects for the current year are satisfactory although a somewhat lower rate of output is anticipated.

The Return for the first five months of the current year is 71¼ tons as compared with 101 tons for the corresponding period of the previous year.

The International Tin Agreement came into force on July 1, 1956, and the Tin Control (Buffer Stock) Regulations, 1956, became operative in September, 1956. Your Company's cash contribution to the Buffer Stock is being made from current production according to the scale laid down by the Malayan Government. The amounts of your Company's contributions during the months of October and November were £601 and £609 respectively.

CAPITAL REPAYMENTS

In May, 1956, the Shareholders by Special Resolution approved a reduction in the Capital of the Company from £100,000 divided into 100,000 shares of £1 each to £62,500 divided into 100,000 shares of 12s. 6d. each, such reduction to be accomplished by returning to Shareholders of the 100,000 shares capital to the extent of 7s. 6d. per share. At the same time a Resolution was passed restoring the nominal Capital of the Company to the original amount of £100,000 by the creation of 60,000 unissued additional shares of 12s. 6d. each.

These Resolutions were later approved by the Court and the sum of 7s. 6d. per share was returned to Shareholders in August of the current year, free of liability for Income Tax and Surtax in their hands.

With the subsequent coming into force of the International Tin Agreement and the publication of the Tin Control (Buffer Stock) Regulations, 1956, your Board was able to further assess the Company's future financial commitments and to recommend a second capital repayment of 7s. 6d. per share. At an Extraordinary General Meeting held on November 7, 1956, Shareholders unanimously approved a Special Resolution giving effect to this recommendation and the application to the Court for Confirmation has now been made.

Security conditions on the property remain satisfactory and no incidents occurred during the year under review.

In conclusion I would like to express to our General Managers, the Resident Manager and Staff in Malaya, and the Secretary and Staff at Redruth, the Board's sincere appreciation of all that they have done for the Company during the year under review.

The Statement of Accounts and Balance Sheet, together with the Directors' Report, were received and adopted.

THE LAW DEBENTURE CORPORATION

IMPROVED RESULTS

The sixty-seventh annual general meeting of The Law Debenture Corporation Limited will be held on February 22nd at Winchester House, Old Broad Street, London, E.C.2.

The following are extracts from the statement by the Chairman, Mr R. Ashton Hamlyn, OBE, FCA:

It is with great regret that I have to report the death of our Chairman, Sir A. George Allen, DSO, MC, who unfortunately had only a brief tenure of office as Chairman although he had been a director of the Corporation for 13 years.

The Profit and Loss account shows increases in investment income of £2,685 and in profits on sales of securities of £3,405. On the other hand sundry commissions show a decrease of £3,294 due to a reduction in underwriting commissions and certain non-recurring commissions received in the previous year. There was a reduction of £1,098 in fees received as Trustees and Registrars. However, as in 1955, we received arrears of fees amounting to £2,250 our true figure for fees as Trustees shows an increase of approximately £1,100. The final result is an increase in gross profit of £2,859.

There has been a reduction in the liability for Income Tax for the year of £12,707 which is due to the realisation of certain investments which had been written down in previous years out of taxed profits. A similar reduction is not likely to occur in the future. In view of this it is recommended that the greater part of the resulting increase in net profits be carried to general reserve.

Net profit carried down shows an increase of £14,445 at £94,381, which together with £22,570 brought forward from the previous year makes a total of £116,951 available for appropriation. Your Board has decided to place £30,000 to general reserve bringing this reserve up to £345,000; and after payment of the usual Preference dividend recommends a final dividend of 12 per cent on Ordinary Stock which, with the interim of 7 per cent already paid, makes a total of 19 per cent for the year. The amount of undistributed profits to be carried forward is increased by £3,719 to £26,289.

The book value of our holdings of Debentures and Loan Stocks has been further reduced from £161,481 to £55,972. The total of the holdings of Preference shares shows little change but Ordinary shareholdings have been increased by £123,807. The market value of our investments at December 31, 1956 plus net current assets shows a decline of 7.2 per cent compared with the same date last year. Over the same period The Financial Times Indices adjusted to the proportions of our various fixed interest and ordinary shareholdings (including an adjustment for North American holdings) show a decline of 9.3 per cent.

THE OUTLOOK

Stockholders will appreciate that consequent upon the aftermath of the Suez crisis the outlook for some of the industries in which your Corporation has invested cannot be as good as it has been in the past year. Therefore, although it is hoped to present a satisfactory result for the current year, a further increase in investment income such as has been experienced in recent years is not expected.

BRITISH TABULATING MACHINE

A YEAR OF GREAT ACTIVITY

The fiftieth annual general meeting of The British Tabulating Machine Company Limited was held on January 25th in London, Sir Cecil M. Weir, KCMG, KBE, MC (the chairman), presiding.

The following is an extract from his circulated statement:

The past financial year has been one of great activity. Broadly, this activity falls into three main fields: meeting a steadily increasing demand for normal punched card equipment, bringing into everyday use electronic equipment to which I have referred in previous statements as developments, and finally, both broadening the base and stepping up the rate of our technical development, particularly in the electronic field.

Output in the year of new electronically operated machines has been double that of the previous year, and the output of other punched card equipment has been appreciably more than in any previous year.

Our overseas turnover has expanded in step with our business at home and we anticipate that this will reflect itself in due course in the profitability of those sections of our business.

The general outlook is an encouraging one. We have made progress in the development of new machines, those previously developed in the electronic and electro-mechanical field are giving satisfaction to Users and the order book for all types of our equipment is fuller than ever before. The report was adopted.

APPOINTMENTS

GENERAL SALES MANAGER

Applications are invited for the post of General Sales Manager to cover the activities of an old-established Engineering firm in Structural Steel Fabrication, General Engineering (including presswork, machining and fabrication), Sectrial Iron Founding. The position requires a good knowledge of engineering possibilities, commercial experience with proved ability for Sales Promotion and management of Area Sales Staffs. The salary will be fully commensurate with the responsibilities which are substantial.—Applications, in confidence, to be made to Box 613.

AMERICAN Organisation in Europe wants social scientist with research and writing experience and knowledge of Eastern Europe and experience in audience analysis particularly desirable. Good salary plus housing.—Reply to Box 618.

APPLICATIONS are invited for a senior post with leading Management Consultancy. A life of unusual interest and variety can be expected, due to the range of problems embraced by the nature of the work. Success can only be achieved by those possessing imagination and analytical ability of a high order, coupled with the flexibility of outlook necessary in applying efforts successfully to all branches of industry and commerce. Preference will be given to those, aged between 35 and 45, who have a proven record of executive and administration ability in commerce or industry, and can demonstrate a clear understanding of management problems and their solution. Other essential features are academic qualifications, backed by sound training in a major field, such as technology, production, marketing, or accounting. Applications will only be considered when age, education, qualifications and experience are fully detailed.—Letters should be addressed, in confidence, to A.H., c/o R. Anderson (Advertising) Co., Ltd., 14 William IV Street, Strand, London, W.C.2.

BRITISH NYLON SPINNERS LIMITED invite applications from women, aged 21-25, for vacancies in their Consumer and Retail Research Section in Monmouthshire. The work will provide opportunities to undertake to all aspects of Market Research. Preference will be given to graduates who can offer Economics as one of their subjects. A good standard of health is important, as considerable travel is involved and much of the work takes place out of doors.—Apply in writing to Personnel Manager, Pontypool, Mon.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of Investigational Officer in the Department of Agricultural Economics. Candidates should have academic qualifications and/or practical experience in Agriculture, Economics or Accountancy. Salary scale, £450 x £25 to £550 x £50 to £650 per annum, with membership of the F.S.S.U. and Children's Allowance Scheme; graduates would have an initial salary of £[illegible] per annum. Investigational Officers may be considered, on reaching a salary of £550 per annum, for promotion to the grade of Senior Investigational Officer (salary scale, £650 x £50 to £1,050 per annum).—Applications should be sent not later than February 18, 1957, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

ABILITY and opportunity together govern advancement. Have you the ability without—so far—the opportunity? Could you develop the power to sell intangible ideas? If so, you might communicate with advertisers, a leading Life-Insurance Company expanding activities and prepared to train for interesting, highly paid and pensionable sales-careers high-calibre men possessing outstanding potential and possible management qualifications. —Fullest details, confidentially, to Box 619.

STATISTICIAN with good knowledge of sales analysis, market research and business organisation needed by firm of international repute in the food industry. Good scope for successful applicant. Age 26-35 years.—Reply to Box 601.

EXPERIENCED SENIOR EXECUTIVE, with 11 years active managerial background, seeks administrative appointment, preferably London area. Thorough knowledge overseas marketing. Aged 35. Fluent French. Undeterred by hard work and difficulties.—Box 605.

ADVERTISER urgently requires H.M. Customs and Excise Annual Statement of Trade of the United Kingdom (especially Volume II) for 1934 and 1938; alternatively any other year containing figures relating to 1934 and 1938 would be acceptable.—Write, with price required, to Box X487, c/o Streets, 110 Old Broad Street, E.C.2.

WORK STUDY.—Next four-weeks full-time course March 11th. Details of this and seven other courses, including evening and correspondence, from the School of Time & Motion Study, 29 Cork Street, Piccadilly, W.1

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of Investigational Officer in the Department of Agricultural Economics. Candidates should have academic qualifications and/or practical experience in Agriculture, Economics or Accountancy. Salary scale, £450 x £25 to £550 x £50 to £650 per annum, with membership of the F.S.S.U. and Children's Allowance Scheme; graduates would have an initial salary of £[illegible] per annum. Investigational Officers may be considered, on reaching a salary of £550 per annum, for promotion to the grade of Senior Investigational Officer (salary scale, £650 x £50 to £1,050 per annum).—Applications should be sent not later than February 18, 1957, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

B.SC.(ECON.) LONDON UNIVERSITY

UNIVERSITY CORRESPONDENCE COLLEGE provides postal tuition for the above Degree (obtainable without residence), which is a valuable qualification for those seeking executive appointments in commerce or industry, government or municipal posts. The College, established 1887, is an Educational Trust. Highly qualified Tutors. Low fees. Prospectus of U.C.C. Courses for London Degrees and Diplomas, G.C.E. free from the Registrar, 60 Burlington House, Cambridge.

UNIVERSITY OF LONDON

A course of two lectures on (i) "The Family in the Process of Social Change in Yugoslavia" and (ii) "Citizens' Management in the Social Services in Yugoslavia" will be given by Professor E. Pusić (Zagreb) at 5 p.m. on February 7th and 14th at the London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2. Admission free, without ticket.—James Henderson, Academic Registrar.

SUCCESSFUL TUITION FOR THE B.SC.(ECON.) DEGREE

Wolsey Hall (Est. 1894) provides Postal Courses in a wide range of subjects for the two examinations for Lond. Univ. B.Sc.(Econ.) (three if Entrance is included). Moderate fees, instalments. Over 1,000 Wolsey Hall students have secured this valuable degree since 1925.—Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P.16, WOLSEY HALL, OXFORD.

SAVILE ROW CLOTHES. Cancelled export orders for direct from eminent tailors, Lesley & Roberts, Huntsman, Kilgour, etc. Lounge, Dress Suits, Overcoats, etc., from 10 gns.—Regent Dress Co. (2nd floor), 17 Shaftesbury Avenue, Piccadilly Circus, W.1. GER 7180 (next to Café Monico).

EXPERT POSTAL TUITION for Examinations—University Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus—and/or advice, mentioning examination or subjects in which interested, to the Secretary (G9/2), METROPOLITAN COLLEGE, ST. ALBANS or call at 30 Queen Victoria Street, London, E.C.4.

ANNUAL AIR SUBSCRIPTION RATES

Subscriptions to most countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is either because the alternative is not available or not recommended.

	Airmail	Air Freight
Australia	£8 5s. sterlg.	—
Canada	—	$21.50 or £7 14s.
East Africa	£7 15s.	£5 5s.
Egypt	£6 0s.	£5 5s.
Europe (except Poland)	£4 15s.	—
Gibralta, Malta	£3 15s.	—
Hongkong	—	£7
India & Ceylon	£7 15s.	£6
Iran	£6	—
Iraq	£6	—
Israel	£6	—
Japan	£9	—
Malaya	£7 15s.	£6 15s.
New Zealand	£9 sterlg.	—
Nigeria, Gold Coast	£7 15s.	£5 5s.
Pakistan	£7 15s.	£6
Rhodesia (N. & S.)	£7 15s.	£5 10s.
S. Africa	£7 15s.	£5 10s.
S. America	£7 15s.	—
Sudan	£6	£5 10s
U.S.A.	—	$21.5s or £7 14s.
W. Indies	£7 15s.	—

SOME FACTS ABOUT ATOMIC POWER . . .

[*for peaceful use*]

▸ **ELECTRICITY**	The electricity produced by atomic power stations is exactly the same as electricity produced by any other means. The nuclear reactor simply replaces the conventional coal or oil burning plant which produces heat in thermal stations.
▸ **EFFICIENCY**	Uranium 235 is theoretically capable of producing 3 million times the energy obtained from an equal weight of coal. At the same time it can save the cost of haulage, storage and handling and plant maintenance as well as the cost of ash disposal.
▸ **SUPPLY**	The world's store of atomic fuel is virtually inexhaustible — whereas coal and oil supplies are limited and insufficient to meet future world needs.
▸ **CONVENIENCE**	Nuclear fuel is compact and easily transportable. It can be carried to parts of the world where the transport of conventional fuels is impossible or where means of transport do not exist.
▸ **SAFETY**	Boiling water reactors are safe and in the United States are being built in centres of population. There, they are also being erected at various universities for training students in this all-important development.

MITCHELL DEVELOPMENTS in the field of atomic power are the logical outcome of 35 years' exceptionally wide experience in all branches of engineering and electrical supply.
The agreement between Mitchell Engineering Ltd and AMF Atomics Inc of New York will undoubtedly have far-reaching effects in applying atomic power for the benefit of mankind.

MITCHELL COMPANIES are at present engaged on *three important contracts* for the United Kingdom Atomic Energy Authority.

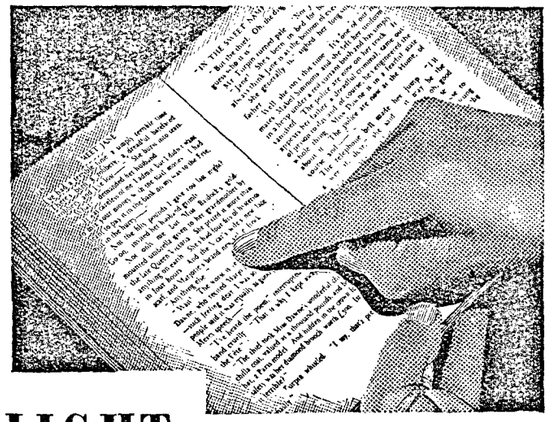
Executive material

—HOW IS IT TO BE FOUND?



For the fourth year in succession, the Manchester Guardian is helping employers tackle this problem by putting them in touch with intelligent youngsters keen on making a worthwhile career.

On each weekday until March 4, thirty-one leading companies are taking turns to present a whole-page announcement about the careers each of them offers to graduates and school-leavers. The response to last year's announcements was so successful that many of the same firms are taking part again, together with new ones. Here is an interesting and imaginative approach to the problem of staff-recruitment which you may well find worth looking at.

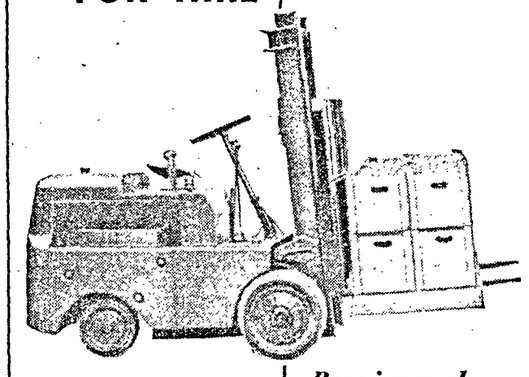
MANCHESTER GUARDIAN

To remind you...

that if you have a vacancy to fill, junior or senior, skilled or unskilled, you should get in touch with The Officers' Association. This organisation is an Employment Bureau, and it has on its books much promising material. If The Officers' Association introduces a man, you may be sure that he is a candidate of complete integrity, potentially suited for that particular job, and well worth interviewing. Next time you have any vacancy whatsoever, why not first try The Officers' Association? Ring them at ABBey 2556, or write to Dept. P.2, The Officers' Association, Windsor House, Victoria Street, London, S.W.1.

LIGHT - right where you want it!

ANGLEPOISE lets you SEE what you're doing. A finger touch beams its light on the object, to "*stay put*" in any position. It never sags; needs only a 25 or 40 watt bulb. Perfect for close work — reading, writing, knitting, etc.



In Black, Cream or Cream-and-Gold, at electrical shops or stores, from 97/7 (or send for Booklet 35). New additional colours: RED and YELLOW.

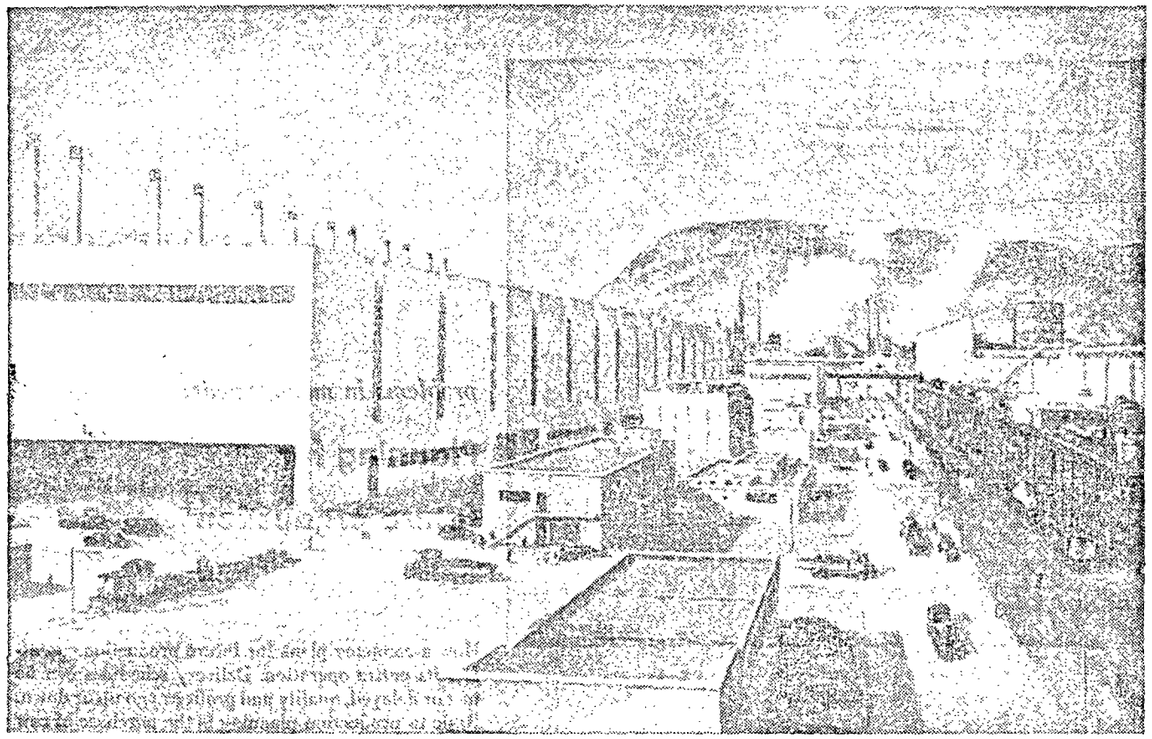
problems in management:

Planning for future production

How a company plans for future production can affect its entire operation. Delivery schedules can be met or delayed, quality and profit can go up or down. Basic to production planning is the purchase of raw materials from dependable sources.

Consider Dow phenol and substituted phenols for instance. These basic chemicals have many and varied applications. Phenol is used for molding powders, laminates, adhesives and protective coatings. Bisphenol A plays an important role in the manufacture of modified phenolic resins for varnishes, as an antioxidant, and in epoxy type coatings and adhesives. An intermediate for varnish and lacquer resins, p-tert-Butylphenol is also used as a soap antioxidant and as an oil additive. Other Dow substituted phenols like p-Phenylphenol, for making phenolic resins, and 4-tert-Butylcatechol, which is a stabilizer for monomeric styrene and butadiene, are ready to help you in your production planning.



Whatever the application, wherever the use—manufacturers who plan ahead rely on Dow for a stable and constant supply of phenol and substituted phenols. Get in touch with your local Dow representative or the nearest Dow branch office.

you can depend on DOW CHEMICALS

Abbey Works, Port Talbot, by Charles Cundall, R.A.

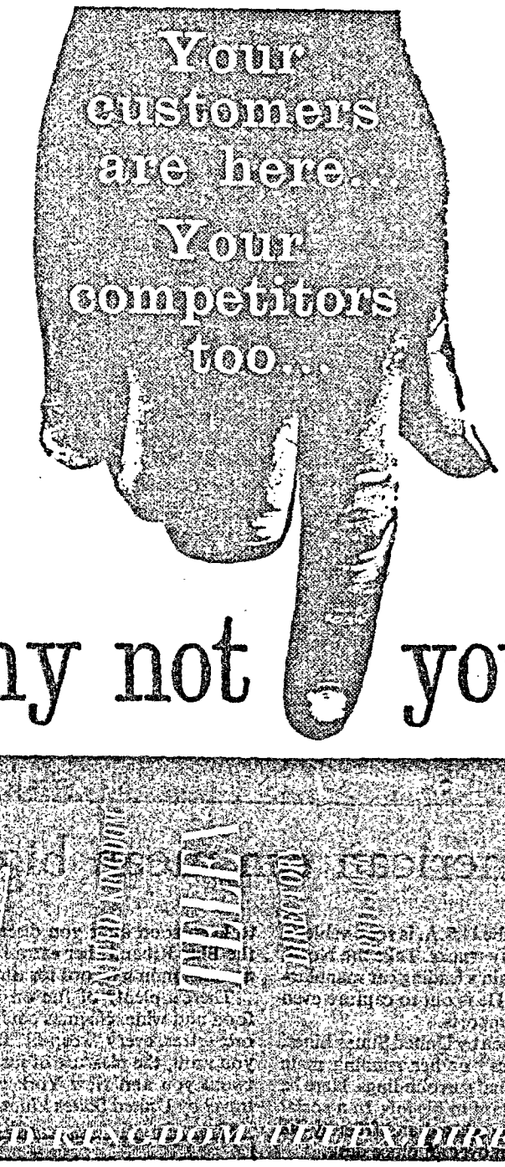
Between the mountains and the sea...

A MAGNIFICENT CITY OF STEEL

By day and night, it makes the steel that Britain needs

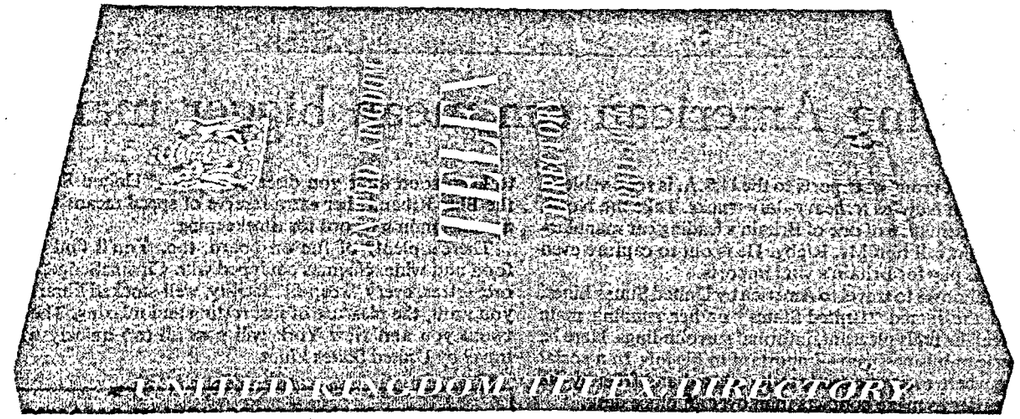
FOR 4½ MILES along the coast of South Wales lies one of Britain's post-war wonders. Tucked between sand-hill and mountain is a city whose sole and urgent purpose it is to make steel—steel that Britain so desperately needs.

This city is The Steel Company of Wales, one of the largest and most modern integrated steel plants not only in Britain but in all Europe. Here over 13,000 men are at work, producing steel for every one of Britain's major industries.



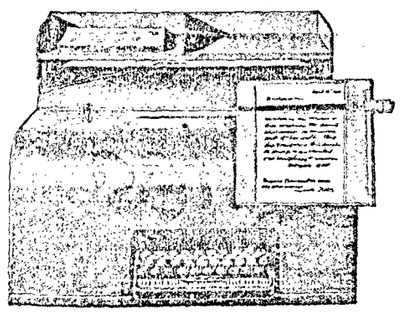
Already The Steel Company of Wales makes 35% of Britain's sheet steel—*but this is not all.* The Steel Company of Wales also makes two-thirds of Britain's tinplate. Two great tinplate works, one at Trostre and one at Velindre, have been opened since the war—Velindre so recently that the full effect of its production is yet to be felt.

Day and night, The Steel Company of Wales is at work, *its aim simple and unwavering:* to make steel, to make tinplate from steel, for Britain and abroad. In this magnificent city in Wales, tomorrow's prosperity is being forged.



Opportunities for graduates and technicians

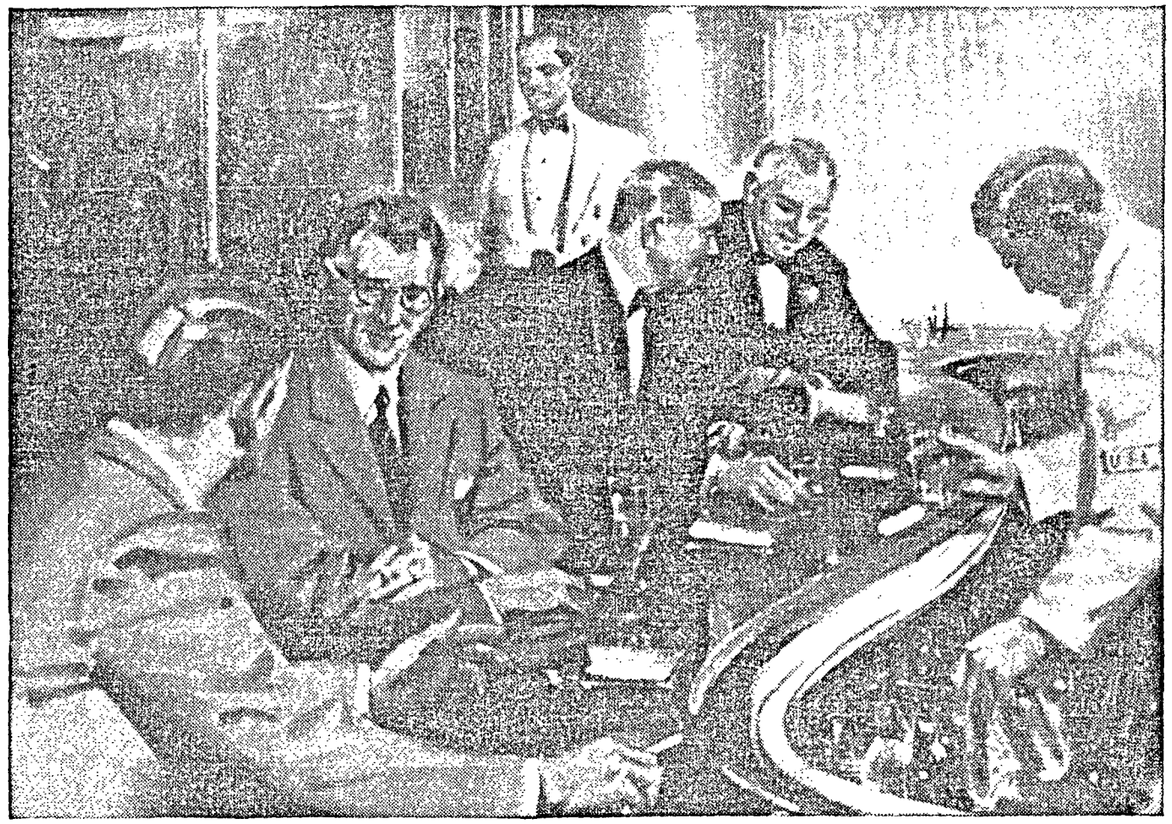
If you are a graduate—or likely to be one soon—in mechanical or electrical engineering, physics, metallurgy or mathematics, we would be very pleased to hear from you. Just send a postcard to: The Personnel Superintendent, Abbey Works, Port Talbot, Glamorgan, and in return we will send you more information about the Company.



THE STEEL COMPANY OF WALES LIMITED

Why not you?

Modern business needs Telex...



...and this is the book that proves it. Listed here are more than 3,500 of the most progressive firms in the country who already use this 24-hour Post Office service. They have full teleprinter communication with each other and with 75,000 more Telex users overseas.

Why do they use it? Because Telex combines the speed of the telephone with the authority of the printed word. Because it is cheap—a Telex call between exchanges over 25 miles apart is about half the cost of a telephone call. Because it is easy—no special staff is needed; a good typist soon becomes a skilled operator.

See Telex in action. Contact your Telephone Manager or the address below and ask for . . . **a demonstration, a descriptive booklet, further information and advice.**

Travelling American *can* mean bigger markets

BRITAIN's biggest group of exports to the U.S.A. is road vehicles of all kinds, from bicycles to heavy-duty trucks. Take the North American representative of one of Britain's leading car manufacturers. We might call him Mr. Rigby. He is out to capture even more dollars to pay for Britain's vital imports.

Mr. Rigby chooses to travel to America by United States Lines.

On board the famed "United States" or her running mate the "America" he finds pleasant, informal surroundings. Here he meets American businessmen—important in his job. In a social atmosphere where everyone tends to be relaxed and friendly, he finds it far easier to make contacts than over an office desk.

If you are a businessman, remember that here is a perfect background in which to begin a really successful American trip. While they are unhurried, and unworried, you meet the men who may make all the difference.

Punctuality is important, too. You may have an appointment to keep soon after you disembark. The "United States" holds the Blue Riband; her extra reserve of speed means that she has an outstanding record for timekeeping.

There's plenty of fun on board, too. You'll find unexcelled food and wine, cinemas equipped with CinemaScope, top-grade orchestras, every "keep-fit" facility, well-stocked libraries and, if you want, the pleasure of just resting and relaxing. The days between you and New York will pass all too quickly when you travel by United States Lines.

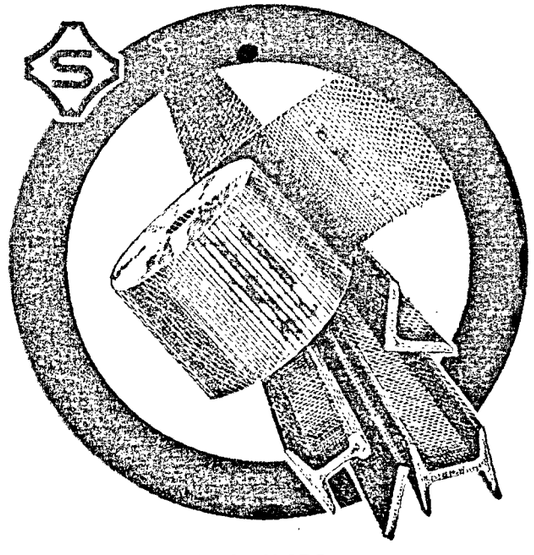
PERIQUE—AND THE PIPE OF PEACE

'Tis fine Perique

that makes Three Nuns

so different



When your confirmed pipe-smoker is wrapped in lazy dreams and the drowsy comfort of Three Nuns Tobacco, he may not know the inner secret of his bliss. 'Tis the black heart of fine Perique in the small significant dark centres of those famous Three Nuns curly discs. Centuries ago, Perique (itself a rich and rare tobacco) was being grown by the Indians in a tiny, ten-mile plot of land in the Mississippi area. And only there does Perique, even today, truly flourish. And so the pipe of peace, smoked by the Indian Braves, is translated today to the peaceful pipe of the Three Nuns smoker.

Three Nuns

with the black heart of Perique

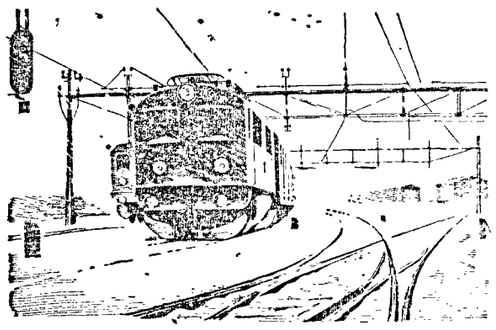
Australia counts her wealth in Roëntgens



Prospecting has come a long way since the primitive methods of Gold Rush days. Uranium is the prize metal now—and Australia uses novel techniques to find it. Wagon Drills driven by compressed air are used to drill holes up to 100 ft. deep. A probe connected to a Geiger Counter is then lowered into the hole and records the degree of radio-activity in milli-Roëntgens — a reading often verified from dust samples collected during drilling. With the direction of the ore body surveyed, exploratory shafts are sunk and lateral drives made into the main body of the ore.

In the Northern Territories alone, these methods have led to the location of *nine major fields*—one of the richest deposits of uranium in the world, and a great increase in Australia's mineral wealth.

Atlas Copco have supplied practically all the equipment and technical staff needed for every stage of the drilling operations —Compressors, Rock and Wagon Drills Sandvik Coromant tungsten carbide tipped drill steels and Long-hole Equipment.

Railway safety at Stockholm

Compressed air is versatile. Atlas Copco provide the means for all its many applications. At Stockholm's main railway station, air supplied from Atlas Copco compressors is blown round the points in winter to keep them free from ice and snow; a successful new method of maintaining safety that has also brought considerable savings in manpower and costs.

The Atlas Copco Group of Companies is responsible for the manufacture of compressed air equipment and its distribution and servicing in 90 countries throughout the world. Group Headquarters: Atlas Copco AB, Stockholm 1.

Atlas Copco puts compressed air to work for the world

Amber over Green

THE reduction in Bank rate on Thursday was mainly a technical money market operation ; it is discussed in Business Notes on page 491. It does not mean that the authorities have decided upon a policy of progressive relaxation ; indeed, the fact that the persistent drop in the Treasury bill rate had almost forced them into this reduction may mean that they will feel that they have less room to afford relaxations in other things. But it does mean that the new Chancellor has been thrust, almost certainly unwillingly, into an early step that will have an effect upon the great debate about the future of the British economy, which has suddenly emerged from under the cloud of the Suez misadventure, and is still shadowed by its consequences. There are two apparently contrasting voices. One speaks with increasing insistence of the danger that Britain will lose ground in the world race because of the restraints imposed upon investment and output in the past eighteen months. This is the voice of growth and expansion. The other speaks no less insistently of the limits set to the activities of this crowded trading island by the balance of its payments with the rest of the world, and of the renewed perils of inflated costs and prices if demand is now enlarged again. This is the voice of stability and precaution.

It is with these two voices sounding in his ears that the new Chancellor has now to set about constructing his April Budget, and to decide whether, after this reduction in Bank rate, he will have to tighten up taxation (as Mr Macmillan half threatened to do before he became First Lord of the Treasury), or can leave things as they are or further slacken the screw. Mr Thorneycroft will do well to recognise the fact, which the present controversy may disguise, that this is not an argument about ends but about means. There can be no dissent from the truism that the first objective of economic policy should be to stimulate the productive investment upon which the nation's future standard of life, and its stance in the world, entirely depend. But the opportunity of moving forward into another industrial revolution, with an almost boundless prospect, by building up the nation's capital of machines, its resources of power and its apparatus of communications is constantly overlaid by a dilemma ; the dilemma is that the expenditure of the nation's means on other things—on consumption, on social programmes and the concerns of government, including defence—has not left room enough for the necessary high volume of investment in production. In other words, there has not been the volume of savings to finance it ; and it was to arrest the chronic instability caused by persistent inflation and repeated crises, or threats of crisis, in the balance of payments that the decision was made in 1956 to choke off demand.

The question now, quite simply, is whether the time has come to put expansion first again. The argument is between those who believe that if production is now allowed to go ahead, so that factories and machines can work to the top of their capacity, sufficient safeguards

against renewed inflation and exchange difficulties will be generated in the shape of more goods, higher productivity, lower labour costs and lower overheads—and sufficient savings ; and those who say, with the chairman of Lloyds Bank, that the real need " is rather to create conditions in which a revival of saving will make it possible to press on more rapidly, at one and the same time, with additions to our domestic wealth *and* with the rebuilding of our overseas capital."

On the need " to press on more rapidly," then, there is no dispute. The question is : When ? The advocates of " expansion now " put a strong case. The potential increase in output last year, judged by the number of investment projects that were coming to fruition, must have been at least £750 million ; yet production stood still. And this year, because the rate of investment was still high in 1955-56, there should be a similarly large addition to productive capacity which may, again, not be used. Why, it may be asked, is this state of affairs not reflected, as it would have been before the war, in a considerable rise in unemployment ? The answer is that it is reflected instead in a slowing down of productivity, in short-time working, and in the withdrawal from industry of " marginal " workers—in a new sort of " suppressed deflation."

Whatever the success of the policy of disinflation in producing a balance of payments surplus of probably over £200 million last year, the expansionists say, in the field of labour mobility and labour costs it has just not worked. Despite the constant coming and going of workers between jobs there has not been the " purposive " movement into the more efficient and the export industries that was hoped for. Many of the men have merely slowed down their output or gone on to a two- or three-day week instead. Clearly, looking backwards, a fair criticism of the Government's policy eighteen months ago is that it did not, when it instituted disinflation, move at the same time against the blockage in the housing market by introducing the Rents Bill then. Since production has stopped rising, labour costs per unit of output (which it was one of the purposes of disinflation to contain, because in 1955 they were increasing faster than those of our competitors) have risen not less, but slightly more, rapidly than before.

★

There is the core of the argument, which is both widely and respectably supported, for a return towards the " flat-out production " policy of 1953-55 : that a country which has indefinitely to keep down its rate of production cannot prosper ; and that the country's competitive position, which has not improved during the slow-down, will be worse still in a year's time. Mr Thorneycroft will surely not under-estimate the weight of these arguments ; nobody can fairly suppose that a few days in Treasury surroundings can have committed him to restrictive and defensive attitudes ; his wish will be—it must be—to give what encouragement and incentive he can. What " he can " ; there is the test of judgment and the touchstone of decision. As the Chancellor settles down to make, not a blue-print for the next twenty years, but a Budget for the next financial year in the light of this year's and next year's facts, he is obliged to weigh also with care and responsibility the other arguments which would set the signals now not at green but at red.

Whatever his aspirations, it is in fact to the immediate outlook for the public finances and for the national economy that the Chancellor must necessarily address himself first. On the Budget proper, while civil expenditure (in real as well as in money terms) threatens to rise sharply, the projected reductions in defence expenditure are more likely, in 1957-58 as distinct from subsequent years, to be counted in tens rather than in hundreds of millions. The barometer for the economy at large must be the prospective balance of payments. Normally, on the basis of the external surplus of £200 million or more achieved last year, domestic demand might reasonably be somewhat enlarged this year. But the cost of Suez has to be paid, in both real and money terms. The current six months may well show a further shortfall in the balance of payments ; and the possibility of industrial expansion in coming months will, in any case, be limited by the availability, and the cost, of oil supplies. Wage rates and, as the expansionists themselves argue, labour costs per unit of output are still rising ; and prices are likely to rise again from the " plateau " that was achieved in the last nine months of last year. And Britain has already thrown in its second line of dollar reserves, which are in any case —and this is the nub of the problem—not adequate to serve a properly flexible policy.

★

These are dampening thoughts, which Mr Thorneycroft, with the best will in the world, cannot avoid. He can argue, fairly enough, that foreign confidence in the pound will not be sustained for long if British production stays indefinitely stagnant. But neither will it if the balance of payments deteriorates again—in the long run (and not so long a run at that) it is trade, not psychology, that determines the value of the currency. There is the dilemma ; and the trouble is that the credit squeeze and austere budgeting (with tax levels already penal), instituted to make possible a larger advance on a more even keel after a pause, have had such a delayed or diminished effect in restoring the balance between supplies and demands, between resources and requirements.

What, then, should be the Chancellor's mood as he broods at his desk ? Undoubtedly he should be eager to do as much as possible, without courting a calamitous setback, to re-activate the upward cycle of investment and output, and certainly, by keeping in good heart those who have to make decisions this year, to prevent an actual, and deeply damaging, downturn later on.

Equally he is bound to set his face against simply letting things rip. In the field of monetary policy he has resisted the powerful technical and other arguments for lowering Bank rate for some three weeks longer than the money market itself had expected ; now he must face the fact that, as things are, this weeks' reduction in the price of money may merely mean relying more on the continued rationing of its supply, undesirably, by physical controls (directives to bankers, etc.). But his main instrument of policy must clearly still be his Budget; and there the lower and upper limits are plain. Presumably, at the one extreme, he will not, despite Mr Macmillan's warning, put income tax up. Probably, at the other, he will find it hard to go as far in relaxation as both to restore the investment allowances and to implement all the " Royal Commission " reforms in taxation (to the extent of £150 to £200 of tax reliefs). But, equally plainly, his right course will be to go as far as he dare, if only in reshaping the intolerably heavy tax burden to reinstate incentives in some degree. In choosing between the green light and the red, the Chancellor will probably be wise to set up a new signal, unknown to the Ministry of Transport, of amber over green.

Liberty, Equality, Sorority

ONE aspect of the Suez venture has not yet been fully explored: its ultimate effect on the Commonwealth bond. In November, while the Government's supporters found comfort in reassurances from Australian, New Zealand, and some private Canadian sources, its critics—among them *The Economist*—were quick to point to the intense strain it had straight away imposed on the bond. While Canada pressed for a quick shift into reverse gear and the South African Nationalists publicly washed their hands, in Asia Mr Nehru, Mr Suhrawardy and Mr Bandaranaike each breasted angry waves of " quit the Commonwealth " agitation. They were helped to ride these waves by the speed with which Britain and France agreed to cease fire and withdraw ; and with the completion of the withdrawal the immediate crisis was passed. But the long term effect is another matter.

Nobody seriously denies that the attack on Egypt has left a permanent mark on the Commonwealth relationship. To date, however, most discussion has turned on the over-simple issue of the size of the mark. The Left depicts it as hugely sombre ; it adds that the Asian member countries would probably have snapped the bond at once if they had not seen that the British themselves were divided. The Right asserts its confidence that the bond will hold ; but is sometimes heard muttering that it might be no bad thing if it did snap: " Then we'll know who our real friends are." What seems missing is any awareness that these events have probably affected the nature of the Commonwealth relationship quite as much as its strength. And in this change of character there is one encouraging element—though it is not of a kind to encourage Blimps.

The underlying psychology of the pre-Suez relationship could have had no more vivid illustration than the way the Asian member peoples reacted to the attack on Egypt. Their indignation was at once channelled into demands that their countries should leave the Commonwealth. Yet its eight—soon to be nine—sovereign member states are constitutionally equals, wholly independent of one another ; and anyone who doubts the genuineness of this independence has only to study their varied voting records in the United Nations, or their attitudes on issues ranging from Nato to China via Kashmir. Now, if one member of a club offends another by his behaviour, it is an odd and unusual reaction for the offended party to think of severing his ties with the whole club. Yet never for a moment was it suggested that it was the offender, rather, who should be expelled or suspended from membership. When taxed with this at the time, even Indians who are articulately proud of their country's republican status, independent policy, and prominent place in world affairs, tended to retort with the argument that, after all, " you have the Queen here."

★

Is it, then, not unfair to say that at least up to November Britain's seven sister nations were not fully adjusted to the equality of status they had attained ? In public, sisterhood was being tirelessly reaffirmed ; but in the privacy of many Asian, as well as Canadian or Australian, hearts, Britain was still regarded as mother—and expected to pour the tea.

Britain's historical role as mother country is not in dispute. But a conventional mother-daughter relationship ends when the daughters are mature enough to handle their own affairs. A certain time-lag may occur before the daughters see their emancipation clearly, especially if the old lady preserves a reputation as a shrewd adviser. But if Mum is caught pinching hats in Oxford Street, the relationship changes abruptly. She is now in need of advice herself. The daughters may appreciate that she has lately been under severe strain ; but they have lost their mother-figure. And, to be blunt, it was high time they did.

There is no point in pretending that the Commonwealth is at this moment a particularly happy family. But it would be equally silly to read too much into such portents as an Oxford Union resolution that Commonwealth membership is now " meaningless." Long before Suez, membership had ceased to be based on a stereotyped " loyalty " implying blind acquiescence

in any course Her Majesty's Government in the United Kingdom might take. Today the basis for membership is the visible interest of the sovereign members in belonging to a large, inter-continental, and yet familiar group. The material advantages of their association are, admittedly, sometimes shared by non-members—as in the cases of the sterling area and the Colombo Plan; nevertheless, without the Commonwealth neither sterling area nor Colombo Plan would have evolved. The looseness of their bond even leaves room for bitter dispute between individual members—as witness Kashmir. The flaw in their relationship in recent years has not been a lack of "loyal" uniformity, but rather their seeming inability to appreciate that Britain's apron strings are now no more substantial than the emperor's new clothes.

★

Some kind of shock was probably needed to bring their psychological relationship into line with the constitutional. In providing this shock, Sir Anthony Eden's government may have contributed as decisively to the evolution of the Commonwealth as Mr Attlee's did when it transferred sovereignty to India, Pakistan and Ceylon. But it should not be supposed that only the Asian members have been affected, or stood in need of shock treatment. Canadian critics who have long assailed their government with the charge of adopting a moral posture in world affairs, but doing nothing much to help matters, now have the gratification of seeing Mr Lester Pearson, the godfather of the United Nations emergency force, and General Burns, its commander, in the thick of the struggle to restore Middle Eastern peace. In the antipodean Realms there are signs of a re-examination of the simple tenets—"wherever Britain stands, we stand"—beloved by Mr Holland and others. And realms and republics alike will welcome signs that Britain, too, has taken the point. The oldest among them has in the past been irritated as much as the youngest by the bland proprietorial references of some Westminster politicians to "our Commonwealth."

Many people in this country will not find it easy to make the mental adjustment that is now called for. In their mood since the Suez crisis there is a strong element of what might be termed ingrowing imperialism: not aggressive but possessive, not a wish to strike out but an impulse to clutch at something that is vanishing. No impulse could be more misguided. As one of a sisterhood, Britain enjoys the prospect of a long, lively, sometimes quarrelsome, but always healthy, life in the family of nations that has grown up around it. In the capacity of elder sister, it has a clear and special responsibility towards the other members—notably in the event of a threat to the common weal. But if it tries to keep up the role of a dominant Mum, it will not only hamper their efforts to play their full part in the affairs of a world that needs the utmost they can offer; it will also be shortening the life of the Commonwealth. The Government would be well advised to give a lead to public opinion by some gesture indicating that it recognises and welcomes the transition to real sisterhood. The obvious gesture is a proposal that the next meeting of the Prime Ministers of the Commonwealth should be held, for the first time, not in London but in one of the sovereign members' other capitals.

FORMOSA TODAY—II

Aspects of a Myth

FROM OUR SPECIAL CORRESPONDENT LATELY IN TAIPEH

THE impermanence of communism is an article of faith in Taipeh and in Washington. This belief explains the persistence of the Chinese Nationalist myth of an impending return to the mainland. That communism—in China as elsewhere—contains within itself the seeds of its own disintegration is common ground between Chinese Nationalists and American officials concerned with Chinese affairs. This permits Americans to subscribe to the myth without necessarily accepting the Nationalist view of how to translate it into reality.

After all allowance is made for the element of propaganda in Nationalist promises to "recover the mainland" soon, or in a stated year, there remains a hard, unshaken core of belief that President Chiang Kai-shek, or his successor, *will* regain control of China, by means that are not stated. There are certainly Americans who share this belief, but the highest American officials tend to interpret it as meaning that (later, perhaps, rather than sooner) communism will collapse in China, to be replaced by a nationalist regime. The advent of such a regime, it is argued, would make possible the reunification of Formosa and continental China; thus the "return to the mainland" would be accomplished. Implicit in this argument—though it is seldom explicitly stated—is an assumption that the leaders of the new nationalist regime would not necessarily be Chiang Kai-shek or his successors.

It is important to realise that this distinction exists, because the extent to which the myth is a real danger to world peace depends on the time and the manner in which it is to be translated into reality. It is not the purpose of this article to examine possible means of reducing or eradicating the danger, but an understanding of the myth is essential to an understanding both of the international problem which Formosa presents and of the domestic state of the island. Without

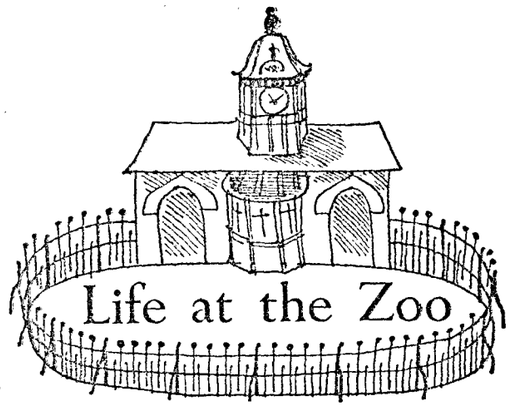
reference to the myth, the existence of two governments—central and provincial—and two bureaucracies on Formosa would be unintelligible. The myth has itself become a political fact. It explains why there can only be "local" elections on the island—not national ones (more than 99 per cent of China's population being on the mainland). It is a reason why the creation of a separate and independent "Republic of Formosa" is at present a political impossibility. The myth, however interpreted, helps to justify America's wholehearted support for the Chinese Nationalist regime and refusal to recognise its powerful rival.

Considering the limitations inherent in acceptance of the myth, the regeneration of the Nationalist government and the resurgence of the Kuomintang as a party are phenomena that surprise the visitor to Formosa. Like the Long Parliament, the government of the Republic of China goes on and on; unlike the Long Parliament, it has managed not merely to stay alive, but (as an article in *The Economist* last week explained) to improve itself. The National Assembly that now sits in Taipeh was elected in China in 1948, and the terms of its members have been extended indefinitely; so have those of members of the Legislative Yuan, whom the National Assembly elects. Chiang Kai-shek was re-elected as President in February, 1954; his second term expires in 1960.

The self-improvement is evident, but the major anomalies of the dual administration could be removed only if the myth itself—the justification and condition of survival—were discarded. Thus the cumbrous apparatus of the old Chinese government, with its five Yuan (branches), continues to function as though the territory under its purview still covered four million square miles, instead of less than half the area of Scotland. The Executive Yuan (cabinet) is kept busy, of course, though some of its functions are duplicated by branches of the provincial government. But the other four Yuan—Legislative, Judicial, Control, Examination—are sometimes under-employed; and their search for occupation does not always serve efficiency.

★

Within the limitations of its national claims, however, the Nationalist government has done much to reduce the cumbrousness of the administrative machine. The central government bureaucracy has been pruned and is outnumbered nearly four to one by the 81,000 civilian employees of the provincial and local authorities. Local autonomy is now reasonably satisfactory, municipal and district councils having been elected by direct and secret ballot since 1950-51; five mayors and sixteen district commissioners are likewise elected; so is the provisional Provincial Assembly of 57 members. In all these elections, an overwhelming proportion of Taiwanese (Formosan-born Chinese) candidates were successful. The general direction of local affairs remains, however, firmly in the central government's hands through its appointee, the Governor of Formosa.



In the artificial circumstances of Formosa, political, as distinct from administrative, life tends to stagnate. As determined by the yardstick of the Chinese elections of 1947-48, the Kuomintang continues to be the dominant party. Two other anti-communist parties, the Young China party and the Democratic Socialists, flourish, however, and the first of these is represented in the central government. The need for security has limited the full application of the freedoms guaranteed by the 1946 Constitution, but it would be wrong to think of Formosa as being in a state of terror. It may be impolitic to question the myth; but the atmosphere, whether in Taipeh or elsewhere, is extraordinarily friendly and relaxed, and speech is uninhibited.

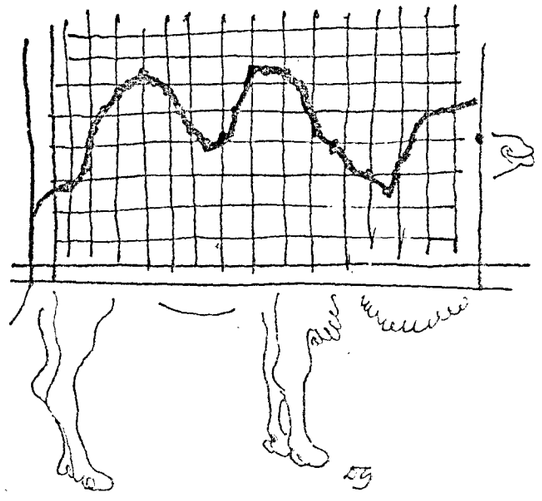
Though constantly under threat of war, Formosa is more secure internally than, say, South Vietnam, and the encroachments on personal liberty are consequently fewer. Most of the time, people are left alone and the privacy of their correspondence is respected. Then a sample check may be made and further action taken if deemed necessary. The Nationalist government is haunted, however, by the fear of airborne landings. As a result, stringent security restrictions curtail movement in the mountainous interior of Formosa. Your correspondent had to obtain a special pass, authenticated by a photograph, before being allowed to visit a power house in central Formosa—and credentials were scrutinised at police check-points in the forbidden area. Apart from these precautions, there is complete freedom of movement in Formosa. The term "free China" is more than a figure of speech.

The international cloud of uncertainty that hangs over the future of Formosa inhibits speculation about the future of Nationalist China's leadership. But it is reasonably certain that so long as President Chiang is alive and in good health, he will remain the unquestioned leader of his fragment of a divided nation. If death or incapacity were to remove him within the next few years, it may be assumed that he would be succeeded by the Vice-President, General Ch'en Ch'eng, who, at 59, is ten years younger than the Generalissimo. Ch'en Ch'eng, a fervent Nationalist and an able administrator, can claim much of the credit for the success of the land reform programme, and for restoring good relations between the mainlanders and the Taiwanese during his term of office as Governor. With him in office, the powerful but shadowy figure of the President's son, General Chiang Ching-kuo, would no doubt remain in the background, charged, as now, with security and intelligence.

Beyond that—beyond the deaths or retirements of Chiang Kai-shek and Ch'en Ch'eng—it is impossible to see. Whether the *de facto* separation of Formosa from the mainland would then be enshrined in the creation of a separate state would depend as much on developments on the communist mainland as upon the evolving attitudes of the Nationalists. All that can be said with certainty after a visit to Formosa is that today such a possibility does not enter into politics.

(Concluded).

IN the quiet streets north of Regent's Park the Zoological Society of London has brought together the closest concentration of varied animals in the world, a total of some 3,300 (excluding fish and non-vertebrates), which are joined each year by more than two million human vertebrates on the other side of the bars. It has now entered upon a programme of considerable improvements and development, of which the first part—an animal hospital—was opened last month. Together with the society's complementary park at Whipsnade outside London, the zoo attracts some 2.6 million visitors each year ; on that basis, it can probably claim to have a larger custom than any other single British place of entertainment offering an unvarying daily programme. Regent's Park and Whipsnade are the most famous British zoos, but there are some dozen others (and a larger number of near-zoos) all over the country.



Most zoos are run by private companies in conjunction with fun-fairs and circuses : they have the advantage over those run by scientific or quasi-scientific societies that they need to keep only the larger and more spectacular animals, many of which are comparatively easy to feed and care for. The London zoo, on the other hand, has the almost unfair advantage of 36 acres of Crown land in the middle of the biggest mass market; it is none the less remarkable that it should continue so successfully to combine the pursuit of knowledge with popularity, in an age when other bodies with similar original objects find it increasingly hard to reconcile the two.

The Zoological Society was established by a group of eminent scientists—including Sir Stamford Raffles and Sir Humphrey Davy—in 1826, with the good nineteenth century aims of "the advancement of Zoology and Animal Physiology, and the introduction of new and curious subjects of the Animal Kingdom." Shortly after its foundation it received its Royal Charter and opened the gardens, since when it has never looked back. It is, first of all, a scientific body. It publishes learned monographs and, to encourage research, sends expeditions to foreign countries to work in zoology. And the public is prepared to pay for the pleasure of looking at its animals to such an extent that it contributes roundly to the scientific expenses.

Running the Regent's Park zoo is in itself an expensive business. Provisions for the animals alone cost the society over £90,000 a year, despite the fact that it has a farm at Whipsnade which produces large quantities of fodder. A large elephant, for example, eats about a hundredweight of hay a day, along with oats, bran, fruit and vegetables, as well as the delicacies he may pick up from his fans ; his official food alone may cost £400 a year. A lion, eating ten or twelve pounds of meat a day, may have £200 spent on his food in a year. These mouths, however, are not the hardest to fill, although friends of the zoo may help out in difficulties. A noble earl helps to keep the giraffes supplied with the evergreen oak of which they are so fond, and another friend of the zoo charged himself with providing earthworms for a kiwi, which ate some 300 lb last year. Locusts and flies are bred as food on the premises: of more ordinary provisions, the zoo consumes 100 tons of meat a year, 14,000 eggs and 13,400 pints of milk.

All this expenditure is rather more than covered by the zoo's several sources of income. In 1955 the society earned more than £210,000 from admission charges at Regent's Park, £21,000 from fellows' subscriptions at £3 a time, and nearly £25,000 from catering profits and the sale of guides and souvenirs. The chimpanzees earned more than another £1,000 on admissions to their tea-party, and charges for rides on animals brought in nearly £5,000. The total income at Regent's Park in 1955 exceeded £295,000 (against £281,000 of expenses); income at Whipsnade exceeded £110,000 (against £93,000 of expenses) ; and both zoos probably showed another profit last year.

The "introduction of new and curious subjects of the Animal Kingdom" to Regent's Park is effected partly by purchase (£11,000 was spent on cost and carriage of animals in 1955), but also by presents to or deposits in the zoo from kind friends. Sir Winston

Churchill, for instance, lent a lion which was presented to him and which would no doubt have been a nuisance around the house ; and he has recently done the same with some small tropical fish. His name is included in the list of donors, together with—to cite from the 1955 list—some intriguingly varied colleagues: "Leckford Estates Ltd., one Falcated Teal," "the Ministry of Works, one Tufted Duck," "Master S. Atkinson, three House Mice," and—surely most alarming of all—"General Post Office (Returned Letters Section), three Spotted-head Snakes." One should not forget, too, the small, ordinary bear presented by Mr Khrushchev to Prince Charles last spring, which would have proved a bit much for the Private Household.

In addition to these contributions from donors in this country, the society has friends abroad who present animals, or it may arrange an exchange with some foreign zoo or society. (The 1955 list of donors includes "the Zoological Gardens at Prague, two Hungarian skunks and four Smooth Snakes.") The society's research expeditions may also take the opportunity of collecting some animals of special interest, so that the fruits of the expedition may help to pay for it.

The greatest boon to the zoo's receipts is, however, the way in which certain animals catch the public fancy. Before the war the arrival of the giant pandas from China increased the number of visitors enormously, but the supply of these absurd and delicate bears has been cut off by political troubles. The biggest boom of all was caused by the birth of the polar bear cub, Brumas, in 1949 ; she brought almost a million more people into the zoo in that year. But Brumas is a big girl now ; interest in her has waned, and the attendances have fallen again to their "normal" annual level of two million odd.

At present, then, the desire to look at animals seems both deep-rooted and steady : it also seems unlikely to be harmed by those customary scapegoats of unsuccessful entertainers—television and the cinema. A nodding acquaintance with Little Men from Mars seems rather to whet the appetite for crocodiles and gorillas, and the joy given to thousands of children by those apes with coloured behinds is unlikely to fade until colour TV enters British homes. In fact, one of the strongest claims of television to be educational is that it has stimulated interest in animals ; the BBC used to have a zoo series, and a regular weekly programme from Regent's Park has recently been arranged with an independent TV contracting company. This year the London zoo may benefit even more because of petrol rationing and the difficulty of getting out of the city. How nice to know that those exhausting afternoons with the children and that uneasy sense of kinship with the chimpanzees will serve to advance the cause of science.

Notes of the Week

Mr Sandys Returns

IT will now be for the service chiefs to appraise, digest and argue about the practical military implications of Mr Sandys's mission to Washington—which, be it noted, was an exclusively civilian one. There is likely to be a lot of appraisal, digestion and argument between now and the publication date of the defence white paper, which was originally due this month but will now probably be delayed until nearer the beginning of the new financial year. Mr Sandys's course is a tricky one. The only economising achievement that can reasonably be expected of him in the immediate future is to turn the defence estimates for 1957-58 over the hump, to start them falling instead of perpetually rising ; the question is whether those of his advisers who, at heart, deplore the economy campaign (and they have some perfectly reasonable arguments on their side) will try to play on this point sufficiently to block the Government's second and major aim. This second aim is to get into the right posture for reducing the eventual defence bill—by, say, the end of this Parliament in 1959 or 1960—to a level more in line with that of other European members of Nato, and thus to save those not-quite-chimerical hundreds of millions of pounds.

Mr Sandys has brought back from Washington two contributions to these aims. First, he has apparently got the right sort of rocket: Britain is to receive American missiles, including the medium-range ballistic missile (which should eventually lead to economies in the V-bomber deterrent force) and various other rather less apocalyptic devices that are discussed in an article on page 487. By relieving British industry of the need to go it alone in the research on, design and production of, every type of weapon, this could considerably relieve the long-term strain upon Britain's scarce and precious resources of scientific and very skilled technical manpower ; but the economies, in money terms, will not be great. The real question for those who want large defence economies is when and whether Mr Sandys can start getting rid of general conscription. The communiqué issued after the Washington talks reflected General Norstad's anxiety that "military capacity, conventional as well as nuclear, must be kept in a high

state of readiness"; but it went on to recognise that "financial and economic stability is an essential foundation of military strength, and that this must be taken into account in assessing a country's defence contribution." Translated from the communiquese, this appears to mean: if (or, rather, when) Britain cuts down the number of its conventional forces in Germany and elsewhere, on the grounds of economy, the United States will not take this as any justification for a commensurate reduction in its own forces. To have secured this intimated assurance is a considerable personal achievement for Mr Sandys.

Sinai and the Assembly

THE General Assembly of the United Nations was right to stress in its resolution of February 2nd that scrupulous observance of the 1949 armistice by both Egypt and Israel is the aim to be sought. It should not, in its anxiety to secure complete Israeli withdrawal from Sinai, lose sight of the fact that freedom for Israeli shipping in the Gulf of Aqaba and the Suez Canal are included in the armistice requirements. How to secure withdrawal *and* the maritime freedom of Israel is the issue.

The first resolution of February 2nd "deplored" Israel's failure to complete the withdrawal from Sinai and Gaza and "called upon" Israel to do so without further delay. The second "called upon" both countries to observe the armistice and "considered that" the UN emergency force should take up positions on the demarcation line. The guarded language of the second is explained by the need to get a two-thirds majority for it. The voting upon it nevertheless contained a mite of promise for the future. India and Indonesia were among the sponsors and the Asian block, with the exception of the Arab states, voted solidly for it. Even the Arab states were content to abstain.

The Secretary-General was requested, by the same resolution, to consult the parties and report back. When he does so it will be to tell the assembly that Israel, lacking the guarantees it seeks, has refused to withdraw. The assembly might reasonably expect to know at the same time whether Egypt intends to keep the canal and the Gulf of Aqaba closed to Israeli shipping; for according to the principle it has itself enunciated, total observance of the armistice is the intention. Israel has told Mr Hammarskjöld that if Egypt renounces its claim to blockade the gulf, withdrawal will be made easier. The degree of condemnation of Israel ought to take account of Egypt's willingness, or unwillingness, to observe the agreement. If, in the end, sanctions are considered (which would itself be unfortunate), they must surely depend on Egypt's renunciation of belligerent rights.

A great deal of responsibility now rests on the United States. Mr Lodge approached the problem warily on February 2nd, perhaps because his government's anxiety to secure a favourable reception by the Arabs of the Eisenhower doctrine made him over-sensitive to Arab opinion. The effect was to put upon Mr Hammarskjöld more responsibility for action than his office can bear. His report will put the matter back in the assembly's lap, and the day will be nearer when the Israeli withdrawal, and Egypt's observance of other parts of the armistice will call for action of equal urgency.

Russia Slackens Pace

THE Supreme Soviet opened its budgetary session in Moscow on Tuesday with a heavy programme before it. In addition to the economic plan and budget for the current year, the deputies will be asked to endorse the long-awaited new legal code; finally, they will hear a review of the international situation. Changes in the government, if any, can be announced at any stage, as Mr Malenkov's resignation was announced two years ago.

The session has already begun with a portent of apparent change of policy. Mr Pervukhin, the new chairman of the State Economic Commission, announced that Soviet gross industrial production this year would increase by 7.1 per cent. Although it is still a high rate of growth by general world standards, this represents a considerable slackening of pace compared with the general pattern of Soviet development since the war, or with last year's rise of 11 per cent. Heavy and light industry will both be affected by the fall, and unless production is to be speeded up in the following years, it will fall far short of its targets even in such basic branches of the present five-year plan as coal and steel. The prospect of such a revision is more striking than the further reduction of the military budget from 102,460 million to 96,700 million roubles, which brings the direct share of defence down from 18 to 16 per cent of total expenditure.

A closer scrutiny will be needed to decide whether this declining rate of growth is a temporary feature brought about by technological requirements, or whether it marks a change in the direction of Soviet economic planning. Even if the Russians choose to depart from their established principle of mortgaging the present for the future, it will remain a question who is most likely to benefit from such a relaxation: domestic consumers, or the eager claimants from Eastern Europe or China. The new emphasis on housing would indicate that pressure at home is likely to prove the strongest. The foreign affairs debate in turn may show how far, in the Russian view, the state of international politics justifies a period of economic relaxation.

Pensions from the Moon

THE Labour party's embryo plan for pensions has reached the stage—usual for a Labour document some two to three months before publication—where plausible leaks about it are getting into the newspapers. There are two kind things, and one very unkind one, that may need to be said about it. It is clear that Labour is going to propound the principle that both pensions and contributions should vary with income; that is a most commendable advance. The reputed aim of at least "half-pay for everyone on retirement," if it could really be paid for, would also be a redistribution scheme of the right kind; the sort of social service that is needed now is not a further equalisation of incomes between different people, but greater equalisation of each person's standards at different stages of his or her life. Unfortunately, the principal question remains: whether this plan is to be regarded as a policy or as a propaganda device

will depend on the way in which it is proposed that it should be financed.

The first indications are depressing. The figures published in some newspapers last Sunday strongly suggest that Labour, having left aside all such nuisances as demands for actuarial balance, is falling back into one of the oldest arithmetical delusions in the business: since the number of current contributors is always likely to be several times the number of current pensioners, 8 per cent paid out in respect of each contributor (including 5 per cent paid out by the state) might seem to suffice to "finance" pensions at near to half-earnings. This would be a variant of the old chain-letter trick: today's recipients are paid for by today's contributors, and today's contributors will be paid, when they become recipients, by contributors of tomorrow.

It is no answer to say that nearly all state pension schemes, including the present national insurance scheme, fall into some sort of actuarial deficiency. The size of the strain that is then put on the national economy depends on the size of the deficiency; and it is not really difficult to understand how the strain would have to be met. Savings for old age are the larger part of the nation's normal personal savings; when these savings are transferred to support the current spending of pensioners they are dissipated, and have to be replaced by new savings forced through higher taxation. That higher taxation would be additional to the contributions proposed under the scheme. The Tories may be going to have great fun employing actuaries to work out how astronomical this additional taxation would have to be. If the Labour executive has been handed the sort of proposal one fears, its best course is clear: it should scrap the present draft, make a general statement of aims, draw frank attention to the actuarial problems, and say that Labour will refer the question to a Royal Commission or the Government Actuary as soon as it gets into power. It will be a pity if the party is going to make a laughing stock of itself by parading as a policy any arithmetical enormities Mr Richard Crossman may have thought up in his bath.

To the Guillotine

PARLIAMENT'S machinery will only work if there is sensible co-operation between the two sides, and the past week has presented observers with two depressing instances of what happens when such co-operation is not forthcoming. The first was over the Death Penalty Abolition Bill. Although nominally sponsored by Miss Alice Bacon, this was in fact the bill which Mr Silverman piloted through the Commons last session, only to see it thrown out by the Lords. If the Commons could have passed it again this session, the Lords' veto would have been overridden. But it was only second on the list for debate in private members' time last Friday. Ahead of it was a minor bill about advertising hire purchase, and Tory MPs chose to speak about this for the whole five hours of the sitting. One Tory spoke for over an hour. Filibustering is against the rules of the House, but the Labour abolitionists clearly felt that the Tories would not have been nearly so loquacious if the second bill had been one they liked. Nor they would; but Labour members would have resorted to precisely the same practice if it had seemed to be to their advantage.

The proof of this is to be found in the second example of the Parliamentary machine getting jammed in the past fortnight. This has been over the Rents Bill. So little progress was being made by the standing committee considering it in detail that the Government has had to wheel on the "guillotine," and impose a timetable for the rest of the bill's progress through the Commons. Labour made the usual outraged noises, but the "guillotine" has now been used several times since the war by both Labour and Tory Governments: at each application, the arguments on both

Letter to the Editor

SIR,—In addressing to you a series of letters upon banking, I do not pretend to have any perfectly new theory to advance. On a topic of which the literature is already so copious, absolute novelty would be scarcely a recommendation, but on a complicated question it is desirable that the various lights in which its details strike individual minds should be continually expressed. . . . There is another reason for its being desirable that much should be written on the currency. It is peculiarly a subject on which men are apt to follow the course of their own thoughts. . . . There is a kind of hot-headedness in the pursuit of very abstract truth; a mind which has once made the painful puzzling effort will not allow a question as to the value of the result. In a little while a man's system becomes part of himself; he has so ingrained his mind with the repetition of a single argument, that to doubt his own theory seems like doubting his own understanding. The only way of avoiding all this, is that many people should be allowed to give their opinions, and that each should be at the pains to follow and master the opinions of the others. Every now and then money is scarce, and people begin to think why it is scarce. . . . The knowledge so acquired is very much like the degree of attainment which desultory men sometimes acquire in a language. . . . The public are always in the grammar of the currency; they give no such day by day consecutive attention to it as is necessary to thorough knowledge. The subject cannot, however, be really settled until it has been duly reflected upon by able and considerate men of business. These are the only sure judges. . . . Men of business in England do not, however, like the currency question. They are perplexed to define accurately what money is; *how* to count they know, but *what* to count they do not know. On one point only is there a true agreement. All real Englishmen are firm bullionists. They understand coin; there is something substantial in that; but that rectangular slips of oddly marked paper should be fancied to have inherent value puzzles them, bores them, and angers them. . . . There is nothing indeed in the subject which should frighten really thoughtful men of business. I do not say it can be achieved by a rushing man in a railway train, but there is nothing in it to deter quiet, composed, considerate men of action.

★

The Economist

February 7, 1857

This extract comes from a long letter on "The General Aspect of the Banking Question," signed "A Banker," which was Walter Bagehot's first contribution to THE ECONOMIST. *From it and the letters that followed arose an invitation to James Wilson's house to discuss the question further and Bagehot's meeting with Wilson's eldest daughter to whom he became engaged at the end of* 1857.

sides get more perfunctory. The conclusion to which one is being driven is not that this trend to perfunctoriness should be reversed, but, rather despairingly, that it might be better to agree to introduce a timetable from the start of any bill certain to arouse controversy—except, of course, financial and constitutional measures. The case for "guillotining" the Rents Bill was unanswerable. After nine effective sittings, the committee was still dealing with only the second of the eighteen clauses and eight schedules. Now it is given another eighteen sittings to finish its job. Probably that will be enough; but any slight danger of skimping discussion on the later clauses would have been avoided if the committee had been dealt a maximum of twenty-seven sittings to consider the bill from the start. A still better remedy, of course, would be for MPs to come to realise that delaying tactics do not add to their parties' reputations, and for them to be sharply told this whenever they indulge in them. A growl of disapproval deserves to be uttered, this week, towards both right and left.

Voices On

THE case was put in *The Economist* last week for the appointment of another Mr William Clark as press relations adviser to the Prime Minister. The arguments of some Conservative politicians against this course—their fear that a lively figure in this office can become a power behind the scenes, and might even propagate his own policies instead of the Government's—have been made at least equally plain. The appointment on Tuesday of Mr Harold Evans, until now chief information officer at the Colonial Office, to sit at Mr Clark's former desk is an interesting compromise between these views. By going to the conventional government information offices instead of to Fleet Street for their man, the Government may in effect be throwing out an assurance to Tory critics that the new incumbent's communications to the press should tend to be somewhat stodgier than Mr Clark's; this effect is likely to be mitigated by the fact that Mr Evans is known to pressmen who have had dealings with him as an able, personable and diplomatic man.

The main argument in *The Economist* last week was that the post should be attached to Mr Macmillan's office instead of to Dr Hill's; the ingenious compromise now decided upon is that Mr Evans is to be press relations adviser to both. There is an argument for this. Mr Clark's excellent service to the press was based on his close, and until the last few weeks incessant, personal relationship with the former Prime Minister; it was this closeness which aroused some Tory suspicions, and Mr Macmillan's reaction might have been to shut up before his press relations adviser like a clam. Now Dr Hill, musing in Cabinet without portfolio, is likely to have the main responsibility for judging what background information can best be passed through Mr Evans to the press, and Mr Evans will presumably find Dr Hill more easily accessible than Mr Macmillan if some particular issue sets his telephone constantly buzzing. The important point, however, is that Mr Macmillan will be standing by as Mr Evans's joint boss and shield; this will almost certainly enable Mr Evans to be less ultra-cautious than if he had been Dr Hill's adviser alone. Although this is not precisely the system *The Economist* would have chosen, it is reasonably near to it. Because of the recent press and political controversy about his office, however, Mr Evans is likely to have to earn every penny of his £3,000 a year.

Free Trade Sketch

THE OEEC committee which was asked to study the possibility of setting up a free trade area in Europe around the common market has published its report this week. It broadly concludes that such a scheme is technically possible, though a problem would arise from the area's tariffs with the world outside. Internally, both the free trade area and the common market are intended to remove tariffs altogether. But against the outside world, while the common market will set up a common tariff wall, the free trade nations will retain different national tariffs. This means that goods entering the area might cost more in one country, say France, where tariffs are high, than in another, say Sweden, where they are lower. Somehow traders must be prevented from taking advantage of these differences to evade the higher tariffs. Drawing a great deal on British experience, the experts concluded that some system of certificates of origin to show where goods come from could overcome this danger, and thus make the whole scheme feasible.

In the actual reduction of tariffs, the report emphasises, there must be a definite timetable which countries must stick to, as well as firm rules about the removal of quotas. Balance of payments crises and difficulties in a particular industry or region may compel a country to abandon these commitments temporarily. But such exceptions must be brief and rare. Indeed, if the whole scheme is not to be jeopardised by one bad boy continually running into trouble, "escape clauses" must be subject to strict rules—and perhaps to prior authorisation by some central body of the area. This is a far-reaching political notion. The report clearly suggests that "the system of prior authorisation may lead to the abandonment of the unanimity rule" in OEEC.

To take such central decisions and run the area, institutions will be needed; a Council of Ministers, a managing committee and a body of a "fact-finding and possibly judicial character" are suggested within the framework of OEEC. These seem rather similar in structure to the institutions visualised for the common market, and the need for close liaison between the two is a continuous theme of the report. On the methods of tariff reduction, liaison between the two groups of negotiators has already led the common market to devise rules which might simply be taken over by the free trade area. And on several other matters, the procedure suggested for escape clauses, for instance, and the "rules of competition," there are signs of parallel thought, which should speed the free trade treaty.

★

The free trade area countries, however, have still to face many of the wider political problems which the common market has overcome. Agriculture is the worst of these. Few countries in fact want free trade in agriculture, but most are pleased politically to say they do; agriculture is therefore theoretically included in the common market, even though a protective system will in fact be maintained. For Britain, on the other hand, because of its Commonwealth preferences, it is a political necessity to proclaim that agriculture must be left out, and so the free trade report records a head-on collision between Britain and its partners. The free trade area, too, has still to decide how the less developed members of OEEC, Greece, Turkey and Portugal, are to fit into its orbit. All the old problems of the common market negotiations—social harmonisation, France's special subsidies and the whole question of concerting national economic policies—will have to be thrashed out once again.

Lords Reformers

HOUSE OF LORDS reform cannot, and should not, be expected to take a high place in the new Government's agenda; but as a white paper, setting out a provisional plan, is expected in the spring or summer, some other Ministers besides Lord Salisbury should be giving the problem some thought. An interesting reform scheme has just been proffered in a Fabian pamphlet by Mr Anthony Wedgwood Benn, a young Labour MP who—as the eldest son of a peer—is under threat of being banished to the Lords himself. He suggests that the House of Lords should be kept only for ceremonial purposes, and that the Privy Council should be turned into the legislative second chamber. This would exchange for an unwieldy and unrepresentative body of nearly 900, one of only 200 with a much fairer party balance and a more distinguished membership. (The full strength of the Privy Council is about 280, but some 80 are MPs and so would not be eligible for the new second chamber.) The big disadvantage of the proposal, however, is that such a House would be heavily weighted with ex-Ministers. Most reformers feel that the second chamber needs to recruit more, not fewer, people who have come in from ordinary life instead of up from the House of Commons.

★

Mr Benn's scheme is not therefore really a very good one. But it contains a hint for the Government. Lord Salisbury, it is reliably believed, wants to introduce a block of life peers but to retain a large slice of hereditary peers, elected by the present House. The difficulties before this proposal are obvious. One cynical objection is that if peers are to be paid sessional allowances under the new scheme—and to attract Labour life peers they will have to be—backwoodsmen coming up from the country for a theatre in town will presumably be able to sign in at the House and draw £3 a day to finance their excursion. But the biggest difficulty is that the Labour party is unlikely to co-operate in any reform that does not give it some real prospect of a second chamber not permanently Tory. Cannot Lord Salisbury mould his proposals in a way that would proffer it this prospect, in return for a tacit understanding that Labour should then drop its obsession about the Upper House's powers? Mr Benn suggests that the delaying power should be cut from twelve months to three, but a second chamber which could be relied upon to give sensible judgments should be allowed to make the first chamber occasionally think again for a year.

Czechs in Moscow

THE Czech Communists have won the unenviable reputation of being the good boys of the Soviet block; they have disseminated all the approved ideas about the Hungarian revolt; their attitude to the Jugoslavs is disapproving. They have now received some reward for their services. A large delegation has been received in Moscow as—in the words of their President, Mr Zapotocky—"friends, brothers and equals"; their Russian hosts made a great fuss of them; and they have returned home apparently well pleased. They have put the best possible face on their promise to go on supplying uranium to the Russians. They themselves have been promised some additional economic help; the Czech economy is not in such a mess as those of other satellites, but it has not escaped the effects of last year's changes and upheavals in Poland and Hungary. The Czechs have also agreed to strengthen the Warsaw Treaty. What this involves is not yet clear, but it may mean much: no Soviet troops have been stationed on Czechoslovak soil yet.

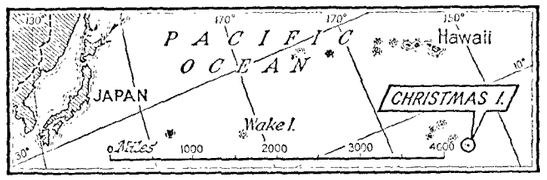
Two joint statements—one by the two governments, the other by the two parties—were issued at the end of the visit. Both contained indications of the ways in which the Russians propose to repair the ravages that the Poles and the Hungarians have wrought on the economic and political solidarity of the "socialist camp." Plans for the close co-ordination of national economies under the auspices of the Comecon have so far been made principally at the inter-satellite level. The Russians now apparently intend to strengthen the economic links that radiate from Moscow; plans are to be drawn up for close co-operation between individual Russian and Czech industries. In this way, the Russians may hope to limit the disruptive economic consequences of any further outbreaks of political trouble in Eastern Europe. Politically, the strong emphasis on bilateral contacts between the Czech and Soviet Communist parties suggests that Moscow is feeling its way very cautiously with the rumoured plans for setting up a new Communist organisation on the lines of the Cominform. The Poles are probably a major stumbling-block. If they came in, unwillingly, they might prove an uncomfortable disruptive influence. But if they defiantly stayed outside, the disunity of the block would be glaringly exposed.

Algeria Reaches Uno

ALGERIA has finally found its way to the political committee of the United Nations Assembly. The French, while still questioning Uno's competence, did not walk out this time—at least, not at the start. M. Pineau, their foreign minister, claimed that his government joined in the debate merely to show good will and to confound its critics. In a marathon speech he emphasised French achievements and plans; he also revived the old bogeys of foreign intervention and communist infiltration to explain why the Algerian revolt is still alive after two years. For once the French did an excellent public relations job, and efforts are still being made to reach a compromise resolution, innocuous

enough for them to be able to accept it. They are also in a strong legal position in arguing that this is a matter of domestic jurisdiction.

To ease the national conscience, the French press is busily proclaiming that "Arab slave-owners" and "the executioners from Budapest" are now trying to sit in judgment on their country. The United Nations would never pass any judgments if the moral credentials of its members were to be investigated in each case. Nor can a legal fiction camouflage the reality of a situation. Last week brought another proof that Algeria is a very peculiar "part of France." A one-week strike called by the National Front of Liberation was obeyed first by the bulk and then by a dwindling proportion of Moslems in Algeria. But would a French Socialist premier have dared to send soldiers to break open shops if the strike had taken place between the Mediterranean and the Channel?



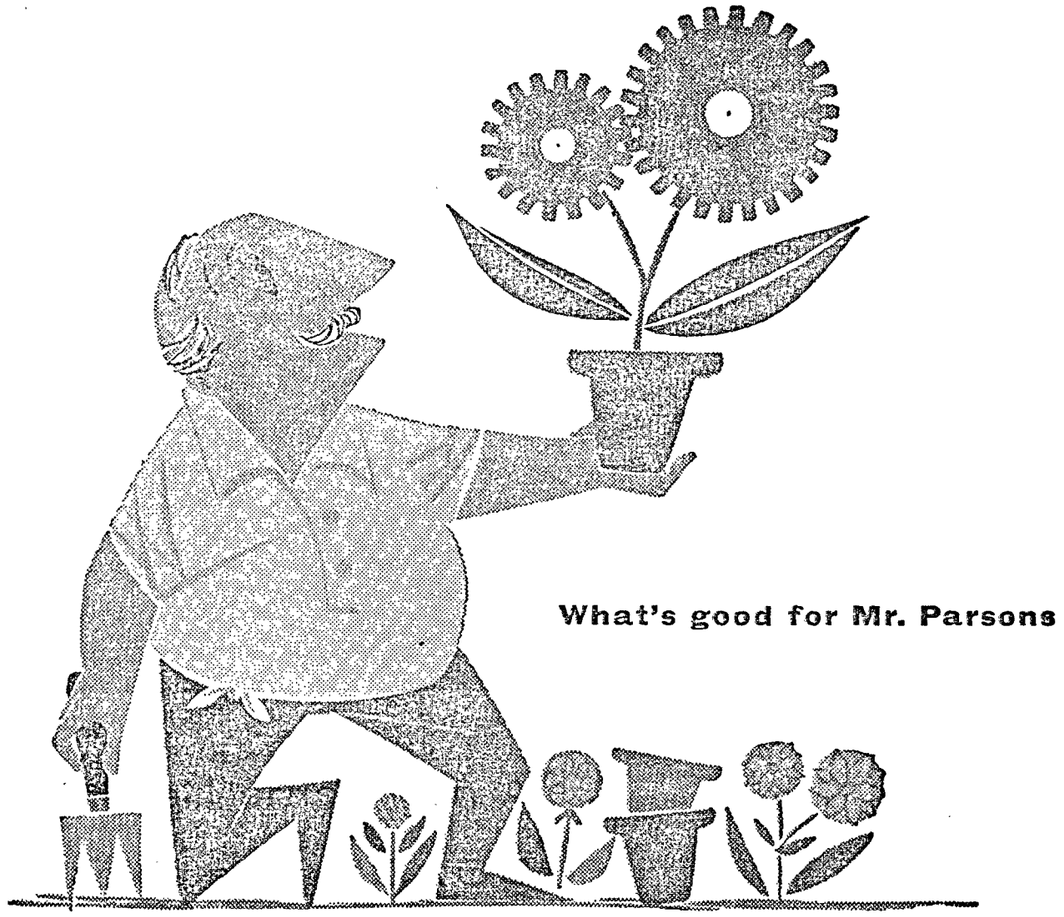
★

Algeria will not become more French by any incantation of legal formulæ. France can always get away with it in the United Nations; even if a hostile motion musters two-thirds of the votes in the General Assembly, M. Pineau can always wield the argument of Uno's legal "incompetence." But the revolt itself will not respect that argument. France needs to find a solution because half a million of its soldiers are now in Algeria, because the war is costly and seemingly hopeless, and because its continuation threatens French prospects, not only in North Africa, but also in other overseas territories. True, France has shown that it can live for a long time with a painful external disease, but is it always necessary to wait until the operation has to be performed without anæsthetics? It seems that a peaceful solution must involve the promise of some form of independence to Algerians at the end of the road.

Japanese Nightmares

THE Japanese request that Britain should suspend its hydrogen bomb test, which is due to take place near Christmas Island next summer, is prompted more by pressure from the electorate than by any alarm which the Japanese government itself feels. Understandably, the Japanese are sensitive on the subject of atomic explosions, particularly since the American test at Bikini in 1954, when the radio-active ashes of an island, which was unexpectedly destroyed by the bomb, were carried beyond the official danger zone and eventually killed part of the crew of a fishing boat. This accident gave a focus for popular indignation, but most Japanese were more alarmed by the mild radio-activity found in fish caught soon afterwards. In most of the fish the quantity was far too small to do any harm but there was naturally a general scare; housewives rushed to buy geiger-counters; about a million pounds of fish were declared unsaleable and had to be destroyed.

The present test should not produce nearly such alarming results; the bomb is to be exploded a mile and a half up, and so should suck up very little dust; the prohibited danger zone is large and now that much more is known about the effects of the bomb an accident is most unlikely. There seems to be no reason why Japan should be more affected than any other Pacific country by the drift of radio-active dust. (Russian explosions in central Asia constitute a greater threat; they, too, have been the subject of government protests.) Japanese fishermen have most to complain about. In their contention, Christmas Island



is one of the best tuna fishing grounds, and the test will cost them about £2.7 million. They will probably lose more if the Japanese public allows itself to be stampeded into a fresh scare and refuses to buy fish after the bomb has been exploded. A serious and exact examination of the risks is likely to be of more use in limiting the effects of the explosion than an almost hopeless request for a suspension; but the Japanese government had to make the gesture.

The Feet of the Young Men

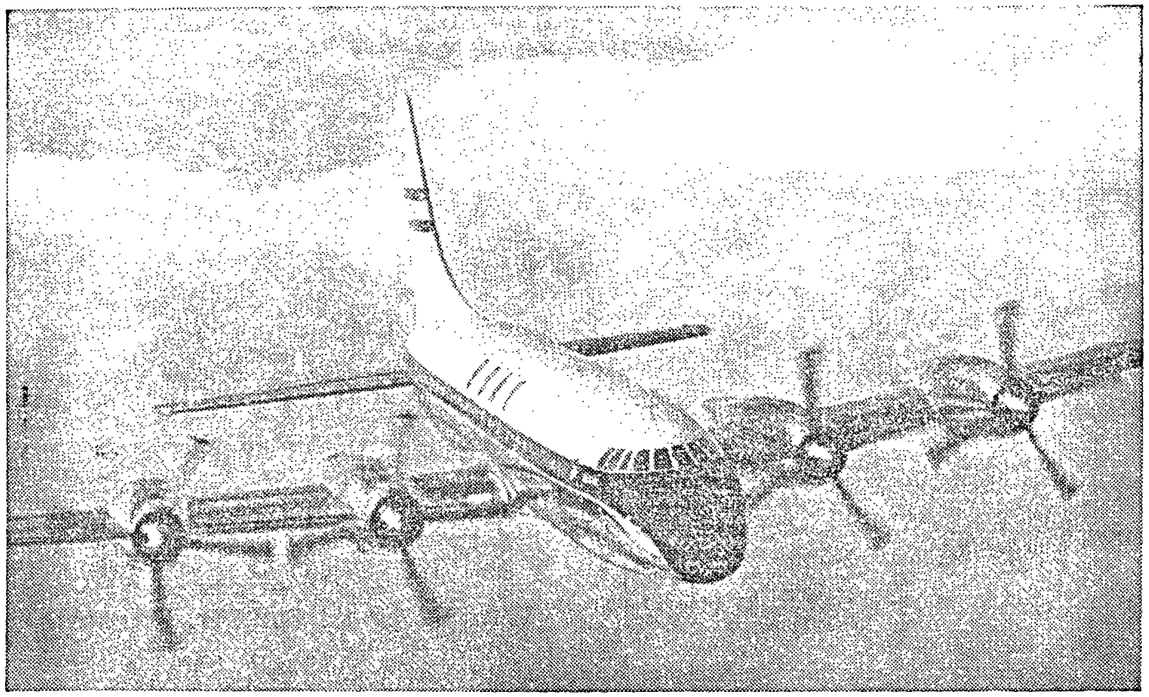
ARE the pick of Britain's young people really being driven overseas by lack of outlets for their legitimate ambitions, and all the other things middle-class people write to *The Times* about? Two recent polls have been prayed in aid of this thesis. On Tuesday the *News Chronicle* Gallup poll revealed that the extraordinary proportion of 41 per cent of the population of this country said that they would like to emigrate if free to do so; this was back to the previous high-water mark of 42 per cent in the austerity days of March, 1948, and it compared with only 28 per cent in December, 1955. It is a very revealing index of the tendency to grizzle since living standards stopped rising, but—in view of the form in which the question was put—is it really much more?

The second and more interesting poll was published in the Cambridge undergraduate magazine *Varsity*: 5,183 men and 420 women—the entire second and third year student body of the university—were asked the much more definite questions, "Have you decided to emigrate when you have graduated?" and "If not, have you considered doing so?" Only 6 per cent of the men and 10 per cent of the women bothered to answer these leading questions; of these respondents, 11.3 per cent of the men and 34.1 per cent of the women had decided to leave, and 27.6 per cent of the men and 14.9 per cent of the women were considering doing so. A little arithmetic discloses—on the rather presumptive, but not wholly unreasonable, assumption that failure to answer would generally be equivalent, in this instance, to a "No"—that the serious prospective emigrants total 54 out of 5,603 persons, with some three times that number "considering" the possibility. The proportion is higher, certainly, than that of emigrants in general to total population; so if all these intentions were carried out they would constitute something of a selective drain. It should not simply be scoffed at. But the contrast with the

What's good for Mr. Parsons

. . . is good for expanding industry

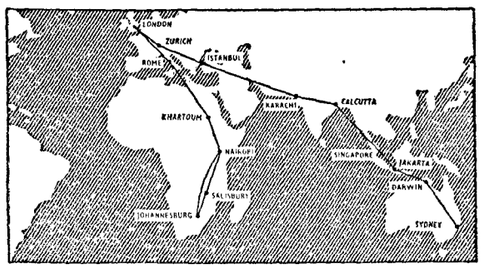
Now that he has retired, Mr. Parsons has all the time in the world to tend that precious garden. And everything in the garden is lovely—thanks to a pension secured through Life Assurance.



Yet Mr. Parsons is not the only one to benefit. Money paid in premiums was invested by his Life Office, and much of it was used to provide vital development capital for British industry.

Through endowment and pension policies, and through staff pension schemes, Life Assurance is making provision for retirement incomes for an ever-increasing number of people. In many other ways, too, such as family protection, house purchase and educational policies, Life Assurance is providing an important social service.

Life Assurance



part of the British way of life

Issued by The Life Offices' Association, London. Established 1889

So quiet you can hear the fizz in your drink. The unique whispering quietness of the Britannia derives from her four Bristol Proteus turboprop engines.

Britannias are flying first on the London-Johannesburg route and will also go into service soon on the route from London to Sydney.

A new name flies into

BOAC's timetables . . .

Britannia

A new name is appearing in the timetables of BOAC. . . Britannia*. The new Bristol Britannia—the Whispering Giant—is now in service on the London-Johannesburg route.

BOAC's passengers can fly to South Africa in the largest, fastest, smoothest, quietest turboprop airliner of all.

Bristol are proud to have shared with BOAC the enterprise of pioneering the Britannia—the world's most advanced turboprop airliner.

BRISTOL AIRCRAFT LIMITED

Gallup inquiry is notable, especially as the younger respondents to Gallup are likely to have been more dissatisfied than the older. The contrast, of course, is between saying one "wants" and saying one has "decided" to emigrate. It is a large difference; but so is the difference between "deciding" and actually going—let alone staying away.

It is sad, no doubt, that the respondents' intentions to go should be mostly based on dissatisfaction, disgruntlement, and a general tendency to sell Britain short, rather than on a fine constructive Commonwealth-building idealism. But disgruntlement is nowadays a creditably modish attitude, while constructive Commonwealth-building idealism is, if not non-U, at all events decidedly non-OK. On balance, the *Varsity* survey is rather a reassuring than an alarming document.

New Corporations for Old Colonies

One can understand all the reasons why Labour and some Tory critics have protested against the Government's decisions that Colonial Development and Welfare funds will no longer be available to Ghana after its independence day next month, and that the Colonial Development Corporation will be unable to embark on any new project there. It is a pity that the Lord Chancellor, in a rather abstruse speech, appeared to base the Government's case on a merely legalistic view. There is no clear alternative to the development and welfare fund as a source of grants for emerged colonies; and, although there are several possible ways of borrowing money, none of them is as favourable as the CDC, which charges low interest, does not insist on an immediate return and provides technical advice. Moreover, the immediate sums that would be involved are much smaller than the eventual commitments. Ghana will be followed into independence by Malaya this year, and probably by Central Africa, Nigeria and the Caribbean Federation within the next five years. The same financial problems will recur: in some cases more acutely than in Ghana, a relatively wealthy country whose share in colonial funds has been small. In ten years, Ghana was allotted just over £4 million from development and welfare funds, and although the CDC had several projects in view, its only completed operation was on roads, and cost less than £250,000.

Nevertheless, the Government's decision was the right one. The CDC, which wants to extend its empire, is not the right instrument for financing independent countries; the need is for a separate (and small) fund which will help to tide over these new countries until they establish their own creditworthiness, not for the mixture as before. The question of development in new dominions is a general one, which could not appropriately be dealt with by way of an amendment to the independence bill. Lord Home has promised a comprehensive review in consultation with the rest of the Commonwealth and, if a case is made, amendment of the Overseas Resources Development Act. The only really justifiable criticism is that if the Commonwealth is to make some special provision for its members, it is a pity that this was not arranged before Ghana's independence, since the bill has cut off aid with an unfriendly abruptness.

Charity or Compensation?

British refugees from Egypt can now queue for relief on an official staircase; but compensation on a scale to take many of them out of the queue altogether is still denied. The Government, tardily awaking to the fact that its responsibilities do not end with the bare provision of bed and board in isolated hostels, has set up the Anglo-Egyptian Resettlement Board to take over most of the functions of the Anglo-Egyptian Aid Society, the small voluntary organisation which for the last two months has been palliating official churlishness with impromptu generosity. The Board will now give the refugees money to cover their immediate needs, and will try to find them accommodation and jobs; so far only a quarter of the 1,200 registered with the labour exchange are in work. The Society will supplement this basic charity with social and educational welfare.

The Board hopes to dispense official money without losing the warmth of a voluntary organisation. But there is not much warmth in its initial budget. For the financial year ending in April, the Government has allotted £475,000 for the refugees and of this about three-quarters is spent on the upkeep of the hostels. The Society has received only £30,000 from the remainder, and has therefore had to work largely on voluntary subscriptions; it has been spending about £2,000 a day. The unexpended £70,000 of the Government grant is to go to the Board to cover small cash payments and working expenses. Refugees are still drifting across Europe to England, but on the present estimate of 4,000, the sum works out at £17 10s. a head.

★

The grant ought to be raised; but a basic criticism of Government policy is its irresponsible attitude towards compensation. The Prime Minister made it clear on Tuesday that, at present, the Treasury has no intention of compensating either firms or individuals for capital losses or for loss of income. Instead, the claims are to be recorded in the expectation of eventual Egyptian repayment. Consequently, the many people with perfectly legitimate claims have to beg peanut charity. Many of them lost £3,000 or so in Egypt. With such a sum they would have the chance to set themselves up again or, as several hundred want to do, migrate to Australia. The Government has edged in the right direction by promising to make advances on Egyptian pensions, but this policy could be carried further. Claims on Egypt would not be prejudiced by advances to the claimants in full. And no less is due.

King Saud and Prince Abdulillah

The meeting of King Saud and Emir Abdulillah, Crown Prince of Iraq, hard on the heels of the King's meetings with President Eisenhower and Mr Dulles, could prove more important than the discussions with the State Department. The conflict between Saudi Arabia and Iraq is at the root of much trouble in the Middle East; and the support of the United States for the Baghdad Pact powers

is in conflict with the policy of Saudi Arabia, Egypt and Syria. King Saud has been reassured about the Eisenhower doctrine by which aid will be given to countries "dedicated to the fight against international communism," and among these countries Iraq must certainly be counted. If King Saud and Emir Abdulillah find themselves broadly in agreement on American policy and on resistance to international communism, Saudi Arabia's links with Syria and Egypt will be weakened. Iraq might then begin to emerge from its near-isolation in the Arab Middle East.

This would be no small triumph for American diplomacy, but there are difficulties in other directions. The United States seems unwilling to pay the rent demanded by King Saud for the American base at Dhahran or to meet in full his request for military equipment. Nor could Mr Dulles influence Britain to make the concessions regarding Bureimi and the Trucial coast in general that King Saud would like to see. If, after prolonging his stay in Washington, King Saud leaves dissatisfied, he may well find himself less inclined to accept the Eisenhower doctrine than he appears to be at the moment.

Agreeable Talks in Amman

THE Prime Minister of Jordan said on Monday at the opening of the negotiations in Amman that the termination of the Anglo-Jordanian Treaty would herald a new era of friendly relations with Britain. Certainly the discussions need not take long. Britain wants "the minimum of delay"—as the British Ambassador put it—in getting rid of a treaty which costs the British taxpayer more than £10 million a year, contains an embarrassing commitment to defend Jordan against Israel (or any other nation), and provokes the hate of a large part of the Jordanian people. The new era would be welcome. Jordan, for its part, wants to be free of British ties and has the promise of annual subsidies from Egypt, Syria and Saudi Arabia.

In giving up its three military bases in Jordan, the British Government desires to take away the stores and movable installations worth altogether about £12 million. It wishes those installations that remain to be bought by Jordan—which, lacking the means to pay for them, would have to buy on credit. Britain has the right under the treaty to sell the stores and installations or to take them away, but they may be the most difficult subject to deal with in the discussions; there are some that Jordan will be unwilling to see go.

The development loans to Jordan do not come into these talks, but the payment of just over £10 million for defence, and to supplement the budget, would end automatically with the treaty. The loans may continue, at least until such current projects as the Aqaba road are completed; but the House of Commons will want to see the friendliness of the new era before going further.

Lewisham North

Our special correspondent visited Lewisham North to report on the crucial by-election there next Thursday:

THE constituency which has suddenly become the centre of the national political battle is mainly a London dormitory area, but not a particularly wealthy one. It contains large and increasing numbers of council houses (because they are increasing, Labour is furious at the "Tory trick" which has called the election for the day before this year's register comes into force), many houses built on land whose 99-year leaseholds are coming to an end, and a considerable number that will be affected by the Rents Bill. It has not much industry, but a number of industrial workers live there, and it also contains part of the professional Blackheath district. The forces in the constituency are summed up in the fact that Lewisham South (Lab. majority 6,343) is represented by Mr Herbert Morrison, and Lewisham West (Con. majority 4,325) by Mr Henry Price of the Middle Class Alliance. Lewisham North (Con. majority 3,236) lies between. It would require a swing of just under 4 per cent for Labour to win it in a straight fight; this is not going to be a straight fight (there is an Independent Loyalist candidate who must draw off some votes from the Tory), and the swing to Labour in recent by-elections has been over 5 per cent. The question whether disgruntled Tories really will abstain in an election where their demonstration would lose the Government a seat is therefore about to be put to the test. Nationally and arithmetically, this would be just about the final seat that Labour could expect to capture from the Tories in a general election where it was going to win a majority of precisely 60 in the House.

Mr MacDermot, the Labour candidate, is a barrister and an intellectual: a meeting of his on Tuesday, addressed by himself and Mr Anthony Wedgwood Benn, certainly had terrific moral tone. The candidate's enthusiasm became apparent when he spoke of "the complexity of the modern world" and of the need to strengthen the United Nations, but (surprisingly and commendably) he seemed less eager to stir up wrath against the Rents Bill, where his easiest field must lie. His performance was capable and downright rather than fiery, with heavy emphasis on the rising cost of living: he may win the respect rather than the affection of his working-class supporters, but his appeal could be strong to some more prosperous voters. He lays emphasis on the need for leasehold reform and on the provisions for individual home-ownership in Labour's "Homes for the Future."

★

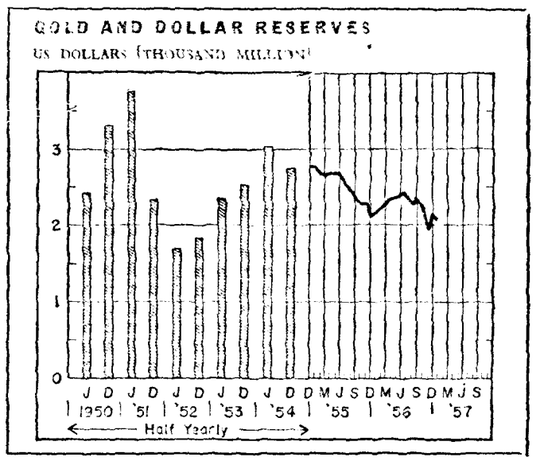
Mr Farmer, the Conservative candidate, bluntly considers his feet to be more firmly on the ground than his opponent's: he declares himself no politician but a business-man, a local council-school boy who has worked himself up. He is a governor of local schools and a London County Councillor: the lorries of his family business are a familiar sight in Lewisham. His party staff are determined that rents are not the prime issue in the election, but will not substitute any other issue: their tactic seems to be a reaffirmation of the splendidness of everything Tory, especially Mr Farmer, and of the frightfulness of most things Labour, especially Dr Summerskill. The candidate claims to be converting the doubtful "at the rate of three to one"; at a meeting of his it was sociologically pleasing to find a man in the front row with a genuine big cigar, and a crowd farther back who had come to have a nice heckle. The first supporting speaker and the candidate had a rough time: they were followed by Mr Enoch Powell, Financial Secretary to the Treasury, who was to explain the advantages to everyone of the Rents Bill. Confronted with an audience of hostile tenants, he relegated the bill to question time, and adopted the Lord Chancellor's tactic of making a speech so dull that it sent even the jolly hecklers to sleep. When questioned on rents he began firmly: "As the bill stands *at the moment*," and wriggled adroitly clear. Mr Farmer may gain votes through being a local man and firmly entrenched in the middle-class of the constituency; he seems unlikely to gain them by force of persuasion.

★

"Greene lights the way to British Independence, free from the shackles of Dollar Dictatorship" is one of the less snappy slogans of the third candidate, Miss Leslie Greene, who is backed by the League of Empire Loyalists. Her assets are an agent with a splendid beard, considerable cheerfulness and energy, and a neat tongue with a phrase: when asked whether her anti-Americanism led her to find common ground with the Bevanites, she said that such ground would be a treacherous bog. Her disadvantages are those resulting from a passionate belief in principles and a total lack of policy. She likes Australians, Canadians and white South Africans. She does not like Americans, Indians, West Indian immigrants or any British political party. She does not think she will lose her deposit. Will her intervention lose the Government the by-election? Labour is quietly confident that it will.

Ireland to the Polls

OUR Correspondent in Dublin writes: Mr Costello has decided to take the initiative. The Dail will be dissolved on Tuesday next; polling will be on March 5th and the new Dail will meet on March 20th. It will be the sixteenth since the General Election of 1918; as only five administrations have held office since 1922, the Irish democracy obviously has a habit of changing its parliamentary representatives more frequently than its governments. It remains to be seen if the coming election will bring a further change. Although the tide has hitherto been strongly against the present government parties, they may gain from the general anger that a dissolution has been forced at a time when economic policies have still to be reshaped. It is recognised that Mr Costello's decision was inevitable, but Mr MacBride will get little thanks for making it so. Mr De Valera, who is the potential beneficiary, might well prefer to have waited longer.



The principal point of interest will be the showing of *Sinn Fein*, the political front of the border raiders. They have stated that if they win a majority, they will set up a parliament for all-Ireland, thus repeating the gambit of the first Dail; indeed, Sinn Fein do not accept the legality of anything that has happened in Ireland since 1922. It is not expected that this long-preserved virginity will attract the electors; it is thought that Sinn Fein may win only a couple of seats or so, probably at the expense of Mr MacBride and his associates. This might amend first thoughts about the inappositeness of the election from the point of view of Anglo-Irish relations: it could be an actual advantage that the real extent of support for Sinn Fein should be shown.

Britain and European Trade

THE issue of a white paper on the free trade area offers welcome assurance that the Government is determined to push on with it. The OEEC report on the scheme makes clear that it can be made to work. The way seems clear for a firm political decision, when the OEEC council meets next week, to draft a treaty or convention. The OEEC report, summarised on page 454, shows that there are big problems to be tackled before it can be completed; but, given a political will, it seems fair to hope that a treaty draft can be completed by the end of the year and put into practice in 1958.

The common market treaty, however, which originally inspired the whole free trade project, is still hanging fire. An article on page 484 describes the objections which have burst out into the open in Holland at the eleventh hour, as the public has become aware how much the common market has been modified to satisfy the French. The Dutch are not likely to torpedo it at this stage, but their rearguard action, together with the last-minute struggle over the French overseas territories, is consuming precious time. M. Spaak's target date for the signature of the treaties, first put at mid-January, then at mid-February, then at the end of the month, has now been postponed once more to March 10th. These delays are disquieting, for the political conjuncture so favourable to ratification of the treaties, with Dr Adenauer in power in Germany and M. Mollet in France, may not last long. Already there are ominous suggestions from France that to deal with the growing payments crisis measures are being hatched which sharply conflict with the whole spirit of the common market.

If the common market were to fail at the last minute, the free trade scheme can and should go forward anyway. Many people in the common market countries, particularly in Germany and Holland, would actually prefer this. But a collapse of the common market project, like the collapse of EDC, would deal a bitter political blow at the whole movement towards greater European unity. In Britain, in France, in Germany, its advocates would be, like Sisyphus, back at the start of a cruel uphill task.

Letters to the Editor

Safety in the Crowded Air

SIR—Your very interesting article on air safety (January 19th) focuses attention on many problems of air transport that are not confined to the Atlantic area. It is on the internal routes of the United Kingdom that some of the greatest collision risks exist.

The aim of en-route air traffic control is the separation by a safe margin of each aircraft from all others: this separation to be vertical, lateral or both. Clearly the first requirement is that the controllers have all the facts, and to this end a coast-to-coast radar coverage is planned in the United States at a cost of $9 million. Canada is to spend $5 million on a similar plan. In Britain no such schemes have been announced, and only the South-east and North-west of England boast extensive radar cover. Many miles of airways, let alone the flight information regions (the "free air" between the airways), are outside the radar ken of the controller. In addition, height can only be checked by the pilot, whose technically inadequate altimeter is the sole criterion, since height-finding ground radars are seldom used.

Once the controllers can see the traffic picture, the next requirement is that they should be in a position to exercise control. In Britain the difficulty is a fundamental one: civil and military movements are not subject to a unified control. A certain amount of co-operation exists between these two users of the air, but until control of all aircraft is integrated, the solution of the "near-miss" problem must be the pursuit of a will-o'-the-wisp. It is not by chance that cases of near-collision in the air constantly show one participant to be civil and the other military. The sky is not divided: control of aircraft cannot be divided either.

If the facts are to be fully presented on the ground, the same is required in the air. The British Air Line Pilots' Association has recently drawn attention to the need for more accurate altimeters. The "plan-view" picture is happier, where aircraft are equipped (as many now are), with the Decca Flight Log, which gives the pilot a constant pictorial display of his position.

Your article rightly mentioned the importance of fatigue as a factor influencing the efficiency of ground controllers. Exactly the same factors affect aircrew, for a mistake by controller or by pilot can cause the same disaster. And let us note that fatigue can be caused not only by working hours that are too long, but also by working short periods at high intensity with too small a staff. Lorry drivers are the subject of more safeguarding legislation than are passenger-carrying airline pilots.

At this point it may be asked whether a cockpit full of radio and electronic "black boxes" cannot be manned by fewer pilots, since so much of their work is now done by machinery. Unfortunately the answer is No, since all these aids to navigation (Decca most of all) require constant monitoring by the crew if action based on incorrect data is to be avoided. It may be suspected therefore that the operation of some medium-sized aircraft with a crew of two (and to a greater extent the operation of certain smaller airliners with a crew of only one) cannot contribute to air safety, no matter how many automatic navigation aids are carried. Enough pairs of eyes, moreover, as well as better visibility from the cockpit, would enable the crew to keep a far better "look-out" in clear weather.

A further aid is a collision-warning device in the cockpit to warn of the proximity of other aircraft.—Yours faithfully,

R. A. TWOMEY
Cambrian Airways

The Stoker's Dilemma

SIR—It must indeed be a hard fate for anyone with the literary pretensions of the correspondent, who wrote on "The Stoker's Dilemma" in your February 2nd issue, to be incarcerated, as one imagines he is, in a hospital secretary's office. How nice to escape from all those doctors, preoccupied with the sordid facts of life and death, from the even more mundane routine of hospital meals or fuel supplies, and let one's imagination really run riot with the Ministry of Health's pamphlet on the training of stokers.

Government pamphlets are fair game, but the Ministry should have no difficulty in standing by this one—if they *can identify it beneath your correspondent's* elaborations. Had he been interested in the facts, he could have discovered from the City and Guilds of London Institute that over 1,400 "Sams" took the examination for the Boiler Operators' Certificate last summer, and 80 per cent were successful. One hundred and eighteen of the candidates, by the way, were employed by the hospital boards in Scotland. Like many another would-be comic, your correspondent has only succeeded in making himself ridiculous.

What is objectionable about the article is the implication that because stoker Sam sits in his kitchen and not his parlour, does not read *The Economist* and has a daughter by the name of Eth, he is neither capable of nor interested in learning how to do his job better. In fact, the interest and enthusiasm shown in groups, similar to those which the Ministry of Health now proposes, is quite remarkable. I am sorry that *The Economist* should lend support to any suggestion that there is a level in industry, or the public service, below which self-improvement is not to be encouraged.—Yours faithfully,

ANGUS MACFARLANE
National Industrial Fuel Efficiency Service, London, W.1

★

SIR—As an active lay trade unionist I have knowledge of recent interest shown by members who are stokers (I am not) by requesting from their union officer details of courses proposed locally; and I am aware of special meetings of stoker members being arranged to give full details of the schemes. There may not be in our industries the training courses demanded by modern methods, and it has never been easy to secure full support for those that exist. In my view, however, the stoker schemes ought to be encouraged by such a serious paper as *The Economist*, not made fun of.—Yours faithfully,

J. DESMOND BROWN
Bristol

Suez Impact on the Sudan

SIR—The article in *The Economist* of January 19th was so generalised that some detail is necessary if a fair opinion is to be formed regarding the effect of *the situation on the March elections.*

The proposal to cut relations with Great Britain and France was brought up in Parliament by the "Azharites" in the middle of December, 1956, when the Government coalition was strong. It was defeated because the relations between the pro-Egyptian parties (Azharites and People's Democratic Party) were not at their best. Since then great changes have taken place. The defection of the PDP from the Government and its co-operation with Ismail el Azhari is again possible. Sudanese political parties have no clear-cut lines of demarcation; the wandering MP is a feature of our parliamentary life.

The Prime Minister, Sayed Abdullah Bey Khalil, who is also Secretary-General of the Umma Party, was about to convince everybody that his party's western outlook was fruitful. Then the allied forces landed in Port Said and anti-western feeling reached its climax. Thanks to Soviet aggression on Hungary, the feeling did not last long enough to force him into a competition of slogans and commitments with Ismail el Azhari. When he swings towards America (and there is reason to believe he is already doing so) he will be prompted by the necessity to avoid economic collapse rather than a desire to maintain the badly damaged friendship with Britain and France. This is now the plight of the friends of Britain in the Sudan.

But when Abdullah Bey Khalil takes this step he is not certain to get the support of the PDP who, though at present his allies, depend on Egypt for moral and other support. He therefore needs a majority without them in the coming elections. This may be possible. There is tension between the Azharites and President Nasser, who gave them financial and moral support in the last elections, and accusations of corruption and favouritism against the earlier government of Azhari are not without plausibility. On the other hand, the shrewd Azhari has represented the Umma Party as a sympathiser of the Baghdad Pact. He has been helped in this by Egyptian propaganda, to which the townspeople have been deplorably susceptible.

Britain, in her anxiety to win Azhari, completely neglected the "faith in Britain" of the non-Moslem Southerners and left them open to Egyptian temptations, to which some of the ambitious Southern politicians were pitifully susceptible. In the long run, the Liberal Party of the South (which with the Umma and the PDP forms the Government coalition) is the only hope of the Umma Party; but Britain must help the Umma by ceasing to woo Azhari and by recovering the Southerners' faith.

Soviet propaganda, referred to in the article, does not come into the open in the Sudan. The Egyptian Embassy in Khartoum has completely relieved Russia of this work.—Yours faithfully,

OMER EL ZEIN
Khartoum

The Dartford Tuppennies

SIR—In your January 14th issue you referred to the fact that when I was Postmaster-General of the United States I handled a similar situation and was able to reap a profit of a half-million dollars for the Post Office. For your information, I checked my report for that year and found that the profit on the imperforated and unglued stamps was $1,645,478.70. They were sold in the Department within a thirty-day period and the profit was net as they were sold to collectors.—Yours faithfully,

JAMES A. FARLEY
The Coca-Cola Export Corporation

Zik Goes Home

SIR—With reference to the Note in your issue of January 26th, may I point out that the Action Group in fact won the municipal elections in Lagos. We would make the further comment that the Action Group holds the view that it is unprecedented in the history of the Commonwealth that a premier should dissolve a legislature because he alone was found guilty of misconduct instead of resigning himself. The Action Group believes that the staging of the elections cannot cleanse Zik of serious charges in the Tribunal findings, as the wrong impression appears to have been created abroad that Nigeria has a lower standard of public morality than that accepted in other parts of the civilised world.—Yours faithfully,

AYOTUNDE ROSIJI,
Federal General Secretary,
Lagos, Nigeria Action Group

Books & Publications

From Desperation to Audacity

THE WAR AT SEA 1939-1945: *Volume II, The Period of Balance*
By S. W. Roskill.
Her Majesty's Stationery Office. 539 pages. 42s.

MAY one ask, courteously but firmly, that Sir Charles Webster and Mr Frankland (or those who supervise their work) should give us soon the first volume of their study of the strategic offensive waged by Bomber Command in the last war? Until they do, it will not be possible to bring to bear on the arguments of today the full lessons of yesterday; and the naval historian, in his quiet, good-tempered way, will go on raising doubts about the manner in which our expanding air strength was used in the period when we moved from desperate defensive to the audacious offensive. What, above all, will they reply to the suggestion that we nearly lost the war in the winter and spring of 1943 for lack of long-range aircraft and the neglect of Coastal Command?

One hastens to say, at this point, that Captain Roskill's manner of capping narrative with comment is quite unobjectionable. He records criticism of air strategy without ever grousing at the *Air Ministry. For example, the third* chapter of this volume, about maritime air operations in 1942, is admirably impartial. It is only when he is describing the convoy slaughter of March 1943, or the destroyer casualties of the previous year in the Mediterranean, that remonstrance breaks through.

It is generally agreed, on the strength of his first volume, that this author has distinction both of style and judgment. What are the best things in his elaborate and complex tapestry of battle at sea? For vividness, the account of Admiral Vian's conduct of the second battle of Sirte; for balanced allocation of blame and skilful merging of British and enemy sources, the analysis of the passage of *the Scharnhorst and the Gneisenau* through the Channel; for deep relief recollected in tranquillity, the chapter on the triumph of the escorts, both air and naval, in the Battle of the Atlantic between March and June 1943; for a picture of the interdependence of all arms, the chapters on the Malta convoys. *Here is the moral drawn:*

> If the Army was driven back on land and the advanced airfields were lost, the Royal Air Force could no longer cover our Malta convoys, nor could our striking forces attack the enemy's traffic to Tripoli. If Malta could not be supplied, the naval and air forces based there were bound gradually to become ineffective. If that happened, the enemy's supply route was made much safer and he could therefore reinforce the Afrika Corps quicker than we could build up the Army of the Nile. This in turn would make our condition on land more precarious. The circle was a complete one.

In the desperate battles of January-July 1942 only seven British supply ships of the thirty that tried to get to Malta survived with their cargoes; while Rommel lost 163,000 tons of supply shipping in the same period. It is difficult to believe that the spectacular North African landings came at the end of the following autumn.

These 450 pages, admirably indexed and charted, take us to the Arctic, to the Pacific with the Americans, to the Indian Ocean (where only good fortune saved us from disaster) with the Japanese, to the South Atlantic with the commerce raiders. A five-ocean war with a two-ocean navy, writes the author. In no volume of this series so far have we been given a more vivid sense of the grand strategy of an island at war, with a great power coming to its aid in the nick of time.

What, lastly, are we to think of the convoys to Russia? Admirals King and Pound agreed at one moment; "a most unsound operation." Political reasons for persisting with them are obvious, as they were for the Dieppe operation. But the strain on the Home Fleet, with all the consequences for the Mediterranean, was disproportionate; unless, of course, the cargoes made all the difference between Russian survival and defeat. *But did they?* The Russians never seriously tried to harass the U-boats that waited off the Kola inlet; nor did they give the fighter protection against the German bombers from Norway that they could have given. It is a sad story; and those who worked under Dudley Pound will remember that the political pressure to get convoy PQ 17 through must have had much to do with his conduct of the operation.

Two criticisms can be made. Captain Roskill should tell us more about changes in weapons and ships—invention played a large part in regaining initiative from the enemy. Secondly, he should tell us more about crews. How were the great casualties of the regular service being replaced? How long did it take to train an officer and a technician from civil life? It is part of his theme that human quality prevailed; we would like to know more about the human beings.

Feuilleton d'outre Tombe

MY SECRET DIARY OF THE DREYFUS CASE 1894-1899.
By Maurice Paléologue.
Secker and Warburg. 230 pages. 21s.

IT was not for nothing that M. Paléologue admired Chateaubriand. As a young and junior official of the Quai d'Orsay he had dealt with the Dreyfus case; in his old age he sold to his publishers what he described as a lightly touched-up version of his diary of the time, to be published four years after his death; and he added the valuable assurance that he had destroyed all the documents on which his manuscript had been based. The result is a most entertaining book which inspires no belief. M. Paléologue emerges from the modest niche which he occupies in most histories of the Affair to a central position of the greatest influence. With his accustomed sense of drama, he unfolds an Ouida-like version of the tale, seasoned with *l'amour, le hig-lif* and other such gaieties, and weighted by substantial doses of foresight, hindsight and anything but insight. He adds (without evidence to speak of) a couple of extra culprits beside Esterhazy; but he has little except gossip to add to the known story.

The book is wholly absurd. But this does not mean that it is insignificant or unreadable. It is significant as an example of the most froth-brained attitude that could be held by an honest Frenchman who, hampered by a typically Gallic lack of logic, nevertheless sought for the truth and succeeded in changing his opinion about Dreyfus's guilt. Most of all it is significant as showing the utter disregard for the processes of law of a Frenchman whose training ought to have taught him better, and who was not blinded by passion. His account of how he tried to influence the members of the Rennes court-martial would be scarifying if it were believed. After a talk with Lord Russell of Killowen, he says, with great truth: "I could thus judge the extent to which the French mind, which is so open to the sense of justice, is closed to the notion of law."

Finally, though shallow-minded, the book is well constructed and very readable. It may tempt new readers towards more serious versions of one of the world's most enthralling stories.

Intelligence in Action

THE LION AND THE HONEYCOMB.
By R. P. Blackmur.
Methuen. 317 pages. 25s.

OF all that brilliant school of literary critics at work in the United States during the past three decades, Mr Blackmur is perhaps the finest. "Perhaps," because some of his major works—studies of Henry Adams and of Dostoevsky—are, as yet, unpublished. Thus the full range of his perceptions, of his subtle and tenacious insight, are known only to his immediate students. Often, a reader of the essays in this fascinating collection will have the impression of viewing fragments of a more explicit vision, of hearing on a piano parts of a score whose orchestration exists but is concealed. There are words and phrases which are, for Mr Blackmur and those who know the totality of his work, charged with a peculiar density of meaning and resonance. Used in these essays they add a touch of mystery to a style already resistant; but, as in Coleridge, it is a touch that excites the mind and compels it to better work. And that is the gift of a great critic.

Mr Blackmur ranges widely. Unlike some of the other "new critics," who tend to concentrate their scrutiny on a small number of seventeenth-century and contemporary writers, he extends his sensibility far outside the canon, to Plato and Racine, to the Russian novelists and T. E. Lawrence. Mr Blackmur is at his finest in that complex area where religious experience and systematic morality shade over into orders of feeling more traditionally associated with literature. In what is probably the best essay written on Mr Eliot's critical standards and methods, Mr Blackmur quotes the following sentence: "To judge a work of art by artistic or by religious standards, to judge a religion by religious or artistic standards should come in the end to the same thing. . . ." That says much about the quality of his own ideals.

With Coleridge and Baudelaire, Mr Blackmur shares a gift for the illuminating phrase, for the flash of imagery in which scholarship and criticism coalesce. He writes of T. E. Lawrence: "He walked always with pebbles in his boots." He says, "Montaigne descended all the stairs of doubt (an action which is one of the great poems of the mind) because he loved life herself so much." Or of I. A. Richards: he "read Coleridge in the early 'thirties; it was love in ambush. . . ." And, always, Mr Blackmur relates the specific apprehension, the act of literary judgment, to the wider ordering of humane values. His entire work is a plea for the kind of awareness in which the moral, rhetorical and imaginative proclivities of the mind are fully engaged.

For this is more than a book of essays on Dante and T. S. Eliot and Henry James and T. E. Lawrence and the poetics of Yeats. It is written "in the hope of straightening things out." It is a protest against the "new illiteracy" of those who know how to read slogans and trash, but who have forgotten how to read words. There is a dark strain in Mr Blackmur's thought: he looks at the world "with terrified sympathy, like the horror of being about to fall." He is seeking to enrich and heighten the individual intelligence so that the work of art, in which much of our small progress of understanding is stored, may be experienced and understood. "Some people call the mode of this intelligence in action criticism. It had better be called the charity of compassionate understanding."

"The Lion and the Honeycomb" cannot be read quickly. Most of the essays call for sustained tension of thought and in a few, such as the one on Dante's letter to Can Grande, the difficulties of Mr Blackmur's method and the hint of preciosity in his language tend to obscure the subject. But that is rarely the case. This is an extraordinarily exciting and important book, and here too there are "poems of the mind."

Those Damned Frigates

THE NAVAL WAR OF 1812.
By C. S. Forester.
Michael Joseph. 261 pages. 21s.

"THOSE damned frigates," as the Duke of Wellington called them, play a much more important part in American than in British history. A story, which was going the rounds towards the end of the last war, illustrates the ignorance of the average Englishman about the war that founded the American Navy but which, to English eyes, is a minor episode compared with the epic struggle against Napoleon. "Don't you realise that you burnt Washington?" complained an American to his English colleague. "Good God, did we? I know that we burnt Joan of Arc."

There can be no excuse for such ignorance after the publication of Mr Forester's book. When a popular novelist turns to writing straight history some eyebrows may be lifted, though not by those who have long admired the accuracy of detail in the Hornblower series. Nevertheless Mr Forester remains, as might be expected, more interested in men and tactics than in the legal quibbles and constructional statistics which were so important in 1812. On the vexed question of impressment he does not, for example, throw any new light on the contemporary rumour that most of the petty officers in American ships were deserters from the Royal Navy. Although he rightly calls the naval constructor Joshua Humphreys the real architect of victory in the famous frigate actions at the start of the war because he built what we should call pocket-battleships and called them frigates, he is reluctant to give comparative gunnery details. No authorities are quoted, nor does he seem to be aware of recent publications describing American activities in European waters. He describes the war from the American point of view, though he is remarkably fair to the other side with the single exception of Broke, whom he unwarrantably charges with bad taste. As might be expected of a narrative writer of his eminence, the tactical details of the various actions are admirably described, but one still has to go to Mahan to realise what a disastrous effect the numerical superiority of the British had on the American economy, once the Admiralty had been shaken out of a complacency bred of too many victories over European opponents.

The peace treaty settled none of the problems which caused this unnecessary and inconclusive war, but two important

results did emerge. One was a marked improvement in British gunnery, and the other was Mr Madison's reluctant admission that a navy, far from creating the tyrannical aristocratic caste he had feared, was essential for the United States. It is for this reason that the ensigns of the captured British frigates are today displayed with pride at Annapolis.

Puritan Legacy

THE PURITAN TRADITION IN ENGLISH LIFE.
By John Marlowe.
The Cresset Press. 148 pages. 16s.

THE part played by Puritanism in the making of modern English society has been an important one, but historians have never been in complete agreement about it. This latest essay, neatly written and very tidily arranged, demonstrates the strength and weakness of historical generalisation. It has a thesis: that the achievements and limitations of Victorian middle-class England derive from the theological theories and religious opinions of the sixteenth- and seventeenth-century Puritans. The eighteenth century was a sort of interlude when Puritanism went underground: the twentieth century is a period of decline, though not necessarily of fall. "There may be another harrowing and Puritanism may once more seep upwards through English society."

Prophecies apart, this compact thesis is weak in both terminology and logic. No attempt is made until the last chapter to relate Puritanism to Protestantism in general; no relevant comparisons are made with other countries (Scotland, for instance, or Puritan New England) to separate out wheat and chaff, cause and coincidence, in English social history; internal transformations within the various English Protestant sects are very sketchily handled; and terms like "state," freely applied when referring to other formal categories like "medieval" and "modern" collectivism, need much more careful handling than the author offers. Finally, many particular generalisations, which seem to be based on a shelf-full of respectable secondary authorities, can be challenged: for instance, a view of the nineteenth century which focuses attention on "the apogee of the propertied middle class between the passing of the Reform Bill in 1832 and the passing of the second Reform Bill in 1878" [*sic*]; and even the lock, stock, and barrel acceptance of the familiar but by now much-qualified thesis that hard work and business initiative were products of Puritanism.

It is also very disputable whether the public schools owed much to Puritanism—Thomas Arnold's religion can only be related to Puritanism by a much more subtle argument than Mr Marlowe sets out—or whether Mr Gladstone can be confidently pigeonholed as a great Puritan. Indeed, an interpretation of mid-Victorian England which seems to depend on an assumption that "we're all Puritans now" is one of the weakest sections of this book. A careful study of Matthew Arnold's writings and a comparison of his arguments with those of his father would do more to illuminate this tangled subject than a hundred pages of broad generalisation, for the Victorians, Puritan or not, knew far more about Puritanism than we do. They saw its achievement and its limitations at a time when the "key of prison house" was still locked. Mr Marlowe has done well to open locked doors again, but his essay, for all its assurance, is far from a safe guide to the intricate passages within the house.

Byronic Mystery

LORD BYRON'S MARRIAGE.
By G. Wilson Knight.
Routledge and Kegan Paul. 313 pages. 30s.

AN immense admiration for Byron's genius, already expressed in his book "Lord Byron: Christian Virtues," is the motive that has impelled Professor Wilson Knight to investigate the episode that resulted in Byron's social ostracism and his sinister reputation—the breakdown of his marriage. He brings to the problem a scholar's mind and an imaginative critical method in the weighing of evidence. He has succeeded in providing an extremely plausible thesis, based upon Byron's homosexual inclinations, to account for the sudden change in Lady Byron's attitude to her husband after a year and more of marriage, and for her subsequent campaign of defamation that culminated in the destruction of the poet's Memoirs. Mr Knight proves that the scandal of incest was a smoke-screen raised and fanned by Lady Byron after the rupture of the marriage in order to obscure the real issue, which she wished to conceal at all costs, since it might have involved revelations shaming to herself as well as to Byron.

The clue to the mystery Mr Knight finds in the Don Leon poems, which other critics have ignored as mere obscene libel. He attributes their authorship to George Colman, an accomplished playwright and versifier, and a notorious homosexual, with whom Byron was on friendly terms. These poems seem to have aroused in Mr Knight the same sensations as Chapman's Homer did in Keats: "a new planet," he says, "swims into our ken." They are certainly written with skill and force and an abundance of indecent wit; but—important? great? Important for the purpose of evidence, yes; although we do not know for certain that Byron did discuss with Colman the details of his sexual relations with his wife. And if he did, surely he was guilty of a caddish disloyalty that is far more blamable than any sexual irregularity. This aspect of the case seems to have been overlooked by Professor Knight, who bids us forgive Lady Byron for her malice and regards Byron as the injured party. She, too, was disloyal as well as unwise if (as appears likely) she discussed her husband's sexual practices with her former governess, whose horror was a devastating shock to Annabella; but at least she had the excuse of inexperience. She presumably talked because she needed counsel; Byron, if he did confide in Colman, can only have done so from bravado.

The story is a sordid one; and though it may be necessary to probe into the separation scandal in order to get Byron's personality and genius into truer focus, one cannot help wishing that Mr Knight's immense gifts as a literary critic had been employed on worthier material.

Americans Discover Poverty

FROM THE DEPTHS: *The Discovery of Poverty in the United States.*
By Robert H. Bremner.
New York University Press. 377 pages. $5.50.

HERE is a fascinating book, likely by its grace of style and its richness of material to attract the general reader as well as the student of American social and intellectual history. But it is hard to treat the book as a definitive study, for the question then arises, a study of what? In part the book deals with the history of American social legislation (mainly since the Civil War), but not thoroughly. In larger part, the book deals with the growth of an awareness of the existence of poverty in the United States and with the attitude of Americans towards it.

This second group of themes demands to be set in the context of American political and social thought. Dr Bremner notes that "excessive individualism" was largely responsible for society's refusal to face the post-Civil War problem of urban poverty, but he does not relate this to the whole question of the limitations of the ingrained liberalism in American life. But if the wood is lost in the trees, rarely have the trees been so lovingly outlined. The transition from indiscriminate individual charity towards "scientific philanthropy" is well shown. This transition was largely the work of the settlement movements, taken from the English model of Toynbee Hall; these started as "lady bountiful" schemes to bring "a little light and culture" to the poor and to tell them to stay sober and to live frugally. But, to their own surprise, the settlement workers soon passed beyond the view of poverty as merely the sum of individual failings. Their settlements became sources of accurate knowledge about the social problem of poverty and even of deliberate research into it. But Dr Bremner is wrong to imply that "scientific philanthropy" always denoted a body of knowledge concerned with social reform. The notion of a "science of philanthropy" had its origins in the sociology of Herbert Spencer and his American followers like William Graham Sumner (and even Andrew Carnegie), who preached the folly of all conscious social reform and that only those should be helped who helped themselves. Surely it was this

Social-Darwinism, the belief that direct charity merely supported the unfit and hindered the survival of those fittest who were the guarantee of social progress, that kept American social legislation, right into the nineteen-thirties, so under-developed by European standards ?

Dr Bremner shows clearly how widely, in the "progressive era" early this century, spread the belief that the mere publication of the "facts" would lead to reform, and he criticises this limited view. But his criticism offers no alternative viewpoint itself, precisely because it has not been so much the case, in the long run, that social reform has triumphed, as that gross poverty has, indeed, vanished, with the rising national income. The book is thus at its best as a history of attitudes to poverty, not of policy about poverty. And his account of these attitudes in American art and literature is fascinating, though social history such as this must surely draw on the files of newspapers also if it is to be a history of common opinion, not just of uncommon opinion, however perceptive.

Home Thoughts on Abroad

THE CHANGING ENVIRONMENT OF INTERNATIONAL RELATIONS: *Brookings Lectures,* 1956.
By Grayson Kirk, Harrison S. Brown, Denis W. Brogan, Edward S. Mason, Harold H. Fisher and Willard L. Thorp.
The Brookings Institution, Washington, D.C. London: *Faber.* 167 pages. 18s. 6d. $2.50.

THE time has come when some American educational foundation should make an additional cash grant to organisations which have already been given the money for a series of public lectures—with the condition that these lectures are not published. Either this, or else a five-year moratorium on symposia in international relations, is badly needed.

Books like this cannot be ignored in case they contain something new. But this one does not. These were probably stimulating lectures to hear (and some grand "bull sessions" may have followed); but in print they can only serve as an introduction to American thinking about foreign policy, and there are already better introductions. Mr Grayson Kirk, the president of Columbia University, does assure us that it is not just party spleen for Mr Stevenson to try to make an issue of the Administration's "complacency" in foreign policy. He speaks about the "grim and disturbing" fact of the decline of Western influence in Asia. "Economic and technical aid are important and must be continued . . . but there is no historical evidence to show that peoples have ever been politically influenced by gratitude." This is a welcome reminder. But his argument seems to hint that what is really required is an ideology as well as guns, ball-bearings and butter. However, it could equally follow from his premises that what internationalist Americans need most to realise is that no scheme at all, of technical aid or propaganda, can guarantee gratitude. They may have to become reconciled to a world in which American subsidies will be constantly demanded, but will be constantly wasted and even used to unfriendly purposes. It is the curse of published lectures that they offer such a barrage of warnings and hopes that they tempt the unwary reader to think that the limits of manœuvre are wider than they are.

Professor Brogan is the English contributor. If he covers familiar ground to reach familiar conclusions (that countries misunderstand each other because they live differently), it is better to travel with him than to arrive with the others. This is one of his best essays, witty, sparkling, brilliantly impressionistic, a storehouse of odd information—he is almost the Dylan Thomas of political scientists. Professor Thorp offers some handy statistics of American-Asian trade; Professor Mason ably summarises American hopes for the expansion of international trade; Professor Brown threatens us with either an "Age of Darkness" or else the triumph of "science and technology"; and Professor Fisher argues with a kind of higher pragmatism that Asians will be of most use to the West if they are helped for their own sake alone and not because they can be of use.

Guide to Ireland

THE STORY OF IRELAND.
By Brian Inglis.
Faber. 270 pages. 16s.

IT is a rare pleasure to review a book about Ireland that can be recommended unreservedly. There are so many Irish issues still unresolved, some of them indeed still undefined, that the usual book about Ireland is either a wholly partisan text or achieves impartiality only by taking both sides of the road, thus lengthening the reader's journey and reducing its interest even more drastically. Mr Inglis has produced a well-written survey, on a convenient scale, which tells a coherent story. The stranger will get all the history that he needs to know. He will get an admirably balanced account of the economic problems of the country. And there is a useful concluding chapter, which reviews Ireland on both sides of the border since the Treaty.

All this is conveyed to the reader with a grace that is only too rare in books of this kind. Most books about Ireland have been written to prove or disprove some *thesis.* Heroes and villains abound; the virtue of faith is constantly invoked at the expense of charity. Mr Inglis has let us off that. This is the book for anybody who wants to know what makes up modern Ireland without plunging into the depths of historical detail.

The survey of the Irish background is made by the development of three principal themes—nationalism, land and people, culture and religion. That these are the dominant themes in Irish society no one will dispute. The extent to which they still underlie current policies and political attitudes is made clear. Possibly Mr Inglis has underestimated the pull of the Gaelic past. Modern Irish nationalism may flow from Wolfe Tone and Davis or from O'Connell, but its idiom is deeply coloured by older traditions and ways of thought. But that is a comment rather than a criticism.

When he comes to revise a further edition, Mr Inglis might possibly develop some points further for the benefit of the English visitor. The divergence between values and institutions in the two countries has grown greatly. Fifty years ago, Tom Kettle wrote that "Ireland is separated from England by the Irish Sea and the Act of Union." Today, one might substitute the second war and the general election of 1945. Mr Inglis, one hopes, will develop that point. In the meantime he has provided a first-class guide to Irish history.

Shorter Notices

IN SILENCE I SPEAK: *Cardinal Mindszenty and Hungary's "New Order."*
By George N. Shuster. *Gollancz.* 315 pages. 21s.

This is a disappointing book. The account it gives of Hungary under communist rule, and in particular of the communists' relations with the churches, does not add anything of much significance to what is already known, nor does it throw any fresh light on the struggle that has been going on in Hungary. Neither the author's laudable attempts to make clear what communism means to the individual peasant, worker, clergyman and so on, nor his more general discussions of the nature and purpose of communist rule, are particularly illuminating; perhaps his wordy and discursive style is partly to blame. The central figure in the book is Cardinal Mindszenty. There are detailed accounts, based on first-hand evidence from some of the Cardinal's associates, of his background, his career, his relations with his mother, and what details were then known of his imprisonment. Surprisingly, however, there is no account of his trial. Although, like all communist show trials, this was a travesty of justice, it does not deserve to be passed over in silence, since it had an important and significant place in the development of the communist attack on the Hungarian churches.

BUSINESS PRACTICES, TRADE POSITION, AND COMPETITION.
By Oswald Knauth.
Columbia University Press. London: *Oxford University Press.* 181 pages. 24s.

In this short book, Mr Knauth, a distinguished figure in American business, ranges over a vast territory, in which the principal recurring landmarks are the inadequacy of economic theory concerning competition and monopoly, and the shortcomings of American anti-trust policy. But the reader is hurried along too fast, and he is given too short a glimpse of each of many items. The book touches on many interesting points, though it raises few new ones.

Advertising travels first class in the international editions of LIFE. For these are the magazines where uniquely large pages and outstanding reproduction reflect the quality of your product and deliver your message with maximum impact. And it reaches your best prospects the world over—key people in business, government and the professions.

LIFE INTERNATIONAL is published in English fortnightly and circulated in 120 countries outside North America.

LIFE EN ESPAÑOL is printed in Spanish every fortnight for Latin America.

Their combined net paid circulation of over 610,000 is concentrated at upper income levels. Join other leading companies the world over who have invested more advertising linage in each of these magazines than in any other overseas edition.

INTRODUCING ONE OF THE

USI BILLION DOLLAR BOARD

JAMES BRUCE – Director, American *Airlines, Commercial Credit, Republic Steel,* National Dairy Products; U. S. Ambassador to Argentina (1947-49); Director, Mutual Defense Assistance Program (1949-50).

James Bruce is one of the members of the Board of U. S. Industries, Inc. . . . a board that is largely responsible for what amounts to an industrial miracle. Just consider: Back in 1948 the company, then known as Pressed Steel Car, was completely dependent on the frantic ups and downs of the freight car market. Today it has a new name . . . 12 booming divisions turning out products for every basic industry . . . and sales double the best of the old days. And USI doesn't make a single freight car!

Some transformation! But perhaps not so surprising when you realize that the directors have management backgrounds in chemicals, transportation, finance, precision tool manufacturing, research and government planning. So far, their wide experience has steered USI into producing aircraft landing gears, engine lathes, petroleum pumping equipment, giant metal forming presses, welded steel pipe for water, gas and oil transmission, dairy equipment, cookware, electrical fittings, steel tanks, and components and systems for jet aircraft and guided missiles. And USI is just getting started!

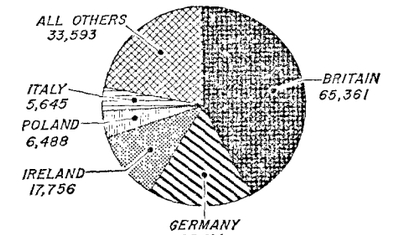
American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Keeper of the Quotas

Washington, D.C.

PRESIDENTIAL proposals for major changes in the laws governing immigration, such as those Mr Eisenhower dispatched to Congress last week, inevitably provoke, as a kind of reflex action, the comment that nothing of importance is likely to happen. The racial composition of the American population is a field which by tradition Congress feels especially competent to till. The inclination of Presidents to be more generous has usually been overridden by the legislature, which is more susceptible to the prejudices of the rural areas against the cities with their distinctive racial blocks, to the dislike of the Anglo-Saxon South and the "old immigrants" of German and Scandinavian stock in the Bible belts of the Midwest for the "new immigrants" from southern and eastern Europe, and to the anxiety of the craftsmen's unions to be protected against competition from incoming foreigners.



The largest number of people to cast themselves into the legendary American melting pot in a single year was over a million and a quarter in 1907. After 1890 Italy, Russia and the Balkans had succeeded Ireland, Germany and Scandinavia as the main source of immigration, but despite successive anti-foreign movements, of which the "know nothings" of the eighteen-fifties made the loudest noise, no important restrictive legislation was enacted before 1921. Since then exclusion, couched in the guise of discrimination, has been the reigning principle, and Ellis Island, until recently the internment centre for newcomers whose papers were not in proper order, has replaced Bedloes Island, site of the Statue of Liberty, as the symbol of America's welcome to aliens.

The present basic statute, the McCarran-Walter Act, which was passed in 1952 over Mr Truman's veto, is, like the law of 1924 of which it is a recodification, frankly racist in inspiration. It is founded on the proposition that Irishmen, Swedes and Germans are more assimilable than Italians, Greeks or Russians, and that the "liberties of the American people" can only be preserved if its "culture pattern" is stabilised. By a statistically questionable exercise the "national origins" of the American population of 1920 were computed, and immigration quotas, bearing a proportionate relationship to the existing racial structure, assigned to each foreign country. The total annual quota, fixed at one-sixth of one per cent of the total white population living in the continental United States in 1920, is approximately 155,000. By far the largest shares are reserved for Britain, Germany and Ireland. Mainly because neither the British nor the Irish are settling in the United States in anything like the numbers allowed, the average annual immigration by quota is only about 80,000, and the racial mixture, instead of favouring the north and west of Europe over the south and east by more than four to one, only does so by about five to four.

This does not by any means account for all the immigration into the United States every year, or even half of it, since there are about 155,000 non-quota immigrants, made up of refugees, spouses and children of American citizens, and inhabitants of the western hemisphere, who are not restricted by this type of legislation. Indeed, since the war, under special Acts for displaced persons and refugees, the United States has played a modest part in coping with the great forced migrations of the time. But the countries most suffering from an excess of their own population, some of them, like Italy and Greece, now bound by close ties of alliance to the United States, still have minute quotas and long waiting lists. As one member at least of the House of Representatives' Judiciary Committee recently found out to his surprise and dismay, "every Greek school child knows the figure 308," which is the annual number of Greeks which the United States finds it safe to absorb. In fact even that meagre figure is misleading, since half the Greek quota has been "mortgaged" until 2018. When Congress admitted displaced persons under a special scheme after the war, it charged off the numbers

IMMIGRATION TODAY

ANNUAL QUOTAS: Total 154,657 persons

WAITING TO COME at end of 1956

	Persons	Annual Quota
Chinese	5,240	105
Greeks	104,200	308
Italians	131,520	5,645
Germans	42,230	25,814
French.....	21,710	3,069
British.....	None	65,361

against future years, so that the "cultural pattern" should right itself in time.

No one now believes, since the frontier has disappeared, that there should be a return to unlimited immigration. Liberals, following the findings of President Truman's Commission, usually advocate the abolition of the national origins principle and a "unified annual quota" of about 250,000. The President's requests, cleaving closely to his unheeded message of last year, come remarkably near to this without requiring the complete abolition of the McCarran-Walter Act. His most striking proposals, and those least likely to succeed, call for a switch to the 1950 census, from that of thirty years before, as the basis for all calculations, which would increase the total quota by 65,000; the distribution of unused quotas to countries that need them; and the carry-over of places that have been unclaimed from one year to the next. These proposals combined would increase quota immigration from the present 80,000 a year to 220,000. In addition, by abolishing the system of mortgaged national quotas, the President would allow in possibly a further 8,000 a year. Finally he would regularise the manner in which an airlift was flown through a small loophole in the existing law to bring 18,000 Hungarian "parolees" into the country. He wants authority to bring in up to 67,000 people a year who may have to flee under comparable circumstances, with the Attorney General having the power to grant them permanent residence, subject to congressional veto of any individual.

★

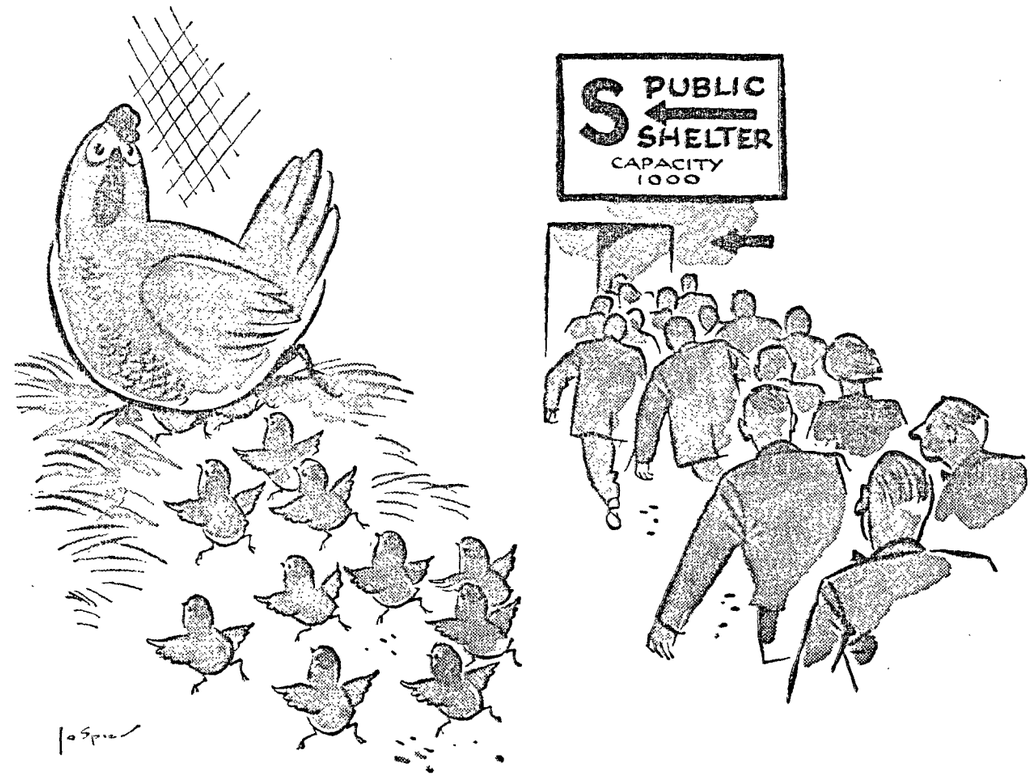
Besides these fundamental proposals, which would change the whole drift of the McCarran-Walter law, the President has repeated his endorsement of a number of minor modifications in its administration that would bring more than proportionate gains in humanity and common sense. Many refugees, for example, filled in false papers at some time or another to avoid deportation behind the Iron Curtain and this at present renders them automatically ineligible for admission. The President urges leniency in such cases and in two instances shows himself aware of the bad impression made by inflexible laws affecting temporary visitors. He asks that they should not have to be fingerprinted and that those merely passing through on their way elsewhere should not have to satisfy the full security standards. It is a pity that the President did not also cut through the undergrowth of security regulations which have forced so many scientific conferences to be held outside the United States.

People who think that this is a favourable year for legislation on aliens, since the worst of the security scare is over and something will obviously have to be done about the Hungarians, may have reckoned without Mr Francis Walter. The surviving partner of the two untypical Democrats from Pennsylvania and Nevada who sponsored the present law, Mr Walter has established an extraordinary personal ascendancy in the House of Representatives. Congressmen of both parties, even if they detest his views, respect him for his gentlemanly manner, unfailing courtesy, and encyclopedic knowledge of what is regarded as a difficult, technical subject. He regards the McCarran-Walter Act as his monument and few Congressmen, many of whom received small kindnesses from him when they were new to Washington, are anxious to be the first to discompose him.

Because of Hungary and the more sympathetic attitude of the Senate since Senator McCarran's death, it is likely that some legislation helping refugees and including some of the minor modifications will go through. But the major proposals are another matter, unless the White House is prepared to fight for them.

Some Hope for Oil

PRESIDENT EISENHOWER at least shows more awareness than his Secretary of State of the urgency of Europe's oil shortage. But it is not clear from the comments he made at his press conference on Wednesday just how he proposes to bring something more effective than exhortations to bear on the reluctant Texas producers. Up to now the federal government has taken the position that it has no authority to order the Texas Railroad Commission to raise its limit on the State's output of oil, on



"By Ginger! We Might Even Try Negotiating With the Oil Potentates of Texas"

Herblock in the *Washington Pos*

the ground that this is a power reserved to Texas under the jealously guarded constitutional guarantees of states rights. The President now implies that the powers of his office would enable him to supersede the state authorities if the national interest required it—once he had found that his ends could not be achieved by "friendly persuasion." He made it clear, however, that he still hopes this will suffice.

Appeals from the Administration for an increase in the output of crude oil in Texas are hardly likely to be effective unless Texas is conceded a *quid pro quo* in the form of a promise that oil imports will be restricted once the emergency is over. Such a long-term treatment would

How well do you know foreign markets?

WHETHER YOU BUY TEA from the hills of Assam or Ceylon, you enjoy definite advantages when you use the services of bankers on the spot.

Facts about local conditions, special customs and business methods—all so important to good business—are then immediately at your disposal.

The First National City Bank of New York offers you just such a service wherever your business interests are and whatever they may be. With 70 overseas branches, offices and affiliates in 24 different countries around the world, together with banking correspondents reporting current market conditions from over 3,500 major centres of commerce—The First National City Bank covers the globe.

The staff of the two London branches will be pleased to keep your business in touch with up-to-the-minute local knowledge. A visit may prove well worth while.

FIRST IN WORLD-WIDE BANKING

A Voice
in the storm

Above the trans-Atlantic gales of recent months sane voices have been heard, trying to repair rather than embitter the Anglo-American partnership, determined to review the shortcomings of their own country before moralising on those of their friends.

Few papers have played a more distinguished role in this respect than THE REPORTER, the liberal and internationalist American fortnightly which has brought a new dimension to trans-Atlantic journalism. Through its exploration of the real significance of the current news; through its insight into the changing patterns of American life and work; through its gaiety and good temper, THE REPORTER has become—in less than eight years—one of the most respected journals of fact and opinion in the free world. The wide audience it now commands in Britain is evidence of this.

Make sure that you get one of the limited number of copies still available.

The current issues are principally devoted to an illuminating discussion of the ways in which the United States shall live up to its responsibilities in the Middle East.

have worse international effects than the present temporary disease. Just before the Suez Canal was blocked there was even heavier pressure than usual from domestic oil producers, the so-called independents, for restrictions, especially on oil from the Middle East. These imports, it was argued, were holding down the price of American oil in the face of rising production costs; thus they were eating away the profits out of which come the funds for finding and developing the new oil fields on which the United States must rely for its reserve capacity in an emergency. With the emergency came proof that the United States and Europe were indeed heavily dependent on America's reserve capacity. The domestic producers are now playing their strengthened hand with skill, trying to improve their permanent bargaining position still more before the struggle over import restrictions is resumed. In particular they insist that imports, which are still coming in at a rate of about 800,000 barrels a day, mainly from Venezuela, must be reduced to a trickle before domestic output is increased.

The Assistant Secretary of the Interior now appears hopeful that the importing companies can be persuaded to divert these imports to Europe without any assurance that additional supplies to replace them will be available from Texas. The companies could do this by complying with another of the Administration's appeals—that American refiners should use less crude oil and thus release more for export. Stocks of petrol in the United States are well above normal, and any domestic shortage of heavy oils that might result from reduced refinery operations could be alleviated by drawing on the government's strategic stocks. Under the Defence Production Act the President does have the power to order refiners to use less crude oil, if the national interest requires it, and his emergency powers, if he has to use them, might be more successfully applied in this field than in Texas.

Meanwhile, the partial failure of the oil lift to Europe, when Europe's needs are being cited as the excuse for charging higher prices to American consumers, has given the government's critics plenty of live ammunition. Their first salvoes were directed against the Administration which authorised, and the major oil companies which compose, the Middle East Emergency Committee, the body responsible for co-ordinating the flow of oil to Europe. The oil companies are probably more susceptible to pressure from Congress than from the Administration. But if the special Senate committee which has taken command of the investigations continues as it began this week, the real issues may be lost in a wide-ranging, but largely irrelevant, attack on the whole oil industry, long a favourite target of the monopoly hunters.

Boom Running Down?

THE economic speculation of the past month has been concerned with whether the huge General Motors Corporation may not be running down. First, the company's share of the automobile market has slipped below what has become its normal half or more; in January it was responsible for only 48 per cent of total car output. Secondly, it postponed building two new plants, one in the Ohio valley, the other south of San Francisco; this suggested that General Motors thought the time for expansion was over. According to the president of the firm, this postponement affects future years rather than this year and will not in fact reduce planned outlays on new plant and tools in 1957. Nevertheless, several other large companies have announced cutbacks in their programmes of expansion and there has been a decline in contracts for new industrial building. Some people are therefore now beginning to wonder whether capital spending, which has put so much of the lift into the present boom, will go up this year as much as was forecast earlier.

Meanwhile, motor car output remains disappointing—and is directly responsible for the recent falling-off in orders for steel for future delivery. But here the blame falls directly on General Motors, for its output in January was 4 per cent below its figure for January, 1956, while the Ford Company's output was up by 25 per cent. Dealers, it is said, could sell both more Fords and more cars from the Chrysler Corporation, the other member of the industry's Big Three; General Motors seems to be failing to attract customers as a result of not having redesigned its cars this year. But car makers are holding back their output in order not to overload their dealers with stocks as they did in 1956. Then the usual spring upturn in demand, on which the industry relies, did not materialise, yet the industry is once again relying on it this year.

Obviously the credit squeeze which the authorities have been applying for so long is at last actually slowing down the boom, as it did some time ago for housing, instead of merely keeping the boom from speeding up. It is significant that the Federal Reserve System, which before Christmas seemed about to tighten the squeeze by yet another rise in its discount rate, has not yet done so and is no longer expected to do so. There has in recent weeks been an accumulation of economic weaknesses, none of them very important in themselves, but all of them together apparently worrying to the stock market. However, the economists for government and private agencies who were testifying last week before Congress all expected 1957 to be a slightly better year than 1956, the best ever, in spite of the inflation about which the President is so concerned.

Teamsters Without Team Spirit

FROM A LABOUR CORRESPONDENT

WHEN the executive council of the American Federation of Labour and Congress of Industrial Organisations held its midwinter meeting last week at Miami Beach, Florida, political temperatures rose nearly as high as that of the semi-tropical air outside. For after just over a year of marriage, the merger between the two great trade union groups is still more one of name than of fact, except at the top. Indeed, all through the year disputes between former members of the AFL and of the CIO, over which should have the right to recruit certain types of worker, have prevented the new federation from conducting campaigns to increase trade union membership. And in the large industrial states the frequent absence of any effective merger between the rival AFL and CIO councils at the local level has undermined much of labour's

potential political influence. On top of all this, the public attention recently focused on corruption and gangsterism in trade unions forced the council last week to concentrate on drawing up an ethical code for the 680,000 officers of its member unions.

But, whatever private disputes on other questions may separate the unions making up the federation, there has been a public show of remarkable unanimity on this issue. Only one group, the huge teamsters' union, with 1,330,000 members the largest single affiliate of the AFL-CIO, has failed to approve the stand taken by the executive council against what is broadly known as racketeering. It was the recent refusal of several leading teamsters to answer questions put to them by the latest congressional investigation into violence, extortion and misuse of funds by trade union officials which forced the executive council to concentrate on this problem at last week's meeting.

★

The teamsters' union, whose members now drive lorries and vans, not horses, has always troubled the rest of the labour movement. At present, the union is coming more and more under the domination of its ninth vice-president, Mr James Hoffa of Detroit, Michigan, an extremely energetic, capable and almost ruthless man, who has fought his way up from the ranks and who today, although only 44 years old, seems sure to succeed Mr Dave Beck as president of the teamsters before long. Mr Hoffa and a number of his close associates are among those who have refused to answer questions put by a series of congressional committees, on the constitutional grounds that they might incriminate themselves. And one of Mr Hoffa's friends, Mr Johnny Dio, a convicted extortionist, is at present awaiting trial for allegedly planning the blinding of a New York journalist who was exposing gangster elements in the trade unions. Mr Hoffa has been charged with utilising such elements, with the help of Mr Dio, to gain control of the New York teamsters, and thus to extend his empire throughout the east coast.

But Mr Hoffa is by no means simply a strong-arm man whose power rests on his demonstrated ability to suppress opposition with violence. He has many friends in the business community, and some employers in the road transport industry have even been his partners in a variety of enterprises. Mr Hoffa's financial connections with these employers and with officials of the insurance company which underwrites the health and welfare plans of his union have been under government scrutiny for some time; thus far, nothing illegal has been proved against him. A trade union leader with the standards of a businessman, Mr Hoffa sees nothing wrong in having financial relationships with employers with whom he also negotiates working contracts for the union members whom he represents. Although he is not a millionaire like Mr Beck, he is comfortably well off. Mr Hoffa maintains, however, that he ought to be highly paid, since he has brought great benefits to the members he represents.

There is little doubt that these benefits have been an important factor in enabling him to extend his power, as have the changes he has made in the structure of the teamsters' union. Dealing with a fragmented industry, composed of thousands of small road transport units, Mr Hoffa has negotiated area-wide agreements with uniform conditions applicable throughout large sections of the country. One such agreement, for example, covers twelve midwestern states, and its provisions apply to every road transport company employing lorry drivers in the area. Within the industry, Mr Hoffa's allies are the larger companies, able to pay the higher wages he negotiates in his contracts; such wages may often mean the death of smaller enterprises.

★

Because of the strategic part played by the teamsters' union in the American distributive economy, it is almost indispensable for other union leaders, whatever they may feel about the unrestrained imperialism of the teamsters, to develop a working relationship with them. By refusing to cross a picket line or by providing financial help, the teamsters can make all the difference to the outcome of many a labour struggle. There are many union leaders who are thus dependent upon the teamsters, no matter what public stand they take against them.

Last week the AFL-CIO executive council accepted the resolution proposed by its ethical practices committee opposing any financial relationship which hinders a union leader from carrying out his obligations. Simultaneously, the council also condemned "kickbacks" or "under-the-table" payments to union leaders and called upon its affiliated unions to expel any official or member found to be indulging in these or other malpractices, or found to be a communist or a fascist. Indeed, in its very zealousness, the council has short-cut some of the legal guarantees normally accorded to every citizen, by recommending that action against alleged crooks be taken by unions even before their legal guilt is established. The council also advocated the expulsion of union officials who exercise the constitutional right of not giving evidence for fear of incriminating themselves. This indicates the deep concern felt by labour leaders over the increasing attention being paid to the conduct of union officials and over the ugly revelations which may be made in the coming congressional hearings.

It is entirely possible that not even the aggressive and powerful teamsters will be able to resist this pressure. They have already agreed to co-operate with the congressional investigation, now that a special committee has been set up which has an undisputed right to conduct such an enquiry. And even though in the past Mr Beck and Mr Hoffa have publicly defied the AFL leaders, they have never carried out their threat of withdrawing from the federation. In this case, too, they may prefer to remain within the federation, while they seek support from other unions for their position. Even now, they have pledged their aid to the building trades group in its fight with former CIO unions over who should organise the men who are building new facilities inside large industrial plants.

Should these internal strains lead to an open split in the AFL-CIO, Mr Hoffa will be ready to take advantage of the disagreement for his own and the teamsters' benefit. Indeed, divorce proceedings might have begun already were it not for the strong personality of Mr George Meany, the president of the AFL-CIO, and the great respect in which he is held by all groups. One of the main contributions which Mr Meany, who came originally from the AFL, has made to labour unity has been the forthright support which he has given to the attack, led by men from CIO unions, on corrupt practices. But even Mr Meany is finding it increasingly difficult to keep all these factions under the same roof.

State of New York

LIKE President Eisenhower, Mr Harriman, the Democratic Governor of New York, has just sent his third and his biggest budget to a legislature controlled by the opposition, which in this case is Republican. Mr Harriman, the last of the prominent New Dealers in high office, hopes to go the President one better in the year beginning on April 1st: he plans to increase spending, decrease taxes slightly, and still balance the budget as state law requires, although admittedly only by drawing on reserves and the proceeds of bond issues. There has been Republican grumbling over the $400 million increase in state costs since Mr Harriman went to Albany three years ago. But the needs of the richest and most populous state are real and with both Mr Harriman and the two leading Republicans in the legislature determined to enter the race for the Governorship next year, there is not much dispute about giving the voters what they want.

Spending is estimated at $1.6 billion in the Governor's budget, $176 million above that in the current year and $86 million more than revenues. Most of it goes on education, health, highways and public welfare, and the increases in these categories are hardly controversial. Republicans will also probably concur with Mr Harriman's proposal to extend rent control though they do not like it; they can oppose his electoral reforms only at the cost of making the Governor appear to be the champion of the people against a stubborn legislature. He wants to lower the voting age to 18, let the voters choose their parties' candidates at primary elections, allow citizens to initiate constitutional amendments, and pave the way for permanent registration of voters.

The real fireworks are likely to come over New York City's share of the $875 million to be given to local communities for education, health, and so on. The city has long complained that as it has about half the people in the state and pays more than half the taxes, it deserves more than 40 per cent of this aid. Mayor Wagner, who faces an election this autumn, asked for $55 million more; the Governor, in the interests of equity and Democratic solidarity, proposes $17 million. A Republican legislature, most of whose members come from small towns, is likely to turn a colder shoulder than usual to this request from a Democrat whose city's budget is larger than that of the state and who makes no secret of his desire to make usefully timed tax concessions to his own supporters.

Repealing the Corn Law

THE Secretary of Agriculture's most urgent business with the new Congress is to secure repeal of one corn law and passage of another. Corn (or rather maize) growers did not rally quite enough votes last December to continue the allotment of 51 million acres they were allowed to plant last year; their failure to do so brought back into force a law which would reduce plantings to a mere 37 million acres. Rather than make so drastic a reduction, farmers probably would sacrifice their rights to price support and participation in the soil bank scheme for withdrawing land from use. Neither Mr Benson nor Republicans from the middle west can risk the overproduction and slump which might follow, not only in maize, but also in hogs and livestock. Mr Benson has now agreed to support maize prices for three years at 70 per cent of parity (a figure estimated to give farmers a fair return); his freedom to fix supports as low as he liked was the chief reason why farmers turned down the larger acreage.

The Administration may have to pay a higher price for passage of its corn law before plantings begin in March. As Mr Poage of Texas remarked: "We have no objection to helping the corn boys. But they'll have to play ball." Spokesmen for other crops—cotton, wheat, and tobacco—are all looking for a free ride for their pet schemes on the maize waggon, and Congressmen from the drought areas have more ambitious ideas than the $76 million more for relief which Mr Benson wants. But no frontal assault on the Administration's flexible price schemes is looked for until 1958, an election year. If inventories are excluded, there was a 5 per cent rise in farm income in 1956, the first since 1951; this has strengthened the feeling that the soil bank scheme should be given a fair run. The best year for farm exports since 1926—the result of the Administration's cut-price disposal schemes and perhaps of temporary developments abroad—is also making Congressmen think twice about a return to high, rigid price supports.

At the end of November the Department of Agriculture still had $8.1 billion invested in farm commodities. But for the first time since 1952 the mountain of surpluses was a trifle lower. President Eisenhower was able to report that in 1956 the Administration had disposed of $3.3 billion worth of surplus farm commodities. He is virtually certain to get the new authority he asks to incur another $1 billion of losses in selling surpluses abroad for foreign currencies, as well as the relaxation of the prohibition on bartering surplus commodities for strategic materials with countries in the communist block.

Campaign Cheques

THE Senate sub-committee on political spending sat grimly in Washington throughout the campaign, but this does not seem to have exerted much restraining influence. Its report, published last week, submits a total of $33 million for money spent during the election compared with $23 million reported in 1952. And the committee is the first to point out that this is far below the true figure, which may be three or four times as great. Nor has the committee uncovered much that was not known before, although it provides some fascinating detail and underlines situations which a democracy can ignore at its peril.

It has long been recognised that the federal limit of $3 million on the spending of political committees is obsolete. When television and radio time alone claims $9 million, avoidance is the only course, and this is done through a proliferation of committees, each with its own $3 million limit. Individuals may not give more than

$5,000 to a political committee, but they may endow as many as they like. A federal structure adds to the loopholes. Local and state committees need not report to Washington, while candidates for Congress are only required to account for their personal disbursements. In Oregon, for example, there was heavy and approximately equal spending by the supporters of Senator Morse and Mr McKay. Yet Senator Morse, on whose behalf $266,000 was spent, submitted to Washington only his personal accounts for $7,360. Mr McKay, whom the Administration pushed into the race, sent in a truer bill for his defeat: it was for $214,776.

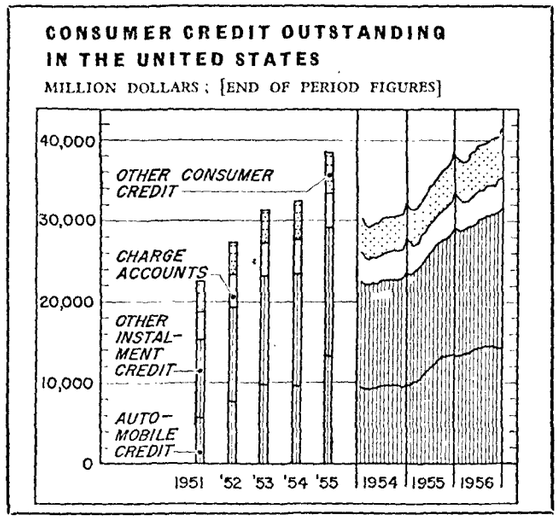
Special interests play a dangerously large part in elections. Corporations and trade unions are not allowed to contribute directly, but twelve wealthy families contributed $1.1 million, 90 per cent of it to the Republican cause. Organisations set up by the labour movement spent $941,000, almost all of it on Democratic candidates. Senator Curtis, the Republican colleague of Senators Gore and Mansfield, would not sign their report because he felt, almost certainly wrongly, that more complete reporting of labour's contribution would have brought Democratic spending, put at $11 million, close to the Republicans' $20 million. Contributors are also concentrated geographically; New Yorkers signed the biggest proportion of the large cheques for both parties.

The sub-committee's recommendations that limits on spending should be raised to a more realistic and enforceable level, that more complete reporting should be required, and that means should be taken to broaden the financial basis of both parties are all steps long overdue and largely uncontroversial. The pity is that they do not seem to arouse much interest in Congress, at least between elections.

Abundant Aluminium

WITH 1957 the aluminium industry entered its first year of plenty and probably a series of them. For domestic output of primary aluminium went up in 1956 by 7 per cent, to nearly 1,700,000 tons, more than double the amount produced in 1950. With imports from Canada and reclaimed scrap, the actual supply available for the year was nearly 2,500,000 tons, and by 1960 it should be about 3 million tons. During the next few years the last of the new facilities which were built with government help, to meet expanded defence needs after the Korean war, will be coming into production. Such help is no longer available, nor is the government buying aluminium for its stockpile any more. This is another reason why supplies have now become plentiful, but the producers are welcoming the new abundance.

In the past many manufacturers have been reluctant to expand their use of aluminium because they could not count on regular supplies of the metal. Now the producers feel justified in encouraging the development of new uses for aluminium and are confident that demand for it will grow as rapidly as output. Apart from anything else, its price already compares favourably with that of other non-ferrous metals and competition may drive it down. So more and more skyscrapers are likely to be sheathed in coloured aluminium plates, more and more electric impulses to be carried by aluminium wires and more and more food to be wrapped in aluminium foil. Additional needs of all kinds for the metal are likely to be found in building, in transport equipment, in consumer goods and many other products.



The new plenty is bringing a change in the geographic pattern of the industry. Now that they are no longer mainly dependent on the demand for aluminium which comes from the aircraft industry, which is to a great extent concentrated on the west coast, producers are finding it more profitable to put their new plants in the great manufacturing centre of the country near to the factories which process the aluminium. This is also near to the coal fields which now provide the industry with a growing proportion of its fuel. The Pacific Northwest can no longer offer the hydro-electricity at cheap rates which drew the infant aluminium industry to Washington and Oregon during the war years; indeed, at present, there is none to spare at any price. Now that the adult industry is on its own, it is setting up house in the valley of the Ohio River instead of in that of the Columbia.

SHORTER NOTES

A recent advertisement in the *New York Times* offers a new opening to young women with doctorate degrees from any accredited university. The Flamingo Hotel at Las Vegas, Nevada's famous gambling resort, is staging a lavish production built around sixteen such girls, who are not, the advertisement points out, chorus girls although "slight dancing ability" and good looks are required. Given a name which combines that of a famous college society, reserved for the more intellectual students, with that of the most genuine way of reproducing music, they will be known as the "Hi Phi Betas." Already two PhD's, two doctors of home economics, and one each of anthropology and physics have been recruited. Masters of Arts will not be accepted.

★

Hawaii has sent a Democratic delegate to Washington for the first time since 1932, but it remains to be seen whether he is any more successful than his Republican predecessors in obtaining statehood for the Territory.

The World Overseas

Norstad's Divisions

FROM OUR DEFENCE CORRESPONDENT

DURING his first visit to London next week as Supreme Commander, Allied Forces in Europe, General Norstad expects to discuss the way in which British defence economies will affect him. This is not only, and perhaps not even primarily, a military issue. In Paris this week he has forcefully underlined all that he said in New York about the importance of achieving the agreed minimum shield of thirty Nato divisions. What concerns him is not so much the possibility of losing one or two British divisions at this stage, but the development of the idea that any member of the alliance may make such economies, dictated by national and perhaps temporary exigencies, on a unilateral reassessment of the strategic requirements of Nato as a whole. For if one can do it, so can all, and the purpose and coherence of the whole alliance, together with the authority of Shape, will dissolve. It is one thing for Britain to want to withdraw a division or cut the RAF in Europe; it is another for it to find any reasons to justify such a withdrawal other than those of economy. It can be taken for granted that General Norstad will press very strongly indeed for a public explanation of any British economies in terms which will leave the strategic decisions about Nato's needs very definitely in Paris.

The Supreme Commander is also bound to resist such economies on any grounds, though he is in fact well aware of the reasons which prompt Britain to consider them. He has not got thirty divisions; he has only fourteen or fifteen. The five divisions which he expects to get from Germany by the end of the year—though they will still be under training—and an additional division from Holland will bring him to twenty. The full thirty is now not expected until 1961 or so; and he therefore remains well below strength. That strength is the Shape estimate of what is necessary to ensure that Europe cannot be overrun at vital points too swiftly for the atomic deterrent to take effect. The present deficiency is bound to offer, in Shape's view, a permanent temptation to the Russians to make a smash and grab raid on a calculation that gains could be snatched without incurring atomic retaliation. Continued deficiency in Shape divisions may give rise in Russian minds to the dangerous idea that the West is not resolute, rather than that it is simply relying on a thin tripwire. It is true that so far Nato has got away with its forces heavily under strength; but this was, in Shape's view, achieved by relying on an atomic preponderance that no longer exists. The unrest in eastern Europe may offer a short further breathing space.

It is in fact unlikely that the British defence chiefs will resist this argument. But against even a temporary withdrawal of substantial British ground forces, General Norstad is bound to point out that the time is highly inopportune. The Germans are now offering financial concessions on a scale which reveals their great anxiety to keep the British divisions intact. There is the very real difficulty of countering the persistent suspicions of other Nato members that any withdrawal is simply the first move of Britain to disengage itself entirely. This would affect the speed with which other Nato divisions, especially French and German, are being formed. From Shape's point of view, if cuts must be made in British commitments, the four divisions are the last that should be touched; Nato commanders would rather have a further cut made in the RAF, even though it has been cut almost every year. To halve RAF strength would only reduce Nato's air strength by 10 per cent, and this could be absorbed. Still lower in priorities from Shape's point of view is the V-bomber force (whose role the Strategic Air Command could take over).

The Royal Navy comes last of all. The physical presence of Britain in the alliance is symbolised by strong ground forces more than by anything else. If these forces must take a cut, Shape will press first for a specific undertaking that it is purely temporary; second, that the command structure of four divisions should remain (even if this reduces the military effectiveness of the British forces). Finally, it will certainly be stressed that economies of this or of any less damaging kind must not be unilateral, but must be proposed to, and accepted by, Nato as a whole.

Unfortunately for General Norstad, a reduction of Britain's land forces in Germany offers the quickest hope of budgetary economies in 1957-58, compared with cuts in research and development, or even in the Navy and RAF. Such economies would also make a more immediate contribution to easing the balance of payments. They hold out, too, most promise of ending conscription. There is, however, another question about the minimum point below which the British commitment cannot fall: if the land forces were cut (and a reduction of 30,000 men out of 80,000 is gloomily talked of in the corridors of Shape), and the RAF by several more squadrons, could Britain expect to fill so many senior command positions in the chain, or expect to exert anything like its present influence at headquarters? The answer must probably be no; if Britain's contribution were to fall almost to the level of Holland's, it could not expect to carry its present weight simply on the

strength of a (from Paris or Bonn) invisible atomic strike force and invisible navy. Yet if the British brasshats departed, belief that Britain is committed to Nato would be further undermined. General Norstad is not only going to London for men and arms; but for some emphatic official statements which will carry conviction to every corner of the area behind what he calls "the most dangerous frontier in the world in the atomic age."

Iraq Stands Fast

FROM OUR SPECIAL CORRESPONDENT

THOSE who get their news of Iraq from Cairo, Damascus and other ill-disposed sources have been hearing a great deal about Iraqi dissatisfaction with life. The visitor to Baghdad and its neighbourhood gets rather a different impression. The sounds that split his eardrum are those of hammering, concrete mixing, welding and other deeds of construction. At the south gate of the town, where men are working overtime to finish the new Tigris bridge in time for opening in March, the din outdoes the hooting and the street cries. In the country, the normal monotony of the plain between the rivers is broken by the phut-phut of new generators, the landscape is dotted with dumps of yellow bricks waiting labour, and the skyline by the wiry outlines of cranes and excavators at work on ditches or roads. In all large towns, and in many rural areas, Iraq is busy.

Nothing short of swift and drastic action would have kept this building boom going without disturbance when, in November, the dropping of the British bombs on Egypt furnished political dynamite, ready-made, to every agitator in the Arab world. Fortunately for Iraq, it had a government with the resolve and the capacity to keep things quiet. Yet that government had received a shattering body-blow. For Nuri Pasha's government is founded on two main pillars—in foreign affairs, support of the Baghdad Pact and, at home, "development" financed by revenue from oil; and here (as Iraqis saw it) was the British member of the pact both fighting alongside Israel, and heedlessly inviting Arab counteraction against Iraq's main artery—the oil pipeline through Syria. Both pillars were knocked away.

Collapse was missed by a hair's breadth and the building boom offers at least part of the explanation why. Demonstrations of the classic anti-western type, once so easily engineered by a quick whip round the slums, have become more difficult for the usual agents to organise, because men earning 15 shillings (unskilled) to 30 shillings (skilled) a day are buying watches and radios and are no longer willing to risk a broken head or a spell in gaol. Only in Mosul, which is notoriously hot-tempered, and Nejef, where "development" has not yet blossomed much, were there riots of the old shape and temper. The phenomenon is the more remarkable because Nuri Pasha's government was already under fire, not merely from the anti-western, anti-colonial grumblers who are "against" almost any government, but from one or two more responsible conservative groups who think it someone else's turn for office after the unprecedentedly long term of two and a half years.

Very broadly speaking, the Iraqi reading and listening public can be divided into two groups—a small but well-led one consisting of "doers" who know what hard work it is putting plans into practice, and an enormous but leaderless one consisting of talkers who do not. Also broadly speaking, the first group sees western connections, help and advice as the shortest road to raising the standard of living and the second has not actually mapped any route, long or short, towards that end. The merchant class, which craves stability in the present good times, can be said to belong to the first group. All students, many ill-paid teachers and, usually, the labouring classes mill about in the wake of the second. The difference between the crisis of 1956 and all earlier crises was that prosperity had, anyway temporarily, transferred a sizeable section of the workers into the first group. Only the students attempted to riot; the rest of Baghdad kept to the pavement and watched them rush by in numbers the police were able to handle.

But the severe shaking that the Nuri government got from the Suez earthquake has embroiled it in some drastic and unpopular action on the home front. Any member of the opposition who sowed alarm and despondency (and some who did not) were clapped into gaol; press censorship was imposed; police vans paid night calls; all schools and colleges were shut down; and, more recently, jamming apparatus has been bought and installed to stop the rumours sown by Damascus and Cairo radios. The trouble with such a policy is that it is difficult to relax; this is happening, but too slowly for most tastes. The worst college ringleaders, instead of being exempt from military service, have been drafted. (Apparently the army can take it.) The schools have reopened on a basis of parental bonds of £100 demanded in the case of suspects.

Aerials in Mud Villages

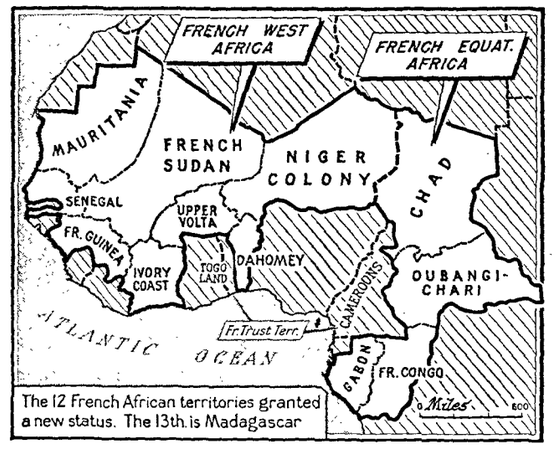
Though the clamp is still screwed down, there is pertinence in a story going the rounds—that when three exiles, an Egyptian, a Syrian and an Iraqi, met to exchange grievances in Beirut, the third dumbfounded the others by leaving early to catch the plane for Baghdad. Iraq today is a despotism, in that its prime minister handpicked its Parliament, but it is a benevolent one, in that, given the ingredients, no other system would have produced, in the time, a pace, system and spread of development that far surpass the present rate of progress of any other neighbouring state.

Nevertheless, there is a widespread sense of frustration. Outlets have been stopped up, and sources of information denied without enough attempt to provide people with substitutes. Baghdad radio, for instance, is poor and behind with the news by comparison with the forbidden stations. It is also reticent where it could afford to be frank. No one expects it to blossom overnight into the insidious moderation of Cairo's best broadcasts, but a straight and ample news service on BBC lines would earn it dividends not only at home but abroad (where no one ever bothers to turn it on). The scope for better information services is obvious to anyone who watches the nightly crowd round any Baghdad shop that keeps a television set in its window, or counts the aerials in the mud villages. They might even sober the student by informing him of a fact unknown to him—that there is a job waiting for every young Iraqi who is minded to get himself even a modest technical qualification.

The government is still panting from the strain put upon it by the Suez crisis. It needs a fillip if it is to recover its wind. It is hoping for good news of help as a result of the ex-Regent's present visit to America. But the boost it really wants (and that would be equally imperative for any successor) is a resumption of the lost oil revenue. Without it, the ordinary budget is bound to be in deficit when the financial year ends in March; even the Development Board, though it has an unspent balance of nearly £70 million, can scarcely commission the new jobs on its programme, though it can keep existing ones going for some time. No government would be secure if, after a taste of better things, the Iraqi worker were to have to drop back into the old life of hungry idleness on £10 to £15 a year.

French African Autonomy

FROM OUR PARIS CORRESPONDENT



THE precedent of partial self-rule, newly granted to the "Autonomous Republic of Togoland"—with officially recognised "possibilities of evolution"—is already proving a contagious example for the rest of French Africa. A similar statute has been offered to the other Trust territory, the Cameroons. And the government, which seemed a pioneer with its more modest colonial reform bill eight months ago, was made to look almost retrograde during last week's Assembly debate on the bill's detailed terms, until it gave almost equal freedoms to the other territories. African opinion is evolving fast.

Significantly, M. Apithy, a deputy from Dahomey, which lies between Togoland and the Gold Coast on the west and Nigeria to the east, led the campaign for concessions. This despite his being the most conservative of the Assembly's forty negro deputies, since he sits with M. Pinay's Independents. The government's bill set up "Government Councils" in each of thirteen French African territories, with a majority of ministers elected by the local Assembly and a minority chosen by the Governor, acting as permanent, unassailable prime minister. M. Apithy demanded that all the ministers be elected by the Assembly, and an African prime minister be responsible to it. In fact, bar the wording, the negro deputies wanted Togo-style autonomy.

Unfortunately, the government, though willing, could not acknowledge such a local sovereignty in its non-Trust territories. That would have strained the Constitution, and the conservatives, too far. The 1946 Constitution inconveniently proclaims the Republic "one and indivisible"—still another argument against written constitutions. So the decree finally voted is a compromise which gives the Africans as much as the Constitution and the conservatives will yield. The ministers, including a "vice-premier," will all be elected by the Assembly, and "can" all resign if the Assembly withdraws its confidence—rather leaving the Governor high and dry. The Assembly, to which another fine subtlety has given "deliberative" but not "legislative" powers will nevertheless be elected by universal suffrage and control the purse-strings. The subterfuge is transparent. And everyone eloquently agrees the Constitution must, of course, be changed. But when? Meanwhile, in the territories, the new Assemblies will be elected in late March and the Government Councils set up immediately afterwards.

The autonomy offered is strictly local. The Government Councils are responsible only for local affairs, the Assemblies only for the limited local budgets (at present about £6 million in a "rich" territory). Most of the major powers of co-ordination between the territories will remain in French hands: foreign affairs, army and police, overall economic policy and French investment funds, even the telegraph service, air services and universities. Autonomy for the Africans means, essentially, a real forum for political aspirations in the Assemblies; control of local government; and the quicker growth of a negro civil service.

Whatever its limitations, the new system is far the biggest step to emancipation ever taken freely in the French Union. The African deputies themselves do not, for the moment, ask for more. It may appear surprising but does not seem simply to be tactics. African leaders are acutely aware that France provides nearly $200 million a year of irreplacable and often far from immediately profitable investment, and that the common market scheme could double this figure. Further, is not such "interdependence" a sign of the times?

The 12 French African territories granted a new status. The 13th is Madagascar

France itself is tiptoeing into European unity. Some African politicians tend to see the advantages of European "interdependence"; they have no universally accepted code, like Islam, to rally them against the French, whose culture is in fact one of their own élite's common bonds. But one third of French Africans are Moslems, and the Algerian waves are rippling southwards. The demand for independence is never far from the surface, especially among the students and trade unions. There are, however, still good chances for "interdependence."

The question is, in what form? First, in Africa itself. M. Senghor, one of the two main African leaders, objects that local autonomy in the territories would lead to the "Balkanisation" of Africa. He wants autonomy at the level of the regional groupings, French West Africa and Equatorial Africa, which have till now been the centres of French rule, but will now confine themselves mainly to economic co-ordination. This idea certainly rides the present African current of unity. The main parties, especially the powerful RDA, or African Democratic Rally, whose leader, M. Houphouët-Boigny, is one of M. Mollet's ministers, stretch throughout French Africa; so does the newly-united trade union movement. But, as breeding-grounds of representative government, the vast, heterogeneous regional groupings would be more artificial than the admittedly ill-delimited territories. There will be monthly meetings of the "vice-premiers" and some technical co-operation, but immediately, at least, no real federalism.

M. Senghor, however, goes further. He would want the regional federations to enter as equals with France in a confederal Union, where France, like any other member, would obey the Union's decisions. Meanwhile, as his African Convention Party's programme cryptically puts it: "The question of independence is reserved." Such a Union is obviously not for today; most Frenchmen have certainly not yet worked round to the thought of France no longer being the metropolis. Yet the French must, sooner or later, either give political substance to "interdependence" or accept African independence within a "Commonwealth." What they cannot do is reject both. The reform bill (which seems to incline towards a "Commonwealth") hastens the choice, but gives both the French and the Africans a better chance to think it out calmly.

China's "Delirium of Reason"

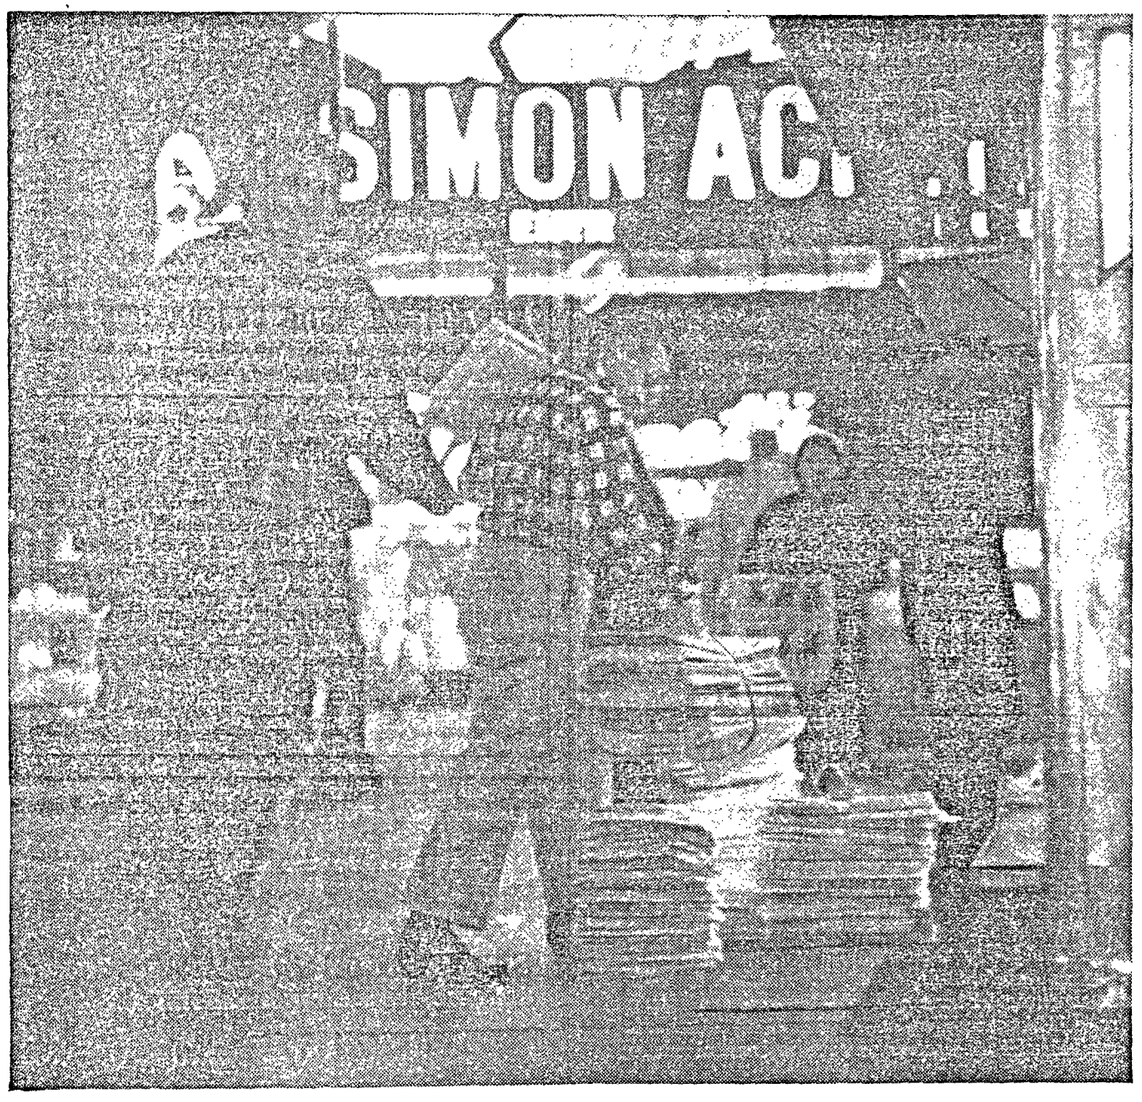
FROM OUR SPECIAL CORRESPONDENT

THERE is a Delirium of Reason inside China today which makes the western visitor feel deranged, sinful and guilty. The traffic policeman admonishes a reckless cyclist: "You understand, comrade, that if you had been killed by that truck, it would have been my fault?" "I admire your sincerity, comrade." "It is my duty to the state and my responsibility to Chairman Mao to prevent the deaths of comrades in the street." "I promise, comrade, to announce and reflect on my error at self-criticism tomorrow." Or your guide gently separates two brawling children on the street; "Young Pioneers do not quarrel in the new China," he chides. Or you ask in surprise why the two imperial lions have been quietly restored, within the last few months, to their former position at the entrance to the old Hongkong Bank on the Shanghai Bund. "But why not? We are not superstitious about stone lions." "Well, then, why take them away in the first place?" "Doubtless there was a reason." Or you inquire whether Mr Feng, the Editor of *Chinese Literature*, who has been lauding the encouragement to free literary criticism, would publish an article critical of Comrade Mao Tse-tung in his next issue. "But"—reasonable, if surprised—"what possible criticism could validly be offered against Chairman Mao?"

Vice-Premier Chen Yun is similarly reasonable about a reversion to the free market to help correct the mistakes which have affected pig, poultry and vegetable sales under co-operativism. And he is sweet reason itself over the growing activities of "secret factories" operating quite illegally in rivalry to state enterprises: "These secret factories are generally engaged in useful work." The former capitalists are reasonable enough to become managers of the businesses which they have surrendered to the state; the state is reasonable enough to pay them 5 per cent on the value of their property until a reasonable period of transition of seven years has passed. The Party is reasonable enough to tolerate a loyal and democratic parliamentary "opposition," whose spokesman, Mr Sa Kung-liao, explains that the reasonable duty of a reasonable opposition is "not to oppose, but to consult with, the Communist Party and so ensure long-term political co-existence." The Shanghai prostitute is not ordered into the reformatory; she is reasoned with, by the police and her friends and members of her local street committee, until—in despair, one imagines—she "volunteers" reasonably to enter the reformatory.

This Delirium of Reason has helped to produce a stifling atmosphere of purity and righteousness, logic and virtue, which the rough, carnal western visitor finds hard to take. He feels guilty if he locks his bedroom door behind him; he hastily picks up a match which he drops on the stairs; he aches to see an offensive drunk on the streets. (Literally, the only drunk this correspondent saw in either Peking, Canton or Shanghai was being helped, shamefaced, into a pedicab by a reasonable policeman, who paid his fare for him.)

Communism—for the time being, at least—seems, indeed, to have become a religion for the Chinese, who are normally more interested in philosophy than religion, and in devils rather than a god. This spiritual reaction is a result and a projection of the astonishing flexibility of Chinese Communist policy, of the adaptability and persuasiveness of Chinese Communist leaders. No one now is forced to do anything in China; he is persuaded, as a reasonable Chinese, to join a united and agreed course of action which wiser and even more reasonable Chinese have designed for him.



So much for the faithful. For the hierarchy, Comrade Mao is the most reasonable of patriarchs, and Comrade Chou the most reasonable of evangelical missionaries. All the evidence makes it clear, however, that the hierarchy is far from happy over developments in Eastern Europe and entertains some scepticism of the reasonableness of present Soviet policy. Selfish interest, as well as enlightened reason, made it certain that Peking would stand by Moscow; but diplomatic observers in Peking were surprised by the force and explicit detail of the manifesto of loyalty to "the centre of world communism" published on December 29th.

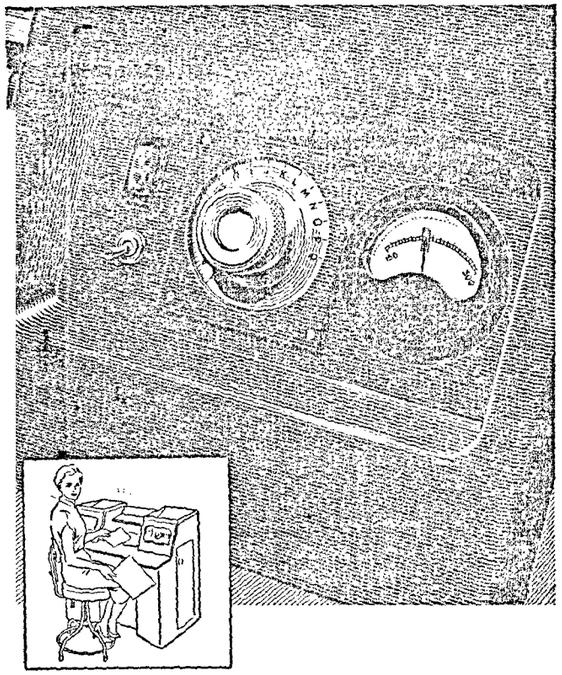
It can be taken for granted that the voice of Mao Tse-tung, promulgating doctrine and dogma for world communism, will be heard with increasing assurance—with or without the cordial approval of the Kremlin. But, being realistic as well as reasonable men, the Chinese will permit no breach with Russia: their dependence upon Soviet aid will probably be greater during the second five-year plan than during the first. The army of Soviet technicians and advisers who laid the foundations of the north-eastern industrial complex have now moved west, where development plans are even more ambitious. It is now accepted by all objective western observers on the spot that the unknown measure of Soviet aid, in advice and materials, has been far greater than previously reckoned or suspected, and that the Chinese blandly expect it to increase still further. As reasonable men—and reasonable allies—of course.

Cold War in the Levant

FROM OUR MIDDLE EAST CORRESPONDENTS

RELATIONS between Syria and Lebanon are worse now than they have ever been since the two countries gained their independence from France. They are fighting a cold war; at present it is a war of words, but there are ominous signs that Syria intends to take economic action against Lebanon in an effort to force its adhesion to the Syrian-Egyptian-Saudi block. The blunt and level-headed Prime Minister of Lebanon, Sami es-Solh (whose family

Tomorrow comes to Times Square



Tomorrow's newspapers jostle today off the sidewalk. Within them the day is chronicled and complete, columned for a million eyes. The world sees the world on newsprint . . . newsprint which flows in gathering spate from Bowater mills in Britain and North America. In Calhoun, Tennessee, a third great newsprint machine has now come into operation, raising the output from Bowaters' mills there to 300,000 tons a year. The expansion of the Tennessee mills, rapid as it has been, accords with the growth of the Bowater Organisation. New plant in Tennessee, Nova Scotia and Newfoundland matches Bowater developments on the Thames, on Merseyside and in Kent.

SCOTCH LIQUEUR

A sight to gladden the heart of man!

JOHN HOPE MORRISON & CO. LTD. EDINBURGH

name means "peace" in Arabic), gave notice last week: "I *am a man of peace.* Anyone who wants peace can have it, but anyone who wants war can have that, too."

Sami Bey did not mean armed conflict. He was expressing the developing Lebanese mood of open anger against Syria, a mood which demands that pressure from Damascus, whether in the form of propaganda or economic sanctions, be resisted. The Syrian government started the trouble. The Lebanese government, conscious of its weakness and its need for the transit trade to Syria and beyond, was, until mid-January, most scrupulous in its efforts to avoid offence; its censors took great pains not only to restrain the newspapers of Lebanon, but even to delete unfriendly references to Syria from despatches sent overseas.

The situation is different now. The Christian press of Lebanon is fighting back strongly and with the wit which is one of its most striking contributions to Middle East journalism. (One columnist has written a number of searing articles against the Syrian government of Sabri el-Assali, calling it "the government of Sabri Kadar.") The public is being warned against the "agents" of Abdel Hamid Sarraj, the strong man of the Syrian Army, who is considered the power behind the scenes. It is being called on to "vote Lebanese" in this year's general election in opposition to those candidates who toe the Syrian-Egyptian line. Of even greater significance is the guarded tone of the Moslem press of Lebanon, usually friendly to Syria; it is calling for restraint on *both* sides.

The continuously uneasy, sometimes antagonistic, relations between the two Levant states has generally had economic causes, but this latest conflict has its roots in the Syrian dislike of political moderation in Lebanon. The Syrians accuse the Lebanese of being half-hearted in support of Arab causes. They are particularly angry that Lebanon did not break off diplomatic relations with Britain and France, and that, more recently, it has openly welcomed the Eisenhower doctrine.

The Syrian government also accuses the Lebanese government of conniving at plots which Syrian exiles are reported to be hatching in Lebanon. The Lebanese refusal to extradite some Syrians accused of conspiracy in the court martial now in progress in Damascus is the particular case at issue. The Lebanese government contends that they are genuine political exiles entitled to sanctuary.

Economic Sanctions?

For their part, the Lebanese have real grievances. They have lost their oil transit revenues by the cutting of the Iraq Petroleum Company's pipelines and are losing essential airport income by the refusal of Syria to permit British and French airlines to use its airspace. During the Port Said affair, the Lebanese newspapers took a restrained attitude about the cutting of the pipelines although in private they complained of it. Now there are open protests that Syria ought not to have acted without consulting other Arab states and that the delay in permitting repairs is damaging the economies of three states: Iraq, Lebanon, and Syria itself. Further, any hope that existed of influencing Syria by diplomacy was dashed last week when Mohamed Sabra, Lebanese Minister of Public Works, stated that it was useless to make any further *démarches* in Damascus.

Rumours are current in Beirut that Syria is considering new economic sanctions to influence Lebanese foreign policy. Already the Syrian government has banned the export of livestock from Syria to Lebanon and has banned the transit of livestock to Lebanon from other countries, notably Turkey and Iraq. Prices of meat have consequently risen in Beirut; but the first consignment, part of a gross order of 7,500 sheep, has arrived from Jugoslavia. Turkey is also to send 10,000 sheep and Iraq is switching its supplies through Turkey (instead of Syria) and thence by sea to Beirut.

It may well be that the Syrian campaign is going too far and may have an effect contrary to the one intended. The Christians of Lebanon have always looked down the Mediterranean for a western protector against the Moslem hinterland. Far from turning against the Eisenhower doctrine and the western connection, they are now likely to seek the financial benefits of their innate anti-communism. Their tendency will be to look for help from the United States and to commit themselves at least in spirit to the westward-looking policy of the Baghdad powers. If the Syrian policy also hits the livelihoods of the commercially minded Lebanese Moslems, there is likely to be much less Moslem resistance to the policy.

Down to Earth on Disarmament?

FROM OUR UNITED NATIONS CORRESPONDENT

THE prospects for the next round of disarmament talks now seem even more uncertain than usual. The five-nation UN sub-committee (comprising Britain, Canada, France, Russia and the United States), which has long been the effective theatre of debate, is expected to meet at Lancaster House in London in mid-March. By a unanimous vote in the Assembly, the sub-committee has been asked to study and report on all the proposals, old and new, that have hitherto been tabled. Most delegates were content to have achieved this unanimity, even if it was only on a procedural resolution. At the previous Assembly the Soviet block had been forced into the position of having to vote against a western resolution on disarmament. A triumph of this kind is cheap and short-lived, and this year the western delegates wisely sought Russian agreement, and got it. But last Friday their hopes were somewhat dashed by the issuing in Moscow of an official statement accusing the West of putting forward new conditions "which have brought the whole question to final stalemate," and America of "stepping up preparations for atomic war."

The heartening fact remains, however, that the disarmament debate in this Assembly was much more down to earth than on previous occasions. Canada, Norway and Japan—"the new northern block," as one diplomat commented—proposed a rationing system for tests of nuclear weapons, while Sweden and Finland asked for a complete suspension of tests pending a full report from the UN scientists' committee on the effects of radiation. The Polish delegate surprised and delighted the Assembly by delivering a completely objective speech in a Jugoslav accent. M. Jules Moch did much to restore French prestige by a dazzling if disheartening analysis of the disarmament problem, and this was followed by an ill-tempered intervention from Mr Krishna Menon, who has now succeeded Mr Vyshinsky as the most controversial, the unpredictable and entertaining character at UNO.

Much of the credit for the realistic nature of the discussion was due to Mr Harold Stassen. He commented wrily not long ago that it is sometimes harder for him to move policy within the US government than it is to move it within another government. Mr Stassen used his fortnight in New York in January to engage in serious discussions with the Russians while, in his spare time, sniping cheerfully at Vice President Nixon. He thinks—or, at least, he thought before last Friday—that the possibility of a limited agreement on disarmament was being brought nearer by three recent Soviet switches of policy. The Russians now accept at least the principle of aerial reconnaissance. They have unequivocally accepted the West's proposals for military manpower ceilings for the first phase of disarmament. And their proposal about a phased withdrawal of foreign troops from Nato and satellite countries in Europe is one which the Americans would at least like to discuss.

Dutch Qualms about the Common Market

FROM OUR CORRESPONDENT IN HOLLAND

THE great expectations which the Dutch once cherished on the economic integration of Europe have faded almost to vanishing point now that the time has come for practical steps and specific, far-reaching decisions. There is a general feeling in Holland, in political as well as in business circles, that what is happening now in Brussels does not correspond at all with the original concept of the common market and the customs union, which was in fact a Dutch initiative, submitted to the Messina conference by the Benelux ministers. It provided for a supranational authority with real powers, independent of the national governments. The draft treaty of Brussels, as it is interpreted here, puts all the decisive powers in the hands of the council of national ministers. The original (Dutch) plan would have assured Holland of a free market for its agricultural products, with an external tariff not too high in view of the dependence of Dutch industries on supplies from outside Europe. Finally, the Dutch plan included transport as a separate branch of enterprise which would find in the common market an area of free competition. Little of all this is realised in the Brussels draft.

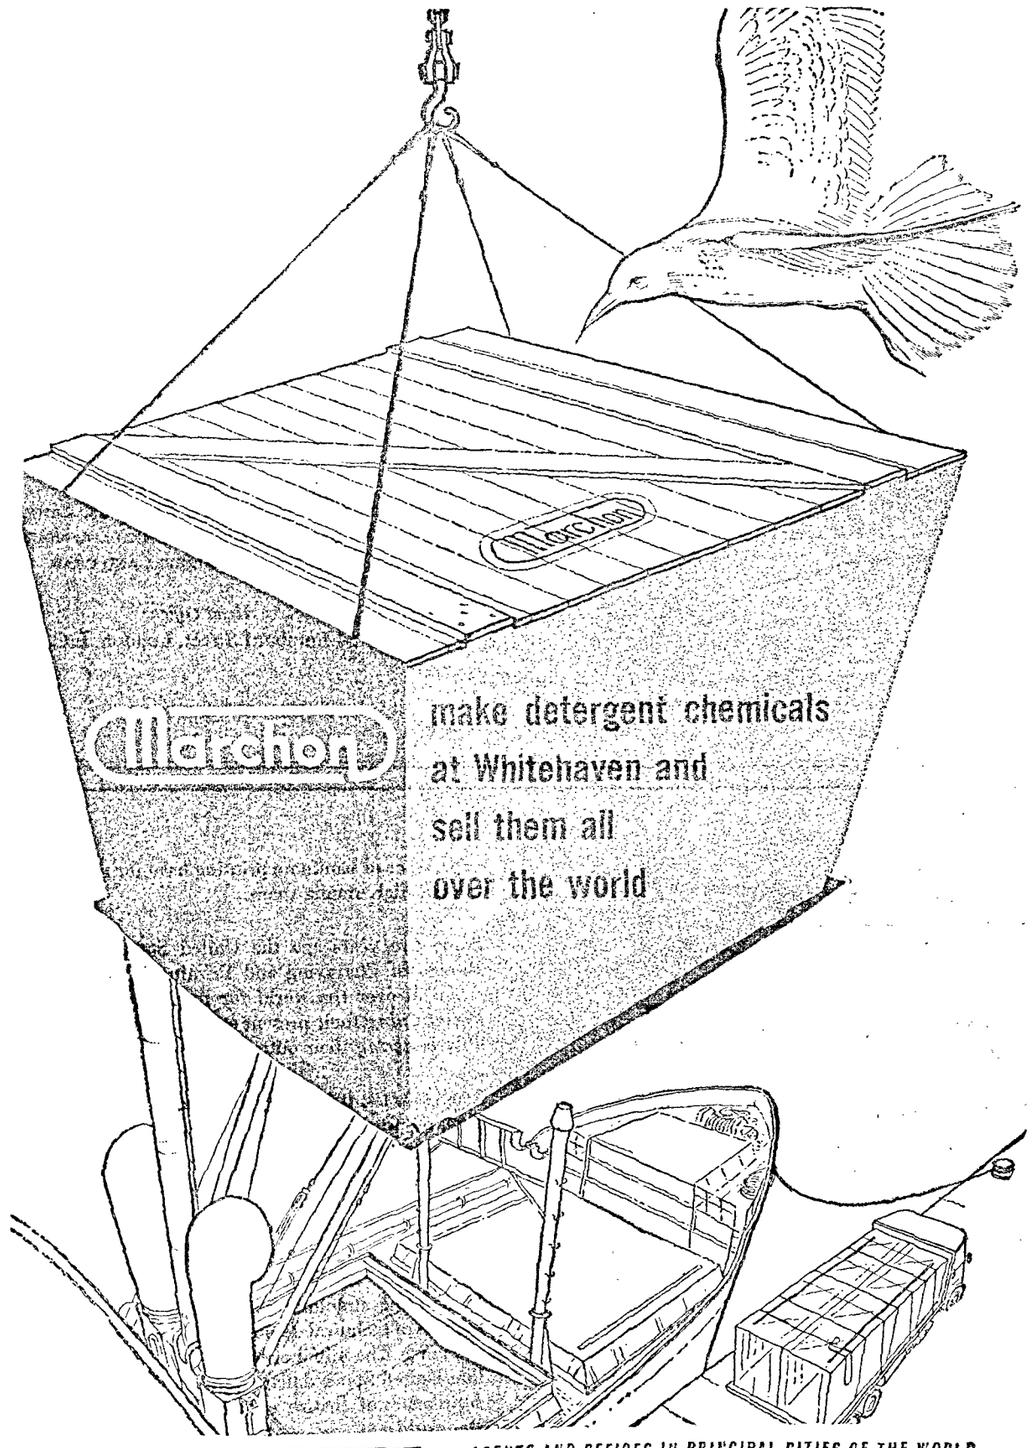
Possibly the Dutch objections will be met in the final agreement and Holland will be treated as a special case. But the original enthusiasm of the Dutch has gone. Eight leading Dutch businessmen published a statement last week that the Brussels draft is unacceptable for Holland's economy. They raised four main objections. The high external tariffs would increase the costs of production of industrial commodities. Holland's greatest source of competitive power in foreign markets, its relatively low costs, would disappear. This disadvantage would not be compensated, in their opinion, by a bigger European market; there, indeed, the Dutch fear German competition in industrial products.

The second objection raised in the statement was against the French claim for minimum prices of agricultural products. These would deprive Holland of one of the main advantages of a common market. About 40 per cent of Holland's total export trade is agricultural, and 60 per cent of its total agricultural exports go to the five Messina countries. The proposed system of minimum prices threatens to make real economic competition within the common market impossible in this field and would even deprive Holland of some of its existing markets for agricultural produce. In effect, a penalty is imposed on the best organised agriculture of the six with its low production costs. The third objection is to the proposed harmonisation of social provisions. This again would raise costs considerably and worsen the terms of trade with areas outside the common market. Finally, nothing has been done to make transport competitive, to abolish government subsidies and to assure free water traffic.

All these complaints are shared by government officials and by large sections of public opinion. There is an increasing pressure on parliament and on the government not to sign or ratify the drafts until the Dutch requirements are met. M. Spaak's quick visit to the Hague has improved the chances, but more time will be needed for negotiation.

On one point the Dutch government will be intransigent: the French proposal for capital investment in overseas territories. The Dutch foreign minister, Dr Luns, has made it perfectly clear to his Belgian colleague that he will not sign the drafts if this proposal is not fundamentally changed. The Dutch government understands that the French are asking for an amount of investment capital in overseas territories about equal to the defence expenditure of the six countries. But the Dutch government does not want to provide backing for French colonial policy; and this, it is felt, is what the French are after.

There is a growing tendency in Holland now to look to the British plans for a European free trade area in preference to the common market which is—as a government official put it—beginning to look like an organisation for consolidation of national interests rather than a means of integration. As yet the British plans are so vague that a definite opinion is impossible. Holland cannot stay outside the common market and at the same time maintain the Benelux Union, assuming that Belgium accepts the Brussels treaty. The Dutch may therefore be forced into a position in which they have to accept the common market in order to save Benelux which is beyond any question advantageous for the Dutch economy. Perhaps the declared preference of the eight Dutch businessmen for the free trade area must be looked at as a tactical manœuvre to back their government's struggle in the Brussels negotiations, and not as a serious alternative. For in the final analysis Holland cannot afford to stay outside "little Europe," and it is aware of this.



[*The state of negotiations for the Common Market is discussed in a Note on page* 461.]

Now in its second year

The Paper Bulletin

This is a bulletin service for paper users and makers. It deals with the supply, demand and price trends for paper, paper products and raw materials. The eighth quarterly issue is now available. Full details from:

THE ECONOMIST INTELLIGENCE UNIT LTD.
22 Ryder Street, London, S.W.1. Whitehall 1511, Extension 144.

speeds the U.S.

Dollar!

The American dollar bill has become the quintessence of money value: a symbol, a standard . . . and a reality. Forgers know this. So the making of dollars is fenced round with stringent security measures: and their engraving and printing are so intricate, so exact as to put them clean outside the normal definition of fine printing. Such standards are met by few companies and Thomas De La Rue with their wide experience of banknote printing have for many years ranked high among them.

Some two years ago the *United States Treasury's Bureau of Engraving and Printing invited tenders* from all over the world for machinery capable of *maintaining* their present standards while considerably *bettering* their output and efficiency.

The contract, it is *finally announced*, goes to De La Rue, the world's largest printers of foreign currency. The new fully automatic machines developed by the Company will make available to the U.S. Treasury the most modern methods of printing currency at speeds which will double the present attainable output.

Behind the announcement of this award lie many months of technical demonstrations and transatlantic voyaging. The initial order will bring Britain 1½ million United States dollars—and further establish the supremacy of *British security printing* throughout the world.

THE BUSINESS WORLD

Mr Sandys's Shopping List

WHAT the Minister of Defence offered to buy and the Americans offered to sell by way of guided weapons during the recent talks in Washington will probably remain secret for some weeks. But when the details are announced it may help the layman to form his own opinion of the success of the mission if he has an idea of the choice of weapons that are available in the American supermarket for guided missiles—as well as the state of Mr Sandys's own larder at home.

The practice of calling every weapon with a rocket motor at one end and a warhead at the other a "guided missile" is slovenly but understandable. Top and tail, however, are the resemblances between the vicious little rocket fired from a fighter and the lumbering 40-ton weapon designed to fly 5,000 miles to its target. Missiles can most simply be classified by considering what kind of conventional weapon they are designed to replace. They may perform the same broad function as artillery; as aircraft cannon; as anti-aircraft batteries; or as bombers. To each of these roles, missiles bring their own special contribution in the form of increased range, because they carry their own motors, or of increased accuracy because they carry sentient electronic mechanisms that help to lead them to their target even when the target is attempting to evade them. The price of this extra range and accuracy is very high. In money, time and manpower, it costs as much and takes as long to develop a guided weapon as to develop a manned aircraft to perform the same function—some £20 to £30 millions, for example, for a fighter aircraft or for an anti-aircraft missile that does the same job.

Britain's defence machine is going through a difficult period of transition today. The replacement of conventional weapons by guided missiles in each of the four broad categories is accepted as inevitable; but the missiles themselves are not reliable enough to justify abandoning their conventional counterparts. It will be at least five years before real confidence could be placed in an air defence system relying wholly on missiles. Two parallel systems of defence, based on different technical principles, need to be kept in being for a considerable period.

This is the background against which Mr Sandys went to Washington. No attempt has been made in this country to develop either the "artillery" or the "bomber" categories of missile until recently, when work started on a long-range weapon. Five design teams made up of aircraft and electronics manufacturers are working on projects in the two middle categories, namely airborne and anti-aircraft missiles.

The first to go into production is the relatively elementary Fairey Fireflash, developed by Fairey Aviation, Plessey and E. K. Cole and described by the RAF as an airborne training weapon. It rides a radar beam to its target. Far more sophisticated, and reputed to be ahead of anything of the same type in the United States, is the airborne weapon developed by de Havilland and Mullard. This probably homes on the heat from its target's engines. After a period during which it was as easily distracted as a puppy, this has grown up into a well disciplined and reliable hunter. The three other projects are for anti-aircraft type missiles, one developed by English Electric, a second with a ram-jet as well as a rocket designed by a Bristol Aeroplane-Ferranti team and a third, designed by Armstrong Whitworth and the General Electric Company, which is for use on ships. A sixth project, far less advanced than these, is for a 1,000-mile rocket. Rolls-Royce has an agreement with North American Aviation that covers rocket motors big enough for a project of this kind; English Electric seems another probable contractor.

In the United States there are about forty guided weapons of various kinds under development or in service. Nearly three times as much money has been spent on developing them as was spent to develop the atom bomb. They have not all come along any faster than

in this country; the American missile programme has had its ups and downs; but work started several years earlier and this lead has never been lost. Most of the American weapons now in service date back to 1946-47.

Of the American weapons in the artillery category, Britain has already ordered quantities of the *Corporal* missile built by Firestone, with a range of 20 to 50 miles. This is guided principally by radar and an improved version is going into production. There is less interest in this country in the Douglas-built *Honest John* and its successor, *Little John*, which are rockets with 20-mile range and no guidance or in unmanned bombers that fly up to 400 miles. Of the airborne weapons available, the de Havilland-Mullard missile is believed here to have an edge over its American counterparts, the radar-homing Hughes *Falcon* and Sperry *Sparrow* (used by the US Navy) and the Philco *Sidewinder* which is attracted to its prey by heat. But work has recently been started by Douglas on a project, *Ding-Dong*, which is intended to have an atomic warhead. This, even if the guidance system is none too accurate, may still blast any bomber out of the sky.

The chief interest of Mr Sandys's mission, however, centres on the last two categories of missile. The Douglas-built *Nike* that has been set up in batteries around American cities is inefficient and needs huge ground services. But the less publicised *Talos*, originally designed by Bendix for the US Navy but now adapted for land defences, is an anti-aircraft weapon more formidable than anything available in Britain. Talos might become the standard anti-aircraft weapon of Nato. It seems certain that Talos batteries will be erected around the US Strategic Air Command's British airfields, which are at present defended for SAC by the Royal Air Force, and highly probable that the design will be built in Britain. Talos uses a combination of rocket and ram-jet, and its roots go back to 1945.

It is in long-range ballistic rockets that American work is so far ahead of anything contemplated in Western Europe. These are of two types. First, there is the rocket-powered Convair *Atlas*, weighing 40 tons and designed to fly 5,000 miles with a nuclear warhead, and its partner *Titan* built by Martin, described as a "back-stop" to Atlas and using the same components. Out of this has also come a project for a shorter, 1,000- to 1,500-mile missile, the *Thor*, built by Douglas. Thor's development has been rapid because it uses so many Atlas data and parts. This group of missiles carry a detailed plan of the course to their target; instruments in the missile check continuously how far the flight is departing from this ideal course and make their corrections. So does the medium range *Jupiter*, designed for the US Army by the V2 inventor, von Braun.

The other project is the North American *Navaho*, intended to have the same range as Atlas, but using a ram-jet engine to achieve it. Where Atlas climbs 800 miles above the earth before turning over to curve down on to its target, Navaho is designed to cruise at 90,000 feet, beyond fighter range but still with the atmosphere. Its guidance depends on steering by the stars—though when its purpose is considered there may be a touch of blasphemy in the term "celestial guidance." The Northrop *Snark*, which is designed to fly 4,000 miles at subsonic speeds (and recently lost its way on test), uses the same guidance. These formidable weapons are a long way from service and some months from full-dress trials. The performance figures quoted are those that it is hoped they will reach, not those that have been demonstrated under test. But there is little reason to suspect that they will fall far short of their designed capabilities.

In these warheads lies an obstacle that could rob an Anglo-American missile agreement of much of its value. Without the devastating explosive power of a hydrogen or atomic warhead, long-range weapons like Atlas, Thor and Navaho, and even short-range artillery ones like Corporal, are extravagant, unreliable toys. But the American Government is legally bound neither to sell fission or fusion warheads nor to release any information about their design. Corporal comes to this country without its warhead.

The heart of a fission or fusion bomb is not a wodge of uranium packed like TNT into the space the weapon designer has allowed. It is a carefully machined assembly in which the explosive charge consists of several components formed into shapes that have been worked out with great precision by scientists for each type of weapon. Each atomic and hydrogen warhead is tailored for its designated weapon. If, while providing data on guided missiles, and even the missiles themselves, the United States continues to withhold information about these warheads, all work on them will have to be duplicated laboriously in this country. If Mr Sandys has gained any concession here, the success of his mission will have exceeded expectations.

A Missile Glossary

Guided Missile. One of which the course can be controlled after launching and throughout its flight.

Methods of guidance. **Beam riding,** in which the missile follows a radar beam locked on to the target. **Command systems,** in which the missile is guided to its target by direct instructions from the ground. **Homing systems** in which **active** homing involves the missile tracking a target illuminated by ground radar and **passive** homing in which the missile picks up signals sent out involuntarily by the target.

Speeds: 2,000 mph or approximately Mach 3 are minimum speeds.

Power Plant. Solid or liquid fuelled **rockets. Ramjets** (simplified jet engines without moving parts and capable of high speeds) improve fuel consumption but restrict a missile's altitude because they need oxygen.

Fuels. Ramjets use kerosene. Solid fuelled rockets burn cordite. Liquid fuelled use mainly liquid oxygen or hydrogen peroxide with a hydrocarbon fuel such as kerosene.

Guidance systems. Entirely electronic. Preliminary ground radar forms an integral part of a missile defence system. Actual homing depends on a wide variety of "signals" sent out by moving target, whether manned bomber or unmanned missile. Radar emissions or reflections, heat, noise, vibration, static electricity, or ionised air around a target are all susceptible to electronic tracking—this makes defence against ballistic missiles theoretically possible. Ballistic missiles fly either by **celestial guidance,** using the stars, or **inertial guidance,** following a pre-set course with the missile correcting its own deviations. On nearing its target, **terminal guidance** may help it to home on, for example, the heat emitted by a city or a factory.

Warhead: severely limited in size by the high fuel consumption of rocket motors. A missile carries about ten times the weight of its warhead in fuel. Long-range missiles useless without atomic or preferably hydrogen warhead. Atomic warheads are being considered for anti-aircraft missiles; they would reduce the accuracy required in guidance. Missiles launched to attack other missiles also need atomic warheads in order to ensure destroying warhead of incoming missile.

Limitations. Guidance systems can be deflected by counter-measures taken by target. Early types of motors, rocket controls, and guidance mechanism were far from perfect, but are improving. Vibration is a constant danger to the electronic mechanisms in a missile.

EROSION OF THE TAX BASE—I

The Tax Skyscraper

TECHNICAL language often jargonises commonsense into obscurity, but the expression "the erosion of the tax base" which was adopted by the Royal Commission on the Taxation of Profits and Income expresses exactly the process from which many of our present fiscal discontents spring. Income is the classic measuring rod of taxable capacity; but income lacks precise definition and neither accounting practice nor fiscal law sets a clear boundary between it and capital. When tax rates were low, dispute about what was income and what capital was not serious. With present high rates the distinction between the two, arbitrary as it has to be, becomes fundamental. More important, the income tax is exposed (in the words of the Royal Commission) to the danger that successive concessions, designed to take care of special situations, will cause a progressive erosion of the tax base until its efficacy as an instrument of taxation is seriously weakened. Double taxation relief, capital allowances, fair treatment for losses, and relief for retirement benefits, are improvements, entirely justifiable in themselves, which have contributed to the whittling-down process. As the process continues, it leaves less income chargeable to tax and it pushes ever higher the rate of tax that is necessary to yield a given revenue.

Income is becoming increasingly uncertain as the tax base; indeed Mr Kaldor, its leading critic, has written: "Our present nominal rate structure would produce fantastic results if taxable capacity were measured directly into a sound vessel instead of through a sieve." Hence the search for an alternative. The greatest awareness of the problem is shown by the left who unfortunately think it can be solved largely by catching capital gains and countering avoidance. The real problem is much more serious; present rates of taxation have to be raised from too narrow a base. The consequences are all too evident. Those who can escape do so; companies, playwrights, and (TUC, please note) skilled technicians, emigrate. Those who remain have to be sheltered by a variety of expedients—initial and investment allowances, fringe benefits, and the like. The consequential fall in voluntary individual savings has to be counterbalanced by forced saving by the State through budget surpluses or by the ploughing back of profits by corporations. Taxes on personal incomes of the order of £15,000 million produce £2,300 million, a flat rate of 3s. 1d. in the £; a standard rate of 8s. 6d. and a maximum rate of 18s. 6d. seem excessive for so modest an average.

Historically, erosion can be said to have started from the exemptions from tax designed to encourage saving. Relief from income tax for life assurance premiums is over one hundred years old. Tax-free interest has been paid on national savings certificates since the first world war and Mr Macmillan extended the principle to post office and trustee bank interest in his last budget. Employees contributing to approved superannuation funds have enjoyed relief since 1921 and this relief, too, was extended last April to enable the self-employed to get tax exemption on the premiums they pay to provide for their own retirement. All these reliefs are offered for particular forms of saving, and not to savings generally. An individual may, indeed, qualify for all of them and yet actually be dissaving. They all involve the principle of an expenditure tax, charging a differential rate on income according to use to which it is put. The Royal Commission found no principle of equity to support such tax preference for personal saving, and it might have been more outspoken on the point if it had foreseen the extension of tax-free interest which was to come. Savings may be a good thing, but particular forms of tax preference for them ought not to be allowed to erode the tax base further. Many would prefer to be encouraged to make their own savings in their own way if a lower standard rate of tax allowed them room.

Battering by the waves breaks down cliffs and fertile land is lost for ever in the sea; so also a permanent loss

of taxable capacity results from nationalisation. The nationalised industries are expected to pay their way and there is general agreement with the Royal Commission's view that they should bear a proper share of taxation in common with other corporations. But their prices are "political" and their enterprise varies; the result is less income to be taxed. Last year the turnover of the Central Electricity Authority exceeded £380 million. What would its tax bill have been under private enterprise—£20 million or 1 per cent of the yield of the income tax? Last year the United Kingdom tax bill of a single oil company amounted to £8.7 million. This comparison does not touch the merits or demerits of nationalisation; but once incomes are removed from the private sector to the public sector of industry and accorded different tax treatment the burden on the private sector must be increased.

One of the newest forms of tax erosion arises from the non-distribution of corporate profits. The retention of profits on a large scale is a post-war development. By 1955 such retentions amounted to £1,500 million, after tax had been paid on them; if they had been paid out as dividends the gross distributions would have been twice as large. Here must lie one main explanation of the lagging yield of surtax. The modest increases in the number of surtax payers from 105,000 to 259,000 between 1938 and 1955, and in the yield from £59 million in 1939-40 to £126 million in 1953-54 (in spite of steep increases in rates) offend the evidence of one's eyes. There are no statistics to show the amount of surtax that is lost because profits are not fully distributed. The 1955 report of the Inland Revenue put the total investment income of surtax payers at £407 million. A broad, but not a wild, guess shows what is at stake. Take the gross undistributed profits of 1955 at £3,000 million and assume first that one half of this was paid out in dividends and secondly, that one-half of these dividends went into the pockets of surtax payers. The total increase in surtaxable income would be £750 million. If this paid tax at 3s. 6d. in the £—the rate applicable to incomes between £3,000 and £4,000—it would yield £131 million—as much as the present surtax revenue.

Ploughing back is commonly reckoned to be virtuous and is encouraged by the Government. It provides a fund of saving which is thought to be greater than would be the saving by individuals if larger dividends were paid. With incomplete logic, Labour Chancellors supposed that ploughing back was an instrument to control inflation; their policy reinforced both the distaste of their supporters for dividends and the inborn predilection of many industrialists to hang on to their profits (until frightened by a take-over bidder) by introducing heavy profits tax on dividends.

The Inland Revenue is well aware of the loss of surtax which follows the retention of profits by corporations. As long ago as 1921 legislation was aimed at private companies that did not pay reasonable dividends; before the war one of the main worries of directors of successful private companies was to escape a "surtax direction." In 1948 the contradiction between exhortations to follow a conservative dividend policy and the long-standing provisions by which private companies could be charged to surtax on the ground that they had distributed too little led to the Cripps "umbrella"; this undertaking still gives protection to most private trading companies.

Retention of profits by both private and public companies has led to many contradictions and distortions. It has facilitated the expansion of existing companies at the cost of denuding the capital market of funds for financing new enterprises. Limitation of dividends has kept the market prices of shares below their true values, and thus encouraged the activities of the take-over bidder. The expansion of assets, and of profits in consequence, has gradually led to an increase in share values. Undistributed income, after paying income tax and profits tax at the lower rate, has been transmuted into capital, and has never entered into individual surtax returns. Hence the investor's emphasis on "growth" stocks; hence also the campaign for a capital gains tax to catch the fish which escape the surtax net.

In this context, it is blind to deny the case that can be made out for a capital gains tax. But allowing that case, serious objections remain. Capital gains can result from other elements beside retained profits—from the goodwill accruing to successful entrepreneurship, for example, which has a claim to be pure capital. Some paper gains are not true gains at all; the growth of the value of assets resulting from inflation certainly has no real taxable capacity. It would be doubtful wisdom to saddle the Revenue and the taxpayer with another highly complicated tax involving considerable administrative difficulty, offering the prospect of a modest and uncertain yield.

What is the alternative? Would it be just to remove the protection of the Cripps "umbrella" from private companies and leave public companies unaffected? It is unthinkable technically that anything like the surtax direction procedure could be applied to public companies. Does not logic point to putting the profits tax arrangements into reverse? Instead of charging distributed profits at a high differential rate, let undistributed profits bear the burden. An encouragement to distribute, with a charge in lieu, as it were, of surtax on profits not distributed, would promote a more rational system of savings, widen the basis of income on which tax is levied, and thus lead to a scaling down of rates. The increase in dividends, and hence of share values, which would result would no doubt cause the left much more sorrow than the increase in surtax yield would bring joy. But the insulation of £3,000 million of profits from any charge to surtax now creates a dust-bowl of taxable capacity. The consequences of this and of other examples of tax erosion will be examined in a second article.

(To be concluded)

Business Notes

Bank Rate: 5 Per Cent

BANK rate came down on Thursday by ½ per cent from the high level of 5½ per cent established almost twelve months ago. Having disappointed market hopes several times since the turn of the year, the Bank in the end succeeded in again achieving a measure of surprise. Hopes of a Bank rate reduction had been most clearly apparent in the sharp fall that had occurred in the Treasury Bill rate since early December, from nearly 5⅛ per cent to under 4⅛ per cent; but in recent weeks the authorities have been trying to put a brake on this movement, and that had suggested to some observers that the reduction was not, after all, imminent. The hesitancy of the authorities in following the market movement, it is now clear, was due to fears that the reduction would be construed as a "green light" for the economy implying that the need for disinflation had diminished. This, emphatically, is not the signal that the lower Bank rate is intended to give. Its avowed purpose is to change the technical character of the monetary effort to achieve disinflation, and perhaps thereby to make it more effective. The role of Bank rate, it is now argued, has become exaggerated since its use was revived in 1951—it has become a grand signal rather than a flexible technical instrument. For this change in the public's attitude to Bank rate the authorities have only themselves to blame—the traffic light metaphor was their own invention—but it now seems that they are seeking to educate the public out of its excessive regard towards Bank rate.

★

Whether these purposes can be achieved without untoward effects will depend less upon the way in which this Bank rate easing is publicised than upon the manner in which monetary technique is now developed. The underlying principle, evidently, is that effective credit control depends upon tautness in the liquidity ratios of the banks; this tautness requires due control of the supply of liquid assets—mainly Treasury bills— and this in turn requires a market condition that enables the Treasury to finance itself more by sales of medium and long-dated stocks and less by bills. A reduction of money rates, consolidated by the cut in Bank rate, may promote this technical objective. But it will not achieve the fundamental purpose of keeping credit restraint at least as effective as before unless the sale of stocks is pressed relentlessly forward, thus putting a brake on any rise in the gilt-edged market. In principle, effective control certainly can be achieved by these means; but it has to be remembered that at one point the restraint indubitably has been eased—by the consequential reduction in the rates charged by the banks on loans and overdrafts. If that reduction goes hand in hand with a further significant fall in gilt-edged yields, the authorities will find it all the more difficult to persuade the public that they have not indeed given a green light.

Impact on Money Rates

FOR the present, at least, these precepts seem to be well in mind. The Chancellor, when questioned in the House after the Bank rate reduction, emphasised that, so far from being a "signal for bankers or others controlling sources of finance to relax credit or to ease restrictions on lending," it was "designed to enable the Bank of England to maintain the full effectiveness of monetary policy." Moreover, so long as there was need for restraint in order to make room for exports and essential investment, "we shall continue to make full use of the interest rates to discourage spending and to encourage saving"—to which assurance the Chancellor added the reminder that an effective monetary policy is concerned "not only with the Bank rate but with the market operations associated with it."

If these principles are to be successfully followed, and if the risk of giving a green light is to be cut to a minimum, it is important that the Bank rate move should not be allowed to touch off a further substantial fall in rates—even within the money market. It is not yet sure, however, that such a response will be avoided. Inevitably, the move was immediately followed by a corresponding fall in the basic banking rates that are keyed to Bank rate. The clearing banks' interest allowance on deposits subject to seven days' notice was reduced from 3½ to 3 per cent, and their agreed minimum charge for short loans to the money market came down from 3¾ to 3½ per cent (this rate is in practice applicable only to a portion of the banks' loans to the market, the so-called "regular" money). It was naturally impossible to gauge on Thursday what the consequential effect would be on the following day's Treasury bill tender. Since the Treasury bill rate was already, before the Bank's action, almost 1 per cent below Bank rate, it was arguable that it ought not to fall much further, and certainly should not drop by the full extent of the Bank rate reduction. First indications suggested that it was likely to fall by around ½ per cent, and possibly by rather more than that. On a slightly longer view of the course of rates, much will obviously depend upon the behaviour of sterling. It is impossible to attach great importance to Thursday's small movements in sterling: the spot rate against the dollar was edging gently down before and immediately after the Bank rate announcement; but it recovered to close at $2.78\frac{13}{16}$.

Stage Set for Funding

If there ever was a Bank rate move that City markets could take in their stride, this week's was the one. Markets had been signalling it for weeks through the strength of gilt-edged, and Stock Exchange betting on Thursday morning varied between even money and six to four against. They seldom get closer than that in picking a particular Thursday. So markets took the reduction in their stride. The move was well managed, too; immediately on the announcement the market learned that the Government broker was a potential seller of substantial quantities of a list of long-dated and irredeemable stocks at prices unchanged from Wednesday. As some of his prices were nevertheless a fraction above current market prices there was still room for small advances. But broadly the Bank of England has pegged at least temporarily long-dated stocks against a rise, and that clearly is its way of saying "No green light."

* Ex-dividend. Gilt-edged prices are shown net.

Market reactions therefore were confined to a tiny rise in long-dated gilt-edged, a fairly substantial rise at the short-dated end of the gilt-edged list, a modest rise in industrial ordinary stocks, and it contributed to the rally in metals. The table shows some of the salient movements on Thursday which was not as it turned out a day of big business. One amusing side line was the two new corporation stocks —Walsall's issue of £2 million 5¼ per cent stock 1967-69 at £99½, and Dundee's issue of £1¼ million on identical terms. Lists for both had opened and closed on Wednesday, and both had been casualties in the small market recession of the first half of the week, underwriters of the Walsall issue having had to take up 75 per cent and underwriters of the Dundee issue 69 per cent. When both stocks opened on Thursday morning at 10s. discount, with only £10 per £100 paid, they became ideal deep Bank rate hedges. Each of the scrips closed at ¼ premium: the speculators had relieved the underwriters.

Naturally not all the interest rates that hang more remotely on Bank rate are yet clearly defined. The Building Societies Association was ready with its now familiar statement. The fall in Bank rate will have no immediate effect on the rates paid and charged by the societies. Whether it will ultimately have an effect depends on whether the decrease leads to a general reduction in interest

rates. Oddly, the societies have not pointed out, as they might have done, that the increase in their own rate of tax now makes it unusually difficult to adjust down to a minor reduction in interest rates. There are still some doubts, too, about the rates that stock jobbers will have to pay for bank accommodation. On the assumption that these will come down by ½ per cent to about 4¼ per cent for gilt-edged jobbers and about 5½ per cent for industrial jobbers, the cost of carrying a jobbing book will be materially lightened, with consequent benefit to the breadth of the market.

Another factor that should make for better markets is the acceptance of the view that heavy selling by Government Departments is better achieved on a firm market than on a depressed one. The third, and perhaps most important influence, is the present market frame of mind that already talks of the 5 per cent Bank rate as just a step towards 4½ per cent. Against these influences the "No Green Light" slogan is not going to be easy to sustain. It will need to be sustained by a refunding issue by the Government itself though perhaps not immediately. Despite the brave front that offered a wide range of long and irredeemable stocks on Thursday the market is beginning to feel that the Government broker may soon have little beyond Treasury 3½ per cent 1979-81 and Conversion 4½ per cent that he can still regularly offer.

Gold and Oil

The gold figures for January were the best for any month since Colonel Nasser's seizure of the Suez canal at the end of July; and after some initial confusion, they were recognised as such by the exchange market, sterling again momentarily touching its parity of $2.80. The reserves fell by $49 million; but no drawings have yet been made on the line of credit with the Export-Import Bank, nor on the standby credit with the International Monetary Fund. After taking account of defence aid of $4 million, there was thus a dollar deficit of $53 million; the comparable deficits net of special items were $218 million in December, $313 million in November, $91 million in October, $128 million in September and $119 million in August.

THE PRESSURE ABATES

($ million)	EPU Settlement*	Direct Dollar Balance	Aid and Special Payments or Credits	Change in Reserves	Reserves at end of Period
1956—					
August	−51	− 63	− 10	−129	2,276
September	−34	− 94	+180†	+ 52	2,328
October	−23	− 63	+ 7	− 84	2,244
November	−23	−235	+ 34‡	−279	1,965
December	−49	−169	+386§	+163	2,133
1957—					
January	−17	− 36	+ 4	− 49	2,084
February	+19				

* Relates to balance in *previous* month. † Includes $177 mn. from sale of Trinidad Oil. ‡ Includes $30 mn. from official sale of US government bonds. § Balance of drawing of $561 mn. from IMF, defence aid of $6 mn. and end-year instalments of $181 mn. on US and Canadian postwar loans.

Furthermore, $17 million of last month's deficit was attributable to the gold settlement of the December deficit with the European Payments Union; the January balance with EPU came out at a surplus of £9 million—the first surplus since May last, which will this month bring in a gold receipt of $19 million. Reckoning the EPU settlement to the month in which it relates, the true deficit for January is only $17 million—compared with the massive deficits of $178 million in December and $334 million in November.

The new year recovery, foreshadowed by sterling's progress in the market, reflects the virtual ending of the speculative attack on sterling. The gold figures seem to confirm the impression from the markets that the capital account was probably near neutral last month. The small net dollar deficit was the resultant of a belated surplus on normal sterling area transactions—stultified earlier by the speculative leads and lags—and of the special payments for dollar oil.

Those payments have been estimated to be running at around $30 million a month on account of Britain's requirements alone; in January they may have fallen somewhat short of that figure, as supplies from the Western Hemisphere lagged behind expectations. But further dollar expenditure was being incurred on Western Hemisphere oil for re-export to Western Europe. Thus in effect the Treasury is financing oil imports 100 per cent in dollars and being reimbursed through EPU for exports of refined products to Europe 75 per cent in dollars.

£30 Million for Tankers

Three exacting parties have been satisfied in the formation of Tanker Finance Limited. This new company, formed under the auspices of M. Samuel and Co. is purchasing £30 million of new tankers, which are building for the Shell group in British and European yards and are being delivered during the next three years. It provides, that is, a block of long-term finance for tankers that leading spokesmen for the Shell group have repeatedly urged the City to undertake. There have always been difficulties, concerning not the security but the shape of such an investment; to the banks a loan over the life of a tanker is unthinkably long and to the insurance offices and pension funds it is unattractively short, averaging ten years over a twenty-year life.

These problems are neatly solved by the new company. The sponsors have arranged, in conjunction with Hoare and Co. and Joseph Sebag and Co., for Tanker Finance Ltd. to borrow £22½ million from the institutions and £7½ million from Lloyds Bank. The institutions' money will be repaid by a cumulative sinking fund over a period from the ninth to the twenty-fourth years, giving an average life of 17.8 years. The bank money will be repaid over the first eight years by equal annual instalments. Both the institutional and the bank loans will be secured pari passu by a mortgage on the ships and on the charters that the Shell group is to enter into for periods of twenty-four years at fixed rates of hire. Shell will be responsible for working the ships, and at the end of the mortgage period, the tankers will revert to them.

In effect, therefore, the arrangements amount to a rent charge on the security of Shell—which is in itself an attractive proposition. Tanker Finance Ltd will own the ships; Shell will charter them; and the charters will be arranged to balance precisely the service and repayments of the loans. Shape and security will thus march together in a new form of financing that is likely to set a precedent for similar operations in future. The information given about the scheme does not disclose what the effective rate of interest will be; nor does it specify at what rate the loans will be taken up. To satisfy both borrowers and lenders (on an excellent but non-quoted investment) the rate may presumably lie in the range of 6½ to 7 per cent. And the money, presumably, will be provided by instalments over a period of three years or so as the tankers come into service.

Fuel Oil Prices

Since the price of fuel oil in Britain was raised by 3½d. a gallon on December 4th the basic price of Bunker "C" fuel oil in the Caribbean and the Gulf of Mexico has risen by a further 40 cents a barrel, equivalent to nearly a penny a gallon. Heavy Venezuelan crudes which have a high fuel oil yield have risen by 25 cents a barrel since December 4th, and the Texas and other American crudes by an average of 35 cents a barrel. Crude oil prices in the Middle East have not risen in line with the Caribbean—indeed because of the enforced haul round the Cape they are no longer competitive with even the highest priced Caribbean and Texas crudes delivered to the US east coast or to Western Europe. The other emergency costs—the re-routing of tankers for the longer haul round the Cape, the higher level of freight rates, and the higher refining and inland distribution costs per gallon of oil handled—are still as high as they were in December. It is therefore clear that oil companies in Britain are absorbing at least part of the increase in basic prices that has occurred since December. How long this restraint will continue must depend on their assessment of the longer term outlook for fuel oil prices.

The ceiling for fuel oil prices in Britain is set by the cost of importing marginal supplies from the Caribbean. The Caribbean price, in turn, must be competitive with US Gulf crude delivered to refineries on the east coast of the United States. The effective limit to that price is set by the need to remain roughly competitive, on a thermal basis, with the price of local American coal. This limit appears to have been reached, if not exceeded in places, and as America is already half-way through the season of peak winter demand, the price of fuel oil there is unlikely to rise much further, even if competition from coal would let it.

The first basic price relationship to be settled after the Suez Canal and Mediterranean pipelines are reopened will be that between Persian Gulf, Caribbean and US Gulf crudes. One of the main factors governing this will be the extent of any restrictions that may be imposed on the import of crude oil into the United States. If the present Persian Gulf price is unchanged, and tanker freights fall substantially with the return to normal trading, and if no barriers are raised against the import of Middle East oil into the

United States, it could undercut the new US Gulf price, and perhaps bring this and Caribbean prices down. As Middle East supplies improve the European demand for crude and fuel oil from the Western Hemisphere will decline and some of the recent exceptionally high demand for bunker fuel oil (for ships carrying coal, for example) may also fall off. Now that consumers have been starkly exposed to the risk of interrupted supplies inherent in any decision to switch to fuel oil, the European demand for fuel oil may not continue to grow at its recent remarkable rate. But the problem of refinery balance in Europe, with fuel oil short and low grade petrol over-plentiful, seems likely to persist. To alleviate it, the oil companies will still be forced to obtain quite substantial quantities of fuel oil from the Western Hemisphere. On balance, the pressure on fuel oil prices may ease—but not by much.

The Shrinking Surplus

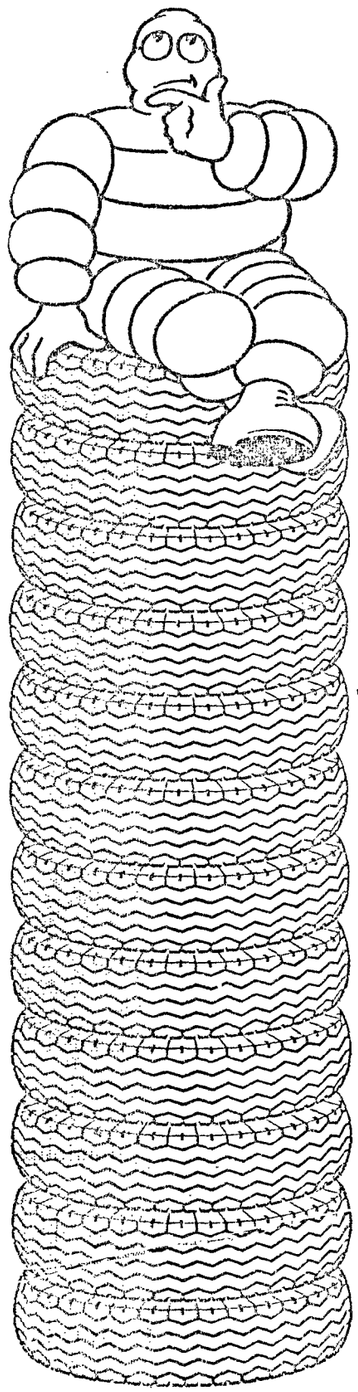
It is now certain that the out-turn of the budget for the current year will fall far short of the hopes expressed by Mr Macmillan shortly after the Suez cease-fire, and it is even questionable whether it will match the more conservative forecast made a few weeks later. On the first occasion Mr Macmillan hoped that his originally estimated above-line surplus of £460 million would be "largely realised"—except to the extent of an estimated £35-50 million of Suez expenditure. On the second occasion he expected the total out-turn of the Exchequer accounts—including the "below-line" items—to better the budget estimates. These estimates, it should be recalled, did not take credit for the £100 million of economies that were promised in the budget speech. Now, up to February 2nd, the above-line account still shows a cumulative deficit, of just under £14 million, whereas at the corresponding date last year there was a surplus of £271 million. This deterioration of £285 million contrasts with the improvement of £63 million provided for in the budget—before crediting the £100 million. If in the remaining weeks of the fiscal year net receipts are no larger than in the same period last year (in the past five weeks they have been smaller), the final above-line surplus will be little more than £100 million. This week the Treasury issued civil supplementary estimates totalling £94½ million and a Ministry of Defence estimate of £1.7 million; this follows last week's supplementary for the Army of £39 million. The net revision in the supplementary estimates comes to £107½ million.

Some consolation for this depressing performance can, however, be found in the below-line account. Because of the new procedure for financing the nationalised industries direct from the Exchequer, net below-line expenditure was expected to rise from £538 million to £803 million: up to date, it has fallen by £42½ million, to £449 million. The main influence here has been the extraordinarily sharp reduction in net borrowings by local authorities from the Public Works Loan Board. These demands had been expected to fall in the full year from £297 million to £176 million; actually, they have so far fallen from £292 million to only £67 million—£109 million of new borrowings being offset by £42 million of repayments. The other big factor has been the lag in the new system of financing the state boards; up to date they have absorbed £218½ million, compared with the £350 million originally expected to be provided in the full year. At present, therefore, the overall account shows a deficit of £463 million, or £242 million more than at the similar date last year, whereas for the full year the expected deterioration was £202 million.

More Goods by Rail

There has clearly been some transfer of traffic from road to rail since fuel rationing began, but it is not possible yet to measure it in any precise terms. The Ministry of Transport has produced some rough estimates prepared with unusual haste by the Transport Commission about rail tonnages last week—it normally takes a month for full returns to be ready—and these suggest that the shift so far has been quite small. General merchandise traffic in the week to February 1st is thought to have been about 8-9 per cent higher than in the comparable week last year, minerals traffic about 3-4 per cent higher, and coal traffic—where there was probably less room for transfer—about 2 per cent up. In total the increase in tonnage may have been about 3-4 per cent; but the order of increase in ton mileage—which would be a better measure of fuel saving on the road—will not be known for several weeks.

But even if these gains are entirely due to fuel rationing, they still fall a long way short of what was thought likely. Tentative estimates in these columns a month ago suggested that, even with a 15 per cent saving in fuel by all road goods vehicle operators, about a tenth might still have to be added to present rail tonnages by transfers from the road throughout the period of rationing, and slightly more of the ton mileage. There may have been room for fuel economy in road operations of more than 15 per cent; but the next few weeks should show whether rather more road traffic will have to be transferred. All the fuel set aside for the issue of supplementary rations has now been allocated to the 211,000 goods vehicle operators that applied—about half the total but roughly the number the Ministry expected.



The switch in passenger traffic has been more marked, however. Last week the railways carried about 20 per cent more passengers than a year ago; and London Transport reports an 8 per cent increase in train journeys and a 6 per cent increase in bus journeys. Most urban public transport operators have experienced an unaccustomed ease in running with the decline in private traffic and the disappearance of congestion. Sir John Elliot, Chairman of London Transport, has argued, as was to be expected, that "it would be a stupendous piece of folly if the biggest real improvement in travel conditions since the war were thrown away." But neither fuel rationing nor any licensing system of private traffic are adequate solutions of the problem of urban congestion, and the report the Ministry of Transport has asked the Road Research Board to prepare of traffic conditions in London during rationing is unlikely to reveal any better solutions than the ones the Minister has already been offered.

Accounting problem:

HOW COULD MICHELIN DISCOVER THEIR OVERALL STOCK POSITION *AT A MOMENT'S NOTICE?*

28 LEDGERS, one for each depot *plus* one for Head Office, had to be referred to before Michelin could discover the overall position for any one of their 900 items of stock. As the demand was increasing, this meant depots got dangerously low in certain items and costly last-minute transfers often had to be made.

Like many firms, big and small, faced with this kind of problem, they called in Burroughs.

SOLUTION. In co-operation with Michelin, our representative evolved a complete system, from the collecting and summarizing of original data to the storage of the final records; this system was based on six Burroughs Sensimatics. All movements of stock—despatches, sales, transfers—are recorded by the Sensimatics in such a form that the machine Supervisor can find out *within seconds* the stock position for any size of tyre. Total in the Company's possession, quantity in Central Stores, total out at depots, total in individual depots—all available at a glance. The result is more effective allocation of new stocks, fewer emergency transfers, and infinitely quicker returns of monthly figures.

HOW BURROUGHS MIGHT BE ABLE TO HELP YOU

How many of your staff are engaged in figure-work? How long does it take you to get the figures you want? Are the figures always accurate when you do get them?

Burroughs Accounting Machines will do this figure-work for you without tying down a lot of staff *and* do it far more speedily and far more accurately. Burroughs make machines suited to every size of business and you have everything to gain by consulting them.

They will advise *against* buying one of their machines if they don't think you need one. Their advice, of course, is free. The local Burroughs office is in the phone book, or you can write direct to London if you prefer.

The most experienced manufacturers of Adding, Calculating, Accounting, Typewriter-Accounting, Statistical and Microfilm Equipment

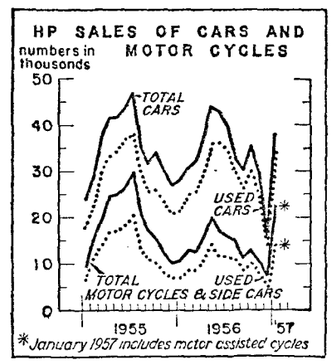
BURROUGHS ADDING MACHINE LTD., 356-366 OXFORD STREET, LONDON, W.1

National Provincial Capital

ANOTHER of the big banks is to simplify its capital by getting rid of uncalled liability and establishing a single class of fully-paid shares. The National Provincial Bank has at present three classes of capital, which rank *pari passu* for dividends, only one of which is fully paid—the £1,170,000 of £1 shares. The other two classes comprise 600,000 "A" shares of £5, on which only 14s. is paid up and 7,889,420 "B" shares of £5 on which £1 is paid; of the uncalled portions £3 6s. 8d. in each case represents reserve liability. The bank proposes, subject to the assent of the Court as well as of shareholders, to cancel the whole uncalled liability on these classes and then to consolidate the resultant paid-up units into £1 fully paid shares. This operation should improve the marketability of these classes. The board also considers that the scheme should "recognise" the "better marketability" at present enjoyed by the existing £1 (fully paid) shares. It therefore offers them a one-in-fifteen free scrip issue from the share premium account—which seems a generous rating of the counterpart of what is being done for the "A" and "B" classes.

After this change, all three classes are to receive a one-in-ten bonus from the share premium account (making the total draft on that account £1,033,742, out of £1,144,950). The aggregate capital of all classes will then be £10,513,162 all in £1 fully paid shares. This compares with a present paid-up capital of £9,479,420. The directors hope to maintain in 1957 the 18 per cent dividend paid for 1956—"subject to the maintenance of satisfactory profits and in the absence of unforeseen circumstances." On this basis the effective return to the "A" and "B" shareholders will be increased by one-tenth, and that to the existing £1 shares by slightly more than one-sixth. There would seem to be room for controversy about a difference in treatment as perceptible as this.

Retail Trade Picks Up



RETAILERS ended 1956 in a rosy Christmas glow. In November and December came the first signs that customers were becoming either accustomed or resigned to higher rates of purchase tax and hire purchase restrictions, both by then nearly a year old. In November the value of retail sales was five per cent higher, and in December seven per cent higher than in the same months of 1955, a year when the autumn budget had first sent customers through the household departments like locusts to clear them of goods at the old rates of tax, and then induced a frame of mind in which customers almost boycotted those same shops. The rising volume of hire purchase business now being transacted probably explains why, furniture sales, for example, rose 12 per cent in December and the multiple furniture shops' share rose 16 per cent—these shops had been the worst hit by hire purchase restrictions. Radio and cycle shops reported as much as 20 per cent more business. Compared with this, business in clothing, which formed the backbone of trade during most of 1956, was ticking over with a mere 5 per cent increase, and for once the multiple clothing chains failed to set the pace for the others. Christmas is often the time when department stores come into their own, and their sales were 9 per cent higher than the year before.

Taking the year as a whole, the Board of Trade estimates that the steady 5 to 6 per cent increase in retail spending did represent a small increase in the volume of goods sold as well as an increase in their prices. But at this stage the shift in trade between different departments probably interests retailers much more than its average level. In the past few years customers have played an infuriating ding-dong game between durable consumer goods (bought on hire purchase) and "soft" goods like clothing and textiles, leaving alternate departments comparatively empty for months at a time. December's revival in household goods must have many traders wondering whether this is the start of another pendulum swing.

Hire Purchase Boomlet

AT the turn of the year the minimum hire purchase deposit on most types of motor vehicles was dropped from 50 per cent to 20 per cent—a concession by the Treasury and the Board of Trade that, it was thought, looked big but would have small effect. Hire purchase of consumer durables was rallying from the swingeing restrictions imposed in February, 1956, but in the motor trade petrol was rationed and dearer; second-hand car prices and public confidence were both low; the public, it seemed, might make only a limited use of the easier terms.

Hire purchase contracts in January, normally an inactive month in the motor business, provide occasion for thinking again. Private cars hire purchased totalled 38,232, well over twice the December figure of 16,537 and over a third more than in January last year. Most of the increase was as expected in second-hand cars, but the rise was from 14,105 in December to no less than 34,086 in January; there was also a modest recovery in hire purchase sales of new cars. Motor cycles and side cars show the biggest jump — no fewer than 22,639 contracts recorded compared with 7,285 in December and 10,807 in January last year; here is evidence of the rapidly growing popularity of motor scooters (and also of the inclusion of power-assisted cycles in the figures for the first time).

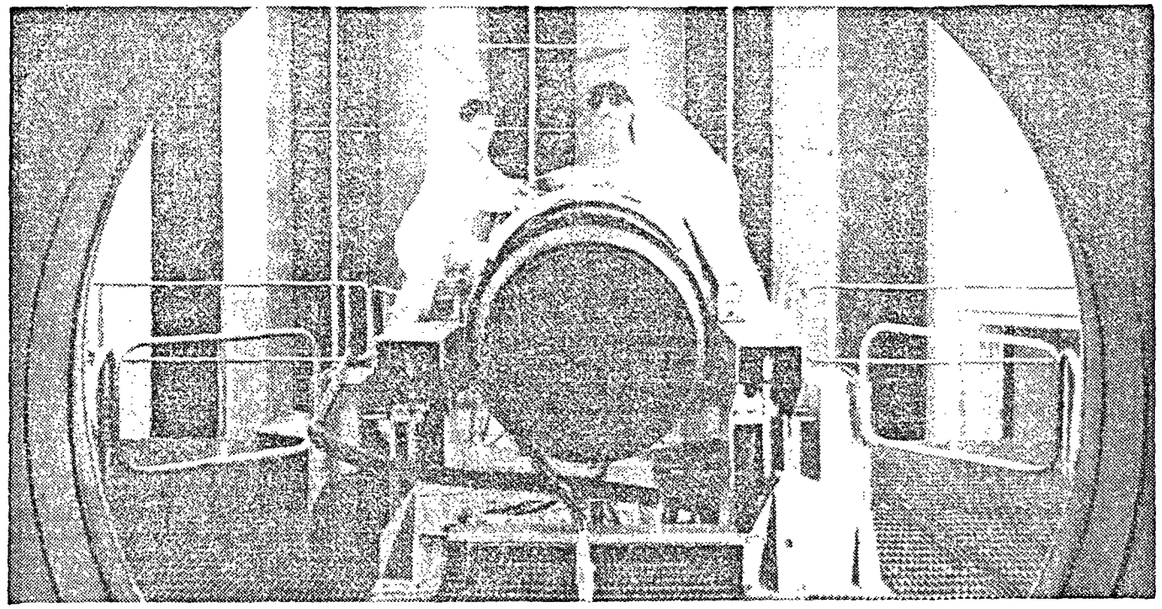
January's figures must contain some contracts held over from November and December, and perhaps some element of anticipation by people who have been tempted by low prices to buy early a second-hand car for the summer.

Perhaps some have even bought a second vehicle for the sake of its petrol entitlement. These are transient influences and they may be less than the full explanation of January's recovery. Will the next few months show that motor hire purchase, like the hire purchase trade of the retail shops, has passed the trough of its decline and resumed its long term rise? This would have been an opportune moment for the Government to produce its promised bill on hire purchase finance—if it had been ready.

Vanadium Bids

VANADIUM, used in steel making, in high-temperature alloys and in the construction of nuclear power stations, is a rare metal. Outside the United States the big producing area is South West Africa, where the South West Africa Company (SWACO) mines the metal in association with lead at three small mines and has exclusive rights in the development of any vanadium-bearing ores discovered in an area of 3,000 square miles. Vanadium may not be the major source of SWACO's profits, but its industrial and strategic importance is the key to the two bids which have been made for the 531,807 13s. 4d. shares of SWACO. These have been changing hands on the London market at over £5 this week.

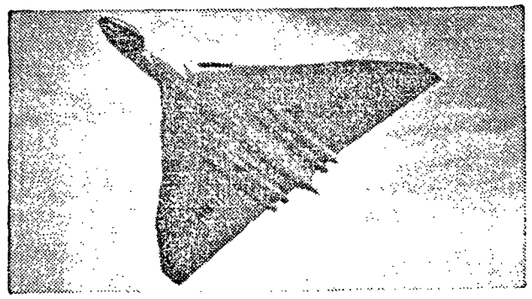
The first bid came from Tsumeb, a company mining copper, lead and zinc in South West Africa; a majority of its 4 million 5s. shares (which are not quoted) are owned by American mining interests. The offer was of one Tsumeb share plus 20s. in cash for every four SWACO shares. This offer requires acceptance by holders of not less than 75 per cent of SWACO's shares. If Tsumeb gains control it will apply for a transfer of SWACO's domicile to South West Africa (with obvious tax benefits) and for a London quotation for the Tsumeb shares issued to SWACO shareholders. In Throgmorton Street a tentative price range of £18 to £22 for the Tsumeb shares (on which an interim dividend of 35s. has already been paid) has been suggested; but it has been questioned whether a free market could be established on the basis of the small number of shares released by the bid. The second offer came from a group made up of New Consolidated Gold Fields (apparently as the senior partner), the Anglo American Corporation and the British South Africa Company. It is of £5 per share for two out of every three shares in SWACO, thus leaving each shareholder with a continuing but minority interest in the company (but again with a narrow market unless more shares were released). No change in SWACO's domicile is contemplated by this group.



The arithmetic worth of the two bids does not appear to be greatly different. The future of SWACO may be decided more by the Treasury's attitude towards a change in domicile (it refused SWACO's own request for such a change a few months ago) and control than by straightforward investment considerations. There are already close links between Tsumeb and SWACO: 95,000, or 2.37 per cent, of Tsumeb's shares are owned by SWACO; recently Tsumeb and its associates have bought SWACO shares; and the two companies, whose properties are in the same area, have an agreement on prospecting. A spokesman of Tsumeb has said that if his company's bid were successful SWACO's vanadium would continue to be sold in this country for sterling. He is right to emphasise this point, for vanadium colours and may in the end decide the issue.

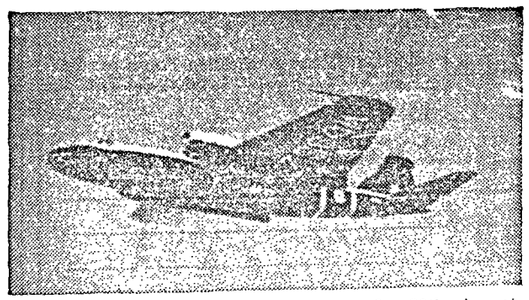
The Support Costs of Coal

IN common law as in common sense, property on the surface of the land used to have an absolute right not to be disturbed by tunnelling underneath; but in history, this right of support or compensation for damage was often disposed of by landowners along with the original permission to take minerals from beneath their land. Colliery owners, and the National Coal Board that succeeded them, could therefore argue that they had paid "once for all" for any succeeding disturbances of the surface, and the damage that these might cause. Legislation during the last hundred years gave certain authorities the right to prevent the working of coal under their property, but on the other hand made it possible for a private owner's common law right of support to be overridden, on payment of compensation, "in the national interest." When the ownership of coal in the ground was nationalised (in 1938, eight years before the mines were), the "right of support" of surface property was converted into a right to compensation.



The Coal Board took over ownership of the coal as well as the collieries: it succeeded to a mixture of rights to mine without further compensation for subsidence and of obligations to support or compensate property-owners if it did not. A committee, reporting on mining subsidence in 1949, recommended that new over-riding rights to compensation, regardless of what existed or had been sold before, should be created: but that the Exchequer should make a grant to the Coal Board covering the extra liabilities, theoretically already paid for once, that this imposed on them. In 1950 the Labour Government extended this principle to small houses affected by subsidence, but granted the NCB only half of its costs under the extra liability. The Coal Mining (Subsidence) Bill that had its second reading last week proposes to extend the over-riding right to compensation to all owners of surface property: but to make the Coal Board and hence the coal consumer pay all the compensation for subsidence.

In the Commons last week the Government and the Opposition took up wholly predictable positions of "principle" on the question of where the liability should be borne. Only Sir Hugh Lucas-Tooth broke the neat party division by arguing that the Exchequer might bear the cost of the subsidence for which the Coal Board or its predecessors had paid once already—though the NCB should bear the cost of new liabilities for future subsidence, as the bill provides. More conventional party supporters managed to blur the logic of this distinction: Conservatives averred stoutly that this was an entirely new obligation to avoid nuisance that they were placing upon the industry, as they had done on others, and Labour supporters, grumbling darkly that "this wouldn't have been done to the coal-owners," managed to convince themselves that the taxpayer ought to bear the burden of new as well as old obligations to make good damage due to the subsidence caused by mining coal.



Olympus in test cell at Bristol. Olympus engines in development have already run at observed thrusts well in excess of 16,000 lb, emphasizing the fact that the Olympus has the greatest development potential of any engine of its class.

BRISTOL OLYMPUS COMPLETES TEST AT WORLD'S HIGHEST RATING

Olympus in service. Olympus engines of earlier marks are in quantity production for Avro Vulcan B1 bombers, now in squadron service with the Royal Air Force.

Outstanding high-altitude performance. On 29th August 1955 an English Electric Canberra powered by two Olympus engines reached 65,890 ft, setting a new world's altitude record.

An Olympus 6 turbojet engine has completed an officially observed 150-hour type-test run at a rating of 16,000 lb thrust without reheat. So tested, the Olympus is the most advanced turbojet in the world—and it is ready for production.

Remarkable for low fuel consumption and great power at high altitudes—qualities vital to Britain's V bomber force—the Olympus has greater development potential than any other high-thrust turbojet in the world.

Among other Bristol products are:—the Britannia airliner, its Proteus engine, and the Orpheus turbojet, which is the power unit of NATO light fighters.

ADDRESS IN FULL .....

A Banker on Credit Controls

THE Duke of Buccleuch, governor of the Royal Bank of Scotland, in his annual statement issued earlier this week argued that the time might be approaching (" if indeed it has not already arrived ") when the restrictive credit policy of the past two years " might be put into reverse." He did not wish to see more than a slight easing of the brakes. The best course, he held, would be to reduce interest rates (which was quickly satisfied on Thursday), but to retain the governmental directive on advances. He holds that direct credit controls have been more effective weapons of control than higher interest rates.

The Royal Bank's balance sheet shows a fall in deposits in the calendar year 1956 by £8.2 million to £120.1 million. The gilt-edged portfolio, shown at or under market value, is down by £4.2 million to just under £40 million ; advances are down fractionally to £44.9 million. The net profit, after providing for taxation and investment depreciation, declined slightly from £640,936 to £638,801. The other Scottish bank that makes up its accounts on December 31st, the Clydesdale and North of Scotland Bank, again follows its parent bank, the Midland, in valuing its investments at or under cost and below redemption value, and in stating that no transfers have been made, either from inner reserves or current profits, to cover the market depreciation below book value. The Clydesdale shows an increase in that depreciation from 7.1 to 7.4 per cent (£6 million on the book portfolio of £81.1 million). Its net profit is down from £487,956 to £481,832. These results (and also those of the Scottish banks reporting in the autumn) contrast with the bumper profits announced by the English banks ; one reason for the contrast has been the considerably larger proportion of deposits in interest-bearing accounts north of the border.

Metal Exchange's Lost Surplus

THE London Metal Exchange grew to greatness because a buyer or seller could always deal there, at a price, and having grown great it attracted surplus metal from all over the world. When a surplus existed the exchange could offer satisfactory hedging facilities to holders of metal because quotations for forward delivery commanded a premium over prompt supplies. Since the war it has rarely been able to fulfil that function. For many years supplies were scarce ; latterly such surpluses as have appeared have generally not been allowed to reach London.

As the chairman of the committee, Mr Philip G. Smith, pointed out at the exchange's 75th anniversary celebrations this week, the United States government has taken the surplus of lead and zinc off the market. It is supporting prices by taking into the stockpile the surplus of domestic metal, and also by exchanging its surplus farm commodities for foreign metal. The British Metal Corporation, in its latest annual review, estimates that the American government bought nearly 60,000 tons of domestic lead in 1956 (making close on 180,000 tons in all) and about 60,000 tons of foreign lead ; its purchases of domestic zinc are estimated at 100,000 tons last year (making nearly 270,000 tons in all) and of foreign zinc at about 150,000 tons. Now copper is in surplus : will producers allow at least a reasonable quantity of metal to flow to market and test the exchange's ability to do its job ?

Sponsoring Fundamental Research

SPONSORED research, as it exists on a large scale in the United States and a much smaller scale in this country, is generally applied research work done by an independent organisation on behalf of an industrial customer on strictly defined problems. The detailed findings become the customer's property, and are not generally published in full. The new Scottish venture announced last week by Arthur D. Little, the oldest and most widely capable of all the commercial sponsored research organisations in America, is rather different. Its purpose is to engage in " fundamental scientific investigations "; though industrial customers will provide the money and specify the subject, they will not direct the research ; and the findings will be published freely, not confined to the firm that paid for the work.

From the American side, this may represent one reaction to the fear now widely expressed across the Atlantic that too little basic and fundamental research is being done there to inspire the vast machinery for applying research results that exists throughout American industrial research departments. These American industrial laboratories, moreover, have in the past relied to a considerable extent upon a transatlantic flow of fundamental research findings from Europe ; of late, they find this flow is slackening. This change, plus the quality of European scientific training, is one reason why American research laboratories have recently been recruiting on a large scale over here.

The opportunity to take advantage of an established research team in Scotland arose from a conversation about a year ago between Mr Raymond Stevens, president of Arthur D. Little, and Dr F. N. Woodward, then director of the Institute of Seaweed Research. This institute was

set up by the Scottish Council about twelve years ago to study the development of industrial uses of seaweed in the highlands and isles of Scotland: from its work has developed an alginates industry with a total output now worth about a million pounds a year. The institute's pioneering work in now largely done, though some research on seaweed products will be continued. The American company has bought the laboratories at Inveresk Gale near Glasgow; and the research team now employed there, which is to be enlarged, will work almost entirely on its behalf. Eight projects have been agreed on to begin with, mainly in the chemical field; the first three, on which work is now starting, are on aspects of polymerisation, sugar chemistry, and corrosion. All so far are for American clients: but the laboratory will be ready to do fundamental research for any British organisation willing to finance this and allow free publication of the results.

Expansion in Bowaters

EXPANSION is never far from the minds of the directors of Bowater Paper Corporation; there is an exuberance both in their plans and their ways of announcing them. In setting out the details of the £15 million issue of the 5¾ per cent convertible loan stock (1978-82) at 97½ (on which the market still hopes for a premium when dealings begin), Sir Eric Bowater reveals the size of the Corporation's development programme.

In Britain the programme, already well under way, will cost in all about £36½ million; in North America the current programme, costing about $186 million, will be extended at a cost of a further $60 million. The timing of these programmes ensures some addition to profit earning capacity each year until about 1960 and Bowaters Southern Paper hopes to pay its first common dividend in 1959. Sir Eric believes that the increased capacity planned by the newsprint makers "will in the not distant future again fall short of meeting world needs." In the meanwhile, he estimates that profits of Bowater Paper in 1956 were higher than those in the previous year and anticipates "some increase" in the ordinary dividend. Sir Eric's forecast sent the price of the £1 ordinary shares up to 46s. 3d.; allowing for dealing costs that is above the first conversion price on the loan stock.

Outlook for Softwood

THE start of the new timber trading season brings expectations of a closer balance between supplies of softwood and estimated needs than existed last year. Supplies should be lower because high freight rates from Pacific coast to this country may deny Canadian shippers any effective comeback on the British market for some months. Reduced offers are also expected from Sweden and Finland; sawmills there, faced with rising costs and lower profits, are cutting their output. Austria, the third largest European timber exporter, will also be producing less timber but it appears that Russia intends to be an active and competitive seller.

The British timber trade enters the new year with commercial stocks of softwood of less than 500,000 standards compared with about 620,000 standards at the beginning of 1956. But the gradual sales from the British Government's strategic reserves buttress those stocks and give the trade reason enough for not holding more; the recent invitation from the Board of Trade for tenders for an additional 140,000 standards from the stockpile, including 60,000 standards unsold from last year's offers, is understood to mark the final clearing of government holdings of softwood. It will be surprising if softwood consumption this year exceeds the estimated 1956 total of nearly 1.4 million standards, as indications point to a decline in total building this year. Moreover, the outlook in other timber using industries is not rosy while credit restrictions are retained.

How will prices react to that prospect? Cautious buying by British importers throughout last year helped to bring about a steady decline in shippers' prices of all grades of softwood. Now many Scandinavian, especially Finnish, sawmills are finding it difficult to operate without higher prices. The opening gambit has come from the Russians, whose offer of 190,000 standards to Britain at reduced prices has been well received. The Scandinavians do not appear unduly worried. Their forward sales are reported to be satisfactory and even if British buying remains slow over the coming weeks they will probably sit tight.

Sterling Area's Trade Gap

IT is some comfort to learn that the sterling area's visible balance of trade with the rest of the world was showing an improvement last year up to the time when the big purchases of dollar oil upset the accounts. Figures published by the Board of Trade show that in the first nine months of 1956 the gross deficit with non-sterling countries fell by £56 million to £721 million, compared with the same period of 1955. While imports from non-sterling countries rose by eight per cent to £3,408 million, exports to those countries rose by 13 per cent to £2,687 million. Britain can take most of the credit for that improvement: its imports from non-sterling countries rose by only three per cent to £1,757 million, but its exports rose by 18 per cent to £1,350 million; the result was a fall in Britain's own deficit with the non-sterling world of £149 million to £407 million. The overseas sterling countries together, on the other hand, spent £1,650 million on imports from non-sterling countries, an increase of 14 per cent, while the sales rose by only nine per cent to £1,335 million.

STERLING AREA TRADE WITH NON-STERLING COUNTRIES

Percentage Change Jan.-Sept., 1956 over Jan.-Sept., 1955

Exports to:	Dollar Area	OEEC Area	Other Countries	Total
from—				
U.K.	+32	+10	+19	+13
Rest	− 1	+ 5	+22	+ 9
All	+14	+ 8	+21	+13
Imports from:	**Dollar Area**	**OEEC Area**	**Other Countries**	**Total**
into—				
U.K.	− 2	+ 5	+ 9	+ 3
Rest	+ 6	+15	+19	+14
All	+ 1	+ 9	+15	+ 8

The value of Britain's sales was swollen by an increase in prices, whereas prices of the overseas sterling countries' exports as a whole had fallen. In the fourth quarter of 1956, owing largely to the Suez crisis, the prices of several major sterling commodities increased. Some of the overseas sterling countries were more spendthrift than others—India especially: India's imports from non-sterling countries rose by £78 million to £261 million in the first nine months of 1956, while its exports fell by £13 million to £153 million. Australia, once so prodigal, had completely reformed; its imports from non-sterling countries dropped by £9 million to £199 million while its exports—helped by higher prices for wool and wheat—rose by £27 million to £236 million.

SHORTER NOTES

S. Pearson Industries, which is controlled by the Pearson family trust, of which Lord Cowdray is chairman, has arranged to buy the shares in The Financial News Limited owned by the Eyre family trusts. The purchase involves the transfer of the controlling interest in The Financial News Limited, which in turn has been the principal shareholder in the Financial Times Limited since 1945 when the shareholdings of Lord Camrose and his family were acquired. Following the purchase Mr R. T. B. Gibson has joined the boards of both companies and Colonel O. E. Crosthwaite Eyre, MP, has resigned from them. Lord Bracken remains chairman of both companies, whose management and policy are to continue unchanged.

The Bank of London and South America announces a final dividend of 7 per cent, against 5 per cent, making 9 per cent for 1956, against 7 per cent. Net profit after tax is shown at £560,047, against £391,694.

★

Prices of elephant tusks showed a fall of about five per cent at the first auctions in London this year. Soft Mozambique sound tusks weighing between 81 and 100 lb sold for £125 to £130 a cwt; bangles, oversize, fetched £81 a cwt and bangles, defective, fetched £60 to £62 a cwt. Scrivelloes, ball, weighing 14 to 20 lb sold for about £80 a cwt.

★

Sir George Bolton, who at the end of this month relinquishes his executive responsibilities at the Bank of England, is to become deputy chairman of the Commonwealth Development Finance Corporation. As previously announced, Sir George also becomes deputy chairman of the Bank of London and South America, and remains on the Court of the Bank.

★

The International Sugar Council, after noting that all restrictions on exports had lapsed (reported in *The Economist* of last week), called upon exporting members of the sugar agreement to release for export the minimum stocks held and decided that exports made before the next meeting of the council should not be charged against quotas when these are reintroduced. The next meeting is due on March 6th.

Company Notes

IMPERIAL TOBACCO. The news that Imperial Tobacco Company's ordinary dividend was to be 21 per cent for the third year running and that gross profits had barely been maintained in the year to October 31st was enough to knock 2s. 1½d. off the price of "Imps." The stock now stands at 47s. 3d. to yield £8 18s. per cent. It is still an income stock, but the touch of equity in it is not simply occasional; it is rare. Even a giant with a dominant say in the market, it seems, is not immune from competition. Imperial Tobacco can perhaps afford to look with detachment on the fierce struggle among the smaller tobacco companies but it can hardly afford to ignore the thrust of its biggest competitor, Gallaher.

The directors of Imperial Tobacco have had to report that "the company's cigarette and tobacco sales were not fully maintained in the second half of the year, with the result that there was a slight fall in the total weight of sales for the year." The gross trading profits of the parent company (which is in effect the tobacco company shorn of ancillary operations in making paper and board for the trade) show little change at £19,895,434 (against £19,872,496). Investment income has risen, thanks in large part to the bigger dividends paid by "BATs," from £4,988,827 to £5,314,203 but taxes, too, are higher and net profits after tax have fallen from £12,021,323 to £11,339,637. The earnings cover for the dividend remains slender—one reason for the high yield on the stock.

The paper and board-making subsidiaries of Imperial Tobacco have in the past given a small but welcome fillip to consolidated trading profits. But this was not the case in 1955-56. The group's gross profit came to £23,363,843, only a few pounds higher than the £23,310,352 earned in 1954-55. The tax provision rose from £14,420,685 to £15,395,483 and consolidated net profits fell from £12,966,504 to £12,369,764. These earnings do not include the exceptional profit of £1,188,844 which arose from the increase in the rate of tobacco duty last April; in accordance with the company's usual practice this profit has been carried direct to contingencies reserve.

RHODESIAN COPPER. Profits of the **Rhodesian Selection Trust** group of copper companies declined further in the December quarter. **Roan Antelope** sold rather more copper, and **Mufulira** rather less, than in the September quarter, and the average price realised dropped by roughly £10 a ton; moreover operating expenses—though not costs per ton—were higher because the output of both mines rose quite sharply. Roan's estimated gross profit fell by £8,000 to £1,917,000, and Mufulira's more sharply, by £324,000 to £2,839,000. The figures for the six months to December—the first half of the financial year—are shown in the table. No six-monthly comparison with 1955-56 can be made for **Chibuluma**, for that mine did not come into production until last March. Chibuluma's output in the December quarter was 2,111 tons, less than half as much as in the previous quarter, but sales were 293 tons higher at 4,263 tons. The gross profit was a trifle higher at £439,000, bringing the profits for the first six months to £872,000. Dividends from Chibuluma, of which RST holds 64.29 per cent of the capital, are subject to restriction until the £5 million loan from the American government has been repaid. The gross profit of Mufulira and Chibuluma attributable to Rhodesian

Selection Trust fell by £208,000 to £1,868,000, thanks entirely to the decline in Mufulira's profits.

Copper has fallen further since the December quarter, when the average price realised by Roan Antelope was £269 a ton. This week cash copper in London touched £246 a ton; the RST group cut its fixed price to UK consumers by £20

	Six months ended Dec. 1955	Dec. 1956
	(£'000s)	
Roan Antelope:

to £250 a ton and the American producers cut their price by two cents to 34 cents a lb (£272 a ton). Although consumption has slackened, the main reason for the weakness is that production is expanding and has not been checked—as so often in the past—by strikes. But if the price were to fall much lower it would not be long before the major producers, in the United States at least, started to restrict output.

★

CENTRAL MINING and CONSOLIDATED GOLD FIELDS. Arithmetic is not always everything in a take-over bid or a merger, and sometimes the conclusion that emerges reflects the impact of personalities as much as the drift of the figuring. Certainly, all the arithmetic associated with the proposed merger between Central Mining and Consolidated Gold Fields suggested that it would have been an admirable match. Consolidated Gold Fields was and is looking towards investment in metals other than gold. Central Mining's interests, with the exception of Harmony, are concentrated upon the older gold producers and after the Trinidad Oil deal it has plenty of cash to invest (even though its profits on share dealings are subject to tax). Yet the proposed marriage after detailed examination and discussions has been called off. The price of Consolidated Gold Fields' shares has subsequently come down from 60s. to 58s. and of Central Mining's shares from 55s. 3d. to 52s. 6d. Central Mining is left with funds seeking an investment outlet, which might one day still make a match with some other organisation attractive.

★

BOWMAKER. Criminal proceedings are pending against the former managing director of Bowmaker, a leading hire purchase finance house. Until these proceedings are completed the company's accounts for the year to October 31st will not be issued nor will the annual general meeting be convened. In the meantime the directors have announced that the audit for the year has been completed. Completion was delayed because "the directors considered it advisable to have a further investigation of the company's books and records to December 19, 1956 (the date on which the former managing director was removed from office)."

The audit now shows that the group's profit after tax (other than the profits tax on distributions) for the year to October 31st was £195,266, compared with £279,948 for 1954-55. In that year the company paid an interim of 7½ per cent and a final of 15 per cent on the ordinary shares; for the latest year the interim was 10 per cent and it is now to be followed by a second interim of 10 per cent. There will be no final dividend, so the full year's payment is 20 per cent, against 22½ per cent. The directors say that "the company's operations continue on a normal basis and show a satisfactory trend." Public confidence, inevitably shaken by such events, should be at least partly restored by the preliminary announcement; the 5s. shares stand at 16s. 9d. and yield a few pence under 6 per cent.

LONDON STOCK EXCHANGE

Next Account begins: February 13th
Next Contango Day: February 13th
Next Settlement Day: February 19th

WITH the Treasury bill rate steady at last week's tender the market was less willing to absorb stock. Gilt-edged prices lost ground on Monday and Tuesday, but responded quickly to buying on Wednesday afternoon in front of the Bank rate reduction. After the announcement, selling by the Government broker limited the rise in the long-dated and irredeemable stocks, but the "shorts" rose sharply. Underwriters were left with 60 and 75 per cent respectively of the Dundee and Walsall loans, which opened at a small discount, though they were bought in the morning as a Bank rate hedge and closed at a small premium. Industrial shares rallied late on Wednesday, after slipping back steadily throughout the week, *The Economist* indicator falling 4.9 to 194.0. After the reduction in Bank rate to 5 per cent, prices improved.

Following the increased dividend Bank of London and South America jumped 15s. to 132s. 6d., and National Provincial rose after the capital reorganisation proposals. Other bank shares moved up in step. Benskin's Brewery gained 5s. 6d. to 54s. on the merger discussions with Ind Coope. Guinness fell 1s. 6d. to 39s. 3d., following the meeting. Stores were generally easier. Liebig's lost 4s. 6d. to 51s. 9d. on the fall in profits, but Rio Flour climbed to a peak of 46s. 3d. before easing to 41s. 9d. Imperial Tobacco sank back after the dividend announcement to 47s. 3d., a loss of 3s. 3d. over the week. Aircraft were again unsettled, Blackburn losing 1s. 3d. to 14s. on the redundancy announcement. Steels were easier and Stewarts and Lloyds fell 2s. 4½d. to 27s. 9d. ex capitalisation.

Kern Oil rose to 28s. 9d. on the bid from Rio Tinto, while other oil shares were little changed on balance. South-West Africa Company jumped to 101s. 3d. after the counter-bid for the shares. Central Mining lost 3s. 3d. to 52s. 6d., and Consolidated Gold Fields lost 2s. 9d. to 57s. 9d. on the breakdown of the merger.

[1] Electricity production for New Zealand represents about 87 per cent of total generation. [2] Copper and tin refer to metal production. [3] General trade (including re-exports) except for Canada, which is special trade only. Imports are cif except for Australia, Canada and S. Africa which are fob; exports are fob. Trade for India includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia 12 months ended June 30th. [4] Gold and foreign exchange holdings are those of the government and central bank: only figures for Australia include holdings of commercial banks. Cost of living for S. Africa and S. Rhodesia relates to Europeans only and for S. Africa includes direct taxes. [5] Including foreign investments. [6] Including semi-processed gold. Beginning January, 1955, including South-West Africa. [7] In July, 1948 part of holdings was transferred to the State Bank of Pakistan. [8] April, 1948—March, 1949. [9] Including some long-term securities. [10] Average for third quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended February 2nd, 1957, there was an "above-line" surplus (after allowing for Sinking Funds) of £119,510,000 compared with a surplus of £151,208,000 in the previous week and a surplus of £145,698,000 in the corresponding period of last year. There was a net expenditure "below-line" last week of £5,692,000, bringing the total deficit to £463,068,000 (£220,538,000 in 1955-56).

THE MONEY MARKET

BANK rate was reduced to 5 per cent on *Thursday, just under a year after it was* raised from 4½ to 5½ per cent. After the close of business, the clearing banks announced a reduction of ½ per cent in deposit rate, to 3 per cent; the minimum notice of withdrawal remains unchanged at seven days. The clearing banks' minimum rate on day-to-day loans to the discount market was also reduced by ½ per cent, to 3½ per cent.

Credit was in short supply in the money market on Thursday, and business was confused by the uncertainty about rates, *in particular about* the outcome of yesterday's Treasury bill tender. No dealings took place after the Bank rate change, and *the upshot was that*, notwithstanding very large special purchases by the Bank, four or five houses sought seven-day loans at *the new Bank rate.*

At the Treasury *bill* tender on Friday last the discount market made no change in its bid of £98 17s. 3d. per cent. However, a further increase was made by outside tenderers, so that although total applications for the unchanged offer of *£190 million dropped by nearly £30* million, to £384.1 million, the allotted portion of the market's bid slumped further to the exceptionally low figure of 21 per cent. The average rate of allotment fell by another 2¾d., to £4 10s. 10.07d. per *cent. At yesterday's tender*, the offer was again unchanged at £190 million.

COMPANY MEETINGS

COLVILLES LIMITED

(Steel and Iron Manufacturers)

LARGER SALES BUT INCREASED COSTS

DEMAND CONTINUES STRONG

SIR ANDREW McCANCE ON DEVELOPMENT PLANS

The twenty-sixth annual general meeting of Colvilles Limited was held on February 8th at Glasgow.

The following is the statement of Sir Andrew McCance, DL, DSc, LLD, FRS, chairman and managing director:

In the early part of last year, Sir John Craig expressed his wish to retire from the position of Chairman, which he had occupied with distinction for forty years. His association with the Company, extending over sixty-eight years, has been so exceptional, so fruitful and of such a determinative character that the Board believed many friends of the Company would like to possess a record of his outstanding career. They arranged for a short biographical brochure to be prepared and sent to all shareholders, and many expressions of thanks and appreciation have been received in terms of affectionate regard for a great personality. I am glad he is continuing as a Director of the Company.

I thank my colleagues on the Board for the expression of their confidence in appointing me Chairman in succession to Sir John Craig.

ACCOUNTS

In comparing the accounts for 1956 with those for the previous year, there is one noticeable difference in the fixed assets—the item under the heading "Development Expenditure and Construction Work in Progress" which now stands at £11,412,025. This represents the amount expended up to September 30, 1956, on the new blast furnace and steelworks plant at Ravenscraig and the unloading arrangements for ore ships at General Terminus on the Clyde.

We are now passing through the peak rate of our expenditure on this development, the total at the present time being approximately £1 million per month. In due course this rate of expenditure will ease off as the plant nears completion.

This development expenditure also accounts for the item "Bank Loan" which on September 30, 1956, stood in the Balance Sheet at £1,430,000. Since that date, the Iron and Steel Holding and Realisation Agency has paid up the outstanding balance of £3 million on the 4 million 5½ per cent cumulative preference shares, this having taken place on October 20, 1956.

OUTSTANDING CALL ON DEBENTURE STOCK

They have also agreed that the outstanding call on the £10 million 4½ per cent debenture stock, on which £10 for each £100 has already been paid, will be made available during 1957, which will provide the financial requirements of the first stage of our development programme.

In our original estimates, an allowance of 4½ per cent per annum was made for increasing costs and escalation during the period of construction, and from experience so far this adjustment has been only just adequate. With the present disturbed state of the world, the outlook on this matter is far from clear, but it would seem that during the next twelve months there may be further increases in costs and prices of plant and construction.

Another aspect of the present uncertainties is the desirability and the need to provide against temporary interruptions in the supply of raw materials, which are liable to occur when they are least expected. For this reason the value of our stocks has risen sharply and stocks of iron ore and other raw materials have contributed materially to the increase from £10,916,035 to £13,678,016 shown in the Consolidated Accounts for stocks and work in progress.

A favourable feature is the reduction in the charge for income tax which has fallen from £3,477,564 to £3,340,344 in spite of the increase in profits. This is due to the relief in respect of investment allowances on the capital expenditure during this financial period. This allowance is applicable to capital contracts placed not later than February 17, 1956. Fortunately, we had already placed the major part of the contracts for Ravenscraig before this date.

IMPROVEMENT IN SALES

On the trading side, the improvement in sales has been approximately £10,900,000, but against that there has been an increase in costs of £10,200,000.

The cost of fuel during 1956 was £1,976,000 more than the expenditure in 1955, while the total wages, etc., paid increased by £1,718,000, or nearly 17 per cent more than last year.

Greater deliveries of steel during the year and reductions in conversion costs brought about by plant improvements, together with tax savings arising from investment allowance on capital expenditure, have brought the profit available for appropriation to £2,674,393.

Dividends.—After careful consideration of all circumstances, the Board decided to recommend a final dividend of 8 per cent, making a total of 11 per cent for the year.

NEW PLANT AT RAVENSCRAIG

As mentioned already, the new blast furnace and melting shop at Ravenscraig are now at a stage which requires a heavy rate of expenditure. The proportion of that expenditure relating to the blast furnace and coke ovens is clearly in respect of additional capacity and this was provided for in the changes in the share structure made when the Company was denationalised. The new melting shop equipment mainly replaces old and out-of-date furnaces which will be closed down whenever the Ravenscraig plant is in full production. The original cost of the old plant has been largely recovered by the depreciation allowance received over the years of its existence, but in terms of cash this is pitiably inadequate today to reinstate these units as modern productive assets. If the earning power of the business is to be maintained, these and similar exhausted assets must be replaced and the cost of replacements must come, as far as possible, from current earnings or from the accumulated reserves which have arisen from surplus earnings in previous years.

Unfortunately, the current high rate of taxation materially retards the progress of this replacement, but additional funds for modernisation are a necessity and the Board propose to transfer to Capital Reserve the sum of £1,500,000 for this purpose.

SUBSIDIARY COMPANIES

The activities of our subsidiary companies form an important section of Group production and make a substantial contribution to Group profit. During the present financial year, this has amounted to approximately 38 per cent of the total trading profit.

For some years a policy has been followed which aimed at restricting the range and variety of products rolled at each of the works and of developing the appropriate plant for their special production at each location. This limitation of variety assists materially in lowering the cost of production, a matter of ever-increasing importance under present-day conditions. It is hoped that during 1957 the major part of such rearrangements in regard to heavy sections will have been completed.

The works of the Lanarkshire Steel Company Limited with its large 36-inch mill is specially suited for the production of heavy joists and sections of all kinds. A redesign of the existing layout with modernisation of the mill drives and handling equipment, now almost finished, will add 1,000 to 1,500 tons per week to the capacity at a low capital cost.

CLYDE ALLOY STEEL COMPANY

The Clyde Alloy Steel Company Limited devote their attention to the production of all varieties of alloy and special steels and to medium and light castings for the engineering industry, and the demand has grown steadily for all their specialities during the postwar period.

The growth in the consumption of alloy steel has in fact exceeded in recent years the growth in the producing facilities of the companies engaged in this trade and there have been some noticeable shortages in consequence.

All the open hearth billets rerolled by the Clyde Alloy Steel Co. into finished products have hitherto been produced at the Dalzell Works of Colvilles. The pressure of this demand, coupled with the greater demand for the mild steel products also produced at Dalzell, has indicated that some further specialisation of function is necessary.

HALLSIDE WORKS

It has been decided therefore to rebuild the Hallside Works of the Steel Company of Scotland Limited into a unit wholly devoted to the production of alloy and special steel billets for this developing trade. Sections rolled there will in future be rolled at our other works, notably Lanarkshire and Glengarnock, so that two mills will now produce what has hitherto required the facilities at three mills to produce and economies will inevitably accrue.

When completed, the capacity of Hallside for special steels will be 150,000 tons per annum and the alterations are estimated to cost £2,500,000. In designing the layout and plant, the possibility of utilising automatic rolling methods has been kept very much in mind as experiments on one of our smaller mills have already indicated its advantages.

In the supply of accurately sized light castings of high quality, the Clyde Alloy Steel Company has been particularly successful and the demand has exceeded their capacity. A large extension to the light foundry has therefore been authorised and work has already progressed on its construction. This extension, which will cost approximately £400,000, will constitute in itself a complete mechanised production unit and will bring the capacity for steel castings at the Clyde Alloy foundries up to 250 tons per week. Much thought has been put into this extension and we are confident it will prove a highly successful addition.

SMITH & McLEAN

Smith & McLean Limited have had a satisfactory year. At the works devoted to the manufacture of galvanised sheets and to general galvanising, metal spraying and sheet iron work, demand has varied from time to time but on the whole they have been well employed throughout the year. The demand for sheets and light plates has continued good, and the steadiness of employment is helped by the fact that these works produce sizes and qualities not readily procurable—if procurable at all—anywhere else.

The Board recognises the changes which have taken place in the modern methods of steel sheet production. They are giving their serious attention to the problem of methods suitable for the type and qualities of product for which this Company has established its reputation.

The Mossend Works of the Colville Constructional Company Limited have been employed to capacity during the year, the most important of many contracts which they have undertaken being the construction of the new melting shop at Ravenscraig. Their production of welded fabrication at Glengarnock expands steadily and an extension to their shops is under construction. The concentration of structural work at Mossend and welded fabrication work at Glengarnock is another instance where specialisation of function has brought its rewards. The activities of this Company maintain steady progress and during the past six years the annual turnover has doubled.

FULLWOOD FOUNDRY

A record output of ingot moulds has been produced by the Fullwood Foundry Company Limited supplying the requirements of our own works and other users. Favourable comments on the mechanised production methods developed in this foundry have been made by visitors from other countries.

The progress made in alternative types of fabrication is having its impact on the demand for ordinary iron castings and markets will undoubtedly suffer some progressive contraction on this account. On the other hand, the market for iron castings of special composition with improved properties is showing a compensating growth and more and more the jobbing foundry department of Fullwood is being concentrated on this class of work in the development of which the technical resources of the Group can give important assistance.

The pig iron produced at Dixon's Ironworks Limited has helped our supply position during the past year and this Company has made a small profit. The steady advances in the cost of imported ore, coal and labour, insofar as they have not been adequately reflected in the selling price of basic iron, however, have now adversely affected the results from this plant. It is the intention to transfer the production of pig iron from Dixon's to Ravenscraig in due course.

ETNA IRON AND STEEL

The Etna Iron and Steel Company Limited has proved most helpful in providing facilities for the rolling of the small order and the odd size, thereby removing these sometimes troublesome features from the programmes of the high production mills. Plant improvements and production changes have resulted in useful economies and this Company has had a satisfactory year.

In 1948 and 1952 Colvilles acquired shares in Blanchland Fluor Mines Limited and most of the fluorspar used in the steelworks has since come from this source. During the past year we had the opportunity of purchasing a further holding and, our total holding being now more than 51 per cent, this Company becomes a subsidiary of Colvilles Limited as from October 1, 1956.

DEVELOPMENT

An investigation into the demand for steel within the area for which the Company is the principal supplier, taking into account the trend in the growth of demand shown by the experience of recent years, has been completed. The conclusion is indicated that an annual ingot capacity of 2,500,000 tons is necessary to meet the requirements of the immediate future.

The policy which has been followed of expanding pig iron production must be continued in development schemes to meet this increased steel demand. The main problem in the further expansion of pig iron in Scotland is the problem of coking coal supplies, but discussions with the National Coal Board, Scottish Area, have resulted in assurances that adequate supplies will be available in due course for a second blast furnace at Ravenscraig.

While the melting shop at Ravenscraig has been designed to permit of additional open hearth furnaces being constructed as they may be required, changes in the methods of steelmaking are engaging the attention of metallurgists all over the world and as a result greater production from existing units may be brought about by pretreatment with oxygen of liquid iron. Experiments of this kind on a pilot-plant scale are already being tried out at Clydebridge Works. The results so far are encouraging, but it is too early to forecast what the final conclusions will be.

The replacement of the cogging mill at Dalzell with a larger mill at Ravenscraig has also been planned. When this cogging mill is installed, it will enable the present plate mill at Dalzell to be replaced by a high production 4-high plate mill in keeping with modern production requirements.

At Glengarnock Works the electrification of the finishing stands of the section mill is nearing completion and this with the rail bank extension should increase the capacity of the Works by 1,000 to 1,500 tons per week. The melting furnaces have already been suitably enlarged to meet this extra output.

The 3-high plate mill at Clydebridge Works, which was installed in 1923, although modified in many ways during the intervening years, is also due for replacement and plans for this purpose embodying a 4-high mill of modern design have been prepared.

The above schemes have received the approval of the Iron and Steel Board and the Development Committee of the British Iron and Steel Federation.

It will be seen that the plans for expanding the steel production of the Company are making active progress.

PRESENT AND FUTURE OUTLOOK

In spite of a slight unevenness which has taken place during the past six months, the demand for steel continues strong. This is particularly the case in heavy sections and plates, and light sections and bars. For these products, our output has already been taken up for a large part of the next financial year.

The great change which has overtaken the motor car industry has had its repercussions on alloy bars and ancillary light products and on the demand for drop forging billets.

Nevertheless, it is hoped that the large volume of long-term construction of all kinds already placed with the engineering industries should act as a corrective to temporary weaknesses in other fields and should give a useful supporting action to the general market.

IMPORTANCE OF RAW MATERIALS

While the demand for steel in all parts of the world continues to mount upwards and while no doubt has so far been cast on the assumption made by economic experts that a yearly percentage increase on a compound interest basis is likely to continue, this rate of expansion clearly cannot go on indefinitely. The raw material position must determine the rate of expansion.

The essential raw materials for steelmaking are coking coal and iron ore. All other materials are ancillary. Scrap, for instance, which is used in large quantities, is economically advantageous, but future progress and expansion must be governed by the availability of the two essential raw materials.

The reserves of coking coal in Britain are not unlimited and alternative methods of making pig iron economically without the use of coking coal have made little progress so far. The problem of coking coal supplies is one that may remain with us for some time.

WORLD IRON ORE RESERVES

The resetves of iron ore in the world, fortunately, seem more than adequate to cover the foreshadowed expansion of the steel industry for many years to come. The discovery of new deposits is more than keeping pace with the exhaustion of the older deposits. New mines, however, take a long time to bring into active production, particularly when they are situated in out of the way localities as many of them are. The difficulties of transporting the ore from the mines to the centres where it can be used, involving as it does both rail and sea carriage, are already making themselves evident.

The rate of expansion in steel production must be determined by the rate of progress in the development of the ore fields, both old and new. Whether that development and progress are moving fast enough at the present time to keep pace with the world's demand for steel is not yet clear.

All these new ore fields are situated outside Britain and, unfortunately, this country is no longer in any position to take a prominent part in the promotion or encouragement of schemes demanding foreign investment. We have been forced, or we have forced ourselves, into a secondary position in such matters so that the question of determining the rate of progress lies in other hands. Be that as it may, the likelihood must not be excluded that during the next decade some slowing down in the rate of construction of new steel capacity may be brought about by the rate of progress in the development of raw material supplies.

On the other hand, it cannot be said that any change is likely in the estimated growth of demand. Higher standards of living demand higher earnings which can only be realised from higher production and a greater volume of trade, and experience has shown that from whatever angle it is regarded, increased trade can only be maintained and kept in being by increased supplies of steel. In consequence, it does not seem likely that the difficulties of past years in regard to supplies are going to change rapidly.

The year under review has been particularly difficult in this respect and I would like to express the appreciation of the Board for the splendid assistance and support given to the Company by all members of the staff at the Head Office and Works, whose successful efforts are deserving of the highest praise.

DEATH OF SIR JOHN CRAIG

Since this Statement was printed, it is with deep regret that I have to advise shareholders of the death on February 1, 1957, of Sir John Craig.

Chairman of the Company from 1916 to 1956, his passing deprives Colvilles and the Scottish steel industry of a great personality and a great leader.

APPENDIX

ANALYSIS OF INCOME AND EXPENDITURE

	1956 (£'000)	1955 (£'000)
Income from sales, interest, etc.	68,085	57,128
Cost of materials, trade expenses and services bought	34,758	28,219
Cost of fuel	12,460	10,434
Depreciation	1,087	1,031
Debenture interest	45	35
	48,350	39,769
Balance available for wages, salaries, taxation, dividends and re-investment by way of reserves	19,735	17,359
Distributed as follows:		
Wages, salaries, national insurance and superannuation contributions	12,014	10,235
Taxation	2,850	2,931
Dividends—Gross	1,155	1,167
Reserves	3,716	2,915
	19,735	17,359

Note.—Since wages and salaries are paid before deduction of tax, dividends have been treated on the same basis and the amount of taxation has been adjusted accordingly.

THE AVON INDIA RUBBER COMPANY

NEW SALES RECORD

The sixty-seventh ordinary general meeting of The Avon India Rubber Company, Limited, was held on February 4th, at Melksham, Wilts., Mr C. M. Floyd, OBE (the Chairman), presiding. The following is an extract from his circulated statement:

The group profit for the year after providing for taxation of £186,273, amounted to £277,734, compared with £247,132.

Conditions in the Home Market have been less favourable than in previous years, but in spite of this sales have again beaten all previous records and the value of our export sales shows a substantial increase.

Your Company has acquired the whole of the Spencer Moulton issued capital at a cost of £352,492 and has purchased further shares in J. W. & T. Connolly Limited, to give Avon a controlling two-thirds interest.

To continue the provision of new equipment, your Directors obtained the consent of the Capital Issues Committee to the issue of a further £600,000 Loan Stock. A part of this Loan Stock is required to cover your Company's share of the new capital being raised by the tyre manufacturers of Great Britain to establish a British synthetic rubber plant. A further part is required to finance stocks overseas, necessary to the continued development of our export business.

Conditions are becoming more and more competitive, but your Directors have confidence in your Company's ability to continue to make progress.

The report was adopted.

A COMPLETE BANKING SERVICE FOR TRANSACTIONS WITH KUWAIT

THE ROYAL BANK OF SCOTLAND

POSITION OF STRENGTH AND LIQUIDITY

EFFECTS OF SUEZ CRISIS ON COUNTRY'S ECONOMY

TIME APPROACHING FOR CAUTIOUS EASING OF RESTRICTIONS

HIGH TAXATION THE LIMITING FACTOR IN ECONOMIC DEVELOPMENT

THE DUKE OF BUCCLEUCH ON GOVERNMENT EXPENDITURE AND GREATER PRODUCTIVITY

The Annual General Court of Proprietors of The Royal Bank of Scotland will be held on February 26th, in Edinburgh.

The following is the circulated statement of the Governor of the Bank, His Grace the Duke of Buccleuch and Queensberry, KT, PC, GCVO, LLD.

Following the procedure adopted last year, I have the pleasure to submit to you my review of 1956 along with the Annual Report and Accounts. I wish at the outset to refer with regret to the loss which the Bank has sustained through the death of Mr Gerard Powys Dewhurst, an Extraordinary Director of the Bank since 1949. Previously he was for many years Chairman of Williams Deacon's Bank, Limited, and an Ordinary Director of the Royal Bank.

Today we have confronting us a very different economic picture from that of a year ago. The inflationary pressures on our economy were then still causing concern despite the Bank Rate increases of 1955 and the squeeze on bank lending which had been operating for approximately six months. The decision in February of last year to make a further increase of 1 per cent in Bank Rate did not therefore come as a surprise. This raised the Rate to 5½ per cent, at which level it stood throughout the remainder of the year. An upward adjustment of our deposit and loan rates and all the other rates which affect our earnings followed and I shall have something to say later about the effect of these higher rates on our results for the year. Meantime, however, I wish to comment on a few more general topics.

DISINFLATIONARY MEASURES INTENSIFIED

In my Statement last year I outlined the measures which the Government had taken in the monetary field as part of its policy against inflation and I explained that the necessity for the directive issued to the Banks in July 1955, to secure a positive and significant reduction in the level of their overdrafts, had arisen because the orthodox monetary controls imposed in the earlier part of the year had been slow in their effect. This two-pronged attack was intensified by the increase in the Bank Rate in February to which I have referred and there is no doubt that the policy of credit restriction, embracing also the restrictions on hire purchase lending, met with an increasing measure of success as 1956 progressed. Gradually the force was taken out of the inflationary pressures. The employment situation changed. By late summer overtime working in many industries had been reduced and, while there was no significant increase in the unemployment figures, it was becoming clear that the state of over-full employment was ending. Consumer demand at home was slackening off; prices were being held reasonably stable; the volume and value of our exports were rising and more promising national savings figures were being recorded.

The whole situation was drastically transformed by the Suez crisis. It is still difficult to assess the full effects which this will have on our economy. It may cause serious dislocation to many industries and has already had harmful repercussions on the motor car industry. Its impact on the economy already moving along the disinflationary path has given rise to fears that the movement may be accentuated to such an extent that, if the squeeze on credit is not relaxed, we may soon be faced with problems of deflation.

NEED FOR CAUTION

Claims for relaxation of the present controls over credit have thus gathered momentum in recent weeks. They have gained encouragement from the reductions which have taken place in the Treasury Bill Rate and from the easement of the Hire Purchase regulations applicable to sales of motor cars. I agree that the time may be approaching, if indeed it has not already arrived, when the policy of the past two years might be put slowly into reverse, but I feel that we should proceed cautiously. There is, I think, a danger that, if we move too soon or go too far all at once, we may lose the benefit of much that has been achieved, for I am not altogether convinced, despite the changes which have taken place, that our economic climate has yet changed sufficiently to justify more than a slight easing of the brakes.

If, then, this is to be the policy, how is it to be carried into effect? Should the first step be to bring about a reduction in interest rates or to withdraw the direct controls? For the reasons I have given, I feel it might be unwise to do both at this time, and I lean on the side of those who take the view that the best course would be to reduce interest rates while maintaining the direct controls, at least for the present. There are differing views about the relative merits of interest rates and of the directive as effective measures of control. My own view is that in the field of credit in the conditions of today direct controls are the more effective weapon, and I think this is borne out by the experiences of the past two years, for I consider it has been the squeeze on advances by the banking system rather than the relatively high interest rates which has exercised the more effective check on the inflationary pressures.

TAXATION AND INTEREST RATES

Last year I referred to the fact that high taxation had tended to blunt the effect of the traditional method of controlling the supply of credit through movements in interest rates and, while I personally do not like direct controls being imposed through the banking system, I am more than ever convinced that the interest rate weapon cannot any longer be relied upon by itself, nor at any rate unless we are prepared to see Bank Rate pushed up to a level which would be harmful in other directions. For one thing, high interest rates increase the cost of Government borrowing and are thus a burden on the taxpayer. They also place an additional strain on our external payments account by increasing the cost of servicing overseas holdings of Sterling. These considerations alone make it desirable that the Government should not maintain high interest rates any longer than necessary and I think we may look forward to a downward movement of interest rates.

As I have indicated, I do not consider that this need necessarily be accompanied by relaxation of the directive on bank lending. At the same time, however, I feel bound to add that I regard the directive as essentially a short-term expedient and at best an imperfect instrument of control. It should, therefore, be the policy of the Government to authorise its withdrawal at the earliest possible moment. For my part, I shall welcome the day when Bankers are again free to consider applications for advances solely on their merits as banking propositions.

STRENGTHENING OF STERLING

The Middle East crisis brought Sterling under almost continuous pressure in the second half of the year. Official support was given to maintain both the official and transferable account rates and the cost of this to our gold and dollar reserves was substantial, resulting in the loss in a space of five or six months of approximately one-quarter of the reserves held before the trouble started. In December, however, the Authorities took steps to fortify the reserves by exercising drawing rights on the International Monetary Fund and by arranging borrowing facilities from the Export-Import Bank. This has restored confidence in the ability and the determination of the Government to maintain the value of the Pound and, as a result, there has been a very appreciable strengthening of the value of Sterling in terms of all foreign currencies in recent weeks. We shall have heavy Dollar payments to make for the substantial purchases of Western Hemisphere oil which have been arranged to replace, as far as possible, supplies lost through the closure of the Suez Canal, but with the increased reserves now available there is confidence that these can be met without further danger to Sterling.

Nevertheless, the impact of the crisis will be felt throughout industry. Production will be curtailed and this may, in the long run, have a detrimental effect on our exports. It has also brought home to us the extent to which our failure to secure a higher production of coal has made us increasingly dependent on oil for the expanding fuel needs of industry and has stressed the necessity of pushing ahead as far as possible with our nuclear power programme. The rationing of petrol and oil will have a serious effect on every branch of our economy; it will create particular difficulties for those who are entirely dependent on fuel oil supplies.

A SPUR TO INFLATION

Criticism has been levelled at the decision of the Government to increase the customs duty on petrol and oil and I feel that it may have been a mistake to take such a quick and seemingly *ad hoc* decision, for it has undoubtedly given rise to a widespread belief that the Government think that all our ills can be cured by increases in taxation. On this ground alone it may have been a bad decision. It was surely also psychologically unwise to suggest that it might be necessary to increase the standard rate of income tax in the next Budget, for until more information was available as to the full consequences of the crisis and its probable duration no reliable forecast of the full financial effect could possibly be made. Surely, too, every effort must be made to avoid further increases in taxation. I am convinced that the high level and the incidence of our existing taxation are factors limiting our economic development at the present time. Taxation is a spur to inflation; a brake on all those qualities of which we are so much in need today—initiative, enterprise, and the will to work. It reduces the ability and the desire to save and encourages waste and extravagance. Surely, therefore, the aim must be to reduce rather than increase it further and, what is perhaps of equal importance, the Government should let the people know that it regards this as one of its major tasks. Has the time not arrived for making a further review of Government expenditure, because there is a widespread belief that substantial economies are possible? Furthermore, one of the main problems facing us today is the fact that the Government is unable to meet the whole of its expenditure out of the vast sums taken in taxation and is still financing the balance by increases in the money supply. This continual creation of additional money in excess of increased production has been one of the chief causes of our recurring financial crises. It is inflationary and some means of reducing the expenditure of the Government should be sought. If in the end it is found impossible to secure any large measure of reduction, we shall have to depend on securing greater productivity in industry to provide for the increased capital investment needed in the private sector of the economy. I have previously spoken about this question of productivity and I make no apology for referring to it again. Increased productivity is one of the things which we need most of all today. There are good grounds for believing that it would not be impossible to achieve the small increase in the overall rate which would go a long way towards solving our difficulties, and every effort should be made to secure this by increasing incentives through a lowering of taxation and in other ways. We should also encourage by all means in our power the removal by employees and by managements of restrictive practices which are prevalent in industry today and which are very often carried on in the mistaken belief that they benefit those who impose them.

A WONDERFUL OPPORTUNITY

Turning now to Scottish industry and trade, I refer first to our staple industries in the shipbuilding and engineering field, upon which the well-being of so many of our people depends. These industries have had a good year and seem assured of a high level of activity for many years ahead. The whole world is now committed to a large shipbuilding programme, not only for tankers which have featured so much in the news recently, but also for vessels of all descriptions. This presents our shipbuilders with a wonderful opportunity to secure orders sufficient to keep our shipyards busy for a long time to come. They must, however, maintain their efficiency at the highest level in order to keep their prices competitive with those of shipbuilders in other countries. The demand for steel products both for home requirements and for overseas markets continues to rise and, despite increased production, still remains unsatisfied. We are grateful to the shipbuilding and steel industries for the substantial contribution they make to our earnings of foreign currencies.

In 1956 the whisky industry again set up a new record of sales overseas and maintained its position as Britain's greatest dollar earner. Scotch Whisky remains in demand throughout the world. It has qualities which cannot be matched by whiskies produced elsewhere and, with additional supplies now becoming available, it is confidently expected that fresh export records will be set up in the years ahead.

It is quality, too, which has been responsible for the creation of the world-wide demand for cashmere knitwear, hosiery and the other products of our mills in the Borders and elsewhere. In fact, the whole range of our textile products—knitwear, woollen cloth, cotton fabrics, household linen and jute goods—makes a very substantial and valuable contribution to our earnings overseas.

FARMING INDUSTRY'S SUCCESS

Our farmers again had very difficult conditions to contend with in 1956. The drought of the previous year extended well into the summer and when it broke it was followed by a long period of abnormally heavy rainfall. Notwithstanding the consequent difficulties of harvesting, the yield of our agricultural products was generally good. The heavy rains again led to serious flooding in some parts of the country and, while not on the scale experienced in 1948, this was nevertheless a serious matter for those affected. It caused not only a loss of produce at the time but may also have a detrimental effect on the future cropping of the land. Despite these periodical set-backs, the farming industry is having marked success in its all-out efforts to lessen our dependence on imports of foodstuffs and, because of the facilities we extend to the industry, we feel justified in claiming some share of the credit. Unfortunately, the drift from the land, particularly in the remoter areas, continues and we seem no nearer a solution of this problem, despite the improvement which has taken place in the conditions of employment of those engaged in agriculture and forestry.

Unemployment in Scotland still continues to run above the level of the average of the United Kingdom. This is largely due, as is well known, to the lack of a proper diversification of our industry. The Scottish Council (Development and Industry) and others have done much to improve the situation by extending the range of our economic activity. They have brought new industries to Scotland; helped to provide better factory accommodation in new industrial estates and given encouragement and advice to businesses engaged in the newer industries upon which we are placing so many of our hopes for the future. In many other directions the Council has dealt with the problem in a realistic and practical way. Notwithstanding this, however, we are still unduly dependent on our heavy industries to provide employment for our people.

One of the most heartening features of recent years is the development of the petroleum chemical industry taking place at Grangemouth. Great advances have been made in the past few years and Grangemouth is fast growing into one of our major industrial areas, and I pay tribute to those farsighted individuals to whom we are indebted for this progress. I wish also to add a word of thanks to all those concerns throughout the whole country—some of them relatively small—with no established market overseas who are, through strenuous efforts, increasing their sales to foreign buyers.

RESULT OF YEAR'S OPERATIONS

In regard to our own affairs, the year's operations have resulted in a Profit of £638,801 after making allocations to the Staff Pension and Widows' Funds and after providing for all taxation and making transfers to Reserves for Contingencies, out of which provisions have been made for all bad and doubtful debts, fluctuations in the value of Investments and other contingencies. This was a reduction of some £2,100 on the Profit of 1955, reflecting the fact already disclosed by the results of other Scottish Banks that the year was generally less favourable to the Scottish Banks than to Banks south of the Border. The main reason for this difference lies in the higher proportion of deposits bearing interest held by the Scottish Banks, which makes our earnings less subject to variation as a result of changes in the level of interest rates than appears to be the case with the English Banks. In our case, another factor which affected our earnings was the reduced resources available to us throughout the year. Our Deposits at just over £120 million show a drop of £8 million as compared with the figure at December 31, 1955, in large measure due to competition from Tax Reserve Certificates and Treasury Bills. We also know that many of our customers, because of the impact of the credit squeeze, have had to operate on much lower working balances than normally.

Our Advances at £44,900,000 were £300,000 down on the figure at the end of the previous year, and this is mainly due to the curtailment of credit through the operation of the squeeze. Applications for accommodation continue unabated and, as many of our customers at the end of the year had not fully drawn against limits previously agreed, it will be surprising if we are able to prevent the total from rising in the current year.

Our Investments, in conformity with our traditional practice, are shown at or under the market value at the date of the balance. The total at which they appear in the Balance Sheet is approximately £4,300,000 less than the figure at the end of the previous year. While the year has been a fairly difficult one, the result of our operations is regarded as satisfactory and the position shown by our Balance Sheet reflects strength and liquidity. These remarks apply also to the consolidated figures of the Group.

The payment of a final dividend at the rate of 7 per cent actual, making 14 per cent for the year, the same rate as paid in 1955, will be recommended at the Annual Court of Proprietors on February 26th, and this, together with the interim dividend paid in September, will absorb £478,975. Of the remaining balance, it is proposed to allocate £150,000 to our Reserve for Contingencies, leaving a sum of £143,353 to be carried forward.

Looking at the Group as a whole, the consolidated Profit amounted to £900,679, an increase of £41,000 over the figure for 1955. Williams Deacon's Bank, Limited, had a very successful year and continues to expand its branch system in areas where it has not hitherto been represented. The experience of Glyn, Mills & Company was very much the same as our own and, consequently, their

profit for the year showed a slight reduction. At the end of the year the total Deposits of the Group amounted to £311,686,000, and the Advances to £115,133,000.

TRIBUTE TO EXECUTIVES AND STAFF

Finally, I should like, on behalf of the Court, to pay a special tribute to the whole of the Bank's Staff, from the General Manager, Mr Ballantyne, and his team at Head Office to the newest joined recruit. It is team work that makes for success, and all of them have contributed in their varying capacities to the smooth working of the organisation. To them all I would like to express our appreciation for the manner in which they have carried out their duties.

WEST RIDING WORSTED AND WOOLLEN MILLS

SIR JOHN KEELING'S STATEMENT

The twenty-eighth annual general meeting of West Riding Worsted and Woollen Mills Limited was held on February 7th, at Bradford, Sir John Keeling (the Chairman) presiding.

The following is an extract from his circulated statement :

I am glad to be able to report that in the year under review our operating subsidiary companies were well employed, leading in most cases to considerably higher production. This, and the efficiency of our plants, enabled us to offset the narrow margins of profit obtainable. We subscribe to the need for restraint in prices as a practical measure to combat the inflationary forces at work in the national economy, but the principal factor affecting prices in the Wool Textile Industry is fluctuation in the price of its raw material.

The trading profit of the Group for the year was £1,184,468, before Taxation, compared with £1,007,923 for the previous year, an improvement of 17½ per cent.

The Chairman then referred to the upward movement in Merino Wool values which occurred during the last few months of their financial year, and to what had happened to wool values in general since that, and continued : The rise has been too rapid and its causes too suspect to be other than an anxiety.

Another disturbing feature is that production costs continue to rise and to eat into profit margins. When it comes to foreign trade, they are an additional and most serious handicap.

On the subject of foreign trade, I must refer to the recent decision of the United States Government to put a "quota barrier" in the shape of a penal tariff to any further expansion in the weight of worsted and woollen cloth imports. The United States has been an important market for specialised manufactures, in which one of our operating subsidiaries has been established for something like 70 years. It is disappointing, to say the least, to have to face the limitation of dollar exports which are so vital to the economy of this country.

On the other side of the picture, I can tell you that we have secured our share of business since the end of our financial year, and have been able to maintain an excellent level of activity. Orders are sufficient to ensure the continuation of this position for some months to come. Accordingly, and despite the difficulties I have mentioned, I feel we have reason to anticipate a not unsatisfactory result from the current year's operations.

The report and accounts were adopted.

BARCLAYS BANK LIMITED

ANNUAL MEETING OF STOCKHOLDERS

The Annual General Meeting for the year 1957 of the Stockholders of Barclays Bank Limited was held on February 6th, at the Head Office of the Bank, 54 Lombard Street, London, E.C.3. Mr A. W. Tuke (the Chairman) presided.

The Secretary read the Notice convening the Meeting and the Report of the Auditors.

The Chairman moved :

"That the Report of the Directors of the Company now produced, together with the Accounts annexed as at December 31, 1956, duly audited, be received, approved and adopted, and that there be declared, payable on the 20th instant, to the Stockholders registered in the books of the Company on January 13, 1957, a Final Dividend of 7 per cent, making 12 per cent for the year, on the Ordinary Stock, and a Final Dividend of 10 per cent, making 20 per cent for the year, on the Staff Stock, less income tax at the standard rate in each case."

Sir F. Cecil Ellerton, Deputy Chairman, seconded the motion, which was carried.

Mr Theodore David Barclay ; Mr Mungo Campbell, CBE ; the Hon George William ffolkes Dawnay, MC ; Mr Cuthbert Fitzherbert ; Mr Richard Evelyn Fleming, MC ; Mr Alexander Ludovic Grant ; Sir Albert Henry Stanley Hinchliffe ; and Mr David Wyamar Vaughan, retiring Directors, were re-elected Directors of the Company, and other ordinary business was transacted.

A vote of thanks to the Staff and a vote of thanks to the Chairman for presiding at the Meeting were unanimously accorded, and the proceedings terminated.

MARTINS BANK LIMITED

ANNUAL GENERAL MEETING

The one hundred and twenty-sixth annual general meeting of Martins Bank Limited was held on February 8th at the head office, Liverpool. Sir A. Harold Bibby, DSO, DL, Chairman of the Bank, presided.

The notice convening the meeting and the auditors' report were read. The report and accounts for 1956 were adopted.

The Chairman said that brief particulars of the scheme for reorganising the Bank's capital had, supported by advice, been published in the press as it was felt to be in the best interest of members to disclose the correct details without delay. He added that no useful purpose would be served by discussing the matter at the moment, but it was hoped to post circulars to members on February 11th for consideration at meetings on Wednesday, March 6th.

Resolutions were passed re-electing the retiring directors and fixing the auditors' remuneration.

A vote of thanks was unanimously accorded to Sir A. Harold Bibby for presiding.

The chief general manager, Mr M. Conacher, replied to the tribute to the staff.

THE RAFIDAIN BANK

RADIO RENTALS LIMITED

EFFECT OF SEVERE GOVERNMENT RESTRICTIONS

MR P. PERRING-THOMS ON CURRENT TRENDS

The twentieth annual general meeting of Radio Rentals Limited was held on February 5th at Grosvenor House, Park Lane, London, W.1, Mr P. Perring-Thoms (chairman and managing director), presiding.

The Secretary (Mr A. O. B. Wall, CA) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts: The Accounts for the twentieth financial year of the Company show a new record profit.

After providing for all charges other than Taxation the Group profit is £1,028,586, an increase of £226,300. The net profit of the Group after providing an extra £189,182 for Taxation is £37,118 above last year.

In the Consolidated Profit and Loss Account I would draw your attention to the provision for Depreciation of no less than £1,533,901, which reflects your Directors' continuing prudent and conservative policy. Staff Bonus, Pensions Scheme and Staff Welfare Fund shows a comparatively small increase due to a certain amount of bonus being commuted to basic wage.

All the subsidiary companies except Rentevision Ltd., which has not traded, operated at a profit for the year under review.

Turning now to the items of appropriations, your Directors recommend the payment of a final dividend of 17½ per cent payable on the Capital as increased by the bonus issue in October last of 1,796,253 Ordinary Shares of 5s. each. It is also proposed to transfer £400,000 to General Reserve.

In the Consolidated Balance Sheet you will note the increase in the cost of radio and television sets on or for rental. All these new stocks were manufactured by our subsidiary, Mains Radio Gramophones Limited, and I am happy to tell you that their products have been much admired by the public and are well thought of by our own technical field staff.

The expenditure on 14 new retail shops during the year and the re-siting of 13 other branches is partly reflected in the increase in freehold and leasehold fixed assets. The only other item of interest in the Consolidated Balance Sheet is the reduction in the amounts receivable in respect of Hire Purchase Service Agreements which, of course, follows on the larger hire purchase deposits now required by Government Order.

IMPACT OF DIFFICULT TRADING CONDITIONS

Shareholders are aware of the difficult trading conditions recently imposed upon your Company, and will no doubt be interested to assess their impact upon the year under review, also the possible effect on the future. I briefly mentioned in my last review the increase of Purchase Tax of October, 1955. This disturbance to trading was followed by a serious tightening of the credit squeeze. You will appreciate that in this business we cannot healthily and economically develop on share capital alone, as a material measure of temporary finance is essential during a period of growth.

Having adjusted our trading to make the best of the circumstances the next obstacle to planned progress came on February 17, 1956, when for the first time rental of radio and television became the subject of a Control Order requiring that nine months' rentals for any radio or television set must be paid in advance of installation. That control is the most serious legislative restriction in peacetime that has ever affected the Group and but for this the results for the year under review would, I am convinced, have been materially better.

The impact of the Order is particularly heavy on the radio renting branch of the business, and the decrease in the number of subscribers renting our radio sets is unparalleled in the history of the Company. On the other hand Radio Rentals (Sales with Service) Limited, which deals with the sales branch of the Group's trading, has improved its results and indeed since the introduction of the Order the proportion of sales orders to rental orders has increased materially.

In the meantime we are concentrating on television rental which is now the major part of our business, and here I am pleased to report that conditions have proved less difficult to the extent that we have been able to complete a satisfactory programme during the last half-year of the year under review, and for the following four months to Christmas, 1956. In my opinion the reason why television has been less seriously affected is due to its being a very new industry and also because as yet the complicated business of the disposal of re-hire sets does not arise to the degree that it does in radio renting.

While the authorities continue to insist on placing the Radio and Television Rental Industry at an unfair disadvantage to the rest of the trade we shall do everything possible to overcome the handicap and every effort will continue to be made to obtain a just modification of the Control of Renting Order.

CONFIDENCE IN THE FUTURE

I have no wish to emphasise or belittle the difficulties of trading under controls, seeking only to inform you as briefly as possible of the position. I can also give you the brighter side of the picture because there are two factors in our favour which are most important in our television business. The public are becoming increasingly aware that a television set is a scientific instrument requiring expert attention, the service and maintenance of which can more effectively and economically be provided by a rental service organisation especially where, as in our case, they are also the manufacturers. Secondly, I am pleased to inform you that a growing percentage of our new rental business is being done with members of the public who previously owned a set and who required a replacement. Whilst this tendency can be maintained I have every confidence in the profitable future of our Group. In the first four months of the current financial year public demand for our television service has been high and a very satisfactory volume of business was transacted.

In July, 1956, Sir Giles Guthrie, Bart, and Mr G. W. Parker were appointed Directors of the Parent Company and the subsidiaries, and I would take this opportunity of recording my appreciation of their contributions to the deliberations of your Board.

Finally, I must pay my annual tribute to the staff for their energetic and enthusiastic work for the Group during the year. At the present time petrol rationing is causing them severe dislocation of work and personal inconvenience, but their loyal co-operation in meeting the problem is worthy of the highest praise. I have much pleasure in according to the staff of the Group the thanks of the Board and the shareholders.

The report and accounts were adopted and the retiring directors, Sir Giles Guthrie, Bart, Mr G. W. Parker and Mr J. L. Wilkie, CA, were re-elected.

LLOYD'S PACKING WAREHOUSES (HOLDINGS) LIMITED

YEAR OF RISING COSTS AND FALLING MARGINS

The sixty-first Annual General Meeting of Lloyd's Packing Warehouses (Holdings) Limited, was held on February 1st in Manchester, Sir Eric A. Carpenter, OBE (the Chairman), presiding.

The following is an extract from his circulated statement:

The Consolidated Profit and Loss Account shows the Group Trading Profit at £406,658, a decrease of £174,149 compared with the previous year. After making provision for Taxation £234,276, as against £299,656 net last year, there is an Aggregate Net Profit of £172,382 compared with £281,151 a year ago. Deducting £13,205, the proportion attributable to outside shareholders' interests, and adding the balance brought forward from the previous year £290,839, there is an available balance in the Group of £450,016. From this sum, £25,000 has been allocated to General Reserve.

Your Directors recommend the payment of a final dividend of 7 per cent less tax on the ordinary stock, making 12 per cent less tax for the year. This dividend, together with the preference and ordinary dividends already paid, will absorb £110,388 leaving, after making the allocation to Reserve referred to, a balance to carry forward in the Group of £314,628 as against £290,839 brought in.

Referring to the Consolidated Balance Sheet, Current Assets at £2,329,598 are £300,366 less than a year ago, this being attributable to reductions in stocks and debtors. Current Assets exceed Current Liabilities by £1,565,227 and Combined Capital and Revenue Reserves total £1,377,626, as against £1,350,475 a year ago.

The Consolidated Accounts of Regentone Products Limited, show a Trading Profit of £34,229 for the year under review, compared with £427,753 for the eighteen months to September 30, 1955. After providing £9,075 for Taxation, the balance of £25,154 is carried forward to the credit of Profit and Loss Account.

The statement then reviewed the activities in the main Divisions constituting the Group and after referring to the very considerable fall in the profits of Regentone as a result of the credit restrictions and increase in the rate of Purchase Tax imposed by the Chancellor during the year, the Chairman continued :

Needless to say, following the measures taken by the Chancellor, immediate steps were taken to reorientate the nature of business more in keeping with market requirements. From the commencement of our new financial year to date, the turnover compares favourably with the corresponding period of the previous year, up to which time the results were satisfactory.

SUMMARY

The year under review has been one of rising costs and falling margins. Reductions in costs which can be brought about by installation of more modern plant are constantly overtaken by increases in wages, and those overhead expenses over which we have no control.

The results demonstrate the grave danger, from the point of view of the national economy, if inflation is not checked. The activities of the Lloyd's Group of Companies are, in large measure, related directly or indirectly to exports and there is abundant evidence that, as a nation, our competitive ability in the export field is being seriously challenged. The radio and television industry, in which the Group has a substantial interest, has a valuable export potential, but its efficiency is essentially based upon the home market. The export potential will be impaired if the industry is to be subjected to rates of purchase tax and hire purchase deposits which have a crippling effect on its home sales.

I conclude with expressing my gratitude to Mr F. L. Chaplin, the Managing Director, my Colleagues on the Board, and to Management and Staffs throughout the Group, for their valued services. I feel sure Stockholders will wish to join me in that expression.

The report and accounts were adopted.

ARTHUR GUINNESS SON AND COMPANY LIMITED

CONTINUED EXPANSION OF BEER SALES

The Annual General Meeting of Arthur Guinness Son and Company Limited was held on January 31st at Park Royal Brewery, London, N.W.10.

The Earl of Iveagh, KG, CB, CMG, Chairman of the Company, who presided, said: Your 1956 gross profits increased over 1955 by nearly three quarters of a million, due to increased beer sales. On the brewing side the straight increase was over £800,000, due to record sales. In spite of rising costs our bulk sale price has remained unchanged for the last six years. This is only possible by expanding sales, and although we are always on the search for economies, yet there is not scope in all the possible economies to offset rising costs. Looking into the immediate future the picture is not rosy ; in my opinion we shall be fortunate if we are able in this present year to hold our sales and our profits.

A very large part of gross profits has disappeared in taxation, partly due to tax adjustments but principally because higher profits attract higher income tax. The effect of the two budgets of last year in regard to profits tax was to make the maintenance of our dividend much more costly than before.

CONFECTIONERY GROUP RESULTS

William Nuttall Group profits have fallen, as was anticipated by Major Allnatt last year ; but even this lower figure shows a very handsome return on the money invested. Sales have been expanding, and our very well managed subsidiary is extending into new areas. There were large reserves in the Group accumulated from undistributed profits. Part of these have been capitalised ; so that the share capital is now £1 million.

RECORD OVERSEAS SALES

Our beer sales overseas have been a record, and I would draw your attention to the Exports Supplement in the Annual Report. In Guinness Exports Limited we have an exceedingly enterprising and imaginative Chairman in Mr A. W. Fawcett, and it is due largely to his drive and to his fine team that the results are so good. They have regained our old American export market and are slowly extending it ; but it is still small. During the year we took over the minority interest in Guinness Exports which is now wholly owned by us.

ALE BREWING IN USA AND IRELAND

The arrangements by which the Goebel Brewery of Detroit in the USA was licensed to brew Guinness Beer and Guinness Ale under our direction have been terminated. It became clear that heavy expenditure would be needed to break into the tough beer world of America and we were not prepared to adventure the money. Neither the experiment nor its termination involve your company in loss.

In Ireland our ale sales fell. During the year we took an interest in Smithwicks Brewery, Kilkenny, and are represented on their board.

NORTHERN IRELAND SUBSIDIARY

We have established a separate company at Belfast which is entirely responsible for selling, distribution and advertising of Guinness in Northern Ireland.

The Earl of Iveagh concluded by paying a tribute to staff and employees, to whom a bonus of one month's pay had been given. He made special reference to those who had retired on pension during the year, including more than sixty with over forty years' service and several with over fifty years'.

The Report and Accounts were unanimously adopted and the recommendation of the Directors approved for the payment of final dividends on February 1st of 3 per cent on the Preference Stock and 15 per cent on the Ordinary Stock, both less Income Tax.

APPOINTMENTS

THE QUEEN'S UNIVERSITY OF BELFAST

The Senate of The Queen's University of Belfast invites applications for the post of Tutor in Practical Work in the School of Social Studies from September 1, 1957, or such later date as may be arranged. Initial placing on the salary scale of £650 x £50 to £1,000 plus F.S.S.U. benefits will depend on qualifications and experience. Candidates should hold a University degree and have had practical experience in a family case work agency recognised for training, but arrangements to gain such experience can be made for a successful candidate who is otherwise well qualified. Postgraduate qualifications in specialist fields of social work would be an advantage. Applications should be submitted by April 1, 1957.—Further particulars can be obtained from G. R. Cowie, M.A., LL.B., Secretary.

ECONOMIST.—Economics Graduate, aged 25 to 35, is required to work and write on economic problems connected with nuclear power and nuclear power station design. Analytical ability and adaptability are more important than a previous technical background, as the applicant appointed will have every opportunity to learn about the technical aspects of the work. Previous industrial experience an advantage.—Write, giving details of educational qualifications and career, to Personnel Manager (G), The Power Jets (Research & Development) Limited, Fraser & Chalmers Engineering Works, Erith, Kent.

MARKET RESEARCH OR MARKETING

Men with an aptitude for statistics, and some experience in the use of Marketing Research are invited to apply for an appointment in one of the larger Advertising Agencies. The job is to assist the account executives in the planning side of their work—interpreting sales figures, suggesting and making arrangements for specific Research, collaborating with the client's own Research Department and so forth. Although this is obviously a responsible position, men with relatively short experience of Market Research would be considered.—Box 625.

THE National Institute of Economic and Social Research invites applications for the post of Senior Research Officer. The successful candidate will take charge of research on the measurement of the comparative economic position of different socio-economic groups. The appointment, which is for three years starting at a date between March 1 and October 1, 1957, will carry a salary within the range £1,100 to £1,450 p.a., with F.S.S.U. provision and family allowances. A special appointment at a higher salary would be considered for a candidate of exceptional qualifications.—Applications to the Secretary (from whom further particulars may be obtained) at 2 Dean Trench Street, London, S.W.1, not later than February 28th.

THE ROYAL COLLEGE OF SCIENCE AND TECHNOLOGY GLASGOW

(Affiliated to the University of Glasgow)

DEPARTMENT OF INDUSTRIAL ADMINISTRATION

APPOINTMENT OF SENIOR LECTURER

Applications are invited for a Senior Lectureship in the Department of Industrial Administration.

Candidates should possess a good academic degree, or equivalent qualification, and have had experience in industry or administration, preferably in such fields as Industrial Engineering, Work Study, Planning and Control, Operational Research or Accountancy. The salary scale will be on the scale £1,400 x £50 to £1,550 with superannuation and a scheme of family allowances. There may be some revision of this scale in the near future.

Forms of application may be obtained from the Secretary-Treasurer, The Royal College of Science and Technology, George Street, Glasgow, C.1.

MARKETING.—Applications are invited for a Senior Executive position of unusual scope and interest with a large manufacturing Company. The appointment will involve the direction of a unit engaged in forecasting short and long-term market trends and carrying out continuous investigations in fields affecting commercial policy. The Company is interested in Graduate Economists or Statisticians, preferably with post-graduate research experience, who have a wide knowledge both of the study of economic trends and of the organisation of consumer research ; the work will cover home and overseas markets. Previous experience in the administrative aspects of controlling a small department will also be of advantage. This appointment offers an attractive career and the starting salary will be in the region of £1,750 or possibly more, depending upon experience and qualifications. Applications will be treated in strict confidence.—Box 620.

QUALIFIED ACCOUNTANT with fluent French is required for professional appointment in the Belgian Congo. Administrative ability, energy and intuitive essential. Exceptional prospects for the right man.—Write Box X.496, c/o Streets, 110 Old Broad Street, E.C.2.

NOTTINGHAM AND DISTRICT TECHNICAL COLLEGE

Principal : D. A. R. Clark, M.Sc.(Tech.)

Applications are invited for the following appointment : LECTURER IN MANAGEMENT STUDIES, with Work Study experience.

Salary in accordance with the Burnham Technical Scale as follows : (Men), £1,200 x £30 to £1,350 per annum.

The policy of the College is to encourage staff and students to undertake research work, on an appreciable amount being in progress at the present time.

Further particulars and form of application may be obtained from the Principal, Nottingham and District Technical College, Shakespeare Street, Nottingham, to whom completed forms should be returned as soon as possible.

W. G. JACKSON,
Clerk to the Joint Education Committee

PERSONAL ASSISTANT TO SENIOR EXECUTIVE

Applications are invited for the post of Personal Assistant to a Senior Executive with a prominent Developing Organisation. Candidates must be men between the age of 25 and 33 and should have a good University degree (Arts or Science) or equivalent professional qualification, and at least 2 years' post graduate experience in industry or commerce. It would be an advantage for candidates to have had civil engineering, building, or housing or estate management experience.

Requirements include a high level of intelligence, marked administrative ability, socially impressive personality, robust health and marked drive and ambition. It is proposed to allow the chosen candidate about six months' practical training on the job before he is given major executive responsibilities.

The post will be in London, but some travelling within Great Britain will be involved. Starting salary will be about £1,500 p.a., and there are excellent prospects of rapid increase of salary.

Candidates are asked to make their applications on the standard form which is available from : The Secretary (C21), 14 Welbeck Street, London, W.1 (Telephone : WELbeck 1144).

ADVERTISING/SALES PROMOTION MANAGER required by Leading Food Manufacturer near London. Applicants (30-42 age group) should have wide knowledge of techniques of advertising with emphasis on promotional experience with branded packaged products. Substantial salary and attractive amenities including non-contributory pension.—Applications, stating age, full details of experience and present salary, to Box 622.

APPOINTMENTS

THE UNIVERSITY OF MANCHESTER

HALLSWORTH RESEARCH FELLOWSHIPS

Applications are invited for the above Research Fellowships for advanced work in the field of political Economy and Public Administration. The value of the Fellowships will normally be within the range of £700-£1,500 per annum, according to experience and qualifications. Regulations governing the award of the Fellowships may be obtained from the Registrar, the University, Manchester, 13, to whom applications should be sent not later than March 1, 1957.

THE UNIVERSITY OF LIVERPOOL

Applications are invited for a Leverhulme Postgraduate Fellowship in any Department of the Faculty of Arts. The Fellowship will be tenable for one year at a value of £500, but may be renewed for a second year at a value of £550.

Applications, three copies, stating age, qualifications and experience, proposed field of research and the names of two referees, should be received not later than March 1, 1957, by the undersigned, from whom further particulars may be obtained.

STANLEY DUMBELL,
Registrar.

THE UNIVERSITY OF LEEDS

THE FACULTIES OF ARTS, ECONOMIC AND SOCIAL STUDIES AND LAW
POSTGRADUATE SCHOLARSHIPS

Applications are invited for not more than three Postgraduate Research Scholarships tenable at the University of Leeds by graduates of other Universities. These Scholarships, each of the value of £330 a year plus fees, will be tenable from October 1, 1957, for advanced study or research in the Faculties of Arts, Economic and Social Studies and Law, and will be renewable annually. Maximum tenure three years.—Applications (including those of students who will graduate in June, 1957), should be submitted on forms obtainable from The Registrar, The University, Leeds 2. Closing date May 1, 1957.

MANAGEMENT SELECTION LIMITED have been retained to advise on the selection of the

GENERAL SALES MANAGER

for a company (3,000-4,000 employees) making and marketing quality domestic electrical appliances. The appointment results from policy and organisational decisions, which form part of a determined attack on this market. The Company has plans for a very considerable expansion in the next few years. Responsibility will be to the Sales Director (who retires in 1-2 years) for the policy, planning and control of sales throughout Great Britain. Headquarters in London.

Candidates must have had successful experience in a highly competitive market, including managing a consumer goods sales organisation, and directing a large field force selling in the retail trade. Knowledge of the domestic electrical appliance field an advantage but not essential. Good general education necessary, preferably with a University degree. Age 35-45, salary £3,000-£5,000.

Please send brief details, in strict confidence, to H. E. Roff (S249), Management Selection Limited, 17 Stratton Street, London, W.1. No information will be passed to our clients without candidates' permission after full personal discussion at which the identity of the Company will be disclosed.

ATTRACTIVE OPPORTUNITIES are offered to QUALIFIED ACCOUNTANTS (age limit 30 years) in the Unilever Audit Department. Candidates need not have had any previous commercial experience. The work provides excellent experience in progressive auditing techniques and in modern methods of accounting and commercial control in a wide variety of process industries. A certain amount of travel in the U.K. is entailed although the work is based on London or Port Sunlight. Audit Department is a recognised training ground for men suitable for promotion to commercial positions in the Concern—not confined solely to accounting. There is also considerable scope for advancement within the Audit Department. Successful candidates will be eligible for consideration for the Concern's Management Development Scheme which is designed to train young men for managerial positions. The commencing salary will depend on qualifications and experience, but will not be less than £650 per annum for men who have completed National Service.

Applications, accompanied by a brief summary of education and experience, should be sent to Personnel Division (GOS 141), Unilever Limited, Unilever House, Blackfriars, London, E.C.4.

RELAYS

High level TECHNICAL COMMERCIAL MANAGER is sought by a large company in the London area to assume responsibility for the control of its Relay Division. This responsibility covers designs, selling and production. Applicant should preferably be technically qualified, having experience in this field or associated products. The starting salary should be commensurate with experience but will be right applicant should not be below £2,500 per annum. Good pension scheme and other benefits.—Applications, in strictest confidence, to Box 624.

STATISTICAL OFFICER (female) required for interesting post at Felixstowe, dealing with agricultural contract spraying. Applicants should have B.Sc. (Economics), previous experience in statistical work and typing ability. Attractive terms of appointment.—Applications quoting No. 13161, stating age, qualifications, experience and salary required, to Personnel Manager, Pitons Pest Control Limited, Bourn, Cambridge.

UNIVERSITY OF CAMBRIDGE

DEPARTMENT OF ESTATE MANAGEMENT

The Department of Estate Management proposes to award, from October 1, 1957, grants for research in economic, legal or social problems related to the ownership, tenure or development of land.

Essential qualifications : good honours degree in History, Economic History, Economics, Agricultural Economics, or Law, or a degree with a high class in Estate Management, or evidence of likelihood to obtain such a degree not later than July, 1957.

Value of a grant £400 a year, plus University and College fees. Normally tenable for two years.

Particulars from Secretary, Board of Estate Management, 74 Trumpington Street, Cambridge. Completed applications should reach him by March 15th.

ROLLS-ROYCE (AERO ENGINE DIVISION)

have several vacancies in their ENGINEERING AUDIT DEPARTMENT AT DERBY

which is concerned with work study, budgetary control, office organisation and methods, and other special duties on behalf of the management.

Candidates should be between the ages of 25 and 35, and whilst preference will be given to those with a good engineering degree or its equivalent, together with some experience in work study or industrial consultancy, consideration will be given to those with accountancy or commercial qualifications supported by appropriate industrial experience. Initiative, personality, and the ability to deal successfully with people at all levels, are essential requirements.

Those interested should write for an application form to the

Staff Appointments Officer,
Rolls-Royce Limited,
P.O. Box 31, Derby.

CHIEF PERSONNEL OFFICER

Large and leading internationally known manufacturer of engineering products in the Midlands requires CHIEF PERSONNEL OFFICER to be in complete charge of well-established department.

Age 35-45. University degree and I.P.M. membership desirable but not essential. Must have had more than ten years practical administrative experience in personnel activities with at least five in engineering. Only applicants currently holding a senior personnel position in industry need apply. Successful applicant must be first-class administrator and thoroughly familiar with various training schemes and up-to-date recruitment and selection methods as well as being well-informed on all matters relating to engineering, Trade Unions, and Employers' Associations. This is a senior appointment and a good four-figure salary and well-established staff superannuation scheme. An excellent opportunity for the right man.

Apply in GUARANTEED STRICTEST CONFIDENCE, in accordance with professional ethics, giving contact telephone number, details of date and place of birth, education, background, names of firms, positions held with dates and salaries, to

Dr. P. S. de Q. CABOT.

P. S. CABOT AND COMPANY,
37-41 BEDFORD ROW,
LONDON, W.C.1.

MANAGEMENT ACCOUNTING

Manufacturing-distribution Company of international repute with 8,500 employees and London Head Office seeks Chartered Accountant with two or three years' experience since qualifying. Must have first-class brain, be willing to learn the business and to assume responsibility for financial forecasting and control within five years. Pension. Salary by arrangement.—Box 621.

INTERNATIONAL TRADE UNION organisation (London headquarters) offers position as Translator/Interpreter/Reporter. Permanent post with non-contributory superannuation scheme. Three weeks' annual paid holiday. Applicants, whose mother-tongue should be English, must be able to translate and interpret from French, German and one or more Scandinavian languages. Should also be capable of producing reports and minutes of meetings. Previous trade union experience an asset. —Applications, stating age, qualifications, previous experience and salary required, together with references, should be forwarded to Box 611.

APPLICATIONS are invited from professionally qualified accountants for the appointment of LECTURER in the DEPARTMENT OF AIRCRAFT ECONOMICS AND PRODUCTION. Applicants should have had industrial experience in accountancy, stock control and use of costing and accounting machines. A University degree and ability to lecture on industrial economics are advantages. Salary dependent on qualifications and experience, with superannuation under F.S.S.U., and family allowance. Normally term and vacation conditions apply and a house on the College estate may be available.—Applications, giving full particulars of qualifications and experience, and quoting the names of three referees, should be forwarded to the Recorder, The College of Aeronautics, Cranfield, Bletchley, Bucks, from whom further particulars may be obtained.

MINISTRY OF EDUCATION requires, for England only, H.M. Inspectors (men and women). Preferably under 50. Good educational qualifications and experience in Adult Education desirable. Qualifications in Economics, Philosophy and Psychology particularly desirable.

Permanent posts, non-contributory pension. Present Salary (increases under consideration) London (men) £1,300 x 12 increments to £2,050 ; (women) £1,232 by 12 increments to £1,930 (being improved by equal pay scheme). Elsewhere slightly less. Appointment may, if appropriate, be made above the minimum. Higher posts filled by promotion ; also some with £115 allowance.

Application form from The Secretary (Inspectors' Section), Ministry of Education, Curzon Street, London, W.1. Closing date March 16, 1957.

EXPERIENCED SENIOR EXECUTIVE, with 11 years active managerial background, seeks administrative appointment, preferably London area. Thorough knowledge overseas marketing. Aged 35. Fluent French. Undeterred by hard work and difficulties.—Box 605.

TECHNICALLY QUALIFIED COMMERCIAL EXECUTIVE, 43, Public School and University Graduate (Chemistry), seeks responsible post in Dominions or other overseas territories where hard work and ability appreciated. Import/export and Home Sales experience with extensive personal contacts Chemical and Plastics industries. Fluent French, moderate German. Would welcome position offering responsibility for production and/or sales development of a new project.—Box 623.

AIR AND SURFACE WARNING RADAR
INTERCEPTION CONTROL SYSTEMS
COMPLETE SHIPBORNE RADAR INSTALLATIONS
RADAR TRAINING, PLANNING AND ADVISORY SERVICES

For many years Marconi's have collaborated with the Admiralty, Air Ministry and Ministry of Supply in the development and production of radar equipments. They are at present entrusted with contracts to re-equip radar formations of the R.A.F. and are responsible for the radar at London Airport and other major airports. As a result of the experience thus gained in research, development and production, a unique knowledge of the detailed planning of radar stations and systems has been built up and is now being applied by Marconi's to the provision of integrated naval and air radar defence networks and complete installations for civil airports in many parts of the world.

A well-designed, skilfully-coloured Signature Paper on your boxes can achieve distinctive recognition for your goods, not only at point of sale, but before it and after it. This is advertising without pause; effective, as many firms have discovered, far and away beyond its cost. In fact, apart from a charge for the special rollers on your first order, you pay very little more than for standard box-cover papers. Let us design a Signature Paper for you!

SANDERSON

OF BERNERS STREET

ARTHUR SANDERSON & SONS LTD
DEPT. E, 52 BERNERS STREET, LONDON, W.1

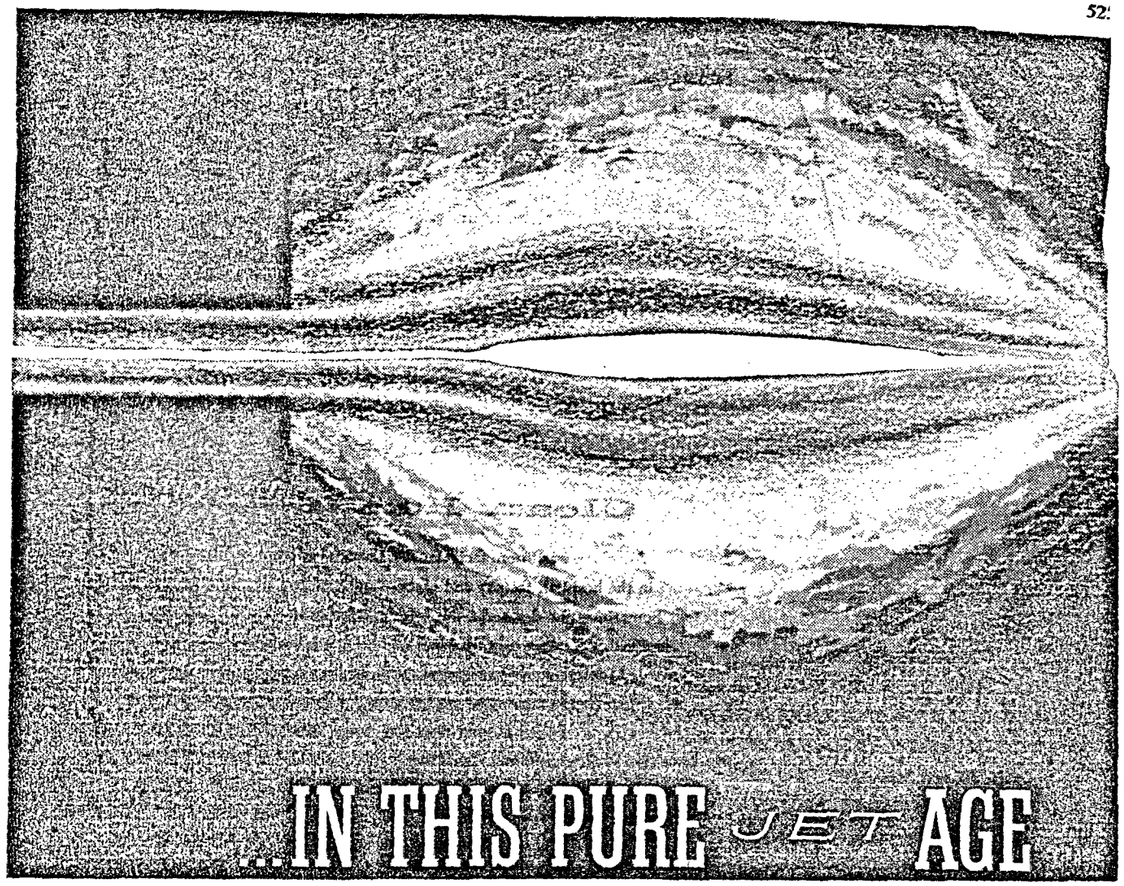
they saw this man—

built exports from zero to £13,000

'Why don't *we* go into the export field?' A firm of weaving equipment makers began asking that question in 1950—and they went the right way about getting a sensible answer. They saw the man from E.C.G.D. He told them bluntly that there were big risks as well as big profits in export—and that some of those risks couldn't be insured against commercially. Then he explained how an E.C.G.D. policy would give them the *comprehensive* cover they needed. They took out a policy—and took the plunge. They've never regretted it. In the first year their export turnover was £1,000. Four years later it had multiplied 13 times to £13,000! How much did they have to pay in premiums? *About 2/11½d. a day over the four years.* Are *you* thinking of branching out into export? Then get on to your local E.C.G.D. office and ask for the E.C.G.D. man to call. If you're already an exporter, he'll be calling on you anyway. Don't you think you'd better see him—and listen to what he's got to say?

With acknowledgements to John Bartholomew & Son Ltd.

●



This is a true story, but because business between E.C.G.D. and exporters is strictly confidential any details which could identify the exporter have been left out.

E·C·G·D

E.C.G.D. is a Government Department set up to help exporters. Its services are fully explained in the booklet 'Payment Secured'. Write for a free copy.

...IN THIS PURE JET AGE

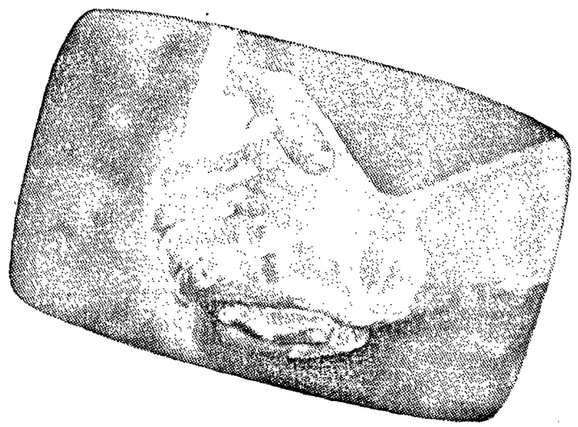
The technique of steel furnace boosting with a jet of pure oxygen stabilizes quality and batch uniformity.

This principle, whether applied to Open Hearth, Blast or Bessemer, enables manufacturers to widen still further their range of specialised quality steels.

Growing demands of scientific and industrial progress require speedier delivery in the face of increasing competition. It is vital that manufacturers employ this latest technique which shows greater economy and is only made possible by employing the proven principle of the Butterley on-site Tonnage Generator.

This compact, efficient plant produces a continuous supply of Oxygen and/or Nitrogen at any desired purity and pressure, piped direct to the point of usage, in the exact quantity desired. Its efficiency eliminates production hold-ups by maintaining a constant supply, and maintenance costs are low.

The Butterley Company have acquired the sole production and sales rights of this, the most successful American Process, for the United Kingdom, British Commonwealth, and certain European countries.



If you can use oxygen, consult

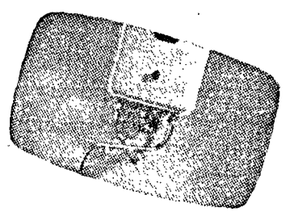
Current contracts include: British Celanese Ltd., Brymbo Steel Works Ltd., Imperial Chemical Industries Ltd., Steel Company of Wales Ltd., Stewarts and Lloyds Ltd. *Makers since 1790 of: Railway and other bridges; constructional steelwork; unit bridging; overhead cranes; railway wagons and mine cars; meehanite castings; iron paving; mining and sheet metal machinery; wrought iron bars; sewage ejectors, pumps and air compressors; wood washing machinery; high quality bricks; aglite lightweight aggregate.*



Clean hands

Adequate washroom facilities are essential to combat disease in the hospital, factory and office—and vital for clean food. Sometimes the demand is for large quantities of hot water continuously, day and night—or maybe it is needed instantaneously at irregular times. But whatever the hot water requirement, the Heating Engineers at your Area Gas Board have had considerable experience in fitting thousands of different hot water installations and will gladly advise you on your problem.

WHATEVER YOUR BUSINESS—The Gas Industry appreciates the needs of consumers for prompt service and for advice which accords with the customer's special circumstances and requirements. Each Area Gas Board offers efficient service to users of gas-fired equipment and can give expert advice based upon the pooled knowledge of all the Boards and of gas users in other countries.

Soviet Waterways

The Development of the Inland Navigation System in the USSR

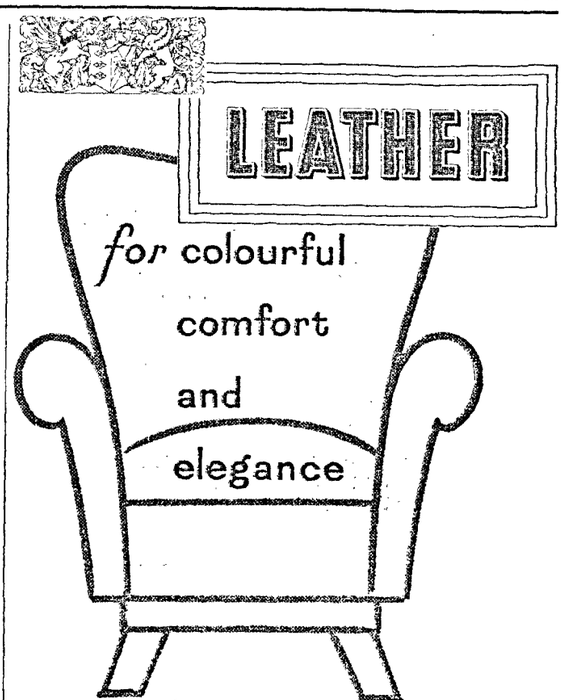
By ANDREI LEBED and BORIS YAKOVLEV

The book deals with transportation features of river engineering developments in the Soviet Union, including political and social aspects. Traces the history of canal-building in the Russian Empire. Gives extensive attention to proposed projects as well as to those in progress or already completed in the Soviet period. Covers in detail steps toward construction of a unified inland waterway system for the entire Soviet Union. A large chapter is devoted to Siberia.

Of interest to students of Soviet geography, economics, sociology, history, military affairs.

Recommended for supplementary reading in connection with standard texts.

Provided with 28 sketch maps, bibliography, index of places and projects.



Partial List of Contents

The Development of Waterways in Russia to 1914 . Research, Planning, and Standards . The Concept of a Unified Deep-Water Transportation System . The Problem of the Dnepr . The Greater Volga . Installations in the Asiatic USSR . River Engineering Projects in the Sixth Five-Year Plan, 1956-60 . Some Special Features of Soviet River Engineering Construction.

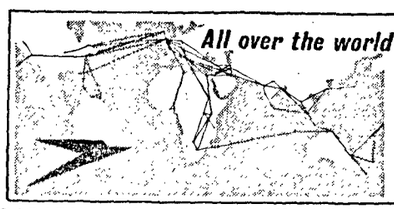
NOW TO SOUTH AFRICA – SOON TO AUSTRALIA

Fastest, smoothest, most spacious jet-prop airliner in the world

THE B.O.A.C.



Whispering Giant

Britannia

Step aboard the *Britannia*! Now in service to South Africa—Johannesburg in less than a day! Soon in service between London and Sydney. Discover a standard of passenger comfort unparalleled in all the world. The spaciousness of the cabins is a dream of inspired planning; the service and cuisine beyond comparison. This magnificent airliner is so *smooth* in flight, you'll find it hard to realise you're moving at all —you are wafted gently along at over 6 miles a minute without strain or travel fatigue. And the *Britannia* is equipped with the latest radar for fair-weather flying all the way. Fly B.O.A.C. *Britannia*—it's a wonderful new experience.

De luxe First Class services (fully-reclining "Slumberettes") and low-fare Tourist services by Britannia. Also First Class and Tourist services by S.A.A. DC-7B to South Africa; by Qantas Super-G Constellation to Australia

Consult your local B.O.A.C. Appointed Travel Agent or B.O.A.C., Airways Terminal, Victoria, S.W.1 (VIC 2323); 75 Regent Street, W.1 (MAY 6611); or offices in Birmingham, Leeds, Manchester, Liverpool and Glasgow (see your Telephone Directory for details).

B·O·A·C takes good care of you

Last Chance for Local Government?

THERE is only one sure way of arousing excitement about local government finance: that is to put the rates up. Of all British prejudices, the belief that local rates should never rise, whatever may happen to other prices and taxes, is the most deeply rooted—and, for all that, perhaps the most frequently frustrated. The first response to Mr Henry Brooke's statement of last Tuesday has been in the best tradition. The Minister of Housing and Local Government recently decided to reduce the rates on shops and offices by 20 per cent (a "good thing," especially for shopkeepers). Now most people think that he is about to increase the rate burden on industry by 100 per cent (and that they deplore as a "bad thing"). This is not only the wrong response to those particular proposals; it also ignores the major reforms proposed by Mr Brooke in the financial relations between central and local government. These, together with the collateral reforms of the structure and functions of local government, offer perhaps the last chance of securing more independence and infusing more vigour in local government.

It has long been clear that the only hope of making local government more self-reliant lies in some loosening of the financial nexus between central and local government. Local authorities in England and Wales now receive £490 million a year in rate revenues; but they also receive £581 million in grants from the central purse. There is no proposal—certainly there should be no immediate hope—of reducing the total amount of Exchequer assistance in any large way. Indeed, what Mr Brooke is proposing sounds at first hearing aridly technical; it is to replace the specific grants made to the local councils by "a general grant of an amount fixed in advance for a short period of years, though not necessarily at the same level for each year of the period." This may seem like a mere change of form. Yet it touches the most obstinate weakness of local government finance.

An illustration will make plainer the fundamental character of the Minister's proposals. Of the £581 million of government grants, £73 million are being distributed to the poorer authorities as equalisation grants to make up for their poverty. These are to be retained, though the way in which they are calculated will be revised, and some part of them will go direct to the district councils, instead of by way of county halls. The rest of the grants—now running at £508 million—go at present to local authorities in aid of specific services, and most of them take the form of a percentage grant in reimbursement of actual spending. By far the biggest is the education grant, which is currently costing about £300 million a year and is designed basically to cover 60 per cent of the local education authorities' net expenditure. Now, in the new proposals, this specific grant is to go, together with others, such as the grants for the fire and local health services. In place of these earmarked grants, the Minister proposes that the local councils shall receive general grants with no strings attached which they will be able to

spend as they think best. A general grant of some £280 million, plus the equalisation grant, appears to be contemplated.

Rearrangements of this kind inevitably create disturbance, because some lose while others gain. Even if the wisdom of angels could find a perfect formula for the grant, using the nicest calculations of the populations of the counties and county boroughs that receive it, some of them would still be full of dissatisfaction. Mr Brooke will not have an easy time when he comes to spell out his proposals in detail to the representative bodies of these authorities. And powerful bodies in the field of education will entertain the darkest mistrust of his motives. Yet this single step, technical though it may appear, is the first move of major importance to release local government from its thraldom to central direction and central finance. To put the matter bluntly, when a local education authority is responsible for finding only 8s. out of every pound it spends, its eye is bound to be fixed more on the ends than on the means. That is natural and human. To make the point is not to say that education authorities have been viciously wasteful or to argue that the nation's total bill for education should, or could, be slashed. But in future, what they will spend will pass more directly under the test of need and economy. Mr Brooke's proposals are a move for making better use of money, not a manifesto for skinflints.

What the new system aims at securing is greater scope for local decisions about local requirements. It will be for the local authorities themselves to weigh competing claims against their resources (one major element in these being the untied grant that they receive from the Exchequer), and to justify their own choices to their own ratepayers. Many of them will not like this, for they have enjoyed a postwar regime of easy access to capital and the automatic receipt of tied grants. Spirit and democratic purpose have largely disappeared from local government because it has in considerable measure positively cultivated this dependence, and has concerned itself much less with what its own ratepayers wanted—and were prepared to vote for and to pay for out of their own pockets.

★

So the untying of a major part of the grant will widen the area of democratic decision that will be open to local government. Will the local authorities be willing and able to seize their new opportunities? Clearly, many can; local treasurers and finance committees have been re-learning for a year or two the simple rules of housekeeping that match ends to means. But it cannot be supposed that all councils will relish these changes or, indeed, that all of them are immediately able or ambitious to draw from them new energies and resourcefulness. Mr Brooke's proposals hold out the opportunity, almost at the last minute, of rebuilding democratic strength in what used to be a vigorous training ground for British democratic institutions.

That is the essence of the task. It is unlikely to be a quick job. If the Minister's discussions occupy most of the summer, legislation can hardly be through in time to become effective before April, 1959. The prospect of a general election will inevitably, if unfortunately, be a major influence upon the deliberations; hence, no doubt, Mr Brooke's reference to the need for "some transitional grant arrangements" after the main changes are introduced. But it must be earnestly hoped that the Government will not allow short-term political considerations to frustrate the main purpose—for that is the long-term stuff of democracy. Too much has already been compromised for comfort in local government finance. The Minister's clear declaration on the maintenance of the rating system is welcome; it is a miracle that the system continues to work as well as it does after the ravages of inflation, interference and indecision that have afflicted it since the war. But its present state would be charitably described as a mess. Houses are assessed on the basis of 1939 values, and they will not be rated on current values until the 1961 valuation. Shops and offices are currently valued, but are to be 20 per cent derated. Industrial properties, too, are currently valued, but even when their contribution is raised, as the Government has concluded "is now right," it will be from 25 per cent to 50 per cent of the full rate, leaving them, as from that still undetermined day, still 50 per cent derated.

★

The second task in the reform of local government finance to which Mr Brooke has set his hand must be to end these anomalies and anachronisms—and to bring in some contribution from agriculture, too. As in national taxation, so in local finance: expedient reliefs for certain sections of the community have had the effect of increasing the burdens falling on others in a wholly disproportionate way. The integrity and vitality of the rating system will never be restored in full until all properties are valued on a current basis, and all classes of property are contributing equitably to the pool of rate revenues. There is a long history of political shiftiness in handling these touchy problems, and Mr Brooke will soon find himself under the same pressures that proved too much for so many of his predecessors. He should not falter.

To untie the bulk of the grants from the Exchequer, therefore, represents only a first stage in financial independence for local government. Rating has to be made to work, its foundations have to be strengthened, and it must be kept abreast of changing conditions and changing money values. When that is done, many contradictions in local finance will disappear. Local needs will be met by local decisions, and financed to a critical extent out of local pockets. These aspirations may perhaps be dismissed as echoes from the parish pump. But it was around the parish pump that democracy learned to work before the man in Whitehall was ever heard of.

M. Mollet's Record

M. MOLLET, when he arrives in Washington for his talks with President Eisenhower on February 26th, will have had a longer uninterrupted tenure of office, by one day, than any other prime minister of the Fourth Republic. (M. Queuille's first administration lasted 391 days; M. Mollet was invested on January 31st last year.) Measured by days, his record will be unchallengeable; how does it stand if measured by performance?

If the circumstances in which this minority government came to power are recalled, M. Mollet's record is astonishing. Nothing in the composition of the new Assembly gave any ground for supposing that it would produce any greater governmental stability than the Assembly which preceded it. Two Frenchmen out of five voted for parties hostile to the parliamentary regime; some 150 Communists and more than 50 Poujadists found their way to the Palais Bourbon. Hemmed in by these two wings, the two centre block parties which had fought the election against each other emerged with less than 200 deputies apiece. Because the voting had shown a slight swing to the left, the Republican Front of Socialists and orthodox Radicals, led by MM. Mollet and Mendès-France, was asked to form the government in preference to a coalition of conservatives (*indépendants*), Catholics (MRP), and dissident Radicals. But from the start M. Mollet was condemned to a balancing act; his Front could directly command less than a third of the Assembly's votes.

Disciplined Socialist support is the real secret of M. Mollet's long tenure of office. The 100 or so Socialist votes are, in fact, an indispensable element in any governmental equation in this divided assembly. As general secretary of his party M. Mollet could claim, paraphrasing Louis XIV, "la stabilité c'est moi." After over a year of rule the principle is still arithmetically true, but it is losing force because of one important change in the present parliament: the decreasing pressure from the wings, which tends to relax the formerly imperative pressure for discipline in the parties of the centre.

The Communists returned to the Chamber in confident mood as by far the largest single party. Determined to force the Socialists into "unity of action," they at first hesitated to attack the government's Algerian policy. When they finally came out to attack, two terrible blows from outside the ring sent them back into their corner. Mr Khrushchev's indictment of Stalin threw the most Stalinist party in Western Europe into panic; and scarcely had its leaders had time to close the ranks and restore a semblance of order when the party was further shaken by the news from Hungary. It may even be said that the Soviet tanks in Budapest removed the possibility of a popular front in Paris. For some time to come the French Communists are condemned to political isolation.

The Poujadists, on the other wing, are tending to return to the republican fold; like other right-wing rebels before them, they have found a position of irreconcilable detachment from the current flow of politics impossible to maintain. Uneasy in their fruitless isolation, they responded instinctively to the nationalist appeals of their colleagues on the right. At the same time, the two million or so discontented Frenchmen who had pinned their hopes on M. Poujade could see that they were not getting value for their votes; and his own defeat in a recent Paris by-election may mark the eclipse of a movement which succeeded for a brief period in channelling the powerful forces of discontent that always threaten any French republic from the right.

The orthodox conservatives have cause to rejoice. Strong nationalist currents are running in French opinion, set in motion largely by the struggle with Arab nationalism for control of north-west Africa. The Egyptian expedition caused few heart-searchings in France, where a mood which puts simple national interest first is tending to pull the electors to the right. In parliament the disintegration of the Poujadist group is likely to bring new adherents to the conservatives. Finally, the threat of a popular front (always present in the minds of the French politicians, though M. Mollet has never used it) has receded. Encouraged by all these developments, M. Pinay's followers are no longer content to exact concessions of policy from a Socialist-led government; by now they want a share of office for themselves. An early government crisis cannot, therefore, be ruled out. M. Mollet is immune until he returns from Washington, but perhaps not for long after.

★

What did M. Mollet achieve while his parliamentary position was less precarious? His apologists produce a short list of social reforms, including three weeks' holidays with pay, higher pensions and outlines of long-term programmes for housing and education. The list is short because the government was thrown on the defensive on the economic front. No manipulation of the retail price index, designed to prevent the automatic working of the sliding scale of wages, can camouflage inflationary pressures on the scale on which they have appeared in France. Though a successful loan was floated last year and industrial expansion went on, the budgetary deficit is rising. In the last two years government expenditure increased by about £800 million a year, of which defence has absorbed nearly half. Expenditure is still tending to rise, while production

has begun to slacken, and this is bound to affect revenue. No wonder that M. Ramadier, the finance minister, is now reaching for the budgetary axe instead of the socialist textbook. And the balance of payments is causing even greater concern. The trade gap widened last year by more than $1,000 million. Foreign exchange reserves, comfortable at the end of 1955, slumped by about $750 million last year, and are now approaching a stage at which not even the expected appeal to the International Monetary Fund may prove sufficient to avert a crisis for the franc. The feeling is spreading in Paris that the long period of "expansion in stability" is drawing to an end.

★

It is less on what he has done than on what he is going to do that the advocates of prolonging M. Mollet's term of office rest their case. Having eliminated the Saar as an obstacle to better relations with Germany, he is generally regarded as the pilot best suited to get the Euratom and common market treaties through the French Assembly. In "making Europe," so the argument runs, he will solve all France's problems; the wind of competition will bring new vigour to its old-fashioned economy, while politically "Europe" will provide France with a new purpose, curing it of its inferiority complex and of introspective brooding on past glories. The chances of M. Mollet getting the treaties through are good, though it would be a mistake to underestimate the Assembly's capacity for procrastination and last-minute surprises. But the European policy cannot be treated in isolation. A disaster in Algeria would give the European common market a most inauspicious start; or a balance of payments crisis, compelling the French, say, to impose new import restrictions, might nip the whole project in the bud.

M. Mollet's balance-sheet of achievement and failure cannot be made up without taking account of the central issue of French politics, the war in Algeria. The Republican Front fought its electoral campaign with a pledge to bring peace to Algeria; and it is here that the government's performance is weakest. M. Mollet started by mismanaging his first visit to Algiers, where he gave way to the angry French settlers. Many misfortunes can probably be traced back psychologically to that disastrous day: the kidnapping of the Algerian leaders on their way from Morocco to Tunis in October; even, perhaps, the Suez campaign itself, which for Frenchmen was a short-cut—which went astray—to success in Algeria. M. Lacoste, the minister resident in charge of Algerian affairs, has wasted much of his effort in the fruitless attempt to disarm the anger of the settlers. He has not won them over (the prospect of a single chamber dominated by Moslems angers them), but he has succeeded in throwing moderate Moslems into the arms of the rebels. The rebellion, far from being crushed, continues to be kept alive by the succession of terror and reprisals. Elections have been promised for three months after the cease-fire; but when is that? The Arab leaders, who at one time welcomed M. Mollet's government as an administration capable of coming to terms with them, are now waiting for its successor.

★

It must be recognised that M. Mollet's Algerian policy has had broad support at home. Though half a million troops are tied up in Algeria, and the conflict costs more than a million pounds a day, these sacrifices have not in fact aroused great passion. On the contrary, *Mendèsisme*, which a year ago seemed to be a growing force in French politics, has appeared to dissolve, and M. Mendès-France, having withdrawn from the government, finds himself without power and with little influence. Must he stay in the wilderness until there is another disaster like that of Dien Bien Phu? France is better able to fight in Algeria than it was in Indo-China, but each day weakens its links with Morocco and Tunisia, poisoning what once promised to be a good and fruitful relationship. Even the bold new project to set French colonies on the road to some sort of commonwealth requires a solution in Algeria. And what impact an enforced flight from Algeria might have on home politics nobody can foretell.

The United Nations debate on Algeria can bring no answer to the problem. For the moment the mere threat of intervention from the UN Assembly has acted as a brake on French internal dissensions. His visit to Washington will provide M. Mollet with another respite. But the conservatives and Catholics clearly feel that their time to take office has almost come. If they hesitate beyond next month, it will be because some among them prefer to delay the attack until M. Mollet has carried through the European treaties. That, if it is done, will be his outstanding achievement. When he falls, there is no reason to expect that his successor will find the problem of French government less intractable than he has found it.

Britain and Europe

In addition to the two leading articles on following pages on British participation in the proposed European free trade area and relations with the common market, and on the need for a close British association with the proposed European atomic community (Euratom), a despatch from our Paris Correspondent on page 569 sums up the discussion of the free trade project this week by the Council of Ministers of the Organisation for European Economic Co-operation.

A Nearly White Paper

THE negotiations have now been launched within the Organisation for European Economic Co-operation on the details of the European free trade area. An article from our Paris correspondent on page 569 describes the discussions at the Chateau de la Muette this week, and the system of detailed treaty-building that has now been set up under Mr Thorneycroft's "co-ordination." Meanwhile, and from the domestic point of view most important, a white paper (Cmnd 72) has set out the British Government's views about what the aim of these negotiations should be. This sort of white paper inevitably tends to be caviare to the general, but the broad impression given by it deserves wide publicity: after having been extraordinarily liberal in grand design, more congratulations are now due to the Government for seeking to be so liberal in small detail. There are so many places in the twenty-four paragraphs of this closely-written white paper where Britain could have struck a jarring note, and in very few has it done so.

Broadly speaking, Britain is going to be opposed to escape clauses. There had been some fear that, while supporting reductions in tariffs, the British Government might be on the less liberal side on such matters as quantitative import restrictions, but the white paper recommends flatly that progressive annual liberalisations should lead to the abolition of quantitative restrictions "well within the transitional period contemplated for the reduction of tariffs." In the one field, besides agriculture, where some British illiberalism was inevitable, the white paper states (but note the sternness of the language) that "in the event of acute balance of payments difficulties, it is clear that the imposition of [import] quotas must be permitted and this without prior consultation, though it should be made subject to frequent and stringent examination." Moreover it recommends, with quite startling importance, that the decisions passed down by OEEC on whether "a country is carrying out its obligations"—together with any decision on a request by a country to be allowed to default on its obligations for any reason other than a balance of payments crisis—should not be subject to the unanimity rule. This, surely, is a braver recommendation for some derogation from national sovereignty than has yet been generally realised.

★

So far, so good. On two positive points, the white paper is even better. It shows scant sympathy with those who fear unemployment, in the unimportant sense that some workers may have gradually to change their jobs; indeed, it says frankly that "increased specialisation" of production within the free trade area should be one of the sought-after advantages of the whole scheme. (There may be a case for a compensation fund to ease the movement of resources out of affected industries; but this should be treated as a domestic matter, and is not discussed in the white paper.) The Government, however, has seized upon the point that the possibility of unemployment spread through too stern deflationary policies in some continental countries could be a different kettle of fish; it calls for consultations on "the avoidance of marked divergences between the policies pursued by member countries" and on "the maintenance of satisfactory multilateral payments arrangements." The impression emerges that Britain may (and should) seek the creation of some institutional mechanism that could be brought into play if the free trade area should ever run on the rocks of, say, a deflation-hard D-mark. And the British Government is more specific than some others have been about the need for certainty in the timetable, "so that industry in each country can plan its production and its investment in advance knowledge of how it is likely to stand in relation to the tariffs of other countries and of what the position of imports from other countries into its own market will be."

★

There remain the two features of the British memorandum that have naturally ruffled most liberals abroad. The first, which caused the biggest row at Paris this week, concerns Britain's insistence that agriculture should be totally excluded from the scheme. The more one examines the tariff schedules concerned, the more convinced one becomes that the tying of this decision to the need to maintain imperial preference is mainly a red herring; most of the commodities Commonwealth countries send to Britain are commodities that Europeans simply do not produce. The real reason for the ban on freer trade in food is that "the United Kingdom and most other European countries protect their home agriculture by one means or another for well-known reasons" (this means reasons of political votes), "and will wish to continue to do so." But European agricultural nations that have hotly protested about this can fairly be asked, by non-agricultural and non-political Britons who dislike Britain's excessive agricultural protection quite as much as they do, to ponder how long they really think that Britain will be able to maintain this one blatant moral weakness in its reservations once the trend to freer trade in industrial goods is afoot. The point to note is not simply that, without this exclusion of agriculture, Britain would not join the free trade area; it is that if Britain remained outside the area there would be little hope of ever loosening our agricultural protectionism, while now we are coming in useful pressures will surely arise. Liberals

—on the continent as in Britain—should think this one out—with an inscrutable smile.

The other question concerns the white paper's rather too loud protestation that "Her Majesty's Government consider it indispensable that the free trade area should be formed in such a way as to be wholly consistent with the existing objective of a collective approach to the widest possible system of multilateral trade and payments." These resounding polysyllables are unobjectionable in good times, but what about in bad ones? It is to be hoped that the negotiators at Paris will not be so carried away with their resonance that they intrude unnecessary clauses about perpetual non-discrimination —under all circumstances—into the agreement. It is another subject for an inscrutable smile that a free trade area, if sensibly drawn up, could conceivably be a useful mechanism for maintaining European production if ever there should be an American slump.

Foster Parent for Euratom

THE six continental countries which are preparing to set up the common market have also drafted a treaty for a European Atomic Community—"Euratom." It was announced in Washington last week that the United States had agreed to help Euratom with knowledge, technicians and supplies of enriched uranium. Next week, the three emissaries of Euratom who have had such success in America are coming to Britain on a similar quest. The association with America is indispensable in practice and invaluable in its wider implications, but it would be a mistake to leave the United States to be Euratom's only foster-parent. A link with Euratom must be found for Britain, so that the technical lead that Britain has built up in the last decade can be used to give it a proper part in nuclear development in Europe during the next.

Some of the grounds for active British association with Euratom are familiar: the political virtue of strengthening Europe; the economic advantage of pooling European resources in the task of developing the costly new nuclear industries; the danger that, if Britain stays out of the venture, Germany with its great chemical, metallurgical and electrical industries may in a few years dominate Western Europe in this new field, with the United States alone as a senior external partner. But what has not perhaps been sufficiently realised in this country yet is the size of Europe's stake in nuclear power, and the crucial part which Euratom may play in the next phase of European economic development.

Euratom's "three wise men," entrusted with the task of sketching out the six countries' needs for atomic power, have suggested that the members of the proposed community should instal some 15 million kilowatts of nuclear power capacity within the next ten years. The fact is that the growing fuel imports of the Euratom countries, which may otherwise reach the equivalent of some 175 million tons of coal by 1965, can be kept within bounds only if nuclear power stations are built on a massive scale. The Euratom agency is designed to be the centre of a collective effort to do this, a brain centre of research and power programmes. Hitherto Britain has confined its co-operation with Europe in nuclear development to the Organisation for European Economic Co-operation and the European Organisation for Nuclear Research, where some useful work has been done as a supplement to national efforts. Euratom offers a vastly broader prospect. It is time not only to decide on a close British association with it, but also to consider what interests this must marry and what form it should take.

Britain's most obvious first interest is in the expanding European market for reactors and power stations. Within a few years British industry will have the capacity to build power stations on a large scale in Europe; its technical experience should enable it to make good use of this, provided the market is kept open. Free trade for British equipment is the first prize for British association with Euratom. The first gesture of association by the British Government could very sensibly be an offer to join the common market in nuclear equipment and materials which the Euratom treaty envisages. More is needed than the mere renunciation of quotas and tariffs. The political associations which hang round the atom have helped to create a strong pressure in every country to set up its own nuclear industry, and British contractors, seeking power station contracts in Europe, have already run up against this to their cost. Britain needs to secure a political guarantee that national discrimination will not drive British industry from the markets of Euratom, once its designs and experience have been shared. The association must, therefore, be such that the British industry is considered a permanent and founder member of the Euratom partnership, with its productive capacity and knowledge serving European plans and requirements.

On its side, Europe's chief interest is in British scientific and technical knowledge, especially in the next few years; and in return for free and full entry to the European market Britain should give this generously. There is no reason why it should not consider accepting the Euratom rules on exchange of information, with the exception of military knowledge. This would mean, it should be recognised, that Harwell would place its great fund of scientific knowledge, and much that is concerned with its industrial application, at the disposal of Euratom; but it would mean, too, that Britain would obtain access in return not only to the European market, but also to all that Euratom and its members will learn. These proposals may naturally be resisted by those of Britain's atomic experts who feel that the best way to keep Britain's lead in nuclear power is to guard it jealously; and certainly the quid pro quo—access to the market and to the future fund of knowledge—must be assured. Technically, it is true at the moment, Britain has everything to offer Europe and Europe has, as yet, little to offer in return. But as an objection this may be technically shortsighted as well as politically unfruitful. Not even the United States has the resources to try out all the hundreds of types of reactors which may bring results in nuclear power. In Western Europe the need to pool much smaller resources of money and trained men seems obvious, for Britain as well as other countries. Britain can help Euratom now with skill and information—for instance relating to the Calder Hall type reactor, perhaps the most economical for the first phase of Europe's power programme. But tomorrow, when the western European countries, starting technically at the point which Britain has reached now, are together devoting far greater resources to nuclear research, Britain will have much to learn from them—the fruits, say, of a concentrated Euratom programme of research into the use of plutonium as fuel. And it is a hard practical fact that an imaginative British participation in Euratom from the start—the sending of British scientists to work at its research centre, for instance—will do more, perhaps, than any guarantees to ensure that British industry and British methods will play an active part in the industrial applications that follow.

A community of knowledge and an open market in contracting are the countervailing essentials for a British link with Euratom. There may not be the same need for Britain to be associated with its wider powers —the near-monopoly of sale of fissile material, for instance, and the expensive powers of control over those who use it. But it has nevertheless to be borne in mind that these powers may later have special political value. Euratom was originally designed only for peaceful development; French insistence on the right to make the bomb has forced its creators to extend its powers to cover military production, too. As, day by day, atomic warheads become more and more commonplace explosives, the pressure for their use and eventual manufacture by other European countries, above all by Germany, will grow. And when that pressure becomes irresistible, Euratom will provide the best collective instrument. Western European Union has the political task of co-ordinating Europe's defence effort and controlling the German contribution. A strong Euratom, with Britain intimately associated, may provide it with an indispensable tool.

PARKINSON LOOKS AT RETIREMENT—I

All the R-age

"The Economist" has secured rights to another startling discovery by the author of Parkinson's Law.

SOME recent events have raised in our minds the question: at what age should a man retire? This problem has been the subject of many commissions of inquiry, but the evidence heard has always been hopelessly conflicting. Where the retirement age is fixed at 65, successors of the man who retires will always have found, by experience, that mental powers and energy show signs of flagging at 62.

This would be a most useful conclusion to have reached had not a different phenomenon been observed in organisations where the age of retirement has been fixed at 60. There, we are told, people are found to lose their grip, in some degree, at the age of 57. Similarly, all men whose retiring age is 55 are known to be past their best at 52. It would seem, in short, that efficiency declines at the age of R minus 3, irrespective of the age at which R has been fixed. This is an interesting fact in itself, but not directly helpful when it comes to deciding what the R-age is to be.

It may, however, serve to suggest that the investigations hitherto pursued have been on the wrong lines. Let us therefore struggle to set them along the right ones. The fact is that the age of retirement should not be related in any way to the man whose retirement we are considering. It is his successor we have to watch.

According to our researches, a business man will pass through the following stages in a successful career:

(1) Age of qualification = Q
(2) Age of promotion = P (Q + 10)
(3) Age of authority = A (P + 8)
(4) Age of achievement = AA (A + 7)
(5) Age of distinction = D (AA + 9)
(6) Age of dignity = DD (D + 6)
(7) Age of wisdom = W (DD + 3)
(8) Age of obstruction = OO (W + 7, which is also Q + 50)

The above scale is governed by the value of Q, which is to be understood as a technical term. It does not mean that a man at Q knows anything of the business he will have to transact. It is the age at which a professional or business career begins, usually after an elaborate training which has proved profitable only to those paid for organising it. It will be seen that if Q = 22, our business man (let us call him X) will not reach OO (the age of obstruction) until he is 72. So far as his own efficiency is concerned, there is no valid reason for replacing him until he is 71. But our problem centres not on him but on Y, his destined successor. How are the ages of X and Y likely to compare? To be more exact, how old will X have been when Y first entered the department or firm?

This problem has been the subject of prolonged investigation. Our inquiries have tended to prove that the age-gap between X and Y is exactly fifteen years. (It is not, we find, the normal practice for the son to succeed the father directly.) Taking this average of fifteen years, and assuming that Q = 22, we find that Y will have reached AA (the age of achievement) at 47, when X is only 62. And that, clearly, is where the crisis occurs. For Y, if thwarted in his ambition through X still retaining control, enters, it has been proved, a different series of stages in his career, following upon stage 3. These stages are as follows:

(4) Age of frustration (F)=A+7
(5) Age of jealousy (J)=F+9
(6) Age of resignation (R)=J+4
(7) Age of oblivion (O)=R+5

When X, therefore, is 72, Y is 57, just entering on the age of resignation. Should X at last retire at that age, Y is quite unfit to take his place, being now resigned (after a decade of frustration and jealousy) to a career of mediocrity. For Y, opportunity will have come just ten years too late.

The age of frustration will not always be the same in years, depending as it does on the factor Q, but its symptoms are easy to recognise. The man who is denied the opportunity of taking decisions of importance begins to regard as important the decisions he is allowed to take. He becomes fussy about filing, keen on seeing that pencils are sharpened, eager to ensure that the windows are open (or shut) and apt to use two or three different coloured inks. The age of jealousy reveals itself in an emphasis upon seniority. "After all, I am still somebody." "I was never consulted." "Z has very little experience." But that period gives place to the age of resignation. "I am not one of these ambitious types." "Z is welcome to a seat on the Board—more trouble than it is worth, I should say."

The theory has been advanced that the age of frustration is also marked by an interest in local politics. It it now known, however, that men enter local politics solely as a result of being unhappily married. It will be apparent, however, from the other symptoms described, that the man still in a subordinate position at 47 (or equivalent) will never be fit for anything else.

The problem, it is now clear, is to make X retire at the age of 60, while still able to do the work better than anyone else. The immediate change may be for the worse but the alternative is to have no possible successor at hand when X finally goes. And the more outstanding X has proved to be, and the longer his period of office, the more hopeless is the task of replacing him. Those nearest him in seniority are already too old and have been subordinate for too long. All they can do is to block the way for anyone junior to them: a task in which they will certainly not fail. No competent successor will appear for years, nor at all until some crisis has brought a new leader to the fore.

So the hard decision has to be taken. Unless X goes in good time, the whole organisation will eventually suffer. But how is X to be moved? For the benefit of our many readers now at the age of authority, but not yet in top command, an article next week will set down the modern, scientific, humane and uncounterable methods of how to get rid of the boss.

(To be concluded.)

Notes of the Week

Bermuda

MR MACMILLAN'S rendezvous with President Eisenhower (at Bermuda, March 21st to 24th) has been announced, together with M. Mollet's (Washington, February 26th and 27th) in a week when Soviet notes and declarations are as thick in the sky as swallows in autumn. Marshal Bulganin presses the Prime Minister for his views on a convenient date to visit Moscow, since May will not do. Marshal Bulganin reminds Dr Adenauer of the need for a "decisive fresh orientation of relations between the Soviet Union and the Federal Republic of Germany." Mr Shepilov offers a draft four-power declaration to put things right in the Middle East.

This burst of Soviet diplomatic rock and roll will do no harm if it reminds the western statesmen about to meet of the world ridden by menace and uncertainty in which their three governments have been divided and are now to be reconciled. The President and Mr Macmillan will be going to Bermuda less to transact specific business than to conduct a public reconciliation: that is the overriding purpose, without which the subject-matter of the briefs would have been left to more routine handling.

If the reconciliation is to mean much, the manner in which it is effected will be important. Tact will be needed, no doubt; but tact without candour will achieve little. It is hardly more than a year since the President and Sir Anthony Eden met in Washington; the soporific "Joint Declaration" in which, no doubt to please British self-esteem, their feeling of a vague community of outlook and purpose was wrapped up can be re-read now and found meaningless. Candour may require the President to say *some unwelcome things* at Bermuda about British hankerings after power which the United States will not support, and British commitments which it finds irrelevant and embarrassing to its own affairs, in different parts of the world. Candour should prompt Mr Macmillan to ask for more definition of Washington's view of the extent and depth of the Anglo-American alliance: where and when does it, and does it not, apply? If London and Washington could concert their ideas better on matters which lie outside the text of the Nato treaty, Britain in Europe would be a more useful and a less expensive friend.

Mr Shepilov Not So Pink

MR SHEPILOV'S review of the international situation was the highlight of the closing session of the Supreme Soviet. In a lengthy speech the Soviet foreign minister balanced hopes with fears and promises with threats. He began by recalling that the first Geneva conference in 1955 had opened perspectives; but "certain imperialist circles" attempted last year to reverse the trend, with a measure of success. Intervention in Egypt and the "counter-revolutionary putsch in Hungary" were just two examples of the same kind of warmongering plot to Mr Shepilov. People in the West who expected Russia to get "pink," or who pinned hopes on the spread of national communism, would be disappointed. Nevertheless, Mr Shepilov did repeatedly emphasise Russia's desire to come to terms with the West.

His speech was marked by a new manner towards France and Great Britain—no longer villains in chief, but victims of American rapacity. Japan and Germany gain in strength and importance, while Britain and France are squeezed out; Mr Shepilov remarked with sorrow that Britain, which once controlled four-fifths of Middle East oil, was now left with a mere third.

The Soviet peace offensive has been in a bad way since the rising in Hungary. Mr Shepilov revived it. His speech contained a plea for disarmament, an appeal for more trade, and, once again, a proposal for an international economic conference. An important passage dealt with the Middle East. Mr Shepilov may not have expected his idea of a four-power agreement to demilitarise the Middle East to be taken up by the three governments to which it was addressed. But, read in conjunction with the Notes to them and with the resolution submitted at the United Nations, his speech gives clear notice that Russia has no intention of leaving the initiative in President Eisenhower's hands.

Caution in the Treasury

TWO main points emerged from Tuesday's economic debate in the Commons. First, the Government now believes that in the year to June 30th next—the period most affected by the Suez crisis—Britain looks like earning "a small but by no means unsubstantial surplus" on its balance of payments, instead of ending barely all-square as the Prime Minister had previously forecast. With shipping schedules distorted all over the world, the freakishly bad trade figures in January are apparently to be read as mainly the reverse side of the medal to the freakishly good ones in November; the average visible gap in the three months since the Suez invasion is now shown to have been almost precisely the same as the average gap *in the ten months* before it. Because of the drop in Britain's oil profits in the Middle East, invisible earnings are now clearly much smaller than before November, but apparently this is not expected to wash the surplus in the year to next June entirely away.

Secondly, however, the Treasury—speaking through its new Economic Secretary, Mr Birch—still considers that "it would be the greatest possible mistake if we were to start stimulating home demand." The Treasury's eyes are not on all those unofficial prophecies that productive capacity a year hence could be at an annual rate some £1,500 million higher than present intentions to produce; they are perforce on the balance of payments and therefore—presumably—on the desirability of giving no net reliefs in the budget in some seven weeks' time. If official estimates about the course of the balance of payments were too sanguine—and one still has an uneasy feeling that they could be—few people would question this cautiousness. But since one can hardly support the Treasury's policies on the grounds that one disbelieves its prognostications, a battle is clearly—and not surprisingly—emerging between the Treasury and some other Ministers (and several outside economists) about the desirable shape of the budget. This lends particular interest to remarks made—and omitted—about the probable course of demand in the two ministerial utterances in the Commons debate this week, as well as in Mr Thorneycroft's own speech to leading industrialists and trade unionists last weekend.

The Course of Demand

IN his speech last weekend Mr Thorneycroft said that "the beginning of an answer to those who foresee too little demand in 1957" is that export demand "is strong and still rising." Clearly, however, it is only a beginning. Even leaving aside (in our view rightly) any exaggeratedly deflationary gloominess arising from Wall Street's latest bout of the jitters, export demand is not likely to rise enough in 1957 to take up all the slack of which the most ambitious expansionists speak; moreover—since the immediate internal consequence of a rise in sales would probably be to raise profit margins from their present low ebb, rather than greatly to raise personal incomes—the multiplier effect on the domestic economy of any increase in demand this year is likely to be low. The only other sort of demand about which the Treasury has hazarded a forecast for 1957 is investment demand, which Mr Birch thinks is likely to show a "slight increase" over 1956; private investment has flattened out, but Mr Birch thinks that a fall in housing "will be more than compensated by increased capital expenditure in certain basic services and basic industries." Nothing was said about consumption in the debate; there is a good argument that consumption out of stable incomes

might well rise by more this year than in 1956—partly because a significant part of last year's personal incomes was obligatorily diverted to repaying hire purchase debt—but no Treasury spokesman has yet advanced it.

Among the other two possible sources of demand, is current Government spending on goods and services expected to rise this year? Although much of the rise that has been publicly foreshadowed in Government expenditure seems to be on capital account (and thus is included in Mr Birch's calculation already mentioned), the trend of current expenditure is no doubt in the same upward direction. But Mr Thorneycroft will get into a row from the Governor of the Bank of England if he does not try to resist it. What about stocks? The argument that any great expansion in production this year might lead to excessive stockbuilding of overseas materials has become one of the most respectable weapons in the armoury of arguments for a stern budget. But if the Chancellor is right in his belief that export demand—and therefore presumably world trade—is rising, might it not be wise to lay in the stocks now (or rather as soon as the canal is cleared), rather than to wait until after world prices have risen?

To pose these questions is not to say that the Treasury's present course is necessarily wrong, still less to propagate the myth of an imminent grave deflation; the signs, for what they are worth, are that demand probably will be high enough to raise output somewhat this year, once the oil shortage is over. But are the authorities prepared to allow it to rise by as much as some other people think it safely could, or are they merely (with their better sources of information) estimating that outside influences will make it rise by more than most private commentators have been estimating? The material for judging this is simply not being made available. Next time he speaks the Chancellor should indicate frankly how much under-production he envisages will have to be tolerated if he is to accomplish his design of a "regular" external surplus of more than £150 million a year. The debate could then proceed in a less airy and unsatisfactory manner than it did in the House this week.

The Reluctant Débutant

THE defence debate on Wednesday was singularly uninformative, but the time was ill-chosen to get worthwhile answers either on financial economies or national service. Mr Sandys has been in office less than two months, and General Norstad was still in London discussing the delicate but crucial question of British commitments in Europe. It would have been more worrying to hear the Minister laying down definite defence doctrine on this début than to read the discourse he actually made on Wednesday, which hardly suggested that he had any answers in the bag at all.

He was, of course, stonewalling. He again disclaimed any intention of "slashing about indiscriminately" and did not even repeat in public what is being said in private: that though in 1957-58 the Government will only aim to get defence expenditure over the hump, its hope is that economies somewhere near the scale widely discussed may appear in the years thereafter. He would not be drawn on conscription, and certainly not about that horrible thistle, selective service, which alone promises to contribute sizably to the manpower and cost economies he talked about. He set out all the right questions: how big an army do we need for our European and overseas treaty commitments; when to abandon fighters in the face of Russia's growing battery of atomic V-2s; what to do about a navy designed to fight global war when the only hope for Britain is to spend the money on the deterrent to such a war. He then provided none of the answers, and did not even promise to give them next month. Probably this is wise. It may well be that Mr Sandys's best course now would be to decide to postpone the annual defence white paper not merely until March but until later this year, and to introduce the estimates simply on a statement of foreseeable service needs. The rumblings in the debate on Wednesday should not serve to hurry him. Mr George Brown was reasonably right in saying that in defence Britain has reached one of those turning points that do not often occur. The wrong way to go round a turning point is at a showy political trot. But Mr Sandys has raised expectations which he must satisfy: when the white paper does appear it must make a clean break with its predecessors in getting to grips with the defence dilemma.

Mr Dulles and the Straits of Tiran

SOME obscurities still surround the American plan to break the deadlock between Egypt and Israel at the United Nations, but Mr Dulles has let it be known that he has, at least, a plan. He is not only proposing free navigation in the Gulf of Aqaba, but is apparently prepared to take action to secure and guarantee it; this is the great need of Israel if it is going to develop Eilat as its southern outlet to the sea. The opening of the gulf and the development of Eilat may, in the long run, be important for Europe's supply lines as well.

In regard to the Suez Canal, in contrast, Mr Dulles does not seem to contemplate action outside the United Nations to enforce freedom of navigation; American gunboats can hardly shepherd Israeli ships through the canal; but he would like to see the principle reaffirmed. No plan has been elaborated yet for the future of the Gaza strip beyond stationing UN forces there or enlarging the truce observer corps. Do these proposals mean that the strip reverts to Egyptian administration? The insistence that Israel must leave suggests that it does. The strip must, in any case, be linked to the economy of either Egypt or Israel; it cannot exist on its own. If Uno took over the administration, as has been suggested, the strip could trade with both Israel and Egypt, since Uno could hardly join in a boycott of Israel. The Arab States and Egypt will not want it to stay under Israeli administration or be administered by the United Nations; Israel will oppose its return to Egypt.

If Israel gets the Aqaba Gulf open to its shipping it will have scored an important point, and there is every reason why the United Nations should maintain pressure to secure freedom for Israeli shipping through the Suez Canal. But Israel possibly exaggerates the importance of the Gaza strip from a security point of view. At best it is only one of the jumping off grounds for the fedayeen of Egypt; they are organised and trained elsewhere and can, if necessary, jump

off from other places. The Israeli plans to deal with the problem of the refugees in the strip are much more important; the UN should not forget that the restlessness and incursions of the refugees were the real start of the trouble in that area.

Dues at Suez

UNLESS an interim arrangement can be agreed upon for the collection of Suez Canal dues, Britain, France and some other maritime powers will have a difficult problem to face in March. President Nasser told Mr Hammarskjöld before clearing began that when the canal reopened to shipping, all dues would have to be paid to his national administration. He had not pressed this claim in the summer because it would have precipitated trouble, notably with Britain and France, which insisted that their ships paid dues to a blocked account of the old company: now that military intervention has failed he has no such inhibitions. What will Britain, France and some other countries do if he stops their first ships for non-payment of dues? Or will they pay up and look pleasant?

They hope to avoid the issue by securing an interim agreement with Egypt by which the dues would be paid to a holding authority, pending a definitive agreement regarding the canal. President Nasser is not likely to recognise the Suez Canal Users' Association; one of the ideas being discussed is that dues should be paid in part to the World Bank and in part to Egypt. The United States (which allowed its ships to pay to the Egyptian administration) is in broad agreement with Britain and is working to recruit support in the lobbies of the United Nations. So far, another seven countries have promised their support.

President Nasser's position, as expressed to Mr Hammarskjöld, is unchanged as far as anyone knows; but it may be that his urgent need to secure the $50 million blocked in America may encourage him to avoid a crisis which would postpone their release. No one is suggesting, in any case, that the arrangement should be other than temporary; and the agreement could specify that it was made without prejudice to the final settlement to be negotiated, one assumes, from the six points approved by the Security Council and from Mr Hammarskjöld's letter of October 20th to the Egyptian Foreign Minister. President Nasser's international reputation would be strengthened by reasonableness on this point; but few people in London or Washington expect it.

Haste in Jordan

THE anxiety of the Jordan government to assure its own people that its pledge was being fulfilled was responsible for the brief hitch last weekend in the negotiations in Amman. So much had been said about ending the Anglo-Jordanian treaty that Suleiman Nabulsi wanted at the outset to produce, like a rabbit from a hat, a joint announcement of its early termination, to satisfy the feeling which he and his party had themselves aroused.

The suggestion that the British were using delaying tactics was nonsense, as the Jordanian prime minister knew when he made it; the British are just as ready as he to finish the business quickly. First, however, they needed assurances about the timetable for withdrawal of the British forces, the security of stores and equipment, and the right to sell or remove them.

The need for such assurances is clear now that it is known that the Jordan Army helped itself to the Zerqa stores, valued at about £3,500,000, which the British left in its charge at the end of October when, in face of hostile demonstrations by the local people, they evacuated Zerqa. (And, one is inclined to say, if British forces cannot defend their own stores, it is high time for them to leave.)

Pros and Cons of an Inquiry

AS the trouble at Briggs' Motor Bodies has dragged on, some people have thought it a pity that the Minister of Labour did not immediately follow the suggestion of the National Union of General and Municipal Workers, one of the unions involved, and hold an inquiry into the background to the succession of disputes and stoppages that have taken place at the firm's Dagenham factory during the last two years. Mr Macleod would no doubt argue that industry's confidence in his Ministry's conciliation service (which settles far more disputes than are ever mentioned in the newspapers) depends on his reputation for impartiality, and on his playing the role of a friend whose advice is to be sought, rather than of a schoolmaster who intervenes to apportion blame. He would also maintain that if the procedural agreements worked out within industry are to have any force he must not intervene until agreed procedures are exhausted and there is complete deadlock. Even then he would make sure that nothing more could be done by his conciliation officers before he took the exceptional step of calling for an inquiry: the findings of committees of inquiry might lose their moral force if they were three a penny.

These are strong arguments. They might even prove to be justified arguments in this particular case. If the Briggs' men, in the ballot which has been ordered by the Amalgamated Engineering Union, do not vote to strike on the issue of reinstating their shop steward Mr McLoughlin, the Minister will be generally congratulated for his inaction to date; and an interesting industrial precedent will have emerged. But if the majority vote is in favour of a strike, Mr Macleod will be widely expected to act. Under the Industrial Courts Act he may appoint an orthodox court of inquiry into the circumstances of the dispute.

The trouble is that this orthodox inquiry would not be the kind of inquiry which Mr Matthews of the NUGMW has asked for, and which the employers say they would welcome. It is the background that Mr Matthews—and the public—want investigated, not just the immediate dispute. A wider examination might produce all sorts of useful lessons for both sides of industry: for example, how not to manage men, how not to put too much power into the hands of shop stewards, and—above all—how not to be led by the nose by communists. The gain from all this should outweigh the unorthodoxy of the step. There

is a precedent in the Leggett inquiry, in 1951, into unofficial stoppages at the docks—whereas the last orthodox court of inquiry into a dock strike quite failed to bring out the machinations of a few individuals (which were an open secret among all journalists covering the case at the time). If he is called upon to act in the Briggs' affair Mr Macleod should not stand too rigidly by his Ministry's book of etiquette, but should make the terms of any inquiry as wide as possible.

Voices Everywhere

THE House of Lords had an irritating debate last week on Lord Strang's motion drawing attention to the "inadequacy of the provision made for the external broadcasting services of the BBC." It would be nice if there could be a sense of proportion about these. The value of the BBC's overseas services is not, as so many peers alleged, "incalculable." It is considerable and varying. As a personal judgment, the programmes range, in ascending order of importance, from the corporation's cosy chats to Britain's west European friends, through its talks to our instinctive enemies, to the special programmes needed for the colonies, up to the generally excellent material broadcast to peoples under communist subjection. The pattern of importance is changing all the time as a result of such developments as the growth of television in richer territories and the physical crowding of the air waves; this last factor, leading to the sheer difficulty of tuning in to programmes by those without a hair line accuracy in the twiddling of knobs, is in some cases diminishing the usefulness of programmes broadcast from London and increasing that of recordings and other canned means of sending information overseas.

The most justifiable of the BBC's complaints is that, in a service where Governments are always tempted not to raise the annual grant-in-aid by quite enough to compensate for the annual rise in costs, haphazard cuts are made, on no very sensible basis, practically every year. There is need for a long term review. Dr Hill, the Chancellor of the Duchy of Lancaster, is engaged on such a review at the moment. As the first fruit of it, the BBC's Arabic service is to be doubled, from 4½ hours a day to 9 hours; there can be arguments about the advisability of this (partly depending on what is going to be in the programmes), but it is clearly likely to have to be balanced by cuts elsewhere—most probably and most sensibly in the BBC's services to western Europe.

It is against these cuts that the close friends and associates of the BBC—in Parliament, public life and the press—are now being deployed in an awesomely distinguished protest parade. The protest tends to be a blanket and unreasoning one, declaring that on no account must any part of any overseas service be cut; the fear that the Government might try to dictate the content of BBC programmes overseas (as Lord Halifax and some other Tories would like, and as certain bovine Foreign Office actions at the time of Suez seemed to threaten) is also now being deliberately overplayed as part of the anti-economy, not of the anti-interference, campaign. One conclusion might be that if BBC publicity in overseas broadcasts is as good as BBC publicity about overseas broadcasts, the country must indeed be well served. But is it only those who object to pressure groups who are beginning to wonder whether, in both fields, the corporation is able to distinguish between an admirable sufficiency and just that last little lick too much?

Agreement in Ghana

THE danger has been averted that the new Commonwealth state of Ghana might fall apart like a badly made sand castle immediately the mould of British authority is removed from the Gold Coast on March 6th. Ashanti will rejoice, not secede, on independence day. For this outcome, great credit is due to the Colonial Secretary, Mr Lennox-Boyd, and the Governor, Sir Charles Arden-Clarke; for though as independence, and with it civil war, drew nearer the saner heads in Dr Nkrumah's ministry—and in the Asantehene's entourage—wanted a settlement on any reasonable terms, the exact moment had to be chosen and the right arguments marshalled. Almost all the concessions have been wrung from Dr Nkrumah's side—as is indicated by the last-minute flurry by two of his Ministers (Messrs Botsio and Gbedemah) in London and by Dr Busia's triumphant comment: "we have made it very difficult for anyone to establish a dictatorship in the Gold Coast."

Necessarily, the Ashanti and Northern Territory opposition parties have had to abandon their dream of a federal constitution; they have also given up their demand for a second chamber, composed largely of chiefs, to safeguard tribal traditions from the impious hands of legislators and to block any future changes in the constitution. Otherwise their demands for checks upon the powers conferred on the executive by a sovereign and unitary unicameral constitution have been met—on paper. The outstanding points, set out in a British Government White Paper (Cmd 71), are as follows:

Amending the Constitution: Dr Nkrumah will not be able to amend the constitution (which is embodied in an Order in Council in accordance with section 6 of the schedule to the Act of Independence) merely by use of his two-thirds majority in the House of Assembly. For anything of importance he will also require the agreement of two-thirds of the regional assemblies. As there will be five of these, Ashanti or Northern Territories will have to support any amendment. The regional assemblies are, however, to be elected for three years, against five for the national assembly; the government could appeal to a local electorate to change its mind about blocking an amendment during one parliament's lifetime.

Regional Assemblies will consist of an elected house and, for tribal affairs, a House of Chiefs. Their greatest importance will be to provide the check described above; but they are also to have something like County Council functions. They still, however, will have no taxing power, no control over the police beyond vague watch committee functions, and apparently (contrary to the recommendations of the Bourne report) no representation on corporate bodies such as marketing boards (which are the source of so much patronage). Moreover, their exact functions and composition are only to be determined by a commission after independence.

The Chiefs are to have their functions guaranteed in the constitution; their appeals will lie to an arbitrator appointed by the Judicial Service Commission, not to the mistrusted Nkrumah government.

The Judicial Service Commission, composed of the Chief Justice, the Attorney-General and three other senior officials, will remain as at present, appointing judges and judicial officers, but as vacancies occur it will itself be appointed by the government of the day. *The Public Service Commission* will, as now, control all but a handful of senior appointments and public service discipline, but will itself also, as vacancies occur, be appointed by the government in consultation with the Leader of the Opposition.

Thus Dr Busia has reason to be hopeful. At the worst it would take some time to pack the civil service and judicial commissions and force or bribe through constitutional amendments. But a very complex constitution is being imposed on a very inexperienced and divided country, whose trained white administrators are departing fast. The nature and working of the crucially important regional assemblies are left rather in the air; the government will have a majority on the commission determining them, and its strong centralising and authoritarian propensities must be expected to make themselves felt. But there is hope, first, that the struggle will now be peaceful and, second, that the opposition will feel temporarily secure enough to settle down to win the only real safeguard—enough electoral support to make it permanently the alternative government in being.

Bargaining for Malta

IF, as Mr Mintoff claims, three-quarters of the plan for absorbing Malta in the United Kingdom is in the bag, the last quarter still sticks awkwardly out. The financial and constitutional meaning of integration is now being worked out at the Colonial Office, and it is evident that both over Malta's economic relationship with Britain and over the definition of defence and foreign affairs (which are to be administered from London) Maltese and British interpretations do not quite fit. Mr Mintoff was not satisfied with the interim subsidies he got last year, and he has large ideas on what the island should have by way of a permanent private income. He cannot afford to accept too dusty an answer from Britain on this mission. There is to be a general election in Malta on the integration issue at Easter, and it looks like being a desperately close one. At the referendum on integration last February, only 44 per cent of the population voted in favour, while another 40 per cent followed the Opposition policy of boycott. Since then, the continual squabbles over money between Mr Mintoff and the Colonial Office are unlikely to have added to integration's charms, and there have been reports of a swing the other way.

Mr Mintoff likes to say that integration will raise Maltese standards of living to British levels: at present they are estimated to be rather under half as high. Obviously, no political union can bridge that gap—only a gradual increase in productivity could—but he is hoping for a sufficient increase in British subventions to enable him to advertise to his people that they are on the way towards what he calls "economic equivalence." While long-term development for Malta is obviously desirable, the harbour is its only major asset, and for several years to come Malta's economy will depend on servicing the naval base and on Exchequer grants.

Mr Mintoff can base his arguments for more British help on both moral and practical grounds. Morally, Britain has considerable responsibility for Malta's condition. The island has been an important naval base since the Napoleonic wars, but in all these years Britain has done virtually nothing to make Malta more self-sufficient and less dependent on a single source of income. Agriculture, fishing and tourism (all potential sources of revenue) have been neglected and the harbour lacks deep water berths and dry docks. But Mr Mintoff will probably make more play with his other bargaining counter: the strategic importance of Malta as a base. And both parties in the negotiations know that integration would be a feather in the cap of the colonial policy of a British Government which must have a nagging fear that otherwise the island might turn—some day—into another Cyprus. Mr Mintoff has a strong hand if he does not overplay it.

Germany's "Productivity" Pensions

THE new west German pensions scheme may stimulate those in the Labour party and elsewhere who are incubating a new system of pensions for Britain. The German scheme, which has now passed through all its parliamentary stages, links old age and invalid pensions to the current level of wages and salaries. Thus it promises the pensioner not only protection against inflation, but, in addition, a share of the increase in the general prosperity and productivity of the community.

Each year a standard, based on an average of the earnings of employed persons during the previous three years (some £30 a month in 1953-55), is worked out. The pensioner who earned an average wage during his life will, if he has retired after 40 years' work, get a pension of 60 per cent of this standard (£18 a month when the scheme starts, or a good deal more than the £2 per week he would get in Britain). Pensions will retain a personal element as well, based on personal income and on the number of years' contributions. Assuming that a man has 40 years' insured employment to his credit, if he earned 10 per cent less than average during his working life, he will get a ten per cent lower pension; if he earned ten per cent more, a proportionately higher pension, and so on up to an initial maximum of about £38 10s. a month.

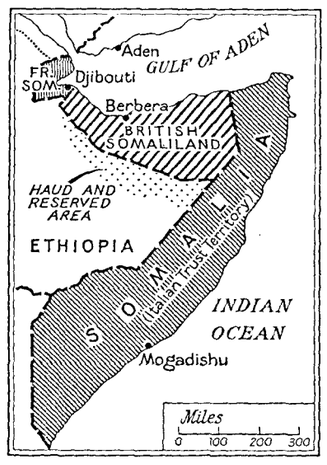
★

Critics in Germany and Britain will at once ask two vital questions about this generous project: who is to pay for it?—and will it, in seeking to shelter pensioners from inflation, produce inflation itself? Contributions are increased and will continue to cover the bulk of the cost; no doubt the increase, whether of the worker's or the employer's share, will tend to push labour costs up. The government's share of the cost is enlarged, too; it becomes some £315 million in the first year of the scheme; and

this amount will tend to grow as wages (and pensions) rise. The Christian Democrats, who fathered the scheme, quailed at the last minute before this blank cheque drawn on future governments, and introduced provision for the legislature to review the standard by which pension scales are calculated—that is, to change the relationship between pensions, wage rates, and national product if it becomes necessary. But the principle that the three must be linked remains. Dr Adenauer's government has not only brought off an electoral scoop, but introduced the most radical change in German social insurance since Bismarck. Whether it will work must depend on the soundness of German financial policy and the development of the economy in future years.

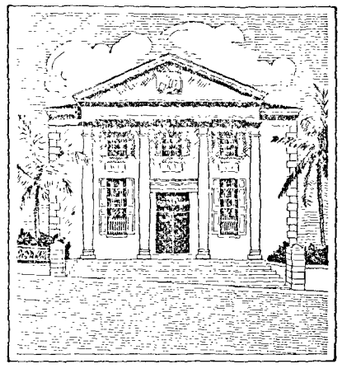
Absent from Court

It has long been possible for a defendant to write a letter to a magistrates' court instead of appearing in person to hear his case dealt with. In so doing, he saves himself time and money. But the time of the police is not saved, because, in the present state of the law, the case has to be proved even when the defendant's letter admits his guilt; details of the vast number of hours of police time that are spent in magistrates' courts in the Metropolitan Police District were given by the departmental committee on the summary trial of minor offences, which reported in July, 1955 (Cmd 9524).



The new Magistrates' Courts Bill, published last week, seeks to give effect to the committee's recommendations. It proposes that where a defendant has pleaded guilty in writing the court can dispose of his case in his absence and in the absence of the prosecution. The new procedure will not apply to juvenile courts, or to offences that can be tried on indictment or to those which may carry a sentence of more than three months' imprisonment. Further, the court, after convicting an absent defendant, will not be able to sentence him to imprisonment or impose any disqualification on him (that is, from driving a vehicle) without adjourning to enable him to appear before sentence is passed.

However, as the committee pointed out, not many of the offenders who will be subject to the new procedure can be punished by imprisonment on a first conviction. It also pointed out that a disadvantage of the present procedure of allowing a defendant to absent himself is that he can thereby prevent his previous convictions from coming to the notice of the court. In his absence, the court will not accept a statement from the prosecution of his previous convictions unless they are formally proved—which would often take a disproportionate amount of time and money. The new bill therefore proposes to allow a court to take account of any alleged previous convictions against a defendant whom it has convicted in his absence, provided that notice of these convictions has been served on him at least seven days before the hearing. This should effectively prevent a person, simply by staying away, from being repeatedly convicted as an apparent first offender. The bill does not include the much more controversial proposal of "fining on the spot"—which the committee rejected—and it should get general support.



Bananas and Influence in Somalia

SOMALIA is moving steadily towards independence—and bankruptcy. United Nations trusteeship ends in 1960, and already the Italians who have been running the country are slowly pulling out. But a World Bank mission which has been visiting Somalia reports that the country will be in need of exceptional foreign aid, possibly for as much as 20 years after independence. At present it depends on Italian generosity: about half its revenue comes from direct grants and most of the rest from Italian-subsidised exports of bananas. The bananas, Somalia's only important export, cannot be sold competitively in Italy, and without preferential treatment the industry would collapse. Even with it, they are still more expensive than fruit from elsewhere. There are no quick ways of raising alternative revenue when Italian support stops. The mission has calculated that if the banana subsidy ceases Somalia will need an annual grant of about $6 million to maintain its present very humble standard of life. A decision on how this money is to be raised should not be delayed.

Somalia is a harsh country about the size of Spain with uncompromising climate, infertile soil, and small natural resources; about two-thirds of its people live as nomads on their flocks. Since the irrigated European concessions have developed on the basis of an artificial banana economy, their future is very uncertain. American and Italian companies are hunting for oil, but they have found none yet.

Similar problems are in store for British and French Somaliland, neither of which is likely to put up with foreign rule once Somalia has become independent. Already in the towns there is a Greater Somalia movement, which once found Mr Bevin's approval; it is led from Mogadishu by the Somalia Youth League, once a boys' club, now an aggressive political party. United Somalia would be no more viable than the territories are by themselves; foreign influence from one quarter or another is inevitable. Somalis do not care for any foreigners much, but if pushed they prefer Moslems to Christians and anyone to Ethiopians. The natural pull will be towards the Arab League, and Egypt is already planting the roots of influence in schools in Somalia. The British have lost credit because of their failure to protect tribesmen in the Haud grazing grounds, and French authority is undermined by communist influence in Djibouti. A lot of western money will be needed to keep the horn of Africa friendly.

Taking the East into account

Twenty-five years ago you would have found this 'adding machine' of antiquity in every eastern branch of The Chartered Bank. It was of particular use in calculating the intricacies of exchange rates which often fluctuated with great rapidity. Today, the abacus is being replaced by the slide rule and the electric computer. The East is changing but The Chartered Bank remains in step, so that its knowledge of eastern trade, travel and investment is always up-to-date. This knowledge and a century of experience sustain a complete banking service available throughout a branch system, which extends to most centres of commercial importance in Southern and South-East Asia and the Far East.

Fetters for Public Enterprise?

THE committee stage of the Electricity Supply Bill has raised an important point of political and economic principle. As the bill now stands the Central Electricity Generating Board inherits the power, bestowed by the original nationalising Act on the Central Electricity Authority, and not hitherto used, to manufacture electrical equipment. A group of Conservatives led by Mr Nabarro wants this power withdrawn, on the ground that it threatens private electrical equipment manufacturers with unfair competition and even, were a future Labour Government so minded, with nationalisation by the back door. The Government's original resistance to this pressure was based on the principle that public corporations should conduct themselves like commercial bodies and be similarly free to branch out into ancillary activities; it has now, however, promised a "compromise" solution whereby the Board will only be able to manufacture its own equipment under certain stringent conditions.

Defence Cuts and Taxes

After the discussions which took place on the first night of the session, the public must be agreeably surprised at the amount of the estimates as now presented to Parliament for the War Departments. On that night arguments were founded and charges made on the assumption that in the second year of the peace the country would still find itself saddled with an expenditure for those departments amounting to not less than £25,000,000. Now, however, that the truth is before the country, we find the amount to be just over £19,900,000. . . . But though much progress may have been already made towards bringing down the expenditure for these great services to that of the ordinary peace establishments, yet unfortunately the war has left behind it the usual disagreeable legacy of an increased annual charge upon the finances of the country, in the form of back reckonings to be cleared up, and of certain additions to the interest of the public debt. . . . Such is the substance of the case presented to the House of Commons last night by the Chancellor of the Exchequer. The actual war estimates have disappeared:—the portion of the income tax imposed for the war he entirely gives up, and brings it down to the rate at which it stood in 1854 at the commencement of the war. The rate of *sevenpence in the pound*, with which twelve years of profound peace, but of great fiscal reforms, had made us familiar, is to be continued three years longer. In 1860, Parliament will have the opportunity of again dealing with the whole question, as Mr Gladstone provided in 1853 that it should. But when Mr Disraeli talks of the compact of 1853, by which the income tax, terminating in 1860, should be reduced first to *sixpence* and then to *fivepence* in the meantime, it was not contemplated that we should have to encounter a Russian war; and it was just as much a breach of any implied compact entered into in 1853, that the income tax should be raised from *sevenpence* to *sixteenpence* during the war, in place of being reduced to sixpence as provided by the Act of 1853, as it would be now to continue the income tax at *sevenpence* for three years in order to redeem the obligations of the war, in place of allowing it to drop at once to *fivepence*.

The Economist
February 14, 1857

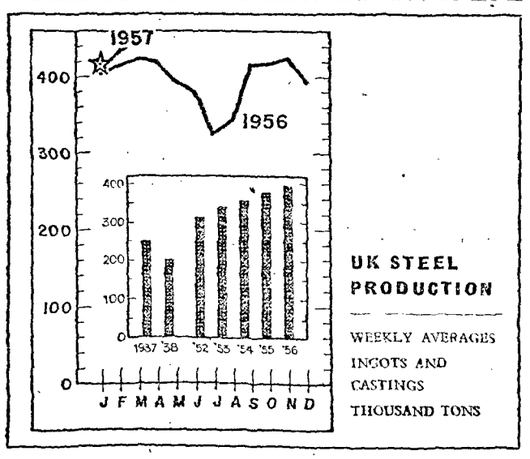
Given certain important provisos, the Government's original view was certainly right, and its subsequent compromise correspondingly wrong. One of the stock anti-nationalisation arguments has always been that public enterprise is bound to get into a rut and lose dynamic energy. This loss is generally thought of in terms of technical progress and adaptability to customers' needs. But in the long run the hallmark of dynamic business is the ability to expand, contract or shift the frontiers of "the industry" in the light of these new techniques and needs, and no surer recipe for stagnation could be devised than a rigid set of *ultra vires* prohibitions on public-corporation enterprise. The conditions in which it is exercised are, however, important. Private enterprise, contemplating such ventures, weighs profit and loss and in theory hazards only its own resources. Public enterprise, whatever its statutory obligations to "break even," has the consoling knowledge that no error, however expensive, will be actually fatal; the taxpayer will in the last resort have to come to the rescue. That knowledge could encourage irresponsible forays into unsuitable territory, whose only results would be damage to private competitors.

Admittedly, it is not only of public enterprise that this is in practice true. A big enough private enterprise outgrows the sanction of bankruptcy, and would get some public succour in the last resort (like the Cunard White Star in the 1930s). The difference is that this last-resort recourse to the public purse has been established, for public enterprise, as a first resort, automatically preceding, for instance, the adoption of a politically unpopular price policy. The right to a commercial body's freedom goes with the duty of keeping up to commercial standards of costing and price policy—and indeed, given the privileged position of public enterprise, of improving on them. The dissident Conservatives—and the Government—would have been wiser to emphasise this duty than to try to balance existing political fetters on public enterprise with new fetters of their own.

Clenched Fist in Hungary

MR KADAR'S recent denial that his government was ruthless is not being borne out by the behaviour of members of the regime, who have in fact been adopting an increasingly uncompromising line; in a characteristic statement one leading Communist said last week that the government would pursue its "clenched-fist policy" until the "total liquidation of the counter-revolution."

The signs of Russian overlordship are no longer carefully disguised. Red stars are being hoisted again over factories and mines; Soviet war memorials are being restored; in the schools (where, according to Mr Kadar, "counter-revolution is on the attack") the teaching of Russian has again been made compulsory, though in some schools the children are refusing to co-operate. The reopening of the universities, which had been closed for three months, was preceded by a series of precautionary police raids on students' hostels in Budapest; some caches of arms and ammunition were discovered, and some students arrested. Mr Konya, the government commissioner for education, appealed to the students to oppose "counter-revolutionary elements . . . who were constantly inciting them to make



trouble"; he uttered a blunt warning that the universities would be closed if these elements gained any ground.

Increased political repression is accompanied by growing poverty and hardship. Government spokesmen over-state the recovery in coal production and, in general, put the best face they can on the economic situation. But the truth keeps breaking through. Production in January reached only about 50 per cent of the October level. There are widespread dismissals, falling wages and a growing threat of unemployment. But those who are driven to seek a more tolerable life in the West may find the way far more dangerous. If caught trying to escape, they are now to be tried on a criminal charge; those who help, or even encourage, others to flee are also liable to long terms of imprisonment.

Austrian Tightrope

RUSSIAN and Chinese newspapers have been accusing the Austrian government of violating its neutrality; attacks have been most bitter against Chancellor Raab's alleged encouragement of "large groups of fully armed Fascists" to come and go over the Hungarian border and to use Austrian airfields as bases for their supply of weapons and ammunition. But the Russian papers have also protested against Austria's proposed membership of the Coal and Steel Community. This may prove to be serious. *Izvestia* says that "since all the other members of the pool are also members of the North Atlantic Treaty Organisation, Austria's membership would in fact mean direct economic assistance to the aggressive policy of the Atlantic block and participation in the arms race." The attack may have been partly inspired by the current campaign to reinforce the Warsaw pact by playing up German ambitions; Austria's wish to join the Coal and Steel Community is said to be the result of the desire of German magnates for "the economic annexation of Austria."

Membership of the Coal and Steel Community would inevitably bring Austria into close relationship with west European powers. But a close economic relation need not conflict with neutrality; nor, indeed, need a close political association, provided that military links are firmly excluded.

No doubt the truth is that the Russians are particularly sensitive about these western European bodies by association with the defunct European Defence Community.

A Strange Decision

THE Government has behaved both curiously and uneconomically in refusing permission to a private company which wants to build a complete new town for 25,000 people at Allhallows-on-Sea in Kent. The initial purpose of the town would be to house about two thousand workers from the nearby oil refinery, who at present travel considerable distances daily to their work. But the promoters are also hopeful that the site's natural (and highly topical) advantages for exporting to the European continent might induce other industries to settle there, if housing and other facilities are made available. Kent County Council, however, refused planning permission for the project because of the high agricultural value of the land, much of which produces two crops a year; and the Minister of Housing, on appeal, has now taken up the same attitude.

The Government wants to encourage the development of new towns as a means of relieving congestion in London, and this particular project would help this policy without entailing any use of compulsory powers of purchase or of public subsidies—save to the extent that the London County Council might enter into an agreement in return for nominating some of the tenancies in the new town. If only as an experiment it would surely be a good Conservative idea to have one private new town to set beside the fifteen official ones—especially as the Allhallows project has been designed and planned by an experienced architect. It is true that the anticipated new industries may not materialise, but if they do not the promoters will only be losing their own money. And assuming that the project has reasonable prospects of success (as it appears to have), is it really right that such a large and important development should be blocked in the interest of shielding 650 agricultural acres? The Government must have a strange estimate of the difference between the market price and the real value of market gardens. Mr Brooke will probably be given a chance to think again about this decision. He should certainly do so.

SHORTER NOTE

The Economists' Bookshop first opened its doors at 11-12 Clements Inn Passage, W.C.2, on February 17, 1947. Its tenth birthday is being marked by a series of exhibitions of which the first, from March 25th to April 12th, has been arranged with the help of the Oxford University Press and its associated American University presses. The bookshop is a joint venture of the London School of Economics and of this journal, and was founded in the belief that the staff and students of the School and the readers of *The Economist* all over the world would both find a use for a bookshop specialising in the literature of the social sciences and public affairs. This expectation has been more than fully justified, and the bookshop moves into its second decade with a worldwide clientele and a healthy balance sheet.

Two famous Companies, American and British, bring new basic industry to

Northern Ireland

DU PONT and BRITISH OXYGEN announce new developments

THE decision of the Du Pont Company (United Kingdom) Ltd. to construct a neoprene synthetic rubber plant in Northern Ireland brings a new and important basic industry to the Province. This will be the first neoprene synthetic rubber plant to be constructed in the United Kingdom and the British Commonwealth.

Because neoprene synthetic rubber will be made from acetylene, Carbide Industries Ltd., a subsidiary of the British Oxygen Company Ltd., will build, at the same time, a plant to supply acetylene to the Du Pont Company (United Kingdom) Ltd.

The two plants will be located side by side at Maydown, near Londonderry. The Du Pont Company (United Kingdom) Ltd. will commence construction on their site of over 300 acres in mid-1957. An initial labour force of over 300 men will be required to man the plant.

Carbide Industries Ltd. will build their plant on a neighbouring 50-acre site and building work will start as soon as possible. When in production over 300 workers will be employed.

Thus two world-famous companies, one American and one British, now join over 100 firms which have set up factories in Northern Ireland since the war.

In recent months announcements of new developments in Northern Ireland have been made by

CHEMSTRAND LTD.
FLEXIBOX LTD.
BESSBROOK PRODUCTS LTD.
BALLANTYNE SPORTSWEAR CO. LTD.
F. M. ASPIN (TOOLS) LTD.
SUMMERSON HOLDINGS LTD.

Twelve new Government factories are planned or building now to rent (for as little as 9d. per square foot). Also available are factories on repayment and capital grants for plant, machinery and new buildings.

Letters to the Editor

Liberty, Equality, Sorority

SIR—I have just read the interesting article in your issue of February 9th, but to my surprise I found that it ended in the middle of its argument.

Assuming that the recent events referred to will prove to have jerked the various member states of the Commonwealth into realising that they are not tied by any political apron-strings to a mother country (which is what, if I read it aright, the article was suggesting ought to happen), then what will happen should at some future date Britain get itself involved in another Suez-type mess? Presumably the other Commonwealth members, having learned the lesson pointed out by the article, will not again talk about their own leaving the Commonwealth, but will meet to expel Britain from the Commonwealth.

This having been done, what then is the position of Her Majesty the Queen? Presumably the other member states could solve the problem by electing some other person as Head of the Commonwealth, but they may insist that they still wish her to continue in that office. If so, will she herself have any say in the matter, or will she be obliged to leave Britain to take up residence in, say, India, Ghana, or the Caribbean Federation? Or will she divide her time between the two offices of being Queen of England, Scotland, Wales and Northern Ireland, and Head of the Commonwealth which no longer includes these countries? And if so, will Prince Charles automatically succeed her in both offices?

These are some of the points which were in my mind when your article came to its end. I hope very much that a second article will carry on and deal with them.—Yours faithfully, D. HARRISON

London, W.8

The Feet of the Young Men

SIR—We were honoured to read the mention of our emigration survey in your columns last week. However, it is regrettable that the comment should have been written from a false basic premise with the consequence that all that followed is grossly misleading.

You stated that "5,183 men and 420 women—the entire second and third year student body of the university" were asked to answer the survey. The note then said "only 6 per cent of the men and 10 per cent of the women bothered to answer." In fact approximately 450 questionnaires were sent out to a representative cross section of those in their second and third years at the university, the actual number of answers received after frivolous and otherwise "spoilt" papers had been rejected was 384. This represented 6.5 per cent of the total number of men and 11.6 per cent of the women in their second and third year. We believe this was an adequate sample for a survey of this kind. Far from only 6 per cent bothering to answer the questions, 90 per cent of the questionnaires were returned. 11.3 per cent of the men and 34.1 per cent of the women answered "Yes" to the question, "Have you decided to emigrate when you have graduated?" And to the second question, "If not, have you considered doing so?" 27.6 per cent of the men and 14.9 per cent of the women said "Yes."

Your conclusion that the total number of serious prospective emigrants is 54 is thus completely misleading. Allowing a margin of error of 1.3 per cent, the total number of men who are emigrating is 518. Further, the *Varsity* poll is very close to the figures revealed by the *News Chronicle* Gallup Poll. The latter showed that 41 per cent of the population of this country would like to emigrate if free to do so, our poll showed that 38.9 per cent of the men and 49 per cent of the women questioned were more or less seriously considering emigration.

Your comment concludes by saying that the *Varsity* survey is "rather a reassuring than an alarming document." We feel that the loss of one-tenth of the future leaders of Britain is of the utmost gravity.—Yours faithfully,

TIMOTHY S. GREEN,
Editor, *Varsity*
N. E. CLARKE,
News Editor

Cambridge

Exporting to Undeveloped Countries

SIR,—Over four years just completed in Burma, with visits to neighbouring Far Eastern countries, and short spells in the Middle East have made me wonder whether British industry is fully aware of the changing export conditions in "underdeveloped" countries.

Most of these countries are introducing varying degrees of economic nationalism. As a result, old-established "foreign" trading concerns are shrinking in activity and becoming less effective as exporters' agents; commercial operations are becoming immensely complicated by official tendering procedures; the almost total lack of local mechanical labour means that strong preferences are shown to the offers of imports which are accompanied by some form of additional technical services.

To keep an export market, let alone develop it, new forms of oversea representation are becoming necessary. The traditional types of agent, who covered a multitude of products and whose initiative was bought by agency fees on goods sold will no longer do, because the criteria of quality, price and satisfactory delivery dates are of themselves no longer sufficient to attract buyers.

Our main competitors, for example in the engineering field, the Germans and Japanese, are setting up specialised "engineering services" for maintenance and advisory work and are appointing technicians as part of the permanent staff of carefully selected "national" concerns. In contrast to this, the representation of British electrical manufacturers in Burma, for example, comprises, with one or two exceptions, a mixture of old-established "foreign" trading firms, each displaying a list of agency activities as long as one's arm from tinned baby's food to bulldozers (I was recently directed to one of them to have my fountain pen repaired), and little one-roomed shops displaying native medicines and musical instruments, tucked away behind pavement stalls in the main thoroughfares or down dingy side streets.

Successful representation overseas must be permanent and it must be specialised. Permanency means having exporters' technical staff placed in "market" countries to watch for new contracts, progress and tendering for potential ones and help with general technical advice. Many forms of organisation are possible, starting with the setting up of "regional" offices to cover groups of countries, but the most effective would be to post technicians to carefully chosen "national" firms in countries comprising those regions. Specialisation can be brought about by group representation of firms producing similar or related goods.

All this involves a commitment to varying degrees of overhead expenses. Such a commitment cannot be safely undertaken without a survey of sales potentialities. The material of such "market surveys" exists in abundance in countries with plans for economic and social development, but the questions arise: are British manufacturers properly equipped to carry out such surveys for themselves? If not, are there other British organisations which could be commissioned to do the detailed work required? The present answer to these questions would, I suggest, be negative. —Yours faithfully, A. STANWIN

Hampstead.

Back Towards Normal?

SIR—I have always appreciated how you feel about the party represented by this club, but your attitude towards the agricultural community is a mystery. However, the explanation may be found on page 270 of the issue of January 26th by the following remark made in a different context:—

> . . the constitutional hare was hastily stuffed back into its burrow.

Can it be that your knowledge of the countryside is confused?—Yours faithfully, JOHN W. GREY

Tuscan Tycoon

THE MERCHANT OF PRATO.
By Iris Origo.
Cape. 380 pages. 35s.

HOW often, when tacking sluggishly between shoals of dynasties and sandbanks of feudal campaigning, the reader of medieval history—or most other history for that matter—longs for a brisk breeze of reality, a fresh breath to put flesh and blood on the stiff bodies and mask-like faces, to give a sense of contact with living humanity under the alien robes and "Anglo-Saxon attitudes." Social histories and historical novels cater in their different way for this desire, but it is refreshing to find scholarship and imagination so finely allied that the result is both an exhaustive social survey and a vivid evocation of men and women in the reality of their daily lives.

Marchesa Iris Origo has achieved this balance brilliantly in her study of Francesco Datini, merchant of Prato in fourteenth-century Tuscany. The searcher after facts will find them in prodigious quantity. The reader hoping for imaginative insight into medieval, or rather pre-Renaissance, society will be rewarded with the vision of a whole community. Yet, so unobtrusive is Marchesa Origo's scholarship and so pervasive her sympathetic understanding, the scholar's imagination will also be stirred and the casual reader's learning insensibly extended.

The achievement is due in part to the material itself. In 1870, when the documents of Francesco Datini were brought to light—after lying in sacks for some 400 years—the store included over 150,000 letters, 500 account books and ledgers, 300 deeds of partnership, 400 insurance policies and thousands of bills of lading and exchange, cheques and business instructions. Some of this material has been worked over, and a full account of Datini's trading interests is already in existence. But Marchesa Origo has made the first comprehensive study of both the commercial and domestic papers left by Datini, and it is unlikely that any richer or more informative sources will be brought to light. Datini and his wife—unlike most medieval merchant couples—spent much of their time apart and the husband's letters of instruction, written twice and thrice a week, and his wife's replies are unique in the cumulative information they give about the domestic life of the time.

But the wealth of the material is only a precondition of success. Inadequately digested, it would have engulfed, not enlightened the reader. The art lies in the selection and arrangement of evocative fact from a mass of trivia and repetition. While the Marchesa gives the main line of Datini's career so that we see him in his early days in Avignon, in his years of expansion and prosperity as an international trader and in the last years of anxious opulence, the separate aspects of the man—as merchant, as banker, as husband, father and householder—are skilfully disentangled, and to the thread of his life are also strung chapters of absorbing detail, describing the food, drink, medicines, clothes, pieties and household arrangements of the day.

In a sense, it is a strange and fascinating labyrinth—full of pungent herbs and spices, where pies are baked with twenty rich ingredients to avoid the limitations of the sumptuary laws (an earlier austerity?), where gowns are trimmed with miniver and fringe (sold for the equivalent of nearly £2 an ounce), where stinking poultices are recommended for fertility, where men drink wine and a little toasted bread of a morning to fend off the Black Death, where domestic slaves are bought and sold from Africa and Tartary, slaves who rob their mistresses, produce little bastards and live to see these children brought up, legitimised and dowered by their natural fathers.

Yet, through all the strangeness, two qualities persist—the note of a common, shared humanity and, which is more surprising, a strange accent of modernity. The portrait of Datini's friend, Ser Lapo Mazzei, is one of almost archetypal goodness—the man of "measure," of modest ambition, warm affections, and unchanging loyalty whom the Stoics, St. Thomas Aquinas and Confucius would have equally approved.

But in Francesco Datini himself we find, as Marchesa Origo points out, something else—the driving cupidity, allied to unlimited energy and industry, upon which private enterprise in the west has been built up. And with it go the restless anxiety, the nervous tension and high pressure of living associated so often with the proverbial trials and ulcers of the modern business executive. In Datini's day, the mood was termed *maninconia.* Today we would no doubt talk of neurosis. But it is revealing to learn how early the peculiar conditions of high pressure commercialism took their toll in human *angst.*

The Expansion of Parliament

THE APPROACH TO SELF-GOVERNMENT.
By W. Ivor Jennings.
Cambridge University Press. 204 pages. 16s.

TO the British way of thinking the granting of independence to a colony and the creation of some form of democratic representative government to inherit British sovereignty and take over British institutions of law and government already implanted in the colony are inseparable parts of the same process. Yet it repeatedly leads to trouble, for it is frequently found that the nationalist movement which united the colonial people against British rule do not correspond to a normal majority party once independence is granted, but to a racial or religious majority with a desire to assert conformity, and to whose rule the minority will not submit even in conditions imitated from British parliamentary life. The economic, racial and cultural background does not correspond to the political realities on which British parliamentary institutions are founded.

All this, of course, finds a reflection, before independence is granted, in various adaptations of the British system, of which the commonest is some form of federalism, and, in racially diverse areas, of communal electorates or "fancy franchises." Even in so-called "homogeneous" colonial areas, like the Gold Coast or Uganda, the fears of minorities may lead, as in the Ghana constitution, to the creation of checks upon Parliaments' power which are alien to normal British ideas. Even so, these adaptations are often severely strained by the actual tension in the body politic. The problems of meeting them have now been most thoroughly and authoritatively analysed by Sir Ivor Jennings in a book that not only throws a flood of life on the adaptability or otherwise of British-type constitutions to politically underdeveloped countries, but also on the conditions, usually unrecognised, in which they work so well at home. In that sense, "The Approach to Self-Government" is the complement to Sir Ivor's three previous books on the British constitution, and is based on valuable comparisons between the working of transplanted parliamentary institutions in the Asian countries and in Burma, in the old Dominions and the unitary and plural societies of the colonies.

Sir Ivor himself has helped to make a number of colonial constitutions, notably Ceylon's; and this book is impregnated with the view that constitutions cannot be imposed according to Benthamite propositions, but must first be tailored as closely as possible to local conditions and then must stretch and contract naturally to fit them as it is worn. Even so, the remarkable thing is that the British constitutional framework of crown, cabinet and house or houses of parliament based on universal suffrage and usually single-member constituencies works so well in such a variety of circumstances—in Pakistan, fragmented into two; in Ireland, anxious above all to be different—and is the choice of wholly different societies like Malaya or the Gold Coast. No one prefers American, French or even Swiss models. It fits very different systems of law—Roman-Dutch, French, Spanish and Hindu and Muslim law; even African tribal law. Yet the problem is to stretch it to cover far deeper divisions than those of distance or language or religion, such as are experienced in Canada or Australia. It is in getting down to the basic point of the unit which can be governed by British methods, once British overlordship has gone, that Sir Ivor is at his brilliant best.

He takes the five conditions that make an area a possible state: homogeneity of population; economic viability; capacity for self-defence; capacity to support a government; adequate administrative personnel; ability to retain the citizen's loyalty. These conditions affect the working of a British-type constitution at every point—the organisation of secret ballots, for example, from the maintenance of a register of voters to the use of symbols on ballot papers. Sir Ivor shows what badly needed to be shown, that neither in Britain nor anywhere else does the counting of heads lead to "one vote, one value" in the strict form that many nationalist demagogues demand; and his study of how communalism can work in Asia should be studied by every African politician. He has wise words to say about the qualifications of candidates as well as voters ("A mere handful of illiterates in a legislature of a hundred persons is not likely to obstruct government"); on administration ("to confer self-government merely because there are competent politicians available is to invite difficulties in practical administration"); and party ("a party system is needed for cabinet government; but one way to encourage the development of a party system is to establish cabinet government, even if it be partial. . . .").

Sir Ivor is clearly convinced that good government—in the widely understood sense of a democracy that will work in practice—is more important than self-government which ends in bloodshed; he is for a reasonably slow pace in ensuring it; he takes the view that Britain's failure is not in the defects of this or that dominion constitution, but in the abandonment of Palestine to civil war in 1948 simply because the problem looked insoluble. To him, a British-type constitution is an infinite boon, for it does demonstrably work in such diverse conditions; it is the natural starting point for independence because it can be adapted so well, for it is itself the product of adaptations to a society that has in Britain passed through so many phases. He stands up strongly and cogently, therefore, for the "transitional constitution" in the last but not necessarily brief stages before independence—an argument of vital relevance to the colonies today.

Novels and Readers

THE RISE OF THE NOVEL.
By Ian Watt.
Chatto and Windus. 319 pages. 25s.

THIS is a first-rate piece of literary history: learned, sensible, well-balanced, and the work of a scholar who is also a very good critic. It will fully satisfy both the professional student of literature and those whose interest in the novel arises from its documentary value as illustrating the development of English society in the eighteenth century and after. Mr Watt begins with the philosophical background. From Descartes stems the modern assumption that individual experience rather than collective tradition affords the best basis for the pursuit of truth; and in England Locke made legitimate a method whereby thought is allowed to spring from the immediate facts of consciousness.

And the novel starts here. Its technical characteristics as they emerge in Defoe and Richardson have "an aim which the novelist shares with the philosopher—the production of what purports to be an authentic account of the actual experiences of individuals." The true nature of the novel's realism is a formal realism, residing not in the kind of life presented, but in the manner of presentation: one allowing "a more immediate imitation of individual experience set in its temporal and spatial environment than do other literary forms." And the new aim produces new canons of style. The writer is concerned "to make the words bring his object home to us in all its concrete particularity"; traditional extrinsic beauties are sacrificed in the interest of just such a close correspondence of words to things as was being recommended, in another field, by the Royal Society.

In all this there was much to offend or disconcert conventional literary expectation; and the new form might not have established itself had it not been able to appeal, in part at least, to a new reading public. This is a subject upon which there has been much easy generalisation, and Mr Watt approaches it with an admirable caution and thoroughness. Literacy, leisure, the cost of books in their several categories, such tolerably reliable figures as exist on the size of editions and the currency of newssheets and journals, the beginning and growth of the circulating libraries: these are all carefully reviewed. The division of labour is shown to be of great importance. Just as today the cake-shop's "Why bother to bake?" entices housewives to settle down before the television screen, so in eighteenth century London did the fact that beer, candles and soap need no longer be made in the home enable a new class of society to beguile itself with "Moll Flanders" and "Pamela." Pamela herself, indeed, in seeking fresh domestic employment which shall free her from Mr B's importunities, is disposed to bargain for "a little Time for Reading." She thus has some claim to be regarded as Mr Watt's heroine as well as Richardson's; her very ignorance made her receptive of originality; she has at least her humble place as illustrating the new social context of literature that enabled the English novelists to lead the way in breaking with the matter and manner of previous fiction.

From general topics such as these Mr Watt passes to a consideration of particular novelists and novels. He is better, perhaps, on Defoe than on Fielding—and certainly best of all on Richardson. "Clarissa" is by far the greatest work of art with which he is concerned, and he rises to it magnificently.

Portraits of the Artists

MODERN ENGLISH PAINTERS: *Lewis to Moore.*
By John Rothenstein.
Eyre and Spottiswoode. 345 pages. 35s.

THIS is the companion volume to an earlier one sub-titled "Sickert to Smith." The subjects are arranged in chronological order of their dates of birth, with the result that most of the painters in the present volume, unlike the first, are still alive. In a walk of life where resentments and passions run unusually high (as who should know better than Sir John Rothenstein?), the possibility that an offended painter might turn up at the Tate Gallery in fighting mood might, one would think, be somewhat inhibiting. Perhaps, indeed, in the critical appreciation of these painters'

10

IT WAS during the freeze-up and fuel crisis of February, 1947, that The Economists' Bookshop was born. In celebration of its tenth year of bookselling, The Economists' Bookshop proposes to hold a series of exhibitions of books that have been published during this decade.

The exhibitions will be held chiefly during the universities' Easter and Summer vacations and we hope that our customers, at home and abroad, will bear them in mind when visiting London.

Shortly before each of these exhibitions, an announcement will appear in these columns.

The Economists' Bookshop

11-12 CLEMENTS INN PASSAGE
ALDWYCH · LONDON · W.C.2

work the accent is on appreciation. But as the son of Sir William Rothenstein, Sir John was particularly well qualified, by personal recollections and access to letters as well as by his own expertise, to write this book, and the result is lively and informative.

There are some good stories and some glimpses into the jungle. The chapter on Wyndham Lewis for example (the Lewis referred to so anonymously in the sub-title) shows what ruthless vendettas the Bloomsbury circle would pursue against those who were not their friends, persistently vilifying them, if they could not be ignored, in the columns of *The Nation*. The book also tells what made these artists become artists, what influences shaped their work and what they meant to achieve. The first world war was the catalyst for several of this group. It weaned Paul Nash from the nice but slight paintings that he used to do in his youth, though Stanley Spencer says that it permanently clouded the bright vision of his own youth.

The book is supplied with 32 reproductions of paintings—which is fairly generous. But ideally far more are needed to profit fully from the discussion of the paintings, especially as many of the works cited are in private collections. Nevertheless this book is interesting to read and valuable to have on the shelf—a book to be referred to again and again as the painters with whom it deals are represented in exhibitions.

Arabian Journey

SULTAN IN OMAN.
By James Morris.
Faber. 165 pages. 16s.

IN the autumn of 1955, the Imam of Oman fled from his capital at Nizwa before the advance of the British-led troops of his sovereign the Sultan of Muscat. To affirm his rule over the disputed middle section of his territories, the Sultan journeyed from Salala, on the shore of the Arabian sea, across the south-east corner of Arabia to Muscat, calling at Nizwa on the way and taking the submission of tribes and villages that had wavered in their loyalty. "The journey had never been made before, least of all by motor vehicle. No such crossing had been made of the Jaddat al Harasis; no one had driven from Dhufar to Muscat; the mountains of Oman were almost unexplored; even the Wadi Jeziz, the pass between Bureimi and the sea, had (until a few years ago) been described only by the hardiest of Arabian travellers." Mr Morris, then resident correspondent of *The Times* in the Middle East, journeyed with the Sultan and has described the historic episode in this book.

Mr Morris shoots the fleeting minute on the wing in the dusty wake of the Sultan's racing truck or pauses in patience while he holds state in ragged corners of the desert or mountain; the pace of his prose slides easily to a tranquil halt after the screeching of brakes. There was no time for the ponderous learning of the great Arabian travellers; but, perhaps because of this, the landscape and the people, whether in the howling wilderness of the unknown regions or by lantern light on the seashore at Muscat, emerge with particular vividness from the pages. In short, Mr Morris, who writes well, has again written well, and the result is one of the most easily read books of Arabian travel.

It has also historical and some geographical importance. But he is not happy with the complicated politics of the region which he brushes in with broad and, one feels, impatient strokes. Doubtless he desired no more than to give the journey its political perspective, but the trouble with Mr Morris is that he writes so well that he can often with a phrase carry the wrong conviction. His romanticism savours the British officers of the Batinah Force but does less than justice to the adventuring oilmen whose existence he seems to regret as much as he does the politicians of Cairo or Damascus. The political perspective is distorted by some urbane prejudices. Even these are expressed entertainingly.

The Cup that Stimulates

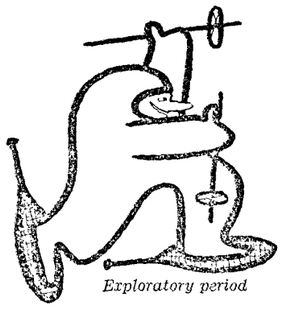
THE PENNY UNIVERSITIES: *a History of the Coffee-Houses.*
By Aytoun Ellis.
Secker and Warburg. 307 pages. 30s.

IF they can stimulate disgruntled or mildly seditious talk in congenial surroundings, new drinks have little difficulty in catching on when existence seems drab and uncertain. The appearance of the coffee-house in Cromwell's England is perhaps no more surprising than the rise of the Espresso bar in Butskell's. But the longevity of the vogue is astonishing. For a hundred years or so, the hopeful, the ambitious and the smart found their chosen houses the right milieu for both business and pleasure, whether they were courtiers, merchants, highwaymen or merely intellectuals. Then quite suddenly, in the latter half of the eighteenth century, the pub, the chop-house and, above all, the club ousted the coffee-house.

In the end, no doubt, men needed something stronger to drink; somewhere to eat; and, still more, greater privacy and comfort to contain their cliques. But no one has fully explained the remarkable survival of a fad, or its swift demise. Only in the City, that home of conservatism, did the houses linger on to become institutions like Lloyd's and the Baltic Exchange.

Mr Ellis has no novel interpretation to offer for a phenomenon of some interest. His approach is that of the antiquarian, recording rather than analysing; and he has assembled a mass of agreeable anecdote. His chronicle is obviously a labour of love, admirably produced by its publishers; the reader is filled with admiration for the industry and perseverance which have gone into its compilation. But the coffee-houses are worth serious inquiry, and still await their historian.

Pensions for the Retired



PENSION SCHEMES AND RETIREMENT BENEFITS.
By Gordon A. Hosking.
Sweet and Maxwell. 380 pages. 42s.

THE author has brought up to date and extended a previous book "Superannuation Schemes," dated 1948 and written by himself and R. C. B. Lane. Despite the growth of interest in pension schemes, particularly in the postwar years, these books represent the only serious attempt at a comprehensive textbook on the subject, and Mr Hosking is to be congratulated on having produced so soon a volume that includes an exposition of the pension clauses of the Finance Act 1956. In addition to the mass of technical information given, there are chapters on the broader issues of pensions in relation to the national economy, and on the approach to pension problems in the United States.

Tax reliefs are of vital importance in any type of pension arrangement, whether in connection with employer/employee schemes or the new "self-employed" class admitted last year. The relevant sections of the Income Tax Act 1952, which consolidated previous enactments, and of the Finance Act 1956 are given in full in the appendices, and the conditions and limitations necessary if the most favourable tax treatment is to be obtained are explained fully and clearly in the text.

A wide variety of schemes is possible and each type is dealt with in turn; but it is plain that the author's preference is for the self-administered or private fund, and a large part of the book is devoted to the machinery required to set up a private fund. All matters, including consideration of benefits to be provided, types of schemes, actuarial calculations, investments and administrative organisation, are thoroughly covered. Less than justice is, however, done to insured schemes. Insurance offices have made a considerable contribution to the development of pension arrangements, particularly since the war, and it is unfortunate that credit has not been given to them. Although chapters dealing with the new self-employed pension arrangements are most interesting and informative, little attention is paid to the variety of contracts on offer from insurance companies, although the possibilities (and desirability) of some form of self-administered fund are fully explored.

It seems likely that, at some time, the mass of legislation on pension schemes will be tidied up and some of the existing anomalies removed—indeed the process may be said to have started last year. In the meantime this book will serve as an admirable work of reference and an exposition of the diverse and complex factors involved in pension schemes, but it would be improved by a fuller treatment of insured schemes so that a less biased picture is given, especially when comparisons are made with private funds.

Exploratory period

PIGS FOR FIGURES

"What made your people install Hollerith?" the accountant was asked. He grinned, "Well, you know what our people are," he said. "Pigs for figures! They're right, of course."

Three-way Choice

Figures. Figures at speed. Reliable. Selective. Up-to-the-minute. Modern business, because its control is based on figures, points all the time to mechanisation. What could this mean to you? Punched card equipment? An electronic multiplier or calculator? Or are you ready for an electronic computer? Maybe it's time you had a word with Hollerith.

Responsible Advice

If you are faced with such major decisions it would reward you to co-opt Hollerith methods and operations research men, accountants and technicians to collaborate with your own people for an exploratory period. No fee is involved.

Evolution and Revolution

Hollerith will plan equipment to meet your individual needs. Behind their advice lies 50 years' experience: first, in punched card techniques; then, with the coming of electronics, in multipliers, in calculators and in computers.

Behind their advice

Research in both punched card and electronic equipment goes on steadily. Evolution not revolution.

The Hollerith Type 550 Electronic Calculator

Education

If you decide to take a look at your business in the context of punched cards or computers, short-term residential courses are available to you, or your executives, at the Hollerith Education Centre, in Berkshire. These courses put techniques and applications at your finger tips, quickly. They provide the knowledge necessary to informed judgment.

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Between Arab and Jew

Washington, D.C.

MR HAMMARSKJÖLD'S opposition to the use of sanctions against Israel has come as a great relief to the Administration which, having placed so much weight on the Secretary-General's shoulders, would have felt morally bound to uphold him if he had made an issue of confidence out of the adoption of sanctions. Moreover, the clear distinction in the Hammarskjöld report between the binding effects of a decision of the Security Council and a mere recommendation of the General Assembly has reassured many people in Washington who were expressing a mounting sense of uneasiness at the idea of American policy being determined by shifting majorities in the unwieldy and eccentrically weighted Assembly. Significantly enough, a speech in the House of Lords by Lord Cherwell on the defects of the United Nations has recently been reprinted both in the Congressional Record and in a widely read news magazine and has caused much comment.

But the postponement of the Afro-Asian block's resolution on sanctions will be of little help to Mr Dulles unless, before it comes to a choice, he can induce the Israelis to trust to a new American declaration on Gaza and the Gulf of Aqaba. According to reports, the United States would promise to support freedom of navigation for all countries in the Gulf, and United Nations action to ensure that the Gaza strip was not again used as a base for attacks on Israel. The Americans hope that this will be enough to enable Mr Ben Gurion to order the withdrawal of Israeli troops without being repudiated by his own people, but not enough to enable the Israelis to boast of crowning a military success with political victory and thus threaten the Arabs with loss of face. If the American declaration does not provide the cover behind which the Israelis would be willing to withdraw, Mr Dulles will find himself back in the same unenviable dilemma in which he found himself a week ago.

After his highly successful week of Arab diplomacy in Washington, which confirmed him in the belief that his judgments during the Suez Crisis and over the issuance of the Eisenhower Doctrine had been sound, Mr Dulles confronted the prospect of all these gains disappearing forthwith like a desert mirage if he allowed the Israelis to get away with their defiance of the United Nations. All his Arab visitors—the most pro-American of them, Dr Malik of the Lebanon, being also the most forceful—had made it clear that the American attitude to Gaza and Aqaba was the touchstone by which the President's good faith would be judged. Dr Malik indeed said bluntly that American influence would never be accepted in the area until the Arabs were disabused of the idea that, whatever the merits of a dispute, the United States would in the last resort always support Israel. This phrase echoes one used by Mr Dulles himself to the Senate Foreign Relations Committee exactly a year ago. It is an idea which has obviously inspired much of American policy in the intervening period.

Until the last minute the President and Mr Dulles, with their usual optimism, seem to have thought that, simply because Israel was a democracy, it would be willing to display "a decent respect for the opinion of mankind," without being so disagreeable as to insist on guarantees. But Mr Eban, the Israeli Ambassador whose flawless elocution and unfailing debating skill are a source of endless irritation to American officials, promptly pointed out that the President's phrase was a quotation from a passage of the Declaration of Independence, explaining why the colonists felt they should set out their motives for defying the opinions of the majority of foreign governments. And, as it became increasingly apparent that the Administration was resigning itself to support sanctions in the United Nations if really forced into a corner rather than to forfeit the goodwill of its Arab guests, the political friends of Israel began to mobilise their powerful forces.

Agitation against penalising Israel by Mr Ives and Mr Javits, the two Republican Senators from New York, was only to be expected. Even Senator Knowland, who hopes to succeed Mr Eisenhower as President in four years' time, could for this reason be discounted, to some extent, as he rumbled on about the "double standard" of the United Nations in threatening Israel and looking helplessly at Kashmir and Hungary. But when Mr Wiley, the State Department's most dependable mouthpiece in the Senate, gave notice that on this subject it would not get his help and, above all, when a protest came from Senator Thye of Minnesota, an unemotional Republican internationalist who has been almost invariably responsive to the President's lead, then it became clear that any move which would really hurt Israel, such as the cutting off of private American remittances, would have absolutely no political support.

★

The Administration was caught between the imperatives of its self-chosen Arab policy and the shrinkage to disappearing point of its domestic political base, with a last-minute reversal of Israeli recusance as its only hope. The

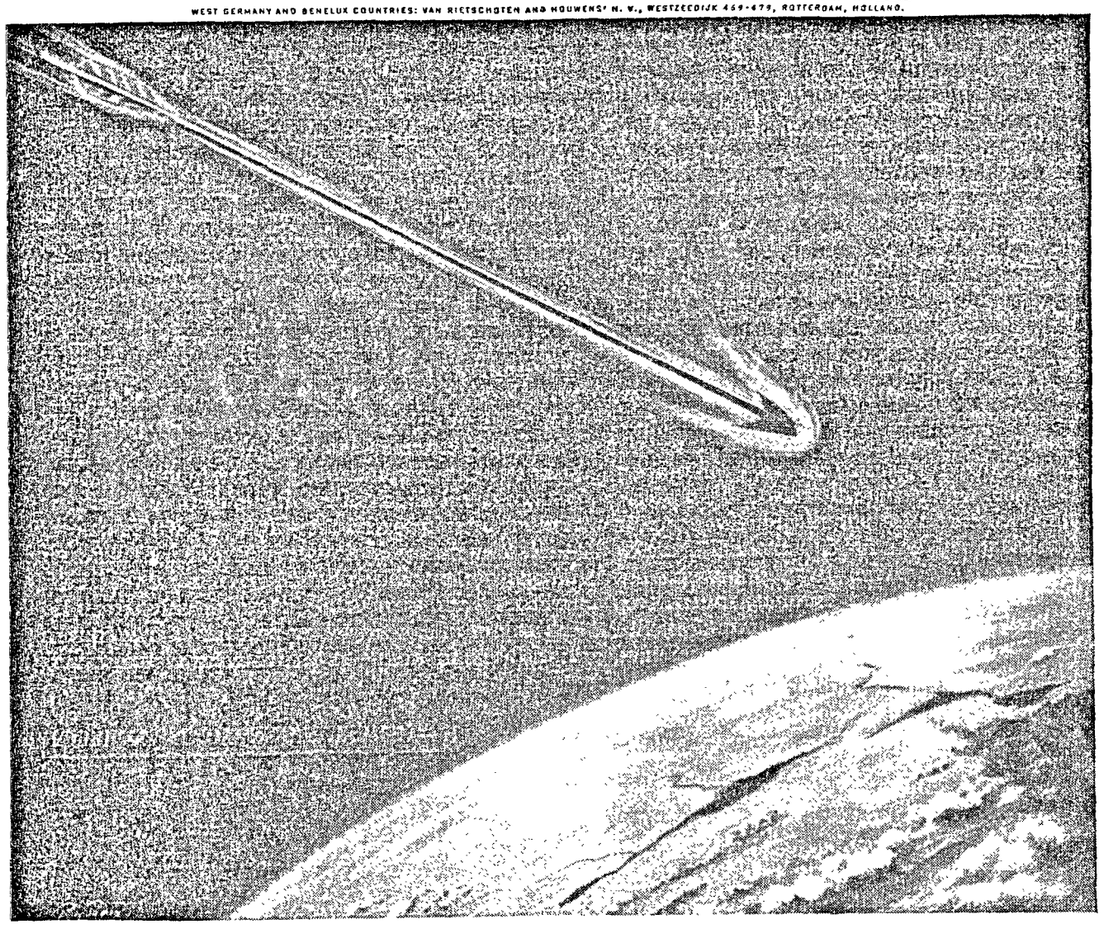
position was made the more embarrassing by the failure of Mr Dulles's presentation of the Eisenhower Doctrine to shock the Senate out of the leisurely tenor of its ways, and by the decision of a group of Democrats that they would turn the Administration's legislative importunity into an occasion for harrying, insulting and discrediting the Secretary of State. The Eisenhower Doctrine sprang from the urgent plea of the ambassadors of the Asian members of the Baghdad Pact, when they saw Mr Dulles jointly in mid-December, for a clear American commitment. After the National Security Council had debated and rejected the idea of joining the Baghdad Pact, it was first decided to call a special session of Congress, at which the military commitment, which Iran in particular regarded as imperative, would be clothed in a big new authorisation for economic aid. On the advice of congressional leaders, first the special session, then the request for new money were dropped in the hope of obtaining prompt compliance: all that was left under the economic head of the resolution was a request for freedom to spend without legislative restrictions $200 million which had already been appropriated.

Yet the hearings in the Joint Senate Committee have dragged on, and the debate on the floor will not now start until next week. Moreover, the elucidation of substance, as so often with Senators who like to feel themselves on a footing with the Founding Fathers, has become bogged down in wrangles over constitutional law. Senator Fulbright seems to be arguing simultaneously that the delegation of authority to the President to engage American troops in certain circumstances in the Middle East is an unwarranted aggrandisement of the Presidency and that, by unnecessarily confirming powers which the President has already, it will unwisely limit his future actions elsewhere. As a result, the resolution has now emerged from the Senate Committee with its military clause weakened. Moreover, however much foreign critics of Mr Dulles may secretly rejoice in the violent words spoken in debate about the shifting sands of his expository technique, they cannot possibly feel that American policy will be improved by such rough handling of the man at the wheel at this most delicate moment.

Siege of New York

BUSINESSMEN who have been building up stocks of sugar, tea, coffee and wool found their pessimism justified this week when the greatest port in the world became doubly strike-bound. A strike of tug-boat crews, now entering its third week, makes the berthing of ships dangerous and has immobilised the barges which normally bring in two-thirds of New York's fuel oil and coal; other more expensive means of transport are being tried, but a really cold snap would cause hardship. Then, on Tuesday, the International Longshoremen's Association renewed the dock strike suspended last November under the Taft-Hartley Act. The New York dockers turned down the employers' last offer by the overwhelming vote of 14,458 to 1,185, and dockers in other ports from Maine to Virginia followed suit.

Only twice before in the history of the Taft-Hartley Act has a cooling-off period failed to produce a settlement, and the ILA was the trade union involved in one of those cases. But there is recalcitrance on both sides, not so much over wages as over strategic power. The ILA was expelled from the American Federation of Labour four years ago for the corruption and criminal connections of some of its officers. To outmanœuvre the rival organisation set up by the AFL, it is holding out for some progress toward the right to bargain for all the Atlantic and Gulf ports, even though this time the dockers in the Gulf and South Atlantic ports signed a separate agreement in January, and even though the National Labour Relations Board has declared the demand for such a "master contract" illegal. The ILA accepted the federal mediators' formula which contained a vague gesture in this direction; it was the employers who drew back after their preliminary acceptance. One point they would like to include is a "right to work" clause; the ILA's attempt to dictate the working of the piers, coupled with repeated costly stoppages, may end by sending shipping elsewhere.



A mysterious and sinister figure in New York this week has been Mr Harry Bridges, the head of the west coast dockers, who have also been expelled from the AFL. The ILA is insisting that its new contract should end when Mr Bridges's does. The objections of the New York shippers seem to be mainly that this date, August 1st, would come at the peak of the transatlantic season, but the day of national dock stoppages may not be far off. Meanwhile, the government in Washington, which has thrown all its resources of mediation into the present strike, has one more duty under the Taft-Hartley Act: the President must submit proposals for a settlement to Congress.

A Promising Visit

EVEN though King Saud and his romantically robed retinue of sixty Saudi Arabians did not arrive by magic carpet, their glamour—and their generosity—seem to have charmed most Washingtonians, even if not all Americans, out of their earlier prejudices against the public and private lives of their visitors. On his side the King, after his unusually long state visit, seems to have gone away genuinely convinced of the goodwill of Americans and of the peaceful purpose of President Eisenhower's offer of military protection and economic aid to the middle eastern countries. Since King Saud was already genuinely convinced of the dangers of communism, there is real hope that he may prove an effective intermediary between the United States and the other neutralist Arab countries—especially Egypt and Syria. This was the purpose for which the King was invited.

In return for this indefinite promise to use his good offices on America's—and the world's—behalf, the King received what, from the official communique, seemed almost as indefinite a promise of military aid. But it is reported from Washington that he is in fact to get $50 million worth of military supplies this year and enough during the next four years to build up his army to a strength of 40,000 from its present 15,000; the additional cost is estimated at another $200 million. This army will be organised into two divisions, with about 100 tanks and 100 aircraft, and the King has given his word that none of it will be used

When the tip sublimes!

Away up where it's cold, black and lonely at 500,000 ft., the thermal attack on a missile or "airplane" isn't very meaningful. The air molecules at that height are barely nodding neighbors, rather than crammed together in a fluid mass. But, escape and re-entry into the earth's dense envelope of atmosphere generate thermal attacks of frightening ferocity. Nose and leading-edge temperatures may rise to 3000°F.

Even titanium won't stand such temperatures for more than a few minutes. For all those areas requiring long-time service life up to 1000°F, however, titanium's light weight, great strength and corrosion resistance offer outstanding design advantages.

Production quantities of very high strength heat-treated sheet, to close gage and flatness tolerances, are being engineered into advanced aircraft and missiles. For non-military applications, all types of mill products are obtainable at constantly lower price levels.

T.M.C.A. is again adding to its production facilities to properly service an ever-expanding market. T.M.C.A. engineering service and technical literature are readily available to all those industries challenged by weight, strength and corrosion problems.

Winter Wisdom

WHEN chills are in the air the way to keep the cold out is to be warm within. Towards bed-time take a little White Horse with hot lemon and sugar or in hot milk. Let sound sleep and the soothing glow of this fine Scotch whisky drive off the questing germs of colds and influenza. There is no more pleasant precaution.

Maximum Prices: Bottles 36/-, ½-Bottles 18/9, ¼-Bottles 9/9, Miniature Bottles 3/9

against Israel. Whether this will satisfy Israel's friends in America remains to be seen, but it will be difficult for them to make an effective protest since Saudi Arabia is to pay for the arms out of its oil revenues. The King's main argument for these military supplies was that he was under heavy pressure to accept similar equipment from the Russians but had refused to have anything to do with them.

If the reports are correct, the only direct dollar payments which Saudi Arabia is to get as a result of the King's visit is $10 million for improving the port of Damman, which is used by the American oil companies, and $10 million a year for facilities at the Dhahran air base for another five years. This is an increase of $7 million a year for something which the Americans insist is really only an air junction ; the extra money is to be spent on training more Saudi pilots and troops, nominally so that they can guard the air field. The Administration, it is said, was very relieved that the King did not ask for any large economic grants, since Congress would undoubtedly have posed awkward questions about feudal conditions in his country and about his huge oil revenues which, it is estimated, will double in ten years, reaching an annual figure of $600 million. The Administration was equally relieved that he did ask to join the World Bank as this should mean that the oil revenues will be put to work on development projects, with the help of a technical mission from the Bank to straighten out the Saudi finances ; such a group could not be accused of attempting an American infiltration into the country, as was the ill-fated Point Four mission which King Saud threw out in the first year of his reign.

Guards Go To School

FROM A DEFENCE CORRESPONDENT

THE tripping tongue of Mr Charles Wilson, the Secretary of Defence, has ensured that during this year's hearings in Congress on military matters a disproportionate amount of time, effort and indignation will be expended on a scheme to intensify the training of the National Guard. Mr Wilson, a genius in the production of both motor-cars and ill-timed remarks, did his cause immeasurable harm by a breezy reference to "draft-dodging," by enlistment in the National Guard, as having been "a sort of scandal" during the Korean war. By exploiting this unpleasantry as an "insult to all National Guardsmen," his critics were able to create a silly but telling diversion from the main issue of how the country is best to create a reliable ready reserve force. In fact those units of the National Guard which actually reached the front line in any of the last three wars acquitted themselves well. The real point is that, in almost every case, they only got there after a prolonged period of field organisation and training. That is a luxury which the Army cannot now expect to enjoy in a modern war employing weapons of great speed and range.

In spite of their title, units of the National Guard are in peacetime first and foremost state troops, direct descendants of the colonial militia units whose colours and uniforms are still treasured. They are commanded by the Governors of their respective states, who occasionally call on them to maintain order in times of disaster or rioting. National Guard officers enjoy considerable political influence and social cachet within the state, which gives them a strong claim on the attention of their local members of Congress when their privileges seem in danger. On the other hand, the Guard is supposed to constitute the principal component of the Army's reserve establishment and to be available for national service immediately on mobilisation. For this purpose its 400,000 men are organised into 27 divisions, 18 regimental teams, 8 field artillery and 123 anti-aircraft battalions, with support units. The Guard's weakness lies in its lack of any solid period of basic training ; as a result, during the evening and weekend drills and summer camps, the permanent staff is so busy teaching elementary lessons to floods of young recruits that there is little opportunity for the unit training which prepares men for battle.

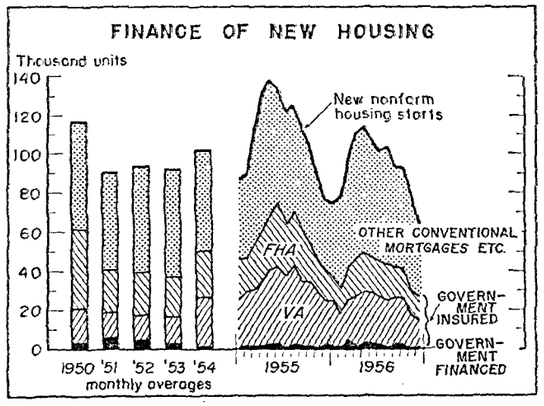
To correct this situation the Army has devised a plan which, having won the approval of the Department of Defence and of the President, is supposed to go into effect in April. Its essential requirement is that all recruits, for the National Guard or any other military unit, must first of all receive six uninterrupted months of basic training before undertaking any part-time commitments. The opposition argues that, unless the National Guard can continue to offer to youths between seventeen and eighteen and a half the chance of staying at school or at work, immune from conscription, in return for two hours' training a week and two weeks of continuous service in the summer, the National Guard will find its stream of volunteers drying up. Underlying this is the National Guard's traditional suspicion that the Regular Army wishes to eliminate it altogether and have its main functions absorbed by the Organised Reserve ; this is directly under the Army's control and consists at present almost wholly of skeleton units of officers and non-commissioned officers, which would need to be filled out on mobilisation with fresh and completely untrained recruits. In addition, the Southerners are afraid that, if the federal authorities control recruitment, Negroes may be posted to units which are determined to remain wholly white.

It is safe to say that a large number of Congressmen, and certainly a majority of the most vocal ones, have been more impressed so far by the spokesmen of the National Guard than by the most reasoned arguments of the Army. They seem particularly sympathetic to the Guard's compromise proposal of an eleven-week (as against a six-month) period of concentrated training, to be followed by a similar period the following year. This would permit youths between seventeen and eighteen and a half to get their training in the long summer holidays and avoid interference with academic terms. The Army contends that this would be inadequate and would waste effort and money. But it is doubtful whether Congressmen, habitually sympathetic to the "home-folks" and constitutionally suspicious of professional soldiers, will accept the official plan.

Perhaps, however, the argument may lead to a little more realistic thinking about the sort of ground forces that are most likely to be needed in a future war—which is the real underlying question. The present reserve establishment is based on the requirements of the last world war, with some modifications, and the whole frame of reference of the present debate seems to stand in need of much more rigorous examination than either the Army or the Reserve has yet seen fit to give it.

Great Wall of America

THE Secretary of State has so many more important things on his mind that it seems a pity he should so stubbornly defend a decision that was wrong. Last August the State Department refused to allow a number of highly qualified newspapermen to accept an invitation to visit Communist China which expelled all foreign correspondents in 1949. Three, less well known, went anyway and are now threatened with invalidation of their passports and other penalties. Mr Gardner Cowles, the publisher of *Look* magazine, which sent two of them, is demanding a public hearing and the American Society of Newspaper Publishers has protested, in the name of freedom of the press, against the ban and against any punishment of journalists who disobey it.



The State Department's argument is that where it has no representatives it cannot protect American travellers; nor has it forgotten the $120,000 the United States paid Hungary to secure the release of four airmen, or the concessions exacted by Hungary as the price of letting Mr Vogeler go. Then, too, it is understandably irritated after three years of fruitless negotiation with the Chinese over the prisoners they hold. Journalists, nevertheless, have special claims to run risks and democracies ought to accept some in the interests of truth. Last week, however, Mr Dulles produced a new twist: that the Chinese were offering to release their ten American prisoners if the journalists were allowed to come and that the United States would not submit to such "blackmail." In principle, it is wrong to link the two, but in practice the bargain is one in which America gains on two counts—if the State Department believes in a free press.

Unfortunately Mr Dulles went on to say that, even if the prisoners were released, the State Department was unlikely to issue passports for a country it did not recognise; "this is never done." The newspapers have been quick to point out that there were American correspondents in Russia throughout the long period of non-recognition; more recently reporters have travelled to Mongolia and Eastern Germany. Mr Dulles has backed himself into the position that Americans are safer behind an intellectual great wall just as the Chinese have begun to dismantle theirs.

Shelter for Housing?

THE fact that 200,000 fewer houses were started in 1956 than in 1955 looks to many Congressmen like a black cloud; they are all for hoisting a government umbrella. To the Administration, on the other hand, it has much more the appearance of a patch of blue in a stormy inflationary sky. Last year increases in business investment and spending by the states and localities more than made up for the declines in housing and automobiles; prices would have risen more than they did if housebuilding had continued at 1955's clip of 1.3 million homes begun. The chairman of the Federal Reserve Board, far from being apologetic about the credit squeeze, thinks it should have been sharper; the building of more schools and houses, in his view, should be deferred until other demands for credit slow up, unless Congress is prepared to increase taxes.

Builders, who have some remedies like cost-cutting in their own hands, may be too pessimistic when they prophesy that only 900,000 houses will be built in 1957. All the Administration now proposes to ensure a "fair but not excessive" level of activity is to ask Congress for a $1 billion increase in the lending power of the Federal National Mortgage Association, which provides a market for govern-

ment-insured mortgages, and an increase to 5 per cent in the interest paid on mortgages guaranteed by the Veterans' Administration. The rate on those insured by the Federal Housing Administration went up last December when it was found that lenders were putting their money into conventional mortgages yielding 6 per cent. Most of the fall last year was in housing financed by government-insured mortgages; these are the bread and butter of the industry.

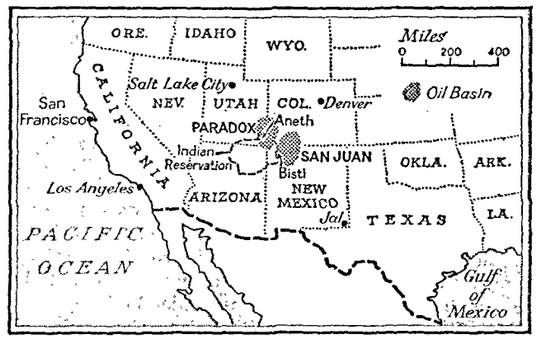
Many powerful members of Congress, listening to the cries of house builders and home hunters, would prefer to use some of the reserves of the servicemen's life insurance fund to provide direct government loans at 4½ per cent. Such a raid would be vetoed as inflationary, as requiring the Treasury to borrow an equivalent amount elsewhere, and as a reversal of the trend to private financing of building which is the Administration's pride. But the empty till of FNMA may force the government to make other concessions. Congress is showing a tendency to vote only stop-gap replenishments until it is sure of some shelter for the housing industry, and if the economic weather worsens, even the Administration may help to provide it.

Boom in Trade

THIS week President Eisenhower sent his first annual report to Congress on the working of the Trade Agreements Act, as required under the amended law passed in 1955, preceded by yet another plea for congressional approval of United States membership in the Organisation for Trade Co-operation. Congress is just as suspicious of this project as it has always been even though, in the President's view, it is essential if the trade agreements programme is to be made even more effective. But last year proved, what has always been obvious, that the really effective stimulus to a continued growth of profitable world trade,

which the Act is supposed to promote, is not legislation but prosperity.

The preliminary figures for American foreign trade in 1956 show that both exports and imports broke all earlier records. Exports of merchandise were valued at well over $17 billion, about $3 billion more than in 1955, and in addition $1.7 billion worth of military aid shipments were sent overseas last year. The gains are in part explained by the success of the government's efforts to dispose of its agricultural surpluses abroad. Another notable increase was in exports of coal to Europe, in consequence of the growing demand of industry there for fuel—and at the end of the year exports of oil were of course rising. These growing demands of industry abroad, especially in Canada, were also responsible for what was the most important dollar increase in exports, the gain in shipments of machinery for mining, building and manufacturing. Expansion, but this time in the United States, also explains the gain in imports, valued at about $12.5 billion in 1956, some 10 per cent higher than in 1955. American manufacturers were using more raw materials and Americans in general were drinking more coffee and buying more newspapers; more important from the point of view of Britain, they were also drinking more whisky and buying more woollens and antiques.



But imports did not go up enough to prevent another record being set—by the trade gap. United States exports in 1956 were worth about $6.5 billion more than imports, compared with a difference of just over $4 billion in 1955. This gap was, however, satisfactorily filled, not by dollars provided by the American taxpayer—foreign aid outlays were much the same in both years—but by increases in spending by American tourists and in private investments abroad. The latter went up by about 10 per cent in 1956, to a total of nearly $32 billion. Much of this is explained by comparatively low interest rates in the United States, which encouraged Americans to lend money abroad. The final result was that, for the first time since the immediate postwar years, net foreign investment added about $1.4 billion to the gross national product of the United States instead of subtracting from it.

Corners in Oil

THE establishment last week of the Four Corners Pipe Line Company by a group of leading oil firms, including the Shell Oil Company and the Standard Oil Company of California, seems to have solved the main difficulty of America's newest oil field. Expected to become an abundant producer, the field is situated in a desert region in the Rocky Mountains where four states meet—the only place in the United States where they do—and where there is practically no use for oil and practically no means of carrying it away. But there is plenty of use for it in California, the nearest important consuming centre and a rapidly growing one which is no longer producing enough for its needs.

The new pipeline will carry 60,000 barrels a day—and later as much as 160,000—of crude petroleum 600 miles from Four Corners to refineries in Los Angeles. It may begin to do so soon after the end of the year; much of the preliminary work has already been done and the necessary pipe is available—which is not always the case just now. Oil pipelines are common carriers available to all comers, and it therefore appears possible that, at least until the region is more fully developed, nothing more may be heard of the other projects, put up by competing companies, for pipelines to take the oil to refineries in Salt Lake City, or to join existing pipelines at Jal in New Mexico which go to the Gulf coast.

With a pipeline on the way, the drilling of new wells will be stepped up as the weather improves; most of the leading oil companies are already active in the region. There are two areas being developed: the Paradox Basin, where the chief discovery so far is the Aneth field, struck just a year

ago, with a number of other productive areas nearby, which may turn out to be either the same pool or separate ones; and the San Juan Basin, around existing natural gas wells which are supplying California and the Pacific Northwest with this fuel. Here the Bisti field, discovered in the autumn of 1955, is so far the main producing area. While it is not difficult to find oil here, many of the wells are less lucrative than are the much more prolific Aneth ones; indeed, some of them are hardly worth exploiting commercially. The Aneth field, of a very different geological type, produces a light oil which is said to have good lubricating qualities, well suited to Californian needs.

All of this adds up to a development which may turn out to be more profitable than the disappointing Williston Basin, far north in Montana, which a few years ago was arousing so much excitement, although the experts were never so enthusiastic about it as was the press. For one group the new development is already profitable: the 78,000 poverty-stricken Navajo Indians whose reservation includes Four Corners. They made $33 million (as much as their tribe's annual income) when oil leases on 400,000 acres of their land were put up for auction last November, the royalties on the oil produced are still to come.

Bankers Out on a Branch

FROM A CORRESPONDENT IN NEW YORK

BANKERS all over America are watching a move in New York State to widen the scope permitted to bank holding companies. It is less than a year since Congress finally passed a law to control holding companies, which the independent bankers hoped was a political victory for the traditional American single office bank. The failure of the

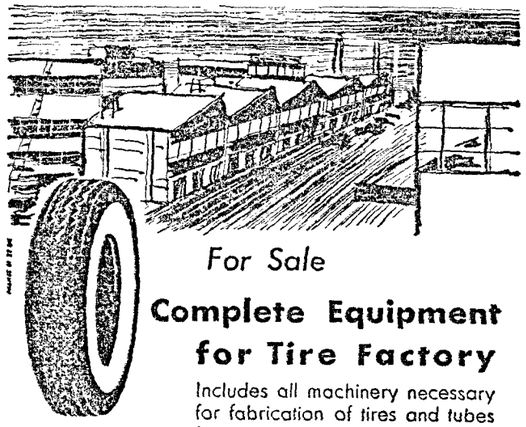
law to deal with mergers, the most popular method of concentrating banking resources, was its most glaring loophole and one through which the Transamerica Corporation, the big western holding company which was the main target of the measure, slipped while Congress was debating the restrictive legislation. Now the First National City Bank of New York, an eight billion dollar giant, is seeking to satisfy the Federal Reserve Board, as it must under the new law, that its use of a holding company to acquire a bank in White Plains, New York, would be in the public interest and consistent with sound banking and the maintenance of competition. It will be a bitter blow to the independent bankers if it succeeds.

They cannot even count on the New York law to block the expansion of big Wall Street banks like the First National City. A Bill is being introduced in the State Legislature to make it legal for a bank in one of the state's banking districts to acquire a bank in another district through the device of a holding company. In New York, which like the other forty-seven states imposes its own banking regulations side by side with federal requirements, new needs arising out of new conditions are pressing against old laws expressing deep prejudices. For many years the issue of bank holding companies has been confused and their growth stunted by the regulations to which branch banking must submit. Only one bank holding company doing state-wide business exists in New York. It is the Marine Midland Corporation of Buffalo which is said to control about 18 per cent of the commercial banking resources in the state outside New York City. It was not affected when regulations governing branch banking were adopted and has so far remained unscathed. These state regulations owe their present form to the banking holiday of 1933, which led to an examination of all banks and a virtual relicensing of those strong enough to open. When the dust had settled, almost two hundred communities found that they had no banking facilities whatever, and applied for the relief that branch banking, then limited to big cities, might bring.

After long debate the Legislature passed a law dividing the state into nine districts, each containing three or more counties, each "constituting a natural commercial and trade area," within which branch banking would be allowed, provided that the State Superintendent of Banks and two-thirds of the State Banking Board agreed. The fact that this law did not mention bank holding companies was not interpreted as an invitation to expand them. On the contrary, there seems to have been a tacit understanding that the Act regulating branch banking casts doubt on any attempt to create a new bank holding company. In part this was due to New Deal attacks on all holding companies, in part, perhaps, to a confusion which still persists in the highest quarters over the difference between the operations of a bank holding company and a branch banking system. In any event, for twenty years the districting Act has proved a deterrent to both types of expansion.

Meanwhile, during the long years that Congress was considering a federal law to control bank holding companies, circumstances and banking requirements in the state changed. Population has grown, and standards of living have risen. Cities have spread into suburbs, and not always in accordance with the lines that define bank districts. For example, New York City is in the second banking district; but many of its former residents now live in Nassau County, which is in the first district, in Westchester County which is in the third, or in New Jersey which has its own very different rules. These ex-urbanites have not been able to take their banking connections with them. City banks have been losing customers to suburban banks, and suburban banks have been faced with demands for expansion in services and lending power which they are not equipped to meet.

The situation has become particularly acute in Westchester County where, during the last five years, deposits of insured commercial banks have risen by 35 per cent while those in New York City were rising by only 3.5 per cent. Not only are the city banks looking with longing at the rich field over the district line, but the suburban banks, competing for new business and beset by the problems inherent in expansion, are also beginning to reach out for capital from New York City. There is a rumour that the request of the First National City Bank to be allowed to form a holding company, the First New York Corporation, to control both the parent bank and the County Trust Company of White Plains, was made in answer to a plea for aid from the smaller bank. Although it is the largest bank in Westchester County, it is said to have felt that its competitive position was endangered by the threat that Rockefeller money might flow into the capital structure of a competitor.



★

The formal request was made in November, and hearings before the Federal Reserve Board and the state authorities followed in January. The decisions have not yet been handed down, but the publicity which accompanied the hearings gives some clue to the complexity of the issues and interests involved. All the familiar jousting teams sprang into action, small banks against big banks, big banks against big competitors, unit banks against branch or holding company banks, Congressmen against the hint of trusts, city interests against country interests, Democrats against Republicans, the advocates of states' rights against federal encroachment, the Justice Department against anti-trust violations.

The hope is that the State Legislature, spurred on by its joint legislative committee to revise the banking law, will pass an Act which will allow bankers to meet the state's needs for banking facilities without encouraging monopoly. The Federal Reserve Bank in New York City has lent the committee one of its own officers to help in drafting the Act, which somehow will have to try to hold the balance between unit banking, branch banking, bank holding companies and the new pattern of federal regulation which is emerging. Meanwhile, the Federal Reserve Board is far from happy in its task of administering the federal Act. It is not accustomed to conducting formal administrative hearings, and for those on the request by the First National City Bank the board had to borrow a trial examiner from the National Labour Relations Board. Some observers predict that Congress will repeal the bank holding company Act if it proves to be a disappointment to its sponsors. Others insist that, despite its inadequacies and the confusions it creates for the states, the Act does lay down needed ground rules and remove uncertainties which have stunted the growth of banks. Even to the initiated it becomes clear why there are repeated demands for a national commission to study the entire money and credit system.

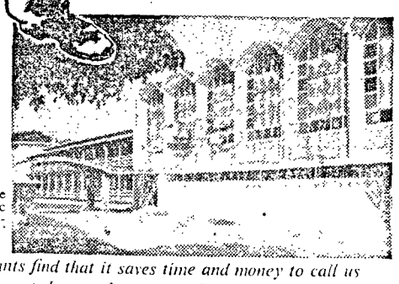
ENGINEERING COLLEGE. Administration and Library Building from entrance court (coloured glass infilling in pre-cast concrete units.)

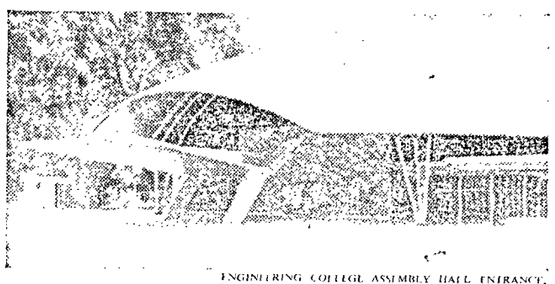
BURMA'S NEW ENGINEERING COLLEGE AND POLYTECHNIC INSTITUTE

Designed and erected for the Special Projects Implementing Board, GOVERNMENT OF THE UNION OF BURMA



ARCHITECTS: *Raglan Squire and Partners*

CONSULTING ENGINEERS: *Ove Arup and Partners (for Engineering College Assembly Hall)*



CONTRACTORS: *Taylor Woodrow Construction Ltd., in association with United Burmese Engineers Ltd.*

The Prime Minister of the Union of Burma has described these impressive buildings as an inspiration to Burmese students in their resolve to modernize and industrialize their country.

On such projects, Taylor Woodrow's world-wide experience is of immense value to the client. Burmese sand, for example, is exceptionally fine — quite unlike that demanded for home specifications. The mixes were therefore designed by Taylor Woodrow at Southall, and resulted in concrete of extremely high strength. Extensive facilities for research and development, as well as ample resources in plant and skill, are major reasons for entrusting your next project to Taylor Woodrow.

Main front and entrance canopy of Polytechnic building, nearing completion.

ENGINEERING COLLEGE ASSEMBLY HALL ENTRANCE. The roof of native teak (140 tons), is believed to be the largest laminated timber dome ever built.

Clients and consultants find that it saves time and money to call us into full collaboration at the very beginning of any scheme.

Italian Socialists in Travail

FROM A SPECIAL CORRESPONDENT IN VENICE

THE seven hundred delegates of the Italian Socialist party who met last week in Venice for the 32nd congress of the party were called upon to define the future relations of the party with the communists; to pronounce upon the prospect of socialist reunification (and hence on future relations with the Social Democrats from whom they split ten years ago), and to consider the creation of a socialist alternative to the present centre coalition which has governed Italy since 1947. As the presence of Mr Morgan Phillips, M. Commin, and Mr Bevan showed, the chances of creating a strong and reunited Italian socialist party are of much more than purely Italian significance.

The congress was preceded by several months of harsh polemic within the party. Signor Nenni's meeting last August at Pralognan with Signor Saragat, the leader of the Social Democrats, at which an initial discussion of reunification took place, produced an angry reaction from those in the party who, headed by its vice-secretary, Signor Pertini, objected to any move which was likely to weaken the party's ties with the communists. It was expected that at Venice these dissenters would make themselves heard. But in fact few of them did so. This was a matter of tactics rather than a change in their conviction: they calculated that an overt opposition to the new line would only confirm their minority position and strengthen Signor Nenni's hand. No modifications to the secretary's opening speech were therefore proposed: no contrasting final motions were presented, and no list of opposition candidates appeared for the election to the new central committee. There was, as a result, a certain air of unreality about the proceedings: a show of unanimity which only in part masked the underlying differences of interpretation advanced, cautiously and in a proliferation of verbiage, by many speakers.

A number of fundamental decisions nevertheless emerged. In the first place it is clear that the old *frontismo* with the communists has been discarded. All the delegates were firmly opposed to the adoption of an anti-communist policy, but all equally called for a new autonomous socialist policy which should lead, rather than be led by, the other forces of the Left, and which should seek to become the rallying point of the political aspirations of the working classes of the country. There was general agreement, too, on the need for democracy both within the party and the state, for the toleration of minorities and for reform by parliamentary means. Signor Nenni himself explicitly stated that the old maximalist view of socialism through bloody revolution had to be abandoned, and although most of the delegates from the base of the party continued to talk of reformism with the utmost disdain, it was clear that in fact they have begun to think in terms of the methods pursued by the other social democrat parties in western Europe. The very warm welcome given to Mr Bevan and the many references to the valuable experience of the British Labour party were highly significant: the Soviet world has ceased to exert an exclusive fascination upon Signor Nenni and his followers.

There was general, if somewhat imprecise, agreement about the need for reunification of all socialist forces in the country. There is a wealth of anger in the party against Signor Saragat for the compromises which his alliance with the Christian Democrats has forced upon him. But at the same time the party sees that electorally it needs the help of his followers. In internal policy it proposes nothing that should prove to be unacceptable, at least on ideological grounds: in foreign policy it proposes Italian neutrality between the two blocks, though it is willing to accept Italy's participation in Nato on a strictly defensive basis, and to consider favourably further European economic integration with the proviso that participation should contribute to the wellbeing of the working classes of the country. The party's neutralism has hitherto been in strident conflict with the policy pursued by the Social Democrats, but it may be that the changing situation will ease the way towards a compromise.

About many of the details of future policy there remains a penumbra of uncertainty. Signor Nenni made an urgent appeal for a modern formulation of socialism which would face the imminent problems of the second industrial revolution, but few of his followers demonstrated any clear grasp either of what these are or how they can be met. The lack of political education at the base of the party remains one of its most grievous weaknesses: even in trade union matters there was little evidence of positive ideas. The congress did, however, listen with great attention to its two most eminent trade unionists, Signori Foa and Santi, who both argued strongly for an independent trade unionism. Great though the difficulties of this are, the personal triumph of Signor Foa (who headed the poll for the new central committee) is a promising sign. But the party still has to make up its mind about its attitude to the great mass of workers who vote for the Christian Democrats, and it is difficult to see how its aim of working-class unity can be obtained at the same time as it opposes the party which so many workers support.

The presentation to the country of a future united socialist party as an alternative government must inevitably present

the party's leaders with many difficult problems of this sort. The composition of the new central committee arouses some doubts of their ability to face them with vigour and singleness of purpose. In the vote for the committee's 81 members many of the muffled doubts heard during the congress found expression in the election of a considerable number of representatives of groups not entirely in agreement with the secretary of the party. How strong their reservations will prove to be depends much on the skill of Signor Nenni himself, who, by his presentation of the case for a new policy, confirmed that he remains the one person of sufficient stature to guide the party towards its fulfilment.

Strains in Spain

FROM OUR CORRESPONDENT IN MADRID

READING the Spanish press one would hardly guess that the Franco state is in crisis. The papers carry plenty of news and comment about the trials and troubles of other lands, but practically nothing about the situation at home, which is bad and getting worse. It is impossible, of course, to conceal from the public what it already knows, such as that prices are rising and the value of the peseta falling. So the controlled press keeps one jump ahead, or tries to, by expatiating on the troubles of other countries. Thus one finds headlines like these: "The European Market will force devaluation of the franc"—"The value of the dollar is half what it was in 1940"—"Inflation threatens the American economy."

Still, once in a while a significant fact or a pertinent comment trickles through. "On the whole, prices are stable," observed *El Dia* in gentle irony recently. "It is true that oil, butter and meat have risen, but Chinese vases and French masters of the 19th century have fallen back." *Pueblo*, organ of the labour syndicates, indignantly pointed out that "whereas our workers are poorer than the workers in other countries our rich are as rich, or richer, than the rich elsewhere."

People are worried; they have shown it in Barcelona and Madrid by boycotting the trams, the only way they could protest collectively without running foul of the law. The government is trying not to show that it, too, is worried; but there is not much to be cheerful about, judging from the symptoms of a rapidly deteriorating economy which are, in the words of one observer, "almost too awful to contemplate."

Inflation is gaining ground. Wages have been raised twice in the past ten months by an average total of almost 30 per cent, without any commensurate increase in production. The effect of these wage increases has been cancelled out by an equivalent rise in the cost of living. The drain on the nation's dollar reserves is like a hæmorrhage. From $94 million in December, 1955, reserves had dropped to $28 million in December last year, to $21 million in January this year, and are now reportedly around $10 million. (Spain has a gold reserve, so far untouched, of $120 million.) The value of the peseta has dropped from a steady 43 to the dollar in June to around 54 now. Fiduciary circulation has increased by 24 per cent in a year. The budget deficit has swollen to 16 billion pesetas.

The export of citrus, Spain's biggest earner of foreign exchange in normal years, has been crippled by last year's great frost; by January 20th only 97,964 tons had been exported compared with 441,775 tons up to January 22nd of last year. The terms of trade have shifted to Spain's disadvantage. In 1955 (January to August) the average price a ton of imports was 236.42 gold pesetas; in the same period last year it had risen to 275.75 gold pesetas. Prices earned by the average ton of exports moved the other way: 132.25 gold pesetas in 1956 (January to August) as against 155.38 for the same period in 1955.

Spain is in the grip of a shortage of two major staples: olive oil and wheat. It consumes 465,000 tons of olive oil a year; this year's crop will be only between 335,000 and 350,000 tons. Consumption of wheat is 4.3 million tons; this year's crop will probably be around 3.5 million tons. It is hoped that American sales (for pesetas on the basis of a 40-year loan) of surplus vegetable oils and grain will bridge the gap. But besides hurting the wheat crop, lack of rain is affecting Spain's supply of hydro-electric power, so that power cuts have had to be imposed three days a week and industrial production is slowed down.

Looking to Washington

The Spanish government is turning to the United States for help. It has asked for an extra $30 million in aid for 1956-57 and hopes for $130 million in 1957-58. At the same time General Franco is trying to talk the Russians into returning the $560 million worth of gold which Dr Negrin's Republican government shipped to Odessa in February 1937. Moscow's price may be the establishment of diplomatic relations. Or it may be higher: perhaps abandonment of the American alliance.

American aid since 1954 amounts to $458,800,000. This does not include what has been spent on building up the armed forces. About $278 million consisted of agricultural sales to make up shortages and to help keep food prices down. It is by no means certain that the United States government will come to an easy decision regarding future and larger outpourings of economic aid to Spain. For one thing, Americans have begun to feel that the weather cannot be blamed for all of Spain's troubles. They consider that the government has been living beyond the country's means, spending too much on non-productive projects like the grandiose labour universities and the architecturally remarkable but probably very expensive (nobody seems to know what it cost) *Valle de los Caidos*, to be the final resting place of the Civil War dead. The sentiment exists, moreover, that the Franco government has not gone as far as it might in encouraging investment of foreign capital which would develop the Spanish economy and relieve the American taxpayer of some of the burden of keeping Spain (and the Franco regime) going. There are the bases to consider, but there is also the fact that General Franco has been losing popularity. Opposition is growing in right-wing quarters, among those who were with him and for him during the Civil War and after, and who today have lost their old enthusiasm. Throughout the country discontent seems to be becoming more general; it is spearheaded by the students through agitation in the streets; clandestine leaflets attack the government.

Given these facts, along with the major economic and political crisis now building up, it may not be long before Washington feels the need for an agonising reappraisal of its Spanish policy.

How secure is YOUR transport?

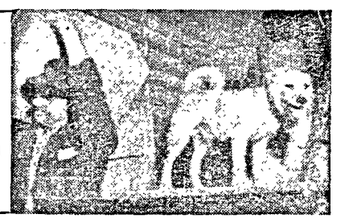
By taking special precautions against damage and loss, BRITISH ROAD SERVICES achieve reliability and economy in transport.

DURING this period of petrol rationing, British Road Services will continue to do their utmost to meet your needs and maintain their previous high standards.

They are helped in their efforts by these important factors: They are a highly-organized and nationwide concern with widespread resources at their disposal. They are staffed with experienced, enthusiastic men. And, during this difficult time, they are working in very close collaboration with British Railways who will provide, on behalf of B.R.S., those long distance hauls that can no longer be covered by direct road services. British Road Services therefore continue to offer you the best that existing conditions permit, *and they give you their assurance that they will do everything possible to keep your traffic moving efficiently and securely.*

Safeguarding your goods

Look at the precautions B.R.S. take: From their vast fleet of vehicles, of all types, they can select the most suitable for your needs. And their twenty-four-hour nationwide engineering service keeps all vehicles in peak running condition.



No practical security measure is overlooked, and special arrangements are made to safeguard those traffics most susceptible to damage or loss. Constant research provides the most modern and suitable vehicles and equipment, so that all manner of goods can be properly handled, conveyed and protected, with resultant economy for you and satisfaction to your customers.

Co-operative planning

In your own interest, and in the interests of the nation, your transport requirements need to be skilfully arranged.

Experienced men at B.R.S. are eager to discuss with you every aspect of your transport requirements, and to co-operate in improving methods, minimizing risks and reducing costs. Just telephone your local man. Action will follow immediately.

The Guard Dog. The pet of the driver, the bane of the intruder. Just one of the many ways in which British Road Services protect your traffic.

The Sultan and his Ex-Protector

BY OUR SPECIAL CORRESPONDENT

WHEN Sultan Mohammed V of Morocco visited General Franco this week he must have seen the Caudillo's Moorish bodyguard. These horsemen are one symbol of the ties which entangle Spain with Morocco, ties which the two countries have lately been trying to loosen. Although the Sultan was on a private visit, he and General Franco have now signed a diplomatic agreement, by which they will consult with each other on matters of common interest, and also an agreement by which Spain will still provide the northern zone of Morocco with judges. But after three months of discussions the largest knots are as firmly tied as ever.

The tangle dates, of course, from the Spanish protectorate of the northern zone of Morocco. This began in 1913, a year after France and Spain agreed to divide Morocco (excluding the international city of Tangier) between them. It ended last year, under pressure of Moroccan terrorism in the French zone. Yet the three zones of Morocco are still divided by frontiers, and in the northern zone you would almost think that the protectorate still exists. The road from Tangier to Tetuan, winding over the bare, brown rolling countryside, is as full of pot-holes as any main road in Spain. At first sight Tetuan seems an Andalusian town—all fountains and gardens, whitewash and curly green tiles, flowered balconies and wrought iron. But the streets are filled with a far more motley crowd: Spanish policemen and Moors in their straight, hooded robes; Madrid fashions and the eternal dusty black of the Mediterranean peasant; white bundles with only the eyes showing, and lumpy Berber women with huge straw hats surmounting wimples made of bath towels. On the main square a minaret towers behind the Spanish buildings and from your café table you see the muezzin call the faithful to prayer. Through a white archway in a corner of the square is the Arab town, the *medina,* its narrow arched streets teeming with people and lined with open shops; and in another corner is the entrance to the palace of the khalifa Moulay Hassan, the Sultan's representative during the Spanish protectorate, who is shortly to come to London as Morocco's first ambassador. But the square itself is called the Plaza de España.

★

The Spanishness of the northern zone keeps Morocco divided. In the southern zone the currency is the Moroccan franc, which is linked to the French franc; but in Tetuan it is mainly the Spanish peseta. Important services belong to Spaniards—the railways and the airport, for example, and there are Spanish post offices. The judicial system is Spanish for Europeans and Moslem for the Moslems, and it has to be absorbed into a single system for Morocco as a whole. The Spanish High Commissioner, who reigned with all the pomp of a viceroy, has gone and in his place, from a crimson velvet office, reigns Abd el-Khalek Torres, the former nationalist leader, as Governor of the northern zone. But there are still Spaniards at the head of some of the departments of state, and most of the lesser officials are Spanish. Above all, unification is delayed by the fact that the level of wages and prices in the northern zone is Spanish, being perhaps 30 per cent lower than in the southern zone. To lift the frontier would be to cause a rush of people and goods from north to south.

The underlying cause of delay, however, is that neither country is quite single-minded about integration. For the sake of prestige the Spaniards would regret the disappearance of the peseta from North Africa; but its circulation there, and its quotation on Tangier's free market, is a horrid demonstration of its weakness, as well as a leak in Spanish exchange control. In one sense again, the Spaniards do not want to go on subsidising the budget of the northern zone; but they are continuing to do so for the present because the zone's bankruptcy would greatly harm Spanish interests—most of the zone's meagre industry is Spanish and, above all, so are the iron ore mines, perhaps 60 per cent of whose profits go to Spain. Aid, moreover, is consistent with General Franco's pro-Arab policy—and he has a particularly soft spot for the country from which he launched his *coup.*

The Moroccan government, for its part, wants the northern zone integrated with the southern and Spanish influence reduced—when it thinks in political as opposed to economic terms. Presumably it is to this end that Mr Torres is to go as ambassador to Egypt, to be replaced, no doubt, by someone less vice-regal, more manageable, and of longer standing with the Istiqlal party. (Mr Torres used to have a nationalist party of his own.) On the other hand, Morocco does not want to lose Spanish financial support or Spanish officials—there is no one to put in their place. Mr Torres told your correspondent that the Spaniards in government service are co-operating well; and he was pleased, too, with the Spanish army, which keeps itself to itself in the ancient *presidios* of Ceuta and Melilla (which are still Spanish), and does not move about the country without asking him first. Of Ceuta and Melilla nothing has yet been said.

Not everyone in Morocco would share Mr Torres's satisfaction with the Spaniards. The system of commissions, which some might crudely call bribes, has not speeded public works, and some people were a bit annoyed when the viaduct on the new road to Ceuta collapsed before it was opened. Moroccans, however, believe in the commission system themselves. They have indeed, a lot in common with Spaniards. These may have left their zone almost as undeveloped as they found it; but by doing nothing they have not roused antagonism and jealousy as French zeal has done. The Spaniards, again, may have kept all the best jobs for themselves, but they did so more out of self-interest than through the feeling of superiority which has earned such hatred for French settlers. Racial superiority, indeed, would be out of place between two peoples who have been invading each other's territory for twelve hundred years. If the Spaniards own the factories of Tetuan, the Moors of Chauen still claim to have the keys of their ancestors' houses in Seville.

King Hussein's Message

FROM OUR SPECIAL CORRESPONDENT IN AMMAN

DEBATE still continues in Jordan on the subject of the message sent by King Hussein to Prime Minister Suliman Nabulsi, warning him against the danger of communist infiltration. The message is certainly the most startling, if not the most important, development in Jordanian politics since the new government was formed after the general elections last October. Although undoubtedly disconcerted by this unexpected intervention from the Palace, the government has taken immediate steps to curb communist propaganda by stopping the showing of Russian films, the distribution of Tass bulletins and the publication of a new communist weekly, *Al Jamahir.* In addition, bookshops have been searched for communist literature.

The King's message was ably drafted. It took its stand firmly on Arab nationalism and its Islamic associations. Its real purport was that the coincidence of communist and Arab interests in recent months was purely accidental and that their long-term interests would certainly diverge. The key sentence was: "We will not replace the colonialism that is disappearing from the Arab world by a new form of imperialism."

It might seem that there was nothing in the message to which Arab nationalists could object. But there is more to it than meets the eye. The Egyptian and Syrian governments, together with their powerful allies in Jordan, deny the existence of the communist menace, and the King's warning seems an implied contradiction of the official line emanating from Cairo and Damascus. It disturbed the more extreme nationalists, who saw in it a deviation from the course pursued by the Jordanian government. Their disturbance was reflected by the Egyptian press, which spoke of a "grave crisis" in Jordan. The view has been expressed in Amman that the message gave the communists undue publicity and even an aura of martyrdom.

Visitors at the Palace

The timing of the King's message has come in for comment. Although he certainly knew his words would be unpalatable to certain members of the government, he can hardly have intended to force a cabinet crisis amid the negotiations for the termination of the treaty with Britain. Ending the British link is still a step that appeals strongly to the Jordanian public, and anything delaying it would bring odium on the heads of those responsible. The act of termination is likely to mark the springtide of popularity of the present government. The testing time will come thereafter when serious economic problems must be faced without the boost supplied by nationalist issues.

Some attention has been attracted by the fact that the King within the last few days has been conferring with several politicians of the old school, including at least four who held the office of prime minister in days of British influence. Inevitably, some have concluded that the King's message was inspired by "reactionary influences." In the absence of proof, judgment is perforce suspended. But many of the warier observers, with the welfare of the dynasty and the independence of Jordan at heart, hope that no drastic step is contemplated at the present juncture.

The Nationalist tide is still running strongly, and there is no doubt that the present government, a combination of nationalist and radical elements, reflects the opinion of the majority in the country. Any attempt to stem the tide is likely to store up dangerously explosive forces. If moderation is to come at all, it had better come from within the government as a natural result of the discharge of the responsibilities of office. At any rate, during the present delicate stage of transition, many would prefer to have the extremists in the government rather than in the streets.

New Life for OEEC

FROM OUR PARIS CORRESPONDENT

THE OEEC countries have taken the free trade area scheme into the negotiating stage. All the countries are willing to join the talks; this had been doubtful. The ministers at their meeting this week have therefore taken a big step forward, and new life has been injected into a body which had seemed to be growing dangerously anæmic.

The decisions taken, although procedural, in fact reflect an initial negotiation. It has been decided to appoint a political co-ordinator, Mr Thorneycroft, in his capacity as OEEC chairman; he is to be the Spaak, as it were, of the free trade zone. He will co-ordinate working groups, of which there will be at least three. The first will deal with the general problems of setting up a free trade area. The other two will tackle the major stumbling blocks that have emerged: agriculture and the status of the less developed countries (Greece, Turkey, Portugal, Ireland and Iceland). The intention is that as much of a draft convention as possible should be ready by July.

There was trouble in getting a clear distinction between the working groups accepted. It suits Britain to isolate the agricultural problem, and the problem of the poor countries, from the free trade area proper. For industrial free trade the British Government is a purist. Tariffs and quotas must be lowered automatically (though the kind of protection provided by double price systems, for instance, will not be dented); escape clauses must be reduced to a minimum. But Britain remains a non-taker on agriculture, and it fears that the special needs of countries like Greece, if introduced into the central discussion, will blur the issues. Naturally the countries interested in these problems would prefer to stir the whole brew in one pot. Apart from Switzerland, no one clearly backs Britain in excluding agriculture, though it is recognised that the common market powers themselves propose a regulated agricultural market, not a free one. The Danes, who risk being excluded from the common market without compensation in the free trade area, are particularly anxious. As for the poorer countries, they realise that unless they get special concessions, in particular an investment fund to help finance their development, the free trade area will not benefit them much.

Britain, for all its objections to including agriculture in the area, will sit on the relevant working group. The other countries take this as a warrant for hoping that some compromise may be possible in practice, however immaculate the principle remains. Could agricultural goods be more

narrowly defined than the British Government has done? Could guarantees be obtained of increased British purchases from food exporters ?

Whether separating these questions will keep the central talks pure from the British point of view is a moot point. The French will certainly want at least the same far-reaching safeguards as they have obtained in the common market. In general, the problem of co-ordination with the common market will raise complicated issues. For instance, the British view is that a country in acute balance of payments trouble can reimpose quotas without consulting its colleagues. The Swiss have asked whether countries affected by these acts could likewise retaliate without consulting anyone. If the answer were "yes," the free trade principle would be wobbling dangerously on its tightrope. It is in any case certain that in the common market a different line would be taken—a country would be less free to act, but its neighbours would be more obliged to succour it with credits for instance. Could France, to take a far from implausible case, be treated one way in the common market and act in another way in the free trade area ? Clearly not. Such problems are not insoluble but are looming much larger now that the ministers are penetrating into the foothills of negotiation.

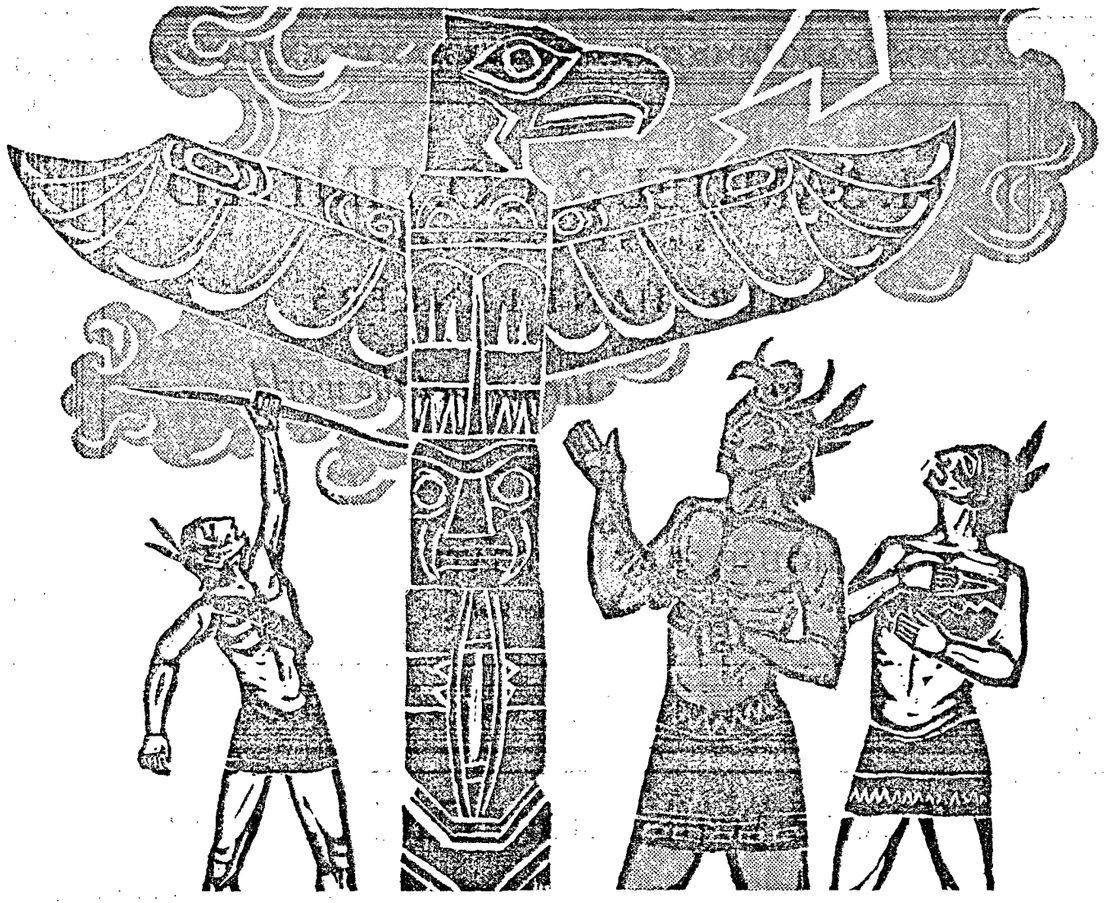
It is worth noting that the Six have not spoken in chorus. Though M. Spaak read a joint declaration, their ministers also spoke each for his country. In fact they run the whole gamut of attitudes from Germany, which is near the British position, to France at the farther pole. They will not directly contradict one another, neither will they speak as one. The distinction may considerably affect the negotiations.

No one is committed yet to a free trade area, which is still only a rough outline. Despite the clearing of the undergrowth done by the Six on the common market it is hard to see how a draft convention could be ready by July. Mr Thorneycroft will be busy as European panjandrum as well as British Chancellor.

Brazil Attracts the Foreign Investor

FROM A CORRESPONDENT IN RIO DE JANEIRO

PRESIDENT KUBITSCHECK'S government has completed its first year in office. On his election, the president announced that his five-year term would advance Brazil fifty years. In the first year the country's economy has undoubtedly progressed, but the conventional economist would be hard pressed to explain how. Not only did Snr Kubitscheck take office in a more bitter political atmosphere than did any of his predecessors but his legacy of economic discord was longer. He inherited thirty years of profiteering and inflation, and the leap-frogging of prices and wages has become as inexorable as the seasons. Last year, the prices of even modest necessities increased by an average of 40 per cent. The sanguine official economic forecast is that inflation will reach saturation point and will result in a "natural stabilisation on new levels."



But Brazil's ability to ride a crisis has often confounded the experts. The licking political fire which at one time threatened the government has now died to a spluttering of bitterness and mistrust. The passive philosophy of the average Brazilian may provide licence for shameless profiteering and inept management of domestic affairs, but it also provides the best guard against political extremism. On the economic front, the value of the cruzeiro is hardening despite the unpromising conditions. And the political upheavals of a year ago have not discouraged foreign investment. The United States alone supplied Brazil with more than $400 million last year, about half as long-term loans from the Export-Import bank and the rest in the form of development schemes, private capital, surplus farm products, and technical aid. German industrial investment made great strides forward during 1956; the rate of German economic and commercial expansion in Brazil is claimed to be well ahead of the American. The Brazilian government has been able to advance many of its development plans, and if, in addition, it would recognise that the country's sovereignty is sufficiently assured to allow in foreign money to develop natural resources—notably oil—President Kubitscheck would be well on his way to achieving his fifty years of progress in five.

Britain Falls Behind

Brazil's natural wealth, growing population and central position are its main attractions for investors. With a population which should reach 100 million in twenty years' time, it is an expanding market far from likely trouble spots, and surrounded by other growing markets. Moreover, a steady process of industrialisation combined with a restrictive exchange policy have made it a shrinking market for imported manufactured goods, and former exporters who want to retain Brazilian custom have found that to do so they must start manufacturing locally. By doing this, they are not only able to retain the Brazilian market but are in a position to supply Brazil's neighbours.

In the new wave of investment there have been only a few drops of British money. Although for British interests, there are understandable objections and limitations to investment in Brazil, there is also a stolid scepticism and an almost defiant ignorance in the United Kingdom about Brazil, which Brazilians put down simply to disinterest bred by inability to compete. Brazilian buyers and manufacturing interests often do not now think of Britain as a possible supplier or partner; visitors from London are sometimes brought up with a jerk when Brazilians, showing them round shining new German-equipped factories, assume sympathetically that as Britain "has fallen so far behind competition," their visit is a sightseeing, not a business one. As Brazil's policy is to favour first-comers many British manufacturers have probably by now lost their chance. In the meantime, well known German, Swiss, Italian, French, Swedish, American and Japanese undertakings set up local subsidiaries to produce everything from steel to paper, jeeps to bicycles, chemicals to fountain pens.

While British exporters of manufactured goods may have to write off this market in the not so distant future, British suppliers of capital equipment are being squeezed out mainly through lack of financing. It seems that some directors of the World Bank share Britain's apparent scepticism about Brazil, for the Bank continues to hold back from financing development schemes. This policy is depriving Europe, and particularly Britain, of the chance of competing for orders, which since the Export-Import Bank is far bolder, go unchallenged to American suppliers; last year orders amounting to almost £100 million went to American firms, their prices unquestioned.

Fly Away, Thunder Bird

FOR THOUSANDS of years before Columbus sailed, Redskins roamed the prairies and forests of North America. Although as hunters and trackers they knew the ways of nature, they remained ignorant of the causes of most natural phenomena, and so were a prey to many fears. Above all they dreaded thunder—the awesome clamour of the Thunder Bird's beating wings. To protect themselves from this deity when lightning flashed from its eyes, they offered gifts to it in effigy.

Today, in industry, much thought is given to protection in all its forms. But effigies are not in demand. Modern manufacturers, well versed in cause and effect, take logical steps to see their goods are properly protected — effectively guarded by reliable packaging materials. The majority pick stout "Fiberite" cases, and crisp, attractive cartons made from "Thames Board". They know this tried and trusty protection is backed by the skill and reputation of Thames Board Mills Limited, the largest manufacturers of packaging materials in this country.

THE BUSINESS WORLD

The Big Screen Shrinks

LAST year, by a coincidence, the British public seems to have spent roughly as much on buying new television sets—some £105-£110 million—as it did on going to the cinema : and the Exchequer may have taken about £30-£35 million of this in each case. These two ways of buying visual entertainment, on capital and on current account, are not directly comparable. Most people buy their television sets on instalments, and prudent ones may insure against repairs and tube replacements, or even provide for replacing the set itself eventually : and if he rents the set, a viewer pays for his television on current account, at the price of about four cinema seats a week. But however they are paid, all these are fixed charges. Once the set is in the drawing room, the programmes cost no more than a few units of electricity (and so many hours off the tube's expendable working life). Any particular programme appears virtually free, and the more time one spends looking in the better value one gets for one's capital investment in the set. The cinema business, by contrast, simply sells visual entertainment to customers who come out to get it and pay for it at the time.

Nevertheless, the two compete indirectly for the public's disposable income, which has been increasing in recent years, and quite directly for its disposable time, which has not. Television's share of that income and that time is continuing to increase. The cinema's share of both is continuing to fall. That is the real problem of the British film industry ; all others are secondary.

Among the less apparent accomplishments with which Mr Peter Thorneycroft arrived at the Treasury last month was an unusual knowledge of the problems of the British film industry : he found there a unique opportunity to finish what he had begun to do about them. As President of the Board of Trade, Mr Thorneycroft had been responsible for initiating a bill, now before Parliament, which might be said to refurbish about two-thirds of a Government policy towards this industry. Last month he inherited the power to complete the other, most important third of that policy : a comprehensive review of entertainments duty.

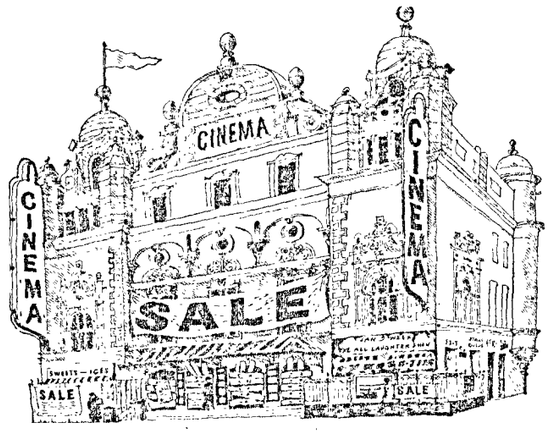
The Cinematograph Films Bill, which was introduced in the House of Lords and has completed its committee stage there, is designed to polish and bring up to date most of the threefold policy of protection for film production in Britain that dates back to 1927 :

> The oldest armour in this policy is the quota system under which a prescribed percentage of the films that British cinemas show have to be made in Britain.
>
> The second support for British films is the National Film Finance Corporation, which for the last eight years has been putting up the risk capital for British film production. It has lent more than £12 million since 1948, and has had to write off nearly £5 million.
>
> The third form of support given to British producers is the "Eady levy" introduced in 1950. This is a levy on box office takings that is distributed direct to the makers of films in Britain without paying the normal margins for distribution, exhibition or duty. The levy is nominally a voluntary contribution by exhibitors ; but it was introduced under government pressure, with a remission of duty to enable exhibitors to pay it.

Today, the Government is concerned to strengthen, not to alter, this established policy. The bill proposes to extend the quota system for ten years, though the Board is now promising to discuss the weaknesses of the system with the trade after this bill becomes law and to clear them up in amending legislation later. The lending powers of the National Film Finance Corporation are due to end at the beginning of March this year, and the bill proposes to extend those powers for ten years. The corporation's responsibilities, however, will be subtly altered : it is now told for the first time to conduct its business so as to avoid defaulting on any of the loans it may obtain from the Board of Trade or other financial institutions. Its job is no longer, that is to say, simply a rescue operation.

Rather more of the burden of protecting British film production is shifted in this bill on to the levy from the

box office receipts. This is now to be made a statutory levy on exhibitor's turnover, instead of a voluntary one. The change seems mainly designed to rob the trade of bargaining power when it comes each year to argue about entertainments duty: the Government is anxious to fortify the fiction that the levy and the duty have nothing to do with each other.



However, during the years while the Government has been fiddling with the shares of the box office pie that ordinary commercial bargaining would give the people concerned—after first taking its own huge slice—the size of that pie has been steadily shrinking. For during those years cinema audiences have been steadily diminishing. Attendances in 1949-1950 totalled about 1,400 million a year; nearly four million people were going to the cinema every day. At that time there were only about 240,000 television sets in British homes. Last year, cinema attendances seem likely to have totalled about eleven hundred million, or three million people a day; the number of sets has reached about 6½ million. For every television set bought, the cinema trade has lost about one admission a week.

By charging those people who still come to the cinema more for their seats the trade has managed to keep its total takings fairly level over the last seven years, at about £105-110 million a year. Entertainments duty is now taking about £33 million a year and the levy about £2½ million; so "net takings" are about the same—roughly £68 million a year. The exhibitors keep some £44 million a year out of this; the distributors take about £9 million; and about £15 million a year reaches the film producers. But because 70 per cent of the films shown in Britain come from abroad, only about £3¾ million a year of this goes to British film producers. The levy at present increases their income from British showings by about £2½ million a year, or 65 per cent; and British films also earn about £1½ million a year from overseas.

None of these participants in box office takings believes that he is getting nearly enough. The exhibitors say that in 1956 Britain's 4,400 cinemas had an operating profit of barely £2½ million a year from showing films. These cinemas admittedly earn much more profit—about £7½ million a year—from showing advertisements and selling ice-cream; but their total surplus of £10 million is reckoned before providing for any depreciation or any profit. At book value, the cinemas in Britain represent an investment of about £100 million; on a replacement basis, excluding site values, their current value has been rather conservatively put at £250 million. The industry argues that proper depreciation would require £7-7½ million a year, and that the cinema owners as a group ought to be able to expect a profit of at least fifteen per cent on book value, or £15 million a year.

Film producers, in their turn, publish some estimates of their own costs and revenue. Even taking the present rate of levy into account, they calculate, the revenue producers obtain from home and overseas has recently fallen about £750,000 a year short of their total expenditure. They claim that film production employs about £11-12 million of capital. Film production is an extremely risky business, and they argue that an investor in it would need at least 25 per cent on his capital; that would require another £2½ million a year for profit—which would mean an annual levy of about £5 million. The distributors are content to point out that their revenue has now declined, while their operating expenses have continued to increase.

These accounts of insolvency have been deployed to persuade the Chancellor that the industry needs, not only a levy of £5 million a year for producers alone, but also a reduction in entertainments duty of some £21 million a year—in order to keep all the exhibitors, distributors, and producers in the British film business

at present happy and prosperous. It may be added that even with a cut of two-thirds in duty, the trade would not propose to pass any reduction in duty on to its patrons: many exhibitors doubt whether cuts in prices would attract patrons back. They may be right; they certainly sound defeatist, though it is fair to say that healthier profits might allow them to compete in quality, with better films. In their arguments to the Chancellor, fatalistically, they quote an independent estimate that attendance may fall by another 10 per cent by 1960; from their own experience, they think this forecast rather optimistic.

Over the years British politicians of all shades have become committed to keeping British film producers in business. That in itself is no reason why the Chancellor should today feel committed to keeping the whole trade in a style to which on its own evidence it has recently become thoroughly unaccustomed. Many of the people concerned in film production have recently benefited from an immense hardening of the market for what is somewhat euphemistically called "talent," with the advent of commercial television; and producers' own opportunities have widened. As to exhibition, it seems very doubtful whether in 1960 Britain will exert enough commercial demand to keep open all the cinemas in business today: the industry certainly has a peak load problem, but it also has considerably more cinema seat

per head than in most other countries. The closing of cinemas that has begun—the number operating fell by about 200 last year—is part of an inevitable process of rationalisation and adjustment to a smaller share of the public's leisure hours.

Nevertheless, the trade can fairly argue that the public is still prepared to pay for cinema entertainment about £33 million a year more than it now receives for providing that entertainment. And it does seem hard that a losing competitor in entertainment should be hampered by a tax burden that is not necessarily larger than that of its winning rival, but which hampers its power to compete considerably more. It has always been said that a straight reduction in entertainments duty would benefit American producers far more than British. This is true; but this year the Motion Picture Association of America has undertaken that any increase in revenue its members might receive from a change in duty would be employed in Britain, not remitted in dollars. This in its turn would promote the production of yet more "British-American" films over here, which enjoy advantages in the United States for which other British films have to struggle bitterly. This should not be allowed to blur the strong case for a substantial reduction in this duty, if this Chancellor can afford reductions this year.

EROSION OF THE TAX BASE—II

Finding the Fiscal Mean

AN article last week examined, from the distance of a broad perspective, some of the reasons why rates of income tax are so high. They are high largely because the British people have piled fiscal burdens on themselves that would frighten any other country in the world. But they are high, too, because every attempt to ease the tax load on particular groups of people means a bigger load for the rest; every anomaly of tax treatment, and every element of avoidance, means a higher rate at the margin for taxpayers who cannot legally escape the net. The base of the income tax structure is income; but the conception of taxable income has been progressively eroded, and tax rates are in consequence so much the higher.

Erosion can happen from inaction as well as action. A good example is to be found in the Schedule A tax on owner occupiers. This is based on a notional income from a right of occupation which could produce a money income if the owner let his property; by his own choice he enjoys an income in kind of a value equivalent to the income forgone. Schedule A assessments are historically designed to represent rack rentals, but the last valuation was in 1935 and net assessments are now so out of line with contemporary values that they often represent a mere 1 per cent or 1½ per cent of present-day capital values. A private house, assessed at £50, can often be let for £250. The consequences are fatal to fiscal equity. Of two taxpayers each with taxable incomes of £2,000 who is the better off: the one with a salary of £1,950, together with a house assessed at £50, or the other with £2,000 wholly from salary?

In 1936-37 Schedule A assessments totalled £337 million out of a total of £3,231 million; in 1954-55 they had declined to £315 million out of a total of £13,196 million. To the extent that low Schedule A values are deductible in arriving at Schedule D assessments (when the taxpayer pays correspondingly more) their lowness is not so serious; similarly when properties are let the difference is mopped up by an excess rent assessment. But in the case of owner occupiers, erosion persists—and moreover they enjoy maintenance reliefs which set present-day repair bills against 1935 rack rents. The yield of Schedule A tax on owner occupiers is estimated at £25 million. Such a modest yield may be justified on the non-fiscal ground that owner occupiers deserve a perquisite to match the privileges enjoyed by rent-restricted tenants; this justification, for what it is worth, is about to disappear.

★

A collector's piece prized by connoisseurs of tax erosion is provided by the exemption from profits tax on dividends given to companies controlled by overseas corporations. When such relief was first given in 1947 the basic rate of profits tax (then deductible for income tax assessments) was 5½ per cent and the additional rate for distributions 8¼ per cent. The difference between the rates was small and this particular exemption could be justified because other countries granted reciprocal relief and because it encouraged overseas investment in this country. Now the basic rate is 3 per cent and the rate on distribution 27 per cent. No conscious decision has been taken to increase the advantage offered to foreign corporations from 1s. 8d. to 5s. 6d. in the £; the privilege grew unnoticed as the emphasis of profits tax was switched from total profits to distributed profits. What is the cost of the relief, and can it still be upheld by the argument of reciprocity?

At first sight the capital allowances would seem to be a classic example of erosion. The ordinary annual allowance, by definition, is "five-fourths of what is just and reasonable." The twenty per cent initial and investment allowances clearly seem to be greater than is consistent with a true balance of profit. But the apparently generous allowances given for wasting assets are generous only when they are related to historical costs. Measured against the current value of the assets used up in earning current revenue, they are more reasonable; they offer a rough-and-ready substitute for

the allowance of wear and tear on a *replacement basis*. But the allowances ought to be watched—especially the investment allowances which either give those items of expenditure on which they are still available (ships, fuel saving, appliances, and scientific research) more than they ought to have, or discriminate against all other forms of capital investment which do not at present qualify for them.

Benefits in kind provide an alarming example of the way in which the volume of income entering into tax returns can be limited. Here again innocent precedents have developed into widespread leakage. When a bank or colliery manager was required to live on the job in a house and district not of his own choice the advantage of living rent free could reasonably be regarded as outside the charge to tax. But that is a far cry from the multiplicity of service tenancies that exist today. Houses, cars, pensions, health services, meal vouchers (which are becoming almost negotiable instruments), sports clubs, welfare facilities of all kinds, national insurance contributions—the list grows longer each day. The benefits all form part of the rewards enjoyed by the employee, and all by-pass the PAYE card. The Royal Commission's comment was a masterpiece of moderation: "The provision of untaxable benefits in kind is capable of becoming an abuse of the tax system." Their suggestion that untaxable benefits may have to be dealt with by special legislation might have been given more precision and emphasis. A new Truck Act is needed.

★

Tax avoidance has been left to the last, not because it is unimportant, but to correct the common idea that it is the only cause of the erosion of the tax base. It is indeed important, but it is the result of high taxation, rather than its cause. Emotional resentment against people who, by some rearrangement of their affairs, seem to be paying less than their "fair" share is easy to arouse. But no tax system has ever achieved natural justice in the distribution of the burden between different taxpayers in different circumstances. Nor can it be asserted as a matter of moral principle that a man has a duty not to alter the disposition of his affairs in order to save tax. If the state imposes a maximum personal rate of 92½ per cent it cannot complain if some of its citizens have a propensity for leisure after working a three or four day week.

The problems of definition of avoidance are formidable. The happy couple who choose to be married on the 5th, rather than on the 6th, of April are clearly guilty of avoidance. What of the self-employed man who at last has the opportunity of avoiding tax by paying a retirement benefits premium? No one would criticise a householder who makes a maintenance claim to save Schedule A, but what about the owner of two companies, one successful and the other unsuccessful, who marries them so that subvention relief may save Schedule D? Opinion, moreover, changes with the passage of time. Thirty years ago many thought it near the knuckle to make charitable subscriptions under covenant; now it is thought uncharitable not to do so.

Indiscriminate criticism of tax avoidance leads to some strange contradictions. Should a wealthy taxpayer refuse to buy the maximum holding of National Savings or Tax Reserve certificates because, by reason of their tax privileges, they offer the equivalent of gross yields of 56 per cent and 40 per cent, respectively? Is an industrialist to retain inefficient boiler plant because the installation of fuel saving equipment would bring him a 20 per cent subsidy on his capital expenditure? Should a farmer refuse to modernise his labourers' cottages on the ground that the agricultural capital allowance is extravagant? To crown it all, should a board of directors keep dividends down to avoid paying profits tax at the higher rate?

Fulmination about tax avoidance is not enough; Criticism of citizens who do what the law permits has no value. If Parliament considers that a course of action is wrong, it can legislate against it; indeed it does so increasingly. Tax avoidance must bear its full share of the responsibility for the erosion of the tax base, but any attempt to stop it by direct action is doomed to failure. At best it will merely plug holes. The root causes of avoidance are the high marginal rates of tax that inevitably result when attempts are made to produce a quart of tax out of a pint pot of income and to drive egalitarianism to excess.

★

These articles have been concerned with diagnosis, not prescription. But it is not difficult to end on a constructive note. If erosion is to be stopped, even at this late stage, it is essential that there should be a general awareness of what is happening. Public sympathy has always been on the side of the taxpayer and no Chancellor ever lost popularity by giving concessions. The trouble is that a particular relief usually helps a few people a lot and hurts the rest only a little. If an industry can be saved at the cost of an additional farthing on the standard rate nobody grumbles. But farthings add up and when they total 8s 6d the consequences have to be faced. With this awareness must go a recognition of the transformation that would be produced if, say, the same total revenue were collected by imposing half the present rates of tax on double the present taxable income. The advantages of avoidance and evasion would wither. Emigration of companies and individuals would be replaced by immigration. The disincentives of high marginal rates of tax would disappear. Corporate and personal business extravagance would quickly come under the control of self-interest. The present bias towards corporate saving would be modified and a healthier capital market would emerge.

These changes would only be gradual. Breeding geese to lay golden eggs is more difficult than killing them, though a far-sighted Chancellor would find it vastly more rewarding. He has two tools to his hand: he can direct his budget surpluses primarily to the relief of direct taxation and he can swing the balance of taxation towards indirect taxes. In the course of time, he would find himself able to resist further erosion and then to recover fiscal ground that is now lost. Such suggestions are not inimical to those who strive for a more equal society; but they recognise the fact that levelling through too progressive a fiscal system leads to levelling down instead of up. Thanks to Mr Kaldor there is a growing understanding by the left that overcropping is a major cause of erosion, but his solution of a nomadic migration to the new lands of the expenditure tax is too radical. It would be better by careful husbandry to put the taxable capacity of the country into good heart.

Business Notes

£300 Million Government Issue

THE Government's refunding operation—at least the first instalment of it—has come much sooner than the market expected and in a form that the market did not foresee. The issue was announced on Monday and lists opened and closed on Thursday for a further £300 million of the "Eternity three and a halves"—the Funding 3½ per cent stock 1999-2004. The issue price of £80 (with a first interest payment of £1 18s. 10d. on July 14th) was closely aligned to the market price of the existing £143 million of this stock, and contrasted sharply with the price of 103 at which that earlier issue was made in July 1954. The Treasury and the Bank of England by their action laid themselves open to two lines of criticism—first that they had produced a new issue too hot on the heels of a Bank rate reduction for strict propriety, and secondly that they had produced a stock that is likely to be too long in date to fit the tastes of those who could buy it.

Redemption Yields on Long Dated Stocks

	Funding 3½% 1999-2004	Gas 3% 1990-95	Transport 3% 1978-88	Treas. 3½% 1979-81	Conv. 4½% 1962

Net at 7s. 6d.	3 0 0	3 3 5	3 6 8	3 8 9	3 0 2

All yields to latest date.

There are indeed some oddities in the operation but in this crude form criticism is not well founded. The authorities did not profit by their own previous change of Bank rate to issue a stock at a higher price. The price of the stock in the market was just the same on the day before the Bank rate change as when the issue was announced, and the issue price of £80 is exactly equivalent allowing for accrued interest to the market price of £79⅞ of the old stock. It happens also that the gross redemption yield of 4½ per cent is the lowest gross redemption yield that can at the moment be found in the market except among the shortest dated stocks. The action of the Bank of England in sending the Government broker to the market last Thursday to offer substantial quantities of long-dated stocks at unchanged prices, the Chancellor's "no green light" speech last week and the Governor's speech this week can now all be construed as indicating that the Bank rate change is not intended to reduce long-term interest rates and will not be allowed to do so. But to hold the market steady the Government broker has to be supplied with long-dated stock that he can sell. His brave offers last week may not have been a bluff, but the policy could not have been continued for long without a replenishment of the holdings that the Government broker has to offer.

"Failure" According to Plan

THE Government issue was clearly designed to be in the common phrase a "failure." With an industrial issue that is underwritten the terms "success" and "failure" serve well enough. The public subscribes and it is a success or the underwriters have to have some of it and it is dubbed a failure. With Government issues which run to hundreds of millions and which are not underwritten, in the market the terms cease to have meaning. There are no hundreds of millions that investors can mobilise on a single day without selling other stocks. The object of the issue was to provide some stock that can be sold gradually on the market in the weeks and months to come. The cryptic words of Thursday's announcement that "applicants for over £1 million received full allotment and larger applicants about 91 per cent of their applications" imply

that most of the issue must have gone into official portfolios as intended. The operation takes care of £240 million not of funding in the strict sense but of replacing the issues maturing this year. The total amount of those maturities should not be forgotten. The compulsory maturities—the 2¾ per cent Funding stock 1952-7, the 5 per cent Exchequer stock 1957, and the 2¼ per cent Funding Stock 1957—amount to £904 million. If it were decided to deal also with the optional maturity of the 4 per cent conversion loan 1957-8 this year, the total would be £1,580 million. That may provide the answer to those who ask: Why bring a long-dated stock now, when the main demand from investors is for short dates? The shorts, and perhaps the mediums, will have their turn, and in the meantime their urgency is less because official holdings can still sell Conversion 4½ per cent 1962 and Treasury 3½ per cent 1979-81.

A question much less easy to answer is why a stock was chosen for this operation (and therefore for substantial future selling in the market) that has never been popular with the market though it enjoys a limited demand from the pension funds. The choice of the longest stock apart from the irredeemables, certainly did take the market by surprise. It was not even realised that the Government had nothing left to sell out of the first £143 million of the same stock issued 2½ years ago. But it is now clear that that first tranche did move into safe hands quite quickly.

Mr Governor on Bank Rate

MEANWHILE, some additional light has been shed upon Bank rate policy by the Governor of the Bank himself. In an address prepared for the annual dinner of the Coventry Chamber of Commerce (but actually delivered by the deputy-governor) Mr Cobbold took the unusual step of explaining some of the technical considerations behind the Bank rate decision. In recent years, he recalled, "the foreign exchange position has been on a see-saw, swinging sometimes just above and sometimes just below the danger-line." There are signs that "we may now be due for one of the swings in the right direction"; but after the experiences of these years, and in view of the fact that sterling's recent recovery has been largely due to the external credit, "this time . . . the country as a whole must really give a heave—so that we pull ourselves well clear of the danger line and give ourselves that margin for future swings which recently we have not had."

Therefore the change in the Bank rate, which the Governor regards as an adjustment to market conditions, required "a cautious approach." There was "much to be said . . . for first allowing market rates to move to a new level and settle down, and thereafter adjusting Bank rate to take account of the new structure." This is what the Bank feels that it has done; and the Governor even went so far as to make the point by likening his recent policy to that now followed by the Bank of Canada, which adjusts its rediscount rate every week into precise relationship to the Treasury bill allotment rate. Fortunately, the Governor is evidently not intending to push this principle of "following the market" to this ultimate limit: "there are many occasions when we here should wish to use Bank rate more positively, to mark a change of policy or a reinforcement of policy. But the present is not one of those occasions." The reduction has therefore to be regarded as an adjustment of technique "with no implication of a change of policy."

This harmonises with the Chancellor's statement that no "green light" was intended; but on the nature of the new technique to keep money restraint effective, and thus to avoid the green light signal, the Governor was less candid. He merely said that there had been no decision to abandon the use of interest rates in favour of other ingredients of monetary control. "We have every intention of continuing to use the influence of interest rates, together with the other ingredients, in such mixtures as seem suited to the needs of the moment." Among the non-monetary ingredients, the Governor would like to see a greater admixture of restraint in government and other public expenditures. It is one of the prime duties of the central bank, he said, "to sound warning bells when government and near-government spending is putting too heavy a burden on the country's resources." This is a bell that Mr Cobbold's speeches have been ringing for some time past.

More Flexible Money Rates?

IN the money market, the technical readjustments to the 5 per cent Bank rate have been unusually protracted and uncertain. On the morrow of the reduction the discount houses raised their basic price for tendering for the weekly offer of Treasury bills by 1s. 7d. to £98 18s. 10d. per cent, and mainly for this reason the average rate of discount on the whole allotment dropped by nearly $\frac{5}{16}$ per cent to slightly less than 4¼ per cent. Since the bill rate had previously fallen to almost 1 per cent below the 5½ per cent Bank rate, this was a rather larger reduction than had been generally expected. The first tender after a Bank rate change is not, however, usually a dependable guide to the future, so that suggestions that the bill rate may now begin to discount yet another fall in Bank rate may be premature. A further fall in the bill rate now would reinforce that impression, which seems to be contrary to the wishes of the authorities. It is possible, therefore, that to avoid this risk the market sought to leave room in its initial tender for an upward rather than a downward readjustment of rates.

A major source of this uncertainty has been the attitude of the clearing banks. They did not, immediately upon the reduction in Bank rate, make a clean and clear corresponding reduction in the minimum rates fixed under their arrangements for making short loans to the money market. Since early 1955, when the banks ceased to lend to the market at virtually inflexible rates (scaled in three tiers according to the security) the principle of operation has been that approximately two-thirds of the money should be lent at the basic rate (1¼ per cent below Bank rate) and that the remainder should carry fluctuating rates dependent upon conditions in the market. This system could not in practice be operated with precision, and deviations from the broad "target" distribution have tended to become more marked. Even so, the effect has been to enable other lenders, who have no large proportion of their money lent at a minimum (and in practice unvarying) rate, to secure a higher average return for their lendings than could be secured by the clearing banks. Accordingly, after last week's Bank rate change, several clearing banks suggested more flexible arrangements—and one suggestion was that the principle of lending a part of the money at a stable rate should be abandoned altogether.

These possibilities, which were not favoured by all the banks, have been under discussion with the market throughout most of the past week. The upshot seems to be that in future there will be no attempt to reach any agreed principle between the banks as a group on the one hand and the market on the other. The two-to-one principle has now, it appears, been abandoned, and no alternative common formula has been put in its place. But since the ratio could never be closely observed in practice, the change in this respect is not of much consequence. The likely practical result seems to be that the individual banks will mostly manage their money in much the same way as they have lately done. The discount market has also recently made a modest and unobtrusive move towards flexibility in its arrangements for concerting its Treasury bill tenders. Since the early days of the war these arrangements have rested on the principle that the market's total application should "cover" the total amount offered. The corollary of this principle is the concerted tender rate, but it has recently been recognised that a modest flexibility in rates is not only feasible but is desirable to meet the sometimes sharply divergent interests of the several houses. Now, therefore, any house is at liberty to submit a moderate proportion of its tenders at a price slightly above (i.e. a lower interest rate) the basic agreed price.

Man in the Middle of Coal

IF Mr James Crawford, who was appointed "labour relations member" of the National Coal Board last week, was chosen as a compromise between somebody outside the trade unions, and a nominee of the National Union of Mineworkers the compromise has not turned away the union's wrath. It once appeared, indeed, that Mr Aubrey Jones, the former Minister of Fuel and Power, was on the point of blandishing the NUM into accepting a man completely outside the unions. But what they might have accepted from the softly-spoken Mr Jones, the NUM leaders were not prepared to accept from Lord Mills, reputedly a strong man with no excessive love for trade unions. Lord Mills, in his turn, may not have been anxious to begin office with a trial of strength, but his appointment of a trade unionist from outside coal has not mollified the NUM, which this week issued a protest about "a person without any mining experience."

This pretty exercise in the art of the possible has not been without amusement, watched from the outside: moreover, Mr Crawford, a most distinguished trade unionist, is no doubt an excellent negotiator. But a lifetime of seeking to raise wages relative to output is not necessarily the ideal training for seeking, in a different hat, to raise output relative to wages. And it is ridiculous that the National Union of Mineworkers should claim the right to insist upon one of their own men in this key job. Mining is an industry unlike any other, and its dependence upon sheer physical human effort is so great that labour relations offer perhaps the richest potential field for improving the whole industry's performance. Moreover, morale can be of decisive importance to the industry, and it is not entirely sentimental to say that the Board needs to seek the trust of its miners. But the proof of that trust today is the presence and position of Mr James Bowman.

Electricity to Rule

ON the promise of the Minister of Labour to inquire into its dispute with the Central Electricity Authority and the area boards, the Electrical Power Engineers' Association on Thursday evening withdrew its threat to work to rule—a threat that might have meant power cuts within the next few weeks. Tactically the association had picked the right month. Although this winter has been a mild one so far, February is often the heaviest month for electricity demand. At some stations the margin of spare capacity is now uncomfortably small; a dispute of this kind could have been very serious, since most of the 16,000 technical engineering staff employed by the authority and boards, ranging from foremen to station superintendents, are members of the Electrical Power Engineers' Association. Working to rule could have meant taking a plant out of service for maintenance immediately it failed to keep to the high testing standards instead of waiting for the following weekend or other period of light load.

The dispute has arisen out of a claim the association put in in November, 1955, for a restoration of 1948 salary differentials and for the up-grading of a number of its members' posts. The engineers had to choose their methods of bringing pressure to bear with some care, since by law employees of the electricity supply industry are in danger of committing a criminal offence if they break their contracts knowing that it could lead to a breakdown in supplies.

Wall Street and London

IT is common ground among investors that the London market could not remain isolated if there were a big setback on the New York market. But this week has shown that the repercussions on London of a limited decline on Wall Street need not be serious—unless investors were in the mood to heed it as the beginning of a big break. The break on Wall Street has not so far looked frightening to operators in the London market. There has been little of that marked expansion in turnover as prices fell that is normally associated with the early stages of a Wall Street break. Nor are there real grounds for thinking that the American monetary authorities, with their record of skilful management, would be sluggish in keeping a market or a business adjustment healthy and within bounds.

Nevertheless, the fall on Wall Street has been marked. Since the beginning of February the Dow Jones Industrial average has come down from 479.16 to 462.14. A low point was touched on Tuesday of this week at 454.82. The rail

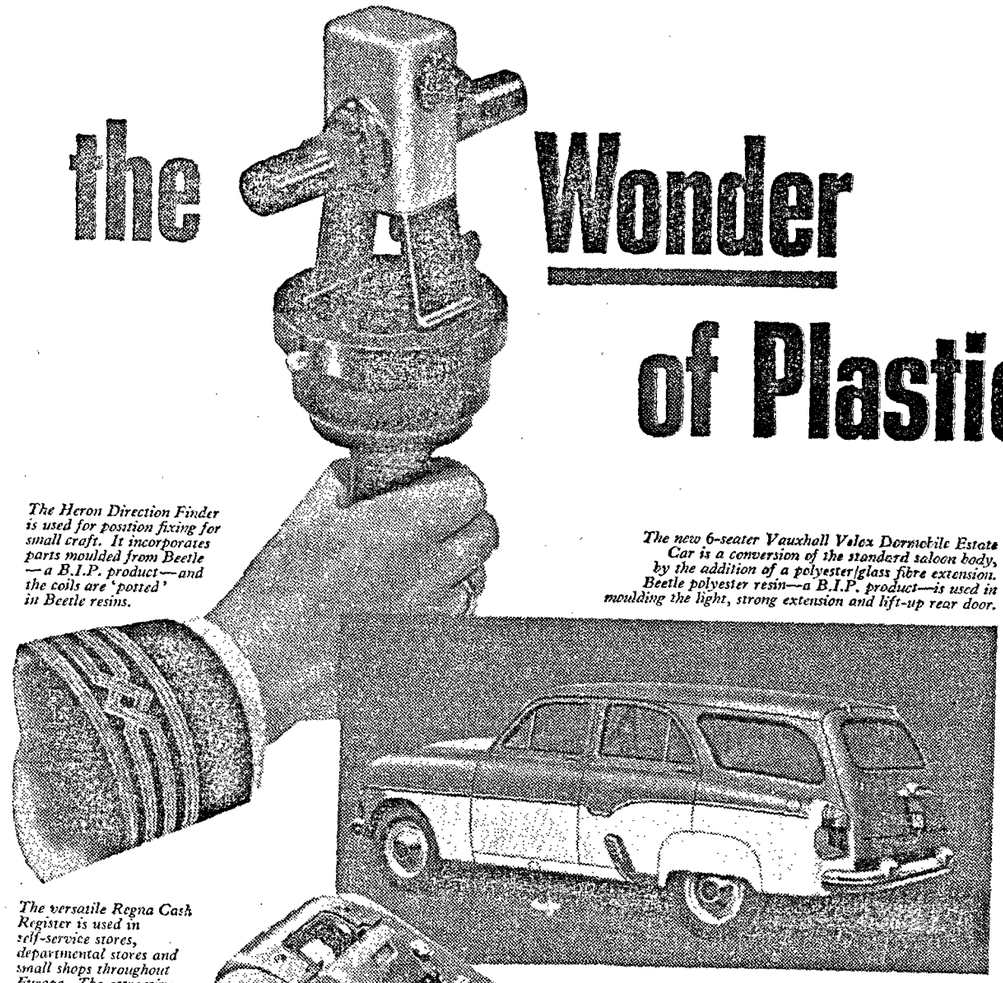
average, 148.79 at the end of January, touched a low point of 139.23 on the same day. The downward adjustment had been long and widely anticipated; its repercussions were small. There was some weakness at the end of the Stock Exchange account on Tuesday, but on balance *The Economist* indicator shows a modest net gain in the week ended on Wednesday at 195.9 against 194.0. The market is cushioned against (but not isolated from) a minor American recession partly because it expected it and by two additional facts: distributions by British industrial companies have generally been conservative, so that a decline in profits does not as frequently mean a reduction in dividend as it would in the United States; moreover, with few exceptions Americans who have bought in the London market seem unlikely to attempt to resell. Such weak holders as there were probably sold in November, and in this month (which is not the season for tax selling) there have been few such sales.

In London, gilt-edged securities as well as industrials have declined. At 88.84 the *Financial Times* index of Government securities shows a fall of 0.37 since the Bank rate decision. That decline springs not from Wall Street but from the fact that a firm line on long-dated interest rates was shown just when Bank rate was reduced. It has not had a material market effect. The Northern Ireland Electricity issue of £3 million 5 per cent stock (1975-77) at 98½, with a 5 per cent coupon obviously tailored to the lower Bank rate to offer a redemption yield of £5 2s. 4d. per cent, was nevertheless just comfortably oversubscribed, applicants for over £12,000 receiving 70 per cent of their requirements. The stock opened at par, but a discount of ⅛ was soon established.

Petrol Rationing for How Long?

LAST week's guarded optimism of the OEEC oil committee, when it reassessed earlier and more gloomy forecasts of Europe's oil shortage, should be taken as an assurance that the present restrictions on consumption will not have to be intensified, rather than a sign that their complete removal is imminent. Total oil supplies for the first quarter are now expected to amount to 80 per cent of Europe's normal requirements—5 per cent more than had been forecast earlier. These supplies will comprise about 87 per cent of its normal requirements of petrol, 75 per cent of its gas and diesel oil needs, and nearly 80 per cent of normal fuel oil supplies. Part of the apparently striking improvement in fuel oil supplies—earlier estimates put fuel oil arrivals at less than 65 per cent of normal—seems to have come from an earlier statistical muddle. Helped by the long spell of mild weather, Europe still has, on the average, over three weeks' supply of fuel oil in stock. But the rate of withdrawal has been rapid, and as even the restricted consumption of gas, diesel and fuel oils is still greater than the improved rate of arrivals, these stocks are still declining. Priority is therefore still being given to imports of black oils, in an attempt to rebuild stocks to a safe level before next winter.

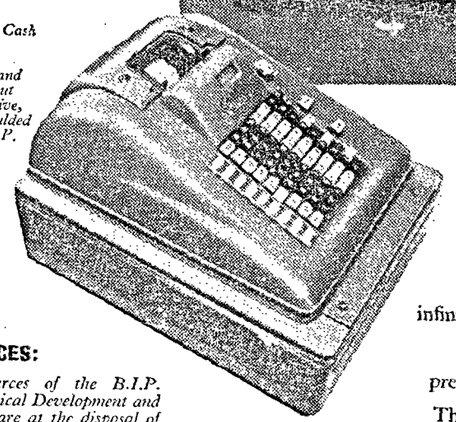
Relatively easy supplies of petrol have already encouraged some countries on the Continent to loosen or abandon rationing. Britain, itself, is probably now receiving over 90 per cent of its normal supplies of petrol. And as motorists have been hoarding coupons, petrol consumption in Britain has been running well below 75 per cent of normal. So stocks have actually been rising and they are now as high as usual for the time of year. It is tempting to draw from this the conclusion that Britain, too, could abandon petrol rationing when the present period ends on April 17th.



But in normal circumstances Europe's consumption of petrol begins to rise sharply in March, and in the second quarter it is about a third higher than in the first. In Britain the seasonal rise is slightly less, but when Easter is in the second quarter a 25 per cent rise can be expected—and motorists now hoarding coupons will cash them later. Before rationing could be safely abandoned, the present rate of petrol arrivals would therefore have to be increased by at least a third in the second quarter. There is little in the latest news from Egypt or Syria to give this assurance, and the cut back in refinery throughput in the United States offers Europe a net addition of only about 3 per cent in crude oil supplies after tankers have been diverted from the Cape run to fetch it. Statistically, therefore, there is no case for ending petrol rationing yet; and it would be politically impossible to reimpose restrictions once they had been taken off. Higher supplementary allowances, and possibly a higher basic ration, with the government still controlling consumption but under a looser rein, would seem to be a safer course.

Ill Wind for Middle East Oil

THE ill wind cutting across the Suez Canal and across the oil pipelines to the Mediterranean has blown good to Iran, where the consortium of oil companies has exceeded its targets for the production of both crude oil and refined products in the contract year that ended on January 29, 1957. Under its agreement with the Iranian Government the consortium had guaranteed to produce 27.5 million cubic metres (rather less than 27 million tons) of Iranian crude in 1956-7. Overfulfilment of this guarantee by some three million tons, which has helped Iran to recover some of the ground it lost in 1951 to 1953, has been facilitated by the ban on the shipment of Arabian crude to the refinery at Bahrain. The relatively small output of Bahrain crude has not been affected, but has been supplemented by importing crude from Iran across the Persian Gulf, instead of from Saudi Arabia. Arabia, although still delivering its crude through Tapline to the Mediterranean at a rate of about 16 million tons a year, has suffered both from the ban on shipments to the Bahrain refinery and from the general embargo on all shipments of Arabian oil to Britain or France. As a result output there has been cut back by about 40 per cent, storing up further problems for the time when the royalty payments next come to be examined.



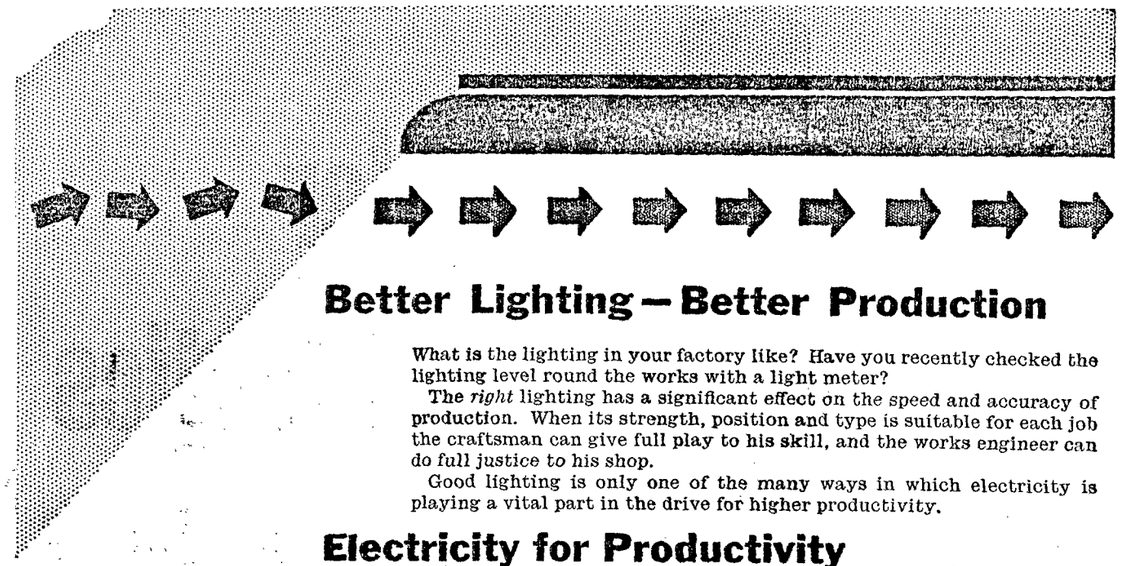
Production in Kuwait, which averaged 4.8 million tons a month during the first nine months of 1956, fell sharply to 2.3 million tons in November when few tankers were available to lift it in the Persian Gulf. By December it had risen again to 3.4 million tons, and has improved further in January, although Kuwait must still be losing a quarter of its normal revenue. Output in Qatar has been recovering after an earlier shortage of tankers. Worst hit of all, owing

the Wonder of Plastics

The Heron Direction Finder is used for position fixing for small craft. It incorporates parts moulded from Beetle—a B.I.P. product—and the coils are 'potted' in Beetle resins.

The new 6-seater Vauxhall Velox Dormobile Estate Car is a conversion of the standard saloon body, by the addition of a polyester/glass fibre extension. Beetle polyester resin—a B.I.P. product—is used in moulding the light, strong extension and lift-up rear door.

The versatile Regna Cash Register is used in self-service stores, departmental stores and small shops throughout Europe. The attractive, strong housing is moulded from Beetle—a B.I.P. product—by Norsk Teknisk Porselens A/S, Norway.



B.I.P. SERVICES:

The full resources of the B.I.P. Research, Technical Development and Design services are at the disposal of manufacturers interested in the possibilities of plastics. Advice will gladly be given on any problem concerning plastics applications, irrespective of the type of material involved.

In ships and shops, in cars and catering, plastics to-day play their part. Their role may be contributory, it may be fundamental, but the wonder of plastics is in their versatility, their infinite possibilities. Types and grades are innumerable, each with its own properties—and limitations—presenting a wide field of choice to the intending user. The leading plastics materials manufacturers maintain extensive consultative and development services and none is better qualified to advise and assist than B.I.P.

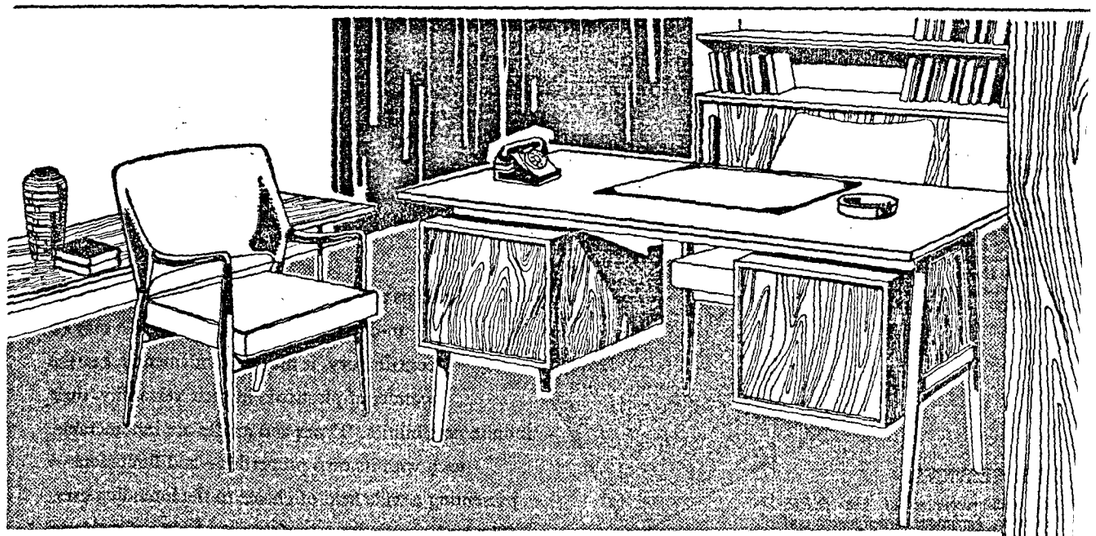
Better Lighting—Better Production

What is the lighting in your factory like? Have you recently checked the lighting level round the works with a light meter?



The *right* lighting has a significant effect on the speed and accuracy of production. When its strength, position and type is suitable for each job the craftsman can give full play to his skill, and the works engineer can do full justice to his shop.

Good lighting is only one of the many ways in which electricity is playing a vital part in the drive for higher productivity.

Electricity for Productivity

Ask your ELECTRICITY BOARD for advice and information, or get in touch with E.D.A. They can lend you, without charge, films about the uses of electricity in industry. E.D.A. are also publishing a series of books on Electricity and Productivity. Titles now available are: Electric Motors and Controls, Higher Production, Lighting in Industry, Materials Handling, and Resistance Heating Price 8/6, or 9/- post free.

Issued by the British Electrical Development Association, 2 Savoy Hill, London, W.C.2

Seeing yourself as others see you

Your day should begin with the confidence inspired by an office that will make an impression on your visitors. As Catesbys see it, the creation of an atmosphere is as important as a sense of efficiency. Ask your secretary to ring Museum 7777.

to the closure of the pipelines to the Mediterranean, is Iraq. Production in the Basrah field in the south has been maintained at its capacity rate of just over 8 million tons a year, as this can be piped down to tankers loading in the Persian Gulf. But the 25 million tons supplied annually from the fields in northern Iraq has now been shut in completely—except for about 1 million tons for local consumption—until the pipeline outlets are reopened. It remains to be seen whether the Iraq government will accept without question the resultant drastic reduction in its royalty income as the inevitable outcome of its neighbour's sabotage.

Valves, Tubes and Profits

It would have been interesting to know what conclusions about the public interest the Monopoly Commission would have drawn about conditions ruling in the electronic valve industry. But its investigation, published this week, into the supply of radio valves and cathode tubes was turned three-quarters of the way through into a straight fact-finding inquiry which will now, presumably, provide the Registrar of Restrictive Practices with data against which to consider the agreements between valve manufacturers that are soon to be registered with it. The facts are fairly startling. Nothing was known publicly about the numbers of valves produced until this week. The Monopolies Commission now reports that in 1954, production was running at more than 54 million valves and 1.6 million tubes a year, more than 90 per cent of which were produced by the six members of the British Valve Manufacturers' Association, and the remainder by ten relatively small concerns. Head and shoulders above the rest stands one giant, Mullard Ltd., a member of the BVA and responsible for 67 per cent of all the radio valves and 51 per cent of all the cathode tubes supplied in this country, imports included.

The fact that manufacturers sold their goods to set-makers at prices far lower than those to the general public has been well known and defended by the trade on the grounds that it kept down the price of receivers. But the Commission's report provides data for the first time on how wide the gap was. In 1954, most manufacturers were selling cathode tubes to manufacturers at a loss to themselves—nearly 20 per cent below cost—and making on average a profit of nearly 18 per cent on those sold to the public, although some manufacturers made a loss here too. Mullard, whose costs were far lower, was making a profit on both transactions, some 12 per cent on sales to manufacturers but nearly 73 per cent on sales to the public. On radio valves fewer manufacturers showed a loss on sales to set-makers.

The industry has already abandoned collective resale price maintenance, which has become illegal, and has also abandoned its common price policy. It claims, too, that the high profits recorded by the Commission have since vanished. They arise in the first place for the need for self-financing on a vast scale and for a high rate of expenditure on research. Some figures to illustrate this argument were given by Mullard. The last year for which the Commission obtained figures, 1954, was a good one for the radio industry, with Mullard's operations showing a profit of nearly 40 per cent on capital employed. Heavy capital expenditure, the firm says, has since brought this figure down to 16 per cent, while other manufacturers say that they are showing a net loss, which will not be recouped until new equipment begins to pay its way in several years' time. This is an industry in which technical efficiency is everything, and Mullard's growth is the result of economies of scale in an industry where big output leads inexorably and inevitably to bigger output. But it happens also to be one of the few industries of which the Commission found quite a number of customers ready to complain, admittedly in answer to questionnaires, about the restrictive agreements enforced by the BVA.

Lancashire Keeps Trying

The Cotton Board has published a guarded statement on the report of the delegation that recently went to India and Hongkong to try to persuade these countries to accept a limit on their exports of cotton textiles to Britain. The Indian industry, it is stated, accepted the possibility of a ceiling for three years on their own exports, "subject to satisfactory arrangements." The satisfactory arrangements, it may be presumed, would be the acceptance of a ceiling by Hongkong and Pakistan also. No agreement was reached with the Hongkong industry, but it is hoped that one may be eventually. In the meantime the delegation will offer to go to Pakistan. It seems that the proposed ceiling would be UK imports of cloth (including cloth for processing and re-export) and made-up goods in 1956. These were: India 141 million square yards, Hongkong 85 million and Pakistan 7½ million. Any unused portion of a quota, it is believed, could be carried over into the first six months of the following year.

If Hongkong should come to accept a ceiling in principle the difficulty will be to negotiate an agreement with Pakistan. That country would surely refuse to accept a quota based on its exports last year, for its young textile industry is just starting to build up an export trade. But would a more liberal quota be acceptable to the other two countries?

Bank Shareholders' Rights

An unusual problem of shareholders' rights has been raised by the decision of two banks—Martins and the National Provincial—to cancel shareholders' uncalled liability, to distribute scrip issues, and simplify their capital structures into single classes of fully paid capital. Both banks have fully paid and partly paid shares and each has given a more generous slice of the new equity to the fully paid shareholders than it seemed bound to offer. Holders of Martins Bank fully paid shares are offered a free scrip issue of one in four and the holders of partly paid shares a free scrip issue of one in five. National Provincial Bank is distributing a one for fifteen free scrip issue to holders of its fully paid shares before distributing a further one for ten bonus to all classes. In each case, the result favours the fully paid against the partly paid shareholders.

What is the justification for such inequality of treatment? Dividend rights in both banks are *pari passu* to the amounts paid up on the capital. The capital rights in the remote contingency of liquidation are *pari passu* for the National Provincial shares. In Martins Bank counsel's opinion is that the partly paid would in liquidation, after repayment of the amounts paid up on both classes, rank as though each £20 share (£2 10s. paid) were 20 £1 shares, which seems to lean in favour of the partly paid. And Martins Bank's circular concedes that the terms for the fully paid shareholders are better than they could have expected if the free scrip issue had been made in accordance with legal dividend rights. The two boards have evidently been using market prices as their yardsticks. There has been a persistently better price (and lower yield) on the fully paid shares. In Martins Bank the long effect has been that the partly paid shares have stood 6.6 per cent below the fully paid and the extra distribution to the fully paid shareholders is less than that differential implies.

The market assessment of those shares reflects the fact that dealings in partly paid shares are automatically limited. The banks are obliged to scrutinise transferees and some investors, for example trustees, are not in a position to assume liability for a call however remote it may be. The uncalled capital is not all callable at will. Martins Bank, with £17 10s. per share callable, can call only £5 10s. at the directors' discretion and £12 a share in liquidation. The National Provincial can call at will 19s. 4d. on the "A" shares and 13s. 4d. on the "B" shares, leaving £3 6s. 8d. on each class callable only in liquidation. Those liabilities —both the callable and the "reserve"—are the theoretical extra security to depositors which common sense says is no longer needed. They can also be said to afford extra protection for the fully paid shareholders to the extent only of the callable part of the liability. Cancellation could therefore be regarded as a sacrifice by the fully paid shareholders. But does it merit the compensation that is offered?

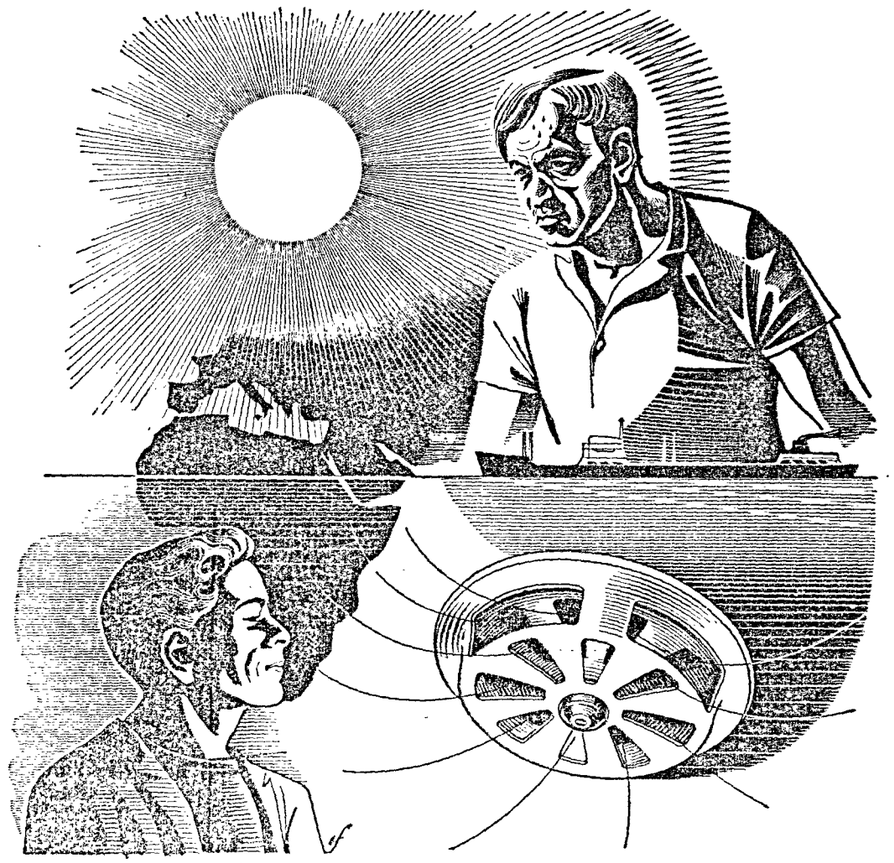
At Par with the Mark

THE main event on the foreign exchange market this week has been the rise of sterling to parity with the Deutsche-Mark. By Tuesday sterling had risen to 11.75¾-76 and had thus reached parity for the first time since December, 1955. Sterling has also been strong in terms of other continental currencies. In relation to the French franc the rate is now touching the figure of 987.35 at which the French authorities will be called upon to intervene in support of the currency. For a considerable time the French franc has been at or near its support point in relation to the D-Mark and it is largely as a result of the consequent supporting operations in Paris that the French authorities have been sustaining the losses of foreign exchange reserve that are shown with monotonous weekly regularity in the returns of the Bank of France. The gold and dollar reserve of the bank itself has so far not been touched and remains at the sacrosanct figure of $570 million. But the gold and dollars in the Fond de Stabilisation are ebbing away.

is the more impressive for the fact that it has persisted in spite of the disappointing trade figures for January. The foreign exchange market reports that the business passing is comparatively small and that most traders who require sterling are still living from hand to mouth. There has so far been little evidence of covering of short accounts in sterling, most of which are against US dollars. Some of these accounts opened during the past year cover periods of up to three years, many of them being on behalf of American firms with British subsidiaries. It is a remarkable testimony to the flexibility of the forward market that it has been able to accommodate such abnormal forward sales. These open accounts are being allowed to run on, but there is little evidence of new ones being opened except with genuine commercial justification. The forward market is therefore now in equilibrium. The premium of ⅞ cent on three months' forward dollars represents 1¼ per cent per annum and is almost exactly equal to the margin between the US Treasury bill rate of 3.05 per cent and the sterling Treasury bill rate of 4¼ per cent. In the spot market the demand for sterling on commercial account has this week gathered sufficient momentum to offset the persistent additional demand for dollars in respect of oil imports and the dollar rate, which closed at 2.79^{13}_{16}$ on Bank rate day (and not at $2.78$$^{13}_{16}$ as erroneously stated here last week) has since recovered to $2.79⅞.

Building Societies on Looser Rein

ONE half of one per cent off Bank rate will not bring any early change in the rates at which building societies borrow and lend, but a further reduction to 4¼ per cent, should it occur, could make the societies reconsider the rates paid to shareholders and charged to mortgage borrowers. One reason why the societies will not change their interest rates now is that the composite rate of tax has been raised from 4s. 10d. to 5s. 4d. in the £ for the current year.



The bigger societies have entered this year in an easier frame of mind just because they have found an equilibrium in interest charged and paid which promotes the flow of savings without stifling the demand for mortgages. Last year when withdrawals were mounting and the inflow of new savings was dwindling, they had to ration mortgage lending, laying down inelastic quotas for their branch offices. The largest society of all, the Halifax, has now abandoned rationing and the other leading societies have increased their

Expansion is always dear to the hearts of building society men and expansion—though at a cost in terms of the ratio of reserves to total assets—is now possible. The increase in mortgage rates did not curtail the demand for loans, but the increase in rates on shares and deposits checked heavy withdrawals and, despite the competition of the new forms of savings, new investments continue to flow into the societies. The figures shown in the accompanying table include those of the Halifax Building Society (which is no longer a member of the Association) and thus relate to 209 societies representing about 90 per cent of the total assets of the movement. At the end of last year the combined assets of these societies came to £2,018 million, against £1,886 million at the end of 1955. The figures show that the rate of withdrawals dropped sharply in the last quarter of the year. Having lent about £300 million on new mortgages over the year (which is nevertheless a substantial reduction compared with 1955), the societies were in balance and were poised for a further advance.

Trade Deficit Soars

LAST month Britain's visible balance of trade showed a sharp deterioration that was largely the obverse of the fortuitous "improvement" recorded in the previous two months. Imports in November and December were held back by the dislocation of shipping that followed the closure of the Suez Canal. In January the pipeline filled up and imports shot up to the record figure of £376.2 million cif; the rise in commodity prices and freight rates played a part in that increase. The average value for the three months November to January, however, was £335 million, only two per cent higher than the average for the first ten months of 1956. Exports, on the other hand, amounted to £261 million fob, only £7.3 million higher than the low figure recorded in December. The average value for three months was £269 million, two per cent higher than the average for the first ten months. Exports in January should normally compare favourably with the fourth quarter's average of £280 million. The shortfall may not be wholly attributable to the lack of shipping. Exports of ships and boats, which were exceptionally high in the fourth quarter, may well have fallen off; the loss of business in Middle East markets may have become more pronounced, and shipments of motor cars to the Continent presumably suffered from petrol rationing there.

* Provisional.

With re-exports at £11.7 million, the gross trade deficit jumped by £60.7 million (compared with December) to no less than £103.6 million; the average deficit for the three months, however, was £53 million, almost the same as the average for the first ten months of 1956. Next month the deficit should fall to a more normal level. Most of the backlog of imports was probably cleared last month, and more shipping will have become available to move exports.

Strip-Tease at Luton

VAUXHALL has chosen to titillate public fancy by disclosing the details of its new Victor four-cylinder car bit by bit. Last week they displayed the car, enveloped in a vaudeville show, to foreign distributors and correspondents, and this week they announced that 7,000 have already been ordered: but so far all that have been divulged to the British public are its price, its engine and passenger capacities, and a few vague phrases about its appearance. The Victor apparently has an engine of 1,500 c.c. (believed to be that at present used in the Wyvern, of $3\frac{1}{4}$-in. bore and 3-in. stroke) a four-seater body, with a very large boot, and a very modern appearance—which, rumour says, includes a wrap-around windscreen and a generous acreage of chrome. These scrappy details are interesting indeed. It is not easy to imagine how full use can be made of a $1\frac{1}{2}$-litre engine to convey only four persons and a reasonable amount of impedimenta. One would have thought that 1,200 c.c. was the upper limit of engine size called for, and that greater capacity would exact a forfeit in weight of the engine, and therefore, also in additional structure weight, in material cost, and, above all, in fuel consumption. But Vauxhall knows its job, and—unless American influence has deflected the aim—it is hard to believe that the company will not get pretty close to its commercial target.

It was announced some time ago that the present Vauxhall expansion scheme is aimed at a yearly output of 250,000-260,000 units. Vauxhall's output of commercial vehicles has always been a high proportion of its total, and a split of 80,000-85,000 commercial vehicles, and 170,000-175,000 pleasure cars might be a fair guess for the planned output. A machining rate of 65 units an hour for one important component of the Victor has been mentioned, which on a *single-shift* basis would mean 130,000 units a year, or, say, 110,000 Victors a year. This would leave 60,000-65,000 for a six-cylinder, six-passenger car—the Velox/Cresta, with, presumably, a new body and perhaps a slightly larger engine than the present 2,250 c.c. power plant, if it is to match the 2,553 c.c. engines of the six-cylinder Fords.

Frustrated Airlines

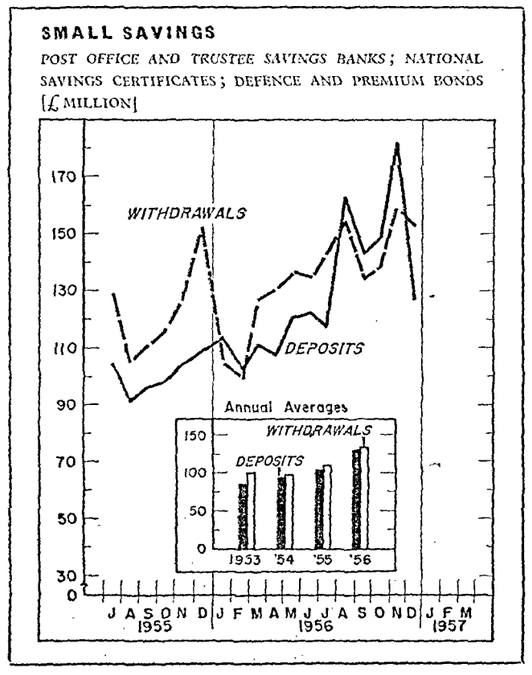
BY bidding to buy the Central African Government's insolvent airline, Central African Airways Corporation, Hunting-Clan may have found a way to sidetrack some of the licensing regulations that today cause such frustrations

among British operators. Hunting-Clan and Airwork operate between them one of the few regular services run by independent airlines along routes that bring them into direct competition with the nationalised corporations. This is a third-class service between London and Central Africa. The fare is substantially lower than BOAC's tourist rate and permission to operate is given only on the condition that the standard of service must be substantially lower too.

While both operators freely agreed to the conditions laid down when they accepted their seven-year licences, neither of them expected the terms to be interpreted with full stringency. The severest restriction has been the refusal by the licensing body, the Air Transport Advisory Council, to allow them to use any type of aircraft but the Vikings with which the service started. Vikings were obsolescent then; they are obsolete today and more expensive to run than alternative types that both companies want to use. Airwork has Hermes aircraft bought second-hand from BOAC: Hunting, more optimistically, ordered five new Viscounts. It sold the first three some years ago without ever putting them into service. Late last year the remaining two were delivered and have been standing idle while Hunting negotiated vainly for permission to use them.

If, however, Hunting-Clan succeeds in buying Central African Airways, it will take over the traffic rights enjoyed by CAA, which include routes to London, South Africa, and the Middle East. On those routes it will not come under the jurisdiction of the Air Transport Advisory Council and will be free to use whatever aircraft it can afford. There must be better ways of protecting the two nationalised air corporations from indiscriminate poaching of their traffic by independent operators than by insisting that the only aircraft the independents shall use are not only old when the service begins, but shall continue to age along with it, so that the competitive position of the independent service deteriorates steadily with time.

Reaction in Rubber



At around 26d. a lb for spot, natural rubber has come to rest a shade above the low point of last week but fully 6d. a lb lower than at the beginning of this year. Some reaction after the Suez rise could not have been avoided, though speculative operations in the East postponed it for a time. Manufacturers who had bought heavily to cover the interruption of supplies due to the closing of the Suez Canal could afford to wait; the demand for tyres, particularly in Britain, suffered further from the introduction of petrol rationing; and sales of motor cars in the United States proved to be smaller than expected.

The weakness of prices was accentuated last week by short selling from dealers who were apparently expecting the failure of a Chinese dealer in Singapore. It now seems clear that a crash will be avoided. Consequently some short sales have been covered and that has helped to steady the market. Manufacturers in Britain appear to be buying regularly again for their current requirements; Russia has also been buying, though selectively and probably not in quantities as large as last year.

Third Class up the Pole?

An intensive series of talks carried out at two separate levels is gradually setting a new pattern of air travel between this country and the American continent. At the lower of the two levels, the airlines that operate on the North Atlantic dispersed last weekend after a week's discussions on how to operate the third-class services that they have agreed to introduce in the spring of next year. Some of the European carriers are still deeply unhappy about the project, but other operators went to the meeting determined to allow no back-sliding from either the principle of third-class fares or the low rate of £150 return. There was also a strong feeling that the new services should not be allowed to creep up in amenities until they threatened the existing tourist services. A special study is going to be made of seating arrangements which give up to five inches less leg-room than present tourist seats (why not try arrangements to cut off passengers' legs at the thigh before embarking, or to quick-freeze people and fold them up?). But the question of meals remains as wide open as when the meeting started. Galleys, even lunch boxes, and the cabin staff they require all take up room that could be used for extra seats; yet passengers cannot be required to fast for entire journeys of 9 to 13 hours. Although the rational solution seems to be the purchase of packed meals by each passenger at the airport, some airlines cling to the tradition of serving them in the air, and even of serving them free at the cost of a slight increase in fare.

Talks on a higher level start next week between the British and United States governments on traffic rights between the two countries. Without government approval

Wise move...

Nice flying!

The holiday mood came over them. The holiday move was the next question. 'Let's start to enjoy it', said he. '*Let's enjoy the start*', said she . . . 'Let's fly KLM!' So that was agreed.

Point of departure . . . and they're feeling better already! KLM travel is the most soothing, most reassuring experience in this small world. The comfort is perfect. The food is perfect. The service is perfect. The schedules fast, frequent, dependable.

And you can move to any European pleasure ground. Holland? Scandinavia? Switzerland? Austria? Germany? Italy? France? There's a gaily coloured KLM Holiday folder waiting for you now at your Travel Agent (or direct from KLM — see below).

You reserve your seats on KLM flights through your Travel Agent or through KLM Royal Dutch Airlines, Time & Life Building, New Bond Street, W.1. Tel: MAYfair 8703 and at Birmingham, Manchester, Glasgow and Dublin.

they can neither land on nor fly over that country's territory. Next week's meeting at Bermuda is concerned largely with negotiations to open the important Polar route between North America and this country. This route has certain advantages over the North Atlantic as a means of reaching points in the midwest and far west of the United States. The British government has not given permission for a polar service to Britain before because the British Overseas Airways Corporation did not possess the aircraft to operate a similar service to the United States. Now that BOAC is getting such aircraft, and wants to exercise more of its rights to serve points west of New York, the government is prepared to discuss giving rights to American carriers in return for concessions from the US government to BOAC.

The Battle of Hawick

IT is to gain possession either of assets which may not have been exploited fully or of earnings which may not have been distributed freely, or both, that the take-over bidder makes his bid. It is because the real worth of such a business is not reflected to the full in the value of its shares that he gets his opportunity. And because his action may lead to a more rational deployment of resources that the discipline of the free market gives its blessing.

In the attempt associated with the name of Mr Hugh Fraser to secure control of the non-exempt private company Lyle and Scott, the Hawick knitwear firm, extra colour is added to the pattern. About 37 per cent of the shares are owned by employees, including its present chairman, Mr Charles Oliver, who adopts a paternal attitude to the business. The remuneration of shareholders is not the only object for which the business is run. Mr Oliver fought back when eight investment trusts and five individual shareholders requisitioned an extraordinary general meeting in order to unseat Mr Oliver and two other directors and to replace them by Mr Fraser and two other directors from the House of Fraser. This group now has over 50 per cent of the shares. A weapon lay to Mr Oliver's hand in the articles of association which, as is necessary in private companies, impose some restriction on the transfer of shares. In his earlier telegram to Scottish MPs, asking for their support against "the secret bid," Mr Oliver, seemingly taken by surprise, said that the investment trusts had become shareholders in Lyle and Scott in 1949 "on the basis that if they desired to transfer any of their ordinary shares they would in the first instance offer them to the other shareholders." Article 9 reads:

> No registered holder of more than one per cent of the ordinary share capital shall, without the consent of the directors, be entitled to transfer any ordinary shares for a nominal consideration or by way of security, and no transfer shall take place for an onerous consideration so long as any other ordinary shareholder is willing to purchase the same.

In the Court of Session, Edinburgh, Lord Strachan found that there was a *prima facie* ground for thinking that those bidding for and now possessing control had not followed the procedure of article 9 and he granted an interim interdict, restraining the eight investment trusts and five individual shareholders from voting at the extraordinary general meeting. This judgment has been upheld in the Court of Appeal. A further legal action, which will take some time before it comes before the courts, is pending on the legality of the share transfers.

Using Less Steel

BRITISH industry did not use all the extra steel that it bought last year, and by the last quarter of the year it was actually using less than at the end of 1955. Steel consumers' stocks, which showed some sign of being run down in the autumn, have again increased; at the end of the year, they held 3,865,000 tons, while merchants held about 356,000 tons in stock. The two together were about 15 per cent higher than at the end of 1955; so were the steel industry's own stocks (mainly of ingots and semis), which amounted to 1,440,000 tons. But steel production had increased by about 5 per cent during the year; output in the steel-using industries probably increased much less, though within them emphasis was shifting to the capital goods industries that consume a much larger amount of steel.

The steel industry is already comparatively well informed about stocks, in comparison with most others; but it still does not find them simple to interpret. The Iron and Steel Board this week suggested cautiously that during the last few months of 1956 less steel was being used to build up the volume of work in progress among its customer industries; stocks of partly fabricated steel, that is to say, were being brought down to balance a lower rate of output. It feels that this check to the expansion of steel consumption will not last long; but may not stocks of steel held before fabrication also be brought down into balance in the next few months?

The stock figures also throw an odd light upon the much-publicised shortage of steel plate. Supplies during the last three months of 1956 were 13 per cent higher than a year before; but in spite of the complaints about scarcity, three-quarters of this extra steel went into stocks. Consumers'

stocks of plate increased by 140,000 tons during last year as a whole; and during recent months exports of plate have been exceeding producers' deliveries for export quite significantly, which suggests that merchants and customers have been selling some of what they managed to get at home on the far more remunerative foreign market.

SHORTER NOTES

The buyer who through much of last year was acquiring Standard Motor 5s. units has now been named. It is Massey-Harris-Ferguson of Canada. It is disclosed that that company now has an 18½ per cent interest in Standard's 27,710,000 ordinary 5s. units.

★

Imperial Chemical Industries this week reduced its prices for wrought titanium and titanium alloy products by about 10 per cent. Its raw titanium has been the cheapest in the world for the past year.

★

The Pressed Steel Company proposes to issue to holders of its preference and ordinary stock £2 million of debenture stock which will carry an option of conversion into ordinary shares in the four years 1958 to 1961. Terms of the issue and of the conversion option have not yet been disclosed.

★

Distillers Company foreshadows proposals for simplifying the group capital structure by offering holders of the preference and preferred shares in certain subsidiaries "a suitable stock" in the parent company in exchange.

★

The fall in tea prices in London was checked this week after the news that the quantity to be offered during the next two weeks was to be reduced. The official quotation for plain tea rose slightly by 2d. to 4s. 1d. a lb.

Company Notes

BORAX. Stockholders of Borax (Holdings), whose dividend of 8½ per cent (equal to 25 per cent on the old capital) gives them a yield of about 1.8 per cent at 23s. 3d. hold their shares in two expectations—that Borax has great growth before it and that the rearrangement of the business last year which made Borax a holding company with American and other operating subsidiaries will produce a big tax saving. The preliminary statement justifies both those beliefs, but it also provides a rough measure of them—and optimism is best when it is restrained by fact. The profit before tax for the year ended September 30th was over £700,000 higher. The British Income tax went down sharply and the overseas tax rose somewhat less sharply, so that in the end the total tax charge of £1¼ million showed a reduction (notwithstanding the higher profit) of about £200,000. The company only paid in taxes 30 per cent of its total income against 44 per cent in the previous year. The last conclusion needs careful qualification. The main step in the company's rearrangement was taken at the end of April last year. The accounts are drawn to September 30th. Nevertheless, it is understood that roughly a year's tax advantage has come into the present figures. It will be subject, however, to subsequent negotiations with the tax authorities and to possible adjustment. It is hoped that the chairman's speech may help stockholders to a closer understanding of what is necessarily a complicated calculation.

F. W. WOOLWORTH AND COMPANY'S 90 million 5s. stock units are widely spread and the company's name is familiar to everyone. Yet its full reports are never as informative as they could be. Shareholders have been told of the forthcoming 50 per cent free scrip issue and of the revaluation of the company's properties. No doubt they expected to be given a few more details when the full accounts were published. They will be disappointed; not a word in the chairman's speech nor a figure in the accounts refers to the revaluation.

Mr Reginald Berridge does tell stockholders that turnover went up again last year (though he does not say what its value was) but trading profits, advancing from £22,942,772 to £23,649,863, did not expand as quickly as sales. The increase in purchase tax cut the demand for some of the goods Woolworth sells on its cash and carry basis and "expenses were substantially higher, mainly due to wages and rates payments." Over the year the company opened 42 new stores (12 of them with self-service) bringing the total up to 955 (including 29 self-service stores) and by the end of this year the company is likely to have nearly 1,000 stores open. In the balance sheet, fixed assets are shown at cost and after depreciation have a value of over £27¼ million, against £21¼ million. The company is still rich in liquid assets as its trade requires it to be and Mr Berridge explains again that the figure for cash at the end of the year is not necessarily indicative of the state of the company's funds over the rest of the year, for stocks on December 31st are "substantially lower than during the year and particularly at the commencement of the Christmas trade." On the increased dividend of 60 per cent, the 5s. ordinary shares yield 5.1 per cent at 58s. 9d.

	At December 31, 1955	1956

★

BRITISH SOUTH AFRICA COMPANY. The main source of the income of the "Chartered" company is mineral royalties, notably from copper, in Rhodesia. It will under the present agreement continue to earn these royalties until 1986, when the mineral rights revert to the Government of Northern Rhodesia. The company always retains part of the net income earned from these royalties and from this money it is building up its investment portfolio. It is a big investor in the Rhodesian copper companies and in the South African finance houses but in recent years the spread of its portfolio has been widened. Looking ahead to 1986, the policy of the company is to build itself up gradually as an investment trust and as it does so it looks beyond South Africa and metals.

The year to September 30th witnessed high prices for copper and thus, as was expected, the net income of the "Chartered" company has risen sharply—from £5,617,654 to £6,974,156. When its full accounts are published, it will not

be *surprising if they* reveal that investment income came to over £2 million (it came to £1.8 million in 1954-55) while mineral royalties may be more than £2 million up on the 1954-55 figure of £10 million. But it is clear that royalty income, thanks to lower copper prices, will fall in the current year. Yet the directors have raised the ordinary dividend from 30 to 35 per cent and, judging by the company's past dividend record, they would not have done so unless they were reasonably confident of their ability to maintain this rate. On this dividend the 15s. units, at 68s. xd, yield 7.7 per cent. They provide one of the least risky routes into investment in Rhodesian copper.

★

SHAW AND KILBURN. Because Mr Charles Clore's bid for Sears (True Form) was the most important and most spectacular example of his forte, the take over bid, his name and that of Sears Holdings are *automatically associated* with the boot and shoe trade. Through further purchases, Sears has indeed a big say in that trade but the company also has big interests in shipbuilding, hosiery machinery, general engineering and, through Scottish Motor Traction, it has garages and a vehicle distribution agency.

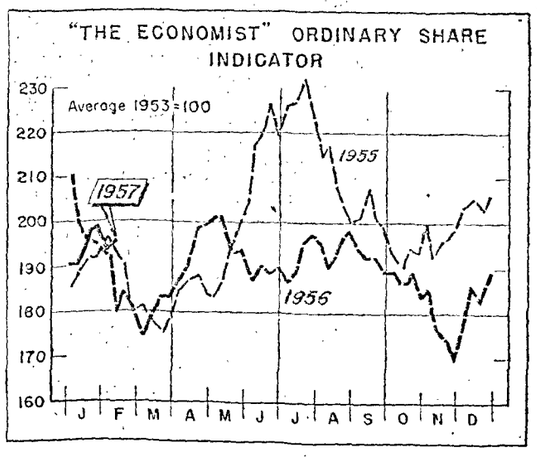
Asset values are not all Mr Clore looks for. *Declining industries never seem to* catch his eye. He seeks opportunities where he sees chances of expansion. His latest bid, for the £150,000 of ordinary shares in Shaw and Kilburn, falls into this category. Shaw and Kilburn is the principal Vauxhall distributor in a large part of London and the home counties; through SMT, Sears owns a similar Vauxhall agency in Scotland. SMT has surplus cash; hire purchase is an integral part of any vehicle distribution agency; and a direct link between SMT and Shaw and Kilburn is probable.

The mechanics of the bid follow Mr Clore's usual practice. Owners of every six 5s. Shaw and Kilburn shares are offered five non-voting 5s. "A" ordinary shares in Sears Holdings. The directors of Shaw and Kilburn recommend acceptance. It is small wonder that they do so, for the terms of the offer, when set against the *market price* of the Shaw and Kilburn shares at any time since they were first quoted in June, 1954, are attractive. At a price of 14s. 4½d. on the Sears "A" shares, the value of the offer is 12s. 6d. for each Shaw and Kilburn share. A few days ago they stood at only 7s. 6d., for investors were anticipating a drop in profits when the accounts for 1956 were published. In two days they climbed to 11s. 10½d.

★

LINEN THREAD. Before charging depreciation and repairs, the gross profits of *Linen Thread company* in the year to September 30th fell from £1,505,258 to £1,349,289. In the preliminary report the directors attribute this decline to uneconomic prices for weaving yarns sold in the United Kingdom, smaller profit margins on threads and netting because of increased wages and fuel costs, a provision for a decline in the market prices of flax stocks and exceptional expenditure on the transfer of machinery between mills. They do not say anything about the experience of the American mills, which account for about half the assets and turnover of the group; a year ago they expressed confidence in their ability to maintain sales and profits in the United States.

After tax, net profits have fallen from £379,955 to £231,292 but £350,000 (against £300,000) has been written back as a tax provision no longer required and the ordinary dividend, absorbing £151,800 net, has been left unchanged *at 8 per* cent. On this dividend the yield is £7 7s. *per cent with the £1 units standing at* 21s. 9d. xd. Linen Thread is one of the bigger companies in the textile industry which has made a bid for a smaller concern; about a fortnight ago its directors announced that the company controlled over 53 per cent of the ordinary share capital of Ulster Spinning, for whose 1s. shares Linen Thread had made a bid of 3s. a share.



LONDON STOCK EXCHANGE

Next Account begins: February 27th
Next Contango Day: February 27th
Next Settlement Day: February 19th

In spite of several unfavourable influences prices were mainly steady this week. Gilt-edged stocks recovered on Wednesday afternoon after the weak spell that followed the announcement of the Government's funding operation and the disclosure of the larger trade gap for January. Undated stocks were lowered and the existing 3½ per cent Funding Stock 1999/2004 dropped back on balance to 79⅞, but shorts rose again on the sharp fall in the Treasury bill rate. The new Northern Ireland Electricity loan was fully subscribed, but slipped back to a discount of 1/8 on Thursday after opening at par. The economic situation and falling prices on Wall Street unsettled industrial stocks, but there was some recovery with the start of the new account on Wednesday, and over the week *The Economist* indicator gained 1.9 to 195.9. Dollar stocks recovered sharply on Thursday after drifting lower during the week.

Bank shares were enlivened by the capital reorganisation proposed by National Provincial. Midland partly paid jumped 7s. 6d. to 172s. 6d. and District "A" 5s. to 78s. Benskin's Brewery rose a further 7s. to 61s. Motor shares improved; Standard gained 6d. to 7s. (the large buyer was revealed as Massey-Harris-Ferguson). *Following the fire* Jaguar dropped to 20s., recovering later to 21s. Aircraft shares were again weak, Folland losing 2s. 6d. to 10s. 3d. and Westland 7½d. to 6s. 4½d. Courtaulds gained 2s. 4½d. to 34s. 6d. and Calico Printers 1s. 9d. to 45s. 9d., but Linen Thread fell back to 21s. 9d. xd following the fall in profits. Rank Organisation rose 9d. to 9s. 9d., but other cinema shares weakened.

On Wednesday a sharp *rise in* Middle East Oil shares occurred and Suez Canal issues *improved. Copper shares were* mainly weaker. Diamond shares receded on the report of a possible substitute and tea shares declined on lower tea prices.

(1) Annual figures are for June of each year. (2) Engineering, shipbuilding, electrical goods, vehicles, metal goods, precision instruments and jewellery. (3) Textiles, leather goods, clothing, food, drink and tobacco, manufactures of wood and cork, paper and printing. (4) Number registered as unemployed expressed as a percentage of the estimated number of employees. (5) From June, 1956, onwards comparison with earlier figures is affected by the revocation of the Notification of Vacancies Order, 1952. (6) United Kingdom. (7) There was a reduction in this month due to discontinued registration of persons losing title to unemployment benefit. (8) Figures have been revised back to July, 1955, on the basis of the mid-1956 count of National Insurance Cards but the complete series is not yet available; it will be published at a later date.

(1) Relates to wholesale prices in Athens and Piraeus only for Greece. Figures for Ireland from 1953 onwards are for home produced goods only. (2) July-December. (3) Relates to prices in capital cities only for Austria, France, Greece and Turkey. Belgium and Austria exclude rent. Denmark excludes direct taxes. Figures for Ireland are based on August, 1953 = 100. (4) Including direct taxes. (5) Including trade with Faeroe Islands. (6) Index numbers of unit value which compare the current average value of trade with its value in 1953; they are influenced by changes in the composition of trade as well as price movements. (7) Deposit money and notes and coins held by business, individuals and foreigners. Except for Greece holdings of issuing authority and other banks are excluded. (8) Holdings of the government and central bank at end of period. Figures for Greece are gold only. Foreign exchange figures for Norway exclude government holdings; Netherlands, Norway and Sweden include foreign investments. Gold includes some long-term securities. (9) Beginning May, 1954, a new drachma equal to 1,000 old drachmas introduced.

Financial Statistics

EXCHEQUER RETURNS

For the week ended February 9th, 1957, there was an "above-line" surplus (after allowing for Sinking Funds) of £144,859,000 compared with a surplus of £119,510,000 in the previous week and a surplus of £108,270,000 in the corresponding period of last year. There was a net expenditure "below-line" last week of £21,273,000, bringing the total deficit to £339,482,000 (£123,972,000 in 1955-56).

THE MONEY MARKET

At the Treasury bill tender following last week's reduction in Bank rate the average rate of allotment fell by 6s. 1¼d. per cent, to £4 4s. 8.29d. per cent. This marks a margin of just over ¾ per cent below Bank rate; after the Bank rate increase in February last the margin was under ½ per cent. The discount market's bid last week was raised by 1s. 7d. per cent to £98 8s. 10d. per cent; applications for the unchanged offer of £190 million fell by £12.6 million to £371.5 million, and the market's allotment rate picked up from 21 to 38 per cent. After the tender rates on bank bills were marked down further.

Credit supplies have been generally short in the past week; but the Bank has consistently made good the deficiency through special purchases. Official help was needed on a moderate scale around the week-end, and on Monday the special purchases were very large. They dwindled to very small proportions on Tuesday, and on Wednesday market supplies were just adequate. The Bank's help has been given mainly through the banks, which have passed on the money at 4⅞ and even 4¾ per cent; rates on fresh loans from market sources have ranged up to 4 per cent, but have also been down to the clearing banks' new minimum of 3½ per cent on the "regular" portion of money. Dealings in April and May maturities have been generally at 4⅝ per cent.

Homes and the Halifax

In 1957 thousands of people will own their own homes free of mortgage, having made their last payment to the Halifax Building Society. Many thousands more will, with the help of this famous organization, start to achieve the security and independence which home-ownership brings.

The society is anxious and willing to help such people. With its background of strength and stability, it has unexcelled facilities to offer both to those who wish to buy a home of their own and to those who seek a safe depository for their investments.

COMPANY MEETINGS

THE LANCASHIRE STEEL CORPORATION

A NOTEWORTHY ACHIEVEMENT

BENEFITS FROM DEVELOPMENT PROGRAMME

SIR JOHN JAMES ON NEED FOR REVISION OF PRICE-FIXING POLICIES

The Twenty-seventh Annual General Meeting of The Lancashire Steel Corporation Limited was held on *February 12th* at Warrington.

Sir John James, Chairman and Managing Director, who presided, said: Gentlemen, Once again it is my privilege to present to you the Directors' Report and Accounts for the year just ended, and in moving their adoption take the opportunity of giving you my review of the results for that year and the present position and prospects of the Company.

Before doing so, however, it is my sad duty to refer to the recent death of Mr Sinclair Kerr. Mr Kerr had been associated with the Company for almost 30 years, and the valuable work which he did can hardly be over-estimated, particularly in the years immediately preceding and after the formation of the present Company. Although in the last two or three years his health had been far from good, his sudden death came as a great shock to us all.

The Directors' Report and Accounts are in your possession and, with your permission, I shall take them as read. (Agreed.)

THE YEAR'S RESULTS

The total income of the Group for the 52 weeks ended September 29, 1956, shows little change compared with that of the previous year, amounting in fact to £2,986,000 as against £2,942,000. It should be noted here, however, that the figures for 1956 are after charging Depreciation of £650,000 and Reserve for Replacement of Fixed Assets of £350,000, making a total charge of £1 million as compared with £875,000 in 1955. The increase in Depreciation is due to the large expenditure on Fixed Assets which came into operation late in the financial year and on which Depreciation is now being provided for the first time.

In presenting the Accounts for last year I drew your attention to the fact that the profit was a record in the history of the Company, and although the current year's increase is small, it again, of course, constitutes a new record. This is all the more noteworthy as although the output of our products exceeded in most cases that of the year before, we had to bear alarming increases in costs of production in May and June. The full effect of these was felt until December last before the overdue revision of steel prices was made. The increased costs were much too large to be absorbed either by increased effort or efficiency, and it is disturbing that the increases given last December still leave a balance of increased cost yet to be made good. I shall refer to this question of steel prices later.

The present economic difficulties resulting from the closure of the Suez Canal, particularly with their effect on the difficulties of obtaining raw material and especially of oil supplies of which, in common with all other Steel Makers, the Company has made increasing use in recent years, makes it extremely difficult to forecast the future, but the extensions to the Works which are now coming into operation give me every hope that when these difficulties are surmounted, as I am sure they will be, the present figures should not by any means be regarded as exceptional, provided always that the industry can enjoy a fair world price for its products both at home and abroad.

After providing for Taxation of £1,520,000, or rather more than half the total income, the net income of the Group amounted to £1,466,000 compared with a similar figure for 1955 of £1,497,000, thus enabling the Directors, after making the usual allocation to General Reserve of the same figure as last year (except for the small addition of £927 to round up the General Reserve to £5,500,000), to recommend again a Final Dividend of 8 per cent, making 11 per cent for the year. It will be my duty later in this Meeting to recommend this for the Shareholders' approval.

GROUP'S FINANCIAL STRENGTH

Turning to the Consolidated Balance Sheet of the Corporation and its Subsidiary Companies, I am again pleased to draw attention to the Group's financial strength, Current Assets amounting to £11,706,000 compared with Current Liabilities and Provisions of £5,126,000, a surplus of £6,580,000. Although this represents a decrease of approximately £900,000 compared with the surplus a year ago, it should be noted that Capital Expenditure during the year amounted to the substantial figure of £2,917,000. To incur this expenditure without materially affecting the financial strength of the Group is, I think, very gratifying.

DEVELOPMENT PROGRAMME

Turning to the work of the year under review, it has been a great disappointment to me that such slow progress has been made with our Development Programme, but I can now see the advantages making themselves felt. They will have an incerasing effect upon the future prospects of the Company.

With our Accounts are photographs of three of the main items of the Development Programme which have now been completed. That on the inside front cover shows our first large Blast Furnace which has just been put into production after constructional delays arising from the difficulty in obtaining delivery of fabricated steel and electrical equipment. The new structure embodies the most modern equipment and, as the picture shows, is situated on the site of the old furnaces.

We have also recently put into use our new Blast Furnace Bunker installation which when complete, will bring our raw material handling equipment up to the best modern standards and greatly facilitate and improve internal traffic, as belt conveying has been installed in place of locomotives and trucks.

The other photographs are of our new Steel Plant. This Plant is situated on an entirely new site from which steel ingots can pass into the Rolling Mills quite independently of, and without interference with, the existing Plant. The new Plant consists of a 600-ton Active Mixer and two 250-ton Steel Furnaces, of which the first is now in production. Although we are short of molten iron, a deficiency which, however, is rapidly being made good, the Plant is working satisfactorily and the second Furnace is ready to go into production. I hope that by April this whole unit will be working to its nominal capacity and for the first time in our history giving us the ingots to keep our Rolling Mills fully employed without the necessity of buying steel.

As an ancillary to these productive units we have installed a further 21 Coke Ovens of modern design adjoining our existing batteries. These Ovens came into production at the end of January. This will enable us to begin the rebuilding programme of the existing Ovens, some of which have been working continuously for 25 years.

Our new raw material sidings are now nearing completion; included with these is a new railway connection giving direct access to British Railways and providing an alternative means of access to the Works, the lack of which has given us great concern in the past. Not only will this facilitate the reception of raw materials, but it will also enable us to handle the increased internal transport arising from increased production without further addition to our present equipment, and will lower the cost by more efficient working of our transport.

To meet our Development Programme we are installing equipment to increase the rate of discharge at our wharf on the Manchester Ship Canal. This will enable modern ocean-going ships, carrying some 10,000 tons, to be discharged continuously at a rate of up to 1,000 tons per hour so that they can be ready for sea again within 24 hours of arrival. We hope this will encourage Shipowners to modernise existing, and design their future, Iron Ore Carriers to our mutual advantage.

Finally, before passing from the Development Programme I should mention that amenities for our employees have not been forgotten. Amongst others I may mention

the installation of new canteens and considerable extension of the welfare services.

This Development Programme has already entirely altered the appearance of the Irlam Works, and I firmly believe that, when finally completed, the Works will be one of the most efficient units of its size in the country.

SUMMARY OF POSITION

To summarise the position we have reached, I would say that by the end of this year the Irlam Works will have been developed to a stage where it is capable of producing some 650,000 tons of ingots per annum. To complete this stage, together with further expenditure to which we are already committed and which is planned to achieve operating economies and to expand the flexibility of our programmes and the services and products which we can offer to our customers, will involve further expenditure of some £1¾ million. I am confident that, assuming our margins will be adjusted fairly to meet those rising costs which are beyond our control, our increasing output should enable us to meet this further expenditure from our own resources.

In our main Subsidiaries, Rylands Brothers and Whitecross, satisfactory progress has been made in increasing the production of Hard Steel. Two Patenting Furnaces of new and improved design are now in operation and three new high-speed continuous wiredrawing machines have been installed, while two more will be starting up very shortly.

The demand for wire and wire products has been well maintained and the heavy demand for Nails in the Export Market is encouraging, but the incidence of myxomatosis both here and in Australia has been responsible for a falling away in demand for Wire Netting.

During the year competition from the Continent in the Export Market has shown a steady increase and is likely to become more severe during the coming year.

Before turning from our own affairs you will, I am sure, be interested to realise the development which has taken place since the end of the war in 1945. By the end of this year total expenditure on Capital and Development will amount to approximately £15 million. As a result of this expenditure the range of our products has been considerably extended and the ingot output will have been increased from some 330,000 tons in 1945 to some 650,000 tons per annum—an increase of almost 100 per cent. This increase will have been achieved at a cost of £47 per ingot ton, which is far below the present cost of a new integrated Steel Works.

STEEL PRICES

This increased output will enable us to extend the range of our products either on the lines with which we are traditionally associated or in some new field. It is, however, a matter of great concern to us that during 1956 many of our present products have been subject to very unsatisfactory awards in the matter of steel prices. For instance, in the case of one of our main products, prices have been fixed on a basis which, after depreciation, allow a return of only some 9 per cent on the full replacement cost of our new Plant. Even this 9 per cent is before taxation of 50 per cent, and the cash return is, therefore, on present margins only 4½ per cent. Surely this cannot be regarded as an economic return encouraging Makers to expand their production of a commodity in great demand throughout the country and which serves as the raw material for many other industries.

The unfortunate effect of these arbitrary price-fixing policies in the Steel Industry has been a matter of common knowledge for many years For example, I need only mention the extreme and continuing shortage of steel plates which has hampered the efforts of our shipbuilders to give reasonable delivery against foreign competition, and the shortage of heavy sections which has delayed construction urgently needed for the expansion of the country's basic industries. These shortages arose, no doubt, in the first instance through the impact of full employment on an industry which before the war produced only some 10/11 million tons of steel per annum against some 21 million tons today, but the continuation of these shortages throughout 12 years is, in my opinion, largely the direct result of the inadequate return which has been allowed on such products. As a consequence, the steel firms have naturally felt reluctant to install the enormously expensive machinery necessary to produce plates and heavy sections in the volume required today. I hope that the same tendency which appears to be developing in the case of our own products will be rectified before it drives us into other and more remunerative fields, thus creating serious shortages amongst our customers and the industries which they themselves supply.

In my opinion, the time is overdue for a complete review and new thinking over the principles on which price-fixing in the Steel Industry is based. The whole future well-being and power of expansion of this great industry depends upon a reasonably remunerative return, out of which money can be ploughed back to help in financing improvement and development, and at the same time providing a reasonable return on invested Capital, far too often prejudiced by historic value. It must not be forgotten that this country very largely depends upon the well-being and efficiency of the Steel Industry.

OVERSEAS DEVELOPMENT

With a view to extending our trade relations overseas, as so many British Companies are doing nowadays, you will have noted that your Company, together with Stewarts and Lloyds, proposes to take a part in the reorganisation and expansion of the Iron and Steel Industry in Southern Rhodesia, and to assume a financial interest in a new Company which is being formed for that purpose. I have great hopes that this will prove to be a profitable investment in the future, and as the proposed new Company is also acquiring very large reserves of high-grade iron ore in Southern Rhodesia, and as long-distance handicaps are rapidly being overcome by modern shipping, I fully expect that this will prove in years to come a most valuable source of the ore required by the British Steel Industry. The proved tonnage is estimated at about 80 million tons, and I understand these deposits can be worked, when adequate rail and port facilities are available, at around 2 million tons per annum. In our case, we also hope to develop our interest in Rhodesia by the installation of a Wiredrawing Plant for producing a wide range of the wire products so urgently needed in that developing country.

In concluding my remarks, I must pay my own and the Directors' tribute to the efforts of all employees of the Companies in the Group. 1956 was in many respects a most difficult year, and their efforts have contributed largely to what I hope you regard as a satisfactory result.

The report and accounts were adopted.

CLYDESDALE & NORTH OF SCOTLAND BANK

HIGHLY SATISFACTORY RESULTS

SIR HAROLD E. YARROW ON NEED FOR MAXIMUM PRODUCTION AND EFFORT

The one hundred and nineteenth Annual General Meeting of Shareholders of Clydesdale & North of Scotland Bank Limited was held on February 13th in the Head Office, St. Vincent Place, Glasgow.

Sir Harold E. Yarrow, Baronet, CBE, LLD, Chairman of the Bank, presided, and in the course of his speech said:

I think you will agree that the results are highly satisfactory.

As compared with the previous year, our Deposits have increased by £2 million and our Note Circulation by a further £1,300,000. Offsetting these increases the total of Acceptances, Confirmed Credits and Engagements on account of Customers has fallen by £2,600,000.

Our liquid position remains strong. Cash, Balances with other Banks and Money at Call and Short Notice in London amount to £74 million representing 38 per cent of our liabilities to the public in respect of Deposits and Notes in Circulation—a very satisfactory liquidity ratio. Our holding in British Government Securities at just over £81 million is higher on the year by about £500,000. At the time of making up our figures, the Book Value of our investments was £6 million in excess of the Market Value. Advances to Customers and other Accounts show a reduction on the year of just over £1 million and now stand at £41,059,150.

The net profit for the year at £481,832 shows a decrease of just over £6,000 as compared with 1955. This fall may be attributed to the increase in the Bank Rate to 5½ per cent. The year's dividend remains unchanged and the carry forward to 1957 is £200,732.

Following the restrictions imposed by the wartime Defence (Finance) Regulations the banks have been under more or less constant restraint by the authorities for fully eleven years and since 1955 the pressure has been intensified. Throughout this whole period they have willingly responded without regard to the effect on their earning capacity or to the unwelcome task they have had to face in refusing accommodation to customers whose requests would normally be regarded as sound and, indeed, in every way desirable. The banks are justified in asking—and certainly in wondering—whether the task of operating the credit squeeze should fall upon them quite so heavily as it does, especially since borrowers unable to secure accommodation from them can now frequently find the finance elsewhere. The fact that the banks have been willing in the national interest to see their traditional functions suspended should not be taken as willingness to have these usurped by other financial institutions. I think it can be claimed that the operation of the credit restriction policy by the banks has served the Country well in so far as it was designed to influence decisions rather than to make things difficult for those who had made genuine business commitments. It has certainly put an end to bank borrowing for speculative purposes. Having achieved these aims, it seems about time for consideration of some relaxation and this could be offset by a more vigorous and much needed attack on public expenditure as the main source of inflation.

After a detailed review of the activities of the Scottish Industries, the Chairman continued:

NATIONAL NEEDS AND OPPORTUNITIES

If recent events have provided any lesson of value in the shaping of economic policy, it surely is that of growing international interdependence, and it must be the general hope that this fact will be increasingly appreciated throughout the world.

For Britain, there are, however, other considerations the regard for which points to one overriding conclusion—that if she is to play her appointed role in world affairs she must be economically strong. Yet if the past year has demonstrated the need for a healthy national economy as a basis of world influence, it has also emphasised afresh the vulnerable condition Britain has reached in the postwar years. The most efficient combination of our native skill and producing techniques must be constantly maintained if we are to ensure the progressive wellbeing of our Country. It needs to be remembered that the large population of these Islands cannot be maintained, far less improved in their standard of life, save on a basis of a large and successful volume of international trade. Happenings in the Middle East thus underline the need for a revision of our whole attitude towards economic matters.

Wherein, then, has our policy been wrong? It has, I believe, been mistaken in one major respect. We have been impatient to reap the harvest of industrial production before the crops were ripe for gathering—in other words, we have sought to secure improvement in our current standard of living before we have rebuilt our economy from its war-weakened state and given it that added stability necessary in a competitive world. Partly the general standard of living consists of leisure; and to enjoy leisure we must have economic security so far as that is obtainable in a dynamic world.

If, therefore we are to secure the advantages which the remarkable advances in science in these days make possible, we must adjust our outlook in order to satisfy two basic requirements. The first is that we must provide the means for applying these scientific advances to industrial purposes, and the second is that once they are provided we must make the fullest and most efficient use of them in increasing production. Production, in a word, is the keynote. From it, all else flows—the means to maintain and improve our standard of life through trade at home and abroad, and the means to provide the savings for capital investment essential to our further prosperity. Only when the full significance of increased production is realised by everyone and the maximum co-operation and effort developed over the whole field of industry can our economic position be regarded as at all assured.

The report and accounts were adopted.

MICHAEL NAIRN & GREENWICH

ADVERSE FACTORS AFFECT PROFITS

The thirty-fifth annual general meeting of Michael Nairn & Greenwich Limited was held on February 8th at Kirkcaldy.

Sir Robert Spencer-Nairn, Bart, chairman, in the course of his speech, said: The total earnings of the group, after providing £538,828 to meet taxation based on income for the year, amount to £320,341 and show a decrease of £249,139 over the results of the previous year. The results reflect the more difficult trading conditions experienced during the past year. The Board recommend the payment of a final dividend of 5¾ per cent, less income tax, on the Ordinary Stock which makes 7 per cent for the year.

The reduction in net earnings from last year's figures can be attributed to a variety of adverse factors affecting both the manufacturing and sales side of our business. Throughout the period covered by the accounts our production costs have tended to rise, and the increase in linoleum costs has been only partially recovered in selling prices. Then again, due partly to credit restrictions at home and to intensive competition, quota and currency obstacles in overseas markets, our sales of linoleum have barely reached last year's level.

The rapid growth of the "Do-it-Yourself" movement in this country has led to increased sales of our attractive range of Linoleum Tiles and Congowall wall-covering which lend themselves admirably to application by home handymen and women.

The report and accounts were adopted.

THE NATIONAL BANK LIMITED

DIVIDEND RAISED BY ONE PER CENT

LORD PAKENHAM MAKES NEW CALL FOR FINANCIAL ENQUIRY AND FOR A STRONGER CENTRAL BANK FOR IRELAND

The one hundred and twenty-second Annual General Meeting of the proprietors was held at 34 College Green, Dublin, on February 7th. Lord Pakenham, PC, Chairman of the Bank, referred to changes in the Directorate by reason of the retirement of Lord FitzAlan and Sir Cornelius Gregg, and the appointment of Mr Cecil M. Rait and Mr E. H. Nugent; also to the appointment of Mr John Leydon as Chairman of the Irish Board in place of Sir Cornelius Gregg.

ACCOUNTS AND PROFIT

Concerning the Report, Balance Sheet and Profit and Loss Accounts, the Chairman pointed out that the net profit for 1956 was up by £15,000 and the distributable sum was £447,000. After careful thought it had been decided that the dividend should be increased from 6 per cent to 7 per cent making 12 per cent for the year.

ENGLAND AND IRELAND COMPARED

Lord Pakenham said that the year in each country had been dominated by the struggle against inflation and the connected phenomena of declining reserves, an adverse trade balance, and a shortage of savings in relation to expenditure. The Governments had shown themselves acutely aware of the inflationary menace to the economic life of the people. The improvement in the balance of trade was pronounced.

The need for increased saving had been stressed in both countries with encouraging results in England. However, even apart from the aftermath of Suez, there were facts to be set on the gloomy side of the account, to some extent at least, the price paid for the improvements. There was an obvious distinction between the fundamental problems of Ireland—an under-developed country with an unemployment problem and heavy net emigration—and those of fully employed postwar England; but on a closer examination the analogies were just as striking. The wisest heads in each country were at one in attaching a priority to their national reserves. Ireland as a creditor country without pretensions as an international banking centre had here some advantage over Britain, but in each case a long-term policy for maintaining the reserves (in England building them up to a much more adequate level) was a *sine qua non* of self-preservation. Both regarded full employment as a supreme social objective and each was increasingly concerned with the necessity for much more productive investment. In a negative sense each had brought its economy into balance, but the problem of passing from stagnation to expansion without destroying the balance so precariously acquired remained elusive in both countries. Last year Lord Pakenham called for a far-reaching financial reappraisal. He now repeated this suggestion. In Ireland certain Committees had been established. He welcomed particularly the Capital Investment and Advisory Committees and the decision to bring forward a separate Capital Budget. In England it was encouraging to notice that the request for a fundamental enquiry had recently been given influential support. It had been stated that the economic future of Britain depended on her changing from a country of low investment to that of high investment. This applied equally to Ireland.

A STRONGER CENTRAL BANK FOR IRELAND

There was one feature, or rather absence of such in the Irish banking system, which although easily explainable in history was now a serious liability. Ireland did not possess a Central Bank which could play a leading part in the credit policy of the country. It would be absolutely disastrous to steer along a road that led towards tampering with the admirable arrangements which secured parity between the Irish and British currencies. But in Ireland the present system of negotiations between the Department for Finance and the Banks—friendly though they were—were vitiated institutionally by the existence of a vacuum in the place usually reserved for a Central Bank. A strong Irish Central Bank empowered to play a vital constructive part in formulating and operating a national and financial policy was patently overdue.

STAFF

On behalf of the Board Lord Pakenham expressed thanks to the staff in Ireland, England and Wales. He mentioned that the Bank expected to open new branches during the year, the first to be opened in England since 1922. With higher profits in the last two years the Bank had been able to offer slightly more generous rewards in certain directions. They could do worse than follow the old instruction of St Benedict in fixing the scope of the Abbot's discretion—*sic omnia temperet, ut et sit quod fortes cupiant, et infirmi non refugiant*—"Let him so temper all things that the strong may have something to strive after and the weak nothing at which to take alarm,"—a careful blend of accents on "opportunity" and the "Welfare State." He could think of no better motto for the Governments of Ireland or England or any country which sought to conduct its affairs on lines of Christian prudence.

Lord Pakenham concluded by saying:

"A Bank is not a charitable institution. But neither is it an instrument of torture for grinding the faces of the needy. Sound commercial principles are an essential condition of its prosperity. But an indispensable service to the Public, courteously rendered, is the justification of its very existence. It exists to fertilise the talent that would otherwise moulder in a napkin; its professional life calls forth the whole combination of qualities that between them generate trust. One Bank at least I have found to be a very human affair."

The Report and Accounts were adopted. The retiring Directors, Lord Pakenham, PC, Mr Hubert Briscoe, Sir Evan M. Jenkins, Mr Cecil M. Rait and Mr E. H. Nugent were re-elected.

F. W. WOOLWORTH AND COMPANY

CONTINUED PROGRESS

The forty-eighth annual general meeting of F. W. Woolworth and Company Limited will be held on March 8th in London.

The following are extracts from the Statement by the Chairman, Mr R. J. Berridge, circulated with the report and accounts for the year to December 31, 1956:

The year 1956 constituted the forty-eighth year of trading of the Company and I trust that the Report of the Directors and the Accounts now presented will give satisfaction.

The Company's progress continued during 1956. For yet another year turnover increased substantially—to a greater extent than during 1955 in fact. It is thus reasonable to conclude that the Company's policy of meriting in still greater measure the confidence of the shopping public through the merchandise values on the stores' counters was successful.

LOWER PROFIT MARGINS

On the other hand the trading profit of the parent Company increased by no more than 2.88 per cent, for the reasons that follow. Gross Profit margins were lower as a whole, partly due to the Purchase Tax increases levied in October, 1955. In particular the public did not take kindly to the entirely new 30 per cent tax on many household goods which had always been free of tax previously, even during the War years. As a consequence, shoppers virtually imposed a buying freeze on these articles.

Expenses were substantially higher, mainly due to wages and rates payments; wages represent the major proportion of total overheads and so when they stride ahead, profits are reduced materially. The new Valuation Lists for Rates resulted in the substantial increase of £500,000 per annum being levied on the Company's Stores for the full year from April 1, 1956 or £375,000 for the nine months to December 31, 1956.

The proposed 20 per cent reduction of Rateable Values of Shops dating from April 1, 1957, is thus most welcome, but I suggest it is no more than an equitable adjustment in relation to other classes of property.

NEW STORES AND IMPROVED STORES

During last year 42 new stores were opened in areas where the Company had not been represented previously, together with the last of the blitzed stores at Kingsbury, North London. These additions raise the grand total to 955 stores in operation at the end of 1956. A considerable number of existing stores also were either enlarged and/or modernised.

The new stores already referred to include 12 Self-Service stores, giving an overall total of 29 operating on this basis. Self-Service has become more popular with the public during the past year, but as the problems set by their mode of operation are not entirely solved, the Board's policy is to continue with this type of development with some caution.

The programme for new stores and improvements to existing stores for the current year is on much the same scale as for last year and new stores likely to open will bring into sight the target of 1,000 stores. It is noteworthy that the new Super-store in Cornmarket, Oxford, is expected to be completed for opening during the latter part of 1957 and it will be characterised by extensive new and up-to-date facilities.

Subsidiary Companies.—In addition to the two stores already operating in Jamaica and Trinidad, the purpose-built store in Barbados opened for business in October last and it has been well received there. It will be remembered that Barbados may possibly become the Capital of the Federation of the British Caribbean, which would add considerably to its importance and prosperity. Additional sites have been acquired in Jamaica and Trinidad and will be developed as soon as possible.

PROFIT AND DIVIDEND

Net Profit before Taxation amounted to £23,319,355 compared with £22,523,066 for 1955. The increase was thus £796,289 or 3.54 per cent. It will be noted that the Subsidiary Companies contributed £44,057, this amount being attributable to the Kingston, Jamaica, store (for the full year to June 30, 1956) and to the Port of Spain, Trinidad, store (for the eight months to June 30, 1956). These profits augur well for the future and are beginning to represent a good yield for the investment made in those areas.

The proposed appropriation to General Reserve is again £2 million, as for several years now. The proposed Final Dividend payable March 9, 1957, is 2s. per unit of Ordinary Stock compared with 1s. 10d. per unit of Stock last year.

Net Current Assets at £21,672,033 compare with £24,844,925 at December 31, 1955, or a decrease of £3,172,892. This reduction can be related in a direct way to the higher investment in Subsidiary Companies and to the rise in Net Fixed Assets of £6,374,366.

Revenue Reserves: with the proposed transfer of £2 million from Net Profit for 1956 General Reserve now stands at £9,500,000 and the Profit and Loss Account Balance after proposed appropriations is £969,166 higher at £4,013,611. As a consequence Revenue Reserves now total £13,513,611 compared with £10,544,445 or £2,969,166 higher than a year ago, so that there is substantially more in hand for future developments.

PROSPECTS

What can be said of the prospects for 1957? It must be encouraging to all of us to read of the steps that are to be taken to put this country of ours in a stronger position economically. To achieve this, mention has already been made of incentives. So that the whole population will play its part, a reduction of taxation in one form or another is undoubtedly a prerequisite, applicable both to individuals and to Companies alike.

In this new and encouraging atmosphere the Company's trading will participate in any greater prosperity that results with the horizon dimmed only by the prospect of overheads rising at a greater rate than the gross profit on additional business.

TRINIDAD SUGAR ESTATES

The thirty-fourth annual ordinary general meeting was held on February 7th in London Mr E. Cassleton Elliott, CBE, FSAA (the chairman), presiding.

The following is an extract from his circulated address:

The year under review was a disappointing one compared with 1955 as owing to the weather conditions and Froghopper damage the Crop was lower by 1,205 tons.

The average price per ton realised for sugar including by-products, after deducting the levies of £2 15s. per ton made under the Trinidad Sugar Industries Special Funds Ordinance, was £44 5s. 7d. compared with £43 3s. 5d. in 1955. As a result of the smaller production of sugar our costs in Trinidad rose from £37 6s. 5d. to £41 5s. 3d. per ton so that the profit per ton in Trinidad was £3 0s. 4d. compared with £5 17s. in 1955.

The Company's financial position remains satisfactory, the surplus of current assets over current liabilities and provisions being £173,500 compared with £168,904 last year.

With regard to the prospects for 1957 Crop, the latest estimates available are that we shall have a tonnage of Estate and Farmers canes about equal to last year.

The Sugar Act has now been passed by Parliament and came into operation as from January 1st. This will not affect the price which we obtain for our sugar under the Commonwealth Sugar Agreement.

The report was adopted and a dividend of 6 per cent approved.

LIEBIG'S EXTRACT OF MEAT COMPANY

OXO ACHIEVES RECORD SALES

The ninety-second annual general meeting of Liebig's Extract of Meat Company Limited, will be held on March 7th in London. The following is an extract from the circulated statement of the chairman, Mr Kenneth M. Carlisle:

The depreciation in value of the Argentine and Paraguayan currencies accounts almost entirely for the net exchange loss of £181,000. These losses are an important factor in reducing Profits less Losses before Taxation by £383,000 to £1,502,000.

Oxo Limited achieved a record turnover showing a substantial increase over previous years. In common with the general tendency the fruits of the higher turnover have very largely been applied towards absorbing increased costs of manufacture and distribution. At the same time, we have in general maintained (in certain important instances, reduced) selling prices to the consumer—a policy which we shall continue to pursue as long as possible.

QUALITY AND VALUE

Sales of Oxo Cubes have risen again both to the trade and over the counter. Results disclosed for the first four months of the new financial year give me reason to believe that this improvement is being maintained. I regard this state of affairs as the best possible vote of confidence in the quality and value of the Oxo Cube. A similar forward impetus is also apparent in the other major division of Oxo Limited's operations.

Sales, distribution and market share achieved by our well-known Fray Bentos brand Canned Meats and Preserves for the year were greater than in the previous year.

Europe.—The general tendency has been towards increased turnover in all established proprietary products containing Extract of Meat. Diversifications and new products have helped to swell the total. The same pattern of rising costs is evident but, by dint of increased mechanisation and improved processes, our companies have been able over the past year to absorb these rising costs.

River Plate.—In the Argentine the Provisional Government is still making a study of the Meat Packing Industry, but at the time of writing there is no change in the situation. In respect of operations since 1946, we do not know whether the Company owes money to the Meat Board, or the Meat Board owes money to the Company. The sums involved are substantial, but we consider that we have been conservative in the amounts for which we have taken credit over these years. We have done what we can, during this long period of uncertainty, to maintain the efficiency of our plant, machinery and transport, and to introduce improvements, but much more has still to be undertaken.

After a detailed review of the Group's other world-wide activities, the Statement concluded:

Current Year.—Sales in the first few months of the current year have, in general, shown consistent increases as compared with a year ago. The crisis in the Middle East, however, and the consequent dislocation of transport, which has resulted in higher freights, petrol rationing in the United Kingdom and restrictions in the use of fuel on the continent, must increase costs of manufacture and distribution throughout the Group. Our sales forces will be considerably less mobile and our efforts to maintain or increase profits through higher turnover will therefore be severely handicapped.

SECOND BRITISH ASSETS TRUST

A YEAR OF UNCERTAINTIES

MR A. C. BLAIR ON CURRENT REVENUE OUTLOOK

The Seventy-eighth Annual General Meeting of Second British Assets Trust Limited will be held on Thursday, March 7, 1957, at the registered office of the Company, 9, Charlotte Square, Edinburgh.

The following is the review by the Chairman, Mr Alastair C. Blair, CVO, WS, which has been circulated with the Report and Accounts for the year ended December 31, 1956.

The Annual Report this year comes to you in a new form. We have felt for some time that we should try to make it clearer and more interesting and I hope that we have achieved our object.

You will find in the Report a table of distribution of investments which not only gives the usual geographical spread but also the distribution between different industries with comparative figures for the previous year. For some time we have been trying to eliminate the weaker investments from our portfolio and to concentrate on those Companies that are growing and whose management is progressive. This has resulted in a reduction in the number of holdings in Ordinary and Common Stocks (which comprise 88.2 per cent of our total funds) to about 160 Companies. The tables, on page 10 of the Report, show that this has led to growth both of income and capital. We hope for the future that such growth will continue and that our policy may in the short run minimise for us the effect of any industrial set-back.

CURRENT YEAR'S ESTIMATE SATISFACTORY

The summary of quarterly figures in the Report indicates both soundness and spread by the evenness of our income quarter by quarter, but it also shows that the rate of increase in income is slowing down. In part at least this is due to the shortage of money, as in this country many Companies whose profits have risen have not increased their dividends, while in the USA there is a growing tendency to distribute "stock dividends" rather than pay out dividends in cash. Although money is likely to be in short supply for many a long day, nevertheless our estimate for 1957 is satisfactory, and in these circumstances we have felt justified in continuing to recommend a fairly full distribution of our income—only 13½ per cent of our net divisible income this year being carried to Reserve.

A year ago I said that 1956 would be a year of uncertainties. This has been only

too true, and it was difficult at any time during the year to make long-term investment plans. The credit squeeze intensified in the United Kingdom; the American Presidential election hung over us for most of the year; but above all the blocking of the Suez Canal has caused world uncertainty and created serious problems for industry in this country. In the light of such difficulties it is satisfactory to record that our valuation was slightly better at the end of 1956 than a year ago.

In all the present circumstances it is natural to regard the immediate future with caution. Apart, however, from exchange speculation against sterling caused mainly by the Suez crisis, the British economy is now in better condition than it has been for some years. Credit restrictions have removed surplus home demand and encouraged exports. Considerable additions to manufacturing capacity have been made by industry over the past few years and provided international politics do not continue to disrupt world trade a further increase in the nation's output should be possible.

APPOINTMENT

THE REPUBLIC OF THE SUDAN

The Ministry of Education invites applications from suitably qualified candidates for the post of lecturers in the following subjects in the Khartoum Technical Institute:—(a) Civil Engineering, (b) Mechanical and Electrical Engineering, (c) Commerce. Qualification for (a) and (b) is a degree in Civil, Mechanical or Electrical Engineering, or technical equivalent, e.g., A.M.I.Mech.E., A.M.I.E.E., A.M.I.C.E., A.R.I.B.A., etc. Teaching experience in a similar appointment would be an advantage. For (c) a degree in Economics or Commerce or equivalent qualification in Accountancy is required. Minimum age 25 years. Successful candidates for (a) and (b) will be required to teach their subjects up to Higher National Certificate and will also be required to supervise certain Workshop and Laboratory activities. Candidates for (c) will be required to teach their subjects, Accountancy or Economics up to professional standards.

Appointment will be on Short Term Contract with bonus for a period up to five years. Salary scale ranges from £1,075 to £1,675 per annum. Point of entry into the scale will be determined by age, qualifications and experience. A Cost of Living Allowance which is reviewed quarterly is payable. An Outfit Allowance of £E.50 is payable on appointment.

Please write, preferably on a postcard, for application forms and further information to the Sudan Embassy, Personnel Section, Cleveland Row, St. James's, London, S.W.1, quoting "Lecturers 4/1027."

THE Operational Research Department of the Steel Company of Wales Ltd. (Steel Division), Port Talbot, invites applications from qualified men who have completed National Service.

The Company operates the largest modern Integrated Steel Plant in Europe, laid out on South Wales seaboard in spacious and pleasant surroundings with ideal working conditions. A further £50 million project is in hand. There are good residential districts within easy reach of the works.

On appointment successful candidates will be engaged in a wide range of stimulating problems concerned with all aspects of the efficiency and development of this complex plant: there is ample scope for originality of approach and initiative.

All the usual facilities are provided including an attractive pension scheme, salaries in keeping with age, qualifications and experience.

Removal expenses will be paid for a married man (maximum of 5 per cent of salary).

Vacancies available for:—

1. Statistician with honours degree in Mathematics or Statistics and a few years' experience.
2. Junior Statistician.
3. Three or four graduates in Science or Engineering who seek to apply their training to industrial problems.

Applicants should write, giving briefly age, qualifications and any information which they consider important in connection with the position they are applying for, to:—

Superintendent, Personnel Services,
The Steel Company of Wales, Limited
(Steel Division),
Abbey Works,
PORT TALBOT, Glam.

THE COUNCIL OF INDUSTRIAL DESIGN requires two Industrial Liaison Officers each to cover a group of manufacturing industries, and to assist in promoting the Council's object of raising standards of industrial design through The Design Centre and by other means. About a quarter of the time is spent visiting manufacturers in industrial areas. General qualifications are a good general education and for post (a) training as a mechanical engineer and experience as a designer, preferably of consumer goods; for post (b) architectural training, experience of kitchen and other domestic equipment and an interest in street furniture. Age 28-45. Starting salary according to qualifications and experience, in the scale £1,070-£1,410, or £1,355-£1,610. Contributory pension scheme.—Application forms, to be returned within a fortnight of this advertisement, obtainable with further details from the Establishment Officer, 28 Haymarket, S.W.1.

EXCELLENT prospects exist for a young man or lady speaker with a national NON-PARTY organisation of over 30 years' standing. Must be prepared, after training, to address both outdoor and indoor audiences. Lack of experience is no handicap for a young man or lady with the right personality who is interested in the problems of the nation. Reply, giving full particulars.—Box 629

KILLINGHALL (RUBBER) DEVELOPMENT SYNDICATE LIMITED

MR ADDINSELL'S STATEMENT

The forty-seventh annual general meeting of this company was held on February 11th in London, Mr Jack Addinsell, chairman, presiding

The following is an extract from his circulated statement:

Net proceeds from our sales of rubber amounted to £40,958 as against £34,233, an increase of 4½d. per lb. Cost of production went up 3½d. per lb, of which, however, 2½d. per lb related to higher duty and cess. An important item in our revenue is the income we receive in the form of tin tribute from Killinghall Tin Limited and this showed a fall of £4,252.

Profit before taxation, at £34,022, was practically the same as for 1954-55. Your Directors recommend a final dividend of 30 per cent, making, with the interim of 10 per cent paid in July, a total of 40 per cent, the same as for the previous year. Current assets at £83,496 exceed current liabilities, including future taxation, by £45,728 and your Board have decided to return 10s. per £1 Stock Unit, as being in excess of our needs, to the stockholders by reducing the Company's capital to £26,250.

Crop for the first five months of the current year amounted to 175,600 lb, which compares with 162,600 lb for the same period in the year under review. Yields from our postwar rubber planted in 1947 and 1948, and which first came into tapping in 1954, are making a good showing with current production in excess of 1,000 lb per acre per annum.

The report was adopted and at a subsequent extraordinary general meeting the proposed return of capital was approved

THE EDINBURGH AND EAST OF SCOTLAND COLLEGE OF AGRICULTURE

Applications are invited for the post of ADVISORY ECONOMIST and HEAD of the ECONOMICS DEPARTMENT of the College.

Salary: Grade I (Int.), £1,380 to £1,950.

The post is superannuable under F.S.S.U.

Applicants should hold an Honours Degree in Economics or Agricultural Economics, should have wide experience of post-graduate work, lecturing and administration.

Application Forms, further particulars and conditions of service may be obtained from the Secretary, 13 George Square, Edinburgh, 8. Applications should be submitted within two weeks of the appearance of this advertisement.

THE ALIMI CO-OPERATIVE MARKETING UNION LIMITED

FORT JAMESON, NORTHERN RHODESIA

Applications are invited for the position of Manager of the above Agricultural Produce Organisation. Age limit 30 to 45 years.

Qualification: A sound knowledge of business commercial methods. A Degree in Commerce or Economics an advantage, but not essential. Ability to work with Africans essential.

Salary: Commencing salary according to qualifications and experience, but not less than £1,200 per annum. Free passages and housing will be provided.

Further details can be obtained from the Commissioner for Northern Rhodesia, 57 Haymarket, London, S.W.1, to whom applications (3 copies), giving details of educational qualifications and experience, should be sent, together with copies of references, before March 15, 1957.

A VACANCY occurs in the INVESTMENTS BRANCH of a world-wide industrial organisation for a man of exceptional ability, age 27-30, who by his experience has already shown that he possesses a real grasp of investment problems. A good University Degree is preferable, but it is essential that he has an enquiring and analytical mind and the ability to work independently, largely without supervision. The position offers excellent prospects. Write, giving full details of qualifications and previous experience, quoting reference H.4033, to Box 5130, c/o 191 Gresham House, E.C.2.

ECONOMISTS. A leading manufacturing Company will shortly be making appointments at various levels in its Market Research Department. These will be suitable for men or women in the approximate age bracket 23/35 who graduated with first-class honours, though a slightly lower standard might be considered if there is other evidence of exceptional ability whether at school or university, during National Service, or in commercial or industrial posts held. A full personal history should be given. All applications will be acknowledged and interviews for those selected arranged at an early date.—Box 631.

EXECUTIVE required for leading Financial and Investment Group. Must be experienced in administration, investments, publicity and salesmanship. Age 30-45. Excellent prospects.—Apply Box 627.

ORGANISING SECRETARY (male) required for the INTERNATIONAL DAIRY CONGRESS, London, June 29-July 4, 1959. Appointment would be for 2½ years (July 1, 1957-December 31, 1959). Experience in the dairy industry and a speaking knowledge of at least one foreign language (preferably French or German) are desirable but not essential. Letter of application, in own handwriting, accompanied by details of experience, qualifications, age, and salary required, should be sent immediately to UNITED KINGDOM DAIRY ASSOCIATION, 17 DEVONSHIRE STREET, LONDON, W.1

A FIRM supplying packaging materials to a wide range of industrial outlets has a vacancy in its Market Research Department for others in the West End of London) for an assistant to interpret, and supervise the collection of, sales and other statistics and to prepare reports on economic subjects. Applicants should be aged 21/27 and should have a degree in economics and/or appropriate experience. The post offers possibilities of later development to outside market investigations and within the marketing division of the company. Salary according to qualifications and experience.—Box 632.

WELL-ESTABLISHED City firm, Textile and Packaging Machinery Overseas Sales, require for expansion programme two Executives. Languages advantageous. Travelling involved. Write Box F1746, c/o 95 Bishopsgate, E.C.2.

MILK MARKETING BOARD FOR NORTHERN IRELAND

APPOINTMENT OF SALES DEVELOPMENT OFFICER

Applications are invited for the post of Sales Development Officer (Male) on the staff of the Board who are responsible for the marketing of over one hundred million gallons of milk per annum.

The salary scale is £990 per annum rising by annual increments to a maximum of £1,195 per annum. The commencing salary will be determined by reference to qualifications and experience.

The duties attached to the post relate mainly to the promotion of the sale of milk for consumption in liquid form, and milk products. This will involve market research, the application of sales technique and assisting in the organisation of events relating to sales development.

Applicants, who must be of British nationality, should have a good general education, experience in the carrying out of market research, a knowledge of advertising and modern sales technique and the ability to speak in public. Some knowledge of the milk industry would be an advantage.

The work is interesting and requires initiative and imagination. There will be ample opportunity for the development of original ideas.

Preference will be given to suitably qualified ex-service candidates.

The appointment will be subject to the conditions of employment laid down by the Board which include a provision that eligible staff shall contribute to the Northern Ireland Local Government Officers' Superannuation Scheme.

Applications must be made on the prescribed form, copies of which may be obtained from the Secretary, Milk Marketing Board for Northern Ireland, Castlehill Road, Belfast.

The closing date for the receipt of applications will be THURSDAY, FEBRUARY 28, 1957.

GENERAL MANAGER FOR CALICO PRINTING WORKS

Seedhill Finishing Company, Limited of Paisley, a subsidiary of William Hollins and Company, Limited, of Nottingham, require a *General Manager, aged about 35-45, for their* Cloth Printing Works at Aelesion, Paisley. University or other technical qualifications and good practical experience, preferably including wool and cotton unions, essential.

This is a senior appointment covering all activities of management, with a commencing salary of from £2,000 to £2,500 a year, depending on qualifications, and holding excellent prospects, including the possibility of a Directorship.

A good house is available and the company has a Superannuation Scheme in force.

Apply, in confidence, to The Managing Director, Seedhill Finishing Company, Limited, Paisley, Scotland.

RESEARCH ASSISTANT. Opportunity for appointment in economics department of large financial institution in London to man or woman with good economics degree, aged 22-30. Starting remuneration varies with age: at 25 (subject to short probation): £680 (men), £600 (women). Non-contributory pension. Write to Box No. 697, c/o Charles Barker & Sons, Ltd., Gateway House, London, E.C.4

EXECUTIVE (Accountancy qualification an advantage), age 25-45, required by large manufacturing company West London, to take charge Office Department controlling works planning and progressing; knowledge of works procedures essential, but main requirement lies in institution and control of adequate records, both office and works, covering wide variety of products. The successful applicant must be of strong personality, and able handle staff. Knowledge punched cards an advantage. The position is a senior one in the organisation, the commencing salary being according to experience but not less than £1,250 per annum. Contributory Pension Scheme.—Apply, giving age, details past experience and salary earned, in confidence, to Box 628

YOUNG Public School man required for important City organisation. Applicants should have completed their National Service. Maximum age 23. While vacancies only available in London, candidates may indicate whether they desire to serve overseas. Generous salary scale. Three weeks' annual leave, lunch provided, contributory pension scheme, five-day week. Apply in own handwriting to Box 630.

STATISTICIAN with good knowledge of sales analysis, market research and business organisation needed by firm of international repute in the food industry. Good scope for successful applicant. Age 26-35 years.—Reply to Box 601.

APPOINTMENTS

THE UNIVERSITY OF MANCHESTER

Applications are invited for two full-time posts of ASSISTANT SECRETARY to the Appointments Board. The possession of a University degree is desirable.

The first post is open to both men and women and will be concerned mainly with science and technology students and graduates. Initial salary within the range £1,000 to £1,350 per annum according to experience and qualifications.

The second post is open to women only and will be concerned mainly with women students and graduates. Initial salary within the range of £650 to £1,050 per annum according to qualifications and experience.

Both appointments will carry membership of the F.S.S.U. and Children's Allowance Scheme. Duties to commence as soon as possible.—Forms of applications and further particulars may be obtained from the Registrar, the University, Manchester 13, to whom applications should be sent not later than March 1, 1957.

UNITED KINGDOM ATOMIC ENERGY AUTHORITY

ENGINEERS, CHEMISTS AND PHYSICISTS

Applications are invited by the Industrial Group of the United Kingdom Atomic Energy Authority for vacancies in the Commercial and Overseas Departments of the Technical Policy Branch at Risley, Warrington, Lancs.

A. COMMERCIAL DEPARTMENT (Reference No. 1745)

The duties will be concerned with the exploitation of technological information and sales of materials, particularly nuclear fuel, by the Authority, both in the United Kingdom and Overseas. There will also be opportunities for working in collaboration with British Industries and the Electricity Supply Authorities in the development of industrial applications of atomic energy.

A sound technical/commercial background is called for with the ability to appreciate the commercial value of technological development work. Candidates should have had previous experience of (a) high-level industrial negotiations and the drawing up of commercial agreements and/or sales contracts, and/or (b) working in close liaison with the Research Engineering and Production Departments of a major industrial concern.

Selected candidates will be given facilities to acquire an understanding of the technical processes and plants of the Industrial Group.

B. OVERSEAS DEPARTMENT (Reference No. 1747)

The responsibilities will cover a wide range of duties including negotiations with foreign government departments and industrial concerns; the implementation of international agreements on the peaceful use of atomic energy and attendance at international conferences. In the technical field all aspects of atomic power generation will be covered, including design and construction of power reactors and chemical plants, together with design and fabrication of nuclear elements.

Preference will be given to candidates in their early thirties with a background of technical achievement and ability to appreciate detail rapidly. Previous experience of overseas liaison and a knowledge of economics will be an advantage.

QUALIFICATIONS :—

Candidates for all posts should possess a degree in one of the Applied Sciences and/or be corporate members of one of the Senior Professional Institutions.

Salaries will be assessed within the following scales:—

Grade I £1,705—£1,980 per annum
Grade II £1,235—£1,655 per annum

A contributory Pension Scheme is in operation.

Authority houses for renting by successful married candidates may be available in due course, or alternatively, substantial assistance may be given towards legal expenses incurred on private purchase.

Send a postcard asking for an application form and quoting appropriate reference number to The Recruitment Officer, United Kingdom Atomic Energy Authority, Industrial Group Headquarters, Risley, Warrington, Lancs. Closing date—March 4, 1957.

CREDIT CONTROL

The U.K. Sales Division of DEXION LIMITED is expanding its activities to market its products through a nation-wide network of distributors. To help with this, the company seeks a man to initiate and develop the job of Credit Control Officer. He will be centred in London and will be required to work with U.K. Sales Regions in advising on all matters connected with distributors' accounts. This is a senior appointment and applicants should possess wide knowledge of this type of work. Equally important, however, is the ability to develop a job from scratch with the minimum of supervision. Please write in the fullest possible detail of education and experience to:—Personnel Dept. (CC5), Dexion, Ltd., Musgrove Road, London, N.W.6.

ROLLS-ROYCE

(AERO ENGINE DIVISION)

have several vacancies in their
ENGINEERING AUDIT DEPARTMENT
AT DERBY

which is concerned with work study, budgetary control, office organisation and methods, and other special duties on behalf of the management.

Candidates should be between the ages of 25 and 35, and whilst preference will be given to those with a good engineering degree or its equivalent, together with some experience in work study or industrial consultancy, consideration will be given to those with accountancy or commercial qualifications supported by appropriate industrial experience. Initiative, personality, and the ability to deal successfully with people at all levels, are essential requirements.

Those interested should write for an application form to

Staff Appointments Officer,
Rolls-Royce Limited,
P.O. Box 31, Derby.

MIDDLESEX COUNTY COUNCIL

APPOINTMENT OF ESTABLISHMENT OFFICER

Applications are invited for the above post in the office of the Clerk of the County Council. Duties involve general staff management of all employees (except teachers and firemen) and O. & M. work. Salary £2,500 x £100 —£3,000 p.a. Pensionable and subject to medical assessment and prescribed conditions.—Applications, stating age, qualifications, previous appointments, experience and names of three referees to reach the undersigned not later than March 4, 1957. Detailed list of duties on application. (Quote U.543 E.) Canvassing disqualifies.

Guildhall, KENNETH GOODACRE.
Westminster, S.W.1. Clerk of the County Council

PERSONAL ASSISTANT TO SENIOR EXECUTIVE

Applications are invited for the post of Personal Assistant to a Senior Executive with a prominent Developing Organisation. Candidates must be men between the age of 25 and 33 and should have a good University degree (Arts or Science) or equivalent professional qualification, and at least 2 years' post-graduate experience in industry or commerce. It would be an advantage for candidates to have had civil engineering, building, or housing or estate management experience.

Requirements include a high level of intelligence, marked administrative ability, socially impressive personality, robust health and marked drive and ambition. It is proposed to allow the chosen candidate about six months' practical training on the job before he is given major executive responsibilities.

The post will be in London, but some travelling within Great Britain will be involved. Starting salary will be about £1,500 p.a., and there are excellent prospects of rapid increase of salary.

Candidates are asked to make their applications on the standard form which is available from: The Secretary (C21), 14 Welbeck Street, London, W.1 (Telephone: WELbeck 1144).

NATIONAL COAL BOARD

NORTH WESTERN DIVISION
DIVISIONAL HEADQUARTERS

ASSISTANT SECRETARY required. The successful applicant will assist the Divisional Secretary and deputise in his absence. Duties involve a considerable amount of and other minutes and papers and general assistance in the administration of the Secretary's Department. Proved administrative ability accompanied by a good command of the written and spoken word and a sound education (preferably up to Degree standard) essential. Previous experience of similar work an advantage. Salary scale £1,085 x £35 to £1,475 per annum.—Applications, giving full details of age, education, qualifications, experience and present position to Staff Director, 40 Portland Street, Manchester, 1, within 7 days.

DIVISIONAL CHIEF FINANCE OFFICER REQUIRED BY WEST MIDLANDS COAL BOARD

An accountant of outstanding ability holding recognised accountancy qualifications and who has had experience in large-scale industry is required for the post, which will become vacant shortly.

Normal salary range is £2,000-£2,600 but up to £2,850 would be paid to a man of exceptional qualifications and experience.

Duties comprise financial control of capital and revenue expenditure, including development of budgetary control, and general advice on financial matters throughout the Division.

Applications, within 14 days of this date, to Divisional Chief Staff Officer, National Coal Board, West Midlands Division, Himley Hall, Dudley, Worcs.

IBM UNITED KINGDOM LIMITED require a number of outstanding men, aged 25-40, with initiative, drive and real organising ability, for positions concerned with Electronic Data Processing Machines. Qualifications should include a wide experience of systems and methods in Commerce and/or Industry preferably but not essentially including Punched Card Systems. A degree or other professional qualification is desirable. Necessary training will be given (the next course commences in London on April 1, 1957) and a salary commensurate with qualifications and experience will be paid during this period. A number of graduate mathematicians interested in programming, with or without experience in this field, is also urgently required. These openings, which occur in London, Birmingham and Manchester, represent excellent opportunities in a field with an enormous future.—Full details, please, to the Personnel Manager, 101 Wigmore Street, London, W.1, quoting reference EDPM 4.

QUALIFIED ACCOUNTANT with fluent French is required for professional appointment in the Belgian Congo. Administrative ability, energy and initiative essential. Exceptional prospects for the right man.—Write Box X.496, c/o Streets, 110 Old Broad Street, E.C.2.

ECONOMIST—Economics Graduate, aged 25 to 35, required to work and write on economic problems connected with nuclear power and nuclear power station design. Analytical ability and adaptability are more important than a previous technical background, as the applicant appointed will have every opportunity to learn about the technical aspects of the work. Previous industrial experience an advantage.—Write, giving details of educational qualifications and career, to Personnel Manager (E), The General Electric Company, Limited, Fraser & Chalmers Engineering Works, Erith, Kent.

A GRADUATE STATISTICIAN is required by the Milk Marketing Board for work in connection with statistics from their Creameries and Central Laboratory. Post is permanent and pensionable. Age 25 to 30. Experience an advantage. Attractive salary according to age and experience.—Applications to Senior Staff Officer, Milk Marketing Board, Thames Ditton, Surrey.

STOCKBROKERS who deal mainly for institutional clients require young man with experience in an investment department for statistical work. Ample scope for promotion and ability will be well rewarded. Bonus, pension scheme and free luncheon vouchers.—Box 626.

UNIVERSITY OF CAMBRIDGE

DEPARTMENT OF ESTATE MANAGEMENT

The Department of Estate Management proposes to award, from October 1, 1957, grants for research in economic, legal or social problems related to the ownership, tenure or development of land.

Essential qualifications: good honours degree in History, Economic History, Economics, Agricultural Economics, or Law, or a degree with a high class in Estate Management, or evidence of likelihood to obtain such a degree not later than July, 1957.

Value of a grant £400 a year, plus University and College fees. Normally tenable for two years.

Particulars from Secretary, Board of Estate Management, 74 Trumpington Street, Cambridge. Completed applications should reach him by March 15th.

SCIENTIFIC COMPUTING IN IBM.—Young men and women trained as mathematicians, or as engineers or scientists, with a good mathematical background, are needed to help in the formation of a scientific and technical computing group. Members of this group will operate a scientific computing centre in the London area, based on a high-speed digital computer. They will also work with outside organisations throughout the country advising on the use of IBM equipment for scientific work and assisting in the setting up and operation of computing installations within these organisations. Members of this group will be provided with an initial period of training in the London data processing centre. Opportunities will be provided later for specialisation within this centre on particular types of equipment or computing applications. Other opportunities will arise for regional work in connection with assistance to outside organisations.—Please write, in first instance, to the Personnel Manager, IBM United Kingdom Limited, 101 Wigmore Street, London, W.1, quoting reference SC2.

SUCCESSFUL Company Director (39, Fellow of Institute) seeks change; widely experienced all aspects Management, Costing, Budgetary Control, Sales and Personnel work. Capable organiser, strong personality, and good mixer.—Box 634.

EXPORT—top executive with major industrial concern seeks change. Graduate, linguist, widely travelled, age 33. Fully experienced all aspects export trade.—Box 633.

NORANDA MINES LIMITED

DIVIDEND NOTICE

Notice is hereby given that an interim dividend of Fifty Cents (50c) per share, Canadian Funds, has been declared by the Directors of Noranda Mines Limited, payable March 15th to Shareholders of record February 15, 1957.

By Order of the Board,
Toronto, Ontario, C. H. WINDELER,
February 5, 1957. Secretary.

MIDDLE EAST MARKETS—WHAT FUTURE? The Middle East Economic Digest, a new subscription weekly starts shortly. Accurate up-to-the-minute information from Middle East sources.—Details from Economic Features, 84 Chancery Lane, W.C.2. CHA. 8533-4.

UNIVERSITY OF LONDON

A lecture entitled "Some Thoughts about the Pattern of Trade" will be given by Professor A. J. Brown (Leeds) at 5 p.m. on February 22nd at the London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2. ADMISSION FREE, WITHOUT TICKET. James Henderson, Academic Registrar.

the things they say!

Huge place, isn't it?

Darn sight too huge, if you ask me. These new I.C.I. places cost millions and millions — and what's it all for?

Why, surely to make new chemicals for Britain's expanding industries . . . ?

Not a bit of it — profits for a few top hats in the City, that's all it's for, mark my words. It isn't right that a few men should control such wealth and power, and if I were running this country . . .

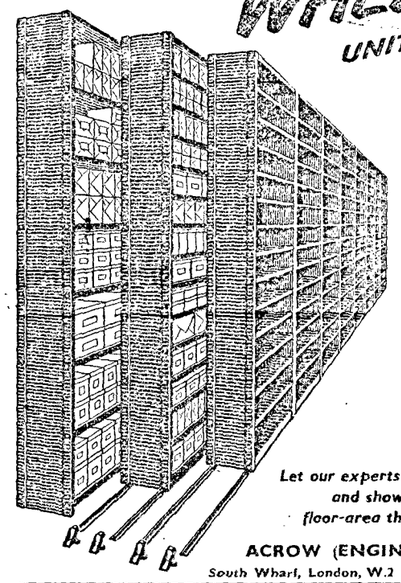
Oh, come. You talk as though I.C.I. were controlled by a few financiers answerable to no one but themselves.

Well, isn't it?

Of course not. Nor is any big public company today.

Go on! I.C.I. is run by a handful of directors, and don't you say it isn't.

Certainly the big policy decisions in I.C.I. are made by the Directors. But nearly all of them are men who've come up through the organization, and none holds his position on the strength of a big block of shares or anything like that. Anyway, control of I.C.I. ultimately lies in the hands of the I.C.I. stockholders.



And who are they, eh?

A fair cross-section of the community—from foremen plasterers to district n.. from shop assistants to judges. All told, no fewer than a quarter of a million people. The number is going up all the time, too, for under I.C.I.'s Profit-Sharing Scheme over 80,000 of its employees are also being given shares in the business.

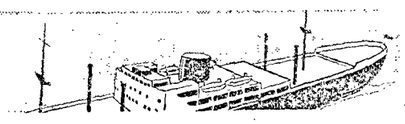
HOW WILL INDUSTRY TAKE THE STRAIN?



The prospect for industry has changed more swiftly than expected since the Manchester Guardian's last annual survey. To find out exactly how things stand, Manchester Guardian reporters have had interviews with leading people in industry up and down the country. The result—'Production under Pressure'—is a stimulating analysis which shows how far industry can be justified in its present confidence. The Manchester Guardian Survey of Industry, Trade and Finance, 1957, includes many other articles which turn an expert eye on the future of industry.

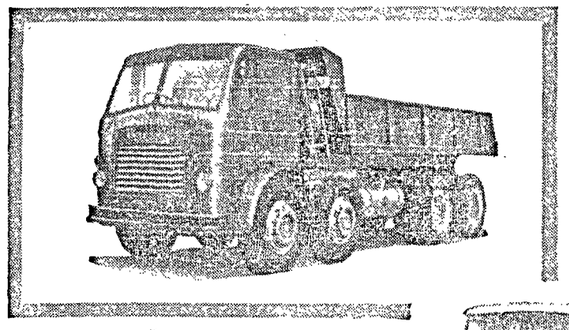
Our trucks ... from 30 CWT TO 150 TONS-

(AND MORE THAN 100 *DIFFERENT MODELS IN BETWEEN)...*

are ALL fuel savers

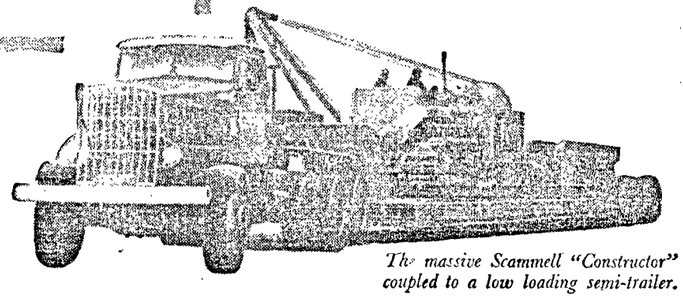
The popular Albion 30 cwt. "Cairn" cuts short-haul delivery costs to the bone.

No organisation in the world offers such a wide range of road vehicles as the Leyland Association of manufacturers. From the unequalled range of capacities available, transport operators will find the exact truck for their particular job, whether it is for modest 30 cwt. delivery work or gigantic constructional schemes entailing load-carrying of up to 150 tons.



Every vehicle carries the guarantee of high performance, wonderful mechanical reliability . . . and a standard of fuel, maintenance and operating economy that has no equal.

Vehicles from the Leyland Group are working successfully in all corners of the earth, untroubled by extremes of climate or the primitive terrain of the "outbacks".

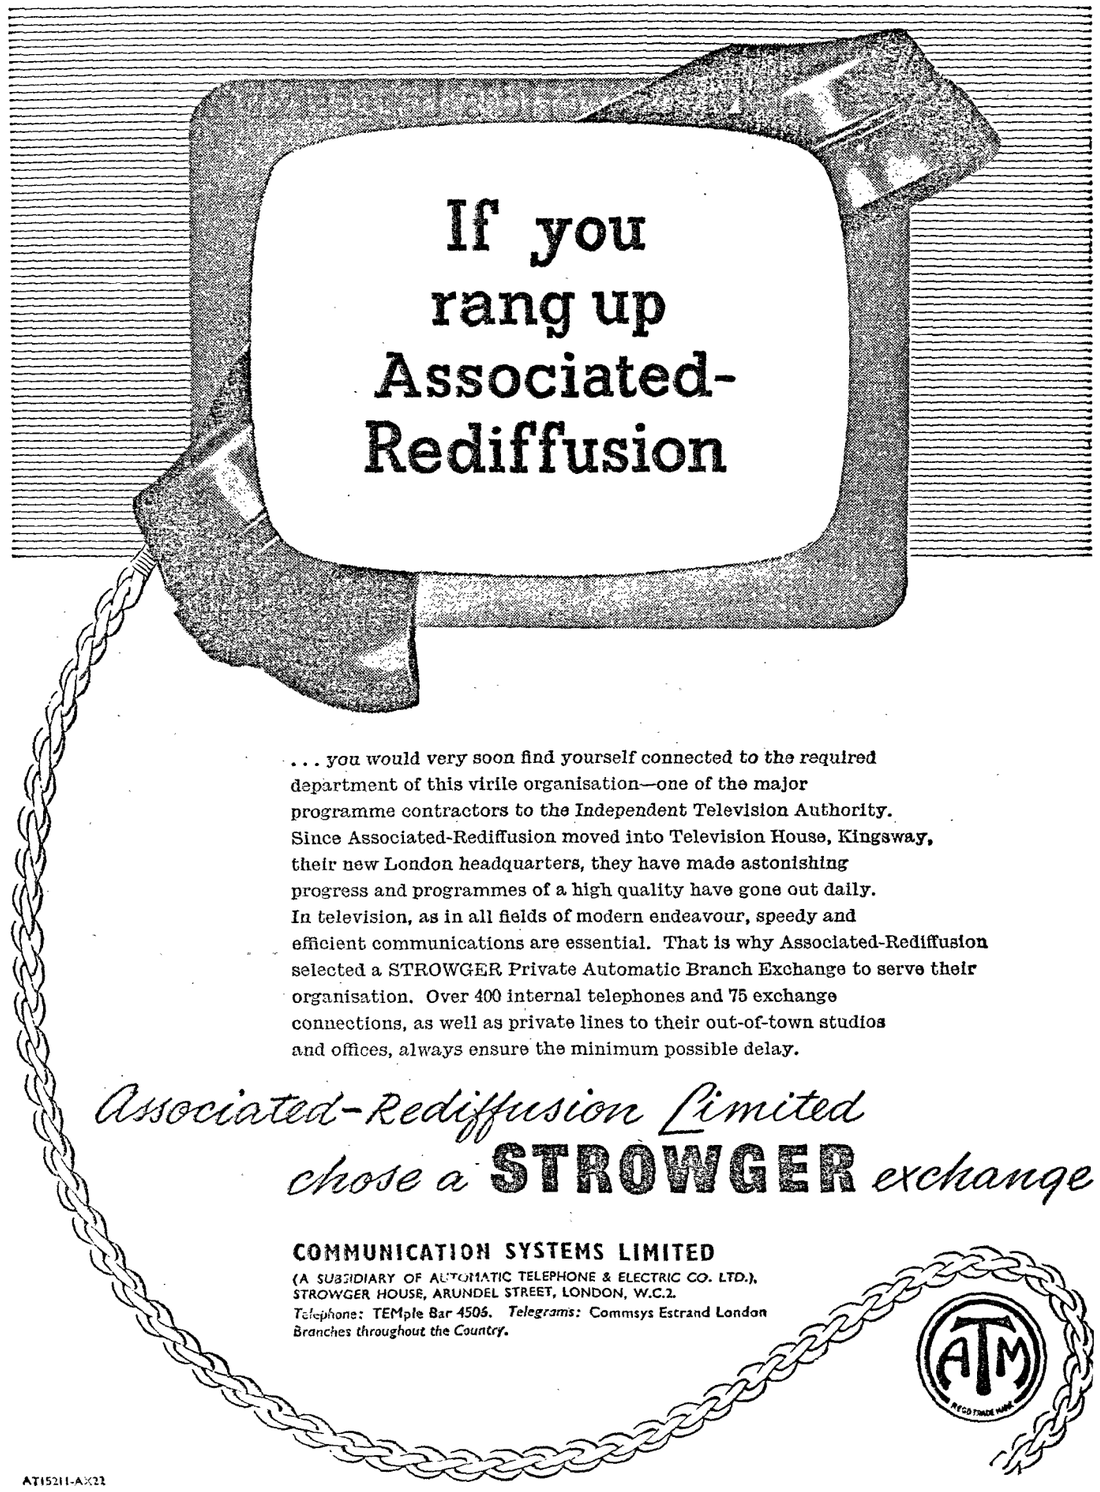


In addition, the organisation manufactures oil engines for an almost limitless variety of industrial applications.

Linked with the immense creative activities of the Group is an after-sales spares and repair service from branches and agencies in over 60 countries ensuring that customers will enjoy non-stop performance.

Particulars of the full range of products and nearest service station available will be sent on application.

Here is the 24-ton 8-wheeled "Octopus," heaviest in the Leyland range.



The massive Scammell "Constructor" coupled to a low loading semi-trailer.

Sweden drives world's biggest tunnel

Fast flowing rivers streak Sweden's semi-Arctic north. For a country without either coal or oil, a source of cheap, abundant power. At Stornorrfors on the River Ume, the Swedish State Water Power Board is building Sweden's biggest hydro-electric power station. It is here that water discharged by the turbines in the underground power house will travel the two and a half miles back to the river through a tunnel 49 feet wide and 85 feet high. There was a time when a tunnel of this size would never have been attempted. Equipment to do the job fast and economically didn't exist. Only since the introduction of the Swedish Method of rock-drilling, pioneered by Atlas Copco and the Sandvik Steelworks in collaboration with Swedish engineers, has tunnelling on this scale been practical. Today, huge tunnels and cathedral-like power houses below ground are commonplace. Witness Stornorrfors, the world's biggest tunnel, where they are drilling 500 feet per man shift with Atlas Copco rock drills in the excavation of two million cubic yards of rock.

Oil drilling in the Sahara

Compressed air is versatile. Atlas Copco provide the means for all its many applications. In the Algerian Sahara, where large-scale drilling operations are in progress, compressed air is being used instead of water as a bore-hole scavenger. Atlas Copco CT air-cooled compressors, mounted on trucks, provide the air needed to blow pulverised rock, sand and dust to the surface.

The Atlas Copco Group of Companies is responsible for the manufacture of compressed air equipment and its distribution and servicing in 90 countries throughout the world. Group Headquarters: Atlas Copco AB, Stockholm 1.

Atlas Copco puts compressed air to work for the world

Democracy's Way

THE week after the Lewisham by-election, a week which has seen what was in effect yet another miniature budget, finds the Conservative party facing three questions. Where do they stand now? Why? And even more important, what should they do?

To the question of where the Conservatives stand North Lewisham does provide a clue, provided it is rightly read. All sorts of wrong reasons are being conjured up for Labour's victory, after a by-election which, with its old-time spectacle of fully-attended meetings and its high final poll, perhaps gave some excuse for romantic political illusions. But when all the personal explanations have been attempted—and when the Suez crisis (which everybody says did not affect the voting) and the Rents Bill (which everybody says did) are also given their electoral weight—the fact remains: the result of the by-election was dead on the fourteen-month-long statistical trend against the Government.

If one makes the too pro-Government assumption that all Miss Greene's 1,487 supporters would have voted Conservative in her absence, the swing to Labour was 3½ per cent; if one makes the slightly too anti-Government assumption that they would otherwise have abstained (or divided equally between Conservative and Labour), the swing to Labour was 5½ per cent. Since the end of 1955 the swing to Labour in by-elections has oscillated between the lower of these figures and what can be regarded as the Tonbridge maximum (June, 1956) of 8½ per cent. In a marginal constituency, where there usually is an accretion of support to the party in previous control of the seat, one would expect the result to be near the bottom, rather than the top, of the recent range. The analyst can guess, as analysts will, that the instinct to give a chance to a new Government and the fact that the election was fought on an old Tory-weighted register should have pushed the swing still lower on this occasion, that the Suez venture (which was certainly not generally unpopular, although its failure was) was a neutral factor, and that it was opposition to the Rents Bill which pushed the swing fatally up again. But these are the ripples on the surface. The obstinate undertow of reality is that a consistent swing now indicates that any general election since the early winter of 1955-56—pre-Suez or post-Suez, pre-Rents Bill or post-Rents Bill—would have been likely to be won by Labour, with a majority, probably, of between 50 and 150 in the House. It is on this persisting swing, not on the Lewisham result in isolation, that the Tories should fix their eyes.

What happened in the winter of 1955-56, to set the trend off? It is not easy to give a confident answer, apart from the simple fact that the Tories had by then been four full years in office and had lost Sir Winston as Prime Minister. But another simple fact is surely significant; it was at the end of 1955 that living standards stopped rising. Until then, the Conservatives had been able to propagate the dynamic idea of an acquisitive and expanding society, within which everybody would seek to emulate each other in trying to get richer

and—most important—in which nearly everybody succeeded; and to point, in proof, to an increase in the national income of some 3 to 4 per cent a year. All this naturally had a greater appeal than Labour's promise to do all sorts of painful things in order to effect a once-for-all redistribution of 1 or 2 per cent of that income from the rich to the poor. The vote was for carrots, not sticks. That is democracy's way.

★

But the process tended to outrun itself. The rate of growth in this island's income is conditioned by two things: by the need to prevent the value of the currency from being continually undermined by inflation at home; and by the need to prevent the value of the pound from being undermined abroad by an unfavourable balance of payments. When the demands of consumption and investment, of the people and the Government, showed ahead of the resources—and the savings—available, when the diversion of effort from exports became threateningly high and foreign confidence in sterling wavered, the advance had to be slowed down. There can be dispute about the efficacy of the monetary and budgetary means adopted to restrain the excess demands; there can be none about the proposition that it is no use having a fast car if it skids and turns over at the corners. The test, of course, of the measures adopted during the past eighteen months is their success in restoring the equilibrium of the economy so that the advance can be resumed. But, meanwhile, it has been arrested; and the sad truth is that, so long as the rise in income is slowed down, the majority vote is always likely nowadays to go against a Conservative government in power, because there is a majority of people who think that when Labour says it would redistribute income towards the hard pressed, the hard pressed means them. "Fair shares" climb back on to the centre of the electoral hustings. That is democracy's way, too.

What, then, should the Conservatives do? Clearly there is only one answer to this; in so far as their guns are trained in the right direction they should stick to them. Their proper response to the unfriendly electoral trend is not to abandon the policy of restoring the balance of the economy but to press it forward, with all speed, to the point of success. It involves especially, at this season of the year, looking to the balance of the national finances, as well as of the national economy, and to the part which a recasting, if not a reduction, of taxation can play in the process of recovering a safe momentum. In the measures which they have announced in this post-Lewisham week they have recognised at least half of the pikestaff. They cannot win the next election (and, more important, advance the wealth and welfare of the country) by not annoying people. The Tories therefore need not be too worried if tenants' associations clamour that their moderate retreat on Clause 9 of the Rents Bill is insufficiently precipitate, and if the Labour party makes great play with the increases in health service contributions and the price of school meals. The questions are rather, first, whether they are doing all that they can, within the limits of their policies, to reduce the demands of public expenditure by these and other means; and secondly, how far it will be possible, without upsetting the applecart again, for Mr Thorneycroft to include in his Budget some at least of the tax changes which the "opportunity State" to which his leader has pledged himself requires.

The sort of Budget that is needed for a new advance is plain enough. Ideally, it would restore the investment allowances; it would raise the starting point for surtax on earned (but not unearned) incomes; it would possibly make some reliefs in other direct taxes (if necessary counter-balanced by some increases in indirect ones); and it might even make a start in halting, if not reversing, the erosion of the tax base (especially on company profits) which was the subject of two articles in *The Economist* last week and the week before. What prospect is there now that the Chancellor could afford anything of this kind in April?

The conclusion that emerges from a study of the estimates, and economies, announced this week is that by next autumn real Government expenditure on current goods and services should be at a rate at least slightly lower than it has been in the past year. The £110 million increase over this year's total estimates, of which Mr Thorneycroft spoke, does not include the £20 million to be saved on the health service and whatever is to be saved on defence; and, most important, since the prices of things that the Government buys must have risen by some 3 or 4 per cent, any rise in the estimates of less than about £120 to £160 million is likely to mean that the Government is setting some real resources free. The question before Mr Thorneycroft is whether he thinks that private demand on its own, in the absence of tax reliefs, would rise this year by more than the resources that will be available.

This is an economic question and Mr Thorneycroft should not be asked, either by his party colleagues or by more detached critics, to rig the answer for political reasons. A dozen Lewishams do not matter beside the task of putting the economy securely into balance. But, even within the terms of his economic brief, the Chancellor has two objectives: if the first is to resist a return to inflation, the second is to look ahead to the end for which this policy is the means. That end, on political and economic grounds alike, is a return, not to inflation, but to a steadier expansion. It is to that end that incentives in the Budget, if they can honestly be afforded, should be directed—in particular, to maintain the confidence of business men as they make their decisions about investment in the course of the coming year. If the Chancellor of the Exchequer does decide, as he well may, that there is no room for tax reliefs, or opportunity for redressing the tax burden, he may reasonably be asked whether he ought not to have made more room and opportunity by still sterner cuts this week. But though the question should certainly be asked, it should not be asked too hectoringly. The Chancellor's dilemma is that of the nation itself: how to marry stability and progress. And probably it could ultimately be resolved only if the British people themselves were willing (and were encouraged) to work like the Germans, to save like the Swiss, and to compete like the Americans. Perhaps the real message that should be heeded from Lewisham is not the one that came out of it to the Tories last week, but the one that came from there a hundred years ago. The constituency that Labour has just captured is the former home of Samuel Smiles.

How Strong a Shield?

TWO and a half years ago, when the western European governments faced the collapse of the European Defence Community, the British government was credited with a diplomatic triumph in winning French assent to a German army by the promise.

> to maintain on the mainland of Europe . . . four divisions and the tactical Air Force, or whatever the Supreme Commander regards as equivalent fighting capacity. The United Kingdom undertakes not to withdraw these forces against the wishes of the majority of the Brussels Treaty Powers, who should take their decision in the knowledge of the views of the Supreme Allied Commander.

This undertaking still stands between the British government and big defence cuts.

The difficulty is not merely one of finding foreign exchange, for instance, through "support costs." Beyond the drag on the British balance of payments, the commitment to keep something approaching 100,000 men in Germany indefinitely makes almost impracticable any early abolition of conscription, along with all the economies this would yield to the British taxpayer, since it ties up more than half the number of men likely to be produced for the regular army by ordinary recruitment. Other commitments elsewhere can be cut when they no longer serve a real national interest. But they would have to be slashed almost to vanishing point to be met by the remaining 50,000 volunteers likely to be forthcoming; there could be almost no preparations to meet limited wars "round the periphery" at all. As it is, the reduction in the Army's strength will leave it with 360,000 men in addition to Rhine Army's 80,000.

General Norstad, the Supreme Allied Commander, has made it plain that he cannot regard a major cut in the British commitment in Europe as justified by anything that has happened since it was entered into. Militarily, he is not halfway to the goal of 30 divisions which was then agreed to be the minimum for a shield in Europe, even taking the new atomic artillery into account. He can accept a temporary 25 per cent cut in the British forces on compassionate grounds, but not on grounds that would lead to other countries following suit and so leave him with, say, nine effective divisions instead of his present twelve or thirteen; and the plea that the original commitment can be met by fewer men (or fewer planes) is, apart from sensible pruning, an obvious self-deception. It is open to the British Government to decide that large defence savings are unavoidable on economic grounds; it is not open to the government to pretend that it can have both radical cuts and adequate defence as defined in Nato planning.

The problem is not merely to provide a shield, but to maintain an alliance. If the strength of the shield fails to give confidence, then the alliance will dissolve. With the French tied up in Algeria, the Germans not yet in the line, the British preparing a reduction of their contingent, and the Americans feeling both their flanks somewhat in the air, the shield and the alliance are both in a critical state. But how important is the shield, and what practical purpose does it serve? It can be argued that successive allied commanders have for ten years held western Europe with a mere dozen divisions backed by the threat of the strategic air force. Even another dozen divisions would not make the threat of retaliation by long-range bombers any less important as the real deterrent to aggression in Europe. To this two answers are offered. The first is that the Russians may soon equal the West in its power of strategic bombing. The second is that, under the Nato plan, the shield has an important part of its own to play in the deterrent. Its existence is supposed to make sure that the Russians could not advance into Europe without being involved in heavy land fighting. If they had the power in a few hours to seize capitals and governments *in situ*, it might be difficult to retaliate with atomic weapons; and this possibility could be a permanent temptation to a fatal smash-and-grab raid.

But the plans for the shield have always been much more ambitious than to provide a few hours' fighting while armageddon got going. The European governments have to be offered the hope that they will not be overrun by the Russians and have to be liberated afterwards. Planning at Shape therefore has been in terms of forcing the aggressor, however deep his penetration, to retreat. Tactical atomic weapons have been mounted in numbers for the precise purpose of "pinching off" attacking forces by atomic air strikes and missile attacks upon their communications. But the ultimate hope goes further than this: it is to develop an atomic defence with low-yield weapons of such density, accuracy and selectivity that even along the long land frontier between East and West could not be penetrated.

That is the ideal—the ultimate hope of Nato governments for a complete defence; and the ideal can seldom be achieved—or afforded. But the immediate nightmare of Shape commanders is of an attack so swift and made at so many points that their screen forces would be unable to prevent their artillery from being overrun even before the command to fire it was given; that by the time the command was given (and it is quite obscure who would give it) the invaders would be so mixed up with the inhabitants that it would be impossible to fire tactical atomic weapons at all.

General Norstad cannot, therefore, be blamed for resisting any action that would reduce his holding forces still further now. As things are, there is a balanced American army of 150,000 men with five divisions, and a British army of 80,000 with four divisions; the French "division" is no more than a series of training cadres; the Belgians have three very under-strength divisions amounting to 32,000 men; the Dutch have one division of 10,000; the Canadians and Danes amount to another. To add up General Norstad's "divisions" is thus like adding lemons and oranges. But to present a cut of 20,000 men in Rhine Army as a useful "streamlining" of four British divisions, soon to be completed by the new guided missiles artillery regiment, is not likely to impress Western European Union. In terms of "equivalent fighting capacity" it represents the loss of a British division to the shield.

From this analysis of the forces in Europe and their present allotted task it is not easy to draw any easy or comforting conclusions. The shield, even if it is not weakened, is not strong. On practical military grounds, a request at the forthcoming WEU meeting that British economies should at least be delayed until the five German divisions are ready would be difficult to resist. But even when they are ready, the British Government is not released from its pledge; on the contrary, it is then that the conditions are fulfilled for which the original commitment was made.

There is still every reason to press the search for the most economical and effective use of the men in Rhine Army and in Second Tactical Air Force. The phrase "equivalent fighting capacity" ought to be a stimulus to better army organisation. It seems likely enough that some useful pruning in headquarters staffs of the Rhine Army is possible. There is sense in deciding just how long a campaign modern atomic divisions are expected to have to sustain, for upon this depends the size and cost of the supply and maintenance "tail." More mobile forces may be more economical of manpower—if not of transport and maintenance—than larger, more static formations; the British are thinking increasingly of the brigade group as the basic formation, while the Americans plan smaller divisions—but more of them organised in self-contained combat groups. The equipment of the Canberras with tactical A-bombs may justify cutting the air force. And there are other ways in which Britain could make its contribution to WEU; the role of supplying atomic tactical weapons and instruction to non-American allied forces could be Britain's. The auspicious start made in dovetailing research and development of weapons among the European Nato governments can be followed up.

But when all these economies have been made, and the improvements to efficiency have been achieved, an expensive commitment remains—short of a revolutionary change in strategic and tactical thinking. And to default on that commitment could prove very much more expensive in the end. On the necessary minimum of concerted defence in Europe depends the hope that a more favourable political situation may eventually emerge, offering real security at lower cost. Mr Sandys is now announcing cuts; but in the defence debate he did show himself well aware of the binding nature of the pledge.

The Antagonists

ATTEMPTS at New York and elsewhere to reduce the dispute between Egypt and Israel to simple principles are more difficult than is often supposed. President Eisenhower based his broadcast on Wednesday (which is further discussed on page 624) on one such principle, in itself unexceptionable, that an assailant must not profit from an armed attack. From this he concluded that the United Nations has no choice but to exert pressure on Israel first. But a study of the matters actually at issue between Israel and Egypt suggests that a choice does, in fact, exist.

In 1947, the General Assembly of the United Nations voted the partition of Palestine, and when in the following year the Arab states tried to upset this decision by force, the Jews proceeded to take by force more than the territory allotted to them. The frontiers so established acquired a legal, if not permanent, status by the armistice agreements of 1949; it is the line then drawn between Egypt and Israel which is now bedevilling discussions in the General Assembly. Israel accepted that line when it signed the armistice with Egypt, and was therefore at fault to breach it by the invasion of 1956; on that ground the General Assembly was therefore right to require Israel to withdraw.

The parallel that has been assumed between the Israeli invasion and the Anglo-French landing is not, however, particularly apposite. Whatever justification Britain and France may produce for their military action, it had nothing to do with the armistice agreement. Israel, on the other hand, can argue that

the armistice, by which its action stands condemned, had already been broken before the invasion took place. In an obscure way, and under compulsion of Israeli resistance to its demands, the Assembly has recognised this distinction. At the same time as it has called on Israel to relinquish its latest conquests, the Assembly has also prodded Egypt to relinquish its claim to belligerent rights in the Suez Canal and the Gulf of Aqaba, which was a prior part of the broken armistice. Neither Israel nor Egypt has yielded, and there is little that the Assembly can do about it; sanctions against Israel, which are again being suggested, might not command a two-thirds vote and, even if they did, are unlikely to command the co-operation of all the members, or to bring Israel to heel.

★

The only power clearly expressed in the Middle East at the moment is that of Israel, a taut-muscled featherweight which has knocked the middleweight of Egypt groggy. The immediate danger to peace does not lie in Egyptian strength destroying a feeble Israel, but in Israel, declaring a plague on all houses, holding tight to all that it has, and, if driven to it, taking more. Israeli propaganda has used the fedayeen threat deftly; but the fedayeen, no doubt a real irritant, are not a threat to Israel's national existence. If the Gaza strip were returned to Egypt, guerrilla activity could scratch more virulently but could not undermine the stability of the Israeli state; without the Gaza strip, Egypt could still (and, no doubt, would) send fedayeen into Israel from Sinai or from other Arab states. Gaza is interesting to the Israelis in part as a trophy of war, because the strip was the base and headquarters of the army which they defeated; in part because it shelters 230,000 refugees who would become at once a burden and a test of Israeli concepts of Arab-Jewish relations. If he were able to isolate these refugees from extreme Arab opinion, Mr Ben Gurion could give them a chance to choose between compensation and repatriation: the chance to go back with money into the Arab world or to stay and settle within the Israeli state. In short, he would like to use the Gaza strip to prove that the refugee problem is not insoluble. No one knows whether he is right or wrong.

But the heart of the Israeli anxiety looks beyond immediate difficulties to the long-term interests of the state. Mr Ben Gurion is working with careful foresight to get Uno to complete the work of 1947 by giving his country its economic freedom; that, in the case now before the United Nations, means access through the Gulf of Aqaba or the Suez Canal, or both, to southern waters. It would be at best a single step forward, a crack in the surprisingly solid armour of the Arab boycott; but to achieve it the Israeli government is ready to force grim austerity upon its people and risk economic sanctions. Our correspondent in Israel describes what this means on page 649.

Israel has always sought a return of Uno to the substance of the question, which means an effort to give Israel more permanent frontiers than armistice demarcation lines and to establish free relations with all states, including its Arab neighbours. Mr Hammarskjöld's mission to Israel and the Arabs last year showed how strong was the resistance of the Ben Gurion government to any efforts to perpetuate the situation as it was then. The policy of massive retaliation by the Israeli army against limited frontier infringements by the Arabs was designed not only to deter the infiltrators who came over from the refugee camps and were a nuisance, but to keep the world alive to the temporary and dangerous nature of present arrangements. It can be asserted that the policy is wrong, but, whether right or wrong, it remains true that Israel wants a long-term settlement, and uses every means, including raids and invasion, to resist any effort to solidify the truce. To restore the armistice agreement, as Mr Hammarskjöld proposed in his report to the General Assembly, would be acceptable if it meant free passage for Israel shipping in the Suez Canal and the Gulf of Aqaba, because it would advance the long-term claims of Israel; to withdraw, and restore the past imperfect truce, would mean defeat for Israel, not for Egypt.

By contrast, the Arab case is rooted in the belief that the natural growth of 40-odd million Arabs, ranged against less than two million Israelis and allied to ever-increasing revenues from oil, will one day enable them to destroy the state of Israel. The Arabs, and therefore Egypt, oppose a definitive settlement or anything likely to contribute to it.

★

Egyptian diplomatists appear to run counter to this policy by hinting in New York and Washington at an unexpected moderation. The reason is clear: Israel *did* inflict a defeat. Egypt's military strength is gravely impaired. Its oilfields in Sinai are wrecked. The national economy, while lacking the fundamental weakness of Israel's, equally lacks that support from other nations on which Israel can confidently count. Cotton exports for the first five months of the current season are less than half the figure for the comparable period of last season, partly because there is no trade with Britain and France but partly, and more significantly, because the Soviet block is buying less. Whatever fulminations the press and radio of Cairo permit themselves, Egypt is in no shape to make war tomorrow or for many tomorrows to come. President Nasser needs a breather; his problem is, in getting it, to give away as little as possible of a permanent nature.

He must find it difficult to yield on the canal or the gulf because the passage of Israeli ships would break the blockade of Israel which has been the Arabs' main weapon, and which was its weapon for four years before he came to power in Egypt. By being the first to give way on this point, he would risk weakening his hold on Egyptian opinion and losing the leadership of Arab

nationalism as well. Mr Ben Gurion is also bound to notice that opinion in Israel is strongly in favour of holding in the north the Gaza strip, and in the south the Sharm el-Sheikh headlands that overlook the Gulf of Aqaba. Each can push the other too far. Nevertheless, President Nasser depends on Uno to win his case for him ; he cannot win it by military action. Both he and Mr Ben Gurion must desire an end to the economic difficulties which the present situation forces on them ; at some stage they should be prepared to sacrifice some part of their claims to break the deadlock. President Nasser might reasonably calculate that the free navigation of the Gulf of Aqaba has less impact on the minds of the Arabs than the thought of Israeli trade and shipping passing through the Suez Canal. Mr Ben Gurion, for his part, while he may hold that the Gulf of Aqaba is vital to the future, of Israel, could perhaps admit to himself that the Gaza strip is not. The General Assembly could work upon this narrow margin of potential compromise.

The Assembly has not been able to do this because of its somewhat blinkered adherence to the principle that the attacker, Israel, must first give up all its conquests. This was the advice of Mr Hammarskjöld ; but he also indicated that the armistice had already been broken earlier, among other things by Egypt's exercise of belligerent rights in the canal and the gulf. The principle is certainly not as clear cut as the votes in the General Assembly made it appear. If the aim is peace in Sinai and not simply a legal formula, there is no reason at all why Mr Hammarskjöld should not be instructed to seek a bargain between Egypt and Israel "under the counter" before the Israeli withdrawal is completed.

PARKINSON LOOKS AT RETIREMENT—II

How to Get Rid of the Boss

THE first article in this series discussed the need to emulate in business a custom once well known in African tribes: that of liquidating the chief at a certain point in his career. In this, as in so many other matters, modern science is not at a loss. The crude methods of the past have been superseded. In days gone by it was usual, no doubt, for the other directors to talk inaudibly at board meetings, one merely opening and shutting his mouth and another nodding in apparent comprehension, thus convincing the chairman that he was actually going deaf. But there is a modern technique which is far more effective and certain. The method depends essentially on (a) *Air travel* and (b) *The filling in of forms*. Research has shown that the high official who is given enough of each will very soon begin to talk of retirement.

The opening step in this technique is to lay before the great man a programme : consisting, say, of a conference at Helsinki in June, a congress at Adelaide in July, and a convention at Ottawa in August, each lasting about three weeks. He is assured that the prestige of the department or firm will depend on his presence and that the delegation of this duty to anyone else would be regarded as an insult by all others taking part. The programme of travel will allow of his return to the office for about three or four days between one conference and the next.

The essence of the technique is so to arrange matters that the conferences are held at places the maximum distance apart and in climates which offer the sharpest contrast in heat and cold. There should be no possibility whatever of a restful sea voyage in any part of the schedule. It must be air travel all the way. No particular care need be taken in the choice between one route and another. All are alike in being planned for the convenience of the mails rather than the passengers. It can safely be assumed, almost without inquiry, that most flights will involve take-off at 2.50 a.m., reporting at the airfield at 1.30 and weighing baggage at the terminal at 12.45. Arrival will be scheduled for 3.10 a.m. on the next day but one. Going one way round the world it is possible and indeed customary to have breakfast about three times. In the opposite direction the passenger will, with any luck, have nothing to eat for hours at a stretch.

Most of the flight time will, of course, be spent in filling in various declarations about currency and health. How much have you in dollars (US), pounds (sterling), francs, marks, guilders, yen, lire, and pounds (Australian) ; how much in letters of credit, travellers' cheques, postage stamps and postal orders ? Where did you sleep last night and the night before that ? (This last is an easy question, for the air traveller is usually able to declare, in good faith, that he has not slept at all for the past week.) When were you born and what was your grandmother's maiden name ? How many children have you and why ? What will be the length of your stay and where ? What is the object of your visit, if any ? Have you had chicken-pox and why not ? Have you a visa for Patagonia and a re-entry permit for Hongkong ? The penalty for making a false declaration is life-imprisonment. Fasten your seat-belts, please. We are about to land at Rangoon. Local time is 2.47 a.m. Outside temperature is 110°F. We shall stop here for approximately one hour. Breakfast will be served on the aircraft five hours after take-off. Thank you. No smoking, please.

It will be observed that air travel, considered as a retirement-accelerator, has the advantage of including a fair amount of form-filling. But form-filling proper is

a separate ordeal, not necessarily connected with travel. The art of devising forms to be filled in depends on three elements: (a) *obscurity*, (b) *lack of space* and (c) *the heaviest penalties for failure*. In a form-compiling department, obscurity is ensured by various branches dealing respectively with *ambiguity*, *irrelevance* and *jargon*. But some of the simpler devices have now become automatic. Thus, a favourite opening gambit is a section, usually in the top right-hand corner, worded thus:—

Return rendered in respect of the month of	

As you have been sent the form on February 16th, you have no idea whether it relates to last month, this month or next. Only the sender knows that, but he is asking you. At this point the ambiguity expert takes over, collaborating closely with a space consultant, and this is the result:—

Cross out the word which does not apply	Full Name	Address	Domicile	When Naturalised and why	Status
Mr..... Mrs. ..... Miss					

Such a form as this is specially designed, of course, for a Colonel, Lord, Professor or Doctor called Alexander Winthrop Percival Blenkinsop-Fotheringay of Battleaxe Towers, Layer-de-la-Haye, near Newcastle-under-Lyme, Lincolnshire-parts-of-Kesteven. Follows the word "domicile," which is practically meaningless except to an international lawyer and after that a mysterious reference to naturalisation. Lastly, we have the word "status" which leaves the filler-in wondering whether to put "Admiral (Ret'd)," "married," "American citizen" or "managing director."

Now the ambiguity expert hands over the task to a specialist in irrelevance, who calls in a new space allocator to advise on layout:—

Number of Your Identity Card or Passport	Your Grandfather's full name	Your Grandmother's maiden name	Have you been vaccinated, inoculated, when and why?	Give full details

Note : *The penalty for furnishing incorrect information may be a fine of £5,000 or a year's penal servitude or quite possibly both.*

Then the half completed work of art is sent to the jargon specialist who produces something on these lines:—

(253)	
What special circumstances are alleged to justify the adjusted allocation for which request is made in respect of the quota period to which the former application (143) relates, whether or not the former level had been revised and in what sense and for what purpose and whether this or any previous application made by any other party or parties has been rejected by any other planning authority under sub-section VII (35) or for any other reason, and whether this or the latter decision was made the subject of an appeal and with what result and why.	

Finally, the form goes to the space technician who adds the space-for-signature section, the finish which crowns the whole:—

I/We (*block capitals*) ..... declare under penalty that all the information I/we have furnished above is true to the best of my/our knowledge, as witness my/our signature signed this ..... day of ..... 19.....

(*Signature*) .....

Witness :—

Name .....

Address .....

Occupation .....

Photograph Passport Size

Seal .....

Thumb print

This is quite straightforward except for the final touch of confusion as to whose photograph or thumb print is wanted, the I/we person or the witness. It probably does not matter, anyway.

★

Experiment has shown that elderly men in responsible positions will soon be forced to retire if given sufficient air travel and sufficient forms. Indeed, at the first mention of a conference at Stockholm or Vancouver, they often realise that their time has arrived. Very rarely nowadays is it necessary to adopt methods of a severe character. It used to be the custom not only to arrange tours to overseas countries, but to plan details of inspection tours and banquets there. It will suffice to cite from the case-book of one such tour. By the fifth day the distinguished visitor concerned could walk only when supported by a secretary on one side and a personal assistant on the other. On the sixth day he died, thus confirming the general impression that he must have been tired or unwell. Such methods as these are now discountenanced and have, indeed, proved needless. People are learning to retire in time.

But a serious problem remains. What are we ourselves to do when nearing the retirement age we have fixed for others ? It will be obvious at once that our own case is entirely different from any other case we have so far considered. We do not claim to be outstanding in any way but it just so happens that there is no possible successor in sight. It is with genuine reluctance that we agree to postpone our retirement for a few years, purely in the public interest. And when a senior member of our staff approaches us with details of a conference at Teheran or Hobart, we promptly wave it aside, announcing that all conferences are a waste of time.

"Besides," we continue blandly, "My arrangements are already made. I shall be salmon fishing for the next two months and will return to this office at the end of October, by which date I shall expect all the forms to have been filled in. Goodbye, until then." We knew how to make our predecessors retire. When it comes to forcing our own retirement, our successors must find some method of their own.

Notes of the Week

Washington and Jerusalem

WHEN the texts of the exchanges between the United States and Israeli governments were published this week, they showed that the assurances offered by Washington were less concrete than the first inspired "leaks" had suggested. In particular, what was said about freedom of passage in the Gulf of Aqaba did not amount to a guarantee. The United States was "prepared to exercise the right of free and innocent passage" on behalf of ships of American registry, in the absence of a decision to the contrary by some such body as the Hague Court. It was prepared "to join with others to secure general recognition of this right." But nothing was said of enforcement. The right of innocent passage is one that the Egyptians have always handsomely conceded—maintaining, however, that their own rights of belligerency overrode it in the case of ships bound for Israel.

Replying to the American Note, the Israelis offered to withdraw if they got a precise guarantee "for the specific protection of Israeli-bound shipping," or, alternatively, if arrangements could be made to station the UN Emergency Force

> along the western coast of the Gulf of Aqaba until a peace settlement is achieved, or until an agreed and permanent arrangement for freedom of navigation is otherwise procured.

★

Mr Eisenhower's broadcast on Wednesday made it clear why the President is unwilling to consider these (in themselves, sensible) suggestions. To him it is cardinal that a state which "attacks and occupies foreign territory in the face of United Nations disapproval" should not be allowed to impose conditions; he refuses to accept that "armed attack can properly achieve the purposes of the assailant." Conceding that the Israelis had had grave provocation, he holds that the "renewed and earnest effort" to secure justice for all the parties must wait until Israel has withdrawn.

The President's sincerity carries authority with it and endows even an intellectual muddle with moral dignity. But is it irrelevant that the assailant's purposes must be recognised as legitimate? Need it really be supposed that the play cannot go on until the furniture has been put back where it was? Egypt and Israel have both given offence to the United Nations; so have many other countries; Egypt, for one, has said nothing to suggest that it will not cheerfully give offence again. Each side has a grievance. The two offences could be purged, and the two grievances removed, together. To tackle them together might conceivably produce a settlement; the alternative, entrenchment on a moral position arbitrarily chosen, is unlikely to do as much.

The Politics of the *Edgar Bonnet*

EGYPTIAN frogmen are taking another look at the *Edgar Bonnet*, a tug said to be laden with explosives which is sunk in the Suez Canal. Until they remove the cargo, render it harmless, or admit it is not there, General Wheeler's salvage craft cannot remove the hull and thereby open the canal to ships of 10,000 tons. The *Edgar Bonnet* has therefore political importance; by delaying work on it, Egypt can delay the opening of the canal without being too obvious about it. Once the tug is removed, Egypt must tell the maritime nations frankly whether ships can pass through the canal before Israel evacuates the Sinai and the Gaza strip. Politics apart, there is no reason why the Egyptians should not have tackled the explosive cargo before now.

If anyone wanted to be awkward, he could send a vessel of 300 tons now, for an Egyptian ship of that size has already passed through the canal and the principle is the same whether the tonnage is 30,000 tons or 300. But before ships start using the canal there is the question of dues to be settled. The British Government is asking Mr Hammarskjöld to take up this matter with Egypt. After consultation with some of the users, Britain suggests an interim agreement by which Egypt would receive half of the canal income and half would be paid to the World Bank or the United Nations to be held for maintenance and development of the canal, pending a final settlement.

Between the nationalisation of the canal and its blocking at the end of October, the ships of some nations paid their dues to the Egyptian administration. Ships of others paid them either into blocked accounts in their own countries or to the Suez Canal Company. Under this arrangement, Egypt was getting about 40 per cent of the dues, enough to keep the canal running from day to day. The Egyptian income under the British scheme would therefore be higher than before; even so, it is doubtful whether President Nasser will accept.

The Rent Concessions

THE Government's concessions over Clause 9 of the Rents Bill are not highly damaging to the bill's purpose, but they are not very sensible either. The most important change is to delay by nine months the decontrol of the 800,000 rented houses covered by Clause 9: no rent demand or notice to quit will now take effect until 15 months after the bill becomes law, that is, until somewhere around the autumn of 1958. To encourage voluntary agreements in the meantime, a second amendment provides that agreed rent increases may take effect immediately so long as the new contract guarantees a minimum of three years' security of tenure. Finally, for a period of three years, it will be made illegal for any landlord to demand a premium as a condition of continued occupation.

The argument put forward for the postponement of decontrol is that, after eighteen years of absolute security, six months is rather a short period for tenants to uproot themselves; the Government's conclusion seems to be that tenants need between now and September of next year to ponder the possibility of making a move. The incentive to early voluntary agreements between landlords and their sitting tenants is also intended, in the current jargon, to "ease the impact of decontrol"; its effect will be that the new agreements must be concluded in ignorance of what free market rents will really be, and some of them will probably be pitched too high. Moreover, the greater the number of tenancies that is held off the free market for three years in this way, the greater is likely to be the rise in rents of those that are decontrolled in September, 1958; all the 800,000 tenancies will not now be thrown on to the free market at one bump. The third amendment, the prohibition of premiums, is intended to protect the more gullible tenants, and seems economically unobjectionable; it may therefore be ungracious to point out that it will also be very difficult to enforce.

From a national point of view, it has always been obvious that the initial uprooting of some tenants is bound to be an unpleasant business whenever it occurs, and that it is only later on (at least a year after decontrol) that the very real benefits of a larger free market in rented property will begin to appear. Mr Brooke's amendments will delay this very desirable consummation, and also set back the timetable for further instalments of decontrol. In political terms, too, the Conservatives seem to be running an uncalculated risk: under the new rent timetable the next general election will very likely arrive after the shocks but before many of the benefits.

Tale of Three Rebels

ONCE upon a time there were three politicians—a Liberal, a Labour man, and a Tory—who all disagreed with their party lines about the invasion of Suez. Their subsequent histories make interesting reading.

The Liberal, Mr Davies, has been asked to contest one of the only six Liberal seats in the country, at Carmarthen, at least partly because he disagreed with his party's Suez line, and agreed with the Tories. The reason for this is that the coming by-election at Carmarthen looks like being a desperately close one; Lady Megan Lloyd George needs only a 3½ per cent swing to win it for Labour; and if the Liberals had put up a man who agreed with their majority views on Suez, the Tories might have entered a candidate of their own and split the anti-Labour vote.

The Labour MP—the colourful, independent and often very sensible Mr Stanley Evans—resigned his seat at Wednesbury in face of a unanimous vote of "no confidence" from his local executive. Labour can fairly claim that Mr Evans's support for the Government on Suez was only the latest of a fairly long line of disagreements with official policy, and that he has shown by a subsequent newspaper article that at the end he retained few points of contact with official party thinking. Mr Evans, however, was elected as MP for the borough of Wednesbury, not for the local Labour party. The local Socialists had no right to expect him to resign from Parliament, nor was there any reason for him to volunteer to do so. It is a pity Mr Evans is not fighting the coming by-election as an Independent. Even with the party machines against him, the result might be surprising.

The Tory is Mr Nigel Nicolson, MP for Bournemouth East. The Bournemouth Tories have now chosen a new candidate for the next election, washing their hands of him because of his opposition to the Suez policy. Mr Nicolson has quite rightly refused to give up his seat, and will contest the general election as an Independent.

Wednesbury and Bournemouth should think carefully where their intolerance is leading. By seeking to crush any independence of spirit, by seeking to make every MP lobby fodder, the local parties are striking, not only at the institution of Parliament, but at their own future. It surely no coincidence that the men at present marked out to become Foreign Secretary and Chancellor of the Exchequer in the next Labour Government were both in open rebellion only five years ago, and that the last three leaders of the Tory party were all rebels at some time in their careers, Sir Winston Churchill more often than not, and Mr Macmillan for a time even refusing the Tory Whip. The tale of the three Suez dissenters is one of the most disturbing commentaries possible on the state of British politics in 1957.

German Concern About Rhine Army

ALREADY at the time of the Suez crisis the commander-in-chief of the fledgling Luftwaffe, Lt.-Gen. Kammhuber, was complaining that the British forces in Germany had been so plundered of technicians and equipment as to be no longer fighting fit. So it is scarcely surprising that the proposals for new and much more substantial reductions in the size of Rhine Army and Second Tactical Air Force have provoked some anxious questioning at the German Foreign Office and Ministry of Defence.

The immediate reaction at the Federal Foreign Office was sympathetic: "We see and acknowledge" Britain's limitations. But the strategists of the defence ministry, supported by the Chancellor himself, who has repeatedly declared that in the peculiar conditions of divided Germany conventional weapons count as much as ever they did, are uneasy at the prospect of a weakening of west Germany's already tenuous defences before even five German divisions are ready. The Federal Cabinet has been deciding this week what observations Herr von Brentano should make when the Ministers of Western European Union meet in London on Tuesday, and it looks as though General Norstad can rely on German backing if he presses Britain to think again.

While German officialdom and most of the press continue to show a remarkable courtesy towards Britain in present

troubles, some individual newspapers and politicians are not so sparing. The question "Why should the German taxpayer have to contribute more than last year to the upkeep of British troops when their number is about to be reduced?" is a natural. But those who raise it are being firmly told that the contingency has been discounted in the negotiations on support costs, which are still dragging along tortuously, though on the whole amiably, in Bonn.

Bonn, Moscow, and the German Question

No hopes have flickered on either side of the Elbe at the prospect of representatives of Britain, France, the United States and west Germany meeting in Washington next month to review the problem of reunifying Germany. The deadlock is so complete that it is impossible to see what new observations or acceptable proposals the one-sided working party will be able to make in its report to the Nato council of ministers on May 2nd. The most they can do is to restate the known arguments, remap the familiar stumbling blocks, and speculate once again how the Russians might be coaxed out of their misgivings and their intransigence. Only Dr Adenauer is likely to gain. It was he who first mooted the project, fully appreciating the value in election year of obtaining formal allied confirmation—which he is bound to get—of the wisdom of his uncompromising stand for free all-German elections and no dealings with the puppet regime in east Berlin.

Marshal Bulganin sounded here and there a friendly note in his latest letter to the Chancellor, but he cleared no new path out of the German predicament. Dr Adenauer has already replied unofficially. There are not two German states, he points out, legally entitled to negotiate with each other on equal terms. There is only one German state: east Germany is occupied by 22 Russian divisions and ruled by an illegally elected government.

The Chancellor's insinuation that the one German state must therefore be the Federal Republic as it is today has been promptly challenged by the opposition. The Free Democrats recall that the Basic Law of 1949 expressly lays down that the Federal Republic was founded "to give a new order to political life for a transitional period." By seeming to presume that there can be no constitutional or economic changes after reunion, Dr Adenauer, the Free Democrats object, is unnecessarily antagonising the Russians and many east Germans whose fear that militarism, social injustice, and other evils of the past might be restored in a reunited Germany is genuine and understandable. Of this more will be heard during the election campaign.

Marshal Bulganin is pressing once again for a full-blown trade agreement. It is very doubtful whether he will get it, at any rate in the near future. The west Germans have less to gain at the moment from trading with Russia than the Russians have. A trade agreement is a strong card for Germany, not to be lightly discarded when so much still remains at stake.

Mr Shepilov and Mr Gromyko

MR SHEPILOV'S sudden resignation from the ministry of foreign affairs on the morrow of his major speech on the international situation came as a surprise. A glimpse at the background and personalities involved in this latest Soviet reshuffle should add some substance to speculation.

The Theoretician. *Dimitri T. Shepilov* was born in 1905 in Ashkabad (Turkmenia). He came to Moscow as a student, first of law, then of agricultural economics, and his gifts were rapidly recognised. He fell foul, however, of the purging machine and his appointment as head of a state farm in Siberia in the early 1930's was tantamount to exile. He came back to Moscow to lecture at the Lenin Institute of Economics. His theoretical background, writing ability and oratorical gifts destined him for propaganda and he became the head of the party's *Agitprop* in 1948. Soon after, he suffered a second setback for his connections with N. Voznessensky, Stalin's most prominent postwar victim. He came back as editor of *Pravda* and was elected to the central committee in 1952 (at the 19th congress).

After Stalin's death the rise of Mr Shepilov coincides with that of Mr Khrushchev. He launched the attack on the heresy of "priority of consumer goods" which preceded Mr Malenkov's resignation in February, 1955. Five months later Shepilov was included in the party secretariat headed by Mr Khrushchev; at the 20th congress last year he was elected to the party presidium as a candidate member. Though he succeeded Mr Molotov at the ministry of foreign affairs only last June, he had been understudying him for some time, as in his visits to Cairo and Belgrade.

Mr Shepilov is probably the most able man of the younger Soviet generation, and his career is not at an end. It may even be that his very assets qualified him to woo restless intellectuals at home and improve relations with foreign communists—the job apparently assigned to him in the secretariat to which he now returns. Nevertheless, his sudden resignation has a political significance.

The Bureaucrat. *Andrei A. Gromyko* was born 47 years ago in Byelorussia. He, too, studied agricultural economics and then lectured at the Lenin Institute in Moscow. He entered the foreign service in 1939, when Mr Molotov succeeded Litvinov as foreign minister. He was counsellor and then ambassador in Washington, and in 1946 became Soviet representative to the United Nations. He took part in all the important international conferences. Recalled to the headquarters he remained there for five years as deputy minister before coming as ambassador to London in 1952. After Stalin's death he returned to Moscow as first deputy foreign minister.

Mr Gromyko's assets are professional skill, technical knowledge, tenacity and the ability to carry out orders. A man capable of shaping policy has been replaced by the perfect bureaucrat. Mr Shepilov was associated with the bolder policy carried out under Mr Khrushchev's guidance. Some of its recent vagaries may have displeased a group in the collective leadership. His resignation need not mark a change in Soviet foreign policy; it foreshadows, however, a tighter control by the party presidium over foreign affairs.

Last week's events could be read as a setback to Mr Khrushchev. On the other hand, he played first fiddle in the meeting of the central committee which decided upon the change, and the other nominations seem to favour him.

The Party Boss. *Nikolai S. Patolichev*, who now replaces Mr Gromyko as first deputy minister, is a typical party boss. He has served as party secretary in many parts of the country. Though he graduated from a military academy in 1937, during the war he was put in charge of a region beyond the Urals, important for wartime production. In 1946 he served for a brief period under Khrushchev in the Ukraine, but subsequently became first secretary of the party in Byelorussia. Accused of "russification," he was somewhat in the background after Stalin's death and he apparently owes his comeback to Khrushchev.

The Newcomer. *Frol S. Kozlov*, the new candidate member of the party presidium, hitherto limited his activity to Leningrad, where he climbed the ladders of party hierarchy. He gained prominence early in 1953 during the so-called "doctors' plot" by his vociferous attacks against "spies" and "bandits." For this reason he seemed in danger after Stalin's death, during the short Malenkov-Beria interlude, when the purgers were being purged. Later in the year, however, after Beria's fall, he actually replaced Malenkov's man Andrianov as head of the party in Leningrad. This he owes to Mr Khrushchev, who can rely on yet another ally in the party's highest council.

No Change on Cyprus

CYPRUS has been discussed at length this week in both New York and London. Neither discussion has brought a solution any closer. The United Nations General Assembly witnessed the distasteful spectacle of two old friends slinging mud at each other. The British delegate accused the Greek government of shipping arms and ammunition to the terrorists in Cyprus. The Greek foreign minister demanded self-determination for Cyprus and claimed to have proof of British atrocities against Cypriots. The American delegate urged both parties to drop their resolutions. At the time of writing the debate is not concluded; but whatever the outcome, the fund of Anglo-Greek goodwill will be still further diminished.

In the House of Commons, Mr Lennox-Boyd said that British policy "must be based on reality and not on fantasy." But reality is precisely what this policy appears to lack. The pleas of Opposition speakers that the Government should break out of the present deadlock with some new political initiative met with no response. Government spokesmen stuck to their old brief—that self-government cannot be introduced until internal security is restored. This cannot be denied, but it gives no ground for the Government to use the campaign against Eoka as an excuse for going slow in the search for a political settlement. On the contrary, it is surely clear that it must act with more energy and initiative in order to dispel the poisoned and suspicious atmosphere that repression is inevitably creating.

Government spokesmen also continued to insist that Archbishop Makarios must stay where he is until he denounces terrorism. But whatever this political prelate's connection with Eoka, the fact remains that he could negotiate on behalf of the Cypriots, and apparently no one else can. Until he is brought back from the Seychelles (not necessarily to Cyprus) the deadlock will remain.

Political discussions should be started; but whether they would lead to a settlement is another matter. The Greek government has unnecessarily made the worst of the Radcliffe constitution. Mr Lennox-Boyd has not helped matters by his very ambiguous attitude over the extent to which it could be altered by negotiation. And even if agreement could be reached on the Radcliffe proposals, there remains the further obstacle of self-determination. The Greeks will probably insist on a definite promise on this as part of a settlement. Mr Lennox-Boyd believes that the Turks will not tolerate it unless the Turkish minority has self-determination too. There is not much light at the end of the Cypriot tunnel; what there is reveals the spectre of a bizarre and perilous partition.

A Constitution for Malaya

THE constitutional commission for Malaya, of which Lord Reid was chairman and Sir Ivor Jennings a member, has grasped its nettles. The proposed federal form of government, even though of the "strong" type, which retains all the rulers as constitutional monarchs electing a federal constitutional monarch from their number every five years, fits Malayan history and Islamic predilections. More controversial is the commission's endorsement of *jus soli*—the recommendation that on Merdeka day all should become citizens: both those who are citizens of the states now (which excludes many Chinese) and those who have lived for five years in Malaya previously (which would include them). Residents of the former settlements, now to be states, are to possess dual British and Malayan nationality. Unless some differential franchise is adopted, or the condition that citizenship requires an elementary knowledge of Malay is oppressively interpreted, this means that at the next election (postponed to 1959) the Tengku's government will have to appeal much more for Chinese support for its policies.

★

Though it will be neither a realm nor a republic, Malaya is to remain in the Commonwealth by recognising the Queen as Head of the Commonwealth. This new pattern need cause no heartburnings, though it brings Malaya's status at the outset nearer to India's status on achieving Commonwealth membership than was Ceylon's. The Prime Minister of the Federation will come to Commonwealth premiers' conferences (and should come to the next, even if it antedates Merdeka slightly); more immediately, the common problems of Malaya, Britain and the Commonwealth in meeting communist subversion will be met by the treaty of defence under which the Commonwealth reserve in South-East Asia will be stationed—though as unobtrusively as possible—on Malayan soil.

But there is not much time between now and August 31st, the target day for independence, for the Malayan government, legislature and rulers to accept the constitution so devised with or without amendment; there must be time to pass it through Parliament at Westminster. There is much that could be argued, both about nationality and about the provisions to safeguard Malayan jobs and rights in the land. It looks as if the last-minute rush on Malayan independence will rival the Gold Coast photo-finish.

Farm Politics

SOME more changes in agricultural policy are expected shortly. The most immediately practical reform to which the Government should be pressed is to reduce the excessive security of tenure now enjoyed by tenant farmers. A landlord can at present only rid himself of a bad tenant by proving his case to a county agricultural committee; since landlords are understandably reluctant to stir up trouble, and since the committees often lean over backwards to protect tenants, the procedure works very badly. The Government (through these committees) has its own powers for removing inefficient farmers. The result of the court case over Lady Garbett's eviction was a striking vindication of the fairness with which these powers are now used and a complete repudiation (by no less a person than Lord Goddard) of any suggestion of bureaucratic tyranny. Yet what is the advantage of powers whose mildest and rarest use provokes a public outcry? Mr Heathcoat-Amory would probably willingly sacrifice his own powers of coercion in favour of restoring the landlords' right to terminate a tenancy—subject to reasonable notice and adequate compensation. He should do so without further delay.

Meanwhile, this year's farm price review has already started. From the Government standpoint, the review can best be regarded as a holding operation. Under the new long-term agreement between Government and farmers' unions, it is not possible to cut the total value of the agricultural guarantees by more than 2½ per cent (about £29 million), assuming costs are constant. But costs have not been constant. Increases in farm wages (up by £10 million a year), in the prices of fuel and of some other things have mopped up most of the £29 million margin, and the limit of Government ambition may well be to hold the guarantees at their present level. Since Mr Heathcoat-Amory is already committed to finding extra money for improvement grants, while the current subsidy bill has exceeded expectations, it will be an unhappy outlook if he fails in this modest ambition. He will also have the luckless but vital task of resisting the demand for specially favourable treatment for milk producers which the National Farmers' Union—in deference to its weaker brethren—is pledged to press.

Economy and Electronics

IN seeking his economies in defence Mr Sandys's problem will always be to keep a margin on what he gains on the manpower swings after making his losses on the electronic and atomic roundabouts. This week the votes on account for the services (which are based on the trend under the present staggered conscription plan, not on any anticipated policy changes) forecast the reduction of 65,000 men in the combined strengths of the Army, Navy and RAF by March, 1958. At the same time the training of the Royal Artillery with the Corporal missile has begun, and the appointment of an Admiral (human, not robot) with responsibility for nuclear propulsion has been announced. The Corporal and the Admiral are not likely to be forces for economy. A little experience with missile batteries will probably fairly quickly indicate how surprisingly much manpower—mostly highly skilled electricians, transport and supply and maintenance "tail"—is needed for a substantial backing of ground forces by atomic artillery. Nuclear propulsion for the navy means not only new engines but new ships—as well as the further apotheosis of the one-time stoker into atomic pile maintenance artificer.

It need not, however, always follow that new gadgets tend to swallow up savings made elsewhere in defence costs. Intelligently used by the RASC, electronics could work the other way. The Third Report from the Select Committee on Estimates recently had hard but despairing things to say about the services' stores depots. Items ranging from clothing to chairs, from bren ammunition to bicycles are fantastically over-ordered. Dumps of slow-moving stores cover acres, the happy hunting ground of disposals tycoons. Clearly, the services should visit the US Seventh army in Europe, and investigate the IBM system of supply and stock control which has replaced a corps of clerks by punched card machines. The Americans have found that 90 per cent of a field army's recurrent needs amount to 30,000 items—the other 400,000 items which the army has hitherto stocked in bulk are now held in small dumps in the United States or in the makers' warehouses, and flown in when required. Not only has this saved men and dollars all round, but it has reduced the maximum time taken to replace a "low consumption" part from 120 days to two weeks.

Doctors on the Warpath

ALL that the doctors have secured from a new Minister of Health is the promise of a royal commission to review their remuneration, and the dentists' as well. Mr Macmillan announced on Wednesday—the day the doctors' negotiating committee had the postponed talks with Mr Vosper—that the Government had decided that it could not entertain the claim for a general 24 per cent increase in remuneration at the present time, though in the House of Lords it was announced that junior hospital staffs are to have some increase.

Faced with gross expenditure on the health service totalling £690 million, the Government could hardly be blamed for refusing to give the doctors all they were asking for, especially as this would have looked as if it accepted the doctors' interpretation of the Spens formula, which would give them an automatic guarantee that their pay would rise with the cost of living. But it is, after all, five years since the Danckwerts award, which itself related to incomes for 1950-51, put the doctors in a favoured position, compared with other professions, by allowing them for 1950 a 100 per cent increase on what the Spens committee thought they ought to have earned in 1939; and in the course of the last year, as the increased estimates for the cost of the health service show, rises in pay have had to be given to most branches of hospital staffs—but not including the doctors—and to chemists. If the Government had offered the doctors something on account, pending a review by an independent body, the doctors' representatives would have been well advised to have accepted it. But they can be forgiven for being up in arms at the prospect of waiting for an increase until the cumbersome machinery of a royal commission has creaked out its findings. If the Government genuinely wanted an independent review of medical and dental earnings, it could obtain one by a much simpler body. By setting up a royal commission it shows itself merely anxious to buy time.

Hungary's Good Neighbours

ABOUT half the refugees who fled from Hungary are still in camps in Austria and Jugoslavia, their future uncharted. The United Nations has been more generous with sentiment than with cash or hospitality. In December, the Secretary-General appealed for $10 million to relieve Austria, but with several members absorbed in supporting their own intake of refugees, not much more than half this sum was collected, and Dr Lindt, the New High Commissioner for Refugees, has had to go to New York to ask for more. There are some 60,000 refugees in Austrian camps, and of these the League of Red Cross Societies, helped by the UN fund, has undertaken to care for 45,000 until July: after that, if no more money is raised, the full burden will fall on Austria, which is already paying out $80,000 a day.

On a smaller scale, the Jugoslavs are struggling with the same problem. When escape from Hungary into Austria was blocked last month, over 17,000 refugees poured into Jugoslavia instead, and they are still trickling across. The Jugoslavs have received only trifling help from outside. A few hundred of the refugees there have been offered homes in Europe and the High Commissioner has sent $50,000: enough money to keep the refugees for only two days. The burden on Jugoslavia is almost as great as on Austria. While richer nations measured their generosity with coffee-spoons, these two countries have never questioned the right of all Hungarians to asylum on their soil, and both carry a grossly unfair share of what is acknowledged as an international commitment.

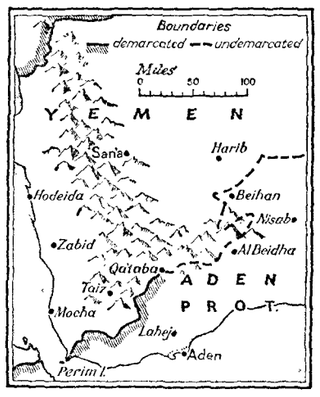
The exodus from Austria and Jugoslavia cannot be hurried up until the United States has made up its mind how many more refugees it will accept. At least half of them want to go there, and will not consider alternative destinations so long as there is still a chance. Dr Lindt, as well as raising funds, is also trying to get the American quota increased. But settling the Hungarians is bound to be a slow business if they are not again to be sent to countries where they do not want to stay permanently. Theoretically, there are homes for all of them: France, for instance, has offered sanctuary to anyone who undertakes to stay. Canada, Australia, Venezuela, Columbia and Brazil are all possible hosts, but transport is slow to organise and in some cases there is no fare money. Meanwhile, the kitty is nearly empty.

Reforming Local Government

WHEN Mr Brooke revealed his new financial proposals for local authorities last week, he also announced that there is to be a debate in the Commons on the white paper on areas and functions which Mr Sandys produced last summer. There needs to be. The Government's present proposals for local government reorganisation are weak and muddled in the extreme. It is proposed to set up another Local Government Commission, but one which will not be allowed to go beyond the minimum of agreement reached by the four local authority associations. Only in the big "conurbations" (i.e. the urban sprawls around Britain's major cities) would the commission be encouraged to raise its eyes and prescribe boldly—with, however, little hope of the Government endorsing its proposals unless Ministers show more courage than hitherto. If the commission is to be something more than half a dogsbody and half a stalking-horse, it is essential that fruitful "principles" should be laid down for its guidance, and that Mr Brooke should not be deterred by local vested interests masquerading as ancient institutions. Here are some concrete suggestions, starting (as any Conservative Government ought to start) at the bottom rung:

(1) *Amalgamate and integrate the smaller urban and rural authorities.* It would be a great mistake to confer increased powers and financial independence (as is now proposed) upon authorities which are potentially too small for efficient administration. Most of the 500 authorities below 10,000 population fall in this category. The only way of creating effective units which are not too remote is by uniting the smaller towns with their rural hinterlands. The service requirements of town and countryside are becoming increasingly similar, and the best way to make farmers and shopkeepers co-operate would be to put them on the same council.

(2) *Provide fair and consistent treatment for the medium-sized towns.* The four seaside resorts of Hastings, Eastbourne, Hove and Worthing have all much the same population and financial capacity. Two are county boroughs (and run all their services), two are not (and run very few). These anomalies should be ended by giving to similar towns the same status. A middle-sized town (i.e. one of roughly 60,000 to 200,000 population) should no longer be regarded as completely self-sufficient, but it can reasonably operate most services.



(3) *Unite some of the weaker English counties.* This is not only intrinsically desirable for administrative efficiency, but is a necessary corollary of the other proposals—which would have the effect of confirming more powers upon the smaller authorities and of concentrating the counties' duties upon services that need to be planned over fairly broad areas. The Welsh counties, being much weaker units, need separate consideration. (Conceivably, of course, some counties should not merely be merged with others, but split and divided up among neighbours.)

(4) *Establish new authorities in the "conurbations."* In several provincial conurbations, there seems little doubt that the best solution would be to set up an elected major authority which would operate certain services of concern to the entire urban area and its immediate environment—such as town and country planning, water supply, main highways, sewage disposal, fire services and perhaps police. Its boundaries ought to be drawn wide enough to deal with the intractable "overspill" problem which now plagues local government relations in these areas. Thus, the new authority would in effect be a special sort of county council, covering a radius of 20 or so miles from the urban centre. In the case of Greater London, any such approach would encounter stormy objections and special difficulties—and it is for dealing with the problems of London local government that a genuine Royal Commission would, perhaps, be wise.

Arms For and Against Yemen

NEWS of the delivery of Soviet arms to the Yemen, and of Egyptian officers training Yemeni troops in Hodeida and Sana'a, is disquieting. It almost certainly means that there will be more and graver trouble on the Aden Protectorate frontier, and no doubt that is the reason why Sir Pierson Dixon brought it to the attention of UN delegations last weekend.

Already the use of automatic weapons has been noted among tribesmen who normally are armed with antique rifles. There have been some British casualties. An Aden newspaper has lately reported that a Russian ship has delivered the residue of the Yemen arms order. As the trading caravans usually bring fairly reliable information into Aden, the report probably contains some truth; although it is hard to believe that the cargo included 50 Stalin tanks and 30 Mig planes. (The report states that the total order cost $20 million, of which the Soviet government waived $15 million and "the Soviet people" subscribed $4 million.) At least one can conclude that there are likely to be more arms available to feed the endemic disputes in the Aden tribal area.

Meanwhile, elements of the British 33rd Paratroop Field Regiment armed with 75-mm howitzers are arriving in Aden and will be deployed as a mobile force in the defence of the frontier region. The howitzers are bigger than any weapons that have yet been used in the fighting in that area. They are doubtless necessary to protect the loyal sheikhs and may intimidate some dissident tribesmen; but it is difficult to see how artillery can compel disaffected tribesmen to behave themselves so long as Imam Ahmed of the Yemen continues to provide a sanctuary for the rebellious when things get hot.

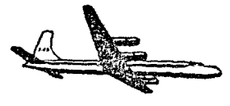
Social Services and the Taxpayer

THE Vote on Account, which was published this week, shows the cost of the social services that will fall on the taxpayer in the coming year. Since the estimates do not include expenditure from the rates, or expenditure that is offset from the national insurance fund, the table does not give a complete picture of the cost of the services. Thus of the total expenditure on the health service of £690 million, foretold by Mr Thorneycroft in the House of Commons on Tuesday, only £550 million will, under present arrangements, be paid for out of taxation. About £40 million at present is paid out of the insurance fund towards the cost (the increased amount which the fund is to pay has not been allowed for in the new estimates; but it is hoped that the relief will be of the order of £20 million in 1957-58, and £40 million in a full year); while another £26 million falls on the rates.

Patching Insurance Benefits

THERE will have to be another National Insurance Bill when the Government gives legislative form to its proposals for levying a greater share of health service costs from insurance contributions. In the meantime the National Insurance Bill that was published last week is a miscellany, ironing out some anomalies in the present law and giving effect to various recommendations of the national insurance advisory committee.

Most of these are concerned with dependants' allowances and abolish hard cases: for instance, the lack at present of any widowed mother's allowance for a mother whose divorced husband had been contributing to their children's support before his death. More important is the provision enabling pensioners to surrender their pensions temporarily, return to work and earn pension increments by paying contributions until they reach the age of 70 (65 for a woman) and are "deemed to have retired." At present, retirement is considered an irrevocable act, and a retired pensioner who elects to return to work cannot earn increments to his pension even if his pension is totally extinguished by his wages and the operation of the earnings rule. The new measure should encourage some pensioners to return to work and is therefore satisfactory as far as it goes. But the number who will be persuaded to return to a full-time job by the prospect of a few shillings increase in their pension cannot be large. The new bill will remove a deterrent rather than provide an incentive.



In its proposal for unemployment benefit, on the other hand, the bill does neither. It provides that a worker on a five-day week will no longer receive benefit for his free day (usually, of course, his Saturday) unless he is unemployed on all his normal working days in that week. At present he has to be unemployed for only one other day in a week in order to receive benefit for two days. But the bill does nothing to encourage workers to move from an industry hit by recession to another job where they are really wanted, or to deter employers from spreading less work among the same number of men. Decisions given by the national insurance commissioners last year showed that the case law on the unemployment benefit payable to a worker who has a guaranteed week—whether of wages or of hours of work—is anomalous. But, even if the guaranteed week muddle could not be cleared up in this measure, the Government could at least have restored the prewar practice of paying benefit only when a worker has been unemployed for three days out of six. The present law, enabling him to receive benefit when he has missed only two days, gives an incentive to workers to hang on to their jobs and to employers to hang on to their men. It is a subsidy to stagnation and immobility, and ought to have been removed.

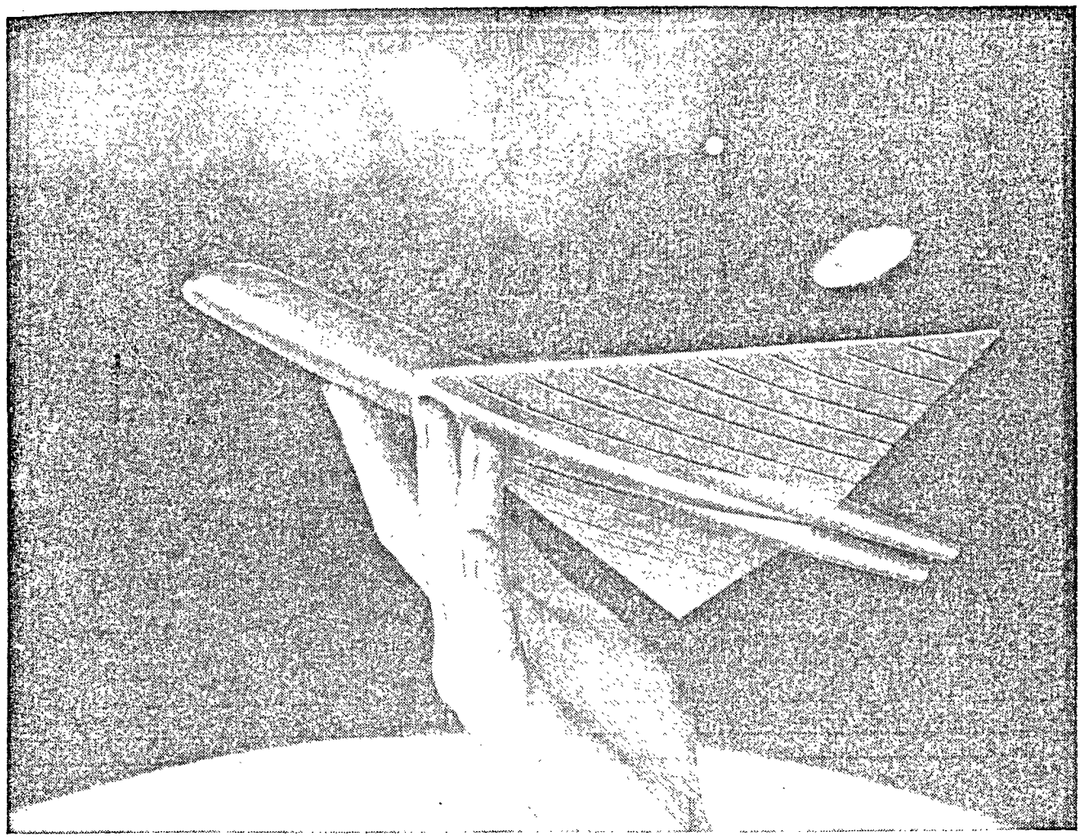
SAS fly superbly



the new short-cut Polar Route to the Far East

From February 24th . . . over the Pole to Tokyo, cutting time in the air by hours—another sky-high achievement for SAS. Using the amazing new Douglas DC-7C—fastest, quietest long-range airliner in service—SAS bring the Far East nearer. And passengers enjoy not only greater-than-ever comfort, but also that rich, warm hospitality for which Scandinavia and SAS are famed.

The shape of steel to come

NEVER has the steel industry had so much to contribute to Britain's future scientific progress, as well as to her basic services and other industries. What is the next great project that will challenge the steel industry's versatility and skill? The devising of special steels to help tomorrow's aircraft break the 'heat barrier'? Co-operation with research physicists to build new plant for atomic power stations? This much is certain — Britain's future is closely linked to the growth and development of steel. What is the state of this vital industry?

Output is continually rising. New plant is coming into service. Advanced instrumentation in the works is streamlining the whole process of steel production. Raw materials, too, are used with ever-increasing efficiency and economy. Ore treatment has made great strides and fuel consumption per ton of steel has been reduced by 15% since the war. The pattern of steelmaking is changing its shape. The whole industry is growing.

Plant has been greatly expanded and thoroughly modernised, and already output is two-thirds higher than pre-war. Further expansion is in hand to enable steel to catch up with the growing demand, and a steady increase in annual output is foreseen for years ahead.

Steel is a modern industry. An expanding industry. With its vast development programme, the industry looks confidently towards a great future — to the shape of steel to come.

Steel is quick to make use of all the most modern techniques: television, for example. In a steelworks this can give a man a second pair of eyes — perhaps to watch an operation going on inside a furnace where it would otherwise be invisible.

Issued by The British Iron and Steel Federation

STEEL HOUSE, TOTHILL STREET, LONDON, S.W.1.

But the greatest increase in social service expenditure in the coming year is the £42 million for the education vote. It would be £3½ million more but for the extra 2d. to be charged for school meals. If the expenditure of local authorities on education is added, the total for England and Wales

CENTRAL EXPENDITURE ON THE SOCIAL SERVICES
(£ million)

	Estimated expenditure		Increase or decrease
	1956-57*	1957-58	
Education (including universities)	403	445	+42
Health Service	529	550	+21
National Insurance (including family allowances)	220	225	+5½
National Assistance	129	133	+ 4
Housing	77	79	+ 2

* Including supplementaries.

alone would be £570 million. A large rise was only to be expected in view of the additional 150,000 children in the secondary schools next year. They will cost £77 per year per pupil (England and Wales again), and the extra expenditure will only partly be offset by a decrease of 80,000 children in primary schools at a cost of £47 per year per pupil.

O and M and More Pay

THE Civil Service Clerical Association has put before the Treasury a plan for overhauling the structure of the clerical grades of the civil service. The main object, of course, is more money for the association's members; but the bait offered to the Treasury is a reduction in numbers and a better use of man and woman power.

The grade concerned has two sections, clerical assistants and clerical officers. Since the war, the rates of pay have not attracted school leavers as they used to do, and a scheme was started for recruiting people over 40. Only 5 per cent of the grade is now under 25. Here, one would think, is a good way of making use of people who want to come back into jobs in middle life. But Mr Green, the association's secretary, thinks that these are not the people who will take most readily to office automation, and that more must be done to attract the school leaver. He also thinks that as a contraction of the clerical grades seems inevitable, because of recruiting difficulties, better use should be made of those that remain. His recipe is that some of the less exacting tasks now performed by clerical officers should be done by assistants, and that in consequence the officers should be reduced in numbers while the assistants get more pay.

Is this a good idea? In a time of full employment it is clearly sensible to save man and woman power, but whether the present scheme would save money would depend on the size of the contraction and the size of the increase given to the assistants. The scheme really has the unspoken corollary that some of the work of executive officers should be done by clerical officers—who would in turn get more pay—and that some of the work done by the administrative grade should be done by the executive grade—who would in turn get more pay. The pyramid, in other words, would be broadened at the base.

There is reason to think that the base is too broad already. It is already said of the Treasury that it will scarcely notice the employment of five new people at £700 while making a great fuss about one person at £2,000—although the senior appointment might save far more money than the difference in salaries. Under civil service procedure too much work is fed in at a low level of the hierarchy, and too much time and money wasted as it passes upward from grade to grade with successive memoranda attached. The questions that should be asked are whether much of the work now done could not be cut out altogether, and whether the present staffing of the Organisation and Management Division is adequate to produce anything other than minor economies.

Dr Jagan Celebrates

AN invitation to the Ghana independence celebrations is a fine feather in the cap of Dr Cheddi Jagan, the ex-chief minister of British Guiana and leader of the People's Progressive Party. Dr Jagan and Mr Burnham, the Marxist (but not Moscow-inspired) leader of the PPP splinter, are far and away the most significant politicians in their territory, and their selection is not unreasonable: however, it is on the cards that Dr Nkrumah has enjoyed cocking a mild snook at the Colonial Office, which disapproves deeply of Dr Jagan and does not care much for Mr Burnham. It would be a great pity if their journey to Ghana were foiled by the difficulty of getting United States transit visas; both are on the American black list. No harm, and possibly some good, can come from these two Guianese leaders meeting other Commonwealth members—particularly the leaders of the British Caribbean Federation.

The Colonial Office had hoped that in the four years since the constitution was suspended, some strong rival political party might emerge. But the PPP, though split, is still expected to sweep the board at the elections promised for the early autumn. The two factions do not in fact tread very heavily on each other's toes, since Dr Jagan has allegiance mainly from the Indian labourers on the sugar plantations, while Mr Burnham's followers are chiefly in Georgetown.

None of the parties is enthusiastic about the very limited return to constitutional government. Fourteen members are to be elected to the Legislative Council, but the Governor can (and undoubtedly will, if the PPP is returned) nominate another fourteen, and there is no office of chief minister. Dr Jagan called in December for a united front to wrest a more advanced constitution from the Colonial Office by means of strikes, boycotts and non-co-operation. Although Dr Jagan has never concealed his communism, he has never before displayed it so plainly as in that statement: a Muscovite web of dogma, abuse and self-criticism spun with skilful confusion. But the strength of PPP depends on overcrowding and poverty, not on dogma. Government development schemes have so far only skimmed the problems of land reform and reclamation.

Spotlight on Incomes

STATISTICS about the size of incomes are not as easy to come by as might be expected—even for the tax-gatherers. Because income from different sources is assessed separately, estimates of people's total incomes have to be based on sample surveys made from time to time. The results of a survey in 1954-55, covering 5 per cent of taxpayers, were published last week in the 99th report of the Commissioners of Inland Revenue. It estimates that there were then 20.3 million taxpayers, with incomes which averaged out at £560 before tax and £500 after tax. At the top, 315,000 came within the surtax range but, after tax, only 138,300 had incomes of over £2,000 and only 7,300 exceeded £4,000.

These incomes are struck after deducting national insurance and superannuation contributions, expenses, depreciation and mortgage interest. On this basis, for every £10 of personal income before tax coming from earnings, profits and pensions, another £1 came from investment. Just over half of this investment income was drawn by non-surtax payers. One out of every four people with a gross income around £500 drew some money from investment, although it made up only 3 per cent of their income; at the £1,000 mark these proportions had doubled.

How does income vary with family size? If the upper income classes are defined as those with more than £1,000 a year before tax, they are relatively most numerous among married couples with two children (among which, in 1954-55, they formed 10 per cent of the total) and relatively least among married couples with four or more children (6 per cent of the total) and among single people (3 per cent only). The falling-off of top incomes among larger families reflects the tendency of the unskilled manual worker to have the most children. But whether there was one child or four in the family, rather more than three-quarters of these family incomes fell in the range £400-£1,000

The New Tyranny

Conservatism properly consists in resisting all new and crude political changes, and never was conservatism in this sense more needed than now. The wild speculation which heretofore dissipated the national capital in fruitless commercial enterprises, ending in bankruptcy and convulsions, is at present let loose on legislation. A flood of imagination, extremely fertilising in the regions of romance and poetry, now pours itself over political institutions, and innumerable schemes of supposed improvement are propounded. . . . A combination of circumstances—Parliamentary reform, the general progress of intelligence, the increase of population, of wealth, and of the influence of the middle classes—has, in truth, so completely identified the Executive Government and the Legislature with the nation at large, that no individual now dreams that either will wilfully commit, on any portion of the people, an act of oppression. Mistaken they both may be—mistaken the whole public may be—but no man now dreads tyranny from either. The danger now to be dreaded is very different. . . . In the name of philanthropy it is urged to interfere with labour, and in the name of humanity to regulate trades. We are no longer in danger of oppression from the Government: we have now to guard against the Legislature being made the instrument to promote, by the national power, the separate objects and serve the separate interests of different classes. If we are to have the legal profession, the medical profession, the men of science, philanthropists; humanitarians, landlords, capitalists, labourers, merchants, bankers, farmers, manufacturers, each class in turn, inveigling or intimidating the Legislature into doing its bidding and serving its purpose, the new statute book, we may be quite sure, will be a greater disgrace and affliction for our descendants than is for us our present jumble of laws and codes and systems.

Hardly Cricket

FOURTEEN states and two international sports federations have co-operated with Unesco to produce a study called "The Place of Sport in Education." * One of their difficulties in answering the secretariat's questionnaire was in saying what they meant by sport. Hungary, for instance, had this shot at defining it:

> The characteristics of this activity are the maximum exertion of completely voluntary effort, the renunciation of comfort and of the satisfaction of natural desires incompatible with the manner of life required by the improvement of "performance," and the joy of attaining a distant objective.

The Danes include as a sport "rhythmical gymnastics exercises with musical accompaniment," while the Australians include life-saving.

In addition to the fact that they did not have a satisfactory definition of the questions they were supposed to answer, the officials of the various countries were clearly anxious that their countries should be represented in the accepted way abroad. The Australians hark back to the playing fields of Eton, while the Poles say, apropos of not very much but with considerable pride, that "criticism is fairly intense," and that an objection to successful sportsmen is that they tend to become individualists. In Poland, we are told, sport is "a basic part of socialist educational theory"; in Spain, also, it falls into the province of the Youth Front. Endearingly, "the situation in Honduras is not very favourable . . . the attitude of the teachers . . . is one of *laisser faire.*"

The reflections on the status of international sport are sour and pointed, as when New Zealand points out that "the Olympic Games are now regarded by many as merely a testing ground for two great political units." The British and the Danes (whom we managed to beat at football last year) perhaps reveal a certain pique when they deplore the fact that "victories gained in international competitions are so inevitably bound up with national prestige." The Australians bluntly say that "the sportsmen of the world are, on the whole, not renowned for great intelligence and culture, and probably make relatively inferior ambassadors." The total effect of this propaganda, pessimism and muddled thinking, presented in intolerable confusion, is to make one seize with joy on a French mention of those who regard sport as "a somewhat pointless form of play. . . ." What, one wonders, would be their definition of certain Unesco activities?

Letters to the Editor

Suez and the Sudan

SIR—Sayed Omer's letter is all the more interesting as its conclusions are similar to those of Mr Ian Colvin, who has recently visited the Sudan. These conclusions are:

(1) That all would be well for Britain in the Sudan if a strong alliance between the Umma party and the Southern Liberal party could be formed.

(2) That the "post-Suez" feeling is nothing more than a temporary boost to the pro-Egyptian elements, which are somehow identified with communist influence.

(3) That there is a temporary vacuum in Sudanese political life which Sayed Omer thinks may be filled by America: a situation which he describes as "the plight of Britain's friends in the Sudan." Mr Ian Colvin, on the other hand, describes it as: the last foothold of Britain in the Middle East.

According to this analysis, the Sudanese general elections in March will arrive to find Azhari at the head of a "popular front" composed of the townspeople, the major part of the intelligentsia, the Communists, and a big section of the People's Democratic party, while the Umma party is expected to look westward and to rally the "non-Moslem" South for its support. If such a situation comes about, then Mr Omer's prophecy, that a majority for the Umma party and the Liberals (of the South) "may well be possible," is unfounded. Indeed, it is the decisive victory of the Azhari Coalition which would be highly likely. The results of the 1953 elections may be repeated. It is unlikely, however, that two such watertight coalitions will fight out the next elections in the Sudan. As Sayed Omer said, the mobility of members between Sudanese parties is very high—a phenomenon which reflects the fact that the policies of the major parties are similar.

This makes it much more likely that the immediate contest will be one between slogans designed to appeal to the electorate, rather than one between principles. An issue of principle is, however, bound to crop up—at least as far as foreign policy is concerned. Until its independence, the Sudan was virtually insulated from Arab politics. It is now in the middle of the picture and is thus exposed to the impact of the Palestine problem, the implications of the Suez venture, and the alleged failure of the only western alliance in the area: the Baghdad Pact. These will deter any prudent Sudanese statesman from declaring himself for the West—at least as far as northern statesmen are concerned. Nor will it help to appeal to the fact that the Southern Sudanese are less sensitive to Middle Eastern currents, as there is a widely held conviction that Northern Sudanese political parties should not, in the interest of the unity of the country, drag the South into a partisan conflict. There is, on the other hand, no major Sudanese party which would declare itself a communist alliance.

To conclude, therefore, I think it is highly unlikely that the coming contest in the Sudan will be between a pro-Egyptian coalition and a pro-British coalition; that a "West" versus "East" contest is out of the question; and that neutralism with a Bandoeng flavour may ultimately be the official policy of the major Sudanese political party.—Yours faithfully, SADIK EL MAHDI

Oxford

Charity or Compensation

SIR—I wish to refer to your article of February 9th. As a British national (Maltese) expelled from Egypt I am particularly happy about the favourable and sympathetic articles which the English press has published on this subject. The Government has decided to take the problem more fully in its own hands, and none too soon. There are three complex points to this problem:

(1) *Employment:* The great majority of refugees are clerical workers, and there seems to be a tendency not to engage non-Anglo-Saxons for this kind of work. The Government should exert pressure on firms to accept those who are seeking office employment. I do not see why we should change our way of life. Is it not enough that our mothers, sisters and wives will have to find work, which most of them did not have to in Egypt, if they expect a minimum standard of living?

(2) *Compensation:* It is not a question of who is going to effect payment, but of time to be reckoned in months and not years. Our assets were lost because of the policy of the British Government, and we expect this Government to pay compensation. The calculation for payment to those who have lost tangible assets will be quite easy. But what about those who have lost their indemnities, pensions and insurance policies after 20 or 30 years' service with a firm? They are too old to start life anew and will find it difficult, if not impossible, to find employment.

(3) *Immigration:* The Maltese in Egypt had as assistance a special fund to help them immigrate to Australia. Immigration was open to all without discrimination of age or qualifications. The money was lent to the prospective immigrant, who pledged to repay it by weekly instalments. Is this fund still in force? Its function would certainly solve a big part of the problem.—Yours faithfully, CLAUDE PEREIRA

London, S.E.5

All the R-age

SIR—Your assertion that men enter local politics solely as a result of being unhappily married, while broadly true, requires some qualification, at least as regards boroughs—conditions are different in counties and in urban and rural districts.

Boroughs have mayors, and mayors have mayoresses. You might some time consider it worth investigating how many men are currently sitting on borough councils solely because their wives fancy themselves as mayoresses.

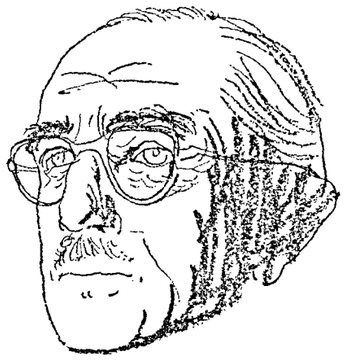
This has a weighty side-product. Since the only way of getting on to most borough councils is to join the dominant party, the party's councillors tend in time to contain a high proportion (thought in some cases to be 100 per cent) of men whose political convictions are quite other than those inferred by the labels that every three years they expose to the electorate.

Granted, aspirations to be mayoress in no way preclude marital unhappiness. But there is a chicken and egg problem here that is not to be solved by glib generalities.—Yours faithfully,

Scarborough MEREDITH WHITTAKER

Sacred Cows

SIR—May I add to your article of February 2nd and that although cows in India are ill-bred, ill-fed and ill-maintained, and produce less milk per cow than in any country in the world, our Government is now seriously trying to improve them.



An All-India Central Stud Farm was started in Bangalore in 1955. An Agricultural Research Institute has undertaken to build up pedigree herds. The Five-Year Plan has approved the "Key Village Project," whose aims are better cattle and more milk. Old and unproductive stock is to be segregated, and a special day is observed to create enthusiasm in the general public. Lastly, although orthodox Hindus treat cows as sacred, several hundred "satyagrahis" (offering passive resistance to cow-slaughter) have lately been imprisoned. Mr Nehru and other leaders have criticised these agitators and marvelled at their sympathy for cows which, under their care, would be "skeletal miseries." Of course, the Government opposes indiscriminate slaughter.—Yours faithfully, AMITAVA GUPTA

London, N.2

Books & Publications

Statesman and Soldier

THE TURN OF THE TIDE 1939-1943.
By Arthur Bryant.
Collins. 766 pages. 30s.

THOSE who may often have wondered what the Chiefs of Staff thought in response to those strenuous memoranda imbedded in the gleaming appendices of six Churchillian volumes may now enjoy discovering for themselves what was passing, at the end of one long day after another, through the mind of the vehemently able chairman of that able body, as he jotted down his staircase thoughts to relieve his feelings, clear his head and—a privilege denied, for security reasons, to more junior officers—inform his wife. To assist the historian of the Royal Regiment, Lord Alanbrooke annotated these wartime diaries with more tranquil "Notes on My Life," which explain, mellow, but do not tamper with the original; and Sir Arthur Bryant has now unobtrusively stitched the staccato fragments into a flowing narrative.

A natural leader, trained in the hardest tests, twice salvaging hopeless propositions, Lord Alanbrooke thrice had that command in the field for which he was so pre-eminently fitted snatched away, because he was indispensable as CIGS or because of the exigencies of the Grand Alliance. Only now may one sense his disappointment, in these diaries, which came to represent the nearest to relaxation he allowed himelf throughout the war, save for brief spells of bird-watching or with his young family at Ferney Close. His capacity for sheer hard work stretched to the utmost—all the Chiefs of Staff had done more than a full day's work before they attended upon the nocturnal strategic cud-chewings of the Minister of Defence—it is a wonder (and to us a godsend) that the CIGS managed to keep a diary as well as fulltime watch and ward. One can thus hardly expect a rounded picture (even with his second thoughts and Sir Ian Jacob's diaries superadded) either of the Field Marshal himself, the first to recognise that "a diary is necessarily an impulsive and therefore somewhat unbalanced record of events," or of the great master he served with an intensely critical devotion and a frequently exasperated enjoyment. It was Lord Alanbrooke's peculiar contribution, more than any other man's, to achieve a relation of the brilliant, but immediate and sometimes contrary, hunch to the long haul: to enforce in stubborn argument a strategic coherence upon the bewilderingly restless Churchillian genius without the sacrifice of its astonishing impetus and fertility. By its inevitable emphasis upon this straining after coherence (indeed, perhaps from Sir Arthur Bryant's very skill in providing coherence) this first volume may serve, quite inadvertently, to yield less than justice to the greatest war leader ever to serve this country. For the book's point of view is, quite properly, that of the greatest of his lieutenants, whose sharp eye at very close quarters, late at night (and on occasion admittedly "liverish") sometimes seems to have observed not "warts and all," but just the warts.

Neither—statesman or soldier—could have done as much without the other; nor may we measure their personal contributions as if they were the sort of logistical problems with which the CIGS would so often confront the impulsive genius he "would not have missed the chance of working with . . . for anything on earth." To have worked so long and so closely together is a tribute at once to Sir Winston's perspicacity and to Lord Alanbrooke's strength of mind, character and physique. Not always keeping his temper, he never lost his head. Not a patient man—his brain moves too fast—he schooled himself to the long haul without developing tunnel vision. It was a high-spirited, high-tempered, exhausting and astonishingly successful partnership: enriched by fun, growing dividends and a tremendous mutual respect.

Junior officers must often have been struck by the considerable awe in which "Brookie" was held by their seniors: and not just because he was CIGS. They recognised him, it was evident, as the best soldier of them all: none has ever questioned that; and many have since gone out of their way to say so. He knew his stuff, and could out-think the lot of them. Further, he was as straight as a die: men knew where he stood and where they stood with him. He was utterly lacking in "side" or self-seeking. Again, he was a good picker, with a sensitive knowledge of the field to draw upon. In his demanding and abrupt efficiency, he knew when to scold, when to encourage, when to protect. Men admired, feared, and liked him: in that order, perhaps. He became, in peculiar, the conscience of the Army: a dark, incisive, round-shouldered, Irish eagle, the reluctant chairman of a council of war, frustrating, in selfless but far from patient service, those talents that could not otherwise but have forced him into the company of the great captains. And here he is—in his shirt-sleeves.

Political Missionary

THE LIFE OF RICHARD STAFFORD CRIPPS.
By Colin Cooke.
Hodder and Stoughton. 414 pages. 30s.

THIS careful sympathetic life of Sir Stafford Cripps has one large fault: its subject does not come to life. Why is this, when so much is so thoroughly told and so well documented? Why does the man escape Mr Cooke's industrious grasp?

Certainly the first reason is that Mr Cooke has been much too weighed down by his task. The frame of the portrait is too conscientiously wrought. It is fun to be told that Sir Stafford's father played on the winning side against the Arsenal in an FA Cup Final. But the family annals of Cripps and Potter are too dutifully drawn-out; and the careful background discourses on social life, the law and the like distract from the central riddle of Sir Stafford.

But the second reason is the personal riddle itself, which neither the painstaking (but solemnly readable) record of his career nor the pretentious essay on "greatness in politics," which begins the book, succeed in resolving. How was it that this pious Christian son of pious Christian gentry became first a famous legal precisian; then an alarming socialist doctrinaire; then during the war, after a dispiriting embassy to Russia, a political missionary in India as well as fleetingly a missionary of another kind at home; and finally, after protesting against Mr Churchill's "hand to mouth" ways of running the war, a minister of the highest administrative skill—and then the Iron Chancellor? Neither the man himself nor his relations with his Labour colleagues (except Mr Lansbury) come into proper focus.

There are clues here, of course, though the riddle remains at the end. Sir Stafford Cripps was both a lifelong churchman and, more than any other political leader of his time, an intellectual. He carried both his Christian principles and his political ideas to logical conclusions that were often as utterly unreal as they were honestly—and confidently—held. He turned to the Labour party because, under the influence of his father and Bishop Burge (who had been his headmaster at Winchester), he saw foreign policy as the extension into international relations of the movement for Christian unity; and because, like William Temple and Professor Tawney, he saw in Labour socialism a potentially practical recognition "of the familiar commonplace that 'morality is of the nature of things' and that men are all, in very truth, members one of another." Thus persuaded of both the virtues of "pacifism" and the social sin of unemployment, he called during the thirties, not only for a Popular Front, but also for a Labour programme that would end (to quote Tawney again) "the capitalist dictatorship in which democracy finds everywhere its most insidious and most relentless foe." Like Professor Laski he could not believe that, if Labour came in, the capitalists would not kick over the ballot boxes.

The same sentiments and convictions that sent this Wykehamist into the Labour party gave him a special sympathy for the aspiring peoples of the Empire; and his precise confidence of mind enabled him, after only a few days on holiday in Jamaica in 1938, to furnish Mr Manley with a 10-point programme for his new political party, just as four years later it enabled him at the summit of his wartime influence, to grapple with the problem of Indian independence and to come so near, despite Mr Gandhi and the limits of his own brief, to a solution. It was altogether suitable that in 1946 he should have been the leading spirit in the delegation that found a way—by a surgical partition—to set India free; and no parts of this book show the man better than the Indian (and Jamaican) passages.

One more clue to the riddle of Sir Stafford Cripps is that, rarely among politicians, he was by early inclination and training something of a scientist. This not only gave him one lever to his very great legal success in specialised work at the bar; together with his devoted work during the first world war as assistant superintendent of the Queensferry explosives factory, it also helped to give him the bent of mind that made him, rarely among ministers, a "manager." Mr Cooke claims that "the stimulation of active thought on the management of industry is one of Sir Stafford's legacies to his country." Certainly his striking work as Minister of Aircraft Production in the second war and as President of the Board of Trade afterwards led on to his stern—and principled—management of the wider national economy at the Exchequer.

It all adds up, for those who did not know Sir Stafford's kindly, sensitive, friendly self, to a strange and somewhat forbidding amalgam. "Perhaps," a profile-writer in the *Observer* said some years ago, "if Stafford could for once say 'I don't know the answer' or 'Yes, I was wrong,' the barriers would disappear, and Elijah would stand forth, glittering in his glory and visible to us all." That he was a good man, a deeply sincere man and a memorable public servant is unmistakable; whether he was a great man is, *pace* Mr Cooke's piety, still unproven.

Hungary's October Days

THE HUNGARIAN REVOLUTION.
By George Mikes.
Deutsch. 192 pages. 12s. 6d.

THE fate of Hungary has faded from the headlines, but the Hungarians are by no means reconciled to Mr Kadar's Moscow-controlled regime. It is, therefore, very appropriate that Mr Mikes, and his publisher, should have produced so quickly this short and useful account of the origin and course of the Hungarian revolt that began last October. Mr Mikes, himself a Hungarian by birth, does not claim to have been a real eyewitness of what happened. During the revolution he spent a few days in Hungary with a BBC television team. Later, in Vienna, he interviewed scores of refugees from all levels of society.

The book begins with a brief survey of the history of Hungary between 1919 and 1945. It goes on to a lively account of the Communists' gradual seizure of power and of the Rakosi regime—an account in which the author's controlled indignation at the brutalities of the system is mingled with his neat mockery at its stupidities.

In his account of the revolution last October, Mr Mikes provides a coherent picture of what, to many newspaper readers, must have been a number of confused impressions. There are some vivid and moving accounts of individual incidents; one in particular that sticks in the memory is the original demonstration on October 23rd at the statue of the Polish General Bem. The next day, October 24th, Suslov and Mikoyan paid their lightning visit to Budapest during which they kicked out Gerö and installed Nagy as prime minister. Mr Mikes believes that he is able to give the first accurate (and highly dramatic) explanation of why, in his first broadcast a few hours later, Mr Nagy failed to disclaim responsibility for calling in the Russian army.

Mr Mikes describes clearly the way in which the revolution gradually swept Mr Nagy along a path on which he was bound to come into disastrous collision with the Russians. He believes, and his belief is borne out by the timetable of events, that it was Mr Nagy's promise of free elections on October 30th rather than his later declaration of neutrality that made the Russians decide on a second intervention. Mr Mikes also argues, ingeniously but less convincingly, that if the Anglo-French ultimatum to Egypt had come a month later, Hungary would be a second Poland today. On present evidence, it seems more probable that the attack on Suez did no more than smooth the path for aggression in Hungary.

The account of what happened after November 4th is not so good as the description of the October days. And it is a pity that so little space is given to the origins and nature of the workers councils that sprang up all over the country and for some time wielded much more effective power than did Mr Kadar himself. Moreover, in a book that owes so much to the restraint and wit with which it is written, it is a pity, even though it is understandable, that in the concluding pages the author's bitterness at the failure of the West to save Hungary should have got the better of him—especially as he is able to suggest no course by which the West might have saved Hungary without risking a third world war.

The publisher's net profits from the sale of this book are to be given to the Hungarian refugees.

Eve of War

DOCUMENTS ON GERMAN FOREIGN POLICY, 1918-45: *Series D, Vol. VII, The Last Days of Peace, August 9-September 3, 1939.*
Her Majesty's Stationery Office. 746 pages. 40s.

VOLUME VII of the German Documents at last fills the gap that had been left between August 8 and September 4, 1939: at the same time, by providing, in a series of appendices, papers which have been found too late to fit into their chronological place, it fills various gaps unavoidably left in earlier volumes. The cross-references make the whole into something of a scholars' paradise.

Many familiar stories are here rounded off: there are, for example, some seventy documents on Russia that did not appear in "Nazi-Soviet Relations." The German Embassies in London, Paris and Washington report accurately on last moment public opinion. In view of its position, Slovakia assumes decisive strategic importance. Meanwhile Hungary incurs rather more than Hitler's usual suspicion, partly because of its claims to Slovak territory. Equally unwelcome are the Magyar claims in Rumania, whose oil makes its friendship at least as desirable as that of Slovakia; further, the German minority in Rumania objects to the Hungarian revisionist programme. Finally the Hungarians are so indiscreet as to betray their sympathy for Poland.

The sting of Volume VII is, however, in its tail, for the appendices provide unexpected excitements. Appendix III, Section K, reveals for the first time a military directive dated December 21, 1937, and based upon the famous Hossbach Protocol of November 5th of that year. Section B (i) (c) supplies the recorded conversation between Goering and the Prince of Hesse when the references to Czechoslovakia were deleted from Hitler's letter to Mussolini after the Anschluss, so that the letter might be published with safety. Appendix I very usefully makes public Halder's diary. Here on August 28th is recorded a meeting at which Hitler privately addressed Reichstag deputies and "several Party notables." He was evidently much concerned to conceal his real proceedings and to reassure the Nazi Party, for, although to Mussolini and his intimates he boasted of the eternal understanding he had achieved

with Stalin, on this occasion he described his Moscow agreement as "A pact with Satan to cast out the Devil." Further he declared that "the Duce's attitude serves our best interests" piqued though he certainly was by Mussolini's non-belligerency. The editors of these volumes suggest that the meeting described by the Italian Ambassador (see Italian Documents, Series VIII, vol. XIII, No. 346) as having taken place on August 27th was probably the same one, though Attolico's account diverges considerably; at all events no other record has been found hitherto of any such meeting either on August 27th or 28th.

Labour of Love

A KEY TO RICARDO.
By Oswald St Clair.
Routledge and Kegan Paul. 389 pages. 35s.

THIS book admirably fulfils the promise of its title. Ricardo is not an easy writer. His style is clear, his simplifications have been justly described as heroic; but between those simplifications and the complex reality of economic life a tension is set up which results, too often for comfort and clarity, in formulations resembling the "agreed" communiqués of deadlocked opponents at international conferences.

Mr St Clair has an admirable eye for these ambiguities and an admirable skill in isolating their contradictory components. Disarmingly, he claims "one qualification not possessed by professional economists, namely, a considerable obtuseness"; anything which he has succeeded in making clear to himself must, he feels, be perfectly clear to the average reader. The notion of an "average reader" making any detailed study of Ricardo at all is perhaps an odd one. Economics today is in full retreat from the Ricardian approach that, thanks first to the discipleship of Mill and then to the piety of Alfred Marshall, dominated British thinking throughout the nineteenth century. The genealogy of current ideas can be traced back rather to Adam Smith, preoccupied with the roots and processes of economic growth, and to Malthus, preoccupied with the roots and processes of economic disharmony, than to Ricardo; unless one looks eastward at the all too prolific patriarchy of Marxian illegitimates. That is, indeed, Mr St Clair's conclusion, as it was Schumpeter's and Jevons's; Ricardo "shunted the car of Economic science on to a wrong line."

"It has been worth while, I think," says Mr St Clair, "to study the way in which this state of affairs came about." Has it? To the specialist student of the history of economic ideas, yes. Such a student will find this "Key" an invaluable companion to Professor Sraffa's great ten-volume edition, a hardly less valuable supplement to Schumpeter's unsympathetic chapter. To Mr St Clair himself, evidently, yes; an amateur economist, like Ricardo before him, he has performed with unmistakable and contagious zest a labour of love. But is it, as Professor W. H. Hutt asserts in his foreword, a virtue to avoid any assessment of Ricardo's ideas in the light of *modern* theory, or any application of them to the problems of today? Never mind. There is something rather refreshing about a piece of work done very well indeed for the love of it; and it is a reminder that economics is a timeless humane study as well as a present tool of material betterment.

The Contemporary Novel

CATASTROPHE AND IMAGINATION.
By John McCormick.
Longmans. 338 pages. 25s.

THIS is an interpretation of the recent English and American novel in its political and social context. Mr McCormick finds the present state of the world wholly inimical to the arts. "World War I," he writes, "dislocated the life of imagination, and World War II induced virtual paralysis." Our plight is to be seen all over the place: "Business Administration is followed as a respectable intellectual discipline; the Geiger-counter becomes mightier than the pen." Confronted by this situation, the novelist must, above all things, not run away. More than ever before, he must realise that the health of his art consists in its being rooted in society. A universally enjoying and suffering *humanity is no doubt his ultimate theme*, but if it is to be rendered powerfully it had better be in terms of what is dynamic in an actual, contemporary and observed community. In a last analysis, the novelist's job consists in getting at society.

Starting off from some such tenets as these, Mr McCormick naturally distributes the emphasis of his attention and commendation in consonance with them. To admire Mr E. M. Forster, he implies, lays one open to the suspicion of being "culturally an Edwardian." He has little regard for those frontiers of the novel which look towards parable or fantasy; briskly attacks Mr Wyndham Lewis as "an amateur Kafka, English-bred . . . like a man playing bad tennis in the twilight"; displays no interest in Miss Compton-Burnett; and denounces as "Cyrillism" (the reference is apparently to Mr Connolly) that sort of polite English fiction which preserves "the elaborate arcana of the upper-middle-class atmosphere." Only Miss Iris Murdoch, Mr Wain and Mr Amis, he thinks, get away from this and so "promise better things." It is odd to be told, immediately after this, that both "Hurry on Down" and "Lucky Jim" "are negligible as novels." Mr. McCormick might here, in fact, catch a glimpse of the chief weakness of his customary critical approach: its failure to give the same alert consideration to the quality of writers as to their materials, attitudes and obsessions. Nevertheless, this is an honest and vigorous book, based on wide reading and lively convictions, and likely to be of great interest to the few readers who give an equal regard to the novel's development on either side of the Atlantic.

Home Life Observed

FAMILY AND NEIGHBOURHOOD.
By J. M. Mogey.
Oxford University Press. 197 pages. 30s.

THIS short and interesting book describes how ordinary people live in two parts of Oxford: the slum of St Ebbe's, which huddles between Christ Church and the gasworks, and the postwar Barton housing estate up at the north-east corner of the city. Although the result recalls in places Olivia's "item, two lips, indifferent red; item, two grey eyes, with lids to them"—most families, it appears, breakfast between seven and nine, and married couples prefer to have children—nothing has been taken for granted, and even the most obvious conclusions have been reached in an irreproachably scientific way. The tendency of working-class people to "keep themselves to themselves" is still very marked; families in St Ebbe's hardly ever enter each other's houses, unless they are near relations, and indeed two out of every three households there do not admit to having any "friends" at all. Bad as their living conditions are, it is noteworthy that they complain about them less than do those who live in the much more modern houses at Barton; it seems that the appetite for better housing facilities comes not from leaky roofs and cramped quarters, but from experience of better things.

This pair of studies, based on material six years old, is described by Professor G. D. H. Cole in a foreword as a pilot survey; lack of money has unfortunately delayed further progress. Clearly the preliminary work will have been invaluable to the team who carried it out; and much here set down will be useful to sociologists working on similar problems, or using the technique of the "free interview" which Dr Mogey describes clearly. This technique seems to be limited in value by the difficulty that ill-educated people in Midland towns have in expressing ideas that are at all complicated or out of the ordinary run.

Family Law

A CENTURY OF FAMILY LAW.
Edited by R. H. Graveson and F. R. Crane.
Sweet and Maxwell. 477 pages. 35s.

THIS book is the joint work of professors and other lawyers at King's College, London—thirteen of them responsible, some for one chapter and some for two. The accruing royalties will go to a charitable trust established for the Law Faculty; and if the book gets the sale it deserves, the charity will enjoy a handsome addition to its funds.

The work marks or celebrates the centenary of divorce (in the modern sense) in this country. In 1857 the first Matrimonial Causes Act came into force and gave to the civil courts the power (which they had never before possessed) of terminating a marriage. But it did more than that. It started a chain of

Communism at the Works!

WOODROW WYATT'S

revelation of

THE PERIL in our MIDST

Few of us realize the extent of the threat to our liberties offered by Communist control of the trade unions. Mr. Woodrow Wyatt, a former Minister and today a well-known television commentator, exposes with facts and figures the magnitude of the danger in this topical, hard-hitting booklet, which is being widely read and talked of in business and industrial circles as well as in political organizations and trade union branches throughout the country.

'We urge employers to post a copy of this pamphlet to every employee's home'—Scope.

'I commend it to all trade unionists'—Cassandra, Daily Mirror.

'Everyone should read this book and grasp its grave significance'—Liverpool Echo.

legislation that emancipated the married Englishwoman and converted her from a slave to a free citizen. The Act of 1857 was followed by married women's property Acts which, for the first time, permitted married women to hold their own property and enjoy their separately earned incomes. It led through laws and judgments of the courts to the opening of the professions, to the Parliamentary vote, and to the abolition of a husband's freedom to chastise and imprison his wife.

Until 1891—only sixty-six years ago—an English husband had the right—or was believed by the highest authorities to have the right—under common law, of flogging his wife if she disobeyed him and imprisoning her if she wanted to leave him. And it was not till Lord Halsbury delivered judgment, in *Regina v.* Jackson, that the husband lost it. Jackson, the husband, with the help of a lawyer's clerk, kidnapped his wife in 1891 as she was leaving church, drove her to a house he had leased, and kept her there a prisoner *incommunicado* until her relations secured a writ of habeas corpus.

The book covers a wide field apart from the immediate relationship of man and wife. There are chapters on the rights of children, family settlements, the entry of women into politics, the universities, medicine and other professions, and the conflict between English family law and the corresponding law of foreign countries. The chapters vary a good deal in character. Some of them are practically textbooks and others are made up mainly of narrative. But, taken all in all, the book, considering its subject, is surprisingly readable—surely a remarkable achievement.

Round the Postwar World

THE FIVE POUND LOOK.
By Tom Houston.
Weidenfeld and Nicolson. 284 pages. 21s.

THE author himself disarms criticism on the ground that his story is taken directly from life and therefore avoids the dishonesty of shape or pattern; he admits that it has a hazy beginning, too much middle and no end in sight, and that if the digressions were deleted there would be little or no book left. With these drawbacks premised the reader is left to consider the "digressions."

The story begins with a young Oxford graduate who has resigned from an excellent industrial job because he wanted something a bit more individual, and has jettisoned a possible one with a leading daily paper by declaring that he did not really want to be a journalist but was one of the odd fellows, who cannot fit in anywhere else, to whom Fleet Street offers jobs. In this frame of mind he took up the Duke of Edinburgh's challenge that a graduate should be capable of working his way round the world on £5. He took off as a groom in charge of bloodstock travelling by air to New York, and immediately began his digressions, which soon included matrimony. Thereafter the Houstons meandered on their unworldly way, meeting with lucky breaks and great kindness, supporting hardships cheerfully, working their passage in various unconventional ways with the courage and stamina to be expected of their kind. (A map would have been helpful.) The writer's comments on people and customs are thoughtful, tolerant and amusing, and he avoids the awful itch of the cursory traveller to pontificate on what ought to be done.

The disappointing feature of this entertaining book is that it is about an intelligent and able-bodied young man who, with every advantage of environment and education, was unemployed and could not decide what to do, and after a nine months' uninhibited caper was not very sure what to do next. "That," says Mr Houston, "is the end of my story." One hopes not.

Shorter Notices

LIFE AND LABOUR IN NEWFOUNDLAND.
By C. R. Fay.
Heffer. 261 pages. 18s.

It is right that Newfoundland should once more be brought to our attention. Until 1949 our oldest imperial asset (or liability, according to the way one looks at it), it presented a problem usually shirked or shelved by the Colonial Office but now, under Canadian federal dispensation, nearing a solution. Now that the fishing is being put into its modern economic context—a polite circumlocution—and surrendering men to the safer and more profitable demands for newsprint, fuel and power and, in due course, the tourist industry; now that, in other words, Newfoundland is on the boom, we need to know more about it.

It is remarkable how few standard works there are on the subject and how much one is obliged to depend on newspaper and periodical files for information. The few volumes available are apt to be for the specialist and, unless one is forced to lump it, indigestible. This volume is, unfortunately, no exception. The title is misleading, for all but the last two chapters are concerned with the history of the Newfoundland connection. One must sympathise with the learned author. The Colonial Office records abound in source material which he, as the world's leading expert on the island, finds so interesting that he is at a loss to condense and present it fairly. For serious students, such as those at the Memorial University in St. John's Newfoundland for whom in lecture form he originally gathered this material, this book is clearly important. To others, casually drawn to brush up on the island, it is too formidable.

25 ECONOMIC ESSAYS IN HONOUR OF ERIK LINDAHL.
Ekonomisk Tidskrift, Stockholm. 412 pages. 20 Sw. kronor.

The *Festschrift* notoriously, at the best of times, presents its reviewer with a sticky job. It is a distillation of many brews, generally high-powered; it has no uniting principle except, perhaps, the character and special interests of the individual in whose honour it is prepared; and it is meant for expert reading only. The *Festschrift* offered to Professor Erik Lindahl is to all other *Festschriften* as Minoan Linear A to mere ordinary Greek; for in addition to all the above attributes it is written, in spite of its English title, predominantly in the Scandinavian languages and German, not to mention mathematics.

English language contributions are "Macro-economics and linear programming," by Ragnar Frisch; "On Wage-Drift: A problem of Money-Wage Dynamics," by Bent Hansen and Gösta Rehn; "Methods of Dynamic Analysis," by J. R. Hicks; "The Gross Domestic Product of Sweden, 1861-1951," by Ohf Lindahl; "Stability Problems in the Australian Economy," by Erik Lundberg; "The Research Work of the Secretariat of the Economic Commission for Europe," by Gunnar Myrdal; "Capital Accumulation and National Wealth in an Expanding Economy," by Ingvar Svennilson; "The Transactions Demand for Money," by Ralph Turvey; "Marginal Productivity with Different Agricultural Products," by Gustav Akerman; and "The Cumulative Process," by Johan Akerman. One may hope that some at least of these will appear more accessibly—and less expensively—in learned journals.

CURRENT LEGAL PROBLEMS 1956.
Edited by G. W. Keeton and G. Schwarzenberger.
Stevens and Sons. 282 pages. 32s. 6d.

This collection of legal essays from *University College, London,* begins with an off-beat address by Mr Justice Devlin to the Bentham Club. Many lawyers take the view that the common law, if it were allowed to be properly used, would be adequate to protect the subject against bureaucratic erosion. While claiming that he was not presiding over the liquidation of the common law, Sir Patrick ventured to say that the lady is not so young as she once was, and that she cannot any longer indulge in activities which in her youth she would have taken in her stride, and that perhaps the time has come for her to hand over a part of her former responsibilities. He thought that the common law no longer has the strength to keep the executive under proper control.

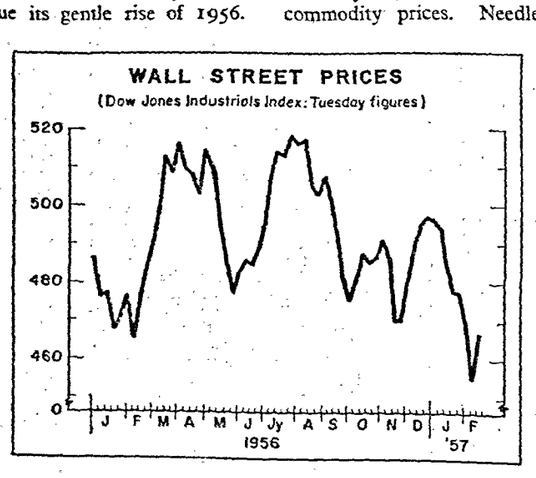
The other essays do not attain to the realism of Sir Patrick's. In his observations on security of tenure under the Landlord and Tenant Act, 1954, Mr E. H. Scammell misses the opportunity of depicting the movement from contract to status in the relations between landlord and tenant, a movement that is about to be stemmed by the proposed amendments of the Rents Acts.

Mr E. R. H. Ivamy questions whether it is not now necessary to amend the Sale of Goods Act, 1893, which apart from one amendment two years ago has stood firm amid the shifting legislative sands. He suggests that there might well be a partial interference by statute with the freedom to contract for the sale of goods, by making it illegal to exclude in all such contracts terms similar to those which were implied by law in every hire-purchase agreement.

Professor Dennis Lloyd contributes a useful review of the law relating to obscenity, and there is a penetrating analysis of the constitutional future of Malta by Professor R. C. Fitzgerald. To demonstrate how up to date the book is, Mr Bin Cheng devotes several pages of an essay on air law to considering the legal status of outer space, artificial satellites and space travel.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.



Economic Jitters

Washington, D.C.

THE weekly and monthly deluge of statistics, major and minor, is beginning to suggest that, during this year, the United States may have to face a dilemma not unlike that which now confronts the British Government: whether it should reflate the economy at a time when the original reasons for restraint are still apparent. Because the balance of payments is not a problem for Americans, the dilemma can be nothing like as painful as the one across the Atlantic. Nor is it yet at all certain that the choice will have to be made; there is at least an even chance that this year the American economy will continue its gentle rise of 1956. But the capable economists around the President and in the central bank are aware that they may have to choose, and they have been discussing what they should do if in fact the pace of business falters.

The signs so far, while rather faint, are numerous enough to convince most of the experts that much of the exuberance has gone out of the boom, for the moment, at least. Many traders on Wall Street obviously share this view. Even though the stock market, taken as a whole, rose very little, if at all, during 1956, share prices in general remain high in relation to earnings. The moment when investors decide that the prospects for growth—the one thing that justifies current market prices—are dimming, prices are bound to become vulnerable. The current nervousness in the market apparently arises from a combined realisation that the boom may be slowing down a little, and that the kind of wage-cost-price spiral which is afflicting parts of the economy often makes its first impact on business profits. In any case, while the steep decline early this month was quickly halted and reversed even after breaking through several technical resistance points, the stock market remains jittery and may well go down some more.

What, then, are the signs that the economy as a whole may be about to pause? The list includes a drop in new orders for machine tools; disappointing figures for railway freight traffic this winter; the continued fall in housing starts, which are now running about 14 per cent below the level of a year ago; a decline in bank loans to business in the first six weeks of the year that was apparently considerably more than seasonable; the announcement by a scattering of large firms, such as the General Motors Corporation, that projects for expansion will be postponed; slow sales and layoffs of work people in the television and appliance industries; the lack of improvement in motor car sales and production compared even with the reduced levels of last year; and the weakening of a number of sensitive commodity prices. Needless to say, none of these is conclusive, nor do they prove anything definite even when they are all taken together. It is often forgotten that last year, too, there were jitters in the late winter, and that, on the whole, they proved to be unfounded. Yet the signs cannot be altogether ignored.

The government economist assessing the situation has every reason to believe that the underlying forces of demand remain very strong indeed. Witnesses at the annual hearings before the Congressional Joint Economic Committee, which were more than usually fruitful this year, painted roughly this picture: government spending at all levels is certain to rise in 1957; consumer spending, bolstered by incomes at record heights and an exploding population, is likely to be strong, though not sufficient by itself to offset possible depressing factors elsewhere; business spending on plant and equipment is certain to show a total at least as high as last year, but equally certain to increase, if at all, far more slowly than in the past two years; buying for inventory is unlikely to go up, and may become a depressing factor; residential building is almost bound to decline, but other construction is equally bound to be strong; and finally, export demand, while probably good, is threatened by the potential impact on Europe of a prolonged closing of the Suez Canal.

It all adds up to a picture that led private economists testifying before the Joint Economic Committee to predict almost unanimously that the gross national product this year would be higher than last year's $412 billion. Furthermore, if monetary theory has any validity at all, a slowing down in one part of the economy should, in conditions where restraint has held back activity for over a year, release resources for expansion elsewhere. If the Federal Reserve System has succeeded in tempering the boom by curtailing many desirable activities, such as homebuilding, then these "postponed" activities may well rush in to fill the gap caused by, for example, a pause in the expansion of plant and equipment.

Secondly, however, the government economist is aware, from evidence given at the Joint Committee hearings by trade union economists and by others, such as Mr Leon Keyserling, who was President Truman's chief economic adviser, that it is the unanimous view of the left that there is no pervading inflationary threat to the economy and that total growth has been far too slow. These men want, immediately, easier credit, higher wages, more consumer buying power and a slowdown in capital investment by industry. They hint at a contraction or recession to come, and mourn the alleged injustices of the policy of restraint. None of this is taken very seriously, but there have been times when the left has produced accurate assessments of the situation and has prescribed just the right medicine.

Finally, of course, in the government economist's mind is the fact that prices are rising and the memory of what actually happened as a result of the policies with which the government fought the recession of 1953 to 1954. The Federal Reserve people believe that easy money was then perpetuated too long, and that this is a reason for the recent rise in wholesale and retail prices. Needless to say, the first move by the government to head off a slump this year would have to be in the monetary field, but the central bank does not want to be responsible for a panicky action that could only raise prices further in the end. There is a genuine hatred of inflation in the Eisenhower Administration (although much of the testimony from the left at the Joint Committee hearings frankly accepted a little inflation as a price worth paying for other desirable objectives). In short, it will take a substantial number of unmistakeable signs that the economy is slipping before counteraction is taken. Though they would not say so publicly, officials of both the Administration and the Federal Reserve believe at the back of their minds that a little temporary unemployment is a small price to pay for preserving the value of the dollar.

This, as always, is the heart of the potential dilemma. How is it known whether the unemployment will be "little" and "temporary"? And how is the public clamour for remedial action at the first sign of widespread layoffs to be resisted? To make the problem worse, the American economy has such stickiness in its price structure that it might well take a genuine recession to halt convincingly the creeping rise in prices which characterised last year. For example, in 1954, output in many industries was curtailed while prices were maintained or even, in some cases, increased. It is quite clear that neither the Administration nor the Federal Reserve wants a full-fledged recession; but it is equally clear that restraint will continue to be the order of the day for at least a little longer. If the reaction in Wall Street to the recent signs has at times approached panic, the reaction in Washington has been closer to relief.

Doctrine's Dilemma

IF Mr Ben Gurion rejects the President's last and most urgent plea to withdraw Israeli forces from Gaza and the Straits of Tiran before the United Nations begins its twice postponed debate on Friday, the Administration will be plunged back into the painful dilemma from which Mr Dulles has been struggling to extricate it. A bipartisan front against imposing sanctions on Israel, which no doubt encourages Mr Ben Gurion to resist, has been formed just as the Senate begins to debate the resolution giving the President a freer hand in the Middle East. Senator Knowland's objections have been reinforced by demands from Senator Johnson, the Democratic leader, and from the Democratic Policy Committee that the United States should oppose any attempt to apply sanctions. The Democrats, indeed, are believed to be behind the President's hasty return from his holiday in Georgia; they were not content to discuss the problem with Mr Dulles.

No meeting of minds emerged from Mr Eisenhower's session with members of the Foreign Relations, Armed Services and Appropriations Committees. But his sudden decision to go over the head of Congress in a radio and television speech to the country shows him to be unshaken in his belief that the future of peace in the Middle East and of the United Nations itself is at stake unless Israel withdraws without demanding further assurances than those Mr Dulles has already set out. Neither the President nor Mr Dulles said that the United States would vote for sanctions; both were exceedingly vague about their nature, the President speaking of "moral pressure" similar to that applied to the Soviet Union. Perhaps a way out can be found along these lines. Otherwise the President seems doggedly and, in the context, courageously prepared to risk his own great popularity in a congressional storm in order, as he believes, to uphold the authority of the United Nations and convince the Arab states that they can count on impartial justice from Washington.

Last week the committees which have concluded their hearings on the Eisenhower Doctrine urged the Senate to approve it and went out of their way to insist that their alteration of its wording reflected a purely domestic disagreement over the President's powers and in no way detracted from their strong support for the substance of the proposal. Even so, the Administration must regret more than ever the long and arid dispute over this point between Mr Dulles and the Democrats, which has entangled the final debate in the differences over Israel.

Texas Catches the Oil Bus

NO sooner had the Administration decided that the oil crisis was at last being met adequately than the Texas Railroad Commission at last brought itself to admit that a crisis existed. At least such an admission seems implicit in the commission's decision to allow the state's output in March to go up by 210,901 barrels a day, double the increase authorised this month, to a total of 3,733,054

barrels a day. Only last week General Thompson, one of the commission's three members, had told a congressional committee that Europe's oil emergency was "melting away" if, indeed, it had ever been more than a newspaper scare. Yet this week the commission has for the first time taken emergency action by permitting a much greater increase in production than had been expected.

The President's appeal a fortnight ago, and the bad publicity which Texas was getting as a result of its obstinacy, may have had something to do with this change of heart. While he was in Washington General Thompson may also have been convinced that the big importing companies are really going to send to Europe the crude oil which they have been bringing into the east coast of the United States from Venezuela. The Texas producers have always insisted that imports must be checked before domestic production is stepped up, in order that prices should not be weakened by the increased supply. More important, the Texas Legislature is said to have put pressure on the commission, in order that the state revenues should not lose the benefit of the additional taxes which would be paid on the higher output.

Indeed, the oil producers, as well as the legislature, may have realised that, if Texas did not act quickly, it was going to miss the bus. For the Administration had apparently written off any hope of getting more oil for Europe from Texas and its sudden optimism last week showed that it believed Europe might manage without Texas. The optimism sprang in part from a reassessment of the complicated and confused figures for European oil supplies and in part from the substantial reductions in refinery runs, averaging about 5 per cent, by the leading companies. This has been releasing an extra 200,000 barrels of crude oil a day for Europe and thus makes it possible for the refiners to do without a large part of their imports from Venezuela. Shipments of oil to Europe during the first week of February were only just below the goal of 500,000 barrels a day, for the first time since the beginning of December, and nearly all of this was in the form of crude or fuel oil. Whether or not this satisfactory figure can be maintained depends on the weather in the United States. Moreover, it is becoming urgent to rebuild stocks of crude oil there, for they are now well below what is considered a safe minimum for the time of year. Some at least of any increase which comes from Texas is certainly needed for this purpose.

Democratic Opposition

LAST weekend the Democratic National Committee met in San Francisco, the first time it had ever crossed the Mississippi River. This is where the marginal seats were won which gave the party its present congressional majority, and where the liberal wing hopes to find, in the future, the strength to shoulder aside the conservative southern Democrats now in control of Congress. From this friendly territory salvoes were launched, not only at the Administration—Mr Stevenson declared its foreign policies had led the country close to disaster—but also, indirectly, at the party's own congressional leaders; it is they who in the past have blocked the legislation on Negro rights and other progressive measures which are a matter of political life and death to Democrats in the north and west.

At San Francisco Mr Paul Butler, the national chairman who was swept into the wings when Mr Stevenson seemed to have some chance of winning the Presidency, was re-elected for two years to the rather thankless task of running the party's Washington headquarters while it is out of office. What was more surprising was the decision of the committee to give Mr Butler's brainchild, the National Advisory Council, power to formulate and interpret party policy between conventions. Mr Butler's original scheme was framed to give the party's leaders outside Congress a voice in legislation; this foundered on the determination of Senator Johnson and Mr Rayburn, the Democratic leaders in the Senate and House, to have nothing to do with the council. With such progressives in command as Mr Truman, Mrs Roosevelt, Governor Williams of Michigan, and Governor Harriman of New York, the council lost no time in calling on Democratic members of Congress to carry out the platform of the party by passing legislation protecting Negro rights. The council's voice may not carry to Washington, but the voters will be reminded that the Southerners do not speak for the whole party when it has no spokesman in the White House.

The split over policy would be more pressing and important if the next election were a presidential, not a congressional, one. In 1958 national issues will be less important than state issues, and Democrats, because so few of their seats in the Senate fall vacant, have sound hopes of increasing their majorities. The real problem, and one discussed anxiously behind the scenes, was how to refill the party coffers and pay off its debts—something both factions understand.

Competition for Savings

OVER 40 million holders of savings bonds are at last likely to receive a modest share of the higher interest rates other investors are enjoying. The Treasury has asked Congress to give it the power to raise the interest on savings bonds to 4¼ per cent, although at present it only proposes to increase the return from 3 to 3¼ per cent. Greater generosity might have started a landslide of exchanges, which the Treasury is anxious to avoid; this is one good argument against even considering the "purchasing power" savings bond which some economists advocate. Over $40 billion is invested in the small denomination E and H series; when other savings bonds are included, the total of $57 billion is about a fifth of the whole public debt.

Savings bonds are no longer to be issued in big denominations, and only $10,000 rather than $20,000 may be invested in them in any year. This is because the more sophisticated investors, who used to find these bonds paid slightly more than long-term government issues, have been cashing big amounts. They can get 3½ or 4 per cent on other government or high-grade corporate securities. The smaller savers are more loyal or just less knowledgeable; moreover, seven or eight million of them save automatically under pay-roll deduction plans, something which the Treasury relies on and to some extent exploits. But even small savers have been cashing more bonds in the past six months than they have been buying, and in January, when commercial banks were allowed to raise the interest they pay on savings deposits, redemptions of small savings bonds were the highest for eleven years.

Congress probably will agree to do something for the small saver, although it has a prejudice against giving the Treasury all the discretion it asks. This should help to stop a drain which has financially embarrassed the Treasury and made it more difficult for the Federal Reserve authorities to restrict credit. The Treasury is only comfortable when its cash balance is $2 billion or more; at present it is less than $1.3 billion, and before March 15th, when income tax receipts begin to flood in, $880 million must be found to pay off holders of three maturing issues who refused to accept the new securities offered in a $10.2 billion refinancing operation, even though the yields were the highest for similar securities since 1933. This temporary stringency explains why the International Monetary Fund sold gold to the Treasury and may sell more to get dollars for Britain and other borrowers. The device enables the Treasury to issue gold certificates and relieves it of the necessity of borrowing from the market.

Stuck With Stamps?

FROM A CORRESPONDENT IN NEW YORK

HOUSEWIVES, bearing banners with the legend "Save our Stamps," recently marched on the State Legislature in Tennessee and secured at least a temporary reprieve for the trading stamps which are the most discussed, the least understood and perhaps the most potent new sales device in the United States today. Half of all the families in the country, according to some estimates, collect them, and the Bureau of Labour Statistics is trying to decide whether they should figure in its consumer price index. Trading stamps are small gummed coupons about the size of postage stamps. A stamp company sells them to retail traders usually for about $15 for five thousand, although a big purchaser may pay considerably less. For every 10 cents worth of goods the consumer buys at that shop she is given a stamp. When she has a book full, usually representing purchases of $120, she takes it to a redemption centre run by the stamp company, where it entitles her to household appliances, furnishings, toys or a number of other products worth from $2 to $3 at retail prices.

Estimates of the size of the stamp business are guesses. One is that some 370 stamp companies collect $490 million a year from shopkeepers for stamps and distribute about $450 million worth of goods as prizes. Other estimates are higher. Whatever the amount, the competitive pressure is such that in recent months even the chains of food shops have succumbed to the craze. Only the giant Great Atlantic and Pacific Tea Company, among the big food retailers, has held out—and it has advertised heavily and cut its prices to offset the lure of stamps.

Trading stamps have existed for over fifty years, but their phenomenal growth began only in 1951, when independent supermarkets started to issue them. The main reason for their present popularity seems to be that, with shops and services and goods highly standardised, trading stamps give a retailer an advantage over his competitors. The fact that he loses this advantage when they also begin to give away stamps shifts part of the competitive burden back to the stamp company, which must provide more desirable premiums at better prices. But by then the shopkeeper dare not abandon the stamps for fear of losing business.

The controversy starts with the question, "What kind of sales incentive does the trading stamp represent?" One group answers that the stamp is a device to get around legal restrictions on price-cutting. Others deny that it can be a price incentive when merchants often raise the price of their own goods to offset the cost of the stamps. One woman rejoices in stamps because she believes she is getting something for nothing. Another believes that the shops which issue stamps probably charge more for their goods, but she is too prosperous or too much of an addict to care. Some collectors even complain if prices are cut a few cents and a stamp is lost. The ability to fulfil contradictory yearnings seems to give stamps their special value. With them, a housewife satisfies her apparently insatiable desire for goods, particularly for luxuries, without suffering any pangs of conscience over extravagance and without asking her husband for more money.

If there should be a depression, however, past experience suggests that consumers would want to redeem the stamps in cash. When the dispute has been taken to the courts, they have usually held that the stamps are simply a discount to consumers for paying cash, not a form of price-cutting which violates the resale price maintenance laws of the states. But as the stamp fever rises—it is only now reaching Canada—the questioning continues.

★

Shopkeepers disagree vehemently over the merits of the trading stamp. Its critics dislike the additional work it brings; they dislike its cost even more. This usually ranges from 2 per cent to 3 per cent of a retailer's gross sales, in addition to the minor costs of handling. They argue that profit margins, particularly in the food trade, are too thin to stand that kind of added drain. Many object to stamps on somewhat higher grounds. They argue that stamp schemes confuse and may defraud the consumer, who finds it difficult to know whether more has been added to the price of her original purchases than she recovers in prizes.

Many merchants, on the other hand, maintain that they do not raise prices to pay for stamps they give away. In some cases the increased sales that the stamps create pay not only for the stamps, but also may reduce the ratio of operating costs to sales. Estimates vary on how big an increase in sales is needed to achieve this. Some food chains put it as high as 20 per cent; other kinds of retailers, with bigger profits to start with, may require as little as a 12 per cent increase. The exact amount depends on whether operating expenses rise with bigger sales, on the price a merchant has to pay for his stamps, and on his profit margin. Enemies of the stamps reply that they create no new sales, but merely shift trade from one shop to another and lose their appeal when competitors also offer them. In this view the stamps create a parasitic business that benefits from the efforts of the shopkeeper while giving him little or no recompense.

The stamp companies, which are now on the defensive as never before, argue that the cost of stamps is a legitimate expense of doing business. Stamps promote sales just as do air conditioning, car-parks, packaging, or advertising; they

add neither more nor less to the value of the merchandise. Some retailers share this opinion and take it literally ; they cut their advertising budgets to offset the cost of the stamps —a habit that does not endear stamp plans to advertising interests. The stamp companies insist, moreover, that they themselves perform a distributive function ; the redemption centres become important outlets for the ever-rushing flow of goods. If, as seems to be the case, people tend to choose premiums that they would not feel justified in buying for cash, the redemption centres are creating new business. Ideally, a stamp firm, such as the Sperry and Hutchinson Company, the biggest by far, should be able, because of its vast buying power, to distribute goods more cheaply than more conventional outlets. In practice most stamp companies prefer a bigger profit. The stamp companies also doubt whether any consumer is foolish enough to accept stamps as a substitute for good merchandise, and note that shops which sell on account sometimes find that they can speed up collections when they give stamps to customers who pay within ten days.

Thus the evidence is sharply divided. Some retailers claim that trading stamps have kept them in business ; others say the stamps have brought them close to ruin. While the food stores, chemists' shops, petrol stations and department stores fight the battle out, the Federal Trade Commission is investigating the whole situation, including perhaps the question of the exclusive rights given to single shops to issue stamps in a given area, and the case of stamps which are never redeemed, either through the customers' oversight or because the stamp company has disappeared. Eventually it may need a Supreme Court ruling to bring an end to the discussion. In earlier decades, stamps were usually a small shop's defence against the chain store. Now that the chains themselves have adopted them, the government may view them less leniently than it has done in the past.

Communists Go West

THE *Communist party of the United States met last* week, for the first time since 1950, in a social hall which had once been a Russian Orthodox church ; after four days, Americanism had won another victory over Russian orthodoxy. Battle was joined between the ailing Mr William Z. Foster, long the party's chairman and Moscow's spokesman in the United States, and Mr John Gates, editor of the *Daily Worker*. Mr Gates had been charged with "liquidationist-revisionism" in a greeting to the convention from the French Communist leader, M. Duclos, who condemned the recent evidence of deviationism in American Communist circles. Mr Gates, also accused of being an ally of Mr Dulles, wanted to change the party into a political and educational association, which would be able to infiltrate mass organisations and would also, he presumably hoped, be free of the legal restrictions which now beset the party. This change was opposed, for the present at least, by the 300 delegates from 34 states, half of them from New York and nearly all of them elderly. But even though they were prepared to continue the party in its present form, they were not prepared to continue along its present lines.

After bitter argument, they voted, by about two to one, for the "rightist" policy of applying Marxist-Leninist principles in accordance with democratic traditions and the requirements of the American class struggle. When the obscurities of Communist jargon are penetrated, this means that the party voted to break away from Soviet leadership and to be run by an elected committee of sixty members instead of by a small "politbureau." The headquarters is also to be moved to Chicago from New York, to be nearer to two struggling classes of Americans—midwestern farmers and Negro industrial workers. Chicago does not want the Communists any more than does the National Association for the Advancement of Coloured People, through whom, instead of through left-wing organisations, they now propose to work in fighting racial segregation in southern schools. The Communists are also now hoping to co-operate with various labour and liberal groups. These used to be condemned as "social Fascists" but they have now been promoted to "bourgeois reformers" ; however, even this compliment has not made them welcome Communist help.

It would be going too far to interpret all this as a declaration of permanent independence from Moscow. Among the 10,000 or so Americans left in the party today, there are few, if any, of the idealists who sent its membership up to 100,000 twenty years ago. While international Communism is in its present state of flux, the hard-headed realists who are still in charge in the United States see some advantages in the new flexibility there ; more important, they know that the party's only hope of regaining any influence is to seem to Americanise itself. But last week's change in tactics does not mean that American Communists have changed their ultimate goals.

SHORTER NOTES

Although the dock strike was settled in New York on Sunday, it was Thursday before the union leaders ordered the east coast longshoremen back to work. They were waiting for local issues to be settled in other ports, particularly in Baltimore, where the employers objected to a "master contract" which applies to all the east coast ports. This is the basic feature of the new three-year agreement, which brings an immediate increase of 18 cents in the present wage of $2.48 cents an hour, with another seven cents to come next October and again in October, 1958.

★

Out of the mouth of a babe come the most lucrative answers in the history of television and radio. Leonard Ross, aged 11, by his encyclopædic knowledge of stock market lore recently won the Columbia Broadcasting System's "$64,000 Challenge," bringing his total winnings to $164,000. His nearest competitor, Mr Charles Van Doren, an instructor at Columbia University who in ten weeks became the "quiz champ" and a television personality capable of altering the balance of power between the two big networks, has won only $143,000 on the National Broadcasting Company's show "Twenty-one." But Mr Van Doren will answer questions on any subject ; Leonard has been concentrating on the stock market almost all his life—ever since he was seven.

A Voice in the storm

Above the trans-Atlantic gales of recent months sane voices have been heard, trying to repair rather than embitter the Anglo-American partnership, determined to review the shortcomings of their own country before moralising on those of their friends.

Few papers have played a more distinguished role in this respect than THE REPORTER, the liberal and internationalist American fortnightly which has brought a new dimension to trans-Atlantic journalism. Through its exploration of the real significance of the current news ; through its insight into the changing patterns of American life and work; through its gaiety and good temper, THE REPORTER has become—in less than eight years—one of the most respected journals of fact and opinion in the free world. The wide audience it now commands in Britain is evidence of this.

Make sure that you get one of the limited number of copies still available.

The current issues are principally devoted to an illuminating discussion of the ways in which the United States shall live up to its responsibilities in the Middle East.

Israel Faces Isolation

FROM OUR CORRESPONDENT IN TEL AVIV

THE demonstrations held throughout Israel two weeks ago were the biggest ever seen in this country. The crowd which moved through Allenby Street in Tel Aviv was estimated at 120,000. In Jerusalem and the smaller towns as well huge crowds protested against the policy of the United Nations ; and in Nachal Oz, in sight of the town of Gaza, the settlers of the Gaza area pledged themselves never to go back to the old regime under which the strip had been a base for fedayeen raids against their homes and farms. Thus Israel demonstrated to its own citizens and to the world at large that it would only withdraw its troops from the approaches to Eilat and from the Gaza strip if it could get guarantees for free passage through the Gulf of Akaba and against renewed fedayeen raids. The demonstrations were held after a renewed appeal from President Eisenhower and in the full knowledge that there was a real danger that the United Nations might impose sanctions against Israel.

The demonstrations were organised by the coalition parties. But that does not mean that the opposition is not backing the government. The religious parties which do not belong to the coalition organised political harangues during religious services in the synagogues. And Heruth, which advocated, much earlier than did Mr Ben Gurion, a firm stand against the evacuation of territory taken during the Sinai campaign, attacks the Prime Minister not for too much but for too little firmness. The only opponents of the government's policy are the communists, and their political weight is small.

The public has taken the threat of economic sanctions with astonishing calm. It is difficult to say whether this calmness flows from a secret belief that at the last moment sanctions will not materialise or from confidence that Israel will be able to weather the storm. The first explanation can be deduced from paragraphs in the papers which explain that the General Assembly is only empowered to recommend sanctions and that a resolution of the Security Council is needed to impose them—in which case Israel believes that France would use its veto. And confidence that Israel could weather the storm flows from the experiences of the war with the Arabs after the resolution of the United Nations in 1947. People say to each other: "We shall win through now as we did then."

Nobody, however, can clearly envisage what economic sanctions would mean for the economy and for daily life in Israel. The man in the street is only now beginning to realise that the United States imposed its "private" sanctions immediately after the outbreak of the Sinai campaign. Since then Israel has received no money from the grant in aid for 1956-57 ; this should have amounted to $25 million. Nor has any surplus food been received ; $17.5 million worth should have been shipped to Israel. Finally, technical aid worth $4 million has also been stopped. These three items make a hole of $46 million in Israel's dollar income. In addition the country has now to pay much more for its oil—the only fuel in the country—as the price of oil and of transport has gone up steeply. Thus the drop in Israel's dollar income is already estimated at roughly $80 million out of about $470 million.

Nevertheless, Israel has so far been carrying on much as before ; the only drastic steps so far taken to cut down dollar expenditure has been to curtail the use of electric current and of cars. It is true that certain foods, among them butter, which came from the American surplus stores, has either disappeared or is to be had only at exorbitant prices. But the average citizen eats as well as before and does not yet feel the pinch. Now all this is to be changed, and in a hurry.

While the Knesset has been discussing a budget prepared before the Sinai campaign, the Treasury has been busy preparing a new one which cuts expenditure by £1,110 million out of a budget of £1,850 million (excluding defence expenditure, which is kept secret). And every day brings new rumours of what is to be done to meet the emergency ; government expenses are to be cut down by at least 10 per cent ; income above a certain level is to be taxed up to 95 per cent ; holidays with pay, which have been the right of every employee in Israel down to domestic servants employed by the hour, are to be abolished ; a compulsory loan is to be imposed, and so on. The one thing not yet proposed is to stop pegging wages to the cost of living index, an arrangement mainly responsible for inflation but dear to the trade unions, as they look on it as the wage-earner's main reinsurance against price rises. The next few weeks will show which of all the many measures now being discussed will be adopted by the government and backed by the Labour Federation.

It is certain that the settled part of the population will bear the hardships that are now to be expected with fairly good grace. But to bring down the standard of living is one thing ; the threat of mass unemployment is another. Already the employment position is far from good, although Israel is at the peak of the orange season, which provides jobs for many thousands. In some places labour exchanges are simply closing down. Emergency jobs which have sustained a considerable number of new immigrants at subsistence

level have to be financed from the public purse and this is empty. The problem is made worse by the cessation of the American grant-in-aid. The counterpart funds from this were used to finance part of the development projects which provided jobs for the unemployed, and the curtailing of the projects is now considered almost inevitable.

Many people believe that the economic difficulties which are now becoming obvious to all will have a salutary effect. They hope that the rude awakening will jerk people out of the fools' paradise in which they have been living; that the endlessly repeated slogan of economic independence will now, out of sheer necessity, become a reality; that by forcing the standard of living down, Israeli goods will become competitive. But these optimists have so far failed to suggest a remedy for rising unemployment; nor can they say how fast the planned export drive will catch up with dwindling dollar reserves.

Yet whatever economic hardships lie ahead, Israel appears firmly resolved to stick to its demand for guarantees as the price for evacuation. Moreover, the country is firmly resolved to do the impossible again; for on top of all its other difficulties, immigration is increasing and promises to reach the 100,000 mark this year.

Agreement by the Six

FROM OUR PARIS CORRESPONDENT

THE agreement this week by the prime ministers of the Six to link their overseas possessions with the common market meets or partly meets, the last and hardest of the many French conditions which have all along circumscribed the common market talks. The decision to vest Euratom with the property rights in fissile materials settles the last political issue in the other treaty under discussion and removes a major obstacle to American aid for Euratom's power projects. Both treaties should now be completed and signed by mid-March.

On the overseas territories the French have obtained a big political commitment to "Eurafrica" from their partners. They need German funds in particular if they are to have a future even in black Africa where elections for local autonomous governments will be held on March 31st. They have obtained the European overseas investment fund they sought. But the limits of the agreement show how reluctant the Germans, particularly, have been to become entangled in France's colonial future with Algeria in revolt and Moroccan marauders penetrating the Sahara. It has been signed "*for a first period*" of *five years only*. The French merely obtain $312 million of European funds (though in the last year of the five they will get as much as $120 million—a precedent for later, the French hope). This is far less than they once aimed at. Colonial goods (coffee, cocoa, bananas and so on) will enjoy a European preference guaranteed by common market tariffs, to be gradually raised during the running-in period, against outside producers. In return the French will open their overseas market at the same rate as the common market; in five years this means relatively little. The end of the wedge is thin.

The stage is now set for ratification. Despite doubts quickened in Dutch and German minds by the transformation that the common market has undergone at the hands of the French there still seems little doubt of ratification outside France. In France the Assembly demanded satisfaction last month on agriculture and the colonies. The farmers have welcomed, as well they might, the preferential agricultural arrangements since obtained. Although the agreement on the French Union does not meet all the French employers' original demands, it looks as if they are now going to be less intransigent about it. These are good signs. But as the rift between M. Mollet and the Right on other issues widens, it is impossible to be more than hopeful about ratification in the spring or early summer.

Changes in Soviet Planning

SOVIET planning methods must be substantially revised to make possible a more rational regional development. These are the orders of the communist central committee which met in Moscow last week as soon as the meeting of the Supreme Soviet had ended. Mr Khrushchev himself outlined the necessary changes, and their tendency can be gathered from the recommendations published at the end of the meeting. Centralised control through a mass of ministries which tend to work as watertight compartments, apparently hinders a proper division of labour and resources, causes waste, overburdens the transport system, and so on. There is obviously no question of abandoning control from Moscow. The intention is rather that the central planning bodies (the *Gosplan* and *Gosekonkomissya*) should rely more in future on regional organs. It is intended, for this purpose, to divide the country into economic areas. Designed as it is to raise efficiency, the programme should have other consequences as well. It could relieve some of the nationalist discontent against Moscow's rule and, by harnessing various local authorities, provide a temporary Soviet substitute for the workers' councils made fashionable by the Jugoslavs and the Poles.

SOVIET BASIC PRODUCTION
(Mn. tons)

	1955	1956	1957 plan	1960 plan
Coal	391	419	446	593
Electricity*	170	192	211	320
Crude Oil	71	84	97	135
Crude steel	45·3	48·6	51·5	63·3

* Billion kWh.

The central committee also recommended the creation of a special commission to collect and spread the latest technological information both from Russia itself and from foreign countries. All these measures are signs that an attempt is being made to stop the sudden drop in the rate of growth of Soviet industrial production. In the last few years gross industrial output in the Soviet Union increased on an average by between 11 and 13 per cent annually. This year, according to Mr Pervukhin, it will rise by only 7 per cent. Almost all the branches of production are equally affected by this reduction. It can be seen from the table above that even basic production, that traditional favourite, is *temporarily* lagging behind schedule.

The slackening may well be temporary, as it is not accompanied by any radical redistribution of resources. Capital investment is still going up and the somewhat increased share of housing is not enough to justify the decline. This has probably been produced by a combination of many factors. The planners are apparently reluctant to keep industry permanently at full stretch and are trying to build up stocks at the factory level. Supplies from eastern Europe have been affected by recent events there. The year 1957 may also be a period of retooling, of technological change in Soviet industry. Last but not least, investment projects have taken much longer to mature than had been expected. One aim of the present changes of policy is to bring investments more quickly to fruition.

SOVIET BUDGET
(Bn. roubles)

	1956 est.	%	1956 actual	%	1957 est.	%
Revenue:—						
Turnover tax	271·2	45·8	258·1	44·3	278·3	45·1

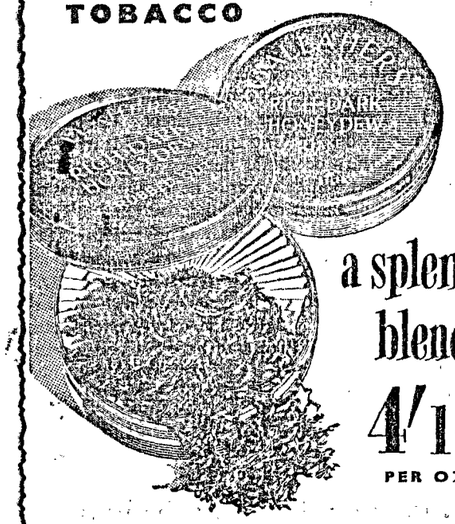
* Including insurance funds, collective farm taxes and profits of MTS.
† Including interest and premiums on bonds; advances to banks.

Mr Zverev, the finance minister, did not reveal any drastic changes in his budget for the current year. Last year's and this year's figures are set out in the accompanying table. Admittedly, a reduction in wholesale prices has made comparison difficult; it is this cut which explains the apparently declining share of "allocations to the national economy" in the total budgetary expenditure. Assuming that prices have not been *tilted in favour of heavy industry*, the proportion spent on grants to consumer industries has actually been increased this year. The stiff rise in outlay on the cultural and social services is largely due to the high cost of the new pensions scheme and other social benefits. These, together with slight wage increases, have recently replaced cuts in retail prices as the official method of raising the standard of living. Price changes must also be taken into account when looking at the cut in defence expenditure. In any case, the cut looks small in view of the much publicised demobilisation of 1,800,000 soldiers. The budget figures suggest that the Russians are spending money to maintain the striking power of their forces despite the reduction in numbers.

To the average Russian town dweller the pledge to build houses with a total floor space of 46 million square metres, or 28 per cent more than last year, is probably the most welcome announcement. But he will take it with a grain of salt: last year he received much less than he had been promised and the demand for housing is insatiable. The current plan foresees double the amount of construction compared with the previous five years (1951-55) and, judging by the new spurt, this target might be slightly exceeded. Even so, the average Russian would have less than 10 square yards of floor space by 1960. Mr Molotov recently admitted that pressure from the workers compelled the leaders to revise their plans in this field and this pressure remains undiminished.

Steps towards more equal wages, a certain degree of *relaxation, greater concern with housing and a slight shift* in investment in favour of the consumer—all the recent economic moves have a somewhat "Malenkovist" accent despite the ritual assurances about "priority of heavy industry." The accent, however, is only slight. The quantities of consumer goods that Mr Malenkov and Mr Mikoyan promised after Stalin's death for delivery in 1955 will in fact be on the market only this year or next. Overcrowding will be the plague of Soviet towns for many years to come *unless housing gets a still larger share of investment*. For the time being, however, major decisions in economic policy seem to have been postponed. Hopes are pinned on changes in planning methods and on the technological revolution. On economic problems, as on other questions, the factions in the Kremlin seem to have reached a compromise. How lasting it is will be shown when the revised version of the present five-year plan is published, as it should be, later this year.

Walkover for Mr Nehru



FROM OUR CORRESPONDENT IN INDIA

INDIA will begin to hold the world's biggest—and dullest—*general election* tomorrow. There are 193 million voters and no issues. Everybody knows the Congress will win and hardly anybody is so out of sympathy with Congress policies as to be very upset. Over 100 million of the electorate are expected to do their duty by going to the polls; they cannot reasonably be expected, except locally, to get excited as well.

The Congress victory may not be quite universal. It is bound to have a large majority at the Centre, and in states *like Uttar Pradesh* or Madhya Pradesh the opposition groups will be lucky if they come back strong enough even to oppose effectively. In some states and local areas, however, the fight may be tougher. The hangover of the linguistic states controversy will cause Congress to lose some seats in North Gujerat to the protagonists of a separate Gujerat state, and some in Maharashtra to those who prefer a unilingual Maharashtra to bilingual Bombay. In Orissa the leftist Ganatantra Parishad has high hopes; they are based on a combination of the general Oryia discontent that Orissa's border *with Bihar has not* been rectified and the hold of such ex-princes as the Maharaja of Patna in what used to be their states.

In Madras the Congress Reforms Committee made up of Congressmen who have seceded because they feel too many caste communalists have been given tickets, is causing the party machine some anxiety. In the South Telengana area of Andhra, the Communists have undoubtedly lost considerable ground since their sweeping victories of 1952, but they are still likely to win more seats than anyone else. In West Bengal, the crowding

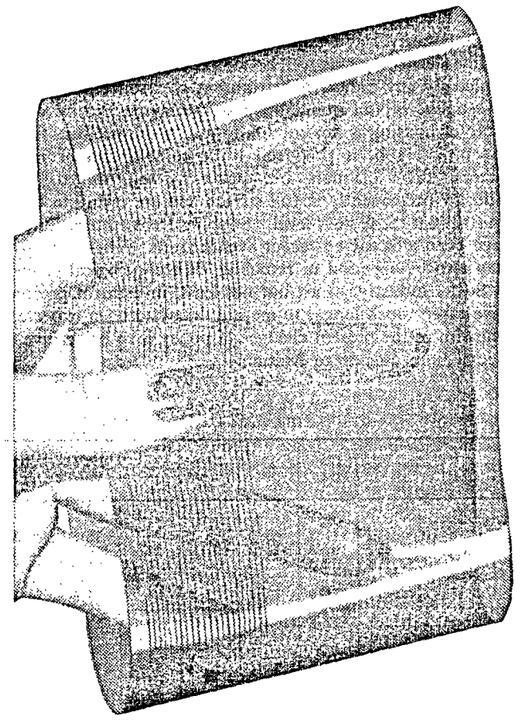
How to recognise fine Brandy

V·S·O·P



The finest brandy comes from the Grande and Petite Champagne districts of Cognac. Only Cognac originating from these two areas, at least half of which must be from the Grande Champagne, is entitled by French law to be called Fine Champagne Cognac.

Remy Martin produce Fine Champagne V.S.O.P. Cognac and *nothing less good*. They only offer for sale Brandy which has reached perfection. That is why when you insist on Remy Martin you can be sure of getting *a really fine Cognac*.

refugees, middle-class unemployment, and an effective electoral arrangement between the Communists and the Praja Socialists will cost Congress many seats, especially in and around Calcutta. Finally, in Kerala, the smallest state of all, even Congressmen are not confident of winning an absolute majority. Yet even with all these difficulties it is probable that Congress will still win a majority everywhere, except perhaps in Kerala, and that this majority will be handsome everywhere, except perhaps in Orissa and possibly in West Bengal.

The reasons for the Congress Party's impregnable position are complex. First, it alone is truly national. It is fighting almost every seat, where the Communists, for example, are fighting only one quarter of the state assembly seats, and the Hindu communal parties are totally unimportant south of the Vindhyas. Secondly, its leadership—not just Mr Nehru but men like Pandit Pant and Mr T. T. Krishnamachari and Mr Morarji Desai and Dr B. C. Roy—are widely known, whilst the Praja Socialists' best known leader, Mr J. P. Narain, has officially retired from politics, the Communists have only a couple of well-known names, and most people would be hard put to it to name a single leader of the Hindu communal parties since the death of Dr S. P. Mukherjee. Thirdly, the Congress has its record to campaign for it. It achieved *independence*; it made the first five-year plan work; it integrated the states and abolished zemindari (a form of landlordism); it invented non-alignment and the socialist pattern. By contrast, the three communalist parties cannot get together; there have been divisions within the Praja Socialists and the Communists are still recovering from the discredit of Hungary and restalinisation. It is therefore not surprising that Mr. J. P. Narain has felt it necessary to call on Mr Nehru to invent an opposition, too.

Two Revolutions at Once

Above all, the opposition is ineffective because the Congress is carrying through two great revolutions at once, and there are very few who wish to oppose both. The Congress is changing Hindu society, and it is bringing in socialism. Most of those who do not like the changes in Hindu society, who object to divorce and inheritance for daughters and getting rid of caste, have no particular objection to socialism. The Hindu communal parties produce manifestoes as full of state control and ceilings on incomes as anybody else; but the electorate still feels that Congress's socialism is somehow more authentic. On the other hand, most of those who prefer free enterprise to socialism are as eager as any Congressman to remove the accretions of centuries from their society. A few stand for parliament as independents or for minor parties. The great majority grumble at Congress's socialism but vote for it and contribute to its funds. It is at least less socialist than either the Praja Socialists or the Communists.

Moreover, the Congress is still a Movement, as well as a Party. Its candidates cover an enormous range of opinion, from the Maharani of Gwalior to Mr Krishna Menon, and it has deliberately chosen to include every sort of person amongst those to whom it gave tickets. There are landlords and peasant leaders, trade unionists and industrialists, Naga tribesman and Akali Sikhs. There are hundreds of Moslems, Christians and Parsis; 15 per cent of the seats were reserved for women, though it has not everywhere been possible to find so many. The Congress, in short, is a reflection of the nation.

If more was still wanted the Security Council provided it. Every opposition party has a policy on Kashmir distinguished from Mr Nehru's only by being rather more intransigent. When the Security Council voted against India they rallied round him with such enthusiasm that he had to explain to the voters that his Kashmir policy is his own nevertheless, and that the proper party to vote for in order to support it is the Congress. Where there is such unanimity, the path of opposition is hard indeed.

Elections in Siam

FROM A CORRESPONDENT IN BANGKOK

NEXT Tuesday, Siam will hold its first general election since the introduction of the multi-party system. No one seems to doubt that the Seri Manangasila or Government party will win a resounding victory. The party can, however, hardly be described as having a large and enthusiastic following. And, while many of the things now happening are far from being in accord with usual democratic practice, there are other things which would be just as strange in a frankly non-democratic country.

The strength of the Government party is due to several factors. It is the only party with wide financial resources. It represents authority in a country where traditional respect for authority in almost any form has long outlived the system of absolute monarchy (ended in 1932) which gave it birth. Its opponents have frittered away their strength by forming no fewer than twenty-one parties, most of them still in their infancy, all with very limited funds, and few with much of a well-defined alternative programme to that of the Government party. They also allege, as a further excuse for their weakness, many cases of the improper use of governmental powers to ensure the ruling party's success; but it must be admitted that definitions of "proper" and "improper" are bound to vary where so few precedents for correct election behaviour exist. And, finally, there is still a very widespread political apathy on the part of the general public.

This apathy is undoubtedly the Government party's greatest ally—it is easily understandable in a country blessed with a warm climate, an abundance of food, and a record of two centuries of peace and independence. It is hard to see how this apathy can be wholly eliminated unless the growth of industrialism or consistent failure to find markets for the bulk of surplus rice leads to real economic hardship. But this is not all. There is a very noticeable trend among politically conscious Siamese to say: "The Government party is sure to win, so why bother to vote?"

The Prime Minister, Marshal Pibul, and some of the leading lights of the Government party have announced that, fearing the possible defeat of their original candidates for the metropolitan constituencies, they intend to run in Bangkok themselves. This decision has caused great interest. It is widely held that while the Premier can be virtually certain of a heavy majority, some of the other ministers may fail to hold their seats. Furthermore any candidates who now withdraw may be rewarded by second category (appointed) membership of the new assembly; or, in case the bicameral system is revived, with seats in the upper house. Such an offer does not necessarily appear

"improper" here. As one Siamese intellectual put it—without any apparent irony—"There is nothing undemocratic about it. No one is forced to accept the offer."

Discontent with the present system of *appointing* fifty per cent of the members of the House of Representatives has long been voiced in the press. Recently, the Premier has made statements to the effect that he hopes to abolish second category membership in the near future and to restore the former bicameral system. No further details have been published. The response from the opposition has not been enthusiastic, since the membership of the restored upper house is likely to be so arranged that Marshal Pibul's government may rely on the same sort of effective support as that now received from second category members.

There are daily accusations in the press that the government is impeding the conduct of its opponents' campaigns. For example, at least one candidate was arrested for "vehement oratory" involving "stirring up feelings against the government." Yet, if this is an example of suppressing democratic rights, there are others to the contrary. A new party was very recently formed under the name of Sri Ariya Maitti Party—a name referring to the utopian age to be ushered in with the birth of a new Buddha in the distant future. Its leader, Police-Captain Chiab Chaisong, is a close friend of the ex-premier, Nai Pridi Panomyong, whose present exile in China he shared until recently. According to the present government, Nai Pridi is an arch-enemy, having entered into conspiracy with the Chinese Communists and allegedly being responsible to some extent for the murder (shortly after World War II) of King Ananda Mahidol. Yet Police-Captain Chiab has been allowed to return from China unmolested and to form a party which calls for the immediate return of Nai Pridi, "Beloved of the people," and for friendly relations with all countries, including Communist China; moreover its programme is designed to set up complete state socialism. It is true that this party has announced its intention of not competing until the 1962 election, but the fact remains that it is allowed to exist and to make propaganda of a kind which the present government must regard as little short of treason. Furthermore, Nai Had Chamloy, a candidate belonging to another opposition party, is allowed to campaign with posters displaying two photographs—one of a colleague killed in a political incident and one of himself over the captions "Dead already" and "Still alive." The implication of these captions is obvious.

Siam, which well within living memory had one of the most absolute monarchical governments in the world, is still at the stage of cautiously experimenting with democracy. The government can argue with more than just a show of reason that present conditions are apt to thrust authoritarianism on whoever happens to be in power. So long as a great part of the Siamese people not only give unquestioning obedience to those in authority, but actually seem to hanker for clear-cut orders as to what and what not to do; so long as a great many politically conscious citizens waver between a pessimism which causes them to abstain from voting and an opportunism which cares more for office than for the labour of constructing a really acceptable democratic programme—for just so long will authoritarianism of one sort or another remain inevitable. The non-apathetic part of the population is growing, and the government is sufficiently aware of the trend to make considerable efforts to appear democratic. The next general election in 1962 may well show that Siam is progressing faster than is yet generally suspected.

Whose Colonies?

FROM OUR UNITED NATIONS CORRESPONDENT

THE Greek claim to Cyprus has been before the General Assembly's political committee this week. Meanwhile, the proceedings of the Assembly's colonial committee have been enlivened by the presentation of similar territorial claims. Yemen claimed Aden and the Aden protectorate, Spain claimed Gibraltar, Argentina and Chile claimed the Falkland Islands and dependencies, Guatemala and Mexico claimed British Honduras, and Indonesia claimed Dutch New Guinea. The problem of the transition of colonies to independence is made infinitely more difficult by the desire of avowedly anti-colonial countries to extend their domains at the expense of colonial people.

There is a certain irony in the fact that protests against the so-called illegal extension of the colonial system were accompanied by protests against its apparent contraction. In particular, there were complaints that Portugal is evading the obligations of the UN Charter by pretending that its overseas territories are not colonies at all but integral parts of Portugal. The Assembly's colonial committee has recommended the appointment of a special committee to decide which of the sixteen new members admitted to the United Nations in 1955 administer "territories whose peoples have not yet attained a full measure of self-government."

This, if approved at a plenary session, will revive a sterile controversy. It is obvious that many territories which are not colonies do not have full self-government: Washington DC is a case in point. Nothing is gained by attempting to apply UN supervision to non-self-governing territories without the co-operation of the administering power. If the new committee is appointed and decides that Portugal's overseas territories are colonies within the meaning of article 73 of the Charter, then Portugal can merely follow the Belgian example and refrain from co-operating with the United Nations in this matter.

Visiting Australia?

P&O

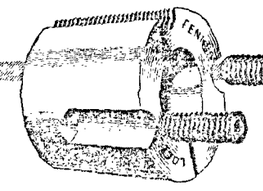
offer a saving of £140

YES! At least £140. That's the difference between the normal First Class return fare to Sydney and the Special First Class *return ticket* known as 'Boomerang'.

To qualify for this concession simply arrange to sail outward between the 1st of February and the end of May—the quiet season. You can *return to Britain* between September 1st and December 31st of that same year or next. Thus your visit can be of 3 or 18 months *duration as you* wish. Why not take advantage of this special inducement?

On the journey itself you will be treated as a welcome guest. Your comfort and convenience will be studied from every angle. You will find the appointments, the service and the cuisine well up to luxury hotel standards. Ports of call when via Suez usually include Port Said, Aden, Bombay, Colombo, Fremantle, Adelaide, Melbourne and Sydney.

ONE WAY ONLY



Again quiet season travelling has advantages. Travel during Feb. to May offers a wider choice of first class accommodation—more for your money.

engineers, designers and contractors to world industry

Simon resources and experience are brought to bear on many industrial developments of national and international importance.

SULPHURIC ACID

Many Simon-Carves sulphuric acid plants are used in oil production at great overseas refineries. Others in Britain and abroad help to increase world harvests by supplying acid for fertiliser manufacture: among these are two important new plants in Australia. Also in Australia are plants operating in the vital field of uranium production. At home the output of acid is significantly increased—and payments for imported materials reduced—by two great plants at Billingham and Widnes which make sulphuric acid and cement clinker from British anhydrite.

set fair

FOR THE ABBEY NATIONAL, 1956 was a year of sound and steady progress. This is, perhaps, best illustrated by the growth of total assets to £258,246,000 at 31st December, 1956.

Advances on mortgage during 1956 amounted to £40,300,000—or a little more than in the previous year. Two points deserve emphasis: first, this result was largely made possible by the new savings invested in the Society during the year; and, secondly, the Board maintained their high standard governing mortgage securities throughout the period.

The strength and solidity of the Society's financial structure was the Board's concern from first to last. Thus Cash and Trustee Securities at 31st December, 1956 amounted to £37,205,000, while Reserves and Carry Forward aggregated £9,917,000.

Here, then, is a record of service that is ample justification for saying 'Invest in Safety'—with the Abbey National.

The Society's shares yield 3½ per cent. per annum, income tax paid by the Society. This is equivalent to £6 . 1 . 9d. where the standard rate of income tax is paid—a first-rate safety-first investment by any test.

THE BUSINESS WORLD

Non-U Airlines

THE Minister of Transport has set one of his more obscure machines in motion by asking the Air Transport Advisory Council to advise him "urgently" on the aircraft that independent airlines should be allowed to operate. This temporarily relieves him of having to explain why his Ministry has reduced one airline, Hunting-Clan, to such a state of frustration that it is selling off (no doubt at a profit) two new Viscount airliners that have been standing idle at London airport since they were delivered last autumn. But when the council has ground out its answer it may involve him in changing, and changing radically, the policy which his predecessors have adopted towards the independent airlines. The reason why the two Viscounts remain grounded because they carry independent colours dates back to 1952.

What has come to be called the "new" policy for civil aviation was first put forward in that year. Up to that time the nationalised corporations had a virtual monopoly of all Britain's scheduled air traffic. The changes made in 1952 opened up to the independents a whole vista of new, but as it turned out somewhat scrubby, pastures. They were allowed, for example, to operate all-freight services in parallel with the corporations' passenger services. They were to be allowed to fly normal scheduled services on entirely new routes that the corporations had not yet developed. They were given a free hand in the holiday business to arrange inclusive tours with travel agents. Most important of all, it was laid down that an independent airline could run a parallel third-class service on colonial routes where the corporations were already operating first and tourist class flights.

This was freedom to compete of a strictly qualified kind, but the bigger independent companies believed that it was the first step in a new policy that would be developed and expanded in the light of experience. Events have proved them wrong. The policy has not deviated one iota from the strict letter of the directive given nearly five years ago. The terms of reference given then to the ATAC have been precisely followed. Air transport has not stood still in the meantime. It is a fluid, rapidly expanding, rapidly changing industry and conditions and requirements that might have been acceptable five years ago are anachronisms today. The directive that was designed to open up prospects for the independent airlines is, five years and two ministers later, in some danger of squeezing them out of business.

At a first quick look, traffic figures might seem to belie this. The ATAC has not completed its statistics for the financial year 1956-57, but in the previous year, 1955-56, traffic carried by the independent airlines roughly doubled and was three times as great as in 1953-55. There was certainly another big rise last summer. But this is not the kind of traffic on which big enterprises can be built. A vigorous and well-equipped merchant air transport industry, fighting for trade with international competitors with the same vigour as the merchant marine, cannot be developed out of the business of carrying holiday parties to the tourist resorts of Europe, or running feeder services round the smaller airports of the British Isles. Yet this is where most of the expansion has taken place. The car ferries and internal feeder services between them carried nearly three-quarters of all the independent airlines' passengers in 1955-56 and if there has been any change in these proportions in 1956, it will have been the result of an upsurge in holiday traffic.

The "inclusive tours" on which this traffic is based deserve a word of explanation. The travel agent and the airline work together to evolve a price for an all-in holiday, transport being by aircraft on charter to the travel agent, departing on specified dates throughout the summer. The licence to operate such "package holidays" lasts one season only; 160 tours were approved for the 1956 summer season and the number of applications for the 1957 season looks as if it might be double this figure. Although British European Air-

ways have complained that the growth of this traffic is costing the corporation passengers, it has in fact solved the holiday peak traffic that so plagued BEA.

The independents' major disappointment has come over the development of long-range traffic; here the test case has come in the operations of third-class passenger services. Because the big international airlines exercise a tight control over international air fares through their own cartel, the International Air Transport Association, and because this control is endorsed by almost all governments, the field for these services was limited from the outset to British territories. The first of the "colonial coach" services was opened by Airwork and Hunting-Clan working in partnership. Their network extends over east, west and central Africa.

The service is operated under stringent restrictions. Not only is the fare substantially lower than that charged on the British Overseas Airways Corporation standard tourist service on the same routes, but diabolical skill is exercised to see that the standard of service is deliberately degraded as well. The operators have been able to quash the more outrageous suggestions for making their services slow and uncomfortable, but they are nevertheless operating today twin-engined Vikings, aircraft that have long been abandoned for any normal scheduled operations, fitted with 27 seats and served by one stewardess—whose stamina under cramped conditions in African heat can only be admired.

However much skill is exercised in fitting out these aircraft (and both operators have shown great ingenuity in doing this) the fact remains that Vikings were old when these coach services began, are four years older today and are fast qualifying as museum pieces. Their operating costs are rocketing. Both operators want to change them. Airwork wants to use Hermes bought secondhand from BOAC and Hunting wants to use the Viscounts it bought new from Vickers-Armstrongs. Both have been given to understand that their applications will be rejected, and therefore neither has taken the decisive step of asking the Air Transport Advisory Council for amendments to their coach licences.

This policy will no doubt be defended on the grounds that, until a week or so ago, BOAC was itself using an old aircraft, the Argonaut, or Canadair IV, on the route. This is roughly as old as the Viking: until the Britannia could be put into service, any change in the type of aircraft that the two independents were allowed to use would have narrowed the differential between their service and that of BOAC. But there is something basically at fault in any civil air policy that deliberately penalises one operator because another, bigger, airline has had disappointments over its equipment. Applications put in now might get a more favourable answer. But this softening of the official attitude comes at a time when the whole future of the coach services is in doubt. They are threatened from two sides. The gradual acquisition of self-government by former colonial territories is removing one of the conditions that made the coach services possible, the fact that they were operated within British territory.

There is, however, a much broader issue implicit in the future of the coach services, which makes this a test case for the Government's future policy for independent airlines. It is this: now that third-class services are being introduced by the international airlines, will the British independent operators be allowed to bid for licences to operate these under IATA rules?

The terms of the original directive say that the passenger services reserved to the corporations are "normal scheduled services providing for passengers at first and/or second-class (tourist) fares, as defined for the purposes of the International Air Transport Association." What IATA has in prospect is a first-class service on the North Atlantic, with a luxury service for those who want to pay a surcharge of about 10 per cent. Secondly, there is the standard tourist service and next spring there will be a third lower fare with rates corresponding roughly to the independent airlines' present third-class services in Africa.

★

BOAC has not been slow to see the implications of this fare structure. Mr Watkinson has shown in the House of Commons this week that he, too, is aware of the new factor raised by these fares. Fare changes that start on the North Atlantic tend to spread in time over the entire international nework. Great care, therefore, has been taken to avoid the use in IATA terminology of the term "third class" although it does appear in statements from IATA's headquarters in Montreal. The official nomenclature of the new fare is "tourist-type" or T (for tourist) 34 (the number of inches of leg room per seat). Because of this play with words, it is technically possible for the Ministry of Transport to waive inquiries about the rights of the independents to bid for these third-class services by saying that, officially, no such things exist. But unless IATA decides to eliminate first or tourist travel on the North Atlantic by the autumn, when the fares are frozen for the next 18 months, there will be three basic fares in force on that route, whatever the fancy names by which they may be known. And BOAC, along with the other major airlines, fully intends to operate two or three class aircraft. The independents might well fear competition from mixed-class aircraft of this type along their own coach routes.

The old policy failed because of a fundamental contradiction in its terms. The one method by which cheap fares can be made profitable is to operate them with the best, most efficient, aircraft available. These may not necessarily be the latest types off the assembly line, but they will be basically modern. But the development of aircraft for mixed class services makes nonsense of any future attempt to specify what types of aircraft are to be used for what type of service.

If, therefore, the ATAC advise the Minister simply to allow the independents to replace their obsolete with obsolescent aircraft, the issue of the future of the third-class services will still not be solved. At a time when the number of colonies is dwindling, the International Air Transport Association has been taking decisions the effect of which will be to open a widening prospect of third-class travel over all the international network. Which British airlines will be allowed to take these opportunities? The earlier directive to the ATAC says that third-class flights are the province of the independent airlines. BOAC and BEA will say otherwise.

Unless the policy of allowing some scope to independent airlines is to be repudiated by the government that introduced it, will not the changing conditions introduced by the airlines themselves lead the Government inexorably towards the American system of having more than one designated airline flying the world's routes? This has not been the European way, but a lesson might perhaps be learned from both Pan-American and Trans-World Airlines, which manage to sweep up an increasing proportion of traffic.

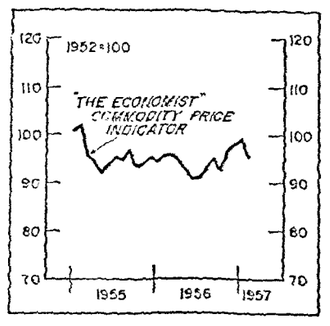
Such a policy would be more complicated to implement than one that merely made room for the independents on services operated inside British territory. The independent operators, once they venture outside British territory, must abide by the rate and fare structure laid down by the International Air Transport Association. And it would still be possible for governments to refuse permission for such services to be flown into their territory. Everything would still depend on the pressure that the British Government could exert on behalf of the independent airlines to wring bilateral concessions for them.

The decisive question the Minister must ask himself is not how much damage such a system would do to BOAC, but how much benefit it might bring to the air passenger. This is not as simple an answer as it might sound, for BOAC would have to be strong enough to meet this increased competition. But it is, nevertheless, the right way to look at the problems of air transport.

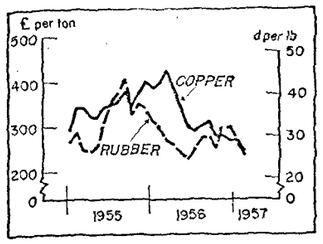
Commodities after the Crisis

THE post-Suez surge in commodity prices is spent. This week *The Economist* commodity indicator touched 95.2, a point roughly half-way between the trough of last July and the twin peaks that were reached at the end of November and again in the middle of last month. The seizure of the Suez canal and the war in Egypt gave commodities a double boost. On neither occasion was there a panicky rush to buy, but after the canal was blocked at the beginning of November consumers were eager to buy prompt supplies and commodity traders covered their sales. That increased demand was backed by the upswing in the American economy and it smothered the impact of the decline in industrial output in Britain. Freight rates naturally rose sharply, too, though the effect on cif prices was substantial for only a few commodities such as grain, sugar and coal.

Before the canal was seized in July the average level of commodity prices was at its lowest for over three years. The subsequent rise took *The Economist* indicator to 94.7 in mid-September, 5½ per cent higher than on July 24th. Prices then began to ease, but rallied again when Israel attacked Egypt at the end of October. The second advance was sharper; the indicator rose by eight per cent to 99.1 at the end of November, its highest point since February, 1955.



All the main groups of commodities contributed to this advance. Between July and November the food index rose by 10 per cent to 100.3; fibres 17 per cent to 94, metals five per cent to 97, and "others"—rubber, gasoline and copra—rose by 9½ per cent to 106. The strength of several commodities was accentuated by factors not directly connected with the Middle East.

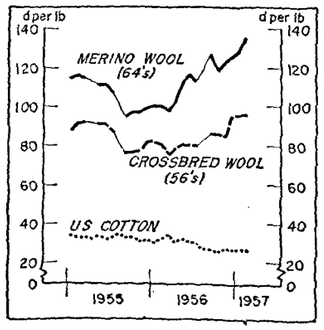


But once the threat of widespread conflict faded prices were bound to fall. Supplies rerouted round the Cape began to arrive and the shortage of one commodity—oil—threatened the ability of industry to absorb many others. Consumers, their immediate needs covered, could afford to wait for lower prices. For the next few weeks, at least, prices could remain weak. Some commodities are more fortunate than others: certain food items are holding up well, and the non-ferrous metals can count on some support to stem the slide.

Save for an occasional rally, copper has been falling for nearly a year. On the London Metal Exchange cash metal is now about £243 a ton, 44 per cent below the peak of last March; the Rhodesian Selection Trust companies have cut their fixed price to UK consumers by another £10 to £240 a ton; and the American producers have cut their prices to 32 cents a lb (£256 a ton). There has

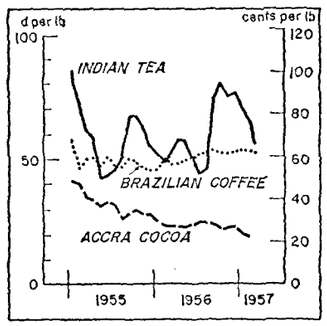
HOW COMMODITY PRICES HAVE MOVED

	July 25	Nov. 28	Feb. 20
Copper, cash, £ per ton	286½	276	243
Tin, cash, £ per ton	758½	847½	767
Zinc, prompt, £ per ton	93	101½	98
Rubber, spot, d. per lb.	26½	33½	25½
Cotton futures, d. per lb.	27.20	27.65	25.75
Merino wool top futures, d. per lb.	118	145½	141½
Barley futures, £ per ton	24	28½	25½
Cocoa futures, £ per ton	216	213	173
Raw sugar, spot, £ per ton	34½	48½	55½

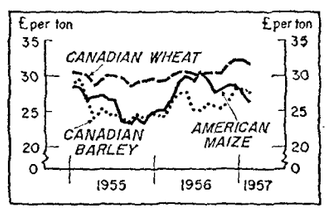


been no drastic fall in consumption; but production has steadily increased and has not been checked, as so often in the past, by strikes. There is a *limit to the probable* fall. Producers are strong enough to defend prices by restricting output, and more of America's production could find a home in the American strategic stock.

Though lead and zinc prices have declined they would have dropped like a stone if the American government had not been taking most of the surplus into the stockpile. Tin prices have eased, and should fall further when the strike in the Penang smelter is settled. Now that the American government has ceased adding tin to its stockpile a surplus of about 10,000 tons should appear this year. But tin, too, has a lifebelt. The tin agreement is in being and the manager of the buffer stock has ample funds with which to buy the surplus and try to keep prices between £720 to £800 a ton, the middle slice of the price range in the tin scheme.



Raw wool prices have shown remarkable strength. The average price of merino 64's last week was 136d. a lb (clean landed, UK), 15 per cent higher than at the close of the 1955-56 season, and crossbred 56's were 96d. a lb, showing an advance of 20 per cent. Prices seem in no serious danger for the rest of the season that ends on June 30th. World demand for cotton is also high. Confidence in prices has returned and stocks are being built up. But prices of American-type cotton have risen only slightly, for an almost unlimited supply is available from the American government's stock. Raw jute, traditionally a volatile market, has fallen sharply; first are now about £99 a ton cif UK, £20 below the recent peak. Sisal has weakened, with the top grade of British East African fibre £73 10s. a ton cif UK, and the small surplus of production suggests that this fibre will remain cheap.



Rubber has dropped back to 26d. a lb for No. 1 RSS, which is almost the level of last July. Forecasts of American car production this year have been trimmed and European demand has been depressed by the further fall in demand for tyres that followed petrol rationing. Consumption of natural rubber in the western world may be smaller than last year, so that the prospect for prices depends largely on whether that reduction is offset by bigger purchases by Russia and other Communist countries.

Among the beverages only cocoa is in trouble. World production has expanded faster than consumption and Accra cocoa is now about £177 a ton cif UK, the lowest price for nearly eight years. Even if the Brazilian crop should fall below expectations a recovery in prices will be tempered by the substantial stocks that consumers hold. World production of tea in 1956 appears to have been only slightly in excess of consumption, thanks to the restriction of plucking in North India towards the end of the year. But now that arrivals in London have returned to normal, prices have dropped, especially for plain tea which is now 4s. 1½d. a lb against 5s. 6½d. at the Suez peak. Coffee has been fairly steady at very profitable prices; production and consumption are in rough balance and radical changes in price are unlikely during the next few months.

Raw sugar is enjoying a boom for the first time since the Korean war. Between the end of October and the middle of January prices soared by three cents to 6.37 cents a lb fas Cuba. That level has not been held, but prices are still high and fluctuating sharply. For the first time in history raw sugar has been able to throw off the crutches of the international sugar agreement; all restrictions on sugar exports have temporarily lapsed. Vegetable oils and fats rose quickly after the Suez canal was closed. Consumers are now well supplied and prices have declined, with Philippine copra down to about £63 10s. a ton, £5 below the recent peak.

The Suez troubles had almost no effect on fob prices of wheat, but cif prices rose sharply with the increased cost of freight: indeed the timing of purchases was really determined by the importer's view of freight rates—not wheat prices. The Fort William price of Canadian wheat is in fact slightly cheaper than a year ago, at $1.66 a bushel, and the cif price to the United Kingdom is £2 7s. 6d. higher at £31 15s. a ton.

Recently prices have eased, owing to the decline in freight rates and to cheaper offerings from Argentina. Feed grains, too, have weakened. The United States is a pressing seller of maize, and European demand has slackened.

This spring commodities will probably face two contrary pressures. Assuming that the Suez canal will soon be open to the ships of all nations at reasonable charges, the pipeline will shorten, supplies will increase, and the freight element in these prices may fall further. But if the end of the oil shortage is then in sight business confidence should strengthen and possibly the activity of the European motor and auxilliary industries will pick up. Which will prove the stronger—the pressure of a potentially higher demand or of a rising supply at the point of consumption? The answer will be determined by economic prospects in the United States and in Britain and by the financial policies that those countries pursue. American industrial activity is the real key.

Business Notes

A Carrot Forgotten

THE donkey has eaten the carrot, and—how base his ingratitude—he has ceased to run. The gilt-edged market has been dragging gently downwards through the week. The *Financial Times* index of Government securities was 88.29 on Wednesday compared with 88.84 a week earlier. The Government broker, now supplied with plenty of Funding 3½ per cent stock 1999-2004 which he would apparently be prepared to supply at about one-eighth over the issue price of £80 finds that buyers can get all they want from the old tranche of the same issue, now quoted in the market at 79¼. It must be assumed that Government funding through sales in the market has been reduced to a fraction of its former rate since Bank rate was reduced. Edinburgh Corporation found an unhappy market for its issue of £5 million 5 per cent stock 1975-77 at £98 10s. per cent, and, popular borrower though the Royal Burgh is, 71 per cent of the issue (which opened at ⅜ discount) was left with the underwriters.

The behaviour of the industrial market has been just a shade less disillusioned. *The Economist* indicator achieved a small advance from 195.9 to 196.8. A movement so small in this sensitive indicator means little more than that prices have held fully steady. It has not been a week of active markets, and what activity there has been has been largely in the side lines. Shipping shares have advanced; so have selected tea shares, including Aibheel, where the agency house concerned has itself made an attractive (and possibly forestalling) take-over bid. The logical expectation now is that the donkey should take a little time to digest his carrot. There are big calls to pay on issues already made, and there is at least one big issue to come requiring a clear run.

Steel of Wales Offer?

ARRANGEMENTS now reaching an advanced stage for the sale to the public of the ordinary capital of Steel Company of Wales have been the main topic of conversation on the Stock Exchange this week. The current expectation is an offer next month of about 40 million £1 ordinary shares to raise about £43 million. This would be the biggest operation that the Iron and Steel Holding and Realisation has tackled, and also the largest ordinary share marketing that the Stock Exchange has ever seen. Its prospect has been sufficient to restrain and slightly to lower other steel equities; its execution would inevitably impose a close season for other new issues. An operation of such complexity and sheer size will demand great courage and skill from Sir John Morison and the group of leading merchant banks and stockbrokers that collaborate with him.

The capital structure of Steel Company of Wales will have to be rearranged before the ordinary share offer is made. It is presumed that the present issued share capital of £16,936,041 will be increased to the authorised limit of £40 million. That would still leave a big weight of £83.2 million of prior charges. Of these, the publicly held £15 million of 3 per cent first mortgage debenture stock 1952-57 matures at £101 on July 16th this year. Of the remaining borrowings £28.2 million has been provided by Finance Corporation for Industry and £40 million by ISHRA itself. If precedent is followed these prior charges will be retained by present holders for marketing when occasion arises. It seems a little surprising that the agency and the consortium have apparently decided against taking advantage of the present appetite for convertible loan stocks. Such a stock, if issued below par would have undoubtedly appealed to the institutions. The decision was presumably taken because the prior charges are already heavy compared with the equity.

The equity will nevertheless be an attractive election hedge. Earnings of Steel of Wales have yet to reach their peak. Indeed the prospectus will have to show that a substantial increase in the current 4 per cent dividend is contemplated because in relation to current yields on other steel shares, a yield of at least 7 per cent would be needed to make this offer go. In the year to last September profits were £9½ million after depreciation and nearly £6 million after debenture and loan interest. To increase the distribution to about 7½ per cent, even on a much larger ordinary capital, would not involve the distribution of an unreasonable proportion of the earnings.

Optimism About Petrol

COMMERCIAL vehicle operators might be more justified than private motorists in drawing optimistic conclusions from the various ministerial statements made this week about the future of petrol rationing. With understandable caution, the government is preparing for another rationing period for all petrol users, private and commercial. A decision whether or not to implement these plans will be taken in March, in the light of later information about the Suez Canal, the trans-Syrian pipelines, and the supplies available from the Western Hemisphere. The key to this decision will be the reassessment of supply prospects for the second quarter to be made by the OEEC oil committee on March 5th.

Private motorists now have an assurance that their next ration, if there has to be one, will not be below the present level, but the government has not yet confirmed the general impression that any new ration is likely to be more generous than the old. The only rope motorists have been given so far is permission to use their current coupons—both basic and supplementary—over the Easter holidays and up to the end of April. Bus and coach services and the road haulage industry, on the other hand, have received more definite assurances about their future rations, if supplies still have to be restricted. Regular bus and coach services will receive 95 per cent, and coaches used on excursions and tours 75 per cent of their normal consumption for the time of year. Lorries will receive an initial allotment equal to the sum of the basic and supplementaries they have received during the first rationing period. In addition to this, they may apply for extra supplies to satisfy seasonal increases in requirements. Together this will provide them, according to the Minister of Transport, with more than 80 per cent of their normal seasonal requirements of both petrol and diesel fuel.

Other oil users have also been given comforting assurances. Industry can now count on fuel oil deliveries being maintained at their present level; but the Government is giving first priority to the rebuilding of fuel oil stocks during the summer, so that existing restrictions on the use of fuel oil may have to be kept on longer than those on petrol. From April 1st the restrictions on the consumption of gas and diesel oils will be lightened, with industry taking a cut of only 10 per cent—instead of the current 20 per cent—and supplies for non-industrial central heating allowed at 75 per cent of normal. The 10 per cent cut now imposed on supplies for agriculture and fishing vessels will not be continued after April 1st. These changes will still leave the average saving on gas and diesel oil use at about 15 per cent; the exceptionally mild weather, by keeping central heating demand below normal, has enabled stocks to be well maintained.

Can Bill Rates be Held?

AT last week's Treasury bill tender the discount market had second thoughts about the new pattern of rates required by the Bank rate reduction, and narrowed the adjustment made immediately after that move. Having previously raised its basic tender price by 1s. 7d. per cent (*equivalent to a fall in the discount rate by* ⅛ to roughly 4¼ *per cent*), it reduced it by 4d.—a move that seemed to be in accordance with the presumed official view that the Bank rate change should not start another major slide in rates. This adjustment, however, involved a sharp reduction in the market's share of the bills—though not so steep a reduction as might be inferred from the mere 10 per cent allotment secured by tenders at the basic price (since tenders under the new "elasticity" rule, which gives scope for slightly higher bids for moderate amounts, can count upon full allotment). The fall in the market's share resulted partly from the under-allotment of the whole offering, which was cut to only £170 million in response to the new issue of "Eternity" stock. But it also reflected the keenness of outside competition: the average rate on the whole allotment rose by less than 10d., to £4 5s. 6d. per cent, whereas the market's basic rate had risen by 1s. 4d.

In these circumstances, it seems questionable whether last week's level of rates will be held, in spite of the fact that money stringency forced discount houses "into the Bank" on Wednesday—for seven-day loans at 5 per cent. The new and more flexible arrangements of the clearing banks for loans to the market are intended to be operated so as to yield the banks an average return of approximately 3½ per cent on their money (with the basic portions at the agreed *minimum of 3½ per cent which is the same relationship to* Bank rate as that obtaining since January, 1955). If clearing bank money on the average does not cost more than that, a downward pressure on the bill rate may be hard to avoid. Hence, if the authorities really intend to keep rates firm, their market tactics will have to be tough.

January Trade

THE detailed returns of British overseas trade in January show that the fall in exports, compared with the average of the fourth quarter of 1956, was by no means wholly due to shipping delays. At £261.0 million fob, *exports were £19 million—seven per cent—lower than the* average for the fourth quarter. One third of that drop is explained by deliveries of ships, which always vary a good deal, and fell to £4 million in January against an average of over £10 million in the fourth quarter. Exports of most major groups of manufactures were fairly well maintained. Surprisingly shipments in January to the sterling area, which would have been expected to suffer most sharply from the closing of the Suez Canal, fell by no more than the general seven per cent average. Shipments to the dollar area were 14 per cent below the fourth quarter's average, owing partly to the usual seasonal fall in shipments to Canada, and shipments to the OEEC area were only four per cent lower.

OIL IMPORTS BEFORE AND AFTER SUEZ
(million gallons)

	Average Jan.-Oct., 1956	Nov., 1956	Dec., 1956	Jan., 1957
Total crude	650·9	419·1	507·8	424·4
of which :				
Middle East.....	544·1	294·1	305·2	234·1
W. Hemisphere..	83·4	117·1	179·2	184·1
Total products	215·7	159·5	181·1	203·9
of which :				
Middle East.....	18·6	5·1	5·8	16·3
W. Hemisphere..	116·4	101·1	143·1	149·2

Imports in January amounted to a record £376.5 million cif; arrivals from the sterling area, which fell sharply in the previous two months, were particularly high. The average value of imports between November and January was just two per cent higher than the average for the first ten months of 1956, and that was more than accounted for by the increase in cif prices; apart from the fall in oil supplies the volume of imports was little changed. Last month the drop in import prices of food was more than offset by higher prices of petroleum and wool, and the average cost of imports rose by one point to 110 (1954=100). Among exports, prices of engineering products fell by one point to 109, but refined petroleum, sugar and textiles were dearer, so that the average price of exports also rose by one point to 109. Arrivals of crude oil in January were much lower than in the previous month, but total imports of oil products increased; imports of fuel oil, at 73.6 million gallons, were more than twice as high as in December and higher even than in January, 1956.

Paying for Promises

IT could cost the country 4 million tons of coal a year to end the attendance condition for payment of the extra "bonus shift" in British mining; this was one National Coal Board estimate during negotiations with the National Union of Mineworkers last year, though the union argued that the loss might be no more than about a million tons a year. The NCB and the NUM had agreed in December to postpone a further review of the issue until June next: last week, somewhat unexpectedly, the board announced that it would waive the attendance condition at the beginning of June if the union would co-operate in persuading a delegate conference to accept Hungarian miners in the pits, and to begin a campaign for improved attendance, fewer strikes and improved output. There is no reason to doubt that an NUM conference will be prepared to make such promises; but no reason on the basis of past experience to believe that the miners in the coalfields need keep them. The Coal Board's offer, in any case, is conditional upon promises, not performance: its only further stipulation is that if "any deterioration should occur in any coalfield," the miners' union should continue its campaign for better performance.

In spite of rather higher output in recent weeks, "voluntary absenteeism" in the industry is at present bad and getting worse. The attendance conditions, by which a miner who works five shifts in a week is paid for six, but thus loses two days' pay if he works only four days a week, was part of the 1947 agreement that promised miners a five-day week: it was intended to improve attendance among men working only three or four days a week, to offset the loss of output from those formerly working six. In practice, extensions of hours agreements, modifying the five-day week "while the emergency lasted," were introduced late in 1947 and are still in force: miners are still asked to work on Saturdays and Saturday shifts are in fact worked in some 700 of the board's 880 mines, producing perhaps 12 million tons of coal a year. Many other industries enjoy a five-day week: in few are there comparable conditions linking so much of a week's pay to regular attendance: but in few can absenteeism be equally important. It may be that the Coal Board had anyway given up hope of enforcing the attendance condition or any alternative formula beyond June. If so, it remains to be seen whether they were wise to attach such transparently weak conditions to their gesture of concession.

Car Output on the Turn?

APART from Jaguar and Ford, which have particular problems of their own to contend with at the present time, the motor industry as a whole has been going through a slightly less trying time in the last few weeks. Last month, both car and commercial vehicle output, though slightly better than in December, were still running at only three-fifths of the rate attained in January last year. But since then the pulse of cars sales has shown a bit more life and the amount of short time working has receded. This experience is by no means shared by all firms. The home market, thanks primarily it seems to the reduction in the size of hire purchase deposit, has been responsible for the improvement enjoyed by some plants; others have increased exports. Sales of the smaller commercial vehicle are still gloomily in the doldrums, though, and a number of the car servicing plants, which are normally employed reconditioning spare parts, have had much idle time on their hands since petrol rationing started.

Vauxhall would appear to have the best story to tell at the moment. Since it put the new Victor car and the new range of Bedford trucks into production, it has taken back two-thirds of the 1,900 men it had to lay off in August and January (rather more than a tenth of its total factory payroll then) and it still has several hundred vacancies to fill. Neither BMC nor Standard, which both dispensed with about a tenth of their labour force last summer, have been able to do that yet. But Standard is now working a full five-day week, except in one section employing about 250 people, and it has taken some labour back on the tractor plant, which is now producing at the rate of 250 a day, against the envisaged capacity of 300. Austin is also working a full week—except on commercial vehicles and in some smaller departments; it is now negotiating with the unions for an additional shift. The Nuffield factories, however, are still working four or five days a week, with three or four day working on commercial vehicles, but again at one plant—Cowley—overtime is being worked.

Both Rootes and Ford have been dismissing more men in order to lift themselves out of three-day working. The Rootes factories have now laid off about a thousand since September, when the total labour force was 13,000; the remainder, with the help of some good overseas sales, are now mostly on a four-day week. At the Ford plants, about a twelfth of the total payroll of 36,000 have left since petrol rationing started, a thousand of them going of their own accord. The remainder are now back on a full week. And now that the Ministry of Labour has entered the arena the threatened strike of AEU members at the Briggs plant may not take place.

Building Society Progress

THE *distinctive achievement* of the Abbey National Building Society is not that in a difficult year it has built up its total assets from £237.4 million to £258.2 million. Nor that the society has succeeded in increasing its reserves and in maintaining a high liquidity ratio (of 13.9 per cent allowing for investment depreciation). The table that summarises the progress of the Abbey National and the Co-operative Permanent shows also the kind of progress that good and big societies were able to make. The distinctive feature of the Abbey National's accounts is that despite higher withdrawals and a diminished flow of investment money, it has been possible to increase by about £1 million the amount of mortgage lending done. Money has, however, remained on ration throughout the year. Much more, perhaps twice as much, could have been lent on acceptable security if investors had supplied it. That reason, together with the much improved interest rates that competitive forms of saving now command, explains why the building societies will be in no hurry to move interest charges down. They are at last enjoying a much improved flow of investments, and in the Abbey National old borrowers only start paying 6 per cent on their mortgages next month.

Building society accounts this year will be studied for the sake of the additional information that the Registrar of Friendly Societies now requires to be given—the stake of the investors for over £5,000—the borrowings of mortgage borrowers for over £25,000 with more than one mortgage and the properties associations in which a receiver or manager has been appointed. Naturally neither the Abbey National nor the Co-operative has ghosts in those cupboards, though it happens, perhaps because the Co-operative, bravely and properly, baled out the Exeter Benefit Society, that the Abbey National comes out the cleaner of the two. The Abbey National has no shareholders with

Investments and Deposits (£ million)	Abbey National		Co-operative Permanent

Accountants' Counterpoint

IT was a darkly clad meeting. Once someone referred to paragraph 14 of the scheme to integrate the Society of Incorporated Accountants with the Institute of Chartered Accountants and the sudden flutter of white memoranda was like a flight of seagulls rising from a blue-grey sea. As sober in tone as in dress, the meeting of chartered accountants at the Royal Festival Hall to discuss the integration scheme lasted two and a half hours before the vote.

A few dozed off in the warm comfort of the hall; some left before the vote was taken; and more, those perhaps with a quick eye for estimating a majority, having voted, did not wait for the result. It was a straw vote. The crucial one is the postal poll, in which for acceptance the scheme requires a two-thirds majority of the members of the institute voting. But the Festival Hall vote must have encouraged those who have piloted the scheme over the last two years. Of those voting, 1,097 were in favour of integration and 278 against. The split was thus almost exactly 80 per cent to 20 per cent. Accountants from London and its suburbs must have predominated in the audience, and their attitude about the scheme may be different from that of chartered accountants in the provinces; but this majority was sufficiently big to suggest that on the postal poll the scheme will probably be approved, though perhaps only just so.

Opposition to the scheme was expressed largely in the broad vowels of Yorkshire and Lancashire. It was not easy for these speakers to put into words an almost emotional conservatism, *nor* did the obvious sincerity of their protestations prevent the counter-charge of "self interest" being levelled against them. They hammered at the point that the council had not been unanimous in recommending the integration scheme and had failed to make this clear in the memorandum; then a member of the council revealed that the number of opponents to the scheme was not more than five out of a council of 45 and that this opposition came mainly from those who believed that the scheme did not go far enough and not that it went too far.

The council, said some objectors, had taken two years over the scheme; without prior consultation members had been given only two months to consider it; that was not enough time. The scheme broke faith with clerks who had taken up articles in the belief that they were to become members of the institute in its present form; they should have been consulted and even given a vote. The proposals did nothing to "close" the profession. So the arguments went on, often coming back to the society's "bye law" candidates and to the possibility of "dilution." One member of "the Manchester school" (as it was later dubbed) said: "an increase in quantity will not necessarily mean an increase in quality." Another from London, whose prosiness earned the only slow handclap of the meeting, spoke of "socially inadequate training." The dissenters were the more vocal; their first speeches were received with rounds of applause. But those sitting on the concert stage remained outwardly unperturbed and by the end of the meeting voices supporting their proposals were dominant.

Much of the opposition's thunder had been stolen by a prepared statement by Mr W. H. Lawson, the vice-president of the institute and "the chief architect of the scheme." It answered the arguments which had already been raised at the district meetings. This statement and a lengthy summary of the other speeches will be sent out to all chartered accountants before they vote. Mr Lawson spoke of the scheme as "a major step towards the unification of the accountancy profession" by bringing into one body many of those trained in a professional office and he revealed that the institute had received a letter from the Association of Certified and Corporate Accountants suggesting that representatives should be appointed "to discuss possible further steps in the integration of the profession." His constant theme was that there would be no lowering of standards and at the end of the meeting he summed up the matter bluntly: "It is this scheme or no other."

How we try to be singularly plural

A STATEMENT
OF COMPANY POLICY
BY THE MANAGING DIRECTOR
OF THE **REED PAPER GROUP**

"One of the most important problems facing industry today is that of reconciling the size of the large business with the initiative which is traditionally the hallmark of the small one. Once upon a time, it was said of us that we were 'a nation of shopkeepers'. But inevitably, of course, the more successful and progressive of the smaller businesses had to grow — both of themselves and by absorbing, taking over or amalgamating with others. The result has been to create a problem of *size* — of largeness for those concerns which have grown and grown and of smallness for those which have remained static.

"In the case of the Group (with which I personally am concerned) containing 19 separate producing and selling companies, the salient issue, I think, is one of how successfully to combine individual initiative with corporate strength. On the one hand, we have to make the resources of our largeness an asset — yet fight shy of red tape and 'remote control from the top'. On the other, we must see that the individual companies, while retaining their traditional enterprise and initiative, are not hampered from development through lack of capital and technical resources.

"The key to the problem, as I see it, lies with *people*. If the Group management is functioning efficiently — by keeping its eye on *overall* objectives and ensuring the recruitment, training and development of key personnel imbued with the right spirit of initiative and personal responsibility — the people who make up the Group will reflect this spirit by functioning efficiently at all levels. And I need hardly add, these good internal relations will also make for better external service.

"Our solution then, within the Reed Paper Group, is the maximum of decentralisation — with the Group management retaining *only* those functions which are vital for co-ordination and concentration of resources. The Reed Paper Group is an integrated, efficient whole . . . yet it is also 19 separate major companies concerned with every aspect of paper making and converting. Each of them, while having access to Group resources, retains its individuality and independence, and understand the character and aims of the Group so well that it can think and act *for itself*. To our customers and shareholders, we feel we may confidently say '*YOU profit from the initiative of each Company backed by the resources of the Group*'."

Philip E Watts.

"YOU profit from the initiative of each Company backed by the resources of the Group"

MORE POWER AT LOWER COST

*The **Eland** is a Turbo-prop aero engine type tested at 3,000 e.h.p., with even greater power being developed. It combines low weight, low fuel consumption and ease of maintenance. Napier have installed **Elands** in a Convair 340 airliner and the conversion has shown a handsome all-round efficiency increase. Similar conversions of other operational piston-engined airliners are being investigated. **Elands** will also power the Fairey Rotodyne 40-seater helicopter.*

*The **Eland** is an engine of great importance in world aviation and a fine example of the Napier principle: more power at lower cost.*

NAPIER

Partners in progress with The ENGLISH ELECTRIC Company Ltd.

D. NAPIER AND SON LIMITED · LONDON · W.3.

CRC 196

over £5,000 and only £4 million of deposits from 236 such investors. The Co-operative has 156 such share investors for a total of £3.5 million and 324 depositors of over £5,000 each for a total of £9.9 million. Most of these investors, naturally enough in a society with roots in the co-operative movement, are industrial provident societies. The Abbey National shows mortgages outstanding for £1.1 million from the large borrowers and the Co-operative shows £1.7 million. The Abbey National's receiverships cover mortgage debts of under £20,000 and the Co-operative's receiverships cover £77,000. All these figures are but a small proportion of the total assets of the two societies.

Local Loans Rate Cut

RATES of interest on new loans from the Public Works Loans Fund to the local authorities have been reduced. For less than five years, the rate remains at 5¼ per cent, which has been in force since June 23rd last year. Longer loans of from 5 to 15 years and those over 15 years are reduced from 5¾ per cent (the rate established on October 20th) to 5½ per cent. Local authorities will still have to test their ability to raise the money in the market before approaching the PWLB.

The "market" comprehends both the mortgage market and the Stock Exchange. Conditions in the mortgage market have recently eased. Just before the change in PWLB rates mortgages for 10 years were being fixed at 5⅝ per cent and for 20 years at 5⅜ per cent. Last October the rate for 10 year mortgages was over 6 per cent and for 20 year money 5¾ per cent. Stock Exchange yields show a similar movement. Early last October the London County Council issue was made at a gross redemption yield of £5 10s. 9d. per cent. This week Edinburgh's issue of £5 million 5 per cent stock (with a life of 18 to 20 years) is made at £98 10s. to offer a gross redemption yield of £5 2s. 5d. per cent. The Treasury would argue that the reduction in PWLB rates follows the fall in market rates, and it insists that its action is "in no sense a sign of any relaxation of the credit policy."

Hard as a Diamond

TWO years ago the diamond world was stirred by the claim that "man-made" diamonds had been produced by the General Electric Company of the United States. The claim was true; they were made by subjecting a carbon compound to intense pressure and heat. But competition with gem or industrial diamonds was not immediately threatened: the product was tiny and irregular in shape. The company hoped eventually to produce larger sizes of a shape and at a price that could compete with natural industrial stones. Since then development has continued, but commercial production has not yet begun. General Electric has now announced that its research had led to the production of a new substance, which it calls "borazon." This it claims may be "of equal, probably greater" importance to industry than man-made diamonds. "Borazon" is a compound of boron and nitrogen, made under pressures of 1 million lb per square inch, and temperatures of 3,000 degrees Fahrenheit. It is said to be as hard as diamond, and to withstand a much greater heat.

General Electric thinks that "borazon" can be used wherever industrial diamonds are used as an abrasive. Its superior heat resistance would make possible better methods of mounting stones in industrial tools and might allow bits and wheels to be run at higher speeds, performing their cutting and polishing jobs more efficiently. The company has not yet decided when to start pilot production, but it hopes that "borazon" can be produced at a competitive price. The material as now known seems nearest to crusning boart, widely used as an abrasive and now selling for 18s. 3d. a carat. The market for industrial diamonds is large; sales by the Central Selling Organisation last year, including deliveries to the United States strategic stock, were worth £24 million. The United States would like to be independent of outside supplies of this essential material, and General Electric would not be truly American if it did not relish the chance of a crack at the diamond monopoly.

Suez and the Baltic

THE possibility that the Suez Canal may be open for 10,000-tonners within a matter of weeks is beginning to have its effect on tramp freight rates for prompt tonnage. Although fixtures are still being made with alternative rates for transit through the Canal or deviation round the Cape of Good Hope, there is a hesitant tone in the market, and rates are tending to fall. The Chamber of Shipping voyage index for January was 173.7, compared with the December peak of 189.4, and a decline in rates for coal and grain were responsible for most of this fall. There were advances in rates for several other commodities, including sugar, ore and esparto grass.

The gradual return of British ships from requisition has helped the supply of tonnage; the favourable weather in Europe has helped to reduce the demand for grain and prevented too heavy inroads into stocks of coal. If voyage chartering has been fairly inactive in recent weeks, with rates for prompt tonnage weakening to some extent, there has been no lack of interest in consecutive voyage chartering and long-term contracting, mainly for Transatlantic coal, not only for the rest of this year but also for several years ahead, and these rates have held up well. Some ships have been fixed at 78s. per ton for consecutive voyages in 1958, only about 20s. below the current spot rate; and one large ship which will not be delivered from the shipyard until 1960 has been chartered for eight or nine years at about 34s. 6d. per ton.

Five Pounds Coloured

THE Bank of England on Thursday issued its new five pound notes—slightly larger than one pound notes, of the same quality paper and colour printed. The announcement of the new issue last summer was widely

welcomed in trade and industry. The rise in incomes since the war has greatly increased the use of the "fiver"—its circulation has risen from 7¼ per cent of the total note circulation in 1939 to about 13¾ per cent—but the unwieldly size of the note has deterred wage departments from putting it into pay packets. The Coal Board, however, and some high-wage industrial firms do do so. Furthermore, the big fiver has never quite lost its traditional association with the plutocrat, or its wartime aura of suspicion and "spivvery." On all counts the new issue fits the bill. Meanwhile, the old issue remains legal tender.

The Bank of England has promised also an entirely new series of notes—£5, £1 and 10s.—bearing the Queen's portrait. That is an innovation for the Bank; the portrait of George V did appear on notes issued between 1914 and 1928, but these were Treasury notes. The first of the new notes is likely to be the £1 note; but it is not expected to be ready for several years.

Butter Gains on Margarine

BUTTER in Britain has long cost less than in almost any other country, and it is now cheaper than at any time since rationing ended in May, 1954. Britain is the only large open market for butter; it takes the bulk of the exportable production of New Zealand, Australia, Denmark and Argentina, and is the residual market for other producers. Supplies have increased, prices have fallen and consumption has responded. The Commonwealth Economic Committee estimates that consumption per head last year rose by 0.6 lb to 15.2 lb, an increase that matched the fall of six per cent in the average price. Butter's gain was not wholly at the expense of margarine, consumption of which fell by 0.5 lb to 17.4 lb per head. In recent months the fall in butter prices has gathered pace; finest New Zealand butter is now 252s. a cwt ex-store; about 70s. lower than in September and nearly 120s. lower than a year ago.

In the multiple groceries butter now costs as little as 2s. 6d. a lb. Most butter at that price is a blend of several kinds—Australian, Argentine, domestic, and possibly Dutch, Finnish or Swedish too. Blends may lack the distinctive flavour of "straight" butters, but all must have a minimum butter fat content of 84 per cent. At this price butter is only 3d. a lb dearer than the top grades of margarine, most of which contain 10 per cent of butter. Butter is certainly gaining further ground this year, though reliable estimates of consumption are not yet available. Faced with increased competition, will the margarine manufacturers cut their prices? Some of the smaller manufacturers are already feeling the pinch; the policy of the big manufacturers may well be influenced by their view of how long butter will continue to be available at 2s. 6d. a lb.

Retail Business

CUSTOMER TRENDS

Number 2—February 1957

This new quarterly bulletin deals with the demand for consumer goods in the home market. It includes short and long-term forecasts of sales by different outlets and merchandise groups, regional surveys and reports on special investigations.

Among the special subjects in the second issue are: the growth of mail order business; the women's clothing trade; motivation research.

Trustee Banks Problem

WHEN the Chancellor allowed the first £15 of savings bank interest to be exempt from income tax, he excluded the special investment departments of the Trustee Savings Banks drawing a distinction, on paper at least, between the department that hands all its money to the Treasury and pays a fixed 2½ per cent only to depositors, and the department that uses the incentive of higher interest rates. The reaction has not been to stimulate deposits in the ordinary departments. Deposits in the ordinary departments shrank last year, while those in the special investment departments continued to grow. The special investment departments were doing well on local authority loans and mortgages at rates of interest up to 6 per cent and their payments to depositors were rising; some of them now pay up to 4 per cent.

TRUSTEE SAVINGS BANKS

Years ended November 20th (£ million)	1953	1954	1955	1956
Deposits:—				
Ordinary Department ..	824·9	827·1	827·3	811·6
Special Investment	143·7	192·6	226·2	282·8
Govt. Stock held for depositors (nominal value)	109·6	114·3	124·6	134·6
Total balances	1,078·2	1,133·9	1,178·1	1,229·0

In the ordinary departments, however, the banks are undoubtedly feeling the squeeze of rising costs despite the mutual arrangement whereby the established banks help out their weaker or younger colleagues. The government takes all the deposit money, allows the banks £2 17s. 6d. per cent, out of which they pay depositors £2 10s., and have 7s. 6d. per £100 for their own expenses. They will soon be telling the Treasury that that is not enough. In the last year ended November 20th they balanced as a whole with a margin of a little over £60,000. This year there may be a deficit of about £70,000. They will ask for at least another sixpence and probably another shilling. A shilling more would leave a margin of perhaps £200,000 and cover rising costs to some time ahead. And the Treasury, that borrows cheaply from the trustee banks, seems to have no good reason for refusal. Yet if there is no inquiry and no squeeze on working margins whence is the drive for efficiency to come?

Tankers in the Sixties

THE latest half-yearly report on the world tanker fleet compiled by John L. Jacobs provides much detail about the nature of the remarkable jump in the rate of tanker ordering during the last six months of 1956. About 330 vessels and just over 12 million tons deadweight were added to the builders' order books, a much higher figure than the 7 million tons booked in each of the two previous six months. Allowing for the half year's new launchings of about 60 tankers totalling 1½ million tons—which was somewhat less than usual—this brought the total of confirmed contracts in hand to 960 tankers of almost 30 million tons, or roughly two-thirds of the tonnage then afloat and about 85 per cent of the carrying capacity, taking into account the higher speeds of the new vessels.

The most significant development of the six months was the sudden rush of ordering for vessels beyond the 38,000 to 42,000 dwt range, which is the size of tanker that can just about pass through the Suez Canal fully loaded. A quarter of the new tonnage booked was for tankers of 45,000 tons or more in size, including three of more than 100,000 tons and 26 of between 50,000 and 65,000 tons. Again the Greeks led the way, but orders from the major oil companies were particularly heavy: they booked half the 142 new tankers between 45,000 and 65,000 tons.

Most of the world's building yards are now fully booked, at their present construction capacity, until 1963, though Japan and the United States are still able to offer deliveries in 1961 and some British yards are reserving berths from that year for oil companies. Before the end of 1960, however, about 24½ million tons of tankers in the present order book are due to be delivered, and tramp tanker freights by then may well be sharply reflecting this large onrush of new launchings, since only just over 6 million tons of the present fleet will be more than 20 years old.

British Exports in 1956

THE recorded value of British exports rose by 9 per cent last year to a record £3,172 million. The true increase over 1955 was better still. The 1956 figures were swollen by the repayment of £22½ million worth of silver bullion to the United States (a capital item), and the 1955 figures were swollen by the overspill from the dock strike of October, 1954. Allowing for those distortions, the real increase in value in 1956 was 10 per cent, and the increase in volume was 6 per cent. Engineering products again played the largest part in the advance. The greatest gains, moreover, were made in non-sterling markets. Exports and re-exports to the dollar area rose by £125 million to a record £542 million, and exports to OEEC countries rose by £92 million to £909 million. Shipments to sterling markets were only a little higher than in 1955, owing partly to import restrictions, but also because Britain lost some ground to its competitors. But though British exports grew at a slightly faster rate than in 1955, that did no more than diminish the rate of decline in Britain's share of world exports.

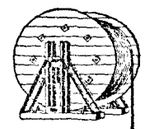
Central Bank for Ghana

THE first legislative steps have been taken to create a central bank for the new dominion of Ghana. The Bank of Ghana will take over the currency issuing functions of the West African Currency Board, though the board's currency will remain legal tender and be in general use until the bank issues its own notes and coins, expressed in terms of the Ghana pound. That pound will be at parity with sterling and the Bank of Ghana is required by its statutes to issue and redeem its notes and coin against sterling. The new currency will at first be fully backed, mostly by sterling assets, but there is provision for a limited fiduciary issue.

This new central bank will have more than currency issue functions. It is to become the main, and ultimately the sole, banker of the government, and will have power to make limited temporary advances to the government to smooth over the seasonal fluctuations in revenue which are particularly marked in a country as dependent as the Gold Coast on a single crop—cocoa. The Bank of Ghana may also become banker to other banks. It will not compete for commercial business. The bill setting up this institution assumes a high degree of banking and money market development in that it gives the Bank of Ghana power to require other banks operating in the country to maintain at all times a minimum holding of liquid assets expressed as a proportion of the commercial banks' deposit liabilities. The present Bank of the Gold Coast, which has hitherto been one of the government's bankers, is to be reorganised as a commercial bank under the name of the Ghana Commercial Bank. In the preparation of the central banking organisation for the new dominion the Bank of England through one of its advisers, Mr J. B. Loynes, has played its customary role of good friend and counsellor. Its assistance is to be detected not only in the technical, administrative arrangements of the new central bank, but in wider policy issues which should ensure that Ghana remains a member of the sterling family.

Management Neuroses



THE comfortable idea that in business merit alone takes a man to the top and merit alone keeps him there has long been challenged by psychologists who deny that the rise and survival in office of managerial talent is determined by a set of Marshallian economic laws comparable to those applied to the prosperity or bankruptcy of the Victorian entrepreneur. On the contrary, their clinical experience with company directors and departmental managers prone on their consulting room couches suggests to them that far too many of those who do reach the top linger there in a state of deepening neurosis long after they have ceased to be equal to what is (the doctors are good enough to admit) a very exacting job. "Among those in senior positions," declares Dr Alexander Kennedy in a survey recently reprinted in *The Lancet*, "the tendency to hold on to power as such is apt to increase as real capacity diminishes." This it is not too hard to do; for, as he points out, it takes "many times" as much energy and effort to get a new idea adopted than passively to block it, so that the advantage in the battle lies wholly with the defence.

The symptoms of declining power to direct a great company's destinies, as listed by Dr Kennedy, will be readily identifiable in everyday terms by the rising generation of ambitious young executives: bad temper and continual grumbling among their seniors, with longer hours worked but less done; repeated consultation with medical specialists and self medication "often accompanied by an interest in life assurance and financial security"; feelings of persecution by colleagues; even "an increase in alcoholic intake and verbal output." The problem (which is investigated in another context on page 622) is however to get rid of them, and Dr Kennedy's remedies will be eagerly examined. These however are not new: earlier retirement and sidetracking to smaller jobs with more high-sounding titles. Dr Kennedy faces the fact that one difficulty is the tenderness of directors or top managers to colleagues who, showing all or some of the fatal symptoms, ought to be got rid of; for they realise that it probably only requires a new round of purchase tax changes or some similar emergency to put their departments in such a state that they would be the next on the casualty list. Despite this Dr Kennedy declares that business life will, and ought to, get steadily tougher, for which, by better methods of selection, he proposes to develop a stronger strain of top executives. Unfortunately, he has nothing to say about the supply which may be forthcoming in the reasonably near future against the number of vacancies that undoubtedly exist.

Glasspol Grows Up

GLASS-REINFORCED plastics have developed rapidly in the last few years. This new structural material, which is frequently called "glasspol," is not the only kind of reinforced plastic, but the great strength and low weight of glass fibres, coupled with glasspol's relative cheapness and ease of manufacture, gives it a good competitive edge in a variety of uses from boats and buses to miners' helmets and translucent roof panelling. According to a paper read to the Royal Society of Arts last week by Mr A. Hudson Davies, managing director of Fibreglass, more than 1,500 tons of glass fibre products were used for reinforcement last year, against about 200 tons in 1953. With increasing output, too, costs have been cut: since 1950 the price of the cheapest glass fibre reinforcement has fallen from 15s. a pound to less than 4s. a pound.

This is still relatively small-scale production, and Mr Hudson Davies states that development of resin-glass laminates has a long way to go. New resin compounds are continually being evolved, and when the industry has more systematic information about the properties of different resin-glass laminates and their methods of manufacture, and with quicker moulding times, glasspol, he claims, could become a major structural material. Knowledge about the use of glasspol has perhaps gone furthest in its applications for aircraft, where glasspol was first used in the last war to make electrically transparent windows for radar domes. The aircraft industry and other military uses now take about

We are the cablemakers

but not that alone.

We thread power through the worried earth of
cities, steeple-high across the fields,
in channels sunk in the ooze of river beds.

We bring together copper and paper and lead and oil and metal tape and jute and steel wire and rubber and cambric and polyvinyl chloride and polyethylene and polytetrafluoroethylene and nylon and brains.

Here is a cable to cross a wilderness.
A meal for termites once. Not now.
It's poisoned.

We who make cable must be chemists, physicists, geologists, metallurgists, electrical engineers, mechanical engineers, civil engineers, mathematicians, as well as toxicologists.

Here is a cable for a jet plane not yet
built. Melt it if you can.

We who make cable work with Nature and only change it when we must. We had to change the arrangement of the molecules in polyethylene, otherwise it would liquefy at 100°C.

This is not a cable at all.
It's a cord for deaf-aid. Tiny isn't it?

We who make cable must think on many lines. And we must work for the World.

BRITISH INSULATED CALLENDER'S CABLES LIMITED

Parent company of the BICC Group—the World's largest organization (comprising 40 companies) with complete facilities for research, manufacture and contracting in the transmission and distribution of electrical energy for power and communication.

BICC think for the World on many lines

An Army routed

Kwehelì is a peace loving man. His tribe no longer goes to war—in the ways his forefathers knew. Yet, throughout his life, regularly year by year (and sometimes several times a year) Kwehelì has had to fight —and just as regularly lose—a battle which has threatened his very livelihood. Today, that battle has been won. For Kwehelì. By Shell.

In the sun-soaked lands of the Rhodesias, maize is a staple food. It is also a favourite target of the voracious army worm—caterpillar of the moth *Laphygma exempta*. The army worm, so called because of its vast numbers, appears suddenly, unexpectedly and devastatingly. It comes like a thief in the night and in a few short hours can destroy every young and promising plant in its path . . . pasture, forage grass or cereal. For generations, when the army worm struck, hunger came close.

Today, however, the army worm has been routed—and the livelihood of millions of Kwehelis protected. Tests have conclusively proved that even when followed by continuous and heavy rain, a complete kill of the army worm can be obtained by a dilution of endrin 19.5% emulsifiable concentrate applied by knapsack sprayer.

Endrin, developed by Shell, is the most effective insecticide ever used against this voracious pest. It is also a most persistent method of control, economical and easy to apply.

For further information apply to your Shell Company. *Issued by The Shell Petroleum Company Limited, London, E.C.3, England*

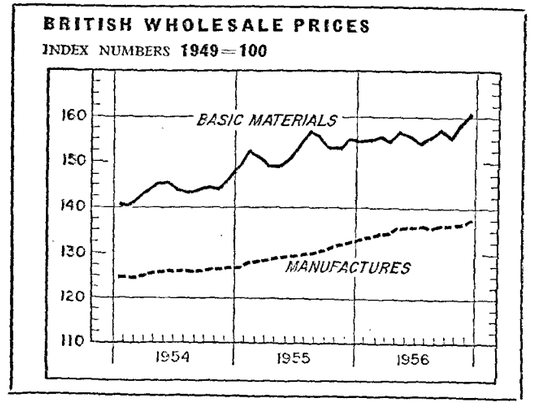
30 per cent of the present glasspol market, and corrugated translucent roof panelling takes another 30 per cent. Boats, from dinghies to motor cruisers, take perhaps a tenth, and commercial vehicles and buses another 12 per cent. Mr Hudson Davies estimates that about 3,000 lorries and 2,500 buses now on the road are fitted with some resin-glass panelling.

Small Windfall from Australia

EXPORTERS to Australia have had a small windfall this week. Following the relaxation of import restrictions by £A30 million on January 1st the Commonwealth government has announced an increase in quotas for many goods needed by industry. The increases apply only to the current licensing quarter ending on March 31st, and their value is roughly estimated at a few million pounds. The action has been taken, it is stated, to raise stocks and minimise possible shortages before the licensing period is extended to four months on April 1st. Increases of 100 per cent on current quotas are being made for certain chemicals and dyes, paints and colours, metal powders, pipes and tubes, ball and roller bearings, unbleached cotton piece goods, and parts for air-operated equipment and compressors and certain textile machinery. Items increased by 50 per cent include agricultural machinery, and parts for motor vehicles, earth-moving equipment, boot and shoe machinery, printing and paper-making machinery and refrigeration equipment.

The Transferable Lira

THE Italian Government has this week announced the setting up of a freely transferable lira area. It will at first consist of all countries associated with the European Payments Union, but in due course will cover the whole world outside the dollar countries. Italy already operates transferable arrangements with countries that belong to the system of multilateral foreign exchange arbitrage operations, set up within the EPU group. The lire which can be used in these arbitrage operations are called "multilateral-lire."



In due course the group of countries within which multilateral or transferable lire are used will be expanded as Italy's existing bilateral payments arrangements expire. There are 18 countries with which bilateral arrangements still obtain. They include Greece, Turkey, Portugal, Spain and the countries of the Middle East and of the Soviet block. Notice has been given to each of these countries that when their bilateral agreements with Italy expire they will not be renewed. They have also been given the option to come into the multilateral account system straight away. Their multilateral or transferable lire accounts must, however, be fed by payments in sterling, francs, marks and other currencies already in the arbitrage system.

When the adjustment is complete Italy's payments arrangements with the rest of the world will resemble closely to those that are applied to sterling: nearly all currencies will be segregated into two groups, the dollar block and the rest. Then only one more step would be needed to proceed to a fully multilateral system, namely, permission to transfer funds freely from a transferable area to a dollar area lire account.

"Imps" Capital Needs

IT is apparent from the full accounts of the Imperial Tobacco Company that that group will have to be a substantial borrower in the capital market though probably not immediately. On October 31st next year the company's £10 million of 3¼ per cent notes (out of total fixed-interest borrowing of £65 million) will reach its final date. It must presumably be refunded before then. In addition the consolidated accounts show bank overdrafts of £29.1 million, against £26.9 million, so that it will occasion no surprise if something more than the £10 million of maturities is borrowed.

The absorption of additional capital into the business even in a year like that ended on October 31st last when profits stood approximately still at £23.3 million gross and the dividend was held at 21 per cent is noteworthy; of the £10 million absorbed last year, the largest single item was a rise of £6.8 million in stocks. The stocks—most of them in bond—were higher physically and higher in cost per lb, but it is evident that the amount of duty paid stock was higher too, as were the debtors, which are just stocks at one remove. The increase of 3s. per lb in the British tobacco duty last April produced an uncovenanted net profit of £1.2 million that was carried straight to reserve, but it also greatly increased the capital that the group has to use in its uncovenanted job of honorary tax collector for the Government, and the increase in the Irish duty operated in the same direction. The plea for a reduction in the duty (though it would turn windfall profits into windfall losses) will doubtless be heard again. But in facing its capital needs the group will have to face the facts. Those facts at the moment seem to be keener competition in the trade,

a rate of duty that definitely limits consumption, and the commitment of a larger sum than ever in financing the tobacco duty.

Copperbelt Costs Compared

THE growth of the copper mining industry of Northern Rhodesia is a stirring achievement, but that should not be an excuse for exaggerating the copperbelt's competitive power. Sir Ronald Prain, chairman of the Rhodesian Selection Trust group of copper companies, has always tried to check that tendency, and he did so again in his recent address to the New York section of the American Institute of Mining, Metallurgical and Petroleum Engineers. The belief that the cost of production on the Rhodesian copperbelt is far lower than in the United States is a myth, he said. In 1955 the average cost on the copperbelt was over 19 cents a lb (£152 a ton) for electrolytic copper, compared with about 18¼ cents a lb (£146 a ton) in the United States. "The exactness of these figures is open to question, but I do not think that the generality is." After obtaining information on costs for the bulk of free world production in 1955, he estimates that 52 per cent of this tonnage was produced at a lower cost and 32 per cent at a higher cost than Rhodesian output (which accounted for the other 16 per cent).

Sir Ronald pointed out that costs in Rhodesia contain a large element, principally royalties, which vary with the price of copper, and which therefore act as a cushion when prices fall. Assuming that other mines do not enjoy these variables, and that copper prices fell to the break-even point for Rhodesian producers, he estimates that 38 per cent of the same world tonnage would still be produced more cheaply than in Rhodesia, and 46 per cent at a higher cost. He did not state what the break-even point for Rhodesia would be, but an average of about £125 a ton might not be wide of the mark.

Company Notes

ENGLISH ELECTRIC. The belief that a cash issue by English Electric was imminent has been restraining the market price of its ordinary stock for some weeks. There will be such an issue, but not just yet. Funding is scarcely avoidable when bank overdrafts come to £20 million, nearly double what they were at the end of 1955. But as yet the directors have not made any application to the Capital Issues Committee.

The curbing rein on the market price thus remains. How big a curb was demonstrated by the market's reaction to the unexpected increase in profits and in the ordinary dividend. The price of the stock went up from 52s. 6d. to 56s. 6d. but the dividend yield widened, too. On the old dividend of 12½ per cent the yield just before the preliminary report was published was £4 15s. 3d. On the new dividend of 14 per cent, the yield is £4 19s. per cent. Nor did the price of the stock move up on the hint that an issue was not to be made immediately.

	1955	1956
Consolidated earnings:—	£	£
Trading profit	8,791,696	9,468,796
Depreciation	1,894,656	2,291,417
Taxation	3,471,954	3,521,309
Net profit	*2,733,302*	*2,911,812*
Ordinary dividends	1,006,537	1,225,349
Retained profits	1,672,673	1,611,667
Consolidated balance sheet:—		
Net fixed assets	20,074,380	23,041,120
Net current assets	34,074,948	32,768,581
Stocks	40,130,347	43,924,515
Cash	630,979	971,242
Bank overdrafts	10,333,472	20,538,635
Reserves	25,397,701	27,429,357
Ordinary capital	15,221,721	15,221,721

£1 ordinary stock at 56s. 6d. yields £4 19s. per cent.

The turnover of the group went up by 8½ per cent, but gross trading profits rose by only 2½ per cent. The ratio of profits to sales come down from nearly 5.7 to 5.4 per cent and, whether it is calculated by the employment of labour or capital, productivity was slightly down on the year. The increase in trading profits from £8,791,696 to £9,468,796 reflects a slight improvement in the profitability of exports, but strong competition in export markets for power transformers still led to some losses. Losses were made by the group's two Canadian subsidiaries, though of the two Canadian Marconi is hardly likely to become a persistent or large loser. Between them the Canadian companies have borrowed about £4¼ million (against £2½ million) from the banks. English Electric's results are surprisingly good but one fact shareholders, waiting on the issue, will be anxious to learn is the state of the group's order books, and it is expected that what they learn will be reassuring.

★

BRITISH-AMERICAN TOBACCO. Better standards of living throughout the world provide British-American Tobacco with its opportunity. To grasp this opportunity, BAT has to rely increasingly on the local manufacture of cigarettes and tobacco and less on exports from this country. Economic nationalism thus becomes a danger. How much a danger was illustrated a few years back when BAT lost its investments in China. Now in the preliminary report, the directors say: "Owing to the present unsettled situation in the Middle East, certain subsidiaries in that area have not been included in the consolidated figures in respect of the year to September 30th and full provision has been made for the investment in those subsidiaries in the books of the relevant sub-holding company out of reserves and undivided profits." As a result reserves and undivided profits in the consolidated balance sheet will show a net reduction over the year of £5,756,685.

Until the full accounts are published, investors can draw two tentative conclusions from this statement. First, as £3,400,000 has been put to replacement reserves and £1,000,000 to the parent company's general reserve from the year's profits, the effective reduction of the book value of investments is high. On these figures alone it cannot be less than £10 million and it is probably more. Secondly, because not all the subsidiaries have been consolidated, the group's trading profit of £51,878,873 in 1955-56 is not directly comparable with the profit of £51,960,942 in 1954-55. One, possibly optimistic, way of looking at these figures is that BAT has been able to maintain earnings without the benefit in the latest year of the profits of Middle Eastern subsidiaries.

But it was not the trend in profits nor the loss (possibly permanent) of investments which caught the investor's eye. It was rather the increase in the ordinary dividend and the proposed free scrip issue. The tax-free dividend for the full year has been raised from 17½ to 20 per cent, as some anticipated when the second interim payment was increased last August. And now the directors propose to make a one for three free scrip issue. They state that this issue does not necessarily imply an increase in dividend distributions. But some investors, looking at the size of reserves and earnings, are prepared to bank on better payments in the future, even though they realise that not all earnings are remitted back to this country. The first interim payment for the current year is the same as the August payment of 5¾ per cent, tax free, but the new shares to be issued as scrip do not rank for this payment. The cautious will continue for the moment to calculate the yield on a tax-free dividend of 20 per cent; on that basis the gross yield is £5 19s. per cent at 58s. 6d., the price which the 10s. units reached after rising 6d. on the dividend announcement. But even the cautious cannot altogether ignore the possibility of growth in "BATs."

★

DECCA RECORD. LP, Hi-Fi and pops all make their contribution to the boom in the market for gramophone records. The boom continues. But in this country the market is dominated by EMI and Decca Record. Competition between these two giants, whose range of products extends far beyond the gramophone, is fierce and that keeps profit margins down. In the year to March 21, 1956, Decca's sales went up by £3,370,000 to £12,860,000 (including exports of £3,410,000) yet its trading profits went up by a mere £50,000 to £1,780,000 and net profits fell quite sharply, from £527,000 to £419,000. The ordinary dividend rate was left unchanged at 43¾ per cent on the capital as increased by rights and free scrip issues.

These results relate to a period long since past but fortunately the directors tell shareholders something of the group's experience in more recent months. In the first nine months of the current financial year sales were 30 per cent higher than in the same period of 1955 and "the momentum of the record business has increased." But Decca has had to absorb further increases in costs and has again had to spend heavily on research and development.

The directors are still thinking in terms of expansion and with the preliminary statement they announced yet another rights issue of ordinary shares. The offer is one new 4s. share at 22s. 6d. for every five held. The directors anticipate that the dividend for the current year on the new capital will not be less than 43¾ per cent. The existing shares now stand at 29s. ex rights, to yield just over 6 per cent.

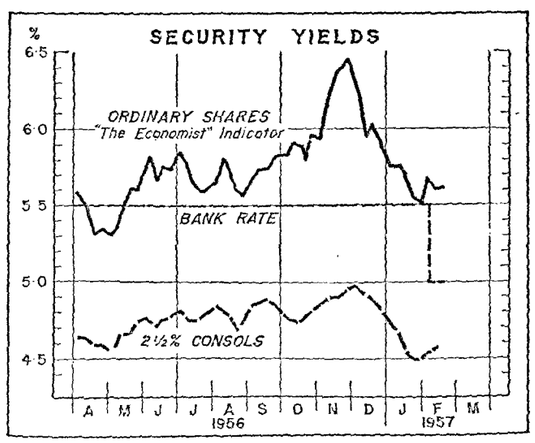
★

LEYLAND MOTORS. In November Leyland Motors, planning a further expansion in output on the acquisition of the tank arsenal at Farington, raised about £5 million by a rights issue of ordinary shares. An unchanged ordinary dividend for the year to September 30th, for which the new shares ranked for payment, was then forecast by the directors. This dividend of 12½ per cent has been formally declared. The directors also told shareholders that new records in output and in exports had been established.

Thus Throgmorton Street was prepared well in advance for a good-looking preliminary statement. In the event it was slightly more handsome than the market had anticipated. Trading profits were shown to have risen from £4,487,911 to £5,527,775 and net profits, after a bigger tax charge, from £1,826,372 to £2,327,796. On this statement the £1 units went up 6d. to 44s. 6d. (to yield 5⅛ per cent). The advance in profits was too big simply to be attributed to the inclusion of a full year's figures for the subsidiary, Scammell Lorries. Well over half of Leyland's output is sold abroad and clearly the directors, who are planning further extensions in production, see a prospect of expanding foreign markets. They must hope that economies of production on a larger scale will offset any rise in prime costs.

★

BRITISH OXYGEN. The report of the Monopolies Commission on British Oxygen came out not many weeks ago. Now that company's directors have effectively left the ordinary dividend unchanged. On the capital as increased by the 50 per cent free scrip issue, the dividend rate is to per cent, so that at a price of 32s. 6d. the £1 units yield £6 3s. per cent. The directors say that increases in costs, with a resultant lowering of profit margins, have largely offset "the benefit of continued sales growth at home and overseas." For the year to September 30th, gross profits after depreciation came to £5,198,464. This is comparable with £4,845,639 for the previous year if twelve months' trading of the parent company is included; the published profit for 1954-55 of £4,277,152 included the trading of the parent company for nine months only.



LONDON STOCK EXCHANGE

First dealings:	Feb. 13	Feb. 27	Mar. 13
Last dealings:	Feb. 26	Mar. 12	Mar. 26
Account Day:	Mar. 5	Mar. 19	Apr. 2

British funds flagged this week under the steady pressure of new issues; long-dated stocks and irredeemables losing up to ¾ on balance. Short-dated stocks made further small gains. Corporation issues receded and the new 5 per cent Northern Ireland Electricity stock fell to ½ discount on Wednesday, when the lists for the new Edinburgh loan remained open all day, 71 per cent of the stock being left with the underwriters. Dealings started at ⅛ discount on Thursday. Japanese bonds made persistent gains throughout the week. Industrial shares were firm.

On the increase in dividend English Electric jumped 4s. 3d. to 56s. 6d.; GEC improved 1s. 9d. to 56s., and AEI rose slightly to 66s. 6d. C. A. Parsons advanced 4s. 6d. to 62s. 3d. and A. Reyrolle 6s. to 104s. 6d. Following the rights issue Decca fell to 29s. 1r. Motors showed several small improvements and Blackburn Aircraft recovered 2s. 9d. to 17s. Cinema shares were again bought on hopes of tax concessions, Associated British Picture jumping 1s. 10½d. to 11s. 4½d. and Gaumont-British 1s. 3d. to 11s. 4½d. Steel shares weakened in anticipation of a public offer of SCOW, but losses were not heavy; Colvilles fell 1s. 4½d. and United Steel 1s. to the common price of 30s. 6d. Shipping shares were active and made considerable gains; Royal Mail rose 3s. to 42s. 9d. and Dene Shipping, Liner Holdings, Lyle Shipping and Houlder Line were prominent.

Oil shares rose sharply on Wednesday when Shell gained 3s. 7½d. and BP 2s. 10½d. At the same time gold mines weakened; F. S. Geduld fell 2s. 6d. and Western Holdings 1s. 10½d. Coppers declined, Nchanga slipping to 11⅛ and RST to 20s. 9d. ex the one-for-one capitalisation. Beralt Tin lost 3s. to 43s. on the report of further wolfram discoveries in America. Rubbers and teas (under the lead of Aibheel) enjoyed considerable support and made substantial gains.

THE MONEY MARKET

THE discount market reduced its common bid at the Treasury bill tender on Friday of last week by 4d. to £98 18s. 6d. per cent, marking an increase in its rate of discount of just over $\frac{1}{16}$ per cent. Applications at this price were allotted only 10 per cent; the discount houses, however, also submitted individual tenders at higher prices. The average rate of allotment rose by 9¾d. (just over $\frac{1}{32}$ per cent) to £4 5s. 6.04d. per cent. Total applications dropped by £23.5 million to £348 million, but the Treasury "cut the top off" the tender of £190 million and allotted only £170 million.

Credit has generally been comfortable in the past week—but on two days the market has been in the Bank. On Thursday of last week heavy tax transfers and repayments to the Bank of the seven-day loans taken on Bank rate day created an acute stringency, and notwithstanding large help from the Bank by means of special purchases, three or four houses had to seek new facilities at Bank rate. On the ensuing days credit supplies became plentiful; on Friday and Monday some funds remained unlent. Balances were offered by "outside" banks at down to 3 per cent, and May maturities have been sold as low as 4½ per cent. On Wednesday the Bank gave no special help and five or six houses again had to take loans at the penal rate, though the amount involved was small.

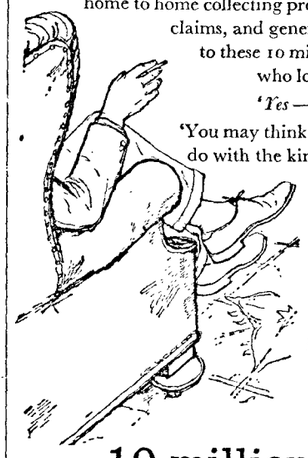
Who on earth can save?

'Save . . . save . . . save! That's all you hear these days. I ask you, who can save?'

'We all can, George. And we do; through our life assurances. And so do at least 10 million British families — through Home Service Insurance'.

'Ah! You mean this "man at the door" business?'



'Exactly, George. And do you realise that this "business" — Home Service Insurance — invests enormous sums in the country's economic welfare? Over £300,000,000 has already been invested in Industry and Commerce alone, while probably twice that amount has gone into Government Securities, Mortgages and the like'.

'Really? You astonish . . .'

'And these savings are now increasing at the rate of about £60,000,000 a year, which I think you'll admit is pretty good'

'Yes — but . . .'

'And all this comes about through that well known personality, the Insurance Man, who goes from home to home collecting premiums, paying claims, and generally being counsellor and guide to these 10 million families who look on him as a personal friend'.

'Yes — but how . . .'

'You may think that all this has nothing to do with the kind of insurances you and I hold. You couldn't be more wrong. The Home Service Insurance Man also does a substantial proportion of the "ordinary" life assurance business in this country, as well as a lot of fire and accident insurance. All in all, George, as an instrument of our economic survival, the Insurance Man is doing a good job of work'.

10 million families save through

COMPANY MEETINGS

THE KUALA LUMPUR RUBBER COMPANY LIMITED

The fiftieth Annual General Meeting of the Kuala Lumpur Rubber Company Limited was held on February 19th in London. Mr E. B. Skinner (Chairman) presided.

At the Meeting Mr Skinner made the following Statement:

WARDIEBURN ESTATE

Further to my remarks which went out with the Report and Accounts under consideration today we have received a report from our Advisers, Messrs Valentine & Dunne, Mining and Civil Engineers, on the question of further possibilities of mining on Wardieburn Estate.

We have also received detailed comments by our Eastern Agents, Messrs R. E. A. & Cumberbatch Limited, on that report.

At present there are two mining leases in existence. One of 434¼ acres sub-leased to the Kampong Lanjut Tin Company, and two other small areas of 65½ acres sub-leased to Chinese. The report says there are only two other small areas which might be worth while mining—one of about 13 acres which might be worked from the area sub-leased to Kampong Lanjut Tin Company and the other of about 77 acres which might be suitable for working by gravel pump operations. The drawback to the second block of 77 acres is that the working of it would probably upset the drainage of a large area of modern rubber. It will therefore be seen that there is only a small additional acreage suitable for mining.

In view of our recent sales of land for building purposes we thought it desirable to have advice also on the possibilities of further sales and Messrs Valentine & Dunne report that they estimate that there may be about 233 acres suitable for building of which at present about 40 acres are leased to the Military until 1962—leaving say 193 acres. Of this area the staff bungalows, labourers' quarters and factory occupy a large part and therefore would not be available for selling. It is estimated that apart from the further possible mining and building areas there will remain some 1,200 acres of rubber land of which about 72 per cent is modern rubber.

The value of Wardieburn Estate seems therefore to lie in rubber rather than in mining and building potentialities.

THE CHAIRMAN'S STATEMENT

The following is an extract from Mr Skinner's Statement circulated with the Report and Accounts:

The Company has had another satisfactory year as will be seen by the Directors' Report and the Profit and Loss account.

The crop for the year (3,600,756 lb) exceeded that of the previous year by 93,414 lb and the estimated crop for 1956-57 is 159,244 lb more than the actual crop for the past year. As the immature areas come into bearing there should be a steady increase in crop over that obtained from the old seedling areas which are being steadily replanted.

The improved profit position was due to the increased selling price 86 cents (2s.) as compared with 78 cents (1s. 10d.) per lb for the previous year.

Owing to the increased cost of wages the Estate cost was 13.62d. per lb as compared with 13.39d. per lb for 1954-55. In view of the urgent need to improve the yield by replanting and new planting it was not considered desirable to recommend a dividend of more than 12½ per cent free of tax. It was also considered desirable to create a Building Reserve as the Labour Department are pressing for more modern buildings for the labour. A great deal has already been done in this matter but much still remains to be done.

In my remarks last year I referred to some land which the Government wished to requisition but I said at the time that they did not proceed in the matter. Since then *the Government had approached us again* and it was agreed that we should sell some 257 acres on the far side of the river on Klang Gates division (part of Wardieburn Estate) at *the agreed price of* $500 (£54½). The transaction took place after the end of the Company's year so does not appear in the present Accounts.

The Company was honoured by a visit to Wardieburn Estate on November 1, 1956, of HRH The Duke of Edinburgh. He was met and conducted round by the manager and spent altogether about half an hour on the estate.

The report and accounts were adopted.

TEACHER *(DISTILLERS)* LIMITED

SCOTCH WHISKY — LARGEST DOLLAR EARNER

The Eighth Annual General Meeting of Teacher (Distillers) Limited was held on February 19th in Glasgow.

Mr R. M. Teacher, the Chairman, presided and, in the course of his speech, said:

The gross profit, before deductions, amounts to £728,288 as against last year at £598,700. *After various appropriations and* provision for taxation of £358,226, we are left with a net profit of £291,415, an increase of £21,646 on last year. In view of the increased profit which, while mainly due to increased turnover, is in part due to the benefit we are receiving from more efficient production, your Board recommend that the final dividend of 7½ per cent last year should be increased by 2½ per cent making, with the interim dividend of 5 per cent already paid, a total of 15 per cent for the year. When considering this increase in dividend, we have had to bear in mind the need to conserve our resources against present-day rapid changes in conditions, taxation, and, for the time being, development and expansion.

During the course of the year we started negotiations to acquire the old-established cooperage business of Messrs C. S. Whitelaw Limited. Just prior to the end of the financial year, these negotiations were completed.

Accounting for the increased turnover, as in previous years, the dollar markets still take first place. Sales of HIGHLAND CREAM in the United States continue to claim the major portion of our exports. The dollar earnings of the Scotch Whisky industry cannot be too strongly emphasised at this time as no other British export earns a greater sum than Scotch Whisky. In Canada, sales over the past years have been declining largely due to discrimination against Scotch Whisky in the maintenance by provincial Governments of a considerable differential in price between Domestic Whiskey and Scotch.

At the close of the year our Export Director visited the Far Eastern markets and Australia and New Zealand, and this valuable personal contact with our Agents has confirmed the growing appreciation of the quality of our Brand. Unfortunately, the Australian market is, if anything, however, more restricted by import licences. This same barrier, through currency restrictions, still applies to our South American trade. Steady progress continues in that all-important market of South Africa.

HOME TRADE

As with all markets, the Home Trade is limited only by the stocks of fully matured whisky available, but we have made proportionately increased quantities available for home consumption, and the demand for these still exceeds the supply.

Production of Scotch Whisky is at a very high level at the present time, and one cannot forecast conditions at the maturity date, but fully matured stocks, as I have said, are the main factor restricting our sales. As more stock becomes available so does competition increase, but, for the present, demand for our Brand continues to rise.

The report was adopted.

H. M. HOBSON

PROGRESSIVE POLICY JUSTIFIED

The twenty-first annual general meeting of H. M. Hobson Limited was held on February 20th in London.

Mr T. Simpson (Chairman and Managing Director) presided and, in the course of his speech, said: Last year I referred to progress and expansion, and I think Shareholders will agree that the Accounts show that my remarks were justified.

The Group Profit for the year, before Taxation, amounted to £616,937, compared with *£469,096* last year. The Consolidated Net Profit, after Taxation, is £307,272, compared with £237,378. Your Directors recommend a dividend of 15 per cent (less tax).

The order book is extremely healthy, and is so spread that we are able to look to the future with confidence. Your Directors feel that the progressive policy of purchasing the most up-to-date high precision plant and equipment has been fully justified and will prove to be so in the future.

The atomic energy side of the business has developed rapidly, and new contracts have been received both for control systems and Isotope handling mechanisms.

Your Company subscribed very materially to the success of the latest Research Reactor DIDO, having designed and constructed the complete electro-mechanical control system, working in close collaboration with the Reactor engineers at Harwell.

The Subsidiary Company, Integral Limited, has again had a successful year, and it is anticipated that the present rate of production will be more than maintained.

The report was adopted.

THE PROVINCIAL BUILDING SOCIETY

IMPRESSIVE FIGURES

The Annual General Meeting of the Provincial Building Society was held on February 19th at Leeds. Lieutenant-Colonel F. W. Moore, DSO, MC (President of the Society), who presided, in the course of his speech, said:

The Report, Annual Accounts and Balance Sheet, are a matter of satisfaction. Difficulties were not of our own making and affected most businesses. They resulted from measures taken by the Government to protect the purchasing power of our national currency —sterling.

ACCOUNTS FOR THE YEAR ENDED DECEMBER 31st, 1956

	1956	Increase
Total Assets	67,182,482 +	4,039,071
Mortgage Assets	56,833,454 +	3,292,592
Amount advanced during year	9,531,441 –	2,054,367
Total Deposits	7,458,067 –	872,932
Total Shares	54,435,547 +	4,442,628
Investments in Trustee Securities	8,239,504 +	952,273
Total Net Liquidity	9,041,205 +	490,053
Reserve Funds	4,301,650 +	287,849
Income Tax and Profits Tax	982,000 +	212,000
Number of Borrowers' Accounts	65,913 +	1,409
Number of Shareholders' Accounts	62,243 +	4,619
Number of Depositors' Accounts	18,635 –	948
	146,843 +	5,080
Percentage of Total Net Liquidity to Shares and Deposits	14·60	
Percentage of Reserve Funds to Total Assets	6·40	
Percentage of Reserve Funds to Mortgage Assets	7·56	

The profits have been seriously affected by the increased tax burden. The composite rate of tax has been raised during the year from a rate of 4s. 10d. in the £ to 5s. 4d. in the £, which had the effect of reducing our balance of profit and increasing taxation by £46,000.

Inclusive of the profits tax we are called on to pay, our total provision for all taxation in the year under review amounts to £982,000 as against £770,000.

Throughout the year under review, new house building has been relatively busy. I am referring to private enterprise house building which, to a large extent, depends on Building Society finance to maintain its momentum. Your Society has done its share in the financing of this new building which has formed a very high percentage of our lending. It is your Board's view that we must at the same time continue our lending on the purchases of good sound secondhand houses.

As Members you will all know that you belong to a strong Society. I can illustrate this fact by telling you that in 1946 the Society's assets were £33 million and reserves £2 million; and in 1956 our assets were £67 million and reserves £4,250,000 and that the reserves have kept pace with the Society's growth over this ten-year period.

It is the wish of us all that 1957 may see the end of the nation's monetary difficulties and thus provide all engaged in business activity with those stable conditions so necessary to clear the air for a brighter future.

The report and accounts were adopted.

BUKIT KAJANG RUBBER ESTATES, LIMITED

MR ADDINSELL'S STATEMENT

The forty-seventh annual general meeting of this Company was held in London on February 14th, Mr Jack Addinsell, chairman, presiding. The following is from his circulated statement:

Crop harvested amounted to 1,261,579 lb, an increase of 113,704 lb on the previous year. Output would have been higher but for unsettled labour and shortage of tappers at Rengo Malay estate while both estates were affected by the "Go Slow" movement imposed by the Trade Unions throughout the country in May. During the financial year 144 acres of postwar replantings on Bukit Kajang estate were brought into tapping and are yielding satisfactorily.

Cost of production increased by 5½d. per lb of which export duty and cess accounted for 2½d., the balance being primarily due to higher labour wages. This increase in costs was largely offset by an increase in net proceeds from our rubber which averaged 5d. per lb more than last year. Profit for the year, however, was £6,556 higher as a result of an increase of £4,788 in receipts from Replanting Cess Fund, higher revenue from Investments, and the receipt of £1,646 the initial instalment of Replanting Grants.

After providing for taxation there remains £33,549 from which your Directors have transferred £14,215 to Replanting Reserve, £4,000 to Capital General Reserve, and recommend a First and Final Dividend of 7½ per cent.

The report and accounts were adopted.

THE ATLAS STONE COMPANY

The twenty-sixth ordinary general meeting of The Atlas Stone Company, Limited, was held on February 19th in London, Mr Bernard Davis (Chairman and Managing Director) presiding.

The following is an extract from his circulated statement:

Trading profit for the year amounted to £92,252, which compares with £74,559 for the previous year. After charging Depreciation, Taxation as well as all other outgoings, there remains a net available balance of £97,748, out of which your Directors recommend that a Dividend on the Ordinary Shares of 10 per cent, less tax, should be paid.

With regard to the year under review, it is satisfactory to report the highest surplus yet recorded in the history of your Company and which has been achieved in a year of unsettled conditions.

The volume as well as the value of our turnover has substantially increased, and this has enabled us to absorb increased costs of labour, raw materials, transport and fuel. We respect the Government's appeal to Industry to stabilise prices, and we will adhere to this as long as it is economically possible.

All products manufactured by our Company are continually examined for new and improved methods of manufacture, and a watchful eye kept upon any new development which may be a useful adjunct to our present sphere of activities.

I am confident that our Company will continue to obtain a satisfactory share of available markets with, I hope, benefit to Shareholders and Employees alike. The report was adopted.

METROPOLITAN RAILWAY COUNTRY ESTATES, LIMITED

SIR BERNARD DOCKER'S STATEMENT

The thirty-seventh annual general meeting of The Metropolitan Railway Country Estates Limited, was held on February 21st at Kensal House, 553-579, Harrow Road, London, W.10.

The following is an extract from the statement by the Chairman, Sir Bernard Docker, KBE, circulated with the report and accounts for the year ended October 31, 1956:

We have had a year of rather mixed results. In our main activity of estate development, the credit squeeze severely affected some of our customers and adversely affected the volume of completed business and substantially reduced the profits brought into the accounts this year from that source. Our consolidated net profits before tax were £64,760, comparing with £113,061 in 1955 and after providing for tax and maintaining the dividend at 15 per cent, the same rate as last year, we shall carry forward to next year £152,790, compared with £149,941 brought forward. In a rather difficult year, therefore, we have maintained our position and there is a small increase in the carry forward.

The Consolidated Balance Sheet shows no significant changes. Freehold properties held for re-sale were £676,584 and claims outstanding under the Town and Country Planning Act, 1954, at the end of the year were £98,921. I am glad to say that a substantial part of these long overdue claims has now been paid since the Balance Sheet date and our bank overdraft has been correspondingly reduced.

TOWN AND COUNTRY PLANNING

Apart from claims we have had one interesting but so far unsuccessful appeal against the refusal of planning permission which although not serious for us financially, illustrates the difficulties under which private enterprise development languishes. At the invitation of the local Council of Bicester, Oxfordshire, we decided to purchase at auction about 60 acres of land in the town, for light industrial development.

Bicester clearly needs some expansion if it is to be a live centre and not drift into almost suburban dependence on Oxford. One would have thought that such development at our risk and cost, without subsidy, would have been welcomed by the County and Central Authorities. Particularly so, since declared Government policy is to seek dispersal of industry, to inject vigour into the smaller towns and to reduce congestion in such centres as London and Birmingham. Not so, however. The local wishes have been overruled.

After referring to current developments of building estates near Doncaster and at Scunthorpe and smaller projects in Sussex, Cheshire and North Bucks and in the greater London area as well as the affairs of the subsidiary Companies the statement continues:

The difficulty of forecastilig results is self-evident. I shall not attempt to do more than say that our activities are in a healthy state. We have three quarters of a million pounds' worth of property assets and an enterprising management. Our Balance Sheet is buttressed by no less than five years' dividend at the current rate in the carry forward. For all these reasons, assuming no major collapse in business generally, I believe that a year hence we should be able to report satisfactory results.

J. SAMUEL WHITE AND COMPANY

(Shipbuilders and Engineers)

HIGH LEVEL OF ACTIVITY

The fifty-ninth ordinary general meeting of J. Samuel White and Company, Limited, was held on February 20th in London, Mr J. A. Milne, CBE (chairman and managing director), presiding.

The following is an extract from his circulated address:

I am glad to present such a satisfactory report. Orders received, work completed and work in hand during the year under review have been commented upon by your Board in their Annual Report.

Since then we have received an order from the Admiralty for a further frigate and also two lifeboats for the Royal National Lifeboat Institution. The frigate HMS *Grafton* has been completed.

The Shipbuilding and Engineering Departments have a very full order book and will be fully employed for the next three or four years.

In the Boatbuilding Department the Inshore Minesweeper Programme will be completed within the next fifteen months and to keep the Department fully employed every effort is being made to find other boatbuilding work.

Somerton Works were well employed in the manufacture of refrigeration components, but orders for aircraft components have eased and new products are being developed to maintain a full labour force.

During the year your Company purchased the whole of the 18,000 £1 shares at par value of Henry Bannister & Co. Ltd., a private company incorporated in 1918. The Company is well known for high-class ropes used in particular by yachtsmen.

On September 19, 1956, an Extraordinary Meeting was held when ordinary resolutions were passed increasing the capital of the Company to £1 million by creating a further 2,320,000 Ordinary shares and appropriating £280,000 out of General Revenue Reserve Account to pay up in full 1,120,000 Ordinary Shares to members on the Ordinary Share Register on August 28, 1956.

STOCK EXCHANGE ACTIVITY

The new scrip issue attracted activity on the Stock Exchange, so much so that your Board considered it proper to announce through the press their confidence in the future of the Company and their intention to recommend in due course a final dividend for the year of 10 per cent and a bonus of 10 per cent (both less income tax). This announcement did ease the Stock Exchange activity and the principal buyer later advised me that the shares had been bought for investment purposes and not with a view to making a bid for the capital.

The Net Trading Profit of £359,239 is only slightly lower than the previous year and the Board have implemented their press announcement to recommend a final dividend of 10 per cent and a bonus of 10 per cent (both less income tax) and continue their policy of placing as much as possible to reserve by transferring £55,000 to General Reserve and £10,000 to Superannuation Reserve.

The assets of the Company have increased from £1,305,737 to £1,380,899.

The report was adopted.

GOLD COAST MAIN REEF

The twenty-third annual general meeting of Gold Coast Main Reef Limited was held on February 20th in London. Major-General W. W. Richards, CB, CBE, MC, chairman, presided.

The following is an extract from his Statement circulated with the Report and Accounts for the year ended June 30, 1956:

Last year I explained that the cessation of production from November 20, 1955, to February 26, 1956, due to the strike of African employees, would have the most serious effect on the year's results. Strike expenditure amounted to £50,342.

No dividend distribution was possible and the Company commenced the current year with a debit balance of £15,584.

Ore Reserves.—There was a gratifying increase of 32,066 tons in the Ore Reserves which, at June 30, 1956 (including ore in pillars) amounted to 356,414 tons, averaging 8.31 dwts. per ton, over a width of 72.9 inches.

The Chairman, addressing the meeting, said: We submit for your consideration a Resolution proposing that from February 20th onwards the name of the Company shall be changed to Ghana Main Reef Limited.

We look to the future of Ghana with a proper measure of confidence and hope. A country abounding in natural resources where, in my view, British invested capital will continue to receive consideration and encouragement.

The Report and Accounts were adopted and the Resolution changing the name of the Company was approved.

NATIONAL MORTGAGE & AGENCY CO. OF NEW ZEALAND, LTD.

The eighty-first annual general meeting of this company was held on February 19th in London, The Right Honourable Lord Glenconner, chairman, presiding.

The following are extracts from his review for the year to September 30, 1956:

The year has again been a most successful one for your company despite the drought conditions in many parts of the South Island which made the season one of the most difficult for the farming industry for many years.

Wool production continued at a high level, resulting in yet another substantial increase in the weight of wool sold during the 1955-56 season. At the opening sales for 1956-57 prices of all classes of wool have shown an increase.

Results from our merchandise and general trading activities have been most successful and I am glad to report on the success of new agencies, particularly those concerned with agricultural machinery. Present indications are that prices will again be favourable for our farmer clients in this coming season.

The development of our business is reflected in the gross profit of £571,377, the highest in the history of the company. Trading conditions generally have been very active and turnover in all departments has increased. Net profit is £158,640, compared with £142,709. Your directors recommend a final dividend of 5¾ per cent, making a total distribution for the year of £60,000.

The report and accounts were adopted.

ALEXANDERS DISCOUNT COMPANY LIMITED

MONETARY CONTROL AND THE BANK RATE

SIR ERIC GORE BROWNE'S VIEWS

The eighty-ninth annual general meeting of Alexanders Discount Company Limited was held on February 14th in London.

Sir Eric Gore Browne, DSO, OBE, TD (the chairman), who presided, said:

Since the Accounts of your Company for 1956 were circulated to you, with my Statement, the Bank Rate has been lowered by ½ per cent to 5 per cent. And, in the result, the gap which these Accounts showed between the cost and the market value of our holdings of Government Bonds has been reduced by a considerable figure, while our holding of Bills, which we had purchased before the Bank Rate fell, have also made their contribution towards the improvement in our position. At last Friday's tender for Treasury Bills the average rate of discount worked out at £4 4s. 8.29d. per cent per annum or just over ¾ per cent below the Bank Rate of 5 per cent, as compared with £4 11s. 3d. per cent per annum or nearly I per cent below the Bank Rate before it was lowered.

In my Statement to you in respect of the year 1954 I told you that the Discount Market, in the world in which we live today, is a sensitive instrument and subject to influences over which it has no control, and which may at any time affect its current position.

And in my Statement to you covering the year 1955, and in the Statement which you have before you, I told you of my doubt whether the classical Bank Rate theory is in fact effective either in curbing inflation or in dealing with the national problem of external balances.

The sensitiveness of the Discount Market has been emphasised by the events of the last few days when we have seen several houses, on the same day on which the Bank Rate was reduced, and, in spite of a very large amount of indirect help given by the Bank of England, compelled owing to shortness of credit to borrow from the Bank of England at the new rate of 5 per cent. And my doubts have been increased as to the efficacy of the Bank Rate, as an instrument of domestic monetary control, in circumstances which seem to render it in some degree ineffective, and which is, as my Statement for 1956 told you, extremely costly not only to the British taxpayer but also in respect of the service of foreign holdings of sterling in the London market.

Well, there it is. We live in the days of a controlled economy operating in a welfare state, but I cannot help wondering whether, having regard to the fact that half of the world's trade is still financed through sterling for which adequate gold or dollar backing is essential, the time has not arrived to have an authoritative inquiry in order to review, in the light of present day conditions, our whole financial system and to examine, in particular, monetary policy, the use of traditional monetary instruments and their effectiveness in a modern world.

I have thought it well to invite your attention to these national problems which have a direct bearing not only on the fortunes of the London Discount Market but of all of us who are privileged to be members of the British Commonwealth of Nations. But you may rest assured that we on this side of the table will go forward with confidence and will continue to give of our best to maintain the high tradition of this great company which we are all of us in our respective spheres very proud to serve.

The report and accounts were adopted.

CASTLEFIELD (KLANG) RUBBER ESTATE

MR ADDINSELL'S STATEMENT

The fiftieth annual general meeting of Castlefield (Klang) Rubber Estate, Limited, was held on February 15th in London, Mr Jack Addinsell (the chairman) presiding.

The following is an extract from his circulated statement for the year ended June 30, 1956:

The profit for the year before tax amounted to £100,838 compared with £72,396 for the previous year. After bringing in the balance from the previous year, War Damage grants of £863, and a tax adjustment of £3,544 (last year there were adjustments in our favour of £16,705), and charging £40,947 for tax on the year's profits, there remains £84,197 for disposal. We have transferred £10,000 to Capital General Reserve and £34,469 to Replanting Reserve. The proposed dividend of 40 per cent will be paid on the reduced issued capital of £100,000, and is equivalent, of course, to 20 per cent on the original issued capital of £200,000.

During the year some 94 acres of replantings were taken into tapping at Castlefield estate, where a further 274 acres are being replanted with selected material. At Bukit Benut estate we have had alienated to us by Government a further 712 acres of plantable reserve land contiguous to the estate, and during the year under review approximately 227 acres of this new land was cleared, for planting in the current season. The 1954 and 1955 new plantings at this estate are reported as generally developing well.

Stockholders will again wish me to extend our thanks and appreciation to our Managers, Messrs J. B. Hall and B. Hermon, their Assistants and estates staff, and to our Eastern Agents, for a good year's work.

1956 was Castlefield's Jubilee year. At the first General Meeting, which was held on October 1, 1906, and which my father attended as one of the first Directors, the issued capital of the Company was £30,000 and the planted area was 713 acres. Tapping commenced in September, 1909, and the crop for the year ended June, 1910, was 18,320 lb which was sold at an average price of 8s. 4d. per lb. In that year the Company paid its first dividend of 7½ per cent and income tax was 1s. 2d. in the £. Between 1910 and 1955 the Company paid dividends averaging over 17½ per cent per annum (excluding the years of Japanese occupation), a record which speaks for itself. After half a century of development and expansion our planted acreage has increased over tenfold, half the issued capital has recently been repaid to Stockholders, and the Company can face the future with confidence and a sound Balance Sheet.

The report and accounts were adopted.

LLOYDS BANK LIMITED

ANNUAL GENERAL MEETING

The Annual General Meeting of Lloyds Bank Limited was held on February 15th, at the Head Office, 71 Lombard Street, London, E.C.

The Right Honourable Sir Oliver Franks, GCMG, KCB, CBE, the Chairman, presided.

With the concurrence of the members present the report and accounts and the statement by the Chairman, all of which had been previously circulated, were taken as read.

The report and accounts were adopted and the other ordinary business was transacted.

Votes of thanks were passed to the Chairman and Directors and to the staff.

APPOINTMENTS

VACANCY FOR COMMANDANT OF POLICE COLLEGE

Applications from men over the age of 40 for the post of Commandant of the Police College are invited. The successful candidate will be required to live in the College, where rent free accommodation will be provided for him and his family. (The College is at present situated at Ryton-on-Dunsmore, near Coventry; later it will be at Bramshill House, near Hartley Wintney, Hants.)

The post will be filled on a non-established basis, but special arrangements may be made about the pension position of a successful candidate from the Police Service.

Salary £2,750 per annum.

Applications, stating age, qualifications and experience, should be sent to the Establishment Officer, Home Office (Room 224), Whitehall, London, S.W.1, by February 28, 1957. No testimonials should be sent. Only candidates selected for interview will be notified.

RESEARCH ASSISTANT. Opportunity for appointment in economics department of large financial institution in London to man or woman with good economics degree, aged 23-30. Starting remuneration varies with age; at 25 (subject to short probation): £680 (men), £600 (women). Non-contributory pension. —Write to Box No. 697, c/o Charles Barker & Sons, Ltd., Gateway House, London, E.C.4.

WELL-ESTABLISHED City firm, Textile and Packaging Machinery Overseas Sales, requires for expansion programme two Executives. Languages and Travelling involved.—Write Box FL/46, c/o 95 Bishopsgate, E.C.2.

GENERAL MANAGER FOR CALICO PRINTING WORKS

Seedhill Finishing Company, Limited, of Paisley, a subsidiary of William Hollins and Company, Limited, of Nottingham, require a General Manager, aged about 35-45, for their Cloth Printing Works at Arkleston, Paisley. University or other technical qualifications and good practical experience generally including wool and cotton unions, essential.

This is a senior appointment covering all activities of management, with a commencing salary of from £2,000 to £2,500 a year, depending on qualifications, and holding excellent prospects, including the possibility of a Directorship.

A good house is available and the company has a Superannuation Scheme in force.

Apply, in confidence, to The Managing Director, Seedhill Finishing Company, Limited, Paisley, Scotland.

ORGANIZATION AND METHODS

B.E.A. require a SENIOR SYSTEMS STUDY OFFICER to take charge of a group engaged on the study and development of office organisation, accounting procedures and paper work systems throughout the Corporation. Applicants should have a University Degree or professional qualification in Accountancy. Previous experience of organisation and methods work and some knowledge of electronic data processing essential. Starting salary within the scale £1,225 to £1,535, according to qualifications and experience. Pension scheme. All travel concessions.—Details of age, career, etc., to Head Office Personnel Officer, British European Airways, Keyline House, Rustlip, Middlesex.

COLLEGE OF TECHNOLOGY, BIRMINGHAM

(Designated College of Advanced Technology)

DEPARTMENT OF INDUSTRIAL ADMINISTRATION

Applications are invited for a READERSHIP in INDUSTRIAL ADMINISTRATION with special reference to the human aspects of management, which is to be devoted exclusively to teaching and the initiation and supervision of research in this field.

Candidates must be of graduate status with responsible experience in industry and preferably also in teaching industrial administration.

Special consideration will be given to applications which can involve secondment from industry or research associations for a period of three to five years.

Salary scale: £1,550 to £1,900 (men) or in accordance with the Burnham (Further Education) Scale.

Further information and form of application may be obtained from the Registrar, College of Technology, Suffolk Street, Birmingham, 1, on receipt of stamped, addressed foolscap envelope. Applications to be received within 18 days of this advertisement.

K. R. PILLING,
Clerk to the Governing Body.

A FIRM supplying packaging materials to a wide range of industrial outlets has a vacancy in its Market Research Department (in offices in the West End of London) for an assistant to interpret, and supervise the collection of, sales and other statistics and to prepare reports on economic subjects. Applicants should be aged 21/27 and should have a degree in Economics and/or appropriate experience. The post offers possibilities of later development to outside market investigations and within the marketing division of the company. Salary according to qualifications and experience.—Box 632.

APPOINTMENTS

VICTORIA UNIVERSITY COLLEGE

WELLINGTON, NEW ZEALAND

The Council of Victoria University College proposes shortly to appoint a SENIOR LECTURER and/or a LECTURER in the SCHOOL OF SOCIAL SCIENCE and invites applications from graduates who have specialised in such subjects as Dynamic Psychology, Social Psychology, Sociology or Social Administration.

The salary for a Senior Lecturer will be £1,275 p.a., rising by annual increments of £50 to £1,575 p.a., and for a Lecturer £985 p.a. by increments of £50 to £1,235 p.a. The initial salary will be determined according to the qualifications and experience of the appointee. An allowance is made towards travelling expenses.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

The closing date for the receipt of applications in New Zealand and London, is April 30, 1957.

BATTERSEA POLYTECHNIC, LONDON, S.W.11

(COLLEGE OF ADVANCED TECHNOLOGY)

Applications are invited for a Grade B Lectureship in the Department of Hotel and Catering Management. Candidates should be graduates in Commerce or Economics (Accountancy) or Incorporated Accountants. Salary £761 or £773 x £25—£1,148 plus £50 for a good honours degree, a training allowance and increments for experience, less statutory deductions. Further particulars from the Clerk to the Governing Body, by whom applications should be received as soon as possible.

ECONOMISTS. A leading manufacturing Company will shortly be making appointments at various levels in its Market Research Department. These will be suitable for men or women in the approximate age bracket 23/35 who graduated with first-class honours, though a slightly lower academic standard might be considered if there is other evidence of exceptional ability whether at school or university, during National Service, or in commercial or industrial posts held. A full personal history should be given. All applications will be acknowledged and interviews for those selected arranged at an early date.—Box 631.

CHEMICAL ENGINEER CANADIAN INDUSTRY

Economics department of large processing industry located in Ontario, Canada has vacancy for a chemical engineer with 2 to 4 years' industrial experience who wants to make a career in Canada. This is an outstanding opportunity for a man with an active interest in the economic evaluation of capital and operating expenditures, finance, and general business problems. Professional qualifications in Commerce, Economics, or Accounting will be considered in lieu of industrial experience.

Interviews will be held in England early in March.

Please send details of qualifications and experience by Air Mail to Box 1001, Sarnia, Ontario, Canada.

THE Operational Research Department of the Steel Company of Wales Ltd. (Steel Division), Port Talbot, invites applications from qualified men who have completed National Service.

The Company operates the largest modern integrated Steel Plant in Europe, laid out on the South Wales seaboard in spacious and pleasant surroundings with ideal working conditions. A further £50 million project is in hand. There are good residential districts within easy reach of the Works.

On appointment successful candidates will be engaged in a wide range of stimulating problems concerned with all aspects of the efficiency and development of this complex plant; there is ample scope for originality of approach and initiative.

All the usual facilities are provided including an attractive pension scheme, salaries in keeping with age, qualifications and experience.

Removal expenses will be paid for a married man (maximum of 5 per cent of salary).

Vacancies are available for:—

1. Statistician with honours degree in Mathematics or Statistics and a few years' experience.
2. Junior Statistician.
3. Three or four graduates in Science or Engineering who seek to apply their training to industrial problems.

Applicants should write, giving briefly age, qualifications and any information which they consider important in connection with the position they are applying for, to:—

Superintendent, Personnel Services,
The Steel Company of Wales, Limited
(Steel Division),
Abbey Works,
PORT TALBOT, Glam.

MARKET RESEARCH. Applications are invited for a post in a newly formed department of Imperial Chemical Industries Limited. Applicants should be under 30, and should preferably have had some experience in planning and conducting consumer surveys. Graduates in Economic or Sociology who have not had any experience of market research will, however, be considered. —Applications, giving brief details of qualifications and experience, to Box No. 2625, Stowe & Bowden Ltd., 169 Piccadilly, W.1.

UNIVERSITY OF CAMBRIDGE

UNIVERSITY LECTURESHIP OR UNIVERSITY ASSISTANT LECTURESHIP IN THE FACULTY OF ECONOMICS AND POLITICS

The Appointments Committee of the Faculty of Economics and Politics invite applications for a University Lectureship or University Assistant Lectureship. It is hoped that the person appointed will take office on October 1, 1957. The appointment will be subject to the Statutes and Ordinances of the University.

Further particulars may be obtained from the Secretary of the Appointments Committee of the Faculty of Economics and Politics, The Marshall Library, Downing Street, Cambridge, to whom applications should be sent so as to reach him not later than March 31, 1957. Eight copies of each application should be sent, and, if so desired, one or more copies of any published work or unpublished writings. Testimonials are not required, but a candidate should give the names of two persons to whom reference can be made.

UNIVERSITY OF CAMBRIDGE

DEPARTMENT OF ESTATE MANAGEMENT

The Department of Estate Management proposes to appoint October 1, 1957, grants for research in economic, legal or social problems related to the ownership, tenure or development of land.

Essential qualifications: good honours degree in History, Economic History, Economics, Agricultural Economics, or Law, or a degree with a high class in Estate Management, or evidence of likelihood to obtain such a degree not later than July, 1957.

Value of a grant £400 a year, plus University and College fees. Normally tenable for two years.

Particulars from Secretary, Board of Estate Management, 74 Trumpington Street, Cambridge. Completed applications should reach him by March 15th.

UNIVERSITY OF CAMBRIDGE

DEPARTMENT OF ENGINEERING

POST-GRADUATE COURSE IN CONTROL ENGINEERING

The 1957-58 Post-Graduate Course in Control Engineering will be held in the Department of Engineering, Cambridge University, beginning on October 8, 1957, and lasting approximately nine months. This is the third course of a series which has been established in order to meet the need of certain sections of industry for men trained to a high standard in the theoretical principles and practical application of automatic control and to afford opportunity for study of advanced techniques and modern development in the general field of Control Engineering.

The number of students will be limited and applications must reach the Secretary of the Engineering Laboratory not later than June 1, 1957. Candidates should hold a degree in Engineering or a suitable alternative qualification and have had some practical training and experience. They will be required to attend for interview in Cambridge in July or August.

Further details and forms of application for admission may be obtained from the Secretary, Cambridge University Engineering Laboratory, Trumpington Street, Cambridge.

THE UNITED KINGDOM ATOMIC ENERGY AUTHORITY

DEPUTY COMMERCIAL MANAGER

(SALES)

Applications are invited for a senior appointment in the Commercial Department of the Technical) Policy Branch at Risley, Warrington, Lancs. The post is one of considerable responsibility and will provide opportunities for working in close collaboration with British Industry and with Electricity Supply Authorities in the development of industrial applications of Atomic Energy.

The successful candidate will be directly responsible to the Commercial Manager for all sales of materials by the Authority and, in particular, will be concerned with the sales of nuclear fuel both in the United Kingdom and Overseas.

Candidates should have held senior sales appointments and have had a wide experience of top level sales negotiations both in the field and at the works of a large industrial organisation. They should be accustomed to working in close collaboration with research, engineering and production departments. Administrative ability of a high order is essential.

Preference will be given to candidates with a degree in one of the applied sciences and/or Corporate Membership of one of the Senior professional institutions.

It will be necessary for the successful candidate to acquire an understanding of the technical processes and plants for which the Industrial Group is responsible and a reasonable period of initial training will be allowed for this purpose.

Salary will be assessed within the range £2,000 to £2,500 per annum.

A house for renting by the successful candidate (if married) may be available in due course, alternatively, substantial assistance may be given towards legal expenses incurred in private purchase. There is a contributory pension scheme.

Application forms may be obtained from the Chief Recruitment Officer, Industrial Group Headquarters, United Kingdom Atomic Energy Authority, Risley, Nr. Warrington, Lancs. (Reference Number 1,760)

Closing date: March 11, 1957.

PURCHASING OFFICER required for metal manufacturing Company, N.E. Birmingham. Interesting post for person (male or female) with Degree, or training and experience in commerce or industry; typing an advantage. —Please write, giving details of education, experience, age and salary expected, to Box 639.

THE UNIVERSITY OF MANCHESTER

Applications are invited for two full-time posts of ASSISTANT SECRETARY to the Appointments Board. The possession of a University degree is desirable.

The first post is open to both men and women and will be concerned mainly with science and technology students and graduates. Initial salary within the range £1,000 to £1,350 per annum according to experience and qualifications.

The second post is open to women only and will be concerned mainly with women students and graduates. Initial salary within the range of £650 to £1,050 per annum according to qualifications and experience.

Both appointments will carry membership of the F.S.S.U. and Children's Allowance Scheme. Duties to commence as soon as possible.—Forms of applications and further particulars may be obtained from the Registrar, the University, Manchester 13, to whom applications should be sent not later than March 1, 1957.

UNIVERSITY OF BIRMINGHAM

Applications are invited for the post of ASSISTANT LECTURER (£550-£650 p.a.) or LECTURER (£650-£1,350 p.a.) in ECONOMICS. A special interest in problems of Social Economics is desirable. Duties to commence October 1, 1957.

Applications (two copies), including the names of three referees, should be sent by March 15, 1957, to the Registrar, The University, Birmingham, 15, from whom further particulars can be obtained.

MARKET RESEARCH

Hoover Limited require an Economist or Statistician with experience of market research and some knowledge of economic forecasting. This is a senior appointment and calls for a well qualified candidate with some years of experience in the field.

Applications giving details of age, education, qualifications and experience to Employment Officer, Hoover Limited, Perivale, Greenford, Middlesex.

VENEZUELA. Export Manager, Ione experience engineering, linguist, economist, proceeding shortly to Venezuela, Prepared act as agent or factory representative, or effect market survey.—Box 635.

GOOD ORGANISER (British woman), 25 years office experience Cairo; English/French shorthand/typist, fluent German, Russian, seeks interesting responsible post. —Box 637.

NATIONAL BANK OF INDIA LIMITED

NOTICE IS HEREBY GIVEN that the Transfer Books of the Bank will be closed from March 6th to March 19th, both days inclusive.

By Order of the Board,
W. KERR,
General Manager

Unlike us, they have one of the world's lowest rates of heart attack caused by Coronary Thrombosis — the No. 1 killer in the United States, Britain, Canada, Australia and New Zealand. What makes the Eskimos so fortunate? The answer has been given* by the distinguished American nutritionist, Dr. Norman Jolliffe, confirming research by a young British medical researcher in South Africa, Dr. Brian Bronte-Stewart**: *the Eskimos eat a lot of fish and get the fat they need for warmth and energy from marine oils.* But why are diet and heart disease related? Simply because many cases of heart attack are due to the coronary arteries becoming furred and narrowed by cholesterol deposits, thus precipitating a blockage; and research has shown that many fats we eat raise the cholesterol content in our blood. According to Drs. Bronte-Stewart and Jolliffe, fats from fish and marine oils are a notable exception. These have a molecular structure which helps to keep down the cholesterol level. Hence the low rate of heart attack among Eskimos who eat a lot of marine fats, and the following advice from Norman Jolliffe: eat fish more often. Thanks to British Trawlermen, we in this country enjoy fish in fresh and abundant supply. It is one of the tastiest and most easily prepared of all dishes—the healthiest and CHEAPEST FIRST-CLASS FOOD MONEY CAN BUY

*Lecture before New York's Orange County Heart Association, November, 1956.

Goodbye to all that

A careless stoker can waste a miner's daily coal output. Simultaneously he pollutes the air. He spreads disease and causes considerable expense to the nation. He dissipates a potential export value. Yet, he cannot burn coke or gas other than smokelessly. Engineers at your Area Gas Board have a wealth of information at your disposal on the efficient and smokeless usage of fuel.

WHATEVER YOUR BUSINESS—The Gas Industry appreciates the needs of individual consumers for prompt service and for advice which accords with the customer's special circumstances and requirements. Each Area Gas Board offers efficient service to users of gas-fired equipment and can give expert advice based upon the pooled knowledge of all the Boards and of gas users in other countries.

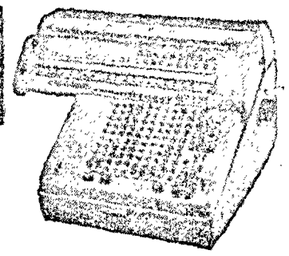
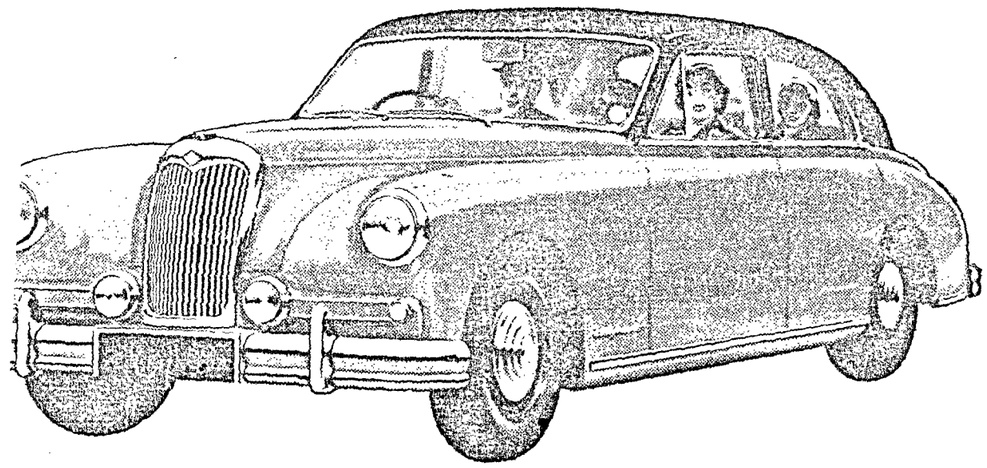
aspects of automation

Q. *How would you exercise remote control over a high-density, infra-red, digital operator?*



A. You wouldn't. But for speed, accuracy and economy in all kinds of figuring you would install Monroe Calculators and Adding-Listing Machines. Set the problem, press a key—and leave the rest to automation. Your Monroe steers its own way through all stages of figuring, short-cuts hundreds of time-wasting intermediate steps, races through complex calculations to the right result. Send today for details of the comprehensive Monroe range. There's a model specifically designed to meet your particular requirements.



MONROE CALCULATING MACHINE COMPANY LIMITED, BUSH HOUSE ALDWYCH, LONDON, W.C.2 COVent Garden 6311.

Monroe

The fully automatic Monroe Duplex 66N is the world's most advanced machine. It combines instant production of figures immediately required with separate accumulation and storage of intermediate figures for use in subsequent calculations.

It's good business to travel American

OFTEN IT's easier to do business in the friendly, relaxed atmosphere of a ship than over an office desk on dry land. If you're going to America on business, why not travel with American businessmen?

Take the case of one passenger, for instance—let's call him James MacGregor. He is a Scotsman, whose job in life is selling socks. Not ordinary socks; they are the product of Scottish sheep and Scottish mills—the kind of luxury goods that have made British craftsmanship famous all over the world.

A great deal of Mr. MacGregor's business is done with America. And he has discovered that the ideal way to travel there is by U.S. Lines. For there, in the friendly, informal surroundings of the famed "United States" or her running-mate the "America," he meets *American* businessmen.

If you're a businessman travelling to North America, remember that here is the perfect atmosphere in which to begin a really successful business trip.

Business aside, there's any amount of fun aboard, too. You'll find unexcelled food and wine; cinemas equipped with CinemaScope; top-grade orchestras; every "keep-fit" facility; well-stocked libraries, and, of course, the pleasure of just resting and relaxing. The days that separate you from New York pass all too quickly. You travel fast in the utmost comfort and arrive refreshed when you travel by United States Lines.

The extra reserve of speed of the "United States" (the Blue Riband holder) means that she has an outstanding record for punctuality. If you have a business appointment soon after you land, that's important!

INTRODUCING

Technology

The Monthly Review of Training and Education for Industry

PUBLISHED BY THE TIMES

TO-DAY it is recognized by Industry, by Educational Authority, and by Government that the prime need is for Technologists and Technicians.

But grants of millions of pounds for new training establishments are not the whole answer. To get effective results, even closer relations must be established between those who teach and those who employ.

It is to promote and develop this vital partnership that 'The Times' has founded TECHNOLOGY.

The industrialist knows what he wants—even though his technical horizons are for ever lifting and widening. Through the pages of TECHNOLOGY his needs will be practically considered and his problems continually discussed.

The teacher on his part, in university, college and school, requires to know that what he is teaching accords in fact with the industrial vision. TECHNOLOGY will keep him regularly informed and aware.

TECHNOLOGY affords a platform for close exchange of thought and opinion between Industry and Education.

In news and views TECHNOLOGY will be of vital practical value and importance to both interests.

THE GOVERNMENT OF BRITISH COLUMBIA

invites you to

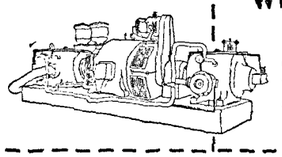
LOCATE YOUR PLANT IN

BRITISH COLUMBIA

Canada's fastest growing province

Reasonable taxation combined with equable climate has attracted billions of dollars in new industry in the last five years . . . . including pipe mills, cement plants and giant chemical firms. They came because British Columbia offers:

- **abundant natural resources.**
- **limitless hydro power; natural gas.**
- **year-round shipping.**
- **proximity to expanding markets.**
- **excellent industrial sites, leasehold or freehold.**



For complete information write to: Agent General for British Columbia, British Columbia House, 1 Regent St., London S.W.1, *or to:*

Hon. E. C. Westwood, Minister *T. L. Sturgess, Deputy Minister*

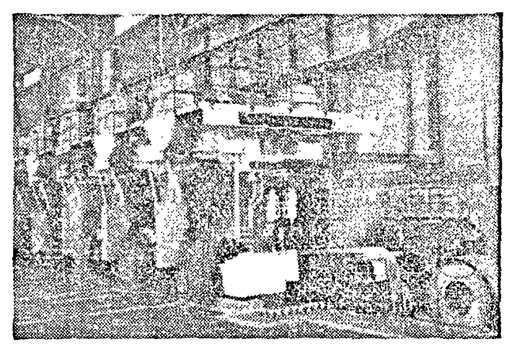
The Abbey Works of The Steel Company of Wales at Port Talbot, Glamorgan, by Harold Forster

THE CITY OF STEEL THAT NEVER SLEEPS



24 hours a day The Steel Company of Wales is making steel for Britain's industries

Without steel Britain cannot make motor-cars, cans, or cookers. If she cannot make them, she cannot sell them abroad. And if Britain cannot sell abroad, she cannot live. *Without steel—without enough steel*—Britain will founder.

In Wales, at Margam, Port Talbot, there is a steel-works—one of the largest and most modern integrated steel plants in Europe. It is not just a factory; it is a city, 4½ miles in length, nearly 2,000 acres in area.

No one lives in this city, but 13,000 people work there. They work night and day. There is not a minute in a year when steel is not being made by The Steel Company of Wales. A furnace is tapped at 3 a.m.; within an hour it is charged again. Day and night, weekday and weekend, continuous steel strip is snaking from the mill at 23 miles an hour.

Steel for cars, rolling-stock and tinplate; special steel for the electrical industry; steel for countless millions of people in a dozen different countries; steel to bring peace and power and prosperity; steel for *Britain*: steel from Wales.

From Port Talbot, steel strip is sent either to the Tinplate Division to be coated with tin or to the Newport Division to be converted into special sheet mainly for the electrical industry. The photograph shows the cold reduction mill at Velindre Works (Tinplate Division). Already The Steel Company of Wales makes two-thirds of Britain's tinplate.

THE STEEL COMPANY OF WALES LIMITED

"It was all over in a matter of seconds. Attack: theft: escape. My messenger was unhurt. But the takings had gone. It happens quite often, but somehow I never really thought it would happen to me. However, 'The Northern' promptly made good my loss."

This is an ACTUAL CASE taken from our records. For a yearly premium of only £1.0.0. the policy holder was insured against any such losses.

From Shadow to Substance

WHILE, in the name of international order, the combined pressure of the United States and Uno has been bringing Israel to the point of withdrawal, President Nasser has been quietly breaching the international order on his own. It is becoming plain beyond doubt that he has been obstructing the final clearance of the Suez Canal until the world should prevail on Israel to relinquish its last footholds beyond the armistice line. There is more than one ground of principle on which the United Nations could stand, if it chose, in its dealings with the two antagonists in Sinai.

That it has not chosen to do so is explained in part by the turmoil of emotions which has distorted the world's vision of the Middle Eastern question from the moment of the Anglo-French act of folly in October, and in part by American preoccupation with communism as the dominant threat in any part of the world. American policy towards Israel and Egypt is at present governed by the attempt to create favourable starting conditions for the Eisenhower doctrine. These require an Israeli withdrawal, and on terms which will give the Arabs no ground for accusing Washington of softness towards Israel. Not until that was achieved, it was argued in Washington, would it be possible to stand on principle against Nasser with any prospect of even a qualified degree of Afro-Asian support (which is indispensable to the President in his resolve to conduct the foreign policy of the United States through the Assembly of the United Nations). Not only, therefore, must the attempt to prevent Egypt from resuming its past offences against Israel be put off until the Israelis have purged their own offence ; but the Israeli withdrawal had to be hastened, lest, before it was achieved, the devices by which Egypt is keeping the Suez Canal closed should force another issue of principle into the open, and so wreck the American effort for a fresh start in Middle East policy.

This chain of argument may not justify, but it does at least explain, Washington's attempt to administer a highly selective form of justice to Israel in the name of the international order. Even so, the refusal to admit that Israel could properly seek conditions was a mistake, as demands for unconditional surrender usually are ; and like most such demands, it led in fact to a prolonged negotiation of what are, in effect, conditions. Israel and Egypt had both broken the armistice, and the assurance that it would not be broken again could reasonably have been asked from both together. Still better would have been a constructive effort to replace the armistice by a settlement of a more durable kind.

The American proposals to Israel on February 11th were a poor starting-point for such an effort. The General Assembly, Mr Dulles then said, had "no authority to require of either Egypt or Israel a substantial modification of the armistice agreement." That is true, but plenty of ways exist of persuading them to do what they cannot be "required" to do. The Israeli withdrawal must be unconditional, he said, "leaving the future of the Gaza strip to be worked out through the efforts and good offices of the United Nations."

He believed " that the United Nations should see that the emergency force " move into " the Gaza area and " be on " the boundary. As for the Gulf of Aqaba in the American view it " comprehends international waters." The assurances offered that respect for the international character of the waters would be made real, not formal, were woolly and inadequate. Mr Ben-Gurion could not be blamed for insisting on something more definite ; he constructed himself admirably, digging himself in firmly but without the appearance of intransigence.

*

Under sceptical Israeli examination, and in the face of a bland Israeli refusal to move until the vague expressions of hope for the best were hardened into statements of intention, the President and Mr Dulles are now left with no choice but to try, once the Israelis do withdraw, to translate the hopes of February 11th into action. It appears as this is written that the process has by now gone far enough to move the Israelis to do what is asked of them. All the same, the stand on an arbitrary principle, or the emotional state which caused that stand to be chosen, has debarred the United Nations from addressing itself to the substance of the Palestine conflict. This substance will still remain to be tackled, even with the immediate issue between the United Nations and Israel resolved.

Almost alone among the delegations in New York, the Canadians this week have made a resolute attempt to bring the Assembly back to a consideration of the real matter at stake, the need to insist that Israel and its Arab neighbours can and should settle down not in a state of muted and bridled belligerency, but in peace together. Our special correspondent indicates on page 734 the difficulty of concentrating the Assembly's attention to such a purpose. Mr Pearson has carried the burden which British diplomacy should have carried if the blunder of the autumn had not deprived this country for the time of the ability to secure a hearing for its views. It now appears possible that the United Nations emergency force, with its functions expanded, may be used to police the frontier between Israel and Egypt while the attempt is made to devise the settlement that escaped the United Nations all through February. It may be a long task.

A Tory Reform for Pensions?

LAST Monday's debate on pensions in the Commons was a depressingly delusive affair. There are three quite separate problems about old age pensions, which MPs persist in mixing up. The first, and to radicals the most important, problem is the relief of need: the provision of a minimum standard of security for the poorest. The second problem is the further encouragement—if necessary, the further subsidising—of adequate savings for their old age by people now in work. The third is the problem of a debt which has been incurred to the retired by the generation now in work, as a result of the way in which expansion has been fostered and incomes redistributed in recent years. That way has been through inflation, which has eaten into the real value of the savings of retired people for their old age ; it is right that they should, so far as possible, be compensated for this.

A principal trouble today is that politicians pretend that these separate problems can—indeed they say " must "—be solved by the same line of action, by a flat increase in benefit rates. This is impossible ; it is arithmetic, not black reaction, which stands in the way. An increase of £1 a week in all insurance benefits now would require other people's spending power to be cut by £320 million a year in compensation ; and, partly because dukes as well as ex-dustmen will soon be drawing national insurance benefits—some 400,000 middle-class people will start to draw retirement pensions next year, ten years after the application of the National Insurance Act—the cut required to give them this extra £1 a week would rise to £500 million a year in twenty-five years' time.

To cite these figures is to set demands for " doubling retirement benefits " in their proper context. It is for this reason that Labour's reported study of a " plan " for progressive pensions, which is said to aim very nearly to double present pension rates—to raise them from the present approximate one-quarter of average industrial wages to approximately one-half of the individual contributor's actual earnings during his working life—and also to guarantee them against " erosion by inflation," really seems more suitable for Laputa (where they spent eight years studying how to extract sunbeams out of cucumbers). The Tories, for their part, would like to raise benefit and contribution rates again—preferably some time just before the next general election. But they are beginning to realise, as Labour will have to realise eventually, that any increase which contribution rates or the budget could conceivably bear must, if it is spread across the whole increasing tribe of pensioners, mean that each individual pensioner is likely to get only a very small increase indeed.

The time is therefore ripe for some detailed thinking about realistic reform of the whole pensions system. The most thoroughgoing reform of all—which, if Britain was starting from scratch, instead of after fifty years of pensions history, might even be the best one—would be to say that, after a certain period, each person entering retirement should be entitled only to the pension he had actuarially earned by his (and his employer's)

ontributions, and that he could draw more than this nly on proof of need. Obviously, however, as the verage pensioner in 1954 had actuarially paid for only ne-twentieth of his pension through contributions (or ontributions made on his behalf), any such scheme, ven if it were to be applied progressively—say, allowng those who retire after 1960 to draw non-means-ested supplements to their actuarial contributions only when they reach the age of 70, those retiring after 1965 o draw them at a still later age, and so on—is at present olitically out of the question. The need therefore, at what one hopes may be the tail end of this period of great inflation, is to think up more immediately practical steps which, while making nobody who is old (or about to become old) worse off, would ensure that measures designed to enable certain of the old to become better off are directed to the right places. Here, as an Aunt Sally for others to knock down, are three specific suggestions, for decisions that could be implemented this year or next.

*

Of the three functions of a state pensions scheme, the first—the relief of need—is of by far the greatest humanitarian importance. Even if one accepts (as one must) the fact that a complete return to actuarial principles in the national insurance scheme is out of the question, there is surely a strong case for saying that it is on national assistance payments, not national insurance benefits, that future *increases* in " uncovenanted " benefits should generally be concentrated. (National assistance payments are made to the very poorest after a means test ; national insurance payments, although also largely coming out of public funds, are made to all insured pensioners without test of need.) Our first specific suggestion—which would be popular—is therefore that the Government might be wise to accept Labour's request last Monday, and institute an enquiry into what level of income (to quote Mr Marquand) is " adequate, decent and reasonable in 1957 " for " the poorest people in this Great Britain of ours " ; but—and this would be unpopular—that the Government should make clear that any improvements suggested by this enquiry should be applied to national assistance scales for the needy aged, not to retirement benefits for all. Moreover, is there any real reason, apart from reasons of tradition, why this increase in national assistance payments should not be financed by an increase in national insurance contributions instead of by taxation ? One of the contingencies an individual should be able to insure against in the insurance scheme is that he might fall, through unforeseen outside circumstances, on very hard times. Anything which enabled recipients to regard national assistance as more of a right, and less of a stigmatic charity, would be an advantage in itself.

The second specific suggestion would be designed to help those people now in work who will not have the advantage of private superannuation schemes when they retire. Everything possible should, of course, be d to encourage the spread of such private superannuation (perhaps by greater—and discriminatory—tax allowances on " cloth cap " pension schemes, to follow Mr Macmillan's concessions to " top hat " ones ?). But there is bound to be upwards of a third of all employees, especially those working on the farms and in other small concerns, who cannot really expect private pensions. Might it not therefore be worth examining whether a " voluntary supplement " could not be introduced into the present state insurance scheme, especially for those manual workers whose incomes are at a level where tax allowances on ordinary insurance are not an attractive bait ? Those who chose to pay the " voluntary supplement " into the fund might have a fairly substantial additional premium paid into the fund by the state on their behalf ; but the additional benefits they would get on retirement should be strictly equal to what they (and the state on their behalf) had saved during their working lives. The burden of such a scheme on the economy, as distinct from on the Exchequer accounts, would not be great ; indeed, in so far as it encouraged savings, it would be one of those admirable forms of state expenditure which would actually be disinflationary in its immediate impact.

*

The third specific suggestion is quite separate from the other two, and might even seem, at first sight, to be out of line with them. But although increases in non-means-tested retirement benefits should be given a much lower priority than increases in means-tested ones, this does not provide a case for maintaining blatant unfairness and distortions in the present national insurance scheme. There is at present one obvious distortion. Rather more than half of all pensioners draw not only their pensions but a supplement in kind, worth 2s. 3d. a week, from the old age pensioners' tobacco tax relief ; all enquiry suggests that it tends to be the worse-off half of pensioners, especially those who cannot afford to smoke and those who live alone, who do not get this supplement. If Mr Thorneycroft could afford it, to withdraw this concession and raise benefits by 2s. 3d. a week in compensation would cost just over £10 million a year. A step of this kind would clear the way for more thoroughgoing reforms in pensions later on.

These suggestions do not add up to a wholesale reform of the pensions system. They are not meant to. Even if one accepts the need for a piecemeal approach, it would be useful if the Government could also take steps further to encourage retirement at 70 instead of 65, and to make private superannuation schemes more easily transferable between employers. But—on the broader pensions front—the need now is to hold the balance between the socially desirable, the economically feasible and the politically possible. Neither party in last Monday's debate seemed ready to weigh pensions on these required scales.

Black and White

IT is impossible for any liberal commentator on the latest manifestations of South Africa's racial policy to avoid again making the undeniable point that it is not only wrong in principle but on the plain facts quite unworkable in practice. The magnification of the African boycott of the buses (a protest against the raising of bus fares in Johannesburg) into a challenge to white supremacy, the mass trials for "treason" (which are examined in detail on page 716), the coercion of the universities to expel their few black students, will rightly set off a new round of condemnation in organs of opinion outside South Africa. All this, however, the Nationalist leaders in the Union have taken into account. Indeed, they now use the attacks on South Africa from abroad to strengthen their hold on public opinion at home, and especially to embarrass the opposition, which has not found under Sir de Villiers Graaf's leadership any more distinctive a policy than it had under Mr Strauss's. The question must be asked, therefore, whether the assumption of the usual high moral tone is by itself enough.

Any scepticism about the usefulness of the barrage of disapproval directed at South Africa from the world's press, pulpits and parliaments and from the United Nations will be suspect to many liberals, as well as left-wingers, and to many religious people who have made the excommunication of South Africa, and its expulsion from the Commonwealth, almost a crusade. It is the belief of these critics that moral pressure will move the South African government in the end. They hope that opprobrium will somehow harden into an application of sanctions, though what sanctions can be exerted against a country sitting on three-quarters of the world's gold production and half its uranium, and now holding in the West's vital sea communications the strategic position formerly occupied by the Suez canal, is not clear.

Disapproval, though it is rightly founded, has clearly not deflected the South African government from its course, or helped the United Party opposition in a single by-election. Is it in fact, alone, the proper approach? There are plenty of signs that it simply feeds the conviction of Afrikaners that nobody who is not one of themselves can understand, let alone judge, their actions. It drives them more into their private world —their obsession with race survival, their theoretical elaborations of apartheid as the ultimate means of stilling their consciences by ultimately restoring to the other races, in some cloud-cuckoo-land reserve to be created some day, the justice and opportunity now denied. It throws them back upon their "laager complex"—their romantic picture of themselves beleaguered in a sea of kaffirs and "kaffirboeties," sustained by the lack of any alternative but to fight it out (the Israelis have a similar attitude). Their perpetual retort is that survival cannot be wrong; and from that they justify step by step the apparatus of police power and administrative despotism built to secure survival. What *is* the alternative?

It is natural to see in this predicament only the good reasons for pitying the Africans who are the policy's evident victims. But are not the white South Africans also victims? To say this is not in any way to condone the many wrongs that are being done; it is to recognise the facts. The conflict in Africa is a very real one, and the whites look like being on the losing side, whatever they do. When every move that the government makes is made in fear of the black, rightless, majority, the government can hardly be said to be a free agent. When even to boycott municipal buses is to shake white prestige and endanger the state, that prestige is obviously low and the state weak. The mass of legislation aimed at keeping an unarmed population down, and at depriving the blacks of education and leaders, is tribute to their power—as assessed by the whites on the spot. The whites claim that their fight is for the "survival of western values in Africa"; but the weapons used to defend those values destroy them in the lives of those who use the weapons. The Nationalists argue that the press is not free to "take sides" in racial issues, and even that a two-party system is inappropriate because one party may incite the Africans. Yet after all this, it is often dangerous to exercise the simple liberty of walking down a street without fear of molestation after dark.

★

Apartheid does not, in fact, preserve western values. All that can be said is that, temporarily, the apparatus of repression secures white South Africans in the enjoyment of a high western material standard of life—which is a different thing. And the strength of the Africans is not merely negative; it is bound to become positive. They are gaining ground fast in the most rapidly expanding sector of South African life, the secondary industries. The Africans want to exchange tribal life and subsistence agriculture for the white man's industrial civilisation—to work in factories, with machines, earning good and rising wages; and they are doing this. This is itself an education which the Bantu Education Act cannot water down: a liberal education in technique, organisation, discipline. Rising living standards, inevitably promote thought, discussion and questioning. They always have. The blacks cannot only read, hear and see that their white rulers fear them. They can see that the whites (as Dr Wassenaar's resignation from leadership in Transvaal shows) are divided among themselves. Faced with white domination, the blacks think (as an article in the February issue of *Encounter* by Mr Colin Welch sensibly argued) in terms of black domination—some day; this "Bantu Imperialism" is what the whites fear, and for ever talk of.

This is the crux that South Africa's critics, and liberals everywhere, have to face. It would be a dereliction of duty to still the voice of their conscience; but it is a dereliction, no less, to turn their eyes from the fatal problem that is shaping itself in Africa: whose domination, black (over black as well as white) or white? We have to weigh the consequences of our preachings; what alternative remedy is there to the doomed neo-Spartan defence of the Nationalists? Is not domination, either way, a defeat for liberalism, whether in the Union or elsewhere in Africa? One thing is sure: the liberals' pleas should be addressed as much to blacks, who will have the future responsibility, as to whites, who have the present power. The magic word is "partnership" which would replace, and indeed dissolve, the stark black and white contest by a reconciling collaboration in which there would be place and opportunity for all according to their grasp. But do the blacks themselves, or those of them who are yet articulate on these themes, believe in partnership? And where is the practical model—in the Rhodesias? The capacity to solve Africa's problems must be generated in Africa itself; and the right role of European liberals, while abating none of their rightful protestations, is to back them by understanding what the problems are.

Lessons from Luxemburg

FROM OUR SPECIAL CORRESPONDENT

NOW that the European Coal and Steel Community has matured from an experiment into an administration, it stands very much in the shade of Euratom and the common market. Its own success has largely made them possible, and they will strengthen its foundations. But "supranationalism" of the kind embodied in the ECSC is not the order of the day. The Euratom and common market treaties give much less power to the federal authority and much more to the Council of Ministers from the six member countries. Inside the ECSC itself, the Council of Ministers has come to share many decisions with the executive body, the High Authority. For while the latter has extensive powers in sharply defined areas, there are many, not defined, where it needs the backing of the national governments in the council to explore and create precedents. A balance of forces has been created between the two.

The compromise is reflected in the approach to the two current problems: the threatened shortages of scrap and of coal. The scrap shortage is world-wide, but the successful attempt to keep its price down in the community by cheapening imports (through a compensation scheme) has led the steel industries to press for more and more supplies. The High Authority recently obtained tacit American consent to increased purchases in the United States, but there is constant pressure from the American steel industry to cut this trade. In the long run, the ECSC industries must clearly rely more on pig-iron from their own blast-furnaces than on further American scrap.

The High Authority stressed the need for more expenditure on blast furnaces in its "general objectives" for investment in 1956. These recommendations are not mandatory. As the authority's attempts to guide investment by raising loans have not been very successful there were doubts about the chances of the recommendations being effective. But success exceeded expectations. In the first nine months of 1956 blast-furnace projects doubled, and rolling-mill projects halved. So far, so good. But, as long as the growing gap between scrap and pig-iron prices makes it increasingly tempting to use scrap, firms might change their policy. So, to keep the gap from widening, the authority proposed to penalise extra scrap purchases: works putting more scrap into the ton of steel would pay more to the compensation fund for imports.

But such a system as this, giving the High Authority added control of the scrap market, required the unanimous approval of the Council of Ministers unless the authority could persuade the steel industries to work it voluntarily. The industries were not prepared to do that and their reluctance was reflected in the Council of Ministers. It took one year, twenty major meetings and ten different proposals for the High Authority to find a formula and, a few weeks ago, finally to wear down all opposition.

The coal situation has similarities. First the boom, and now the Middle East crisis, have created a demand which can only be met by heavy imports of American coal (30 million tons in 1956, probably 37 million tons in 1957). With transatlantic freight rates still as high as 98s. a ton, it is about 50 per cent dearer than ECSC coal. Naturally, the High Authority is anxious to stop community coal becoming dearer than it is; its threat to impose price ceilings is keeping prices down. It is also unlikely to set up a compensation scheme to even out the price of imported and domestic coal: it fears such a system would entrench itself and would immunise prices against competition from imports at need.

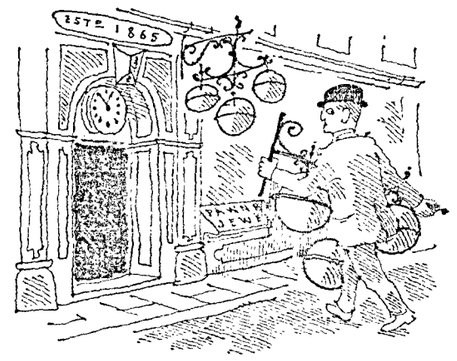
So coal is now wandering round the common market at different prices. This has created distribution problems, especially for the domestic consumer. Industrial stocking has made matters worse. Wholesalers tend to siphon off relatively cheap European domestic coal to industrialists or other large-scale consumers so that, although producers claim they have never produced so much of it, most householders complain that

they cannot find enough. But the governments, not the High Authority, have power over the wholesalers. Here again, the authority has supplied the plan, and the Council of Ministers the backing, to ensure that domestic coal is assigned to domestic purposes.

There remains the question of seeing that the industries obtain fair proportions of European and American coal. The Ruhr is already working a voluntary allocation scheme. Being voluntary, it presents no problems. The High Authority supervises it as usual to control any tendencies towards unfair discrimination. But it intends also to extend the system compulsorily throughout the common market. And where compulsory controls are involved (as for scrap) the Council of Ministers must approve—which it did last month.

The community's pragmatic mixture of methods is neither a free market policy nor a clear-cut system of European controls ; it is not government by the High Authority alone, but it is not government by the Council of Ministers—or even by the nations individually or the industries themselves. It is almost certainly not the practice that the authors of the ECSC envisaged. They aimed to make the High Authority the driving force in the belief that only a strong executive would succeed. It still has the sole right to initiate policy. And in extreme carefully-defined "crisis" situations, reflecting the preoccupations of the war and immediate postwar years rather than those of the nineteen-fifties, it could invoke wide reserve powers. But in the day-to-day practice of a community confronted with problems that only verge on the critical, its powers are much vaguer. It has to have the backing of the national governments in the Council of Ministers. For some decisions the complicated arrangements of the treaty provide that it can obtain this agreement by simple majority voting, but in the most important cases it must be unanimous. Some observers had foreseen that the Council of Ministers would play a big part, but both critics and supporters of the ECSC tended to assume that this would spell failure. So far, however, there seems to be no reason to think that this is so.

In fact, driven mainly by French opposition to supra-nationalism, the drafters of the new Euratom and common market treaties have adapted this working experience of the ECSC into the drafts. In the common market, the European Commission (the High Authority's equivalent) will propose ; the Council of Ministers will dispose—it alone can take the final decisions. This system may not be so like the ECSC as is sometimes claimed. Much of the present solidity of the ECSC is due to the decisiveness with which the High Authority pushed through the original process of opening the common market in coal and steel. Greater problems will arise in the general common market—and over 15 years instead of two. The six governments negotiating in the Council of Ministers are more likely to be timid and to compromise in the vital opening stages than the High Authority was.



In practice the European Commission may be stronger than it seems on paper. The Council of Ministers will not be qualified to administer the hosts of detailed problems that the common market will raise. But the effectiveness of the common market will probably depend more on its political momentum. It is likely to be generally accepted as the departure point of European unity in a way that the ECSC was not, and the need for a common policy may therefore be correspondingly more generally endorsed. Already there are straws in the wind. The prime ministers of the six initiating countries agreed in Paris last week that the "next stage" should be a European Assembly elected by universal suffrage.

Hard Times for Pawnbrokers

PAWNBROKERS have for long shared the unenviable status of mothers-in-law as the butt of heavy jocularity ; these sober business men are understandably irritated at the nickname of "uncle," or the miscalling of the trade which is their livelihood by names such as "popping" or "putting up the spout." They are on the defensive not only against journalistic enquiries, which they expect to lead to yet more mockery, but against the grim process of economic decline. In England, Scotland and Wales, in 1913, there were more than 5,000 licensed pawnbrokers ; in 1950 there were 1,654, and in 1956, 1,002. What do they do, and why are they fading away so fast ?

A pawnbroker lends sums of money up to £10 on the security of goods which are left in his care as pledges, and his trade is one of the most tightly regulated in the country. His licence from the local authority costs £7 10s. Charges on loans of £2 and under are fixed by acts of 1872 and 1922, at monthly rates amounting over a year to interest at 25 per cent ; the pawnbroker may also, at the time of deposit, charge one penny for the pawn ticket and a halfpenny "valuation fee" for each five shillings lent. Loans over £2 are made by special contract with the borrower, probably over periods of three or six months, and calculated also to bring in some 25 per cent on the year. To those who say that this rate still looks unconscionably high, the answer is that it has not been high enough to prevent a third of all pawnbrokers from going out of business in the last six years. To those ambitious pawnbrokers who say that the rate is too low, that the Government should set the pawnshops free to prosper again, the answer is that the present regulations are a protection for the gullible. Pawning, even at a 25 per cent rate, is not a good way of raising money except on a strictly short-term basis ; people wanting to raise some money on their property would often be wise to sell rather than to pawn, thus raising the full value at once.

The most common charge levelled at pawnbrokers by their customers today is not, in fact, that their rates are too high, but that they value pledges far too low ; and as competition grows less it is harder and harder for borrowers to compare the offers of rivals. This complaint looks the less justifiable the closer one studies the trade. Pawnbrokers themselves insist that they are lenders, not buyers. The pledge, if forfeited, must bring in at least the original loan, plus the 25 per cent profit that would have been made had it been redeemed ; the amount most pawnbrokers could profitably lend on security of, for example, a new suit, would be calculated as some 75 per cent of its resale price after a year—which would be far below its price when new. Moreover, here again, the law protects the customer. Pledged goods valued at ten shilling or under become the property of a pawnbroker after a year and a week ; but those valued over ten shillings must be sold, when forfeited, at public auction, and for three years after the sale the depositor may claim back from the broker any profit that may have been made on the resale. This provision theoretically protects depositors against any severe undervaluation, but it is doubtful whether many of them know of it. In practice, goods sent to auction by the pawnbroker are usually reserved by him at a price near the amount lent on them ; it is unusual for him to gain or lose very much on the resale.

Up to twenty years ago the vast bulk of the trade, in quantity if not in value—and the type of trade which made pawnbroking a nasty word with Victorian novelists—was among very poor people in industrial areas, whose few good possessions, such as Sunday clothes, were habitually used to make the link between expenditure and an inadequate income more elastic. Pawnshops took in pledges on a Monday, which would be redeemed on Saturday out of the week's wages—a system which tended to make poor people feel richer than they were, and burdened them with charges that they could ill afford. This type of trade is called "industrial" ; the other, known as "city" pawnbroking, is in loans of rather larger sums, with jewellery or valuables as the pledges, and attracts a very different clientele.

The main reason for the decline in the number of pawnshops is, of course, a drop in "industrial" business: which, in turn, is due to the decline in the numbers of the very poor. The backstreet pawnshops are disappearing fast. Those industrial pawnshops which survive seem to rely partly on people who regard them as a good place to store clothes which are not likely to be wanted for a time: the owner of a heavy overcoat can, in the summer, enjoy its possession in the form of ready cash, while it stays in the care of someone who is legally obliged to look after it. But frequent borrowing and redemption was the real source of prosperity, and occasional trade cannot replace it.

What can replace it ? It should not be assumed that all existing pawnbrokers are hard up ; many of them are doing very nicely, and in their shops vigorous and unEnglish haggling is still the rule, with many "take it or leave its" and bluffing retreats halfway through the door. The reduced volume of their trade is partly offset by the increase in the money-value of goods, and in the improved quality of poor people's property. Some pawnbrokers will even take television sets (although things so easily broken and so liable to grow out of date in a year's wait are unlikely to raise a good price for the depositor), and electric razors and watches are tending to increase as pledges at the expense of clothes. But most pawnshops have read the signs of the times, and now sell new goods as well as secondhand ones (especially cheap jewellery). Their most pressing difficulties, therefore, are much like those endemic among all small shopkeepers. They cannot afford to pay high wages, young people will not come into the trade, and those returning from national service have not the patience to stay and learn it. Permitted profit margins are not large enough to attract new capital, and, although there are some old-established firms with several branches, a business in which so much depends on the personal decision of the man behind the counter about the value of a pledge gives no scope for modern marketing techniques.

Pawnbroking, in short, is no longer a social menace, and it is rapidly ceasing to be a social force or even a topic of fun. Those who say that Britain, like some continental countries, should have state pawnshops to "solve the problem," are as out of date as most advocates of state ownership. For there is now no real "problem" there. The three brass balls which are the pawnbroker's sign have a long tradition, going back to the Lombard merchants with whom, in 1338, Edward III pawned his jewels to raise money for a war on France ; and, sentimentally, it might seem a pity that the Dickensian atmosphere of crowded, brown-papery shelves and old-fashioned uncles should give way to neatly respectable or even brashly modern stores. But perhaps this was an aspect of Old England which we are as well off without.

Notes of the Week

Defence Cuts and WEU

THE ministers of Western European Union have postponed a clash with Britain over the proposed cuts in Rhine Army and the tactical air force. Nato is to discuss the matter again. Britain undertook in 1954 to keep four divisions and the tactical air force, or their equivalent, on the Continent. The "equivalent fighting capacity" of Second Tactical Air Force may be said to be maintained by arming the Canberras stationed in Germany with atom bombs to offset the reduction in the size of the force. But it is not possible to argue that this same increase in firepower can compensate for a reduction of Rhine Army by a third. General Norstad has already forcibly argued that it does not, because the object is to build up a force—of about 30 divisions—capable of fighting on the ground.

Nato, like WEU, has to consider the political strength of the alliance. It obviously does not want a dispute with Britain about fulfilment of pledges; on the other hand, it does not want the alliance to fall apart because declining British forces—there have been some cuts already—make the other members defeatist. Even if the other members do not appropriate the British arguments about economic difficulties for their own use in whittling down their own forces, the awkward fact remains that the size of Rhine Army is important in ensuring that the powerful German contribution that has been promised does not dominate the forces at Nato's disposal. Unexpected as it was that the German Foreign Minister, Herr von Brentano, should have made himself the spokesman of this particular view, the view has cogency; it was the basic reason for the original British pledge. Even if this question is left aside, there is real fear of having, not a shield, but merely a tripwire between western Europe and the Russians.

★

It is thus difficult to see how WEU can easily change its mind when the matter comes back to it from Nato; but no doubt the search will continue for a compromise between the British anxiety to make big financial savings, and the high store set by WEU on the British commitment in Europe. Probably the immediate compromise will be to postpone the cuts; if so, the Minister of Defence can make good use of the postponement. There is every reason for Britain to seek ways of producing a better organised and better armed force, which might seriously be able to meet the same commitment with fewer men. But neither the reorganisation nor the re-equipment is visible yet. Until they are visible, the pledge remains an obstacle, to be over-ridden only by a plea of financial *force majeure*; and that would be unwise.

—And the Budget

IT is now possible to speculate with a little more realism about the possible magnitude of the economies in defence with which Mr Thorneycroft may hope to be presented at budget time, whether or not he can devote them to tax reliefs. The Chancellor indicated last week that even in the coming financial year, when very large economies cannot be expected, the defence vote will be somewhat below the original estimate for 1956-57. This was, after deducting American aid, £1,498.7 million. How much below that figure Mr Sandys can reduce defence costs will no doubt depend in part on his success in cutting British forces in Europe, which is still an unsettled question. But the sort of language Mr Thorneycroft used would be consistent with a figure of, say, £20 million to £30 million below the original 1956-57 estimate.

To gauge the prospective relief to the economy in 1957-58, however, the important comparison is not between next year's estimate and this year's estimate, but between next year's estimate and this year's actual spending. Against Mr Macmillan's earlier economies of £21 million in this

THE OPTIMIST'S DEFENCE ARITHMETIC
(£ million)

Possible cut in 1957–58 Estimate below original 1956–57 Estimates, say	20— 30
Excess of 1956–57 spending, over 1956–57 Estimate*	35
Saving in Real Terms by stabilising Money Terms, say	45— 60
Real Saving	100—125

* Assuming virtually no underspending in any defence vote, except for the Macmillan economies.

year's spending must be set supplementary estimates for all five defence departments of £58.5 million, on account of the Suez affair and other contingencies. This would bring total spending this year to around £1,535 million, unless there has been underspending on particular votes. There usually has been underspending on particular defence votes, but the fact that the supplementaries were presented so late in the year suggests that it may not be considerable this year.

If there is no underspending at all, the money economies for 1957-58 to which Mr Thorneycroft might look forward, on this reckoning, might swell to between £55 million and £65 million. But it is by reference to changes in real spending that Chancellors ought to draw up their budgets. As prices have risen 3 or 4 per cent in the past year expenditure that merely held money costs stable, in a defence budget of £1,500 million, would represent a real saving of between £45 million and £60 million. Taking all these items together, a pattern emerges whereby it might conceivably be open to the Chancellor to claim that, compared with the current year, the real burden of defence costs on the economy is being reduced by upwards of £100 million in 1957-58. There would be a certain amount of cheating in such a claim. For one thing, the reduction would be achieved by comparison with the year of the Suez war (although also with a year of considerable de-stocking); for another, part of the prospective cut in the net estimates might reflect the hope of getting more in support costs from Germany next year. But, if the figures suggested in this note are borne out, the half-promise about the estimates already made is not, economically, to be sneezed at.

Cairo's "Big Four" Conference

THE conference in Cairo of the "big four" had hardly got under way when the Egyptian press announced that it had reached "a united Arab policy." In the broad sense, this can hardly be true. King Saud has shown encouraging interest in the Eisenhower doctrine. King Hussein of Jordan has launched a campaign against communism and got his government to stop Soviet propaganda from entering the country. Syria, on the other hand, has a pro-Russian government and is against the Eisenhower doctrine. Egypt is politically and economically close to the Soviet block. Four of King Saud's interviews in Cairo, with the ambassadors of the United States, Iran, Pakistan and Lebanon, can hardly have pleased either Egypt or Syria.

King Saud is not clutching President Nasser quite as firmly by the hand as he did a little while ago. This is evident from his recent choice of friends, notably Habib Bourguiba, the Prime Minister of Tunisia, and the Sultan of Morocco, neither of whom looks with much favour on Egyptian policy. It suggests a new independence of thought which might fracture the Egyptian line-up against Iraq and cut the flow of Saudi rials to the anti-Iraqi and anti-western press of the Arab world.

The communiqué is, in fact, notable for nothing more than a few obstinate platitudes about the well-known Arab national causes. All four could without difficulty agree in demanding the withdrawal of Israel from Egypt and from the Gaza strip without making public the concessions they might make to secure it. Much will depend on whether the new United States proposals can be presented as acceptable to the nationalists of Syria, Jordan and Egypt. Even on this subject, however, there are some differences. King Saud would agree to concessions to get the Suez canal unblocked and his oil revenues back to peak. Syria would concede nothing at all. And Egypt? It is difficult for President Nasser to yield an inch of the victory that Uno has been vicariously winning for him; but there are faint signs that he might welcome a formula that saved enough of his face.

Iraq Seeks a Loan

IRAQ loses three-quarters of its oil revenues as long as the Iraq Petroleum Company's pipelines through Syria remain cut. These revenues provide the entire development budget and 40 per cent of the ordinary budget, which, therefore, will show a deficit of at least £2.5 million by the end of the financial year on March 31st. Even if the pipelines were restored within the next six weeks it could only be to less than half their capacity. The deficit may reach £10 million.

The Iraq government is therefore asking the IPC for a loan secured on future oil royalties, and the discussions in Baghdad regarding this request are being conducted most sympathetically on the company's side. There seems every reason to help Iraq, the Arab country which has behaved most rationally about its own and western interests, all the more since its difficulties were brought on by the British action in Egypt last autumn.

The problem is not whether the loan should be given but how it should be given. If it were made as an advance against royalties it might come under the Iraqi law which allots 30 per cent of royalties to the ordinary budget and the rest to development. The Iraqi government has never yielded to the temptation to use more than 30 per cent for current expenditure, and it would be unfortunate if the loan were to set a precedent now for breaking the law in this respect. A way may be found to lend the money without direct reference to the royalties agreement, in the knowledge that Iraq's future oil revenues will secure its repayment.

The Chequers Group

MR MACMILLAN'S summoning of six senior colleagues to a weekend "stag party" at Chequers did not signal the establishment of a new type of Government conclave, still less a sudden return to the methods of Charles II's Cabal. In recent years most Prime Ministers have found it best to form an "Inner Cabinet," usually of four or five men, for taking at any rate the big decisions. The late Lord Norwich has recalled how British policy at the time of Munich was largely in the hands of four men: Mr Chamberlain, Lord Halifax, Sir John Simon, and Sir Samuel Hoare. Between 1945-50 four men obviously stood head and shoulders above the rest of the Labour Cabinet: Mr Attlee, Mr Bevin, Mr Morrison and Sir Stafford Cripps. When Sir Winston Churchill was at 10 Downing Street the picture was complicated by the presence of an informal group of personal friends, once called by their leader "our intimate circle," but during his last term there was also a fairly clear inner group of the Cabinet: Sir Winston himself, Sir Anthony Eden, Mr Butler, Lord Salisbury and Lord Woolton.

Mr Macmillan's inner ring is a little larger than usual. The Chequers guest list originally comprised six men besides the Prime Minister: Lord Salisbury, Mr Butler, Mr Selwyn Lloyd, Mr Thorneycroft, Mr Sandys and the Chief Whip. (It is not clear whether the last named was present as a full member or just drinks waiter, nor whether Lord Home joined the group on Sunday hot with some news from India or merely because he had a previous engagement on the Saturday afternoon; Mr Lennox-Boyd, who would have been there, was in hospital). But the original size of the group was probably dictated simply by the fact that no single figure in the second rank has yet pushed himself to the front to join the only two men as yet clearly of top stature: Lord Salisbury and Mr Butler. The only point, in

fact, where Mr Macmillan really differs from his predecessors in this matter is that they invariably preferred to keep the meetings of their "Inner Cabinets" as quiet as possible. They no doubt felt that, while lesser members of the Cabinet obviously knew that they were being excluded from such inner councils, there was no point in publicly labelling them as second class members, and that to excite attention to meetings which could produce no published result was a mistake in rumour-ridden public affairs. The supposition is that one of the things the Chequers group will have discussed last weekend—in addition, of course, to defence—was whether to take risks in the Budget; the guess, after reading the names in the list, is that this particular inner group would be more likely to include a majority of the cautious; but nobody, outside the group, really knows.

When in Doubt

Both the Trades Union Congress and the Federation of British Industries have proffered advice to the Chancellor this week. The TUC's memorandum has obviously been compiled by its rapidly improving group of staff economists, but has equally obviously been edited by the usual sort of TUC committee. The TUC economists enter the plea, with technical arguments, that this year's budget should be sufficiently reflationary to make use of "the considerable increase in productive capacity which the high level of investment in the past two or three years must have created"; the editing committee suggest that one of the best ways to do this would be to take purchase tax off pots and pans. The FBI's booklet may have suffered from some of the same sort of editing, particularly in its over-emphasis on undefined "cuts in Government expenditure" as the easy road back to stability. But the editing has been more liberal (the report's observation that "the most dangerous characteristic of inflation is that, until it gets out of hand, it makes life too easy for business" is an object lesson in candour to more conservative bodies like the TUC); and its especial interest lies in the fact that its authors can view one imponderable factor in the future course of demand from an especial vantage point. They should be in a better position than most other people to gauge their member firms' intentions to (or not to) invest.

The FBI's considered view is that the volume of investment "may be about the same in 1957 as in 1956." "But in 1958," it says, "it will almost certainly be less than in 1957 unless some stimulus is given to it." Nevertheless, it thinks that the arguments for some early reflation are very "finely balanced":

> On the one hand, it is not safe to allow investment programmes to pre-empt resources until the slackening of public expenditure has made room for them. On the other hand, just as there has been a time-lag in restraining investment so there will be in its revival; and so, if a period of recession is to be avoided, it is necessary to apply the stimulus in advance of the time when room will be available.

The Federation's final recommendation to the Chancellor is therefore that "some part of the stimulus to new investment, such as the restoration of investment allowances and the relaxation of the credit squeeze in the narrow sense, should be applied as soon as firm decisions to reduce public expenditure are made"; but that "truly radical reductions in taxation" will have to wait. "For the time being," it says, "the watchword should still be 'when in doubt lean to the side of disinflation'." It is fair to conclude from this that industrial economists are still "in doubt." So, one imagines, is the Treasury—and most other people.

Homicide in the Lords

The debate on the Government's Homicide Bill in the House of Lords was as dull as the 1948 debate on the Labour Government's abortive compromise clause was lively. Then, the opponents of the clause, the Lord Chief Justice in particular, enjoyed themselves in showing up all the inconsistencies and anomalies it would lead to. Last week, no peer spoke enthusiastically about the present compromise, but none was prepared to vote against the second reading.

The reasons they gave for not wishing to oppose the bill reflected their views on capital punishment itself. The abolitionists (Lord Templewood disclaiming any support for the measure) welcomed the prospective drop in the number of executions—though, when the bill becomes law some time this spring or summer, there will in fact have been no execution in Britain for nearly two years. The retentionists (with Lord Ferrers as uncompromising as Lord Templewood) welcomed the proposals to retain the death penalty for murders in which the maintenance of law and order is directly threatened. The middle-of-the-way peers welcomed the bill simply because it is a middle-of-the-way measure, though Lord Samuel regretted that the distinction between capital and non-capital murders had not been drawn on the degree of moral heinousness in the crime.

Another middle-of-the-way speaker, the Archbishop of Canterbury, produced the extraordinary (if quizzical) statement that the controversy over the death penalty was "very unfair to anybody meditating murder." This was capped by Lord Goddard's remark that the one reason for welcoming the bill was that it would stop the policy, adopted since the Silverman Bill passed the House of Commons, of reprieving every murderer, which was very embarrassing to the judges. This, indeed, seems to be the highest measure of agreement that the bill can evoke: that for these holders of two of the most responsible offices in the land it will end a situation that is unfair—both for potential murderers and for their judges.

M. Mollet in Washington

M. Mollet in his journey to Washington has been doing his bit to repair the cracks in the Atlantic alliance; it is a necessary stage in the work that the image of the French prime minister as a "Suez culprit" that has prevailed since October in Washington should be obliterated by a look at the real figure; a staunch anti-Communist, a good European, an architect of the Common Market and of Euratom. Following the example of M. Mendès-France, he did not go to Washington to ask for money. M. Mollet said before he left Paris that economic aid did not figure on the agenda; though it is known that the French need dollars to pay for oil, that they are negotiating a loan with the Import-Export Bank, and that they are anxious for the resumption of American off-shore purchases.

M. Mollet's intention was rather that his Washington talks should range over foreign policy. The future of "Europe" in its relations with French Africa; France's contribution to Nato; Russian diplomacy in the German election year. He and M. Pineau have been pleading Israel's case in the Middle East crisis, and this may have done good in Washington; they may well have agreed to exert a moderating influence on the Israelis in turn. In Algeria the Americans, having helped France to avoid a vote of censure in the United Nations, now expect the French government to make constructive use of their diplomatic respite.

Back in Paris, M. Mollet cannot feel much confidence in his reception by the National Assembly. There is again talk of a government crisis, M. Mitterrand having replaced M. Pleven as the favourite in the fashionable succession stakes. The fact that both belong to the tiny and divided UDSR party is an interesting commentary on the power of the centre in French politics. It seems, however, that M. Mollet will be in real danger not when he expounds his policy but when he seeks the financial means to carry it out. For this reason, American aid, though it did not figure on the official Washington agenda, may really determine by

it margin M. Mollet's team will beat the French postwar ord of governmental stability.

A Match Deferred

THE trouble about matchmaking is that, be it based on passion or reason, it requires the simultaneous agreement both parties. For this reason a union between Signor enni's Socialists and Signor Saragat's Social Democrats, ought nearer by the meeting of the two leaders last igust, has receded again. Hopes were at their highest at e recent Venice congress last month, when Signor Nenni nounced his party's political divorce from the Communists, spoke favourably of European integration, and even reshadowed a possible acceptance of Nato. Although his eech was well received, when the congress came to elect e central committee his candidates were outnumbered by ie spokesmen of party officials and by other representatives groups less favourable to fusion. True, the third round ive him a narrow majority on the executive. But it was ade obvious that strong elements in the party machine ill try to prevent Signor Nenni from making too many ncessions and from rushing too fast into the arms of the ocial Democrats.

An even bigger blow to plans for a merger came from ignor Saragat, who delivered a diatribe against his potential artner, thanking Providence that "the flowery cloak of ennian eloquence proved unable to hide the real situation." n impression was created that he was not ill-pleased by the ailure. Machiavelli's advice never to enter into an alliance vith a stronger partner (the followers of Nenni polled nearly wice as many votes at the last election) and perhaps even desire to stay in office may have reinforced Signor Saragat's fear of communist infiltration. His party has adopted a waiting attitude.

The Italian coalition government does not, therefore, need to fear a crisis precipitated by any desire of the Social Democrats to join Signor Nenni in opposition. Unless it is imposed from below, the Socialist merger is unlikely to take place before next year's elections; they may show how much recent events have weakened the biggest communist party in the West. Popular reaction may then force the leaders to second thoughts about a merger.

Doctors Prepare for Action

The Government's handling of the doctors' pay claim has been singularly inept. Last week, when the appointment of a royal commission to consider medical remuneration, and the position of the medical profession in relation to other professions, was announced in Parliament, no hint was given that all doctors might be given an interim increase pending the commission's deliberations. Indeed, in the House of Lords, Lord Salisbury said that the increase proposed for junior hospital staffs would not be extended beyond that limited class.

The effect of this announcement was what the Government might have expected. The General Medical Services Committee, representing the family doctors in the health service, immediately called an emergency conference of the local medical services committees—the statutory advisory bodies set up under the 1946 Act in local health areas. At this conference, which will be held at an early date, general practitioners will be advised to resign from the health service. In the meantime Mr Macmillan has written to the joint chairmen of the doctors' negotiating committee, in reply to a letter of strong protest received from them, to say, first, that the royal commission was not intended to be a time-wasting procedure and, more important, that its work did not preclude "some interim adjustment."

If this hint of an increase all round has not been given as a result of the threatened resignation, why on earth could it not have been given last week? In any case, it is vague enough for the doctors to proceed with their plans unless the Government makes a definite and acceptable offer. The precise details of those plans are not known. Since the purpose of resignation is to put pressure on the Government, the doctors would not treat people for nothing—or so merely save the taxpayers' money—but would p[ro]bably charge fees to those they deemed able to [pa]y them. Nor could they issue health service prescri[p]tions. They would also be able to sue for bills u[n]paid, and it is an interesting point whether their patie[n]ts could refuse to pay some at least of that portion of their insurance stamp that goes towards the cost of the health service. Another source of funds for many of the resigning doctors would be their share of the £66 million set aside as compensation to them for the loss of their right to sell their practices. This is payable on retirement or death, and it could be very embarrassing for the Chancellor if they all claimed it at once. On the other hand, the older doctors who resigned would be hard hit by the forfeit of their right to a pension; this is payable only after ten years' service, and the health service is not yet nine years old.

Hospital doctors, who work on state-owned premises and with state-provided facilities, are not being advised to resign; but on Thursday morning the joint consultants' committee issued a statement that they would support the family doctors in every possible way.

A Court of How Much Inquiry?

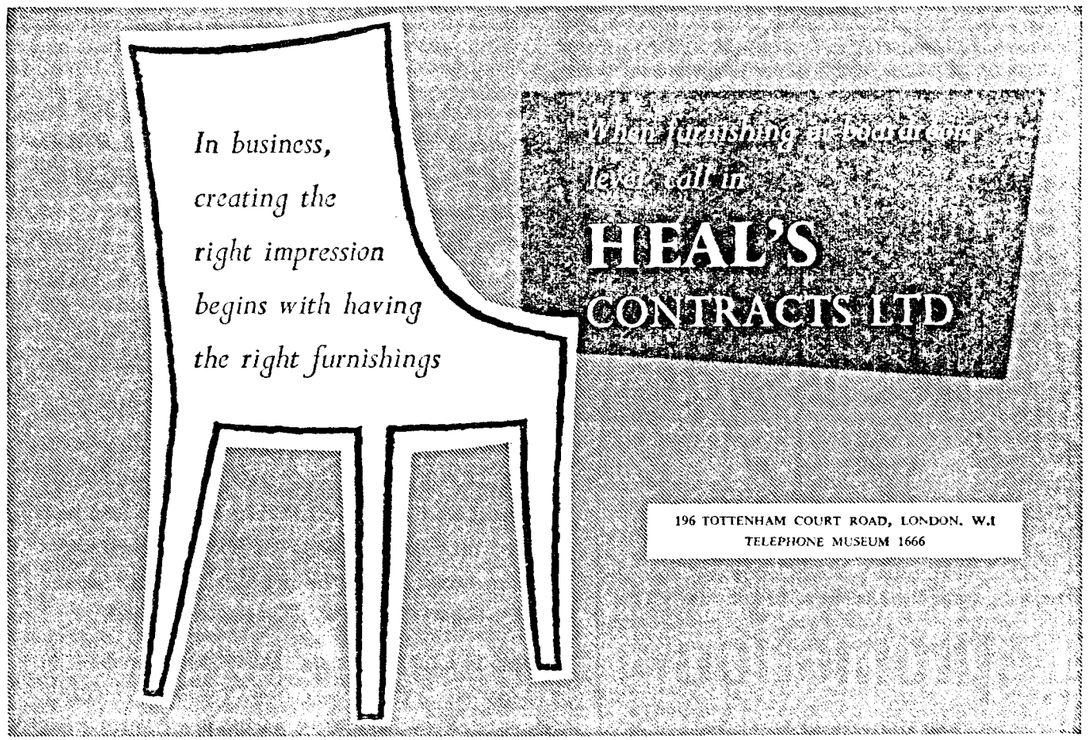
THE national interest in the Briggs affair has never been merely to prevent a strike breaking out there; it has been to get the deepest possible probing of, and the widest possible publicity about, a case study of all that is worst in British industrial attitudes. The basic facts are plain. The Ford Motor Company at Dagenham took over the neighbouring Briggs Motor Bodies factory in 1953; it tried to introduce its own efficiency methods, which would have resulted in a considerable rise in workers' earnings in the factory, but failed in the face of the men's attachment to their long tea breaks and other traditional practices. Since then labour relations at Briggs have gone from bad to worse. In 1956 there were 162 stoppages of work because of disputes in the factory, the fantastic average of more than one every other working day. The stoppages are led by a strong shop stewards' organisation, in which communist influence is predominant. The threat of a total strike that has been hanging over the factory for the last few weeks results from the dismissal, for a breach of discipline, of one of these communist shop stewards, a Mr McLoughlin. Although Fords agreed to pay Mr McLoughlin to stay away from work, pending the report of a court of inquiry, he himself says that he will not accept such "Judas money."

It remains to be seen what will happen in the court of inquiry now. The national interest is that the inquiry should be very wide ranging; but Mr Macleod's decision on Tuesday, in great anxiety to avoid a strike, means that it is going to be a very unusual inquiry. Under union pressure, he has agreed that the court should consist not of the usual three men, but of one, Lord Cameron, assisted by two assessors from either side (the union and Fords). Lord Cameron, a Judge of the Court of Sessions, was chairman of a court of inquiry into the railway dispute two years ago; and his report aroused some criticism when it argued that the nation "having willed the end" of a nationalised railway system must "will the means" by seeing that railwaymen got higher wages, even though the railways were in financial deficit. A heavy responsibility for making his inquiry as wide as possible will rest on him on this occasion.

In a despatch below, our special correspondent describes the present depressing atmosphere in the Briggs works.

Poland's Parliament

POLAND'S new Sejm, now holding its first session, is not expected to be the rubber-stamp institution that its predecessors were. True, the deputies are unlikely to question the fundamentals of the regime, but they are prodded by an outspoken public opinion, and they will certainly not be content dutifully to endorse what the government does. More probably, the government and the ruling party will



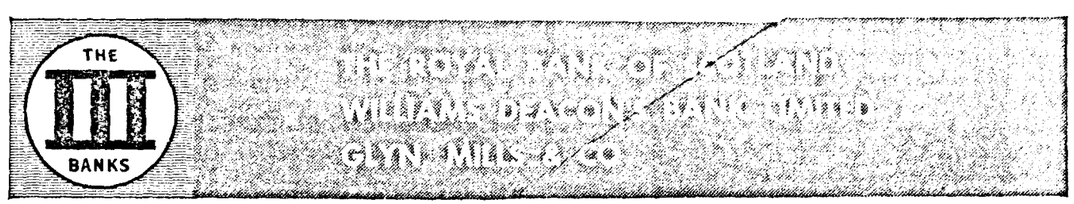
Dispute at Dagenham

OUR special correspondent visited Dagenham on Tuesday, to report on the atmosphere among three groups of people affected by the Briggs dispute:

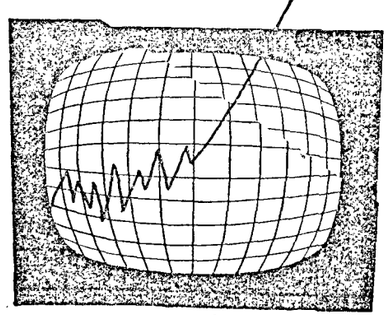
(1) *In the Shop Stewards' Den.* The Amalgamated Engineering Union's shop-stewards at Briggs have a committee room over a hairdresser's shop in the town; they finance it from the proceeds of a football sweep run among the men at the works. The stewards themselves were the only ones at work, but two men and a girl were meritorily doing the accounts. One man pokes at an adding machine, while the other (whom your correspondent subsequently identified from newspaper photographs as the famous Mr McLoughlin) argued: "What have the management ever put into the works? They never owned any capital, because it's us workers who make capital—and they are robbing us of it all the time." This was self-evident to him, and he smiled pityingly at someone who was ignorant of these elementary facts. Arbitration by the Ministry of Labour could not help to solve the problem, for "When it's a question of capital and labour there's no such thing as impartiality." The men had voted to strike "a hundred per cent solid" (the actual vote among AEU members was 1,118 for a strike, 429 against, with some 250 to 500 abstentions; there is a labour force of 9,500 in the factory). One day a Labour government would get in and nationalise everything, but until then there was no chance of making peace with the management.

(2) *With the Wives.* The depression induced by this conversation was somewhat dispelled by two ladies in the rainy street. They had just bought an evening paper, announcing in big headlines the settlement of the strike. Both their husbands worked at Briggs, and, if the strike was really settled—they would not believe it until they heard it on the wireless—they were delighted. With the cost of living the way it is they could not afford any more. One of their husbands was a Briggs' employee, who had had personal experience of work in the Ford factory; he was a skilled man, she said proudly, and would get a pound a week more if he came under Fords, "but then Fords are stricter. There's more give and take in Briggs, and that's why my husband likes it. I'd rather have the money myself, but then I'm not the one who does the work."

(3) *Among the Men.* Four men were having a smoke outside the gates at Briggs. They were sure they didn't want a strike, but would naturally come out if the unions thought it right; only one of them was an AEU member. They disliked Ford's time-study men. "Even if we would get more money from Fords the blokes don't like being mucked about. We got along all right here before they came along." But they were sure that all the pay they had lost in strikes could never be made up in increased wages; and the unions mucked them about as much as the management now. "I reckon an enquiry's what we want. What this plant needs is a dose of salts, and not just for the management either." Men began to stream out of the gates, and, stubbing out their cigarettes, they put the remaining halves in their pockets: "We must slip in and clock out now," they said, "and the best of luck."



what
is
WASTE?



In the ordinary way, something to be avoided. But, according to records, Bankers have used this term since 1740, or even earlier, to denote their system of listing money and cheques received each day for the credit of their customers.

The Three Banks Group

The most successful TV promotion of 1956?

A few weeks before Christmas last year Lines Brothers took over a complete Shopping Guide to show their Tri-ang Toys. This 15-minute feature was transmitted over all stations on Sunday December 2nd between 5.50 and 6.10 in the evening—just after ABC Television's Family Hour and Associated TeleVision's Junior Television.

The results achieved were up to the highest expectations.

Catalogue distribution up over 300%. Toy shops throughout the television areas were told well in advance of this Tri-ang feature. In consequence, over 800,000 catalogues were distributed to them in comparison with 250,000 the year previously. In addition, many shops gave an exceptionally generous display to the toys—whole windows in a considerable number of cases.

Seen by 4,700,000 people. As for the feature itself, in London on ATV it gained a Television Audience Measurement rating of 46. In the North on ABC a TAM rating of 55. And in the Midlands, also on ABC, the best rating of all, 68. The Midland rating put it high up among the top ten programmes of the week.

It was estimated that over 4,700,000 people actually saw this programme.

What the client says. Lines Brothers Ltd., who planned the commercial in conjunction with Colman, Prentis and Varley Ltd., stated 'In every way this commercial feature did a first-class job. We got a large audience. Our retailers were impressed and so were our own sales staff. We got exceptionally good displays of our toys. And, last but not least, the dealers got very good sales'.

use parliament as a testing ground for their policies, which will be modified, if necessary, to avoid the gap which formerly yawned between leaders and people. Eastern Europe, in particular, will watch with close attention this attempt to reconcile dictatorship and democracy.

After political successes comes the economic test. Mr Cyrankiewicz, the prime minister, having presented a scarcely altered government (the changes were made in November) concentrated his speech on economic prospects. The Polish economy is to undergo important changes in the current year. Total industrial output is scheduled to increase by only 4 per cent, but 16 per cent more consumer goods are to be supplied. The share of investment is to be reduced, arms production severely cut and output in certain branches of heavy industry curtailed. In the budget the axe is applied to expenditure on defence and administration; estimates for social welfare are increased. It is hoped that, thanks to all these changes, the higher nominal wages and farmers' incomes will not result in inflation. Much will depend on the success of the policy of incentives for peasant smallholders; last year's good deliveries fell short of expectations.

Foreign trade is another weak spot in the general picture, and the balance of payments will be further strained by a cut of 6.5 million tons in coal exports, Poland's chief source of foreign currency. Mr Cyrankiewicz admitted that, despite the help promised by the Russians last November, Poland will be compelled to limit its imports to the strictest minimum. Attempts are being made in the West to get more raw materials and capital goods on credit. The Polish premier showed anxiety to reassure the Russians that this would not involve any change of allegiance. He stressed the importance of the Warsaw Pact (in view of Germany's rearmament), and Poland's determination to stay in the "socialist camp." At a time when their trade missions are busy negotiating in Washington and other western capitals, the Poles cannot be accused of using false political pretences to get the economic aid which they so much need.

No Plebiscite for Kashmir?

THE anti-British clamour from Delhi and the filibustering of Mr Krishna Menon have obscured the fact that India has good as well as bad reasons for opposing a plebiscite in Kashmir. Indeed, the Indians can scarcely blame the British press for its unsympathetic attitude towards India's case, since they have consistently been less than frank on the issue. They have bound themselves to support a plebiscite by their acceptance of various Security Council resolutions. But in fact they do not want a plebiscite, and they seek to disguise this fact by reiterating their reminders that the Council resolution of April 21, 1948, insisted on the prior withdrawal of "tribesmen and Pakistani nationals" from Azad Kashmir.

The motive for the Indian reluctance—and reticence—should be recognised. Since the violent days of 1947 and 1948, Mr Nehru's government has established an uneasy communal peace in its secular republic. A plebiscite campaign in Kashmir would be likely to be fought on communal lines, with the danger that Hindu extremists would turn on India's 40 million Muslims. This is the unstated reasoning behind Mr Nehru's latest attacks on Britain for its part in the Security Council debate on Kashmir; and the fact that it remains unstated doubtless reflects Mr Nehru's anxiety lest too open a discussion might arouse the very communal violence he wishes to avoid.

India complains that Britain, by co-sponsoring a Kashmir resolution in the Security Council two weeks ago, showed itself indifferent to India's vital interests. The resolution proposed that the president of the Security Council, Hr Jarring, of Sweden, be sent to Delhi and to Karachi to sound the two governments on the possibility of demilitarising Kashmir, bearing in mind "the proposal for the use of a temporary United Nations force." The Indians object that this proposal was made by Pakistan, and that Britain by sponsoring it was taking sides, though they raised no objection to a later resolution, which the Council passed and which merely proposed that Hr Jarring should make the journey.

They allege, too, that the British action was an attempt to pay India back for its opposition to the intervention in Egypt. There is no ground for the allegation. Naturally, Britain seeks an agreed solution to a problem that divides two Asian members of the Commonwealth family. This is no reason for some Indian papers and politicians—but not Mr Nehru—to threaten to leave the Commonwealth.

Not so Co-operative

CARMARTHEN was voting on Thursday after a very Welsh campaign which seems to have been everything that a by-election campaign ought to be. It is the only one of the seven by-elections pending after North Lewisham in which the result seems to be really in doubt, unless the movement of opinion to the left has really reached landslide proportions; it would take a swing of over 10 per cent to rob the Tories of any of their other seats now being put at issue.

But the present flurry of by-elections has had one unexpected consequence. The three prospective recruits to the ranks of Labour MPs that were chosen for good seats in these elections were: a barrister who has been in the party for only a year (the victor of North Lewisham), a young Co-operative intellectual (Mr Stanley Evans's designated successor at Wednesbury, which was also voting on Thursday) and the ex-Liberal Lady Megan Lloyd George at Carmarthen. The young Co-operative man was picked at Wednesbury in preference to a senior trade union official, who was an MP in the 1945 Parliament and is now on the National Executive. This, to long-service trade union MPs, has seemed the last straw in the trend to bourgeoisation of the party. Officially sponsored trade union MPs now constitute only a third of the Parliamentary Labour party; once they could command a handsome majority. This trend has been partly an inevitable and desirable result of the growth of popular education: a steadily larger proportion of the working class's potential leaders are going to a university and so becoming Labour MPs via the Fabian Society and the Transport House Research Department rather than the union lodge. The growth of Co-operative

influence seems to some union leaders to be a different matter. The Co-operatives (as a party, as distinct from as a movement) have always preferred to make their financial contribution to Labour by adopting particular constituencies, rather than by national contributions. They now have 20 Labour MPs representing their interests; it has always been intriguing to speculate what Labour (or for that matter the Tories) would say if a big business organisation like ICI openly financed and organised twenty Conservative members. The trade union leaders (who are themselves being asked to increase their party subscriptions) have long believed that the Co-operatives must make their contribution in some different way; on their insistence the Labour party has now given notice of the termination of its political alliance with the Co-operative movement.

This could mean much or little, but rather more probably little. Theoretically the twenty Co-operative-sponsored MPs would now seem to be freed from the obligation to obey the Labour whip; but they have always been good at co-ordinating their (occasionally divergent) obligations to the Co-operatives and to Labour, and one suspects that they will work hard to see that some compromise is effected now. But the present row has one more amusing side. A group of Labour economists, including Mr Gaitskell, have lately been looking into the economic organisation of the Co-operative movement, at the Co-operatives' request. It has always been a matter for speculation how any economist could make any remarks about Co-operative economic organisation without ruffling feelings. The committee's task must be still more difficult now.

The Irish Election

OUR Correspondent in Dublin writes: The Irish general election will take place on Tuesday in an atmosphere of invincible apathy. Voting is by proportional representation in forty constituencies returning 147 candidates. In well over half of them there is next to no chance of a major change. Between them Mr de Valera (*Fianna Fail*) and Mr Costello (*Fine Gael*) have, in recent years, been taking an increasing proportion of the 147 seats in the Dail: 99 in 1948, 109 in 1951 and 115 in 1954. Changes of government in the last decade have been decided by the fluctuations of the smaller parties—the Farmers, the Independents and Mr MacBride's *Clann na Poblachta*—who, taken together, have fallen from 29 in 1948 to 13 in 1954. But even here, the destination of third and fourth preferences may be decided by personalities and local ties rather than by party labels. Sooner or later, moreover, independent candidates should benefit from the dissatisfaction with the present party structure, which reflects past political scores instead of present political and social interests.

The general feeling in Dublin is that the parties now in office under Mr Costello are unlikely to be able to form a new government, and therefore, presumably, that Mr de Valera will come back. Whether he will come back with a clear majority, or whether the vote will be for deadlock, is another matter, which seems to depend on three main factors:

(1) It is generally believed that the greatest weakness of the present government lies in its Labour wing, which holds 18 seats at the moment, but is expected to hold less after next Tuesday. It might be thought that the recent growth in unemployment would swell the Labour vote; in fact, however, Labour is likely to suffer even in Dublin, the most industrialised area of the country, where even as things are it holds only four of the thirty seats.

(2) Some *Fianna Fail* optimists believe that the recent growth of Mr Costello's own *Fine Gael* will also be sharply reversed. The threat to it is less apparent than that to Labour, but it is true that more *Fine Gael* than *Fianna Fail* seats look vulnerable in this election, and that in several recent by-elections *Fine Gael* supporters stayed at home—either for local reasons or from dissatisfaction at the apparent lack of distinctive policies.

(3) The effects of *Sinn Fein's* intervention are incalculable. The party has put up only 19 candidates and does not seem to have made any great impression; most people assume that it should not get more than three or four seats, if that. But *Sinn Fein's* votes will come from Labour and *Fianna Fail*, not at all from *Fine Gael*; and that could complicate Mr de Valera's chances of getting a majority.

In the last resort it seems that the result will depend on the fortunes of the nineteen Labour seats and on what happens to about one-fifth of the thirty-five seats in the cities of Dublin and Cork.

The South African Treason Trials

THE accused are of all races. Out of the total 156, there are 23 Europeans; 30 are Indians and Coloured; the rest are African. They come from all parts of the Union and include a member of parliament, clergymen, lawyers, doctors, journalists, clerical workers and labourers. Many of them are national or provincial leaders of the numerous organisations which oppose apartheid; more than 50 organisations have been named in the proceedings. They were arrested on allegations of treason and "possibly" of communism, which in South Africa is illegal. Although the scope of treasonable activities is wider in the Union than in this country, these charges are the first of the kind ever laid in time of peace. The alternative charge gives the prosecution a less lethal but more sweeping weapon, since the definition of communism under the 1950 Act includes any disturbance designed to change the existing order, and a communist means anyone who at any time in his life has supported the aims of communism. The maximum penalty for treason is death (although this has only once been carried out) and for communism 10 years' imprisonment.

The proceedings began in January with a mass examination before the magistrate, who is to decide whether there is a case for committing the accused for trial. This preparatory investigation may drag on for anything up to three months. So far the prosecution and defence have each outlined their cases, 11,000 documents have been put in by the prosecution, and the court is hearing oral testimony on some 100 speeches alleged to have been made by the defendants. The accused have the option of reserving their defence or setting it out in full before the magistrate, and there are indications that they will depart from normal procedure by choosing the latter. If they are committed on charges of treason, they could be tried without a jury before two or three judges. Should the magistrate rule that there is no case, the prosecution could start again from the beginning before a different magistrate, although there is no precedent for this happening.

The case for the prosecution, as so far outlined, is that the accused were conspiring to set up a communist state by violence and possibly with foreign assistance. The accused are linked by their attendance, either individually or through their organisations, at a public meeting in 1955 which adopted a document called the Freedom Charter. The prosecution alleges that the social and economic changes envisaged in the charter were to be brought about by revolutionary methods involving force and subversion. As evidence it has put forward a welter of documents; any paper found on the premises of an organisation of which one of the accused was at any time a member can be used as evidence against him. Most of the documents are anti-apartheid, but there is a handful of letters from leading communists and at least one (anonymous) incitement to violence.

The defence has taken the unusual step of outlining its case at the beginning of the investigation. It is trying to do two things: first, prove the innocence of the defendants and, second, expose the proceedings as an experiment in political intimidation. The defence claims that not only are the aims outlined in the Freedom Charter unexceptionable, although repugnant to the South African Government, but there is no indication that they are to be achieved by other than peaceful means. (The Freedom Charter is vague, high-minded and in part socialist: it calls upon the people to "strive" for the changes it advocates.)

Interest in the trial has waned even in South Africa, where few consider that the government's scrupulous observance of legal niceties will in the long run obstruct its political purpose. But it may revive when the defence turns prosecutor by contending that the trial is a political plot similar to the Reichstag fire trial. In his outline of the case, the defence counsel claimed that the accused were victims of "political kite-flying": the government is testing how far it could go towards stifling free speech and criticism. The defence "will endeavour to show that what is on trial here is not just individuals but the ideas which they and thousands of others in our land have openly espoused and expressed."

But while the case drags on at snail pace, the expenses rise. On top of the legal costs, about half the accused have now been sacked from their jobs and have no money to support themselves or their dependants in the months that stretch ahead. The Bishop of Johannesburg (and Christian Action in this country) are trying to raise £100,000; but the fund is still a long way below its target.

General Franco's Reshuffle

MINISTERS in Spain are not immortal like the Caudillo, but they are hard to move. General Franco's first major reconstruction of his government since 1951 gives tacit recognition (nothing more could be expected) to the barely concealed crisis through which the Spanish regime is passing. After too many years in office a dictator's cabinet becomes dull, too openly cynical, and divided within itself. Recent trends have gone against the government in Madrid. Inflation presses, the annual gamble on a good harvest has turned out badly, labour discontent has become impossible to conceal; above all, the intellectual and moral disharmony between the regime and the public has grown more blatant, so that the polite boredom of a few years ago has turned into an angry disgust.

General Franco has worked out afresh his unending political equation between Falange, monarchists, army, and church. He has instituted some reforms in cabinet procedure, setting up a committee system along lines which seem to put more power in the hands of his personal deputy, Captain Carrero Blanco. His new foreign minister, Senor de Castiella, has distinguished himself as a propagandist for Spanish national claims, in particular on Gibraltar; neither Britain nor France, nor indeed the West generally, has much apparent ground to be pleased at this change. An attempt is being made to improve the machinery of co-ordination in economic affairs. But mechanical improvements are unlikely to overcome the defects in the conduct of Spanish economic policy, partly inherent in a state which attempts a system of controls too elaborate for its capacity, partly the expression of an awareness in the government of the weakness of its hold on the nation. General Franco rules through tactical skill and for lack of an alternative. He has found a durable solution for none of the political problems that ruined first the monarchy and then the Republic and brought him to power twenty years ago.

Family Life in Indonesia

PRESIDENT SUKARNO has come to the conclusion that the trouble with politics in Indonesia is that the parties are interpreting "opposition" to mean criticising the government with a view to its overthrow. This, he says, is alien to the spirit of Indonesia, which ought to be governed in a spirit of *gotong-rojong*, mutual assistance: "the essence of family life and the purest reflection of the Indonesian soul." All the major parties must co-operate in one cabinet—including the communists; for, said the president,

> I ask you in the calmest possible manner: can we afford to continue to ignore a group which in the general elections won six million votes? . . . to me there are no such words as "left" and "right." I only want the Indonesian nation to become united.

In addition to this all-party cabinet, President Sukarno wants to establish a National Council, led by himself and composed of the representatives of farmers, workers, intellectuals, business men, religious bodies, and the armed forces, together with the principal cabinet ministers. This council is to advise the cabinet; but Parliament will, it seems, continue as before.

Unfortunately the words "left" and "right" still exist for the politicians, even in Indonesia. The Islamic, Roman Catholic and Protestant parties have made it clear that they will not sit in a cabinet with communists. They have also complained that the composition and powers of the National Council have not been sufficiently defined, and they are afraid that the communists will be able to make use of their better organisation to gain a disproportionately strong position in it. One newspaper commented "if the council's advice is not binding it is a mere waste of time. If it is, the president will have gelded parliament, emasculated the cabinet and done violence to the constitution."

Should the parties reject his plan, President Sukarno might, in his capacity as commander-in-chief, proclaim a

state of siege and administer the country through the armed forces. A more attractive solution, which has the support of the dissident Sumatran leaders and several political parties, is to form a cabinet of "men of integrity" led by Dr Hatta, the former vice-president, who is honest, able and a staunch anti-communist. But the name of Dr Hatta, with whom he has often quarrelled, has become another of the words that do not exist for President Sukarno.

Old Speak and New Spell

VERY few lawyers will question the soundness in law of Mr Justice Harman's judgment in the case of Bernard Shaw's will and very few laymen will question that it was also in accordance with common-sense. To transliterate English into a 40-letter alphabet would make it utterly unrecognisable (let those who doubt this statement try it for themselves) and the loss of time and temper involved in learning a wholly new orthography would for many years to come vastly outweigh the saving whose money value the old jester wanted to be worked out. This part of Shaw's will was clearly the work of a crank and was rightly set aside.

But it will be a great pity if the effect of the publicity is to leave on the public mind the impression that there is no case at all for spelling reform in the English language. No subject, of course, more easily raises ridicule. But the facts remain—that English is rapidly becoming the world's international language; that while few of the world's major languages are simpler and easier to learn in their grammatical structure, none (at least in the West) is as difficult or as absurd in its spelling; and that English, almost alone of the literary languages, has not been reformed in the modern era. What other nations have done—the reasonable pruning of their languages by an official Academy—we could do. We could get rid of the major absurdities (like the "ough" muddle) and if it would help in the process to add an accent or two, or even invent a couple of new letters, there is no reason why we should close our minds to the possibility.

It is strange how, in this revolutionary age, the reforming impetus seems to have been lost. The Victorians systematically reformed all their institutions and they would have got round to spelling reform if they had had time. Trollope would have found it hard to believe that, nearly a century after he wrote of Plantagenet Palliser, decimal coinage (and disestablishment of the Church) would seem further off, and excite less interest, than in his day. Let us have renewed enthusiasm for all these objects of reform—for more logical spelling, for decimal coinage, for the metrical system of weights and measures and for calendar reform. Any one of these would be more useful than nationalisation. And for those who want to be in the *avant garde* of Reform, what about the duo-decimalisation of arithmetic, with the invention, not of fourteen new letters but of two new numbers, so that it would be possible to divide 10 (which, of course, would equal 12 in our present finger-bound notation) by 2, 3, 4 or 6, instead of only by 2 or 5 as at present, and that tedious atrocity 33⅓ per cent would vanish for ever. There is a cause for a zealous Reformer.

It is true that these reforms, except the decimal coinage, could hardly be carried out without the co-operation of the United States and what may be called the *avoirdupois* Commonwealth. But this is not an obstacle; it is an advantage. It provides a subject on which British diplomacy can Take the Initiative and Provide Moral Leadership. In that respect, it is surely, at the moment, unique.

FOCUS ON

Jim Campbell

AT the hearing of his wage claim on Monday Mr James Campbell, general secretary of the National Union of Railwaymen, called the wife of a Paddington porter as a witness. This was a shrewd stroke, and typical of the man. The glazed eyes of the journalists brightened at once: a human story. Next day Mrs Dear and her budget were all over the morning papers. Everyone was discussing how she got through 6 lb of sugar a week (for 3 people), why she bought cauliflowers while they are so dear and whether her husband got tips or only handled freight. Actually her food bill is only slightly less than the national average (which is 31s. a head). But whether or not her evidence strengthened Mr Campbell's argument that there is hardship in living on the railwayman's basic wage, at the bottom of the scale, of £7 a week, she certainly won it good coverage.

This was not Mr Campbell's only case for a rise. He also maintained that railway rates compared unfavourably with rates in other nationalised industries; that they were too low to recruit and keep the right kind of staff in jobs with such a vital role; and that the last increase, in January last year, had left the railwaymen worse off than they were in 1947. The arguments about the cost of living, however, were a particularly important part of his case because this was the only factor that the same Railway Staff National Tribunal took into account in its recent award to the Associated Society of Locomotive Engineers and Firemen. Mr Campbell wants to show that the index is an unreliable guide for incomes up to £1,000 a year in that it is based on the assumption that British households spend only 35 per cent of those incomes on food, whereas Mrs Dear spends about half, and a family with more children would spend an even higher proportion. Food prices in the last year have risen less than other prices, but Mr Campbell argues that the rise in food prices leaves them without enough to spend on other things.

"We men have little idea what these wives are up against," said Mr Campbell. But he himself, like most of his generation, has seen much harder times than his witness—at any rate early in his career. His father was a Glasgow railwayman, a keen trade unionist who introduced his son to the local branch at the age of 16. He was grieved, however, that young Jim had insisted on going on the railways, and would have much preferred him to stay in the nice clean office job that he got at the age of 14. The first world war took the young man to the Middle East and Salonika. Work on the railways paid off during the slump, and Jim had a job as a shunter, at 27s. or so a week. But he was a branch secretary of his union by now, and in 1935 was elected to its national executive. Some eighteen months later he became a full-time officer for Yorkshire, at the princely salary of £550; it was worth being a trade union official in those days. (The equivalent in post-tax purchasing now would be £1800 a year, which junior trade union officials most certainly do not get.) In 1946 he became chief organiser for Ireland (whence the NUR has since withdrawn); then he was assistant general secretary under Mr Figgins, and in March 1953 became general secretary.

He is tall and powerfully built and speaks with a soft Scots accent; his wife, in contrast, is tiny and very Scots. They are a popular couple with those whose workaday paths lie among trade union affairs—she because she is outspoken and free from the snobbery of some general council wives, he because he is good-humoured and sincere, although militant in union causes. The union, indeed, raised the retirement age of the general secretary to 65 in order to avoid parting with him (he is now 62). He may not be quite so popular with the communists, for he has no time for their intrigues. But everyone knows that in his cautious and deliberate way he will do the best he can for his union—which, after all, is his job.

Defence Spending

It is to be hoped that the Government will not misinterpret the large majority by which the House of Commons has accepted, and stamped with its emphatic approval, the budget of the Chancellor of the Exchequer, and suppose that either the Parliament or the country is in favour of a large and lavish military expenditure. . . . It may indeed be said that experience has shown us how unwise and even how improvident, it is for a great nation like England, with complicated relations and numerous possessions all over the world, to be caught in a state of imperfect military organisation and preparation. But if this be so, there are also two other points which experience has equally well shown. The first is, that it is not in proportion to the amount of money expended, or the large forces kept up during peace, that the efficiency of a military arm is secured; that in point of fact great economy and great efficiency are not incompatible; and the second is, that the military ardour and power of a country when an emergency arises, is great in proportion to the prosperity of the people, and their ability to bear the burdens of a war without inflicting too great a pressure upon their means. . . . In this respect what a remarkable contrast did England exhibit in the late European struggle, to all the continental nations engaged in it. It is not too much to say that a pressure upon the resources of those countries and the apprehension of their further exhaustion, induced them to entertain proposals for a conclusion of the war, which could not be said to be sufficient to secure the objects of the war, while the buoyant resources of England enabled us to stand out for such terms as entirely fulfilled those conditions. We do not wish to underrate a perfect and efficient military organisation, but even that is but an indifferent security compared with the general prosperity of a nation which infuses a feeling of high and healthy courage through all its parts, and at the same time enables it without difficulty to bear the burdens necessary for a great struggle when it arises. It was justly observed by Lord Palmerston that the efficiency of a peace military establishment did not consist in having a large force of men, but rather in a well-organised small force, with well-educated and disciplined officers who understood their business, and who knew how to apply their art upon an extended scale when necessity arose.

Brighter Cricket by Controls?

CRICKET, like the cotton industry, is never what it was; and one has an awful suspicion that the august committee which reported to the Marylebone Cricket Club this week has merely followed the example of other committees of inquiry into declining industries, by searching too keenly for scapegoats and for gadgety counters to a long-term economic trend. Before the war, when bat tended to dominate ball, it was said that attendances were falling at first-class matches because people were tired of too many high-scoring drawn games. Now, when ball tends to dominate bat and when drawn games (except in wet summers) are fortunately less common, it is said that attendances are falling because people like to see batsmen beating bowlers at a high scoring rate all round the field. As an incentive to brighter cricket, the committee has therefore recommended that the first innings of each side in county matches should be limited to 85 overs; it is hoped that this would induce batsmen to hit out, but it might merely make bowlers bowl tight (besides killing the leg-spinner, who can delight a crowd by buying his wickets quickly but dearly). The committee's answer to these fears appears to be to assume that the only (because the easiest) form of defensive bowling is bowling at and outside the leg stump; it proposes to meet this by limiting the number and placing of fieldsmen on the leg side. That could end the dominance, and even the careers, of some of the very bowlers (including the best off-break bowlers) who have been most responsible for the heartening resurgence of ball over bat since the war.

★

There is always a temptation for middle-aged men to think that attendances have fallen because the young men of today do not play cricket as brightly as they themselves used to do. But it is not really surprising that the weary weekly round of county matches is losing support in the social and economic circumstances of today; it is therefore particularly fortunate that interest in Test matches, the receipts from which largely keep the counties solvent, is at a peak. The remedy for the counties is surely not to think up new gimmicks to encourage supposedly brighter cricket, but to have a more intriguing fixture list at more attractive times—and to play all their games more adventurously. The proposal for a knock-out county cricket cup (though why the suggested special restriction to 54 overs per innings here?) therefore seems the best part of the committee's proposals. But whether it can or should resist an economic trend which seems likely to force the counties some day to abandon much of their week-day cricket, and concentrate on week-end matches (perhaps with a two- or three-division county championship), is quite another matter.

Letters to the Editor

Erosion of the Tax Base

SIR—Your two lively articles raise some interesting topics. But they erect a structure of conjecture on an unreliable basis of fact.

First, the expression "Erosion of the Tax Base" is not traceable in the majority report of the Royal Commission. It occurs in a memorandum of dissent signed by Mr Kaldor and his two trade union colleagues.

The validity of your inferences may be tested by the following examples:—

(1) In attempting to prove the existence of a "dust bowl of taxable capacity" of some £3,000 million, it seems that you have taken from Table 29 of the National Income figures for 1956 the figure:—

"*Saving before providing for depreciation* and stock appreciation, £1,514 million."

This figure relates to all companies, public and private and the words I have emphasised are significant.

Making a "broad but not a wild guess," you gross this figure up to £3,000 million. Why you should use a standard rate of 10s. in the £ is not clear. You then assume that one-half is paid out in dividends and that one-half of these dividends go into the pockets of surtax payers.

Both assumptions are gratuitous. It is highly improbable that all companies, including public companies, could distribute one-half of their annual undistributed profits, as these would be largely represented by assets employed in the business. Inflation causes large amounts of profits to be retained simply to reduce "accounting" profits to "economic" profits. Without this the physical assets could not be maintained and the tax base would indeed soon be eroded.

(2) The investment income of surtax payers for 1953-54 was £407 million, as you say. This includes Schedule A and Schedule B income. According to the National Income figures the rent, dividends and interest received in 1953 by individuals and non-profit-making bodies such as superannuation funds amounted to £1,553 million. It will be evident that those figures do not support the assumption that one-half of any increased dividends would be received by surtax payers.

In any case, the distribution would give rise to a large number of claims for refund by small taxpayers and exempt institutions, which would go a considerable way towards cancelling out any additional surtax.

I have no space to recite further inaccuracies. It is reckless to talk of "the transformation that would be produced if, say, the same total revenue were collected by imposing half the present rates of tax on double the present taxable income." The true hope in the foreseeable future lies in cuts in national expenditure and exaggeration on the collection side serves no useful purpose.

Nevertheless, there is scope for serious discussion on the arbitrary direction given to savings by the machinery of direct taxation. For example, it seems high time that the "Chancellor's umbrella" was removed from companies under the control of not more than five persons. At present, however, if for any financial year a company is found to have distributed an inadequate dividend the whole of its profits for that year are deemed to have been distributed and surtax assessed accordingly. This provision is penal; it should be amended so as to permit the Special Commissioners to assess only such part of the profit as should properly be distributed.

Another distorting factor lies in the structure of profits tax with its 30 per cent tax on distributed profits and 3 per cent on undistributed. You suggest that the rate on distributions should be lower than the undistributed rate in order to stimulate distributions. Representatives of industry and commerce have for years pressed for the tax to be reduced to a flat rate (if it cannot be abolished) and this, surely, is the sensible approach.—Yours faithfully, C. D. HELLYAR

London, S.W.1

Safety in the Crowded Air

SIR—I do not wish to indicate agreement or disagreement with the letter signed by Mr R. A. Twomey over the name of Cambrian Airways in your issue of February 9th, but I must disassociate Cambrian Airways from the implications contained in it. I feel that your readers may, from his letter, have formed the impression that Mr Twomey was writing with the authority of Cambrian Airways (which was not so) and that safety in the air is a neglected subject on the part of those authorities and airlines responsible for such matters. The related subjects of control, equipment and the human element, are under constant review by the Ministry of Transport and Civil Aviation and the Air Registration Board on the civil side, and the Air Ministry on the military side. These authorities consult and work very closely indeed with BOAC, BEA, the British Independent Air Transport Association, the British Air Line Pilots' Association, and other established organisations, national and international. The measure of success of the authorities can be determined from the accident rate of British aviation, which compares most favourably indeed with that of other nations. This does not mean to say we can be complacent; indeed, exactly the opposite is true. All interested parties are working continuously to improve standards of safety.—Yours faithfully,

L. B. ELWIN
Joint Managing Director
Cambrian Airways Limited

South African Universities

SIR—Though I agree with the sentiments expressed in the article in your issue of February 2nd, I would like to point out that the information you give with regard to the University of Natal is erroneous.

In this university members of staff who teach non-European students are the same persons who teach the European students and are in no way on a worse footing than those who teach European students. Their salaries are the same. That is one reason why we have succeeded in maintaining a high standard of work at this university, where the results, as far as the non-Europeans are concerned, are far better than those obtained in either the separate institution of Fort Hare or in the mixed universities of Cape Town and the Witwatersrand, for the simple reason that the students here receive far more individual attention. This arrangement, however, obviously increases the cost of instruction at the University of Natal.—Yours faithfully, E. G. MALHERBE,

University of Natal

Cold War in the Lebanon

SIR—With reference to your article of February 9th, I would like to call your attention to the reaction of the Lebanon to two measures taken by Syria since 1952.

For the last ten years the economic policy of the Lebanese government has consisted in seeking freedom of exchange for goods and money.

The Syrian decree number 151 of March 3, 1952, forbade any foreigner (including Lebanese) to have in Syria any economic or commercial activity except with a Syrian partner holding 51 per cent of the shares. This was a severe blow to many Lebanese who had in some cases resided in Syria since the French Mandate. The Lebanese government did not take a similar step, considering Syrians to have the same rights as Lebanese, as secured by the Lebanese constitution and law, without having the same obligations.

A Lebanese citizen has not the right to own land in Syria, whereas a Syrian may freely do so in the Lebanon.—Yours faithfully, SALIM NAFFAH

Beirut, Lebanon

New Corporations for Old Colonies

SIR—Your note about the Colonial Development Corporation in the issue of February 9th says "The CDC which wants to extend its empire. . . ." The point at issue in the recent House of Lords' debates was whether CDC should be excluded or not from a territory which is specified in its founding Act. While recognising that the retention of empires is unfashionable these days, there is, I think you will agree, a difference.—Yours faithfully,

C. W. DUMPLETON
Colonial Development Corporation

Books & Publications

From War to Peace in the Far East

BRITISH MILITARY ADMINISTRATION IN THE FAR EAST 1943-46: *History of the Second World War, United Kingdom Military Series.*
By F. S. V. Donnison.
Her Majesty's Stationery Office. 501 pages 40s.

THE military administration of occupied enemy territory or of territory recovered from the enemy in which civil administration has broken down is an important aspect of the task imposed by war, and its immediate aftermath, on a nation's military organisation. It involves the extension of the military authorities' responsibility into a sphere from which in time of peace, at least in a constitutional democratic state, they are carefully excluded. It also requires a participation of military commanders in political matters such as they are not otherwise, even in time of war, called upon to undertake. Military administration may in fact be carried on largely by civilians, but they are subject to the chain of military command, which is subordinate only to the supreme executive authority of the government itself.

The British military administration in the Far East during and after the Pacific war, which is the subject of Mr Donnison's volume of the History of the Second World War, was under the authority of Admiral Mountbatten as Supreme Allied Commander in South-east Asia, and he in turn received instructions directly from the Chiefs of Staff. It superseded the former civil authorities for varying periods during the recovery from the Japanese of the British territories of Burma, Malaya and North Borneo—Hongkong was taken back by the British Pacific Fleet—and was also extended to French Indo-China and the Netherlands East Indies owing to the initial lack of adequate French and Dutch forces on the spot for re-occupation purposes. The tasks undertaken in French and Dutch territories, for which no British administrative experience was available, gave rise to problems of peculiar difficulty with which some of the most interesting pages of Mr Donnison's book are concerned. On the other hand, there was no British military administration of enemy territory in the Far East, as Japan came entirely under the authority of General MacArthur, and Siam was not subjected to any Allied occupation.

In the British and Dutch territories overrun by the Japanese the European officials were either evacuated to India and Australia or interned by the Japanese; in Indo-China they continued to carry on the administration until March, 1945, when they were arrested by the Japanese for fear of their defection in the event of an American landing. In place of the former European administrators the Japanese put either officials of their own or natives of each country who collaborated with them. The nationalist groups led by Aung San in Burma and by Sukarno in Indonesia collaborated with the invaders in the hope of gaining independence for their countries with Japanese aid; Aung San went over to the Allies when Japan's defeat became certain, but Sukarno was still collaborating at the time of Japan's surrender. There were also Communist-led resistance groups that were both anti-Japanese and anti-colonial, notably the Malayan People's Anti-Japanese Army in Malaya and the Viet Minh in Indo-China. When the Allied forces, therefore, drove out the Japanese or took over from them after their surrender, they were faced with problems of two different kinds. There were first of all those that were purely administrative, arising from the interruptions of organised government, the devastations of war (most serious in Burma), the far-reaching economic dislocations and the need both to repatriate the Japanese troops and to succour Allied prisoners of war and internees. The author gives an account of the measures improvised, often under the most adverse conditions, in each area to cope with these problems and gives an idea of the variety and complexity of the tasks that had to be performed by hard-worked officers scattered over the whole vast region included in the range of South-east Asia Command. But for the general reader and the historian a greater interest attaches to the actions taken to deal with problems of the second kind—the political situations uncovered by the retreat and surrender of the Japanese.

On a broad survey of the record, British policy in relation to nationalist movements followed two distinct courses for which no common principle can be found. In Burma and Malaya and also in Indo-China south of latitude 16°N —northern Indo-China having been assigned to Chinese military occupation —the British policy in 1945 was to insist on restoration of the former sovereign authority. The pretensions of Aung San to represent a provisional government of Burma were firmly rejected; the Malayan Communist guerillas were prevented from taking over power anywhere; and the British combined with the French to drive the Viet Minh out of Saigon. In Java, on the other hand, the British failed to carry out pledges previously given to the

South Africa's *Volk*

THE LAST TREK: *A Study of the Boer People and the Afrikaner Nation.*
By Sheila Patterson.
Routledge and Kegan Paul. 343 pages. 28s.

IT is a relief to turn from the spate of books on the "Native Problem" in South Africa to a study of the "White Problem." This is not to imply that the Afrikaner peoples, with whom this book is concerned, are specially to be singled out of the white group. Yet some understanding of their attitudes, beliefs and aspirations is particularly important: South Africa is today governed by a uniracial Cabinet with a compliant majority in both Houses of Parliament. However anachronistic its policies and pronouncements appear to the outsider, they do affect the freedom of movement and expression and the right to choose jobs of millions of non-white peoples, and even whites, and they do conflict sharply with the revolution in race relations now taking place in the rest of Africa and in Asia.

The unending struggle of the Afrikaner peoples to maintain their cultural identity, preserve their racial purity, adjust themselves to the conditions of a modern exchange economy, redress a "Century of Wrong" through political action, and their ultimate triumph at the polls in 1948, has all the ingredients of a great epic. Yet the author's step-by-step account of the emergence of a distinct nation, the systematic development of an Afrikaan language as an instrument of group survival and nation building, the role of the Dutch Reformed churches, the schools and cultural organisations in ensuring the unity of the *Volk*, is drab and plodding. The story lumbers on under the weight of facts, diligently distilled from a massively growing literature, from which the author is loth to part. In one chapter alone the reader is introduced to a host of topics and ideas: party politics in the Union, the philosophy of apartheid, franchise and constitutional issues, the character of the police force, the judicial system, Afrikaner secret societies, the Torch Commando and so on.

By far the most important picture to emerge is the slow corrosion of Afrikaner ideals and loyalties under the impact of urban life. Still more important—and this deserved a much more careful and understanding analysis—is the progressive destruction, as a result of the economic revolution taking place in South Africa, of the social and political order that the Nationalist Party zealously seeks to construct.

Early Backwoodsmen

THE RISE OF THE PELHAMS.
By John B. Owen.
Methuen. 367 pages. 30s.

"A BIRD might build her nest in the Speaker's chair, or in his peruke. There won't be a debate that can disturb her." So wrote Henry Fox of the later years of Henry Pelham's administration. Mr Owen is concerned with the agitations of the 1740s when the Pelhams struggled to achieve political supremacy. They had to win back the factions which Walpole's arrogance had alienated, to attract the independent vote in the Commons, and to persuade the Crown to give them confidence and support. By 1747 Mr Owen sees Henry Pelham as England's second Prime Minister, secure both in the Closet and in the Commons. He had taken five years to recreate the system of Sir Robert Walpole.

Mr Owen's book, originally a research thesis, is the product of meticulous scholarship, and "based above all on the personal biographies of the 686 individuals who sat in the Commons." His primary aim has been "to take into consideration the political behaviour of these independent backbenchers, who constituted a majority of the Lower House." Following Sir Lewis Namier, he divides the Commons into the administration, the professional politicians and the country gentlemen. Ability and oratory counted for much, since large numbers of backbenchers were uninterested in office and rewards. But it is interesting that Mr Owen, despite his primary aim, has to concern himself mainly with the politicians. The Tory backwoodsmen, "hewers of wood and drawers of water" as Bolingbroke called them, were never interested in government; and when Pelham came to conciliate them, he found their main concern to be with a proper distribution of the commissions of peace in the countryside.

Mr Owen's admirable analysis of political groups is not matched by an ability to present personality. It is true that Henry Pelham himself, essentially a man of business, had an elusive personality, but Mr Owen even manages to devitalise Carteret who had bravura, a taste for burgundy and was, according to Shelburne, "the best Greek scholar of the age, overflowing with wit." Moreover Mr Owen slides lightly over Henry Pelham's financial acumen and nursing of the City interest. He mentions that in 1747 the Pelham administration won "both seats for Middlesex and even two at London"; but he fails to explain how in 1746 Pelham had both repealed the City Elections Act and placated the small lenders by agreeing to an open subscription for a government loan. Sometimes Mr Owen appears to be setting up his own windmills, for instance, when he tilts against "those historians who still regard George II as a constitutional figurehead in the hands of designing ministers." He tells us that Professor Feiling accepted the existence of the Tories under the early Hanoverians "without inquiring too closely into their identity or their motives." But Professor Feiling's apt quotation of the squire who would

> Vote as his father did when there's a call
> But had much rather never vote at all

puts Mr Owen's own case very neatly. Indeed there is in Professor Feiling's work a wit and economy lacking in this rather laboured book which, useful to the specialist, is unlikely to appeal to a wider circle of readers.

Understanding America

"If, in any country, we are to understand the people, we have to understand the land first. And what they have done with the land."
THE TIMES 12th November, 1956

To give such an understanding is, precisely, the aim of U.S.A.—ITS GEOGRAPHY AND GROWTH. This book tells how Americans have used—and sometimes misused—their immense natural resources; how they have moulded the land to their will, and how the land has moulded them. It is the story of the partnership between a people and a continent. Containing over 160 photographs, including 7 pages in full colour, the first edition was described by one reviewer as 'a lavish production at a bargain price'. *2nd. Ed. now ready.*

Spending on Research

SCIENCE AND ENGINEERING IN AMERICAN INDUSTRY: *Final Report on a 1953-1954 Survey.*
US Department of Labor, Bureau of Labor Statistics.
Washington: *National Science Foundation.* 119 pages. 70 cents.

UNTIL very recently not a single country in the world had a reliable estimate of its own expenditure on scientific research. But in the last two or three years there has been an increasing demand in many countries for this information, which, it has been thought, would show if enough research is being done. The United States is ahead of other countries both in producing the results of its surveys and in making these more comprehensive than any other that is in progress. This volume covers the main part of the American survey: industry, whose research and development cost $3,700 million out of a total research expenditure in the United States, in 1953, of some $5,400 million. Not all this expenditure, admittedly, came out of industry's own pockets; as in Britain, a large part of the total was paid for by the government through defence contracts. But the proportions were different: in the United States, defence contracts accounted for one-third of the industrial total, whereas the preliminary results of a similar survey in Britain have shown the comparable figure to be between a half and two-thirds.

American research and development, like the British, is concentrated largely in the "science-based industries" (for instance, chemicals) and in the two industries, electrical equipment and aircraft, that receive most of the government contracts. But the distorting effect of government contracts is not so great in the United States, where the aircraft industry accounts for one-fifth of industrial research and development, compared with half in Britain. Expressed as a percentage of sales, research and development expenditure averaged 1.7 per cent across industry, ranging from 8.9 per cent in the aircraft industry to 0.3 per cent in the primary metal industry and 0.2 per cent in food and kindred products.

The survey mainly related to 1953, but enough figures were obtained for 1954 to suggest that expenditure then was 12 per cent greater. There is no indication of how much of this increase was due to an increase in research or development and how much to changes in prices or in accounting practices. Some American reviewers have been surprised by the large number of very small firms found to be doing research and development—of the firms doing this more than half employed fewer than a hundred workers. But of course small firms are very numerous, though their output is only a small part of the total, and their research an even smaller part—4 per cent.

Many of the tables in this report are repetitive, deriving various sorts of percentage distribution from the original figures. Nevertheless, there is enough meat in the thirty-five tables for any reader to digest. But what of the accuracy of the figures? The only ground for any doubt stems from a problem that has caused the British survey a great deal of difficulty—the variability of accounting practice from firm to firm. What each firm in this country knows of its research expenditure depends partly on how fond it is of keeping figures, but partly on such organisational details as whether its research department has its own electricity meter. As the research department gets bigger it develops its own workshops, employs its own typists, and finally gets its own premises, instead of sharing all these with other departments, and so more and more items appear in the accounts. If this difficulty occurs in

Famous American firm sees 61 sites—

Northern Ireland

selected for new plant

GROUND CLEARANCE FOR CHEMSTRAND'S £3½ MILLION PLANT IS AHEAD OF SCHEDULE

"Northern Ireland has what we need"
says Mr. ARVON L. DAVIES, Managing Director of Chemstrand Ltd.

CHEMSTRAND LTD., U.K. subsidiary of the Chemstrand Corporation of U.S.A., recently acquired a 70 acre site at Coleraine, County Londonderry. (The Chemstrand Corporation is jointly owned by the Monsanto Chemical Company and the American Viscose Corporation.)

Site clearance is ahead of schedule, and in 1959 a labour force of 400, mostly men, will work seven days each week in three shifts to produce 5,000,000 lb. of "Acrilan" man-made fibre. Production will be doubled in 1960.

"Northern Ireland has what we need", says Mr. Arvon L. Davies, Managing Director of Chemstrand Ltd. "We looked at 61 sites in the U.K. Our decision to go to Coleraine was based upon a detailed assessment of costs per pound of fibre. When the figures for alternative sites were close together, factors such as labour availability, services, housing, schools and recreational facilities came into play.

We found the Ministry of Commerce more than helpful, prompt and easy to reach. We had good reports of the workers, that they were industrious and able to learn quickly. We are proud to be in Coleraine and to make there a primary product which will diversify the economy of Northern Ireland"

Announcements of new developments in Northern Ireland have been made in recent months by

DU PONT COMPANY (UNITED KINGDOM) LTD.
BRITISH OXYGEN CO. LTD. · FLEXIBOX LTD.
BESSBROOK PRODUCTS LTD. · SUMMERSON HOLDINGS LTD.
F. M. ASPIN (TOOLS) LTD. · BALLANTYNE SPORTSWEAR CO. LTD.

They will join over 100 new firms which have set up there since the war. Twelve new Government factories are planned or building now to rent (for as little as 9*d.* per sq. ft.). Also available are factories on repayment and capital grants for plant, machinery and new buildings.

the things they say!

Did you see in the press the other day how short of engineering technologists we are becoming?

Every year, it seems, there are more than 50,000 new technologists in Russia, and more than 20,000 in America. But the figure for Britain is only 3,000!

Yes, it's a big problem, all right.

What I want to know is: Why doesn't industry do something about it? After all, it's industrial firms that need the technologists — they should help the Universities to produce them.

Many do. For instance, I.C.I. gives over £200,000 to the Universities every year for a variety of purposes, including research fellowships and grants to their scientific departments for the materials and equipment needed in research.

That's quite something — I.C.I. seems to be alive to its own vital interests.

Yes, and that's not the whole story, for I.C.I. recently started, at several Universities, a new scheme of Transfer Scholarships. These will enable young men who haven't studied Science at school to prepare themselves to take it at the University. This scheme will do something to help us get the *extra* technologists that Britain so badly needs.

ICI

the United States, the report ignores it.

Most of this study of American research and development expenditure, and of the employment of scientists and engineers, consisted of a comprehensive survey of the whole of industry; but there was in addition an intensive study of these subjects, and of the policy decisions behind them, in 200 of the largest firms, and the small part of the report dealing with this is in many ways the most interesting. Apparently nearly half of these firms decided their research expenditure with the aid of some formula—in extreme cases, by a complicated but rather arbitrary index of the expected return on the expenditure. Some of these formulæ remind one very strongly of a measure of efficiency used by the RAF at the beginning of the war, which kept the planes on the ground when they were needed in the air.

Discussing their needs for basic research, "Many officials [of American companies] commented that the lack of basic data is due in part to the reduced flow of research findings from European countries and in part to a shift from basic to applied research on the part of the universities." There is food for thought here.

Bankers in Concert

THE AMERICAN BANKERS ASSOCIATION: *Its Past and Present.*
By Wilbert M. Schneider.
Public Affairs Press, Washington, DC. 281 pages. $5.00.

IN a country where trade organisations play as important a part as they do in the United States, it is to be expected that the history of their operations should be written with the high seriousness that attaches to big business. The value of this book lies in the fact that it manages to temper that high seriousness with a modicum of detached judgment. This is not the critical analysis that one might hope for, and there are moments when the golden breath of the American Bankers Association breathes heavily down its author's neck; but in the main this is a straightforward account of what a powerful trade organisation does, how it does it and what its public accomplishments are, or are not.

The association was founded in 1875, after the war between the states and the panic of 1873. Working through an educational branch for the better training of bank staffs, giving advice on legislation and on labour problems, developing skilled techniques for improving relations with the public, the organisation now has 17,000 members and represents 98 per cent of the country's banks. It meets regularly in vast conventions, which do their best with a mixture of speeches, working sessions and entertainment, to "engage the mind for a season in restful and indeed educational objects, to mitigate and counteract the despotism of money," a somewhat romantic aim dating from the founders.

The association's value to the banking world that sustains and uses it is quite clear, but whether its value is the same for small unit banks as for large institutions is a question that the author sidesteps. Perhaps because the organisation is very much alive, an attempt to dissect its internal controversies, or to analyse those conflicts which split bankers apart, would be as interesting as it could be perilous. The reader would like to know whether the association is in fact *as monolithic as it is made to sound*; who runs it; where the seat of power is and how it is handed on; which type of banking interests are paramount in its councils; how association opinion is arrived at and how association influence is exerted on Congress and on state governments.

In general the author, who is professor of economics at the Emmanuel Missionary College, does his honest best to resolve the inevitable conflict between academic theory and business practice that besets such a volume. After discussing various legislative attempts to mould banking nearer to the popular desire, he concludes sadly that the association has not made much progress in persuading its members "to regard their institutions as businesses imbued with a public interest." They have "seldom initiated constructive legislation in advance of the need arising out of a critical economic situation." On the other hand, and this is a fixed branch of the cleft stick in which such writers often find themselves, he concludes that "the inflexibility with which the association has stood for the retention of private enterprise is most commendable." If he does not enlarge on the basic dilemma posed in those statements, he at least sets it down for the thinking reader.

Books Received

DOCUMENTS ON THE SUEZ CRISIS: *26 July to 6 November* 1956.
Selected and introduced by D. C. Watt. *Royal Institute of International Affairs.* 88 pages. 5s.

GOVERNMENT BUDGETING.
By Jesse Burkhead. New York: *John Wiley.* London: *Chapman and Hall.* 483 pages. 60s.
A study in applied economics—exhaustive, but with main emphasis laid on budgeting for the United States' national government.

HOW TO BE HAPPY THOUGH HUMAN.
By W. Beran Wolfe. *Penguin Books.* 367 pages. 4s.

THE WHEAT INDUSTRY IN AUSTRALIA.
By A. R. Callaghan and A. J. Millington. *Angus and Robertson.* 486 pages. 63s.
A comprehensive study of the Australian wheat industry, covering its history, marketing, and the scientific, technical and economic problems of cultivation.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Right Time for Civil Rights?

Washington, D.C.

IN Washington 1957 is supposed to be a favourable year for legislation to protect the civil rights of Negroes. For those familiar with the ways of Congress and the infinite ingenuity of Southerners in manipulating its rules, scepticism is still in order, but there have already been concurrent hearings in sub-committees of both the Senate and the House of Representatives. This means that at least a healthily early start has been made on the proposals sponsored by the Attorney-General, which are the same as those presented last year for the election record—far too late for anything effective to be done about them.

The election showed a substantial shift of Negro votes into the Republican camp; this reached dramatic proportions in some southern cities, such as Richmond, Virginia, and in many of the big northern cities the switch, though slighter, was also marked. The Republicans have a strong interest in consolidating the Negro vote and the northern Democrats in recapturing it, while the Negroes themselves are more than ever determined to hold the politicians to account after the recent outbreaks of violence in the South.

There is nothing new about the Administration's proposals. It has simply picked four items which it is prepared to endorse from the civil rights canon which has been introduced regularly every year for at least a decade by northern Democrats and a few eastern Republicans. Two of the proposals are intended to improve the machinery for enforcing the law. They would set up a civil rights division in the Department of Justice under an Assistant Attorney General, and a presidential commission on civil rights, consisting of six men drawn from both political parties and armed with power to subpœna persons and papers. The Assistant Attorney General would be able to concentrate on matching his wits and those of the Federal Bureau of Investigation against the legal evasions of the southern states. The commission would investigate the innumerable allegations of Negroes being prevented from claiming their rights by economic and other pressures; it would then be able to back any request for further legislation with an accumulation of precise factual evidence.

The other two items on the Attorney General's list are somewhat more substantial. One would permit civil action in the courts, as well as the criminal action which is allowed today, against anyone who tried to prevent a qualified person from exercising his right to vote. The other would empower the Attorney General to institute a civil suit to protect any constitutional right instead of having to wait for the injured party to take action himself. The emphasis on the franchise is not accidental. Many of the Negroes' friends, and some of the Negroes themselves, feel that it was mistaken strategy to start the process of breaking down old southern customs by pressing for the immediate abolition of racial segregation in the schools; it is argued that in many places in the deep South this could only be achieved by the use of force by the federal government to an extent which the country would never tolerate. But if the southern Negroes were assured of their voting rights, they would become a substantial influence in southern elections. Thus have most minorities been assimilated into American life in the past and it is therefore possible that federal intervention in this one field might enable the other types of discrimination to be liquidated by local pressures.

Moreover, there is a further argument for giving the franchise priority over the abolition of school segregation, now that the illegality of this has been established in principle. Many parents who hold moderate views on the race question are bothered at the educational harm that may be done if Negro children of radically different standards are abruptly forced into the white schools. On the other hand, even many convinced segregationists find their consciences pricked at the denial to Negro citizens of the basic American right to vote. The safeguarding of the ballot box is likely to meet less dedicated resistance than the mixing of schools.

A special difficulty arises because in the United States the voting laws, even those affecting federal elections, are separately enacted by the states. The federal Constitution, however, forbids discrimination on certain grounds, including those of race, and guarantees the "equal protection" of the laws, state as well as federal. Therefore, while a state is entitled, as many of the southern states do, to insist that a potential voter must be literate and versed in the Constitution, it is illegal for Negroes to be put through a difficult examination which is not also given to whites. The machinery of registration for voting is usually highly decentralised, and it is clear from the Attorney General's testimony that Negroes are frequently being tricked out of their vote by the local registrar, sometimes by such simple devices as shutting up shop when a Negro approaches. These methods are particularly prevalent in places with Negro majorities where the whites contemplate the awful possibility of Negroes being elected to the powerful local positions of sheriff and judge. In Mississippi, where the Negroes form 46 per cent of the population, the numbers actually voting for Governor in the last elections were, derisorily, 417,000 whites and 7,000 Negroes.

While the Department of Justice already has a remedy against such practices under the criminal law, it is highly improbable that a southern jury could be found to convict a local registrar or a local banker who had exerted economic pressure on Negroes to keep them away from the polls. In any case, since the election would be over by the time the case came to trial, the damage would be irreparable. The new legislation would allow the Attorney General to obtain an immediate injunction against the objectionable practices from a federal court without waiting for the exhaustion of all local administrative remedies, which is another delaying trick in the South.

Since the southern Senators will obviously try to talk the Civil Rights Bill to death, the time factor is all important. The original plan was for the Bill to be rushed through the House first, so as to lessen the danger of different versions being produced by the two chambers. If this happened there would have to be a conference committee to produce a final Bill which in its turn would have to be voted on in each House; this would offer an opportunity for yet another filibuster in the Senate in the frantic last days of the session when it could hardly fail to succeed. Knowing this the Southerners have spun out the hearings in the House sub-committee; planned to last four days they have lasted a month. The House Bill will now go to the Rules Committee, which is headed by a formidable Southerner who will delay as long as possible before allotting it time on the floor.

Meanwhile the Senate hearings are due to end next Tuesday. But that Bill must then go to the full Judiciary Committee, over which the segregationist Senator Eastland of Mississippi wields all the apparent and intangible powers of a chairman. If the Bill is not reported out of the committee by April 21st the Senate will adjourn for ten days over Easter; the general feeling is that any attempt to beat a filibuster will be doomed if the debate is started later than May 1st. Indeed, even now it is probably too late for 1957 to become a civil rights year unless the President is prepared to use unrelenting pressure to prove that he is in earnest.

Sit-down in the Senate

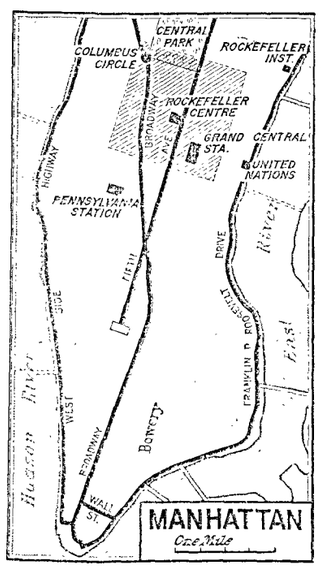
WHILE Mr Eisenhower was busy this week repairing, with M. Mollet, the friendship with France which was one of the casualties of the attack on Egypt and Mr Dulles was busier still negotiating with Israel, the Senate marked time. Many Senators seem determined not to commit themselves to the Eisenhower doctrine for the Middle East until they see how successful the Administration is in avoiding the resort to sanctions which is so unpopular with Congress and most of the press. The State Department insists that there has been no retreat from the position the President took in his speech last week: that if Israel refuses to withdraw, the United Nations has no choice but to apply pressure. But the search for a "middle way" at the United Nations is being stimulated by what is, in effect, a sit-down strike in the Senate.

Moreover, before the final vote is taken, which will not be until next week at the earliest, the Administration will have to do all it can to keep most of the Republicans in line if it is to repel the attack of Senator Russell, the spokesman of the conservative southern Democrats, on the provisions concerning economic aid. What hopes there may have been that Mr Truman would use his influence with the liberal Democrats, who criticise the resolution for quite different reasons, have also disappeared. The ex-President now calls Mr Eisenhower's proposals "too little and too late" and, by turning down the suggestion of Mr Dulles that he should go to Greece and Turkey next month for the tenth anniversary of the Truman Doctrine, he has rejected what may have been a small olive branch—the first—from President Eisenhower.

Goodwill in the Mediterranean is consequently being left to Mr Nixon, a more safely Republican emissary and one whose part the President is delighted to expand. The Vice President flew off this week on his sixth good will tour, which was originally to take him to Ghana, but has since been expanded to include many African countries affected by the Eisenhower Doctrine. An escort of thirty-five television, radio and newspaper reporters will make certain that good will for America and good publicity for Mr Nixon go hand in hand.

Capital Appointments

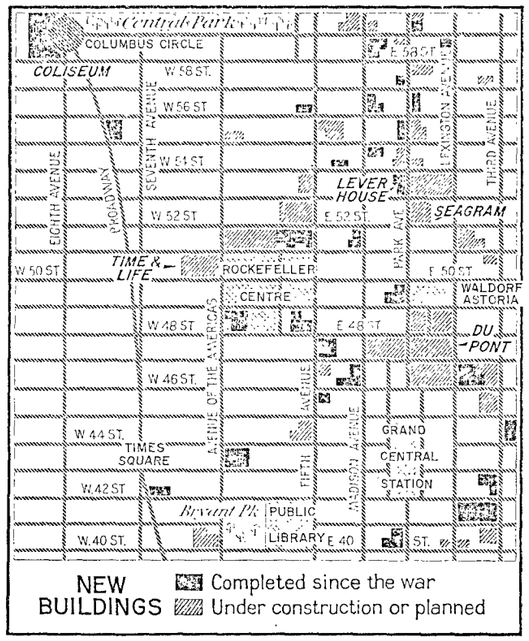
AS Mr Whitney took charge of the American Embassy in London, the President chose Ambassadors for the vacancies in Europe's two other leading capitals. Mr Amory Houghton, the head of a famous glass company, who goes to Paris, has known Europe ever since his father was American Ambassador to Germany and then to Britain in the nineteen-twenties; he served in London during the war on a government economic mission. Like Mr David Bruce, who has been nominated for Bonn, Mr Houghton is a friend of President Eisenhower's; unlike Mr Bruce, he is a Republican. Mr Bruce was President Truman's Ambassador to France and later represented Mr Eisenhower at the European Coal and Steel Community. But now Republicans in the Senate are looking jealously at his contribution of $1,000 to democratic election funds last year; with some justification they also want to know, before they confirm his nomination, whether he shares Mr Stevenson's disapproval of the Administration's foreign policy. A change is also coming at the Moscow Embassy: Mr Bohlen believes that four years there is long enough for anyone but, as a career diplomat, however able, he was not financially eligible for a transfer to London or Paris. He is expected to make an exchange with Mr Llewellyn Thompson, another professional who is now in Vienna.



In most European capitals new American Ambassadors either have been, or are about to be, appointed, but in Washington President Eisenhower's second term has so far brought remarkably few Cabinet changes. While there has just been a substantial turnover of Assistant Secretaries in many departments—Mr Carl McCardle, for example, will no longer be responsible for Mr Dulles's public relations—only one member of the Cabinet has resigned, Dr Arthur Flemming, the head of the Office of Defence Mobilisation.

His departure at this time was planned before Congress began to criticise the government's handling of the European oil emergency, for which he was responsible. He has also been concerned with demands for increased restrictions on imports of such things as watches, which are said to be damaging industries essential to the security of the United States. His successor, Mr Gordon Gray, a "Democrat for Eisenhower," is not likely to be sympathetic to such demands, for his Gray Report, produced for Mr Truman in 1950, is a famous statement of liberal principles for international economic transactions. Not until summer comes and Congress has finished with the Budget is Mr Wilson expected to leave the Department of Defence, probably at about the same time as Admiral Radford retires from the Joint Chiefs of Staff.

New Heart for Manhattan



FROM A CORRESPONDENT IN NEW YORK

ACCORDING to the economic theories prevailing among estate agents and builders, it is profitable to tear down a twenty-story building twenty years old and replace it if the new building will provide sufficient rentable air space for each square foot of ground space. The latest example is the project of certain duPont interests for acquiring five and a half acres of expensive mid-town land between Park and Lexington Avenues to the north of the Grand Central Station, for tearing down two good hotels, a luxury block of flats, assorted office buildings, and a famous exhibition hall, and for replacing them with giant office structures. A central building thirty stories high, flanked by two lower ones on the north and on the south, the whole surrounded by gardens, would cost an estimated $100 million—a figure which suggests that money is perhaps not so tight as the Federal Reserve Board might like to make it. Work cannot start until the New York Central and New Haven railways settle a fifty-year quarrel over which can give a valid lease-hold, but current practice indicates that the present space is doomed and that the tenants should be looking elsewhere.

Shaded area in detail on other map.

The city has gone through these fevers before, and will go through them again. In the nineteen thirties and forties, subsidised housing developments ringed Manhattan. Now it is the expensive heart of New York which is being torn out and rebuilt; land in the area was recently sold at $425 a square foot—which helps to explain why buildings and builders' dream soar so high. Architecturally, this boom picks up where the last great office venture, Rockefeller Centre, left off twenty years ago. Its concept of a group of complementary buildings in a landscaped setting has been adopted for the duPont vision on Park Avenue and for the Chase Manhattan building in the Wall Street district, which is to go up where the Mutual Life Insurance building once stood. Added to this are complete air conditioning

inside, and outside, the glass and metal sheathing first made fashionable by the United Nations headquarters.

In the last ten years plans for 109 of these giant office structures have been filed with the city, adding more than a third to the hundred million square feet of office space available in Manhattan at the end of the war, and providing for some 300,000 more office workers. Structures already announced, but still on the drawing boards, may add another six million square feet before 1960.

These new behemoths appear uptown and down, on Fifth and Madison Avenues, on Park Avenue which is rapidly changing from a street of luxury flats to one of expensive offices, and, most startlingly, on Third, whose once darkened lower reaches are called the Bowery. With its elevated railway gone, Third Avenue has become the best lighted street in town, and it is lined with real estate speculations and construction crews. Before the war Sixth Avenue, now renamed the Avenue of the Americas, lost its elevated railway and was expected to undergo a similar blooming, but the times were wrong. Now that the Rockefeller interests have announced their intention of crossing to that avenue's west side to put up a $70 million building mainly for Time Inc. and its associated magazines, this thoroughfare may also be transformed.

Not all the new activity will result in office buildings. The dreams and drawing boards of planners have included

CONFIDENTIAL

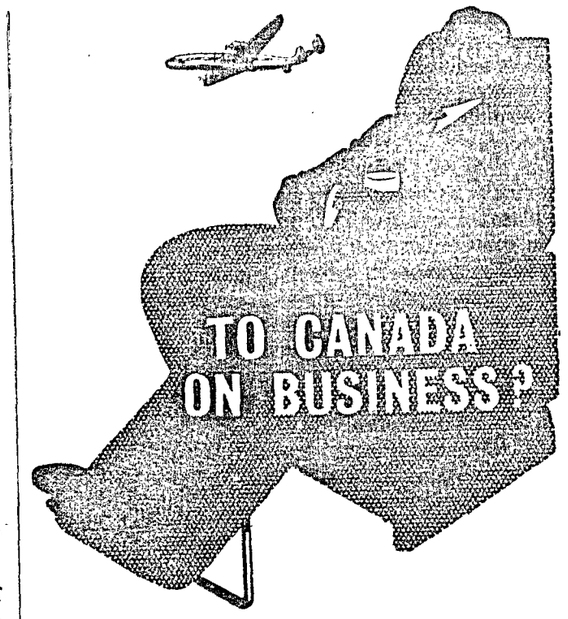
PLANT LOCATION FACTS

on transportation costs

New York State has the most complete network of rail, water, highway and air routes in the world.

At your request we can determine the cost of assembling a given list of raw materials at any one or several locations within New York State. We will prepare cost and schedule data for the distribution of finished products from such locations to principal points of destination throughout the United States. The analysis can include movements by rail, water, highway or air or a combination of these forms of transportation.

Transportation won't be your only problem in deciding on a new plant location. You will want complete facts on labour, markets, water, available sites or buildings, power, fuel and raw materials. And you will want information on these as they apply to the successful operation of a specific plant.



A tailor-made report

Any or all of the factors important to your analysis will be covered in a confidential report to you—tailored to your needs. It will be prepared by a professional and experienced staff to cover either New York State locations of your choice, or, if you wish, sites which we will select on the basis of your needs.

Our booklet "Industrial Location Services", explains what we can do for you. To get your free copy, write me at the New York State Department of Commerce, Room 695, 112 State Street, Albany 7, New York.

TRANS-CANADA AIR LINES

27 Pall Mall, London, S.W.1. WHitehall 0851
And at Glasgow, Manchester and Birmingham

Serving Europe, all Canada, the U.S.A., Bermuda, Nassau and the Caribbean

DEVELOPING OUR RESOURCES

No job for pit ponies

Underground ore cars that are among the world's largest are operated by Inco—The International Nickel Company of Canada—at their mines in the Sudbury district of Ontario. Trains of these cars, each of which carries 260 cubic feet of ore, are hauled by powerful electric locomotives weighing as much as 20 tons.

A rail system operates successfully in these mines, the length of whose underground development is greater than the combined mileage of the London, Paris, New York and Toronto underground subways. Besides hauling ore to the underground crushers, these railways transport timber, explosives, drilling equipment and new track to the working faces. Altogether, tens of thousands of tons may be handled during a single shift.

This efficient underground transport system is only one of the many resources which are helping the Inco-Mond organization to meet industry's continuing demand for great quantities of nickel.

ideas for rebuilding both of the great central railway stations and for remaking a dilapidated section on the upper west side beyond Central Park into a pleasant residential area, for providing scientists at the Rockefeller Institute with nearby housing they can afford and for creating a whole set of new theatres in the Lincoln Square amusement complex just north of Columbus Circle. These, like the new Coliseum, may be partly supported, financially, by rentals from office space rising high in the air above them. Some of these more ambitious schemes are actually under way, some are admitted to be impractical, some are awaiting decisions on other related projects.

The present megalomanic building surge replaces entire blocks and, in the biggest projects, groups of blocks. The Chase Manhattan Bank was given permission to close a street while the duPont interests will open one; the newest schemes for the Lincoln Square amusement centre, which is still in the planning stage, show three streets blocked out. The House of Seagram's thirty-eight storey tower will rise out of a garden, not primarily for aesthetic reasons, but because the zoning laws insist that structures of such height be set back. These zoning laws, added to modern architectural fashions, have produced too many buildings with horizontal stripes of glass and metal, which give the city the look of a giant's barracks. A move is now under way to allow more freedom of design if architects have at least 200,000 square feet to work with.

What started this fever of building is a question with many answers. The effects of rent control began to be felt immediately after the war, when other price controls were dropped and costs went up, to the financial grief of the owners of luxury apartment buildings. Maintenance dropped, deterioration set in, buildings were sold and their space sub-divided, and values shrank, until the point was reached at which it was cheaper to tear down solid old blocks of flats and replace them with office buildings than to wait for the repeal of the state's rent control laws. These apply only lightly to offices, not at all to new building.

Meanwhile, other factors, including the pressures of an expanding economy, have also been at work. Comprehensive air-conditioning has made almost every prewar building in the city obsolete; the cost of installing it in existing buildings lends powerful support to those who argue that it is cheaper to tear down and build anew. A head office in New York gives prestige to oil companies in Tulsa, and uranium companies in Denver; they can justify it further on the ground that it will be within immediate reach of the best legal, administrative and accounting brains in the country. Secretaries and typists feel the same way. Like boards of directors, they seek the best, and that, to most of them, means a new air-cooled office in the Grand Central area. In the present sellers' market for clerical help, they have the last word.

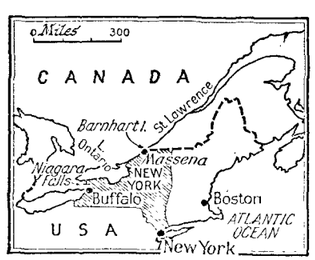
Labour's White Collar

THE trade union leaders who met at Miami last month spent so much time making their federation shipshape for the storm of the Senate investigation, which broke this week, that little time was left to tackle the internal disputes over jurisdiction which employers and innocent bystanders mistakenly hoped would disappear when the American Federation of Labour merged with the Congress of Industrial Organisations in 1955. Mr Meany, the president of the federation, has himself had to undertake to solve two of the knottiest quarrels between the craft unions of the building trades and the industrial unions which take in all types of workers. The building trades angrily refused to submit to arbitration their "rights" over everything except the purest maintenance work in plants and the teamsters are doing all they can to widen the ancient split between craft and industrial unions.

The AFL-CIO has so far borne out its awkward name; in most industries, rival unions exist side by side. Only the barbers and government workers, all small unions, have amalgamated, and rival AFL and CIO councils persist in all the big industrial states. Rival jurisdictions remain the biggest stumbling block to the drive to win new members for trade unions which a joint organisation was expected to promote. The AFL-CIO has over 15 million members, but there are another 26 million workers who might be persuaded to join a trade union. Half of these are white-collar workers; many of the rest are in the South, where last year's organising drives were an ignominious failure.

This rout was due primarily to the hostility aroused among southern workers by the trade unions' support of Negro rights, and the federation has decided that an educational campaign is needed to prepare the ground before another attempt is made. But jurisdictional disputes played their part: two chemical unions, for example, could not agree which was to pluck the biggest plum, consisting of 73 duPont plants. This year the federation, prodded by the industrial unions, is planning a drive to organise white-collar workers; they are increasing more rapidly than production workers and often their wages are lower. Some enthusiasts believe this is the moment to convince them that mechanisation in the office is breaking down all class distinctions. Efforts have been made to secure in advance the co-operation of the twenty or more unions involved. But it remains to be seen whether the automobile workers and steelworkers, for example, will hand over to craft unions the clerks in their own plants whom they have already begun to organise.

Metal Albatross



SENATORS from mining states are already demonstrating once again how little weight is carried by the public demand for general reductions in government spending when it is balanced against the demand of a group of constituents for specific financial aid. The Senate is now well on the way to repeating its success of last summer when it forced the House of Representatives, against its better judgment, to provide $21 million for subsidies to producers of tungsten, asbestos, fluorspar and columbium-tantalum. That sum is already exhausted; another $70 million, now being pushed through the congressional machinery in two parts, is needed to keep the programme going until it lapses at the end of 1958. The subsidy scheme, under which the government buys up to certain amounts of the metals, was originally enacted last year, with the agreement of the Administration, in order to help American

producers of these metals readjust to normal demands now that their output is no longer wanted for the strategic reserve. In the House it was contended that nearly all the money had gone to a few big companies which did not need it, instead of to the small producers for whom it was intended, and that more effective—and less costly—assistance could be provided by tariffs on the imports which make up a large part of the country's supplies of these and many other metals.

This proposal suggests what may be delaying the Administration's promised long-range programme for building a strong and efficient domestic mining industry; last summer's subsidy scheme was only intended to fill the gap until this was ready. The programme has been drafted in the Department of the Interior and is now going round the other interested agencies; if, as seems probable, it contains proposals for restrictions on imports, it must be meeting difficulties in the State Department. Meanwhile, the decline in demands for the strategic stockpile, as its requirements are met in an increasing number of categories, underlines the urgency of the long-term programme. Most of the metals which the government is now buying—or exchanging for its stocks of agricultural commodities—go into the "supplemental" stockpile. This is the euphemism for a reserve which is needed not for strategic but for political reasons and which, before long, may replace the farm surplus as an albatross round the necks of government officials, taxpayers and consumers alike. For already some miners are as dependent as are many farmers on government price supports.

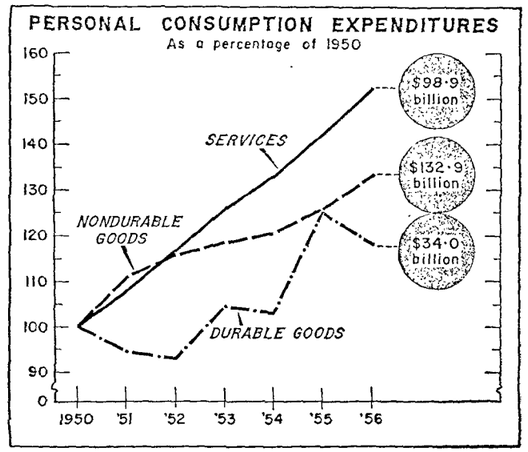
GM is Good for New York

GOVERNOR HARRIMAN of New York puts the prosperity of his state before the dogmas of his party. That at least seems a fair interpretation of his refusal to allow the Reynolds Metal Company, which wants to build a new aluminium mill near Massena, to have 239,000 kilowatts of power from the hydro-electric plant being constructed by the New York Power Authority on Barnhart Island as part of the St Lawrence project. Many of Mr Harriman's fellow Democrats oppose the Reynolds contract, on the grounds that not enough electricity would be left for the needs, or rather for the potential expansion, of rural co-operative and municipal undertakings. According to Democratic theory, these are supposed to have first call on the power supplied by publicly developed projects so that rural and domestic consumers can be sure of cheap electricity.

Mr Harriman seemed to share this objection to the Reynolds contract until the General Motors Corporation announced that, if the aluminium plant were built, a foundry would be put up alongside to make the metal into automobile parts which could then be shipped to Detroit and other places along the St Lawrence Seaway. The employment this will provide, directly and indirectly, in northern New York State, long a depressed area, should be of more benefit to local residents than the promise of a few cents off their electricity bills. But the Governor has also awarded another 115,000 kilowatts of the output to the Niagara Mohawk Corporation, the chief private distributor of electricity in the area. With uncontroversial contracts which have already been approved, this leaves only about 20 per cent of the 750,000 kilowatts which is New York's share of the Barnhart Island capacity (the other half goes to Canada) for the rural co-operatives and municipal undertakings.

The State Power Authority contends that most domestic consumers in the area are supplied by private companies, not by these public agencies, and the Governor has pointed out that, under the new contract, part of the supply can be withdrawn from the Niagara-Mohawk company if it is needed by municipal or co-operative systems. Moreover, the contract provides for a reduction in the rates charged by the company which should save its domestic and rural customers over $2 million a year. The overriding argument for these contracts is that they guarantee the state authority an immediate revenue of $24 million a year which it needs to finance the Barnhart Island projects.

At Your Service



FROM A SPECIAL CORRESPONDENT

ANYONE asked to name the "growth industries" in the United States would probably include oil, chemicals and electric power. He would not be likely to mention personal services—a group including both establishments offering transportation, lodging or amusement to the individual or repair service to his belongings and such personal ministrations as those of doctors, barbers and baby-sitters. Yet in the past six years spending on services has grown twice as fast as spending on goods; by 1956 it equalled the amount spent on all non-durable goods (including food) in 1950. Long-range projections for the American economy indicate that the shift toward the service industries may become even more pronounced during the next ten to twenty years.

Probably the most important cause is the rise in consumer income to levels at which more and more people can afford the luxury of letting other people do their chores. Sociologists and doctors may deplore the fact that, as incomes rise, people are less likely to clean their own homes, shovel their own snow, wash their clothes or walk to the shops, and more likely to call on the maid, the odd-job man, the laundry or the delivery boy. But, in a country where domestic servants are almost unknown, this makes business for those who can offer hired help, laundry or deliveries. To be sure, the "do-it-yourself" appliances make many household jobs easier to do. But when incomes rise sufficiently, as many do each year, the services—including that offered by the local telephone company—make them easier still. Even the new motor snow-shovels are not likely to do away with hired shovellers, any more than

motor lawnmowers have halted the growth of gardening and tree-pruning services. Higher incomes have also permitted greater spending on services that are not luxuries, but necessities in a rising standard of living. These include better medical care and more—if not happier—trips to the dentist. Almost a third of the population is now covered by private insurance plans for hospital care. Expenditures are higher for private nursery schools and summer camps, which offer opportunities both to children and to harassed parents. Even the standard of dying has gone up; the morticians' trade association attributes the gain in the average cost of funerals to better popular taste.

The second great force behind the growth of the service

industries is increasing leisure. All sorts of holiday industries—resorts, motels, travel agencies and the airlines themselves—are booming. And shorter work-weeks also permit more and more people to take up sports like golf or bowling or to attend public amusements. The business of developing photographic films—usually handled by the local chemist—has grown phenomenally, largely because of the public's appetite for taking pictures of the places visited at weekends. Moreover, higher incomes and greater leisure have induced people to spend increasing amounts of money on mechanical gadgets that they are unable to understand, much less to mend. The business of repairing automobiles and television sets has been growing as fast as anything in the United States, and the all-electric kitchen is creating its own repair industry. Formerly anyone could mend a portable wireless, but the invention of the transistor has made even this a hopelessly scientific device.

The desire for a trouble-free life has created a thriving field for new enterprises, such as renting self-drive cars to those who cannot be bothered with their upkeep. In 1955 the gross income of the Hertz Rent-a-Car System was almost $90 million, compared with $33 million in 1950. Receipts from rentals are still small compared to owners' expenditures on repairs, greasing, washing and garaging, which doubled between 1950 and 1955. But the cost of these services and of automobile insurance makes hiring a car increasingly attractive. Two former international tennis stars have started Budge-Wood Services Inc., which offers "home maintenance" (cleaning and repairing carpets, furniture and woodwork), "wardrobe maintenance" (cleaning, mothproofing, tailoring and dressmaking) and the services of cooks and bartenders on an hourly basis. Part-Time Child Care of New York offers not only baby-sitters, but governesses and hospital-trained nurses as well, who will stay at home or travel. The Chambord, probably America's most expensive restaurant, will now deliver ready-cooked meals to those who can pay the price.

The growth of the service industries has not been without problems, of which the most important is the shortage of skilled workers. The increasing efficiency of manufacturing industry means that more and more of the unskilled labour force goes into the service trades—notably selling and delivery work. But the more skilled personal service jobs are still hard to fill, and this has led to sharply higher charges. It now costs two and a half times as much to hire a domestic servant as it did in 1939 and 26 per cent more than in 1949. Among those who have raised their rates the most are trained nurses, barbers, bus drivers and obstetricians, in that order. Despite the tremendous increase in medical care, doctors in general have raised their fees less than beauty shop operators or automobile repair men, but charges for dentistry fully reflect the increased demand. It seems unlikely that either the supply of these trained people, or their productivity in trades that cannot be mechanised, will increase notably in coming years. So the cost of services, as well as their volume, seems certain to rise. It is easy to shrug much of this off as luxury, or even whimsy. But no other field offers such diverse opportunities for serving the public, or for achieving independence in a small business enterprise.

SHORTER NOTES

R. H. Macy and Company, the big department store whose slogan is "it's smart to be thrifty," has won in the courts the right to value its inventory under the so-called LIFO method. This may be worth $9 million in tax refunds for the years 1942 to 1947. LIFO (last in, first out) allows traders to assume that goods sold are the last added to their inventory. It disregards, for tax purposes, any profit made in a period of rising prices, if this was in fact not the case. The government is expected to appeal because many other companies are affected and a great deal more money is involved.

★

During 1956 the Export-Import Bank, which is intended to encourage American exports, authorised 193 credits to borrowers in 38 countries for a total of $1,156,607,000, more than in any year since 1946. The record is largely explained by the $500 million made available to Britain to enable it to pay for oil and its other requirements from the United States.

★

"Roll on, roll off" lorry transportation has been brought to Europe by a company which has been using this method for some time between Florida and Puerto Rico. Under this system, now being tried experimentally by the United States Army between New York and France, trailers are loaded with goods, pulled by road from factory to port, rolled on to a trailer ship, rolled off at the other side of the ocean, and then pulled to their final destination for unloading.

The World Overseas

Cross-Winds at Uno

FROM OUR SPECIAL CORRESPONDENT IN NEW YORK

CARS with the fashionable forward look flow in thousands past the United Nations buildings in New York. Many delegates ride in them, but few seem affected by the look. Outstanding in the Assembly's recent handling of the Middle Eastern problem has been the paucity of forward-looking approaches and the difficulty of rallying support for those that have been made.

When the Assembly faltered into debate on the Middle East again last weekend, the prevailing mood was tiredness and a sluggish aversion from further constructive action. For three weeks the delegates had not had a single bite at the Palestine apple and many were sorry the respite had ended. On the face of things, the Arab-Asian demand for sanctions against Israel had been held back since early February simply to give America and the Secretary-General one more chance of winkling the Israelis out of Gaza and the Aqaba straits. But, in reality, both those who sought sanctions and those who sought to avert them faced trickier problems. The sponsors of sanctions certainly had one eye on Washington. But the other was fixed on the Assembly itself. They knew that the ears of other delegations were aching from their drumbeats and that it was prudent to show a patience that would be contrasted with Israeli mulishness. They could see that it would be fatal to force a vote too brusquely and fail. But how long could they afford to hold back? The Assembly was grinding towards its belated end, and a reopening of old issues just as the chief delegates were packing their bags would be ill-timed. Understanding of Israel's anxieties was spreading among many who had dutifully voted for all earlier demands that it withdraw. Egypt's obstruction of canal clearance had emerged more visibly to the naked eye: General Wheeler was barely choking down his impatience; and Mr Katzin had flown out to examine the canal situation for the Secretary-General.

Still more disturbing for the sponsors of sanctions and heartening for their declared and undeclared opponents was the undertow of compromise running through a weary Assembly. The watery endings of the Algeria and Cyprus debates showed how many delegations were reacting against a prolonged baiting of France and Britain, and how tempting the role of conciliator could appear to Japan, India and other members of the Asian-African group. The group's attempt to make Portugal accountable to the United Nations for its overseas territories had run into sand, and so had Russia's charges of American warmongering in the Middle East—with only four Arab and Asian votes being cast even for a debate on the charges. The Asian-African group itself was far from agreed. Faced with no alternative to a straightforward call for sanctions, no more than one or two, if any, of its twenty-seven members were expected to break the ranks, but more than half of them hoped never to be actually pushed against that wall. The fact that the six sponsors of Friday's sanctions resolution were all Moslem countries, firmly impaled on the hook of Islamic solidarity, pointed up the lack of enthusiasm of the wider Asian-African world.

Even the Soviet block's attitude remained unsure and its representatives' private utterances were sibylline until the debate was well under way. Russia was impaled on a hook of its own. It could not abandon its patronage of Arab aspirations; but as late as Friday, just before the sanctions resolution was introduced, Mr Sobolev reaffirmed Moscow's view that the creation of a United Nations force and the Assembly's other steps to meet the Middle Eastern crisis were violations of the Charter and usurpations of the Security Council's powers. On Tuesday, Mr Sobolev wriggled off his hook as best he could, announcing that Russia could approve Assembly sanctions because the Security Council was paralysed by the veto. But the deduction was quickly made in the delegates' lounges that Moscow now felt confident that it would not in fact have to vote in a sense which would destroy its fundamental thesis that the Charter revolves around the unanimity of the great powers.

However, of all the breezes blowing through conditioned air of the United Nations buildings last week, the strongest blew from Washington and in it hopes rose and fell like leaves. When Mr Ben-Gurion's retort to President Eisenhower's sternly paternal warning gave the Arab-Asian sponsors of sanctions the signal to launch their demand, a gale-force wind from the White House seemed to be filling their sails. Bewildered delegates gathered in corridors trying to work out why the President should court a tremendous domestic row when there was still no likelihood of the sanctions resolution gaining really adequate assent. A technical two-thirds majority gained by virtue of numerous abstentions would scarcely carry the moral force that President Eisenhower would need to enable him to argue in face of a hostile Congress and public opinion that America must obey the "town meeting of the world."

Mr Lester Pearson's speech on Tuesday introduced a refreshing note into an assembly full of intransigence, myopia and searchings for escape holes. Looking beyond the sterile controversy over sanctions, Mr Pearson urged the United Nations (much as the Secretary-General, in the discreetly non-emotive language to which his office constrains him, had often urged it) to view the Palestine problem as a whole and to think in terms not of reversion to the abnormal, but of a solution. His suggestions for practical steps to solve the Gaza-Aqaba problems, and for the use of the UN force as a continuing basis for border peace, were at once assailed by a succession of Arab orators: but a new note had been sounded at last, and some delegates who had been waiting for a bell-wether raised their heads hopefully. The fact that Mr Pearson did not frame his proposals in the form of a resolution showed that he reckoned them even less likely than the sanctions resolution to muster a majority as they stood. But he provided an essential piece of raw material for the forces now seeking compromise—an antithesis to the sanctions thesis: and behind the scenes attempts at synthesis promptly proliferated.

True synthesis being impossible—since it would involve proposals directed towards a real Palestine settlement, and Egypt and its friends refuse to envisage such a settlement at all—the only immediate result seemed bound to be a lowest common denominator with the sole virtue of averting a head-on collision on the sanctions issue. But at this stage of the debate it did appear that if the collision could be averted, and the forces of compromise regrouped under the banner of the forward look, the Assembly might yet have one more chance of gaining in stature by tackling the real problem of Palestinian peace.

French Economy Under Strain

FROM OUR PARIS CORRESPONDENT

THE economic difficulties that are beginning to beset France again, after three years of "expansion in stability," are not a surprise. They have been gathering for the last year, during which output has risen rapidly, whipped-up by suppressed inflation. But now the signs of fever are multiplying. The wage and price freeze decreed last July could at any moment melt away. The economic Minister, M. Ramadier, last week insisted that wage increases would set off a trail of inflation; but the government's angry employees in the post office and the gasworks staged warning strikes. Others are following their lead. M. Ramadier is equally harassed in his efforts to stanch the ever-growing budget deficit. He intends to cut government spending by £250 million; but the subsidies to hold down the retail price index, governing the national minimum wage, will alone cost £60 million extra this year. Above all, despite the new-fledged export drive which seems to have met with some success in January, the government must struggle to keep this year's adverse balance of trade within last year's totally unsatisfactory bounds of £400 million. At this rate, the foreign exchange reserves can last about a year.

France is paying, or failing to pay, mainly for the combination of a belated investment boom and M. Mollet's Moslem expeditions. The investment boom alone would probably have fully taxed French energies. Algeria and Suez, embarked on without regard to resources, have severely overstrained them. Algeria has added £300 million to the budget. And the call-up has led to a serious manpower shortage, so that, without strikes, labour costs rose 10 per cent in 1956. Algeria has diverted output to unproductive ends, and created excess demand. Suez has checked, though not halted, growing output, but added heavily to the trade and budget deficits.

These are passing problems, but they have sharpened a permanent one. The nature and unexpected growth of the trade gap have made economists realise that French expansion will demand imports as never before and that they can only be met by more profitable exports. France, unlike most industrial countries, has hitherto paid her way chiefly by exporting raw materials and semi-finished products, bulk foods like wheat, and the simpler manufactures such as textiles. Last year she earned as much by selling ores and steel alone as from engineering and chemicals. An export drive now means that engineering sales must double or treble in the next ten years; in agriculture, higher cost foods, like dairy produce and vegetables, must loom larger than wheat. The very structure of French industry and agriculture must be adapted to exports.

So far the government has tried to make do with piecemeal actions and not to choose between unpleasant alternatives. The politicians will not, and cannot quickly, throw off Algeria, the economists will not choke the investments they feel are necessary to industrial reconversion and the country's entry into a common market. Hence the limited attempts to stem inflation by freezing wages and prices; by salutary efforts to prune the budget; and by the prospect of more "national loans."

Other inhibitions hamper direct action on overseas commerce. Devaluation would do more harm than good; the present system of "compensation" taxes and export subsidies already amounts to a selective devaluation, all in France's favour, and has even been recognised as a French privilege in the common market. Similarly, to reimpose quotas and backslide on OEEC agreements would involve risks of reprisal and probably hinder production. So the government is merely pressing industries informally to "buy French" and helping them to export more by schemes like the "prospector's insurance" which gives state guarantees to firms risking losses in new markets.

All these limited actions will probably not be enough; for if, as seems likely, production increases this year, so will fuel and raw material imports. Either a deflationary policy must halt investment or an Algerian settlement be found. Some economists think that the only way of averting deflation is to seek a large international credit for several years, against the pledge of a closely-defined plan of commercial rejuvenation. France, with her reserves dispersed, may be forced to this as the only way of avoiding a serious setback to production. But it is hard to imagine such a scheme accepted by France's neighbours until Frenchmen themselves have taken the first steps to self-help and un[illegible] a solution is in sight in Algeria. The prospective eco[illegible] crisis is already entering politics. Domestically, the [illegible]servatives and popular republicans are becom[illegible]d the more critical of the government. Abroad, [illegible]on market payments crisis is far from the best, [illegible]w clearly cuts common market. France has virt[illegible] well as colonial and danger by saying she could not [illegible] sufficient reasons for not while the Algerian crisis l[illegible] linger on through M. Lacoste's across French economic [illegible]arters-of-an-hour." European policies. letting the Algeri[illegible] oft-renewed "

Mr Kishi Takes Over

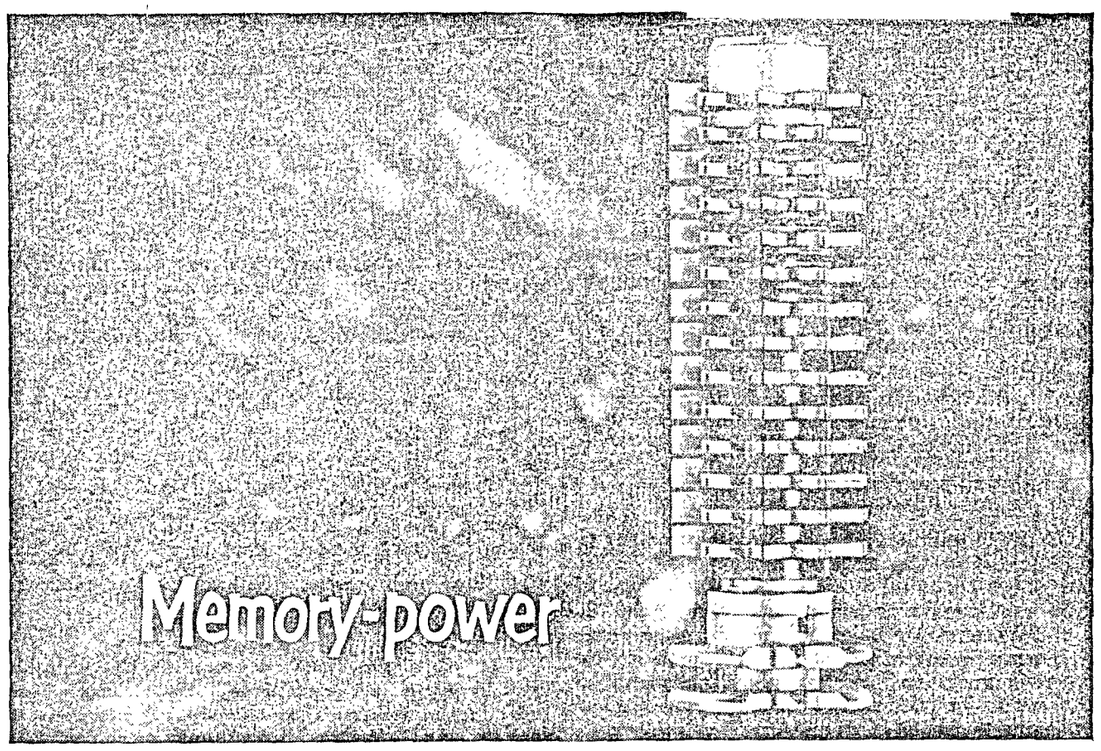
FROM OUR TOKYO CORRESPONDENT

JAPAN'S latest prime minister, Mr Nobusuke Kishi, is an intensely ambitious man. At the age of 60, he bears the scars (metaphorically speaking) of many a savage bout of Japanese political in-fighting. He comes from Choshu (nowadays known as Yamaguchi Prefecture), the traditional home of crafty politicians. Kishi means "river-bank": Mr Kishi has the reputation of always keeping a foothold on both river-banks. In the past, he has not hesitated to knock down political opponents by throwing at their heads charges ranging from tax evasion to scandals with dancing girls; these successful onslaughts were always accompanied by a flashing, big-toothed smile. On the whole, however, he has generally preferred to achieve his ends by devious means, which have led to his being dubbed an arch-intriguer. But neither his frontal attacks nor his gift for guile make Mr Kishi unique among Japanese politicians.

There have been two crucial periods in Mr Kishi's life. From 1936 to 1939, he was the uncrowned king of Manchuria. He was involved as minister of supplies in the subsequent downfall of the wartime Tojo government and, from the end of 1945 until the end of 1948, he languished in an American prison, at Sugamo. He was never charged with being a "war criminal," and he was never brought to trial. Today, with a big smile, he insists that the most important thing for Japan is to be on the best of terms with the United States.

Mr Kishi became foreign minister in the Ishibashi Cabinet that was formed at the beginning of this year; but he never concealed his bitter disappointment at having failed in December, by only seven votes, to become prime minister. Mr Ishibashi had considerable difficulty in accommodating all the factions within the Liberal-Democrat party, including Mr Kishi's, when he came to form a government. When Mr Ishibashi fell ill in January, his illness was shrewdly exploited by the factions. Mr Ishibashi was highly popular in the country and he could easily have been allowed ample time off to recover and recuperate. Instead, the shadow of the long ailing former prime minister, Mr Hatoyama, was invoked to force him into either attending the Diet, or resigning. Mr Kishi carefully stayed away from Mr Ishibashi's sick-bed, an avoidance which gave rise to rumours that Mr Ishibashi's illness was much graver than was supposed. The Socialists joined in the clamour for Mr Ishibashi to drag himself from his bed to the Diet or resign—a move they may live to regret.

Mr Ishibashi had planned to hold Japan's slowly but steadily rising Socialist tide at bay, and to keep the Liberal-Democrats in power, by a domestic programme of full employment, and by following up Mr Hatoyama's *rapprochement* with Russia by strenuously pushing for increased trade with, and perhaps eventual recognition of, communist China. In both aspects of his proposed policy, Mr Ishibashi was making an open bid to help himself to some of the planks from the Socialists' platform. During his illness, when Mr Kishi was handling the debates in the Diet, it became clear that Mr Kishi did not quite go along with those policies. Instead of pushing vigorously for increased trade with China, he evidently preferred to seek American backing for an "economic diplomacy" whereby American dollars would join hands with Japan's "economic power" to put to work the "labour" of underdeveloped South-East Asian countries. The goal was not much in doubt: the restoration of Japan to a position of leadership in Asia. In order to achieve this, Mr Kishi set his face firmly against any idea of "neutrality" for Japan, in or out of the United Nations; he declared that Japan could not be neutral because it was aligned with the United States and the "free democracies." However, in order not to present the Socialists with too obvious a winning card, he scolded the United States for "tactlessness" and "lack of understanding" in its handling of the Okinawa issue and of Japan's defence problems. As for the "East camp versus Western camp" issue, Mr Kishi explained that while one day Japan might act as a bridge between them it was not yet strong enough to attempt it.



Under Mr Kishi's premiership the Liberal-Democrat Party will continue to experience faction feuds; indeed, these may well increase rather than diminish, for Mr Kishi is by no means without enemies inside his own party. His government will also continue to face awkward domestic and external pressures. The Socialists have won much support by resolutely opposing rearmament beyond the very modest level that Japan has achieved; the United States meanwhile has made no secret of its view that Japan is showing far too little enthusiasm for defence. This year Japan is spending £100 million on its own small "self-defence" forces and another £40 million as a contribution to American defence of Japan. The promise made to the United States to add 10,000 men this year to the 150,000 in the Japanese Army has failed to materialise; in the Diet, Mr Kishi was constrained to say that, if the United States suggested sending an atomic task force to Japan, the Japanese government would refuse permission.

Mr Kishi becomes prime minister when Japan has received its first postwar Soviet Ambassador and when the new United States Ambassador bears the familiar name of MacArthur. They represent his two river-banks. He cannot afford to displease either too greatly, and he obviously is not in a position to accommodate both fully. His aim of strengthening Japan may be achieved if he can persuade the United States to dispense more dollars for off-shore purchases of Japanese goods for South-East Asian countries. But his internal position *vis-à-vis* the Socialists will probably be imperilled if in the process he has to yield to American suggestions that Japan should spend more money and raise more men for defence.

Stick and Carrot in Bulgaria

BY A CORRESPONDENT

IT is not surprising that the Russians should have made a great fuss of the Bulgarian delegation which has just returned home with a new 200 million roubles long-term credit in its pocket. The Bulgarian Communists have always been reluctant to countenance any dangerous experiments in liberalisation. Even the brief "thaw" allowed after Mr Chervenkov's "downfall" last April was quickly brought to a halt before it had assumed any serious proportions. At sessions of the central committee since then the "little

This ingenious mechanical memory makes it possible for Burroughs Sensimatic to carry out any type of accounting job—including yours!

extends automatic accounting to all!

Any type of accounting job can be handled by the Burroughs Sensimatic accounting machines—thanks to their unprecedented "memory-power." You can have a choice of totalling capacity, or "memory-power," ranging from 2 totals to no fewer than 19! You can get a Sensimatic with just the "memory-power" *your* accounting jobs demand—just as if it were designed for you!

AND...each Sensimatic, whether a specialized machine or an all-purpose one, has its own exclusive mechanical brain to pilot you through all your accounting operations—*automatically*.

Burroughs Sensimatic

revolt" of the intellectuals under stimuli from Poland was brought under control. Mr Chervenkov is in charge of culture again, and a recent decree forbade the "playing of decadent music" in restaurants and laid down that the repertoires of all restaurant orchestras are to be made up of Bulgarian, Soviet and "people's democratic" music; they must be approved by Mr Chervenkov in person. The army has been curbed by the dismissal of two generals and the reduction in rank of a third.

But despite these precautions, events in Poland and Hungary have created new situations—and new dangers. The Bulgarian, like other east European regimes, is trying to meet these by increased political repression combined with various measures designed to improve living standards. The slogans of "democratisation," "rehabilitation" and "legality" have been replaced by the demand for "vigilance" against "orthodox" class enemies and those newer ones, the "treacherous innovators and revisionists" who reject the dictatorship of the proletariat.

Against Belgrade

Although Bulgaria has never betrayed any tendency to question the Soviet "right" to supremacy in the "socialist camp," it is a sign of the times that its leaders still find it necessary to announce an unrelenting struggle against all those—Belgrade clearly is intended to take note—whose alleged aim is to replace "proletarian internationalism" by "bourgeois nationalism" and to deny the overlordship of the Kremlin. In the general condemnation of Titoism, the Bulgarians (mindful of the prodding from Belgrade to which Moscow made them submit a year ago) are showing no hesitation in getting a little of their own back—more so than their Rumanian neighbours—and *Pravda's* attacks have been studiously echoed by all local Bulgarian speakers and newspapers. Significantly, the Bulgarians, who hitherto have always sneered at Tito's "interest" in Albania, have just sent a strong delegation to Tirana. As it appears, they have been given the task of stepping into Jugoslav shoes.

In a predominantly agricultural country like Bulgaria, where the peasants are strongly rooted in their land (though it is now almost 80 per cent collectivised), it is not surprising that most of the active discontent has come from the countryside. It is there, therefore, that most changes have been hurriedly introduced. The collective farm members have only been able to obtain extremely poor rewards for their labours, mainly because the state's high quota demands made it impossible for the collectives to make even minimum payments to members in either cash or crops. Moreover, there has been no provision for older members no longer able to do a normal day's work. Last autumn much was heard of state grain collectors being ejected from the villages and of discontent assuming other active forms.

Now, old-age pensions up to 150 leva per month are being introduced. Fruit, vegetables and milk have been removed from the compulsory buy-up lists, and in future will be bought on contract, thus assuring producers better prices. Delivery quotas are to be assessed "more fairly" in accordance with climatic, soil and other local conditions. In some regions, grain deliveries have even been completely abolished in order to spur production and to meet the grumbles of peasants, who, because they have been forced to make high deliveries whether or not the harvest was good, have hitherto been left without even their most basic needs in bread. Quite substantial increases in family allowances, and price cuts in popular restaurants have also been made.

The Russian Brother

To pay for all this, capital investment is to be pruned this year by 750 million leva; this will affect mining, power and agrarian projects. The government has promised that unemployment, which has assumed serious proportions, will all be absorbed into industry. Some 60-70,000 new workers, it is said, will find jobs thanks to the large orders for consumer goods that are being placed by "brotherly Russia." The Bulgarians, in fact, are going to process Soviet raw materials into cloth, shirts, dresses, knitwear, boots and furniture, not for themselves but for the Russians—a revealing commentary on Russia's own anxiety to satisfy consumer demand in this period of ferment.

More than 50 per cent of Bulgarian trade is with Russia and the propaganda effort exerted to prove that these arrangements are not on the same iniquitous terms as those recently revealed by the Poles reflects the pressure of domestic opinion about earlier arrangements. Today, there is no doubt that Russia, with its credits, its loan of wheat and its new trade agreement, has been compelled to change the nature of its economic relations with Bulgaria (as with other east European countries); but it remains to be seen how quickly any confidence will be regained and how quickly local economic conditions will improve.

The shock over the attitude of Polish and Hungarian youth towards communism has, not unexpectedly, caused Mr Yugov, the prime minister, to take a firm line with the regime's own children. They too have shown signs of restlessness. Demands that the study of Marxism should be abolished and that learning Russian should no longer be compulsory have been met with threats, expulsions of up to 1,500 students, chiefly from the universities of Sofia, Plovdiv and Varna, and the arrest of some 200 others allegedly responsible for the distribution of anti-Soviet leaflets during the Hungarian revolution. Most of these were "bourgeois" or youngsters from families which had proved "difficult" during the collectivisation drive.

The interesting thing is that, even in Bulgaria, unrest has spread to factories, to the army and even the regime's militia. In a recent appeal, Mr Yugov mentioned all these sections of the community. "Unreliable" families who only a year ago were allowed to resettle in Sofia are being arrested and even deported. "Loyal" citizens are being commanded to "listen for the enemy in trams, buses and coffee shops" and to show such vigilance that "our internal enemies will tremble even in their sleep."

What is Deportation?

FROM OUR BONN CORRESPONDENT

A VIGILANT fortnightly published in Frankfurt is so far alone in calling the German public's attention to the verdict of a Rhineland-Palatinate court rejecting a one-time concentration camp prisoner's claim for compensation. *Die Gegenwart* publishes the full text of the judgment "because we consider both the decision and argumentation to be symptomatic." The judgment, full, if not of wise saws, at least of ancient instances, boils down to this:

On March 9, 1945, Erna Vogler, then fifty-one years old, was arrested by the Gestapo in her home at Neustadt-an-der-Weinstrasse and, "on racial grounds," carried off to the concentration camp for Jews at Theresienstadt in the Reich Protectorate of Bohemia and Moravia, some 50 miles north of Prague. Although Theresienstadt (the whole of this old garrison town had been turned into a prison) was liberated by Russian troops at the end of the same month, it was not until June 29th that Frau Vogler was able to set out for home, and not until July 10th that she had overcome the hazards of travelling in those days and arrived back in Neustadt. Frau Vogler applied for financial aid as a returned émigré (Rückwanderer) on the strength of the federal law of September 18, 1953, which recognises the right to such compensation of anyone who was "deported, expelled, or driven to emigrate" before December 31, 1952, and whose permanent home was in territory which belonged to the German Reich on December 31, 1937. The local compensation court at Frankenthal having rejected her claim on the ground that, strictly speaking, she had not been deported, Frau Vogler appealed to the Land Court at Mainz. After citing the opinion of sundry encyclopædias and dictionaries concerning the etymology of "deportation" and its meaning in practice to Ovid, Dostoevsky and Napoleon, the learned judges of Mainz agree with the lower court's ruling that Frau Vogler was not deported in the legal sense of the word. For Theresienstadt, they point out, is in the Sudetenland, and the Sudetenland was a part of the Reich from November 21, 1938, until May 8, 1945, between which dates Frau Vogler was sent there. "The fate of being in a concentration camp is not tantamount to being in emigration," the three judges sagaciously observe, dismissing Frau Vogler's appeal and ordering her to pay the out-of-court costs of the proceedings.

As *Die Gegenwart* remarks, the verdict is symptomatic of much of official Germany's inclination to compensate according to the letter rather than the spirit of the law. It is a mood that holds out little promise of satisfaction for the citizens of other countries who suffered at the hands of the Nazis and who still hope to receive compensation, although at present they are legally ineligible. Their case was put to the Federal Government by nine west European states—Belgium, Denmark, Britain, France, Greece, Holland, Luxembourg, Norway and Switzerland—in a joint aide-memoire delivered six months ago. Out of fear of the far-fetched claims that generosity might evoke, particularly from the east, the Germans do not propose, in the reply which they produced this week, to broaden the existing law so that it will embrace foreigners. But in order to show good will they are proposing instead to offer, without legal obligation, *ad hoc* payments to individuals in these nine western countries who can prove they are in necessity today in consequence of their former ill treatment by Germans. Few are going to benefit if the offer is circumscribed by the spirit in which compensation is being meted out to individuals by German courts today.

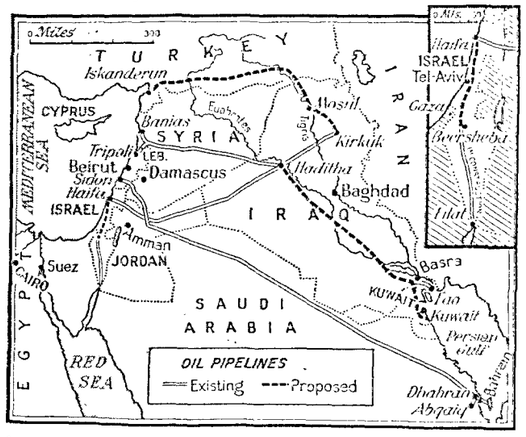
Pakistan's Economic Effort

BY A CORRESPONDENT

LAST week's meeting of the Pakistan National Economic Council indicated that the Pakistan government is seriously considering how best to co-ordinate its development programme. Two problems are being tackled simultaneously: food supply and the maintenance of an even balance between the demands of the eastern and western parts of the country. The five-year plan (1955-60), unlike India's second plan, aims at agricultural self-sufficiency, but food shortages are becoming "recurring features," as the Prime Minister, Mr Suhrawardy, put it, and are not only creating a shortage of foreign exchange, but diverting a large proportion of foreign aid to meet emergencies. This has led to a stringent import policy and, with it, inflationary pressure at home.

Moreover, direction has not always been clear; Mr Suhrawardy complained about "irrigation schemes without consideration of how to utilise the lands," but the severest note was struck by an official of the International Co-operation Administration, who uttered a warning that at the rate at which land was being "wasted, not nurtured, the valley of the Indus would be a desert in less than half a century." There has been a relative success in industrialisation, natural gas has been discovered and exploited; but the main issue of land reform remains to be faced. Both East and West Pakistan have suffered from floods. The Economic Council has reduced the scope of the five-year plan by about £60 million to £810 million, and has called for a tightening of administrative machinery. It is not enough that economic development is carried on at a uniform rate in both parts of the country; the East Pakistanis need to be convinced that this is so.

Not surprisingly, in view of the heavy commitments for defence (57 per cent) and development, the new budget has fallen back on deficit financing. More encouraging is the fact that for the first time in ten years a budget has been modified after presentation in response to criticisms in the Assembly and in the country; the increased duties on tea, coarse cloth, cement and petrol were revised within three days. But the disproportionate expenditure on defence continues to burden all Pakistani governments, and with the present tension over Kashmir it can hardly be expected that it will be reduced.



Middle East Pipelines

1—Plans in Iraq

DR NADIM EL-PACHACHI, the Iraq Minister of Economics, has told the financial committee of the Chamber of Deputies that discussions were in progress "with parties responsible for exporting Iraq oil to world markets" concerning a proposed oil pipeline to link the northern oilfields with the Persian Gulf. The Iraq Petroleum Company has not commented on the scheme and the details of it are still not clear.

It is believed that the government plan is for a pipe running north from the Basra field to cut into the existing lines from Kirkuk to the Mediterranean at Haditha on the Euphrates. At the southern end, the proposed pipeline would join another line, still in the planning stage, from Zubair (near Basra) to Kuwait. Dr Pachachi said the link between Kirkuk and Basra would enable Iraq to export more oil and could be used, if necessary, to carry oil the other way, from the Basra field to the Mediterranean.

The line from Zubair to Kuwait will almost certainly come first. Kuwait appears willing to accept this line, which offers an economical way of getting Basra oil into large tankers which cannot use the present loading-point at Fao. The scheme announced by Dr Pachachi raises more difficult problems. Kirkuk oil sent southward would

be travelling away from the European market; after its 400-mile journey to the gulf it would have to compete with oil produced almost within sight of the sea. To send Basra oil northward would seem pointless so long as the pipelines do not exist to enable the Kirkuk field, 400 miles nearer to the Mediterranean, to be produced at its full capacity.

The Iraq Government's interest in alternative routes is natural when Syria and Egypt between them have brought its principal industry almost to a standstill. But, of the plans in the field, the two most immediately practical seem to be the Zubair-Kuwait line, which would make possible an increase of production at Basra, and a line from Kirkuk through Turkey to the sea at Iskanderun; the route has already had a preliminary survey. The Iraq Government, however, approaches the plan with caution because it might be accused of diverting the pipelines from Syria and Lebanon, "sister" Arab states (although Syria has done its best to stimulate interest in new pipelines by cutting the old). The IPC regards the Basra-Kuwait or Turkey lines as supplementary to, and not alternatives for, the Syrian route. It would certainly be valuable to have alternative routes, but in any event more pipelines will be needed to enable Iraq production to expand.

2—Progress in Israel

Our Correspondent in Tel Aviv writes:

WORK on the eight-inch oil pipeline from Eilat, on the Gulf of Aqaba, to Beersheba, the new capital of the Negev, has been pushed ahead vigorously. Although work only began after the Sinai campaign, it is hoped that it will be completed in April. Some difficult country ahead may cause delays, but the pipelines should certainly be ready for use in the spring. This pipe will be able to carry 750,000 tons of oil a year to Beersheba, whence it would be transported by road or rail to the Haifa refinery. It will be purely a domestic line, cheapening the transportation of something more than half of Israel's present consumption of oil products.

Whether this pipeline can function when ready depends on two factors. Oil can only reach the Eilat terminal of the pipe if the Gulf of Aqaba remains open to Israeli shipping. The Egyptian blockade of the gulf was broken when Israeli forces occupied the Sharm el-Sheikh headlands overlooking the entry to the gulf. The need to keep it open explains the energetic attempts of the Israeli government to get adequate guarantees from the United Nations before relinquishing the position at Sharm el-Sheikh.

The second factor is the supply of oil. A steady supply must reach the terminal at Eilat if the pipeline is to have much real value to the Israeli economy. Officials of the government, when asked about it, say cautiously that the supply position is hopeful; the public is convinced that the oil will come. If the public proves right, Israel will get cheaper oil because it will be carried a shorter distance than would be involved in delivering it at a Mediterrean port, and would get it whether the Suez Canal were open or closed.

Plans more ambitious than the eight-inch pipe are being discussed. The principal idea is a big pipeline, approaching 30 inches in diameter, which would meet not only Israel's requirements but contribute to Europe's needs. It would therefore be one alternative route to the Suez Canal. It is suggested that this pipe could be laid along the route of the eight-inch pipe as far as Beersheba and then be continued north to Haifa. The oil would be sent on as crude or refined products (Haifa refinery can handle five million tons a year) by tanker to European markets. This pipe could carry about 25 million tons of crude a year. There has been talk of a French offer of money and equipment for the project, but so far nothing tangible has emerged.

* * *

The supply position for both schemes is difficult. It is being assumed that the Iranian National Oil Company would sell Israel enough oil for the eight-inch pipe. The quantity involved could be loaded at Bandar Mashūr, south of Iraqi territorial waters, and so avoid the Arab economic boycott to which Iraq is committed. The INOC could not, however, provide the quantity which would be needed for the big pipe; and the international companies, which could supply it, have big stakes in the Arab countries and would be reluctant to challenge the Arab boycott of Israel to such an extent.

THE BUSINESS WORLD

New Age Banking

A MONTH ago, a committee of the London clearing banks completed its investigations into the prospects for applying electronics to banking. This is a matter of importance, not only to the banks but also to their customers. Ordinary methods of office mechanisation have been exploited by the banks to a point where they can offer little further advantage. Mechanisation by electronics, which is still a largely unknown field, would seem to be ideally adaptable to banking procedures which handle vast numbers of figures in sorting, docketing, debiting and crediting, according to standardised practice.

Electronic brains are creatures of routine; they have an elephantine capacity for absorbing instructions but cannot deal with the unexpected or the unpredicted. In a year's study, the committee acquired a firm and imaginative grasp of the possibilities for putting this kind of intelligence to work on banking routine. Whether all the banks are equally impressed with the opportunities of speed and efficiency that electronic systems seem to offer in banking is doubtful. Some of the biggest, it would appear, would be prepared to put the committee's ideas into practice as soon as electronic equipment has been evolved to do the job; others, equally big, remain wholly unconvinced. This split of opinion seems to be reflected in the way that the committee's findings have been made known. There was an opportunity here for interesting the banking public (which increasingly stretches down into the lower income brackets) in the possibilities of a technological revolution in banking. Customer participation in an imaginative venture of this kind is well worth cultivating, and it might have been secured if the bankers had been more willing to explain the objects of their exercise. What they have in mind emerges only indirectly from a list of equipment that the banks have circulated to companies in the electronics industry for their suggestions. This is contemporary; it belongs truly to the age of electronics. But it is a matter of real regret that the banks' attitude on the public relations of this fascinating and far-reaching development belongs to the era of the quill pen.

The next stage in the scheme depends on the examination by electronics manufacturers on how best to fill the banks' specifications. Then it will be for the banks, collectively or individually, to decide whether they are prepared to take the revolutionary step of commissioning pilot apparatus for test under banking conditions. The banks are agreed on one basic principle. Electronic mechanisation, if it comes, must be based on the cheque as the key document in the banking system. To render cheques amenable to the discipline of the electronic computer they will have to carry arabic characters printed in magnetic ink. With that crucial element of standardisation, it will then be possible for individual banks to go ahead with electronic systems as fast or as slowly as they wish, without hampering the schemes of the others.

There are three main fields in banking open to electronic mechanisation. The first, which has so far defied all attempts at mechanisation, is cheque sorting. Secondly, there is debiting and crediting of customers' accounts. Thirdly, there is centralisation of book-keeping to replace separate ledgers at small branches.

(1) *Sorting of Cheques.* Every day the banks' headquarters undertake the grim job of sorting bundles of cheques that their customers have drawn in favour of the clients of other banks, and are now returned for payment. These cheques have to be sent out to the branch on which they were drawn; the biggest banks have more than 2,000 branches, and there are 10,000 branches in England and Wales, so the job is necessarily tedious. It is done today, as it has been done for years, by teams of girls who read progressively across the code numbers of the branches which are printed on the cheques. Between two and three million cheques are sorted every day by this method, and a big bank may handle half a million a day. The girls

sort about 1,500 cheques in the time allowed (there are, of course, exceptions) so that 1,500 girl clerks or so are employed on sorting operations alone.

To carry out the same sorting operation electronically would require two steps. First, two of the figures that are already printed on cheques would in future be printed in magnetic ink in a pre-determined position, probably along the bottom. These figures are the serial number of the cheque itself, and the code number of the branch on which it was drawn. (In addition to these coded figures, the customer's cheques would carry a pre-printed symbol indicating debit and the number of his account.) The next stage calls for a sorting machine that can "read" these magnetic code figures and will drop the cheque into the appropriate pocket for each branch. Like the girls, this robot would have to sort the cheques more than once, since it is hardly economic to build it with 2,000 separate pockets (plus one for damaged cheques), but three sortings into 12 to 15 pockets would do the job.

(2) *Accounting.* Electronic book-keeping presents a more complicated problem. It calls for the development of a computer that has a vast memory for figures, plus a limited calculating section. (The big research computers built so far have a staggering capacity for complicated mathematics, but less capacity for storing figures; but the electronics industry should not find it too difficult to change the emphasis in design.) The bank committee has not yet made up its mind precisely what it wants the computer to do, but it has a fairly clear idea about how the work is to be done.

Once again, the operative document is the cheque. When it is paid in to the payee's bank, a clerk lists it on a slip showing its amount and the account it goes to. This list is also used for totalling the day's business. In an electronic bank, the clerk would have an extra attachment to his present machine that would print on the paying-in slip, again in magnetic ink and in the standard characters, the number of the customer's account, a credit symbol, and the sum to go to his credit. The cheques paid in would then be hand sorted by the receiving banks, as they are now, into bundles corresponding to the paying banks and sent through the clearing. Then they would go to the headquarters of the paying banks, where they would be sorted electronically into the paying branches.

The final stage in an electronic system would be to keep the customer's account in the computer's memory. He has drawn a cheque that has passed through the clearing and has come back through the electronic sorter to his branch. The cheque would then go to the computer. Appended to this machine would be sensing equipment to read the customer's account number and the sum; these figures it would translate into the only language the computer understands—a binary system in which each digit is reduced to a 0 or a 1—and then feed into the computer. In its memory, the computer would hold information giving the totals of all the accounts, together with their identifying numbers. It would simply subtract the sum shown on the cheque from the appropriate account, and feed this out to more ancillary mechanisms that would translate the figures back into ordinary numerals and print the results.

Such equipment would be big and expensive. It would be capable of working in fractions of a second and only the biggest branches would have enough work to justify the investment. Electronic mechanisation might therefore reach a third stage:—

(3) *Centralised Book-keeping.* Centralised book-keeping is likely to be introduced into the banking system whether or not it is tied to electronic accounting. If the central office for a group of local branches uses a computer, transmitters will be needed to send information back and forwards between the computer and each of the branch offices.

★

A system of this kind would represent a far-reaching departure from present banking methods, but it is not a wild Dan Dare conception. Indeed, it would have three great merits. The first is that it does not seek the impossible. Nearly all the requirements that have been described above should be within the capacity of an industry that can build brains into guided missiles. Perhaps the greatest difficulty may be a purely mechanical one—a cheque paper strong enough to stand up to the handling it will have to receive without becoming so dog-eared that its magnetic characters cannot be properly "read." The second merit is that it can be progressively adopted by stages. Electronic sorting of cheques can be introduced without going the whole hog on electronic book-keeping. Equally, even if one of the big clearing banks were to refuse to join the system, it would not rule out its introduction by others (even though it impaired its value). Thirdly, electronic handling can be introduced in parallel with existing methods.

Further investigation may show that improvements can be made in the system that the banks have outlined to the electronics manufacturers. Is there not a chance that some form of photo-electric sensing of ordinary figures could avoid the use of magnetic ink? But the system does seem, to a sympathetic lay eye, to offer hopes of reducing their heavy dependence on clerical drudgery, with its attendant rise in costs. The terms on which the banks could secure the equipment are a matter between them and the electronics industry; the latter, with all the demands being made on it, may have views of its own on the cost of developing special equipment for the banks' electronic revolution. A pilot unit might cost at a guess about £500,000. The banks are not, it seems, united in their views on the committee's ideas, and may find some difficulty in agreeing to a joint research project. But are they bound to keep in step? Is there not room for one or more of them to display the enterprise that they prescribe so readily for other industries?

Power and Level Tendering

IT took the Monopolies Commission longer—more than four years and fifty thousand words—to report on the electrical equipment manufacturing industry than on any other it has considered since it was set up in 1949: yet in essence this report is one of the simplest it has ever made. The arrangements to restrict competition in the supply of turbo-alternators, generators, electric motors and transformers, form an elaborate and complex tangle that the manufacturers took a long time to explain and the Monopolies Commission a long time to assess. But there is nothing complex about what they are designed to do. Most of the major companies in this industry, perhaps the country's most successful and most rapidly expanding supplier of capital goods, fix common prices and put in level tenders to customers at home and abroad who want to buy their electrical machinery: they exchange information about business on offer with some of their foreign competitors, and would like to make price agreements with them.

The companies make no secret of this restriction of price competition; indeed, they defend it as the essential foundation of stability upon which such a virile and technically progressive industry has been built up for the country. The Monopolies Commission, for its part, is equally uncompromising: it considers that the common price agreements operate against the public interest (though one member thinks they may not do so abroad) and it recommends that they should be ended. The Board of Trade, perhaps comfortably for its peace of mind, is now not required to act upon these recommendations. That may, later, be the responsibility of the Restrictive Practices Tribunal —before which the issue may be argued again.

Although the Heavy Electrical Plant Manufacturers have condemned the report of the commission as "doctrinaire" and "unrealistic," they seem incensed mainly by its conclusions. The facts seem hardly in dispute. The manufacturers' "groups" fix minimum prices to be quoted in tenders, which in practice inside Britain usually means that they quote the same price (though for tenders abroad they may agree that one shall put in a lower bid than the rest). Their agreements, in 1952, the latest year for which the commission obtained full details, covered about 90 per cent of the sales of turbo-alternator plant, more than 60 per cent of sales of generators and electric motors (of 1 h.p. or more in output), and about 80 per cent of the sales of transformers (except the smallest ones), at home and abroad. The Associated Electrical Industries group alone, in that year, incidentally accounted for about 39 per cent of home supplies of the heavy turbo-alternator plant: but apart from its participation in the common price arrangements, none of its operations appeared to the commission to be against the public interest.

Most of the arguments that the electrical plant manufacturers put forward to demonstrate that their industry needs the "stability" that common prices can give are of a familiar pattern, and the commission does not accept them. They say that "there are few industries whose capital equipment is so costly," which might possibly be true in the capital goods industries; but one might direct their attention to oil, steel, sugar refining, chemicals, milling, paper, synthetic fibres and drink, which all appear to employ more than twice as much capital per worker as themselves, even if they can ignore super-capitalised public utilities such as their principal customer. Their other overhead costs, owing to a high proportion of indirect and professionally trained labour and staff, plus unusually heavy expenditure on research and development, do seem unusually high. The makers feel that these relatively high total overheads, plus the fact that big equipment is all custom made, even down to major components, and practically nothing can be made for stock, might tempt makers competing in price to cut below cost to keep the plant running. The commission replies that it might not be necessarily in the public interest to prevent this; and it thinks, moreover, that in a trade recession the price agreements would not be strong enough to prevent it, as they did not at various times in the twenties and thirties. The manufacturers also fear that buyers will be tempted to push down the initial cost of the equipment they buy at the expense of higher running and maintenance costs later: the commission argues that customers must be assumed to be technically competent to make up their own minds.

★

The makers told the commission that "it is clear in some cases that (prices) have not been fixed in any very scientific way." The Monopolies Commission's investigations of costs during two years, 1951 and 1952, do suggest very considerable variations in costs, and hence in profits from level prices. However, the commission does not argue that the industry has in general made unduly high profits; only that level prices, in such circumstances, must tend to protect the less efficient producers at the expense of depriving the more efficient producer of his full competitive advantage.

There is another, statutory, monopolist on the buying side of this business. The Central Electricity Authority bought about 79 per cent by value of all the major generating plant purchased in Britain in 1952, and with the Area Boards, 66 per cent of the transformers; counting in exports, about 38 per cent of all turbo-alternators and nearly 40 per cent of all transformers made in Britain. The Monopolies Commission absolves CEA, as it does AEI, of any use of this monopoly power against the public interest. But this considerable

"countervailing power" of CEA is put forward by the heavy electrical manufacturers as the main reason for retaining their price agreements, re-created in the early thirties, during a period of prosperity. The monopoly that their chief home customer enjoys, they feel, gives it a superiority of bargaining strength, even when demand is high, equivalent to that of the fortuitously powerful individual buyer in a weak market.

Clearly, this could be true: it is indeed one of the conditions in which last year's Act laid down that restrictive practices might be held justified, if they were not otherwise unreasonable. Moreover, it is a condition of opposed power that the Monopolies Commission itself accepted, in 1952, as justifying special pricing arrangements, based on cost investigation, between the cable industry and this same monopoly customer, nationalised electricity. But in the case of this electrical machinery, the commission does not agree that nationalisation has radically altered the balance of bargaining. During the whole postwar period, CEA has needed more generating plant than the industry had the capacity available to supply without restricting exports. The report outlines the lengthy and elaborate negotiations by which CEA has obtained some data in support of the common prices quoted, though not all it asked for. It also records the circumstances in which Parsons, one of the most efficient manufacturers of large generating plant and transformers, in 1950 withdrew from the common price agreement on generating plant and quoted lower prices to CEA, later receiving a guarantee of a substantial volume of machinery orders from CEA. It is certainly not easy to conclude from the commission's account that CEA, even since Parsons made this special arrangement, has been in any position to dictate terms to the plant manufacturers' group.

For their price agreements on exports, the makers have a plausible but ticklish argument to offer; it convinced only one member of the commission. Even if agreements tend to hold prices higher than they might otherwise be, they asked, was that not in the national interest so far as export earnings were concerned? Most of the commission refused thus to distinguish the public interest in home and export trade:

> In the long run the public interest is best served, in the export market as well as in the home market, if the level of prices is reasonable for both seller and purchaser and if neither market subsidises the other.

This is a view with which liberal economists would agree—though it might not necessarily be self-evident to the Board of Trade.

As the commission observes, "the conditions which the manufacturers envisage as a result of price competition are, in fact, those of general trade recession." This is a view still deeply ingrained in many parts of British industry, and particularly among manufacturers of capital goods; in this industry the only periods of general price competition in the last thirty years were in fact in the depth of recession, when most of the minimum prices failed to hold. In some of the capital goods industries this fear of recurrent recession seems possibly to have hampered the expansion of capacity to meet demand in the recent boom years. That is hardly true of this one. But its fear of recession still persuades it to cling to a system that proved largely unavailing when recession came. For an industry of such prowess, the attitude seems hopelessly defensive. As the makers told the commission, their export pricing system is already proving vulnerable to more competitive pricing abroad. Could it stand up to the competitive pressures of a free trade area?

Business Notes

Fair Wind for Steel of Wales

As the time for the £40 million share marketing of Steel Company of Wales approaches, markets have obliged with a welcoming smile. Even before the new Stock Exchange account started on Wednesday gilt-edged stocks of industrials had both turned upwards; in the week ended on Wednesday *The Economist* ordinary share indicator rose from 196.8 to 200.6 while the *Financial Times* Government security index rose from 88.29 to 88.84. The advance was maintained on Thursday. It now seems likely that the Steel of Wales offer will be made on a reasonably good market. It will comprise the whole issued (and rearranged) ordinary capital of the company of 40 million £1 shares offered at par and will be based on a projected dividend of 8 per cent (compared with 4 per cent paid last year on a smaller capital). The prior charges to be retained for the present by the Iron and Steel Holding and Realisation Agency and by the Finance Corporation for Industry will also be substantially rearranged; the repayment due in July of the company's £15 million of 3 per cent first mortgage debenture stock held by the public will be provided for in the course of that rearrangement. The monster issue will thus go out on an 8 per cent yield basis which is more favourable to investors than the yield obtainable from other steel shares.

The Steel of Wales offer will also have the distinction of being the most successful Government funding issue so far this year, for it will be underwritten firm and the Government will dispose to the consortium of issuing houses of £40 million worth of stock. That is considerably more than it is believed to have sold to the public out of the recent issue of £300 million of 3½ per cent Funding stock 1999-2004. That stock now on offer from departmental holdings at ⅛ over the issue price of £80 can hardly have attracted buyers, for even the recent improvement in the gilt-edged market has not carried the price of the old tranche to the level of the new. But by being on offer it is doing its work as a peg limiting any further rise in long dated stocks.

The portents, however, are not unfavourable, despite the heavy calls that new issues are now making on the market. On the gilt-edged side the trimming of books by jobbers to what they wish to hold in a level market, as opposed to a rising one, seems to have been completed. On the industrial side the big sums tied in the Bowater issue are now released. And the optimists, chirping as optimists will, are now counting on possible tax cuts.

The Bowater Issue

No less than £220 million of stock was applied for in response to the Bowater Paper Corporation's offer of £15 million 5¾ per cent convertible unsecured loan stock 1978-82 at £97½, and the scrip opened at 9½ premium before settling down just under 8 premium. Since £10 was payable on application, £22 million must have been tied up in applying for this issue and that is sufficient reason to explain a little idleness elsewhere on the Stock Exchange. This outstanding success was achieved without the support of the corporation's substantial number of American stockholders.

Whether the methods that the corporation and its advisers have used in making the allotments are the best that could have been followed is perhaps more debatable. The issue was offered to all classes of the corporation's existing stockholders (but not to the general public) with pink forms for ordinary stockholders on the British register, blue forms on the Canadian register and white forms for the preference loan and debenture holders. American resident stockholders were specifically excluded from the offer. It was intimated that ordinary stockholders would have preferential consideration; but no one was given "rights" to a fixed number of shares. In the event the ordinary stockholders alone most handsomely oversubscribed the whole issue with 17,000 applications for £175 million of stock. And the company has gone near to treating it as a "rights" issue. All applications up to £200 are being allotted in full and then ordinary stockholders have received an allotment on a scale that has not been disclosed but is related to the applicant's present holding. That involved a drastic scaling down for applications from debenture, loan and preference stockholders.

It is a matter for regret that the differences between American and British law makes it impossible to give American investors the opportunity that was offered to the British and Canadian. It is a matter for debate whether an issue that is not made as rights should be allotted almost as though it had been. There are good reasons for not making an issue as of right if a large block of shareholders is excluded, but then the issue should be priced as near to the market as is safe, and allotments made in proportion to amounts applied for. An issue that works out so much like a matter of rights must cause some irritation among those ordinary stockholders who could not participate.

Unilever Pays More

Last week's speculation in the Unilever ordinary stock, which carried the price of the Limited units up from 73s. 6d. to 79s. 6d. and of the NV units from 81s. 9d. to 88s., was justified. For the third successive year the distribution to ordinary shareholders has been increased. In 1954 and 1955 this was achieved by maintaining dividend rates but by paying them on a capital increased by free scrip issues. This method was not on the cards for 1956, because the share premium account of Unilever NV had been practically exhausted by these issues and a free scrip issue from revenue reserves would have attracted tax in Holland. This time the directors have adopted the more conventional way of increasing the rate. The ordinary dividend of Unilever Ltd. is raised from 15¾ to 17½ per cent and, under the dividend equalisation agreement, that of Unilever NV from 14 to 15½ per cent. On this new dividend Limited £1 units yield £4 7s. per cent.

The turnover of the diarchy has risen by about 10 per cent, from £1,515 million to £1,671 million, while combined trading profits have risen more sharply—by nearly 16 per cent—from £85¼ million to nearly £99 million. This result from this giant of international trade is unlike the tale of smaller profit margins told by many British industrial and trading companies recently. The tax bill is also much bigger, going up from £44 million to £52 million and the 1956 combined net profit of £47,182,000 (including non-recurring credits of £2,769,000) compares with £45,118,000 (including non-recurring credits of £6,099,000) in 1955.

But there has been almost a reversal of the experience of 1955. In that year the profits of Unilever Ltd remained practically unchanged while those of Unilever NV soared. Last year it was the profits of the NV sibling which hardly changed—indeed its net profits fell slightly, from £22,203,000 to £21,929,000—while the net profits of the British concern went ahead, from £22,915,000 to £25,253,000.

£40 million for BP's Tankers

The first of the big tanker finance schemes was for £30 million for the Shell group. It was arranged by M. Samuel and Co., with Hoare and Co., and Joseph Sebag, as brokers. The second is for £40 million for the British Petroleum group. It has been arranged by Robert Fleming and Co. and Ship Mortgage Finance Company, with Hoare and Co., J. A. Scrimgeour, and Penney and Macgeorge as

brokers. There is, it will be seen, one common factor in the list providing the "know how." There is also a close similarity of purpose and method in the two schemes. Tanker Charter Company, the new BP financing organ, is like Tanker Finance, which does the same job for Shell, to canalise bank money, insurance money and pension fund money into the ownership of part of the tanker fleet that its oil group is now building when the ships have been completed—not charged on the further tanker programme amounting possibly to as much as £100 million that BP will shortly announce, nor on ships not yet completed. Tanker Charter Company will take over about 16 vessels out of BP's present 40 tanker programme, raise loans on the security of them and charter them back to BP Tanker Company on bareboat terms so drawn that whatever happens the interest and retirement of the loans over the 23 years of the scheme will still be payable. At the end of that period, as in the Shell scheme, the loans will have been redeemed and the tankers will revert to the oil group.

Tanker Charter Company, the "book-keeping company," half owned by Robert Fleming and half by Ship Mortgage Finance, is to borrow £15 million of one to eight year money from a group of banks headed by the National Provincial and including Barclays and the Westminster Bank. The rate of interest on this part of the money starts one per cent above Bank rate, at 6 per cent. There is no reason to suppose that those terms differ from what was arranged with the other bank group, headed by Lloyds, that finances the Shell plan. At that point the two schemes diverge. Tanker Charter Company is arranging to place two loan stocks, a small medium-dated issue and a larger long one. There will be £5 million of a 9 to 12 year stock and £20 million of a 13 to 23 year stock; to help with the placing of the more difficult medium stock, Ship Mortgage Finance itself will subscribe £1 million of it. The loans will be called up over the years 1957 to 1959 probably in half-yearly instalments. The effect of introducing a medium-dated stock into the plan is that, though the maximum length of BP's financing (23 years) is a year shorter than Shell's, the average length of all the borrowed money in it is a fraction of a year longer.

Comparison between the two schemes shows their close similarity. It is true that Tanker Charter Company pays 6½ per cent on its two loan stocks (both placed at par) while Tanker Finance, it is understood, pays 6⅜ per cent, but there has been a modest change in general interest rates between the announcements. It is true also that 6½ per cent for long- and medium-term money is highly attractive. The borrowing is however up to the hilt of the value of the ships charged. Nevertheless, for those who can hold an unquoted stock secured in fact as a rent charge on the oil giants they are a useful investment.

Sterling Recovery Hangs Fire

THE recovery of sterling to parity with the dollar just before Bank rate was reduced early in February proved a flash in the pan; the rate against the dollar dropped back to $2.79¾, though this week it has recovered to $2.79⅞. The reduction in Bank rate seems to have been interpreted abroad as a sign that the stiffness was going out of Britain's anti-inflationary policy. Bears of sterling stopped covering, though they have not been starting fresh speculative operations against sterling. The forward discounts on sterling in terms of dollars and most Continental currencies are still approximately adjusted to the differences in short term interest rates between the money markets concerned.

This week sterling has been firm, but less so than it should be, given the extent of bear accounts that are still open and the arrival of the high season of demand for sterling. Next week's gold and dollar reserve figures at the end of February will probably suggest that sterling has encountered some pressure during the past month. The effect of the reduction in Bank rate has been one of them. Another is the persistent commercial demand for dollars, now reinforced by the unusual flow of dollar oil imports into Britain and the rest of Western Europe. The seasonal peak of commercial demands for sterling is likely this year to be lower than in preceding years because the prices of several important sterling commodities—notably copper, cocoa, tin and rubber—have been lower. The drop in sales of sterling oil to non-sterling countries is another force now pulling in the same direction. The unusual demand for dollars may from now on be met in part out of the $500 million Export-Import Bank credit, but these drawings will not have occurred in time to affect the February reserve figures.

An illustration of the kind of pressure which sterling has had recently to endure comes in a report from Tokyo that the Bank of Japan may be compelled to sell some of its abundant dollars in order to replenish its depleted sterling reserves. That is not what the Bank of Japan wants. It would prefer to keep its dollars and borrow sterling in London, but it complains that in the London market Japanese bonds are being charged rates of 5½ to 6 per cent when they are able to borrow at all. That borrowing technique, when Japan has more than $1,000 million in reserve seems to amount to the introduction of bear speculation into the realm of inter-central banking.

Amending the Waiver

ARRANGEMENTS have now been completed for the $500 million Export-Import Bank credit to the British Government. The agreement signed last Monday places a line of credit of $500 million at the disposal of the United Kingdom to be used over the twelve months ending on February 28, 1958. Interest at 4½ per cent will be charged on the amount actually drawn. The capital will be repayable within ten years, the repayments starting three years hence. On all amounts borrowed the British Government will have to deposit dollar securities in its ownership as collateral and maintain a margin of 20 per cent. As the Chancellor of the Exchequer remarked in the House this week the decision whether, and if so when, to draw on the credit will be a matter of judgment. The dollars can be used only to finance imports of oil and other materials from the United States for, like all Ex-Im Bank credits, this is a "tied" loan. It will presumably be used for that purpose only if it is necessary to soften blows that would otherwise rain on the gold and dollar reserve.

Concurrently with the discussions for the Export-Import

Boom in Convertible Loan Stocks

BOWATER PAPER CORPORATION'S £15 million convertible loan stock, issued at 97½, has attracted applications of £220 million and opened at a premium of £9½. That success following the triumph of the £40 million issue by ICI of another convertible loan stock pinpoints a new technique in industrial issues. What is the secret of success in these convertible prior charges? And is the operation as free from pain to the borrower as it seems to be to the lender? Over the last four months the total of new industrial issues on the London stock market came to £137 million, of which £54 million (40 per cent) was raised on convertible prior charges. This is a high proportion for a type of security that is not in the traditional mainstream of British industrial finance. In Wall Street convertible stocks extend from railroads and public utilities to steel and other industries. In British industrial financing, until the end of last year there had been few postwar examples, the most notable being the £10 million issue by Distillers. Convertible issues had been confined largely to mining and plantation companies, where risks were high and where fortunes moved violently; they remain favourite devices of mining finance houses and unquoted preference shares and loan stocks with conversion options are used by Finance Corporation for Industry and Industrial and Commercial Finance Corporation for the companies they nurse. The lenders hope with Dr Pangloss for the best of all possible worlds: a prior claim on earnings and assets if events went awry and a claim on the equity if they went right.

The latest borrowers in this form, however, are British industrial companies of the highest standing, who have come to market when the lenders called the tune. To attract money they have to offer the double option of a fixed prior charge satisfactory in itself even if run to its final redemption date, plus rights to exchange before then into ordinary shares if the earnings of the business and the market valuation of its shares make the exchange attractive. ICI announced its issue near the bottom of the November fall; the market improved and the stock achieved a fine premium. But without the bait of the conversion option ICI could not have got £40 million so cheaply.

A convertible stock appeals to the institutional investor who is not yet sure that a bull market is developing but who has continually to find investment outlets. Some of them are also anxious to hold more equities and proportionately less gilt-edged stocks. In the quantities that are usually involved, such switches can seldom be made save on a falling market, which means prompt capital depreciation. The attraction of the convertible stock issue is that it offers the prospect of an ultimate stake in the equity on terms that offer a comfortable yield in the meantime and a valuable hedge against the risk of fluctuating prices. It is a security that is tailored to the current needs of the pension funds and assurance offices; their requirements have evolved it.

If the borrower, rather than the lender, called the tune, British industry might favour the convertible issue less. It is useful when a known sum of money is required for a defined capital project. The costs are fixed until the new capital is fully remunerative. The borrower pays no distributed profits tax in respect of loan stock interest as he would do in respect of ordinary and preference dividends (though loan stock interest in the hands of the institutional investor suffers from the fact that it is not franked income as dividends are). When the new capital has fructified, the conversion options may with reasonable luck be exercised and the risk capital is thus increased without any application again to the Capital Issues Committee.

But the conversion option has a cost which has to be paid by the owners of the existing equity. They pay partly by accepting a dilution of the ordinary capital when the conversion rights are exercised, and the cost to them depends on the extent of the dilution. If all the rights on the ICI convertible stock were exercised at the earliest date the ordinary shares so created would represent less than one in seven of the shares in issue; in Bowater's case it would be about one in three. Holders of the ordinary stock pay in another way—their directors have less freedom of manœuvre in raising further capital. The boards of ICI and Bowater have promised equitable treatment for the loan stock holders should they decide to make free scrip issues. But what happens when ordinary shares are issued as rights with a substantial bonus element in the price? Bowater's directors have promised that loan stock holders will be granted rights in proportion to their conversion rights.

★

These are material considerations. Some companies will accept them, confident that their shares will rise and that the conversion rights will be exercised. Yet until all the conversion dates are past the possibility must remain that the loan stock will not be converted and will have to be paid off on maturity. To that extent the company's capital structure is at the mercy of the market and not at the control of the directors. A convertible stock issue will make its maximum appeal to an industrial borrower when the amount raised will not make a vital difference to the capital structure (whether the conversion rights are exercised or not), where the need for more new money while the options are alive is unlikely to be pressing, and where, above all, a growth in earnings can be confidently foreseen on a sufficient scale to ensure that the dilution of the existing equity is relatively painless.

Unless the tone of the market continues to give lenders a whip hand many companies may be willing to pay a shade more in order to make conventional issues rather than put themselves in the equivocal posture that a convertible issue involves. When prior charges are already large a convertible loan stock is inappropriate. The Iron and Steel Holding Realisation Agency has resisted what must have been a strong temptation to furnish such a loan stock for the Steel Company of Wales. The institutions would have welcomed one; but it would have made SCOW's already heavy prior charge capital heavier.

RECENT CONVERTIBLE STOCK ISSUES

Bank credit, an intricate negotiation has been proceeding to revise the waiver clauses in the Anglo-American Financial Agreement of 1945. Such an amendment must be a matter for decision between the US Administration and Congress but in shaping the proposed changes there has been close consultation between the United States and British Governments. Latest reports from Washington suggest that the waiver clauses will be radically amended. As the agreement now stands the waiver applies to the interest part of the annuity only, but when it is invoked it implies complete cancellation of the amount waived. But it also provides that if the waiver is to be successfully invoked it must attract a corresponding reduction in the payments due by the United Kingdom Government on its wartime sterling debts. That particular provision has at no time been workable because the wartime sterling debts were never funded in the way that was envisaged when the loan negotiations were taking place, and it is expected to disappear from the revised agreement.

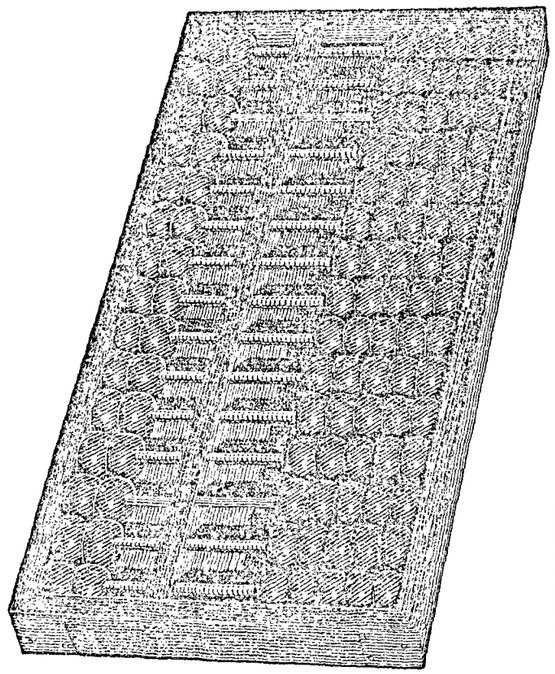
In future the waiver is likely to apply to both interest payments and capital repayments, but if it is used the amounts due will be merely postponed and not cancelled. If the waiver is successfully claimed, the whole range of annuities remaining to be paid under the loan agreement will be shifted forward by one year, thus extending the period of repayment a little further than it already does into the 21st century.

Oil Shortage and Output

INDUSTRIAL output in December, the first full month during which Britain was affected by shortage of oil, was 3 per cent lower than a year before. But in January, when the various schemes of oil allocation had all come into force, output appears likely to have been affected very little: it seems to have been less than one per cent lower than in January 1956. The official forecast of the January index is 137-138 (1948 = 100); allowing for seasonal factors, this would mean that total output was still at just about the average of both 1955 and 1956, 37 per cent higher than in 1948.

Within this stable total output there was a slight decline in manufacturing production last year. During 1955, manufacturing output averaged 142 (1948 = 100): last year it averaged about 140. But output from the public utilities, gas, electricity and water was about 5 per cent higher last year than in 1955; mining output, by the end of last year, was back to the 1955 level; and though building and contracting activity may be beginning to slacken off, it is probably still at a higher level than at the beginning of 1956.

Vauxhall's New Car



THE new Vauxhall Victor shows that General Motors' British subsidiary is more concerned to exploit the proved market for medium priced popular cars than to make any contribution to the development of the lower priced market. The abounding prosperity of the American market is expressing itself in the tendency of the most popular cars, the Chevrolet, Ford and Plymouth, to become ever longer, wider, heavier and more powerful. It must obviously be hard for Detroit to think in terms of such economy cars as the Renaults, the Fiats, and the small Citroen—which may, however, represent the dynamic development in motoring on this side of the Atlantic.

For the market at which it is aimed, the Victor will undoubtedly be a success. It provides excellent transportation for four passengers, with ample room—except that a little more space for the rear passengers' knees would be of advantage to those with long thighs. With a powerful but economical engine—of similar bore and stroke to the 4-cylinder Wyvern, but of more advanced design—it has a very lively performance, and its fuel economy is sure to be very good. In appearance, it is not so taking as the Hillman Minx, which is a close rival, with very similar dimensions, except that the Minx has an engine of 1,390 cc capacity against the Vauxhall's 1,507 cc, the smaller engine being offset by a four-speed gearbox, compared to the three speeds of the Victor. The Victor is the first British car with a wrap-around windscreen, which is now *de rigueur* in the States, giving better vision for the driver at the expense of slightly impairing ease of entry. It seems likely to compete effectively with the smaller Opel, the Rekord, which probably made up the greater part of the 77,000 cars exported in 1955 by GM's German subsidiary: the Rekord has the disadvantage of two doors against the Victor's four. The price in the British market, £728 17s. *including purchase tax, is a little lower than that* of the Minx; and one can expect that the full productive capacity, which seems to be set at a little over 2,000 a week, will be taken up.

In announcing the new Victor, Mr Copelin, the managing director of Vauxhall's, said, in comparing the Victor with a hypothetical smaller car, that the firm's studies showed that in squeezing out cost they squeezed out value still faster. This is no doubt true, but it is not a conclusive argument as to the greatest potential market available. The fact that a car he cannot afford is better value for money is of only academic interest to the motorist on a minimum budget. Vauxhall, along with most other British makers, has thus decided not to tackle a more venturesome but also more ambitious market. The policy can be contrasted with that of Fiat, which is adding an even more frugal car to its excellent 600 model. The Italian policy, on the face of it, seems better attuned to the expansion of motoring.

Trade Agreement with Japan

TALKS on Anglo-Japanese trade and payments arrangements always take an unconscionable time. The last negotiations began on October 1st and are not completely settled now. This week it was announced that new trade arrangements have been signed, covering the year ending September 30, 1957, and that the payments agreement has been extended to March 31st "to give both governments more time to review it." Evidently Japan is still uneasy about the British proposals that the existing form of pay-

Taking the East into account

Twenty-five years ago you would have found this 'adding machine' of antiquity in every eastern branch of The Chartered Bank. It was of particular use in calculating the intricacies of exchange rates which often fluctuated with great rapidity. Today, the abacus is being replaced by the slide rule and the electric computer. The East is changing but The Chartered Bank remains in step, so that its knowledge of eastern trade, travel and investment is always up-to-date. This knowledge and a century of experience sustain a complete banking service available throughout a branch system, which extends to most centres of commercial importance in Southern and South-East Asia and the Far East.

THE CHARTERED BANK

(Incorporated by Royal Charter, 1853)

HEAD OFFICE: 38 BISHOPSGATE, LONDON, E.C.2

ICFC

Finance for Industry and Commerce

ICFC provides finance in the form of long-term loans on fixed terms, or share capital, to industrial or commercial enterprises established in Great Britain. Amounts range normally between £5,000 and £200,000.

During the present period of credit restrictions, the Corporation will only consider applications for capital from firms concerned in work of national importance. Consideration may also be given to new ventures which are soundly conceived and adequately sponsored.

Please write for our booklet—"Capital for Business and Where to Find It" to Dept. I, at any of the addresses below.
