Sir Eric Miller, chairman of the company, in the course of his address, said: We now have a sufficiently large area of modern rubber coming into production to more than offset the loss of trees under our continuing substantial replanting programme; thus our crop of 10,511,336 lb. exceeded that of the previous year by 876,136 lb. As usual, we sold some of our product in the form of sole crepe, and the entire crop realised the equivalent of 2s. 6½d. per lb London landed terms.

WORKING PROFIT

The profit before taxation, but after charging export duty and cess of £186,920 (£218,648), was £519,264, against £461,130 in the previous year. Our trade and other investments brought in £71,840 (£49,575). Taxation in Malaya and the United Kingdom on the year's profit, after allowing for adjustment in respect of previous years, absorbs £253,407 (£213,475). One way and another, the Governments between them kept 58 per cent of our earnings, leaving us with 42 per cent as our net profit of £265,857 (£247,655). Including the balance brought forward, the amount available is £427,438 (£415,823), out of which we have transferred £98,844, representing the year's expenditure on replanting, to Cultivation and Replacement Reserve, and recommend the payment of a final dividend of 25 per cent, making, with the interim dividend already paid, 35 per cent for the year, leaving £178,987 to carry forward to next account, against £161,581 brought in.

PROPERTY SALES

Most shareholders will recall that in 1952 the main part of Pataling estate—some 1,100 acres—was acquired by the State of Selangor for the development of what is now the township of Petaling Jaya and, out of the profit realised from this sale, a capital distribution of 8s. in the £ was made in October, 1952. Since then we have contracted to sell the balance of Pataling, amounting to some 300 acres, at satisfactory prices, the proceeds of 88 acres of which are included in the accounts at October 31, 1956. The capital profit of £34,635 shown in the notes on page 6 of the report and accounts includes these 88 acres, which sum with similar capital profits of £54,181 realised in previous years, makes available £88,816. Unfortunately when we come to distribute this to shareholders, as proposed, the company has to provide for profits tax which requires £18,817, leaving only enough to cover the 2¼d. per 2s. share (which is not taxable in the hands of shareholders) absorbing together £88,509.

REPLANTING

Our rejuvenation programme was further advanced during the year by replanting 1,336 acres of old rubber and new-planting 83 acres. In the calendar years 1957 and 1958 a further 2,300 acres or over 9 per cent of our planted acreage are scheduled for replanting or new-planting.

Sound agricultural conditions have been maintained at all estates.

RUBBER SITUATION

After touching 34d. the price of No. 1 RSS has returned to a more normal level at around 28d., which is a much healthier figure having regard to the price of synthetics.

Estimated world production of natural and synthetic for 1957 is put at 3,160,000 tons against probable consumption of 3,100,000 tons, but the political situation in Indonesia is tending to reduce production in that area. I therefore do not foresee any serious overburden of natural rubber.

This year's car production in USA will depend on the Spring selling campaign during the next month or two, but leading Authorities still look for an output of 6 to 6½ million cars. There are so many cars on the road there that tyre replacement business must be good.

The extensive plans which several of the large manufacturers have in hand to expand their production in different parts of the world is an indication that the demand for rubber is very much on the upgrade, the seasonal fluctuations being of minor significance.

The Pataling Company has benefited from its faith in the merits of sole crepe which continues to maintain a satisfactory premium over ordinary rubber.

TIN MINING

I told you last year that tin prospecting operations at Bikam were at a standstill pending improvement in the security situation. Subsequently the Tin Company came to the conclusion that values so far indicated were not good enough to justify mining, so we are planning to go ahead with replanting rubber there.

The Chinese miner who was interested in the Sultan Idris division of Chumor estate also decided that the tin values were too poor for open-cast mining.

STAFF

The many and varied problems with which our European and Asian staff are confronted today make heavy demands upon them, and the past year has not been an easy one: their loyalty and high sense of duty have been demonstrably evident and is something we value greatly. We also thank our Eastern Agents and Visiting Agents for their unfailing support throughout the year.

CHANGE OF POLITICAL STATUS

The forthcoming change in the political status of Malaya is in many ways momentous, but there is every evidence that those who are taking over the responsibilities of self-government have a clear appreciation of the important part which the Plantation and Mining industries play in the economy of the country. We therefore face the future with confidence.

The report and accounts were unanimously adopted.

THE BRITISH OXYGEN COMPANY LIMITED

SOME INCREASE IN PROFITS DESPITE HIGHER COSTS

PROGRESS OF DEVELOPMENT PLANS

MR J. S. HUTCHISON ON THE MONOPOLIES COMMISSION REPORT

The Seventy-first Annual General Meeting of the British Oxygen Company Limited was held on March 27th at Grosvenor House, Park Lane, London, W.1.

Mr J. S. Hutchison (the Chairman) presided, and, in the course of his speech, said:

The consolidated profit of £5,198,464, after depreciation of £2,610,299, is comparable with £4,845,639 including twelve months' trading of the parent company for 1954-55. (Last year's published figure of £4,277,152 included parent company trading for nine months only.) The additional profit of £352,825 is moderate in relation to a sales advance of 14 per cent and considerable additional capital employed.

CONSOLIDATED BALANCE SHEET

Additional investment in fixed assets was £9.3 million gross and an increase of £2.5 million in stock and work-in-progress refers mainly to tonnage and other oxygen production plants under construction. The £800,000 expansion in debtors reflects trading growth.

This total additional investment in operating assets of approximately £12.5 million was provided by £4 million of existing cash, treasury bills and tax certificates, £4 million bank overdraft, an increase in creditors of £1 million, and depreciation and profit retentions of £3.5 million.

DEBENTURE STOCK ISSUE

Last year I explained our wide programme of capital expenditure necessary to meet the growth in use of industrial gases and to provide for the high demands of the steelmaking programme. In November 1956 the issue was made of £10 million 5¾ per cent Debenture Stock 1981-86 enabling the bank overdraft to be repaid and a substantial sum provided towards the capital expenditure and working capital requirements stated in the prospectus.

UNITED KINGDOM GAS DIVISION

Sales of acetylene, propane, argon, nitrogen and other gases and gas mixtures are up, and medical oxygen, nitrous oxide and other anæsthetic gases have continued on a steady basis.

Advances again occurred in wages, salaries and materials costs and also in the important item of electricity where we do not benefit from the price freeze accorded to the general consumer. Increase in our selling prices was unavoidable despite our bigger output and there was a lowering of profit margins.

ENGINEERING DIVISION

British Oxygen Linde Limited has been active and successful in promoting plant sales and was recently awarded the £525,000 contract for two 50-ton/day oxygen plants to be installed in the new steel works at Durgapur, being built by the Indian Steelworks Construction Company Limited.

A new joint company, British Oxygen Wimpey Limited, was formed recently in association with George Wimpey and Company Limited to deal with the construction of special rocket projects. It is engaged on an important Government contract for the erection of buildings, plant and specialised mechanical equipment for the handling of large tonnages of liquid oxygen and nitrogen.

British Oxygen Aro Equipment Limited is engaged on development work which it is hoped will lead on to quantity production and sale of the very specialised equipment necessary for aeronautical purposes.

Sparklets Limited experienced a sharp contraction in profits. This arose from a big drop in demand for die-cast parts by the motor industry and others affected by the credit squeeze, accompanied by severe price competition. On the syphon side higher purchase tax hit sales of Streamline syphons and the dwindling supplies of hand-made glass vases for the standard models finally ceased. Marketing of the new popular-priced Hostmaster syphon was hastened and it found immediate public favour on its appearance a few months ago, so that the syphon business is steadily recovering. Other sides of Sparklets' business continue favourably, and results are now improving.

ELECTRIC WELDING DIVISION

Quasi-Arc Limited fully held its position in the highly competitive fields of electrodes and electric welding equipment. Assiduous development work has yielded new processes and a number of patents of some importance.

CHEMICALS DIVISION

Many will have read of our project for the manufacture in Northern Ireland of carbide and then of acetylene for pipeline supply to the adjacent du Pont neoprene factory. This may be regarded as our first tonnage acetylene project similar in principle to our tonnage oxygen projects, and is expected to come into operation in 1960.

DEVELOPMENT

In a decade since the war, our capital investment amounted to £46.6 million, of which £24 million came from depreciation reserves and retained profits. Sales of liquid oxygen in the United Kingdom increased four times, and the price is actually less than ten years ago. Overseas we had a threefold increase in turnover and expansion of our installations is parallel with the growing needs of Commonwealth development.

In Britain, the number for whom we provide employment has grown from 7,000 in 1946 to 13,000, and the group total is over 20,000.

The research and development organisation has contributed in many ways to our resource and efficiency. I mention two: the origin and successful establishment of our chemicals division: our complete grasp of the metallurgical/oxygen technique in steelmaking.

Today our capital development plans include replacement or reconstruction of the remaining first liquid oxygen works of twenty years ago and an increase in the 1956 oxygen total by 50 per cent in the next two years.

For tomorrow, our research teams, in addition to long-term fundamental work and applied work which is immediate, are active in such subjects as oxygen methods of steelmaking, liquid oxygen in aircraft, missile propellants, pure nitrogen for annealing, liquid nitrogen for atomic energy, transportation of acetylene and methane in the liquid state, the derivation of acetylene by new methods and investigation of new chemical products having an acetylene base.

MONOPOLIES COMMISSION

The report by the Monopolies and Restrictive Practices Commission published in January deals with our trading in the United Kingdom in oxygen, dissolved acetylene and propane.

I have given a record of fourfold sales expansion since the war, of a threefold expansion in capacity to be completed in the next two years, of development and research projected on a broad front. There must be a profit basis for all this; and a basis solid enough to overcome doubts when it comes to capital programmes, doubts about long-term ventures and doubts about bold research. The financial reward for enterprise must be such as to maintain and increase its momentum by making capital readily available as and when required.

MANAGEMENT AND STAFF

Our high rate of expansion continues to make severe demands on our Executive Directors who carry the responsibility for guidance of our manifold affairs. We are indebted to them and to their subsidiary company Directors and senior officers for a splendid year's work.

We are represented in the field by an army of workers who much more than in most other industries are our ambassadors by whom we are judged by the public. Our reputation is largely in their hands. It is greatly to their credit that a searching inquiry by the Monopolies Commission has revealed so much appreciation by customers of their effort; so very little complaint. And we thank them.

PROSPECTS

I have sketched for you our picture of yesterday's upsurge of growth and enrichment of interests, of today's vigorous expension in capital investment and application of modern techniques, and of the promise of tomorrow in varied fields. I hope you will agree with me that it is a record of vigour, enterprise and progress that gives us the right to look forward with confidence, as we do. I must make it plain, however, that the present industrial disputes will have considerable repercussions on our business. The effect cannot as yet be measured.

The report was adopted.

ENGLISH CHINA CLAYS LIMITED

RECORD HOME AND EXPORT SALES

SIR JOHN KEAY'S STATEMENT

The thirty-eighth annual general meeting of English China Clays Limited was held on March 28th at Hyde Park Hotel, Knightsbridge, London, S.W., Sir John Keay, ACA (chairman and managing director) presiding.

The following is the Chairman's Statement which had been circulated with the report and accounts and was taken as read:

The profit of the Group for the year ended September 30, 1956, after providing £936,439 for taxation, shows a reduction of £59,544 as compared with the previous year and amounts to £1,014,724. Your Directors are providing £80,000 for Taxation Equalisation Reserve and £477,028 to General Reserve, which now stands at £1,850,000 and recommend a final dividend of 3½ per cent, free of tax, which together with the interim dividend of 2 per cent, tax free, already paid brings the Ordinary dividend for the year ended September 30, 1956, to a total of 5½ per cent, tax free. The balance of Profit and Loss Account to be carried forward is £370,433.

The accounts give effect to the scheme of capital reconstruction previously approved by the shareholders and approved by the High Court of Justice on April 16, 1956, and in order to make a comparison with the Accounts of last year it is necessary to refer to the notes on pages 9 to 12 in the printed accounts. These notes explain the changes in the financial structure of the Group occasioned by the adoption of the scheme. All the minority shareholders' interests in English Clays Lovering Pochin and Company, Limited, have now been acquired or paid off and accordingly all the subsidiary companies are now wholly owned.

The Consolidated Balance Sheet at September 30, 1956, shows the issued capital and reserves at £8,464,487, of which £7,455,555 is represented by fixed assets comprising freehold property and mineral rights, leasehold property, plant and machinery, motor vehicles, etc., leaving a balance of £1,008,932 which equals the surplus of current assets over current and deferred liabilities and roughly represents our working capital.

REVIEW OF SALES

During the year under review the sales of our China Clays both in the Home and Export markets have again reached record figures. The Scandinavian and Continental markets have been particularly busy whilst American and Canadian dollar markets have been maintained with difficulty due to the continuing high freights ruling throughout the year. In the dollar markets today the competition of English China Clays with American China Clays is much hampered by Atlantic freighting costs. As mentioned in the Directors' report your company has purchased certain clay properties in Georgia, USA, which are now being worked by a wholly-owned subsidiary company, Anglo-American Clays Corporation. Apart from widening the range of the company's selling facilities in the USA other advantages in times of Atlantic freighting difficulties are expected to accrue.

MOLOCHITE

Since the first introduction of Molochite into the Refractory world it has made a steady progress. In the year under review, however, the increase in sales has been most marked and estimates for 1957 indicate an increase of approximately 100 per cent in sales. Present orders are keeping the Molochite plant working to full capacity, and plans are in hand to erect additional plant in order to meet the growing and encouraging demand.

NEW ACQUISITION

Since September 30, 1955, the company has acquired Cornwall Mills, Limited, of Par, Cornwall, and its subsidiary, Yate Mills, Limited, near Bristol. These mills are equipped for the grinding of rock minerals. The principal products are bases for cleaning powders, dry ground feldspar, silica, quartz and miscellaneous rock minerals. Its acquisition will facilitate considerably the development of the by-products of the company's mines and quarries, the mills at Par being conveniently situated alongside the company's harbour.

BUILDING AND QUARRYING

During the year the Building Subsidiaries showed a falling-off of profits due to the decline in the number of houses built by us for Local Authorities. Despite the smaller number of houses built we have succeeded in maintaining our relative position in the Local Authority housing field. Our maisonette and flat building development has proceeded satisfactorily, and, as mentioned last year, we have entered the field of private enterprise building. During the year, however, development has proceeded at a much slower pace than was anticipated due to the result of the Government's "Credit Squeeze" and its effect on the availability of Building Society finance.

The subsidiary companies dealing with limestone, quarrying, transport, etc., also contributed a substantial proportion of the Group profits.

MODERNISATION OF PLANT

Satisfactory progress was made on the capital schemes mentioned to you last year and which are designed to modernise and increase total China Clay production capacity. The installations at Lee Moor and Burngullow came into production in the late summer, and the Blackpool and Par installations are almost ready to be put into commission. Accordingly the current year's figures will only partly reflect the additional advantages these latter modern installations will yield.

REVIEW OF MANAGEMENT STRUCTURE

Reference was made last year to plans for the reorganisation of the management structure of the subsidiary companies which would follow the financial reconstruction scheme. During the year the services of professional Management Consultants were retained, and in consultation with them the management reorganisation of the subsidiary companies is in course of being put into effect.

The Apprenticeship and Educational training schemes have been extended and developed very successfully, and the Shareholders' prizes awarded to the apprentices showing the best all-round progress for the year in the different crafts were much appreciated.

COSTS OF PRODUCTION

The spiral of rising costs of production has continued throughout the year and the Price Index figures at December, 1956, of certain commodities, the purchase of which is necessary for the production of China Clay, are as follows: coal 174, oil 200, cement 141, timber 152, iron and steel 165. These Index figures are based on June, 1949, prices taken as 100. It has been, and continues to be, the policy of the company wherever possible to absorb partially these cost increases as they occur. The Index of China Clay selling prices, taken on the same basis referred to above, shows a Price Index range at December, 1956, of between 117 and 129, according to the quality. These comparatively low figures for China Clay have been made possible through increased sales and the greater productivity due to modernisation of plant. However, the increases in wages and the prices of consumable goods since September, 1956, particularly in heavy fuel oil and petrol, must inevitably be reflected in increased prices of our products and services.

MR C. SELLECK

It will be observed from the Directors' Report that Mr C. Selleck is not seeking re-election as a Director. It is a matter of great regret to my colleagues and myself that a fundamental divergence of views on matters of policy should bring about a severance of Mr Selleck's association with the group to which his services over a long period have been of great value.

THANKS TO EMPLOYEES AND CUSTOMERS

In conclusion it is customary for me to express on your behalf acknowledgment of the efforts of the workpeople, staff and executives, both at home and abroad. I do so again with great sincerity—it has been a difficult year, but the difficulties have been overcome successfully entirely due to the hard work, loyalty and enthusiastic efforts of all grades of the company's employees acting in the best interest of English China Clays Limited and its customers, to whom also we pay tribute for their loyalty and continued co-operation.

The report and accounts were unanimously adopted and the dividend as recommended was approved.

The retiring director, Mr W. O. Meade-King, was re-elected and Messrs Bourner Bullock & Company were appointed joint auditors of the company with Messrs Alfon, Charlesworth & Company, and the remuneration of the joint auditors was fixed.

At a subsequent extraordinary general meeting resolutions were passed altering the provisions of the company's Articles of Association dealing with the rights of the Preference shareholders and with directors' fees.

ALUMINIUM LIMITED

INDUSTRY'S CONTINUED GROWTH: HIGH LEVELS OF PRODUCTION, SALES AND EARNINGS

GROUP'S RESULTS CONSISTENT WITH STRONG AND EXPANDING CONDITIONS

FURTHER SUBSTANTIAL EXPANSION PLANNED

The annual meeting of Aluminium Limited will be held on April 25th in Montreal.

In his general review of the Company's affairs in 1956, Mr Nathanael V. Davis, the President, stated:

During 1956 the aluminium industry continued its growth, and we believe all North American producers experienced a year of high levels—and probably record levels—of production, sales and earnings. Aluminium Limited's results for the year are consistent with the strong and expanding conditions in which the industry as a whole operated.

The Company's net income, after all charges, including dividends on preferred shares of subsidiaries, was $55,657,372 or $5.56 per share on the 10,013,847 shares outstanding at the year end. Comparable figures for 1955 were $48,193,952 or the equivalent of $4.83 per share on the 9,975,690 shares outstanding on December 31, 1955. The improvement in earnings in 1956 occurred mainly during the last half of the year when a combination of new high levels of production, sales and higher selling prices obtained. Cash generation, comprising net income, depreciation and reserves for future income taxes increased during the year to a total of $106,711,431 or $10.66 per share.

In the second quarter of 1956 the quarterly dividend was increased from US55c per share to US60c per share, and the new rate was maintained for the remainder of the year. Total dividend disbursements were the equivalent of $23,192,053 in Canadian currency as compared with $21,076,253 in 1955.

PRODUCTION AND SALES

In the early part of the year production at the Company's Canadian smelters in the Saguenay area was sharply curtailed by an unusually severe water shortage. With the coming of the spring floods and good summer rains, production was brought up to a high rate and was supplemented by new facilities brought into operation in Kitimat. The increase of production obtained after the spring floods offset by a small margin the losses sustained during the earlier part of the year. The total production of primary metal from all Canadian smelters for the year was 620,300 short tons as compared to 607,700 in 1955. At the year end the Company's Canadian plants were producing at an approximate annual rate of 760,000 tons.

Sales and operating revenues were $483 million in 1956, as compared to $412 million in 1955. Although the total physical volume of sales of aluminium products increased, a large part of the increase in the dollar volume of sales is attributable to the higher selling prices which prevailed during the year. In the United States, the delivered prices of primary aluminium increased in two stages during the year from 22½c per pound at the beginning of the year to 25c at the end of the year. The prices of the Company's primary metal were increased by approximately similar amounts in its several markets during the course of the year.

EXPANSION IN 1956

In 1956, a total of $125 million was spent on the construction of new facilities. The bulk of these capital expenditures went into additional plant for raw materials, smelting and power generation required for the integrated production of primary aluminium. A total of 90,000 tons of new capacity was brought into operation at Kitimat during the year, bringing Kitimat's total installed capacity up to 180,000 tons. Alumina facilities in Jamaica were also enlarged during the year to supply the necessary raw materials for the increased primary aluminium production in Canada. As foreseen in last year's Annual Report, Kitimat, with the increased production facilities now in operation, is beginning to contribute to the Company's earnings. As in previous years, some further expansion took place in the field of fabrication among many of the Company's subsidiaries. At the year end, the total assets employed in the business, after depreciation reserves, stood at $1,084,451,925.

CURRENT BUSINESS

During the closing months of 1956, the supply of primary aluminium caught up with demand in the United Kingdom and the United States, and Aluminium Limited ended 1956 with a small amount of metal available for immediate sale. Since the year end, sales have been running slightly below the rate of production which has been maintained at a high level. The resulting accumulation to date of a relatively small stock of saleable metal is, in the Company's view, basically a healthy and desirable development. For the first time in several years Aluminium Limited and, we believe, other North American producers, are in a position to meet current levels of demand and to encourage—by availability of metal, active selling, and the development of new products and uses—the further growth in the consumption of aluminium which the Company foresees with confidence.

FUTURE EXPANSION

The Company still has before it a large expansion programme. As previously announced, the Company is in the process of increasing Kitimat's production facilities in stages up to a total annual capacity of approximately 300,000 tons, scheduled to be fully installed by 1960. In the Saguenay area, work is progressing on the new hydro-electric plant at Chute-des-Passes, which is expected to provide an additional 700,000 firm horsepower upon completion in 1959. Related smelting facilities in Quebec, with an annual capacity of 120,000 tons, are also being planned together with new alumina and bauxite developments in Jamaica, British Guiana, and French West Africa. Construction is under way both in Jamaica and British Guiana.

The French West African development, which is of a longer term nature, is now being engineered and construction is scheduled to begin towards the end of this year. The opening up of this new and extensive bauxite area is expected to provide the raw material base for potential future operations both within French West Africa and in other areas where additional smelting may be developed.

The overall programme has been designed to permit flexibility in construction schedules and the Company will be prepared to adjust the rate of expansion in the light of market and other conditions as they may develop.

FINANCING

During the course of the year a $100 million intermediate term credit-line was established by the Aluminum Company of Canada, Ltd., with several United States and Canadian banks to provide temporary funds for the Company's expansion programme. Currently, steps are being taken by the Aluminum Company of Canada, Ltd., to raise in the near future a $125 million long-term debenture issue to provide the more permanent capital needed for the Canadian expansion programme. This financing was foreseen when the programme was announced in April of 1956.

This summary would be incomplete if no mention were made of the devotion and perseverance shown by the Company's personnel during the past year and previous years. The pace has been rapid and great credit is due our many people both in Canada and abroad who have devoted themselves with vigour and patience to the task of maintaining operations at high levels and carrying through at the same time an extensive expansion programme.

THE SCOTTISH MUTUAL ASSURANCE SOCIETY

CONTINUED SATISFACTORY EXPANSION

The seventy-fourth annual general meeting of The Scottish Mutual Assurance Society was held on March 27th in Glasgow.

Mr T. R. Patterson, CBE, DL, JP (the Chairman), who presided, referred to the great loss which the Society has suffered by the death of their Chairman, Sir John Craig, CBE, DL, LLD, and paid tribute to the services he had rendered not only to the Society but to the whole business life of Scotland.

The Chairman continued:

The figures in the Report show that the Society continues to expand in a satisfactory manner. For the first time the net new sums assured have exceeded £5 million and we congratulate the Field Staff on achieving a record for the eighth year in succession. The premium income has increased by over 100 per cent compared with the previous year. For the first time also the Life Assurance Fund has increased in a year by more than £1 million and now amounts to nearly £15 million.

The gross rate of interest earned on the funds is £5 18s. 11d. per cent, which is 4s. per cent higher than last year and is a record in the history of the Society. This substantial rate of interest is due to the increases in dividends on our holdings of Ordinary shares and to the favourable terms on which new funds could be invested in the last year or two.

The report was adopted.

REVERTEX LIMITED

ANOTHER SATISFACTORY YEAR

INCREASED VOLUME OF SALES

MR D. H. SCOTT'S STATEMENT

The thirty-third annual general meeting of Revertex Limited was held on March 21st at 51/55 Strand, London, WC, Mr D. H. Scott, CBE (chairman and managing director), presiding.

The assistant secretary (Mr. H. Wiltshire) read the notice convening the meeting and the report of the auditors.

The following is the Statement by the Chairman which had been circulated with the report and accounts for the year ended September 30, 1956, and was taken as read:

I am glad to be able to report that our Company has had another satisfactory year. The volume of sales of both Revertex and Emultex has increased, but owing to reduced profit margins the net profit is somewhat lower than that for the previous year, which was a record year.

GENERAL

During November I visted our establishment at Kluang in Malaya. Although there is still a hard core of bandits in the neighbourhood and precautions have to be taken, conditions in general are a great deal better than they were when I was last there three years ago. Our factory is in very good order and our staff are in good heart.

The great question with which everyone who operates in Malaya is now concerned, is what pattern will emerge after Home Rule has been granted during the course of this year. It is hoped that the administration will learn from the experience of Indonesia and Ceylon and that the process of Malayanisation will be slowed down accordingly, in which case we should be able to count on Kluang as our main base of operations on the latex side, for several years to come.

As you know, we already have a plant in Ceylon and as a further precaution against untoward political developments in Malaya, we are considering the installation of a plant in Africa. Mr Marsh and Mr Coleman, our Eastern Production Manager, are now in Africa investigating the position in detail, and are visiting all the rubber growing districts in Nigeria, the Cameroons and Belgian Congo.

Shareholders will recollect that since the war we have charged depreciation at the rate of 20 per cent per annum on the original cost of all our Malayan assets, with the result that factory buildings, houses, plant, machinery and equipment in that country which cost originally £302,992 now stand in the Balance Sheet at £81,448.

PRODUCTION

During the year we have increased our capacity for Emultex, both by the installation of further plant and by improvements in technique. We have maintained a high standard of quality and you will be interested to know that about half our deliveries of Emultex in this country are now made in bulk by road tankers.

Our third factory unit at Harlow for the production of Alcotex (polyvinyl alcohol), to which I referred in my speech last year, is now practically complete although, unfortunately, about six months behind schedule owing to delays in the delivery of steel and other circumstances beyond our control. We are in course of running in this plant and by the end of the current year our productive capacity for this material should have substantially increased.

ACCOUNTS

For the year under review the profit, before tax, amounted to £392,198 as compared with £467,007 for the previous year. The net profit, after making full provision for taxation, was £193,198 as compared with £234,007. The charge for profits tax on these lower profits was £6,500 more than the previous year, owing to the increase in the rate and the increased distribution.

The value of our stocks and the amount of forward sales of rubber are both appreciably lower, partly because our physical stocks are lower and partly because of the lower price of rubber.

I have explained before that we always hedge our stocks in order to reduce as far as possible the risk from fluctuations in the price of rubber but, as I warned you last year, when there is a persistent backwardation, i.e. when the forward positions are at a discount compared with spot, this hedging can only be done at some cost. In point of fact our hedging last year cost us about £66,000 as compared with £20,700 in the previous year. This may seem a very expensive form of protection but it is the only one available. If we had not hedged, our loss on stock over the year would have been over £240,000. I am glad to say that the backwardation in the rubber market is now very much less, with the result that our hedging for the first four months of the current year has cost us about £4,500.

DIVIDEND AND PROSPECTS

The Directors recommend the payment of a final dividend of 15 per cent, less tax, making with the interim dividend of 10 per cent, less tax, paid last November, a total of 25 per cent, less tax, for the year. The total dividend of 25 per cent, less tax, on the increased capital will absorb the sum of £65,227 net, and after allowing for the £41,250 capitalised last year, unappropriated profits will be increased by £86,721 to £476,608.

In addition the Directors had intended to issue to the shareholders one new ordinary share of 5s. each, credited as fully paid, for every ten shares held. HM Treasury has however refused its consent to this issue.

I find it more than usually difficult to forecast the results for the current year. The estimated profit for the first quarter, before allowing for hedging, is a little lower than for the first quarter of the previous year. At present it looks as though the cost of hedging should be very much less than last year. On the other hand, competition in the Emultex field is keener than ever and the margin of profit is lower. At this stage I cannot say, therefore, whether the profits for the year will be higher or lower than last year, but I think they will be not unsatisfactory. On a longer view I hope that the profits on Alcotex and other products which we are developing will more than offset any decline in the profits on Emultex.

In conclusion I know you would like me to express your appreciation of the good work done by all our staff and employees both at home and in Malaya.

The report and accounts were unanimously adopted and the dividend as recommended was approved.

The retiring director, Mr T. H. Powell, was re-elected, and it was resolved that the remuneration of the auditors, Messrs Deloitte, Plender, Griffiths & Co., be fixed by the directors.

The proceedings terminated with a vote of thanks to the chairman, directors, staff and employees.

BEAUMONT PROPERTY TRUST

FURTHER ACQUISITIONS

The twenty-third annual general meeting of The Beaumont Property Trust, Limited, was held on March 27th in London, Mr Cyril W. Black, JP, MP, FRICS, FAI, chairman, presiding.

The following is an extract from his circulated statement for the year ended September 30, 1956:

For some time past your directors have considered it to be in the interests of the company to reduce, as opportunities occurred, the proportion of our capital invested in blocks of flats, and to increase the proportion invested in shops and other business properties. During the year we reduced the total number of flats in our ownership by 165, from 2,279 to 2,114. Notwithstanding this reduction in our holding of flats, the cost of services rose steeply, in particular in respect of fuel for the hot water and central heating services. Abnormally heavy expenditure was also incurred on repairs and, even after allowing for the fact that part of this expenditure was written off against reserves created for the purpose in previous years, the charge to Revenue Account was very high.

RESERVES STRENGTHENED

The reserves of the Group have been further strengthened during the year by the addition to Contingencies Reserve of a sum of £15,000, and the capital and revenue reserves, including the amounts carried forward, now amount to the impressive total of £314,748, which is equivalent to about 8s. 9d. per £1 Ordinary Share of the Parent Company.

Since the end of the financial year the company has acquired the whole of the issued Share Capital of Aberford Holdings Limited, a company owning long leasehold properties consisting of shops and upper parts in first-class trading positions in Bristol and Exeter. These properties are let to well-known traders. The properties in question are valued at over £150,000, and are mortgaged for £105,000. The consideration for these Shares has been satisfied by the issue to the Vendors of 40,190 Ordinary Shares in the Capital of our Company at 23s. 6d. per Share.

The demand for our properties continues to be very satisfactory and, in the foreseeable future, it is unlikely that there will be any difficulty in keeping them fully let. Your directors therefore envisage a satisfactory and progressive future for the companies.

The report and accounts were adopted.

THE SCOTTISH LIFE ASSURANCE COMPANY, LIMITED

YEAR OF STEADY PROGRESS

In the absence through illness of Mr C. R. Munro, CA, Sir Thomas Clark, Bart, DL, presided at the Annual General Meeting of The Scottish Life Assurance Company, Limited, held in Edinburgh on March 27th.

In moving adoption of the report and accounts for the year ended December 31, 1956, the Chairman said:

NEW BUSINESS—SEVENTH SUCCESSIVE RECORD YEAR

This is the seventh successive occasion on which we can report that the new life assurance business is a record for the Company. Last year the net new business showed the substantial increase of 28 per cent and it is satisfactory that we have not only maintained the position but have shown a further small increase in 1956. It is interesting to note that our new business production has been doubled over the last five years and for the first time in the Company's history the net new business has exceeded £9 million. Included in this figure is group life business of £1,800,000, which is 32 per cent higher than the corresponding figure in 1955.

LIFE AND ANNUITY ACCOUNT

Our premium income continues to increase steadily and this year the increase is 16 per cent over 1955 compared with increases of 22 per cent and 15 per cent in the previous two years. 1956 has proved a favourable year for the investment of our funds and the gross rate of interest earned has risen to £5 13s. 11d. per cent compared with £5 12s. 8d. per cent in 1955. The corresponding net rates, after deduction of income-tax, are £4 19s. 11d. per cent and £4 16s. 11d. per cent respectively. Claims by death at 53 per cent of the expectation, although a little above the extremely low figure of 47 per cent last year, are again satisfactorily light. Once again the expense ratio has shown a small decrease.

BALANCE SHEET

From the distribution of our investments shown in the balance sheet it can be seen that the principal increase during 1956 has been in mortgages, to which I shall refer later. Increases have also occurred in debentures, which have been available on a very satisfactory yield basis and in ordinary shares, both of these increases reflecting a substantial participation in the provision of additional capital for industry. As has been mentioned before, our portfolio of ordinary shares includes a proportion of American and Canadian stocks.

The total market value of our investments is substantially in excess of the figure at which they stand in the Company's books.

PROTECTION AGAINST PREMATURE DEATH

The Life assurance "habits" of the United Kingdom population have changed considerably in the past half century. Fifty years ago only about one quarter of the new ordinary policies issued in the United Kingdom were endowment assurances, whereas at the present time about two-thirds are endowment assurances. It is important, however, to remember that protection against premature death is still a primary object of life assurance and in this connection I am able to report that, including group life assurance, very nearly half of our new business in 1956 was effected under policies payable on death only.

HOUSE PURCHASE SCHEME

As I have already mentioned, our Balance Sheet indicates that we have been very active during 1956 in mortgages, most of which are in connection with our House Purchase Scheme. The demand, indeed, for our mortgage facilities was so great that we found it necessary to limit the amount of our new money to be invested in this manner. At the same time we were well able to maintain our careful selection of borrowers and properties. These investments are all well secured and have the added attraction of introducing life assurance business to the Company. Although interest rates continued to rise during 1956, we have kept the rate of interest on these loans at 5½ per cent.

PURCHASED LIFE ANNUITIES

It has for long been appreciated that in the case of a purchased life annuity, part of each payment is in fact a return to the purchaser of a portion of the original capital, the remainder of the payment being interest on that capital. Under taxation practice as it was before the 1956 Finance Act, however, the whole of each annual payment was regarded as income and subjected to deduction of tax. This was clearly an injustice which has been remedied, with the result that each annual payment of a life annuity purchased by the annuitant is now split into a capital portion and an interest portion, and only the interest portion is treated as taxable income of the annuitant.

SELF-EMPLOYED PERSONS

A second major benefit effected by the 1956 Finance Act is the entirely new facility for the provision of pensions for self-employed persons—facilities which, moreover, are not restricted to self-employed persons but are open to employed persons for whom no superannuation arrangements exist. Subject to certain conditions, self-employed persons can now set aside premiums which are to be applied towards providing a pension. These premiums, within certain statutory limits, rank for relief not only from income tax but also from surtax. Furthermore, the premiums must be placed by the Company in a special fund, the interest income of which is relieved from tax—a considerable advantage which the policyholder could not obtain as an individual.

As is revealed in the Directors' report, circulated with the Annual Accounts, we have issued in 1956, 171 contracts under the provisions to which I have just referred, for premiums of about £50,000. These contracts were all issued on a non-profit basis. We can now also offer a with profits contract under which a bonus pension may be added to the basic pension, thus affording some degree of protection against the effects of inflation.

TAXATION OF LIFE ASSURANCE OFFICES

Other important changes introduced by the Finance Act relate to the basis of taxation of life assurance offices. The subject is one which involves considerable technical detail and I therefore propose to refer only to one change which we were particularly glad to see. Until last year, trustees, who established private pension funds to provide pensions for employees and which were approved under Section 379 of the Income Tax Act 1952, were allowed to have interest on the fund exempted from income tax. If, however, instead of investing the fund themselves the trustees reassured the fund with a life assurance company, the same privilege concerning relief from income tax did not apply to the interest collected by the life assurance company. The 1956 Finance Act has corrected this taxation defect and as a result we have been able to improve our terms both for new and already existing pension schemes of this type.

DIVIDEND

It is recommended that the final dividend for 1956 be 6s. per share, making with the interim of 4s. already paid, a total of 10s. per share—the same as in 1955.

The motion was duly adopted.

IONIAN BANK LIMITED

MR A. H. REID'S STATEMENT

The one hundred and eighteenth annual general meeting of Ionian Bank Limited will be held on April 16th at 25-31 Moorgate, London, E.C.2.

The following are extracts from the statement by the Chairman, Mr A. H. Reid, CBE, circulated with the report and accounts for the year ended December 31, 1956:

As you will see from the Directors' report, our Egyptian branches have been sequestrated and "Egyptianised," but we have succeeded in repatriating those of our staff who are of British and French nationality and who were dismissed by the Sequestrator and expelled. Next August would have seen the fiftieth anniversary of the opening of our Alexandria branch. In the half-century which has elapsed it is fair to say that the Ionian Bank has made a noteworthy contribution to the development of Egypt's economy. Over the years we have acquired a wide circle of friends in every branch of Egypt's economy, and the business that we have created has earned us good profits. I may add that last autumn our organisation in Egypt was giving employment to some 330 men and women, of whom the overwhelming majority were Egyptian subjects.

CHANGES IN ACCOUNTS

The exclusion of all figures relating to Egypt from our accounts for the year ended December 31, 1956, has resulted in important changes when the accounts are compared with those for the previous year, which included our Egyptian activities. It is hardly surprising that our total assets should have fallen from £16,695,546 to £13,457,616. This decrease is largely to be accounted for by a fall in loans, advances and other assets from £7,260,459 to £5,121,804, and in liabilities of customers for documentary credits, guarantees and other obligations from

£4,242,759 to £2,680,993. Similarly, deposits have fallen from £11,217,617 to £9,541,471.

On the other hand, although cash in hand and balances with foreign correspondents have fallen from £2,405,494 to £1,905,569, our holding of British Government Securities has increased from £1,471,500 to £1,879,959, which figure represents the lower of cost or market value.

PROGRESS IN GREECE

In Greece progress has on the whole been well maintained. Tobacco continued to be the most important export, but the second place, which had previously been held by currants and sultanas, was taken by raw cotton. There was also a substantial increase in exports of mineral ores. Imports were much greater than in the previous year. However, invisible receipts, especially emigrants' remittances and income from shipping, continued to increase, and these receipts combined with financial aid from America made it possible to meet the cost of the imports without drawing on foreign currency reserves.

The introduction of higher rates of interest for savings deposits, together with the growing feeling of confidence in the country's economy attracted a larger volume of funds to the banks. However, there was a narrow margin between the rates paid on deposits and lending rates, and most banks had some difficulty in covering their increased expenses. Our branches in Greece have again increased their volume of business, but for the reason given above their profits have been lower than in the previous year. Our two subsidiary companies had an active year.

POSITION IN CYPRUS

The unhappy situation in Cyprus persisted throughout the year, during the whole of which the island was in a state of emergency. Nevertheless, economic conditions were active, and in general trade and commerce had a good year, though inflationary conditions continue to prevail, and have manifested themselves in labour shortages and a constant rise in the cost of living. The grain harvest was well above the average, and prices realised were good. The carob and citrus crops, on the other hand, were lower in quantity, though they sold at higher prices than in 1955.

Meanwhile, military expenditure continued at a higher level, though there are indications that the peak has been reached, if it has not been passed.

On the other hand, the expenditure of the Government of Cyprus is unusually high, and last year it included nearly £3½ million attributable to increases directly connected with the emergency. Our own branches had an active year and realised good profits.

BANCA NAZIONALE DEL LAVORO

PROGRESS OF BANCA NAZIONALE DEL LAVORO DURING 1956

DEPOSITS rose from Lit.603,707 million to Lit.666,685 million (£gs.380,962,800).
PROFIT rose from Lit.810 million to Lit.933 million (£gs.533,100).
RESERVES rose from Lit.5,300 million to Lit.7,420 million and, after approval of the balance sheet, to Lit.9,000 million (£gs.5,142,900).
STAFF RETIREMENT FUND & PROVIDENT FUND rose from Lit.13,061 million to Lit.15,197 million (£gs.8,684,000).
PREMISES, ETC. figure at a value of one Lira after Lit.787 million (£gs.449,700) had been written off during 1956. The real estate gave a rent of Lit.583 million (£gs.333,100). An amount of Lit.737 million (£gs.421,100) spent during the last year for the installation, reconstruction and organisation of the Bank's premises, and Branch Offices, was also written off.
PARTICIPATIONS, except for the Bank's share in the Autonomous Sections stand in the Balance Sheet at a value of one Lira after Lit.377 million (£gs.215,400) had been written off during 1956.
TAXES paid in 1956 amounted to Lit.3,613 million (£gs.2,064,500).
RECOVERIES in 1956 in respect of debts totally written off amounted to Lit.351 million (£gs.200,500).
THE TOTAL OF THE BALANCE SHEET, exclusive of the "Contra-Accounts", rose from Lit.802,821 million to Lit.931,164 million (£gs.532,093,700).

AUTONOMOUS SECTIONS

BANCA NAZIONALE DEL LAVORO operates also in various specific fields of activity through the intermediary of its following Autonomous Sections, the annual accounts of which are shown separately.
—Section for Mortgage Credit
—Section for Hotel and Tourist Credit
—Section for Credit to Medium-sized and Small Industries
—Section for Motion Picture Credit
—Section for Credit to Co-operatives
The importance of these Sections and of the intervention in the respective spheres of activity during 1956 will appear from the following:
TOTAL CAPITAL FUNDS OF THE SECTIONS rose from Lit.4,537 million to Lit.5,537 million (£gs.3,164,000).
TOTAL RESERVES of the Sections rose from Lit.1,667 million to Lit.2,076 million (£gs.1,186,300) after approval of the Balance Sheets as at 31st December, 1956.
ADVANCES AND LOANS (including half-yearly payments due) which on 31st December, 1955 amounted to Lit.67,863 million, reached a total of Lit.87,445 million (£gs.49,968,500) at the close of 1956.
PROFIT of the Sections rose from Lit.560 million to Lit.661 million (£gs.377,700).
THE TOTALS OF THE BALANCE SHEET OF THE SECTIONS, exclusive of the "Contra-Accounts", altogether rose from Lit.73,069 million to Lit.96,548 million (£gs.55,169,100).
COMBINED CAPITAL AND RESERVES OF BANCA NAZIONALE DEL LAVORO AND ITS AUTONOMOUS SECTIONS AFTER THE APPROVAL OF THE BALANCE SHEETS AS AT 31st DECEMBER, 1956, AMOUNT TO Lit.20,756,781,200 (£gs.11,861,000).

HARRODS LIMITED

ANOTHER RECORD YEAR

SIR RICHARD BURBIDGE ON THE CONTINUED PROGRESS

The sixty-seventh annual general meeting of Harrods Limited will be held on April 25th in London.

The following is an extract from the statement by the chairman and managing director, Sir Richard Burbidge, Bart, CBE, which has been circulated with the report and accounts:

The result of the trading for the year to January 31, 1957, has exceeded my most optimistic expectations. It has been a year of irregular and unconventional business. There is no need for me to remind you of the many adverse factors that affected us, the credit squeeze, the very cold spring and wet summer, the Suez crisis and petrol rationing.

The trading for the first half-year was frankly disappointing, except at Harrods. During the second half-year, on the other hand, all our stores increased their turnover and, strange to say, this was in part the result of the adverse factors just mentioned. The bad weather undoubtedly made more people spend their holidays at home, and this benefited our London Stores in particular. The very heavy pre-budget buying in October and November, 1955, made it difficult to maintain our trade in the corresponding months this year. On the other hand there was a certain amount of forward buying during the Suez crisis owing to the fear that prices would rise, while the general relief when actual operations ceased certainly had a beneficial effect on the trade during the Christmas and January Sale periods.

While I suppose I should not grumble if the final result is satisfactory, I must confess that these ups and downs in trade are very disturbing from a merchandise planning point of view. The frequent political and economic crises have caused many instances of forward buying (of necessities rather than luxury goods) due to lack of confidence in the possible supply position or the price level of commodities. Such purchases are made forward because the purchaser feels that if prices increase the goods will be out of reach. Whereas in the past most families had a favourable margin between income and expenditure, a margin that could cover increased prices, there is now an ever-growing number of people who have little or no margin at all. The main reason for this is the present penal rate of taxation which is gradually but surely sapping the self-confidence of the nation.

I realise that Government expenditure, like all other expenditure, has increased, but I feel that whereas the individual or the Company has at times to cut expenditure, because extra income is hard to obtain, Governments are under no such handicap. They raise taxation to cover their increased expenditure, and in addition in recent years have budgeted for large surpluses with the avowed intention of withdrawing spending power from the individual. I think the time has come when some relief must be given.

I am sure that without proper incentives we cannot achieve the production that is so necessary, and the greatest incentive of all would be for taxation to be reduced and more freedom allowed the individual to decide how earnings should be spent.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

The Gross Profit on Trading increased by £818,182 (to the record figure of £9,035,621, an increase of nearly 10 per cent. While this was to a small extent due to the inclusion for the first time of profit from Rackhams in Birmingham, it was in the main due to increased trade which again broke all records. The total Gross Profit is £9,164,079 against £8,263,047 last year.

After deducting various expenses the profit before Taxation is £299,402 more than last year and amounts to £2,462,798. Nearly 60 per cent of this profit is absorbed by taxation which is £229,829 more than last year, this representing no less than three-quarters of the increased profit.

After various appropriations and allowing for the dividends of £575,000, there will remain a balance of £23,138 which will increase the total of Profit Carried Forward to £441,722.

Consolidated Balance Sheet: Total Reserves, including Future Income Tax, now amount to £6,799,902, a very substantial figure.

Total Assets have increased by £595,873 during the year, of which £193,831 is represented by Current Assets now amounting to £10,287,527, very nearly one-half of the total.

I am sure you will agree that the Accounts disclose a strong and satisfactory position and are evidence that we continue to make progress.

HARRODS AND SUBSIDIARIES

The backbone of the Group is still Harrods in Knightsbridge, where trading and profits have been exceptionally good.

Our other businesses in London, Dickins & Jones and D. H. Evans, have both surpassed their previous best, and have contributed to a larger extent to "Harrods'" profits. I am sure their success will continue.

Our other business in the South, Rockheys of Torquay, has enjoyed the best year since we purchased it, and we can look forward to a larger dividend contribution from it in the future.

Kendal Milne & Company, in Manchester, has not been so successful as our other stores, but they have been much more adversely affected by the prevailing conditions and also by certain alterations that have taken place. I am pleased to say their total trade during the second half-year increased, and I look forward with confidence to better results next year.

Our Sheffield Store, John Walshe, succeeded in achieving a record turnover, and will, I am sure, continue to improve.

Henderson's, in Liverpool, had a very satisfactory year, both as regards turnover, another record, and profit.

Birmingham: Negotiations have been continuing between our architects and the Corporation, and we hope to put our plans before the Council in the near future. I am more confident than ever that this development will enhance the centre of this great city and prove itself an important step forward in the fortunes of your company.

PROSPECTS

I cannot see any relief from the burden of growing expenses, so it becomes more and more necessary to increase our turnover. The re-development of Knightsbridge and particularly the erection of vast new office buildings will bring many more customers to the district, and this should help our main store.

Provided that general conditions do not deteriorate, I feel we may justifiably look forward to another satisfactory year.

HASTINGS AND THANET BUILDING SOCIETY

PROGRESS BASED ON GREAT STRENGTH

The Annual General Meeting was held at Ramsgate on March 28th, and in his review the Chairman, Mr Ernest Barber, LRIBA, said that the Report and Statement of Accounts for the year ended December 31, 1956, provided sure evidence that the Society had continued to develop on an eminently satisfactory basis. The credit squeeze and the Suez trouble had had an effect on business, but mankind through the ages had always been faced with crises, and it was the task of the board to plan for these ups and downs. Due to the steady loyalty and support of members, the results for last year were very creditable indeed, and would bear the most critical examination.

1956 started by business being buoyant. The Society could claim that during the year it had never ceased to accept applications for loans. It was well to remind critics that building societies were mutual-benefit institutions, not concerned with making profits. Investors sought a safe depository for savings at a rate of interest in keeping with market rates. The equally thrifty borrower, buying a house for occupation, generally had but a limited amount of money for the down-payment. He paid the lender, through the Society, a fair rate of interest, plus only a margin to cover administrative expenses and essential reserves. The rate of interest at which building societies could lend was clearly governed by the rate at which they could borrow, and the savings facilities offered by the Government were the most active competitor for funds.

During the year 1956, total assets increased by nearly £1½ million, and now exceeded £21 million; the surplus on the year enabled the Directors to maintain powerful reserve and surplus funds at over 5 per cent of total assets, which was looked upon as ideal. Over £2¼ million was in gilt-edged securities and at the Bank, the proportion to total funds being far in excess of the minimum recommended by the Building Societies Association. New savings in 1956 were a record, at £3¾ million, but because of higher withdrawals, advances at £3¼ million, mainly for the provision of homes, were less than in 1955.

A new branch had recently been opened at Kingston-upon-Thames, and others at Watford and Ilford would shortly be ready.

The Society welcomed into membership the members of the Orpington Building Society, the Brentwood Building Society, and the Amersham & District Permanent Building Society, a total of 1,000 investors and 400 borrowers, who would gain the extra benefits which a larger organisation provided.

The Society was ready to discuss with any well-constituted small or medium Society, schemes under which a union might be beneficial, and the Directors were confident that many opportunities for such talks would present themselves in the near future.

The Report and Accounts were adopted, the retiring Directors re-elected, and the Auditors re-appointed.

THE INVERESK PAPER COMPANY

UNSETTLED TRADING CONDITIONS

MR CHARLES SNELLING ON CAPITAL EXPENDITURE AND DEVELOPMENT

The thirty-fourth annual general meeting of The Inveresk Paper Company Limited was held on March 26th in London.

Mr Charles Snelling, CBE (chairman and managing director), presided, and, in the course of his speech, said:

I would first of all refer to the resignation from the Board of Mr Douglas Hamlyn owing to ill-health. He was associated with the Company for some twenty-seven years and was latterly Deputy Chairman. I am sure you will join with me in expressing our appreciation of the very great services he rendered to the Group and in wishing him improved health, so that he may enjoy the leisure he so fully deserves. Mr A. H. Bruce has been elected Deputy Chairman in his place.

A year ago I sounded a note of warning that owing to unfavourable trading conditions the profits of the Group for the year now under review would be adversely affected, and this warning was confirmed at the time of the interim dividend announcement last September. As stated at that time, the Group profits were materially affected owing to generally unsettled trading conditions during the last seven months of the financial year and the fact that there was no compensating increase in the selling price of paper during that period to offset the substantial rise in production costs.

When comparing the results with the previous financial year, there must be taken into account the fact that in the year to September, 1955, we were working a considerable amount of overtime, whereas for the last seven months of the financial year under review short-time working was in operation.

There seems little doubt that the unfavourable trading conditions to which I referred a year ago were greatly aggravated by the subsequent so-called credit squeeze whereby many of our customers experienced a rapid recession in trade. As a result, particularly during the latter part of the year, demand for paper products further declined.

In addition to suffering the effects of the limitations placed on credit facilities of Industry generally, we have also had steadily rising costs of production following the increase in coal and power prices in June, 1956. As it was not found possible to adjust paper prices to meet these increased costs, it will be appreciated that they had to be absorbed by the Mills, which have been obliged to operate at a much smaller margin of profit.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

The Group's trading profits before taxation but after charging depreciation of £564,000 amounted to £3,149,000. Provision for taxation required £1,738,000—over 55 per cent of the profits—so that the net consolidated profits amounted to £1,411,000, a decrease of £608,000 compared with the previous year.

After including £87,000 past over-provision for taxation and deducting the proportion of profits applicable to outside shareholders, the net profit amounted to £1,441,000 of which £660,000 has been retained in the accounts of subsidiary companies and £374,000 in the accounts of the parent company, making a total of £1,034,000 added to the Group's reserves from the profits of the year.

Having regard to these retained profits of over a million pounds, your Directors feel justified in recommending the maintenance of the same dividend as last year by the payment of a final dividend of 6¼ per cent free of tax on the issued Ordinary Stock, making with the 1¾ per cent interim dividend already paid a total of 8¼ per cent free of tax for the year.

CAPITAL EXPENDITURE PROGRAMME

Group capital expenditure for the year amounted to £1,890,000 which means that over the last eleven years since the War we have spent nearly £9 million on capital expenditure and during the same period have written off by way of depreciation practically £4 million. Capital commitments outstanding at the close of the year totalled about £1,800,000 and further expenditure has since been undertaken.

A considerable proportion of this expenditure is in connection with the reconstruction being carried out at three of our Mills—namely, The Witchampton Paper Mills Limited, the Woodhall Paper Company Limited, and Harold Jackson Limited, involving a major reconstruction of the Witchampton machine and the installation of a new board machine at the Woodhall Company. We have also commenced the installation of a new steam boiler plant at The Carrongrove Paper Company.

In addition, we have continued our policy of modernising our Mills, new buildings and machinery having been built and installed with the object of producing first-class quality paper at the lowest possible cost.

This capital expenditure programme, in addition to the purchase of new undertakings, has so far been financed entirely out of our own resources and amply justifies our policy of re-investing part of our taxed profits in the business year by year. Whether or not we can continue to finance future capital expenditure out of our own resources will depend to a large extent upon future trading results. Although we had substantial cash balances and tax reserves certificates at the end of September last, we have since had to make heavy taxation payments amounting to approximately £1,600,000. In view of our outstanding capital expenditure and the necessity to provide additional working capital owing to ever-increasing costs, the amount remaining may well prove to be insufficient for the needs of our many companies.

OUTLOOK

I was hoping to be able to tell you the situation had improved sufficiently to allow us to resume normal working conditions, but although it has improved somewhat we are not yet back to full-time working at all our Mills.

It was only a few weeks ago we were able to get a slight increase in our selling prices, the first since January, 1956, but this was not nearly sufficient to cover our additional costs of production. The change-over from overtime to short-time working at our Mills has further increased our costs, our paper prices having been established on the basis of overtime working, i.e., in October, 1955, and in January, 1956.

For the first five months of the current financial year profits have been on a reduced scale and, as we are directly dependent on the prosperity of other industries, production will continue to be restricted until confidence is restored.

The immediate future, therefore, is difficult to assess, but your Directors feel that as and when the Suez crisis is resolved and stability returns, we can look forward to better trading conditions. In addition, as soon as full production is resumed the Group will have the benefit of the increased earning capacity resulting from the capital expenditure and development at our Mills.

As you will appreciate, the conditions of the past year have proved most difficult and have thrown a heavy burden on all concerned in the management and smooth running of a large Group such as ours. I am sure you will wish me to express our thanks to our Deputy Chairman, Managing Directors, Managers and all our Staff and Employees for their valued services to the Group during the year.

The report was adopted.

BORAX (HOLDINGS) LIMITED

RECORD SALES

MR D. ABEL SMITH'S STATEMENT

The fifty-ninth annual general meeting of Borax (Holdings) Limited was held on March 27th in London.

The Chairman, Mr D. Abel Smith, MC, said that this was the first annual statement since the company became a Holding Company. Trading profits were again the highest in the company's history, Group profits before taxation being £2,913,425, an increase of £549,479. Taxation at £1,042,639 showed a decrease of £208,207. The 1956 charge was 35.8 per cent of the profits before tax against 52.9 per cent in 1955. In 1956 United Kingdom taxes accounted for 20.8 per cent of the total taxes as against 57.4 per cent in 1955. Both the swing in the incidence of tax from the United Kingdom to overseas and the big reduction in the effective tax rate resulted from the reorganisation of the Group. Under the old organisation the company lost the benefit of the high depletion allowances granted to mining companies in the United States of America.

THE DIVIDEND

The recommended final dividend on Deferred Ordinary Stock was 6¼ per cent less tax. This was equivalent to a final payment of 19 per cent on the old Deferred Ordinary Capital of £3 million, making a total on the old capital of 25 per cent less tax compared with 23 per cent less tax for 1955. The policy of the Board was to retain profits while the large construction programme of the American subsidiary was in progress. After payment of proposed dividends a balance of £1,888,263 would remain.

The Chairman added that in the holding Company's balance sheet was the estimated liability for future UK income tax, only a small figure of £4,423, while there remained provisions for current taxation of £798,104 for UK taxes and £490,634 for overseas taxes. The greater part of the current tax provisions were for taxes arising on profits earned prior to the reorganisation and it was probable that a substantial portion would not be required. However, the Board considered it would not be wise to free these provisions until agreement was reached with HM Inspector of Taxes.

The considerable increase during the year in the fixed assets—£17,847,021—was due partly to the revaluation of mines and properties in the United States of America. These had always stood at the price originally paid, many a long time ago, often before mineral deposits were proved.

The major decision of the year had been to transform the company from an operating into a holding company, and this had involved the formation of two new operating companies. The new British subsidiary adopted the company's old name "Borax Consolidated Limited" which had a great deal of goodwill attached to it throughout world industry. The American operating company in which the company owned 74.25 per cent of the issued equity capital was the United States Borax and Chemical Corporation. On July 2nd the stockholders of the United States Potash Company, in which the company had a 31 per cent holding, voted in favour of a merger into the American operating company. It was a natural and happy union.

The Company had subsidiaries in the UK, the USA, France, Belgium, Spain, Turkey and had interests through some of them in several other countries both in Europe and South America.

SATISFACTORY RESULTS

In the UK, despite many difficulties, results on the whole were satisfactory. Sales reached a new high level but profit margins were appreciably lower. In the export markets, where Borax Consolidated Limited acted for the United States Borax and Chemical Corporation, there were record sales. In the USA itself production and sales of boron products were at the highest level in history. This, and the increased efficiency as a result of modernisation, helped offset the higher labour and material costs.

Practically every borax and boric acid plant was operated to capacity throughout the year under review. Therefore no increase in volume could be anticipated until the completion of new plant facilities expected in the latter part of the current year.

The research programme of the company's two new laboratories in the UK and the USA were naturally very closely integrated, and while the major effort would be concentrated on boron products time would be devoted to the development of new uses for potash as well as to entirely unexplored fields of research. Members perhaps had seen reports hinting at tremendous new outlets for boron. All the work in connection with such uses was secret, therefore the reports must of necessity be considered rather speculative.

The Chairman concluded that the long range outlook for the Group's business, with its many interests, was good and continued growth was to be anticipated.

The report and accounts were adopted.

UNITED SERDANG (SUMATRA) RUBBER

The forty-ninth annual general meeting of the United Serdang (Sumatra) Rubber Plantations, Limited, was held on March 27th in London.

Sir Eric Miller, Chairman, who presided, said in the course of his speech: The crop harvested by our eight rubber estates during the year under review was 13,327,249 lbs, 9 per cent more than that for the preceding year. The standard of upkeep and cultivation, particularly of the young and medium aged areas, shows a definite improvement.

All immature areas, including 312 acres replanted with rubber last year, show generally satisfactory development.

The average price realised for our rubber was about 8 per cent lower than the corresponding figure for 1954-1955. Production costs, on the other hand, continued their remorseless increase under the pressure of Indonesian inflation.

The rupiah profit of the group for the year was Rupiah 14,145,945.

The sterling profit and loss account, on a remittance basis, shows a disappointing picture, explained partly by the severe taxation and remittance restrictions operative in Indonesia, but also by the fact that the remittances received during the year were based mainly on the trading results for 1953-1954, a period of low rubber prices.

However, remittances received by instalments since August 31, 1956 on account of 1954-1955 profits now total £97,310, thus enabling the Directors to recommend the payment of a dividend of 6 per cent, less income tax, the same rate as for the two preceding years, which will leave £33,683 to be carried forward against £52,629 brought in.

The Board have given careful consideration to the financial requirements of the company under the conditions now prevailing in Indonesia and have come to the conclusion that a return of capital of 6d. in respect of each 2s. of stock would leave the company with adequate working capital.

By the enforced retention in Indonesia of local fiscal profits, less tax, local provision is now made automatically for replanting on a modest scale, leaving us free to reassess the company's sterling requirements in relation to the finance required for shipments of produce and for the Eastern staff and the general operations of the company.

The proposed return of capital requires £355,818, after which we will be left with around £250,000 of sterling working capital which is about right for an undertaking of this importance.

From what you read in the press you will appreciate that it is impossible for me to offer any worthwhile comments on the complex political changes which are in the making in Indonesia. Those of us who have played a part in the economic development of the archipelago during the past half century, and appreciate the potentialities of this important segment of South East Asia, remain hopeful that the present discontents will gradually give place to more viable conditions, thus enabling the peoples of these many attractive islands to work out a happy and prosperous future for themselves. Given the opportunity we will be only too glad to continue to co-operate constructively towards this objective, which is of great moment to the world at large.

The report and accounts and a special resolution for the proposed capital repayment were duly adopted.

CROWN ZELLERBACH CORPORATION

(Incorporated in the State of Nevada, United States of America)

MANUFACTURERS OF PULP, PAPER AND ALLIED PRODUCTS, LUMBER, PLYWOOD AND OTHER FOREST PRODUCTS

CONDENSED SUMMARY OF CONSOLIDATED RESULTS FOR YEAR ENDED DECEMBER 31

	1956	1955
Net sales	$462,350,000	$414,080,000
Net income (see footnote)	$50,048,000	$44,128,000
Dividends declared	$26,110,000	$25,676,000
Earnings retained in the business	$23,938,000	$18,452,000
Shares of common stock outstanding	13,799,000	13,773,000
Per share of common stock outstanding:		
Net income	$3.53	$3.11
Dividends declared:		
Crown Zellerbach Corporation	$1.80	$1.65
Gaylord Container Corporation	—	$1.80
Earnings retained in the business	$1.73	$1.34
Federal, state and other taxes (except social security taxes)	$41,739,000	$40,171,000
Additions to properties	$70,317,000	$39,697,000
Consolidated long term debt (excluding current portion)	$99,440,000	$55,777,000
Ratio of debt to total capitalization	21%	15%
Production of paper and paperboard—tons	1,660,000	1,589,000
Assets employed to maintain job for each employee	$19,991	$17,381
Number of share owners at end of year	29,907	28,615
Common share owners' book value per share	$24.34	$20.69

Net income for 1956 excludes $23,617,000 net gain on disposition of investment in Fibreboard Products Inc.

Residents in the British Isles, whose shares are not registered in their own names, and other interested parties may, on application, obtain copies of the Annual Report to December 31, 1956, from the London Transfer Agents, The British Empire Trust Company, Limited, 3, Lombard Street, London, E.C.3, and may have their names placed on the Mailing List for quarterly reports and other communications.

LEYLAND MOTORS LIMITED

BENEFITS OF A WELL-EQUIPPED ORGANISATION

The thirty-eighth Annual General Meeting of Leyland Motors Limited was held on March 27th at Leyland, Lancashire, Sir Henry Spurrier (Chairman and Managing Director) presiding.

The following is an extract from his circulated statement:

The past twelve months has proved a very trying period for the British Motor Industry generally. Leyland has encountered many difficulties also. It is undoubtedly due to our careful preparation and the intensive development of our export markets, pursued consistently since the end of the war, that the Group has been able to maintain a full Order Book, expand its production and continue to carry on with its budget plans to improve equipment. As a result, we now face the future with a considerable measure of confidence.

The crises brought about by political strains in the Near East and the closing of the Suez Canal presented us with new and serious problems. The Middle East has always been a market of great importance for our products, and whilst we believe that "Leyland" is still "persona grata" in all those countries, it will require a stable political settlement before we can trade freely once again on our old footing.

Competition, particularly from Europe, is becoming ever more intense throughout the world. I am satisfied, however, that we can still meet this challenge, on level terms, if we always keep in front of us, as our primary objective, the need to design and produce a range of vehicles and units which will match any others in performance, quality and value for money.

The establishment of such level terms is absolutely essential. If we are to enter into a European limited free trade area, which we believe to be the right road for this country, it must be recognised by everybody that we shall then have to face intensified competition. To maintain our high living standard, provided by the privileges of the Welfare State, we must be put into a position to combat this competition by being allowed effective financial facilities for re-equipment, and we shall all have to work at least as efficiently and as long as our Continental competitors.

We realise that the Government has serious economic problems to contend with, and on that account no useful purpose would be served by being over-critical of taxation policy. Nevertheless, we know of numerous examples on the Continent where factory developments, particularly those concerned with export, are being allowed to be written off completely within a few years—in some cases within two or three years. Such a policy must be common to all. There is no way round it, other than to match it on level terms.

SCAMMELL LORRIES LTD.

We have experienced a full year's working with this, our newest member. Our expectations have been fully realised in every way, and the partnership is working happily.

BRITISH UNITED TRACTION LTD.

British Railways, during the year, commenced, in earnest, to put into service numbers of multiple diesel engined trains equipped with BUT auto motive units.

British United Traction Limited (BUT) is a Company owned jointly by AEC and Leyland, whose diesel engines, transmissions and other mechanical equipment are developed and sold specially to meet the particular needs of rail traction. The majority of British Railways' new orders for stock of this character have, to date, specified BUT equipment.

After reviewing the activities of the Group's overseas interests, the statement continued:

ACCOUNTS

The turnover has increased substantially during the financial year under review, enabling a record profit to be made. However, profit margins have been reduced in comparison with the previous year.

The net Group profit is £2,327,796 (£1,826,372) after providing for depreciation and taxation. It reflects the increased turnover, and includes, for the first time, a full year's profit of Scammell Lorries Limited.

Income Tax and Profits Tax together absorbed £2,469,026 (£1,957,316).

The rate of dividend on the Ordinary Stock which we recommend for your approval is 2s. 6d. (2s. 6d.) per stock unit, less tax, and absorbs net £712,471 (£534,353).

I am glad to be able to tell you that business has been proceeding very satisfactorily since the end of the financial year, and that a happy atmosphere between management, staff and men has existed in the Group organisation throughout the year.

The report and accounts were adopted.

APPOINTMENTS

THE UNIVERSITY OF MANCHESTER

RESEARCH STUDENTSHIPS AND RESEARCH GRANTS IN ECONOMIC AND SOCIAL STUDIES

Applications are invited for the above studentships and grants, tenable for one year in the first instance, and renewable for a further period not exceeding two years. The studentships are normally of the value of £350 or £400 per annum. They are offered to candidates who have obtained the degree of Bachelor or Master in this or any other approved University.—Applications should be sent not later than July 1, 1957, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

UNIVERSITY OF ST. ANDREWS

QUEEN'S COLLEGE, DUNDEE
LECTURESHIP IN STATISTICS

Applications are invited for the post of Lecturer in Statistics (specialising in economic and social statistics) in Queen's College, Dundee. Candidates should normally possess an Honours Degree in Statistics or in Mathematics. The present salary scale is £650 x £50 to £1,350, with efficiency bar at £1,000; but the scale is under review, and placing will be on the newly revised scale according to qualifications and experience. F.S.S.U. and Family Allowance benefits; a grant towards removal expenses may be made. Eight copies of the application, which should contain the names of three referees, should be lodged with the undernoted not later than April 30, 1957.

PATRICK CUMMING,
Joint Clerk to the University Court.

March, 1957.

GRADUATE TRAINEES required for production and commercial departments of large lamp manufacturing concern with headquarters in London. Features of responsibility available after period of general training for industrial career. Economics Graduate preferred for commercial vacancy. *Interested applicants* should write, giving full details of qualifications, experience, etc., and stating *preference for production* or commercial side to Box 661.

A *Chemical Manufacturing Company*, already one of the world's leading concerns in its specialised field and still expanding, is seeking a

FINANCIAL CONTROLLER

The location is the North Midlands, with a London office. The man appointed will be required to advise the Chairman and Directors on Financial and Commercial matters at the highest level. If he has experience of the Chemical or a related industry so much the better, but this is not absolutely essential. He will certainly be a person of adequate educational background and acceptable personality, probably a University graduate. He must be able to represent the Company in Industrial or commercial negotiations often involving large sums. He may be an Accountant or possibly a Banker with commercial experience. He will have charge of the Company's Accounting and related departments and must be able to work amicably with technical colleagues. He must be willing to travel at home or abroad when necessary. The successful applicant will be in a position to influence the Company's policy very substantially, and he will find his employers ready to reward successful effort.

The Company has in mind a man in the age-range 40-45, already earning £4,000 a year or more. There is a discretionary bonus.

Applications, which will receive the personal attention of the Chairman and will be treated in the strictest confidence, should be addressed to Box 666.

THE National Coal Board wish to appoint Statisticians on the staffs of their Area Headquarters, to be responsible for the collection, processing analysis and interpretation of management statistics. Duties will include control and co-ordination of returns and maintenance of an Area library of routine information.

A good degree in statistics or in Economics or Mathematics with statistics is required; exceptionally, candidates holding a recognised statistical qualification (e.g. the Certificate of the Royal Statistical Society) would be considered. Experience of statistical work in industry is desirable. Candidates should have the capacity for working in close co-operation with officials in other departments.

The posts will be administrative Grade 5/6. The salary scales are: Grade 5, £940 x £30—£1,200 (male), or £853 x £30—£1,113 (female). Grade 6, £780 x £25—£965 (male), or £704 x £20—£793 x £25—£878 (female). The starting salary will depend upon qualifications and experience. The posts are superannuable.

Apply, giving full personal particulars, to National Coal Board, Staff Department, Hobart House, London, S.W.1, marking envelope DIV. 656, before April 17, 1957.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS will shortly appoint an additional Assistant Secretary for economic and statistical research, the collation and interpretation of data affecting the profession and the building industry, and as an adviser on statistical considerations involved in surveys by questionnaire.

A degree in statistics, or economics with statistics, is essential. Previous experience of the building industry or social or market research is desirable.

Age limits 28-35. Salary £1,250-£50-£2,000 per annum.

Further information and application forms from the Secretary, R.I.B.A., 66 Portland Place, London, W.1.

Closing date for applications, April 12, 1957.

MARKET RESEARCH. Experienced field supervisor, resident London, interested in temporary work (3/3 months).—Write, giving details of experience, Box 670.

BRITISH CARIBBEAN FEDERATION

Applications are invited for the following posts on the *Establishment* of the Federal Government of the West Indies:

(a) *Senior Economist*, salary $10,800 per annum;
(b) *Economist*, salary $8,880 per annum;
(c) *Two Research Assistants*, Economic, salary on the scale of $4,080 x 240 to $5,520;
(d) Two Research Assistants, Statistics, salary on the scale of $4,080 x 240 to $5,520.

Rate of exchange $4.80 to pound sterling.

Posts will eventually be pensionable on the Federal *Establishment* and arrangements would be made to preserve existing pension rights of serving Government officers by secondment. Selected candidates would be required to serve in Trinidad when headquarters are established there and initially, and at any stage, in any of the West Indian Islands. Free passages provided on first appointment and termination for officer and family up to five persons in all. Leave at the rate of 45 days a year. Leave passages up to three adult passages after four of two and a half years.

Senior Economist would be required immediately on assumption to initiate and direct programme of preparatory work of collating data and of economic assessment of the Federal area in order that interim Government and, by April, 1958, Federal Government can be presented with studies and base plan on which economic planning can be formulated. He will be attached to the Federal Economic Planning Unit and will work in collaboration with the Federal Statistician. The post must be accepted on the understanding that it may later be decided to appoint another Economist of equal or higher rank or salary.

Qualifications required are an honours or research degree in economics with at least five years' experience in the field of applied economics, i.e., in economic planning organisation or Department of Finance or trade and production or comparable experience elsewhere in economic research investigation, or survey of practical nature. Practical knowledge of economic problems of under-developed territories desirable, also ability to apply theoretical knowledge to their solution. Administrative experience essential and capacity to set up and run economic planning organisation as a department of the Federal government.

Economist will work under the direction of the Senior Economist in carrying out the above duties. Honour or research degree in economics required with at least two years' experience similar to that required for Senior Economist.

Research Assistant will work under the direction of the Senior Economist and Federal Statistician, respectively, on normal duty of these appointments. A degree in economics required preferably with some postgraduate experience as Research Assistant in economics or statistics.

Applications, giving age and particulars of qualifications and experience, together with names of two personal referees, should be submitted before April 12, 1957, to Federal Establishment Officer, Pre-Federal Secretariat, Bridgetown, Barbados, from whom further particulars may be obtained. One copy of application to Director of Recruitment, Colonial Office, Great Smith Street, S.W.1, quoting BCD 123/500/02.

A large-scale concern, directed from the North Midlands with production in locations dispersed over the whole country, seeks the services of a highly qualified and experienced industrialist who can prove in practice his ability to achieve top level responsibility. The immediate vacancy will require qualifications and experience in Company Secretarial matters, in Financial and Cost Accounting, in general Commercial activities, and in Administration as applied to an undertaking with many subsidiary and branch concerns. Looking ahead, the appointment will depend to some extent on proven ability to guide the Board on financial and other major policy issues; it will carry the possibility of a seat on the Board in due course. Ideally, a man between 40 and 48 years of age with the necessary background is sought. Remuneration will be commensurate with the responsibilities involved. The Company's executives will be encouraged to apply without prejudice. Invitations are invited, giving full details of age, qualifications and experience, to be addressed to J. H., c/o Messrs R. Anderson & Co., Ltd., 14 William IV Street, Strand W.C.2.

AN EXCEPTIONAL OPPORTUNITY occurs in a large group, with Head Offices in Manchester, for a man of character, with a good education and some industrial background in a junior or intermediate executive capacity, to train quickly for a higher management post. To a suitable applicant two years' intensive training will be offered at a commencing salary of £2,500 per annum, followed by either the offer of an exacting executive appointment at substantially more salary or a definite indication of non-compliance with anticipated standard. Applicants should reply (in confidence), stating precisely what they have done so far, not what they could do, given the appropriate opportunity. Personal selling of personality not interesting. Only facts will be assessed.—Box 653.

GENERAL MANAGER.—A building and contracting organisation, with headquarters in London, invites applications for the post of General Manager. *Applicants should be men* between 35 and 50 with sound technical qualifications and extensive experience of industrial and domestic building, contracting and jobbing work, and have held a top level executive post for not less than 3 years.

Commencing salary £5,000 per annum plus profit sharing. It is intended that the selected candidate will be appointed to the Board after one year, and opportunities for rapid and substantial increase of salary are excellent.

Please write, giving brief details of qualifications and experience, in strict confidence, to Assistant Director (H23) 14, Welbeck Street, London, W.1.

A vacancy exists on the staff of a London Public Company for a man aged about 25 years to carry out research and development in the flexible packaging industry. Applicants should have technical qualifications and experience in marketing and market research. Salary according to qualifications, but not less than £1,000 per annum.—Write, giving age and technical qualifications and full details of experience, to Box "Y.D." c/o J. W. Vickers & Co., Ltd., 7-8 Great Winchester Street, E.C.2.

UNIVERSITY OF EDINBURGH

DEPARTMENT OF POLITICAL ECONOMY

Applications are invited for the post of Lecturer in Economics in the Department of Political Economy. Salary Scale (presently under review), £700 x £50 to £900; Bar: £950 x £50 to £1,350 per annum, with placement according to qualifications and experience, and with superannuation benefit and family allowance where applicable. The successful candidate will be expected to take up duty on October 1, 1957.

Further particulars may be obtained from the undersigned, with whom applications, giving the names of two referees, should be lodged not later than April 30, 1957.

CHARLES H. STEWART,
Secretary to the University.

March, 1957.

FEDERATION OF RHODESIA AND NYASALAND

VACANCY: ECONOMIST,
DEPARTMENT OF THE FEDERAL PRIME MINISTER AND CABINET OFFICE.

Applications are invited from candidates, under 45, with a good Honours Degree in Economics and who have had experience in an economic advisory capacity, or in lecturing in Economics, for the post of ECONOMIST in the Economic Section of the Department of the Prime Minister and Cabinet Office, Salisbury. The post is permanent and pensionable.

Salary £2,150 per annum. (Fixed.)

Duties of the Section include advice to the Government on economic questions, development planning and the preparation of memoranda on these and other allied topics. The successful applicant will work as Deputy to the Chief Economist, who is head of the Section.

Applications, in duplicate, giving details of nationality, age, marital status, qualifications, experience, date available, together with the names and addresses of two referees, should reach the Secretary(R), Rhodesia House, 429 Strand, London, W.C.2, by April 26th.

MINISTRY OF LABOUR AND NATIONAL SERVICE: TRAINING OFFICER (TRAINING WITHIN INDUSTRY). The Civil Service Commissioners *invite applications* for at least 3 pensionable posts.

Age at least 31 on January 1, 1957.

Candidates must have had practical experience of supervision and management, preferably including experience as Education and Training Officer. They must also have completed a T.W.I. (Institute) course of training as T.W.I. Trainer, and have up-to-date experience in the presentation of training programmes to supervisory staff.

London salary scale (men), £1,055-£1,225. Women's scale at present £967-£1,129, but is being increased each year until equality with men's scale is reached by 1961. Somewhat lower pay outside London.

Promotion prospects. Five-day week.

Particulars and application form from Secretary, Civil Service Commission, 6 Burlington Gardens, London, W.1, quoting No. 4681/57/7. Completed application forms should be returned by April 17, 1957.

TARIFF SPECIALIST. A very well-known and expanding Company, with Head Office and chief manufacturing unit in the provinces, invites applications for an important appointment in its Market Research Section. The position is an exacting and responsible one requiring sound judgment and high intellectual ability. Duties will be connected entirely with tariffs and related problems affecting the Company's activities and interests, and will extend over a wide range of products and markets. Essential qualifications are a good-class University Degree in Economics or Commerce, preferably with International Trade as a special subject, and at least 2 years' experience as a Tariff specialist in industry or a trade association. Applications, which will be regarded as strictly confidential, should set out full personal history.—Box 668.

DIRECTOR OF COMPANIES.

Shortly relinquishing position with companies in South Africa. Age 39 years. Thorough knowledge of Production Control. Sales Promotion. Budget and Commercial Control.

Holds executive position in companies dealing with Packaging, Engineering (general and motor), Chemical Products. Seeks senior position with company in Southern Africa or other part of Commonwealth.—Write Box E 574, c/o 191 Gresham House, E.C.2.

EXPORT Manager, British, early forties, multi-lingual, world travelled, top level experience all aspects export, with excellent contacts abroad and capable of rapidly developing new markets and extending present outlets for branded consumer goods, seeks interview with manufacturers or trade group with view to permanent appointment.—Box 669.

WORK STUDY.—Next six-weeks' full-time course starts April 23rd. Details of this and eight others, including part-time, evening and correspondence, from The School of Time and Motion Study, 29 Cork Street, Piccadilly, London, W.1.

IF all the bottles of Duff Gordon's El Cid Sherry I drunk last year were laid end to end across the Atlantic Ocean, they'd sink. What a dreadful waste that would be. Let's not try it.

FOR SALE.—*Economist* 1948 through 1955, lacking 6 issues. In Easibinders. What offers?—Box 663.

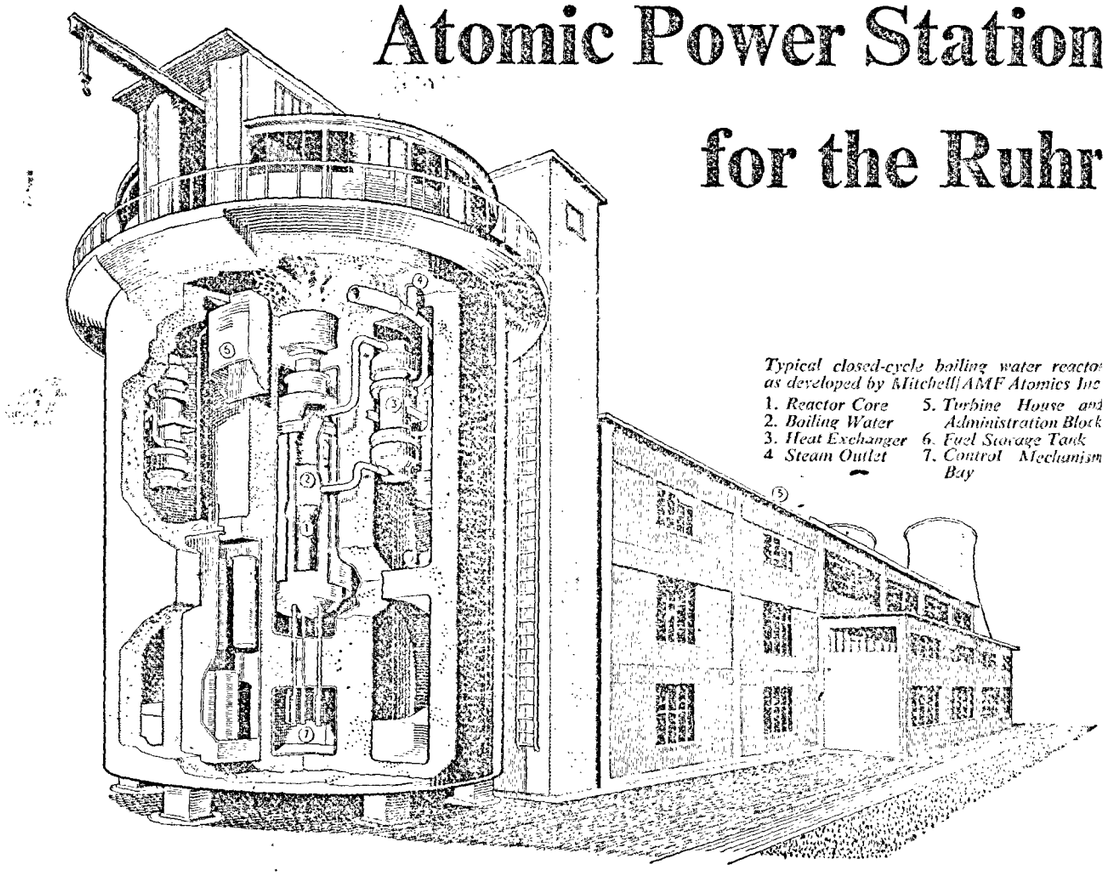
EXPERT POSTAL TUITION

for Examinations—University Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus—and/or advice, mentioning examination or subjects in which interested, to the Secretary (G9/2),

METROPOLITAN COLLEGE, ST. ALBANS

or call at 30 Queen Victoria Street, London, E.C.4.

ANNUAL AIR SUBSCRIPTION RATES



Subscriptions to most countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is either because the alternative is not available or not recommended.

ATOMIC POWER FOR PEACEFUL USE

Atomic Power Station for the Ruhr

Typical closed-cycle boiling water reactor as developed by Mitchell/AMF Atomics Inc
1. *Reactor Core*
2. *Boiling Water*
3. *Heat Exchanger*
4. *Steam Outlet*
5. *Turbine House and Administration Block*
6. *Fuel Storage Tank*
7. *Control Mechanism Bay*

MITCHELL'S AWARDED FIRST BRITISH REACTOR EXPORT ORDER

An atomic power station with an electrical output of 15,000 kW has been ordered from Mitchell Engineering Ltd by Rheinisch-Westfalisches Elektrizitatswerk AG. Mitchells are co-operating in this important export enterprise with their American associates, AMF Atomics Inc of New York.

THE STATION, which will be situated in the Ruhr, is of the closed-cycle boiling water type. The contract was secured in face of competition from seven international companies because this type of reactor was considered the most promising and suitable design at the present stage of development for the capacity required. Mitchell's share of the contract is valued at over 3 million dollars.

The station is expected to provide electrical power to the grid by 1959. Mitchells are providing the primary and secondary steam circuits, the reactor vessel and heat exchange pipes AMF Atomics will be responsible for the core, core control gear and instrumentation.

This reactor for the Federal Republic will provide the first practical contribution to the introduction of nuclear power in Germany and is also the first large scale reactor contract to be obtained for export by a British Company. It is a tangible expression of the joint Mitchell/AMF programme for the peaceful development of atomic power.

The reactor will be situated below ground.

Mitchells are also engaged on a total of four contracts for British Atomic Plant at Chapelcross, Capenhurst, Springfields and Dounreay.

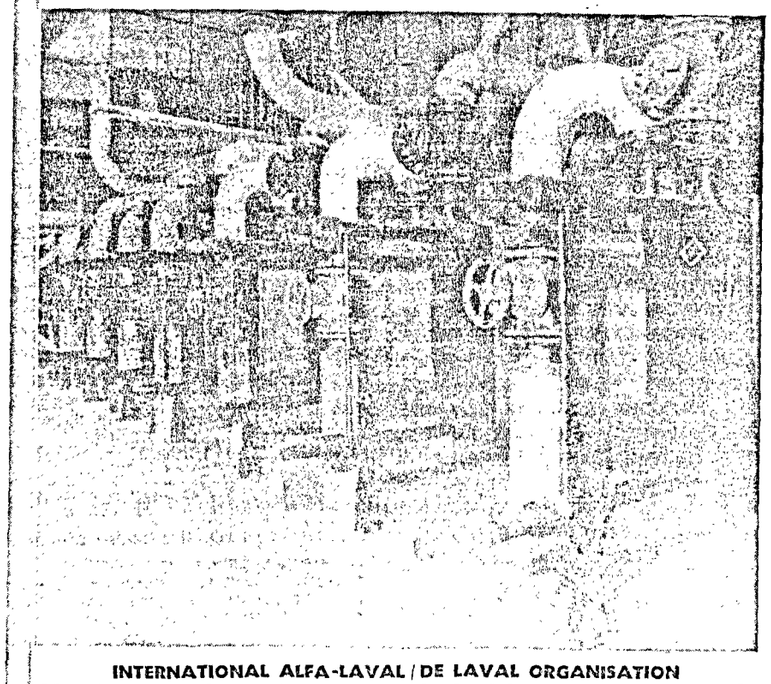
DE LAVAL

8 DE LAVAL Heat Exchangers saves 62.4 tons of coal in 24 hours due to

- maximum utilization of heating surfaces
- time-saving ease of inspection and "in place" cleaning
- flexibility to meet changed operating conditions
- design that permits several functions in same unit



Pulp mills are only one of hundreds of applications where De Laval heat exchangers may be profitably employed to recover heat that otherwise is needlessly wasted.

WITH ACKNOWLEDGMENTS TO JOHN BARTHOLOMEW & SONS LTD.

While you read this a Swedish pulp mill saves 77 lbs of coal

YOU CAN MAKE THIS SAME SAVING

In the 45 seconds it takes to read this a Swedish pulp manufacturer saves heat equivalent to 77 lbs of coal because he installed DE LAVAL Heat Exchangers.

Fastest Route to Profits in Petroleum Processing

The investor wants results—and wants them quickly. Not until the petrochemical producer starts to produce, or the refinery is put on stream, does he see any return on his investment: and as a result he measures the efficiency of an engineering organisation by the time which elapses between the signing of the contract and the first production from the plant.

The Kellogg organisation is at the service of industry anywhere in the world. Customers know that by entrusting their engineering requirements to Kellogg they are drawing on fifty years' experience with processes and process equipment, on a reputation for flexibility and economy in planning, and on unrivalled facilities for construction, procuring of materials and skilled labour, and training of local personnel. In addition, there is the unique background provided by the Kellogg associate companies, with their wide knowledge and full understanding of the local problems facing petroleum processors throughout the world.

The Kellogg International Corporation staff is in the unique position of being able to draw on this unmatched reservoir of world-wide experience, but at the same time execute at Kellogg House, London, the engineering, procurement and construction planning for plants in Europe, the Middle East, the Far East and the United Kingdom. In addition the K.I.C. staff assists the sister Kellogg organisation in other parts of the world by procuring material in the United Kingdom and shipping it to foreign construction sites.

You are invited to consult with the Kellogg International Corporation concerning your problems of petroleum refining or petrochemical processing.

What does the big circulation rise of "quality" papers mean to advertisers?

NEVER have people in the upper socio-economic classes been so easy to reach as now. This large, continuing increase in circulation of the "class" publications—Dailies, Sundays and Weekly Magazines—has important implication for 3 main groups of advertisers.

1. Those selling consumer goods and services directly to the AB market.
2. Those who need to influence business executives who buy capital goods.
3. Those who wish to influence opinion leaders.

Of the papers calculated to reach this audience, The Observer has gained the most significant increase in circulation. The Observer's circulation has doubled since the war and now stands at 633,064.

Last year alone The Observer's circulation went up by 10.4%—the largest increase of *any* Sunday paper. And this was in a year when Sunday papers as a whole lost 1.2% of circulation.

The Hulton Readership Survey for 1956 gives the *readership* of The Observer as 1,880,000 people. This represents the highest number of readers per copy of any national daily or Sunday newspaper. The I.P.A. National Readership Survey for 1956 puts the total readership of The Observer at the even higher figure of 2,056,000 readers.

Not only does The Observer provide a concentrated, unwasteful, receptive audience: it provides a massive audience. It is also extremely economic.

If you would like to know in detail and at leisure how The Observer can help you, or your clients, please write or phone to Norman Berridge, The Observer, 22 Tudor Street, E.C.4, Fleet Street 9991.

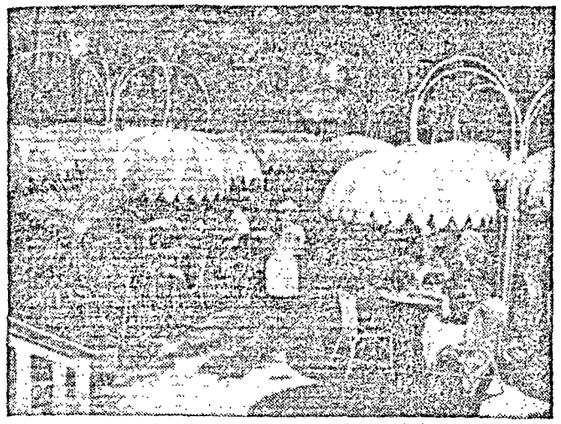
Improving competitive position

You may be in a competitive position today, but what about tomorrow? Markets and competition change, and you must be ahead of them. That is where research is important. It is important in your organization and that of your supplier.

Let us consider research at Dow and the part played by glycols, a typical product group. Dow research has developed the largest number of glycols available to industry. Using these glycols plus an almost unlimited number of other chemicals, Dow is able to offer its customers every possible aid in developing new products or improving old ones.



Now glycols are being used as solvents, moisture control agents, antifreeze agents, plasticizers and for a wide variety of other uses. They have found extensive applications in many industries including food and beverages, textiles, cosmetics, paper and paints.

Is your supplier able to give you all the benefits of research? Make sure of your competitive position. For glycols get in touch with your local Dow representative or the nearest Dow branch office.

Nuclear power
for the nation's future

AN EXAMPLE of industry pooling its resources to prepare for a mighty project is the linking of the A.E.I.—John Thompson Nuclear Energy Company with two important firms of Civil Engineering Contractors—Balfour, Beatty and Co. Ltd. and John Laing and Son Ltd.

To the strength of the A.E.I.—John Thompson Nuclear Energy Company and its constituents (British Thomson-Houston, Metropolitan-Vickers and John Thompson) is added a fund of knowledge in the civil engineering field.

The Balfour Beatty Group has a world-wide reputation in all forms of engineering and construction work and is at present carrying out major contracts for the Central Electricity Authority. John Laing and Son Ltd. has carried out building and civil engineering work at the first Government Atomic Energy Establishment at Windscale and is at present engaged in the construction of power stations in the United Kingdom, as well as in major development schemes in Canada.

The Dog it was that Died

THE lapse of a week has put into perspective the view that the resignation of Lord Salisbury might be the last straw that would break the Government's back. The immediate issue of policy for Cyprus is examined in a later article. But, politically, the important point is that, forced to choose between releasing Archbishop Makarios and retaining Lord Salisbury, Mr Macmillan kept the policy and let the peer go. Nothing could more clinchingly disprove that he has been Lenny the Lion to Lord Salisbury's ventriloquy.

The real danger is not that the Government's back will be broken by Lord Salisbury's departure, on top of the other discontents in the Conservative party. It is rather that its backbone may bend under all the party pressures. Whatever the polite and political evasions when he took over from Sir Anthony Eden, Mr Macmillan's task then was to face the facts of the world today—diplomatic and economic—instead of flying in their face. There can be arguments about his Government's grasp of the task. The most topically relevant, apart from Cyprus, are two: one concerns the possibility of combining adequate defence with the radical economies described on another page, an issue that may possibly split Ministerial opinion, though not Conservative politics, more than Cyprus does ; the other, the Budget, is the theme of the following article.

The policy of facing the facts always had to run the gauntlet of those Conservatives who, living in the past, are unwilling to participate in the liquidation of old imperial positions. No doubt Lord Salisbury's retreat to his tent may, for all his own loyalty to the Government, powerfully stiffen, if only catalytically, these kickers against the pricks. No doubt, with the polls, the by-elections and the strikes or the buying-off of strikes singing dirges in his ears, the Prime Minister will be strongly tempted to stand askew again to the facts. And no doubt Mr Thorneycroft is being regarded by the imperialists and the non-imperialists alike in the Conservative party as the god from the machine who will pour all the desired oil on the troubled middle-class waters.

But it is imperative that the Prime Minister, and both his Foreign Secretary and his Chancellor of the Exchequer, should recognise that, for both nation and party, the need for a coherent policy must come first. The last straw in Lord Salisbury's resignation was not the Government's but his own ; nettled at the lack of urgency attached by his colleagues to his Lords reform and still reluctant to swallow the actual diminution of British power abroad, he strained at a gnat in Cyprus. So, too, in next week's budget the need is not for sops but for calculated incentives that will make the most of the country's productive and export capacity, while preserving the value of the pound, at home and abroad.

These are hard words for party politicians. It is the measure of Mr Macmillan's unused capital that we can still expect to be able to say that, despite the abrupt withdrawal of his noblest patron, "the man recovered of the bite."

A Budget to Get Richer?

The Chancellor will be wise to keep his eye next Tuesday on the dangers of letting production lag, as well as on the dangers of letting sterling slip

LET the Government be very clear about the tide in economic policy which it needs to catch this year. The desirable thing is that the country should start getting richer again; the necessary thing is that it should not get so much more spendthrift in the process that it falls into another early sterling crisis. This balance between production and the pound—between the need to allow internal demand to be high enough to encourage maximum production, but to keep it low enough to consolidate Britain's present external surplus—was expected to be the theme of the Government's annual Economic Survey, published this week. The impression that most people have drawn from the survey is that the Chancellor's emphasis is likely to be on the side of caution; it would accord with at least some passages in it if Mr Thorneycroft kept back a considerable part of the more than £100 million that is being saved on defence, and gave no significant tax reliefs next Tuesday. But closer study of this unusually ambivalent document suggests that, in fact, when the survey was written Mr Thorneycroft still stood amid a central controversy unresolved.

THE nature of the controversy is revealed by the survey itself. "The economic policy followed during 1956," its authors declare,

> was one of disinflation, designed to encourage exports, check imports and stabilise prices. It was also the Government's desire to place the main burden of restraint on consumption rather than investment.

In the event, exports did, in fact, rise by some £250 million in real terms; the balance of payments improved by more than £300 million, to a surplus of £233 million in 1956; and consumption (aided by a considerable, but not necessarily permanent, rise in savings) rose by only about ½ per cent, while fixed industrial investment rose by 5 per cent. Despite the fact that retail prices rose by about 5 per cent (owing almost entirely to an increase of 8 per cent in annual earnings per employee, while output per man year fell), the authors of the survey are justified in claiming that, within the terms of reference they have set down, "on the whole this policy was successful."

But the Government made one other assumption when the policy of disinflation was launched. "We shall, of course," said the then Economic Secretary to the Treasury in the budget debate on April 23, 1956, "achieve an appreciable increase in production this year. The fact that investment has risen . . . is itself an indication of that." Now the survey says that "between 1955 and 1956 the gross domestic product rose by just over one per cent, the smallest increase since 1952." Moreover the increase, which is put at £240 million in real terms, was a very peculiar one: most of it "appears to have come from increased output by the distributive and service trades"—presumably this means that more shopworkers and transport workers spent more time handling the same volume of goods—and "from higher agricultural output" (which, since it came in the most subsidised sector of the economy and with a flush of surplus milk and eggs, was not the sort of output most required). Industrial production, to which the Economic Secretary was primarily referring last year, "did not expand at all."

The reason for this failure to expand is, of course, that industrial production does not spring fully primed from newly installed plant: demand has to increase sufficiently to ensure that the new plant is used. In 1956, the Government deliberately held down domestic demand, in order to secure a diversion of effort to exports. This was undoubtedly the right policy. But the survey's assumption that there are no unpleasant lessons to be learned from the length of the restraint on output is really a little too complaisant.

SUCH, then, is the official story of the successes—and of the one most apparent failure, apart, of course, from the alarming costs inflation—of internal economic policy in 1956. The immediate questions for 1957 are obvious. Does the Government consider that redeployment of resources has now gone far enough for expansion to be resumed, once the oil shortage is over? If it considers that it has, then is the volume of demand necessary to bring about that expansion already innate in the economic prospect for 1957, or could it be Mr Thorneycroft's duty and pleasure to stimulate it by tax reliefs. Those were the questions for which the country was leaning forward to get some answer when the survey was published this week. The survey does not answer them.

There is, for example, no estimate in it of the amount by which production could expand in 1957 if capacity were fully used, even though the general tone of the comment about under-utilisation of capacity confirms that there is quite a lot. More surprisingly, there is no mention in the survey of the expected trend in 1957 of personal consumption, stockbuilding or government current expenditure, though the silence about the last-named may well have been explained by the delay in publication of the defence white paper. About investment the survey does forecast that

> investment by private industry is likely to remain this year at about its present high level, and investment in the basic services of fuel, power and transport (including new road building) is expected to increase.

But nothing is said about the possibility of a diminution towards the year's end, or whether this switch in emphasis from the private back to the public sector is really considered desirable. The only source of prospective demand that is given any detailed study is that for exports. After a discussion of the course of the boom in different overseas countries, the survey forecasts that export markets "as a whole will continue to expand, although not at the same rate as in 1956."

This could be taken to mean that exports must be expected to rise by less than £250 million in 1957. If that were true, then—as the capacity for production increases is certainly greater than £250 million in 1957—the way might well be open for a reflationary budget. But it is here, on page 37 of the survey, that the Government's more cautious and its more ambitious natures fight a fascinating battle across the printed word. One suspects that this page must have gone through many drafts and many editings.

The voice of caution begins with the very necessary reminder that Britain needs a large visible surplus in its balance of payments this year in order to "meet all its overseas commitments," to "strengthen our position as an international banker," to start building up the reserves after their recent "temporary reverse" as a result of the Suez crisis, and to repay by 1959 the $561 million recently drawn from the IMF. "This means that even if the terms of trade should improve slightly, exports must be increased more rapidly than in recent years," and "further, that a considerable proportion of the additional output will need to be exported" (this is the first reference to the prospect that additional output might be secured). The survey believes that "there should be no lack of markets for these goods, but competition from the other main manufacturing countries will be keen"; the conclusion that might be drawn is that British industry must not be enticed from confronting this competition by the pull of buoyant home demand, but the innocuous conclusion actually set down is that "exporters will need drive and determination."

The voice of ambition then takes up the refrain. It is granted that "we will have to earn more in order to pay for the increased imports which will be needed when the expansion of production is resumed," and that "our prospects, therefore, depend mainly on our success in the expansion of exports." But

> the very heavy investment of the last two or three years has improved our industrial efficiency and expanded our capacity. . . . Thus our equipment for a further export drive has been considerably strengthened. With good prospects for world trade, and with a record of rising exports, the external conditions for a successful year are already present.

The stage is now set for some conclusion. It is reached, with magnificent neutrality, in the last two sentences of the survey. "Internally," declares the voice of ambition in the penultimate sentence, "high savings and all possible restraint in Government expenditure should create a situation favourable to the export effort and help us to avoid any undue increase in the level of imports when expansion is resumed." One can see how easily that phrase could serve as a text for a reflationary budget next week. But the voice of caution still has the last word. "We can look forward," it declares in the very next sentence, "to further progress in industrial investment and with it further improvements in the living standards of the whole community only when the balance of payments has been placed on a really secure footing."

IT is clear where this leaves the outside commentator; it leaves him in the dark. But the controversy which is reflected, albeit neutrally, in the survey is one on which the outsider should obviously state a view. It will be too silly if the disagreement is simply regarded as one between stern economists and give-away politicians. The difference between the two views, as they emerge between the lines of the survey, is not large: probably, in terms of next week's budget, no more than a restored investment allowance, a weather eye to the production index, and a very few tens of million pounds of tax reliefs are involved. The smallest balance of payments surplus with which we can get away in 1957, if we are to consolidate the reserves and prepare to repay the IMF, is probably at least as large as the surplus we secured in 1956; this means that exports must still rise this year by enough to make up for the loss of oil earnings and to pay for the increased imports which a policy of mild internal re-expansion might invite. But what the apostle of mild expansion would be willing to risk—and here the difference of emphasis appears—in order to expand internal demand and production, is the last few million pounds of money that the apostle of caution thinks must be kept for extra rebuilding of the reserves or for increasing overseas investment.

The difference of emphasis, in fact, concerns something much more far-reaching than the narrow margins of this year's budget calculations. It concerns the attitude one takes to Britain's future as a "developing," not a "developed," country. At this stage of the new scientific revolution there is the strongest case for saying that the most profitable outlets for investment are in those countries, like our own, which have the facilities and the skilled labour resources to handle the very complicated mechanisms of the new age. To say that Britain should be a developing country now does not, of course, mean that it can plan to run a perennial current external deficit, although some fortunate

developing countries, such as Canada, can. But there is room for anxiety—at any rate more anxiety than the survey expresses—when we find ourselves forced, because of the external reckoning, to keep our potential production so lengthily and unremittingly down.

IT is on this reckoning of the need to keep Britain itself a developing country that Mr Thorneycroft can reasonably be urged to yield to a few temptations in making tax reliefs next week. Which reliefs should these be ? The important thing is to go on encouraging private investment ; on balance the case for restoration of the investment allowances is strong. It would have been strong even if the defence economies announced on Thursday (and discussed in a note on page 20) had been only of the expected order of £30 or £40 million, instead of over £100 million, compared with last year's spending. The fact that the projected defence cuts are larger than expected raises the question whether Mr Thorneycroft should not go further. Perhaps two things need to be said here. If the Chancellor is in an expansionist mood, the best general relief would be to raise the earned income allowance from two-ninths to one quarter ; that would cost up to £90 million in a full year, and would be preferable to a straight cut in income tax rates. If Mr Thorneycroft does not feel he can do this, then he should, at the very least, make a vow to keep a close watch on the production index as the year progresses. The best relief later in the year, if output does not rise and external payments continue in satisfactory surplus, would be a relaxation of the hire purchase restrictions, perhaps just at about the time that the first restrictive impact of the Rents Bill on spending power is felt.

The other tax reliefs that should certainly be considered in the budget—apart from any which were balanced by new imposts elsewhere—should be those which, because they would cost only a few tens of millions of pounds, are worth implementing in their own right. There are three fields to plough over here. One is the field of middle-class reliefs ; the wisest courses here would be to let people with incomes above £2,025 a year go on receiving earned income relief on a graduated scale and to increase the income tax allowance for children kept in full-time education after the age of fifteen, as was suggested in *The Economist* three weeks ago. The second field is that of company taxation : there are a lot of remaining "technical" recommendations of the Royal Commission which are certainly due for implementation. The third field is the promised review of the entertainments tax. The case for relieving sport and the living theatre should surely now be granted ; and there is an argument for giving a fair part of their duty back to the cinemas—perhaps balancing this by a special impost on, say, television licensing fees and other new sorts of amusement.

It would not be surprising, in view of the tone of the Economic Survey, if reliefs in these three fields of middle-class taxation, amendments in company tax, and entertainments duty—without either restoration of the investment allowances or a raising of the earned income allowance—made up the whole budget. If Mr Thorneycroft feels that he cannot make either of these general reliefs in the allowances, however, he ought to consider one other possibility : that of making room for at least one general relief by economies or new imposts elsewhere. Among possible economies in Government expenditure, there is strong pressure for trying to secure some new system for enforcing economy in lending to nationalised industries. Among possible tax imposts to balance some reliefs, there is a case for extending purchase tax to some things that now escape them, such as sweets and confectionery ; and now that the Rents Bill is on the way to the statute book, house owners could well be made to pay more on Schedule A.

There, then, is a ragbag of devices to choose from. The recipe should be expansion with security. A budget which kept within the limits suggested here, even if Mr Thorneycroft seized the opportunity of announcing the coming demise of the special petrol tax, would not set the Thames on fire. But it would not set the pound on fire either. And that, at the moment, together with the earliest possible end to marking-time in production, is the political and economic aim, which is by far the most important.

The Economist

APRIL 4, 1857

COBDEN AND BRIGHT DEFEATED

THE most striking features of the elections, as far as personal considerations go, are the return of Lord John Russell for the City of London, and the rejection of Mr Cobden, Mr Bright, and Mr Gibson for Huddersfield and Manchester. So far as Lord John Russell is concerned, no one will be surprised, and the great majority of men, whatever their political views may be, will rejoice at the result. . . . But whatever may have been the claims of Lord John Russell upon the constituency of London, it is impossible to say that, looking only to special services of the past, the claims which Mr Bright and Mr Gibson had upon the constituency of Manchester, and which Mr Cobden might well ask from that of Huddersfield, were not at least equally great. . . . While, however, we confess to sincere gratification in the defeat of Mr Bright and Mr Cobden, because we think it was a lesson which they wanted much and which they had distinctly brought upon themselves, our joy would be turned into sorrow if we had the least idea that they would be absent from the new Parliament. They have made for themselves so eminent and useful a position there, that any House of Commons would be felt to be incomplete without them. But we have no such fear. They have many followers of little note and use, who, doubtless, will be only too happy to give place to them. Crotchetty and extreme as they often are, mistaken and short-sighted as we often think them, they can be ill spared from the Great Council of the nation.

Cyprus After the Storm

During Archbishop Makarios's exile, some illusions about Britain's position in the eastern Mediterranean have been blown away by the Middle Eastern storm

THE Government acted sensibly in deciding to set Archbishop Makarios free without haggling over the exact terms of his release. Whether it is enough to set the Cypriot log-jam moving remains to be seen. What is certain is that too many intransigent things have been said to allow any quick and easy settlement ; too many extreme attitudes have been struck to leave any step open that treads on nobody's toes. The Government has somehow to avoid giving the impression that its caution is indecision and its realism weakness.

Mr Lennox-Boyd's statement last week struck this balance as far as it went. The Greek Government and the Greek Cypriots have been mollified ; Athens sent its ambassador, recalled when the Archbishop was deported, straight back to London. The Turks were not provoked into an angry reply. But present Turkish moderation is more diplomatic than real ; unless the British Government moves resolutely forward, the Turks will be encouraged to think that there is a vacuum in British policy which they can rush in to fill. And since he became a free man, the Archbishop has given an unfortunate demonstration that if given an inch, he will do his best to take an ell. He gained his release without taking the unconditional stand against terrorism for which he had been asked ; he straightway asserted that he would not negotiate until he was allowed to return to Cyprus, and would not negotiate with the Turkish Cypriots. This is altogether unreasonable. If his attitude stems from a belief that the Government is on the run, he should be promptly disabused.

In fact, all those concerned—in Athens, Ankara, London and Nicosia—need to make up their minds that a settlement requires concessions from all. If the present unhappy condition of the island is to be ended without resort to further conflict or to partition—itself the counsel of despair—both the Greeks and the Turks must revise their present attitudes. The Greeks must abandon the ostrich-like behaviour which Athens radio has always been so fond of attributing to the British, and drop the pretence that Turkey's reasonable interest in the future of Cyprus can be left out of account and the matter settled between the British and the Cypriots alone. The quite arbitrary and indefensible Greek interpretation of the United Nations Assembly's recent resolution on Cyprus (that it calls exclusively for bilateral negotiations between Britain and the Cypriots) is a product of this attitude.

The Turks, too, if they keep their toes dug in on their present uncompromising stand, might wreck any settlement acceptable to the great majority of Cypriots. But in the process they would give far greater substance to the fears of a possibly neutral, even hostile, Greece which they use to justify their present attitude ; and Nato's defence planning in the eastern Mediterranean would be permanently disabled. Turkey can legitimately ask that in any Cyprus settlement the defence of its vital southern ports, as well as the civic rights of Turks in Cyprus, should be thoroughly safeguarded ; but it has no right to impose a veto on any arrangement that it does not like.

A FURTHER important contribution will be needed from the British Government. Almost certainly it will have to promise the Cypriots that so many years after they have started working the Radcliffe constitution, or an agreed version of it, they will be allowed to choose the future international status of the island—which might not then be necessarily union with Greece. Successive British governments have managed to erect so great a barrier of mistrust between themselves and the Cypriots that it is unlikely that anything less than a promise, with some date, will do.

The Government may find it easier to give such a firm pledge when it has thought out afresh how indispensable the Cyprus base—so called—really is to Britain. The limitations of the island as a military base were clearly demonstrated by the Port Said expedition. It lacks the facilities essential for a full-scale base—which, indeed, it was never designed to be. It was meant to be a military headquarters and communications centre for the Middle East. When the British army left Egypt, it left behind a huge depot under civilian maintenance ; and under the terms of the Anglo-Egyptian treaty of 1954, Cyprus would have been the brain-centre from which the reactivation of the Suez base would have been directed. But the Suez Canal depot and all that it contained has become one of the major (but singularly unsung) casualties of the Suez adventure ; and the Cyprus headquarters is a head that has lost its body.

Thus Cyprus has no important part to play in a war against Russia. Nato's interest in the island arises out

of the fact that the tension created by the dispute has disrupted its plans for joint defence of the eastern Mediterranean. Is it still true—as Mr Lennox-Boyd asserted in December—that "our strategic position in Cyprus remains vital for the performance of our defence obligations in the Middle East"? In two countries, Egypt and Jordan, these specifically British commitments have been pruned away. Those that still exist under the Baghdad Pact and the Anglo-Iraqi treaty belong more to the kind of commitment against the danger of communist aggression that cannot be fulfilled from Cyprus. There remain the various treaties with the sheikhdoms along the Persian Gulf under which, as protecting power, Britain is pledged to defend each of them—principally from the ambitions of its Arab neighbours, and nowadays particularly against Saudi Arabia. These old commitments were carried lightly so long as Britain was the unchallenged paramount power in the region; oil, and the growth of a nationalist threat, may make them at once more important and more burdensome than they have been. They can be conveniently and cheaply met by reinforcing the Persian Gulf at need by air from a Cyprus that remains under British sovereignty. But other arrangements to move the relatively small bodies of men required would not be impossible. Convenience can be bought at too high a price.

It can be strongly argued that if any case remains for British insistence on retaining sovereignty over Cyprus, it rests on the danger of Greco-Turkish conflict. This has become the heart of the matter, and Mr Lennox-Boyd was right to stress the importance of settling what he called the "international status" of the island. If the Greek and Turkish governments could be induced, with Nato's good offices, to take part in discussion on the future of the island, the negotiations with the islanders on the Radcliffe constitution would be greatly eased. In those negotiations the Governor's reserve powers are likely to be the chief bone of contention; and the Cypriots are much more likely to accept these as reasonable if convinced that the Radcliffe constitution is only a half-way house.

Nevertheless, it would surely be unwise to delay talks with the Cypriots (including, as the Colonial Secretary has freely acknowledged, Archbishop Makarios) until Nato has carried out its diplomatic "exercise"—if it ever does. If the Greek government's demand for direct British-Cypriot talks were met, it would be much more difficult for it to refuse to sit round a table with the British, the Turks and the Nato-appointed conciliators. And if the Government invites delegations of Greek and Turkish Cypriots to come to London at once to discuss the Radcliffe constitution, it will not be easy for Archbishop Makarios to hold back—especially as the great majority of Cypriots are weary of the disturbed and restricted existence of the past two years.

In the circumstances, it would be tragic if the Government now failed to make the most of its opportunities—opportunities for which (though its past mistakes are great) it can claim some immediate credit. If it is to reach its objective it will have to make up its mind to move forward on more than one front at once. The three aspects of the Cyprus problem—its strategic importance to Britain, its connection with Greece and Turkey, and its internal progress towards self-government—are all too intimately connected to be dealt with apart. In the twelve months of Archbishop Makarios's exile, some stubborn illusions about Britain's power and Britain's needs in the eastern Mediterranean have been blown away by the Middle Eastern storm: among them, the idea that the British interest can be served by delaying a settlement. It cannot; the next phase of negotiation should seek a conclusion.

Israel Alone

What comes after the unconditional Israeli withdrawal from Egypt? The Israelis, isolated in the world and compelled to rely on their own strength, might feel forced to go to war again. But could another invasion bring them any nearer to real security?

The speed of Egypt's return to Gaza confirmed the fears of Israeli cynics who judged the withdrawal a profitless act of faith. Decisive military victory has been traded in for "hopes and expectations" of goodwill; a war has been won, but not a peace. In Gaza, only a thin Unef shield separates an Egyptian administrator in general's clothing from an Israeli army at the ready. On the Gulf of Aqaba, crossed fingers and a company of Finns keep the Egyptians from their vantage point at Sharm el-Sheikh. The renewal on a serious scale of fedayeen raids and of the blocking of the gulf to Israeli shipping are as yet only fears for the future. But positions and opportunities are not substantially different from what they were in October. What is the state of Israel after the flash of victory and the grudged retreat?

The Sinai adventure and the four months' bargaining that followed have shown up more acutely than before

both the strength and the weakness of Israel's position. Israel is surrounded by countries that have not ceased to proclaim their hostile intentions; no country in the world is vitally interested in helping Israel, though at present Israel is stronger than its neighbours. The predicament is overlaid by shadings of goodwill, by private overtures of friendship and the sense of moral obligation of other countries. But these do not add up to much in the immediate balance sheet. Israel's actions are determined by the knowledge that it is in danger, alone, and strong; and, since October, this isolation has been emphasised time and again by the show of hands at the United Nations.

Israel is inevitably a loser in the present state of the cold war. Unlike its Arab neighbours with their oil wells, pipelines and sites for foreign bases, and in spite of its strategic situation on the Mediterranean and Indian Ocean systems, Israel has not been regarded as a prize in the manoeuvres of the great powers. Although the United States gives Israel money and private sympathy in plenty, it withholds political support. For the hard fact is that Israel is an obstacle in the way of America's fighting mission against communism. Outspoken support for Israel might nullify President Eisenhower's chosen policy of competing with Russia for Arab friendship. No doubt Israel's wellbeing troubles the American conscience, but it takes a bad second place in the tactics of the cold war. While America and Russia play their wary musical chairs for the Arab states, Israel cannot hope for much change of attitude from either.

Only feeble friendship is offered Israel from other countries. The one exception is France, which (with its own pressing interests in the Near Eastern and North African region to serve) has not tried to sheer away from Israel in the last few months, and is still relied upon for arms and at least economic help in a future, perhaps early, emergency. The British government, with its eyes on oil and on the few Arabs with whom it is still on nodding acquaintance, is too intent on the long climb back to Arab (and American) goodwill to risk more than a passing wave for Israel. Some Scandinavian and Latin American countries are friendly but cautious. A few Asian and African nations indulge in secretive friendship: Burma and Ethiopia, for instance, are believed to have privately declared some support for Israel. But all this adds up to very little.

Israel has recognised that for the present its only sure weapon is its own strength. The question is how this strength should be employed; Israel has to decide whether to sit tight or whether to break out again. The lessons of the Sinai campaign can be used to support either policy. On the one hand, a successful war has brought Israel no nearer to the peace settlement which it so much needs. On the other, it has shown that military victory is not difficult and that the rest of the Arab states will be in no hurry to come to Egypt's assistance. But perhaps the most important effect of the war on the Israelis is that it has made them less patient. It is because of this that a policy of keeping behind the armistice lines, and waiting for the opportunity to come to terms with the Arabs by peaceful means, would be politically feasible only if Egypt and the other Arab states were to desist from belligerent acts against Israel. But should the raids or the sea blockade start again (the blockade by land has never been interrupted), Israel's confidence in its own military vigour, combined with its disillusion over the likelihood of other countries exerting any serious pressure on its tormentors, is not likely to support an attitude of restraint and endurance. The strength of Mr Ben-Gurion's position today is remarkable, considering the widespread anger and scepticism over the unconditional withdrawal. It is personal triumph; no other leader could have weathered the political blast. If the Arab states now provoke Israel, patience will be very much more difficult. Nor, judged by the warning remarks he has made over the last few weeks, would Mr Ben-Gurion be patient.

The most obvious issue is the passage of the Gulf of Aqaba. Mr Ben-Gurion has made it plain that any attempt to interfere with Israeli shipping in the gulf would be answered by force. The trade outlet to the south and east has become a symbol of the economic independence which in the past was made impossible by the Arab blockade and boycott. Trouble from Gaza would not be so obvious a *casus belli*: Egyptian raids across the border would not threaten the same economic stranglehold as the molestation of shipping, and they could be met with equivalent counter-action, though such raids could always serve as an occasion for war.

A third test will be Israel's right to send ships through the Suez Canal. This, for several reasons, is in a different category from the Aqaba or Gaza tests. It is not a local issue, since other powers have the same interests as Israel. It is a less bitter controversy, since the right was not won in the campaign and therefore has not been affected one way or the other by the retreat, vital though the right remains. The Israeli government, voluble in its warnings about Aqaba and Gaza, has been guarded about its intentions if an Israeli test ship is barred from the canal. But it seems a reasonable assumption that other countries, no more disposed than before to risk their own interests for Israel, will gladly pass the decision to the International Court, whose verdict may have no more effect on Egyptian conduct than the Security Council resolution did.

Finally, always in the background, there are Cairo radio and its echoes constantly promising to annihilate Israel in the Arabs' own good time; there is the boycott, which extends beyond the refusal of the Arabs themselves to trade with Israel to the black-listing of foreign firms which do business in Israel; and there is the constant threat of an arms race. For Israel there are two ways to keep even with its neighbours in the competi-

ion for arms; the first is to try and get arms from outside; the second is to take them from the Arabs. To the blockade and the boycott, which add greatly to the difficulties of an already precarious economy, Israel has no answer.

If the Israeli army invades Egypt again, it may have either of two objectives. One possible plan might aim at the seizure of both shores of the Gulf of Aqaba, with a view, this time, to holding them until a peace settlement. The other and more ambitious plan would aim at striking a decisive blow against Egypt; it would be unlikely this time to stop short of the Nile. A march to Cairo would be aimed partly at unseating President Nasser, who in Israel as in Britain is thought by many people to be the fountain of ill, and partly at seizing control of the Suez canal to collect at last a bargaining counter that would really impress the west. But a victory on either plan would have a grave drawback and a grave limitation. Militant expansionism in Israel, at present a minority attitude, would be strengthened and would even be implanted in the minds of those who at present genuinely discountenance it. And the renewed war would almost certainly fail to make Israel permanently more secure. Israel cannot hope to dominate the Middle East, and a warlike policy would make it even more difficult for its neighbours to accept it as an equal. Other Palestinian kingdoms have tried to survive by getting their own blows in first. The kingdom of David and Solomon and the Crusader Kingdom of Jerusalem both lived like this, but in less than a hundred years they had both succumbed to greater numbers. The Crusaders would have died out earlier through lack of men had it not been for jealousies and quarrels among their enemies. Israel, a country of a million and a half people, cannot hope to keep upwards of 40 million hostile Arabs permanently at bay. Its hope must lie in gradually disarming their hostility; otherwise, as they grow less disunited and their animosity towards Israel more determined, their greater weight of numbers must prevail.

This is not a cheerful picture for Israel. But it is also dangerous for the rest of the world. For one question has not yet been asked: what will the Soviet Union do if Israel again attacks an Arab state? Russian intervention on behalf of an Arab country could be the first reaction in a chain leading to the third world war. President Eisenhower's strategy in the Middle East cold war is to make friends with as many Arab countries as possible in order to keep them from the Russian fold. In such a strategy the substance of the Arab-Israeli conflict appears of secondary importance, and causes Israeli interests to weigh comparatively light in the balance. But such a balance is unreal, if only because it disregards the possibility that a local quarrel can lead to a world war. For the present, Israel can protect itself, but Israel's own strength is unlikely to win for it a permanent peace. This can only be done from outside, and only with strong American support. It will not be done until it is realised that the danger of letting the dispute between Arabs and Israelis slide is at least as grave a danger to world peace as the inconvenience of not enjoying Arab friendship.

NOTES OF THE WEEK

THE DEFENCE WHITE PAPER

Slashing the Services

At first reading of the defence white paper, which appears just as *The Economist* goes to press, suggests that Mr Sandys's formula for cheaper and better defence without conscription achieves its air of conviction by an admirably logical statement of what has to be done with a certain vagueness about how it is to be done in details. A more complete examination must be deferred until next week; Mr Sandys's five-year plan for a radical reorganisation of the armed forces is a welcome attempt to rethink the defence situation from elementals and it deserves very careful analysis. But the immediate economies are in black and white. They take a bigger weight off the economy than was expected—for which there must be gratitude. Mr Sandys's bill is £1,420 million after deducting American and German aid, a saving of £117 million on 1956-57 on present prices and of over £200 million, Mr Sandys claims, on what the bill would have been without drastic reorganisation. He makes more cautious promises of economies in coming years. Though he disavowed any intention to slash or mutilate the services, this comes near to slashing.

This is to be achieved by frank reliance on the nuclear deterrent to meet any serious threat; the drastic pruning of all minor commitments; the acceptance of the logic that defence is collective, with the British role, whether nuclear or in conventional arms and operations, never more than contributory. After saying the right things about integrated western forces and shared commitments under existing pacts and alliances, the white paper sets out—but only very broadly—the economies to be made in the British contribution of manpower and material. Successive cuts in the call-up are to end conscription in 1960; the last national service man will leave the forces two years later, and by then they will consist of 375,000 regulars in all three arms compared with 690,000 regulars and conscripts now and 625,000 at the end of this year. Rhine Army is to be cut from 77,000 to 64,000 this year, and by more next. Such

instances of the economies to be made in research and development as are given in the white paper, are those commonly anticipated: no fighter to be developed after the P.1 and no bomber after the V's. Missiles are to come from America though some unspecified British missile development is to go on. Air defence is to be confined to V-bomber airfields; the Army's task is to be reduced by cutting garrisons and regrouping upon a central mobile striking force; the Navy—and here the white paper is vaguest—is to be cut to "a small number" of task forces. The final abandonment of home defence will produce further savings.

WHAT IS LEFT OUT

The pattern is clear, even ruthless. What is less clear is what will be left of effective conventional forces after the deterrent takes priority in a much reduced budget. The white paper accepts not only the need to defend the colonies and areas like the Trucial states (the traditional Commonwealth commitment is dropped), but also to play a part in "limited operations." Are these seen in terms of conventional arms? If so, the contribution which a British army probably cut to 150,000 men—no actual figure is risked—will be able to make will be small; and it is far from certain how far there will be resources to make it airborne at short notice. Either other members of the alliance must find more of the manpower in future or nuclear weapons must be used. The vagueness of the white paper on such points may be the scars of major wars fought round this issue within the cabinet and between Mr Sandys and his service chiefs. But he emerges as a minister of defence determined to assert his authority. Nevertheless, there is a lot of explaining to be done, and Mr Sandys must do it.

PARLIAMENT

No Cecil in the Cabinet

All this week observers at Westminster have been shrimping around for reactions to the departure of Lord Salisbury. There has been no sign that any other members of the Cabinet have any intention of resigning with him; his colleagues in Cabinet included many who greatly respected him, some who were privately rather awed by him, but apparently none who genuinely followed him in any meaningful sense of the word. His influence for strength in policy was a considerable national asset in the Geneva days of high-level talks with Russia, but it had become much less valuable since the Suez and Hungarian tragedies. Indeed, the two most frequent comments about the resignation's repercussions in Cabinet have been digs at two of his colleagues. It is being asked who will now become Foreign Secretary, and suggested that it may even be Mr Selwyn Lloyd; and it is being noted that although Lord Salisbury's anomalous responsibility for atomic research has not been given to Lord Mills (the obvious man to take it over), it has been assumed by the Prime Minister himself who, as principal remaining patron of the society for not being beastly to Lord Mills, is the least embarrassing alternative choice.

NO RUSTLE IN THE HOUSE

The Lord President's resignation has also caused less disturbance than might have been expected among Conservative backbenchers in the House. This was partly due to the Prime Minister's success in the debate on Bermuda this week when, obscuring Lord Salisbury in a cloud of strontium 90, he delighted Tory MPs by uncovering and exacerbating the row in the Labour party about H-bomb tests. It is possible that the Tories will grow more restless when the issue of canal tolls has to be faced, or else after the budget, but no new sparks have been struck on the comparatively minor issue of Archbishop Makarios's release. Even the diehards have not been running very high blood pressures over Cyprus since the Suez fiasco proved its limitations as a base, and the dominant backbench reaction to Lord Salisbury's departure therefore seems to be a mixture of surprise and irritation. Among Tory workers in the constituencies tempers could run higher, but there, too, there may be a feeling that Lord Salisbury's choice of an issue bordered on the frivolous. Newspaper eulogies of the Cecil conscience find little echo in Abbey House.

There remains the admittedly graver problem of leadership in the (unreformed?) Lords, where the Conservative peers regarded Lord Salisbury as an all-wise shepherd, to be followed blindly. Lord Home, the designated replacement, will presumably often be away on his duties as Commonwealth Relations Secretary. Clearly he cannot carry on both jobs indefinitely. The sensible thing might be to let Lord Hailsham, who has been named deputy leader, take on the full work of leadership. But even his well-known powers of persuasion and tact could now be severely strained.

DIRTY BIG BANGS

Mr Macmillan's defence of the Government's decision to go on with the hydrogen bomb tests was watertight; his reasons for a more cautious attitude towards rationing such tests were also convincing, if depressing. To take the scientific facts before the political *fracas*, the position is this. The danger from megaton bomb tests comes, not from external radioactivity, but from internal radioactivity set up inside the body by absorbing one particular fission product, the calcium-like strontium 90. Hitherto, the achievement of very large explosions has been related to the amount of fission produced; it followed, therefore, that the radioactive waste in the stratosphere gave a good clue to the size of the bomb exploded. But it is now possible to achieve a larger explosion from the fusion process which is sandwiched between two series of uranium fission; the toxic fall out of the explosion is therefore no longer necessarily related to size. The Eden plan for rationing bomb tests was based on the need to limit the build-up of strontium in the atmosphere to a tolerable level; but, for policing purposes, what now has to be detected is not just the size, but the type of explosion. This can only be done by having neutral or United Nations observers on the spot. Britain is willing to invite these; whether Russia could be trusted to invite them to all their tests is quite another matter.

It is therefore clear that rationing of the tests has become more difficult. Where Mr Macmillan was less than candid was in his tendency to minimise the seriousness of this development. He argued that the British tests would not make any dangerous addition to the present strontium level; as the present level is a hundred times less than the maximum allowable concentration defined by the Medical Research Council, this is true. But this position can be

held only if explosions do not take place more frequently than they have done in the last few years ; if more countries are to carry out tests of the type of triple-stage H-bomb that has started the trouble, while the coming into operation of missiles requires more tests by each country, there is real danger that the safety level may be overrun. The best way to avert this danger, of course, would be to abolish all nuclear tests. But on this the British position is clear. If we are to develop the weapons, we must have the tests ; if we are not to have the weapons, we must have general disarmament. And that looks a long way off.

★

It should be obvious from this that the Labour party's new official policy—that Britain should " postpone " the Christmas Island test, while " taking an immediate initiative " to reach international agreement about abolishing all future tests—is as silly a play upon words, and as blatant a disregard of difficulties, as motions about " taking an initiative " usually are. But it is unfortunately not certain that Labour will lose politically from this show of unconstructiveness. For a brief moment on Wednesday morning, as the possibility emerged that a majority of Labour MPs might vote against their shadow cabinet in favour of banning all tests, there was talk of a Labour split that might make Lord Salisbury's resignation on the other side look like a merely conventional explosion. But in the end the Labour rumpus, in H-bomb terminology, has all the symptoms of a clean, rather than a dirty, big bang: the fusion is now more evident than the fission, and neutral observers cannot honestly detect any signs of a deadly fall-out. Mr Gaitskell may have been made to look temporarily silly, by putting his name to a policy of postponement in which he does not believe ; but the Government could be made to look more silly still if a fleet of Japanese fishermen sat off Christmas Island and stopped the test from taking place. For any Government in power, this issue is politically damaging ; that is one of the penalties of being a Government at the present time.

SUEZ CANAL

Beware of Boycott

THE French government is firm, and the British Government appears fairly firm, in the intention to boycott the Suez Canal while the attempt is made to bring President Nasser up to scratch. It is doubtful whether this form of pressure can achieve anything. Shipowners who refuse to use the canal will be placed at a greater disadvantage against their competitors than they can sustain for long. American ships will pay their dues to the Egyptian canal authority as they did after nationalisation. Sweden and Norway have given no advice to their shipowners. Italy frankly states that it cannot afford a boycott. The Asian nations will almost certainly use the canal.

The provocation to a boycott is great. The memorandum for a Suez Canal settlement which Egypt sent to interested governments last weekend is open for discussion, but there is nothing in the document to suggest that the Egyptian government's mind is very open. It ignores the " six principles " for a settlement approved by the Security Council on October 13th last year. It even falls short of earlier Egyptian proposals. President Nasser said in September that he was willing to accept the decisions of an international conference as long as they did not mean international control. Dr Fawzi told the Security Council in October that foremost among the objects of negotiation should be a system of co-operation between Egypt and the users. All that Egypt offers now is the 1888 guarantee of free navigation and the reference of disputes to the International Court or to arbitration.

But if the guarantees of free transit are made adequate, most maritime nations may be prepared to accept President Nasser's terms. The proposal that 50 per cent of the dues be set aside as reserve for development with the UN or the World Bank was too much to hope for. In 1955, the old company spent slightly more than 50 per cent on running costs, paid out more than a quarter in profits, and allotted only one-eighth for improvements, depreciation and special reserve. The Egyptian offer of 25 per cent for development is reasonable enough by comparison—or would be, if President Nasser could be persuaded to pay it to a holding account with Uno or the World Bank to save him from the temptation of raiding the till. It would just about enable him to finance the £100 million development plan prepared by the old company. He was able to collect nearly 50 per cent of the dues during the period of partial boycott between the seizure and the Anglo-French invasion ; he has little reason to fear that the results of a renewed boycott would be worse for him now.

PASSAGE AND REFUGEES

President Nasser told a group of American journalists last Saturday that Egypt would prevent the passage of Israeli ships through the Suez Canal until the Arab refugee problem was settled. Spokesmen of the Israeli foreign ministry and of the Foreign Office in London have contended that this wrongly linked two matters that are separate. No doubt they assume that President Nasser, knowing the immense difficulty of settling the refugee problem, was simply justifying in advance his refusal to let Israeli ships transit the canal. There are good reasons for the assumption. He said " The Arabs want the refugees to have their rights, property and land," a claim which it is now manifestly impossible to fulfil. And he threw his proposal—if that is what it was—casually into the columns of the press.

Yet the closing of the canal to Israeli ships and the Arab refugees are not, in fact, entirely separate matters. They both derive from the Palestine war. When President Nasser says, " We want it (the problem of refugees and the canal) settled as a whole," he shows a revealing lack of respect for the 1888 Convention and for the principle of free passage ; still, it would be a mistake to dismiss his statement lightly as a propaganda trick. The Israeli Government wants the problem settled as a whole ; one of the purposes of the invasion of Egypt was to throw off the Arab blockade. President Nasser should be asked, perhaps by Mr Hammarskjöld, whether he seriously wants to discuss a general settlement.

Uno needs the opportunity to tackle the substance of the question. All the existing resolutions since 1947 have been ignored by one side or the other ; they stand, if anything, as an obstacle to settlement, each side insisting rigidly only on those Uno decisions which suit it. Perhaps the time has come to throw away the whole palimpsest of decisions that have successively been overtaken or frustrated and to look for something new. A new commission, composed of governments not committed in the conflict, might examine the facts again and submit proposals for settling the problem " as a whole "—that is, boundaries, refugees, belligerent rights and all.

LABOUR DISPUTES

Strikes Suspended

THE decision to suspend the engineering and shipbuilding strikes was taken on Tuesday because one man was on his sick bed, and because of the courage of another who had to be escorted to his car by police after the meeting, through a hostile and communist-dominated crowd. As president of the Amalgamated Engineering Union, Mr William Carron had the casting vote when his executive was split equally (one member being absent through illness); and it was he who, on a card vote, brought his million members to the side of common sense—and with them a majority of the confederation.

It was common sense, not only from the country's point of view, but also from that of the strikers—it is obviously better for them to be earning during the ten days or so that it takes to get out the report. But it was not only the communists who assailed Mr Carron, nor only the old-fashioned fire-eaters like Mr Ted Hill. Mr Frank Cousins, of the Transport and General Workers' Union, who had lately seemed to be departing from the path of militancy, spoke for continuing the strike, and so did representatives of many of the small unions. The logical, as opposed to the political or emotional, reason for opposing the resolution was that the outcome of these courts of inquiry might not be acceptable to the unions, but that, once the men went back to work, it would be difficult to get them out on strike again. The decision to go back to work was partly influenced by the possible difficulty of getting some of them out in the first place (the stoppage was due to spread to the restless Midlands this week) and to difficulties about strike pay. Unfortunately, however, the decision seems also to have been made on the union leaders' assumption that a 5 per cent increase is in the bag—this being the amount the shipbuilding employers offered—and that the courts of inquiry are merely adjudicating on an additional increase, over and above that figure, and on the question of restrictive practices.

But the shipbuilders' offer of 5 per cent was conditional on union co-operation to end restrictive practices, and was refused ; while the engineering employers, being generally less prosperous than the shipbuilders, offered only 3½ per cent, on similar conditions. Moreover, the court of inquiry, like the tribunal that awarded the National Union of Railwaymen for unemployment*; but whether or not the workers won their strike depended less on whether there was heavy unemployment in that industry than on the degree of union organisation. Full employment since the war has not led to more strikes because the unions, now more highly organised than ever, have been getting their own way without recourse to them.

Yet the extent to which trade unionists are prepared to strike, even when they lose more by striking than they can gain by a year's wage increase, is still astonishing. The shipbuilding strike was, after all, only for an extra 2½ per cent above the employers' offer, and ten days' loss of earnings would more than wipe out that gain for this year. It is perhaps still more surprising that more often than not strikes have no financial object. In 1955, for example, only 20 per cent of all strikers had a wage increase as their object, although other disputes concerned with wage payments brought the percentage that went on strike because of wage disputes to 48. Working arrangements, rules and discipline accounted for 16 per cent of the strikers, and demarcation disputes were another important cause. But a high proportion of strikers were simply engaged in supporting other trade unionists, either in sympathetic strikes, which accounted for 15 per cent of all strikes, or to obtain the reinstatement of particular individuals. To this extent they have souls above money.

Strikes and Some Statistics

ALTHOUGH the strike funds of the big trade unions are smaller than is generally supposed, there is no evidence that the unions comprising the Confederation of Shipbuilding and Engineering Unions made up their separate minds about whether to continue the strikes on the basis of whether they could afford to do so. Mr Carron's Amalgamated Engineering Union (whose casting vote called off the strike) and Mr Ted Hill's boilermakers' society (which led the opposition to Mr Carron) both probably started with uncommitted reserves of between about £11 and £12 per member ; the AEU's uncommitted reserve at the end of 1955 was £11.4 million for a membership of close on a million (most of whom were on strike) and the boilermakers' about £1 million for a membership of 88,000 (all on strike). The giant Transport and General Workers' Union is poorer for its size than both these organisations (a reserve of only £9.7 million at the end of 1955, excluding funds earmarked for other purposes, and a membership of 1¼ million) ; while the Electrical Trades Union, whose substance has been wasted by previous strikes, was the poorest of all (only £280,000 for a membership of 210,000, or little more than £1 per member). Yet both the TGWU and the ETU voted for continuing the strike, although admittedly only a proportion of their memberships were involved.

Union reserves do not need to be so large nowadays because—contrary perhaps to the prevailing impression this week—unions do not resort to strikes as readily as they did before the war. According to the Ministry of Labour, the average yearly number of days lost through strikes during the years 1914 to 1918 was about 5.4 million. In the following three years it rose astronomically, to 49.1 million. In 1926, the year of the general strike, 162 million working days were lost ; excluding that year, the annual average from 1922 to 1932 was about 7.6 million. Since 1932 the totals have been much lower. The average for 1940 to 1945 was nearly 2 million, and since the war 2.2 million ; and the worst postwar year up to now has been 1955, when the docks, railways and mines played the leading parts in 3.8 million working days lost. 1957 has already broken that unhappy record.

★

Those who think that the answer to all this waste is to ban strikes only need to look at the figures for two wars, when they were illegal: the peak of 1955 was almost equalled in 1944, at 3.7 million days lost. Those, on the other hand, who think that the remedy is the discipline of unemployment have some evidence from the inter-war years on their side. There was then an inverse correlation between the number of strikes (as opposed to number of days lost) and the figures

* See " Strikes," by K. G. J. C. Knowles. Blackwell. 42s.

waymen 3 per cent, may be gloriously indifferent to what the men would accept. It may—quite probably should—award less than the conditional offers. It is too early, therefore, to rejoice at the ending of these costly strikes, or for anybody to count chickens about the costs of settlement.

CHOICE FOR THE ENGINE DRIVERS

In turning down the "package deal" by which the Transport Commission offered it an increase of 5 per cent in wages in return for undertakings about productivity and promises to discuss the co-ordination and timing of future wage claims, the Associated Society of Locomotive Engineers and Firemen has put itself firmly in the wrong. The National Union of Railwaymen and the Transport Salaried Staffs Association both accepted the conditions. The ASLEF leaders say that they stand on the principle that they have a right to the wage increase quite apart from any conditions, and that their members have authorised them to put in another claim when they think it appropriate. The Transport Commission has quite rightly retorted that in that case the footplatemen cannot have the 5 per cent increase, but must revert to the 3 per cent increase which they were awarded last November. That decision would apparently have to apply to the footplatemen in the NUR also, to the indignation of that union.

The results are that ASLEF and the NUR are once more set against each other, and that there is a renewed but vague threat of a railway strike. This is not really as worrying as it may seem. ASLEF is a small union—73,000 men—whose reserves have not yet recovered from a three weeks' strike over a wage claim in the summer of 1955; it would be very hard put to it to maintain a long stoppage now, and some of its members might well be becoming increasingly irritated by the hamhandedness of its tactics compared with those of the NUR. The NUR has always been more co-operative about measures to increase productivity than ASLEF—partly, admittedly, because the most important productivity measures now under discussion, the economic manning of diesel and electric trains, would remove more featherbeds from under the footplatemen than from under other branches of the railway staff. But the Transport Commission, in this dispute, enjoys the unusual luxury of an obviously strong bargaining position. It should at all costs stick to its guns.

DOCTORS' PAY

Time for Consultation

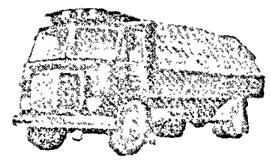
CAN nothing be done to end the protracted dispute over doctors' pay? If the doctors' representatives persist in their present tactics, and in refusing to co-operate with the Royal Commission, the profession will almost certainly be split and it will quite certainly lose what public sympathy exists for its case. Indeed, the weakness of its bargaining position is that the only party to gain will be the Government, for if the threats of withdrawal are even very selectively carried out, the Exchequer will gain financially at the expense of either doctor or patient.

But if the time has come for less intransigence from the doctors' leaders, a conciliatory move from the Government is also overdue. Now that a 10 per cent rise has come into force for junior hospital staffs, it would be only too easy for the Government merely to announce a flat percentage increase for all other doctors. But a much better, and more civil, course would be to fix the maximum sum of money that can be afforded and to offer to negotiate with doctors' leaders on the way it should best be distributed.

The doctors' claim of a 24 per cent increase for all of them would, it has been estimated, cost £20 million. There is not the slightest possibility of the Government's giving away this amount for an interim rise, since it would in effect be accepting Spens and all. But it is worth pointing out that even if this sum were added to all other payments to all doctors in the health service (hospital doctors and general practitioners), the percentage of total health service expenditure accounted for by doctors' earnings would be increased to only 18.5. According to the estimates published this week, payments to doctors now account for 16 per cent of the total gross expenditure of £690 million. In 1949-50, the first complete year of the service and before the Danckwerts award put doctors' earnings up, payments to doctors accounted for roughly the same proportion. In the same period the percentage accounted for by nurses' salaries, inside and outside hospitals, has gone up from 10 to 15. An even bigger proportionate rise has been gained by hospital workers other than nurses and doctors. The total of all these salaries, wages and expenses—of domestic staffs, technicians, administrators, porters, gardeners, engineers and a host of others—is now estimated to cost over £118 million a year, 18 per cent of the total compared with 11.5 per cent in 1949-50, and some £7 million more than all doctors' earnings in all branches of the health service. This should not be taken as justification of the doctors' 24 per cent claim. But it does show that the ancillary limbs of the service are outgrowing its main body.

IRAN

Dr Adenauer Strikes Oil

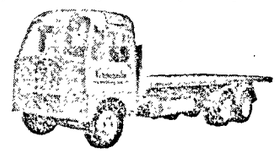


THE dream of an Italian oil empire in Iran, breaking the monopoly of the great oil companies, has been deflated, but it has been given a more real if less ambitious substance by the news of German interest. Even Signor Mattei, head of the Italian natural gas monopoly (ENI), admits that no contract is made or imminent between his company and the Iranian government. His partisan in Iran, Dr Ala, has resigned the premiership. The Shah and the new prime minister, Dr Eghbal, are both well aware of the dependence of Iranian development on American aid and on the major oil companies. It is doubtful in any case whether ENI, whose technical resources are overstretched in Italy, could open a Middle Eastern field alone, even if it had the cash. Signor Mattei's political and economic ambitions seem, once more, to have outrun his means.

But on the heels of Dr Adenauer, who has been returning the Shah's visit to Bonn, a team of German experts is now to visit Iran. It will investigate the possibilities of German participation in Iranian development, above all the oil of Qum. German talk is more muted than Signor Mattei's. There is no question of breaking the fifty-fifty principle in any arrangement for sharing profits, it is explained, and an Iranian company, as at Abadan, would actually raise the oil. No specific deal, in any case, has yet been made, and it is doubtful whether Germany can provide the $150 million needed for a refinery or the enormous sum (a German estimate is $250 million to $300 million) for a new pipeline to carry the oil across Turkey to the sea. It will take in any case some five years for the field to be opened up. But

NOW MORE THAN EVER
A.E.C's ARE MILES AHEAD

20 30 M.P.H.

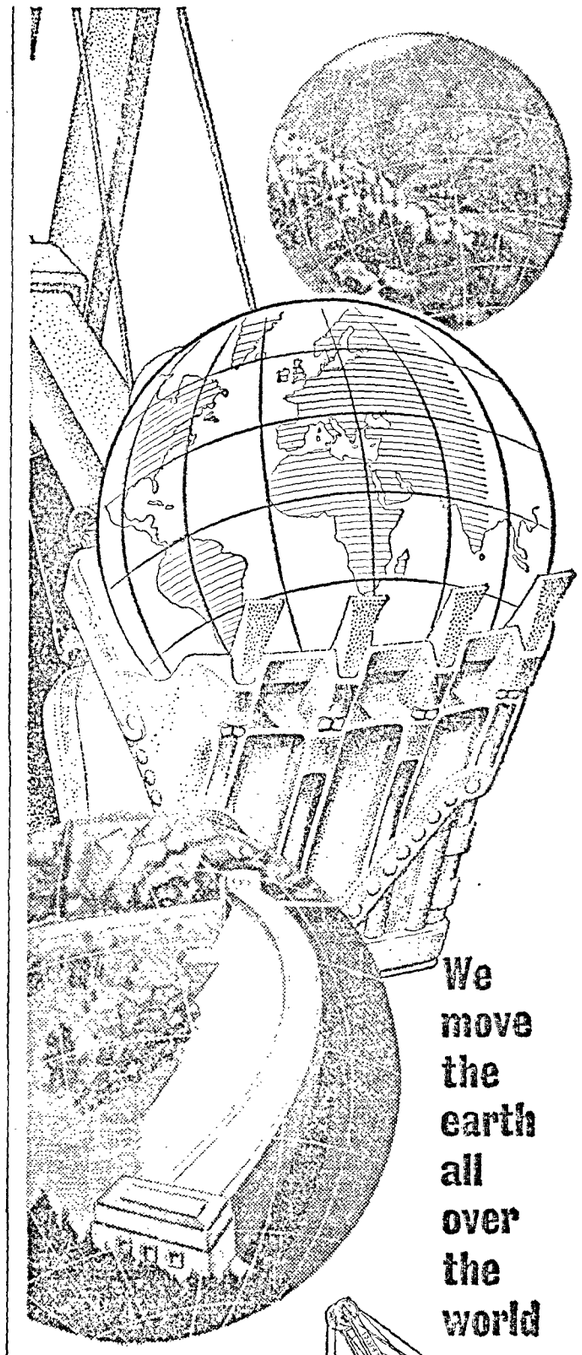


Given the speed, there are sound arguments for using a big capacity diesel-engined vehicle. The diesel engine has a relatively low fuel consumption; properly maintained, it needs little attention, runs for long periods between overhauls and lasts for years.
From May 1st every diesel-engined A.E.C., from the 14-tons gross 'Mercury' to the 24-tons gross 'Mammoth Major', will be allowed to travel at 30 m.p.h. For users of small vehicles this opens up a new concept of big vehicle operation. A.E.C. goods vehicles, built for economical running and sustained reliability, are used by hundreds of operators all over Britain. They know that the big capacity vehicle pays. Let us show how the operation of A.E.C.'s will pay you too.

'Mercury'. 9½-tons payload. 14-tons gross. Bodies from 10 ft. 1 in. - 21 ft. 4 in.

'Mammoth Major' 8. 24-tons gross. Bodies from 18 ft. 10 in. - 24 ft. 7 in.

'Mammoth Major' 6. 20-tons gross. Bodies from 18 ft. 10 in. - 24 ft. 7 in.



Power, Performance, Capacity... and 30 m.p.h.

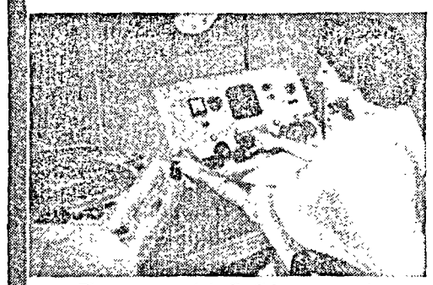
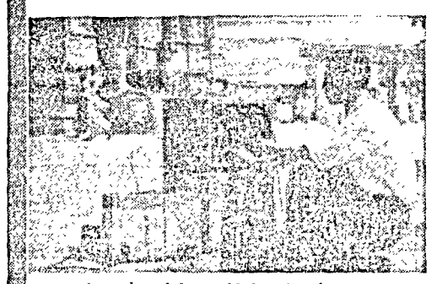
Marconi's hand in Radio Ceylon



Solo on the Jalatharangha, rice bowls tuned by filling with water, and tapped to traditional rhythms.



Control boys during assembly at Chelmsford.

The Minister of Posts, Broadcasting and Information services switches on.

The announcer of the English programme in Continuity Suite 1.

A member of the outside broadcasting team operating his equipment during the 2,500th anniversary celebration of Buddhism.

Last year the new studio installation in Radio Ceylon was officially switched on by the Rt. Hon. C. A. S. Marikar, Minister of Posts, Broadcasting and Information. The work of re-equipping the studios and providing a new continuity system and control room was begun by Marconi's in 1949 and completed in time for Radio Ceylon to take part in the 2,500th anniversary celebrations of Buddhism. The new system makes possible a national service with simultaneous programmes in four languages, and a commercial service with programmes in a further five languages.

MARCONI

Complete Sound Broadcasting and Television Systems

MARCONI'S WIRELESS TELEGRAPH COMPANY LIMITED, CHELMSFORD, ESSEX

LG 17

German interest is keen. Qum is said to be able to yield some 20 million tons of oil a year once the transport problem is overcome. And the partnership between Italy and Germany might encounter better political conditions in the Middle East than any Anglo-Saxon venture would.

Iran is not the only Moslem country where Germany continues to make spectacular efforts both to expand trade and help development. The Vice-Chancellor, Herr Blücher, recently made arrangements for more German help to Pakistan; and the German trade fair in Cairo is proving an astonishing success.

KASHMIR

Blot in India's Copybook

A PAINFUL contrast has been visible between India's splendid achievement in holding the biggest general elections in history in an atmosphere of freedom and fair play, and the deplorable way in which the subsequent elections in Indian-held Kashmir were rigged. In India over 115 million votes were cast—a good ten million more than in 1952; and if clinching evidence of this vast electorate's freedom of choice is called for, it is to be seen in the fact that the ruling Congress party, as in 1952, got slightly less than half the votes. But in Kashmir the "victory" of Mr Bakshi's candidates was a solemn farce.

Before the voting began they had secured 40 out of 75 seats in the local assembly, thanks to the absence or disqualification of rival candidates, and with this safe majority in hand they have been cantering happily through the remaining contests. The main opposition group, whose leaders, including the deposed state premier, Sheikh Abdullah, are still imprisoned without trial, boycotted the elections; and it was in any case impossible for any candidate who challenged the finality of India's acquisition of Kashmir to stand.

If public opinion in India takes enough notice of this blot in the country's otherwise clean copybook, the mission of exploration which Mr Jarring, of Sweden, has undertaken on behalf of the Security Council may prove a little more fruitful than seemed likely when the Council nominated him in February. The dangers involved in carrying out the all-Kashmir plebiscite originally envisaged have long been apparent; but Mr Bakshi's blot is a reminder that the existing state of affairs in Kashmir is also dangerous. Mr Jarring is an old and known friend in both Delhi and Karachi, and it would be ludicrous for Indians to apply to him their rather childish charge that everybody is being unfair to them because of their stand against the attack on Egypt (a stand which the majority in the Council shared). There seems at least a chance that he may get minds in both capitals moving towards a compromise which would bestow democratic institutions on Kashmir—and help to stabilise them in Pakistan.

HUNGARY

Mr Kadar's Red Carpet

ON their latest visit to Moscow, Mr Kadar and his colleagues found themselves not on the mat but on a red carpet. Receptions were held, speeches were made, and toasts were drunk, all in honour of the "dear guests" from Hungary; and they went home with their pockets bulging with promises of economic help, including 875 million roubles worth of commodity credits and convertible currency to be used this year.

A price, however, had to be paid. Mr Kadar, who promised when he became premier last November that the Soviet army would go as soon as order was restored, has agreed that its continued "temporary" presence in Hungary is necessary, because of the international situation caused by "the aggressive Atlantic block," "the dangerous arms race" and so on. Mr Kadar must realise that nothing will more firmly cement the bitter hostility of the Hungarian people towards him. Probably, however, he has in any case abandoned all hope of making his regime acceptable. In the widely publicised speeches that he made in Russia he repeatedly denounced the "traitor" Imre Nagy and his group, and condemned "national communism" as the "belatedly born twin brother of Hitlerite national socialism." Inside Hungary, the regime still finds it necessary to take ruthless steps to crush the simmering discontent. (Mr Marosan, a member of the government, said recently that "it was impossible to govern without a mailed fist.") A security check of the whole population is to be carried out between now and September, in the hope, no doubt, of tracking down all those who played active parts in the revolt last October; and an emergency decree empowers the police to banish to a remote part of the country for up to two years anybody considered "politically unreliable" or "dangerous to the state or to public order." The Hungarians will soon find it hard to distinguish between Mr Kadar and Mr Rakosi.

RADIO PROGRAMMES

The Future of Sound

HALF the population now lives in homes with television, and this is inevitably reducing the numbers who listen to sound radio. On present trends, when the BBC's licence comes up for reconsideration in 1962, three quarters of the population may have TV, and the average audience listening in to sound each day may have fallen below three million, compared with 4.7 million now and 6.4 million in 1953. Last year the BBC spent just under £11 million on its domestic sound broadcasts and £7 million on television. It is clear, even on these rough forecasts, that the time has come to reconsider the allocation between sound and vision of the BBC's total revenue—which has been raised to £25 million a year excluding grants in aid of overseas services. Next week Sir Ian Jacob is expected to announce his plans for a reallocation of resources.

Two points should be made about the awkward decision before him. First, although the stage has certainly been reached when the BBC must consider reducing expenditure on sound, to transfer resources from sound to television would worsen the quality of the former faster than it would improve the quality of the latter: the cost of an hour of sound broadcasting is £600 against £3,000 for an hour of television. Secondly, about the programmes to be cut. Unfortunately, the customers' choice in sound is still heavily in favour of light entertainment; notwithstanding the inroads of television, two-thirds of the listening public still tunes in to the Light—apart from the vast audience for Radio Luxemburg—compared with 32 per cent who patronise the Home (or its regional variations) and 1 per cent who are well pleased to be patronised by the Third.

This has set off fears that, in seeking economies, the BBC will make a series of cuts and mergers in which the Third, perhaps after a brief period of civilising the Home, will virtually disappear, while the Home will shed a few middle brow programmes to raise the tone of the Light.

Of course, the possible loss of the Third is a development that needs to be bitterly resisted; but, of course, this is a trend that will set in under the present system, whatever is done next week, as the number of listeners further declines. Yet there is such an obvious way of resisting this trend. The real question to be asked is why, with the growth of VHF broadcasts, the listener should not in coming years gain rather than lose in variety, even if his numbers are less. Besides the three VHF wavelengths used by the BBC, three or four more are available in each district for other VHF stations. There are commercial organisations that believe they could profitably take up these wavelengths, financing themselves by advertisements. Why on earth not let these—or other—commercial bodies take these wavelengths to serve the light entertainment audiences, and continue the licence revenue to the BBC as, in part, an educational subsidy for maintaining the full glory of the Third? Indeed it would be a very good, although immediately less practical, thing to let some educational or even municipal organisations have a wavelength, financed partly by licence subsidy and partly by advertisements, as well.

OBSCENE PUBLICATIONS BILL

Obscenity for a Select Committee

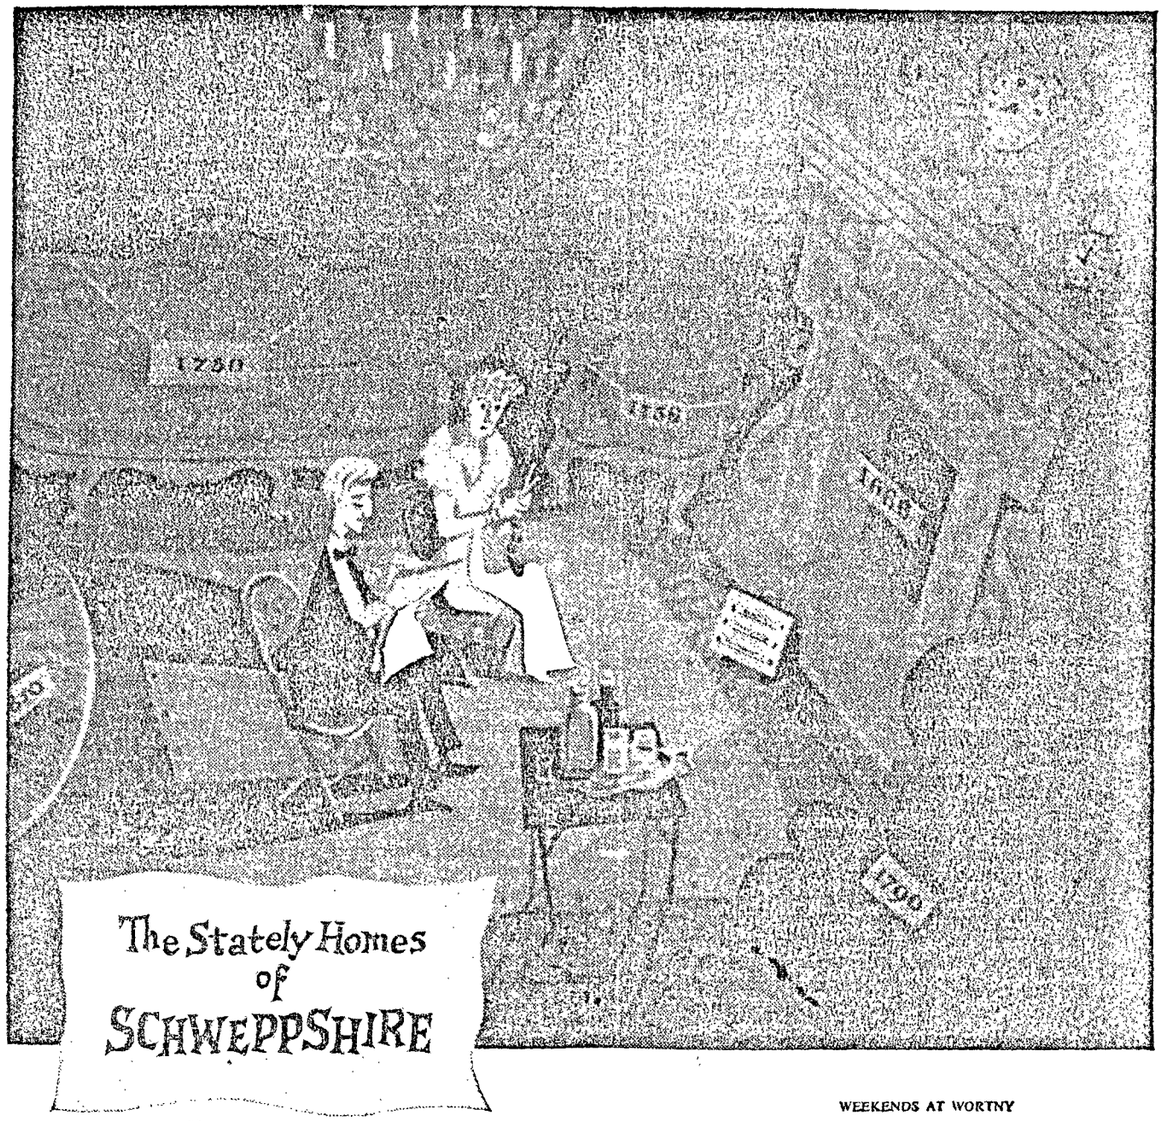
THE Home Office's reaction to the Obscene Publications Bill has been doubly interesting. It had been realised that under Mr Butler's command the department would no longer instinctively regard all private members' bills for liberalising the morality laws as something nasty which the cat had brought into the House; the question was what it would do about proposals which its experts considered to be unworkable. It is clear that, rightly or wrongly, its experts do so consider the present Obscene Publications Bill.

The intention of the bill is to permit, as opposed to the present practice of sometimes tolerating, the publication of seriously meant books which some people might consider to be corrupting. On Friday Mr Simon, Mr Butler's undersecretary, welcomed this intention, but criticised the bill on the following grounds. First, the Home Office considers that the penalties proposed, of a £500 fine or four months' imprisonment, are too small in view of the profitability of the trade in really dirty books. Secondly, the obligation for all cases under the bill to be approved by the Attorney-General would make too much work for that official. Thirdly, the bill would introduce an entirely new principle into English law, in allowing the author, printer or publisher of a book to be heard by the courts if a book from their hands is in danger of being declared obscene. Finally, and most fundamentally, Mr Simon claimed that it would be impossible to convince a jury that the dominant effect of a publication is to deprave and corrupt those among whom it is intended to circulate—and this doctrine of "guilty knowledge" is the real point of the bill.

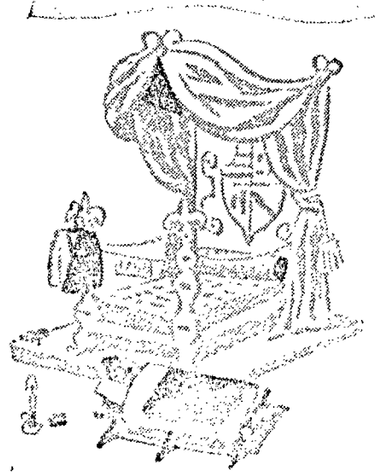
Having made these rather devastating criticisms, however, Mr Simon, instead of recommending rejection of the bill, suggested that the House should pass it to a select committee. The committee which is now to be set up will be able to call for evidence from whomever it likes; presumably the witnesses called will include the Home Office experts, as well as Sir Alan Herbert's colleagues from the Society of Authors who sponsored the present bill. There is therefore a good prospect that a measure that will be considered workable by both sides will emerge from the committee, whether or not it emerges in time for enactment this session. The importance of the precedent is that some of the many other complicated reforming measures, which Mr Butler is known to want to implement while at the Home Office, could presumably be helped through in private members' time in this way, if private members so wish. A door has been set swinging attractively open, on which other would-be reformers among backbench MPs may be tempted to push, now that they can feel that they are more likely to get help than obstruction. This is not the least of Mr Butler's parliamentary achievements.

FRANCE

Government on Sufferance



M. MOLLET'S government is now assured of life until the end of May at least. But the vote of confidence which it survived last week shows the weakness of its position. In an Assembly of 595 members, 221 deputies voted for the government and 188 against; 110 abstained. The government owes its reprieve to the unwillingness of a large part of the divided opposition to precipitate a crisis at this stage.



Some deputies are trying to spare the feelings of the Socialists because they hope to join them in a future coalition. Most critics, however, particularly the conservative followers of M. Pinay, who abstained wholesale, are in no hurry to take over because they consider that on the two main fronts of governmental action things must still get worse before they can get better. They find it convenient that the policy of repression in Algeria should be carried out by a Socialist-led government. They do not fear that M. Mollet will keep his pledge of elections there, since the promise is subordinated to the very unlikely condition of a cease-fire. Some of them, convinced that a few more months will bring about the financial bankruptcy of the government, think it convenient to wait until things have got worse; they will then be able to assert that Socialists find the coffers full when they take office and leave them empty when they go.

M. Mollet could exploit the hesitations of his critics and turn his numerical weakness into strength. Instead of remaining the prisoner of a conservative opposition, he could face it with the alternative of granting him the powers necessary for radical reforms or of shouldering the blame for his failure. It is feared in Paris, however, that, undaunted by 14 months of failure, the government still hopes that some miracle can yet crown its Algerian policy with a happy end. It will, therefore, stick to it and pay its way with economic palliatives—haphazard budgetary cuts, import restrictions and increasingly costly borrowing.

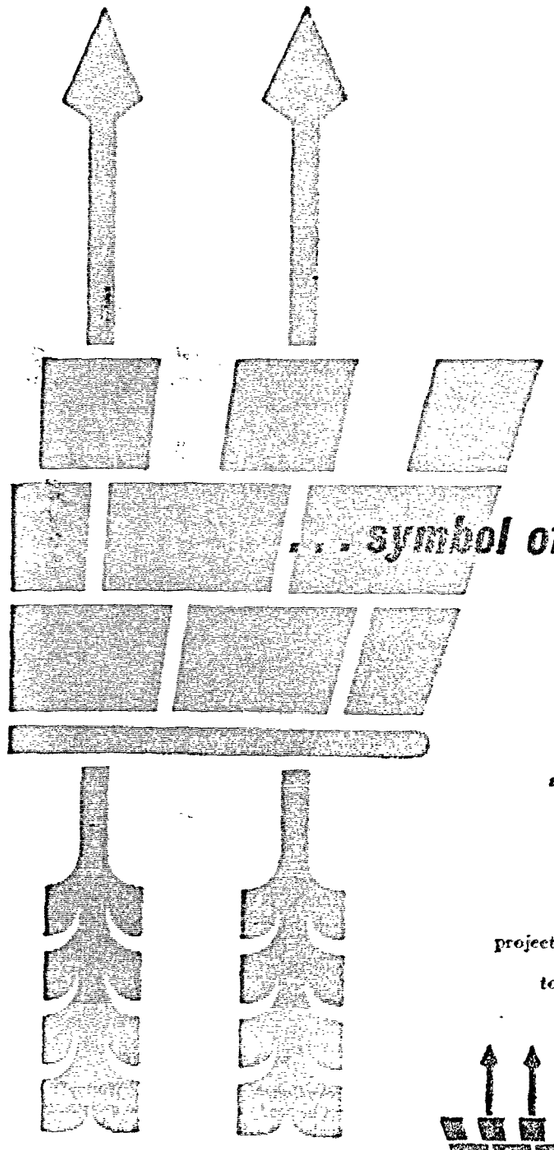
A CASE OF CONSCIENCE

Intellectuals in France, probably more than elsewhere, claim the right and duty to express the voice of national conscience. The methods of repression used by French troops in Algeria at first provoked individual protests, but these have now swollen into a chorus which is beginning to

WEEKENDS AT WORTNY

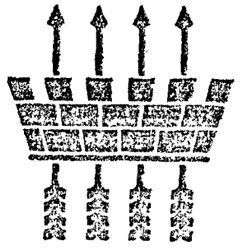
It is really fairly essential to get asked to Welbroke-Cortenay (pronounced "Wortny") because not only do the people there have the most tremendous taste, but also everything is absolutely bang period—not just period of course but an actual period with a date which is practically almost even a day of the month. So DO NOT TOUCH.

One or two snags of course. It is no bad idea to slip into your bag a tin of pressed beef: because the kitchens (1485) are only suitable for the preparation of larks' tongues, lampreys, boars' heads and oxen roasted whole—articles which the Co-op, to the apologetic annoyance of your hosts, are not invariably able to supply.



Bring own hot water bottles, because they hadn't been invented by any date which could possibly be admitted as a proper kind of date here. Similarly of course there are no ping pong tables, radio sets or bridge markers. No corkscrews, and the soap in the bathroom certainly is not of the modern kind. And DO NOT TOUCH.

Of course one can always sit, as long as one sits down very slowly indeed. It is perhaps worth pointing out that it is a good thing not to sit where one might think one was supposed to sit but only somewhere else in a rather bad light round the corner. And DO NOT TOUCH.



Of course it is rather wonderful to be able to choose the date of the room you sleep in. I always select the one with the bed you are actually able to use. This guest's maid's bedroom is 1788 marred by the restoration in 1789 of a chip out of the nose of the cherub supporting the mirror which was knocked off by an American Secession scent bottle thrown in a Georgian quarrel between a Bastille period husband and wife. So DO NOT TOUCH.

have an impact on politics. A series of events has compelled thinking Frenchmen to wrestle with awkward questions. A book by M. Simon has suggested that Hitler, though defeated, may have contaminated his conquerors with his criminal methods. M. Servan-Schreiber, the able editor of the weekly *l'Express*, has been describing at length his experiences as a lieutenant in Algeria, and has insisted on the blind absurdity of the conflict. Other reservists bring back stories of tortures perpetrated by French troops. The "suicide" of an Algerian lawyer, Ali Boumendjel, while in the hands of French paratroopers, he led a Paris professor to suspend his lectures until the government shows more respect for the principles which he is supposed to teach his students.

Reactions to these reports of atrocities have begun to divide the French in a manner reminiscent of the Dreyfus case. On one side are the people who deny or dismiss them as an insult to the greatness of France and to the honour of its army. On the other are men who would think it a disservice to their country to condone by silence wrongs committed in the name of France. The arguments of justice against expediency and of principle against national interest are old, but the political divisions are no longer the same as in the time of Dreyfus, since the Socialists (or at least their official spokesmen) now lead the "national" wing, while the clergy lean towards the camp accused of treason and defeatism by its opponents.

The question is the more important because the Algerian war is not one waged by proxy, through mercenaries. Thousands of young Frenchmen, national servicemen and reservists, are getting their second education there. Many people fear that they will come back home with dangerous principles, or lack of principles; some even see a real threat to the Republic in the various rowdy demonstrations staged under patriotic pretexts like the one held last week in Paris. A case of national conscience has been added to the complicated Algerian problem.

SOVIET UNION

Recasting a Bureaucracy

SOVIET governmental and economic machinery is to be overhauled radically. Such is the meaning of the lengthy "theses" published by *Pravda*, which will be submitted by Mr Khrushchev to the Supreme Soviet next month. The biggest change will take place in the economic departments. As was foreshadowed in February, centralised control through a host of industrial ministries working as watertight compartments is to be abolished. Instead, regional economic boards will be set up which will have the advantage of being closer to production. The central government will be streamlined by this purge of ministries, but it will now include the prime ministers of the member republics.

All these changes point in the direction of greater regional devolution. Moscow, however, has no intention of abandoning its central control of the economy. Together with these decentralising reforms, it has been decided to strengthen the powers of the state planning commission (the *Gosplan*), which will absorb the separate body for current planning (*Gosekonkomissya*) headed first by Mr Saburov and now by Mr Pervukhin. The reinforced *Gosplan* and its subsidiary organs will direct and supervise the regional boards. This mixture of tighter planning at the centre with greater initiative for the various regions is a return to Soviet ideals of earlier days. Then, however, there was not much of an economy to direct; the new system is designed for one consuming about 50 million tons of steel a year.

The system evolved under Stalin has been crippling valuable initiative now that the Soviet Union has millions of highly skilled managers and technicians. Interference from Moscow with huge industrial concerns lying far away leads to blunders and waste. Further cuts in the bureaucratic overgrowth in the capital should yield recruits for the battle of production. The next session of the Supreme Soviet, which is to open on May 7th, ought to show whether the changes will be limited to the method of running the economy. It is also likely to endorse the revised version of the current five-year plan, which, despite Mr Khrushchev's continued emphasis on heavy industry, may reveal some shifts in the actual distribution of resources.

ROUBLES ON THE LEVEL

Moscow's way of marking April 1st this year was not to make a joke but to end one. The official exchange rate for the rouble has for years been a joke in distinctly bad taste. It has not affected Russia's foreign trade, which is carried on in terms of sterling, dollars, gold or other acceptable media—a practice which will evidently continue. But diplomatic missions, journalists, and other foreigners in Russia have been forced to buy roubles worth about 5d., or six US cents, at the artificial rate of four to the dollar and 11.20 to the pound sterling. It has cost £4,000 a year to keep a typist at the British embassy in Moscow; and most newspapermen, even when they have managed to coax visas out of the Soviet bureaucracy, have found life in Russia too expensive to be justified by the meagre access to news allowed them. For the individual wishing to visit Russia, the effect has been to tie him tightly to the apron strings of the official Soviet tourist agency, which, by selling him cut-price coupons valid only in its approved establishments, has reinforced the already numerous means of preventing him moving about the country freely.

The fiction of the official rate is still to be maintained, presumably for prestige reasons; but in practice it seems that embassies, correspondents, business men and other visitors will now be able to buy all the roubles they need for running expenses at ten to the dollar, and 27.80 to the pound, thanks to the "premiums" which have just been offered. The Soviet government's action may be overdue, but it is none the less welcome. One would like to think that it reflects a new responsiveness to the complaints so long voiced by critics of the Russian habit of preaching co-existence and practising what amounts to apartheid. But there are many other impediments to be dropped before that can be taken for granted.

EUROPE

A Free Trade Symposium

THE latest bulletin of the Oxford Institute of Statistics performs a useful service. It is a symposium on the free trade area by a number of economists. On the continent the common market has been searchingly discussed by business men and economists for several years. In Britain,

in the brief time since the free trade scheme exploded amongst an apathetic public, detailed discussion of its merits and problems, going beyond political emotion and economic prejudice, has been all too rare.

All the economists favour the scheme, under certain conditions, but for reasons whose great variety shows how difficult it is to reach an accurate assessment of its merits. Mr Roy Harrod believes the free trade area will bring great economies of scale in production and emphasises that continuous economic growth will minimise the pain. Professor Johnson, on the other hand, is sceptical about economies of scale and believes that free trade will do most good where it hurts most, knocking out inefficient British industries and allowing British consumers to buy cheaper abroad. Mr Balogh tilts enthusiastically at his favourite Aunt Sallies—the danger of German dominance and of the collapse of the sterling area, but these do not prevent even him from giving conditional approval.

The contributors recognise that the free trade scheme will create difficult new problems and they are soon at grips with the hardest of these: the whole scheme could be shipwrecked if one country, through a separate inflationary policy, is caught in chronic balance of payments difficulties, which force it to go back on its obligations to cut tariffs. And one deflationary member, Mr Balogh fears, could do just as much harm. Once more the remedies suggested differ widely. The battle between the advocates of fixed and floating exchange rates is joined again. Mr Sargent approves of quota restrictions for a fixed and limited period; most contributors set their faces hard against them. But there is broad agreement on two positive remedies for the balance of payments problem. Like the common market countries, the economists see more generous credit facilities as the first bridge over both short-term and long-term payments difficulties. The European Payments Union should be "softened" and its credit lines made automatic, Mr Harrod suggests. Long-term disequilibria could be dealt with by long-term investment by the creditor countries, say in Euratom or the less developed countries, says Mr Black. And there is a general belief that common economic policies, or at least a very close co-ordination of national policies, with perhaps even the creation of a European central bank, are a necessity. Free trade alone, the economists imply, is not enough.

GERMANY

Fall of a Socialist

TEN years ago Dr Victor Agartz was made head of the Bizonal Economic Council, the advisory German body set up by the British and American allies which was the embryo of the future west German government. Last week he went to gaol, arrested when the courier of his private economic research institute was caught bringing in funds from eastern Germany. The money, Dr Agartz claims, was a subscription from the east German trade unions. But the prosecution hold it to have been the last of many subsidies for an agency which is assisting the banned west German communist party. The division of Germany has claimed another distinguished victim.

Dr Agartz is not a tragic figure like some of the renegades who have actually gone east. His defection, if he has defected, seems the result of an obscure blend between spiky left-wing socialism and personal disappointment. Since the heady days when he was the respected adviser of the British occupation, backed by a Labour government, his policies of planning have been in the wilderness. The liberal economics of Professor Erhard, favourite son of the Americans, have guided German recovery. As Dr Agartz's influence languished, his voice became more shrill. The research institute of the German trade union federation, of which he was head, became the mouthpiece less of the whole German trade union movement—hostile to communism, restrained on wages—than of the extreme left wing, militant and violently critical of west German society. Last year, Dr Agartz lost his job. His violent views were causing more and more dissension in the trade union movement and a confused accusation of contact with eastern Germany fell across his name. He set up his own research agency; its publications were such that the west German trade union executive forbade branches to spend funds on them.

Although he was already apart from the orthodox labour movements in west Germany, it is impossible not to notice that his arrest has taken place in an election year. The west German socialists and the trade unions have disowned Dr Agartz, but his arrest will not do them any good. The taint of communist contacts has already been brought into the campaign against them. Much publicity has been given by the Christian Democrats to the past of Herr Wehner, a Social Democrat who, as a communist opponent of Hitler, was imprisoned by the Swedes for working as a communist political agent. Dr Agartz may not deserve much sympathy, but it would be unfortunate if contacts with east Germany became a stigma, at a moment when the German socialists are making such precious use of them to undermine Herr Ulbricht.

ARGENTINA

Two Puzzles for Aramburu

GENERAL ARAMBURU, the provisional President of Argentina, is trying to do two very difficult things. With elections in the offing, he wants, first, to ensure that there is no return to demagogic dictatorship, and second, to introduce a programme of economic austerity. His insistence that the constituent assembly elections should precede the general elections has raised a storm from the supporters of Dr Frondizi, the left-wing Radical leader, who is thought to stand the best chance of winning the presidency when the military government hands over to an elected administration in a year's time. The constituent assembly is to be elected by proportional representation, and since this favours the smaller parties the President's policy is seen as an attempt to thwart Dr Frondizi's hopes. The air force backs Dr Frondizi, and the President's tactics have led to the resignation of Commodore Julio Krause, the Air Minister and a member of the Military Revolutionary Council. Although the quick turnover in cabinet ministers in the last six months has not weakened General Aramburu's position, this crack in the military junta will be very much harder to mend.

The President's economic programme is having as rough a passage as his political policy. In his two months as Minister of Finance, Dr Verrier, with the President's support, produced so severe an economic recovery plan that five cabinet ministers threatened to resign. Despite Dr Verrier's warnings that the economic situation had deteriorated in the eighteen months since the revolution, that reserves of foreign exchange would be exhausted by

the end of the year, and that the budget deficits could only be met by issuing more paper money, his plan was thrown out and he himself went with it. His successor, Dr Vasena, is expected to try to temper austerity with political expediency—a policy unlikely to solve either the economic or the electoral puzzle.

MIDDLE EAST

Jordan as a Yardstick

Our special correspondent writes from Basra:—

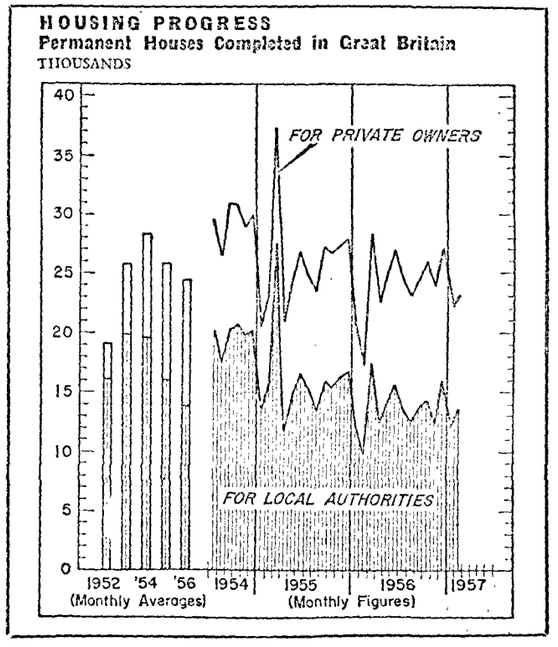
ACROSS the Arab world the ear of the general public is glued to the "Voice of the Arabs" from Cairo. Political talk is all of Gaza and of Egypt's accession of strength through its new links with Syria and Jordan. But much of the merchant community listens with only half a mind; good nationalists though its members may wish to be, their chief concern is to do good business in a stable currency. Thus though they display the coloured stickers bearing the Nasser portrait, new issues of which are frequent (the newest suggest that he has put on weight), and though they listen complacently enough to the creed that the new unity between Egypt and Syria, to which Jordan is now being hooked, will be the nucleus of a greater Arab unity, they are waiting to judge of this unity till they see how Jordan fares.

At present, their yardstick is the Jordan pound, simply because Jordan has taken Arab financial backing in place of support from London. Though linked to sterling, the Jordan pound fell last week on the Beirut free market to 805-8 Lebanese piastres, whereas sterling and the Iraqi dinar stood around 845. (The Egyptian pound stands in the low six hundreds, though not quite at its lowest ebb.

The Egyptian merchant abroad tends to increase their hesitancy. Often he is only a first generation Egyptian, usually of Syrian or Lebanese extraction, who is fearful of not being counted among the *Herrenvolk* under the state trading regulations; usually, too, he prefers to keep his money outside Egypt and in Lebanese pounds, rupees, or a hard western currency. In Saudi Arabia and the Persian Gulf he is a disincentive to enthusiasm for Nasser.

Yet the merchant carries weight only with a small, though important, section of the community. The general public is all for a hero who rose from the people, got rid of a monarchy, fought Israel, and by prodigious diplomacy seems to have done what he likes with the United Nations. He is given full credit for having put the great Arab nation on the world map after centuries of eclipse. Yet if Jordan, having accepted Arab subsidies, is allowed to get into severe economic difficulties, the shadow Nasser casts over merchant communities farther afield will grow darker. Jordan is the guinea-pig.

FAMILY SERVICE UNITS



Problems or People?

THE Family Service Units stem from a wartime undertaking by a group of conscientious objectors who tackled the job of helping, in the humblest and most practical spirit, bombed-out families "considered unfit for billeting." This unfitness consisted in a degree of demoralisation which expressed itself in apathy, total domestic incompetence, and filthy habits; it sprang from a great variety of causes; and it was recognised as an old and continuing peacetime problem, by no means always curable by the mere provision of better housing and higher incomes. That problem remains; a disproportionate burden on the social services, a self-perpetuating source of delinquency and squalor, and —given the frequent combination of "problem family" conditions with high fertility—a source of acute distress to the eugenically minded.

The FSU has now published a critical bibliography* of the various studies which have dealt with the "problem family"; defining it, evaluating policies designed to deal with it, or advising changes in those policies. But this booklet is more than a bibliography. Throughout its pages there runs a protest against stereotyped ideas and prejudices, and, above all, against the penal and authoritarian attitude. These are people first, problems only secondarily; not gobbets of deteriorated raw material to be reclaimed and re-processed into inoffensiveness by an administrative machine, but individuals suffering from particular combinations of weakness—by no means always innate—and ill fortune.

There is no shadow of doubt that this is the right attitude for social workers. Whether it is, in this context, possible as an exclusive guiding principle for society as a whole is another matter. It is one thing to demonstrate that the patient individual efforts of the case-worker to keep each "problem family" a going concern yield better results (and cost much less) than penal treatment. It is quite another to condemn, as an unjustifiable infringement of liberty, even so mild an exercise of social self-defence as the authorising of health visitors to give contraceptive advice "if the number of children is about as much as the family income will stand." In the scale of human values tenderness towards the most repulsive sort of unfortunate ranks high; it is an attribute of the saints; but a society in which it took precedence over every consideration for the needs of the normal citizen would have a poor expectation of life.

* "The Problem of 'The Problem Family.'" By A. F. Philp and Noel Timms. Family Service Units, 25, St Mary's Grove, London, N.1. 77 pages, 7s. 6d.

LETTERS

The Stricken and the Swung

SIR—Your comment on the Beckenham by-election result in your issue of March 30th is in line with the widely held view of a deliberate abstention from among Conservative voters at the present time. May I question this out of my experience at Bristol West, where I was Labour candidate ?

At Bristol the result showed a swing of just over 5 per cent to Labour on a poll of 61 per cent, as against a poll of 72 per cent in 1955. The Conservative majority dropped from 22,001 to 14,162 through a loss of over 8,000 votes, Labour dropping only a few hundred on 1955.

Neglecting changes in the register, what really happened ? Was there a withholding of Conservative votes ?

The evidence is lacking. The best traditionally Conservative ward polled 66 per cent as against 77 per cent in 1955, a drop of 11 per cent. But the best Labour ward polled 53 per cent as against 66 per cent in 1955, a drop of 13 per cent. An analysis by polling districts shows the same pattern—a fall in votes at least as heavy in Labour as in Conservative areas.

The obvious explanation of the result, then, is a clear switch of votes. My own guess is that about 5 per cent of the 1955 Conservative vote changed right over to Labour, while Labour also had a net gain from amongst the abstentions of 1955. Far from votes being withheld on one side the election was marked by a normal characteristic of by-elections in safe constituencies—apathy.

If the results of Bristol East and other current by-elections are looked at in this way by the party leaders, they may draw rather different conclusions than hitherto.—Yours faithfully,

*London, N.W.*8 W. T. RODGERS

Bulk Buying from the Colonies

A Study of the Bulk Purchase of Colonial Commodities by the United Kingdom Government

CHARLOTTE LEUBUSCHER

This book shows that bulk purchase has become an important issue in British colonial policy since 1945, when bulk purchase existed side by side with a free world market in the various commodities. 30*s. net*

Pioneer Peasant Colonization in Ceylon

A Study in Asian Agrarian Problems

B. H. FARMER

The author considers the recent policy of the Ceylon Government to encourage peasant cultivators to colonize the dry zone of the island, and analyses the causes of its successes and failures. *Illustrated* 55*s. net*

OXFORD UNIVERSITY PRESS

Education Costs

SIR—Mr Charles Murphy's letter published in your issue of March 16th may not have been intended to be deliberately misleading. But does anyone really think that the only expense incurred inside a classroom is the teacher's salary? The classroom costs money to provide, furnish, heat, clean and repair, and the cost of these services is about 20 per cent of the total budget of a typical local education authority. Then, too, schools employ non-teaching staff—cleaners, clerical assistants, groundsmen, and so on. These account for about another 8 per cent. Staff not directly employed in schools (administration, medical, dental, youth service, etc.) together account for not more than about 6 per cent of the total budget, compared with over 50 per cent for teaching staff.

Though classes of 40 and over may be quite common, the national average number of pupils per full-time teacher in 1956 was 31 in primary schools and 21 in secondary schools. Teachers deal with classes of 40 because some have no responsibility for a class ; many head teachers in primary schools are in this category, while in secondary and grammar schools specialists without specific class responsibility are not uncommon. Teaching costs per pupil in primary schools were £21.42 in 1955-56 and in secondary schools £35.97 (these costs are much higher now). This works out, on the basis of Mr Murphy's class of 40, at £856 in primary schools and £1,440 in secondary schools. Few teachers are on the scale minimum and many enjoy special allowances.

Nearly all of Mr Murphy's figures are suspect For example, a secondary modern master, if qualified, cannot start at less than £475 a year, and in 1955-56 the average expenditure on books, stationery and materials per pupil in primary schools was over 22s. and not 16s. In secondary schools it was £2 11s.

Letters such as Mr Murphy's do no good to the cause of education nor to the teaching profession as a whole.—

Yours faithfully, F. M. WALKER

Oxford City Treasurer

Pensions Preserved

SIR—In the comment in your issue of March 23rd on preservation of pension rights, you state that " some minor tax difficulties still obstruct the full transfer of pension rights." No doubt the adjective " minor " is appropriate in the sense that these tax difficulties could easily be eliminated by Parliament, if it were really interested in " setting the people free." But the day-to-day effects of these tax difficulties are by no means " minor." They provide, and have for years provided, a seemingly good excuse for the typical pension rules which are designed to bind employees for life. Their intricate complexity enables the case for transferable rights to be dismissed by impressive references to mysterious tax complications, and at the same time leads politicians to regard the whole subject as too niggling and labyrinthine to deserve their serious notice.

This is not the only case of seemingly minor tax difficulties having a frictional effect which seriously stunts genuine private enterprise. To hack away furiously at this wretched undergrowth would surely be in the best tradition of *The Economist*.—Yours faithfully,

Leeds RICHARD WAINWRIGHT

Parliamentary Privilege

SIR—The interest displayed by you in the subject of parliamentary privilege causes me to suggest that you might be interested in a proposal for a reform in the existing procedure.

At the present time, once the Speaker has ruled that a matter is *prima facie* a breach of privilege, a motion is then made by the Leader of the House that the matter be referred to the Committee of Privileges. Should the motion be passed, the matter then goes before the committee, notwithstanding it is apparent that the matter at the worst could only be a technical breach, and accordingly the dignity of the House requires that no action should be taken.

I suggest that the powers of the Speaker should be enlarged to give him the right to refuse to accept the motion that the matter be referred to the Committee of Privileges, if he is satisfied that the dignity of the House requires that no further action be taken on the matter.

A ruling by the Speaker that a matter was a breach of privilege would make it clear that should the offence be repeated it could not be said to be done in ignorance and at the same time by giving power to the Speaker to refuse the motion, it might save the House time and loss of dignity.—Yours faithfully,

*London, N.W.*11 EDWARD F. IWI

BOOKS

Expedition to Egypt

Les Secrets de l'Expédition d'Egypte

By Merry and Serge Bromberger.
Editions des 4 Fils Aymon. 272 pages. 795 francs.

One Hundred Hours to Suez

By Robert Henriques.
Collins. 254 pages. 16s.

Guilty Men, 1957

By Michael Foot and Mervyn Jones.
Gollancz. 264 pages. 12s. 6d.

BECAUSE of its often tactless disclosures, the account of the Anglo-French expedition to Egypt by the brothers Bromberger is bound to evoke contemptuous official denials. It will be resented by many supporters of the Egyptian adventure, at least in this country, where any unorthodox version of the motives and sequence of British actions tends to be treated as an attack. Yet MM. Merry and Serge Bromberger are impenitent supporters and partisans of the expedition themselves, and their account, though highly critical, is by no means unsympathetic. Frank imperialists, the authors believe that their country had done a great deal of good in Egypt, that President Nasser is doing a great deal of harm there, and that the blow struck against him was worth striking ; they even draw some optimistic conclusions about its consequences.

No denials of what they say ought to mislead anyone into supposing that their book is in any way scandalous or irresponsible. On the contrary, it is the first consistent explanation of what happened: how the Anglo-French expedition was planned ; how it came to coincide in point of time, but failed to be co-ordinated operationally, with the Israeli invasion of Sinai ; what caused it to be bungled, and where the political calculations went wrong.

Both the authors accompanied the expedition, and quite obviously they have had excellent sources from which to fill in the political and administrative background to their experiences. In presenting their narrative they use rhetorical devices, and their manner of exposition inclines to the dramatic: thus the account of the meeting in Paris on October 16th is given in direct speech, though, as they say, only Sir Anthony Eden, M. Mollet, M. Pineau and Mr Selwyn Lloyd were present. But the narrative in general rings true. France, they explain, in the summer and autumn of 1956 had to work with two allies—Britain and Israel—who were hostile to each other. The Israeli decision to attack Egypt was taken in mid-October ; by that time the Franco-Israeli friendship was firmly established and the French supply of arms, which Israel desperately needed to counterbalance the lavish Russian supplies to Egypt, was well under way. But the Anglo-French joint military planners, who had started work in London a few days after President Nasser's seizure of the Suez Canal, were planning without cognizance of the special Franco-Israeli relationship. They were planning, too, for a hypothetical operation against Egypt the nature of which had not been decided, and for which no date was set.

It is essential to the Bromberger version that the Israelis in mid-October told the French of their decision to invade Sinai, and that the French told the British. This knowledge was confined to a very few men, but it was the key to the decision to land at the mouth of the Suez Canal at the beginning of November. M. Mollet, however, (MM. Bromberger relate) failed to persuade Sir Anthony Eden to join in the operation openly on the Israeli side ; British intervention must be an intervention " between " the combatants. This was the harder for the Israelis as they did not want an Anglo-French expedition at all ; as they foresaw, it would embarrass and frustrate them ; they wanted French air cover to protect the Israeli towns, French air supply to assist their task forces in Sinai, and some limited French naval support. All this they received, but in order to secure it they had to swallow the Port Said expedition. To the last, British planning ignored Israeli movements and refused any co-operation with the Israeli forces (who, after all, were fighting the same enemy). The French carried out two separate operations, one in concert with Britain, one in support of Israel, though naturally they used the same ships and the Cyprus airfields for both.

MM. Bromberger are able to show clearly enough how the British fiction of impartiality distorted the planning of the campaign, lengthened its timetable, and in important ways contributed to the failure to reach the objectives. In believing the fiction to have been a political as well as a military mistake—" It was not so much the intervention that shocked international opinion, as the pretext "—they may have been right or wrong. They are probably right in holding that the impossibility of admitting any co-ordination with the Israeli action meant that our own forces were kept in the dark about our own plan, and that this contributed to the military bungling of the operation. Even in the last few hours before the cease-fire, a complete seizure of the (by then, undefended) canal would probably still have been fairly simple in co-operation with the Israelis ; but this was excluded, and the Anglo-French force finished up in the ridiculous position of holding the Port Said end only. A quick and resolute seizure of the entire canal would not have saved Britain and France from the eventual political debacle (though here the brothers Bromberger would differ) ; but it might have produced wholly different tactical conditions for negotiating the resumption of traffic.

Colonel Henriques has written an elegant and enjoyable account of the Israeli campaign in Sinai and Gaza. The campaign was brilliant and adventurous and makes an absorbing narrative. Colonel Henriques arrived in Israel just as the fighting stopped, talked to many of the Israeli commanders, and was given official facilities to find out all he could. Obviously, he was not given official help in finding out the political background of the campaign, and indeed he remains innocent of any apparent knowledge of it. He knows nothing of collusion. This may have led him to overestimate the technical effectiveness of the Israelis' performance. Yet his account of their remarkable army, its unusual soldiers and its amateur methods of getting professional results, was well worth writing.

The title " Guilty Men, 1957 " speaks for itself. Mr Foot and Mr Jones have written an arid and one-sided tract, in which the enemy is the Conservative government and the Labour party is the Angel of Peace.

The White House

The American Presidency

By Clinton Rossiter.
Hamish Hamilton. 191 pages. 16s.

THERE has been no shortage in recent years of books on the American Presidency. Just as the curiosity of the American man-in-the-street has led him to demand details, literally, of the President's intestines, so the American reporter has probed, metaphorically, into the intestines of presidential power. But not all the academic X-rays have been equally informative—especially for the English layman. Some are too legalistic, some too journalistic, some too historical, some too polemical. The peculiar merit of Mr Rossiter's study is that, despite the fact that it originated in a course of lectures to a Chicago audience, it seems to cover just the ground, at just the level of detail and allusiveness, that the average well-informed British reader needs. It is delightfully written, with humour and a total absence of pontification. It can be read with particular profit by anyone brought up to see this most American of American institutions through the sharp but distorting spectacles of Harold Laski—" Harold Laski, who," Mr Rossiter remarks, " wanted a new deck more than a New Deal."

Mr Rossiter, for his part, is by no

means discontented with the presidential office as it exists today. And "today" in this context means a bare year ago, since Mr Rossiter has not been shy of putting the presidency of Mr Eisenhower under the same spotlight that he turns on FDR or Andrew Jackson. His verdict, in a nutshell, is that he "already stands above Polk and Cleveland, and he has a reasonable chance to move up to Jefferson and Theodore Roosevelt." Mr Rossiter is not worried about the great power that the American system of government concentrates in one man, because he believes, and advances excellent arguments to substantiate it, that the presidency is an essentially democratic office. For this reason he does not much favour any of the ingenious reforms which various of his academic colleagues have proposed for the presidency. Basically, his advice is "Leave Your Presidency Alone." One may agree or dissent, but certainly Mr Rossiter's lively book arrives at its conclusion by no complacent, smug or lazy intellectual road. It is fresh, quizzical and searching—a first-rate exposition of its theme.

Painless Guide to Uno

The Second Lesson

By Bernard Moore
Macmillan. 237 pages. 21s.

IT is a pleasant change for one more accustomed to lawyers' tomes and postgraduate theses to be buttonholed by a journalist who wants to tell his readers what the United Nations is like in human terms. Mr Moore, who spent seven years covering Uno for the BBC, describes the place, the people and the atmosphere with humour and insight. He expresses a firm distaste for the upended matchbox of pale green glass which houses the Secretariat, for the bright modernity of committee and council rooms, and—more understandably—for the faintly common Assembly hall and the dead common murals. He has a fund of stories of the kind that abound in closed societies: the one about the Iraqi delegate, a bachelor, who suggested that the Trusteeship Council might well leave the Fon of Bikom alone to handle his hundred wives, adding, "May God give him strength in his arduous task"; the one about Mr Krishna Menon having to admit, in the midst of his ardent advocacy of Outer Mongolia's admission to Uno, that he did not know the name of his protege's capital city; and the one about the Latin American delegate's annotated speech which contained the marginal reminder, "Weak point. Shout."

Fortified by this personal approach, the reader will find that he has been guided painlessly through the intricacies of the veto and the "Uniting for Peace" machinery, the pros and cons of Chinese representation, Secretariat loyalties, domestic jurisdiction, and most of the major problems that have dogged the organisation during its first eleven years. In a chapter on "Foreign Bodies" the author stresses the political disadvantages of the United States as the headquarters of an international organisation.

Mr Moore's "first lesson" was learned as a permanent correspondent at Geneva in the nineteen-thirties, and although he has many reservations to make about Uno he realises that, as André Maurois prophetically said of the League, "whether people want it or not, their destinies are now so closely intertwined that . . . if tomorrow some catastrophe destroyed it, it would come to life again under a different name."

The Classical World

Greek Civilisation

By André Bonnard.
Allen and Unwin. 209 pages. 30s.

PROFESSOR BONNARD'S title promises more than he gives. His book only goes as far as Pericles and therefore leaves out, for example, Euripides, Aristophanes, Plato and Aristotle. These omissions are to be remedied in a further book, but it would have been fairer to label this one plainly "Volume I." Nor does it cover the whole field within its period: it is mainly a series of separate but connected studies, written by one whose prime interest is in literature, about life seen through the eyes of some of the best Greek writers. Half the book is about the poems, the ideas and the world of Homer, Archilochus, Sappho and Aeschylus; Solon and Pericles get a chapter each; and the rest is mostly about Greek religion and those aspects of Greek society which are most apt to interest a good citizen of Lausanne like Professor Bonnard: on the credit side, democracy; on the debit, slavery, infanticide and the degraded status of women.

Professor Bonnard is no slave to accuracy. His asseverations tend to be bold, and are therefore sometimes doubtful (his translator points out some of the doubts in footnotes). He relies on secondary sources for what he dismisses rather airily as "the general confirmation of facts and events." Even in his own field of literature he makes more than the best of his material: he silently fills out gaps in the text of Sappho and knits disjointed fragments of Archilochus into a factitiously continuous series.

But to attack his accuracy in detail is (one suspects) to leave the author unscathed. This is not a cram-book for students, and its value does not rest on its statement of facts. It is a personal and sensitive interpretation of the development of the Greek mind as seen in Greek literature. One can agree or disagree at many points, but either way it is a stimulating and lively book. It is full of quotations from the author's chosen writers, and his translator uses (with few exceptions) good English versions of them—particularly Professor Thomson's incomparable translations from Aeschylus, than which there is nothing in English closer to Greek.

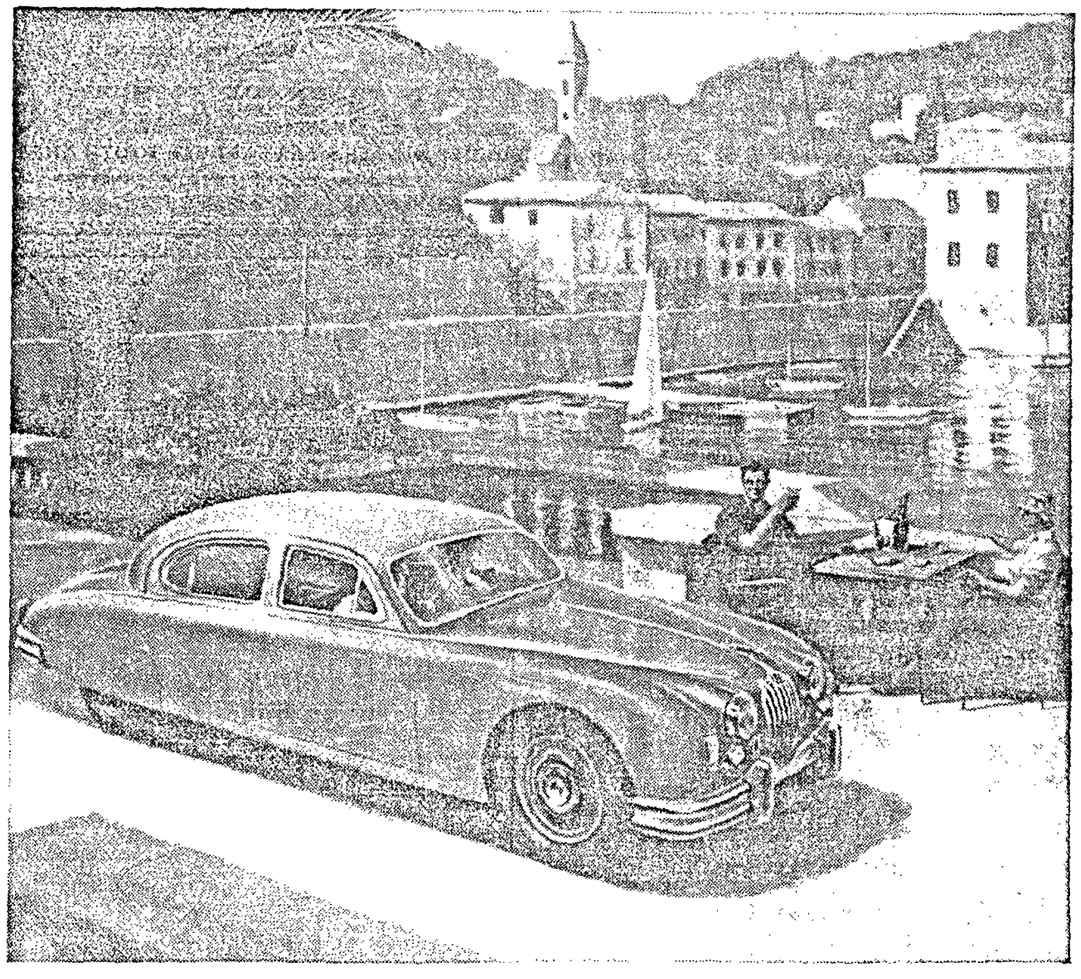
The book is exceptionally well translated by Professor Lytton Sells; it is handsomely produced and requires no previous knowledge of the subject.

Indian Civil Servant

A Young Victorian in India: *Letters of H. M. Kisch.*

Edited by Ethel A. Waley Cohen.
Cape. 242 pages. 25s.

H. M. KISCH passed into the Indian Civil Service in 1873 when it was perhaps at its zenith. Within six months the great Bihar famine of 1874 broke out and, just over twenty-three years old, Kisch was ordered to Tirhut, a remote district covering 198 square miles on the borders of Nepal. Here he experienced his first Indian hot weather, sleeping, not beneath punkahs in a cool bungalow, but camped in an indigo factory and spending ten to fourteen consecutive hours a day riding from village to village. With the aid of three clerks and 36 other ranks, he organised relief; found employment for tens of thousands; built dams and tanks; set up depots for 12 million lb of rice worth a million rupees; kept detailed accounts of every anna paid out; held his first court as a magistrate to sentence corrupt subordinates and dishonest grain merchants; worried how to protect his rice depots from Nepalese raiders. Tension mounts as the monsoon falls due. Will the rains fail for the second year running? They come. Dams burst and are repaired amid every kind of distraction. The rains cease. Anxiety returns. The Governor visits the famine area and inspects Kisch's work. The rains return torrentially. The land breathes again.



In his letters home, Kisch looks back on these seven crowded months. At their beginning he could not speak the language, did not know how to dig a good tank, build a grain depot, or store rice so that it remained undamaged by heat or damp. Now, a veteran of twenty-three years and ten months, he has all these, and half a hundred other matters, at his finger tips. He opens the Gazette one day and finds himself the youngest member of a short list (his name placed second) of officers specially gazetted for outstanding work. The crowning recognition of a difficult job well done was his transfer to cope with the worst district in the Province. Obviously a marked man, he is promoted rapidly. He retires, laden with honours, in 1904 and dies in 1942 at the age of 92, the "father of the ICS."

Summarised thus, these letters must sound pure Kipling; but whereas Kipling would be complacently self-righteous and brassily imperial, Kisch remains agreeably unselfconscious. As a description of things seen and done in out of the way corners of India, his quiet letters will give pleasure to Indians and British alike. The historian is, however, disappointed that Kisch sheds scarcely a beam on the great controversies of the day: the second Afghan war, the agitated viceroyalty of Lord Ripon, the formation of the Indian National Congress. Kisch epitomises the strength and weakness of the ICS—a body of supremely assured, capable, and devoted public servants in whom political sense and judgment were rare.

"A world beater"... *Courtenay Edwards DAILY MAIL*

From the moment of its introduction, press and public have acclaimed the 2.4-litre as a Jaguar masterpiece. Powered by the famous XK engine with an output of 112 b.h.p. phenomenal acceleration is placed at the driver's command and speeds in excess of 100 m.p.h. are attainable with the ease and silence characteristic of every Jaguar. To motorists everywhere who demand a car of the highest quality and performance with compact dimensions and economical fuel consumption, the 2.4-litre Jaguar makes an irresistible appeal.

AMERICAN SURVEY

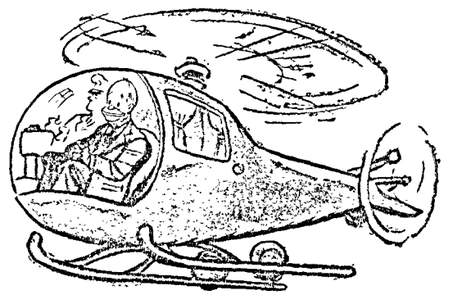
AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

State of the President

WASHINGTON D.C.

THE public success of the Bermuda conference, coupled with the Israeli withdrawal from Gaza and the passage by Congress of the Eisenhower doctrine for the Middle East, has temporarily stilled the major controversies which monopolised public attention during the first three months of the year. But President Eisenhower is experiencing, not an interlude of calm, but rather a subtle sapping of his prestige and criticism of the quality of his personal leadership.

This mood of restless dissatisfaction would have caused no surprise during the terms of any of his recent predecessors, but in Mr Eisenhower's case it is unprecedented. No President has been so immune from personal attack. There are many reasons for this happy circumstance; but probably the most important has been the President's extraordinary skill in fulfilling his ceremonial and psychological functions as head of state, as distinguished from his duties as an executive and political leader.



Mr Eisenhower's personal amiability, his exemplary family life, his regular church-going, his fondness for such conventional pastimes as bridge and golf, his soldierly dignity, and his gift for expressing himself in moral truisms have all contributed to a widespread confidence in the stability, morality, good taste and unruffled authority at the centre of the nation's public life. He is an entirely reassuring public figure, with none of Mr Roosevelt's complexity or flashing colour; he never undermines the presidential image, as Mr Truman occasionally did, by lapses into profanity or bad temper. Mr Eisenhower's political strength rests on this rock of public trust in his personal qualities.

Certain minor, even trivial, incidents have recently, so to speak, chipped this rock. Journalists accompanying Mr Eisenhower to his Gettysburg farm last weekend, for example, were stopped by the Maryland police for speeding despite their explanation that they had to travel at more than seventy miles an hour to keep up with the President. It then became publicly known for the first time that the President's motorcade frequently violates the traffic laws. It once travelled at ninety miles an hour on the very day that Mr Eisenhower had made a public plea for safe driving. This episode has caused wide public comment. For the first time since he has been in office, Mr Eisenhower has been the subject of editorial rebuke in normally friendly newspapers for setting a bad example in his private conduct.

There is also more vocal grumbling about the old niggling question of the frequency of the President's holidays and the amount of time he devotes to playing golf. When a reporter at his last press conference asked the President if he would set an example of government thrift by forgoing the purchase of two helicopters "for getting you out to the golf course a little faster," Mr Eisenhower gave way to red-faced rage and cut short his questioner with unaccustomed abruptness. This, too, caused a twenty-four hour sensation in the capital.

Much of the present concern, apart from these pin-pricks, centres on the issue of the President's health. Before Mr Eisenhower went to Bermuda there was a flurry of stories in the foreign press depicting him as an ageing and enfeebled leader physically unequal to the burdens of his office. The American press carried far less alarming accounts, but the articles published abroad were duly noted and stirred uneasy memories of the rapid physical decline

The Helicopter Era

Herblock in the *Washington Post*

and death of Mr Roosevelt twelve years ago. Although there is no tangible evidence that President Eisenhower's health has really deteriorated, concern about it raises difficult questions about the vigour of his leadership.

The President broke off a holiday in Georgia to deal with the crisis over Israel. He then converted his journey to Bermuda into a leisurely sea voyage to obtain added rest. Upon his return, he indicated he was planning another holiday in the south in the near future. These efforts to protect his health, coupled with inherently trivial incidents, have acquired a disproportionate political significance.

This is because any serious diminution of Mr Eisenhower's personal prestige would vitally affect his authority as chief executive and party leader. If Mr Eisenhower were to become less the supremely popular and revered father figure and more the ordinary political chief, if the public were to come to view him, not as a leader who prefers to drive with a loose rein, but rather as one who does not have the strength to do otherwise, his effectiveness would be seriously impaired regardless of the facts of his physical condition.

★

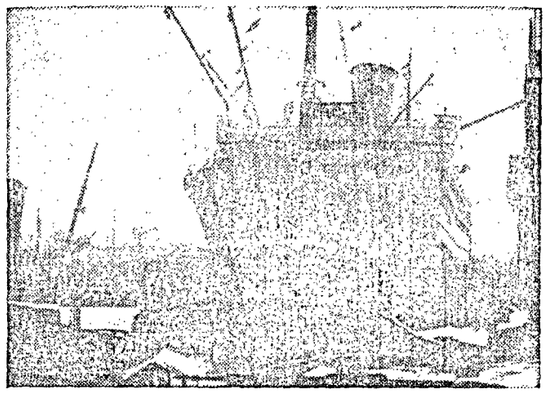
Critics have long contended that Mr Eisenhower husbands his prestige in a miserly fashion rather than expending it in open battle on behalf of his programme. The more controversial items in that programme are now in such trouble that it is believed that he can rescue them only by a strong show of personal leadership. He has already made gestures in this direction. At the end of February the President delivered one of his rare "fireside chats" to the country on behalf of his policy toward Israel. At a recent press conference, after seeming to temporise for many weeks, he came staunchly to the defence of his Budget and foreign aid, which have been loudly and relentlessly attacked by his conservative supporters. The Budget battle, however, is far from won.

The Administration's social welfare projects are also in danger, notably the proposed Bill providing federal aid for the construction of schools. Three months ago, the controversial Powell Amendment requiring racial desegregation seemed to be the only serious threat to the passage of this measure. Now there is growing sentiment in Congress to abandon the school programme solely for reasons of economy.

Many of the President's political problems are the result of restiveness in the ranks of his own party. Mr Knowland, the Republican leader in the Senate, has exploited popular sentiment against the Administration's policy toward Israel to build a bridgehead of dissent on issues of foreign policy. Senator Jenner and other irreconcilables of the far right wing began deriding "modern Republicanism" with vehemence as soon as they had put last November's election safely behind them. These rumblings presage a renewed struggle for control of the party in 1960 when Mr Eisenhower retires. The President and his advisers are in the further dilemma that most of the Republican seats in the Senate which are at stake in next year's midterm election are held by conservatives of the old Taft faction. The Administration cannot repudiate these stalwarts without risking all hope of recapturing the Senate, but at the same time it is not easy to draw the mantle of modern Republicanism around the likes of Senators Bricker, McCarthy, Jenner and Malone.

Notwithstanding his present troubles, Mr Eisenhower remains in a remarkably strong position. This should be emphasised. His personal prestige in the country, so triumphantly recorded in last November's vote, has not yet been seriously impaired. He can, if he cares to, still successfully counter his critics in Congress on budgetary matters and rescue the school and foreign aid programmes. The present flurries of criticism are not so much rebellions against his leadership as they are expressions of the need for a stronger hand. The real question is whether the President can continue to win enough victories by the soft methods of patience and persuasion he has followed in the past.

Another Democrat from Texas



A TORNADO cut a symbolic swathe through Republican Dallas on Tuesday as Texans went to the polls to choose a new Senator to fill out the rest of the term of Mr Price Daniel, an Eisenhower Democrat who resigned his seat early this year in order to become Governor. The victor is Mr Ralph Yarborough, a liberal and four-time loser in elections for state office, who owes his success this time to the splitting of the conservative vote between Representative Martin Dies, the isolationist Democrat, who gave his name to the notorious Dies committee and Mr Thad Hutcheson, on whom Republican hopes throughout the country were pinned. Had Mr Hutcheson won, the Senate would have been divided evenly between Republicans and Democrats, and Mr Nixon, the Republican who presides over the Senate by virtue of being Vice President, would have been able to break the tie over who should control the Senate in favour of the Republicans.

Now the seats of power, the committee chairmanships, will continue to be occupied by Democrats, and Mr Lyndon Johnson, the Democratic leader in the Senate, and Mr Rayburn, the Speaker of the House, both of whom come from Texas, can breathe again. The vote was 320,810 for Mr Yarborough, 264,344 for Mr Dies, and 206,313 for Mr Hutcheson. These three captured over 90 per cent of the total vote, although fifteen other Democrats and one other Republican hung on in this free-for-all race to the very end. There were no preliminary elections to sift out candidates on either side, and no provision for a run-off. However, the scandals in the state government, first in the land office and more recently in the department controlling insurance, which Mr Yarborough exploited, acted rather like a primary election by depriving most of the candidates of any newspaper publicity.

The substitution of Mr Yarborough for the conservative Mr Daniel will strengthen the progressives in the Senate, at least until 1958, when Mr Yarborough will have to defend his seat. He is a Democrat who stuck to Mr Stevenson in 1952 and 1956, when so many Texan Democrats climbed on the Eisenhower bandwagon. A self-proclaimed Fair Dealer, he won rural votes by indefatigable handshaking and milk-drinking and labour votes by denouncing the Taft-Hartley Labour Relations Act and campaigning for higher income tax exemptions and bigger old age pensions. But as an East Texan he found himself almost tongue-tied on the difficult issue of abolishing the colour bar in state-supported schools.

Repairs to Housing

THE number of houses started fell in February to a seasonally adjusted annual rate of 910,000, the lowest since 1951, and both house-seekers and house-builders have been besieging Congress with stories of hardship and alarmist prophecies of a housing-bred depression. Last week the President responded by ordering the greatest possible reduction possible, under present law, in the down-payments required on mortgages insured by the Federal

Fresh fields and foreign markets

Beef on the hoof is pretty difficult to judge, whether for meat or for hides, but banking on the spot can bring that extra local "know-how" to the business in hand.

Facts about the language, the people, the customs, all play such a vital part in commercial undertakings overseas.

This is where The First National City Bank of New York can be of special service for businessmen with foreign interests.

The extensive organization is based on a network of 70 branches, offices and affiliates, strategically located in 24 countries outside the United States. In addition, the world's markets are covered by over 3,500 banking correspondents reporting current trading conditions from every important centre of commerce.

Wherever your interests lie, and whatever they may be, this world-wide organization is at your service. Our two London branches are anxious to be of assistance.

the things they say!

Huge place, isn't it?

Darn sight too huge, if you ask me. These new I.C.I. places cost millions and millions — and what's it all for?

Why, surely to make new chemicals for Britain's expanding industries . . . ?

Not a bit of it — profits for a few top hats in the City, that's all it's for, mark my words. It isn't right that a few men should control such wealth and power, and if I were running this country . . .

Oh, come. You talk as though I.C.I. were controlled by a few financiers answerable to no one but themselves.

Well, isn't it?

Of course not. Nor is any big public company today.

Go on! I.C.I. is run by a handful of directors, and don't you say it isn't.

Certainly the big policy decisions in I.C.I. are made by the Directors. But nearly all of them are men who've come up through the organization, and none holds his position on the strength of a big block of shares or anything like that. Anyway, control of I.C.I. ultimately lies in the hands of the I.C.I. stockholders.

And who are they, eh?

A fair cross-section of the community—from foremen plasterers to district nurses, from shop assistants to judges. All told, no fewer than a quarter of a million people. The number is going up all the time, too, for under I.C.I.'s Profit-Sharing Scheme over 80,000 of its employees are also being given shares in the business.

ICI

Housing Administration in order to make it easier for poor families to buy houses. Some observers are interpreting this as a sign that the Administration is beginning to fear deflation more than inflation, and is propping up an industry which is itself a substantial prop to the whole economy.

But builders and lenders on mortgage are looking this gift house in the mouth; they realise it will not provide a penny more in mortgage funds, and it is credit which is short, particularly for the mortgages guaranteed by the Veterans Administration. Congress is apparently determined to refuse the Administration's request that interest rates payable on such mortgages be raised from 4½ per cent to 5 per cent because this would increase the cost to ex-servicemen, a 20 million strong group which Congress likes to treat tenderly. But nothing else is likely to attract more lenders.

The concessions made by the Administration seem to have been granted in the hope—which seems almost certain to be disappointed—that they would satisfy Democratic demands that more government money be pumped into housing. There are a few straws which suggest that economists are today looking in the direction of deflation as well as inflation when they hold up a wet finger to the economic breeze: for example, Mr Martin, the chairman of the Federal Reserve Board, describes its policy as "passive." But in the main the Administration is turning a sceptical ear to the cries of builders that the "roof has fallen in on housing." The number of houses to let or for sale is still near rock bottom, suggesting that the underlying market is sound; and government economists point out that with builders tending to build larger and more expensive houses, the number started is a misleading indicator.

Ill-Wind for Teamsters

THE gales that have blown Mr Dave Beck, the President of the Teamsters Union, some 80 times into the uncertain shelter of the Fifth Amendment and nearer to the outstretched arms of the income tax inspectors, abated slightly last week. But the force of the storm is far from spent and next week it is likely to be felt in New York, where the committee intends to investigate allegations of illegal collusion between local union officials and their members' employers.

The American Federation of Labour and Council of Industrial Organisations has taken advantage of this ill-wind to suspend Mr Beck as a member of its executive council and as a vice president of the federation on the ground that his refusal to answer questions about his use of union funds had brought the labour movement into disrepute. Under the ethical code recently adopted by the federation over the objections of the teamsters, the use of the Fifth Amendment is grounds for expelling an officer from his union. But will the teamsters expel Mr Beck? His future—and that of the labour movement, which would be grievously weakened by jurisdictional strife if the most powerful union in the country left the AFL-CIO—depends on how firm a rein he has over his teamsters. There are reports of local unions burning Mr Beck in effigy, demanding his resignation and refusing to support his "defence fund." But if each local leader can mobilise his machine vote at the teamsters convention in September, they may be able to ride rough-shod over any rebellion of the rank and file.

Already this week the executive board of the teamsters has voted, in effect, to uphold Mr Beck in his refusal to answer the questions of the Senate investigating committee and it is believed they also approved the raising of a $1 million fund to put the teamsters and their officers in a more favourable light. Millions of Americans who, to the distress of honest trade union leaders, have been regularly switching on their television and radio sets to watch the hit programme of the week, will relish the observation of Mr Kennedy, the committee's counsel, that the committee gave Mr Beck a chance to do this free ten days ago.

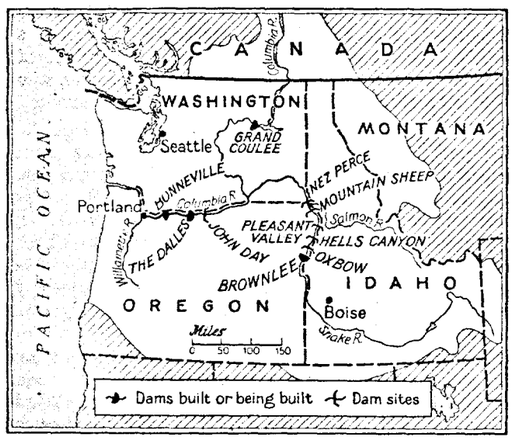
No Cuts for "Pork"

WASHINGTON, D.C.

WHEN President Eisenhower last week forcefully urged the virtue of self-discipline on an economy-talking Congress, he took as one of his main targets "the vast number of public works that are authorised without proper engineering studies to back them up." The following day the Senate passed a Bill authorising work on rivers, harbours and flood control valued at $1.5 billion, a quarter of which lacked the approval of the Bureau of the Budget or even the easily obtained backing of the Army's Corps of Engineers. On hand to watch the success of their efforts were members of the Rivers and Harbours Congress, a coalition of local private interests who form a privileged super-lobby headed by Senator McClellan of Arkansas, who is himself a member of the Senate Public Works Committee.

The annual jostling for these projects, known colloquially as "pork," represents American politics at its most elemental. For a member of the House from a marginal seat, success in obtaining Federal money for a locally favoured dam, canal or scheme to make a river navigable, may be just what it takes to give him security in his job for the rest of his political career. Senators theoretically concern themselves with larger schemes affecting the economy of whole states, but few can afford to neglect entirely even the more parochial ambitions of constituents.

The "pork barrel" is usually put together by a coalition of members of Congress from the Mississippi Valley and the Rocky Mountains, the underdeveloped areas that stand in greatest need of economic aid. The same members of this coalition work together on reclamation projects in the semi-arid States, and subsidies for sugar beets, wool, silver and other minerals. It has a firm grip on the committees which distribute such plums and can assemble additional votes by its power to pass on the more modest requirements of other parts of the country.



Last year the President vetoed such a Bill. This year, while members of the House were celebrating their temporary success in slashing over $800 million from the President's $72 billion Budget, about $100 million of this from the appropriation for health, education and welfare, all attempts on the floor of the Senate to have the questionable items of "pork" either cut out by Congress or left to the discretion of the President, were beaten down. Senator Douglas of Illinois or Senator Knowland of California had only to suggest that economy begins at home for the Chairman of the Public Works Committee to offer to cut out all projects in Illinois and California forthwith.

TVA for the Columbia?

FROM A CORRESPONDENT IN OREGON

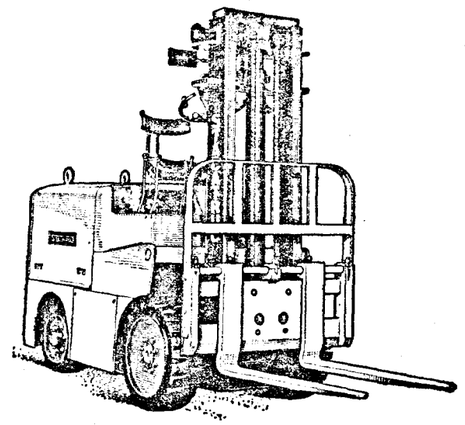
CROWDED along the canyon of the Snake River, the major tributary of the Columbia, which cuts its way along the boundary of Oregon and Idaho, are half a dozen sites for dams capable of providing much needed water storage and hydro-electricity for the development of the Columbia River Basin. One is the controversial site at Hells Canyon. But in recent years the deadlock between the advocates of government building and the advocates of the private electricity companies has frustrated the full development of the continent's second greatest water system.

The election last November drastically altered the political climate of the Pacific Northwest on this issue. Democrats were swept into control of the state governments of Washington and Oregon, which had been dominated by Republicans, and in the senatorial races in Washington, Oregon and Idaho, Democratic supporters of government development of hydro-electric power defeated the Republican candidates who defended President Eisenhower's policy of encouraging the use of private capital, wherever possible, either independently, or in "partnership" with the federal government. One result was to reduce to vanishing point any prospects of

such a "partnership" policy in the states of the Columbia Basin. It also became virtually certain that the Republican-sponsored Columbia Interstate Compact, a proposed seven-state agreement to form a regional agency with purely advisory powers over the co-ordination of private and governmental projects, would never be ratified by its principal members, Oregon and Washington.

In Washington, D.C., last month the triumphant Democrats held hearings which they hoped would lead to a reversal of the decision of the Federal Power Commission that the Idaho Power Company could build three small dams in place of the single high federal dam which the Democrats feel is needed to exploit the Hells Canyon site to the full. Congressional action is the only hope for the high dam now that the Supreme Court has this week refused to interfere with the decision of a lower court that the FPC's action was legal. But Mr Seaton, Mr McKay's succesor as Secretary of the Interior, had shown signs much earlier that he had absorbed the lesson of Mr McKay's defeat at the hands of Senator Morse, a Democrat and a most energetic advocate of government development.

In January Mr Seaton informed the commission that the Bureau of Reclamation was studying the feasibility of a high dam at the Pleasant Valley site, down the river from Hells Canyon. Such a dam would rule out two of the three low dams which the Idaho Power Company has permission to build, as well as two other low private dams, at Pleasant Valley and Mountain Sheep, which the FPC is now considering. But coupled with the company's third site, at Brownlee, where it has already invested $14 million, a high dam at Pleasant Valley would provide exactly the same storage capacity for flood control, irrigation, and the production of electricity as the high dam at Hells Canyon. The Eisenhower Administration would be able, in this way, to give the voters of the Northwest what they have shown they want, without too evident a loss of face. The staff of the Federal Power Commission has just recommended a third solution for the Snake—a high dam at Nez Perce, still further down stream. But this would be below the mouth of the Salmon, a tributary of the Snake, and would shut off the salmon runs. Fishing as a sport is too much valued in the Northwest, and is too valuable a tourist attraction, to permit planners to disregard it.



★

There is a growing possibility that differences such as these over development of the Columbia and its tributaries may lead to the creation by the federal government of a responsible development agency enjoying an autonomy similar to that of the Tennessee Valley Authority. A Bill will be introduced shortly in Congress which would create a Columbia River Development Authority, with a five-man board of directors appointed by the President, on which there would be representatives of the four states most vitally concerned in the exploitation of the Columbia system—Washingon, Oregon, Idaho and Montana.

Unlike the TVA, the CRDC would have responsibility for only one phase of the development of water resources—hydro-electricity. The corporation would absorb the present Bonneville Power Administration, an independent agency of the Department of the Interior, created twenty years ago to market the electricity generated by federal projects in the Pacific Northwest. The CRDC would have authority to plan, construct and operate hydro-electric projects and distribute the electricity produced, but the actual construction would be carried out, as before, by the Army's Corps of Engineers and the Bureau of Reclamation. The key to the plan is the arrangement for financing the Authority's capital expenditures by the issuance of bonds to be retired out of revenues from sale of electricity. The securities would be guaranteed by the US Treasury.

The Bonneville Power Administration is now receiving more than $60 million a year from its sales of electricity. The prospect is that CRDC would eventually have a gross income of approximately $100 million. From this revenue it would finance its own operations and repay the capital chargeable to electricity in projects on the Columbia and its tributaries. The cost of navigation, fish conservation, flood control and other benefits from the authority's dams would be paid, as before, by the federal government.

This would make it unnecessary in the future to depend on federal appropriations for the generation and distribu-

how much is a Stacatruc?

The answer is that a Stacatruc is a good deal,
in the drive for higher production and lower costs.
It takes the load off human muscles . . .
it lifts up to 3 tons . . . transports them . . . stacks goods
higher and saves floor space . . . loads
and off-loads vehicles . . . tows a trailer . . .
keeps machines fed with materials . . .
speeds up production . . . reduces costs . . . and, with a range
of ancillary attachments, the Stacatruc becomes
a crane or scoop, or will rotate or tip its load.
A Stacatruc is so much to industry that its use
is universal, and in the role of easing
man's burden there is no better machine than
the Stacatruc fork lift truck—part of
Britain's best mobile materials handling system.

Man reads... tree

Rustle your paper and hear, beyond the noise of headlines, a tree falling in a forest of pine. The Bowater axe bites as clean on Scandinavian hills as it does in Canada and Tennessee. A paper bridge has been thrown across the world. A strong span links this country with North America where Bowater planning and Bowater plant now match their British counterpart in size, output and development. From these twin sources, whose capacity grows with every month that passes, paper and paper products flow out to world markets in increasing volume. Demand is still setting a cracking pace. Bowaters are in vigorous pursuit, on both sides of the Atlantic.

Bowaters

tion of hydro-electricity in the Pacific Northwest. The reluctance of Congress in recent years to make such appropriations has been the major obstacle to expansion of the programme which began two decades ago with the erection of the Bonneville and Grand Coulee dams. For example, Congress, whether controlled by the Republicans or Democrats, has repeatedly refused to authorise the construction of the $500 million Hells Canyon dam on the Snake River. This was why the Federal Power Commission granted the construction licences to the Idaho Power Company for a series of three smaller dams.

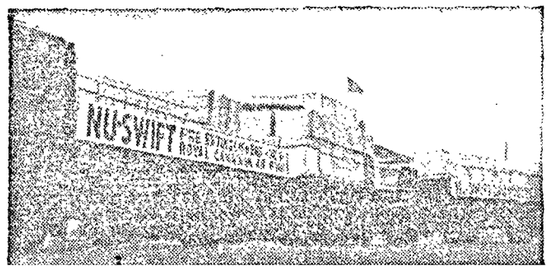
The sponsors of a Columbia River Development corporation, who include the members of the Northwest Public Power Association and many newspapers and state officials in the Northwest, were encouraged by a sentence in President Eisenhower's recent Budget Message to Congress. "Legislation is recommended to authorise TVA," the message read, "to finance new generating facilities by the sale of revenue bonds." This, in essence, is the basic principle of CRDC, but even TVA, established as it is, has encountered Congressional opposition to such a scheme.

The idea of a regional corporation grows out of the general realisation in the Pacific Northwest that Congress and the private electricity companies cannot, even together, be counted upon to provide all the money necessary to keep pace with the prospective demand for electricity in the area. It has been estimated that this would require about $500 million a year for several years to come. Federal appropriations for Columbia development in the year ending June 30, 1957, totalled about $75 million. Private firms spent a somewhat smaller amount. At this rate, the Northwest faces the probability of a critical electricity shortage within the next five or six years. Even this winter, during the seasonal drop in the flow of the Columbia, it was necessary for the Bonneville Power Administration to withdraw a substantial amount of the electricity it supplies to aluminium plants and other industrial firms. Cheap, abundant electricity has been the basis of all the hopes of the region for industrial development; without it, the Northwest knows it will be passed by.

An Enemy of the Bankers

SOUTHERN Democrats forsook their party last week and joined with the Republicans to deny Representative Patman the opportunity, which he would have relished, of conducting the investigation into the monetary system proposed by the President in his State of the Union Message in January. This is a victory for the Administration and a defeat for cheap money. Mr Patman's dislike of bankers and the Federal Reserve system is equalled only by his distaste for credit restraint. The Democratic proposal that the inquiry should be conducted by a subcommittee of the House Banking Committee, under Mr Patman's direction, was defeated by 225 to 174, on the grounds that Mr Patman would find it difficult to be objective.

The President's original proposal was that a commission of nine independent experts should be formed which would be comparable to the Aldrich Commission that laid the groundwork of the Federal Reserve system before the first world war. However, it was soon realised that unless Congress was allowed to participate, it might not provide the money for such a commission, it might not accept any legislation which the commission might recommend, and it might refuse to waive the conflict of interest laws. This would make it difficult to persuade able men to serve. At the eleventh hour before the vote was taken, the Administration advanced a compromise under which the commission would be composed of four Senators and four members of the House, divided equally between the parties, and eight public members. The defeat of the Patman proposal clears the way for such a suggestion. But it by no means guarantees that it will go through. The reflections cast on Mr Patman during the debate have angered many influential Democrats, particularly Mr Rayburn, his colleague from Texas and the Speaker of the House. There may be no inquiry at all, or Congress, which feels that there have been too many costly independent study groups of late, may insist on running this one through a joint committee of the Senate and the House.



Case of the Disabled President

WHEN the Attorney General this week presented to a sub-committee of the House the Administration's proposals for a constitutional amendment to make clear what should happen when a President is unable to carry out his duties, the name of the Vice President, Mr Nixon, was never mentioned. But his unpopularity with the Democrats haunted the proceedings. Mr Brownell, in urging his scheme on the House, argued that it would diminish the present powers of the Vice Presidency; in his view, under present constitutional law, the Vice President alone has the power to decide when he should shoulder the burdens of the Presidency.

In 168 years, only three Presidents—Garfield, Wilson, and Mr Eisenhower himself—have suffered serious disablement; in no case did the Vice President step in. The country survived as Mr Rayburn, the powerful Democratic Speaker of the House, points out. But in an age of hydrogen bombs and aircraft crashes such as that of President Magsaysay of the Philippines, it can well be argued that the danger of the President being captured, injured, or immobilised is greater than before.

The plan put forward by the Administration is a direct outgrowth of the President's heart attack. It provides that the President may transfer his duties to the Vice President whenever he feels unable to carry them out—a provision which has aroused groundless fears that Mr Eisenhower means to do so when the international situation permits; in fact, it is unlikely that any constitutional amendment would receive the necessary assent from three-quarters of the states before Mr Eisenhower's term is completed in 1960. But the scheme also provides that if a President does not realise his incapacity or, because he is a prisoner, for example, cannot make the transfer of authority, this may be accomplished by a simple majority vote of his ten-member Cabinet. In both cases, the President would have the right to reassume his powers when he saw fit. The Administration has been courageous in facing this difficulty, which others would ignore or get around by appointing a "disability council" drawn from the Supreme Court and Congress. Both solutions, however, raise in their turn the spectre of a political conspiracy against the President; neither is likely to be accepted in the near future.

Profile

Dollar Drive through Fire Fighting

Approved by the Fire and Accident Underwriters Associations of New Zealand, approved by the official German Testing Station for Hand Fire Extinguishers, approved by the Fire Marshal of Ontario Province, Canada, approved by the Danish Ministry for Trade, Industry and Shipping, approved by the Underwriters Laboratories of Chicago, U.S.A., approved by the Municipality of Beirut in the Lebanon, approved by the Swedish State Testing Institution, approved by Switzerland's Federal Testing Laboratories, approved by the Corps of Firemen of Caracas, Venezuela, approved by . . .

Used by the Nigerian Railways (Ebute Metta, Nigeria, B.W.A.), used by ASEA, the famous firm of manufacturing electrical engineers (Västeras, Sweden), used by the Hellenic Telecommunications Co. (15 Stadium Street, Athens, Greece), used by Roan Antelope Copper Mines Ltd. (P.O.B. 851, Lusaka, N. Rhodesia, Central African Federation), used by the Great Norwegian Spitzbergen Coal Company (Spitzbergen), used by Empresa Electrica de Guatemala (P.O.B. 209, Guatemala City), used by the prominent Danish shipowning concern of A.P. Möller (*Kongens Nytorv* 8, Copenhagen), used by . . .

You will find Nu-Swift fire extinguishers in every ship of the British Navy (and in ships of 16 other navies), in the royal yachts of Great Britain, Denmark and Norway, you will find them altogether in some seventy different countries.

Exports of Nu-Swift fire extinguishers and pressure charges have multiplied five times in six years. They now account for 40 per cent of total production and vastly exceed pre-war home sales.

Some record, this. How was it done?

The first step frequently is to get the approval of the national or local authority (which may be a fire service, a Government testing institution, an insurance body—see the first paragraph). Next come the concessionaires who have been appointed in all the many countries where Nu-Swift fire extinguishers are on sale. They may be large or small firms, or single individuals; what they all have in common is that they sell, talk breathe, live Nu-Swift, that they are fired (if this verb may be used in such a context) by enthusiasm backed by thorough knowledge of the equipment they handle.

F. Graucob

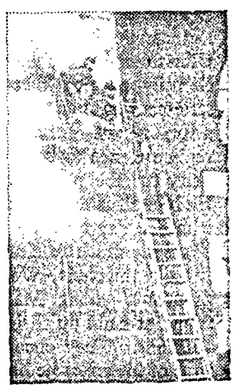
The factory where these extinguishers are made stands at Elland in the bleak, even somewhat grim, setting of industrial Yorkshire, and it is one of those ironic twists of history that the former textile mill building which house an older part of the works was all but destroyed by fir nearly a hundred years ago. One of the newer parts, whic is occupied by the Research and Development Sub-Divisio is called 'Braintree,' the name being one of those de touches—one is almost tempted to say private jokes- in which this organisation expresses the mind of its creato Its laboratories are splendidly equipped, and it may b mentioned in passing that Nu-Swift make all their ow small tools, that they have constructed several of th atomic hydrogen arc-welding machines which, as we sha see, play such an important part in production, that the have made some of their own zinc-spraying equipmer and test gear, and that they also design and partly carr out their own building extensions.

But it is time now that we meet the man who abo all others is Nu-Swift: F. Graucob, Chairman and Managi Director, who gives, not very seriously perhaps, ski-i in Switzerland and hunting rhinos in Africa as his hobbie who in outlook and appearance is about the younge grandfather it has been the writer's privilege to meet, an who, when the point is pressed, says: "It fascinates me tha we can to-day produce something which is considered superior all over the civilised world." Nothing could be more characteristic of the man.

In 1917, at the age of 15, and still wearing shorts, F. Graucob started selling automatic vending machines by cold-canvas in Copenhagen, Denmark. Eight years later he set up business in London with a capital of £18. In 1943 his Company bought the Nuswift Engineering Co., Ltd., who ten years earlier had taken over the manufacture of Nu-Swift fire extinguishers from the original makers, 1926 having been the year in which the first model had come out. In 1946 the Company's name was changed to its present form, Nu-Swift, Ltd. A few months earlier E. E. C. Cawood, who after 27 years' service had just left the Navy, where he had had extensive fire-fighting experience, had joined the Company as a salesman. A man of dynamic personality, he is now the Technical Director in charge of development, research and production.

Broadly speaking, Nu-Swift fire extinguishers come under five headings: Universal models 1301 and 2301 for class "A" risks (wood, paper, textiles, furnishings, carbonaceous substances in general); the Air Foam model 1400 for class "B" risks (inflammable liquids such as petrol, oils, paraffin, white spirit, paints, lacquers, varnishes, enamels, greases, fats and tar); The Auto (CTC) models 1003 and 1000 for class "C" risks (cars, lorries, buses, tractors, minor electrical risks, small petrol fires); the Auto (Chloro-Flash) models 2003 and 2000 for extra hazardous "B" and "C" risks (spirits, alcohols and organic solvents, motors, switchgear, electrical risks such as TV and radar); the Carbon Dioxide model 1210 for medium-sized indoor "B" and "C" risks (spirits, alcohols and organic solvents in medium quantities, and medium-sized electrical equipment).

A new development is the outcome of a recent agreement with the Safety First Products Corporation, Elmsford, New York, U.S.A.: dry powder extinguishers of a greatly improved design for use on inflammable-liquid fires and fires on electrical equipment, for which Nu-Swift Ltd. now have a manufacturing licence and selling rights for most countries outside the North American Continent.



One feature which all Nu-Swift fire extinguishers have in common is that they are pressure-charge-operated, advantages claimed among others being certainty in operation, safety, and reduced risk of corrosion and deterioration. Another one, which forcefully strikes every visitor to the Works, is the extreme care taken to make the equipment foolproof. This is as it should be for, if anything, fire-fighting equipment must be reliable. Inspection is, of course, the hub of this universe, and it is characteristic of this Company and the outlook of the man at the helm that the Inspection Department is here called the Customers' Satisfaction Sub-Division.

A short description of the production of model 1301 will show clearly how inspection and testing enter into every stage. It is there at the start, when raw materials are subjected to quality inspection. Steel sheets are cut by means of a guillotine, a hundred-ton press stamps out dome, bottom and skirt, and the body sheet is rolled into cylindrical shape. Atomic-hydrogen arc-welding equipment provides the longitudinal seam and the handle is joined to the dome by spot-welding while the brass neck ring is silver-soldered into the dome. A thread milling machine cuts the screw thread into the neck ring and the dome is welded to the cylindrical body—again by the atomic-hydrogen arc-welding process. Next come shotblasting inside and outside and spraying with high-purity zinc, whereupon thickness and evenness of this zinc-sprayed rust protection is checked. The bottom is now atomic-hydrogen-arc-welded to the body, shotblasted and zinc-sprayed.

Next the finished body is pressure tested, first hydraulically at 350 lb/sq. in. for five minutes, and then with compressed air under water, one body in every 500 being pressure-tested to destruction. After the skirt has been pressed on, the dip-tube inserted and screwed on to the discharge elbow, and the elbow fitted to the body, the interior of the body is flooded with a second coat of rust protection in the form of a plastic coating, and the exterior sprayed with a first coat of zinc chromate primer. Baking for 13 minutes in an infra-red radiation-heated oven at 300° F follows, and after spraying of the body with stove enamel this process is repeated. A transfer giving name, description and short instructions for the use of the appliance is then affixed to the body, which is sprayed with clear stoving lacquer to protect the transfer and the painted surface. After repeating the baking process described above for the second time, the discharge hose with the nozzle is fitted to the elbow and the head is screwed to the body.

The extinguisher, now complete, is pressure-tested for the third time—with compressed air under water and, after one extinguisher out of every day's batch has been tested for actual performance with charge and nozzle, and the throw of jet and spray measured, the remainder receive the pressure charge and all is ready for packing.

The cardboard skillet carries outside the makers' message: "You can rely on this Nu-Swift Extinguisher because: (1) discharge is definite, (2) liquid is harmless, (3) operation is instantaneous, (4) there is no explosion risk, (5) it is recharged in thirty seconds." To these five advantages the student of economics feels bound to add Number Six: it earns dollars. As a prominent American said once to Graucob: "If there were more companies in Britain like Nu-Swift there would be no dollar problem."

Fire Tragedy

THE WORLD OVERSEAS

The Harich Heresy

FROM OUR BONN CORRESPONDENT

THE east German deputy prime minister and foremost Communist, Herr Walter Ulbricht, has chiefly himself to kick if the publications most prized in his domain this spring, even by party comrades, are the illegal newspapers *Einheit* and *Sozialdemokrat*. These are prepared by the East Bureau of the Social Democratic party at Bonn and smuggled week after week, in ample quantities and by several ways and means, into the Democratic Republic. The singular fascination of current issues derives from their plugging of the political views of Professor Wolfgang Harich and his circle of inquiring, anti-Stalinist Communist friends. For fear their questioning of the regime might have become wildly contagious, Herr Ulbricht had Professor Harich arrested in November and sentenced last month to ten years' penal servitude. And to make certain that the world at large should not get a clear picture of what the professor had really been up to, only hand-picked party men were allowed to witness and report the trial.

One would have thought an old stager like Herr Ulbricht knew better than to stimulate curiosity so. The east German security chief, Herr Ernst Wollweber, a tough customer who has managed none the less to keep more in touch with ordinary mortals, recommended that there should be no trial at all.

Herr Ulbricht insisted, and now pretty well everything he wanted to suppress is on all tongues. The Social Democrats began by publishing the memorandum with which Professor Harich tentatively sounded them in the challenging days of last November when Poland was stirring restlessly and all Hungary was ablaze. Now they have come out with Professor Harich's impenitent statement in court, which the public prosecutor tried repeatedly to stifle, and which was withheld from publication in the Democratic Republic. To make matters worse for Herr Ulbricht and his fellow-Stalinists, the east German radio, clumsily alleging that the version of Professor Harich's statement in court published by the Social Democrats is a forgery, has broadcast a tape recording of what the regime claims to be the true version. All in all, the publicity for the professor and his ideas has been extensive. He himself is not qualified to become the German Gomulka who one day must oust the anachronistic Ulbricht, but he has done much to clear the way for such a reformer.

Now thirty-six, Wolfgang Harich was one of the few promising young Marxists whom the German veterans found at hand on their return to Berlin in the wake of the Russians. They encouraged and promoted him. By the time of his arrest he had become professor of social sciences at East Berlin University and an influential writer and publisher under party auspices. How the seeds of unorthodoxy came to be sown, and how they germinated, Professor Harich tells in his memorandum. The conspicuous stages of growth followed the east German rising of June 17, 1953; the twentieth congress of the Russian Communist Party; Mr Gomulka's re-emergence in Poland; and, finally, the Hungarian rising. Between and during these events there were formative talks with individual Polish, Hungarian, and Jugoslav Communists, and also with such disappointed German comrades as the playwright Bertolt Brecht. "We are a group of functionaries of the Socialist Unity party, representing a broad articulate and an even broader inarticulate following," Herr Harich told the western Social Democrats at the outset of his plea for the establishment of socialism in Germany within a fabric of law and decency. The agreed goal was socialism, and it should be acknowledged that it might be reached along roads other than those travelled by the Russians.

> It is not our intention to break with the party . . . . We do not propose to repudiate Marxism-Leninism but to liberate it from Stalinism and dogmatism and to restore its basis of humanist, non-dogmatic thought.

Professor Harich hoped to be able to put this case openly to the veteran German leaders. They would not even receive him. On October 28th he vainly unfolded his ideas to Mr Pushkin, the Soviet Ambassador. ("He got very angry," Professor Harich confided to the Social Democrats.) Then he became desperate:

> Against us stands the Stalinist party and the State apparatus. This reactionary apparatus we have to fight with every means at our disposal.

Under such a regime there could be only one end. But in his personal statement during the trial, vindicating his conduct, Professor Harich did not falter. (The tape recording broadcast by the east German radio was that of Herr Harich's brief words before being sentenced, in which he thanked the security police for not having treated him more roughly.) He declared he had not wanted to organise a popular rising.

> But I appreciated the situation more soberly than those who were obliged to do so by virtue of their office. I thought the danger of a rising existed and I think it still exists.

By pressing for changes in the regime he had hoped to make a rising superfluous. He repeated he was not an enemy of socialism. On the contrary. But foundations similar to those on which the German Democratic Republic was built had bred revolution in Hungary. It was absurd to contend that he was an agent merely because, as a German socialist, he had been in touch with the West German Social Democrats. He denied that the East Bureau of the Social Democratic party was engaged in espionage. The Social Democratic party was the strongest socialist party in Germany, and without it there could be no democratic socialist development.

The worldly-wise (whose kind let Hitler go so long unopposed) reproach Herr Harich with having been naïve. Some have even written him off as a complete failure. Yet his openness and sincerity, combined with a current of good sense in his argument, seem to be proving remarkably effective. His ideas are being read and discussed sympathetically and hopefully by the millions of east German socialists who consider they have been betrayed by the virtually alien *Apparatchiks* running the state.

French Sympathies

FROM OUR PARIS CORRESPONDENT

THE most striking feature of the Bromberger brothers' book, *Les Secrets de l'Expédition d'Egypte* [which is reviewed on page 35], is that it has aroused far more impassioned comment in Britain than in France. The Brombergers themselves explain why: speaking of collusion with Israel, they remark that "French opinion never imagined things happened otherwise."

From the first, the French leaders openly chose Israel and virtually renounced an Arab policy (though they thought that if they succeeded they would find all the Arab "friends" they wanted). But single-mindedness has its virtues. The French never claimed, like Sir Anthony Eden, to be impartial policemen; "collusion" has therefore never become a vile aspersion. Basically, of course, most Frenchmen, unlike so many British, were not morally horrified by the aggression in Egypt. This was not simply determination of the Right to pacify Algeria in Cairo. Long experience as a continental power has imbued the French with a lively sense of the limits of pacifism and, for many even of the Left, Colonel Nasser had overtaxed them. On the whole the French are proud that they have supported aggrieved Israel alone, and the French government continues to support it. There were protests against the "folly" of the operation (from M. Mendès-France when it started and from others, more numerous, when it failed). But apart from the Communists and a minority of the Left, few denounced its immorality. The French have drawn a moral about their weakness from the Suez failure, but not that they were in the wrong.

On the contrary, most observers assume that the best titbits were leaked to the Brombergers by the Ministry of Defence to show, technically at least, how much in the right the French military were. The Brombergers criticise hesitant British policy, symbolised by an invalid Prime Minister, and British military methods, which slowed up operations for a vital week. And yet, in this as in other ways a mirror of the common French view, their book is not only without bitterness, but friendly and even affectionate about the British. The French do resent America which under President Eisenhower and Mr Dulles, seems to them to have been at best a giant with a head of clay; but not the British. This partly reflects the official attitude which has been to refrain from anything like recrimination but is more than that. Without malice or irony, the suspicion that Britain failed France in a common misfortune has probably been a slight consolation for defeat. Since 1940, French mistrust of perfidious Albion has been waning; awareness of a common predicament has replaced it. But only since the Egyptian expedition has the uncomfortable feeling faded that Britain with its political poise, its Commonwealth and American relations and its A-bombs, might still be something of a great power while France was not. The divisions over the handling of the Suez Canal crisis, even in the Conservative party, and now the strikes and Mr Macmillan's other troubles, are not far from making some Frenchmen think the British are going through a moral crisis in some ways comparable to their own over the European Defence Community. In one sense, the EDC crisis and the Mendès-France ministry were a last attempt by Frenchmen to assert the traditional view of their country's place in the world. They have not looked at it in the same way since. The failure, even together with Britain, to assert an independent French policy in the desperate throw at Port Said, did not really come as a surprise.

This, even more than the absorption in the Algerian war, probably explains the astonishing lack of controversy. The French have not looked back to the failure in Egypt, but forward from it. It has been the biggest single factor in turning the common market from a highly doubtful starter last summer into a good prospect for ratification today; and in making "Eurafrica," based on Saharan raw materials, a word to conjure with. This need not be wishful thinking. The countries of Africa west and south of the Sahara are, for geographical and economic reasons, far more hopeful as wholehearted allies than the states of the Middle East. Much of their future may depend on French capacity to act in realistic economic and political terms in the next few years.

The new perspectives inevitably affect the Entente Cordiale. Britain remains the friend the French most want to have; and as the Queen's visit approaches they are proving themselves devotees of royalty as only republicans can be. But they are acutely aware that as a world force the Entente Cordiale showed itself by the Suez Canal to be something of an *Entente Nostalgique*. It is not mere accident that the socialist who is probably the most pro-British prime minister France has had since the war, should also be the one who, as the Brombergers put it, "has been trying for years to recruit Britain for a united Europe."

Crown and Cabinet in Jordan

FROM OUR MIDDLE EAST CORRESPONDENTS

ALL is now well between the Crown and the Cabinet in Jordan—at least on the surface. The King has agreed to exchange ambassadors with Soviet Russia. The decision came after several days in which there were persistent rumours of a government crisis. On Wednesday, the prime minister, Suleiman Nabulsi, met King Hussein for half an hour, went on to a Cabinet meeting, and emerged two hours later smiling and relaxed. The foreign minister, Abdullah Rimawi, then made the announcement about Russia.

The prime minister later told the Middle East News Agency, a semi-official Egyptian organisation, that Jordan's "liberal policy" was unchanged; it would accept aid from

either East or West as long as it was unconditional; it would never be unfriendly to the Soviet Union just for the sake of western policy. It is difficult to say exactly what happened in the few days preceding the decision. On the face of it, the left-wing members of the Cabinet pressed for diplomatic relations with Russia and the King, after resisting for some days, reluctantly agreed on condition that it was clear that Jordan would still like American aid.

There is evident tension between the government on the one hand, and the King and other anti-communist elements on the other, which the latest decision cannot have eased. The prime minister flatly denied recent reports of a crisis, but the Cabinet is known to have been annoyed by the visit to Damascus undertaken by the chief of the Royal Diwan, Bahjat el-Talhouni, allegedly without the knowledge of the government. The King's recent warning to the prime minister against the dangers of communist infiltration was resented by several members of the government, particularly by those with pronounced leanings to the left. They have steadily maintained that the communist menace is a fiction used by the western powers to perpetuate their influence in the Middle East. Their resentment was increased by the fact that the King's message was released simultaneously to them and to the press. It was also reported at the same time that measures to remove communist literature from bookshops and news-stands had been taken on orders from the palace, without the knowledge of the ministry of the interior. While members of the government were disconcerted by the King's initiative, several politicians of the old school welcomed it as a check on extreme left-wing members of the government.

Threats for Scandinavia

THE Scandinavian countries have been subjected, during the past fortnight, to a series of veiled threats and criticisms from the Soviet government and press which make a strong contrast to the "charm offensive" of last summer. Mr Bulganin has sent letters to the prime ministers of Norway and Denmark warning them that the Soviet Union would have to liquidate the aggressive bases of the North Atlantic Treaty Organisation if war broke out and he has even reminded the Danes that a single hydrogen bomb would be sufficient to destroy a territory much bigger than Denmark although "it must be expected that more than a single bomb will be used if necessary." These letters seem to have been chiefly provoked by the decision to equip Nato with atomic weapons and are attempts, which show no signs of being successful, to raise public opinion against them; but neutral Sweden and even Finland have also come under attack.

Relations between Finland and the Soviet Union had become remarkably amicable. The Russians have allowed Finland to join the Nordic council, evacuated their base at Porkkala, sent Marshal Voroshilov, the President of the Soviet Union, to cement good relations with a state visit, and this week have confirmed that Messrs Bulganin and Khrushchev will visit Finland in June. But last week *Izvestia* published attacks on "Finnish military circles" which, it said, are "trying to revive war propaganda under the guise of concern for the defence of the country" and resurrecting "Fascist organisations" which are banned by the Soviet-Finnish peace treaty. This may be a preliminary warning to the Finns not to be too independent in their foreign affairs; the Finnish government is always extremely careful not to make any public statements which might annoy Russia but the Finnish people made their feelings plain during the Hungarian revolt (about £220,000 was subscribed to the Red Cross by a population of four million) and Finnish business men are beginning to cast wistful eyes at the plans for European free trade.

It is between Russia and Sweden that real friction is developing, although Sweden's "alliance-free" position ought to make it easy for them to keep on good terms. The Russians have long been known to take a pronounced interest in Sweden's land, sea and radar defences but when a spy trial, last autumn, produced fresh evidence of the complicity of Soviet Embassy staff, the uninhibited comments of the press induced the Soviet ambassador, Rear Admiral Rodionov, to resign. His departure has not improved matters: three more embassy officials left hurriedly last month after another man was found guilty of selling classified information on defence to a foreign power.

ARMED BANDS IN ESTONIA

Attack being the best form of defence the Russians have replied with counter-charges. They recently declared an expert on Slavonic languages, who was attached to the Swedish embassy in Moscow, to be *persona non grata* on the ground that he had illegally received an official document (this document is believed to have been the syllabus of Moscow University) and *Pravda* and *Izvestia* have given much publicity to reports on the machinations of "Swedish agents." These, they say, are Estonian nationalists recruited and trained by emigré organisations in Sweden and sent back to make contact with armed bandits in Estonian forests. Repeated attacks have also been made on "Swedish reactionaries" who are said to be trying to make public opinion hostile to Russia and to push Sweden into the "suicide course" of abandoning its neutrality. These attacks are presumably the result of the current campaign of Swedish conservatives and military leaders to persuade the government to buy atomic weapons.

The atmosphere thus poisoned has not been improved by the latest news in the Wallenberg case. It was recently announced that Hr Wallenberg, a Swedish diplomat who disappeared when Russian troops entered Hungary at the end of the war, died in a Russian prison in 1947. For twelve years the Soviet government consistently denied any knowledge of his whereabouts, in spite of a spate of notes and appeals from Sweden and a mass of evidence, collected from ex-prisoners of war, which showed that he had been imprisoned in Russia. Last year, however, in response to a fresh appeal from Hr Unden, Mr Bulganin ordered a new search to be made, and a note was discovered in the archives of Lubyanka prison which had been written by the prison's chief medical officer to Mr Abakumov, then minister for state security. This reported Hr Wallenberg's death from heart failure, and noted that his body had been ordered to be cremated without a post-mortem. The Russians have, of course, put all the blame for Hr Wallenberg's imprisonment on Mr Abakumov, who was executed in 1953 as one of Beria's associates. But, as the Swedish government has tartly pointed out, the Soviet government can hardly disclaim all responsibility for the arbitrary behaviour of its security service.

Hr Wallenberg's fate may have been elucidated by the Soviet government in the hope that the affair would be forgotten more quickly once the mystery was solved. But the very scanty information produced has only increased the Swedes' conviction that Mr Bulganin could produce more details if he wished, and the Soviet government's cavalier treatment of the subject, combined with persistent rumours that Hr Wallenberg is still alive, are likely to keep Swedish interest and resentment at a high pitch.

It looks as if it will be a long time before anything more is heard of the invitation to visit Sweden which was so cordially accepted by Mr Bulganin last year.

Algeria Seen from Tunis

FROM A SPECIAL CORRESPONDENT

AT the end of the recent Tunisian celebration of the first anniversary of independence, Algerian leaders who were present as guests of the New Destur party, if not of the government itself, gave a press conference. Those participating were thoroughly representative of the Front of National Liberation, including, as spokesman, Dr Lamine Debbaghine, a leading rebel soldier, "Colonel" Oumrane and Ferhat Abbas, the former assimilationist. Nothing could have been more definite than their refusal to consider discussions for a cease-fire leading to free and internationally supervised elections. A few days later, M. Mollet, in the closing stages of the debate in the French National Assembly, made an equally uncompromising statement on the French side. The deadlock is complete.

Any hope that the unanimously agreed resolution of the United Nations General Assembly would facilitate a compromise has thus vanished. France, M. Pineau said at the time, had assumed a moral commitment to find a just and peaceful solution in accordance with the Charter. So far, however, the only result has been that the so-called pacification has been intensified. This is now taking on the appearance of repression pure and simple—a development which has produced significant protests in France itself.

The French government is in fact clearly banking on M. Lacoste's assurances that "pacification" will soon achieve its purposes. Ever since last October, the minister resident at Algiers has been asserting that the last quarter of an hour has been reached at the end of which determination will have gained its reward. There is indeed a widespread impression among qualified French observers of liberal outlook that the National Liberation Front is at the moment disorganised and bewildered by the very heavy blows which have been inflicted by General Massu and his parachutists. It is likely that the Tunisian, and possibly the Moroccan, governments, whose relations with France are constantly imperilled by the fighting in Algeria have pressed on the Algerian leaders the desirability of discussing terms for a cease-fire, to be followed by elections with non-French observers. But if this is so, they have had no success in their efforts.

The Algerians declare most emphatically that they will never accept a cease-fire or elections unless the principle of Algerian independence is first recognised. They deny any analogy with the Sudan. There the British Government had accepted the possibility of independence and the Sudanese already possessed the elements of a national government. In this case no national Algerian body is recognised and the French government has declared that any idea of independence is completely ruled out. The setting up and recognition of a provisional Algerian government is therefore, they hold, an indispensable first step.

On the other hand two interesting new points were made by the Algerian leaders in conversation after the press conference. One was the statement that a provisional government could certainly include one or more Europeans. The other was the stress put on the amount of support which the National Liberation Front is receiving from liberal Frenchmen. The rebel fighter, "Colonel" Oumrane, spoke of his gratitude to French doctors for treating his wounds, and said that in some ways he had received more help from Frenchmen than from his own people. The point is to some extent borne out by the numerous arrests which the French administration has recently been making among French liberals in Algeria.

It may be of course that the Algerian leaders' firmness is simply bluff. But nothing in their manner in private bears out such a theory. They express, and appear to feel, complete confidence. Their compatriots, they say, are for the most part peasants and accustomed to hard times. Some years the rains fail and they starve. "It's a bad year" is their comment; this is their attitude now.

One is, in fact, left with the impression that it would be very rash to count on the insurrection collapsing. It seems that very little success is being achieved in applying the proposed reforms. Land cannot be distributed because the proposed recipients dare not accept it even if they wish. Candidates are not coming forward for administrative posts as was hoped. It has been impossible to hold municipal elections in the supposedly pacified districts. M. Mollet in his last speech spoke of decentralisation. Algeria would be divided into areas, some with Muslim and some with Christian majorities, and enjoying a large degree of local autonomy. Such a plan is perhaps the least impracticable of those that have been suggested, but there is no more likelihood of its proving acceptable to either party in Algeria than there was of a similar project being accepted by the two parties in Palestine.

LONG STRUGGLE AHEAD

For the moment everything suggests the continuation of a long and increasingly savage struggle. It is comprehensible that the French government should do all it can to maintain its position, and both M. Mollet and M. Lacoste have committed themselves so fully that they have hardly any alternative but to go on. Yet there is a very real possibility that the result may be the same sort of collapse that occurred in Morocco and Tunisia; in Algeria the danger of internecine French strife would be added.

While the Algerian conflict goes on it is daily and visibly destroying French influence in Morocco and Tunisia. French participation in the celebration of the anniversary of Tunisian independence was hardly apparent to the public until their attention was attracted by the abrupt departure of the French delegate, M. Mitterrand, as a protest against the presence of the Algerian leaders. The foreign powers who took the limelight in Tunis were the Americans and—a very long way behind indeed—the Russians. This was very different from the celebrations in Ghana, where one of the Tunisian delegates said it appeared to him just as much an English as a Ghanian celebration.

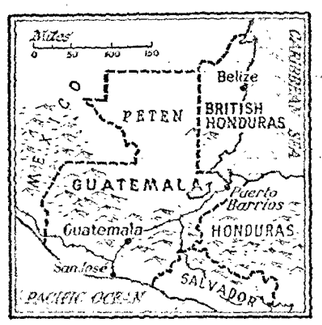
Unfair to New Zealand?

FROM A CORRESPONDENT IN WELLINGTON

A NEW ZEALAND trade mission led by Mr Holyoake, the deputy prime minister and minister for agriculture, has arrived in London with a long list of grievances. The 1932 Ottawa agreement placed trade between Britain and New Zealand on a mutually advantageous basis, but the New Zealanders feel that Britain has gradually been taking more and giving less. In order to adjust the balance of advantage, the mission is going to ask Britain to bolster up New Zealand preferences, possibly by a scattering of fresh quotas and regulations elsewhere.

The New Zealanders can support their case by pointing out that they themselves have gone beyond the letter of the preference system by granting higher margins of preference on many British goods than they are obliged to under any agreement. Moreover, since British preferences in the New Zealand market are on a percentage basis, they still have the same effective weight as at the time of the Ottawa agreement. But many of the New Zealand preferences are specific, and therefore mean very much less than they did in 1932. For instance, the preferential duty on butter is still 15s. a hundredweight, and on apples 4s. 6d. a case (for four months in the year). Allowing for the depreciation in the value of the pound, a duty nearly three times as high would be needed to give equivalent protection today.

Except for wool, New Zealand's exports are foodstuffs, and these go largely to the United Kingdom. Over the last year or so, the price of New Zealand beef in the United Kingdom market has dropped by about a quarter; and mutton and lamb prices, too, are down. Butter prices fell in the year by between 35 and 40 per cent, and cheese prices are now weak. The dairy industry is even more alarmed than the meat producers about future prospects.



One of the basic reasons for this alarm is British agricultural policy. The New Zealanders have seen subsidies to British agriculture developed to the level of £225 million annually. They have read that British agricultural production may increase by 20 per cent in the next ten years. They have realised that the population of Britain is not increasing, and that the standard of living is unlikely to rise sufficiently to absorb the larger quantities of dairy produce at prices which would be economic for the New Zealand producer. Moreover, they see the same things happening in the meat trade, for Britain is increasing its production of both beef and mutton. The New Zealanders are also worried about the way in which Britain is being treated as the dumping ground for surpluses which cannot be absorbed elsewhere.

The aim of the New Zealand trade mission is a British market in which the traditional suppliers, including the home producer, can be assured of stability and economic prices. They are not deterred by the fact that such a policy may involve regulations and quotas. Although this would cut across the spirit and letter of the General Agreement on Tariffs and Trade, the New Zealanders feel that the spirit of Ottawa ought to take precedence. Few New Zealand producers are enthusiastic about Gatt, which they feel was joined, not because it was good for New Zealand, but because the government preferred to be co-operative and belong to the club.

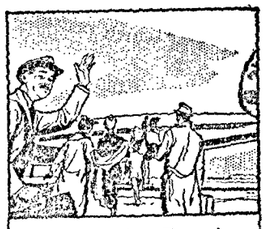
Any such regulation of the British market would inevitably involve foreign suppliers; of these, Argentina is the most important. One of the intentions of the Ottawa agreements was to give New Zealand preferences over Argentina, and it is felt that these should still obtain. But if, as expected, imports of Argentinian fruit and meat are allowed to expand, prices are likely to become progressively lower. Apart from foreign competition, the New Zealanders are alarmed by the way in which Britain by its system of subsidies is rapidly increasing home production with very little regard to the price mechanism. They further deplore the lack of consultation between Britain and its Commonwealth suppliers on policy for British agriculture, and its tardiness in introducing anti-dumping legislation.

Crack in the Caribbean Chain

THE capture by the People's United Party of all nine seats at last month's general election underlines the reluctance of British Honduras to be linked in any way with the Caribbean Federation. Mr Leigh Richardson, who led the PUP during its three years in office, was ousted from leadership partly because, during these three years, he had come round to the view that there might be some advantages in economic and political links with the British West Indies. Shortly before the elections he formed the Honduran Independence Party and campaigned on a platform of internal self-government within the British Commonwealth. But the 12,000 voters who bothered to go to the polls (only half the total electorate) preferred Mr George Price, the new PUP leader, who promised to work for an independent republic, with closer relations with Latin America. There are strong American-Indian traditions in British Honduras; Spanish is widely spoken; Roman Catholicism is the dominant religion. There are, moreover, unhappy memories of Jamaican rule, while the present poverty and unemployment are blamed on the British administration.

The election results will have pleased the Guatemalans, who have been putting forward regular claims to British Honduras for many years. Although Mr Price stops well short of demanding union with Guatemala, he has been consistently anti-British and is expected to try and steer British Honduras away from the Commonwealth. Guatemalan rulers have always found the claim to British Honduras an easy way of whipping up popular emotion, but in the last year or so the discovery of oil in the Peten has given them an economic reason for wanting union between the two countries, for by far the quickest route from the Peten to the sea is through Belize.

An independent British Honduras would not at present be economically viable. Most of the 80,000 inhabitants are clustered round the towns; most food is imported. Money and technical advice will be needed if the Latin American attraction is to be countered.

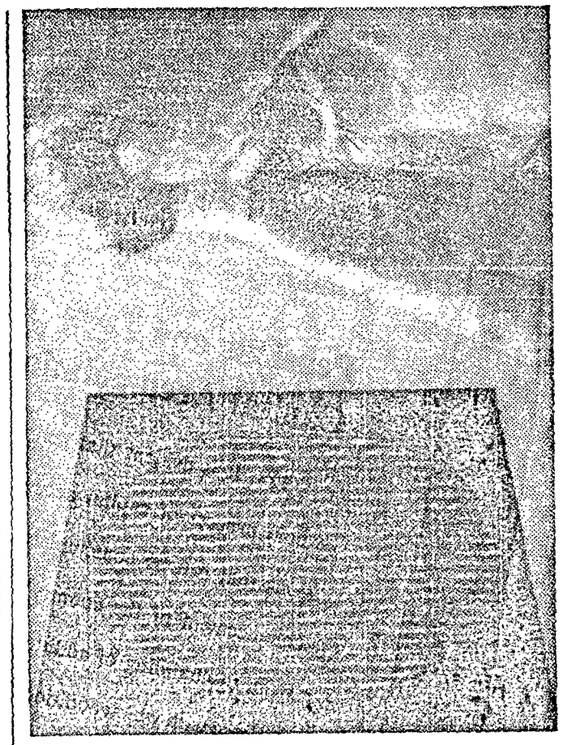


Enjoy Canadian hospitality all the way by TCA Super Constellation

Montreal and Toronto are one relaxed night away when you fly TCA Super Constellation. And the morning you step down, TCA connections wait to fly you across Canada or to key U.S. cities.

NEW LOW FIRST CLASS FARE

TCA offers a new *low* First Class fare to Canada and will continue to offer Deluxe accommodation, with a 'Siesta' sleeper seat, at a small extra charge. Both classes will enjoy a separate club lounge and the finest in food and service. Ask your Travel Agent for full details.



TCA's 15-day Excursion Return offers a saving of more than £34 on a Regular Tourist Fare.

Serving Europe, all Canada, the U.S.A., Bermuda, Nassau and the Caribbean

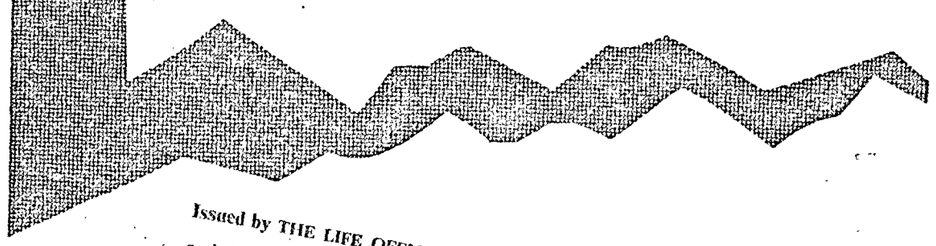
One and a half million times larger than life

You are looking at something which, until recently, has never been seen by the human eye. It is a photograph of a metal compound, magnified 1½ million times, showing lines of molecules one ten millionth of a centimetre apart.

A TI scientist took the photograph using an electron microscope at TI's research laboratories near Cambridge as a first step in a study of the strength, fracture, fatigue and creep of metals. Direct photographs have been taken of the defects which affect the behaviour of metals under stress. The further study of these defects and their movement may eventually lead to the development of metals, very much stronger than those at present available.

Over 200 scientists and technologists are working for the community through TI. Some long-range projects are regarded as a contribution to the pool of knowledge, but the results of the main body of work are to be seen in the design and quality of the wide range of existing products and the new products and processes which stem from TI's seven Divisions:

STEEL TUBE DIVISION · ENGINEERING DIVISION
ELECTRICAL DIVISION · ALUMINIUM DIVISION · STEEL DIVISION
CYCLE DIVISION · GENERAL DIVISION



TUBE INVESTMENTS LIMITED

The following extract is from the Report of the Committee on the Economic and Financial Problems of the Provision for Old Age, 1954. Cmd. 9333 ("The Phillips Report"), Page 34.

Pensions and Capital Accumulation

128. It is evident that pensions are intimately linked with the whole process of capital accumulation and that the scale of pensions that can be contemplated depends, on the one hand on the enhancement of the country's productive power that would result from the building of additional capital assets, and on the other on the ease with which additional savings can be spared for this purpose. If the National Insurance Scheme were conducted on the same principles as a private scheme, then the investment of the contributions would enable valuable assets to be constructed that would eventually furnish the means out of which pensions could be paid. But the Scheme is heading for a deficit that will have to be met out of general taxation, and, to some degree, out of the savings of the taxpayer, so that it will actively impede the very process of capital accumulation on which, implicitly, it rests.

and the ASSOCIATED SCOTTISH LIFE OFFICES, EDINBURGH
in the interest of a better understanding of the fundamental problems of providing a higher level of retirement pensions without harm to the Nation's economy.

THE BUSINESS WORLD

Survey of Disinflation

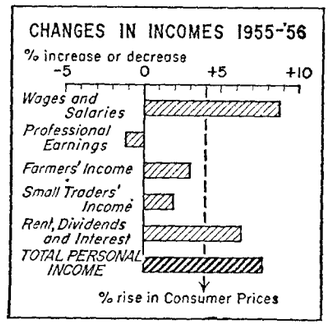
Disinflationary policy in 1956 succeeded in some of its objects but failed in others. It must be given most of the credit for restoring Britain's balance of payments from the plunging deficit of late 1955 to a substantial surplus in 1956. It steadied consumption, while the investment boom continued to run its course; and brought about an impressive if partly involuntary increase in personal savings. It took the edge off total demand for labour, and caused some small net transfers of unskilled labour between industries. On the other hand, it did no more than moderate the rises in prices and wages; and it wrote off any significant increase in output. So it probably raised labour costs at least in British industry more than galloping inflation had done during the boom.

It was a rapid worsening of the balance of payments that led the Government to stiffen its restraint upon internal demand at the end of 1955; and the Economic Survey is able to record that this trend at least was rapidly reversed. Imports rose no further, after their "enormous increase" in 1955, while exports continued to rise, rather faster than the year before. The visible trade deficit was thus reduced by £300 million from one year to the other. Disappointingly, there was little net change on invisible account, which has been expected to improve after the disappointing performance of 1955: this seems to have been mainly the effect of Suez on oil shipping. But the improvement in the visible balance transformed the country's balance of payments from a deficit of £113 million (excluding defence aid) in the last half of 1955 to a surplus of £145 million in the first half of last year and of £65 million in the second (£37 million of interest on North American loans having been paid into a special account and not debited against the current balance of payments). Counting in defence aid, the change was from a deficit of £79 million for the whole of 1955 to a surplus of £233 million last year.

Figures show the contribution to the apparent increase in domestic output between 1955 & 1956 at 1955 factor cost

The huge increase in imports in 1955 occurred largely in response to industrial demand for materials from overseas; production has been rising, and there seems also to have been some periodical upswing in stocks. Last year this growth of demand for materials was checked, along with the growth of industrial output; the volume of imports fell very slightly, but their cost was about level with 1955. Exports, when adventitious elements are ironed out of the comparison, may have risen about 6 per cent in volume, as against a rise of, say, 4½ per cent in 1955. This increase was achieved, moreover, by selling more of the right things to the right places: it was particularly marked in exports of capital equipment and in trade with North America and Europe. Nevertheless, it has again to be set against a considerably larger increase in world trade in manufactures: so the British share of that trade continued to fall.

The current surplus on the balance of payments was rather more than sufficient to cover Britain's net long-term investment overseas. The survey introduces new tables recording what it calls Britain's "long-term" overseas investment account; these



estimates, set against the current balance of payments and changes in its monetary assets and liabilities *vis à vis* the rest of the world, afford an indication of how its "overseas monetary position" changed during the year. In 1956 the country's balance on current and long-term investment account improved to a surplus of £42 million, following a deficit of some £240 million in 1955. In the first half of last year, indeed, in spite of some running down of sterling balances abroad, this surplus on "commercial account" made possible an increase of £95 million in the reserves. But in the second half of the year, the worst period for the trade of the overseas sterling area with other countries, an increase in overseas investment moved Britain's "commercial account" into deficit; moreover with the crisis of confidence over the Suez adventure, there was a considerable outflow of miscellaneous capital and big reductions in overseas holdings of sterling. Britain suffered large losses of gold and dollars. By calling in second-line reserves—drawings upon the International Monetary Fund and credits from the Fund and the American Export-Import Bank—it was able to check speculation against sterling. But the political adventure had cost the reserves more than a virtuous year of disinflation had increased them.

Restraint at Home

People had larger incomes, but did not spend much more. This made room for a continued rise in investment and exports, though production rose hardly at all last year.

GOVERNMENT policies were aimed at arresting an inflation in which the price of final output in the economy had been rising between 1947 and 1955 by rather over 4 per cent a year: but in 1956 the price of final output rose by more than 5 per cent. An increase of about £1,180 million in the gross domestic product at current prices, that is to say, comes down to an increase of only about £240 million when expenditure is revalued at constant prices (the alternative method of calculating the gross domestic product from figures of output suggests, incidentally, a real increase of only about one per cent, or £160 million). With an increase of about £100 million in imported resources, this made at the most £340 million of extra supplies in real terms available in the economy. Well over two-thirds of these extra resources went overseas in exports; there was an increase of about £80 million in fixed investment; consumption rose only about £60 million in real terms, and government expenditure on current account by £50 million. There was an off-setting saving in stockbuilding; though stocks seem to have gone on rising, last year's increase was £100 million less than in 1955.

Against the tiny increase in consumption—about a half of one per cent, after allowing for price increases—one can set a large increase in personal income: total disposable income, after taxes, rose by nearly £1,100 million, or 8 per cent. The balance between income and spending, which is nowadays confidently labelled "personal saving" though it is bound to contain a considerable residual error, rose sharply, from £1,004 million in 1955 to £1,481 million in 1956. "The balance of personal savings," says the survey, "is shown to rise by nearly £500 million, bringing the total of personal savings up to 10 per cent of disposable personal income, a proportion considerably higher than in any previous year since the war." This increase in saving—which was clearly substantial—represents the difference between the balance of assets and liabilities of people over the year. Repayments of hire purchase instalments and reductions in overdrafts and mortgages would probably account for about a third of the increase.

This moderation of demand from consumers, and a markedly slower rate of stockbuilding, enabled exports to rise even more, and fixed investment to go on rising—though according to the survey less than half as much as the year before. Fixed investment is put at £3,088 million during 1956, an increase of 8 per cent in money terms; but the Government's indices of investment goods prices bring this down to an increase of only about 3 per cent in real terms. No outsider can assess the quality of these indices, which are unpublished; they suggest a much larger real increase in industrial and commercial building and works than in plant and machinery deliveries, which sounds rather peculiar in the third year of an investment boom. Whatever adjustment for higher prices is made, fixed investment last year seems to have been at its highest level ever in this country, though the rate of expansion began to slacken by last spring. Fixed investment in 1956, as in 1955, rose more in manufacturing industry than in other sectors of the economy, reversing the trend of earlier years when housing or the nationalised industries made the running.

The bulk of the increase in fixed investment, therefore, was carried out by private industry. Fixed investment by companies rose by about £130 million in 1956 (the increase had been £200 million in 1955); but their investment in stocks rose much less than the year before, so that the two forms of investment together came to rather less than in 1955. The survey puts the total fixed investment of companies at £1,106 million, plus an increase of £300 million in the value of their stocks; with undistributed profits, after tax, rising to £1,513 million and the raising of £236 million by new issues, this would once more leave the company sector comfortably able to finance its expansion of capacity and remain a net lender to other sectors of the economy. But the survey's estimates of company profits have to be judged against the year's experience in industry and commerce.

Dead Level in Industry

Industrial costs rose, while output did not. There was more activity—and more profit—in commerce and trade than in manufacturing. Price inflation slowed only a little.

WHATEVER increase there was in national output last year seems to have come from agriculture and from increased activity in distribution and the service trades—not from industry. Throughout the year, industrial production remained at the high level first reached early in 1955, about 35-38 per cent higher than in 1948. It showed no signs of increasing generally during the year, though "there were widely divergent movements in different industries." The working population showed no significant increase and with the softening of demand for marginal workers the number of women in jobs declined slightly. Manufacturing ouput, the most dynamic element in economic expansion in Britain since the war, is indeed shown as falling slightly last year, by just over 1 per cent. Manufacturing employment also fell during the year; but the survey, taking averages for 1956 against those for 1955, reckons that ouput per man-year in manufacturing declined by about 2 per cent. Since annual earnings in manufacturing industry rose by 8 per cent—fully as much as in the boom of 1955—it may be inferred that labour costs rose by roughly 10 per cent. Fuel prices rose even more; but prices of other basic materials went up only about 2½ per cent. Since some of the manufacturing industries were operating well below capacity, their overhead costs will also have risen. Year-to-year comparisons of "costs" of this kind are inherently dubious. What one might more confidently say is that earnings continued to rise at more than the rate that investment in improved equipment could match even at full output, and that industry was in fact working somewhat below capacity.

In such circumstances, businessmen may well have considered it prudent to absorb what they hope are temporary additions to costs, over and above the ordinary rate of inflation; and prices of manufactured goods certainly did not rise as much as the survey suggests that costs in manufacturing may have done. With an air of discovery, the survey comments, "The implication is that profit margins in manufacturing were on average reduced." The Government statisticians, holding that there was some slight decline in manufacturing profits, which account for two-thirds of gross trading profits in private industrial and trading companies as a whole, nevertheless think that gross profits rose by 3 per cent for all companies—implying a rise of 10 per cent or so in profits outside manufacturing. Clearly, commerce and trade were doing better last year than manufacturing industry was; but so sharp a contrast in profits is surprising.

Whether or not prices rose as fast as costs, they were hardly stable. There is an air of unctuous disingenuousness about the survey's discussion of Mr Macmillan's price plateau; the reader can almost feel the politician's breath coming down his own neck, let alone the authors'. In fact, retail prices rose about 5 per cent between 1955 and 1956, though only about 3 per cent during the course of 1956 itself; and prices of all manufactured goods are said to have risen by about 4½ per cent between the two years.

Strain upon the metal-using industries, often cited as one of the main reasons for stiffening disinflation late in 1955, eased considerably during 1956; total output in this mixed bag of engineering industries indeed fell slightly. Within this group, the survey shows output for investment (excluding cars) as rising about 3 per cent (which is in line with its modest estimate for the real increase in capital investment in plant and machinery). Output of cars for the home market and metal consumer goods fell by more than 20 per cent; and engineering output for defence, which in recent years has taken about an eighth of their total production, also declined. Engineering exports rose. But the survey shows also a marked decrease in output of "other industrial goods, repair work, and stock changes," which includes most semi-manufactures and components—suggesting that intermediate output in British engineering may be geared rather more to the production of motors and consumer goods than to the building of plant and machinery. These industries' total demands for steel were more easily supplied in 1956 than in 1955—though imports of steel were virtually as large as in the previous year and cost more.

"When Expansion Is Resumed . . ."

In 1956, Britain could not have improved both production and the balance of payments; it was one or the other. Is it still?

"ON THE whole," concludes a survey that is generally concerned more to delineate the Government's disinflationary policy than to analyse its working or its results very deeply, "this policy was successful." This verdict may seem overkind to less committed observers: but the reasoning is consistent, if circular. By forgoing increases in consumption and production and simultaneously encouraging exports the nation

secured a substantial improvement in the current balance of payments; most capital goods industries, the railways and the coal mines gained small numbers of unskilled and semi-skilled workers; savings rose; the price plateau held for six months. "Restoration of the current balance of payments surplus without checking production could have been achieved only by an even better export performance"; and the only major expansion achieved in exports was of precisely the capital goods that home investment required.

Once the Suez Canal is back in use, the survey suggests, "a renewed upturn in European production in the second half of 1957 may be expected" if perhaps "at a more moderate pace than in recent years." Equally, it is distantly confident about the United States: "generally speaking no great changes from the present prosperous conditions seem likely, one way or the other." And any general pick-up in economic activity later this year might somewhat increase the general level of commodity prices for the primary producing countries. But its prophecies are largely reserved for foreigners. At home, this survey is much less prepared to look ahead—or to relate what happened in 1955 and 1956 to the long-term progress of the economy.

Estimates of investment intentions for 1957 in private industry are now in the public domain, and the Treasury will recently have concluded its annual exercise in telling the nationalised industries what it agrees that they may invest this year. Here the survey permits itself a clear indication: "Investment by private industry is likely to remain this year at about its present high level, and investment in the basic services of fuel, power and transport (including new road building) is expected to increase." Private industrial investment would appear from the quarterly estimates, already to be running down—though there remains some possibility that last year's increase, in real terms, may have been under-estimated. This investment, the survey agrees, has improved British industrial efficiency and capacity.

How much potential expansion in output will be available from that additional capacity is unknown, but it must be considerable. In its understandable, and indeed inevitable, emphasis upon improving the balance of payments enough "to finance our long-term investment overseas and strengthen our position as an international banker," the survey tends to treat that expansion as an independent phenomenon, to be reckoned with when, for reasons presumably of its own, it occurs.

"When the expansion of industrial production is resumed," it notes, additional imports will be needed; this means an even more rapid increase in exports than in recent years and that "a considerable proportion of the additional output" must be exported. Kept thus at arm's length, industrial expansion is no longer treated as the capacity from which it will be practicable to supply more to the various sectors of demand, but as something that in "the external conditions for a successful year," Britain may cautiously be able to afford. "Internally, high savings and all possible restraint in Government expenditure should create a situation favourable to the export effort and help us to avoid any undue increase in the level of imports when expansion is resumed."

BUSINESS NOTES

BALANCE OF PAYMENTS

Where Suez Hit Sterling

THE characteristic feature of the sterling crisis of the second half of 1956 was that, apart from some fall in earnings of Middle East oil companies, the strain was concentrated wholly on the capital account. Britain's current balance with all countries was transformed from a deficit of £102 million in the second half of 1955 to a surplus in 1956 of £154 million in the first half and £79 million in the second; and the deficit with non-sterling countries shrank from £211 million in the second half of 1955 to £92 million in the second half of 1956. Despite the receipts from the sale of the Trinidad Oil Company, there was still a small net outflow of long term investment. In consequence, as the first line of the table shows, the "commercial balance" with the non-sterling world improved from a deficit of £243 million to one of £106 million. But for the drawing of £201 million from the International Monetary Fund at the end of December, the reserves would have fallen in the half year by £291 million (compared with a rise of £95 million in the first half of 1956 and a fall of £200 million in the second half of 1955). This is attributable to three major influences:

The running down of sterling balances;

The withdrawal of short term capital through a host of other channels;

To a smaller extent, a reduction in the contribution of gold and foreign exchange of the overseas sterling area.

In the second half of 1956 the overseas sterling area as a whole provided Britain with a net sum of only £9 million of gold and exchange; the current deficit with Britain of £171 million was financed largely by a big increase in the inflow into those countries of British investment capital (of £113 million), and also by some running down of sterling balances. The overseas sterling countries were thus able to countenance a rise in imports from both the dollar area

and, still more, from Europe. The country in which this trend was most marked was India, but it was seen also in the colonies, whose sterling balances actually fell somewhat, to £1,286 million—still accounting for nearly two-fifths of all overseas countries' sterling holdings. On the other hand, there was a further increase in receipts from gold sales, for the most part of course from South Africa, to a new record of £125 million in the second half year—half as much again as in the whole of 1953.

WHO DREW?

A striking feature of the analysis of the capital strain is the extent to which this was attributable to Western Europe. Of the further reduction of £84 million in the sterling balances of non-sterling countries in the half-year, £30 million was attributable to OEEC countries. The much smaller holdings of dollar countries, which had been heavily run down in the year preceding the Suez crisis, had already virtually touched bottom (at £37 million), whilst those of other western hemisphere countries actually rose by £7 million, following a rise of £16 million in the first half. Balances of other non-sterling countries, however, dropped by £60 million in the second half and £114 million in the year as a whole—a fall attributable primarily, no doubt, to Japan, China and the non-sterling Middle East.

THE CAPITAL STRAIN
Transactions with non-sterling world
(£ million)

	1955		1956	
	Jan.–June	July–Dec.	Jan.–June	July–Dec.
Balance of current transactions and long-term capital	−105	−243	+ 14	−106
Receipts of foreign exchange from RSA	+ 96	+ 36	+113	+ 9
"Commercial balance"	− 9	−207	+127	− 97
Short-term and miscellaneous capital, and errors and omissions	+ 30	+ 45	+ 17	− 76
Movement of sterling balances	− 24	− 58	− 48	− 84
Change in official holdings of non-dollar currencies, EPU debt, etc.	− 26	+ 20	− 1	+ 3
Dollar payment into waiver account	...	...	...	− 37
IMF drawing (+) repayments (−) by UK	...	...	...	+201
Change in reserves	− 29	−200	+ 95	− 90

The outflow of £76 million of "miscellaneous capital and errors and omissions," which includes a partial estimates of the "leads and lags" in current payments, also appears to have been attributable to a substantial degree to OEEC countries. The speculative pressure from Europe is reflected in the fact that while the commercial deficit of the whole sterling area with OEEC rose only from £84 million to £106 million, the official statisticians estimate that the net dollar deficit in all transactions with these countries rose from £144 million to £215 million. It thus accounted for over two-thirds of the loss in the reserves in the second half-year excluding the IMF drawing.

STERLING AND GOLD RESERVES

Increase in Reserves

THE British gold and dollar figures reflect little of the excitement and two-way activity that have characterised the foreign exchange market in recent weeks. During March the reserve rose by $62 million, which included $17 million from the European Payments Union in settlement of the February surplus, and $5 million of defence aid from the United States; as the regular $3 million was paid out to creditors of EPU in bilateral settlements the residual inflow, reflecting market operations during March, was $43 million. India, however, is known to have drawn $67½ million from the International Monetary Fund during March, and the precise effect of this operation on the reserve cannot be assessed. As a member of the sterling area India banked the dollars in London and replenished its sterling reserves, but it is probable that it drew considerably on its London balances to make non-sterling payments which may have cost gold and dollars.

THE GOLD RESERVE

($ million)	EPU settlement*	Direct dollar balance	Aid and special payments or credits	Change in reserves	Reserves at end of period
1956 :—					
August	−51	− 68	− 10	−129	2,276
September	−34	− 94	+180†	+ 52	2,328
October	−28	− 63	+ 7	− 84	2,244
November	−28	−285	+ 34‡	−279	1,965
December	−49	−169	+386§	+163	2,133
1957 :—					
January	−17	− 36	+ 4	− 49	2,084
February	+20	− 20	+ 63	+ 63	2,147
March	+17	− 27	+ 72	+ 62	2,209
April	− 6				

* Relates to balance in previous month. † Includes $177 mn. from sale of Trinidad Oil ‡ Includes $30 mn. from official sale of US government bonds. § Balance of drawing of $561 mn. from IMF, defence aid of $5 mn. and end-year instalments of $181 mn. on US and Canadian postwar loans. Includes drawings by India from IMF of $59 million in February and $57 million in March.

But for the Indian drawing from the IMF the residual change in the reserve last month, reflecting the intervention of the Exchange Equalisation Account in the market, would probably have been small. The trend is more truly reflected in the balance with EPU, where the January-February surpluses of £9 million and £8 million gave way to a deficit of £3 million in March. The deterioration here and in the residual balance is attributable to the further pressure on sterling caused by the strikes. Dollar payments for oil continue to be "very heavy," but so far there has been no drawing by Britain on the IMF standby credit or on the $500 million credit from the Export-Import Bank.

STERLING BEARS COVER

During the past week the foreign exchange market has reflected the fluctuating news of labour troubles in Britain. The rate on New York, which was hovering around $2.79 towards the end of last week, took a sudden dip on Monday and touched $2.78½. At the same time the three-months premium on dollars, which had narrowed down to ⅛ cents, widened to ⅞ cents. Since then the official rate has recovered sharply to 2.78⅞, and the three months' premium on dollars has narrowed to ¾ cents, the most flattering rate for forward sterling since February 1955. This must denote a covering of short accounts. Continental rates have also moved in favour of sterling during the latter part of this week.

The feature of the exchange market continues to be the underlying weakness of the French franc. France's deficit with EPU last month rose to $93,696,000 from $88,040,000 in February. The March deficit would have been greater still had it not been for a massive mobilisation operation by the Bank of France which ordered all French banks, nationalised or not, to repatriate any surplus foreign exchange balances in excess of those existing on January 1st. This succeeded in bringing to the Bank of France, and therefore into the EPU clearing, foreign currencies which did not represent current commercial transactions. This running down of foreign currency balances partly explains Britain's deficit with EPU of £3 million in March, which will be settled this month by a payment of $6 million. France has already asked for a $200 million extension of its quota when EPU is renewed for a further year from June 30th next.

THE MARKETS

Waiting for the Budget

IT would have been remarkable if markets had developed a clear direction this week. Investors had a mass of heavy information to digest—the Economic Survey, the national income figures, the gold and dollar statement, the balance of payments, the strikes and their settlement, and the continued intransigence of Colonel Nasser. And they had to look forward to the budget. So most investors marked time. But markets have not been stagnant; there has been enough business passing to show that investors were not shaken in their theory that inflation is still winning. Oil shares have been bought. Industrials have risen a little. *The Economist* indicator is up two points, from 204.9 to 206.9. Gilt edged have sagged a little. The *Financial Times* index of government securities was down in the week ended on Wednesday from 87.48 to 87.32.

A pronounced surfeit of short-dated bonds is still felt in the money market while the big banks are certainly not buyers; a few of them are believed still to be sellers. At the longer dated end of the list institutions such as insurance companies are showing a pronounced reluctance to buy. Their predilection is for the double option—the fixed interest security that might become a useful equity. The massive over-subscription of the Pressed Steel Company's issue of £2 million 5½ per cent convertible debenture stock 1977-82 at par, is an illustration of the sort of investment ideas that prevail among them. The offer attracted £22 million of applications.

It is futile to expect markets to adopt any other shape until after the budget, or to hope that funding by sales of government stocks through the market will yet start up again. The government broker, with a more varied list of securities on offer than usual, prices his holdings in general at about half a point above the market. It is arguable that to cut those prices and get funding restarted is an obvious need, but sound tactics suggest that such a move should be carefully timed so that when selling does start it finds a market ready to absorb stock.

BRITAIN'S INDUSTRIAL CAPITAL

'Real Investment' in 1956

MUCH of the information published in the preliminary White Paper on National Income and Expenditure now finds its way into the Economic Survey, this year published the day before. But one "scoop" left for the national income accounts was the estimate of how much the country ought to have been setting aside last year to maintain the value of its fixed assets—continuing the important figuring on capital consumption introduced in last year's Blue Book, which for the first time provided an official estimate of national income after allowing for depreciation.

Last year new investment in fixed assets was valued at £3,088 million but partly offsetting this, it is reckoned that £1,735 million should have been allowed for wear and tear and obsolescence, so that only £1,353 million could be counted as a net addition to assets. Between 1955 and 1956, gross capital formation rose in value by 8 per cent, but capital consumption rose more than this following the 1953-55 boom and consequently there was only a 5 per cent increase in the value of net investment which seems to have been entirely swallowed up by higher prices. The amount of net investment, in real terms, was apparently no higher last year than in 1955; indeed, expressed as a proportion of the national income, these figures suggest a fractional fall in it.

NET FIXED CAPITAL FORMATION AND NATIONAL INCOME
(£ million)

	1953	1954	1955	1956
Gross domestic capital formation	2,268	2,550	2,855	3,088
Less capital consumption	−1,368	−1,427	−1,568	−1,735
Net domestic fixed capital formation	1,000	1,123	1,287	1,353
Gross national product	14,901	15,906	16,803	18,002
Less capital consumption	−1,368	−1,427	−1,568	−1,735
National increase	13,533	14,479	15,235	16,267

Behind these figures of capital consumption lies a formidable exercise full of hazards: it is perhaps no wonder that these hide themselves rather coyly among the notes at the back of the white paper. Only the bare total figures are given and it is impossible to judge them closely or carry the interpretation further until more detailed estimates appear, presumably in the next Blue Book.

HOW DOES BRITAIN COMPARE?

Many comparisons have been made since the war of the extent to which the major industrial countries have been investing in fixed capital equipment—nearly always to Britain's disadvantage. All have so far suffered from the inadequacy and incomparability of the data. In the last two or three years, however, official statisticians in Britain and other countries have been refining their estimates of national investment; and in the current issue of *The Banker*, Dr T. Barna, one of Britain's most prominent academic statisticians, has there been able to present comparisons of net investment in Britain, Western Germany and the United States on almost exactly the same basis.

His results are comparatively favourable to Britain. Using the same method of estimating net investment that the Central Statistical Office does, he calculates that the net value of fixed assets in manufacturing, shown in dollars of comparable purchasing power, has just about doubled between 1938 and 1956 in all three countries. Since 1948, the net value of manufacturing assets rose by 25 per cent in the United States, by 50 per cent in this country, and by as much as 110 per cent in Western Germany; but these differences were no more than enough to offset the much greater net investment in manufacturing during wartime in the United States and Britain than in Germany (which expanded its industrial capacity during these years by con-

quest rather than investment). Moreover, Britain's proportionate addition to capital per worker in manufacturing since 1938 has been much more than in either country.

OUTPUT & CAPITAL PER HEAD IN MANUFACTURING
(In dollars of 1950 purchasing power)

	Output per Head			Capital per Head		
	United Kingdom	Western Germany	United States	United Kingdom	Western Germany	United States
	$	$	$	$	$	$
1929	1,300	1,700	3,800	1,300	1,900	4,900
1937-8	1,700	1,900	3,800	1,300	1,800	4,200
1948	2,100	—	4,700	1,700	2,000	4,600
1956	2,300	2,200	5,950	2,200	2,300	5,200

Dr Barna's new calculations raise one important technical point; he holds that official estimates of investment in Britain over the years leave out a very large amount of capital equipment put into manufacturing industry during the war (and some since) with Government money. It will since have been transferred on comparatively advantageous terms to companies, and is not necessarily depreciated in the normal way at all. This may account for a substantial increment of comparatively modern capital equipment in British manufacturing that Government estimates have so far missed.

DEFENCE PRODUCTION

Lean Future for the Aircraft Industry?

DETAILED figures for defence expenditure had not been published when this issue of *The Economist* went to press, but the summary of defence policy contained in the White Paper issued on Thursday makes it plain that the aircraft and to a lesser extent the electronics industries face a future almost as lean as that which they endured during the postwar Hungry Forties. During the past five years, one-eighth of the output of the metal-using industries has been going into defence production and "an undue proportion of qualified scientists and engineers are engaged on military work." The reversing of this trend is bound to be painful, particularly since these industries have come to rely on their defence contracts to provide them with the flow of know-how and research that is needed for their civil projects. This is most obvious in the case of the aircraft industry, but it applies no less to electronics.

Not only will the cake be smaller, but there are indications that the traditional defence industries will be getting a smaller slice of this smaller cake. The emphasis on nuclear weapons of every shape and size, from H-bombs down to pocket-size atomic warheads for anti-aircraft missiles means that expenditure on research and production at the Atomic Energy Authority's weapons establishment at Aldermaston will be rising at the same time as it is contracting in other industries. The decision to build no more manned fighters or bombers beyond those already on the stocks does not automatically throw all the research and development work of the past three or four years into the waste-paper basket since the dividing line between the ultra-high speed fighter and the guided missile (which does not necessarily have to be rocket-shaped) is more apparent than real. But the diminishing size of the RAF gives notice to industry that even though the new defence plan provides for continued work on guided missiles in this country, if only to see that British industry has a nodding acquaintance with its new technology, the projects will be fewer and will be ordered in smaller numbers than they were in the past. "Some establishments," says the White Paper bleakly, "will have to be closed."

REORGANISING ELECTRICITY

Politics and Power

SELDOM can any minister have seemed at such pains to dissociate himself from what he was obliged to argue as was the Paymaster General this week in announcing the Government's surrender to the Tory backbenchers on the Electricity Bill. Mr Maudling had to say that for the reasons he himself had dismissed in the committee stage the Minister of Power had decided that the nationalised electricity industry should not be allowed to manufacture electrical plant if it felt that prices were fixed against it by private manufacturers; but only for research and development. The only new factor in the argument that has appeared since this clause was put into the bill is that a Monopolies Commission report has described in great detail just how manufacturers do exactly that; so Mr Maudling's apparent distaste for what he had to say was understandable.

This point in the Electricity Bill will probably never be an important one in practice; but the circumstances of the concession are vaguely repellent. It is convenient for the Government that the Tory backbench fuel and power group happens to be partly co-terminous with its extreme right-wing critics on foreign policy, and that it has before Parliament at the present time a bill for the reorganisation of a nationalised industry in which none of the people now responsible is really interested. Each time the Government has to clear up another part of the mess it has made of foreign policy, it is able to give a sop to the same group of critics in different hats by altering the Electricity Bill slightly more to their liking. It remains questionable, however, whether the number of changes that these gentlemen want to insert into the bill will last out the mistakes abroad that the Government has to repair; so the concessions on electricity need to be strictly rationed. This week the Government did not, as had been foreseen, insert into the bill the further meaningless concession that all electricity authorities should borrow capital without a Treasury guarantee. Is it saving this up as the Parliamentary price of surrendering to Nasser over payment of the Canal dues?

BUDGET BACKGROUND

The Exchequer Accounts

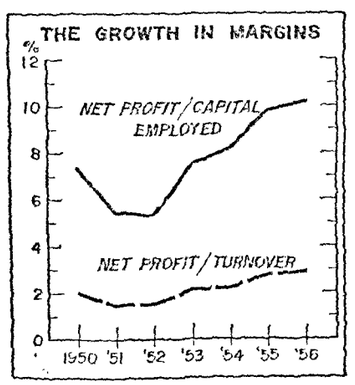
THE Exchequer returns for the budget year to the end of March show that, after the expected spurt in issues in the final week, the surplus of current revenue came out at £289.8 million. This was £107 million smaller than the surplus in 1955-56—though Mr Macmillan had budgeted for a substantial increase in the surplus, even before taking account of his promised "economies." Yet, as was suggested here last week, the out-turn is a good deal better than seemed likely a few months ago. In the below line accounts—which are not strictly part of the budget accounts at all since authority for the expenditures they represent is drawn from

Continued on page 66

Unilever's Growth

£4 PER CENT is a moderate yield. It is the yield offered by Unilever Limited's £1 ordinary stock at 87s. 6d. In buying the stock at that price or in refraining from taking profits on existing holdings, private and institutional investors look beyond the fat earnings cover and the progressive dividend record. They look for further growth in one of the largest trading empires in the world, an empire tied to the custom of the housewife. The latest increases in dividend from 15¾ to 17½ per cent for Limited and from 14 to 15½ per cent for NV have reinforced that confidence.

There are risks. As a user and a producer of raw materials for soap and fats, the Unilever dyarchy is best served by stable commodity prices. Violent fluctuations in them can bring sudden stock losses or gains. But the empire is so big that its directors can afford to say that a stock loss or profit of less than £1 million is not "material"—in the sense that they need not make any special transfer to or from reserves to take account of it. As a producer of margarines, fats, soaps, detergents and proprietary foods, Unilever Limited and Unilever NV trade in highly competitive markets, where advertising costs are high. But the two partners have the skill, the experience, the financial resources and the sheer size to meet any challenger on better than equal terms. Ultimately, then, the balance which investors have to strike is between the risk of world trade recession and the assumption that living standards will continue to improve.



Investors who prefer the expansionist view may take growth for granted, simply because such growth can be largely self-financed. In 1956 Unilever Limited and Unilever NV spent £37 million on fixed assets (against £28 million) and they expect to spend still more this year. Yet the group made no appeal to the capital market and is not likely to have to do so this year.

Last year the capital employed by the group went up by nearly £40 million to over £470½ million, liquid and near liquid assets rising by about £15½ million, partly on involuntary growth, for stocks were about £10 million less than they would have been had not the Middle Eastern crisis delayed the arrival of some raw materials and caused some forestalling purchases by consumers. To finance this growth, over £19 million was provided in depreciation and over £35 million by profit retentions.

By an improvement in stock control and in the employment of physical capital, the rate of return of net profits to capital employed rose last year from 9.8 to 10.2 per cent. The margin of net profits to turnover rose from 2.8 to 2.9 per cent. This is not a big return. But in a year in which Unilever's own economists estimate that world industrial output rose by 4 per cent, the group's turnover rose by 10.3 per cent—from £1,515 million to £1,671 million, including a rise in inter-group transactions from £394 million to £441 million. And the combined gross trading profits of the two partners rose by 15¼ per cent.

The increase in sales was fairly uniform both by product and by area. But the increase was most marked geographically in "Africa, the Middle East and Australasia," and in commenting on the trade of the United Africa Group in British West Africa the directors specifically say "gross margins tended to increase, except margins on textiles in Ghana." The directors also draw attention to "the success of the best quality margarines" and to the "remarkable headway" made by synthetic detergents (which make up about one third of Unilever's soap and detergent sales).

These are but a few facts gleaned from the mass of information which the Unilever report always provides. Some facts and figures, because commercial prudence so dictates, are missing, notably the profits earned (as opposed to the actual sales achieved, which are disclosed) in individual product groups. But shareholders will receive additional information during this year. The directors have decided to issue an interim announcement of turnover and profits for the first half of each year. They warn shareholders that, because of fluctuations in the prices of oils and fats, "six monthly figures can be particularly misleading for a business such as Unilever." Price fluctuations are usually "ironed out" over a full year, but in the half yearly figures where these fluctuations may have a more important (though perhaps only temporary) influence they intend to publish the amount of any stock reserve adjustments.

* Before taking account of "economies" estimated in budget speech at £20 mn.

is due partly to a shortfall of customs and excise revenues, but mainly to an unexpectedly large rise in expenditures. As can be seen from the table, this was spread fairly evenly over the three main constituents—interest on the national debt, defence expenditure and civil expenditure.

THE BANKING PICTURE

Accelerating Advances

ONE third of the remarkable increase in net personal saving estimated by the Economic Survey to have taken place in 1956 is attributed to a reduction in borrowings from three sources—building societies, hire purchase companies and the banks. This year, there are already indications that in each of these channels of finance the trend is turning upwards. The most striking visible change is in bank advances. The latest quarterly classification, for the three months to mid-February, showed the first upturn in borrowings by the personal and professional group and by hire purchase finance companies since the squeeze took effect. Now the figures of the clearing banks for their mid-March make-up show a further large expansion in advances to the private sector.

The banks' total advances rose in the four weeks to mid-March by £53 million, despite further repayments by the state boards of £17½ million. The increase of £70½ million in advances to all other borrowers follows a rise of no less than £97 million in the preceding (five-week) period. Admittedly, bank borrowing is seasonally high in the tax gathering weeks of the new year, and it seems that the expansion in the March period was partly attributable to special influences at the National Provincial (which was responsible for two-fifths of the aggregate increase in advances). But allowing for all these factors there seems still to have been an underlying expansion. Much of the new credit has gone to the "essential" industries producing for export; but while there has been no conscious departure from the principles of the squeeze on other borrowers, there is little doubt that these have been able, for one reason or another, to get more bank accommodation.

Whatever the exact force at present of the squeeze by official request, the banks face a growing pressure for restraint from commercial considerations of liquidity.

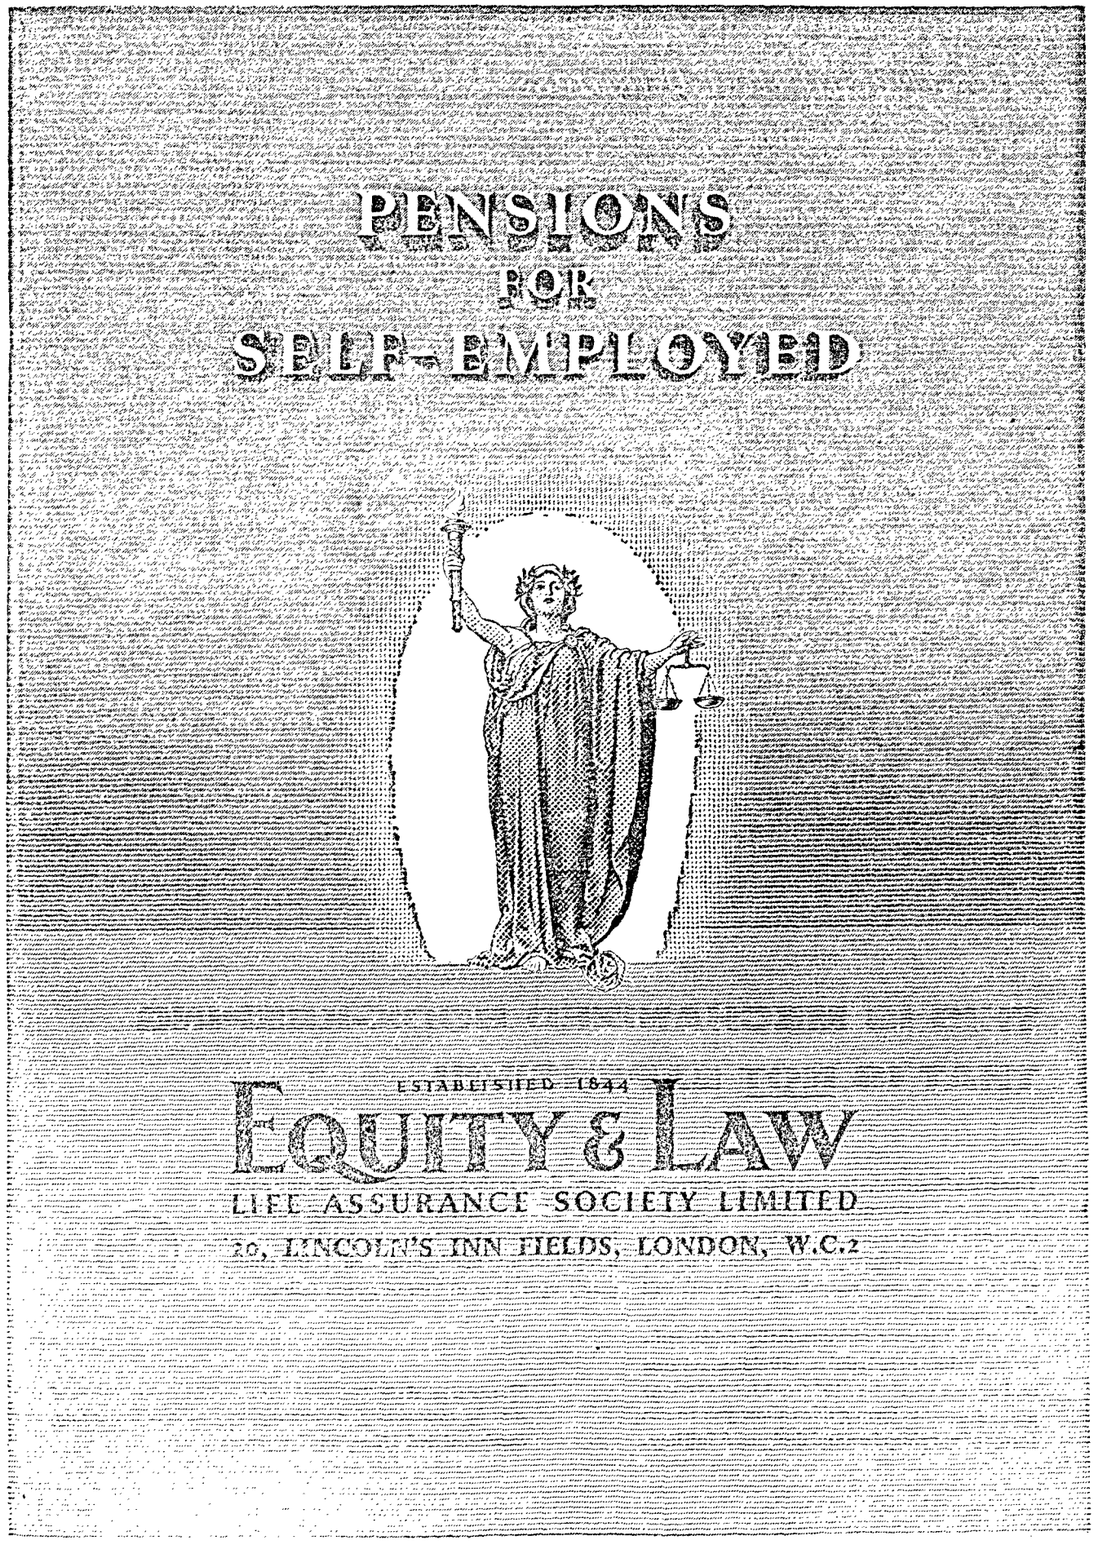
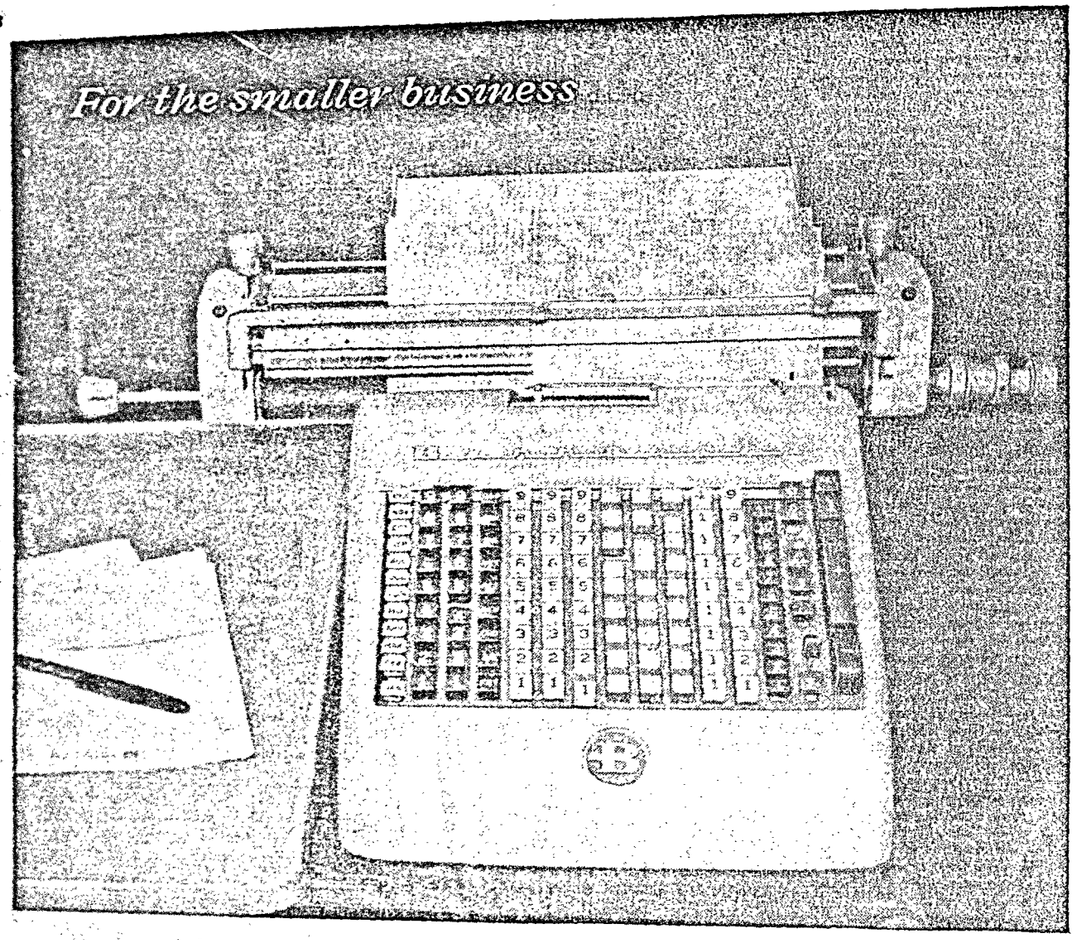
* After deducting items in course of collection. † Ratio of assets to published deposits.



Holdings of liquid assets were run down further between February and March, as the Treasury was repaying bills from its surplus of revenue, and in conjunction with the rise in advances this induced two of the Big Five banks—the National Provincial and Lloyds—to sell nearly £8 million each of investments. The aggregate decline in portfolios was £18 million, reversing the greater part of the purchases made in the first seven weeks of the year—primarily by the Midland and Barclays. But the average liquidity ratio dropped a full point, to 32.6 per cent, and that at Lloyds dipped fractionally below the conventional minimum of 30 per cent.



TRADE WITH AUSTRALIA

Canberra Opens the Door

WHILE some members of the sterling area are tightening up on imports others are relaxing restrictions. Last month South Africa took a further step towards the removal of import controls; this week Australia announced an increase of import licences of £A75 million a year, starting on April 1st. This increase (the economic background of which was described on page 1098 of *The Economist* of last week) raises the permitted level of imports to £A775 million in the year beginning July 1st and follows an increase of £A30 million a year on January 1st. Full details are not yet available.

Licences for industrial materials and equipment, which come under the administrative and "A" categories, are increased by about £A30 million a year. Licences for consumer goods, which hitherto have borne the brunt of the restrictions, are eased considerably. Licences for consumer items in category A are increased by about £A10 million a year, or by 20 per cent; they include washing

THIS IS MECHANIZED BOOK-KEEPING
THAT IS NOT EXPENSIVE!

This is the Burroughs Director 600, an extremely versatile accounting machine, especially designed for the small and medium sized business. Sales, purchase, and general ledgers, stock records, cost records, payroll—it will do them all!

The Director automatically adds, subtracts, prints in red, dates, tabulates, returns and spaces correctly; 15" front feed carriage and adjustable form guides allow you to use forms of varying sizes and designs. A full keyboard date makes rapid date changing easy. Listing key, combined with a short-cut keyboard, enables you to convert a Director to a rapid adding machine as well. Hand emergency operation in case of power failure.

Burroughs *The most experienced manufacturers of Adding, Calculating, Accounting, Typewriter-Accounting, Statistical and Microfilm Equipment*

BURROUGHS ADDING MACHINE LIMITED, AVON HOUSE, 356-366 OXFORD STREET, LONDON, W.1

machines, refrigerators, carpets, linoleum, whisky and pottery.

Licences for items in category B are increased by about £A20 million a year, or by 66 per cent; they include cotton, rayon and wool piece goods, clothing, toys and sporting goods and certain metal manufactures and appliances and glassware. Imports of paper in this category are transferred to category A, and are increased by 10 per cent. Licences are once more transferable among all goods in category B and the sub-categories are abolished. These relaxations together equal £A60 million a year; it is not yet clear on what goods the remaining £A15 million will be spent. Imports of unassembled and assembled motor vehicles are unchanged; a statement will be made when the government has completed a review of imports of motor vehicles and of the needs arising from projected developments in local manufacture and assembly. A further extension of the licencing period, which was increased from three to four months on April 1st, will be considered in November.

COSTS OF FLYING

Dearer Air Fares

THE international airlines are taking emergency action to raise their fares by five per cent this summer on flights to Europe and across the North Atlantic. This is a case of the operators becoming snarled up in their own rate-fixing procedure. They would not normally consider making fare changes before September, the date when ironically enough they are due to iron out the last details of the new third-class Atlantic fares to be introduced in

Mr Bentley Wins at Halifax

SMOKY grey fog hung over Halifax, with grey chimneys and grey hills peeping through the murk. Inside the Victoria Hall a grey cloud of tobacco smoke hung over the drab stalls and galleries and grey suits and dresses of the patient voters. Golden mayoral chains on the platform and an occasional bright red hat in the pit stalls shone through the haze. Beneath Mr Fred Bentley's silver grey head a broad smile developed; he was home by eight votes. The very arithmetic of Mr Bentley's election was exciting. He was the third and last of the successful candidates for the Halifax Building Society's board. First came Mr Currer Briggs with 1,330, then Mr Cowan Douglas 1,298; Mr Bentley scored 1,255 and Mr Roger Tolson, the vice president and only loser, 1,247. The number of imported voters—employees, agents, and surveyors—brought into Halifax for conferences on that auspicious first of April was 740; the President, Mr Algernon Denham, let drop this figure while hotly denying a still higher one. They did not necessarily all vote the board's ticket, but it is a fair guess that among those who reached the meeting under their own steam, the preference for Mr Bentley was more decided than the voting figures show.

It was a needle contest with the issue always in doubt. Most of the support for Mr Bentley was effective, but some of it came close to ruining his chances, while another few minutes of dissertation from the President on his dispute with the Building Societies Association could have put Mr Bentley to the top of the poll; the master in building society techniques was for once right off form. But it was a well mannered, well conducted meeting of lower middle-class Yorkshire men and women who had stood some hours of discomfort and would tolerate anything short of boredom. It applauded the Archdeacon of Halifax when he called Mr Bentley "a man of Halifax, honoured by many for his services to the community." It applauded Miss Hilda Smith, the daughter of a former general manager and director, when she declared: "The directors are our servants, not our masters." And impartially it clapped Mr Denham for promising that the annual meeting of the Halifax would never be held in London. But slow clapping and stamping speeded the long speeches of Mr Warbreck-Howell in favour of Mr Bentley, and of Mr Denham himself.

The main issues inevitably were of personality and personal conduct. Mr Bentley showed just how he felt when he pleaded guilty to an outburst in the boardroom in 1955. He could not, he said, recall an occasion when any recommendation he had made as general manager had been accepted by the board unless he had got the president's approval before entering the board room. The charges and counter charges were distasteful. Mr Denham alleged that there was an interval of several days between a decision of the council of the Building Societies Association not to put a ceiling on investment of limited company money and the receipt of the letter informing the Halifax board of the fact. Mr Bentley was both vice-chairman of the association and general manager of the Halifax at the time; the implication is that he delayed telling his board. A counter charge by Mr Bentley, not denied by Mr Denham, related to a visit by Mr Denham and Mr Tolson behind Mr Bentley's back to the vice-chairman of the association, Mr Meikle, who is general manager of the Woolwich Equitable Society, to explain the Halifax board's attitude to Mr Bentley's candidature. It may have been odd for a non-member society to approach the vice-chairman of the Building Societies Association about the composition of its own board, but there is no evidence that it gave offence to Mr Meikle.

One singular incident at the Halifax meeting was the intervention of Mr Hubert Newton, who spoke as a member of the Halifax society, though he is better known as general manager of the Leek and Moorlands society and a past chairman of the Building Societies Association. He made the point, since underlined by the Association in a public statement, that the big investments of company money, which were one of the elements in Mr Denham's quarrel with the association, do not, on the figures now published, form an important part of building society liabilities.

So after three hours' debate, Mr Bentley, whose stature in the building society movement is high, was put on the Halifax board, and Mr Tolson, a wool spinner of distinction, was put off. It would be pleasant to think, now the votes have been cast, that the quarrel could be forgotten and the Halifax could resume its great influence in the association and the movement. That clearly was Mr Bentley's hope, but unfortunately it does not follow yet. Mr Bentley, as he warned members, still needs the concurrence of the trustees of the Halifax pension fund before he can take his seat. Then he, though chairman of the association, will be a single director of a non-member society, whose board is apparently still at loggerheads with the association. The outcome of the grievous Halifax affair has still to be revealed. Much depends on whether Mr Denham can make his next move a constructive one.

the spring of 1958. But rising costs have forced at least some operators into the position where they cannot face the summer at present fares and each operator is therefore applying to its respective government for permission to allow a surcharge of 5 per cent to be made on existing rates.

If these charges are to be made from May 1st, as the operators want, governments will have to move more quickly than they are accustomed to do. The ponderous *gavotte performed* by the airlines each time they negotiate a basic change in rates arises from the need to get approval of the change from the government of each interested airline. The process of getting—sometimes forcing—unanimous agreement from a group of operators whose views differ radically, getting government approval to those changes, and finally putting the new rates into operation can take anything from one to two years. By the time the new third-class fares come into force, with their spartan standards of comfort, passengers may well find that they are paying almost as much for their ticket as they did for the old tourist services a few years before.

The airlines are caught temporarily in a period of rising costs, particularly for fuel, wages and replacements, when the new aircraft that might counter-balance these increases are still some way off. They cannot expect much help from rising traffic, since summer services both in Europe and the North Atlantic are already flown almost booked to capacity. But fortunes vary markedly between different operators, and they would gain more sympathy in their search for higher fares if the surcharge was made optional rather than mandatory on all international operators. Just because this is an emergency procedure, and the sum involved is small, such a clause might have been acceptable to governments. It would have given the airlines an opportunity to give practical expression to the repeated assertions that their rate-fixing body, the International Air Transport Association, is not a rate-fixing cartel.

CITY TRAFFIC

Congestion in Prospect

IN a few weeks petrol rationing will begin to ease, and traffic congestion can be expected to clog up the streets of British cities again. The enforced switch from private to public transport probably reached its peak at the end of January, when the volume of private traffic in inner London was about a third below normal and London Transport was carrying about 9 per cent more passengers. Already there have been noticeable signs of a drift back towards "normal."

Fuel rationing was certainly an effective short-term cure for the problem of urban congestion—at least on the streets. But no one could seriously suggest this as a permanent solution, nor would an administrative ban on private transport in city centres be more workable or acceptable. Even Sir John Elliott, who opened up a vigorous poster campaign "on behalf of" his nine million customers against any attitude of hopeless resignation to the return of chaos, would be unlikely to argue for either of these extreme measures. Equally it would be silly to imagine, as some pundits have done, that radical measures could have been implemented in the short period of relief offered by rationing, though Mr Watkinson claims that the police and others have learnt some new lessons which they will now be able to adopt. The roots of the problem are too deeply embedded for any quick cuts; the growth of traffic has been outstripping the capacity of central urban streets for decades. The only sane policy will need time and patience; it will involve parking meters and more off-street parking lots in the centre of cities and on the inner fringes near bus and tube termini to get rid of the principal villain—the street parker, of whom there were more than 40,000 in London before rationing—and then, when the real dimensions of the inadequacy of present street capacity can be better seen, a start might be made on cutting a few new expensive highways planned in the light of adequate intelligence of where moving traffic really wants to go. This, broadly but slowly, seems to be the present direction of official policy.

There is another side to the coin, however. Though the end of rationing and the return of congestion in full summer bloom may lose London Transport and other public urban transport operators much of their windfall gain in business, they will still have to wrestle with the dislocation that clogged-up streets cause to their running times and with the concentrated surges of peak hour loads. London Transport has given its squad of bus movement controllers out in the field a stronger brief and has armed them with roadside telephones and a super-controller at the centre, in a further attempt to secure the best running traffic conditions may permit.

HIRE PURCHASE

Boomlet but No Bill

THERE is not after all to be a Hire Purchase Bill this session. Sir David Eccles made the announcement last week, and it will come as no surprise to the hire purchase finance houses, for they knew that the Government's intentions had already received several draftings and were making heavy weather. There is widespread agreement that some regulation of the terms on which hire purchase finance houses may raise deposits by public advertisement would improve the investment status of the good houses; but there is no agreement that some such formula as: capital plus free reserves times X equals the maximum

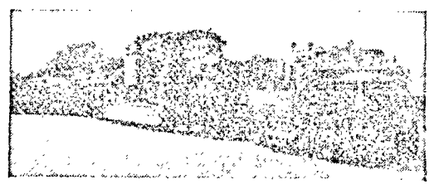
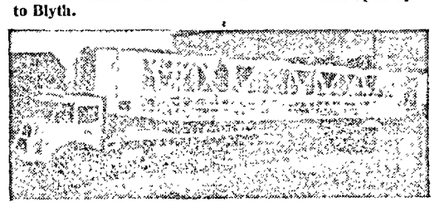
How adaptable is YOUR transport?

Even in this period of fuel rationing, BRITISH ROAD SERVICES remain eager to investigate and advise you on your new or difficult transport problems.



TO BE OUTSTANDING in the field of road haulage, a transport service must be flexible. It must be able to adapt itself to your individual needs. To provide the vehicles best suited to your loads. To carry out the smallest, most routine assignments, or to satisfy the biggest, most difficult demands. And it must provide punctuality, speed and reliability. All these requirements are met by British Road Services.

Further, during this difficult time of fuel rationing, British Road Services are endeavouring in every way to adapt themselves to serving your interests, and the interests of the Nation, as befits the largest and *most adaptable road haulage operator in the British Isles.*



The facts. Consider for yourself these facts: British Road Services are a nationwide organization with vast, widespread resources. They are staffed with experienced, enthusiastic men and sound administrators. At the present time, they are working in close collaboration with British Railways who are handling, on their behalf, the long distance hauls which can no longer be covered by direct road services.

Furthermore, their round-the-clock skilled engineering service keeps the large B.R.S. fleet in the most economical running condition. And with the help of their teleprinter network, B.R.S. can rapidly transmit their traffic plans down to the last careful detail — thus avoiding waste of time, money and resources. *Your time and your money, too.*

Economical methods. Sound knowledge and careful planning result not only in good transport, but also in economies to you. B.R.S. are eager to advise you on improved handling techniques, new types of vehicles, and new ideas in transport. Constant research keeps B.R.S. thoroughly up-to-date. Just telephone your local man. Action will follow immediately.

Pickfords heavy haulage vehicles are renowned for their adaptability in moving indivisible loads. This example shows a 165-ton transformer en route from Newcastle upon Tyne to Blyth.

This illustration shows how a B.R.S. general haulage branch carried a light but lengthy girder from Radley to Wales by adapting a normal vehicle for this special journey.

British Road Services Ltd

ing momentum. The total contracts registered for all items by HP Information for March was a record at 98,465 compared with 75,380 in February and 55,201 in March last year. The figures for motor cycles are swelled by a rapidly developing trade in the hire purchase of motor scooters.

COTTON EXPORTS

Lancashire in Fourth Place

BRITISH exports of cotton piece goods fell last year for the fifth year in succession and Britain dropped from third to fourth place among the world's exporters. Its total of 474 million square yards was 15 per cent lower than in 1955; in only one peacetime year—1945—when Lancashire was struggling to recover from the wartime concentration scheme, has the total been lower. The heaviest fall in Lancashire's exports was to Australia (where import restrictions were much to blame) and to the African markets. The record was not entirely gloomy; shipments to several

EXPORTS OF COTTON PIECE GOODS
(million square yards)

	1936–38 average	1953	1954	1955	1956
Japan	2,511	914	1,278	1,139	1,262
India*	203	655	861	749	740
United States	252	628	613	552	520
Britain	1,719	709	637	555	474
Other Western Europe	1,366	1,521	1,566	1,420	1,320
All countries	6,010	4,810	5,420	4,950	4,990

* Million yards.

Asian countries were higher than in 1955 and there was a recovery in shipments to North America. Of the major exporters only Japan sold more cotton piece goods than in the previous year, its shipments rising by 11 per cent to 1,262 million square yards. India's shipments were almost as high as in 1955, at 740 million square yards, and shipments by the United States fell by six per cent to 520 million; exports from both these countries remained much higher than before the war. Shipments from all countries last year are provisionally estimated by the Cotton Board at 4,990 million square yards, one per cent higher than in 1955.

COMPUTERS IN ACTION

Electronics on the Rates

THE Norwich City Corporation has stolen a march on many a bigger and wealthier local authority by becoming the first City Hall in the world to turn over its accounting and book-keeping operations to an electronic computer. On Wednesday, the Lord Mayor took formal delivery of a computer and its ancillary equipment manufactured and more or less tailored to Norwich's requirements by Elliott Brothers and referred to as "Fred, the Fiendishly Rapid Electronic Device." The total installation, with its magnetic film for storing information, its calculating units, its punched tape for feeding data in and out of the system and its electric automatic typewriters for printing the final results, is costing the Corporation nearly £40,000. The annual saving was at first estimated at £8,000, but a closer survey carried out by the Corporation's own methods division suggests that it may now be nearer £15,000 a year, or 10 per cent of the council's total administrative costs.

The first job prepared for the computer has been the half-yearly rate demands for the 30,000 properties in the municipality. It will start immediately on calculating and printing the demands, and thereafter will keep automatic account of payments as they come in, some of them in weekly instalments of a few shillings a time, making allowances for sale of the properties and any other factor that would alter the original statement. It will then be extended to deal with the wages of 2,000 corporation staff, water rates, day-to-day cost accounting, and the loans and credits of the Corporation, including repayments of interest and principal. It takes time to prepare data in a form that suits a computer but the great advantage of this or any other computer accounting system is that once this hurdle has been overcome, the system itself thereafter makes all the necessary adjustments and allowances needed to deal with changing circumstances, and ferrets out automatically all the information from its own internal store. The Norwich installation, with four clerks feeding information on punched tape, and two trained "programmers" to prepare the work, frees 20 experienced clerks for work in other departments and disposes of a battery of punch card equipment.

COBALT

Developing New Markets

PRODUCERS of cobalt, a metal widely used in industry, are facing the prospect of surplus for the first time since the war. The years of scarcity discouraged research into new uses, and substitutes for cobalt in some applications were found. Though world consumption is still growing, production is growing faster, reaching about 15,000 short tons last year. To stimulate consumption producers have cut the price and are jointly sponsoring research into new uses. The spot price, after remaining steady for three years, was reduced on December 1st by 2s. to 19s. a lb, delivered United Kingdom, and reduced again to 16s. a lb on February 1st. (A large part of world supplies are sold under contract at slightly less than the spot price.) Research, and the publication of papers on cobalt, will be undertaken by the Cobalt Development Institute that was recently set up in Brussels.

The initiative in both moves was taken by Union Minière du Haut Katanga, the Belgian Congo producer which accounts for about two-thirds of world production and sets the world price. Membership of the institute includes the two Rhodesian producers, Rhokana Corporation and Rhodesian Selection Trust. The production of Rhokana,

"Motor Business"

The March issue of this quarterly research bulletin for the motor and allied industries is now available and includes:

The long-term growth in domestic commercial vehicle demand.
Prospects for buses and coaches.
The Swiss market for vehicles and tractors.
Notes on the Russian motor industry.

The Bulletin is fully illustrated by charts, amongst which are:

Price indices of used vehicles.
World exports of vehicles.

For full particulars of this Bulletin, apply to:

THE ECONOMIST INTELLIGENCE UNIT LIMITED
22, Ryder Street, St. James's, London, S.W.1.
WHitehall 1511. Ext. 49.

now amounting to about 1,200 short tons a year, covers Britain's requirements; RST's interest comes from its new Chibuluma copper-cobalt mine. Cobalt's fastest growing market, however, which now accounts for roughly a third of total consumption, is in high-temperature alloys for jet engines and guided missiles.

PETROL SUPPLIES

No Peace for the Pump

ALTHOUGH the government has not yet removed the shilling increase in petrol duty, many dealers have apparently decided to take no chances and have started to reduce their stocks to minimum working levels in order to keep their losses down when the extra shilling is removed or reduced, even though they may be caught out by any sharp upsurge in motoring at the start of the new rationing period. They may also soon stand to lose the increase in dealers' margins—1½d. a gallon—on any petrol they happen to have in hand. This was imposed in two stages, in December and last month, to compensate them for their smaller throughputs during rationing. But there will be no case for keeping the whole of this increase in the new rationing period. Petrol sales through pumps then are likely to be on average not more than 20 per cent below normal whereas the extra 1½d. added about a third to their margins, bringing them to a little over 7d., on average, for each gallon.

The easing of petrol supplies in the next few months will also almost certainly usher in a new, and even more furious, stage in the war over tied garages. This controversy has been somewhat submerged by the fuel shortage and there was an informal agreement by the oil companies to limit their efforts at seeking new customers while rationing lasted. But it seems that this has not prevented some suppliers taking advantage of any financial strains among dealers to offer them new inducements for agreeing to give exclusive sale or exclusive display of their petrol and lubricating oils. About 92 per cent of all garages are now associated with or owned by oil companies, and as the remaining 8 per cent are probably determined individualists no matter what inducements are offered, the oil companies will be concentrating their efforts on getting as many of this 92 per cent as they can and getting them on long term contracts.

TOBACCO

Fighting for Smokers

FOR the first time since the early thirties competition has now become really intense in the tobacco industry, and there is strong chance that the industry may be entering a period of some interesting shifts in fortunes for many companies. The first sign of these new conditions came about two years ago when imports of tobacco leaf first matched the postwar level of demand. Consumption rose sharply at first, but the increase in the tobacco duty a year ago appears to have put an effective brake on that. Then the Restrictive Trade Practices Act last summer swept away some of the industry's self-imposed shackles on competition—which a few of the smaller concerns had already been putting under some strain. And now, perhaps rather ironically, the Monopolies Commission is starting to investigate the industry as a possible "single firm" monopoly—just when the industry's colossus, Imperial Tobacco, is itself feeling the pinch of competition.

Total spending on cigarettes and tobacco in 1956 rose by some six per cent to a record £935 million. This was the biggest annual increase since 1948, but because of the 5 per cent rise in duty and some price increases, the increase in real consumption was the smallest for six years. The volume of smoking actually fell after the budget, but over the whole year it rose by just over one per cent to about 250 million lb—which was still a good five per cent below 1946, before the Dalton increase in tobacco duties. This halt in the growth of smoking appears to have taken even the Exchequer by surprise; total receipts from the duties are likely to have fallen short of the £707 million estimate and may have set the Chancellor wondering whether there might now be some substance in the industry's perennial argument about diminishing returns.

The increase in duty and the vigour of competition took a slice off Imperial's turnover in the second half of last year. Any reduction in that company's share of the home market, probably still more than three-fourths (it leaves the export market to British-American Tobacco), might be fairly welcome. But it is difficult to say yet which of the other firms and brands have been gaining. No doubt Gallaher, with its highly successful Senior Service brand among others, has acquired new strength, but its report has yet to come out. Carreras, on the other hand, has only with difficulty been able to maintain its relative position, and the other medium-sized firm in the industry, Godfrey Phillips, has also not yet reported.

Amongst the smallest companies, a number of which have been in the red for several years, competition has become desperate. Gift coupon trading has brought some immediate gains for some. Kensitas, which is owned by J. Wix and which led the field in this form of selling before 1934 when the practice was dropped by agreement, with compensation, claims to have expanded its sales more than ten-fold since December and to have earned more than the scheme has cost.

SHORTER NOTES

The total of share and deposit investments over £5,000 in the Bradford Permanent Building Society was incorrectly shown in the table on page 1106 of *The Economist* last week as £11,134,000. The correct figure is £1,134,000.

* * *

At the time Crosse and Blackwell announced a one for five rights issue at 30s. per ordinary share, its existing shares stood at 38s. 6d. and not at 58s. 6d. as stated in these columns last week.

* * *

Mr L. P. Jackson, the chairman of Gordon Hotels, has announced the results of the polls taken at the company's recent extraordinary meeting. All eight resolutions put forward by the shareholders committee to remove Mr Jackson and three of his co-directors from the board and to appoint others were defeated. The majorities in favour of the sitting board were in each case small. The resolution to remove Mr Jackson was defeated on a poll by 624,588 votes against 582,322 votes.

Overheard in the bar of the Royal Court Theatre Club.

"Now my wife swears by the News Chronicle"

"So do millions of other people. They like it because it's different from any other popular daily."

"In what way?"

"Well, it treats its readers as adults to start with. It assumes that they like to make up their minds without having other people's opinions forced on them. Whatever the event the News Chronicle reports it objectively. Whatever the controversy, the News Chronicle weighs up the pros and cons and encourages its readers to think for themselves. That is why it is the most influential of all popular dailies."

"But what sort of people does it influence?"

"The more intelligent sections of the community, irrespective of class or income group. For the News Chronicle has a readership of over 5 million you know, so its readers must be a pretty good cross-section of all walks of life. They're the sort of people who appreciate worthwhile things—good music, good books, good drama—in fact, I bet there were quite a few News Chronicle readers in the audience tonight. One great advantage of advertising to such people is this. They have the nous to recognize good value."

And if you wish to find out how economical it is to advertise in the News Chronicle just ring William Memory, Advertisement Director, FLEET STREET 5000

NEWS CHRONICLE
AND DAILY DISPATCH

COMPANY AFFAIRS

ASSOCIATED ELECTRICAL

DISCUSSING the fall from £15.3 million to £10.3 million in the profits of Associated Electrical Industries last year Lord Chandos told shareholderes on Wednesday that he did not think that 1956 "will prove a reliable guide to the potential earning capacity of the group when the results of our capital expansion and reorganisation begin to take effect." Among the reasons he enumerated for the fall in profits were:

(1) An increase in wages and a consequent reduction in margins, especially on exports.

(2) A sharp fall in the demand for such products as valves and cathode ray tubes which coincided with a reorganisation of production.

(3) Reduced margins on lamps, again occurring when production and sales were being rationalised.

Looking ahead, Lord Chandos drew attention to the "unusually large influx of orders" since the turn of the year and to the contribution to earnings the new factories which AEI was building last year will begin to make in the latter months of the current year. Looking still further ahead, he believe that the electrical industry will about double in size in the next ten years.

REYROLLE

WHEN an unexpected piece of news comes over the Stock Exchange "ticker," the jobbers, with a sharp glance at the state of their books, have to act quickly. The composition of their books may force them to act illogically. Is that what happened when Reyrolle's abrupt decline in profits was announced? After this news the company's £1 ordinary stock units fell from 112s. to 101s. before recovering to 105s.

The facts on which investors and dealers had to come to an opinion were meagre. The final ordinary dividend (payable on the capital as increased by the rights issue of 1,526,470 shares at 70s. each) was raised from 10 to 11 per cent. Thus the full year's dividend was increased from 16½ to 17½ per cent, the minimum rate within the range of market expectations. This increase did nothing to soften the shock of the fall in earnings. After tax of £1,303,353, the net profit for the year to December 31st was £1,259,920; in 1955, after tax of £1,690,587, the net profit was £1,986,296, but this figure included a surplus of £232,372 arising from a revision of the basis for valuing work in progress. On this showing, gross profits appear to have fallen by about 24 per cent.

Reyrolle's stock has been brought down to an exiguous yield as a growth stock in the atomic power field. Expected growth of this kind takes time to come to maturity and investors who took up the stock did so with the prospects of five years ahead rather than with current trends in profits in mind. Hence the optimists might say: take the long view, ignore this setback, and note that, though the dividend cover has been reduced, it is still ample. But Reyrolle's results may suggest to the more cautious that rising costs even in so fully occupied an industry as electrical manufacturing can seriously influence the size of the fruit that a growing tree bears. At the newly established price of 105s. the Reyrolle stock yields 3.4 per cent. That may be more realistic.

DISTILLERS' CAPITAL PROPOSALS

LARGE groups with interlocking subsidiaries often find it advantageous to tidy up their capital structures. The Beecham Group and Bowater Paper have both done so and now Distillers has issued details of its scheme to convert the preference shares of its subsidiaries into an undated 5½ per cent consolidated unsecured loan stock of the parent company. On a maximum conversion £9,910,870 of the new stock would be issued; no minimum proportion of acceptances is laid down; but the directors of the subsidiary companies recommend shareholders to accept. The new loan stock is redeemable by purchase up to a price of £110.

The details of the conversion are set down in the accompanying table. Shareholders gain in income and cash payments are to be made where these are necessary to cover accrued dividends on the existing preference stocks. The terms have been fixed by reference to the market prices of the shares and to the

Per £100 of preference	New 5½% loan stock	New income	Maximum of new stock
	£	£ s. d.	£
Booth's Distilleries 5%	100	5 10 0	168,250
Booth's Distilleries 6%	120	6 12 0	566,230
Booth's Distilleries 6½%	125	6 17 6	3,683
Buchanan-Dewar 6%	115	6 6 6	2,272,226
Buchanan-Dewar 7½%	142½	7 16 9	3,210,621
James Buchanan 6%	115	6 6 6	709,962
John Dewar 6%	115	6 6 6	262,694
John Haig 5%	100	5 10 0	29,880
Manchester Chemical 6%	115	6 6 6	11,229
United Yeast 6%	115	6 6 6	56,914
John Walker 7%	135	7 8 6	1,924,454
White Horse Distillers 7½%	142½	7 16 9	695,727

rights of the different classes of holders. The choice of an unsecured loan stock of the parent company (covered about six times by assets and about 22 times by earnings) as the method of exchange should ensure that there is no dilution of the security now attached to the preference shares.

The method should also save the Distillers group profits tax. But this is not the primary object of the scheme. Rather this object is to make more easy (and less costly because it will save stamp duty) transfers of assets and shares between subsidiaries within the group. The scheme, which has been planned for some time, will tidy up the capital of the group and may in the end tidy up its administration too. Similarly, another large group, Turner and Newall, has set in train a reorganisation of the share capital and administration of its subsidiaries.

Most of the outstanding preference shares are held by the public. A few are held by investment trusts and some more by composite insurance offices. Dividends on any of the preference shares held by investment trusts rank as "franked" income; these trusts are likely to lose a little on the exchange. Nor do the composite insurance offices welcome a change from "franked" to "unfranked" income. But these holders form a tiny minority. The scheme should commend itself to the bulk of shareholders.

DE HAVILLAND

THE decision to restore the de Havilland ordinary dividend to 7½ per cent, at which it stood before the Comet disasters, gave a fillip to the company's £1 stock units. Confidence should gain further strength from the full report and the cautious but not unhopeful tone of the statement by the chairman, Mr W. E. Nixon.

The increase in the dividend from 5 to 7½ per cent (absorbing £378,246 net) followed an advance in net profits from £958,575 to £1,659,238 and in gross profits from £3,923,232 to £5,558,121. Most of the divisions of the group had a successful year, but the chairman says: "It is especially gratifying to report that a large part of the additional profit is attributable to the Canadian company." The group was able to finance a growth in its physical and working capital without difficulty and it should not find it too exacting to provide the money for its further commitments (estimated at September 30th at nearly £2 million).

Two comments by Mr Nixon point to the future plans of de Havilland. He says: "Against the possible curtailment of military work there is no doubt that there are great opportunities in the expanding civil market" and the flight of the new Comet prototypes he claims as "a sound start to our plans for recovering our position in the jet transport field."

The company appears able at least to maintain the dividend at 7½ per cent (which gives a yield of 6⅝ per cent with the £1 stock units at 23s. 6d.). Indeed the directors in deciding upon the latest dividend gave specific attention to "the present uncertainty of the industry" and the need to "conserve financial resources."

VAUXHALL MOTORS

ALL the ordinary shares of Vauxhall Motors are owned by General Motors of the United States. There is no British interest in the equity. But Vauxhall is one of the Big Three of the British motor industry and it is instructive to compare its results with those of Ford Motor Company. Both companies work to the calendar year.

Last year Vauxhall's gross profits fell by 41 per cent and Ford's by 44 per cent. In value Vauxhall's sales fell by 5 per cent and Ford's by 4 per cent. The number of vehicles sold by Vauxhall fell by 13 per cent and the number sold by Ford by 8½ per cent. The decline in Vauxhall's volume of sales was sharper in motor cars than in commercial vehicles. Vauxhall's margin remained higher than Ford's; Vauxhall's margin came down from 14.4 per cent to 9.0 per cent and Ford's from 11.8 to 6.8 per cent. On the average the selling price and the profit earned on each Vauxhall vehicle remained higher than the price and profit per Ford vehicle; one reason for this may be that a bigger proportion of Vauxhall's output is commercial vehicles. Both companies in 1956 earned on the average a smaller profit on vehicles fetching higher prices. One final comparison can be made: last year Ford spent about £14 million on fixed assets while Vauxhall spent about £17 million towards its five-year development programme, which the directors say "will now be substantially completed by June."

Sales and earnings:	1955 £'000	1956 £'000
Sales	75,113	71,293
Gross profit	10,825	6,386
Taxation	4,282	2,452

Vehicles sold	142,149	123,643
	£	£
Sales value per vehicle	529	576
Gross profit per vehicle	76	51½
	%	%
Gross profit/sales	14·4	9·0

MURPHY RADIO

THE results of Murphy Radio for the year to December 31st are reassuring. Last year the domestic sales of radio and television sets fell sharply, though exports went up. In December, the chairman of Murphy Radio, Mr E. J. Power, revealed that in 1956 the company's exports of broadcast receivers were nearly as many as the output of television receivers. Success in overseas markets, coupled with a contribution from the electronics division, is likely therefore to be the reason for the rise in the company's gross profits from £502,421 to £544,524.

Taxation has also gone up, from £275,190 to £311,817, and as a result net profits show a small decline, from £244,375 to £235,555. Hence it is not surprising that the directors, with a programme of expansion in train this year, have left the ordinary dividend at 20 per cent (absorbing £104,650 net). The 5s. ordinary shares rose 6d. to 14s. 3d. after the preliminary announcement and yield 7 per cent.

EMI and THORN

SOME of the radio and television manufacturers took a hard knock in the home market last year and competition between them is strong. Electric and Musical Industries was one of the companies whose profits were adversely affected by the fall in sales and its directors set in train a reorganisation of its production facilities. Now comes the news that EMI and Thorn Electrical Industries are to merge their domestic interests in radio and television receivers in a new jointly owned company. Mr Jules Thorn, the chairman of Thorn Electrical, will become the chairman of the new company.

The new company will be responsible for the design and marketing of all receivers under the Ferguson, HMV and Marconiphone trade marks. Production will be largely concentrated at the Thorn factories, so that EMI, though it will probably continue to produce certain components, will almost cease to manufacture radio and television sets. The aim is to secure manufacturing economies.

London Stock Exchange

FIRST DEALINGS:	Mar. 27	Apr. 10	May 1
LAST DEALINGS:	Apr. 9	Apr. 30	May 14
ACCOUNT DAY:	Apr. 16	May 7	May 21

THE vote for a resumption of work in the shipbuilding and engineering industries prompted a recovery in industrial stocks on Tuesday, which eliminated earlier losses and brought a further small advance in The Economist indicator of 2 points to 206.9. Although gilt-edged securities recovered at the same time, earlier losses were not fully recouped and the rally petered out on Wednesday.

Take-over rumours caused some sharp rises among brewery shares, Taylor Walker jumping 6s. to 33s. before receding after the board's denial. Henekey's advanced 3s. to 12s. and Young and Co. "A" gained 3s. 9d. to 41s. 3d. W. Barratt rose 25s. to 80s. before reacting to 72s. 6d. Its proposed rights and scrip issues were announced on Wednesday. Other stores were firm, but Currys eased in spite of the increased dividend. Cinema shares were again slightly higher. Glaxo gained 2s. to 32s. helped by the higher interim, while Borax rose 1s. 9d. to 25s. 1½d. Rising retail sales and the continued expansion in hire-purchase sales of motors assisted the upward movement in manufacturing shares and finance houses rose further. Bowmaker gained 1s. 9d. to 19s. 9d. and United Dominions Trust 3s. to 88s. Shipbuilding and engineering shares were little changed on balance. Turner and Newall rose on the reorganisation plan.

Oil shares developed a minor boom this week; Burmah gained 6s. to 104s. 9d., Apex (Trinidad) rose 4s., British-Borneo 5s. 6d., Canadian Eagle, regd. 4s. 9d., Shell Trinidad 12s. 6d., Trinidad Central 3s. 6d. and Ultramar 3s. 1½d. Kaffirs were often higher following the monthly returns, Hartebeestfontein gaining 1s. to 47s. 4½d. on balance. Coppers hardened, Rhokana improving 1⅜ to 38½ xd. Consolidated Zinc rose 3s. 6d. to a new peak of 89s. 3d. Rubbers rose consistently and tea shares hardened.

(1) Electricity production for New Zealand represents deliveries only. (2) Copper and tin refer to metal production. (3) General trade (including re-exports) except for Canada, which is special trade only. Imports are cif except for Australia, Canada and S. Africa which are fob; exports are fob. Trade for India includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia 12 months ended June 30th. (4) Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for S. Africa and S. Rhodesia relates to Europeans only and for S. Africa includes direct taxes. (5) Including foreign investments. (6) Including semi-processed gold. Beginning January, 1955, including South-West Africa. (7) In July, 1948, part of holdings was transferred to the State Bank of Pakistan. (8) April, 1948—March, 1949. (9) Including some long-term securities. (10) Average for third quarter.

Financial Statistics

EXCHEQUER RETURNS

For the eight days ended March 31st, 1957, there was an "above-line" deficit (after allowing for Sinking Funds) of £54,204,000 compared with a surplus of £25,112,000 in the previous week and a deficit of £21,405,000 in the corresponding period of last year. There was a net surplus "below-line" last week of £37,887,000, bringing the total deficit for the financial year to £331,354,000 (£140,878,000 in 1955–56).

THE MONEY MARKET

CREDIT stringency last week returned to the money market. Large official purchases of bills were needed on Thursday before the week-end, and further, somewhat smaller, help was granted on the first two days of this week. Nonetheless, two or three houses were obliged to take small loans at Bank rate on Monday, and again on Wednesday, when the Bank gave no special help to alleviate the shortage of funds caused largely by Monday's support of sterling in the exchange market. The market's borrowing at the Bank is reflected in part in the rise of £26.2 million, to the unusually high total of £44.8 million, in discounts and advances shown in the Bank return for the week to Wednesday.

The rise in the Treasury bill rate at the first three tenders in March was reversed on Friday of last week, when the discount market raised its common bid by 2d. to £98 19s. 6d. per cent. The move was largely tactical.

Total applications last week for the unchanged offer of £250 million dropped by £3.6 million to £391.6 million, and the market's move raised its allotment rate from 44 to 50 per cent. The average rate of discount on all bills allotted fell by 7d. per cent to £4 1s. 11¾d. per cent; this compares with the recent low point of just £4 per cent at the tender on March 1.

The Bank return shows a further seasonal outflow of notes of £12.4 million in the week to Wednesday.

What blows up must come down

And what blew up in this instance was an autoclave. Installed in a chemical works, it took the roof off the building, and flung 235 lb. of metal sixty yards with fatal effect.

What Vulcan say about it

The foregoing proves, if proof be needed, that danger can lurk undetected in every kind of factory plant. Boilers, lifts, hoists, cranes —all are liable to accident.

That's why regular and competent inspection by specialist engineers is essential. And Vulcan's Engineer-Surveyors are the experts. It's their job to detect the defects, to ferret out the flaws, to point out whatsoever is wrong and how to put it right. Always remember safety first is Vulcan first.

FREE For news of industrial accidents and ways to avoid them, ask us now for 'Vulcan' —a quarterly journal for Power Users. Please write to Dept. 17.

Perhaps you didn't know that

RAPPERSWIL

built on a small promontory jutting out into the beautiful Lake of Zurich, was once an important fortified town. In 1358 a wooden bridge, 4,672 feet long, was built across the Lake. This bridge at that time was considered to be one of the wonders of Europe.

But everybody knows

that Rapperswil, besides being a tourist attraction, due to its historic castle, is also an important centre of industry, its main products being plastic mouldings for industrial purposes, plastic leather cloth and mechanical springs.

The Rapperswil Branch of the Union Bank of Switzerland will gladly negotiate your Travellers Cheques, effect payments under your Travellers Letters of credit or advise you in other financial matters.

It seems there was an Englishman, a Scotsman and an Australian

The Englishman wanted to make a capital investment in Australian industry. Naturally he wanted some sound market information.

The Scotsman was thinking of expanding his business and opening an Australian branch. He wanted information and a first-class banking service with offices on the spot.

The Australian, having an eye to business with the Scotsman and Englishman, wanted a Bank with a London Office.

They all went to The English, Scottish and Australian Bank and got exactly what they wanted. So will you, if you have any business with Australia.

ABRIDGED REPORT

CANADIAN PACIFIC RAILWAY COMPANY

(Incorporated in Canada with Limited Liability)

SEVENTY-SIXTH ANNUAL REPORT OF THE DIRECTORS FOR THE YEAR ENDED DECEMBER 31, 1956

TO THE SHAREHOLDERS:

Railway revenue, which for the first time exceeded the half-billion dollar mark, was 13% higher than in 1955 and 7% above 1953, the previous record year. Costs, however, increased substantially and as a consequence the improvement in net earnings was not as great as might have been expected. The return earned on railway net investment was only 3.15%.

Other Income amounted to $30.0 million, an increase of $2.3 million over the comparable income for the previous year. Net income from petroleum rents, royalties, reservation fees, and land rents, formerly accounted for through Land Surplus Account and now included in Other Income, amounted to $5.3 million after provision for applicable income taxes.

Net Income amounted to $55.6 million, which, after providing for dividends of 4% on Preference Stock, regular dividends amounting to $1.50 per share and an extra dividend of 25c. per share on Ordinary Stock, left a balance of $26.2 million available for modernisation and other corporate purposes.

The Income and the Retained Income Accounts of your Company show the following results for the year ended December 31, 1956:—

INCOME ACCOUNT

Railway Revenue			$505,262,393
Railway Expenses			463,926,566
Net Earnings			$ 41,335,827
Other Income			30,034,463
			$ 71,370,290
Fixed Charges			15,752,302
Net Income			$ 55,617,988
Dividends:

COMPANY MEETINGS

THE BRITISH OIL & CAKE MILLS LIMITED

ANIMAL FEEDINGSTUFFS RECORD SALES

NEED FOR BEST COMBINATION OF CONCENTRATES AND ROUGHAGE

NECESSITY FOR RETENTION OF PROFITS

SUBSTANTIAL REDUCTION OF TAX BURDEN ON INDUSTRY ESSENTIAL

The Annual General Meeting of The British Oil and Cake Mills will be held on April 24th, at Unilever House, Blackfriars, London, EC4.

The following is the review by the Chairman, Mr G. Chipperfield, CBE, which has been circulated with the Report and Accounts for the year ended December 31, 1956.

OIL MILLING

Our mills handled a larger total throughput of seed in 1956 than in the previous year mainly because of increased supplies of Canadian linseed becoming available. Large quantities of vegetable oils were again delivered to associated soap and margarine manufacturers and our total deliveries to other customers showed a useful increase over comparative figures for the previous year. We have had some cases of non-delivery of imported raw materials even against firm purchase contracts, for instance, cottonseed from the Middle East as a result of the Suez intervention, but I am happy to say that in spite of these difficulties we were able to meet all our contractual obligations to our customers.

Edible oils underwent wide fluctuations in price and in demand. In the early months of the year liquid oils were affected by the adverse olive oil situation with the result that these oils became dearer and in short supply until May, from which point prices eased away until the effects of the Suez intervention and the expectation of a smaller groundnut crop in Nigeria were reflected by a period of rising prices and temporary abnormal demand.

We did profitable business in the processing of linseed and linseed oil but this market has unfortunately become unduly speculative and subject to violent price fluctuations. In fact, the following comment from a well-known Market Review is hardly exaggerated and illustrates the disadvantages of commodity markets being unduly dominated by the speculative element :

> "Linseed oil is now becoming a gambler's paradise and it is impossible to make any intelligent comment on the situation. The opening of a terminal market in linseed oil in Monte Carlo might be an appropriate step to take !"

We have had to close our new Castor Mill in Hull for the time being because, under existing preferential tariff arrangements, India while refusing to sell us castor seed delivers oil here at prices quite inconsistent with what we regard as a proper standard of living in this country. It seems to me that, in considering what is called the European Free Trade Area, our Government should bear this aspect of the problem in mind in view of the need to safeguard the standard of life to which we are accustomed. It is futile to talk about higher pay packets if you cannot sell the resulting products in the markets of the world or even meet competitive products on price in our home market.

COMPOUND TRADE

Once more we achieved record sales of compound animal feedingstuffs and this was again specially so in the case of poultry foods the volume of which has risen in keeping with the increase in the poultry population and is one of the factors which has enabled the country to become practically independent of foreign egg supplies.

1956 saw the launching of Calfwena, a new form of calf food designed to make possible the weaning of calves from milk or milk replacement at five weeks instead of the customary 12-14 weeks. The economic and nutritional virtues of this product won it an enthusiastic reception and it certainly provides the milk producer with yet another means of combating rising labour costs and many of the rearing problems which under traditional methods call for specialised staff.

Sowlac, the corresponding line for baby pigs, is now available in pellet as well as in meal form and this product has certainly helped to encourage the artificial rearing of pigs in this country, a system which can make a significant contribution to the economics of home bacon and pork production.

It has always been the Company's policy to encourage the rational use of home grown foods to the fullest possible extent compatible with economic production and, with this object, Cerecon, a pig fattening concentrate, was introduced in 1956 for supplementing home grown cereals available on the farm for the feeding of pigs.

SUPPLIES OF INGREDIENTS

At the beginning of 1956 we were faced with the encouraging outlook of large world stocks of grain. Subsequent events, however, caused a steady increase in market prices. The principal factors affecting the cost of our ingredients, which, including the bags, represent more than 85 per cent of the price of compounds, were the severe frosts which damaged the standing crops on the Continent during the early part of the year, the effect on American markets of the signing of the US Farm Bill and, of course, the Suez incident, which caused a shortage of freight and consequent substantial increase in shipping costs. On the average this amounted to about £2 per ton as compared with a year ago.

On the home market an important feature has been the setting up with the approval of the Minister of Agriculture of a Working Party, on which our Company is represented, with the purpose of facilitating the marketing of home grown barley. Despite the very bad weather conditions under which harvesting took place, the Working Party succeeded, by means of the issue of a weekly price indication, in enabling growers as a whole to obtain a better average ex farm price, especially during the flush period, than has been possible during the past few years. We naturally continue to give the farmer all the support we can by giving priority to home grown grain and any other suitable home produced ingredients, and from the last crop we expect to absorb about 250,000 tons of home grown grain.

I referred in my Review last year to criticisms of the amount of feedingstuffs imported. At the Annual Luncheon when the prizes in connection with our 18th National Milk Yield Competition were presented by Sir Thomas Peacock, Chairman of the Milk Marketing Board, I again made reference to this subject, in particular to the exaggerated picture often given of what the importation amounts to and the lack of attention too often paid to what the country gets in return. In fact, the tonnage of imported animal feeding stuffs was about 30 per cent less in 1955 than in 1938, largely due to the increased use of scientifically produced compounds instead of so-called "straight" feeds, whilst agricultural productivity of all kinds increased during that time by 55 per cent. Imported feedingstuffs represent only between 3 per cent and 4 per cent of our national import bill, compared with 33 per cent for food, drink and tobacco and, of this modest outlay, a great deal is spent in Commonwealth countries to which we expect to sell manufactured goods. On the other hand, the farming community produce more than £1,000 million a year of livestock products. It is illogical to talk about imported feedingstuffs without regard to the saving in the imports of farm products which can be produced here as a result and Sir James Turner, the President of the NFU, recently referred with justifiable pride to the increasing extent to which the British farmer supplies the country's requirements of food. Criticism of imported feedingstuffs is often associated with propaganda connected with the more intensive growing of grass. We must surely remember, however, that we keep cows essentially for the purpose of producing milk and consequently the economic necessity is to produce as much milk from as few cows with as low overheads (including building and equipment) as possible. For this purpose the best available nutritional combination of concentrates and roughage is needed. Grass quality in this country can certainly be helped by the efficient use of fertilisers but it still depends largely upon the vagaries of the climate and it would surely be wrong to have large numbers of low yielding cows spread over wide areas of grass of varying quality rather than a limited national herd, scientifically fed and high-yielding. This would release the greatest possible acreage for other farm products which are required for the national larder and which would otherwise have to be imported.

I suggest that three parallel steps to improve both output and efficiency in production of milk are needed. First, improvement in existing techniques of grassland production and output. Secondly, more efficient methods of conserving roughages for winter feeding. Thirdly, the gradual elimination of the inefficient cow from the national herd so that, by the judicious feeding of both concentrates and roughages, whether green or conserved, we can produce the same or more milk from fewer cows bred for efficiency. In this way land could be freed for the production of more home-killed meat with a resultant saving in imports from abroad. I think we can also add to these three points more reliable methods of assessing the value of roughages. Our laboratories carry out hundreds of tests for farmers every year and our conclusion is that the gradual deterioration of silage and other roughages and its effect on production are not properly appreciated, nor the resultant wastage in the nutritional value of the concentrates used. In my view much more can be done by co-operation between research workers in the industries concerned and those in the official research centres to encourage progress on these lines.

RESEARCH AND FIELD WORK

Our demonstration and experimental farms continue to play their part in providing the farming community with a shop window through which new developments in feeding, housing and management techniques can be viewed and their worth assessed. Their value, both in the promotion of demand for the Company's products and the general advancement of agricultural science may be judged from the fact that our visitors are numbered in increasing thousands each year. (Last year over 12,000.) Perhaps the most successful meeting of its kind in farming history in this country took place at our Barlby Farm at Selby in May, 1956, when well over two thousand farmers from all over the country attended a demonstration of our Cattle Progeny Testing activities and Beef Rearing experiments. (A picture taken at this demonstration is shown in the Report.) To accommodate the requests for places at the corresponding demonstration in 1957, if petrol restrictions do not prevent its being held, it will be necessary to extend the staging of the demonstration over two days.

We maintain our policy of making the fullest possible use of modern nutritional knowledge from our own research and that of outside bodies in formulating our compounds. Whilst the price per ton of feed is obviously of prime importance, the true economic yardstick, of course, is the cost of feeding per unit of saleable product, whether it be milk, meat, eggs, bacon or pork and, thanks to increasing knowledge as a result of the use of recording on farms as a management technique—a practice which cannot be too widely encouraged—this fact is becoming generally recognised.

Apart from continuing our work on cattle and pig progeny testing, on developments in the poultry field, especially "broilers," or table poultry, we have stepped up our work on the production of beef, including beef from the dairy herd. At Barlby we rear Friesian calves for beef production, demonstrating not only that, by suitable feeding and management, calves born in the winter months can make a quality beef animal for slaughter at about 18-20 months, but also that the greater economy in rearing costs due to use of BOCM Baby Calf Food instead of liquid milk has a very marked effect on the profit of the animal. Calves reared since the spring of 1956 have been weaned at five weeks of age under the Company's new early-weaning programme already referred to, and show excellent economy and progress; in fact, there is no doubt that this system is assured of a place on the beef farm as well as the dairy farm.

At South Cathkin Farm groups of Beef Shorthorn/Ayrshire cross calves were reared under this new method last spring, which have aroused much interest in the yards this winter. Further groups of calves are being reared by early-weaning this winter, the first half of the winter being devoted to the Angus/Friesian cross and the second half to the Beef Shorthorn/Ayrshire cross, thus providing information on the merits of these crossbreds for beef.

ACCOUNTS

Profits from our animal feedingstuffs trade reflect the increased sales to which I have already referred and show a satisfactory increase over the preceding year. Notwithstanding the considerable fluctuations during the year in oilseed prices we were able to maintain satisfactory profits from our business in edible and technical oils. We made a somewhat higher contribution under the terms of the pooling agreement with our Holding Company and Associated Companies, to which I have referred on previous occasions.

The profit for the year, before taxation, was £2,448,820. After providing for taxation of £1,163,000 on these profits and including released provisions of £15,129 for taxation of previous years, there remained a surplus of £1,300,949 of which dividends took £682,591, leaving £618,358 retained in the business.

As I have pointed out on previous occasions, after paying a reasonable return to those who supply the capital needs of the Company, profits are required to maintain the healthy development of a business with due regard to the heavy burden of taxation which industry has to carry and this is a fact which is too often overlooked or ignored when people talk about "profits." There still seems to be insufficient realisation in some circles of the fact that high taxation is a potent factor in raising the cost of living and in breeding inflation. It is, in fact, as I have said on a previous occasion, a form of economic self-strangulation which has developed to a point where a drastic cut in Government expenditure and a substantial reduction in the taxation burden on industry are essential. It is a pity to leave the realisation of this fact till the country reaches the verge of serious economic difficulties. There appears to be inadequate consciousness of the perils confronting us as a result of increasing amounts being spent on projects, which may in themselves be worthy, but which we simply cannot afford. The Government can hardly object to criticism that they are shirking their responsibilities by inaction and by not facing the need to reduce the growing burden of their expenditure, particularly on schemes which encourage personal extravagance and the relief of burdens which those who stand to benefit from them could properly carry themselves. The present level of penal taxation not only discourages enterprise and stifles personal initiative but could eventually deprive the country of large numbers of its potential specialists.

Once again our Balance Sheet reflects the increased financial requirements of our businesses. Capital expenditure in 1956 was £2,200,000 which included substantial amounts for additional manufacturing capacities for our Selby, London and Avonmouth compound plants. During the past seven years we have spent £8½ million on increasing and modernising our production capacity and facilities, and £11½ million have been absorbed in providing working capital to finance the maintenance and expansion of the business. The investment in stocks and debtors rose from £16,306,000 at December 31, 1955, to £17,942,000 at December 31, 1956, the increase of £1,636,000 being due to higher raw material prices and increased trade. The additional finance has been partly provided from depreciation, partly from the retained profits, as I have already mentioned, and partly by our Holding Company which advanced a further £1,271,000 to us during the year.

The average basic weekly wage of our mill employees rose from £7 6s. in 1955 to £7 18s. in 1956, an increase of 8 per cent. On the other hand, the average weekly pay packet increased from £10 15s. in 1955 to £12 in 1956, representing an increase in average earnings of 11½ per cent. This comparison again suggests that there is a margin to cover variations in the cost of living which should enable the brake to be put upon demands for increases at a time when the danger of inflationary trends is particularly acute.

TECHNICAL DEVELOPMENTS

The majority of the technical developments in our business in 1956 were directed towards the expansion and modernisation of our animal feeding stuffs plants. The first stage of our new compound mill at Selby has been completed, practically the whole of our new plant at Manchester is in operation, the greater proportion of the new buildings being erected at Silvertown have been completed and at Avonmouth our new mill was ready to go into operation at the end of the year. Further plans for modernisation at our Leith and Hull mills are under consideration.

It will be appreciated that the art and the process of compounding animal feeds has reached such a high standard of selection and combination of ingredients that formulation as a whole has largely passed to the scientific sphere, with the result that a very high degree of scientific background is needed by those responsible. In particular, minerals and other trace ingredients, such as vitamins and antibiotics, must be incorporated and distributed throughout a mixture with meticulous skill and care in order to ensure that they perform their proper functions. For this reason we have included in the planning of our modern mills and the modernisation of our older ones what we call "Dispensaries" where this particular phase of manufacture can be carried out under the best possible conditions. An illustration of one of these Dispensaries accompanies our Report.

On the oil side, a new experimental laboratory devoted to the development of new oil and fat products and technical sales service, has been put into operation at Erith, which includes a factory scale pilot plant. Productivity is still the keyword for both labour and machinery and to this end incentives are being carried to the maintenance as well as the production side in the mill, always, of course, in close consultation with the employees concerned or their representatives.

A limited amount of abnormal turnover resulted from the recent emergency condi-

tions and their effect on markets and sales, but our mills took this in their stride and exemplified again the ingrained industriousness and ingenuity of the workers of this country. In exceptional weeks our mills produced and handled tonnages well beyond our normal conception of maximum output, thanks to the enthusiasm and efficiency of their personnel.

PROGRESS PAYMENTS

We have again been able to pay tribute to the contribution to the Company's progress of our employees at all levels and in all stages of operation by continuing the arrangement whereby annual progress payments are made (below higher management) and in 1957 we shall again pay the sum of £30 in the case of those aged 21 and over and £15 to those under 21 years regardless of status or sex. I cannot pay too high a tribute to the loyalty and efficiency of our employees at all levels. We constitute a large community and the achievements and the progress of our Company do not suggest any spirit of defeatism such as is regrettably evident in certain circles where it appears to be deemed appropriate to denigrate the part which Britain plays and the influence it exercises in the free world.

BRITISH-AMERICAN TOBACCO COMPANY LIMITED

EXPANSION FINANCED FROM PROFIT RETENTION

The fifty-fourth Annual General Meeting was held on March 29th, in London. Mr D. M. Oppenheim, the Chairman, in the course of his speech, said: From the Report and Accounts you will have been glad to see once again an increase in the Holding Company's available net profit. Over a number of years (since the end of the war) most of our overseas subsidiary and associated companies have been faced both with the problems of rehabilitation and modernisation and the need for expansion under conditions in which the necessary plant, machinery and building materials have been scarce and costly. These capital projects, because of remittance, credit and other restrictions, have had in many instances to be financed from the retained profits of the companies concerned. Moreover, the expansion of sales and, in many cases, increased tobacco taxation have required the employment of additional working capital which has been yet further increased by the large sums needed in inflationary economies to meet the replacement cost of stocks and other assets. This additional working capital has been found by the retention of profits in the companies concerned, at the expense, of course, of the sums which otherwise would have been available for dividends to the Holding Company. With, however, the completion of most of the major schemes initiated after the war the total amount of dividends received has increased as is demonstrated by the larger share of the Group Available Net Profit dealt with in the accounts of the Holding Company.

Modernisation and expansion are continuing features of the business. In modernisation I include not only the constant replacement of old machines by new and more efficient machines, but also the adoption of new processes and new techniques, with which we must keep abreast in the highly competitive conditions of today. Expansion is due not only to success against competition, but also to the steady increase in sales in some areas where there are growing populations and improving standards of living which enable people to progress from other more primitive forms of smoking to the more expensive and acceptable machine-made cigarette. It is, however, in some of these rapidly expanding economies that one finds inflation, with all the restrictions and difficulties which accompany that condition, dictating the necessity for the members of the Group to maintain large reserves and an appropriate degree of liquidity. The very fact that it has been possible to carry out the postwar rehabilitation and expansion, as well as to conserve the real capital employed in the various businesses, and at the same time to provide progressive returns to the shareholders, seems to me to justify the reserve and dividend policies which have been pursued by the various subsidiary and associated companies.

The satisfactory trend of Group sales for the early part of the year to September 30, 1956, continued throughout the year and the figures available to me for the first five months of the current financial year—even excluding, as they do, those for certain parts of the Middle East area—are running above those for the same period last year. I should point out, however, that the consolidated trading profit may be affected by increasing costs and higher tobacco taxation, which in some overseas countries cannot be fully covered by adequate price adjustments. Nevertheless I should expect the share of the Group Available Net Profit at the disposition of the Holding Company to be at least maintained for the year 1956-57.

The report was adopted. At the subsequent Extraordinary General Meeting the resolutions relating to the Capitalisation issue were passed.

GENERAL INVESTORS AND TRUSTEES

The fiftieth annual general meeting of the General Investors and Trustees, Limited, was held on March 28th in London, Mr R. G. Mills (the Chairman) presiding.

The following is an extract from his circulated statement:

Your Company's gross revenue amounted to £321,130, compared with £292,911 for the previous financial year, net profit figures being £148,060 and £134,919 respectively. Adding £21,729 brought forward plus taxation in respect of previous years the total available is £171,102. The Directors have repeated a transfer of £30,000 to General Reserve and recommend a final payment of a dividend of 9 per cent, less Tax, making a total of 14 per cent, less Tax, for the year. In addition, because this is the half-centenary of the Company, we recommend a bonus distribution of 1½ per cent, less Tax.

In 1950, the value of our portfolio was £2,398,178 and has shown progressive increases to that at which it stands, namely £4,921,380, in the Balance Sheet. The gross revenue in 1950 amounted to £138,585 and as already mentioned that for the year under review had attained a total of £321,130. These increases have arisen partially from the introduction of new money plus retained revenue during the period aggregating approximately £693,000.

As to the prospects for the current year, it is difficult to assess what effect credit restriction and other economic factors may have on the return on our investments. I feel, however, that our result for the current year will not be disappointing.

The report was adopted.

THE STEETLEY COMPANY LIMITED

(DOLOMITE AND REFRACTORIES)

The Annual General Meeting was held in Sheffield, on 29th March, 1957. The accounts for the years ended 31st December, showed:—

	1955	1956
	£	£
Trading Surplus...	1,187,593	1,561,155
Taxation	586,287	801,874
Profit...	601,306	759,281
Issued Share Capital	3,164,874	3,164,874
Dividends	159,079	217,636
Undistributed Profits	442,227	541,645

The following is an extract from the statement to shareholders made by Mr. N. M. Peech, Chairman:—

Production and sales at home and in Canada attained new peaks and the works operated more efficiently than ever before. The dividend on the ordinary shares of 13% is the same rate as last year but is payable for a full year on the capital increased by the new issue of shares late in 1955. The Company is engaged on a considerable programme of expansion and modernisation (the authorised and unspent capital expenditure at the end of 1956 amounted to £3,145,000) but little benefit therefrom will be felt in 1957. Meantime current demand for the group's products remains good.

ASSOCIATED ELECTRICAL INDUSTRIES LIMITED

PREVIOUS RECORD OF APPARATUS SUPPLIED EXCEEDED BY £5.4 MILLION

CONTINUOUS AND PROGRESSIVE GROWTH: CAPITAL EMPLOYED NOW OVER £100 MILLION

LORD CHANDOS ON COMPANY'S ROLE IN DEVELOPING NEW PRODUCTS

The fifty-seventh annual general meeting of Associated Electrical Industries Limited was held on April 3rd, at the Connaught Rooms, Great Queen Street, Kingsway, London W.C.2.

The Right Honourable The Viscount Chandos, DSO, MC, the Chairman, presided, and in the course of his speech said:

During the past year we have paid three quarterly dividends of 2½ per cent, and your Directors recommend the payment of a final dividend of 7½ per cent, making a total distribution of 15 per cent on the increased capital; the same rate as for 1955.

Our trading profit for the year, before taxation, but after deduction of all other charges, amounted to £10,307,000, compared with £15,320,000 in 1955. The amount set aside for UK taxation, based on the profits for the year, was £5,848,000, and of this, £1,564,000 was for Profits Tax against £1,254,000 in 1955, an increase of nearly 25 per cent. Net profit available for distribution after taxation was £4,460,000, and after adjustments in respect of previous years' taxation and outside stockholders' interest, the balance attributable to AEI was £4,372,000.

Owing to the shrinkage in our earnings, after taking £2,761,000 for net dividends, the total additions to our Reserves and Carry Forward are only £1,611,000 and the total retentions in the business £4,551,000, *including depreciation.* Of this sum £1,250,000 has been added to the AEI General Reserve making it £13,250,000 and the balance is retained in the subsidiaries or added to the Carry Forward. The capital employed in the business at the end of 1956 was £103,966,000, which, after subtracting £4,919,000 preference capital, shows the equity capital as £99,047,000 against a nominal figure of £33,638,000. A 15 per cent Ordinary Dividend therefore gives a return on the equity capital of £5 2s. per cent.

The Reserve for the Increased Cost of the Replacement of Fixed Assets, which stood at £7,900,000, has been transferred to the retained Reserves of the subsidiaries. Such a Reserve might have been used year by year to write down our plant, but it has not been so applied because we could write all our fixed assets down to £1 and have a substantial surplus from existing Reserves. It is thus a Revenue Reserve, and just as free as any other. It seems therefore better to show it under surpluses retained by subsidiaries than in the special category to which it had previously been allocated. There are objections to any form of earmarked Reserves, and in future our surpluses will be retained in the subsidiaries or allocated to General Reserve unless some special circumstances warrant a more limited description.

TRADING CONDITIONS

In 1956 the total value of electrical apparatus shipped and invoiced to our customers surpassed that in the record year of 1955 by approximately £5,400,000. Notwithstanding this increase, the profits fell sharply below those for 1955. This was from a number of causes. Part of this fall is due to general conditions in the industry. We have had to absorb further wage increases, and this has meant that margins, especially in the export trade, have shrunk. I do not regard this myself as particularly disturbing: I have frequently told the stockholders that some shrinkage in margins was likely and even healthy, as the seller's market began to fade. The shrinkage in margins must be offset by lower costs and larger production and these are the two targets at which we aim.

I particularly wish the stockholders to know that, apart from general conditions in the industry, there were particular reasons which affected our profits. Government action in the early part of the year caused a sharp fall in the demand for a number of our lighter products: valves and cathode ray tubes are an example. This happened to strike us at a time when the Siemens-Ediswan and Hotpoint reorganisations were not yet complete. The fall thus had a more marked effect on our fortunes than if these companies had been completely established in their new functions.

Secondly, there has been, and indeed there still is, very keen competition in lamps and lighting, and here again the reduced profit margins came upon us when we were in the course of rationalising our whole lamp production and sales.

Lastly, we are building a number of new factories, and there has not yet been time for production from any of them to make an appreciable addition to our revenues. On the contrary, these new projects involve, apart from the capital invested in them, heavy initial expenses of a non-productive nature. The latter half of 1957 should witness the first beginnings of revenue from these sources. In short, I do not think that 1956 will prove a reliable guide to the potential earning capacity of the Group when the results of our capital expansion and reorganisation begin to take effect.

There has been an unusually large influx of orders since the turn of the year. The order book is in a healthy condition, and ensures that our capacity will be employed at a high rate for at least the next year or two.

You will be aware that the Monopolies Commission reported recently on electronic valves and electrical plant. The Restrictive Trade Practices Act now in force is intended to determine by judicial procedure the "public interest" in the trade practices explored in such great detail by the Commission. The result desired by our legislators is increased competition within our industry. This is a decision of the Government, and whatever the effects may be upon the industry, we must guard against the dangers of slowing down research, technical development and improvement of factory equipment, all of which are essential to industrial progress, particularly in this, the chief exporting industry of Great Britain.

INDUSTRY'S PROSPECTS

We remain of opinion that the electrical industry in the next ten years will nearly double in size. This may appear at first sight a big assumption, but it can perhaps best be brought into focus by looking back at our own Company's affairs. At December 31, 1946, the capital employed in our business was £22 million. Today it is over £100 million. The cost of our fixed assets in 1946 amounted to rather under £15 million. Today it stands at £59 million. Of course their value at today's prices would be more than twice this figure. Stocks and works in progress amounted to £17 million in 1946, today they amount to about £65 million. All these figures are about four times those of 1946, but it should be remembered that they include some acquisitions, of which the most notable has been that of Siemens Brothers.

After reviewing the Group's achievements in the technical field, Lord Chandos continued:

From what I have said you will see that the demand for our established products and the development of new products are limited only by the resources that we can bring to bear on any problem. It may truly be said that the first half of this century has witnessed the growth of the Company from comparatively small beginnings to the great position that it now occupies in national affairs. Now that we have entered into the second fifty years it is plain that our responsibility to the nation continues to grow. We must be prepared where necessary to evolve new administrative methods in order to take full advantage of our opportunities.

The Chairman then outlined the very large expansion programme which had been undertaken and said:

In some ways this expansion programme differs from those to which I have been accustomed in other branches of industry. They are not in the main designed to meet estimated but known demands. It will be interesting to give a short review of the progress of many of these projects.

EMPLOYEES AND STOCKHOLDERS

I have so far made no reference to the most important asset of the Company, that is the work put in by our 88,000 employees. Once again, it is a pleasant duty to record that they have given loyal and hard-working service, without which the new records in production could not have been reached.

All over the thousand and one activities in which your Company is engaged, you can feel the pulse of progress and of expansion. In this industry, as in some others in the twentieth century, I repeat that to stand still is to die, and we are determined to press forward with all speed the development of new uses of electrical energy, new manufacturing technique, and, above all, by new research reaching out into the most advanced areas of modern science, of which the frontiers seem to be widening almost as I speak. The Company has a manufacturing space of sixteen million square feet. It is all fully committed to production, and is in need of the help which our new expansions will give it. The extent to which we can earn profits upon it depends upon factors which are not always within our control, but it cannot be doubted that over a period it will not only contribute greatly to the prosperity of your Company, but make a striking addition to the national wealth. The report and accounts were adopted, and a final Ordinary dividend of 7½ per cent was approved.

THE DECCA RECORD COMPANY

POSTWAR HISTORY OF REMARKABLE GROWTH CONTINUED

MR E. R. LEWIS ON EXPANDING VOLUME OF WIDESPREAD OPERATIONS

The twenty-seventh annual general meeting of The Decca Record Company Limited was held on April 2nd at Winchester House, Old Broad Street, London, E.C.2.

Mr E. R. Lewis (the Chairman) presided, and in the course of his speech said: I very much regret that Sir Cyril Entwistle, after six weeks in hospital, is unable, under doctor's orders, to be present today. It was to have been his last Annual Meeting as Chairman of the Company, and he particularly wanted to be present.

As you have already been informed, he has at his own wish retired from the Chairmanship, a position which he has held with distinction for the last 23 years, and he has been a member of the Board for over 26 years. I should mention that his decision had nothing whatever to do with his present illness. I am happy to say that Sir Cyril has agreed to continue to serve as a Director. I am sure you will join with me in wishing him a speedy and complete recovery.

THE ACCOUNTS

In the Consolidated Profit and Loss Account the balance from Trading Account which amounts to £1,797,936 shows an increase over that of the previous year of £68,112, and is the highest ever achieved by the Company. Maintenance, Depreciation and Interest charges all showed substantial increases, and accordingly the balance of profit for the year before tax at £1,032,193 shows a reduction of £108,440 from that of the previous year.

Net profits after tax amounted to £433,623, against £526,369. Profits Tax showed an increase of £41,240, largely due to the payment of dividend on increased capital. This tax is a serious burden on enterprise.

Turnover for the year to March 31, 1956, at £12,860,000, was £3,294,000 greater than that of the previous year. In order to finance this increased turnover, and certain capital commitments, we had to raise new capital. It is obvious that this would have been impossible unless subscribers to the shares were to receive a dividend and for the payment of such dividend the Company is penalised by distributed Profits Tax.

There can be no time when it was more vital than now to increase productivity and exports in the interests of the country, and it is surely time that the heavy burden of Profits Tax, which falls exclusively on those who take the greatest risk in supplying equity capital, should be reduced or, preferably, abolished. At least the discrimination against distributed profits should be ended.

We are recommending a Final Dividend on the Ordinary and "A" Ordinary Shares of 1s. 2d., less tax, making a total for the year of 1s. 9d., less tax, the same as for the previous year though on capital increased by one-third.

During the year under review the Group experienced increased cost of salaries, wages and materials. Heavy expenditure was also incurred in research and development, the benefit from which it is hoped will be derived in future years.

REVIEW OF OPERATIONS

or the year under review the Record ess showed a further expansion in both the home and export markets and in the operations of our subsidiaries in the USA and Canada. The production of over 27 million records in our English factories, out of a total industry production of 62 million records, was the highest in the history of the business.

The Decca Navigator Company made further progress during the year with a considerable increase in marine and air hirings.

The Decca Radar Division retains its leading position in the marine radar field.

The total exports of the Group amounted to £3,413,000, of which no less than £935,000 represented sales to the USA and Canada. The consolidated sales for the first ten months of the year ended March 31, 1957, amounted to £13,960,000, £1,100,000 greater than that for the whole of the previous year.

THE CURRENT YEAR

In the Record business the production of our factories for the year ended March 31, 1957, was greater than that of any previous period. For the month of January production and sales reached the unprecedented figure of over 4 million records.

Shortly after the last Annual meeting we signed a contract with the Radio Corporation of America, under which we have secured rights to manufacture their recordings and distribute them in the United Kingdom, under the trademark RCA. We regard the contract as a most valuable one for the Company.

THE NAVIGATOR

Navigator hirings have increased at a considerably higher rate than in any previous year, the cumulative total of hire and sale contracts up to January 31st last amounting to 3,770 units. This accelerated expansion illustrates the great value attached to the Decca Navigator as an aid to accurate and safe navigation at sea and in the air.

A long range version of the Decca Navigator System, known as "Dectra," has been developed, in the hope that it will provide a solution to the problem of navigation on the North Atlantic air route.

In co-operation with the Bendix Aviation Corporation, two Standard Decca chains are being set up in Newfoundland, and two further chains on the mainland of Canada, covering the Gulf of St Lawrence. These developments mark our first entry on a major scale into the new world and we believe it will be the beginning of what may well be the largest expansion of the area of Decca coverage.

RADAR

Orders for marine radar have continued at a most satisfactory rate during the current year and we have at present a large backlog of orders. The latest development has been the introduction of the True Motion Radar (TM46) incorporating a principle quite revolutionary in the field. The new set has created immense interest throughout the shipping world.

In conventional radar one's own ship, although in fact moving, appears as a stationary dot in the centre of the picture, with coastline, buoys, and other fixed objects moving past it like scenery through a train window. The movement of other ships under way is therefore "relative" and plotting is necessary to determine their actual speed and course.

In Decca True Motion Radar stationary objects remain stationary on the picture, one's own ship is seen moving across the screen, and all other moving objects are also seen on their true course and at their right speed. Ambiguity in the radar picture which has sometimes in the past been held to be a contributory factor in collisions is thus completely removed. Deliveries of sets started last month.

A new wind-finding radar has been developed and orders for this new set, together with the Decca meteorological equipment, have been stimulated in view of the fact that 1957 is the international and geophysical year. One of the wind-finding radars is in use by the latest Antarctic Expedition.

Orders have been obtained from overseas countries for various types of defence radar, which should make a substantial contribution towards results for the current year's trading.

The Radar Company has continued its very important work in connection with research, development and production contracts for the Government of a highly important nature. Total contracts of the Radar division outstanding at the present time amount to £6 million.

Turnover of the Radar Division to March 31st last has shown a considerable increase, and although results have not been commensurate with the technical achievements, and the turnover of the business, there is no reason to anticipate that they will show an improvement over those of the previous year.

HIGHER CURRENT OUTPUT

Output for the Group for the first nine months of the year ended last month is 30 per cent greater than that of the previous period, with exports running at a record level. All sections of the business have participated in this expansion.

The results of trading for the year ended March 31, 1957, are expected to show a considerable increase over those of the previous year. We anticipate that the dividend on the capital as increased by the new shares will be no less than for the year under review. A First Interim dividend of 3d. per share, less tax on account of the year ended March 31, 1957, payable on the increased capital, has been declared.

I hope it will be possible to present the next Annual Accounts at an earlier date. The immediate future is clouded by industrial disputes the repercussions of which will be felt by industry throughout the country. The amount of damage to be done to our own enterprise will, of course, depend on the length and the extent of these troubles.

Your Company is, however, in a position to weather any storms that may arise, and I look forward to the future with every confidence that the remarkable growth that has taken place since the war will be resumed as and when conditions become more normal again.

The report was adopted.

UNION COMMERCIAL INVESTMENT COMPANY LIMITED

INCREASE OF CAPITAL APPROVED

POSSIBLE EFFECT OF LABOUR UNREST

MR PATRICK L. FLEMING ON INVESTMENT POLICY

The Forty-Third Annual General Meeting of Union Commercial Investment Company Limited was held on March 29th at Winchester House, Old Broad Street, London, E.C.

Mr Patrick L. Fleming, the chairman, who presided, said:

Our gross income and our expenses, including taxation, have each increased by £6,000, resulting in a profit almost exactly the same as last year. This means that our earnings are 16 per cent on £525,000 Ordinary stock, against 18.7 per cent on £450,000; and I may say that the earnings for the current year look like being about the same.

The gross income from investments is up by £7,000, which is about what we expected, seeing that we had the use of the extra £75,000 of Ordinary capital for five and a half months; and the decline of £1,000 in underwriting commission is due to the tempo of the capital market having been slower than in the active year of 1955.

The parallel increase in expenses is due to rent and salaries, to directors' fees and to taxation. The main reason for rent and salaries going up so suddenly is the recent increases of capital, which have involved a larger contribution towards such services as we enjoy jointly with our associated companies. The increase in directors' fees does not mean that the Institute of Directors, to which the members of your Board pay a levy of 1s. 2d. per week, has had the good fortune to become affiliated to the Confederation of Shipbuilding and Engineering Unions; it means simply that we are now drawing up to 80 per cent of what the owners awarded us in 1928—at a time when what we employees call the take-home pay was much more worth while than it is today.

INVESTMENT OVERSEAS

The increase in taxation is partly due simply to the increase in income, but partly also to our having become liable to profits tax. Our liability to profits tax is likely to grow in the future to the extent that we put more money into debentures and into companies overseas. You will see that we have done just that in the year under review and we have done so deliberately.

In the 12 years that I have been chairman, the Ordinary dividend has gone up from 1½ per cent to 11 per cent, and the break-up value of the stock has risen from some figure which we were ashamed at the time to mention, to 248 per cent. While modesty compels me to admit that much of this rise in value is due to the politicians who have poured so much money down the drain that the prices of Ordinary shares have inevitably floated upwards, a time must come when inflation will wash the profits of some companies clean away, so that it is common sense to moor some part of our money to debentures, the income from which is more likely to stay where it is.

We have been investing in the USA despite the penalty of profits tax, simply because the yield on the shares of a good American industrial is about half as much again as that on a comparable company at home; and the reason for that is that in America high dividends are welcomed both by the government and by the unions as a contribution to the American Way of Life, while at home they are assumed to be subversive of the Welfare State. Consequently, in the USA the investor gets more for his money. Profits tax on income arising from within the Empire seems to be levied in the belief, which British politicians have held off and on for nearly two hundred years, that Empire is rather a nuisance. I have personally protested to innumerable MPs that if we are to suffer such penal discouragement from investing in the Empire, the next tea party will not be in Boston but in Moscow—only to be informed that the Chancellor cannot afford the loss of the Revenue. What I cannot get into their heads is that the tax has already so deterred investment in the Empire and that the only loss to the Treasury would be about £1 million which, as you may have seen recently in the papers, is only twice as much as was lost by buying too many underclothes for the WRAC.

We therefore propose to continue to invest your money in defiance of profits tax in the hope that before long what is quaintly known as the wisdom of Parliament will be adulterated with a little common sense.

FUTURE PROSPECTS

And now what of the future? One of the problems of an investment trust is that shareholders consider the accounts for the year just ended, which cost 300 guineas even to get audited, like a month-old copy of the local paper, whereas the chairman's speech is expected to resemble a free issue of Old Moore's Almanac. What I expect is worrying you is what the effect is likely to be on your company of this business of strikes. The short-term answer is that strikes should not affect us very much, owing to the selection and spread of our investments. The long-term answer is that labour unrest has occurred again and again in our history; and the interests of the men, of the employers and of the country have always been met in the end by new invention and new capital. Inventive ability in this country is as high as ever it was, but the one subject on which both political parties seem to be agreed is that nobody must be allowed on any account to accumulate any capital. If we were a primitive community and counted our wealth in cattle it is hardly likely that we should stop the animals breeding; but the elders of our little tribe would rather slaughter the milch cows than that anyone should have more veal than anyone else. The result is that the damage which a strike must inevitably do is being gratuitously extended, in terms of money and time, by the fiscal policy of any government that happens to be in power.

The report and accounts were adopted and a resolution for increasing the capital of the company to £1,100,000 by the creation of 100,000 shares of £1 each was approved.

ALLIANCE BUILDING SOCIETY

OUTSTANDING PROGRESS

ASSETS INCREASED TO £56 MILLION

The ninety-fourth annual general meeting of the Alliance Building Society was held on March 29th at Brighton.

Mr F. J. Wellman, JP, the chairman, in the course of his speech said: We have had a very successful year of business in 1956 despite all the troubles of that momentous year. We have increased our total assets from £51,140,000 to £56,230,000, which represents an increase of just under 10 per cent for the year. The number of our members and depositors increased from 74,912 to 81,823.

The Shares Account shows that £12,311,713 was paid in and that withdrawals, including interest, amounted to £8,270,797. The balance remaining invested by shareholders at the year-end had risen from £46,937,198 to £52,545,000.

Although restrictions on advances were in force during the greater part of the year no less than £10,206,392 was advanced on 6,211 new mortgages.

After making provision for all expenses, interest, taxation and other charges, the surplus on the year's working amounted to £152,665 or 5s. 5½d. for every £100 employed in the business. £150,000 was transferred to General Reserve which now amounts to £1,170,000.

We are well into another year for which we have made—and are carrying out—ambitious but realistic plans. If, mercifully, we are spared the dislocation of extended industrial strife I believe we can look forward to another period of great progress for our Society.

HOME OWNERSHIP

The history of the past decade shows that home ownership has not lacked popular appeal—but many must have felt that a low controlled rent at the expense of a private landlord had certain obvious attractions wherever it could be enjoyed.

If the Rent Bill now being considered by Parliament becomes law a complete change of atmosphere will be brought into being and the true value of home ownership will have an added appeal to all thoughtful people.

Throughout their long history Building Societies have preached and existed for home ownership. Provided people keep their commitments within reasonable limits I am sure this makes for a stable and contented community.

The Building Societies, of course, must not fail to provide an adequate volume of house purchase facilities and this means attracting a sufficient flow of funds.

3½%, 4¼% OR 4½% ON INVESTMENTS CLEAR OF INCOME TAX

We are alive to this need and have taken steps to meet it. In addition to our normal Fully Paid Shares at 3½ per cent, we now offer small savers 4½ per cent on Subscription Shares up to the maximum of £3 15s. per week. In addition there are new Accumulating Shares at 4¼ per cent. All the rates quoted are clear of income tax which is borne by the Society. The response to these new facilities has thus far been good.

The report and accounts were adopted.

TAYLOR, WALKER & COMPANY

EVER-INCREASING DEMAND FOR BOTTLED BEERS

EFFORTS TO COMBAT RISING PRODUCTION COSTS

LIEUTENANT COLONEL W. H. KINGSMILL'S STATEMENT

The fiftieth annual general meeting of Taylor, Walker & Company Limited will be held on April 18th in London.

The following is the statement by the Chairman and Managing Director, Lieutenant Colonel W. H. Kingsmill, DSO, MC, which has been circulated with the report and accounts for the year ended December 31, 1956:

Ladies and Gentlemen, you will remember that last year I warned you that the decline in the trade had been halted, due to the very hot summer of 1955, and I also said that this could be easily upset should we have a bad summer in 1956. As you well know, the 1956 summer was not good, but in spite of this I consider that the trade was very reasonably maintained, though, of course, we could not look for an expansion under the climatic conditions prevailing.

We have now had the benefit of a full year's trading in the production and distribution of draught beer for the Cannon Brewery houses as well as our own. Due to this concentration we have been able to keep down the cost of production of beer, in spite of increasing overheads, to what your directors consider to be a very reasonable level.

TRADING RESULTS

Turning to the Accounts for the year 1956, you will notice that Group profit before taxation has risen from £939,081 to £1,040,236, whereas the Group surplus after taxation has fallen from £474,012 to £452,583. To put the matter shortly, your company made a Group profit (before taxation, but after depreciation, management fees, debenture interest and mortgage interest) of £1,040,236, out of which the Government took in taxation alone a total of £593,174. Profits tax has risen from £119,875 to £151,602, a rise of some £32,000, while income tax has increased from £410,268 to £441,572, an increase of some £31,000. Also, last year your Group had tax adjustments amounting to £65,074, as against this year's adjustments of £5,521. This, of course, does not include the enormous sum paid to the Government in Beer Duty and Wine and Spirit Duty, which amounted to more than £7,700,000 for the year. Overall, these are staggering sums for one Group of companies to have to bear. But even this does not represent the sum total of taxation. Each public house pays in addition an annual licence duty which varies according to the size and trade of the individual house, but which in the case of a big house with a large trade exceeds £800 per annum.

Your Directors, however, have much pleasure in recommending to the Stockholders that a Final Dividend of 7 per cent gross be paid on the Ordinary Stock of the Company, making a total of 10 per cent gross for the financial year 1956.

The conversion of the Cannon Brewery property has not gone as quickly as your Directors had hoped, due to the necessity for the detailed plans for the bonded warehouse being passed by the Customs and Excise before work could commence. However, work on the necessary structural alterations has now begun and it is hoped that, subject to unforeseen circumstances, the whole of the Cannon Brewery premises will have been converted early in 1958.

You will also have seen that one of our subsidiary companies, the Curtis Distillery Company Limited has entered into a joint manufacturing agreement with Messrs J. and W. Nicholson and Company Limited for the erection and working of a single rectifying plant which will produce the gin for these two companies. This does not mean that a single gin only will be produced, as each company's gin will maintain its own individuality, but it will mean that only one plant instead of two will be in production and this must inevitably lead to a saving in overheads.

NEW ACQUISITIONS

In April last year your Company purchased the old-established firm of David Stevenson (Beers and Minerals) Limited of Paisley near Glasgow. This firm had fallen on hard times, but we consider it to be a useful purchase, not only as a depot for distributing our own beers throughout Scotland, but also for bottling beers and mineral waters. This Company is now in the process of reorganisation and your Board is of the opinion that in a short time it should show a good return on the purchase price.

Last September your Company purchased the whole of the Ordinary Share Capital of the Chesham and Brackley Breweries Limited whose area stretches from west of Watford to near Stratford-on-Avon and which owns 226 licensed premises. This has considerably extended the area over which the Taylor Walker Group have representation and your Board again is of the opinion that it will materially strengthen our position. The finance for this was found by a special issue of debentures. Had it not been for the difficulties created by petrol rationing, Taylor Walker Beers would have already been fully introduced into these houses, but the bottled beers we have so far been able to introduce have been more than favourably received.

During the year, in order to relieve pressure on our own bottling facilities at Limehouse, we have made arrangements for a proportion of our beers to be bottled under our supervision at a brewery outside London. This, we hope, will enable us to continue to meet the ever increasing demand for our bottled beers with a minimum of capital expenditure.

CONTINUED EXPORT MARKET EXPANSION

Our export market continues to expand and recently "Reserve" Pale Ale under the label of "Special Pale Ale" has been introduced into Belgium. It is exported in bulk and bottled by a Belgian brewery under our supervision.

Whilst it is too early yet to be able to assess the trend of trade in 1957, the very open winter we have had up to the end of February has been beneficial and has helped us to meet the ever increasing cost of production not only in raw materials, but also in petrol and diesel oil due to the closure of the Suez Canal. The reassessment of your Company's premises from the rating angle is an added burden.

Your Company is striving always to keep down the cost of production whilst maintaining the very high standard of its products, and the fact that we have been able to do this is in no small measure due to the co-operation we have continued to receive from the staff and employees of the Taylor Walker Group, to whom the Board would now like to pay public tribute.

HICKSON & WELCH (HOLDINGS)

RECORD TURNOVER AND PROFIT

The fifth annual general meeting of Hickson & Welch (Holdings) Limited was held on March 29th in London, Mr. Bernard Hickson, MSc, FRIC (Chairman and Managing Director), presiding.

The following is an extract from his circulated statement:

The trading profit has again increased. This increase is smaller than the corresponding rise shown in the previous year's figures, but can be considered satisfactory having regard to falling prices in our overseas markets due to keener competition from continental chemical manufacturers. In addition costs have continued to rise at home. Despite these direct deductions from our margins, we have managed in most cases to meet foreign competition and by increased production, have attained a record Group turnover and profit.

Hickson & Welch Ltd. has again expanded, and has completed on schedule its two year capital programme. The output, sales turnover, and profit for the year are the highest in the history of the company. The two companies at Huddersfield, John W. Leitch & Co. Ltd. and its subsidiary, the Gardinol Chemical Co. Ltd., in addition to their own manufacture and sales programmes, have continued to meet the demand for chemicals required for further manufacture by Hickson & Welch Ltd. at Castleford. Hickson & Dadajee Private Ltd., your associated company in India, has produced and sold Sulphur Black dye up to the permitted amount licensed by the Indian Government, and the resulting profit from that operation has been eminently satisfactory.

After reviewing the progress of the Timber Impregnation Companies at home and overseas, the statement continued:

Taxation on the profits of the year under review amounts in total to £214,721, resulting in a net profit after tax of £202,612 compared with £196,571. Your Board recommend a final dividend of 11 per cent, making with the interim dividend paid, 15 per cent, the same as last year.

PROPOSED SCRIP ISSUE

Your Board has decided to recommend the issue by way of bonus of 300,000 10s. Ordinary Shares in the ratio of three new fully paid shares for every eleven shares held.

I have before me details of the results of all the companies in the Group for the first four months of the current financial period, and I am pleased to be able to tell you that a good start has been made. Your directors consider that in the absence of any unforeseen contingency the results for the current year will enable them to maintain dividends at the rates declared for the year ended September 30, 1956, on the present share capital, and also upon that which it is proposed to issue by way of bonus shares.

The report was adopted and the scrip issue approved.

THE HALIFAX BUILDING SOCIETY

ONE HUNDRED AND FOURTH ANNUAL MEETING

SPEECH OF ALGERNON DENHAM, JP

The One Hundred and Fourth Annual Meeting of the members of the Halifax Building Society was held in Halifax on April 1, 1957, the President, Mr Algernon Denham, JP, presiding. In his review of the year the President stated:

Our experience in the past year can, I think, be described as falling into two distinct periods. In the first half of the year we were paying on the bulk of our shares a 2½ per cent rate of interest which, as we were soon made to realise, was too low for us to compete effectively for investments.

Our present rates of interest came into operation on August 1, 1956, and in the second half of the year the rate paid on the majority of our shares was 3½ per cent income tax paid by the Society.

The introduction of the higher rate was immediately effective both in stimulating investments and in reducing withdrawals, so much so that from August, 1956, to January, 1957, our net inflow of investments was £20,651,000 whereas the comparative figure in the preceding six months was only £3,097,000.

I believe the result of our year's effort is reassuring and satisfactory. The growth in assets is easily a record, and it is interesting to note that the increase of assets during the year totalling £32,800,000 is the equivalent of our total growth in the first 73 years of our existence.

The net inflow of funds in the second half of the year, which averaged £3½ million per month, happily coincided with favourable investment opportunities of which we were able to take advantage. Not only were mortgage restrictions relaxed, but we were able to build up our liquidity to 17.9 per cent of total assets, and on January 31, 1957, we were holding £53,234,000 in Trustee Securities and cash.

Our revenue surplus of £610,904 is only £22,080 greater than last year, notwithstanding our substantial growth. This does not perturb us, and should be welcomed by borrower and investor alike as each section benefits by the narrowness of our operating margin.

Our total lendings at £46,123,749 are some £2½ million less than last year. This experience is due to the recession of income during the first six months, which necessitated some measure of restriction in our advances.

Since the end of the year our advances have been 40 per cent higher than in the corresponding period last year, but much depends upon the availability of attractive securities if this figure is to be maintained. 96.8 per cent of our lendings during the year have been to occupier borrowers.

Profits tax, which cost us £243,000, is, in the case of building societies, an imposition from which they should be immune.

One of the main purposes of profits tax was an attempt to discourage inflation by restricting dividend distribution by limited companies and, in my view, we, as mutual institutions, are entitled to complete relief. The tax was also intended to replace excess profits tax from which building societies were exempt, and I have never understood the reasons for the imposition of profit tax on them.

JOHN EMSLEY LIMITED

The tenth Annual General Meeting of John Emsley, Limited, was held on April 3rd at Bradford, Mr Harold Jaques, ASAA, chairman and joint managing director, presiding. The following is an extract from his circulated statement:

I am pleased to report that the profit for the year's working has increased by more than £45,000 over that shown last year.

During the year a further spinning firm—The Wapping Worsted Spinning Company, Limited, was added to our Group. I feel sure that this will prove to be a valuable addition to our Group.

Wool values based on 64's tops are about 30 per cent higher than a year ago. These increases have tended to bring out more business, thereby forcing longer delivery dates, due in part to the general shortage of labour throughout the industry.

The distribution of our goods in the United States of America has been maintained with profit, and an extension of sales in the Canadian market is anticipated.

We are greatly concerned at the rapid rises in costs of all kinds with which we are faced. Most, if not all, are entirely beyond our control. They are a severe threat to the continuity of our exports. Our efforts to meet this situation by more efficient utilisation of machinery are having some success. It should be remembered, however, that the high styling and general intricacy of the cloths required by many of our most important export markets make mass production methods extremely difficult.

We have a longer order book than we have had for some years past, which will ensure maximum activity for many months. The report was adopted.

HENEKEYS LIMITED

FRUSTRATING TAXATION BURDEN

The thirty-seventh annual ordinary general meeting of Henekeys Limited was held on April 2nd in London. Sir Bernard D. F. Docker, KBE, JP (the chairman), presided and, in the course of his speech, said:

Turnover is up by £104,000, but expenses are up, so that in spite of increased earnings the Net Profit subject to Taxation is up no more than £800. Taxation has taken an extra £4,000, and this year there is no over-provision to be added back (£4,000 last year); our profit after taxation, therefore, is £7,000 down. Increased turnover, without a compensating rise in profit, is an only too familiar experience in business today. A large reduction in taxation is vital to the very existence of this country. The present heavy burden is completely frustrating and unfair.

The reconstruction of Whitehall and City Branches, improvement to Yarmouth, and the provision of off-licences at Twickenham, Bromley and Marylebone, are now complete and should benefit us in turnover and profit in the future.

We anticipate further rises in expenditure for General Rates, Depreciation, Rent and Profits Tax, and I think that although there is a flattening out of the rise in wages, they will also be up again.

Against this our turnover is still rising, and we have raised certain prices which will, I hope, offset the increases. Our prices despite this still show very good value. As far as it is possible to forecast, I expect another satisfactory year.

The rumours regarding a take-over bid are without foundation. The report was adopted.

INTERNATIONAL COMBUSTION (HOLDINGS) LIMITED

Annual Report and Accounts of the I.C.L. Group for 1955-56

INTERNATIONAL COMBUSTION LTD.
Complete Steam Raising Plants for Electric Power Stations and for other purposes in Great Britain.

INTERNATIONAL COMBUSTION PRODUCTS LTD.
Mechanical Stokers, Pulverising Mills, Feeders and Burners for all Steam Raising Equipment, Material Handling Equipment, Vibrating, Screening and Filtering Equipment etc., for sale in Great Britain.

INTERNATIONAL COMBUSTION (EXPORT) LTD.
All products of the Group for sale abroad.

RILEY (IC) PRODUCTS LTD.
Mechanical Stokers for small installations, Syntron Vibratory Equipment.

PRINCIPAL FEATURES

1954-5 £		1955-6 £
825,964	Net Profit for Year after Taxation	913,414
5,062	Preference Dividend	5,175
330,936 (20%)	Ordinary Dividend (22½%)	372,300
489,966	Net Profit retained in the Group for Development, Expansion and Contingencies	535,939
825,964		913,414
3,370,906	Net Current Assets before providing for advance taxation	4,269,783
1,034,849	Fixed Assets (less depreciation)	1,033,048
435,301	Investments (less Provision)	400,203
4,841,056	Total Capital Employed	5,703,034

EXTRACTS FROM THE CHAIRMAN'S REVIEW

The Group Profit of £2,097,229 is a record.

Group output showed an increase, achieved against a background of continuing material shortages.

Orders on hand at the year end show a fall compared with the previous exceptional year. Since then, however, inquiries have been received to supply two additional boiler units to complete the High Marnham Station, the first thermal station to be built by the Central Electricity Authority for a capacity of 1,000 MW to generate plant and thus a landmark in the history of electricity generation. Substantial orders have also been received for oil heating apparatus.

Our Subsidiary and Associated Companies in Portugal, Australia, Africa and India have reported satisfactory working results.

After considerable negotiations with the various interests concerned and with the co-operation of the Atomic Energy Authority and Central Electricity Authority, a Group Company has been established, known as Atomic Power Constructions Limited, in which our Company is a substantial shareholder, to undertake the construction of power plants of the Improved Calder Hall type. This Company should qualify for a reasonable share of the expanding programme for nuclear stations.

The working results of the Group for the current year will, I believe, approximate to those of the last year.

CHAIRMAN'S REMARKS AT MEETING

The Chairman stressed the necessity of maintaining a liquid position. Whilst it was anticipated that approximately £1,000,000 would be utilised for extensions to works, it might also become necessary to finance long-term contracts. Similarly, further development of manufacturing plants overseas might involve the Company in providing additional finance and considerable expenditure was anticipated on atomic power plant development.

JAMES PASCALL, LIMITED

RECORD RESULTS

The sixtieth annual general meeting of James Pascall, Limited, was held on March 28th in London.

Mr R. Ellman Brown, FCA (the Chairman), in the course of his speech, said:

It is with great pleasure that I am able to report a record result for the year ended December 31, 1956. The profit, subject to taxation, is £484,439, which represents an increase over 1955 of £119,603, and is the highest in the Company's history, exceeding by approximately £10,000 the previous record of the year 1954.

This figure has been attained in the face of ever-increasing competition, and whilst the relative ratio of the national consumption of sweets has decreased as against chocolate.

I attribute these results in great measure to our policy of further expanding the sales organisation and of increasing our sales promotion—our expenditure on advertising exceeding by £150,000 the sum total of 1954. Shareholders will be able to gauge from this the measure of the increased competition now ruling within the confectionery industry, where overall production potential undoubtedly exceeds existing demand. I feel that the expansionist policy which we have pursued has justified itself by results, and this course your Directors propose to continue.

Despite increased competition both from home and foreign sources, our export trade continued at a most satisfactory level during 1956, and once again I am glad to report that our sales to dollar markets were considerably increased. The Profit on Trading amounted to £636,688 compared with £485,964 for the year 1955. The Directors propose that the dividend on the Ordinary Shares should be increased from 50 per cent to 55 per cent. Your Directors would have considered a further small increase in the Ordinary Dividend were it not for the manifold uncertainties of the year 1957.

FUTURE OUTLOOK

I am loath to forecast results for the year 1957. As I have already indicated, your Directors' policy is one of continued expansion and we have undertaken a fresh programme of technological and factory development, to improve still further our manufacturing efficiency and the range and attractiveness of our products. Our Sales forecasts have been drawn on the basis of a greater tonnage for this year, but the Suez crisis has since brought into play many imponderables which we cannot yet clearly resolve, and for the first weeks of 1957 our sales were running below last year's level. Our own organisation for direct distribution has so far, in the main, successfully overcome the difficulties of fuel rationing, but it is evident that the wholesale trade has had greater problems in this direction, which we hope they will satisfactorily surmount. In any event, it is clear that we shall have to bear in 1957 much heavier transport costs than was the case in 1956.

Similarly, it is also evident that further additional costs will have to be met by the industry in 1957. Nevertheless, your Board feels that it must take a long term view in these matters and continue to plan for the future rather than against the possibility of temporary stringency. I believe that the measures in hand for the continued rationalisation and improved efficiency of our methods of production will keep us fully competitive in this highly competitive market.

The report and accounts were adopted.

ASHANTI GOLDFIELDS

The sixtieth annual general meeting of Ashanti Goldfields Corporation Limited was held on April 3rd in London.

Major-General Sir Edward L. Spears, Bart, KBE, CB, MC, FInstD (Chairman and Managing Director), presided and, in the course of his speech, said:

The reduced profits for the year under review are due to the 14 weeks general strike on the mines from November 20th to February 27th. In the current year, the re-equipment of your property, and the improvements to the shaft system and underground lay-out, on which such large sums have been spent, has reached a stage when we can, unless the unforeseen occurs, look forward with confidence to obtaining a high level of output of ore of not less than 17.6 dwt.

From October to March, the record tonnage of 164,900 was produced, yielding 133,309 ounces of gold. Working profit was £654,342. If our expectations are fulfilled the results for the second half year should at least equal these figures, and will constitute the second largest output of gold in any year in the history of Ashanti Mine.

The technical position of the mine continues to be strong. Reserves are sufficient for five to six years' supplies to the mill, and prospects for future development are encouraging.

As regards future dividends, you may rest assured that it will be our policy to relate these to the improved profits which we hope to achieve, while making adequate provision for the necessary expenditure to ensure the future of the property.

The report was adopted.

HADFIELDS LIMITED

The Sixty-ninth Annual General Meeting of Hadfields, Limited, was held on April 4th at Sheffield, Lord Dudley G. Gordon, DSO, LLD, MIMechE (the chairman) presiding.

The following is an extract from his circulated statement: The profit earned and attributable to the Hadfields Group of Companies was somewhat in excess of the previous year.

During the year Research and Development continued with the greatest vigour and achieved satisfactory results. One example of development following research is in the expanding field of nuclear power. In order to meet these specialised requirements a number of new alloy steels have been developed. With the opening of the Calder Hall Nuclear Power Station, the first large-scale installation utilising these special alloy steels has been completed and manufacture for further large contracts is proceeding.

The total value of commercial orders received from home and overseas customers shows an increase compared with the previous year. Included in this is a significant advance in export work.

It is clear that at the present time it is difficult to forecast what will be the full effect of what is known as the "Suez Crisis." Certainly this must have its effect on industry generally and it is impossible for any one undertaking such as ours, which gives service to industry, to escape altogether the repercussions of such difficulties.

This does not mean that your Directors have any lack of faith in the future. Active consideration is being given to further extensions to enable us to meet the demand for our products. The report was adopted.

TANKER INVESTMENT TRUST

At the thirty-fifth Annual General Meeting of Tanker Investment Trust Limited held on April 1st in London, the Chairman, Mr Kenneth Keith, who presided, said:

In my statement, which accompanied the Report and Accounts, I informed you that your Board had under active consideration certain proposals which, if they came to fruition, would necessitate realisation and reinvestment of your Company's portfolio of general investments. Arrangements have now been finalised which will further expand your Company's interests in shipping—again in a Bermudan Company.

In this venture, as in London and Overseas Tankers Limited, your Company is an equal partner with London and Overseas Freighters Limited, but in this case the ships concerned are bulk carriers, not tankers. The share capital of this new Company, London and Overseas Bulk Carriers Limited, is only nominal at the present time, but it is visualised that your Company will subscribe such additional capital as may be required in years to come to retain a 50 per cent interest in the equity.

London and Overseas Bulk Carriers have contracted for the construction of two 25,000 dwt bulk carriers in Germany for delivery in 1961 and 1962. The first of these is provided with long term employment at a satisfactory rate of freight. Negotiations are in progress with a view to securing similar employment for the second vessel at a higher rate of hire, even though she will not be completed until a year later.

It will be apparent that this new investment in shipping has the advantage of spreading the Company's interests into the dry-cargo field whilst maintaining the advantages of the long term employment peculiar to the bulk carrier type of ship.

THE CHARTERED BANK

103rd ANNUAL GENERAL MEETING

The One Hundred and Third Annual General Meeting of The Chartered Bank was held on April 3rd at the Bank's Head Office, 38 Bishopsgate, London, E.C.2.

The Chairman of the Bank, Mr V. A. Grantham, presided.

Mr H. F. Morford, Chief General Manager, read the notice convening the meeting and the report of the Auditors. With the consent of the stockholders present, the Report and Accounts, which had been circulated previously, were taken as read.

The Chairman then moved that the Report and Accounts for the year 1956 be approved and that a final dividend of 7½ per cent, less Income Tax, be declared; this, together with the interim dividend of 7½ per cent already paid, made a total distribution for 1956 of 15 per cent.

The resolution was seconded by Sir John Tait and carried unanimously.

The retiring Directors, Mr V. A. Grantham, Mr Archibald Orr Lang, and Sir William Cockburn, were re-elected.

Messrs W. A. Browne & Company and Messrs Deloitte, Plender, Griffiths & Company were re-appointed Auditors, and their remuneration was fixed.

A vote of thanks to the Directors, General Managers, Branch Managers and the Staff at home and abroad for their successful conduct of the affairs of the Bank was proposed by Sir John Woodhead, KCSI, CIE, and seconded by Mr Joseph Nissim.

APPOINTMENT

RHODES UNIVERSITY

GRAHAMSTOWN, SOUTH AFRICA

Applications are invited for the post of LECTURER or JUNIOR LECTURER IN *SOCIOLOGY*.

The salary scales:

Lecturer: £800 x £50—£1,050 p.a.

Junior Lecturer: £550 x £50—£750 p.a.

In the case of *married persons only* a variable cost-of-living allowance, at present £234 p.a., is payable in addition. *Previous experience and academic qualifications* may be taken into account in fixing the commencing salary.

Full particulars and application forms may be obtained from the *Secretary, Association of Universities of the British Commonwealth*, 36 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in *South Africa and London*, is *April* 30, 1957.

AIR MINISTRY: TRANSLATOR IN GERMAN AND FRENCH. The Civil Service Commissioners invite applications for a post in London. Appointment will be temporary in the first instance, but there are prospects of establishment.

Age at least 21 on March 1, 1957.

Candidates must normally have at least a 2nd class honours degree in German, and must have a thorough practical knowledge of German and a working knowledge of French. Candidates without a degree may be admitted if they have a thorough knowledge of both languages acquired through residence in the countries.

Starting salary (men) from £485 (at 21) to £625 (at 25 or over). Maximum £1,000. Women's pay lower at present, but being improved each year until equality with men's scale is reached by 1961.

Particulars and application form from Secretary, Civil Service Commission, 6 *Burlington Gardens, London*, W.1, quoting No. 4683/57/9. Completed application forms should be returned by April 30, 1957.

ECONOMIC male, 1st/2nd Class Hons., required for special investigations current economic problems. Age 24-28. Some business experience desirable.—Write E/1, P.S.D. The Metal Box Co. Ltd., 37 Baker Street, London, W.1.

OLD-established City Investment Bankers require MANAGER with *investment and administrative* experience to take charge of department dealing actively in Canadian securities. Age approximately 35-50 years.—Please write, *giving full particulars*, to Box E.593, c/o 191 Gresham House, E.C.2.

MARKET Research Department of the Co-operative Wholesale Society Ltd. has a Consumer Research Section which undertakes national surveys on a wide range of subjects. The Section, which has its own field staff and testing panels, is controlled from Manchester.

Following a promotion, the department requires a suitable person to take charge of the operation of the Section. Principal duty would be to collaborate with other members of the staff in survey planning and report drafting, and to take full responsibility for liaison between, including quota determination, questionnaire drafting, control of interviewers and tabulation of results. Experience is an essential qualification.

Applications, giving full details of age, education, career to date and present commitments should be addressed to Central Personnel Department, C.W.S., Limited, Balloon Street, Manchester, 4, to be received not later than April 18, 1957.

A CAREER IN MARKET RESEARCH

A few attractive vacancies in our Market Research Department are open to single young women under 30 years of age.

In this interesting and active out-door work our interviewers meet and talk with people of all kinds in connection with our Market Research surveys. The work can involve considerable travel throughout Great Britain and when away from home good hotel accommodation is arranged.

This is *not* a selling job.

Applicants for these positions should be prepared to be based upon London, Newcastle, Manchester and Oxford.

Apart from a good standard of education, our interviewers must possess a pleasing personality and appearance, the ability to drive and a preference for the healthy and active out-door life.

The Company provides a minimum gross remuneration of £500 per annum and, naturally, in addition pays expenses when away on Company business.

Applicants should write, giving full details, to the Personnel Officer, Petfoods Limited, Melton Mowbray, Leicestershire.

A LARGE-SCALE CONCERN, directed from the North Midlands but with branches and associated concerns throughout Great Britain, proposes to appoint a Personnel Manager directly responsible to the Managing Director. Applications are invited from qualified men with experience, preferably with dispersed undertakings, covering recruitment, training, promotion, welfare at all levels; salary and wage assessments and job assessment techniques, T.U. negotiations. *This is a new appointment* offering great scope.—Full details of age, education and qualifications, experience, salary, should be included in applications to F. M., The Wallace Attwood Company, *Management Consultants*, Chantrey House, Eccleston Street, S.W.1.

GEORGE KENT LTD., Instrument Engineers, Luton, wish to appoint a *Sales Engineer* Executive to take charge of the Controls and Records Section of their Sales Department. The successful candidate would also be required to extend the Company's market research organisation and take an active part in sales forecasting.

Candidates should be between 25 and 35 years of age and, preferably, graduates in economics and statistics. *Equally suitable qualifications* would be a degree in engineering, with an inclination towards the administrative side of sales. Commencing salary will depend on qualifications and experience.

Apply in confidence, giving full details, to the Administrative Manager.

LONDON COUNTY COUNCIL

London School of Printing and Graphic Arts. Applications invited for post of *Senior Lecturer in Management Studies* in the department of administrative subjects. *Preference* will be given to candidates qualified to teach factory management, work study and allied subjects to *students* preparing for the intermediate certificate and national diploma in Management Studies. Candidates should state any other *subject they are qualified* to teach. Salary £1,350 x £50 to £1,550, plus London allowance £96 or £48.—Application forms from Principal at the School, Back Hill, E.C.1, returnable by April 20, 1957. (313)

ASSISTANT STATISTICIAN required by N.C.B.'s Statistics Branch at London Headquarters, with degree in economic statistics or economics with statistics as special subject. Post graduate experience in drafting reports and concise comments on statistical material is desirable. Post offers good *opportunities* for promotion. *Appointment* (superannuable), depending on qualifications and experience, within inclusive scale, £770 to £898 (male), £694 to £810 (female).

Write, with full details of age, education, qualifications and experience, to National Coal Board, Staff Department, Hobart House, London, S.W.1, *marking* envelope X.673/D, *before* April 15, 1957.

MANAGEMENT SELECTION LIMITED have been retained to advise on the appointment of a

MARKETING MANAGER

for a leading international company in the cosmetic field. This is a new appointment, and the company, which is situated in the West End of London, seeks a man of outstanding ability to co-ordinate its marketing effort. The position will interest those earning about £3,000.

Candidates, who should preferably be in their mid-thirties, must have successfully controlled a sales force and have experience in *marketing, advertising* and promoting the sale of packaged consumer goods.

Please send brief *details in confidence*, quoting *reference* S359, to P. J. H. Fryer, Management Selection Limited, 17 Stratton Street, London, W.1. No information will be disclosed to our *clients until* candidates know their identity and have given permission after personal discussion.

ADMINISTRATIVE CLASS, HOME CIVIL SERVICE. Supplementary Open Competition, 1957. The Civil Service Commissioners invite *applications from first-class* honours graduates for about half a dozen posts. Competition open to men and women at least 24 and under 26 on August 1, 1957, with *extension* for service in H.M. Forces. Selection by tests and interviews at Civil Service Selection Board in London in late June, followed by final interview.

Starting salary (London): £605; £665 for a man if he has done two years' compulsory Forces service. Special increase of £75 normally after two years' service. Salary scales of higher posts: £1,375 to £1,950 and £2,000 to £2,600. Somewhat lower outside London. Women's scales, where lower than men's, are being raised to reach equality with men's by 1961.

Full particulars (including prospects of promotion) and application form from the Secretary, Civil Service Commission, 6 Burlington Gardens, London, W.1, quoting number 541/57/7. Completed application forms should *be returned by May 15, 1957*

A Chemical Manufacturing Company, *already* one of the world's leading concerns in its specialised field and still expanding, is seeking a

FINANCIAL CONTROLLER

The *location* is the North Midlands, with a London office. The man appointed will be required to advise the Chairman and Directors on Financial and Commercial matters at the highest level. If he has experience of the Chemical or a related industry so much the better, but this is not absolutely essential. He will certainly be a person of adequate educational background and acceptable personality, probably a University graduate. He must be able to represent the Company in financial or commercial negotiations often involving large sums. He may be an Accountant or possibly a *Banker with commercial experience*. He will have charge of the Company's Accounting and related departments and must be able to work amicably with technical colleagues. *He must be willing* to travel at home or abroad when necessary. The successful applicant will be in a position to *influence the Company's policy* very substantially, and he will find his employers ready to reward successful effort.

The Company has in *mind a man in the age-range 40-45, already earning £4,000* a year or more. There is a discretionary bonus.

Applications, which will receive the personal attention of the Chairman and will be treated in the strictest *confidence*, should be addressed to Box 666.

QUALIFIED Accountant with wide experience required for professional *appointment in Central Africa. Initially* the appointment would be for a tour of 2 years, but it is a permanent one leading to exceptional prospects for a man with energy and initiative. Sound knowledge of French is necessary.—Write Box X.892, c/o Streets, 110 Old Broad Street, E.C.2.

STATISTICIAN REQUIRED by large Birmingham Ironmongering Company. The applicant should have a good educational background (preferably Public School) and a pleasing personality. Experience in Market Research in the domestic appliance and general engineering fields would be an advantage and the ability to present information in a clear and easily understood manner is essential. —Apply, *giving full details* of age, experience and salary required, to Box 673.

NORTH WESTERN GAS BOARD

MATHEMATICIAN—ELECTRONIC COMPUTER PROGRAMMING

Applications are invited from graduates with a *first or second class* Honours Degree in Mathematics for the post of Senior Programmer to an Electronic Digital Computer Installation shortly to be set up by the Board for *commercial applications*. Full facilities for comprehensive training will be made available to the successful applicant.

Candidates should preferably be between 27 and 32 years of age and have had some business experience. The appointment will be pensionable, and whilst the *commencing salary* will be according to age, qualifications and experience, it will not be less than £1,100 per annum.

Applications, giving full details of education, age, qualifications and experience, should be forwarded to the *Secretary*, North Western Gas Board, 60 Whitworth Street, Manchester, 1, within 14 days.

MINISTRY OF AGRICULTURE, FISHERIES AND FOOD and DEPARTMENT OF AGRICULTURE FOR SCOTLAND. The Civil Service Commissioners invite applications for three pensionable posts—one AGRICULTURAL ECONOMIST and one ASSISTANT AGRICULTURAL ECONOMIST in London, and an ASSISTANT AGRICULTURAL ECONOMIST in Edinburgh.

Age, at least 26 on April 1, 1957, for Agricultural Economist, and at least 21 and under 28 on that date for *Assistant Agricultural Economist*. Deduction from age for service in H.M. Forces. All candidates must have 1st or 2nd Class Honours degree in agriculture or economics or related subject. Pass degree or post-graduate diploma acceptable in certain circumstances. In addition, for the Agricultural Economist post, candidates must *have had at least three years'* appropriate post-graduate or other experience of value.

Men's salaries (London)—Agricultural Economist £1,135 to £1,345; Assistant Agricultural Economist £605 to £1,055 (£585 to £1,025 in Edinburgh). Starting pay above minimum in certain cases. Women's pay slightly lower at present but being *improved* each year *to reach* equality with men's by 1961. Promotion prospects.

Further particulars and application forms from Secretary, Civil Service Commission, 6 Burlington Gardens, London, W.1, quoting No. 4682/57/7. Completed applications should be returned by April 23, 1957.

FORMER H.M. Inspector of Taxes (40), Oxford graduate, last five years as Assistant in Tax Department of very large International group of companies, seeks *similar* appointment. Experienced in the preparation of extensive computations and of studies of the tax problems arising in such a group. Salary £1,700.—Box 672.

SUCCESSFUL TUITION FOR THE B.Sc.(ECON.) DEGREE

Wolsey Hall (Est. 1894) provides Postal Courses in a wide range of subjects for the two examinations for *Lond. Univ. B.Sc.(Econ) (three if Entrance* is included). Moderate fees, instalments. 1,000 Wolsey Hall students have secured this valuable degree since 1925.—Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P.16, WOLSEY HALL, OXFORD.

"FROM A PAPER CLIP TO AN OFFICE." (*EDITION SEVENTEEN.*) 45,000 copies of the March, 1957, edition of this fully priced and illustrated 92-page catalogue have been mailed throughout Great Britain during this week. It *provides a priced* specification and summary of everything used in the modern office. If you have not received a copy supplies are still available to any office organisation *free of charge*. (We regret we cannot send to private individuals).—P. Matthews and Son, Ltd., 61/63 Dale Street, Liverpool, 2.

"FOREIGN AFFAIRS: An American Quarterly Review." *Complete set from* 1922. Vols. 1-24, bound brown cloth, Vol. 25 to date, unbound. As new condition. Terminating subscription in July at end of current vol. Possibly subscription can be transferred to purchaser. Cost 25s. to 45s. per vol. over the years. Offers invited.—Box 671.

TAPE TRANSCRIPTION of *conferences, reports or* letters undertaken on your *premises* or ours, in this *country* or abroad. Service by post to provinces.—The Palantype Agency, 229-231 High Holborn, W.C.1. (CHAncery 3460.)

FEELING FOGBOUND? Stand at your window with a glass of Duff Gordon's El Cid Sherry. Watch the mist turn rosy.

WORK STUDY.—Next six-weeks' *full-time* course starts May 6th. Details of this and eight others, including part-time, evening and correspondence, from The School of Time and Motion Study, 29 *Cork Street*, Piccadilly, London, W.1.

JERSEY IN SPRINGTIME. Come south for the sun and stay at Hotel L'Horizon, St. Brelade's Bay. The hotel, *facing* south across the Bay, is in an *ideal setting* for a perfect spring holiday. Continental cuisine. Good wine cellar. Cocktail bar. Drinks and cigarettes at low Jersey prices. Sixty bedrooms; some with private *bathrooms, many with* private sun balconies. *Resident* dance band.—Write for tariff, or telephone Southern 887.

THE Economists' Bookshop has the world's widest range of books on Economics, Politics, History, Anthropology and the Social Sciences. World-wide mailing service. Second-hand books bought.—11-12 Clement's Inn Passage, Aldwych, London, W.C.2.

EXPERT POSTAL TUITION for *Examinations*—University Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, *General Certificate of Education*, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus—and/or advice, mentioning examination or subjects in which interested, to *the Secretary (G9/2)*.

METROPOLITAN COLLEGE, ST. ALBANS or call at 30 Queen Victoria Street, London, E.C.4.

ANNUAL AIR SUBSCRIPTION RATES

Subscriptions to most countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is either because the alternative is not available or not recommended.

	Airmail	Air Freight		Airmail	Air Freight		Airmail	Air Freight
Australia	£8 5s. strlg.	—	India & Ceylon	£7 15s.	£6	Pakistan	£7 15s.	£6

"An' there ain't no buses runnin'
from the Bank to Mandalay....."

RUDYARD KIPLING

No, nor from the Bank to Broken Hill, to Stradbroke Island, or to Weipa. Nature has not always arranged for valuable mineral deposits to be situated within commuting distance of large cities. Even in the old prospecting days the lone miner searched for the great bonanzas in the lands that God gave Cain. Today, the search for new orebodies goes on in remote areas inaccessible even to the tough prospector. The forty-niner and his mule have been followed by the geologist in his helicopter. Modern aids to prospecting leap over the walls of vast distances, and even the absence of airstrips does not hinder the vertical descent of the helicopter.

In their continent-wide search for new mineral sources Consolidated Zinc's geologists often have to leave the busy bus routes. The concrete and steel fingers of road and rail do not point the way for them in the remote outback. But the soft swoop of the helicopter sets them down in areas trodden only by aboriginal man, where the geological series is often uncharted and where they hope to discover new orebodies to supply raw materials for the expanding demands of industry throughout the free world.

DUNLOP TUBELESS

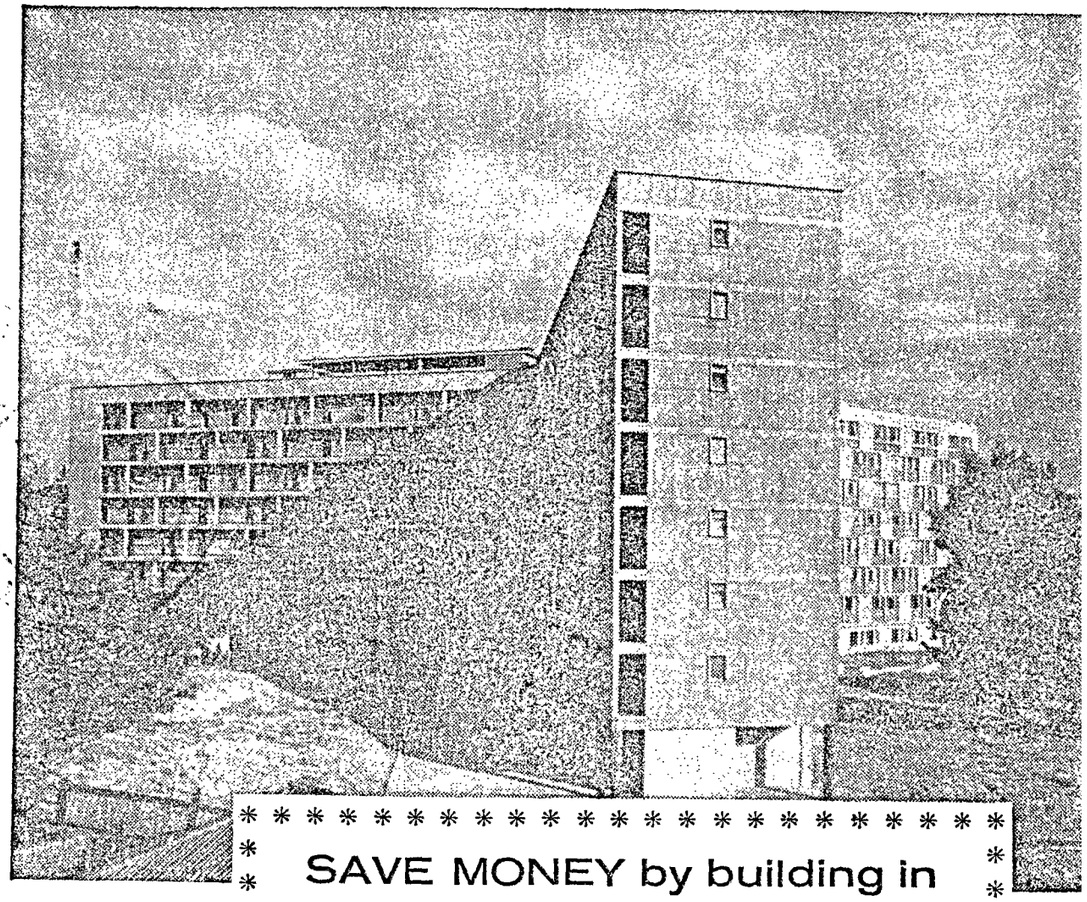
Flies almost as fast as the stork—the DC-7C

Whatever your reason for getting there sooner...

Take the DC-7C—world's fastest airliner

With their top speed a remarkable 410 miles an hour, the famous DC-7 series of airliners—the DC-7C, DC-7B and DC-7—*wing you in spacious comfort across oceans and continents . . . anywhere in the world.*

The trans-ocean DC-7C saves travel time, not only by speed, but by its ability to fly farther without refuelling than any other airliner. And its dependability is in the famous tradition of the Douglas-built DC-6 and DC-6B airliners, in service throughout the world.

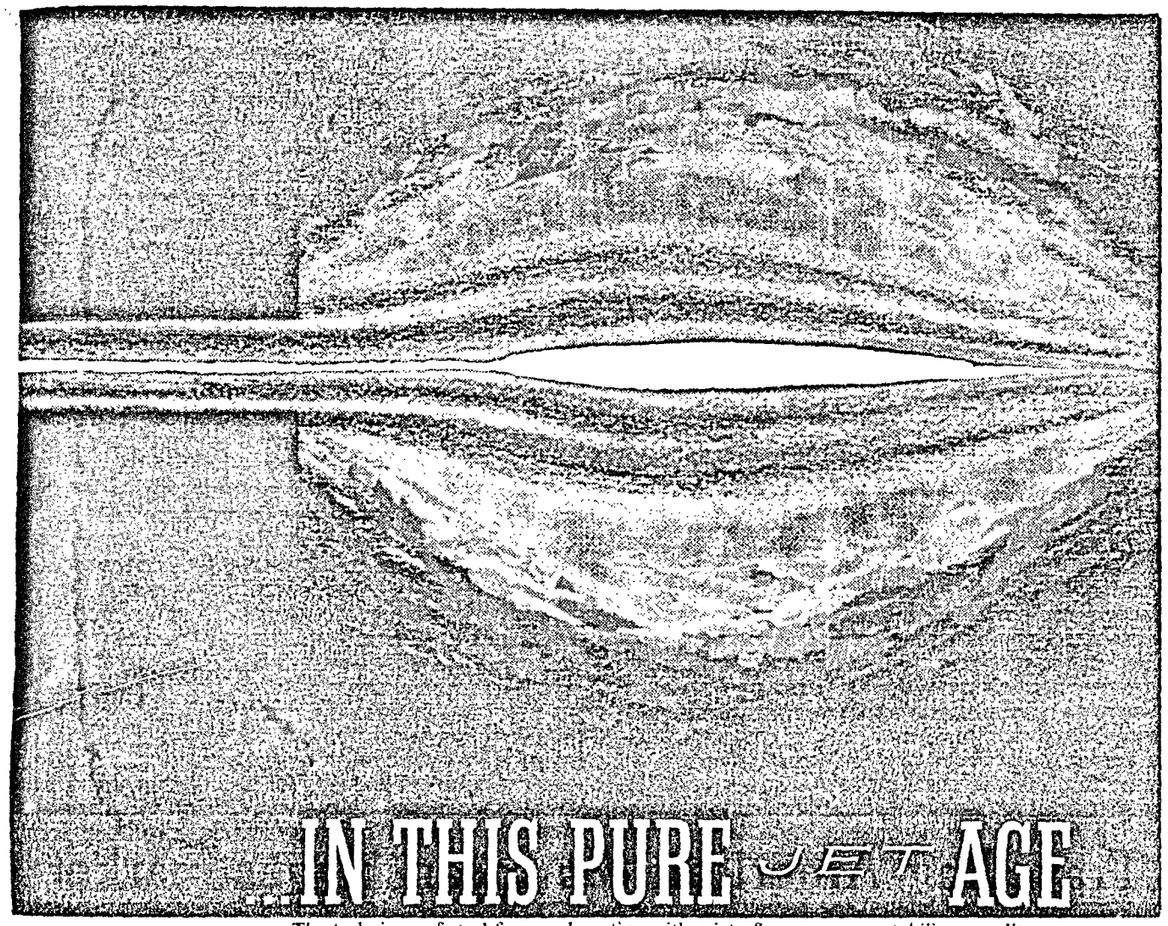


On your next trip go Douglas. See why more people, more airlines fly Douglas than all other airplanes *combined.*

DOUGLAS

BUILDER OF THE DC-8 JETLINER

● BEVIN COURT, Finsbury. ARCHITECTS: Skinner, Bailey & Lubetkin A/A.R.I.B.A. CONTRACTORS: Tersons Ltd.
Reinforced concrete used for the whole of the main structure. Precast reinforced concrete slabs used for facing.



SAVE MONEY by building in REINFORCED CONCRETE

REINFORCED CONCRETE is being used increasingly in Great Britain for offices, factories, warehouses, flats, schools and similar building and industrial projects, as it has proved itself the *cheapest form of construction.* For the building frame, external cladding, staircases, floors and roof, reinforced concrete offers many advantages—in addition to that of low cost. Modern concrete technology, aided by research—The Blue Circle Group of Companies alone spend over £300,000 each year on research and development—and the availability of the range of Blue Circle Products for structural and decorative concrete, have placed concrete in the forefront of modern constructional materials.

IN THIS PURE JET AGE

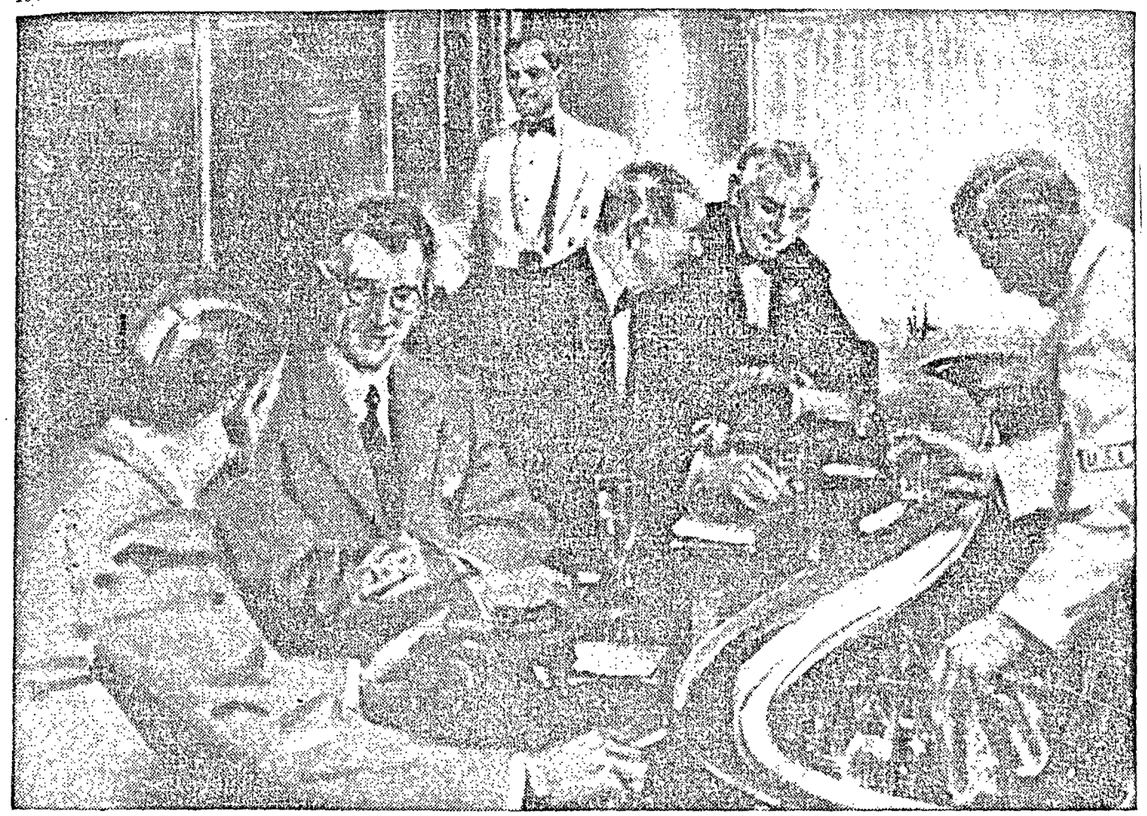
The technique of steel furnace boosting with a jet of pure oxygen stabilizes quality and batch uniformity.

This principle, whether applied to Open Hearth, Blast or Bessemer, enables manufacturers to widen still further their range of specialised quality steels.

Growing demands of scientific and industrial progress require speedier delivery in the face of increasing competition. It is vital that manufacturers employ this latest technique which shows greater economy and is only made possible by employing the proven principle of the Butterley on-site Tonnage Generator.

This compact, efficient plant produces a continuous supply of Oxygen and/or Nitrogen at any desired purity and pressure, piped direct to the point of usage, in the exact quantity desired. Its efficiency eliminates production hold-ups by maintaining a constant supply, and maintenance costs are low.

The Butterley Company have acquired the sole production and sales rights of this, the most successful American Process, for the United Kingdom, British Commonwealth, and certain European countries.



If you can use oxygen, consult

Travelling American *can* mean bigger markets

BRITAIN'S biggest group of exports to the U.S.A. is road vehicles of all kinds, from bicycles to heavy-duty trucks. Take the North American representative of one of Britain's leading car manufacturers. We might call him Mr. Rigby. He is out to capture even more dollars to pay for Britain's vital imports.

Mr. Rigby chooses to travel to America by United States Lines.

On board the famed "United States" or her running-mate the "America" he finds pleasant, informal surroundings. Here he meets American businessmen—important in his job. In a social atmosphere where everyone tends to be relaxed and friendly, he finds it far easier to make contacts than over an office desk.

If you are a businessman, remember that here is a perfect background in which to begin a really successful American trip. While they are unhurried, and unworried, you meet the men who may make all the difference.

Punctuality is important, too. You may have an appointment to keep soon after you disembark. The "United States" holds the Blue Riband; her extra reserve of speed means that she has an outstanding record for timekeeping.

There's plenty of fun on board, too. You'll find unexcelled food and wine, cinemas equipped with CinemaScope, top-grade orchestras, every "keep-fit" facility, well-stocked libraries and, if you want, the pleasure of just resting and relaxing. The days between you and New York will pass all too quickly when you travel by United States Lines.

Is it really exciting?

LIFE seems exciting, certainly, if you read the popular newspapers. Hardly a day goes by without murder, divorce, sex and violence, making the front-page headlines. Will you find things different in the Manchester Guardian?

Different—yet hardly less exciting. For truth is not only stranger than fiction—it is stranger than half-truth or hysteria. The Manchester Guardian works on the assumption that good reporting, in good English, is the core of good journalism. The excitement is in the news itself. (If the day's news is *not* exciting, neither huge type nor scare words will really make it so.)

Habit makes slaves of us all. But if you *can* bring yourself to make a change, to try the Manchester Guardian as your daily paper—you may find that journalism has a new meaning, a new value, for you.

"'Wallpapering is easy', my friends said. 'Do it yourself'. So I did—and fell off the ladder. I sprained my shoulder and caught my eye on the brush handle. It might have been very serious. As it was, I was away from work for 12 weeks. The £120 I got from 'The Northern' was a godsend."

This is an ACTUAL CASE taken from our records. For a yearly premium of £2.10.0 this Policyholder is insured for total disablement compensation of £10 per week for a maximum of 104 weeks. £1,000 is payable in addition if the disablement should prove total and permanent. Alternative benefits include £1,000 in the event of accidental death or loss of eye or limb.

Surplus Rather than Energy

ALTHOUGH Mr Thorneycroft's budget of bits and pieces is inevitably being attacked from the left as a class-conscious affair, because it has given most reliefs to those who pay the most tax, its most important characteristic is that it is a conservative budget in something quite other than the class sense. Its caution is revealed by the budget accounts. Thanks to the economies in Government spending which he, or more effectively Mr Sandys, had announced before last Tuesday, Mr Thorneycroft could bring into his budget ordinary expenditure which, in money terms, promises to be £41 million less than ordinary expenditure in 1956-57; as prices have already risen significantly above the 1956-57 average, and must clearly be expected to rise more, the estimated saving in real terms is considerably greater. Some measure of that real saving can be gauged from the fact that the Chancellor estimated that ordinary revenue, thanks mainly to this past and prospective rise in prices, would have risen by £229 million in 1957-58 on the basis of unchanged tax rates. This gave Mr Thorneycroft a prospective increase of £270 million in his ordinary budget surplus. He has elected to give only £98 million of this away. Even allowing for some £40 million of adventitious bookkeeping receipts in his prospective tax revenue, it is not unreasonable, if also a little over-simplified, to say that the net effect aimed at in the budget is that the excess of the Government's current revenue over current expenditure should restrain demand by between £100 and £150 million more in 1957-58 than it did in 1956-57.

This cautious decision could be justified on two grounds. One would be if the Chancellor thought that, although industrial production failed to rise, total demand was insufficiently restrained last year; the other and more cheering argument, on which the Chancellor and the Treasury really rest their case, is that, although the budgetary balance will restrain demand a little more this year, other factors will swell demand and production more. Almost all outside analysts will agree that these other factors are likely to swell demand; but most will regret that Mr Thorneycroft was not more specific in his estimates of by how much.

Some estimate of the indications of the trend that he did give—and of the quantities that outside estimators might reasonably affix to them—is made in a note on page 113. Here it is enough to say that, if one adds together one's highest estimates of the possible increases in real consumption, exports and investment, and then subtracts from them the £100 to £150 million odd of apparent real saving on Government current expenditure, they would suggest an increase in demand and production this financial year of a little over £500 million. This is a sizeable increase. But it is still only a little more than two-thirds of the annual rate of increase in production that was being achieved in the two years up to mid-1955, despite the fact that the present under-utilisation of expanded capacity has led many economists to suggest that the rate of enrichment could now be considerably higher. The Chancellor explained his

caution forthrightly : "It would indeed be the easiest task for any Chancellor to boost home consumption and investment at the cost of lower exports, of higher imports and a thumping external deficit. It is, however, a policy in which I should be prepared myself to play no part whatever." It is into this cautious framework that Mr Thorneycroft has fitted his tax reliefs ; and it is in this framework that the longer-term economic and political implications of the budget must be viewed.

THE principal consequence in terms of taxation was that the Chancellor felt unable either to restore the investment allowances or to raise the general earned income allowance, which would have reached down into the middle (emigrant ?) and lower ranges of taxpayers ; the first, at any rate, of these omissions is probably the budget's main mistake. With £45 million of his chosen £98 million of reliefs, there can clearly be no argument in these columns. The reduction in entertainments duty, as offset by the excise levy on television licences, and the £40 million of "middle-class" reliefs (especially the higher income tax allowance for older children, and the earned income concession to surtax payers) accord very neatly with *The Economist's* own prescriptions, as set out in our article on "middle-class" reliefs four weeks ago. But the Chancellor's chosen directions for his other £53 million of reliefs are a different matter, and deserve some critical scrutiny.

The biggest of them, costing £25 million this year, which has been surprisingly underplayed in comment so far, is the exemption from tax for overseas trade corporations, in order to assist British exports and investment abroad. There is a strong case for encouraging the establishment of overseas subsidiaries to push British sales ; mining and extractive ventures can also present a sound argument for the relief ; but it is less certain that it is wise to extend it to manufacturing concerns overseas. Many people may think that it would be better to encourage British manufacturing investment at home than in at least some places abroad. The second biggest individual relief, the £18 million of purchase tax reductions on kitchenware and some other domestic goods, is, together with the expected but expedited demise of the special petrol tax, the most obvious political sop in the budget. It raises doubts because, by introducing yet another stratum of purchase tax, the Chancellor is moving still further away from the ultimately desirable objective of turning purchase tax into a flat rate sales tax on all commodities. If Mr Thorneycroft wanted to help the housewife he would have done better to reduce rates on modern labour-saving devices which bear tax at the top end of the scale, rather than relieving the more old-fashioned hardware at the bottom end, mainly because consumers have recently and temporarily seemed to be wanting less of it.

Something of the same sort of criticism can be made, guardedly, of a third relief : the discovery that shipbuilding is a very "special case," which deserves a discriminatorily doubled investment allowance. However "special" the predicament of the shipping lines, faced as they are with a peculiar variety of international competition, it remains a pity to depart from the general principle that should underlie the investment allowances: they should be a flat rate encouragement for all types of capital development, rather than a selective instrument for encouraging those forms of investment which the gentlemen in Whitehall consider to be most "desirable"—or most inconveniently capable of going abroad. Similar doubts must apply to the Chancellor's remarks about monetary policy, and his extension of the powers of the Capital Issues Committee over bank advances ; Conservative Chancellors ought to want to move away from physical rationing of credit, based on special favours to those industries which the Treasury vaguely considers to be most essential, towards the general rationing of credit by price in favour of those industries which the market shows to be most profitable. If the Radcliffe committee on monetary policy, whose formation is discussed in a note on page 113, can educate them about this it will perform a very useful function.

THESE criticisms of the details of the budget may have seemed unduly carping. But there is an important point of principle involved, and it lies close to the heart of the question of precisely where the Conservatives think they want to be going. Between 1952 and mid-1955, the Conservative Government seemed to be imbibing, partly to their own and other people's surprise, two major and progressive truths : more and more they were lifting their eyes to the glittering possibility of increasing production by up to 4½ per cent per annum ; more and more they were learning to trust the market to determine what forms that production should take. Ever since Mr Butler left the Treasury, one has had the feeling that the Government, no doubt under the pressure of sober reminders of the temporary limits set by the balance of payments, has been in some danger of losing its nerve on both counts. Last year, declared the Chancellor on Tuesday, did not present a picture of stagnation, but the picture of "a nation girding itself for new and greater effort" ; the impression given by his budget is that this year the nation will be girding still (which may be right), but also pulling fussily at those sartorial trimmings—a doubly tied bootlace here, an extra chest protector there—which the Treasury considers to be most important.

In the end, it is the lack of ambition in the budget, and the air of planners' selectivity about some of its (at present) least criticised reliefs, which may prove to be its main political misfortunes for the Conservative party. In an expanding economy, the Tories would not need to worry about the sort of attack which Labour is now developing (like a doll which can say only "Mama" when it is either squeezed or released) against this so-called "rich man's budget" ; the ordinary man is much less stirred to envy than Labour thinks at the sight of other people getting richer, provided he is also getting richer himself. But he has to be getting richer himself, and the legitimate aim of political parties is to relate that enrichment to some sort of political master-image, which used to be that there was something called Conservative freedom and that it seemed to work. Mr Thorneycroft could have produced many much worse budgets than he did on Tuesday, including some that would have immediately pleased his backbenchers more. But it cannot really be said that he has yet been able to recapture for the Tories —as Mr Butler once seemed to be capturing during his Chancellorship—that most intangible, elusive but essential political thing, *la puissance d'une idée en marche.*

THE BUDGET, and reactions to it, are also examined in a Business Leader beginning on page 157, in Notes of the Week on pages 112 and 113 and in Business Notes.

Uno's Abacus

The Middle East may soon confront the UN Assembly with a fresh test for which it is ill-equipped. But most of the suggestions for reforming it, or setting it aside, misunderstand the real problem

SMOKE—the smoke of doubt and confusion—still lingers over the battlegrounds where the United Nations' fate and future value as a peace-making tool are being decided. In the Port Said-Gaza-Tiran triangle, not only Egyptian and Israeli intentions are uncertain ; an even bigger query-shaped cloud looms over the intentions of the UN member states. The adjourned Assembly, not dead but tranquillised, could be reconvened quickly if a fresh conflict were threatened at any corner of the triangle. But could it offer any useful initiative—if, for example, an Israeli ship ventures into the Suez Canal, or if saboteurs attack the new Eilat pipeline ? When the delegations dispersed last month, most of them showed a marked distaste for constructive initiatives. Their instinct was to disengage and leave it to Mr Hammarskjöld to mop up. This attitude betrayed some ignorance of the difficulty of defusing time-bombs with a mop.

In sum, the Assembly's recent conduct—if inertia rates as conduct—has greatly strengthened the argument, which Mr Macmillan and Mr Lloyd pressed at Bermuda, that the Assembly has shown itself incapable of doing the kind of job that the Charter originally assigned to the Security Council, and that there should be an inquest on the 1950 "uniting for peace" resolution, under which the Assembly may meet and call for collective action if a great-power veto prevents the Council from coping with a conflict.

WHEN the Prime Minister reported on Bermuda to the House of Commons last week, he was able to claim that he and the Foreign Secretary had been particularly concerned to impress on the Americans the danger of letting reliance on Uno become a substitute for a foreign policy. This was an easy claim to make, for the real point at issue was a different one. The President had certainly, by a succession of ill-worded and over-moralistic statements, exposed himself to the charge of passively awaiting the Assembly's verdicts as if it were a court, not a conference ; but the charge was not justified by the record. On the contrary, the Americans had devoted considerable energy, during the Assembly's session, to canvassing their policies among other members. So had the Canadians ; and as their public statements about the Assembly had been more forthright and critical, they were all the better placed to contest, at Bermuda, the real British argument—that the Assembly is an intolerably lopsided and inefficient mechanism.

Let it be said at once that the fact that Britain supported the "uniting for peace" resolution in 1950 is not in itself any bar to a demand for its reassessment today. No Assembly action under the resolution was ever taken until last October ; only now can a case history of its practical effects be studied ; and it is plain to see that the Assembly has not succeeded in clearing up the Palestine problem, any more than the Council had done.

But it is in those last words that reality begins to emerge. The Council, armed with all the "mandatory" powers given it in the Charter, had failed to solve the problem in eight years. Its failure cannot simply be attributed to Soviet abuse of the veto power. Its resolution calling upon Egypt to let Israeli ships through the

Suez Canal, for example, was nullified not by Russia but by Egypt. Nor is there any sign of the Council's latest resolution on Kashmir deflecting India from its chosen course; on this issue, indeed, an Assembly resolution in the same sense would have much greater impact—a point which the Pakistanis are already considering. Thus, whatever the terms of the Charter, in the real world, divided as it is today, the distinction between the Council's "mandatory" decisions and the Assembly's mere recommendations is very nearly meaningless.

BRITAIN and France have therefore nothing to gain by relieving Russia as self-appointed sentinels of the veto. True, they are now obvious volunteers for this particular bit of sentry-go, for they are far more susceptible to world opinion than a totalitarian superpower need be. But they cannot abolish that opinion merely by giving the Council corpse-reviving injections and dwelling on the constitutional impotence of the Assembly. To jump out of the fire into the frying-pan may be instinctive, but it confers no immunity. What has to be grasped is that the impact of a UN resolution, in Assembly or Council, depends neither on its "mandatory" value, nor on its elementary mathematics, but on the realities of the situation involved.

These realities embrace much more than factors of size and strength. Tiny Israel withstood volley after volley of resolutions during the winter months; and let nobody be misled into supposing that its eventual withdrawal was in deference to the two-thirds majority arrayed against it. A government that changes its policy after a UN vote is not bowing to a mathematical law. It is accepting the fact that it cannot afford to antagonise any further those elements in the hostile majority whose friendship, support, or at least tolerance are essential to it. Once this is grasped, it is mercifully possible to dispense with the arid discussion about "weighted voting" in Uno which Mr Dulles has just revived. Mercifully, because in the world of today there is no conceivable formula for adjusting the relative voting power of nations which would be either acceptable or just.

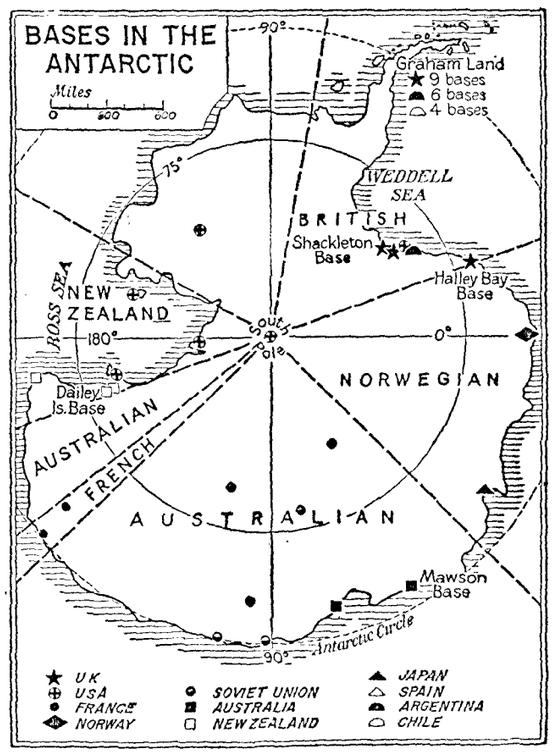
As an abacus for rough and ready reckoning, the Assembly will have to go on being used as it is. The real question is whether it can be put to any more constructive purpose. The true revelation of its latest session was not the newly amplified voice of Asia and Africa—continents which were grossly underrepresented in Uno's first years—but rather the impossibility of evolving constructive plans in so large and loose-knit a gathering. The Assembly now comprises 81 delegations. It is technically possible to convene it at short notice. It is politically possible to rally most of its members behind an urgent call for a cease-fire, and even behind an emergency project like the UN force now in Sinai. But it has proved quite impracticable to get this amorphous mass to shape the kind of positive and definite measures that are needed in areas of bitter conflict such as Palestine.

MUST this be accepted as an unalterable state of affairs? Must harassed secretaries-general, mediators or other individual envoys always be left suspended over a void, submitting one suggestion after another without inducing the sluggish monster of Turtle Bay to bestir itself except in moments of supreme crisis? If so, the Assembly may be an unconscionable time dying, but its eventual death, by its own hand, is only a matter of time. But the experience of the past few months suggests that it could save itself by comparatively modest exertions, if it began now, before its reputation suffers further damage. And perhaps the most promising field of experiment is the gulf that divides it from the Secretary-General and his staff. The obvious way of filling this gap is with small, manageable bodies which, for lack of a better name, might be termed select committees.

In the past, the Assembly has set up special committees and commissions from time to time, but their allotted task has usually been to examine a situation and report back at a leisurely annual tempo. Something more urgent and more authoritative is needed today. Any new committees set up to strengthen and guide the secretariat's hand while the Assembly is in repose would have to be carefully tailored to meet several vital requirements. They should be small, to permit of quick and precise decisions and, if necessary, of mobility; but at the same time they should be sufficiently representative of the various groups and interests in the Assembly to make it unlikely that the parent body would reject their findings; the aim, indeed, would be to make plenary debates almost wholly unnecessary if the system worked smoothly. They should be given as much authority as the Assembly can muster—but no glamour; a strict rule of privacy for all their proceedings would help to screen out those delegates who like to join committees to get personal publicity, and leave a clearer field for the solid citizens who are actually concerned to get results.

A development in this direction would help to give the powers of the second rank, and other states that are ready to put more power to Uno's elbow, a position that would lift them out of the ruck of self-seeking nonentities—without resort to the futile algebra of weighted voting. It would make for a sense of individual responsibility which an 81-member gathering cannot generate. It might begin to convert the Assembly from an arena into a construction site. Whether or not this is the best way of galvanising the United Nations into action, it is certainly high time to discuss what the best way is; for the Middle East may soon confront Uno with a fresh test of a kind with which it is at present quite unfit to grapple.

Frozen White Elephant?



Eleven nations are busily pouring funds into Antarctic research. Britain could press more effectively for an early international settlement of the rival claims for a place on the ice if its own efforts were organised.

ANTARCTICA, a continent the size of the United States and Europe put together, is an unknown quantity: the last unexplored land mass in the world. It will not remain unknown for long; governments are pouring money into exploration and research in order to establish a right to a share if the place should turn out to be valuable. True, claims have been staked already; most of the continent is theoretically divided into slices of cake running from the coast to the pole and shared out between Great Britain, New Zealand, France, Australia and Norway. But except in the Falkland Islands Dependencies (which fall into the British sector but are claimed by both Argentina and Chile), little was done to explore the interior of the continent between the journeys of Scott and Amundsen and the second world war, and it is very doubtful whether the claims could be made good in international law. In any case, they are not recognised by the Soviet Union or the United States, and they seem to be regarded chiefly as bargaining counters which might give their owners a more influential voice in deciding the future of Antarctica.

Meanwhile the scientists benefit. A flow of government funds and encouragement has been poured into the International Geophysical Year (IGY) which officially begins in June; eleven countries are establishing more than fifty observation stations on the continent and its surrounding islands in order to make a thorough study of its geology, atmosphere, meteorology and geography. It has been agreed, with some difficulty, that no territorial claims shall be made on the ground of exploration done for the IGY. But there is a general feeling that those who contribute most will be best placed when something worth having turns up, or when the fate of the continent is settled.

BRITAIN is in danger of being outstripped in this scramble for a place on the ice, although everything possible has been done on the money available. The Royal Society has established a base on the Weddell Sea, and the Falkland Islands Dependencies survey has been stepped up. This survey was originally started in 1943 to counter Chilean and Argentine claims to the Dependencies by providing, as international law requires, "an administration suitable to the needs of the territory"; but it now includes an aerial survey of 50,000 square miles of the Graham Land peninsula, and nine meteorological stations which will contribute to the IGY. There is also the Commonwealth Transantarctic expedition, but this coincides with the IGY only by chance (it has lost a good deal of valuable publicity as a result of public confusion between it and the Royal Society expedition); its members are trying to cross the continent from the Weddell Sea to the Ross Sea, and while their journey will undoubtedly provide an epic adventure story, it is not expected to be of great scientific value.

All this activity represents a considerable achievement considering the amount of money available: the total cost for the next two years will be about £2 million. But over the same period "Operation Deep Freeze," the American contribution, will have £10 million spent on it, in addition to a free supply of icebreakers, aircraft and heavy supply ships from the United States navy. The Russians are being almost as lavish; they have established a large and well-equipped base which they call Mirny (peaceful) and are using two 12,000-ton ice-breaking cargo ships, a slightly smaller supply vessel and at least six twin-engined aircraft. Even Argentina has an ice-breaker, while the

British make do with 1,000-ton hired sealers and have already suffered a good deal of danger and delay.

The possible uses of Antarctica provide nearly as much scope for the imagination as interplanetary travel. It might become a vast refrigerator for food surpluses, a plankton farm, a source of valuable minerals or a strategic naval base in a new war—but not until scientific ingenuity has risen a good deal above its present level. A refrigerator which is blocked by ice for two-thirds of the year and is several weeks' journey from the dining-room is of little use. Antarctic minerals, with the possible exception of thorium and radium, would be difficult to exploit economically. Winds that reach 200 mph, and seas that are frozen for eight months of the year, make experts doubtful of the usefulness of establishing air or submarine bases—although Drake Passage, between Graham Land and Cape Horn, would become a vital sea route if the Panama Canal were blocked. Technically, it would be possible to build an airstrip for commercial planes, somewhat on the lines of the American venture at Thule in Greenland, but the economic uses of short cuts across Antarctica are limited.

THE uncertain potentialities make it all the more important to seek some kind of workable international agreement for the continent before a new discovery makes it yet another subject of dispute. The British have a particular interest in a quick settlement, since the longer it is delayed the further they will be outclassed by the lavishness of American and Russian expenditure. But no really satisfactory suggestions for control or division have yet been put forward. Advocates of world government believe that this vast empty space would be a suitable beginner's exercise for United Nations administrators; sceptics are only anxious to keep it from the United Nations, where, they fear, it will become involved in issues and intrigues that have nothing to do with the Antarctic. Others favour some form of condominium, or, since little administration would, after all, be required, an international licensing authority to which individual firms could apply for development rights. They agree only that no one nation should be allowed to dominate the continent.

If Britain is to take the lead in promoting a settlement it must speed up its own aerial and ground surveys in order to get a clear idea of the relative value of the anchorages, minerals and possible airstrips in its own slice, so that it knows what its own interests are. The Falkland Islands Dependencies survey, although admirable as far as it goes, is limited in extent, and the Royal Society expedition is gravely hampered by its lack of transport; greater mobility is the great need—more aircraft, more surface vehicles, "Weasels" and "Snocats," above all an ice-breaker. But not only more money is needed. At the moment, responsibility for survey and research in Graham Land is borne by the governor of the Falkland islands, eight hundred miles away, and through him by the Colonial Office, while the Foreign Office deals with international complications and the Royal Society concerns itself exclusively with the IGY. Some sort of operations board with authority to co-ordinate research, distribute funds, and work towards an international settlement is needed. Without it Britain cannot seriously compete.

NOTES OF THE WEEK

PARLIAMENT

Mr Thorneycroft's Reception

AFTER all the talk about this year's budget promising to be the turning point of the present Parliament, the atmosphere in the House on Tuesday was strangely not electric. The Tories grasped near the beginning of the Chancellor's speech that this was going to be a moderate prize-giving, the sort of budget that was unlikely to send them into their paroxysms of disappointment or delirious joy. Labour still has an inferiority complex on budget days, based on the general feeling that it is the party which puts taxes on while the Tories take them off. Opposition MPs yelped their delight whenever Mr Thorneycroft said that there were still economic difficulties before the country, and bayed their disapproval whenever he said that the prospects were, in some respects, brighter. The effect, on any spectator whose main concern is not how many government jobs how many Labour MPs are likely to get if they win the next election, was singularly repellent. Throughout all this, the Chancellor delivered his speech clearly, decisively and without flourish. When he sat down his party gave him a considerable ovation; and post-budget probing confirms that he has done enough, in what is called a "courageously conservative way," to stop the threat of rot in the Tory party.

The chief complaint heard among Government backbenchers afterwards was that he has not given sufficient reliefs to middle-class people earning below £2,000. This is a point on which the non-U Tories are particularly sensitive; they, at least, recognise that all the absentees and swinging voters at recent by-elections were not retired people and surtax payers. The much bigger political question, whether Mr Thorneycroft has done enough to enable production and living standards to start rising again for the whole community, was mooted by only a few thinking Tory backbenchers immediately after the budget. It was also insufficiently mooted by Labour, which fell back instead on its all too obvious instinctive line of attack. Within minutes of Mr Thorneycroft sitting down, there was Mr Griffiths hammering his bosom over the plight of the old people and the other poor. The price of rallying the Tory right by surtax concessions has been to expose the Tory left to endless jibes about "the tycoon's party." This is very dreary after a budget which provided a legitimate opening for more constructive left-wing attack, on the issue of insufficient encouragement for industrial expansion. Mr Wilson, indeed, in his witty but not very coherent speech on Wednesday, seemed to be concentrating his general economic argument on the opposite tack: although he assailed the Tories for tolerating stagnation, he also called the budget an "assignment with inflation." The Opposition would do well to make up its mind which of these opposing horses its wants to ride.

ECONOMIC PROSPECT

Not Much Expansion

THE passage in Mr Thorneycroft's budget speech about the "economic prospects for 1957-58" was disappointingly unexplicit, and a lot of guesswork is needed to arrive at any estimate of the degree of "expansion with security" at which the Chancellor is aiming. Among the various sources of potentially increasing demand:

(1) Mr Thorneycroft said that he "cannot tell" whether this year's increase in exports will "exceed or fall short" of last year's increase of £250 million in real terms, but he is confident that the rise in them will be "substantial."

(2) He believes that fixed investment is likely to be maintained at what he regards as its present high level, and may increase "slightly"; presumably, however, he does not expect the real increase to be much more than £50 million.

(3) He said nothing about the expected trend of stock-building expenditure; this was a most regrettable omission.

(4) He anticipates "some increase" in real consumption, because last year hire purchase instalments were being repaid, and "once people have paid their debts they not unnaturally tend to buy more." In view of the latest retail trade figures, it would not be at all surprising if this increase in personal spending were the main reflationary force in 1957-58. But even if one assumes that up to half of last year's abnormal increase in personal savings could disappear again this year, it should be remembered that some of the burden of this year's wage increases is likely to be passed on to higher prices rather than on to increasing consumption, that perhaps only about half of the tax cuts encourage personal spending, and that there will be some pre-emption of purchasing power this financial year by rent increases. The increase in real consumption therefore does not seem likely to be over £350 million. It might well be considerably less.

Even if one adds the most generous of these estimates of increased spending together—and then subtracts any part of the increased demand which is likely to be met from increased imports, together with the apparent real saving of between £100 and £150 million in Government current expenditure—it is difficult to arrive at an estimate for increased demand and production of much over £500 million this financial year. This would represent a growth of under 3 per cent in gross national product. Industrial production might well rise by rather more in the immediate future, as the engineering factories work at fuller blast to make up for the output lost in the strikes, but it would not be surprising—on present vague prospects—if it began to flag again towards the turn of the calendar year.

Parliament should therefore press for two things in the budget debates. First, it should ask the Chancellor or his Economic Secretary to be more explicit about the estimates of the possible increases in production and consumption that the Treasury has in mind; it must have some, and this new-fangled insinuation that because the estimates are necessarily tentative they cannot be revealed is an insinuation that needs to be firmly squashed. (It would be just as sensible to say that the Exchequer cannot publish any estimates of its own expenditure and revenue, because they are tentative too.) Secondly, the Chancellor should be urged to keep a weather eye on the production index as the year progresses—and, if it fails to pick up or later begins to flag again, to lay his finger on the trigger of post-budget expansionary devices. The best of these—better than a lower Bank rate—might well be a relaxation of the hire purchase restrictions in the autumn.

CREDIT POLICY

Where to Probe

IT would be a mistake either to hail the promised Radcliffe Committee on monetary and credit policy as a probable panacea for many of our economic ills, or to denigrate it as a foredoomed futility. The forerunner with which it is being compared is the famous report a generation ago to which Lord Macmillan gave his name, and which Maynard Keynes so largely wrote. There is no Keynes to dominate the scene, and awe his colleagues, now. There are, instead, a dozen or so eminent monetary economists, of more or less equal stature and very decided individual views; if they were all let loose on this committee, they would busy themselves writing minority reports and notes of dissent from each other. Contrary to the assumption of most politicians, the main bone of economic contention now is not really about the mechanisms by which inflation might be stopped; it is about how many and which social and economic unpleasantnesses—either in allowing more unemployment and curbing production, or in standing up to trade union wage demands—it is worth incurring in the process.

The committee is not therefore likely to add much to expert knowledge or general enlightenment on the broader aspects of policy. But there are some subsidiary things it could and should do, principally through probing for information. A long list could be computed of these subsidiary opportunities, but here are three suggestions. First, the committee should seize this chance to question the commercial bankers as closely as it can to find out how much (or how little) effect the Chancellor's "requests" for restraint have really had on bank lending, as distinct from on the excuses purveyed to customers for quite rightly rejecting loan applications that were undesirable on normal banking grounds. Secondly, although one suspects that research will confirm that high interest rates have relatively little effect in damping borrowers' eagerness to borrow, the committee should glean as much information as it can on the undoubted effect that rising interest rates (or rather the fall in gilt edged values associated with them) can have in curbing various lending institutions'

willingness to lend. Thirdly—and although this may not have occurred to Mr Thorneycroft as one of the possible benefits from the inquiry, it is a thought to whet the appetites of economists everywhere—the members of this committee could have a unique opportunity to press for reform of the obscurantist weekly return and annual report which are now used to cloak from the public the most interesting activities of the nationalised Bank of England.

JORDAN

Kingdom in Crisis

ACCLAIMED in March as the "hero of the liberation," King Hussein finds himself in April in a dangerous conflict with Jordan's parliamentary leaders. The outcome is obscure as this issue of *The Economist* goes to press ; in form at least, the government of Suleiman Nabulsi appears to have accepted its dismissal ; but it is by no means apparent that the King is in a position to go over the heads of the popular leaders in this way. The chain of events that was to be foreseen when the King dismissed General Glubb early last year is unwinding fast.

King Hussein then made his choice between the western (in Jordan's case, the British) camp and the camp of Arab nationalism. By throwing off British supervision he cut himself off from the possibility of British support, a fact which last month's agreement to terminate the Anglo-Jordan treaty did no more than formally register ; since the dismissal of General Glubb he has, therefore, been dependent in effect on Arab nationalism to support the throne. Arab nationalism, however, does not merely attack western influence. It is a movement of protest against the social order and against the existing partitions of the Arab world ; on both grounds it is essentially hostile to the Arab monarchies.

A young and inexperienced king has thus been engaged in the hardest of political tasks, that of conciliating a dynamic opposition by espousing parts of its programme while rejecting other parts. When he drew the line at any toleration of communist influence he was able to get his government's passive acquiescence but not its active support. His attempt to conduct an anti-communist policy of his own led him to act independently of his cabinet, both externally—in the exchange of messages with the other Arab governments through his own private messenger—and in some ways, too, domestically. His prime minister, Suleiman Nabulsi, when he said last week that his country was certainly not prepared to make an enemy of the Soviet Union simply to please the West, took up a position that the King could not easily refuse to endorse ; but by that time the relationship between the king and his cabinet had, as it appears, degenerated into a trial of strength. If the king succeeds in getting a new government to take office, this will only be the first round of a contest in which the odds are against him.

ISRAEL

Triumph and Stalemate

WHILE General Wheeler congratulates his team on opening the Suez canal a month ahead of schedule, the Israelis have been celebrating at Eilat. The arrival of the American tanker *Kern Hills* with Persian oil ; the near-completion of the 8-inch pipeline from Eilat to Beersheba, and the promise of French money for a 16-inch pipeline from Beersheba to Ashdod Yam on the Mediterranean have given some substance to Israeli dreams—although the Arab states have already protested, and the State Department is disclaiming the idea that the tanker's passage constituted a test. Developments at Eilat will to some extent determine Israel's reaction to Cairo's continued intransigence over the passage of Israeli ships through the canal. By building pipes and roads from the Gulf of Aqaba to the Mediterranean, the Israelis hope eventually to put themselves in the position of being able to by-pass the canal at less cost than a boycott by any other country would entail.

But the Eilat project is still a gamble ; the Israelis cannot feel prepared to abandon their claim to a right to use the canal. Here the position is stalemate: the Israelis have said that they will send a test ship, and Cairo radio has retorted if it is sent the Egyptians will sink it. But the Israeli darts are probably aimed more at the western powers than at Cairo ; there is every sign that the western powers are once again reluctant to compromise their own interest in the canal for the sake of Israel. Except for the American insistence that disputes should go to arbitration, the question of Israeli ships is believed to be conveniently omitted from the negotiations that have been going on between Cairo and Washington.

At the third point of tension between Israel and Egypt, General Burns has suggested that the Gaza frontier should be defended by two barbed wire fences with a minefield between. This suggestion, which has a glaring commonsense, has been accepted by the Israelis and received with silence by Egypt ; the Egyptians, however, will probably agree, provided that acceptance is not taken to mean that they recognise the armistice line as a frontier.

CHANNEL TUNNEL

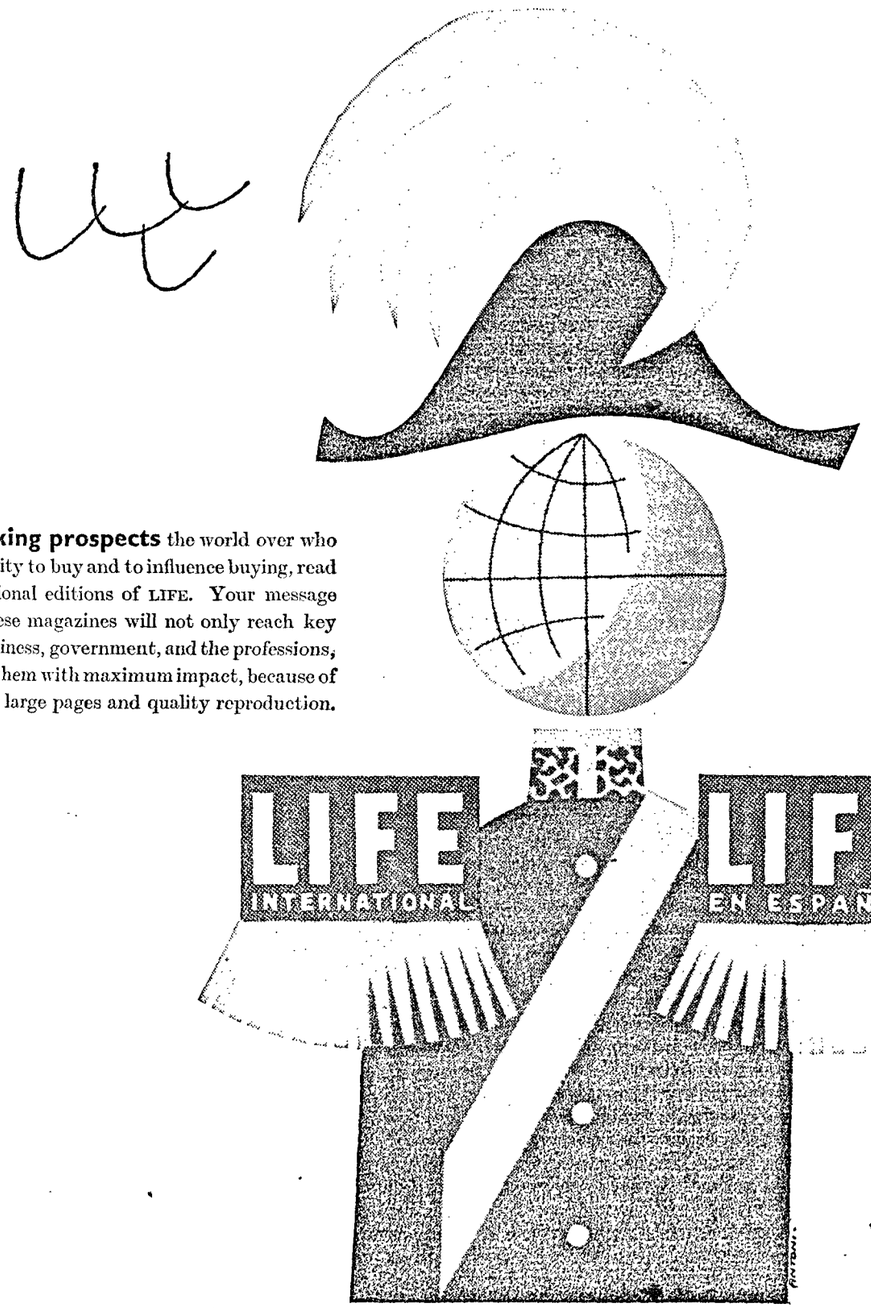
An Economic Link?

FROM the status of a stale joke, the Channel Tunnel has suddenly regained that of a serious possibility. The resurrection is, so far, partial and tentative ; the Government's interest in it seems to have been aroused by a strictly limited initiative by a group of American experts, Technical Studies, Inc. This small body of engineers, lawyers and business men has seen a favourable constellation of circumstances in the closer economic links projected between Britain and the Continent, and the fact that prewar military fears about the project are now obviously nonsense. Their limited objective is to carry out a pilot study, technical, legal and financial, using the best available expertise on both sides of the Channel. It is estimated that this study might take a year or more, given the necessary initial permission from the French and British Governments. Who should thereafter put up the capital, carry out the work, and administer the enterprise as a going concern remain open questions whose answer is in no way predetermined by the American origin of the inquiry. The existing Channel Tunnel companies, in both Britain and France, are in a state of very suspended animation ; but they could provide the framework of a new organisation—either Franco-British, European, or all three plus American.

The first sighting shot at the capital that might be required is about £100 million: it is believed that the tunnel would have to be all-rail, because of the difficulty

We are the cablemakers

but not that alone.



We encompass the World with bands of power.
Strangers to few cities.
You will find us in straat and gade,
in weg, rue and praça,
in pasco, alameda, place, rua, djalan and sharia,
and in Bloomsbury.
This mighty cable went to Portugal.
(You can dance in Lisbon under the light it brings).
This mighty cable went to Uganda.
(We used local timber to support the overhead lines).
This mighty cable is 16 miles long.
(No joints—a World record for submarine power cable).
This mighty cable stayed at home
and brings breadwinners from Southend to Liverpool Street.
What's in the morning mail?
A letter from Trivandrum with a query about cores.
Another from Reykjavik—something on the building laws.
A report from Birkirkara. Sheaves of notes from Singapore.
Here's an answer from Mombasa.
(That's one we're waiting for).
And, of course, this:
Dear Sirs, I am interested in your scheme for
graduate apprentices . . . I should like to travel . . .
We who make, lay and sling cables
must speak many tongues.
We who make, lay and sling cables
must know about soils and seas and winds and heat
and dust and mountains and insects and rain and
lightning and rivers and lakes
wherever the trail of power leads.
We who make, lay and sling cables
must think for the World on many lines.

BICC think for the World on many lines

of dealing with motor exhaust fumes. Economically, one should start with a bias [illegible] project. Some two million passengers annually between Britain and France; the goods carried between the two countries each year are worth more than £200 million, and the goods carried between Britain and Western Europe as a whole are worth nearly £2,000 million. How much of this growing traffic would be diverted to an all-rail route, and how many extra passengers, now deterred by dislike of sea and air travel from going abroad at all, would swell the total, is anyone's guess; but, on the face of it, it should be possible, by charging quite reasonable tolls, to make the project profitable and to amortise capital of £100 million within quite a short period.

The trouble, of course, is that the building of the tunnel would necessarily be a fairly long-term project; and there are many long-term transport projects—particularly on Britain's roads—which, one suspects, would be at least equally lucrative. This country has not got the capital for them. But that merely suggests what the British Government's reaction to this tentative initiative should be. In the first place, if the Channel Tunnel is an economic proposition, the Government should in no circumstances veto it just because the air and sea services which would be hit by its competition are publicly-owned. Secondly, if there is any chance of getting in capital from abroad for the project, let us welcome it. Capital for transport improvement is all too rare. For Britain and France to hold up any possible opportunity for proceeding with an economic scheme, out of a vague feeling that only a "Nasser-nalised" tunnel would do, would be an adolescent political act.

SINGAPORE

A Condition for Self-Government

MR LENNOX-BOYD will need to explain what prompted him to make, on the last day of the Singapore constitutional conference, when all other matters had been agreed, his last-minute condition that no person involved in seditious activities may stand in the first elections for the new legislature of the State of Singapore. The conference has taken a month, and there have been various incidental crises, but an examination of the agreement reached suggests that, so far as is possible, every contingency has been sewn up. The British Government has agreed, as was expected, that the Internal Security Council, which is to watch over any developments that might endanger the base, should consist of three British members, with the United Kingdom High Commissioner as chairman, three Singapore ministers and a member from the Federation of Malaya with the casting vote. Complete internal autonomy has been granted, subject to British control of defence and external affairs (other than trade relations); and the British Government retains the right to suspend the constitution if the conditions of the agreement are breached on the Singapore side. Other safeguards have been skilfully built into the agreement; the independence of judiciary and police has been protected, and there are elaborate provisions for regular consultation—though no council for liaison on external affairs and defence between Britain and Singapore has been put into the conference's report. Broadly, the conference has agreed on all the points which have been exhaustively discussed over the last year, and Britain has made graceful concessions on the composition of the security council, Singapore citizenship, protection of British trade interests, and the appointment of a Malayan to represent the Queen as Head of State.

The last-minute condition has united the Singapore delegation in opposition; it is bound to make a bad impression and will enable the opposition in Singapore to represent the whole agreement as a sham. It will be said that the first free elections are not free at all but staged by the colonial power. Yet the condition itself can only operate for a single election—and another could be held within a few months of the first with no such qualification on candidates. It seems extraordinarily ham-handed. Either a calculated risk is being taken, or it is not. Has Mr Lennox Boyd received new and appalling secret intelligence about communist plans in Singapore? If communists had to be prevented from standing as candidates, would it not have been better to seek a private arrangement to that effect with Mr Lim and Mr Lee, instead of hazarding in this way the acceptability of the agreement in Singapore?

RADIO

Sound and Fretwork

THE BBC has made the worst of all its worlds of sound broadcasting in the plans which Sir Ian Jacob announced last Monday. Though the corporation is giving the appearance of providing four programmes, it is in fact only going to provide a little more than two. The main trend is towards giving the mass audience the light entertainment it undoubtedly wants, and which so many listeners now get from Radio Luxemburg. To this end, the "incidental instruction" plugs in the Light, and many of those on the Home, are to be moved to the new hobbies Network (some, echoing Ogden Nash, will say Fretwork) Three, which is to be colonised out of the Third's time; this will permit the Home and the Light to run together for considerable stretches of the day, transmitting a constant background of dance or palm beach music for those who cannot give their full attention to anything, and who take their radio like their wallpaper. The Home Service is apparently going to lose many of its middle-brow features in the process, and become (even while it has a separate existence) an alternative light channel, breaking occasionally into schools, housewives, drama, rapportage, Welsh hymns and solemn national occasions. The Third, despite the succour of its new protection association, is to lose 40 per cent of its time. How Sir Ian Jacob can say it will be the better for a cut of this magnitude is past understanding. It is not that bad, even if it does occasionally play to the cognoscenti too snobbishly.

Let it be made clear what the objection to this rearrangement of programmes is. The objection is not that the mass audience is to get more of what it wants; it has a right to have it. The objection is that other people are to suffer a disproportionate cut in the programmes they like, while there is an untapped source of revenue which could make it economic to satisfy the mass audience and the minority audience too. That alternative source of revenue, to which sound radio will have to turn sooner or later, is commercial advertising.

OEEC

Europe's Economy Weathers the Winter

THE economy of western Europe has taken the shock of the closing of the Suez canal with remarkable ease. This is the most interesting conclusion implied by the OEEC annual report, *Europe Today*. Before the Middle East crisis, the inflation of 1955 and 1956 was already beginning to ease off, as anti-inflationary policies brought their reward. There were exceptions, it is true; while the squeeze was working in Germany, Britain and Scandinavia, inflation and payments difficulties were striking at the Netherlands and France. The unbalance between the mark and the weaker franc and pound was still pronounced. But broadly speaking, the picture was one of a slower growth, of a steadying in the European economy which was encouraging after the sharp rise in prices of 1955 and early 1956.

The Suez crisis did not substantially disturb these trends. It shook sterling and the franc, it is true, and sent a shiver of alarm through commodity markets. But the short-term flight of pounds has since been reversed, and commodity prices steadied quickly after the first shock. Even the disturbing effects of the increase in oil prices were diminished by the mild winter and the successful restraint of demand. Lack of fuel has not in practice been a troublesome brake either on transport or industrial production, except in a few special fields like cars. Europe, like Britain, has suffered a loss of dollars spent on oil, and the payments difficulties of France and Britain have forced France to impose new import taxes and made Mr Thorneycroft cautious this week. But here the Middle East crisis aggravated an existing weakness.

The European economy would not have come out so well without the work of OEEC itself, whose oil committee, working with the oil companies, has done so much to maintain supplies of fuel oil, both through overcoming the tanker shortage and helping individual countries whose supply position was weak. For the first three months, it seems, stocks played a key part in filling the needs of industry and maintaining oil supplies. But by February, stocks of fuel oil had dropped to two weeks' supply. Just in time, however, the growth of imports from the western hemisphere, co-ordinated in Europe by the team of OEEC and the oil companies, got going on a large enough scale to maintain deliveries to consumers. Supplies have now reached the comfortable level of 98 per cent of needs. Not only the resilience and flexibility of the European economy but the efficiency of the co-operative European institutions which have developed over the years were tested by the crisis. Both have come out well.

ITALY

Creaking Coalition

THE Italian government is once more in serious difficulties. The trouble this time arises out of the land tenancy bill. In Italy, land tenancies are extremely complicated and various, and, for different reasons, unsatisfactory to both landowners and tenants. Seven years ago the prime minister, Signor Segni, who was then minister of agriculture, produced proposals for reform over which the Italian parliament has quarrelled, on and on, ever since. It is a danger [illegible] to bring to an issue; two years ago the fall of Signor Scelba's cabinet. Last month, the prime minister managed to get a compromise bill accepted in principle by a small majority in the Chamber. But the imminent prospect of being pinned down to definite commitments on the detailed clauses of the bill—the debate has begun this week—reopened the fissures in his three-party coalition. Only after three long meetings could the party leaders manage last week to agree on compromise amendments, under which only tenants under contract since 1952 can be dismissed immediately for "just cause"; those whose contracts date from before 1952 must be allowed a transition period.

Even now, the fate of the bill, and with it that of the government, is uncertain. The right-wing Liberal party is fighting hard to prevent any further changes. The party represents the interests of the landowners; but whatever its other motives, it can reasonably claim that the landowners cannot be expected to take a genuine interest in the care and development of their property—which is to everyone's benefit—if they are unable to get rid of unsatisfactory tenants. Both the Christian Democrats and the Social Democrats are divided. The left wing of the Christian Democrats, led by the trade union leader, Signor Pastore, holds that the bill still takes insufficient care of the interests of the tenants. Signor Matteotti, the secretary-general of the Social Democrats, agrees; his attitude may be influenced by his anxiety for a fusion between his party and the Nenni Socialists. If the prime minister weathers this storm, it will be not so much because his own party and his coalition partners are wholeheartedly behind him, as because they are reluctant to turn themselves out of office.

STRIKES

On Inquiry

Our special correspondent attended the Courts of Inquiry into the shipbuilding and engineering disputes. The report of the Court of Inquiry into the Briggs' dispute arrived too late for adequate comment this week.

THE parties to the disputes faced each other across long tables draped in dark cloth: on the unions' side, the same familiar faces appeared (rearranged in a different order of precedence) in both cases, while on the employers' side a few faces changed, but the general effect did not. In spite of the bad employer-worker relations that are often evident in these industries each set of negotiators accepted its opponents' aspersions with, at the worst, wry smiles, and, at the best, cheerful laughter.

Mr Ted Hill was spokesman for the shipbuilding unions; in cold print, many of his sentiments are terrifying—but nothing could be less alarming than the way he says them. His tubby figure and rumbling voice make him seem like an uncle whose will to be stern with the kiddies is overcome by natural *bonhomie*—an old-fashioned uncle, whose arguments are old-fashioned, too. He distrusts figures, and described some relating to absenteeism, which were put forward by Mr Sloan, director and spokesman of the employers' federation, as "abstract, obnoxious, contentious and very often misquoted," while declaring his reliance on "human considerations" and on the superior quality of British ships. His opponent concentrated his defence on competition from abroad, and on restrictive practices. He appealed to the unions to behave in a waymore in line with contemporary conditions [illegible] from making a moving speech that did not inhibit Mr Hill

Mr W. J. Carron of the Amalgamated "hungry thirties." Union spoke for the engineering unions: his case, [illegible]ineering than Mr Hill's, was put with more ingenuity. He claimed that last year's low profits and production in engineering were due to Government policy rather than to any real fall in demand; and that the employers' federation wanted to keep wages down to protect its less efficient members, although higher wages are a stimulus to greater managerial efficiency. Mr Macarty, the employers' spokesman, said that this theory needed a whole course of enquiry to itself.

The inquiry ended discouragingly. The unions refused to agree that the employers should submit as evidence documents prepared by the unions about restrictive practices in shipbuilding; and the employers poured cold water on a suggestion by the unions that a central joint council should be set up to settle disputes and promote efficiency. Their spokesman said that their federation (like the unions' confederation) had only advisory functions. But at least the chairman, Professor Jack, coaxed both sides into abandoning their prepared briefs and engaging in free discussion. That was a step, perhaps, towards abandoning rigid attitudes—even if a small one.

RAILWAY PAY

Wisdom or Weakness?

THE British Transport Commission, which gave a 5 per cent increase in wages to the National Union of Railwaymen in return for certain undertakings about productivity, has decided to give the same increase to members of the Associated Society of Locomotive Engineers and Firemen, even though their leaders refused to give the mild general assurances that were required. Was this wisdom or yet another familiar selling of the pass?

The commission at first said that it would withhold the increase from all the footplatemen, including those in the NUR, until the undertaking was given. But that, of course, brought them a visit from Mr Campbell of the NUR, who no doubt warned them of the fury that would have broken over his head if that had happened; about a quarter of the footplatemen belong to his union. There is also some suggestion that the commission was doubtful whether, having agreed to pay all members of the NUR 5 per cent, it was legally able to withhold the increase from some of them. Finally, the commission must certainly have wished to co-operate with Mr Campbell, who is emerging as a progressive man. In an article in *The Railway Review* he has just told his members

> Our future depends in large degree on the contribution we make, both individually and collectively, to improving efficiency. What we put in is every bit as important as what we take out.

It would have been a pity to undermine the position of so enlightened a union leader. But was the only course to withhold the increase from the NUR as well?

Two courses suggest themselves, and both were apparently considered. One was to pay the increase to members of the NUR only. The main argument against this course is that it would have set one union violently against the other. Their relations have often been bad, but this would have meant war—and the commission's hope of ever getting co-operation from ASLEF might have been the first casualty. The second possible course was to make an individual approach to the men, by putting the document promising co-operation about productivity in every pay packet, and paying the increase to all who would sign it. This course holds out evident attractions, especially to those who think that it would be a good thing to try to split the members of ASLEF from their [illegible]-restrictively-minded leaders. But the men's loyalty to their union is probably strong.

So, in pursuit of better relations, the commission has given way; but not, the commission's apologists insist, in response to the bullying of ASLEF. It was Mr Campbell who won the ASLEF men their 5 per cent, and the commission is hoping that, remembering this fact, they will follow the practices of their mates in the NUR. The outsider can only say, very dubiously: "May the gamble come off."

SOUTH AFRICA

Apartheid in Practice

EVEN some of its supporters are wincing as apartheid is carried through to its logical conclusions. The two measures which the South African parliament is now in process of making law are both intended to minimise contact between the races, and both have caused disquiet in the country. The university bill which will eventually debar black or coloured students from Witwatersrand and Cape Town is being pushed through despite almost unanimous opposition from both universities. It provides that the new non-European colleges will be completely under the thumb of the minister of native affairs, Dr Verwoerd, who will vet the list of entrants and will appoint the teaching and administrative staff.

The other measure is the Native Laws Amendment Bill, a blanket stifling of free discussion between the races. In its original form the bill made it an offence to hold, without the minister's express consent, a mixed meeting in any church, club or institution erected after 1938. The church clause went a bit too far. The Anglican and Roman Catholic churches were up in arms threatening defiance, and even the Dutch Reformed Church (which has held that the untimely expression of Christian unity would harm the Kingdom of God) was disturbed. To keep the support of the Dutch church, the minister watered down his bill in such a manner that the responsibility for obedience falls on the African, not on the bishops. As amended the bill gives the minister and the local authority power to forbid a non-European to attend any gathering where his presence is considered a nuisance.

Although the church clause has caused the greatest furore in the country and in parliament, there are in fact not a great many churches built since 1938 where all races worship together. But the threat hanging over all mixed gatherings may cripple the few remaining liberal organisations in South Africa. The Institute of Race Relations may be debarred from using the hall it has just built in Johannesburg for inter-racial conferences, while the Liberal party, led by Mr Alan Paton, is wondering whether it can continue to exist. Black and white South African may soon find it impossible to meet as equals at all: in the words

of Dr Verwoerd "There can be contact between natives and others as individuals, but this contact must be the same as that between a ward and a guardian."

INDONESIA

Sukarno takes the Wheel

HAVING failed to direct the Indonesian republic towards "guided democracy" by back-seat driving, [illegible] Sukarno has now openly assumed responsibility for the government. He has succeeded in forming "an emergency, extra-parliamentary, business cabinet of experts" whose task it will be to set up a National Council which will represent, by methods still undisclosed, economic and political interests, and which is intended to become the supreme authority in Indonesia. The new cabinet is less apolitical than its official description suggests. Three Nationalists are included, and while the cabinet contains no overt communists, three of its members are said to be communist sympathisers. One minister was a member of the Masjumi (the bitterly anti-communist Moslem party), but has been expelled for joining; it seems likely that the small Moslem party, PSI, will also expel a member who has accepted office. The other major Moslem party, Nahdatul Ulama, has allowed four of its members to join, possibly hoping that compliance will enable them to exercise some control over the composition of the National Council.

This may be a forlorn hope. Certainly, the only party that stands to gain from Dr Sukarno's plans is the PKI (communists). On the other hand, the president still has to reckon with the army leaders who control the major Indonesian islands outside Java. Not only are they, by and large, anti-communist, but they are unlikely to allow the president to carry out his "conception" without extracting very substantial concessions of local autonomy for the islands, and improved pay and living conditions for the troops. A settlement of their grievances is urgent, for the state of frozen revolution, which has lasted nearly four months in Sumatra, shows signs of melting into civil war. But if the president concedes too much to the army the six million well organised members of the Communist party may resort to violence or to a general strike in order to get the share in the government which Dr Sukarno himself has promised them. He will find it hard to avoid both the frying pan and the fire.

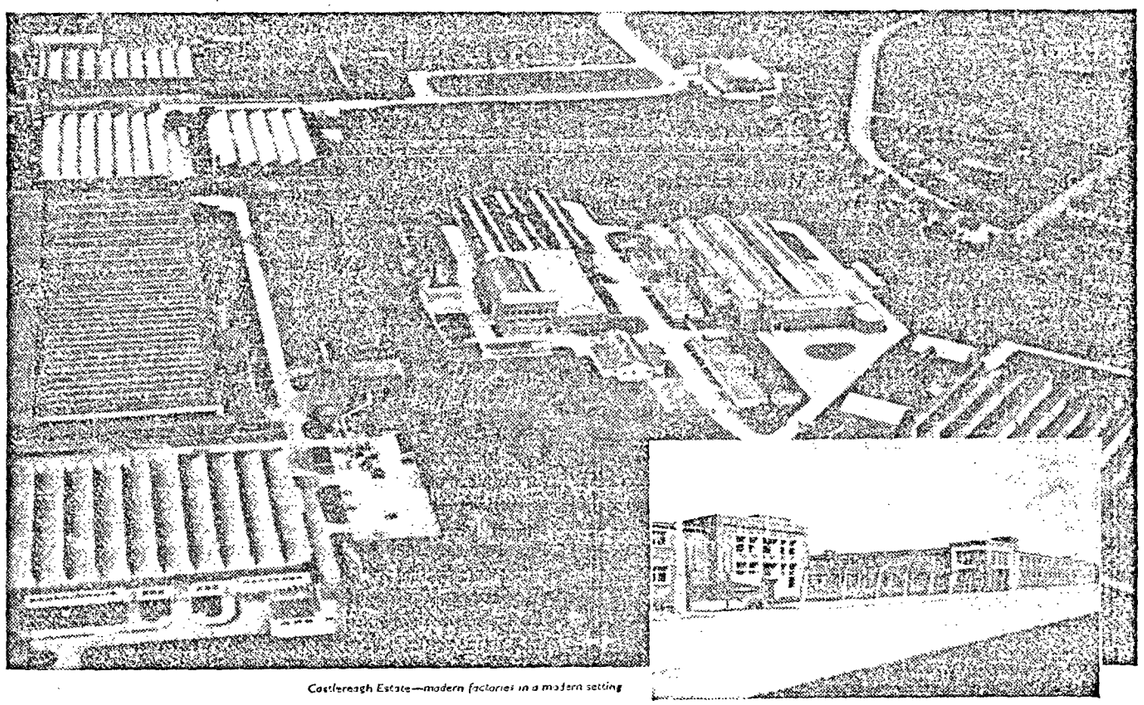
THE ADAMS CASE

Trial by Jury

OF all the interesting points in the trial of Dr Adams for murder, which ended on the seventeenth day in an acquittal, the most important to many people will be the judge's remarks on the proceedings in the magistrates' court at Eastbourne. As a result of those proceedings, there cannot have been an adult, of the sort from whom a jury is drawn, who had not read full accounts of them in the newspapers and been influenced accordingly before the case opened at the Old Bailey.

This, of course, is true of most juries in most notorious trials. But the case of Dr Adams must cause misgivings first, about the prosecution's tactics in the magistrate's court and, secondly, about the practice of holding the preliminary proceedings in public. At the magistrate's court the prosecution brought forward a great deal of information, in order to secure a committal, which was not advanced as evidence at the Old Bailey. It is this that made the pre-trial publicity so harmful. [illegible] for this publicity. For, as Mr Justice [illegible] Devlin pointed out to the jury, the magistrates have power to hold preliminary proceedings in private, and, speaking judicially but firmly, the judge said that it would have been wiser if the Eastbourne magistrates had used their discretion in the Adams case. Whether private preliminary hearings should become a general rule in murder cases, as has been suggested, is more debatable; a person's reputation may be less damaged if the magistrates decide in open court that there is no case for committal, though in Scotland the evidence against a suspect is always submitted in secret through the local procurator-fiscal to the law officers of the Crown, who decide, again in secret, whether there is a case for trial. But English magistrates should at least be instructed to use their discretion more readily when a case is clearly going to achieve nationwide publicity.

MANCHESTER



A City in Need of an Outlet

THIS weekend the Town and Country Planning Association is holding a conference on the problems of congestion and dispersal in the Manchester area. The conference is timely, because Manchester is at present, and with good reason, a chagrined and impatient city. With one-quarter of its population living in 62,000 slum houses—many of which are not just technically "unfit," but in truly shocking condition—it has worse squalor and congestion than any English city, with the possible exception of Liverpool. But Liverpool possesses what Manchester has vainly sought ever since 1945—a large and booming satellite town capable of accommodating many thousands of ex-slum families, thereby enabling redevelopment to go forward in the central parts of the city. Manchester is now waiting once again to hear whether Mr Henry Brooke will reverse a previous government decision (made in 1954) and allow it to build a satellite town at either Lymm or Mobberley, some ten miles to the south of the city in Cheshire—a project which has always encountered bitter opposition from the Cheshire County Council.

Manchester's tribulations derive basically from an antiquated pattern of local government, accompanied by intense conflicts and rivalries amongst numerous local authorities. There are no fewer than 70 local councils (including 4 counties and 7 county boroughs) operating within ten miles of central Manchester, and there is no authority capable of securing effective co-ordination of any of the specialised facilities needed for the whole urban area. An imaginative project for the creation of such an authority, described as a Manchester County Council, was put forward after the war by a group of local authorities, and it is worth recording that a very similar scheme has recently been successfully launched in Canada for the large urban area around Toronto. Any such reform would require a considerable regrouping of the existing smaller authorities. But if Mr Brooke seeks a fruitful place for applying the ideas hinted at in last year's local government white paper, he should turn his eyes to the Manchester area.

His decision on the city's housing problems cannot, how-

Here is proof of how firms GROW in Northern Ireland

Castlereagh Estate—modern factories in a modern setting

There are ten firms on the Government Estate at Castlereagh near Belfast. Their original production area was 790,500 sq. ft. This has now gone up by more than 50% to 1,210,500 sq. ft. because six of the ten firms have *grown*. Indeed, three of the six have more than doubled their original plants; they are:—

SHORT BROTHERS AND HARLAND LTD. Their precision engineering division took a 35,000 sq. ft. factory on Castlereagh. A second factory and a new research block on adjoining sites and an extension to the first factory have increased the original space by 135,000 sq. ft.

LINES BROTHERS (NORTHERN IRELAND) LTD. A further 120,000 sq. ft. is to be added to their 72,500 sq. ft. factory.

PITMAN'S UNIVERSITIES PRESS started in small temporary premises. Moved in 1955 to a new 14,000 sq. ft. factory which is now being extended by a further 18,000 sq. ft.

A further major expansion is:—

BRITISH TABULATING MACHINE CO. LTD. which took over two factories of 268,000 sq. ft. A further factory of 104,000 sq. ft. is now being built on the estate.

The growth of Castlereagh is further proof that rapid expansion is easy in Northern Ireland where modern factories and good labour are matched by full and generous co-operation from the Northern Ireland Government.

IF YOU, TOO, ARE THINKING OF EXPANSION, CONSULT

ever, wait that long. Manchester's housing programme has already been cut drastically for lack of sites, and any further delay may mean that its slums will still be standing and occupied towards the end of the century. Lymm or Mobberley—being rather close to the city and on good agricultural land—may not be ideal sites for new towns. But either of them is preferable to pushing Manchester into building a few more scattered extensions of its already inflated suburbia, while it struggles once again to conclude piecemeal agreements with more distant Cheshire towns.

IRAN

A Consortium's Success

In the troubled oilfields of the Middle East, Iran, once the storm centre, presents a reassuring picture of calm. Its output has scarcely suffered at all from the Middle East crisis. In its last operating year, the international consortium reports, it exported 30 million cubic metres of oil (the cubic metre is the strange unit which the agreement used). This was 9.8 per cent more than was promised. Iran had the advantage of freedom from pipeline troubles: and any cut in exports caused by the closing of the Suez Canal was largely countered by deliveries to the refinery that Bahrain across the gulf. Bahrain's needs are falling now that deliveries from Saudi Arabia are permitted again, but with the canal reopened any slackening in Iran's exports should not last long. The consortium is confident that it can exceed its targets this year, too.

Its success is due as much to political prudence as technical skill. In Iran, the oil agreement was inevitably criticised as a creeping comeback of foreign enterprise. But the consortium has done everything it can to make it clear that NIOC, the Iranian national oil company which actually raises the oil, is not a junior partner. NIOC's prestige is growing as it undertakes new enterprises, exploring, for instance, with some success, the Agha Jari field. The big test of NIOC will come when it seeks to open up the untapped field of Qum, outside the consortium's field of interest. Here, too, the international companies have been prudent, maintaining a discreet distance from the rumours and negotiations which have surrounded the names of Signor Mattei and Dr Adenauer.

BAGHDAD PACT

Atoms for Trade

On the last evening of March the main competitors for local attention in Baghdad were the new moon—the first sign of which spelt the start of Ramadan, the month of fasting—and Sir John Cockcroft, newly come from Harwell to lecture and to assist at the opening by King Fiesal of the Baghdad Pact Nuclear Centre.

To the British public nuclear power signifies, above all else, energy for industry and warmth for the home. To Turkish and Pakistani fellow members of the pact, it means much the same. To Iraq and Iran, where there are cheap oil supplies and a wealth of natural gas that is at present being burnt off on every oilfield, those aspects are less interesting. But the Iraqi audience that gathered to hear Sir John heard its first public news of what can be done with radio-active isotopes in industry, medicine and agriculture. He was able to convey all that they can mean as tracers, as destroyers of malignant elements and as promoters of beneficent ones in such fields as sterilisation, food preservation and plant growth.

The economic committee of the Baghdad Pact is bent on making isotopes available for these purposes, but is at present hampered by lack of money. Yet scientists who are also economists agree that, perhaps a decade from now, traffic in isotopes will be one of the big items in world trade. The Baghdad centre is to produce them by means of British techniques and to give training courses based on British invention, methods and apparatus. It could therefore considerably assist this branch of British export trade. Yet the grant it is getting from the British Treasury is not enough to run the centre comfortably. Is it really impossible to find the £30,000 a year that is about what is needed? What better use could be made of a fraction of the £10 million a year that has been saved from the shambles in Jordan?

Atoms cast on Middle Eastern waters will, like the bread of old, bring back a sure return. If they are sown too stingily, the local openings for this future branch of world trade will be seized by the pushing salesmen already on tour on behalf of other actual and potential producers of isotopes.

The Economist

APRIL 11, 1857

MR TOOKE'S NEW VOLUMES

THE venerable veteran of Free Trade and Economic Science, Mr Tooke, has just presented to the world, in conjunction with his able coadjutor Mr Newmarch, a work of the greatest value not only in itself, but more especially as it continues through the period of the last ten most eventful years, his former work upon Prices and the State of the Circulation. . . . Under the unpretending title of *The History of Prices*, there will be found in the work now completed more accurate and minute information, more deep thought and philosophic research, applied in a useful and practical shape, upon the subjects of trade, banking, circulation, and the numerous questions which have arisen out of them, than in any other work in the language. From his own knowledge and observation Mr Tooke has been able to give to the world an accurate account of all the great changes and vicissitudes which . . . have attended the onward course of the rapidly expanding commerce of this country;—he has been enabled to show us to what some of our greatest checks and misfortunes have been attributable, and to plant a beacon in our future path by which they may be hereafter avoided. During the whole of the eventful period of sixty-five years to which we have adverted, Mr Tooke has devoted himself with undeviating consistency to the defence and illustration of two great principles of political-economical science, viz., free trade, and a sound system of currency and banking. . . . His pen has been perseveringly used for more than half a century in combating error and in maintaining true principles in relation to those most important topics. . . . And now, although at an age as we learn from the preface to his new volumes of "upwards of fourscore," the world has the advantage of receiving from his hands this History, brought down to the close of 1856, the *latter volumes exhibiting marks of vigour and of extended* research even greater than the portions of the work which apply to former periods.

TOWARDS COLLECTIVE DEFENCE

1. Science, Savings—and Security?

"THE Government are confident that this defence plan, while helping to relieve the strain upon the economy, will produce compact all-regular forces of the highest quality, armed and organised on the most up-to-date lines." On these words ends the ten-page five-year plan for defence issued a week ago. It is the most logical and realistic piece of military policy-making which has been put to the public since the first atomic bomb destroyed a Japanese city in a few seconds. There can be no question of the public's gratitude for what this remarkable State paper, does and what it promises. Yet, presumably by design, since Mr Sandys was himself the draughtsman, one word is missing from this final paragraph—a question-begging word dear to those who write official documents. That word is "adequate."

The white paper plans a cheaper defence organisation corresponding to the fact that "new and ever more formidable weapons have been succeeding each other at an increasing rate." Any responsible critique of it, however admiring, must ask whether it really covers all the reasonable political and military risks; and if the decisive choice of weapons in this plan seems to leave risks uncovered, it must frankly set them out. Cheaper defence is one thing, adequate defence another. Taking advantage of nuclear military technology to make large and welcome economies should not give currency to the idea that cheapness and adequacy in defence have automatically become, for the first time in human affairs, consistent.

The economies have to be assessed in the context in which the white paper puts them; and like every part of it, those references are very carefully worded. Britain's influence in the world, it is stated, depends on the health of its internal economy and the success of its export trade, and military expenditure must be related to these. This implies two things:

1. The rate at which defence *would* absorb resources without drastic reorganisation would leave the country ultimately weaker for all its bristling armaments.

2. The resources released should be used in ways that enable the country to maintain and increase its influence.

A minor military operation which for lack of sufficient reserves can threaten the collapse of the pound reveals not the country's strength but its weakness—as persistence in the Suez adventure might have done. Military expenditure should not consume the whole margin of resources which Britain, as its imperial positions dissolve, can use to back its policies and aid its friends. Mr Sandys eschews the phrase "waging the cold war," which was much used in previous defence surveys. Yet it is a convenient shorthand phrase for the struggle to retain otherwise than by the display of force the co-operation and respect of uncommitted or emergent countries in Asia and Africa. The success of the white paper must be partly judged on whether the country's enhanced economic stability is so encashed. Otherwise it could be said that greater risks had been taken simply to raise living standards at home, *carpe diem*, without increasing Britain's potency in the western alliance.

In taking his bold but calculated risks Mr Sandys, of course, has had to work within the limits of the politically possible. There is no economic reason why, if people were willing, Britain should not adjust the level of consumption to a defence budget of £1,700 million or more. If such expenditure would buy defence against thermonuclear devastation, or certainty that the deterrent would be permanently effective, there might be political backing for it. But there is no such defence, and the background against which any minister of defence operates—especially after the military fiasco of Suez—is the widespread conviction that most of the taxes extracted from the country under the Attlee plan to spend £4,700 million on defence in three (later spread over five) years have gone down the drain. In fairness, it should be said that there has been no war. But, right or wrong, the nation is not prepared to go on spending at that rate; Mr Sandys was bound to make policy in the framework of a reduced defence budget.

The next point to be made about cheaper defence is that it is a reduction of Britain's share of the collective western burden. Britain has been devoting ten per cent of its gross national product, seven per cent of its working population, one-eighth of the output of its metal-working

industries and an undue share of its scientific brain power to defence, and the changes now made return a proportion of these resources to the productive sector of the British economy. Nato has reacted unfavourably, but rather, as an article from our Paris correspondent on page 149 shows, because Britain decided to make cuts on its own, not because it is defaulting on its fair share. The answer is that, in its economies, the white paper faces unilaterally the realities that Nato has been too slow to face collectively; and that, in doing so, never has British defence been reorganised on lines which more completely commit this country to Europe. The new plan may leave Britain less able to defend Europe's interests in the Middle or Far East; but it does not take Britain out of Europe. This, for Nato, is the first lesson to be drawn from our abandonment of home defence, the concentration of the remains of fighter command on the airfields mounting the deterrent, the acceptance of Britain's role as "Intermediate Rocket Launching Platform No. 1" for Thor, notwithstanding Russian threats, and the cuts in the Navy. In every way, the white paper leaves Britain more a contributor, more integrated with its allies' forces and fate, less a free agent.

The final question is how far further cuts may be expected from this policy. The white paper thinks it will "further appreciably reduce the burden on the economy" but not in proportion to the rundown in manpower. Despite the burden-sharing agreement with America on missiles, and the rundown of research and development, the cost of the new weapons will take up a lot of the cumulative savings on manpower. Whether cuts of £100 million can be made again in future years depend on the commitments and technological trends examined in the following sections.

2. *Responsibilities, Risks and Priorities*

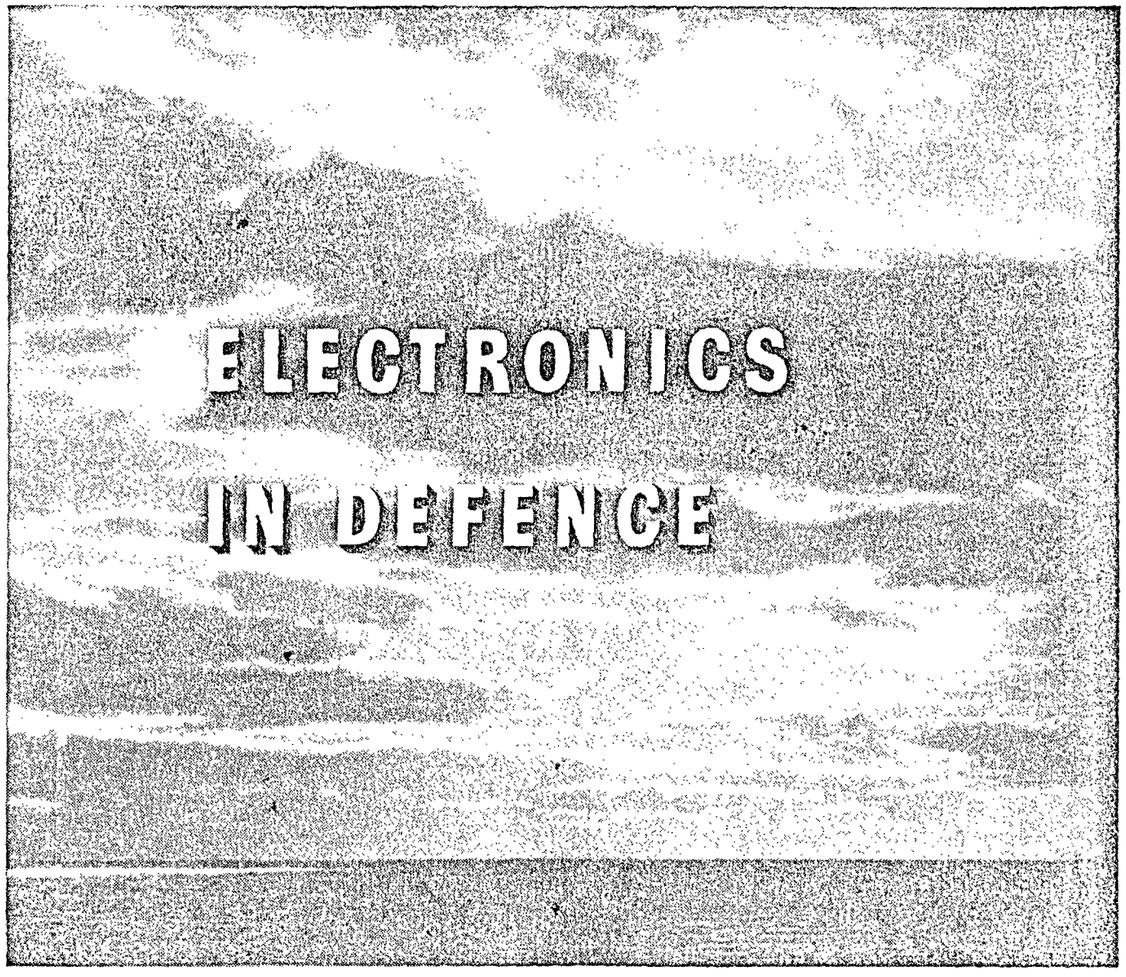
Britain cannot be strong in both nuclear and conventional armaments, on land, at sea and in the air. But are we preparing for the most likely contingencies?

NOTWITHSTANDING the white paper's excuse for its predecessors' woolliness that "it is only now that the future picture is becoming sufficiently clear to enable a comprehensive reshaping of policy to be undertaken," the basic strategic facts which it acknowledges for the first time have been clear since Russia exploded its hydrogen bomb. Defence became deterrence in 1955 when Sir Winston Churchill announced the decision to build our own "equaliser" to be tested this summer. Mr Sandys has now put on official headed paper the stark truth that a global war will be so devastating in the first days that it is impossible to foresee or plan the course of "broken-backed" warfare thereafter. The logic of the thermonuclear stalemate is that the two sides are as lethal to each other as duellists in a small room armed with grenades.

It is an immense gain in realism that Mr Sandys has dropped, therefore, all attempts to fit the forces to fight "broken-backed," war, and has made the full savings possible from dismantling home defence, reducing "civil defence" to a background study of Crusoesque post-atomic survival measures, and thinking of the reserves only in terms of limited but perhaps relatively protracted wars fought with conventional weapons.

Fighter command is reduced and confined to the defence of the airfields on which the deterrent is mounted, and which must not offer a temptingly easy target; but this role will remain only so long as there are bombers to intercept and insufficient ground-to-air rockets to intercept them. When Russia has rockets the use of fighters will taper off to minor tasks like intercepting aircraft trying to jam the radar. When only three or four bombers or missiles need to reach this island to destroy it as an organised modern society, its proper posture can only be that of the scorpion.

The sting, however, is to be American-made. "The free world is today mainly dependent for its protection on the nuclear capacity of the United States." This is so incontrovertible that the question arises why Britain needs to divert resources to making a "modest contribution" at all; why is there "a wide measure of agreement" that we should? (Some Nato critics do not share in it.) The idea that Britain needs bombs and bombers under its own command to destroy "targets" of special importance to it in nuclear war is outdated. But though the white paper does not state them there are three cogent reasons:



1. The making of our own "conventional" atomic bombs belonged to an earlier phase, but now that we have them, we virtually have the megaton bomb as well. The capital cost has been incurred, the bombs are now cheap to produce, so that we might as well continue.

2. In the means of delivery we also have a capital of accumulated know-how, and our scientific, if not technological, contribution is highly prized in America. The cost of research and development is rising astronomically, and may even tell on America's resources, so that provided there is division of labour a British contribution is well worth the West's while.

3. Though it seems inconceivable that America should abandon Europe except by the latter's folly, we have to live indefinitely in a nuclear world, and possession of the H-bomb gives Britain the power, *in extremis*, to refuse to submit to dictation. This is an argument which has its weakness; if every state sets out to acquire this power, disaster will supervene. It is one which Britain must essentially share with western Europe; and sooner or later control seems the only alternative to chaos.

So much for the logic of the great deterrent. The white paper follows its predecessors in admitting the need for forces capable of dealing with "limited wars"—as well as minor colonial law-and-order operations—which might become dangerous. But it places the emphasis differently. It lays down that even small wars must be dealt with collectively, and that "this conception of collective defence is the basis of the North Atlantic, South East Asia and Baghdad alliances." It itemises the major areas where Britain has a collective responsibility, and the minor ones where it has specific one (the colonies or the Trucial states).

This is the convenient approach if the big reduction in army manpower, with the abolition of conscription, is to

Electronics is fundamental to Britain's complex system of defence. Whether it be communications on land sea or air; whether it be radar in its many forms; or whether it be local or remote control systems, its efficiency will be dependent upon electronic techniques.

And now the British Electronics Industry is meeting the challenge of the latest addition to defence—the guided missile.

Intricate electronic devices are used to direct the missile to its target, to control its stability in flight, and to detonate it at just the right moment.

Such electronic devices make special demands upon the valve industry. A wide range of valves and electronic tubes is required that will operate reliably even when subjected to severe conditions of vibration, rapid acceleration, considerable degrees of shock and sometimes extremes of temperature.

The research and production facilities of the Mullard organisation have been so applied to this problem that today Mullard are supplying by far the major portion of British valves and electronic tubes for guided missiles.

In defence, as in industry, economy is often achieved with increased efficiency by means of improved equipment. Working in conjunction with the Government, Marconi's have been responsible more than any other commercial undertaking for great improvements in the equipment which ensures the swift, lucid and secure interchange of intelligence. Thirty-two airforces rely on Marconi radio communications, navigational aids and radar. Integrated naval and air radar defence networks have been entrusted to Marconi's in many parts of the world. Radar formations of the RAF are now being re-equipped by Marconi's. Marconi equipment in war ships and shore stations contributes to accurate navigation and efficient operation.

be justified. The white paper tours the periphery of the free world and details the sore spots; the implication is that in none of them in future will the demand for British riflemen be large. Either a threat will be met by an alliance to which the British contribution in battalions will be modest; or it will be a brushfire which a battalion or two from the nearest colonial garrison can handle. One is asked to believe not that these commitments were cut to fit the forces that might be got from volunteering, but that an assessment of the contingencies showed that they could be handled by forces of 375,000 men which—as it happened—was just what the experts thought could be got without conscription. This is the most controversial point in the white paper—the point at which its admirable logic tends to become blurred.

In the first place, it is not made clear whether limited threats would be met by tactical nuclear weapons or by conventional armaments. No question arises in colonial defence—except perhaps Hongkong—but it does arise elsewhere. In the previous white paper it was stated that " in such limited wars the possible use of nuclear weapons cannot be excluded "; but Mr Sandys has not repeated this.

Yet the whole programme envisages the arming of the reduced forces with nuclear weapons. The reduction of Rhine Army from 77,000 to 64,000 men and of the Tactical Airforce by half is justified because they will have atomic rocket artillery (the Corporal) and atomic bombs for the Canberras. The navy is to have missile ships which must imply atomic warheads; carrier aircraft can drop A-bombs.

But if " graduated " use of atomic weapons is not envisaged, and all aggression beyond the powers of the small conventional forces is to be met by calling in the H-bomb, what is the role of tactical nuclear firepower? It is this, rather than the investment in the H-bomb, which calls for explanation. " The frontiers of the free world," says the white paper, " must be firmly defended on the ground." In terms of the white paper, this can only mean either (1) they must be defended by atomic cannon and rockets or (2) they must mainly be defended by other nations' manpower and machine-guns. It is difficult to see how an army of 150,000 or 160,000 can produce expeditionary forces large enough to be effective in a war fought with conventional weapons in the Middle or Far East. To be mobile these must be small; to be small but of use they must have colossal hitting-power. The conclusion must be that he who calls in the British ally in future calls in a tactical nuclear force capable of sealing up passes and pasting up concentration points with kiloton bombs but not much else.

If this is the intention, it is not stated. This may be because the Government does not think that the time is ripe either in Nato or elsewhere for an explicit statement that aggression might in the first instance be met by nuclear arms. It may also be because the Government's service advisers are themselves not entirely clear how effective tactical weapons would be in any imaginable theatre of war outside Europe. It does not follow that the West would be the only belligerent to use nuclear weapons, and its small compact forces, its bridgeheads, ports and fleets may well present better targets for low-yield atomic warheads than would its enemies; if this were so, the West might, once it had dropped the first bomb, find itself at once suffering from the obloquy of using the bomb and being outclassed at its own game.

This uncertainty carries the risk that it will make allies hesitate; in Europe and perhaps elsewhere Russia might receive the impression that in a sudden mêlée the governments concerned might lose their nerve and fail to call in the tactical nuclear arm until it was too late, or try to fight it out with inferior conventional forces, particularly when it became clear that to restore the situation the bomb would have to fall on their own people and towns. It must be expected that Russia, seeking advantages by any means short of global war, will be tempted to exploit any weak point in the West's defences or other deterrence: and a shortage of conventional forces may be that weakness. That temptation will be increased when Russia has the means of delivering its own hydrogen bombs as easily on America, as America can on Russia.

Finally it must be noted that reliance on tactical nuclear weapons is vain in cases of civil war or subversion. Sizeable

Expenditure—Real and Imaginary

THE expected reduction in defence expenditure this year in money terms is £105 million; this is the difference between last year's actual defence expenditure of £1,525 million (after deducting £65 million of actual US and German contributions) and this year's estimate of £1,420 million (after deducting £63 million of expected US and German contributions). It is, however, open to the Government to say that, since the prices of defence commodities and services expected to be bought in 1957-58 are already bound to be higher than their prices in 1956-57, the volume of real resources set free by the cuts, compared with last year, must (in terms of constant 1956 prices) be somewhat larger than £105 million: probably it is of the order of £150 million.

Unfortunately, various other figures have been quoted in the press in the past week, with Government encouragement. To cite the two extremes:

(1) The original estimate for defence expenditure in 1956-57 (which in the end was exceeded by over £26 million) was £1,499 million; this is £79 million more than the new estimate for 1957-58, and that figure has been given some publicity. It is an utterly meaningless figure, and seems to be based on the strange argument that since last year's estimate was exceeded, this year's might be too—and by a precisely similar amount. But it might equally be under-utilised; one cannot make any sensible calculation except on the basis that this year's estimate is the best estimate now available of what expenditure will actually be.

(2) Because the programme tentatively envisaged for 1957-58 a year ago would have cost about £217 million more gross than the programme now envisaged, some publicity has also been given to this figure. From the economic point of view, this is also a meaningless abstraction. It measures the paper cuts that had to be made in the services' own estimates of what they would have needed to continue last year's programme.

In addition to the figures mentioned above, calculations—ranging between these extremes—have appeared in the press of the defence "saving" citing the difference between last year's original plus supplementary estimates and this year's original estimates—both including US and German contributions (£154 million), and excluding them (£117 million). Both should be disregarded as having no economic significance at all.

conventional forces, widely dispersed in garrisons, and far-ranging warships, which can quickly be rushed to a trouble-spot have always been the best—if by no means always effective—deterrent to interference of this kind.

To these shortcomings in the white paper plan there are a number of possible answers:

1. It can be argued that even after the rundown of forces there will be enough conventional armaments to meet any limited threat in which Britain is likely to be called to play a substantial part. This may be true—provided two limited wars do not start together.

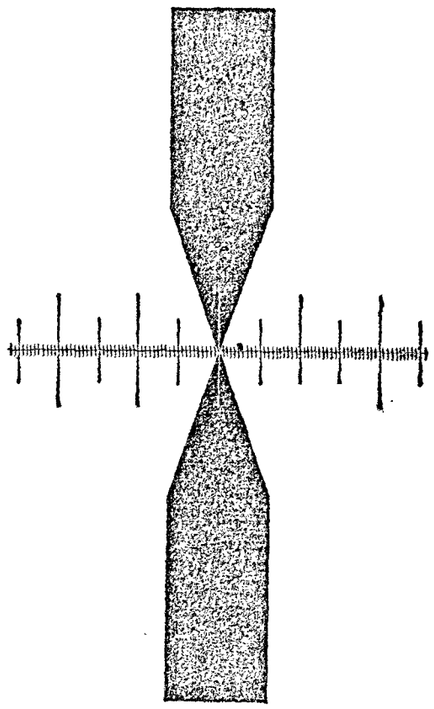
2. It can be argued that because Britain reduces manpower to offset the cost of nuclear weapons, not everyone should do the same. Roles should dovetail, and others should provide the mass conventional arms. That may be acceptable—provided it does not look as if Britain was taking the soft option.

3. It is argued that even in conventional terms Britain gets far more out of 375,000 regulars than a partly conscript force; that is true—but again its effectiveness depends on the airlift that will bring it quickly into action with its armour; and that will be expensive.

The real safeguard in Mr Sandys's plan is that it is a five-year plan, and like the Attlee plan it can be modified in the light of experience. It makes significant reservations both on the possibilities of further economies, and on conscription. The planned rate of reduction in the forces in fact could be slowed down by using the selective call-up which is evidently to be the chosen instrument for tapering off national service.

3. *Manpower, Firepower and Missiles*

How many men, ships and aircraft shall we get for limited war? Staking so much on missiles, long and short range, how soon shall we get them?



ONE of the white paper's signal achievements is the new view which it takes of the three services. By anticipating the development of the new weapons, it points to the breakdown of the rigid frontiers between them—frontiers defended with a vigour which has had bad effects on defence as a whole. Implicit in a reduction of the forces to 375,000 men, all concerned with firing missiles from land, floating or airborne bases, is the idea of a unified service. This in itself would make possible better use of manpower as well as more interesting and attractive careers for professional fighting men. So long as the services, active and in reserve, were large, this tendency could be resisted because each was a natural administrative unit; but by 1962 the waste and weakness of three separate ministries will stand out.

As this unity of aim grows, the need to define the "role" of each service, dear to writers of white papers hitherto, may conveniently disappear. The RAF will ultimately divide between rocketeering, flying the new central reserve to operational areas and performing tactical air tasks by land and sea. The white paper is frankly doubtful of the navy's future on the hypothesis that a thermonuclear war would be short, so that the problem of keeping sea communications open would not arise. Nor does it endorse the American view that carriers offer important alternative mobile bases for mounting the great deterrent.

The navy's importance probably lies now most in its part in a limited war. As colonial bases disappear, and leased bases reveal their uncertainties, the carrier increasingly proves the natural mobile base along the west's sea communications, capable of carrying and escorting troops and equipment to their destination, providing air cover of the kind required and able to exert its influence further inland than the cruiser used to do. This was proved in the Suez operation, where carrier aircraft did most of the work. The decision to base carrier task forces on single carriers, instead of groups, probably reflects this view. The white paper does not refer to the Russian submarine threat, into which the Russians are, however, pouring immense resources—mistakenly if the possibility of broken-backed warfare can be ruled out. The Russians, however, have other purposes for their huge unobtrusive submarine fleets. They threaten America's communications with its European bases; they could play a part in a limited war; as missile carriers, they could neutralise Russian disadvantages in delivering atomic attacks on outlying but mostly coastal industrial bases. As a blockade in being, they cannot be ignored; but the proper division of the burden between the British and American navies is undecided.

The army's future turns upon the white paper's proposals for ending conscription. To the argument that Britain ought to concentrate on conventional forces as the "little deterrent," while America undertakes the nuclear role, one retort is where do the men come from? The technical arms attract the volunteers, and both the reduced navy and RAF should be wholly professional—perhaps turning applications down—by 1962. But by 1962, the Army will have had to convert its 85,000 3-year men into regulars—a yearly intake of 25,000 volunteers ready to serve the colours for 6 to 8 years. As the Army is now getting only about 12,000 volunteers a year this seems unlikely. The real advantage of the rundown in army strength to 160,000 (no actual figure is given) is that it will between now and the ending of conscription in 1960 enable the government to experiment with a form of selective service which may continue.

An army of 160,000 is very small even to deal with the curtailed list of commitments. Even with regulars, half its strength ought to be at home. If Rhine Army is reduced by 1960 to 50,000, this would leave 25,000 to provide the colonial garrisons, with something in hand for the Commonwealth strategic reserve. Out of the 75,000 troops at home would have to come all troops in training, men in movement, specialised arms, supply and staffs and the central reserve. If the former is put at 50,000, the central reserve will not much exceed 25,000, or one infantry brigade group, with an armoured regiment and three para-troop battalions. If it could be entirely airborne at short notice with its equipment it would be a useful striking force—and one that would have dealt with the canal in a few days, had we had it. But such an airborne force will be very expensive. A smaller airborne force would be little more than a riot squad—or a unit of nuclear artillery.

Nothing more accurate than Electronics

If at some stage in your process you require high operating speeds in sorting, batching, counting, computing, accurate and wide speed control, or non-destructive testing and inspection, electronic equipment can do it. If the appropriate equipment does not already exist it can be designed and made for your job.

Once installed it will last as long as your machines and need little maintenance or attention. It will consistently raise the standard of your products.

Because it does its work so quickly and so well you will find production rising while overheads are reduced. This is only one of the many ways in which electricity is playing a vital part in the drive for higher productivity.

Electricity for Productivity

'Induction and Dielectric Heating', just published, is a very important addition to the E.D.A. series of books on Electricity and Productivity. Other titles available are Electric Motors and Controls, Higher Production, Lighting in Industry, Materials Handling, and Resistance Heating. Price 8/6, or 9/- post free.

If you would like further advice or information on how electricity can improve productivity, get in touch with your ELECTRICITY BOARD, or with E.D.A. They can lend you, without charge, films about the uses of electricity in industry.

ARGONARC WELDING

helps to build

Britain's Guided Missiles

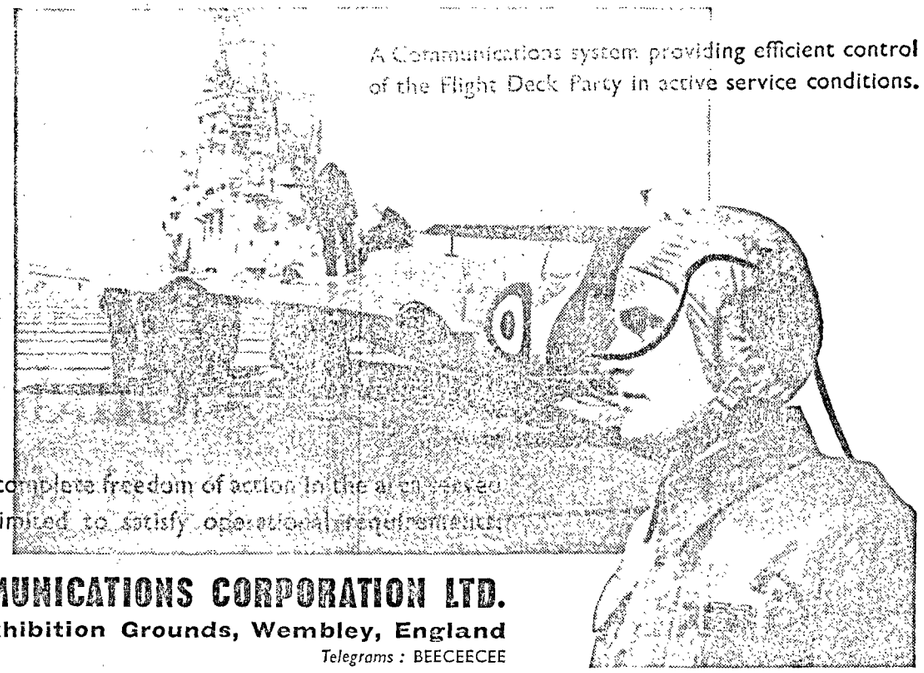
For today's vitally important guided missile programme, British Oxygen is helping to develop new and improved welding techniques to meet Britain's defence needs.
The Argonarc welding process is used in all branches of aircraft construction, but the high quality precision welds obtainable with Argonarc make this process particularly important for the production of guided missiles.

Argonarc welding gives:

★ GREATER STRENGTH

★ BETTER WELD CONTROL

★ INCREASED SPEED OF PRODUCTION



A full range of Argonarc torches is available for all types of welding, both for manual and automatic operation.

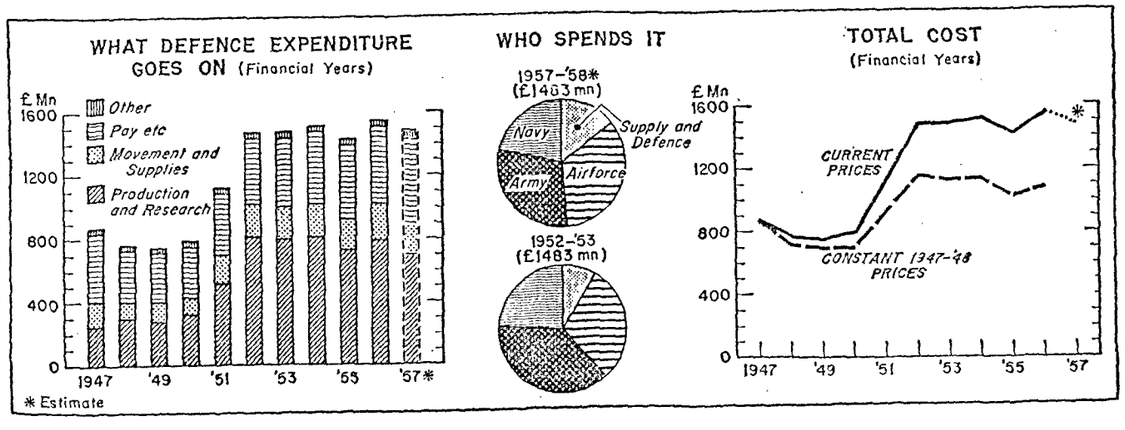
IF much is now staked on small forces, much also is staked on their weapon, the nuclear-tipped guided missile. In fact this weapon has yet to prove itself ; to this extent the Minister and his scientific advisers are giving a hostage to fortune when they decided to concentrate all future research on this one weapon in all its forms. But they had little choice. Although the production bill for the coming financial year is estimated at nearly £550 million compared with £612 million last year, the Ministry of Supply, which provides the money for all weapon research, including nuclear warheads, is alone in showing an appreciable rise in defence expenditure in this coming year, from £185 million to nearly £200 million. If work on supersonic bombers and ultra-high speed fighters had been continued in parallel with research into guided weapons, it would be easy to see this figure rising towards £250 million. Manned aircraft have been developed as an insurance against the failure of the guided missile. The premium has become too expensive to be renewed.

What are the alternatives ? In the United States, work on guided missiles has been divided fairly equally between those intended for offensive and for defensive roles. Such an extensive programme was too much for British resources and the biggest effort here has gone into developing defensive types to replace the fighter aircraft. In their present form, however, British guided weapons are armed with nothing more formidable than high explosive.

Missiles take perhaps a year or so less to develop than aircraft but their gestation must still be measured over several years. To keep a sense of perspective, some distinction must be drawn between the weapons that are available now, and those that will not be in service for several years.

The short-range atomic missile is a tactical weapon of the present. The American Corporal rocket used by British and American troops is not an elegant design, but it is as effective a means of delivering a small atomic warhead 50 to 100 miles as any known today.

The weapons for which the world is waiting with apprehension are the ballistic rockets that can fly at least 1,000 miles, and preferably 1,500 miles. The distance is not arbitrarily chosen ; it represents the ranges over which missiles launched from the East or Western sides of the Iron Curtain could reach the more important enemy targets. In America, the true ballistic missile, the most advanced of which is Thor, is only now starting firing trials as a complete unit. If these trials go well, Thor might be in service, and even being delivered to this country, within the next two or three years. If they go badly, its introduction could be much later. A weapon in the same class as Thor is being developed in Britain, but its late start puts it years behind.



Meanwhile, the Russians have been firing test missiles with ranges of 1,000 miles at a rate that is reported to have reached as much as five a month last year. These need not have been more than test vehicles but they suggest that the Soviet Union must be approaching the point where a 1,000-mile range weapon could go into production.

Beyond these intermediate missiles are the ultimate monsters which will further change the timing of deterrent strategy, by carrying thermo-nuclear warheads the 5,000 miles that separate the mainlands of the United States and Russia. The first American weapon, Atlas, is due to start firing trials this year, but that does not mean that it is anything like as far developed as Thor, and several years of intensive work are likely to be needed before it is. There is nothing to suggest that the Russians are any further ahead here than the Americans, which leaves them at a disadvantage.

Britain will have to rely for several years on importing these offensive missiles from the United States. But if work on manned bombers is coming to an end in five or six years' time when the V bombers have been developed to their ultimate limits, development on long-range missiles must be pressed ahead now to be ready to carry British-built thermonuclear warheads when the Russians develop a successful defensive missile against V bombers.

The development of atomic warheads is not, however, being confined to long-range weapons only. Several American anti-aircraft missiles are being fitted with small nuclear tips, including some of those carried by fighters. The implications of this change may take some time to work themselves out. An atomic anti-aircraft missile no longer has the impossible task of scoring a direct hit on every attacker: a nuclear blast anywhere in the vicinity of a raiding aircraft will be enough to hurl it out of the sky. The same principle can be applied to defence against a ballistic missile, so that at the very moment when the supreme power of the deterrent is given official recognition, the defence is receiving a nuclear shot in the arm that may bring it staggering to its feet.

All these developments eat money and manpower of the highest quality, so that even with the reduced size of the forces it is inconceivable that the production bill could even be held at its present level without a close dove-tailing of research and development between this country and the United States, accompanied, at some time or other, by an agreement on atomic warheads.

4. Nato and the Plan

The logic of the white paper applies with as much force to Nato as to Britain, and should force the allied commands and governments to meet the rising costs of new weapons by reshaping and reintegrating their forces and arms production

ARTICLE three of the North Atlantic Treaty lays down that its members ". . . by means of continuous and effective self-help and mutual aid will maintain and develop their individual and collective capacity to resist armed attack." The white paper, criticised in Europe as a unilateral decision repugnant to the spirit of Nato, in fact insists that "the trend is towards the creation of integrated allied forces." The whole trouble is that the trend is far too gradual. Nato commands are, to some extent, integrated though they are also elaborate and top-heavy with liaisoning; but the forces are separately organised, with different weapons, standards, methods, and supply systems leading to supply ports or bases. So much is this so that it is an immense task to switch a division away from the sector prescribed for that particular nationality. Standardisation has been pursued by a variety of committees but while agreement has been reached on common user items like carburettors and—the greatest achievement to date—small arms ammunition, the British and Americans compete furiously in trying to sell tanks to the Germans, who in any event have decided later to build yet another type of their own.

It should, on the contrary, be clear that if Mr Sandys's plans are to be fully successful, they must have wider application. The full savings cannot be achieved, or Nato defence made efficient, until the rough division of functions between Nato members becomes true specialisation in arms, formations and production. Britain is the first Nato country to renounce the attempt to maintain multipurpose forces; but if this is beyond Britain's strength, it is almost certainly beyond that of most Nato countries other than the United States. The white paper should prove a catalyst of allied military thought.

Continental thinking suffers even more from uncertainty about the uses of tactical nuclear weapons than British, and this undoubtedly holds up more radical reorganisation. The British view is evidently that the shield forces can be reduced to a level just enough to ensure that no attack by satellite armies could hope to be successful without Russian aid, in which case the strategic nuclear deterrent would be involved, since nothing short of it can prevent Europe being overrun. There is therefore nothing sacrosanct even about the 1955 reduced target of 30 divisions. But what then is the role of the nuclear arms—the 280mm cannon and rocket artillery—which is hardly needed to deal with a satellite incursion? The continental governments still nurse hopes that either they can meet an attack by large enough conventional forces, or ultimately be in a position to defeat a full-scale Russian invasion by low-yield nuclear weapons without causing H-bombs to fly. The bogy of having their cities occupied by the Russians, of having to liberate them on the pattern of 1944-45, persists in their minds. The white paper was needed to provoke them to decide exactly what are the contingencies in Europe and with what forces they can best be met. It ought, too, to widen the horizon of Nato strategic thinking; Nato criticism of the white paper would have been more impressive if it had been directed at the risks Britain runs outside rather than inside Europe.

It should also prompt a reappraisal of policy in the United States, and President Eisenhower's favourable response to the plan is a good sign. There must be integration of functions and production with the United States if waste is to be stopped. If attempting to produce both conventional and nuclear forces has overstrained Britain's economy and compelled drastic economies American legislation is partly to blame; and it is hardly enough to have excellent relations at the level of pure science. The fact is that the ABC agreements on nuclear know-how have worked greatly to Britain's and Europe's disadvantage and need overhauling. If specialisation is to go further it does not follow that America should make all the missiles. It is, for instance, very arguable that Britain can supply, in terms of volunteer manpower, a first-rate navy of 100,000 men; what we cannot afford is enough up-to-date ships for them, and by reducing the naval strength to 75,000 we are contributing less of a valuable specialised force than we could. It might be appropriate for the Americans to supply modern ships, and for the Royal Navy to contribute, unreduced, its matchless naval efficiency, know-how and tradition to western sea power.

It was perhaps unfortunate that the British white paper could not be endorsed in advance by Nato. But though Nato exists to undertake just such a "comprehensive reshaping of policy" for the alliance as a whole, it is at present politically incapable of doing so, as the protracted discussions over the reduction in Rhine Army showed. In default of it, the British plan now admittedly defines the types of forces which Britain wishes to fit into everyone else's; it is a pre-cut piece of the jig-saw puzzle of collective defence to which the other pieces, North American, French, German and so on, should be fitted. But it could be modified, if the same ends could be achieved by other means. It is not an assertion of sovereignty, but the contrary. Whether the British Government realised it or not, the white paper is the most complete confession yet made by Britain that adequate defence and national sovereignty are incompatible—and if this is put to the test by Nato it could lead to very considerable restraints being placed upon every member's freedom of action. A white paper which makes the insular decision to abolish conscription points logically to a degree of integrated allied defence which would take such decisions out of the hands of member states, and make the determining of manpower policy a collective function. But this cannot come about until all the members of the alliance have faced the issues squarely. For allies that have not carried the burden of a two-year call-up or the cost of nuclear research which now gives Europe the megaton deterrent independently of America to cavil at the white paper is hardly reasonable; nevertheless reshaping allied defence must be done collectively henceforth, and not by a chain reaction of unilateral cuts and decisions.

BOOKS

The Cat in the Doctor's Bag

The Fateful Years: *Memoirs 1931-1945*

By Hugh Dalton.
Muller. 493 pages. 30s.

THE second volume of Mr Dalton's autobiography has been unfairly bombarded from two sides. Labour expostulants have objected because it lets the cat (there is hot argument about its proper colour) out of the bag. But the only cat that is let out of the bag is Mr Dalton himself, which is surely the right purpose of an autobiography. Critics with other politics have been fastidiously shocked because the comrades at the top of the Labour party are presented by Mr Dalton as Kilkenny cats. These critics protest too much. They need only read their Trollope or the history of the Conservative party from Beaverbrook to the latest Lord Salisbury to see that politicians, whatever their colour, are much the same.

What is the factor *x* that causes a man to be chosen as the political leader of a party? In 1935 Mr Dalton preferred Mr Morrison because he doubted whether Mr Attlee had what it takes. Ten years afterwards, with power in Labour's grasp, he was, as the tide and Mr Bevin were, on Mr Attlee's side, and he feels, as he usually does, that he was right. The interesting question is why he himself lacked *x*.

He would probably answer that *x* is not enough without *y*—the opportunity or chance. It was on a Budget day ten years ago—not the Budget day itself but the day of an emergency Budget in the autumn—that Mr Dalton stumbled most unfortunately, but finally, from the top slopes of the Labour mountain. The tale of the prompt and honourable price which he paid for the indulgence of a few trivial words will be told in the next volume of the autobiography, together with the story of his carefree Chancellorship. But the turning-point came very much earlier. The confidential verdict of Mr Dalton on Mr Dalton is that, if he had not lost his seat in the 1931 debacle, he would "almost certainly" have been Mr Lansbury's deputy in the Parliamentary party, then Deputy Prime Minister in the wartime Coalition and finally Labour Prime Minister.

But x, which can be judged, remains more assessable than y, which cannot. Why was Mr Dalton never really a serious contestant for the Labour leadership? No man in the party during the preparatory thirties and forties had a larger, or larger-hearted, influence on the party's best young men: "Little Hugh," now at the summit, is not alone in his gratitude to "Big Hugh." None among the Labour leadership before the war had a clearer view of world realities. His indictment then, of Cripps and Laski, as well as of Lansbury, was right. Yet the South Col, ill-luck or not, was his limit. Why?

This is where this autobiography is so good. It gives the answer as it goes along. The song in Mr Dalton's heart (identifiable a decade or so ago, in a strictly economic and financial context, as the wind on the nation's stomach) has been his own political handicap all along. For all his notable services to his party and, in wartime, to this country, Mr Dalton has always been, by his own account, too sure of himself—and of others' shortcomings. To a point, both when he was, with ebullient ability and effect, first Minister of Economic Warfare, with fascinating cloak-and-dagger responsibilities in occupied Europe, and then when he was wartime President of the Board of Trade, with a backward "never again" look at the old depressed areas, this self-confidence was his armour. At the Treasury, afterwards, it was his downfall; so it has been in the party.

"Both you and I saw," Mr Dalton wrote to Winston Churchill on May 25, 1945, "more clearly than many members of either your party or mine, the growing German menace in prewar years. I greatly appreciated your support for the case I made in the House of Commons on May 25th, 1938. . . ." And when Mr Churchill, almost exactly five years before, had exhorted his new Coalition Ministry to all-out resistance to "That Man," Mr Dalton records that, "there were loud cries of approval all round the table, in which, I think, Amery, George Lloyd and I were loudest."

Very likely these claims are true enough. But, set down now, they are, revealing clues to the reason why, unlike his constituency football team, Bishop Auckland, which plays this Saturday in its 18th Amateur Cup Final, Mr Dalton never reached the last round.

F.D.R.

Roosevelt: *the Lion and the Fox*

By James McGregor Burns.
Secker and Warburg. 569 pages. 45s.

ROOSEVELT-GESCHICHTE is getting its second wind. For the moment the spate of contemporary memoirs—"The Roosevelt I knew" type—has ceased: and now the biographers, historians and analysts have taken over, the second generation who know the Great Crash only as a childhood memory; to whom FDR's Hundred Days belong as much to the past as Napoleon's; who have spent most of their adult years in a world in which there was a good deal more to fear than fear itself. They bring to their subject, for the most part, a dispassionate spirit which their predecessors notably lacked, but they also bring a critical temper which is more than proof against the FDR charm that, while he lived, so effectively armoured him against all but the most embittered of his enemies.

Of these latter-day Rooseveltians, Mr Burns must now, on the evidence of "The Lion and the Fox," be counted one of the most accomplished. His book is a "political biography"—the first such, his publishers surprisingly assert, as if other Roosevelt biographers, by some miracle of excision, had contrived to tell the life story and leave the politics out. However, it certainly focuses consistently on "politics" in the strict, technical, one might almost say American, sense of the term, as the art of the possible, of the how rather than the why, of statecraft as Machiavelli conceived it. As such, the book becomes also a study in political leadership, although this very properly leads Mr Burns on to ask more fundamental questions about the Rooseveltian strategy as well as tactics, about his ultimate objectives and ultimate successes. This gives the biography an extra dimension of interest and intensity; one reads on not only because of the abiding fascination of "the four times President," but also because of the crucial questions which Rooseveltian politics provoke, for other decades than those in which they found their immediate occasion.

Mr Burns not only raises the questions; he continuously strives to answer them, at each stage in his subject's sinuous career as well as in the grand inquest which he holds at the close. His judgments are by no means continuously favourable. Roosevelt is marked down on more than one occasion for failures of leadership, for indecision, for tortuousness (though this less often, perhaps, than one might expect), for errors of timing and even, on occasions, signs of timidity. On balance, however, Mr Burns finds for the prisoner at the bar. Roosevelt, it is true, "was less a great creative leader than a skilful manipulator and a brilliant interpreter." But "for all his deviousness, he was basically a moral man"—not "an absolute moralist" because he had few illusions about a man's imperfect nature, but an aristocrat dedicated to the purposes of democracy, a great warrior who "would use the tricks of the fox to serve the purposes of the lion."

All this Mr Burns traces with subtlety, scrupulous fairness and considerable detail, through the first seven years of Roosevelt's presidencies, together with a brief conspectus of his early years and a short epilogue on the war period. It is impossible not to regret the foreshortening involved in the decision to cut down on the years 1940-45. These, after all, were the supreme years of test and triumph, of boundless power and supranational leadership, and the hoary,

always-valid, never-valid, excuse about scholars not yet having "the full data" will pass muster only if it means that, when time permits, Mr Burns is planning to take us over the rest of the course. When he does, he might consider one or two modifications in his generally admirable style of treatment. He surely might take the more familiar historical events of the period as read; these 500 odd pages could have been usefully reduced by dropping the pretence (which the bibliography over-elaborately refutes) that Mr Burns's is the first conducted tour over the site.

Secondly, Mr Burns's narrative gifts are considerable enough for him to spurn the touches of spurious drama that frequently deface the opening paragraphs of new chapters and lead him, in at least one instance—the picture of FDR on election night, 1940—to attempt a most unhappy blend of *Time*-style and Lytton Strachey. His book as a whole is so good, so full, so freshly made from primary materials, so intelligently thought out in every judgment, that these defects stand out the more glaringly. For all that, they are in essence minor blemishes, in a book that no student of Roosevelt can ignore.

France's Weakness

De la IIIe à la IVe République

By André Siegfried.
Paris: *Grasset.* 270 pages. 780 francs.

M. ANDRE SIEGFRIED, like the constitution of the Third Republic, was born in 1875. There is in these reflections on French politics something of an autobiographical nostalgia for the great days of the Third Republic, of which he gave us so tantalising a sketch in his brief memoir of his father some years ago. It would, however, be a mistake simply to treat this as a work interesting for its author rather than for itself. M. Siegfried pays a rare compliment from a Frenchman to a foreigner when he says in one passage that Mr Philip Williams's book, "Politics in Post-War France," is the best so far written on the Fourth Republic. One can only return the compliment by saying that this is far and away the best book that France's contemporary political predicament has so far produced—and not only for the reason that, unlike so many Anglo-Saxon political scientists of the present breed, M. Siegfried knows how to wear his learning lightly.

In the first place, M. Siegfried is the first writer who has felt himself far enough away from the battle to be able to treat the history of France since 1875 as a single theme incorporating both Vichy and the Resistance in their proper place, without attempting to disguise the continuity that runs through both and links both with the past and with the future. In the second place, M. Siegfried has a theory to explain France's predicament. He believes that the characteristic thing about France is the contrast that exists between the French citizen in his private capacity, where his attitude is one of down-to-earth individualism, passionately concerned with the immediate and the practical, and the French citizen as a member of a political community, where he thinks and acts in terms of abstract principle. Continuity in French political life between the Third and the Fourth Republic is provided, not so much by the presence of the same political parties, as by the persistence of a number of ideological clans which form the nuclei of the parties existing at any particular moment. The activities and attitudes of these clans are dictated partly by the historical tradition and partly by the particular personal temperaments to which they appeal. In this, the French political parties based upon them clearly differ from political parties in other countries, where party allegiances are dictated by more obvious considerations of self-interest. Instead of France adapting itself to history, to industrialisation, to its new place in the world and so on, history is asked to adapt itself to the French political constellation. Its refusal to do so is the source of France's present discontent.

M. Siegfried is not, however, ashamed of his countrymen. He says at one point that he sometimes reflects whether it is not the case that the countries that are well governed are the countries where people think little, and he insists, in discussing, for instance, the continued appeal of the French Communist party, that it is no use judging French politics by Anglo-Saxon standards. One has to allow for the persistence of ideology and learn how to live with it.

The peculiar difficulties of the Fourth Republic, as M. Siegfried sees them, arise from the fact that both the constitution itself and certain political habits that have grown up are even less favourable to stable government and the pursuit of definite policies than was the case under the Third Republic. M. Siegfried, for instance, regrets the eclipse of the old senate, which he regards as having been the model of what a second chamber should be—a judgment that may surprise many. The rule by Assembly, which is largely dominant in the present constitution, is made even worse in his view by the increasing tendency of deputies to accumulate local responsibilities, to which they regard their parliamentary position as simply an adjunct. This fragmentation of the political sovereign is seen as being paralleled by a decline in the sense of the unity of the state from the executive point of view. It is a pity that M. Siegfried has not allowed himself more space to elaborate his point that the associations of state employees have attained an altogether unhealthy position of control over matters of appointment and promotion within the service.

Again, like other recent commentators on the French scene, he is preoccupied with the penetration of the ruling *élites* in the bureaucracy and nationalised sector of the economy on the one hand and in business on the other—although here perhaps what troubles him is the impact the man who is at ease in government service is likely to have on the more competitive forms of enterprise which France clearly needs to develop.

It is obvious that for M. Siegfried no simple solutions, such as altering the electoral system, or playing about with the machinery for dissolution, will affect the essential weaknesses of a system which in its working, if not in its results, corresponds so closely to what Frenchmen appear to expect in politics.

Behind the Japanese Scenes

Japanese People and Politics

By Chitoshi Yanaga.
USA: *John Wiley.* London: *Chapman and Hall.* 418 pages. 60s.

THIS is the first attempt that has been made to describe the theory and practice of Japan's postwar constitution. Mr Yanaga is well qualified for the task; a Japanese trained in political science at Yale, he is able not only to comprehend his own country's political system as only a native can, but to write about it in western terms. He does this very ably, although he is apt to involve himself in over-frequent and sometimes oddly misleading comparisons of Japanese institutions with British or American ones.

Mr Yanaga opens his study with an interesting analysis of Japanese political behaviour and its historical roots, and he deals not only with such well-known Japanese characteristics as national insularity, respect for authority and consciousness of kinship, but also with the inexactness of Japanese thought and language, the importance of the old school tie in politics, and the Japanese conception of the perfect bureaucrat. Such generalisations on character must always lead to over-simplification, but they do give a much needed background to Japanese political behaviour. This is followed by a formal analysis of the functions and powers of the prime minister, cabinet and diet, frequently clarified and enlivened by asides on such subjects as the "ministerial bug," which infects all Japanese politicians with a consuming ambition to obtain, however temporarily, a cabinet post, or the tendency of standing committees to identify themselves with the administrative departments which they are supposed to check. These illuminating references to the shady side of politics become more frequent in the chapter describing how the political parties function, the problems of the party president, which make it impossible for him to exercise fully "the common virtues of the honest man," and the conventions that govern the formation of splinter groups. There is an excellent chapter on the history and character of the Japanese civil service, its sufferings from the operation of Parkinson's first law, its prestige as the main gateway to power and a political career and the intense competition for admission to the administrative grades.

Some gaps have necessarily been left in this attempt to make a comprehensive survey of the Japanese political system: the chapter on the citizen and the law gives no indication of the practical effectiveness and independence of the judiciary, and the few pages devoted to relations with the outside world only skim the surface of the subject. But this book will help anyone who wants to get behind the formal façade of the constitution to the real forces behind modern Japanese politics.

Middle East Record

Diplomacy in the Near and Middle East:

A documentary record. Volume I 1535-1914. *Volume II* 1914-1956.
By J. C. Hurewitz.
New York: *Von Nostrand.* London: *Macmillan.* 310 and 446 pages respectively. 84s. for both volumes.

THE second volume of this work is one that will prove indispensable to all students of international politics in the Middle East. Professor Hurewitz has provided an invaluable collection of the most important international agreements and concessions covering the area since 1914. Moreover he has prefaced each document with a short pointed introduction, covering its origins and significance, and providing a short bibliography for the more serious student.

If this were all he had done, there would be little more to say about the volume. But he has unfortunately set out, as the title suggests, to "illuminate" the "decisive developments in the last four decades." This has led him not only to print the international treaties, concessions and agreements, but also to attempt a selection from the available documentation of the more important diplomatic negotiations. This procedure is inevitably open to objection. In the first place, their presence over-inflates the size of the book. In the second place it is rarely possible to select from what are already selections, without distinction.

Professor Hurewitz does his best. His piecing together of the secret agreements of June 1915 on the future of Constantinople is useful and successful. But his selection, from the various volumes of "The Foreign Relations of the United States," on American oil policy 1920-23 is a great deal less than adequate. His selection from the Versailles records is equally open to criticism. And his selection from "Nazi-Soviet Relations" of the draft Four-Power pact sent by the Germans to Moscow in late November 1940 tends to perpetuate the myth that sees in this a revival of Russian demands on the Middle East. In fact, as a perusal of Molotov's immediately preceding talks with Ribbentrop in Berlin shows, this idea was Ribbentrop's, not Molotov's, and of German not Russian origin. Molotov was interested, with a mountainous suspicion which Sir William Seeds or Lord Strang would have recognised, in Germany's designs in the Balkans and Finland. It is clear that he only agreed to the sphere of interest allotted to Russia on German insistence.

There are one or two unfortunate omissions. There is no text of the Saudi-Arabian concession to Standard Oil of California of May 29, 1933. It was unlucky that General de Gaulle's memoirs, which their accompanying volume of documents, appeared too late for any use to be made of their evidence on Anglo-French relations in the Middle East in 1940-45. There is nothing on the Middle East Supply Centre, and possibly a little too much on Palestine for a volume of this size. These are, however, only minor blemishes on a volume likely to prove of great value to anyone interested in the Middle East. The first volume covers too wide a period of time to earn an equivalent recommendation.

Liberalism in Caricature

The Anti-Capitalistic Mentality

By Ludwig von Mises.
Macmillan. 120 pages. 28s.

THIS is a sad little book, from which admirers of its author—and these are many, even among those who radically disagree with his political conclusions—should be warned away. Professor von Mises has a splendid analytical mind and an admirable passion for liberty; but as a student of human nature he is worse than null and as a debater he is of Hyde Park standard. This essay in social psychology and the history of opinion would get low marks if presented by a second-year undergraduate to his tutor—who would, however, charitably reflect that a little experience of life would remedy the cocksure superficiality which it displays and probably improve its writer's manners. No such consoling reflection is possible here.

The "anti-capitalist mentality," according to Professor von Mises, is the entirely discreditable product of envy, conceit, ignorance, and dishonesty. Envy, as he sees it, is the dominating state of mind of everyone who is not at the very top of his particular tree; since its direct expression may be impolitic, it is translated into hostility to "the system." (Rentiers, the reader may be surprised to learn, are generally hostile to "the system," because they are less rich than active tycoons.) Conceit, working on the same principle, runs envy a close second. Ignorance blinds men to the lessons of history (which, were it not distorted by envious and conceited teachers, would show capitalism to have been everywhere and always an unmixed blessing) and to those of economics, which show that all interference with the acquisitive instinct is self-defeating and destructive. Mental dishonesty, in the service of all three vices, accounts for the misleading of the common man by politicians, academies, novelists, playwrights, Hollywood actors, detective-story writers (this is a deliciously owlish section) and, so far as one can make out, every other type of articulate individual except Professor Mises and his totally committed disciples—among whom not even Professor Jewkes, let alone Professors Robbins, Hayek and Röpke, could by the standards of this book be properly included.

To find an equal dogmatism coupled with an equally *simpliste* view of the springs of conduct, an equal propensity for propping up dummies and knocking them down, an equal contempt for human facts coupled with an equally vituperative style, one would have to turn to the less sophisticated Marxists—whom Professor von Mises also resembles, as negative resembles print, in his vision of inevitable and blood-boltered catastrophe punishing any deviation from the pure capitalist way. Seldom can an equally powerful thinker have perpetrated so resoundingly silly a book. The case for freedom needs making and re-making, tirelessly and ingeniously; but its cause is ill served by such stuff as this.

Industry for the Masses

Industry and Press Relations

By Peter Hayle
Staples. 142 pages. 12s. 6d.

THE author, writing under a pseudonym, sets down the rules with clarity. In these days when mass produced newspapers are more concerned with entertainment than with serious matters and the "spike" awaits practically all copy that is neither sensational nor amusing, it will interest

TRADE WITH CHINA

A Practical Guide
Published by
TA KUNG PAO
Hong Kong

A COMPACT BOOK with comprehensive, useful and up-to-date information for businessmen and industrialists with their eyes on the China Market . . . written by authorities on China's industrial development, import and export business . . . an absolute must for those who are trading or interested in trade with China.

Distributors:
PRACTICAL BOOK CO, Hong Kong
DONALD MOORE LTD, Singapore
MARUZEN CO LTD, Tokyo, Japan

laymen who read this book to find that there are many journalists in Fleet Street and in the provinces who are so active on industrial subjects.

Somewhat surprisingly, the author pays little attention to the hazards that beset press relations, even in the hands of experienced people. Of these perhaps the greatest is the sub-editor, who, to fit space requirements, frequently tears to pieces a carefully written story, sometimes with disastrous results. As a rule industrialists expect newspapers to print statements exactly as given and take it very much to heart when announcements in which every dot and comma have been carefully studied are treated in such cavalier fashion. Because of the havoc this can cause at times, one distinguished industrial correspondent on a national newspaper will not permit any changes in his copy without prior consultation.

In the broad field of public relations a full understanding of the best way to encourage favourable treatment by the press is very important, and anything that can further the education of industrialists in this respect is to be welcomed. The last serious guidance given in this field was a publication called "What's the Point" issued by the Federation of British Industries in 1949. It then said that industry was slack in getting over the simple plain facts and advocated serious thinking about how to put the matter right. Most industrialists still seem to have a lot to learn.

Insurance Policy for Oil

SIR—You seem unduly pessimistic in supposing that an increase in coal output could only be achieved at an exorbitant cost. In fact, what little is known about the reserves in the Midland and Yorkshire coalfields certainly suggests that there is considerable scope for an increase in output of really cheap coal from these areas.

This coal is not of very high quality, but it would be eminently suitable for conversion to oil. Underground gasification of inaccessible seams, and the coal released by nuclear electricity production, are additional raw materials for oil production. Quite a lot of development work needs to be done to find the best method of oil synthesis, but existing plants in South Africa and on the Continent show that it can be done reasonably economically. It may well be that such processes would provide the best long-term insurance policy for oil.—Yours faithfully, B. H. WORMSLEY
London, S.W.7

★

SIR—I was surprised that no mention was made in the interesting article in your issue of March 23rd of the possibility of producing important quantities of oil by the process of underground gasification of coal. Underground gasification would appear to have many prospective advantages for the United Kingdom, particularly based upon utilising only the cheapest-cost pits for coal. The following come readily to mind: dispensing with a large percentage of unsatisfactory labour and tending to concentrate the best in the best coalmines; more complete utilisation of raw material; recovery and use of valuable chemicals now being lost in combustion and smoke, which should be a valuable asset to the efficient chemical industry. Little difficulty should be met with in overcoming technical, chemical, and engineering problems of underground gasification and subsequent manufacture of oil, greases, chemicals from the gas.

As to the oil produced, considering the fuller use of raw material, valuable by-products, saving in transport and handling, etc., it might well be found possible to sell it—delivered in the United Kingdom—at little if any more than imported oil from natural sources. But even if it did cost more, the cost would be in sterling, spent in the United Kingdom, and the strategic value would be large. To these considerations must also be added the direct and indirect value to the highly efficient chemical industry of added supplies of valuable (and highly adaptable) raw materials—home produced.—Yours faithfully, H. A. R. BRETT
Johannesburg, South Africa

Zik Wins Under Pressure

SIR—You state that it baffles conjecture how Dr Azikiwe's electorate understood his remark that his bank dealings had been "to liberalise credit." Surely not. West Africans seem to know everything about credit. They pay dowries on it, eat this month's meals on it and spend days and days trying to obtain more of it. Parts of Dr Azikiwe's speech may have been above the heads of his electorate, but the bits about credit would have gone straight home. To liberalise credit, however translated, would mean to them that the precious stuff becomes freer for all.—Yours faithfully, ANTHONY SMITH
Manchester

New Age Banking

SIR—It is to be hoped that the committee of the London clearing banks on applying electronics to banking gave thought to the need for the establishment of a decimal currency.

Even in these days of pre-electronic book keeping, the introduction of a decimal currency would of itself significantly reduce clerical costs, and surely electronic computers can more readily be applied to a decimal currency than to our own. It would be ironic if the adoption of the decimal currency should be hampered in later years because of the existence of a highly complex system of electronic accounting based on our present coinage.

The immediate introduction of the decimal currency can hardly prove an unsurmountable obstacle, for all that we need is to base the currency on the existing five shilling piece. This would allow of the elimination of the fractional halfpenny while still retaining the general monetary value of that token. Mercifully the farthing is now of such little utility that it can be ignored.—Yours faithfully, GETHYN DAVIES
Hampstead, N.W.3

What is Deportation?

SIR—With reference to your article of March 2, 1957, in which you criticised the inconsistencies of the German compensation law and singled out a verdict of a German Court at Frankenthal, I should like to inform you that this verdict has been reversed on March 1, 1957, by the Oberlandesgericht Neustadt an der Weinstrasse. This Superior Court decided that financial aid for returned emigrés (Rückwanderer), should also be given to people who have been deported to Theresienstadt or similar camps.

—Yours faithfully,
London, W.1 F. KARSTEN

AMBASSADOR HOTEL · ACCRA

FOR THE GOVERNMENT OF GHANA

ARCHITECT: *A. G. Paton*, A.I.A.A., L.R.I.B.A.
CONSULTING ENGINEERS: *Ove Arup & Partners*
QUANTITY SURVEYORS: *Widnell & Trollope*

AT THIS HISTORIC MOMENT Ghana points with justifiable pride to her magnificent record of enterprise and progress. The Taylor Woodrow organisation has been privileged to play some part in this inspiring development, including harbour extensions, railways, roads and bridges and other major projects.

In Accra, this fine new luxury hotel stands as an example of skill and craftsmanship, of the profitable combination of African and European endeavours. Here, as always, Taylor Woodrow made the fullest use of modern structural and mechanical aids, including a 70ft tower crane, the first of its type ever to be used in West Africa.

Clients and consultants find that it saves time and money to call us into full collaboration at the very beginning of any scheme.

TAYLOR WOODROW *build everywhere*

Democrats Mark Time

WASHINGTON D.C.

MR LYNDON JOHNSON, of Texas, the political virtuoso who, as Democratic majority leader, dominates the inner life of the Senate, has never appeared more the master of the political scene than he does today. With Congress expected to adjourn on or about August 1st the present session is already half gone, and little is likely to be accomplished in the second half. But Senator Johnson is unperturbed. Although he operates at a feverish pace, his cool and practised inward eye is fixed on the return of the Democratic tide which he expects in the elections of 1958 and 1960.

The victory of Mr Yarborough in the special senatorial election in Texas and the local Democratic victories in Michigan last week furnished, from Mr Johnson's viewpoint, fresh evidence of the validity of his underlying assumptions. His opinion is that, for the present, party harmony must remain the over-riding objective and that therefore no large and dramatic effects are possible. The results in Texas not only reaffirmed the *status quo* by maintaining the Democrats' 49 to 47 control of the Senate, but also underlined the narrow margin on which Mr Johnson works. Supremely the man of middle views, he is too much the loyal Democrat to be either the cynical agent of the alliance with the Republicans on economic issues which his more conservative southern colleagues advocate or the spokesman of the liberal doctrines dear to the northern wing of his party. To take either course would shatter the surface harmony which now prevails.

The returns from Michigan, where a progressive Governor, Mr Mennen Williams, and the aggressive shock troops of Mr Walter Reuther's United Automobile Workers produced another sweeping victory for the Democrats, likewise provide comfort for Mr Johnson, in spite of the ideological gulf which separates him from the party in Michigan. They prove to his satisfaction, as did the outcome of the congressional elections of 1954 and 1956, that beneath the Eisenhower sweep the majority of the country remains rooted in its Democratic loyalties. Time, he believes, is on his side and favours his policy of masterly inactivity.

Senator Johnson has expressed the belief that modern Republicanism is nothing but Mr Eisenhower and a few publicity men at their typewriters. He argues that the President has not remade his party, and that this will become evident in 1958 when 15 of the 21 Republican Senators seeking re-election will be either conservatives of the Taft school or extreme isolationists, such as Senators McCarthy and Jenner, for whom Mr Eisenhower cannot campaign with enthusiasm and for whom he may not campaign at all. Mr Meade Alcorn, the new chairman of the Republican National Committee, has announced that he will support all the party's candidates, but the President has refused to commit himself.

By 1960, Mr Johnson believes, the gap between the rhetoric of modern Republicanism and the performance of old-style congressional Republicans will have become unmistakably clear. At the same time if, as he confidently expects, the Democrats gain half-a-dozen seats in the Senate next year, they will be able to blow their partisan trumpets more loudly on liberal issues and risk the occasional defection of the die-hard members of their own conservative southern wing. With the Republicans unmasked and the Democrats attacking vigorously, the White House, he argues, should fall to them in 1960.

★

Other Democrats, as well as many impartial observers, dispute the soundness of Mr. Johnson's position. They believe that the President, if he has not thoroughly transformed his party, has at least altered its image sufficiently to narrow, to a significant degree, the difference between the two parties. Northern Democrats fear that what Mr Eisenhower has twice done, Mr Nixon, now the Vice President, may accomplish a third time in 1960 with more modest but equally decisive success. It is urgently necessary, they believe, for Democrats in Congress to distinguish themselves in the mind of the public from their Republican rivals.

Mr Johnson, however, rides unchallenged over these dissenters. He has effectively bound every Democratic faction in the Senate to him by guiding strings of personal obligation, loyalty, or hope of gain. The ninety or more younger members in the liberal Democratic block in the House of Representatives are restive, but there again the party's margin of control is too narrow to permit of any revolt against the Speaker, Mr Rayburn, the elderly fellow-Texan who is Mr Johnson's former mentor and present ally. The distinguished advisory committee appointed by Mr Butler, the chairman of the Democratic National Committee, which includes among its members Mr Stevenson, the party's titular leader, has so far proved only a sedate and unobtrusive appendage to the congressional power system.

The real dilemma of the dissenters is the poverty of exciting and popular issues. The civil rights of Negroes, federal aid for the construction of schools, foreign aid and tariffs exhaust the list. On each of these questions Mr Eisenhower has taken over the traditional position, and even some of the rhetorical trimmings, of the Democrats. All they are left with are quarrels over the scope and the details of legislation. This provokes dismay and acute frustration among liberal Democrats, but Mr Johnson, with his cheerful view of the future, refuses to regard it as a matter for concern. Indeed, since he is the majority leader and many

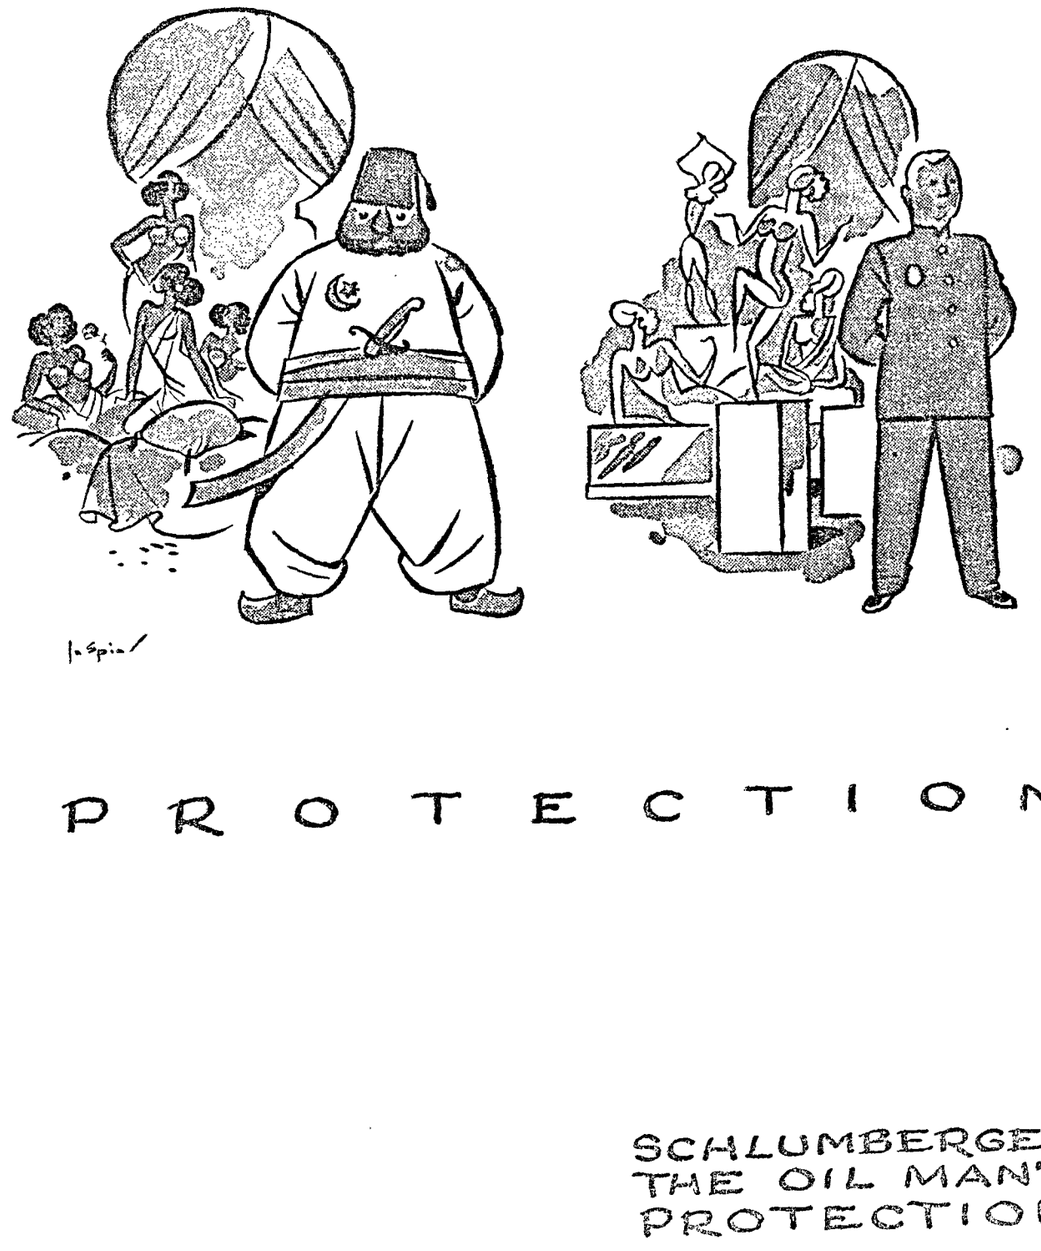
of the President's lieutenants in Congress are cool to modern Republicanism, Mr Johnson knows that representatives of the White House have sooner or later always to come to him and meet his terms in shaping legislation, a fact from which he doubtless derives much of his pleasure in life.

Each of these issues, except Negro rights, has become entangled with fiscal problems. The Budget has become the battleground for friends and enemies of the welfare state, for isolationists and internationalists. The economy drive, initially set in motion by spokesmen of the Administration, has had the effect of a boomerang on the President's Budget. The House in the past fortnight has indulged in a series of furious marches and counter-marches in the field of appropriations for health, education, welfare and the postal service. The foreign aid appropriation is virtually certain to be severely cut in the House. This drive against foreign aid is part of a broader thrust against heavy defence spending, against the relaxation of immigration barriers on behalf of Hungarian refugees, and in favour of high tariffs. It will require the concerted efforts of both President Eisenhower and Mr Johnson to contain this resurgent mood, which is isolationist in spirit if not in name, when the turn of the Senate comes.

The Negro rights legislation, which is expected to reach the Senate floor by the middle of May, will touch off a long and angry debate. The question is whether this will result in the passage of the Bill or only in an impassioned demonstration of conflicting emotions on the racial issue. More than civil rights hangs upon the outcome for, if either the liberals or the conservatives feel they have been too badly defeated in that struggle, they are likely to become intransigent over the related question of whether schools receiving federal aid should be required to abolish the colour bar. The prolonged clash over civil rights, with its effects upon the mood and temper of the Senate, is therefore likely to provide the severest test of Mr Johnson's policy of moderation and the only drama of an otherwise dull and drifting session.

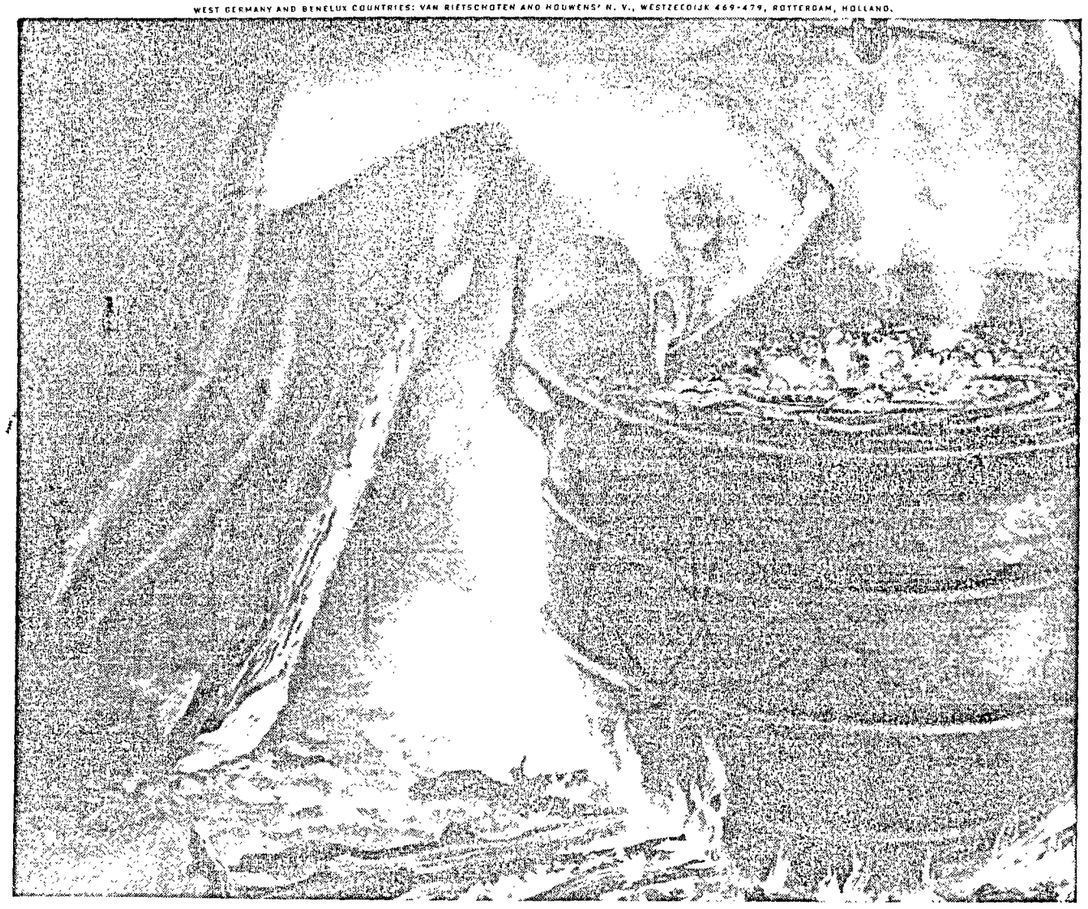
Britain's Example

NEARLY all the American comment on this week's British Budget and on last week's defence white paper is surprised ; some of it is shocked, some of it envious, some of it sympathetic ; and most of it agrees that Britain is setting an example, although to whom and whether good or bad is more controversial. To the congressional doctors the reductions in spending and taxation are just what they want to order for Americans. But the cuts can hardly fail to have an unfortunate effect on the appropriations for foreign aid. These have always seemed the obvious place where the British budgetary prescription might be applied to the United States—and the defence white paper makes these appropriations look even more obviously suited to reduction.



Senator Russell, chairman of the Senate Armed Services Committee, was speaking for many when he asked the Secretary of State this week why the defences of the free world had become weaker in the past ten years in spite of American aid. And it is widely held that Britain would not have dared to "withdraw as a world power" had it not been able to count on American protection and on the United States assuming responsibility for British commitments overseas. Here it is felt Britain has set a specifically bad example to the other members of the North Atlantic Treaty Organisation ; it will now be difficult, if not impossible, to hold them back from also reducing their contributions to the western alliance. In the Administration, where the British problem is better understood than in Congress, the main criticism has been of the defeatism, and the discouraging effect on public morale in other countries, of the blunt statement that there is at present no means of providing adequate protection against the consequences of a nuclear attack.

Finally, Senator Douglas and others contend that the "virtual disappearance" of Britain's land forces, and the likelihood that other countries will follow the same policy, mean that the world may have to choose between acquiescing in an act of limited aggression or initiating a "nuclear holocaust." But there are many, the President among them, who admire the courage with which Britain is cutting through the undergrowth of conventional armaments and inter-service rivalries into the brave new—and for the present less expensive—world of guided missiles. And after all, as Mr Eisenhower has pointed out, the United States reorganised its own defence establishment four years ago in order to bring it up to date with the military facts of the day.



The President Turns

WHEN the Under Secretary of the Treasury tells a congressional committee that it would be sound to cut the Budget by $2 or $3 billion at the precise moment at which Mr Eisenhower is telling his press conference that no startling reductions, of the order of $2 billion, are to be expected, it is clear that even inside the Administration rebellion has not been stamped out. But last week the President, who has been so much criticised for the flabbiness of his leadership, vigorously followed up the eloquent defence he made over a fortnight ago of his Budget in general and the foreign aid appropriation in particular. His theme is that peace is more important than tax cuts. Moreover, he went after that to the rescue of the school Bill which, after having been pronounced a casualty of the economy drive, showed a flicker of life: a House subcommittee proposed a compromise between the Republican and the Democratic proposals on offering federal money to the states for the construction of schools. First in a talk to the Advertising Council, and then in a speech to the National Education Association, which was broadcast nationally, the President insisted that schools were more important than guided missiles, radar warnings, or peaceful atomic power, and made it plain that he had no sympathy with the attempt of the United States Chamber of Commerce to treat the shortage of buildings and teachers as an illusion.

The boldness of Mr Dulles's proposals on foreign economic aid—in a year when the mutual security programme is everyone's favourite target for economy—is also a hopeful sign of fighting spirit. Mr Dulles, fortified by a report from the businessmen of the Committee for Economic Development which, like the International Development Advisory Board before it, recommends a long-term approach to economic aid, has suggested an economic development fund, capable eventually (but not this year) of making loans

UNITED KINGDOM AND COMMONWEALTH COUNTRIES (EXCEPT CANADA): BRITISH METAL CORP., LTD., PRINCES HOUSE, 95 GRESHAM ST., LONDON E. C. 2, ENGLAND.

...and one for the pot!

Witches of old brewed heroic broths to encourage visions, prognostications, spells, and spasms. Even unrequited love yielded to these near-lethal potions. Add the tail of a cat, the ear of a rabbit, sixteen varieties of tree roots, and a few "trigger" ingredients, known only to the witches guild . . . and stand back!

Folklore ignores the witches' maintenance problems, but such overwhelming corrosives must have liquidated many a cauldron inventory. After all, the witches had no titanium.

Titanium is available today, and it is the most promising metal for the chemical, textile and pulp industries . . . or any place where severe corrosion presents forbidding maintenance or design problems.

Titanium is inherently passive to such vicious corroding agents as ferric, cupric, stannic and mercuric chlorides, and the hypochlorites. There is even little or no pitting or localized attack — a source of difficulty with practically all other metals. Stagnant conditions, surface deposits, fouling marine organisms and moist salt crystals are not troublesome to titanium. Strongly oxidizing agents in high concentrations and at high temperatures are readily handled with titanium. Slight additions of oxidizing agents to sulfuric, hydrochloric or phosphoric acid inhibit attack.

Titanium tubing, sheet, strip, plate, extrusions, bar and billet are all available from T.M.C.A.— and prices are dropping to competitive levels. T.M.C.A. technical service is available upon request.

. . . FIRST IN Titanium

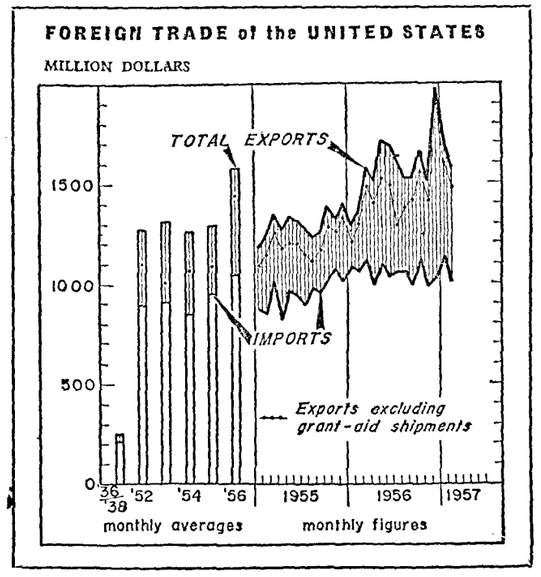
up to $750,000 a year. He asked the Senate Select Committee on Foreign Aid, which is surveying the field before the Administration submits its detailed proposals in May, to make more efficient management of economic aid possible by abandoning annual appropriations and the rigid allocation of money, in advance, to individual countries. He urged, in addition, that all spending related to defence—the lion's share of the money—be charged to the military appropriations to dispel confusion and exaggerated notions of the amount of economic aid going abroad. Finally, he held out no hopes of a lower total bill for mutual aid. Such an expansion of economic aid—even if only in terms of the loans which Congress prefers to grants—needs to be justified to Americans by the President as well if it is to have a chance of being accepted. The State Department, unfortunately, cannot apply to Congress the forceful arguments of the Postmaster General who, when his funds were threatened, simply announced that he would eliminate third class deliveries, shut post offices on Saturdays, and stop issuing postal orders.

Trade Battles to Come

WASHINGTON, D.C.

THE message sent to Congress last week by the President asking for American participation in the Organisation for Trade Co-operation wisely met the opposition half way by stressing the safeguards for American trade in the legislation, and the advantages of joining this year. In particular, the approach of the European common market is supplying congressional supporters of the OTC with a much needed new argument. According to the Boggs Report, the first product of the new sub-committee of the House of Representatives on foreign trade policy, American exporters will need the machinery of the OTC if they are to prevent themselves being squeezed out of European markets. The President's third attempt to secure American membership of the organisation, which will be handled this year by the Department of Commerce instead of by the more vulnerable State Department, will be one of the three sectors upon which the 1957 trade battles will be fought. The two others will witness a tug-of-war between rival proposals on dumping and the high-pressure campaign to win restrictions on the import of plywood and veneer. These are both symptoms of the extent to which domestic producers are losing interest in tariff increases won through the "escape clause" and are turning elsewhere for protection against foreign competition.



The Administration, which has been holding the line against the use of quotas, even at the price of arranging with the Japanese to restrict their textile exports to the United States, is worried by the skill and vigour of the plywood campaign. As with textiles, it is the South, formerly the home of free trade, which is claiming most of the injury, with some support from New England; Japan is once more the villain of the piece; and again it is low wages in Japan which are providing the choicest material for propaganda. A quota Bill introduced into the Senate by Senator Thurmond of South Carolina, with twenty co-speakers from both political parties, would cut imports by two-thirds by limiting them to 15 per cent of domestic production. The industry's campaign naturally ignores the ample evidence that its present difficulties are due not to imports, but to the recession in house building. Moreover, the Tariff Commission has unanimously found the industry's claim of injury to be without merit, because Japanese enterprise has created a new demand—for flush doorways—rather than stolen any American market.

But the pressure for quotas is particularly dangerous at this time because, with the reopening of the Suez Canal, the domestic oil interests threaten to make a determined effort to prevent oil imports from resuming anything like their former dimensions. Also the bicycle manufacturers, who had part of their way over tariff increases two years ago, now confess that these have done them no good and are asking Congress to give them quotas. Ironically, imports of British lightweight bicycles, which received the lighter of the two tariff increases, have fallen substantially in the meantime. But the import totals have been more than made up by a switch in demand to German middleweight bicycles, which suffered the higher tariff penalty.

★

The controversy over dumping, which could become a serious threat to foreign trade, is expected to be all the fiercer in that the issues are so little understood. Under the present anti-dumping law of 1921 two findings have to be made before penal duties can be inflicted on dumped imports. The Treasury has to find price discrimination against the domestic industry, and the Tariff Commission has to find that the domestic industry has in fact been injured. This year's hearings will be focused in the first place on a technical proposal by the Treasury to redefine "fair value," the figure with which the export price is compared to see whether dumping is involved. The effect would be to confirm an administrative change made two years ago which has provoked urgent protests from the importing interests. If under the old system a Swedish firm was able to command a monopoly price on its home market of $100 for its product, an export price of $80 in Canada and one of $85 in the United States, all three figures being

(*Continued on page 146*)

QUESTION FOR ADVERTISERS

How should today's Advertising Agency differ from yesterday's?

CHANGE is the key word of our time!
And, in the changing world of selling, the functions of an advertising agency must now penetrate beyond the narrow professionalism of traditional agency service.
What then are the changing functions of an advertising agency — as McCann-Erickson see them — in 1957, and in the challenging years ahead?
You will best get the answers, we believe, not by looking first at the advertising agency, but by looking at the basic change taking place in selling generally.
This is the changing relationship between the manufacturer, the retailer and the consumer.
Not so long ago, the manufacturer's selling responsibility virtually stopped at the retailer level. It was not the maker but the retailer who undertook almost the entire job of selling goods to the consumer.
But today... the maker must be the seller, too!
With the multiplicity of products on the market... with the variety of brands, grades and prices within each product category...and especially with the growth of the impersonal, self-service supermarket... the manufacturer can no longer afford to delegate his selling to the retailer. He must not only make the product but also make the sale to the consumer.
Today a manufacturer's profits depend as much on marketing skills as on production skills. Indeed, almost any company can now make goods more easily than it can sell them.

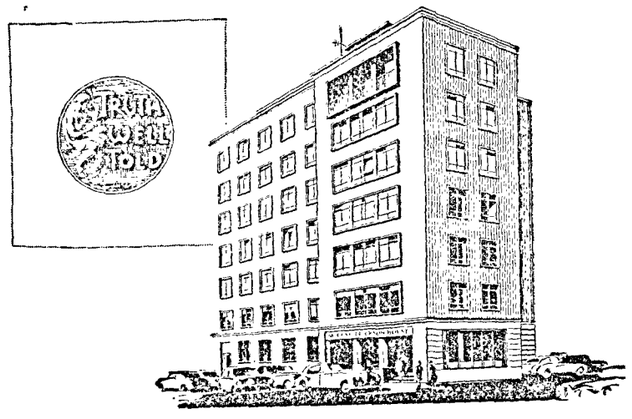
The Agency's Most Significant Role Today

Undoubtedly the manufacturer and retailer have benefited by this shift in marketing responsibility... for undoubtedly the "selling velocity" of any product is increased by shortening the gap, psychologically, between the manufacturer and the ultimate buyer of his product.
But... the very closing of this gap has resulted in putting an extraordinary physical distance between buyer and seller ... for they no longer meet face to face.
This has important consequences. For, when the retailer did most of the selling job, he not only got to know his customers ... he knew what they wanted and did not want ... what price attracted them and what price started an argument. Indeed, every sale was an interview.
The retailer had never heard of a "structured questionnaire" or of "motivational research". But he got the information just the same. For people have always enjoyed talking about the goods they want and buy.
The retailer acquired an intimate awareness of the consumer.
And our big question today — in this changing world of selling— is "What can take the place of this function?"

It is in meeting this need that McCann-Erickson believe the changing role of the advertising agency has most significance.

It is upon this single basic premise—intimate awareness of the consumer—that the changing contribution and function of the advertising agency must rest.
The implications of this are considerable as a manufacturer's customers swell from thousands to millions... as a manufacturer's existing products are threatened by newcomers... and as he reaches for new profit opportunities by introducing new products to the market.
In these circumstances we believe the advertising agency must now accept the basic responsibility not only for presenting the company and its products to the customer but equally for functioning as a two-way bridge, by also presenting the consumer's changing viewpoint to the manufacturer.
For who should be expected to carry out this role... the manufacturer, whose primary function is to make the goods? Or the advertising agency, whose essential business is to know the consumer and the market?

The Agency's New Areas of Responsibility



To fulfil its function in these changing times, McCann-Erickson believe the advertising agency must be equipped to help the manufacturer improve not only his sales but also his methods of making sales at a profit.

1 **The agency must be in a position to help management better manage its mass communication and mass distribution activities.**

2 **The agency must be able to help management control its total marketing process by accurately representing the company's customers — both consumer and trade — in the councils of management.**

3 **The agency must help management continuously to acquire precise and current marketing facts—and accurate evaluations of these facts. For, as marketing mistakes get more costly, there is increasing need for current facts to be used as the basis of all planning.**

Does all this mean that the 1957 advertising agency should transform itself into a "marketing agency"? Decidedly not. It means that the advertising agency—if it is to join with the manufacturer in coping with changing marketing conditions —must now be completely marketing-oriented. A very different thing!
For, whilst the agency's creative contribution—in print, on TV, and at point of sale—will always be THE GREAT CONTRIBUTION, its function and responsibility to clients in these changing times is too great to be bound by the one word: creativity.
Our business is helping other businesses develop sales, under increasingly competitive conditions, at a profit.

above the cost of production, that Sweden was not dumping Canadian price and conclu[de] the Treasury's new procedure, in the United States. [As] in law, it is the $100 price that which it wants con[pared] with the $85 and the finding of price would be comp[ulsory] would be automatic. discrimination not all. Efforts to alter the law in one way have opened the flood doors to a series of other proposals which could radically affect the prospects of exporters in the dollar market. The extreme protectionists want to do away altogether with the second leg of the dumping calipers, the Tariff Commission's finding on "injury." The Treasury slide rule would then automatically invoke the legal penalties. A second, superficially more modest, group headed by General Kenneth Royall, a former Secretary of the Army, would insert as a legal definition of "injury" the fantastic standard of "non-utilisation of the full productive capacity of the domestic industry."

However, the importing interests are counter-attacking hard through their own highly articulate Anti-dumping Committee. They are struggling with the tricky task of drafting a Bill that would direct the Treasury to distinguish between artificial price cutting by the foreign supplier to take over the American market, which would be penalised, and the meeting in "good faith" by foreigners of the type of competition encountered in the American market. The importers claim that the original legislation was aimed only at deliberate price cutting in the former category, and that its purpose has subsequently been twisted to make it into a protectionist device. The importers also seek to force the Treasury to grant hearings to those accused of dumping, with an appeal to the President or to the courts; in trade matters, only dumping cases lack such safeguards.

Sour Plums for Diplomats

RECENT criticism of President Eisenhower's diplomatic appointments is likely to crystallise around the nomination of Mr Scott McLeod as Ambassador to Eire. He is linked with the suicide of Mr Herbert Norman, Canadian Ambassador to Egypt, which has so deplorably embittered neighbourly relations; the State Department's Bureau of Security, which Mr McLeod now heads, approved the report by the Senate's Internal Security Subcommittee which revived the long-discredited allegations about Mr Norman's Communist connections. This is a reminder of Mr McLeod's much-resented co-operation with Senator McCarthy and his part in the harassment and persecution to which American foreign service officers were subjected in the early years of the Eisenhower Administration. Now Mr McLeod, who is not a professional diplomat, is being rewarded with one of the few pleasant, not very important but also not very expensive, posts which are available for men and women who make a career out of serving their country abroad, usually in more than their fair share of uncomfortable assignments.

That far too many of these plums have been used to pay political debts incurred during last autumn's election is one of the complaints being made about the recent heavy crop of ambassadorial changes although, when they are analysed, nearly as many professional diplomats are replacing political appointees as *vice versa*. The President seems to be as resigned as are diplomats themselves to the fact that many of the more important embassies can be occupied only by Americans with large private means because of the high cost of entertaining in cities such as Paris and the low allowances for expenses provided by Congress. But this is a point which is at last causing some concern to the Senate Foreign Relations Committee, although unfortunately not to the Appropriations Committee. The system does not necessarily mean that bad appointments are made, but it may mean that the best appointments cannot be made.

The waste of the country's trained diplomatic brains which this involves has been underlined now that the time has come for Mr Bohlen to leave Moscow; Manila was the only suitable post that could be found for America's outstanding, but unfortunately not wealthy, Soviet expert. It is only chance, and hardly a lucky one, which has given the Manila Embassy unexpected importance with the death of the Philippine President, Mr Magsaysay. And before Mr Bohlen arrives there, he must once more go through the process of Senate confirmation. Senator Bridges has promised that this will be just as difficult for him as it was in 1953, when he was sent to Moscow, even though this time Mr McLeod will not be in a position to back up the Senator's efforts.

Penn-Texas Round-up

THE recent disputes between stockholders in Britain are simple affairs compared with the confusing battle now being waged in the United States for the control of Fairbanks, Morse and Company, a Chicago manufacturer of diesel engines, scales and pumps. The invaders are led by a refugee financier, Mr Leopold Silberstein, and his Penn-Texas Corporation, a holding company for a mixed industrial empire ranging from oil, gas and plastics to machine tools, heavy machinery, aircraft, radio and electronics. Penn-Texas now claims unofficially that it controls a majority of the voting shares in Fairbanks, Morse, and is thus able to control the Fairbanks board, on which it already has four directors. The colour and excitement in the case have been provided by the methods used by Mr Silberstein and Penn-Texas to acquire the shares of Fairbanks, Morse. Some have been obtained secretly with the help of Swiss banks, others from a variety of mysterious undercover agents who bought the shares at prices above the market, and resold to Mr Silberstein at a fat profit to themselves. At least $14 million of these shares have not yet been paid for by Penn-Texas, and to secure its debts the company has pledged as collateral large amounts of the Fairbanks, Morse stock it already owns. Claiming "conspiracy, gambling contracts and violations of the Securities and Exchange Act" by Penn-Texas, the Fairbanks, Morse management has challenged the insurgents' right to vote the shares they have acquired; the final decision now rests with the courts.

Simultaneously, the Fairbanks, Morse management has invaded the enemy camp, where it is supporting the efforts of a stockholders' committee to unseat Mr Silberstein from the board of his own Penn-Texas Corporation, and put Mr Robert Morse, Jr., president of Fairbanks, Morse, on it instead. Mr Silberstein maintains that Penn-Texas shareholders will benefit from the purchase of Fairbanks, Morse, a sound company with an unimpressive earnings record which he claims would be transformed if he took over. But

in order to pay for his intricate transactions in Fairbanks, Morse shares, Mr Silberstein has had to raise cash from his Penn-Texas group by another complex scheme. Some Penn-Texas assets have been sold for cash, and then leased back at a cost which, over a period, greatly exceeds the proceeds. And while the market price of Fairbanks, Morse shares has soared, holders of Penn-Texas shares have seen them lose more than half their value. There is plenty of meat for two Senate committees and one House committee as well as the Securities and Exchange Commission and the courts to get their teeth into before the issue of the control of Fairbanks, Morse is finally decided.

Two Armies in One

FROM A SPECIAL CORRESPONDENT

THE announcement that two new types of military unit, called Atomic Support Commands, have been formed at Fort Bragg and Fort Hood is the first public indication that the army is producing a solution to a major dilemma of modern war. Hitherto the need to be ready with atomic weapons for a full-scale war and with non-atomic weapons for a localised "brush fire" has seemed to demand two complete armies. Carried to its logical conclusion, this would be impossibly costly.

The two new commands spring from a full year's experience with the Southern European Task Force, a Nato component in Northern Italy. Setaf is not the exact model. Since it had the special mission of providing atomic support for Nato's conventional ground troops scattered through North Italy it was split into three sections and given added and somewhat abnormal functions. But it provided the idea.

The type of unit at Fort Bragg is "air transportable" and is to operate in support of the airborne infantry division stationed there. It will have the Honest John rocket, which has a nuclear warhead and is moveable, launcher and all, by air. At Fort Hood, where there is an armoured division, a "medium" support unit has just been created. Its equipment includes both Honest John and the larger Corporal missile. When the big two-hundred-mile Redstone missile has been delivered there will be a third, "heavy" unit, deploying all these weapons.

★

Each Atomic Support Command is expected to have five thousand men divided into missile battalions, armoured infantry battalions, combat engineers—especially bridge builders—and the usual auxiliaries. The whole unit is essentially what its name implies, not a complete combat force, but a heavy fire-support element whose function is approximately that of today's army or corps artillery. Five of the commands are scheduled for this year and five more for a year later.

The total strength of only fifty thousand men is small in relation to the one million men army and will not, in fact, even be an addition to it, since the troops for the new commands will come from existing divisions which are being scaled down. Yet in this disproportionately small force will be concentrated practically all the atomic weapons of the army. "Two armies" for "two wars" will thus require no more men than are already in the military establishment.

No Surrender in Virginia

FROM A CORRESPONDENT IN CHARLOTTESVILLE

WITH the Supreme Court's confirmation of the orders of a lower court that Negro children must be admitted to hitherto all-white schools in Arlington and Charlottesville, Virginia is entering upon a new stage of its "massive resistance" to the Supreme Court's 1954 decision that racial segregation in education is unconstitutional. The state is falling back on a complex legal contrivance, the Stanley Plan, named after the Governor, which was created at a special session of the State Legislature last autumn. In rough outline, these laws provide that, in a community which has been ordered by a federal court to discontinue segregation on the basis of race, the authority and responsibility hitherto exercised locally by the school board are to be exercised centrally by the State Governor, with the assistance of a three-man pupil assignment board named by him. The aim will be to reorganise school attendance, on the pretext of greater efficiency, so that white and Negro children are still kept separate. If efforts by the board and the Governor to maintain segregation are unsuccessful, the schools are to be closed. No state funds are to be available for integrated schools, if a community should decide to operate such schools in compliance with a court order.

While many legislators were entirely cynical about this plan's ability to stand up to the court test to which it was certain to be put, they felt it could be relied on to provide time—some hoped for at least five years—during which there would be no integration in any of the state's schools; they would be maintained as in the past, or closed down altogether. In fact, this pupil assignment plan has already been declared unconstitutional by a local court, but this decision can hardly make its way up to the Supreme Court for confirmation before next autumn, if then. But both Charlottesville and Arlington, a suburb of Washington inhabited chiefly by federal civil servants, are now required, by order of the federal court, to take a course of action which is prohibited by the state law of Virginia. And under the United States Constitution a state cannot be sued without its consent, which is one of the reasons why the Stanley Plan provided for the Governor to take over responsibility from the local boards.

★

But for the rest of this year Virginia's resistance to the Supreme Court will be a matter of political as well as legal defiance. For the state must elect a new Governor in November, and the main issue seems bound to be the question which is already Virginia's over-riding concern, constantly discussed, in language far from temperate, at country stores and city dinner tables. The preservation of school segregation has been the undeviating objective of Senator Harry Flood Byrd, who controls the Democratic party in the state. His dominance has not always gone undisputed but a member of the Byrd machine was heard to remark last autumn that, with segregation as an election issue, the organisation had been given a new lease of life which would last for a generation. Since the epithet

"nigger-lover" can now be hurled at all political opposition, this estimate of the situation is widely shared.

Last month Senator Byrd told a cheering Kiwanis Club lunch in Richmond, the state capital, that "we have a right to defy the Supreme Court if we do so without violence and do not try to overthrow the government." He said that the Federal Attorney General and the National Association for the Advancement of Coloured People were taking Virginia on first because

> they want to break us down. If they force Virginia with all its prestige of leadership in the South to surrender, it will have a terrific and powerful effect on other southern states.

In the interests of harmony at this time of crisis, the Senator is imposing a monolithic front on his party; there is apparently to be no contest even for the Democratic nomination for the Governorship. Mr Byrd has picked Mr Lindsay Almond, the State Attorney General, who has been the outstanding exponent of the Stanley Plan, as his party's candidate.

Clearly, if Virginian voters are to have any political alternative this year, it must be offered from outside the Democratic party. Particular interest therefore attaches to the Republican candidate and especially to whether he will be Mr Ted Dalton, a lawyer, a state senator, and the party leader in the state; he polled 45 per cent of the votes when he and the retiring Governor, Mr Stanley, opposed each other in 1953. It is difficult for Mr Dalton to decide whether or not to run, for there is a vacancy in a desirable federal judgeship, which he might have. At the same time, his party has every incentive to put up its best candidate in an effort to consolidate and extend its recent gains in the South in a key state.

★

The type of campaign which will be waged if Mr Dalton is the Republican nominee is already clear. In his recent call for resistance, Senator Byrd stated that "we cannot have integration in Virginia and preserve the public schools." Mr Dalton followed this by demanding that the public (state-financed) school system should be maintained. Governor Stanley then handed reporters a statement saying that Mr Dalton had thus proved himself an integrationist and dared him to run for Governor with that speech as his platform. Mr Dalton's reply was crisp and immediate: "If I run for Governor, it will be on a plank of fighting integration to the last ditch." His argument is that the Byrd-Stanley plan "will bring wholesale integration" when the legislation "cutting off the funds topples down in court." Mr Dalton—and some other state legislators—favour the Gray Plan, an alternative prepared by a commission which Governor Stanley appointed but later abandoned. This would have permitted local option on integration, with provisions for transferring Negro and white children to new schools where necessary and for grants from state funds to enable children to attend private schools in the most difficult cases. Mr Dalton believes that in practice this scheme would enable a greater degree of segregation to be maintained for longer than would the Stanley Plan and would avoid the closing of the public schools.

But the label of "integrationist"—whether valid or not—is so damaging that few political observers in the state now expect Mr Dalton, if he runs, to do as well as in 1953. In fact, some stalwarts of the Byrd machine believe that this campaign will destroy not only him but the Virginian Republican party as well. On the other hand, the extent to which southern Virginia, the part of the state where the Negro population is densest and prejudice therefore strongest, has so far dominated the state's vocal and official reaction to the Supreme Court decision makes accurate forecasting difficult. Particularly in the industrial areas, in northern Virginia, and in the Shenandoah Valley where public schools are a source of pride and the Negro population small, rumours circulate of Democrats who intend quietly to cross party lines and vote for Mr Dalton if he is a candidate. Few Virginians really believe that, over a period, outright resistance to the Supreme Court's decision can be maintained. But in the present welter of emotion, support for a gradualist programme is almost synonymous with political suicide.

Hold-up on the Highways

THE battle over whether the great new federal interstate highway system should be disfigured by commercial hoardings still rages in Washington, although the Administration has decided to seek authority to withhold 5 per cent of a state's grant if it does not co-operate in keeping the verges clear of advertising. As the federal government is putting up 90 per cent of the money for express ways between virtually all cities, this is a big stick; it shows that the Administration, like many Americans, is sceptical of the claim that motorists may succumb to "highway hypnosis" if they are not kept on the alert by the claims of rival brands of toothpaste and whiskey. Representatives of the $25 billion a year roadside business interests can, however, invoke the abused principle of states' rights. A way to prevent motorists from becoming a captive audience without invading this dangerous province has been suggested by Senator Neuberger, who would have Washington pay most of the cost of buying up strips of land on both sides of the roads. This would be costly, and it may be that the last word will be spoken, not by the government, but by alert businessmen who are beginning to suspect that a billboard in a beauty spot is a poor advertisement for their company.

Passions have run so high over what is to happen along the highways that they have obscured the fact that the highways themselves are getting off to a slow start. Money from road users—in the shape of taxes on petrol, tyres, and extra-heavy lorries—is coming up to expectations, although Mr Tallamy, the Federal Highway Administrator, is worried about costs, which have risen so much since the estimates were prepared three years ago that completion of the 41,000 mile network may take sixteen instead of thirteen years. It is spending which is lagging; according to the latest estimates, only $1.1 billion is to be taken from the highway trust fund this year instead of the $1.9 billion expected. Part of the trouble is that federal procedures require lengthy public hearings before each stretch of interstate road is approved. But most of the slowdown is the fault of the states, which hate to increase taxes to provide even their 10 per cent of the cost, and which are hampered by inadequate engineering staffs and old-fashioned methods of acquiring land.

THE WORLD OVERSEAS

BRITAIN'S ALLIES READ THE WHITE PAPER

1. The Bomb Confronts Germany

FROM OUR BONN CORRESPONDENT

WHATEVER dark thoughts may nag him in the middle of the night, the Federal Minister of Defence exudes in public a strikingly good-natured equanimity. Herr Strauss rises effortlessly to the occasion of a big press conference. Not only is he unhurried and amusing; he also, flatteringly, brings along with him his top colleagues at the ministry, the State Secretary and the commanders-in-chief of the three services. It is a performance shrewdly intended to demonstrate that all is well both with day to day developments and the whole trend of the delicate and unpopular business of German rearmament.

It was put on again this week. There was evidence that many Germans, official and unofficial, had been rattled by the inferences that might be drawn from the radical changes in Britain's defence planning. Western Germany's own programme had only just been subjected to far-reaching modifications, with the embarrassing admission that Herr Blank had been trying to do too much too fast. Now here was Britain proclaiming revised strategic principles that seemed to challenge the validity of much of the Adenauer government's conception of Germany's defence requirements. The British white paper had again called into serious question the Federal Chancellor's insistence on the efficacy of conscription and conventional weapons. This time it was more than just the opposition in the Bundestag speaking.

Flanked as usual by his heavy cannon from the ministry, Herr Strauss set about allaying, as far as possible, the natural misgivings of the Germans, who rightly or wrongly see themselves more exposed than anybody else to the blasts of nuclear warfare. The upshot of his argument and his answers to troubled questioners was that the Bonn defence planners reckon they can see ahead for two years at the most, have made up their minds what can be done during this period, and are already launched upon it. The tempo of the development of weapons had been so *stürmisch* since 1945, he observed, that no one could predict today the requirements of 1959. Yet the military necessity for equipping the Bundeswehr with tactical nuclear weapons, as well as the principle involved, had now become incontestable. For Nato's European partners to dispense with nuclear weapons would be to hand over Europe to the Russians. And, he contended, no one in his senses could expect the West German army to accept inferior equipment.

But for technical reasons alone it would be impossible to equip the Bundeswehr with nuclear weapons for another eighteen months to two years. The defence ministry would therefore go ahead with its present plans for raising seven divisions by the end of 1958, the timetable being to put three more or less trained "grenadier" divisions at the disposal of Nato by July 1st, two armoured divisions by the end of the year, and one mountain division and one airborne division by April 1958. (Although Herr Strauss did not mention it, these promises will now be easier to keep thanks to the vacating of barrack room space by the 13,000 British troops who are to be withdrawn from Germany this year.) In the meantime, he warned, there could be no toying with the idea of abolishing conscription, as the Social Democrats and Free Democrats have been demanding with renewed hope. Western Germany, right up against the iron curtain, was in a very different strategic situation from Britain's.

The realities which the British white paper has so clearly stated will undoubtedly deeply influence West German policy in many directions. Voices are already clamouring for a more energetic organisation of active and passive defence against nuclear attack. Others are advocating the necessity for a European arms community now that the decisive weapons can hardly be developed any longer individually by small nations. The only real hope is seen to lie in new efforts to bring about a political solution. If it is still necessary, there will be renewed pressure on Dr Adenauer to talk with the Russians and listen to them more receptively. To judge by their indignant reaction to some of the implications of the British proposals, it may well be that they are convinced the time has come to be more accommodating in seeking a solution of the German problem.

2. A Jolt for Nato

FROM OUR PARIS CORRESPONDENT

IT would have been pleasanter for Nato if the Government, in the matter of the defence cuts, had shown the same talent for charming allies as the Queen has shown in Paris. Seasoned diplomats here admit frankly that the white paper came as a shock. Even in the recent discussions on the cutting of Britain's forces in Germany, its allies

were not led to expect a long-term defence programme with such profound implications. They feel they have had their hands forced on issues which have never been discussed.

Nato has already suffered from earlier failures to honour commitments—Germany's slowness in rearming, the mass migration of the French army to Algeria. But these had the look of temporary failures to reach an accepted target. The British decisions call in question the target itself. When, for reasons of economy and domestic politics, the Government aims at cutting the army to 160,000 men and abolishing conscription by 1960, the example is enticing. Several nations are divided over conscription or have accepted it reluctantly, especially Germany and the Scandinavian countries. Many other countries can insist on the overriding need for economy—above all, France, where the foreign trade crisis is already encouraging thoughts of big defence cuts when the Algerian war is over.

Mr Macmillan's difficulties are appreciated. And experts admit that Britain may be blazing the trail in applying the "political directive to the military" which Nato accepted last December; they are particularly astonished at British ruthlessness in reducing the Navy. But if Britain has tackled problems European countries must sooner or later face, this only makes it more regrettable that decisions should have been taken with so little consultation. If the British conclusions are correct, they imply changes for most European countries.

The allies also have political complaints. The cuts have been so made that it is impossible to use them in bargaining with Russia on disarmament. Again, they wonder whether it was necessary to have had such bitter discussion—now adjourned till next October's session of the Western European Union council—over whether Britain should withdraw 27,000 or 22,000 troops from Germany. It has become easier to plead, as the German Social Democrats have done already, that other countries, following Britain's lead, have a right to act solely in the narrow national interest.

★

Nato's first need is precisely to prevent this. The alliance has had a lean time lately. In 1955, the "thaw" cast doubts on its usefulness. Hungary answered these doubts, just as Suez provided the classic case of disastrous failure to co-operate. The recommendations of Nato's "three wise men" for closer political consultation were an attempt to prevent further breakdowns in co-operation. Now, four months later, comes the dismaying White Paper. Although Europe has survived several critical years with far less than Shape's absolute minimum requirement of a shield of "about thirty" divisions, the allied governments, rightly or wrongly, are too much aware of the importance of the shield in maintaining the political balance in Europe—and in Germany especially—to accept without question any lowering of targets that the experts advocate.

Nato's mood is still too confused for large constructive proposals to emerge. There is increasing talk of "burden sharing" and of "correlating" arms production. Willingness to produce arms in common is greater than it was, but previous attempts were nearly all disappointing and common production of new weapons could only show results gradually. It will be difficult to generate inspiration out of the idea of a slow interweaving of British, French and German production plans, and of the hoped-for relaxation of American curbs on the European use of transatlantic techniques. Nevertheless, though integrated production will not produce the men if they are lacking, it could increase cohesion and alleviate some of the financial problems which tempt countries to cut defence commitments.

There are signs of some real progress in political consultation within Nato. There seems to have been a marked growth of co-operation in formulating policy between the allies in the Council and even in Uno. But this kind of slow progress can hardly outweigh the adverse effect of a series of unilateral decisions like those in the White Paper. If in the months to come Nato fails to clarify its collective views of the problems raised by atomic defence, it will inevitably be jolted again and again by shocks of the same kind.

Divided Syria

FROM OUR MIDDLE EAST CORRESPONDENT

THE crisis that ruffled the Syrian political scene in March seems to have subsided without effecting any marked change. There is indeed some ground for doubt whether the differences that arose in Damascus deserve the name of "crisis" at all—particularly since the more alarmist reports emanated from Baghdad and Beirut, where developments in Syria tend to be painted in lurid colours.

The story of crisis in Syria first arose from reports that sweeping transfers in army appointments had been proposed. The most striking of these reported transfers was that of Colonel Abdul Hamid Sarraj, the chief of the Syrian Deuxième Bureau, who has become the symbol of extreme anti-western nationalism. It was said that he had been appointed military attaché in Cairo (other reports said Moscow). In either post, his power to influence the internal situation in Syria would have been materially reduced. The other reported transfers would have weakened further the left wing element in the army, which, in the existing state of emergency—declared immediately after the attack on Egypt—wields extensive power.

It was stated that the prime mover behind the proposed transfers was General Tawfik Nizamuddin, the Syrian commander-in-chief. Unconfirmed reports had it that the General's plan was blocked by the intervention of Khalid el Azm, the acting minister of defence, who was supported by a threatened revolt of extreme nationalist members of the officers' corps. Whatever the truth of the matter, Colonel Sarraj still remains at the head of the Deuxième Bureau, and there is no confirmation of large-scale transfers of other officers.

It would seem, therefore, that the Syrian Left, based on strong support in the army and on key positions in the government, has weathered the storm—or perhaps breeze. Further confirmation of this supposition may be read into the failure of the moderates, so far, to put an end to the state of emergency. Those opposing the return to civil authority have been strengthened by official reports from Damascus that an unknown aircraft had circled the Jebel Druze dropping anti-regime leaflets signed by the "Free Druzes," and by two bomb-throwing incidents in Damascus, both directed against conservative parties.

Through the blur of personalities, parties and propaganda, two basic issues can be seen dominating Syrian politics: the problem of Israel and the position of the Arab world between East and West. The Israeli issue can be simply stated. The Arab states are seriously afraid that the Israeli government is seeking a pretext for renewing the war, either against Egypt or against Jordan. This danger has divided Syrian opinion. On the one hand, the nationalists, for whom the Baath-Socialists provide the intellectual drive, advocate accelerating the movement towards federal and economic union with Egypt and Jordan, on the grounds that only unity can give the Arabs strength to resist Israeli aggression. On the other hand, the moderates fear that hasty movement in that direction would give Israel just the excuse it needs for invoking the right of preventive war in view of the "changed situation."

In present circumstances, with the Richards mission touring the Middle East, the problem of the position of the Arab world between East and West must be closely concerned with the Eisenhower doctrines. The Syrian attitude to the doctrine still has to be stated in unequivocal terms. Most official spokesmen have contented themselves with saying that the government is prepared to listen to the explanations of Mr Richards before determining its stand. An important rider has usually been added—that a Syrian decision would have to await consultation with the other Arab "liberated" states. Nevertheless, the more vocal Syrian politicians have tended to adopt a negative attitude. Akram Haurani, the leader of the Baath-Socialists, has flatly accused "imperialism" of seeking a breach in Arab nationalism to maintain influence.

"The last plot," he wrote, "throws a vivid light on the traitors who have been recruited by imperialism from the relics of feudalism, reaction and confessionalism." Others have proclaimed the determination of Syria to adhere to "positive neutralism," which means, among other things, a strong tendency to look for undesirable strings in connection with any offer of aid from the West. The possibility that the Syrian government will reject the aid proffered under the terms of the Eisenhower doctrine—the Syrians have consistently refused to accept the blessings of Point Four—is worrying the moderates, who fear that the alternative may be acceptance of Soviet aid on terms superficially attractive, yet designed in the long run to establish a stranglehold on the country.

Thus on both crucial issues Syrian opinion is divided; and whenever its divisions break surface, a political crisis, more or less acute, can develop.

Siam Gets into Politics

FROM A CORRESPONDENT IN BANGKOK

DESPITE the general election in February and the demonstrations, charges and counter-charges that followed, the Siamese triumvirate of Field-Marshal Pibul, Marshal Sarit and Police General Phao emerges apparently unscathed. Indeed, it is in some respects reinforced, for Phao and Sarit are now ministers of the interior and of defence respectively, instead of deputy ministers. But the only one of the trio to come out of the past few weeks with his reputation enhanced is Marshal Sarit, whose cool handling of the crisis was much praised.

Some of the mud freely slung around after the elections has inevitably appeared to stick on Marshal Pibul, although he remains prime minister. As for General Phao, he was widely blamed for some of the shortcomings of the Seri Manangasila (government) party and for failing to prevent the demonstrations. His half-hearted attempt to resign all his public posts came to nothing, however, and he has been reappointed secretary-general of the party.

The conduct and results of the elections produced enough surprises to confound the most reliable of prophets. Few people thought that the elections would be scrupulously fair, but even fewer were prepared for the large scale chicanery which is widely alleged to have occurred. In the country as a whole, the Seri Manangasila party, instead of the expected large majority, obtained only a little more than half the contested seats. As it seems, the Siamese people are awaking from the political apathy which has long distinguished them from their neighbours in Burma and elsewhere. Widespread primary education appears to have removed from the minds of the villagers the confusion between ruling in the King's name and "carrying out the royal behest."

★

The election returns in Bangkok, which gave seven seats to the Seri Manangasila party and only two to Nai Khuang's Democrats (including Nai Khuang himself) came as a great shock to many people. As the counting of the votes proceeded, it appeared that the Democrats were likely to win five or six of the nine seats, but towards the end a landslide occurred in the opposite direction; this was regarded as highly suspicious, and popular reaction was immediate. The city was flooded with rumours about the intimidation of voters, the use of huge numbers of "firecards" or illicit voting cards, and the presence of "paratroops" or blocks of illegal voters at many polling stations. It was alleged that, when all these measures failed to give to the Seri Manangasila party the desired large majority, a falsification of returns was resorted to. The rumours have been indignantly denied and the public awaits with great interest the results of the court cases to be brought by supporters of Nai Khuang. The prime minister at once declared that he would not take office again unless the charges against his party were first disproved, but he has since reversed this decision.

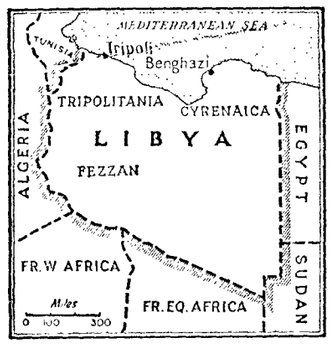
Meanwhile, a state of emergency was declared. Marshal Sarit, Commander-in-Chief of the Army, was temporarily placed in charge of all the armed forces, including the police; political gatherings were forbidden, and tanks patrolled the streets. The students of Bangkok's universities, previously remarkable in Asia for never taking part in political demonstrations, gathered in thousands opposite the ministry of the interior. They defied the current emergency regulations, and marched in a body to Government House; there, after a slight scuffle, they came face to face with the prime minister. Marshal Sarit, who appeared early on the scene, very astutely managed to calm them and to persuade them to disperse even though they declared themselves dissatisfied with the prime minister's reply to their "ten demands," which included the holding of new elections.

Marshal Sarit's handling of the whole explosive situation displayed remarkable ability and judgment. Within a few days, he had become something of a popular hero, even with the students; yet this popularity was achieved without his giving any indication that he intended to do more than keep the peace until the new Assembly should be convened and the new cabinet take office.

One of the reasons given for proclaiming a state of emergency was that certain "foreigners" were manipulating the situation for their own ends. These mysterious foreigners were variously held to be Americans or Chinese, though nobody could be sure; most probably the authorities used

the suggestion of foreign interference to restore unity among the Thais. Some weeks of uncertainty followed. Then the Assembly was convened and Marshal Phibul Songgram resumed office.

In short, on the surface it appears that the storm has died down leaving everything much as it was. But though the Seri Manangasila party still has a majority among the elected members of the Assembly and the backing of the second category (appointed) members, there will henceforth be a powerfully vocal opposition in the House, led by Nai Khuang, whose stature has recently increased immeasurably. All serious allegations of abuses of power by those in authority will be fully aired on the floor of the Assembly. More important still, the court cases arising from charges brought by Nai Khuang's supporters against their election opponents will be given wide publicity.



Even if the charges prove exaggerated, or if evidence is lacking to bring them home, some of the mud will stick and the government will have to reckon with a public much more critical and observant than at any time in the past. The certainty of criticism is good for governments. Some Siamese say that the elections have made them "ashamed to face foreigners." Certainly a lot of dirty linen has been washed in public, but if this helps to destroy what remains of the traditional apathy to politics, then the elections may have done good.

Libya Looks West

FROM A SPECIAL CORRESPONDENT

LIBYA, on achieving independence five years ago, naturally turned to the east, where alone, at that time, there were other independent Arab states which could give it support and encouragement. Since Tunisia and Morocco have became independent too, the position is changed: there is now a rival centre of attraction and one to which Libya feels more drawn. For though the frontiers of Cyrenaica adjoin Egypt, within the Arab world the Libyans feel themselves as part of the Maghreb or Arab west rather than as easterners. Meanwhile, the Arab League itself has been split as the result of Iraq's initiative in forming the Baghdad Pact.

While not going so far as to take Iraq's side in this quarrel, Libya has, like Iraq, been actively cultivating good relations with Turkey. The Libyan government shares the point of view of those states within the Arab League which are trying to bring about a compromise between Egypt and Iraq and are anxious to arrive at terms with the West which will ensure aid for themselves and co-operation against communism. The eastern Arab statesmen for whom the present prime minister of Libya, Mustafa ben Halim, professes the greatest admiration are President Chamoun of Lebanon and King Saud. His feelings in this respect are no doubt reinforced by his realisation of Libya's material needs and interests. It is a vast, thinly populated country. Its three provinces differ widely in population and wealth, if indeed the word wealth can properly be applied to a country which is mostly desert. Each has to support its own legislature and ministers as well as jointly to maintain the federal government and the monarchy which link them together. While revenue from internal resources is less than £3 million a year, expenses, even on the present modest standards, amount to about £10 million. The difference is partly made up by international bodies, but mainly by grants from individual countries, particularly Great Britain and the United States. The American grant is in the main a simple commercial transaction, by which an agreed sum is paid over in return for the lease of the Wheelus air base. With Britain there is a treaty of alliance and friendship: Libya permits the stationing of British troops in its territory, while Britain gives financial aid. The two aspects are thus less closely related in the British case than in the American, so that the reduction in the number of British troops stationed in Libya will not necessarily carry with it a proportionate reduction in the amount of aid given.

In the circumstances the present prosperity of Libya, taking into account its very limited resources, is remarkable. Some twenty different companies are busily exploring for oil; building activity is considerable and a great extension of government services is taking place. Cyrenaica, for example, now has 28,000 Arab pupils in its schools, as opposed to 2,000 before the war. A university is in process of formation; the faculty of arts is already in existence in Benghazi, where it will soon be doubled by a faculty of law; the faculty of science will be located in Tripoli.

The hospital staffs include English, Egyptian, Italian, Greek and German doctors. Of the five professors in the Faculty of Arts, four are Egyptians, most of whom completed their studies in British universities, while the fifth is a Briton who spent many years teaching in Egyptian universities and was among the staff expelled from Egypt when Egypt abrogated the Anglo-Egyptian Treaty. The Dean is an American of Iraqi origin. The secondary schools are mainly staffed by Egyptians. Under Libyan direction, these various elements find it perfectly possible to work together harmoniously in spite of the political troubles affecting the relations of the countries to which they belong. This is possible just because politically Libya really is independent. During the difficult moments of the Port Said affair, for example, the reading rooms maintained by foreign embassies in Tripoli were all ordered to close down, Egyptian, British and American alike.

Of course Libya is affected like the rest of the Arab world by the political whirlwinds in the east. The townspeople and the young feel the attraction of the pan-Arab ideas and methods of which Colonel Nasser has made himself the exponent. Though the great majority of Egyptian teachers confine themselves to their educational tasks, national sympathies cannot be entirely suppressed. In Benghazi, where the foreign embassies are still allowed to keep their reading rooms open, there is no doubt that it is the Egyptian centre which is the greatest attraction. In part this is due to the admirable library of Arabic books which it contains and to the facilities which it offers for reading them; but the propaganda pamphlets are an attraction, too, and humble Cyrenaican parents can be seen urging their children to lisp

the name of Gamal Abdul Nasser as they gaze at portraits of the Egyptian leader in the windows. Nevertheless, the impact of such ideas is lessened by the fact that Libya is to some extent insulated from direct contact with the two problems which are the main stimulants of Arab feeling; the country is separated from the troubled areas of Algeria by the interposition of Tunisia, and from Palestine by that of Egypt.

The fact that Libya is and must remain a country terribly deficient in natural wealth, unless, of course, oil is discovered, does not prevent its people from having a marked character of their own; and the degree of independence and courage which they display does them great credit.

Austrian Presidential Campaign

FROM A SPECIAL CORRESPONDENT IN VIENNA

THE second Austrian Republic has been fortunate in its first two presidents, Karl Renner and Theodor Körner, another greatly respected Socialist. Since Dr Körner's death in January the Austrians have felt a genuine sense of deprivation, for there is no obvious person to take his place. The one outstanding and popular personality is the Chancellor, Dr Julius Raab, the leader of the Austrian People's party. But none would wish him to be transferred so soon from the activity of his present position to the relative passivity of a president: he himself would only be prepared for this, at the earliest, "next time," that is to say, in 1963.

The election of the new Austrian President, which is to take place by direct popular vote on the first Sunday in May, may not seem to be of much importance. But since the office is comparatively new its stature may be considerably affected by the character of the first man to fill it since the State Treaty restored the country's independence. Austria now has an army of which the President is *ex officio* commander-in-chief. And in a country where two big parties of nearly equal strength dominate the scene, the President may have critical decisions to take; the constitution gives him the right to appoint and dismiss the Chancellor, and, since the latter must have a majority in the Chamber, the President can compel a parliamentary dissolution.

The remarkable prosperity which Austria has enjoyed for the last few years has been made possible partly by the elaborate stability of the governmental coalition between the People's party and the Social Democrats, the heirs of the very men who fought one another in the factories of Styria and the streets of Vienna in the civil war of 1934. In the socialist view, the country can only continue to prosper if the banks and basic industries remain nationalised: and since the Social Democrats have several seats less in the Austrian Chamber than their *Volkspartei* partners, their only hope of preserving the economic *status quo* lies in maintaining the coalition in its present form.

This, the Socialists claim, requires a socialist President to re-establish the necessary equilibrium in relation to a lively and able Chancellor. The argument is the chief plank in the socialist platform for the moment, and appeals to a certain number of non-socialists, for instance to one or two liberally minded industrialists. The socialist candidate will also get some unwilling support from the small, and now wholly discredited, Communist party, which today cannot afford even the gesture of putting forward a communist candidate as it did in 1951.

★

In the circumstances the Socialists decided early in the campaign to nominate as their candidate for the presidency Dr Adolf Schärf, who is leader of their party and Vice-Chancellor, next in cabinet rank to Herr Raab. Even among the Socialists themselves there is little enthusiasm for Herr Schärf who, though shrewd and a man of integrity, appears inflexible and colourless; the trade union leader, Herr Böhm, or Herr Helmer, the minister for the interior, would have been more popular.

The Austrian People's party is less clerical, more heterogeneous and more liberal than the followers of Dollfuss and Schuschnigg in the old days. Many of its members and sympathisers believe that Austria's new-found prosperity will quickly stagnate unless the Austrian economy is liberalised, but this would require a stronger *Volkspartei* preponderance in the coalition. Under a liberal minister of finance, Dr Kamitz, the nationalisation of the three big banks (Creditanstalt-Bankverein, Österreichische Landerbank, Österreichische Creditinstitut) has become a purely nominal affair. Further, when an increase in civil servants' salaries from the beginning of this year had to be financed, the *Volkspartei* forced the unwilling Socialists to agree to an issue of "people's bank shares" (*Volksaktien*) in February. This proved to be a tremendous success, 388 million schillings being quickly subscribed, instead of the 225 million required, by 73,000 investors; of the latter over 30,000 bought shares up to 1,000 schillings in value, and most of the remainder subscribed between 1,000 and 5,000 schillings. This sort of thing, although it gives the ordinary public a direct interest in Austrian prosperity, is not what the Socialists want (they would have preferred to increase taxation). Its success seems to indicate that, although the solid core of Austrian, and especially Viennese, socialism is probably invulnerable, the tide is still running in the other direction, as was shown by the parliamentary elections last year, and the elections in Styria last month.

The *Volkspartei* answered the nomination of Herr Schärf by putting forward a well-known surgeon as their presidential candidate (medical men are always in vogue in Vienna, and there was talk of a second medical nomina-

Retail Business

CUSTOMER TRENDS

Number 2

This new quarterly bulletin deals with the demand for consumer goods in the home market. It includes short and long-term forecasts of sales by different outlets and merchandise groups, regional surveys and reports on special investigations.

Among the special subjects in the second issue are: the growth of mail order business; the women's clothing trade; motivation research.

Full particulars from the compilers:

THE ECONOMIST INTELLIGENCE UNIT LTD.
22 Ryder Street, London, S.W.1
WHitehall 1511, Ext. 144

tion by a smaller political group). Professor Wolfgang Denk, who is 75, was proclaimed to be a non-political figure, but he was of course nominated in order to prevent a third socialist presidency. He was officially supported also by the small *Freiheitliche Partei* which is led by a former Nazi minister of agriculture, Herr Reinthaller, and contains most of the remnants of Austrian National Socialism: it brings out a weekly called—a little ominously—*Neue Front,* which attacks everything imaginable and publishes the memoirs of Nazi diplomats. It is one of the many arguments in favour of the Austrian coalition (about which everyone grumbles, though few wish it to end) that, if it broke up, these elements would hold the balance in Parliament: at the moment they seem likely to ensure the election of Professor Denk by a small majority.

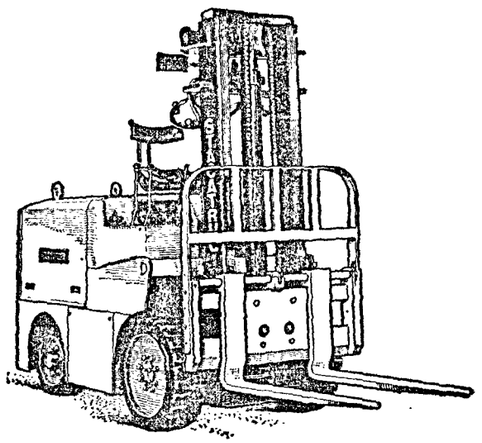
Whether it be Professor Denk or Dr Schärf who is elected, Austria's digestion of the Hungarian revolt has demonstrated its political and economic health. Though the familiar beggar still mars the aspect of a Vienna which buzzes with building activity even in winter, nearly 10,000 Hungarians have been absorbed into the economy and there is a notable shortage of skilled labour. It is true that foreign capital took fright at the time of the Hungarian crisis, but it is to be hoped that the investments in question will not be very long delayed. As for Austro-Russian relations, in spite of angry attacks upon Austria in the Russian press, officially the Soviet Union made no objection to the behaviour of Austria throughout the Hungarian affair. Moreover, the *Volkspartei* and the Socialists are used to ignoring violent abuse in their own colleagues' newspapers: thus the Austrian government is little disturbed by the *menaces of Pravda.*

Taming the Two Rivers

FROM OUR SPECIAL CORRESPONDENT IN IRAQ

THE King of Iraq used a pleasant phrase during the last act of Iraq's national Development Week. Standing on the lip of the deep gorge in northern Iraq that is about to be spanned by the first of the country's great new dams —the Dokhan dam—he thanked the foreign guests who had attended the week's inaugural ceremonies for "the trouble they have taken in sharing our joys." As he spoke, your correspondent's eye travelled over the listening crowd. Perched high above the dam-site, guests and hosts had mingled without formality round the platform from which the King was to lay the first stone of the final wall of the dam. (It will be ready for use sometime in 1958.) Members of the Development Board rubbed shoulders with sturdy local workmen, some in jeans, others in the baggy trousers of Kurdistan ; among them stood contractors' men from the four western countries engaged on the job, Arab visitors from as far west as Morocco and as far south as the Sudan, Saudi Arabians as conspicuously in the front row as Egyptians and Syrians were conspicuous by their absence and—less impressive-looking but no less impressed —the civvy-suited visitors from Britain, America, Turkey, Pakistan, Iran and others of what the King called "sister nations." Last but not least there were the Iraqi hosts—the people of Suleimaniyah and Kirkuk provinces, many in the bulky fringed turbans and flowered cummerbunds that the Kurd wears with the same easy jauntiness as his counterpart, the Scotsman, wears his plaid.

The peak moment of the ceremony came with the sudden appearance of the foundation stone swung on a cable high over the assembled heads. Hung with streamers of bunting, it sailed smoothly towards the middle of the abyss and there dropped vertically to the river bed nearly 400 feet below. As it touched bottom, the band struck up the national anthem. *Hamdulillah !* After a year of stoppages and vicissitudes, all was well. At the Mussayib project in Mesopotamia earlier in the week, there had been an equally moving sight—hundreds of peasants on the new canal bank, clapping the water as the sluice opened and the stream that is to be their livelihood gushed into the new canal system.



The two scenes were as different as would be ceremonies successively held on Romney marsh and in the Cairngorms, yet they had one element in common. Both spelt control of Iraq's plentiful but erratic water supply. At the Dokhan dam site, the flow of the lesser Zab river ranges from 23 cubic metres per second at lowest summer water to 3,600 at the peak of the flood. (The second figure is an estimate as this year's flood over-topped the gauge.) In the Mesopotamian plain, as is well known, such floods could, until last year, do £20 million worth of damage in a matter of hours. The feature of last year's development week was flood control ; that of this year is also storage for summer. When the snows of 1958-59 start thawing, a lake 100 square miles in area will form above the dam, and add storage in the Tigris basin to that already established on the Euphrates.

It is easy to criticise the Dokhan project as having run too far ahead of the irrigation system that is ultimately to stem from it, or the Mussayib one for settling peasants without working ahead of time to provide some credit system (like that of the Sudan's Gezira scheme) in order to set penniless peasants on the right road. But these things will follow, even if in an uneconomic order.

Development Week was a notable feat of organisation. It is no light matter to provide meals for 500, transport, often for 300, over great distances by road and air, and beds for 150 in the mountainous regions of northern Iraq that were zones of insecurity only a very few years ago. From the Baghdad area to the far north, the cortege wound its way from exhibition to new factory, new aerodrome or new housing scheme. It passed in the wake of the King under triumphal arches made of anything from oleanders to the headscarves of one lonely gang of road-menders, and through huge crowds of clapping spectators.

★

A few vignettes stick in the mind's eye. The straight line of a new road, as yet unfinished but outlined for miles by its white concrete curb stones, cutting across the sinuosities of the old track across some wide plain ; the small boy scout at Mosul pronouncing a poem of welcome and then, abashed at accomplishment, turning tail and tearing, scarlet in the face, the whole way down the long line of spectators ; the petitions covered with thumb marks that the King stopped to receive at many villages ; or the bandmaster, baton held high, poised on tiptoe and craning his neck to be sure of striking up the moment the Dokhan dam-stone touched bottom. All could not see everything, but it is to be hoped that through films, shop window displays and travelling exhibitions the ordinary Iraqi will get some idea of what was shown to the foreign visitor. The latter is, after all, less important than the many Iraqis who ignore or underrate what their rulers are about.

how it does go on!

Like any other equipment upon which production flow depends a fork truck has to be completely reliable. It simply must lift, carry and stack in pace with all other processes, hour after hour, day after day, year after year.

Stacatruc fork lifts do all this with an absolute minimum of maintenance.

They go on doing it because they are built to quality standards. Coupled with peerless performance such engineering perfection has won for them world-wide renown as the finest machines of their kind. As part of Britain's best mobile materials handling system Stacatrucs are everywhere taking the burden of mankind's *handling* tasks.

Taking the East into account

Twenty-five years ago you would have found this 'adding machine' of antiquity in every eastern branch of The Chartered Bank. It was of particular use in calculating the intricacies of exchange rates which often fluctuated with great rapidity. Today, the abacus is being replaced by the slide rule and the electric computer. The East is changing but The Chartered Bank remains in step, so that its knowledge of eastern trade, travel and investment is always up-to-date. This knowledge and a century of experience sustain a complete banking service available throughout a branch system, which extends to most centres of commercial importance in Southern and South-East Asia and the Far East.

THE BUSINESS WORLD

An Expedient Budget

BLUNTLY, Mr Thorneycroft laid down in his opening sentences the ground upon which his budget was founded; it was echoed again and again in his later words and in his measures. "With fifty million people living here upon a small island and dependent upon external trade and confidence in sterling it is this, the external position, which is always uppermost in the mind of any Chancellor." His clear priorities—first, a larger trading surplus and an increase in the reserves; second, expansion at home "on a safe and sound basis"—underlay his refusal to "boost home consumption and investment at the cost of lower exports, of higher imports and a thumping external deficit." His room for manœuvre, on his own uncompromising analysis, was limited. He used it, with economic as well as political logic, to strengthen the competitiveness of British companies operating—and selling—overseas, to offer shipping companies an incentive not to sail away to Bermuda, and to concentrate personal tax reliefs upon another class of potential emigrants that the economy can ill afford to lose—rising business executives in the surtax range.

The Chancellor's emphasis upon overseas trade and investment was coupled with a refusal to offer any general tax incentive to investment inside Britain—except to the shipping industry whose assets are so peculiarly mobile. Nor did he refer even in passing to any reform of the profits tax. The only other changes in taxation bearing upon any part of business discharged another commitment that he had inherited from his predecessor along with the obligations to deal with "overseas trade corporations" and to clear away the extra petrol duty as supplies eased—the review of entertainments duty. Minor tinkering with purchase tax—making this even more complicated and unreasonable—plus a number of small adjustments designed to suit the administrative tidiness of departments rather than any useful reform of the tax laws, completed his measures, which give away £98 million this year and £131 million in a full year. The complexity of these adjustments and of the remission of tax for overseas trading, however, promise to make this year's one of the most complex Finance Bills on record.

The Chancellor's Reckoning

EVEN after these concessions, the surplus above the line in the coming year is still expected to reach £462 million, £172 million more than the surplus achieved in 1956-7. Counting in the below-line items, the total deficit is down from £331 million to £125 million. But by no means all of this prospective improvement could be taken as a true disinflationary force; part of it, indeed, is the result of past inflation.

Had the Chancellor made no changes, his surplus above the line would have risen to £560 million—£270 million more than the surplus achieved in the fiscal year just ended, but coincidentally the same figure as that held out by Mr Macmillan in the last budget after counting in the abortive £100 million of "economies." Mr Thorneycroft would thereby have provided all but £27 million of his projected needs to finance net expenditures "below line."

The big projected rise in the surplus in the above line accounts was attributable partly to "buoyancy" (the effect on tax revenues of higher levels of wages and salaries), partly to the effect of past increases in tax rates, partly to windfalls and partly to real economies. Receipts of income tax, which had risen well above estimate in 1956-57, were expected to rise by a further £116 million, despite the effect of last year's exemp-

tions; but the expected rise of £60 million in receipts from profits tax, which were depressed in 1956-57, is "mainly" a result of Mr Macmillan's increases in rates. Customs and excise was expected to rise by £49 million in 1957-58—a rise that would not offset last year's shortfall below estimate, caused mainly by the fall in sales of cars and consumer durables.

Finally, on the revenue side, Mr Thorneycroft was faced with a windfall of £37 million from the anticipated return of the deferred 1956 interest payments on the North American loans—which, however, was expected to be more than offset by declines in other miscellaneous revenue. In sum, before the tax changes, budget revenues were estimated to rise by £229 million above last year's out-turn (which was nearly £40 million short of the April estimates).

A less expected fortification of this year's surplus than the largely "natural" rise in revenue is a projected fall in expenditures. The estimates of civil expenditures on supply services published some weeks ago showed a rise of £131 million above the 1956-57 out-turn, almost wholly on account of the social services; last week this was seen to be offset in part by the large cut in the defence bill, of £105 million below the 1956-57 out-turn, net of American and German aid. Now the balance is transformed by the Chancellor's estimate of a reduction in consolidated fund payments of £67 million. He attributes this expected relief "largely" to the fall in short-term interest rates; but a good part seems likely to result, too, from a fall in payments of accrued interest on national savings certificates. These were swollen last year by the heavy encashments for switches into the new issue, which played an important part in the big increase in debt service above estimate. With the expected saving this year, total ordinary expenditure is put at £41 million below 1956-57—though still £89 million above the original estimate for the year.

★

Flanking the total improvement in the "ex-budget" surplus above the line of £270 million, there was an expected reduction in net payments below the line of £34 million below 1956-57—when they were £182 million smaller than estimated. The bulk of that improvement was attributable to the decline in loans to local authorities by the Public Works Loan Board: issues net of repayments reached only £67 million, compared with £297 million in 1955-56 and the estimate for last year of £176 million. Mr Thorneycroft states that he will "press forward" with this remarkably successful policy of driving the local authorities into the market, and estimates net issues for 1957-58 at a mere £52 million. Advances to the nationalised industries, moreover, were much less than had been estimated. Savings in minor items below line, listed in the table, carried the total improvement in the Exchequer accounts "available" to the Chancellor to £304 million.

A Radical New Relief

For the first time in Britain's fiscal history there is to be a clear differentiation between profits earned at home and those earned overseas. The latter are to be largely freed from British tax. This forms the most costly single tax concession in the budget—£35 million in a full year. That is, however, a much lower figure than the £75 million talked about twelve months ago when Mr Macmillan promised to come within the year to a decision on the taxation of overseas earnings. In making this concession, Mr Thorneycroft has, in substance, adopted the proposals of the majority report of the Royal Commission on Taxation, which were energetically disputed in the minority reports.

Until now, profits earned overseas by companies controlled and managed in this country, having borne local tax, were subject to British income and profits taxes to the extent that the local tax rates ran below the British. This, it was argued, put the British company at a disadvantage with its local competitor. High taxes did not affect the making of profits but they reduced the proportion of profits that could be ploughed back and invested to expand the business. Mining companies were particularly hit because the British tax system limits allowances for the amortisation of a wasting asset to original costs.

The new proposals envisage the formation of "overseas trade corporations," which are controlled and managed in this country but have all their actual trading operations abroad. Trading profits earned abroad by such concerns will be exempted from British income and profits tax. Dividends or distributions to shareholders out of these profits will still be subject to British income tax, and, if they are received by a British company, to profits tax also. Thus it seems distributions to shareholders by British companies wholly operating abroad will escape profits tax (except to the extent that other companies are shareholders) but a remittance in a mixed business from an overseas subsidiary to its British parent would attract that tax. Hence proposals to reshape company structures are likely to become commonplace.

Companies engaged in mining, oil winning, agriculture, manufacture and processing, public utilities and distribution can qualify for the concession, but not those engaged in shipping nor in banking and insurance. Many companies will have to hive off their overseas business into a separate company in order to qualify; though control and management will not have to be transferred overseas. Where local tax rates are high, as they are for the tea estates in India and Ceylon, there will be little or no benefit; but the rubber and tin companies of Malaya, and plantation and mining companies in Borneo and Africa stand to gain. The gain exists, however, only when profits are being earned and reinvested; where a loss is made overseas, the British parent can hardly expect to set this loss against its British tax liability.

Complications in law and administration will arise from the treatment of profits earned on goods manufactured in this country but sold overseas by one of these "trade corporations." The Chancellor, anxious to avoid the charge of having granted a hidden subsidy to exports, has shown he is aware of the possibilities of tax avoidance by the under-pricing of exports: prices of goods transferred to an overseas company will have to be at arm's length—which may be hard to enforce in practice. Another difficulty will arise in distinguishing between the producing and merchanting profit on goods sold in this country by a British company operating overseas.

In making these proposals Mr Thorneycroft has tried to foster overseas earnings. But, because the relief really applies only to profits earned and then retained in overseas territories, they are an inducement for British companies to invest abroad and to build up manufacturing facilities overseas and they may even encourage produce auctions overseas at the expense of British ones. Because there is an incentive not to distribute money

ESTIMATED EFFECT OF CHANGES IN TAXATION

(£ thousand)

	Estimate for 1957-58	Estimate for a full year
INLAND REVENUE	£	£
Income Tax :—		
Extension of earned income relief at two-ninths to £4,005 and one-ninth to £9,945	— 17,000	— 24,500
Increase in the child allowance to £125 for children aged over 11 and £150 for children aged over 16	— 14,500	— 17,500
Exemption of incomes not exceeding £250 for single persons aged 65 or over and not exceeding £400 for married couples where either husband or wife is aged 65 or over	— 1,500	— 2,500
Increase in the income limit for age relief to £700	— 750	— 1,750
Surtax :—		
Deduction from total income of personal allowances in excess of £140	— 6,000	— 9,750
Income Tax and Profits Tax :—		
Exemption of "overseas trade corporations"	— 25,000*	— 35,000†
Increase in investment allowance for ships to 40 per cent	Negligible	— 11,500‡
Total Inland Revenue	— 64,750	— 102,500
CUSTOMS AND EXCISE		
Customs :—		
Hydrocarbon oils	— 10,000§	Nil
Calculation of duty on composite goods	Nil	Nil
Total Customs	— 10,000	Nil
Excise :—		
Entertainment duty	— 11,200	— 12,200
Television duty	+ 6,300	+ 8,000
Purchase tax	— 18,000	— 24,000
Total Excise	— 22,900	— 28,200
Total Customs and Excise	— 32,900	— 28,200
Total	— 97,650	— 130,700

* Divided as follows :—Income tax £20 million; Profits tax £5 million.
† Precise cost will depend on the extent to which companies rearrange their affairs so as to qualify as "overseas trade corporations."
‡ The cost in 1958-59 will be £7 million.
§ Loss from removal of the temporary increase of duty before the end of petrol rationing (allocated wholly to Customs).

the British balance of payments could be an immediate loser, though ultimately perhaps a gainer. British investment overseas is receiving an element of preferential treatment unknown before.

More in the Executive's Pocket

THE Chancellor has decided to apply a large part of his tax reliefs—£130 million in a full year—in extending allowances into the surtax field in a manner that favours the married (and fecund) taxpayer. Those who think the £2,000 to £5,000 class under-privileged are acclaiming the budget as a step in the right direction.

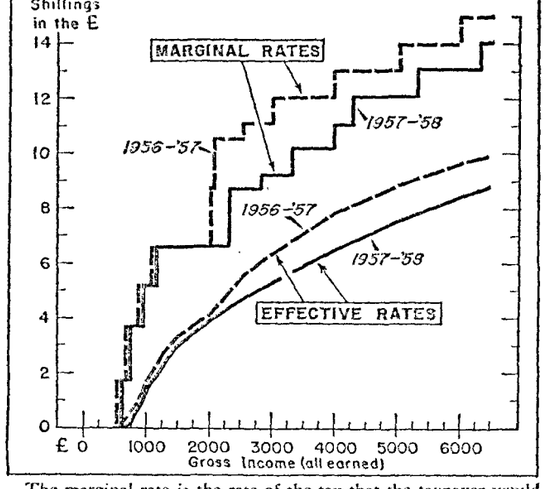
HOW DOES BRITAIN COMPARE?

Tax as percentage of gross income (all earned) for married man with two children (aged over 11 and under 17)

Income Before Tax	United Kingdom		USA	Canada	Australia	Nether-lands	Norway
	Old Rates	New Rates					
£							
2,000	20·7	19·6	11·9	10·5	18·4	25·6	35·3
3,000	31·6	26·6	14·8	13·9	25·7	34·2	45·9
4,000	38·7	32·2	16·8	17·0	31·1	39·9	52·6
5,000	44·0	37·5	18·7	20·3	35·9	43·9	57·7
6,000	48·3	41·9	20·5	23·4	39·6	47·2	61·2
7,000	52·1	45·7	22·1	26·2	42·3	49·8	63·6
8,000	55·0	48·8	23·6	28·3	44·6	51·9	65·5
9,000	57·8	51·6	25·2	30·0	46·6	53·8	67·5
10,000	60·0	54·0	26·7	31·7	48·3	55·3	69·6

Those who hold the contrary view proclaim that, though the reliefs are substantial in the £2,000-£5,000 class, they are very big indeed per head for the much smaller £8,000 to £10,000 class. A man with two children of the appropriate ages and an earned income of £10,000 a year saves £622 in this coming year. The man with £2,000 and the same family saves £43. But there could be no justification for the jump in the marginal rate of tax from 6s. 7d. at the 2,000th £ of earned income to 10s. 6d. at the 2,026th. Like them or not, the direct tax proposals are probably the most constructive section of the budget, and a serious attempt has been made to meet the spirit, though not the letter, of the recommendations of the Royal Commission:

(1) Leaving the child allowance at £100 until the year in which he or she becomes 12, the Chancellor then raises the allowance to £125 until the child reaches 17 and then raises it again to £150. The allowance over age 16 remains subject to the child continuing to receive full-time education or apprenticeship training and the limit on the child's earnings remains at £85, which seems dangerously low if it is desired to encourage apprenticeship at modern wages. The cost is £17½ million in a full year.

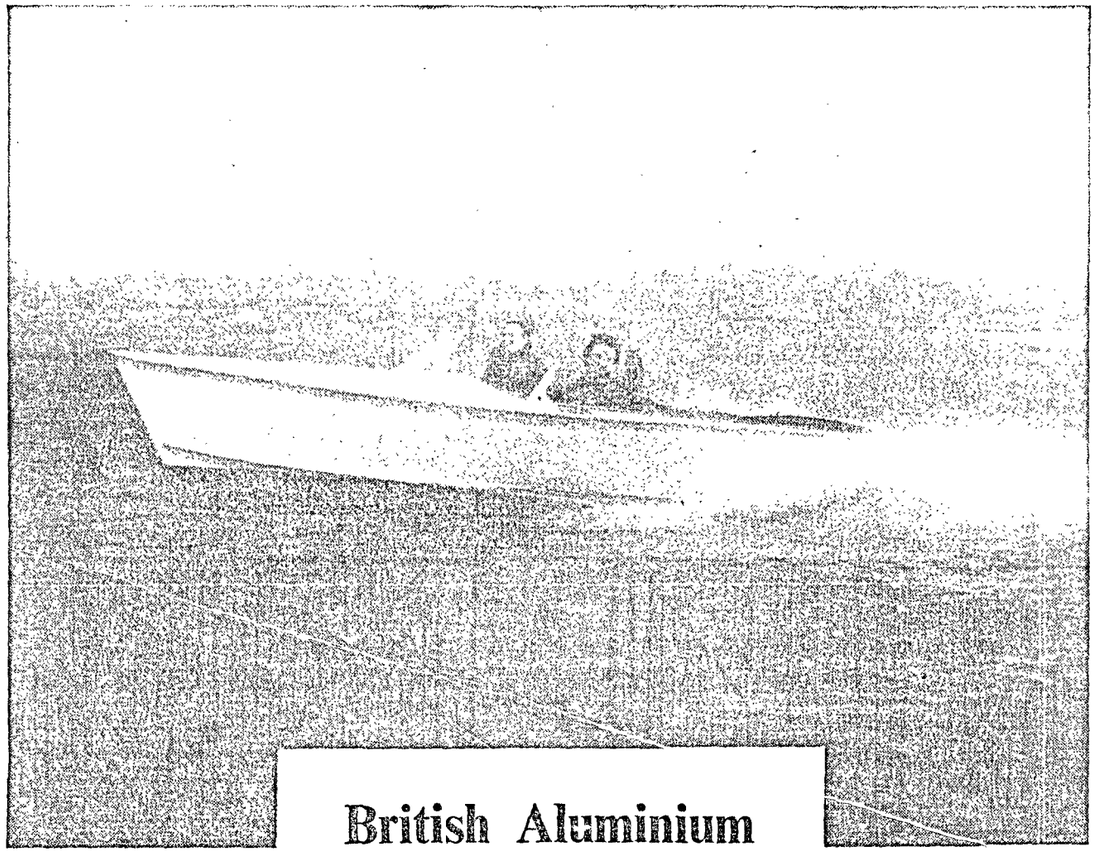


(2) It is proposed to permit some of the personal allowances to rank for surtax as well as for income tax. These are the married allowance (but not the single person's allowance), the child allowance, the housekeeper allowance and the dependent relative allowance (but strangely not the wife's earned income allowance). This has the effect of leaving the lower limit of surtax at £2,000 for the single man but of raising it for the family man. Surtax being paid a year in arrear, the old rate of child allowance is to be used next January. The full reliefs come with the January, 1959, tax demand. The cost in a full year will be £9¾ million.

(3) Earned income relief has been carried right into the field of surtax and up as far as the £10,000 a year man. It will run at the normal rate of two-ninths up to £4,000 a year, and then at one-ninth up to £10,000. The cost in a full year will be £24½ million.

(4) Age relief is to be extended by a tax exemption limit of £250 for single people over 65 and £400 for couples either of which is over 65. (Might it not have been an administrative boon as well as an act of grace to make these modest exemptions general?) The limit up to which the whole income of old people is treated as earned, whatever its source, is raised from £600 to £700.

CHANGES IN TAX RATES



For married man with two children aged 12-16

The marginal rate is the rate of the tax that the taxpayer would pay on the next £1 earned. The effective rate is the average of his tax on the whole income.

These reliefs leave the £1,500 to £2,000 man, on his way towards surtax but not blessed with a large family, disappointed. Their main effect is to relieve substantially the business executive class. As the table shows, though even now the surtax paying class in Britain remains much worse off than its counterparts in Canada and the United States, it has moved into approximate parity with the Dutch middle class. What will be the effect of these more adequate rewards? One may be that in addition to the tax reliefs executives will actually obtain salary advances from their firms. A rise becomes worth asking for, and an increased top hat pension or other non-cash emolument less attractive. The upper middle class will have more money to spend—and to save. The Chancellor can claim also to have given his reliefs largely to people who may spend much of it on education and foreign travel—neither of which contribute much to inflation inside Britain.

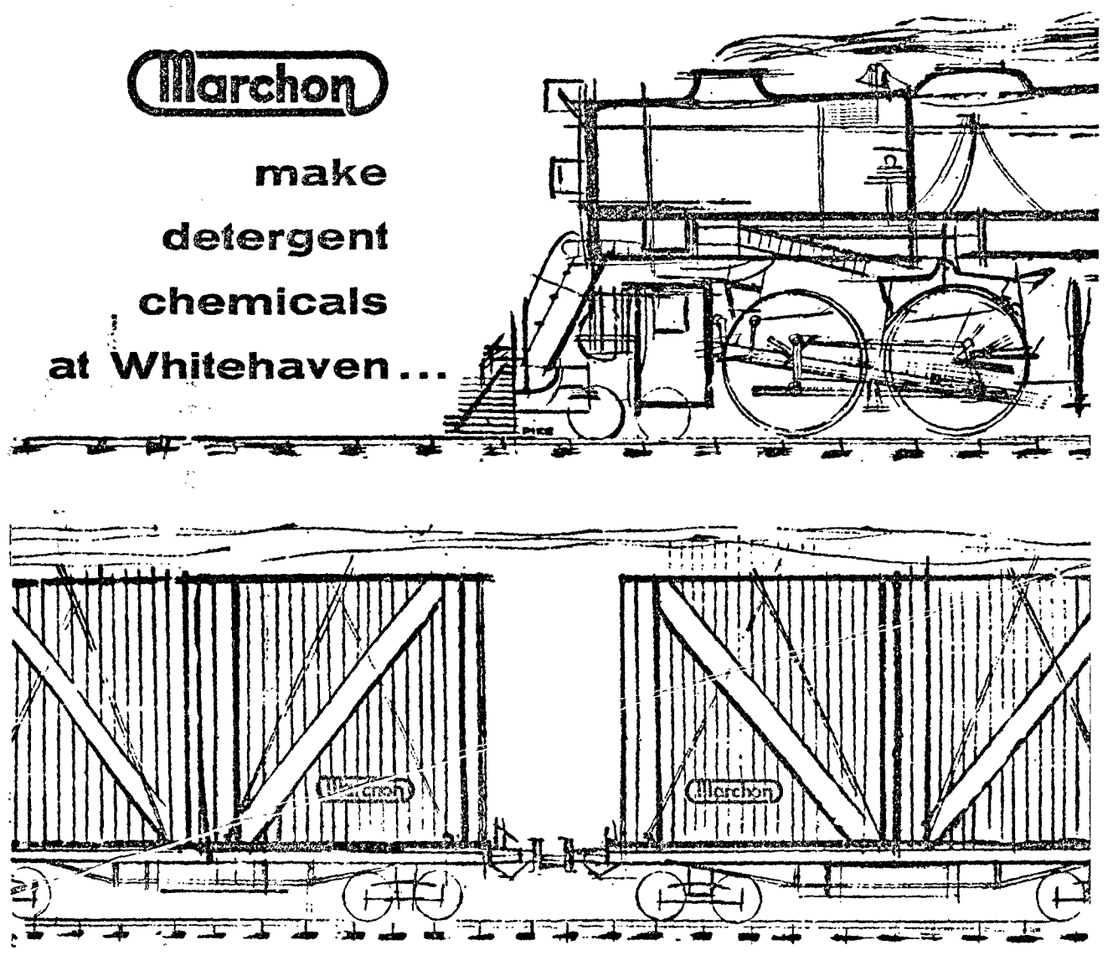
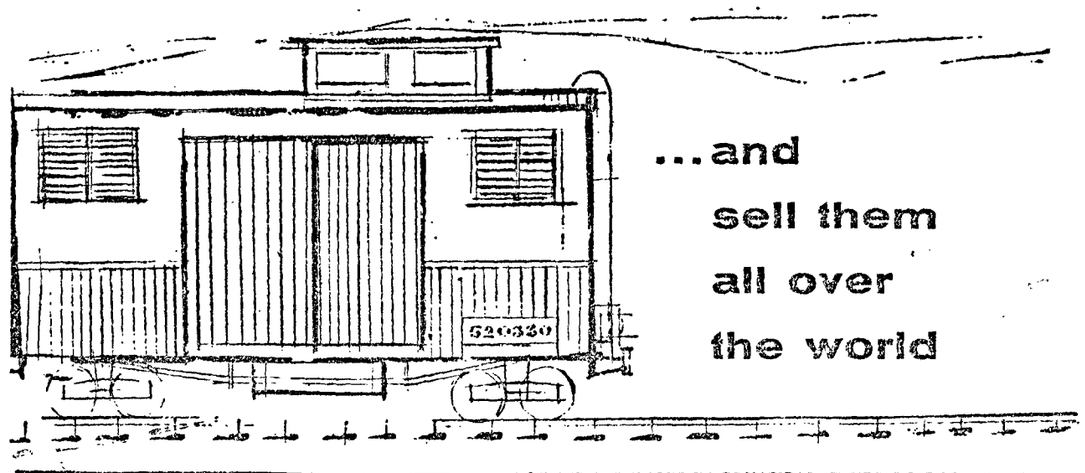
British Aluminium
in Light Craft



Corsaire is a fast open launch designed as an economically priced general purpose runabout, light enough for trailer towing and simple to hoist aboard a yacht.



The 19 ft hull, constructed entirely of aluminium, is robust, stable, and roomy—it will carry seven or more passengers comfortably in open water.

With a Ford Consul 1¾ litre engine, Corsaire has an extremely low all-up weight and a service speed of 22 knots. She is one of several 19 ft Corsaire variations to the design of Mr. Brian Grimston.

Breeding in Bermuda

SPECIAL treatment for one industry or group of industries is distasteful. But shipping, which in February last year was allowed to retain the 20 per cent investment allowance, now has that allowance raised to 40 per cent. Will this stop "breeding in Bermuda"? The bribe is substantial, for investment allowance is a gift while initial allowances that apply to other industries are loans. A ship earning normal voyage profits can be run for many years before ownership and control show a clear advantage. The table shows a tanker costing £1 million earning 15 per cent per annum on voyage profits. On the old tax basis at the end of the sixth year Bermudan ownership would just begin to show an advantage. On the new basis that

End of year	Cumulative voyage profit at 15%	Cumulative tax allowances	
		Old rates*	New rates†

* 20 per cent investment allowance once only plus 15 per cent annual depreciation on the reducing balance system
† 40 per cent once only plus 15 per cent annually.

advantage would not start until the end of the eighth operating year. For a dry cargo vessel earning 11 per cent and depreciated on the reducing balance system at 12½ per cent, the figures would have been eight years on the old basis and now eleven years. Bermuda still presents to the shipowner who sells his ship above its written down value an escape from the balancing charge. Those who have started to breed ships there, will go on. Those who have hesitated may now find the scales tilted in favour of Britain.

Taxing All Viewers

THE GESTURE of taking entertainments duty right off the theatre and sport was popular with MPs as well as delighting the fancy; besides, it cost the Chancellor very little. The theatre was producing no more than £2¼ million in duty a year, and sporting admissions only about £3½ million a year. The great bulk of entertainments duty, for many years, has been paid by the cinema; now nearly all of it will—though the actual amount of duty the cinema pays is to be reduced by about £6½ million a year. Film producers, renters and exhibitors had pleaded with the Chancellor for a cut of £21 million a year; sober men in the trade had expected a cut of perhaps £8 million. Cinema shares, which had already taken credit for an increase in the duty upon Sir David Eccles's "indiscretion" some weeks ago, dropped sharply on Wednesday.

This remission of £6½ million in duty paid by exhibitors has already been partly hypothecated by Government decision; the new Cinematograph Films Bill, which will make the levy that goes from box-office receipts direct to producers statutory and compulsory, has already set the amount of this about £1½ million higher than during the last few years. Cinema exhibitors, many of whom claim to be on the verge of closing down, are not likely to be greatly mollified by the slight widening of regulations under which cinemas in very small villages may claim remission from duty. Nor will the new "television duty" give them much heart.

This new Excise duty will be collected along with the broadcast receiving licence fee by the Post Office, but will not be part of the licence fee; it may bring in £8 million in a full year, against the reduction of £12.2 million in entertainments duty. It has been imposed, the Chancellor said, because "a fairer balance in the taxation of these competitive entertainments (television and cinemas) is desirable." But it is not easy to believe that this "fairer balance" in taxation will significantly redress the tilting balance of competition.

The Shilling Off Petrol

"THE LEAST figure" that the Chancellor could put as the cost to the Exchequer of the removal of the extra shilling a gallon tax on petrol and diesel fuel was £10 million. The reduction of the tax now will certainly press petrol consumption closer against the remaining limits set by rationing, so that the total revenue from the petrol tax should not fall in the same proportion as the reduction in the tax. But with even rationed consumption allowed for at about 90 per cent of normal, the revenue foregone could easily be £10 million a month, and more in the summer. Mr Thorneycroft's "least figure" of the cost is therefore merely the difference between removing the extra tax now and removing it in a month's time.

This cheapening of the consumer price of petrol and diesel fuel must affect the balance of payments; it will add to the strain of replenishing stocks of these products at an abnormal cost in dollars. But as conditions in the Middle East improve the extra dollar outlay can be reduced.

Fiddling with Purchase Tax

THE CUTS in rates of purchase tax on an odd and mainly insignificant collection of goods will cost the Exchequer £18 million this year and £24 million in a full year. In his autumn budget eighteen months ago, Mr Butler aroused the wrath of the Labour Party by suddenly imposing purchase tax at the rate of 30 per cent on an assortment of domestic odds and ends, ranging from table china to saucepans and pot scourers, which had never before been subject to tax. Mr Thorneycroft has now halved the tax on these to 15 per cent, and to make the concession slightly more

generous has extended it to floor coverings and odds and ends such as office furniture.

This gesture to the hypothetical housewife means that there are now as many as seven different rates of purchase tax in force; these are 5, 10, 15, 30, 50, 60 and 90 per cent. Some of the rates apply to only one or two classes of goods; for instance, piece goods are the only items taxed at the rate of 10 per cent, furs the only ones paying 50 per cent and cosmetics and brightly coloured greetings cards as the only two at 90 per cent. Three different rates, 5, 15 and 30 per cent, apply to different furniture.

Two years ago there were only three rates of purchase tax; easing the way towards consolidating this irrational impost into a less discriminatory form of sales tax. This largely meaningless political gesture of "freeing the pots and pans" has gone in the opposite direction.

Death Duty Loophole

ONE TAX loophole to which Mr Thorneycroft has given his attention is avoidance of the estate duty that is levied when the donor of a gift dies within five years of making a gift. Such devices take advantage of the fact that no duty is payable if the property given away (for example, a security due for early redemption) has ceased to exist before the death of the donor. That Mr Thorneycroft has decided that this "disappearing trick" must disappear is not surprising. The practice of making gifts in the form of early redeemable securities made a mockery of the five-year survival rule and went some way to justify the taunt that the payment of death duties was a voluntary act. But the proposed change is open to the criticism that it is retroactive, for it will apply whenever death occurs after the finance bill becomes law.

Control of Credit

THE City received the budget with a restrained welcome. The Chancellor had given many of his tax reliefs in what seemed to City men the right directions. But there was also a warning that credit must not be relaxed. In one specific and questionable aspect monetary policy has been tightened. Banks have been informed that requests for credit to finance buildings, plant and fixed capital are not loans in the ordinary course of business, and the Capital Issues Committee has again been charged with the duty of refusing permission for financing those objects by bank loans unless either the applicant cannot raise the loan from non-banking sources, or it is a short bridging operation pending the completion of funding arrangements. This return to the pre-1953 procedure which will not be easy for the banks to interpret could have the effect of throwing on to the issue market a fair volume of financing that the banks now do. Investors have an appetite for industrial issues and the issues could no doubt be absorbed.

The City welcomed too, and with less reservation, the proposal to set up a Committee of Inquiry with Lord Radcliffe as chairman to investigate "the working of the monetary and credit system and to make recommendations." Much has happened since the Macmillan Committee faced a similar task in 1931.

BUSINESS NOTES

AFTER THE BUDGET

The Market Feels its Way

MARKETS ran up to budget day in cheerful mood. Industrials were advancing merrily and gilt-edged stocks holding their own. They received the budget with no wild enthusiasm but with a general feeling of satisfaction; prices were marked up further on Wednesday morning, but from that point they began to sag. Investors who had bought in anticipation were not prepared to buy more merely because their hopes had been in part fulfilled. On balance industrial shares stand well up on the week. *The Economist* indicator at 212.6 shows a rise of 5.7 on the week and is at its highest point since August 10, 1955. Gilt-edged meanwhile have lost a little ground; the *Financial Times* index of Government securities stood on Wednesday at 87.24, against 87.32 a week earlier.

This looks like faint praise for the budget from the investing public, some of whom may later have more money to put into the market as a result of it, but the movement is not illogical. The budget with its renewed emphasis on the machinery of credit control has done nothing to relieve the distaste for gilt-edged that powerful investors were feeling, and since big investors would not buy, a succession of small selling orders was sufficient to tip the market downwards. On selected industrials the budget does give a lead, and indeed the picking out of companies likely to benefit from the overseas trade corporation provisions made up most of the small rise in industrials on Wednesday. Overseas mines (but not South African registered gold mines), rubber shares and some of the oil shares were bought on Wednesday. Shipping shares were also active. In cinema shares the rise seemed already to have gone too far. The picking out process is likely to absorb a good deal of investors' thought until the Finance Act is on the statute book. And it is not simple. It is not, for example, sufficient to choose

a company registered in this country whose business is wholly overseas, or one with an important and profitable export trade that could easily be hived off. Two other requisites are that the level of tax in the country of operations should be markedly lower than in this country and that the margin between profits and distributions in the chosen company should be high enough to allow the bulk of the overseas earnings to be reinvested.

STERLING'S SMALL RALLY

STERLING has been palpably firmer this week against US dollars and most European currencies. Its advance anticipated the budget, the official rate on New York hardening on Tuesday to $2.78⅞ from around $2.78¾ at the end of last week. After the budget on Wednesday sterling was dealt in up to $2.79⅛. Transferable sterling has also been in demand and has risen this week to $2.7670. But security sterling has not responded nor has the premium on dollar securities in London. The security sterling rate has hardly moved from $2.60 while the premium on dollar securities has remained firm at around 8 per cent over $2.80. Forward markets have moved in sterling's favour: against US dollars the three months' rate is at ¾ per cent discount, a figure which exactly straddles the difference in interest rates between New York and London.

Foreign centres responded favourably to the budget though not to the extent of any big covering of bear accounts. Commercial houses in the United States are still exceptionally short of sterling and only cover their exchange requirements when they must. There has been evidence of such last minute purchases of sterling from New York this week. In spite of the good figures of British overseas trade, the whole of sterling's advance was not held. It drifted down on Thursday to $2.78⅛.

'EXPANSION IN EXPORTS'

A Record Month

THE President of the Board of Trade was seen able to offer some support for the Chancellor's forecast of "expansion in exports, some increase in consumption, and probably a slight increase in fixed investment as well." Speaking in the budget debate, Sir David Eccles said that export orders in the last few weeks had been "a good deal better" than forecast and very well spread among different classes of goods. He claimed that British prices had become competitive and delivery dates reasonable in almost all markets of the world. Exports in March were a record—"convincing proof of the underlying strength of our trading position." Details published by the Board of Trade show that exports were valued at £296.9 million fob, £18.7 million more than in February and £2 million higher than the previous peak in October. The March returns covered one more working day than February.

The average monthly value of exports in the first quarter was £278.7 million; allowing for the repayments of lease-lend silver to the United States, the increase over the first quarter of 1956 was seven per cent, which compares with an average increase in 1956 of 10 per cent over 1955. Repayments of silver bullion last month were worth £1.4 million. The final repayment, which brought the total to over £29 million, came too late to be included in the March trade returns.

Imports in March were also high, amounting to £361.7 million, nearly £41 million more than in February. The average monthly value for the first quarter was £352.9 million, 7½ per cent more than in the same quarter of last year. The real increase, however, is reckoned to be only about half as large as that, for the first quarter included cargoes delayed by the closing of the Suez canal. With re-exports £5½ million higher at £16.4 million the gross visible deficit in March was £48.5 million, £16.8 million above the exceptionally low deficit in February. In the five months from November to March—to allow for the distortions that followed the closing of the canal—the average monthly deficit was £47 million, which was £12½ million smaller than in the same months of 1955-56.

'SOME INCREASE IN CONSUMPTION'

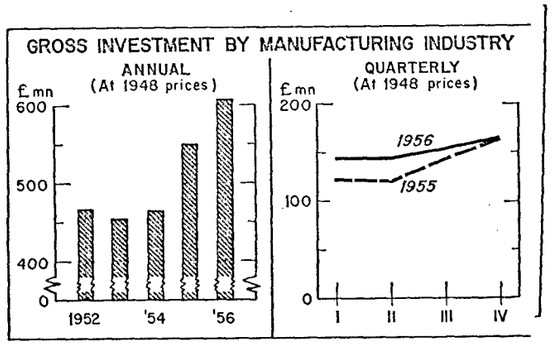
More Spending on Durables

SPENDING on personal consumption rose by about 5 per cent in value last year but the volume of goods and services bought was only half of one per cent more than in 1955. But towards the end of the year there were distinct signs of a recovery in the level of real consumption and this revival has run strongly in the early months of the present year. Since December retail sales have been averaging 7-9 per cent higher than twelve months ago which after allowing for price changes means an increase in volume of about 3-4 per cent.

This revival has been shared on the whole by all lines and by all types of shop, apart from greengrocers and ironmongers, with the multiples and department stores doing

rather better than the rest. Large increases appear nearly all the way down the long columns of the Board of Trade's reports on retail trade in January and February. Though these improvements partly reflect the low level of sales by some shops in the first two months of last year, retail trade returns for March and April are unlikely to show such large gains. Sales of household goods were particularly depressed at the beginning of 1956 so that 11 per cent increase in volume during December, January and February and the 22-23 per cent increase reported by the multiples in February overstate the real improvement. Nevertheless the volume of spending on household goods by the end of 1956 had already caught up with the level of November and December, 1955. Furniture sales were also well up; on February there was an improvement of 20 per cent in value on February, 1956, with the multiples showing gains of 34 per cent.

The revival in hire purchase sales of consumer durables in the last few months suggests that spenders have taken their second wind after the raising of initial deposits last year, but cash sales have also been growing. So far, too, clothing shops, which did very well when sales of household equipment dropped away last year, do not seem to have been affected by the present growth of spending on durable goods. With the present round of wage increases well under way, Mr Thorneycroft's prospect of "some increase in consumption this year seems certain to be realised.



'A SLIGHT INCREASE IN INVESTMENT'

Manufacturers Spend Less

TOTAL gross investment in Britain this year, according to the Chancellor's estimate on Tuesday, should show "a slight increase" on 1956, by which he presumably meant an increase somewhat smaller than the rise of £80 million, in real terms, achieved last year. The whole of this increase seems likely to come from the publicly owned basic industries. Capital spending by manufacturing industry, which has provided the main drive for the investment boom since 1954, will almost certainly be lower in real terms than in 1956.

The rate of growth in real manufacturing investment has been falling away for some time. In 1955 it rose by 18 per cent (when the volume of total gross investment grew by 6 per cent) and in 1956 it rose by 11 per cent (compared with a total increase of 3 per cent). Over the four quarters of last year the decline was quite sharp: during the first six months the volume of manufacturing investment was 18-19 per cent higher than in the same months of 1955, but in the third quarter it was only 8 per cent bigger, and in the last three months there was virtually no change at all. For the present year the Board of Trade survey of manufacturers' investment plans, which was conducted last autumn, suggest that total spending will be no more than in 1956—which probably means that the volume of capital expenditure will be somewhat less. Since this particular survey was started two years ago, early forecasts by industry have always been markedly higher than actual performance but this year, when the forecast is only of no change performance may be closer to prediction.

There is, however, quite a wide difference between the investment plans of different industries this year. The chemical industry, for example, still expects to spend nearly a quarter more than it did in 1956 and the metal manufacturers—mainly iron and steel—expect to invest about a seventh more. Almost all other groups of industries have prepared smaller capital programmes. There is a fairly consistent shift of emphasis in all industries from investment in new factories to investment in new plant and machinery. This does not appear, however, to signal any very marked increase in machinery supplies: whereas total spending on new building work is expected to be 7 per cent less than in 1956 (compared with increases of 26 per cent and 48 per cent in the two previous years), total expenditure on plant, equipment and vehicles is expected to grow by only 3 per cent (against increases of 15 per cent and 21 per cent in 1955 and 1956).

ROYAL DUTCH/SHELL

Expanding Despite Suez

"THE impact of the closing of the Suez Canal, confined as it was to a limited area, was insufficient to reduce in the last quarter the rate of increase in our trade which had been established over the preceding period of the year throughout which it was gathering momentum." Such is the comment of the directors of the Royal Dutch/Shell group on the year's results, which include a 12 per cent increase in net income and an 8 per cent increase in sales. The sales proceeds and other income of the group rose by £270 million to £2,321 million, the principal growth in demand being in heavy oils. Sales taxes, excise duties and similar levies absorbed £486 million (against £444 million) and the total of all other costs rose from £1,313 million to £1,511 million (including an increase of £26 million to £197 million in depreciation and depletion).

The net income of the group advanced from £160 million to £180 million, primarily as a result of increased sales of

Continued on page 16

Investment in Fuel

"INVESTMENT demand is still the main expansionary force at home, and after the private investment boom of the last two years public sector investment may well now make the running," said the Treasury's *Bulletin for Industry* confidently a week before the Budget. Mr Thorneycroft this week put the point more moderately; foreseeing "probably a slight increase in fixed investment" as well as in exports and consumption, he spoke of the "large plans" for atomic energy, coal, and transport. "We are right to do this," he averred. "Ask any industrialist! Few would say that in this sector we are guilty of being overbold."

This begs an inevitable question with superb arrogance. How much investment is going into the nationalised industries, and how does anyone decide how much happens to be right? Some of the facts, at least, were brought up to date this week by a White Paper from the Ministry of Power. This deals only with "Capital Investment in the Coal, Gas and Electricity Industries," but the figures for transport are fairly readily available. Besides giving the Ministry an opportunity to set the record straight upon just how much is being spent in the nuclear electricity programme, the White Paper does bring together all the investment plans of the publicly-owned power industries.

These are prodigious, by the standards of any privately-owned industry except oil. On electricity, the three nationalised authorities in Britain will be spending nearly £3,500 million during the coming decade; it would have been about £2,750 million even without the extra capital expenditure that is associated with nuclear generation. The Coal Board is investing nearly £100 million a year over the decade in its mines and ancillary plants. The gas industry—which has revised its estimates of expansion in business slightly downwards—is spending more than £400 million on fixed investment during the period. (The figures for gas in the bottom table differ sharply from those published in these columns on March 16th: partly because the industry now plans to finance much more investment from internal resources than it had then announced, but also because our estimates did much less than justice to its performance up to 1956.) Transport's fixed investment from 1956 to 1965 inclusive is likely to reach about £1,250 million.

This White Paper contains an appendix upon the most dramatic—and most expensive—of the nationalised investment programmes. Its table showing the details of the nuclear programme, and its comparisons with a programme in which the 6,000 megawatts of nuclear capacity that it is aimed to instal by 1965 would be replaced by conventional power stations burning coal or oil, is set out above. These figures are not new; but they offer greater detail than has been published before.

Distribution	1,000
Extra Working Capital	40
Total Investment	3,350
If all conventional	2,600

One specifically new point is made. The original nuclear programme was estimated to cost £300 million—some £230-£240 million of capital expenditure by the electricity authorities in England and Scotland, and £60-£70 million on ancillary plant and prototype development by the Atomic Energy Authority. This week's White Paper adds: "The Atomic Energy Authority do not expect that their capital expenditure in connection with the revised nuclear programme will be materially different from the estimates given in the (original) White Paper. Expenditure of prototype development is largely independent of the size of the current power programme, and . . . no more capital investment in ancillary plants is likely to be needed to provide these plants for a 6,000 MW programme than was thought necessary for a programme of 1,500-2,000 MW."

In the shorter run, the estimates that have gone through the rudimentary vetting of the Ministry and the Treasury for the coming year are published. The National Coal Board has received approval for £107 million of fixed capital expenditure this year, as against £96 million last year. The three electricity authorities together will be spending £274 million; last year their total was £245 million. The Gas Council is expecting to spend £59 million against £52 million. And the Transport Commission—not recorded in this White Paper—is expecting to spend £150 million this year, against about £123 million last. In all, these "public industries" expect to increase fixed investment by £80 million—as much as the whole of gross fixed investment in Britain increased last year.

Continued from page 168

oil and chemical products, higher prices for some products and "a material expansion" in crude oil production. How little the impact of Suez was upon this international group is revealed in the quarterly figures:—

	Sales, etc.		Net income		Net income/sales	
	1955 £ mill.	1956 £ mill.	1955 £ mill.	1956 £ mill.	1955 %	1956 %

April-June.....	509	560	36	43	7·2	7·7
July-Sept.	538	591	43	43	7·9	8·2
Sept.-Dec.....	530	635	47	43	8·9	7·6
Year's total	2,051	2,321	160	180	7·8	7·8

With sales and income buoyant, the Royal Dutch/Shell group was able to press ahead with its massive expansion and development programme and over 1956 the group spent £354 million (against £306 million) on capital and exploration accounts. Associated companies spent another £34 million, making a total of £388 million. Over half this sum was spent on the acquisition of new concessions, the search for new oil and the development of existing oil fields. Almost all the cost of this programme was met out of retained profits, but cash and securities held by the group fell by £24 million to £320 million. Thus the directors of "Shell" Transport and Trading had no difficulty in maintaining the ordinary dividend rate at 3s. 9d., free of tax, per £1 share, on the capital as increased about a year ago by a 25 per cent free scrip issue.

STEEL DEMAND

Motors Ordering Again

SOME people in the steel industry are privately inclined to regard the motor manufacturers' statement to the President of the Board of Trade, which he quoted so conveniently in the Budget debate, that by the autumn they would need more sheet steel than British mills would be able to provide, as a slight case of *folie de grandeur*. However, there is no doubt that a substantial upsurge in demand for sheet from the motor industry is occurring, though the revival has not yet spread to orders for steel from component makers. The marked response of home demand to the cutting of hire purchase deposits and the easing of restrictions upon the Commonwealth markets, plus growing confidence that petrol rationing will soon be off, are giving the car makers confidence in a much more resilient upswing of business during the rest of 1957 than they would have expected five or six weeks ago.

Their advance notice that they expect to become short of steel is a prudent safeguard for a very large customer to make when he has been gently out of the market for some while and knows it may not be quite so easy to move back instantly into his customary favoured place in it. When demand and production fell away at the beginning of last year, the motor makers continued to accept large deliveries of sheet steel: they built their stocks to a very high level before they cut further orders and began to use up these stocks. When they did cut their orders, home demand fell and was naturally concentrated upon the continuous strip mills; drum makers, for example, who use a very thin sheet and who had been taking hand mill qualities, specified qualities that only the strip mills can make. The steel industry did not want to close the hand mills; these therefore accepted a very large proportion of export orders, and are busy on them.

Naturally the strip mills may have some difficulty in giving the motor makers their customary high place in the queue for British sheet supplies for some months—and the car men are as naturally anxious not to have to buy abroad at high foreign prices while larger amounts of British sheet than usual are being exported. The adjustment for so big a customer, however, should not take too long—provided that the motor makers are able to sell all the cars that they appear to expect to be making in the fourth quarter of 1957.

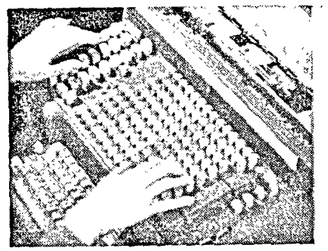
COPPER

Fixed Prices or Free?

ANGLO AMERICAN CORPORATION and Rhodesian Selection Trust, the two Rhodesian copper mining groups, have resumed talks in Salisbury on a common basis for pricing copper. At present Anglo American sells on the basis of the open market quotations of the London Metal Exchange, currently about £242 a ton for cash metal; Rhodesian Selection Trust sells to British consumers at a fixed price, now £240 a ton cif. The talks held last autumn were inconclusive, and the present discussions are not expected to end quickly. No hint has been given of the possible bases of pricing being examined, though Sir Ernest Oppenheimer, chairman of Anglo American, said recently at the formal opening of the new Bancroft mine that the sharp variations in copper prices could, he believed, largely be obviated by "an improved selling technique."

Does that mean that Anglo American is now less reluctant to introduce a fixed price—initially to put a "floor" under copper now that it is in surplus? The group is one of the few large producers that still uses the open market price. If it started to sell at a fixed price jointly with RST it would not be long before the Canadian and Chilean mines, who now sell in Europe on the basis of the London Metal Exchange's prices, followed suit. Nearly all the world's copper would then be marketed at prices fixed by the producers, and the tonnage that establishes the open market price would be even more marginal that it is today. Would it not be better if both groups first delivered more copper to the market, and thereby gave the exchange a fair chance to do its job?

LLOYD'S UNDERWRITERS



An Experiment in Equities

THE drift away from gilt-edged stocks by the big institutions is an established fact of Stock Exchange life. The insurance companies among others have been gradually increasing the percentage of other investments—equity stocks in particular—in their portfolios for a number of years. Now Lloyd's too has joined the movement, and is loosening up on the investments used in the £34 million of deposits made by underwriting members. In a letter dated March 28th underwriters of Lloyd's were informed that they might include up to 50 per cent of non-trustee stocks in the deposits (of a normal minimum of £10,000 per name) that they put up to support their underwriting liabilities.

Wherever there gathers  a wigging of Judges

there's a fitting of

Church's famous English shoes

Leathers, lasts and styles to fit the man and his occasion. Here is 'Buck', a superb brogue in ultra-smooth, cheroot-brown buckskin. Price 129/9. On the left is 'Lo-ped Leader', with slipper flexibility plus robust welted shoe construction. Price 5 guineas. Both have leather soles, for free-breathing comfort and coolness.

Fitted by authorised Agents throughout the country.

For nearest address write CHURCH & CO. LTD., DUKE STREET, NORTHAMPTON

This right to include 50 per cent of non-trustee stocks is circumscribed by four conditions:

(1) Each security is subject to the approval of the committee.

(2) Only the securities of companies registered in London and dealt in on the London Stock Exchange will be accepted.

(3) The market value of the non-trustee stocks, when the member decides to deposit them, must show a premium of at least 10 per cent over the sum that they represent in his deposit. So if he decides to take out £5,000 of gilt-edged from his £10,000 and put in non-trustee stocks instead, he would have to supply stocks of a market value of £5,500.

(4) No part of that 10 per cent margin may be absorbed in the calculation of either the distribution of profits which the syndicates make to their members, or the contribution that they make to Lloyd's Central Fund for Contingencies.

The volume of applications already received suggests that the new rule is likely to be popular. What is not yet clear is the type of security that the committee of Lloyd's is prepared to accept. A list of permitted investments may follow later. The assumption is that some high grade ordinary stocks will be acceptable and that members will use them as a hedge against inflation. That is important because the deposit though held by Lloyd's remains the member's property to the extent that he continues to enjoy the income from it and if he retires or dies the balance of the deposit, after his underwriting liabilities have been cleared, is returned to him or to his estate.

SOVIET ORDERS

A Tyre Factory for Russia

THE contract for a complete tyre factory secured last week in Moscow by a consortium of six British firms is the first of several orders for the complete equipping of Russian factories that are likely to materialise soon as the result of the "shopping list" Bulganin and Khrushchev brought with them on their visit to this country last April. Some small contracts have already been completed, but Moscow airport is now thick with the accents of British businessmen passing through for the final stages of negotiations for these larger deals. The first inquiries for the tyre factory came before April last year, when similar approaches were made by the Russians to firms in France, Germany, and in the United States (where the Battle Act gave the recipients some difficulties in responding). Talks at the time of the B and K visit were followed later last year by visits from other Russian ministerial and rubber industry representatives, and a five-man mission from the consortium flew to Moscow last month to complete the negotiations.

One firm in the consortium, Francis Shaw and Company of Manchester, equipped a Russian tyre factory in the thirties, but the present contract is vastly larger; when the plant is completed towards the end of 1959 it will be one of the largest tyre factories in Europe, and the biggest to have been constructed in one go. The precise value of this contract is not yet known, but one estimate has put it at well over £10 million, which will make it the largest single contract received in this country from the Soviet Union since the war. The Russians will be responsible for designing and building the factory, with the advice of the Dunlop Advisory Service which is acting as consulting engineers. Dunlop has undertaken to prepare an engineering survey and plans for the factory by September, but a preliminary report is to be produced in June so that the Russians can invite tenders for plant and equipment from the members of the consortium in good time.

GERMAN GOLD

Nearer D-Mark Convertibility

A FEW more steps towards complete convertibility have been taken by the Deutsche-Mark since the beginning of this month. From April 1st complete freedom has been restored in the domestic gold market in Germany. Any resident in Germany has been able to buy as much gold as he can afford and to pay for it in Deutsche-Marks over the counter of any bank. On April 5th all remaining vestiges of control on the prices of the precious metals—gold, silver, platinum and palladium—were removed. The only limitations that remain are that permits are still required for the export of these metals. The purchase of gold against US dollars is only permitted to industrial users and to bullion dealers. The general public buying gold against D-Marks has during the past week paid a premium of about 1½ per cent on the official price. It has also had to pay a turnover tax of 4 per cent. The gold on offer in Germany has been in the form of 1 kilo and 100 gramme bars. There has also been some traffic in gold coins which command a small premium over the value of the gold content because they are attractive to small hoarders. The premium varies according to the denomination of the coin. The old Latin Union coins are at the bottom of the list with a 10 per cent premium, and the sovereign is flatteringly at the top commanding a premium of over 20 per cent.

BALANCE OF PAYMENTS

Oil in the Dark

WHAT contribution does the British oil industry make to the balance of payments? No amount of searching through the White Paper or any other published document will provide an answer to this question—or even offer a plus or minus sign. The total cost of the oil imported into Britain is recorded: so are the export earnings of oil refineries in the United Kingdom. But not since 1950 has there been any official estimate of the net dollar cost of Britain's oil imports. Nor is it possible to find out from the White Paper how much the British-controlled tanker fleet earns in carrying oil for foreign consumers, how much of this is offset by British payments for the services of foreign tankers, or what proportion of the net earnings (or payments) is in dollars. Equally little is to be gleaned about the net earnings and currencies derived from British oil companies' operations overseas. Both the net tanker earnings and the net overseas earnings of oil companies are hidden in the statisticians' favourite but meaningless catch-all, the "other (net)," which also includes among other things, overseas earnings from insurance, banking, films, civil aviation, royalties, commissions, overseas profits of British merchants, and sales of gold at home for industrial use. Overseas investment by British oil companies is concealed under a similar heading in the account of capital transactions.

The Treasury, one must suppose, does have much closer

estimates than this, if not at its fingertips at least in its files. But how far they are taken into account in the formulation of government policy on energy supplies or overseas investment is quite unknown. Any discussion in Parliament, or in the press, or by anyone else outside the Government, of the probable foreign exchange cost of the energy to be provided by oil, as opposed to coal and nuclear power, over the next decade, has to be carried on in complete ignorance of the elementary data needed to form a sound judgment.

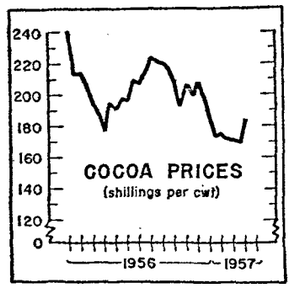
Why, then, should the figures not be published? Apparently they are treated as confidential because they have been provided to the Government by the oil companies in confidence, and some of the companies feel that their publication would embarrass them in their dealings with the Middle Eastern governments, or reveal commercial secrets. But as each royalty agreement renegotiated gives the Middle Eastern governments a closer insight into the profits and other internal operations of the oil companies, the case for secrecy is becoming weaker every year.

DRUG PRICES

The End of a Long Dispute

An eight-year-old argument about drug prices between manufacturers and the Ministry of Health has at last been settled by a formula that apparently satisfies both sides. The Ministry gets an agreement on some form of price control over drugs supplied to the National Health Service; the industry gets an undertaking that price control shall be waived until any drug has been available for at least three years. Both sides have succeeded in making their point. The Ministry's concern over the price of drugs was first aroused in 1950, when it was suggested that the price of branded drugs was higher than that of an unbranded preparation of the same compound. Might it not save the Health Service money if doctors prescribed non-branded drugs? The industry retorted with some justice that the two were not identical.

The Ministry, however, stuck to its guns, only to run into a fresh difficulty. New drugs are almost invariably first put on the market under the maker's brand name, and there is no standard equivalent against which their price can be compared. Because the industry's development costs are heavy, and particularly because years of expensive research can end in disappointment, on the relatively few occasions when a manufacturer develops a new drug of some importance, that drug is expected to earn a profit big enough to carry the costs of less successful investigations. The swans pay for the upkeep of the lame ducks.



This kind of accounting cuts across formulae laid down for the costing of Government contracts. The pricing formula now accepted is that the NHS shall not pay more for branded drugs than their current export prices, competition in the export markets being sharp enough to ensure that these prices are reasonably low. But by delaying the onset of this form of price control for three years after the introduction of a new drug, the Ministry leaves the manufacturer free to recoup development costs during the period when he faces least competition. At the start, 4,000 separate proprietary drugs, on which the NHS is spending £23½ million yearly, will be affected. A saving of £750,000 a year to the Ministry has been suggested, for no one pretends that there have not been some cases of really high profits. The size of the ultimate saving will prove how well or how weakly founded the industry's arguments have been.

COCOA

Outlook Improving

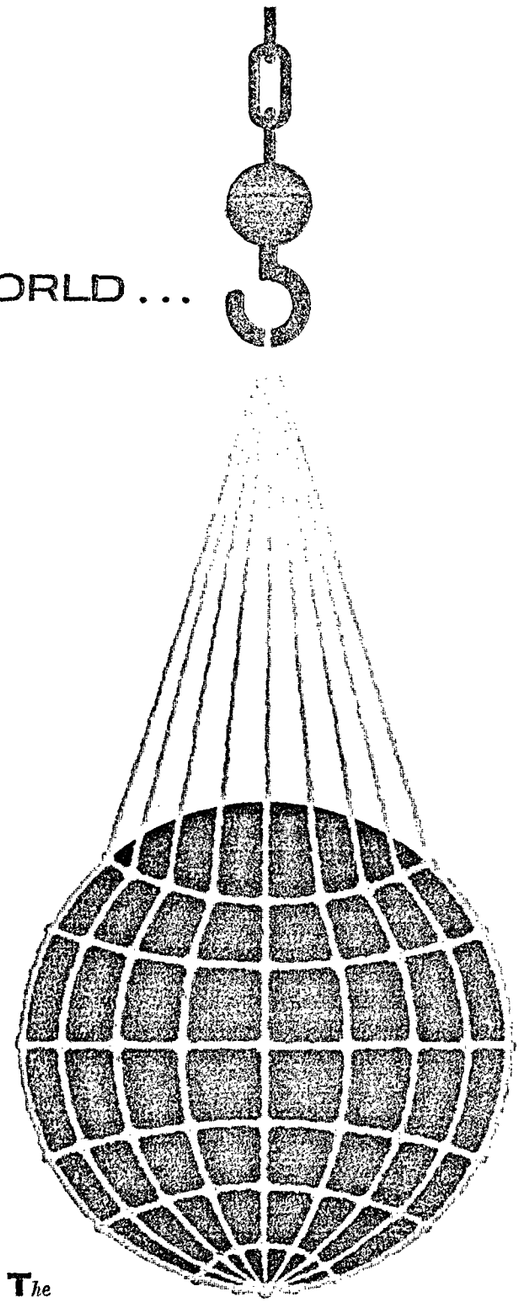
Are cocoa prices on the mend? In the past month Ghana cocoa for May-July shipment has risen by over 20s. to 197s. a cwt cif and the premium for the distant delivery months in the futures market has narrowed. Consumers, particularly in European countries, have been buying steadily and the unsold balance from this season's crops in Ghana and Nigeria is probably no more than about 55,000 tons. Brazilian shippers have not been keen sellers, but if the new crop is as large as reports indicate they will presumably have to sell more freely in time.

World production in 1956-57 is now estimated by Gill and Duffus at the record figure of 929,000 tons, about 90,000 tons higher than in 1955-56. World consumption appears to be responding to lower prices more rapidly than was realised, and Russia has already bought twice as much cocoa as it bought in the whole of 1956. Consumption in 1957 is now forecast by the same firm at about 858,000 tons, an increase of over 60,000 tons on 1956. By the end of the year consumption might be running at a rate of nearly 900,000 tons a year, and it would be remarkable if crop conditions were as favourable next season as this. An apparent surplus of 70,000 tons this year might have little influence on prices if traders were fairly confident about the more distant outlook; as one dealer put it this week: "sentiment itself can be worth 50,000 tons of cocoa." A modest recovery in prices would not harm consumers and might well nip in the bud any ideas that Ghana and Brazil, the two largest producers, might have about price stabilisation.

NATIONAL SAVINGS

A Much Better Year

"National Savings" enjoyed a much better year. Lord Mackintosh of Halifax, the chairman of the National Savings Committee, has claimed the financial year just ended as the best since 1947-48 and though there is room for a small argument about that, there is no doubt that national savings greatly improved. It would have been a poor epitaph on Mr Macmillan's savings budget had they not done so. The attractive new savings certificates, and defence bonds, the exemption from income tax (but not surtax) of the first £15 of interest on deposits in the Post Office and the ordinary departments of the trustee savings banks, and the introduction of the premium bonds all played a part. The difficulty is to assess that part.



The channels of saving over which the National Savings Committee spreads its wings are only a fraction of total savings and the net sum that flows into or out of those

TIME, The Weekly Newsmagazine, Time & Life Building, New Bond St., London W.1

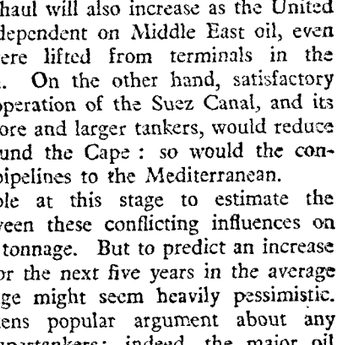
channels is not necessarily all new saving or dis-saving. About £65 million for example has gone into premium bonds since they came on sale in November, most of it in the first month. It is impossible not to suspect that a substantial part of that was a transfer from Stock Exchange securities or from the building societies. The same probability lies behind part of the excellent response to the new savings certificates and perhaps also behind the savings bank deposits and the defence bonds.

There is room for argument about the figures themselves. It is the practice of the National Savings Committee in its weekly return to exclude the defence bonds paid off on maturity since these repayments represent a fulfilment of a contractual obligation undertaken by the Government when the bonds were sold. It is on that basis that Lord Mackintosh claims the last year as the best since 1947-48. The repayments nevertheless represent a subtraction from the national savings total, and may have put investors in funds to apply for other items among the National Savings Committee's wares. The chart has been drawn allowing for defence bond maturities. Moreover it has been drawn adding in the estimated interest accumulated on savings certificates to the new savings total and adding the interest paid out on encashed certificates to the withdrawals total. Alternative methods of presenting the interest item on savings certificates would produce savings figures for the year that differed from the figure of £116.2 million in 1956-57 (against a net dis-saving of £7.3 million in 1955-56) shown in the chart.

TANKER PROSPECTS

From Famine to Feast?

By 1959, and to an increasing extent in 1960 and 1961, there could easily be a substantial surplus of oil tankers, and a corresponding fall in tanker freight rates. This view, which has been held privately for some time by several tanker experts, was aired publicly last week by Mr A. S. C. Hulton, managing director of Shell Tankers, Ltd. Some 45 million tons of tankers are now afloat, and another 30 million tons are on order for delivery between now and 1961. Even if the world consumption of oil rises by 10 per cent a year over the next five years, which is hardly a pessimistic assumption, the supply of tankers would be increasing about 5 per cent a year faster than the demand for oil. Tanker capacity would be fully utilised only if the average length of sea voyage of each ton of oil consumed were to rise by about 5 per cent a year.



What are the chances that this will happen? The average length of voyage will be sharply increased if tankers still have to be routed round the Cape, either because supply routes through the Suez Canal or the pipelines to the Mediterranean are interrupted again, or because their capacity should in any case prove inadequate to move the increasing volume of Middle East oil needed by Europe and America. The average length of haul will also increase as the United States becomes more dependent on Middle East oil, even if all its supplies were lifted from terminals in the Eastern Mediterranean. On the other hand, satisfactory arrangements for the operation of the Suez Canal, and its development to take more and larger tankers, would reduce the tonnage sailing round the Cape: so would the construction of any new pipelines to the Mediterranean.

It is hardly possible at this stage to estimate the probable balance between these conflicting influences on the demand for tanker tonnage. But to predict an increase of 5 per cent a year for the next five years in the average length of tanker voyage might seem heavily pessimistic. This somewhat weakens popular argument about any "reserve fleet" of supertankers: indeed, the major oil companies and independent tanker operators might both have to reappraise plans to order yet another 8 million tons of tankers for delivery between 1961 and 1965. But Norwegian tanker owners, as Mr Hulton remarked, decorate their mantelpieces not with "Home Sweet Home" but with the motto "Thank God the Big Oil Companies are Always Wrong."

SHIPPING

Freight Rates and Suez

The British, American, French and Dutch governments have asked their shipowners not to make use of the Suez Canal until a satisfactory agreement has been reached with Nasser, and so far shipowners and charterers of these nationalities have observed this injunction, despite the extra cost and loss of freight involved in the continuing to sail round the Cape. The majority view at last week's meeting of the International Chamber of Shipping (which represents the bulk of the tonnage normally passing through the Canal) was that the immediate use of the Canal is of less importance than the nature and effectiveness of the guarantees concerning its use, and the undertakings of the Canal administration concerning its technical upkeep and development. There is always the minority, however: a Japanese and an Italian liner company have both announced their intention of routeing ships through the Canal on Nasser's terms. By so doing they reap an immediate advantage over their competitors, and shippers and charterers may well be tempted to do the same.

The current rate for the shipment of ore from India to Italy, for example, is $14.40 per ton via Suez, and $20 per ton via the Cape. As things stand, British, American, French and Dutch registered ships would be unable to accept the Suez option, but ships under flags of convenience, such as Liberia and Panama, have no such obligations. If tonnage was in greater supply than it is and employment was more difficult to find, there is no doubt that they would make the best of this advantage. As it is, although freight rates are back to a more normal pre-Suez level, there appears to be no excess of tonnage on the market. Charterers are meeting definite resistance in their efforts to cut rates, and so far have not succeeded in tempting owners to accept less than 64s. to 65s. per ton for coal from Hampton Roads to the Continent, although 55s. has been accepted for consecutive voyages involving nearly 350,000 tons starting January, 1958.

SHORTER NOTES

It seems likely that petrol rationing will be ended within a few days. The removal of 1d. of the remaining 3d. a gallon "Suez surcharge" on petrol prices reflects the recent improvement in the oil companies' transport, refining and inland distribution costs. Including the reduction in the tax, petrol prices have now fallen by 1s. 1d. a gallon and a further reduction both in the surcharge and in dealers' margins cannot be long delayed.

* * *

The operating surplus of London and Overseas Freighters for the full year to March 31st was £3,475,000, against £1,962,000 in 1955-56.

Thomas Tilling, the industrial holding company, has raised its ordinary dividend from 10 to 11¼ per cent, following on an increase in the consolidated profit in 1956 from £2,316,817 to £2,487,065. The directors also forecast an interim dividend of 6¼ per cent, against 5 per cent.

* * *

In the table which appeared in the note of "Finance Houses for Consumer Credit" (on page 1110 of the issue of March 30th), deposits with United Dominions Trust were shown at £2,611,000. This figure refers to current accounts and accrued expenses and the value of deposits, which is not stated separately in the company's latest balance sheet, is included in the figure of £47,329,000 shown against loans and acceptances.

* * *

On its £9 million of ordinary capital, C. A. Parsons is to pay a final dividend of 3¾ per cent; an interim of 4⅜ per cent was paid on a capital of £3,600,000 before it was increased by a 50 per cent free scrip issue and a one for one rights issue. In 1956 the company's net profits rose from £1,962,613 to £2,293,364.

* * *

Trade talks between New Zealand and Britain opened in London this week.

COMPANY AFFAIRS

RIO TINTO

Canada and uranium are two of the words which loom large in any stock exchange bull's vocabulary. They help to explain why the price of Rio Tinto's 10s. ordinary shares is as high as 96s. 3d., giving a yield of only 2¾ per cent. The price and yield look ahead into the 1960's when the uranium produced in the Algom mines in Canada and in the Mary Kathleen mines in Australia will be sold on fixed-price contracts and will swell Rio Tinto's earnings.

Until that time, the primary sources of Rio Tinto's income are dividends from its investments in the Rhodesian copper producers and, secondarily, from its remaining one-third interest in the Spanish assets it formerly controlled. Earnings and dividends from Rhodesian copper have probably not yet reached their peak and it will be hard luck if Rio Tinto's varied interests in that area do not produce some more winners, but the late 1950's may be a period of waiting.

That investors must be prepared to wait is underlined by Rio Tinto's preliminary report for the year to December 31. This shows that gross income rose by 35 per cent (from £2,513,000 to £3,387,000) and net income, following an increase in tax from £1,389,000 to £1,917,000, by 31 per cent (from £1,124,000 to £1,470,000). Yet the directors have been content merely to keep to their promise when the £1,700,000 rights issue of ordinary shares (at 50s. a share) was made to maintain the ordinary dividend rate at 15 per cent, tax free, on the increased capital. This dividend absorbs £765,000. The reason for this decision is not hard to trace. Much, if not all, of the increase in gross income came from the bigger dividends paid by the Rhodesian copper producers. Since then the price of copper has fallen and the chairmen of these companies have pointed to the likelihood of smaller copper dividends in the current year. This year Rio Tinto's income, by the same token, may fall too. Given this prospect, a dividend rate which should not be difficult to maintain until new ventures produce their bloom has much to commend it.

GLAXO LABORATORIES

Pharmaceutical manufacturers have to spend heavily on research and hence the cover on their ordinary dividends has a strong look because a big slice of profits always has to be ploughed back. They earn much of their profit from the drugs used to treat the commonest kind of ailments or protect large numbers from the rarer diseases; in either case bulk turnover is the key to success. It is important for these manufacturers to be among the first in any new market of this kind. At the moment Glaxo Laboratories is the only producer of the polio vaccine in this country. Hence it has been in favour with investors since the turn of the year. The company has now issued an interim report for the six months to December 31st.

This report was thought in Throgmorton Street not merely to justify the earlier confidence in Glaxo's 10s. ordinary shares, but also to give grounds for fresh hope. The immediate reaction was a rise of 3s. 3d. to 35s. 6d. in their price. The report itself showed that, excluding the South American subsidiaries, turnover was 21 per cent higher than in the last six months of 1955. Gross trading profits were up by about 22 per cent, from £1,313,000 to £1,601,000, showing that margins had been more than maintained. Taxes rose accordingly from £659,000 to £860,000, leaving the net profit attributable to the parent company £75,000 higher at £790,000. The last six months of 1955 was a disappointing period in which profits remained static, so that the latest increase can be regarded as a continuance of the improvement of the first half of 1956.

Since 1947, when the company was made public, the ordinary dividend record has been progressive, though big profit retentions have prevented it from

being spectacularly so. A one-for-two free scrip issue took effect in January and now an interim dividend of 5 per cent has been declared on the increased capital (against the equivalent of 4.17 per cent). The directors have made similar scrip issues and increases of interim payments in the past. These have been followed by bigger final payments. The chance is that history will repeat itself.

RICHARDSONS, WESTGARTH

ATOMIC Power Constructions, a consortium of Richardsons Westgarth, International Combustion and Crompton Parkinson, did not receive one of the first batch of nuclear power contracts, though it seems certain it will secure a future contract. Against this prospect, one member of the consortium, Richardsons Westgarth, is limbering up.

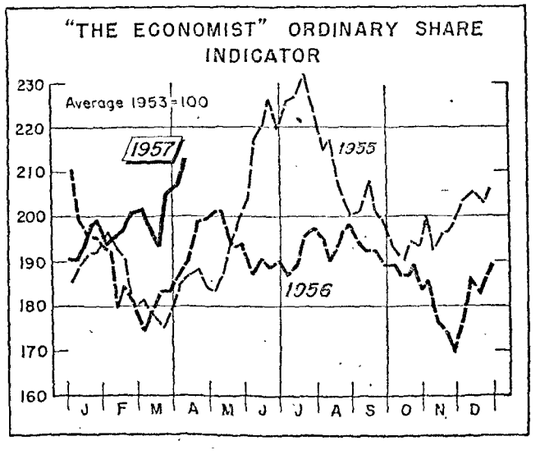
This company has now made its formal offer of eleven of its own 5s. ordinary stock units for every two £1 ordinary shares of Parsons Marine Turbine. The first aim of the proposed merger is to increase the turbine output of Richardsons Westgarth in anticipation of a nuclear power contract. Parsons Marine Turbine has an issued capital of £396,150 and the Richardsons Westgarth offer is effectively conditional upon a 75 per cent acceptance. The offer, recommended by the Parsons Marine Turbine board, should be accepted. Just before it was first foreshadowed, the Parsons units stood at about 65s. They now stand at 100s. The 5s. units of Richardsons Westgarth stand at 18s. 10½d., making the exchange worth 103s. 9d. per Parsons unit. The holders of the Parsons units will receive a dividend of 12 per cent, but they will not be entitled to the Richardsons Westgarth dividend for the year to March 31st last.

This dividend will again be 16⅔ per cent, so that Richardsons Westgarth shares yield 4.4 per cent. This yield looks forward and the Richardsons Westgarth directors now claim a record order book promising employment for several years ahead. The group will have to spend heavily on improving and enlarging its works and plant; but some of this finance is already provided and the directors do not foresee difficulty in raising the remainder.

HUDSON'S BAY

FOR the first time since the Hudson's Bay Oil and Gas Company (in which the Hudson's Bay Company has a 25 per cent interest) was reactivated in 1947, it has earned a net profit. The operating profit of $2,397,000, together with a profit of $2,245,000 arising from the sale of a minor interest in certain natural gas acreage, has been credited to the deficit account, reducing it to $7,148,203. This deficit represents expenditure on exploration, which has added substantially to the company's oil and natural gas reserves. The profit resulted from an active development programme in 1956 which increased net producing acreage by 38 per cent and the number of producing wells by 44 per cent; average daily oil production increased by 60 per cent to 20,992 barrels.

The further development of these oil interests in Western Canada is the most significant point for the bulls of the Hudson's Bay stock. But they should not fail to note that in Canada's booming economy, the company's established trade in the retail, wholesale and fur trades had a most successful year. Total sales in these departments rose from £62 million to over £69 million and trading profits from £3,641,000 to £4,024,000. Such progress, however, was achieved only by spending heavily on capital account. The need for such expenditure can be advanced as a reason why the company's dividend policy is not over-generous. The dividend from trading was left unchanged at 15 per cent and the tax-free dividend from the land account at 2½ per cent. But the meagre yield of 1.9 per cent at the current price of 20s. 6d. xd. on the £1 stock units is pinned to the prospect for oil and not to a hope that the policy on dividends from trading will be altered radically.



London Stock Exchange

FIRST DEALINGS:	Mar. 27	Apr. 10	May 1
LAST DEALINGS:	Apr. 9	Apr. 30	May 14
ACCOUNT DAY:	Apr. 16	May 7	May 21

BEFORE the budget on Tuesday gilt-edged securities were somewhat neglected, while industrial stocks attracted speculative support. With the exception of a small rise last Friday, Government stocks weakened, the *Financial Times* index recording a slight fall on balance to 87.24. On Monday activity in industrials increased and prices of selected stocks went ahead sharply. Business remained at a high level on Tuesday and most prices were maintained. The new account opened on Wednesday and interest centred on likely beneficiaries of the Chancellor's proposed relief for overseas trading corporations. Industrials with overseas activities and especially mines, rubbers, teas and oils rose steeply. The changes in entertainments tax brought gains to greyhound tracks and theatres, while cinema shares fell back. Some domestic suppliers gained ground on purchase tax reductions, but motors declined. Shipping shares rose on the increased investment allowance. *The Economist* indicator jumped 5.7 to 212.6, the highest point reached since 1955.

Chinese bonds improved in anticipation of increased trade with that region. Canadian gas and oil shares were prominent and International Nickel advanced. The revival of interest in the project caused a speculative flurry in the shares of Channel Tunnel. The Pressed Steel convertible debenture came on to the market at 5 premium on Friday and improved to 9¾ premium. The new Tube Investments loan stock started at ¾ discount on Monday and remained around that level.

Leading oil shares were little changed, but Trinidad stocks were especially active. Kaffirs were weak. Tanganyika Concessions gained 7s. 9d. to 16s. 3d. xd., after the doubled interim dividend.

(1) Relates to wholesale prices in Athens and Piraeus only for Greece. Figures for Ireland from *1955 onwards are for home produced goods only*. Figures for Germany, F.R. are producer's prices of industrial products. (2) July-December. (3) Relates to prices in capital cities only for Austria, France, Greece and Turkey. Austria and Belgium *exclude rent*. Denmark includes direct taxes. Figures for Ireland are based on August, 1953=100. (4) Including direct taxes. (5) Including trade with Faeroe Islands. (6) Index numbers of unit value which compare the current average value of trade with its value in 1953; they are influenced by changes in the composition of trade as well as price movements. (7) Deposit money and notes and coins held by business, individuals and foreigners. Except for Greece holdings of the issuing authority and other banks are excluded. (8) Holdings of the government and *central* bank at end of period. Figures for Greece are gold reserves only. Foreign exchange figures for Norway exclude *government holdings*; Netherlands, Norway and Sweden include foreign investments. Ireland includes *some long-term securities*. (9) Beginning May, 1954, a new drachma equal to 1,000 old drachmas was introduced. (10) *Average for third quarter.*

Financial Statistics

EXCHEQUER RETURNS

For the six days ended April 6th, 1957, there was an "above-line" surplus (after allowing for Sinking Funds) of £17,999,000 compared with a deficit of £54,204,000 *in the previous eight days* and a surplus of £3,125,000 in the corresponding period of last year. There was a net expenditure "below-line" last week of £8,493,000, leaving a total surplus of £9,506,000 compared with £3,086,000 in 1956-57.

THE MONEY MARKET

THE upturn in the Treasury bill rate that began in the second week of March was resumed at the tender on Friday of last week, when the discount market reduced its common bid by 4d. to £98 19s. 2d. per cent. Last week's reduction appears to have gone further than bids by some outside applicants—the average rate of discount rose by notably less than the market's ⅛ per cent—and as the unchanged offer of £250 million was under-allotted by £10 million, and applications rose by £19 million, to £410.6 million, the allotment at the market bid fell from 50 to 32 per cent. At yesterday's tender the offer was cut to £230 million.

Credit has been short in Lombard Street through the past week. The Bank gave special help to the market on each of the four working days from Thursday before the week-end (when it reached large proportions) to Monday. Market supplies of funds were adequate for demands on Tuesday, but on the following day some houses were again short, partly on account of repayments of seven-day penal loans, and two or three sought new, but very small, loans from the Bank.

The Bank return shows a further seasonal rise in the active note circulation of £11.6 million in the week to Wednesday. The fiduciary issue has therefore been raised by £50 million to £1,975 million. In the seven weeks since the seasonal low point, the outflow of notes from the Bank has reached £67.7 million.

What does
THE LONDON CORRESPONDENT
say today?

Pigeon Pose. Unlike the tourists, here today and gone tomorrow, the pigeons, who obligingly pose for photographs with them, have a permanent home in Trafalgar Square. A very nice home, too, with every mod. con., running water in all the basins, and—in the summer season—dozens of square meals a day.

Even in the early spring, though the square may be almost deserted, the pigeons are still around—the photographers see to that. For to ensure that there are pigeons (and therefore tourists, and therefore profits) in the square next summer, the photographers keep the birds well-fed throughout the winter. Sensible fellows. They know which side their breadcrumbs are buttered.

A bird in the hand. It's the same principle, really, as a London Assurance Endowment Policy. You pay the premiums now so that you *can enjoy* the benefits later. It may be a little later, with an Education Policy which will pay off when your children's school bills are heaviest; or a good deal later, with a policy designed to provide for a comfortably-off retirement.

If there is any help we can give you, either with Fire, Accident or Life policies of any kind, please get in touch with us by telephone or letter. (Not necessarily, of course, by pigeon post.)

"... laid up for a year—but at least I didn't have to worry too much about money..."

Recently I was laid up for a year. As a professional man in practice on my own, that might have been very serious for me—the National Assistance benefit just isn't enough for me *and* my family. Luckily, however, I'd taken out a Sickness and Accident Policy with the Prudential. All the time I was ill, I had an extra £10.10.0 a week coming in—and that's the sort of security all men in my position ought to have.

		690,207
Balance unappropriated at 31st December, 1955		632,988
		1,323,195
Dividends Nos. 1 and 2 of 6d. and 7d. per share respectively		521,354
Leaving a balance unappropriated of		£851,841

Tonnage milled increased from 1,238,000 tons to 1,312,000 tons and the average yield from 5.34 dwt. to 5.81 dwt. Of the 16,670 ft. sampled on the Basal Reef during the year, 55% was payable, averaging 387 inch/dwt. The ore reserve was re-estimated at the year-end and showed an increase of 250,000 tons at 3,250,000 tons, assaying 6.1 dwt. over an estimated stoping width of 56 inches. At the year-end No. 2 Shaft had been sunk to a depth of 3,775 ft., of which 3,626 ft. had been equipped. The extensions to the reduction plant were completed during the year and are operating satisfactorily.

In the case of each of the above Companies, *discounts have been applied to development values* to conform with adjustments necessary in estimating ore reserves.

UNION CORPORATION, LIMITED—*continued*

THE GROOTVLEI PROPRIETARY MINES, LIMITED

(Incorporated in the Union of South Africa)

Extracted from the Annual Report for the year ended 31st December, 1956

		Per ton milled s. d.
Working Revenue	£6,350,702	54 2
Working Costs	3,570,165	30 5
Working Profit	2,780,537	23 9
Add: Income from Investments and Sundry Revenue	75,731	£2,856,268
Less: Provision for Government Taxes	1,439,065	
Directors' Fees and Sundry Expenditure	37,046	
Pneumoconiosis Outstanding Liability	5,443	1,451,554
		1,404,714
Balance unappropriated at 31st December, 1955		660,236
		2,064,950
Dividends Nos. 35 and 36 of 1s. 1d. and 1s. 4d. per 5s. unit of stock respectively		1,382,190
Leaving a balance unappropriated of		£682,760

Tonnage milled increased from 2,322,000 tons to 2,344,000 tons but the average yield decreased from 4.34 dwt. to 4.31 dwt. Of the 14,020 ft. sampled on the Main Reef during the year 50% was payable, averaging 231 inch/dwt. In addition 4,572 ft. were driven on the Kimberley Reef horizon, 3,192 ft. of which were driven by Daggafontein Mines on this Company's behalf. 440 ft. or 22% of the footage sampled, proved payable, averaging 160 inch/dwt. The ore reserve was re-estimated at the year-end and showed a decrease of 500,000 tons at 15,000,000 tons, assaying 4.5 dwt. over an estimated stoping width of 47 inches.

VAN DYK CONSOLIDATED MINES, LIMITED

(Incorporated in the Union of South Africa)

Extracted from the Annual Report for the year ended 31st December, 1956

		Per ton milled s. d.
Working Revenue	£1,944,790	40 10
Working Costs	1,914,538	40 2
Working Profit	30,252	8
Add: Income from Investments and Sundry Revenue	42,681	
Transfer of appropriation for expenditure on Fixed Assets	38,589	£111,522
Less: Pneumoconiosis Outstanding Liability	6,342	
Directors' Fees and Sundry Expenditure	15,548	21,890
		89,632
Balance unappropriated at 31st December, 1955		213,964
Leaving a balance unappropriated of		£303,596

Tonnage milled decreased from 962,000 tons to 953,000 tons and the average yield decreased from 3.28 dwt. to 3.24 dwt. Of the 14,355 ft. sampled during the year, 23% was payable, averaging 275 inch/dwt. The ore reserve was re-estimated at the year-end and found to have decreased by 200,000 tons to 600,000 tons, assaying 3.9 dwt. over an estimated stoping width of 48 inches. No dividends were declared during the year.

WINKELHAAK MINES, LIMITED

(Incorporated in the Union of South Africa)

Extracted from the first Annual Report for the period from the inception of the Company to 31st December, 1956

CAPITAL: Of the authorised and issued capital of 12,000,020 shares of 10s. each, 3,000,000 were fully paid and 9,000,000 were 4s. paid at the end of the year.

SHAFT SINKING: At the end of the year Nos. 1 and 3 shafts had been sunk 1,210 ft. and 1,472 ft. respectively and Nos. 1A and 3A winzes were sunk to their final depths of 899 ft. and 874 ft. respectively.

DEVELOPMENT: Development started from Nos. 1A and 3A winzes in August and by the end of the year 3,765 ft. had been driven, of which 1,075 ft. from No. 3A winze were sampled. Of this sampled footage 44% proved payable, giving an average value of 484 inch/dwt.

REDUCTION PLANT: Since the close of the year preliminary work has been started on the foundations of the reduction plant, which is planned to have an initial capacity of 60,000 tons per month.

GENERAL: The temporary general offices, engineers office, a number of permanent mine buildings and parts of the native compound were constructed during the period. The compressor station and the main electrical sub-station have been completed and an emergency power supply has been installed. A water conservation dam to supply water to the mine and to Evander Township has been constructed.

EVANDER TOWNSHIP: In the residential area 194 houses and the first portion of the single men's residence have been completed.

EXPENDITURE: Expenditure by the Company to 31st December, 1956, on shafts, plant and equipment, mine development and general expenditure was £1,693,202. Investment in and loans to Evander Township Ltd. amounted to £779,517.

In the case of each of the above Companies, discounts have been applied to development values to conform with adjustments necessary in estimating ore reserves.

ANGLO-SWISS SCREW COMPANY LIMITED

Precision Turned Parts

SATISFACTORY RESULTS IN DIFFICULT CONDITIONS

The thirty-eighth Annual General Meeting of Anglo-Swiss Screw Company Limited was held at West Drayton on April 5th, Mr O. Frey presiding.

The following is an extract from the Chairman's statement:

It gives me much pleasure to welcome Shareholders to this, the first Annual General Meeting of the Company held since its conversion into a Public Company, and I offer a particular welcome to employee-shareholders. I was especially gratified to find that over 10 per cent of our employees took up shares when they came on the market last May.

The year 1956 was far from normal. Many of the industries we serve were severely hit by the credit squeeze, hire-purchase restrictions and purchase tax increases. Brass, our principal raw material, fell 30 per cent in price inside four months, with many subsequent fluctuations. Brass Swarf, which is one of our main sources of revenue, fell and fluctuated in price correspondingly. Finally came the Suez crisis.

Nevertheless, the 1956 net profit of £121,858, after making provision for all charges other than taxation, comfortably exceeds the ten-year average of £108,000 mentioned in our Stock Exchange advertisement last May. I feel that in all the circumstances the 1956 results are satisfactory.

Your directors recommend a final dividend of 4½d. a share, less tax, making with the interim dividend already paid a total of 7½d. a share, less tax, on the issued 5s. ordinary shares. This is the minimum rate for 1956 forecast last May.

Although nearly the whole of the plant and equipment now in use, costing about £340,000, has been installed since 1945 (£185,000 has already been written off in depreciation), your Directors estimate that present replacement cost is about £150,000 more.

It is accordingly recommended that, as well as adding £30,000 out of the 1956 taxed profits to the Capital Reserve for Development and Re-equipment, there should be transferred to the latter from the General Revenue Reserve a further £90,000, making Capital Reserve £150,000 in all. General Revenue Reserve becomes £85,000. Contingencies Reserve remains at £25,000 and unappropriated profits increase by £6,000 to £34,000. Total net assets are £600,000 compared with £594,000 at the end of 1955.

During the year we have considerably added to our facilities for high precision production and measurement. Net Capital Expenditure was £47,000 and capital commitments at the end of the year were about £36,000.

It is indeed no exaggeration to say that we have one of the most modern and best equipped screw machine plants in the world, a plant which is capable of very high productivity, second to none of its kind.

I have to report that the negotiations with British Engraving and Nameplate Manufacturing Company (London) Limited were completed by the end of the year. We are confident that in course of time there will be a good return on our investment to which will be added the advantage of mutual trading benefits.

At the moment it is too early for me to make any forecast for 1957, especially in view of political and economic uncertainties, but I feel the outturn of the year should not be unsatisfactory.

In conclusion, and very sincerely, I wish to thank all our employees who have given us their full and loyal support in 1956.

The Report and Accounts were adopted.

BRITANNIC ASSURANCE COMPANY LIMITED

POLICYHOLDERS' FUNDS NOW OVER £100 MILLION

BONUSES TO POLICYHOLDERS AGAIN INCREASED

At the Ninety-First Annual General Meeting held in Birmingham on April 5, 1957, Mr Frederick A. Powell, FCA, Chairman, said:

Ladies and Gentlemen. We are all very conscious today of the great loss the company sustained last November by the death of our esteemed Chairman, Mr J. A. Jefferson. His death ended an outstanding career of over 50 years with the company, including 40 years as a director and chief executive officer and 32 years as Chairman. To succeed Mr Jefferson, the Board have elected me Chairman. This is a very high honour and one which I appreciate deeply. Mr Kenneth J. Britt becomes our new Vice-Chairman. A number of changes in the higher executive positions have been made. Chief of these is the appointment of Mr John F. Jefferson as General Manager.

GENERAL PROGRESS

I am pleased to report that 1956 was a year of continued progress in all branches. The company's total income amounted to £17,475,000—an increase of £973,000. Premium income in the life branches increased by £541,000 to £12,771,000, and net interest by £371,000 to £3,869,000. Claim payments were over £8 million and included payments of over £5,880,000 to those who survived to receive the proceeds of maturing endowment assurances. Larger surpluses were earned and better bonuses have been declared, the sum allotted to policyholders in respect of the one year 1956 being £2,327,000—an advance of over £211,000 in comparison with 1955. The total funds held for the security of policyholders rose by £4,417,000 and have now passed the £100 million milestone. Our investment reserves of £7,500,000 are for the greater part free reserves, despite the magnitude of the fall in stock exchange prices as a result of the credit squeeze and high rates of interest on new money. The regular transfer of sums to investment reserves in good years and bad has enabled us to meet these fluctuations without a heavy drain on the year's profits or changes in our valuation bases. Policies in force in the life branches assured with bonuses over £221 million in capital sums.

ORDINARY BRANCH

In the Ordinary Branch the outstanding feature of the year was the large sum paid under maturing endowment assurance policies which, including bonuses, was £3,231,000 against £1,407,000 in 1955. It is satisfactory to note that in a year of such heavy maturity claims, for which of course we were fully prepared, we were able to increase the premium income of this branch by £140,000 to £4,217,000 and the fund by over £700,000 to £36,737,000. We were helped in this by a larger inflow of new business, the sums assured under new life policies being £8,229,000 at annual premiums of £415,000 and single premiums of £67,400. The annual premiums under deferred annuities issued were substantially more at £72,900 including annual premiums of £60,700 under retirement annuity contracts issued under the terms of the Finance Act, 1956.

Immediately the 1956 Budget became law, we produced an attractive range of contracts securing the valuable income tax and surtax concessions offered to the self-employed and those not entitled to pensions under approved staff schemes, and we appear to have obtained a fair share of the business so far transacted. Most of our retirement annuity contracts have been issued on a with-profit basis. We also improved our immediate annuity rates and devised an annuity contract securing a refund on death of the difference between the capital sum invested and the annuity payments received.

Other factors in the Ordinary Branch were favourable. Net interest earnings at £1,324,000 were higher by £118,000 and the net rate rose by 3s. 9d. per cent to £3 13s. 11d. per cent. Death claims were lighter than in 1955 and the expense rate remained moderate at 12.67 per cent.

INDUSTRIAL BRANCH

In the Industrial Branch good progress was made. New sums assured increased by £707,000 to £13,450,000, the premium income by £400,000 to £8,553,000, and the fund by £3,302,000 to £56,398,000. Death claims showed little movement and at £1,699,000 were up by only £17,000. Payments under maturing endowment assurances on the other hand again showed a substantial increase, the total of £2,650,000 being £544,000 greater than that of the previous year. The tendency for the percentage of new endowment assurance premiums to total new premiums to increase, which I mentioned a year ago, has continued, the percentage in 1956 being 92.0. Our policyholders are evidently looking on home service insurance more and more as a means of saving. It is a development which is of importance to the national economy, because the effect of saving is to help to keep prices down. Savings under home service insurance have the great virtue of being more permanent and continuous than most other forms of saving because of the regular weekly or monthly call of the insurance man.

Net interest earned amounted to £2,544,000 —an increase of £253,000. The net rate of interest earned on the fund increased by 3s. 11d. per cent to £4 14s. 5d. per cent.

VALUATION OF LIABILITIES

Our life contracts continue to be valued by the net premium method at 2 per cent, except for the closed British Legal Industrial Branch fund, which is valued at 2½ per cent. Ordinary Branch bonuses have also again been valued at 2½ per cent.

In the Ordinary Branch the directors, after transferring £100,000 to investment reserve fund, have allocated £1,007,578 to policyholders, against £936,405 a year ago, and have declared a reversionary bonus on with-profit policies in force on December 31, 1956, at the rate of 40s. per cent of the sum assured, against 38s. per cent a year ago. 1956 was the first time the allocation to Ordinary Branch policyholders for bonuses for one year exceeded £1 million.

In the Industrial Branch an allocation to Britannic policyholders of £1,300,000 has been made and has enabled the directors to improve the reversionary bonus scheme by starting with a declaration of 8 per cent of the sum assured after eight year's premiums have been paid. The total bonus additions to premium-paying policies will now range from 8 per cent after eight years to 37 per cent after 37 years. The voluntary allocations from surplus to Britannic and British Legal Industrial Branch policyholders have now reached a total of over £12,524,000.

INVESTMENTS

The further rise in the general level of interest rates provided us with good opportunities for the long-term investment of available funds. We have taken advantage of these opportunities by investing substantial sums in long-term loans to local authorities at remunerative rates of interest, our holdings in such loans having increased during the year by £1,917,000 to £12,209,000. United Kingdom mortgages increased during the year from £16,858,000 to £18,895,000, the addition of £2,037,000 arising almost entirely from loans advanced under the company's house purchase scheme. This scheme continues to attract borrowers who recognise it as a simple and effective method of becoming owners of their homes.

FIRE AND ACCIDENT BRANCH

In the Fire and Accident Branch the premium income, which amounted to £847,000, showed a very satisfactory increase of £102,000. As you are aware, our Fire and Accident business is wholly reinsured with the British General Insurance Company who manage the business for us. Our association is a mutually satisfactory one, and once again I am pleased to express our appreciation of the happy relations which exist between us.

STAFF

You will have seen from the accounts that we are increasing the amount transferred to the staff pension fund from £220,000 to £250,000. One of the reasons for the increase is that we have been conscious for a long time of the difficulties of our old pensioners in trying to make ends meet on a fixed income, and as from the beginning of this year we have increased the pensions granted under our pension scheme before 1955 by amounts depending on the size and date of the pension. You will understand also that increases in the general level of salaries of members of the staff, which have been inevitable in recent years, have added to the liabilities of the pension fund.

It is my privilege to express on your behalf our thanks to a very fine staff for their work during the year. Most of the credit for the excellent results before you is due to them, and we thank them very sincerely.

THE BRITISH SOUTH AFRICA COMPANY

A VERY FAVOURABLE RESULT

MR C. HELY-HUTCHINSON ON COPPER PRICES AND THE OUTLOOK

The fifty-ninth annual meeting of The British South Africa Company was held on March 28th in London.

Mr C. Hely-Hutchinson (the President) presided and, in the course of his speech, said: The Profit and Loss Account records that the gross income for the year was £15¼ million. This is an improvement upon the comparable figure for the previous year of £2¼ million, and of that improvement some £2 million was in respect of Mining Revenue and £750,000 in respect of interest and dividends. The larger receipts from dividends were due in part to larger distributions by Northern Rhodesian Copper Companies. The higher interest rates ruling for short term money which forms at all times a large part of the Company's liquid resources, accounted to a large extent for the increase in interest receipts. As to the Mining Revenue, this included royalty upon 368,000 tons of copper which was valued for royalty purposes at an average of £316 a ton. These figures are respectively about 30,000 tons and £30 a ton higher than those for the previous year.

The total charges, other than taxes, amounted to about £750,000. Taxes are recorded at £7½ million, and there remains a net profit of nearly £7 million, which is an improvement of £1.4 million. A dividend at the rate of 35 per cent (an increase of 5 per cent) is recommended.

CURRENT YEAR'S PROSPECTS

The London Metal Exchange quotation for a ton of electrolytic copper, which has been following a downward course since the end of the year under review, is now in the neighbourhood of £240. The value for royalty purposes based upon such a quotation would be £216. Bearing in mind the higher quotations ruling during the early months of the current financial year and if, for the remainder of the year, the quotation should remain at about its present level the average value per ton of copper for royalty purposes for the whole year may prove to be about £225.

On that basis, assuming a normal rate of production of copper and making appropriate provision for the lower rate of royalty per ton applicable in those circumstances and for a reduced income from dividends from shares in copper producing companies, the profit, after taxes, for the whole of the current financial year would be in the neighbourhood of £4½ million—say £2½ million less than the profit for the past year.

That estimate depends for its accuracy upon two unknowns—the future rate of copper production and the future course of copper prices.

As to the first of these, with the advent of Bancroft Mines and the Chibaluma Company as new producers it would under ordinary circumstances be reasonable to expect a higher rate of copper production this year than last.

The future course of copper prices is not a matter about which I should care to express any firm opinion. There appears to be some grounds for hoping that the price of electrolytic copper will not fall materially below its present level for any long period in the immediate future and, consequently, that it is reasonable to hope that the profit after taxes for the current year will not fall below the estimate of £4½ million, but there can be no certainty on that point.

RHODESIA RAILWAYS TRUST

The Company has recently made an offer to purchase at 60s. a share those shares in Rhodesia Railways Trust which it does not itself own. The issued share capital of the Trust is just over £2 million in shares of £1 each, and of these the Company holds just over 81 per cent, leaving just over 375,000 shares held by others. The amount involved in the offer is thus about £1,125,000.

The Balance Sheet shows that the net current assets at the end of last year amounted to £2 million. The Company had commitments in addition to the liabilities recorded in the Balance Sheet of about £8 million. These include, in addition to some lesser obligations, the Company's undertaking to subscribe £4 million spread over the four years 1957-1960 in respect of the Kariba hydroelectric undertaking and a further £2 million (which has since been provided) for the finance of Bancroft Mines.

In addition, arrangements are in train for setting up a new wholly-owned subsidiary to invest in property in the Federation, and for a substantial participation in the equity and loan capital of a company which has been formed in the Federation to take over and develop the Steel undertaking at present owned by the Southern Rhodesia Government. Furthermore, the Company always has to have moneys in hand to enable it to contribute substantially to projects calculated to add to its royalty revenues over the next 30 years, of which there are at least two now under consideration, and to enable it to continue, as in the cases of the Kariba and Steel undertakings, to take its proper share in the public affairs of the Federation from which it draws so large a proportion of its Revenues. Commitments such as these can be financed either out of the Company's existing assets or out of the Company's current and future profits.

It is, as you are aware, a guiding principle of the Company's financial policy to build up as best may be during the next 30 years a substantial body of investments, the income from which may to some extent compensate for the loss of the mineral revenues which in 1986 are to be handed over to the Northern Rhodesia Government. That policy will obviously be the more effectively served to the extent to which such commitments as have now been taken and may be taken in future are the more financed out of the profits of the Company. In these days of high taxation, and especially bearing in mind the crippling effect of the tax on distributed profits, the retention for investment of a substantial part of the profit may well commend itself to many Shareholders.

The report was adopted.

SCOTTISH AMICABLE LIFE ASSURANCE SOCIETY

ANOTHER NEW BUSINESS RECORD

FAVOURABLE FUTURE BONUS PROSPECTS

The one hundred and thirty-first Annual General Meeting of the Scottish Amicable Life Assurance Society was held in Glasgow on April 10th, Sir Lynden Macassey, KBE, QC (President of the Society) presiding.

In moving the adoption of the Report and Accounts, the Right Honourable Lord Bilsland, KT (Chairman of the Ordinary Directors) said that individual assurances had been issued for net sums assured in excess of £11,500,000, a total which had surpassed the previous year's record by nearly £1,000,000. Over the year, group life sums assured in force had increased by £4,000,000 and deferred pension benefits by more than £1,700,000 per annum.

RETIREMENT PROVISION FOR SELF-EMPLOYED

A new class of business had been opened up by the Government's decision to implement, in a modified form, the Millard Tucker Committee's recommendations dealing with retirement provision for the self-employed. The Society had accordingly devised special approved contracts to meet the needs of those who wished to take advantage of the new legislation. To meet the point that the earnings of self-employed persons frequently fluctuate quite widely from year to year, the premiums under these policies may be varied from year to year. The flexibility and simplicity of the Society's contract had aroused a great deal of interest and one particular feature of the with-profit deferred annuity was emphasised—its participation in bonus on the same basis as for life assurance policies. These with-profit contracts were therefore backed by the Society's unique record of bonus distributions over the past 130 years.

An important condition of Inland Revenue approval for these special annuity contracts is that they cannot be surrendered or assigned, a disability which restricts their usefulness in certain cases, and would lead self-employed persons still to find a prominent place among their policies for the traditional all-purpose endowment assurance which attracts a substantial degree of income tax relief and is entirely free of any tie or taxation liability in respect of the proceeds at maturity. The 1956 Finance Act also remedied the injustice of the taxation of the capital element in an annuity and brought about a reduction in the taxation on many annuities, both new and existing.

NEW QUINQUENNIUM'S EXCELLENT START

The Annual Report and Accounts showed that the total premium revenue continued to expand very rapidly, amounting to almost £7,200,000 in 1956, an increase of more than £705,000 when compared with 1955. The mortality experience under the Society's life assurance contracts had again been extremely favourable. In this and in other respects the excellent start to the new quinquennium gave a considerable measure of confidence with regard to future bonus prospects. As a result of the year's operations, the total funds had increased by over £5,800,000 and had now reached and passed the £50,000,000 mark. The funds had in fact doubled in the past six years.

The Report and Accounts were adopted.

TELEPHONE AND GENERAL TRUST

ANOTHER PROGRESSIVE YEAR

SIR ALEXANDER ROGER ON A STRONG AND HEALTHY POSITION

The thirty-first annual general meeting of the Telephone and General Trust Limited will be held on April 30th, in London.

The following is an extract from the statement by the Chairman, Sir Alexander Roger, KCIE, which has been circulated with the report and accounts:

The Directors' Report and Accounts show that we have had another progressive year.

Gross Profit before taxation amounted to £369,594 compared with £340,500 in the previous year. Taxation took £189,200 (£166,600 last year) or 51.2 per cent, leaving a Net Profit of £180,394—an increase of £6,494 despite the fact that Miscellaneous Income, always a variable item, was £4,288 only as compared with £18,650 in 1955.

We have transferred £25,000 to General Reserve, bringing that up to £200,000.

An Interim Dividend of 3 per cent was paid in October last on £1,110,000 Ordinary Stock. The "rights" issue of £245,000 Ordinary Stock made in July, referred to in the Directors' Report, did not participate in this Interim Dividend. We are proposing to pay a Final Dividend of 10 per cent on the £1,355,000 Ordinary Stock now in issue as against a Final of 9 per cent on £1,110,000 last year. In addition 13 per cent is being paid on the "A" Ordinary Stock against 12 per cent last year.

After providing for the foregoing and the 7 per cent Preference Dividend, Profit and Loss Carry Forward is increased by £28,721 to £185,630.

BALANCE SHEET

Your Directors propose that the Authorised Ordinary Capital be increased by £400,000 to a total of £2 million in order that we may be in a position to make further issues if and when necessary.

Capital Reserve is increased by the transfer of £175,500 from Share Premium Account bringing the balance thereon to £625,500, as referred to in the Directors' Report. In addition we have Revenue Reserves amounting to £485,630.

The valuation of £3,351,168 for quoted investments represents an appreciation of £1,788,643 on the net book cost of £1,562,525, forming a substantial margin against a variation in market values.

Of the Trust's total investments including loans to subsidiary and associated companies, on the basis of book cost 40.93 per cent are in Loans, Debentures and British Government Stocks, 6.01 per cent in Preference Stocks and 53.06 per cent in Ordinary Stocks. Geographically, 93.38 per cent are in the British Commonwealth and 6.62 per cent in foreign countries.

We have cash at call and at bank totalling £579,384, most of which will be required at least temporarily during 1957 for the development of our overseas subsidiary and associated operating companies.

The Group Reserves total £1,810,892—an increase of £350,596.

The Net Assets of telephone operating and servicing subsidiary companies have increased by £853,042 to £5,130,983.

TELEPHONE OPERATING COMPANIES PORTUGAL

The Trust has maintained close association with the Anglo-Portuguese Telephone Company since 1928 at which date it first acquired a considerable investment in the Company.

The unceasing demand for telephone service in Portugal necessitates the supply of greater quantities of plant and equipment and, consequently, additional financing to meet the cost.

In October, 1956, the APT Company raised 80,000 Contos (£1 million) in Portugal in the form of Obligations to Bearer.

A substantial part of the proceeds of the issue was paid to the Trust in reduction of loan.

The financial arrangements between the Trust and the Company for many years have proved to be mutually satisfactory.

The APT Company continues its sound progress and, in terms of telephone growth, nearly 19,000 stations were added during 1956, the number in service at December 31st last being well over 189,000.

The Company's relationship with the Portuguese Ministerial and Departmental Authorities is friendly and cordial in every direction.

The visit to Portugal of Her Majesty Queen Elizabeth and HRH the Duke of Edinburgh between February 18th and 21st last, aroused tremendous enthusiasm and rejoicing there and enhanced beyond all measure the goodwill and regard which has so long existed between Great Britain and Portugal.

WEST INDIES COMPANIES

Following a visit to Trinidad and Barbados by Mr A. F. Roger and Mr A. W. Anderson, both Directors of Telephone Trust, I also have just returned from a visit to the West Indies telephone operating Companies, calling in at Barbados and Trinidad, thence on to Jamaica where I spent some weeks, being joined by our Director, Mr G. W. Fyfe.

In Jamaica there were important outstanding problems to be dealt with, and I am glad to say that after talks with the Chief Minister and the Minister of Finance considerable progress has been made towards a mutually satisfactory settlement of the various problems, and I am hopeful that the complete accord reached will enable the Company to go ahead with its plans.

The three telephone operating Companies in which we are interested in Jamaica, Trinidad and Barbados, collectively expended some £976,000 on development and improvement of their inside and outside plant during 1956.

The aggregate gross book value of their Plant Assets amounted to over £6,300,000 at December 31, 1956, with some 57,000 stations in service in addition to the trunk service throughout the respective Islands.

Ten years ago at the end of 1946 the gross Plant Assets of these West Indies Companies amounted to some £1,028,000. Thus in that period they have grown more than six times.

This large development has been carried out practically entirely with automatic telephone equipment and cable exported from the United Kingdom, and has played an important part in the economic and social progress of those territories.

All this requires large sums of money, and the temporary and permanent financing of these Companies' capital expenditure programmes is under constant review by us in London and by the local Managements.

GENERAL

The Trust was formed in June, 1926, with an authorised Capital of £202,000 to carry on the business of an Investment Trust Company and is in particular, although not exclusively, interested in the telephone operating industry throughout the world.

Since that date there has been steady and progressive growth both in our telephone operating and in our general Investment interests so that today the Trust's Issued Share and Loan Capital amounts to £4,005,000.

I think you will agree that the Balance Sheet shows a strong and healthy position and I feel we can look to the future with confidence.

WESLEYAN AND GENERAL ASSURANCE SOCIETY

The one hundred and sixteenth Annual General Meeting was held on April 2, 1957. Mr A. H. Sayer, MC, JP, the Society's Chairman, in moving the adoption of the Reports, said:

During the year good progress was made in the Industrial Department where the new Sums Assured showed an increase of 16 per cent over the previous year and the premium income was £70,884 greater. The Fire and Accident Departments, too, showed a vigorous growth with an 11½ per cent increase in premium income. The new business figures in the Ordinary Department, however, were affected by the credit squeeze which caused a curtailment of House Purchase transactions compared with the previous year; this in turn affected the Ordinary Department new Sums Assured which at £4,400,000 were £650,000 below the figure for the previous year.

So far this year, business is good in all Departments, and I confidently expect that record figures will be achieved during 1957.

Exactly ten years ago yesterday, the then Chairman of the Society referred to the new form of annuity that the Society had introduced and said that the Inland Revenue might amend the law so as to allow a proper proportion of purchased life annuities to be free of tax, in which event the Society's new form of annuity would become unnecessary. What he then foretold has come to pass; Section 27 of the Finance Act, 1956, righted the injustice against which the Society's form of annuity was directed. The merit of the new legislation was so evident that the relevant clause of the Finance Bill passed through all Parliamentary stages with little or no comment from Members, in striking contrast to the lively debate on Section 25 of the Finance Act, 1949, which put an end to the Society's pioneering and novel form of annuity.

The Society has prepared a range of attractive policies, giving the "Self-Employed" the utmost advantage and flexibility that is to be obtained from the provisions of the Finance Act, 1956, including an option at any time during the currency of the policy to bring a wife or dependant within the scope of the policy.

The Valuation Surplus of the Ordinary Department was £489,019; £309,981 was used to grant a bonus of 32s. per cent of the original Sum Assured—the same rate as for last year—to With Profit policy-owners.

The Valuation Surplus of the Industrial (Home Service) Department was £392,441; £110,000 was used to grant additions ranging from 5 per cent to 12½ per cent to the claims moneys on policies becoming claims before the date of the next Annual Meeting.

Consequent upon these allocations of Valuation Surpluses, the Investments Reserve in the Balance Sheet now stands at £3,050,000. The General Reserve now amounts to £200,000.

The report and accounts were adopted.

REFUGE ASSURANCE COMPANY LIMITED

The Chairman, in a statement submitted with the 1956 accounts, referred to the part played by insurance companies in providing capital for industry with the funds resulting from the payments of their policyholders. He said that the public, by taking up and maintaining life assurance contracts, are doing a good thing for themselves and directly helping the country to maintain and increase its prosperity to the advantage of everybody.

He referred to the concessions given by the Finance Act of 1956 to self-employed persons who effect special policies providing an income in old age, but pointed out that for many people there was still much to commend straightforward endowment assurance policies for this purpose.

The combined new sums assured of nearly £35 million in the Life Branches were the greatest yet written by the Company in any year, and the total sums assured and bonuses in force were now £358 million. The total assets of the Company were £145 million.

ALLOCATIONS TO POLICYHOLDERS

In the Ordinary Branch surplus of £1,750,000 was allocated to policyholders to provide a bonus on with-profit policies at the rate of £1 18s. 0d. per cent on the sum assured in respect of each year's premium due in 1956 and paid. This rate is an increase of 4s. per cent over that of 1955.

In the Industrial Branch £1,200,000 was allocated to policyholders to provide a reversionary bonus to premium-paying policies (with certain exceptions) at the rate of £1 per cent on the sum assured for policies dated 1951 and earlier, and £4 per cent for policies dated 1952, it being the first time that the latter class has participated. The conditions under which paid-up policies are granted at advanced ages have also been improved and certain other increases in benefits continued.

HOUSE PURCHASE SCHEME AND INVESTMENTS

During the year £6,200,000 was advanced on House Purchase mortgages, increasing the total advanced on mortgages and loans to £29 million. In addition, the Company has assets of £51 million invested with the British Government or Local Authorities, £38 million in Debentures and Preference Stocks and £16 million in Ordinary stocks. Its investments in industry and commerce are widely spread over many companies.

THE BRADFORD DYERS' ASSOCIATION LIMITED

AMPLE FUNDS FOR DIVERSIFIED ACTIVITIES

MR JAMES EWING ON MIDDLE EAST EVENTS

The Fifty-ninth Annual General Meeting of The Bradford Dyers' Association Limited was held on April 8th at the Midland Hotel, Bradford. Mr James Ewing (the Chairman), who presided, in the course of his speech said:

When I last addressed you I stated that I hoped to place before you next time results no less favourable than were then submitted. But for the unfortunate events in the Middle East, with the improvement as a whole in our other overseas subsidiary companies and overseas investments, the figures today, notwithstanding the serious fall in the Home Branches' profits, would have been no less favourable. The sequestration of our property in Egypt is a serious blow to us but, because of the Association's financial policy during the past few years, our liquid position is sound. Your Board is constantly seeking opportunities of using our ample liquid resources in other fields of activity.

I am confident that, despite the interruption of earnings from Egypt, your Company, with its widely spread interests, is in a sound position to continue to show reasonable profits. Our investment in Egypt, in the accounts before you, actually shows a small trading loss because of our acceptance of the responsibility to resettle the British technical staff and their families.

UNITED KINGDOM

As mentioned in the statement accompanying the Balance Sheet and Accounts, the yardage available in cotton and rayon piece goods fell still further in 1956 and this, coupled with seriously rising costs of wages, dyestuffs, chemicals, fuel and most of our other raw materials, with little opportunity of passing these extra costs to our customers, adversely affected our trading figures. But, as a service section of the industry, with no opportunity of balancing costs by speculation in the finished fabric, it is essential that our selling prices bear a close relationship to cost of production. We stabilised our prices throughout the greater part of 1956, but recently steps have been taken by adjustment of the prices of all the major lines which we process to restore a reasonable level of profit.

We have been making progress with a long term and extensive plan of reorganisation of our wool dyeing and finishing section. The first step was the erection of a new power plant at Brighouse, which has now been operating satisfactorily for over a year. The next phase will be to transfer all processing now carried out at Edward Ripley & Son Limited, Bowling Dyeworks, Bradford, to a newly equipped works at Brighouse to be known as "New Bowling Dyeworks." The transfer will be effected in a gradual and orderly manner so as to allow of the greatest care being taken in ensuring that service to customers is not impaired in the slightest degree. When the plan is completed, the Association will possess at Brighouse the most up to date wool dyeing and finishing plants in the country, designed expressly to cater for the requirements of the woollen and worsted industry.

RESEARCH AND DEVELOPMENT

I am now able to report that later in the year our new Central Research Laboratories, being erected on a site near the centre of Bradford, will be completed and occupied. The work to be undertaken by the Staff in these Laboratories will be directed primarily to the immediate investigation of specific scientific discoveries which may be adapted or modified to provide new techniques for our industry. In severely competitive conditions we rely to an increasing extent on new ideas for the old familiar fibres, no less than for those of recent origin.

Your Board is very much alive to the value of research, but I think it is timely to say to those who are constantly exhorting industrial companies to show more enterprise, that research and the application of discoveries emanating from research require finance. This finance has to come either from an allocation of profits or from additional investment by the public who would only be willing to invest money provided that they could be reasonably certain of receiving an adequate return on the money invested. I refer to research by industrial companies as distinct from research by State aided organisations like the admirable Shirley Institute, for there is need for both.

DIVERSIFICATION

It may be that research and development efforts on our part, however successful, may not attract much new yardage to the looms of this country, but they should ensure that we maintain our share of the business available. Our research leads us into other fields of activity, and already we have linked with a large European Company to produce non-woven fabrics, wherein our skill and experience in handling and finishing fibrous materials can be put to good use. Bondina (BDA) Limited has now become established as a producing unit in the field of interlining fabrics for garment manufacture.

We have also acquired a controlling interest in an old-established company engaged in structural engineering. This company has a full order book and is producing very satisfactory results. Two smaller companies, of which we have acquired controlling interests, operate one in air conditioning and dust extraction, and the other in civil engineering. We believe that both these companies can be developed to make an increasing contribution to our revenues. Our other new interest is in the transport of liquids in bulk. This concern is in an early stage of development, but it is promising very well under an energetic management and will, we believe, become an important unit in an expanding field.

Altogether, these new interests represent the investment in permanent capital and loans of upwards of £500,000. They can be regarded as to some extent replacing dyeing and finishing units which have become redundant and thereby making us less exclusively dependent on the textile manufacturing industry than hitherto we have been.

The report and accounts were adopted.

TWINING CROSFIELD & COMPANY

RECORD RESULTS

The fortieth annual general meeting of Twining Crosfield & Company Limited was held on April 4th, Mr H. W. Backhouse (Chairman) presiding.

The following is an extract from his circulated statement:

We have a good year's trading to report and we are able to show a record profit for the Group. This result has, however, been achieved since the acquisition of the subsidiaries to which I referred in my last statement, as well as another small acquisition during the year. Moreover, it has been earned during a period when the Tea Market has been favourable and we have been able to trade at a reasonable profit for most of the time.

The Tea Market remained fairly steady until November. The price of plain tea varied between 2s. 10½d. per lb and 3s. 5½d. per lb until the Suez crisis created a spot shortage owing to delays in arrivals. The price then rose rapidly to 5s. 6½d. per lb in December, and made substantial retail price increases necessary.

Coffee has not been so favourable a market. There was a slow but steady advance of prices during the first eight months, followed by a steady pattern for the rest of the year. Some retail prices had to be increased and price increases are apt to disturb our regular trade and to prevent expansion.

The report of the Monopolies Commission was published on December 20th. It was very gratifying that the members of that body were able to say that in the Tea Trade there was no evidence of any restrictive practice or of anything of which we need be ashamed.

The prospects for 1957 are as hard to foresee as usual. Heavy buying during November and December has resulted in small sales in January and February. The improved UK stock position has brought about lower price levels, *with plain tea quoted at 3s. 8½d. per lb* on March 8th, and reductions in retail prices. These unsettled conditions will bring their usual anxieties, but we shall endeavour to continue to develop our trade at home and abroad. To this end we are extending our processing plant and warehouse.

The report was adopted.

BANK LEUMI LE-ISRAEL BM

STEADY PROGRESS

The sixth Annual General Meeting of the Bank Leumi Le-Israel BM, being the fifty-fifth of the business established in 1902, was held on March 28, 1957, at the Bank's registered office. Mr S. Hoofien was in the chair, and Dr A. Barth, the General Manager, addressed the meeting.

In his introductory speech, the General Manager pointed to steady progress: the Bank's Reserve Fund had been increased by I£250,000 and the Capital and Reserves amounted to I£5,250,000. The sum of I£100,000 was proposed for appropriation to Contingencies Reserve. Deposits had risen from I£144 million in 1954 and I£152 million in 1955 to I£174 million in 1956. The strengthening of the Bank's position had also found its expression in the considerable increase in the number of depositors, which had increased by 8.6 per cent in 1953, by 13 per cent in 1954, by 18.3 per cent in 1955 and by 20 per cent in 1956.

The number of branches had been increased from 61 to 70 and the opening of several additional branches was contemplated for 1957. The Bank's new Savings Scheme enjoyed great popularity and had attracted over I£7 million in Long-Term Deposits.

The General Manager explained that the credit restriction policy of the Bank of Israel, as an anti-inflationary measure, had almost entirely precluded an expansion of the Bank's loans and advances to customers, and that the increase which had taken place had been rendered possible mainly through rediscounts effected by the Bank of Israel and through Government deposits made for that purpose. The special additional credits had been directed mainly to agriculture and to the export trade

In reviewing general economic conditions, the General Manager referred to the new Interest Law and to the Order of the Minister by which the maximum interest rate had been fixed at 11 per cent, with a maximum of 10 per cent applicable to loans to industry and agriculture.

In conclusion, Dr Barth was in full agreement with the Government's policy aiming at the restriction of consumption through price increases. He stressed the need for increased production, for the reduction of unessential imports, and for the expansion of agricultural and industrial exports.

A final dividend of 6½ per cent was declared, which again brings the total dividend for the year to 12½ per cent.

The Directors retiring in rotation were re-elected, and Mr Y. M. Geri and Mr Z. Onn, who had been co-opted to the Board to fill the vacancies caused by the death of Mr I. Bareli and Mr L. Braudo, were elected.

THE RIO DE JANEIRO FLOUR MILLS & GRANARIES LIMITED

The seventy-first Annual General Meeting was held on April 4th in London.

The Chairman, Mr G. McT. Sheppard, in his address said that the Group Trading Profit showed an increase in Brazilian currency of Cr$6.274.385,00 but, as a result of a small decline in the exchange rate applicable this year compared with last, the sterling equivalent had increased by only £22,757.

Once again the Chairman said he had to report a very difficult year's trading for the four flour mills of the Group. Although larger quantities of wheat than in the previous year had been made available to the milling industry, the flour selling prices initially fixed by the authorities had been based on the assumption that the higher priced Brazilian wheat would not exceed 20 per cent of the total availabilities; this had proved to be a substantial underestimate. After protracted negotiations, which lasted until July, increased flour prices had been authorised to compensate for this and also for the inevitable additional working costs.

The Chairman said the need for expansion was constantly in the minds of the Board, especially in connection with the manufacture of products ancillary to the main business of flour milling. In recent years balanced rations had been produced in all the mills for sale to cattle and pig breeders and poultry farmers. During the last 18 months or so the Group had also manufactured cake mixes and similar articles. The demand for these products was steadily increasing.

The report was adopted.

APPOINTMENTS

ESSEX EDUCATION COMMITTEE

SOUTH-EAST ESSEX TECHNICAL COLLEGE, LONGBRIDGE ROAD, DAGENHAM

Required in September:—

Senior Lecturer in the Department of Commerce and Professional Studies to be responsible for the development of Management Courses and the direction of Research in the field of Management Studies. Applicants should possess good academic qualifications and have had research and teaching experience.

Salary: £1,350 x £50 to £1,550 per annum plus London Allowance.

Further particulars and application forms (stamped addressed foolscap envelope) from the Clerk to the Governors at the College.

OLD-established City Investment Bankers require MANAGER with investment and administrative experience to take charge of department dealing actively in Canadian securities. Age approximately 35-50 years.—Please write giving full particulars, to Box E.593, c/o 191 Gresham House, E.C.2.

Excellent prospects, liberal long service leave, excellent staff pension and life assurance benefits.—Apply to Manager for United Kingdom, 73-76 King William Street, London, E.C.4.

THE SOUTH WALES ELECTRICITY BOARD

Applications are invited for the position of Assistant Statistician in the Department of the Chief Commercial Officer at the Head Office of the Board, St. Mellons, Cardiff.

Candidates should be over 30 years of age and hold a degree in statistics.

The salary for the position will be within the range of Grades 6/7 (£855/£1,025) of the National Joint Council (Administrative and Clerical Grades) for the Electricity Supply Industry, the commencing salary being determined according to qualifications and experience.

Applications, stating age, present position, present salary, qualifications, experience and three referees, should be addressed to the Secretary (Establishments Section) to arrive not later than May 1, 1957.

R. G. WILLIAMS,
Secretary.

St. Mellons, Cardiff.

ACTUARIAL CAREERS IN CANADA

A large Canadian Life Company offers careers to promising young Associates and Fellows. Due to the rapidly expanding nature of its International operations, several openings are already available at its Head Office in Canada with opportunities of promotion to Senior Positions. Salaries are based on time since qualification and experience. Good working conditions, staff privileges and benefits. Head Office located in Toronto, Canada's most modern and rapidly expanding city. Further details and emigration facilities may be discussed by making an appointment in writing with Mr R. E. White, Secretary and Actuary, Confederation Life Association, 18 Park Lane, London, W.1.

NATIONAL SAVINGS COMMITTEE ASSISTANT COMMISSIONERS. The Civil Service Commissioners invite applications for about 10 pensionable posts. Age at least 21 on March 1, 1957.

University education and knowledge of economics desirable. Final year university students may apply. Experience of public speaking, control of office staff and organisation of voluntary workers advantageous.

Men's starting salary (London): £385 at 21 to £625 at 25 or over. Maximum £1,225. Women's pay lower at present, but will reach equality with men's by 1961. Salaries outside London somewhat lower. Promotion prospects.

Particulars and application forms from Secretary, Civil Service Commission, Burlington Gardens, London, W.1, quoting 134/57/7. Completed application forms should be returned by May 2, 1957.

PERSONAL ASSISTANT

(SALES ADMINISTRATION)

Applications are invited for the post of Personal Assistant to the Managing Director of a well-known Chocolate and Confectionery firm.

The selected candidate will be required, after a few months' practical training, to take responsibility for the administration of sales policies, liaison with the production side of the Company, sales force personnel work, advertising, market research, etc.

Starting salary £1,500 p.a. with good prospects for substantial increments.

Candidates should be men between 28 and 37. A University degree in Economics or other relevant subject will be an advantage. Minimum educational qualification—Higher School Certificate or equivalent. Experience should include not less than three years on sales work, of which not less than two years should be in an administrative post. Preference will be given to men with experience in the confectionery or food trades, but this is not essential.

Applications must be on the standard form, which is available from the Secretary (D10), 14 Welbeck Street, London, W.1.

APPLICATIONS are invited from those having a medical or pharmaceutical background and fluent Swedish or Finnish for appointments as Medical Representatives in Sweden or Finland. Previous experience of such work is an advantage, but not essential, as adequate training will be given.—Apply to Personnel Manager, Parke, Davis & Company, Limited, Staines Road, Hounslow, Middlesex.

ASSISTANT ADVERTISING MANAGER

This Company's interests include Izal products, heavy engineering and NCK excavators. The duties include planning and control of press advertising for home and export markets, display and printed literature in conjunction with the Company's advertising agents. The appointment requires a combination of administrative ability and creative flair. Candidates must have a wide experience of product advertising and Company publicity, with preferably a personal as well as a professional interest in some of the side-line aspects of publicity. Age 27 to 32.

The appointment is permanent and pensionable with excellent prospects. Reply (briefly, please) to STAFF OFFICER, Newton Chambers & Company Limited, Thorncliffe, near Sheffield.

STAFFORDSHIRE COUNTY COUNCIL

COUNTY PLANNING AND DEVELOPMENT DEPARTMENT

Applications are invited for the appointment of a Senior Assistant in the Research Section of the Department on A.P.T. Grades V-VI (£814 17s. 6d. to £1,107 0s. 0d. per annum). The commencing salary and grading will be in accordance with qualifications and experience.

The person appointed will be concerned primarily with the economic aspects of the Development Plan and the implementation of overspill proposals. Applicants should have an honours degree in economics, geography or related subjects and should preferably have had research experience in the public service, with a research institution or with industry.

Consideration will be given to the granting of financial assistance in appropriate cases towards removal expenses. Canvassing will disqualify.

Applicants should give details of age, education and training, qualifications, present and previous appointments and experience, and the names of two persons to whom reference can be made. Applications, in which relationship to any member or senior officer of the County Council must be disclosed, should be sent to D. W. Ripley, County Planning and Development Officer, 41a Lasgate Street, Stafford, not later than April 27, 1957.

T. H. EVANS,
CLERK OF THE COUNTY COUNCIL.

INTELLIGENT young man in twenties, preferably with some experience in commerce, offered opportunity with large City company to assist on the trading side of the business. Scope for progress with good initial salary.—Box 678.

UNIVERSITY OF ST. ANDREWS

LECTURESHIP IN POLITICAL ECONOMY

The University Court of the University of St. Andrews invites applications for a Lectureship in Political Economy in St. Salvator's College. Candidates should have a particular interest in Welfare Economics and the economic development of Britain and U.S.A. in the present century. The appointment will date from October 1, 1957. The present salary scale is £650 x £50 to £1,350 per annum (subject to an efficiency bar at £1,000), but the scale is under review and the successful candidate will be placed at a point on the newly revised scale according to qualifications and experience. The post carries F.S.S.U. benefits and family allowances, and a grant towards expenses of removal will be made. Further particulars may be obtained from the undersigned, with whom five copies of the application, together with the names of three referees, should be lodged not later than April 30, 1957.

D. M. DEVINE,
Joint Clerk to the University Court.

College Gate, St. Andrews.

MARKET INVESTIGATIONS LIMITED, an independent, rapidly expanding company with a wide range of clients and a national field staff, need an experienced research officer to plan and carry out consumer surveys. Great variety of work and excellent prospects.—Please telephone LANgham 6507 (extension 5) for an appointment.

MANAGEMENT SELECTION LIMITED have been retained to advise on the appointment of the

WORK STUDY MANAGER

who will be a senior member of an

OPERATIONAL RESEARCH DEPARTMENT

set up by the Board of an industrial group employing about 35,000. This O.R. department is pioneering the development of measurement and control techniques which are among the most advanced in use today. The Work Study Manager will be responsible for developing work study policy, for applying this policy as the empirical branch of an integrated O.R. programme and for directing factory work study teams comprising about 70 staff.

To merit serious consideration, candidates must have at least five years varied experience of work study, including some in engineering; consultancy experience would be helpful. Formal training in work study is essential and a degree, preferably in engineering, is highly desirable. They must produce evidence of original work in this field and be able to perceive the long-term possibilities of work study in the wider context of O.R.

Probable age 28 to 40. Salary subject to negotiation, but not less than £2,000 at the lower end of the age bracket and generous fringe benefits.

Please send brief details to: R. A. Denerley, Management Selection Limited, 17 Stratton Street, London, W.1, quoting reference S357. No information will be disclosed to our clients until candidates have been told their identity and have given permission after full discussion.

ECONOMICS/STATISTICS.—A Graduate with a good degree in Economics is required to analyse the statistics produced by subsidiaries of a large engineering group, and to produce regular reports on the trends revealed. The work has to be developed and there is much scope for initiative. A background of Mathematical Statistics is not required, but candidates do need an aptitude for analysing figures and trends. Actual industrial experience in the work would be of particular interest. The ability to write lucidly and briefly is essential.

Application forms from the Secretary, Market Research Department, T.I. (Export) Limited, 58-72 John Bright Street, Birmingham, 1.

SECRETARY required to run small office of growing professional body. Five-day week; Salary range £400—£480 per annum.—Apply Box 672.

ASSISTANT MARKET INFORMATION OFFICER

A vacancy exists within the Marketing Division of one of the foremost Pharmaceutical Companies in Britain for an Assistant Market Information Officer. Applications are invited from persons preferably in the age range 25-35, having a sound knowledge of the Pharmaceutical Industry or, alternatively, experience in Agricultural Economics relating to the marketing of Veterinary and Agricultural products.

The Company offers a commencing salary commensurate with age, experience, etc., good prospects of advancement and a non-contributory Pension and Life Assurance Scheme.

Applications, giving full details as to age, career to date, current salary, etc., should be addressed to Box 675.

TUBE INVESTMENT LIMITED has two vacancies in its Operational Research team:

(i) Statistician with experience of the application of statistical methods, including design and analysis of experiments;

(ii) Economist with experience of costing and accounting methods. In each case a good honours degree is essential. Preference will be given to candidates in the age range 26 to 30, with experience in manufacturing industry and ambition for the wider opportunities this work can lead to.

Full details to Personnel Manager, T.I. (Group Services) Ltd., Rocky Lane, Aston, Birmingham, 6.

NEWCASTLE UPON TYNE EDUCATION COMMITTEE

MUNICIPAL COLLEGE OF COMMERCE

Applications are invited for the following posts, duties to commence in September, 1957:—

(a) Lecturer in Economics and Commerce.

(b) Lecturer in Management.

Salary in accordance with the Burnham Technical Report, 1956, £1,200—£30—£1,350.

Further information and application form, to be returned within 14 days, obtainable from Director of Education, City Education Office, Northumberland Road, Newcastle upon Tyne, 1.

QUALIFIED Accountant with wide experience required for professional appointment in Central Africa. Initially the appointment would be for a tour of 2 years, but it is a permanent one leading to exceptional prospects for a man with energy and initiative. Sound knowledge of French is necessary.—Write Box X.892, c/o Streets, 110 Old Broad Street, E.C.2.

MARKET RESEARCH

HOOVER LIMITED require a

MARKET RESEARCH EXPERT

to take charge of their new home and overseas Market Research and Economic Forecasting Department. This is a senior appointment and calls for an honours degree economist with some years' experience in a Market Research Organisation.

Applications, giving details of age, education, qualifications and experience, to the Employment Officer, Hoover Limited, Perivale, Greenford, Middlesex.

COST ACCOUNTANT required by manufacturing Company producing consumer goods in the East Midlands. The Company, which is progressive and expanding, requires a young man with practical experience of the whole subject. The successful applicant would be directly responsible to the Managing Director. Commencing salary £1,200 or according to experience.—Box 674.

UNIVERSITY OF BIRMINGHAM

The University will offer a number of Scholarships to graduates and to those expected to graduate this summer who wish to read for higher degrees in the Faculty of Commerce and Social Science. There will be opportunities for advanced study and training in research in all the main departments of the Faculty and in subjects common to more than one department.

Further particulars may be obtained from the Registrar, the University, Birmingham, 15, to whom applications should be sent before June 15, 1957.

UNIVERSITY OF BIRMINGHAM

FACULTY OF COMMERCE AND SOCIAL SCIENCE

EDWARD WILSHAW POSTGRADUATE EXHIBITION

One Exhibition, of the order of £200, but the amount to be determined in each case by the applicants' merits and circumstances, will be offered each year from a fund founded by Sir Edward Wilshaw, K.C.M.G., D.L., LL.D., F.C.I.S., J.P. The Exhibition is open to graduates of this and other Universities who wish to prepare themselves for careers in business administration and management and who propose to read for the Graduates' Commerce Diploma in business administration. Applications (two copies), including the names of two referees, should be sent by June 15, 1957, to the Registrar, the University, Birmingham, 15.

B.Sc.(ECON.) LONDON UNIVERSITY

UNIVERSITY CORRESPONDENCE COLLEGE provides postal tuition for the above degree (obtainable without residence), which is a valuable qualification for those seeking executive appointments in commerce or industry, government or municipal posts. The College, established 1887, is an Educational Trust. Highly qualified Tutors. Low fees. Prospectus of U.C.C., Courses for London Degrees and Diplomas, G.C.E. free from the Registrar, 60 Burlington House, Cambridge.

THE CHARTERED INSTITUTE OF SECRETARIES

Employers requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute (Dept. E), 14 New Bridge Street, London, E.C.4.

WORK STUDY.—Next six-weeks' full-time course starts May 6th. Details of this and eight others, including part-time, evening and correspondence, from The School of Time and Motion Study, 29 Cork Street, Piccadilly, London, W.1.

ASHRIDGE

COURSE 31. THE TREASURY. MAY 3rd-6th.

Introductory Address: Sir Herbert Brittain, K.C.B., K.B.E.. The Influence of the Treasury on the National Economy: Mr R. W. B. Clarke, C.B., O.B.E., Financial Policy at Home: Mr H. H. Hutchinson, The Treasury and External Financial Arrangements: Professor J. H. B. Tew, Ph.D., Prospects of Future Prosperity: Mr. Roger G. Opie, M.A.

Inclusive Fee: £4 4s. 0d.

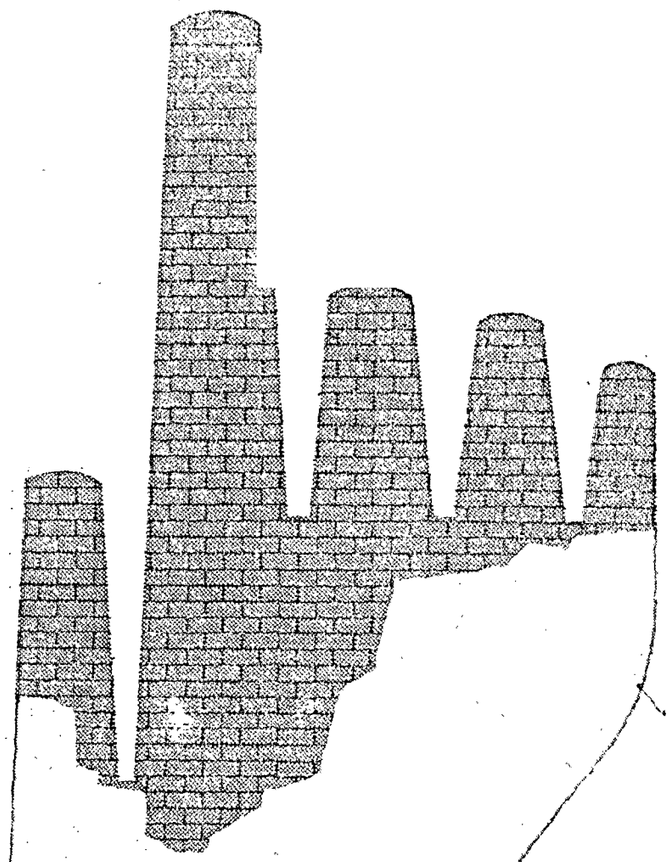
Applications to the Secretary, Ashridge, Berkhamsted, Herts. Tel.: Little Gaddesden 3191.

AMATEUR CONJURERS: brand new spectacular production. Open a bottle of Duff Gordon's 11 Cid Sherry, and watch hundreds of thirsty people appear out of thin air. Works every time.

EXPERT POSTAL TUITION

for Examinations—University Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus—and/or advice, mentioning examination or subjects in which interested, to the Secretary (G9/2).

METROPOLITAN COLLEGE, ST. ALBANS



or call at 30 Queen Victoria Street, London, E.C.4.

ANNUAL AIR SUBSCRIPTION RATES

Subscriptions to most countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is either because the alternative is not available or not recommended.

	Airmail	Air Freight		Airmail	Air Freight		Airmail	Air Freight
Australia	£8 5s. stg.	—	India & Ceylon	£7 15s.	£6	Pakistan	£7 15s.	£6

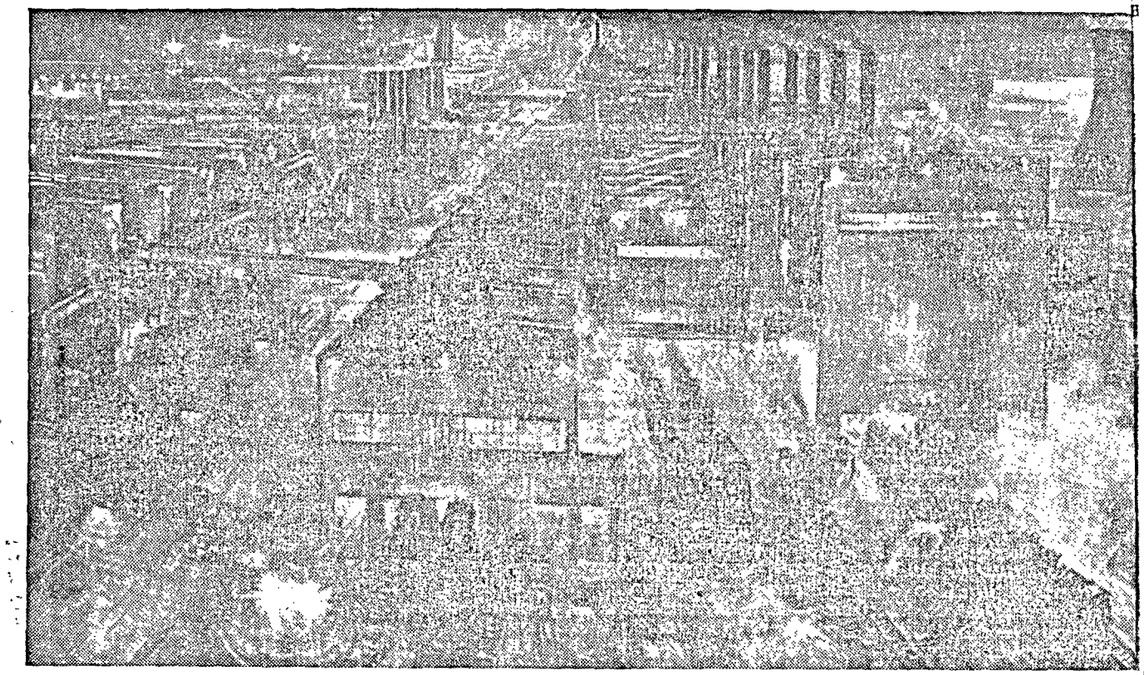
FACTORY EQUIPMENT EXHIBITION



AT EARLS COURT
29th APRIL to 4th MAY

A comprehensive exhibition of equipment and plant designed for greater industrial efficiency and economy

DAILY FROM 10 A.M. to 7 P.M.
(SATURDAY 10 A.M. to 5 P.M.)

ADMISSION 2/6

This exhibition is sponsored by 'The Factory Manager' and 'Factory Equipment News'

The Abbey Works of The Steel Company of Wales, by Harold Fors

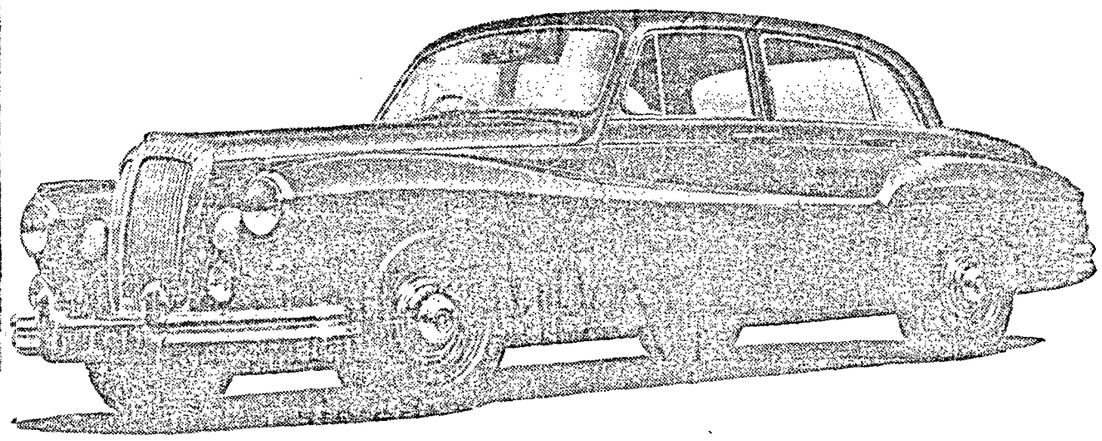
As far as the eye can see . . .

A NEVER-SLEEPING CITY OF STEEL

24 hours a day, The Steel Company of Wales is making steel for every British industry

THE BATTLE OF BRITAIN today is industrial. The aim: to build new economic strength; to lift productivity; to set a pace for the world in the development of atomic power. To win this battle, Britain needs an ever-increasing supply of basic materials. None is more needed than steel.

We *must* have steel. We must have *more* steel, for the work that is ahead. In Port Talbot, Glamorgan, a great part of these needs is being satisfied, for here is Britain's city of steel—the headquarters of The Steel Company of Wales. Already the Company makes a third of Britain's sheet steel and two-thirds of her tinplate. Development plans, going ahead at high priority, will soon increase these proportions. The new spirit of Britain's industrial struggle can be sensed at its most urgent at The Steel Company of Wales.



The Company has three Divisions: Steel and Tinplate account for most of its turnover; but no less important is the Newport Division, whose Orb Works produces special electrical sheet steel—steel that goes into transformers and other equipment for the electronic age.

Day and night, weekday and weekend, The Steel Company of Wales is at work: making iron; making iron into steel; making steel into tinplate. And so this city of steel will continue to work for Britain and for us all.

THE STEEL COMPANY OF WALES LIMITED

Planned for Top Management

THE 100 MPH, 5-SEATER, FULLY AUTOMATIC DAIMLER ONE-O-FOUR IS DESIGNED TO A CONCEPT OF BALANCE

The Daimler Concept of Balance is the perfectly proportioned fusion of the four vital factors top management look for in a car. These are:—

(1) PRESTIGE (2) PERFORMANCE
(3) CONTROL (4) PRICE

The Daimler One-O-Four is the very essence of this Concept of Balance.

1 **A large, distinguished car.** The One-O-Four is graceful and distinguished, in the Daimler tradition. It conveys prosperity without a hint of showiness. It has an interior capacity that you would never suspect from its slim elegance of line.

2 **One of the world's fast cars.** The One-O-Four has a most impressive build-up of speed and reaches 100 m.p.h. quickly and easily. The notable characteristic of its performance is its unfussy behaviour. A quiet engine, absence of *wind noise* and exceptional road holding achieve an unbelievable docility at the top end of the speedometer. With its powerful servo-assisted brakes, the One-O-Four is also one of the world's safest cars.

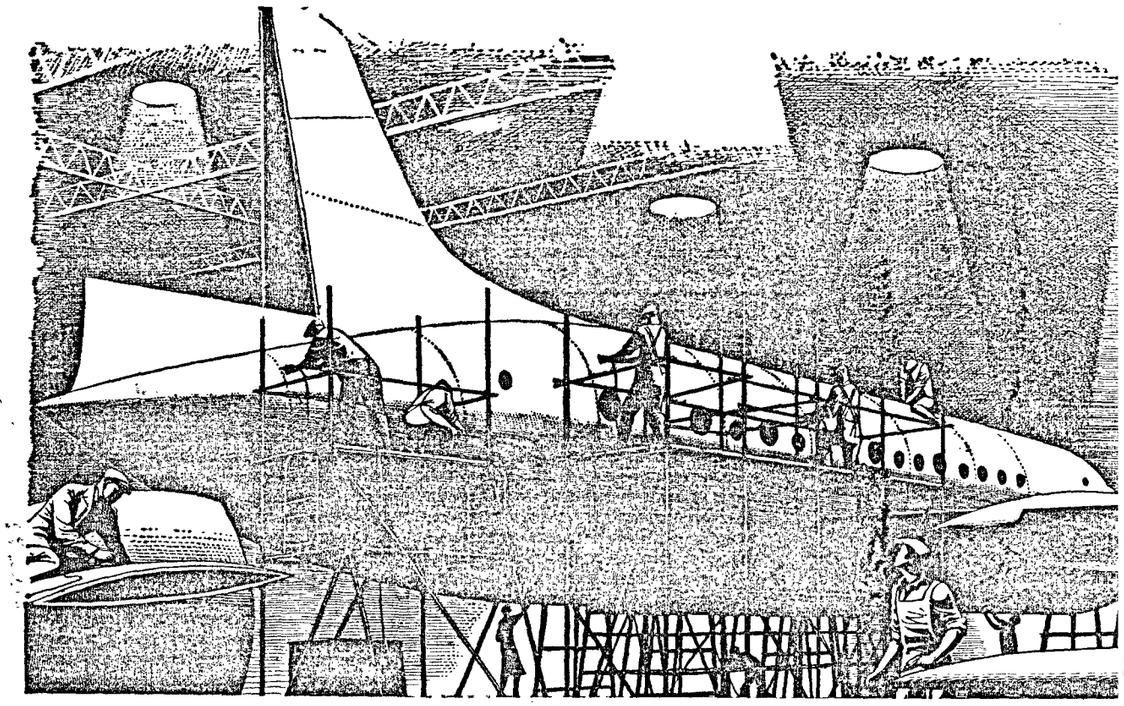
3 **Fully Automatic Drive.** The fully automatic transmission is positively human. Super-human, in fact, for it silently and efficiently changes gear, up or down, always at the right time and always more quickly, more smoothly, than one could do it oneself. Add an exceptionally small turning circle, and you have a large car that is actually very much easier to take through heavy traffic than many a smaller one.

4 **An economic price—£2580.** The nearest rivals to the automatic Daimler One-O-Four, in terms of all that it offers, are considerably more expensive. This car, created on a planned *concept of balance*, offers a very special amalgam of the right qualities at the economically reasonable figure of £2580 inclusive.

Drive Daimler

Discover for yourself the ways in which this remarkable car answers your special needs. Arrange for a demonstration with your nearest Daimler Distributor, whose address will be sent to you, with illustrated brochure and latest Road Test Report, on application to The Daimler Company Ltd., Radford Works, Coventry.

The cars in the current Daimler range are:—



The fully automatic One-O-Four 3½ litre, £2580 inc. P/T.
The fluid transmission One-O-Four 3½ litre, £2395 inc. P/T.
The fully automatic Century 2½ litre, £1,680 inc. P/T.
The fluid transmission Century 2½ litre, £1,495 inc. P/T.

LONDON SHOWROOMS AND DISTRIBUTORS—

Britannia rules the air

The mighty Bristol Britannia, Britain's latest and greatest contribution to civil aviation, is rightly called the Whispering Giant. It is bigger, faster, and quieter than any other turboprop airliner in the world. Already in service on BOAC's South African and Australian flights, the Britannia will soon be covering many more international air-routes. The demand for it is high. Even before the first scheduled flight, as many as 65 Britannias were on the order books of Bristol Aircraft.

At the busy Bristol factories streamlined production methods are speeding the Britannias into service. On the assembly lines hundreds of Atlas Copco pneumatic tools are helping to fulfil the many orders placed for the new airliner and other Bristol aircraft. They include Atlas Copco riveters, screwdrivers, hand drills, chipping hammers and grinders. Light, powerful, and efficient, Atlas Copco pneumatic tools are the natural choice of leading aircraft manufacturers all over the world.

Lifting iron ore by air

Compressed air is versatile. Atlas Copco provide the means for all its many applications. During the disastrous days of April 1940 three ships with valuable cargoes of iron ore were sunk in Narvik Harbour. This ore has now been blown to the surface and reclaimed by use of air from an Atlas Copco AR-compressor.

The Atlas Copco Group of companies is responsible for the manufacture of compressed air equipment and its distribution in 90 countries throughout the world. Group Headquarters: Atlas Copco AB, Stockholm 1.

Atlas Copco puts compressed air to work for the world

Looking for the Mainspring

THERE are more reasons this week than the accident of the calendar for asking the question always put by journalists when Parliament breaks up for Easter: how is the Government doing? Mr Macmillan, the third Prime Minister in little more than two years and the first for a very long time to reach No. 10 unexpectedly and without any overt grooming, has now been in office for three months; and his first spell has been rounded-off by a new defence policy and a novel budget in an old frame. Ever since January all the signs have suggested that the tide in the country was running persistently in the Government's disfavour. The immediate query therefore splits into three, one personal, one political, and one that goes deeper and really embraces the rest. What sort of Prime Minister does Mr Macmillan look like being? What effect are the performances of Mr Sandys—the man of the Government so far—and Mr Thorneycroft likely to have on the tide of opinion? And, finally, what evidence is there in these and other ways that the Government knows where it is going in the search for a mainspring for British policy?

The Prime Minister pointed hopefully the other day to the large number of "don't knows" in the otherwise unfriendly polls. Whether these turn out to be hidden Conservative assets or not—which depends on what the Government does—they are certainly significant. They reflect the fact that neither the new Government nor its new leader has yet taken shape in the public mind. The mystery man is Mr Macmillan himself. Determinedly casual and relaxed, he is obviously enjoying enormously the job of running the country; and his method of doing it is said to be quite simple. He tells his departmental colleagues in a couple of sentences what he wants done, and leaves them to do it: Mr Sandys's defence white paper is one successful, if controversial, example of the method; Mr Thorneycroft's budget is another less path-breaking, but also debatable, example. The doubt that has still to be resolved is whether the Prime Minister's sentences, composed without any burdensome scrutiny of the background, do in fact add up to a coherent policy for this country in 1957.

There are two views of Mr Macmillan. One, now widely held, sees him as shrewdly realistic behind his mannered Edwardian facade; the other sees him as still a deft political dilettante, with only a cursory and Baldwinesque approach to the knobbly details. Politically, his ancestry goes back before Baldwin. He is the first Prime Minister since Bonar Law who has not been, in one sense or another, a crossbencher. In his speeches he is, combatively, a partisan Tory, for all the fabianism of his earlier "middle way," which in any case has been overtaken in the party by the more liberal Butlerism. What is his "middle way," his dynamic, now?

It would be a brash journalist who gave a confident answer. But it is possible to state the problem that has to be solved. Too often it is

treated in three separate parts: foreign policy, defence and home economics. In fact these are, of course, three facets of the same problem. What is Britain's place in the world today? The task is to make the most of the country's means in order to secure the most of its ends. Mr Sandys's defence policy makes no sense without its counterpart in foreign and economic policy. Understandably, this post-Eden administration has so far had no foreign policy beyond the sensible endeavour to talk again, as friends, with the Americans and, as partners, with the Europeans—though Lord Salisbury has again revealed how divided in mind the Conservatives still are on what sort of a foreign policy is feasible. Economically, last week's budget makes no sense unless what is saved by Mr Sandys and by common sense from trying to sustain the pretensions of a great imperial power—Mr Thorneycroft's tax concessions almost exactly equal the savings on defence—is applied to fuelling the new Britain based upon high investment, high production, and the techniques of the new industrial revolution.

This, of course, is the ultimate test of last week's budget. The first and indispensable foundation of any policy for this crowded trading island must indeed be its solvency: a secure pound both at home and abroad. But to secure the pound by putting British industrial development indefinitely into a strait-jacket, to balance the country's economy at less than the highest practicable level, would be to confess failure, and to waste Mr Sandys's resolves. The country's need is to face the world with a new honesty—and fresh zest.

As it is, with Easter at hand, the politicians are thinking more of politics than of policy. The Conservatives can only too easily rally against a Labour line that, on the budget, blames them for spending too little and inflating too much, and, on defence, does not know whether to blame them for having the H-bomb or not. Their most unifying emotion at the moment is scorn for Mr Gaitskell, the "renegade" who knows the right economic questions but gives the wrong political answers. And, on the Opposition side, opportunity is being no less let slip. The Labour party is relying too much on the swing of the pendulum. It is waiting for the fruits of office to fall into its lap. So it is increasingly concerned with what it might do then, not with what it positively stands for now. To the future municipalisation of rented houses, and the future pensioning-off of present and future workers, is painstakingly to be added the future purchase of blocks of shares in key industrial concerns: all in the cause of proving that Labour is, after all, socialist. This is the weakness of Mr Gaitskell's "lonely" non-trade union, non-Bevanite position; he has, all the time, to prove his faith, whether about bombs or about nationalisation.

Yet, in front of him and his followers, there is, in a Labour version, the same glittering opportunity that the Conservatives have still to capture: the opportunity that American labour has glimpsed and partly grasped, the opportunity of standing for, above everything else, a high investing, high producing, high earning, high living—and high profit-making—society. This is the only future for Britain; it is the only future for British Labour and British Conservatism alike. It is the mainspring that both Government and Opposition should be seeking.

Jordan Survives

King Hussein and the state of Jordan have been saved for the moment by the reluctance of the Arab countries and Israel to make a decisive move

JORDAN has, for the moment, survived as a state and a monarchy. Its king has lived through ten hazardous days of government crisis. A new government has taken office under a former Mayor of Jerusalem, Dr Khalidi, a Palestinian Arab leader in no way more friendly to the West than his predecessor (now his foreign minister) Mr Nabulsi. Nothing has been resolved, nothing of substance changed, but peace in the Middle East has been granted a breathing-space.

The western governments, with their power and their money, have been, so far as can be perceived, totally without influence on the Jordanian crisis or on its outcome. On the face of things, peace on the Jordan has depended on the solitary efforts of a man of twenty-one at Amman, but even this appearance—pleasant as it is to see Arab politics in terms of Bedouin warriors rallying to a standard in the desert—is no more than a trick of the light. King Hussein remains caught in the trap that killed his grandfather; a quiet desert principality, conveniently carved out by the British to provide a domain for a Hashemite prince, was transformed in 1949 into a factious Palestinian state divided in outlook and burdened with a mass of malcontents. Since then it has had no rest from the strains of Palestinian politics or from the tug of forces between the neighbouring Arab states, though these stresses were concealed until the King's last year gave in to the mounting pressure and jettisoned public security along with General Glubb.

No doubt King Hussein is able to call on some traditional and family loyalties to help him out from day to day, but there is no national loyalty on which he can stand. The dominant national sentiment in Jordan is not Jordanian, but Arab, and in the state of the Arab world as it is, national loyalties are more likely to pull Jordan apart than to hold it together.

King Hussein found himself in conflict with Suleiman Nabulsi and his National Socialist party on grounds in which political outlook and views of the national future were combined. The late government was neutralist, pan-Arab, left-wing; it was inclined to encourage the movement for the federation of Jordan with Syria, and possibly with Egypt as well. There is no truth in the descriptions of Suleiman Nabulsi as a communist, but his desire to exchange embassies with the Soviet Union cut across the king's fear of communist influence. The trial of strength between the king and his political leaders took the form, when it came, of a curious stalemate. King Hussein found himself unable to rally a political opposition to form a government of a different complexion. The ministers, in their resistance to his wishes, stopped short of agitating for his overthrow. The army did not turn against the king. Apparently its chief of staff, General Abu Nuwar, was disposed to do so, but his faction of young officers proved weaker than it had seemed. He was opposed by a sufficient number of senior officers, over whose heads he had been promoted when General Glubb was dismissed, to turn the trick against him.

The stalemate could at any moment have been upset by interference—for instance, from Syria, which has had troops stationed on Jordan soil in the northern desert since the autumn; or from Cairo, which could have roused the crowds in the towns of west Jordan or in Amman itself. But no intervention came, and the towns remained reasonably quiet. The Syrian government may have drawn back at the thought of an Iraqi counter-move. President Nasser, whose hold on Arab feeling puts him in a position to destroy Jordan without firing a shot, was evidently restrained by uncertainty about the Saudi Arabian reaction. Iraq, which never signed the Palestine armistice, is clearly better off out of contact with Israel; for this, as well as for dynastic reasons, it would prefer the break-up of Jordan to be postponed. The Israelis, as they showed in October, reciprocate heartily Iraq's fear of a common frontier. Preoccupied with the Gulf of Aqaba, they are reluctant to involve themselves on their eastern frontier just now, though if Jordan were to break up they would be bound to make a bid for some or all of the land west of the Jordan river. The truth is that Jordan has survived, not from inner cohesion or from an ability to defend itself, but through the equal reluctance of all its neighbours, at this particular moment, to take the decisive step that would have submerged it. Our correspondent who has returned from Amman to Beirut describes the course of the crisis on page 237.

The circumstances that have spared Jordan this time may or may not be repeated on another occasion. When, one day, they fail to be repeated, a clear danger will arise of a renewal of the Palestine war, accompanied or unaccompanied by fighting among the Arabs themselves. Western interests would plainly be affected by the danger; but it does not follow that any simple course of action offers itself by which American policy (still less European or British policy, with its narrower range of action) can avert it. Britain has written off its military commitment in Jordan and will not be so foolish as to attempt to resume it; the intrinsic absurdity of the commitment was shown in October, when the British Government had to threaten to fight the Israelis on behalf of Jordan at the same time as it prepared to fight Egypt on its own behalf.

The United States government, conscious of the best motives and disposed by habit to simplify issues, may be tempted to apply the formula of offering aid for two purposes, to support national independence and to

The Economist

APRIL 18, 1857

THE LIFE OF CHARLOTTE BRONTË

WE have before us the life of a truly great and noble woman, written by one who has sufficient moral sympathy to understand her character, and sufficient intellectual insight to appreciate her genius. More need not be said—such a work cannot fail to be of the deepest interest. It contains a special interest for female readers, as recording the history of one who, in sickness and health, in obscurity and distinction, ever performed her woman's part with a persistency of gentle willingness and of scrupulous conscientiousness that excite the utmost admiration. It contains an equally deep interest for the general reader, as recording the struggles of genius under circumstances of peculiar difficulty. . . . Wherever her materials admit, Mrs Gaskell has wisely endeavoured to make the subject of her memoir tell her own tale, and she appears to have had access to a large collection of letters, for her work is thickly strewn with them. They are all interesting, but we gain from them more knowledge of the woman than of the authoress; being addressed mostly to relatives or intimate friends, they are naturally a reflex of the heart rather than of the mind. It is chiefly towards the close of her life, after her fame was established and she had been brought in contact with congenial intellects, that the character of her correspondence changes, and that we can gather from the letters any indications of her habit of thought, her opinions, or her tastes. Altogether, the work unveils a side of her character which shows itself very little in her tales. . . . It has been objected by some that Miss Brontë's works show a special defect, particularly objectionable in a lady's writing. We can safely assert that this coarseness is only attributable to the diction—never to the thoughts. . . . Her characters speak as she had heard them speak. The dialect of Yorkshire fairly represents the character of her sturdy sons. They are a plain, out-spoken people, calling things by their real names and scorning euphemisms; and Miss Brontë's sense of the requirements of art would not allow her to depict the men of the West Riding as other than they are. She was unfortunate too, in the gentlemen with whom she came in contact. The curates of "Shirley" and her own brother were not good or refined specimens, and for many years of her life they must have constituted almost all the masculine society that she had.

encourage resistance to communism. It is not clear that the American formula is applicable to Jordan. On the one hand, Jordanian independence cannot count for support on Arab patriotism, to which, indeed, it is an impediment. The choice of political attitudes is not a choice between communists and anti-communists, but merely between various shades of anti-western neutralism and various degrees of attachment to neighbouring parts of the Arab world, with the bitter anti-Zionist obsession running through all. Mr Nabulsi, when he was prime minister, made it clear that he would not sign other people's pledges to fight communism, and that if he accepted aid he would offer nothing whatever in return. As foreign minister now he is probably of the same mind. In the present condition of Jordan it is doubtful if Mr James Richards, the President's special envoy and exponent of the Eisenhower doctrine, will find a visit there worth his while. The western governments will do well to resist the temptation to suppose that they can do anything in Jordan to produce an alignment in its affairs favourable to themselves ; their most useful course would be to concert among themselves their future course of action to limit the damage if, another time, King Hussein fails to walk the high wire.

Aid for Poland?

Poland will not be able to afford much independence of Moscow so long as its economic life is precarious and dependent on Soviet support. It may be in the longer interest of the western countries, including Britain, to help the Poles to repair and reorganise their economy

POLAND is the test case of the thaw in Eastern Europe. Six months after the dramatic beginning of the Gomulka experiment it has become easier to see how far the thaw can go and what are its limits. In the first period, after the Poles had successfully defied Mr Khrushchev's orders, changes went on in Poland at such a pace that it was impossible to guess where the revolutionary tide would carry Mr Gomulka. Since then, the Polish leader has clearly been trying to get the situation under control and to slow down the pace of change. The anti-Stalinist wing of the United Workers' party, which brought Mr Gomulka back, has been told to limit its polemical zeal and to refrain from outbursts that Russia might find provocative. The new regime is making an attempt to consolidate its political position against the background of economic flux. The first signs of a Polish halt coincided with disappointments over western, particularly American, aid. The question began to be asked whether the coldness of Washington had not contributed to Polish caution.

How much could western aid affect the shape of events in Poland ? Those who expect a quick political return on any credits granted are backing the wrong horse. Admittedly, Poland, unlike Jugoslavia, cannot move outside the Soviet orbit. Mr Nagy's example in Hungary is a warning by itself. Mr Gomulka is a communist reformer, not an apostate. He wants to convert other countries within the block, by persuasion or example, to get rid of Stalinist survivals. In order to achieve this aim gradually, without violent and tragic setbacks, he has to act quietly and avoid treading too heavily on Stalinist toes. He has internal reasons, too, for keeping his radical supporters on the leash. His overwhelming electoral success in January has deceived nobody into thinking that the great bulk of the Polish people is unreservedly ready to follow the new road towards a communist society. While more concerned than his predecessors with the popular mood, Mr Gomulka is still determined to maintain the dictatorship of the proletariat based on the United Workers' party. The party may have to be purged of some of its most compromised elements, but it is to remain the pillar of the regime. The snag is that the pillar has been badly battered by the blows it has received since October. The diatribes against Stalinism and the wholesale condemnations of the past did not stir Moscow alone ; they had an unsettling effect on the party rank and file in Poland. To avoid mass desertions, Mr Gomulka was compelled to restrain his reforming followers who in October had helped him to defeat the Stalinist diehards. He now stands in the middle hoping to be able to close the ranks.

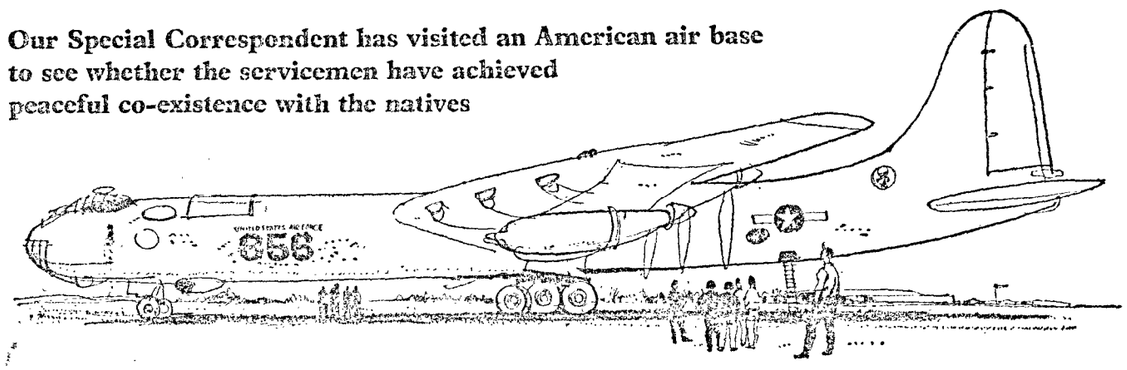
A DISCIPLINED party is the more important for the Polish leadership since it expects to meet difficult obstacles. The Catholic Church has been able to feel its own strength since the new regime has given it greater opportunities for action. The truce signed by the two protagonists has been observed so far, but it is an uneasy one and the communists are watching suspiciously the growing power of their chief rival. The other main threat to Mr Gomulka's regime lies in the countryside. Peasants interpreted the announcement of a new course as a signal to dismantle existing collective farms overnight, and the government is finding difficulty in procuring food supplies. Agricultural production is apparently rising in response to the stimulus of better prices, but the farmers shirk compulsory deliveries and prefer to sell at a higher price for

the market. The ghost of inflation haunts the new regime.

No secret is made of this threat. Mr Gomulka himself recently admitted that in the first months of this year the state's outlay on wages and food had risen faster than was planned, and that the increased cost would not be explained by a corresponding rise in supplies. This spells danger because the nation's resources would in any event have been taxed to the full to keep the pledge of a 15 per cent increase in incomes. Much is already being done to improve the lot of the consumer. New investments have been cut and are being shifted from heavy to light industry. The armed forces have been reduced for the third time in quick succession, and defence expenditure has been cut to about one-tenth of the budget. Private craftsmen and traders have been allowed to fill gaps in the planned economy. Most of the changes, however, will take time to yield results.

Imports might fill a large part of the inflationary gap, but Poland has not now the means to pay for them. Coal shipments, which hitherto accounted for nearly half of the country's exports, have been reduced by increased home consumption, and by the shorter working week in the mines, from 25 million tons in 1955 to an expected 14 million tons this year ; they may be even less in 1958. Exports of timber and cement have gone down. Poland needs credits to pay for its rising import bill. Its leaders turned to Russia first, and in November Mr Gomulka signed a trade agreement in Moscow, the main features of which were the cancelling of past debts and the promise to supply Poland with 1,400,000 tons of grain on credit in the current year. This was not enough, and Polish envoys in western capitals began to sound out the prospect for supplementary loans. Their chief hope was pinned on Washington, where, possibly encouraged by the Jugoslav precedent, the Polish delegates apparently asked for credits amounting to some $300 million. Neither Congress nor the Administration is willing to go as high as that.

POLAND really needs two kinds of credit. Grain, which could be thrown on the market to force the hand of reluctant peasants ; cotton for textile mills ; finished consumer goods to meet growing demand—all these are reliefs required immediately for the present emergency. The other kind, credits for investment, would help Poland to pay its way in future. Coal mining equipment is a case in point. Poland has the resources of coal to step up its output and exports sharply, provided it can sink new shafts and commission new mines. Polish envoys in the western countries, including Britain, have been suggesting that if western concerns were to provide them with mining equipment on credit they could be repaid by the proceeds of the resulting coal exports.



Each of the two forms of aid has a political signficance. If Poland is to hover dangerously on the inflationary precipice, with only the Soviet Union to turn to in case of an emergency, it can hardly be expected to make much of a show of independence of its potential saviour. Western credits for investment, it is argued, could help Poland to reduce its economic dependence on Russia ; until last year two-thirds of Poland's trade turnover was accounted for by the Soviet block. But the ties with Russia, though they might be loosened, cannot be broken. Marks, pounds, or even dollars cannot draw Mr Gomulka's Poland out of the Soviet orbit. A campaign for aid to Poland carried on under the banner of an anti-communist crusade would defeat its purpose and serve nobody. On the other hand, despite the present standstill in Poland's political evolution, it is an incomparably freer country than any other in the Soviet block; and its example could not fail to attract the people of other countries, including those of the Soviet Union, where the fate of eastern Europe will ultimately be decided. Aid given to Poland might have an impact well beyond its frontiers, but the example would be contagious only if it were successful.

GREATER trade across the former iron curtain might possibly contribute to bringing a European solution nearer. This idea may have been behind the suggestion (prompted also by difficulties with Congress) that, while half the American credits should enable the Poles to buy grain or cotton in the United States, the bulk of the rest should be given to west Germany as payment for supplies to Poland. A more acceptable way might be to use the UN Economic Commission for Europe as a channel. The United States would naturally be the chief western lender. But it is now obvious that American credits will fall far short of Poland's hopes and needs. Western European governments would have to fill at least part of the difference. Britain could make an important contribution. Polish trade missions in this country have shown a great interest, particularly in coal-mining equipment, electrical equipment, fertilisers and raw materials from the Commonwealth. The Government, as Mr Selwyn Lloyd told the House of Commons on April 1st, is not prepared to discuss a loan to Poland at present ; but there are possibilities short of a state loan. The machinery of the Export Guarantees Act could be used ; and the Board of Trade could be encouraged to take a broad view in considering applications for export credit guarantees for Poland.

Poland, even before the recent changes, had proved a fair debtor by east European standards, and an investment in Poland today is more likely to prove a gain than a loss. A mixture of western public and private aid for Poland might go a long way towards ensuring the success of Mr Gomulka's experiment in limited independence. This, in turn, might conceivably tend to relax the deadlock and relieve the despair in eastern Europe. The communist heretic will not leave his faith and company, but he might possibly prod his brothers along the road of a limited reform.

American Base

Our Special Correspondent has visited an American air base to see whether the servicemen have achieved peaceful co-existence with the natives

By the entrance to the airfield stood a Spitfire fighter, the pride of a generation of aircraft, set up on a concrete raft as a memorial to the Battle of Britain. Her once-revolutionary lines looked graceful but effete in comparison with the chunky scarlet-and-silver jets howling along the runways in the background. The Royal Air Force ensign fluttered from a twin flagpole, while, next to it—tactfully on the same level, but much larger—flew the Stars and Stripes. This old RAF station, having fallen into disuse after the war, was taken over in 1950 by the United States Air Force as a base for interceptor fighters, and is now manned by some two thousand Americans and two hundred British employees.

This base is one of a score or more of American operational bases in this country, and there are half as many again which are non-operational. The units they serve are the Third Air Force (tactical aircraft supporting General Norstad), and the Seventh Air Division (which is part of the United States Strategic Air Command, whose heavy bombers come over here in relays for training). Including supply depots and air transport services, the total of American bases in Britain is over thirty—the exact number being secret until you have counted them.

These bases are manned (more generously than RAF bases) by some 45,000 American servicemen, who between them have about 35,000 dependants here. Nearly all of them are volunteers; there are no national service conscripts in the American air force. As well as the hard core of long-service regulars, there are large numbers of young men who enlist for four years, instead of doing their ordinary two years of selective service in the army. They usually spend three years overseas. On this camp in Southern England they are evidently far less comfortable than in Germany, where, as a former occupying power, they have done what they like with their airfields. In England, they merely borrow (not lease) the bases from the Air Ministry, which remains responsible for building and extending them. Countries to ge[illegible]is one the men live in long dormitory huts taken over from the RAF, only the officers and senior NCOs having single or double rooms.

The services available to them on the base are, however, better than those available for their British predecessors. There are clubs and bars for all ranks; games fields, with baseball ground and bowling alleys; a cinema, whose films, the American companies insist, must already have been shown on the public circuits; the commissary, or self-service store, where air force wives can buy not only local perishable produce but also the canned goods, cake-mixes and so on, which go to make the American way of life; and finally, the PX (Post Exchange), that remarkable shop through which almost anything from cars to whisky (rationed, for senior ranks only), from suits to toothpaste and baby clothes, can be bought duty free.

None of the servicemen's wives actually lives on this base. Unlike some larger and more remote ones, it has no married quarters and the families live in the nearby towns. As these are holiday resorts, there are plenty of landlords or landladies who are only too glad to find tenants who will stay all the year round. Their enthusiasm first showed itself in the charging of grossly inflated rents to Americans, but this was checked by a few appeals to rent tribunals, and now by the compulsory inspection by the air force authorities of all leases entered into by airmen—an arrangement that still permits some fat profits to be made. Here at least competition for housing is not a source of friction with the local population. And here at least, too, the servicemen are better off than they are in one East Anglian base, where they live, on an average, sixteen miles away.

This sort of problem is being met by building "tobacco houses" on the bases themselves. They are so called because they are built by the British Government, in return for free supplies of tobacco. British manufacturers can then buy this tobacco from the Government for sterling, and in addition to their normal supplies. The houses, built to an ugly bungaloid American specification, remain the property of the Air Ministry.

The American authorities consider, however, that their people can be too much on the base and that it is better that they should live among the local population. A few parents even send their children to British schools on the theory that they pay more regard to the three R's, but most of the young children go to the American school on the base. Children of secondary school age usually go to a boarding school at Bushey Park, where the curriculum fits on to that of American high schools or universities.

It is the single men, rather than the families, who make the most impact on society, sometimes reviving the wartime complaint that what is wrong with Americans is that they are "overpaid, oversexed and over here." With an American private earning perhaps half as much again as a British national service second lieutenant, there is bound to be some ill-feeling. But this is confined to the males, for Anglo-American marriages take place at the rate of 250 a month. The US Air Force regards itself as being *in loco parentis* in the matter of the men's matrimonial affairs. Its control is a marriage guidance counsellor's dream.

If a man wants to get married both he and his girl friend fill in a form giving particulars of parentage, date of birth and so on, including a declaration that each is free to marry; and he must be able to say that he has saved at least $300. He is interviewed by the commandant, and then the couple go to see the chaplain, who will try to find out whether they seem compatible and whether she realises what it means to emigrate. Then she must have a medical examination in an American hospital, to find out whether her health is such that she would be granted an American visa. After all this, the would-be bridegroom is told whether his choice is approved. The authorities have no legal power to stop him marrying if he insists on it—they cannot even withhold dependants' allowances, though they tried that at first—but they can post him elsewhere, and make him aware of the likely effect of defiance on his promotion prospects.

Attempts are sometimes made to introduce the men to girls of guaranteed respectability, but they understandably fight shy of guaranteed girls. Friendship with English people other than girls develops still more slowly; but Englishmen join the Americans round the juke box in the local pub, while across the room sergeants with improbable numbers of stripes devotedly play darts. American negroes, though fully integrated into the air force as far as work is concerned, do not mix much with the others off duty, but they often make friends with West Indians and Africans in England.

Laments have greeted the recent news that two bases in the north are to be closed. The reasons for this sorrow are partly economic—closure will certainly be a hard blow to the local garage-owners and dance-hall proprietors, as well as to British civilians employed there. American military expenditure in 1955-56 brought the United Kingdom an income of $346 million—the largest single source of dollars, three times greater than the dollar income from tourism (excluding fares). And of this, personal expenditure by American servicemen and their families amounted to $63 million—nearly as much as the proceeds of whisky exports.

But, setting aside such mercenary considerations, the further reduction of American forces here will arouse regret, at least on personal grounds. (A lessening of the fearful noise of the jets that now drive the local populations mad is another matter.) One airman told your correspondent that he "had a much better time in Germany." But, as the satisfaction of some individuals may well be in inverse proportion to that of the natives, there seems no reason to doubt the opinion of the American authorities that the relations of their overseas troops with the local people are nowhere better than in Britain.

NOTES OF THE WEEK

COMMONWEALTH RELATIONS

June Rendezvous in London

It is customary to withhold the official announcement of a meeting of Commonwealth prime ministers until they have all had time to make sure that their programmes can be conveniently adjusted; and, as their number grows, so the almost astrological problem of finding a propitious date becomes more complicated. That is doubtless a sufficient explanation of the fact that, while prime ministers in various Commonwealth countries have already made known their intention of attending a meeting in London towards the end of June, there has been an interval between Mr Macmillan's forecast on April 1st and the official announcement. There is no sign that any member government is still too upset by the past winter of discontent to accept a midsummer rendezvous.

This is heartening evidence of the resilience of the system, if "system" is not too precise a word for an organic growth such as the Commonwealth partnership has newly shown itself to be by the budding of a sovereign Ghana. But there is a lurking danger in so successful an overcoming of the strains imposed on the Commonwealth bond by Britain's actions last November. The danger now is of a rebirth

of the feckless assumption that Britain's special historical position entitles it to the loyalty of its fellow members whatever it does. While the Government may have lost any inclination to play the Bourbon, sections of British opinion do not yet seem to have learned the lessons of recent months.

During those months of stress, the suggestion was canvassed that it was time to start rotating the meetings of Commonwealth premiers around their respective capitals. If the Government has considered this idea, its disinclination to try it now has presumably been influenced by the belief that, if this next meeting was held in, say, Ottawa, it would suggest a chillier relationship between Britain and the Asian members than in fact exists. That is a fair argument. But it may also be argued that, once a London meeting has served its purpose as a token of reconciliation, there should be no delay in arranging that subsequent meetings should symbolise the sovereign equality inherent in the Commonwealth bond.

TORIES

Easter Bonnets

THE Conservatives approached the Easter recess feeling more pleased with themselves than at any time since the early days of the Suez invasion. They have been almost equally pleased by the budget, the defence review and the ineffectiveness of the Opposition. They are delighted that Mr Gaitskell has undoubtedly had an unhappy last three weeks of terms. After his somewhat inglorious showing in Labour's internal squabble about defence, about which his party thinks he feels too little, Mr Gaitskell spoke in Monday's debate on economic policy, about which his party feels he thinks too much. At the end of his honest, if painstaking, review—in which, unlike Mr Wilson last week, he did not try to ride every horse in every direction at once—the Labour party, which had admired Mr Wilson's considerable political dexterity, gave their leader only a very ordinary ovation. Mr Nigel Birch seized the opportunity in the following speech to make some spontaneous mockery of Mr Gaitskell, and the Tory benches showed their delight. They also enjoyed themselves on the first day of the defence debate, on Tuesday, as Labour's right and left wings threw unconventional bombs at each other.

There are, however, still three clouds on the Tory horizon. One is the fear of what may happen in the party if Britain and other users of the Suez Canal accept "whatever terms are imposed on them by Colonel Nasser"; Lord Salisbury's unexpected letter to *The Times*, declaring that he hopes "most sincerely that the Government will not lend themselves to any such course," would be ominous for Mr Macmillan in any circumstances but the present. The second cloud, however, which could blot out any major Tory revolt on the Canal issue, is disappointment that petrol rationing is to continue; the party is waiting for its abandonment sufficiently eagerly to make some backbenchers want to solve Middle East awkwardnesses by ignoring, not exacerbating, them. The third cloud is the memory that there has been no by-election since the budget, and that the greater feeling of confidence among Tories at Westminster may not necessarily be reflected in a greater geniality among non-surtax payers in the country. But at Westminster, at least, the Tory sun is shining.

PARLIAMENT

Well up to Timetable

THE general (if mildly spurious) air of Government efficiency and good heart which overlies Westminster on the eve of the recess has been enhanced by the fact that Mr Butler and Mr Heath seem to be well on top of the Parliamentary programme. Admittedly, with Easter falling late and the Finance Bill due to take up so much time from now on, the timetable needs to be well advanced, but there is no sign of the usual spring log jam—despite the fact that a large part of the pre-Christmas term had to be spent in endless debates about Suez. More than twenty bills have been given the Royal Assent since the session began last November. These include several of at least medium size and importance, including Films, Rating and Valuation, Anti-Dumping, House of Commons Disqualification, Homicide and Railway Finance.

The Commons have finished with two of the big bills of the session—Rents and Electricity. The Lords gave the Rents Bill a second reading on Tuesday and will probably have it on the statute book by Whitsun; they will start on the Electricity Bill immediately after Easter. This leaves the Commons with only one big measure, apart from the Finance Bill, and that is the wretched Shops Bill. This is still chugging its way through the Lords, and there seems every prospect that it will either be sufficiently amended to placate liberal (which in this case means Tory) opinion or else dropped altogether. This ill-conceived brat was left on Mr Butler's doorstep at the beginning of the year; as a reform-minded Home Secretary he would presumably like to turn it on its head, and as Leader of the House he would certainly like to forget it. As one other questionably Tory project, the proposed Hire Purchase Bill, has wisely been dropped, the Government is left with only one item outstanding from an admittedly modest Queen's Speech—Lords reform. Mr Macmillan has promised some Government proposals about the Upper House this session, but nobody is expecting any early legislation on the subject. Yet it is fear of controversy, not the exigencies of the timetable, that must now stand in the way.

BUDGET DEBATE

Economics Under a Bushel

MR THORNEYCROFT'S £100 million of tax reliefs must be designed to bring total demand into balance with some estimate, however tentative, of safe potential production; but the four-day budget debate has confirmed that the Government is not going to reveal to anybody what that estimate is. This trend towards hiding the main economic calculations on which the budget is based, for fear that the calculations may prove to be wrong, was started last year, when it was excused as a temporary phenomenon in a "year of redeployment"; its repetition this year, thus throwing out of public sight the budgetary principles which Lord Keynes brought into the Treasury, has been allowed to pass with insufficient parliamentary attack. If the Economic Section of the Treasury, which is the guardian of the Keynesian tradition, is to become a secret service, then it is bound eventually to lose some influence over policy

to purely administrative branches. Anybody who doubts how unfortunate this would be should read a discreet, but implicitly rather worrying, article by the ex-deputy director of the Economic Section in the current issue of *Lloyds Bank Review*. He should also read the speeches of the two junior Treasury ministers in this week's debate. Mr Birch's sparkling inconsequences, delivered without notes, were a parliamentary success; but Mr Enoch Powell's survey of the minutiae of the Exchequer accounts—the sort of speech that could have been made in any pre-war budget debate—was a really rather startling reminder that the new Financial Secretary to the Treasury is a former Professor of Greek.

The immediate explanation of the unrevealing, and deliberately non-economic, way in which the Government has chosen to present the case for its budget this year is presumably that the advice given to it by economists has been conflicting; Mr Thorneycroft virtually confirmed that the amount of tax reliefs eventually decided upon is a compromise, with a bias towards caution. But he was not going to say what figure for the expansion of demand and national income those who have reached this compromise have in mind. Sir David Eccles, at one stage in his speech, seemed to be bubbling on the verge of more welcome indiscretion. He announced that the Government now believes that the prospect for expansion of exports is "somewhat better than when the Economic Survey was drafted" (but was no more explicit about what the prospect then was), and he laid more emphasis than any other minister on the expected rise in consumption this year, on the "undoubted slack in the economy," and on the fact that "the spare capacity could more than meet the extra demand on the home market." His speech accorded fairly well with the estimate, made in *The Economist* last week, that the Government may be hoping that sufficient of this slack will be taken up in the new financial year to allow production to rise by £500 million or so. But nobody really knows. The 1957 debate on the budget resolutions will therefore be remembered principally as the occasion on which Mr Jack Jones burst into tears on the floor of the House. He was not the only one to feel that way.

SUEZ CANAL

The West's Weak Hand

AFTER a six months' break, the Security Council is expected to resume its discussion on the running of the Suez Canal. But the western countries have committed an error of judgment in thinking that the terms which the Egyptians agreed to in October would still be open now. The Egyptian commitments then were sufficiently vague for President Nasser, who now has an immensely stronger hand, to interpret them in the light of new circumstances. He has explained his dismissal of the Security Council's six principles with the intriguing logic that as the principles stood they would be too difficult to understand, but that he has incorporated their substance in his new proposals. The memorandum from Mr Hammarskjöld to Dr Fawzi, which on November 2nd was accepted by Egypt as the basis for negotiation, has apparently been waved aside as no longer relevant: among other points the letter emphasised co-operation between canal users and Egypt and laid down that "the manner of fixing tolls and charges would be subject to agreement."

But the users have now little means of bringing pressure on Egypt to accept these earlier transactions as binding. The resumption of traffic through the canal, even before negotiations began, demonstrated the users' disunity, which makes idle all talk of a complete boycott. The apparent failure of the private American-Egyptian negotiations to produce any substantial concession from President Nasser shows that in this case the West's strongest card has proved a dud. American pressure, without the threat of economic sanctions, has not budged Cairo, and the American government in September repudiated any idea of economic sanctions against Egypt.

The only issue over which Egypt's position is clearly weak is the breaking of the 1888 convention by President Nasser's continued refusal to allow Israeli ships through the canal. The Egyptian claim to belligerent rights under the armistice agreement was denied by the Security Council in 1951, and by both Mr Hammarskjöld and Mr Dulles during the present crisis. But this one point on which the West's bargaining position may be stronger than Egypt's has been omitted from the recent discussions. The Israeli claim is thought an embarrassment and it is known that the State Department would like to hand the problem over to the International Court. But only over Israel is there general agreement, outside the Afro-Asian countries, that President Nasser is in the wrong.

CYPRUS

Solomon's Knife

A PASSAGE in the white paper on defence suggests that the government has begun to re-assess its attitude towards Cyprus. The white paper says that bomber squadrons capable of delivering nuclear weapons are to be based on Cyprus in fulfilment of defence obligations under the Baghdad Pact. A corollary to this seems to be that British sovereignty over Cyprus has become expendable; for the Baghdad Pact faces north, not east, and nuclear weapons are an international factor, not a purely British one. The bombers to deliver them can no doubt be accommodated on Cyprus without British sovereignty.

This new line of thought does not yet seem to have reached Archbishop Makarios, who has apparently emerged from his exile like Rip van Winkle from his sleep, to a world that has changed without his realising it. The Archbishop no longer holds the power of veto over a negotiated settlement because the choice is no longer—as it was at the time of his exile—simply between a negotiated settlement and maintaining the British presence by force of bayonets. If the Cypriots will not accept self-government without enosis, the British may have no alternative to partitioning the island, maintaining only a bomber base by agreement with the Baghdad Pact countries or Nato.

Everything that Archbishop Makarios has said since his release has indeed made partition, deplorable as it would be, seem more probable. The Turkish government has reacted to his intransigent statements as might have been expected. It has now again made it clear that consultations leading to partition must take place with Greece and Britain; and meanwhile it refuses to talk to the Archbishop. It should now be clear to the Greek government and the more fanatical Greek Cypriots that the Turkish factor can no longer be ignored. For all concerned, the breathing

space must be measured in weeks rather than months. Failure to agree on self-government will leave the baby in British hands, but not for long: in the tragic series of postwar disputes unsatisfactorily shelved by partition, another judgment of Solomon may be at hand.

KENYA

A Row in Prospect

THE Lyttelton settlement which gave Kenya a council of ministers of all races—European, Asian, Arab and African—is now in danger. Mr Tom Mboya, who has emerged as the African leader since the African communal election put eight new nationalist-minded Africans into the legislature last month, has made it clear that neither he nor any other African member will serve as a minister unless the government agrees to increase the number of elected members at an early date. Mr Mboya is demanding a reinforcement of 15. This would mean that there would be 23 African elected (and two nominated) members in a House of 74; the size of the present house is 59. Thus the Africans would not have a majority over other races, but they would be more or less equal in strength to the other elected members, both European and Asian. Mr Mboya is claiming this increase on the not entirely unreasonable grounds that eight members find it hard to represent five million Africans adequately. He has in mind a great deal of African constituency work, which he would describe as political education and the settlers as agitation. There can be no doubt that Mr Mboya's ultimate aim is, first, equality of African representation with the other races combined, then superiority on the basis of population.

The Asian members are evidently inclined to back the

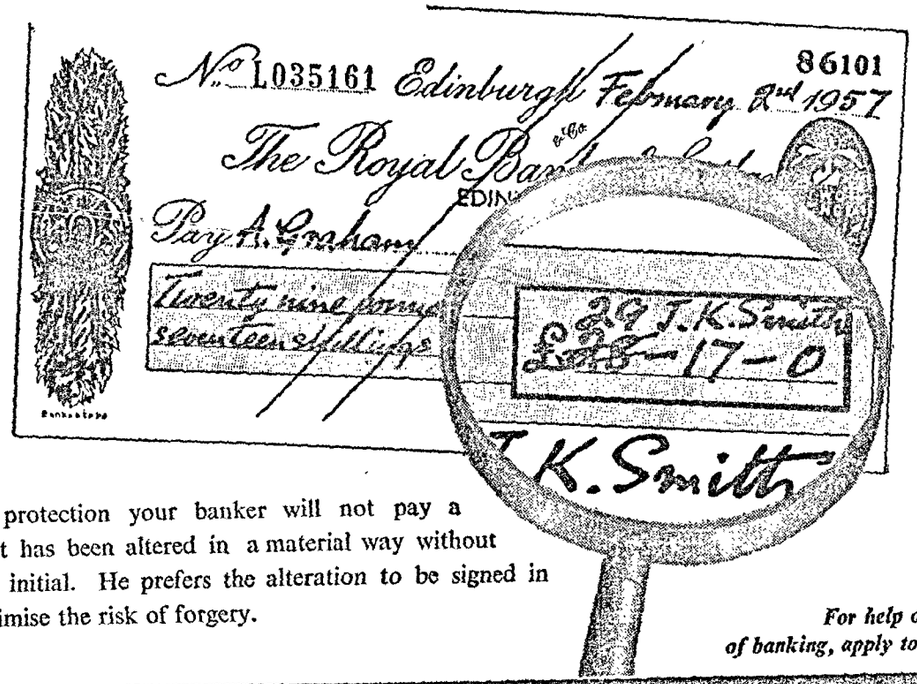
An Account of Shop Stewardship

THE main finding of Lord Cameron's court of inquiry into the dispute at Brigg's Motor Bodies was that "a section of the shop stewards' organisation at Briggs is largely identified with the unfortunate state of affairs existing there," and that this organisation had allocated to itself some extraordinary powers. It raised funds by means of a lottery, which, in the five months from March to August, 1956, had brought in over £16,000. Of this the stewards paid out only £9,340 in prizes; the rest went on their own expenses, on producing a paper ("raucous and belligerent in tone") called *The Voice of Ford Workers*, on supporting strikes, and on contributions to a mysterious "central fund," the purpose of which was not disclosed. In all this the stewards were virtually responsible to no one.

Elected by his own shop, each steward at Briggs represented members of other unions beside his own, and apathy had secured for one union more than its share of the shop stewards. Out of 160 stewards, 54 belonged to the Amalgamated Engineering Union, although it was one of 22 unions and had only some 2,000 of the 9,000 workers employed. The AEU stewards were in theory responsible to their district committee, but this consisted largely of themselves. Lord Cameron found that there were some reasonable people among them, but on the whole they used their power and their newspaper to stir up trouble. They were strongly under communist influence. The court recommended that the unions concerned should immediately look into the organisation of the shop stewards' committee and liquidate its excess powers.

This is not a problem confined to the AEU, nor to Briggs' Motor Bodies, although the dispute there has brought it into sharp relief. The shop stewards' tendency to run off union rails has long been a matter for anxiety at head offices. But they are now recognised as a regrettable necessity in the rules of most unions, for they are usually charged with collecting contributions and recruiting new members. They first made their appearance in the engineering industry at the end of the last century, at a time when rapid technical change made the workers feel the need of a representative who understood their particular problems. Their dissident power became evident in the first world war, when they fomented strikes after the unions had agreed to ban them. During and since the second world war their power has increased still more. Full employment has strengthened them against the employers, so that they are sometimes able to extract wages and conditions over and above what is prescribed in national agreements. Their authority in the eyes of the workers has increased at the expense of that of the branch secretary—the local paid union official, with an office outside the factory. Prosperity, comfort and the telly have robbed the average trade union member of the sense of personal injustice and the missionary zeal that once drove him out to attend dreary branch meetings in the evening.



*

So, for many, the shop steward is the only contact with the union. But it is a contact over which the member has little democratic control. The steward does not work through properly ordered meetings, where resolutions are gravely considered and passed. A shouted slogan or two, answering cries from the comrades, abuse and contempt for anyone who counsels caution—and a strike call is issued which the rank and file is induced to obey in the name of solidarity. It is true that in theory the rank and file can sack their steward. But tradition is such that they are more likely to do so if he makes too little fuss than if he makes too much.

In any case, who would take his place? As Lord Cameron pointed out, the shop steward's is "a thankless task." In most firms he gets time off, with pay, for his union business; but he has less opportunity to earn than his mates. Sometimes he gets a small commission on the contributions, but few stewards, presumably, have had the bright idea of meeting their expenses as luxuriously as the Briggs men did. It follows that the job attracts those who get their satisfaction not from money but from power, or from the pursuit of a mission. Above all, it attracts communists.

Lord Cameron said that Briggs had one of the most powerful shop steward movements in the country; not all industries, certainly, have the same trouble.* The boot and shoe industry is notable for peace, and so, since the war, are the iron and steel workers. Some industries, like agriculture or the docks, lacking factory organisation, do not have stewards at all. But the problem is widespread enough to warrant drastic action by the trade union—even perhaps to the extent of organising the branch, with a centrally appointed and paid official, at the place of work. It is not only particular industries or exports that suffer from the stewards' irresponsible power. It is, above all, trade union authority.

* See Mr B. C. Roberts's excellent "Trade Union Government and Administration in Great Britain," to which acknowledgments are made.

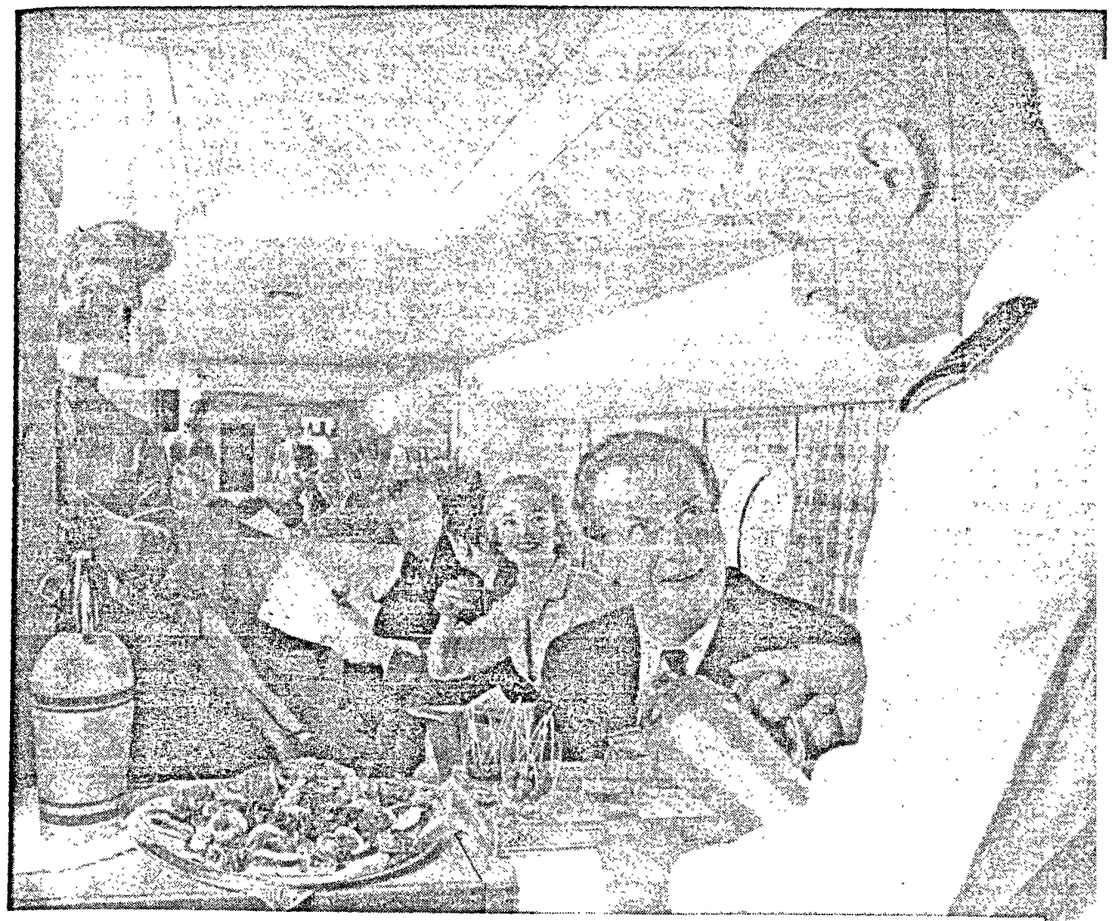
The Royal Bank of Scotland · Williams Deacon's Bank Limited
Glyn, Mills & Co.

Man . . . and Machine



Though Kenya possesses a fast-developing modern mining industry, it is still possible to see ores being won from the earth by the old traditional methods. For successful business dealings the Westerner needs to know something of both these sides of life in Kenya. Here he will do well to consult the National Bank of India; for the bank not only provides an efficient modern banking service, but has also a fund of knowledge of all kinds concerning Kenya, as well as India and Pakistan.

New Monarch super-luxury service to New York by Stratocruiser

Here is something unsurpassed in direct air travel from London to New York—a service *designed* for people who particularly appreciate *luxury*. B.O.A.C. "Monarch" services by *double-deck Stratocruiser*—already the finest across the Atlantic—have now been made super-luxurious.

The interiors of these fast, powerful airliners have been sumptuously redesigned. The upper-deck cabins have been replanned to achieve such *spaciousness* as never before—*every* passenger now enjoys a fully-reclining "Slumberette", or for a nominal extra charge a private sleeper berth. On the lower deck, you can relax over drinks in B.O.A.C.'s gay, smart Atlantic Club Room.

The food is the finest in the air—a magnificent 7-course dinner with vintage wines is served from a silver trolley by the courteous staff of 3 Stewards and a Stewardess.

Consult your local B.O.A.C. Appointed Travel Agent or any B.O.A.C. office.

Remember—it costs no more to fly by B.O.A.C.

Africans in this request, which means that one (though probably not both) Asian ministers may be ready to resign if the government refuses to negotiate. This would finally bring the Lyttelton settlement to an end—unless the governor nominates African and Asian ministers from outside the house, as he has the constitutional right to do, if he can get men to serve. This would be an unhappy expedient, as the whole intention of the former Colonial Secretary when he made the agreement was to have ministers responsible to their communities. Yet rule with a government of white ministers only would be a thoroughly bad alternative, and would attract criticism from abroad as well as from the Labour party at home.

A serious row is therefore in prospect. There should be no illusions about negotiating with Mr Mboya. He is out for power in a mainly, if not entirely, African state. Of course, the way in which this situation should have been avoided—and perhaps in which it could still be ameliorated now—would have been by moving more swiftly towards the creation of multiracial constituencies, with whites and blacks voting for some of the same candidates side by side. But anybody who advocated this during the Mau Mau emergency was accused of "weakness"; and now any concession to Mr Mboya will be dubbed "weakness" too.

LITTER

A Bill for the Bin

On Friday a sparsely attended House of Commons gave an unopposed second reading, against the advice of the Government, to a Conservative private member's measure called the Litter Bill. The impression given by almost every speaker in the debate was that the two junior ministers who opposed the bill must obviously be scruffy types, who were personally in favour of litter. That is the sort of charge that is apt to be levelled against anybody who points out that some social evils can best be solved by non-legislative action—in this case by more education about tidiness in the schools and by more litter bins in public places—and that bills which seek to counter undoubted nuisances by imposing ever-higher penalties can set up strains of which their sponsors could not really approve. Friday's debate was a minor but characteristic case; it is worth examining closely what sort of measure is this Litter Bill, which the wind of a few enthusiasts has now blown on to the floor of the House.

The bill has three objects. One is to embody in general legislation the anti-litter regulations that are now contained in local bye-laws at local authorities' option; as all but one of the 61 county councils in the country have such bye-laws in operation, there can be no great harm (but also not much point) in that. The bill's second object is to increase the theoretical maximum fine for litter-scatterers from £5 to £10; as the actual fines imposed by magistrates throughout the country are almost invariably below the present maximum, ranging from 10s. to £2 according to the magistrates' individual fierceness, the justification claimed for this provision is mainly—and mysteriously—that it would have a "psychological effect." The third object is to extend anti-litter controls from public places to private land. The bill would actually make it a criminal offence to leave a piece of paper in somebody's back garden or somebody's field, and would allow the occupier or his "authorised agent" to tell the passer-by to pick up litter or else be compelled to give his name and address.

It is this last provision which conjures up a picture whose implications the bill's supporters cannot possibly have thought out. "Pick up that dirty piece of paper into which a child has been sick, and put it into your pocket until you find a litter bin some half-an-hour's walk hence," says the Authorised Agent. "But I didn't drop it," says the passer-by. "Don't argue with me," says the Authorised Agent. "If you dispute my authority, by Parliament enacted, I must have your name and address." What is the right answer to give to that? What is the right comment to make about MPs, who would give unofficial—or even official—*authorised agents the right to say that?* The right answer, in Britain if not in Prussia, must be to put this Litter Bill into the parliamentary litter bin very quickly indeed.

GERMANY

Electoral Explosive

Atomic weapons have become electoral explosive in west Germany. Fifteen leading German nuclear scientists have attacked the proposal to give them to the German army and have refused to play a part in their production. The statement is a direct challenge to the stand taken by Herr Strauss, the Minister of Defence, last week, that the military need to arm the Bundeswehr with atomic weapons is incontestable. Dr Adenauer has answered the scientists sharply, emphasising both his own concern for agreed disarmament and the need for the deterrent so long as it is not achieved. But neither the Social Democrats nor the Free Democrats have been slow to use the scientists as a bludgeon in return. The socialists have long opposed atomic weapons for the German army, like any other sort of rearmament; and they fear this would lead to German armed forces getting atomic weapons from the Russians.

Dr Adenauer's position is the harder to contest after the British defence white paper. The use of atomic weapons by German forces was implied in the whole change in the aims of German military planning last year from Herr Blank's mass old-fashioned forces to the streamlined divisions of Herr Strauss. But the cruel prospect that two German armies may in a few years be pointing atomic warheads across the Elbe is as painful for the German electorate as for Germany's allies. Nato's careful distinction between a tactical atomic war in central Europe and the great cataclysm itself seems unreal to Germans; from time to time Nato manœuvres on German soil strengthen the fear that either may mean Germany's extinction.

The debate has been given a new twist by the scientists' discussion of the broader issue whether Germany should make the bomb as well as use it. This naturally raises still greater fears in Germany; feelings abroad need hardly be described. West Germany renounced the manufacture of atomic weapons under the Paris agreements. But Britain's retreat after a mere two years from its undertaking not to reduce its forces on the Continent has, despite formal compliance with the procedures of the alliance, devalued the whole concept of restricted German rearmament and opened the door to a German demand for revision, too. The problem remains obscure so long

as the extent of American atomic aid to Nato is uncertain. Herr Strauss has clearly stated that the German government is not undertaking research on atomic weapons and that it does not contemplate doing so, at least on a national (as against a European) basis. But talk of the manufacture of atomic weapons by a European arms community has spread in Germany.

CANADA

Death by Innuendo

THE anger that has been aroused in Canada by the circumstances surrounding the suicide of Mr Herbert Norman, the Canadian ambassador in Cairo, is entirely understandable. Three weeks before his death, a sub-committee of the United States Senate had published the transcript of a hearing at which an American diplomat had been questioned about Mr Norman's political views. The diplomat said nothing to his discredit, but the published record included a repetition of allegations made—and refuted—several years ago that Mr Norman had had communist connections before the second world war.

It may be questioned whether Mr Norman's suicide can be attributed purely to this particular bit of muck-raking. His government had sent a strong note of protest to Washington immediately after the sub-committee issued its transcript, and had assured him of its unshaken confidence in him. The State Department had expressed similar confidence. Mr Lester Pearson had told the Canadian House of Commons that the sub-committee's action should be treated with the contempt it deserved. In a message to Mr Pearson, Mr Norman himself had expressed deep appreciation of the Commons' reaction, in terms which suggested that he was heartened rather than dismayed, only a fortnight before his death. Nevertheless, the Canadian MP who spoke of "assassination by innuendo" was voicing an anger which was as inevitable as it was nation-wide. Canadian churchmen and other public figures joined the leaders of all the country's political parties in venting their indignation.

Mr Eisenhower and the State Department have firmly disclaimed responsibility for the sub-committee's conduct, emphasising the American constitutional division of powers in terms that imply disapproval of the senators concerned. Canadians, however, are familiar enough with the United States constitution to need no such reminder, and they show little sign of being mollified. While it is undeniable that the Administration has no constitutional means of improving congressional behaviour, the unappeased wrath of a very good neighbour may yet have a healthy effect on Capitol Hill.

FRANCE

Holiday Tasks

M. MOLLET and his ministers will not have much rest during the parliamentary Easter recess, which lasts till the middle of May. M. Ramadier, the finance minister, faces a particularly heavy holiday task. His troubles with the fast sinking foreign exchange reserves are discussed in a Business Note on page 245. On the home front, the higher bank rate and credit restrictions introduced last week will not be enough to halt the inflationary tide. The government intends to supplement these measures with some cuts in public investments. It now also admits the need to raise money through new taxes, which it hopes to be able to fit into the framework of fiscal reform. But new taxes, under whatever guise, are liable to precipitate a crisis when parliament reassembles, so that the fate of the government now partly depends on M. Ramadier's homework.

Budgetary cuts were to form an important part of the austerity programme. No agreement, however, has yet been reached on the means of carrying out the promised reductions of £150 million in civilian and £100 million in military expenditure. It had even been suggested in some quarters that M. Mollet might take advantage of a few weeks' freedom from the deputies to make a fresh attempt to break the Algerian deadlock. But there are no signs as yet that he contemplates throwing over his minister resident in Algeria, M. Lacoste, or altering his hitherto fruitless policies. M. Mollet may claim that the boot is on the other foot and justify his inaction by the recent intransigence of the Algerians. But if the present efforts of the Tunisian premier, Mr Bourguiba, to get the Algerian rebels to moderate their attitude meet with any success, the French government will no longer have any excuse for hedging.

MALTA

No Equivalence Via Extravagance

WHILE the major negotiations about Malta's possible integration into the United Kingdom are in peril—because the British Government boggles at Mr Mintoff's demand that integration should in a fixed period entitle Malta to "equivalence" in wages, social service and living standards—some cold water of criticism has been poured on Mr Mintoff from a strictly independent source. Sir George Schuster and Mr W. D. Scott, the two commissioners who were asked to investigate how much British aid should go to Malta in the interim period before integration, have issued their report. They declare that many of the Maltese government's proposals and estimates under their 1956-57 and 1957-58 budgets were too ambitious: last year it proved to be physically impossible for spending to reach the level originally proposed. The commissioners recommended that the Maltese government's requests for aid for the present year should be scaled down from £6,918,000 to £5,877,000; the Colonial Office, less willing to annoy, has awarded Malta £6,070,000.

The commissioners strongly oppose many Maltese schemes for local betterment, such as a large and sudden increase in Maltese civil servants' salaries. They reject an expensive scheme for a general hospital on grounds (supported by medical evidence) that Malta needs doctors and consultants before beds. They throw doubt on schemes for an industrial trading estate, "where firms should not be encouraged to erect their own factories . . . as this might lead to speculation," and urge that it would be far better for firms to have a fixed stake in their enterprise. The commission's report hardly suggests that the British Government is merely mean to haggle firmly with Mr Malta on the size of block grants. There is still too little sign of understanding in Malta how higher productivity is to be achieved—but more than a suggestion that "equivalence" can be attained by simple subsidy. It cannot.

ASIA

Mr Bevan in India

DURING his visit to India, Mr Aneurin Bevan has been speaking his mind to some purpose. He made short shrift of the sadly common Indian belief that British criticism of Delhi's Kashmir policy is merely a tit-for-tat after India's denunciation of the attack on Egypt. He told members of the Indian parliament that they, having enjoyed the right to disagree with Britain, must not be "hypersensitive" when Britons disagreed with them. His words seem to have had a healthy impact; it is, after all, difficult to identify Mr Bevan as a supporter of Sir Anthony Eden. Later, when questioned about Kashmir, he brought out the essential point that is so often passed over in discussion of that dispute: the fact that the prime interest of India and Pakistan is to live together in friendship, and that the Kashmir question should be resolved in the way that will best contribute to that friendly co-existence.

When he came to discuss the Middle East, Mr Bevan was able to cite Mr Nehru and Mr Krishna Menon in support of his plea that India ought to put pressure on the Arab countries to accept the existence of Israel as a hard fact. He went further. Insisting that those who had thought Sir Anthony Eden wrong were by no means committed to the proposition that President Nasser must be right, he argued that instead of Israel having to go to the International Court to establish its right to use the Suez Canal, it was for Egypt to ask the court for a decision on its claim to bar Israeli commerce. This kind of plain speaking, addressed to an important Asian audience by a speaker whose independence of judgment could hardly be challenged, can do nothing but good.

FOOTBALL

Economics in Sunderland

HAS anybody at the Ministry of Labour paid any attention to the rumpus which has broken out over the affairs of Sunderland Football Club? It is a nice little test case in economic attitudes. At the moment, professional footballers get a maximum wage of £15 a week, plus small bonuses for wins and draws—exiguous payments by results. The marginal productivity of individual star players—easily measurable by the difference in gate receipts when they are not playing—is well up in the surtax class. Inevitably, therefore, many stars get payments on the side—subsidised houses, dummy jobs and, sometimes, straight cash payments; including these and advertisement fees, an international player can probably expect to earn around £1500 a year. Recently a Welsh international centre-forward, a Mr Ford, publicly alleged that side-payments to star players were becoming more and more open and common; the Football League promptly suspended him from football for making this allegation (a committee of the Football Association—a more U-body, including ex-university footballers and the like—has since reversed this decision. Now the chairman and some directors of Sunderland Football Club, for which Mr Ford formerly played, have been arraigned and suspended by a joint committee of the Football League and the Football Association for making precisely the sort of payments to which Mr Ford referred. These payments for special ability were admittedly flatly against the League's rules (by which Sunderland had said it would abide); but to the outsider they would seem to be good commercial practice, even if the methods alleged to have been used for hiding them in the club's accounts were, perhaps, not.

Most professional footballers are not discontented with their lot, because they feel that they are well treated to earn a middle-class standard of living for playing a game. Football directors are not in the industry to make money out of it; usually they spend considerable sums on their hobby. The temptation, therefore, is to say that the League's arrangements for restricting competition in its industry should be left alone. (On a moral plane, there is more reason to get indignant about the international, than the national, football cartel; the present refusal to allow some Hungarian refugees to play in first-class football—for fear that Mr Kadar's government would then refuse to allow its national side to play in international competitions—is a disgraceful infringement of human rights.) But the Football League's national arrangements are, after all, arrangements that could be tackled under the Restrictive Trade Practices Act if the League were concerned with the buying and selling of goods, instead of the buying and selling of contracts for human beings. The case for prodding the League into more liberalism by a Government enquiry, is quite strong.

COMMUNIST BLOCK

Peking and Warsaw

PEKING was the last and most important stage on the Asian journey of the Polish delegation headed by the prime minister, Mr Cyrankiewicz. The Poles' chief aim was to balance Chinese caution against the possibility of new Soviet threats. It is generally believed that the Peking government helped to restrain the Russians during the dramatic days of last October when a conflict with Poland seemed imminent. Then, alarmed by the Hungarian rising, it sent Mr Chou En-lai to Europe to promote a compromise which would prevent satellite unrest from spreading. The Sino-Polish declaration now published suggests that this is still Peking's main preoccupation.

The declaration restates the orthodox communist view on topics such as disarmament, German unification, the Middle East and the situation in Asia. But the Chinese art of compromise is revealed in the passages that deal with relations between communist countries. The common aims of these countries and their need for solidarity are stressed. At the same time, the declaration expresses satisfaction that talks have been held between various communist countries "based on principles of equality, respect for national sovereignty and mutual non-interference in other countries' internal affairs." Finally the Chinese declare their wholehearted approval of Poland's achievements since October, considering them a "growing contribution to the socialist family of nations." At the end of the talks Mr Mao Tse-tung apparently accepted a Polish invitation to visit Warsaw later in the year. If he does go, it will be his first trip abroad since he visited Moscow in the winter of 1949-50 for a memorable piece of oriental bargaining with Stalin—since when China has acquired a new weight in the communist councils.

SOVIET UNION

Medals for Mr Khrushchev

MR KHRUSHCHEV is riding high again, having just been decorated with the Order of Lenin and the gold star of the Hammer and Sickle. Usually the Russians reserve such distinctions for an anniversary (thus on his sixtieth birthday, in 1954, Mr Khrushchev received the title of Hero of Soviet Labour), but on this occasion Mr Khrushchev's success in directing the drive to conquer virgin lands has been used as an occasion. The purpose is to show that the first secretary of the party has recovered his once shaken position. The new decorations are one among several steps to put him more sharply in the limelight. All the recent economic debates in the central committee were dominated by Nikita Khrushchev, and it has also been left to him—and not to the prime minister, Marshal Bulganin—to present next month to the Supreme Soviet the crucial project for the reorganisation of the country's government and planning.

Clinging to the top rung of the Soviet ladder has not been easy for Mr Khrushchev. The rebuff to Soviet authority in Poland and the rising in Hungary exposed him to criticism as the author of the indictment of Stalin at the twentieth party congress. Sensing the danger, Mr Khrushchev retreated a little way from his advanced positions, paid tribute to Stalin's memory, and applied the brakes in eastern Europe. He was probably helped in the struggle by the windfall of an exceptionally good harvest from the new lands of Kazakhstan and Siberia, which have been brought under cultivation through a campaign led by him. But Mr Khrushchev knows that the variable weather conditions in those difficult regions cannot be relied upon for two years running; he is now busy touring collective farms in European Russia to exhort farmers to produce more there. Agricultural success is only one element in the still unfinished struggle among the Soviet leaders. Mr Khrushchev's medals, however, are tokens that he has weathered one storm at least.

SOVIET MORATORIUM

THE Soviet Government has been asking meetings of workers and farmers to endorse a proposal that it should cease floating its annual state loans, while simultaneously suspending the servicing of the past loans debt for 20 or 25 years. It claims that the project is being received enthusiastically, but the average Russian probably has mixed feelings on the subject. He must be pleased that this year's small loan promises to be the last dose of forced saving for a long period. He cannot be delighted by the prospect of getting no return on his previous savings for the next quarter of a century.

Semi-compulsory loans were the favourite form of saving in Stalin's time. Each spring a new loan was floated and a campaign followed in which workers and civil servants could hardly refuse to subscribe the agreed amount, usually equal to four weeks' wages. Originally a choice was offered between interest-bearing and prize-winning bonds, but the inflationary complexes of the population made the interest-bearing loans unpopular and caused them to be dropped; for some time only bonds resembling the premium bonds in this country, with lottery drawings equivalent to a rate of interest varying from 3 to 4 per cent, have been floated. The stability of prices in recent years, and even more the growing purchasing power of the rouble, however, have turned the resulting state debt—now amounting to 260 billion roubles, or about half the annual budget—into a real burden; its servicing by now exceeds half the intake from new borrowing. In other words, through this moratorium the government will be getting for the next quarter of a century a sum, part loan, part gift, exceeding two weeks' wages a year.

That the system was unpopular was shown by the fact that in the two years following Stalin's death the amount thus levied was halved. It was subsequently restored to its previous level, however, from fear of inflation. On balance, the average Russian may be lucky to have done with the whole system. Mr Khrushchev replied in advance to any suggestions of lack of enthusiasm by declaring that outsiders "cannot understand the soul of the Soviet man." The charitable comment on the whole operation is that Russia's new leaders cannot get rid of Stalin's system of forced saving without defaulting on the debts incurred under it.

GERMANY

Bromide for a Spring Boom

THE new credit restrictions in Germany, designed to prevent spring fever from getting out of hand, are a renewed mark of the economy's vitality. Mild weather has prevented the normal winter slackening, and the economy is more fully stretched than usual as consumers and business men turn to their spring shopping. In February, industrial production was 12 per cent higher than a year before; consumer prices were up 4 per cent and industrial prices 3 per cent. Last year production per man hour rose by only about half as much as earnings. And new wage increases and the shortening of the working week from 48 to 45 hours should mean a further upward pressure on production costs. The Bank deutscher Länder has therefore tightened the credit squeeze and cut by 15 per cent the rediscount facilities of credit institutions.

The distinctive feature of these measures is a sharp new discrimination against borrowing from abroad. Reserve requirements for deposits from non-residents in large banks are put at 20 per cent, compared to 12 for German residents, and there are similar differences for other foreign deposits as well as new discrimination through the rediscount arrangements. The new credit measures thus ingeniously strike at both the enemies that flank the German boom. Inflation will be hit by a cut in bank liquidity of over DM 2,500 million, made in a manner designed to discourage foreign funds, unlike the earlier rise in interest rates which tended to draw them in. The bank's policy of lowering interest rates remains unchanged.

But a cure for Germany's structural payments surplus seems unlikely before the full impact of rearmament as well as of heavier social spending and tax reliefs is felt next year. Professor Erhard continues to do what he can to encourage imports by every sort of ingenious scheme. But the mark's strength was shown by a recent survey. Between 1949 and 1956 its purchasing power declined by 5.3 per cent; that of the pound by 24 per cent.

LETTERS

Car Fashions at Geneva

SIR—In your note of March 23rd you comment on the Swiss car market and state that British manufacturers get an insignificant share of it because of concentration on the medium-sized car. You further infer that the reported action of an agent of a major British medium-sized car manufacturer, by taking on an additional agency of a 450 cc German car, indicates the preferences of the Swiss car buyers.

The following table gives details of the new car market in Switzerland for 1956. This table is divided into four groups and shows for British and all other makes of cars, the proportion of sales in each group.

New Car Registrations 1956

	All Makes	British
Total.....	55,001	5,555
Of which :—	%	%
Under 800 ccs. ...	10·5	—
801–1000 ccs.....	6·7	6·8
1001–1650 ccs.	58·3	53·8
1650 ccs. and over	24·5	39·4

It is clear from the above figures that 90 per cent of the market is covered by classes in which British cars compete and, furthermore, that the bulk of registrations cover cars which are in the medium and big car classes.

It is assumed that by "this richest car market in Europe" you mean that the individual there is better off than other Europeans. It is this very fact, coupled with the mountainous nature of their country, that makes the medium-sized car attractive to Swiss buyers.—Yours faithfully,

C. G. TIPPER
Vauxhall Motors Limited,
Luton, Beds Export Sales Manager

Uno's Abacus

SIR—In outline there is little difference between the general plan of the United Nations and the general plan stated in your article of April 13th. In both plans there is an assembly of the representatives of the member states, which elects an executive committee, which takes action as may be required by circumstances and by a sufficient majority of the world. As you say, the sufficient majority is that which the criminal state cannot afford to antagonise. There is already a scale regulating the subscriptions of members to the expenses of Uno, and this scale could be applied to weight the voting in the Assembly. There remains the veto, which is now due for revision. The voting on the Security Council (the executive committee) should require a majority which the criminal state cannot afford to antagonise, say 60 per cent of the power of the world. A three-fifths majority of the Security Council, elected by weighted voting, should control sufficient power. It is only necessary to revise the Charter.—Yours faithfully,

Birkenhead F. A. ROBINSON

Frozen White Elephant?

SIR—The interesting article in your issue of April 13th contains one most misleading sentence. Thorium and radium have no pride of place in ease of exploitation. Thorium minerals are not high priced (even tin ore sells for more), and radium is essentially a by-product. Secondly, no element depends, even remotely, on the price of itself or its minerals as regards exploitability. Exploitability depends upon the richness of the ore; for example, a given lead ore can be more valuable than a workable but low-grade uranium ore (though this last phrase is too extreme to apply to Antarctica).

The interest of Antarctica lies in the possibility of freak deposits of rare elements as regards richness. There is no positive reason to expect this, but insufficient is known of the crust of the earth in relation to the genesis of ores to exclude such a possibility. To search for such deposits, even in the recent past, would have been unthinkable. Today, airborne geophysics has proved itself by finding deposits, and the fairly near future could see its application to Antarctica.

Yours faithfully,

London, E.C.2 ROBERT A. MACKAY

Seeing Eye Machines

SIR—In their letter in your issue of March 30th, Dr Bell and Miss Haddy draw the conclusion that "ultra-fast" reading machines are a doubtful investment. In fact, we are being pressed to increase our reading speed, and are planning to do so. Why this discrepancy? It is because the assumptions on which your correspondents argue are untrue.

(1) The amount of arithmetical processing required in accounting, the recording of stock movements, and other such activities varies over a wide range. The enormous majority of the work consists of simple addition and subtraction. The rest may have a number of multiplying and comparison processes, or may require sorting in a long random list. It is precisely because so many operatives are needed to feed a computer with the first kind of work that almost only the minority kind, needing "a mere handful" of clerks, is in practice undertaken and so is quoted as typical.

For simple subtotalling and totalling, one of the slower commercial equipments accepts 60 characters per second; one of the faster 1,000 per second. A good punch operator and a verifier will average 5 punches per second, the pair of them over a 40-hour week. So these computers, on a 160-hour week, need 96 to 1,600 operators. Scale down this utilisation by a large factor; it is still quite a "handful."

(2) We point out to all potential clients for a reading machine that it is better, if at all feasible, to produce punched cards or tape while originating the document. Attachments for this purpose vary in cost according to their nature; a typical price is £300 extra. If, therefore, 100 typewriters, time clocks or cash registers are involved, a reading machine may be cheaper. But in many cases several hundred or even several thousand such separate feeds are involved; the capital argument for a reading machine then becomes overwhelming.

(3) Separate documents of varying sizes can be moved up to about 750 per minute. The "ultra-fast reader" in our nomenclature beginning to be called the "slow" version) will just read about 18 characters per document at this speed.

(4) It is not fair to quote the price baldly at £50,000. This is the extreme of the price-range quoted, which includes transferring and sorting machinery and an effective maximum of various input and output arrangements. The lower end of the price range is £22,000; and your correspondents disregard the capital or rental saving on the card-punching machines. These facts make even your correspondents' first example one of fair capital recovery.

—Yours faithfully,

C. E. G. BAILEY
Technical Director
Solartron Electronic Business
Machines Ltd., Thames Ditton, Surrey

Black and White

SIR—In the conclusion to the article of March 2nd you seem to have been led astray by Mr Colin Welch's article in *Encounter*.

Mr Welch challenges South African liberals' contact with and knowledge of African leaders. As one who is glad to have the friendship of many of the accused at the "treason trial" and other African leaders, I repudiate the suggestion that the main African leaders think in terms of ultimate "black domination."

They want a democratic South Africa in which, of course, Africans will numerically predominate, but as men, not blacks. The extent to which they might then wish to do to the white minority what it today is seeking to do to them, depends on our attitudes in the meanwhile and the way that democracy is finally won. But "preaching partnership" will get nowhere. The word at present seems a device for maintaining the privileges of 200,000 Federation whites against 7 million blacks. No system of balancing unequal groups can stand by comparison with a democracy of persons, which is an ideal irrevocably implanted in Africa.

The future of white-black co-operation no longer depends on words, but on the degree of active identification with each other achieved in working towards a common goal, even if this involves being charged with "treason," etc.—Yours faithfully,

Port Elizabeth, S.A. C. W. M. GELL

BOOKS

The Paragon of Animals

Battle for the Mind: *A physiology of conversion and brainwashing*

By William Sargant.
Heinemann. 272 pages. 25s.

THE Russian trials of the nineteen-thirties, with their stereotyped confessions, were disturbing for more than political reasons. Why should respected men confirm these confessions as they stood there in court, apparently unbruised, well-fed and unafraid? Dark rumours of brutal treatment, threats of death and "drugging," somehow failed to square with their demeanour.

Since the war a small avalanche of books and articles in the psychiatric journals has made the technique familiar. Fear, suspense, squalid conditions, the naked high-powered bulb, semi-starvation, prevention of sleep, interminable interrogation and possibly torture are the usual ingredients, and it is easy to understand how by these methods confessions, true or false, are obtained. What is more difficult to grasp is the change of heart which has so often happened at the same time: the wholesale discarding of established values and the firm adoption of a new philosophy. It is the tenacity of this conversion, persisting through the fattening-up period while the bruises are fading, which is the essence of brainwashing.

In this stimulating and well-written book the author, a well-known psychiatrist, ranges widely over the world and through history looking at the methods of those who have sought to alter men's beliefs for religious, political or medical ends. With Mr Robert Graves's help he even explores the means that ancient Greek priests and doctors used both for treatment of nervous and mental illness and for religious indoctrination at the "Mysteries."

His starting-point and recurring theme is the later and less well-known work of Ivan Pavlov. Long after his classical experiments on conditioned reflexes, Pavlov turned to inducing experimental neurosis in dogs and related his discoveries to the problems of neurosis in human beings. He defined four temperamental types of dogs, two of which he found to be much less resistant to stress than the others. They seemed to correspond to the old Hippocratic categories of choleric and melancholic man. But although these two types broke down more easily, all dogs could be made neurotic by sufficiently severe experimental stress. Three progressive stages of breakdown emerged: the "equiva- [illegible] " in which all stimuli resulted only in the same depth of response; the "paradoxical," in which weak stimuli provoked greater responses than strong ones; the "ultraparadoxical," in which the dog's conditioned responses were reversed—it would attack its loved master or take a sudden liking to a person it has previously disliked, just as the brainwashed grow fond of their inquisitors. All the three stages were accompanied by heightened suggestibility.

In his chapters on Russian and Chinese methods of indoctrination, Dr Sargant shows that the brain-washers seem to be deliberately applying Pavlov's discoveries to human beings for their own purposes. But long sections of the book are devoted to showing how extraordinarily similar these methods are to the technique arrived at empirically by John Wesley and others who aimed at rapid religious conversion, and also to the means used for extracting confessions by the Inquisition and in police stations nearer home. Dr Sargant finds Pavlovian theory fruitful of understanding in several diverse fields: for instance, the treatment of neurosis by drug-induced catharsis; some aspects of the case of Timothy Evans; the strange modern revivalist cult of snake-handling in parts of North Carolina; and in the success of Dr Billy Graham.

Everywhere Dr Sargant looks, he sees Pavlov's paradoxical and ultraparadoxical stages of brain inhibition emerging under the influence of profound emotion, and the reader must admit that it is a most illuminating concept. But does Dr Sargant see it too often? When he drags schizophrenia and severe depressive illness into his net, and expounds them and the shock therapies in these terms, he strains his theory to breaking point, as the Freudians have done before him in trying to understand these illnesses in terms of their own theory. With these presumably biochemical diseases we had best still confess almost total ignorance of causes and in the meantime be thankful that they can, in a measure, be treated.

As a mechanistic philosopher, Dr Sargant does not ring true. With his apparent, though unexpressed, interest in religious, ethical and political values, beyond the mere mechanism of indoctrination and conversion, it is not surprising that, despite his obvious efforts to avoid the word mind and to write brain instead, the word will keep intruding. Had this book been written by a cold-blooded man, it would have been unbearable.

His conclusion about man's resistance to indoctrination is depressing. Firm unco-operation, detached amusement, refusal to worry and ability to sleep in snatches seem feeble weapons to pit against the battery of the brainwasher. But the book itself is not depressing. I is intelligible, human and highly enjoyable, and a landmark in its field.

Unfinished Melodrama

Votes for Women: *The story of a struggle*

By Roger Fulford.
Faber. 343 pages. 25s.

"IF it's by a good author it's a good play." Flawner Bannal's rule of thumb gives the right answer more often than not, and if we add "and a good subject" the odds in favour are raised. Mr Fulford has always displayed a gift for gathering up and displaying stores of strange information about his chosen subjects, and never has this gift found a happier hunting ground than his present theme, for among the champions of votes for women are to be found a goodly fellowship of oddities nicely combining the sublime with the ridiculous. So here we have the whole story. It begins, after a glance at Anglo-Saxon abbesses who are alleged to have been summoned to the Witanagemot, with Wm. Thompson, whose "Appeal of one half of the human race, Women, against the pretentions of the other half, Men," published in 1825, stated all the arguments subsequently advanced in favour of votes for women and refuted all arguments subsequently advanced against it; but it fell so flat that hardly anyone in the suffragette decade had even heard of the book or its author.

The suffragette melodrama was cut short by the outbreak of war, and before it was over the vote had been granted. So a number of questions arise to which no certain answers can be given. At one end of the scale are those who say that the Pankhurst army won the vote, and that the enfranchisement in 1918 was the work of a male sex which could not face a postwar renewal of suffragettism. Then there are those who say that the vote was won by feminine war service, and in spite of suffragettism—to which, of course, a Christabel Pankhurst might reply that the suffragettes could not foresee that a war would come and do their job for them.

There are also those who regard the vote as an inevitable result of the advance of woman on all fronts, and point to the great increase in the membership of the non-violent woman suffrage societies during the suffragette years—to which, again, a Christabel Pankhurst might reply that the Women's Social and Political Union was the best recruiting agent for its sleeping partners, the societies that wanted "votes without tears." A careful reading suggests that Mr Fulford is not quite certain of the right answer. His job is to tell the story, and it could not be better told.

On the Brink of Defeat

Invasion 1940

By Peter Fleming.
Hart-Davis. 323 pages. 25s.

THIS interim report on five months of war is excellent reading. Squire Fleming and Colonel Fleming join forces with the winner of a First in English at Oxford to produce wise and well-flavoured history. On almost every page a wry smile or a good-humoured sneer crosses the face of the sage as he describes a hesitating Hitler and the bewildered British groping for contact across thirty odd kilometres of sea. To the sentiment that has gathered around the time when we "stood alone" (not quite alone, in fact) some corrective was needed, and Mr Fleming as a historian is notably un-Bryantish. The adjustment is made quite simply by placing Churchill's situation and Hitler's face to face.

How very odd were those five months of waiting after Dunkirk. Britain could not know of the Fuehrer's belief that it might collapse under appeals and threats, and that "Dr Jekyll wistfully titivating his olive branch" was preventing "Mr Hyde from sharpening his sword." Nor could we know that the state of the German Navy, the failure to plan invasion far ahead, and the belief of the generals that this would be only a glorified river-crossing doomed the attempt to failure. Mr Fleming's military criticism of Operation Sealion is devastating. The number of divisions to be landed was reduced in weeks from 25-40 on a broad front to 13 on a narrow front. The plan assumed that surprise was possible and took no serious account of what the Royal Navy could do to the build-up. The difficulties of inter-service planning were scarcely grasped. And when the Luftwaffe was in sight of its end—by destroying the Sector Stations of Fighter Command to win supremacy in the air—it was switched to the bombing of London just because we had lightly bombed Berlin.

★

The military analysis in this book is very well done. The picture of the national mood, of "John Bull at Bay," is not always so good. The flavour of Eton and Printing House Square is rather too strong. Life in arms factories, shipyards and marshalling yards was nasty, strenuous and short for many; not for them the patriotic melodrama of the rural Home Guard. But it is fun to have one's favourite legends examined through Mr Fleming's eyeglass. Could we really have believed that parachutists came down holding live grenades in each hand? Or that airborne troops were disguised as nuns? Or that there was really a fifth column in this country? We seem to have been more frightened of being outwitted than of being bombed. If Hitler had just left us alone, how quickly it would all have become another phoney war.

Mr Fleming shows that Sealion was no piece of dilettantism but a deadly serious plan, defeated not only by Fighter Command but by the spirit of the people. And he argues in a most important closing chapter that the island's resistance—the first of the great resistance efforts—saved Russia and doomed Hitler.

★

The Defence of the United Kingdom: *History of the Second World War, United Kingdom Military Series*

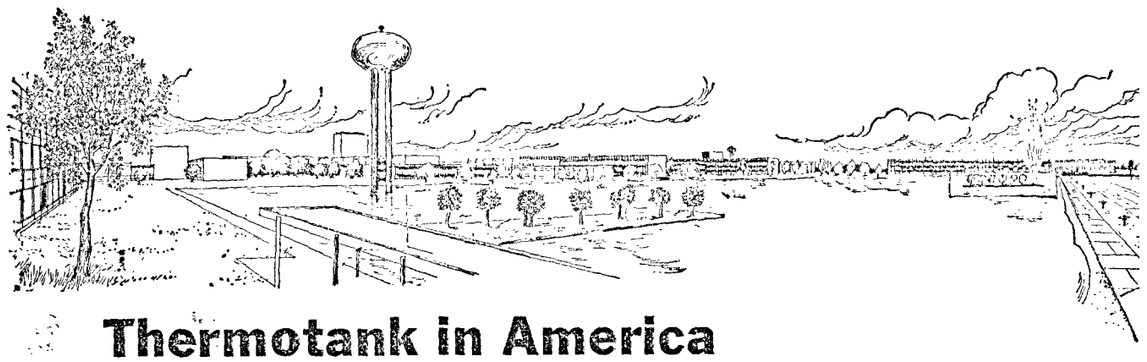
By Basil Collier.
Her Majesty's Stationery Office. 576 pages. 50s.

HOW far ought the official history of the defence of the United Kingdom to stretch? Had this volume stood alone, its scope would have had to be immense. One might argue that the Battle of the Atlantic would have occupied the foremost place. This volume is, however, only one of many, and the defence of sea routes is fully covered elsewhere. Mr Collier rightly makes no more than brief allusion to it. He also sharply prunes some naval plans for events that did not occur. The main features of his book are prewar preparations, the Battle of Britain, the "Sealion" invasion plans, and the episode of the long-range weapons, V.1 and V.2.

★

This writer is not censorious and is less outspoken than some of his colleagues. From the inter-war years there emerges, when one digs through crowded facts and cautious comment, a picture shading off from the brilliant to the woolly and the inert. In the former category are found air organisation, aircraft design, progress with radar; in the latter the half-hearted treatment of reports from one committee after another, nearly all to the point, and features such as the playing about with port defence. The caution is exemplified by the term "highly inconvenient" for unjustifiable delay.

Caution appears too as we approach the Battle of Britain, in allusion to the work of Lord Beaverbrook, who is handled as though he were a hot potato, which in a sense perhaps he was, and is. Sobriety is, however, useful in the account of the day-to-day fighting, which gives a clearer impression than the highly-coloured narratives that followed events at various intervals. The historian pays a warm tribute—and none can be excessive—to the courage and skill of the British pilots, but he also suggests, pretty convincingly, some errors in tactics and reports. Of July 10th, in the phase of attacks on convoys, he remarks that it was "not unsatisfactory" but that "intercepting fighters had not arrived in such good time as to suggest that escort for convoys could be abolished." He also argues forcibly that the Luftwaffe was too versatile, too ready to accept a success as decisive for that phase, and thus too much given to chopping and changing.



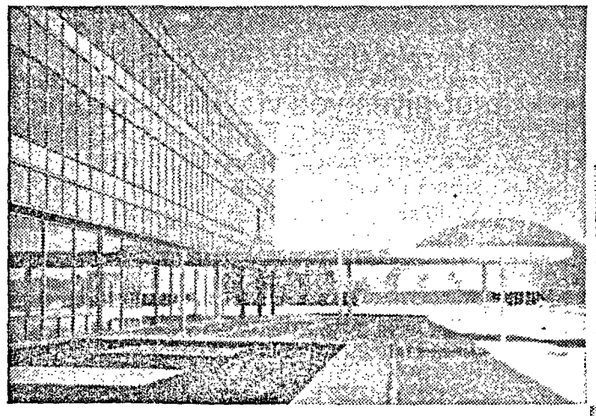
Few who study his examination of the preparations for Sealion will subscribe to the theory, often advanced by both sides but in particular by Germans, that Hitler "never really meant invasion." It is scarcely possible to maintain that view in face of the vast preparations and concentration of force here described in detail. The Germans certainly over-insured themselves in land forces, though this made no difference since they had to win their air war first in any event. Their intelligence must have been at fault about the state of the British Army after Dunkirk. It was, as all know now and many knew then, through no fault of its own the weak link in the defence chain.

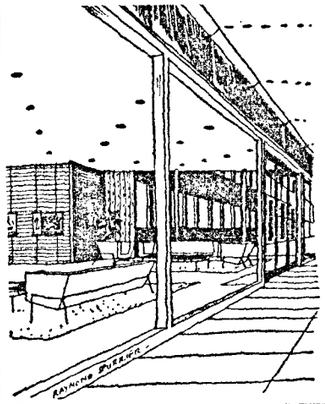
The story of the search for details of the V.1, or flying bomb, and the even more difficult groping for news of the V.2 is fascinating. We had rather more than our share of the luck in the shape of unprompted intelligence, and how much we needed it! The combination of these weapons represented a frightful menace, only a small fraction of which became a reality. The present Minister of Defence comes out well; Lord Cherwell's prophecies were unlucky; but the alliance of the late Sir Roderic Hill and Sir Frederick Pile was vital and one of the finest of the war. Surely few more astonishing feats can have been accomplished in its course than the destruction, near the end of the offensive, of 83 per cent of the flying bombs approaching the country. However, not all the defensive measures against V.1s and V.2s were equally sound. Much of the bombing of sites in France was almost pure waste of effort. Errors were inevitable, but it looks as though the organisation and methods of launching and storing the weapons should have been grasped earlier than they were.

★

History of this sort is seldom vividly presented, and that of Mr Collier is more or less on standard lines. One figure, that of Air Marshal Hill, arouses his enthusiasm, though he is most sympathetic to Air Chief Marshal Sir Hugh Dowding. Where he is most successful is in making it clear that the peril which was defeated or avoided has not been exaggerated in anything previously written about the defence of the United Kingdom. On the contrary, it is probable that many who survey that period in retrospect, while fully conscious of personal danger, of suffering, and of acute discomfort, fail to realise the full extent of the risk to the very existence of the nation.

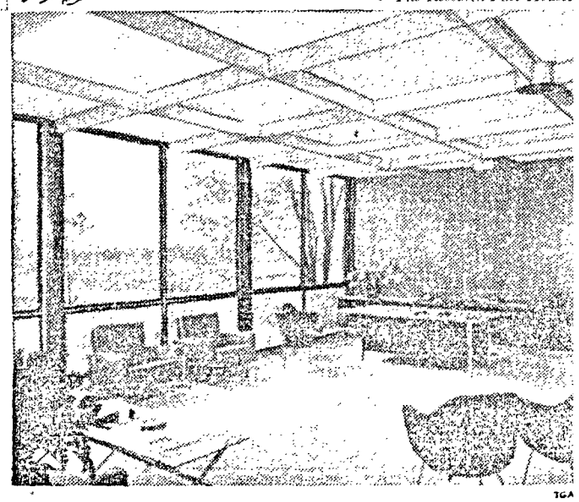
For their fabulous $175,000,000 Technical Centre in Detroit, General Motors chose Thermotank Systems





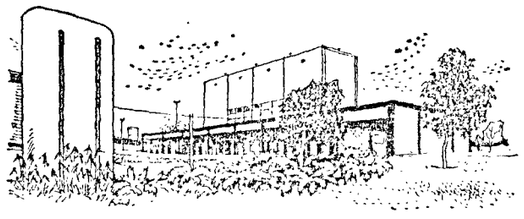
Thermotank in America

chosen to design, construct and install the finest air-conditioning systems in the world



With all the world to choose from, General Motors of America called in Thermotank to design, build and install the air-conditioning systems for their magnificent new Technical Centre—the most up-to-date research establishment in the world.

Totalling over five million dollars in value, the Thermotank equipment in research and administration buildings throughout this 350-acre centre will give thousands of scientists, technicians and office staff noiseless, high-velocity air conditioning all the year round—simply, efficiently and economically. This contract is yet another indication of Thermotank's world-wide leadership in air-conditioning.



- *Panoramic view of part the 350-acre Plant.*
- *The main entrance to t Styling Administration Buil ing and in the backgroun the domed Styling Auditoriu two of the seven buildings a conditioned by Thermotan*

Paperbacks

THE launching of St. Martin's Library by Macmillan marks a new phase in paperback publishing in Britain. Penguins apart, most of the publishers' paperback editions are aimed at the bookstall buyer. They are designed to give new life to a recent best seller, war stories being favourite selections, and they try to catch the buyer's eye by glossy pictorial covers.

Earlier this year Collins added Comet books (*2s. 6d. each*) to their paperbacks, a series which, by including such titles as "Guide to the Moon," by Patrick Moore, and "The Universe and Dr. Einstein," by Lincoln Barnett, is obviously intended to instruct rather than to entertain. The new St. Martin's Library has a different appeal again. Like the Penguins, it has been produced for people who want to possess a particular book rather than for those who want to read any book, though its list is naturally restricted to Macmillan authors. The first twelve titles are certainly varied: they include fiction in the form of "Rogue Herries," by Hugh Walpole, two Hardy novels, Charles Morgan's "Portrait in a Mirror," and Margaret Mitchell's "Gone with the Wind" in two volumes; autobiography in the form of the first two of Osbert Sitwell's four enchanting volumes about his family; "Shakespearean Tragedy," that long-respected piece of criticism by A. C. Bradley; drama in three plays by Sean O'Casey; and Frazer's "The Golden Bough" in two volumes. Their sober covers will consign them to the bookshop rather than for display on the bookstall, and so will their price, varying from 3s. to 6s. a volume.

In the meantime Penguins have gone gayer. Some of their titles now have illustrated covers, though these are carefully designed to attract a new public without offending old Penguin customers. The variety of Penguin titles is as wide as ever. In the last few weeks have appeared, excluding fiction, a Penguin handbook on foreign food (*Plats du Jour* by Patience Gray and Primrose Boyd), which is an illustrated book of recipes for 3s. 6d.; a Pelican on "The English Penal System," by Winifred A. Elkin (3s. 6d.); a Penguin on "Wines and Spirits" by L. W. Marrison (5s.); "Is Peace Possible" by Kathleen Lonsdale; and Doctor Pevsner's second compressed but comprehensive volume on the buildings of London, covering the City and Westminster and costing 15s.

THE Penguin Shakespeare (edited by G. B. Harrison) has long been familiar to British readers. Now the first volume of its American counterpart has been produced in the Folger Library General Reader's Shakespeare, edited by Louis B. Wright and Virginia L. Freund. Ambiguously, the editors have started with one of the more difficult texts: *King Lear*. To judge from this volume, the aim of this Pocket Library series appears to be to present collated texts; the Penguin series, in contrast, leans heavily on the Folio. The text is illustrated by Elizabethan and Jacobean woodcuts.

The editors have broken with a long tradition in presenting the editorial notes on pages facing the text. These take the place of the normal extended notes of explanation and the glossary at the back of the volume. They may distract the reader's attention from the actual text, but they at least save him a continual search back and forth through the book. As this edition is designed for the general reader, the notes define and explain rather than indulge in the literary detective work and cross-referencing so loved by most editors of Shakespeare. The reader may lose in scholarship but he will gain in clarity. And it would be possible to direct and to act from these volumes, which, at the price of 35 cents, is no small advantage.

Roman Poets

Poets in a Landscape

By Gilbert Highet.
Hamish Hamilton. 276 pages. 30s.

PROFESSOR HIGHET is a Latinist who knows how to use a camera. He has had the ingenious idea of writing a book about his favourite Latin poets in relation to the places where they were born or lived, and illustrating it by his own photographs. The latter are first-rate; fifty of them, illustrating charmingly chosen bits of Italy. Lake Garda seen from Sirmio with a storm rising from the North, the Mincio and his Roman scenes are particularly good.

The text is thorough and informative, but not quite up to the pictures. Professor Highet cannot forget that he is a teacher: each poet is dealt with at some length, and the link with the photographs is occasionally tenuous. There is no difficulty about such strongly localised poets as Catullus and Horace; but the main point about Ovid's native town is that he left it. Therefore an essay about Ovid the poet and Ovid the product of Sulmo becomes a trifle two-headed. The home-town part of the book is the best of it. It is pleasantly done and takes one down new paths. As a critic and brief biographer Professor Highet is less inspiring: he explains too thoroughly and uses modern instances with more zeal than illumination. The whole smacks rather of the first-year lecture-room.

The translations, of which there are many, aim high but do not always succeed. Professor Highet is rightly at pains to avoid the impression that his poets were writing a dead language; but the attempt to avoid artificiality sometimes leads to flatness. His versions are accurate, so far as the content of the poems is concerned; but he is not a poet, and where the tension of the originals is high he is apt to fail. He does best where he accepts the discipline of imitating the original metre, and least well in the many cases where he is translating hexameters and pentameters, which he turns into unrhymed six-foot and five-foot iambics. This is not a natural form in English and, as his rhythms are slack, it amounts to little more than a prose translation and loses the tautness of the original. The book is therefore best read with the originals in hand; with that reservation, it forms a pleasant and unusual introduction to a tour of Italy.

Human Comedy

Honoré de Balzac: *a biography*

By Herbert J. Hunt.
University of London. The Athlone Press.
210 pages. 21s.

"I SHALL have carried a whole society in my head . . ." so claimed Balzac in the preface to his "*Comédie Humaine*" and nobody acquainted with that literary monument will deny his claim. Professor Hunt decided that it was time to reintroduce its author to the British public. In this short book he has succeeded in stripping the man from the legend, while tracing Balzac's life from its provincial beginnings through years of strife and creation in Paris to his death on the morrow of the wedding with Countess Hanska, for so long an awkward and distant epistolary lover. The book is scholarly and elegant. If the final portrait is not very fascinating, the fault is Balzac's: the man was so much smaller than his work. A social climber, a snob seeking a coat of arms for an imaginary title, a grotesque dandy, a tragicomic businessman always losing money, Balzac often cuts a poor figure. No wonder that a talent for story-telling was his redeeming social grace; creation was his realm.

Harassed by publishers, pursued by creditors, Balzac had to slave at his writing table despite his proverbial ease and fertile imagination. Inevitably his pieces were uneven. Some were slipshod, over-written and interspersed with naïve philosophical digressions. But such was his genius, his skill in observation, that, put together, they form a gigantic and most vivid canvas of nineteenth-century France, with almost all walks of life accurately described. The protagonists reappear on the stage against this background: not only the legendary figures—Le Père Goriot, Vautrin, the criminal turned head of police, or de Rubempré and de Rastignac, two studies in ambition; but also a host of minor characters, such as the banker Nucingen or the doctor Bianchon. And above them all towers "the saintly, worshipped, solid, lovable, beautiful, noble and young, the all-powerful five-franc piece"—the mainspring of all activity.

Professor Hunt recalls the apocryphal story of Balzac on his deathbed asking for the imaginary Bianchon: "he would save me . . ." *Se non è vero,* it sounds true of the man who believed in the world of his own creation and was also dominated by it. It is a sign of his genius that the picture he draws is more devastating than he intended and the vision much richer than the petty ideas of the author. Professor Hunt intends to follow this interesting study of the man with a guide to his immense work.

Lonely Road

Proust's Way

By Georges Piroué. Translated by Gerard Hopkins.
Heinemann. 141 pages. 15s.

HARD on the heels of Professor Germaine Brée's excellent "Marcel Proust and the Escape from Time" comes this new "essay in descriptive criticism" to present an instructive contrast. In the earlier study, all the emphasis was on the architectural organisation of Proust's masterpiece: what was expounded was a triumph of construction, the technical embodiment of a coherent philosophy; what was emphasised was the success both of Proust the author in imposing, against all expectation, a perfect form on his apparently formless material and of "Marcel" the narrator in discovering, against all expectation, the life-giving significance of his apparently futile past. The keynote was victory.

To M. Piroué, on the contrary, the keynote is defeat. From the evening when, at Combray, the child Marcel guiltily but ecstatically imposes his will on his mother, to the evening when, at the Guermantes' reception, he finds his vocation under the shadow of death, the story is of one long degradation, of a more and more pathological retreat from life and love into a private nightmare, where nothing is directly experienced or has any reality except as fodder for the solitary self-tormenting imagination. Through the medium of that imagination the characters themselves, and the society of which they form part, suffer a similar degradation and disintegration; death is at work on them all, not only physical death, but moral death. Art is the only redemption; but that which is redeemed is cruelty, misery and lies—above all, and at the root of every relationship, lies. No true contact between human beings is possible.

To M. Piroué, this obsession with falsification and solitary self-torment is a reflection of Proust's private life; of his inversion which must be concealed, of the emotionally generated invalidism confining him to the shelter of his cork-lined room. No nonsense about "Marcel" being a separate, autonomous creation; he is merely a heterosexual version of his author. His agonising encounters with Gomorrah—and the surprising extension of Gomorrah's frontiers—correspond to the invert's agonising encounters with the normal; with "the desires, in those he loves, which are incompatible with his own." (The enigmatic Albertine becomes perfectly comprehensible when rechristened Albert.) The Proustian universe is merely a magic-lantern projection of a sick man's preoccupations; the expression, imputed to all society, of a deepening self-disgust.

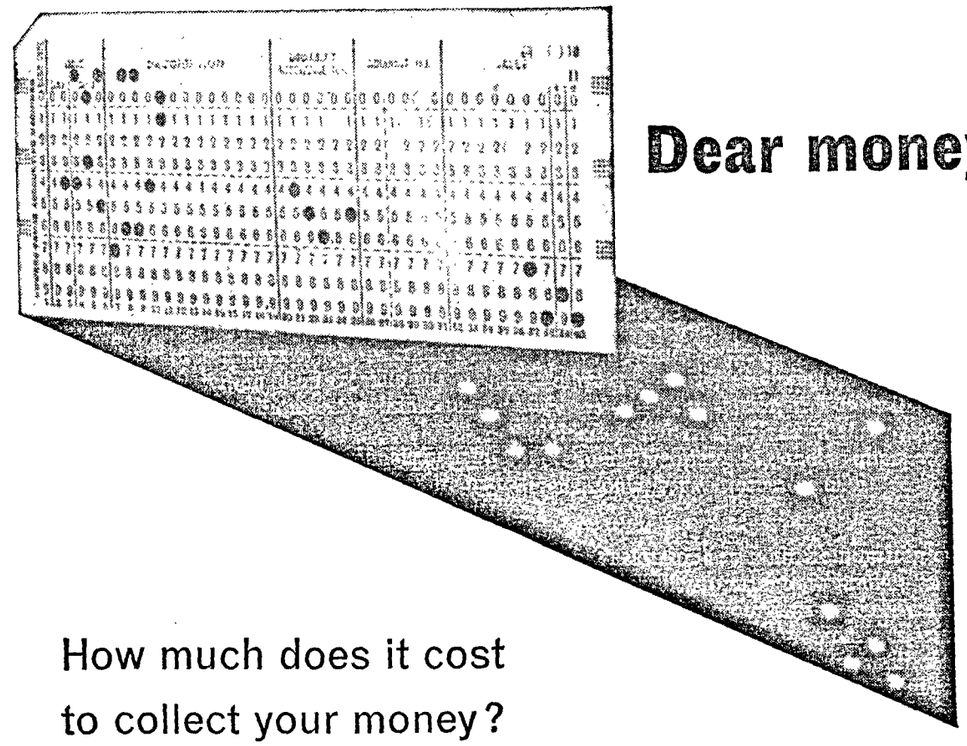
Even were the biographical facts not incontrovertible, it would hardly be possible to spring to Proust's defence with a flat denial. But in proving degradation and disintegration to be Proust's master-theme and the only one he was capable, whatever its guise, of handling, M. Piroué sweepingly omits—and indeed denies in the teeth of the evidence—other elements that match and balance that theme. Thus he asserts, as a highly significant fact, that no new generations are shown growing up in the sterile Proustian world to replace the dead or doomed elders; whereas a principal character in the final, all-illuminating scene is, precisely, the lovely and vital young girl who is the descendant at once of the Guermantes and of Swann and in whom the narrator greets his own youth. Nor, surely, is it merely the desire to pay a brief tribute to a piece of real-life human goodness that prompted Proust to tell the wartime story of the Larivières, those representatives of the magnificently robust and well-rooted stock from which he drew his indomitable Françoise. Unemphatically but surely they set, like Françoise herself, a standard of objective sanity, energy and worth; they stand for all those "by whom France has survived." The invert in his cork-lined room, the "illustrious sufferer from a passion for the absolute," as M. Piroué calls him, is a pitiable figure portraying, for the most part, other pitiable figures; but to represent him as unable to see or depict anything but magic-lantern projections of his own moral and physical malady is unwarrantably to diminish him and his work.

World Integration?

An International Economy: *Problems and Prospects*

By Gunnar Myrdal.
Routledge and Kegan Paul. 392 pages. 37s. 6d.

THE problem of the underdeveloped countries has become increasingly urgent in recent years. The demand for self-determination and economic development has spread through the world. In nearly all countries the appetite for political and economic progress has now been whetted. But in many of the underdeveloped countries little material progress has yet been made; hence the sense of frustration that can easily lead to extremist policies.



A survey of international economic developments in the west, which concentrates on the problems of relations with the underdeveloped countries, is therefore most welcome. And Professor Myrdal, who is a master of economics and sociology, and who has also had practical experience as a politician and international civil servant, is well equipped for the task.

The main thesis of his book is that if peace and stability are now to be preserved, the disparity between economic conditions in the poor, underdeveloped countries and those in America, Europe and other rich countries must be narrowed and eventually removed. That would require abandoning calculations of national interests, which motivate most international economic policies, in favour of a more enlightened and generous spirit of internationalism. The rich countries should help the poor. World government, and perhaps a "Welfare World," would be the ultimate ideal. Mr Myrdal recognises that the world is not ripe for this. Nationalism is too strong. He therefore turns to the world as it is to seek the political, economic and social reasons why international economic co-operation has not made better progress and to examine what practical steps can help the underdeveloped countries.

Unfortunately, his survey of recent economic history is as confusing as it is provocative. It sweeps across the sociological problems of economic development, the problems of international trade and payments, the immobility of capital and labour, and the problems of European integration. It seems at moments to contain a sociologist's general theory of historical progress, clothed in the term "integration." At other moments its main purpose seems to be to condemn the world, with the wrath of an Old Testament prophet, for its nationalism. Indeed in this context the author seems to be in danger of so exaggerating the failures of post-war economic co-operation that he may damage rather than help the cause of internationalism.

When he turns to the problems of the underdeveloped countries, Mr Myrdal is much more lucid. He analyses the internal problems of underdeveloped countries, emphasising the interplay of social, political and economic forces in the process of economic growth. He argues strongly that more capital and aid should be given to underdeveloped countries, and that it should be given through international agencies so as to avoid the political strings—or the suspicions of them—which are associated with bilateral aid. In a most interesting chapter he considers what should be the objectives of the external commercial policies of underdeveloped countries. He is led to the conclusion that the traditional doctrines of Free Trade are generally inapplicable to underdeveloped countries: in their own interests—and without harming the long-term interests of their trading partners—they are justified in regulating their imports and exports by unorthodox methods.

This, and many of Mr Myrdal's other conclusions, will provide plenty of food for thought for those concerned with international economic policies. And the emphasis on the moral and political foundations of international economic relations is most salutary: too often these issues are buried beneath a flood of financial and commercial technicalities. As a whole, however, the book is too loosely written and suffers from excessive use of sociological jargon. Like all Mr Myrdal's works, it is original and stimulating. But for a book in which integration is the dominant word, the argument is not well integrated.

Dear money

How much does it cost to collect your money?

Whether you sell goods or services, run a business or control the finances of a local authority, the preparation of invoices, bills, demands (call them what you will) involves costly clerical effort.

Powers-Samas punched card methods make light work of the job. Machines do the arithmetic and produce the finished bills — swiftly, at low cost and with machine accuracy. Then they fill in their time with other accounting, costing and statistical tasks.

What does punched card equipment cost? Powers-Samas have matched their ranges of machines to the needs and budgets of the small, the medium and the large organisation.

Crossbench Tory

Beyond the Dreams of Avarice: *Essays of a Social Critic*

By Russell Kirk.
Henry Regnery Company, Chicago. 351 pages. $4.50.

LORD KEYNES once referred to Marxism as "the *reductio ad absurdum* of Benthamism," and Dr Kirk would fully endorse this view. Perhaps the thought of the nineteenth century, as of any age, is fully understood only when one has exposed those underlying assumptions and latent beliefs that were shared in common by thinkers who seem, superficially, to be poles apart. It has been Dr Kirk's special contribution to conservative thinking in the United States that he has tirelessly groped for a set of ideas that enables him to group for attack Bentham and Marx, John Dewey and Dr Kinsey, American liberals and English socialists. He has drawn his ideas from such equally unusual combinations as Burke and Samuel Johnson, Tocqueville and Newman, and among American heroes Randolph of Roanoke and Orestes Brownson. It is characteristic that his two favourite modern poets seem to be T. S. Eliot and Roy Campbell.

It is this crossbench toryism that gives Dr Kirk, as a vigorous critic of modernity, his special flavour of sturdy independence. He has shown, more triumphantly than any of his counterparts on this side of the Atlantic, that conservatism can still be intelligent even when crotchety; and that strong convictions about the silliness of modern society need derive neither from mere reactionary prejudice and nostalgia, nor from that "defected rationality" which he delights to attribute to the "intellectuals" of both right and left. He holds that "the Benthamite and the Marxist do common service to Mammon," that the age of gluttony and unbounded avarice is upon us, and that escape from it lies only in a return to traditional moral and religious principles. He sees, in the commercialised lubricity of much of the American and British press, in the drab standardisation of modern town planning, above all in the welfare state and in the "improvements" of it proposed by all parties alike, the signs of a civilisation decaying because it has lost Christian values, humanist standards, and traditional wisdom.

With much of this criticism the reflective and independent observer of present conditions and trends will readily agree. But Dr Kirk gives the irresistible impression that he is more eager to attack liberals and socialists than to find a balanced and exact explanation for the trends that he deplores. Despite his love of traditions his historical perspective is badly foreshortened, as when he argues that "serious journalism . . . commenced at the end of the French Revolution," and that the welfare state as it exists in Britain was almost entirely the creation of utopian socialists. He does not know his Bentham very well, and his argument about literary censorship is oddly lacking in logic. It was not, after all, collectivism that produced the astonishing standardisation of American life, but the operations of free enterprise commercialism in all its forms: and if he will not have a predominantly individualist or collectivist economy and will not attempt to "split the difference" between them, there is little wonder that he refuses to suggest any constructive proposals for concrete improvement.

These essays, half on America and half on Britain, have all appeared before as articles and are full of repetitions and transient reflections. But there is much in them that is sane, shrewd, provocative and interesting. Let Dr Kirk shed some of his more obvious partisan bias, read more widely in history, and present his conclusions in more integrated form, and he can become one of the outstanding social critics of our age.

BOOKS RECEIVED

LONDON PLEASURES FOR YOUNG PEOPLE.
By Leslie Daiken. *Thames and Hudson.* 112 pages. 5s.
A most useful illustrated guide, especially for those entertaining young foreigners. It gives information on how to visit out-of-the-way places of interest.

By Sven Hassel. Translated by Maurice Michael. *Allen and Unwin.* 297 pages. 15s.

VENICE: *and environs.*
FLORENCE: *and environs.*
Edited by L. Russell Muirhead. The Blue Guides. *Benn.* 64 and 87 pages, respectively. 4s. 6d. and 6s.

PROGRESS IN THE AGE OF REASON: *the seventeenth century to the present day.*
By R. V. Sampson. *Heinemann.* 259 pages. 21s.

WITH BLOOD AND WITH IRON: *the Lidice story.*
By J. B. Hutak. *Hale.* 160 pages. 15s.

Time Remembered

The Twenties

By John Montgomery.
Allen and Unwin.
334 pages. 25s.

BOOKS written with a view to cashing in on a vogue are rarely very good. The current vogue of the nineteen twenties—as exemplified in the success of "The Boy Friend," the revival of the Charleston, and the repeated but luckily unsuccessful attempts by fashion-fuehrers to get women back into extinguisher hats and tubular dresses—has inspired Mr Montgomery to throw together an "informal social history." It is satisfactory neither as information, in the sense of giving the reader any understanding of the sequence and development of events between the Armistice and the Depression, nor evocative, imparting the feel and colour of life as it was lived a generation ago. The political and economic history is superficial, disconnected, cocksure, and not infrequently wrong; the account of social and intellectual life, art, sport, fashion and crime, gives much the same impression as an incompetent photographer's snapshot album—yes, one feels, that's Aunty, underexposed and showing all her teeth, that's little Johnny, overexposed and blank-faced, here is the View, which needed a colour-filter and did not get it. Here, in fact, are Pip, Squeak and Wilfred, Mrs. Meyrick, Michael Arlen, Rudolph Valentino, D. H. Lawrence (obsessed with "thwarted passion"), Wonderful Wembley, Aimée McPherson, 2LO, and the General Strike; recognisable, but all in flat dim grey or obliterating black-and-white, and, almost unbelievably, dull.

And yet something gets through; something not entirely unsympathetic, despite the frightful clothes, and the Bright Young Things, and Jix, and ribbon-building, and the humours of Punch, and the combined callousness and stupidity of the Establishment. There was plenty of indignation, but little *argot*; plenty of vulgarity, but plenty of vitality, too; a loosening-up which held the promise of genuine freedom; above all, hope.

Something else gets through, too; a conviction that there is, after all, such a thing as progress. A good many things, from economic policy to music recording, really are managed better these days. There is less blaring self-righteousness, whether from the Old Guard or the *avant-garde*, than there was. There is more tolerance. If distrust for the intellect remains unabated, positive worship of stupidity has decreased. If the relations between the sexes are still rather a mess, at least the mess is handled more humanely. And—inevitably, looking at those dreadful pictures, one returns to the topic—girls today have more sense than to try to convert themselves into the likeness of vertical worms or praying mantises. *Eppur si muove*—not always, it is well for the older generation to remind itself, in undesirable directions.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Mr Dulles's Other Island

WASHINGTON D.C.

THE American Administration is gradually assimilating the conclusions reached at Bermuda. They were conclusions rather than decisions, since the much advertised realism of the conference consisted of each side gracefully acknowledging those policies of the other which it was powerless to alter. America accepted the British defence cuts, while Britain swallowed the American approach to the Middle East which, although sketchy on the positive side, is firm in eschewing the use of force.

But changes of this order are not digested overnight. Generals in the Pentagon still mutter into the receptive ears of influential journalists that at Bermuda the President again sold the pass of his former service. The British cuts are interpreted as yet another forced retreat in the rearguard action the American Army has been fighting against a commitment to conduct only one type of war, that of total destruction. After the President had adopted the military "new look" America seemed to have lost the ability to fight other kinds of war. But so long as the strategic concepts of the North Atlantic Treaty Organisation remained intact, it was possible to visualise a limited struggle being undertaken by the alliance as a whole. The Defence Department, accordingly, is pressing for *diplomatic* delaying action against further instalments of the British military "withdrawal" from Europe. In particular, concern is being expressed that the President, advised only by a civilian Under Secretary of Defence—and one who has since retired—should have left the British with the impression at Bermuda that the Americans endorse the notion that missiles replace manpower without loss of effectiveness, after precisely the opposite conviction had been conveyed to M. Mollet.

While in the military establishment there is pressure to limit America's accommodation to its ally, the State Department, which has been operating for nearly a fortnight without any communication with its chief, is showing some nervousness in finding itself the West's bargaining agent over the Suez Canal. Weeks of direct contact with Colonel Nasser have convinced the Americans that the only terms to be had are those offered by Egypt, somewhat dressed up to look like an international instrument. But they are not willing to bear the odium of forcing any such unpleasant medicine down the throats of the principal users of the canal. While the British have encouraged the United States to take the lead, the Americans are acutely conscious that they have not been formally authorised to negotiate on anybody's behalf but their own. Not wishing to provoke any further backlash of anti-Americanism in Britain if they can help it, they have been confining themselves to narrowing the gap between the Nasser memorandum and the demands which Mr Dulles felt last summer that the users were legally entitled to advance.

To this end, the Americans took advantage of the Egyptian invitation to make "comments" on the Nasser memorandum. Under this guise, the United States made what were in essence *counter-proposals*. The Egyptian reply to these is described cautiously as "responsive" to some degree. But a very wide gulf remains. As a result, the Americans have tentatively decided to lay the two drafts before the Security Council and ask its help in reconciling them. Thus the responsibility for the virtual acceptance of the Egyptian terms would be more widely spread.

Meanwhile it remains the objective of American policy to refer two questions to the International Court at the earliest suitable moment: that of the international passage of the Straits of Tiran and that of Egyptian belligerency towards Israel in the Suez Canal. In both cases the United States undertakes to support the juridical position of Israel. In the American view, Israel should be content with this and should not, with vulgar ostentation, demonstrate that it has gained anything whatsoever from its military victory in Sinai. The strongest pressure is being put on Mr Ben Gurion not to make any test case of Israeli rights in the canal, on the ground that agreement with Egypt over principles, not mentioning Israel in any way, should come first, to provide the basis for an Israeli resort to law.

Even the celebrations over the passage to Eilat of the American ship *Kern Hills*, which had been chartered by the Israelis, and whose owners had not co-operated with the State Department, were thought to be in bad taste. They seriously threatened America's relations with King Saud, just at the moment when he was proving his anti-communist *bona fides* by urging King Hussein of Jordan to dismiss his left-wing Prime Minister, who had no intention of accepting economic aid from Mr Richards, President Eisenhower's emissary in the Middle East. And they disrupted the delicately planned minuet according to which the Americans were to have warned the Saudis of the approach of an American vessel testing its rights through the Straits, the King was to have protested formally, and everyone would have cheerfully trooped off to The Hague to take the matter to court.

★

It is to this rather stagnant Washington that Mr Dulles has just returned after ten days of primitive seclusion on Duck Island. In this Canadian retreat, according to his latest biographer, Mr John Robinson Beal of *Time* magazine, he lives in a log cabin, built by Red Indians, without telephone or even electric light, and, at the crucial turning points of foreign policy, jots down his ideas on a yellow pad under an oil lamp. Almost invariably when he has gone there something has come unstuck in Washington. This time the only explosions have issued from small time-bombs

which he had carelessly left behind, in the shape of two more than usually strange diplomatic appointments, and from the backhanded compliments bestowed on him in Mr Beal's book.

The American government's latest gifts to the capitals of Switzerland and Ireland are respectively Mr William Taylor, an eccentric whose half-baked opinions on every conceivable subject have been proffered to radio audiences nightly by courtesy of the General Motors Corporation, and Mr Scott McLeod, a McCarthyite policeman who demoralised the State Department for months by the pathological zeal with which he pursued his duties as its security officer. Mr Taylor's reward seems to have been the President's own idea; Mr Eisenhower has admired his judgment on foreign affairs ever since Mr Taylor, unlike most commentators, upheld him over his wartime arrangement with Admiral Darlan. But the President has placed squarely on Mr Dulles the responsibility for Mr McLeod. From Mr Beal's book it appears that Mr Dulles's distaste for administration led him, as soon as he became Secretary of State in 1953, to delegate immediately all that side of his duties to the president of the company which makes Quaker Oats. This gentleman, learning that he would have to appoint a security officer, consulted a neighbour in Chicago and thus, casually, Mr McLeod's name was proposed. Mr McLeod's first major act was to leak derogatory allegations to the press about Mr Bohlen, the department's most accomplished career officer, who had just been nominated as Ambassador in Moscow. Mr Dulles, according to his biographer, then decided to dismiss Mr McLeod for disloyalty, and was only dissuaded on the grounds that it would look bad to make such short riddance of a man who should not have been appointed in the first place. It is with this information freshly before the public that Mr McLeod has been rewarded, and removed from Washington, by elevation to the quiet patrician comforts of the Dublin Embassy. The Democrats would be less than human if they did not take partisan advantage of the appointment.

But, despite this uproar, Mr Dulles's main test—and the only excuse for his neglect of administrative chores—will be the quality of the ideas he has brought back on the pages of the yellow pad. In his book Mr Beal compares Mr Dulles to Einstein and the doctrine of liberation of the Soviet satellites to the theory of relativity. He says they were equally complicated processes of thought ending in a grossly over-simplified formula. It is to be hoped that Mr Dulles's plans for the Middle East will be less rarefied.

Budgeting for Ballots

THE Democrats, who are itching to beat the Administration to a tax cut, can hardly wait to hear what the Treasury found in the 60 million individual tax returns which were due this week. Only if the revenue holds up can the Democrats cut taxes without laying themselves open to charges of blatant irresponsibility. Such a cut, to take effect in January, would set their scene admirably for the congressional elections of 1958. But, if revenues are disappointing, the prospective $1.8 billion surplus may be wiped out and tax relief put out of political reach.

The other half of the battle is how big a dent Congress can make in the Administration's $71.8 billion plans for spending in the year which begins next July. It would cost at least $2.5 billion to increase the exemption for individual taxpayers by $100, the kindest cut of all for 60 million voters. Such calculations are anguish to the Republicans. They have to stand by while their opponents make off with Republican traditions of thrift and low taxes. But their patron saint of economy, Mr George Humphrey, the Secretary of the Treasury, argues that the Budget must be reduced by at least $3 billion to justify tax relief; and Mr Gabriel Hauge, the President's personal economic adviser, insisted this week that the cuts made so far have not gone nearly far enough to hold out hope of early relief.

The saving spree in the House has so far yielded $1 billion out of appropriation Bills totalling $14 billion. To this the President has added $254 million which will not be needed for the soil bank, but this is likely to be more than swallowed up in the rise in military costs beyond what was expected. The big appropriations Bills are yet to come, particularly the giant one for defence. But already the House has demonstrated the bluntness of its shears and the undiscriminating way in which it handles them.

Among its penny-wise proposals is one to prevent the Bureau of Labour Statistics from checking the sources of its price index, which is used to fix wages for millions of workers—something the President may have had in mind when he said that in 1957 the United States could not be run with the tools of 1890. Cuts in the money for administering unemployment insurance, which is required by law, will almost certainly have to be replaced. The need for something like the Senate's proposal of a joint committee on the Budget, to do for Congress what the Bureau of the Budget does for the Administration, was never more apparent. Unfortunately, there is no sign that the House is any more willing than it has been in the past to share its financial prerogatives in order to secure more effective control over spending.

No Postman's Knock

LOCKED-UP post offices and an almost complete absence last Saturday of postmen completing their appointed rounds marked a notable turn in the constant guerilla warfare between the Administration and Congress over money. This time it was the Postmaster General, Mr Summerfield, who bit the congressional watchdogs. The PMG, moreover, has hung on with a bulldog grip, refusing to provide certain services until Congress not only promised but actually voted, the cash he sought. The dispute was over a supplementary request for $47 million for the remaining three months of the present fiscal year, without which Mr Summerfield insisted he could not provide even the existing level of services. An Administration of businessmen has failed to make the Post Office conspicuously efficient. But its inability to staunch the deficit is largely the responsibility of Congress, which feels that there are both principles involved and votes to be lost in putting the Post Office on a paying basis.

Part of the reason why Mr Summerfield spent his appropriation too fast this year is that Congress gave his postmen a $17 million wage rise in 1956 and is only now ready, very grudgingly, to give him the money to pay it. The other difficulty is the growing number of letters and parcels posted by Americans. The uninformed—among whom

this time must be counted Mr Brundage, the Director of the Budget—might conclude that this would swell postal revenues. But this is not the case. All such income goes to the Treasury, leaving the Post Office completely dependent upon its congressional appropriation. In an effort to hold down spending and discourage requests for supplementary appropriations, Congress has passed an anti-deficiency law which requires departments and agencies of the government to spend no more than a quarter of their money in each three months. Like Canute, however, Congress has found that its fiat fails to hold back the population or prevent it from writing letters. The Postmaster General had no choice but to disregard the law.

Mr Summerfield's sit-down strike has apparently been successful and Easter cards will be delivered on time. But Congress dislikes being made to eat humble pie. The Administration's hopes of persuading it to wipe out the postal deficit by authorising higher postal rates never looked very substantial. Now they are slimmer than ever and so is the prospective budget surplus, which was calculated on the blithe assumption that the $600 million subsidy for the Post Office would not have to be found next year.

No More Room for Refugees

WHEN the Hungarian refugees flooded into Austria last winter, it looked as if they might also sweep a new immigration Bill through Congress. For a time they even managed to shake Representative Walter out of his self-satisfaction with the existing legislation. But now he is once more firmly entrenched in his suspicions of all foreigners, especially those who want to come to the United States, and hearings have not even begun, either in his House Committee or in the Senate, on any of the various immigration Bills which are pending. Until last week the President had done nothing to stir up congressional interest in the legislation which he requested so urgently at the end of January. Now he has drawn attention to its importance but at the same time, by pointing out that the legislators have "quite a bit on their plate right now," he offered Congress an excuse for inaction which it is only too likely to take—unless it is shaken out of its apathy by the unusual coalition of Senator Case of New Jersey and Senator McCarthy of Wisconsin, both of whom are pressing for many more Hungarians to be allowed into the country.

In the absence of legislation only a few more are likely to be admitted. For 25,000 of the 31,000 Hungarians who have come in—10,000 more than President Eisenhower promised to find room for when the emergency began and about 20 per cent of those who fled from home—are not regular immigrants but "parolees," welcomed on a temporary basis under an elastic and somewhat doubtful interpretation of the McCarran-Walter Act. Until Congress gives these people permanent status it is understandable that the Department of Justice, although apparently not the State Department, should have doubts about admitting any further large number of Hungarians. Moreover the influx into Austria has eased and there seems some prospect that, with the help of other countries, all of the existing Hungarian refugees may be provided for. The United States, for the present at least, is therefore only prepared to admit those whose exclusion would involve breaking up families and skilled workers, such as scientists and engineers, for whom there is a real need in the United States.

Floral Tribute

FROM A CORRESPONDENT IN CALIFORNIA

THE Easter ritual takes an odd and very American form at the San Francisco International Airport. Here the growers and distributors of cut flowers join with the commercial air lines to spend a frantic Holy Week sending millions of blossoms eastward for the corsages which most American women expect to receive before they join the Easter Parade. The mass movement of more than $5 million worth of flowers in this single week is the climax of the year for a major industry of the San Francisco Bay area, whose greenhouses and fields are the largest single source of flowers in the country.

The remarkably even, temperate climate of the region and its long growing season, the fortunate result of combining a southerly latitude with cold offshore currents, led very early to commercial flower growing. The coming of air-freight services, to which flowers, because of their lightness, are ideally adapted, brought the whole country within reach. Today, flowers constitute approximately 80 per cent of all airfreight leaving the San Francisco airport, and the city's immense wholesale flower centre is one of the largest and most modern in the United States.

During the week before Easter, the outlying growing areas, the flower market and the airport are scenes of day and night activity as the flowers are picked, prepared and packed for their last-minute flight to florists' shops across the continent. The flowers are placed in waterproof cardboard cartons as short a time as possible before their scheduled departure, so that often scarcely twelve hours elapse between the time they are picked and their appearance in display cases in eastern cities. To insure that they will be at the peak of perfection on Easter morning, many varieties are shipped before they are in bloom. Roses, chrysanthemums and camellias are sent as partially-opened buds. Gardenias, which are especially favoured for corsages, are literally green when they leave San Francisco, and turn white on their journey.

* * *

The immense volume involved and the premium upon last-minute shipment require almost split-second timing of flights from the airport during Easter week. One large distributing organisation alone dispatches more than a hundred loads every day during the week, using scheduled airfreight and passenger flights as well as specially chartered aircraft for destinations not conveniently served by regular services. Almost without exception, every one of the eastbound flights leaving San Francisco during Easter Week carries flowers as a part of its freight. Many cargo aircraft are devoted exclusively to them and luggage space on passenger flights is given over to flowers as fully as possible. In addition, a number of regular passenger flights during the week leave with no passengers aboard; the seats and much of the aisle space are occupied by cartons of flowers instead. Because of their lightness, a special category of charges has had to be devised for airborne flowers; a carton of 250 cubic inches is considered as the equivalent of one pound, although it is usually much less in actual weight. But aircraft carrying shipments composed largely of flowers are so much lighter than usual that they can provide speedy delivery.

The flower growers of the San Francisco area, with their space limited by their nearness to expanding urban centres, have turned increasingly to the more expensive varieties and to those cultivated in greenhouses. One result is that the city has become the orchid capital of the nation; it not only produces the most, but also carries on the most advanced experiments in breeding and cultivation. Such field-grown flowers as daisies, stocks and heather are migrating to Los Angeles, despite the celebrated smog which is a serious threat to the industry, and to Phœnix, Arizona. Daffodils are a specialty of the Pacific Northwest, although growers are frequently unable to exploit the huge Easter market because of the difficulty of causing the peak season for blossom to coincide with the varying dates on which Easter falls.

San Francisco also serves as the distribution centre for a growing trade in exotic floral products from Hawaii. These, including ginger flowers, field-grown orchids, frangipani and bird-of-paradise flowers, are particular favourites on the Pacific Coast, and have claimed part of the market originally served by San Francisco growers.

Although much of the industry's annual schedule is dominated by the planning and cultivation necessary to arrange the fullest production just before Easter, the San Francisco area's flower farmers continue to be a chief source of supply for the nation's florists throughout the year. They provide hothouse varieties in the summer, when most places have their own field-grown supplies, and summer blooms throughout the winter by planting new crops each week. They also supply San Francisco's numerous street-corner flowerstalls, which rank with the cable cars as one of the city's distinctive charms. But best of all the flower grower knows that if Easter is here, Mother's Day cannot be far behind; the second Sunday in May is an occasion for national flower-giving on a scale that rivals Easter itself.

Lead for Labour?

MR WALTER REUTHER, the president of the United Automobile Workers, was unanimously re-elected for his seventh term last week at Atlantic City and the members of the union who, under his vigorous and blameless leadership, have set the pace for many other trade unionists, also approved his plan for creating a public review board of distinguished citizens. This will guarantee the purity of the union's practices and, it is hoped, exempt it from the hostility inspired by the sensational discoveries of the Senate investigating committee. Such a board is of course more needed by the teamsters, or lorry-drivers, whose officers have provided the sensations, than by the UAW, where virtue is rampant.

In a forthright speech to the convention Mr Meany, the president of the American Federation of Labour and Congress of Industrial Organisations, made it quite plain that Mr Beck, the erring president of the teamsters, is not likely to be reinstated as a vice president of the federation when his case is heard in May. But Mr Meany said frankly that the teamsters alone can act on this hint to clean out their own stable. On this score, the meeting of the executive council of the teamsters which was held last month was more hopeful than was at first reported; instead of endorsing Mr Beck's demand for a $1 million personal publicity fund, the council, by a vote of 962, rebuffed him and limited it to fighting anti-labour legislation. Voting with the majority were Mr Hoffa, considered to be Mr Beck's heir until he was indicted for bribing a member of the investigating committee's staff, and Mr Lee, who is a likely candidate should the reformers triumph.

Mr Lee is the favoured candidate of the AFL-CIO, not only for his personal qualities—he is honest and the respected president of the Chicago Federation of Labour as well as the teamsters' eighth vice president—but because so many other top teamsters have been rolled in Mr Beck's mud, or worse. Any change in the drivers of the teamsters' union, however, would have to be undertaken at the union's convention in September, to which few of the angry rank and file will find their way.

Fortunately for labour, Congress does not seem likely to legislate against trade union abuses until the committee has finished its work next year. Labour has time to put its house in order. But there will be a constant prod at its back: the McClellan committee has been looking this week at a case of a dynamiting "goon squad"—strong-arm men—in Scranton, Pennsylvania, the state that once produced the Molly McGuires, and then goes to New York City, where it will once more pick up the teamsters' trail, and in particular that of Mr Hoffa.

Southern Stalling

WASHINGTON, D.C.

ATTEMPTS to move the Civil Rights Bill out of the Senate Judiciary Committee, headed by one southern segregationist, Senator Eastland of Mississippi, and out of the House Rules Committee, headed by another, Mr Howard Smith, appear to have been thwarted until after the Easter recess. The supporters of the Bill, which would protect the civil liberties of Negroes, particularly their voting rights, are accusing both Mr Eastland and Mr Smith of deliberately holding up the Bill as they did last year. But, since the Administration presented its case earlier in the session this year, there is a limit to what stalling can do. The more time wasted, however, the better from the southern viewpoint, since it is generally considered that the inevitable filibuster to delay passage of the Bill in the Senate will be very difficult to overcome unless the floor debate is started by May 1st—that is, immediately after the Easter recess—which now seems impossible.

The main danger foreseen by the northern supporters of the Bill is that, as the session wears on and urgent business

Third year of Publication

The Paper Bulletin

The 9th quarterly issue contains three special reports:
1. The Fibre Board Packing Case Industry.
2. The Irish Paper Industry.
3. Trends in British Paper Output.

The issue also contains: A Summary of the Contents; Guide for Paper Users; Raw Material Notes; Reports on Paper Using Industries; General Notes; Comprehensive Statistics; Charts.

The March monthly supplement dealt with the implications of the European free trade area for the paper industry.

piles up, pressures will accumulate in favour of a compromise that will take the heart out of the Administration's proposals. One that is already being suggested would concede the skilful case being developed by Senator Ervin of North Carolina against the Bill's reliance on judicial injunction to prevent Negroes from being deprived of their voting rights. When the federal government brings a suit against an alleged violation of such an injunction, there is no trial by jury. Senator Ervin pictures Southerners deprived of this traditional safeguard and thrown wholesale into gaol, for contempt of injunctions. But liberals, even though some are troubled in their consciences by this feature, argue that the new Bill will be of no help to the Negroes if its enforcement depends on inevitably prejudiced southern juries.

The outcome turns very largely on the Administration. The Negroes and their allies will judge its performance less by what the President and the Attorney General say than by what is actually done by General Persons and Mr Jack Martin, the White House liaison officers; these are the men who have real influence with the conservative Republicans on whose votes depend any hope of breaking the filibuster. Senator Lyndon Johnson of Texas, the Democratic majority leader and the most skilful manager in the Senate, is thought to have presidential ambitions and, if he wishes to be considered anything more than a southern regional candidate, he will have to avoid disappointing the northern liberals too greatly. For this reason there is a possibility that he may surprise everyone by helping the measure on its way.

Laboratory for Peace

FROM A SPECIAL CORRESPONDENT

THE Manhattan District of the United States Army Corps of Engineers, the project which produced the first atomic bomb, was a unique combination of industrial, scientific and military minds. When the war was over, a group of educationalists who had worked on the project felt deeply that the teamwork between governmental and academic institutions which had achieved such important results ought not to come to an end. A scheme for a non-profit corporation including nine leading universities in the northeastern states, called Associated Universities Incorporated, found instant favour and its functions were continued and enlarged when in August, 1946, the Army was succeeded by the newly-created Atomic Energy Commission. Today, the Brookhaven National Laboratory, the research facility operated by this group, has physical assets of more than forty million dollars and an annual operating budget of a quarter of that sum. It is the largest establishment in the world devoted entirely to research on peaceful applications of nuclear energy, and many important discoveries have resulted from the scientific activities of its staff.

The laboratory is seventy miles from mid-town Manhattan, on a 6,700 acre tract in the middle of Long Island, formerly known as Camp Upton, which served as an overseas screening centre in two wars. The technical and administrative buildings are widely dispersed over the southern half of the site and the architecture displays a weary aspect which is a kind of camouflage, since it dulls the eye to a careful observation of detail. There is none of Harwell's visible concession to æsthetic feeling and members of the staff complain that the only flowers which bloom on the grounds are those in the six-acre field used for experiments in plant genetics.

The atomic pile and high energy particle accelerator which are the very heart of Brookhaven's research effort stand on a pleasant rolling knoll some distance from the administrative buildings. Nearby is the inescapable towering chimney which carries short-lived radioactive wastes away from the ground. The centre of the pile, or reactor, is a twenty-five foot block of granite; inside, atoms of normal metallic uranium are splitting in a continuous chain reaction. This pile became "critical" (that is, the continuous reaction began) more than six years ago; since then research activities have been proceeding on its dome and two of its faces for twenty-four hours a day; it is designed so that seventy separate experiments can be performed simultaneously.

There have been many valuable results from these experiments. Brookhaven physicists have developed new methods of computing the weight of atomic nuclei. They have also invented a device called a "fast chopper," an ingenious way of measuring the "cross-sections" of nuclei, that is, their power to absorb the neutrons which strike them. Elaborate information has been collected here on the effect of radiation on chemical substances, such as rubber, petroleum and plastics, knowledge which will have important industrial repercussions in the years to come. Radioactive isotopes, for use in hospitals, agriculture and industry, are also produced.

Brookhaven's Cosmotron is the second largest particle accelerator now in operation. In the middle of the Cosmotron is a giant magnet, an iron ring with an outer diameter of 75 feet. Around it is a vacuum chamber, not unlike a race track; into this chamber tiny sub-atomic fractions of matter known as protons are fired. As they circle the track, the particles are given an extra kick in voltage until, after making the trip round the magnet some three million times, they are moving at a velocity approaching the speed of light. At this point, a target is inserted into the chamber; the hopped-up protons smash into it, and the observed results add to fundamental knowledge about matter. Using a recently developed principle known as "strong focusing" of protons, the National Laboratory's scientists are now engaged in building a new accelerator almost ten times as powerful as the Cosmotron, due for completion in 1960.

Also under construction is a new medical research reactor which will be in operation by 1958. The laboratory operates a forty-eight bed hospital, and medical research, particularly into cancer, is an important part of its programme. The nuclear engineering department is now designing a new kind of industrial reactor using a mixture of uranium and liquid bismuth to generate electricity.

★

Altogether, more than 1,800 persons are employed at Brookhaven, including 35 senior scientists, some of whom are paid $10,000 to $15,000 a year; there are 325 people on the permanent scientific staff in all, and the median annual income for this group is $8,000 (about £2,850). Until recently those who have just gained doctorates in science have been brought in at starting salaries of $6-$7,000, but this is now being raised to $7,200-$7,800 because of the fierce competition for young scientists and engineers in the United States. As well as the permanent employees, there are some 300 transients working at the laboratory. These "visitors" are an important part of the Brookhaven staff; they come from universities, industry and overseas, and often stay for a year or more. Those of the transient staff who come from large industrial concerns are, of course, paid by their companies; the Westinghouse Corporation, the Dow Chemical Company and the B.F. Goodrich Rubber Company are among those which feel that it is good business to maintain one or more employees at the laboratory. Scientists on leave from universities may be supported either by Brookhaven or by their own institution. In another category are the 65 foreign scientists; in order to obtain permission to employ them, the laboratory must show that they are essential to its work. In contrast to the Argonne National Laboratory and the Institute of Nuclear Studies at Oak Ridge, Brookhaven offers no formal teaching programme; here all learning is by doing.

The executive staff at Brookhaven is drawn from scientific or academic pursuits and its attitude toward research workers is protective; they are considered to be delicate blooms which must be insulated as much as possible from non-technical detail. Amateur theatricals flourish at the laboratory, but it is music which seems to engage most of the off-duty interest of the scientific intellectual. It is not uncommon for a physicist earning $8,000 a year to possess a high fidelity gramophone system worth over $1,500.

Both at work and away, Brookhaven people assert their fierce devotion to pure basic research, which they define as an attempt to understand how nature works. With this is coupled a drive to get things into print, to publish the results of experiments in the scientific journals. Many, perhaps most, of Brookhaven's dedicated scientists regard research as an end in itself; the practical application of their work is to them a distasteful appendage. The constant emphasis on separation of pure and applied physics recalls the fact that the laboratory, and modern nuclear science itself, sprang from the wartime development of a weapon of mass destruction, which outraged the consciences of many of the scientific employees of the Manhattan District. It is an attitude which will alter as the atomic energy programme grows away from its origins.

What is the future of the National Laboratory? Associated Universities was originally established to encourage co-operative effort in an area in which the cost of equipment was enormous and there was a shortage of trained personnel. Now, ten years later, the big machines—the reactors, accelerators, electronic computers—have become even more costly. And, while the number of scientists and technicians with nuclear experience has grown, research in the United States is hobbled by the tendency of such persons to collect in "sub-critical" pools, too small to tackle the really big jobs, and cut off from outside contacts by corporate or institutional boundaries—and by security regulations.

But the director of the AEC's physics programme has stated that basic research carried on at university laboratories is far less costly to the government than that done at the national laboratories—Brookhaven, Argonne, Oak Ridge and Berkeley, California. Nevertheless, the building programme now going on at Brookhaven indicates forward planning on a semi-permanent basis. Moreover, Associated Universities itself is being asked to do other jobs in addition to its operation of the laboratory. The group recently completed a study of radiation for the Defence Department, and has now undertaken to construct and operate the new National Radio Astronomy facility in West Virginia. New needs, in a functioning society, evoke new institutions, and Associated Universities offers one tested method of meeting some of the problems of organising technological progress.

Going to the Fair

FROM A CORRESPONDENT IN NEW YORK

THE so-called Trade Fairs which spread across Europe during the interwar years, never quite caught on in the United States, where the tradition of holding fairs, which was at least half a millenium old when America was settled, had taken an agricultural and competitive rather than a mercantile, form. While specialised efforts, such as the annual Toy Fair and the Furniture Exhibit, have been extremely successful in the United States, previous attempts to launch a general trade fair have failed. One was held in Chicago in 1950, but was not repeated, and the Canadian Industries Fair has been given up. What seems to be a general trend away from such gatherings has been emphasised by the closing down of the London section of the British Industries Fair. Nevertheless, a sanguine entrepreneur in New York city has now organised the United States World Trade Fair, billed as the largest international trade exposition ever held in the Western Hemisphere.

During this week and next, in New York's huge white Coliseum, an estimated one million visitors will go "Around the World for 90 cents." They will look at the lavish national pavilions of 42 countries, including Poland and Czechoslovakia. They will examine three thousand separate displays from trade exhibitors in 59 countries, and a large number of items which would have appealed to P. T. Barnum. Among these are King Farouk's jewel collection, carillons from the Netherlands and gorgeous mannequins. A smaller but more significant stream will be those who come to buy. Perhaps 100,000 representatives of retail shops and wholesale distributors will compare prices and order goods. The sponsors hope to make the fair an annual or biennial effort, which will play a significant part in international trade and in the American economy. Only a few general trade fairs in the past have achieved such significance, an historical example being the fair at Nijni Novgorod, which was closed down by the Russians in 1930.

The British Government is spending approximately £12,000 on its national pavilion, displaying woollens, tourism, aircraft and atomic energy. This amount is approximately one-eighth of the sum previously spent in publicising the British Industries Fair, and it is something of a gamble by the British who are feeling Japanese and German competition in the dollar market. According to a Board of Trade official, 500 serious enquiries from buyers in the dollar area would justify the expenditure involved. In addition, 150 British companies are represented in the nine commodity groups, including manufacturers of the world's smallest and cheapest power-saw, of pocket knives, of overcoats, and of seersucker plastics. The results of the fair, in terms of new orders for British manufacturers, will be awaited with interest. Unlike the United States government, which regards participation in such fairs as a propaganda device, Whitehall is primarily interested in the ring of the cash register.

IN THE BELGIAN CONGO A BRILLIANT SUCCESS HAS BEEN ACHIEVED BY PRIVATE ENTERPRISE:

The Union Minière du Haut Katanga

THE serious shortage of copper from which the whole world suffered during 1955 and 1956 led to the acceleration of numerous mining projects, especially in Northern Rhodesia. It is interesting to stress the no less spectacular development in the neighbouring territory of the Haut-Katanga, at the same time as these mines began to be worked on the copper belt. The British public is, of course, not unaware of the importance of the interests their country has obtained there through the medium of Tanganyika Concessions Limited.

The Union Minière du Haut Katanga enjoys a reputation today both on the score of the position it occupies in the world among the producers of strategic metals as well as on that of its successes in the social field. Nevertheless, its beginnings were very difficult. The company was compelled to undertake its work in unhealthy conditions, of discomfort and of isolation which nowadays are difficult to imagine.

It need hardly be recalled that the Union Minière was born of the collaboration of Belgian and British business men and technicians under the aegis of Leopold II, King of the Belgians and Sovereign of the Independent Congo State, so much maligned at the time, who created the basis of modern Katanga and who, whilst co-ordinating the efforts of those working to build up the essential infrastructure, in particular a railroad, conceived the plan of a limited company able to make good use of the mineral resources of the Haut-Katanga.

In 1891, a Chartered Company, the Cie. du Katanga, belonging to the group, Société Générale de Belgique, had received the property rights in one-third of the unoccupied part of that province together with a concession for its mineral wealth, the Independent State retaining the other two-thirds. In 1900 the Comité Spécial du Katanga, in some degree a Chartered Company, was created for the joint management of this property. The C.S.K. in the same year conceded to Robert (later Sir Robert) Williams prospecting rights in the Haut Katanga mining region. Leopold II had, in fact, the political vision to unite himself with his powerful southern neighbour, the only one capable in that region of furnishing technicians able to undertake the immediate investigation of the mineral wealth revealed by the Belgian geologist Cornet eight years previously. Furthermore this collaboration was tantamount to the *de facto* admission by Cecil Rhodes of the sovereignty of the Congo over the Katanga. The future was thus assured.

In the following year, Robert Williams transferred his rights to Tanganyika Concessions Limited. Thus the work was set in train. Five years later, in 1906, the Union Minière du Haut-Katanga was created in order to work the mines discovered or yet to be discovered. The C.S.K. in agreement with the T.C.L. brought to the U.M.H.K. the results of the studies and the prospecting carried out, and granted to that company the exploitation rights in a well defined area for a period of 30 years. The concession was later extended to 1990.

The initial capital was fixed at 10 million francs, 100,000 shares subscribed half by the Société Générale de Belgique and half by the T.C.L. Further, 100,000 dividend bearing shares were allocated gratis to the C.S.K. as remuneration for the assets brought in by it. 40,000 of them were reassigned to the T.C.L.

In case of an increase of capital, it was laid down that as many dividend bearing shares would be created as there were shares in the new issue, which dividend bearing shares would enjoy the right to vote and would be given gratis to the C.S.K., two-thirds of whose capital belongs, it will be recalled, to the Colony.

The community of the Belgian Congo has therefore already derived the greatest benefit from the work of the Union Minière.

The undertaking by the U.M.H.K. of the activities of the T.C.L. presented some problems of a delicate nature. The young company had neither the experience nor the personnel to undertake this task by itself immediately. Thus a technical committee of management, acting under the direction of Robert Williams, Vice-Chairman of the Company, was created. This committee set to work in Africa and was independent of the representative of the Board. This chain of command was naturally bound to create difficulties, which were not, indeed, absent. In addition to this, the creation in the heart of Africa of a mining and metallurgical industry presented in itself a number of extremely difficult problems.

Coming from the South, the railway reached Elisabethville and the Etoile Mine in 1910. A foundry, the first metallurgical venture of the Katanga, had been built close by on the Lubumbashi river. The first copper casting was made there in 1911, but this activity was only a very temporary one. In point of fact, the cost price of the metal proved itself to be prohibitive. The whole capital of the company was swallowed up and its liabilities grew continually heavier.

In 1912 important measures of reorganization were undertaken. From that point onwards, Belgian engineers and technicians in ever increasing numbers took the place of their English and foreign colleagues and it was with the consent of the British shareholders that the technical management passed into Belgian hands. On the financial level, Belgium also increased its activity. The Société Générale under the influence of its Governor, Jean Jadot, agreed to take further risks and made further investments in the Union Minière. The latter's capital was increased by 2.5 million francs and 10 million francs of debentures were put on the market. This was certainly a heavy burden, but within a short while the correctness of these views was proved: during the 1914-18 war it was possible to supply the Allies with 85,000 tons of copper, an outstanding achievement for that time.

Since those heroic days, the Union Minière has developed spectacularly. After the brief crisis which followed the first world war, the company began to thrive.

The period from 1923 to 1930 is one of great achievements: Elisabethville became a metallurgical centre of the greatest importance. The process of electrolysis began to be used. Cobalt, at first considered an impurity, was recovered from production. In 1930, the Francqui hydroelectric power station began to operate.

Since there was insufficient labour at Katanga, it became necessary to import it from more or less remote districts. These men were at first housed in camps and were subject to demoralising influences. It is greatly to the credit of the Union Minière that since 1928 it applied a policy of settling families of the workers and that it has never ceased to promote their social welfare. As a matter of fact, since the beginning the company has been concerned with the well-being of the natives. It has been a pioneer in this field.

The increase in the financial means of the Union Minière kept pace with the rapid development of its installations. Between 1921 and 1930, the capital was increased to 400,000 francs and debenture loans for an amount of nearly 500 million francs were placed on the London and Amsterdam markets.

Then, suddenly, the great crisis of the 1930's came, sparing neither the Congo nor the Union Minière. The price of copper dropped sharply and production had to be drastically reduced. But, even when this period was at its darkest, the company continued to use its initiative. Several branches were created and in the midst of the crisis new installations were established. Consequently, when circumstances, under the pressure of international tension, again became favourable, the Union Minière was prepared to continue its upward trend.

The year 1937 is an important date in the history of the company's capital. The various securities were unified and replaced by capital shares without nominal value, the same as those with which we are familiar today, offered on the market in tenths of one share. The company's capital was increased to 300 million francs by the issue of 414,000 new shares. According to the agreement, the Comité Special du Katanga at the same time received a certificate, entitling it to 414,000 votes at the meetings of the company. It was understood furthermore that the C.S.K. would be entitled to a royalty of 10% of the extra dividends to be distributed among the shareholders over and above a first dividend of 1,150,000 francs. As in the case of each increase in capital, the C.S.K. reassigned a part of its rights to the T.C.L. in conformity with the agreements between them.

The increase of capital in 1937 permitted the Union Minière to take radical steps towards rendering its financial position a sound one and towards repaying the considerable loans it had contracted in sterling and in guilders.

The 30's were for the company the end of an era which may be termed that of the creators. With the second World War a new era commenced, an era of rapid and uninterrupted development up to the present day. During the war, in spite of all difficulties and at the cost of an all-out effort the U.M.H.K. was able to afford the Allies the indispensable aid of 800,000 tons of copper delivered to the U.K., the whole production of cobalt shipped to the U.S.A. and invaluable supplies of uranium. Whilst the metallurgic works were modernizing their equipment, the region of Kolwezi in the western sector became the principal mining centre of the Haut Katanga.

The transformation of Katanga in these last ten years, the result of the ceaseless activity of the Union Minière, is at least as spectacular as that of 1923 to 1930. Visitors today are unanimous in recognizing the economic and social equilibrium of this region which was recently so poor and so desolate.

The industrial power of the company is considerable. The range of its products has increased and their volume has grown incessantly. Through the intermediary of its numerous branches it participates in all sectors of economic activity. In 1956, the Union Minière produced 247,500 tons of copper, 9,100 tons of cobalt, 203,800 tons of concentrates containing approximately 58% zinc, 110 tons of cadmium, 118 tons of silver and large quantities of germanium, uranium and radium. Four hydroelectric power stations have a production capacity of about 2,400 million k.w.h. per year, of which 500 million are now exported each year to Rhodesia.

* * *

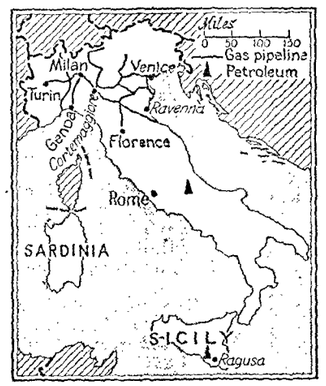
In the social field, the company employs those methods best adapted to the progress of the work, in agreement with the Government of the Colony. The population of its settlements at the end of 1956 was nearly 89,000—the families of its 22,000 native workers.

On the financial plane, the capital evolution of the U.M.H.K. goes hand-in-hand with its astonishing expansion. The capital was increased from 300 million to 1 milliard francs in 1946 and then by stages to 8 milliard in 1956, by incorporation of its various reserves.

The profits obtained by the Union Minière reflect its prosperity. In spite of considerable investments, they have increased from 600 million francs (or £4.3 million) in 1946 to 1,838 million francs (or £13.1 million) in 1950 and 4,098 million francs (or £29.3 million) in 1955, whilst production of copper, the principal product of the company, rose from 144,000 tons to 235,000 tons. The increase in production enabled the greatest profit to be obtained from price increases on the non-ferrous metals markets.

All this, however, is only a phase of development. The near future will see numerous new plans realized, both in mines and metallurgy and in the social sphere.

After a period of extraordinary boom and then of instability, the copper market is now recovering its equilibrium. There can be no doubt that before long it will experience a new prosperity. The shareholders of the Union Minière du Haut Katanga can face the future with confidence.



THE WORLD OVERSEAS

The Oil Outsider

THE hold of the great private oil companies in the Middle East, eroded already by nationalism, has now been challenged by a new figure, Signor Enrico Mattei, the 51-year-old president of the Italian state corporation, Ente Nazionale Idrocarburi (ENI). Two months ago he reached an agreement with Egypt for joint exploitation of the oilfield of *El Belayim in Sinai*, on terms which depart from the 50-50 principle for royalties adopted by the established companies in the Middle East. Since then he has been seeking an agreement with Iran to explore the promising Qum field. Here he has failed for the moment. But he remains a thorn in the side of the established oil giants and an economic and political force to reckon with in his own country.

His combination of capitalist enterprise with state privilege and power is peculiarly Italian. When Mussolini's bloated corporative state was decapitated, many of the hydra's limbs remained adrift in the economy, inert bureaucratic monstrosities in some cases, in others a ready tool for able and ambitious men—of whom Signor Mattei was the most spectacular. Like the fifteenth century condottieri who became as powerful as the princes they served, he has carved out an economic empire for himself in the state's name. In the confusion of 1945, the Italian provisional government sent him to the Po valley to wind up the local branch of the state-owned natural gas company, which had prodded at the basin for years with negligible results. Instead of selling off the gear and firing the staff, he threw his orders into the wastepaper basket, borrowed money and drilled as fast as he could. He was either very able or incredibly lucky; perhaps both. Small finds were followed in 1949 by an astonishing strike at Cortemaggiore. By 1956 Signor Mattei was producing 3.5 billion cubic metres of gas compared to a mere 400 million cubic metres seven years before. Natural gas, flowing mainly through the pipelines which he had thrown across northern Italy with conspicuous scorn for municipalities and property rights, was supplying 11.5 per cent of the country's fuel, and a precious raw material for the chemical industry.

Signor Mattei sold his methane not at the tiny production cost but at a price competitive with imported fuel, and his financial assets quickly multiplied. He entered parliament as a Christian Democratic deputy, and in 1953 it gratefully appointed him head of a new and bigger state corporation with a monopoly of oil and natural gas production in the Po valley, and with capital assets of some £33 million. He was not without critics. Industry, handicapped by high fuel costs, complained that he was not passing on the benefits of the new cheap fuel. Politicians began to ask how Mussolini's legacy of economic states within the state could be brought under parliamentary control. A "Ministry of State Participations" was eventually set up, a new democratic head for the hydra. But whether the head will move the limbs, or the reverse, remains uncertain. Signor Mattei's success and influence have grown year by year. ENI makes an annual profit of over £2 million, and has an investment programme of £102 million for 1956-8.

The golden egg of natural gas has recently shown signs of tarnishing; production went up by only 22 per cent in 1955, a slower growth than in former years. No new finds have been made as rich as Cortemaggiore. But Signor Mattei is expanding his empire. He distributes a fifth of Italy's petrol and has developed "motels" to encourage sales; he is building a £26 million synthetic rubber plant at Ravenna; he is said to have searched Sardinia for uranium by helicopter. And he has set his sights on the biggest quarry of all, oil.

The Po valley is regarded by some geologists as Italy's most promising potential source of oil. Since Standard Oil, which had been exploring there, was driven out by the 1953 law, it has been Signor Mattei's preserve. But his search has had little success. Critics claim, perhaps unjustly, that his technical resources are hopelessly inadequate to the task of exploration. Drilling does seem to have been more active in Sicily, where, under a regional law favourable to foreign companies, a patchwork of busy exploration concessions has taken shape. The Gulf company struck oil near Ragusa in 1953, and they expect to bring up over a million tons this year. Thus, from their preserves in the opposite ends of Italy, the private firms and Signor Mattei glowered jealously at one another.

The struggle came to a head in 1955 when oil was struck 100 miles east of Rome. This was neutral ground, where, while ENI had no monopoly, private companies had no security for the future. The existing law allowed them exploration rights but no guarantee that they could continue to exploit any oil they found. The first strike was made by a company jointly formed by Gulf and the Italian chemical concern, Montecatini. But Signor Mattei rushed his drilling teams to the area, and soon struck oil close by. Then he concentrated all his efforts on influencing a new bill which was designed to clarify the ambiguous law.

This time the opposition to him was more articulate. It comprised the international companies; Signor Sturzo, the Sicilian founder of the Christian Democratic party; many oil technicians; the small band who appreciate how much liberal economic policies have done for Italy since the war; and a growing number who were disquieted at Signor Mattei's swelling power. But on his side were not only the left and centre of his own party, but many Communists and Socialists. Adept at publicity, he also commanded widespread emotional support outside parliament. Habits of thinking derived from both Mussolini and Marx, social bitterness, and anti-American and anti-British resentment originating in the bungling of Italy's surrender, combined to increase the popular backing for the Italian David in his challenge to the Goliaths of Anglo-Saxon capitalism.

★

Signor Mattei did not get all he wanted, but the law clearly gives him a privileged position. A belt of ENI territory may surround each private concession, and the 50-50 profits rule is abandoned for a more flexible arrangement; any of the international companies which worked under it would be breaking the common front. Gulf soon gave up its drilling on the mainland and retired to Sicily in a huff. And as yet the promise of the Abruzzi field has not been fulfilled.

Successful in Italy, Signor Mattei is now challenging the great oil companies in the Middle East. Last year he quietly went into a company in Egypt, which is producing oil along the Gulf of Suez. Now this has gone into partnership with the Egyptian Government to exploit El Belayim, which might yield a million tons this year. The contract is not a direct affront to the 50-50 principle, but it can be interpreted as one. ENI's subsidiary will pay 50 per cent royalty on the profits it draws, but it will only hold 51 per cent of the shares of the new company, and the Egyptian government the remainder. In all, therefore, Egypt will get some 74 per cent of the total profits from the field. The contract which Signor Mattei hoped to sign with Iran was similar. He was not to produce the Qum oil, but he hoped to play a large part in its distribution, a task for which his experience suits him well. But the scheme fell through—perhaps because of the awareness of the Shah and his advisers of their dependence on the United States.

Signor Mattei's weakness is lack of finance and technical resources in comparison to those of the great companies. He might well be content to stop his disturbing activities once they accept him as an equal, if a smaller one, and give his infant company a chance to learn from them. The outsider's strength is political. As a have-not power, defeated Italy, like Germany, is acceptable to a Nasser or a Mossadegh. Mattei's search for a partnership with the nationalism that alarms the Anglo-Saxon powers awakens an echo of political sympathy in Italy too. A stir of approval ran through Italy when an Italian tanker broke the ban on Mossadegh's Abadan. Mattei's challenge to the 50-50 principle is not merely a means of pressure on the major companies but a political challenge too.

Albania Steps Up the Attack

FROM OUR CORRESPONDENT IN BELGRADE

THE Albanian leaders, whose visit to Moscow completed the set of satellite pilgrimages to Russia since the Hungarian revolt, wasted no time in getting down to their favourite occupation of attacking Jugoslavia. In his first speech, the Albanian prime minister, Mr Mehmet Shehu, hailed the Soviet Union's glorious leadership and attacked the Jugoslav communists as "revisionists and opportunists" in almost the same breath. Ever since 1948, reviling the "comrades" across the border has been one of the main occupations of Albania's communist leaders. They have acted as pace-setters in making loud accusations against Marshal Tito which are later echoed by the rest of the Soviet block; while, more recently, when flattery of Jugoslavia was the order of the day, Albania lagged behind. Personal antagonism towards their former Jugoslav "protectors" is one reason for the Albanians' attitude, for no gratitude is felt for the support which the Jugoslavs gave the Albanian communist party in its infancy; but it is also undoubtedly approved and abetted by the Kremlin. Ever since 1948, Albania has been cited by the Russians as an example of a small country threatened by a big one—a victim of Jugoslav interference, imperialism and exploitation—so that when the Jugoslavs make similar accusations against the Russians, they can be told that they are in no position to throw stones.

When diplomatic relations between Marshal Tito and the Soviet block were "normalised," the Albanians alone refused to make an unreserved apology for having made "wrongful accusations." Their gestures of conciliation to Belgrade during their last party congress were only half-hearted. Mr Hoxha, the first secretary of the party, refused to rehabilitate those Albanians who had been executed for "Titoist" deviation, and continued to insist that Koci Xoxe was an "imperialist criminal" whose liquidation was justified. While other East European communists were falling over backwards to withdraw their earlier abuse of Marshal Tito, the Albanian leaders only talked of pre-1948 "misunderstandings."

Then, last November, when the new differences between Belgrade and Moscow developed into fierce public criticism of the Jugoslavs, it was Mr Hoxha who heralded the campaign by writing an article for *Pravda* in which the deadly term "revisionist" was applied to Marshal Tito's attitude towards the Soviet intervention in Hungary. The Jugoslavs retorted by publishing Tito's Pula speech, and so took up openly the challenge to verbal hostilities which have been gaining in bitterness ever since.

The new battle is not confined to ideology. The Albanians have also been delegated to set the pace in reviving traditional national quarrels which were not brought up even in the worst days of the 1948-54 feud. Mr Hoxha recently complained that the "Belgrade chauvinists" had "denationalised" the Albanian minority of 500,000 living in the Kosmet region, declaring that not even "Serbian royalists and Greek imperialists" had been guilty of such practices. Kosmet, whose inhabitants also include Serbs and Shiptars, is particularly sensitive to national antagonisms; and, according to the Jugoslavs, Moscow chose it as a propaganda target to divert attention from the embarrassing ideological principles now in dispute. The Jugoslavs quickly reacted by holding a big meeting at Pristina, the main town of Kosmet, to demonstrate with facts and figures the wellbeing of the Albanian minority. They have also brought counter-charges about Albania's treatment of its Montenegrin minority, and have accused Albania of desecrating Serbian graves of the first world war, adding the taunt that "even King Zog had respected the last resting place of dead soldiers."

It is hard to say how much antagonism really exists among the mixed population of Kosmet. Since the war, the government has been very careful in its handling of minority rights. The national groups have an equal say in municipal, regional and district committees, and there is substantial evidence that neither group is unfairly favoured. Among individuals, however, the old feuds have yet to disappear. This is not surprising in an area where education is still scanty. The old grudges are still raw, and a longer period of education and intermingling will be needed before they are healed. But now the government's efforts will probably be intensified, if only to impress Albanians across the border.

Since making these charges of "revisionism" and "denationalisation," Tirana has carried the offensive a stage further. Just before the Albanian leaders left for Moscow, their party newspaper, *Zeri i Populit*, claimed that the Jugoslavs have "actively joined" the imperialists; previously the charge had only been that they were "objectively aiding" the imperialists. The pace may have been set for a new attack.

Towards Multi-Racialism

FROM OUR SPECIAL CORRESPONDENT LATELY IN TANGANYIKA

TANGANYIKA is the quietest but by no means the dullest of the British African territories. Between the surrender of the fabulous General Lettow von Vorbeck in 1918 and the opening of the no less fabulous ground-nuts campaign of 1947, virtually no event disturbed the equatorial scene. During the thirties, there was a good deal of Nazi propaganda among the remaining German settlers; and at one time, the immigrant British became seriously alarmed by rumours that Neville Chamberlain would restore Tanganyika to Germany. But when war came, the German plotters were efficiently rounded up and their property was first sequestrated and then confiscated. Today, nothing remains of *Deutsch Ost-Afrika* save the blockship sunk in Dar-es-Salaam harbour and a number of *bomas* or fortresses from which the former administrators used to exercise their dynamic and ferocious rule. Of Mr Strachey's ground-nuts nothing remains whatever.

The Tanganyika of today is politically unique in Africa, being a genuine multi-racial society in embryo. This is formally recognised in the agreement under which the British Government accepted the Mandate. But it also results naturally from the population structure. At the end of 1955, Tanganyika contained 8,205,000 Africans, 94,400 Asians and only 25,000 Europeans. (In Kenya, a territory about half its size, the corresponding figures were 5,815,000 Africans, 180,000 Indians and 52,400 Europeans.) Whatever, therefore, the political future of Tanganyika, it obviously cannot be a preserve either of Europeans or Indians. Sir Edward Twining, who has been Governor since 1949, has never failed to make this fact crystal clear. And the Africans, because they do not fear European domination, have at present no desire to root the Europeans out.

If Tanganyika is spared the troubles of Kenya or Rhodesia, it suffers from the opposite complaint of political inertia. The territory is still ruled in colonial style by the governor and a Legislative Council containing 31 official and 30 representative members. The latter are divided equally between the three races, one of each race representing each of the eight provinces and the capital, Dar-es-Salaam. Next year there are to be elections in certain constituencies and the franchise is being extended, but compared with developments in Ghana and elsewhere, these measures are bound soon to seem antiquated.

*

Because of poor communications, especially with the Central African Federation, Tanganyika has not yet felt the impact of African nationalism. There is one party, the Tanganyika African National Union (Tanu) which is in line with African nationalist parties elsewhere. But its leader, Mr Julius Nyerere, a globe-trotter of considerable ambition, is still rather small beer in the great anti-colonial capitals, and he has not as yet much support from the left wing of the British Labour party. Inside Tanganyika, support for Tanu is chiefly concentrated in the Dar-es-Salaam area, in the towns on the central railway.

Confronted with Tanu, the government encouraged the formation of the multi-racial United Tanganyika Party (UTP). Its task is delicate: to animate political life in a country which is still pre-political. In particular, the party is faced with the problem of grafting western institutions such as local, county and town councils upon African tribal government. Democratic local government at the Native Authority level works well enough, and in some cases, for instance among the Chagga tribe on Kilimanjaro, even the women take part in administrative decisions. But the UTP's aim is to recruit a political elite of all three races.

The party's main complaint is that the British provincial and district commissioners, whose instinct is to isolate and protect the African, make it difficult to mix the races. During its short life the UTP has also found the attitude of the European settlers depressingly negative. A few of them, notably a group of young farmers on the western slopes of Kilimanjaro, subscribe to the programme of the Capricorn African Society, which at its congress last year contracted to establish common citizenship and multi-racial institutions in all British African territories. But most of the thinly scattered European farmers and businessmen regard the UTP merely as a means of containing Tanu. The Indians have responded politely. But they will not commit themselves, since they are afraid that they may eventually have to live in a African nationalist Tanganyika rather than in the multi-racial society which they would much prefer.

The economy of Tanganyika steadily improves. In 1955 exports of sisal and coffee amounted to £10 million and £7 million respectively. Although coffee is mainly grown by African smallholders on plots averaging less than an acre (unlike sisal which is a European owned plantation crop) the production and marketing of coffee is highly organised by bodies such as the Kilimanjaro Native Co-operative Union and the Bukoba NCU. As a producer of minerals, Tanganyika, with its diamonds, gold, silver and lead, reigns unchallenged in East Africa, and production rose from £2 million worth in 1951 to £5½ million in 1955. In its land policy the government has been guided by the report of the East African Royal Commission on Land and Population. Only a tiny percentage of the land has been alienated to Europeans. But great efforts are needed to raise African agriculture above the subsistence level. The hoe is still the basic implement throughout most of the territory's vast area, the African is still inclined towards a shifting cultivation, and the tsetse fly still debars large regions from carrying stock.

All this means that a great deal of capital is needed, particularly for bush clearance and farm mechanisation. But there is a danger that investors, particularly the large corporations, will be put off either by doubts about the territory's future status or by impatience with the slow financial return from a country so undeveloped in its communications and power resources. If substance is to be given to the multi-racial political concept, Tanganyika must surely undergo the kind of steady economic advance that has succeeded so well in the Belgian Congo. But this seems beyond the present resources of the resident Europeans.

Jordan's Breathing Space

FROM OUR CORRESPONDENT IN BEIRUT

Tuesday night

FEW people in Amman foresee a long life for the new government formed by Dr Hussein Fakhri el Khalidi yesterday. Although the initial reception was reasonably good, it is widely regarded as a stopgap designed to give the tension a chance of easing. It consists of three politicians, a banker, a doctor, a dentist and a judge. Two of its members, the premier and the deputy premier, Said el Mufti, are from the Senate; the rest are drawn from outside parliament. An early test will come when the government presents its programme to parliament.

There seems no intention of effecting any radical break with the foreign policy of the former left-wing coalition government of Suleiman Nabulsi. The appointment of the premier of the outgoing government as foreign minister in the new one itself suggests that there is no such intention. Both the King and Dr Khalidi, moreover, have explicitly stated that Jordan will continue to pursue the ideal of Arab unity, that it rejects "imperialism" and foreign alliances, and adopts a system of "positive neutrality" as the basis of its policy.

The vigorous statement of these slogans by the King and the premier is an attempt both to appease the nationalists and to steal their thunder. There is strong latent radicalism among the urban masses of Jordan and in the refugee

camps; allied to nationalism, it carries an appeal of overwhelming strength. The King and his advisers have wisely decided to go along with the nationalist current, although they certainly hope to purge it of its extreme radical taint.

The desire of the King to have at least one outstanding member of the former government in the new administration is easy to understand. He badly needed to reassure the masses, among whom the Nabulsi government was probably the most popular Jordan has ever had. But Nabulsi's decision to accept the foreign ministry is less easy to interpret. Perhaps he did so in order to ensure the continuity of foreign policy, which might otherwise have been undermined in spite of the King's recent declarations. Perhaps he hopes to wean his National Socialist party, the largest in the chamber, away from its alliance with the extremist Baath Socialists and National Front, and to aim at a right-centre coalition in which the National Socialists would have a larger say, commensurate with their representation in the chamber. At all events, his decision marks an abrupt reversal in policy since last week, when Dr Khalidi's first attempt to form a government failed because of the joint refusal of the left-wing parties to serve with him.

"I don't like it; it's much too quiet." This remark is often to be heard in Amman today. There is little doubt that the King's resolute action on Saturday night stopped the left wing in its tracks. His action against the plotters at Zerka, and the subsequent show of force in Amman, with an armoured regiment rumbling into town to shield the palace, had a stunning effect. But few would care to prophesy that the leftist masses have been disposed of once and for all. Loyal troops are in command in Amman and its neighbourhood. But where the masses are concerned, action in Jordan usually begins on the West Bank, whence it hits the country with hurricane speed and violence. The fact that the mob has held its hand has given the army no chance of chopping its fingers off, and there is a widespread feeling that the real test of strength lies ahead.

The new government is confronted with three delicate problems: diplomatic relations with the Soviet Union; the reinstatement of the civil servants who were dismissed by the Nabulsi government; and what to do about the mission of Mr Richards, President Eisenhower's special envoy.

The first question is delicate for Mr Nabulsi personally, rather than for the government as a whole. There is no evidence of any widespread popular demand for relations with the Soviet government. But Nabulsi himself forced the issue on King and people, and he will have to do some adroit word-swallowing if the new government—as seems likely—decides to defer consideration of the question. It

"Motor Business"

The March issue of this quarterly research bulletin for the motor and allied industries is now available and includes:
The long-term growth in domestic commercial vehicle demand.
Prospects for buses and coaches.
The Swiss market for vehicles and tractors.
Notes on the Russian motor industry.
The Bulletin is fully illustrated by charts, amongst which are:
Price indices of used vehicles.
World exports of vehicles.
For full particulars of this Bulletin, apply to:
THE ECONOMIST INTELLIGENCE UNIT LIMITED
22, Ryder Street, St. James's, London, S.W.1.
WHitehall 1511. Ext. 49.

is on the issue of reinstating the dismissed civil servants that the Left feels strongly. It regards the civil administration as having been packed by former "reactionary" governments, and it was the insistence of the Nabulsi government on reversing that trend that contributed more powerfully perhaps than any other factor to the crisis between King and government. The new government must walk warily if it is to avoid storms from the left.

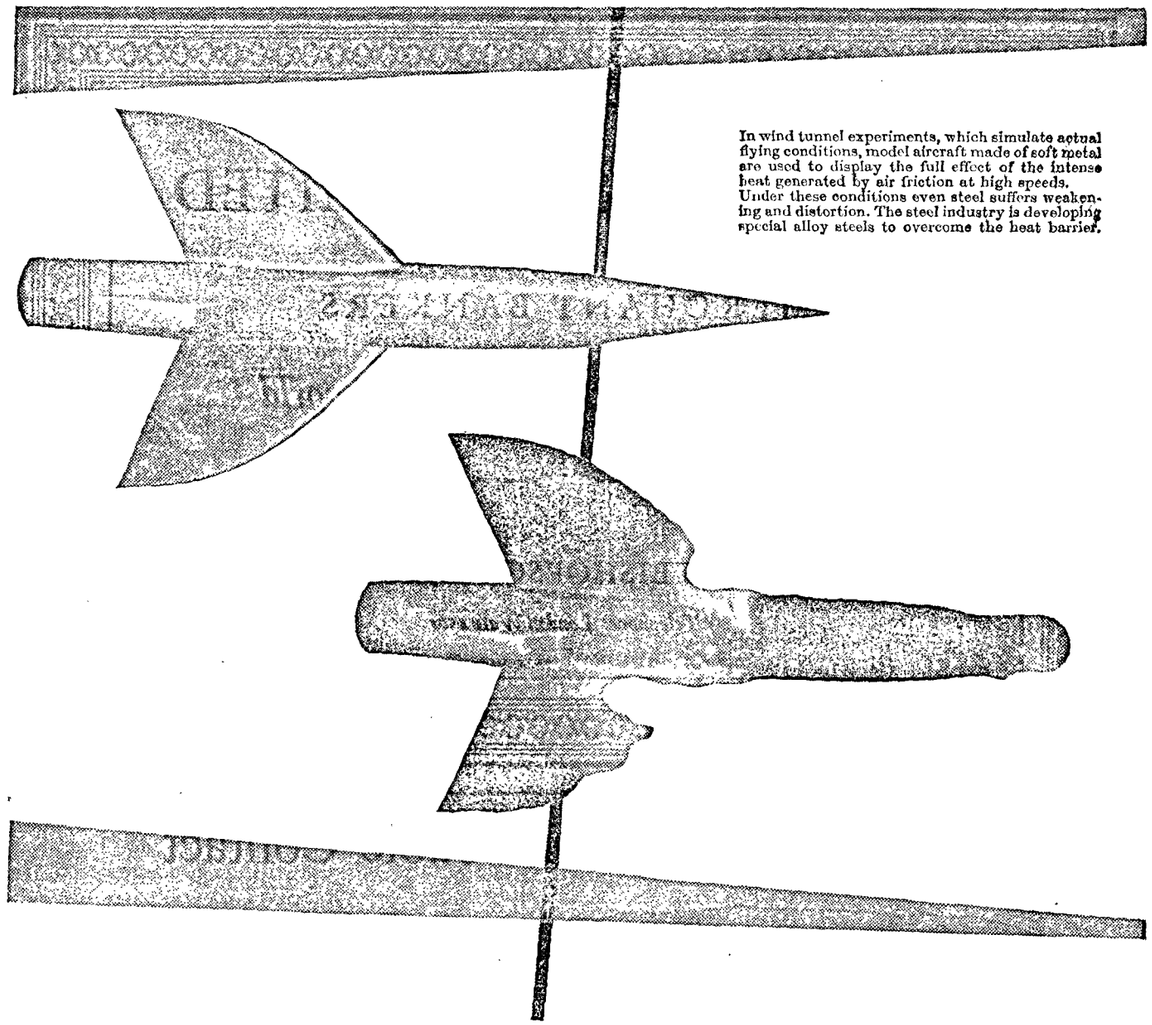
The problem of the Richards mission is still more serious. There is no doubt that the moderates in Jordan would welcome United States aid if it were offered on reasonable conditions that left Jordanian sovereignty untouched. Yet many left-wing leaders have made it a prestige issue by stating in so many words that they would bring the mobs into the street rather than admit Mr Richards. Popular agitation against his mission by largely left-controlled "national guidance committees" is just the spark to set off the kind of popular explosion that would stretch the army to the limit and put almost irresistible temptation in the way of Jordan's neighbours.

Tunisian Light and Shade

FROM A SPECIAL CORRESPONDENT

At the first anniversary of Tunisian independence last month the official delegates and journalists from forty-seven countries were present as guests of the government. The idea of celebrating in a big way came to the prime minister, Mr Bourguiba, when he attended the celebrations in Ghana. Tunisia, he thought, should do at least as much as Ghana to make itself known in the world. Not that the Tunisians suffer from the Egyptian itch to be a great power, for which position their population of three and a half million and lack of natural resources in no way fit them. But they do have the ambition to be a model progressive state in the Arab world, of which they recognise themselves to be part. They remember that they were the first Arab state to experiment with a constitution nearly a century ago. Some of them will say that whatever harm colonialism may have done them, they are deeply grateful to France for having given them the Cartesian outlook. However this may be, they give the impression of believing in racial and religious tolerance, of a marked tendency towards social reform and of pursuing a foreign policy which, while directed to complete independence, aims at co-operation with their Muslim and Christian neighbours.

Though the draft constitution states that sovereignty resides in the people, Tunisia is, for the moment at least, governed by one party, the New Destour, with an unquestioned leader, Mr Habib Bourguiba. In the foreign field his object is to emancipate Tunisia from too great dependence on one country, France, by cultivating relations with other African and western Mediterranean countries and with the United States. He would like the North African countries, including Libya and Algeria, to be linked in a loose federation which would have a kind of commonwealth relationship with France or western Europe as a whole. Within the Arab world he supports the more moderate and less fanatical elements wherever these are to be found. His energy in furthering his aims is considerable, as shown by his personal attendance at the United Nations and at the Ghana celebrations, his recent stay in Morocco, his forthcoming journey to Libya, and his flying visit to Spain.



The greatest obstacle to the fulfilment of these plans is the continued struggle in Algeria, with its inevitable effects on Tunisian public opinion. French residents and French capital are leaving the country, and the otherwise excellent prospects of peaceful Franco-Tunisian coexistence are being ruined. The damage thus done to French interests is obvious and irreparable, and as France's closest ally Britain shares to some extent in the French eclipse; for an Englishman it was something of a shock to be asked more than once whether one was American or Russian as if no other alternative could exist. The British Council is investigating the possibilities of working in Tunisia; but the BBC Arabic service, which used to command an immense audience, has lost much ground, partly as a result of the opening up of many newer and more direct western contacts and partly because of British support of France in Algeria and the joint Suez expedition. The most conspicuous foreigners are the Americans, thanks to their large and efficient diplomatic organisation, their economic mission studying Tunisian needs, and the visit of the Vice-President, Mr Nixon.

In internal affairs, the tendencies of the government have been shown by the subordination of the *waqf* administration to the civil government, by the abolition of plural marriage and by the granting to women of the right to vote in municipal elections. Jews are treated as the equals of other citizens and there is a Jewish minister in the government. Another revealing sign is the attention given to youth activities and sport; these are grouped in a special ministry under the prime minister's office. Tunisia has a very high birth rate and half the population is under twenty years of age. A considerable percentage of the budget is devoted to them.

★

Unemployed young men can earn their keep (without wages) by working on various construction projects. Children's hostels, founded under the protectorate but now greatly extended, take charge during the day of the children of needy parents who cannot at present be accommodated in the schools. They receive food, medical attention and a simplified form of elementary education. "Children's Villages" take complete charge of some three thousand orphans, feeding and clothing them, providing a boy scout type of training and teaching them a craft or agriculture. The teachers are keen and the children obviously well and happy.

The charm of the Tunisian scenery and the friendliness of the people make Tunisia a pleasant country to visit. The dark side of the picture, apart from the Algerian nightmare, is the tremendous growth of the population, unaccompanied by a corresponding increase in productivity; the massive unemployment; the recurring droughts and the lack of easily exploitable natural resources. But the examples of neighbouring Libya and of other undeveloped countries show that worse difficulties than Tunisia's can be overcome by the joint operation of international philanthropy, interested or disinterested, and the resources of modern techniques. Miracles are being worked by these means daily in many parts of the world; and Tunisia is by no means the least worthy candidate for a miracle.

In wind tunnel experiments, which simulate actual flying conditions, model aircraft made of soft metal are used to display the full effect of the intense heat generated by air friction at high speeds. Under these conditions even steel suffers weakening and distortion. The steel industry is developing special alloy steels to overcome the heat barrier.

Steel in the jet-age

The work of the British steel industry is more varied than ever — and more vital to our economy. There are steel components in supersonic aircraft and in guided rockets. There is steel by thousands of tons in the new atomic power stations. And goods made wholly or largely of steel formed over 40% of Britain's exports in 1956.

Today it matters very much indeed that Britain's steel industry should be preparing for the growing and changing needs of tomorrow.

In steelworks all over the country you will see the results of the industry's post-war, jet-age planning. You will see new plant, bigger plant; the most up-to-date steelmaking devices; the latest techniques. Everywhere you will see expansion, development, modernisation, to keep pace with the ever growing demand.

Already our blast furnaces and open hearth furnaces are producing two-thirds more than in 1946. And as output increases, fuel consumption per ton and man hours per ton are being steadily reduced. Further expansion is in hand and a steady increase in annual output is foreseen for years ahead.

Steel is judged by its performance

Twelve years before Cable Contact

The first South American cable was laid between Pernambuco and Lisbon in 1874—twelve years after the Bank of London & South America had opened its doors in Brazil.

Since then, commerce with Latin America has increased enormously, and with it have grown the influence and interests of the Bank. Today, the Bank holds a unique position as the *only* British bank in Latin America. It has Branches in most of the important trading centres of that vast Continent.

Up-to-date reports on local markets, trading regulations and general economic conditions, are received regularly from branches overseas and are summarised in the Bank's *Fortnightly Review*, which is distributed to customers and made available to those who have business in Latin America, Portugal or Spain.

THE BUSINESS WORLD

Courtaulds Swallows Celanese

THE press officer at British Celanese got out a rather pathetic release recently: "Textile event of the year," he wrote, "is the 'Tricel' fashion parade and exhibition on May 7th to 10th." But fate had other plans. The textile event of the year—indeed of the decade—was nearer to hand and was not a mannequin show. It was the plan that British Celanese should be swallowed by its much larger rival, Courtaulds, and that a single vast combine controlling over 85 per cent of the British rayon industry should thus be formed. It is an event that many have expected for years and yet took everyone by surprise.

There is no struggle. In the joint statement the board of British Celanese announces that it will strongly recommend all classes of stockholders to accept. Details of the offer are likely to go out to Celanese stockholders early in May. They will find it most attractive. The basis of exchange into Courtaulds ordinary and preference stocks shown in the table gives each class of stockholder a prospective rise in income except the participating second preference holders, and they get cash compensation. It gave the Celanese ordinary at 15s. 3d., an immediate rise of 7s. 6d.; and it gives the two classes of Celanese preference stockholder a markedly better covered security. The offer excludes final ordinary dividends by both companies. They will be 6 per cent, making 10 per cent for the year to March 31st, by Courtaulds and 3 per cent, making 4½ per cent, from British Celanese. There is, of course, no promise that the 10 per cent dividend will be maintained after the merger, but that seems a likely target and would justify the present price of 35s. 6d. for Courtaulds and make Celanese worth 23s. 9d. There should be little difficulty in getting the necessary acceptances. The big shareholder in British Celanese is the Dreyfus family trust, and both the Dreyfus brothers are now dead. The spirit of pioneering rivalry between the two groups seems to have died down.

WHY has Courtaulds thought it worth while to bid so high for its smaller rival? Celanese is markedly the weaker of the two. The announcement of the bid shows the relationship between them when it foreshadows that, despite some recovery in the second half of the financial year just ended, Celanese profits have been about two-thirds of the £2.4 million achieved in the previous year, while Courtaulds profits for the same period will turn out (before tax and before preference dividends) at about four-fifths of the previous year's £18.1 million. Exact computation of earnings per share is difficult on those rough approximations, but it seems that Celanese ordinary stockholders are leaving a company in which earnings per stock unit are about 6 per cent and are going into one in which they are in the region of 22 per cent. They are also leaving a company in which capital gearing is fairly high, where management has its ups and downs, and where the vulnerability to trade fluctuations is great for one where capital gearing is low, dividends conservative, and a dominating position in the industry.

Courtaulds clearly is buying partly for the assets—for

* Assumed dividend 10 per cent.

the good manufacturing capacity on the more expensive acetate side of the industry, which Celanese possesses. The terms seem to have been based on asset values. Working from the last available balance sheets (those of March 31, 1956) Courtaulds net tangible assets should rise from £124 million to around £146 million and its issued capital from £56 million to £70.5 million.

The explanation for the merger given by the two boards reads thus :

> It would greatly strengthen the ability of both companies to meet competition from imported textiles in the home market, and would also enable them to improve their position in the export markets having regard particularly to the problems and opportunities which are certain to arise if the proposals for the European Common Market and free trade area are completed.

That is all true enough but it should not be tied too closely to the Common Market. The first attempts to arrange a merger date from before the war.

THOUGH the new combine will not be financially enormously greater than Courtaulds now is, in the eyes of the trade it will be much more dominating. Of the British production of man-made fibres last year —255 million lbs of staple and 225 million lbs of continuous filament, some 80 per cent was viscose in which Courtaulds dominates, about 10 per cent acetate, in which Celanese is probably bigger than Courtaulds, and about 10 per cent the newer synthetics. It seems that by weight, Courtaulds already has about 75 per cent of the home market and the combined firm will have well over 80 per cent, probably nearly 90 per cent if Courtaulds' half-interest in British Nylon Spinners is included. Outside the combine there will remain several small companies : Lansil and Nelsons Silk make acetate ; Lustrafil, Kirklees, Harbens, and British Enka (also licensed to make nylon) make viscose.

On the newer synthetics Courtaulds is also strong but nothing like so dominating. It has a 50 per cent interest (jointly with ICI) in British Nylon Spinners. It has announced the arrival of its first acrylic fibre this summer, while Celanese has arranged to manufacture nylon 6 under licence from British Nylon Spinners. ICI on the other hand has the whole of Terylene and the other half of British Nylon Spinners and Chemstrand —the American associate of Monsanto Chemicals and American Viscose—proposes to manufacture acrylic fibres in Ireland. There are rumours, not yet confirmed, that fibres will be included in the products that Du Pont de Nemours will make in Northern Ireland. It is partly to face those giants from the chemical trades and to face imports that the merger will be needed.

Such a monopoly might not be permitted in America, which makes it unfortunate that Celanese does not disclose its shareholdings in Celanese Corporation of America and in Canadian Celanese. They are believed not to be dominating. The merged concern will need to convince its customers that though a monopoly, it does not intend to behave like one. It will not be helped by the practice so highly developed by British Celanese (but practised by Courtaulds, too), of competing with the Companies' own customers—the textile spinners, manufacturers and makers up.

It is fair to point out that Courtaulds traditionally pursues a low and steady price policy ; that it does so most markedly in that section of its business where it already enjoys a monopoly in this country—viscose rayon staple ; and that nothing but sheer size has enabled it to quote those low prices. Courtaulds seems to regard itself less as competing with other rayon manufacturers than as supplying the cheapest raw material that the spinners can buy, complementary to and in competition with, other fibres.

In the field that Courtaulds already has to itself there is no reason to expect a change. The chemical sides of Courtaulds and Celanese should also fit in well together. But where the two companies overlap—in acetate, in triacetate, at last passing out of its birth pangs, in warp knitting, in the overseas developments in the United States and in Australia and in the large staffs in London and Manchester—there will be opportunities for big, and painful rationalisation. One of the first decisions to be taken must obviously be whether to admit the employees of Celanese to the Courtaulds profit-sharing scheme and, if so, on what terms ? Even that decision has apparently not yet been taken. No new management could fail to unify and to prune, but a wise one would tackle that distasteful job piecemeal.

How Big a Car?

Demand for cars is surging up again—and in spite of restraint last year, expansion of motoring in Britain is still ahead of forecasts. But are the cars Britain is building the ones to keep that expansion going ?

IN 1953, an attempt was made in these columns to assess the potential growth of the car population of this country. The latest figures then available gave a total of registrations in 1952 of 2¼ million cars, with an average annual increase from 1948 of 6 per cent. Making assumptions that were then proclaimed, and facts have proved, to be optimistic—that motor car manufacturers would seek to cater in particular for the lowest-priced potential market, and that the Government might somewhat lighten the monstrous burden of taxation on motoring—we predicted a car population for 1959 of between 4.28 million and 5.58 million—the higher figure representing an average annual increase (compound) of 12 per cent.

Meanwhile, the Government has substituted scorpions for whips in their treatment of motoring, increasing the purchase tax on cars and restricting hire purchase facilities ; nor have the British manufacturers been concerned to develop very small cars for "minimum motoring" of the character, or the technical brilliance, of their Continental competitors. None the less, the registrations in the autumn of 1956 had reached 3.84 million—an average annual increase of 11.2 per cent. By 1959, a continuation of this rate of increase would mean a car population of 5.30 million—much nearer to the upper than the lower of our two limits. The desire of the people of this country to enjoy the extra convenience that the ownership of a motor car affords seems well-nigh insatiable.

Given this insatiable appetite, how much further can the extension of car ownership go ? Implications that are important both for the motor car manufacturers and for the Government may be drawn from an attempt to answer that question. The key factor is the pyramid of income distribution in this country. The table of net incomes after income and sur-tax, gives the basic information for the tax year 1954-55. In the middle of the 1954-55 tax year, namely, August, 1954, there were 3.17 million cars registered in Britain. From the table of net incomes, it appears that there were then about 3.2 million taxpayers with an income, after tax, of £680 a year, so that there must have been about as many car-owners with net incomes below that figure as non-motorists with net incomes above that figure. It seems a fair guess that by 1970, with an improving standard of living and only modest assumptions as to the encouragement of new motoring by Governments and manufacturers, the number of car owners might reach about 7 million. This figure would be about the same as the number of taxpayers who had net incomes over, say, £525 a year in 1954-55. It might also indicate UK sales of new motor cars in the region of 800,000 to a million a year.

If it is assumed that the average purchaser of a new car keeps his car for three years, such a forecast would postulate 2¾ to 3 million motorists in the new car-buying class. If so, some of the new car buyers would have to be in the income groups that were earning less than £750 a year net after tax in 1954-55—for above this limit, there were in 1954-55 only about 2¼ million income tax payers. Allowing for some rise in the real net income of this class, a fair figure to set might be that the purchase of a new car, of the type in maximum demand and, on that account, offering the most economical motoring of an acceptable standard, would have to be within the reach of those with a net income of about £900-£950 a year. From these figures certain deductions can be made about the size and operating cost of a car that might meet the greatest demand in this country. How far are such deductions in line with the design and marketing policies now being followed by the British motor industry ?

OF Britain's "Big Five" manufacturers, the British Motor Corporation, Ford and Standard make what Britain classes as very small cars—the Austin A.35 and Morris Minor, the Anglia, and the Standard Eight. In addition, Ford offers a car that is no smaller but much cheaper, the Popular, by continuing to build the former model of Anglia on tooling that has already been amortised. Rootes does not compete in any class below the Hillman Minx, and it became clear this year that Vauxhall, *in posse* if not *in esse* the one of

BRITISH INCOMES AFTER TAX, 1954-55

Net Income After Tax	Net Incomes in Group Total		Cumulative Total of Incomes in Succeeding Groups	
	Number	£m	Number	Amount £m
Above £4,000	7,300	33·1	7,300	33·1
£4,000–£2,000	131,000	339·0	138,300	372·1
£2,000–£1,000	731,000	958·0	869,300	1,330·1
£1,000– £750	1,650,000	1,382·0	2,519,300	2,712·1
£750– £500	5,730,000	3,469·0	8,249,300	6,181·1
£500– £250	8,730,000	3,265·0	16,979,300	9,446·1

the three biggest makers in the country, will not compete below that class either. In unveiling its new Victor car recently, Mr Philip Copelin, Vauxhall's managing director, gave a closely reasoned explanation why not—which in essence may offer the reasons why none of Britain's popular makers have yet descended into the "minimum motoring market" for which Continental makers have vied in recent years.

Mr Copelin said that the company's design and engineering studies, which led to the creation of the Victor, had showed that, if they had chosen a smaller size of car than the Victor—a full four-seater with a kerb weight of 19½ cwt—they would have "squeezed out value quicker than cost." The implication, unspoken but inescapable, seemed to be that this was the optimum size of car for the maximum market. From the marketing side, what is the cost of such a car to the owner who buys it new and runs it for three years? If the manufacturing economies of large-scale production give a selling price, ex PT—in 1957 terms—of £420 or 46d. per lb of kerb weight, depreciation of 55 per cent in the first three years would cost £230, or, adding interest, about £100 a year for capital charges. Running, say, 7,000 miles at 35 mpg would take 200 gallons of petrol, or, at 3s. ex-tax, £30 a year. Insurance, tyres and other costs would add, say, £40 a year, making a total of £170 a year. Fiscal policy at present adds 70 per cent to that annual cost; but even if it added no more than 30 per cent, to cover both a reasonable contribution to the cost of the roads and an equal amount for sumptuary taxation, the total annual cost would be about £220 a year. This is clearly beyond the reach of most people at the income level of £900-£950 a year after tax, who were postulated above not only as potential motorists, but as potential buyers of new cars.

★

One might consider, instead of a car of 19½ cwt kerb weight, a vehicle of 10½ cwt kerb weight—or 6½ per cent below that achieved by the 600 cc Fiat. A technical assessment might possibly judge that more than 50 per cent of the value had been squeezed out. But it should be possible, if all inessentials were eschewed, and every technical economy secured, to achieve a saving of at least 40 per cent in the initial price and—given enlightened co-operation in fiscal policy—in almost all the other costs. This would give a total annual cost of 60 per cent of £220 a year, or, say, £130 a year—a figure that might be just within the means of an owner with a net income of £900-£950 a year. Such an analysis would point to a car that could offer motoring they could afford to the number of car-owners needed to buy the number of new cars necessary to sustain the size of British car population which seems to be feasible.

American thinking about the size, weight and power of automobiles is almost inevitably dominated by American conditions. Until lately the leaders of the American market were the six-cylinder Chevrolet, Ford and Plymouth. These are cars of some 3,400 lb weight and about 140 bhp, able to carry six passengers in ample room at a top speed of over 90 mph with acceleration greater than that of most European sports cars at a fuel consumption that—with 25 per cent gasoline—was not expensive. (The larger, thirstier, more powerful V-8 car now coming into vogue seems to give poor value for the increment in cost, and shows only how superabundant is American prosperity and how powerful are the forces of emulation.) With 5-8 million new cars—of full size, or, to European eyes, larger than life size—coming into the market each year, more economical motoring could be obtained by buying a secondhand full-size car in the latter part of its eight- to ten-year life than by a smaller car, new or jalopy.

BUT for the British market—and almost certainly for the rest of the European market—the pattern that suits the American market does not necessarily apply. To most readers of *The Economist*, buttered bread is better value for money than dry bread; but to a starving man who can afford enough dry bread, but not enough bread and butter, to sustain life, unbuttered bread is preferable. Motoring with a vehicle which is, technically speaking, sub-standard in value for money, but can be afforded, will be preferred to no motoring at all. For some of the existing car markets outside North America, the array of sizes of vehicle offered by the British makers caters pretty well—as a letter from Vauxhall Motors on page 215 very fairly points out. But if the expansion of motor building capacity is to be based upon a continuing expansion of car ownership in European economies, cars tailored neatly for the classes who can at present afford new cars may not do.

The medium-sized, comfortably-priced car hardly offers the home market, the common market, or indeed most of the world's markets any vision of design and manufacture such as generated the Ford Model T. The target at which the Victor, the new Wolseley and the Minx are aimed is certainly there, and can be hit. It is suggested here that there is a greater target for which a very different missile is needed. Can that target be seen from Dagenham or from Longbridge—or from any firing point in Germany or France? Or is it a hallucination? The fact that Fiat, having achieved a resounding success with its 600 model of 11¼ cwt kerb weight, is now establishing manufacturing facilities of perhaps greater capacity, for a two-cylinder air-cooled car of 400-500 cc, suggests that from Mirfiori it is seen as a target and not taken to be a hallucination. With the wealthier British market as the primary consideration, something between the two Fiats, say a 500-cc car of 10½ cwt kerb weight, might be justified. One could expect the manufacturing costs of such a car in the quantities that the British home market would make possible, to have a very good prospect of sweeping the board throughout Europe.

BUSINESS NOTES

THE FRANC UNDER PRESSURE

France Scrapes the Barrel

THE shifts and improvisations by which France has been trying to defend the ultimately untenable position of the over-valued franc are almost exhausted. Recent defensive measures include raising to 15 per cent the "compensation" tax on imports liberalised under the OEEC code. This is the additional tax which France has the right to exclude from its obligation to reduce tariffs under the Common Market Treaty. For all practical purposes it is a veiled, selective devaluation of the franc to compensate for the difference between French and foreign costs of production. The government is also trying to combat inflation by offering a new loan on unprecedently generous terms. The loan, for which the lists are still open, carries interest at 5 per cent tax-free for the first five years and is repayable by drawings over the next 10 years at a premium of 10 per cent. The drawn bonds will be repaid at the price of 110 adjusted to movements in the index of French ordinary shares, thus combining for investors the attractions of a generous fixed interest security and an equity stock. In addition the Bank of France has raised its official discount rate from 3 to 4 per cent and introduced other restrictive measures. Down payments on hire purchase contracts have been increased from 25 to 30 per cent, and the repayment period has been reduced from 21 to 18 months for cars and from 18 to 15 months for household goods.

The French balance of payments, despite these stop gaps, is now running at a deficit which threatens to wipe out the free gold and exchange reserves in a matter of weeks. The French EPU deficit in March was a record $94 million and would have been even larger had the Bank of France not introduced a special element into the figures by ordering commercial banks to hand over all their foreign exchange holdings in excess of the sum held at the beginning of last year. The latest figures of the Bank of France show that the free reserves at the disposal of the Stabilisation Fund have dropped to the equivalent of £42 million from £110 million at the beginning of 1956. There is also the Bank of France's own gold reserve of £300 million, generally regarded as sacrosanct. France has already drawn $100 million from the $262 million credit placed at its disposal by the International Monetary Fund. The bottom of the barrel is in sight.

IN THE MARKETS

Investors Prefer Equities

INVESTORS have begun to tread out in the markets the measure that they think expressive of Britain after the budget. It differs hardly at all from the steps they were tracing out a fortnight earlier. Gilt edged are dragging gently downwards. In the week since the budget the *Financial Times* index of government securities has fallen from 87.34 to 86.26. Industrials are edging haltingly upwards. *The Economist* indicator worked out to Tuesday instead of Wednesday for this shortened week, and now excluding British Celanese, which has become largely a duplication of Courtaulds, shows a rise on the six days from 212.6 to 214.9, the rise has been anything but wholehearted. It has been checked by the troubles in Jordan, which unsettled oil shares though only for a day or two. Recently, moreover, some of the stocks that the budget favoured, for example shipping shares, have lost some of their first gains. But the preference of investors is clear. They are much more ready to buy selected industrials than to go further into gilt edged.

That preference, unless it is soon redressed, may have important repercussions. It is going to be fairly easy to make industrial issues. This week has seen one of them, the offer of 2,200,000 £1 ordinary shares of Thomas Firth and John Brown at 20s. 6d. to help pay for the purchase from ISHRA of William Beardmore. These are offered as rights on a two for five basis at 20s. 6d. and the price is sufficiently below the existing shares at 28s. to ensure success. It is going on the other hand to be fairly difficult to make gilt edged issues though there have this week been two small corporation loans of £2 million each for Brighton and Nottingham, both in 5 per cent 1969 stocks at £97 10s. per cent. If it does remain difficult to make large gilt edged issues, the Government will be faced with a difficult problem. It has to deal with about £300 million of Exchequer 5 per cent stock of 1957 maturing in mid-June. The normal solution would be a funding issue some time in May to put the Treasury in funds to meet the repayment. Such an issue at the moment seems a poor prospect. There is currently hardly any absorption of government stocks from official portfolios. On the contrary there is selling—not heavy—by the public. A fraction of this is thought in the markets to come from Lloyd's underwriters switching part of their deposits into equity stocks. As attractive rights issues like that of Thomas Firth and John Brown are announced there must be more such selling. Owners of the rights often have to sell something in order to exercise them, and they often choose to sell gilt edged.

SHIPPING OUTLOOK

P & O, Nasser and Nassau

SIR WILLIAM CURRIE'S speech at Wednesday's meeting of the P & O company will be studied chiefly for his guidance on two points: What difference has the closing of the Suez Canal meant to the earnings of one of its biggest users? It happens that Peninsular and Oriental's last accounts ending on September 30th were struck at the very moment when the Suez crisis was about to impinge on shipping profits. And what effect will the budget's concession to shipping—the widening of investment

allowances to 40 per cent—have on P & O's plans to build tankers in Bermuda?

Sir William, who does not mince words about the Egyptian action and who strongly supports the Suez Canal Company, nevertheless cannot attempt any estimate of the effect of the crisis on the group's earnings. Many of the effects will continue long after the ships are passing through the canal again. He does give stockholders a useful consolation. Net earnings of the group before tax so far this year are just about the same as in the corresponding period of last year. It should naturally be underlined that Sir William is not thereby saying that the Canal affair has had no effect on P & O's earnings. Had it not been for that upheaval he believes that results for the current year to date would have shown considerable improvement.

On the second point—Bermuda and Charter Shipping Company, which is P & O's instrument there, Sir William is much more specific. The increase in the investment allowance to shipping was the most important single concession for which the British Shipping industry had asked, and he is most grateful to the Chancellor. The company has not had time to consider whether it should reduce its proposed investment in Charter Shipping (which has already placed contracts for several tankers). But the budget concession will do more than any other step to remove the inducements to shipping capital to continue to flow into tax-free countries.

LONDON TRAFFIC

Signs of Relief

PERHAPS by coincidence the last parliamentary day before Easter last year and the year before happened to find the House of Commons discussing London's traffic problems; on neither occasion was the Minister of Transport—or to be precise his parliamentary secretary—able to convince his hearers that something definite was being done about them. This year, however, several notable announcements two days before the House went into recess gave quite the opposite impression. The most significant item of news concerned Park Lane and Hyde Park Corner, which is thought to be the busiest traffic intersection in the world with nearly 100,000 vehicles using it on average every 12 hour day. It seems that the Ministry has at last convinced the London County Council that something more than a reconstructed roundabout is required at Hyde Park Corner, and the LCC will get a 75 per cent grant from the Ministry towards the total estimated cost of £3 million for the new agreed scheme. This will include an underpass for east-west car traffic in addition to two new roundabouts at Hyde Park Corner and converting the two roads running north from there to Marble Arch into two one-way carriageways. Together with several other major reconstruction projects now in hand in inner London, this should give a marked impetus to traffic flow at these more notorious points of congestion. But much traffic will pass round the present Hyde Park Corner roundabout before this new arrangement materialises; final plans have still to be prepared, the Royal Fine Arts Commission has still to give its final views, and a bill has to be promoted in Parliament. Nevertheless the Ministry should perhaps get some commendation for at last coming to a decision on a scheme that it has had in its pigeon holes for several years.

The second major announcement this week came from Westminster City Council, which has shown much more commendable speed in preparing a parking meter scheme for the north west corner of Mayfair, even though it has been taken more or less wholly from the proposals of the Samuels Committee in December, which intended it to be the prototype for others in London and elsewhere in the country. It has adopted the Samuels list of charges—sixpence for one hour, a shilling for two, and ten shillings extra for staying up to two hours more—but perhaps unwisely it has also adopted the area the Samuels Committee suggested, which covers only about an eighth of a square mile and is much too small, in inner London, for an experimental scheme to run smoothly. The area should be extended to the whole of Mayfair, which is four times larger, and the prototype scheme should be extended rapidly to neighbouring areas as soon as it has been in operation for a short while.

HAWKER SIDDELEY

Retreat from Aircraft

THE details of the offer that Hawker Siddeley has made for the entire capital of the Brush group were not available when this issue of *The Economist* went to press, but it is in line with Hawker Siddeley's new policy of developing interests outside the aircraft industry. The need for this was stressed by Sir Thomas Sopwith in his recent statement to shareholders; it is an obvious and sensible choice at a time when the defence programme is shrinking. The choice of Brush is a logical one in the sense that it serves the expansion of Hawker-Siddeley's atomic interests. The group has set up a nuclear laboratory, and Brush could provide the electrical manufacturing capacity essential to the development of an atomic business.

How far this policy will go and how much of it will be concentrated in Canada is a secret of the Hawker Siddeley boardroom. But it is also rumoured that the group is negotiating for the purchase of the Algoma Steel Corporation, one of Canada's two large steel producers. From aircraft into steel seems a long step, but Hawker Siddeley has interests, both British and Canadian, on the periphery of the steel industry, and it has not denied the report.

Out of a total profit of £12½ million by the Hawker Siddeley group in the year to July 31st, over £6 million came from the Canadian members. By no means all the profit came from aircraft: through Canadian Car and Foundry, the Hawker Siddeley group is a producer of railway rolling stock and buses, and through its other Canadian interests steel castings and alloy forgings and castings.

RESTRICTIVE PRACTICES

Agreements on View

MORE than 30 people arrived to inspect the files of the Registrar of Restrictive Trading Agreements at London, Edinburgh, and Belfast on Monday afternoon, the first day the registers were opened to the public. For a shilling they were able to examine any of the 1,003 agreements that the Registrar had by then been able to make available for inspection out of the 1,424 he had received. This is good progress in six weeks since February 28th, which was the closing date for registration. Only 800 of

The Trail in Profits

IT is, indeed, a long, long trail. Profit margins have been steadily whittled down, but an absolute fall in quarterly profits has still to occur. Beginning with the group of companies which reported in January-March, 1956, the quarterly analyses—comparing the latest year's profits with the previous year's—show that the rate of advance has slowed down from 12½ per cent through 11½ per cent, 4 per cent and 2½ per cent to 1 per cent in the latest sample. This was made up of 439 companies reporting in the first quarter of this year and their accounts relate to a mean financial year ending in mid-November. But these are all plus signs and if the results of Unilever and Royal Dutch/Shell are typical of the experience of those international giants whose 1956 accounts are to be published soon, profits in the current quarter may still not show a minus sign. The capital base, thanks to new issues and retained profits, is, however, constantly rising. In terms of return on investment the fall has begun.

The increase of 1 per cent (by £5 million to £489½ million) in this particular sample of 439 companies is not out of line with the Economic Survey's estimate, that in the whole field of domestic corporate earnings, private as well as public, trading profits in 1956 rose by 3 per cent (by £84 million to £3,043 million). The survey suggested that while profits from transport, distribution and other services rose the profits of manufacturing industry declined slightly. It is difficult in *The Economist's* sample to make a clear distinction between these two sectors of corporate earnings. But clearly the profits of those companies closest to consumers were expanding the most. The profits of breweries and distilleries rose by 9 per cent, of food companies by 11 per cent, of shops and stores by 4 per cent and of shipping companies by 11½ per cent. By contrast, big falls in profits were reported in the following groups: motors, etc. (down by 16 per cent), electrical manufacturing (down by 10 per cent), paper, etc. (down by 12 per cent) and miscellaneous manufacturing (down by 6 per cent). The profits of the iron and steel companies, which nearly all come in at this season, show no perceptible change, while the profits of the tobacco companies (including both Imperial Tobacco and British-American Tobacco) rose by 2¾ per cent.

Because statutory depreciation was higher (up by £8 million) and because profits tax (up by £6½ million), though not income tax, took more, the 439 companies were not able to plough back in reserves as much as in the previous year. Reserve appropriations from net profits came down by £19 million to £117 million. Net ordinary dividends paid by these companies went up by £4 million to £66 million. But these dividends were declared on more issued capital. Grossed up at the standard rate of income tax, the average dividend rate on issued capital emerges unchanged at 17¼ per cent. The capital employed by these companies rose more sharply than did their issued capital, so that the average rate of return on net worth came down slightly from 6.8 per cent to 6.6 per cent.

Growth is apparent in the increase in the gross book value of fixed assets by £227 million and in stocks and debtors by £127 million. Part of the increase in fixed assets represented revaluations. Part of the increase in working capital was involuntary; some companies were not able to cut back production in step with the fall in demand. Whatever the cause, the increase of £353 million in fixed and working capital had to be financed. Trade creditors and other current liabilities rose by £47 million, revenue and capital reserves by £133 million, tax reserves by £4 million and depreciation by £64 million. These sums were not sufficient. Net liquid assets were reduced by £40 million and £65 million was raised in new issues—£4 million in preference, £25 million in ordinary and £36 million in loan capital.

Last year was not an easy time for British industry. Some manufacturers had to reduce output; almost all of them saw their profit margins falling; and yet most of them were anxious to maintain their rate of investment. These figures show that real mortar was being slapped on real bricks and that new plant and machinery was being installed in the factories. The rate of real new investment may not be high enough: much of this figuring could easily relate to physical replacement of worn-out assets. But the costs of this investment, whatever its purpose, are high. The break-even points of profits on British industrial capital have risen. From this fact the investor in British ordinary shares can draw a lesson: if the sap of production rises he can sit back to admire the bloom on the rose; if it fails to rise he might have to reach for his secateurs.

the 1,424 had arrived by then, the bulk of them in the last few days, and the majority had failed to satisfy fully all the rules for registration, which meant further correspondence and scrutiny. But this 1,400 or so—allowing for those agreements which have been submitted but appear to be not liable to registration—represent, according to the Registrar, a high proportion of the practices that were called up in the first batch last August: namely, agreements about common prices and conditions of sale, agreed tendering, and preferential or exclusive trading. This number is much smaller than some people may have thought. But the mere threat of registration has forced the abandonment of many agreements and another substantial number appear to have been modified or replaced by new agreements which are not due for registration until three months after they were made.

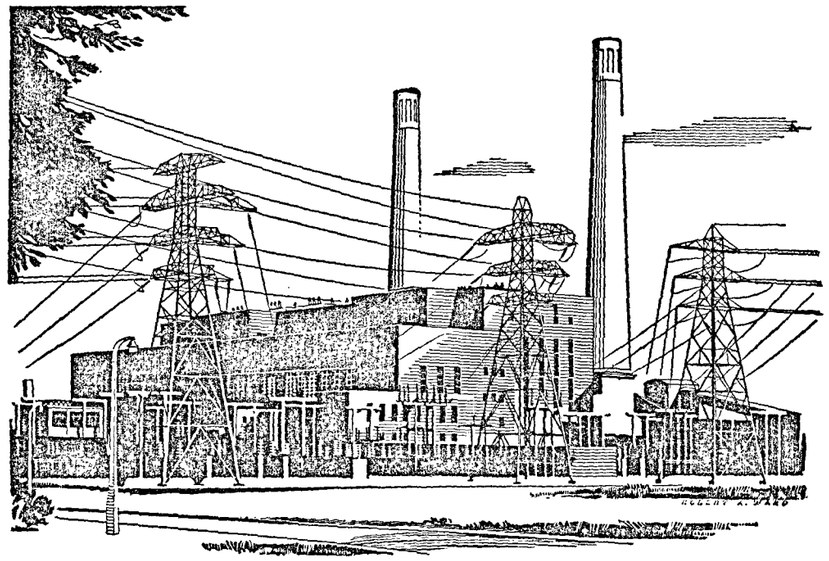
This should make the task of compiling and scrutinising the register much simpler—at least until the next batch of restrictive practices are called up. But the Registrar, for quite compelling reasons, has decided not to provide an index of parties to registered agreements. The number of parties is immense, and the index could only list names since the Act did not stipulate registration of the parties' addresses. Thus the ordinary member of the public is provided only with a classified list of the commodities affected by agreements, and the code numbers of the files containing agreements concerning each commodity. On the performance of the staff at the public search room in London on Monday afternoon, where eight people arrived in the first five minutes—including one girl who immediately compiled a list of more than twenty files she wanted to inspect—all for a shilling—this method of classification should not prove a major difficulty, even though the present index lists 45 files under the heading of building materials and 32 under electronic valves and cathode ray tubes. The staff can give much help in tracking down the file that contains the particular agreement that is wanted, and also in explaining—though not in commenting upon—the documents in the file. These are straight copies of the documents registered by the parties to the agreement, such as resolutions, rule books, the list of parties, and the area the agreement covers. The time of the next stage—taking these practices to Court—is still uncertain, but the Board of Trade has now issued the list of agreements it will direct the Registrar to start on first. It is a curiously assorted bag, possibly designed to secure precedents over as wide a range of practices as possible. But this first list should fully occupy the Court for quite a while.

AIRLINE AGREEMENTS

One Out of Step

THE most surprising outcome of the emergency decision by the international airlines to raise their fares in Europe and the North Atlantic by five per cent from May 1st is that one or two operators appear to have refused to make the increase. Aer Lingus announced last week that all its fares would remain unchanged with the single exception of the Dublin to Barcelona excursion fare which is going up by 13s. There are also reports that the Greek airline, which is in the throes of being reorganised into Olympic Airlines, has come to the same decision; certainly no instructions had been received early this week from Athens to apply the increase to current fares.

Any exception of this kind is both important and welcome, because the International Air Transport Association, which provides the machinery by which the airlines fix the level of international fares, normally stipulates that all its members shall keep in step and move fares up or downwards together. It is the enforcement of this rule that has given IATA the much resented label of "cartel." To permit an operator with modern equipment such as Aer Lingus to opt out of this emergency increase is a sensible gesture. Last year was a generally profitable year for the airlines, but different operators are caught by rising costs in different ways. Both the British corporations seem to have increased their traffic by about 11 per cent during their past financial year; both cautiously report having made a profit without yet putting a figure to it.

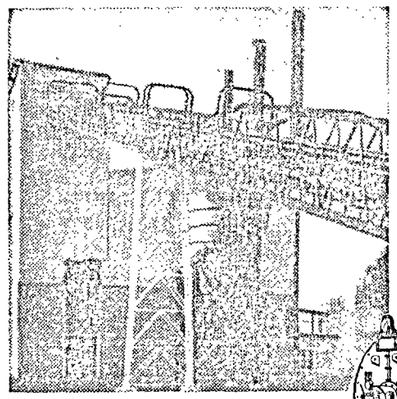


Among the European operators, KLM has made a profit of more than £2 million, nearly 13 per cent higher than the year before, Sabena ended the year with a profit of about £600,000, four times higher than in 1955; SAS, whose financial year ends in September, ended the 1955-56 period with a net surplus of nearly £750,000 and Air France too expects to show a profit when returns are available next month. The American North Atlantic airlines also did well.

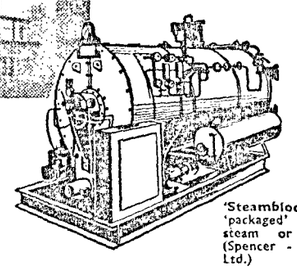
These profits, however, are a tiny margin on gross revenues that run into tens of millions of pounds for each airline. During the past three or four months fuel costs, salaries and landing charges have all risen, the increases hitting some operators harder than others. Individual operators have their own particular difficulties; BEA, for example, which has been carrying servicemen at half-fare on some of its most lucrative routes. These are genuine difficulties, but since they do not affect all airlines with equal severity, it is plainly sensible to let those whose costs have been hit the least hard continue to pass the benefit on to their passengers.

BEA TO DUBLIN

ON Sunday, in bright sunshine, British European Airways opened the first British air service to Dublin for eleven years. The occasion marked more than the ending of the practical monopoly of the Irish airline, Aer Lingus, of the traffic between Dublin and this country. No government allows a foreign airline into its territory without extracting a comparable concession for its own operator, and Aer Lingus now has the right to pick up passengers from the north at Manchester and fly them through to the continent.



BEA can certainly afford to be generous, even though its financial holding in Aer Lingus has been reduced from 40 to as little as 10 per cent. As in so many cases in Europe, the services to Dublin are based on a pooling arrangement with Aer Lingus—but one that still allows BEA to take three-quarters of all new traffic until the two reach parity. During the summer, BEA has been strengthening its hold on European air traffic by introducing new Viscounts specially tailored for routes like those to France (especially Paris), Switzerland, Germany, and Ireland that are rather too short to be economic for the standard Viscounts even though some other airlines, including Aer Lingus and Air France, do use them for this purpose. BEA had formerly been at a disadvantage in operating the same routes with ageing piston-engined aircraft such as the

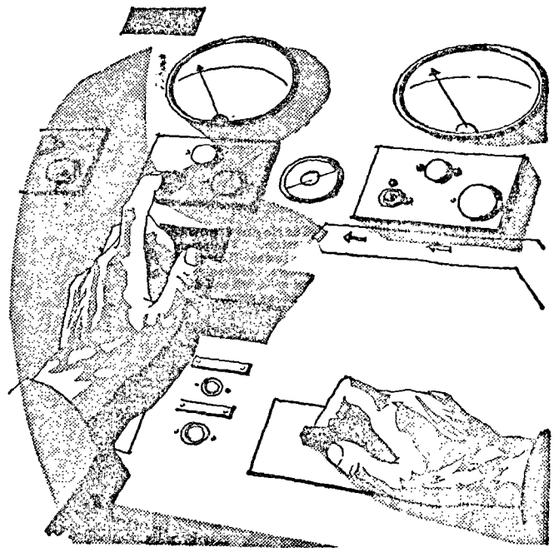


Carrington power station. Equipment includes Babcock boilers, coal-pulverizing mills, ash and dust-handling plant.

"Industry depends on STEAM"

MOST of the world's electricity is steam-generated, and Industry, largely dependent upon electricity from steam power stations, is itself an enormous user of steam for processing and heating and, in some large industries, for both power-generation and processing. Babcock & Wilcox are the world's largest manufacturers of steam-raising equipment for both land and marine applications, and offer to steam-users *large or small*, a comprehensive, world-wide service embracing everything from fuel-handling and boiler plant, for every kind of fuel, to complete systems of ash and dust disposal. They are also large makers of welded pressure-vessels, heat-exchangers, separately-fired superheaters and other plant for the oil and chemical industries, and of a whole range of general equipment such as cranes and conveyors, steel chimneys and fabricated steel structures. The Babcock organisation serves Industry at every level.

Boiler house of H. J. Heinz Co. (Pty.) Ltd. factory in Australia; equipped with Babcock boilers, coal, ash and dust-handling plant and steel self-supporting chimneys.



'Steambloc' automatic, oil-fired 'packaged' boiler for industrial steam or hot-water supply. (Spencer - Bonecourt - Clarkson Ltd.)

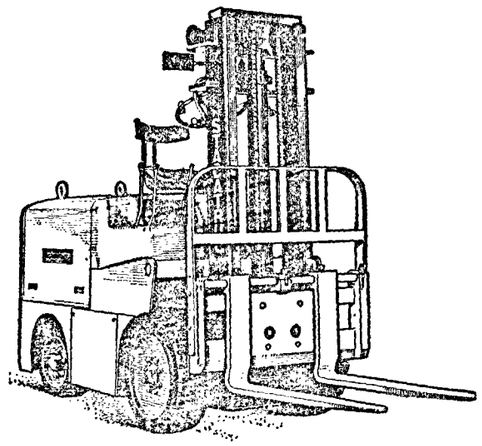
Mechanised Muscles



Cheap and speedy materials handling in many industries owes not a little to Simon developments in mechanical, pneumatic and fluidised conveying and in automatic process control. A Simon plant on Tyneside, for example, bunkers a million tons a year of iron ore from ocean vessels, and at the touch of a button on a control panel loads 500 tons into rail wagons in five seconds. Simon equipment loads flour from the mill into Simon bulk flour wagons and discharges it into Simon bulk bins at the bakery. Simon plants load, unload, handle and store a multitude of materials in countries all over the world. Simon engineers welcome industrial handling problems on anything from a factory to a national scale.

ENGINEERS, DESIGNERS AND CONTRACTORS TO WORLD INDUSTRY

how it does go on!

Like any other equipment upon which production flow depends a fork truck has to be completely reliable. It simply must lift, carry and stack in pace with all other processes, hour after hour, day after day, year after year.

Stacatruc fork lifts do all this with an absolute minimum of maintenance.

They go on doing it because they are built to quality standards. Coupled with peerless performance such engineering perfection has won for them world-wide renown as the finest machines of their kind. As part of Britain's best mobile materials handling system Stacatrucs are everywhere taking the burden of mankind's handling tasks.

Ambassador or downright old ones like Dakotas. The process of replacing them with the new Viscounts began in February and should be completed in July, giving BEA a fleet based almost entirely on turbo-prop aircraft.

PETROL

Jordan and the Ration

LAST week it seemed that the government had decided to accept the economic risks and reap the political rewards of abandoning petrol rationing before Easter. Ie was being admitted in Whitehall that, with motorists now free to cash four months' coupons at will, the prevailing optimism might easily turn rationing into a farce. Hopes were raised further by the Prime Minister's hint in his speech at Ayr that some temporary accommodation with Colonel Nasser might be reached, thus enabling British tankers to use the canal, and a decision to abandon petrol rationing to be taken before a satisfactory solution of the long-term problem of the canal had been achieved. But the risks and the rewards were very nicely balanced ; rumblings from Jordan—and from Hatfield—have now tipped the scales the other way.

Stocks of petrol in Britain are high—in some refineries embarrassingly so—and supplies are now arriving in the country at virtually the normal rate. Even if petrol were sold freely now, at the beginning of the peak motoring season and at a price 1s. 1d. a gallon cheaper than it was in the winter, it seems unlikely that stocks would be drawn down very much faster than they would have been under normal conditions at this time of year. But although physical supplies may be maintained at adequate levels by continuing to draw on Western Hemisphere sources—unless the skeleton Middle East supply routes now open to Mediterranean are sabotaged again—there is now no assurance that the extra dollar burden can be quickly reduced and eliminated. Three-fifths of the capacity of the trans-Syrian pipelines is still out of action ; trouble between Jordan and Syria could hinder the repairs to this and endanger the two-fifths that has already been repaired. TAPline, which carries 16 million tons a year of Saudi-Arabian oil through both Jordan and Syria to the Mediterranean, could lose even its charmed life. These additional uncertainties, even if they do not delay still further a settlement on the use of the canal, are enough to justify the retention of rationing, at least until the dust in Jordan settles. And if it does not settle, the motorists who are optimistically using up their four months' supply of petrol coupons in advance may find themselves on short commons before the end of the summer.

EXPORTS OF MANUFACTURES

Britain's Share Falls Further

THE latest estimates of world exports of manufactures bring up to date, but do not substantially modify, the figures published in the Economic Survey and in the Board of Trade's detailed analysis of the changes in Britain's share of that trade in recent years. It is now clear that in 1956 the value of world exports of manufactures continued to grow at the exceptionally high rate of the previous year. The total is provisionally estimated at $38,545 million, an increase of 14 per cent over 1955. British exports again rose at a smaller rate—10 per cent—and its share of the world market fell further. When allowance is made for the repayments of silver bullion to the United States last year and for the distortions of the dock strikes of earlier years, the board estimates that Britain's share fell from 19.5 per cent in 1955 to 18.8 per cent in 1956. The rate of decline was smaller than in 1955, but greater than in earlier years.

Britain's main competitors, the United States, Germany and Japan, did better than that: with a greater than average

* Adjusted figures.

rise in exports their share of the market increased. United States exports of manufactures rose by 17 per cent and its share increased from 24.5 per cent in 1955 to 25.3 per cent in 1956. West Germany increased its exports by 20½ per cent and its share of the market rose from 15.5 to 16.4 per cent. By the fourth quarter of last year the value of Germany's exports was only six per cent less than Britain's —a striking advance since 1951 when its exports were less than half of British exports. The German figures, moreover, exclude East Germany, which accounted for roughly one-third of all Germany's exports before the war.

RAW SUGAR

Russia Buys More

THE recent weakness in commodity prices has passed raw wool and sugar by. This week raw sugar touched a new peak of 6.75 cents a lb fas Cuba and it is now twice as dear as a year ago. Though wool prices (which are discussed in another Business Note) are also high, they cannot match sugar's gains. The advance was set off by a further purchase by Russia of 150,000 tons of Cuban raw sugar at a net price of 6.06 cents a lb fas ; an option on another 50,000 tons at a slightly higher price was not taken up. Russia, traditionally an exporter to the free market, has now bought about 410,000 tons this year, including about 60,000 tons of British refined sugar. As Russia has an export quota—which may yet be fulfilled—of 200,000 tons, it has already become a net importer to the tune of over 200,000 tons. With demand from other countries still buoyant, there is little prospect of any easing in supplies until the European beet crop is harvested towards the end of the year.

The high level of sugar prices has brought a handsome surplus to the British Sugar Board. Since it started operations on January 1st the board has been able to sell Commonwealth sugar to refiners at a market price well above the fixed price that it pays to producers. It can hardly be long now before the Minister of Agriculture and Food decides that the surcharge on raw sugar can safely be sus-

pended or reduced. This surcharge, introduced at 1s. 2d. a cwt, is meant to recoup the loss incurred by the board when the market price is below the fixed price ; it is not intended that the board should do more than balance its accounts over a period.

RAW WOOL

£1 Million A Day

WOOL growers in the Dominions are enjoying a wonderful year. Prices are high ; the adventitious factors—such as the Suez crisis—that assisted the advance earlier in the season are gone and prices now seem to be pretty firmly based on a buoyant world consumption. Last week the average price of merino 64's reached a new peak for the season of 137d. a lb (clean weight) cif UK ; that was 4¾d. a lb above the average for July, when the 1956-1957 season began. The average price of crossbred 56's last week was 106d. a lb, slightly below the peak of last month but 26d. a lb above the average for July. The high price of merino wool relative to crossbreds has led consumers to use some fine crossbreds in substitution, thereby narrowing the premium for merinos.

WOOL PRICES THIS SEASON
(average price, d. per lb (clean), cif UK)

Source : *New Zealand Wool Commission (London Agency)*

Australia, the largest wool producer, is riding high on the sheep's back. Bigger earnings from wool have enabled import restrictions to be eased, to the benefit of British and other exporters. Australia's wool cheque may well amount to about £365 million this season, roughly £100 million more than in 1955-1956, and higher than in any season since the Korean peak of £509 million in 1950-1951. In the first nine nine months (July to March) of this season, the volume of wool sold rose by 14 per cent to 1,057 million lb, compared with the same period of 1955-1956, and earnings rose by over 50 per cent to £285 million.

CHEQUE ENDORSEMENT

Mr Page Comes into the Straight

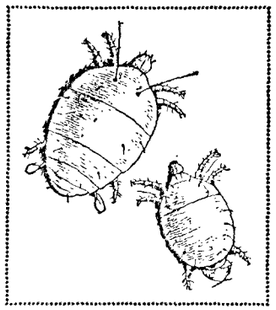
MR GRAHAM PAGE'S pertinacity in the cause of abolishing the endorsement on cheques has almost won through. Last week his Cheques (No. 2) Bill was given a second reading, and committed to a Committee of the House with the blessing of the Government. The Economic Secretary to the Treasury indicated that "certain minor amendments" may be necessary in committee, to make the Bill "more water-tight," but the general approval of the banks and the business community is assured and there is no reason to expect real trouble in this last stage.

The struggle has been long and complicated. It has been argued for years that endorsements in general, and particularly on cheques paid in to the payee's own account, serve no useful purpose. But the law, laid down in other days was the practical complication that in recent years the endorsement on a cheque has also often been used as a receipt, so that the banking system has been called in aid of business accountancy. But pressure for reform has been growing, and at the end of 1954, after five years of public discussion, Mr Graham Page, the member for Crosby, introduced a bill to abolish the endorsement on cheques paid in to the payee's account. That bill did not receive a second reading, but it prompted the Government to set up the Mocatta Committee to examine the whole question. The Committee reported in November of last year in favour of abolition ; the problem of the endorsement-receipt had been finally solved by the willingness of the banks to continue to examine such endorsements, by arrangement with individual customers and on the addition of a distinguishing mark to the front of cheques requiring that treatment.

Mr Page's present bill does not adopt the method of reform recommended by the Committee: it is simpler than the bill drafted by the Committee, and Mr Birch, while acknowledging the importance of the Committee's work, has expressly preferred Mr Page's approach. When the bill becomes law a cheque will have to be endorsed only when it is passed on to a third party, or when it has a receipt form on its back. Some remarkable statistics have been produced of the man-hours that the reform will save. Business men will accept with mild gratitude whatever small time-saving comes their way.

BANK CAPITAL CHANGE

District Bank Rearranges Its Shares



THE last four years have been a period during which the bank dividend freeze of long standing has been thawed. This year several banks have got down to the problem of modernising their capital structures, cancelling uncalled liabilities, and making their shares a more marketable commodity. It is now the turn of the District Bank. That bank's capital consists of three classes:

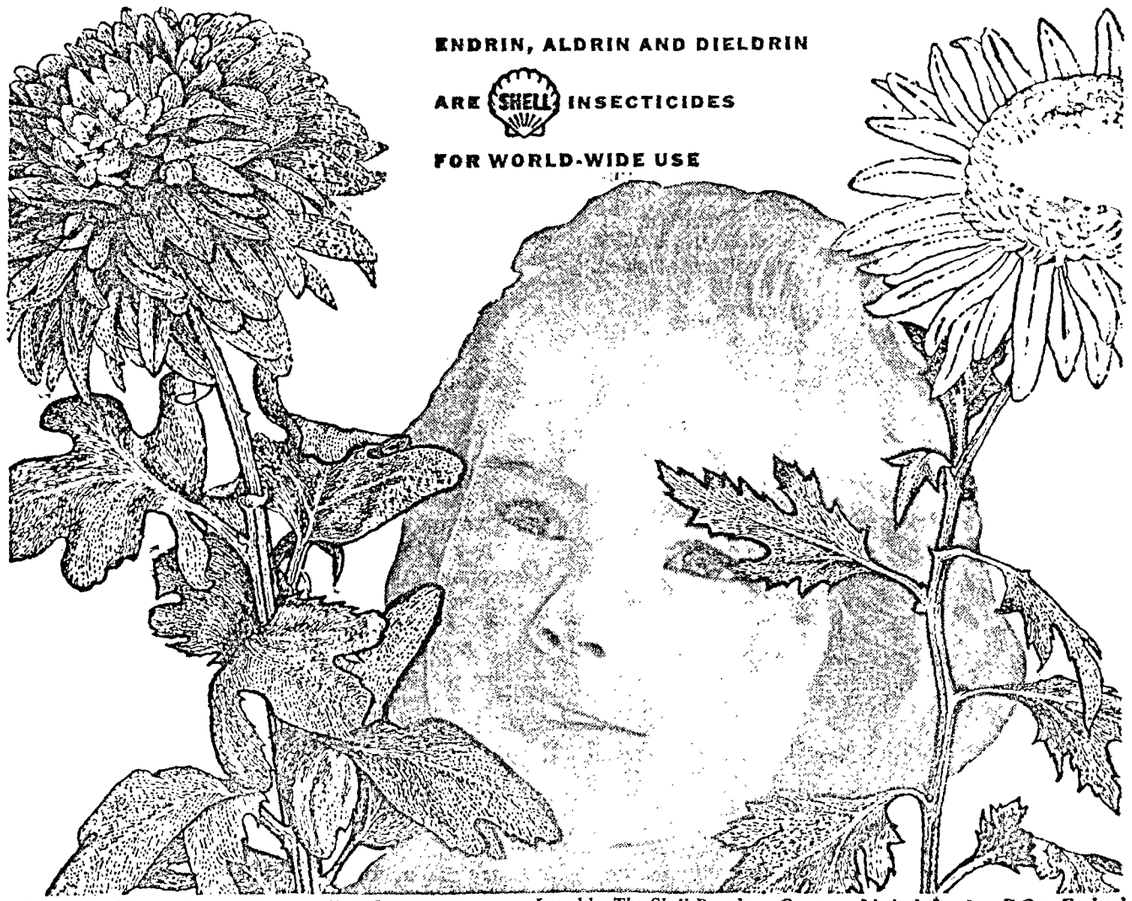
1,896,000 of "A" shares of £5 (£1 paid)
316,000 of "B" shares of £1 fully paid
764,428 of "C" shares of £1 fully paid.

The "A" shares are the original capital ; the "B" shares date from the 1929 centenary bonus and the "C" shares from the absorption of the Manchester and County Bank in 1935. The "A" and "C" shares participate equally in the equity and currently enjoy a 20 per cent dividend ; the "B" shares are limited to a maximum dividend of 10 per cent. But the "A" shares, because of their uncalled liability, of which 13s. 4d. is callable (in theory) at any time and £3 6s. 8d. per share only in a winding up, are distinctly less marketable than the "C."

The bank has sought to even out these historical anomalies and to bring all three classes down to a straight equality. It proposes first to cancel all the uncalled liability on the "A" shares, and, because they have normally stood lower in the market than the "C" shares, to compensate the "C" shareholders with a one for 25 free issue. Secondly, the "B" shares are admitted to dividend equality by the simple process of first halving their nominal amount and then reconsolidating them. That, incidentally, lets them into the equity gratis on the reduced nominal capital basis. Thirdly, the bank proposes after the adjustment to make a two for five free scrip issue to the single new class and to move on to a 15 per cent dividend basis on its new capital.

Livelihood in bloom

Bulbs are not the only bringers of beauty and brilliance to the flower fields of Holland—or of bread to the Dutch breadwinner. When spring has finally fled and the black earth basks in the stronger suns of summer and autumn, myriad new buds will open, fresh petals unfurl, other colours awaken. Provided . . .



Provided green fingers. Good feeding. Care, attention and *protection*—from wind and weather and from a host of eager enemies which creep or crawl or fly, for a million billion insects believe that flowers are made for them alone. Of these, one of the most damaging to a livelihood in bloom is, or was, *Steneotarsonemus pallidus*, the Cyclamen Mite.

This tiny but widespread pest of temperate climates attacks many valuable plants and flowers: conceals itself in fold of leaf or bud and there silently sucks the life-sap. Unchecked, the result is inevitably complete loss, commercially, for in the flower market a deformed plant is as unsaleable as a dead one. Yet until recently the Cyclamen Mite defied every effort at control. Then, sprays of Shell endrin were tried—and the answer found. Deeply penetrative and highly persistent, Shell endrin not only destroys the destructive mite, *but provides protection from further attack for nine months or more without re-spraying.*

A simple, effective and economic measure which is, aptly enough, earning for this Shell insecticide ever bigger and better bouquets from flower growers.

Shell endrin

ENDRIN, ALDRIN AND DIELDRIN

WHAT'S IN A PUNCHED CARD?

A small buff card, punched with holes. What can it do for you?

Seeing is believing

Punched cards do business arithmetic at lightning speeds. A punched number can add itself to, subtract itself from, multiply or divide itself by, another number. It can post itself. It can select, file or print itself. And that's only the beginning of the story. Ask us to show you how Hollerith punches and verifiers, sorters and tabulators automatically take both office and factory accountancy through all essential calculations and print the results. As invoices, statements and ledger-sheets. As production control statements, payrolls, statistics. And so on.

At lightning speed

Sums in milliseconds

See the Electronic Multiplier speeding up multiplying to 6,000 calculations an hour. And the Electronic Calculator doing even more involved calculating, and dividing, at the same speed. Come and learn about the Hec Electronic Computer, which carries out lengthy calculating and arithmetical work as an integrated data processing unit.

The Hollerith REGD. *Type "901" Tabulator*

Responsible advice

Which machines do you need? What job or jobs could they do for you? The answer is personal to your own business. Why not ask Hollerith to collaborate with your own people for an exploratory period? Their suggestions will be practical and realistic, based on established working techniques. There is no fee.

Education

If you decide to take a new look at your business in the context of punched cards or computers, short-term residential courses are available to you, or to your executives, at the Hollerith Education Centre in Berkshire. They put at your disposal the most up-to-date techniques and applications.

Learn more about Hollerith electronics

THE BRITISH TABULATING MACHINE COMPANY LIMITED, 17 PARK LANE, W.1

That 15 per cent will be a small advance on the 20 per cent now paid on the old basis, which is equal to 14 2/7 per cent on the new capital. The table shows how the capital now stands:—

	Present holding number of shares	Gross dividend	New holding number of shares	Future gross income
		£		£ s. d.
"A" shares	250	50	350	52 10 0
"B" shares	250	25	175	26 5 0
"C" shares	250	50	364	54 12 0

If the scheme is approved by shareholders it will also need the sanction of the court.

BOWATER PAPER

Disappointment with a Better Dividend

THE first effective conversion price on Bowater Paper's new convertible loan stock is 46s. 6d. per £1 ordinary share. On the eve of the company's dividend announcement the £1 shares stood above this price, at 47s. 9d. In the prospectus for the convertible loan stock Sir Eric Bowater had foreshadowed an increase in the ordinary dividend. The promise has been kept and the ordinary dividend is in effect raised from 11¼ per cent to 12½ per cent. Some potential sellers were waiting for this announcement and after it the market price dropped 1s. 7½d. to 46s. 1½d. before recovering to 47s. 6d.

The full year's trading results for 1956 show how dependent the group has become on overseas earnings. For the whole group the consolidated revenue is £16,129,000, including the earnings of the new subsidiary, Mersey Paper of Liverpool, Nova Scotia, for eight months; the trading profits of that subsidiary in that period came to $5,019,000. The revenue of £16,129,000 is well up on the 1955 figure of £13,210,000, as is the net profit of £6,251,000 on the 1955 net profit of £4,323,000. But the fact that the profit of £7,715,000 in the six months to June 30th last included only about two months of the earnings of the new subsidiary suggest that margins may have fallen in the latter months of 1956. And while the profits of Bowater's principal British subsidiary have crept up from £3,629,000 to £3,835,000, the profits of the Bowater Corporation of North America have gone ahead from $22,579,000 to $28,404,000. The directors attribute the increase in profits to the inclusion of the new subsidiary's figures and to an increase in output at the Tennessee mills; they add that "the overall production of the organisation also exceeded that for the previous year, and this was achieved without taking into account the production of the new Mersey company."

NEW CARS

A Forerunner from British Motor?

THE unveiling of the new Wolseley 1500 is in its own right not uninteresting. If, as may well be the case, it is the forerunner of new British Motor Corporation cars to use not only most of the mechanical parts—engine and transmission—but also most of the same body panels, it is of much greater interest. There are some details of the Wolseley panels which seem to lend themselves to cosmetic treatment, chromium trim and so on, that could transform the appearance. If BMC could be as successful as General Motors are in the United States in utilising a very high common factor of body panels in a surprisingly wide range of different-looking cars, they would certainly produce their range of different makes with much more economy than at present.

The new Wolseley can be very readily compared with the Vauxhall Victor. The stated maximum power of the Vauxhall 1500 cc engine is 10 per cent greater than that of the BMC engine, and at lower engine speeds, the gain is slightly greater. It will be surprising if the Wolseley's fuel economy is as good as that of the Victor, which sustains Vauxhall's excellent standard in this increasingly important characteristic. The Victor has a three-speed gearbox, which gives an easier life to the indolent driver. Wolseley have used a four-speed box most intelligently, reacting to the increasing popularity of overdrive gears by giving an unusually high top gear ratio, with a top speed of 18½ miles per hour at 1,000 revs, against the Victor's 16½ mph; and a third speed, close up to top gear, which the driver should be able to use freely in traffic when the Victor will be using top gear.

The Wolseley's body is a good deal more conservative, in lines and in decoration, than the Victor's; while its lines are likely to be more acceptable to British eyes for the next year or two, in two or three years, when much bigger windscreen and rear window areas are likely to have become more general, it might look rather old-fashioned compared to the Victor. The Vauxhall car also appears to provide more room for passengers and much more room for luggage.

SHORTER NOTES

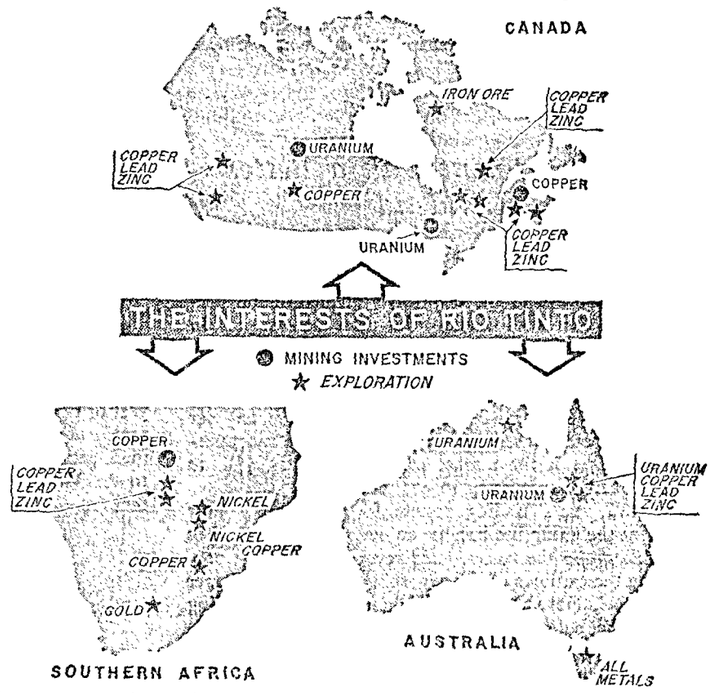
De Beers Consolidated Mines announce that sales of diamonds through the Central Selling Organisation totalled £17,742,000 in the first quarter of this year, nearly £2 million lower than in the fourth quarter of 1956. The decline was entirely in gem diamonds, sales of which amounted to £10,972,000, compared with £13,742,000 in the fourth quarter; sales of industrial diamonds rose by £825,000 to £6,770,000.

* * *

Following the sharp advance from 50 per cent to 100 per cent in the total dividend of the Legal and General Assurance Company, the chairman, Mr W. B. L. Barrington, warned shareholders at this week's meeting that the company must accumulate strong internal reserves and that it would be unwise for some time to expect any further increase in the dividend.

* * *

A sharp expansion in the gross profits of Whitbread, from £2,286,669 to £2,675,020, in 1956 has been followed by an increase in the ordinary dividend from 21 to 24 per cent.



Rio Tinto's New Colours

RIO TINTO is not a mining finance house in the usual sense of that phrase. It is a holding company whose interests are in mines and minerals. The distinction is important—and not simply because of the attitude of the tax collector. It means that if Rio Tinto's *extensive exploration programmes* produce properties worth developing, the company is likely to look around for partners to help to finance the new ventures. It has already done so. Rio Tinto of Canada (in which Rio Tinto's interest went down to 40 per cent last year, but which is now back to just over 50 per cent) is the product of the merger of Rio Tinto and Mr J. H. Hirshhorn's Canadian mining interests; and Union Minière de Haut Katanga, for which Rio Tinto is doing some exploration work in Africa; has a 10 per cent interest in it.

Rio Tinto now has a large number of subsidiary companies. They are effectively controlled by the British company, but they are directed and managed locally. On occasions the Rio Tinto directors may think of Pooh Bah, but the effect is that the earnings of these subsidiaries (until they are distributed to this country) do not attract British tax. Thus the Chancellor's concession of the "overseas trade corporation" probably has no great significance for Rio Tinto. An extensive structure is based on a capital of about £20 million employed by the parent company; of this sum about £6 million represents the instalments from the Spanish syndicate which brought a two-thirds interest in the Spanish pyrites properties formerly owned by Rio Tinto. There is another £2 million to come from this source.

The accompanying map sets down in detail the location and the minerals in which Rio Tinto either has an investment or for which it is exploring. At the moment its interests are divided as to 60 per cent base metals, 20 per cent uranium and 20 per cent others. Thus in 1956 the uranium proportion went up from 15 to 20 per cent. Another division which may expand soon, if and when the offer for Kern Oil goes through, is oil.

At the moment the principal sources of Rio Tinto's income are its investments (undisclosed in detail) in the Rhodesian copper producers; and because their dividends may be lower this year Rio Tinto's income may also fall. In 1960 profits will flow from Canadian and Australian uranium sold under fixed price contracts. Some of these ventures have been financed on loans raised on terms that strictly limit the dividend that the operating company can pay before the loan is redeemed. But at the end of the contracts capital expenditure on the mines will be fully amortised (as will that laid out by other producers). Then Rio Tinto may have to offer its uranium on a free market with the risk of lower prices. Meanwhile, Rio Tinto is pushing ahead with exploration for many kinds of metals; some of these already show promise, as does the nickel project in Southern Rhodesia, and profits from uranium may come at the right time for full development. But such programmes are costly and the risks must not be minimised. Investors, however, seem to be looking more at the uranium than at the risks, for on the maintained dividend of 15 per cent, tax free, the 10s. stock units yield only 2¼ per cent at the current price of 95s.

COMPANY AFFAIRS

SEARS HOLDINGS

WHEN Mr Charles Clore announced a year ago a 50 per cent free scrip issue of "A" non-voting ordinary shares of Sears Holdings, he said that the ordinary dividend for 1956 on the new capital would not be less than 20 per cent. He is actually paying 22½ per cent (against the 1955 equivalent of 13⅓ per cent). Last year was as busy a year as ever for Mr Clore and Sears Holdings in the matter of new acquisitions. Scottish Motor Traction, after a bitter struggle, was added to the group; later in the year Manfield and Sons and Dolcis were added to the footwear division of the group.

One year's profits are not strictly comparable with another in this growing industrial holding company. In 1955 Sears earned a profit of £4,210,266, including £42,999 of pre-acquisition profits of new subsidiaries. In 1956 the group earned a profit of £6,121,129, including pre-acquisition profits of £1,191,204. Deducting these pre-acquisition earnings the Sears directors show the 1956 gross profit at £4,929,925 (against £4,167,267) and net profits at £1,928,063 (against £1,605,021). And they add that the aggregate profit of £6,121,129 includes fifteen months' profits of Scottish Motor Traction and the profits of "certain other subsidiaries for periods of less than twelve months."

BRITISH INSULATED

NOWHERE is the story of narrowing profit margins more familiar than in the electrical manufacturing industry. British Insulated Callender's Cables is another company in that industry to report a drop in trading profits. In 1956 they fell from £11,852,852 to £9,322,544. But this result came as no surprise to investors, for in December

the company's half-yearly report revealed that while sales had risen profits were falling. Even then the directors were speaking of the difficulty of passing on increases in costs, and said that the 1956 results would not reach the record level of 1955. One factor which added to the cable-makers' difficulties must have been the fluctuations in the price of copper.

Taxation has fallen from £4,839,058 to £3,464,752, but the net profit attributable to members of the holding company has been reduced from £4,501,532 to £3,715,631. The cover on the ordinary dividend, which the directors left unchanged at 12½ per cent, has thus been reduced from over four to three times. At the current price of 52s. 6d., the £1 ordinary stock units yield 4¾ per cent.

GENERAL MINING

BY no means all the South African finance houses are basking in golden sunshine. A shadow was suddenly thrown across the Kaffir market by the preliminary report of General Mining. For twenty years this finance house has paid a dividend of 25 per cent. For 1956 that dividend was reduced to 20 per cent. The £1 ordinary shares, which were weak before the preliminary announcement, immediately lost another 3s. 9d. to stand at 58s. 1½d. and to yield 6⅞ per cent.

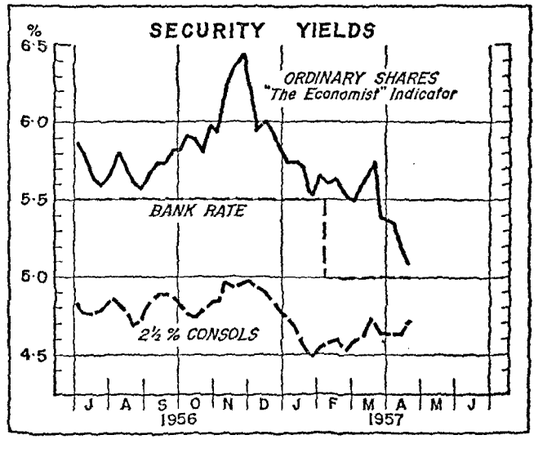
General Mining's profit has risen from £906,492 (including sharedealing profits of £13,463) to £975,469 (including sharedealing profits of £6,814). Admittedly £442,717 has been written off investments (of which £150,000 has been provided from the investment reserve), but this is not out of line with the drop of about 10 per cent in the market value of Kaffirs last year and it is less than the £540,080 (of which £475,000 came from the investment reserve) written off in 1955.

But behind these figures and the dividend decision loom other facts. General Mining has interests in some of the old producers and, though uranium production has given a few of them a fresh lease of life, their dividends are static or declining. Other of its interests are in an active and costly stage of development. Thus much of General Mining's extra income must have come from the OFS producing mines in which it has only minority investments. With development programmes under way at Riebeeck (which is adjacent to Loraine and Freddies Consolidated), at Buffelsfontein and Stilfontein, General Mining is probably short of liquid capital. It is progress at these properties to which investors in General Mining will pin their hopes.

SWAN HUNTER

IN a note accompanying the full accounts of Swan, Hunter, and Wigham Richardson the directors say: "before his death, Mr J. W. Elliott had completed his annual statement accompanying the accounts. The Board does not desire to alter these remarks in any way and they are reproduced in their entirety." Mr Elliott's review, after recording the jump in the trading surplus from £3,012,874 to £3,803,599, looked forward. Last year the group spent £1,480,764 on capital account (a sum equivalent to 84 per cent of the 1956 net profit) and within the next four or five years will spend something in the region of £6 million.

That expenditure is "considerably in excess" of what was contemplated a year ago. This revision is due in part to an increase in costs, but in the main to an expansion of the programme in order to meet the demand for large tankers. Mr Elliott said: "The closure of the Suez Canal, while not initiating the movement to increase the size of tankers, has accelerated the demand for large ships, and we now have to adapt, our yards to build these large ships at an earlier date and at an increased tempo." The revised programme seems in the directors' opinion to provide reason enough for the decision to leave the ordinary dividend unchanged at 14 per cent in spite of a rise in net profits from £1,380,100 to £1,622,472 and in the face of an order book which will keep the "works busy for some years ahead."



London Stock Exchange

FIRST DEALINGS:	Apr. 10	May 1	May 15
LAST DEALINGS:	Apr. 30	May 14	May 28
ACCOUNT DAY:	May 7	May 21	June 4

A SHORT-LIVED rally, following the reduction in the Treasury bill rate on Friday, was the only favourable movement in gilt-edged prices in a week of persistent losses. The *Financial Times* Government securities index recorded a loss of nearly a point to stand at 86.26 on Tuesday's close; 3½ per cent War Loan lost 1⅛ to 73⅛ and 4 per cent Consols ⅞ to 79½. Industrial stocks fully held their recent gains and The Economist indicator rose 2.3 points to 214.9. Canadian stocks were again firm and International Nickel were especially strong. The dollar premium rose to 8 per cent over the rate for the day.

Insurance shares were unsettled. London and Lancashire and Commercial Union fell sharply on the announcement of unchanged dividends. Legal and General dropped 4 points to 31½ on the chairman's statement about future dividends. Prudential "A" fell 2 points to 41½ xd. On the increased dividend, Whitbread "A" gained 4s. 3d. to 73s. Taylor Walker improved 3s. to 32s. 6d. xd. Road construction shares rose, with Associated Portland Cement putting on 1s. 4½d. to 43s. 6d. Better prospects for the motor industry brought British Motor up to 8s. 1½d. and Standard to 7s. 4½d. and, among the steel shares, John Summers rose 3s. 6d. to 34s. J. & P. Coats and English Sewing Cotton were prominent among the textile issues with gains of 2s. 6d. and 1s. respectively. Shipping shares improved.

The £1 ordinary stock units of British Celanese have been removed from *The Economist* ordinary share indicator. The indicator now comprises 49 stocks.

Figures cover general trade as far as possible. Area totals include estimates for countries for which data are not available. Data refer to calendar years. (1) Excludes China (mainland), USSR, and non-reporting countries of Eastern Europe. (2) Including the trade of Newfoundland in 1948, with no adjustment for trade between the two areas. (3) Partly estimated.

Industrial Profits and Assets

THE tables below continue the analysis of company balance sheets and profit and loss accounts which was introduced in *The Economist* of January 22, 1949; the figures are discussed on an earlier page in this issue.

Comparative analysis of 439 profit and loss accounts published January-March, 1957 (£'000)

THE MONEY MARKET

THE see-saw in the Treasury bill rate continues. At the tender on Friday of last week the discount market reversed its tactics of the previous week and raised its bid by the unusually large margin of 8d. per cent, to £98 19s. 10d. *per cent—within 2d. of the recent peak* of £99 per cent. The market's move last week was larger than expected by outside applicants; its allotment rate rose from 32 to 54 per cent and the average rate of allotment fell by only 2s. 2d. (compared with the market's effective reduction of 2s. 8d. per cent) to £4 0s. 9.36d. per cent. Total applications rose by £5.1 million to £415.7 million, and the allotment fell by £10 million to £230 million; yesterday's offer was stepped up to £240 million.

Credit conditions in Lombard Street have been mixed in the past few days. One or two houses were "in the Bank" for small amounts on both Thursday before the week-end and on Monday, despite moderate official help through purchases of bills on both days. But conditions were comfortable on the short Saturday session (when there was actually a surplus of funds) and on Tuesday (when official disbursements were heavy). Money became available at down to 3 per cent and July maturities changed hands at 3⅛ per cent.

At the Treasury bill tender in New York the rate rose from 3.154 per cent to 3.194 per cent.

COMPANY MEETINGS

LEGAL AND GENERAL ASSURANCE SOCIETY LIMITED

A GREAT QUINQUENNIUM

NEW LIFE BUSINESS AGAIN A RECORD

ASSETS AT £290 MILLION REPRESENT TRULY REMARKABLE EXPANSION

The one hundred and twentieth Annual General Meeting of Legal and General Assurance Society Limited will be held on May 8th at Aldwych House, Aldwych, London, W.C.2.

The following is an extract from the statement by the Chairman, the Honourable W. B. L. Barrington, which has been circulated with the report and accounts:

SHARE CAPITAL

With this statement you will have received a proposed resolution to sub-divide each of the Society's shares into four shares of 5s. each. Your directors feel that the shares in this form will have a wider appeal and they therefore recommend you to adopt this resolution.

ACCOUNTS FOR 1956

The accounts relate to the last year of the Society's twenty-fourth quinquennium and are associated with the valuation of assets and liabilities on which a formal statement, incorporating the valuation report of the actuary, is submitted herewith. I shall refer to this again later in this review.

It has been in truth a great quinquennium for the Society in which we have seen our affairs go forward in all our spheres of activity; and we find ourselves today able to look with considerable satisfaction on our position, even though the five years in question were fraught with many problems and ended at a time when our valuation coincided with an exceptionally depressed level in the market values of fixed interest securities, and with correspondingly high interest rates.

LIFE AND ANNUITY FUND

Last year I was able to speak of a record total of new life business of £115,020,108 net sums assured. This figure was exceptional, but it has, nevertheless been exceeded in 1956 when we attained a total of £137,102,052. This was indeed a fine achievement and made a total for the quinquennium of £507 million, or rather more than the aggregate for the five preceding quinquennia; that is, the new life business obtained in these last five years exceeded the whole of the new life business for the preceding 25 years.

We have now completed one full year of operation as a life office in Australia with the excellent total of £2,433,573 in new life sums assured of which no less than 63 per cent is on a with-profit basis. This high proportion is very welcome and is in line with our intention to foster an increase in policies participating in the profits of the Society, which we feel would be in the best interest of the policyholders and the Society. Our enterprise in Australia has made an admirable start and we are confident that it will come to successful and profitable maturity.

In Southern Africa we have again obtained a record total of new business exceeding £22 million, in keeping with our position as a long-established Office which is very much at home in the Union. Our interests in the Rhodesias steadily increase and it is our hope and desire to play a full part in the progress of this young and promising territory.

MORTALITY EXPERIENCE

We have made the usual investigation into the mortality experience of our life assurance and annuity business. I am glad to be able to state that in the case of life assurance the experience is entirely favourable, the claims being less than the amount expected under the valuation tables of mortality.

RATE OF INTEREST

The gross rate of interest earned on the life assurance and annuity fund, excluding the amount invested in purchased reversions, was £5 1s. 7d. per cent as compared with £4 16s. 4d. per cent in the previous year. The corresponding net rates were £4 9s. 4d. per cent and £4 4s. 1d. per cent.

EXPENSES OF MANAGEMENT

The total cost of commission and expenses of management, expressed at a ratio to the life premium income, was 10.07 per cent compared with 9.42 per cent in 1955 and 9.34 per cent in 1954. A material part of this increase for 1956 was occasioned by an over-all improvement in the remuneration of the society's staff as a whole dating from October, 1955, which first operated for a full year in 1956.

FIRE INSURANCE ACCOUNT

The net premium income of the fire insurance account amounted to £2,364,935, which represented an increase of £170,036.

ACCIDENT INSURANCE ACCOUNT

The net premium income of the accident insurance account amounted to £1,845,373, which represented an increase of £161,989.

FIRE AND ACCIDENT

The results of our combined fire and accident operations were—premium income £4,210,308; claims paid and outstanding £1,840,429 or 43.71 per cent of income; commission, expenses of management, and overseas taxation £1,875,787 or 44.55 per cent.

The total profit transferred to the profit and loss account after providing the necessary reserves for unexpired risks and for liability under special contracts was £272,819.

MARINE ACCOUNT

The marine account continues to make satisfactory progress. The premium income for 1956 was £835,992, as against £725,544 in 1955.

The 1954 account has been closed and the balance for that year of £33,348 has been retained in the fund. This at the end of 1956 was £1,056,313, representing 126.35 per cent of the premium income.

ASSETS

The total assets of the society at December 31, 1956, amounted to £290,038,315, having increased during the year by £27,873,161.

QUINQUENNIAL VALUATION

I have directed your attention to the separate report by the directors on assets and liabilities which includes the quinquennial valuation report, and recommendations by the actuary as to allocation of available surplus. These have been adopted by the board and are reflected in the report and accounts now submitted for your consideration.

The resultant position is that the surplus disclosed in the life fund is £2,808,690, that in the sinking fund £228,233, and that in the permanent sickness fund £97,233. Of these amounts, £2 million, £100,000 and £40,000 respectively have been transferred to the profit and loss account and after provision of the sum of £219,961 for bonuses to the new series participating policyholders there remains a total sum of £774,195 to be carried forward in the three funds.

PROFIT AND LOSS ACCOUNT

The balance brought forward in the consolidated profit and loss account was £238,773, to which has been added £250,813 in interest and dividends and £2,140,000 in quinquennial transfers as already explained. Transfers from the fire insurance and accident insurance accounts totalled £272,819.

The account will retain a balance carried forward of £1,925,813.

BONUS DECLARATION

I have left to the last a special reference to the bonus rates of 45s. per cent per annum compound which we have felt able to declare for new participating policies in the United Kingdom and Southern Africa, of 32s. 6d. per cent per annum compound in Australia, and of 30s. per cent per annum simple for pension policies for self-employed. The society has a long and very creditable history where bonus declarations are concerned and we are very mindful of this proud record. We are also concerned to look ahead and in the years to come the recent changes in our constitution should be much to our

advantage. These enabled us, for example, to embark on the new series of participating assurances, and generally to move to a policy more directed to with-profit business activities which we regard as all-important since our future goes hand in hand with the satisfaction of our policyholders. They may rightly feel entitled to a substantial interest in the success of the society and we should not expect the same progress in the future as in the past if we did not agree with them.

We shall, therefore, direct our best endeavours to increasing our strength and resources for the security of our policyholders as a whole, and secondly, as we hope and trust, for the profit of all who participate in our fortunes. These are important responsibilities which have grown with our rapid expansion in recent decades.

Finally, may I say a word to the shareholders for whom a substantial increase in dividend is now recommended.

I have already stressed the importance of accumulating strong internal reserves in order to meet any unforeseeable contingencies with which the society may be faced in the future and which it is impossible to assess at the present time. In the light of this, and bearing in mind that we are at the beginning of a new quinquennium involving more development at home and overseas, our shareholders would be unwise to expect for some time any further increase in the dividend.

In conclusion, both I and the directors, and I am sure that I can also speak for the shareholders and policyholders, would like to express our gratitude and thanks to our general manager, Mr G. W. Bridge, and to all his officials and staff at home and overseas, for the splendid contribution they have made to the success of the society.

NORTH BRITISH & MERCANTILE INSURANCE

RECORD NEW LIFE BUSINESS

The annual general meeting of North British and Mercantile Insurance Company Limited will be held on May 9th in Edinburgh.

The following is an extract from the circulated statement of the Chairman, the Right Honourable Lord Brand, CMG, DCL:

Fire Department.—During the past year the experience of this very important section of our business has, I am sorry to say, been unsatisfactory. This is due almost entirely to the outcome of our United States and Canadian business though in the United Kingdom the results from our Fire Department business were not as good as those to which we are accustomed largely owing to the abnormal number of claims for water damage following burst pipes in the very severe weather conditions of the early part of the year.

Premiums at £18,480,490 show an increase of £1,054,463 compared with the 1955 figure of £17,426,027 whilst losses at £9,905,399 show an increase of £1,345,203 over the figure of £8,560,196 in the previous year with a ratio of 53.60 per cent against 49.12 per cent in 1955.

After an addition of £265,606 to the Provision for Unexpired Risks we are left with an adverse balance on our Fire Account this year of £318,669, 1.72 per cent, which compares wtih a profit of £491,268, 2.82 per cent, in the previous year.

Casualty Department.—Total premiums amounted to £9,428,598, being £1,768,650 in excess of those for 1955. Total claims incurred amounted to £5,453,510 against £4,135,629, the percentage of claims to premiums being 57.84 per cent compared with 53.99 per cent for 1955.

Commission, Expenses of Management and Overseas Taxes were £3,937,411 compared with £3,072,140 for the previous year, the respective ratios to premiums being 41.76 per cent for 1956 and 40.10 per cent for 1955.

There is an underwriting loss of £165,176, 1.75 per cent of premiums compared with an underwriting profit of £237,927, 3.11 per cent for 1955.

Marine Department.—The Marine premium income for 1956 was £1,837,413, which compares with £1,730,660 in 1955.

We have transferred the sum of £338,532 from our Marine Fund to Profit and Loss Account.

Life Department.—We again wrote a record volume of new business, the total new sums assured after deduction of reassurances given off being £14,384,509 in 1956 compared with £13,791,700 in 1955.

Consolidated Profit and Loss Account.—Net Interest on Investments amounts to £1,171,492 compared with £1,133,727 in the previous year. The operations in the Fire, Accident and Marine Accounts during the year resulted in a net loss of £145,313 compared with a profit of £1,060,831 in 1955.

The proposed dividend of 2s. 3d. per share and the preference dividend will absorb £751,812.

United Kingdom Taxes amount to £299,587 and Overseas Taxes charged to this Account £5,211.

GENERAL REFRACTORIES LIMITED

GENEFAX HOUSE, SHEFFIELD, 10

A comprehensive range of refractories serving all industries is produced by the Company and its Subsidiaries at their Works and Quarries situated in many parts of England, Scotland, Wales, and in Belgium. Research and technical field service facilities are available. The Company has offices and representatives throughout the United Kingdom and Agents in all parts of the world.

EXTRACTS FROM THE CHAIRMAN'S STATEMENT:

The Gross Sales of your Group of Companies have exceeded those of last year by almost 20 per cent, and Export Sales again exceeded £1 million. This substantial increase in the turnover was most gratifying, especially as a considerable proportion of it was in specialities such as "Ferroclad" Brick, "Densyl," and the "Sillmax" range of high alumina products.

This has been another year of progress. The Group Trading Surplus for 1956 amounted to £871,119, which shows an increase of £179,720 over 1955. Your Directors recommend a Dividend of 17½ per cent, less Income Tax.

The statement then referred to the progress of the three major Capital development programmes and continued: During the year record tonnages of output have been established.

As part of our schemes for increasing our production capacity, work on the erection of a new tunnel kiln at Lowood Works, near Sheffield, has been commenced, and as a result of this and other projects we shall, in the near future, be in a position to increase substantially our production of basic and other high class refractories.

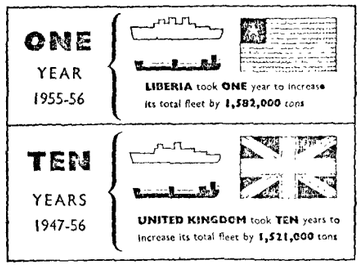
At home the demand for our products remains at a high level and we feel that the future is full of promise. Our export trade continues to expand at a very satisfactory rate.

Your Directors have been giving careful consideration to the proposals that this country should, to a modified extent, link itself to the European Free Trade Area. While I have little doubt that we should be able to increase our continental trade, we must not overlook the possibility that some of our best customers in this country might be seriously affected by continental competition.

Copies of the Accounts and Chairman's Statement may be obtained from the Secretary, Genefax House, Sheffield, 10.

Peninsular and Oriental P&O *Steam Navigation Company*

"Every New Ship... an expression of Faith in the Future"



Who would have thought a year ago that a few months later the greatest international shipping highway in the world would be blocked?

STOCKHOLDERS may well ask what the closing of the Canal has cost the P. & O. Group.

The losses on the liner voyages subsequent to those which had been begun when the dislocation occurred, have been reduced by surcharges on the freight and passage earnings. The tramps owned by the Group have, of course, benefited from the high market rates induced by the closing of the Canal. Not all has been loss for the Group as a whole. But you will, I hope, see from this very brief mention of some of the factors involved that it is impossible to evaluate the nett loss to the Group through the seizure of the Canal by Egypt in July 1956, simply because much of it has been indirect and will continue for long after the ships are passing through the Canal again.

To the citizens of this country in their personal lives, to the commercial community, as well as to shipping, this act of sabotage has caused grievous loss. And not only to the West, but also to the East.

TAXATION AND TANKERS

I said a year ago that your Board were studying the position created by the increasing number of ships registered in countries where little or no taxation is levied. Two facts are enough to show the scale of the problem. First, the growth in the tonnage registered in Liberia during the twelve months ended 30th June, 1956, has been greater than the growth in tonnage registered in the U.K. during the ten years 1947-1956. Secondly, during the year 1956 the combined tonnage of Liberian and Panamanian tankers actually surpassed the total of British tanker tonnage and these two countries combined are now the largest tanker owners in the world.

We came to the conclusion, after the most exhaustive investigation, that we could not ignore the attraction of investing in a shipping company which would operate in a tax-free country. We therefore decided to form a wholly-owned subsidiary company, the Charter Shipping Company, which has been registered in Bermuda and which has already placed contracts for several tankers. The Board of the Company intend that any tankers which may be owned by Charter Shipping Company will be registered under the British flag, will be manned according to British standards and at British rates of wages; the ships will be at the disposal of the British Government as are ships owned in this country.

BUDGET CONCESSION WELCOMED

The Chancellor's proposals to extend the investment allowance for shipping to 40% has greatly altered this picture. This was the most important single concession for which the Shipping Industry had asked, and we are most grateful to the Chancellor for meeting it and so enabling us to face the problem of replacement with a very much greater chance of success than before.

There has not been time for us to consider fully whether as a consequence we should reduce our proposed investment in Charter Shipping Company, but at least this concession will do more than any other step to remove the inducements to shipping capital to continue in the future to flow into tax free countries.

OUR EARNINGS

Rates of freight current at the time when the plans for a ship are being prepared are not infrequently below what is required to show a reasonable return on the investment. But fortunately importers and exporters are starting to appreciate that if new ships are to be built to keep open the lifelines of trade, rates of freight must rise to a level which allows for the current cost of replacement besides providing reasonable interest on capital invested in the ship. In the long term, unless this simple economic fact is recognised, the money to pay for new ships will not be forthcoming.

Had it not been for the Canal upheaval, I believe that the results for this present year to date would have shown considerable improvement on the figures for the same period in the accounts before you. Tramp rates have been very high although now well below their peak; there has been time for rate increases in some of the liner trades to produce results and as a result—in spite of everything—our net earnings as a group for the current year before taxation, based on individual returns received at this date, are just about the same as the corresponding figures for last year.

★

If you are interested in these extracts from Sir William Currie's speech at the 117th Annual General Meeting please write for a full report to the Secretary, P & O Steam Navigation Co., 122 Leadenhall Street, London, E.C.3.

SINCE THE WAR ENDED *our faith in the future of Britain has been symbolised in the construction for our Group fleets of more than 1.3 million gross tons of passenger and cargo ships at a cost of over £150 million. Every new ship is an expression of faith in the future.*

THE BRITISH WAGON COMPANY LIMITED

COMPANY'S LONG SERVICE TO INDUSTRY AND COMMERCE

The eighty-eighth Annual General Meeting of The British Wagon Company Limited was held at the Company's Offices, 23 Moorgate, Rotherham, on April 12th, the Chairman, Mr W. H. Copley, FCA, presiding.

The following is an extract from his circulated Statement:

The Net Earnings of the Group for 1956 of £922,343 show an increase on 1955 of £131,000, and the Net Profit for the year of £229,217 after providing for taxation is a satisfactory result.

A first Interim Dividend of 5 per cent on the Paid up Capital was distributed on August 1, 1956, and a second Interim Dividend of 15 per cent was paid on March 15, 1957, making a total of 20 per cent for the year. No further dividend will be recommended in respect of 1956.

TRADING CONDITIONS

In our report last year we referred to the effect which the Hire-purchase (Control) Order No. 180, introduced on February 18, 1956, was likely to have on our business. You will recall that this Order provided for a minimum initial rent of 50 per cent. Not only did this Order reduce the amount of our average investment per case, but it also put a considerable brake on the demand for hire-purchase facilities throughout the year.

This reduction in business unfortunately coincided with increased money cost, and rising overhead expenses, by no means all of which were passed on to our hirers.

In these circumstances it may appear anomalous to report a record profit for 1956, but as you know, the earnings on our hire-purchase business are spread over the life of the Agreements, which may be up to two years, and it follows that the reduction in our hire-purchase business in 1956 will have an effect upon our earnings in 1957.

Early in this current year the pendulum swung somewhat in our favour. As you will remember, the motor car manufacturers experienced increasing difficulty with their export markets in the latter part of 1956, and this position was materially aggravated by the Suez Crisis. In addition, following the introduction of petrol rationing in December, sales in the Home market were seriously curtailed.

In order to stimulate a demand for motor cars in an effort to maintain employment during the temporary recession the Government found it necessary to relax the Hire-purchase (Control) Order on motor cars and light vans, reducing the initial rent required from 50 per cent to 20 per cent of the cost price.

It is difficult to see why this relaxation was not extended to cover heavy commercial vehicles and agricultural machinery.

On February 7, 1957, we were glad to learn that the Bank rate had been reduced by ½ per cent to 5 per cent. This showed an immediate saving upon our short term borrowings and represents a welcome contribution towards our steadily increasing overheads, which we have been unable to offset by increased turnover.

Summarising, 1957 has opened on a more cheerful note than pervaded 1956, although in the same way that the decrease in business in 1956 will have a marked effect upon the earnings of the current year, improvement in 1957 will yield most of its fruits in 1958.

PERMANENT POWERS TO CONTROL HIRE PURCHASE BUSINESS

We learned from the Queen's Speech last autumn that we are to have additional legislation to take permanent powers to control the terms of hire-purchase business on the one hand, and the manner and extent of borrowings by Hire-purchase Companies on the other.

Your Company has always been conducted on the most conservative lines, and we would not oppose a reasonable degree of control providing that it does not hinder normal growth. However, if there is to be permanent legislation to control the terms of hire-purchase business on the one hand, and the ratio of borrowings to capital and reserves on the other, we should clearly be freed from the yoke of the Capital Issues Committee and be able to increase our borrowings on the terms we think best suited to our business within the prescribed limitations.

A VERY SOUND BORROWING BASE

We submit that there is no case for the suggested introduction of a statutory liquidity ratio. Although the growth of Finance Companies in this country is, with some exceptions like ourselves, comparatively recent, the inherently liquid nature of our business provides a very sound borrowing base. Deposit loans, mainly at three and six months' notice, are relatively long dated compared to the period of repayment appertaining to Bank and Building Society funds, and our Assets are self-liquidating in about 20 months even in free trading conditions.

Building Societies are required to make periodical returns to the Registrar, and in our view the adoption of a similar procedure in the appropriate form for Finance Companies would provide an adequate safeguard and would be a much more workable arrangement than the cumbrous legislation envisaged.

We have endeavoured to convey these views to the Government through Finance Houses Association.

In spite of current frustrations we remain quietly confident that the need for our services will ensure our continued progress. There are other countries within the Commonwealth, however, where great strides are being made, because people there still have the incentive to work and take responsibility, and where private enterprise can flourish in freer conditions. Our long service to commerce and industry at home has given us many valuable introductions overseas, which are being carefully but energetically followed up.

The Report concluded with a review of the satisfactory progress of the Subsidiary Companies.

The Report and Accounts were unanimously adopted.

The Special Resolution amending the Articles of Association of the Company in accordance with the requirements of the Stock Exchanges was sanctioned.

COW & GATE LIMITED

A VERY GOOD YEAR

The forty-eighth annual general meeting of Cow & Gate Limited was held on April 12th at Guildford. Mr Ernest E. Taylor, CBE (Chairman and Joint Managing Director), presided and, having paid tribute to Mr Bramwell Gates on his retirement from the Chairmanship owing to ill-health, continued:

I am pleased to announce that we have had a very good year, and the total trading profit of the Group has increased by almost £300,000. Nearly every Company in England has been affected by the credit squeeze, and it is obvious that, at any rate for the time being, we have got to finance the development and expansion of the Company largely from our own resources. For this reason we have decided this year to put more to reserve than last year and maintain the dividend at 17½ per cent. In spite of the building of reserves it is apparent that your Company will be requiring more permanent capital, and I hope that during the coming year I may have some statement to make about this and to invite your co-operation and participation.

It is interesting to recall that in 1955 we had a revaluation of the freehold and leasehold properties in the United Kingdom made by Messrs Debenham, Tewson & Chinnocks, and in their opinion the valuation of the Companies' properties stands at upwards of £1¼ million above the book figures. The new figures are shown in the Group accounts.

OUR INFANT FOODS SUPREME

Sales of our infant foods have increased during the past year, and indeed there has been a steady increase for the past six years, which we believe shows that parents are more than ever determined to see that their children get a proper start in life.

Many shareholders may perhaps not realise the ramifications of the Cow & Gate Group. Not only do subsidiary companies retail bottled milk, butter, cream and cheese, but we also manufacture butter, cream and cheese. For those who prefer the best English butter there is "Farmer's Wife" and "Rose of Torridge." Our Farmer's Wife and Double Devon creams, which are long-keeping fresh creams of the finest quality, can be bought from dairymen, grocers and fruiterers over a very wide area.

I am glad to say that, largely as a result of the work of the English Country Cheese Council, many of our excellent territorial cheeses such as Wensleydale, Caerphilly, Lancashire, etc., previously little known beyond the confines of their local areas, are now becoming popular on a much wider scale.

We have also recently introduced "Creamed Rice," which is a milk pudding packed in cans.

On the liquid milk side we have expanded still further, but mainly in our existing operating areas, because we believe that after so many years of extensive growth we should consolidate our business, and in the coming years this should increase the profitability of the liquid milk subsidiary companies.

Our business in Canada is going ahead by leaps and bounds, and Farmer's Wife, a milk food which is largely used as a foundation for infant feeding by the medical profession in this Dominion, is earning the tremendous reputation which Cow & Gate already enjoys in this country.

At the moment profits in Canada are comparatively small but in the years to come we are certain that we shall have a fine and profitable business there.

The report and accounts were adopted.

GRESHAM LIFE ASSURANCE SOCIETY LIMITED

RECORD NEW BUSINESS

THE HONOURABLE W. B. L. BARRINGTON'S REVIEW

The One Hundred and Eighth Annual General Meeting of the Gresham Life Assurance Society Limited was held on April 11th at 188 Fleet Street, London, EC.

The Honourable W. B. L. Barrington, the chairman, who presided, said:

Before I proceed, I would refer with deep regret to the death in July last of Mr Henry Hoare, who had been a director of the Society for 48 years until his retirement in May of last year. He will be greatly missed by all of us. We benefited for many years from his wise counsel, his great knowledge and charming personality. His place on the board has been filled by Sir Charles Norton, MBE, MC, whose name will be submitted to this meeting for re-election. Sir Charles, who is a director of the Legal & General and is the immediate past president of the Law Society, is a most welcome addition to our board.

Lord Harcourt has now returned from Washington on relinquishing his office as Her Majesty's Economic Minister. I am sure you will all wish to join with me in congratulating him on his being created a KCMG in recognition of his valuable services.

NEW BUSINESS RECORD

I referred last year to the imminent nationalisation of our business in India. This has now been carried out and, of course, has resulted in the loss of that branch's large production, but it is pleasing to be able to record that, in spite of this, our results for 1956 were an all time record for the Society. Our total new sums assured under life and endowment policies of all types, after deducting sums reassured, amounted to £12,545,000, compared with £11,992,000 in 1955 and £12,502,000 in 1954.

This excellent result is mainly accounted for by an increase in our British new business, from £6,939,000 in the previous year to £8,545,000 in 1956. Allowing for the loss of our nationalised Indian business our remaining overseas branches did very well in producing £4 million in new sums assured. The increased total production is indeed welcome and I have no doubt that you will wish me to express a special vote of thanks to our agency organisation, including the managers and staff of our branches in this country and overseas, for their excellent efforts.

INDIA

During 1956, the Indian Government passed a law nationalising all life assurance business in India, and as from September 1, 1956, the large and valuable portfolio which the Gresham had built up in that country over more than 60 years passed to the newly formed Life Insurance Corporation of India. Whilst we cannot but regret the decision of the Government of India to nationalise life assurance, we have every confidence that the conditions of the nationalisation will be carried out with fairness to all concerned. We feel sure, also, that our former policyholders will continue to receive the service and attention to which they were accustomed and which caused them to effect their policies with the Gresham in the first place.

THE SOCIETY'S FUNDS

Following the Indian nationalisation the life assurance fund decreased during the year from £22,332,848 to £20,896,436. The total funds of the Society amounted to £21,150,195 at the end of the year.

A further fall occurred during the year in the Stock Exchange quotations of all fixed interest investments, and the generally upward trend in the values of Ordinary shares which has been experienced for some years was reversed. Nevertheless, the usual valuation of the Society's assets as a whole, that is, including the investments in property, revealed that the assets appear in the balance sheet at values which in the aggregate were within their market value at December 31st last.

There is an increase in the average rate of interest, net of United Kingdom income tax, earned by the Society's funds. The rate of interest in 1956 was £4 11s. 3d. per cent, compared with £4 3s. per cent in 1955, but perhaps I should explain that part of this increase is accounted for by certain effects of the nationalisation in India.

PREMIUM INCOME

During 1956 the Society received premiums, net of reassurances, amounting to £3,587,648, whilst income from all sources amounted to £4,476,170. These figures are both approximately £225,000 less than those for 1955, which again is due to the exclusion of figures for India.

TAX CONCESSIONS

You will no doubt have read with pleasure of two somewhat overdue tax concessions which were included in the Finance Act, 1956.

First, the Act provided a relief to annuitants for which life offices had been pressing for many years. "Purchased annuities" are now taxed only on the interest portion of each payment, the part representing the return of the purchase money being free of tax.

The other concession affects the self-employed, including many members of the professional classes, who are now, within limits, relieved of both income tax and surtax on premiums for approved types of deferred annuity policies.

MANAGEMENT AND STAFF

I would again express our appreciation of the admirable work of our manager and secretary, Mr Chapman, and his excellent staff who have had many complicated problems to deal with particularly in connection with the nationalisation of our Indian portfolio and the completion of the Egyptian transfer.

The report and accounts were unanimously adopted and, the other formal business having been transacted, the proceedings terminated with a vote of thanks to the chairman.

CALEDONIAN INSURANCE COMPANY

RECORD NEW LIFE BUSINESS

The one hundred and fifty second Annual General Meeting of the Caledonian Insurance Company will be held on May 9th, in Edinburgh.

The following is an extract from the circulated Statement of the Chairman, Mr P. G. Macdonald, WS:

Previous Chairmen have from time to time commented on our unfavourable underwriting results in the United States of America, which have persisted over many years. The Board decided to sell as at December 31, 1956, to the Peerless Insurance Company, of Keen, New Hampshire, the Caledonian-American Insurance Company, our American Subsidiary, together with the portfolio of business written by our United States branch. The profit resulting from the sale of our subsidiary has been used to strengthen the Company's inner reserves.

Life Department.— I am pleased again to report record new Life business for the Company. After deducting Reassurances the new Sums Assured, including Group Life business, amounted to £4,286,000 as against £3,918,000 last year and Annuity Bonds securing £407,000 per annum were issued as compared with £327,700 in the previous year.

Our Life premium income exceeded £1,162,000 and has increased by more than £39,000 and net interest income increased by more than £53,000 to £546,304. The rate of interest earned in the year before deduction of tax was £5 9s. 10d.; in the previous year the rate earned was £5 6s. After deduction of tax the corresponding rates are £4 3s. 4d. and £4.

The Life Fund before allocation of the Shareholders' portion of profits stood at £13,822,838 as compared with £12,993,608 a year ago.

Last year was the final year of another Triennium. The results of the Actuarial Valuation are extremely satisfactory. Reversionary Bonuses have been declared for the three years ended December 31, 1956; ordinary participating Whole Life Assurances receiving 50s. per cent per annum and Endowment Assurances receiving 48s. per cent per annum, both calculated on the Sum Assured. At our last Triennial Valuation the corresponding bonus rates were 42s. and 40s. per cent per annum. In respect of Retirement Pension Policies a Reversionary Bonus of 45s. per £100 of guaranteed pension per annum has been declared. Reversionary Bonuses have also been declared at appropriate rates in respect of all other classes of participating Policies according to the profit-earning capacity of the respective classes of Assurance.

We have also decided that With Profit Policies becoming claims by death or maturity after December 31, 1956 will, until further notice, be granted interim bonuses at the same rates.

After allocating £130,000 to additional reserves we are carrying forward £143,370 as against £138,864 when our last Triennial Valuation was made.

These very favourable results justify a confident outlook for the future and demonstrate the attractiveness of a "Caledonian" With Profits Policy.

The total premium income for all departments was £8,960,279 compared with £9,316,904 for 1955.

ATLAS COPCO AB

(Compressed Air Engineers)

STOCKHOLM, SWEDEN

ORDERS AND DELIVERIES AT RECORD LEVEL

The annual general meeting of Atlas Copco AB was held in Stockholm on Saturday, April 13th. The following is an extract from the report submitted and approved at the meeting :

The Board of Directors and the Managing Director (Mr Walter Wehtje) have pleasure in submitting herewith their Report on the Company's activities during 1956.

The Board are pleased to report that both orders received and deliveries effected reached a record level during the year. Deliveries in 1956 totalled Kr.159 million (£11 million) and exceeded the previous year's figure by Kr.30 million (£2.1 million). It is expected that delivery dates can be shortened during 1957, an improvement which should strengthen sales still further.

The aggregate value of invoiced orders rose from Kr.247 million (£17 million) in 1955 to Kr.315 million (£21.7 million) in 1956. Sales were particularly high in Sweden, Canada, France and Italy. Out of the total of invoiced orders 70 per cent were distributed to subsidiaries and agents abroad, and 30 per cent to the Swedish sales company. New associate companies have been set up in Austria and the Belgian Congo.

TECHNICAL DEVELOPMENTS

A new pusher-feed rock drill, larger and faster than existing models, was introduced during the year. Manufacture has also begun of large rock drilling machines for long-hole drilling and for use with wagon drills. The Company also introduced a dentist's drill, driven by compressed air, which has aroused great interest. Other developments have included transport trucks driven by compressed air for use underground and a loading machine running on rubber tyres, based on an Italian design.

PRODUCTION AND EMPLOYMENT

The steadily rising demand for the Company's products entailed an increase in production. Owing to the growing difficulties in achieving such an increase on the required scale, the Company acquired a share majority in Arpic Engineering SA, of Antwerp, a former competitor. This firm is equipped with modern and well-organised workshops and, according to present plans, will be used to manufacture those portable compressors which have been built in Stockholm up to now.

In the year under review 200 new employees joined the Company in Stockholm.

RESULTS

Thanks to the larger turnover the gross operating profit increased from Kr.23 million (£1.6 million) in 1955 to nearly Kr.28 million (£1.9 million) in 1956.

This increase was largely offset by increased depreciation on buildings and machinery, higher administrative costs and interest charges, and a slight reduction in dividends paid by subsidiaries.

Owing to the heavy burden of taxation and the high level of investment duties the results were still further reduced so that the net profit was only slightly higher than in the previous year.

DISTRIBUTION OF PROFITS

The Company's profit for the year was Kr. 8,224,989 (£0.6 million) compared with Kr. 7,851,170 (£0.5 million) in 1955. Figures show that profits totalling Kr.13,014,224 (£0.9 million) are at the disposal of the General Meeting. The Board of Directors accordingly propose to distribute a dividend of 10 per cent (i.e. Kr.2.50 per share) totalling Kr.4,900,000 (£3.3 million), and to carry forward to 1957 the balance of Kr.8,114,224 (£0.6 million).

NATION LIFE AND GENERAL ASSURANCE

PROGRESS REVIEWED

The thirty-second Annual General Meeting of Nation Life and General Assurance Company Limited was held on April 16th at Teddington, Mr H. Cox, the chairman, presiding. The following is an extract from his circulated statement:

The company's income during 1956 was £324,359, as compared with £312,756 for 1955, an increase of £11,603. The premium income for the year was £275,697. The new sums assured totalled £430,615 in 1956 as compared with £502,082 in the previous year. The average sum assured per policy was £89 as compared with £82 in 1955.

The company continues to increase the amount of the sum assured per policy issued, and our house purchase prospectus has assisted in this. We continue to bring the advantages of our home service to members of the community who are not ordinarily associated with industrial assurance. Some of our policies are for substantial sums assured, and we have arrangements for reassurance so that the liability of the company is strictly limited.

During the year we have paid to our policyholders £152,053, the total being made up of claims by death £35,745, maturity £108,512, and cash surrender £7,796. In 1955 our payments to policyholders amounted to £137,582.

It is the policy of your board to encourage policyholders to maintain their business in force and we believe that our arrangements do help our policyholders. The rate of collections to premiums due to be collected is extremely satisfactory, being 98.6 per cent for the year. We have contractual obligations to our policyholders to revive or reinstate our policies within 12 months from the date of lapsing.

Our increased income for the year indicates that your board's judgment was correct in believing that opening the branch offices would lead to increased premium income. We believe our expenses ratio is at its peak, and with increased premium income lower working costs must follow.

Our investment income was £47,371, an increase of £4,360 as compared with 1955, and the net interest yield on the fund was £5 5s. 3d. per cent as compared with £4 18s. 5d. per cent for 1955.

You have a recomendation that a final dividend of 6d. per 5s. stock unit (free of tax) be paid, making a total dividend of 8d. per 5s. stock unit (free of tax) for the year ended December 31, 1956. The directors also recommend that the payment of an interim dividend of 2d. per 5s. stock unit (free of tax) be made for the year ending December 31, 1957.

Your board decided to issue a prospectus for Ordinary Branch business, to operate from January 1, 1957, the purpose of the prospectus being the issue of policies for our retirement annuity plan, approved under the Finance Act of 1956.

The report and accounts were adopted.

CLERICAL, MEDICAL AND GENERAL LIFE ASSURANCE SOCIETY

CONTINUED STEADY PROGRESS

NEW LIFE BUSINESS EXCEEDS £10M

The hundred and thirty-third Annual General Meeting of the Clerical, Medical and General Life Assurance Society was held on April 17th, at the Society's Chief Office, 15, St. James's Square, London, S.W.1.

Lieutenant Colonel Sir Francis H. Humphrys, GCMG, GCVO, KBE, CIE, the chairman, presided and, in moving the adoption of the report and accounts, said:

Although the year 1956 was one of considerable disturbance, both political and economic, I am glad to be able to place before you a Report which, with the accompanying Accounts, gives evidence of continued steady progress in the Society's affairs.

NEW BUSINESS

The amount of the net new Sums Assured under individual and group Life Assurances exceeded £10 million for the first time, the actual figure being £10,126,000, as compared with £9,821,000 for 1955. In addition, provision was made for Deferred Annuities of £355,000 per annum under the new form of Pension Contract which we introduced in 1955.

I should like once more to express our thanks to the Employers' Liability Assurance Corporation for the valuable help we have continued to receive from them.

CLAIMS

The claims by death, at £570,000, were considerably heavier than those of the previous year, but remained well within the provision made in our valuation. Fluctuations in the amount of death claims are inevitable, and we were fortunate in experiencing an exceptionally favourable year in 1955.

The claims by maturity, amounting to £684,000, were also greater than those of 1955, but this is merely a reflection of the amount of business on our books.

PROGRESS OF FUNDS

As a result of the year's transactions, the Life Assurance and Annuity Funds increased by over £1,500,000 to £27,364,000.

The Capital Redemption and Annuity Certain Funds fell by about £225,000 to £2,118,000. Since the "return of capital" element in an ordinary Immediate Annuity is now not taxable under the 1956 Finance Act, contracts for Annuities Certain, which alone used to enjoy this concession, have become less attractive.

INVESTMENTS

We have valued our assets on the same conservative lines as usual, and their market value continues to show a substantial margin over the figure at which they appear in the Balance Sheet.

The gross yield on the Life Assurance Fund increased by 3s. 3d. to £5 17s. 2d. per cent, and the net yield by 2s. 7d. to £4 8s. 1d. per cent.

THE VALUE OF LIFE ASSURANCE

Life Offices today perform so many complex tasks that their basic function—that of providing simple Life Assurance—is in danger of being submerged. The unique value of Life Assurance to the married man, during his working years, is self-evident in these days when heavy taxation makes the saving of adequate capital sums by other means so difficult. Its continuing value to the married man, after retirement on pension is, however, just as real though not, perhaps, when viewed from earlier life, so obvious.

When retirement on pension occurs and stock has to be taken of the family's income position, the husband may feel forced, by lack of capital resources, to exchange the pension on his own life for a smaller "last survivor" pension in order that a portion of the income may continue, after his death, to a wife or other dependant. If, however, there are in existence adequate Whole Life policies on his life to make provision for his dependants after his death, all need to consider such a reduction in pension income is avoided.

If, further, the payment of premiums upon these policies has been arranged to cease at the retirement age, not only can the pension be enjoyed in full but also there is concurrent relief, at the most welcome moment, from further premium payments. It only remains for me to add, in this connection, that the terms quoted by this Society for Whole Life policies with premiums limited in number are most attractive.

The report and accounts were adopted.

BROWN BROTHERS LTD.

CONTINUED EXPANSION OF BUSINESS

The sixtieth Ordinary General Meeting of Brown Brothers Limited was held in London on April 12, 1957.

Sir Richard Yeabsley, CBE, FCA, the Chairman, presided. The following is an extract from his circulated statement: I am pleased to report once again sales at a record level. However, there has been a considerable increase in operating expenses, with the result that the net trading profit of the Group, amounts to £976,894, compared with £1,096,929 for the previous year.

The Group net profit, before tax, amounts to £789,342, as against £941,944 a year ago.

The provision for taxation amounts to £460,419, leaving a net profit for the Group, after charging taxation, of £328,923.

The directors propose a final payment of 10 per cent (less tax) on the issued Ordinary capital, making a total of 12½ per cent for the year.

No capital has been issued by the Company for cash since the sum of £326,880 was raised in 1951. Since that time the business of the Company has greatly expanded.

At the present time, plans have been prepared for the building of certain properties, at a combined cost of approximately £250,000.

To finance these projects, and to ensure that the further development of the Company will not be hindered, your Directors have obtained permission from the Capital Issues Committee to raise the sum of £400,000 by way of mortgage on certain of our properties.

I mentioned in my speech last year that we were hoping to introduce a simple form of Employees Profit Sharing Scheme. I am pleased to say that this has now been carried into effect.

TRADING CONDITIONS

Our Motor Departments are fully employed in servicing the repairing industry of the Motor Trade.

The facilities of our tyre fitting departments have been kept fully employed and once again we can report an increased business.

The Cycle section showed a substantial reduction in the early part of the year. In the last months, however, sales showed a considerable improvement.

It is pleasing to report further progress in our Radio and Electrical departments.

NEW SUBSIDIARY COMPANY

The Needham Engineering Company, Limited. The Share Capital of this old-established company, which specialises in the electrical, radio and machinery fields, was acquired during the year.

DEVELOPMENTS

The rebuilding programme at our main premises at Great Eastern Street is making good progress. During the next few weeks we shall be opening a new branch of the parent company in Sheffield.

At this stage it is impossible to make any reliable forecast of our prospects for the coming year. Sales for the first two months compare favourably with the opening months of 1956. Attention must be drawn, however, to the fact that this increase in sales is not, in itself, sufficient to cover the continued increase in costs of all kinds.

The report was adopted.

THE NATIONAL MUTUAL LIFE ASSURANCE SOCIETY

HIGH BONUSES

The annual general meeting of The National Mutual Life Assurance Society was held on April 16th in London.

In his speech to the members Mr Kenneth Moore said that in spite of the strains and stresses of political and international troubles of the years 1955 and 1956 the biennial valuation showed the Society's affairs to be in thoroughly sound shape. The bonuses declared, 52s. 6d. per cent per annum compound on whole life policies and 47s. 6d. per cent per annum compound for endowment assurances, were amongst the highest in the long history of the Society. Equally significant was the decision that interim bonuses also were to be at these high rates.

EXCELLENT VALUATION RESULTS

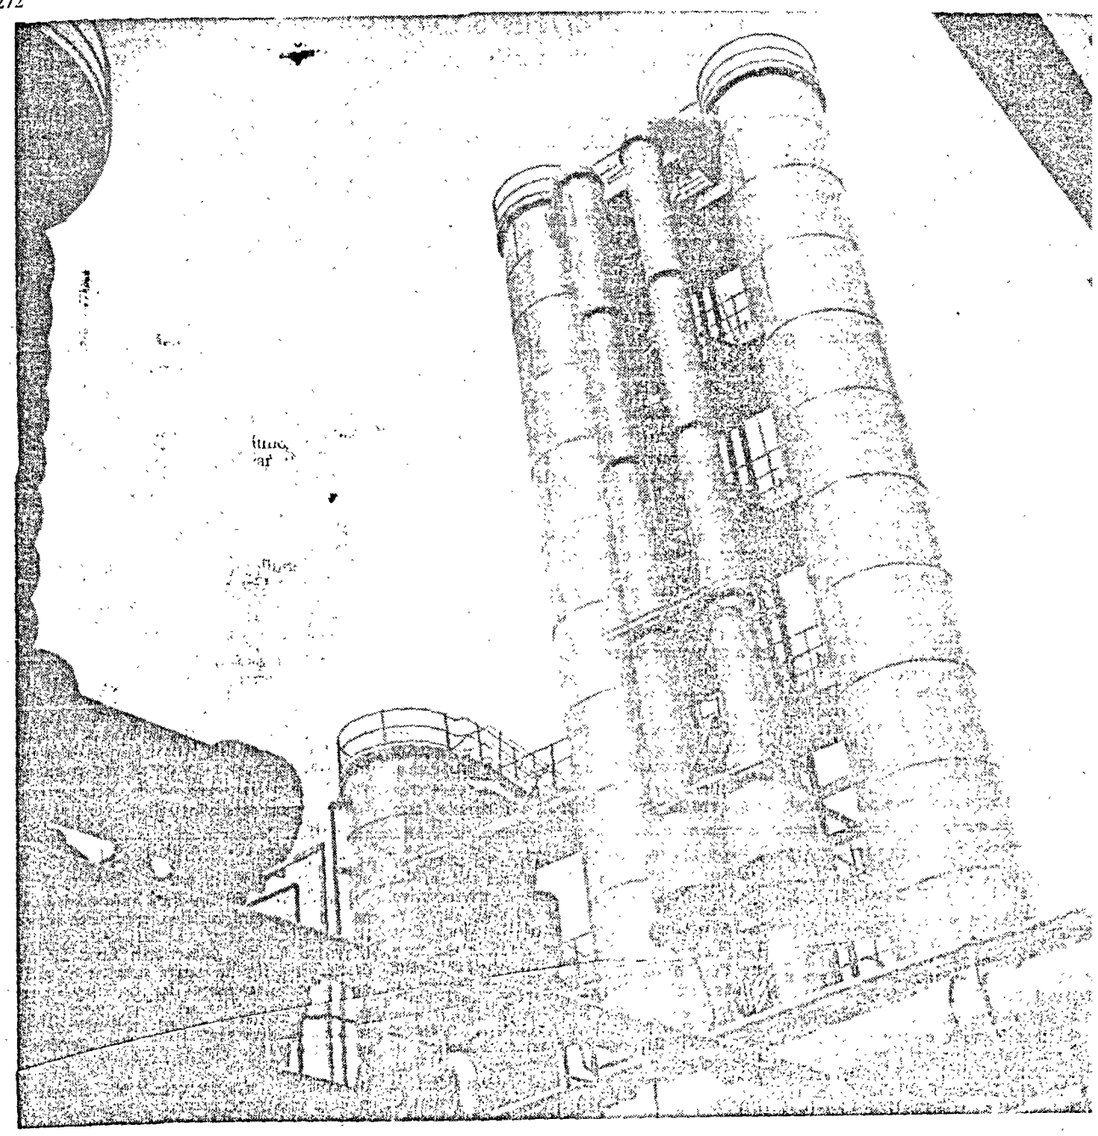
The Chairman went on to comment on some of the individual items in the valuation report and accounts.

Mortality experience had continued to be remarkably favourable. The valuation of assurances had again been carried out on the 1924/1929 mortality tables—a conservative basis having regard to the striking improvement in the expectation of life since that period, which would be reflected in the new mortality tables due to be published this year by the Institute and Faculty of Actuaries. The rate of interest earned on the total funds, including the Reserve Fund, had risen over the last two years from £3 14s. 7d. per cent to £4 3s. 9d. per cent after deduction of income tax, a significant increase which was, however, in part, a reflex of the considerable fall which had taken place in the market value of fixed interest securities in the same period.

Although it had been impossible to avoid depreciation on the Society's holdings of fixed interest securities, it had, to a considerable extent, been off-set by substantial appreciation on the Society's holdings of Ordinary Shares. These holdings of Ordinary Shares amounted at December 31st last to over £3,800,000—representing roughly 27 per cent of our total assets. These shares, which in the main had an external or international favour, including a substantial proportion of Canadian and American equities of the highest class, had served the Society well with the result that the free reserve fund stood at the end of a very troublesome period at £1,100,000 or 11 per cent of the marketable securities.

Mr Kenneth Moore then looked back over past history and recalled references by the Society's Chairman in the 1920s, Mr J. Maynard Keynes (afterwards Lord Keynes) to the case for an active investment policy and for investment in ordinary shares "within the due bounds of prudence." The Society's progressive lead at that time was materially divergent from the practice of other life offices but, thirty years later, what was regarded in the past as a distinctly unorthodox development of investment policy, had now become common practice. This had operated in the national interest and, for policyholders, as a most valuable hedge against the evils of inflation.

MANAGEMENT AND DIRECTORATE



A tribute was paid to Mr Recknell who retired after thirty-three years in the service of the Society including twenty-four years as its Actuary and Manager and fifteen years as a member of the Board. The Board had appointed Mr M. H. Oram to succeed him as Actuary and Manager, and to fill the vacancy on the Board had appointed Mr G. L. C. Touche as a Director.

The report and accounts were adopted.

ANNUAL AIR SUBSCRIPTION RATES

Subscriptions to most countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is either because the alternative is not available or not recommended.

	Airmail	Air Freight
Australia	£8 5s. strlg.	—
Canada	—	$21.50 or £7 14s.
East Africa	£7 15s.	£5 5s.
Egypt	£6 0s.	£5 5s.
Europe (except Poland)	£4 15s.	—
Gibraltar, Malta.	£3 15s.	—
Hongkong	—	£7
India & Ceylon	£7 15s.	£6
Iran	£6	—
Iraq	£6	—
Israel	£6	—
Japan	£9	—
Malaya	£7 15s.	£6 15s.
New Zealand	£9 strlg.	—
Nigeria, Ghana	£7 15s.	£5 5s.
Pakistan	£7 15s.	£6
Rhodesia (N. & S.)	£7 15s.	£5 10s.
S. Africa	£7 15s.	£5 10s.
S. America	£7 15s	—
Sudan	£6	£5 10s.
U.S.A.	—	$21.50 or £7 14s.
W. Indies	£7 15s.	—

Mr. Therm burns to serve you . . .

He uses coal, so important to Britain, with increasing efficiency :—

Production efficiency per cent. has been increased and more therms are obtained per ton of coal carbonised.

Thus he now uses *two million tons* less coal each year than if he was working at his 1948 efficiency figure.

Mr. Therm's oil gasification plants are producing useful gas from the products of the oil refineries. One plant at the Isle of Grain will, in this way, produce 80 million cubic feet of gas a day from oil. Besides oil, waste refinery gas is used by Mr. Therm to supplement gas supplies.

He is drilling in a search for natural gas and although final results as yet cannot be assessed, the important possibilities of underground gas storage are being studied.

Technical problems involving the transport, handling and storage of imported liquified natural gas are being studied — to this end visits have been paid to the United States of America and Soviet Russia.

To meet the Clean Air Act Mr. Therm's research programme includes the production of high grade smokeless fuels from coal.

His other efforts include the high pressure gasification of heavy oils and coal — the catalytic cracking of oil — the purification of gas to make sulphuric acid — the combustion of different gas mixtures — the utilisation of gas in industry.

Mr. Therm offers research scholarships in chemistry or chemical engineering at the Universities.

MR. THERM'S INDUSTRY IS LIVE AND VITAL

The Gas Industry makes the best use of the Nation's coal

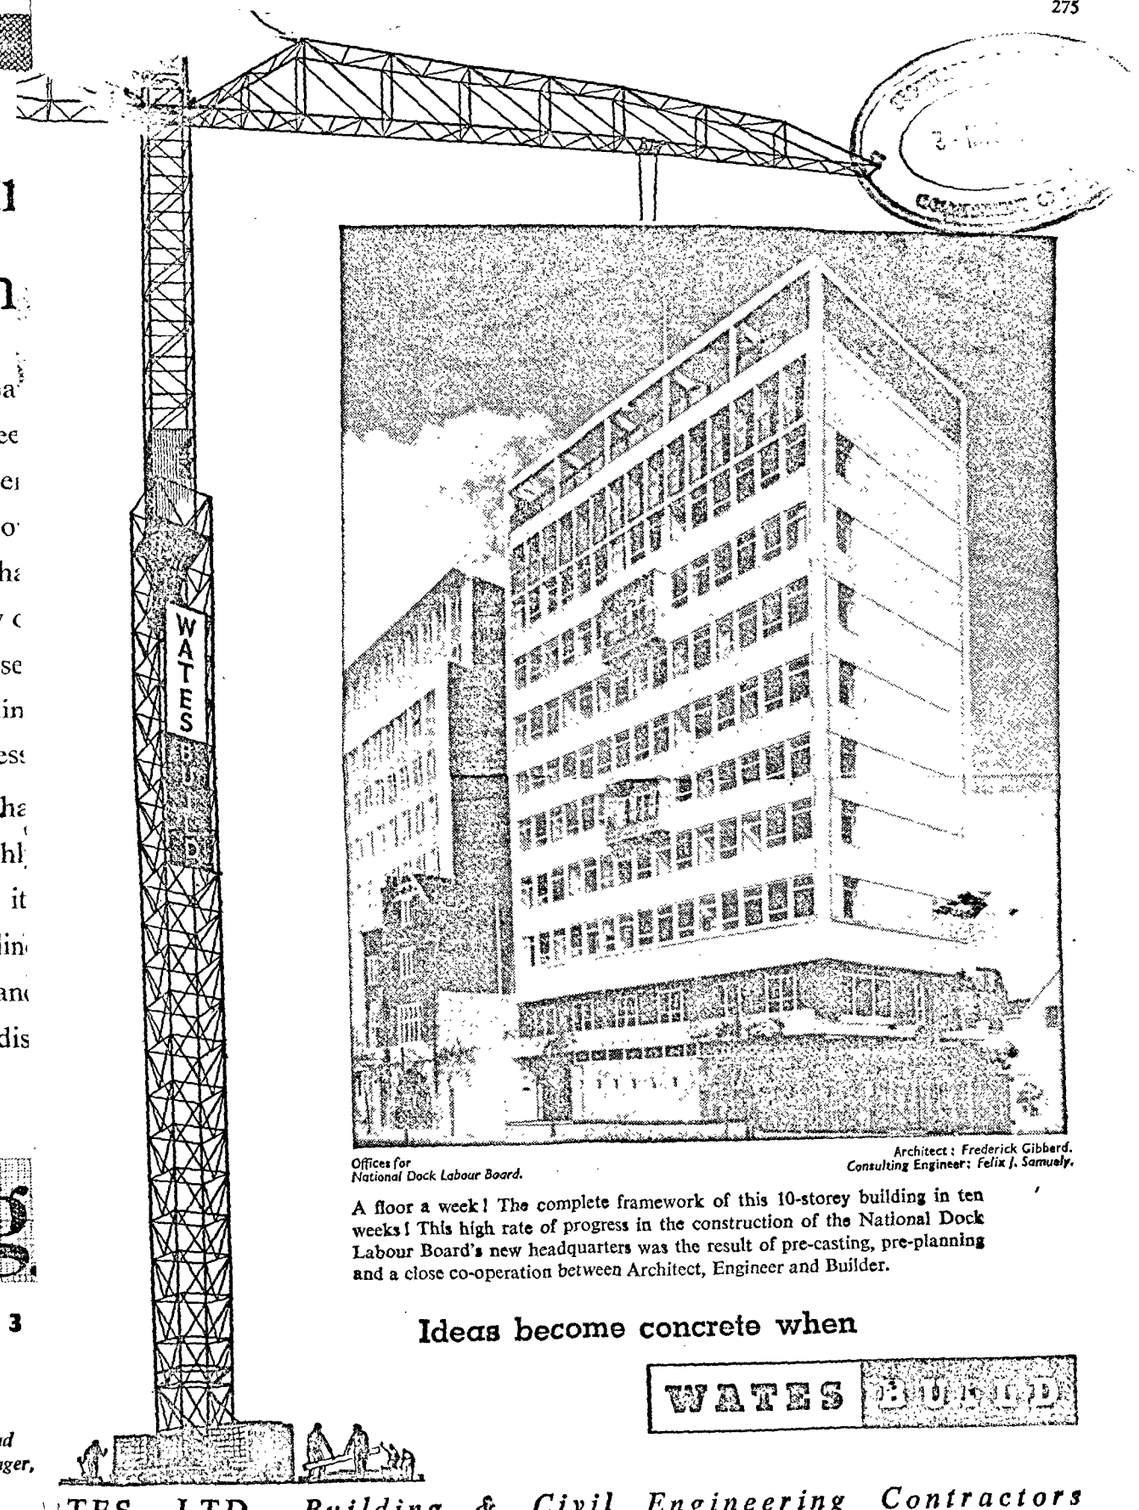
A bridge between Industry and Education

It has been made clear in the past few months that if this country is to keep its place in the modern world, there must be a great expansion in the flow of specialists into industry. But that is not all. It is the responsibility of both industry and education to see that the training available is in line with modern technological progress.



It is to help solve this problem that *The Times* is producing the monthly publication TECHNOLOGY. In its pages Industry will explain the line of its development, its problems and its needs, while Education will discuss its plans and its difficulties.

Focus on Lightweight Strength

The phenomenal strength possessed by many of nature's smaller creatures has often been envied by man. In engineering, particularly aircraft engineering, his striving for greater strength for less weight has resulted in the development of a new metal—TITANIUM. Until recently this metal has been expensive owing to the scarcity of an essential raw material TITANIUM TETRACHLORIDE. Now, however, titanium tetrachloride is being produced in bulk and titanium will soon be available to larger sections of industry. Titanium tetrachloride is produced by

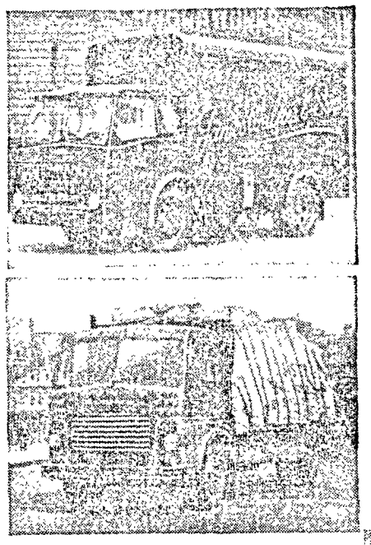
The Fight Against Fahrenheit

HEAT is the Houdini of the elements. Only the most meticulous insulation applications can hold it, make it work and pay for itself.

The general principles of heat insulation have been known for at least twenty centuries. The elder Pliny commented on the ability of cork to retard the flow of heat, pointing out its application to winter footwear and roofing. Yet it's only a few decades ago that thermal insulation went almost unconsidered in industry—so long as some uncomfortably hot surface was covered with something which would not perish, the job sufficed. The vast stride which industrial insulation has taken since says much for the foresight of industrial leaders and the work of specialist insulation manufacturers.

Yet even today, in a thousand and one factories in the British Isles—from a platoon of platers in a single storey shed to those twenty-acre labyrinths of modern industry—heat is escaping into thin air. Hundreds of thousands of tons of coal are wasted each year—hundreds of thousands of tons producing nothing but loads of clinkers.

In this specialised field of thermal insulation, Newalls have led the way for more than fifty years. Factories, ships, power stations, paper mills, oil refineries, all owe to Newalls some credit for increased efficiency and economy of operation.



This organisation is at the call of any business today which considers that it can improve its own efficiency and increase its profit margin by the application of modern insulation methods. There's very little about heat control unknown to Newalls after fifty years of experiment with, and manufacture and application of, thermal insulating materials. Correspondence on the subject is cordially invited.

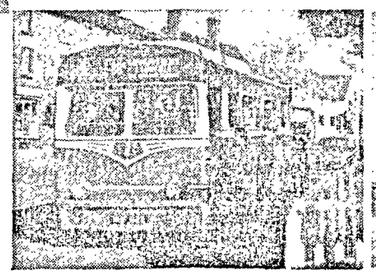
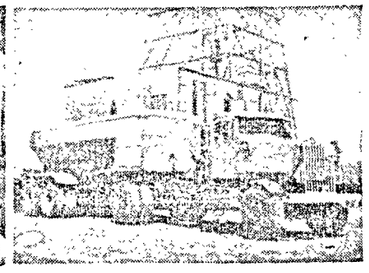
Albion Leyland

If road transport is essential to your business... *SO ARE WE!*





Today, trucks are just as much part and parcel of trade equipment as typewriters! Practically every firm employs them in some shape or form, scaling from small delivery vans to giant multi-wheelers.

The Leyland Group of commercial vehicle makers... incorporating the famous firms of Leyland, Albion and Scammell... is the only single organisation which makes almost every size of truck needed in industry. Their factories produce well over 100 types, ranging in capacity from 30 cwt. to 150 tons with every practicable size in between.

Within these wide limits, there is certain to be exactly the truck you want. It is equally certain that, like all vehicles made by these famous manufacturers, it will be supreme in performance and startlingly economical to run. AND IT WILL BE KEENLY COMPETITIVE IN PRICE!

(Top) The 30 cwt. Albion 'Cairn' is a wonderfully economical unit for short-distance work.
(Above) The most popular cruiser-weight truck in the world is the Leyland 7-8 ton 'Comet.'
(Adjoining right) The 'Tiger-Cub'—one of the range of Leyland buses which forms so great a proportion of public transport both at home and abroad.

Vol. II — EUROPE IN 1960

What will Europe be like in 1960?

This report shows how incomes will rise, how spending habits will change, how markets will grow, what investment will be needed, output in basic industries, bottlenecks and problems which may arise.

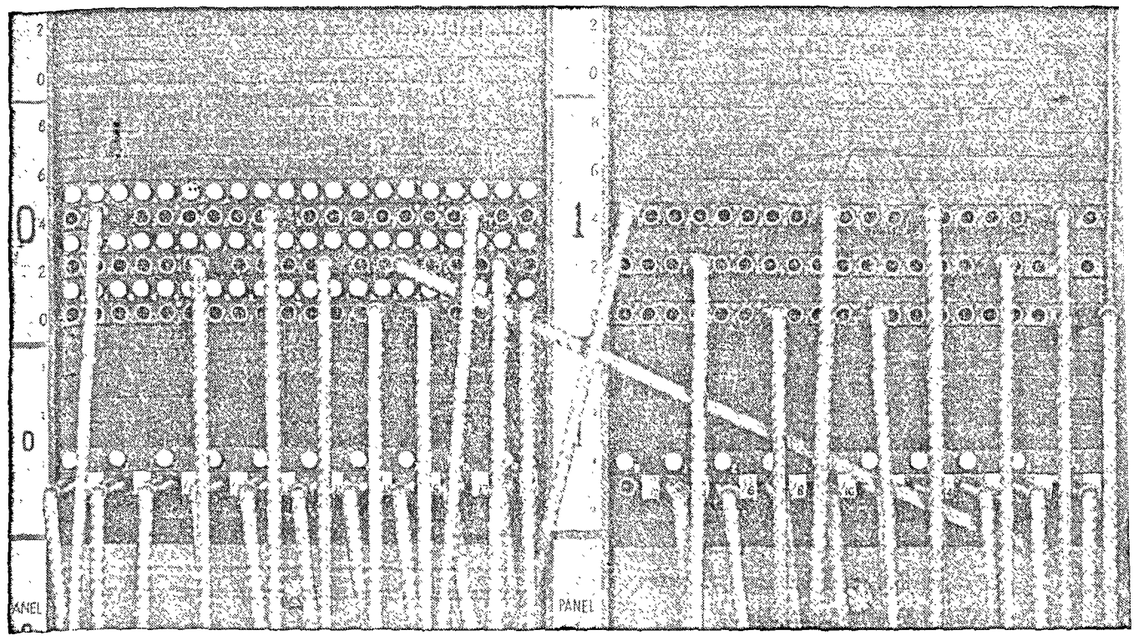
Each volume: 7/- from Her Majesty's Stationery Office

"Yes, delivery Friday week— I'll handle it myself"

"No thanks, Bill— we're tackling this one ourselves"

"3.30 then—we'll both get together with Williams"

"Chief Mill Chemist speaking"



"I'll be seeing you at th mill tomorrow"

"Mr. Johnson's in New Zealand— can I help you?"

"Certainly—we'll get you a test done at Aylesford"

"Will you look after that while I'm in the States?"

"What do our market survey people think?"

19 company line-up to get things done

The Reed Paper Group includes 19 separate yet major companies . . . situated in different parts of the country and concerned with every aspect of making paper and paper products. Each company, while having access to Group resources, retains its individuality and independence, and understands the character and aims of the Group so well that it can think and act *for itself.* Yet the Group remains an efficient whole which *gets things done* . . . to your best advantage.

What makes this possible? It is that lines of communication throughout the Group are *flexible*—and day-to-day problems are solved not by rigid procedure through formal channels, but by *personal* contacts and informal meetings between the people concerned. This holds good "vertically and horizontally" *at all levels*—both within individual companies and, whenever necessary, between one company and another. The men-on-the-spot have the responsibility—and the initiative to see any job through to your best advantage. Yet should need arise, they have only to pick up their telephones to draw upon the central resources and specialised knowledge of the Group.

Informal efficiency is the keynote. It is why your every meeting with a Reed manager, salesman or technician can be so refreshingly satisfying and profitable. It is why your every dealing with a Reed company can give you the best and right materials for *your* needs.

"YOU profit from the initiative of each Company backed by the resources of the Group"

Disarming Candour

A SHOCKING lot of nonsense is being talked about disarmament, so clouding the air, and carrying such risks, that it may be a bigger menace than strontium. This fall-out of fallacies seems to have been set off by a fusion of hopes and fears. People whose eyes are glued to the heavens, whether in apprehension or in sure expectation of seeing a bluebird, are apt to walk into ponds or step on the end of a rake. Taking the fearful and the hopeful together, there are at present plenty of volunteers for immersion or concussion.

On the one hand, there are those obsessed by fears that nuclear test explosions may both endanger posterity and bring death or disease to several thousand present inhabitants of the world (a world, let it be coldly recorded, whose population is rising by thirty million each year). Most of the alarm voiced about this is as sincere as it is natural, and has no connection with the efforts being made by western communists to send down their fellow countrymen's spines shivers which evidently do not affect the vertebrae of their own masters in Moscow. But it is fair to ask campaigners against the Christmas Island tests—if they reject Mr Macmillan's assurances that the effects will be negligible—to ponder a timely piece of evidence. The Russians, whose scientific advisers are thought to be pretty good these days, have just set off five explosions in twelve days on their own territory. Siberia today is no longer an empty land, and millions of Russians are settled much nearer than Japan to the test sites. The Kremlin's aberrations scarcely extend to the mass maiming or extinction of its own productive workers, particularly in strategic areas such as its Far Eastern maritime provinces or the reclaimed "virgin lands" east of the Urals.

However, the frankly fearful deserve vastly more sympathy and respect than the busy chasers of bluebirds, among whom must be numbered a good many speakers in last week's defence debate in the Commons. Some supporters of the Opposition proposal to postpone the British tests, in the hope that Russia and the United States would then quickly accept the termination of their own programmes, seemed to think a unilateral gesture would suffice to bring about this miracle. They have had their answer from Mr Khrushchev, whose rejection of a Japanese appeal for a unilateral Soviet suspension of tests was based on the argument that this gesture would look like a sign of weakness. But other members of the House tried to depict a lightening of the skies, an imminent break in the clouds that have hung over the United Nations disarmament talks for eleven years.

What exactly they thought they saw in the heavens is not clear. The infectious warmth of Mr Stassen's smile may have led some people to overlook the cautionary clauses in his remarks about the progress of the present talks at Lancaster House. The relative suavity with which Mr Zorin had there been reiterating the familiar Soviet position perhaps created a belief that the position itself had changed. The mere fact that

both Russians and Americans have been stressing the importance of limited first steps, in phrases which have a very similar ring to them, tends to divert attention from the fact that the "first steps" which each advocates have been firmly rejected by the other. Mr Zorin may, of course, have brought something new back from Moscow this week (though a first reading of Mr Bulganin's Easter letter to Mr Macmillan does not suggest it). But up to the eve of Easter the Russians had not budged.

WHY, then, the facile assumptions in the defence debate, the rash of headlines headier than the cautiously qualified diplomatic correspondents' messages beneath them, the echoing optimism of Mr Eisenhower, Mr Dulles and Mr Macmillan over the weekend? Is it just the sight of the blue UN flag still dipping lazily under a blue spring sky outside Lancaster House? Nobody would wish the talks to break down; but the mere fact that they are continuing proves no more than that no party wants the odium of leaving the table first. Even the Americans, the most ebullient of the western participants, have denied that there has been any "break-through." There are really only two explanations for the recent prevalence of optimism. One is the vernal mood; the other is that the instinctive reaction to prophecies of doom such as have lately been uttered by MM. Joliot-Curie, Schweitzer and others, is to grab the nearest tranquilliser.

This is as regrettable as it is easy to understand. There was never a time when it was more necessary to look the less pleasing facts of life in the nuclear age in the face. There is no excuse for any public man failing to do so. All the harsh truths have been newly burnished up and laid before his eyes. The Russians have made it clear that they will no more accept an effective policing of tests than an effective policing of general disarmament; either project would rob them of the advantages their top-secret system gives them over the relatively "open" West. Mr Eisenhower and Mr Macmillan have rejected the idea (revived by Mr Bulganin in his latest letter) that test explosions could be controlled without supervision on the spot. Marshal Zhukov has shattered western hopes that Russia might accept, in its own interest, a distinction between the use of tactical nuclear arms and the resort to all-out, mutually suicidal thermonuclear conflict. Moscow will have none of the idea of reciprocal air inspection between Russia and the United States; Washington, none of the Soviet counter-proposal (also included in Mr Bulganin's Easter letter) for inspection limited to a zone in Europe, which would apparently embrace most of the Atlantic allies' territory, including Britain, but no significant portion of Russia's home terrain. And after all these years even the greenest back-bench MP can hardly need reminding that the simple "ban the bomb" slogan lacks all meaning when its own advocates reject the restraints and controls which would be essential to the putting into force of a real ban.

One cannot altogether exclude the possibility that Mr Bulganin actually wishes to step through the door, as opposed to just keeping it ajar; and that Mr Zorin may therefore have returned from Moscow bearing something more substantial than the traditional kisses and eggs of a Russian Easter. But one can very nearly exclude it. Why should the Soviet government feel any need to give ground on disarmament now? The shift toward nuclear arms has helped it to grapple with the manpower shortage which oppressed it a year or two ago. It can contemplate with serenity a western world distracted by British and French withdrawals of troops; by public anxiety about strontium 90 (an anxiety from which the Russian public is considerately shielded); and by the spectre of nuclear weapons in the hands of a Germany whose political future is uncertain, but whose people have an urge to be free of foreign restraints and a hankering for frontier revisions. When the West is stewing in so much juice, it is hard to envisage Moscow rushing in to ease its embarrassments.

NONE of this amounts to any sort of case for slackening in the decade-long struggle to secure disarmament. On the contrary, the shedding of these prevalent illusions must be regarded only as a first step towards a new effort. It is in fact an indispensable first step. Today's need is for another good look, unblurred either by fright or by optimistic fantasy, at the realities of the problem. There is much to be said for the new American moves in that direction. Mr Stassen has blown two healthy whiffs of realism into Lancaster House, by announcing that the United States has no thought of again slashing its forces down to the level of weakness at which the second world war and the Korean war caught them, and by proposing that production of nuclear weapons should be ended without any linked attempt to detect and destroy stockpiles. Swingeing disarmament on the scale of which the western powers carried it out after both the world wars, is simply not to be seriously considered until international supervision of a ubiquitous and unrestricted kind becomes acceptable to the powers; and since that degree of supervision would destroy the top-secrecy which is one of the bases of the Soviet system, it is not going to be accepted.

The routing out of hidden bombs from under everybody's beds is an even less conceivable development in the real world in which we have to live; it would involve a degree of interference by outsiders which would be as unacceptable to, say, India's new defence minister as to the United States Congress or the Soviet Presidium. The policing of production would itself be a massive and delicate undertaking; but it is at least imaginable, and it may prove practicable. It is surely along lines such as these that the new attack on the whole problem must be made. Disarmament, like other forms of politics, is the art of the possible.

The Statesman's Burden

The Prime Minister has said that he will give "further study" to the load of work upon Ministers

SHORTLY before the Parliamentary recess the Prime Minister was asked by Mr Desmond Donnelly whether he would recommend

> the appointment of a select committee to review and enquire into the working of the present system of government with a view to reducing the burden on ministers and securing the more efficient working of Parliament.

Mr Macmillan replied that he intended to give this idea "further study," and that he was thinking of consulting "very experienced colleagues on both sides of the House" on the

> very large questions as to the functions of ministers and their duties to Parliament, and the great increase in work, which, of course, has grown up with the complexity of modern government.

It seems possible that a pebble is about to be thrown into a considerable pool. This may be a good week to start discussing the most useful ripples.

The parliamentary question that the Prime Minister was answering had its origins in a letter which Mr Donnelly (who is a Labour backbencher) wrote to *The Times* last December, and in which Mr Macmillan and some of his senior ministers are known to have shown some interest. In that letter, Mr Donnelly made three points. One was that he wanted to recreate the wartime precedent of getting Whitehall "to make greater use of men outside the bureaucracy." There may possibly be a case for bringing more scientists, economists and other experts (often, preferably, on short sabbatical leave from the universities) into strictly specialist jobs in the civil service. But the idea of bringing in so-called "distinguished" general help from outside is, in general, one to be regarded askance: in Labour's case it would mean bringing into salaried posts some party supporters on the model of the American civil service, in the Tories' case it would probably mean bringing in more "practical business men." Many of the people who would have sufficient time to take temporary posts of this sort would be likely to be of lesser quality than the established civil servants.

The second point in Mr Donnelly's letter was that the work of Parliament needs to be reformed; he himself suggested

> regional authorities to deal with matters such as education, housing and health, leaving Parliament more time to deal with national and external problems.

Regional devolution does not seem to be what is needed; intra-parliamentary devolution may be. There is a case for examining the uses to which Parliament puts the main devices at its disposal—question time, standing committee, select committee, and general debate by the whole House. This, perhaps, is one problem that could well be examined by a select committee of MPs.

It is, however, Mr Donnelly's third and principal point which may be of greatest interest to the Prime Minister at this time. This was the argument that senior cabinet ministers nowadays do not get time to function properly as cabinet ministers: they do not get time to think. The problem was first posed after the first world war, and has recently become sadly familiar in practice. A statesman falls ill through overwork; there follows a period when he is making many wrong decisions because he is ill, but he himself does not recognise the fact and his colleagues are too embarrassed to tell him; then his illness overpowers him and he retires, his mistakes made, into the shadows.

WHERE the problem is that of departmental ministries a little below the summit, the remedy is surely obvious. It is to have government departments that are not too big. A department is too big, and ought to be split, if the number of papers which is thrown up on to its chief civil servant's desk in any average day is greater than an ordinary man can handle in that day. On this criterion, the Ministry of Transport has been too big for some years; the Board of Trade would have been too big but for the extraordinary luck it has had in the capabilities of its top civil servants; and there are other ministries (defence is the obvious case in present point) which can become intolerably heavy burdens for a short period while they stand unaccustomedly near the centre of policy. But, in general, provided his top civil servants are not persistently overloaded, a minister with only departmental responsibilities can still lead a not impossibly overworked life.

The real difficulty arises for those who, in addition to—or instead of—departmental responsibilities, have to think out the genuinely top policy decisions. To meet this problem, the recipe usually proposed is that as much as possible of the detailed work should be passed down to more junior ministers: that the man right at the top should act, either through the chairmanship of cabinet committees or in some more or less formal way, as a species of "overlord." This, in essence, was Mr Donnelly's own suggestion. The main difficulty that arises is what sort of a man an overlord should or may be. Both Sir Anthony Eden (as Prime Minister) and Sir Stafford Cripps (as Chancellor, with a Minister of Economic Affairs below him) were supposed to be overlords. Both, although able men,

proved to be temperamentally incapable of devolving many of the details of policy on to their subordinates. They worked far into the night, and the strain of office sapped the one and killed the other.

It is no answer to say that overlords should not work that way, for it is sometimes extraordinarily difficult for them not to. The extreme view of an overlord's function, as held by some people, is that he should think out the general policy he wants implemented, and tell his subordinates to implement it—without himself being too concerned about the details. This system might conceivably work for a Prime Minister, but it is unlikely to work well for any other office. If any lesser overlord passed down policy ukases to his subordinates without knowing sufficient of the details on which those policies should be based, then the man lower down (who did know the details) would be constantly complaining to the Prime Minister and Cabinet about what an impossible job his overlord was setting him.

Those who think that one must be able to find a half-way house between the overlord who busies himself with all the details and the overlord who busies himself with none should take heed of the example of Ernest Bevin, who tried. His method of running his departments was said to be to devolve a lot of work on his subordinates in the first instance; and then, when anything went wrong, to call them into his office and shout knowledgeably at them. The result was that timid subordinates began to hand all the most awkward, if minor, policy decisions up to him; he became, against his will, an "overworking" type, and undermined his health.

ALL this may sound very gloomy. But it surely goes to suggest that the only way out of the *impasse* is not by referring the problem to a select committee, but by pragmatic trial and error. Trial in the last ten years has suggested that in one field of modern British Government an overlord has a part to play; it has confirmed the moderate usefulness of the Morrison/Butler role as Lord Privy Seal or Lord President—that is, as the principal co-ordinator of those strands of policy that do not pass through the Foreign Office or the Treasury. Recent experience suggests that four points can be made about this role.

First, it should be allied to the job of Leader of the House (and thus manager of the parliamentary programme), and probably also to the control of a department of state with a sizeable civil service staff; Mr Butler's assumption of the Home Office, given his willingness to devolve much of the detailed work there to the ablest of his under-secretaries, may well be the right solution.

Secondly, the best way to run this co-ordinating office (and, incidentally, probably also the best way to be a Prime Minister) is for the overlord to throw out a stream of ideas, as suggestions not ukases, to his subordinate departmental ministers: and to ask those departmental ministers to come to him if they run into real difficulties —the best measure of "real difficulties" being if there is a split between a departmental minister and his top civil service advisers.

Thirdly, the office probably needs to be flanked by a second senior "small department" minister who will concern himself with the details, as distinct from the broad objects, of designated legislation; the nearest approach to this function in the present Government is performed by the Lord Chancellor, who has acted as step-parent to Mr Thorneycroft's Restrictive Trade Practices Act and to much other useful legislation.

The *fourth* point that has emerged about the office of Lord Privy Seal or Lord President, however, is the most awkward one. Although the role needs to be filled, it is becoming increasingly obvious that it is not, by itself, a main seat of power; both Mr Butler and Mr Morrison, looking back on recent personal political disappointments, would probably agree.

THE most obvious remaining problems of devolution concern the two monster departments that are the main seats of power: the Foreign Office and the Treasury. There is not much that can profitably be said at the present time about the running of the Foreign Office. The way it has been run since Sir Anthony Eden left it seems to be that an army of under-secretaries has managed the less important departments in it; and that the Foreign Secretary has acted as the principal co-ordinator of their work, but only collectively—until recently, with the Prime Minister and one other—as a director of general foreign policy. This has not been an ideal system; now that the "one other," Lord Salisbury, has departed, the situation is more confused still. But this, like so much else in this reckoning, is a matter that must depend essentially upon personalities.

In the other monster department of central policy, the Treasury, however, a reform of structure can be suggested. The idea of hiving off a Minister of Economic Affairs, under the Chancellor, was tried in Sir Stafford Cripps's day. It did not work. A better idea might be to hive off a department equivalent to the American Bureau of the Budget. The office of Financial Secretary to the Treasury could be abolished, and a Minister of State put in charge of the Inland Revenue, the Customs and Excise, and part of the Home Finance section of the Treasury. The Economic Secretary to the Treasury could then become an under-secretary to keep an eye on overseas financial affairs; and the Economic Section of the Treasury should cluster around the Chancellor himself, who would thus become a species of economic overlord (the detailed job of pruning government expenditure and improving the efficiency of revenue collection having become the main responsibility of some ambitious ministerial colleague immediately below him). It is to specific reforms of this kind that the Prime Minister might most profitably turn his mind. On the whole, he would be wise to keep a select committee out of it.

Egypt's Empire-Builders

Egypt's best known instruments of propaganda are Cairo radio and illustrated weekly magazines; just as potent is Egypt's influence through the export of teachers. Do its Arab neighbours realise what Egypt wants to make of their young people?

PRESIDENT NASSER, talking of Egypt's home affairs to a foreign visitor just over a year ago, remarked that a solution of its economic and population problems hung on three requirements. The first was control over some major source of energy; the second was the hold on Arab emotions that was best to be gained by championing the Arab cause against Israel; the third was control over the Suez Canal earlier than the appointed date in 1968. Since he spoke, his second and third wishes have come true with such éclat that his progress with the first tends to escape notice. Yet it is considerable.

At present, and for so long as Egypt lacks the capital to develop hydro-electric or solar energy, the nearest major energy source is the oil of Saudi Arabia and of the sheikhdoms of the Persian Gulf (now called the Arabian Gulf on Cairo radio). In each of these rich, under-developed territories, a hereditary ruler with oil revenue to burn is responding to the popular cry for education. It is important from President Nasser's angle that it takes far less time to build a school than to train the staff to man it. Therefore today, and for perhaps fifteen years to come, all the less developed Arab countries (including Iraq but not the more prudent or more fortunate Sudan, where teachers' training has kept pace with the school building programme) are obliged to recruit even their vernacular-teaching staff abroad. The same applies, of course, to their English language teachers; there are more Egyptians than any other nationality teaching English in the Middle East today.

The situation predates President Nasser's regime. For years, the more cultivated Arabic-speaking nationalities—Lebanese, Syrians, Palestinians, Egyptians—have been in demand for lack of local teachers everywhere from Libya to Muscat; the difference between then and now is the pace at which schools are mushrooming into being through the expenditure of revenue from oil. Opportunity meets Egypt half way because, whereas the supply of Lebanese or ex-Palestinian teachers is limited, that from the overcrowded Nile valley seems inexhaustible. President Nasser is in a position to reap the reward of Egypt's twenty-five-year start in the matter of higher education and of a university structure that has long been top-heavy. The quality of Egyptian pedagogy may be low by European standards (and it has fallen catastrophically in the last few years) but it thrives on its old reputation and is still high by the standards of Arabia. In each oil-bearing country, therefore, the protagonist of a "greater Arab nation" under Egyptian management has an instrument ready to hand—the schoolmaster for the new school, not to mention the inspector for the schools system as a whole.

Two other factors promote this export of teachers. One is Egypt's practice of the French system whereby a teacher seconded for service abroad gets not only his Egyptian salary and all rights of seniority and promotion, but the salary paid by the employing territory as well; there is no dearth of recruits. The other—a temporary phenomenon, though it may well last another ten or fifteen years—is the reluctance of the young secondary schoolboy in the fast-developing oil states to take up teaching as a career. Most young men prefer to get rich by the much quicker methods available in the bazaar; or if they take to a profession they will rate law, medicine, engineering, or even the grade they call "agricultural economist," higher than teaching—not merely because teaching is less well paid, but because it is socially lowly. In Kuwait, where teachers' pay is good, the number of male Kuwaiti teachers has lately fallen, not only proportionately but absolutely (from 107 in 1954-55 to 98 now; the corresponding numbers for Egyptians are 159, rising to 262). Nowhere else does the unbalance reach these proportions, but then no one else is building schools as fast as Kuwait.

The figures can be misleading, because by no means every Egyptian abroad is a hot-gospeller for Nasser. This should be fairly recognised; and to satisfy the thirst for education is, in itself, good work. Inside Egypt, the teaching world contains many independent minds that are dubious about President Nasser's methods of pushing education around. Abroad, therefore, one meets many Egyptian schoolmasters who have chosen foreign service either in order to save money, or because, being genuine pedagogues, they like the excellent apparatus available in, say, Kuwait, or because they belong to the Moslem Brotherhood and so, while anti-western, are also anti-Nasser. Here and there one comes across a royalist, or an Egyptian of Syrian or Lebanese extraction who fears that dictatorship may sometime lead to discrimination against non-members of the Nile Valley *Herrenvolk*, or even sceptics who prefer to put by some savings in a currency that is not Egyptian pounds. But these people, though they may even constitute the majority, are everywhere interspersed with members of Egypt's Cultural Mission—men and women glib with patter from Cairo's Ministry of National Guidance and capable ("like the one rotten mango in a basket," as an Iraqi put it) of injecting into a whole school the tincture

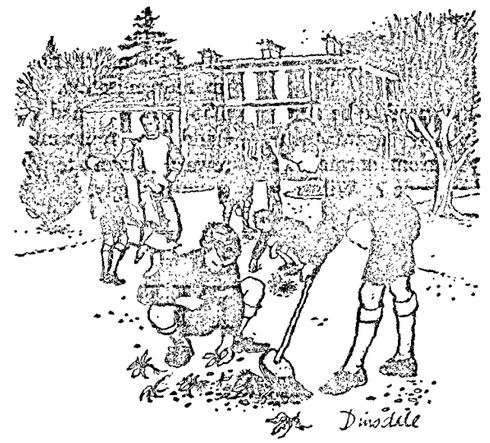
of disloyalty to the local ruler or government. Moreover, although not every Egyptian abroad is a Nasserite any more than every German abroad was a Hitlerite, a sense of national pride is apt to turn even the lukewarm into propagandists whenever Egypt's position is challenged or criticised.

How far is a ruler such as King Saud, or the Sheikh of Kuwait, aware of the anomaly whereby he is paying Egyptians to teach the next generation of his subjects that thrones and hereditary rule are out of date, that the western race that has created the wealth that produces superb classrooms and self-wiping blackboards is fit only to be booed, and that a role of importance for the Arabs hangs on creating a greater Arab nation run in subservience to Cairo? The education departments in Libya and Iraq have seen the red light and consider that they have dismissed the firebrands; in Iraq, where about 500 Egyptian teachers are still serving, arrangements are being made to reduce the number by altering the liability of teachers for military service. But some of the Egyptians so dismissed seem to have had no difficulty in getting taken on by Kuwait or Saudi Arabia. A point that at once strikes anyone who scrutinises the efficient work they are doing is their proprietary behaviour. "We are doing this and that. We intend to run a university here." Who is we? Egypt's greater Arab nation, not the Kuwaitis.

Even in remote Qatar this spring, where Wahhabi tenets have caused the employment of many Egyptians who are Moslem Brethren, the *pièce de résistance* at a recent school festival, acted by small boys who would never in the normal course have heard of Sinai, was a mimed attack on a tent adorned with Israel's Star of David, and a triumphal stoning and burning of it by fellow-pupils dressed as Egyptians. In the penniless sheikhdoms still farther south, primary schools that are being built out of the rulers' small purses, or with British money, have to be staffed with Egyptians or with equally anti-western Palestinians. Would it matter if the school were in a tent, if the money could be put to paying a less biased master? But for the moment, and for teaching in the vernacular, no other is available.

This limitation of choice will shrink with time. More schools must lead, in the end, to more local candidates for the profession of schoolmaster; it may take less time to get girls than to get boys of quality to think of the job as a vocation—partly because fewer alternatives are open to the educated girl and partly because, as a reaction against her enclosed life, she works harder than her brother. Provided rulers and ministries of education push on with organising better training, pay and status, therefore, the local teacher should be elbowing the foreigner out of the vernacular section some ten years from now. But action is needed if that decade is not to be turned to account by an expansionist Egypt. The Nasser dictatorship is ready to sow unrest in order to bring its protagonists to power in Jordan today, and is forging a weapon to do the same in the rich oil-bearing lands of Saudi Arabia and Kuwait tomorrow.

A generation of good local schoolmasters cannot be conjured up overnight. But there are ways of hastening the process if the need for it is taken seriously. Cannot the great endowed educational bodies (such as the Rockefeller and Ford foundations) prime the pump by setting on foot, perhaps in Beirut, an institute for producing the men and women to train Arab teachers? To do the actual training centrally would be out of the question because, as Turkey and the Sudan both discovered long ago, the rural schoolmaster, and probably all primary and intermediate schoolmasters, are best trained in the environment in which they must later live and teach. Secondary schoolmasters may be another matter. What is needed today is a pooling of thought by educationists both from the independent oil countries and from the west—for both have an interest in widening the choice of candidates for schoolmastership in the Arab world.



Approved School

Our Special Correspondent (who wrote about primary schools on January 26th and preparatory schools on March 9th) last week visited two schools which had not broken up for the Easter holidays

The big house at the end of the drive was an unusually pleasant specimen of early Victorian architecture. Beneath an arched loggia French windows opened on to the well-mown lawns. The hall was spacious, with parquet flooring, doors faced with mirror glass, and a fine staircase leading to the headmaster's flat. This also led to the boys' dormitories. These rooms, now with their rows of iron bedsteads, were once occupied by the guests and entourage of the Baroness Burdett-Coutts.

Great philanthropist though she was, it was not the Baroness who was responsible for turning her home into an "approved school" for delinquent boys. It was bought in 1937 by the managers of what was originally one of the two all-Jewish "approved schools" in this country. (It still houses all the Jewish children in the country between the ages of 8 and 13 who have been committed by courts to approved schools, but, as Jewish parents seem to strive harder than Christians to keep their families together, they are now enough to fill only 9 out of 63 places.) This original religious background is not untypical, for as many as 94 of the 119 approved schools in England and Wales are run by voluntary bodies of one kind or another, the rest being run by local authorities. The phrase "Home Office approved schools" merely shows who does the approving—and half the paying, the other half being paid by the local authorities in whose areas the culprits live.

The cost per child is at present £9 a week. Whenever this figure is mentioned in the press, angry letters from readers point out that it costs less to send a boy to Eton, and urge the folly of accommodating slum-dwellers in stately homes. But the Home Office is not quite as extravagant as the protesters think. In the first place it costs less to buy an unwanted stately home than to build a new institution; only one of 119 was built as an approved school. Secondly, the figure of £9 a week includes clothes. The children's own clothes, often filthy and verminous, are sent back to the parents. Thirdly, the £9 is the average cost of keeping a boy all the year round, except for 24 days home leave to which he is entitled under Home Office regulations. Fourthly, although (unlike Borstals) approved schools have no supervisory staff as such, the staff-pupil ratio has to be high. At this school the teaching staff consists of the headmaster, his deputy and four assistants—giving average classes of only about 15. Moreover, they are paid rather more than the Burnham scale as a small recognition of the arduousness of their work and the brevity of their holidays.

As it boasts a psychiatrist, which not all approved schools do, this school gets a good many emotionally disturbed boys sent on to it by the "classifying school," where they are studied and sorted out in the first three weeks of their detention. But less than a third of the 63 pupils here have ever had psychiatric treatment. More often than not, said the headmaster, they are just plain naughty and psychiatric treatment might lessen their sense of responsibility. Almost invariably, their family background is chaotic. Johnny, for example, was illegitimate, and his mother later married a Mr Evans and had two more children. Mr Evans disappeared and she went to live with Mr Morris, until he disappeared too. Joe comes of a family, all of whom either are or have been in prison, except for his seven-year-old sister who is not yet quite old enough for an approved school. The first task of the school, when such boys arrive, is to win their confidence and liking—for until that is done they are quite unteachable. It was easy to believe that this headmaster could accomplish much by kindness.

But gentle methods, he says, will not do for every boy and sometimes a good beating produces better results. Corporal punishment, however, is probably a good deal less frequent than at the average public school. Discipline is chiefly maintained by a system of weekly grading, on which privileges are based Those in the first and second grades can go out on Saturday afternoons without escort; those in the first grade get 1s. 6d. pocket money, while those in the fourth grade get only 2d. Ought good behaviour to earn a monetary reward? Anyway the system seemed to work, at least while your correspondent was there. Some were sitting round a master in the paddock, studying the flowers that they had picked in the grounds; some were reading (comics allowed); some were making a new home for the rabbits. All were little angels.

Possibly the imminence of Easter leave had something to do with this. All 63 boys were due to go home—or if they had no homes, to temporary foster-parents — next day. Occasionally they have to be brought back, just as, occasionally, they walk out of the unbarred gates and abscond. But they know that this will lengthen their detention. By law the maximum period is three years, but the school managers will let a reasonably well-behaved boy out on licence after eighteen months or less. A welfare worker then keeps an eye on him and, if necessary, he can be recalled to the school. After that he is still under supervision for another three years. At present about 75 or 80 per cent of boys at junior approved schools, and 66 per cent of all ages, are not brought before the courts again in the three years after their discharge.

The success rate for girls is higher—about 80 per cent—and there are far fewer of them in approved schools. Compared with 5,760 boys there are only 1,172 girls. The female of the species is at all ages more law abiding than the male, partly perhaps from lack of initiative and partly from a greater interest in security and stability. But there is a technical reason for the higher success rate for approved school girls. Whereas 90 per cent of boys are sent there for stealing, most of the older girls are committed as being "out of control" or "in need of care and protection." This normally means that they have been staying out all night with men. If they do this again when they get out, nothing can be done—if they are over seventeen. Besides, no one supervises them after they are married.

Paradoxically, the fact that the girls usually have not broken the law tends to make the task of the girls' schools harder. The pupils are full of resentment at being "put away" for what their elder sisters can do with impunity. They are furious at being in a school at all at their great age. At the one which your correspondent visited, run by a religious organisation for girls between 15 and 17, there was very little academic work going on. The time-table was almost entirely occupied by dressmaking, cookery, shorthand typing, bible-reading, letter writing and so on; but there was one period in English or arithmetic, and this was bitterly resented. Equally, the girls loathe the netball and the organised games, regarding rock 'n' roll as the only sort of exercise appropriate to their age and station. And they long to make up their faces, to get out of their brown serge pinafore dresses and flat heels into C & A Modes and high heels. Most of all, however, they want to get back to the boys. The cloistered conditions that any girl at an expensive boarding school takes for granted are purgatory to them.

THERE are searching questions that need to be asked about this system. Will the girls regard their stay here as being too far removed from normal life to have any relevance to it when they leave? Will they want to model themselves on the devoted officers who now look after them? A glance at their dressing tables shows that Elvis reigns supreme. But there is one other question which, though natural, turns out to have less relevance. Your correspondent inquired whether innocent girls in need of care might not be corrupted by association with the others. The headmistress replied in a matter of fact way that she had no V.I.s: "Virgo intacta," she explained. She certainly has a tougher job than any headmaster.

The girls' schools, perhaps, should strive after a more normal way of life; and in this they need the co-operation of visitors, who can introduce the girls to normal happy homes. The schools would also have an easier task if they were larger, so that their activities could be made more varied and more interesting. As the approved school population has declined in the last ten years from 11,000 to 7,000 (mainly because of other methods of treatment), the Home Office has succeeded in closing 20 schools, all in the teeth of strong opposition from the managers. It would be a pity if the multifarious voluntary interests were to hold up reorganisation. But to meet some of the people who are concerned with approved schools is to understand how reluctant they are to be deprived of the rewarding work to which they have devoted themselves so unsparingly.

NOTES OF THE WEEK

SOVIET RELATIONS

Letters from Moscow

B and K, before they checked out after ten days at Claridge's exactly a year ago, agreed with Sir Anthony Eden upon a joint communiqué, in which it was stated:

> One of the important factors in strengthening international confidence consists in personal contacts between leading statesmen, which have produced positive results.

As things have turned out, international confidence has not flourished in any luxuriant degree since then; but the discovery of "personal contact" evidently bore fruit in an exchange of letters between Mr Bulganin and Sir Anthony Eden. These, or some of them—they relate to the Middle Eastern crisis and bear dates between September 11th and October 6th—were suddenly published by London and Moscow on Monday night; so much for the benefits of private correspondence. On April 20th, as if to make sure that the practice will not be continued with Sir Anthony Eden's successor, Mr Bulganin sent Mr Macmillan a long letter, which Moscow proceeded to publish three days later.

The letter to Mr Macmillan repeats the Soviet proposal for a four-Power declaration of non-intervention in the Middle East; it talks of "temporary transitional measures" towards disarmament and towards a collective security system in Europe; and it ventilates once again the idea of a demilitarised zone, "and of areas with restriction of armaments," in Europe. This last, as Mr Bulganin points out, is roughly the idea put up by Sir Anthony Eden in 1955 as part of a possible settlement of the German question.

Dr Adenauer did not like the Eden plan, as it was called for a short time, and the western powers quietly buried it between the two Geneva conferences; but similar or related plans continue to crop up. Dr Adenauer himself, in January, startled his opponents and confused his friends by declaring a long-standing interest in the idea of a "thinned-out zone"—thinned out in a military sense, that is—in and near Germany.

Mr Gaitskell when he spoke in Berlin last month produced a set of ideas for a solution of the German question that looks like the Eden plan in an extended and elaborated form, and Labour members of Parliament made these ideas known, under the name of the Gaitskell Plan, to the Anglo-German conference at Königswinter before Easter. Their reception at Königswinter was mixed, British conservatives and German Christian Democrats looking sideways at it as a threat to Nato, while even the German socialists, suspicious of neutralisation, would go no further than to say that the Gaitskell Plan would need careful study. This

Eden, Adenauer, Bulganin or Gaitskell plan suffers from the defect that the vital factor would be the accompanying political and military conditions; and these, in advance of negotiations (which, so far, always recede) are necessarily wrapped in uncertainty.

WITHOUT JUGOSLAV PIMENTO

AT a reception in Moscow Mr Khrushchev turned to the Jugoslav ambassador and said in a jocular mood: "Jugoslavia wants us to buy pepper, but at the moment we find Bulgarian pepper more to our taste." Two days previously Marshal Tito had declared at Brioni that Jugoslavia, to preserve its position of independence, refused to rejoin the Soviet block. The Kremlin is busy devising a new and more appetising fare for Eastern Europe, and Mr Khrushchev may have wanted to let it be known that the new menu was not going to include any highly-spiced dishes prepared by the chef at Brioni.

"National communism" is now violently attacked in the Soviet Union. It may seem odd that this campaign coincides with renewed praise of Stalin, who, as the theoretician of "socialism in a single country," could stake claims of paternity for the idea. But words serve here as a cloak for the real discussion. Heretics in Eastern Europe would not disagree with the Soviet leaders that communism is by definition an international movement. What they resent is that "internationalist" has been identified with Russian and "internationalism" used as a disguise for Soviet domination.

It was this inflexible domination of the world communist movement by Moscow that Stalin's successors tried to relax after his death. The experiment got out of hand, however, and ended in the Hungarian insurrection. Since then the Russians have been busy preventing the fire of revolt from spreading. Mr Khrushchev brutally warned the West on April 20th against interference in eastern Germany or anywhere else within the block: "We are not saints and, if necessary, we will rap your knuckles." Mr Molotov echoed him with a warning to the satellites that by going it alone they would weaken themselves even more than the block. Finally, the Poles were reminded that the solidarity of the communist camp is their only guarantee of the Oder-Neisse frontier. Having made plain the limits of relaxation, Stalin's successors may soon feel able to revert to a gentler treatment of their allies.

JORDAN

East Bank and West Bank

THE throne of Jordan is like a sand castle at the edge of the tide; maybe the waves will recede and leave it standing; maybe one larger than the rest will suddenly reduce it to a little heap of remains. As our correspondent in Beirut points out on page 316, King Hussein's fate now hangs on the loyalty of the army.

He has had to succumb to popular clamour from the left and accept the resignation of the mixed-bag cabinet that was formed with such difficulty last week. He can count only on the loyalty of the Beduin segment of his army; its west-bank Palestinian element is bound to favour the views of the crowd that would like to unseat him, and even its east-bank town element is uncertain—witness the defection of General Hayyari last week, apparently in the belief that the enquiries that are being made in connection with the King's present purge would uncover something shady.

The future of Jordan as an independent state now seems to turn on three dubious factors. The first is the intention of Saudi Arabia to be true to a club of Kings, to pay the Jordanian army, and, if need be, to use its own troops, now in Jordan, to maintain the throne. Its self-interest in doing this would be to keep its pipeline free of communist interference and to ward off an added suggestion of throttle-hold by Egypt and Syria. The second is the unwillingness of Egypt to pitch Saudi Arabia into opposition by over-calling its hand in Jordan. The third, most dubious of all, is remembrance on the part of the left-bank Palestinians that turmoil in Arab Palestine could deliver them into Israeli hands.

SUEZ CANAL

West Breeze *Blows the Gaff*

EVER since the United Nations decided that it was in their interests to clear the Suez Canal unconditionally, it has been patent that the best thing to do with it, once cleared, would be to use it. To leave it unused hurts the users much more than it hurts President Nasser, and they cleared it—surely—for their own ends rather than as a sop to him for having been attacked. The surrender to his commanding position was made in November, when it was decided to treat him as a victim at the hands of a belligerent, without simultaneously demanding that he should cease to claim his brand of belligerent rights in the matter of Israeli shipping. The passage through the canal this week of the ship *West Breeze* flying the British flag publicised the situation but did not alter it; it was the first falling stone of a landslide; but the landslide is common sense.

None of this exempts the users from the need to establish, to the extent that is in their power, a legal standing to sustain them in their future dealings with the Egyptian canal authority. The Egyptian declaration, addressed to the United Nations and made public on Wednesday night, does not give them very much in this respect, simply because it is a unilateral Egyptian declaration. Like many Arab instruments, it is worded in a manner that leaves a good deal to interpretation, though it is not as loose as Dr Mossadegh's sublimely fuzzy nationalisation law of 1951. Since the declaration is a unilateral Egyptian instrument, it is easy to guess who will do the interpreting in the first instance.

President Nasser does, however, undertake specifically to abide by arbitration in certain kinds of dispute, and he accepts for some purposes the jurisdiction of the International Court of Justice. His acceptance may have to be tested before it can be held to be worth much: what would his attitude be, for instance, if the Hague Court were asked for a ruling on the rights of Israeli shipping under the 1888 Convention? Perhaps he would then claim to decide for himself that the declaration did not give any rights to Israel; but ought not some of the users, in their own interest, to consider applying this particular test? This would be more useful than simply to dismiss the declaration out of hand as worthless.

PARLIAMENT

The Gap in Defence

THE defence debate just before Easter brought the Government a political victory, but left one big question mark over its defence policy. Mr Sandys made out his case both for nuclear forces which will prevent (or at worst fight) a world war, and for saying that the small, mobile conventional forces Britain is to keep will be adequate for dealing with the Yemeni and any minor colonial wars. But the debate confirmed that the gap which his economies may be creating is in Britain's resources to wage or prevent the intermediate type of war. Labour hammered effectively at the point that Mr Sandys's plans seem to be based on using tactical atomic weapons in such campaigns, and at the question: can any war be fought with these tactical atomic weapons (remembering they are as powerful as the Hiroshima bomb) without leading up to full-scale nuclear bombing? All Mr Sandys would say is that "the possibility is not to be excluded." He thought, for instance, that tactical atomic weapons might have been used in Korea without leading to a general conflagration. It is a fair political—and military—point that this is a pretty crucial issue to poise on a "might."

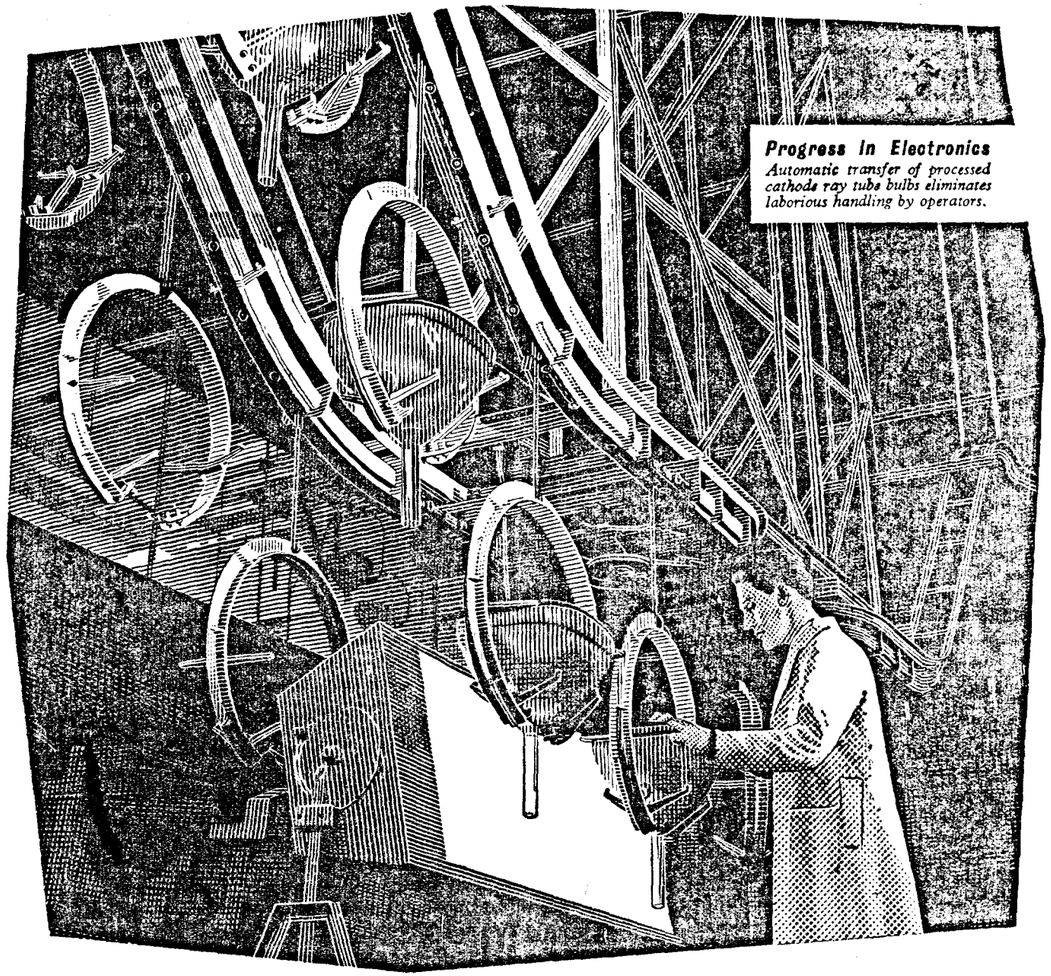
Apart from this, the only fresh news out of the debate was the scheme for thinning down the number of men who are to be called up during the interim two and a half years before National Service is abolished. All men born in 1938 will be liable for call up; all men born in 1940 or later will not. Some of the class of 1939 will be needed, but not all. There is therefore bound to arise a situation where men born on one day in 1939 will be liable for call up, but those who entered the world 24 hours later will escape. All systems of call up involve arbitrary chances, but the Government (which has consistently shrunk from arbitrary selection through a ballot) may yet regret that it has not faced this frankly. Its chosen system rests on the single point that as few men as possible should be able to complain that they are having to serve while their precise contemporaries are not; it would be a strange coincidence if this proved to be the most sensible method of selection in an industrial society.

Labour, however, was in no case to take up this point, since it carries the albatross of egalitarianism round its neck. Labour's opening shot in the debate was surprisingly effective, for Mr George Brown, even though he lacks discretion, is not short of courage; he was the one Opposition leader who could convincingly make some virtue out of Labour's troubles over the H-bomb. But Mr Macmillan tartly reminded Mr Gaitskell that those with responsibility cannot afford the luxury of evading decisions. Mr Gaitskell has been criticised by some people for not taking on the Prime Minister in this debate. Considering the state of the going, he was probably wise.

CO-OPERATIVES

A Bizarre Alliance

DESPITE public efforts by both Labour and Co-operative leaders to minimise their differences, the annual Co-operative party conference at Skegness did not dispel the sense of strain hanging over the relations between the two bodies. It is not, however, a strain that is likely to break into real crisis; perhaps that can best be understood by examining how the strain has come about. Labour's dissatisfaction with the *status quo* boils down to a simple matter of arithmetic. There are now 21 Co-operative MPs, and, if left unchecked, the number might rise to about 30 after the next election. Labour leaders remember that twice since the war governments have come to power with Commons majorities well below 30. The quality of the Co-operative MPs and candidates is, if anything, above the Labour average (that is one reason why more selection committees are picking them) but Labour cannot be happy about so big a group being finally answerable, at least in part, to the Co-operative organisation rather than to Transport House.



This dissatisfaction, however, is checked by three considerations. One is that the Co-operatives bring Labour a lot of money. A second is that although the Co-operative party tends to be a rather left wing organisation—at Skegness it came within an ace of calling for a complete ban on the H-bomb—it is, theoretically, just one of several subordinate departments of the staider Co-operative Union. The decisions taken at Skegness have no validity unless approved by the Co-operative Union's annual Congress over Whitsun. And with this more sober parent body—still more with the Co-operative MPs who actually turn up at Westminster—Transport House's relations have always been much more friendly.

A third check on Labour dissatisfaction, however, is that Transport House must be uneasily aware that the make-up of the Co-operative party—and of the financial advantages Labour derives from it—is bizarre. At Skegness the number of votes officially entered in each division totalled around eight million. This figure is reached by counting one vote for every housewife who has taken a number at a local Co-operative Retail Society affiliated to the Co-operative party. (Only in a few places has the more democratic practice been adopted of making local societies set up separate political groups, which the politically keen join voluntarily.) The result, of course, is that many of the eight million votes nominally cast at Skegness were the votes of people who are certainly not Labour in their politics. It is surprising that the other parties have not done more to try to capture local influence in a customers' organisation with such large political funds attached to it. Two doors away from the Co-operative party's London headquarters in Victoria Street, for example, is the home of the Liberal party. The latter might be wise to show a greedier interest in its neighbour.

BRITISH COMMUNISM

Dispensable Comrades?

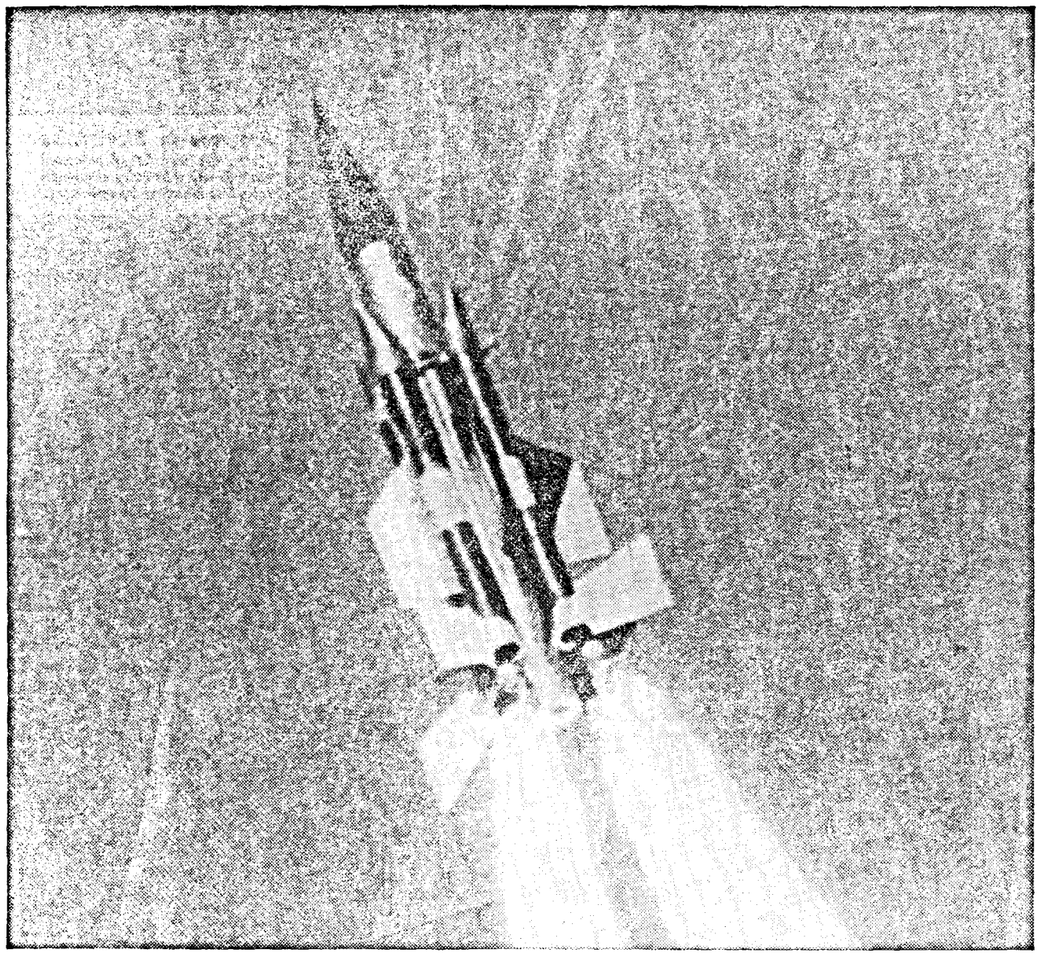
SOMEWHERE in the Soviet Embassy, or in some other office in London, there must be an official whose duty it is to make recommendations to Moscow about the attitude it should adopt towards the British Communist party. In drawing up his report after the 1957 annual congress of the party at Hammersmith last weekend, he may well feel that two points stick out like a sore thumb. First, there is no real prospect that the political arm of the party can do any better in the foreseeable future than in the recent past, when it has usually managed to win only about 3 or 4 per cent of the votes in any ordinary working-class constituency where it has put up

Men and machines

Over the past ten years the machinery on which Mullard electronic valves and tubes are manufactured has been completely revolutionised in design. This has been achieved through intensive research into manufacturing techniques and by a bold productive investment policy.

To-day's machines produce more and better valves and tubes because many processes are automatically controlled, and the unavoidably erratic element in human intervention largely eliminated.

This trend towards increased mechanisation and automatic process control has accompanied the great development of the Electronics Industry. Since 1950, the number of men and women employed in Mullard factories alone has increased by more than 110%.



The Mullard attitude towards production takes heed of the welfare of the employees and the prosperity of the towns in which Mullard factories are situated. Above all, it recognises the responsibility of a leading organisation in a vital industry to produce efficiently in the national interest.

parliamentary candidates; it wins only about the same proportion of the potential poll in the union elections where it puts up candidates, but there, as only about 7 or 8 per cent of the total membership votes, its candidates sometimes get in. The industrial side of the party's work is therefore much more valuable for international communism than the political side. Secondly, the political arm of the party—Mr Gollan's King Street campaigners—are becoming more of a propagandist liability. This diminution of value to the Soviet cause of British communist politicians was not checked by the fact that the party leaders, after having lost 7,000 of their previous 34,000 registered followers last year, duly won all the voting divisions they wanted to win at Hammersmith. The principal result of the sheeplike voting—despite such speeches as Professor Levy's—is that British communist congresses have become even more of a national newspaper joke. The best propaganda for international communism last weekend, it may have been noted, was the bluff attack launched on Mr Gollan and his henchmen by Mr McLoughlin, the bellman of Briggs—an attack that did Russia no harm.

The conclusion that an intelligent Soviet analyst would draw is not that Mr Gollan and his henchmen should be thrown overboard. People who are in communist politics because official party positions pander to their sense of self-importance, rather than because of any active disruption they are able to do, are still of some subsidiary value to the Soviet cause. But it might now be craftier if less of the advice that goes to some of the industrial cadres went through King Street, and more through the less open channels that exist. It would not be greatly to Russia's disadvantage if the *Daily Worker*, a King Street organ and a bit of a liability in post-Hungary conditions, became a weekly instead of a daily paper; and if office-holders in the British Communist party went on fewer political visits to Russia for a time. It will be interesting to see if any developments of this kind take place.

PANAMA

The Other Canal

PANAMANIANS, though clearly of the opinion that the winds from Suez should blow Panama some good, are confused about what they want. President de la Guardia made a nationalist splash a couple of weeks ago by telling a British journalist that Panama intends to resume complete control over the Panama Canal; but a few days later, to still the ripples, he was denying any intention to nationalise. Since the seizure of the Suez Canal the opposition parties at Panama have joined with the extreme hotheads. Led—by some twist of Latin American politics—by the vice-president, they have been demanding that Panama should have a say in the administration of the canal. This has led to a lot of quibbling over the kind of sovereignty that the Americans exercise over the canal and the five miles of land on either side of it. The wording of the 1903 treaty is so ambiguous that the Americans understand it to mean complete sovereignty, while the Panamanians take it to mean jurisdictional rights. But since most responsible Panamanians are in fact very happy to leave the complicated business of running the canal to the Americans, the main purpose of the dispute is an attempt to embarrass the American government into giving Panama a larger share of the profits.

But the Panamanians may be overplaying their hand. They are running the risk of irritating the Americans at a time when the 1955 treaty with Panama is still before Congress. American military manœuvres have been held in the zone this week, perhaps as a warning to the Panamanians as well as a general demonstration of strength. The supplementary provisions of the treaty, which have still not been approved by Congress, include the handing over of American surplus property to Panama; the building of a $20 million bridge over the canal and, most important, the equalisation of the wages paid to Panamanians working in the Canal Zone with the wages paid to Americans who also work there. It would be a very severe political blow for President de la Guardia if these clauses failed to get congressional approval.

Panama at present gets a yearly rent of nearly $2 million from the Americans. Partly because the Suez Canal has been blocked, traffic across Panama was higher last month than ever before. Instead of this pointless dispute over sovereignty, which is much more likely to annoy than embarrass the American government, the Panamanians would be well advised to concentrate on their case (in itself, not unreasonable) for better terms.

JAPAN

A Japanese Agag

MR KISHI, the Japanese prime minister, has cause to tread as delicately in his travels this summer as Agag, the King of Amalek. When he visits Washington he has to convince Mr Dulles that Japan is still a loyal ally of the United States and a worthy recipient of American dollars. American special procurement orders are expected to fall below the $587 million earned last year, but they will amount to a considerable sum. Even apart from military considerations, Japan still cannot afford to antagonise the United States. Indeed, one of the purposes of Mr Kishi's visit will be to seek American financial backing for Japanese commercial ventures in south-east Asia and to co-ordinate American and Japanese policies there.

But when he goes to India and Burma, Mr Kishi will need to avoid giving the impression that he is in Mr Dulles's pocket; in the Philippines he must decide whether Filipino nationalism or American dollars will win the presidential elections next autumn and play his cards accordingly, while in Formosa he has to encourage the Chinese Nationalists to continue their flourishing trade with Japan without prejudice to Japanese hopes of increased trade with Communist China.

Mr Kishi's efforts to be all things to all men will not have been made easier by the visit of a delegation of the Japanese Socialist party to Peking. This was the first political delegation from Japan to Communist China. Mr Chou En-lai welcomed it with an offer to abrogate China's anti-Japanese alliance with the Soviet Union if the Japanese tore up their security pact with the United States. The visit ended with a joint declaration calling for Japanese neutrality, a Far East peace pact, and recognition of Communist China.

EUROPE IN 1960

Prospects of Economic Growth

FOR the third time since it was set up in 1948, the Organisation for European Economic Co-operation has produced a survey looking several years ahead into the economic future of Western Europe; but its new survey, "Europe in 1960,"* is of an essentially different character from the others. Its first "four-year plan," in 1948, simply aggregated the expectations submitted to OEEC by its eighteen member nations for their economies from 1948 to 1952. The second survey, in 195', set the "broad objective" of a 25 per cent expansion of output during the ensuing five years, and indicated what this goal would require in various economic sectors. The survey published this week offers an intelligent all-round guess how expansion in Western Europe might be expected to continue "under reasonably favourable peacetime conditions" during the next few years. It sets no targets; but it dovetails the changes that it expects in the major sectors of demand into the expansion that it considers practicable in the major determinants of output—labour and productivity.

Any such exercise in circular economic reasoning has to be based upon specific assumptions. OEEC assumes that full employment will, on the whole, be maintained ("as an essential condition for expansion . . . not a purely formal assumption"); that there will not be any catastrophic setback in world trade; inflation will be kept in hand; barriers to trade and resources will continue to fall. These assumptions do not seem unrealistic at present; of the two main problems of domestic policy, OEEC evidently feels that the most difficult will be, not to maintain expansion, but to prevent inflation.

GIVEN these assumptions, OEEC expects the gross national product of its members to rise by 17.4 per cent in the five years. This is a slower rate of expansion than the growth of 26.5 per cent between 1950 and 1955, when an element of postwar reconstruction, the taking up of the slack in productive capacity, and the addition to the labour force of about 8 million people helped expansion. In the next five years OEEC expects that there will be a slower growth in the labour force—some 4 million people—partly because two major sources of extra labour in recent years, the influx of refugees from east Germany and the absorption of additional people of working age into paid employment, cannot be counted on to the same degree. Moreover, labour is likely to be working shorter hours; capacity will be more fully stretched; with reconstruction mainly over, OEEC thinks the yield of output from new investment will fall.

But the expected growth of 2.7 per cent a year is a fairly rapid one by most standards, faster, for instance, than that of the United States in the last five years or of prewar Europe. During the period, however, OEEC expects that fixed investment in the OEEC countries might rise by 24 per cent, or 4-4½ per cent a year. One reason for this high rate is that a much larger proportion of investment, in Europe as in Britain, will have to go to basic sectors which do not yield immediate returns in output; another that these sectors are highly capital-intensive and tending to become more so.

The most important of these sectors will be fuel. Merely to raise coal production by 5 per cent, investment may have to rise to some $600 million a year, against $480 million in 1955. By 1960 investment in oil refining will have to be double what it was in 1955, for oil requirements are expected to be half as big again. And there might be an investment of some $2,000 million in nuclear energy, even though it will be making little contribution to power supplies during the period.

Transport is another sector where there may be a big increase in investment without direct return. Long-term capital investment in roads is put at $1.6 billion in 1960, double what it was in 1955, though this should not do a great deal more than sustain present miserable expenditure, let alone provide Europe with the new highway network it needs.

Investment in iron and steel may also have to rise sharply. Though it cost only $3,000 million to raise output by 20 million tons between 1950 and 1955 when reconstruction was still going on, it may cost twice as much to raise it by 23 million tons by 1960. Investment in manufacturing is expected to rise 20 per cent by 1960, though this factor seems a rather rough guess in the OEEC assessment.

Private consumption is expected to grow by 18 per cent between 1956 and 1960, more slowly than in the previous five years but still faster than national production as a whole—for governments are cutting down their share of consumption. The leading sector, OEEC expects, will remain durable consumer goods, above all cars and other means of transport. There should be nearly 9 million more vehicles on the road by 1960 (a growth of over 50 per cent); 7½ million of these vehicles will be passenger cars. Scrapping could bring new car sales up to some 10 million. Spending on food and rent will continue to rise much more slowly; spending on clothing, a little faster than consumption as a whole. OEEC expects an all-round rise in industrial production of 25 per cent if the demand develops as expected.

TO feed this expansion, imports are expected to rise by 22 per cent, with imports of manufactures growing by 40 per cent as more are liberalised. To pay for these and allow for some export of capital and strengthening of reserves, exports will have to grow by about 24 per cent. But the bulk of this growth will fall upon certain industries, above all industrial equipment and chemicals.

The survey thus shows that in the next five years a considerable shift will have to take place in the pattern of Europe's production. With resources fully stretched, the change will not be easy, and a chapter is devoted to obstacles to the mobility of resources. Internally, controlled rents and the dependence of investment on retained profits are picked out as two vital inhibitions to free movement of labour and capital. But international movement is still inhibited too. In this next, tighter phase of Europe's growth, removal of tariffs and quotas and of obstacles to movement of labour and capital will become more important than ever.

A number of structural problems are discussed. There is a danger that the undeveloped Mediterranean countries of OEEC—Greece, Turkey, Portugal, Southern Italy—will lag behind, or at least fail to gain much ground in comparison with the surging growth of developed northern Europe. With demand for food growing only slowly, agriculture remains a chronic problem, especially, again, for specialist countries like Denmark and for the undeveloped South.

Despite the hope that payments as a whole will remain balanced, the dollar problem, OEEC believes, will remain. These problems, too, seem to cry out for common efforts. The south can only be developed through a common investment effort; agricultural expansion depends on an increase in intra-European trade; the dollar problem can only be resolved if institutions like the free trade area and the common market are used to bring pressure on the United States for tariff reduction. Impartially and unobtrusively, OEEC's report is a remarkable economic justification for its own efforts.

* Eighth Report of the OEEC. Volume II: Europe in 1960. Paris: Organization for European Economic Co-operation.

Continued from page 297

None of this is new—it has been an avowed policy of the Japanese socialists for years—but the thought of neutrality has a strong appeal for many non-socialist Japanese, and Mr Chou En-lai's offers may make it more difficult to assure the Americans of Japanese loyalty without antagonising voters at home. One thing may help; Mr Menzies, the prime minister of Australia, has paid a good will visit to Tokyo to improve Australian-Japanese relations and open up the way for increased trade.

RATIONING

Petrol Leaks

RATIONING does not work unless people believe in its continuance; that is the first lesson of this Easter, making the Ministry of Power's rumbling warning that those who buy or sell petrol without coupons may be prosecuted (under the Defence Regulations) seem rather pointlessly portentous. The apparently normal holiday stream of cars on the road this Easter, despite rationing, was due to two main causes. First, motorists, with their new ration books in their pockets, are no longer economising in coupons, because they believe that before the official end of this coupon period, rationing will have been discontinued. The Ministry could counter this by making coupons valid for only one month at a time, but this would be a pity. Secondly, however—and this annoyed the Ministry—some garages were undoubtedly trying to attract customers last weekend by not asking for coupons at all.

The Ministry cannot possibly expect to check this by sending an army of coppers' narks round to every roadside garage. It can effectively check illegal sales only by its method of administering the rationing scheme. This method is simple enough: the garage-manager, having collected coupons from drivers, hands them in bulk, with a statement of their value, to the wholesaler's tanker-driver, who delivers that amount into the storage-tanks. Through the wholesaler the coupons reach and are checked by the Ministry—or rather, the extra staff of 1,900 (half civil servants drafted in from elsewhere, and half temporary employees) checks as large a sample as it can. The surplus which was sold without coupons last weekend must have come from two main sources: (a) from stocks held over by the garages (probably from the time of the "voluntary" ten per cent cut in supplies); and (b) from optimistic garage owners who believed that by the time they next need to refill their pumps, wholesalers will no longer be required to check off deliveries against coupons. As many garages have only a fortnight or so between deliveries, this last assumption was risky.

The rationing scheme would really break down if wholesalers, although legally required to collect coupons from the garage owners, delivered petrol without doing so. But there has never been a danger of this; most of the wholesalers are the distribution departments of the big oil companies, and big concerns keep within the law. If political conditions in the Middle East really do lead to further limitation of supplies, and if rationing has (and is seen to have) to be kept on, the Ministry will therefore quickly recapture control of the situation, and sales of off-ration petrol will cease in all garages that want to have enough petrol to remain in business. As a matter of practical administration and sensible public relations, the Ministry would have been wise to rely on this, instead of peevishly pretending that it could largely rely instead on spot checks and petty prosecutions.

DOCTORS' PAY

Five per cent Interim

IN the whole of the protracted and unhappy dispute between the Government and the medical profession over doctors' pay, the most illuminating remark came earlier this month in a debate in the House of Lords. "The state," said Lord Home, replying for the Government,

> has no inherent virtues as an employer . . . . [This] is the first time it has had to work out a relationship with one of the great skilled professions, and . . . it must take time before a satisfactory code of relationship and conditions of service can be finally established.

However much one is disposed to blame the British Medical Association for the extent to which the dispute has become embittered in recent months—and it does deserve quite a lot of blame—the fact remains that in the whole nine years of the service no Government has taken a single step towards working out the relationship which Lord Home now belatedly recognises to be needed. Last week's announcement of further interim pay increases, pending the recommendations of the royal commission, almost seems to have been designed to show the state at its worst in dealing with "one of the great skilled professions."

It would have been perfectly possible, once the case for an interim increase had been accepted, for the Government to have decided on the total sum that it was willing to grant for such increases, and then to have offered to negotiate with the profession on how it should be distributed. Instead, the Government fixed on a percentage increase one month for junior hospital staffs, and then halved it the next for all other practising doctors. There was at least a case for negotiating whether a higher proportion of the £4,600,000 which all these increases are to cost, excluding the 5 per cent rise for dentists, should not have gone to all doctors who earn less than £2,000 a year (and who, incidentally, will not benefit from the surtax reliefs in the budget). As it is, the Government has decided without explaining how its decision was arrived at, that below the surtax level hospital senior registrars, previously earning up to £1,400 a year, should receive a 10 per cent increase, but that the 5,000 or so general practitioners who earn less than £2,000 a year net of practice expenses should receive only 5 per cent. Possibly, however, the reference in Mr Macmillan's statement to consultation on the distribution of the award means that the Danckwerts precedent will be followed so that, by loading some of the capitation fees, doctors with small and medium-sized lists of patients get a higher proportionate benefit.

But, for the long term, the relation between the earnings of general practitioners and of hospital staffs, and between medical earnings as a whole and those of other professions, is a matter for the royal commission. Now that the doctors have been reassured about the way the commission will interpret its rather stupid terms of reference, it is equally stupid of the British Medical Association to persist in boycotting it. The commission will certainly produce a report

and make recommendations, and the doctors are bound to be the losers if these findings are made without the fullest possible expert evidence.

SHOPS BILL

No Reasons Why

MR WALTER PADLEY'S presidential address at Blackpool to the Union of Shop, Distributive & Allied Workers, attacking "irresponsible and misleading" criticisms of the Shops Bill, was just beaten into second place for the Easter booby-prize by that of the USDAW's Assistant General Secretary, who characterised the supporters of the general consumer as a "small minority interest." It contained, however, more pearls of economic and social unwisdom than might have been expected by even the most sadly experienced observer. Mr Padley had one valid, if not precisely novel, point to make: when overtime has to be paid to employees working late or unorthodox hours, then—unless there is a counterbalancing improvement in efficiency—the expense must be recouped in the price of the goods. The increase in prices needed to cover the cost of universal overtime for prewar hours would, he asserted, amount to between six and seven shillings per week per family of four.

His calculations may be correct. They are certainly irrelevant. For shopkeepers do not face the alternative of being legally forced or legally forbidden to incur extra costs by offering extra convenience to their customers; in the absence of restrictive laws they would be as free to choose one policy or the other as they now are to provide or to do without expensive amenities like carpeted floors, elaborate displays, and especially expert service—and to price their wares accordingly. The threadbare argument that a few inveterate late closers can enforce longer and longer hours on their unwilling competitors is sufficiently answered by the very fact cited by Mr Padley to prove that earlier closing would inflict no inconvenience—the fact, that is, that not all shopkeepers stay open for the full period now legally permitted.

There may conceivably be reasons, not apparent to the outsider, why any enterprising grocer should not constitute himself the working woman's friend, and, while keeping his total hours at the present level, substitute—as is common practice in some countries—evening for afternoon opening; why shop assistants should find appropriately paid overtime more abhorrent than do industrial workers; why an employer who (having more workers in his shop than the average 1.75 quoted by Mr Padley) is able to introduce a shift system, should not do so. There may be circumstances, peculiar to British retail trade, forbidding that freedom which in America is found compatible with a thirty-nine-hour average week and sixty-dollar average weekly earnings; a freedom which, allowing retailers to cater for the "night people" of industry, has done so much to make shift-working practicable and so to increase productivity in general. If there are such reasons and such circumstances, Mr Padley has not made them public. All that he has made plain is that undesirable pressure from this union's vested interest must be one of the reasons why the Government has not yet scrapped or significantly liberalised its restrictive Shops Bill.

IRAN

Firm Hands in Teheran

THE Shah's new government is sticking to its predecessor's policies on both home and foreign fronts. It is asking the Majlis for authority to agree to exploit oil resources, in certain areas not covered by the consortium, in conjunction with the Italian state-controlled corporation, ENI; but the area envisaged does not, as was suggested at one time, include the Iranian national oil company's best plum, which is at Qum on the central plateau. With its eye on the Suez Canal as the lifeline for imports of capital equipment for development, the Iranian government has told an Egyptian minister in transit through Teheran that it has no use for politicians who, while labelling themselves "neutral," in fact come down on the Soviet side of the fence on account of their anti-western prejudices. As to home affairs, it has announced that it hopes to change the parliamentary term from two years to four, and—a familiar platitude—that it intends to reform the civil service. The immense difficulty in the way of pruning this hopelessly overstaffed machine is that there is as yet no alternative work that the extra and well-kept hands could, or would, take to outside the public service.

The cause of the recent change of government was purely internal. When three American members of a Point IV mission in south-east Iran were murdered by bandits in lonely country near the Pakistan border, Mr Hossein Ala resigned office to make way for a much younger successor and one more calculated to take a strong line over internal security. Dr Manouchehr Eghbal, the new premier, is made of tough stuff. By profession a medical man, he has for some time been president of Teheran University, which he has ruled with so firm a hand that student demonstrations are no longer fashionable. His techniques have been various: one is the institution of foreign travel bursaries for the best young men of the year; another, which he exercised on a famous occasion during the Suez crisis, is the physical insertion of his burly presence into a crowd in order to disband troublemakers—an operation which, being also Minister of Court, he has been known to perform in white tie and top hat.

How far will he allay the misgivings of the educated and deeply discontented element within Iran that detests and resents absolute government, stacked elections and hand-picked parliaments? His rousing vote of confidence in the Majlis, obtained last week by 110 votes to 4, needs to be interpreted in this light. He began his term of office with the statement that he intends to rescind martial law (for the first time since the war); but those who have disliked it will need to see changes before they believe them, for General Teymour Bakhtiar, a man who personifies the strong hand, brain-washings and the like, is one of four "assistants to the prime minister."

SIERRA LEONE

Probity or Expediency?

WELL-MEANT efforts by the Colonial Office to graft British standards of probity on to African institutions do not always turn out as expected. In Sierra Leone, attempts to keep the House of Representatives clean appear to have been twisted to less honourable ends. On May 8th, Sierra Leone will be holding its first general election with a wide franchise, but at the last minute there has been a flurry about candidates' qualifications. A clause inserted in the new constitution at the end of last year debars any candidate who has ever been disqualified from practising a profession. This clause, which had been in Sierra Leone's earlier constitution, had been removed in 1951 as unduly severe, but was put back in response to strong pressure from the present Legislative Council, which was elected indirectly and on a limited franchise.

The person most affected by the clause is Mr Rogers-Wright, the leader of the United Progressive party, who in 1947 was disqualified for less than a year from practising as a barrister. A delegation from this party, which a fortnight ago visited London with a petition to the Queen, tried to persuade the Colonial Secretary to cancel the rule which prevents its leader from standing for election. The delegation's case, which seems to have some justification, is that the government only re-inserted the clause in order to hamstring the most formidable opposition party. The UPP, a young and noisy party with a rather ill-defined socialist policy, claims a larger membership than the well-established Sierra Leone People's party, and even without Mr Rogers-Wright (whom the delegation described as the Nkrumah of Sierra Leone) is expected to make a good showing in the elections. The petition is still being considered, but on April 10th Mr Lennox-Boyd said in the House of Commons that nothing can now be done until after the elections, and then only if the new House of Representatives votes for a change. But neither the clause itself, nor the process by which it became law, is easy to defend. It looks as if the Colonial Office's zeal against corruption has led it into an error.

TEACHERS' CONFERENCE

Professional Pride and Union Restriction

THE annual conference of the National Union of Teachers this week was enlivened, reassured and cheered by a speech from the Minister of Education. Any speech of Lord Hailsham's is enlivening. Its reassuring aspect was the Minister's expression of confidence that the block grant would not, as the teachers fear, mean that local authorities will cut down their expenditure on education in order to spend more on other things. One had the feeling that Lord Hailsham was reassuring himself too, especially as much of his speech was devoted to attacking those who would economise on education. His most cheering words, from the point of view of his audience, was the news that he intends to put before the Cabinet in a week or two proposals for a three-year training course for teachers. The teachers have long felt that the two-year course for non-graduates at state training colleges is incompatible with their desire to be regarded as professional people. Lord Hailsham certainly got off on the right foot when he began by calling himself "a professional man coming before a body of professional men and women." But of course he has better reasons for the three-year training than merely pleasing the teachers' vanity. Two years is little enough time to learn not only what to teach but also how to teach, especially as training college recruits are unlikely to have been the brightest members of their schools, for these will have gone to universities. There is a good case for making this change after 1960, when the size of classes is falling.

Too much mumbo-jumbo, however, can be attached to this question of how to teach. In demanding that the regulations should make it quite impossible (instead of, as now, nearly impossible) for people to teach unless they have had the recognised training, the teachers think they are behaving like a profession. But to allow people without a specific qualification to teach is not like allowing unqualified persons to practise medicine. There are born teachers just as there are born writers and artists; and there are others who, after a ten-year course, would still be very bad teachers. In passing unanimously their silly resolution (against the advice of their executive, which favoured a woollier formula for the same idea), the teachers were once again behaving like a trade union. This is the Apprenticeship Method of keeping labour scarce. And let them remember Lord Hailsham's warning, as one professional person to another, that where professional pride is accompanied by superiority and arrogance, it is justly unpopular.

APRIL 25, 1857

POPULATION IN FRANCE

¶ Persons at all familiar with the interior of French households of the middle and the humbler classes are thoroughly aware that not "merely the spirit of thrift," but the spirit of the severest parsimony, compared to which the hard frugality of the Scotch peasant is indulgence in luxury, very generally presides, and has long presided, over the general *ménage* of France. From this we comprehend how the French have gradually dwindled in stature; and we may be excused for saying—looking back at their Colberts, L'Hopitals, Des Cartes, Malebranches, Pascals, Fenelons, and crowds of other great *men . . .—we can comprehend how they* have dwindled in mind. We can fancy, too, that the mothers of France have had irresistible motives for not caring to provide more generous nourishment for their children when stunted bodies saved them from being the prey of the conscription. The wars of the first Bonaparte were less destructive to the population than the conscription and the imperial system of Government, *with all its vast taxes and minute* supervisions and restrictions continued and extended by his successors, whatever titles they might bear. . . . All history teaches the same lesson. Rome flourished after the proscriptions of Marius and Sylla. Italy recovered and was *glorious after the devastating inroads of millions of* barbarians. But Rome became stagnant under Augustus and his successors, and was conquered: and *Italy fell into* decay under the chronic care of Pontiffs and Emperors. The fixed and exhausting Government of the Sultan has been more ruinous to European Turkey and to the part of Asia under his sway than were the inroads of his barbarian *ancestors and the subversion of the Eastern Empire.* We should now fall, therefore, into a ruinous error were we to ascribe to wars—passing calamities—exceptions, as it were, to the general progress and yet parts of it—the destruction of nations. . . . These are not, indeed, sufficient *reasons for* ever wantonly or unjustly commencing and obstinately continuing them. But with all their evils and crimes, wars are not so destructive to nations as are the false and pernicious policy which grows from themselves. . . . The all-ruling, all-pervading, all-interfering Government of France is the palpable cause of the slow progress of its prosperity and population.

KOREA

Korean Storm Against Britain

THE Board of Trade has caused a furore in Korea by casually announcing that the total ban on trade with North Korea, imposed when the war broke out, has been relaxed and that non-strategic goods can now be exported on licence, as they are to China. In itself the concession is of little importance; no British firm has shown any interest in the North Korean market since the announcement was made. But the South Koreans regard it as a betrayal. A government-owned newspaper, *The Korean Republic,* said:

> Trade with the Reds in the north, in our opinion, would be a partial surrender—certainly a compromise—with an enemy at least as evil and threatening as Hitler's Germany. The war in Korea has not ended . . . there is only a state of suspended hostilities between field commanders. On moral grounds trade with the enemy under these circumstances is indefensible; from a practical point of view it is folly.

Preparations for "spontaneous demonstrations" against the British decision are going forward throughout the country, and although the foreign minister, Mr Cho Chung-wan, has been soothed by assurances that no war materials will be licensed, he has not yet taken back his threat to *blockade North Korean ports against British shipping.*

All this is a storm in a tea-cup, but it need not have arisen with such violence if the Board of Trade and the Foreign Office had taken the trouble to prepare the South Korean government for the announcement. The Board of Trade stated clearly enough that Britain had no intention of sending North Korea embargoed goods or of granting it official recognition; and indeed the new arrangements merely remove an anomaly by bringing Britain's treatment of North Korea into line with that accorded to North Vietnam. But this might well have been explained in advance to the South Koreans.

IRISH REPUBLIC

Awaiting Their Budget

Our correspondent in Dublin writes:

DR RYAN will present his first budget early in May against a background of more encouraging trade returns (the trade deficit for the seasonally adverse first quarter of 1957 was £15 million, against £33 million in the first quarter of 1956), and of a savings success on the Irish version of premium bonds. But there his encouragement stops. Both above and below the line, the budget is in deficit. The programme of capital investment calls for a much higher volume of saving than is likely to be achieved. It does not seem that Dr Ryan will have any liberty of action—unless, like Mr Thorneycroft, he manages to cut current government expenditure.

The first report of the advisory committee on capital investment, which was set up by Mr Costello's government last November, has just shown him how he could do this. This remarkably valuable and plain-spoken document points out that "the community has been unwilling to sustain, by its own current efforts, public capital outlay at the level reached in recent years." It dismisses the possibility of large-scale borrowing from the banking system whose liquidity was affected by the loss of external assets in 1955 and 1956. It therefore recommends the abolition of the wartime subsidies on butter and flour. Still more uncompromisingly, it suggests that grants to local authorities on relief of rates on agricultural land should be discontinued. It remains to be seen how the new government will take this courageous report. Ministers have a clear majority; they have the political opportunity for radical measures. The committee's suggestion that farmers should be compensated for the withdrawal of the relief grant by the provision of vouchers for fertilisers and lime has much to commend it. A weakness of Irish agriculture is that, while there is no great incentive to farm better, there is no sanction at all against farming badly.

SOCIAL SERVICES

Double Duty Mothers

AFTER so much uninformed and indiscriminate criticism, from pulpits and elsewhere, of the growing class of wage-earning mothers, a recent survey by the National Council of Women comes as a highly desirable antidote. After careful sifting of the views and experience of probation officers, teachers, health visitors, magistrates, school attendance officers, doctors, and a wide range of working mothers themselves, its verdict is of open acquittal. "No case," says the report, "was made that the mere fact of a woman's going out to work is detrimental to her home and family"; notably "there was an overwhelming consensus of opinion that there has been no increase in juvenile delinquency due to mothers taking up employment." The governing factor in the family's welfare is not the mother's status as earner or non-earner but her character and competence—in either situation. This is not to say that no problem exists. Where working hours and school hours coincide, or where a grandmother or friendly neighbour will look after otherwise unsupervised children, all is well; but hours do not always fit, a responsible substitute is not always available, and holidays are a recurrent difficulty. There are nowhere near enough day nurseries for small children, and play centres and clubs for their elders, to relieve working mothers of anxiety.

By implication, the report favours a re-expansion of the shrunken day-nursery programme; the inquiry, being social rather than economic, did not bring out the fact that day nursery places are apt to cost considerably more than a woman's total earnings (and therefore, presumably, more than her contribution to national output when in work). The motive for taking paid employment is, it appears, purely economic nine times out of ten—either to provide sheer necessities (in widowhood, desertion, or the disablement of the chief breadwinner), or, more frequenly, in order to provide the family with a generally higher standard of living. The report sensibly concludes that the balance of advantage, varying from family to family, is for those concerned to decide. The tipping of that balance by the provision of heavily subsidised nurseries would mean, however, a net loss to national output for the sake of an erratically distributed gain to the beneficiaries. It would come much cheaper to pay those in need quite generously to look after their children themselves—and to encourage employers to explore more wholeheartedly the possibilities of part-time work harmonising with family responsibilities.

BOOKS

Fortunes of the Gentry

The Wealth of Five Northamptonshire Families, 1540-1640.

By Mary E. Finch.
Northamptonshire Record Society. 265 pages. 30s.

RECENT investigations of the changes in English society in the century before the Civil War have aroused almost as much passion among historians as did the war itself for those involved. In 1941 Professor Tawney set up his standard. He imposed upon the period 1540-1640 the broad generalisation of "the rise of the gentry." In a period when prices were trebled, the crown and the aristocracy were enfeebled by habits of extravagance and traditional ways of management. The beneficiaries were the gentry who saw and realised the great profits to be derived from the application of business methods to agriculture. This great shift of power both caused and was completed by the Civil War, a gigantic act of foreclosure.

A decade later Mr Trevor-Roper attacked this position, first turning its flank by destroying the arguments for the ruinous indebtedness of the aristocracy, and then mounting a powerful assault on the main thesis of the rise of the gentry. Land alone, he argued, however efficiently managed, could seldom do more than enable a family to keep up with inflation. The spectacular and significant rises of this period are to be attributed to the profits of trade, law and, above all, of office. The line of cleavage came not between aristocracy and gentry, but between the court gentry, the beneficiaries of trade, law and politics, and the mere gentry, excluded from opportunity and living a pinched existence on their estates. It was the resentment of the mere gentry which produced growing political strain and, eventually, civil war.

The controversy continues, generating both heat and light. It gives particular interest to Miss Finch's study of the fortunes of these five families, the Ishams, Spencers, Treshams, Fitzwilliams and Brudenells. Four out of the five families owed their establishment on the land to the profits of trade, law or office. Only the Spencers, recognised as exceptional by Trevor-Roper, owed their rise into the peerage principally to the profits of sheep-farming. But four out of the five families were already established upon the land by 1540, the entry of the Ishams being delayed until 1560. Consequently, as Miss Finch emphasises, her study throws light on the factors which affected the prosperity, survival or ruin of landed families, but cannot be used to answer more general questions. Again, a detailed study such as this is dependent on the survival of family records and is likely to emphasise the survival of families. Here only the Treshams present Miss Finch with a study in ruin, and their papers only survived because they were walled up, probably by Francis Tresham before Gunpowder Plot. But by restricting her inquiry to these five families Miss Finch has been able to achieve remarkably detailed and precise results. She knows what questions to ask, and she has shown both skill and caution in analysing the accounts.

Apart from the Spencers, agricultural profits alone produced no spectacular rises in the fortunes of these families. The Ishams were able to treble their income from land in the fifty years before 1640, but this was achieved by a rigorously frugal policy and the sacrifice of the younger sons. It was by trade and marriage that the Brudenells enlarged their estates in the sixteenth century; and in the thirty years before the Civil War Thomas, Lord Brudeneil, by unusually careful and enlightened management, succeeded in doubling his income from his lands. Against the background of the price rise over the century these expansions of agricultural income were not enough to carry a family upwards. Other sources of income were of considerable importance. In the sixteenth century Sir Thomas Brudenell was trading in wool; and in the seventeenth century Sir John Isham was investing in mortgages, showing a higher yield than land. The Fitzwilliam family was maintained by court patronage and office in the sixteenth century, and its fortunes were restored by a City marriage in 1638. Wise marriages could indeed do much. The fortunes of the Ishams, Spencers and Brudenells all benefited substantially from marriages. In contrast there stands Sir Lewis Tresham's marriage, at a critical moment for his family, to a Spanish girl, who brought him nothing but the illusory hope of the fortune of her grandfather, the Spanish Viceroy of the West Indies.

In Miss Finch's view, "it was the factors governing family expenditure which directly determined the rise and fall of a family"; and she shows how much both the Ishams and the Spencers owed to their savings. This was particularly important in the earlier part of the period, for it was not until the 1630s that landowners could raise long-term loans on mortgage. The unfortunate Sir Thomas Tresham, in addition to his expensive tastes for hospitality, building and Catholicism, had to provide for three sons and six daughters. Ruthless

Quantity and Price Indexes in National Accounts

by RICHARD STONE

This comprehensive survey of the basic conceptual problems encountered in deflating national product and its components—the first of its kind—deals systematically with the many issues involved in the construction of index numbers of quantity and price within the framework of national accounts.

124 pp. Demy 8vo Price 10s.

improvements of the estate were inadequate, and, failing long-term loans, he was driven to sell. Even so, the history of the Treshams shows the degree of adversity, extravagance and folly which was required to destroy a landed family. Miss Finch's lucid analysis will not settle the controversy among general historians. But the Northamptonshire Record Society is to be congratulated on a volume that should arouse the interest of a wider circle of readers than its own members.

Fighting Journalist

Turkey in my Time

By Ahmed Emin Yalman.
University of Oklahoma Press. 304 pages. $4.00.

THE author's name means "the highest summit of a mountain." "It sounded pretentious," he says, "but most people were taking pretentious names." He chose it, after much thumbing through the dictionary, in 1935, when Mustafa Kemal passed a law compelling all Turks (most of whom had hitherto had no surnames) to adopt and register a family name. Ahmed Emin Yalman was born in 1888, in Salonika, at a time when the despotic Sultan Abdülhamid II was ruthlessly repressing his subjects' aspirations after reform. He began his journalistic career at the age of eighteen in Istanbul when the press was subject to a double censorship (the second was by palace officials and spies) and when each paper employed two special men to write the obligatory praises of the Sultan that all reputable journalists spurned as "dirty work." Today, after a long and distinguished journalistic career, he is owner and editor of a well-known Istanbul newspaper, *Vatan*.

Mr Yalman describes the tremendous changes that have taken place in his country during his lifetime. He also describes—and these are some of the best bits in the book—his various encounters with Atatürk. In 1917, for instance, a long conversation with Turkey's great leader during a chance encounter on a train journey from Germany brought it vividly home to him that Turkey was not, as he had previously believed, a "seaworthy ship," but a "doomed, floating wreck." Another meeting took place seven years later when Mustapha Kemal summoned Mr Yalman and six other editors to a private conference at which he explained and justified his proposal to abolish the Khalifate—a proposal which at the time appeared so revolutionary that it made the assembled editors feel "as though we had been struck by lightning."

Mr Yalman has never been tied to his editorial chair. Apart from his involuntary stay in Malta in 1920-21 as an internee of the British, he has travelled widely in the United States and Western Europe. He is sympathetic towards America, but his comments on his other travels tend to suggest that, in his view, Turkey has been the only bright spot in an otherwise naughty Europe. Yet on occasion he has been deeply critical of both Atatürk and his successors. The vicissitudes of his journalistic career bear witness to his determination to maintain his independent stand and to speak out boldly against evils and abuses. Several times his outspokenness led to the suspension of the newspaper on which he was then working, and his criticism of Atatürk's policies in the mid-twenties led to his retirement from journalism for ten years. After the last war, his vigorous campaign against reactionary forces in Turkey led, in 1952, to a very nearly successful attempt to assassinate him. It is not without reason that Mr Yalman has come to be known as the best liked and most hated man in Turkey.

Israel Unexplained

The State of Israel

By L. F. Rushbrook Williams.
Faber. 229 pages. 21s.

PROFESSOR RUSHBROOK WILLIAMS decided to write his survey of the State of Israel because he "could not find out" from any existing books "how this little state manages to maintain itself as an independent entity." He is quite right in thinking that an intelligent gentile's guide to Israel has yet to be written; he was also right in thinking that 1956-7 was a good time to write one. But he is wrong in thinking that he is—or we are—any the wiser now.

He was struck, he says, by the fact that there have only been four short periods in history when Palestine has possessed a separate political existence—under David, under Judas Maccabæus, under the Frankish crusaders, and under Mr Ben Gurion. But his analysis of Mr Ben Gurion's formula for independence contains no more than a passing reference to foreign economic aid; the Israeli army is considered only in its role as a welfare institution, while the fact that it is the most potent military force in the Middle East is not even mentioned; and the defence of the frontiers by quasi-civilian settlements and by "the policy of retaliation" rates less than a page.

Professor Rushbrook Williams's book is, indeed, completely uncritical—part stodgy travelogue ("The streets are gay with bright-coloured skirts and blouses . . ."), part statement of fact and near-fact about the organisation of the State. But with Israel, all uncritical descriptions are inevitably misleading to the point of inaccuracy.

It is, for instance, misleading to give a "brief history" of the events leading up to the Balfour Declaration which does not mention the offers of territory elsewhere. "Eventually," says Professor Rushbrook Williams, "it was found that only Palestine was suitable. . . ." It is misleading to describe the events leading up to the end of the Mandate without mentioning the Stern Gang. It is misleading to describe the absorption of immigrants, in a chapter headed "Unity out of Diversity," without mentioning that the expression "Black Jews" has become common in Israel and that "Black Jews" do resent the present supremacy of the "White Jews." It is misleading to say that the Maabaroth (transit camps for immigrants) were a "great success" and that they consisted of "neat tin huts," when the squalid little shanty towns that have grown up on the fringes of Haifa and Tel Aviv are regarded, even by Israelis, as a regrettable necessity. It is misleading to say that "everyone is proud of the part that he is playing in making the Zionist dream come true," when many of the recent immigrants from North Africa have been settled more or less against their will (though no doubt rightly) in the development areas of the Negev.

The sins of omission in this book are equally grave. What is the value of describing Israel's economic progress without counting the cost? Is it really sensible to give less space to the balance of payments than to the tourist trade, or more space to the evolution of leghorn cross-bred chickens than to American aid?

It may fairly be said in the author's defence that he has looked at Israel from the viewpoint of an expert in Asian affairs. By Asian standards Israel is, no doubt, a highly efficient Utopia. But the conclusion that should surely be drawn is that the real issue between Israel and its Arab neighbours is that Asia cannot afford (or thinks it cannot) to tolerate an efficient Utopia in its midst. Professor Rushbrook Williams seems only to have been impressed with the fact that there is "no hubbub" at Lydda airport, that there are no beggars, and that Israelis are good at road safety. It is not surprising, therefore, that he has failed to state the Arab case in terms even as strong as those which most enlightened Israelis would accept.

The Soviet Air Threat

Soviet Air Power

By Richard E. Stockwell.
New York: *Pageant Press.* 250 pages and 16 pages of photographs. $7.50.

THIS book, written by an outstanding American and published in America last year, gives a comprehensive picture of the growth of the Soviet air power, its present organisation and its tactical and strategical principles. The Soviet Union, which, according to Nato, has over 20,000 aircraft, has six air forces in all:

(1) The *Army Air Force*, accounting possibly for about 70 per cent of all operable aircraft, has the task of supporting the ground forces. The Russians have in peacetime 175 divisions, organised in six independent armies, and each such land army has two or more air armies attached to it, equipped with modern jet aircraft.

(2) The *Long Range Flying Command*—an equivalent of the American Strategic Air Force—is the most dangerous force and the most feared in the United States. This air force, equipped with about 2,000 long range bombers, some with a range enabling them to reach almost any target in America, is based mainly in the area along the Arctic Circle.

(3) The *Fighter-Interceptor Command* is a small force. It defends two zones of approach to Russia as well as all strategic targets.

(4) The *Naval Air Force*, consisting of some 1,500 aircraft, is a handmaiden of the rapidly expanding Soviet navy.

(5) The *Airborne troops* consist of seven divisions of 10,000 men each, with another three divisions in formation; according to the German expert, Colonel General K. Student, these formations have about 7,500 aircraft for an air-lift.

(6) *Civil Aviation* consists of several air-lines, covering the whole of Russia's vast territory and linking it with China, the Middle East and other countries adjacent to Russia; all these air lines serve as a strategic reserve.

This very brief summary of Mr Stockwell's book would be incomplete without a few words about the effort devoted to developing guided missiles. The launching sites are particularly densely concentrated along the Soviet-controlled shores of the Baltic. There are at least twenty in the area of Riga, poised against Sweden, and in the countries of Eastern Europe, especially in Rumania and Bulgaria, aimed at Turkey and the Dardanelles. There are also many along the North Sea, and on the Island of Sakhalin—intended to counteract American bombers operating from the bases in Japan.

In the closing chapter of his book, Mr Stockwell quotes several Soviet high ranking military leaders, who in their statements or articles put a special emphasis on the importance of a surprise; it is obvious that, in case of a future war, the Soviet will try to stage another Pearl Harbour, only more so, on the presumption that the initial blow could be so staggering as to make retaliation only theoretical.

Liberation and Defeat

Four-Power Control in Germany and Austria 1945-1946. *Survey of International Affairs 1939-46*

By Michael Balfour and John Mair.
Issued under the auspices of the *Royal Institute of International Affairs.*
Oxford University Press. 402 pages. 48s.

MR BALFOUR and Mr Mair write as insiders, as men who took part in the four-Power control, the one of Germany, the other of Austria. Three of the powers subscribed to liberal democracy, the fourth to dialectical materialism. The term "democracy," however, was used by all—only with different connotations. Apparent verbal agreement veiled disagreement over real aims. And the definition of words may in the end mean the delimitation of spheres of power—which shows how important it is to be clear about meanings.

The two stories in this book are dissimilar. This may be partly because the Germans pose such dreadful problems, the Austrians less so (though they can produce a Hitler). The Austrians were liberated, the Germans defeated. The Moscow declaration of 1943—both stories go back to the planning stage of Allied occupation policy—called Austria "the first free country to fall a victim to Hitlerite aggression." But even then the Russians had already staked their claim for reparations: they had insisted on the inclusion in the same declaration of a reference to Austria's responsibility for taking part in Hitler's war. The effects of this inclusion persisted into the State Treaty of 1955, which ended the occupation of the country. But despite economic spoilation by the Russians Austria was lucky; from the beginning its people had their own "all-Austrian" government, remained united, and is now free. The country may owe its luck to its small size. Germany was a greater prize, and here the Russians proceeded more methodically (the book does not quite convey how methodically). They were helped by the French, who prevented the setting up of central German agencies.

Mr Balfour is concerned to point out that the notion of collective guilt was a German invention and that the Allies never spoke of anything more damning than collective responsibility even in Germany. But then he describes their initial determination to impose a "hard peace." He discusses the possible merits of a revolutionary peace, that is, of the imposition by the victors of a new social structure such as was achieved by the Russians in their zone. But he rejects the idea that states of mind depend decisively on environment. The West was pledged to a removal of "the psychological roots of German aggression." Any such operation requires a precise diagnosis of the evil. The author's reference (admittedly after speaking of the emergence of Christian Democratic parties in other European countries) to the Protestant and Catholic churches' common resistance to "fascism" makes one wonder. Why fascism? National socialism was a different, a much nastier phenomenon.

After diagnosis comes the question of cure. European integration as the therapy for the German psyche (possibly the only one) belongs to a later period than that described by Mr Balfour. What the two authors present is a clear and very useful account of what needed to be done in the early phase, what was done, and how. This is given with a high degree of reliability.

SHORTER NOTICES

Italy

By Gerardo Zampaglione.
Benn. Nation of the Modern World Series. 282 pages. 30s.

To write a general survey of Italy, past and present, in under 300 pages is a tall order indeed. Signor Zampaglione has produced a useful book, but he would have produced an even more satisfactory one if he had not tried to combine survey with apologia. The reader ends by feeling that the author protests too much, and that he has failed to realise that he can count on a preponderantly sympathetic audience in England.

In discussing, for instance, the part

The Union of Burma

A Study of the First Years of Independence

HUGH TINKER

As an underdeveloped country hoping to achieve rapid industrialization and self-sufficiency, Burma's experiences provide evidence which no one interested in comparable areas of the world can ignore. This study exhibits a society under stress and examines many of the consequences in cultural, economic, and political change. Most of the material presented here has not appeared previously in print, and has not been available to the public, even in Burma. 42s. *net*

OXFORD UNIVERSITY PRESS

played by Italy during the first world war, he is, quite naturally, much concerned that Italy's contribution to the allied victory should be given full recognition (he mentions three times in six pages that it has been under-estimated), but he fails to give a clear picture of the very divided war aims of the different Italian political groups at that time. His anxiety to present his country always in the best possible light sometimes involves him in inconsistencies. He is obviously a sincere democrat and a strong opponent of fascism. In his concluding chapter he hails the gradual disappearance of colonialism as a moral achievement with far-reaching consequences. But all this does not prevent him from justifying Mussolini's annexation of Abyssinia as "legitimate expansion." (Mussolini's flirtations with Hitler, however, were "bad statesmanship.") Why, he says, should Italy be deprived of the benefits of colonialism just because it had achieved unity late and "had been unlucky" in its first attempts at colonial expansion?

The first part of the book deals with the story of the *Risorgimento* and the history of united Italy up to 1945. The second part deals with postwar Italy, and includes chapters on foreign policy, economic matters, the south and relations between church and state. The author provides much useful information, but does not give a sufficiently clear picture of the particular political and economic problems confronting Italians today—for instance, the frustration that many moderate left-centre Italians feel at the lack of a strong, genuinely democratic, socialist party. It is also a pity that, although there is a good map, the index should be confined to proper names.

★

Economics of Plantations

By W. E. Hiley.
Faber. 216 pages. 25s.

The purpose of this book is to convince students that some of the accepted practices of forestry are uneconomic, and that the study of forestry economics can substantially influence productivity. Although the techniques described are not original, it is claimed that their application in solving the practical problems of forest management and policy is new. However, from the frequent references to his earlier writings, it is clear that they represent a consolidation of earlier and consistently held ideas: the long production period means that compound interest plays a dominant role and the rate of interest is a measure of the productivity; influential factors in the economic cultivation of forests are land fertility and methods of thinning, yet good land is seldom used in afforestation and the influence of thinning methods have not received adequate attention in the past. The value of relating the thinning methods to the simple criterion of the pattern of annual growth rings is a good example of an economics technique applied to a technical problem.

The scope of the book is broadly described as how to grow timber as profitably or as cheaply as possible. Much is made of the importance of compound interest in the economic calculations, but it would have been worth emphasising that once a forestry enterprise is built up into a "flow resource," net revenue can be gauged in terms of simple interest on the capital value. Apart from supplying students with an understanding of the special complexities of forest finance, the book will show potential investors in tree-growing what considerations they will have to face and what methods they can adopt in forming estimates of future return. It is no mean task to attempt to marry the complex biological requirements of good silviculture with the economic considerations, especially as the essential measurements are not always available. In these circumstances the author has to be congratulated in developing a line of thought that carries conviction.

LETTERS

Surplus Rather than Energy

SIR—You think that the general principle that should underlie the investment allowance is that there should be a flat rate encouragement for all types of capital development. You appear to mean that there should be a flat rate allowance for all types of fixed asset and hence you criticise a discriminatory doubling of the allowance on ships. But a flat rate allowance on all types of fixed asset will not provide a flat rate of encouragement to investment in all types of asset. To accomplish that objective, the availability of funds for, and the expected profitability of, different types of asset must be improved by the same proportion. Obviously no complex of rates can be devised to do this perfectly, but certainly a single flat rate is not the answer.

The truth of the matter is that all capital allowances involve inequities between classes of taxpayer and this is true of the various schemes of accelerating allowances limited to original cost as well as those which, like the investment allowance, provide for allowances in excess of original cost. Whether such inequities should be accentuated to promote fiscal objectives is another question, but it is noteworthy that capital allowances seem to excite less complaint of tax inequity than one might expect. So long as the "gentlemen in Whitehall" wish to exercise a selective influence on investment, capital allowances are probably a less objectionable way of doing so than the much more rigid and administratively difficult alternative of physical controls.—Yours faithfully,
London, S.W.15 A. F. EARLE

Talking Turkey in Kashmir

SIR—May I offer one comment on the report of your correspondent in your issue of March 16th? The Indian General Staff seem to assume that Laddakh would go to India in certain circumstances, and from this unwarranted assumption they make out a case that they ought to control the lines of communication through the Srinagar Valley in order to keep out Chinese infiltration.

In the first place there is no reason whatsoever why Laddakh should go to India. In accordance with the 1941 Indian Government census, the population of the Laddakh District was 195,431, of which 154,492 were Muslims. Of the 40,939 non-Muslims, the majority were Buddhists. Since there are in Pakistan more Buddhists than in India, there is no reason why these few thousand Buddhists should not choose Pakistan.

Again, if the object is to prevent infiltration, then I suppose Pakistan is better qualified to deal with it than neutral India. Furthermore, it is difficult to conceive why the Chinese should infiltrate through the remote passes, some of them the highest in the world, and closed for the better part of the year, when they can easily get anywhere in India without let or hindrance.—Yours faithfully,
S. M. HAQ

Towards Collective Defence

SIR—In your article of April 18th you use the adjective "military" to describe the fiasco of Suez. I am surprised to see you slipping in this direction.

It is always easy to blame those who cannot speak up for themselves and it will be interesting one day to read the full story and see where the blame really should lie. I feel that on that day many from whom we have heard a great deal since October 29th will not be so confident that their loud-spoken opinion did anything except accelerate the fiasco.

Unlike some of the louder-mouthed, the fighting services have at least never faltered in their loyalty to their country and therefore I beg you, Sir, not to descend to easy insinuation against the efficiency of those who, in spite of endless restrictions, brought off a remarkable feat of arms only to be deprived of complete success when within twenty-four hours of their wide-open goal.—Yours faithfully, J. NELSON
London, S.W.3

Cyprus After the Storm

SIR—As the partition of Cyprus is being freely mooted, may I advise that when the time comes to divide Gibraltar into two self-contained flats, the Spaniards, with their predilection for cooking with garlic, should be allotted the upper half.—Yours faithfully,
London, N.2 GEORGE SCHWARTZ

DEVELOPING OUR RESOURCES

INCO NICKEL puts a landslide to work

A triumph of mining skill has given the world thousands of tons of one of the most vital of modern materials—nickel. At their Creighton Mine, in Northern Ontario, Inco—The International Nickel Company of Canada—have successfully developed lower grade ores, not worth mining in the ordinary way, by a method known as 'panel caving'. In caving, a vertical 'slice' of the sloping ore body to be mined is undercut and, as the material from a previous slice is drawn out, the unsupported ore fragments and crumbles. Drawing continues, the 'caved' seam settling continuously. The broken ore is treated in a crusher 2,000 feet below the surface, and carried over a quarter of a mile on conveyor belting to the vertical hoist shaft. After the ore has been concentrated, it is pumped through a pipeline 7¼ miles long to the smelter.
This lower-cost bulk method of mining is typical of the efforts made by the Inco-Mond organization to ensure for industry the maximum yield of metal at the lowest possible cost. It is only one page from a story as fascinating and romantic as any in modern history.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Lull in the Boom

WASHINGTON D.C.

AMERICAN businessmen, like their European counterparts, have a marked capacity for pessimism. Their hearts flutter nervously and their heads wag knowingly with every report of a decline in the stock market, a layoff in an automobile factory, a fall in the number of new houses started in a month. One sturdy representative of the breed, the respected president of a large corporation, predicted to the chairman of the Federal Reserve Board last spring that if the bank rate were raised again—as it subsequently was—there would be between 9 million and 10 million unemployed by August. Recently, when the *Wall Street Journal* reported, with something less than complete accuracy, that in Washington the authorities now feared deflation more than inflation, businessmen in New York reacted with: "Well, I'm glad to see they're waking up to the situation down there."

Government economists may feel, as most of them do at the moment, that business is much better than business sentiment makes it out to be, but they are also aware that this pessimism may create an uncomfortable situation for the authorities. It is the sort of climate that leads to increasing pressure for relaxation of the restraints on total demand which the government has now been applying for about eighteen months. Mainly, the pressure is likely to be directed at monetary restraint. The chairman of the Federal Reserve Board (the central bank), who believes that inflation is still the main problem facing the economy, feels that the present lull is "the most critical period in the fight against inflation." He knows how difficult it is to justify restraint when the current economic indicators demonstrate some softness in the economy and when the immediate inflationary threat has clearly evaporated.

What, in fact, is the current situation? The economy has been accurately described as "moving sidewise" for about four months. The Federal Reserve Board's index of industrial production was the same in March as it was in October, and it would have showed a small decline but for the increase in petroleum output as a result of the Suez crisis. The gross national product—a better indicator of the general economic situation—barely inched upward in the first quarter of the year, according to preliminary estimates, and most of the rise is probably attributable to higher prices. The motor industry is making and selling cars at about the same reduced rate as last year. House building is in a genuine recession with new starts in March at the lowest rate since 1949, though total construction activity is still at near-record levels. Wholesale prices have finally stopped rising and the average is now about the same as in January. Perhaps most important, business has sharply reduced the rate at which it is adding to its reserve stocks of goods and materials.

The point about all this, however, is that the worst the pessimists can claim is that the economy, as a whole, has stopped growing, not that it is actually receding. True, an onslaught of statistics comes from the left showing that the annual growth in productivity, combined with the growth of the labour force, should lead to a persistent rise in the gross national product of at least 5 per cent every year. This embattled band, led by President Truman's chief economic adviser, Mr Leon Keyserling, feels that every quarter in which the gross national product fails to rise by the prescribed percentage brings the Russians nearer to victory in the cold war. In a situation like the present, the left and the more vociferous of the business pessimists—such as the National Association of Homebuilders—join forces, cry alarm, and urge an immediate end to "tight money." Yet somehow, despite some statistical legerdemain, these people cannot quite make out a convincing case that the economy is in real trouble.

★

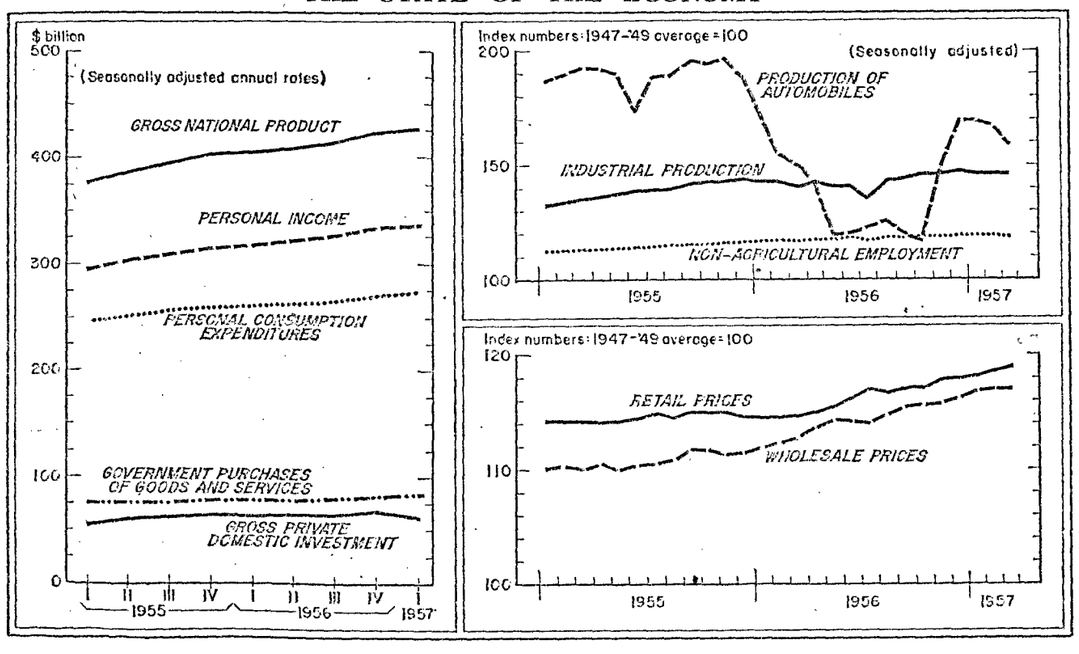
The reasons are obvious from the front pages of the newspapers: two weeks ago it was total employment which was at another record high in March, with unemployment still only about 4 per cent of the labour force. A few days later it was personal income which reached a record. Then over last weekend came the preliminary reports on gross national product, which scarcely looked like a slump. Meanwhile, all the underlying forces of demand continue to show strength, though not the exuberance of 1955 and 1956. From present indications, consumers, government, business investors and foreign buyers will all spend more in the aggregate this year than last.

To officials of the central bank, who have spent most of their time in the past two years trying to inject a note of sanity into the psychology of boom, this is a situation in which the chief danger is that the economy will take off again toward the stratosphere, not that it will sink gently into recession. To the sceptic who asks where the renewed upsurge of inflationary demand is to come from, they reply that in each of the past two years the degree of upsurge—once from consumers and once from business investment—was badly underestimated in advance, and that they "just have a feeling" that the push will come again from some unexpected quarter.

This caution is reinforced by two recent events. One is the sudden spate of tax-cutting talk—quite serious talk—in Congress. It is now as certain as anything can be that there will be a reduction in personal income taxes to take effect next January, whether the Bill passes late this session or early next, and therefore that consumers will soon have still more money to spend. The second is a technical

problem associated with the management of the government debt which has produced a rather sharp increase in the money supply. The problem resulted from the almost simultaneous decision of thousands of holders of wartime "F" and "G" savings bonds—bonds in large denominations held by large investors—to cash them and to invest the money in more recent government issues and other places where it could earn more attractive yields. This created a serious cash problem for the Treasury during the winter months, and it was forced to resort to the banks for ready money.

The problem was made worse by the recent heavy drawings upon the International Monetary Fund, which, while they do not affect the American budget or taxes, do affect the Treasury's cash position. The result of it all was an unwanted expansion of $2.3 billion in bank credit in March alone. The Federal Reserve system, in effect, had to bolster up bank reserves—both by open market operations and by a liberal policy of lending through its "discount window"—more than it would have liked, simply to help the Treasury over its difficulties.



There should be no mistaking the seriousness with which the government as a whole, and the Federal Reserve Board in particular, viewed last year's 3 per cent rise in prices. There is little disposition in the government to accept the thesis of Professor Slichter of Harvard and others that in today's American economy the lesser evil is to accept a creeping price rise of perhaps 2 per cent a year as a sort of insurance against unemployment. In the present situation, the "Fed" will not be entirely satisfied until a significant proportion of prices actually declines, to offset those which for various reasons concerned with costs and productivity must be expected to continue rising. In short, a stable level of wholesale prices is not quite good enough; the central bank will not feel it has wrestled the devil inflation to the ground until the index shows a convincing drop.

Mr Dulles's Menu

At his press conference on Tuesday the Secretary of State put a little meat on the very bare and rather stale bones of the basic concepts—peace, justice, liberty—underlying American foreign policy which he had set before the annual luncheon of the Associated Press on Monday. The only juicy mouthful in his speech had been his account of the conflict of loyalties which arose over the middle eastern crisis last autumn, when the United States felt obliged to put its pledge to renounce force under the United Nations Charter before its historic ties to Britain and France. Now, in pursuit of a peaceful and just settlement, Mr Dulles feels the time has come to report to the Security Council on the long-drawn out American negotiations with Egypt over the operation of the Suez Canal. But apparently he does not intend to press for any action in the council—an omission which makes it doubtful whether the report will in fact do much to advance a settlement in the Middle East.

Similarly, in the case of Jordan, Mr Dulles's expression of confidence in King Hussein will not be of much practical help in preventing Jordan from "falling under the dominance of other countries," particularly since it has been emphasised that the Administration does not consider that any of Jordan's neighbours, even Syria, are "controlled by international communism." This means that the United States is not committed under the Eisenhower doctrine to use force to preserve Jordan's independence or King Hussein's throne—even if he should ask for such aid. Thus all that the King can expect from the United States is behind-the-scenes pressure on Saudi Arabia to continue supporting him and, if nevertheless Jordan is attacked, an American effort in the United Nations to make the aggressors withdraw.

THE STATE OF THE ECONOMY

On other less urgent matters, however, Mr Dulles was a little more promising, perhaps in response to the friendlier winds which have recently been blowing from Moscow. At his press conference he held out some slight hope that it might be possible to stop testing hydrogen bombs; in his speech he had declared categorically that controls on armaments were not only possible but "in the last reckoning indispensable" and that they need not "encompass everything at once." He had also talked once again at length about the liberation of satellite countries from Soviet domination; he has now made it clear that he meant only "peaceful liberation," but that this is something which must always be an issue between the United States and the Soviet Union. Finally, even before Mr Dulles spoke of promoting "the interchange of goods to mutual advantage," the United States had at last proposed some modification in the embargoes on trade with Communist China which have irked its allies for so long; these are discussed in detail in a Business Note on page 334.

How to Cut a Budget

Last week President Eisenhower was twice rapped over the knuckles for the extravagance of his budgeting: his conservative elder brother "who has been criticising me since I was five years old" could be dismissed with a laugh, but it was more serious when Mr Per Jacobsson of the International Monetary Fund said that, in the interests of a stable world economy, the United States should not let its foreign aid programme stand in the way of a possible fall in government outlays. However, it was not this criticism but a realisation that the enthusiasm for budget-cutting in both Congress and the Republican party was getting out of control which led the President to send his own proposals for reducing government spending to the Speaker of the House of Representatives.

The President's letter was a tactful lecture on how to set about cutting the Budget without jeopardising the national security and on why the House's efforts so far will have little if any practical effect on actual expenditure in this or any other fiscal year. The money to be spent in the 1958 year, which begins next July, is already committed either by law—ex-servicemen's pensions, for example—or under authorisations for future spending approved by Congress in past years, as in the case of aircraft contracted for long ago which will have to be paid for when they are delivered next autumn. Most of the cuts made by the House will therefore have to be put back either by the Senate or by later supplementary appropriations. Nearly all the cuts which Mr Eisenhower now feels can be made in the Budget which he submitted last January are in appropriations which will not affect spending before the 1959 fiscal year. Congress is still talking of a reduction of $3 or $4 billion but the President's recommendations amount to only $1,858 million; they include $500 million less for the military part of foreign aid, a similar cut in American military procurement, which would only be a deferment and would involve less efficient forward planning, and smaller reductions in funds for housing and public works.

Then Mr Eisenhower threw budget-cutting back into Congress's lap by telling the House how it could improve the situation by doing things which it has always refused to do: by raising postal rates and charges for various other government services; by requiring states to participate in federal programmes for relieving disasters and for developing water resources; by considering the future, as well as the immediate, cost of programmes when they are initiated; and by rejecting public works projects which are put forward by local interests without the approval of government engineers. And in case such projects still creep into appropriation Bills, the President wants power to veto individual items without having to veto the whole Bill and thus leave an entire government department without funds. Presidents have been wanting this power for eighty years but Congress is as determined as ever not to make this concession to the executive.

How Not to Cut a Budget

It was typical of the mood which has prevailed during the present session of Congress that the traditional Easter recess was threatened not by any feeling among members that they had accomplished too little to deserve a holiday but by a squabble over money. For weeks urgently needed funds for public assistance and loans to small business men were held up because the House refused to provide metal subsidies on which Senators from mining states insisted until the last moment. There was some justification for the House's parsimony in this case, but little for the way in which it dealt with appropriations for the United States Information Agency, the last and the worst of its fund-slashing performances before the recess. Three separate appeals from the President, who cannot on this occasion be criticised for failing to fight for his programme,

"It's No Bunny"

Herblock in the *Washington Post*

made no impression on a House determined to cut $38 million—26 per cent—from the $144 million requested for overseas propaganda next year; another $47 million was taken from the $228 million requested at the same time for the State Department.

It was clear that Congressmen were thinking only of saving as much money as possible in a way which would cause no direct pain to their constituents. For the USIA is left free to adapt its plans to its lack of money as it chooses—except that it may not add to its present almost farcical entertainment allowances. If by selective cuts the House had tried to improve the agency's operations, the attempt would have been received with some sympathy even by those who believe most strongly that a little money spent abroad on countering communist misstatements and spreading the American point of view will do far more to foster peace than a lot of money spent on armaments.

Mr James Reston, of the *New York Times*, speaks for many when he argues that the USIA might achieve more if it changed some of its methods. But, as he points out, its main difficulty is that it has had no responsibility for the policy which it has to try and explain to the world. Now, however, the agency has recently been given a new head, Mr Arthur Larson, a dynamic intellectual who has the ear of the President and more influence than his predecessors in the places where national policy is made. For this reason it is particularly hard that he should now be hampered by lack of funds. Moreover, Mr Larson's "modern Republicanism" is unfortunately so suspect among the conservative Republicans who dominate the Senate Appropriations Committee that they may refuse to allow that committee to repair even a little of the damage done by the House.

Airways for Tomorrow

IN 1946, six billion passenger miles were flown by commercial airlines in the United States; last year the figure was 20 billion, and by 1975 it is likely to be 70 billion. There is not expected to be any great increase in the number of commercial airliners—there are about 1,500 in operation today—but they will be larger, carrying an average of 100 or more passengers instead of 40, and faster, making many more landings a day than they do now. On top of this, there will probably be double the present number of 61,000 private aircraft flying by 1975. Already there can be as many as 220 aircraft in the air at one time in the neighbourhood of a major city and in the last four months of 1956 452 "near collisions," almost four a day, were reported, about three-quarters of them when visibility was good. There is thus a solid statistical basis for the growing concern lest the country's airways may become as overcrowded and as dangerous as its highways.

This concern, unfortunately dramatised every few months by a serious air disaster, has led to a proliferation of administrative and congressional studies on how to ensure both safety and speed in the air. At first sight the latest proposal from Mr Edward Curtis, the President's special assistant for planning aviation facilities, seems to be no more than a request for yet another committee to stir a broth which has already been cooking since 1948. But Mr Curtis's three-man Airways Modernisation Board is intended to test, and to choose between, various new methods of regulating military and civilian flying. He insists that it is traffic controls at the airports which are at fault, not the actual lay-outs of the airports themselves. He has found "an over-abundance of electronic systems . . . to improve our terminal and *en route* operation," but he has also found an over-abundance of government agencies studying aviation problems with no one having sufficient authority to decide which improved system of control is best.

If Congress approves the new board, it will only be a temporary organisation and it will be left to other agencies to acquire the equipment and to set up the system which it recommends. Mr Curtis goes out of his way to praise the recent efforts of the Civil Aeronautics Administration to expand its existing radar facilities in order to reduce the dangers and delays in air traffic; the programme begun last year, to be completed by 1961, has now been expanded and its estimated cost stepped up from $246 million to $810 million. But on his final report, coming shortly, Mr Curtis nevertheless intends to propose a drastic change in the governmental organisation for dealing with aviation.

Indian Spending

FROM A CORRESPONDENT IN COLORADO

THINGS are looking up for the 80,000 Navajo Indians, the largest, but until not so long ago among the poorest and most neglected, of all the American Indian tribes. The credit, however, is due more to the ironic compensations of nature than to man's benevolence. In 1868 8,000 Navajos were herded on to a reservation of 25,000 square miles in the southwest, mainly in Arizona and New Mexico, a huge tract but one which consists of some of the dryest and poorest land in the United States. The economy of the tribe remained almost wholly pastoral and the Indians and their animals multiplied until the resources of the reservation could no longer support them. Despite the conscientiousness of many federal officials and fitful attention from Congress, the Navajo became one of the most poverty-stricken minorities in the country, 80 per cent illiterate and racked by disease.

In recent years their plight has been alleviated. Congress approved a development programme to cost $80 million over ten years; many members of the tribe have been resettled outside the reservation; educational opportunities have improved and able Navajo leaders have emerged. About five-sixths of all Navajo children are now going to schools of some sort, and most of the 2,300 older children attending the government's special intertribal school at Brigham City, Utah, are Navajo.

Now geography has done still more for them. Underneath those barren acres are stored large reserves of uranium, oil and other minerals unknown and useless in 1868, but of vast importance to the industry and technology of today. One of the largest American uranium mills operates mostly with ores on which the Navajo receive royalties. Oil fields already in production are another source of income. Now the Navajo have, in the past few months alone, been offered about $35 million by oil companies, just for the privilege of exploring for oil on their lands, and more such bids are about to be opened. The Navajo themselves would prefer a half-share of the profits from any oil discovered, such as countries in the Middle East now enjoy, in place of the flat sum and the 12.5 per cent royalty on oil produced which is specified in the Act permitting them to lease their land. But such a change would mean taking a risk and the Department of the Interior has so far refused to allow the Indians to do this, on the ground that the law demands that all leases be awarded after competitive bidding.

In addition the Navajo will have the benefit of the $33 million Navajo dam, one of the larger units in the vast Upper Colorado Basin storage project, and one of the first to be built. It will generate no power, but will store water to irrigate some 80,000 parched acres of the reservation, and thus help some of the tribesmen to make the transition from flocks to farms. The Navajo also own the site on which the government is to build a town for workers on the huge Glen Canyon dam, which is just now getting under way, and they will be paid for it. Furthermore, plans are being discussed for a large timber project, which would harvest mature trees from the upland forests included in the reservation, for an electric power plant to be run by coal found on the reservation, and for other similar enterprises. One fund, of about $350,000, is to be used to interest industries in building suitable factories on or near the reservation. The Navajo who have been resettled outside the reservation have proved to be quick with their hands and adept at fine work and two small industrial plants have already been established near the reservation. The Navajo council is also discussing using some of its money for greater efforts in the fields of health and education.

However, with $30 million in hand, the coming meeting of the tribal council this spring will be able to make much larger plans. It has already spent a year or more in preliminary discussion. As one observer has said, $30 million is far from wealth if it is to be divided among 80,000 people. But as seed money for a planned economy and prosperity, it is potentially capable of mighty things if used as wisely as the Navajo hope to use it.

Storming the Brain Waves

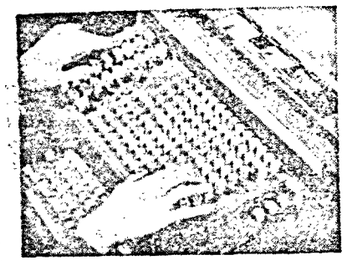
"BRAINSTORM," thanks to the advertising profession, no longer means a temporary fit of insanity, although there is perhaps a superficial resemblance between a day in a lunatic asylum and some of the brainstorming sessions which caught the fancy of leading American industrial companies a few years ago and are now winning favour in governmental and academic circles. The jargon too seems ludicrous—"creative ideation," "imagineering"—but to laugh at a new idea or to suggest that it is impractical is the only reaction forbidden to people "phasing in and out" of these "group thinks." The original brainstorming technique was to bring together a dozen or more persons, sometimes including outsiders and housewives as well as those directly concerned, and present them with a problem for solution: how to sell a new gadget or how to use an unprofitable by-product. The group then attacks the problem without any preconceived views on it, with rapid fire suggestions, the quicker the better; no one is inhibited from producing any idea, however ill-informed or fantastic.

What is supposed to result are enough brain waves—187 in 47 minutes on one occasion—to solve the problem. But it may take weeks of evaluating the secretary's notes or the tape recording to decide whether the session has in fact produced even one feasible proposal; at the most about 6 to 10 per cent are found to be applicable. Those who contend that brainstorming is not worth the trouble argue that in any case ideas are usually plentiful; what is lacking is the sustained imagination needed to apply them in practice. Another argument is that in fact the people who have genuine brain waves at a "buzz session" would have had just the same bright ideas if they had been left alone at their desks or machines. But to many of the industrialists who now use the technique, its main advantage is that it gives minor employees, who might otherwise feel isolated in a huge organisation, an opportunity to make a contribution to the company's development. The opportunity may in fact be used only to voice complaints but, even so, brainstorming is regarded as a better morale builder than the suggestion box.

It is hardly possible to make any accurate assessment of how many new ideas of commercial, or any other, value have actually been produced by brainstorms; but many companies are taking them seriously, even sending their staffs to college to attend courses in "creative thinking." The research institutes also arrange brainstorms for the benefit of their clients. Here the group, usually smaller, is composed of people who are experts, although not in the particular field under study; sometimes they evaluate their brain waves themselves or this may be left to the trained staff of the institute, with the commercial sponsors of the project receiving periodical reports. This is known as the "packaged brainstorm."

SHORTER NOTES

Mr Jack Soble, a Lithuanian who has become a naturalised American citizen, and his Russian-born wife, have now pleaded guilty to having conspired to obtain information relating to the national defence for transmission to Russia. This is only one of the six counts on which they were indicted at the beginning of February; they pleaded not guilty on all of them at that time. The change of plea, on a count which does not carry the death penalty as does the first count in the indictment, suggests that they expect to save their lives by co-operating with the government in its investigations of Soviet spy rings—an expectation which is likely to be fulfilled.



★

No sooner had President Eisenhower proposed an independent study of the country's monetary and fiscal system than it became obvious that such a study would be conducted by Congress if at all and on a definitely partisan basis. In the end, however, the investigation is to be undertaken, not by the liberal Democrats who wanted to turn it into an attack on the Administration's tight money policy, but by the conservatives of both parties, led by Senator Byrd of Virginia, who dominate the Senate Finance Committee. Even so, the study, which begins shortly, is likely to concentrate much more on the immediate questions of taxation and debt management than on long-term developments in financial institutions, which was what the President proposed.

MACHINE AND PLATE SHOPS

in fast growing Eastern Canadian town

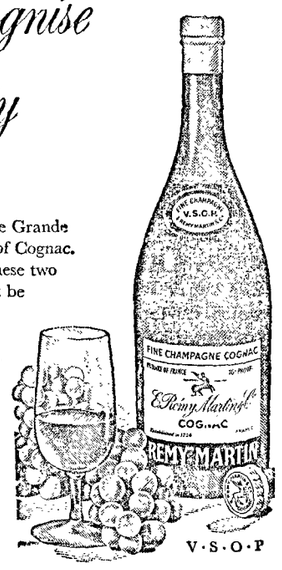
A MANUFACTURER of Industrial equipment who wishes to retire after many years of extremely successful operation desires to correspond with party interested in carrying on well established and extensive operation in centre of rapidly developing mining and industrial area.

The plant, which consists of a modern and well-equipped machine shop and two fully-equipped plate shops, all with electric cranes, is capable of manufacturing mine cars and other mining equipment, pumps, snow-plows, bulldozers, pressure vessels, fabricated structural steel, heating boilers and also various types of equipment for nearby pulp and paper industries.

Electric power, skilled labour, rail and port facilities as well as land and additional labour required for expansion are readily available. The plant contains 45,000 square feet of floor space in modern fire-proof buildings. The present day valuation of land, buildings, machinery and equipment is estimated at close to $1,000,000.

Company's growth and development has been financed mainly out of retained earnings. Working capital is ample for present needs and to finance some further expansion.

Management staff and loyal and skilled labour force will continue with new owner; and principal shareholder (in early 60's and excellent health) who founded business and is chief executive, would also be willing to continue in whole or partial management capacity during transitional period, if desired by purchaser.



Interested parties should write Box 676 The London Economist.

How to recognise fine Brandy

V·S·O·P

The finest brandy comes from the Grande and Petite Champagne districts of Cognac. Only Cognac originating from these two areas, at least half of which must be from the Grande Champagne, is entitled by French law to be called Fine Champagne Cognac.

Remy Martin produce Fine Champagne V.S.O.P. Cognac and *nothing less good*. They only offer for sale Brandy which has reached perfection. That is why when you insist on Remy Martin you can be sure of getting *a really fine Cognac*.

Nigeria Prepares to Parley

FROM OUR SPECIAL CORRESPONDENT IN LAGOS

NIGERIA'S big three, the Sardauna of Sokoto, premier of the Northern Region, Dr Azikiwe, premier of the East, and Chief Awolowo, premier of the West, have "hung heads" together in Government House and come up with the happy announcement that they are agreed on demanding independence in 1959 at the London conference next month. Since independence was approved in the House of Representatives on March 26th this was the inevitable outcome of the premiers' talks. The question is what else have they agreed upon? Will independent Nigeria be a loose confederation of the three regions; a close federation on present lines; or a unitary state with a strong central government? The premiers may have settled the agenda, but this is a long way from agreeing on detailed proposals.

If the premiers anticipated a hard fight with the Colonial Office there would be more sense in hiding their hand. But as they know quite well, no such fight is in prospect. What the Colonial Office wants from the Nigerian leaders is the outline of an agreed and reasonably practicable scheme. In the past it was possible to temporise and leave the most thorny problems—revenue allocation or the control of the police—unresolved in the hands of British officials at the centre. But this is the last lap, the final share-out of power.

All the parties are sending delegates to the conference. Of the three main parties, the Northern People's Party is most intent on increased regional powers. The Action Group, in power in the West, is committed to regional self-government this year; in the East its supporters, who are in opposition, want to break down that region into smaller states. Dr Azikiwe's National Council of Nigeria and the Cameroons, in power in the East, also favours the "creation of states," but not unless the North will also submit to dismemberment. Then there are minor groups such as the United Middle Belt Congress, which exists to split a mainly pagan middle state off from the Moslem North; the Northern Elements Progressive Union, which is anti-chiefs and anti-feudalism; the Conference of Chiefs, which is pro-chiefs and pro-feudalism; and finally there are three Cameroons parties, the most important of which favours an independent Nigeria, provided it pays the Cameroons' financial deficit, until such time as the British and French Cameroons can join to form an independent republic.

This babel of voices ought not, however, to obscure one important advance. Nobody after the Lyttelton conferences in 1954 could have predicted with certainty that three years later Nigeria would want to remain a single state. Yet this has happened; the regions have even agreed on a federal franchise—adult suffrage in the East and West; manhood suffrage in the North, which keeps its women in purdah. There are several reasons for this new sense of nationhood. One is the growth of a sense of federal power and dignity among Nigerians in public life and in the public service. Another is the example of Ghana, which has suddenly shown up regional self-government for the makeshift it is, and has kindled the ambition to create a new West African state beside which Ghana would be very much the "small brother" in both world and African affairs. Chief Awolowo has said his work is done in the West and has indicated that he might transfer to the centre—a big change in attitude.

The pressure of Nigerian professional and middle-class opinion is another reason for the swing towards federation. This has helped to force the Northern Emirs to face independence in 1959. The tribal jealousies, which tend to break up regions, combine with more sophisticated intellectual attitudes to weaken the regions and strengthen the centre. So do party rivalries in the south, where the NCNC stirs up agitation in the West for the creation of a non-Yoruba "Mid-West state," and the Action Group replies tit-for-tat by encouraging pressure in the East for a non-Ibo "Calabar-Oguja-Rivers" state. Ironically enough, the Zikist doctrine of a unitary state is making headway at the moment when Dr Azikiwe himself is having to fight hard to retain his grip over his own party and keep alive his own slim chances of Federal leadership. Mr Tafawa Balewa, now Minister of Transport, is tipped for the post of federal prime minister.

But regional feelings will be strongly represented at the conference. And once the regions start bargaining, the hard fact will emerge that everything they want tends to weaken the federal power. For instance, the regions want

control of the police, which in the opinion of some British officials would make the task of the governor-general or the federal prime minister extremely difficult. They are completely at odds on finance—the North and West wanting the revenues to be apportioned according to derivation (if it can be ascertained) and the East and Cameroons wanting it shared according to need. In this battle, the federal power is almost certain to lose control of finance.

Nobody wants the federal centre to wither away, but if it is to be avoided the regions must all make big concessions. The Nigerian front in London is likely to be a ragged one, which prompts fears here that the British will use these disagreements to postpone independence. There is a strong likelihood, in fact, that the Nigerian delegation will end by proposing that the conference should merely make interim decisions about a purely African federal council of ministers, and relegate the states problem, the fiscal share-out, the public service and law and order to a series of commissions. But 1959 is not far off, and unless decisions are taken now, the danger is that there will be no agreement on the structure of the state to which sovereign powers are to be transferred. And that might be fatal to the tender plant of Nigerian nationhood, which is now just showing above the soil of tribalism, illiteracy and provincialism.

Revulsion in Jordan

FROM OUR CORRESPONDENT IN BEIRUT

Wednesday

EMBOLDENED by the flight of General Ali Hayyari to Damascus and by the evident signs of confusion in the Jordan army, the left-wing parties have shown their hand.

A strike movement that developed this morning quickly led to violence and early clashes between rioters and the police, and resulted in several casualties among the latter, including four in Amman alone. Demonstrations also flared up in the West Bank cities of Jerusalem, Rammallah, Nablus, Jenin and Tulkarm, attacking the Khalidi government and the Eisenhower doctrine and carrying Egyptian, Syrian and Jordanian flags. A strike movement began, despite the agreement of left-wing leaders to give the government twenty-four hours in which to study the latest demands advanced by the left-wing parties. This suggests that the control of the movement by its leaders leaves much to be desired. In fact, there is every indication that a thoroughly ugly situation is developing with the prospect of a head-on collision between the mob and the army.

This new phase in the Jordan crisis began with the presentation to the government, under threat of strike action, of demands elaborated by the national steering committee of the left-wing parties during their conference at Nablus. The National Socialist party, of which Suleiman Nabulsi is the leader, was represented at the conference; and the fact that its representatives acquiesced in the demand for the government's resignation, despite Nabulsi's acceptance of the portfolio of foreign affairs, is a measure of the strength of the reaction from the left that has developed since the weekend. It is clear that the National Socialists either condemned the action of their leader, or felt compelled to go along with the other left-wing parties for fear of losing their mass following to more extreme groups—the Baath Socialists and the National Block.

The demands that were presented to the government by the representatives of the national steering committee yesterday could scarcely be more comprehensive. They included the resignation of the Khalidi government, its replacement by a government based on political parties, the rejection of the Eisenhower doctrine, the adoption of a policy of "positive neutrality," a purge of the civil service and the release of army officers now under arrest for the part they are alleged to have played in the Zerka conspiracy against the Palace. In fact, the left wing is demanding a return to the position of lunchtime on April 10th, when the former government of Suleiman Nabulsi was still in the saddle and pressing the King hard.

The only possible difference might lie in the position of Suleiman Nabulsi himself. After his apparent attempt at compromise with the Palace by accepting the portfolio of foreign affairs in the Khalidi government, the Left may well regard him with suspicion and insist on party government under a different prime minister. A National Socialist speaker addressing the demonstration in Amman announced Nabulsi's resignation from the government.

There is every prospect that under resolute leadership the left-wing masses can wear down the resistance of the loyal elements in the army, and thereby force a decision in their favour which would leave the King in a most precarious position. Spectators of the Amman demonstration noticed several government officials taking part. The King may face a choice between abdication and virtually complete submission to those elements which he has hitherto shown every determination to extrude from the government of the country. Even before that painful choice is put before him, he must decide whether to seek yet another compromise on terms still more unfavourable to himself—or to throw the weight of the army against the mob in a desperate effort to restore the situation to the position of last week. A decision in the latter sense would clearly mean serious bloodletting. (*The fall of the Khalidi government, which followed, is discussed on page 293.*)

Germany's Outsize Easter Egg

FROM OUR BONN CORRESPONDENT

IN many west German gardens last Sunday the Easter Hare performed even more startling prodigies than usual. All sorts of elaborate toys were found in the bushes along with the traditional chocolate and painted eggs. In the adult world, innumerable newly hatched cars and motor scooters swelled the awesome southward flow of glittering traffic along the autobahns and the Rhine. Probably never have the flower shops bunched so many roses and carnations at 1s. 8d. a head. Only a few sourpusses—mostly bankers, economists, and big employers—viewed the Easter spree with some misgiving.

The wage increases that came into force on April 1st and the recent improvements in old age pensions and social insurance payments are raising the purchasing power of employees and dependants by some £1,000 million a year. The Bank Deutscher Laender estimates that this represents an increase of 15 per cent since the second quarter of 1956. Well over three million people are sharing in the new handout. For some 840,000 railway, post office, and federal, state and municipal workers, wages have gone up by 7 per cent. For 1,200,000 builders hourly pay is up by 10 per cent, part of which is meant to compensate for the cutting of the working week from 48 to 45 hours. At the same time the 45 hour week was introduced for a million textile and clothing workers, hourly rates being increased by 7 to 9 per cent for the former and by 8 per cent for the latter. Nor is this all. At the end of May a 45 hour week and a rise of ten per cent in hourly pay will come into force in the shoe trade and the chemical, paper, and ceramic industries.

It is much too early to determine what effect this distribution of largesse (the wrong word, perhaps, since many think the increases long overdue) will have on the givers and the takers; to predict how far extended automation can offset rising costs of production, and whether in fact the takers will in the end be any better off. But it is being pointed out that between 1955 and 1956 the west German worker increased his output on the average by only 3.4 per cent while that hour's work cost his employer 8.8 per cent more.

Some of the measures that are being taken or contemplated to stop the boom galloping headlong into inflation were discussed in *The Economist* last week. That the problem is engaging managerial as well as official minds is apparent from a striking three-quarter page advertisement published in all the major newspapers, in which 58 big consumer-goods manufacturers jointly undertake not to raise their prices before the end of the year. They include Agfa, Muelhens 4711, Faber-Castell, Bosch, Salamander (shoes), Henkel (soap and detergents), Beiersdorf (Nivea products), and last (but, as the warmer weather sets in, not least) the Dortmund breweries.

"The hour," the manufacturers declare, "demands from our firms, which are particularly dependent on the consumer's buying power, an active contribution towards keeping prices stable. Consequently we have decided not to raise the prices of the branded articles that we make for private use." Many other firms will feel compelled to follow this example. Already several big stores have sent telegrams to the Minister of Economics assuring him that they will do their utmost to keep prices steady and that they approve of his programme for opening west Germany more widely to competitive imports.

But there is doubt in the air. The 58 would-be benefactors end their proud announcement with the sobering observation: "Whether we can maintain our current prices beyond the end of this year does not rest within our power alone. Our prices are linked with the costs of production and marketing." Dr Adenauer's opponents have quickly fastened upon this warning, protesting that the campaign to keep prices stable is no more than an electioneering stunt organised by big business.

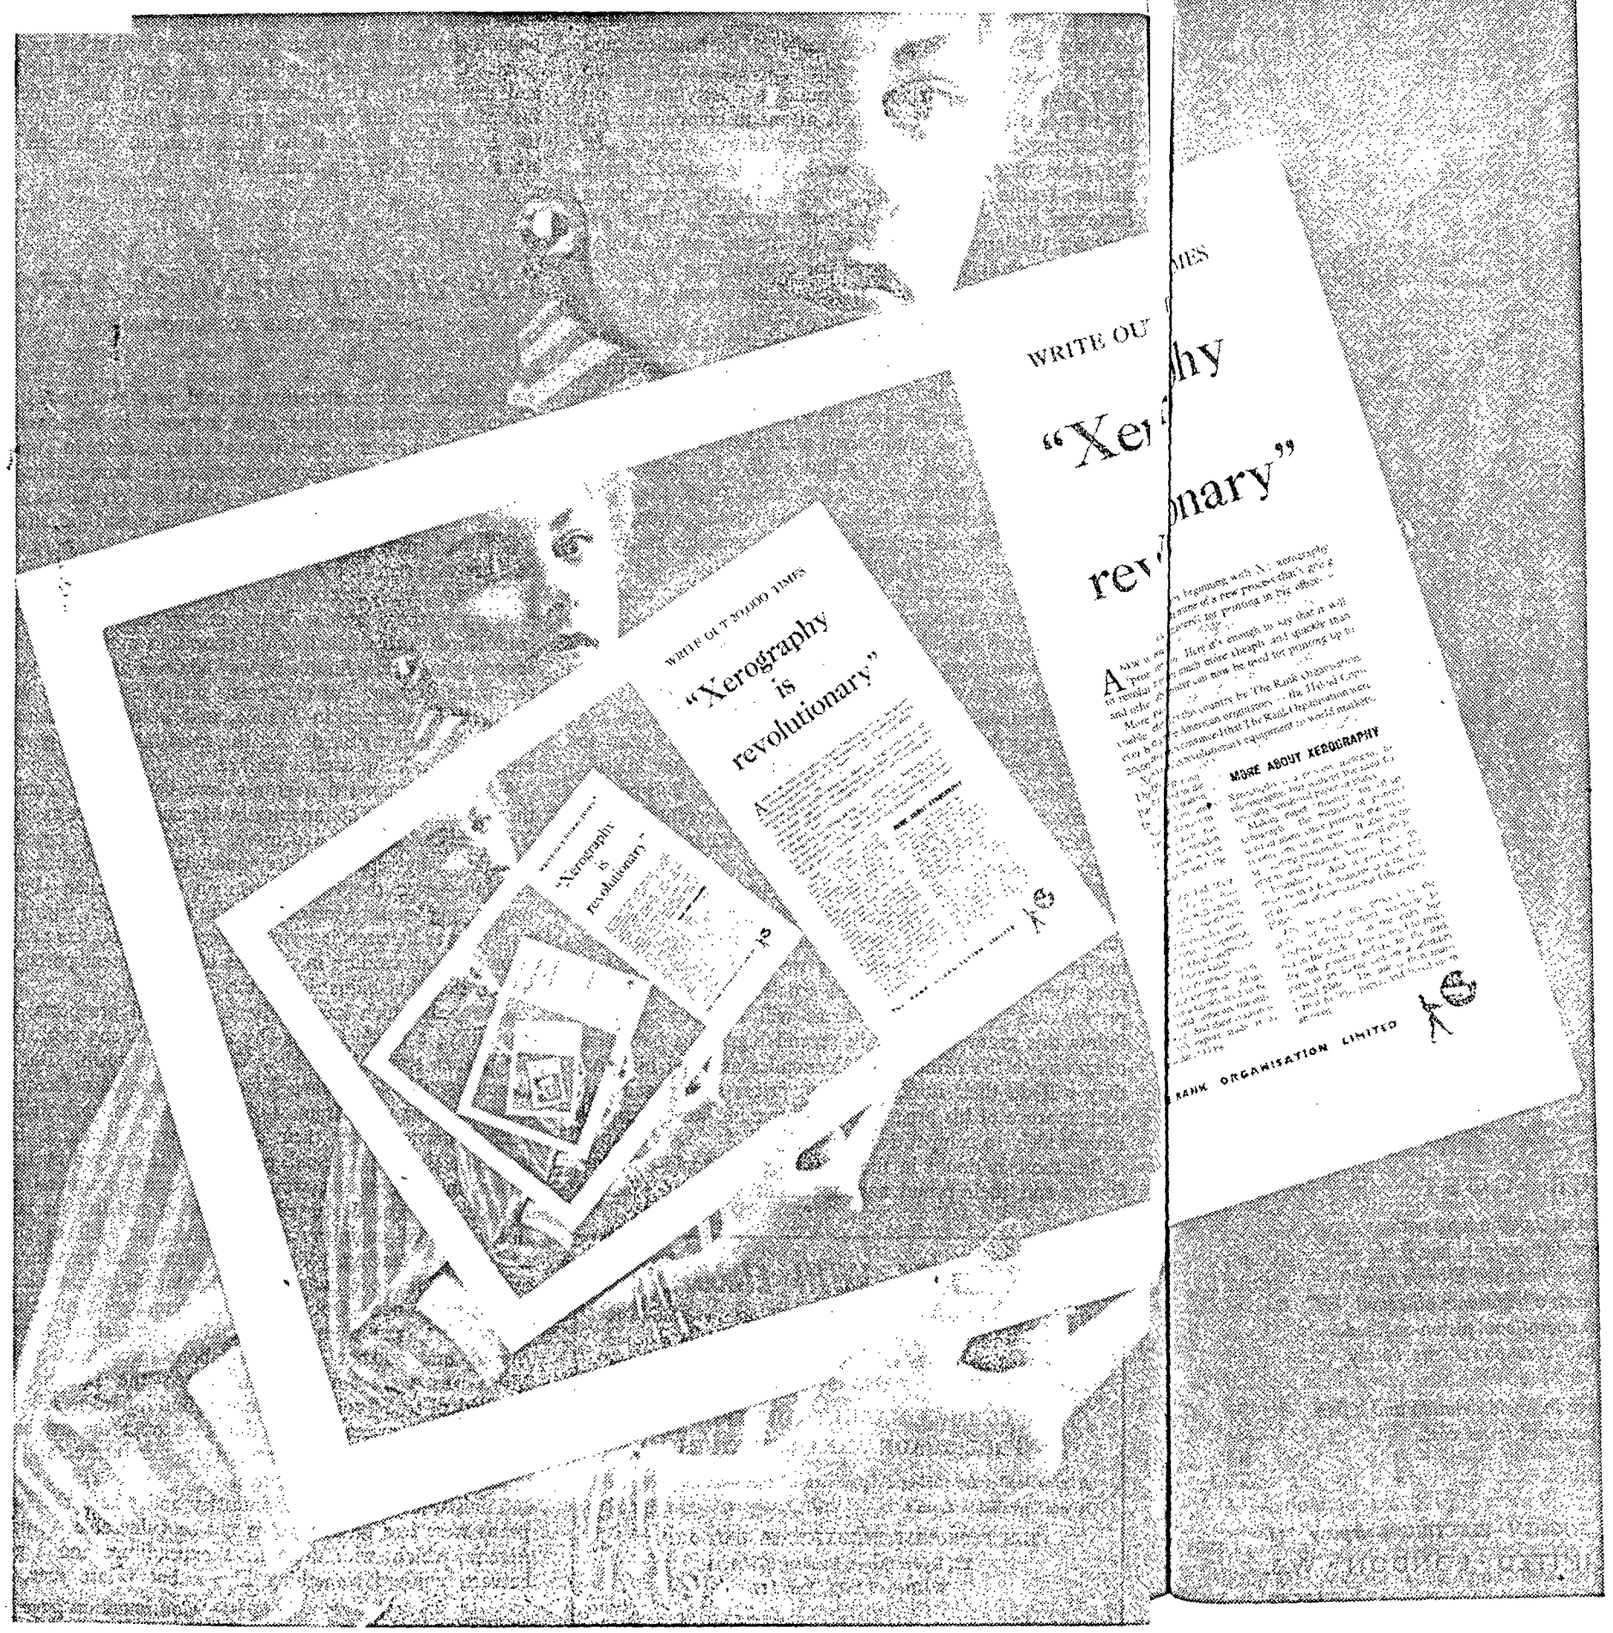
Migration from North Africa

FROM OUR PARIS CORRESPONDENT



So much anxious attention is paid to the obstacles the million French settlers raise to peace in Algeria that little has been given to the effects of independence in Tunisia and Morocco on the European settlers in these countries. Yet by March 80,000 of the 530,000 settlers in the two former protectorates had returned to France and the current flow is perhaps a thousand a week. Financially, even many of those who remain are now on the way out. Nearly £300 million apparently streamed last year from the oversea franc zone on to the domestic French money market, most of it from North Africa. Much of this enormous sum was military spending in Algeria finding its way home. But the economic substance draining out of Tunisia and Morocco also went to swell investment in France, and helped to maintain private loans last year despite the extra money the government drew off the capital market.

Half the homeward migrants have come from Tunisia, though the French community in Morocco is twice as large. Yet Morocco has suffered more. For Tunisia is speeding emigration by replacing three-quarters of the French civil servants—even the village postmen were French—by its own young men. Morocco, on the other hand, with relatively fewer literates, is trying to keep its Europeans; and is apparently succeeding in the case of government posts, but not in the vital industrial sector.

Morocco, which has excellent industrial prospects, was until 1954 a haven for tax-shy and trouble-shy capitalists. Casablanca resembled a New World boom town. But the insecurity the Europeans have felt since last October's massacres, the unwillingness of Moroccans to work well for French masters, and their constant wage demands have created a slump. The old, privileged life enjoyed by Europeans on salaries that would have been unimpressive in France, has been destroyed by inflation and heavier taxes. Badly needed engineers and foremen, as well as shopkeepers, are leaving. The bigger firms will remain, but several building contractors have decamped, lock, stock and barrel, to France. Out of 528 firms employing more than 50 workers, 122 were closed and 350 on short time in March, and 200,000 out of a labour force of a million Moroccans were unemployed. Even the farmers, the minority of true "colons," who now find it hard to sell their land at good prices, are tending to extract the maximum profit from it with little regard to the future, and are sending the proceeds to France.

Tunisia, which has little industry and where the Europeans were less productive, is not so vulnerable. And in Algeria, which, with the army's expenditure and a good harvest, enjoyed something like a boom last year, the

THE ECONOMIST APRIL 27, 1957

WRITE OUT 20,000 TIMES

"Xerography is revolutionary"

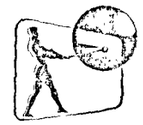
A NEW WORD joins the select company beginning with X: xerography (pronounced zerography). It's the name of a new process that's going to revolutionise the production of 'masters' for printing in big offices — and other organisations too.

More about xerography further on. Here it's enough to say that it will enable offset litho 'masters' to be made much more cheaply and quickly than ever before; and that even a paper master can now be used for printing up to 20,000 good copies.

Xerography was introduced into this country by The Rank Organisation. This need not surprise you. The American originators — the Haloid Company of Rochester, New York — were convinced that The Rank Organisation were the right people to introduce this revolutionary equipment to world markets.

'Rank?' you may say. 'But they make films'. Yes indeed. And for the past year we have been telling you about our film making, its problems and achievements. But one of the ways in which The Rank Organisation has tackled its problems has been to broaden its base. It now has interests — very important interests — far beyond the world of entertainment.

Rank industrial activities had their origin in manufacturing for the film industry. Apart from its well-known interests in the radio and television fields the Organisation today includes companies making electronic equipment, precision instruments, optical equipment and machine tools of many kinds.



Rank-XeroX Limited is its newest scion; xerography its latest enterprise. Many of its products are acknowledged to be the best in the world; some are the only ones in the world. And their contribution to Britain's export trade is as important as that of films.

MORE ABOUT XEROGRAPHY

Xerography is a process analogous to photography, but without the need for specially sensitised paper or plates.

Making 'masters' for offset lithography (the process used in many office printing machines) is only one of its uses. It also opens up exciting possibilities in aerial photography and medical X-ray. Its scope is boundless. And it produces the masters in a few minutes at a fraction of the cost of conventional lithographic plates.

The basis of the process is a special photo-conductive plate which will conduct electricity in the light but not in the dark. After the plate has been charged and exposed, dry developing powder is applied which adheres only to the dark parts of the image. The powder image is then transferred by electrostatic attraction to the final material, such as an offset litho plate, and fused on by heat.

THE RANK ORGANISATION LIMITED

MORE POWER AT LOWER COST

*The **Eland** is a Turbo-prop aero engine type tested at 3,000 e.h.p., with even greater power being developed. It combines low weight, low fuel consumption and ease of maintenance. Napier have installed **Elands** in a Convair 340 airliner and the conversion has shown a handsome all-round efficiency increase. Similar conversions of other operational piston-engined airliners are being investigated. **Elands** will also power the Fairey Rotodyne 40-seater helicopter.*

*The **Eland** is an engine of great importance in world aviation and a fine example of the Napier principle: more power at lower cost.*

ntinued from page 317

opeans are staying put. Though money has flowed ntifully from Algeria to France, bank deposits in Algeria e also risen—in marked contrast to the ex-protectorates. geria has grown richer during the rebellion, independent nisia and Morocco have grown poorer.

The labour-hungry, booming state of the French onomy has made the transfer home less painful than ght have been expected. Apart from lawyers, most tech-cally and professionally qualified repatriates can easily find bs. Civil servants are absorbed in the home administra-on (though policemen have found themselves re-posted to lgeria, probably nearer their starting point than they oped). A few hundred farmers have settled down in outh-western France. They bought considerable tracts of heap land (annoying the peasants by raising its price) and oubled yields by go-ahead management (which meant acking labour). Despite the consequent tension they have ontributed to the recent revival of the long declining outh-west. The government would like to settle other epatriates in Corsica. The less self-reliant were, until ecently, accumulating in camps and boarding-houses round Marseilles and other southern ports. But the government is now providing loans up to £15,000 to set up repatriates in business. The great problem remains housing: the rich have pushed up prices in Paris and the Riviera, the less lucky are living with relatives or in the depressing, rented hotel rooms which are the new slums of a house-hunting France. Nevertheless, the fear that the influx of embittered "colons" from Tunisia and Morocco would foment political trouble in France has not yet been justified.

★

Even in Algeria, where the settlers are most deeply rooted, many will leave when their privileges are curtailed. But big firms will stay, and many people will leave only gradually, since it is hard to realise assets like land in a hurry. As long as the French economy continues to expand, the rate of return will probably be manageable and the migration, like most others in history, will finally benefit the receiving country. The dangers will probably lie less in France than in North Africa.

The Europeans' departure impoverishes poor countries which are explosive with the revolutionary social pressures of one of the world's most rapidly rising populations. It makes their need of capital, and of the technicians to use it, more urgent than ever. But the longer the Algerian war lasts, the greater will be the migration and the consequent strains on the moderate North African regimes. And this year the situation will be aggravated by bad harvests. French public grants to Tunisia and Morocco have become bargaining counters in negotiations complicated by the Algerian issue and have been repeatedly postponed. Every year's delay will increase the ultimate burden on France, which has probably put more money into the French Union since the war than any European country into under-developed areas, but cannot continue to meet the ever rising bill. America has given few signs of filling the gap. Even the end of the Algerian war will bring little quiet to North Africa unless the Sahara's future is settled, and the still sketchy idea of "Eurafrica" filled out; these seem the only ways of providing new revenues as prolific as the rising population.

"Uncle Louis" Nears Polling Day

FROM OUR OTTAWA CORRESPONDENT

A DEFINITIVE study is badly needed of the "father image" in North American politics. It must embrace Canadian experience as well as the Eisenhower phenomenon; for it is now obvious that Mr Louis St Laurent led the way as long ago as 1949, although Canada—as well as being less prone to "Mom-ism"—was content with an uncle instead of a father.

A few months after Mr St Laurent succeeded Mackenzie King as Prime Minister, in the election campaign of 1949, he established a new public character called "Uncle Louis." This benevolent figure appeared without warning. Before the campaign Mr St Laurent had seemed a cultivated corporation lawyer, rather too stiff and too prosperous to please the Liberal strategists. He combined the air of a grand seigneur with a tendency to outbursts of Irish temper. But all went well "on the night": the unsuspected Uncle Louis played to tremendous applause. He repeated the success in 1953, and he is now attempting his third, and presumably last, appearance with every hope of a similar result. Polling day is June 10th; and the Prime Minister probably trusts Uncle Louis well enough by now to be confident of taking him to London for the Commonwealth meeting later in the month.

Observation of Mr St Laurent's success alongside Mr Eisenhower's—different as the two men are—suggests a certain common formula to which many a prospective statesman should be able to conform. Obviously he should not appear to be too bright. He should not offer specific policies, for that brings him down to the level of ordinary politicians. He should cultivate the air of a slippered family man sucking his pipe by the fire, all passion spent. He should claim only the tolerant judgment of one long acquainted with human folly, thus tacitly asserting his own immunity from it. He must display an unconquerable affection for every grubby child that crosses his path, and a deep, old-fashioned love of his native land. This last quality he will wisely concede also to his opponents: but somehow it will seem nobler and wiser in him. Finally, he will convey a slight suggestion of weariness under burdens patiently borne. This wistful touch arouses the maternal instinct in both male and female voters. It clinches all.

It is a pity that the coming election has to be presented in these terms; but unfortunately it promises no real test of opinion on Canada's basic problems. Its chief fascination will be to see how the old master, now in his 76th year, can re-create the character of Uncle Louis. For Uncle Louis is the vote-getter; Mr St Laurent himself hasn't been trying to get votes for four years. But Uncle Louis hasn't been seen in the House since the early stages of this parliament, and his memory has faded among those who do daily business with the Prime Minister. The real St Laurent is as different from the public image as the real Eisenhower; but he has no Sherman Adams. That tricky tendency to outbursts of temper is no longer a secret; it was one of the features of the parliamentary session just ended.

During this three months' session, the opposition apparently set out to rattle the entrenched Liberal ministers: it succeeded beyond hope, but in doing so forfeited the chance

of showing its own qualification to govern. It may have tarnished the government's shining armour in the eyes of a few close observers, but it never looked anything like a knight itself. The Conservatives missed their new leader. Mr John Diefenbaker, elected leader only in December, must have deliberately decided that it was more important to show himself in the country than to demonstrate leadership in the House of Commons. The fact that he was probably right is a bitter judgment on Canada's parliament after 22 years of Liberal rule.

The government, enjoying the support of 168 members out of 260 (with five vacancies), devoted much of its legislation to patching up soft spots in the constituencies, with special attention to the rural vote, which is heavily overweighted. It cast aside long held and oft proclaimed principles about keeping out of provincial affairs in the hope of rescuing Nova Scotia and New Brunswick, which have both ungratefully elected Conservative provincial governments. It has committed itself to extensive power developments, which it always previously refused on the highest grounds of principle. The free-trade standards of Gatt, which it has long and self-righteously paraded before the world, have been abandoned, with all their international significance, for the sake of making doubly sure of a dozen seats in rural Ontario. A price support has been established, at a high level, for powdered milk. It automatically invokes powers of control over imports which precisely parallel those of Section 22 in the United States Agricultural Adjustment Act —a favourite object of denunciation by this government for many years. It happens that the chief victims of the powdered milk subsidy are not in the United States, but in New Zealand and Australia. This will provide a good opportunity for Mr St Laurent to show what Uncle Louis can do at the June Commonwealth meeting.

★

Not one of the opposition parties has stood up in protest against these measures. They have preferred to concentrate on revelations of small improprieties and misleading or careless statements by ministers; and these show no sign of stirring an apathetic public. Postwar prosperity has not palled on the Canadian people, and it is now at a peak. Fear of toppling over the peak into recession is still inchoate and remote.

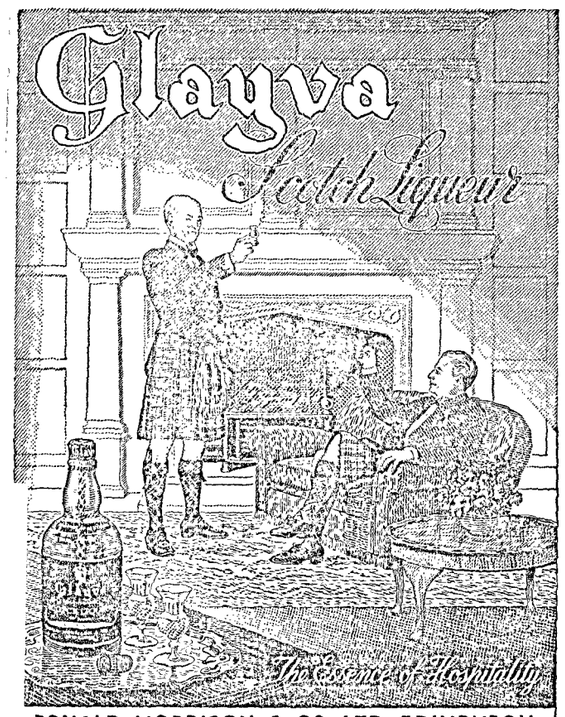
Even the voters most worried by signs of Liberal deterioration find nowhere else to turn. The opposition is split three ways: the Progressive Conservatives (51 seats) are the only challenge in the Maritimes and Ontario; in the west, Social Credit (15 seats) and CCF (22 seats) are stronger. And the Conservatives seem determined to make their appeal more amorphous even than that of the Liberals. It is hard to be more all-inclusive than a party with such a long record of being all things to all men, and the effort is again ending in demands for higher spending and lower taxes, less inflation and easier money.

Mr Bruce Hutchison, the editor, reporter and historian, complained the other day that Canadians suffer from the illusion that they can go on indefinitely living beyond their means by foreign borrowing; and from the illusion that their economy is secure, when it is tightly geared to this investment. But these very illusions are being acclaimed as the Liberal government's miracles, and, says Mr Hutchison, "we have no party willing to warn us of these dangers".

German Assets in Austria

FROM A CORRESPONDENT

For the past nine months a joint Austro-German government commission has been wrestling with the intricate question of German assets. They met in Pörtschach on the Wörthersee, in Baden-Baden, Munich and Vienna. They shunned publicity and for six months no report of their activities percolated through the press, until the Catholic weekly *Die Furche* interrupted the idyll with a long anonymous article which alleged that the commission's recommendations contravened the State Treaty. At this rate, it said, the country would get into difficulties with its foreign relations.



The article caused official consternation and much speculation not only about the identity of the author but about the nature and intention of the "leak." Two things are now certain: the author was a member of the Foreign Ministry speaking for the left-wing Catholic pressure group, and whoever authorised the leak it was not the Chancellor, Herr Raab. Dr Canaval, editor of the *Salzburger Nachrichten* and a personal friend of the Chancellor's, replied with a leader attacking *Die Furche* mainly on the score that it had accused honest, well-meaning civil servants of what amounted to high treason. It would have been more to the point to ask what motive the author might have for warning public opinion in advance about the outcome of incomplete and delicate negotiations which must in any case be followed by prolonged debate before the treaty is ratified. It is assumed that *Die Furche* thought it better that Bonn should be irritated at an early stage rather be forced to witness a violent struggle on the floor of Parliament in Vienna. At all events, the Catholic group has succeeded in prolonging the negotiations through the winter.

Essentially the questions at stake are these: Since the Austrian State was never *de jure* at war with the Allies and was consequently exempted from payment of reparations, was it, or was it not, the intention that the German assets should to some extent compensate Austria for the heavy oil payments to Russia? And has Austria not been allowed to pay Russia for these assets at the rate of, to quote the treaty, "$150 million in freely convertible currency within a period of six years"? (The payment is actually being made in industrial products.) The answer is: Yes, but pacific relations with western Germany are not only desirable but must always be a vital tenet of Austria's foreign policy. Therefore Austria cannot afford to stand pat on its rights.

Interpretation of the treaty text raises a thicket of tactical considerations. Article 22, paragraph 13, of the State Treaty lays down that

> Austria binds herself to return no properties handed over to her as former German assets, rights and interests, with the exception of property serving educational, cultural, charitable or religious purposes, to the ownership of German legal persons, or, in so far as the value of the assets exceeds 260,000 schillings, to the ownership of German natural persons.

This sum of 260,000 schillings has won a certain well-deserved notoriety. First of all, it is unclear whether it is intended to represent $10,000 at the exchange rate prevailing in 1955 or whether the sum in Austrian schillings

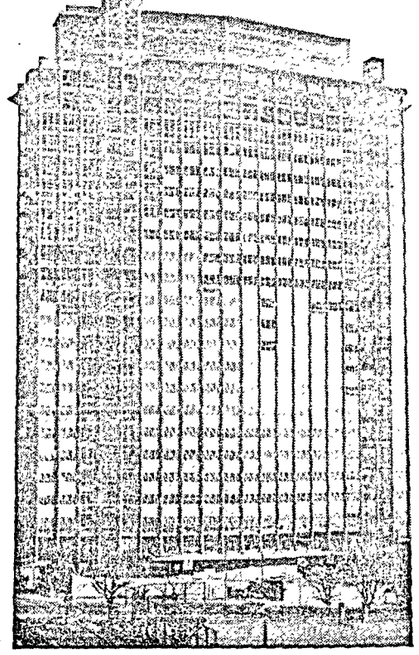
Completion on time...

PEEDY COMPLETION with high quality, and above all, completion on time: these are the real measures of the cost of new building. Time is money, and the lowest tender is not necessarily the cheapest. Construction hold-ups and delays mean to the building owner idle capital and business lost.

The resources of the Laing organization all contribute to speedier building. Co-ordinated planning control, facilities for site investigation and materials testing, maximum mechanisation, new operational techniques with new materials, and also a good reputation which we intend to keep—all these add up to efficient, economical on-time construction.

If you call us in while your scheme is at the planning stage, our experience of speedier methods and practical knowledge of building costs is available in consultation with your architects and engineers. Designing a scheme around the plant that will build it makes for economy in construction. Working these problems out together with your design team is the way to save time and money later on.



21 storeys in 20 months

This 21-storey office building for the British Columbia Electric Company in Vancouver is the tallest building in Canada west of Toronto. Construction in 20 months is a tribute not only to modern methods but also to the close co-operation and team work of all concerned with the project.

has a legal validity of its own. And were the *signatories'* financial advisers aware that they must distinguish between the taxable value of property and its market value, which may well be a multiple of the taxable assessment? It can at any rate be maintained that these 260,000 schillings stand for a sum X. Subject to conditions stated in the Treaty, properties worth less than X may be returned, those worth X-plus may not. And it is not altogether a bad thing that a treaty which is riddled with ambiguities throughout should leave ample room for negotiation on this issue. What particularly agitated the author of the criticism in the *Die Furche* article, however, were recommendations that where property consists of various categories (factories, land or housing) these may be considered separately, and that 260,000 schillings may be repaid on each part. Here protest is certainly justified; the wording of the Treaty is perfectly clear.

A fresh development is that the east German government has presented a note to Vienna, stating that, as one of the two successor states of the German Reich, eastern Germany cannot be left out of the discussions on German assets. The east German government is willing, the note continues, to enter on negotiations on Austrian assets in its part of Germany, and vice versa, but it will not recognise the validity of a treaty concluded with Bonn alone. It is considered here that the note is merely part of Pankow's campaign to gain piecemeal recognition by way of commercial agreements or any other means which presents itself. Vienna has no diplomatic relations with Pankow.

The commission's work is now at an end, but a few relatively minor points are still open and are to be settled by the Cabinets. These are believed to concern pensions and liabilities: some reluctance has been noticed among Austrian purchasers to take over their predecessors' debts in spite of the advantage of a low tax assessment.

It is intended that the treaty should be signed and ratified by Whitsun, when Dr Adenauer is to visit Vienna.

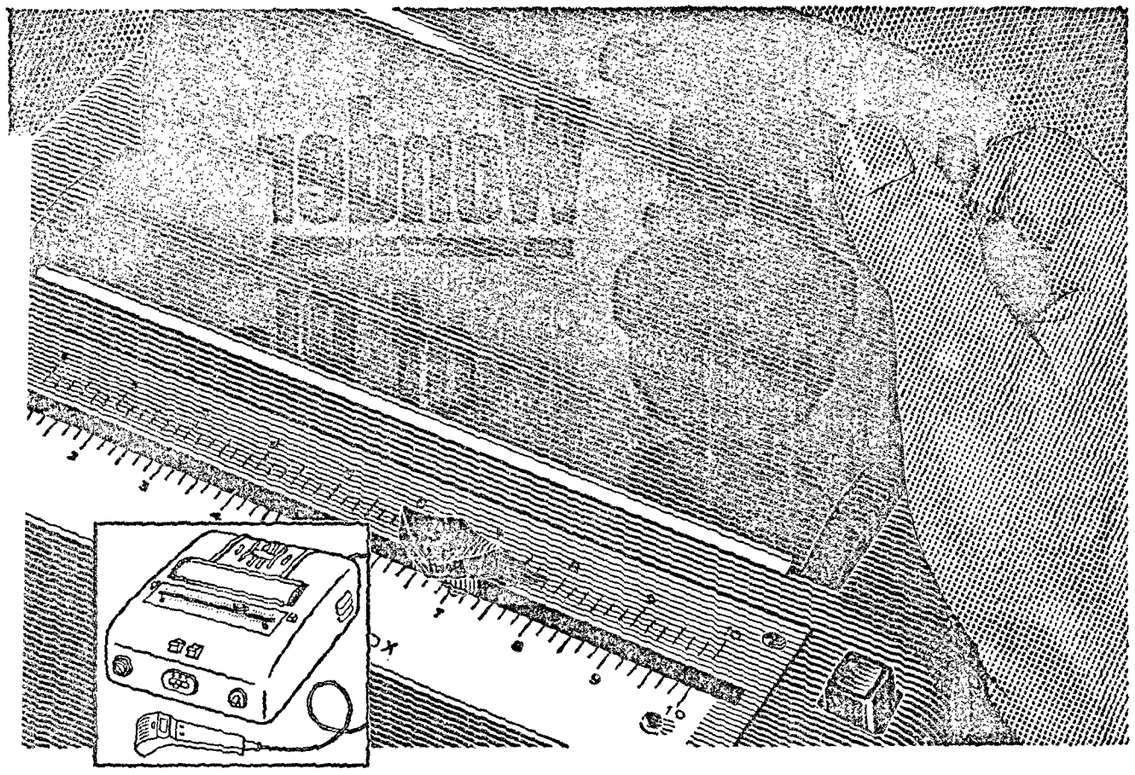
Chile's Legal Dictatorship

FROM A CORRESPONDENT IN SANTIAGO

The riots at the beginning of this month brought Chile to the verge of its most serious political crisis since 1931, when the dictatorial regime of General Ibañez was overthrown. This time, General Ibañez, who again became president in 1952, has managed to surmount the crisis, but only by using methods which are reminiscent of his earlier dictatorial government.

The riots arose from Chile's notorious inflation. During the last four years, national income per head in Chile has been dropping at the rate of 7 per cent a year. In 1955, the cost of living went up by over 80 per cent, while last year the government and their financial advisers were congratulating themselves on having kept the annual rise to a mere 38 per cent. An ill-timed increase of 50 per cent in bus fares, announced by the authorities during the last week in March, released a wave of protests which for three days kept the capital in a state of chaos. The Central Trade Union Organisation planned to call a general strike in support of the students who started the riots, but this was averted by the government, which put all trade union leaders under preventive arrest.

The government has said that the whole disturbance was a preconceived and seditious plan by the extreme left-wing parties. But while there is no doubt that agitators took advantage of the rioting to incite the crowds against the authorities, the incentive for the riots was already there.



President Ibañez was elected in 1952 for a six-year term in office against the strong opposition of every traditional political party. Independent voters supported him because they believed that his firm and austere personality was the most likely to put an end to corruption and to curb the inflationary spiral. They remembered his achievements as a strong leader when he ruled between 1927 and 1931. However, far from putting an end to corruption, his administration has been involved in an embarrassing series of scandals involving wholesale smuggling, unlawful disbursement of public funds and even bribery. Furthermore, his administration has been extremely inept in solving the economic problems of the nation, and his decision in 1955 to hire the services of the American firm of financial advisers, Klein-Saks, was felt by some to be an admission of his inability to cope with the inflation unaided.

The latest, and most telling, demonstration of his loss of popular support came at the beginning of March when his party—the Agrarian Labour Party—suffered an extremely severe defeat in the general elections which has left him without congressional support. And to crown all this, many people were alienated by the unnecessary brutality displayed by army and police in repressing the riots. The official casualty list of 23 dead and 287 wounded, of which only five were policemen lightly injured, reflects the character of the struggle.

President Ibañez has reaped some important advantages from the seven days of crisis. He has ordered the total destruction of the Horizon Press, where six left-wing newspapers and magazines are published, thus, at one blow, assuring himself of a friendly press for the remainder of his term in office. Also, using the riots as justification, he has asked congress to grant him special extra-constitutional powers to deal with what he calls "the grave communist menace." Congress (the pre-election congress, since the new one does not take office until May 21st) voted him powers to arrest, imprison and deport to concentration camps anybody he wants out of the way. Chile is today under what some people call a "legal dictatorship." Scores of journalists and trade union leaders have already been arrested and sent to concentration camps in Melinka and Putre, in the south of Chile. The government also controls all radio news broadcasts, and has imposed a strict press censorship.

Some supporters of General Ibañez believe that these measures will eventually be justified by the defeat of inflation. His critics maintain that political repression is hardly likely to solve the country's economic problems. Chile, according to these critics, is on the way to becoming an "illegal dictatorship." President Ibañez is already 79, and is not likely to want to stand again for the presidency when his term runs out next year. But his close friend, the former Minister of the Interior, Colonel Benjamin Videla, is said to be an eager candidate for the presidency, especially if this does not involve the bother of going through an election. In the latest cabinet reshuffle precipitated by the resignation of four ministers who objected to President Ibañez's police methods, Colonel Videla lost his ministry. But this may well be a case of *reculer pour mieux sauter*.

PUT YOUR VOICE ON THIS SHEET

—and save time, money, mistakes

This sheet is the Sound Carrier of the Remington Ultravox Dictating Machine. Today no forward-looking business man needs to be reminded that without a dictating machine, he is hamstringing his own efficiency.

Notes, memoranda, reports, letters can be recorded instantly, accurately, in the office, at home, in your car—with an astonishing saving of time and money.

Remington Ultravox is the most modern and efficient of all dictating machines—the machine that will streamline your dictation and save time, money and error in a way you never imagined possible.

Remington Ultravox is merely one of the many modern methods devised by Remington to streamline the day-by-day efficiency of business operations. The Man from Remington Rand will gladly call upon you to discuss their application to your own problems—without obligation.

the Wonder of Plastics

The Heron Direction Finder is used for position fixing for small craft. It incorporates parts moulded from Beetle—a B.I.P. product—and the coils are 'potted' in Beetle resins.

The new 6-seater Vauxhall Velox Dormobile Estate Car is a conversion of the standard saloon body, by the addition of a polyester/glass fibre extension. Beetle polyester resin—a B.I.P. product—is used in moulding the light, strong extension and lift-up rear door.

The versatile Regna Cash Register is used in self-service stores, departmental stores and small shops throughout Europe. The attractive, strong housing is moulded from Beetle—a B.I.P. product—by Norsk Teknisk Porselens A/S, Norway.

In ships and shops, in cars and catering, plastics to-day play their part. Their role may be contributory, it may be fundamental, but the wonder of plastics is in their versatility, their infinite possibilities. Types and grades are innumerable, each with its own properties—and limitations—presenting a wide field of choice to the intending user. The leading plastics materials manufacturers maintain extensive consultative and development services and none is better qualified to advise and assist than B.I.P.

B.I.P. SERVICES:

The full resources of the B.I.P. Research, Technical Development and Design services are at the disposal of manufacturers interested in the possibilities of plastics. Advice will gladly be given on any problem concerning plastics applications, irrespective of the type of material involved.

THE BUSINESS WORLD

A Future for Futures?

NEARLY all the futures markets reopened in Britain after the war have now been operating for three years—some for much longer. Trading in rubber was freed at the end of 1946; tin followed late in 1949, cocoa in January 1951 and lead in October 1952. In the following year zinc, copper and wheat joined the ranks of the free and a new futures market in wool tops was opened. Futures trading in barley and maize was resumed in January 1954, and cotton futures followed in May. Futures trading in raw sugar, the last market to be freed, started only last January.

How successfully have the markets fulfilled their functions? Futures markets try to anticipate future prices of actual commodities and allow traders to protect themselves against loss on their transactions in actual commodities. In so doing they help to adjust supply and demand, facilitate dealings for forward delivery, and reduce the cost of distribution.

When a trader buys a commodity to sell it later on, or when a consumer buys it to use it later on he runs the risk of a change in its value; he becomes an involuntary speculator. To protect himself he sells an equivalent quantity of paper warrants entitling the buyer to delivery of the commodity in, say, six months' time. When he sells the actual commodity he buys back his futures. If prices have fallen in the meantime the loss on the sale of the actual commodity is offset by the profit on the futures transaction; if prices have risen the profit on the actual sale is offset by the loss on futures. The method of operating has several variants, and the risk of price changes can never be completely hedged; the "paper" commodity is of a standard grade whereas the actual commodity is a particular grade chosen for a particular need, and the prices of each do not always move together. But the broader the market the smaller the disparity in price is likely to be and the better the hedge.

No one supposed that the markets would have an easy time in the first few postwar years, and many doubted whether they could regain their prewar trade. They had to start again in a very different world. Consumers, for so long cossetted by official supply departments, had forgotten the art of buying and hedging; many preferred fixed prices. The merchanting community had declined in numbers and substance; its capital had been eroded by inflation. The freedom of the markets was circumscribed by exchange restrictions and other forms of official interference with the marketing of commodities.

Given the world in which they now work it is gratifying that some markets have functioned as well as they have. The London Metal Exchange, the markets in rubber, cocoa and wool tops are enjoying a modest success and the barley futures market has recently got on its feet. But after a promising start the cotton futures market is now struggling for survival, and wheat and maize futures show only the faintest signs of life.

The Liverpool Cotton Exchange, the birthplace of futures trading, provides an unhappy case study of the difficulties that beset markets. The famous "ring" in the exchange is a sad sight today. The clamour and excitement of prewar days are gone, leaving only a handful of jobbers to chat idly with one another, do the crossword puzzles and—just occasionally—make a trade. The main trouble is that present government policies—American government policy in particular—are incompatible with free markets.

In 1955 trade in raw cotton and manufactures was disrupted by the expectation that the American government would be forced to subsidise exports of raw cotton. In 1956 a subsidy was introduced, at a level that closely confirmed the Liverpool market's predictions, and the Government became the primary exporter. The new American selling programme has

been successful within its limits, but it has wrecked the delicate mechanism of futures markets. The New York cotton exchange has been turned into a purely domestic market (as Chicago is for grains), and the link between New York and Liverpool has snapped. In effect a floor price has been put under American cotton for export this season; spinners here have thus had little need to hedge and futures business has fallen away.

The day may come when spinners will want to hedge their risks, only to find that the weary jobbers have drifted to other jobs. Some of the big spinning combines see the risk and fear it. But with stronger finances than before the war, with an increasing use of man-made fibres and—in some groups—a move towards verticalisation, the combines would not be the hardest

TURNOVERS BEFORE AND SINCE THE WAR
(Monthly averages in tons)

	Average 1936–1938	1954	1955	1956*
Rubber	...	16,218	36,622	36,091
Tin	7,538	2,463	3,313	3,993
Lead	33,456	13,258	13,585	17,485
Zinc	31,651	16,235	18,485	18,525
Copper	45,667	21,117	28,875	32,931
Cocoa	22,443	23,733	15,935	17,660
Wool†	...	1,581	1,219	1,814
Cotton‡	...	4,473	5,799	2,235

* Turnover in metals not fully comparable with previous years. † Contract units of 5,000 lb. ‡ Contracts of 100 bales.

hit. It is the small independent mills that would suffer most from the lack of hedging facilities, and the pace of elimination or amalgamation with larger concerns would quicken in consequence.

The spinners themselves could do something to help the futures market, if more of them regarded it as *their* market and knew how to use it. If they based their selling prices for yarn on Liverpool futures all members of the trade could hedge their risks on a common price basis and future trading and stock-holding would be encouraged.

Even in those markets that are more active there is no call for complacency. Take the Metal Exchange: before the war the United States was a large exporter of non-ferrous metals and the exchange (or rather the merchants and operators who used it) was the residual world buyer. Now the United States is a large net importer and the American government is the residual world buyer of lead and zinc; a similar service it performed for tin has now passed to the International Tin Agreement's buffer stock. And though copper is in surplus little of it has appeared on the exchange. When metals were short and spot supplies commanded a premium consumers justly complained that the cost of hedging was often disproportionate to the risks involved. Now the shortage has disappeared, but because the surplus is not allowed to flow to the market the premiums for spot supplies tend to persist and merchants cannot build up stocks.

Hedging facilities also suffer because all markets are to a greater or lesser degree "thin"—that is, turnovers are small, with the result that prices are too sensitive and buyers and sellers cannot trade without moving prices against them. This produces a vicious circle: markets are thin because too few traders use them, and more traders will not use them because they are thin.

CHANGES in the method or pattern of trading are partly to blame for the thinness of some markets. Before the war British West African cocoa was shipped by many private firms whose activities stimulated business in futures. Now all that cocoa is sold through the official marketing board which does not hedge. Before the war the United States bought a large part of its supplies of natural rubber through London; now it buys direct from the East. Prices of wheat are fixed by government agencies, who are often the sole sellers too. And by selling on a "price-to-be-fixed" basis the Canadian and Australian wheat boards are covering buyers against a large part of their price risks. Turnover in metals is restricted not only by the changed role of the United States: British consumers now draw far more of their supplies direct from the producers than before the war. Opportunities for arbitrage between futures markets have also diminished, not because exchange is denied but because some foreign markets—such as the Chicago grain and New York cotton markets—have lost their international character. And all markets report that professional speculators, whose activities did much to broaden business, are almost non-existent.

Though the futures markets may never regain their prewar importance they should not be content to stand still. It is doubtful whether some market authorities have done all they can to attract custom, and doubtful, too, whether their potential customers have done all they can to help put the markets on their feet. They have a responsibility for despite the changed pattern a great part of the world's trade in commodities is still done in sterling, and the hedging facilities that London and Liverpool offer help to hold that trade together. If there were a greater willingness to operate, periods of extreme prices would be shorter and fluctuations less sharp. Would that not be in everyone's interest?

Harder times may come to the markets' aid. When profit margins are narrow industry can least afford to carry the risk of unhedged stocks; the Dunlop Rubber Company's accounts point the moral. Hedging facilities should therefore attract more interest. Marketing policies may also change for the better. The copper producers may be obliged to put metal on the market, and the American government cannot go on acquiring the surplus of lead and zinc for ever. And if the United States solves its problem of over-production of farm products the time will surely come when exports of American grain and cotton are handled wholly by the private trade. In the long run, it will pay trade and industry to give the futures markets full support.

Camera on Companies

Statistics published by the National Institute of Economic and Social Research throw light on the sources and uses of corporate finance

FAMILY snapshots, however faded, have some charm but little use. Statistical snapshots, unavoidably faded, have little charm but some use. They suggest where the camera should now be pointed. The roll of statistical film exposed, developed and printed by the National Institute of Economic and Social Research looks old: it relates to "Company Income and Finance 1949-53." But its findings have a contemporary relevance. Such studies are not new. *The Economist* began the first series of the kind after the passing of the 1948 Companies Act—in January, 1949. But the National Institute breaks new ground in using accounting dates (and not the dates on which the reports were published). Above all, the results have been so analysed as to produce a full survey of the sources and uses of company finance.

Reliance on these statistics, as on any others of the type, has to be qualified. The figures relate only to public quoted companies. That population, because of the births, marriages and deaths of public companies, is slowly shifting. The results are broken down into industrial groups, and a group can be dominated by the untypical experience of one giant or rapidly growing company. Companies trading wholly abroad have been excluded, but many which trade both in this country and abroad are unavoidably included in the analysis. The years of tabulation relate to accounts made up at any time within the fiscal year: the year "1953" may thus include both an account drawn up on March 31, 1954, and one drawn up on April 30, 1953, though most company accounts cluster around the calendar year-end.

How comprehensive are these statistics? Each year about 2,900 public companies were included in the analysis. These companies had in issue about 43 per cent of the paid-up capital of all public and private companies (totalling £6,412 million) and about 67 per cent of the paid-up capital of all public companies (totalling £4,062 million). Because public companies control a large number of private companies these percentages are appreciable understatements. Over the five years, 1949-53, the National Institute's "grid" of companies earned about 56 per cent of all corporate profits (and in manufacturing alone about 71 per cent). Over this period, because of a higher rate of growth, these grid companies increased their share in total corporate profits from 51 to 60 per cent (and in manufacturing from 66 to 75 per cent). These percentages probably represent slight overstatements. By numbers employed, the grid companies covered about 46 per cent of British manufacturing activity, but the cover varied widely between industries; it was 21 per cent in clothing and footwear and 85 per cent in tobacco.

It is probably fair, without regarding the figures as exact, to use them as a measure for public companies and to compare the experience they depict with that of the corporate sector as a whole. Such a comparison establishes that profits in 1949-1953 were growing faster in public companies than in other companies. The difference may be partly due to the acquisition of non-quoted companies by public companies. It may also reflect differences in managerial ability, financial strength, and in access to capital for the purpose of

expanding capacity. Secondly, the public companies alone do not appear to have been net lenders to the rest of the economy as the Blue Book on the national income suggests that all companies were. The Blue Book estimated gross domestic fixed capital formation, plus additions to stocks by companies, in 1949-53 at £4,606 million; but it also estimated that the undistributed income of these companies was some £1,000 million greater, at £5,721 million. Within the National Institute's grid, gross expenditure on fixed assets, plus additions to stocks, was £3,045 million; but those companies set aside from income only £2,688 million. Thus these public companies were net borrowers from the rest of the economy—a fact which may owe something

to the inclusion of some companies which operate in part overseas, as well as to the greater proportionate growth of the quoted companies.

It is possible to take these comparisons made by the National Institute a stage further and to compare the experience of the 100 biggest companies with that of the smaller ones. The accompanying tables have been framed with that purpose in mind. This analysis is tentative because in the giants overseas earnings probably have a greater proportionate weight on the results. Moreover, these were the 100 biggest companies (by the measure of net assets) at the beginning of the period; by 1953 the list of the first hundred had changed, and so had the ranking within it.

By the end of the period, the 100 giants owned about 46 per cent of the net assets of the grid companies (including 49 per cent of fixed assets) and about 47 per cent of the reserves. Over the five years they had earned about 42½ per cent of the grid companies' trading profits (and possibly something like 28 per cent of all corporate profits); they had added to their own reserves and depreciation about 44½ per cent of total appropriations; and they had spent on fixed assets about 47½ per cent of the total expenditure of the grid companies. Because of linking difficulties these percentages are probably slight understatements, but it is thus tempting to think of a 45/55 split between the giants and the rest.

Over the five years the giants were expanding faster than the smaller companies. The expenditure on assets of the first 100 is not far short of the total expenditure of the remaining 2,750-odd companies and in terms of the formation of fixed assets (net of depreciation) seems to have been absolutely higher. To finance this growth, the giants relied slightly more than the smaller companies did on the capital market and slightly less on ploughed back profits. In particular they relied on debenture and loan stock issues, raising more in this way than did the remaining companies, and they raised less by issues of ordinary capital. Profits of the giants were also advancing faster than were profits of other public companies or private companies; but it also seems they were distributing slightly less of their net earnings in dividends. Nevertheless, the differences between the giants and the other public companies are marginal.

The National Institute's statistics have opened up a useful new line of study. A much more refined analysis and economic appreciation of the role of the giants is needed. So, too, is work on differing rates of growth and on the differing experience of declining, static and expanding industries. Fortunately, much of that work is now in hand at the National Institute. And the framework of the statistical analysis pioneered by the National Institute has been taken over by the Board of Trade, where it will be applied to more up-to-date material. A longer series of statistics and a refinement of their interpretation should produce firmer conclusions.

BUSINESS NOTES

IN THE MARKETS

English Electric's £16 Million

The big event in the market since Easter has been the announcement of English Electric Company's new issue—debenture stock and ordinary shares to raise £16 million altogether and thereby almost to extinguish a bank overdraft that stood at £16¼ million at the end of 1956. It is a big sum and in an unresponsive market could have been difficult to raise. But English Electric has been happy in its timing. It struck a responsive market both on the fixed interest and equity sides. *The Economist* Indicator of ordinary shares has risen 1.9 to 218.3 over the week ended on Wednesday and the gilt-edged market enjoyed a good rally after the Easter break. The market and the Government broker's selling prices have come together for the medium-dated stocks and he is a successful seller, particularly of 4½ per cent conversion stock. The institutions seem to have money to invest and the speculators some to risk. A noticeable speculation by some of the "gross funds" was the buying of 3½ per cent war loan on Wednesday before it went ex interest in the hope that the price would not drop by the full value of the interest payment by Thursday afternoon with a further rise in gilt-edged that speculation was beginning to come right. Much of the upward flurry on the Stock Exchange, but hardly the sudden rally in sterling, was the result of hopes so premature as to be almost silly of an immediate reduction in Bank rate. The rise in gilt-edged, but not in industrials, continued on Thursday afternoon after the Bank rate hopes had been dashed.

Careful investors do not trust the market yet, but English Electric, expected to post provisional allotment letters on May 3rd, got a fine start. The debenture issue to be offered to all classes of stockholder but not the general public consists of £9 million of 5½ per cent stock 1977-82 at £97 and the ordinary share issue goes as rights in the ratio of one for five at 50s. requiring 3,044,244 £1 ordinary shares. The terms for the debenture issue are generous. The gross redemption yield of £5 14s. 6d. per cent compares with £5 14s. per cent obtainable from the Metal Box 5½ per cent loan stock, and most investors would regard the English Electric debenture as superior. The company and Lazard Brothers, who advise it, have set their faces against seeking easy popularity with a convertible stock and rightly so. They will have to use the issue market again from time to time and to borrow well the company must have a firm capital structure. Payments on the new stock are spread out until August 13th. In the price of the ordinary share issue the company has not given away any large bonus. The existing shares stood at 59s. when the issue at 50s. was announced (making the rights worth 1s. 6d. per share). The reasons for cutting the rights fine are clear. The directors who "view the future of the electrical industry with great confidence" intend to maintain the total distribution this year on the ordinary capital at 14 per cent and to do so must obviously avoid any watering of the capital. Since the last issue 18 months ago the number of ordinary stockholders has gone up from 23,000 to 35,000. Investors do not seem to need much persuading.

STERLING

The Pound's Rally

It has been an excellent week for sterling. The official rate against the dollar improved on Wednesday from $2.78¾ to $2.79⅛ though it slipped back on Thursday to $2.79 3/16. There has been evidence of some support from the Exchange Equalisation Account, but there was also good commercial buying of sterling from New York, which is as it should be at this season of the year. The oil companies seemed temporarily to have stopped buying dollars. The highly sensitive market for transferable sterling has been helped by considerable buying from Communist sources. The rate in Zurich has improved from $2.76 to $2.77. The Russians have recently been big buyers of sugar and it is estimated that about half their purchases are made in terms of sterling. The Chinese also have been replenishing their sterling balances, which they try to maintain at a fairly high level, and which had been considerably run down at the height of the Middle East crisis.

The Bulganin letter has now been interpreted in some quarters as the first hint of an easing of the international situation. If that be so, it must help sterling. In a negative way the approach of the German elections, though this introduces an element of uncertainty in the political and economic future of Germany, also helps sterling. But the bear account in sterling is exclusively the work of non-residents, while the bull account in Deutsche marks is largely held by the Germans themselves.

STEEL EXPANSION

From Sheet to Plate

A production target of 28 million ingot tons a year by 1962 has been talked about in the steel industry for some time: though no full development plan has yet been presented by the Iron and Steel Board to the Minister of Power, the British Iron and Steel Federation this week gave details of some of the major projects that will be included. The most important is perhaps the integrated steelworks to be built by Richard Thomas and Baldwins on a site close to deep water at Newport. Significantly, this last major nationalised company has not committed itself to installing the fourth wide strip mill as the finishing end of this new steelworks. Though the size of the commitment for a company still to be resold to the public may have something

to do with announcing only the first bite at this project, the setback of expansion in the motor industry, which was the consumer most concerned to argue for starting on the fourth strip mill forthwith, may have been more important. In spite of the motor industry's insistence that it is growing steadily busier, and may need more sheet steel than existing mills can provide as soon as this autumn, their steel suppliers have become a good deal more cautious about providing such expensive supporting investment. This is an argument about timing, not about the eventual need for a fourth mill: the steelworks at Newport is on a site that could accommodate one. Capacity at the existing strip mills, meanwhile, is being considerably enlarged.

Other items in the programme reflect the shift of emphasis in flat steel production towards heavier products. Colvilles are installing two four-high plate mills at Ravenscraig, while the massive expansion scheme at South Durham will double its plate production: Consett is putting in a plate mill and extra integrated steelmaking capacity, and United Steel is to instal a plate mill at Appleby-Frodingham. By the end of the new development plan, plate capacity will be increased by about a million tons a year.

BRITISH PETROLEUM

Three Shillings, Tax Free

UNLIKE the Royal Dutch/Shell statement, the preliminary report of British Petroleum for 1956 says nothing about the effects of the Suez crisis on earnings. What it does record is that over the whole year British Petroleum's sales of crude oil and refined products rose by 11 per cent, from 48 million tons to 53 million tons—figures which give no indication of value, because they are not broken down by products. The consolidated profit rose from £139,817,943 to £155,480,900. The depreciation provision was about £3 million higher at £25,202,874 and the total tax charge (after crediting British tax relief) went up from £71,389,477 to £76,324,120. Consolidated net profits thus made a sizeable advance, from £45,308,243 to £53,014,561.

Cautious investors, arguing that after all the British Government has the controlling interest in the company and that it would at the moment be impolitic and untimely to be more generous in dividends, were not much disappointed with the directors' decision to leave the ordinary dividend unchanged at 3s., tax free, per £1 unit (or 15 per cent, tax free). The price of the shares remained little changed at around 146s. The yield of a few pence over £2 per cent at that price still represents a big leap forward in political and economic time.

IMPERIAL CHEMICAL INDUSTRIES

A Fall in Margins

IN December, when Imperial Chemical Industries made its highly successful convertible loan stock issue, the directors said that the policy of stable prices was having its effect upon profit margins. Investors drew the obvious inference: the ordinary dividend would be left unchanged. The inference was right: the 1956 dividend is 10 per cent, as in 1955. And the profit statement spells out in figures the directors' warning about margins.

Last year ICI's sales rose by about 5¾ per cent, from £411 million to £435 million, but, before all charges, the consolidated trading surplus was £65,245 lower at £76,727,131. The tax provision is also down slightly (from £23,900,433 to £23,764,834), but the depreciation provision is quite sharply up (from £20,379,824 to £23,459,049) and the employees' profit sharing bonus is slightly higher at £3,146,643 (against £2,833,467). Thus the net income for the year has fallen by £4,684,024 to £19,293,139. This is one measure of the fall in profit margins. Another—and perhaps more significant one—is to compare the ratio of net income to sales in six-monthly periods since the beginning of 1955. In the consecutive half-years the ratio has come down from 5.8 per cent, through 5.9 per cent and 4.7 per cent, to 4.2 per cent in the last six months of 1956. This downward drag is not a new investment factor and investors in accepting a yield of 4½ per cent on the £1 units at a price of 44s. 9d. are looking beyond current experience to the point at which ICI's new heavy capital investments make their contribution to earnings. There is no need for them, on these results, to lower their gaze.

BRITISH DELIVERIES

Not So Competitive

AN organisation that orders a wide range of British capital equipment and other materials to the value of £58 million, as the Royal Dutch/Shell group did last year, is well placed to assess the competitive performance of British suppliers. British delivery dates for many types of equipment have indeed shortened slightly, and British manufacturers now have a much better record than they had some years ago in meeting promised delivery dates once they have set them. But in the experience of the oil industry, at least, the statement made by the President of the Board of Trade in the course of the budget debate that "... as a result of the credit squeeze, British prices (have) become competitive and delivery dates reasonable in almost all markets in the world" sounds almost incredibly complacent.

Of its £58 million worth of purchases in Britain last year, the Shell group bought £44 million worth for use in its operations overseas, and of these exports roughly a third were destined for capital projects. Yet there are still relatively few important items of capital equipment used by the oil industry overseas that can be obtained in Britain without waiting at least a year for delivery. Delivery periods for some of the smaller equipment, such as diesel engines and milling and pipe-cutting machines, have shortened during the past year, but this gain is counterbalanced by long delivery times on heavier types. Certain heavy machines, for example, are still consistently quoted at 24 to 30 months delivery, and the oil companies still have to wait up to three years for large gas turbines, up to two years for large generating plant, and a year or more for boilers, pressure vessels, tankage and heat exchangers from British suppliers. In some cases delivery times have been lengthened—the steel structures now urgently needed for under-water drilling, for example, now take 13 months to deliver, compared with 10 months two years ago.

If time were of no account, substantially all of the materials needed to build a new refinery, and over 80 per cent of the materials required for a new drilling venture, could be bought in Britain. But oil exploration and development programmes overseas cannot wait, and because of

long delivery times in Britain, the oil company buyers are forced to take their business overseas, especially to suppliers on the Continent. The Shell group, for example, last year bought for its overseas operations even more from Continental suppliers than it bought in Britain, although a few years ago over 60 per cent of its requirements were filled from this country. The oil equipment industry in Europe is largely a postwar development, and in many cases Continental firms entered the field later than the British. But the better delivery terms still offered on the Continent show that British suppliers have been less ready than their foreign competitors to expand capacity in anticipation of a continuing high demand from the oil industry. Such caution has lost them orders, and lost the country exports.

MANUFACTURING INVESTMENT

Revising the Figures

A MAJOR revision that the Board of Trade has had to make to its estimate of investment by manufacturing industry during the last three months of 1956 gives this series of figures an unexpected upward twist. Hitherto the rate of increase in manufacturing investment had taken the form of a very smooth curve. It rose steadily during 1955, the quarterly increases being 15, 21, 22, and 35 per cent respectively, and it had been falling away just as steadily during 1956, when the quarterly increases were thought to be 29, 26, 13, and 6 per cent respectively. The forecast of investment spending this year, which was made last September by the companies that contribute to the Board's survey, showed a rate of increase—of one per cent more than in 1956—that also fitted snugly into this trend. But the increase in manufacturing investment during the last quarter of 1956 has now been put at 17 per cent, instead of 6 per cent, which is bigger than the third quarter's increase and makes the estimated increase for the whole year 20 per cent (instead of 17 per cent) and not much different from the original forecast of 21 per cent.

Why investment expenditure by manufacturing industry should have risen like this at the end of last year is somewhat perplexing. In real terms, however, there appears to have been very little difference between the third and fourth quarters; the volume of manufacturing investment in those two periods was about 8 and 9 per cent respectively more than in 1955 compared with real increases of 18 and 19 per cent respectively in the first and second quarters. The reasons for the Board's change, however, are explained; the provisional estimate was not based upon full returns, the completion of provisional results of the 1955 census of production has given the Board the opportunity of bringing the weights for different industries more up to date, and the provisional figure contained a sizeable arithmetical error.

The changes this revision makes to previous estimates of total investment in 1956 are not very large. Total investment at current prices was about £21 million larger than stated, making the increase on 1955 about 8½ per cent, and at 1948 prices it was about £14 million higher, giving an increase of not quite 4 per cent over the year before. For the fourth quarter, though, the revised figure means that in real terms the level of total gross investment was about the same as at the end of 1955 and did not fall slightly as had previously been thought.

Third year of Publication

The Paper Bulletin

The 9th quarterly issue contains three special reports:
1. The Fibre Board Packing Case Industry.
2. The Irish Paper Industry.
3. Trends in British Paper Output.

The issue also contains: A Summary of the Contents; Guide for Paper Users; Raw Material Notes; Reports on Paper Using Industries; General Notes; Comprehensive Statistics; Charts.

The March monthly supplement dealt with the implications of the European free trade area for the paper industry.

DEFENCE PRODUCTION

The Air Ministry's Case

THE Air Ministry has stated its grounds for the drastic switch in defence production outlined a few weeks ago in the Defence White Paper. The decision to stop further development of manned fighters and bombers was, it was explained, taken on purely military grounds. But at least one of these grounds seems to have been that, faced with a choice of cuts, the Service chiefs felt that it was better to gamble on the weapons of the future than to accept the nominally shorter odds on further development of conventional aircraft that had already run into a good many difficulties.

The gamble is not, in fact, so much as a wild throw as it seems. The project for a manned supersonic bomber may have been dropped—and even the Americans have only ordered 18 of their own supersonic Hustler—but the Air Marshals have a supersonic bomber of sorts up their sleeve. This is a small, supersonic, rocket powered and unmanned aircraft, somewhat misleadingly described as a "powered guided bomb" that will be carried by the big V bombers, or even the smaller Valiant, part of the way to its target, and will complete the journey with its bomb through the enemy defences under its own power. It was suggested this week that such a machine would be released from the mother aircraft outside enemy radar range. If it develops successfully, this two-stage bombing technique would provide a back-stop to development delays to the American ballistic missile, Thor, firing trials of which this year have so far been dogged with accidents.

Where air defence is concerned the RAF, with orders for two anti-aircraft guided weapons safely signed, is already beginning to talk of manned fighter aircraft as a means for filling the gaps between the first missile launching sites until these have been built into an adequate network. This is hardly a cheap defence system; up to 100 rounds of each missile need to be fired to complete service acceptance trials, and more if the trials are unsuccessful. The manufacturers themselves fire about 100 complete missiles a year during tests.

THE FIRST GUIDED WEAPONS

IT was only on Thursday week, in an eight-line statement, that the Minister of Supply slipped in an announcement about the first three guided weapon orders placed with British industry. One is for the airborne weapon, Firestreak, developed by de Havilland; its infra-red guidance system is the work of Mullard, and it is just starting its service trials before becoming the standard armament for

fighter aircraft like the Javelin, the P.1, and perhaps even the Folland Gnat. The other two are both for anti-aircraft weapons. One still unnamed weapon is built entirely by English Electric teams and the other, Bloodhound, is the work of the Bristol Aeroplane Company and Ferranti. The main difference between the two is that the English Electric weapon is rocket powered throughout, the Bristol one uses rocket boosters but flies on a ram-jet engine. The choice of two anti-aircraft weapons is reminiscent of the decision to order both the big V-bombers.

Neither the Bristol nor English Electric weapons are as far advanced in production as that of de Havilland; indeed the English Electric order has only been signed very recently and represents in part a reassessment of the weapon's potentialities. The development of these big rockets, which must have an effective range in the order of 50 miles to be of any value, is more difficult than that of a small airborne rocket carried by fighter aircraft to within a few miles of its target, making the task of the homing equipment incomparably easier. This week English Electric showed excerpts from test films illustrating not only successful flights that ended on the target but unsuccessful ones that ended abruptly with the disintegration of the missile.

The British anti-aircraft designs are the rough equivalent of the more sophisticated American service missiles; they are not, however, as advanced as those that the Americans now have under development. It is generally reckoned that such early weapons have a one in three chance of homing on their target. The de Havilland-Mullard weapon, on the other hand, is widely believed to be ahead of any comparable design in the United States. The use of an airborne weapon of this kind is limited, but it marks an important interim stage until anti-aircraft missiles are lethal enough and reliable enough to assume all the functions of the fighter.

EXPORTS TO CHINA

America Gives Some Ground

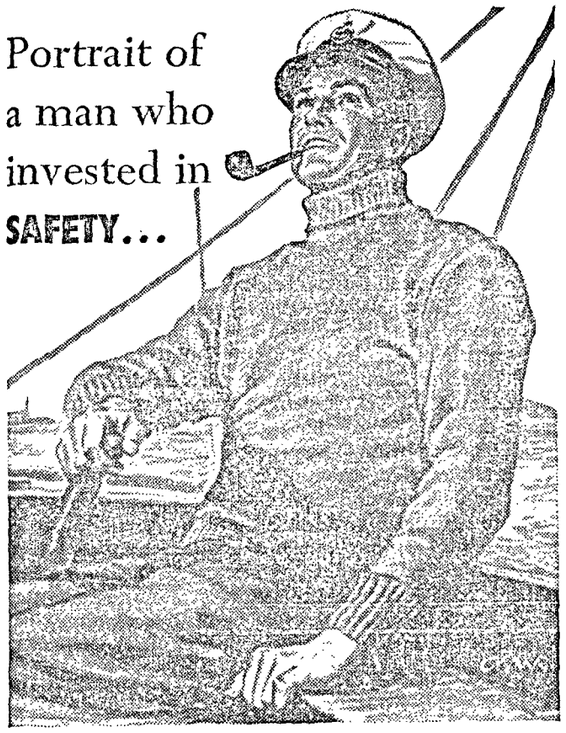
The American government's proposals for easing the embargo on exports to China go some way, but not all the way, towards meeting the views of Britain and other countries. At present the list of goods that cannot be shipped to China contains over 400 items, more than twice as many as the Soviet block list contains. Britain has long wanted to end this strange discrimination by removing from the China list all items that can be shipped to the Soviet block. The United States agrees that one list should serve for both areas, but the system of control proposed would still discriminate against China. It would remove from control certain "non-strategic" items on the China list, and place on the Soviet block list the remaining items still embargoed for China. Such items would then become subject to supervisory control for export to the Soviet block, and could be restricted in quantity if there were subsequent grounds for believing that the goods were being transhipped to China. Finally the exceptions procedure, whereby limited quantities of embargoed goods, such as Malayan rubber and British heavy tractors, have been sent to China, would be tightened up. The United States would not itself take advantage of its proposals; it "will continue its unilateral embargo on all trade with Communist China."

The detailed American proposals were expected in London this week, and will be jointly discussed with all the governments represented on the China committee of the Consultative Group at its regular meetings in Paris. The attitude of the British Government must depend on how many goods of substantial interest to British exporters are still left on the proposed embargo. Exporters will not be able to assess the merits of the American proposals before the decisions are reached: the Prime Minister, in his promised statement, is unlikely to reveal full details. But however irritating British exporters may find America's attitude they should exaggerate the potential loss of trade. British exports to China last year rose by £2.8 million to £10.7 million; if the British case had been accepted in full, British exports might not rise to much more than twice the 1956 total. Such an increase would be useful but it would not dramatically swell Britain's export earnings. Short of the complete removal of controls, the gains for Britain and for the entrepot trade of Hongkong could hardly be large.

INSURANCE POLICY

The Prudential in 1956

The Prudential, with total assets of £856.8 million, towers above the next biggest insurance company—the Legal and General (which passed the Pearl in 1954) and has assets of £289.3 million. Very size, therefore, restricts the Prudential's scope for investment manœuvre. It can pursue a gradual policy, but it cannot in the markets available to it make sudden and dramatic changes in the composition of its investment portfolio. The table shows



DISTRIBUTION OF ASSETS

	1953	1954	1955	1956
	%	%	%	%
Mortgages, including policy loans	5·6	5·6	6·7	7·8
British Govt. and Govt. guaranteed	42·3	39·8	35·3	32·8
British municipal and county and Overseas Govt. and municipal	6·0	5·8	5·5	5·8
Debenture stocks	14·0	14·8	16·3	16·7
Preference shares	6·9	7·0	7·3	7·1
Ordinary shares	11·8	14·2	15·4	16·0
Other investments	0·2	0·2	0·3	0·3
Property	9·8	9·9	10·3	10·7
Cash, agent's balances, etc.	3·4	2·7	2·9	2·8
Total %	100·0	100·0	100·0	100·0
Total £ million	709·4	771·5*	817·4	856·8

* Ordinary shares were written up by £8 million and properties by £3 million to strengthen the actuarial reserves.

that it has gradually over a period of years been making important changes. The stake in gilt-edged is being progressively reduced. Substantial new lines of debentures are being absorbed, the equity portfolio is growing steadily and an increasing interest is being shown in mortgages and property investment. It may be that this last change received an extra fillip last year because the building societies had less money to put into mortgages than the mortgage market could have taken from them. The Prudential last year put £8.3 million into mortgages, it also put £2.8 million into loans to local authorities, reflecting the fact that the local authorities were forced away from the Public Works Loan Board on to the market.

Assets increased last year by £39.3 million (£6.6 million less than the increase of the previous year). Balance sheet figures have been struck after transfers to investment reserve of £1.9 million (against £1.8 million). Despite the bad year in markets the Prudential was able to meet the whole of its depreciation out of inner reserves, large contingency funds at £32¼ million remaining unhypothecated.

with **ABBEY NATIONAL** naturally!

At the helm of his little five-tonner he's as happy as a king and as free as the breeze. On weekdays, you'll find him in an architect's office, well-established in his profession with a partnership in the offing. Like all people in responsible positions, he has his worries, but at least he loses no sleep over the security of his savings, for he has invested in Safety with Abbey National.

The Abbey National gives him a good return free of income tax. Today this is 3½ per cent—equal to £6.1.9 per cent where the standard rate of income tax is paid.

"When stocks and shares are meeting squalls or headwinds," says our yachtsman, "give me the good ship Abbey National." Any amount from £1 to £5,000 is accepted.

Taking the East into account

Twenty-five years ago you would have found this 'adding machine' of antiquity in every eastern branch of The Chartered Bank. It was of particular use in calculating the intricacies of exchange rates which often fluctuated with great rapidity. Today, the abacus is being replaced by the slide rule and the electric computer. The East is changing but The Chartered Bank remains in step, so that its knowledge of eastern trade, travel and investment is always up-to-date. This knowledge and a century of experience sustain a complete banking service available throughout a branch system, which extends to most centres of commercial importance in Southern and South-East Asia and the Far East.

THE CHARTERED BANK

(*Incorporated by Royal Charter, 1853*)

HEAD OFFICE: 38 BISHOPSGATE, LONDON, E.C.2

UK EXPORTS

Metals Take the Lead

DESPITE the buffetings that followed the Suez crisis British exports are still buoyant. The record value of £297 million in March brought the average for the first quarter to nearly £279 million a month. If repayments of silver bullion to the United States are excluded the increase in value over the first quarter of last year was seven per cent, and the volume was 3 to 4 per cent higher. The rate of growth, however, has slackened; in the whole of 1956 exports were 10 per cent higher in value and six per cent higher in volume than in 1955. The Suez crisis is partly to blame. Exports to Egypt, which formerly took about one per cent of total British exports, have almost ceased and the volume of petroleum shipments has had to be sharply

PROGRESS THIS YEAR
(monthly averages—£ thousands)

	Year 1956	1st qtr. 1956	1st qtr. 1957
Machinery, non-electric	41,964	42,366	45,942
All textiles	27,679	28,215	30,155
Road vehicles and chassis	25,073	25,815	25,631
Chemicals	20,377	20,046	22,518
Electric machinery	18,082	17,637	18,853
Iron and steel	14,440	13,713	17,508
Non-ferrous metals	8,566	7,963	10,337
Petroleum	8,290	8,317	8,021
Aircraft	5,967	7,072	4,620

reduced. But exports to other Middle East countries, particularly Kuwait, Persia and the Sudan, have continued to increase and were 20 per cent higher in the first quarter than in the same quarter of 1956. Last year's remarkable growth in exports to North America and India has not been maintained, but shipments to the OEEC countries have forged ahead; the average value in the first quarter was £86 million a month (including re-exports), 24 per cent higher than in the same quarter of 1956 and 14 per cent above the average for the whole of 1956.

Engineering products as a group are no longer making the fastest gains, though they still accounted for over one quarter of the total rise in British exports between the first quarter of 1956 and 1957. Leading the field now are iron and steel and non-ferrous metals, shipments of which were both about 30 per cent higher than in the first quarter of 1956; chemicals, which rose by 12½ per cent; and textiles, which increased by seven per cent, thanks mainly to a further growth in shipments of wool textiles and partly to a welcome revival in shipments of cotton and synthetic textiles. The absolute figures for the main groups are shown in the table. The rise in export prices was checked last month, the index remaining at 110 (1954=100); import prices fell by one point to 110, thus moving the terms of trade in Britain's favour by one point to 100.

FUEL CONSUMPTION

Oil Conversion before Suez

OIL consumption in Britain rose by 8.5 per cent in 1956 to 25.2 million tons, a rate of increase only slightly lower than that recorded in 1955, in spite of the lack of any rise in industrial production last year. Statistics issued by the Petroleum Information Bureau show that the demand for fuel oil continued to increase in 1956 at a rate of over 20 per cent a year, although in the last quarter, when the first impact of the restrictions on consumption was felt, the rate of increase dropped to 16 per cent. As this rise in fuel oil consumption was not accompanied by higher industrial output, it must be mainly accounted for by conversion from coal-burning plant and by the rising demand for oil for central heating. The figures for the first quarter of 1957, when they are published, will be the first to show the full effect of the restrictions on consumption, but of much greater concern to the oil companies is the rate of increase in demand that can be expected when a free market returns. How much, for example, will the rate of growth in fuel oil demand be retarded by consumers' memories of the restrictions—and experience of the much higher prices—that resulted from the closure of the Suez Canal?

In contrast to fuel oil, petrol consumption rose by little more than one per cent in 1956, and in the last quarter, when rationing began to take effect, started to fall. Deliveries of petrol through dealers rose faster over the year, but were offset by the reduced demand from commercial consumers, as more lorry fleets were switched over to diesel fuel. Partly as a result of this switch, the premium grades of petrol were again more popular than the regular grades. A similar trend towards the increased use of diesel fuel was evident on the land, where the tractor powered by tax-free vaporising oil continues to give way to the more efficient diesel equipment.

THE WOOL INDUSTRY

High Output in Britain

SOME sections of the British wool industry may complain of severe competition, but the level of output as a whole remains high. Prices are firm; demand at home and abroad is buoyant; and delivery dates are tending to lengthen. Output in the woollen section, after lagging behind, has recently increased. That appears to reflect a general improvement in demand, including the recovery in the fortunes of the carpet industry, and not simply a swing of fashion from worsteds to woollens in women's wear. The latest returns of the Wool Industry Bureau of Statistics show that the rate of delivery of woollen fabrics in February was five per cent higher than a year ago, while deliveries of worsted fabrics were six per cent higher. The rate of wool consumption in all sections was five per cent higher than in February last year. Production of tops (the worsted process) in February rose by six per cent compared with a year ago and deliveries of worsted yarn were seven per cent up; though deliveries of worsted yarn fell by 6½ per cent, deliveries of weaving yarn rose by 11 per cent and deliveries of hand-knitting yarn rose by as much as 28 per cent, reflecting the fashion for "quick-knit" wools.

Topmakers still find that they cannot sell on the basis of the current replacement cost of raw wool and they are apt to be envious of the spinners' superior bargaining power. Spinners appear to have had little difficulty in passing on higher prices of wool, though a 64's B top now costs them about 152d. a lb, 24d. more than six months ago. Nevertheless the rise in prices is encouraging the use of lower grades of wool and the use of rayon in mixtures. Firms are experimenting with the new acrylic fibres, and some are beginning to use less terylene in mixtures, say 33 per cent instead of 50 per cent. Some spinners of coloured yarns have been offered more orders than they care to accept; experience has shown them that if wool prices were to fall some orders could disappear overnight. Few people are anticipating a fall in prices soon, but topmakers will be cautious about buying wool forward to tide them over the between-seasons' gap in the auctions.

RUSSIAN STEEL

Expansion Helps Efficiency

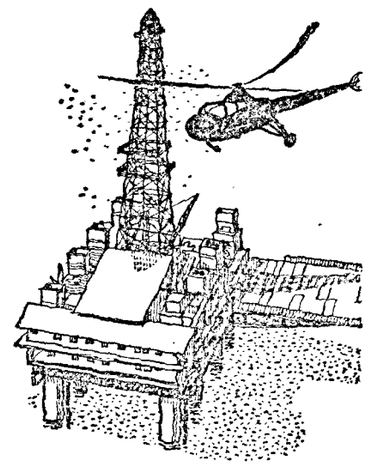
FOUR or five years ago the fashion was for British industry to send productivity teams to the United States: in the last two years technical teams have been going in the opposite direction—to Russia. Their purpose has been rather different—primarily to learn what was there rather than to learn from what was there. But these processes are inter-related. Two years ago some British steel experts accompanied an international mission to steelworks in South Russia: last year a completely British team visited the massive steel complex in the Urals, inspecting the works at Magnitogorsk, Chelyabinsk and Novo-Taguil. Both teams were interested in seeing the reality behind Russian steel statistics: both returned with a high respect for Soviet management and advancing technical efficiency.

Reporting upon the second visit in the British Iron and Steel Federation's *Steel Review*, two members of the team pick out a number of sharp differences between Russian steel and British:

> Far higher earnings differentials for skill, and more sharply rising bonuses for output. A labourer at Magnitogorsk earns 600 roubles a month (say £22 at the latest "tourist" exchange rate); a skilled man 1,200 roubles; top craftsmen 2,000 roubles; managers, 4,000 roubles.
>
> Total labour productivity in Russian steel is a little below British or German, and less than a third of American, though in the large integrated plants labour productivity "is probably as good as the general run of plants in this country."
>
> Being shorter of capital than labour, the Russians concentrate on plant productivity. Automatically-controlled blast furnaces at Magnitogorsk, with a 26 foot 9 inch hearth diameter, produce 2,000 tons of pig iron a day, operating on 86 per cent sinter and using 13-14 cwt of coke per ton of iron. This rate is 40-50 per cent higher than at similar furnaces in Britain or the United States.

Much of this "splendid performance," the report suggests, is the outcome of a pattern of development in which the steelworks have been deliberately planned as the core of

More Offshore Oil



THE first major offshore oilfield discovered in the Middle East, Aramco's Safaniya field off the coast of Saudi-Arabia, came into production last week. Elsewhere in the Persian Gulf, Shell is waiting only for a replacement of the expensive drilling platform destroyed in a storm last winter to recommence drilling in 80 feet of water off the coast of Qatar; BP, in association with a French company, is preparing to drill its first exploratory well off the Trucial Coast; and the Italians are negotiating for leases to drill off the Persian coast.

This flurry of activity is a measure of the oil companies' confidence that more major oilfields underlie the waters of the Persian Gulf. But all offshore drilling is enormously expensive—an offshore well may easily cost five times as much as a well on the mainland. So the greatest stimulus to offshore exploration comes when the chances of finding a large oilfield underwater are much greater than on the more intensively explored mainland.

This is to some extent the case off the coast of Borneo, where Shell drilling rigs are active, and also, if recent discoveries are an accurate guide, in the Gulf of Paria off the coast of Trinidad. But by far the most extensive exploration for offshore deposits has been carried out off the coast of the United States—above all in the Gulf of Mexico off the coast of Louisiana, where over a hundred offshore drilling rigs are now in operation and over 600 wells are expected to be drilled this year. Even there the 1956 production rate of some 40 million barrels of crude oil and 124 billion cubic feet of natural gas is still far short of the volume required to make an investment of well over $1,000 million pay off.

Three main types of equipment are used in offshore drilling. Permanent self-contained platforms can be mounted on huge piles resting on the sea bed and by "directional drilling" up to a dozen wells may be drilled from one platform. Mobile drilling platforms, one of which is shown in the diagram, are equipped with huge legs which, although resting on the sea bed while the rig is operating, can be retracted so that the entire structure floats and can be towed away to the next location. Floating drilling tenders, mounted on barges or converted tank landing craft, are moored to a small permanent structure on which the derrick alone is mounted.

The depth of well required is not a limiting factor in offshore drilling; wells up to four miles deep are quite

feasible. The main problem is the depth of water in which the equipment has to operate. So far no well has been drilled in the seabed below more than 112 feet of water, although drilling in 125 feet of water is to be attempted in the Gulf of Mexico this year, and existing types of equipment might be economic in depths of up to 200 feet.

But for deeper water some completely new techniques will be required. Fully floating drilling platforms, with flexible drill pipe connections to allow for tidal movements; diving bells for underwater well completions; and even underwater storage tanks—these are the talk of the future, if the rewards for finding oil are sufficiently attractive.

new engineering and industrial activities, assuring each plant of a steady and economic load. Moreover, the rapid expansion of capacity—it rose by about 18 million tons between 1950 and 1956 and is planned to rise another 23 million tons by 1960—means that entirely new plants are constantly being commissioned in which all the technical improvements Russia has developed or can learn from elsewhere are continually being applied.

MANPOWER

Labour Force Shrinks Slightly

THERE were about 81,000 fewer people in civil employment at the end of February than a year before, and about 83,000 more unemployed. The total working population, in which one might have expected a "natural" increase of say 30,000 during the twelve months, was 42,000 down : this expected increase will have been wholly offset by the withdrawal of people of working age, particularly women, from gainful employment during the period of disinflation.

Making allowance for seasonal factors and for the revision of manpower figures by the Ministry of Labour, one can infer that the labour force in British civic employment went on rising up to last summer, though at a slower rate than in the years up to 1955. In September it was about 120,000 higher than in September, 1955—when civic employment was fully 320,000 up on September, 1954. But since September civil employment has fallen by another 120,000, over and above the seasonal drop.

During the whole disinflationary period the major decline has been in manufacturing industry: other sectors of the economy, notably construction, distribution and the service trades, have been gaining extra workers. Within manufacturing, there have been marginal net increases in employment in chemicals and in some few capital goods industries within engineering. But these have been largely, according to last week's Economic Survey, of unskilled labour. The main effect of disinflation on the labour market has been slightly to soften the extremity of demand at the margin—there are now rather more people wholly unemployed than jobs on offer—and to halt the steady absorption of extra people into gainful employment that had been the main mitigating factor during the period of brimful employment from 1952 to 1955.

BUILDING PROSPECTS

Prosperity but not Expansion

THE pace of building and civil engineering construction is still steadily easing off. It is a little too early for provisional estimates of output in the first three months of this year, but the value of work done in that period is unlikely to have been much more than 3-5 per cent more than twelve months ago. This would reflect the trend of last year, when the value of the industry's output rose by 14 per cent in the first six months but by only 7 per cent in the last quarter. For over a year the industry has been voicing apprehensions about its prospects and last year's results certainly showed the declining trend expected by builders, though the actual physical increase of some 6 per cent (and a 3-4 per cent improvement in productivity) was somewhat larger than their public remarks would have le one to expect.

The industry's apprehensions about actual redundanc this year have been much more vocal, though they ar blended with a philosophic view that if it is necessary the the industry will have to put up with it. Nevertheless th immediate basis for these fears is also not very convincing There is still a large volume of work in hand for mos sections of the industry. The fall in house building shoul be more than offset by other public new work and thoug credit restrictions seem to have brought the recent shar increase in industrial building and other private work t an end for the time being, there is unlikely to be any reduc tion in the rate of this type of construction this year. It i indeed difficult to see why total building and civil engin eering output in 1957 should be less than in 1956. Th present prospects for 1958 are perhaps more bleak and th budget failed to provide any obvious stimulus for th industry's customers, but the fall in the amount of worl passing through architects' and surveyors' offices tha started just over a year ago seems recently to have tailed off

AIR TRANSPORT

Two IATA Anniversaries

THE International Air Transport Association is marking up two anniversaries, the tenth year of inter-airline clearing operations and, on May 1st, the fifth year of tourist fares. The clearing operations, which began in London in 1947 with a turnover of £13 million, and ended last year with a turnover of £176 million, are one of the most valuable services that IATA performs for the international airlines, but the introduction of tourist fares was a major landmark in the industry's commercial development.

The first tourist fares of 1952 were 30 per cent below the standard rates for what then became first-class travel. Introduced first on the North Atlantic, they spread over the main international routes, tapping the first mass market for flying. More than 3 million passengers have flown across the North Atlantic in the five years since the new fares were introduced, and two-thirds of them flew tourist. Of the 785,000 who crossed last year, nearly 80 per cent flew tourist.

These figures seem to suggest that the airlines are right in contemplating another major change in May next year, the introduction of third-class fares at roughly 20 per cent less than the present tourist rates, but in five years of experience with a two-tier fare structure, many of the illusions with which the airlines embarked on their great tourist experiment have been rudely shattered. It is not, as was once thought possible, feasible to pension off old aircraft on tourist services. These will operate first-class services adequately for years—witness the Stratocruisers, but low fares call for the most efficient machines available, and these are usually the newest and fastest.

Another illusion was that low fares could be introduced without seriously affecting the first-class market. The evidence is that first-class air travel has been all but destroyed by the growth of tourist services, and the North Atlantic, which is a particularly uncomfortable journey, is one of its last bastions. Third-class fares may destroy the tourist market in the same way, for the difference between the two will be largely a matter of leg room, and it is arguable how much three inches of extra space (the average

difference) is worth in hard cash. The airlines, most of whom have just raised their fares by 5 per cent as an emergency measure, must decide this autumn whether they are going to anticipate events by eliminating the middle fare entirely, leaving only first and the new third class, or whether they will wait a year or so to see how the new experiment shapes.

FEED GRAINS

Barley Cheaper than Maize

PRICES of feed grains are still depressed. American maize is now about £24 a ton cif UK, over £5 10s. below its post-Suez peak and Canadian No. 2 feed barley, at about £21 10s. a ton, is over £8 below its peak. Prices originally fell because freight rates dropped ; then the mild winter and the early spring cut consumption of feedingstuffs. Producing countries had to reduce export prices and some speculators were caught out. Now freight rates have eased again, demand has slackened further, and the American government is accepting lower prices for its surplus stock of maize. Canada, which normally meets the bulk of Britain's needs for imported barley has had to meet keen competition here from France, and from Argentina and Iraq in Continental markets. Barley at present prices is drawing some demand away from maize, but there is a limit to the interchangeability of the two grains in the manufacture of feedingstuffs. Some recovery in demand for feed grains is due, for consumers' stocks are running low and consumption of feedingstuffs for poultry begins to increase at this season. But supplies in the producing countries are plentiful and prices are unlikely to rise far.

PULP AND PAPER

OEEC Remains Cautious

A SECOND series of forecasts of consumption of pulp and paper in Europe has just been published by the Organisation for European Economic Co-operation (OEEC). The original forecasts for the period up to 1960 were all reached or exceeded by 1955 ; will the revised ones suffer a similar fate ? In 1953 consumption of pulp products—paper, board and rayon pulp—in the OEEC countries and Finland was reckoned to increase from 9.7 million tons in 1950 to 12.3 million tons in 1960. By 1955 consumption had already soared to 14.2 million tons. Why did the OEEC so greatly underestimate demand ? First, the forecasts prepared in 1953 were undoubtedly influenced by the events of the previous year, when the paper industries of Western Europe—and none more than the British—suffered a severe recession after the buying spree provoked by the Korean war. Secondly, the subsequent removal of most restrictions on usage of paper and board released a massive suppressed demand, especially in Britain.

In revising its forecasts for 1960 the OEEC disregards this non-recurrent influence and assumes that henceforth demand for pulp products will be at a "normal level." This apparently means that demand is not expected to expand appreciably faster than the gross national product. In the favourable conditions of 1950-55 a rise of 26½ per cent in the gross national product of OEEC countries was accompanied by a rise of 47 per cent in consumption of pulp products. For 1955-1960 an increase of 17 per cent in GNP is forecast and one of 20 per cent in consumption of pulp products. Between 1955 and 1960 Western Europe's requirements of pulp products would rise by just over 2¾ million tons to nearly 17 million tons. The OEEC does not think that Western Europe will have much difficulty in meeting that demand from its own resources. There is enough wood in Scandinavia ; and the formation of a free trade area could stimulate construction of pulping capacity. But has the OEEC again been too cautious ? Paper enjoys a dynamic demand which may continue to grow much faster than GNP. It is still displacing timber in packaging ; it is being used ever more lavishly as an aid to selling ; and its technical and domestic applications are multiplying.

CITY MERGERS

Merchant Banks Expand

MERGERS and expansion schemes are gaining popularity among the merchant banks of the City. Earlier in the year Hambro Bank absorbed Mocatta and Goldsmid, the bullion brokers, thereby adding to the merchant banking side a new business which was maintained as an entity. Now a true merger between two merchant banks—Seligman Brothers and S. G. Warburg and Company—is announced. The joint business will be known as S. G. Warburg and Company (incorporating Seligman Brothers), so that the Seligman house, familiar to the City of London for nearly 100 years, disappears as a separate entity, the Seligman partners joining boards of companies in the Warburg group. For S. G. Warburg and Company this acquisition adds a final feather in an already well-adorned cap. The Warburg firm, which was established in London in 1934 under the name of New Trading Company, has thus quickly made its way to that inner sanctum of acceptance houses, whose paper is eligible for rediscount with the Bank of England. To achieve membership of the Acceptance Houses Committee in little more than twenty years is record-making progress.

STOCK EXCHANGE STATISTICS

Curious Calculations

LAST year the gross interest and dividend payments on stock exchange securities came to £1,316 million, an increase of 7.5 per cent on the 1955 total of £1,244 million. Not more than £625 million of this is believed to have flowed into personal disposable income—£35 million, or 6 per cent, more than in 1955. These estimates are taken from the third issue of *Interest and Dividends upon Securities quoted on the Stock Exchange, London.* The formality of the title shows that the statistics have the official blessing of the Stock Exchange Council.

Gross interest on loan capital, largely made up of gilt-edged stocks, rose by 7.9 per cent, from £627 million to £676 million ; gross dividends on ordinary capital by 8.5 per cent, from £524 million to £567 million ; but gross preference dividends remained unchanged at £73 million. These payments were made on more issued capital. In all the nominal value of securities in the year to end-June, 1956, went up from £24,997 million to £26,309 million, with loan capital going up from £20,546 million to £21,577 million, preference capital from £1,224 million to £1,240 million and ordinary capital from £3,226 million to £3,492

million. The stock exchange statisticians go a step further and calculate the change in market values in the year to end-June: loan capital at market prices thus came down from £17,218 million to £16,831 million, preference capital from £1,190 million to £1.059 million and ordinary capital from £10,171 million to £9,530 million.

These figures have involved a great deal of work. But the material is used to produce the odd concept of an average rate of return on preference and ordinary capital. The total of all dividends paid over the year on ordinary stocks is related to the market value of those stocks on a single date (June 29th) and the return on ordinary capital is set down at 5.95 per cent (against 5.15 per cent). Similarly the rate on preference stocks is set down at 6.90 per cent (against 6.16 per cent) and the rate on all share capital —an even odder concept—at 6.05 per cent (against 5.26 per cent). These figures have little meaning.

WATER POLLUTION

Detergents Downstream

THERE is no easy solution to the problem of what to do with synthetic detergents once they have gurgled down the sink hole. Experiments carried out by the Water Pollution Research Board of the DSIR, and described in the Board's report for 1956, suggest that if purification plants at sewage works are designed with a certain margin of capacity in hand, they are likely to be able to remove up to 80 per cent of the detergent coming in to the works, but probably not much more. If, however, the plant is working to its full capacity, as it will be at many works, the proportion of detergent removed will probably be much lower. In some of the Board's experiments only 50 per cent was removed.

Until, therefore, the manufacturers of detergents alter their chemical formulae to give a product that can be destroyed by the normal biological purification process used by sewage works, a certain proportion of household detergent will continue to flow into the streams, rivers and reservoirs of the countryside. This could hardly be described as a major additional source of water pollution. People are eating a far greater amount of detergent from washed plates and cutlery than they are ever likely to drink from not wholly purified water supplies, and there is less alarm about the effects of detergents than when they first came on the market and manifested their presence in clouds of scummy foam blowing off the rivers. Even this foam can to some extent be trapped before it becomes a nuisance.

But the Board's investigations have brought one unexpected factor to light. "Very small concentrations" of detergent—as little as one part in a million in water—cause a marked reduction in the rate at which a slowly flowing stream can absorb oxygen from the air. This could have serious consequences in polluted streams or, as the chairman of the Board prefers to put it, "would be an important factor in determining their capacity for self-purification." This is a rather more disquieting aspect of the use of synthetic detergents. The growth of their market proves their popularity and their washing efficiency: but they are not an unmixed blessing. The standing committee set up by the government to keep their effects "under review" has a complex task on its hands.

OIL MEASUREMENT

Everyman an Oilman

TO the British motorist—and the Canadian—petrol comes in imperial gallons. In the United States the motorist also thinks in gallons, but smaller ones: one imperial gallon equals about 1.2 US gallons. Gallons are also the preferred unit of measurement of the British Customs' authorities—measured, however, at 60 degrees fahrenheit.

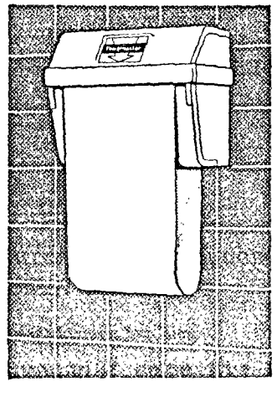
For larger quantities the oil industry itself abandons the gallon completely. In America, and in the calculations of American oil companies overseas, the standard unit is the barrel (of 42 US gallons or 35 imperial gallons). In describing the throughput or capacity of refineries or pipelines, their favourite term, which the British companies sometimes adopt as well, is a measurement of a rate of flow—barrels per day. British and Dutch companies as a rule, however, have a penchant for measurement by weight. Their favourite unit is the ton—the long ton of 2,240 pounds, not the metric ton found on the Continent, nor the American short ton of 2,000 pounds which is used in American oil circles mainly to measure bitumen supplies. British companies also use tons to measure pipeline and refinery capacity or flow—in tons per year.

Conversion of tons into gallons or barrels is always difficult, because it varies with the specific gravity of the oil. Thus there are only about 240 gallons of fuel oil in a ton, but over 300 gallons of petrol. Even crude oil varies according to the country and field from which it is produced, although usually within the range of 7 to 7½ barrels a ton. A convenient shorthand, which can be used with crude or fuel oil, is that one barrel a day is roughly equal to 50 tons a year.

Thus the resumption of the flow through the trans-Syrian pipelines at 200,000 barrels a day is equivalent to an annual throughput of some 10 million tons. But the innocent observer who wants to find out whether the consortium of oil companies in Iran has met its production target will find himself confronted by an agreement expressed in cubic metres. This is the final equation: 1 barrel = 35 imperial gallons = 42 US gallons = 0.159 cubic metres = 159 litres.

BUILDING WITH ASHES

Profits from Waste

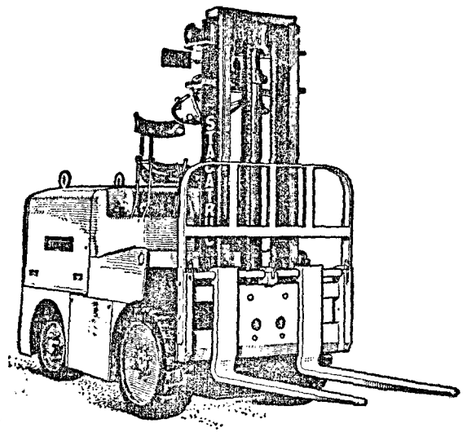


DISPOSAL of the fly ash waste product of power stations has become a major—and costly—headache for the Central Electricity Authority. Roughly six million tons of clinker and fly ash has now to be got rid of each year after burning about 43 million tons of coal, and as power stations turn steadily towards pulverised coal firing rather more of this waste product will be fly ash and less will be clinker, for which some market has been built up in breeze blocks and in road building. The amount of fly ash residue, now about two million tons a year, is likely to double by 1960 and to treble by 1964. Hitherto only a negligible amount has found a useful outlet—in cement; disposal of the remainder can cost 10s. or more a ton, and finding new dumping sites is becoming progressively more difficult.

But a process developed by Dr Somogyi, a consulting engineer who has formed a private company, Sinterlite

"You'd think they'd have Towelmasters by now!"

Poor chap—left high and wet! And to add insult to injury he knows that a Towelmaster would guarantee him a good, clean dry every single time he washed his hands. He knows how efficient and hygienic it is. Moreover he knows that the Advance Towelmaster Service costs only 5/- for each roll of towelling used—and a roll is enough to give 180 pairs of hands a real, honest-to-goodness dry. Can you wonder that a man's not happy without a Towelmaster!



ADVANCE

Towelmaster

...the willing horse

It is an old axiom that everyone flogs the willing horse—but who wants to use horses in this enlightened age, when mechanical means can do a vastly better job? Nevertheless, it is quite surprising how often materials are humped around by manpower alone at a cost not only measured in fatigue, injury and slowed down production, but in the waste of good hard cash. More and more enlightened industries are taking burdens off men's backs by substituting the horse power of mechanical handling . . . Stacatruc handling . . . for this superlatively well engineered lift truck is the most versatile aid to quicker, cheaper and easier handling available today.

Lifting, transporting and stacking all manner of materials with unfailing dependability, the Stacatruc fork lift truck is an integral part of Britain's best mobile materials handling system.

Ltd., to promote it, opens up the prospect of turning this increasingly expensive waste product into a profitable by-product by converting it into light weight aggregate for the building industry. The first plant of this kind has been installed at Battersea Power Station, where it will be operated by The Cementation Company after it is opened by Lord Mills next week. The fly ash is first turned into small pellets and then heated in a furnace at a temperature of up to 2,000° F. The furnace is heated by burning the carbon contained in the fly ash pellets; with high carbon residues the process gives off surplus heat that can be used elsewhere, but the plant has been designed specifically to burn materials with very low carbon content—with as little as 5-7 per cent.

This feature of the Somogyi process has attracted considerable interest from overseas and in this country, as it could be applied not only to power station refuse but also to colliery slag and even to low grade coal seams. About 40 million tons of colliery refuse is dumped each year and roughly 2,500 million tons has accumulated from the past, and Dr Somogyi claims that much of this could in time be economically processed to produce heat and aggregate. But other materials are also found in these waste residues. CEA is now investigating the possibility of recovering germanium and other elements from power station refuse, and research undertaken by Sinterlite has shown that it is economically feasible to recover iron by magnetic separation from fly ash with a sufficiently high iron content. A large number of the slag heaps that disfigure mining areas have, it seems, suitable iron contents and on the basis of the work so far done by Sinterlite the cost of extraction would be less than the present cost of imported iron ore.

SHORTER NOTES

United Drapery Trust has evidently maintained the improvement in its trading results shown in the half-yearly figures. Consolidated profits for the full year to January 26th were £6,647,033, against £6,091,144 in the previous year. Group net profit after tax shows a more moderate rise at £2,599,879, against £2,453,756. The dividend is held unchanged with a final payment of 20 per cent, again making 32½ per cent for the year. The company is, however, capitalising £693,211 of reserves to make a one for ten free scrip issue to ordinary stockholders.

* * *

Cammell Laird announces an unchanged final dividend of 10 per cent, again making 14 per cent for 1956. Profits before tax were £1,913,000, against £1,785,000.

COMPANY AFFAIRS

HAWKER SIDDELEY

PLANS to diversify Hawker Siddeley, away from aircraft and towards expanding industries, took final shape last week end. Hawker Siddeley's plans to absorb the Brush Group point directly towards nuclear energy, for Brush can provide the electrical manufacturing capacity that Hawker Siddeley needs to take, in Sir Roy Dobson's words, "a further big step in this field that will be all important in the years to come."

The details of the offer of Hawker Siddeley shares for those of the Brush Group are as follows:

One new Hawker Siddeley £1 ordinary share is offered for every five of the 11,461,652 Brush 5s. ordinary shares. With the Hawker shares at 37s. 6d. the offer prices the Brush shares at 7s. 6d. On the eve of the offer the Brush shares stood at 7s., having come up recently from 5s. 1½d.

One £1 cumulative preference share in Hawker Siddeley is offered for one £1 5½ per cent Brush preference share (1,660,000 are in issue). The dividend on the Hawker Siddeley preference is to be increased from 5 to 5½ per cent. On this offer the Brush preference shares gained 3s. 6d. to 18s.

Four new Hawker Siddeley ordinary shares are offered for every five 6 per cent £1 convertible preference shares of Brush (of which 474,587 are in issue). These units jumped 11s. 3d. to 28s. 9d. on the offer.

Shareholders in the Brush Group will presumably follow the advice of their directors and the example of Thomas Tilling (which owns about 20 per cent of the Brush ordinary capital) and accept the offer. There is a gain in income; the 1956 ordinary dividend of Brush was passed and Sir Roy Dobson has said that, as the Hawker Siddeley dividend will be left at 10 per cent for 1956-57, the Brush ordinary shareholders will thus receive the equivalent of a dividend of 8 per cent on their present holdings. And the offer should solve the capital problem which has overshadowed the Brush Group for years; at the end of 1955 it had a bank overdraft of nearly £6 million and that overdraft has since grown. It is to this problem that the directors of Hawker Siddeley will have to turn their attention if the offer goes through. Its existence explains why a company with net assets of £8 million should be taken over for the equivalent of £6 million.

Canada's expanding horizons have already attracted Hawker Siddeley. Nearly half its profits in 1955-56 were earned in that country and its interests there range well beyond aircraft and include Canadian Car and Foundry, makers of railway rolling stock. Hawker Siddeley was already on the fringes of the Canadian steel industry. And it is now to have a direct stake in that industry. Through its subsidiary, A. V. Roe, Canada, Hawker Siddeley has bought a minority interest in Algoma Steel largely from the estate of the late Sir James Dunn. The purchase at an unrevealed price consists of 150,000 Algoma shares; McIntyre Porcupine has bought another 150,000; the Royal Bank of Canada, acting on behalf of British investors, another 50,000; and Mannesmann International, a German company which is building a seamless tube plant adjacent to Algoma, has bought 200,000 shares. Thus about one-third of the issued capital of Algoma, which has yet to pay a dividend but which has accumulated about $78½ million in reserves, has changed hands. The total price paid for the shares (out of an issued capital of 1,650,000 shares) is believed to be in the region of $50 million.

BABCOCK AND WILCOX

HAVE investors over-estimated the growth prospects of some of the nuclear power companies? Following the fall in Reyrolle's profits, another nuclear power concern, Babcock and Wilcox, has reported a big fall in its profits in 1956. This leading firm of boiler-makers secured an early contract from the Atomic Energy Authority to supply boilers for Calder Hall and Chapel Cross; work on these sites is well advanced. But it has not secured a contract from the Central Electricity Authority for a commercial nuclear station.

Thus it was first in the field. Yet in 1956 its gross profits fell by about 22½ per cent, from £4,728,418 to £3,668,461. Its net profits came down from £2,239,809 to £1,547,216, but the ordinary dividend was left unchanged at 15 per cent. Can the pressure of rising costs on profit margins and difficulties in export markets be the only reasons for this sharp decline in profits? The answer must await the chairman's state-

ment, but at the current price of 79s., to which they fell from 81s. 3d. after the preliminary announcement, the yield on the £1 units of 3¾ per cent still looks low.

"BLUE CIRCLE"

ON Thursday morning the £1 ordinary stock units of Associated Portland Cement fell from 48s. 3d. to 45s. 6d. This was a measure of the disappointment in the market with the results and dividends of the "Blue Circle" group of cement companies. Since these companies' big free scrip issues (150 per cent by Associated Portland Cement and 200 per cent by its subsidiary, British Portland Cement) there had been hopes that the directors would loosen the purse-strings. But the dividend policy remains as conservative as ever. Effectively the dividend rates have been left unchanged: at 9 per cent for 1956 from Associated Portland Cement, 7½ per cent from British Portland Cement, and 35 per cent from Alpha Cement.

Better dividends were expected because of the tremendous accumulated resources of these companies. The reason why better dividends have not been declared is perhaps the stickiness of earnings. Sales, no doubt, have been well maintained, but margins may have been trimmed. The pressure on margins has since increased and prices will be raised in July. The gross profits of Associated Portland have edged up—from £13,072,868 to £13,672,157—and so have the gross profits of Alpha Cement—from £1,175,054 to £1,197,307—but those of British Portland have fallen—from £4,129,482 to £3,994,681. All three companies have reported a slight fall in their net surpluses.

VICKERS

THROGMORTON STREET was not looking for an increase in the Vickers ordinary dividend but it was expecting a strong advance in profits. The ordinary dividend was in fact left unchanged at 10 per cent, but the 1956 preliminary statement revealed only a slight increase in profits before tax—from £12,286,558 to £12,701,167—and a slight fall in net profits—from £5,597,696 to £5,332,546.

The failure of gross profits to expand more reflects first the bigger provision for depreciation (resulting presumably from past capital expenditure)

Consolidated earnings :—	1955 £	1956 £
Gross profit	16,359,469	20,055,601
Development and tooling	410,150	2,109,115
Depreciation	2,554,712	3,120,057
Provisions on work in progress	1,108,049	2,125,262
Profit before tax	12,286,558	12,701,167
Taxation	5,938,376	6,521,045
Net profit	5,597,696	5,332,546
Ordinary dividends	1,680,567	1,680,567
Retained by subsidiaries	2,619,216	2,893,731
Retained by parent	954,497	414,832

£1 ordinary stock at 44s. yields £4 11s. per cent.

and secondly an increase in special charges. The charge for "development and special tooling" rose sharply, from

£410,150 to £2,109,115; in itself that could foreshadow some future benefits. The provisions "for further expenditure on completed work and possible losses on work-in-progress" also rose abruptly, from £1,108,049 to £2,125,262; that could relate to contingent as well as to actual items.

The results suggested a deferment of hopes and the £1 ordinary stock units fell another 1s. to stand at 44s. and to offer a yield of £4 11s. per cent.

THOMAS TILLING

DIVERSITY of interests protects an industrial holding company, as it does an investment trust, from many risks. Such a company as Thomas Tilling does not spread its investments as wide as a trust but it has a much closer control of the investments it does hold. Most of its investments are controlling interests; and the industrial holding company keeps control of the purse strings. It also on occasion provides part of the management. In an expanding economy almost automatic growth comes to such a holding company. But to make the most of it the holding company must be prepared to provide new money or to extend credit.

Thus, while growth seems likely, the funds of Thomas Tilling seem fully employed. They could in a sense receive substantial reinforcements this year, for the group has accepted the Hawker Siddeley offer for its 20 per cent holding in the Brush group. Will it wish to retain the Hawker shares it will be receiving in exchange? At the end of last year Thomas Tilling held in cash and tax reserve certificates £399,731 and £728,355 in quoted investments (which had a market value of £554,310) and it had borrowed £891,964 from the banks. Its funds included £2,403,544 of the net assets of Cornhill Insurance (which insurance company has invested £1,567,889 of its portfolio of £5,421,483 in ordinary shares); and £2,810,497 of the hire purchase debts of Mutual Finance. Against this, there was £4,245,000 in ordinary capital, £4,227,457 in revenue reserves, £3,762,154 in minority interests and £1,615,030 of the deposits and current accounts of Mutual Finance.

The consolidated trading profit rose from £2,179,015 to £2,420,181 and total income from £2,794,457 to £3,076,122. Following an increase in net income from £712,702 to £814,685, the ordinary dividend was raised from 10 to 11¼ per cent. But the chairman, Mr Lionel Fraser, has already announced that the next interim dividend will be 6¼ per cent (against 5 per cent) so that a total payment of 12½ per cent seems likely for 1957. On that assumption, the £1 units yield about 4⅞ per cent at 51s. 3d.

Unfortunately, Mr Fraser does not reveal what contribution the main subsidiaries make to profits. But he does say that James A. Jobling, the manufacturers of "Pyrex," in which Thomas Tilling has a 60 per cent interest, achieved an increase in sales but reported

lower profits; but this company has added to its capacity and has an "excellent order book." Mr Fraser does not expect the profits of Mutual Finance, the hire purchase finance house in which Tilling has a 98 per cent interest, to be as good as the record results for 1956. The premium income and underwriting profits of Cornhill Insurance, in which Tilling has a 53 per cent interest, have grown.

CUNARD STEAM-SHIP

CUNARD is automatically associated with the "Queens," and with the North Atlantic. The emphasis is correct, for more than some other large shipping companies its fortunes are bound up with passenger liners. But Cunard does a big cargo trade as well and last year it must have enjoyed some benefit (though this may prove temporary) from the increase in freight rates. Like the other shipping companies it must benefit from the doubling of investment allowances.

On that fact alone, the decision to raise the ordinary dividend from 10 to 11 per cent can be justified. It can also be justified by the increase in profits. Last year its operating surplus went up from £7,405,872 to £8,419,874. The net surplus advanced from £1,827,969 to £2,260,971, from which the 11 per cent ordinary dividend absorbs £822,250 net. The British tax provision was £2,675,683 before crediting the investment allowance relief of £802,476, compared with £2,504,070 (before a relief of £746,148) in 1955. The increase in the ordinary dividend was not reflected in the price of the £1 ordinary stock, which, at 27s., yields £8 3s. per cent.

GALLAHER

GALLAHER has recently been one of the most successful competitors in the tobacco industry. It has also been the most active in the capital market, with the result that for the year 1956 it has £11 million of ordinary capital ranking for dividend, compared with £5,437,500 (of which £500,000 ranked for the final dividend only). The company has

	Years ended December 31, 1955 £	1956 £
Group trading profit	4,033,217	5,060,995
British tax	2,085,196	2,917,501
Net profit	1,948,021	2,143,494
Exceptional profit (net) to contingencies Reserve	Nil	216,377
Carry forward	1,963,206	2,813,212
Parent Company :—		
Preference divs. (net)	145,439	180,262
Ordinary divs. (net)	767,266	1,106,875

achieved an increase of about £1 million in the group profit before tax, excluding a windfall of £397,022 gross (£180,645 net) resulting from the increase in the tobacco duty. The net result, which conforms with the directors' forecast of last August, is that with much more money at its disposal the group has been able to declare a final dividend of 12½ per cent making 17½ per cent for 1956, against 25 per cent on half the capital in 1955, and that the group balance carried forward has been increased by about £850,000. The market's expectations were thus fulfilled.

RUBBER SHARE-OUT

LAST November Guthrie and Company's scheme for redeploying the surplus liquid assets of the rubber companies in that group through a new trust company was produced and quickly abandoned. It was obvious that opposition to a plan that might hoist assets out of the reach of shareholders, was strong. The surplus liquid assets above what the rubber companies seemed likely to need, remained. It is good to see that Sir John Hay and his co-directors have been big enough to adopt the obvious alternative and to allow shareholders to taste the fruits that are theirs. Only two of the companies concerned have produced dividend statements since the scheme was abandoned. Linggi last month paid a special tax free dividend of 10 per cent making a total of 35 per cent for the year ended October 31st (against 25 per cent tax free), and thereby used up some £85,000 of its reserves. This week Labu Cheviot in addition to raising its normal dividend for the year ended December 31st from 40 per cent, less tax, to 42½ per cent, less tax, proposes to repay 6d. on each 2s. ordinary share. The repayment is tax free to shareholders. It knocks £145,801 off the company's share premium account.

HARLAND AND WOLFF

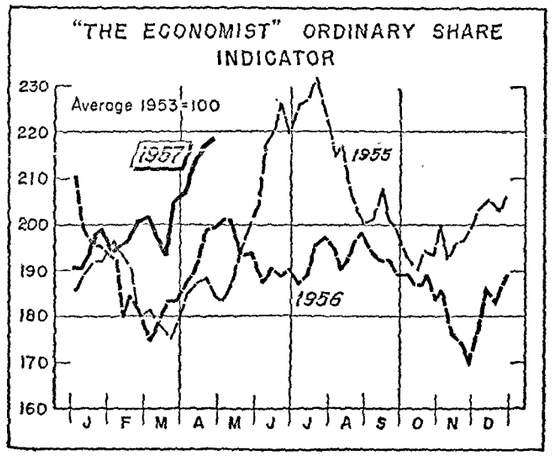
AFTER tax, the net profits of Harland and Wolff, the shipbuilders, fell in 1956 from £920,859 to £901,297 and, for the fourth successive year the ordinary dividend was left unchanged at 10 per cent—not a surprising decision in view of the labour dispute. But the trend in profits was rather better than the net earnings suggest. First, the

tax provision was higher at £900,845 (against £888,768). Secondly, the profit of £60,315 on the settlement of contracts completed in earlier years was much lower than the 1955 credit of £200,581. If these profits of earlier years are excluded, gross profits on the year's business appear to have risen from £1,609,046 to £1,741,827. The £1 ordinary units of Harland and Wolff now stand at 34s. and yield 5⅛ per cent.

LOMBARD BANKING

THE introduction on the Stock Exchange of the £1 six per cent preference shares of Lombard Banking this week with an expected opening price of between 17s. and 18s. is small beer in the issue market: there are only 413,693 of the shares in issue; the company's 1,412,753 5s. ordinary shares are not yet to be quoted. Yet in another way the emergence of Lombard Banking as a quoted company is worth note. Its growth, even for a hire purchase finance house, has been phenomenal. In the decade 1947-56 group net profits before tax have risen without a break from £11,000 to £398,000—a thirty-six fold increase. The group specialising in hire purchase finance on agricultural, industrial and commercial goods, including motors but not the smaller domestic consumer goods, has recently been reorganising its affairs, so that the parent company concentrates on banking and the subsidiaries on hire purchase financing. It must be contemplated that the parent will thus receive deposits and re-lend them to the hire purchase subsidiaries. The building up of a bank in the full and normal sense of the word is naturally not complete. No right is yet claimed to create and maintain hidden reserves.

It must be expected that growth will continue and that to promote it a quotation will ultimately be sought for the ordinary capital. The ordinary shares that received 27½ per cent last year also received a free scrip distribution of four ordinary shares and three £1 6 per cent preference shares for every 16 ordinary shares held and must now be considered to be on a 20 per cent dividend basis.



London Stock Exchange

FIRST DEALINGS:	Apr. 10	May 1	May 15
LAST DEALINGS:	Apr. 30	May 14	May 28
ACCOUNT DAY:	May 7	May 21	June 4

LAST week's fall in the Treasury bill rate followed by talk of a reduction in the Bank rate led to a reversal of the downward trend of gilt-edged stocks. Since last Wednesday and even after the announcement of an unchanged Bank rate on Thursday prices advanced steadily, the *Financial Times* index of Government securities improving a point to 86.98 in the three days of dealing. Short-dated issues moved up, 4 per cent Conversion 1957-58, rising to 99⅝. Scarborough Corporation took advantage of the good market to announce an issue of £1 million 5 per cent stock at £96¾, with the single date of 1966. Though underwriters of both the Brighton and Nottingham issues had been left with stock and both started at ¼ discount on Wednesday Brighton rose to ⅛ discount and Nottingham to ½ discount. Industrial stocks were again better and Canadian issues attracted considerable support, International Nickel and Aluminium Limited making outstanding gains.

Bank shares were mainly quiet, although Bank of British West Africa advanced 3s. to 33s. 6d. on the increased dividend. Royal Exchange Assurance held the gain of 12s. 6d. to 150s., which followed the increase in dividend, but Employers' Liability fell 1s. 3d. on the dividend announcement. A surprise among stores was provided by a sharp rise of 8s. 3d. to 68s. 9d. in John Barker. Austin Reed jumped 4s. to 29s. 9d. on the higher dividend. Hoover "A" gained 2s. 4½d. to 37s. 10½d.; finance houses advanced, United Dominions Trust rising 3s. to 95s. Bowmaker fell 9d. to 22s. 4½d. on the publication of the full report. Steel shares rose. The Pressed Steel convertible debenture rose to a premium of 17.

Oil shares fell back on the troubles in Jordan. Kaffirs weakened again. Rubbers continued to attract support and there were small changes in tea shares.

THE MONEY MARKET

At the Treasury bill tender on Thursday before the holiday the discount market raised its bid by 6d. to £99 0s. 4d. per cent, following the increase of 8d. per cent at the previous week's tender. The discount rate has thus been reduced below 4 per cent, reversing the rise in March occasioned by the weakness of sterling and the strikes. The market last week secured allotment of 55 per cent of its common bid (compared with 54 per cent the week before) and the total allotment was stepped up by £10 million to £240 million. The average rate of discount rose in line with the market rate, by just under 2s. per cent to £3 18s. 9.15d. per cent, its lowest since July, 1955. At yesterday's tender, the offer was cut £40 million to £200 million.

Credit conditions in Lombard Street continued difficult around the holiday. On Thursday last the Bank gave a moderate amount of special aid, partly to facilitate repayments of seven-day penal loans; but on Tuesday it gave no special relief, and one or two houses had to take a small amount at Bank rate. The stringency has kept rates for overnight loans up to 3¾ per cent—that is within ⅝ of last week's bill rate. July maturities have changed hands at 3⅞ per cent and also at 3¾ per cent.

The Bank return for Wednesday shows a further outflow of notes of £7.0 million in the week straddling Easter; this brought the total outflow in the nine weeks since the seasonal low point to £93.1 million.

VULCAN INSPECTS—AND PROTECTS

The crane with a load of mischief

RAISING a load of scrap just so far was one thing. But raising it that extra foot or two was another, and what with the increased acceleration and the jib angle, this mobile monster simply fell flat on its face.

What Vulcan say about it

No crane, mobile or otherwise, can be expected to do more than the lifting job for which it was designed. If it does, then accidents will happen, as sure as our name's Vulcan. Our Engineer-Surveyors scent danger before disaster, and industrial machinery is their happy hunting ground. Everything, from a boiler to a vacuum vessel, comes under their expert eyes and receives that specialist scrutiny for which Vulcan is renowned. That's why safety first is Vulcan first.

FREE: For news of industrial accidents and ways to avoid them, ask us for 'Vulcan,' a quarterly journal for Power users. Please write to Dept. 17.

Pensions and Capital Accumulation

128. It is evident that pensions are intimately linked with the whole process of capital accumulation and that the scale of pensions that can be contemplated depends, on the one hand on the enhancement of the country's productive power that would result from the building of additional capital assets, and on the other on the ease with which additional savings can be spared for this purpose. If the National Insurance Scheme were conducted on the same principles as a private scheme, then the investment of the contributions would enable valuable assets to be constructed that would eventually furnish the means out of which pensions could be paid. But the Scheme is heading for a deficit that will have to be met out of general taxation, and, to some degree, out of the savings of the taxpayer, so that it will actively impede the very process of capital accumulation on which, implicitly, it rests.

Issued by THE LIFE OFFICES' ASSOCIATION, LONDON and the ASSOCIATED SCOTTISH LIFE OFFICES, EDINBURGH in the interest of a better understanding of the fundamental problems of providing a higher level of retirement pensions without harm to the Nation's economy.

CO-OPERATIVE INSURANCE SOCIETY LIMITED

SATISFACTORY RESULTS IN SPITE OF DIFFICULTIES

MR S. LEONARD KASSELL'S REVIEW

Mr S. Leonard Kassell, Chairman, at the eighty-ninth Annual General Meeting held on April 24, 1957, said:

In concluding my report to the Shareholders last year, I stated that the year 1955 had not been an easy one in many respects and that 1956 had not opened very auspiciously. I expressed the view that as the CIS is very firmly established and well organised we should face up to and overcome any difficulties which might arise.

Difficulties did arise and were greater than I visualised at the time. The prolonged dispute with our full-time Agents Union has resulted in a setback in the rate of progress which we have been making in the postwar years. Nevertheless, in my opinion the eighty-ninth Annual report, Statement of Accounts and Balance Sheet which I now submit for your approval are satisfactory.

Our premium income increased by £2,355,855 to £40,464,224 and our assets by £15,635,004 to £180,029,361. The Industrial Life Assurance Fund has passed the £100 million mark and the Ordinary Life Fund is over £60 million.

These life funds are held in trust for and invested primarily for the benefit of the owners of the 11¼ million life policies which were in force as at the end of 1956.

It will be seen from the Balance Sheet that the Society's investments are well spread.

Owing to the limitation of loans by Building Societies the CIS was subject to great pressure during the early part of 1956 and it was necessary therefore to take steps to limit the volume of applications. Nevertheless, the new advances made reached the very substantial total of £5,750,000.

Other important classes of investment, all of which have grown during the year are Debentures and Debenture Stocks, Preference and Guaranteed Stocks, and Ordinary Stocks. By investing in these categories the Directors ensure that the Society's policyholders shall have an interest and a share in the profits of the many and varied industries in which they are employed.

It will be seen, therefore, that the holder of a life policy in the CIS is not only protecting his dependants and probably accumulating a capital sum to be paid in later life, but he is also securing a stake in the property and industry of the country which in most cases he could not acquire by any other means.

Whenever the Directors in the investment of the Society's Funds can serve not only the interests of our policyholders, but also the wider interests of the Co-operative Movement they are very happy to do so. Many Retail Societies can testify to the assistance they have received in recent years from the CIS in the furtherance of their development schemes.

ADMINISTRATION

As most of our policyholders are aware, in 1956 the Society's full-time Agents staged a new business strike which lasted about twenty weeks and was finally resolved by referring the matter under dispute to a newly constituted Conciliation Board. The Directors agreed to the setting up of this Conciliation Board for the whole of the various grades of CIS employees, although, so far as they were aware, no other Insurance Office had done so.

In the interest of the Society's policyholders it is vital that costs of administration should be reduced to the minimum consistent with the maintenance of an efficient service and equitable treatment of the staff. Any concessions made beyond this cannot be justified, for they can be made only at the expense of the policyholders whose interests it is the duty of the Board to protect.

It was solely with this in mind that the Directors resisted the demands of the Agents' Union and not in their own or the shareholders' interests—neither the Directors nor the shareholders of the CIS can benefit in any way whatever from the success or prosperity of the Society; the CIS is a Society run for the benefit of the consumers—in this case the policyholders.

The Board are anxious to maintain good relations with all grades of the staff and are always willing to hear representations on their behalf—I doubt if there is any other Insurance Office where the staff, through their appropriate Unions, have such ready access to the Management and the Board. The Directors have always been ready and willing to concede improvements in salaries and conditions where they feel that they are justified, and this policy will continue to guide them in the future in their dealings with the various Unions representing the staff.

LIFE DEPARTMENT

The new sums assured in the Life Department last year totalled £63,378,659, of which £23,709,845 was in the Ordinary Life Section and £39,668,814 in the Industrial Life Section.

During the year we introduced a new Pension Annuity policy for persons in non-pensionable employment. This policy has been designed to take advantage of the valuable concessions made in the Finance Act 1956 to employees who have a job which does not carry a pension on retirement, and to self-employed persons. I am glad to say that we are meeting with some success in the sale of these policies despite the fact that nearly all employees in the Co-operative Movement are in pensionable employment and thus ineligible to take out such policies.

I am very happy to be able to announce a further increase in the bonus in the Ordinary Section from 38s. per cent to 40s. per cent.

The bonus in the Industrial Section has been maintained at 25s. per cent. You may remember that last year we increased the rate in this Section by one-half from 16s. 8d. per cent.

MOTOR DEPARTMENT

For the second consecutive year the premium income in this Department increased by almost £600,000 to nearly £4,700,000. Part of this increase was due to the revision in rates which came into operation as from January 1, 1956, for new business and as from March 1, 1956, onwards in respect of renewals of existing business. The balance of the increase was due to the continued expansion of our Motor business.

Despite the general impression that it is difficult to write Motor insurance at a profit, I am once again able to report a surplus on this account. The surplus for 1956 amounted to £389,588, of which £312,994 represents the actual underwriting profit and the balance interest on the Fund. The claims ratio for 1956 showed a considerable improvement over that for 1955, but as I said last year there can be no doubt that one of the principal reasons why our Motor account so consistently shows a surplus is that the Society's administrative expenses are so low.

FIRE DEPARTMENT

The premium income of £1,765,855 in this Department showed an increase of £61,634.

There was an increase of £119,055 in the claims paid and outstanding compared with 1955, which is in part attributable to the number of claims which arose in respect of burst pipes in the early part of 1956. Notwithstanding this, however, the account produced a satisfactory surplus.

ACCIDENT DEPARTMENT

This Department deals with Personal Accident and a large variety of General Accident risks. It also handles a substantial volume of Fidelity, including Mortgage Guarantee business. The total premium income was £1,743,430.

The results in all sections were again very satisfactory and the surplus of £332,417 was not much below that for 1955, which was the highest ever achieved.

PROFIT & LOSS ACCOUNT

The sum of £2,600,000 has been transferred to the Profit and Loss Account from the Departmental Revenue Accounts, of which £2 million has been applied to writing-down investments.

DISTRIBUTION OF PROFITS

It is gratifying to be able to report that, after making these transfers and making adequate reserves for contingencies, the total amount to be distributed to policyholders in respect of our operations for the year 1956 is the record sum of £5,800,000. Approximately £5,300,000 of this is due to our Ordinary and Industrial Life policyholders. The balance of approximately £500,000 is payable to Co-operative Societies as a dividend on the Fire and General and Collective Life premiums paid to the CIS during the year. The dividend payable to the shareholders—the CWS and SCWS—amounts to only £2,625, being 5 per cent on the nominal paid-up share capital of £52,500.

TAXATION

Each year I have to report that the Society's tax liability continues to grow. In respect of our transactions during the year 1956 it amounted to £1,322,108, being an increase of £289,391 over our liability for the previous year.

The Report and Accounts were adopted.

STANHOPE STEAMSHIP

The fifth annual general meeting of the Stanhope Steamship Company Limited, will be held on May 17th in London.

The following is an extract from the circulated statement by the Chairman, Mr J. A. Billmeir, CBE, FICS:

The Accounts show that the policy adopted by the Company last year in purchasing four modern vessels and ordering three new vessels has been fully justified.

The Newbuilding Contracts then outstanding covered two diesel cargo vessels of over 11,000 tons each and one diesel tanker of 19,000 tons. Notwithstanding the delays in completion, the cargo vessels were delivered in December, 1956, and the new diesel tanker has been delivered since the end of the year. It is interesting to note that the cost of these three new vessels, approximately £3 million, is almost equal to the original cost to the Company of the other ten vessels, and this will give Stockholders some indication of the difficulties of fleet replacement.

During the year, the Company completed the registration of a small subsidiary company in Bermuda. This subsidiary has contracted for a new diesel tanker of 18,500 tons, which is to be built in the United Kingdom.

Freight rates during the year have been firm. The closing of the Suez Canal, whilst causing higher freight rates, has also given rise to higher running costs and trading expenses for both dry cargo and tanker tonnage. Since the turn of the year, freight rates have fallen sharply, but subject to no other unforeseen circumstances arising, the outlook seems reasonably sound.

At the Annual General Meeting on April 11, 1957, it was resolved to distribute **a dividend of 12 per cent.** on the ordinary share capital of DM 60,000,000. for the business year 1956. This dividend will be paid by any of our branch offices and by the authorized paying agents, as from April 12, 1957, on presentation of dividend warrant No. 4. The following are the principal items of the

Annual Balance Sheet as at December 31, 1956:

Capital (initial capital and reserves)		DM	100,010,000.—
Pension Funds	abt.	DM	58,198,000.—
Deposits with Banking Department	abt.	DM	1,402,415,000.—
including Savings Deposits	abt.	DM	435,962,000.—
Debtors	abt.	DM	628,284,000.—
Long-Term Loans extended by the Mortgage Department	abt.	DM	958,795,000.—
Circulation Mortgage Bonds and Long-Term Borrowings extended by the Mortgage Department	abt.	DM	1,059,311,000.—
Net Profit	abt.	DM	7,372,000.—

The complete 1956 Balance Sheet was published in No. 72 of "Bundesanzeiger" (German Federal Gazette), dated April 12, 1957.

THE BOARD OF MANAGEMENT

Munich, April 1957.

MANCHESTER OIL REFINERY (HOLDINGS) LIMITED

IMPROVED RESULTS

MR RUDOLPH E. F. de TRAFFORD'S STATEMENT

The ninth annual general meeting of Manchester Oil Refinery (Holdings) Limited will be held on May 17th at Winchester House, Old Broad Street, London, E.C.

The following is the statement by the Chairman (Mr Rudolph E. F. de Trafford, OBE), which has been circulated with the report and accounts:

I am glad to be able to report improved results for the year ended December 31, 1956.

The Accounts of the company have been circulated. The Consolidated Profit and Loss Account shows a trading profit of £385,312 which compares with £327,239 for the previous year, while the Group profit before taxation amounted to £204,820 as against £163,720. Taxation, other than profits tax arising from the distribution of preference and ordinary dividends, absorbs £90,242 and the profits attributable to outside shareholders amount to £6,424 leaving a net profit attributable to Parent Company at £108,154 which compares with £82,879 for the previous year. Your directors recommend the payment of a final ordinary dividend of 8½ per cent less tax, making a total distribution for the year of 12½ per cent less tax—the same as that paid for the last two years. There will be carried forward on the Consolidated Profit and Loss Account the sum of £93,782 which compares with £67,250 as at December 31, 1955.

BALANCE SHEET ITEMS

Turning to the Consolidated Balance Sheet, it will be observed that the cost of fixed assets shows an increase during the year of £155,710 and after providing for depreciation the net book value of these assets has risen from £763,490 to £824,183. Mention should be made of the considerable increase in Stocks, mainly due to the fact that two tankers with crude oil were in transit at the end of the year, in addition to one cargo which had just arrived. In this connection stockholders should realise that our crude oil supply position, fortunately, was not adversely affected by the Suez crisis as our crude oil supplies are all drawn from the Western Hemisphere. You will note that the debtors have increased by approximately £180,000 as compared with the figure at December 31, 1955. This is partly due to the inclusion for the first time of the debtors of Marine & Industrial Lubricants Limited but mainly to exceptionally high sales at increased prices during the last three months of 1956.

Your company during the period under review increased its investment in Albatros S.A. Belge pour le Raffinage de Pétrole to the extent of acquiring at par 12 million Belgian francs 7 per cent Convertible Notes due for repayment in 1964 at a cost of £36,773 of which £50,731 was paid in 1956 and the balance after the turn of the year. It will be recollected that stockholders were advised of this proposed investment at last year's Annual General Meeting. Other investments made during the year were a further £17,500 in Marine & Industrial Lubricants Limited, £12,500 in Stratton Chemicals Limited and a further £3,250 in Petrocarbon Developments Limited. I will deal with these companies later in this statement.

CHANGES AMONGST SENIOR EXECUTIVES

I will now refer to certain changes which have taken place amongst our senior executives. Mr E. J. Dunstan, a director of the Holding Company and the General Manager of the refining and sales companies, has retired after nineteen years' service. I should like to take this opportunity of paying tribute to the great services which he has rendered during this period in all aspects of the development of our Group of companies. Dr G. Tugendhat has been appointed Group Managing Director and has resigned as Deputy Chairman. Major General L. O. Lyne has been appointed Deputy Chairman. We have appointed Mr J. C. Wood-Mallock and Mr S. R. Jarvie to be Joint General Managers of the refining and sales companies and both have been elected to the Board of the Holding Company. Mr Wood-Mallock has been responsible for the technical side of our refining operations and Mr Jarvie has been Manager of our export company, Raven Oil Company Limited. Both joined the Group ten years ago.

PROSPECTS

Turning now to your company's prospects; our aim continues to be the strengthening of our position as producers of high grade petroleum products in our own field. This necessitates continual review of the processes by which we produce our established grades and a vigorous search for new products with which to extend our range. In this connection you will appreciate the great importance of a strong research organisation. We have recently reorganised and strengthened this department, which should, under the direction of Dr Steiner, materially assist our progress. Our relationship with our crude oil suppliers remains excellent and we are taking active steps to ensure the continuity of our supplies for the next few years. We have been fortunate enough in a world of wildly fluctuating freight charges to complete arrangements for our tanker requirements for the next two years on satisfactory terms. We have decided to put up additional storage tanks at the refinery which will allow us to increase the throughput in 1958. On the chemical side of our business the new sulphonate plant, to which I referred in my statement last year, is now in operation. Sulphonates are assuming more and more the character of "tailor made" products to meet customers' increasingly stringent and individual requirements. In order to maintain and expand our position in this market we are erecting certain ancillary plants and providing for additional storage facilities. The chemical products plant is now in full production and should make a quite substantial contribution to our profits in the current year. The overall prospects can best be summarised by the statement that your directors look forward to the future of your company with confidence and believe that, subject to there being no general recession in the trade of the country or widespread industrial unrest, the profits for the current year should show further improvement.

ACTIVITIES OF SUBSIDIARY COMPANIES

Turning now to the activities of our subsidiary companies. Raven Oil Company Limited has had another successful year. Flexibox Limited has made further progress under the management of Mr F. B. Porges. Its new factory at Ballymena in Northern Ireland has started operations, and production and sales should show an improvement in the current year. The company capitalised a portion of its undistributed profits during the year and as a result the issued share capital has been increased from £25,000 to £60,000.

I will deal briefly with the companies in which we have made investments during 1956. Albatros SA Belge pour le Raffinage de Pétrole, whose refinery continues to operate under the processing agreement made with the British Petroleum Company Limited, is today in a strengthened financial position as a result of the note issue made during the year, to our investment in which I have already referred. During the year we acquired from Lambert Brothers Limited their shareholding in Marine & Industrial Lubricants Limited, which thus becomes a wholly owned subsidiary. This company has made good progress during the year in the marine field and will, I am sure, under the vigorous management of Mr J. E. Harvey, MP, continue to provide a useful and profitable market for the off-take of some of our oils. Stratton Chemicals Limited is a new company formed in conjunction with C. P. Steuber & Company Inc., of New York, one of the leading American firms specialising in export and shipping of liquid chemicals in bulk. This company has acquired the existing business of Chemitrade Limited, a firm dealing in the distribution of imported chemicals in the UK market. In view of your company's increasing interest in the chemical field, it was felt important to have first-hand contact with developments in the international chemical market and in this country, and we believe that this small investment should prove profitable.

The £3,250 subscribed to Petrocarbon Developments Limited is a re-investment of capital profits received after the voluntary liquidation of the original company, Petrocarbon Limited. Petrocarbon Developments Ltd., a chemical engineering company, has already rendered valuable consultancy services to our refinery and is currently designing and engineering one of the ancillary plants for sulphonates to which I referred earlier.

DIRECTORS' FEES

You will see from the Agenda for our Meeting that you are asked to sanction an increase in the fees of your directors from £400 to £600 a year and of the additional fee of your Chairman from £800 to £1,000 a year. These fees have remained unaltered for nine years and the new rates are designed to bring the remuneration of your non-executive directors more into line with their responsibilities and current practice. I hope that these proposals will commend themselves to you.

Finally, I am sure that I shall have the full support of all stockholders in using this opportunity to convey to the management and to all members of the staff our very real appreciation of their good work during the year and of their great contribution to the fortunes of the company.

THE LONDON & LANCASHIRE INSURANCE COMPANY LIMITED

HE HONOURABLE R. M. PRESTON'S STATEMENT

The Annual General Meeting of The ondon & Lancashire Insurance Company imited will be held on May 15th at 7 hancery Lane, London, W.C.

The Chairman, The Honourable R. M. reston, DSO, has issued a Statement to tockholders from which the following has een taken:

For the first time since 1906 the accounts isclosed an overall underwriting loss. The ggregate net premium income for all Departments for 1956 had increased to 30,162,186 against £29,200,230 for 1955, an ncrease of £961,956. The underwriting loss mounted to £398,364, or 1.32 per cent, as gainst a profit of £804,602 or 2.76 per cent f premiums.

Fire Department.—Premiums amounted to £11,797,133 as against £11,545,717. The nderwriting loss was £201,547, or 1.71 per ent, as compared with a profit of £425,325, r 3.68 per cent.

Rather more than half of the business in the Fire Department was transacted in North America and the experience there was markedly worse in 1956. The losses in the United States and Canada more than accounted for the underwriting loss in the Department as a whole.

Accident Department. — Premiums amounted to £14,450,610 compared with £13,770,347, with an underwriting loss of £596,817, or 4.13 per cent, as against a loss of £120,723, or 0.88 per cent.

Motor Vehicle insurance again showed a widespread worsening experience caused by increasing rate of accident occurrence, higher repair costs and ever amounting injured Third Party awards. The proper and justified correction of the insurance experience could only come from an increase in premium rates.

Marine Department.—Premium Income—current year—1956, £3,914,443 against 1955, £3,884,166. Profit transferred to Profit and Loss Account £400,000.

The balance of underwriting funds for all years amounted to £4,700,301 against £5,235,774.

In Marine, as in other forms of Insurance, inflation was causing a continuing increase in cost of repairs and in claims settlements.

Life Assurance Account.—Net new sums assured, excluding Annuity business and Group Life Assurance at £6,657,131, were approximately the same as the previous year.

The net interest receipts and Shareholders' proportion of Life profits amounted in all in 1956 to £941,099, a slight increase on last year's figure of £928,787.

Mr Preston stated that although net interest earnings had increased somewhat, the Directors had decided that it would not be appropriate at the present time to increase the final dividend which would become payable on May 17th.

In the investment market the considerable rise in interest rates early in the year resulted in a quite substantial drop in the excess of market value of investments over the Balance Sheet value. There was a similar rise in interest rates in the United States, where the Company had substantial funds invested. Nevertheless, that extraneous reserve at the end of the year still amounted to more than 25 per cent of the Balance Sheet values of the investments. The lowering of Bank Rate since 1956 had resulted in some recovery of the earlier depreciation.

The Chairman concluded his Statement by according thanks to the General Manager and Staffs for their work during the year.

BANCO DI ROMA

ROME, ITALY

Joint Stock Company—Paid up Capital L. 1,000,000,000 Reserve L. 3,500,000,000

77th Year

ORDINARY MEETING OF APRIL 15, 1957

Under the Chairmanship of H. E. Prof. Costantino Bresciani Turroni, the Banco di Roma held the Ordinary Meeting of its shareholders which, after hearing the reports of the Board of Directors and of the Auditors, approved the Balance Sheet closed at December 31, 1956, the Profit and Loss Account and the allocation of the year's profit.

After giving a brief outline of the most salient aspects of Italy's economic situation in the framework of world conditions, the Board of Directors' report comments on the outstanding data referring to the activity carried on by the Bank in 1956 both in Italy and abroad, which, as shown by the grand total of the balance sheet items, amounts to L. 1,128,000 million, with an increase of 127,000 million Lire over the total for 1955.

The volume of credit supplied in different forms to the Italian economy, including total investments (381,900 million Lire), credits for commercial acceptances, opening of documentary credits and guarantees for third parties (70,000 million Lire), amounts to about 452,000 million Lire and shows an increase of 49,000 million Lire over the corresponding figure in the previous balance sheet. The funds collected, which show a further increase of 52,700 million Lire, added to the circular cheques outstanding, make a total of 581,000 million Lire. Cash funds and investments in Government, Government-guaranteed and other bonds also followed an upward trend, reaching a global amount of about 242,000 million Lire.

The net profit for the year which, after provisions have been made for the usual sinking funds and appropriations, amounts to 846,214,018 Lire—over 26 million Lire more than in 1955—has made it possible to grant Shareholders a 9 per cent. dividend and to allocate 750 million Lire to the Reserve, which is thus brought up to 3,500 million Lire.

The Meeting then proceeded to appoint the Auditors for the three-year term 1957-1959 and to elect the Chairman of the Board of Auditors. The Board of Directors, which met immediately after the Shareholders' Meeting, re-confirmed the following appointments: H. E. Prof. Costantino Bresciani Turroni as Chairman, Baron Prof. Francesco Mario Oddasso as Deputy Chairman and Cav. del Lavoro Ugo Foscolo as Managing Director.

THOMAS TILLING LIMITED

(Industrial Holding Company)

MR W. LIONEL FRASER ON HIS CONFIDENCE IN THE FUTURE PROSPERITY OF THE GROUP

"WE HAVE GOOD MEN AND WE HAVE GOOD BUSINESSES"

The Sixtieth Annual General Meeting of Thomas Tilling Limited will be held on 15th May at Crewe House, Curzon Street, London, W.1.

The following is an abridgement of the review by the Chairman, Mr W. Lionel Fraser, CMG, which has been circulated to Stock and Shareholders with the Directors' Report and Accounts for the year ended 31st December, 1956:

Mr J. A. Falconer, who has been the Managing Director of the Company since 1st January, 1950 has expressed his desire to retire from that appointment on 31st May next, but will remain on the Board. He will be succeeded by Mr P. H. D. Ryder, who was appointed Deputy Managing Director last June.

The proportion of the 1956 profit before taxation of £2,487,065 attributable to Thomas Tilling Limited was £1,675,455. This compares with £1,520,859 for 1955. The consolidated profit of the year 1956 attributable to Thomas Tilling Limited after allowing for taxation and the interests of minority shareholders is £814,685, which is an increase of £101,983 over 1955. Preference Dividends of £79,062 have been paid and an Interim Dividend of 5 per cent on the Ordinary Stock was paid on November 24, 1956. Your Board recommend the payment of a Final Dividend of 6¼ per cent, making a total of 11¼ per cent for 1956 (1955, 10 per cent). It is the intention of the Board, provided no unforeseen circumstances arise, to pay an Interim Ordinary Dividend of 6¼ per cent in November 1957.

Reports on the following Companies and Interests were then given by the Chairman.

Alexandra Building Services Limited (Quarry Masters, Brick-makers Building Trades' Merchants & Haulage Contractors in Scotland), John H. Ashton Limited (Mahogany and hardwood merchants), Bagshawe & Company Limited (Manufacturers of conveyors and elevators, mechanical chains and malleable iron castings), The British Steam Specialties Limited (Manufacturers and distributors of valves, gauges, etc.), The Brush Group Limited (Manufacturers of electrical equipment and Diesel engines), Cornhill Insurance Company Limited, Daimler Hire Limited (Motor car hirers, chauffeur-driven and drive-yourself services), Mark Dawson & Son Limited (Worsted spinners), Heinemann Holdings Limited (Book printers and publishers), Timothy Hird & Sons Limited (Worsted combers and spinners), Hobourn Aero Components Limited (Manufacturers of light engineering components, textile machinery, electrical convection heaters), E. R. Holloway Limited (Comb and plastic goods manufacturers), James A. Jobling & Company Limited (Manufacturers of "Pyrex" brand glassware), Lime-Sand Mortar Limited (Ready-mixed mortar and ready-mixed concrete manufacturers, sand and gravel producers), Henry Lister & Sons Limited (Manufacturers of flannel and blazer cloths), Mutual Finance Limited (Hire purchase finance, brokerage and banking), Newey & Eyre Limited (Industrial electrical engineering suppliers), Palmer's Travelling Cradle & Scaffold Company Limited (Scaffolding and cradle contractors), Safca Aerosol Manufacturing Limited (Fillers of pressurised packages and manufacturers of Aerosol valves), Spray & Burgass Limited (Dyers and Finishers), Stevensons (Dyers) Limited (Hosiery dyers and finishers), Stratstone Limited (Distributors of Daimler & Volkswagen cars), H. C. Wakefield & Sons Limited (Building contractors), Walton Hosiery Company Limited (Manufacturers of fully fashioned nylon stockings).

Having mentioned the Company's interest in real estate, the Chairman then continued:

GENERAL REVIEW AND PROSPECTS

"There is not much I can add to what I have already said, but perhaps Stockholders will share my satisfaction that in a year of severe economic and political crises, the Tilling Group has come through not only unscathed but stronger. It is a real tribute to the Group's resilience and diversification, and it seems to me to give added proof that our conception of Tillings as an Industrial Holding Company is sound and progressive.

Our oft-repeated policy has been to gather around us men of vision and energy who can retain their interest in the businesses so many of them have helped to create and establish. They unite with a bigger central organisation, but they keep their own sense of identity and their freedom to manage their Companies. They are our willing partners and our friends, and they have our entire support in all their legitimate endeavours for their development and expansion. For our part, we are fully aware of the responsibility this close association entails, and we have formed a highly skilled Headquarters Staff at Crewe House, who are always ready to advise and to encourage on a basis of mutual respect and co-operation.

I proclaim my faith in the future of this country, simply because I believe we have a high proportion of decent, sensible men and women of all grades. They must of necessity vary in their outlook and in their ability technically and otherwise, but basically they are sound and wise in their judgments. And by the same token I affirm my confidence in the future prosperity of Tillings, because we have fine, varied interests and an abundance of able, forward-thinking people to guard and guide them.

Conditions beyond our control may seem at times to impede us, but your Board is resolute in its determination to ensure that your Company shall continue to play a constructive and a developing role in British Industry. We have good men and we have good businesses. As time goes on others will join us, but we shall remain discriminating, and we are likely to build on our existing interests and those of a kindred nature. We believe our foundations are well constructed and as I have said before, Stockholders should have no cause for disappointment in the years to come."

NATIONAL BANK OF PAKISTAN

EXPANSION OF ACTIVITIES

The Eighth Annual General Meeting of the National Bank of Pakistan was held on April 13th at Dacca, East Pakistan.

The following is an extract from the speech by Mr Hoshang N. E. Dinshaw president of the central board of directors:

Our deposits reached the peak figure of Rs. 51.64 crores, showing a substantial increase over the previous year's figure of Rs. 47.22 crores.

Our advances likewise, which attained a peak figure of Rs. 38.25 crores, show further improvement on the total of Rs. 34.11 crores recorded last year. Advances to the general public have shown a satisfactory increase from Rs. 20.02 crores to Rs. 30.19 crores and reveal the expanding participation of the Bank in the development of commerce and industry throughout Pakistan.

The Foreign Exchange business of the Bank showed further expansion to Rs. 114 crores during the year under review.

The profits earned by the bank increased from Rs. 75.12 lacs in 1955 to Rs. 79.52 lacs in 1956. This increase was the result of an all round expansion and also of careful and effective control over expenditure. The dividend paid to the shareholders remains unchanged at 5 per cent.

Reserves have been further strengthened by an allocation of Rs. 20 lacs, and now aggregate Rs. 85 lacs, 56 per cent of the paid-up capital of the Bank.

ECONOMIC ACTIVITY

Economic activity was maintained at a high level throughout the year and the industrial production index (1950=100) rose from 386 in 1955 to 420.

Bank credit attained a peak figure of Rs. 124.34 crores in February. After the usual off-season decline the year closed with outstandings of Rs. 123 crores, against Rs. 116 crores in December, 1955. Industrial advances increased by 56 per cent whereas commercial advances rose by 27 per cent only during this period.

Our gold and foreign currency reserves, which had increased from Rs. 97 crores in September, 1955, to Rs. 139 crores in June, 1956, fell back to Rs. 126 crores by the end of the year.

An event of great importance was the publication in May of Pakistan's first Five-year Plan. This provides for a total expenditure of Rs. 1,160 crores of which Rs. 800 crores have been allocated to the public sector and Rs. 360 crores to private account. The emphasis throughout the Plan is on the importance of private enterprise.

It is gratifying to learn that the Pakistan Industrial Development Corporation, which has already initiated and brought to fruition vast industrial projects in many fields, has now, nearing finalisation, complete plans for the establishment of a major steel plant for which suitable ores and fuels are available in the country.

I welcome the proposed establishment of the Pakistan Industrial Credit and Investment Company which is expected to commence functioning this year.

Preparations for the establishment of an Agricultural Bank are also well advanced. This Bank will provide direct credit facilities and technical assistance to co-operative societies, agriculturists, etc.

INTERNATIONAL NICKEL COMPANY OF CANADA

1956 AN HISTORIC YEAR

The annual meeting of The International Nickel Company of Canada was held on April 24th in Toronto.

Dr John F. Thompson, the chairman, in the course of his address, said: For the Company 1956 was an historic year. Net earnings reached a new high, ore production was the greatest for any year and deliveries of our two principal products—nickel and copper—were at high levels. In spite of the record ore production our ore reserves were increased.

The year saw the beginning of the development by the Company in northern Manitoba of two nickel mines and related surface plants which by 1960 will give International Nickel a second nickel-mining operation, exceeded in importance only by its Sudbury District enterprise, in Ontario, which is the largest in the world. The Manitoba project, together with expansion already under way in the Sudbury District, is scheduled to lift Inco's annual nickel-producing capacity to 385 million pounds in 1961.

Net earnings for the year of $96,296,000 showed an increase of $4,730,008 over the previous peak year of 1955.

Deliveries of nickel in all forms in 1956 totalled 286 million pounds. These were the second highest for any year, being exceeded only by the 290 million pounds in 1955, when the Company delivered in excess of its production by depleting working stocks.

Commenting on the price of nickel, the chairman said: Our policy of selling our production at reasonable prices is consistent with the large production which we must move year after year and the responsibilities which stem from our position in the industry. We have an obligation to our shareholders and customers to see that there is a perpetuation and growth of the market in the future at reasonable and stable prices at which satisfactory profits can be realised, markets can be held and important consumers can be reassured that they can plan well ahead for the economic use of nickel.

OTHER PRODUCTS

The 1956 deliveries of copper were at a postwar high of 271 million pounds, an increase of more than 8 million pounds over 1955. The average price realised by the Company in 1956 was higher than in 1955 and was a major factor contributing to the increased earnings.

Deliveries of platinum metals were 371,000 ounces, down 200 ounces from 1955.

The year 1956 saw the first shipments of pellets from the Company's iron ore recovery plant near Copper Cliff, Ontario. This newest of our plants is playing a key role in making possible the Company's high nickel output.

Manitoba Project.—We regard the Manitoba project as one of the important events in our Company's history and one which will have a significant effect on future operations and progress. It is gratifying to be able to report that the development of this project is proceeding on schedule and according to plan.

Outlook.—The extent of the confidence your Company has in the future of nickel is clearly evident from the comprehensive activities it has undertaken to develop simultaneously both sources of supply and markets for the metal. Regardless of International Nickel's relative position in the industry, it is our firm intention to continue striving not only to enlarge existing markets and uses but to build up new ones as well. It is our firm belief that this Company will be selling nickel in the future in larger quantities than ever.

The report was adopted.

F. PERKINS LIMITED

(Manuf[illegible]rs of High Quality Diesel Engines)

EXCELLENT RESULTS OF EXPORT DRIVE

MR F. A. PERKINS ON MEASURES TO COUNTERACT INCREASING COSTS

The twenty-fifth annual general meeting of F. Perkins Limited will be held on May 13th at Peterborough.

The following is an extract from the statement by the Chairman, Mr F. A. Perkins, which has been circulated with the report and accounts for the year ended December 31, 1956:

The Directors recommend a Dividend to Ordinary Shareholders of 10 per cent for 1956.

I am again able to report an increase in turnover, which for the year was over £21,500,000, being 8 per cent over 1955.

During the year there were increases in our own wages and also in the prices charged to us by our suppliers. It was found that the Company could no longer absorb these increased costs and for the first time since early 1952 we increased the prices of engines and spares. We were, however, only able to pass on to our customers a part of this additional cost and the nett profit for year at £768,934 shows a decrease on 1955.

Last year I referred to the necessity to raise additional finance but up to the time of writing there has been no propitious moment to carry out this operation. At the same time we have not delayed the progress of our plans and due to the low level at which we have maintained our stocks we have limited the bank overdraft to a reasonable figure.

During the year there has been expended £655,000 on capital assets, and at the end of the year the capital commitments stand at £601,000. These commitments cover the completion of the building operations and the equipment required to meet the present programme of the Company, but further expenditure has been planned for the near future.

OVERSEAS ACTIVITIES

The progress of the Canadian Subsidiary continues and in order to provide engineering facilities to meet the most encouraging demand for our engines from manufacturers in N. America further accommodation has been acquired. I feel sure that our policy of persevering with the development of this market will prove successful.

In Australia new marketing arrangements have been developed during the year which have enabled us to meet the growing demand for our engines, particularly in view of the increase in the Australian Home Market manufacturing programme. In South Africa the favourable trend reported last year continues.

I am happy to report that Messrs Simpson and Company, Limited, have made great strides in developing the manufacture of Perkins engines in India to meet the wishes of the Indian Government.

I am also able to report that satisfactory progress has continued in France with the local manufacture of Perkins engines, and during the year we have increased our investment in our Associated French Company by £24,500.

COMPREHENSIVE TRAINING SCHEME

I believe you will be interested to know that, in order to play its part in achieving a higher level of technical skill, which is so essential to our national economy, your Company has established a comprehensive Training Scheme in a separate Training School at Eastfield. In our Training schemes we provide individual attention to the practical and theoretical requirements of the trainee, not only for his future in the Company, but for his future as a citizen and craftsman, professional engineer, or business man.

Our Service School which provides training in the maintenance of our engines, and is well known all over the world, has an attendance of over 3,000 students each year.

DEVELOPMENT DIFFICULTIES OVERCOME

The difficulties experienced in the development of the R6 engine were overcome in 1956. The R6 Mark 2 was introduced and in subsequent service the unit has proved itself completely reliable and equal to the well-proven P6.

As is generally known, Vauxhall Motors have for many years employed our engines with success but growing demand has now caused them to manufacture their own diesel engine. It is, however, a particular pleasure for me to advise you that we have secured two large contracts with manufacturer customers which will more than offset our loss in this direction.

There has been a noticeable increase in the demand for the L4 engine in agricultural and industrial applications.

It is significant that there has again been an overall increase in the number of engines exported, to a figure of 74 per cent of the production of the Company, as direct exports and also indirect, i.e., through manufacturers in this Country fitting our engines in their equipment. The increase is due in large part to exports direct from Peterborough to the customers overseas. This is the result of an intensive drive by our Export Department.

FUTURE PROSPECTS

I do not believe that any Chairman's Statement is complete unless some estimate of the future is given to the Shareholders. In recent years there has been little difficulty in doing this, but at this particular time this is not so easy to do in spite of the fact that we have complete faith in our products, our organisation and our ability to maintain our business against competition. We can see ahead of us further rising costs due to increases in wage rates and certain raw materials. To counteract this trend we are making a concentrated effort to re-design our products where economies in production are possible, and are continuously investigating new materials and processes.

I hope to have illustrated to you the continuing and growing vitality of your Company. Whatever difficulties lie ahead will, I am sure, be surmounted and I gladly pay tribute to all employees, and to my colleagues on the Board to whom is due a very large share of our continued prosperity.

ADAMS (DURHAM) LIMITED

STATEMENT BY LIEUTENANT COLONEL W. D. GIBB[illegible]

The fifth annual general meeting of Adam (Durham) Limited was held on April 15[illegible] in London, Lieutenant Colonel W. D. Gibb[illegible] chairman, presiding.

The following is an extract from his circulated statement:

The year under review has again been difficult period of trading in the Confectioner Industry and Shareholders will have read the declining profits and, in some cases, substantial losses of our competitors. There has been one or two exceptions where manufacturers have maintained or even bettered the results and your Company falls into the latter category.

At the last Annual General Meeting reported that for the first three months of the year your Company had been on a profit making basis. This improvement was maintained and the net profit for the year amounted to £11,515, out of which it is proposed to pay a dividend at the rate of 5 per cent, less tax

Sales were the highest in the history of your Company and they continue to show an upward trend in spite of the fact that the small to medium size manufacturers appear to be losing ground to the larger firms. However, increased costs of raw materials and wages had the effect of reducing our margins in the year under review and are likely to continue to do so We face the future with cautious optimism

The report and accounts were adopted.

THE RHEOSTATIC CO.

INCREASED SALES

The twentieth annual general meeting of The Rheostatic Company Limited was held on April 24th at Slough, Mr M. J. Gartside, chairman and managing director, presiding.

The following is an extract from his circulated statement for the year to September 30, 1956:

The figures represent a steady advance in the growth of your Company. Increased sales in the home and export fields were achieved in spite of credit restrictions and increasing competition in the Export markets

The net profit of the parent Company in the United Kingdom before taxation was £249,985. After deduction of Income Tax and Profits Tax the remaining Profit is £148,175, which compares with last year's figure of £134,965. The Directors recommend a final dividend of 7½ per cent, which makes a total of 12½ per cent for the year.

The products of your Company, Satchwell temperature controls, are extensively applied in the fields of domestic electric water heating and electric cooking, and of central heating and air conditioning. In the central heating field the rapid increase of popularity of automatic oil-burning in all kinds of buildings produced an unprecedented demand for the Company's products.

In spite of adverse factors, sales for the first six months of the current financial year are appreciably the same as those of the corresponding period last year. Your Board continues to have confidence in the future progress of the Company.

The report and accounts were adopted.

WINTERBOTTOM BOOK CLOTH COMPANY LIMITED

FURTHER EXPANSION AND DEVELOPMENT

The sixty-fifth annual general meeting of The Winterbottom Book Cloth Company Limited was held on April 24th in Manchester, Mr Mark Brickhill, the Chairman, presiding.

The following is an extract from his circulated statement: The sum of £648,295 has been spent during the year by the group on land, buildings, plant, etc., of which £116,014 is attributable to the parent company. This money has been spent on both expansion and modernisation which, you may recall, I mentioned to you last year. The policy is continuing, as will be realised from the amount of capital commitments at the date of the Balance Sheet amounting to £383,000, which includes £47,000 in respect of the Parent Company.

All these projects have been financed from our own resources which has necessitated the realisation of some of the investment portfolio. These investments have been acquired over the years by funding the Company's reserves with the intention of having funds available for the expansion of the Group's activities as and when opportunities occur.

INVESTMENTS REVIEWED

During the year, the whole of the investment portfolio was reviewed and its construction revised in order to include a higher proportion of equity investments, thus guarding both capital and income against continued inflation. Furthermore, it was considered wise to include in the portfolio a higher percentage of dollar securities. Based on the market value at December 31, 1956, the approximate distribution of the portfolio was:

	per cent
Fixed Interest Investments	38
Equity Investments — United Kingdom	44
Equity Investments—USA and Canada	18
	100

As a result of the above transactions the book value of the Parent Company's quoted investments at December 31, 1956, was reduced to £2,064,093, from which should be deducted the Investment Reserve of £172,602, giving a net value of £1,891,491. Against this, the market value was £1,978,688, showing a surplus of £87,197.

Stocks of Raw Materials have been maintained at a level sufficient for our requirements and although the values show increases in both the Parent Company and Consolidated Balance Sheets this is due to increased costs and not increased quantities.

The Group Trading Profit has been increased slightly but the charge for taxation on the profits of the year has been increased by £56,984. Further, the amount brought into credit for Taxation provisions no longer required has been reduced by £31,958 with the result that the profit after taxation is reduced by £53,544. After allowing for Minority Interests and Profits retained by Subsidiary Companies the profit of the Parent Company amounts to £496,560.

The Accounts provide for the same dividends as last year and a further £100,000 has been placed to Group Plant Replacement and Development Reserve. I feel sure you will agree that it is essential for the Company to retain a reasonable amount of its profits in order to provide funds necessary to maintain and increase where possible the scope of the business. The penal effect of the Profits Tax Distribution charge is such that the Company has to pay the sum of £117,000 approximately on the annual dividends and this shows an increase of £25,000 over last year when the same dividends were paid.

BROADENING ACTIVITIES

The year 1956 has been one of considerable expansion and development in the Parent Company and in every one of the various subsidiaries, a list of which is given in the printed Report in your possession. It should be realised that the scope of the Company's activities is now spread over a wide field and the original business of weaving, bleaching, dyeing and finishing is now a much smaller percentage of the business of the Group than that of a few years ago. The entry into this larger field by our subsidiaries has been very successful. Although our subsidiaries, both at home and abroad, are very busy, we have experienced considerable difficulty at some of our branches in securing sufficient labour. We have experienced, and still are experiencing increasing costs of materials, as evidenced in the lower margin of profits, which we hope to improve by greater productivity.

The report was adopted.

THE EAST ASIATIC COMPANY, LIMITED

(Aktieselskabet Det Ostasiatiske Kompagni)

COPENHAGEN, DENMARK

60th ANNIVERSARY

The following is a summary of the report for the financial year 1956 presented by the Board of THE EAST ASIATIC COMPANY, LIMITED at the Company's Annual General Meeting in Copenhagen on March 27, 1957.

It is steadily becoming more and more evident that international developments are staging towards a grouping of countries in larger spheres of interest. This it is to be hoped, will pave the way for the initiation of economic co-ordination on a global scale for the benefit of all, through a rational apportioning of work and an effective distribution of what is produced.

The difficulties to be overcome are not only of a national and geographical nature. A change of mentality is required to realise that economic progress is measured in terms of production and not only in increased incomes.

The Company, whose activities, in view of their nature, are susceptible to changes in international conditions, must, under such circumstances, regard it of importance to invest in equities and enterprises of various kinds. In the course of the past year the Company, through expansion and other means, endeavoured to act accordingly, both in regard to locality and commercial circumstances.

Shipping Department

Satisfactory supplies of cargo were available for the Company's routes, several of which had to be diverted via South Africa after the closing of the Suez Canal in October. The events associated with the Suez crisis occasioned very firm freight markets in the latter half of the year.

In the course of the year the Company took delivery of the M.S. "Sinaloa" from the Nakskov Shipbuilding Yard, and M.S. "Sargodha" and M.S. "Baroda" from Burmeister & Wain. The Company's fleet at the close of the year thus comprised 55 motorships aggregating 588,592 tons deadweight, with an average age of 10 years, standing in the books at Kr.386.66 per ton deadweight.

At the close of the year 9 ships were under construction or on order: three 10,000-ton cargo liners from Burmeister & Wain, and two 10,000-ton cargo liners and four 17,500-ton tankers from the Nakskov Shipbuilding Yard. Of this new building programme, M.S. "Ravenaga" will be delivered to the Company in the spring of 1957, while the remaining vessels will be completed at the rate of between two and three ships a year during the next few years.

In the Profit and Loss Account the fleet has been written down by 5 per cent, ordinary depreciation, and further by Kr.25,104,062.23 as extraordinary depreciation on ships and new buildings Kr.34,366 618 92 in all.

The Commercial Departments

The general inflationary tendency in conjunction with the political crisis in the latter half of the year contributed to maintaining prices in world markets, although the presence of considerable surplus stocks of several categories of commodities might have had a contrary effect.

The commercial departments of the Head Office—the import, export and wood departments—took cognisance of the situation in their dispositions, which affected the turnover and working results.

In the Company's spheres of operations in the Far East work proceeded normally during the year, but a continued closing of the Suez Canal will result in increasing transport costs, which in turn will influence the commercial turnover, and economic conditions in various countries will accordingly be adversely affected.

In Australia, where the import of goods is still restricted, interests have been extended to new enterprises.

The Company is steadily expanding its investments and business in Africa: in South Africa, Federation of the Rhodesias and Nyasaland, British East Africa and the Congo, as well as in Ghana (Gold Coast) and Nigeria.

In the United States of America, Canada and the South American countries where the Company is established steady progress is being made.

Participation in Other Companies

With the addition of new investments these interests stand in the Balance Sheet at Kr.77,062,014.14, against which there is a Security Fund showing a reserve of Kr.6,121,031.12.

The results of the year under review were as follows:—

From Shipping		Kr. 55,486,087.49
From Trade		„ 10,699,083.06
Branches		„ 53,082,829.80
Dividends from Investments in other Companies		„ 6,077,869.12
		Kr. 125,245,669.46
Less: Interest and Financing Expenses		„ 2,888,779.95
		Kr. 122,356,889.51
Administration Expenses at Head Office and Branches	Kr 50,415,126.88	
Allocation for Taxes	„ 10,204,262.72	
		„ 60,619,620.60
		Kr. 61,737,268.91
Depreciation		„ 38,312,722.88
		Kr. 23,424,546.03
Balance brought forward from last year		„ 7,556,473.20
for disposal		Kr. 30,981,019.23

which it is proposed to apply in accordance with the accounts as follows: to pay to the shareholders a dividend of 15% plus a bonus of 3% on the occasion of the Company's 60th financial year; to distribute a bonus of Kr.4,603,400.12 to the Board, Managing Directors and Employees; to allocate Kr.3,000,000.00 to the Extra Reserve Fund, Kr.3,500,000.00 to the Pension Fund, Kr.1,000,000.00 to the Extra Depreciation Fund for Buildings and Furniture and Kr.2,000,000.00 to a Research Fund; leaving Kr.7,877,619.11 to be carried forward to next year.

The printed accounts and an accompanying booklet are available on application to the Company's Head Office, 2, Holtergegade, Copenhagen K.

JAS. WILLIAMSON & SON, LTD.

TURNOVER WELL MAINTAINED DESPITE OBSTACLES

LORD PEEL'S STATEMENT

The twenty-sixth annual general meeting of Jas. Williamson & Son, Ltd., was held on April 17th at The Royal King's Arms Hotel, Lancaster, The Right Honourable The Earl Peel, chairman of the company, presiding.

The following is the Chairman's statement circulated with the report and accounts for the year ended December 24, 1956 :

You will, I am sure, understand that both politically and economically the year 1956 brought much anxiety to a business with such widespread interests as ours. Credit restrictions at home and reduced import quotas in some major overseas markets rendered trading conditions much more difficult, but in spite of these obstacles turnover was well maintained. Profit margins were narrower than in 1955, which was our record year, and Group Trading Profit at £869,415 compares with £1,002,885. Taxation, of course, takes the major portion of this and from what is left your Board recommend you to declare a final dividend of 8 per cent, making with the interim a total of 12 per cent for the year. We think it advisable to make this small reduction from the rate of 12½ per cent paid last year and also to strengthen our Reserves in the manner set out in the Directors' Report.

EFFECT OF TAXATION

At some risk of being wearisome I feel I must once again refer to the effect of taxation. Let me instance a piece of equipment which originally cost £100,000 and must now be replaced at current prices of, say, three times the original cost. We have, of course, set aside year by year the £100,000 but what about the balance of £200,000 now required. This must be found from the profits of the business, or rather from what is left of these profits after they have been ruthlessly taxed. A business which cannot make profits enough to bear all these burdens will die and the livelihood of its workpeople will disappear.

It will have been a satisfaction to you that the Monopolies Commission could find nothing of moment to complain about in the current practices of the Linoleum Industry. The cost of the years of searching examination has, of course, to be paid for out of profits and taxation. Over and above this, however, the enquiry imposed a burden on the time and attention of hard-worked men, which could have been used to better purpose.

THE LEATHER CLOTH COMPANY

Integration of The Leather Cloth Company's business with the corresponding departments of Williamson's has reached a point at which it is desirable to consolidate their activities. Accordingly, as from December 24th last a complete merger of assets and liabilities was made in proper form. This will also make possible a simplification of office procedure and will eliminate much inter-company paper. I need only add a brief explanation of the relevant figures in the Consolidated Balance Sheet. The Leather Cloth Company has paid from its Reserves a Special Dividend of £50,000. This comes to Williamson's as owners of the whole of the Subsidiary's Share Capital and has been carried to Capital Reserve (part of £105,986). This fund should take care of any contingencies which may arise. You will notice that there has been a small adjustment in the amount of "Excess of Net Tangible Assets over Cost of Shares. . . ." This now stands as a Capital Reserve at £105,277. Any estimate of the ultimate element of profit contained in that figure must be hypothetical. We bought this shareholding at what we regarded, in all the circumstances, a fair price and we have reason to be well pleased with our purchase.

I am glad to say that I have been able again to visit some of our Overseas Markets. It has been our policy for many years to regularly to send out suitably trained officials from Lancaster, but we believe it to be highly desirable that the Chairman should himself go from time to time.

TRIBUTE TO MANAGEMENT, STAFF AND WORKPEOPLE

You will wish that I should express our thanks to the Management, the Staff and Workpeople of the Company for their real combined effort that has been given during the past year. We have always been proud of the good relationships that have existed for so long amongst all ranks of the organisation and much has been done since the war to develop joint consultation, training methods, and a knowledge of the Company's affairs and policies. More may always remain to be done, but as one example of team work I may instance the accident frequency rate which, after showing a steady reduction in recent years, has reached a remarkably low figure in 1956.

I know it is generally hoped that a Chairman will make some forecast of the trend of business for the current year. I wish I could see the future clearly enough to make any such remarks worthwhile. I can only say that we have a business of which we have good reason to be proud and we are steadily and methodically improving our factories and equipment at no small cost. This is an earnest of our confidence.

The report and accounts were adopted and the final dividend as recommended was approved. The retiring directors, Mr. J. Black, Sir Cuthbert B. Clegg, and Mr. Hedley Bell, FCA, were re-elected and the remuneration of the auditors, Messrs Van Price and Goodyear, was fixed.

APPOINTMENTS

UNIVERSITY OF DUBLIN

TRINITY COLLEGE

ASSISTANT LECTURER IN POLITICAL SCIENCE

Applications are invited for the post of Assistant Lecturer in Political Science (salary £550 x £50 to £650).

Salary scale £500-£750 per annum (new grade under review).—Further particulars may be obtained from the Registrar, to whom applications (six copies) must be sent not later than May 31, 1957.

MANAGEMENT SELECTION LIMITED

have been retained to advise on the appointment of the

PERSONNEL MANAGER

for the Head Office in London of a well-known company manufacturing and marketing high quality domestic electrical appliances. The Company has three factories, employs several thousands and has plans for substantial expansion.

This is a new senior appointment and the Personnel Manager will be responsible for: formulating personnel policy; establishing and operating a central personnel department; and providing operating management with appropriate services to facilitate the maximum development of personnel throughout the Company.

The starting salary of up to £2,500 is envisaged; a car provided. There are good prospects of early advancement.

The high responsibilities and scope offered will suit men aged 30 to 40 who have had at least five years' practical experience of industrial personnel management, including experience of management recruitment and development. A degree or one year course in P.M. is essential but candidates must provide evidence of their ability for constructive and original thought.

Please send brief details, in confidence, quoting Ref. S.380, to R. A. Demeriey, Management Selection Limited, 17 Stratton Street, London, W.1. No information will be disclosed to our clients until candidates know their identity and have given permission after personal discussion.

UNILEVER LIMITED

UNILEVER'S Economics and Statistics Department has a vacancy for a statistician in its operational statistics section. His basic training should be as an economist, but should also have a good understanding of the statistical bases of the modern statistical techniques (preferably being a strong mathematician). Practice in applying economics and statistics to business operations desirable; a knowledge of accounting would also be an advantage.

The successful candidate should be aged about 30. Starting salary will depend on qualifications and experience but will not be less than £1,200 p.a.

Applications should be made to Personnel Division (PRB/1535), Unilever Limited, Unilever House, London, E.C.4.

ACTUARY

A Head Office of a Canadian Life Assurance Company with $6 million premium income has a vacancy for an assistant actuary in its rapidly expanding group department. Applicants should either have recently qualified as Fellows of the Institute of Actuaries or Faculty of Actuaries or should expect to do so shortly. Experience in life and group annuity work is an advantage but not essential. Relocation expenses paid.—Box 679.

ACTUARIAL STUDENTS—passed at least some part of Part I of Faculty or Institute Examinations—required by Australian Mutual Provident Society (the largest British Mutual Life Office). After short initial preparatory period at London Office the Society will pay all fare costs to Australia. Salary depending upon qualifications—Minimum £625 sterling at age 21, £725 at age 23, £800 sterling at age 25. Substantial bonuses and increases on passing examinations. Excellent conditions, liberal long service leave, excellent staff pension scheme, assurance benefits.—Apply to Manager for United Kingdom, 73-76 King William Street, London, E.C.4.

LEADING MERCHANT HOUSE in Malaya offers attractive appointment to experienced executive, age 30-40, with successful commercial engineering background to take charge of all their engineering activities including the sale, installation and servicing of a wide range of engineering plant and equipment and the representation of many well-known U.K. manufacturers. This post involves control of technical staff and direct responsibility to the Board for the success of a major department. Total remuneration would be not less than £3,000 per annum.—Apply with full details to box 136, Haddon's, Salisbury Square, London, E.C.4.

ENGINEERING OFFICER required as Senior Executive Assistant to administer and control all aspects of Management Engineering and Apprenticeship training for group of Engineering Companies employing 6,000 personnel.

Applicants should be ex-Public School and University man, fully conversant with modern educational methods and training methods. Preference given to ex-Service Administrative Officer.

Salary limits 40/55. Primary location near Birmingham. Full details of age, experience, etc., to Secretary,

[illegible] LIMITED invites applications from men aged [illegible] for the position of management assistant in [illegible]ming Organisation at Harrow. A developed [illegible] the economics of planning is essential, and [illegible] of the problems of stock planning, control and [illegible] distribution would be an advantage. The post [illegible]-education to degree standard, but more weight [illegible]ven to previous commercial experience.—Apply [illegible]st 125A, Kodak Limited, Harrow, Middlesex.

THE UNIVERSITY OF MANCHESTER

RESEARCH STUDENTSHIPS AND RESEARCH GRANTS IN ECONOMIC AND SOCIAL STUDIES

Applications are invited for the above studentships and grants, tenable for one year in the first instance, and renewable for a further period not exceeding two years. The studentships are normally of the value of £350 or £400 per annum. They are offered to candidates who have obtained the degree of Bachelor or Master in this or any other approved University. Applications should be sent not later than July 1, 1957, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

MANAGEMENT ACCOUNTANT

THE DISTILLERS COMPANY LIMITED

The Company invites applications for the post of Management Accountant in the Economics and Statistics Section of its Industrial Group in London.

Candidates, who should be under 35 years of age, must be Chartered or Incorporated Accountants and must hold an Honours Degree, preferably in Economics or Mathematics. Industrial experience with specialised knowledge of management accountancy or industrial economics is desirable.

Salary, depending on experience, in the range £1,000 to £1,500. Non-contributory pension scheme.

Write: Staff Manager, The Distillers Company Limited, 21 St. James's Square, London, S.W.1. Quote Ref.: 18/57.

ECONOMICS/STATISTICS.—A Graduate with a good degree in Economics is required to analyse the statistics produced by subsidiaries of a large engineering group, and to produce regular reports on the trends revealed. The work has to be developed and there is much scope for initiative. A background of Mathematical Statistics is not required, but candidates do need an aptitude for analysing figures and trends. Actual industrial experience in the work would be of particular interest. The ability to write lucidly and briefly is essential.

Application forms from the Secretary, Market Research Department, T.I. (Export) Limited, 58-72 John Bright Street, Birmingham, 1.

STATISTICIAN required by Arthur Guinness Son & Co. (Park Royal) Ltd. Graduate preferred but Diploma of Royal Statistical Society would be acceptable. Salary in the scale £700 to £900 according to qualifications and experience. Five-day week, free luncheons, four weeks' holiday (24 weeks' this year), non-contributory pension scheme, excellent sports facilities.—Apply in writing to Personnel Manager, Park Royal Brewery, London, N.W.10.

FIRST BRITISH REACTOR EXPORT ORDER:

Mitchell Engineering Ltd of London, working as a consortium with their American associates AMF Atomics Inc, and Siemens-Schuckertwerke of Erlanger, are to supply an atomic power station to the largest power organisation in the Ruhr, Rheinisch-Westfalisches Elektrizitatswerk AG

THE CONTRACT—for a station of the closed cycle boiling water type—was secured in the face of competition from seven international companies because this type of reactor was considered the most promising and suitable design at the present stage of development for the capacity required. Mitchell's share of the contract is valued at over three million dollars. The station is expected to provide electrical power to the grid by 1959. Mitchells are providing the primary and secondary steam circuits, the reactor vessel and heat exchange pipes. AMF Atomics will be responsible for the core, core control gear and instrumentation.

This reactor for the Federal Republic will provide the first practical contribution to the introduction of nuclear power in Germany and is also the first large scale reactor contract to be obtained for export by a British Company. It is a tangible expression of the joint Mitchell/AMF programme for the peaceful development of atomic power.

▶ *Mitchells are also engaged on four contracts for British Atomic Plant at Chapelcross, Capenhurst, Springfields and Dounreay.*

Half per cent Downwards?

The authorities may be being forced to consider another reduction in Bank rate. An alternative is suggested to them.

When the Dust Settles . . .

The engineering and shipbuilding reports have recommended a wider inquiry into industrial problems.

Who Wins in Jordan?

Suppression of the pro-Syrians and pro-Egyptians in Jordan has bought time, but it contains a danger.

Hungarian Exodus

A reminder is needed that the problem of the refugees from Hungary is not yet solved.

Shipping's Boom Year

The shipping companies made fine profits in 1956; less buoyant figures are to be expected in 1957.

Lancashire's Lot

Britain's cotton industry may shrink further; the Japanese industry has its difficulties too.

Britain's Turkish Friends

The Cyprus issue is coming between Britain and one of its few remaining Middle Eastern friendships.

still better Export cover- at no extra cost!

One year after announcing substantial cuts in premium rates, the EXPORT CREDITS GUARANTEE DEPARTMENT takes another big step forward in improving its service to Britain's exporters.

From April 1st its main guarantees, already second to none, cover *more* risks and a *greater percentage* of major losses. And claims arising from losses will be met sooner.

If you are an exporter, you cannot afford to miss finding out about E.C.G.D.'s new export cover. Write for descriptive literature, and

see the ECGD man when he calls

HE'S GOT INGRAM COOLNESS ALL OVER HIS FACE

Ingram coolness changes a man's attitude to shaving! Ingram is so comforting because it combines its own face lotion, which cools, soothes and protects as soon as your brush touches your face. Your razor has an easy passage — and *you* have a contented skin. There's no sting, no bite, no drag with Ingram, the coolest shave in the world. Ingramshave tomorrow!

INGRAM combines its own face lotion

Who are the most likely prospective customers for cars, washing machines, refrigerators and other durable goods?

A RECENT ARTICLE in The Financial Times* shows that expenditure on durable household goods and motor cars in 1956 amounted to £923 million. This is an increase of 37 per cent on 1952, when expenditure was £675 million. Moreover, only a small part of this increase is due to higher prices.

Who are the people responsible for this colossal rise in buying? A table of ownership of certain durable goods gives this picture.

Obviously, but significantly, the upper and middle classes are far heavier buyers of durable goods than the working class.

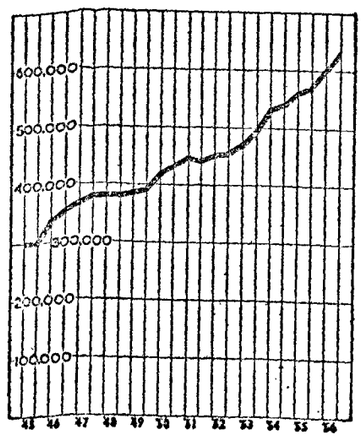
The figures on Chart I also suggest strongly that the upper and middle class market for these goods is far from saturated. And this market offers the most immediate likely prospects.

OWNERSHIP OF DURABLE GOODS BY CLASS

	Middle Class %	*Working Class* %
Lawn Mower	65	29
TV Set	55	45
Telephone	50	7
Car	41	12
Washing Machine	37	20
Refrigerator...	25	5
Motor Cycle	6	7

How to reach these prospects

The Hulton Readership Survey for 1956 and the I.P.A. National Readership Survey for 1956 give the *readership* of The Observer as 1,880,000 and 2,056,000 readers respectively.



Three-quarters of The Observer's readers belong to the middle classes as defined by The Financial Times, which contain 4,212,100 adults—the top 11% of the population.

Thus The Observer is an unexcelled advertising medium for durable household goods—not only those in the Financial Times' list but many other household goods traditionally thought of as mass-market rather than quality goods.

Not only does The Observer provide an audience of the most likely buyers, but it provides it most economically with a minimum wastage. Nor is this audience small—a glance back at the readership figures shows it to be surprisingly massive.

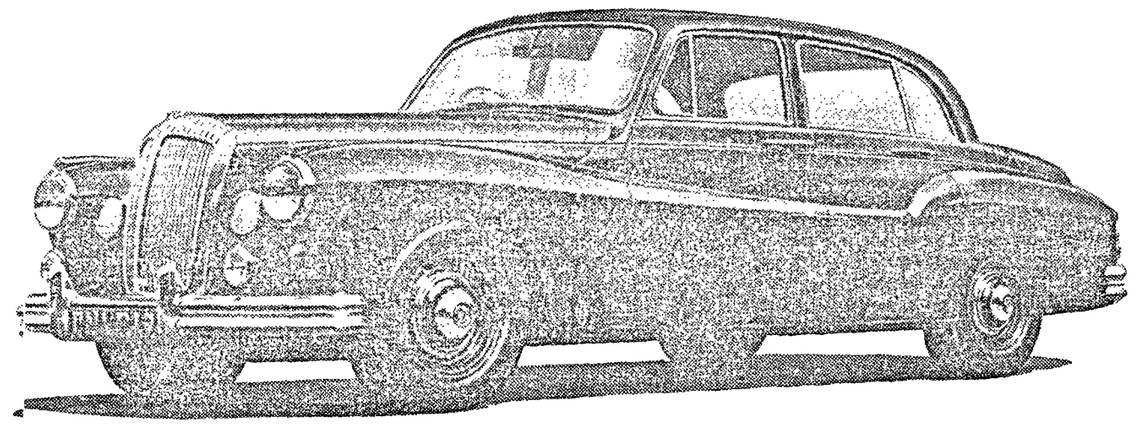
Manufacturers of durable household goods, motor cars and other automotive products, and their advertising agents, are cordially invited to write or phone for further details to Norman Berridge, The Observer, 22 Tudor Street, E.C.4. Fleet Street, 9991.

* *Taken from an article by Mark Abrams in The Financial Times of Saturday, March 16, 1957*

THE OBSERVER

The astonishing growth of The Observer's circulation

The circulation of The Observer has doubled since the war from 298,619 to 633,064. It is still increasing.



Last year alone, The Observer's circulation went up by 10.4%—the largest increase of *any* Sunday paper. And this was in a year when Sunday papers as a whole lost 1.2% of circulation.

The Hulton Readership survey for 1956 indicates that it has the highest number of readers per copy of *any* national daily or Sunday paper.

According to the latest available Hulton figures, The Observer has a higher percentage of readers, who read only one Sunday paper, than any other of the Sundays.

Planned for Top Management

THE 100 MPH, 5-SEATER, FULLY AUTOMATIC DAIMLER ONE-O-FOUR IS DESIGNED TO A CONCEPT OF BALANCE

The Daimler Concept of Balance is the perfectly proportioned fusion of the four vital factors top management look for in a car. These are:—

1 PRESTIGE 2 PERFORMANCE
3 CONTROL 4 PRICE

The Daimler One-O-Four is the very essence of this Concept of Balance.

1 A large, distinguished car. The One-O-Four is graceful and distinguished, in the Daimler tradition. It conveys prosperity without a hint of showiness. It has an interior capacity that you would never suspect from its slim elegance of line.

2 One of the world's fast cars. The One-O-Four has a most impressive build-up of speed and reaches 100 m.p.h. quickly and easily. The notable characteristic of its performance is its unfussy behaviour. A quiet engine, absence of wind noise and exceptional road holding achieve an unbelievable docility at the top end of the speedometer. With its powerful servo-assisted brakes, the One-O-Four is also one of the world's safest cars.

3 Fully Automatic Drive. The fully automatic transmission is positively human. Super-human, in fact, for it silently and efficiently changes gear, up or down, always at the right time and always more quickly, more smoothly, than one could do it oneself. Add an exceptionally small turning circle, and you have a large car that is actually very much easier to take through heavy traffic than many a smaller one.

4 An economic price—£2580. The nearest rivals to the automatic Daimler One-O-Four, in terms of all that it offers, are considerably more expensive. This car, created on a planned *concept of balance*, offers a very special amalgam of the right qualities at the economically reasonable figure of £2580 inclusive.

Drive Daimler

Discover for yourself the ways in which this remarkable car answers your special needs. Arrange for a demonstration with your nearest Daimler Distributor, whose address will be sent to you, with illustrated brochure and latest Road Test Report, on application to The Daimler Company Ltd., Radford Works, Coventry.

The cars in the current Daimler range are:—

The fully automatic One-O-Four 3½ litre, £2580 inc. P/T.
The fluid transmission One-O-Four 3½ litre, £2395 inc. P/T.
The fully automatic Century 2½ litre, £1,680 inc. P/T.
The fluid transmission Century 2½ litre, £1,495 inc. P/T.

Soundest Way to Erect and Protect a Multi-Million Investment

The ultimate cost of a £5-, £10-, or £20-million petroleum refinery is determined not by the figure on the engineering and construction contract, but by the speed and efficiency with which the refinery can be put on stream. Lost production can cost an oil company thousands of pounds daily and, for large refineries, add up to millions. Sound protection against delays in putting the plant on stream or against failure to fulfill production guarantees promptly is to assign all or a major share of engineering and construction to the Kellogg Organization.

The bigger the investment, the more a refiner can benefit by enlisting the long and broad experience of this world-wide organization. A contract with Kellogg's expedites selection of the most economic processes . . . integrates plant design for maximum output of individual units . . . assures the proper materials to minimize corrosion . . . means the utmost in efficiency of piping, instrumentation, every phase of the job.

Whatever the assignment or its size, refiners can depend on Kellogg International Corporation to get their investment on stream quickly—and with a firm guarantee of product yield and utility efficiency.

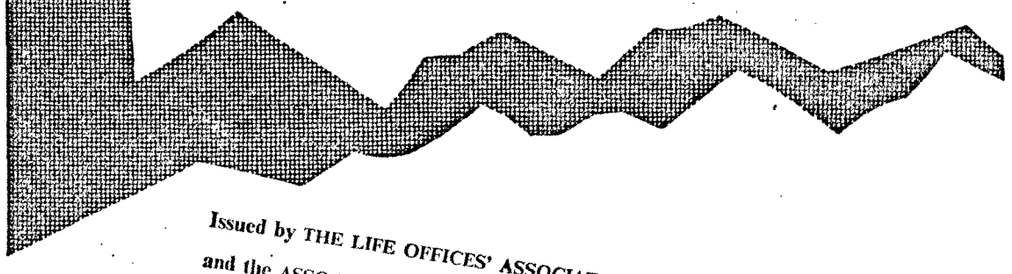
Pye links ships on the Clyde with G.P.O. Telephone System



The first International V.H.F. Public Correspondence Radio-Telephone Station opens on May 6th at Piper Hall on the island of Bute. This station provides facilities for passengers and personnel of ships on the Firth of Clyde to be connected with any telephone subscriber in Great Britain. Test crews of new vessels on trials on the measured mile of Arran will be able to communicate direct with suppliers of equipment, or with shipyards, to arrange immediate replacements or repairs; passengers can make social or business arrangements well in advance of docking; the crews can arrange for supplies and replacements to be awaiting them.
The Clyde station is the first of a series which are to be set up at strategic points on the coastline of Great Britain to take this type of call, because owing to the enormous increase of radio-telephony in yachts and coasters, the main coastal stations have been unable to handle all the resulting calls, which has meant considerable time-lag for urgent business users and occasionally delayed emergency calls.
All the equipment at the Piper Hall station is designed by Pye Engineers to British Post Office specifications. It is the outcome of a three-year engineering programme, which has put Pye V.H.F., A.M. and F.M. equipment in the fore-front of world development. All Pye marine V.H.F. equipment, both fixed and mobile, is designed to meet the new international F.M. marine requirements.

Pensions and Capital Accumulation

128. It is evident that pensions are intimately linked with the whole process of capital accumulation and that the scale of pensions that can be contemplated depends, on the one hand on the enhancement of the country's productive power that would result from the building of additional capital assets, and on the other on the ease with which additional savings can be spared for this purpose. If the National Insurance Scheme were conducted on the same principles as a private scheme, then the investment of the contributions would enable valuable assets to be constructed that would eventually furnish the means out of which pensions could be paid. But the Scheme is heading for a deficit that will have to be met out of general taxation, and, to some degree, out of the savings of the taxpayer, so that it will actively impede the very process of capital accumulation on which, implicitly, it rests.

Issued by THE LIFE OFFICES' ASSOCIATION, LONDON and the ASSOCIATED SCOTTISH LIFE OFFICES, EDINBURGH in the interest of a better understanding of the fundamental problems of providing a higher level of retirement pensions without harm to the Nation's economy.

Half per cent Downwards?

THE continuing fall in the rate for Treasury bills has naturally given rise to the expectation that the Bank rate itself may be reduced again fairly soon. This is therefore an apt moment to ask whether, if in fact a further reduction in Bank rate is being contemplated, it would in present circumstances be the right step to take. In part, any answer must depend upon the general view that is taken of the circumstances themselves; and it has to be confessed that the Government, like other governments in other countries and like most of its critics here, is in two minds about the medicine which the economy will need most—a tranquilliser or a stimulant—in the next twelve months. But, even without embarking upon this wider argument, there are good reasons for doubting whether another reduction in Bank rate will necessarily be the proper prescription.

The authorities' reaction to the fall in the Treasury bill rate seems to be that they do not think it should be happening, but that if their hand is forced they may let Bank rate be reduced by another half per cent and explain that this is yet another purely "technical operation." It is, of course, entirely sensible to wait and see if the plentiful supply of investible funds in the short money market is a temporary Treasury bill phenomenon, rather than a sign that savings are beginning to run ahead of a possibly slackening urge for private investment; and the fact that the whole issue of engineering wages comes up for decision this weekend provides a powerful additional reason for caution. But if the recent glut of short funds does prove to be neither temporary nor adventitious—if, that is, the downward pressure on market rates continues—then a reduction of Bank rate in response to it could hardly be regarded again as "purely technical." A lowering of Bank rate to 4½ per cent would mean that the rate had been reduced by a full one per cent in two stages over three months. Quite clearly, the volume of investment and consumer demand in the economy in 1957 would then be higher than it would have been if the rate had been kept at its pre-February level of 5½ per cent all through the year; and the practical question—which is also a question of principle—is whether a "technical" reduction of Bank rate is the best way of achieving this economic result.

This is not to say, of course, that, if the downward pressure on rates really is considered to be something more than a temporary money market phenomenon, the authorities should stand resolutely and permanently against it like inverted Daltons, trying to rig the market against a basic economic trend. If, however, this trend does become established—if, that is, the authorities decide that it does mirror the fact that intentions to invest are falling short of the funds available for investment—there is one obvious alternative to reducing Bank rate. (Another would have been to restore the investment allowances in the Budget, but this was not done.) This alternative is to make some relaxation in the restrictions at present imposed on credit. Money is now rationed partly by price and

partly by physical controls (directives to bankers, references to the Capital Issues Committee, and so forth). Within the confines of this double control, the demand for short funds has once again fallen short of supply. The reaction last February was to lower the price of money, but to keep the physical controls intact; indeed, by last month's extension of the power of the Capital Issues Committee, the physical controls have actually been tightened.

For any other commodity but money, the natural impulse of a Conservative Government would have been to put the emphasis the other way round. Why not in money? Why should not the Chancellor write to the Governor of the Bank of England asking him, in view of the easier conditions in the money market, to relax somewhat the previous directives and "requests" that commercial bankers should exercise an even greater restraint in their lending than would be imposed on them by ordinary banking principles? Mr Thorneycroft should then add that it is the intention of the Government, by its operations in the money market, to keep money sufficiently short—and money rates sufficiently high—to enforce the rationing of credit by price. If the authorities feel that market conditions are about to force them to take some action, a move in this direction would be economically more sensible, and liberally preferable, to another reduction in Bank rate at the present time.

When the Dust Settles . . .

Which problems of industrial relations could be usefully subjected to "authoritative examination," and by what sort of body?

THE courts of inquiry into the engineering and shipbuilding disputes reported on Thursday. The main immediate interest will be in their recommended awards, and whether there is any danger that the strikes will be renewed; these aspects are discussed in a note on page 382. But when the dust has settled, as the Minister of Labour put it the other day, there will be more interest in the proposal that there should be an "authoritative and impartial examination of the wider issues of wages policy in an inflationary setting" by a small body with which the Treasury, "the British Employers Confederation, the TUC and the nationalised industries should be associated." It is not clear whether the court wants a standing body or a once-for-all inquiry. A standing body, bringing together all these staid people and trying to make agreed statements each year on the sort of percentage wage increase (if any) that might be afforded in most industries, would probably tend to become a body that would make most of the right noises; it is unlikely that it would be a very powerful organ and its proposed make-up certainly needs study. But these are not sufficient reasons to condemn it out of hand.

The idea of a once-for-all inquiry—a sort of Royal Commission—is a different matter. One's immediate reaction is that if such an inquiry were held, it should not be confined to the problem of inflation, but should consider all the features of industrial relations that currently cause alarm. No one is in much doubt what these are; and it is important that they should be regularly restated, even though the remedies may be hard to find. But it must be asked soberly in which of these problems an inquiry could really help.

(1) Wage Inflation. The automatic annual process by which the unions decide on a claim in the early summer, submit it in the autumn and get perhaps half of what they asked in the following spring, has this week suffered a small variation which has reduced it to the absurd. The Amalgamated Engineering Union, at its annual conference, while still involved in its old wage claim, is discussing a new one—based, presumably, either on the rise in the cost of living since the increase they have not yet had or on the rise in productivity since then?

No doubt an impartial inquiry could voice once again the old advice about linking wage claims to productivity. It might put its authority behind a proposal to make wage contracts of, say, three years' duration, with a cost of living escalator clause, so that frontal clashes were at least less frequent. It might make specific recommendations about the structure of collective bargaining—for example, that some of the big units of national wage negotiation, notably in engineering, should be broken up into smaller units that would take account of differing degrees of prosperity in such heterogeneous industry. It might propose that efforts should be made to organise production without such heavy reliance on overtime, which not only puts up costs, but also makes nonsense of a wages structure. But it is idle to think that a once-for-all report on more general issues could really add very much to what was said in the white paper on wage inflation last year.

It is equally idle to suppose that a committee of inquiry could find a way out by proposing legislation to put what is called a national wages policy in place of collective bargaining. The unions have always resisted the idea of governmental interference with wages, and as their co-operation is essential, a national wages policy (even if it could be devised, and even if the Government wanted it) is simply "not on." Is the conclusion, therefore, that if free collective bargaining is to stay, full employment will have to go? There is another alternative: it is to carry collective bargaining to its own logical conclusion and, when the wage demands are unbearable, to stand up to strikes.

In so far as there has been any attempt to stand up to national stoppages since the war, it has succeeded—on the railways in 1955, in London printing in 1956 and at the docks in 1954-55. Admittedly, in these disputes—which were the only recent major stoppages in which all members of one union were involved—the workers' effectiveness was impaired by another union, in the same trade, which remained at work; admittedly a strike such as the recent one in engineering, when workers were being called out in relays, could probably last a longer time and inflict more damage. But even the strike of engineering and shipbuilding workers in March, although it resulted in the loss of 3.65 million working days or 50 per cent more than were lost in the whole of 1956, seems unlikely to have depressed production in that month by more than a point or two; spread over the whole twelve months of the year, that loss in production seems almost insignificant. Of the western democracies, only Sweden, the Netherlands, Switzerland and Western Germany have a lower postwar average of days lost in disputes per thousand workers than Britain has. Yet whenever a strike is threatened, such an atmosphere of impending disaster is created that the whole nation hangs on the footsteps of Sir Wilfred Neden as he shuttles between union leaders and employers. (One danger of a "standing" committee of inquiry is, of course, that it could conceivably become a force for urging him to shuttle more assiduously still.)

(2) Restrictive practices. On this question, there is even less that a new committee of inquiry could usefully do. The matter is already being dealt with on the National Joint Advisory Council (on which are represented employers, TUC and the nationalised industries), taking individual industries in turn. Though the results may be of limited value, this appears to be the most practical approach; what it needs is speeding up.

(3) Communists in the unions. The communist problem is a very real one. But the union leaders themselves know about it well enough. They take one of three attitudes; to fight the communists and try to keep them out of union jobs; to do the reverse and try to get them in; or, most frequently, to say "What do I care about his politics? He's a good trade unionist." But whatever attitude a leader adopts he usually does so in full possession of the facts, and there is nothing that a committee of inquiry could do to make him change his mind.

(4) Union organisation. The inefficiency of trade union organisation is brought home to the public chiefly by inter-union disputes. It is baffled that the Trades Union Congress, whose power in labour relations is so great that the Government can hardly move without its assent, should be almost powerless to prevent dog fights among its own members. It seems only common sense that the unions should forget their history, sink their jealousies, and be prepared to yield up some of their autonomy to the TUC; that they should reorganise themselves into fewer unions, exchange their overlapping membership, and find a better alternative to the branch which few bother to attend. Clearly some unions have better organisation and communication with their rank and file than others. Possibly a committee of inquiry could hold up one or two unions with an effective organisation as a model for the others. But the unions are unlikely to put their house in order on the advice of inquiring outsiders.

(5) Human rights. Here at last is something that a commission could valuably examine, and progressive opinion should no longer run away from it. Nothing is more disturbing in the current trade union scene than the occasional—but increasing—cases of workpeople who are victimised, and perhaps expelled from their unions with consequent loss of livelihood, because they have annoyed either their national or (more often) their local union officials. There are three alternative things that might be done about it:

(*a*) To prohibit by law compulsory membership of a union as a condition of holding a job. This is the effect of recent legislation in some states in America; the objection to it—apart from the political fuss it would cause—is that there is just a little justice in the union leaders' claim that no one who benefits from wages and conditions negotiated by the union should be exempt from making his contribution to it, in money and solidarity.

(*b*) To accept the closed shop and, because that endows the unions with a privileged position, to regulate parts of their conduct by law—e.g. prescribe secret ballots and specified minimum votes for election of officials, etc. There is quite a lot that could be said for this—but it would require the state to assume new supervisory powers over trade union activities and needs careful probing.

(*c*) To recognise the right of workpeople to sue unions for damages if they have been hurt by malicious actions against themselves as individuals. At the moment (e.g. the Bonsor and Huntley cases), these suits for damages may lie only if the unions have offended against their own rules, which can easily be changed.

These are fundamental matters of personal liberty and justice. They are far too much glossed over; and a Royal Commission would be worth while if it lifted their weight from the nation's conscience. But it is not with them that the sort of inquiry now being discussed would apparently be most concerned; indeed, there is a danger that the form of strictly representative get-together suggested by the courts might tend to put them into eclipse.

Who Wins in Jordan?

Young King Hussein has defeated his extremists; Egypt, and perhaps Russia, have suffered a setback. But can he, with American support, keep the lid on the Palestinian cauldron?

KING HUSSEIN has dispersed or imprisoned the leaders of the extreme nationalist and left-wing parties in Jordan and, with the support of those loyal elements in his army which Sir John Glubb gathered with such care from the desert, has reimposed a thinly veiled autocratic rule. The democracy established by free elections in October has been abandoned because the popular will was too wilful in the hands of the people's chosen leaders. The young king has, in short, returned to the way of his grandfather, King Abdullah, who saw his people as children to be led benignly or, if need be, beaten for their transgressions. The strong man of the new government is the Foreign Minister, Samir el-Rifai, to whom King Abdullah himself sometimes turned in a crisis. He is a man admired for his cleverness and disliked for his toughness. He and the very old guard who constitute the cabinet were brought up to rule at the king's will; they have few illusions about the wisdom of the Jordanian people.

The king has acted with courage and determination. He took his throne and even his head in his hands when he went two weeks ago to Zerqa to halt a mutiny of his troops. He has shown an acute sense of the issues at stake, which were no less than his country's solvency and the existence of his throne. The Nabulsi government, with the king's approval, ended the Anglo-Jordanian Treaty in March and secured from Egypt, Syria and Saudi Arabia promises of £12.5 million a year to replace the British subsidies. But only the Saudi instalment was paid, rather late. Meanwhile, the Nabulsi government drew daily closer to the Egyptian-Syrian camp. In its "positive neutralism" it decided to exchange embassies with Russia, and dismissed many officials who opposed its policies. The king and the conservatives feared that if the Nabulsi policy were sustained, the country would go bankrupt and be denied American aid. Further, the result of the pro-Syrian policy of Abdullah Rimawi as foreign minister could have been the end of Hussein's kingship, for the Baath Party, of which Rimawi is the leader in Jordan, advocates a united Arab republic and looks for the union of Jordan and Syria as one step on the road. Any financial or other difficulty in Jordan that tends to push it towards Syria is regarded by the Baathis as a good thing. It is too early to say how the king's riposte will turn out. But on the face of it, Nabulsi and Rimawi left him little choice.

The United States government links events in Jordan with King Saud's acceptance of the Eisenhower doctrine as, together, a major victory against Russia in the cold war in the Middle East. It was through King Saud that the Americans assured King Hussein that he could have aid without a visit from Mr James Richards, the President's special envoy. At the request—as it is stated in Washington—of Iraq and Lebanon it sent the Sixth Fleet to the eastern Mediterranean to deter either Israel or Syria from intervention. American marines, equipped "to drop from the sky" on Jordan if the need arises, are on a "friendly visit" to Lebanon.

This is the Eisenhower doctrine in action. King Hussein, self-committed to the fight against international communism, has been promised some of the funds he needs, and a force is standing by in case anyone should intervene from outside. The State Department is justifiably pleased with the immediate results. Three months ago, Syria and Saudi Arabia were solidly aligned with Egypt, and Jordan was being steadily welded to the block. Now Egypt and Syria are alone; for whatever declarations of "brotherliness" the Jordanian king and ministers may make to President Nasser and President Kuwatly, the fact remains that neither Saudi Arabia nor Jordan is at this moment in the Egyptian camp. They are, in fact, very close to Iraq and Lebanon, the two pro-western Arab states.

THE gains are great. The danger lies in overrating them, as they are overrated if the month of crisis in Jordan is viewed as a simple struggle between King Hussein and the red pawns of Russia. Jordan's trouble is that it is not really a country at all. It requires about ten million pounds a year to save its trade and treasury from bankruptcy. The east bank, the former Transjordan, was a desert remnant of Ottoman Syria given by Britain to Abdullah as an emirate in 1921. The west bank is a residue of mandatory Palestine which King Abdullah incorporated in his kingdom after the Palestine war. The east bank may still be in the main loyal to the throne, but it has only 600,000 people. Some 900,000 Palestinians, nearly half of them refugees, constitute the remainder of the population on the west bank. They have no inherent loyalty to the king, regard the people across the river as backward, and have an impassioned belief that the western powers were, by the creation of Israel, responsible for all their ills. King Abdullah was himself assassinated in Jerusalem.

The Palestinians are the most fervent and bitter element in popular nationalism, which is everywhere stronger in the Middle East than it was two or three years ago. They are firm supporters of President Nasser. Whatever faults they may see in him, these weigh lightly in the scales against the fact that he has carried the primary aim of liberation from western dominance a stage further. He had the courage to turn to Russia and snap the West's leading strings. He got the British out, seized the Suez Canal, and procured arms; and even when they admit his defeat by Israel, his reputation is retrieved for them by his diplomatic success in emerging with profit from the defeat. When King Hussein permitted Jordan its first free elections last autumn, Palestinian nationalism won outright.

Neither the structure of Jordan nor the opinion of the people has changed. The king has succeeded in imposing his will with the aid of a small ruling group, long out of touch with popular sentiment, and of an army that is neither as well led nor as loyal as it might be. In turning his back on Egypt he is in conflict with the great body of common opinion in Jordan. It is far too soon to say that the crisis is over; for in effect he has clamped down a powerful head of nationalist steam without fitting a safety valve.

Indeed, the Eisenhower doctrine, by calling on the Arabs to resist international communism, could itself increase the explosive pressure. The Arab nationalist regards it as an effort to drag him back into the clutches of the west, and he tends to prefer the Russians because they ask him for no more than neutrality. King Hussein has been very careful to insist on his friendship for Egypt and Syria, on his Arab patriotism, on his enmity for Israel and, despite his opposition to communism, on his neutrality; but it is still doubtful whether his words will convince the rabid west bank, which will look to the immediate grant of $10 million aid and to the arrival of the Sixth Fleet off the coast of Lebanon as true evidence of what the king's policy is. Already people in the cafés and bazaars of Jordan will be murmuring that the king has sold the new freedom of Jordan for dollars. Mr Eisenhower may find himself converting governments while Mr Khrushchev continues to convert people, in the Middle East.

The events of April have bought time. Jordan was in danger of total collapse and possibly of dismemberment by Israel, or Syria, or both; or it might have survived as a Syrian appendage and a playground for Soviet policy. These dangers have been staved off, but the solution is temporary. King Hussein and the west need to build a relationship on some foundation more solid than the suppression of all popular opposition. If that could be done, the respite that the young king has won might bring more durable gains than are yet to be seen. If it cannot, then American policy has to face the danger that the popular forces in the Arab world will be permanently aligned against it, just as, in the last ten years, they have been aligned against Britain.

(*The position in Jordan and Lebanon, and Israeli anxieties about the future of Arab Palestine, are discussed in messages from overseas on pages* 409 *and* 410.)

Hungarian Exodus

What kind of people are the Hungarians who six months ago started fleeing across their frontiers, where have they gone to, and what has happened to their hopes?

THE mass migration of Hungarians from Hungary began just six months ago. More than 170,000 people flooded over the border into Austria and, later, when this crossing became too dangerous, another 19,000 made their way to Jugoslavia. Two-thirds of all these refugees have now moved on; some to permanent or semi-permanent settlement in countries which they may have reached by chance or snap decision; others filling in time in Europe while they hope for a further move to the American or Australian continent. Six months is not very long, but the wave of half-guilty emotion that swept the non-communist world has had an even shorter life. In the host countries, refugee anecdotes quickly became as tedious as a war-time bomb story; the sense of responsibility spent itself without awakening much curiosity or understanding.

Most of the refugees are under thirty; many are unmarried men. Some were escaping from a fight which they had lost—freedom fighters faced with the choice of flight or deportation. Others fled to avoid the fighting; some of these, including many farmers who had land near the frontier, went back when the revolution failed; others, such as the entire University of Sopron, staff and students, who all crossed into Austria together, chose to stay in exile. The refugees who fled to Jugoslavia differed from those who fled to Austria only in that they waited longer before leaving their country. They include several trade unionists and other politically conscious Hungarians who stayed as long as it seemed useful to stay; many of these had more time to plan their escape and took their families with them.

The mistake of some western countries has been to think of the Hungarian exodus in terms of the premeditated escape of other political refugees from communism. Although for many years the Magyar

instinct for migration had been frustrated by closed frontiers, the minefields and the barbed wire barriers on the border had been removed as part of destalinisation. The discontented could have left their country without very much difficulty several months before the insurrection. But for most of these young men and women, their eventual escape was not a conscious journey to a paradise of western freedom and opportunity. Many of them had not seriously thought of leaving their country before the revolution. Decisions were made in fear, anger, and the turmoil of a mass flight. Some seized a chance; others were blown out of their country as if by an earthquake and landed in a capitalist world which they had been taught to despise and fear, looking at their new surroundings not with gratitude, but with the shock and suspicion of earthquake victims.

OFTEN it was only a matter of chance in which country they landed. Most of them wanted to go to the United States (for about a hundred years the traditional destination of emigrant Magyars), but had no other strong predilections. In the later stages of the exodus it became possible for voluntary workers to help the refugees to choose a suitable destination, but at the beginning, when some 10,000 arrived in 36 hours and there was nowhere to put them, methods had to be arbitrary. Batches of refugees would simply be asked to agree to go to a certain country, and except for a superficial medical check, that would be all. During some of the more chaotic episodes, refugees got into trains without knowing where they were going. They arrived, often shocked and fearful, in a country about which they knew nothing but which they believed to be hostile.

Those host countries had least trouble that made an effort to understand the turmoil in the minds of their guests. Some countries made mistakes that now seem elementary. France, though it generously put no ceiling on the number of refugees it was ready to take, made few preparations to receive them. For instance, several Hungarians, deeply disturbed by being housed in occupied military barracks, were sent flying over the nearby Swiss frontier by an unexplained army exercise. By contrast, Holland prepared its reception carefully. The problems of resettlement are now being sorted out, but muddles might have been avoided if the hosts had been more imaginative. In Britain, nearly half the 21,000 Hungarians who came here are now in work. Of the remainder, 5,000 are on their way to Canada (and will be replaced by refugees still in Austria). Nearly 4,000 are the miners brought over by the Coal Board; their training is now nearly complete, but so far only a handful are to be allowed down the mines. Other trade unions have welcomed the refugees, but not the Musicians' Union, which has turned a cold face to Hungarian musicians.

The most serious and immediate problem concerns refugees who are now in Jugoslavia awaiting resettlement. Of the 19,000 Hungarians who escaped to Jugoslavia, only about 1,000 have so far been settled in other countries. For this there is more than one explanation. The first wave of western generosity was spent by the time the flight into Jugoslavia began; several countries, ignoring the facts, are reluctant to accept refugees who escaped to a communist country; and, finally, pigheadedness on the part of both Jugoslavia and some west European countries has made it impossible until now for the various United Nations and voluntary organisations to set to work. About 2,000 refugees gave up and returned to Hungary, but it is costing Jugoslavia almost $30,000 a day to maintain those who remain. The situation has now suddenly got much worse. The Jugoslav government had housed some refugees in old army camps, others in hotels along the Dalmatian coast. But now the tourist season is starting; the government cannot afford to forfeit the foreign currency, and the refugees in hotels have been turned out to join the others in camps which were already overcrowded. Australia has offered to take 2,000 refugees from Jugoslavia, Belgium 1,500, and other countries have promised to take about 2-3,000 between them. A trickle of about 20 refugees a day is still entering Jugoslavia. There is urgent need both for more generous offers and for European half-way stages where the refugees can live and work while they wait for shipping to Australia. But many European countries are remarkably reluctant to offer temporary hospitality. Britain has agreed to replace the 5,000 Hungarians going to Canada, but, ignoring the urgent wishes of the United Nations High Commission for Refugees, has stipulated that they should all come from Austria; this seems an indefensible attitude.

The housing problem in Jugoslavia is at the moment particularly disquieting. But over the six months' period the Austrian government has carried the heavier burden, paying out about $10 million and still looking after some 37,000 refugees. About two months ago Mr Lindt, the United Nations High Commissioner for Refugees, appealed to members of the United Nations for financial help for Austria and Jugoslavia. The only government to respond to this appeal was Holland, with a cheque for nearly $3 million. The United States is arranging to send surplus food and has promised help with transport.

Other governments apparently think that they have provided enough money already. But between now and the end of the year about $22 million may be needed to maintain the 50,000 still in Austria and Jugoslavia. If they could be resettled the cost would be less: the expense of sending a thousand refugees even to the furthest destination is only two-thirds the price of maintaining them for a year. There is almost no hard core among the Hungarian refugees; the ones who remain were unlucky, arrived late or refused other offers because they hoped to get to America. But as the problem drags on, resettlement becomes more difficult.

NOTES OF THE WEEK

DISARMAMENT

Mr Zorin's Easter Bunny

TWO cries are apt to go up whenever the Soviet foreign ministry whips another rabbit out of the hat which Mr Molotov and his sporadic successors have long kept stuffed with bunnies for all occasions. One school dismisses the Russian move as pure propaganda, the other hails it as proof that the Kremlin is at last ready to settle. Both are wrong in the case of the proposals which Mr Zorin brought back to the London disarmament talks after his Easter trip to Moscow. Obviously the proposals have propaganda value. Marshal Zhukov was telling the troops in Red Square that the reactionaries had rejected them just when most of us reactionaries were reading the first summaries of them in Wednesday's newspapers. Equally obviously, it is something that the Russians have taken another bite at Mr Eisenhower's "open skies" offer, even if they cannot yet swallow it whole.

Mr Stassen can now claim to have budged them a long way from their earlier insistence that mutual inspection from the air was merely an intolerable form of espionage. The Americans will doubtless reject the idea that aerial access to a slab of Siberia which excludes that territory's main industrial centres is a fair swap for access to an area stretching from Seattle to Texas, from California to Omaha; they will go on pressing for "open skies" for the whole of both powers' territories. But Russia has virtually invited them to press on that door, and may have difficulty in slamming it shut again.

Quite possibly the Soviet rulers, contemplating the impracticability of policing full-scale disarmament on the one hand, and the strain of keeping up full-scale armament on the other, are now no clearer than the West about what their real terms ought to be. There is no evidence that they are panicky and on the point of giving way; on the contrary, they give the impression of being sure of themselves and of their ultimate goals—although less sure how to proceed at the present stage of affairs. If one assumes that their natural objective is to get rid of the bases in Europe and Asia which will give the United States a military advantage over them until they possess intercontinental missiles, then time is on their side in one important respect, and they need not worry unduly about the immediate present. In that case it is essential that the West should not develop illusions that the Russians are on the run and, exulting in that thought, stiffen its own terms.

AUSTRIA

Mr Mikoyan's Sales Talk

A FORMER minister of trade, Mr Mikoyan is Russia's most expert salesman. Moscow made a wise choice when it sent him abroad last week as part of its drive to break the European wall of suspicion surrounding the Soviet camp ever since the Hungarian insurrection was crushed. Mr Mikoyan used Vienna as a platform to inform not only the Austrians, but the world, that the Russians really are striving for peace and are willing to listen to any reasonable proposals. He interspersed his plea for disarmament with praise for the lucky neutrals.

Compliments to the Austrians on their neutrality were a pleasant departure. Not so long ago the Soviet press was violently attacking Austria for its "interference" in Hungarian affairs, and issuing stern warnings against Vienna's alleged intention to join the European Coal and Steel Community or the proposed free trade area. Mr Mikoyan dismissed all such incidents metaphorically: "Autumn was a period of bad weather. Now one can feel the advent of political spring." Preferring the carrot to the stick, he chose to conciliate the Austrians with offers of more trade. The final communiqué foreshadows that Soviet-Austrian trade exchanges will be boosted under a new long-term agreement. It was disclosed at the end of the talks that Mr Malenkov will soon follow his colleague's trail, and that the Austrian chancellor will pay an official visit to Moscow in the second half of this year. Mr Mikoyan has accomplished his mission.

GERMANY

Dr Adenauer in the Toils

BONN must have seemed an ingenious, even imaginative choice for this week's meeting of the North Atlantic Council. German forces are at last beginning to take their place in the Nato system. The Hungarian rising had aroused in the German people a new awareness that their life depends on the alliance. What more fitting than this demonstration that Germany is now an equal ally? What better fillip for Dr Adenauer, the paladin of Nato, in his electoral campaign? Russian diplomatic efforts have, however, been neatly timed to obliterate these advantages. The resurrection, by Mr Bulganin and Mr Mikoyan, of the Eden plan for a zone of controlled disarmament running down either side of the iron curtain has an obvious appeal in Germany, which (or part of which) the zone would cover. And the urgency of disarmament has been driven home in the German mind by Mr Bulganin's brutal warning that atomic war would turn Germany into a cemetery.

The Russian campaign, however, would not have been so successful if Dr Adenauer had not played up to it by seeking to create the appearance of activity in German-Russian relations with an eye to his electoral campaign. A fortnight ago he answered a letter from Mr Bulganin by agreeing to send a delegation to Moscow to talk on trade and other matters. On April 25th he had another long talk with the Soviet Ambassador. The Chancellor's policy—to put out friendly feelers towards Russia, but rearm in the meantime—is in itself reasonable, and it can be made to appear reasonable to the German electorate.

But Dr Adenauer appears not to have reckoned with any active reaction from Moscow, and now that Moscow has joined in the game, he has become involved in inconsistencies. Under the pressure of a public opinion alarmed by the prospect of a concentration of atomic weapons in Germany, the Chancellor appealed for a renewed effort at world nuclear disarmament. He told Mr Smirnov that western Germany had not asked for atomic weapons, but hoped, rather, that their possession would be restricted to America, Russia and Britain. Yet it was the Chancellor himself who first suggested that German troops would have to have atomic armaments. Once more his logic is perfectly right. Every effort must be made to achieve disarmament, nuclear and conventional. If these efforts fail, the arming of German troops with atomic weapons may in time become a military necessity for Nato. Still, the Chancellor can hardly have been as indignant or as surprised as he seemed at Russia's violent warning on Monday. With one eye on the ballot box, he has taken a diplomatic fall.

THE COURTS OF INQUIRY

Choice for the Confederation

THE courts of inquiry have recommended a pretty rough splitting of differences in the shipbuilding dispute, and (more controversially) have said that the same settlement should apply to engineering. When the disputes were referred to the courts the engineering employers had offered increases of about 3½ per cent and the shipbuilding employers increases of about 5 per cent, both of them to be conditional on certain undertakings. The documents concerned (which are reproduced in the reports) would pledge the unions to refrain from submitting a wage claim for twelve months afterwards; to use their authority to promote efficiency, punctuality, the cessation of restrictive practices; and to settle all disputes by the agreed procedure. The unions had not liked the twelve month standstill (the average time between the submission of a claim and the granting of an increase has been 7½ months, so the actual gap between wage increases would be more than twelve months); but they were prepared to agree to this provided the offer were raised to 12s. 6d. The courts proposed that they should choose; either a rise of 8s. 6d. (i.e. about 5 per cent) without conditions, or a rise of 11s. (about 6½ per cent) with a possibly modified version of these conditions, which they believe would go far to pay for the increase.

In making these recommendations, the courts admit that a rise of 5 per cent throughout industry would be inflationary. But they have not made their recommendations in the light of the economic situation—that is what they think should be done by an independent body. They have taken the situation as they found it, with less profitable industries than shipbuilding and engineering having recently won increases of 5 per cent. The point again illustrates the conflicting nonsense in the reasoned arguments for wage claims: the railwaymen get a good rise because, working for an unprosperous industry, they have been paid less than workers elsewhere. Then the engineers must get at least as much because their industry is more prosperous.

The attempt to link the wage increase, not to any index of productivity, but to an undertaking to promote it, is obviously good. But before hailing this as a turning point in industrial relations it will be as well to remember that the unions are still under considerable pressure not to accept it, that the executives have sadly little influence with the tough characters of the engineering shops and shipyards, and that undertakings of a similar type have produced disappointing results elsewhere.
