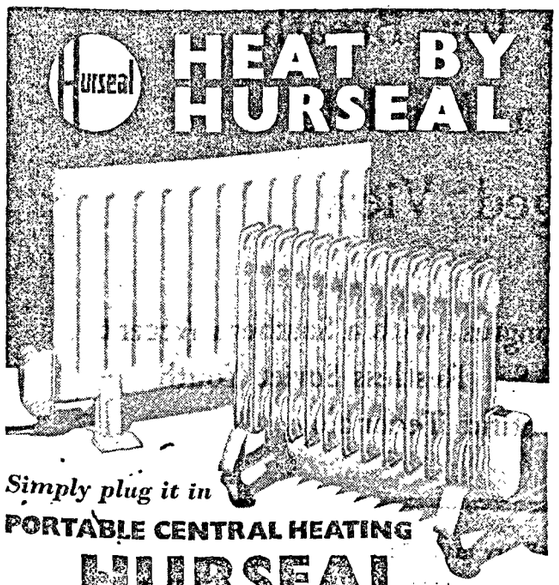
2,300 Degrees of Experience

BIG FIGURES in Fahrenheit may not mean much to many of us. Minus 300 degrees means more than ten times colder than that winter last year when the car broke down ten miles from home. 2,000 degrees means some twenty times hotter than that day last summer when the tarmacadam pavement actually bubbled. That's as far as we can, or want to, go. Temperatures like those are best left to people like Newalls.



These figures of minus 300°F to over 2,000°F do, in fact, represent the wide horizon of temperatures within which Newalls work. For more than fifty years, heat—and its control—has been a Newalls speciality, and during that time a wide range of materials has been produced to offer effective insulation for every need within this temperature range.

Newalls (Reg'd Brand) 85% Magnesia, Nicosil, Newtempheit, E.H.T., Amosite Asbestos and Newparex and Nonpareil insulating bricks provide every form of heat control; Nonpareil corkboard provides cold insulation to meet all requirements; Paxtiles, Paxboard, Paxfelt, Paxmarine and Sprayed 'Limpet' Asbestos provide sound and thermal insulation combined with fire protection.

But there's much more to Newalls than the manufacture of materials to control extreme temperatures. There's a wealth of knowledge and practical experience to go into every contract Newalls handle. There's a know-how which you can use to advantage if you have any trouble in keeping heat—and cold—in their proper places, and making them work to the last degree. To seek Newalls advice will cost you nothing.

Automatic control

Automatic control and adequate instrumentation of industrial processes are essentials for higher productivity. This is particularly important when large quantities of fuel are used and critical time and temperature limits are essential for success. Gas is the only commercial fluid fuel of declared constant calorific value and lends itself ideally to automatic control. The Industrial Gas Engineers at your Area Gas Board have considerable knowledge of this subject, which they will gladly pass on to you.

WHATEVER YOUR BUSINESS — The Gas Industry appreciates the needs of individual consumers for prompt service and for advice which accords with the customer's special circumstances and requirements. Each Area Gas Board offers efficient service to users of gas-fired equipment and can give expert advice based upon the pooled knowledge of all the Boards and of gas users in other countries.

No One Else Can

REPORTS from Washington leave no doubt that the United States government is on the verge of what could be a dramatic new departure: the enunciation of an active American policy in the Middle East. To state a policy in outline is one thing, to work it out in detail another, to make it effective in action another again. We do not know whether President Eisenhower and Mr Dulles have yet looked beyond the first stage, the formulation of a general intention or "Eisenhower doctrine." The President's message to Congress had not been sent when this article was written. The expectation in Washington is outlined on page 30.

What appears clear is that the makers of American policy have at last resolved that the Middle East can no longer safely remain as a hiatus in the American system of alliances and power positions which stretches round most of the world. Spectators in London will feel that it is high time—as indeed it is. They will wish, resentfully, that the American government could have worked its way round to this conclusion six months ago, before British Middle Eastern policy had reached its present state of paralysis. To reflect that no such American initiative would have been politically possible six months ago is no great consolation. Perhaps it needed something as shocking as the British disaster of November to force a drastic revision on Washington; and those who claim to see in that some *post facto* justification for the late Suez adventure can draw what comfort they can from it—though it is a queer sort of policy for British power to draw American power in by first destroying itself.

The recession of British influence has left the Arab world as a dangerous vacuum into which, failing an American initiative of an ambitious kind, only Soviet power can flow, with grave danger to Europe. Naturally, the Arabs will deny that any such vacuum, or any such threat, exists; the Middle East is theirs, they will say, and they are fully capable of filling it without outside help—how wrongly appears clearly enough when Syria threatens to keep the Iraq pipeline shut until the outside world forces Israel to give up Gaza. The Middle East crisis is by no means over. The canal and the pipelines are still blocked; Russian influence continues to seep in; no Palestine peace is in sight; the danger-points at which new upheavals or new wars can start are still alive. Britain, powerless for the moment to do anything better than stand aside and avoid doing further damage, can only welcome the American decision not to remain inactive.

What Washington appears to have decided amounts so far to the two first moves in preparation for an attempt to fill the gap. The President is on the point of asking Congress for a declaration that the United States would not inactively watch a Communist aggression or the spread of Communist influence in the Middle East, together with an advance authorisation to use force. At the same time, he will seek authority for a programme of economic aid, of the order of magnitude of $400 million or $500 million, for friendly Middle Eastern countries.

Together, these two weapons look like a powerful armoury; but their use, as they are intended to be used, to repair the damage and construct a new and stable position, will meet with complications that have still to be resolved.

This is not by any means to disparage the President's opening move. The effect will be to stretch the western trip-wire, the warning of American retaliation against a Soviet aggression, across a region which at present lies outside it. That will be a real gain. Europe has had good cause to be thankful for the existence of such a line, which Russia may not cross without the fear of world war, from the Baltic to the Mediterranean. The new trip-wire will be a logical extension of the old. Its political supports promise, however, to be incomparably flimsier. Not all the Arab states will be prepared, as the states of Western Europe have been prepared, to accept American protection; among those who will probably stand out are some in key positions, like Syria and Egypt itself. Many Arabs fear western protection more than they fear Communist aggression. The protection of a military guarantee is effective, in any event, only against a military attack.

The possibility of an armed Soviet attack somewhere in the Middle East cannot be ruled out, as the violent Russian reaction to the violent Israeli and Anglo-French actions in Egypt showed as lately as November. But, in general, Moscow has other and more promising methods at its disposal: political subversion, the supply of arms, the stirring up of local trouble. Such methods have failed, relatively speaking, in Europe because the states of Europe have attained a relative cohesion within and among themselves. In the Levant, Palestine and Arabia no such cohesion exists. Most of the Arab states themselves are new and artificial creations. None of them has yet accepted the existence of Israel. The political structure of the region has reached no point of equilibrium yet; flux and upheaval have gone on since the Ottoman Empire began to decline, and have not approached their end. As is probably realised in Washington, more than a trip-wire will be needed to put an end to them. Of necessity, the new policy will involve the Americans in a complex series of new attitudes and approaches to the different Middle Eastern states.

★

Anything like a package solution for the Middle East is probably impossible in these conditions; there is a limit to what can be done, and that little will have to be done piecemeal, plugging a security gap here and there, encouraging an honest government or supporting a sensible development project. Against this it can be objected that certain fears and obsessions vitiate the life of the Arab countries collectively; this is true, and particularly true of the Arab fear of and obsession with Israel. Either by itself or through the United Nations, Washington will be obliged to find some way—as the new policy, when explained, may recognise—of assuring both Israel's neighbours and Israel itself against attack by each other. As the history of the Tripartite Declaration showed, such assurances are unreal or uncertain unless the two sides can at the same time be induced to live together according to accepted international rules. Until they are, the mere pushing back of (to take the example of the moment) Israel behind the armistice line is a technical triumph of no durable effect.

While these problems persist, economic aid is not a panacea but merely a palliative; yet palliatives are better than nothing, provided that they are administered in a sensible way. Indeed, the shortcomings of economic aid as a solution for international problems arise in part from a misconception of what it is for and of what can be hoped from it. Administrators of American aid have learnt enough to beware of the grandiose, all-embracing plan. The only course in the Middle East will be to select sound projects from those which the recipients themselves propose, and to back them on their individual merits.

Even more treacherous is the political selection of recipients. Nobody can be expected to give his resources to help a hostile country; with that qualification, it is usually a mistake to ask a country in return for aid to accept a specific alignment either in international politics or in its economic relations. The offer to finance the Aswan High Dam was a mistake because it was made for the wrong reason, to prevent Egypt from getting Russia to support the scheme. The purpose of aid should not be to tie a country to the giver, or to secure a bias in its economic conduct, or even to win friends. It is to help the construction of sound economies and healthy communities, in which the rational and enlightened pursuit of self-interest becomes possible. It follows that aid should be given where it will do most good, not in return for promises of friendship, or to prevent aid from coming from another quarter. Most of all is this true in the Middle East, where poverty, economic pessimism, uncertainty of political allegiance, self-mistrust and mistrust of the outside world are peculiarly intertwined.

The Soviet declaration of interest in the Middle East, contained in Mr Bulganin's bellicose message to Sir Anthony Eden on November 5th, is now to be met, in effect, with an American counter-declaration which will have the added advantage of standing on an economic as well as a military leg. Reasonably simple in its implication for great-power strategy, in the Middle East itself the new American policy, or what is so far known of it, begins by marking out a rough and approximate route across an uncertain political terrain.

Success is still to be earned by articulated action. No policy for the Middle East has succeeded yet; this may be because the policies attempted have been misconceived or misapplied or because the state of the region rules out a wholly successful Middle East policy at present. It remains right and necessary, as it is welcome, for the United States to make the attempt; no one else can.

The Way to Cut Defence

NEXT month's White Paper on defence policy has already taken on a critical importance. This is true whether the test is budgetary and economic or diplomatic. Britain's outlay on defence is now widely looked at askance, with a deeply sceptical eye. The general public has taken it to heart not only that the Suez campaign showed that this country cannot "go it alone," but also that, when this test came, its forces were not even equipped to do so; and those more particularly concerned with the state of the national economy can now point with a fresh insistence to the load in taxes, foreign exchange and industrial resources which defence spending at the rate of £1,500 million a year represents, and to the inadequate return that is received from it.

It is not only the calendar that requires an urgent new look at the defence burden. The defence commitment is at the centre of national policy as it has been pursued since the war: it is the expression, and the cost, of British foreign policy in a peace-time cold war, which is not yet over. For this reason, though it is now necessary to face the fact that the present level of defence costs, always a drag on the economy, is becoming higher than the country will tolerate, the argument cannot be left there. What is in question is this country's proper posture, with its allies, in the world.

Quite clearly, until the danger has been removed against which the western nations, most providently if also extravagantly, have armed themselves in order to keep the postwar peace, defence is not expendable. It can be argued that the risk of a direct military assault has now been reduced by Russia's own troubles as well as by western resolution; and anyway Nato is increasingly drifting in spite of itself into reliance on meeting the risk by a "tripwire" technique which will go some way to meet the yearning for cheaper defence. But, equally clearly, to throw in our hand and dismantle our defences at this moment, while the risk remains, would make nonsense of what we and our allies have done, rightly and realistically, since the Russian replaced the German threat. We cannot adjure the duty, in the alliance, of self-defence. What we can, and must, do is to root out all commitments for defence which stem simply from false conceptions of national prestige and power and all those outlays, fostered often merely by service prestige, which in terms of goods delivered (or not delivered) produce no real defence. It is the right relation of policy to resources, of ends to means and of results to effort, that the nation has now to weigh.

★

In itself, it should be admitted, the Suez campaign proves nothing new. It has rather, with its consequences and its cost, served as a catalyst, allowing to form the widespread belief—to which Mr Macmillan's remarks at the last Nato meeting added shape—that this country has been carrying more than its fair share of the defence burden; that it has been spending too much too wastefully, on many objectives that were never practicable anyway; and that it must spend less henceforward. "How much less?" the defence chiefs may ask, "and on what?" Faced with the demand, which some are now making, for a straight cut of, say, three or four hundred million pounds, the details to be decided by them, they will naturally be resentful. But what is the layman to do? What sort of a picture of defence policy has he been given?

In a series of annual defence white papers, preparedness for every type of war, cold, hot, limited, global, with every type of weapon, conventional and unconventional, in every part of the world, on land, sea and in the air, has been enjoined in rounded platitudes. Any and every scheme in hand, whether near completion or a mere gleam in some air-marshal's or admiral's eye, has been justified as top priority. And round this structure of top priorities is erected a wall of security which

THE DEFENCE BURDEN
(Defence expenditure as a percentage of gross national product)

	1949–54	1955		1949–54	1955
Denmark	2·5	3·2	Netherlands	5·1	5·8
Luxembourg .	2·8	3·4	Greece.....	6·8	5·8
Belgium	3·6	3·6	France.....	7·5	6·6
Norway.....	3·6	3·9	Canada	5·7	6·8
Italy	4·3	4·1	UK	8·2	8·2
Portugal	3·8	4·4	USA	9·8	10·3
W. Germany..	...	4·5			

guards it not only from the enemy's gaze, but from any real attempt by outsiders logically to relate forces available or in the pipeline to commitments (or *vice versa*). Faith in what goes on behind this wall is shaken when tales of inter-service strife leak out, and when it appears that battleships and minesweepers are vital one year, and scrap-iron the next. And, unfortunate though it may be that the Suez action should be taken as a test, the fact is that, despite the expenditure behind the wall of £7,000 million in five years, the famous airborne fire-brigade was not ready, and a great deal of what was ready was the wrong stuff.

The public reaction to all this, and the demand for drastic inter-service re-thinking, were inevitable and should be salutary. It was clear enough, without the Suez experience, what the recent rate of defence spending has meant to the civil economy. As the figures in the table show, a larger slice has been taken out of Britain's national income than out of that of any other Nato country except the much richer United States. Moreover, this expenditure has been harder for Britain to bear than that of any other Nato country, including the United States, so that the percentage understates

the British burden : a great deal of it has been incurred abroad and persistently aggravates our chronic balance of payments difficulties. At home it falls particularly heavily (because of our effort to go it alone in atomic weapons and the means of delivery) on the engineering and electronics industries and on research resources, with correspondingly adverse effects on exports and industrial re-equipment. It is obvious that to ease the pressure of defence at these points in the period just ahead would substantially help the country. If the British defence budget were cut to the relative size of a country with purely Nato commitments, such as Belgium, nearly £700 million of resources would be restored to the civil economy, and even if it were cut only to France's in 1955, nearly £300 million.

Nor does the light thrown on British commitments by recent events suggest that such a cut is entirely unrealistic in defence terms. For reasons which will long be argued, the indisputable fact has emerged that this country is no longer able to safeguard by force what is traditionally supposed to be the vital strategic link of the whole Commonwealth. The vague, but in defence white papers always repeated, liability for Commonwealth defence can no longer be unilateral or unconditional. There must consequently be a critical appraisal of many of the minor commitments which have risen out of the major Middle Eastern one. What were intended as facilities have had, at this period of nationalist fervour, a costly habit of turning into commitments. Means have become ends. Thus Cyprus, intended as our base to hold the Middle East, in fact became a miniature theatre of war, tying up troops which could not be used for their main purpose. Other involvements which have been justified on the grounds that they are a defence asset—as they might be if Britain were orchestrating Commonwealth defence on pre-1939 lines—now prove almost as much a debit as credit. The usefulness of the bases in Libya, Jordan, Cyprus (perhaps even Iraq, Hong Kong and Singapore) have thus come into question—at any rate as purely British bases carrying with them in some cases acute colonial problems associated with sovereignty and security. These are key queries—to diplomats and defence chiefs alike—in the process of relating policy to resources.

*

But the problem is not just to cut defence : the need is to reshape it in the cause of efficiency as well as economy. This is something which neither our military leaders, nor even a greatly strengthened Ministry of Defence, can do unilaterally. For if we cannot go it alone in war, it follows that we should not go it alone in either arming or disarming. Britain has not the choice between being a first-class and a second-class power—such terms are nearly obsolete—but between becoming an efficient member-state of a western power block or nothing. The main point that emerges from a reappraisal of our commitments and from a frank admission of the present ineffective multipurpose composition of our forces is that defence should be integrated with our allies in each operational area, not just some of them. Flexible forces there must be, and the commitments in every area remain to be met ; but the forces must be integrated western forces based on a unified policy.

It may be argued that we are still very far from this. But it is the only sound defence objective, and once it is seen that Britain cannot alone sustain "balanced" forces capable of independent action everywhere, the extent to which defence has been developed here might be found a useful bargaining counter to speed up the integration process. The Americans have already agreed to supply Nato countries with some nuclear weapons ; independent British mastery of so much thermo-nuclear know-how could be used to force the pace. Britain virtually has the hydrogen bomb ; valuable work has been done on missiles ; the string of British bases exists. These are only some of the assets which this country can undertake to put into the pool against the assurance that, under the integrated development of modern weapons, supplies, wherever they come from, will be allocated to the western forces whatever their nationality as part of a common plan.

This should be the response of the defence planners to the public demand, which cannot now be evaded, that they should reduce their claims to the largest possible extent and eliminate everything that is otiose or futile. Defence they must still provide—and the public itself must realise both that there are real overseas interests to be defended and that the defence of the realm has not suddenly become a dead duty—and they can provide it, more efficiently and more economically, only in a collective framework.

England's Foreign Policy

For, whatever may be the convictions of foreign nations—convictions of which we have no right to complain, because they are legitimate deductions from *former* transactions in our history—all dispassionate and observant Englishmen must be well aware that our tone and temper, as a nation, have of late altogether changed ; that we are no longer aggressive or ambitious ; that we desire nothing better than to be exempted from all foreign calls on our assistance ; that we can scarcely even be persuaded to meddle where we ought ; that we not only do not desire any extension of our empire, but that no considerations except our own safety would induce us to accept one inch of additional territory. We conscientiously believe—and we think that only party passion, or the blindness of class hatred, can believe the contrary—that England alone of all the great nations of the world seeks no aggrandisements—nay, most earnestly deprecates it ; that in future all quarrels in which she may be unhappily engaged, will not be sought by her, but forced upon her ; that any wars she may henceforth wage will be wars strictly of self-defence, or in the cause of justice, or in aid of injured and oppressed allies.

Spens Prescription

THE arguments between the Ministry of Health and the medical profession over doctors' pay have been going on for many months. It is nearly a year since the negotiating committee, which represents general practitioners and hospital staffs, gave notice that a claim would be submitted to cover the rise in the cost of living in the preceding five years. On June 14th, this claim was specified at 24 per cent and was supported by a long memorandum to show the rise in prices and wages and salaries since 1951.

But the doctors might as well have spared themselves the time and expense this document must have entailed. For a month later the claim was rejected outright by the Ministers concerned on the ground that "in present circumstances they would not feel justified in giving consideration to any claim for a general increase in medical remuneration." The "present circumstances" were later defined as the anti-inflationary policy and the plea for restraint in claims for higher pay. The doctors' reply to this was that they had been exercising restraint for a long time already, that they had suffered a steady decline in the real value of their incomes in the meanwhile, and that some of them were now suffering hardship as a result. Above all, they maintained that the Government was bound—by Mr Bevan's acceptance, when he was Minister of Health, of the Spens committee's recommendations on doctors' pay—to give them an increase.

It is on this last point that the dispute has recently centred : on whether the Government has an overriding obligation under the terms of the two Spens reports—one for general practitioners and one for consultants—to make periodic adjustments in doctors' pay to allow for falls in the value of money. The Minister of Health's case is that the Spens recommendations referred only to the pay of doctors on entry into the health service in 1948 ; nevertheless in August he encouraged the negotiating committee to prepare a further memorandum explaining the doctors' view that the Spens reports imposed a continuing obligation on the Government. This memorandum, prepared with the help of the committee's legal advisers, under Sir James Millard Tucker, was presented to the Minister of Health in the middle of September ; like its predecessor, it was summarily rejected some two months later. Since then an exchange of correspondence has taken the issue no farther forward. Mr Turton has refused to give a reasoned reply to the second memorandum, merely saying that it did not show that a legal obligation—that is, one that could be enforced by the courts—existed. The negotiating committee has pointed out that it was known all along that there was no enforceable legal obligation, but that this only made the moral obligation—which its memorandum showed did exist—all the stronger.

It is against this background that the negotiating committee met on Thursday of this week to determine its attitude at its next meeting with the Minister on the following day. These meetings have been heralded by the announcement that the British Medical Guild, a trade union offshoot of the British Medical Association, which is not itself a trade union, has been instructed to prepare for action. This has been interpreted, probably wrongly, as a threat to call a doctors' strike, or rather to call on them to resign from the health service, the implication being that they would continue to treat people outside it. But it is difficult to see how any action of this sort by doctors would not hurt their patients far more than it would the Government. Its main effect would probably be to destroy any public sympathy that may exist for their claim.

MEDICAL EARNINGS

Hospital Staff	Numbers Eng. & Wales	Salary £
Consultants (whole-time*) ..	1,790	2,100–3,100
Senior Hospital Medical Officers	1,200	1,500–1,950
Registrars, including Senior Registrars	3,290	850–1,400
Junior Hospital Medical Officers	550	775–1,075
Senior House Officers	1,850	745
House Officers	2,590	425– 525

General Practitioners	Number of Doctors†	Earnings less Expenses £
Size of List		
Under 1,000	1,500	Up to 1,100
1,000–1,500	2,000	1,100–1,775
1,500–2,000	3,600	1,775–2,200
2,000–2,500	4,300	2,200–2,625
2,500–3,000	3,500	2,625–3,050
Over 3,000	3,900	3,050–3,475

* *In addition*, there are nearly 5,000 part-time consultants who get proportionate pay and a fixed percentage of consultants receive distinction awards.
† Principals only ; in addition there are 1,400 assistants who are paid salaries out of their principals' earnings.

If one leaves aside the question of obligations, whether legal, contractual or moral, and examines the doctors' claim on its merits—which the Government has not yet done—has it any substance ? There has certainly been a rise in prices of the order of 24 per cent since 1951—the year to which the Danckwerts award related. By that award, given in March, 1952, the adjudicator found that, for the year 1950-51, to the incomes the Spens committee thought general practitioners ought to have earned in 1939 a "betterment factor" of 100 per cent should have been added to allow for the change in the value of money. This 100 per cent cost of living increase, which was followed by some adjustment, though not so big, in the salaries of consultants and other hospital staffs, immediately put doctors in a favoured position vis-à-vis most other professional people, particularly servants of the state. But, having felt comparatively well off in 1952, in recent years doctors have felt themselves to be steadily losing ground—during a period, too, in which other professions have been catching them up or reducing the gap.

That the medical profession is now due to increase its lead somewhat is justifiable. An average income of

£2,200 for a general practitioner, after he has deducted his practice expenses, is not easy money; and among junior hospital medical staffs there are cases of hardship. But in making its claim the medical profession overlooks the fact that the other professions which have done well for themselves since 1951—notably higher civil servants and teachers—did very badly before that date. Compared with 1939, civil servants' pay is only 75 per cent higher, though they managed to secure, along with their recent rise, a five-day week—an advantage which is certainly not overlooked by doctors, especially whole-time hospital staff. If the doctors' negotiating committee sticks to the Spens formula, which lays down that any adjustment in its recommendations should have "direct regard not only to estimates of the change in the value of money but to the increases which have in fact taken place since 1939 in other professions," civil service salaries are not a good example to cite.

Does the Spens formula in fact get doctors anywhere? Is it helpful to compare the rises in pay of different professions when almost their only common factor is their reluctance to go on strike? It is especially difficult to compare the earnings of general practitioners with anyone else's, for they are based on the number of patients a doctor looks after and are therefore partly dependent on the size of the population and the number of doctors in general practice. But the doctors' insistence on "Spens and nothing but Spens" arises from their conviction that a simple request for a cost of living increase will always be refused. After all, it took them over three years of negotiations before their earlier claim was allowed to go to adjudication. They know only too well that the Government will always be as firm with professional organisations as it will be weak with trade unions.

On the whole, therefore, the main responsibility for breaking the present deadlock lies with the Minister of Health. Obviously no section of the community can have an automatic guarantee against changes in the value of money; and the doctors cannot reasonably expect this. But can no formula be devised that would prevent these quinquennial major disputes? The problem is, after all, a wider one. It is not only the doctors who need some assurance that their standard of living will not be allowed to slide gradually downhill. Much the best remedy, of course, would be to put a stop to inflation. Meanwhile, perhaps the best proof the Government could give of good will towards the professional classes would be the adoption of the royal commission's proposals for reforms in the family man's surtax. Again, it is not only the doctors who feel that harder work and greater responsibilities seem to leave them financially pretty much as they were.

India's Pause for Breath

TO see the heady figures of India's second five-year plan being physically translated into dams, power and irrigation projects, steel plants and engineering works is impressive and in some ways frightening. The aims are urgent and ambitious; India must have, and is determined to get, the foundations of a modern industrial economy, and it is going about the job with the intensity of a religious war. It is easy for a British visitor to criticise this industrial revolution on the ground that it largely represses the free economic forces that created industrial Britain and are still creating and re-creating industrial America. It would be just as easy for a Russian or a Chinese to say that India's methods of socialist planning reject the compulsions on people that make communist economic development so much more straightforward. First impressions abide: the plan is over-ambitious and imperfectly balanced; the planners, for all their technical skill, have a self-confidence that is disturbing. Yet these impressions must be tempered by compassion towards a people whose average income last year was about £20 a head. To lift that figure to about £40 in the next twenty years does not seem an outrageous target; to fail could mean disaster for India, Asia—and the world.

It might almost be said of India's second plan that it was constructed with the built-in certainty of going seriously askew at some stage. Indians take pride in the fact that it contained no "budgeting by an accountant." To set the sights too high was perhaps a necessary way of creating enthusiasm among 350 million people whose opportunities for economic excitement are limited at twelve annas a day. When the plan was presented early last year it made no bones about the gulfs between intentions and means. Public expenditures of Rs 4,800 crores* (now raised by price increases to Rs 5,300 crores) for the period 1956-61 counted on assistance from abroad of Rs 800 crores, internal savings of Rs 1,200 crores, and deliberate resort to deficit financing to the tune of Rs 1,200 crores. After the clearing of the air between India and the World Bank, substantial assistance for the improvement of the railways seems likely; the bank has already made loans for the expansion of the Tata and the Indian Iron and Steel plants. There is an obvious readiness in New Delhi to assume that the west will vie with the east in providing the means for important parts of the plan (steel with Russian, German, British and American help is the

*A crore of rupees is 10 million rupees, equal to £750,000; a lakh is 100,000 rupees, equal to £7,500. Rs 4,800 crores is thus equivalent to about £3,600 million.

prime example of this kind of give-away competition). But India's present difficulties are of a different order. The fact compelling the re-phasing both of the plan and of India's import policy is the severe pressure on the balance of payments and the alarming rate of drawing on the sterling balances in recent months. In the five years of the plan, the sterling balances were to be used to the extent of Rs 200 crores; in fact, the whole of that sum has been used since last March, and there now remains Rs 536 crores—the bulk of which, under present statutes, is required as cover for the note circulation. The import cuts on consumer goods, announced last week-end, scarcely touch the problem, and it would be optimistic to suppose that they will save the intended 30 crores of rupees in the next six months.

★

India's imports in the past year may not have been immoderate compared with the ambitions of the plan; but they have been allowed (despite all the apparatus of detailed licensing) to run far ahead of what India could currently afford. The incidental strains on other members of the sterling area tend to be minimised in New Delhi; the damage that blatant talk about what the future of the pound can do is not even considered. India equivocates between being a member of the sterling club and being one of its creditors, and its recent policy suggests something less than complete faith in the sterling link and also a disagreeable opportunism in using it. An exchange crisis of such dimensions clearly demonstrates that the government has been failing to match the exchange liabilities that it has allowed to build up under its licensing procedures with the means of paying for the imports. Large imports of steel have been paid for—and much of it lies around awaiting internal transport. Licences for capital goods have been handed out freely, and evidently some appreciable advance payments have been made for equipment that has yet to be delivered; the rumoured revaluation of the German mark encouraged such prepayment and added its own quota of strain on the central gold reserves.

Having thus been taken by surprise, the Indian government is now conducting a re-examination of ends and means. It will not be an easy job, for major schemes in an undeveloped economy are by their nature "lumpy" and if too many have already been started, the process of stretching out those that are accorded less than absolute priority must involve dislocation and waste. Nor has any member of the Indian government openly admitted the need for modification in the plan's timetable. When the Finance Minister, Mr. T. T. Krishnamachari, introduced his supplementary budget five weeks ago he proclaimed that the main idea behind his proposals was that the second plan must go through. But his collection of measures—the reintroduction of the capital gains tax, stiffer excise duties, and a scheme (which has scared private capital much more than the capital gains tax) to impound the so-called "free reserves" of companies—can be fairly described as further repressive action against the private sector of the Indian economy, rather than the reduction of an intense head of steam in the public sector. The valves and screws are being tightened in the hope of keeping the pressure under control. Yet the pace of money creation (which has lately made its impact very sharply on internal prices) has been the outstanding fact of the past year. The immutability of the plan makes an imposing peroration for speeches in the Lok Sabha, but the Indian economy cannot escape the consequences of allowing demand to run so far ahead of resources.

"A basic weakness of the present situation is that the state has very little resources of its own by way of surpluses which it can utilise directly for investment and it has, therefore, to depend upon whatever transfer of private savings it can bring about through its borrowing programmes or through deficit financing." That commendably frank admission in the plan clearly states India's economic dilemma. To have attempted a little less and in less of a hurry, and to have given greater encouragement to free enterprise and private savers in India and overseas would seem, to British eyes, a more circumspect yet a more secure policy. Perhaps the facts of Indian political life make such a course impossible. There is a contempt for private enterprise that is almost pathological; some of it is justified, but the result has been to discourage the growth of public-spirited enterprise. Indian business carries on its shoulder a deep sense of sin and it seeks redemption by finding the shelter of the government and doing exactly what it is told. The biggest concerns accept guidance about their production, their dividends or their capital, knowing that measures can be taken against them if they do not. The small ones go ahead where they see a profit—and their opportunities for expansion may well add an unexpected quota of strain to the plan.

★

There is, therefore, little expression of an independent industrial (as distinct from mercantile) viewpoint in the current reassessment of the plan. That may be a rather greater loss than most of the planners tend to think. They have their own systems of economic and political absolutes, and while they are capable of self-criticism they are also sensitive to the more extreme forms of Congress opinion. That fact accounts for many of the perplexing ambivalences in Indian economic policy. For example, it is held to be politically impossible to make even the most tentative changes in the cottage handloom industries; one is told that social factors are enormously important and that if ministers ignore them they will go out of power. That may be true; but it is difficult to reconcile a policy that restrains the expansion of the weaving mills (which could play a much bigger part in Indian exports and also clothe many more Indians much more cheaply than handlooms) with proposals for improvements to handlooms that would make

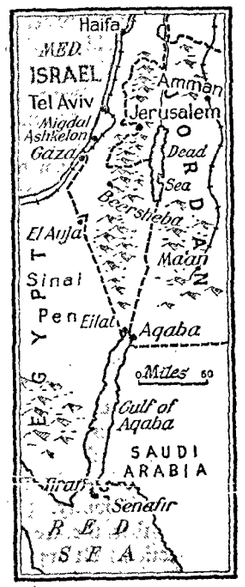
them only somewhat less inefficient than they now are.

There are contradictions, too, in agricultural policy. Heartening progress is being made in village and farm improvement, and the host of modest irrigation schemes already working will soon be supplemented by the major projects now under construction. But in a country where five acres is a large holding, where labour abounds and backwardness and suspicion prevail, a more determined policy for agricultural improvement might have been expected in India's planning. Only the beginnings are visible—education in the use of fertilisers and better seeds, the adoption of the Japanese method of rice cultivation, and the first attempts at the tremendous job of improving animal husbandry. Some observers find hope in an apparent increase in agricultural output over time of about 3 per cent a year, though a long-run average is no help if a monsoon fails. The pressing demands as industrial incomes grow will be concentrated on food and clothing and while the government's buffer stocks of these basic commodities may serve to keep prices in order for a time, the only answer in the end is increased output of both. And hanging as a gigantic question mark over the whole plan is the adequacy of transport to cope with the growing burdens that are being thrust on it.

Success and failure in planning are relative terms. India's plan will not fail in any absolute sense. Industrial assets are being created on an impressive scale and all of them, and more, are needed. Indian labour is learning, and the best of it shows skill and inventiveness. The one to three comparison of efficiency against European standards is bound to improve in time and so will the one to four comparison in wages. The desperate shortages are in technical skill and managerial capacity. The civil service is being combed for managers of the new state-owned enterprises—and the best of them would match most that Europe or America could show. Yet that only adds to the immense difficulties of the central administration where policy making and executive action are concentrated on a few dozen men of great ability and industry, but whose authority as a *corps d'élite* meets little effective challenge from a responsible public opinion. The country looks to them with a submissive faith ; and that, if they are to be true to their responsibilities, should give them humble and contrite hearts.

Notes of the Week

Lesson of Experience



A REMINISCENT phrase echoes in the halls of Uno and even in the conference-rooms of the State Department. It is that nothing can be done on Palestine's borders except with the consent of all the people, Arabs and Jews, involved. Britain used to say the same in Mandatory days ; then it was called action "acceptable to both parties."

Since nothing is acceptable to both parties, the risk that nothing will get done is always preponderant. All experience (including the British surrender of responsibility which left the field open for the Palestine war of 1948) spells out one hard fact. A readiness to impose the unacceptable—at some points on Israel, at others on its Arab adversaries—is the only way out of the Palestine conflict, which, as long as it continues to exist, bedevils every constructive work in the Middle East. There are some local people—quite a few Arabs, but very few Jews—who will admit in private that they are sick of deadlock and would welcome the relief from tension that a UN decision over their heads would bring. Some feel it would remove them from the brink of anarchy on which they hang at present, without saddling them with the responsibility.

Eyes on Gaza and Tiran

THE future of Gaza is an unanswered question, on which hangs a development of significance to a far wider world than just the Middle East. The Gaza question is likely to challenge the capacity of the United Nations to wield authority over a recalcitrant state or states: because, whatever happens, recalcitrance there is bound to be.

For on the one hand the Israelis, though pledged to withdraw from Egypt, are arguing that the Egyptians had in the first place no right to the strip, and that they will not permit Egyptian reoccupation of it. They are giving great publicity to current Egyptian fedayeen raids from Jordan so as to show their main reason for insisting, which is a conviction that Egypt will once again turn the strip into a raiding base. They have also said they can "never tolerate" the reimposition of an Egyptian blockade at the mouth of the Gulf of Aqaba. This could be taken to mean they would like to hold on to the islands at the mouth of the gulf, too. On the other hand, the Egyptians say they will allow no distinction to be made between Gaza and Sinai, and that no discussions on its future status can take place until the Israelis have got out. In this attitude, Egypt is backed by the whole Arab world (not to mention much of Asia)—a world that is in a position to exercise a squeeze by refusing to mend pipelines, or to clear canals, unless the west causes the UN to see Israel out.

In this dilemma, the position so far taken by the United Nations is that Mr Hammarskjöld—being but the servant of the Assembly—is edging Israel back behind the armistice lines, but that if Israel will not go without guarantees more solid than anything hitherto known, he will have to return to the Assembly and ask what to do next.

Here is a point at which the Assembly needs to remember not merely its resolve to get Israel back within its frontiers but also the earlier resolutions of the Security Council that Egyptian raiding and blockading must stop. Almost certainly, the Assembly's only way to grasp this nettle is to give UNEF a longer life and a bigger body, in order to be able to hold the strip while operable guarantees are being worked out.

Oil in Difficulties

THE new Syrian government will not make it any easier for the Iraq Petroleum Company to negotiate the right to repair its pipelines and pumping stations in Syria. The reshuffle of the cabinet removed the moderates of the People's Party and Constitutional Block, leaving an inchoate lump of leftism to rule Syria with an anti-western bias. Salah Bitar, secretary of the Baath (Resurrection) Party, remains as Foreign Secretary. Both before and since the reshuffle he declared that the IPC pipes could not be repaired until Israel evacuated every inch of Egyptian territory and the Gaza strip. It is clear from the immediately preceding note that the future of the IPC pipelines is therefore much in doubt.

The Syrian government did deign to permit the IPC experts to study the damage to the pipes and plant this week, but it is clear already that the Syrian Army's sabotage was extensive enough to require many months of repair work. This means that the normal flow of oil from the Persian Gulf to western Europe cannot be restored until late this year. The work now proceeding in the Suez Canal will clear a channel for 10,000-ton ships by early March, but this will not open the canal for the bulk of oil cargoes. (Empty tankers will be able to go out through the canal and return loaded by the Cape, so shortening the round trip from 70 to 55 days.) As explained on page 60, the canal will be available for substantial oil traffic only when the second stage of clearance is completed in May, but a shortfall on supplies to Europe will remain because of the interruption of the IPC pipelines. It is important that repairs to the pipelines should not be longer delayed.

The Syrian government is in a position to be obdurate, and Lebanon and Iraq, which also lose revenues until repairs are completed, have no influence upon it. British influence was destroyed by the invasion of Egypt ; even the Saudi Arabian order to Aramco that none of its oil must be shipped from Tapline to Britain and France still stands. In short, Europe's need for Arab oil has given a weak and unstable Syria the whip hand. The United Nations needs to press as hard for the opening of the IPC pipeline as it did for the clearing of the Suez Canal.

Wages Week

ONCE again the winter season for wage negotiations is reaching a climax. This week and next the air is filled with the buzz of wage negotiations and the clamour of claims ; the engineering and engine drivers' unions will both hold important meetings next week, but the general impression still seems to be that it will be the bus claim that will really set this year's pace. A month ago the London busmen, whose claim for £1 a week was met by London Transport with an offer in the region of 6s., asked the executive of their union, the Transport and General Workers' Union, for plenary powers so that they could call a strike. These powers were refused, and Mr Cousins himself has lately been hurrying in and out of London Transport's offices to try and better the offer. The report this week was that he is now thinking that he must have at least 9s., whereas London Transport is prepared to concede about 6s. 6d.

Mr Cousins's 9s. represents the 5 per cent rise in the cost of living since the busmen got their last increase in October, 1955. He is rather committed to this figure by his words at the Trades Union Congress last August, when, singling out London Transport workers as an example, he said that he was "not prepared to sit down and see our members' conditions worsened." On the other hand, he did accept 5s. for the provincial busmen. London Transport, for its part, can argue that since last January, when the main round of wage increases (though not the busmen's own increase) took place, the rise in the cost of living has been only 3 per cent. Three per cent, moreover, is the amount that the railways tribunal has offered to the Associated Society of Locomotive Engineers and Firemen ; the latter has not yet replied, but if the busmen get more than that, the underground train drivers will want more too, and then how should British Railways' drivers be content with 3 per cent ? So many claims are inter-connected, and everyone is closely watching everyone else. There will be keen interest in Mr Cousins's meeting with his committee on Monday.

★

Another union which may soon decide that the time is ripe for a claim is the National Union of Mineworkers, which hitherto had been concentrating on getting rid of the bonus shift (a device to prevent absenteeism, by which a man who works five shifts gets paid for six, but if he has worked less than five gets paid only for the shifts he has worked). The union executive had reached agreement with the Coal Board to postpone this issue—on which

it would be quite fatal for the board to retreat—for six months; but a big majority of the miners' lodges have rejected the postponement. Perhaps they will be less insistent on getting rid of the bonus shift if they get something else. It may be mainly on this argument that the Coal Board has offered this week to double, from 10s. to £1 a week, the additional retirement and disability pension which miners get on top of their ordinary national insurance pensions; but the union executive will next week consider a recommendation that it should demand an additional benefit —in the shape of a wage claim of 19s. 6d., to bring the minimum wage for the underground worker to £10, with corresponding increases for other grades.

Impotence

WHEN Sir Ralph Stevenson, then British Ambassador to Egypt, was congratulated in 1954 on the completion of the Anglo-Egyptian Agreement, he remarked that "it was a skinny bird but could be fattened up." In this homely phrase he expressed the essence of the agreement. Its terms were worthless without a sustained and developing relationship with Egypt and the agreement gave the opportunity for its creation. Within three months Britain and Egypt were in head-on collision over Middle East policy; and two years after the signing, British bombs were falling on the outskirts of Cairo. Now Cairo radio has announced the abrogation of the agreement.

The bird had been getting skinnier for months, for it is obvious that a base held only by British civilian contractors in a country becoming steadily more hostile was worth very little. After the bombing started on October 31st, the British civilians in the base were taken into custody and President Nasser drew on their depots to replace the military stores he had lost in Sinai. Abrogation has been back-dated to October 31st in order to demonstrate that the first British bomb destroyed the agreement. Britain is impotent in face of this affront, just as she is impotent to force Syria's hand over the IPC pipeline. That is the price for the invasion of Egypt. Britain is left with at best a claim for compensation.

The agreement itself could have little substance in present circumstances. One could hardly contemplate the return of British civilians to the base, or Egyptian police safeguarding it as British property—much less its reactivation by British troops. The vital importance of the workshops and stores to British strategy and the right to reactivate the base for the defence of Turkey—in short, all those terms for which British negotiators bargained grimly for 18 months—have been jettisoned. Was the base, after all, unnecessary, or was it simply overlooked?

Jordan's Treasure Hunt

ACCORDING to several reports from Amman, one of them quoting the prime minister, Jordan has received the promise of Egypt, Saudi Arabia and Syria that they will give financial aid to replace the British subsidy for a guaranteed period of ten years. The amount offered is variously reported as £10 million and £12 million a year. The latter sum would almost exactly replace current British payments, but the prime minister told the Chamber of Deputies that Arab aid would require some austerity in Jordan, which suggests that the smaller amount is nearer the mark.

The Jordan government is sending a mission to the Arab capitals on this question of financial aid. This seems to mean that the promise referred to in reports from Amman predates the invasion of Egypt and requires firm renewal before Jordan can afford to refuse British subsidies. The economic situation has certainly changed for the worse. The Syrian government has itself been compelled to embark on a regime of austerity. Egypt was in a tight position before the invasion and is now urgently seeking aid instead of offering it. King Saud is hardly likely to fulfil the promise from his exchequer alone; perhaps with this in mind, he warned the Arab heads of state at their Beirut meeting in November against putting any more burdens on the Arab economies at the moment.

Jordan wants the aid from Arab sources in order to make itself independent of Britain by abrogating the Anglo-Jordanian Treaty and getting rid of the British bases in the country. (The Jordanians do not take seriously the fact that the treaty does not provide for unilateral denunciation.) It appears that the inability to secure Arab aid will compel the anti-western government in Jordan to put up with Britain for a little longer. But does Britain still want this unwilling partner? This seems to be an appropriate time to call the Jordan government into conference on the treaty and the money, bearing in mind that there are, at the very least, grave doubts about the value of the treaty to Britain. Jordan might at least be told again that Britain is not anxious to continue paying £12 million a year for opprobrium.

Blunder in Lusaka

IT is difficult to understand why Mr Lennox-Boyd, who is touring Northern Rhodesia and Nyasaland in fulfilment of a long-standing promise, refused to see Mr Harry Nkumbula, the leader of the Northern Rhodesian African Congress. Presumably he was advised not to do so by the Governor, Sir Arthur Benson, but he need not have taken the Governor's advice: in other colonies he has made his own decisions whom to meet. It is true that he did not see Mr Nkumbula in London, but the circumstances were different: Mr Nkumbula was then claiming to represent African opinion in a way that the Northern Rhodesian government thought improper. But in Lusaka—and indeed in the copperbelt by virtue of his alliance with the African Mineworkers' Union—he is a leader in his own right, and it would have been perfectly proper for the Colonial Secretary to have seen him. The Northern Rhodesian government is anxious not to have Mr Nkumbula's reputation inflated, but surely such behaviour is only likely to make him more of a hero with his supporters. It entirely ignores the fact that he has support, and therefore a creative role to play in the country's politics. Ignoring this is not the way to tame him out of his vague but harmful rhodomontades about a "Gold Coast solution for Northern Rhodesia."

The real reason for the *gaffe* was probably political. Mr Lennox-Boyd was presumably warned that if he did anything except drink a cheery beer with African mineworkers and meet African MPs as an official duty, the white population and press would renew their outbursts against the Colonial Office. This might seem awkward at a time when Sir Roy Welensky is almost certainly talking to Mr Lennox-Boyd about a "higher status" for the Federation, the problem of widening (slightly) the African franchise, and the question of the status of a "British protected person" in a new federal citizenship. But it will be still more awkward if Mr Lennox-Boyd has encouraged the local white inhabitants in their belief that the Colonial Office is a "dead hand" which can be progressively ignored. By showing himself more sensitive to African opinion and opinion-makers, Mr Lennox-Boyd would have demonstrated what is certainly true: that the Colonial Office is much more alert to inevitable change than are the white settlers in Central Africa. And this is a truth that needs to be demonstrated, not hidden, at this juncture.

Housing Needs

THE belated appearance of the full-scale 1951 Census housing report for England and Wales (HMSO, £3) gives a reminder of the distortions caused by rent controls. To a large extent it only corrects the preliminary results which were published in 1952, on the basis of a one per cent sample, and which were then discussed in *The Economist*. An irritating change in definition of what constitutes a private household prevents accurate judgment on the sample trial, but it is clear that the final picture has not altered the main conclusions already reached. It is still a picture of far too many large families in small houses and too many small families in large houses.

Rent reform should correct this in part. But not entirely. The report shows how inadequately the stock of houses in this country conforms to the pattern of households today. About 60 per cent of houses in 1951 were more than 30 years old, built in days when families were larger and needs were different. If each family in Great Britain in 1951 had been given a separate house or flat with reasonable bedroom accommodation, and in addition a single person had just one living room and larger families two, then about 5½ million more small houses of up to four rooms would have been needed; among houses with five or more rooms, however, there was already an excess of 3½ million houses. That left a theoretical need of an additional two million dwellings (all small ones) to house every family separately; since some people will always want to share accommodation, however, building on this scale would clearly exceed the demand.

Housing standards have improved quite considerably since 1951: nearly one and a half million new houses have been built in England and Wales for only an additional half a million families. Over the next twenty years, assuming no net outward migration from this country, the number of households is expected to rise from 13.6 million to 15.2 million, about three-quarters of the difference being due to more elderly married couples and elderly widowed and divorced persons. To keep just abreast of this expansion implies only an annual rate of building of 80,000 houses a year. But in this time many existing houses will have become obsolete; slum clearance alone should demolish 75,000 houses a year over the next five years. Two lessons emerge from this figuring. First, housebuilding will have to be kept at a fairly high level (although clearly not at the Conservatives' "crash" rate of 300,000 a year) if accommodation is not to fall back from present-day standards; but, secondly, it should be concentrated much more on small houses. And yet the local authorities continue to build over half their houses with three or more bedrooms.

Power and the Surveyor

FOR a long time, architects, engineers and others concerned with private building have been irritated by the wide powers of the all-powerful local official known as the District Surveyor. A nice story has now arisen inside the London County Council, of which private builders might take note and make use. In London, the district surveyor, by virtue of the powers given to him under a section of the London Building Acts (Amendment) Act of 1939, has the right to object to any form of construction, and indeed to prescribe any measure which he may deem necessary to safety, when any structure is being put up or being altered. Architects and engineers may appeal against his prescriptions to the Superintending Architect of the LCC; but their confidence in the usefulness of appealing from one LCC functionary to his superior is perhaps indicated by the fact that this right is believed to have been exercised precisely once in the last twenty years. In the case which has now arisen, the LCC is itself the aggrieved party; and it, too, has decided not to exercise its right to appeal against the decision of one of its own employees to another of its own employees—even though a successful appeal might save its ratepayers £40,000.

It appears that two years ago the Housing Committee of the LCC accepted a contractor's tender to put up several blocks of flats, costing about £2,500,000; the estimates included a sum of something over £100,000 for "pre-cast concrete cladding." This was discussed with the district surveyor, and the consulting engineer received the impression that this arbiter of structural design and safety had approved them. Manufacture of the cladding was started. But later the district surveyor intimated that he was not aware that work had started, and insisted on seeing it being made; when he did he took grave objection and had the plans redesigned, at an increased cost of nearly £36,000—together with an additional claim by the surveyor, on account of delays, for £5,000.

The housing committee of the LCC was incensed, but found that, if it appealed, it would in effect be appealing from itself to itself. Rather than advertise this ludicrous situation, it has apparently decided to let the ratepayers pay; besides, it was advised, it appears, that the delay of appealing might make things worse. The host of private owners and builders, who have experienced the futility of arguing with a district surveyor who feels that he

knows better than any architect or surveyor who yet added ARIBA or MIStructE to his name, should take advantage of this story. They should agitate for the creation of an independent tribunal of appeal, which should be professional, non-political and non-municipal—and which should meet frequently and arbitrate promptly. The district surveyor should uphold safety; the tribunal should prevent pettifogging. Perhaps a modicum of publicity in this dark corner may help to establish builders' rights and keep building costs down.

Mr Kadar's Bleak New Year

NEW YEAR'S DAY in Hungary came and went without Mr Kadar making his much-heralded pronouncement on political and economic policy. Presumably he kept quiet because he did not know quite what to say. For some time he has been trying—so far, it seems, without success—to make his regime more acceptable to the Hungarian people by persuading some of the non-communist political leaders to join it. But there is no sign that he (and the Russians) would give them more than a decorative role, let alone agree to free elections; and although Soviet troops are becoming much more unobtrusive there is no confirmation of rumours that they are withdrawing altogether. In these circumstances, experienced anti-communists like Bela Kovacs, the respected leader of the Smallholders party, will obviously think twice before involving themselves with the communist regime.

But if Mr Kadar is keeping his own counsel about political developments, he and his spokesmen are being quite frank—sometimes hysterically frank—about Hungary's appalling economic plight. Although food supplies appear to be adequate for the time being, New Year articles and messages have told the people flatly that better times are not just around the corner; in 1957 they must expect unemployment, inflation, fuel shortages and more hardships. These dire warnings, combined with new efforts to turn the financial screw on recalcitrant workers, and the threat of mass dismissals in a few weeks, are no doubt designed to bring about a greater resumption of work. But the miners, whose attitude is of crucial importance, apparently remain unmoved; shortly after Christmas, Budapest radio announced that some of them were going on "paid holiday" and were claiming that this "holiday" was due to them since they could not take it earlier on account of their strike. One can imagine that such a buoyant defiance might make Mr Kadar despair of ever coming to terms with these men. Yet unless he does, the foreign aid for which he is appealing—Russia has promised a credit of $50 million in free currency—will not do him much good.

Peking to the Rescue

PEKING has not taken advantage of the post-Stalinist chaos to challenge Soviet leadership. It has, rather, come to the rescue of the Soviet rulers in the ideological battle. The Chinese communist *politburo* held a special meeting for this purpose; its findings appear in the Peking *People's Daily* in the form of a lengthy analysis of past and present trends in international communism. The Chinese leaders endorse the Soviet version of events in Hungary and give their blessing to the intervention there. They lash out at the Jugoslavs for unwittingly playing into the hands of "counter-revolution" and, after condemning "great power chauvinism" and the extreme nationalism of small nations alike, they appeal for "international proletarian solidarity with the Soviet Union as its centre."

The main reason for this Chinese backing is made explicit throughout the statement. Peking draws a line between differences among communist allies and conflicts with the "imperialist" enemy; the former must be subordinated. Alarmed lest the communist baby be thrown out with the Stalinist bath-water, the Chinese leaders have to come out against the hot-heads of liberalisation. Many pages are devoted to an appreciation of Stalin; the conclusion is drawn that his achievements outweighed his mistakes. The path of the October Revolution is still held to be broadly valid for all communist parties, though it need not be followed blindly. Belief in the necessity of the dictatorship of the proletariat is given as a test of allegiance, which the Poles pass; but the Jugoslavs are accused of spreading doctrines that might lead to bourgeois democracy.

★

Moral backing from China must be invaluable to the Soviet leaders, since Peking is the only serious rival to Moscow in prestige and potential power. Next week Mr Chou En-lai may get some economic rewards in the Russian capital. Having reassured the Russians, will he back the Poles in their bid for greater freedom on the next stage of his journey? The emphasis on international solidarity in their statements may be a sign that the Chinese now favour the revival of a Comintern or Cominform. On such a body, for all their fidelity to Moscow, their man would have a key place. The Soviet difficulties inevitably enhance the authority of China in the communist councils.

The Saar's Quiet Return

AFTER eleven years of separation the Saar returned to Germany this week, quietly enough to give encouraging evidence that this old sore in relations between France and Germany is healed at last. Conflict between France and Germany has long ceased to be sensible, but mutual mistrust has outlasted its rational causes; the Saar issue served as its focus and kept it alive. The quiet acceptance of last year's agreements by parliaments and opinion in both countries suggests that rapprochement between France and Germany is becoming more widely accepted, not only by governments but in the public mind. The final settlement removes what has long been the most unpleasant political obstacle to the further integration of Western Europe.

The sole vocal opposition to the Saar's return to Germany came, strangely, from Dr Heinrich Schneider, leader of the Saar Democrats, whose nationalist campaign aroused so much misgiving at the time of the Saar elections. Since the Saar's return to Germany was agreed, Dr Schneider, lacking fuel for demagogy has lost political momentum. Once he was tipped as a possible national leader for the Free Democrats; his chances now seem slim. So he has sought to recover popularity by campaigning against the terms on which the territory has been incorporated, particularly because of the Federal Republic's refusal to preserve the Saar's social services and benefits. The complaint was genuine. For Saarlanders, the loss of their high French pensions and insurance is the most noticeable immediate economic effect of reunion with Germany. But the Saar, like the rest of Germany, should in time move into line with France in these respects if the European common market comes into being. And the Saarlanders seem to prefer the European to Dr Schneider's way.

For most Germans, the return of the Saar, though welcome, is only a first small step towards the reunification of their country. As Dr Adenauer implied in Saarbrücken on New Year's Day, it sets a precedent for reunification by peaceful negotiation, and also, though he did not point this out, for the preservation of economic ties with third countries. The Saar is joining federal Germany as a new *Land*; east German areas could presumably do the same. An important negative precedent has been set by the refusal to retain special social privileges in the Saar. The east German government continually claims that its "social achievements"—a phrase capable of political extension—must be preserved in the event of reunification. The West German parties, seeing this claim as the communist Trojan horse, have deliberately refused to allow the Saar to create any risky precedents.

Is Science Unfeminine?

SCIENCE well taught, the president of a conference of assistant mistresses declared this week, perhaps gives more scope for a warm response to life than does a reluctant study of the poets. It is good that some schoolmistresses are taking seriously the need to encourage more girls to be scientists. But there is a task here both for the girls' schools and for industry.

It is in the schools, of course, that the trouble starts. Far fewer girls than boys do science. It is true that biology is very generally taught—partly because it leads to a useful lesson about the birds and bees, and partly because it is relevant to courses in nursing and other work in the medical auxiliary field. But biology is the one branch of science that is adequately staffed; indeed there are almost too many biologists. In scientific subjects generally, as the table below shows, the proportion of girls to boys diminishes as one rises through the educational system.

THE SEX RATIO IN MATHEMATICS AND SCIENCE

(1954–55, England and Wales; '000s.)

	Boys	Girls
General Certificate of Education		
Ordinary level passes :—		
Maths, science, technical...	126	59
All subjects...	336	296
Advanced level passes :—		
Maths, science, technical...	39	9
All subjects...	67	30
Scholarship papers taken :—		
Maths, science, technical...	14	3
All subjects...	25	8
Number of University Students		
Pure science ...	12	3
Technology ...	8	0.1
All subjects...	51	17

It has been suggested that girls are naturally averse to science, and they do tend to be more interested in people than in facts and theories. Today, however, all the propaganda about the need for scientists has had some effect in a few girls' schools, and the poor supply of scientists produced by the vast majority seems due more to the absence of suitable and enthusiastic teachers than to the secondary sexual characteristics of the pupils. In 1955 there were 6,930 graduate men teachers of mathematics and science, but only 3,296 graduate women teachers of those subjects. The supply of these women teachers is only just enough to maintain their numbers, and does not begin to cope with the growing school population; and whereas the "deferment" of their national service yields a lot of extra men to teach science, there is no similar influence at work in the girls' schools. A recent report by the Association of Teachers in Colleges and Departments of Education declared that by 1960 many girls' schools would be without any science teaching at all. That is probably too gloomy, but it is certainly true that the situation is rapidly getting worse. The Ministry of Education has done what it can to stimulate the women's training colleges to moderate their devotion to arts and crafts and to get more teacher-trainees to specialise in science. It is now for the schools to help themselves, and they can do that by consciously guiding their girls on to the science side—if there is one—in the hope that some will shortly return as teachers.

★

To be persuaded to become little scientists the girls themselves have to be convinced that this will lead to a nice job, and the brighter ones want to know that it will be a job with prospects. It is here that industry could help. Many firms, while glad to employ women with technical qualifications, tend to keep them in jobs without much hope of advancement—for example, in research, technical filing, library or information work. This limitation has two causes. First, it is not generally accepted in industry (as it is by contrast in the civil service) that a woman can be in charge of men; and secondly, as women soon leave to get married it is not worth while training them for senior work. Imperial Chemicals Industries, for example, has found that while its male scientists often make a lifelong career with the company, its women scientists leave after an average of only five or six years, usually, it seems, in order to become full-time wives. Other women employees, in contrast, often go on working after marriage—indeed, 23 per cent of ICI's 11,000 women workers are married. In the population as a whole 37 per cent of women aged 25 to 34 are at work.

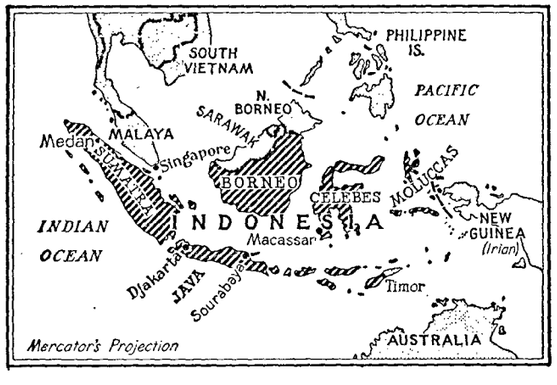
Is this difference inevitable? He who marries the lady scientist can usually maintain the family without her assistance. But that cannot be the whole answer because other kinds of graduate wives like going out to work; a PEP enquiry in 1954 found that they do so much more readily than their non-graduate female friends and relations. It looks as if industry could do something to make its technical jobs more attractive to married women: first by being more ready to admit them to well-paid and interesting jobs, and secondly by reorganising some of the work so that it could be done by part-time employees. No one wants to emulate Russia, where they dump the babies in a creche and carry on regardless. But the taxpayers and ratepayers are to send girls in their thousands to the universities and technical colleges, and unless the life of a woman scientist *qua* scientist can be made to last longer she is a very expensive investment.

More Hungarians

JUST over three weeks ago, the admission of Hungarian refugees into this country was halted, in order to allow the "digestion" of the 12,000 who had already arrived. This digestion has now been completed and, as had been promised, the inflow is to be resumed; it has been announced that before long another 5,000 Hungarians from Austria will be brought in, at the rate of 1,000 a week. This orderly trickle may seem a far cry from the generous impulses which caused all barriers to be lifted for the first improvised rescue operation, but since then there have been two important developments. After most of the original batch of Hungarians had arrived here, it was discovered that many of them were under the false impression that they could quickly go on to America: some thought they could go there by bus. Secondly, the Americans themselves are now in Austria and taking virtually as many Hungarians as wish to go to the United States. Representatives of the British Ministry of Labour believe that not more than 5,000 of those left in Austria will want to come to Britain. As this figure approximately balances those already in Britain who intend to go to Canada (in many cases as a second choice after the United States), the total number to be fitted into British life is likely to be rather less than the 20,000 originally expected.

The pronounced preference of the refugees for the new world is natural (although it will evoke some wry reflections here); but the smaller number now expected will ease the problem of absorbing them into British life. This must be tackled energetically, for the problem is not merely to make use of new skills but to make new citizens. Once this second rescue influx is over, it would be wise to ensure that an inter-departmental committee gathers together and records the lessons of the whole operation. Just as this was not the first time Britain was called upon to grant asylum on such a scale, so it may not be the last.

Free Trade Progress



THE scheme for a free trade area in Europe has passed its first hurdle: the committee of the OEEC countries, which was formed to consider whether the scheme was possible, has reported that it is. The experts' task was purely technical. They were merely asked whether it would be possible to fit a free trade area of the type envisaged around the common market which six continental countries hope to create. All the vital political problems—how long it will take to reduce tariffs, what escape clauses will be introduced for individual industries or countries—have yet to be settled. But the report clears the way for these decisions, and lays on the governments the clear political onus of deciding whether to go ahead with the whole scheme. A meeting of the OEEC council is likely to be called next month to decide.

The progress of the free trade area depends on that of the common market. At one time it was hoped that the six governments would sign the common market treaty in the middle of January; now the end of the month seems more likely. This slight delay may do no harm from the point of view of those concerned with the free trade area, for it will give more time to adjust the common market treaty to the needs of the wider scheme. It will be much easier to set this up if its members can adopt the same rules for tariff reduction as the Six. Fortunately the common market experts have already shown a helpful willingness to modify their notions to fit in with OEEC suggestions. There will be further opportunities for adjustment this month; M. Spaak's visit to Britain next weekend should be a useful catalyst.

Other weighty political issues apart from tariff questions are still unsettled. The question whether Greece, Turkey and Portugal will join will not be easy to decide. On the control of monopolies—on the face of it essential to a really effective free trade area—experts from both the Six and OEEC are tending to the view that an impossible problem is better left alone. But French demands for harmonisation of social conditions may still be troublesome in OEEC discussions as they have been in those of the Six. The whole fate of agriculture is also still unsettled. Britain has so far firmly refused to have agriculture in the scheme. But some way can still perhaps be found which will both preserve preferences and offer at least a gesture of encouragement to agricultural countries in Europe such as Denmark.

Indonesia's Irrepressibles

THE military rebels who failed to achieve their coup in Jakarta last autumn have bobbed up again in Sumatra; this time they have the support of the civilian population and will not be so easily dealt with. Two army officers, Colonel Simbolon, commanding at Medan in north Sumatra, and Colonel Hussein in central Sumatra, have declared that they no longer recognise Mr Sastroamidjojo's government. The governor of central Sumatra has announced that he has

transferred his powers to Colonel Hussein, and in the south, where no military coup has been reported, the governor has taken over the state revenues which would normally have been paid to the central government.

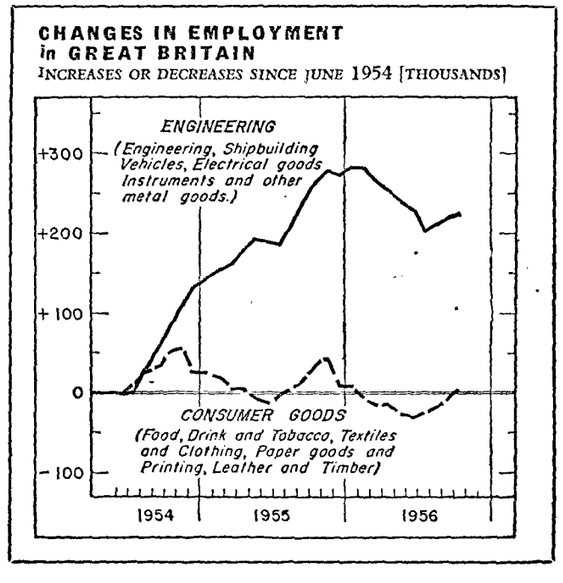
It is only this civilian co-operation and the consequent loss of the Sumatran oil revenues which have made the revolt formidable; the junior army officers have not been unanimous in following their commanders' lead. Both sides seem reluctant to start fighting; the government has contented itself with sending a mission to Colonel Hussein which he refused to see because it was not commissioned by President Sukarno as well as by the cabinet; a state of siege has been proclaimed in the affected areas and the president has made an appeal for loyalty.

These revolts are only another manifestation of the political and administrative weakness of Indonesia. Support has been given by the Sumatrans because they have long been impatient of the inefficiency of the Jakarta government and of the slow progress made in developing their island. They want local autonomy, control over a fair share of the national revenue, and more consideration for Sumatra as one of the richest and most developed of the Indonesian islands. The army officers are merely continuing the feuds which have bedevilled Indonesian politics for years and which brought down Mr Sastroamidjojo's last government. Demanding a more efficient and honest administration than Mr Sastroamidjojo has been able to provide, they would like to persuade Dr Hatta, the former vice president, to take on the job. He has shown no enthusiasm and has suggested presidential government by Dr Sukarno, with a body of ministers not responsible to parliament. Parliament's consent would be needed first; even so, it would be a dangerous experiment, although it might also be the one hope of finding a workable administration.

Pogrom in Algiers

THERE is one French soldier for every two settlers in Algeria and the government has, therefore, little excuse for allowing the extreme elements among the settlers to dictate the course of events. Yet the old year was rung out in Algiers with yet another tragic exercise of ugly mob law by the French settlers. The funeral of a prominent French victim of terrorists provided the setting. Hooligans in the funeral procession, having insulted the government representative and screamed abuse outside the American consulate, proceeded to impose a reign of terror on the town, attacking every Moslem they met; six dead and 58 wounded have already been numbered. To a soldier trying to protect an Arab from ruffians, these yelled: "There are no innocents. The innocent of today will kill you tomorrow." Happily the French mob was prevented from entering the Arab part of the town.

Massacres such as these may well make the ruffians' prophecy come true. Years of nationalist propaganda could not have fostered more hate between two communities which it is official policy to reconcile. The widening gulf also demonstrates the utter failure of the solution by military means which the minister resident, M. Lacoste, has never tired of promising. French liberals in Algeria—and their fate is not a happy one—in an indignant letter of protest attribute the cause of such happenings to the government's refusal to fight "on two fronts"—that is, against extremists of both sides alike. The new massacre, in their opinion, is a sequel to the events of February 6th, when M. Mollet first bowed to the will of an angry and intolerant mob.



In the next few weeks the Algerian question will come up at the United Nations, where unpunished pogroms are likely to have a greater impact than declarations. French critics, perturbed by the seemingly hopeless perspective, are urging the government to change its policy before the conflict passes out of French hands. M. André Philip, himself a Socialist, suggests the immediate recognition of Algeria's right to nationhood and a plan for a North African federation.

But if French words are not to sound empty it would be advisable swiftly to punish the men guilty of last week's massacres, thus showing that French justice is not affected by the colour of a man's skin. The culprits were apparently a minority and M. Mollet has the troops necessary to exact obedience. Western statesmen must do some weeding in their own gardens if they want their righteous protests over Hungary to carry conviction. Uncommitted members of the international jury at Lake Success will have a critical eye for the fruits of western policy, be it in Cyprus or Algeria.

Family Farms

BEFORE introducing his new system of farm improvement grants, the Minister of Agriculture should ponder most carefully the conclusions reached by a recent investigation into the economy of the family farm*—defined as a unit providing full-time work for only one, two, or occasionally three adults. The striking conclusion reached by this admittedly limited survey is that almost half of these farms are uneconomic units, in the sense that they do not provide their occupiers with even the equivalent of a farm labourer's wages after allowing for a modest return on working capital. This conclusion is the more depressing since family farms

* The Family Farm. Farm Economics Branch, School of Agriculture, Cambridge University. 3s. post free.

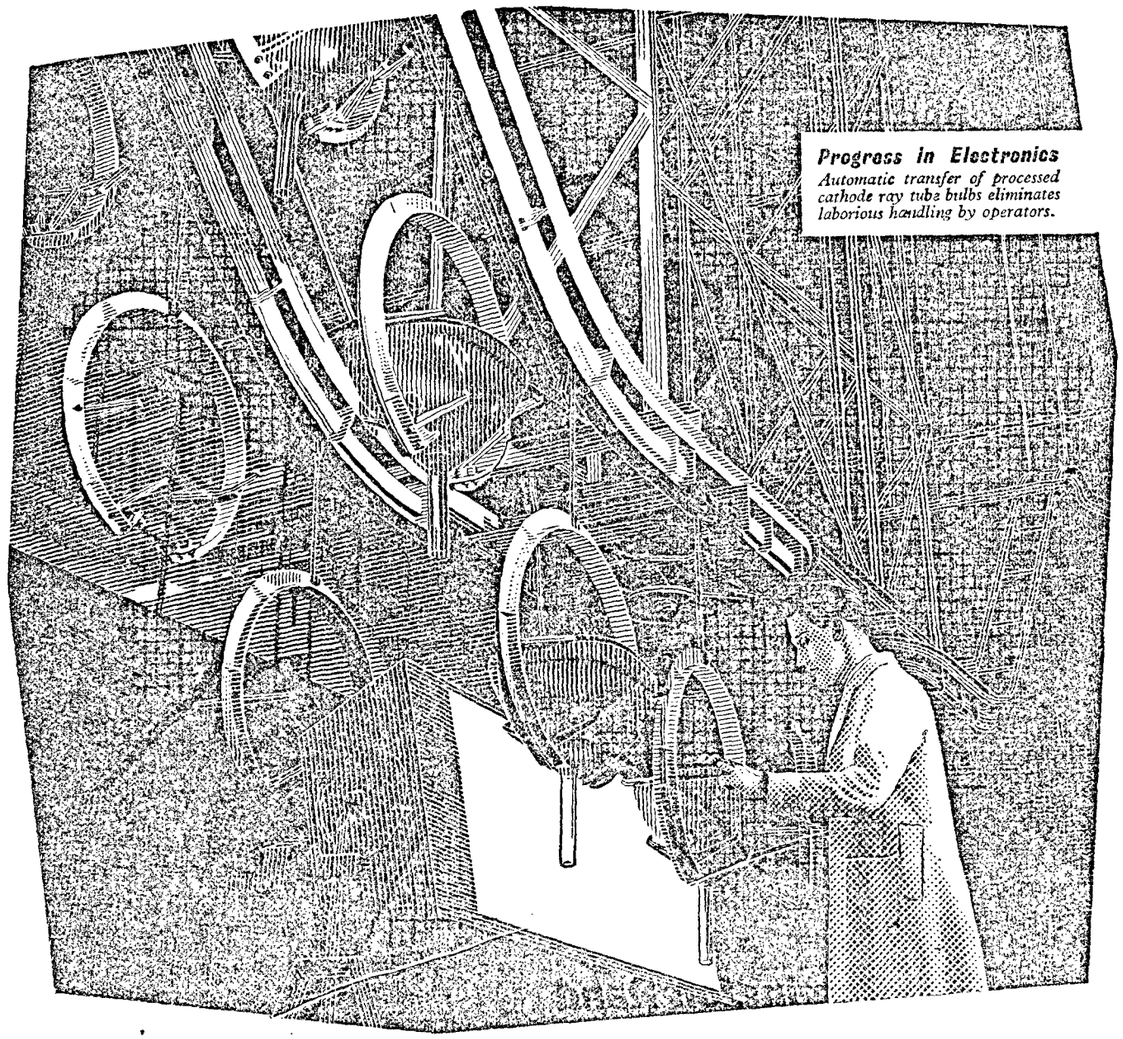
(defined here as units of from 20 to 100 acres) outnumber larger units, although they account for only about a quarter of total production.

Why has Government aid proved ineffective in securing for many family farms a decent living? The explanation lies not in excessive costs but in inadequate output. According to this survey, the smaller farms have little scope for cost reduction; their only route toward greater prosperity is to produce more food. This they could do by carrying more cows, pigs and hens, and feeding them on imported feeding stuffs. But this is a risky recipe for a small farmer as well as an uneconomic policy from the national standpoint. A better way is to improve crop yields (which are still low on small farms) and milk yields. But the basic trouble with many family farms is that they are too small, under modern conditions, to achieve an economic level of production. It is not the principle of the family farm, but its size, which is economically at fault.

The Minister's proposed new system of improvement grants ought to be harnessed to the task of rehabilitating the family farm, instead of being squandered on the larger farms that are already more than adequately subsidised. Mr Heathcoat-Amory claims that it would be administratively difficult to discriminate between farmers; but it could be done on the basis of size of holding with enough flexibility to allow for variations in soil conditions. Moreover, grants should only be given (as under the Hill Farming Acts) to farmers who produce a satisfactory plan for making their units fully economic. If the new grants were concentrated in this way, they would give a powerful stimulus to the enlargement and amalgamation of smaller units, and thus ease the present pressure from small farms for a high level of price guarantees for all the wrong commodities.

Marking Them Down

SALES are not what they used to be. Before the war factories used to fill up slack periods by making cheap and inferior goods expressly in order to be sold at "reduced" prices: they are now, for the most part, too busy to use their time in this way, and most sales have the genuine purpose of clearing stock-rooms for the New Year. This, of course, is particularly true in the fashion trade, which must follow (albeit six months late and at several removes) the changes dictated by the *couturiers*. Household goods and furniture are likely to be the remainders of lines no longer large enough to be handled conveniently, or goods slightly below standard or shop-soiled. There are also some genuine bargains offered as bait to tempt the shoppers, who once they get into the shop can be relied upon to go beserk round other counters as well.



But what of those hideous hats, allegedly reduced to 25 shillings: were they ever really on sale at the crossed-out price of three guineas? Surely not, but neither were they made specially for the sales. They were the disastrous result of a designer's lapse, and after they had been rejected by the retailers' buyers, the manufacturer put them on one side to await January. He then sold them at a low price to the retailer, who now puts them on sale with a specially printed label, showing an "original price" (which might have been asked for them had they been hats of similar quality but of good design) and a "reduced price" (which is the highest compatible with getting rid of the dreadful things at once).

The value of sales fever in paralysing the public's normal discrimination is shown by the fact that a permanent counter selling reduced goods, which attracts only mild interest throughout the year, becomes a scene of frenzy in January and July. Despite the narrowing of their profit margins, the week or fortnight of the January sales is a bumper one for the stores, as well as being a splendid opportunity to recoup the errors of buyers and designers. Everyone is happy, and not even the most respectable store stops to wonder whether the well-organised, mass produced and nicely printed lie of the "original price" is strictly ethical.

Food for Gratitude

AS the festive season yields to the more than usually depressing realities of the New Year, it is proper and wholesome to count one's blessings. No doubt it was not primarily the desire to provide an aid to this calculation which prompted the National Food Survey Committee to undertake, and Her Majesty's Stationery Office to publish, "Studies in Urban Household Diets, 1944-49" (141 pages, 5s. 6d.). This is a serious historic document; its more than a hundred tables and pages of explanatory text are of interest, in the words of the accompanying handout, "to nutritionists, sociologists, and to those engaged in the food trades and market research, as well as to economic historians." It bridges the gap between such prewar studies as "The People's Food" and the series of annual reports published by the National Food Survey since 1950. It provides—for those dreariest of austerity years—practically every combination of facts that the research worker might want, classified and cross-classified according to type of food, nutritive elements, energy value, income groups, ages, occupations, regions, size and composition of household.

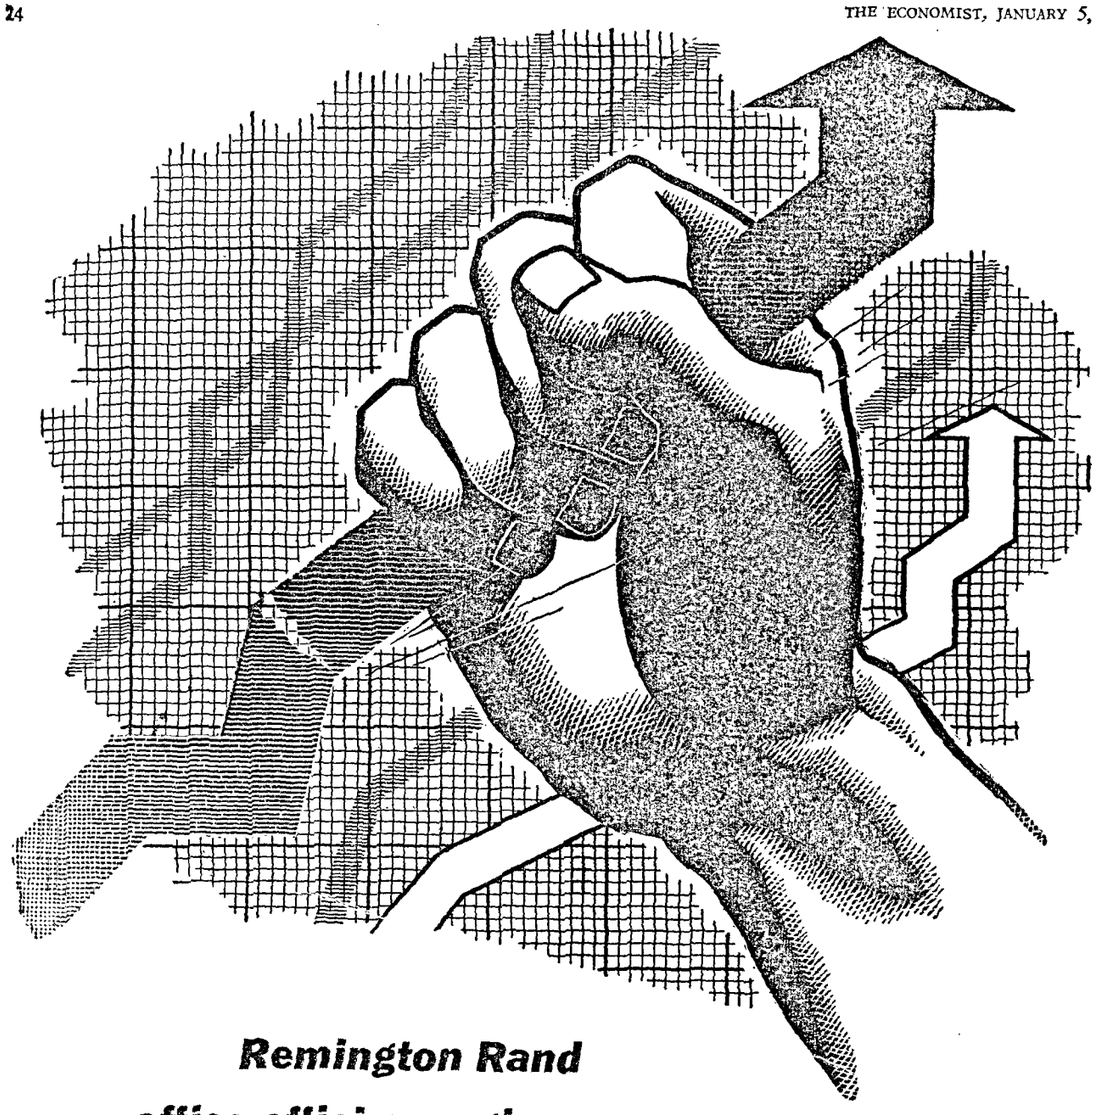
To the ordinary citizen not bent on research, however, it comes as a wonderful reminder, like the discovery of a set of blackout curtains in an attic. Things may not look too bright, petrol is rationed again, neither this month's bills nor the next Budget bear thinking of, but the following, at all events, belong to the past: the 2.1 eggs (including dried equivalent) per week, the 17.48 ounces of meat (including bacon—one to three rashers), the 2.52 ounces of cheese, the grocery order couched in terms not of pounds or ounces but of "books' worth." And behind these evocative figures other recollections, unrecorded by the National Food Survey, rise up with all that delicious snoek-provoking vividness which characterises adult memories of an unloved school or a demobilised serviceman's mental picture of his sergeant; recollections of Dr Edith Summerskill maintaining that margarine tastes the same as butter, of ministers refusing to "pander to an acquired taste" by licensing the importation of French cheeses, of Mr Aneurin Bevan pouring scorn on "those ladies" who wanted supplementary sugar to turn home-grown fruit into jam, recollections of nothing but pork at the butchers' through six summer weeks. . . . It is January, 1957; and, yes, decidedly, we have a great deal for which to be thankful.

Men and machines

Over the past ten years the machinery on which Mullard electronic valves and tubes are manufactured has been completely revolutionised in design. This has been achieved through intensive research into manufacturing techniques and by a bold productive investment policy.

To-day's machines produce more and better valves and tubes because many processes are automatically controlled, and the unavoidably erratic element in human intervention largely eliminated.

This trend towards increased mechanisation and automatic process control has accompanied the great development of the Electronics Industry. Since 1950, the number of men and women employed in Mullard factories alone has increased by more than 110%.



The Mullard attitude towards production takes heed of the welfare of the employees and the prosperity of the towns in which Mullard factories are situated. Above all, it recognises the responsibility of a leading organisation in a vital industry to produce efficiently in the national interest.

Letters to the Editor

Judges Summed Up

SIR—The entertaining article in your issue of December 15th contains a rough summary of the different ranks of judges and a fascinating picture of the scholastic and other affiliations of the judges of High Court rank and above. The information is based mainly on works of reference and is given partly in the form of percentages and diagrams. It would be ungenerous and a little absurd to complain of minor inaccuracies in an article of that sort. There are, however, two mis-statements which ought to be corrected not only in fairness to the judges themselves but because it would be a pity for the public to get so false an impression of the membership of the highest courts in the land.

First, it is stated that the Judicial Committee of the Privy Council is manned by eight former holders of high judicial office in this country who are half-retired from active life and sit only rarely, and whose "phenomenal" average age is 79. The Judicial Committee is in fact manned by the Lords of Appeal in Ordinary, that is to say, by the same Lords who sit for judicial business in the House of Lords. There are nine Lords of Appeal in Ordinary and they and the Lord Chancellor are the permanent and regular judges of the Judicial Committee and the House of Lords, though the Lord Chancellor cannot, in modern times, sit judicially to the same extent as his predecessors. The practice has been to call upon the occasional assistance of ex-Lord Chancellors, such as the late Lord Simon and Lord Jowitt, and of other Lords who hold high judicial office in England, Scotland and Northern Ireland, such as Lord Goddard, Lord MacDermott, Lord Merriman, Lord Evershed, and Lord Clyde, all of whom are Privy Councillors as well as peers. Occasionally, too, the Lord Chancellor has been assisted by a recently retired Law Lord, but that is fairly rare. It is even rarer nowadays for any of the retired judges from the Commonwealth countries to sit. Thus the impression given that the work of the Judicial Committee is done by retired "ancients" is incorrect.

The second mis-statement relates to the question whether a judge who remains in office too long is really irremovable except by the intervention of Parliament. It is stated that "the Lord Chancellor or the senior judge of the division in question could have a quiet word, and if this were intransigently received, he could simply prevent the old gentleman from getting any more work." It is not as simple as that. A serving judge who ignored the supposed "quiet word" could not be prevented from getting any more work either by the senior judge of the division or by the Lord Chancellor. If it were to be found by experience that judges remain in office when they ought to have retired, there would be no remedy except legislation.—Yours faithfully,

London, S.W.3 ALBERT NAPIER

Cleaning Up Sinai

SIR—There are no shortages of potentialities for the resettlement of the Arab refugees if the Arab states so desired. Mr Usborne, MP, has suggested the Sinai peninsula as one such place, thereby reviving a suggestion that was made in the 1955 report of the Director of UNRWA. Others include Iraq, a country rich in natural resources, which has a population of 5 million in an area of 168,000 square miles. In the view of the International Bank for the Reconstruction and Development of Iraq: "There is little doubt that the country can ultimately maintain a much larger population on a considerably high standard of living."

Syria could cope with an increase in population. A United States study mission who examined the country only a few years ago found that: "With the development of a series of major irrigation projects involving the Euphrates and its tributaries possibly 2 million more acres could be put under intensive cultivation." In 1951, the Cairo paper *Musamarat El Geib* reported that "the Syrian Government has officially requested that half a million Egyptian agricultural workers from the Delta region be permitted to emigrate to Syria in order to help develop Syrian land which could be transferred to them as their property." A request which one should add was refused by the Egyptian Government for reasons of their own.—Yours faithfully,

London, N.W.9 MONTY SCHAFFER

Shaky Bases

SIR—I am afraid that your article of December 15th on the negotiations between my Government and that of the United States on the latter's bases in the Philippines lends itself to the propaganda of certain die-hard Americans in blaming the "recess" on alleged efforts "to embarrass President Magsaysay" in preparation for the next elections.

The fact is that upon the unilateral American declaration of the "recess" President Magsaysay told a Manila press conference that he was "fully behind" the Philippine panel of negotiators. Furthermore, the chief Philippine negotiator is Senator Pelaez, who is generally recognised as the President's closest adviser. So far as domestic politics are concerned, the President is so sure of re-election in November that the opposition Liberal Party (which negotiated and signed the 1947 bases treaty) has not yet persuaded anyone of consequence to stand against him.

The crux of the present negotiations is the matter of criminal jurisdiction. Briefly, the desire of the Philippines, set out at the very start of the negotiations, was for provisions corresponding to those in the Nato Status of Forces Agreement and your Visiting Forces Act. Surely you would not consider that unreasonable. Of what use would be Vice-President Nixon's fulsome declarations of recognition of Philippine sovereignty if such sovereignty could not be actually exercised? In this respect it is my personal opinion that we should not accept a position inferior to that of the European allies of the United States.

The details of the negotiations are still "classified" in the Philippines. But the law member of the Philippine panel, Under-Secretary of Justice Barrera, recently declared in a press interview over Station DZMY in Manila:

"As a general principle, we proposed that with respect to offences committed "on-base" by members of the US military forces, if the offences are committed in the actual performance of a specific military duty, they take juris-

diction irrespective of the nationality of the offended party. But if the offence is committed 'off-duty' 'on-base' and the offended party is a Filipino, we proposed that, if the secretary of justice determines that the case is of particular importance, we take jurisdiction."

Many disagreeable incidents have disturbed Philippine-American relations because of the provisions on jurisdiction in the 1947 treaty, and the Filipino leaders who now seek its revision, far from being anti-American, are indeed the best friends that the Americans have. It is not inconceivable that the present situation, if allowed to deteriorate, might turn a sincerely friendly population increasingly hostile and truly make the bases "precarious."—Yours faithfully,

L. MA GUERRERO
Ambassador

Embassy of the Philippines, London

The Law and the Union

SIR—It may be of interest to point out in amplification of your note in last week's issue that Mr Huntley is the first person, it is believed, to sue successfully members of a trade union for conspiracy since the passing of the Trade Disputes Act, 1906.

An aspect of the case that may pass unnoticed is the manner in which the case was prosecuted. The case lasted twelve days before Mr Justice Harman, involving leading counsel on both sides. The costs incurred thereby were considerable. Had employers backed the plaintiff's action the case would have been seriously weakened both legally and in moral justification. The certificate of legal aid granted to the plaintiff in this instance is enough vindication, if such were needed, of a system of state-aided litigation.—Yours faithfully,

Temple, E.C.4 L. J. BLOM-COOPER

Justice

SIR—The associations of lawyers of the three main political parties have combined together in an organisation called "Justice" to do all that is possible to ensure that the workers' leaders and other arrested persons in Hungary shall receive fair trials. We have applied through the Hungarian Legation for permission for three former Attorney-Generals and another eminent QC to go to Budapest as observers in these trials, and have other steps in mind if our present application is refused. We also arranged the recent visit of Mr Gerald Gardiner, QC, to South Africa to observe and report on the preliminary hearings of the treason trials.

All these activities involve considerable expense and we urgently need funds to enable us to carry them through and to expand them as the need arises. We therefore ask your readers to send contributions to "Justice," 1, Mitre Court Buildings, Temple, E.C.4. Cheques should be made payable to "Justice."—Yours faithfully, PETER BENENSON

Pre-scientific Technology

A HISTORY OF TECHNOLOGY: *Volume II, The Mediterranean Civilisations and the Middle Ages. c. 700 BC to c. AD 1500.*
Edited by Charles Singer, E. J. Holmyard, A. R. Hall and Trevor I. Williams.
Oxford University Press. 861 pages and 44 plates. £8 8s.

THIS is the second volume of an ambitious enterprise in which Dr Charles Singer is the moving spirit. The first volume appeared two years ago and received a warm welcome in this journal and elsewhere for the boldness of its conception and the energy and generosity which made its production possible. Volume I dealt with the emergence and development of basic techniques down, roughly speaking, to the Homeric age. By this time all the skills which were characteristic of men in the ages of pre-scientific technology were already in existence: language, writing, metallurgy, primitive machines using rotary motion for such diverse purposes as transport and pottery, the elementary chemistry of dyeing, preserving, baking, fermenting, etc. . . . the list could be extended to considerable length.

It is at this point that the story is taken up in the present volume, and it is carried forward for rather more than two millennia, from about 700 BC to AD 1500. In the plan of the whole work this is an intermediate period between the ages of discovery by trial and error and the rise of modern science. Indeed, from the point of view of technology, the striking thing about these two thousand years is their barrenness compared with their richness in almost every other respect. When we consider how much else was going on and how much we owe to these centuries, it is astonishing how small were the technical gains. Doubtless there was an acceleration in the field of technology as compared with the slow accumulation of earlier millennia, but the possibilities of technological progress, even when most needed, seem to have been little appreciated.

This fact presents the editors of this volume with a difficult problem. In the first volume it could reasonably seem that they were following the main stream of history; in later volumes they will, here and there at least, be on a highway. In this volume they are obliged to spend much of their time in by-ways and dead ends. This volume cannot therefore have the momentum of the earlier one. In a period in which discoveries of fundamental importance are few, the interest lies largely in the adaptation of old means to new ends, in new relations between various skills, in the co-ordination of social and technological history. For instance, the most important question in the whole volume is why the Roman Empire was so deficient in technical progress, despite the great practical gifts in the art of government which it evoked, and despite the fact that some of the principles on which development would have been possible were known but not exploited. This failure is all the more remarkable when we consider the urgent need for labour-saving devices to meet the growing external dangers and the crippling cost of military preparedness. It is not the purpose of this volume to suggest answers to these questions: it simply provides material for seeing such problems in a new light. For this reason alone it is a book with which every historian of the ancient and medieval periods should be familiar. But it is a quarry rather than a history.

The most substantial contributor to the volume is Professor R. J. Forbes of Amsterdam who, among twenty-three contributors, is responsible for about a quarter of the 800 pages. In quality as well as range his contributions are outstanding. He writes on metallurgy, food and drink, hydraulic engineering and sanitation, power and roads (the last in collaboration with Mr R. G. Goodchild). Of these, the chapter on power is the most important, for it was in this field that the greatest practical advance was made, and the way was prepared for the still distant Industrial Revolution. The principles of the efficient use of water power were known in the Roman world from the first century BC, but they appear not to have been applied effectively until the third century AD, and even then in only a few centres. It was left to the Middle Ages to recognise the possibilities of this great extension of energy production, to cover the land with watermills and later with windmills, and so to multiply indefinitely the energy available from non-human sources, in contrast to anything known to the ancient world. The volume has nothing better than the pages in which this process is described.

Another significant medieval development in the use of power lay in the greatly improved means of using draught animals described by Mr E. M. Jope, who is second only to Professor Forbes in the number of his contributions. The ancient form of harness for horses and mules greatly reduced the efficiency of the animal, and this inefficiency increased when more than one animal was attached to the load. The overcoming of this difficulty marked an important step forward in the history of transport. Mr Jope's chapter on vehicles and harness is full of fascinating insights into the problem of transport. The story is often fragmentary and it is hard to believe that, with the problems now defined and the basic material made generally accessible, the literature of the Middle Ages will not yield material to fill some of the many gaps.

These are only a few of the problems dealt with in this volume. On almost every practical art the historian will find something here and the means for discovering more. The book is lavishly illustrated and, though the annotation of the text is sometimes scanty, the notes to the illustrations are admirable. In the preface to the first volume the editors gave it as their general aim to provide students of technology and applied science with some humane and historical background for their studies; they had in mind "the needs of those who have little acquaintance with either the history of science or that of man." One can only wish them well in this aim, though it is probable that those who already know a good deal of history will gain most from the second volume.

Matched Wits

THE LIFE OF LADY MARY WORTLEY MONTAGU.
By Robert Halsband.
Oxford University Press. 326 pages. 30s.
THE LIFE OF LAWRENCE OLIPHANT.
By Philip Henderson.
Robert Hale. 281 pages. 21s.

GOOD talk is sadly ephemeral. Lady Mary Wortley Montagu was a byword for it in the literary and political world of Pope and Walpole; Lawrence Oliphant's rather different brand (which was gossip hot from some diplomatic war or battle front) was sought by connoisseurs ranging from Dickie Monckton Milnes to the Prince of Wales. But the sparkle of their conversation died with them, and neither of these biographers resuscitates it. A good Christmas guessing game would be to furnish them with counterparts in the London of 1920, 1938 and today.

It is through the pen that each lives on—she more than he—for each wrote a good travel book. She produced a classic in her "Embassy Letters" from Constantinople; he wrote one of the best available descriptions of nineteenth-century Palestine. Usually, the traveller of each century sees the world with a different eye; the eighteenth, for instance, watches slaves thrown into the Bosphorus without a qualm, while the nineteenth faints at the mere sound of Armenian massacres. But Lady Mary and Oliphant think alike. Both belong to the breed that slips the cable with home at Dover, and reports foreign habits on their merits instead of on the strength of unfavourable comparisons.

They have one more trait in common —an inability to make a success of the steady side of life; he was forever disappointed of a settled job; she failed to generate the happy family and home she would have liked to organise. Both therefore spent a restless and disappointing old age—he beset with mania for a crank American sect, and she pursuing unworthy young men around the continent and turning into the blowsy old rag-bag of Horace Walpole's letters.

Mr Henderson makes a readable job of Oliphant—not easy when the facts compel an author to devote almost half his space to the incredible magnetism of an evangelist who prescribed physical comfort for himself, and physical bosh for others, in order to promote collective spiritual excitement. Even after he fell under the spell of this fanatic, Oliphant contrived to lard his life with news-gathering, and his long trail runs from Katmandu in 1850 to the Crimea in 1855, China and Japan just as these were opening a chink in their shutters, France in 1870 and Palestine just as organised Jewish colonisation was setting in. He was a good reporter, but lacked the concentration of a Kinglake or a Burton, and the book is a portrait of inability to be the best of a kind in any sphere.

Doctor Halsband is less successful with the personality of Lady Mary. Throughout years of painstaking scholarship, he has enjoyed the pleasures of the chase after unpublished material, and his patience has been rewarded in libraries and archives ranging from those on the elegant shelves of English great houses to American collections and the dusty records of provincial towns in France and Italy. He has unearthed a good deal that is new on Lady Mary's excursions into politics, and on the dispiriting end of her life, and his careful work on dates and the names of all those present make a useful till for scholars. But for the ordinary reader he never recaptures the liveliness of a most versatile woman, because he is too often looking into the view-finder and too seldom at the view.

Diving History

MAN EXPLORES THE SEA: *the story of underwater exploration from the earliest times to Commandant Cousteau.*
By James Dugan.
Hamish Hamilton. 378 pages. 30s.

THIS book is a lively and engrossing history of diving. There are a flood of books today about the "free-diver" with his foot-fins and self-contained breathing apparatus, but Mr Dugan, while keeping the free-diver as his central figure, presents much information on every activity that lures man under the water. His terse, confident narrative, ranging from naked sponge diver to bathyscaphe, deals with ship salvage and treasure hunting, submarines and submarine escape gear, underwater photography and television, "wet" archæology, geology and speleology, even "wet pipelining." The illustrations, widely and imaginatively selected, make an excellent complement to the text. The author's enthusiasm in his search for material extends even to the impressive acknowledgments, where he lists one institution that does not recollect helping him.

He is better at history and adventure than at exposition. Thus his accounts of early submarines and of the salvage in 1839-40 of the *Royal George* are absorbing, but he is difficult to follow on diving physiology and such applications as stage decompression and oxygen-helium mixtures for deep diving in helmet suits. Revealing a sound attitude to the present craze for free-diving as a sport, he denounces indiscriminate slaughter with the fish spear-gun, which has already so depleted the rock-fish population of the Mediterranean sub-littoral. His style strains after the sensational rather less than that of most others who have popularised the underwater scene, and though his writing is frequently without elegance, and sometimes without grammar, he is never dull and occasionally he achieves a memorable passage.

The book's title is misleading. Virtually all we know of the deep and shallow seas has been discovered, not by diving, but by painstaking exploration from the surface, lowering instruments and nets blindly into the ocean. What little the author has to say of these oceanographical methods is scrappy and unreliable. Free-diving in the shallow seas has only recently been exploited by the marine biologist as a serious field method; and a book has yet to be written that describes, accurately and soberly, the living communities, as complex as they are frequently beautiful, which can be studied through the face-plate. And descents in bathysphere and bathyscaphe, although superb as adventure, have so far added little to knowledge of life and conditions of life in what Mr Dugan calls "inner space."

Administration

THE MAKING OF AN ADMINISTRATOR.
Edited by A. Dunsire.
Manchester University Press. 140 pages. 10s. 6d.
CIVIL SERVICE OR BUREAUCRACY?
By E. N. Gladden.
Staples. 224 pages. 21s.

MR DUNSIRE has edited a series of lectures given in Exeter by distinguished experts to celebrate the centenary of the Northcote-Trevelyan report. The question discussed is how to train an administrator, with some side-glances at the prior question, what is the class of person denoted? Sir Edward Bridges, Sir Harold Banwell and Sir Henry Self, who are all administrators, stress the need for general education and learning on the job. Mr Clarke (of the Administrative Staff College) and Colonel Urwick describe and commend different aspects of specific research and training. Mr Dunsire's sensible

summing-up shows the need for both. The book is a good cross-section of views held today on this subject in different quarters.

Mr Gladden has written a sound description of the central non-professional civil service; the viewpoint is that of the least militant member possible of the staff side of a Whitley council. He has added some interesting views of his own about how the service could be improved. He would like to abolish the separate adminstrative class and roll it up with the executives; but as he allows for separate entry of graduates, it is doubtful how much difference that would make. He is all for specific training and research into public administration. More dubiously, he wants to take formal steps to increase the professional feeling and standing of the civil service as a whole. It is doubtful whether a class of employees (like rodent operators) gains much but solemnity by laying claim to professional status.

After reading these books, one is left with some doubt about the scope of inquiries into administration in general. Of course, there should be research and instruction in many of the tools of the administrator's trade—politics, work study, social psychology and so forth. But is administration itself a subject? And what is an administrator? How much is there in common between Whitehall and business, between the permanent secretary and the district postmaster? The common ground is so small that, at least until far more case-studies have been done, one loses significance by generalisation. This, and Mr Gladden's emphasis on the civil servant's status, distract attention from the banausic but fundamental question: do particular kinds of civil servant do the job for which they are hired to the satisfaction of their employers?

Arms and the Soviet

THE SOVIET ARMY.
Edited by B. H. Liddell Hart.
Weidenfeld and Nicolson. 494 pages. 36s.

IN October, 1905, the year of the abortive first Russian Revolution, Stalin, addressing a workers' meeting in Tiflis, said: "What do we need in order to *really win*? We need three things: first—arms, second—arms, third—arms, and arms again!" Whether true or apocryphal, this episode reflects the fundamental attitude of the masters of the Kremlin towards the instruments of power required to give Soviet policy the backing of force or the threat of force; and out of this attitude, with unflagging consistency of purpose and breadth of approach, the Soviet armed forces have been created.

The aim of the book which Captain Liddell Hart has ably edited is to provide a reliable and reasonably up-to-date picture of the Soviet Army, which is still the largest and historically the most complex of the Soviet armed forces. To this end leading international authorities have contributed from their special knowledge or experience to an account which is remarkably full, informative and important. The writers whom Captain Liddell Hart has assembled include General Guderian and Field-Marshal von Manstein, two of the outstanding German leaders in the struggle on the eastern front between 1941 and 1945; General Guillaume, who was French military attaché in Moscow and later became chief of the general staff of the French armed forces; Colonel Louis B. Ely and Dr Raymond L. Garthoff, American specialists whose books testify to their exceptional knowledge of Soviet strategic doctrine and military affairs; Lt.-Colonel F. O. Miksche, whose rare gifts of strategic analysis are well known from his writings and staff college lectures; Sir Eric Ashby, who has exceptional direct knowledge of Soviet scientists and laboratories, and Mr J. M. Mackintosh, who was attached as a British liaison officer to the Soviet armies in the Balkans at the end of 1944 and remained there until 1946; Captain N. Galay, one of the most distinguished Russian military historians and analysts abroad, and Colonel V. V. Pozdnyakov, an officer with long and responsible experience of Soviet chemical warfare services, both of whom served with the Russian liberation movement under General Vlasov.

Much of the detailed material in the book will necessarily interest the specialist. For the general public, however, and for everyone concerned with the formation of free world policy, two points are vital. One is made by General Guillaume: "Since 1917 the Soviet Union, following a policy cautious at first but growing gradually more aggressive, combined with a strategy based on this policy, has undergone a transition from defensive to offensive action in accordance with the strength of the Communist regime and the changing balance of power." The other point is made by Colonel G. C. Reinhardt, a leading American student of tactical atomic warfare:

> The world may be plunged into an all-out nuclear struggle or endure a succession of limited, peripheral conflicts. The Soviet Union has [a] capability for either course, and the choice lies with its rulers. . . . Both forms of aggression must be stopped. Communist hegemony can be attained eventually just as surely by ceaseless nibbling tactics as by blitz attack.

Light on Chinese Darkness

AN ECONOMIC SURVEY OF COMMUNIST CHINA.
By Yuan-li Wu.
London: *Constable.* New York: *Bookman Associates.* 576 pages. 63s.

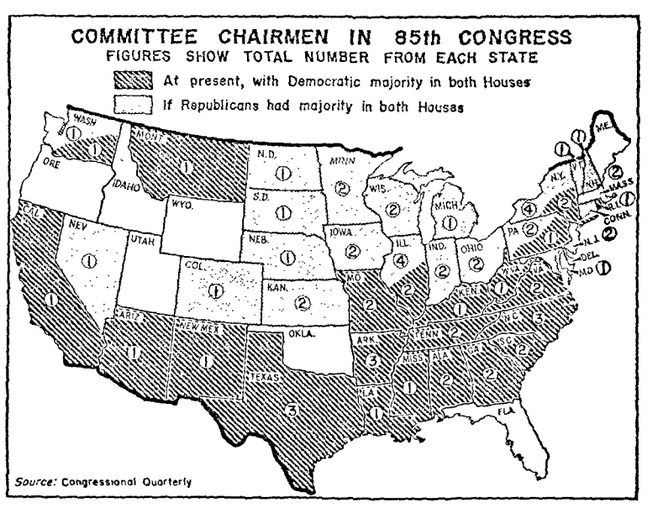
IT is important to the western world to know as much as possible about the situation inside Communist China; and Yuan-li Wu, a graduate of the London School of Economics and now doing research at Stanford University, has provided as detailed a picture of economic developments as western students have received for a long time. In the seven years since the Communists took control, Mr Wu's analysis discloses great economic progress—although the changes, he notes, have come under the lash of "a relentless political purpose." Nevertheless, in China an economic reorganisation has taken place, wealth has been effectively redistributed, consumers' goods strictly regulated, industry relocated and emphasis altered, and relations with the outside world revolutionised. The object clearly is to move China ahead by forced marches, at the same time ensuring that Communist Party control grows apace. Despite gargantuan handicaps in a vast country, the economic transformation has been pursued with logic and purposefulness, according to Mr Wu's survey. On the other hand, despite every Communist effort at concealment, the author has been able to spot the inner conflicts, the stout resistance to change and oppression that point to continuing difficulties for the Communist masters in Peking.

China's recovery since 1949 and its strides toward industrialisation are impressive evidence, says Mr Wu, of how fast a mistreated economy can recover once war and galloping inflation are halted. He takes the reader into factory and field, providing statistics and background for his conclusions. He notes the effect of the unpredictability of the individual upon the most carefully laid of totalitarian plans. But he also suspects that if the Communists succeed in China, as seems increasingly possible, the influence on the remainder of Asia will be tremendous.

"If an effective alternative is not presented by the non-Communist countries, the remaining under-developed countries of Asia and elsewhere may be led to believe, albeit erroneously, that there is no alternative," is the way Mr Wu puts it. He feels that Chinese economic dependence on Russia is complete, although little actual aid is offered. That dependence is a deterrent to the development of Chinese Titoistic tendencies. On the other hand, though rapid industrialisation may gratify Chinese leaders, it means a hard life for the Chinese coolie exploited without his consent and with no regard for his personal welfare.

An attempt at an impartial survey such as this unfortunately cannot be made from inside China today. Yet, Mr Wu points out, the study cannot wait until the bamboo curtain is lifted. To allow the darkness to persist leaves an ignorance that is precisely what the Communists desire. Moreover, the difficulty of assessment mounts with each passing year. Sifting what scraps of information are available on land reform, industrialisation, resources, population, transportation (it is surprising how much can be gathered), Mr Wu compiles a balance sheet of errors and successes which, by being factual and dispassionate, should interest emergent Asians and the West. It is not the final word on China, but it throws light into Communist economic dark corners hitherto deliberately kept shielded.

American Survey



AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Congress with a Southern Accent

Washington, D.C.

FOR the first time since 1848 both Houses of Congress are being organised by a party that lost the Presidency while winning the Legislature. When Vice President Nixon, in his role as president of the Senate, brings down the opening gavel at noon on January 3rd, Senator Lyndon Johnson will be back in his place as majority leader. The Texas Democrat, like the President a brisk survivor of a heart attack, appears fully prepared to place his conciliatory trademark on yet another session. In the House, Representative Sam Rayburn, the perennial Democratic Speaker, will call for order as he has on eight previous occasions since Texas first sent him to Washington in 1913.

On the surface of the Eighty-fifth Congress, nothing seems changed. But just below lurk uncertainties. In the House of Representatives a majority of 233 Democrats to 200 Republicans (there are two vacancies) is not likely to be upset. But in the Senate, the Democrats hold only a hairsbreadth advantage of 49 seats to 47. With Vice President Nixon ready to break a tie in the Republicans' favour, the loss of a single Democratic seat might precipitate an extraordinary mid-session shift of control.

If a valetudinarian atmosphere prevails in the upper house, it will be because on the average five Senators die and two or three more resign during the two-year life of a Congress. In all but a few states the Governor appoints a successor to fill such a vacancy. Democrats consequently heaved a sigh of relief when the courts decided this week in favour of a Democratic Governor in Rhode Island, the home of 89-year old Senator Green; and they have been bringing strong pressure, so far in vain, on the ailing Senator Neely to retire before a Republican is installed as Governor of his state of West Virginia.

But the most substantial threat to continued Democratic control is Senator Price Daniel's election to the governorship of Texas. He takes office on January 15th. Under Texan law, a special election must be held to fill a vacancy in the Senate. There is no provision for a preliminary run-off; at the most recent special election, for a seat in the House of Representatives, so many candidates split the Democratic vote that the Republican won easily. Senator Johnson may be stripped of his leadership by a combination of Republicans and Eisenhower Democrats in his own state.

Quite apart from such risks, the majority leader may find his flock exceptionally troublesome this time. In Congress, the Democratic party is essentially a southern party because the Southerners monopolise the powerful committee chairmanships. The accompanying map shows the concentration of power in southern hands which derives from the tradition that the committee chairmanships are allotted according to seniority. In the one-party South, length of service is easy to accumulate, and the control over legislation which it confers is the main objective of southern participation in national politics. The present division of power, with a Republican in the White House and Democrats in control of the Legislature, is almost ideal from the South's point of view. Its leaders can seem to speak for the whole Democratic party, while they are free of the pressure a Democratic President might bring to bear on them to pass legislation too liberal for their conservative supporters at home.

But to the Senators and Representatives of states where the two-party system is a reality of long standing, this situation is dangerous. Their constituents ask why, when the Democrats are in control of Congress, so few of the measures to which their candidates are pledged are enacted. Many Negroes in the last election found part of the answer in Senator Eastland, an advocate of white supremacy who,

under the seniority rule, is chairman of the Judiciary Committee. The loss of Negro votes to the Republicans is, in the liberals' view, only one example of the long-term erosion of Democratic strength caused by the predominance of Southerners in the congressional party.

Democrats from widely varying regions, like Senator Kennedy, of New England, Senator Humphrey and Senator Douglas, of the Middle West, and Senator Morse and Senator Neuberger from the Pacific Coast, who fear that this southern veto power jeopardises their own futures, have tried in two ways to lessen it. The first was an attempt to make the party in Congress reflect the views expressed at the national convention and in the party platform. In November, the executive committee of the Democratic National Committee voted to set up an advisory council to draw up a programme of legislation. The southern leaders repulsed this attempt at outside interference by refusing to serve on the committee. Senator Johnson had already decided that the Democrats in Congress should wait to see what the President proposes.

At about the same time, six Democratic Senators announced that they would seek a change in Senate Rule 22, which provides that debate may be limited only by a vote of 64 Senators, two-thirds of the whole membership. They invited such liberal Republicans as Senators Ives, Case, and Kuchel to join them. The rule has been the great mainstay of Southerners filibustering against legislation to protect Negro rights. Senator Johnson promptly opposed the change. But Vice President Nixon's attitude may be more important. He is in a position to uphold the liberals' contention that new rules should be adopted in the Senate, as they are in the House, each time a new Congress assembles. If, on the other hand, the Senate is a "continuing body"—because the terms of only one-third of its members expire together, Rule 22 would protect a filibuster to prevent a change in the rules.

Democratic control of Congress, which produces headaches for Democrats, relieves President Eisenhower of some of his own. The seniority of the McCarthys and Malones is greater than that of the new recruits to Eisenhower Republicanism, such as Senator Cooper and Senator Case. With the Democrats in the saddle, the President can encourage "modern Republicanism" without a running fight with committee chairmen of his party but not of his persuasion. Senator Johnson is quite as acceptable to the Administration as majority leader as is Senator Knowland, the Republican. Indeed, the President fared notably better with Congress when the two men changed places in 1955. The main point on which most Democrats in Congress agree is that the function of their party, in the present unusual circumstances, is to act as a responsible arm of government and not oppose purely for the sake of opposition.

On the Brink of the Vacuum

OUT of the clouds surrounding Washington's new policy for the Arab world only one thing emerges clearly: that the Administration has decided to dive into the Middle Eastern vacuum hand in hand with Congress. The type of plunge which the President has decided to recommend depends on reactions to the cumulus which blew out of the State Department last week—reactions in the United Nations and in the press, among America's allies and, most important, among the legislative leaders who were consulted on New Year's Day; their agreement in principle now seems assured. The actual form which the plunge will eventually take depends on Congress but the President is giving an unusually strong push, which can hardly be resisted, by making his recommendations in a special message which will be delivered before the legislative channels are muddied by his report on the State of the Union; normally this contains his first personal requests to a new session.

What Mr Eisenhower would like is $400 million or so for his emergency fund, to be spent on countering any economic penetration of the Middle East by the communists, and a resolution from Congress designed to deter communist aggression in the area. His purpose is to remove any misapprehension which may have arisen abroad as a result of America's lack of support for its allies' Suez expedition, and to demonstrate that the Administration regards the Middle East as vital to the security of the United States. President Eisenhower is, it seems, trying to avoid a repetition of the Korean situation. He believes that aggression was encouraged there by the gap left in the containing wall round the communist world and that it was impolitic, even if not unconstitutional, of President Truman to send American troops to deal with the outbreak without consulting Congress.

The Democrats who control Congress are already nettled because the press knew about the new approach to the Middle East before they did. They are likely to argue that the President wants members of Congress to hold his hand so that they will share the blame should anything go wrong. Much will probably be heard of the Administration's past lack of leadership and present responsibility for the Middle Eastern crisis; the new policy will be closely criticised in committee, particularly on the grounds that it shows lack of faith in the United Nations, although that body has been associated with it by Mr Dulles's quick trip to New York on Monday. But in the end the Democrats can hardly refuse to do what the President asks, since he is at last showing the initiative which they have long demanded. Nor would the Republicans, unenthusiastic as many of them are, dare to oppose a policy which their leader insists is so vital and so urgent.

Spotlight on Aid

WHATEVER action Congress takes this year on foreign aid it should not suffer from any shortage of advice. Two thorough investigations are still being conducted into the effectiveness of the $60 billion worth of American gifts and loans made to foreigners since the war, by the President's advisory committee under Mr Fairless, the former chairman of the United States Steel Corporation, and by a special task force from the Senate. A third review, undertaken on more modest lines by the permanent staff of the Foreign Affairs Committee of the House of Representatives, has already appeared. It was apparently rushed out before the new Congress met so that it could still bear the name of the committee's retiring chairman, Mr James Richards, and it has not yet been endorsed by the whole, notoriously unpredictable, committee. With these qualifications and the further one that its assurance that the United States can now get by with rather lower annual outlays on economic aid already looks sadly dated, the report is to be welcomed as a sensible one.

It acknowledges frankly that economic aid must continue indefinitely, although it repeats an old grievance of the Foreign Affairs Committee that the Defence Department ought to shoulder the burden of administering and explaining to Congress and the country the large sums spent on military assistance to America's allies. But the report supports the idea of making funds available on a long-term basis rather than on the present uncertain cycle of annual authorisations. It wants to tie economic strings to American aid—so as to create "a feeling of continuous obligation on the part of the beneficiary . . . however tenuous" but is strongly opposed to political strings. It deprecates present attempts to force Western Europe to impose stricter controls on trade with the East than it wishes to do and urges the United States to stress positive common interests with allies and neutrals rather than mere resistance to Russia.

One feature which is certain to please the Administration is the report's insistence that the President should have full discretion to use economic aid to help ease countries like Poland and Hungary out of Russia's grip. The Administration has been hoping to send surplus American farm supplies to Poland but has found itself hamstrung by drastic "cold war" legislation. The President is certain to renew last year's unsuccessful request to Congress that he be allowed to barter farm surpluses for Communist goods, and it is quite likely that he will be encouraged by Mr Richards's report to ask for broader powers to respond to developments in Eastern Europe.

Jim Crow on the Wing?

LEGALLY, segregation no longer has a leg to stand on in public transport, now that the Supreme Court has rejected the appeal against its decision in the bus case in Montgomery, Alabama. In practice, sporadic violence and resistance by city councils are depriving Negroes of the immediate enjoyment of their new and hardly earned rights. In Montgomery itself, where Negroes had boycotted the buses for a year, peace and good will prevailed for only a few days. Five shooting attacks by white snipers have encouraged the city to cancel night operation of the buses.

In other southern cities where Negroes have tried to apply the Supreme Court's decision, they have been temporarily repulsed. In Tallahassee, Florida, rather than risk a clash with jeering teen-agers, Negroes abandoned an attempt to "ride integrated" and the city commission withdrew the franchise of the bus company because it was not enforcing segregation. In Birmingham, Alabama, the home of the Negro minister directing the campaign against segregation was bombed, and 21 Negroes travelling in the sections reserved for whites were arrested.

On the other great battlefront, in the schools, there have been retreats, as well as advances. An 86-year-old federal judge in Dallas, Texas, has expressed his detestation of the Supreme Court's decision that segregation in the schools is unconstitutional, and thereby thrown some doubt on the objectivity of his ruling that white schools in Dallas need not at this time accept nineteen Negro students. A congressional subcommittee, made up chiefly of southern segregationists, has produced its expected indictment of "over-hasty" integration of the schools in the District of Columbia.

Elsewhere, however, the pressure of Negroes on the courts to sustain their rights is steadily forcing Jim Crow to take wing. A US District Judge in Florida has issued an injunction forbidding Tallahassee to interfere with the bus company's operations. Birmingham is having second thoughts about prosecuting Negroes for violating a law which they know the courts will declare unconstitutional. In Virginia, the US Circuit Court of Appeals has upheld decisions of lower courts requiring an immediate end of segregation in the schools of Charlottesville and Arlington. Very little has been heard of the Attorney General's loudly heralded meeting with his legal officials to find ways of enforcing the ban on segregation in intra-state transport. Indeed, according to Mr Brownell, the main reliance is to be on voluntary compliance. But the federal government will certainly insist on obedience to court orders.

Law-making Law Breaker

FROM A CORRESPONDENT IN BOSTON

UNTIL Representative Thomas Lane won easy re-election in November from the seventh district of Massachusetts, in the Boston area, no convicted criminal had ever been sent back to Congress from his original constituency. Mr Lane stepped out of a federal gaol only two months before the election, after being fined $10,000 and serving four months for failing to pay $38,542 in income taxes. But sixteen years of assiduously doing small favours for his Irish-American constituents had built him an almost indestructible popularity. The cohesiveness of the Irish vote, founded on memories of discrimination in the days when Irish immigrants first came to the United States, has been constantly demonstrated in Massachusetts politics, especially when an Irishman is under attack.

Moreover Mr Lane is a Democrat and the seventh congressional district was long ago abandoned by Republicans as territory not worth fighting for. They dominated the state legislature when it drew up the constituency boundaries and used the district as a dumping ground for Democratic areas which threatened Republican chances of victory in adjoining constituencies. Thus the only real chance of knocking out Mr Lane was in the primary election in which members of the Democratic party chose their candidates. Since Mr Lane's opponents were unable to get together, he triumphed with a vote of 25,812 against 34,010 spread out between four antagonists.

The voters having spoken, Congress itself is now the lone barrier between Mr Lane and what he evidently regards as his vindication. There are no exact precedents. Seven members of the House of Representatives and two of the Senate have previously been convicted of crimes during their terms of office. Congress was not indignant enough to expel them. But of the seven Representatives only one ever ran again, and he, having been convicted of sedition during the Congress of 1799-1801, had to move from Vermont to Kentucky before winning election four more times.

The Republican minority leader, Mr Joseph Martin, who himself comes from Massachusetts, has excused himself from trying to unseat Mr Lane on the grounds that the "primary responsibility rests with the majority Democratic party." It is understood that with similar timidity the majority leader, Mr John McCormack, also an Irishman from Massachusetts, has declined to take the initiative. Meanwhile in the press a few leader writers have condemned both Mr Lane and his constituents, but the bulk of the country's papers have displayed no special interest. In Mr Lane's own constituency newspapers took the softest possible attitude towards him from the beginning. In some instances it was clear that they too had been recipients of the Congressman's favours and preferred not to cut themselves off in the future. Judging by the past reluctance of Congress to look a moral issue involving one of its members squarely in the eye, Mr Lane seems likely to be allowed to take his seat although one or two conscientious members may force a vote on the question.

Steel on the Escalator

THE steel industry must start the new year with a resolution to do without government aid for its expansion programme. The Administration has turned down its request for rapid depreciation, for tax purposes, of $2.3 billion in new plant and facilities. This scheme, which allows certain industries to write off new plant in five years instead of twenty, was adopted during the Korean hostilities to encourage industry to provide an adequate industrial base for mobilisation in the event of another war. But it is viewed with a jaundiced eye by the Treasury and the ever vigilant Senator Byrd because it postpones tax revenues and makes it harder, at present, to balance the budget. It was not intended, as the Office of Defence Mobilisation reminded the steel industry, to underwrite a peacetime boom, and its defence role is nearly over. Of the 228 industries at one time eligible for such help, only 17 remained last week after the announcement that the expansion goals had been reached for commercial aircraft, heavy steel plate, titanium melting and processing, alkylate, and taconite iron ore. Aluminium lost its preferred position in November.

The steel industry added five million tons to its annual capacity last year, bringing it to 133.5 million tons, a 45 per cent increase in the steel-making facilities available at the end of the last world war. The Administration's rebuff is not likely to blight this growth when 1957 is expected to be a record year and the demand for steel plates to be continuously voracious into 1958. But it will strengthen the demand for more realistic depreciation allowances, and it has already given a further upward nudge to prices which were, in any case, beginning to reflect higher costs of labour, freight, coal and scrap. The steelmakers argue that if they are to finance their expansion out of profits, their earnings must be maintained, even at the cost of higher prices throughout the economy. Not all concerns are able, like the Lukens Steel Company, to revive a practice popular during the Korean war and persuade their customers to provide the capital for new plant.

Deep Freeze and High Flight

THE Christmas tree which sprouted at the South Pole last month was planted by the twenty-four Americans who have taken up residence there under Operation Deep Freeze, part of the United States' contribution to the International Geophysical Year. As a global undertaking the year does not begin until July 1st, but in the Antarctic it opened officially last Tuesday. With eleven countries bringing several thousand men to fifty scientific stations, this normally uninhabited region is becoming almost overcrowded. It is certainly becoming civilised, at least as far as the Americans are concerned; they are building highways and have set up both showers and washing machines on the South Pole. This equipment came by plane and parachute, only one example of how Antarctic exploration has developed as a result of air transport. Men and supplies no longer have to waste half the short summer struggling by ship through the ice packs. This year the first American plane loads landed in the snow direct from New Zealand during October.

The general purpose of this geophysical year—or eighteen months, since it will go on until the end of 1958—is to undertake a concentrated scientific investigation of the earth and its atmosphere and the way in which both are affected by the sun. Intensive study is to be carried out simultaneously and co-operatively all over the world by thousands of scientists from fifty-five countries, including the Soviet Union. The United States is spending altogether over $150 million on the project and the most spectacular part of the American programme is to be the launching of earth satellites to explore the upper atmosphere.

No date for this has yet been announced, but tests have already begun of the rockets which will be used to fire the satellites and of the instruments they will contain. This artificial moon, twenty-one pounds of magnesium with a diameter of twenty inches, will be shot by three stages into an orbit 300 miles or more above the earth and will then, it is hoped, circle the globe at a speed of 18,000 miles an hour for at least fifteen days. It will be accompanied by sub-satellites, ten-ounce balloons made of aluminium-coated plastic, to measure air density in the outer limits of the atmosphere. The satellites themselves will contain radio equipment which will transmit data to a chain of bases stretching from the Atlantic coast of the United States to Chile. Observations made at these bases will be collated by electronic computers in Washington, DC, within a few minutes of being received from the satellite.

Dinner *Ex Machina*

FROM A SPECIAL CORRESPONDENT

THE trade association of the vending machine industry, which profits by the American trend toward "push-buttonitis," announced at its recent convention in Chicago that it had 3,100,000 automatic salesmen on location in the United States. The figure is awe-inspiring, until it is compared with the size of the country.

The surprising thing, in this day of high wages and an almost messianic trend to self-service, is not that so many vending machines exist but that the industry has been so slow to move outside proven paths. Automatic dispensers of chewing gum are at least as old as the twentieth century. Automatic gambling devices burgeoned in the bootleg era after the first world war. An early version of the automatic restaurant has served New York for three decades. For several years it has been possible in suburban areas to buy ice, in a solid chunk or in chopped bits, from a white steel coffin propped on end, a service greatly used and loudly praised by hosts whose hospitality outruns the ice-making capacity of their refrigerators. But only in the past year has their similar need for a dozen eggs or a bottle of milk out of hours been heeded.

This newest development in automatic distribution has come from one of the great retail chains, and seems to be regarded both as an advertising gadget and as a forerunner of complete "autobution" in self-service food shops. Under the sign "Night and Day Quik Pik," the Grand Union branch in a thickly settled area of New Jersey has built across its face a set of eight automatic dispensers which supply bread, milk, eggs, margarine, frozen meats and fish, coffee and tea, at any hour. All that the late shopper or the early riser needs is to have the appropriate coins, drop them in the proper slot, pull the indicated lever, and stand by to receive his purchase.

How important these automatic distributors will prove in terms of immediate profit remains to be seen, but their experimental value to self-service merchants seeking a way out of the huge pits they have dug for themselves may be considerable. In one suburb after another the chains have built bigger and bigger units, until housewives complain of their poor feet, and managers moan that between the cost of space needed to accommodate the rolling shopping baskets and of wages paid to keep shelves filled and bills added up they might as well be running an old-fashioned grocer's shop.

★

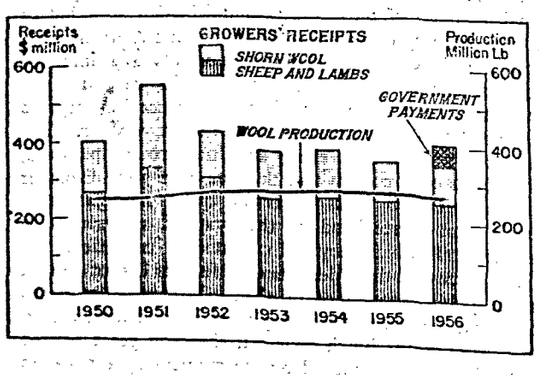
The Independent Grocers Alliance of America, better known as IGA, has one answer in the form of a gigantic assemblage of gadgets called Elmer. Elmer is the offspring of electronics and a conveyor belt. Within his domain the housewife faces a display of packaged items behind glass, a row of keyed buttons and a slot. She has in her hand a key loaded with electronic remembering devices, and this she thrusts into the slot. Then she pushes buttons which tell the key that she wants Bouncey Bread, Soapy Suds and Wheaty Wheezes, each at a given price. The next step is to thrust the key into another slot where it confides the remembered information to overhead slides which deposit the merchandise and the itemised bill on a conveyor belt moving past the cash register, where the housewife pays without question, collects without confusion, and flees.

The IGA claims that while Elmer may sound fearsome, he works wonderfully, and will save $15 on a $50 grocery bill by cutting space, salaries, erroneous arithmetic and petty pilfering. What the housewife thinks is so far unknown. In 1949 she refused to accept Elmer's ancestor, the Keedoozle, nominally on the ground that she would not buy a loaf of bread she could not pinch or a grapefruit she could not squeeze. IGA hopes that by 1957 she may be more trusting, or more resigned to the strictures of the autobutic age.

In the field of food and drink ready for consumption the aim is to replace the works canteen, or the corner drugstore, with what is known as a "full-line feeding battery" capable not only of supplying hot coffee at the drop of a coin (and thus cutting time required for the ubiquitous "coffee break") but also of issuing sandwiches, hot dogs, soup, *chili con carne,* cakes and pastries without the interposition of a cook or a waitress. Such installations cost about $10,000, depending on the number and size of units included, and in some sections they are proving successful enough so that such important suppliers of processed foods as the Campbell Soup Company and the General Foods Corporation are showing interest. Cynics claim, however, that this interest is the result of the deterioration of familiar brands under the difficult conditions of automatic vending, and that the companies are acting to save the reputation of their own products.

Certainly the attempt to provide complete meals by autobution faces problems whose solution requires a great deal of research and development. Even under the best conditions, food spoils quickly. The forty-eight states have a complex network of laws affecting its handling which are meant to safeguard public health, but which also make it difficult to standardise equipment. To design machines that will keep food both sterile and fresh in forty-eight legal meanings of those words, and will deliver it hot or cold at the drop of a coin, is an engineering problem made only a little easier by electronic controls and infra-red cookers than it was in the days of plain ice and direct current. Nor has the task of training a service corps to nurse and feed these sensitive monsters got very far. The mechanic who shuffles along an Underground platform, stopping at each post to take the face off a gum dispenser and stack in new packages, is not quite the figure that people want to see handling the wrapped sandwiches or sterilised milk which they will consume at lunch time.

The success of these dehumanised feeders lies, of course, in the public acceptance of their offerings. Americans want what they want when they want it—and want it fast, particularly at the lunch hour. If they can get a toasted sandwich, a sausage cooked by the momentary application of built-in electrodes, a cup of coffee or a slice of pie served by an automatic vendor faster and more conveniently than at the corner drugstore, they may be willing to pay for it—even in terms of the lower quality that too often seems inevitable when food factories replace individual kitchens. On the other hand, they may decide that the price is too high.



Brannan in Sheep's Clothing

FROM A CORRESPONDENT IN COLORADO

THE Administration's programme, adopted as part of the 1954 Agricultural Act to encourage domestic production of wool and to lessen American reliance on wool from overseas in the interests of national security, is now in its second year. The purpose of the programme was to increase annual output of shorn wool to 360 million pounds (grease basis), but during the first year of operation production, at about 232 million pounds, was slightly less than in the previous year. Yet the programme cost the government about

$60 million in "production incentive payments" to sheep growers. Payments of this kind for all types of perishable agricultural commodity were at the heart of the controversial Democratic farm plan, put forward in 1949 by Mr Charles Brannan, but never implemented—until the Republicans applied it to wool.

The idea is that farmers should sell their products at the market price and then have their income brought up to an agreed level by a subsidy from the government. Under the present wool plan the Secretary of Agriculture fixed 62 cents a pound as the average price to which wool growers were entitled during the 1955 year, which ended last March, for raw greasy wool. The average price actually received in the market was 42.8 cents a pound. Therefore, the average subsidy to which sheep farmers were entitled was 19.2 cents a pound. But instead of simply paying this sum to growers for each pound of wool they had marketed during the year, the department calculated the subsidy on a percentage basis: 19.2 cents is 44.9 per cent of 42.8 cents, so the department made its payments on the basis of 44.9 per cent of each grower's actual market receipts for his wool. The effect of this is to give a greater reward to the man who originally received a higher price for his wool. For example, he who sold his wool for only 40 cents a pound was given

an additional 17 cents in subsidy, or 57 cents in all, while he who originally got 50 cents in the market was paid an additional 22.45 cents, or 72.45 cents in all. The idea was to reward the farmers who grew and marketed better wool. But they were all so confused by this recondite method of calculation and so busy trying to figure out what they were going to receive that they do not seem to have had time to plan to increase or improve their flocks.

Nor did all this subsidy go directly to wool growers (or to their creditors, for many of them borrowed against their expectations): a majority of them had voted, as provided in the Act, to set aside a cent a pound to be spent on promoting the consumption and marketing of "lamb" (as all sheep flesh is euphemistically called in America) and wool. The Act also provided that the Secretary of Agriculture could designate a chosen instrument to administer this promotion programme, and he nominated a new organisation called the American Sheepgrowers' Council, with headquarters in Denver, Colorado. This organisation received nearly five million from the 1955 subsidy and an elaborate advertising and publicity scheme directed at selling more lamb, and more wool, is now under way.

Finally, the Act gave the Secretary of Agriculture power to set the total compensation of growers at any point up to 110 per cent of parity—the magic balance between farmers' receipts and costs which is supposed to give them a fair return. The total compensation of 62 cents a pound for the 1955 wool crop was intended to give growers 106 per cent of parity. The same compensation was set for the current year and for the coming, 1957, year, even though it now represents only 101 per cent of parity, and even though growers made strenuous representations that their costs have crept up so much since 1955 that they now need the full 110 per cent of parity authorised by the Act. They estimate this at 67.5 cents a pound for the 1957 crop; they argue that 62 cents represents an approximate reduction of five per cent in their real reward for 1957 as against 1955, since their costs continue to rise and their output to decline.

SHORTER NOTES

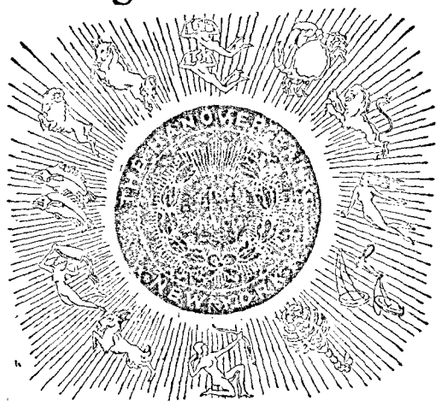
History was made last month when Mr W. F. Turner, a Democratic elector from Alabama, refused to cast his vote in the electoral college for the candidate, Mr Stevenson, who had won a majority of the popular votes in his state. Instead Mr Turner voted as he had a legal, but not a moral, right to do, for a local judge. As a result Mr Stevenson received only 73, not 74, electoral votes.

★

The Interstate Commerce Commission is permitting eastern railways to raise their freight rates by 7 per cent and western railways by 5 per cent, in order to cover recent increases in wages and prices. A request for a similar rise by southern railways is still pending, as is another request from eastern and western railways for an additional increase of 15 per cent, to cover long-term advances in costs.

★

Because of the complicated nature of the issues involved, the President postponed his decision, due on Christmas Eve, on whether or not to accept the Tariff Commission's recommendation that duties should be almost doubled on cotton velveteen fabrics which are imported almost entirely from Italy and Japan.



★

A 57-year-old Sikh farmer from the Punjab, who has lived and prospered in California for thirty-five years, is the first East Indian to be elected to the United States Congress. He defeated the famous woman flyer, Mrs Jacqueline Cochran Odlum, in the Imperial Valley, a district normally both Republican and race-conscious.

★

There are now about 1,380,000 more women than men in the United States; six years ago the figure was only 600,000 and in 1940 there were more men than women as there had been in all earlier censuses. The change in the ratio is explained by the higher death rate among men—males still outnumber females under 24 years old—and by the decline in immigration.

PLANT LOCATION FACTS

on your raw material requirements

We can provide you with accurate data on raw material costs at any specific New York State location. We maintain current and detailed data on local raw materials covering location, quality, quantity, availability and cost. If the materials are to be assembled from more distant points, we will determine their cost laid down at any given site or sites in New York State. In the case of components or semi-processed goods, we will identify suppliers and furnish details as to specifications, costs and delivery schedules.

Assembling materials won't be your only consideration in deciding on a new plant location. You will want complete facts on labor, markets, water, available sites or buildings, power, fuel and transportation. And you will want information on these as they apply to the successful operation of a specific plant.

A tailor-made report

Any or all of the factors important to your analysis will be covered in a confidential report to you—tailored to your needs. It will be prepared by a professional and experienced staff to cover either New York State locations of your choice, or, if you wish, sites which we will select on the basis of your needs.

Our booklet, "Industrial Location Services," explains what we can do for you. To get your free copy, write me at the New York State Department of Commerce, Room 693, 112 State Street, Albany 7, N.Y.

So my advertising is seen where the big money is earned

★ *The independent survey conducted by the Institute of Practitioners in Advertising.*

"I wish I could be sure that mine was. How do you manage it?"

"It's quite simple really. You concentrate on the papers which have a big sale in the major industrial areas. For example, the I.P.A. Survey* lists the eight major industrial areas where the big wages and salaries are earned, and estimates the number of people living in those areas who read each of the national newspapers."

"Amongst the dailies what papers come out on top?"

"Well, the top three are the Daily Mirror, the Daily Express and the News Chronicle. Concentrate on those three and you won't be far wrong. The News Chronicle, of course, is particularly valuable because of the quality of its readership. You can see for yourself the type of paper it is. It appeals to the more intelligent type of reader. The type of person who, whatever his social grade, likes to think for himself. If your products are good value for money, he'll recognise it at once from your advertisements."

"Is the News Chronicle an expensive medium?"

"Anything but. Just ask your advertising agent."

Restless Soviet Youth

A NEW university magazine named "Heresy," published by students in Leningrad, has just been attacked for publishing "decadent" writing. Its very title illustrates the sort of trouble Stalin's successors have to face. There was a time when blunders in Warsaw or shootings in Budapest could be kept from the Soviet public by the full blasts of the propaganda machine. But the seeds of doubt planted by "destalinisation" have grown rapidly, and the once orthodox Russians are in a heretical frame of mind; they are questioning the official version of events at home as well as abroad. Students are the natural vanguard in such a movement; as the favourite children of the regime they have been given the mental tools necessary to probe below the official surface and to pass judgment. Shaken, after Stalin's death, by the collapse of some established dogmas, encouraged to exercise their critical faculty, they are demonstrating that the critical spirit once let loose cannot easily be put back into a new cage, even though it is larger and more comfortable than the old one.

To prevent the intellectual ferment from spreading too rapidly, the Soviet leaders have recently attempted to slow down the retreat from Stalinism in historical research, literature and the arts. Historical journals are showing less zeal in rectifying the Stalinist distortions of the Soviet past. The campaign against Freud and Kafka has been revived, though the works of neither have been published in the Soviet Union. Several Russian novels have been attacked as socially suspect, including a book called "Not by Bread Alone," which had only recently been praised by Moscow critics; its main fault was probably that it drew a disrespectful portrait of a minister and an academician.

But the seeds of doubt have found a fertile ground among Soviet youth. It is difficult to say how big a part events in Poland and Hungary have played in recent gatherings, but it is known that debates at students' meetings have been getting increasingly stormy and have with difficulty been kept under official control. Leningrad, the dethroned capital, seems to be once again the centre of discontent, though restlessness is not limited to any single university. Moscow is also affected, while *Sovietskaya Rossiya* reports outbursts of "demagoguery" at Sverdlovsk in the Urals. *Komsomolska Pravda*, in turn, talks of "demagogues, babblers and yellers trying to make capital of difficulties . . ." at the Kharkov University in the Ukraine.

Formerly, thoughtless youth used to be the chief worry for the Soviet leaders. Rowdies, teddy-boys and latter-day representatives of gilded youth were regularly attacked in the press. But now it is not the thoughtless but the thoughtful, not the youngsters who care too little but those who care too much about the society they live in, that are creating difficulties. The authorities are trying to blur the difference between the outbursts of light-hearted, even disorderly, students and the sincere protests of the young *Komsomols* waking up to the reality of the Stalinist heritage. Appeals to anti-intellectual feelings are another method of discrediting the student movement. Some time ago Mr Khrushchev hinted that there could be no room for "socially hostile" elements in the universities, when sons of workers and peasants had to stay at the bench or on the farm because of the limited number of vacancies. The threat was hardly veiled. For some time a campaign has been waged to increase in the universities the proportion of people with previous experience in industry and agriculture.

All this does not mean that rebellious students will once again prove to be the forerunners of a political revolution. Nor should Russia be looked at through Hungarian spectacles. In the Soviet Union the economic foundations of society are not being questioned in earnest. The standard of life of the average Russian has been rising steadily from the appallingly low postwar level; and as a safety valve against the pressure for change, the government is likely to return to a form of "Malenkovism," to step up the supply of consumer goods and do something about housing conditions. Thus the cultural and political demands of the students are made against a less explosive background and are a lesser threat to the regime than in the rest of Eastern Europe. Nevertheless they confront it with a series of awkward dilemmas.

The enthusiasm of youth is not something to be lightly squandered. It made possible some of the early feats of industrialisation, such as the building of the town of Komsomolsk on the Amur in the distant East. In Stalin's time some of this enthusiasm became soured or transformed into conformist cynicism. A young communist in a recent Soviet novel declares that "what a man thinks and feels should not interest anybody; it is only important that he should say what is required." It is essential to recapture the faith and enthusiasm of the early days now that some of the Stalinist tools of coercion have been discarded. A Russian paper admits that to do so one must be able to answer the questions that are really worrying restless young Russians. The difficulty is that their relentless search for truth is likely to lead destalinisation well beyond its officially intended limits.

The other dilemma is connected with the needs of a growing society. To cow the students Soviet leaders cannot

apply the Tsarist method mockingly summarised in the formula "let them study, sweat and suffer, but learn nothing." The fast expanding economy demands a tremendous number of educated men. Millions of Soviet citizens have by now completed their secondary education. In the institutes of higher learning they are getting intoxicated with the new ferment and infected with the dangerous germ of critical thinking. It is this fast swelling army of the educated which seems the best guarantee that the process of destalinisation, despite halts and retreats, will finally go much further than Stalin's successors at first intended. Mr Khrushchev and his colleagues ought to fear the thirst for knowledge more than student riots in this crisis of the post-Stalinist generation.

Syria's Left Front

FROM OUR MIDDLE EAST CORRESPONDENTS

THE Syrian government has acquired greater coherence by the simple process of dropping all moderates and right-wing elements from the defunct cabinet. The result is a "homogeneous government of the left"; this was the aim of the left-wing groups when they formed their Parliamentary National Front in December. There can be no doubt now that Syria is set on extreme nationalist courses which, by the meaning that the present government gives to nationalism, mean anti-western policies. The People's Party and the Constitutional Block, both moderates by current Syrian standards, were sufficiently confounded by the Anglo-French invasion of Egypt to think about joining the Parliamentary Front, but wisely thought better of it. They would have been dragged along at its heels.

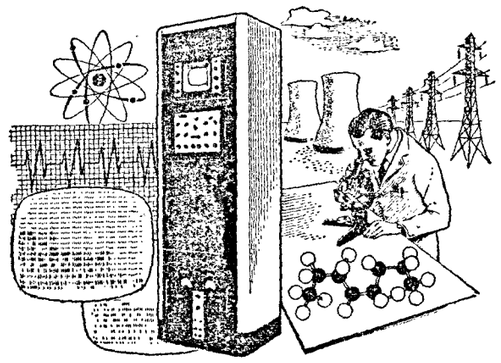
Khaled el-Azm has entered the new government as acting Minister of Defence. He is a wealthy man from one of the "feudal" families, as they are called in Syria, and the only explanation of his curious association with the left-wing in recent years is his stubborn ambition to be president. He claims to be independent, but has for long been closely associated with the Baath Party's socialist leader, Akram Hourani, who is more responsible than anyone else for the Left's new homogeneity. Khaled el-Azm's blustering, stubborn nature has earned him an unwarranted reputation for strength, and it is probably for this reason he has been given the defence ministry. He will be expected to strengthen and control the leftist groups in the army which has never lost its passion for meddling in politics since the Hosni Zaim *coup d'état* of 1949.

The Baath Party has retained the key posts of Foreign Affairs and National Economy, with el-Azm as ally at the Ministry of Defence. It is the driving force behind the new government and sets its tone. The government will therefore almost certainly develop its "neutralism" in close alignment with Egypt, and as long as that country is closely associated with the Soviet block, it will be also. It will be anti-Iraqi, anti-Baghdad Pact, and friendly to every effort the Jordan government makes to break its ties with Britain. (Abdullah Rimawi, the Jordanian Foreign Minister, is also a Baathist.)

The Parliamentary National Front, which paved the way for this government, produced a six-point Charter in mid-December in which it pledged itself to defend Syrian sovereignty and independence and to foil imperialist conspiracies against Syria and Arab nationalism generally. No less than three of the points were devoted to Iraq. The Front said it would foil plots against the safety of the country (a reference to allegations that Iraq had been smuggling arms into Syria), would resist the Baghdad Pact, "which is regarded as an obstacle to Arab unity and as a link in the imperialist chain," and would work for the liberation of the Arab peoples, "particularly the Iraqi people in their struggle against imperialism."

Sabri el-Assali has retained the premiership of this homogeous left, although he is not by disposition well suited for the part. Such is the situation in Syria at the moment, with strong left-wing groups in power in the army and the tide of popular opinion running against the West with new strength since the invasion of Egypt, that there is hardly anyone who can stand against the Hourani-Azm grouping. The President, Shukri Kuwatly, is by no means a natural leftist, but his Egyptian associations, his recent visit to Russia and his desire to retain the presidency against the growing power of the socialist groups, have forced him into sympathetic association with the Front. All in all, the western powers in their efforts to reconstruct a policy for the Middle East must find cold comfort in the new Syrian government.

Homogeneity does not, however, spell stability. The third point of the Parliamentary Front's charter promised to "lead the country to austerity." The wisdom of the aim can hardly be disputed in present-day Syria, but it is unlikely to be popular with the Syrians. The government has to face a budget depleted by the loss of oil revenues caused by the cutting of the IPC pipelines and overdrawn by the army's demand for weapons. To sustain a policy which will see Syria through these difficulties requires more unity than even this left-wing group has got. It is not without significance that it took ten days of intense political manœuvring to form the government at all.



Already austerity has run into opposition. The combined Chambers of Commerce, Agriculture and Industry have protested against the higher duties imposed on luxury goods by the late government. The Chambers deny that many of the items in the list of 4,000 luxuries are in fact luxuries. They also criticise the Ministry of National Economy for assessing duties on the free market rate for currency instead of on the official rate.

In China's Shadow

The Ho Chi Minh Way

FROM OUR SPECIAL CORRESPONDENT

ONE evening, Ho Chi Minh called a conference of regional party bosses. He asked them for a progress report on the land reform programme. One by one the men stood up and repeated the complaints made to them by the peasants. Ho listened carefully, then said: "Those are the complaints the peasants actually made, but their real complaint is that they want to go south and cannot. . . . And now, comrades, we shall have dinner." The men sat around a long table and soup, boiling hot, was served. When the men showed signs of waiting for the soup to cool, Ho Chi Minh said: "What are you waiting for? Eat

What do you know about atomics?

THE PAST TEN YEARS have largely been devoted to acquiring the information and technical know-how which will make the next ten years the really important period in the development of atomic energy. Reactors are being built in many parts of the world. Side by side with that, much of the basic research that will make energy from atomic power a practical proposition is still being done. In the work that has already taken place, and in the research of the future, Sunvic is playing a vital part. Much Sunvic advanced nuclear research apparatus is already in use in Britain and abroad. And now Sunvic are ready to supply complete reactor instrumentation. This contribution to the atomic age is made possible by the vast research facilities of the A.E.I. Group, to which Sunvic belongs.

Sunvic are proud to be playing their part in developing the constructive and peaceful uses of atomic energy—in building the atomic future. And they are anxious to hear from younger men with scientific or technical qualifications who would like to devote their brains and energy to this worthwhile objective.

Today Sunvic takes control

Key man, key industry

HERE IS JAMES WOOLLEY, first hand melter in a steelworks in Scunthorpe. His job needs strength, and skill as well. James Woolley has both. He's been making steel for twenty-six years.

Steel from his company goes to all parts of the world. It may leave Britain in any one of a hundred forms: as railway equipment, as ships, as massive structures for engineering projects.

As the world's demand grows, British steelmakers increase their efforts to turn out steel of the quality and quantity needed. Behind these increased efforts are men of the calibre of James Woolley.

British steel leads the world

THE BRITISH IRON AND STEEL FEDERATION

ap ! " There were protesting voices: " It's too hot." " That is of no importance," said Ho, " eat up, eat up ! " And as the guests scalded their lips and throats, the President of the Democratic Republic of *Vietnam*, added: " This *soup, comrades, is like the agrarian reform programme.* It is good soup, but you must take it slowly if it is going to do you any good."

This simple parable both illustrates Ho's character and approach, and hints at the kind of things that went on *during the land reform drive.* Shortly after the dinner, the central committee of *the Lao Dong* (communist) party dismissed its Stalinist boss, Truong Chinh (who, however, retains a seat on the committee) and replaced him by President Ho *himself.* There are people who argue that Ho Chi Minh was himself responsible for the excesses of the *land reform* programme and that he had gone into apparent semi-retirement during the difficult period, the better to come back later and put the blame on others. He himself told your correspondent that then, as now, he was in touch and that collective leadership prevailed ; the " errors " were in the application of orders locally. It is certain that the Lao Dong leaders pushed through the land reform programme *with a zeal in* which stupidity and ruthlessness competed for first place. Sixteen " landlords " had to be found in each village—a difficult assignment, since the few landlords left in North Vietnam by the end of the Indo-China war fled to the south after the Geneva agreements. But the sixteen had to be found, and were ; sometimes they were paid managers left behind by their masters, sometimes peasants marginally richer than the poorest. All were brought before " people's courts " and condemned to death or imprisonment. The holocaust might have continued to the bitter end, but for the fact that in the later stages, when " landlords " were becoming scarce, some of those so described were party men with friends or relatives in positions of *influence.* The volume of complaints grew until Ho was forced to intervene.

Wave of Suicides

Public discontent reached a sudden and hysterical crescendo in August, 1955, during the early stages of a census of the population. Everywhere this was made the occasion for investigations and denunciations designed to facilitate a *large-scale purge.* Every adult, for instance, was required to name all acquaintances and intimate friends and disclose all he or she knew about them. Party teams cross-checked statements with neighbours. The interrogation touched off a wave of suicides. Alarmed by this development Truong Chinh called a halt, then started again with milder methods.

In North Vietnam, as elsewhere in the communist world, the turning point was the 20th congress of the Soviet Communist party last February. A profound change has come over North Vietnam since then, and particularly since the protracted meeting of the Lao Dong party's central committee from September to November and the demotion of Truong Chinh in November. For instance, periodicals have appeared paying lip service to the Lao Dong party but severely criticising certain aspects of the regime. The most outspoken of these has been *Nhan Van* (" humanism "), which has published scathing denunciations of the imprisonments and tortures inflicted on innocent people during the land reform drive, and has called for the revival or revision of the stillborn 1946 constitution, which guarantees freedom

of speech, the press, association, abode, and movement inside and outside the country. It has been argued that these and similar criticisms have been trial balloons, launched with the government's tacit approval—a view which is supported by the fact that the owner of *Nhan Van*, Mr Phan Khoi, recently visited China as leader of an official cultural delegation, and that paper and printing facilities are available only with the government's approval. The experiment seems, in any case, to be drawing to a close. On December 10th, 500 printing workers in Hanoi passed a resolution condeming *Nhan Van* and calling for action against it. The sixth issue, though prepared for publication, has not been printed, and a press decree, issued on December 14th, while it guarantees freedom of the press, includes clauses which would make any editor hesitate to exercise his freedom.

The visible signs of change persist, however, in Hanoi. Street traders, formerly driven off the streets, are back in profusion (just when the South Vietnam regime has been clearing them away in Saigon) and the need for private enterprise is being officially trumpeted. Private shops have dug up ancient supplies of French socks and perfume, Gillette blades and branded hair creams. For the rest, Hanoi is, as one would expect, profoundly different from the city your correspondent last saw in June, 1952, and not merely because of the absence of Frenchmen (M. Sainteny, back at his post as delegate-general, is still, with quaint nostalgia, styled " M. le gouverneur," by his entourage). There are few cars and half of them are Russian or Czech. Perhaps 95 per cent of the population is dressed, with communist drabness, in khaki or blue drill (those in khaki being police or soldiers), and the occasional Vietnamese in a European suit looks self-consciously like a " feudal remnant." Bookshops sell Marxist classics in Russian and Chinese, though one incongruously offers Choderlos de Laclos's *Les Liaisons Dangereuses.* From 5.30 in the morning, public loudspeakers blare out pep songs ; they are repeated bar by bar until failure to learn is impossible.

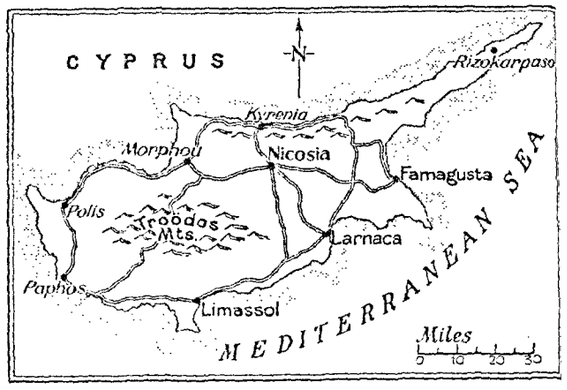
A Run on Suitcases

It is certain that the well-publicised uprising north of Vinh on November 13th was not the only disturbance to the peace, though the other incidents were relatively minor riots by discontented southerners bereft of their hopes of returning to Cochin-China as party or government leaders. Two of these riots took place near the Petit Lac in the centre of Hanoi, where heavily armed police and soldiers, in groups of three, now patrol at night. More significant is the force of the *élan vers le sud* which has gathered strength in the past few weeks. For instance, a rumour that free movement to the south was to be resumed (started perhaps by the party's *agents provocateurs*) swept Hanoi three months ago. People unwilling to reach the south with worthless Ho Chi Minh piastres started a run on gold, the price of which shot up to more than twice the world price. A simultaneous run on suitcases cleaned up the city's scant supplies. Now that disillusion has set in, the price of gold has fallen back to 25 per cent below its peak. But the urge to get away persists. The Canadian delegation of the International Commission for Supervision and Control reports an enormous rise in the number of applications to be allowed to go south ; in the past few weeks significantly, the applications come to the Canadians, not the Indians or Poles. But the time limit for free inter-zonal movement is

long past, and the Canadians have to turn away applicants who are often shadowed by Viet Minh police after leaving the Canadian headquarters.

Yet there is no sign of a convulsion after the manner of Hungary. And it would be a mistake to overlook one factor of stability: the astonishing economic progress of the past eighteen months. China, which made possible the victory of Dien Bien Phu, is paying for much of the economic progress, too, much as the Americans are financing recovery in the south. And the progress is real even though some of its aspects—such as the building of railways from China into Tongking, which gives the Chinese a long-sought outlet to the port of Haiphong—are directly profitable to the donors. A match factory has been built, and a new power station has been completed at Tanh Hoa with Russian assistance. Coal, tin and textile production have risen, though not yet to prewar levels. But the most striking progress is in rice production. Last year, a Russian gift of Burmese rice staved off famine; today there is a surplus and the Indian government has been offered up to 50,000 tons. True, the south is planning to export 250,000 tons next year; but the north, unlike the south, is traditionally a deficit area. This is the measure of the stringency of the "race for viability" between the two zones.

Partitioning Cyprus



THE Turks have fastened with alacrity upon the possibility of partitioning Cyprus; Mr Menderes has said that it would offer a reasonable basis for a solution of the Cyprus problem. Turkish fears for their minority in Cyprus and for the strategic safety of their southern ports are legitimate. But does either the Turkish or the British Government really feel that partition is the right way to allay them?

The authorities in Cyprus are believed to look upon partition with scepticism; nevertheless they have worked out a detailed scheme under which the island would be divided into two completely self-contained parts. Although nothing is known of the details of this plan, it is clear that any scheme of partition, if not actually impractical, would have grave disadvantages and would cause serious economic and human dislocation. The Turks living on the island, about 95,000 or 18 per cent of the population, are distributed throughout all the rural and urban areas. Most towns have a Turkish quarter; some villages are entirely, or almost entirely, Turkish. But it is not possible to draw a line on the map and say that on one side of it the population is predominantly Turkish and that only a small and easily-managed transfer of populations would be needed to make the district completely Turkish.

Speculation has picked on the district of Paphos as a possible Turkish area merely because there the proportion of Turks (24 per cent) is rather higher than elsewhere. But to turn this into the Turkish region of a partitioned Cyprus would, as it appears, involve moving nearly a quarter of the population of the island. Some 95,000 Turks would have to be crowded into a predominantly rural area which now supports only 63,000 people at a relatively low standard of living, an area more industrially backward than the island generally and lacking an adequate port. It is not an attractive proposition. Nor would it set the strategic fears

of the Turks at rest. To do that, they might have to b offered instead the north-eastern part of the island, with i long "panhandle" stretching towards the Turkish ports Iskenderun and Mersin. But that would require even large transfers of population.

Then there is the question of the British base. Apparentl if Cyprus were partitioned, the British would propose withdraw into a small military enclave. This would pr

sumably involve abandoning most of the costly airfields tha have been built in different parts of the island. And unles the British forces could still make use of the port a Famagusta, they would enjoy even worse port facilities tha those which proved useless in November. Cyprus woul become for the British even less of a base and even more o a mere staging post than it is at present.

Economic Consequences of Israel's War

FROM OUR CORRESPONDENT IN TEL-AVIV

EVERYBODY in Israel talks about the need to pay for th war with Egypt but nobody can say how much it cos and what it is still going to cost. In addition to the actua expenditure on the Sinai campaign armaments have to b reckoned in. What part of the defence budget and of th money paid for equipment has to be written down as actua war costs? Is it everything that the army has bought sinc Colonel Nasser's deal with the Eastern block or only part o it? Then there is the dislocation of the economy caused by a week's fighting and the mobilisation of considerable numbers of men, women and transport for several weeks. This dislocation was not as severe as might have been expected. The troops who crossed into Sinai came from farms, factories and offices, and the lorries which carried them were taken from garages and sometimes even straight off the road. Nevertheless, production was carried on without severe hitches and this was partly due to the over-employment in many enterprises and to the enthusiasm of the people left behind. Israeli economists have long maintained that a considerable number of workers were redundant; they were proved right during the seven days' war.

One of the main problems the economy has to face is a shortage of oil, caused not by the blockage of the Suez Canal but by the cutting off of oil supplies from Russia. Israel depends entirely on oil for its fuel supply and during

the last few years has bought roughly one third of it from Russia. When Moscow stopped deliveries, the supply of electricity for domestic use was severely restricted; this entails inconvenience but no real hardship. Irrigation which depends on oil for pumping is fortunately not a problem during the rainy winter months. It might become one in summer if, in the meantime, oil supplies do not improve. Some factories will have to switch to night shifts, others which use much electricity, as do cement plants, may have to curtail production severely. If the cement industry is in fact thus cut down, this will lead to unemployment because housing and the industries geared to it employ a considerable number of workers in Israel. Certain industries such as those making electrical appliances saw their market shrink overnight and will have to dismiss workers. The internal market has been slack since tension rose in the middle of October. So far it shows no sign of recovery. People buy only necessities, the entertainment industry suffers and tourism, on which Israel has been pinning high hopes in recent years, is dead; whether it will revive with the spring season remains to be seen.

The United States has been helping Israel by means of grants in aid—the last one amounted to $25 million—and the sale of surplus food stuffs. Both are now cancelled, at least for the time being. The negotiations for a loan of $75 million from the Export-Import bank were interrupted by the Sinai fighting. A delegation from the United States which was to have studied economic conditions in Israel before granting the loan was due in Israel a week before the campaign started. Thus the foreign currency budget, which in Israel is of primary importance, has been severely upset. More money, however, is expected from the United Jewish Appeal in the United States which is now being carried on as a high-powered emergency activity. The citrus season promises to be very good because the Spanish groves suffered severely from frost last year and have not yet recovered, so that Israeli fruit is earning good prices. There is, in addition, an income of $30-40 million a year in the shape of restitution money from Germany, and German reparations are still an important source of capital goods and raw materials.

Export Drive Slows Down

Last year Israel's dollar deficit amounted to $300 million. The government hoped to decrease this by fostering exports. At first the export drive seemed to be succeeding. Not only oranges and diamonds, Israel's two most important dollar earners, brought in tidy sums, but industrial exports began to go up, too. This success, however, turned out to be temporary. Industrialists were often unable to compete abroad, because of their high production costs; in any case, the internal market provided them with a sufficient outlet for their goods. The present emergency may force them to seek markets abroad. But they point out that the steady rise in costs, because of the automatic linking of wages with the cost-of-living index, makes it impossible to calculate prices accurately, and that orders accepted at a certain price in the end constitute a loss because in the meantime costs in Israel have increased.

The Labour Federation has at long last admitted that there is truth in this argument, and has used the present emergency for deciding on several important changes in wages policy. Collective agreements, which in recent years have almost invariably meant higher wages, will in future be valid for two years, instead of one. Wages will be

adjusted to the cost-of-living index once in six months, instead of every quarter; and increases will be granted only if prices rise by more than three per cent. As the government is trying every device to keep prices stable, and as the Bank of Israel is sticking to its tight monetary policy, despite pressure by group interests, the cost-inflation which has been such a plague for the Israeli producer, may possibly be slowed down.

The government is also trying to recoup part of its war expenditure by loans and levies. A voluntary internal loan has been launched and has been made attractive by being linked to the dollar and freed of income tax. But money is so scarce that workers' councils are arranging for loans to be granted to workers so as to enable them to buy the new bonds. Several other levies, on transport, on postage stamps and so on are being imposed, and it has been hastily decided not to include them in the cost-of-living index. Such a decision would have been violently opposed in ordinary times; today it is accepted with a good grace.

Financing Immigration

While the question of how to pay for the war is still far from solution, another financial and economic problem begins to loom large—the financing of immigration, which this year may involve 50-70,000 people. Immigration has never stopped, but it did temporarily slow down. But immigration from North Africa has been on the increase this year and now there are Jews from Egypt to be reckoned with, and perhaps refugees from Hungary as well. The financing of immigration is carried through in two stages. First of all, people have to be cared for when they arrive, housed at least temporarily, and distributed according to their abilities. This calls for considerable funds. The second stage, when they have to be settled on the land or provided with steady employment, is even costlier. But in Israel today finding employment for tens of thousands of people is not only a financial problem; it implies a replanning of economic expansion. It is now being slowly realised that the development of agriculture has reached saturation-point, at least temporarily. Farmers complain that they cannot sell everything they produce, that prices are going down. Although additional immigration means additional demand for agricultural produce, this will not solve the employment problems of the newcomers. The absorption will need new industrial plans.

At present, the employment situation is fairly good, because the picking season in the orange groves provides jobs. The position will become bad in the spring. In the meantime, the government has started on the quick building of an oil-pipeline from Elath to Beersheba, which, eventually, is to be continued to the oil refineries in Haifa; it is also planning to improve the harbour facilities at Elath. The intention is to provide Israel with the possibility of importing fuel without using the Suez Canal. These projects, together with several minor ones, will ease the unemployment problem. Nevertheless, Israel might soon find that immigration can be even more expensive than a short war. But in Israel the economist has never been asked whether, from his point of view, the absorption of mass immigration was feasible. He has simply been given a certain task and asked to solve it. At present he must solve the problem of how to finance the Sinai campaign and meet the cost of increased immigration, and that at a time when certain sources of outside assistance have dried up, at least temporarily.

The growth of an Idea

For many years Barclays Bank has been building up a structure unique in world banking, a structure based upon two distinct principles. The private banks which combined to form Barclays have provided the foundation for a system of Local Head Offices which lodges in the hands of local people a broad measure of the day-to-day control of affairs; while, ranged around the English bank, there has been developed a group of associated companies which provide in Scotland, in France, in the Mediterranean, in Africa, in Canada, and in the West Indies, a banking service comparable to that of the parent company. The Englishman doing business overseas may well find invaluable this direct representation in many countries; it is of course supplemented by a network of correspondent banks throughout the world.

The system of decentralisation through Local Head Offices is not confined to this country. Branch managers can deal with practically any banking question you put to them; but if they have to refer to higher authority most of them need go only to their Local Directors in Norwich or Nairobi, in Leicester or Lagos, rather than to a remote Head office in London.

Economic Outlook for 1957

AWAITING RE-EXPANSION

The Year the Economy Stood Still

THE past year has been the year in which the British economy stood still. When this annual survey was last written twelve months—and how many aeons of political events—ago, its main prognostication for 1956 was that "by about the time of Mr Macmillan's first budget—or possibly a little later—[the Chancellor] might face a genuine damping down of domestic demand." He would then, it was argued, have two choices before him. One would be to try to reflate demand in order to secure the maximum expansion in production of which the British economy was capable. The other would be to keep up the squeeze "in order to divert production to export and even, perhaps, to create a little slack in the economy that would help to damp down future wage demands."

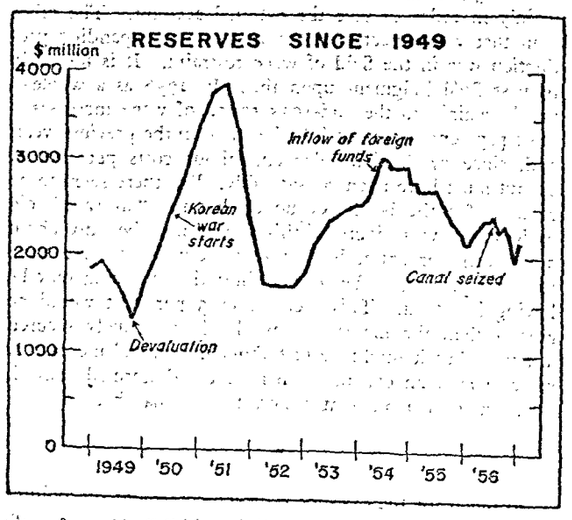
The central economic fact in the first half of 1956 was that the Chancellor plumped for the second alternative. He plumped for it so hard that total internal demand upon resources was not only held in check in 1956, but seems to have actually declined. Consumption increased by only about £50 million (in real terms) in the year; although the end-year Exchequer returns are disappointing, it still seems probable that real current expenditure by public authorities on goods and services declined by a little more than this amount. Fixed investment increased again, perhaps by up to £150 million (also in real terms); but the best guess that can be made—from some very confusing stock figures—is that this, too, was more than counterbalanced by the decline in the rate of stockbuilding. The total fall in demand may have been over £100 million.

The resources released by this fall in domestic demand, plus the resources created by the expansion in productive capacity, were therefore free to meet any increased demand for exports; since the expansion of potential productive capacity, reaping the first fruits of the investment boom of 1955, may well have been of the order of £750 million a year, the new resources standing free to assuage the export market were substantial. Unfortunately, however, not all these resources were in the right places or producing products at the right prices. In the first eleven months of the year, the volume of exports increased by some 6 per cent; this would imply an annual rate of increase of some £180 million in real terms. In the same period, the volume of imports was virtually unchanged.

This real improvement of some £180 million in the export-import account, together with a swing towards us in invisibles and in the terms of trade (2 per cent better in the first eleven months of 1956 than in the same period of 1955), sufficed to turn the balance of payments deficit of £133 million in 1955 into a (probably reasonably healthy) surplus; the balance of payments surplus in the first half of 1956 was £135 million, and the outturn in the second six months should have raised the surplus for 1956 as a whole to somewhere around £200 million. But the cost of this switch in resources—since export demand increased by only some £180 million and since internal demand fell—was that there was only enough total additional demand to raise production by some £50 million; this may have been some £700 million less than the increase in production which Britain could have enjoyed if it had been able to expand output to the utmost, without bothering about the balance of payments.

This £700 million or so was the cost of disinflating, mainly in order to save the external account. The other gain that was expected at the cost of not expanding production was in the field of wage restraint. It is too early to pass final judgment upon this. In 1956 as a whole—thanks mainly to the end-1955 round of wage increases—wage payments were much higher than in the previous year, and, since productivity flagged, labour costs per unit of output must have risen considerably. But there seem to be grounds for the belief (or hope) that the "average" big trade union wage increase this winter may be only about 3 per cent, or about half of that secured by these same unions a year ago; the fear of short time working may be having its effect. This increase of 3 per cent would be greater than the increase in productivity actually secured last year, but it might be just about the annual increase in wages which an expanding Britain could normally afford. One can only hope that a new fashion has been set.

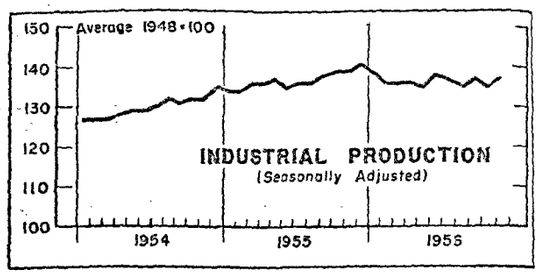
★



So much for the ex-Suez achievements—and the failures—of the year when the economy stood still. What, now, of the prospects for 1957—as regards output, the trend of demand, and external dangers to the economy?

The new year starts under the shadow of the crisis of confidence in sterling that has resulted from the Suez adventure. The dominant influence upon the economy in the early months of the year will be the impediments to production which the measures needed to meet that crisis of con-

fidence (as well as the blocking of the canal itself) must cause. But—this is the gleam on the horizon—the prospects that may emerge by the end of the year could be very different from the prospects for 1957 as a whole.



The sunny side of the eventual outlook for output was discussed in a leading article in *The Economist* two weeks ago. Production in Britain is probably running some £700 million below capacity; as capacity is certain to increase further during 1957, as last year's heavy investment comes to fruition, this suggests that the annual rate of production to which the country could start to move, once present troubles are over, could theoretically be quite massively—perhaps £1,000 to £1,500 million—higher than the annual rate of production now. There is, of course, no prospect whatever of this sort of increase being achieved in this year's income as a whole (the shortage of oil, and possibly of some other trans-Suez imports, in the first six months will see to that); there is not much hope of the capacity increase being completely attained even in terms of the annual rate of production achieved by the end of the year, or perhaps even in that achieved by the spring of 1958. But the gleam of hope remains: once immediate post-Suez troubles are over, the capacity for a massive increase in production should be there to use—if only the country can afford to dare to use it.

What of the demands that will be put in 1957 upon this productive capacity? There are signs that personal consumption (even assuming only a 3 per cent standard for this winter's wage increases) may expand by more this year than it did last. A year ago the fairly substantial rise in prices that had then just taken place, together with the absorption of a considerable part of current income in payment of instalments on goods bought during the 1954-55 hire purchase boom, could be seen as dampeners for real consumption in 1956; neither factor is likely to have so potent an effect on consumption in 1957. Increases in the

rate of stockbuilding must also be expected to add to net demands upon resources this year; this may be particularly true in the period immediately after the Suez Canal is cleared, when some stocks of raw materials may need to be fairly energetically rebuilt.

These two sources of demand—for consumption and stockbuilding—could together add perhaps £300 to £400 million to internal demand this year, even if fiscal and monetary policies do not change. Against this, however, fixed industrial investment (unfortunately) seems to be about to stop rising; if housebuilding is cut significantly, thanks to the (welcome) reforms in rent restriction and subsidy policy, total fixed investment may actually fall. And the usual question mark hangs over Government expenditure, particularly over defence; it is more likely to fall than rise. The general picture that emerges from these

hypothetical pluses and minuses is that in 1957 as a whole new internal demands may conceivably exceed new supplies, and the outturn of the balance of payments threatens to be worse than in 1956; but this threat appears to arise wholly from the strains to be expected in the first half of the year, not from doubts about the *capacity* for industrial recovery after that. Towards the end of the year, with the canal reopened and oil presumably in adequate supply, present indications suggest that internal demand may be falling considerably short of an expanding capacity to produce. And it is in that second half-year that any measures taken in the budget will have their main effect.

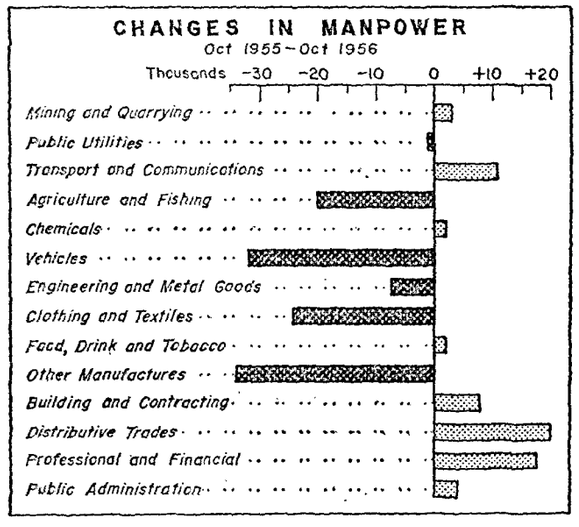
Why, then, has Mr Macmillan been talking about the possibility that he may have to raise income tax, instead of the opportunity that he may have to lower it? The answer is to be found in the three extraneous factors that are the modern British Chancellor's heaviest burdens.

(1) Mr Macmillan may feel that he will have to maintain the squeeze, or even intensify it, in order to keep the country in balance of payments surplus. In these first abnormal months of the year—while the canal is closed—he expects a balance of payments deficit, although one that should be no larger than the surplus that was attained in the second half of 1956. After the canal is cleared and after the immediate period of re-stocking that may follow, however, the spare resources for running a healthy export surplus should be becoming fairly rapidly available. It may be a nice question then how far reflation of domestic demand would pull resources away from the export market, and how far it would merely lift them out of the wasteful and clogging morass of short-time working. The answer may depend largely on the buoyancy of industrial activity and demand abroad—particularly activity and demand in America: for the time being the American prospect looks quite good.

(2) Mr Macmillan may decide to maintain or intensify the squeeze in order to persuade foreign speculators to recapture confidence in the pound sterling. In the short term, this recapture of confidence is vital, and it can only be achieved by austerity. But for the medium term, after the canal is cleared, the Chancellor should do some hard thinking about what sort of Britain he thinks that foreign speculators will have abiding confidence in. Must we really accept the view that foreigners would be scared by an expanding Britain, preferring to see a stagnant or declining one?

(3) As soon as the present round of wage increases is over, Mr Macmillan is likely to start worrying about the next round. On present prospects, one would expect the end-1957 round of wage claims to be put forward in conditions when declared dividends will recently have fallen (thanks to the considerable decline in profit margins in 1956), and after a year in which prices need not necessarily have risen by much more than in 1956 (even though the increases in the next few months may be rather heavier). But if Mr Macmillan did reflate demand in the summer and autumn (by lowering the Bank rate or other means), profit margins (although not necessarily prices) would start to rise again as more economic runs of production recommenced, and the consequent escape from the shadow of short-time working might make the unions more voracious. Once again, however, must we really accept the view that Britain cannot afford flat-out production under its present union structure? If so, this is a pretty poor lookout.

That, then, is the best summary one can make of the economic outlook at the beginning of 1957, and of the questions that will need to be answered in the course of it. The first four to five months are likely to be a period of considerable anxiety; the second seven to eight months could conceivably be a period of considerable emerging opportunity. The first period of austerity must not be fumbled; the second period of opportunity, if it presents itself, should not be missed. Those who are already saying that, in anticipation of the second period, the Chancellor should be prepared for an early decrease in Bank rate are almost certainly premature. But it is perhaps not too early to say what the Chancellor's first step should be if these opportunities do present themselves: it should not be a lower Bank rate, but a restoration of the investment allowances. For some months yet the British economy seems bound (at best) to stand still waiting at the lights; but, as soon as the lights change, the Chancellor should be ready to move smartly forward to re-expansion.



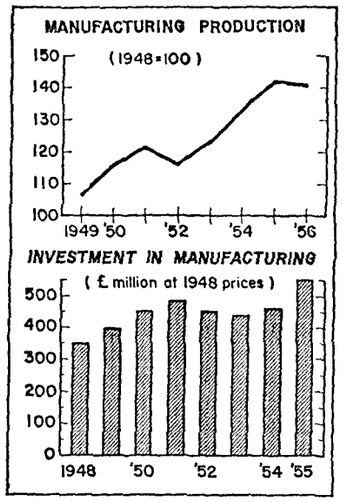
The Price of Disinflation

PRODUCTION has remained roughly level for nearly twenty months now—one of Britain's longest spells since the war without any real expansion. This has been the price of moderate success in some of the objects of disinflationary policy, but not in others. Industry has needed no extra imports; the extreme pressure of labour demand has eased; and within industry, there has been a genuine shift of effort towards export. These are significant achievements. But the shifts of manpower between industries, into those currently nominated as "vital" and "undermanned," have been trivial.

The extra output forgone—the measure of the slack—is conventionally guessed at some £500-£750 million in 1956, an amount equal to the expansion in national income achieved in most years since the war. The guess could be conservative: industrial capacity may have grown faster in the last two years than perhaps ever before. But this "price" of disinflation was hardly calculated in advance and paid deliberately: throughout last year Government spokesmen were repeatedly pretending, at least, that they expected output to begin rising again within a few months.

One reason why it did not seems to derive from the peculiar nature of brimful employment. During 1956, employment declined by about 50,000 people, though one would have expected a "natural increase" of perhaps 20,000 from the excess of young people entering industry over the number of older ones leaving it through retirement and marriage. Yet the numbers unemployed rose by only 38,000. A large proportion of the people who moved out of the "disinflated" industries during last year, that is to say, moved out of employment altogether—married women went back home and older men finally took that postponed retirement. Thus they swelled neither that "healthy margin" of unemployment many economic pilgrims look for as a panacea nor the labour forces of the industries where demand continued to outpace production.

It took time, moreover, for those disinflated industries to decide to let men go. At first, both the trades unions and those employers who had spent the previous two years scouring the byways for people to bribe into jobs preferred short-time working. In the motor industry, most disinflated of all, affected first by credit squeezes of different kinds and now by petrol shortage, this period of deliberately underemploying labour to keep hold of it has probably passed by now—particularly as employers find that continued short-time keeps their worst workers but sends their best men off in search of something better than three days' work a week.



These industries producing metal consumer goods, selected as the bad boys of the 1955 boom, were duly placed under restraint last year. Rather disconcertingly, manufacturing as a whole lost nearly twice as many people as the total decline in civil employment, and most of the extra people thus made available seem to have gone into the distributive trades and services. Transport achieved a small but useful increase in manpower and the building labour force went up a little; the mines checked their loss of men, but gained very few, and agriculture lost workers.

This slight shrinkage in manufacturing employment was accompanied by a slight shrinkage in manufacturing output, taken as a whole. In the metal-using industries, the cuts

in output and employment in motors and other metal consumer goods were not fully offset by corresponding increases in the capital goods industries. Since capital goods have a much greater relative weight than cars and consumer goods in this key industrial group, this remains puzzling. The ramifications of the motor industry throughout the engineering industries offer one clue; and the inflexibility of output in the plant and machinery industries perhaps another. A long order-book, moreover, may cause the average shipbuilder or machine tool maker less pain than it does academic economists.

It therefore turned out to be much harder than most people hoped, in 1956, to transfer resources between manufacturing industries, though the shift towards export within industries was simpler. Some of the stickiness may be out of the system by now; and the economic aftermath of the Suez adventure seems certain to give the policy several more months to work. Industry's direct use of oil in Britain is really significant only here and there, as in steel, where output is being maintained and can be increased by the use of other liquid fuels. How much the squeezing of road transport and the lengthening of voyages to destinations East of Suez will affect production schedules is much less certain. Industrial output seems likely to slip off a few points over the next three or four months; it would be optimistic to expect it to begin rising before the autumn.

Such an assessment is from the "supply side" alone—reckoning the physical limitations likely to depress output for a while, and ignoring how demand may change. A renewed period of industrial stagnation, certainly, will mesh the gears of disinflation more firmly, and give them time to complete their work. But on the conventional arithmetic of "potential extra resources" employed above, another year without any significant rise in production would cost twice as much as 1956 did. Its cost in business confidence, far harder to guess, might also take longer to pay.

Industrial output in this country has not risen since May, 1955, and the recent upsurge of capital investment by private industry did not begin until 1954. In terms of extra output, businessmen have as yet tasted none of the fruits of their investment boom; nor has the new equipment they have brought in even been given its full chance to cut costs. Industry's recorded "investment intentions" this year point so far to no increase over last year's spending. Industrial investment is likely to be declining by the end of this year. If by then the vast investment effort of the last three years still shows no signs of paying off, the Chancellor may have some difficulty when he does decide to stimulate another surge forward.

Further Rise in Exports?

IN all recent years save 1956 British exports have struggled against a clamant home market. In 1956 home demand gradually became less clamorous and exports crept ahead. According to the recorded values, exports rose by 10 per cent between the first eleven months of 1955 and 1956; these values, however, are a misleading index of the true rate of increase. Export prices rose by about four per cent in 1956; exports in 1955 were inflated by the overspill from the dock strikes of October 1954; and the 1956 figures were inflated by a capital item, the repayment of £20 million worth of silver bullion to the United States. After making allowance for these distortions, the volume of exports in 1956 is reckoned to be nearly six per cent larger than in 1955; that compares with an increase in 1955 over 1954 of less than five per cent. Imports, on the other hand, rose in value by only one per cent in 1956, and the volume was virtually unchanged.

The medicine of tighter and dearer money can thus claim to have had some effect. But there may still be some disappointment that exports have not risen faster than they have. Britain's share of world exports still declined, though at a slower rate than in 1955. There are two main explanations for the modest rate of increase. The sharp expansion in exports to North America, India and certain European countries was partly offset by declines in other markets, mainly in the sterling area. Exports to Australia, Britain's largest market, fell by £36 million to £226 million in the first eleven months of 1956, and exports to New Zealand fell by £12 million to £117 million. Import restrictions were largely to blame for the decline, but in these and other sterling markets Britain has lost some ground to its competitors, particularly Germany and Japan.

Non-Sterling Area	1,429	1,701
Of which :—		
Dollar Area	378	500
OEEC Area	745	832
Rest of World	306	369

The second explanation is that the slackening in home demand could have only a delayed impact on exports of British capital goods. The decline in home orders may enable many firms to shorten their export delivery dates and thereby win back some overseas business lost to foreign competitors. But those orders cannot be completed and shipped for some time ahead. The export returns are simply a guide to the state of trade months ago—in the capital goods industries one or two years ago. In the industries making consumer durables, the fall in home demand quickly freed resources for export, but those industries have generally found it more difficult to expand their exports.

In 1956, as before, engineering products and chemicals lead the advance in exports, but there have also been substantial increases in many other products, notably iron and steel, non-ferrous metals and refined petroleum. The principal gains—and losses—are shown in the table. The lame dogs were chiefly motor cars and cotton and rayon textiles. The motor industry's creditable gains in North American markets were more than offset by setbacks elsewhere, particularly in Australia, New Zealand, South Africa and Eire. Shipments of cotton and rayon goods suffered particularly from import restrictions in Australasia, and from increased Japanese competition in West Africa.

What are the prospects for 1957? Once the canal is clear, at any rate, the rate of increase in exports last year should be maintained, and may be improved upon. World demand remains remarkably buoyant, and most sections of British industry will be better placed to compete for foreign business than in 1956. In the capital goods industries the volume of home orders is falling, and capacity is growing somewhat. Hence delivery dates may tend to shorten, and in those industries delivery is often a more important selling point than price. And the engineering industries as a whole can count on some slackening in the rise in costs.

Some business with the Middle East is being lost owing to difficulties of payments and deliveries following the Suez crisis. Some orders may also be lost to the United States and Japan in Far Eastern markets, because Britain is at a disadvantage in shipping time and freight costs until traffic again flows freely through the Suez Canal. But these losses are unlikely to be heavy. Petrol rationing in Europe has made it still more difficult for the motor car industry to expand exports, and the big increase in exports of ships and boats may not be maintained this year; the tonnage completed for foreign owners in 1956 was exceptionally high. But exports of aircraft should continue to rise, reflecting the growing volume of foreign orders for the Viscount and other aeroplanes, and there are signs of a revival in exports of cotton textiles.

A further expansion in exports to North America and some European countries should be possible, and there is the prospect of some easing in import restrictions in Australia, and perhaps in New Zealand too. On balance, the opportunities for British exporters seem more favourable than a year ago.

A Peep into the Bargain Basement

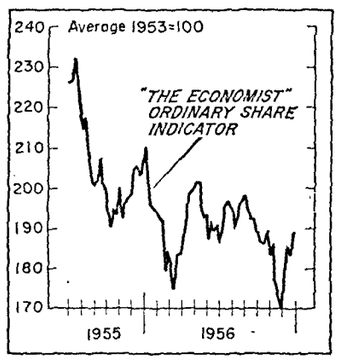
BAD times are here again, and it is time for investors to start thinking about buying. Once that paradox has been understood the investment problems of 1957 can be faced rationally. But it must be understood that successful investors are those who buy in a depressed market and sell in a booming one. They think seriously of selling a shipping share with apparently brilliant prospects at a time when freight rates have already reached an all-time peak. And they think seriously about buying motor shares when the short-term outlook for the motor industry is manifestly bleak. Such an investor is not yet a substantial buyer. He knows that the worst from industry has still to come, but he also now begins to think about the abolition of petrol rationing, and the possible reduction of the tax on petrol, and make his guess about the timing of those events. He steers by anticipation.

If the outlook for industry is a happy new year in 1958, opportunities for investors should occur in 1957. Company reports will be showing narrower profit margins, with—it is a reasonable guess—much more than a sprinkling of

actual reductions of profits and dividends. Public confidence may still be on the low side. The eyes of the world will still be on sterling and the British gold reserve. But the level of Stock Exchange prices of industrial stocks (not of gilt-edged) is usually determined by a small volume of anticipatory buying. The salesman's brother-in-law who knows that old "Bert" is working harder than ever, the supplier who gets an unexpectedly large order for raw

Rise or fall, per cent on the previous year for the Financial Times ordinary share index and for the gross profits shown in *The Economist* quarterly analysis. A seasonal element persists in the profit curve.

material and the customer who suffers an unexpected delay on delivery may all help themselves to a few hundred shares and start the ball rolling. Therefore, share markets often foretell what the published balance sheets from industry will show, and as the chart indicates they tend to foretell profits about 15 months ahead.



The events of 1956 were certainly not foreseen in these columns a year ago but the investor who took his cue from the forecast made then has, despite the unforeseen events, not done badly. Liquidity, the right prescription, was right for 1956. Those who kept liquid (or invested in short dated stock and therefore on balance did not suffer depreciation) now have full freedom of choice. Is it right now to pull on one's buying boots and stride into the market? If so, which direction shall the sortie take?

There seem to be four main pitfalls to be avoided by those who do venture out—(1) a weakening of sterling, (2) some loss of competitive power by British industry as the bills for the Suez affair are added (as in the end they must be) to industrial costs, (3) some (presumably temporary) recession in commodity prices after the Suez bottleneck is uncorked, and (4) the risk, though it is not a certainty, of market recession on Wall Street from which British share markets could not hope to be immune.

Before he goes far the investor must make up his mind about sterling. It will, no doubt, be successfully defended. The whole of British financial policy since Suez has been keyed to mobilising reserves in order to defend sterling, and the reserves thus mobilised make a formidable total. But there may well be times during the next few months when those whose portfolios contain a hedge against sterling will feel more comfortable for the fact. The obvious hedges are dollar stocks or gold shares with copper shares and diamond shares as second strings. Each of these must be considered on its merits as an investment as well as for its insurance value. Dollar stocks as a stake in the risks and the great possibilities of growth in United States and Canadian industry, copper in relation to the possibility of lower dividends resulting from the lower price of the metal, diamond shares in relation to a possible recession in the demand for industrial stones and to the reported Russian discoveries and gold shares in relation to the fact that French investors are now buying them as a hedge presumably against the franc. The conventional gold shares to hold for the purpose of hedging are the established producers of the Rand, but it is worth consideration whether the geographical balance of the industry has not shifted so far away from the Rand towards the Orange Free State as to make some of the new mines of the OFS a better choice. Investors who prefer a holding not tied to the fortunes of one mine will naturally choose the shares of one of the mining finance houses.

The investor can also afford to look at the gilt-edged market. That market looked ripe for an advance when the Suez crisis broke in July. Instead of a rise there was a fall, but in the last few weeks it has looked firm again, and rides into the new year in good fettle. If enough confidence can be built up, buying of gilt-edged and other fixed interest securities can be expected to increase and to spread from the ultra-short dated stocks towards the medium dates.

No one would suggest that any investor should plunge headlong into the industrial share market. The risks are many, and the trough of the bear market has likely enough not yet been reached. But such a trough never is recognised until it has been passed. There is a case for the substantial fund that has kept itself conveniently liquid now to start looking out for opportunities for investing a small part of the available total, choosing its purchases from among those industries that have been hit hardest—not least hard—by recent events, choosing also as always from among those industries where the element of long-term growth is strong. The motor industry selects itself (and if the motor industry is right, can hire-purchase finance be far behind?). The oil industry equally seems worth looking at and possibly the textile industries, which have recently produced some unexpectedly good results. Possibly, since nothing seems likely to prevent this from becoming increasingly an electrical copper age, it is worth assessing copper shares again at the only point in a decade when a reduction in dividends has looked likely. Equally the argument exists for looking at copper finance shares.

It is likely that 1957 will be a year of shocks for investors, and that many of them will be unpleasant. No one yet knows the full cost of the Suez affair or what twist it may give the economy. The cautious investor will not discard his caution, but for those few who command courage, caution and arithmetic, the shocks themselves may produce useful opportunities.

FLYING TO CANADA?

TWO WAYS TO SAVE WITH TCA

15-DAY EXCURSION
SAVE £34
on a normal tourist fare

Now you can fly to Canada on TCA's new 15-Day Tourist Excursion, and save over £34 on a normal tourist fare. Fly the fast, direct TCA Super Constellation route to either Montreal or Toronto.

Ask your Travel Agent for full details of TCA's two wonderful saving offers.

FAMILY FARE PLAN
SAVE £214†
on fares for a family of four

Once again TCA's popular Family Fare Plan will be in operation from now until March 31, offering really worthwhile saving for Dad, Mum and the children when they fly together in either Tourist or First Class.

† Based on a family of four flying Tourist return from London to Montreal.

ICFC

Finance for Industry and Commerce

ICFC provides finance in the form of long-term loans on fixed terms, or share capital, to industrial or commercial enterprises established in Great Britain. Amounts range normally between £5,000 and £200,000.

During the present period of credit restrictions, the Corporation will only consider applications for capital from firms concerned in work of national importance. Consideration may also be given to new ventures which are soundly conceived and adequately sponsored.

Please write for our booklet—"Capital for Business and Where to Find It" to Dept. I, at any of the addresses below.

THE BUSINESS WORLD

Lorries in a Muddle

THE row that has blown up to Cabinet level about the fuel rationing scheme for goods vehicles was to be expected. It has arisen just as much from the apparent failure of vehicle operators to understand what the scheme is intended to do as from the nature of the scheme itself. The cut of 25 per cent of total normal petrol and diesel fuel consumption by goods vehicles plainly involved hardship for someone, and it was quite impracticable to do it by issuing the same flat rate ration at the outset to everyone: fuel consumption varies enormously from business to business and from vehicle to vehicle. It was equally unrealistic to think of spreading the cut evenly over all traffics, since some consideration must be given to traffics that can only move by road. So the Ministry of Transport, to whom the rationing of goods vehicles was passed by the Ministry of Fuel and Power, decided—rightly so—to pitch the basic ration at a fairly low level. It set up in some haste a special administrative machine to cope with applications for supplementary allowances from the half-million operators of the 1,150,000 goods vehicles in the country, intending to concentrate the planned cut in fuel consumption upon the road traffic that could most easily be transferred to rail.

This decision inevitably meant that some hauliers and traders would suffer more than others and, unfortunately, also that there would be appreciable delay before all operators knew just how much petrol, both basic and supplementary, they would get, and thus before they could plan their future operations on a fairly firm basis. The Ministry was at fault for not making this unmistakably clear at the outset, though the point was implicit in the statement of priorities for supplementary rations issued a fortnight before rationing began. The basic ration, which throughout the country amounts to a half of normal petrol consumption and a third of normal diesel usage, is designed to allow all vehicles roughly 500 miles of running a month. This is so low as to leave even the least intensively used vehicle with barely any margin to spare. The issue of this basic allowance to all who had bothered to apply was completed by December 17th. By then, too, the Ministry's regional traffic commissioners had opened up 200 sub-offices to handle applications for supplementary rations. But incredible as it may seem, the total number of applications received in the first two weeks of rationing —which admittedly included the Christmas period— was only 50,000, a tenth of the total number of lorry operators in the country.

This is a ludicrously low figure, whichever way it is considered. If the Ministry's statistics are correct, it means that, on average, only 25 applications have been arriving each day at each of its 200 sub-offices— and that replies have been sent at the average rate of only 15 a day. Over the same period, it might be noted, over half the 3.8 million motorists in the country have applied for extra allowances, and these had a proportionately larger basic ration to start with. In numbers of vehicles, however, these 50,000 applications almost certainly represent a proportion considerably higher than a tenth (how much more the Ministry is at present unable to say). They include applications from the divisions of British Road Services, for example, which runs about 15,000 vehicles; most of the 17,000 or so private hauliers, with just over 100,000 vehicles between them, are also believed to have sent in applications; and no doubt many firms with large C licence fleets have also applied. Nevertheless with so few applicants (and several operators have had to make more than one application as their vehicles are licensed in more than one region) the proportion of vehicles for which supplementaries have been applied for can hardly exceed half on the most favourable reckoning.

Why were so few applications for extra fuel received in these first two weeks? It is, to say the least, highly unlikely that the majority of goods vehicle owners are content with the size of their basic ration, even though some efforts appear to have been made to economise in fuel by securing better loadings, by setting up vehicle pools, and by such devices as sending

vehicles out in pairs so that one can be towed other on the return journey. But in many cases reason can only be sheer dilatoriness.

With relatively so few applications to deal with, however, the Ministry ought to have cleared them much more rapidly than it has done. Admittedly, until some idea of the total demand for extra fuel emerges, it might be difficult for the rationing staff to judge how best to squeeze an unknown pint and a bit into the rationed pint pot. Meanwhile it has been dealing with applications largely on an interim basis, and it has representatives of British Railways sitting in to advise which particular traffics could be taken by rail. Unfortunately the Ministry's statistics do not show how many of the 30,000 applications already "dealt with" have been rejected outright, how many have been given advances on account, and how many have been awarded the full, final supplementary allowance. But it appears that few fall within the third category. The niggardly size of some provisional allowances has clearly not been to the liking of many hauliers, especially long-distance operators, who have been naturally quick to complain that their businesses need more fuel but slow to accept that they are likely to be squeezed more tightly than most since theirs is the traffic that is perhaps on the whole most suited to emergency transfer to the railways. This delay is understandable: forced transfer of work to the railways will undoubtedly mean desperate straits for some haulage businesses over the next few months.

★

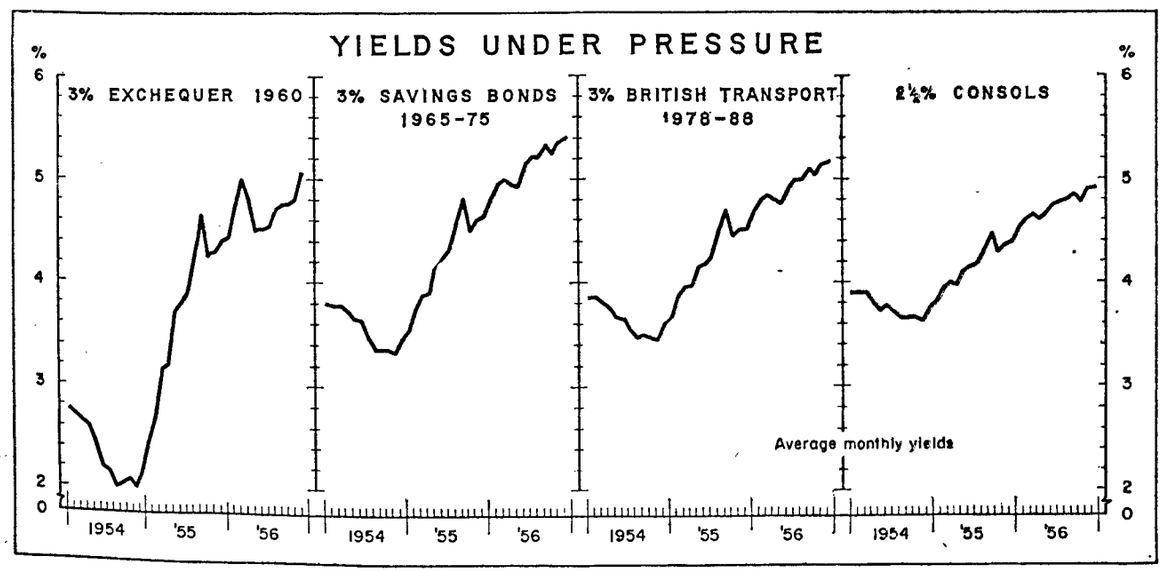
Most businesses, in haulage and industry, thus do not yet know how much fuel they will finally get—which, whatever the cause, is to be lamented—and may not know for at least another month (even if all those who intend to apply do so in the next week or two). But long-distance operators at least ought to have started to plan their future operations on the assumption that they will probably get a great deal less than 75 per cent of their normal fuel needs ("C" licensed fleets getting rather less than haulage vehicles), and other operators can draw similarly conservative conclusions of their own from the Ministry's list of priorities—as British Road Services have had to. The parable about the ten wise and foolish virgins, with their oil lamps, might be borne in mind, even if this time there is a plea, if only of ignorance, in defence of folly.

The experience of British Railways in the first few weeks of the oil shortage certainly suggests this counsel is necessary. Although passenger traffic has risen to about 10 per cent above what might have been expected were petrol not rationed, there has been barely any increase in freight movements that could be ascribed to a diversion of traffic. Coal traffic in the week before rationing was the heaviest since the summer of Dunkirk, but that was almost entirely due to record output in the mines. General merchandise traffic appears to have risen by about two per cent above normal, while mineral traffic has hardly changed. What indications they are of road haulage activities would also seem to indicate that most operators are still running at not far short of normal, steadily eating into their basic ration.

It may be another month, therefore, before any significant shift of traffic gets under way and, instead of being spread fairly evenly over the whole period of shortage, it may well be concentrated upon the later months. This will help neither industry nor the railways, who obviously see in this enforced transfer an unexpected opportunity of persuading some business to return permanently. But how much extra traffic can the railways expect to come forward? The cut of a quarter in the fuel consumption of goods vehicles need not mean as large a cut in the traffic carried, since there are many practicable and economic ways of running vehicles more economically, but it can hardly be less than 5-10 per cent. Since in terms of loaded ton miles road and rail have virtually equal shares of total freight movements (the road share, totalling about 22,500 million ton miles a year, now slightly exceeds that of rail), the additional rail traffic would also be at least 5-10 per cent. But more than half the total road ton mileage comes from fairly short haul work, not exceeding 40 miles a journey, which the railways are unlikely (and naturally unwilling) to find coming their way. If all goods vehicle operators are able to achieve a saving in fuel consumption by more intensive working of, say, 15 per cent and if perhaps a quarter of all long distance road traffic is switched to rail, the overall cut of 25 per cent in fuel consumption would just about be achieved. This would mean transferring about 2,500 million ton miles a year of road traffic, which would add about 12 per cent to total rail movements. In terms of tonnage, which would be of critical importance for railway terminal handling facilities, the extra load would be about 30 million tons, or 10 per cent more.

This is only a rough guess at the possible order of the switch in traffic, but it may not be very far out if industrial output does not suffer from the oil shortage. Could the railways carry an extra load of this order? Again there can be no precise answer. Undoubtedly the railways have much spare capacity, especially for general merchandise, but this margin varies in different parts of the country, over different routes, and also at different times. Speed of wagon turn-round, the capacity of terminal facilities, and the shortage of certain grades of labour will set the limits. If the bulk of diverted traffic were available in full wagon loads for fairly long journeys there should be few difficulties, and the rates would be competitive. But if a lot of unsuitable traffic is forced to transfer, such as parcels and other small consignments—or furniture, at the other extreme—there would be trouble. Packing and handling costs may present certain problems as the railways have not much spare container capacity. But the most immediate need is for the transfer to start fairly quickly. Otherwise there could be a real "road-to-rail crisis" in March or April.

A Gilt-Edged View



IT was in mid-November 1954 that the gilt-edged market turned downwards. War Loan 3½ per cent was then standing at 90¾. Two years later on November 30, 1956, with a strong element of lack of confidence added to the tightened grip of the credit squeeze, War Loan touched its lowest point of 68⅛. From there the market has rebounded to finish the year and start the new one in good spirits. Window dressing has occurred, though the Government broker's action has been limited to raising his selling prices as the market rose; the banks doubtless feel that they have been fortunate in the level of prices that prevailed for their December 31st balance sheets. But it is quite arguable that something of more substance has also been happening in the gilt-edged market, possibly even that a two-year bear market is played out. The stricter credit policy remains almost intact, but the turn downwards preceded by a significant interval even the first tentative application of it. There is no reason why recovery should not precede any remission of strictness in policy. Prices are made by what buyers and sellers suppose is going to happen just as much as by what has already happened.

To accept the view that a steady to firm gilt-edged market may be in prospect does not mean going any distance with those who proclaim that a reduction of Bank rate is just round the corner. It is, however, essential to believe that the credit squeeze will not be intensified, that the Chancellor will feel that recent events have given the economy a shock sufficient to make any further tightening of the credit screw unnecessary. Since the Chancellor undoubtedly would tighten the credit screw if that were necessary to defend sterling, it is also necessary to assume that sterling will be sustained by the measures already taken. Investors are beginning to make these assumptions.

There are signs too that on the market side the credit squeeze is being applied in a slightly more liberal way—with the object not of depressing gilt-edged prices but rather of obtaining the maximum amount of funding at steady prices. The distinction between the two is narrow: the Government broker must remain a persistent net seller whichever form the policy takes. The distinction is rather in his manner of selling which must on the new view be based on the assumption that a steady market is a better incentive to buyers than are falling prices. It may be significant that he is a buyer, not a seller of the next maturity, the 5 per cent stock of 1957, though it is now little more than a six months bill, whereas a year ago he was still a seller of the 1954-56 stock that was then the next maturity.

The buying of gilt-edged during these past few weeks is worth a closer glance. It has not until this week been large. The buying by discount houses of short bonds has been a substantial element in it. It included some closing of short accounts by the market itself that must always occur as the jobbers change their view. But the institutions—pension funds and insurance companies—have also been buying in a small way and that buying could, if the climate were right, go further. The banks have bought little since the Chancellor beckoned them into the market last July.

The banks had every excuse for responding tardily to the Chancellor's scarcely veiled invitation to increase their investments; they had to face an unknown loss of deposits when the premium bonds went on sale, and they had wounds to lick resulting from their previous

incursions into the gilt-edged market. But the first rush for the premium bonds is now over and if interest rates remain fairly attractive and the market seems firmly grounded, some of them will be tempted to buy more freely. It is likely that the insurance companies and the self-invested pension funds have money available for investment. They have already put a good deal into long-dated and high-yielding industrial debentures and the ICI convertible loan stock has tickled their fancy. But the supply of such stocks is limited. The institutions have probably invested almost as much as they wish in unquoted investments such as local authority mortgages. Moreover, the squeeze on the capital expenditures of the local authorities is probably now actually reducing the calls that they will try to make on the mortgage market.

Stability appears to be occurring at around present interest rates. From the published indications savings seem to have responded to higher interest rates. The national savings total for the first three quarters of the financial year (excluding accumulated interest but including the premium bonds) showed a net inflow of savings of £57.3 million, compared with a net outflow of £57.8 million in the same part of the previous year. The building societies, too, have raked enough money in to be able to start lending more freely in 1957 and the insurance companies are now announcing their usual array of annual records. A steady market of the kind that happens without being engineered would be of no small assistance to the Treasury itself. Its 1957 maturities make a formidable list—£101 million of 2¾ per cent Funding Stock reaching its final date on June 15th, £300 million of 5 per cent Exchequer Stock maturing on the same date and £503 million of 2½ per cent Serial Funding Stock maturing on November 14th, making a total of £904 million of compulsory maturities. In addition there are £2,185 million of optional maturities of which, however, only the £676 million of 4 per cent Conversion Stock 1957-58 is at a price which makes its redemption a proposition worth considering. The Government must therefore undertake substantial conversion operations in addition to whatever borrowing it has to do for the nationalised industries, and it must find dates for other borrowers.

The sale of a large amount of stock on the market and the switching of a large amount on terms that enabled the Government broker to accumulate the next maturity without paying out cash on balance is possible even in a falling market as the well-fought rearguard action of 1956 showed. But it would be infinitely easier on a market that was active and holding steady. With good luck that could be the climate. There will be reactions ; possibly the rise, particularly in the short-dated stocks, has recently gone too fast and investors will remain nervous about sterling for some time. But without expecting the advance to remain as sharp and unbroken as it recently has been, the optimists think they can look forward to a little more buying by the banks who look to the short dates and a little more by those institutions that prefer 20-year stocks and longer. And as confidence grows buying should spread from the short and the long towards the medium dated issues.

Business Notes

Happy New Year for ICI

About 70,000 applications for £240 million of stock have made Imperial Chemical Industries' issue of £40 million 5½ per cent convertible loan stock at £96 a huge, indeed an embarrassing, success. Allotments will not be made until next Thursday, and the start of dealings, probably on January 14th, is still further off ; but the market is already talking about a premium of 2½ points when dealings begin. In support of that argument the strong demand for industrial fixed interest stocks can be quoted. When the terms of the ICI issue were fixed the Esso debenture stood at 3 discount, and now stands at only ¼ discount, while the British Oxygen debenture stood at 1⅛ discount and has now risen to 4¼ premium. With ICI ordinary stock at 39s., it costs, including stamp duty, over 40s. a share to bring it home. The option to convert the new loan stock into ordinary shares at the equivalent of 40s. next July is thus already of more than potential value.

The success of the ICI issue was only one symptom of the buoyant market that saw the old year out, and gained further strength with the opening on Wednesday of the first stock exchange account of 1957. Gilt-edged—especially the short-dated stocks—have been heavily bought in a rising market though the market paused when it learned the gold figures on Thursday. Industrials, including most of the recent favourites, have been moving upwards. Borax at £15¼ on Wednesday showed a rise of 25s. in two days. In the new 5s. form on Thursday the shares eased to 25s. 4½d., slightly less than the equivalent of Wednesday's price. Oil shares, too, have gone ahead, and textile shares have been attracting broadening interest. Investors are in

much happier mood. But lest the picture should get out of perspective, it is worth remembering that prices are recovering from a low level and that the volume of activity is still fairly modest. The number of Stock Exchange markings on the first day of the first account of 1957 was 9,006. On the corresponding day a year ago the number was 12,151.

Gold Reinforcements at Work

Any remaining illusions about what would have been sterling's fate if the Chancellor had not been able to make his swift and grandiose mobilisation of second-line reserves must be finally shattered by the December gold figures. Without the drawing of $561½ million from the International Monetary Fund the reserves would have fallen by not much short of $400 million ; the extent of the loss without the knowledge that this and the other major reinforcements were available defies imagination. The December account was burdened by very large end-year payments on North American loans, totalling $188.6 million ; this included $104 million on the US and Canadian postwar loans paid into a special holding account of the Federal Reserve Bank pending Congressional sanction of the waiver. In addition, $49½ million was paid to the European Payments Union in gold settlement of the November deficit of £24 million, and $3 million as the usual monthly instalment to EPU creditors. The residual dollar deficit thus comes out at $158 million.

THE PAYMENTS AND THE RELIEF
($ million)

Reserves at end November		1,965
End-year debt payments:		
US and Canadian post-war loans and lend-lease settlement :		
Principal	−71·8	
Interest paid to holding account	−104·0	
Interest and principal on loan element of Marshall Aid	−5·3	
Quarterly instalment Canadian interest free loan of 1942	−7·5	
Monthly repayment to EPU creditors	−3·0	
	−191·6	
EPU settlement for November	−49·4	
	−241·0	
US Aid	+ 6·0	
Residual dollar balance	−158·5	
Drawing from IMF	+561·5	
Change in reserves in December		+ 168
Reserves at end December		2,133
Reinforcements mobilised:		
IMF standby credit		*738·5*
Export-Import credit		*500*
Release of holding account ( )		*103·8*

It is understood that the whole of this loss was attributable to operations in the first ten days of December, before the announcement of the IMF assistance (which includes a standby credit of $738½ million). The rate of the speculative and psychological drain in this period thus appears to have been at least as strong as in November, when the gold loss was $279 million ; though the pressure in EPU appears to have abated, as the month's deficit fell from £24 million to £8 million (of which £2 million represented a half yearly interest payment), to be settled by a gold payment this month of $17 million. Part of last month's loss is attributable to payments for dollar oil, but this is believed to have been relatively small in relation to the capital strain in the first ten days.

Sterling now stands in good stead to meet the current strain of the Suez dislocation. Behind the enlarged reserves are the lines of credit of $738½ million from IMF and $500 million from the Export-Import bank—and it seems that the Ex-Im credit is likely to be used liberally to maintain the level of the central reserves. A further reinforcement should soon be provided by the release of the holding account. Finally, there is no reason to expect further sustained speculative pressure. Sterling has continued firm at around $2.78⅛ since mid-December, and on Wednesday it reached $2.78 13/16. The advance was continued on Thursday after the gold figures were announced. The spot rate headed $2.78 7/8-1 1/16, the discount on sterling three months forward dropped to 2 cents, compared with 2½ cents a week earlier.

Demand for Steel Now

Now that steel prices have gone up, the industry is waiting to see whether its customers will begin to run down their stocks really sharply in early 1957. Nobody knows yet how steel stocks in the hands of merchants and consumers stood at the end of the year, but there is not much doubt that they were still very high. The peak, just over four million tons of finished steel products, may have been passed a little more than half-way through 1956 ; by the end of September consumers' stocks showed a very slight decline, though merchants' stocks had risen further. But at that time everybody knew an increase in prices could not be far off ; today, steel is not quite as much better than money as it was a month ago. Moreover, certain major consumers such as the motor industry must by now have taken a view—probably a poor one—of their prospects in the first half of 1957. Sheet steel stocks were run down a little in the third quarter and probably more in the fourth quarter of 1956, but are still high enough to make a significant difference to current home demand from the strip

STEEL SUPPLIES IN BRITAIN
(million ingot tons equivalent.)

Exports	2·90	3·36	3·4
Home deliveries	16·59	18·21	19·3

mills. The main demand has already shifted from light to heavy steel: will it soften further?

The craftsmen's ban on overtime last year cost the industry half a million tons of the extra output it had intended to deliver, but it still produced about 900,000 ingot tons more steel than in 1955. Imports did not come down in total. On balance, British steel consumers received about a million ingot tons more than the year before, or, say, 750,000 tons of extra finished steel. Although the complaints about shortage of heavy steel continued unabated, consumers did not use all this steel: as so often in periods of shortage, they built stocks up.

Having so far arranged largely to offset the cut it has suffered in fuel oil supplies with extra creosote-pitch and other alternative fuels, the industry has begun this year fairly confident of being able to produce 22¼ million tons of crude steel. It does not imagine that British consumers will want 1½ million ingot tons more steel this year. But it is still in the fairly comfortable position of being ready to sell these consumers supplies they had to buy expensively from abroad last year; the "cushion of imports" is still a plump one. Beyond 1957, the industry is looking rather warily once again at its customers' expansion plans: but not, for the moment, allowing scepticism to temper its own.

Financing Steel Expansion

BEING already committed to a crude steel capacity for Britain of some 23½ million tons by 1958, the industry is now prepared to talk of 28 million tons by 1962; this would require blast furnace capacity for about 20 million tons of pig iron. Between now and 1958, completion of its second development plan will also require £200 million of capital investment, to add to the £550 million the industry has ploughed into steel since the war; and the further expansion up to 1962 at present looks likely to cost another £400 million. If this much expansion is achieved, the industry will have invested about £1,150 million since the war (at today's prices, say £1,300 million).

Where has it been getting the money so far? In its current *Steel Review*, the British Iron and Steel Federation estimates that between 1946 and 1955, of the £427 million it invested in new capacity (as against replacement of plant), only about £105 million, a quarter, was raised by external borrowing. Another quarter of the money, some £110 million, came from what the federation calls "exceptional internal resources"—profits earned by charging export premiums, the earnings of companies from activities outside steelmaking, such as constructional engineering, the temporary use of tax reserves and the "once-for-all" receipts from colliery compensation. Just under half of the investment, £212 million, was financed from "normal internal resources"—retained profits from home steel prices. In 1954-55, these "normal" retained profits were contributing about £35 million a year to investment in steel expansion.

Of the investment that the industry intends between 1957 and 1962, it reckons that £515 million, say £85-£90 million a year, will be required for additional capacity (upon the optimistic assumption that the depreciation provided in the home steel price will take full care of replacement). At best, it thinks, it might be able to borrow from outside at about double the rate of recent years—say £20 million a year. Exceptional internal resources are likely to be down about a third—to say £8 million a year. Retained profits might offer about £42 million a year—leaving out profits gained from export premiums, as a calculation based on expanding capacity for British consumers reasonably should. This leaves a gap of say £20 million required each year to provide this net after tax from home steel prices, the industry would need to raise prices by an average of £2 8s a ton. That estimate leaves out the inadequacy of the depreciation provided in steel prices to cover replacement after tax has been paid; and the need to cover marginal costs on certain plant, as the Iron and Steel Board has now begun to do in the latest steel prices. It is merely a blur account of the profits that the steel industry must have if it is to expand as much as its steel consumers demand.

Ten Years of Rationalisation

THE British coal industry served the nation last year with just about as much coal as it did in 1955, which was certainly much more than in 1947 but also somewhat less than in 1951, 1952, 1953 or 1954. In a year without expansion in the British economy, this was enough to allow the coke ovens and the power stations the extra coal that they, almost alone, needed; also a small increase in the industry's net exports, which had been cut so savagely the year before. Britain began the year with more coal in stock than ever before, and these stocks are probably nearly as high now. They are largely a legacy from the very heavy coal import programme of 1955, and should come in very useful to take some of the work off oil in industry this winter.

Slackening of the general demand for labour during 1956 has not enabled the coal mines to recruit many extra men though it has stopped the mining labour force from declining further; and the miners in the industry have been working rather fewer shifts a week than in recent years. The rank-and-file majority against the agreement reached between the Coal Board and the National Union of Mineworkers to postpone negotiations over the "bonus shift" may revive a danger to output that the board hoped to avoid for a little longer. If the arrangement by which miners receive an extra shift's pay for every week in which they work five shifts were converted into a straight addition to the shift rate, absenteeism would almost certainly increase: how much this would cost in coal is a matter of dispute, but it might reach 4-5 million tons a year.

The board must be apprehensive, therefore, even about maintaining the sorry 1955-56 level of output during 1957. It takes a certain fortitude to declare much pride in the coal industry's recent service to the nation at such a moment, and the National Coal Board's painful protestations this week on the tenth anniversary of nationalisation are perhaps best counted as necessary professions of faith, from which the outsider should decently avert his eyes. All the customary rationalisations are there, burnished with long use: the industry pants away marking time up that downward escalator, inches painfully along its investment pipeline, manfully toils to replace the capacity that vanished yesterday. All, too, must be nearly as true as they are pat; but it is hard to avoid the feeling that while the industry spent the first five years after nationalisation producing extra coal, its extra output ever since has been largely of excuses.

Output Dead Level

INDUSTRIAL output last year seems likely to have run out almost exactly the same as in 1955. During the first ten months of the year the official production index for all industries averaged 137 (1948=100), exactly the same as in those months of 1955; in November, the index seems likely to have been 144-145, against 147 in November, 1952; and heavier short-time working here and there in December will probably have made output then slightly below December, 1955. Seasonally adjusted figures show output in October and November just under 136 (1948=100), about 2 per cent lower than at the same time a year before. But in September and October manufacturing output looks to have been as much as 4 per cent down, on a similar comparison.

The Commission Meets a Monopoly

IN one of the last major inquiries that the Monopolies Commission completed before the new Restrictive Trade Practices Act restricted its activities to the study of "single firm" monopolies, the Commission was confronted with a single firm monopoly *par excellence*—the British Oxygen Company, which is responsible for no less than 98.5 per cent of the oxygen and dissolved acetylene supplied in Britain. The main result of this encounter is a resounding defeat for the British principle of "empiricism" in dealing with monopoly that leaves considerable doubt whether the Commission as now reconstituted is ever likely to achieve anything.

The British Oxygen Company, as portrayed in this report, fits almost too closely to the economic copybook caricature of monopoly to be true. It has steadily worked its way to virtually complete control of oxygen and acetylene manufacture and to a dominant position in the supply of oxygen-making apparatus in this country by buying out its competitors. It has not recently, the Commission thinks, been anxious to push its last, and comparatively insignificant, competitor out of business; but it was only in 1955 that BOC disclosed its ownership of a subsidiary that was being used as a "fighting company" to undercut this rival's prices in certain marketing regions. Much of the oxygen it sells is under contracts that make exclusive dealing with it a condition of supply; and it publishes no price list and charges customers at different rates, usually at delivered prices that tend to average transport costs. Moreover, though BOC since the war has set up its own research department and now spends about 2½ per cent of turnover on research and development, the commission is uncertain whether these efforts are adequate; over the years, most of the significant improvements and developments in oxygen manufacture have come from outside this country. This is not in any obvious way an inefficient company; and it is certainly able to show that the prices of its products have not risen nearly as much since before the war as prices in general. Nevertheless, the commission still thinks BOC's profits in such a relatively riskless situation have been "unjustifiably high."

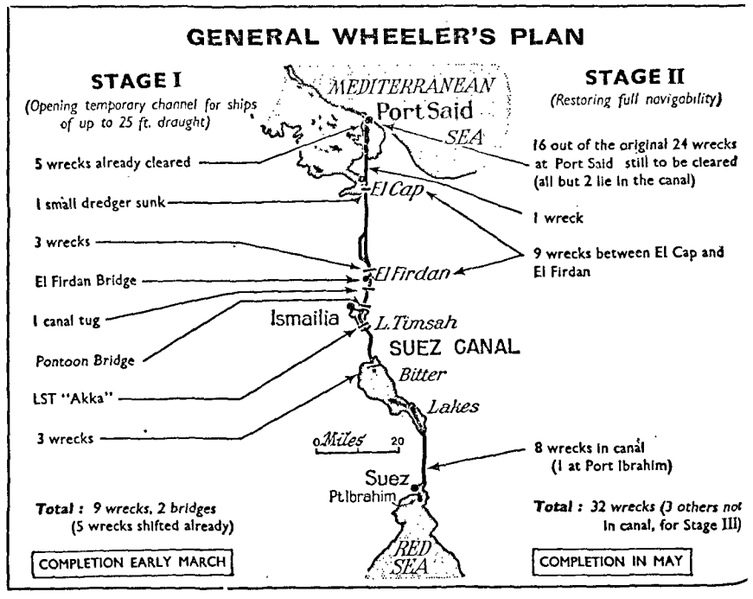
Is State Control the Answer?

JUST where any level of profit becomes "unjustifiably high" is a question that other businessmen as well as the British Oxygen Company might dispute with the Monopolies Commission. In the years 1952 to 1954, on its gas manufacturing and selling operations, BOC made a profit of 23-24 per cent on capital employed, counting capital at historical book values written down at Inland Revenue rates. The Commission finds that this rate on historical capital values gives BOC, "an almost complete financial monopoly facing a limited financial risk," a higher rate of profit than most groups of public companies according to figures the commission has calculated from results recorded by *The Economist* (which are obviously an average of higher and lower rates) in the same years. In reply, the company reasonably enough points out that if the assets employed are taken at replacement costs, this margin of porfit looks much smaller—about 16½ per cent. To this, the commission in its turn points out that BOC was able to raise £8 million of new ordinary capital in 1955 on a basis offering a 6 per cent yield, which would have required just over 9 per cent in profit before tax. Even on the replacement basis, it therefore argues, a substantial part of BOC's profits would remain after giving the return that stockholders now demand from investment in so safe a business.

The company, incidentally cited in its argument about profits the fact that the nationalised Iron and Steel Corporation of Great Britain was permitted to earn 17 per cent on the replacement value of its capital in 1952. This, however, related to profits not only on home sales of steel but on exports and activities outside steel; and it might be added

that in its heyday the Iron and Steel Corporation hardly controlled quite such a proportion of the iron and steel industry as BOC does of output of these two industrial gases.

Two of the members of the commission, indeed, suggested that "the desirability of public ownership and management, with a guaranteed return on capital, should be seriously considered" (they might even have nominated a possible chairman). All the members agreed that the monopoly position of BOC operated against the public interest and may be expected to continue to do so unless changes are made. But the main change that the commissio has to suggest is a sad anticlimax: that BOC's prices a costs should be subject to periodical review by the Boa of Trade. Price control is hardly the most obvious wa to restore free competition to any industry. British ant monopoly legislation makes no provision for the breakir up of any company into competing units (and incidentall none for this special form of discriminating price control But without some such power to restore competition, rath than chain monopolies by the leg, it might be as well disband the reconstituted Monopolies Commission.



Prospects at the Canal

AFTER several false starts, the United Nations salvage team has at last begun clearing the Suez Canal. Although full details of the salvage fleet under General Wheeler's command have not yet been released, it is clear from what is already known that his force is not the equal, in size or effectiveness, of the Anglo-French force now lying idle. Five British salvage vessels at Port Said have been taken over temporarily, and General Wheeler is now reported to have decided that he will not need any of the others.

General Wheeler's plan of operation is virtually th same as that prepared by the Admiralty some weeks ago. The work is divided into three parts. The first stage will be to clear the nine wrecks remaining in the main channel which, with the two destroyed bridges, still deny passage to vessels with a draught of up to 25 feet. Stage two is intended to restore the canal to full use, which means clearing a further 32 wrecks, repairing essential shore facilities, and doing any necessary dredging —which might be considerable at the southern end. The final stage will include the removal of all remaining obstructions from ports and basins and the disposal of wrecks previously raised and towed out of the main channel. If General Wheeler is able to keep to his timetable—the course of events since he arrived in Egypt makes one wonder—stage one should be completed, and a temporary channel opened to shipping, early in March; stage two, and the restoration of maximum transit, should be finished in May. This is rather more optimistic than the Admiralty's tentative schedule; with rather more resources it estimated that stage one would take seven weeks against General Wheeler's ten, but General Wheeler has had the opportunity of examining the wrecks on the spot.

Most of the work in stage one will arise in the centre of the canal, and three teams are to tackle it simultaneously. The first will operate between Port Said and El Firdan (4 wrecks); another will tackle the three obstructions between there and Lake Timsah; and the third will operate southwards to the Red Sea (also 4 wrecks). The object will be to lift these wrecks to the side of the channel or slew them parallel to the banks. Lifting craft normally work in pairs and operate by passing wires under the wreck, securing them to the lifting craft on each side. These vessels then alternately fill and empty their tanks with water, tightening the wires at each fill (as there is virtually no tide in the canal, normal tidal lift cannot be used). Where the weight of the sunken ship is too heavy for lifting craft, buoyancy may have to be restored by patching, coffer-damming and pumping, or by the use of compressed air. In the last resort a wreck may have to be carved or blown to pieces, and this may yet be the fate of the tank landing ship "Akka," which lies on its side with a cargo of cement and scrap iron an presents the stickiest problem of all th 52 ships originally sunk.

World shipping movements will n return to normal immediately stage tw has been completed (even if no politic blocking follows the removal of th physical obstructions). Nor ca Western Europe expect more than trickle of oil imports from the Persia Gulf *via the canal after stage one* over. The temporary passage will tak the smallest tankers only, and even the vessels may at times be subjected some delay. Even when canal mov ments are back to normal, it may b wise not to count on oil restrictio being removed until refinery stocks ha been built up to working levels and als perhaps, until repairs have been made the Iraq Petroleum pipeline in Syri On General Wheeler's present rath favourable forecast about clearance wo at the canal, petrol rationing will plain have to last until at least June or July.

Budget Off Target

IT now seems certain that the Exchequer accounts for the current fiscal year will show a marked divergence from the budget estimates. The Chancellor stated last month that the total outturn "will be better, not worse, than I forecast last April"; but as he then intimated, this would be wholly attributable to a shortfall in issues below-line—"by more than £150 million" compared with the budget estimate. However, a large part of this saving does not represent a corresponding relief for the economy as a whole; and part of it may represent merely a temporary lag in payments, authority for which is not confined, as it is for payments above the line by the Finance Act, to the current fiscal year. In the above-line account, the deterioration seems likely to be considerable, notwithstanding the Chancellor's declaration last month that the surplus will still be "very large."

Total deficit	**−927·5**	**−118·1†**	**−222·0†**

* Original estimates; not providing for subsequent net cuts in expenditure, estimated in budget speech at £20 mn., arising from reductions in bread and milk subsidies, as partly offset by increases in farm subsidies and family allowances. † Increased deficit. ‡ Increased surplus. § Reduced deficit.

The Exchequer returns for the first nine months of the fiscal year, to December 31st, show a rise in total ordinary revenue of £126.7 million, compared with the estimated rise in the full year of £304.4 million; and a rise in ordinary expenditures of £340.0 million, which is nearly £80 million more than the budgeted rise in the full year. The net deterioration in the above line balance is thus £213.3 million, compared with the budgeted improvement of £42.7 million, to a surplus on the basis of the original estimates of £440 million. The subsequent economies announced in a number of stages by the Chancellor totalled £91¼ million; but of these, it has been intimated that £5 million will not be made on account of the Suez requirements. These are expected to entail additional expenditure of £35-£50 million in the current fiscal year—though a small part of this may be offset by the increase in the petrol tax, which is expected to be more than sufficient to offset the effect of rationing on duty receipts.

More Than Suez

THE rise in budget expenditure is attributable to more than the Suez influences; the increase in spending on supply services now amounts to over £270 million, that is £43 million more than the expected rise for the twelve months. Further, interest payments on the national debt are up by over £64 million, just twice the estimated increase for the full year; one of the most important causes of this must have been the big increase in encashments of national savings certificates (entailing payments of the accrued interest) to exchange into the attractive new issue.

On the revenue side, the significance of the nine months' figures is severely limited by the seasonal concentration of income tax and surtax in the early months of the new year. About three-fifths of the year's income tax remains to be collected in this final quarter, so that the rise in receipts to December 31st by £80.9 million, compared with an expected £142.6 million in the year, is not unsatisfactory. But there does appear to be a marked shortfall in receipts from customs and excise (up by £77.2 million compared with the estimated £144.3 million); this seems attributable mainly to the fall in sales of cars and other durable consumer goods—and thus reflects success in the Government's disinflationary measures. The fall in other revenues represents a small decline in motor duties, a decline in miscellaneous receipts and higher spending by the Post Office, which is now expected to show a deficit, instead of the surplus of £10 million originally estimated.

The deterioration in the above line account has been more than offset by the improvement below line; the net

Retail Business

CUSTOMER TRENDS

This is a new quarterly bulletin for those interested in the home market for consumer goods. It includes short and long-term forecasts of sales by different outlets and merchandise groups, regional surveys and reports on special investigations.

deficit here is £343 million, which is £95 million less than a year ago; yet the budget estimate was of a big increase in the deficit from £538 million to £803 million. (As a result of the new procedure of providing the capital needs of the nationalised industries direct from the Exchequer). The upshot has been that the overall deficit, expected to rise by £222 million to £363 million, has so far risen by only £118 million.

The shortfall in the capital outlays is attributable primarily to lags in loans to local authorities and in those to the state industries. Local loans, which in the full year were expected to fall from £331 million to £220 million, have so far reached only £85.3 million; the switch to market sources of finance has gone further than expected, though the fall is also attributable to some decline in local outlays. The new loans to nationalised industries were estimated at £350 million both this year and next; the first advances were made in August, and by the end-year they had reached only £154.4 million. The mid-December instalment was £46.6 million, which is considerably above each of the four preceding instalments. It included £20 million for the Transport Commission, needed largely on account of the incidence of interest payments, and a first £5.4 million for British Overseas Airways Corporation.

Bill Rate Down Again

At the last Treasury bill tender of 1956 the discount houses raised their application price for 91-day bills for the third successive week—by a further 3d. to £98 15s. 9d. per cent, compared with £98 14s. 9d. on December 7th. The average discount rate at which the full £270 million was allotted thus fell from £4 18s. 1.43d. per cent to £4 17s. 1.81d. per cent, easily the lowest rate for the period covered by the 5½ per cent Bank rate, and roughly ¼ per cent below the highest point reached in the second quarter of the year (in mid-October). The immediate cause of this movement was the market's desire to replenish its portfolios of 91-day paper, since these had been depleted by outside competition and by the fact that it had been virtually obliged to take up large amounts of 63-day bills during the eight weeks (from end-October) when these were on offer.

The keenness of the demand for bills reflects a conviction that the next move in Bank rate will be downwards—and a rising hope that the move may not be long delayed. It is hard to see how such hopes can be reconciled with the Chancellor's pronouncement on monetary policy early last month; but the fact that the Treasury bill rate has fallen steadily for three weeks seems sufficient proof that this easing is not contrary to the wishes of the authorities. Moreover, the money market last Monday enjoyed an exceptionally easy year-end—by midday credit supplies were so abundant as to lead the Bank of England to mop up the surplus by resales of short bills. This ease was partly attributable to precautionary market borrowings of seven-day money at the Bank on two days after the holidays, but the major factor was its large holdings of maturing bills. Although the purpose of the offering of 63-day paper is to enlarge the maturities during the heavy tax-gathering weeks of the new year, the first batch of these bills started with a December 31st maturity, for which the market tendered heavily. To this extent the pressures of the year-end were transferred to the Treasury, which over the turn of the year required £4 million of Ways and Means advances from the Bank of England.

Martins Dividend

Martins Bank, as usual the first of the clearing banks to announce its annual results, has confirmed one expectation and disappointed another. All the English banks have almost certainly gained more from the swing than they have lost on the roundabouts of higher interest rates—and Martins reports a small increase in its published profits, from £930,616 to £944,780. Some City optimists, however, had been hoping for some increase in bank dividends, encouraged perhaps by the increase that is to be made by Lloyds Bank arising from its capital reorganisation. These hopes have been dimmed, if not dashed, by the Martins decision: the bank's final maintains the year's distribution at the 17½ per cent paid since 1953. Significantly, the allocations of retained profits are again confined to inner reserves—£200,000 to premises and £300,000 to contingencies.

Amending the Indicator

At the end of the calendar year, *The Economist* ordinary share indicator is re-based and linked back to the original base (average 1953 = 100) by a conversion factor, as explained in these columns on October 27th when the indicator was introduced. Secondly, the 50 constituent stocks are reconsidered and changes are made to bring in

stocks which are of high current market interest. The latest re-basing has been taken as an opportunity to introduce Burmah Oil £1 units and Joseph Lucas (Industries) £1 units into the indicator in the place of London Brick £1 units and Wall Paper Manfacturers £1 deferred units, a substitution decided upon after consultation with a number of leading stockbrokers. The list of London Active Securities appearing on page 67 has also been revised.

The Economist Indicator shows that over the calendar year ordinary share values fell by just over 8 per cent. At the end of November, after the repercussions of the Suez crisis, these values showed a fall over eleven months of about 17½ per cent. Thus in December leading active stocks rallied sharply—much to the relief of those who value their portfolios at the year end. Following a further rally in the market, the indicator, in its slightly amended form, had risen to 190.5 by the close of dealings on January 2nd.

Better Discount Results

The good running margins enjoyed on financing bill portfolios and the recovery in short bond values during 1956 have enabled those discount houses that were hard hit by the onset of dear money in 1955 to make good some of the damage then done. The National Discount Company, one of the two big houses that was last year obliged to reduce its dividend and to show a substantial uncovered depreciation on its bond portfolios, is maintaining its distribution at the lower level (10 per cent, against 12 per cent in 1954), but this time the payment is apparently being made out of a current surplus—the disclosed "balance of profit" of £202,103 is computed after making a provision "towards" depreciation on securities—whereas in 1955 the "balance for the year" (of £105,725) reflected transfers from inner reserves. After the remainder of the contingency reserves had been applied to writing down investments, there remained a book depreciation of £3,228,203; this has now narrowed to £2,493,573, and thus is just covered by the published reserves and carry-forward.

The Union Discount, the only one of the big houses that succeeded in 1955 both in maintaining its dividend and in valuing investments at or below current market prices, is also maintaining its dividend this year at 12½ per cent. Its published profit is £420,000, in place of the "balance for year" of £391,000 reported for 1955. The 1954 profit was £505,000.

Dearer Tea

The steady advance in prices of plain tea is now being passed on to the British public. Several blenders have raised their retail prices by between 4d. and 8d. a lb, and other firms will soon follow suit. The rise in prices is mainly the result of the shortage of tea in London following the closing of the Suez Canal. In the two months before the Christmas holidays the official quotation for plain tea in London rose by 2s 1½d to 5s 6½d a lb, and it has only dropped by 2d a lb since then. Prices of the better grades, however, have been falling steadily. That fall chiefly reflects the seasonal decline in quality, and hence it does not fully offset the higher cost of plain tea. Three months ago the "concertina" between plain and best tea stretched from 3s 6d to about 10s a lb; now it has shrunk to between 5s 4d and about 6s 4d a lb. Arrivals of tea via the Cape are now being landed in London, and the quantities put up for auction here are increasing. Buyers are naturally hoping that prices of plain tea will weaken further.

Cooler Fusion

Scientists at the University of California believe that they have been able to bring about fusion between two atoms without having to resort to the immense heats of 100 million degrees centigrade that once seemed an indispensable part of the fusion process whether it occurred naturally, as in the sun, or artificially, as in a hydrogen bomb. Full details of the Californian experiments are not yet available but they seem to have demonstrated that fusion between two hydrogen atoms can be brought about through the medium of nothing more formidable than an obscure and enigmatic atomic particle known as a meson. The function and nature of mesons are far from clear; they are reputed to play an important part in holding together the variety of particles, some electrically charged and some uncharged, that make up an atom. They are described as mid-way in size between an electron (the small particle that circles the nucleus) and a proton (the relatively large particle that goes to make up the nucleus). But the fact that a meson lives only for two millionths of a second makes its study difficult; at the end of this brief existence, moreover, it is quite liable to turn itself into an electron.

The mesons studied in California did not all do this. Some of them began to circle the single-particle nucleus of hydrogen atoms for all the world as if they were electrons, but as they were heavier, they got so close to the nucleus that they became what is termed "mesic atoms." In some way, yet to be explained, these mesic atoms have a special affinity for the nuclei of atoms of heavy hydrogen (which differ from "light" or ordinary hydrogen by having two particles, not one, in their nuclei). Revolving around the nucleus of the ordinary hydrogen atom, the mesic atom tends to force it to fuse with a heavy hydrogen atom, probably because its presence so close to the hydrogen nucleus cancels out the forces that normally repel one nucleus from another. The mesic atom remains unaffected by the fusion and if its life were long enough, it would travel off to bring about more reactions. In fact, the life is so brief that a meson cannot often bring off one reaction, even under the most favourable laboratory conditions. It takes vast particle accelerating machines driven by equally large quantities of electricity to provide a stream of mesons adequate enough to conduct even these preliminary experiments.

The importance of the Californian results is twofold. First, it makes a big contribution to basic knowledge of nuclear physics and the intense, highly individual lives of the particles of an atom. Secondly, it adds point to the

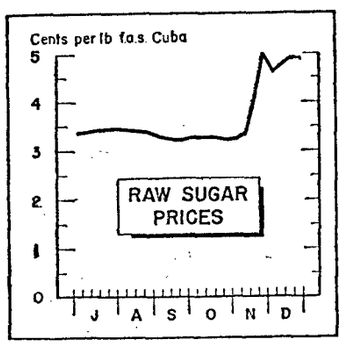
search for still unidentified particles that would behave like mesons but have a longer life. Russian scientists say such a particle exists; if it does, "cold" fusion may yet become a practical way of releasing atomic energy. Work on similar lines is being carried out at Harwell.

The Advantages of Immortality

A SERIES of meetings by shareholders of the various tea companies in the management of Alex Lawrie and Company have drawn the attention of tea investors to a new problem and possibly to the solution of it. The Indian Government collects estate duty on the death of British shareholders of British registered companies if the business happens to be in India. The duty is 7½ per cent on the market value of the shareholding if the value of that shareholding (not of the deceased estate) exceeds 5,000 rupees (about £375). It is a small but persistent drain on the resources of many companies. The Alex Lawrie group (of which Jokai is the best known company) is now altering the articles of association of the companies, so that the burden will fall on the deceased estates and not on the companies.

The precedent may or may not be followed; the agency houses are not all of one mind on the wisdom of this particular method. But it seems certain that all groups will point out to their larger shareholders that immortality is cheap and easy to achieve. For a modest fee—sometimes for no fee if the shareholder is a good customer of his bank—some banks will allow registration in the name of the bank nominee company. Bank nominees never die.

Insurance in 1956



IT seems certain that last year's new ordinary life assurance business has comfortably exceeded the 1955 record of £1,108 million net new sums assured. Staff pension and life assurance schemes are being arranged with the life offices as freely as ever. But the machinery for "Millard Tucker" pension contracts for the self-employed has taken time to run in; it is doubtful if there was any substantial business from that source in 1956.

Further increases in bonuses to the with-profit policy holders of the life offices and the life departments of the composite insurance companies testify to excellent trading profits, the dominant source of which is the steadily rising yield on the invested funds. But the assets, naturally, have suffered depreciation and that has had to be covered out of inner reserves. Those inner reserves have, with very little respite, taken the strain of a decade of falling prices of fixed interest stocks in which—with a few exceptions—life offices invest towards half their assets. In 1956 there was no escape from depreciation by holding British equities. According to the Actuaries Investment Index, debentures fell by 8.2 per cent, preference shares by 9.0 per cent and ordinary shares by the same proportion. A representative life office holding—3 per cent Savings Bonds—fell by 5.2 per cent. On an average distribution of its assets, a life office will have done well in 1956 to avoid depreciation of about 5 per cent of its market value at the beginning of the year. Most life offices and life departments of composite companies must still have some fat left in their inner reserves. All of them can with propriety raise the rate of interest underlying the actuarial valuation of their liabilities in line with the increase in the yield on the invested funds and use the reserves released to write down their assets.

New Start for the Sugar Scheme

BY January 1st sufficient exporting and importing countries had either accepted the revised International Sugar Agreement, or expressed their intention of accepting by July 1st, to bring the scheme into immediate effect. The agreement, which seeks to regulate the price and marketing of raw sugar in the "free" world market, has virtually the same membership as before. It remains for the exporters outside the old agreement—Indonesia, Peru and Brazil—to signify their intentions. Brazil, which took no part in the negotiations last year, is most unlikely to join.

The scheme comes into force when the outlook for the free world market is much brighter than for several years. World demand is buoyant; the burdensome stocks of earlier years have been worked off; the new European beet crop is smaller than last year's and it seems unlikely that the East European exporters will have much sugar to spare. The latent strength of the market was shown dramatically after the fighting in Egypt broke out. In three weeks the spot price jumped by 1¾ cents to 5 cents a lb fas Cuba, the highest level reached for over four years.

When the Sugar Council meets in London on January 29th it will almost certainly have to decide to leave exports unrestricted; this would be the first such occasion in the history of international sugar schemes. There are now four "datum" points for the adjustment of export quotas: 3.15, 3.25, 3.45 and 4.0 cents a lb. When the average price for seventeen consecutive market days is between those points there are complicated provisions for the adjustments of quotas—partly automatic and partly at the council's discretion. When the average price is below 3.15 cents the effective quotas can be cut by a maximum of 20 per cent of the basic export tonnages; when the average price is above 4.0 cents all restrictions on exports are to be removed. The Cuban spot price is now about 5.10 cents a lb and the London price about 49s. 9d. a cwt cif. Forward prices in the London market, which resumed trading in futures this week, suggest that traders are not expecting any radical decline in the next few months.

Shipyards Below Capacity

BRITISH shipyards completed just under 1½ million tons of new ships last year, which was about the same as in 1954 and more than in any other year since the war. But this country was ousted as the world's leading shipbuilder by Japan, which turned out about 1,650,000 gross tons, having doubled its output in 1956. Moreover, the British shipbuilders themselves now argue that they have the labour and the capacity to build more than 1¼ million gross tons of ships a year; what holds them back is lack of steel. The steel industry, while aware that it lacks sufficient steel plate capacity, would presumably reply that its deliveries of steel products in general to shipbuilding rose by about 12 per cent last year, and its deliveries of plates by about 11 per cent.

During the year the yards booked another 2 million tons of orders for new ships, leaving the order books at the end of the year at roughly 6 million tons. This leaves most yards booked into the early sixties; about half this accumulation of orders are for tankers, a third for dry-cargo freighters, and the rest for passenger ships and specialised vessels. The industry has had a number of orders for tankers increased in size during the last few months; it is anxious to argue that several British yards are now capable of building 65,000-ton tankers, and could increase their berths in size to build even bigger vessels. How fast this could be done is doubtful: and if a fleet of super-tankers is required, it will probably take all the available capacity in Britain and abroad to get a significant number afloat before the end of this decade.

SHORTER NOTES

The Central Electricity Authority installed generating plant with an output capacity of 1,797,000 kilowatts during 1956, and about 140,000 kW of generating capacity was commissioned in the power stations now owned by the South of Scotland Electricity Board, which were planned by the former British Electricity Authority. The total of 1,937,000 kW installed last year was a record, as the 1,721,000 kW brought in during 1955 had been. The annual capacity which it had "permission" to bring in during both 1955 and 1956, according to its last annual report, was set at 1,550,000 kW. The authority used to complain that its expansion was being limited by Government orders during the years when it was failing to commission as much as the Government had allowed.

★

In the same inquiry in which it found that the British Oxygen Company's almost complete monopoly of oxygen and dissolved acetylene manufacture and supply in this country operated against the public interest (referred to in a Business Note on page 59) the Monopolies Commission reported that the conditions of monopoly laid down in the 1948 Act existed in the supply of propane in this country, in that Esso, Shell and BP supply over 60 per cent of this industrial gas, and ICI supplies 37 per cent. But it found no evidence of any restrictive practices by these suppliers that operated against the public interest.

★

The Bank of England has transferred, in accordance with the Anglo-Egyptian agreement of 1955, £20 million from Egypt's blocked No. 2 account to its No. 1 account. This has no practical effect, as the current account has been blocked since the nationalisation of the Suez Canal at the end of July.

★

The total value of clearings at the London Clearing House and the twelve Provincial Clearings reached £160,889 million in 1956. This represented an increase of 5.4 per cent; the increase in 1955 was 5.8 per cent, but that in 1954 was 17.0 per cent and in 1953 11.6 per cent. The figures do not include cheques in branch clearings within individual banks or those cleared under local arrangements.

★

The order for 20 Vickers Vanguard airliners placed this week by Trans-Canada airlines is the largest single dollar order ($67 million) to be placed here since the war, and it marks the first sale of the Vanguard abroad. Airlines have been marking time while they weighed the merits of large turbo-props like the 102 seat Vanguard against the smaller jet airliners, British, French, American—and Russian.

Company Notes

DORMAN LONG. The decision by the directors of Dorman Long to leave the ordinary dividend unchanged at 8 per cent surprised no one—at least no one who is aware of the conservative inclinations of the board. What surprised some was the fall in gross profits before tax from £8,152,000 to £7,271,000. Sir Ellis Hunter's statement with the full accounts now makes it clear that much of this decline occurred in the group's bridge building, engineering and chemical divisions. Here gross profits fell by £878,000 to £2,734,000, reflecting chiefly a decline in activity in South Africa but also a "substantial" exchange loss on the devaluation of the Argentine peso. In the iron and steel division, gross profits fell by £313,000 to £4,537,000 as a result of higher costs and the embargo on overtime working by the maintenance men.

The prospect for the group, as new capacity comes into production this year and next, seems to be of rising profits, though not necessarily of bigger profit margins. Against this, ordinary shareholders must set the increase in fixed interest charges. In the last financial year the group spent about £12¼ million on capital account, £11¾ million of it in the steel division. To pay for this the company called up from ISHRA another £750,000 on the 5½ per cent preference shares and the remaining £9 million of 4½ per cent unsecured loan stock. Capital commitments are shown in the balance sheet at £11¾ million, but this is by no means the full cost of development. Before the end of the current financial year, the remaining balance of £3¾ million will be called up on the preference shares and "according to present estimates" the remaining £14¾ million of the loan arranged with the Finance Corporation for

Industry. Investors looking at the yield of 6.8 on the £1 shares at 23s. 6d. xd. may come to the conclusion that an increase in the dividend, welcome though it would be, is still not in sight.

★

COTTON RESULTS. Lancashire is used to hard times, and when the immediate prospects for the cotton industry look a little brighter its spokesmen are seldom jubilant. Two instances of their ingrained reticence came to the notice of investors at the turn of the year.

Lancashire Cotton Corporation's full report for the year to October 31st showed that the directors' unexpected decision to raise the ordinary dividend from 12½ to 17½ per cent was fully justified by reserves and strong liquid resources. The report also showed that trading profits had risen from £2,865,376 to £2,929,715 and total income from £3,015,537 to £3,250,265. Over the same period the value of stocks went up from £5,941,592 to £7,273,519. The profit figures are surprisingly good, but the chairman, Mr Roger Lee, does not tell shareholders how they were achieved. He tells them instead of the difficult times the Lancashire industry experienced in the first months of 1956, owing to the uncertainty about the disposal of the American cotton surplus.

Part of the explanation of the increase in profits may perhaps be found in Mr Roger Lee's references to the acquisition of three new spinning subsidiaries (included for the first time in the 1955-56 accounts), to "successful bulk production" of new yarns, and to the production of man-made fibres for the tufted carpet industry. Mr Lee now reports that order books have lengthened and are "satisfactory."

The reticence of **Fine Spinners and Doublers** is of a different kind. Announcing the repetition of an interim ordinary dividend of 5 per cent, the directors say a good deal about the state of trade but publish no profit figures, merely saying: "results for the first half of the year have been moderate." Yarns spun wholly from rayon and synthetic staple fibres by Fine Spinners have enjoyed "a steady trade," but blended yarns of cotton and rayon staple have had to face "exceptionally keen competition." Since early autumn, they add, there has been the usual seasonal improvement in all sections of the business, "stimulated this year by the crisis in the Middle East." Orders are sufficient to carry the group well into the current calendar year.

★

RALEIGH INDUSTRIES. "The sellers' market has come to an end rather more abruptly than many of us expected." So says Mr George Wilson, the chairman of Raleigh Industries. At the end of last July the group effectively had no cash resources; it had borrowed over £650,000 from the banks; and it has plans to spend another £4,500,000 in the next few years on capital account. Most boards of directors, confronted with these facts, would have been content to leave the ordinary dividend unchanged. Yet the Raleigh directors decided to increase the dividend from 12½ to 13½ per cent, an increase in line with the rise in trading profits from £2,192,593 to £2,367,374 and the consequent increase in payments under the profit sharing scheme.

Raleigh Industries has become increasingly dependent on overseas sales. In 1955-56 export sales rose by 27 per cent, but sales at home fell by 15 per cent (compared with a decline of about 30 per cent in the industry as a whole). Over 70 per cent of the group's production of bicycles goes into export markets. So far in the current financial year, export sales have been maintained, but these may be affected by the closing of the Suez Canal and by the repercussions of the Middle East crisis. At home sales are running below those of the last financial year, though in recent weeks they "have taken a turn for the better." This may not be unconnected with the introduction of "an improved and more attractive easy payment scheme with reduced interest charges." It is difficult to infer from this report that another increase in profits is likely this year, and without higher earnings a bigger dividend seems unlikely.

LONDON STOCK EXCHANGE

Next Account begins: January 16th

Next Contango Day: January 16th

Next Settlement Day: January 8th

THE firmness of gilt-edged securities has been a feature of the market since the holiday. The short-dated stocks have continued a move upwards; 4 per cent Conversion 1957/58 gained another ⅜ to 98⅞ and the movement was continued throughout the list, 3½ per cent War Loan improving 1⅛ to 71. Industrial stocks did little more than hold their recent gains up to the close of the old account, but the new account brought a general rise in prices.

Bank shares were often slightly lower. Martins £1 losing 1s. 6d. to 64s. 6d. following the results, but District "A" rose 3s. to 74s. 6d. Discount houses showed sizeable gains and finance houses also advanced. Ford was outstanding among motor shares, rising 2s. to 31s., and Dunlop recovered 1s. 1½d. to 16s. 9d. A further swift rise occurred in textile shares: British Celanese gained 1s. 3d. to 14s. 9d. and Courtaulds 1s. 4½d. to 34s. 7½d.; Patons and Baldwins picked up 1s. 10½d. and Jute Industries jumped 3s. 3d. to 19s. Marks and Spencer rose a further 2s. 10½d. to 63s. 9d. Shipbuilding shares were well supported, but steels were again in decline. London and Overseas Freighters and Borax both advanced on the stock splits.

American plans for the Middle East helped oil shares to stage a sharp recovery on Monday, but after rising 10s. to 144s. British Petroleum then eased to 41s. 6d. Kaffirs showed many sharp rises; Buffelsfontein was 3s. up at 33s. 1½d. and Doornfontein rose 2s. 7½d. to 25s. 6d.

***The Economist* Ordinary Share Indicator was re-based on December 31, 1956, and linked back to the original base (Average 1953 = 100). The opportunity was taken to replace London Brick £1 units and Wall Paper Manufacturers £1 deferred units by Burmah Oil £1 units and Joseph Lucas (Industries) £1 units in the 50 ordinary shares used.**

[1] Electricity production for New Zealand represents about 87 per cent of total generation. [2] Copper and tin refer to metal production. [3] General trade (including re-exports) except for Canada, which is special trade only. Imports are cif except for Australia, Canada and S. Africa which are fob; exports are fob. Trade for India includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia 12 months ended June 30th. [4] Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for S. Africa and S. Rhodesia relates to Europeans only and for S. Africa includes direct taxes. [5] Including foreign investments. [6] Including semi-processed gold. Beginning January, 1955, including South-West Africa. [7] In July, 1948, part of holdings was transferred to the State Bank of Pakistan. [8] April, 1948—March, 1949. [9] Including some long-term securities.

Financial Statistics

EXCHEQUER RETURNS

For the 16 days ended December 31st, 1956, there was an "above-line" deficit (after allowing for Sinking Funds) of £107,270,000 compared with a deficit of £48,087,000 in the previous week and a deficit of £50,201,000 in the corresponding period of last year. Net expenditure "below-line" was £42,264,000, bringing the total deficit to £927,470,000 (£809,435,000 in 1955-56).

THE MONEY MARKET

THE discount market made a further increase in its bid at the Treasury bill tender before the year-end, by 3d. to £98 15s. 9d. per cent. This marked a discount rate of just over $4\frac{31}{32}$ per cent and brought the fall in the rate over the previous three weeks to over $\frac{3}{16}$ per cent. The allotment was down by £10 million, to £270 million, and total applications fell by slightly less; the proportion of the market's application to be allotted remained at 68 per cent.

The market anticipated that the customary year-end squeeze would this year be obviated by the first maturities of 63-day bills. In the event, while credit was in acute demand on Thursday and Friday before the weekend, necessitating fairly large borrowings from the Bank by five or six houses on each day, on Monday itself the very large turnover resulted in a large surplus of funds, taken up by fairly large special sales by the Bank. There was a further surplus on Tuesday, but the Bank did not then intervene. There was a large turnover of maturities, March dates being dealt in at $4\frac{3}{4}$ per cent and February maturities at $4\frac{11}{16}$ per cent. Conditions became tight again on Wednesday, partly as a result of subscriptions to the ICI issue; the Bank made small special purchases.

The Bank return shows a rise in discounts and advances by £34.3 million to £45.3 million, reflecting last week's borrowing by the market.

THIS JUST WENT COMPLETELY OFF THE RAILS

This five-ton steam travelling crane is not the crane it used to be! It raised three tons of stone at a radius slightly less than the correct maximum. A few feet from the ground the load dropped, the crane rocked, and down came the jib, superstructure and all.

What **Vulcan** *say about it . . .*

There's something deceptively solid-looking about a steam travelling crane chugging along its rails. But steam cranes are as vulnerable to overturn and accident as any other type.

Engineer-surveyors from Vulcan Insurance spot danger before disaster, and industrial machinery is their happy hunting ground.

Everything, from a boiler to a vacuum vessel, comes under their expert eyes and receives that specialist scrutiny for which Vulcan is renowned. That's why safety first is Vulcan first.

IMPROVED RESULTS DESPITE GROWING DIFFICULTIES

INADEQUATE TAX ALLOWANCE TO COMBAT INFLATION

MR S. T. FIRMAN ON ABSORBING RISING COSTS

The thirty-ninth annual general meeting of Dowson & Dobson Limited was held on December 20th in Johannesburg.

The following is the statement by the chairman, Mr S. T. Firman, on the year ended June 30, 1956: The year which ended on June 30, 1956, has been one of great interest and intense effort in the face of growing difficulties. It is therefore pleasing to refer to your Directors' Report of November 20, 1956, and to the accompanying Accounts, both of which have been in your hands for some time, which show a Consolidated Net Profit rather higher than in each of the previous three years. The Dividend declarations have been maintained at 17½ per cent on the Ordinary Shares and 5½ per cent on the Preference Shares.

ACCOUNTS

During the year there has been no change in the Nominal Capital of your Company. The issued Ordinary Share Capital was rounded off to £300,000 from £292,000, as intimated in my Statement of December 14, 1955, by the issue of 32,000 Ordinary 5s. shares at 10s. each. The total Issued Capital is now £500,000, being £300,000 in 5s. ordinary Shares and £200,000 in £1 Preference Shares.

The Consolidated Net Profit for the year, prior to taxation, is £224,713 which is £17,893 more than in the previous year. This, however, includes a profit of £7,260 on the sale of certain Fixed Assets. The amount carried forward from the previous year was £694,464, so that the total amount to be dealt with was			£919,177
From this amount was deducted :—			
Provision for taxation		£64,171	
Dividends Nos. 15 and 16 on Preference shares	£11,000		
Dividends Nos. 39 and 40 on Ordinary shares	£51,700		
		£62,700	
			£126,871
Balance carried forward			£792,306

This balance of £792,306 is £97,842 greater than the comparable amount brought in at the beginning of the year and is retained and invested in your business, as is the Share Premium of £8,000 already referred to.

From this balance of £792,306 may now be deducted £30,000, being the 10 per cent Final Ordinary Dividend No. 41 declared on December 10, 1956, in respect of the year ended June 30, 1956.

Interim Ordinary Dividend No. 40 of 7½ per cent plus Final Ordinary Dividend No. 41 of 10 per cent total to 17½ per cent already mentioned in respect of the year ended June 30, 1956; and Preference Dividends Nos. 15 and 16 total to 5½ per cent for that year.

Preference Dividend No. 17, absorbing £5,500, was declared on December 10, 1956, in respect of the six months ending December 31, 1956.

Your Directors have given very serious thought to, and have closely examined the possibility of, increasing the dividend rate on the Ordinary Shares. This has not been possible in the current year due to the increased amount of cash required to finance the contracts which the company has been able to secure and which have yet to be carried out, and to finance the other requirements of an expanding business. It will be noticed from the Balance Sheet that Loans at Call plus the Unsecured Loan amounted to £65,000 at June 30, 1956. Loans on the security of the Company's properties have been increased by £19,000 since June 30, 1955, and stand at £75,000 at June 30, 1956.

The maintenance of Dividends at the previous levels has been achieved despite the continuing inflation which has been noticeable, especially on goods imported from various parts of the world. At the same time and owing to the relaxation of Import Control, competition has again become international in character and the costs of selling and administration have steadily risen. These difficulties have been met by strenuous selling efforts resulting in considerably increased turnover and by selecting those activities carrying better profit margins. The technical staff has been increased in number and in range of technical abilities and the area of activity is being slowly widened to cover portions of Africa not hitherto served.

I am pleased to report that the order book as at June 30th last is greater than in the previous year.

TAXATION AND INFLATION

I trust I may be forgiven for referring to the high taxation rates applicable to Public Companies. Adequate allowance is not provided in the Income Tax Act to cover inflationary factors, with the result that the "effective" tax rate is far higher than the Statutory rate.

I think it cannot be denied that Net Trading Profits should be applied to cover four general classes of appropriation—namely, inflationary factors, taxation, dividends, and that essential "plough back" without which development and progress is barely possible. I think you will agree with the view that the current tax rate is too high for a young developing country, and this position is accentuated by the operation of an Undistributed Profits Tax. Such taxes make it very difficult under conditions of international competition to cover the three other requirements and they tend to encourage the payment of Dividends which are legally out of Profits but are essentially out of Capital, with consequent damage to Company resources and eventual reduction in the amount of tax accruing to the State.

PREMISES

The Directors' Report sets out the properties owned by your Company and it will be observed that Removable Workshops and Store Buildings are being erected on the leased property at Salisbury for the Earth-moving Division of your Company.

Final decision has not yet been taken regarding premises at Durban.

In continuance of your Company's policy of thorough service to its Customers and proper coverage for its Principals, a small branch is now being established at Nelspruit in rented premises.

Arrangements have recently been made for a representative from the Company to reside in Nairobi to ensure that certain important products of your Company will be available to users in East Africa.

THE FUTURE

Conditions in the Central African Federation remain satisfactory.

The Krugersdorp Works continue to be fully occupied with the production of goods for Mines and Railways and for the Building and Heavy Industries. Owing to its versatility it is proving invaluable in the execution of the varied and increasing number of engineering contracts entrusted to the Company.

The Water Treatment Division has enjoyed a successful year and has secured a number of large contracts for completion during the next two to three years in various parts of Central and South Africa.

The range of Industrial Furnaces constructed by the Company was extended during the year by the completion of Licensing Agreements with well-known overseas firms. Encouraging results are already evident.

The franchise for the supply of Wheel and Crawler Tractors, Bulldozers and allied equipment has been extended to cover the Cape Province, where the Company's officers are in close touch with the farming community.

Your Company is fortunate in having accumulated many years of specialised technical knowledge and with the assistance of its overseas Principals, Licensors, and Advisory Engineers, can expect to continue participating in the business offering in South, Central and East Africa.

GENERAL

The prosperity of the Company continues to depend in large measure on the trust placed by its Customers and its Principals in the technical and administrative ability and integrity of your senior Executives, whose sustained efforts are enthusiastically given in your interests. I wish to express the thanks of the Board to the Executive Staff, Branch Managers and all personnel for their loyal and able services rendered during the year.

MERCANTILE CREDIT COMPANY

YEAR OF CHANGE

The twenty-third annual general meeting of the Mercantile Credit Company Limited was held on January 2nd in London. In the absence of the chairman, Sir Mark Turner presided.

The following is an extract from the circulated speech of the chairman, Sir Edward de Stein, for the year ended September 30, 1956:

The financial year now under review has been notable for the changing circumstances with which we have had to cope, for all that we do both at home and overseas has now to be performed within new limits prescribed by law. At the beginning of the financial year these were much less onerous than they are today.

Although the operating profit for the year is little different from that of 1955, the parent company's balance sheet shows some reduction in outstandings, and shareholders should realise that the operations of previous years are partly responsible for our relatively good results.

Ever since the end of the war we have closely watched the Canadian and American scene in instalment financing, and in so doing have learned a great deal. In reverse, we have always welcomed finance company executives from those countries and believe that they have learned from us. It is not surprising therefore that grounds for co-operation should have been found with one such company, Interprovincial Building Credits, Limited, of Toronto.

The report and accounts were adopted.

THE PLESSEY COMPANY

(Manufacturers of Components for the Electrical and Mechanical Engineering Trades)

GREATER VOLUME OF BUSINESS EXECUTED

CURBING INFLATION MOST PRESSING PROBLEM OF OUR TIME

MR A. G. CLARK ON FURTHER BROADENING OF ACTIVITIES

The thirty-second annual general meeting of The Plessey Company Limited was held on December 28th in London, Mr A. G. Clark (chairman and managing director) presiding.

The Secretary (Mr W. F. Cross, BA) read the report of the auditors.

The following is the statement by the Chairman which had been circulated with the report and accounts: We now submit accounts for the year to June 30, 1956. They result in a total profit before taxation of £1,544,712, which is some £10,000 below the profit for the preceding year. The reduction in profit is not, in itself, of great consequence, but it is of importance as indicating that profit margins are tightening. The volume of business done in 1955-56 was greater than the volume done in 1954-55, and we should have been in a position today to report an increased profit had it not been for the disturbance of business resulting from the credit squeeze, and had it not been for the increase in operating costs resulting from the inflationary drift which continued throughout the twelve months under review.

So far as concerns the disturbance of business resulting from the credit squeeze we do not complain. Whatever the complications and difficulties which have been caused by the credit squeeze, the purpose of that squeeze is to curb inflation. To prevent any further surge of inflation is, above all other things, the most pressing of the problems of our time, and if only this problem can be solved the hurts we suffer in the task of solving it are of little importance, and must be borne cheerfully and willingly.

PRIOR IMPORTANCE OF OVERALL STABILITY

Since the squeeze became tighter in the spring of 1956 there have been altogether too many complaints that some one or another trading interest was being badly hit. With these complaints I must admit to having little sympathy. The overall financial stability of the country must take priority over all sectional interests. For without overall stability, we are all heading for trouble. Granted that stability can be obtained, then I am quite confident that this country can maintain its place in the world as a manufacturing power. In this cause no sacrifice is too great.

So far as concerns the increase in operating costs, the increase is the inevitable consequence of the inflationary tendency of recent years, and the risk that we shall price ourselves out of world markets, if that tendency continues, is a real one. We are continually engaged in efforts to improve your Company's manufacturing efficiency, so as to lessen the effect of rising costs. There is a limit, however, to what can be done in this direction, and despite all our efforts the plain fact is that on balance the average product costs us more to produce today than it did two or three years ago.

In February last we made the "rights" issue of 800,000 Ordinary Shares of 10s. each which were offered to Shareholders at 50s. each. This issue brought in £2 million of additional capital, and the effect on our liquid position is reflected in our Balance Sheet. In addition to Stocks and Debtors totalling approximately £6.5 million, we have over £1.5 million in Treasury Bills and Cash. Accordingly we are well placed to finance the further broadening of the base on which the Company operates.

RESEARCH AND DEVELOPMENT

Our work in regard to Research and Development continues to widen this base and to lead to production work of increasing importance. The problems of design and materials which arise today in such fields as Electronics and Aircraft Engineering are such that, even although all avoidable delay is eliminated, many years may be required to progress from initial conception to ultimate production.

We are only today beginning to profit from research initiated several years ago, and are already at work upon the design of projects which will not go into production until the sixties. But, as the dreams of yesterday become the realities of today, horizons widen and a picture takes shape of the direction in which your Company should travel if it is to take full advantage of the technological progress of our age.

Feeling, as I do, that our future plans are founded upon a careful and accurate appreciation of the technical development that will take place over the ten or fifteen years ahead of us, and knowing, as I do, the resources and the effort that we are able to bring to bear to secure the accomplishment of those plans, I look to the future with confidence, for I believe that only international political or financial factors outside our own control can frustrate us.

We now recommend to you the payment of a final dividend of 15 per cent, which will make a total for the year of 30 per cent.

May I say how grateful I am for the good work which has been done during the year by our managers, staff and workpeople? It has represented a very material contribution to the results achieved.

The report and accounts were adopted and the dividend, as recommended, was approved.

The retiring directors, Mr E. J. Earnshaw, MA, MIEE, FRAeS, and Mr J. A. Clark, were re-elected and the remuneration of the auditors, Messrs Deloitte, Plender, Griffiths and Company, having been fixed, the proceedings terminated.

DORMAN LONG AND COMPANY LIMITED

SIR ELLIS HUNTER'S REVIEW

HIGH DEMAND : SEVERE LABOUR SHORTAGE: FACTORS IN THE STEEL INDUSTRY'S DEVELOPMENT

The Sixty-seventh Annual General Meeting of Dorman Long and Company Limited will be held in London on Wednesday, January 23, 1957. The following are extracts from the statement by the Chairman and Managing Director, Sir Ellis Hunter, circulated with the report and accounts.

After transferring £1,250,000 to the Fixed Assets Replacement Reserve of Dorman Long (Steel) Limited (last year £1 million), and after charging depreciation based on historical cost and excluding items extraneous to the year, the group profits before taxation amounted to £7,487,293. From this there falls to be deducted the profits of subsidiary companies attributable to outside shareholders which, also before taxation, amounted to approximately £216,000, leaving approximately £7,271,000, which arose broadly as follows:

	1956 Amount	%	1955 Amount	%
	£		£	
Bridge building, engineering and chemicals ..	2,734,000	38	3,612,000	43
Iron and steel	4,537,000	62	4,850,000	57
	7,271,000	100	8,462,000	100

The Bridge Building and Engineering results depend on contracts completed during each year, and for this reason may be expected to fluctuate from year to year. The substantial fall in 1956 is, however, almost entirely due to circumstances affecting our subsidiaries operating in Africa and the Argentine. The profits of our South African subsidiary, Dorman Long (Africa) Limited, showed a substantial reduction owing to the falling off in major capital works in that country, which resulted in keener competition. In conjunction with Dorman Long (Africa) Limited, we formed a new subsidiary in Rhodesia, the operations of which had not, at the end of its first year's trading, reached a profit-earning stage. Following the change in the Argentine Government in September, 1955, Argentine currency was heavily devalued. As a result, although our subsidiary operating in the Argentine earned a satisfactory profit in pesos, its accounts when converted to sterling showed a substantial loss arising from the necessary revaluation of the net current assets.

DORMAN LONG (STEEL) LIMITED

For the first time our production of ingots has exceeded 2 million tons and at 2,056,000 tons was 106,000 tons higher than in the previous twelve months. Unfortunately, output of rolled steel was down by 39,000 tons at 1,500,200 tons. This fall in production of finished steel arises from the craft unions' embargo on overtime which lasted three months and affected maintenance work. It would have been heavier but for the skill and adaptability of the staff who showed great devotion to duty.

Demand for heavy steel has not only been maintained but intensified. Much more heavy steel could be exported at substantial premiums but for the need to ensure reasonable tonnages to home consumers. The industry has voluntarily limited its exports to the 1954 levels, which were lower than in 1955, and the export of plates is subject to licence in the interests of UK shipbuilding.

In the closing weeks of 1956 half of the new South Bank coke ovens came into production and also one of the two new blast-furnaces at Clay Lane. Both plants are situated at our Cleveland Works. In these new units we have first-class plant, comparable with any in the country, and they will make a valuable contribution to the efficiency of the undertaking.

Work on the combined Universal Beam and Heavy Section Mill at Lackenby has been as rapid as possible under the circumstances but has been further hampered by delay in the delivery of heavy iron and steel works plant. American deliveries have been affected by strikes in the USA and British manufacturers have also failed to live up to the target dates set them.

If production from the existing plants had not been so well maintained the adverse effects of these delays would have been even more pronounced.

SEVERE SHORTAGE OF LABOUR

Our present rate of finished steel production is approximately 7 per cent lower than a year ago. There are two main reasons for this. One to which I have already referred, is the backlog of maintenance resulting from the three months' restriction of work by craft labour. The other is the shortage of craft labour, which is becoming a most serious matter and is largely outside our control as it is almost entirely due to housing shortage in the area.

Our own capital expenditure is directed towards increasing outputs by higher productivity with little increase in the labour force employed, and this by itself would create no housing problem. There is, however, a big expansion in chemical and other industries in this district and our difficulties arise from these other developments which are absorbing a large amount of local labour, particularly craftsmen, at an extremely rapid rate.

FACTORS IN THE STEEL INDUSTRY'S DEVELOPMENT

The labour shortage to which I have just referred is not likely to be the only limiting factor. There is also the possibility of a shortage of raw materials and of transport. The United Kingdom is not the only country importing iron ores; there are other industrial nations which have large and growing needs. Although steps are being taken to develop new sources of supply the ore will have to be transported to the United Kingdom by sea. Here again future shipping needs have been anticipated to some extent, but there is no certainty that cargo carrying capacity will be readily available for any rapid increase in imports.

Any increase in production of home ores will involve mining, and the National Coal Board's experience in attracting labour to the coal mines suggests that the manning of iron ore mines will also be difficult.

The steel industry uses water in very large quantities, and without adequate supplies projects for further expansion of steel making will be checked in any areas affected in this way.

Any further big advance in steel production will involve a corresponding increase in inland transport facilities. It is obvious that the railways will need to take this fully into account in the large capital programme they now envisage.

For supplies from overseas, including iron ores and scrap, we are in competition with steel industries in other countries but in manpower, inland transport facilities and water supplies steel is in competition with other developing industries at home.

A realistic assessment of these factors is essential when considering long term prospects for expanding steel production. The difficulties are probably not insuperable but they are very real and should check facile expectations of large steel output increases year by year comparable with those achieved over the past decade.

DORMAN LONG (BRIDGE AND ENGINEERING) LIMITED

The Middlesbrough and London constructional shops have been working at a high level throughout the year and have order books representing from one to two years' work. Although output of fabricated steelwork was higher in the twelve months under review costs tended to rise and offset some of the advantage which would otherwise have resulted from higher productivity.

The Bridge Department has been well occupied during the year, completing this month (December) the construction of the Volta River Bridge on the Gold Coast. New overseas contracts taken and started include two in Iraq for bridges over the Euphrates —the Qurnah and Nasiriyah Highway Bridges—together representing work valued at £1,059,000, and further bridge orders for Iceland. These orders were secured against keen foreign competition which shows no indication of diminishing.

DORMAN LONG (CHEMICALS) LIMITED

Sections of the new tar distillation and benzole refining plant at Clarence chemical works are now in operation. The plants will soon be dealing with the augmented throughput of tar and crude benzole arising from the new coke ovens at South Bank, and we expect to secure economies in operation and increased efficiency.

In our case there is an additional advantage. As large producers of tar fuel products we can use them for steel melting.

RALEIGH INDUSTRIES LIMITED

ANOTHER RECORD YEAR

MR GEORGE WILSON'S STATEMENT

In his statement to the shareholders, reporting the Company's record production and sales, the Chairman, Mr George Wilson, says:

It is agreeable for me to be able to tell you that our Accounts for the year show a record profit of £2,367,374. After providing for taxation and after deducting the interest of the minority shareholders, there remains £1,175,033 available for appropriation.

On these results we feel justified in raising the amount of our distribution to the Ordinary Shareholders and we have recommended that the dividend for the year be increased to 13½ per cent as compared with 12½ per cent in the previous year. As a matter of interest this represents almost exactly the same sum as the increased distribution which we are making to our workpeople under our new Profit Sharing Scheme.

TRADING REVIEW

In spite of the fact that the past year has brought its problems of rising costs and adverse trading conditions I am happy to tell you that our business has continued to expand and sales of bicycles, gears and components have increased by over £1,400,000 compared with the previous year, thus enabling us to continue unbroken our record of having achieved an increased turnover in each year since the end of the War.

The cycle industry has, generally speaking, experienced a poor year's trading on the Home Market. The sales figures for the industry are down by approximately 30 per cent, against which your Company's sales are down by approximately 15 per cent. Fortunately our export business has been able to take up this slack and has achieved a 27 per cent increase in sales over last year. Export markets now absorb over 70 per cent of our total bicycle production.

OVERSEAS COMPANIES

I am pleased to report that all our overseas companies have experienced a successful year's trading and have, in the aggregate, made a record contribution towards our profits.

REVIEW OF PROSPECTS

Since the end of the financial year conditions of trading have again become more difficult. Sales in the Home Market, where we have had to increase prices, are running at a level below that of last year, but in recent weeks I am pleased to report that they have taken a turn for the better.

We are still maintaining export sales at last year's level but it is only to be expected that we shall suffer repercussions from the serious situation in the Middle East. The long haul round the Cape will inevitably increase the cost to the consumer in many of our important markets and we may also have to face a loss of business in certain markets within or sympathetic to the Arab World.

From the long-term point of view, however, I am satisfied that the demand for bicycles on a world-wide basis will continue to grow as the more undeveloped parts of the world are opened up, and that we shall be assured of increasing sales opportunities. It is, however, vital if we are to take advantage of such conditions that we remain fully competitive.

COMPANY'S FACTORY EXPANSION

The new factory to which I referred last year, in which we are to concentrate the manufacture of our Sturmey-Archer products, is progressing most satisfactorily, and we anticipate that it will be in production by Autumn of next year. This expansion, the greatest in the Company's history, will give us an additional covered floor space of nearly 20 acres and will cost approximately £5 million in all to erect and equip.

Although conditions of trade have hardened since the time when we took the decision to proceed with this expansion, we are confident that this is no more than a passing phase and that the long-term prospects of the Company are excellent and fully justify the completion of this great new extension.

PROFIT SHARING

As announced in my statement last year we have now introduced a profit-sharing scheme for our factory employees under which we allocate to them 13 per cent of group profits in each year, after deducting an allowance at the rate of 10 per cent on the capital employed in the business at the beginning of that year.

During the year under review the scheme has made available for distribution the sum of £230,615 compared with the sum of £194,679 for the previous year when no profit-sharing scheme was in operation.

INFLUENCE

We have served no purely sectional interest nor have we been subordinated to any political purpose. Rather have we concentrated on giving a banking service in keeping with the leading commercial bank of the country.

The condition of the business prior to the sequestration showed a strong and liquid position. Our Bank enjoys an excellent business connection representative of the entire business community throughout the country. The fact that we have the privilege of being Egypt's oldest existent Bank is perhaps the best indication of the value placed upon our services by the public as a whole. It is our hope that the sequestrator, in fulfilling his function, will continue to maintain our high standard of regard for the interests of the Bank's customers, and carry out faithfully the duties which we feel are owed to them. We also hope that he will give the same consideration to our staff that they have come to expect from us.

SENSE OF PROPORTION NEEDED

I do not want to conclude on too pessimistic a note. We need more than ever today a sense of proportion, and it seems to me that we do no service to ourselves, or to others, by wrapping everything in a mantle of gloom. The average man will feel that in 1956 political leadership throughout most of the World has been shown up in an unusually poor light.

Yet it may be that the events of recent months will have served to dispel some illusions, and even if the process is likely to be a long one, we may at least hope that some lessons will be learnt from them so that more realistic and intelligent policies may be followed in the years to come.

AMENDMENT OF ARTICLES

The Chairman then referred to the Bill which the Bank was promoting in Parliament to amend The Colonial Bank Act 1925 under which the Bank operated. He mentioned that the Articles of Association of the Bank were a schedule to The Colonial Bank Act and the opportunity had been taken to revise them so as to bring them up to date to comply with modern practice and with such sections of the Companies Act 1948 which were applied to the Bank.

He said it was necessary for the stockholders to approve the revised Articles at this meeting and they would be asked to approve the Bill at an extraordinary general meeting which would follow immediately after the annual meeting. He mentioned that the only new amendment to the Articles was one permitting four Vice-Chairmen instead of two. The Chairman also said he had given an explanation of the amending Bill in his Statement to the stockholders.

THE DIVIDEND

The Chairman then moved the adoption of the Report of the Directors and the Statement of Accounts and the payment of a final dividend of 4 per cent actual on £12,932,250 Ordinary stock, making 8 per cent for the year, less income tax at the standard rate of 8s. 6d. in the £.

The motion was seconded by Mr A. C. Barnes, Deputy Chairman, and carried.

The retiring directors, Mr Arnold Tiffany Dudley, MC, Captain Derek Fitzgerald and Marshal of the Royal Air Force The Right Honourable The Viscount Portal of Hungerford, KG, GCB, OM, DSO, MC, were re-elected. The Chairman proposed, and Mr Barnes seconded, a resolution to elect Colonel Sir Thomas Ellis Robins, KBE, DSO, to the Board, which was carried unanimously.

On the motion of Mr L. E. D. Bevan, seconded by Mr John Newson-Smith, the auditors, Messrs Deloitte, Plender, Griffiths and Company, Price Waterhouse and Company, Peat, Marwick, Mitchell and Company and Cooper Brothers and Company, were reappointed.

The special resolution approving the revised Articles of Association was moved by the Chairman, seconded by Mr A. C. Barnes, and was carried unanimously.

VOTE OF THANKS

A vote of thanks to the staff, proposed by Mr G. F. Lewis, a director, was seconded by Mr Joseph Nissim, a stockholder, and carried unanimously. It was responded to by Mr J. F. Cade, a general manager.

This concluded the business of the annual general meeting, and at the extraordinary general meeting which followed, the Bill to amend The Colonial Bank Act of 1925 was approved by the stockholders.

A vote of thanks to the Chairman was proposed by Sir Oscar Hobson and carried unanimously.

BARCLAYS BANK DCO

ANNUAL GENERAL MEETING

POSITION IN EGYPT

MR J. S. CROSSLEY'S SPEECH

The thirty-first Ordinary General Meeting of Barclays Bank DCO was held on December 28th at 29 Gracechurch Street, London, E.C.3.

Mr Julian Stanley Crossley (the Chairman) presided.

The Secretary, Mr C. F. S. Pringle, read the notice convening the meeting and the auditors report to the stockholders.

With the concurrence of the stockholders present, the Report and Accounts and Statement by the Chairman, which had been previously circulated, were taken as read.

The Chairman reviewed the position of the Bank's affairs in Egypt as a consequence of the Suez crisis. He said: In my Annual Statement, which was published at the beginning of the month, and which had to be in the printer's hands several weeks earlier, I referred to the position in Egypt and said that I would try to give you more up-to-date information at the time of this Meeting.

I have already said in my statement that with the development of the Egyptian economy and its consequent growth our business has now become self-contained and self-supporting.

THE STAFF

Your principal anxiety will no doubt have been, as mine has been, on the score of our personnel in Egypt. The staff of the Bank there is of course mainly of Egyptian nationality, but 27 are ex-patriate British officials and there are many others of non-Egyptian nationality. I am pleased to be able to tell you that all the ex-patriate British members of the staff are now back in this country, and that the majority of our local officials of British and French nationality have arrived either here or in France.

We shall do everything in our power to help those of our staff who have left Egypt and who may have suffered misfortune through no fault of their own, and those who remain will, we hope, still be working in the Bank there.

SEQUESTRATION ORDER

At the beginning of November a sequestrator was appointed by the Egyptian Government, and all acts of the Bank in Egypt since that date have been carried out under his authority. We have no means of knowing what is taking place, neither, of course, can we exercise any control over the actions of the sequestrator. The Sequestration Order, which applies to all British and French controlled businesses, covers, we believe, something like eleven Banks, comprising a large proportion of the banking system in Egypt. In these circumstances it may be that the policy of the sequestrator will be to carry on the business, as he is empowered to do, with as little disturbance as present conditions allow. It would, I think, be useless at this juncture for us to speculate upon the future. All that we know about the sort of position that obtains today is that it is susceptible of rapid change.

It is important that we should keep a sense of proportion, and it may be of interest to you to know that our Egyptian business represents only slightly more than 5 per cent of the total business of this Bank. In saying this, however, I do not wish to minimise in any way the value which we attach to our business in Egypt. Apart from merely business considerations we have many personal ties of friendship extending back, in some cases, for generations.

NEARLY A CENTURY OF SERVICE

It may interest some of you to know that the Anglo-Egyptian Bank first opened for business in Egypt in 1864. This means that our Bank is the oldest bank operating in Egypt. Since that date, nearly 100 years ago, we can, I think, fairly claim that our Bank has contributed a valuable stabilising

W. & A. GILBEY LIMITED

The Board of W. & A. Gilbey Limited announce that as a result of recent negotiations, National Distillers Products Corporation are acquiring from them for cash their minority shareholding in W. & A. Gilbey Limited of Delaware. At the same time arrangements have been entered into whereby National Distillers will be licensed on a permanent royalty basis to continue the production and marketing of Gilbey brands in the USA.

The Board also announce that Gilbey's Canadian branch, which is expanding rapidly, is being formed into a wholly owned Canadian Company, and finance has been arranged in Canada which will enable that Company to be self-sufficient.

These two developments should be of substantial advantage to Gilbeys, since they should satisfy the immediate requirements of the Group for additional capital while, at the same time, maintaining and possibly increasing its income.

The Directors estimate that the profits of the Group for 1956 will be maintained at approximately the same level as for 1955.

The close of 1956 marks the end of the first hundred years in the life of the business and it enters its second century with confidence in an enterprise that is now world-wide.

THE LANCASHIRE COTTON CORPORATION LIMITED

TRADING PROFIT INCREASE

The following is an extract from a Statement circulated by the Chairman, Mr R. M. Lee, with the Accounts for the year ended October 31, 1956:

ACCOUNTS

During the year we acquired all the Share Capital of the Durban Mill (Holdings) Limited and of the Eagle Spinning Company (Holdings) Limited, and we have continued to operate the mills owned by these Companies. I am glad to be able to report that we have found these to be very satisfactory acquisitions.

I am pleased to report to you an increase in the trading profit of £124,345, making the Trading Profit for the year £2,929,715. I am particularly gratified at this increase, which has taken place during a very trying year for the Textile Industry, to which I shall refer later.

We have allocated to General Reserve £400,000 which brings the total of this Reserve to £6,500,000. In addition £400,000 has been allocated to Replacement of Fixed Assets Reserve, making the total of this Reserve £3,900,000.

Last year we allocated £250,000 to Process and Stock Reserve in view of the uncertainty which prevailed with regard to the level of raw cotton prices. Fortunately the outlook on raw cotton prices is much less uncertain and in consequence we have not felt it necessary to increase the Process and Stock Reserve which stands at £1,250,000.

For many years the Company has ploughed back profits and utilised them in the purchase of modern plant and machinery, and when considering the final dividend your Board decided that the time has now come when an increase in the return should be made to the Ordinary Stockholders. They accordingly recommend a final dividend of 12½ per cent less tax, against 7½ per cent less tax paid last year. An interim dividend of 5 per cent less tax was paid last August, as in the previous year. The interim dividend absorbed £232,675 and the dividend now recommended absorbs £581,686. The amount carried forward is £964,276, of which £56,517 is retained in the accounts of our Subsidiaries.

MACHINERY

The year has seen a further expansion of our policy of constantly improving our machinery. We have continued to install the most modern large package ring frames incorporating all the latest labour-saving devices. The year has also seen the development of new yarns and techniques from the experimental stage to successful bulk production. One instance of this is the tufted carpet industry, for which we are providing very substantial quantities of yarn in both colour and grey, using different man-made fibres.

YARN AND CLOTH IMPORTS

The importation of yarn and cloth free of duty from India and Hongkong continues to be a disturbing feature.

As a result of the meeting between the Prime Minister, Sir Anthony Eden, and Mr Nehru, it was suggested that a delegation from the Industry should visit India to discuss this matter with the leaders of the Industry in India. This suggestion is being followed up, and I am glad to report that our Managing Director, Colonel J. B. Whitchead, has been appointed a member of the delegation which is leaving shortly for India and Hongkong. We earnestly hope that the efforts will be successful in bringing about a more equitable and reasonable state of affairs.

EXPORTS

Competition has intensified throughout the year in practically every one of our export markets, and restrictions and quotas have hindered our efforts in many cases. In these circumstances it is very satisfactory that our Export Department has succeeded in selling a greater weight of yarn, especially to dollar markets, than in any other year since 195[illegible] We hope during the current year conditions will enable us to repeat and indeed to improve on this achievement, although the recently concluded trade agreement with Australia, which is our best overseas market, does give us grounds for certain misgivings.

APPOINTMENTS

OXFORD UNIVERSITY INSTITUTE OF STATISTICS

Research worker required to assist in study of economic aspects of innovation in production methods in the engineering industry. Good knowledge of economics essential, acquaintance with industrial problems an asset. Appointment for 1 year, salary £550-£900 according to age and qualifications.—Application forms obtainable from the Secretary, Institute of Statistics, St. Cross Road, Oxford.

ELECTRICAL ENGINEER
INDIA

ELECTRICAL ENGINEER required for construction of large steel works at Durgapur undertaken by well established, internationally known firm of Engineering Contractors.

Age 30-45. Previous experience of large civil engineering contracts essential. Must be excellent organiser and fully conversant with high-tension ring main switching up to 11 k v with load demands up to 10 megawatts.

Previous experience abroad particularly desirable. Candidates should be A.M.I.E.E. or have equivalent professional qualifications. High degree of integrity with good liaison ability essential

Attractive four-figure salary with tax concessions and substantial bonus. Free passages (essential applicant and family. Tour initially for two and a half years with approximately 2½ months' leave at end of tour, with free passages. Local leaves additional. Housing facilities attractive. If appointment is satisfactory the opportunity of a further tour can be expected.

This is an excellent opportunity for an experienced and technically well qualified, active, and ambitious Electrical Engineer in good health. All replies in GUARANTEED STRICTEST CONFIDENCE.

Apply, stating details of place and date of birth, education, travel, names of firms, positions held with salaries and dates. Private contact telephone number will facilitate acknowledgements.

Dr. P. S. de Q. CABOT.

P. S. CABOT AND COMPANY,
37-41 Bedford Row,
London, W.C.1.

PERSONNEL OFFICER for London factory. Main responsibility is to assist his Production Unit Manager to deal effectively with all aspects of Personnel policy. This includes development of emerging techniques in studying organisation and specific jobs and matching people to them. (Training will be given.) Qualifications: Degree or comparable qualifications in engineering, natural or social science, or law; experience in industry, preferable in work study and personnel. Age 25 to 35. Commencing salary to £1,000.—Personnel Manager (Ref. 6/9), Glacier Metal Co., Ltd., Ealing Road, Wembley, Middlesex.

A NATIONALLY known modern manufacturing Company will shortly have a vacancy for a Chief Statistician due to an internal promotion.

Applications are invited from suitably qualified men who should have a degree in statistics (honours preferred) plus a very sound background in economics; in addition a degree in economics would be an advantage as would several years' industrial experience.

The Statistical Department provides a full statistical service to all divisions of the Company. The Chief Statistician's position is therefore very wide in scope and he must be able to cope with and undertake forecasting and advise on sampling techniques used by the marketing and consumer research departments of the Company.

The starting salary will not be less than £2,000 per annum and applications should be sent to the Chief Personnel Officer, Box 592. Envelopes should be endorsed "Chief Statistician."

THE SCOTTISH GAS BOARD

STATISTICIAN:

Applications are invited for a Statistician at Board Headquarters in Edinburgh. Applicants should be suitably qualified (University Degree with specialisation in Statistics or other appropriate qualification). Preference will be given to applicants with some commercial experience and knowledge of mechanical aids. The successful applicant will be responsible to the Chief Financial Officer for collection, analysis and interpretation of data throughout the Area. The salary for the appointment will be within the scale £1,025-£1,145 per annum. Applications, stating age and giving particulars of education, training, experience and qualifications, should be addressed to the undersigned within fourteen days of the appearance of this advertisement.

(Signed) A. T. HERD,
Secretary.

26 Drumsheugh Gardens, Edinburgh 3.
December 22, 1956.

PERSONAL ASSISTANT TO MANAGING DIRECTOR

A young CHARTERED ACCOUNTANT is sought by the Managing Director of a well-known Public Company, with Head Office in London, to be his Personal Assistant.

His duties will include the collation and interpretation of management statistics and information. As such they will give ample scope for the use of his accountancy training but more importantly they will also provide a unique insight into the management of a live and forward-looking company.

The successful applicant must have had a first-class general education, preferably public school, and since qualifying have completed at least two years in practice or with an industrial concern. It is essential that he has a first-class command of the English language, both written and spoken with correspondence in at least one other language as a desirable but not essential qualification.

This is a first-class opportunity for an outstanding young man who, on completion of 2-3 years' successful service in this initial capacity, could expect promotion to a responsible executive appointment.

Applications (preferably typewritten), containing full details of education, qualifications, experience and present salary, should be sent, in complete confidence, to Box No 597, c/o Charles Barker & Sons Ltd., Gateway House, London, E.C.4.

MANAGEMENT SELECTION LIMITED have been retained to advise on the selection of the

MEDICAL DIRECTOR

for an ethical pharmaceutical company in London. He will be responsible for the development of new products including direction of pharmaceutical laboratories, initiation and evaluation of clinical trials, advice on marketing and technical approval of promotional literature.

This well-established company is part of an internationally known U.S. organisation whose leading status is being maintained by an annual expenditure of about 8 million dollars on research and development. It is intended to augment the U.K. development programme and there are plans to build a new factory and laboratories. The position includes some overseas travel in order to maintain personal liaison with leading medical scientists at home and abroad.

Enquiries are invited from physicians (M.D. or M.R.C.P. an advantage) who have experience of originating or conducting clinical trials of new drugs. They must also have a flair for weighing technical, professional and commercial viewpoints and provide evidence of an imaginative and constructive approach. Salary according to reputation, but will interest those at present earning £3,000 or more.

Please send brief details, in strict confidence, to R. A. Beverley (S.241), Management Selection Ltd., 17 Stratton Street, London, W.1. No information will be passed to our clients without candidates' permission after full personal discussion at which the identity of the Company will be disclosed.

MARKET RESEARCH.—The Metal Box Company requires a woman based London to supervise small staff of field investigators, and play an active part in the collection of information and planning of surveys. Previous experience in market research, preferably among retailers, essential.—Write MJ/MR, The Langham, Portland Place, W.1.

APPOINTMENTS

UNIVERSITY OF BIRMINGHAM

Applications are invited for a senior research post in connection with the Birmingham Redundancy and Rejection Study. Applicants should have experience organising social research. The post will be tenable for two years at a salary, according to qualifications, of £1,250 per annum, plus F.S.S.U.

Applications (two copies), with the names of three referees, should be sent not later than January 31, 1957, to the Registrar, The University, Birmingham, 15, from whom further details may be obtained.

MANAGEMENT SELECTION LIMITED have been retained to advise on the selection of a

SALES AND ADVERTISING EXECUTIVE

for a two-year-old subsidiary of an old-established American Company manufacturing and marketing a variety of domestic electric appliances. The new offices and factory situated in Scotland, already occupy 200,000 sq. ft. and are being rapidly extended. The Company's policy is that the development of the British subsidiary shall be by promotion to the highest Board level from within.

Duties will include responsibility for all advertising, sales promotion, marketing and sales of the Company's products and for advising the Board on the introduction of new and the improvement of existing products. He will also have the opportunity to play an important part in building and developing the Company.

Candidates must be educated to at least School Certificate level and a degree in statistics or economics would be useful background. Essential qualifications are experience of sales management at senior level, a successful record of marketing new consumer products and a knowledge of advertising and modern market research techniques.

Probable age 34 to 45. Minimum salary £3,500.

Please send brief details, in confidence, quoting reference (S.228) to P. J. H. Fryer, Management Selection Limited, 17 Stratton Street, London, W.1. No information will be disclosed to our clients until candidates know their identity and have given permission.

(Administration)

for a pharmaceutical manufacturing company in London, with subsidiaries overseas. It has recently been acquired by a progressive U.S. concern of international repute, and a vigorous policy of re-thinking and expansion has been launched, including plans for building a new factory. There is scope for a man who can justify a starting salary of up to £3,000 and who will be responsible initially for reviewing selling prices, supervising distribution arrangements at home and abroad and stream-lining office organisation and methods. Success in these tasks would make him a logical contender for a seat on the Board within two years.

Candidates must be graduates with a progressive record of achievement in industry, including experience of distribution of consumer goods and of reorganising office procedures; consultancy experience in these fields would be particularly valuable. Age limits 38 to 42; generous pension and life insurance coverage.

Please send brief details, in strict confidence, quoting reference (S.234) to: R. A. Beverley, Management Selection Limited, 17 Stratton Street, London, W.1. No information will be passed to our client until candidates have been told their identity and have given permission after full discussion.

TRAINING OFFICER required by The Steel Company of Wales Limited (Steel Division), Port Talbot.

The successful candidate will be responsible to the Education Officer for the selection and training of potential foremen and for the administration of development projects for existing foremen in a large integrated and expanding Steel Company.

An honours degree in social subjects such as psychology, sociology or economics would be an advantage.

Those wishing to apply should write for official Application Form to:
Superintendent, Personnel Services,
The Steel Company of Wales Limited
(Steel Division),
Abbey Works,
Port Talbot, Glam.

MANAGEMENT SELECTION LIMITED have been retained to advise on the selection of a

GENERAL MANAGER

for a company in the North making equipment for bulk materials handling. It is a leading company in the specialised field and has good development prospects.

Appointment will carry seat on the Board. Responsible to the Managing Director for Production, Sales and Technical Development.

Degree in mechanical engineering desirable; engineering apprenticeship and professional qualification essential. Must have experience in medium to heavy engineering industry, including production and design. Experience of technical sales an advantage.

Essential qualities are a capacity to handle at top management level a wide range of technical and commercial problems and a genuine interest in modern management techniques.

Age limits 45-55, but preferably a man of 50-55 who with his experience and judgment yet retains a strong liking for new ideas. Salary about £4,000. Pension and other benefits which go with a normal post at this level.

Applications, with brief details, in strict confidence, to H. E. Roff (S.123), Management Selection Limited, 17 Stratton Street, London, W.1. No information will be passed to our client without the candidates knowing their identity and giving permission.

THE UNITED KINGDOM ATOMIC ENERGY AUTHORITY

DEPUTY COMMERCIAL MANAGER

(Industrial Relations)

Applications are invited for a senior appointment in the Commercial Department of the Technical Policy Branch at Risley, near Warrington, Lancs.

The post is one of considerable responsibility in a rapidly expanding field and will provide opportunity of working in close collaboration with British Industry in the development of industrial applications of Atomic Energy. The commercial activities will be concerned not so much with product selling in the generally accepted sense but rather with the exploitation of technological information, and will include associated negotiations.

Candidates should have a sound technical/commercial background and be experienced in conducting top-level negotiations and drawing up commercial agreements. They must possess the ability to appreciate the commercial value of technological work and have some knowledge of patents procedure. They will be called upon to work in close co-operation with other sections of a large industrial organisation.

Preference will be given to candidates with a degree in one of the applied science and/or economic disciplines or membership of one of the senior professional institutions.

It will be necessary for the successful candidate to acquire an understanding of the technical processes and plants for which the Industrial Group is responsible, a reasonable period of initial training will be allowed for this purpose.

Salary will be assessed within the range of £2,000 to £2,500 per annum.

Assistance for removing by the successful candidate if married may be available in due course; alternatively substantial assistance may be given towards legal expenses incurred in private purchase. There is a contributory pension scheme.

Application forms may be obtained from the Civil Recruitment Officer, Industrial Group Headquarters, United Kingdom Atomic Energy Authority, Risley, near Warrington, Lancs.

Closing date January 30, 1957.

ACCOUNTING.—A light engineering Company in West London has vacancies for accounts assistants. Duties will include (a) Sales and Cost Sales analysis, (b) Maintenance of finished stock records by quantity and value, (c) Sales budgets. Experience of punched-card accounting an advantage. Salary £900-£700.—Box 595.

THE UNIVERSITY OF SHEFFIELD

CHAIRS OF ECONOMICS

Applications are invited from economists in any branch of the subject for two CHAIRS of ECONOMICS, both vacant at the end of September, 1957, one by the retirement of Professor G. P. Jones, and the other a newly created Chair. One of the professors will be appointed Head of the Department of Economics. In addition to its present functions the Department will in future assume responsibility for the conduct of teaching and research in Business Studies for which exceptional local facilities are available. Salary £2,350 a year, with F.S.S.U. provision and family allowance.—Further particulars should be obtained from The Registrar, The University, Sheffield 10, to whom applications (25 copies, or only from overseas candidates) should be sent by February 16, 1957.

HOUSING TRUST CHIEF EXECUTIVE DESIGNATE

The Western Region Production Development Board, with the approval and support of the Government of the Western Region of Nigeria, intends to establish a Western Region Housing Trust. The objects of the Trust will be the development of Housing Estates as well as fostering the growth of home ownership. Applications are invited for the post of Chief Executive Officer Designate of the Trust. In the preliminary stages his chief duties will be to assist in drafting legislation and in drawing up plans for the establishment and operation of the Trust. During this period he will be engaged on the staff of the Board but, subject to satisfactory performance, will become the Chief Officer of the Trust when formed. His duties will then include (a) organising the development of housing estates and (b) promoting home-ownership on building society lines.

Applicants should possess wide administrative experience in such fields as planning, development, and financing of housing areas and of home ownership schemes. Academic and professional qualifications will be an advantage.

Salary will be £2,500-£3,500, point of entry depending on qualifications and experience.

Further details of the proposed Trust and of the Board's Terms and Conditions of Service can be obtained from:
The London Representative,
Western Region Production Development Board,
18 Grosvenor Gardens,
London, S.W.1,
to whom applications, giving full details of experience, qualifications, etc., should be addressed; replies to reach him not later than January 31, 1957.

General Terms of Employment: House, with basic furniture, provided at rental of £150 per annum; Provident Fund; Outfit Allowance £60; Free Medical Service; Free passage for wife; home leave at full pay at the rate of five days per month of overseas service. Low income tax.

CHIEF MECHANICAL ENGINEER

Leading, well-established and expanding Group of Companies requires Chief Mechanical Engineer. Successful candidate, 35-50, should have university degree or equivalent, and associate membership in one of the senior professional institutions.

Site or shop experience essential with approximately ten years on project design, with proved ability in the design of mechanical handling machinery layouts, pressure vessels, heat exchangers, pumping installations, and associated electrics and instrumentation. Candidates must be knowledgeable in industrial economics and estimating applied to plant design. Experience of modern construction methods essential. Should be able administrator. Substantial four-figure salary, bonus, pension plan and assistance accommodation, etc.

Responsibilities include development of mechanical handling machinery, designs for industrial plants, and management of team of design engineers and related personnel.

Apply in GUARANTEED STRICTEST CONFIDENCE in accordance with professional ethics, giving details of date and place of birth, education, background, names of firms, positions held with dates and salaries to

Dr P. S. de Q. CABOT.

P. S. CABOT & COMPANY,
37-41 BEDFORD ROW,
LONDON, W.C.1.

WOMEN between the ages of 21 and 25 years with good educational background who wish to follow a progressive career in Market Research, are invited to apply for posts with a nationally known Company. An interest in travel, meeting people and studying changes in market conditions will be given scope, and there is considerable opportunity for using initiative. Ability to drive is an advantage, although not essential; the work is outdoor and requires a good standard of health. Salary and working conditions are excellent. A Pension Fund and Group Life Assurance Scheme are in operation. Successful applicants would be expected to fill these posts in February or March; early interviews will therefore be arranged and applications should include full particulars of education, qualifications and age, and should be addressed to Box 591.

EDUCATION OFFICER required for provincial area of political party organisation. Applicants should be University graduates preferably between 25 and 45. Commencing salary, according to experience and qualifications, not less than £750.—Write to Conservative Political Centre, Abbey House, 2-3 Victoria Street, London, S.W.1.

LONDON COUNTY COUNCIL
GARNETT COLLEGE

Training College for Technical Teachers)
Lower 83 New Kent Road, S.E.1

Applications invited from suitably qualified persons for appointment as LECTURER: person appointed will be required to as LECTURER in instruction relating to General Theory and part in instruction relating to reference to Further Practice of Education, with special tutorial responsibility Education, and undertake some applicable to subjects of other work on teaching method of Young Workers; teaching experience in an establishment of further education essential, and experience with young people in industry an advantage. Training College Salary. Appointment will be to the Council's service with assignment to the college.—Application forms and further particulars obtainable from and returnable to Principal at college (S.A.E. wrapp) by January 21. (2478)

APPLICATIONS are invited for the post of Secretary of British West Indies Sugar Association (Incorporated), with headquarters at present in Jamaica, but to be established permanently in Barbados at an early date.

Qualifications for the post include experience in administration and also as secretary of high level conferences. Knowledge of the B.W.I. Sugar Industry would be useful but not essential. The post is one of considerable responsibility and will carry a substantial salary commensurate with the experience and background of the candidate selected.

Please address applications, which will be treated as confidential, to the Chairman, British Wes Indies Sugar Association (Incorporated), 46 Harbour Street, Myrtle Bank P.O., Kingston, Jamaica.

N.Z. REPRESENTATIVE: Graduate in engineering with business experience and contact in both New Zealand and Australian industry wishes to become associated with Principals in developing manufacture and/or sale in Australasia, preferably New Zealand. Prepared to visit U.K. immediately suitable proposition is offered.—Reply P.O. Box 2319, Wellington, N.Z.

EXPELLEE FROM EGYPT, 36 years old, bachelor, of British nationality, Sorbonne graduate, with fluent written and spoken French, Italian, Arabic, fully experienced Import-Export trade, agency work, seeks SALES post, home or foreign. Minimum U.K. salary £1,200 per annum. Faultless U.K. references available.—Box 594.

EX-RAOC officer, 26, going to New Zealand early 1957, wishes to have interview with businessman desiring representation or assistance there.—Box 590.

SUCCESSFUL TUITION FOR THE B.Sc.(ECON.) DEGREE

Wolsey Hall (Est. 1894) provides Postal Courses in a wide range of subjects for the two examinations for Lond. Univ. B.Sc.(Econ.) (three if Entrance is included). Moderate fees, instalments. Over 1,000 Wolsey Hall students have secured this valuable degree since 1925.—Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P.16, WOLSEY HALL, OXFORD.

THAMES RIVERSIDE premises (freehold), E.14 area. Floor area approx. 82,000 sq. ft. Frontage to river approx. 110 ft. Price £90,000 o.n.o. Part of purchase price may remain on mortgage.—Write owners, Box 589.

AVELING-BARFORD LIMITED

NOTICE IS HEREBY GIVEN that the Transfer Books of the Ordinary and "A" Ordinary Stocks will be closed from Thursday, January 24, 1957, to Thursday, February 7, 1957, both days inclusive.

By Order of the Board,
R. A. STONHAM,
Secretary.
Invicta Works, Grantham.
January 1, 1957.

B.Sc.(ECON.) LONDON UNIVERSITY

UNIVERSITY CORRESPONDENCE COLLEGE provides postal tuition for the above Degree (obtainable without residence), which is a valuable qualification for those seeking executive appointments in commerce or industry, government or municipal posts. The College, established 1887, is an Educational Trust. Highly qualified Tutors. Low fees. Prospectus of U.C.C. Courses for London Degrees and Diplomas, G.C.E. free from the Registrar, 60 Burlington House, Cambridge.

THE POLYTECHNIC, REGENT STREET, W.1

Department of Management Studies
"NEW DEVELOPMENTS IN TRAINING"

A series of five lectures for Directors and Senior Executives will be held on Thursdays, January 10, 17, 24, 31, and February 7, 1957, in the Fyvie Hall, 309 Regent Street, W.1.

Lecturers: Professor J. Z. Young, F.R.S.
Mr. Douglas Seymour, M.A.
Mrs. Winifred Raphael, B.Sc.
Mr. Frank A. Heller, B.Sc (Econ.).
Mr. S. D. M. King, M.A.

Fee: £2 15s. (including publications).

Applications to the Registrar, Department of Management Studies, St. Katherine's House, 194 Albany Street, N.W.1 (EUSton 6763).

First Phillips-type Polyethylene Plant for Great Britain

BRITISH HYDROCARBON CHEMICALS LIMITED has awarded the contract for its polyethylene plant to the Stone & Webster Engineering Corporation.

As the British affiliate of the corporation, Badgers will do all detailed design work for the plant, procure the equipment and supervise the construction.

The new plant will produce about 11,000 tons per year of polyethylene, using the low pressure process developed by the Phillips Petroleum Company. It will be located at Grangemouth, Scotland and will receive its feed from the existing ethylene plants designed by Stone & Webster and built by Badgers.

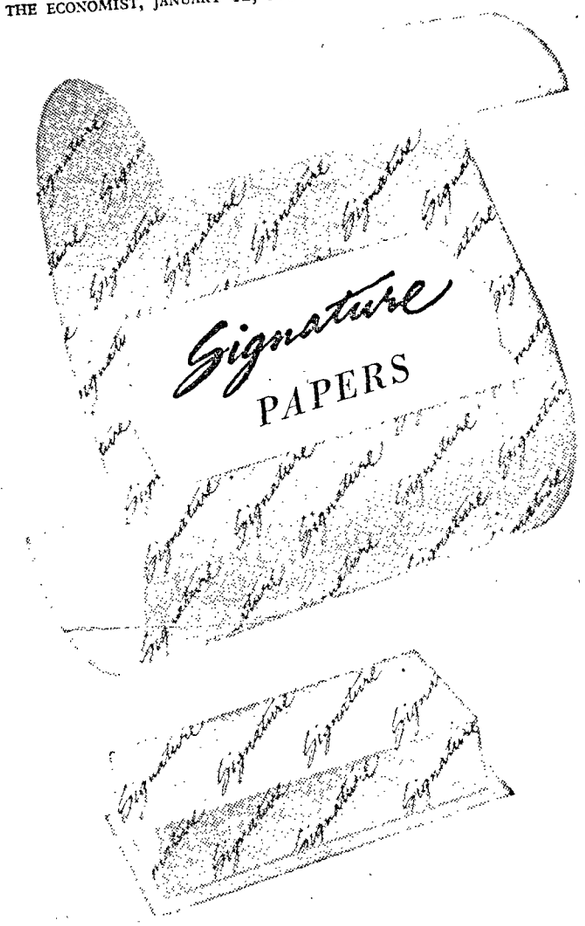
World leader in financial advertising for 50 years

Every year since 1907, financial advertisers have placed more advertising in The New York Times than in any other publication.

This continuing world leadership is based upon the recognition of both the calibre of The New York Times audience and the national impact exerted by advertising in The New York Times.



For The New York Times is read by bankers, security dealers, investment counselors, the top management echelon of U. S. business, industry and finance, and key government officials. These are the men who make America's business decisions, who decide and guide government policies.

In New York, Washington, Chicago, San Francisco . . . in every major city in the U. S., in more than 11,000 communities in every one of the 48 states, The New York Times is trusted, respected, relied-upon.

It is against this background, it is to this influential, decision-making audience that your advertising message is projected when it appears in The New York Times.

New York: 229 West 43rd Street
London: Joshua B. Powers, Ltd., 14, Cockspur Street, S. W. 1

A well-designed, skilfully-coloured Signature Paper on your boxes can achieve distinctive recognition for your goods, not only at point of sale, but before it and after it. This is advertising without pause; effective, as many firms have discovered, far and away beyond its cost. In fact, apart from a charge for the special rollers on your first order, you pay very little more than for standard box-cover papers. Let us design a Signature Paper for you!

Executive material

—HOW IS IT TO BE FOUND?

For the fourth year in succession, the Manchester Guardian is helping employers tackle this problem by putting them in touch with intelligent youngsters keen on making a worthwhile career.
Beginning on January 21 and continuing until March 4, thirty-one leading companies will take turns to present a daily whole-page announcement about the careers each of them offers to graduates and school-leavers. The response to last year's announcements was so successful that many of the same firms will be taking part again, together with new ones. Here is an interesting and imaginative approach to the problem of staff-recruitment which you may well find worth looking at.

MANCHESTER GUARDIAN

LIGHT - right where you want it!

ANGLEPOISE lets you SEE what you're doing. A finger touch beams its light on the object, to "*stay put*" in any position. It never sags; needs only a 25 or 40 watt bulb. Perfect for close work—reading, writing, knitting, etc.
In Black, Cream or Cream-and-Gold, at electrical shops or stores, from 97/7 (or send for Booklet 35).

Our Ref: AES PD

The British European Airways,
Dorland House,
Lower Regent Street, S.W.1.

Gentlemen,

Some four weeks ago, your Representative Mr. G. R. Allen, called upon us about air-freight. . . . Quite frankly, we did not consider even a remote possibility that our machines could be transported in this manner. However, in view of the constant increase in surface transport costs, we decided to send two machines by air to the Continent for exhibition. These weighed 2100 Kg. and 2500 Kg. and owing to their design, left us in doubt as to whether this would be a reasonable experiment.

We were most impressed by the manner in which they were handled. Despatches of this nature will obviously afford us not only a considerable saving of time, but show also a reduction in overall costs, and in the instances mentioned, the saving amounted to something like 20%.

The two clients concerned have written to us recently stating that both machines arrived in first-class condition (even though they were unpacked) and commending us for the initiative taken by using this method. Finally, we have already received further orders from the Continent, with a request that we send them by air.

Yours faithfully,

A. E. Sutton.

BRITISH EUROPEAN AIRWAYS

It's good business to travel American

OFTEN IT'S easier to do business in the friendly, relaxed atmosphere of a ship than over an office desk on dry land. If you're going to America on business, why not travel with American businessmen?

Take the case of one passenger, for instance—let's call him James MacGregor. He is a Scotsman, whose job in life is selling socks. Not ordinary socks; they are the product of Scottish sheep and Scottish mills—the kind of luxury goods that have made British craftsmanship famous all over the world.

A great deal of Mr. MacGregor's business is done with America. And he has discovered that the ideal way to travel there is by U.S. Lines. For there, in the friendly, informal surroundings of the famed "United States" or her running-mate the "America," he meets *American* businessmen.

If you're a businessman travelling to North America, remember that here is the perfect atmosphere in which to begin a really successful business trip.

Business aside, there's any amount of fun aboard, too. You'll find unexcelled food and wine; cinemas equipped with CinemaScope; top-grade orchestras; every "keep-fit" facility; well-stocked libraries, and, of course, the pleasure of just resting and relaxing. The days that separate you from New York pass all too quickly. You travel fast in the utmost comfort and arrive refreshed when you travel by United States Lines.

The extra reserve of speed of the "United States" (the Blue Riband holder) means that she has an outstanding record for punctuality. If you have a business appointment soon after you land, that's important!

problems in management:

Improving competitive position

You may be in a competitive position today, but what about tomorrow? Markets and competition change, and you must be ahead of them. That is where research is important. It is important in your organization and that of your supplier.

Let us consider research at Dow and the part played by glycols, a typical product group. Dow research has developed the largest number of glycols available to industry. Using these glycols plus an almost unlimited number of other chemicals, Dow is able to offer its customers every possible aid in developing new products or improving old ones.

Now glycols are being used as solvents, moisture control agents, antifreeze agents, plasticizers and for a wide variety of other uses. They have found extensive applications in many industries including food and beverages, textiles, cosmetics, paper and paints.

Is your supplier able to give you all the benefits of research? Make sure of your competitive position. For glycols get in touch with your local Dow representative or the nearest Dow branch office.

PERIQUE—AND THE PIPE OF PEACE

'Tis fine Perique that makes Three Nuns so different

When your confirmed pipe-smoker is wrapped in lazy dreams and the drowsy comfort of Three Nuns Tobacco, he may not know the inner secret of his bliss. 'Tis the black heart of fine Perique in the small significant dark centres of those famous Three Nuns curly discs. Centuries ago, Perique (itself a rich and rare tobacco) was being grown by the Indians in a tiny, ten-mile plot of land in the Mississippi area. And only there does Perique, even today, truly flourish. And so the pipe of peace, smoked by the Indian Braves, is translated today to the peaceful pipe of the Three Nuns smoker.

Three Nuns

with the black heart of Perique

The Successor

THE startling event in the past few dramatic days has not been the sudden decision of Sir Anthony Eden to resign, on doctors' orders. It has been the Queen's choice, properly taken on the advice of the Conservative party's elder statesmen, including presumably the retiring Prime Minister, of Mr Macmillan, instead of Mr Butler, to replace him. To say this is not to question the talents, the energy, the astuteness and the power of decision of the new Prime Minister. He is entitled, like every new head of the country's Government, to the fairest wind. It is rather to question the complex of forces and personalities which has caused the Conservatives to break the apparent succession in their leadership.

There will be only respect and sympathy for Sir Anthony Eden in the bitter withdrawal he has felt bound to make. He has made it with the same sense of personal responsibility that has inspired his thirty-three years of public service to his country. It was this sense of personal responsibility, let it be frankly recognised, that inspired his resolve last summer to cut the Suez knot by force; and none of those who have deplored that resolve because of its inevitable consequences would wish either to detract from the courage of his conviction then or to make light of the real personal tragedy which his departure now, ill and harassed, represents. It is the unhappy end of a brief Prime Ministership, so long awaited and so well earned when it came.

It would be less than honest, however, to disguise the opinion that, personal tragedy though it is, Sir Anthony's resignation could be, politically, the nation's gain in the light of all that has flowed from the Suez miscalculation. He has not resigned because his policies have failed, but because his health has broken down. The fact stands that his policies have failed, and his successor should have a better chance than Sir Anthony of putting matters right. Probably the reason for the change—ill-health and not the renunciation of the retiring Prime Minister's policies—will be widely disbelieved abroad. Paradoxically, there could be advantages in this scepticism, for there is no doubt that the first tasks of the new Government should be to give new leadership in a fresh start. It is not difficult to say what these tasks now entail: to rebuild the American alliance, to restore Commonwealth confidence and to recover British initiative in Europe; to recapture expansion at home, to press on with removing the remaining distortions from the economy, and to implement the policies of progressive Conservatism—which are so largely connected with the name of Mr Butler. It would again be less than honest not to say that the chief obstacle at the moment to such a proper balancing of national policies, and to the assured leadership it requires, is the need to set aside the mood that evoked the Suez enterprise and, looking forwards not backwards, to bind up the wounds it caused; and the choice of Mr Macmillan, or rather the reasons which may have produced this choice, must give cause now for some disquiet.

Mr Macmillan's appointment is presumably intended to bind up the wounds of Suez, but what it has really enswathed beneath the bandages is not, at first sight, the harm to the nation, but the hurt feelings of the Conservative party itself. Both those who think that this bandaging is a good thing, and those who are disappointed by it, must turn this weekend to consider the foreign and domestic implications, as they appear now, of the decision to pass over Mr Butler.

Two arguments were clearly advanced against Mr Butler. One was that throughout the Suez crisis he was generally supposed to have been ambiguous and non-committal in his support for Sir Anthony Eden. It has to be recognised, of course, that constitutionally all the members of the Cabinet were collectively responsible for the policies pursued ; this is a fact that should not be forgotten, and Mr Gaitskell has naturally drawn attention to it. But Mr Butler nevertheless managed to give the impression that of all the Ministers he was farthest from spontaneously approving the invasion of Egypt. This might not seem to be a strong argument against him, since whatever its share of responsibility in past failures the new Government will need to pursue a new policy. But, in terms of party confidence, it clearly carried weight, even for Conservative opponents of what was done, who might have preferred Mr Butler to take a stronger line of opposition. He has not in these past few months shown himself to be a very heroic figure—though he may well have been a very sensible one.

★

It is easy enough to speculate on the arguments that Mr Butler may have thrashed out with himself, if he did indeed have doubts about the Suez invasion while still remaining in the Cabinet that launched it. By remaining in the Cabinet, and voicing the views of the moderate element within it, he may have helped to limit the liabilities that were incurred. If Mr Butler had resigned in late October or early November—and it has to be emphasised that all this is, necessarily, speculation—then the affair might still not have ended any earlier or with any less damage than has in the event been done ; and the Conservative party would have been split in a way that might not have healed sufficiently for it to be able to win a general election for many years.

Moreover, in any realignment of political forces that might have emerged, Mr Butler's group would have been in the middle—and groups in the middle in British politics are the groups that usually get crushed. Would the destruction of some of the main forces of progressive Conservatism, which are by far the most hopeful domestic forces in British politics today, really have been preferable to the pattern of events which has in fact emerged ? It is easy to see how the argument ran. Even so, as Prime Minister, Mr Butler might have been shadowed by the doubts of both foes and friends. But the decision that has now been taken is on the face of it designed to placate the doubts of his foes only. The national advantages that might flow from Sir Anthony's resignation—in the shape of an assumption abroad that Britain was disassociating itself from the failures of past policies—could now be thrown away. They may not easily be recaptured even if, as is conceivable, Mr Butler becomes Mr Macmillan's Foreign Secretary.

★

This leads on to the second argument that was advanced against Mr Butler. It was said that, because of the doubts which, among some, amount to charges of disloyalty, his accession would have split the Conservative party. What was meant by this was that, while those Tory MPs who would prefer him as leader are likely still to be willing to serve under Mr Macmillan, because they (like Mr Butler himself) are of a generally accommodating sort, those who prefer Mr Macmillan may include up to thirty or forty bitter right wingers who might have been constantly threatening to renounce the Butlerite whip. Once again, when one remembers who these right-wingers are, this would seem to be an argument in favour of Mr Butler rather than against him. But once again, too, a saving clause must be admitted. There is always the danger that a Macmillan government, because its formation is a compromise with these right wing forces, will follow compromise policies. But there was the fear that a Butler government, too, because its formation would be regarded as a challenge to these forces, might follow compromise policies, even in Mr Butler's own field of progressive economic and social reforms, in order to appease the malcontents. This apprehension (which we would not share, though we recognise the risk) arose from the fact that Mr Butler, although fundamentally the most forward-looking and administratively efficient figure in British politics today, has never quite managed to overthrow a suspicion that he might also be fundamentally lacking in resolution.

It is therefore fair to say that the new Prime Minister, surprising though his appointment is, could conceivably start under certain real advantages. The possible advantages are that, because his elevation will in itself be widely considered to be a placation of the worst influences in the Conservative party, he need not be under such great compulsion to placate them in his policies. His aim must be to press forward and carry through those policies of progressive Conservatism which Mr Butler has himself so largely fathered, where they will be unpopular no less than where they will be popular. His duty will be to make it quite clear that he would resort at once to a general election if his right-wing followers,—jubilant in his accession now, but possibly frustrated if he does not cash their cheques then—sought to make it impossible for the Government to tread the progressive path at home or abroad. It is right to be uneasy, impossible to be optimistic, but very likely wrong, in view of Mr Macmillan's well-known eclecticism, to be despondent about the prospect ahead.

Middle Eastern Priorities

Generally speaking, the Eisenhower doctrine for the Middle East is welcomed, there and elsewhere, by all interested parties who fear Russia—the Turks, the Iranians, the western countries with vulnerable oil interests, and the Middle Eastern governments (though not necessarily the peoples) that count on oil revenue to alter local standards of living and well-being. Equally, it is mistrusted by all Middle Easterners who fear tutelage and old colonialism more than they fear communism and the brand of imperialism Russia displayed in Hungary, and for whom "war" implies the menace not of Russia but of Israel. These include the Syrian government, the left-wing section of the governing Junta *in Cairo, and the man in the street in Egypt, Syria, Jordan and Iraq.*

Typical of this second attitude are broadcasts and newspaper articles describing the Eisenhower doctrine as a "nineteenth century imperialist way of replacing British and French with United States influence" (from Jordan), or as an innovation which "makes us wonder whether our countries are going to become a battlefield" (from Iraq).

In between these two extremes, a broad belt of opinion considers the proposition, as stated so far, too limited in scope to be applauded or condemned out of hand. It is "vague," says Colonel Anwar Sadat on Cairo radio, and "we ask our listeners throughout the Arab world to try and find out its meaning," says Baghdad. When these doubts are further analysed they reduce to a highest common factor : all deplore the President's reluctance at this stage to be specific about a single internal problem of the region. American proposals on these matters may well come later ; they will become imperative before very long. The two leading articles which follow set out two urgent local problems of the kind that will confront American policy in its new and active phase ; and our special correspondent looks at the Eisenhower doctrine from Amman on page 122.

★ ★ ★ ★ ★ ★ ★

I.—Egypt and the Charter

WHEN Mr Dulles amplified the Eisenhower doctrine for the benefit of the foreign affairs committee of the House of Representatives on Tuesday, he is said to have explained (the session was secret) that the doctrine did not embrace the internal problems of the Middle East, which must "remain within the domain of the United Nations." But—this axiom cannot be repeated too often—the United Nations is only what its members make it ; indeed, when action has to deal with a recalcitrant member, it is only what its great power members are ready to make it.

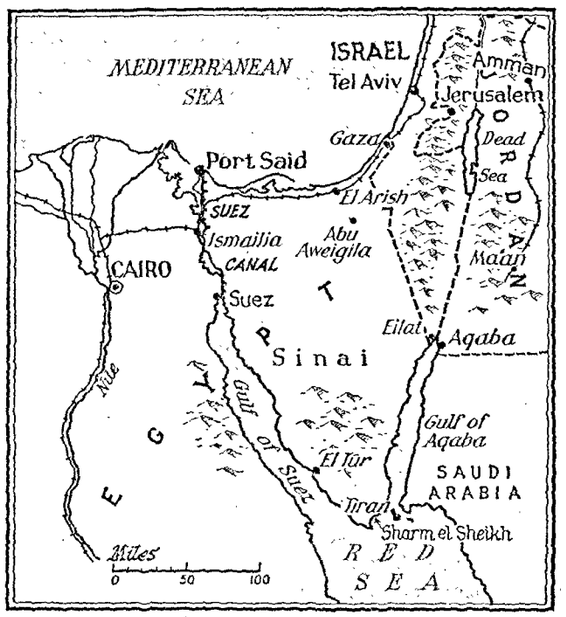
In the Suez Canal dispute and the Egypt-Israel dispute, in the course of which two of those great powers (Britain and France) have played themselves into the dock, Uno is bound to be no more than what the United States makes of it ; it can do no more than what the Americans, assisted probably by Canada and possibly by India, can prompt or cajole a two-thirds majority into deciding ought to be done—and even then, only if the decision is resolute to the point of setting up machinery for action. What are these key members going to make of Uno in order to handle the three questions of the hour: the future of the Gaza strip, prevention of blockade of the international shipping channel into the Gulf of Aqaba, and freedom of passage for the ships of all nations (including Israel's) through the Suez Canal ?

The reaction of most UN members to the hard fact that Uno is what they make of it is, at the moment, flabby. If there is one topic that, more than any other, catches and holds their attention it is their duty to redress aggression. The classic act of aggression, which is invasion by an army, or bombing from the air, infringes the most sacred of all their notions—the concept of sovereignty—and so long as someone's sovereignty remains infringed, they are so hypnotised by the sight as to be oblivious to all other topics. The victim's share in provoking the aggression, or the question whether he as well as the aggressor merits an exercise of UN discipline, are eclipsed in their minds. Egypt, so long as its sovereignty remains violated, can count on retaining the sympathy in Uno which it captured on the night of October 30, 1956. Can it also count on the obliviousness of a majority of governments to its own infringements of, and threats to infringe, UN resolutions and other undertakings that it is pledged to fulfil ?

The Egyptians are making the most of a heyday of sympathy, and an interlude of obliviousness to Egyptian shortcomings and misdemeanours. They have demanded, first, that all British and French troops should quit Egypt unconditionally ; secondly, that all Israeli troops, also unconditionally, should quit not only Egyptian soil but also the Gaza strip and the islands that command the channel into the Gulf of Aqaba ; Gaza and the islands, though till lately occupied by Egypt, are not Egyptian soil in law. Thirdly, they have assented to clearance of their obstructions from the Suez Canal at the expense and by the skill of other nations, while hinting (on their radio, though not from the lips of their President or government—the distinction could be important) that when the canal is clear, it might be usable as an instrument of discriminatory Egyptian policy. In New York, their officials seem to be moving slowly towards resuming talks with the canal's principal users on future management, but, unofficially, they are priming their home public with the thought that Egypt is going to be in a position to grant or withhold the right of passage in order to be able

to coerce any one of three adversaries—Britain, France or Israel. It is relevant to add that their radio is using language that incites their people to be bellicose, and that the fedayeen they have trained are still raiding Israel from Jordan (where Israel is also hitting back).

In a word, the Egyptians are claiming the rights and privileges of a victim in terms of the Charter, and of a nation at peace, but are simultaneously fingering the instruments of a nation at war. At what stage are the UN and the United States going to turn their attention to this one-way conception of working the Charter? Can they do so before the Israeli invader has surrendered all the bargaining counters he captured; or must they wait till after all foreign troops, except their own force, Unef, have left Egyptian soil; or will they never muster the resolve to do it at all?



It is likely that the United Nations will, willy nilly, be pushed to a decision on this matter, and that the push will occur within a week or two. For a test of its members' intentions, and of their collective capacity to act, is imminent in Sinai. So far, the Israel army has been retreating, and Unef advancing in its wake, across the wastes and ravines of central Sinai without hitch or demur. This unobtrusive movement into new positions was easy going in an area that has been likened to the low cards in the game of beggar-my-neighbour—useless except in conjunction with a court card.

A court card is about to be turned up. The Israeli public has suffered so considerably from Egyptian techniques of undeclared war that it is difficult to see how any Israel government could countenance a surrender of two of the points that its army captured, without first getting a solid assurance that these points will not again be used for raiding and blockade. The two points in question are the frontier area at its Mediterranean end (between Abu Aweigila and the sea and including the Gaza strip) and the island of Tiran and the shore batteries near Sharm el Sheikh in southern Sinai from which, intermittently and unpredictably, Egypt has since 1949 conducted a sea blockade.

These are areas in which not only Israel, but other UN members, are entitled to demand that Egypt must apply the article of the Charter that forbids acts which endanger peace (Article I, paragraph 1) at the same time as they apply against Egypt's opponents the article forbidding aggression and the infringement of sovereignty (Article II, paragraph 4). It is relevant to add that the latest UN resolution on the subject—that of November 2nd last—called not only on Israel to quit, but on Egypt to call off the fedayeen. For how long is Israel to be the only party to be adjured to obey it? For how long is President Nasser to be exempt from any obligation to give undertakings for Egypt's good behaviour if Uno clears his territory of intruders and his canal of obstructions?

If, as seems likely, the Israeli army stops its withdrawal short of the points which will threaten its security if they are restored to Egyptian hands, Unef is not in a position to force it to keep moving. In this likely event, Mr Hammarskjöld is bound to go back to the Assembly for fresh instructions. How are Assembly members, including Britain, to vote on the handling of this test case for international authority?

Each individual voter would seem to be faced, like the swineherd of folklore, with three choices. One course is to accept the Nasser doctrine that Israel must hand back its gains unconditionally to Egypt, merely hoping that means may be found later to prevent Egypt from using the vantage points for the old familiar purposes. A second course is to exact conditions from Egypt while Gaza and the mouth of the Gulf of Aqaba are still in Israeli hands. The drawback of the first choice is that it prolongs a lopsided application of the

Charter and increases the likelihood that Egypt, flushed with success, will be arrogant and intractable about right of passage through the canal. The drawback of the second is that the Egyptian reply to any conditions sought by the UN at this stage might be an injunction to cease canal clearance; any injunction would infringe the 1888 Convention, yet few states will be ready to run a risk that hurts Egypt less than it hurts several canal users. The third course, and by far the best, is for Uno, in instructing Israel to withdraw, to undertake itself to prevent raiding and blockade by holding the Gaza strip and the mouth of the gulf pending conversion of the armistice into a peace treaty.

Of course, there are snags to this proposition; one of them is that the United Nations force would need reshaping to a size and form compatible with a longer life than was intended when it was created. But a list of the drawbacks, however long, is offset by possible advantages. The arrangement would eliminate all chance of territorial gain from aggression and kill the

legend, still rife all over the Arab world and the oil area, that the UN and the western powers lack the will to keep Israel within its bounds. It would insulate two points at which, perhaps more than at any other, an "incident" is likely to spark off a war; and it could provide a precedent for international management.

The only discernible alternative to a bold step in this new direction is a lapse, by default, to the *status quo ante*, which must be the prelude to more undeclared war, renewed retaliation, fresh risks that the Soviet Union will openly take sides, and more likelihood of a call on the United States to exert armed force.

* * * * * * *

II.—Jordan must Choose

THE townspeople of Jordan, who dictate that country's politics, desire to be independent of Britain. A parliament elected in October on a pledge to end the Anglo-Jordanian Treaty is suspended between promise and fulfilment by the small matter of about £12 million which Britain pours annually into a poor country to keep it going. The government is therefore asking other Arab countries for guaranteed subsidies to replace those of Britain, being encouraged in this effort by promises from Egypt, Syria and Saudi Arabia.

The Foreign Minister, Abdullah Rimawi, did in fact say that all was settled by his visit in December to Damascus; there only remained the problem of "modalities." As it now appears, the unsettled modalities include the amount of aid, who will pay it, and how and when it will be paid. In short, Syria has agreed to pay money it has not got; Syria's financial difficulties are such that the moderates are glad that a government of the left has now to face the economic problem of the country. Egypt's accustomed financial difficulties have been made worse by the events of the last five months. Saudi Arabia has made it clear that its exchequer cannot bear the burden alone. In these circumstances it is reasonable to assume that Jordan cannot easily do without British money yet.

King Hussein might even not be sorry to see his popular government taught the hard fact of Jordan's economic life. Certainly it would carry more weight with the townspeople if it were the present government, committed as it is up to the hilt to abrogation of the treaty with Britain, that had to confess to the country that adequate aid was not forthcoming from the Arab states. The more Arab nationalism is forced to face reality, the better the chances for ultimate stability of government.

But it does not necessarily follow, as some people seem to assume, that Britain would benefit from this particular revelation. To be convinced of beggary does not always make the beggar feel warmly towards the solvent and charitable outsider, as some people in Britain who resent United States loans might recognise. The Jordanians may be forced to face the facts, but they cannot be forced to like them; Britain can score a point but will not thereby win a partner. Jordan's frustrated nationalists might even, in their anxiety to cock a snook at Britain, fall for the illusion of "string-less" aid offered, perhaps, by Soviet Russia.

This may be pessimism, but the mood and mind of Jordan justify pessimism. Nor could the mood and mind be changed radically by British propaganda. It has been argued in London that "better propaganda" could have prevented the attempt to bring Jordan into the Baghdad Pact from collapsing in bloodshed and disorder, as though by mere loudness of voice Britain, or maybe Iraq, could have shouted Jordan into the pact. But neither Egyptian propaganda nor Saudi Arabian money made Jordanian opinion what it is today. If Jordan had voted freely in the later days of King Abdullah, when that gracious but strong man ruled firmly with his loyal legion, the views of the electorate would not have been markedly different from those which produced the present parliament. President Nasser and the Egyptian revolution gave impetus and encouragement to the Baath Party of Abdullah Rimawi, for example, but the opinions of Rimawi pre-date both. To no small extent President Nasser learnt from the Arab nationalists, not they from him; his propaganda succeeded because it repeated and embroidered the thoughts which the Jordanians harboured already. Can Britain promise to destroy Israel, or brand Nuri es-Said as an "imperialist stooge"? There is nothing that a Voice of Britain can say to change the thinking of refugees and frustrated Palestinian townsmen, or to stay the increasing assent which their ideas enjoy in Amman and other towns east of the river Jordan.

If Jordan must now face the harsh facts about money, so must Britain now face the harsh fact that the attitude of Jordan to the British connection is not a temporary aberration produced by propaganda or an extreme government. Jordan wants to be rid of its British ties. Jordan's financial dependence cannot give Britain a progressive and constructive position in the country. The Jordanians feel they are manacled to Britain by their need for money and that the "perpetual" Anglo-Jordanian Treaty—perpetual in that it makes no provision for denunciation by either party—is the manacle. Revision would not meet their case, for they would say they had been compelled to it by economic necessity.

During these weeks in which the Jordanian government is hunting a philosopher's stone which will turn Arab promises to gold, it would be appropriate to inform Jordan that Britain is equally manacled and equally dislikes it. The £12 million which Britain pays yearly does not b a vital strategic position. This money that Britain an ill afford purchases three military bases, but with a heavy mortgage—and the unenviable

need to defend Jordan against Israel if the Jordanians call for help. It is increasingly evident in Britain—and Jordan should be told so—that Britain can very well do without the financial commitment, without the defence commitment, without the bases, and without the odium which goes with all three.

The R.A.F. has a base at Amman which was evacuated early in November to avoid the hostility of the neighbouring population at the time of the Anglo-French action at Port Said, and another at Mafraq which was deprived of water for ten days in November by a politically inspired strike of tank car drivers. Fuel is brought to the base from Beirut by civilian contractors who must drive through an unfriendly Syria. Food is flown in. There are 1,000 men at Mafraq and the army has some 1,500 at Aqaba, who give Britain a toe-hold at the head of the north-east arm of the Red Sea. These military establishments were valueless in the invasion of Egypt because Jordan would not permit their use for the purpose. Although Mafraq has runways long enough for any aircraft flying today, it is at least open to doubt whether it or any other base in Jordan could make a worthwhile contribution to a war against Soviet Russia. Their retention ensures the antagonism of the local population and strengthens interest in communism ; and although such leanings are often exaggerated, they show how subversion can sap the security of the bases. Recent experience tends to show, in fact, that the only certain use the bases can have is in a war with Israel, the only war for which Jordan would permit their use.

★

It is clear that almost all the assets in Jordan have vanished. There is no more King Abdullah, firm in the conviction that his frontiers were safest if bolstered by alliance with Britain. There is no longer a friendly and co-operative Jordanian army with Glubb Pasha at its head. King Abdullah is dead, a victim of the passions which now torture the country ; General Glubb has been dismissed, on account of those same passions, by the late king's grandson. The mutual defence clause, which had advantages for the British before Israel existed, now commits Britain to defend Jordan against Israel ; Sir Anthony Eden's anxious warning to Israel in October revealed how embarrassing that commitment could be. There remain for Britain only the three isolated footholds over which there is bickering and sometimes conflict with the people they are meant to serve ; these and the annual bill for £12 million. Only Jordan gains.

Yet Jordan frets to be rid of it all. Then let Britain offer an early quittance. Rather than rejoice that economic necessity might force King Hussein and his government unwillingly to Britain's breast, why not grant them a new and unforeseen freedom of choice ? Now is the time to call for a mission from Jordan, to ask what it wants and to tell it, firmly and flatly, that, on the present showing, Britain has now no use for the treaty ; that Britain, like the Jordanian nationalists, wants no more than a friendly relationship " based on equality and respect for each other's sovereignty "; that Britain desires, in any case, to put an end soon to the subsidies.

Few people in Britain can wish harm to Jordan or would force greater poverty on that poor and vulnerable country, or on the host of refugees that overburdens it. But the British taxpayer, too, has enough burdens not to want to buy hate at £12 million a year. It is no more than decent to give the Jordanian government time enough to find the money elsewhere, but it should not be indefinite time ; there must be a clearly defined full stop in prospect.

Britain would thus be rid of embarrassment and expense ; but there is more than that to it. Present Jordanian policy is the negation of constructive effort. It is, in fact, an aggregate of several resistances, but primarily of resistance to Israel and Britain. By removing the resistance to Britain, the nationalists are at once compelled to sacrifice a major part of their *raison d'être* and to seek positively a relationship which will quickly satisfy the urgent needs of the nation. This is as essential to the nationalists as it is to Britain, which has to establish a new and natural relationship with Jordan.

Jordan may after all get the aid from Egypt, Syria and Saudi Arabia and so move into the camp of closer relations with Soviet Russia ; but if this happens, it will happen irrespective of Britain's decision, and will create a situation in which Britain has no choice but to leave without dignity. Alternatively, Jordan might say, as Britain has said, that there is no provision for unilateral abrogation of the treaty and that Britain must therefore continue to pay until the Jordanian government is ready to waive the subsidy. There is, however, evidence in the statements of the Jordanian Prime Minister and Foreign Minister to show that their intention is to abrogate the treaty unilaterally.

Britain should promptly inform the United States of its own intentions, because the United States, if it wishes, can provide some or all of the funds which Jordan requires, and because the Eisenhower doctrine is presumably relevant to the possibility that Jordan may now turn more directly towards Russia. The west gains if the United States can adequately fill the financial gap left by Britain ; but neither the United States nor the west would gain if the gap were filled in such a manner as to confirm a common Arab view—that the Eisenhower doctrine is merely the American way of replacing British power and is deserving of the same calumny. How to come to terms in this or other matters with the tortuous and tortured minds of the Arab nationalists is a problem which the United States government now has to face in detail. There is no simple solution, but at least this can be said: if Jordan wants aid its government must be left to ask for it, so that in the end it is clear that the United States, if willing to give, is not forcing its money on a weak state to make it subservient.

Torn-up Checks?

WHEN Parliament reassembles the week after next, it is to be hoped that MPs—in spite of (indeed because of) all the other things that now command their attention—will also have done some fairly drastic rethinking about the whole function of Parliament and parties in the British system of government. MPs are not usually accustomed to indulge in such thinking (some of them would even say that it is not their job) ; and any attempt at dispassionate discussion of the things that clearly went wrong in the last parliamentary term is too apt to become entangled with passionate argument about who was right in the issue that precipitated all the trouble. Yet, the attempt, and the disentanglement, should be made. Here then, in the hope that they may worry MPs as much as they have certainly worried some outside students of government, are some nagging constitutional reflections, prompted by observation of the proceedings at Westminster between October 30th and December 21st of last year.

It is sometimes said that the British system of government is a cabinet *dictatorship* limited by quinquennial elections. Constitutional theorists from abroad have often been very disturbed about this, for a general election is obviously a crude instrument of discipline—particularly, perhaps, in a country where one party (not at the moment the governing party) has pretended to base domestic politics upon the emotional excitements of a cold class war. A quinquennial election offers only a general judgment on the comparative merit of government and opposition ; it cannot yield a verdict on individual policies ; its efficacy as a restraint must vary enormously with its nearness ; and, in any event, if dictatorial powers were really given to a cabinet which was limited only by its liability to be totally changed in composition and philosophy every five years, there would be impossibly wild quinquennial aberrations in the course of national policy. So much, one imagines, is common ground.

★

The saving grace in this apparently illogical and dangerous system—or so we are accustomed to reassure ourselves—is that the vast powers given every five years to eighteen or so men (led by a prime minister with not easily definable responsibilities) are also subject to a series of more continuous intangible and centripetal restraints. It is these famous " checks and balances " in the British constitution that some people now feel need to be looked at anew.

Those who express disquiet usually start by saying that what might be called the first line of restraints seems to have been overridden in the handling of Suez policy. To take three examples. For the first time in a century a Government went to war, whether rightly or wrongly, without making some prior effort to secure the concurrence of the Opposition. Singularly few civil servants, it is said, even at the highest level, were asked to sift the implications before the ultimatum to Egypt was sent (there is a wry comment here on the intangible nature of the restraints ; civil servants always say that they do not make decisions of policy, but witness their fury in the one case where this happened to be true). And, finally, the process of detailed argument within a divided cabinet itself may also have been cut immoderately short on October 30th by the Prime Minister's resolve to reach a decision before the French plenipotentiaries arrived.

These charges may well be true. But, probably, they are not charges to get too excited about. For one thing, any overrunning of the normal checks this time almost certainly means that careful regard to them is more (not less) likely next time ; the turn of recent events may even lead to the reinforcement in the future of the customary restraints on foreign policy, in the shape of more consultation with the Commonwealth and the United States of America. For another thing, these " unofficial " checks and balances cannot in any case be written more strongly into an unwritten constitution by tangible measures of reform. And, for yet another, this first line of restraints is made to be burst through on occasions when prompt decisions are needed ; the important thing is that there should be an efficient mechanism for measuring the cabinet's good sense when this happens. Political observers have much more reason to be concerned about the strength of the ultimate bulwarks of democracy, on to which policy breaks when this first line of restraints is—as it sometimes legitimately can be—cast aside. According to most of the textbooks, there are three main ultimate checks of this kind. All of them must now be called in to question.

★

The first of these ultimate restraints on cabinet irresponsibility is supposed to be the safety valve of personal conscience and the possibility of parliamentary defeat ; we have always told ourselves that we have a flexible system of government, with the cabinet continuously answerable to, and liable to be thrown out by, the House of Commons. That is the theory: but the fact is that the last time a government with a clear parliamentary majority was brought down in peacetime by a vote in the House of Commons was in 1895. With that in mind, let us look at what happened in the Suez crisis.

What happened was that the most explosive political issue of the last fifty years produced only two resignations of protesting non-cabinet members in the upper

reaches of the government side, and no public dissociation from the Labour party line on the shadow cabinet's side. Lower down the parties, there were only half-a-dozen open revolts by MPs of either persuasion. Yet it is plain that many more politicians than this, including some on both front benches, had grave misgivings about their parties' policies.

Moreover, the reason why so many MPs stifled their qualms was made explicit in the debates. Throughout November and December the speeches of rebellious Conservatives, on both wings of the party, made it clear that, to virtually all of them, a Conservative government, however much in error, seemed preferable to any action which might bring about a Labour government; and how many people believe that Labour members, in a similar situation, would not have said precisely the same thing? Yet, unless MPs exist who in some circumstances would prefer their government to be defeated, the first check in the British constitution must now be assumed to have been thrown away. If, indeed, the belief gains ground that for the other side to take office is the ultimate disaster, then where do we stand as regards Lord Balfour's stated prerequisite for the survival of our system of government: "that the parties are so fundamentally united that they can safely afford to bicker"?

*

These forebodings might seem to be exaggerated, were it not for the experience of what has happened in the past three months to the second assumed check in the constitution, which is the presumption of tolerance within the major parties towards those MPs who defect from the majority party line. Hitherto, a great deal of nonsense has been written about this. Despite all the sternness and rigidity of the party system, there does not seem to have been any instance—until this latest crisis—when an MP has had his parliamentary career terminated, or re-nomination refused, because he had expressed misgivings with his party's *ad hoc* decisions on a single issue of policy. But the fates of Mr Nigel Nicolson, Conservative MP for Bournemouth East, and Mr Stanley Evans, Labour MP for Wednesbury—not to mention whatever did happen to Mr Anthony Nutting—surely suggest that constituency parties are being allowed, by the public and by other MPs, to arrogate much more power than ever before over their members' freedom of action and expression.

Why are they being allowed to do this? Do the public in general, and MPs in particular, honestly believe that members' conduct would be wiser, or more in the public interest, if directed more closely by local committees? If not, why have we not heard more from MPs in defence of their profession's proper liberties—with Labour members saying loudly that, much as they disagree with Mr Stanley Evans's recent opinions on this single issue of Suez, they stand firmly by his right to express them, and with Conservative members saying the same about Mr Nigel Nicolson? In future, perhaps, Ostrogorski's ancient nightmare of caucus government will not be so lightly dismissed.

The third favourite bulwark cited in the constitutional textbooks is the British Parliament's machinery for scrutiny of (as distinct from judgment upon) government policy. Here again the past three months have surely brought cause for concern. Question time has scarcely lived up to its reputation as one of the most vital of British institutions. Indeed, it has been singularly ineffective as a means of clarifying a confused situation: major issues have been consistently evaded by means of irrelevant answers and bland self-contradictions. There can be little doubt that a handful of MPs using the procedure of a select committee—or of a responsible American investigating committee—would have been able to elicit as much information from the Prime Minister or the Foreign Secretary in thirty minutes of interrogation as has emerged from all the confused and repetitive exchanges at question time since the ultimatum was launched.

This is an unexpected conclusion to have reached. In the last two Parliaments reports of select committees have often been criticised in these columns; on detailed matters of administration—for example, investigations by the select committee on estimates into operations of departments such as the Ministry of Works—these badly instructed groups of private members seem to have an almost unique ability to seize on precisely the wrong ends of sticks. It is now beginning to appear, however, that the one sort of investigation for which a select committee might possibly be a relatively efficient instrument would be an investigation into the reasons for, and the methods of arriving at, a high policy decision; and that is the one sort of investigation a select committee is never—at present—allowed to make.

*

These are some thoughts for MPs, and others, to mull over in these last ten days of the Christmas recess. They may not be welcome thoughts to the present generation of MPs, which has lately evinced some peculiar ideas about the sort of actions they consider most likely to bring the institution of Parliament into contempt. The argument of this article has been that in its Suez policy the Government—rightly or wrongly—rode over some of the restraints normally active in the constitution, brought its policy up for judgment and scrutiny against the ultimate bulwarks of British democracy, and that those bulwarks then proved to be startingly inefficient in both operation and conception. Which sort of government—which shade of Conservative or of Labour—would one expect to be most likely in future to resort to policies that might need to be tested against those apparently weakened bulwarks again? There, surely, is a really nagging thought for Conservative MPs. Which? Which? Which?

Notes of the Week

By Whose Choice?

The newspapers were completely unprepared for shocks when Sir Anthony Eden went to see the Queen at Sandringham on Tuesday; the assurance that the visit was a normal one, and held no political implications, was taken at its face value. It will be a fascinating subject for future historical revelation how many people knew how soon that something was in the wind. The formal interviews that Her Majesty held on Thursday morning with Lord Salisbury and Sir Winston Churchill do not necessarily mean that there had been no earlier consultations about what should be done in this emergency.

The first suggestion of those who were eager to block Mr Butler's accession was that the Queen should not appoint a Prime Minister until the 345 Conservative MPs (who have been democratically elected) and a greater number of Conservative candidates, peers and party officers (who have not) had met to choose a new party leader. The Conservative Central Office announced that it rejected any idea of this solution, on the formal grounds that it was not for it to interfere with the Queen's prerogative. The Suez group of MPs, to its credit, never really put their support behind this suggested gimmick for giving themselves (possibly) more weight. Their solution on Wednesday evening—when they thought that Mr Butler was about to be called to the palace—was that Mr Macmillan, as the older man, should take over after "doing a deal" with Mr Butler about the date of his own retirement. There was no evidence on Thursday that there had been such a deal; the right wing seems to have gained its immediate objective without it.

Labour's official view is that the change means that there should now be a general election; as its official view about any development now is that it means that there ought to be a general election, perhaps not too much weight should be given to that. The country could not vote now on what to do in the Suez incident, because the Suez incident is past. It could only vote on what to do about broader domestic and foreign policy problems ahead. The Conservatives' mandate to handle them is not yet run; it remains to be seen how Mr Macmillan will consider that that mandate is to be interpreted.

Hungary and the United Nations

Mr Hammarskjöld presented a discouraging report this week to the General Assembly about United Nations action on Hungary. The group that he asked to investigate the Hungarian situation in November has virtually thrown in its hand, on grounds that are unconvincing. The three members (of all of whom better things might have been expected) found that since the Kadar regime would not let UN observers into Hungary, "what we have looked at is the available and generally known material which does not put us in a position to add anything significant to what is common knowledge about the situation in Hungary." They conclude that it might be better to suspend investigations "for the present."

Their conclusion is wrong. The West is flooded with material—much of it eye-witness material—about the Hungarian revolt on the basis of which it is perfectly possible to make a detailed and reliable analysis of what happened. So much information exists that, merely to find out what happened, the UN observers need not at this late stage go to Hungary at all; even the misleading Kadar propaganda is fully available to them outside the country. In any case, the Assembly does not need an exclusive and exhaustive history of the Hungarian revolt. It needs to place on the record its authoritative statement, so that it has a solid basis on which to pursue its further efforts to liberate the Hungarians.

Fortunately the flabby attitude of the three-member group is not the end of the matter. Mr Hammarskjöld suggested in his report that a new *ad hoc* committee should be set up by the Assembly to investigate the Hungarian situation, and that it should be specifically authorised to take evidence from refugees. His suggestion has been taken up in a resolution. The Assembly should also consider making use of the Peace Observation Commission that it set up in November, 1950; reports from the diplomatic or consular representatives of member governments in Budapest would be a useful source of information on current developments. Mr Kadar is now so anxious for western economic aid that he will think twice before trying to put a stop to these. Although it is not probable that any United Nations action can affect the immediate course of events in Hungary, it is essential, both for Hungarian morale and for its own reputation, that the Assembly should keep its teeth in the problem.

Two Days' Strike?

A demonstration of mass lunacy was given by the national committee of the Amalgamated Engineering Union on Tuesday; and on Thursday a conference of the Confederation of Shipbuilding and Engineering Unions was held to decide whether to follow its most important constituent union round the bend. The AEU committee voted by 28 to 23 to call for a 48-hour strike of the whole

confederation, in support of the wage claim of 10 per cent which the employers rejected outright a few weeks ago. First, however, it had rejected a proposal from a communist delegate for a strike lasting a week. That had been vigorously opposed by Mr John Boyd, the Scottish member of the executive, who said that he was not convinced that union members were prepared to take action contrary to the country's interests:

> Never have the workers of this country been so country conscious. They know that if the economy of the country breaks down they would break down with it. A week's stoppage would do irreparable harm to the country.

Mr Boyd's argument came back to self-interest, but it was certainly enlightened, and his speech was the more courageous in that he is seeking the support of these lunatics in the coming election to the union's general secretaryship.

What casts such doubt on the engineers' sanity is that a strike, whether for a week or for two days, would be so obviously against their self-interest. Far from forcing the employers to make a counter-offer the threat could well have stiffened their resistance. The AEU's decision to threaten a strike before the end of February went with a decision to seek new talks with the employers meanwhile. But the employers seemed likely—and most certainly would be right—to refuse to talk under duress. If the unions were unable to fix a meeting and it really came to a strike they would be in an unhappy position indeed. Many of their members would be puzzled to see how, by walking out in February and then walking back again two days later, they would advance either the willingness or the ability of their employers to pay; it is therefore by no means certain that a strike call in February would have met with solid support. It might well have been a woeful exhibition like the strike over dismissals at the British Motor Corporation last summer, when men were set against men, some striking, some working, all at sixes and sevens.

The confederation, however, has prudently decided to make a new approach without any specific threats, merely authorising its executive to say that, failing satisfactory results, action must be taken. Trade union leaders—even more ardently than the rest of the country—must hope that it has thereby saved the AEU from its own folly.

On Making Peace with Mr Cousins

MR COUSINS, general secretary of the Transport and General Workers' Union, has this week shown what can be done in one field without strikes or threats of strikes—and how sensible his executive was in refusing the busmen power to call one. After their claim for £1 a week had been rejected by London Transport with a counter offer of about 6s., Mr Cousins himself took charge of the negotiations, and the upshot is that he has pushed up the offer, first to 6s. 6d. and then to 7s. 6d. This was some way from the 9s. that he sought to cover the cost of living increase that has taken place since the busmen last had a rise; but even this has largely been conceded in an ingenious form which does not set too dangerous a precedent. The men are to get better rates for Saturday afternoon duty, which will yield them on an average just about 1s. 6d. a week more than hitherto. These rates are already paid on the provincial buses. For London Transport the settlement will mean spending an extra £1½ million a year and probably raising fares again—though the extra passengers forced on to the buses by petrol rationing make the timing and amount of the rise uncertain. But presumably it was thought worth while to reward Mr Cousins's patient negotiating approach, and thus make it unnecessary for him to go on the rampage so early in his career. Those who have to negotiate with him may be well advised to spread the idea—not least to Mr Cousins himself—that this new Colossus is at heart a very moderate man.

★

There was nothing in this settlement seriously to upset the Associated Society of Locomotive Engineers and Firemen: they therefore decided at a conference on Wednesday to accept the 3 per cent which the railways tribunal offered them to cover the rise in the cost of living since their last increase. This is a far cry from the 15 per cent which they had sought, but Mr Albert Hallworth, the general secretary, soothed the delegates by pointing out that this left the executive free to make another claim when they judged the moment ripe, which he thought might be quite soon. The ASLEF's acceptance will not please the National Union of Railwaymen, who were disposed to reject the 3 per cent for themselves; but all three railway unions must be quietly satisfied that the tribunal should have recognised the dubious principle that railway wages should automatically follow rises (although not falls, presumably) in the cost of living index.

That principle is actually enshrined in the industrial agreement for the building industry, and it was in accordance with this that the employers this week granted the builders an extra penny an hour, or 3s. 8d. a week—a sum which, they say, will add £12 to the cost of a three-bedroomed house. As usual, however, the unions want more than a cost of living addition, and they presented a new demand for an increase of 4d. an hour, or 14s. 8d. a week, as well as various other benefits. This must be firmly resisted. The pattern, let us hope, is now set: at about 3 per cent, to cover the rise in the cost of living, it is not excessively more than the country can afford.

No Compromise from Mr Kadar

MR KHRUSHCHEV and Mr Malenkov flew to Budapest on New Year's Day and there held a secret four-day meeting with the top communist leaders of Hungary, Czechoslovakia, Rumania and Bulgaria. Last Sunday, a few hours after a communiqué on this meeting had been published, Budapest Radio broadcast the long-awaited statement of policy by Mr Kadar. Clearly there was a close connection between the two events. In spite of official denials, it is generally believed in Budapest that Mr Kadar tried to get some non-communist political leaders to co-operate with him, on his terms, and that he failed. Presumably he then appealed to Moscow for guidance and backing. Moscow provided both, and in addition, took the opportunity to give other communist leaders, assembled in shattered Budapest, an object lesson in the dangers of going too far with destalinisation. Only the east Germans, who were already begging for economic help in Moscow, and the Poles were missing. Mr Gomulka either was not invited because the Russians feared he might prove a discordant element, or refused to come because he did not wish to lose popularity at home by subscribing to the Russian version of the Hungarian "counter-revolution."

Mr Kadar's declaration has been received with sullen and bitter disappointment by the Hungarians. There are a few minor concessions—a better deal for individual craftsmen, a guarantee of religious teaching in schools for those who want it; a promise never to return to the methods of the "Rakosi-Geroe clique"; and pious platitudes about cutting down the state bureaucracy, overcoming economic difficulties and so on. But to the basic political demands for which the Hungarians have never ceased to press Mr Kadar returns a blank refusal. The dictatorship of the proletariat is reasserted categorically. Mr Nagy graduates from being merely misguided and incompetent to the designation of traitor. "Counter-revolutionaries" and "imperialist agents"—that is, opponents of the regime—are threatened with the utmost rigour of the law. The Soviet forces in Hungary have been of "great assistance"; their position will be settled by "friendly negotiation."

Mr Kadar, in short, shows less readiness to compromise than ever. Yet this did not deter him from announcing that he would try to persuade non-communist leaders to help him carry out his programme: not an easy task, as he added in a superb under-statement. The immediate prospects in Budapest seem to be prolonged deadlock—or possibly another angry explosion.

Mr Malenkov to the Fore

MR GOMULKA'S absence and the presence of Mr Malenkov were two striking features of the international communist meeting in Budapest. Poland is fast becoming odd man out in the Soviet block; its press greeted Russian intervention in Hungary with scarcely veiled hostility, and its public opinion continues to express feelings of sympathy for the Hungarian people. In these circumstances Mr Gomulka could not have identified himself with the proceedings. Mr Malenkov, for his part, was staging an international come-back.

Since Mr Khrushchev is the party's first secretary, Mr Malenkov was in Budapest formally, in all probability, as the representative of the Soviet government. But since his demotion two years ago he holds the lowest government post of all the members of the politbureau; he is only a deputy premier, while most of his colleagues are at least first deputy premiers. His selection as Mr Khrushchev's companion marks a return to the limelight which has a political significance.

Stalinism in its political aspects was to a great extent the result of Stalin's economic policies—the rapid industrialisation, high rate of investment, and relative neglect of the consumer, all of which required coercion and repression to impose them on an unwilling people. Mr Malenkov during his twenty-two months at the helm showed signs of understanding that political relaxation must, therefore, be accompanied, or preceded, by economic concessions. After his fall the priority of heavy industry was reasserted and pledges to the consumers toned down in a manner which contributed to the political restlessness. Russia is still paying the penalty for this contradiction between its economic and its political courses; it is now compelled to make economic concessions in eastern Europe without getting any political return. Perhaps it was awareness of this lesson which caused the Soviet central committee to send the more cautious and statesmanlike Malenkov to Budapest to keep an eye on his blundering successor.

Kenya Line-up

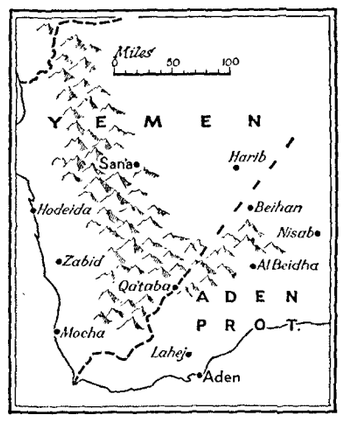
THE announcement that the United Country Party of Kenya has been finally dissolved will not surprise anyone. But it is a matter for great regret. The party was founded when the "Blundell group" of European members of Kenya legislature were in a far more liberal and hopeful frame of mind than they are now: it was an attempt to create a genuine multiracial party supporting multiracial government. But from the first it failed to carry conviction, because Mr Blundell did not feel immediately able to open its membership to Asians and Africans. He considered that an offer of eventual membership was as far as, perhaps farther than, a successful European politician could afford to go—and the subsequent treatment of his venture at the hands of the press and in Kenya social circles has largely shown this fear to be true. The final blow came when the Blundell group lost a seat at the recent elections to the Briggs group, which has always held, not only that white leadership and supremacy must be indefinitely maintained, but that party politics in Kenya are too dangerous and that the Europeans must present a solid white front to the other races.

★

As an inevitable reaction, the African elected members, divided though they are on many matters, have formed their own solid front. Thus the Legislature is divided along the lines of colour and the stage is set for a struggle between the races for power. This will now be fought out on constitutional lines, but the pattern of inevitable concessions has already been set with the appointment of another African minister. There is reason to hope that in the African elections next March a relatively moderate, because small, black electorate will choose the anti-extremist candidates; but the white settlers have seen to it that, anti-extremist or not, African policy will still be one of African nationalism—Kenya for the black man. The right-wing Europeans believe that they can handle this situation, and profess to prefer it in the open. The Africans are likely to settle down to a campaign for increased representation, which in the end would give to them—not to a multiracial "Kenyan" party—control of the country. The Briggs group believe that a solid European front can indefinitely frustrate this African ambition; Mr Blundell's party was started precisely because he read the signs of the times differently, and believed that this was not only reactionary—but absurdly wishful—thinking in history's despite.

Sir Roy's Politics

SOUTH of Kenya there has been another disappointment for liberals in the past week, and it has come from a man whom many have hitherto regarded as Africa's main white hope. Sir Roy Welensky, whose Federal party is in political difficulties, has evidently decided to outbid the Dominion party opposition in Central Africa by demanding more independence for the Federation and an end to Colonial Office "interference"; he has done so in a speech made while Mr Lennox-Boyd was still in the country. By a clever piece of casuistry, Sir Roy is arguing that it is the Africans, not the whites, who are repudiating the basis of racial partnership on which the federation stands; he takes as proof of this the fact that the African nationalist leaders still denounce federation and say that their aim is the establishment of African states on the Gold Coast model. So long as the Colonial Office has responsibilities in Rhodesia and Nyasaland, says Sir Roy, the Africans will turn from the local governments to it in their search for support in this ambition.



All this will seem entirely convincing to the white electorate in Rhodesia. But it will not convince many people in Britain. Sir Roy himself has repeatedly said in London that federation stands or falls by its ability to win African co-operation. He seems to be making very few allowances in an attempt to secure it. The emphasis now should not be on the undoubted existence of some individual African crackpots: the blunt fact is that the broad mass of Africans have not yet heard how their interests will be safeguarded if and when the Colonial Office, and British responsibility, is eliminated. Plans for a federal citizenship were drawn up over a year ago. Lord Malvern blurted something about a two-tier franchise and then went mum. All that has happened since is a rising European claque against the Colonial Office, and a demand for independence.

The suspicion has not entirely unreasonably grown in African minds that the independence demanded, in advance of the due date, is to be for whites only. Every incident in the copperbelt and elsewhere has magnified this suspicion. A recent one was Mr Lennox-Boyd's snub to Mr Nkumbula, put partially right by a last-minute meeting with him this week; the latest is the highly regrettable refusal by the industrial arbitrator to give the African mineworkers any advance in pay against their claim. Sir Roy knows all this. He knows the dangers of endlessly frustrating native peoples under a quasi-liberal semi-apartheid regime. It is a pity to see him swept out of his course by events, instead of shaping them.

Yemen on the Bandwagon

NOMADIC populations, maze-like tribal affiliations and the frequent absence of any well-defined natural landmarks combine to make the demarcation of desert frontiers, whether by territory or by people, an extremely difficult thing. Yemen's frontier with the Aden protectorate has never really been marked out on the ground. The British-Yemeni Treaty of 1934 reaffirmed the status quo on an incompletely defined boundary, and the boundary commission provided for in the 1950 treaty was never formed. Yemen does not want a firm frontier because it would also solidify the frontier of the federation of Aden's protected principalities, to which the Imam Ahmed, ruler of Yemen, is opposed. Not only has he territorial claims; he sees in the federation the seed of an organised Arab neighbour, related through its subjects of the Shafii sect to the Shafiis of Yemen, challenging the supremacy of his own Zaidi sect in his country.

Since Britain launched the federation plan in 1950 the Imam Ahmed has constantly fostered the tribal troubles of the frontier with guns and money, denouncing as aggression any protective action taken from Aden in reply. It is difficult to believe that the fighting which has produced the exchange of protests between Yemen and Britain this week is more than another, somewhat larger, example of the Imam's policy, although exact details from that frontier are hard to come by and not easily intelligible. The Yemen, once jealous of its isolation, has discovered the power of propaganda and seems inclined to exploit Britain's new-found reputation as an "aggressor" for its own ends. In words which are a straight crib from one of the November broadcasts of Cairo radio, the Yemeni chargé d'affaires in Bonn has told journalists that his government would be forced "to call on volunteers from all over the world to resist the British aggression." It may be that "all over the world" in this context means Egypt, Syria and Saudi Arabia, with which the Yemen is associated in military pacts. The frontier situation could get worse.

The Colonial Office might usefully arrange to have faster and fuller news of the frontier troubles than has Yemen, which always manages to have its protest in first. It is strange that Yemen should beat the Aden government in the modern technique of communications. There might also be good reason to send an expert Arabic-speaking mission to the protectorates so that Britain can have an independent report on the situation and the needs of the population there. Its report would have no effect on Yemen; but if the Imam is being given aid from his allies to increase border troubles, it would be an advantage if the Commons and the British people could be told a little more than they know at present about the matter.

Oil for Middle East Lamps

SINCE yesterday the Lebanese Government has been unable to export oil to Syria and Jordan from its depleted supplies. It informed the two governments that, as a result of the sabotage of the Iraq Petroleum Company pipelines in Syria, the stocks in the IPC tanks at Tripoli would be exhausted by January 11th and the Aramco oil at Sidon would only meet the Lebanon's requirements. The Suez affair has created a shortage of oil in Egypt, too. All the Sinai fields are out of action: the Sudr and Asl fields because the Israelis removed the pumps and plugged the wells, Ras Matarma because of a fire, and Bala'im is closed down. Egypt is therefore left with only the Ras Gharib field on the opposite shore of the Red Sea, and with only one tanker capable of carrying about two-thirds of the Ras Gharib output to the refineries at Suez. As Egypt, in any case, imported about a third of its oil requirements, the extent of the shortage is obvious. The stocks in Egypt must have carried the country through to the end of the year, but the government has been forced to impose rationing of kerosene—by far the most important domestic fuel in Egypt. The black market is flourishing.

Both Syria and Egypt have sought American and Russian help, and have received it; Russia has sent in the oil and American companies have distributed it. Syria is reported to be as well off for oil as before the crisis. Russia has also sent some kerosene to Alexandria. Now the American companies are under pressure to meet Egypt's needs in full by bringing crude oil from the Persian Gulf to the refineries at Suez. They have agreed to supply after securing assurances about payment and profits which were unobtainable before the crisis.

It would be tempting to suggest that oil could in this case be used as a weapon to secure Syria's permission to repair the IPC pipelines and to ensure that Egypt does not discriminate against British and French traffic through the Suez Canal. The situation exemplifies the difficulty of American policy in the Middle East: how to preserve a position and influence—and therefore some western position and influence—without encouraging recalcitrance. In this case, the United States will need to release Egypt's dollar holdings in New York to enable the oil to be bought. From the point of view of the oil companies concerned, the problem is simpler. Since they expect to continue trading in the Middle East they could hardly allow themselves to be used as a stick to beat the host governments.

(*A Note on Texas oil on page 113 and two Business Notes on page 133 indicate the present prospect for British oil supplies.*)

Canal Users Rally

THE Suez Canal Users' Association has emerged from the blast hole into which it was driven by the attack on Egypt. Representatives of the fifteen member nations are taking stock this week and, endowed with an Administrator and £50,000, have to determine what the one will do with the other. The formation of Scua occupied the period between the failure of the Menzies mission to Cairo and the reference of the canal dispute to the Security Council. President Nasser's rejection of the eighteen powers' proposals for internationalisation of the canal produced a state of indecision into which Mr Dulles brought the idea of a users' association; taken up by Britain and France, it was endorsed in general terms by a second London conference. On October 1st the association was formally inaugurated, and in the following weeks it appointed several committees and an Administrator, Hr Eyvind Bartels, the Danish consul-general in New York. The members also agreed on a scale of contribution, the USA and the United Kingdom heading the list by each paying 20 per cent of the initial funds. This was as far as Scua had got when its career was abruptly halted.

Scua was hamstrung from the first by different interpretations of its purpose. Even the three proponents were not at one, and Mr Dulles either failed to make his own position clear, or actually changed it. The British and French wanted to use the association to coerce Egypt whether militarily or economically; Mr Dulles disagreed. The divergence became precise over the payment of dues. Mr Dulles had at first agreed with Britain and France that it was part of the association's job to collect dues and pay a proportion to Egypt, but it later transpired that he was not prepared to insist on this point until Scua was a going concern and had entered into a working agreement with Egypt. By mid-October, Mr Dulles seemed to be thinking of Scua mainly as a negotiating body waiting to talk to the Egyptians.

Events since then have narrowed the choice: either it will become a medium for negotiation, or it will pass out of the picture for good. Some of the members would like to establish now a small committee to be ready to negotiate at an appropriate time. But although Scua represents nine-tenths of canal traffic, it would gain from wider membership and particularly from the inclusion of India. Before the resort to force, India declared that the association could be useful as a liaison and consultative body and proposed an enlarged membership. Only developments of this order can save the association from a useless life and an early death.

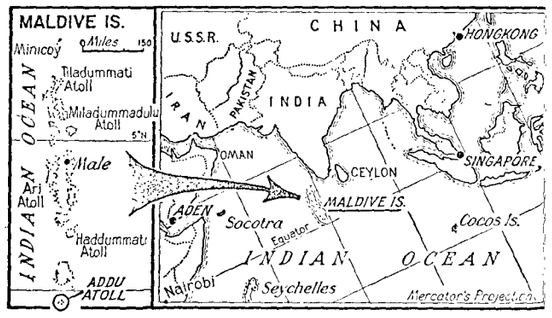
On the Border

BOTH Irish governments are now working hard to suppress the border warfare which has at last led to three fatalities. As the party that has suffered from flagrant aggression, the Ulster government must perhaps be allowed its mead of bitterness: it is rather inclined to take it. Mr Topping, in welcoming Mr Costello's broadcast, pointed out that it had come late in the day; and Lord Brookeborough was hardly intending to soothe the feelings of his Roman Catholic minority when on television he referred to Ulster as Britain's oldest colony populated by Scotsmen, Englishmen and Welshmen. The Ulster government has now outlawed Sinn Fein as well as the IRA. In the south, despite discouragement from their Church, thousands turned out for the funerals of the IRA men who were killed in the Brookeborough raid, and there were signs that there would be a wave of resolutions from local authorities sympathising with their aims.

The most heartening development, however, is that Mr Costello has successfully met the challenge that in sending troops and police to the border, arresting suspects (some of whom have been sentenced), and denouncing IRA activities, the Republican government is "treacherously" assisting Belfast. He curtly refused the request of some of

his supporters in the Dail to reverse his policy; and he has received, as was hoped for and expected, Mr de Valera's support for his statement that illegal forces could not be allowed to usurp the functions of parliament and government. The Irish Prime Minister has in fact gone rather further than any of his predecessors in the direction that both international law and common sense demanded. In deploring the deaths of the three Irishmen killed (two raiders and an Ulster constable), he upheld the thesis that the border does not divide two peoples, and that the death of an Ulsterman is the death of an Irishman, as much the concern of Dublin as of Stormont. Protestants are not enemies. Whether this point will sink in in the Republic remains to be seen. It is clear that the interest of the forces for disorder lies wholly in a rise of the political temperature to the point at which reason and sense are swept away, since they are, according to Mr Costello—who should know—divided into four or five warring factions, united only in the desire to raid Ulster, recruit impressionable young men and earn foreign support and funds. If this is so, a firm hand, and careful deflation of their pretensions, should reduce them, at least for the time being, to impotence. It is possible to be rather more optimistic about the Irish situation than seemed likely four weeks ago.



The Dartford Tuppennies

THE sheet of two hundred and forty imperforate twopenny stamps, which last week netted a profit of some £10,000 for their purchaser, has set off some interesting ethical and economic speculations (or, in other words, a wave of grand jealousy), a Post Office drive to enforce the regulations against the sale of "imperfects," and—prospectively—at least one parliamentary question. Non-philatelic comment upon the matter must start by pointing out that nobody will be hurt, and at least two people will presumably gain, by the transfer of £10,000 to the lucky dealer in Dartford from whatever collector is going to feel that it is worth paying at least this for the stamps. If the Post Office nevertheless still objects to this sort of transaction—and it is difficult to see why it should—its wisest course would be to sell unlimited quantities of imperforate twopennies over its counters, to destroy the Dartford dealer's scarcity profit. If it does not object, then the question arises: why does it not imitate the astuteness of Mr James Farley, who, when the United States Post Office unwittingly provided a similar windfall for a quick-witted collector, duplicated and re-duplicated it in just sufficiently *limited* quantity to reap a public profit of half a million dollars?

The British Post Office will apparently not consider the Farley technique. Its attitude is not precisely similar to the attitude of the British Treasury towards betting, which is that there may be something improper in making too much public money out of supposed vice; its attitude is that, as a post office, it must treat philately as if it does not exist. This is in line with the traditional post office policy of Britain—a policy reflected by the sublime omission from its stamps of any indication of origin. At the other end of the scale stand those countries that have the reputation of bringing well-timed issues (perhaps octagonal, round or oval, certainly king-sized and gloriously coloured) to the rescue, or indeed to the regular support, of their budgets. The British taxpayer must assess the gain in dignity in terms of the cost to himself. The one group that will certainly gain if the GPO continues to treat philately with its present lack of sympathy is philatelists themselves.

By-passing Bandaranaike

THE agreement with the government of the Maldiv Islands permitting Britain to re-establish and opera the former airfield on Addu Atoll (an atoll is a ring of cor islands) has been under negotiation for some time; urgenc was imparted to it by the slow progress made with th Ceylon government over the retention even of the mo basic user-facilities for the RAF after the bases at Katun yake and Trincomalee were handed over to Ceylon. M Bandaranaike has already made it clear that neither the ai nor the naval base would be open to Britain in an arme conflict in which Ceylon was not involved; and the proces of going cap in hand every year to a disapproving Ceylo government even for user facilities in peacetime has becom about as pleasant as getting a liquor-licence in India on th plea of addiction to alcohol. The Navy long hoped to ge the sort of agreement with Ceylon as that which it has wit South Africa for the use of Simonstown, but this has provec quite impossible. Both services would still like to hav

some facilities in Ceylon; but the agreement with th Maldives ensures that the link with Australia will not b broken whatever Mr Bandaranaike (or Mr Nehru) ma choose to do.

Addu Atoll is in the extreme south of the Maldives, o which there are 2,000 islands strung on a necklace betwee latitude 10° N and the equator. In all the Maldives ar 800 miles long, sparsely inhabited by about 90,000 devou Moslem fisherfolk of mixed Sinhalese, Arab, Chinese an Malay ancestry. They are ruled by an elective Sultanat with a Majlis of 50 members representing the various atolls their international status is that of an independent stat under British protection. The base should be ready by th time the Britannias and Comet IIs of the RAF airlift are i operation, and is well placed to refuel them and provid simple repair facilities and wireless and radar communica tions. The base was used for anti-submarine aircraft in th last war, but could hardly serve large-scale operations. I will make it possible to fly men and equipment from Britai to Singapore via Aden or Nairobi, and to reinforce bombe (but not fighter) forces in the Far East. The terms of th lease give the RAF full freedom of action.

Kashmir Essentials

NEXT week the Kashmir dispute will be back, after four years, on the United Nations' plate. Alongside the Middle Eastern conflict, it may seem a small thing. Yet, like Suez, it puts members of the Commonwealth in a painful quandary, and its repercussions are widespread and dangerous. It calls for all the attention that weary ministers and officials can drag away from other preoccupations.

At the Security Council, both Pakistan and India will inevitably lean hard on each other's past misdeeds and on UN rulings of bygone years. For other parties, anxious for an end to a problem that has tainted the Asian air for nine years, the task is to cut firmly through the tangle of recriminations and quotations to the essentials. These are relatively simple. First, the prime interest of India and Pakistan is to live together in friendship. Their inability to do so affects 450 million people directly, and an area wider even than all Asia indirectly. Secondly, friendship and calm cannot be attained while Pakistanis have to watch Kashmir being run as a police state, and there is no prospect of India being able to run it as anything else—even after it has been solemnly taken into the constitutional bosom of the otherwise democratic Indian Union. Thirdly, any change in its status will send out ripples of passion, and if these are to be minimised the change, too, must be kept to the minimum needed to enable Indo-Pakistani friendship to flourish.

All this points straight to the one solution that has never been properly aired—to leave with India and Pakistan those sections of Kashmir that are visibly content to stay with them, and to offer a choice only to the people of the Srinagar valley. Neither country is as yet disposed even to look at this solution. There is all the more need for others to press it upon them. The members of the Commonwealth, the "Bandoeng" group of Asian and African states, indeed the whole UN fraternity could perform no better service than to urge India to drop its self-injurious stubbornness and Pakistan to modify its all-or-nothing claims.

Would the communist powers put a spoke into such a wheel if it began to turn? That need not be taken for granted. A year ago, Mr Khrushchev flitted into Kashmir and told its people that their fate was settled; but last month Chou En-lai told the Pakistanis that he would have to study the problem before saying anything about it. One is inclined to regret Communist China's absence from next week's Security Council debates.

From Sollum to Casablanca

FRANCE intends to behave as a plaintiff, not as a defendant, when the General Assembly of the United Nations tackles the Algerian question later this month. This was the impression left by the French prime minister on Wednesday and by M. Pineau's statements before he left for New York. The French delegation will question the competence of the assembly to deal with the matter and, if a censure is debated, it will walk out; if one were voted, it might even stay out for the rest of the session. Some of its members have already said that they are prepared to question the moral credentials of some UN members.

French confidence is hardly justified by the facts. The situation in Algeria has so deteriorated in recent months that the prospect of a peaceful settlement with the Algerian resistance seems more distant than ever. M. Mollet, in his declaration on Wednesday, did little to help. It is useless to guarantee the freedom of elections three months after the cease-fire, when there is little hope of reaching such a truce. Still, M. Mollet's first official reference to negotiations with the rebels could be a hopeful sign that the government is willing to look beyond the fields of battle, though it is to be feared that France will be even less inclined to compromise after the UN debate.

For France more is involved in this question than merely its moral standing in the outside world. The visit of the Libyan prime minister to Tunis has provided M. Habib Bourguiba with a new occasion to sketch his favourite vision of a North African community, extending it this time "from Sollum to Casablanca"; Libya would thus be linked with the three former French territories. Once again M. Bourguiba warned the French that in this struggle Tunisians "stand with the Algerian people against France," and he reiterated the choice which confronts France, in his view: either to wage a hopeless, never-ending war, or to try boldly to forge new links with a North African federation looking towards Paris rather than Cairo.

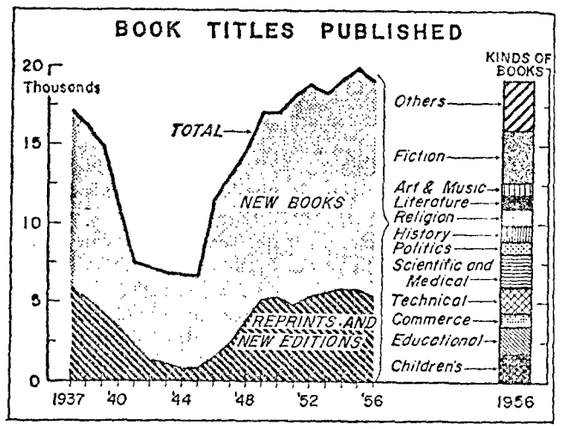
An Algerian Mystery

MYSTERIOUS hints of a very abortive military coup in Algiers came from Paris this week. The discreet official statement merely refers to "verbal imprudences" which made necessary a penalty and several warnings. It has been announced that Brigadier-General Jacques Faure, deputy commander of the Algiers division, has been placed under arrest for thirty days, but the rest of the story has to be pieced together. Rumour in Paris has it that other high officers were involved in a plot concerted with extremists among the settlers, and having as its purpose the substitution of military for civilian rule in Algeria. According to these unofficial versions, M. Lacoste, the minister resident, and several other high officials were to be arrested while on tour, a military dictatorship was to be installed in Algiers, and Paris faced with an accomplished fact. Military attempts to take decisions in North Africa over the head of the French government are not entirely new. "Power to the army" was heard as a slogan in recent disturbances in Algiers.

As yet there is no indication that the colonialist diehards have found much support among the higher commanders of the French expeditionary forces. The plot, as far as is known, had no important backing in France, and there has been no suggestion that any potential French *caudillo* dreamt of crossing the Mediterranean to "establish order" in the home country. Yet nobody can foretell the result of an alliance between settlers guided by blind despair and generals with an Indo-Chinese chip on their shoulder, particularly when such a coalition is faced with a hesitant

government at a loss for a policy. The abortive coup in Algiers may turn out to have been a farce, but the gap between tragedy and farce is often narrow. To argue that the fate of the French Republic is at stake in Algeria may not be unduly alarmist.

Caribbean Capital



BARBADOS will almost certainly be chosen as the site of the capital of the British Caribbean Federation. The commission for recommending a site has nominated Barbados, Jamaica and Trinidad in that order, and although there is sure to be a display of insular patriotism at the Federation meeting later this month, Barbados is the obvious choice by elimination. None of the Leeward or Windward islands has the basic facilities for a "federal shop window," while the choice of either Jamaica or Trinidad would not only be resented by the other, but would also alarm smaller islands which fear big brother domination.

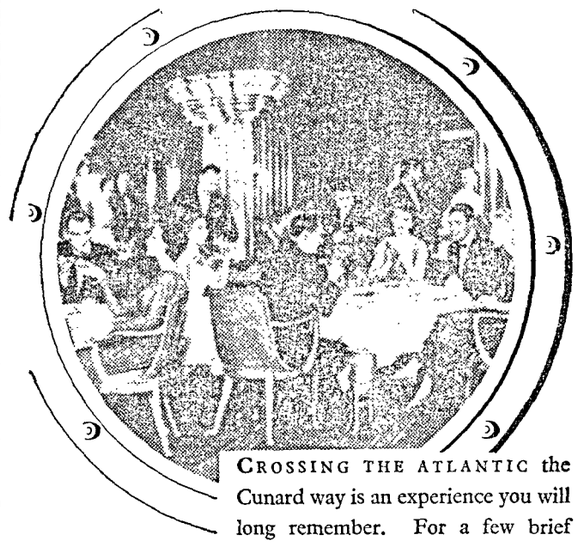
Believing that diplomats, ministers and civil servants make dull company for one another, the commission turned down the idea of an entirely new town. But they were attracted by the notion of twin towns: a federal capital growing up close to a hospitable base. Possible bases were judged on their amenities and communications and on their social and political atmosphere. Kingston ran second to Bridgetown, the capital of Barbados, partly because of the thousand-mile gap between Jamaica and the other islands but mainly because the commission thought it a mistake to choose the largest island. Trinidad came a bad third: the rest of the Federation would resent adding to Trinidad's comparative wealth. This was sufficient reason; the commission was ill-advised to add strictures on its East Indian population and its past tolerance of corruption in public life. There may also be some scepticism about the way the report skates over colour prejudice in Barbados, but this should not clog the wheels of federation.

Business in Books

IS book publishing on the decline? Last year 19,107 titles (including reprints and new editions) were issued; this was 850 fewer than in 1955 and nearly a hundred fewer than in 1954, according to the annual count made by *The Bookseller*. But these figures are not a measure of the output of the book trade, since they take no account of how many copies of each book were published. A best-seller may have a print approaching a quarter of a million copies, a specialised book one of a few hundred; both are reckoned only once in the statistics of new titles. A better guide to the prosperity of the book trade is provided by publishers' turnover. In the first half of 1956 this was 15 per cent higher than in the same months of 1955; over the same period the average retail price of new books (again, however, based on titles only) rose only 5 per cent. The figures for the second half of the year, when prices rose more steeply, may be less encouraging. But it will be surprising if they show that the long boom in books, although it may be slowing down, has yet gone into reverse.

There is no doubt, however, that the trade must be keeping a watchful eye on reading habits. Last year,

fiction continued its postwar decline in importance, accounting for only 18 per cent of titles compared with 22 per cent five years ago and 30 per cent twenty years ago. But two or three times as many engineering, technical and scientific books are now published as in 1937.



Importance of Commerce

Commerce is in itself the widest and the most liberal of the institutions of the world. It effects upon the grandest scale an exchange of good offices between people of all climes and separated from each other by seas and continents, and that upon principles of the most perfect independence of all. If it confers obligations, it equally *and at the same moment receives them.* In spite of all bad laws and restrictions, wherever it exists, it works out the most perfect reciprocity. If, therefore, while we are congratulating ourselves upon the great success and rapid expansion of the trade of this country, we find that remarkable progress is not confined to ourselves, but is going on, if not by such wonderful strides, yet with a rapidity hitherto unknown, in other countries, so far from feeling any jealousy of such facts, we ought to regard them as the best guarantee for the soundness of our own position. . . . It is the peculiarity of every extension of trade, wherever it takes place, to create directly and indirectly new fields of enterprise, new wealth, new sources of consumption, which, considering the multifarious character of British trade, necessarily benefits some portion of it. If, therefore, we feel a national exultation in the fact that during the year which has just expired the export trade of the United Kingdom has increased by *twenty millions*, and has reached, what only ten years ago would have been regarded as a fabulous amount, the sum of £115,000,000, it is an additional satisfaction to find that the trade of all the principal countries in the world has been progressing at the same time. Let us feel assured that a great country like England cannot prosper on the ruin of other countries; but that it is only in proportion as other nations are industrious, enterprising and successful, that our own prosperity will be perpetuated.

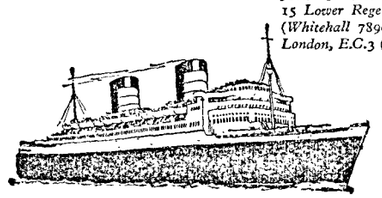
The Stately Ships of Britain



CROSSING THE ATLANTIC the Cunard way is an experience you will long remember. For a few brief days you are a citizen of a floating city with all its sophistication and services yours to command. Whether you go First Class to New York in a mighty "QUEEN" liner, or Tourist to Canada in a smaller sister . . . whatever your choice you will enjoy that tradition of gracious living which has made the name Cunard the hall-mark of all that is best in Atlantic travel.

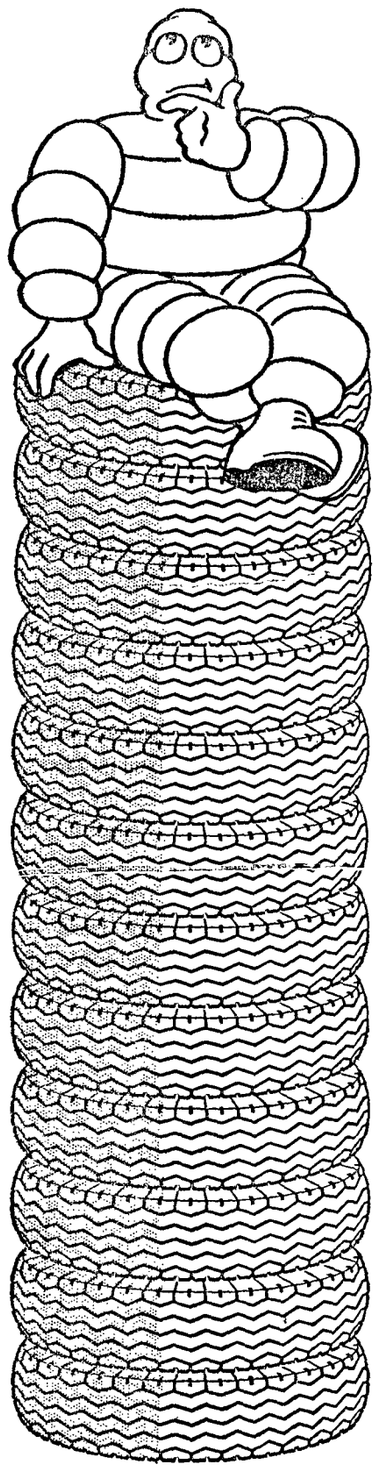
Cunard

TO AND FROM THE U.S.A. AND CANADA

Consult your local travel agent or apply: Cunard Line, Cunard Building, Liverpool, 3 (Liverpool Central 9201); 15 Lower Regent St., London, S.W.1 (Whitehall 7890); 88 Leadenhall St., London, E.C.3 (Avenue 3010).

The Saxons called the first month 'Wulf Monath' and no doubt they had their reasons. In our calendar, however, the name derives from Janus, the Roman deity who kept the gate, looking simultaneously back into the past and forward into the future.

WINTER isn't what it was. There may or may not be snow and ice and arctic winds, but no wolf slinks after you with calculating eye as you go to circus, pantomime or play. And two-headed gods, if they came your way, could expect to receive no better welcome than that accorded to pennies which, by art or nature, have been similarly endowed. Yet this is to do Janus less than justice. There are many occasions when two heads are still better than one, particularly if the second 'head' is ours. And there you have the reason why so many people habitually 'talk things over with the Midland' before they take action in matters of business and finance.



MIDLAND BANK LIMITED

Head Office: Poultry, London, E.C.2

2130 branches throughout England and Wales

Accounting problem:

HOW COULD MICHELIN DISCOVER THEIR OVERALL STOCK POSITION *AT A MOMENT'S NOTICE?*

28 LEDGERS, one for each depot *plus* one for Head Office, had to be referred to before Michelin could discover the overall position for any one of their 900 items of stock. As the demand was increasing, this meant depots got dangerously low in certain items and costly last-minute transfers often had to be made.

Like many firms, big and small, faced with this kind of problem, they called in Burroughs.

SOLUTION. In co-operation with Michelin, our representative evolved a complete system, from the collecting and summarizing of original data to the storage of the final records; this system was based on six Burroughs Sensimatics. All movements of stock—despatches, sales, transfers—are recorded by the Sensimatics in such a form that the machine Supervisor can find out *within seconds* the stock position for any size of tyre. Total in the Company's possession, quantity in Central Stores, total out at depots, total in individual depots—all available at a glance. The result is more effective allocation of new stocks, fewer emergency transfers, and infinitely quicker returns of monthly figures.

HOW BURROUGHS MIGHT BE ABLE TO HELP YOU

How many of your staff are engaged in figure-work? How long does it take you to get the figures you want? Are the figures always accurate when you do get them?

Burroughs Accounting Machines will do this figure-work for you without tying down a lot of staff *and* do it far more speedily and far more accurately. Burroughs make machines suited to every size of business and you have everything to gain by consulting them.

They will advise *against* buying one of their machines if they don't think you need one. Their advice, of course, is free. The local Burroughs office is in the phone book, or you can write direct to London if you prefer.

Burroughs

The most experienced manufacturers of Adding, Calculating, Accounting, Typewriter-Accounting, Statistical and Microfilm Equipment

Letters to the Editor

Battle of the Border

SIR—As a former member of the Government of Northern Ireland, with which I was and am in full accord, and the present Grand Master of the Grand Orange Lodge of Ireland, I deprecate certain statements in your issue of December 22nd. Under the heading of "The Ulster Government," your article states that while the Special Constabulary are reasonably in hand, the Orange Lodges can produce "ugly bigots with firearms who could emulate the I.R.A. (and probably more efficiently) if they were roused."

The much-maligned Orange Order is an orderly and peaceable institution, as has been frequently stated by observers who, with pre-conceived ideas, came to Northern Ireland to see the imposing Twelfth of July demonstrations and departed after expressing their surprise to find from personal experience that they had been misled. To suggest that the Order can produce ugly bigots with firearms is grossly unfair and untrue. Your article states that the Specials are "reasonably" in hand; there is nothing to justify the use of the word "reasonably." It is common knowledge that the Special Constabulary is a well-disciplined force which, despite persistent provocation, has behaved with great gallantry and exemplary forbearance.

The summing up which pictures the Ulster Government considering the pros and cons of playing up the IRA outrages at home and playing them down abroad reveals serious lack of knowledge of the Ulster outlook. To Ulster the union with Great Britain is a matter of life or death.

Lord Brookeborough has stressed that although Ulster and Eire cannot unite, they can be good neighbours on the condition that each recognises the right of the other to shape its destiny in its own way without interference.—Yours faithfully,

WILLIAM MCCLEERY

Ballymoney, Co. Antrim

The Refugees

SIR—May I suggest that South America holds the answer to the massive refugee problems, now enhanced by the Hungarian tragedy, and for years forming scabs upon the conscience of mankind.

Brazil, Argentina, Paraguay, in particular, absorbed more than 2 million refugees between the wars. They came in their shiploads, men, women and children, from all Central Europe, Poland, Jugoslavia, Czechoslovakia, the Saar, Germany, all fleeing from terror or hopeless want. Many arrived without funds; yet in South America they found new lives for old. Tens of thousands found real happiness and prosperity, and enriched the lands to which they came.

First in the Chaco war, and later on a special journey in 1938, I visited scores of settlements, some established in the early 1920s and others in the course of establishment, mainly along the littoral of the Alto Parana in the Misiones territory of Argentina and in Paraguay. Everywhere the settlers were thriving, their homes reflecting their national architecture, and the place names of Central Europe beginning to dot the map. The Yerba (maté), maize, mandioca, cotton, rice, tobacco, and citrus plantations were driving back the forest and the pests that go with it.

In this land of rivers there is always a road to the sea, an outlet. North, west and east of Paraguay on a baseline through Posadas and across Paraguay to the Pilcomayo, the fertile forest lies unbroken to the Orinoco, the Andes and the Atlantic coast, a tract of land larger than the USA, a tract of land that could contain all India, breathtaking in its immensity and possibility.

Thirty years ago when I first went that way it used to be said in South America that the continent could absorb 400 million people—and needed them. In that great land I know men, women and children can find new lives, prosperity and happiness. Such funds as those now growing in the hands of the Lord Mayor of London can remove some of the difficulties.—Yours faithfully,

R. W. THOMPSON

Sudbury, Suffolk

Capital in Manufacturing

SIR—As chairman of a little old west-country firm (of tanners and shoemakers), I was very much interested in your account of Dr Barna's lecture and statistics in your issue of November 24th.

First, I agree entirely that insurance value (i.e. full replacement) is the only significant value for such studies—because it is unaffected by the accidents of date of building or buying, or "valuing" (for balance sheet purposes); or by widely varying practices as to depreciation. It has the further merit of producing the least flattering answer—which is always the right one!

Secondly, fixed assets are fixed assets and unlike any other. But "stock" is only one of two or three classes of liquid assets, and the others (especially "debtors") cannot be ignored. Stock and fixed assets have little in common—except that both are and always must be in the balance sheet at far below insurance value. Nor should "debtors" be taken as roughly equal to and cancelled by "creditors"—sometimes they are, and sometimes they are not. But, in my experience, it is the sum total of gross debtors, plus stock at cost, that decides our very widely fluctuating need of day-to-day money, or working capital. If stock-plus-debtors varies by £500,000, between June 30th and December 31st (as, in our case, it may) then so does our overdraft or other outside finance.

We in business are always and ordinarily and rightly concerned with *our owners'* capital, and what return we are earning on it. But you will find, as I have found, that as much again may be employed in the business, at any "stock-taking," *not* by the owners at all, but by outside interests. For instance, in 1955, this total (bank, etc., creditors, tax, mortgage) was substantially less than the value-by-assets (*not*, of course, the insurance value) of the business; but in 1956, it was substantially more. This outside capital has got to be taken into account in assessing the profitability of the business, or any part of it—even though the creditors and the Inland Revenue charge nothing for their "accommodation," and the banks (and other lenders) only a small fixed rate of interest.

It is in relation to this total capital employed, reasonably corrected for day-to-day fluctuations during the period under review, that one can and should measure (i) one's turnover *vis-à-vis* such capital, and (ii) one's net profit (prior to tax)—for one's various factories, etc. These are the significant figures, and they have the important advantage that they tie up with the audited profit-and-loss account.—Yours faithfully,

H. F. SCOTT STOKES

Glastonbury, Somerset

Three Little Sins, One Little Clown

SIR—Owing to my absence from England here (on business), I have only just seen Mr Schwartz's letter published in your December 15th issue. Objectively, his present attack on planning boils down to the assertion that *laisser faire* is good because it brings about *laisser passer*, the freedom of individuals to move. Historically, he is wrong. Economic *laisser faire* often went with political repression and control over personal movement (e.g., Napoléon III). Conversely, feudal states have encouraged to a remarkable extent the immigration of foreign experts and granted them exceptional privileges; and personal liberty need not be infringed by limitation over private economic activity. The two are on different planes and the discussion on petrol rationing has shown that, on occasion, this is recognised even by those who usually violently assert the contrary.—Yours faithfully,

T. BALOGH

Books & Publications

America and Bolshevik Russia

SOVIET - AMERICAN RELATIONS, 1917-1920: *Volume I, Russia Leaves the War.*
By George F. Kennan.
Faber. 557 pages. 50s.

MR KENNAN is rightly renowned as one of the foremost experts on Russia in the United States. He is also a diplomat of distinction. In this monumental volume he has blended the two sides of his experience to produce an enthralling account of a brief but vital period of the diplomatic history of the United States. The time covered is short: the four months bounded by the October Revolution and the Treaty of Brest-Litovsk. But the assiduous research of the scholar is here combined with the vision of the artist. The result is a memorable study which enriches our understanding of the chequered relations of the West with Bolshevik Russia with a wealth of hitherto unpublished detail.

Mr Kennan has naturally given a much fuller picture of American policy than of the conflicts behind the scenes on the Bolshevik side. He steers his way through a confused and not always creditable story with a combination of skill and fairness that marks the true scholar, who is the master and not the slave of his opinions and his materials. He shows how the various official and unofficial American emissaries inside Russia pursued each his own line without firm guidance or indeed any clear direction on policy from either the State Department or the President. Of the unofficial representatives, at least three believed themselves to be personally entrusted with a mission by the President. One of them, Colonel Robins, whose relations with Trotsky seem at times to have been franker than those with his own government, believed passionately that the Bolsheviks could, if handled the right way, be persuaded to renew the fighting against the Germans. Another, Mr Thompson, believed that the Bolsheviks were "kindly, earnest men, heartily desiring to live at peace with their fellow men." The Ambassador, Mr Francis, deprived of normal diplomatic channels to the Russians, was bewildered by a situation which he did not begin to understand. It is not surprising that in the end the Bolsheviks fooled them all. President Wilson, too, as Mr Kennan shows, was to some extent influenced in drafting his Fourteen Points by the skilful Bolshevik peace propaganda. The foundations of misunderstanding of the true significance of Bolshevism were certainly well and truly laid in these four months. Mr Kennan is concerned to analyse and not to judge. He does not speculate whether more skilfully organised diplomatic relations could have produced a better assessment of the situation or a wiser policy. Certainly his account of the American side of the picture provides no cause for complacency on this side of the Atlantic. If the records were available to the same extent in Britain or in France it is not likely that a much more flattering story would emerge.

Mr Kennan has done his work so well that it may seem ungrateful to cavil. And yet one cannot help regretting that he has almost entirely omitted discussion of one aspect of the story. This is the question of the German subsidies to the Bolsheviks and their influence on Lenin's policy, on which much new information has become available in the captured German Foreign Office documents. Mr Kennan, who has, incidentally, used these documents, deals in passing with the question of this money when discussing the Sisson papers, only to dismiss German money as a factor influencing Lenin's policy after November, 1917. He does not deal with the evidence of the German documents (some of them have already been published, by Dr Katkov in *International Affairs*, and others are due for publication shortly), which apparently suggests continuing very substantial subsidies before and after November, 1917.

Of course, it may well be that Lenin was determined to get out of the war irrespective of the fact that he was being paid by the Germans to do so. There is much evidence to show that his main motive in making peace at any price was not even so much the cause usually alleged, the disintegration of the army (which has probably been exaggerated), but the fact that a resumption of hostilities would inevitably have led to the overthrow of the Bolsheviks. For the portions of the army which retained their morale were the anti-Bolshevik units. Nevertheless, a "revolutionary war" in the event of the Germans insisting on "imperialist and annexationist" terms had been the avowed policy of the Bolsheviks, including Lenin, and many of Lenin's followers sincerely believed in February and March, 1918, that such a war was their duty. It is disappointing that Mr Kennan has not found it possible to analyse the new evidence which is now available on this very controversial question.

Fight Against Secrecy

FREEDOM OR SECRECY.
By James Russell Wiggins.
Oxford University Press. 253 pages. 24s.

MR WIGGINS joined *The Washington Post* nearly ten years ago and is now Executive Editor (anglice Editor) of *The Washington Post and Times-Herald*, the only morning paper in the most important capital in the West. Nobody therefore could be in a better position to observe the devious ways of official secrecy and his observations have led him into the thick of the battle against the departments. He is concerned to see that the public gets all the information it has a right to—on what goes on in its legislatures and courts, what its government, and particularly the military establishment, is up to and even about a wide field of private transactions —and that the press is free to collect, publish and distribute it.

Because in the United States officials talk more freely than in England, because there is no comparable Official Secrets Act and the libel laws are less strict, it may well be asked why Mr Wiggins or anybody else needs to get worried. After reading this book it is easy to see why. The American press may have many privileges, but it needs them to protect the public against the competing privileges of others. Members of Congress, for example, as individuals and Committees of Congress as official bodies are accorded immunities and privileges no Member of Parliament would claim. Mr Wiggins believes that there is a serious threat in the fact that "judicial power has emigrated from the courts . . . to quasi-judicial agencies in the executive branches of government" (by no means a negligible threat in many other democracies) and "to legislative agencies not suited to the trial of issues and not equipped by experience for it." Mr Wiggins produces plenty of evidence to support his fears.

Sometimes, of course, like all men dedicated to a cause, he seems to go too far. It is surely doubtful, considering the disagreements of historians when all the documents are available, whether any amount of information on the military establishment would enable the contemporary voter and taxpayer to "know enough to estimate the training, ability, judgment or genius of the military commanders into whose hands they have put the lives of their sons, the greater part of their fortunes, and the military destiny of the nation." It is possible to recognise that the military are adept at using the security they need to hide their blunders as well, and must be smoked out at intervals, without going as far as Mr Wiggins.

He is also perhaps a little ingenuous in claiming to believe that "what a man does even with his own property is of public concern" in view of the extreme secrecy that surrounded the purchase of *The Washington Times-Herald* by *The Washington Post*. It was surely of public concern that a monopoly was being

established, but the citizens of Washington only learned about this marriage, which concerned them rather directly, when it had been consummated.

But such exaggerations are rare in "Freedom or Secrecy," which is generally a sober, serious and well-documented book and one to be recommended to anyone who feels complacent about the position nearer home.

Testaments of Friendship

FRIENDSHIP'S HARVEST.
By Violet Markham.
Max Reinhardt. 227 pages. 25s.

IN "Return Passage" Miss Markham has already shown her capacity for mingling in her reminiscences, whether of personal or public matters, an easy narrative touch, vivid portraiture, and, unobtrusively but unmistakably, a testimony to the truth that is in her. In "Friendship's Harvest" the same qualities appear; but with portraiture to the fore. This is a gallery of men and women with whom, in many different stations of society and over a long lifetime, Miss Markham has, in her own words, "shared happy adventures of work or friendship." Dr Thomas Jones; Sir Arthur Markham, her brother; the Haldane family; Cecil Torr; Sir Ernest Budge; Mary Macarthur; Hilda Cashmore; John Buchan; Countess Raczynska; Mrs Herbert Paul; Mackenzie King; these are her subjects, and it is interesting to speculate on the common factor that unites them.

Distinction? yes; but of disconcertingly different kinds. Comparing the charming, eccentric, lazy scholar Cecil Torr and the saintlike settlement worker Hilda Cashmore, the *panache* of Countess Raczynska and the sobriety of Mackenzie King, the granitic figure of Sir Robert Morant and the live flame of Mary Macarthur, one reaches the certain conclusion that a high proportion of Miss Markham's friends must have found one another intolerably uncongenial. And yet there is, after all, a common factor. Each was, of his or her own kind, absolutely genuine; each had that high seriousness which is not incompatible with gaiety; each—even, in his own way, Cecil Torr—was a spender, not a hoarder, whether of energy, talent or affection. For fribbles, fakes and the stingy, Miss Markham—despite her mother's recorded opinion that she "had a heart like an artichoke, with a leaf for everyone"—might contrive to find charity, but hardly friendship.

This is a book to be read for pure enjoyment—it is full of good stories—for historical insight, and for something more; wisdom. Ours is not, on the whole, a society which highly regards the counsel of elders; at least, not as such. It may give them gratitude and personal respect, but it is apt automatically to discount the value of their opinions a little further for each year beyond retiring age. Length of experience is useless when most of that experience is irrelevant to a much-changed, ever faster-changing world; such is the modern view, and it is probably, as a general rule, correct enough. But every now and then it is splendidly falsified. By some happy combination of steadiness, suppleness and sympathy, the years are turned into assets; and a reminder and example are provided of what it was that earlier societies expected, and got, from their sages. Here is the essential quality of "Friendship's Harvest."

Physics for Everyman

AN APPROACH TO MODERN PHYSICS.
By E. N. da C. Andrade.
Bell. 241 pages. 25s.

PROFESSOR ANDRADE's book was first published twenty-five years ago under the title of "The Mechanism of Nature." He has now largely rewritten it and given it a somewhat more non-committal title, which may unconsciously reflect a slight change of attitude. Certainly the present outlook in physics lacks the robust self-confidence of the thirties, not so much because recent discoveries have proved earlier ideas to be wrong, as that they now seem to be so much more complicated than was suspected in the era when quantum theory and wave mechanics were giving a revolutionary, and what seemed might be the ultimate, insight into "the mechanism of nature." At the present time, though not daunted by the bewildering variety of new problems that face them, the physicists may perhaps be a little more conscious of "the great ocean of truth all undiscovered" before them, and a very proper note of caution is sounded here and there in this book.

Professor Andrade makes a serious attempt to make modern physics comprehensible to the layman, and knows that it is impossible to do this without first giving a grounding in the basic principles of so-called classical physics. He therefore devotes a full half of his book to the familiar classroom subjects of heat, light, sound and electricity, but unfortunately with little success. In the limited space available, with few diagrams and no mathematics, he just does not manage to make the important things clear enough, in spite of careful writing and a wealth of somewhat avuncular analogies. In fact, the average reader will find that the "approach" offered here will bring him about as close to modern physics as an invitation to a Royal Garden Party would bring him to royalty.

However, Professor Andrade is a member of the royal household of science, and his invitation is quite as irresistible as the other would be. The second half of the book, devoted mainly to atomic and nuclear physics, is extremely readable; some of the analogies are vivid and illuminating; and altogether the reader will get quite a coherent idea of what the physicists believe, though in places he will be far from clear why they believe it. A special virtue of the later section, so often absent in books of this sort, is that some account

is given of the actual way in which observations are made and remote deductions drawn from them; behind most of the big discoveries lie much patience and tedium and disappointment that do not get into the headlines. This is as true of the great modern factory-size investigations as of the "sealing-wax-and-string" experiments that are still capable of really fundamental discoveries, as Professor Andrade points out with the relish to be expected of one who was brought up at Rutherford's feet. A minor complaint concerns the photographs; why, when there are so few of them, were so many wasted on such subjects as the atomic explosion cloud, whose appearance is all too familiar, or the carcases of machines, whose outside appearance is almost irrelevant to their actual operation? One of the greatest attractions of physics is the wealth of visual, almost tangible, demonstrations that can be made of the invisible world of the infinitely small, and any popular book cannot have too many of them.

Turbulent Period

FEUDAL BRITAIN.
By G. W. S. Barrow.
Edward Arnold. 452 pages. 25s.

ON no period of English history have more labour and talent been lavished than on the two and a half centuries between the Norman Conquest and the death of Edward I. Not only have many of our best historians spent their best energies on the study of these years, but there has been a surprising absence of revolution in opinion since the days of Stubbs and Maitland. Despite all that has been done since then, it is remarkable how much of their work still stands. The existence of this long-established tradition makes it, in one way, relatively easy to write an introductory sketch, for the author can step with confidence along an assured path. But in another way it is difficult, for what is assured can easily become dull. Moreover, it is hard, through such a cloud of witnesses, to make the facts themselves seem more real than the things that have been said about them. Mr Barrow has grasped the opportunities opened up by the work of his predecessors and has avoided the pitfalls with great skill. He has a clear mind, an attractive style, a perfect command of the literature on the period, and a faculty for choosing illustrations which put well-worn truths in a new light. This faculty does not come without much hard work, but the machinery never creaks.

It is characteristic of this book that nothing is vague or shadowy. If we miss something of the chaos, squalor and uneasy turbulence of the period in the lucid and orderly narrative, this is a reflection of the tradition in which it is written. The sobriety of its judgment on controversial subjects, like the origin of Parliament, or King John, is also a mark of this tradition. The author is at his best in dealing with questions on which recent scholars have sometime

spoken rashly. He deals out justice with *a firm hand.* The limitations of the series in which the volume appears make it impossible to wander far or often from the beaten track, but it is good to have so much on Wales and Scotland. Nor are these subjects, as too often happens, dragged in out of regard for the susceptibilities of our neighbours: they are made an essential part of the story and move the writer to some of his best pages. Equally, agrarian history has a large part unobtrusively provided for it, and it is treated with a vividness that is in striking contrast to the faded generalities so often pressed into service in an introductory book. As an introduction to the most rewarding period of medieval English history this volume could scarcely be bettered.

Mongolian Prospect

LAND OF BLUE SKY: *A Portrait of Modern Mongolia.*
By Ivor Montagu.
Dobson. 191 pages. 25s.

FOR Mr Ivor Montagu, Mongolia is a land where every prospect pleases and not even man is vile. Its Communist administration endears it to Mr Montagu, and his political sympathies endear him to the Communist administration, which has for a long time now been adverse to the travelling of unscreened foreigners in the country. Indeed, more was known of Mongolia from free travel forty years ago than can be known of the new People's Republic with the facilities for observation which *have existed since* 1930. We must be grateful, therefore, to Mr Montagu and others of his faith for the information they provide, even though their testimony gives only the case in favour of the present regime.

The case is a strong one, for Mongolia —that is to say, the Mongolian People's Republic or Outer Mongolia, as distinct from Inner Mongolia, which remains a part of China—is probably the most successful and well-rooted of all the Communist regimes created with the aid of Russian arms outside the boundaries of the Soviet Union. This is due to the Mongols' fear of the movement of Chinese population, which has already overwhelmed their people over a broad belt of territory between the Great Wall of China and the Gobi desert; the desire to be rid of Chinese rule led the Mongols to seek Russian protection already in Tsarist times. The Russian protectorate over Outer Mongolia dates from 1912; when the Chinese reconquered the country in 1919, the Mongols invoked the aid of the "White" Russian army of Baron Ungern, but this involved them in the Russian civil war, and the affair ended with the Bolsheviks in occupation. The People's Republic owed its origin to them, and Soviet influence has always been paramount there, but it has never been difficult for Moscow to maintain it, because the only alternative has been subjection to China, and the risk of that is more effective than any coercion would be.

Materially also, the Communist regime has been very effective in developing the rich natural resources of the country and creating units of modern industry. Mr Montagu has much to say about the skill and energy of present-day Mongol industrial workers in contrast to former travellers' tales of Mongol indolence; he quotes the experience of a former mining promoter who had to import Chinese labour from a thousand miles away because Mongols "refused at any price to work in the mines." But the Mongols were not alone in the idea that the pasturing of horses and cattle is the only way of life worth following. Socialist industrialisation in Mongolia and Kazakhstan and capitalist industrialisation in Bantu Africa have both had to overcome the same initial disinclinations of tribal herdsmen and warriors for mine and factory. In both cases industry has now got its labour.

Nature of Taboo

TABOO.
By Franz Steiner.
Cohen and West. 154 pages. 18s

THE author of this short book was a refugee scholar from Czechoslovakia who died at the beginning of a promising academic career. Professor Evans-Pritchard commends it in a preface in which he pays tribute to the author's character and learning. The book is indeed packed with erudition of a kind that is rare among anthropologists of today. It follows the traditions of pre-war Continental scholarship and its British nineteenth century antecedents, the encyclopaedic researches of men like Frazer and Tylor. In fact most of the book is devoted to an historical and critical analysis of the theories concerning the nature and origins of the institution of taboo in primitive cultures that were held by the most eminent nineteenth century authorities on the subject. More recent and current theories are discussed chiefly to show how they fit in with the later development of ideas derived from these nineteenth century writers. Dr Steiner points out that taboo was a topic of absorbing, almost morbid interest to Victorian thinkers and scholars concerned with the question of religion. He makes a nice point when he argues that this was probably a consequence of the rigid and taboo-ridden morality of the period and was also related to the emergence of rationalist polemics.

The word *taboo* came into English when Captain Cook's narrative of his third voyage was published in 1784. Dr Steiner gives a summary of Cook's descriptions of Polynesian taboo customs and then examines the voluminous later literature to establish what precisely was the significance of this term and the practices it stood for in this area. He reaches no firm conclusions but draws attention to the importance of taboos as a means of maintaining the powers of chiefs and rulers. The Victorian scholars did not understand this. They regarded taboo as a typical primitive trait and explained it as a magical prohibition followed blindly and irrationally. When they found similar customs in oriental and "higher" religions they explained them away as "survivals." It is only recently that anthropologists have observed the connection between such prohibitions and the rationally intelligible institutions for safeguarding law and morality found in the simpler societies.

This point of view is the background to the main chapters of the book, which discuss in detail the theories of the great Victorian orientalist W. Robertson Smith and his famous colleague Sir James Frazer, and compare them with some of their less well-known critics and successors. Dr Steiner's judgments are moderate and balanced, but he does not hide his opinion that Frazer's contribution was of mediocre worth in comparison with those of some of his contemporaries and successors. Yet the theories current at present, for all their Freudian or functionalist colouring, do not seem to be more cogent than those of seventy years ago. Dr Steiner's book shows that a new study of taboo, using the results of modern field research, is much needed.

Shorter Notice

CIVIL LIBERTIES IN THE UNITED STATES.
By Robert E. Cushman.
Cornell University Press. London: *Oxford University Press.* 261 pages. 22s. 6d.

The Cornell Studies in Civil Liberties have shown how truly great the dogged thoroughness of American scholarship can be on those rare occasions when it is infused with some sense for, in the words of the late Mr Justice Holmes, "The felt needs of our times." The volumes on the American conscientious objector by Messrs M. O. Sibley and P. E. Jacob; on the House Committee on Un-American Activities by Professor R. K. Carr, and on the law of immigration by Professor M. R. Konvitz, have been especially solid and worthy. Now the advisory editor of the series, Professor Robert Cushman, provides a kind of résumé of them all—indeed of the whole field of "civil liberties"—but written for the general reader as well as for the academic, in a clear and pleasant style, untripped by footnotes, though discreetly shod by bibliography.

Here then are a series of clear and well digested answers to questions, about, *inter alia*, the law of libel and slander, postal censorship, academic tenure, separation of church and state, freedom of the person and racial discrimination. It is just straightforward exposition; but some people, although they will find the book very useful indeed, will also be left with an acute feeling of the hollowness of a certain kind of liberalism. Tolerance alone can be a virtue as clammy as much organised charity. Praise for Professor Cushman's book would be unbounded could he but have shown a hint of sympathy at the dilemma typified by the desperate self-assertion of Mr Peter Arno's famous drunk: "I hate everyone, regardless of race, religion or place of national origin." The furthest the author goes from the golden negatives of a John Stuart Mill is to show a touch of envy at the greater ease with which English judges, compared to American, can punish newspaper editors for contempt of court.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

The "Doctrine" in Congress

Washington, D.C.

IN its initial response to Mr Eisenhower's programme for countering the communist threat in the Middle East, Congress has again demonstrated that, while it can deflect, undermine, or embarrass foreign policy, it can neither make nor unmake that policy. When the President presented his three-point programme of economic aid, military assistance, and the discretionary use of armed force to halt external communist aggression last week, Congress was in a mood of evident dissatisfaction; it applauded the President during his half-hour address only five times, and then only perfunctorily. The most fervent clapping greeted his statement that the Middle East was the birthplace of three great religions; one Democratic Senator cynically but privately explained: "We all have Jewish and Christian voters and you never know when a Moslem may show up in your district."

> The **joint resolution** to implement the President's Middle Eastern programme, as proposed by the Administration and now being considered by Congress, would authorise the President to:—
>
> 1. Co-operate with and assist any nation or group of nations in the general area of the Middle East in the development of economic strength dedicated to the maintenance of national independence.
>
> 2. Undertake military assistance programmes with any nation or group of nations of that area desiring such assistance.
>
> 3. Employ the armed forces of the United States as he deemed necessary to secure and protect the territorial integrity and political independence of any such nation or group of nations requesting such aid against overt armed aggression from any nation controlled by international communism. Such employment must be consonant with the treaty obligations of the United States and with the Charter of the United Nations and with actions and recommendations of the United Nations.
>
> **Mr Rayburn's alternative** states simply that:—
>
> the United States regards as vital to her interest the preservation of the independence and integrity of the states of the Middle East and, if necessary, will use her armed force to that end.

Comment by the more important congressional leaders was reserved and cautious. There were a few vagrant cries of dismay from inveterate isolationists in the President's own party and one or two bitter dissents from Democrats who suggested that the Secretary of State should resign. They could not resist contrasting the President's request for authority to use troops, if necessary, with his pre-election assurance to the voters that American armed forces would not be used in the Middle East crisis. But there was no doubt that, barring some unforeseen development, both Houses of Congress would approve the President's request with heavy bipartisan majorities, though perhaps not in the language suggested by the Administration. Mr Rayburn, the Democratic Speaker of the House, has circulated an alternative resolution in a mere thirty-four words, without any reference to economic assistance and without the long explanatory preamble of the Administrations' draft. It seems likely that final action by Congress will not come before early February and that a compromise will be worked out between the two resolutions during the several weeks of debate in committee and on the floor.

In any event most Republicans will probably support the resolution in some form because the President is the leader of their party, while Democrats welcome his show of national initiative, even though they are disappointed that Mr Eisenhower did not provide a clear line of American policy on specific issues such as the future of the Suez Canal and the Arab-Israel dispute. Moreover, most Democrats think that Congress should never override the President directly in his dealings with foreign countries. If he believes that a congressional resolution warning the Russians to keep out of the Middle East is necessary, then Congress cannot, it is widely held, reject such a resolution without seeming to invite the Russians to intervene. Where the Soviet Union is concerned, bipartisanship is the inevitable stepchild of common apprehension.

This enforced unity is frustrating to almost every faction in Congress. Strict constitutionalists of both parties deplore the way in which Congress's theoretically exclusive right to declare war would be vitiated by the granting of a "blank cheque" to the President. The dwindling band of isolationists regrets the necessity of having any Middle Eastern policy at all. Some members are strongly sympathetic to Israel; others share a lingering agreement with the purposes, if not with the execution, of the Anglo-French intervention in the Suez area; while still others believe that the Administration's foreign policy now relies too heavily on the United Nations or, on the other hand, fear that the new programme

may undercut the United Nations. In short, there are advocates of almost every conceivable general attitude or specific panacea, but this welter of opinion dissolves into common irresolution and resignation.

The President has also astutely shored up his relations with the Democrats in Congress. Their former Senator, Mr George, was already on his staff as Ambassador to the North Atlantic Treaty Organisation ; Mr Eisenhower has now named former Representative James Richards, the retiring chairman of the House Committee on Foreign Affairs, also a Democrat, as chief of a special mission to survey Middle Eastern problems. But in spite of these precautions, the debate will be prolonged, since the terms of

"Say, What If She Doesn't Want Her Honor Protected?"

Herblock in *Washington Post*

the President's request for congressional backing were sufficiently vague to raise more questions than they answered. Mr Eisenhower and Mr Dulles, in his subsequent testimony before the House Foreign Affairs Committee, were both at pains to emphasise the continuity between the proposed resolution and long-standing American policy dating back to the Truman Doctrine of 1947. But the parallel struck most observers as laboured and inexact, since Greece and Turkey welcomed American support, while Egypt and some of its Arab neighbours do not.

Nor was it certain what impact the new policy would have on the dispute between Israel and Egypt. Although Israeli sources in Washington at first responded warmly to the prospect of " military assistance," Mr Dulles reminded the House Committee that it was the settled policy of both this and the preceding Administration not to contribute to the arms race in the Middle East by supplying weapons in any large quantities either to Israel or the Arab states. Moreover, the implicit pledge to defend Turkey, Iran and Pakistan, the " northern tier " of the Baghdad Pact, against Russian attack, would have to be " consonant " with existing obligations under the UN Charter. In view of this, it was hard to see what value a restatement of the American intention to uphold collective security could have beyond its usefulness as a psychological gesture to jog the Kremlin's memory of the Korean War.

The principal and quickly agreed reservation about the President's request for authority to use armed forces at his own discretion was that a time limit should be set on this power. " We do not want this blank cheque bouncing around indefinitely if Nixon should ever become President," remarked a Democrat stalwart in the Senate. Since Senator Knowland, the leader of the Republican minority, is no admirer of Vice President Nixon's capacities, diplomatic or otherwise, he promptly made this limitation into a bipartisan suggestion.

Economic aid is a thornier subject. Hostility to foreign economic assistance has been rising steadily in Congress in recent years. Nothing Mr Dulles has done was more popular in Congress than his abrupt cancellation of the Aswan Dam project last July. The President originally intended to ask for an immediate authorisation of $400 million to carry out the economic portion of his programme but, after Mr Dulles had conferred with congressional leaders, he advised the President to drop this idea. Mr Eisenhower instead announced that he would ask for $200 million a year for the next two fiscal years beginning in July ; he has also asked for authority to use $200 million already in hand for the Middle East. Senator Russell of Georgia, the dean of the Democratic southern block, then demanded that important, long-term projects should receive specific congressional approval. If this further restraint is written into the resolution, as now seems possible, the President's area of discretion would be severely circumscribed.

The Administration wants to use the proposed funds to finance basic development projects such as the long stalemated Jordan River plan, a master highway system linking the capitals of Turkey, Lebanon, Iraq and Iran, and the expansion of the Tigris-Euphrates river scheme in Iraq to include Syria. Members of Congress are not necessarily averse to these projects, but they are doubtful whether they deserve to be included in an emergency programme. River development, for example, is not likely to check Syria's rapid deterioration to the status of a Soviet satellite quickly enough. Mr Eisenhower attempted to counteract this anticipated criticism, by declaring:

> Experience shows that indirect aggression rarely if ever succeeds where there is a reasonable security against direct aggression, where the government possesses loyal security forces and where economic conditions are such as not to make communism seem an attractive alternative.

Congress is prepared to give its grudging assent to these abstract propositions, but has no real conviction that in practice they will prove feasible.

The President also readily conceded that his programme " will not solve all the problems of the Middle East " such as those of the Arab refugees, the control of the canal, the Arab-Israel tension, and so on. But it is precisely on these matters that Congress would like to intervene. There is growing sentiment, for example, in favour of a permanent UN Police Force to patrol the Gaza strip. Congress, however, has neither the constitutional authority nor the policy-making mechanisms to propose or execute any solutions for these specific problems. It can only act in broad generalities in support of the President's initiative. Grumbling and dissatisfied though its mood may be, Congress is now prepared to do this. The rest is up to President Eisenhower.

Texas in the Saddle

SINCE Europe is now dependent on American petroleum the rise in the price of crude oil in Texas must be reflected sooner or later both in the balance of payments and in the price of fuel in Britain. But under present emergency conditions this rise may also be the most effective method of assuring the minimum supplies of oil (75 per cent of normal) on which the present rationing system in Britain depends. When the Humble Oil and Refining Company, the largest purchaser of Texas crude oil, set off the rise last week by increasing the price it offers by an average of 35 cents a barrel, or about 12 per cent—the first significant increase since 1953—it did so because at existing prices it had been unable to obtain the additional supplies needed by its associated company for export to Europe.

So far emergency supplies of American oil for Europe have come mainly out of stock but, although the stocks of crude oil in America still appear, on paper, higher than they were at this time last year, the remaining surpluses are so situated that they can be moved to the coast only with the greatest difficulty. When the leading oil buyers asked the Texas Railroad Commission, the state regulatory body, to raise permissible output in Texas in January by nearly 10 per cent, they hoped that this would enable them to secure more oil from the fields most readily accessible from the Gulf of Mexico. The request was opposed by producers in the less accessible fields who would not benefit without additional pipeline connections to move more oil from their wells and who had no objection to forcing an increase in price for such oil as they could move.

The commission owes its powers over the state's oil and natural gas industry to the producers' desire to prevent a repetition of the wasteful and unprofitable over-production from the Texas oilfields in the early nineteen-thirties. It interprets its functions as a state conservation agency on a broad front, covering not only the enforcement of efficient engineering practices but also the regulation of output in Texas (which accounts for over 40 per cent of the oil produced in the United States) so that the supply of oil does not exceed the demand for it in the United States as a whole. With stocks of crude throughout the country at a high level (even though they are not readily available for export) and stocks of petrol even higher, a further increase in Texas output to meet a temporary export demand might, in the commission's conservative view, lead to a glut later. It therefore refused to allow Texas production in January to go above the equivalent of 16 days' output a month at the maximum rates consistent with efficient engineering. This has given the misleading impression that Texas wells are producing at little over half of their capacity. In practice it is almost impossible for the commission's engineers to check the producers' estimates of their maximum efficient rates ; consequently the producers, knowing that they will be allowed to produce only a portion of their theoretical maximum, often inflate their estimates ; their true capacity is therefore much less than it appears to be.

As a result of the commission's caution, exports from the United States to Europe in January are almost certain to fall below the planned rate of 500,000 barrels a day. The temporary nature of the export demand inhibits the industry from making large capital investments in the additional pipelines needed to move the oil that is available inland, and the American government has shown no sign of providing special assistance. In any case these would take time to lay, even if the steel pipe were immediately available. Texas is always zealous in asserting its independence, and no pressure exerted on the commission by the federal government is likely to help Europe. But the higher prices now ruling for crude oil, which should do much to soften the producers' opposition to higher " allowables," suggest that the commission may also become less intractable when it meets on January 18th.

Senate Scene Shifting

FOR a short time last week the Democrats feared that they might be going to lose their narrow control of the Senate before they had ever established it. As the curtain rose on the session, the new Senator from Ohio, Mr Lausche, was discovered in his voting place. He had let it be known that, although elected as a Democrat, he might support the Republicans, but it had been thought that he would wait in the wings until after the first vital votes on the organisation of the Senate ; these settle which party will be in charge of the committees. Although Senator Lausche kept the Democrats in suspense, he finally voted on their side—for this all-important once, at least.

Mr Lausche's was not the only demonstration of political unity. The Democratic chiefs in Congress took breakfast with the party's new advisory committee, even though they had refused to join it and had left no doubt that they resented its announced purpose of supplying Democrats with more militant guidance than they were receiving from the compromises of their congressional leaders. More important, one of the militant and liberal Democrats, although not one who belongs to the new committee, Senator Mike Mansfield, has been appointed assistant leader of the party in the Senate. Since he comes from Montana, his appointment is a post-election recognition of the growing importance of the western states to the Democratic cause. The Republicans have also made some half-hearted concessions to their left wing in their official organisation, by the promotion of Senator Saltonstall of Massachusetts to be chairman of their senatorial conference and of Senator Dirksen of Illinois to succeed him as whip. Mr Dirksen is not as firmly established a liberal as Mr Saltonstall (neither is a noticeably enthusiastic one) but he has recently followed the Eisenhower line.

Meanwhile, however, the leader of the Republicans in the Senate, Mr Knowland, has put a great strain on party loyalty and has openly drawn attention to one of the underlying frictions of the coming session: the fact that both parties are looking for a new presidential candidate for 1960. The Senator has announced his retirement at the end of his term early in 1959. In Washington this means that his followers will no longer feel so bound to do what he asks and that his potential successors will be intriguing for position. In his home state of California this is thought to mean that he intends to run for Governor in 1958 ; if he wins he would then control the state's huge delegation to the Republican presidential nominating convention in 1960 and would be in a strong position to challenge the candidacy of his rival Californian, Vice President Nixon, at present the most fancied heir to Mr Eisenhower.

Speech Unlimited

ONCE more the filibuster, the sacred right of each member of the Senate to obstruct by talking on any subject, relevant or otherwise, until he drops, has come through fire unscathed. By fifty-five votes to thirty-eight, cutting right across party lines, the Senate last week killed an attempt by a bipartisan group of reformers to draw up a completely fresh set of rules. This was a flanking manœuvre to bring about the introduction of an effective system of closure; without one, legislation to protect the civil rights of Negroes is extremely hard to pass, since the Southerners use the filibuster as a last-ditch defence. The sponsors of last week's motion, headed by Senator Anderson of New Mexico, did not directly seek to change Rule XXII, under which closure can only be adopted by the affirmative vote of sixty-four Senators, because, under another of its provisions, debate cannot be limited at all on a motion to amend rules. Rather than see the business of the Senate blocked until the last southern Senator had sunk exhausted to his knees, Senator Anderson's group challenged the usual assumption that the Senate's rules automatically carry over from one Congress to another.

But this ingenious strategy had the disadvantage of shocking conservatives outside the South who hold that, with the terms of only a third of its members expiring with each Congress, the Senate is immortal and its rules never lapse. Senator Lyndon Johnson of Texas, the Democratic leader, took full advantage of this sentiment to dispose of the assault with the managerial skill at which he excels. After lining up an assured majority against Senator Anderson, he persuaded everyone to agree to a unanimous waiver of the rules to permit a debate of precisely seven hours before a vote.

Thus faces and tempers were preserved all round. The northern reformers had enough debate to prove their zeal for civil rights and a vote to show that they had nearly doubled their strength since a similar test four years ago, while the Southerners knew in advance that they would win the vote. But in this carefully scripted production there was one interpolation. Vice President Nixon, from the chair, gave an advisory opinion that Rule XXII's ban on closure during debates on the rules violated the constitutional guarantee to each House of the right to adopt its own rules. Since this ruling was advisory it did not interrupt Senator Johnson's show; since it was made, it added to Mr Nixon's stature among Negroes and upholders of civil rights.

New Model Army

FROM A SPECIAL CORRESPONDENT

THE United States Army is about to begin a very considerable reorganisation of its divisions in order to fit them for atomic warfare without reducing their ability to take part in a non-atomic conflict. At the December meeting of the North Atlantic Council Mr Dulles informed his diplomatic colleagues that the five divisions now assigned to Europe would gradually be placed on the new basis and that their fighting power would be strengthened, even though there would be a reduction of manpower within each division. The military chiefs of the Nato countries were provided with some details, but the complete enterprise will not be unfolded until the defence budget is laid before Congress.

Great claims are being made for the dual functions of the future infantry, airborne and armoured divisions, symbolised by the name "pent-a-na," a mnemonic for the five-group structure with an ability to handle equally an atomic or a non-atomic war. But one of the architects of the new organisation admits candidly that priority is to be given to the atomic side: firstly, because action with atomic weapons will need to be so swift that forces-in-being must be prepared for it at all times; and secondly, because the new weapons now being acquired, and still more those of the near future, are extremely expensive. As there is no doubt that they must be acquired at whatever cost, and as defence funds are limited, lavish expenditure on "modern" weapons can only be achieved by reducing outlays on other types.

The pioneering of the new structure has been carried out by the 101st Airborne Division, the experimental unit at Fort Campbell, Kentucky. While the airborne division of the future will have only 11,500 officers and men, compared with the present standard strength of 17,100, the new infantry division will need 13,800, as against an orthodox infantry division of 17,455, because its tanks and other heavy equipment cannot be transported by air. Otherwise these two types of division will have a similar lay out, with the familiar pattern of three regiments and three accompanying artillery battalions giving way to a five-group array. In order to keep the historic regimental numbers of the old Army, each of the new groups will be called a regiment, but otherwise it will be very different. It will be smaller; its artillery, mainly missiles, will be as much a part of it as the infantry itself; and in increasing measure it will be carried by air. Its mobility will call for wireless communications far more complex and efficient than in the past.

It will shortly be announced which divisions are to be converted first. They will probably move forward only two at a time, because the shuffling of officers, the issuing of new equipment, and the study of new organisation and tactics will put the unit effectively out of action for three or four months. Because of the firm plan to keep the five divisions at present in Germany at peak strength there will probably not be any conversion there. Instead, the divisions will be replaced bodily, one at a time, by divisions whose conversion and retraining will have been completed in the United States. Many experiments with the new formations have in fact been going on for the past two years in the European command. Unlike the airborne and infantry divisions, the armoured divisions, with a strength of 14,684 each, are already so largely reconstructed and retrained that only minor alterations are likely to be necessary to bring them into the new pattern.

The men saved by the reductions in the size of the infantry and airborne divisions—3,700 and 5,600 respectively—will still be used. They will simply be released for other combat duties at corps and army levels. Most of them will serve with the artillery, a term that persists although the weapons will increasingly be the kind of missiles that can be fitted alternatively with nuclear or non-nuclear warheads. This development illustrates significantly the rapid progress being made with the new weapons,

since a short time ago nobody thought of having atomic warheads handled at such a low level. It was only when such a warhead was successfully reduced to an 8-inch calibre that it became possible to think of aiming it with precision by means of accurate launching devices ; and only then could it be entrusted to field forces engaged in tactical as distinguished from strategic warfare.

While the divisions themselves will be smaller, the supplying forces will have to be larger because of the wider dispersals, the more numerous fuel and ammunition dumps, and the longer and swifter hauls which they necessitate. The eventual size of the total force—it is now nineteen divisions, with five in Europe, three in the Far East, nine in the continental United States, and one each in Hawaii and Alaska—will of course be dependent on a budget which Congress invariably scrutinises closely for months. But every assurance has been given that the forces in Europe will not lose in power.

Brake or Accelerator ?

THE automobile companies, chastened by a relatively lean year, entered 1957 at an unexpectedly cautious pace ; output of the new models got off to a slow start. Only 5.8 million cars were turned out last year, compared with the bumper crop of 7.9 million in 1955. But the firms which have sunk record sums in retooling and new plant to make their new models even lower, longer and faster than those of 1956, are fairly confident of persuading 6.5 million Americans to buy one of them. Even with credit tight, and some resistance to higher prices, they think that people who stayed out of the market last year are now ready to trade-in their 1955 models. Besides changes in style to tempt the buyer, the industry in December revived the national automobile show, which had not been held since 1940. It came too late to unveil the new models, most of which had been on the roads for a month, but interest was brisk in displays of fuel-injection power systems and in special super-luxury "limited editions" such as Cadillac's Directeur, an office on wheels complete with stock exchange tape, telephone, and secretary's chair and typewriter.

Fierce competition to hold and increase shares in the market for cars was responsible for the overproduction of 1955. The revival of the national show was taken to be a sign of greater readiness to co-operate in promoting the interest of all manufacturers in a larger market. There are some signs, too, that the industry has learned the lesson that driving the market too hard in one year has to be paid for in the next. Spokesmen for the Chrysler Corporation and the Ford Company have suggested that they aim at greater stability of output, although this may make a virtue of necessity: under a new law, dealers may not be forced to accept more cars from the manufacturers than they think they can sell and manufacturers are now in the middle of the first full year of supplementing unemployment benefits for their workers.

At the show itself, however, Mr Henry Ford, one of the five automobile presidents to open it with a blast on a horn, blew his own company's trumpet with a vigorous announcement that it would seek to increase its share of the market from 28.7 per cent to 31.5 per cent. As the Chrysler Corporation hopes to capture a fifth of the market, and the General Motors Corporation refuses to take the hint that it should be content with 50 per cent, instead of 52.7 per cent, stability in the industry may be forced to take a back seat.

Republicans' Sore Thumb

FROM A CORRESPONDENT IN ST LOUIS

LAST November Missouri achieved the distinction of being the only state outside the South to vote for Mr Stevenson and the only one to come over to his side after having voted for Mr Eisenhower in 1952. Local Democrats took quiet satisfaction in this remarkable demonstration of Missouri's superior discrimination and intelligence, while Republicans angrily reproached each other for the shift which made the state stick out like a sore thumb from their national triumph. But in 1952 Missouri was not typical of the country in the size of the majority it gave to Mr Eisenhower—only 29,000 votes or less than two per cent more than it gave to Mr Stevenson. Thus only a fractional change in the vote was needed to throw the state to the Democratic candidate in 1956—and such, indeed, was the change this year. Mr Stevenson carried Missouri by only 4,729 votes out of 1,832,293 cast.

Basically, Missouri is a one-party state. Although Republican presidential candidates can win there in landslide years, and sometimes carry Republicans into Congress with them, the usual pattern in state and local elections is that of a strong Democratic party, which attracts most of the political talent and campaign funds, tilting against a confused and divided Republican organisation, and almost always winning. St Louis, the leading city, which accounts for nearly one-fifth of the votes in the state, is heavily Democratic ; in some wards Republicans have only the shadow of an organisation. Kansas City has a strong Democratic machine, remaining from the days of boss Tom Pendergast, which can usually count on carrying the city, though by a smaller majority. There are two rural sections, one along the Missouri river across the central part of the state, and another in the cotton-growing Mississippi delta country of the "bootheel"; these were settled by Southerners and still follow the Democratic political patterns of Tennessee and Arkansas.

Republicans traditionally predominate in the northern corn-hog counties which belong, economically and socially, to Iowa. They also claim as their own the Ozark counties in the south-western corner of the state, surrounding the city of Springfield ; this "mountain" country bears a strong political and social resemblance to the backwoods of

eastern Tennessee, which also votes Republican. It is alleged that natives of that region voted happily for Franklin D. Roosevelt during the nineteen-thirties under the impression that it was his Republican cousin Theodore who was running.

In the last 25 years, Republicans have won the Governorship and seats in the United States Senate only when political scandals or strongly-felt emotions have upset ordinary voting habits. Even though President Eisenhower on the strength of his personal popularity managed to carry Missouri in his first campaign, the Republican organisation remained weak, a prey to internecine quarrels, personal struggles, absentee control and all the other symptoms of a party out of power. In 1956 it reached the depths by losing the presidential vote, all but one seat in the House of Representatives (even the veteran Mr Dewey Short succumbing to a bright young advertising and radio executive), the fights for the seat in the United States Senate and for the Governorship, both houses of the State Legislature, and a host of county offices. In these circumstances it was surprising, not that Mr Eisenhower should lose the state, but that he should come so close to winning it again. Indeed, he did carry most of the farm counties and small towns, winning a majority of 71,000 in those parts of the state outside the two main metropolitan areas.

★

The farm vote might have been expected to weigh heavily in Missouri, but the returns bear out the generalisation that there is no farm vote any more. Mr Eisenhower lost ground in some of the counties hardest hit by drought, and some rural voters who were dissatisfied with declining farm income turned against him. But these defections were largely offset by the Republicanism of the larger farmers, who were generally better off than their neighbours, and above all by the votes in the market towns and county seats. With Mr Eisenhower in the field, the normal tendency of small merchants and business men to identify themselves with the interests of their farm customers broke down. Taking the rural areas as a whole, it seems apparent that they divided generally on the same issues and along the same emotional lines as the rest of the country, rather than on farm issues alone.

Significant changes were also taking place in the voting of the metropolitan areas. The city of St Louis cast 54,000 fewer votes than it did in 1952, with the result that Mr Stevenson's majority there went down by 19,000. But in the suburban areas of St Louis, hitherto heavily Republican, which have been growing with boomlike speed while the city stood still, Democrats took over local offices which they had not succeeded in penetrating for twenty years, and Mr Eisenhower's majority in the county as a whole fell from 21,000 in 1952 to 11,000. One reason was that Democratic voters had migrated from the city to the working class and lower middle class suburbs. Another was the extraordinary effort, far more effective than that of the official Democratic organisation, put forth by the Volunteers for Stevenson, composed largely of intense women who believed in him with a fierce intellectual zeal.

Inside the city proper, principal interest centred upon the Negro vote, which accounts for about 18 per cent of the total. In 1952 the Negro wards had given Mr Stevenson majorities of 75 to 82 per cent. This year, his vote fell off by 8,000 but, curiously enough, Mr Eisenhower polled almost exactly the same total he won four years ago; therefore, despite his losses, Mr Stevenson carried the Negro wards by only slightly smaller percentages. But the storm signals are plainly flying. Those Negroes who expressed their disenchantment with the Democrats by staying home in 1956 may well enlarge their numbers and shift to the Republicans next time.

For the present, however, Democrats have everything their way in Missouri. The new Governor, Mr James Blair, should bring a fresh vigour and political intelligence to the party leadership in the state. Senator Thomas Hennings, just re-elected with no significant opposition, made an unusual record for liberalism, courage and probity during his first term. As chairman of the Rules Committee, he will be one of the few non-Southerners in an influential position in the next Congress. Senator Stuart Symington, a former Secretary of the Air Force, has plain sailing ahead for re-election in 1958, and is confidently expected to be a leading contender for the 1960 presidential nomination. The Mayor of St Louis, Mr Raymond Tucker, is one of the most respected and effective mayors in the city's history. Missouri Democrats, in short, have a wealth of talent and their organisation has the strength which is fostered by consistent victories at the polls.

Shut-ins Shut Out

RHODE ISLAND, the smallest state in the union, has just been the scene of the loudest and most protracted election dispute for many years. Governor Roberts, a Democrat, owes his fourth term to a decision of the State Supreme Court, handed down only last week, that there was a constitutional defect in the absentee voting law for civilians. This decision disfranchised nearly 5,000 voters, and the Republican State Senate showed its resentment by refusing to take part in the traditional joint inaugural session. In 1953 Governor Roberts, with a flourish, had signed a Bill allowing absentee voters and shut-ins—the term for those prevented by age or infirmity from getting to the polls—to cast ballots on or before election day. Last week the Governor's lawyers successfully argued that the state constitution does not authorise the legislature to permit voting before election day. Into the discard with the premature ballots went the narrow popular victory of Mr Del Sesto, the Republican candidate.

Among the reasons for the voters' preference for Mr Del Sesto—beside his appeal to his fellow Italian-Americans—were suspicions that Governor Roberts had played politics with judicial appointments. But even if the decision was technically correct, it leaves a bad taste. The Democrats did not decide to challenge the election law until it was found that the absentee vote would clinch Mr Del Sesto's victory; Governor Roberts himself had promised, in a high-principled statement, that he would accept office only if this was the clear will of the people. The Governor's willingness to swallow his principles means that, if the 89-year-old Senator Green dies during the next two years, a Republican Governor will not be able to destroy the paper-thin Democratic majority in the United States Senate by appointing a Republican to fill the vacancy. But in 1958, when Mr Del Sesto has promised to run again, the Governor may find that Democratic gratitude is no substitute for the confidence of the voters.

France streamlines coal-mining

In just seven years, from 1948 to 1955, output per manshift down new and modernised French coal mines jumped by as much as 64 per cent. In these mines, where methods and equipment are the latest, productivity is the highest in Europe; and throughout the industry generally, output has never been greater. Now, with a need for more and more new seams of coal, France is drilling up to 125 miles of galleries a year to search for them.

In this vital development work which is going on all the time below the French coalfields, speed is all-important. The answer has been compressed air drilling equipment. By bringing in Atlas Copco lightweight rock drills and Sandvik Coromant drill steels, French mining engineers have found the most efficient and fastest possible method of opening up the way to further sources of coal—and the way to maintain the present high rate of production.

When fog shrouds Table Bay

Compressed air is versatile. Atlas Copco provide the means for all its many applications. In the lighthouse at Mouille Point near Capetown, a small Atlas Copco air compressor supplies air to operate a siren in dense fog.
The Atlas Copco Group of Companies is responsible for the manufacture of compressed air equipment and its distribution and servicing in ninety countries throughout the world.
Group Headquarters: Atlas Copco AB, Stockholm 1, Sweden.

Atlas Copco puts compressed air to work for the world

The World Overseas

South Africa's Reichstag Fire Trials

FROM OUR CORRESPONDENT IN SOUTH AFRICA

THERE is a good deal of cynicism in South Africa over the present mass trial of 153 men and women of all races on treason and other grave charges. This feeling is strengthened by a conviction that the government has overplayed its hand and blundered. It hoped to produce drama by the pre-dawn swoops on private homes, by fleeting court appearances outside normal hours, by the use of military aircraft to rush the suspects to Johannesburg for a mass trial, and by the wholesale refusal of bail, followed by a wholesale granting of bail some days later. Instead it produced only melodrama and anti-climax, aggravated by inept crowd control by the police in the early stages of the trial.

The trial has been called in private Nationalism's "Reichstag fire trial"; once more Communism is among the pretexts, only now it is "statutory Communism," a variety peculiar to South Africa. Communism was outlawed six years ago, but after the recent arrests the Minister of Justice declared that although Communism in its "active form" had been "completely destroyed," it was now working behind the scenes. Few really believe that all the accused are Communists. Most of the latter, and all the effective ones, were banned years ago, and to uncover only now a sizeable plot argues one of two things: either police incompetence or a high degree of skill on the part of men with radical ideas which they are determined to disseminate. There is some truth in both points; but the list of those arrested shows that it is members of multi-racial bodies fighting for what they believe to be freedom, democracy and human rights for all, who are primarily under suspicion.

The Congress of Democrats, formed in 1952 as a White ally of the influential non-White Congress organisations, is obviously a primary target, and the trial is likely to centre on "The Freedom Charter," a document adopted at the Congress of the People in 1955 which contains a medley of aims, some Victorian, others radical in a deliberately vague way. It declares, for instance, that all national groups shall have equal rights, share in the government as well as in the country's wealth, and be equal before the law. If there is sedition or treason in the Freedom Charter, it is not obvious to the ordinary man. In any event, the prosecution has already admitted that if "subversion" was planned, it was all done at public meetings.

Inevitably South Africans are asking why the Cabinet felt it necessary to go to these elaborate lengths to squash its more outspoken opponents. There are some obvious explanations: it finds ideas and arguments easier to handle (and exploit) than real problems; it is determined to deprive the politically conscious non-Whites of leadership; and it hopes to intimidate all who might wish to participate in multi-racial movements aimed at gaining political rights for non-Whites. And finally, by a mass prosecution it hopes to generate some pre-election enthusiasm among unattached voters and waverers. It can hardly hope to embarrass the United Party, which is already so frightened of being accused of being "soft" to Communism that it bends over backwards to avoid the charge.

The sad fact is that the rule of law ceases to have any real meaning when there is as much statutory discrimination against people of colour as there is in South Africa. In eight years of Nationalist rule the country has, in the words of its most outspoken newspaper critic, "been wrenched from its democratic traditions." For two-thirds of its people South Africa is virtually a police state. Even the highly privileged and free White minority is having its rights reduced—trade unionism has been further injured by the new Industrial Conciliation Act; the independence of universities on racial issues is nearing its end, more extensive censorship of literature is on the way, passports are given as a privilege, the Union's constitution is lamed, the judiciary undermined, and public comment and criticism are inhibited.

A glance at a few of the statutes passed by the Nationalists shows the degree to which individual freedom and liberty have been undermined. The Suppression of Communism Act (1950) not only contains a definition of Communism which is so all-embracing as to be absurd—"a person who professes to be a Communist or who is deemed by the Governor-General to be a Communist on the ground that he is advocating, advising, defending or encouraging . . . the achievement of any of the objects of Communism or any act or commission which is calculated to further the achievement of any such object." It also gives the Minister the most fantastic powers over individuals, without any real opportunity of a challenge in the courts.

The Public Safety Act of 1953 conferred wide powers for the proclamation of a state of emergency where public disorder takes place or is deemed to be threatened, and gave the Minister absolute discretion over the destinies, actions, livelihood, property and liberty of any individual—without the right of appeal to the courts. Newspapers may be suspended and persons detained in gaol without charge and without trial. The Criminal Law Amendment Act of 1953 contains this draconian provision:

> Any person who in any manner whatsoever advises, encourages, incites, commands, aids or procures any other person or persons *in general*; or uses any language or does any act or thing calculated to cause any person or persons in general to commit an offence by way of protest against

a law or in support of any campaign against any law, or in support of any campaign for the repeal or modification of any law or the variation or limitation of the application or administration of any law, shall be guilty of an offence.

There is also the old Riotous Assemblies Act, with its powers of banishment and banning; the Citizenship Act which makes the granting of citizenship and therefore the franchise to newcomers the absolute prerogative of a cabinet minister; the Group Areas Act which confers powers to uproot helpless individuals and groups; the Urban Areas Act which gives local authorities the power to banish any African for any reason; the Interdicts Act which prohibits an African from asking for the protection of the courts until it is too late to benefit him; and the Native Administration Act which gives fearful dictatorial rights over the liberties of the subject.

Obsessed with its theories of race and of White supremacy, the Nationalist Party has convinced itself and its bemused followers that the European in South Africa is doomed unless he retains absolute political control for all time. Moreover, within that framework, the Nationalists maintain, it is necessary for them to retain power, otherwise the White dyke may be breached and the "Black flood" will pour through. Everything the Nationalist government does, therefore, is intended to consolidate Afrikaner Nationalism's hold on the country, even to the length of abusing the parliamentary processes and changing the character of the judiciary by the appointment of relatively junior and inexperienced counsel to the Bench, and the passing over of senior Appeal Court judges in the nomination of a Chief Justice.

And the ultimate political tragedy is that however strongly people may feel about it, there is no effective opposition to this drift to disaster. The United Party, whose challenge in the past has too often lacked vigour and conviction, is inhibited because the majority of its followers believe in some form of *apartheid*. Its new leader, Sir de Villiers Graaff, will not lead the party in a more liberal direction, and it remains to be seen to what extent the party's effectiveness will be improved by the dropping of Mr Strauss. The vast majority of the European electors is still convinced by arguments about the need for White domination. And the non-Whites, politically voiceless, are being cowed by a ruthlessly efficient ruling group, and are in consequence becoming more embittered and desperate. It is a picture of gloom relieved, on the one hand, by the knowledge that, as Hungary has shown, the human spirit is irrepressible; and on the other, by the growing realisation of a small minority of Europeans that the road the Nationalist government is following must end in disaster for all.

The Arab Mood

FROM OUR SPECIAL CORRESPONDENT IN AMMAN

THE plan for the Middle East, presented by President Eisenhower to Congress, is more acceptable to Arab opinion than earlier news leaks suggested. The omission of the word "vacuum"—which is thoroughly offensive to nationalist sentiment—has been noted and it is conceded that the statement was drafted with careful regard for local susceptibilities.

But the Arab governments are likely to adopt an attitude of formal reserve to the American guarantee of support against communist aggression. If the Arabs welcome the guarantee they admit by implication the possibility of communist attack; if they admit that possibility they must logically impose on themselves some restraint in their dealings with communist states. Such restraint is precisely what the Arabs reject. They claim full freedom to develop their foreign relations in any direction they please. The compelling factor behind this claim is their desire for a free hand to call in Russia to redress the balance in the event of the West supporting Israel against them—a suspicion never far from Arab minds.

Yet the military aspect of the Eisenhower doctrine is unlikely to provoke too much fuss in the Arab world, especially as it does not call for action on the part of the Arabs themselves, except to appeal for help in the event of actual attack. That appeal would be forthcoming quickly enough with or without an Eisenhower doctrine to invite it.

The crucial issue is likely to be the division of the $400 million, or whatever sum is ultimately voted, among the states of the area. The Arabs argue that American aid, even on the past scale, not only enabled Israel to survive and prosper, but also has provided resources to build up a formidable military machine which it has not hesitated to use. Unless the distribution of future aid between the various states in the area is revised, the United States will become the target of much of the anti-western odium now falling exclusively on Britain and France.

Palestine the Test

The problem of Palestine remains the starting point of all Arab political thought; if anything, opinion here has hardened in the past few weeks. The current Arab attitude is diametrically opposed to that of the West. While western opinion regards the recent explosion as a decisive argument for seeking a final settlement of the Palestine problem, the Arabs take the contrary view. For a Palestine settlement implies recognition of Israel in some shape or form; and the recent invasion of Egypt confirmed the Arabs in their view that Israel should never exist as a state. Revenge is not only in the air. It is deep in the souls of the people. A politician of the old school, who held high office in the days of British "influence," proposed to your correspondent a compromise between the United Nations resolution of 1947 and the present armistice lines, but hastened to add that it would be a "provisional" compromise only. The permanent existence of Israel cannot be recognised by any Arab who values his political future.

Current nationalist thinking is much influenced by the Baath Socialist movement. Abdullah el-Rimawi, leading Baath Socialist intellectual and Foreign Minister, offered the following destructive analysis of any possible Palestine "settlement." There are, he said, three possible ways of settling the problem within the framework of western thinking: 1. There is the current theory of equilibrium, or preserving a balance of power between the Arabs and the Jews. Events have shown the equilibrium established is unstable. The Jews have not hesitated to upset it whenever they held an advantage. The implication that the Arabs would do likewise if events favoured them was left unspoken but could be felt. 2. There is the possibility of a settlement by a decision of the United Nations and imposed by force. This would mean a *cordon sanitaire* between Israel and the neighbouring Arab countries in the form of a United Nations army. Such an army would be in an impossible strategic situation. The Jews and the Arabs could pierce the cordon at will, alleging aggression by the other side as justification. This settlement is therefore impracticable. 3 A settlement along the lines of a western guarantee to Israel. A guarantee of that nature would automatically drive the Arabs to seek assistance from the Soviet Union. Far from settling the question, it would intensify the great power embroilment in the area with grave dangers to world peace.

Having ruled out all means of settlement, the minister inevitably concluded that the wise course was to leave the problem unsettled at present. It was not part of Arab nationalism to drive the Jews into the sea; but the existence of Israel as a state was contrary to the trend of history in the Middle East and must inevitably come to an end. Many Jews, he said, wished to emigrate from Israel but were prevented from doing so by the Israeli government. Those who wished to stay were welcome to do so and would be encouraged to live harmoniously among their Arab neighbours, as they had done for centuries. Neither Jews nor Arabs were happy under Turkish rule; but at least they shared the same lot and lived peaceably with one another.

The ferment of such ideas among Arab youth and intellectuals of the middle classes is matched by the improvement of the techniques of agitation. The influence of Cairo Radio can scarcely be exaggerated. The offices of the ministers are flooded by telegrams and petitions. A recent protest against President Eisenhower's "vacuum theory" was signed by 400 "workers of Amman." The students' strike at the UNRWA vocational school at Qalandia, near Jerusalem, was another symptom of feelings running dangerously high. The occasion for the strike was the return of three British instructors, who were evacuated at the height of the crisis. The students refused to work under "enemy" tutelage and although the delegation of youths to Amman was exhorted by no fewer than four cabinet ministers to return to work, they remained adamant. Another straw in the icy winds now blowing over Amman is the report of the impending departure of Jordanian students for Czechoslovak universities.

German Liberals Change Leaders

FROM OUR BONN CORRESPONDENT

THE west German Free Democrats are in a hurry to close their ranks, formulate policy and tactics, and plunge with a splash into the Bundestag election campaign. They reckon that only three parties will surmount the five per cent barrier at the polls in September—the Christian Democrats, the Social Democrats, and themselves. Quite understandably they like to see themselves destined before the year is out to be the final arbiter of policy, without whose assent no government can act.

Internal dissensions have obscured their aims and discredited their leadership; they are trying in three stages to get into position to do better. The first was accomplished at Stuttgart on Sunday, when Dr Reinhold Maier, who is about to be elected party chairman in succession to Dr Thomas Dehler, expounded his views for all to contemplate. The second is set for the end of this month, when the executive meets in Berlin to elect the chairman formally and enunciate principles. The third will be reached at Hamburg early in May, when a delegate meeting approves an election programme of specific good works for the next four years.

Although he is going gracefully, the business of unseating Dr Dehler is unpleasant to most members of the party. Dr Dehler is a very likeable man, modest, open, spontaneous, and sincere. But as a leader, too often tactless and quick-tempered, he has landed the party in many an embarrassing rumpus. Of Dr Maier, though he enjoys a scrap as much as anybody, it is said that he always takes thought and counsel before heaving a brick that is likely to provoke reprisals. Dr Dehler cannot wait. Even his friends reluctantly admit that his impetuosity has been largely responsible for the Free Democrats' poor showing before parliament and public.

The ambitions of others have also been undermining Dr Dehler's position. Dr Dehler is 59, Dr Maier 67. To the clamorous group who have been dubbed "the young Turks" but call themselves "the Düsseldorfers," Dr Dehler could be in the way too long. Dr Maier, who shows no hankering after high office, would be ripe for retirement just about when the itching Düsseldorfers reckon they will want to come to the top, which is not all that far ahead.

Hasty Journey to Weimar

The Düsseldorfers are of that hitherto remarkably reserved generation, now entering middle age, whose rough finishing schools were the Wehrmacht and the internment camp. Impatiently contemptuous of 81-year-old Dr Adenauer and his cautious, constantly westward-looking approach to the problem of reunification, they have been urging new tactics. Two of them, Erich Mende (40) and Wolfgang Doehring (37), set off precipitately for Weimar last autumn to talk to the east German "Liberals." They achieved little. Painfully timid, the east Germans shied away from all proposals for a next stage, such as exchanging public speakers across the border.

The man who would have most liked to be present at these talks stayed behind in Düsseldorf. As Minister of Finance and Reconstruction in the coalition government of North Rhine-Westphalia, Herr Willi Weyer thought it advisable to keep away for the time being. Yet he was the moving spirit behind the reconnaissance. At party headquarters they talk of Herr Weyer, who is now 39, as "the battleship in the background." There, it is he, not the more experienced Herr Mende, who is regarded as Dr Maier's eventual successor. Herr Mende is a highly decorated officer who makes a special point of speaking for the ex-servicemen. Better versed than Herr Weyer in federal affairs, and endowed with a more engaging public manner, he is not gifted with the creative mind and energy of Herr Weyer, to whom he is taking second place in the inner councils. Happily scouting for the battleship in the background is the destroyer Doehring. Brash and racy, Herr Doehring claims to have drunk of the fountain of pure liberalism during his wartime captivity in England.

After all the pother they have made about the urgency of cultivating contacts with the east Germans, the Free Democrats are inviting no east Germans to their important gathering in Berlin at the end of the month. Dr Maier seems to

have persuaded the Düsseldorfers that at the moment it is more pressing to prepare for an election which may bring the party a degree of power out of all proportion to its numbers.

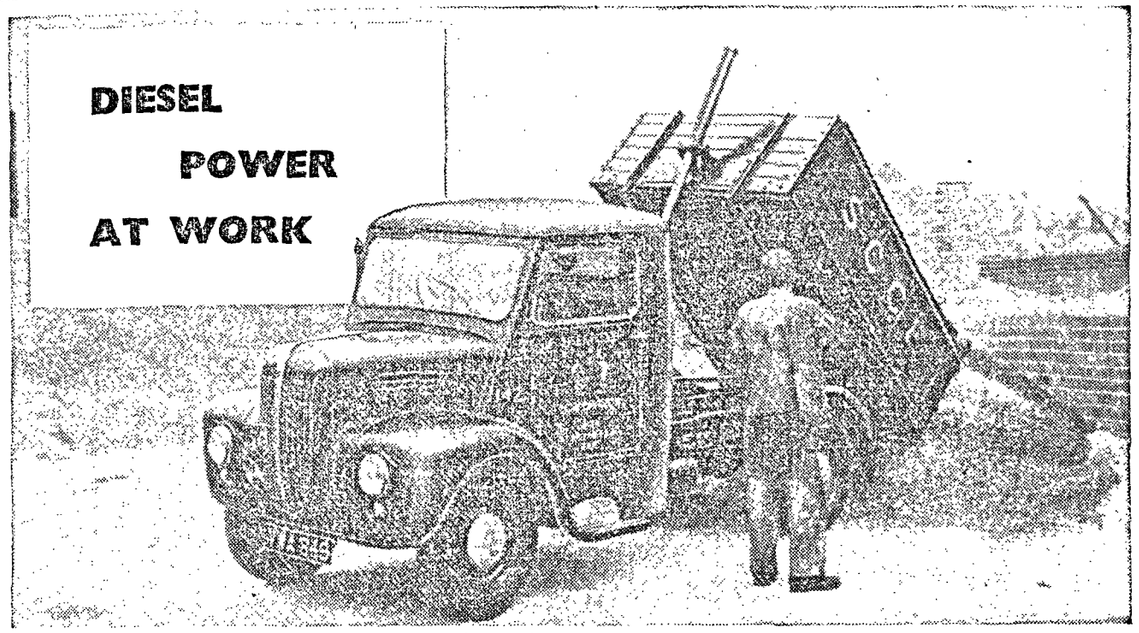
Dr Maier's personal programme parade on his home ground at Stuttgart was a dexterous performance and should engender much useful discussion, if not clarification, at Berlin and Hamburg. Its colourful cloudiness is explained by the party's decision not to commit itself in advance to coalition with either of the two major parties. Until September the way must be kept open for co-operation with both. Dr Maier demands of the Christian Democrats that they tend more lovingly the paths that might lead to reunification, particularly the moss-grown one that begins at the Soviet embassy in Bonn. He scolds them for acting as though the Federal Republic were more than provisional. And he rebukes the romanticism of the "German Europeans" who would like to restore Charlemagne's empire and "have written off Germany beyond the Elbe, including pagan Berlin." Yet in the same breath Dr Maier points out that federal Germany is irrevocably committed to the West, and that this entails a contribution to western defences, even though it may not become effective as quickly as was originally planned.

The Social Democrats would quarrel with little, if any, of this. But Dr Maier rejects their partnership if it means any further nationalisation. Although he did not say so, the Free Democrats suppose that the Socialists would accept an agreement to develop the social services as a fair price for restraint in the fields of ownership.

There is good reason to believe that, should it come to the point, one of the Free Democrats' terms for a coalition with the Christian Democrats would be Dr Adenauer's retirement. Dr Maier carefully refrained from offending the Chancellor's devotees. He contented himself instead with putting it like this: "All too often Germans have said 'Let your Kaiser do your worrying, your King, your Bismarck, your Hindenburg, your Adenauer. They'll put things right'." In other words Dr Maier was saying that it is high time more Germans began to think for themselves. Few will have failed to notice the sly omission of one very famous name from his list.

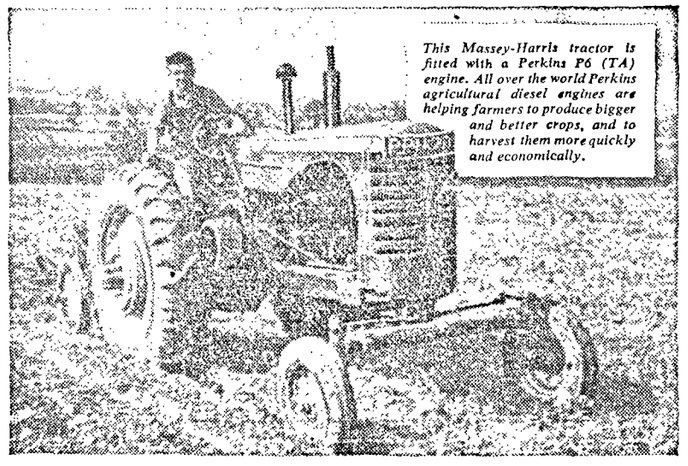
Poland Prepares for Elections

FROM A SPECIAL CORRESPONDENT IN WARSAW



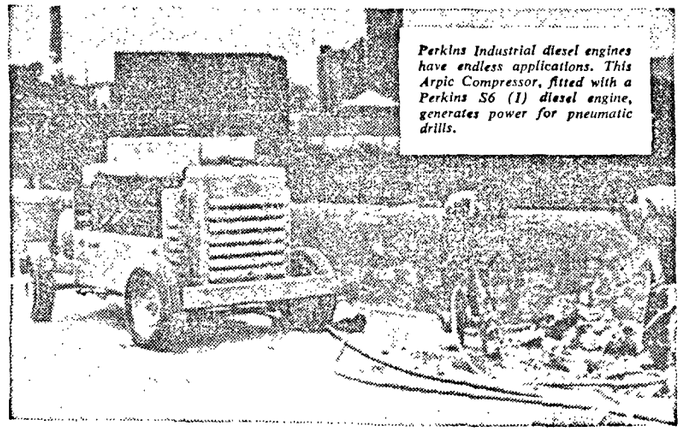
IN contrast with the press, the wireless and the embryonic, rather imperfect, television, the Polish people show singularly few signs of electoral fever. The majority of voters, for instance, have not yet bothered to check their names on the electoral registers which have been available for inspection since the middle of December. Apart from the weather, the reason is probably that the election comes as an anticlimax after the momentous and stormy days of the Polish October revolution. It is generally admitted that by supporting Gomulka and his programme the Polish people played a vital role in changing the leadership and the general political line of the ruling party. In the election they will merely be asked to confirm that line formally and to help choose the men who for the next four years will attempt to see it carried out. Moreover, although the last parliament underwent a miraculous renaissance at the end of its last session, the Sejm and the electoral system are still largely discredited. All are agreed that the new Sejm will be a very different body, but real confidence in it cannot be created overnight.

The new electoral law adopted by the Sejm on October 24, 1956, follows two earlier laws in its general principles of universal, equal, direct franchise, secret ballot, a minimum age of 18 for voters and 21 for candidates and so on. The machinery for conducting the elections is also similar. But this time the commissioners at all three levels (from the state commissions at the top, through the area commissions down to the 15,000 district electoral commissions) were chosen in real consultation with the local bureaus of the political parties, and the social organisations. Perhaps about half of them are communists, but like the rest they tended to be chosen for their professional standing and personal integrity rather than for their party militancy. Sometimes the commissions have been influenced by political considerations; for example, the submission of dissident lists in one or two areas was promptly disallowed. Nevertheless, few believe that the final results can or will be falsified. Large numbers of independent people will be involved in counting the votes; permission has been given for official representatives of the organisations and groups represented on the lists to be present at the count and, in general, there is a kind of vague but real determination to watch the behaviour of the government and the communist party.



Still Only One List

The present electoral law differs not merely in spirit but also in letter from its Stalinist parent of 1952. The most significant change is that it makes it possible to put up to two-thirds more names on each list than the number of deputies to be elected in that constituency. This means in practice that, for example, in the number one constituency in Warsaw the list has ten candidates for six seats and these are placed on the ballot in the order agreed by the members of the electoral block. The voter may cross off the list the names he dislikes and no candidate can be elected if he fails to get an absolute majority of the valid votes cast. From those who thus qualify the six candidates with the highest number of votes will be declared elected. If no names are crossed off, the six top candidates on the list will be automatically elected. It is generally expected that the voters will avail themselves freely of their right to cross off names, and this, combined perhaps with a low poll in some areas, may make some second ballots necessary.



A total of 723 candidates has been put up to fill 459 seats. The need for more than one list has always been officially denied, and from the start it was a foregone conclusion that the parties and organisations would fight the election as one block. But this still left scope for lively electioneering before the candidates were actually selected. The trade unions, co-operatives and other organisations forming the National Front began to dominate the front's local committees. They were encouraged by the growing liberalism of the state and party apparatus, and greatly stimulated by the events of October 19th-22nd; no doubt, too, they profited from the amount of reorganisation and disorganisation in the political parties. Nearly 70,000 nominations poured in, some from spontaneously organised electoral meetings, some formally

Vehicles of all sorts, commercial and private, are powered by Perkins Diesel engines. Available as first equipment or as complete conversion unit for a wide range of vehicles. This 25 cwt. Trojan Tipper is powered by a Perkins P3 (V) engine.

This Massey-Harris tractor is fitted with a Perkins P6 (TA) engine. All over the world Perkins agricultural diesel engines are helping farmers to produce bigger and better crops, and to harvest them more quickly and economically.

Perkins Industrial diesel engines have endless applications. This Arpic Compressor, fitted with a Perkins S6 (1) diesel engine, generates power for pneumatic drills.

ON LAND AND SEA, in industry and on the farm Perkins Diesel engines are at work on a bewildering variety of jobs. For diesel power saves money. Local Authorities find diesel engines reduce fuel consumption by approximately 50%, a considerable saving over an annual period. Farmers save money using Perkins Diesel engines in tractors and combines. At sea, Royal Navy submarines, fishing boats and private yachts use Perkins Diesel engines for economy and safety. The Thames River Police have standardized on Perkins engines. On the road, you'll see the Perkins sign on many well-known commercial vehicles. Whatever the job, diesel engines give you greater reliability, longer life, easier starting and reduced running and maintenance costs. Perkins Diesel engines offer you far more — for far less. May we send you details?

the things they say!

Everybody keeps talking about increasing production — but how are we going to do it, if we don't have more people in our factories?

We'll all have to work more efficiently — managements included.

I've heard that one before. Most of us work hard enough as it is.

I didn't say harder — I said *more efficiently*. We've got to learn to cut out all forms of waste in the way we use our machines and materials.

Most important of all, we've got to stop wasting human effort.

And how's that done?

By studying the way we work in our factories and offices.

By raising our productivity, in fact.

And are we actually raising it now?

Certainly. The national average is going up at the rate of 3% each year.

Is that the best we can do?

Not if the more progressive firms are any criterion. In I.C.I., for example, since the war productivity has been increasing, on the average, at nearly *three times* the national rate.

ICI

[S]

sponsored by front committees and some others submitted by would-be candidates. For years the National Front committees had remained without power, prestige or real political activity, and they were staffed by men unused to taking responsibility or showing initiative.

Quick action was necessary to preserve the key position of the parties and social organisations in the selection of candidates and to retain a degree of central control over the lists. On November 22nd, after consultations at the highest level, the leaders of the bodies grouped in the National Front set up a central co-ordinating commission of political parties and social organisations, to which representatives of progressive Catholic intelligentsia were added. This body rapidly spawned regional local commissions all over the country, which played an important part in fixing the proportions of candidates, sifting and selecting reasonably competent and popular individuals and deciding the order of names on ballot papers. The lists were finally submitted to the area electoral commissions by December 16th.

The governing party had won the first round of the electoral fight, but not without effort and sacrifice. The non-communist parties and organisations, which were in process of evolving from satellites into allies, had bargained fairly hard ; there were all night sittings of the co-ordinating commissions and many last minute submissions of lists. In many rural areas the selecting bodies were more or less forced to accept certain candidates from fear of personal unpopularity, abuse and the threat of demonstrations and even of the storming of their meetings. Many other far-reaching concessions were made to popular opinion which were welcomed for their own sake by the most radical democratic wing of the party. A considerable number of recently rehabilitated politicians have been placed on the lists. The proportion of so-called central candidates, i.e., leaders of national organisations divorced from the constituencies in which they stand, shrank to a mere ten per cent. They make up most of the 83 deputies from the previous Sejm who are standing again.

According to statistics published by the Polish press agency only about 50 per cent of the candidates are members of the hitherto almost monopolistic Polish United Workers Party (PZPR) ; 25 per cent belong to the United Peasant Party (ZSL) ; 10 per cent to the Democratic Party (SD) ; while 15 per cent are non-party or represent progressive Catholic groupings. Now, after the lull caused by the Christmas holidays, the second phase of the electoral struggle has begun in earnest ; this is to make the candidates popular and secure the highest possible poll on January 20th.

"Motor Business"

The December issue of this quarterly research bulletin for the motor and allied industries is now available. It will include :
The outlook for 1957.
The French motor industry.
The East African market for motor vehicles and tractors.
The Bulletin is fully illustrated by charts, amongst which are :
Price indices of used cars and vans.
New registrations in Great Britain, and the hire purchase share of the market.
For full particulars of this Bulletin apply to :

Signor Reale's Revolt

BY A CORRESPONDENT

HOW hollow was Signor Togliatti's victory at the eighth congress of the Italian Communist party has speedily become apparent. A widespread reaction is now under way, captained by one of the party's former leaders, Signor Eugenio Reale. Marked out as a potentially dangerous dissenter he was excluded from the congress, even as an observer: his protests developed into polemical exchanges in the press, and he has now been expelled from the party by a procedure which, in denying him any opportunity to state his case before his comrades, violates the party's own statute. His case against Togliatti is overwhelming. By slavishly following Moscow, he asserts, the party has not only been forced to suppress internal discussion, it has also forfeited its role as guide to the working classes in the country.

Signor Reale's former position in the party makes his revolt of great significance. A life-long communist and once a close friend of Signor Togliatti, he created the party at Naples and refounded it after the war ; he served as undersecretary of state for foreign affairs in successive coalition governments after the war under Signore Bonomi, Parri and De Gasperi, and for two years was ambassador at Warsaw. Subsequently he was responsible for the organisation of commerce with the countries of Eastern Europe through a number of trading organisations which were closely linked with the Italian Communist party and which provided it with an important source of income. He has long been critical of the party's policy (since 1951 he has not sat on its central committee) but only now has he decided to come into the open. Knowing so many of the party's secrets he is a formidable opponent. Nor is he in the isolation which formerly surrounded such rebels as Signore Cucchi and Magnani in 1951. Not only has he recently been joined by a number of the party's leading intellectuals—including Signor Crisafulli who was its nominee to the Constitutional Court, and two noted contributors to *Unità*—he is also assured of support within the party from his many friends and former collaborators.

Hazardous Course

The problem evidently is whether to bring these dissidents out of the party with him or to stimulate internal opposition to Signor Togliatti's apparatus. For the moment it appears that he is seeking the second course. But it is a hazardous and uncertain undertaking. Part of the problem, as he recognises, is that there is no alternative candidate of the intellectual stature of the present party secretary: and it may well be that the new generation of die-hard Stalinists such as Signor Mario Alicata will cheerfully face any number of expulsions and defections rather than jettison their mentor and protector. The present signs, at all events, point to a considerable fall in the membership of the party: in Turin, for example, only some 36-37 per cent have so far renewed their subscriptions out of the 38,000 who were supposed to be members last December.

If things continue in this way it may well be, as Signor Reale asserts, that the party will eventually become merely the home of the unemployed and the landless agrarian labourers, the vehicle of the extreme, impoverished and

revolutionary sections of society. For the many thousands thus cast loose from their political moorings a united socialist party would evidently offer the nearest and surest haven. This has yet to come into existence, but this new reason for its creation will surely influence the debate at the congresses of the two socialist parties which are shortly to take place.

The Arab Refugees

THE problem of the Arab refugees is again casting its dismal shadow before the United Nations. The annual report of Mr Labouisse, the director of the United Nations Relief and Works Agency, is waiting discussion, and once more the General Assembly will be forced to recognise how unsatisfactorily an emergency palliative has been stretched over the years, and how any more imaginative approach towards resettlement of the 900,000 refugees is stymied by political and economic obstruction. The report covers the year ending the month before the Suez canal was nationalised; since then a new crop of difficulties has shot up. National antipathies have been intensified; there are fresh obstacles to an Arab-Israeli settlement; the Israeli seizure of the Gaza strip, where two-thirds of the population are refugees, has imposed extra strain and expense on UNRWA. Yet the coin has another side, for it is just possible that the urgent need to find an answer to the Gaza problem may act as a catalyst for the whole refugee stalemate.

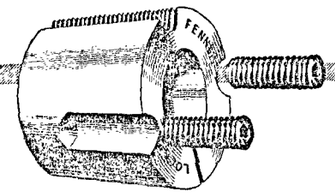
The report is a sad document admitting failure in the long-term, and unsatisfactory performance of the immediate, tasks. The greater part of the blame for the refugees' plight lies with those Middle Eastern countries who play politics with human suffering by blocking any solution commensurate with the problem. As a by-product of this intransigence many of the refugees, sullen and looking ever backwards, accept a meagre dole and, except for the elite, show small interest in schemes for self-support; while the United States and Britain and the very few other contributing nations ease their consciences by providing enough money to allow each refugee something like £10 a year.

Rations for the Dead

The Agency's short-term job of keeping the refugees on the right side of the subsistence line is thwarted by the attitude of the host governments, the apathy of the refugees, and, most of all, by lack of funds. Both in Syria and Egypt the agency has been restricted in the appointment and movement of its staff and bedevilled by hostile propaganda. But the prime example of non co-operation is provided by the refusal of the Jordan government to register refugee deaths. As the 500,000 refugees in Jordan (numbering one-third of the population) have the right to vote, their political pressure is strong, but in order to iron out a situation in which rations are being given to the dead, the Agency are not supplying relief to children born after 1951: a cruelly inequitable solution. Mr Labouisse has asked the Assembly for fresh instructions on this specific score, as well as for a wide re-definition of the Agency's functions. Are operational control and responsibility to remain in its hands or those of the host governments? Mr Labouisse implies that the situation as it is at present in many areas has become intolerable.

Even if the host countries were to become more accommodating, UNRWA still needs more money from members of the United Nations. Its present budget is inadequate to supply even the bare minimum of food and shelter to all the displaced persons who need it. Over and above this, the Agency is well aware that it should be supplying supplementary food to children (at present only 5 per cent of the refugees get cooked meals), new shelters for refugees in Gaza and for the Bedouins in Jordan, and a higher level of education. There is also the distressing situation of claimants for relief who come outside the Agency's mandate. At its last session, the General Assembly appealed to private organisations to help these people, who include many villagers on the Jordan frontier whose land was annexed by Israel, but Mr Labouisse reports that it has been found impossible to do anything for them.

The Agency's eventual task of making the refugees self-supporting waits upon a political settlement between the Arabs and Israel. Until this happens, the Arabs will continue to make propaganda out of the refugees' plight and the Israelis will continue to use them as bargaining counters. Each side accuses the other of inhumanity: neither will give an inch. The refugees themselves are hostile to plans for resettlement since this would end their hopes for a return to Palestine. But their *animus revertendi* is one of time rather than place: they want to return not to Israel but to Palestine as it was before 1948.



Bitter Hatred for Israel

The agency has a particularly hopeless assignment in trying to make the refugees self-supporting in Jordan, where opportunities for work hardly exist. In this connection, Mr Labouisse has asked for an ambitious extension of his mandate to cover the provision of loans or grants for general economic development which would only indirectly help the refugees. But although this plan is imaginative, it will remain academic unless financial contributions become less mean and dilatory.

The Israeli occupation of the Gaza strip, where less than a quarter of the population is able to support itself, has highlighted the problem. By introducing their currency and stamps and by starting some small-scale development schemes the Israelis show signs of wanting their occupation to be more than temporary. But the refugees' bitter hatred for the Israelis has been fanned both by the original bombardment of Gaza and by subsequent violent incidents, magnified in the telling. Apart from all other considerations, the Israelis would find the administration of 200,000 hostile refugees a heavy liability.

So far there has been no Israeli move to offer even a sample of Gaza refugees the choice of repatriation or compensation. Repatriation is a false trail: it is believed that a very small proportion of the refugees would agree to return to Israel as it is now. The United States and Britain have jointly promised to lend the money for compensation. But until the Arabs accept the existence of Israel, the refugees will continue to live in the past, the Arabs will balk at resettling them and the Israelis will regard the refugees as a trump card in the political battle.

THE BUSINESS WORLD

Sterling on the Mend

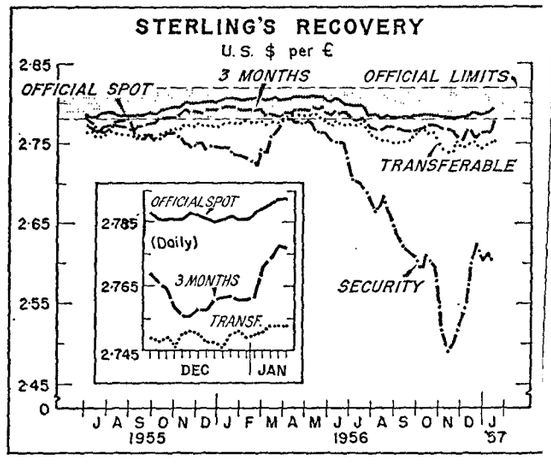
THE past week has seen welcome signs of strength in sterling on the world's foreign exchange markets. The rate against the US dollar has risen to \$2.79⅜ for the first time since the end of July, when the nationalisation of the Suez Canal caused a sudden intensification in the flight from sterling. Transferable sterling which was under \$2.75 at the beginning of the month and had been as low as \$2.73½ at the depth of the November depression, has risen modestly to \$2.75½—a significant move when it is realised that official support of transferable sterling cost substantial sums in dollars during November and December. The other variety of sterling—security sterling—has changed little this week, but the rate of \$2.60 shows a remarkable improvement on the figure of \$2.47½ that was touched in mid-November when the premium on dollar securities quoted in the London market hit its recent maximum of 13 per cent over the official rate.

More striking than these movements in the spot rates has been the improvement of sterling for forward delivery, which is usually more sensitive to speculative sentiment. The discount on sterling three months' forward against the dollar touched 3⅜ cents, little more than a month ago, equal to an annual rate of interest of just on 5 per cent, and was still 2½ cents at the beginning of this month; now it has come down to 1½ cents. This last figure is equivalent to a rate of interest of 2.4 per cent per annum, a figure which does little more than bridge the gap between the Treasury bill rates in New York and London. Equilibrium in forward exchange markets is reached when the premium or discount compensates the differential in short-term interest rates between the two financial centres concerned. Then there is no inducement to move short-term money from one centre to another because the gain in interest is exactly cancelled by the cost of covering the exchange risk.

In the market for sterling in terms of the most important currencies that balance has almost been restored—which suggests that, for the time being, the barometer of speculative sentiment in sterling is around normal. This is confirmed by the evidence of the spot market in sterling which, during the last few days, has given clear signs of covering purchases by bears. As speculative forward sales of sterling mature, they are not being renewed, but are being closed by spot purchases; this accounts both for the narrowing of the discount on forward sterling and for the rise in the spot rate. But while there has been evidence of bear covering, there is no indication yet of any substantial rebuilding of working balances in sterling, the depletion of which played so important a part in the drain on the reserves in the second half of 1956.

The starting point in the recovery of sterling was the massive fortification of the reserves announced on December 11th, by the drawing of \$561 million from the International Monetary Fund, the securing of the balance of the United Kingdom quota of \$1,300 million as a standby credit, and the pledging of the dollar securities owned by the Government as collateral for a \$500 million line of credit with the Export-Import Bank. These operations stopped the flight from the pound, but they did not produce any substantial reverse flow or covering of speculative positions in sterling until this week.

This belated response is surprising, in view of the end-year gold and dollar reserve figures. The fact that these showed an appreciable increase in the reserve (though one that was much less than the inflow of borrowed dollars from the IMF) seems to have brought home to speculators the reality of the recent reinforcement of the reserve and the strength of the forces against which they were pitting their own operations.



These speculative operations reflect a nervousness about sterling that has persisted since the summer of

1955. It dates from the well-publicised secret debate on the widening of the range for fluctuations of exchange rates of currencies adhering to the European Payments Union. That discussion, held within the ministerial council of OEEC and the management board of EPU in Paris, was the starting point from which expectations of some depreciation in the value of sterling and a concurrent appreciation in that of the deutschemark, grew. The subsequent denials of the then Chancellor of the Exchequer, Mr Butler, at the Istanbul meeting of the IMF, had a temporarily reassuring effect. But with evidence of strain in the UK balance of payments and, later, with the advent of the Suez crisis, memories harked back to the theme of exchange flexibility.

The operations mainly responsible for the weakness of sterling and the depletion of the reserve in 1956 fall mainly under the highly elastic heading, "speculative." If the pressure on sterling has owed anything to current commercial transactions this would be attributable more to the outer sterling area than to the United Kingdom. The explanation that springs to mind is the running down of India's sterling balances which, when the full tale of the sterling area's balance of payments for 1956 is told, will probably be shown to have involved substantial claims on the gold and dollar reserve. This influence on sterling should by now have spent most of its force because India's sterling balances have fallen close to their present statutory and working minimum.

If, however, there is to be an appreciable recovery in the reserve it must come from a reversal of the speculative influences to which sterling has recently been subjected. These speculative operations range from the familiar hastening of commercial foreign exchange purchases by sterling area importers, and the corresponding retarding of sterling purchases by importers in non-sterling countries, to the outright sale of forward sterling by foreign speculators. Between these extremes there lies a wide range of transactions that are prompted by any serious weakening of confidence in sterling. For example, subsidiaries of foreign firms operating in sterling countries tend to remit profits which, in more normal circumstances, would be retained in the country of operation. When sterling is under suspicion, foreign firms which have to maintain substantial sterling assets for their business take the trouble and incur the expense of covering these by forward sales of sterling. Most important of all in its recent effect on sterling and the reserves is the tendency to run down working balances in sterling when fear of devaluation or depreciation is in the air. During the past six months working balances of most European countries have been drawn down to the irreducible minimum. There has also been some reduction in certain, though by no means all, Middle Eastern balances.

One deterrent to these speculative operations is their cost. Nothing is easier for the non-resident operator than to sell sterling three months forward. The immediate cost, even at the depth of the recer despondency in the market for sterling, was abou 5 per cent per annum. That represents the differenc between the spot and the forward rate calculated as a annual rate of interest. This, however, does not exhau the risk involved. When towards the end of la November the speculator sold sterling forward for thre months he did so on the basis of a spot rate of $2.78 and paid a discount of 3½ cents for the facility delivering his sterling three months hence. The co of the swap was about 5 per cent, based on the spo and forward rates which then prevailed. Since the however, the spot rate has been moving up and it ma well be that it will have moved up further by th time the contract matures and the speculator has to g into the spot market and buy the sterling which he ha undertaken to deliver. If, by the time he has to delive the spot rate has moved to the other extreme of i permissible fluctuations, namely, to $2.82, and he ha to buy at that rate, the swap would have cost him, n 3½ cents, but 7¼ cents, representing a loss of intere at the rate of over 10 per cent per annum.

The main deterrent to speculation and the mai encouragement to an immediate covering of bea accounts is the unnerving sight day-by-day of a gradu improvement in the spot rate. This, at a time whe sterling is moving into its normal period of season strength, is inducing many bear speculators to cove and cut their loss. The speculators have been covering but so far there has been no new real investment i sterling. Before working balances are restored an foreign investment in sterling securities is reactivate clearer evidence will have to be available that some the underlying reasons for loss of confidence in sterlin have been removed—in particular, that economic states manship in Britain can still produce a lithe and tau economy, instead of one in which cost increases wer to be had for the asking. Foreign opinion on sterlin will not be basically reassured until there is evidenc that the new government can tackle the reduction expenditure and cut taxation.

Business Notes

Mr Macmillan's Boost

Any observer can see from the Stock Exchange closing prices of Thursday that the choice of Mr Macmillan as Prime Minister was welcomed in the City. Gilt edged securities had a good rise; industrials with a mixed bag of net changes showed little change on the day, the *Financial Times* industrial index falling from 180.5 on Wednesday to 180.1 on Thursday. Oil shares recovered and gold shares held steady. The premium on dollar stocks in London which was 7¾ per cent (over $2.80 to the £) on Wednesday touched 8 per cent on Thursday but soon dropped back again to 7½ per cent. Sterling rallied fractionally and the three months discount narrowed. Several commodity prices also rose.

The day's trading opened with jobbers widening their prices to protect themselves and it is fair, if harsh, comment that through the morning each time the name of Butler was mentioned the market eased and with each mention of Macmillan it recovered. Mr Macmillan it was and the market closed buoyant, though without a great volume of business. The outcome was particularly fortunate for ICI, which on Thursday went to allotment for its £40 million 5½ per cent convertible loan stock, not only without any withdrawals but with the reasonable hope that dealings would start at a premium of around 3½. Applications for up to £200 stock have been allotted in full and the larger applicants get an eighth of the amounts applied for. Subject to appropriate minimum allotments.

One item of new discipline in the gilt edged market should go on record. It will no longer be permissible to interpolate small placings of local authority stock out of turn in the queue of gilt edged issues. These placings with their special appeal to the trustee savings banks have met with some popularity until the movement grew in scope. Now it is intended that—apart from two placings already partly arranged that will take their place along with two public issues during the next two weeks—all these placings will take their turn. The ruling may have the odd effect that after these two there will no further placings for local authorities until about 20 public issues have been worked off.

Fuel Oil Prospects

It is up to Texas, as the executive committee of the OEEC pointed out in a plea to the American government this week, whether Europe will be able to maintain its oil rations, especially of fuel oil, at the existing level. The attitude of the Texas Railroad Commission, which controls output in Texas, is discussed in an article on page 113. Exports from the Gulf of Mexico in January are now almost certain to fall below the planned level. And there is still an appalling waste of tanker tonnage in the 100,000 barrels a day of Middle East oil (some of it even taken from the Mediterranean terminal of Tapline) that is still being delivered to the eastern seaboard of the United States because refineries there cannot get enough extra crude from the Gulf of Mexico.

The most urgent need in Europe is for fuel oil, which was short on both sides of the Atlantic before the Suez canal was blocked. European refiners are making as much fuel oil as they can from their crude throughput, but there is practically no fuel oil available for import as such, and this is the season of peak fuel oil consumption in the United States. Although Europe as a whole may still be importing a bare 75 per cent of its normal supplies of petroleum, it is now getting less than 75 per cent of its fuel oil. In Britain, after allowing for the one-third reduction in supplies for central heating, and for the conversion of some power stations from fuel oil to coal, the actual level of fuel oil deliveries is now about 80 per cent of normal. Even this has been achieved only by running down fuel oil stocks in Britain, although these are not yet at a dangerously low level. When the Texas Railroad Commission next meets it is almost certain to sanction an increase in crude oil output for February, although less likely to alter its decision not to raise output in January. The key question therefore for the British and other European governments is whether the anticipated increase in Texas output in February is sufficiently certain, and the time lag in transporting and refining the increased supplies sufficiently short, to warrant further inroads now into their stocks of fuel oil in order to maintain the existing level of deliveries. Whether these deliveries are maintained or not, the increase in the price of Texas crude oil last week, and the renewed rise in the prices of heavy Venezuelan crudes and Bunker "C" heavy fuel oil, make it virtually certain that British consumers will soon be asked again to pay more for their fuel oil.

The government is certainly right to refuse to waste scarce tankers in carrying cut price petrol from America, when the urgent need is for fuel oil or for crude from which fuel oil can be refined. Although the opposition to an increase in crude oil production in Texas would be lessened by evidence of heavy exports from the embarrassingly high American stocks of petrol, the cost in terms of fuel oil forgone of earning the goodwill of independent refiners in the United States would be far more than this country could possibly contemplate.

European Co-operation on Oil

One of the most encouraging aspects of the European fuel shortage has been the extent of the co-operation achieved between the various European governments in

dealing with it. When the OEEC oil committee meets next week it is expected to give its approval to a comprehensive allocation scheme which will attempt to equalise the burden of the shortage between the separate European countries. Up to now, partly because the economies of some European countries are based more on imported oil than others, and partly because the oil companies serving some countries have been more successful in securing emergency supplies than have the companies serving others, there have been major variations in the severity of the oil shortage in individual countries.

It is now proposed that each country should receive, for each main group of products, a "European basic ration" at a fixed proportion of the total supplies it would have received, under normal conditions, in the first quarter of 1957. These supplies include indigenous production, which means that a country such as Germany, which has considerable oil production of its own, is being asked to make a correspondingly greater reduction in its imports. On top of the "European basic" there will be a supplementary allowance dispensed at the discretion of the OEEC oil committee—acting as a sort of European petroleum board—from a special central reserve pool to those countries such as Sweden, Denmark and Italy, whose economies are most dependent on oil. The size of the European "kitty"—how much "basic" and how much "supplementary"—and its composition in terms of products, has yet to be agreed.

The political difficulties of the scheme are enormous; but if the OEEC oil committee can overcome them it will have provided the best instance yet of really workable European co-operation, and even of integration.

United Steel Seeks £9 Million

UNITED STEEL COMPANIES was the first steel undertaking to be denationalised and it is the first to come to the public for more money. The company (whose results are examined on page 146) is seeking to raise about £9 million by a rights issue of six million ordinary £1 shares at 30s. per share. The rights are in the ratio of three new for every seven shares held. This will provide a substantial instalment towards the £20 million needed over the next few years for three major schemes of development—the strip mill at Steel Peach and Tozer, the electric melting shop at Samuel Fox and improvements at the Appleby-Frodingham plate works.

That is a satisfactory contribution, but it may be wondered why the company is proceeding by way of an ordinary share issue when investors are leaning towards fixed interest stocks. Possibly it was because it has recently called up the remaining £5½ million on its 4¾ per cent debenture 1968-78 provided by the holding and realisation agency. Possibly the board feels that with £19 million of prior charges already outstanding half equity and half prior charges is preferable to three equity to five prior charges—quite apart from the complication that the prior charge capital is still held by the agency and the ordinary capital by the public. Secondly shareholders may wonder why the rights have been pitched so low. With the ordinary shares at 32s. 4½d. they were worth on paper merely 8½d. per share and the new shares opened in the market on Thursday at around 3d. per share, but quickly rose to 10½d. (nil paid). Messrs Morgan Grenfell and Co. have underwritten the issue at 9d per share, with sub-underwriting at 6d. A wide response is evidently expected from the company's 60,000 shareholders to whom the appeal must be a well covered 8½ per cent yield (the highest in the steel share list), for the rights are not specially attractive and there is no promise of an increased dividend. But the board does indicate that they believe production will expand and, if it does not, that profits arising from recent capital expenditure should tend to counteract any slackening in demand. That, together with the recent increase in steel prices, will encourage shareholders to think that the present 12½ per cent dividend is secure.

Rumbling Steelmasters

WAS it an accident that on the same day last week the British Iron and Steel Federation published forecasts that British steel output might be expanded between now and 1962 by about 7½ million ingot tons and Sir Ellis Hunter included in his annual statement to shareholders of Dorman Long remarks about "facile expectations of large steel output increases year by year comparable with those achieved over the past decades"? This week the chairman of South Durham, Mr B. Chetwynd Taylor, had some comments to make about the federation that were more directly slighting, though also more opaque in meaning. He began by advocating

> a wider approach to the subject of fixation of steel prices . . . on lines similar to the formula operated in the United States over a long period of years . . . (including) reasonable margins to take care of demands outside the direct control of the industry.

Later he complained of the restrictions upon steel exports imposed on the industry, and went on to question whether the British Iron and Steel Federation, "since approximately 75 per cent of ingot production has been restored to private ownership," should continue to act as a medium for discussions between the Government and the steel industry. His alternative would be "more direct forms of contact between the Board of Trade, the Iron and Steel Board, and the industry."

It is hard to appreciate the inwardness of all this. The "formula of steel pricing operated in the United States" presumably refers to the pricing policy of the United States Steel Corporation, which may exercise price leadership, but certainly would not admit to "price fixation." The restrictions upon the total volume of steel exports accepted by the industry are at least partly offset by the fact that extra profits on selling steel at export premiums—those very regular windfalls—are left out of account in settling the level of steel prices inside Britain. Certainly, with the interposition of the Iron and Steel Board between the federation and the Government, the industry's contacts have become less direct; but this was part of the package deal of denationalisation. The public airing of complaints about the federation, however, may be more significant than the content of particular complaints. Much of the power of this trade association and several of its main postwar functions have certainly been taken over by the state-appointed board; and recently it has displayed a certain malaise, partly

Ebb Tide in Profits

NO oracular powers were required twelve months ago to say that the rate of increase in company profits was slowing down and would slow down still more as the months of 1956 passed by. It was one factor that lay behind the decline in industrial shares prices at that time. Intelligent investment is always anticipatory and investors could see that increases in wages and other prime costs would eat into margins and that many industries would be able to maintain total profits only by producing and selling more. And for some industries, notably the motor and hire-purchase trades, the credit squeeze made it certain that sales would decline.

The facts, based on the results of the 459 companies that published their accounts in the last quarter of 1956, confirm these forecasts. Most of these accounts relate to financial years that ended between June 30th and September 30th last year. The trading profits of the 459 companies rose by £6½ million to £281 million. But this increase of 2½ per cent is smaller than that of 4 per cent in the third quarter, of 11½ per cent in the second and of 12½ per cent in the first. Profits are on the ebb. The capital employed by these 459 companies (at net book values) went up from £891 million to £982 million, so that earnings per £ of invested capital were lower.

Yet it has to be recognised that an increase of 2½ per cent in profits is not an unsatisfactory result for a quarter in which the motor manufacturers' results loom large. It was achieved in spite of a decline of 17½ per cent (from £80.8 million to £66.7 million) in the trading profits of motor, cycle and aircraft companies. That fall was substantially offset by the advance in profits scored by the capital goods industries. Profits earned by building companies rose by 16 per cent, profits of engineering companies by 9 per cent, and profits of the "iron and steel" group (which in this particular sample represented steel-using and heavy engineering firms and not steelmakers) by 27½ per cent. A big increase—of 30 per cent—is reported by companies in the food, confectionery and allied trades. Breweries, another group with a big weight in the sample, achieved an increase of 6½ per cent.

The increase in earnings was based on bigger outputs and bigger sales. And that in turn was based on more real capital investment in the industries concerned. Yet those companies with a mind to expansion (and many of them were of that mind) did not find the going easy. The 459 companies did not plough back as much as in the previous year and equity earnings fell from £108½ million to £101 million. Why, then, did ordinary dividends increase from £31.2 million to £33 million? The answer is that this is an apparent increase only. Dividends are shown net after tax; grossed up and related either to issued capital or to employed capital the return was smaller. Gross returns of 15½ per cent on issued capital and 5.8 per cent on employed capital compare with returns of 16½ per cent and 6.1 per cent in the previous year. Prudence took its seat at the board-room table.

Prudence and financial conservatism were not guests that the directors and managers dare ignore. Within these 459 concerns, money to finance an increase of £137 million in fixed assets (at gross values), of £83½ million in stocks and of £34½ million in debtors had to be found. Borrowed money was dear and hard to get. But bank overdrafts rose by £10½ million to £83.7 million and liquid assets were run down from £280½ million to £248½ million. In spite of the net reinforcement of £103 million to depreciation and other reserves and of an increase in the companies' own debts to their suppliers, appeals had to be made to the capital market. Debenture capital went up by £15½ million, preference capital by £1½ million and ordinary capital (excluding free scrip issues) by £15½ million.

That there will be more capital to service at high rates is one reason why investors do not see equity payments going up this year. But that is not the main reason. In almost every industry investors expect the squeeze on profit margins to become increasingly apparent in published accounts. They are prepared to see a fall in industrial profits as a whole even though some companies continue to make good money. This decline may not occur in the current quarter, which will be dominated by the steelmakers; their accounts show an advance in profits from higher production and the use of new equipment. But, it is argued in Throgmorton Street, the decline in profits (and in a few instances in dividends) has been anticipated and discounted and the shrewd investor is planning his purchases for the day when profits will turn upwards—the day when the benefits of current capital investment will be realised. That seems sensible if he is prepared to wait.

COMPANY RESULTS PUBLISHED OCTOBER TO DECEMBER, 1956

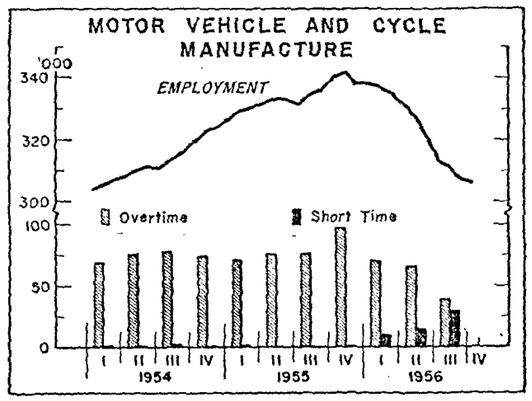
through the loss of a significant number of key people and the consequent overburdening of those who remain. What changes some Steelmasters may have to propose—or whether they would like to do without a central spokesman altogether in "more direct contacts" with governments that may not always be Conservative—remain to be seen.

Bumper Bank Profits

THE season of banking results, although disappointing some wishful thinkers in the stock markets, has matched the pattern foreshadowed in these columns a fortnight ago: every one of the big banks has announced an increase in profits, but the only increased distribution has been that promised by Lloyds Bank last September in connection with its scheme for simplification of capital. Aggregate disclosed profits of the Big Five rose by £1,031,000 to the new peak of £12,243,000, or by 9.2 per cent, the largest increase for many years; the rise in 1955 amounted to 5.9 per cent (but a substantial part of that resulted simply from the effect of the reduction in the income-tax rate upon the net cost of the dividends). As will be seen from the accompanying table, the five banks show an unusual consistency: the highest increase is Barclays' 10.3 per cent and the lowest the National Provincial's 7.9 per cent.

BANK PROFITS AND DIVIDENDS, 1953–56

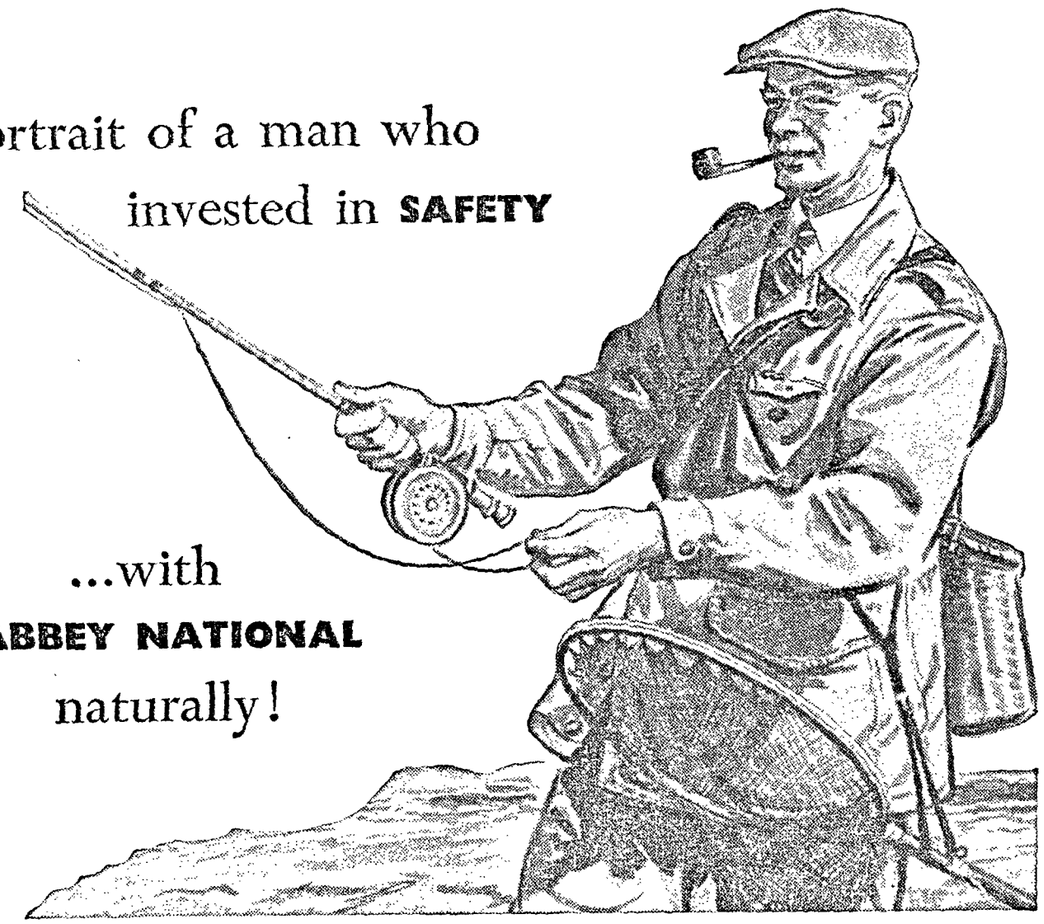
	1953	1954	1955	1956	Change in 1956
	£	£	£	£	%
Barclays	2,300,150	2,549,399	2,645,381	2,917,112	+10·3
	10	*12*	*12*	*12**	
Lloyds	2,083,781	2,186,072	2,322,439	2,541,793	+ 9·4
	11·2	*12*	*12*	*13†*	
Midland	2,127,202	2,397,597	2,654,110	2,888,443	+ 8·8
	16	*18*	*18*		
N. Prov.	1,765,768	1,827,044	1,882,139	2,030,483	+ 7·9
	17	*18*	*18*	*18*	
Westminster	1,474,736	1,623,197	1,708,316	1,865,050	+ 9·2
	14·4	*16*	*16*	*16*	
"Big Five" Total	9,751,637	10,583,309	11,212,385	12,242,831	+ 9·2
Martins	819,921	918,477	930,616	944,780	+ 1·5
	17½	*17½*	*17½*	*17½*	
District	559,744	588,863	636,784	663,060	+ 4·1
	20	*20*	*20*	*20*	
"Big Seven" Total	11,131,302	12,090,649	12,779,785	13,850,721	+ 8·4



* "Special" dividend of 2% paid in 1954–55 now consolidated into basic dividend.

† Final payment of 7% on new single-class capital makes equivalent of 13% (against 12%) on former "A" capital and £5 8s. 4d. per cent (against 5%) on former "B" capital.

The two northern banks show notably smaller increases, perhaps because they, like the National Provincial, are apparently still adhering to the traditional practice of valuing securities at or below market prices, and may therefore be the more concerned to strengthen inner reserves before striking their declared profits. In any case, it is noteworthy that each of these three banks is again returning the whole of its retained (published) profits to such reserves: the National Provincial again puts £1 million and Martins and the District again put £300,000 each to contingencies account, and Martins also repeats its £200,000 allocation to premises fund. The only other bank to follow this policy in the disposal of published profits is the Midland, which this year raises its allocation to contingencies from £1 million to £1,150,000 and that to premises from £85,000 to £150,000. Barclays and the Westminster again put the whole of their disclosed surpluses to published reserves (Barclays' transfer is raised from £1 million to £1,250,000) while Lloyds divides its £1 million of allocations equally between the two kinds of reserves.



More Motor Dismissals

THE latest batch of dismissals in the motor industry may not be the last before petrol rationing ends. Current output at several plants is as much as 40 per cent below last January and drastic revisions have been made to future production schedules; but most managements have been hoping to keep their already much slimmer labour forces for the time being by putting more people on short time working. British Motor Corporation, Ford, Rootes, Standard and Vauxhall have all put some plants on a three-day week. But Ford has found already that there is a fairly early limit to the amount of short time working that is economically bearable. Early in December it switched most of its car plants to a four-day week. Some dismissals would also have been necessary at the Briggs car body plant but at the request of the unions it withheld redundancy notices and tried three-day working instead. It took only a few weeks for the company to change its mind and, despite some resistance from the shop stewards, it has given notice to 500 of the 16,000 workers there this week and expects to have to lay off another 2,500 before four-day working can be resumed. However this week three-day working spread to the car assembly plant at Dagenham, involving a third of the 7,000 employees. At Doncaster, where the Ford Popular is made, the unions chose dismissals rather than short time working, even though this meant that nearly a third of the total labour force would have to be laid off.

Like Ford, both Rootes and Vauxhall were able to keep free of the rest of the industry's troubles early last year. But since September Rootes has laid off 600 of its total

Portrait of a man who invested in SAFETY ...with ABBEY NATIONAL naturally!

He is a man who can relax in comfort, casting his fly with the assured aim that comes of a tranquil mind untroubled by backward glances at the world of stocks and shares. He has invested in Safety with the Abbey National Building Society, with a tax-paid 3½ per cent return — whatever the state of the market. That's equal to £6.1.9 per cent where Income Tax is paid at the standard rate.

No wonder our fisherman wears a contented expression! He has plenty to be contented about, with his money safely invested in Abbey National. Any amount from £1 to £5,000 is accepted.

Advertising travels first class in the international editions of LIFE. For these are the magazines where uniquely large pages and outstanding reproduction reflect the quality of your product and deliver your message with maximum impact. And it reaches your best prospects the world over—key people in business, government and the professions.

LIFE INTERNATIONAL is published in English fortnightly in 120 countries outside North America.

LIFE EN ESPAÑOL is printed in Spanish every fortnight for Latin America.

Their combined net paid circulation of over 610,000 is concentrated at upper income levels. Join other leading companies the world over who have invested more advertising linage in each of these magazines than in any other overseas edition.

LIFE INTERNATIONAL EDITIONS, TIME & LIFE BUILDING, NEW BOND ST., LONDON W.1

strength of about 13,000 and most of the rest are now working three or four days in the week. Vauxhall is also working three or four days a week and has dismissed about 2,000 people since July. Both Standard and BMC shed about a tenth of their total labour force last summer, but they also have had to cut back again in the last month after enjoying a slight revival and a few more men have been laid off. Most of the Standard car assembly lines are working three days a week. Between 10 and 15 per cent of the workers at the Nuffield factories in the BMC group are now on short time: the MG and Riley plants are working four days in five and the commercial vehicle lines for only three days a week. Austin is still working a full week with a few departments on short time ; but output of the Austin A35, like the Morris Minor, is well up, and the full 5-day week is being worked with some overtime.

Buoyant Life Assurance

NEW ordinary life sums assured in 1956 by 68 offices totalled £1,168 million, compared with £1,056 million in 1955, according to an announcement by the life offices' associations: the rate of increase was thus about 11 per cent, compared with 14 per cent in 1955 and 16 per cent in the previous year. This is a record figure, and includes the ordinary branch business of the industrial-cum-ordinary offices. Two companies, the Prudential and Legal and General, are well ahead of the field both in the amount and buoyancy of their new business. The sharp fall in the new business of the Co-operative may have been due to restrictions on house purchase loans: all offices were inundated last year with applications for assistance to borrowers whom the building societies could not supply.

Overseas business has continued to forge ahead, despite the closing of the Indian market, where life assurance was nationalised at the beginning of 1956. At home, where the bulk of the business of the British offices is done, the 1955 records of £700 million new sums assured by individual policies and £245 million by group life policies must each have been broken. The preliminary returns suggest that the group side of the business was particularly active. It looks, too, as if more deferred annuities than ever were issued last year under staff pension schemes. Only the UK figures of the Commonwealth offices that operate in this country are included in the analysis.

It seems that such "Millard Tucker" type pension policies as have been taken out have been mainly with the industrial-cum-ordinary offices. But it still remains to be seen how popular the Chancellor's concession will turn out to be and how much such policies may cut into the bread-and-butter business of the offices. The Industrial Life Offices Association records new sums assured in the "home-service" branch so far announced of £309 million, compared with £296 million by the same offices in 1955 (when aggregate new industrial life sums assured were £302.7 million). Personal savings through the life offices are, however, measured not by the new business transacted but by the growth of the funds of the offices. The funds of the ordinary and industrial offices combined must have grown in 1956 by upwards of £300 million.

Britannia in Service

THE Britannia airliner goes at last into regular scheduled service with the British Overseas Airways Corporation on February 1st. In spite of the delays that have persistently pushed back the introduction of the Britannia it remains the only big turbo-prop airliner in the world ready for commercial use and is likely to remain so for several years. After a period during which it has struggled with an inadequate and out of date fleet against competition from better equipped rivals, BOAC may now have the satisfaction of seeing the Britannia capture passenger traffic on the South African and Australian routes as the smaller Viscount captured it for British European Airways. The last of the route proving trials were taking place this week.

The introduction of the Britannia less than a month after the opening of the North Atlantic services with the new Douglas Seven Seas does, however, have its problems for

the corporation. Fortunately, the Britannia is not a new aircraft in the sense that it has barely been broken into commercial routine. The mechanical snags that kept it out of commercial service have not prevented the aircraft from being extensively flown on a variety of operations ranging from trooping to the moving of Hungarian refugees. But there still remains the problem inseparable from introducing two new types of aircraft almost simultaneously. After nearly two years of operating with a depleted fleet, BOAC is confronted almost with a surfeit of new machines. All 15 of this first, smallest type of Britannia should be delivered by the end of March, and all ten Seven Seas by the end of the summer. A Britannia carries a crew of 10, four of them cabin staff, and training and recruiting of crews on this scale is not going to be easy, especially since with the Britannia BOAC is venturing for the first time into extensive use of two-class aircraft, 19 first-class seats to 48 tourist. The use of a new gas turbine aircraft for predominantly tourist services, with their spartan conception of leg room, is a sign of the change that has come over passenger traffic even during the few years that have elapsed since the introduction of the Comet which flew on these same routes, booked to capacity, exclusively as a first-class aircraft.

Courtaulds' Price Increase

THE surprise about the increase in rayon prices announced by Courtaulds on Monday is not that it should have occurred but that its incidence should be so restricted. Prices of viscose and acetate textile yarns which have remained unchanged since 1951 are being raised by about 10 per cent. Courtaulds' £1 shares rose 6d. to 35s. 6d. after the announcement. All the staple fibre (which represents in bulk well over half Courtaulds' output) and all the industrial yarns (which possibly account for nearly 30 per cent of the remainder) are excluded from the change. It is easy to see why the increase has been necessary. The company's interim statement of last October noted "a general rise in costs not compensated by any general increase in selling prices." Moreover the speeches by chairmen of three smaller viscose producers—Harbens, British Enka and Kirklees—all argued that prices were unreasonably low. It seems certain therefore that present increases will be generally followed.

Why then has the company decided to leave unchanged the prices of industrial yarns and of staple fibre? Industrial yarns go largely into tyres and the motor trade is already under severe economic pressure. Competition in that field has also increased. Harbens, for example, has switched its production towards strong viscose rayon for tyres. Courtaulds may have felt that the traffic would not easily bear an increase. It must be simply to keep viscose rayon staple as the cheapest textile raw material and to maintain a reputation for price stability that the price of viscose rayon staple has been held unchanged. It was last moved in July, 1953, when it was reduced from 27d. to 24d. per lb. It is clear that production has to be on a large scale to be profitable but equally it is clear that profits from such heavily capitalised production are not so much at the mercy of an increase in prime costs as other forms of textile production.

Alexanders' Dividend Maintained

ALEXANDERS DISCOUNT COMPANY, the third of the discount houses that make up their accounts at the end of the calendar year, has, like the National Discount, maintained its distribution at the lower rate paid for 1955. But this company had cut its payment more sharply than did any other discount house—from 12½ to 7½ per cent—and last summer it also reduced its interim from 3¾ to 2½ per cent. It now reports a net profit, after provision "towards" depreciation of securities, of £65,400, whereas last year it announced merely a "balance for the year" (of £67,400, before directors' fees) after drawing upon inner reserves. This change reflects the improvement in current trading conditions that the market has enjoyed during the past year; but the increase in the final dividend from 3¾ per cent to 5 per cent requires a substantial draft on the carry-forward. This is reduced by £45,000 to £167,000; the net cost of the 7½ per cent distribution is £103,500. Investments, again valued "at or under cost and below redemption values," show almost the same short-fall below market value as at end-1955—£2,612,218, compared with £2,613,663.

Management Merger

WHEN the British Institute of Management was formed in 1948 with immense *éclat*, and a blessing as well as a subsidy from Sir Stafford Cripps, it was linked with a number of small specialised management institutes already in the field. Among these was the Institute of Industrial Administration—the only body holding examinations in "general management," and on the results of which it awarded its associateship. The IIA became the "professional wing" of the BIM, which though it has both corporate and individual members, got most of its income from the former, which now number over 2,000. It was never a perfect arrangement, for the IIA was the pioneer body, and was taken over, rehoused (and its examinations remodelled) to give the BIM a clear run. Now the two are to be merged and the BIM becomes the professional organisation of Britain's general managers.

If change there had to be, this is perhaps the right time for it, when the BIM has been undergoing some reorganisation, and will in future have to get along without government subsidy. Though it still gets some conditional aid, it must in future mainly rely on its professional and corporate members for its income, which has risen to £90,000 in 1955-56. But the 3,330 members of the IIA and the 4,800 of the BIM include a mere fraction of the professional and practising managers of British industry and commerce. The BIM remains a minority body; the great bulk of British managers remain unconvinced that membership of a professional body can either serve their collective interests or raise the standards of their art. The BIM's achievements in education and research are not insignificant, but it has yet to impress the average British businessman with that fact.

The $67 Million Vanguard

THE signature last week by Trans Canada Air Lines of an order for 20 Vickers Vanguard airliners, valued at $67 million, marks a turning point in the Vanguard's fortunes. Vickers have invested approximately £8 million in the development of the Vanguard, which is a private venture unaided by any government funds. This aircraft is roughly twice as big and twice as expensive as the Viscount and flies twice as far: it is a measure of the changing values of air transport that such a 100-seat giant can still be classed as of "medium range." The market for this particular type of medium-range transport is, however, one that has attracted the attention of almost every major aircraft manufacturer. Where the Viscount is still the only aircraft of its type in the field ten years after its first flight, the Vanguard has had to contend with other turbo-prop transports like the small Britannia and the Lockheed Electra, and also the prospective competition of small versions of the big Transatlantic jets.

When the opinion of the major airlines swung decisively in favour of jet engines for long-range North Atlantic and intercontinental operations, operators also began to wonder whether jets were not also suitable for the 1,500-3,000 mile ranges. This, after all, had been the chosen field of the first Comets, and North American operators were in a mood to be strongly impressed by arguments that traffic would go to whichever airline offered the fastest service. The difference in cruising speed between jets and turbo-props does not save much time on short journeys, but over, say, 2,000 miles it is still big enough to make a noticeable difference to journey times. These doubts were enough to put into cold storage many promising negotiations for Vanguard sales. It has taken TCA two years to decide that the turbo-prop Vanguard was the best proposition for its medium range routes although, like all the other big operators, it intends to use jet airliners on the North Atlantic. This announcement may well be the start of a swing back in favour of turbo-props, and Vickers expect to have at least one more Vanguard order signed before the month is out. The company's dollar sales of Viscounts and Vanguards, which now stand at nearly $230 million, would then top $250 million, of which between a quarter and a third would represent Rolls-Royce's contribution as suppliers of the engines.

Marks and Spencer's Scrip Issue

DISTASTE is aroused by the non-voting ordinary share when, by a mere stroke of the pen, the holders of a controlling interest can sell half their investment without diminishing by a single vote the control they exercise over the fortunes and direction of a public company. That is what the family controlling Marks and Spencer could achieve, if it wished to do so, by the scrip issue of one new "A" non-voting ordinary share for every one ordinary and "A" ordinary share held, by the capitalisation of £9,046,983 from reserves. No doubt the directors of Marks and Spencer, who have made many free scrip issues in the past, wish simply to bring issued capital in line with employed capital, with the incidental advantage of making the share price less heavy. But it is to be regretted that the amount of voteless capital has at the same time to be so greatly increased.

Marks and Spencer is a company with a heavy weight of non-voting ordinary shares which has not ignored the claims of the voteless shareholder, and there is no reason to suppose that it will do so now. Its dividend policy has been liberal, and the news of another scrip issue has naturally set Throgmorton Street thinking about the size of the next final dividend, for which the new shares will rank. For 1955-56 the company paid 50 per cent. Since then the interim payment has been increased from 17½ to 20 per cent. The market is framing its estimates of the final payment on the increased capital at between 17½ and 20 per cent. If it is right, the 1956-57 full payment would be equivalent to between 27½ and 30 per cent on the increased capital, against an equivalent of 25 per cent a year ago. After the announcement of the capitalisation, the 5s. "A" shares went up by 4s. 7½d. to 7os.

Savings Package Sells

IN 1956 the national savings movement had its best year since 1948. Net receipts through the various channels reached £77¾ million (and £127½ million after crediting accrued interest); in 1955, by contrast, receipts fell short of withdrawals, by £4 million. Lord Mackintosh, the chairman of the national savings committee, recognises that the recovery is attributable to the inducements offered in the Budget. These covered all four of the traditional media—introducing new and higher-yielding issues of defence bonds and national savings certificates, exempting from income tax the first £15 of interest on deposits in the Post Office and Trustee savings banks, and raising the limit of deposits in the special investment departments of the trustee banks from £1,000 to £2,000. But the most distinctive feature of Mr Macmillan's savings package was, of course, the innovation of the prize bonds, which have been on sale since November.

Until the introduction of the new savings certificate in August, there was a continued deterioration in national savings—though this was attributable in part to encash-

Retail Business

CUSTOMER TRENDS

This is a new quarterly bulletin for those interested in the home market for consumer goods. It includes short and long-term forecasts of sales by different outlets and merchandise groups, regional surveys and reports on special investigations.

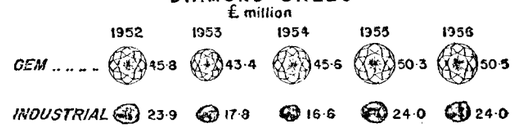
Full particulars from the compilers:

THE ECONOMIST INTELLIGENCE UNIT LTD.
22, Ryder Street, London, S.W.1.
WHItehall 1511, Ext. 144

ments of the older issues in anticipation of the new one. In the last five months of the year the net inflow into all forms of national savings even after the Christmas withdrawals reached no less than £77 million. Since the beginning of the fiscal year on April 1st the net inflow has been £51½ million; in the corresponding period of 1955 there was a net outflow of nearly £62 million.

Last year's surplus happens to correspond almost exactly with the receipts from premium bonds. But there was also a big improvement in certificates (net receipt of £48 million against £12 million), in the Post Office savings bank (net withdrawals of £50 million, against £73 million) and in the Trustee banks (net receipt of £1½ million, against net withdrawal of £16 million). There was, however, a deterioration in defence bonds, net sales of which (excluding redemptions on maturity) fell from £15 million to £1 million. Part of the big increase in "national" savings in the second half of 1956 undoubtedly represented switching from other forms of saving; but in so far as the switch was from bank deposits—as a fair portion appears to have been—that was in line with the Chancellor's declared intention of helping to fund short-term debt.

Tea, Windows, and the Public



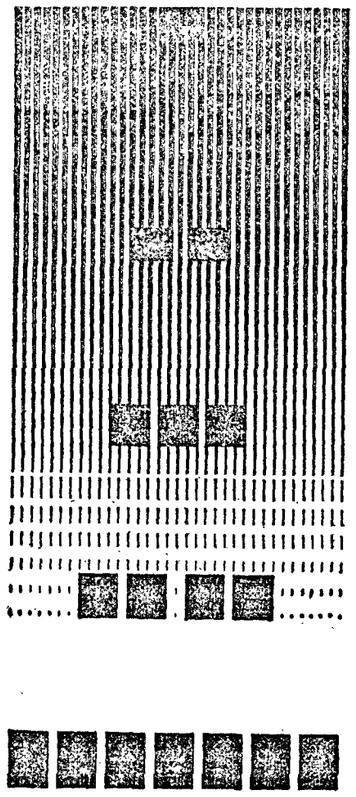
LAST week the Monopolies Commission had to admit that it could think of nothing useful to do to restore competition in an industry overwhelmingly dominated by a monopoly company that it considered was operating against the public interest. This week it had happier duties. Having investigated two other trades, in both of which elements of restriction exist, it was able to report that it had found practically nothing prejudicial to the public interest in the operations of either.

The Commission reported that since the members of the Metal Window Association supply about 90 per cent of the standard metal frames used in Britain, and one member alone, Crittall Manufacturing, supplies about 40 per cent, the conditions to which the Monopolies Act of 1948 applies do exist in this industry. The association operates a common pricing scheme, quantity rebates, individual price maintenance, and uniform delivered prices; but the only practice that the commission recommends should be ended is the association's arrangements for selective price reductions to counter outside competition. It also found that neither Crittall's share of the trade nor its part ownership of Darlington and Simpson Rolling Mills, the principal supplier of window sections, operate against the public interest.

The Commission secondly reported that "the tea trade in this country is conducted on keenly competitive lines," and that the sharp fluctuations in tea prices that have occurred since the decontrol of prices were not caused by "monopoly" conditions or restrictive practices in the tea trade. This inquiry, which followed from a reference of the trade to the Commission by Mr Peter Thorneycroft, as a most dubious sop to vociferous housewives, might perhaps have been rejected out of hand by the Commission a year ago: but the organisation of the London tea auctions, and the arrangements for regulating sales there, did formally bring the trade within "the conditions to which the Act applies," and required fuller study.

Diamonds Still Glitter

THE central selling organisations for diamonds—the Diamond Trading Company and Industrial Distributors (Sales)—have raised the price of both gem diamonds and industrial stones. All gem stones rise immediately by 5.7 per cent. Two of the four main grades of industrial diamonds—dresser stones which are used for grinding and tool stones used in cutting tools each rise by about 8½ per cent. A third main grade of industrial diamonds, crushing boart, also used for incorporating in



grinding tools, was raised by about 9 per cent (from 16s. 9d. per carat to 18s. 3d.) in November. One of the main grades, drilling stones, remains unaffected.

The background of this increase is a buoyant demand for both gem and industrial diamonds and a supply that has proved most difficult to increase. Big stocks held at the end of the war were quickly liquidated: they moved from the central selling organisations to the strategic stockpiles. Stockpile buying has continued since, but production has responded slowly. The record 1956 output, valued at £74.5 million, probably owes something to the expansion of capacity by Williamson Diamonds in Tanganyika. The large expansion of recovery capacity (principally for gem stones) by Consolidated Diamonds of South West Africa has done more to assure output some years forward than currently to increase it, and the prospect that Mr Jack Scott will prove and exploit diamonds in Swaziland remains only a prospect. So far the end of stockpile buying (which in recent years has caused Sir Ernest Oppenheimer to introduce a warning into his speeches to the De Beers shareholders) has not materialised. The central selling organisations, monopoly though they are, have nevertheless held the prices of rough stones below the economic maximum. Last year's record in sales probably owes a little to prices as well as to quantity, because gem stones were raised by 1½ per cent in January and crushing boart in November. In total, however, gem stones have only been raised since the war by about 11½ per cent, and industrial diamonds have suffered only the recent increases (plus for both classes, the equivalent of the devaluation of sterling against the dollar in 1949). At most periods since the war, including the present, demand for diamonds has tended to outrun supplies.

Keeping Scientists Informed

ABOUT a year ago the Department of Scientific and Industrial Research was given the responsibility of planning a national lending library for science and technology; last week it disclosed a first tentative outline of how it proposes to carry out this job. Most urgent among the needs that the new library is designed to fill is

Production grows with good lighting

IN THE MAJORITY of works today the lighting is inadequate or unsuitable, or both. Production is slower than it could be, mistakes are made, health and tempers suffer.

Money spent on a planned lighting system is the best of investments. The foreman can see how things are going; the craftsman at his machine can work more accurately and easily because he can see what he's doing.

Good lighting is only one of the ways in which electricity is playing a vital part in the drive for higher productivity.

Electricity for Productivity

Ask your ELECTRICITY BOARD for advice and information, or get in touch with E.D.A. They can lend you, without charge, films about the uses of electricity in industry. E.D.A. are also publishing a series of books on Electricity and Productivity. Titles now available are: Lighting in Industry, Electric Motors and Controls, Higher Production, Materials Handling, and Resistance Heating. Price 8/6, or 9/- post free.

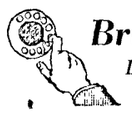
How flexible is YOUR transport?

ALTHOUGH the fuel position will necessitate some alteration to their nationwide road services, British Road Services will continue to do their utmost to meet the requirements of traders in close collaboration with British Railways, and where traffic is beyond the capacity of available trunk road services they will hand it to the Railways for the trunk haul.



British Road Services are a highly organized and nationwide concern, with the vast resources of the British Transport Commission behind them. They possess an enthusiastic staff, sound technical knowledge and are equipped to carry your most ordinary and your most extraordinary loads with speed, safety and punctuality, and moreover they have the *flexibility* needed to serve your interests well during the continuation of the fuel rationing period.

Great advantages to you

A fleet of vehicles, of all kinds, ensures the provision of those best suited to your requirements. Or, in emergency, vehicles can be rapidly adapted to meet your special needs. Constant research provides equipment of the most up-to-date design, and the B.R.S. nationwide engineering service keeps it in peak condition. A teleprinter network linking all depots, and radio control vans operating at ports, facilitate control and increase efficiency. These are remarkable advantages which only a great organization can offer. They are of special advantage during the present difficulties.

Sound planning

With the current need for fuel economy, greater care than ever must be taken to ensure that there is no unavoidable wastage of transport resources, and B.R.S., in close collaboration with British Railways, will be exerting all their efforts to meet the national needs to the very best of their ability. To this end, the keen and experienced representatives of British Road Services are eager to discuss your transport problems with you, to advise on the best way of despatching your traffics and on the types of vehicles available for your special requirements, and to co-operate with you in improving methods and promoting all possible economies. Just telephone your local man. Action will follow immediately.

British Road Services Ltd

Look up your nearest depot in your local telephone directory

for a more comprehensive store in Britain of foreign scientific periodicals which can be lent out to supplement the incomplete resources of other libraries. Only half of the current output of Russian periodicals, for example, ever reaches this country, even in single copies, and only a fraction of them is available for inter-library lending. The Science Museum Library, which has the most comprehensive collection of scientific literature in Britain, now has only 34 per cent of the contents of the World List of Scientific Periodicals. It contains only about 58 per cent of the scientific journals that are searched by the very efficient abstracting services in Russia (which abstract about six foreign scientific journals for every one published inside Russia). The new library, to be reasonably comprehensive, must therefore aim at acquiring double the present supplies of the Science Museum library, and expect to double in size every 16 years, if the experience of the big American libraries is a reliable guide.

The bulk of the routine work of the library—the cataloguing of books and periodicals and the maintenance of records of borrowings, for example—may be undertaken by electronic data-processing systems. If economically practicable, such computers would provide greater speed and flexibility, both in carrying out the routine operations and in answering special requests. Mechanical translators from the Russian, Chinese or other languages now under development, might also be employed. But it has not yet been decided how far the library, and its research department, could help in filling the urgent current need, not only for more Russian and other foreign scientific literature, but also for more comprehensive and accurate abstracting and translation services.

In other respects the planning is along traditional lines. The material will be both stored and lent in traditional paper form, and the books will be despatched and returned through the ordinary postal services. For this reason a central location, somewhere north of Birmingham, is preferred. Even if the plans are speedily approved and the money is forthcoming, it is likely to be at least four years before the new library could be opened. But any papers and volumes acquired before then can be put to good use in the lending department of the Science Museum library.

Japan and Sterling

DURING the Anglo-Japanese commercial talks that have been proceeding in London for some time, the Japanese representatives were informed that the British Government no longer wished to continue the arrangements that have hitherto governed payments between the sterling area and Japan. The intention of the British representatives was simply to inform the Japanese that the remaining vestiges of bilateralism in these arrangements should disappear and that payments should henceforth conform to the normal practice followed by all members of the transferable sterling account area. The only change of substance envisaged was the abrogation of the exchange of notes between the two governments that provided that there would be consultation between them if at any time the balance of payments between the yen and the sterling areas was to get seriously out of equilibrium.

The implication that payments between the two areas should be kept in approximately bilateral balance is out of keeping with the multilateral philosophy represented by the extension of the transferable sterling account area. It has earned some muted reproaches for Britain from the Organisation for European Economic Co-operation. It also offends against the International Monetary Fund code. And it was not achieving equilibrium in yen-sterling payments. The time had clearly come for its disappearance. The Japanese appear to have been surprised by this move and have been looking for ulterior motives, of which the British initiative is innocent. The withdrawal of this exchange of notes should have no effect either on the mechanism of payments or on the volume of trade between the two areas, which will now depend on commercial factors alone.

SHORTER NOTES

Regional Transport Commissioners will now make final assessments on applications for supplementary fuel for goods vehicles and—at the request of road hauliers—will issue coupons in equal monthly instalments. Of the 107,000 applications that have arrived since December 17th—less than half the number expected—25,000 have been refused, 45,500 have been given interim allocations, and only 18,500 have been finally assessed. The Ministry of Transport has also eased the C licence rules to allow traders to carry other firm's goods; as a result insurance companies have decided to extend existing policies to cover these other traffics.

★

Sir Francis Hopwood, a managing director of the Shell Petroleum Company and a principal director of N.V. De Bataafsche Petroleum Maatschappij, the two parent operating companies of the Royal Dutch/Shell Group, is to retire from these offices on June 30th. Mr H. Wilkinson, CMG, president of Canadian Shell, has been appointed as from July 1st a managing director of Shell Petroleum Company and a principal director of N.V. Bataafsche Petroleum Maatschappij.

★

Woolwich Equitable Building Society, which closed its financial year on September 30th, has as usual shown its principal figures also as at December 31st. Total assets at the end of 1956 amounted to £128.0 million compared with £119.9 million at the end of 1955 and with £125.7 million on September 30th. Mortgage advances for the calendar year amounted to £17.3 million against £21.6 million in 1955 and £17.7 million for the year ended September 30, 1956.

★

The International Bank for Reconstruction and Development has made an issue in the United States of $100 million of 4½ per cent twenty year bonds. Marketing of the bonds is being handled by a nationwide group of 161 investment firms and banks headed by Morgan Stanley & Co. and The First Boston Corporation. This marks the first issue of World Bank bonds in the United States for exactly three years, during which issues have been made in Britain, Switzerland and the Netherlands.

Results from the Steelmakers

One worthwhile relic of the nationalisation of the iron and steel industry is that the companies make up their accounts to a common date at the end of September. Their reports are now appearing thick and fast. The reports do not adopt a common accounting format, though in most of them net profits are shown after deducting appropriations to fixed assets replacement reserves; in the accompanying table the net profits figures have been adjusted to this basis, which is not exactly the same computation of the cost of replacing fixed assets as the Steel Board uses in fixing steel prices.

The surprise of the season is the United Steel offer of ordinary shares (discussed on page 134 of this issue), but the reports themselves tell a common story. Profit margins were squeezed as costs rose. Where total profits have fallen or have been barely maintained, the embargo on overtime working by the maintenance men has been largely to blame. Where profits have risen, the rate of expansion has been governed largely by the timing of the various development programmes. Dividend policies have been most cautious.

Development has gone on apace, but there is still much more to do. Working capital commitments are heavier. And the steelmakers are short of liquid resources. Some of them—but perhaps not immediately—may have to follow United Steel's approach to the capital market. The timing of such appeals turns in some degree upon the size of their uncalled loan facilities with ISHRA and with Finance Corporation for Industry. Ploughed-back profits will continue to be the mainstay of development. Hence, though production and profits should increase again this year, an ultra-conservative attitude towards dividends is likely to prevail. That prospect has already led to rumblings of dissent in Throgmorton Street. There it is argued that slightly bigger dividends cannot seriously jeopardise the financing of development, that investors are entitled to some share in the returns accruing from the developments already completed and that bigger payments would improve the status of the companies in any further capital issues.

Stewarts and Lloyds had already issued an informative preliminary statement, discussed in these columns on December 15th. Its full report, attractive though it is, lacks a chairman's statement, though it adds a few more facts. Of these the most important is a gross trading account. While sales rose from £98 million to £114 million the cost of bought-in materials went up from £39 million to £46 million and wages from £25 million to £28½ million. Thus an increase of £16 million in sales produced an increase of about £3 million in gross profits. This was achieved without any startling increase in fixed assets (which rose in net values from £44.3 million to £47.5 million), but stocks rose from £25.7 million to £31.2 million. But the two figures which may hypnotise investors are capital development plans of £27 million and net cash resources of less than £350,000. Preference capital of £10 million and loan stock capital of another £10 million have already been paid up.

United Steel spent over £11 million on capital account in the year to September 30th. Since then it has called up the balance of £5½ million on the debenture stock owned by ISHRA. But it plans to spend another £20 million on development, of which just under £9 million will come from the new issue of ordinary shares. The developments already completed should, Sir Walter Benton Jones tells shareholders, ensure an increase in profits this year. With developments uncompleted, United Steel achieved only a small increase in production last year and though the value of its sales rose by £10 million to £100½ million, gross profits, thanks to the rise in costs and the ban on overtime working, fell slightly—from £12.8 million to £12 million. At the end of the financial year, which witnessed a rise in stocks from £18 million to nearly £23 million, the group had just under £2 million in liquid assets, though it had ploughed back about £8 million into the business.

Thomas Firth and John Brown, a much smaller company which is as much a steel fabricator as a steelmaker, has been a shade more liberal on dividends than the bigger companies, as it could afford to be. Its capital expenditure of under £1 million looks minute beside their programmes, and so does its development plan of about £3½ million. Moreover, at the end of the financial year, it had over £4 million in liquid assets. Thus, following an increase in gross profits from £2,835,521 to £3,227,720, the directors were able to raise the ordinary dividend from 9 to 10 per cent.

South Durham Steel and Iron, too, achieved an increase in production and in gross profits. They rose from £2,754,717 to £3,222,817. But the ordinary dividend is 8 per cent, as forecast in the offer of sale of its shares. During the year the group spent about £4 million on capital account, leaving commitments outstanding at £9½ million. One sentence in the chairman's report which should be welcome to shareholders is Mr B. Chetwynd Talbot's comment that the "directors are only too conscious of their responsibilities to endeavour to maintain the values of the equity capital at a high level and, when the international position becomes clearer, to consider the desirability of raising the rate of distribution."

Lancashire Steel has reported only a minute increase in its gross income, from £2,942,366 to £2,985,652, and its net income shows a slight decline, from £1,497,366 to £1,465,652. The ordinary dividend was left unchanged at 11 per cent. The trading results disappointed the market because new capacity was coming into production last year. This new capacity should make its contribution this year and as Lancashire Steel's development programme is expected to be completed by the end of this year investors naturally hope that this company will be among the first to give shareholders a bite at the cherry.

John Summers' results were well received. Though the ordinary dividend was left unchanged at 12 per cent, gross profits have risen from £8,674,289 to £9,443,033—a satisfactory result for a steel company which was particularly affected by the labour dispute. Net profits have fallen from £2,897,809 to £2,770,601, but this decline can be attributed to the increase in replacement reserve appropriations (charged before arriving at net profits) from £800,000 to £912,500. This group's current development programme, costing about £16½ million and being financed by ploughed-back profits, is due to be completed by the end of 1958.

Company Notes

CARRERAS. Ordinary shareholders in Carreras, the cigarette and tobacco manufacturers, must feel satisfied with the results for the year to October 31st revealed in the company's preliminary statement. The figures, showing that the "net profit attributable to members of Carreras" has risen from £503,325 to £780,732 and the net profit of the parent company from £181,372 to £318,267, confirm the earlier indications by the directors that in spite of intensive competition Carreras was getting its breath back after the heavy blows it had suffered. When they announced the passing of the interim dividend the directors said that the half-yearly results were "slightly more favourable" and before then the chairman had said that better results were to be expected from the home trade. Now the directors say that "severe and intensive competition in the home trade continued during the year, but an improved net profit has been achieved despite a large increase in advertising and sales promotion expenditure, all of which has been charged to the accounts. The export trade was fully maintained throughout the year."

Thus shareholders are left to assume that Carreras did sell more in the home market, but they are still left wondering what part subsidiaries, notably the Canadian subsidiary, have played in the results. Their ordinary dividend has been left unchanged at 8¾ per cent.

★

WATNEY COMBE REID and ARTHUR GUINNESS. "It is a matter of growing concern that the tremendous expenditure on new houses, and on rebuilding and improvement of existing houses, does little more than conserve turnover and as an investment produces no additional return." So says Mr S. H. Combe, speaking perhaps as much for the brewing industry as for his company, Watney Combe Reid. Yet spend money the brewers must to remain active in a highly competitive struggle in what perhaps is a shrinking market.

The roads open to the brewers are now well known and Watney has followed most of them. It has spent money on improving its public houses; it has sold a few of its houses where site values outran investment values to the brewer; it has modernised its brewing and bottling plants; it has encouraged its licensees to be caterers as well as retailers of beer; it has expanded its free trade and thus has put a good deal of emphasis on the sale of its bottled beers; and it has tried, with some success, a new venture for this country of building and running "motels." The directors have even considered selling, for its site value, the Stag Brewery in Pimlico, though the chairman now says that there is "no prospect of any foreseeable offer providing a sufficient margin to warrant expectations of any capital repayment to the equity shareholders." Watney, in fact, has been as progressive as almost any other firm in what is traditionally a conservative-minded industry. Yet the end-result of its efforts was only that its trade remained "fairly steady."

But Watney, like the other brewers, has plans to spend money on capital account which must exceed the statutory figure of over £1 million appearing as commitments in the accounts. Arthur Guinness, a company different from Watney in that it has been long-established in the free and export trades in bottled beers, is another which has firm capital commitments of about £1 million. The length of time a brewer has been established in the free and export trades is significant. His goodwill with the customer is well-established and when brewing profits improve, as they did slightly last year, it is not surprising to find Guinness achieving an increase rather better than the average. The moral is clear: these are income stocks, with only an occasional touch of equity in them.

LONDON STOCK EXCHANGE

Next Account begins: January 16th

Next Contango Day: January 16th

Next Settlement Day: January 22nd

THE recovery in gilt-edged continued this week under the influence of a lower Treasury bill rate and speculation on the course of interest rates. On Thursday prices improved on Mr Macmillan becoming Prime Minister. The *Financial Times* index of Government securities reached 85.92 on Wednesday from the low point of 82.38 at the close of November. Industrial stocks also improved on Thursday.

Unchanged dividends led to small losses among bank shares. Alexanders Discount and Union Discount declined, but National Discount rose following the dividend announcements. Benskin's Brewery gained 2s. 6d. to 48s. 6d. and Northampton Brewery jumped from 59s. 6d. to 65s. on the possibility of merging its interests with P. Phipps. Associated Commercial Vehicles fell heavily from 54s. 6d. xd to 50s. 7½d. Marks and Spencer gained 4s. 7½d. to 70s. on the free scrip issue and Maple improved 3s. 6d. to 29s. Shipbuilding shares were firm, Hawthorn Leslie rose 2s. 3d. to 41s. 6d. and Swan Hunter 9d. to 62s. 6d. Vickers remained at 41s. 9d. following the orders for the Vanguard. Steel shares declined; prior to the announcement of the rights issue United Steel fell to 32s. 3d. and Stewarts & Lloyds were 2s. down at 56s. 3d. xd. Turner and Newall gained 2s. 9d. to 109s. 6d. and International Nickel $10 to $213 (London terms), but Borax in its new form eased to 24s.

Shell Transport gained 2s. 6d. to 160s. 6d., but British Petroleum dropped back 7s. 3d. to 134s. 3d. Lobitos and Anglo-Ecuadorian rose. Good support persisted for the new South African gold mines and the increase in diamond prices assisted a sharp recovery of 10s. to 105s. in De Beers deferred. Consolidated Zinc continued to advance, rising another 5s. 9d. to 79s. 3d. Assam teas were firm.

Industrial Profits and Assets

THE tables below continue the analysis of company balance sheets and profit and loss accounts which was introduced in *The Economist* of January 22, 1949; the figures are discussed on an earlier page in this issue.

Comparative analysis of 459 profit and loss accounts published October-December, 1956 (£'000)

Figures cover general trade as far as possible. Area totals include estimates for countries for which data are not available. Data refer to calendar years with the following exceptions in 1938:—India and Pakistan, year beginning April; Iran, year beginning June.

(1) Excludes China (mainland), USSR, and non-reporting countries of Eastern Europe. (2) Including the trade of Newfoundland in 1938, amounting to $36 million in exports and $31 million in imports. (3) Excluding trade with Taiwan in 1938. (4) Based on two months' data. (5) Partly estimated.

Financial Statistics

EXCHEQUER RETURNS

For the 5 days ended January 5th, 1957, there was an "*above-line*" *surplus* (*after* allowing for Sinking Funds) of £35,752,000 compared with a deficit of £107,270,000 in the previous 16 days and a surplus of £82,492,000 in the corresponding period of last year. Net expenditure "below-line" was £49,208,000, bringing the total deficit to £940,926,000 (£737,595,000 in 1955-56).

THE MONEY MARKET

The Treasury bill rate fell for the fourth successive week at the tender on Friday last. The discount market raised its bid by a further 4d. to £98 16s. 1d. per cent. This brought the rise in the bid since December 7th to 1s. 4d. per cent, marking a reduction in the discount rate by just over ¼ per cent, to 4⅜ per cent. At last week's tender a sharp increase in bids was made also by outside applicants, and the market's allotment rate dropped from its high level of 68 per cent to 54 per cent; the offer of £270 million was under-allotted by £10 million, and total *applications rose steeply by £34.2* million to £406.7 million. At yesterday's tender, the offer was £260 million.

Credit was short in Lombard Street before the week-end, but on the first three days of this week conditions were comfortable. On Thursday last the market faced the first of the heavy new year tax transfers, and in addition five or six houses had to make repayments at the Bank; nonetheless, thanks to the additional maturities of £60 million from the 63-day bills, the market covered requirements with only trifling special assistance. On the Friday special purchases were very large, but *in the first half of this* week market supplies have been adequate.

The price of gold in London has fallen sharply as a result of the big rise in sterling. The price on Wednesday was just 250s. an ounce, compared with 250s. 7d. a week before.

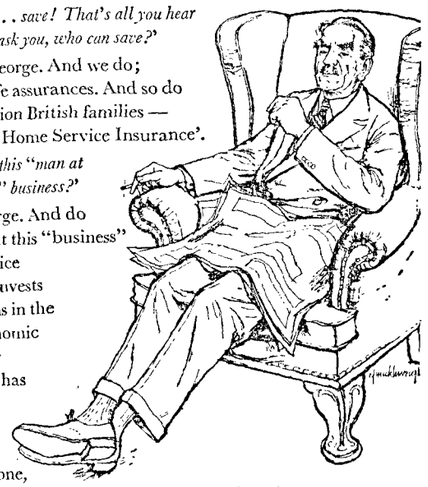
PRO TEM?

True, the Fire Insurance will finance a new building, new stock. But how long does it take a business to recover after a fire? Could you afford to carry on during this period? Legal & General have a 'Loss of Profits' Policy to cover this difficult, in-between time. It helps meet those overheads which must still be paid for — *profits or no profits.*

Such insurance is the only positive way of ensuring that *flames will never rob you of your profits.* If you have not already considered your own position following a fire, may we suggest you get in touch with us *at once?* It will be too late if you find yourself sitting amongst the debris.



LEGAL & GENERAL

ASSURANCE SOCIETY LIMITED

CHIEF ADMINISTRATION: 188 FLEET STREET, LONDON, E.C.4. TEL: CHANCERY 4444

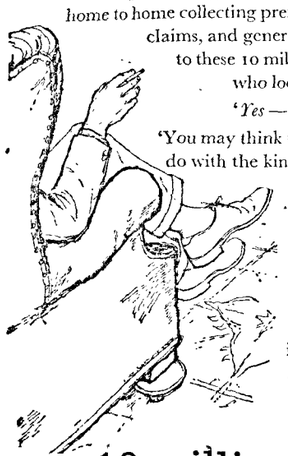
Who on earth can save?

'Save . . . save . . . save! That's all you hear these days. I ask you, who can save?'

'We all can, George. And we do; through our life assurances. And so do at least 10 million British families — through Home Service Insurance'.

'Ah! You mean this "man at the door" business?'

'Exactly, George. And do you realise that this "business" — Home Service Insurance — invests enormous sums in the country's economic welfare? Over £300,000,000 has already been invested in Industry and Commerce alone, while probably twice that amount has gone into Government Securities, Mortgages and the like'.



'Really? You astonish . . .'

'And these savings are now increasing at the rate of about £60,000,000 a year, which I think you'll admit is pretty good'

'Yes — but . . .'

'And all this comes about through that well known personality, the Insurance Man, who goes from home to home collecting premiums, paying claims, and generally being counsellor and guide to these 10 million families who look on him as a personal friend'.

'Yes — but how . . .'

'You may think that all this has nothing to do with the kind of insurances you and I hold. You couldn't be more wrong. The Home Service Insurance Man also does a substantial proportion of the "ordinary" life assurance business in this country, as well as a lot of fire and accident insurance. All in all, George, as an instrument of our economic survival, the Insurance Man is doing a good job of work'.

10 million families save through HOME SERVICE INSURANCE

COMPANY MEETINGS

SOUTH DURHAM STEEL & IRON COMPANY, LIMITED

RECORD LEVEL OF EARNINGS: WIDER APPROACH NEEDED TO FIXATION OF PRICES

BIG INCREASE EXPECTED IN DEMAND FOR STEEL PLATES

MR B. CHETWYND TALBOT ON EXPORT PROBLEMS

The Fifty-eighth Annual General Meeting of South Durham Steel & Iron Company, Limited, will be held on January 30th at the Great Hall, Caxton Hall, Westminster, London, S.W.

The following is the statement by Mr B. Chetwynd Talbot, TD, which has been circulated with the report and accounts:

In forwarding to you the report and accounts for the financial year which ended on September 29, 1956, I include my address to shareholders which will be made at the company's annual meeting in London on January 30, 1957, and which will appear in the press in advance of that date.

PROPRIETORSHIP

The annual meeting, which is the fifty-eighth since South Durham was incorporated as a public company in 1898, is the first opportunity I have had as the chairman of your board of directors of addressing myself to the proprietors of the Equity capital of your company which was placed on the market 12 months ago. Therefore, before I proceed to refer to the results of the past financial year's trading and my remarks in general I give you the details as to the proprietorship of the 8 million of Equity capital issued in the offer of sale by the Iron and Steel Holding and Realisation Agency made a year ago.

The number of holders of the 8 million Ordinary shares exceeded at December 1, 1956, 18,500 and represents an average holding of 433 shares. Likewise the holders of the 3 million 5¼ per cent Debenture stock created at the same time amount to 1,880 and represents an average holding of £1,600 Debenture stock.

It is very gratifying to your directors to know that firstly both the private investor and the investment institutions have a large measure of faith in the future of South Durham and secondly it is further proof that the policy of the Government to return the industry to private ownership has been endorsed by the individual investor and the argument of the opponents of this policy asserting control of the industry would pass into a few hands has been refuted.

FINANCIAL RESULTS

I now turn to the financial results for your company's past year and to the circumstances which have contributed to affect adversely the levels of profits. These principal factors I refer to in detail later in my statement. Your company's gross trading profit for the past financial year amounted to £3,222,817, to which requires to be added £14,518 income from investments. The total gross profit of £3,237,335 represents an increase of £471,878 over the preceding financial year and constitutes a record level of earnings in the history of the company.

In my letter contained in the Offer for Sale, I indicated for the past financial year a reasonable estimate for the level of profit, after charging depreciation but before providing for taxation, interest on the Debenture issue and on the borrowing facilities arranged with our bankers, *Barclays Bank Limited*, should amount to £2.25 million. Despite restrictions affecting levels of production and the progressive increases in costs, and after charging £850,000 for depreciation and an amount of £40,785 in respect of directors' fees, pensions, audit fee and Debenture stock trustees' remuneration as recorded in the profit and loss account, the net profit has exceeded by an amount of £96,550 the amount postulated in the Offer for Sale and comprises a total of £2,346,550.

BALANCE-SHEET FIGURES

In commenting on the balance-sheet figures for the financial year I would draw your attention to the sum of £4,043,460, *including routine* capital expenditure, expended during the year on the development schemes as outlined in your company's capital expenditure commitments contained in the Offer for Sale. The capital commitments at October 1, 1955, amounted to a figure of £9,984,002 and subsequent additions approved by your directors during the past financial year to increase efficiency and to secure higher levels of rolled steel and pipe production comprised an amount of £3.5 million, making, after the deduction of the sum of £4 million expended during the year, an amount approximating £9.5 million.

Due to increases in the levels of production during the year and to the incidence of the higher levels in costs of raw materials and to the values and amounts of work in progress as compared with September, 1955, stocks and work in progress increased by £1,275,000 to an amount of £5.3 million. For similar reasons trade debtors have increased by an amount exceeding £500,000 to a figure of £2.9 million.

The amount owing to our bankers at September 29, 1956, amounted to a sum slightly in excess of £1.4 million, and I refer in detail at a later stage to the factors which have contributed to these facilities being utilised to this extent.

CAPITAL STRUCTURE

Due to the complete reconstruction and increase in your company's capital structure and to the issue of £3 million 5¼ per Cent Debenture stock, the present capital structure of your company is not comparable with that for previous years. I would, however, draw your attention to the following alterations in the capital of the company, the *capital reserves and the revenue reserves. You will remember that in the offer for sale* the authorised capital was increased to 12 million Ordinary and Unclassified shares, of which amount 8 million Ordinary shares were issued. This capital structure compares with the combined amount of Preference and two Ordinary share issues amounting in total to 1,237,820 shares in February, 1951, the date when all the assets of the company were acquired by the Iron and Steel Corporation of Great Britain. During the periods while the assets of the company were held firstly by the Iron and Steel Corporation of Great Britain and subsequently after the passage of the Iron and Steel Act of 1953, by the Iron and Steel Holding and Realisation Agency, these three denominations of shares were merged into Ordinary stock and at the same time the three separate outstanding Debenture issues of South Durham and Cargo Fleet were redeemed and replaced by an equivalent amount of loan which was increased from time to time to meet the expanding levels of capital expenditure. At the end of September, 1955, your company's indebtedness to the Iron and Steel Holding and Realisation Agency in loans amounted to £5.5 million, including approximately £1.8 million of the three original Debenture issues, and was liquidated immediately prior to the offer for sale. The liquidation of these loans was achieved by absorption of these amounts in the sale by the Iron and Steel Holding and Realisation Agency of the 8 million Ordinary shares and included the payment of a special dividend to the Iron and Steel Holding and Realisation Agency amounting to £1,262,180, which was deducted from revenue reserves. The debiting of this special dividend, the capital duty on the £4 million unclassified shares authorised but not issued, and expenses of stamp duty for the 5¼ per Cent Debenture issue, together with the expenses of reorganisation and issue and the discount on the issue price of the Debenture stock, explains the reduction by the sum of £1,409,109 in the amount standing to *revenue reserves at the termination of the last financial year.*

During the last financial year investment allowance reserve has been increased by £350,000 to an amount of £930,000 and replacement of fixed assets reserve by £300,000 to an amount of £600,000. These appropriations are incorporated together with the sum of £500,000 transferred to general reserve as detailed in the profit and loss *account.*

In the offer for sale Barclays Bank undertook to provide borrowing facilities up to £4 million in order to cover the incidence in the immediate future of "hump" expenditure and to finance increases in stocks and work in progress. Under normal conditions these borrowing facilities should prove to be self-liquidating and will be obtained from increases in the annual level of profits and sums retained by way of depreciation, amount placed to general reserve, and taxation allowances.

As I mentioned previously capital expenditure during the last financial year amounted to £4.04 million, and the proportion of this expenditure secured during the year from your company's resources by way of amounts set aside for depreciation and transfers to reserves approximated 51 per cent of the capital expenditure involved.

I now refer to factors which have sub-

stantially contributed to affect the level of profit for the year. As you may remember, for a period of 15 weeks from April 22, 1956, to August 7, 1956, an embargo was imposed by the officials of the Allied Craftsmen's Unions on all overtime, including week-end work from mid-day on Saturday to six o'clock on Monday morning. I think it would be appropriate to state this unfortunate decision was made by the officials of the craftsmen's unions concerned, the large majority of whose members are employed in many industries other than the iron and steel industry. Due to this withdrawal of labour the essential maintenance of plant and machinery was gravely affected and necessitated routine maintenance being carried out during the normal working week, thus seriously impeding the level of production. The completion dates for new plant to become operative were affected and the benefits from increases in production and the corresponding decreases in operational costs were accordingly postponed.

You will doubtless have observed the long overdue increases in the controlled selling prices of a large range of steel products were made public on December 15 and became operative from December 17, 1956. I consider I should remind you that since March, 1956, the steel industry has been carrying in three stages progressive increases in the costs of production without having received during a period of nearly nine months any compensatory adjustments in the home market for the controlled levels of prices for steel products. The first of the three principal items affecting production costs was occasioned by the increases in the agreement negotiated between the industry, the Confederation and the Allied Craftsmen's Unions with regard to the basic level of the scale of wages. The two further items reflecting on the costs of production were imposed on the industry by the British Transport Commission and the National Coal Board at short notice and have been carried by the industry up to the middle of last December. The implications arising from these progressive increases in production costs have imposed a heavy burden on the industry and further increases both direct and indirect have not been taken into account in these recent adjustments. Due to the disruption of normal supplies from the Middle East on which the United Kingdom and Western Europe rely for a substantial proportion of their requirements of oil products, the industry may well be faced in the immediate future with further increases which will tend to offset the full benefit secured from the recent price adjustments.

Naturally the storm of criticism which arose on the publication of these modest increases was anticipated and comprises the continuation of similar statements over a long number of years by consuming industries endeavouring to explain away their own inabilities to compete in export markets. The recent Press announcement stated that the general level of steel prices in the United Kingdom would be 8 per cent below the average levels of prices charged by the Western Europe steel producers to their internal consumers and amounted to an average increase of 6 per cent on costs to the consumer in the home market. By a simple method of arithmetic it will be appreciated that industry in this country has been securing its steel supplies to a degree of nearly 15 per cent below the prices charged to their Continental competitors and though in the recent price adjustments this disparity has been decreased an advantage of 8 per cent in cost is still enjoyed. It has been evident for a long while to many of us entrusted with the responsibility of operations and developments that adequate attempts are not being made by industry to keep in step with their competitors abroad, and an overhaul of methods of production is desirable.

I consider it would be in the interests of both consumers of steel products and the steel industry if a wider approach to the subject of fixation of steel prices is considered on lines similar to the formula operated in the United States over a long period of years. This proposal would include adequate price levels for specified periods in the home market. It would be essential to include reasonable margins to take care of demands outside the direct control of the industry and these proportions contained in the statutory prices would require to be co-related to the length of the period during which the prices of steel products would remain static.

NEW STEEL PIPE DEPARTMENT

During the year the new steel pipe department at Stockton has come into active production. This development has enabled your company to secure contracts of great magnitude in Canada, Venezuela and the Middle East. By the end of November, 1956, the quantity of steel pipes delivered for the final construction of the Westcoast Transmission pipe line was equivalent to a distance of 195 miles. The usages of the vast resources will play an essential part in the economic development of industry in the Western area of this great Dominion. The total mileage of the Westcoast Transmission line amounts to 662 miles and the actual mileage of steel pipes destined under normal conditions to be shipped by your company over the period January, 1956, to March, 1957, is equivalent to a distance of 312 miles and represents 47 per cent of the total length of the line. A contract for a substantial proportion of the pipes for the Trans-Canada project to convey the natural gas from Western Canada to the industrial and more heavily populated eastern section amounting to 636 miles was secured by your company in May, 1956. The first deliveries of pipes are due to commence in March, 1957, and owing to climatic conditions causing cessation of construction during the winter months deliveries will require to be spread over a long period, namely to July, 1959. The tonnage of steel involved in these two contracts amounts to 264,300 tons and the value exceeds $52 million at present levels of prices. Your directors are satisfied that the clauses incorporated in both contracts together with the arrangements made with our bankers covering the forward sales of dollars and firm freight rates secured are adequate to safeguard the financial implications of these two contracts.

In addition to the two large Canadian orders, contracts of similar magnitude have been secured from the principal oil companies for substantial increases in the development of pipelines for the conveyance of oil from the extensive oil-producing areas in the Middle East to ports of shipment. I write these remarks in the middle of December and accordingly it is unwise to prejudge events in that turbulent part of the world, but should these contracts be frustrated or suspended due to international conditions the tonnages in question will, in my opinion, be readily taken up for pipeline construction in other parts of the world.

Before I depart from this new and important sphere of the activities of South Durham I consider you would desire to have full information on the progress which has been achieved in the last 12 months in the development of this industry and the important part this specialised product is playing in the economic progress of the United Kingdom and the Commonwealth. From the experience I have gained during recent years from my visits to Canada and the United States I feel confident that the policy of that great member of our Commonwealth, after determining the ability of its own industries to meet the requirements of its rapidly expanding economy, comprises the intention to secure from the United Kingdom the maximum quantity of plant and machinery for capital investment which we can supply subject to the essential conditions with regard to quality, price and delivery.

CAPITAL EXPENDITURE

I referred earlier in my address to the fact that capital expenditure during the financial year amounted to £4.04 million and the principal items, beyond completion of the new steel pipe plant at Stockton, which have come into operation during the past financial year, comprised at the West Hartlepool works (i) the final stages of the erection of the ore preparation and handling plant, (ii) the completion of the 22 ft. 6 in. diameter blast furnace, which commenced production of iron in April, (iii) the gantry and overhead cranes for the direct handling of hot metal to the steel plant, (iv) additional heating facilities for ingots and slabs to increase plate production, and (v) the installation of the second 4-high stand in the medium plate mill and extensions to finishing facilities to deal expeditiously with the increasing level of steel plate production. The other principal items on which a high level of expenditure during the year has been incurred and which are due to become operative during the present financial year comprise (i) a sinter plant with an annual capacity of half a million tons to secure improvement in the quality of materials charged into the blast furnaces and so obtain a reduction in coke consumption and an increase in iron production; (ii) the construction of a third battery of coke ovens which, on completion, will enable the West Hartlepool works at this stage to be self-reliant as far as coke requirements are concerned.

At Cargo Fleet the principal items of capital expenditure incurred, though not yet operative, comprise (i) extensions to the discharging facilities on the River Tees to enable two ore carriers to be discharged simultaneously, (ii) construction of the ore stocking ground, (iii) replacement of a sinter plant, installed during the war years as an emergency, by a modern unit, and (iv) construction of the 22 ft. 6 in. blast furnace together with ancillary equipment to increase pig iron and ingot production. Subject to no unforeseen delays being incurred, it is anticipated the blast furnace will come into production during the first half of 1957 and the sinter plant during the latter part of 1957.

The principal items contained in the sum of £9.5 million authorised by your directors during the last financial year on capital expenditure outlined above comprise the installation of turbo-alternators of the most modern type to generate the electrical energy requirements of the West Hartlepool works and extensions to the level of steel pipe production at Stockton.

OTHER ACTIVITIES

I now outline the other activities of steel production and fabrication which your company has developed over a period of years. The steel products rolled at the West Hartlepool and Cargo Fleet works play their part in the endeavour to build up the economy of our country. During recent years your company has been entrusted by the Central Electricity Authority and by private enterprise with the fabrication and erection of seven power stations for the generation of electricity. Recent orders secured indicate a continuity in this specialised type of constructional work will be secured. In the range of fabricated steel work required as a matter of urgency for the early completion of the necessary facilities for handling oil products at the refineries constructed recently at Aden and at Kwinana in Western Australia your company has contributed. The supply of fabricated steel work of a similar nature, both for the home and export markets, is continuing to be secured.

A further development during recent years comprises at Stockton extensions to facilities to increase production of storage tanks and industrial plant. Your company has supplied and erected plant of a considerable magnitude to develop treatment of bauxite in Jamaica. Further contracts of a similar nature have been secured for extensions not only in Jamaica but also in British Guiana. The value of these contracts in course of completion and for future extensions amounts to £1.78 million.

During recent years your company has been developing in export markets the sale of a specialised steel product, namely Larssen Steel Piling, rolled at Cargo Fleet. In co-operation with the firms who handle these sales in certain export markets valuable connections have been built up, including among other important contracts secured in Canada the supply of the steel piling for the Toronto Harbour extensions, and during the recent financial year the steel piling for the wharf construction of the Canadian British Aluminium Company Limited at Baie Comeau on the St. Lawrence. Your company also secured during the last year the contract for the supply of steel piling and fabricated steel work, against heavy Continental competition, for the construction at Bluff Harbour in the South Island of New Zealand, which will ultimately play a prominent part in the exports from this Dominion. These negotiations were spread over a period of many months and, as I have placed on record previously, this contract is a further indication of our intention to strengthen the bonds between the members of our Commonwealth.

I have given you an outline of your company's large range of fabricated and specialised steel products the production and marketing of which, both for consumption at home and for export to the Commonwealth and world markets, are the direct responsibility of the directors and officials of your company.

EXPORT RESTRICTIONS

I consider it is my duty to draw your attention to the contradiction in policy which is becoming manifest with regard to the restrictions of steel exports imposed on the industry. In this respect it is hardly necessary for me to remind you of the recent remarks of Ministers regarding the vital necessity not only of maintaining the existing levels of export but in particular of increasing the proportions to the countries from which the essential currencies are secured in order to safeguard our national economy. In my view it has become apparent in recent years that by the restoration of the iron and steel industry to the control of individual investors the approach to these problems and the methods of execution necessitate careful examination. In recording these remarks I appreciate the important part which during a period of some 22 years the British Iron and Steel Federation has exercised in achieving the present level of efficiency in the industry. During the years when the future of the iron and steel industry was afflicted by divergent political opinions I do not question that the firmness of policy in discussions with the Government of the day received during those difficult years the full approval of those in an executive capacity on whose judgment the future of the industry largely depended. In my view it is in the interests for the further development and expansion of the industry as outlined in the Press report of December 15th that a more direct method of approach to discuss these problems requires to be established than exists today. Before the passage of the Iron and Steel Act of 1953 I do not question the correctness of empowering the British Iron and Steel Federation to act as a medium for discussions between the Government of the day and the industry, but since approximately 75 per cent of ingot production has been restored to private ownership I raise the issue whether the British Iron and Steel Federation should be entitled to continue exercising these powers. Your board of directors assumed the responsibility of all facts contained in the offer for sale and likewise these responsibilities continue for the future prosperity of your company. In concluding these opinions it is necessary to bear in mind that the British Iron and Steel Federation has never possessed executive powers with regard to the financial obligations of individual companies nor responsibilities affecting earning powers. In my opinion this position now requires revision to endeavour to secure that more direct forms of contact are established on these vital matters between the Board of Trade, the Iron and Steel Board, and the industry.

DIVIDEND

Your directors have considered in all aspects whether it would have been prudent to increase the dividend for the year over and above the amount of 8 per cent indicated in the Offer for Sale. I have already made reference to the factors which have contributed to the reduction in the level of profits during the past financial year. I ask you to bear in mind that since last June the incidences of the rise in production costs to which I have referred previously have been borne to their full extent and during the first 2½ months of the present financial year these impositions have continued to be carried. Due to the disruption of the normal supply of oil from certain countries in the Middle East additional costs in the level of production have arisen comprising a direct increase in the cost of oil and likewise an amount, from which the full implications will take time to be measured, on freight charges on the import of raw materials. The overall effects of these increases, which may well be of a substantial nature, were not included in the recent increases in selling prices, since both the duration and amounts cannot readily be forecast. Your directors feel in approaching the decision with regard to an increase in the rate of the final dividend these factors are of paramount importance, also bearing in mind the commitments on capital expenditure which have been entered into in order to increase the outputs of the products manufactured by your company. Your directors are only too conscious of their responsibilities to endeavour to maintain the values of the Equity capital at a high level and, when the international position becomes clearer, to consider the desirability of raising the rate of distribution.

FUTURE TRENDS

The Iron and Steel Board and the industry make a detailed study at regular intervals of the trends of the anticipated future levels of steel requirements by industry in the United Kingdom and to maintain a reasonable level for export to Commonwealth and world markets. From a review of the future trend of demand in the near future it is evident a substantial increase of heavy plate production is essential to enable the United Kingdom to maintain and to increase the prominent part which the industry of the United Kingdom has played over a long number of decades in building up the standards of living in the free world.

Arising from experiences gained by your directors in both Europe and the United States it is evident the demand for steel plates during the immediate future is destined to show an increase of considerable magnitude. In my view the demands will arise firstly from the urgent necessity to increase both the carrying capacity and the availability of modern tankers in order to meet the increasing demands for the supply of oil. Secondly, in order to carry economically to the iron and steel producing countries the essential supplies of ore an increase in the number of specialised ships of this nature is required. Thirdly and finally, from the experiences gained during the months the Stockton steel pipe department has been in production an equivalent increase in the demand for steel plates will automatically arise for the construction of trunk lines to transport both oil and gas.

Your directors, after taking into consideration these factors necessitating expansion of steel plate production at West Hartlepool, are submitting proposals to ensure a substantial addition to the level of steel plate production can be achieved.

CONCLUSION

I have stated previously during the financial year the steel pipe department at Stockton commenced production. I now feel I should draw your attention to the great efforts made at West Hartlepool to ensure that plates of the highest quality to comply with the strict requirements of these specifications were rolled and to the whole-hearted co-operation of your managers and employees at Stockton to ensure the quality of this new product would be on a comparable basis with the standards demanded in this specialised industry. I would also draw your attention to the efforts so readily made by all managers, members of our staff and employees to minimise to the greatest extent the handicaps which were encountered during the last financial year arising from the restrictions on overtime working.

Since the end of the financial year your directors have appointed Mr T. J. Williams to the position of group general manager, steel production, and I am confident you would like me to extend to Mr T. J. Williams our wishes for his success in his increased responsibilities.

I intend to add two more remarks. Firstly, you will have observed in your directors' report that Mr J. E. Shepherd has reached the age of 70, and that under Section 185 of the Companies Act, 1948, his reappointment as a director requires your confirmation. Mr Shepherd has been with your company for a period of 33 years and I know full well I am expressing not only the opinion of your directors and of myself of our satisfaction at the decision of Mr Shepherd to continue in his capacity as an executive director, but also to the fullest measure of every member of the staff. Secondly, during the year certain of the officials of your company have retired due to increasing years of age. I would like to place on record to you the value of their services over a long number of years in building up the prospects of your company. During their years of loyal service in the interests of your company I can assure you their successors have been most adequately trained.

THE UNITED STEEL COMPANIES LIMITED

INCREASED PRODUCTION

CONTINUED GROWTH OF DEMAND

SIR WALTER BENTON JONES ON EFFECT OF STRIKES

The annual general meeting of The United Steel Companies Limited will be held on January 31st at the Iron and Steel Institute, 4 Grosvenor Gardens, London, S.W.

The following is the statement by the chairman, Sir Walter Benton Jones, Bt, circulated with the report and accounts for the year to September 30, 1956:

The report of the directors and the accounts covering the twelve months ended on September 30, 1956, are enclosed with this statement. The report shows the growth of steel production, the result of the year's working and refers to the continuing modernisation and expansion of the works and the need to enlarge our capital.

DEMAND AND PRODUCTION

The growth in world demand for steel continues. Steelmaking countries increase their productive capacity year by year and some newcomers have entered the field. World production in 1955 was 265 million tons, which was 35 million tons more than in 1953. But production is still insufficient to overtake demand.

WORLD PRODUCTION

According to the industry's statistical returns there are about thirty countries in the world for which separate production figures are given. The table below arranges them in five groups and gives the production of each group and the total of them all in the years 1953, 1954 and 1955, and compares them with 1937, the highest prewar year.

STEEL PRODUCTION
(in million tons)

	1937	1953	1954	1955
United States of America	50·57	99·65	78·85	104·50
European Coal and Steel Community (E.C.S.C.)	35·67	39·00	43·10	51·76
British Commonwealth	16·70	25·85	26·55	29·24
Russia and satellites*	22·19	50·04	54·21	59·35
Japan	5·71	7·54	7·63	9·26
Others	2·67	8·41	9·65	11·07
	133·51	230·49	219·99	265·18

* Includes Yugoslavia but excludes China.

There was a halt in the USA in 1954 as a result of the steel strike in that country which appears to have cost it and the world 21 million tons. Otherwise every steel producing country has continued its progress year by year and the USA in 1955 surpassed its previous record which was made in 1953.

UNITED KINGDOM PRODUCTION

In the United Kingdom the 1955 production was 19.79 million tons, a gain of 1.27 million tons over the previous year. Imports amounted to 1.86 million tons, and after allowing for re-usable material and stock changes the total supply of steel was 21.57 million tons. Of this the home markets used 85 per cent and 15 per cent went abroad in direct exports. All these figures are taken from published statistics, and even if they are abc to many, not all will know or remember how striking they are.

The capital sum which has been expended in this great expansion in a long period of rising costs far exceeds the proportionate gain in productive capacity and this high capital cost in relation to gain in capacity, it must be assumed, will continue to rise.

With regard to the future, forecasts for the United Kingdom put the demand in 5 or 6 years time at 28 million tons of steel, including some increase for direct export. This would require an addition of 8 million tons to 1955 production.

THE COMPANY'S PRODUCTION

Our Company in the year 1955 produced 2,585,000 tons of crude steel which was an increase of 92,000 tons over the previous year. It is expected that we shall be able to contribute 700,000 tons towards the 8 million tons estimated additional production required for the United Kingdom.

CAPITAL EXPENDITURE

The expansion of our Company and the cost of it has been reported to you from time to time. In 1945-46 our production in round figures was 1,604,000 tons, in 1954-55 it was 2,559,000 tons. The money spent on capital account in that time has been £54 million. In addition, in our last financial year we spent £11 million, bringing the total over these years to about £65 million. Of this sum about £50 million has come from internal resources, £7 million has been brought in from coal mines compensation and the net realisation of investments and £7,700,000 has been found from new capital.

Only a small part of these sums has been spent on new capacity in terms of steel ingots. Part has been applied to replacing and increasing the productive efficiency of existing ingot capacity, part to modernisation, and part to installing plant and equipment for making larger numbers of products and more highly finished products.

FUTURE EXPANSION

With regard to the future, doubtless there may be temporary fluctuations, but there is no doubt that world demand will continue its upward trend and it may well be that supply will lag behind for a considerable time.

It needs no argument to demonstrate that the expansion in steel production throughout the world is too large and is moving too fast to be provided entirely by the internal savings of steel producing companies however owned. Very large contributions have been made and will continue to be made from this source. But the speed at which production is to be increased in order to keep in step with rising demand cannot be governed by the rate at which steel companies as a whole are able to save money.

It has been the policy of our Company to proceed with profitable developments in modernisation as fast as its development staff can design them, and the heavy engineering industry of the country can supply what is needed. So long as this policy is followed there will be times when expenditure will be more than can be met from accumulated financial resources and it will be necessary to augment them with new money.

During the past year work on development has progressed rather more quickly than would have been expected a year or two ago. Besides this earlier call on internal financial resources the amount of money locked up in stocks continues to increase; in eleven years it has risen by more than £18 million.

FUTURE TRADING RESULTS

Trading results since the close of the last financial year have been affected very little by current conditions arising from credit restrictions and the international situation. In particular, the demand for heavy steel products has shown no signs of contraction.

It is difficult to foretell whether the Company's activities will be influenced in the immediate future by circumstances outside its control, but on the other hand the benefits arising from the capital expenditure of recent years, which is large, are now being reflected in the Company's results. This factor would increase profits if existing circumstances remain unchanged and, conversely, it would be a counteraction if circumstances become less favourable. The effect of the increases in costs has been carried since the middle of the year without any compensating advance in steel prices.*

THE ACCOUNTS

The accounts in their present form and the explanatory notes and schedules which have become part of them leave little need for further comment. Capital expenditure amounted to £11,134,000. This has been met from retained earnings and net current assets.

There have been considerable movements in certain items of current assets and current liabilities and the net figure is lower by £2,513,000. The increase in the figure of creditors is mainly due to the presentation of large accounts for capital expenditure in the last month of the year. The comparative figures of taxation show an increase of £1,902,000 which is a reflection of the relative profits of 1955 and 1954.

* Note: Since this statement was written a general increase in steel prices has been announced.

Stocks have increased by £4,787,000 partly due to rise in prices, and partly due to increase in volume arising from growing turnover but also to a considerable extent from the need to provide for temporary interruption to normal movement of materials during major developments.

It is a pleasure to record once again our appreciation and thanks to the staff and all employees at every branch. They display unfailing industry and interest in the operations of the Company and take pride in the contribution which they are able to make to the prosperity, not only of their Branch, but of the Company as a whole.

BRANCHES

All the major productive departments throughout the Company have been fully employed. At many steelworks all over the country production was disturbed to a greater or less extent by what came to be called the craftsmen's embargo, but this disturbance did not reach a significant level at any of the Company's Branches.

The following are the most interesting features of the Branches most of which are the developments:

CUMBERLAND GROUP

Number of employees: 6,307.

When Her Majesty The Queen on her tour of West Cumberland opened the first electric power station to be operated by atomic energy at Calder Hall we were honoured by her visit to our Workington works. Here Her Majesty put into operation a link between the electrical system and the local power lines of the Electricity Grid thus making these works the first steel works in the world to be operated by means of atomic energy. This link makes possible an interchange of current which is estimated to save the consumption of 15,000 tons of coal a year.

The replacement and electrification of the rail mill and secondary mills are now complete and are in operation.

At Distington there has been considerable expansion at the iron foundry which specialises in heavy iron castings such as ingot moulds and slag ladles for our own works and for sale. This production together with general castings has now reached about 2,000 tons per week.

SHEFFIELD GROUP

Number of employees: 16,507.

Samuel Fox and Company Limited.—The trade of this subsidiary is particularly dependent on the activity of the road vehicle industry and it has been affected to some extent in regard to certain products by the difficulties which this industry has experienced during the year.

Nevertheless, a high rate of activity has been maintained and ingot production has for the first time exceeded 300,000 tons in one year.

Production of stainless steel has advanced by 10 per cent over the preceding year, though there has been and still is anxiety about the situation in respect of the supply of nickel, which is an essential constituent of the most popular varieties of this steel.

Rather more than one-fifth of the national production of alloy and stainless ingots during the year was produced at the Stocksbridge works.

Works developments have included the installation of new mills for blooming ingots and for the cold rolling of strip. A combined bar and rod mill is being built and preparations are under way to install later next year another large arc furnace alongside the one which started work in November, 1954, and which has been in successful and continuous operation since that time.

Steel, Peech and Tozer Branch.—The demand for all the products of this branch except railway springs has been heavy and consistent throughout the year, and the recession in the motor industry has produced no appreciable change in our order books.

Steel production exceeded one million ingot tons for the first time. This was achieved partly by the completion of the conversion of the Templeborough furnaces to 100 tons capacity, and partly by operating as many as twelve out of fourteen furnaces at Templeborough. Until five years ago not more than ten furnaces were maintained in operation, but since then numerous advances in furnace repair techniques and a greater use of mechanisation have gradually increased furnace availability to give the present 20 per cent improvement. A still further improvement will come in the present year.

Another four soaking pits of a much improved type have come into operation at the cogging mill thus providing ingot heating capacity which increasing production from the mill itself made necessary.

There has been much concentration on development schemes which cannot be included in the present report but which will reach completion in the present year. These include the Brinsworth Mill, the 30 in. mill expansion, a new cold rolling mill and a new bundling press.

YORKSHIRE ENGINE COMPANY LIMITED

Orders and deliveries increased by over 40 per cent in value. Steam shunting locomotives completed during the year were probably the last steam powered units to leave the works. Diesel locomotives were more than doubled in number and value and orders in hand will allow at least a further doubling of output. The plant has been maintained in good condition and labour relations have been co-operative, in spite of minor incidents that received rather wide publicity.

UNITED COKE AND CHEMICALS COMPANY LIMITED AND ORE MINING BRANCH

Number of employees: 2,273.

The major undertaking during the past financial year has been the continuation of the building of a battery of 43 coke ovens to replace a similar number of obsolescent ovens. These are scheduled to come into operation in July, 1957.

At the Ore Mining Branch a W 600 Dragline has been completed and put to work at the Crosby Warren pit at Scunthorpe. This is a Ransomes and Rapier machine with a bucket capacity of approximately 10 cu yds and is the first of its type to be built.

The output of the Dragonby Mine has been increasing over the past financial year and has now achieved the level of 10,000 tons a week.

LINCOLNSHIRE: APPLEBY-FRODINGHAM STEEL COMPANY BRANCH

Number of employees: 10,724.

The Branch again established record outputs in their plate mills, their section mills and their melting shops. The fact that no record was broken in their blast furnace output may perhaps be regarded as due to the arbitrary nature of the period of a financial year. The two largest furnaces were both relined during the year and iron production is now proceeding on record high levels of output and record low levels of coke consumption.

The large programme of work on replacements and extensions is proceeding to schedule. It includes the additional turbo blower for the ironworks and the additional steel melting furnace which is due for completion early in the new year.

TAXATION

The burden of taxation is a common subject in the statements of company chairmen as it is wherever two or more people are gathered together. No one can deny that a levy of near 50 per cent of income is a heavy weight to carry. But the root of the matter is not really taxation. The root of the matter is State expenditure, and although taxation appears to each one of us as a painful extraction, it is by and large the only source of State income. So long as the State is required by the taxpayer to undertake, or takes on itself, tasks which have to be paid for, the cost of these tasks must be met by taxation. It is a pity there is no glib word for State expenditure, nevertheless we should make more impression if every time we complained about the level of taxation we substituted the words, State expenditure. Most of us think it can be reduced and we are probably right, but if we studied State expenditure and talked about it as much and as often as we talk about taxation our breath might not be wasted.

Here are two examples which alone illustrate the magnitude of State expenditure.

The first example is State expenditure on fixed capital assets. In 1955 this expenditure by the Central Government, the Local Authorities and the Public Corporations amounted to £1,300 million which was 45 per cent of the total amount of public and private spending on fixed capital assets.

The second example is State employment. In 1955 the state directly and indirectly through nationalised services and industries, employed and paid the wages of 6,200,000 persons and this number is 26 per cent of the employed population.

PRODUCTIVITY AND STRIKES

But there is another side of the account which we have come to call productivity. In my statement a year ago I talked about industrial relations and I would now like to add a word which has a bearing on productivity. While we are making strenuous endeavours to increase productivity we still indulge in strikes which have the opposite effect. It is true that they cause less loss of time than in days gone by and it may be that the time lost is not large in relation to time worked, but the effect of the loss cannot be measured in men-days lost by the strikers themselves nor by reference to the area to which they may seem to be confined. The actual individuals who strike may seem to lose only their own wages but indirectly they lose much more and many other people also suffer injury.

Strikes affect the prosperity of the works in which the strikers are employed, they affect the activities of those who supply them with materials and services and those who buy their products. More widely and indirectly the income of the whole country, which is what we have to live on, is lowered and still more remotely the strikers inflict

damage on our goodwill in the markets of countries with whom we trade and in others with whom we hope to trade. In a word the strikers lower the prosperity and prestige of their country which causes a loss not only to themselves but to every one of their countrymen.

NEED FOR BROADER OUTLOOK

In these days we have secured for ourselves a high standard of living and we pride ourselves on having reached a high level of civilisation. It seems unbelievable that in industry with our complete and long established wage negotiating machinery we should ever resort to strikes as a final arbiter. And it is even more unbelievable that public opinion still permits an odd man or an odd number of men for some reason or other and perhaps unknowingly to break their contracts of service with the express object of leading what we have come to call unofficial strikes. Can we not take a broader outlook and allow differences in industry to be settled by arbitration?

To make such a suggestion may seem unrealistic. But is it? These conflicts and this irresponsibility may appear relatively small and the injury they inflict may seem to be confined to those directly concerned. But the harm they do and the reduction in productivity which they cause cannot be measured. It is not confined to the few directly concerned, it harms our country as a whole, in both the commercial and the political world to which we look for a living and in which we hope by example to strengthen the cause of peace.

THE ROYAL BANK OF CANADA

INFLATION STILL THREAT TO CANADIAN ECONOMY

CENTRAL BANK MAY NEED BROADER POWERS FOR EFFECTIVE CONTROL, SAYS MR JAMES MUIR

The Eighty-eighth Annual General Meeting of shareholders of The Royal Bank of Canada was held on Thursday, January 10th, at the Head Office in Montreal. Mr James Muir, Chairman and President, in the course of his address, reviewed some of the economic development which has taken place during 1956, with particular reference to the rising tide of inflationary pressure, pointing out that some of them are from new and unexpected quarters. He expressed the view that it might become necessary to enlarge the powers of the Central Bank of Canada to keep under control the forces which threatened the "integrity of our money."

INFLATION STILL A THREAT

"During 1956, the bugbear of inflation became a reality," said Mr Muir, "and inflationary pressure broke through to raise the price level. Nevertheless flexibility in the economy, plus the impact of governmental and private decisions, notably in the financial world, combined to reduce the inflationary effects below what they might have been.

"Consumption and investment expenditure can rise together only if there is an increase in goods and services, or a rise in prices. The flexiblity necessary to increase our output of goods and services is likely to be smaller in 1957 than it was in 1956. In 1957, therefore, it is even more urgent to curb the rising trend in total money expenditure."

BANK CURBS EFFECTIVE

Mr Muir said that the Bank of Canada and the chartered banks have co-operated within the broad framework of monetary policy to reduce to almost negligible proportions the net inflationary effect of chartered bank operations.

"Consumer credit continues to expand, but consumer credit directly or indirectly financed by banks fell off during the second half of the year, while similar loans by loan companies and credit unions continued in 1956 the rising trend established in 1955. Retail consumer credit by instalment finance companies rose through 1956 to a new high, while chartered bank loans to instalment companies fell steadily during the second half of the year.

"These favourable results, so far as chartered bank credit is concerned, were due to a monetary policy that kept the brakes on the expanding money supply, thereby allowing market rates of interest to rise with the increased demand for funds.

"In addition to overall policy on money supply and money rates, the Bank of Canada continues the ban on term loans, as well as its requirement, fully effective in May, 1956, that chartered banks maintain second-line reserves of treasury bills and day-to-day loans sufficient, with existing statutory cash reserves of 8 per cent, to establish a 'liquidity ratio' of at least 15 per cent of deposit liabilities.

TWO NEW DANGER SPOTS

"I believe that there are at least two sources of inflationary pressure which the Central Bank, with its present powers, will find it difficult to reach.

"First, it is possible, even with no increase in money supply, to increase the activity of that supply by putting otherwise idle funds into the hands of spenders through the ordinary devices provided by the capital market.

"Second, it is possible, with no increase in the money supply, to increase the funds available to businessmen and consumers from sources other than the financial institutions ordinarily controlled by our monetary authorities.

"In a market where interest rates are rising and are expected to rise still further, some borrowers float capital issues to provide cash balances which they may need later. In other words, there is a growing tendency for some, who have future but undefined and as yet unplanned expansion in mind, to go into the capital market unduly far in advance of their actual needs. With high short-term rates for the temporary use of these funds, the net additional cost may not be great; and the general deterrent effect of high rates is weakened by the expectation that rates are going even higher. What we have is a sort of panic: a panic to get money now for fear it will not be available later. This is an unexpected cousin of the typical inflation—it is inflation of the capital funds market.

"As a result, corporate securities may be sold to non-bank investors, who presumably either have surplus funds or divest themselves of other assets, such as government securities, to those who have these funds. Thus, otherwise idle money may be put into the hands of spenders.

"It would seem highly desirable that those who employ the capital issues device to build up speculative cash balances should voluntarily impose upon themselves a greater measure of restraint. Nobody, I am sure, wishes to see any attempt at the direct supervision of capital issues such as might result from an undue limitation, through these speculative transactions, of the effectiveness of our monetary policy.

"The second source of additional inflationary pressure is the result of the growth of non-bank repositories of funds. Some of these are subject to governmental regulation or control but not by our monetary authorities, and not for purposes appropriate to monetary policy."

BROADER POWERS NEEDED?

"The curtailment of bank credit may have little direct effect on the supply of funds from non-bank sources. Even those institutions, such as the finance companies, with traditionally large bank loans, have alternative sources of funds, and these sources become more significant as the non-bank sector of the business community increases in importance as a repository of liquid funds.

"It would seem, therefore, to be at least open to doubt whether the present facilities and techniques available to our monetary authorities are sufficiently wide in scope to deal with present-day problems of credit control.

"It may be taking too positive a view of a distant scene, but it would at least appear that, in order to be fair and in order to achieve the best results, our monetary and credit control may have to embrace a wider area of our financial world than it now does."

ASSETS EXCEED $3,500,000,000

Mr K. M. Sedgewick, General Manager, commenting on the bank's financial statement, noted that assets had reached the impressive figure of $3,571,298,320 and deposits had passed the $3,250,000,000 mark, both new high points in Canadian banking history. Capital Funds now stand at $186,701,633, an increase of approximately $36,000,000 during the year. The bank's liquid position continued strong, with total quick assets of $1,958,263,058, representing 57.8 per cent of all liabilities to the public. "General business has been conducted at an active tempo since our last review," said Mr Sedgewick. "We play a part in practically all phases of Canada's development, and it is our aim that we shall continue to do so." Referring to the bank's extensive foreign organisation in Central and South America and the West Indies, Mr Sedgewick mentioned that in addition to the bank's present well-located branches abroad, there was under consideration the possibility of opening at two new points. "It has long been our policy to select business carefully," commented Mr Sedgewick, "and as a result, the asset position of our branches abroad continues at a high standard."

ENI

ENTE NAZIONALE IDROCARBURI
ROME, ITALY

(Italian State Corporation for Oil and Natural Gas)

DEVELOPMENT OF PROSPECTING, PRODUCTION, TRANSPORT AND DISTRIBUTION ACTIVITIES

INVESTMENTS FOR LIT.180,000 MILLION OVER A PERIOD OF THREE YEARS

The ENI balance sheet for the year ending pril 30, 1956, was published recently. The eport of the Board of Directors, which ccompanies it, illustrates the situation in taly, as well as throughout the world, in the ydrocarbon sector, and touches upon the hief problems concerning the development f power resources. It covers the activity of he Group, examines its prospects for the uture, and comments upon items in the alance sheet.

PROSPECTING AND PRODUCTION ACTIVITIES

The prospecting activities of the ENI roup of Companies were developed further n the area exclusive to it, as well as in the emainder of Italian national territory and broad. Geological surveys in 1955 in parcular covered extensive areas in Peninsular taly and Sicily.

Geophysical surveys were conducted by 7 crews, totalling 137.5 crew-months, an ncrease of about 20 per cent as compared with the preceding year.

In 1955 AGIP Mineraria and affiliates sank 28 exploration wells in Italy on their own account, with a total depth of 214,526 ft, 10 of which proved productive, and 53 production wells with a total depth of 315,898 ft. In carrying out this activity, considerable supply difficulties had to be overcome owing to the fact that drilling sites were very far apart.

AGIP Mineraria affiliates started and continued their activity abroad. In Egypt, prospecting continued in the permit areas along the coast of the Gulf of Suez and ten wells were drilled (eight of them now completed), totalling some 66,000 ft in depth In Somaliland, an exploration well was sunk in Northern Midjurtinia.

ENI Group Companies further drilled a total of 25,906 ft in Italy and abroad, on account of other companies.

The Group's drilling rigs in operation at the end of 1955 numbered 34, 16 for great depths and 18 for medium and shallow depths. Two additional 16,400 ft drilling rigs started operating in 1956.

The Group's intense exploration activities produced remarkable results. In the Po Valley, gas deposits were found at Pandino (Milan), Orzivecchi, Bagnolo Mella (Brescia), and Budrio (Bologna). In the Abruzzi, at Casalbordino, Tocco Casauria, Vallecupa and Madonna della Croce, some wells drilled by SOMICEM encountered oil-bearing strata in limestone formations which, according to tests, should offer interesting production possibilities. In Sicily, exploration activity was continued in the Cisina gas fields and in the area south of Catania. Drilling near Ardizzone (Catania) tapped a gas-bearing structure.

The total production of natural gas by the ENI Companies ("AGIP Mineraria," "Ravennate Metano" and "Mineraria Sicilia Orientale") in 1955 rose to 117,935 million cu ft, as compared with 95,337 million cu ft in 1954, an increase of 23.8 per cent. During the first four months of 1956, production reached 54,730 million cu ft, showing an increase of 33.5 per cent compared with the corresponding period of the preceding year (40,994 million cu ft).

Total output of liquid and liquefiable hydrocarbons in 1955 amounted to 114,851 metric tons, including 54,700 tons obtained through gasoline recovery at the Cortemaggiore plant.

TRANSPORT AND UTILISATION OF NATURAL GAS

In 1955 both transport activities and production increased considerably. During the year, ENI Group Companies dealing with the transport and distribution of natural gas, built and installed 286.8 miles of new gas pipelines. In the aggregate, the gas pipeline network in use on December 31, 1955, reached a length of 2,531.9 miles, involving the use of 180,000 metric tons of steel. A further 155 miles of pipelines were either being installed on the same date, or were already installed but not yet in use.

At the end of 1955 there were 1,720 industrial users served by the SNAM and "Azienda Metanodotti Padani" network. The number of users connected with the city networks of the ENI Companies, which distribute gas for domestic use only, rose from 10,191 to 15,830 during the year.

In 1955 the ENI Group distributed a total of 123,790 million cu ft of natural gas, of which 95.4 per cent represented its own production; this figure is equivalent to 97 per cent of Italian consumption as a whole. In almost every sector of consumption the increase in sales over the preceding year was considerable. The greater increase in relative value refers to domestic and civil uses (31 per cent) and chemical processing uses (29 per cent). For industrial thermal appliances the increase was 22.4 per cent; the most striking increases were registered by the following industries: food (60.2 per cent), chemicals (28.6 per cent), rubber processing (27.1 per cent), and metallurgical (27 per cent).

PETROLEUM TRANSPORT AND PROCESSING

The AGIP tanker fleet in service at the end of 1955 comprised 11 units with a total deadweight capacity of 109,930 tons. Transport in 1955, measured in tons-per-mile, was 79 per cent higher than in 1954, chiefly because of the entry into service of two new tankers, *Alderamine* and *Cortemaggiore*, which took place during the year.

In March of the current year an order was placed with the Ancona Cantieri Navali Riuniti for a turbine tanker with a total deadweight capacity of 36.000 tons, driven by a 16,000-hp steam turbine.

In the sector of hydrocarbon processing, the activity of the Group's Companies in 1955 was chiefly concerned with the qualitative improvement of products, by means of technical improvements to installations.

In 1955, two catalytic reforming plants went into production at the IROM Refinery in Venice and the STANIC Refinery in Leghorn. The Cortemaggiore distillation and catalytic cracking plant for processing the crude obtained from this field was also taken into service.

During 1955, the refineries connected with the Group processed about five million tons of crude, and utilised plant capacity to an impressive degree.

DISTRIBUTION OF PETROLEUM PRODUCTS

Sixty-two per cent of the Group's output was sold on the home market and 38 per cent on foreign markets; in the preceding year the percentages had been 55 per cent and 45 per cent respectively.

Sales registered a remarkable increase in 1955, in spite of keen competition. The new 98-100-octane "Supercortemaggiore (RM)" petrol, placed on the market by AGIP in April of this year, was given a most favourable reception by the public on account of its high efficiency, and the new fuel oil, "Fluid AGIP Extra." which is particularly suited for automatic burners, has found wide acceptance for central heating systems, as well as in industrial plants.

In the sector of liquefied petroleum gas an increase was registered throughout Italy —and especially in the South—in the sales of bottled liquid gas (AGIPGAS), and centralised distribution systems were completed, which were already serving 800 users by the end of the year. In many localities the conversion of coal-gas networks into distribution networks for propanised air or pure propane is in the planning stage.

A new company, "AGIPGAS Città," was set up at the beginning of 1956 by "Nuovo Pignone" and "Metano Città" for the installation and operation of such networks.

PETROCHEMICAL AND MISCELLANEOUS ACTIVITIES

In 1955 and during the first few months of 1956, the bottling plants for liquefied gases at Cagliari, Leghorn, Arma di Taggia, Fabriano, Viterbo, Palermo and Bologna, went into production. The Foggia plant is under construction.

Work on the ANIC petrochemical plant at Ravenna, which will process natural gas for the production of synthetic rubber and nitrogenous fertilisers, began in 1955 on a plot of land purchased from the municipality.

The road network, some plant buildings, the warehouses, the wharf along the Candiano canal, and the first residential building have reached an advanced stage: and the initial equipment will be installed next autumn. The major plants, such as the thermoelectric power station, plants for air liquefaction and the production of oxygen and nitrogen, installations for purifying and

separating gases for the production of ammonia, and plants for synthesising butadiene, as well as a considerable portion of the equipment used in rubber production, have already been ordered.

In the engineering industry sector, "Nuovo Pignone" developed its reconversion programme in 1955, and switched production over to installations and equipment for the petroleum, chemical and mining industries, thus fulfilling the aim of complementing the activities of the other Companies of the ENI Group. The output of compressors, engine-compressor units and equipment for the production and distribution of petroleum products, was increased considerably, and the production of drilling equipment started.

Società Termoelettrica Italiana (STEI) produced 804 m. kWh in the Tavazzano power station last year, registering an increase of 13 per cent over the 1954 output. Compared with the aggregate of "large producers," this figure represented about two per cent of the total electric power produced, and about 12 per cent of thermo-electric power.

In December, 1955, the San Donato Milanese "Study Centre," on which building work started in 1953, was inaugurated. The Centre buildings cover a total area of about 323,000 sq ft.

NUCLEAR ENERGY

In the field of exploitation of nuclear energy for industrial purposes, the ENI Group launched some projects for the training of technical and specialised personnel, and for prospecting for radio-active minerals, reaching positive and highly interesting results which warrant further developments of ENI's activities in this field.

PROGRAMMES AND PROBLEMS

Activity programmes outlined in the report of the ENI Board include about Lit. 180,000 million for investments to be effected during the three-year period 1956-58. The funds needed will be secured partly from internal sources and through recourse to ordinary credit, and partly by floating a bond issue for Lit.60,000 million divided into three annual series of Lit.20,000 million each.

Investments are contemplated for an amount of about Lit.45,000 million for petroleum processing plants and related transport and distribution activities; and almost equal investments are anticipated for the construction of the Ravenna petro-chemical plant. The largest share, however, will be destined for hydro-carbon prospecting and production activities, for which an investment of about Lit.75,000 million is envisaged, half of which will be for use in Peninsular Italy.

SUMMARY OF BALANCE SHEET

The Profit and Loss Account at April 30, 1956, shows a net profit of Lit.4,157,689,299, which the ENI Board proposes to distribute as follows:

Lit.831,535,899—or 20 per cent, to the ordinary reserve fund;

Lit.2,720,500,000—or 65 per cent, being the share reserved to the State, to increase ENI's capital endowment fund, pursuant to the provisions of the Act of February 10, 1953, No. 136.

Lit.623,653,400—or 15 per cent, to finance scientific studies and research on hydrocarbons and other sources of power.

The Court of Accounts Delegate : Gino Calvari.

ANNUAL REPORT AND STATEMENT OF THE CHAIRMAN . . . HAWKER SIDDELEY GROUP

Sir Thomas Sopwith reviews Hawker Siddeley Group 21st Anniversary

PERIOD OF GREAT ACTIVITY: EXPANDING INTERESTS IN OTHER FIELDS

The 21st Annual General Meeting of the Hawker Siddeley Group was held on January 9th at the Dorchester Hotel, London. During the course of his speech Sir Thomas Sopwith, CBE, the chairman, said:

As this is our 21st Anniversary, it is fitting that I should deal with our progress since the Group was formed.

The last twenty-one years have been a period of intense activity and development. Our companies have produced more than 44,000 aircraft.

In the Second World War companies of the Group made over a quarter of the aircraft used by the Royal Air Force.

Among many other products during the period were a wide range of aero engines, motor cars, diesel engines, factory-built houses and industrial buildings—and it must not be forgotten that we produced the Gloster-Whittle E.28/39, the first Allied jet aeroplane, which played no small part in changing the entire face of aviation.

From a small beginning the Company has become the largest group of aircraft and aero engine designers and manufacturers under one control in the British Commonwealth and is expanding its interests in other fields. A. V. Roe Canada Ltd. has, in the space of eleven years, become one of the major industrial units in Canada.

We have had another satisfactory year's trading, and the profits of the Group for the year ended 31st July 1956, before taxation, amounted to £12,847,867, compared with £12,675,537 last year.

I have on several occasions laid stress on the need to retain large sums for keeping the Group thoroughly up-to-date as regards plant and equipment including the latest developments in nuclear power and electronics. Your Board is continuing this policy which is essential to ensure successful trading results in the future. In addition, we are embarking on the design and manufacture of a civil turbo-jet transport aircraft and other private ventures without Government assistance.

Your Board is recommending a final dividend on the ordinary shares of 7% less tax, making, with the interim dividend already paid, a total dividend for the year of 10%. Your directors feel it is essential to retain in the business a substantial part of the profits after taxation, to finance research, capital expenditure and a high volume of production.

Although we have been able to retain nearly £5 million in the operating companies this year, it has been necessary to set aside more than £7 million for taxation.

In Canada 500,000 new common shares of A. V. Roe Canada Ltd. have been sold to investors there. This was the fulfilment of a desire by your Board to give the Canadian public an opportunity to participate in a company which is one of the largest in the Dominion.

Highlights of the year include:

1. AIRCRAFT IN SERVICE

The Avro 'Vulcan', Hawker 'Hunter' and Gloster 'Javelin' are all in service with the Royal Air Force.

2. CIVIL AIRCRAFT MARKET ENTERED

A world-wide market awaits the right aircraft in the civil transport field and we believe that the Armstrong Whitworth civil aeroplane is an answer.

3. INVESTMENT IN TECHNICAL FACILITIES EXPANDED

At home and in Canada big investments have been made in providing technical facilities without which it is impossible to survive in this fast-moving technical world:

Sir W. G. Armstrong Whitworth Aircraft Ltd. are incurring substantial expenditure on expansion of facilities in connection with guided missiles and aircraft.

A self-contained establishment for Armstrong Siddeley Motors' research work in gas turbines and rockets is nearing completion.

At A. V. Roe & Co. Ltd. expansion of facilities was continued and a new wind tunnel capable of providing very high speeds will shortly be available. A special building equipped to investigate the 'heat barrier' will be ready early in 1957.

At Hawker Aircraft Ltd. new premises are being built to house increased design, research and development staffs.

In Canada, considerable expansion has been necessary to Orenda Engines' facilities to cope with the new intensive programme on the 'Iroquois' engine.

Canadian Steel Improvement Ltd. have just completed an extensive expansion programme.

4. GUIDED MISSILE PROGRESS

Practice firing missiles designed and built by Sir W. G. Armstrong Whitworth Aircraft Ltd. have been fired from H.M.S. Girdle Ness. The A.W.A. research establishment will include a laboratory where all the conditions of the launching and flight of guided missiles can be simulated.

5. RESEARCH INTO NUCLEAR POWER

Hawker Siddeley Nuclear Power Co. Ltd. are engaged in studies of certain nuclear reactor systems, in particular, the liquid metal fuel type of reactor.

6. NEW ERA FOR CANADA FOR MANUFACTURE OF RAILWAY ROLLING STOCK

Canadian Car and Foundry Co. Ltd. have made arrangements with the Budd Co. to manufacture the famous line of Budd railway passenger cars required by the Canadian Railways. Development is also proceeding in the diesel-driven rail cars of special types suitable for the North American Continent.

7. CANADIAN AUTOMOTIVE FIELD BROADENED

The Canadian Car & Foundry Co. Ltd. are building the first diesel-powered truck designed in Canada.

I will now deal with other activities of the major companies.

AIRCRAFT

Production of the 'Vulcan' is now in full swing but development still proceeds. Avro's now possess one of the largest technical and research teams in this country.

Delivery of Hawker 'Hunters' to Denmark and Peru has been completed and good progress made towards fulfilment of the larger order from Sweden.

We have hopes that the new 'Hunter' Two-seater will add further to our order book both at home and abroad.

Production of the Gloster 'Javelin' 1 is now completed, and later versions are on the production line.

Avro Aircraft in Canada are making satisfactory progress with the development of the CF-105 while continuing production on schedule of the CF-100.

AERO ENGINES

Armstrong Siddeley turbo-jet and turbo-prop engines are now flying in 23 types of military aircraft. More than 10,000 Sapphire type engines have been produced at home and in the United States.

During the last ten years Armstrong Siddeley Motors have paid particular attention to rocket motor development and now have a considerable stake in this important power plant of the future.

In Canada, Orenda Engines Ltd.'s new engine, the 'Iroquois,' has been running for some time and has passed a stringent endurance test at a high power.

MOTOR CARS

In company with other manufacturers, Armstrong Siddeley have experienced a falling off in sales, but plans are going ahead for the future.

METALS

The commercial side of High Duty Alloys' business, which has been showing promising growth, was affected last year by the credit squeeze but the ground lost has now, to some extent, been recovered. The company have maintained a high level of supplies for military and civil aeroplanes.

Canadian Steel Improvement Ltd. have made considerable advances in forging techniques, particularly in titanium.

Canadian Steel Foundries (1956) Ltd. operate the largest and most modern foundry of its kind in Canada.

DIESEL ENGINES

Armstrong Siddeley Motors Ltd. have expanded their range of engines and applications and increased their sales.

HOUSES AND CIVIL ENGINEERING

Hawksley S.M.D. Ltd. have continued the use of aluminium for the building and civil engineering industries.

Kelvin Construction Co. Ltd., the steel construction branch of the Group, have had a successful year and have completed many industrial buildings during this period.

BUSES AND RAILWAY ROLLING STOCK

Canadian Car & Foundry Co. Ltd. have completed a large number of railway wagons and trucks. On the automotive side a steady production flow was maintained and future prospects are highly satisfactory.

AIR TRAINING

There has been a substantial increase in the number of students at Air Service Training Ltd.

IN CONCLUSION

Before I conclude I must strike a note of warning.

In the future aviation could be the means of saving civilisation.

Other countries are spending more and more money on the construction of aircraft, and we must speak from similar strength.

We must continue, to evolve better and better aircraft, missiles and all manner of defence equipment.

If defence is cut to very low limits there is the serious danger that our teams of experts will disintegrate and it must always be remembered that a healthy aircraft industry is a most profitable source of export business, which is the life blood of the country.

The nation has every right to be proud of its technical achievements. We in the Group are proud of our own, the products of the skill and experience of our technicians and craftsmen who are second to none in their ability, knowledge and enthusiasm.

The welfare of our Group lies in the direction of diversification, both in the type of its business and its location. Already our Canadian Company has become an important part of its country's economy and opportunities for expansion and consolidation will not be missed either at home or abroad. Our efficiency will be maintained so that we are in a position to take advantage of world prosperity which, when sanity prevails, must lie ahead.

In assessing our record for the year I am sure you will join me in expressing our thanks to the 75,000 executives and employees who have made it possible.

The report and accounts were adopted.

BANK OF CEYLON

AN EVENTFUL YEAR

FOREIGN AID WITHOUT POLITICAL STRINGS WELCOMED

MR H. V. PERERA ON NEW GOVERNMENT'S OBJECTIVES

The annual general meeting of the Bank of Ceylon was held on December 29th at Colombo.

The following is an extract from the statement by the Chairman, Mr H. V. Perera, QC, on the report and accounts for the year ended September 30, 1956:

Since I addressed you last year in December we have witnessed many events of political and economic significance both at home and abroad. In the international sphere political events both in the Middle East and Europe have threatened to disrupt world peace; but the United Nations Organisation has successfully demonstrated that, backed by moral force, it is possible to ensure that the rights of every nation, big or small, are recognised.

Political tension over the Suez Canal dispute followed by military action has interfered to a considerable extent with international trade and commerce. It is hoped that before long normal conditions will be restored.

Ceylon was admitted early this year to membership of the United Nations Organisation. I have no doubt that Ceylon will make its due contribution towards furthering the aims and objectives of this great organisation.

In our own country a new Government with a new political, economic and social programme came into power in April, 1956—a Government which has among its objectives, non-alignment with power blocks and the rapid development of a socialistic pattern of society.

In the field of economic activity it is gratifying to note the grant of 5 million dollars in economic aid by the United States of America out of its foreign aid appropriations for 1955/56. This, together with Colombo Plan aid, will greatly assist our economic progress and provide additional finance for schemes of development already being planned by our Government. Our Prime Minister has stated that foreign aid without political strings, from whatever country it is offered, would be most welcome and I am certain that, in the absence of a sufficient rate of capital accumulation in our country, foreign assistance will provide a useful and much-needed source of finance for economic development.

TEA

This year average prices of tea sold in Colombo have not shown the wide fluctuations experienced in 1955. The steadier conditions are welcome in that they are conducive to expansion of trade and contribute to the stability of the industry, but crop forecasts in North India for the next few months seem to indicate that annual production will be well ahead of last year and that world supplies will be in excess of world demand. A world shortage of good quality high grown tea has in the course of the year benefited producers of tea at high elevations, but growers in the low-country districts have had to bear a substantial drop in their sales prices. In the light of these conditions the renewal of the international tea agreement would appear to be desirable to give market confidence and to provide safeguards for the growers of tea especially in low-country areas which appear to be most vulnerable to fluctuations in market prices.

The ownership of some tea lands in Ceylon has recently been passing to a few Ceylonese speculators who, thinking more of their immediate personal gain than of the economic size of the tea estate, have broken up estates with results which would prove disastrous for the industry if carried out on a large scale. This fragmentation does not augur well for the future of Ceylon's chief industry, and prompt action on the part of the Government to protect this industry is a vital necessity.

The subject of replanting has not received sufficient attention, and progress, if any, has been tardy. Replanting has already been undertaken in India and it is likely that a centrally organised replanting scheme will soon be put into operation in that country. If we are not to be confronted with the prospect of competition from low-cost tea from Indian estates it is essential that we modernise our tea gardens and replant old areas in contour system by vegetative propagation. If owners will not voluntarily undertake these responsibilities, provision should be made by Government to make it obligatory for them to do so. If necessary, Government should levy a replanting cess on exports and give all assistance in framing, co-ordinating and implementing a replanting scheme.

RUBBER

Rubber has lived up to its reputation for elasticity in price and in the course of the year market values have registered many fluctuations which have been caused chiefly by political events and by reversals in the fortunes of the motor industry. Production of synthetic rubber has been increasing in the United States and elsewhere to meet increasing world demand for rubber while production of natural rubber has been lower than last year and still lags behind consumption. With the advance in scientific processes and the production of a more "natural" form of synthetic rubber, competition between natural and synthetic tends to hinge more and more on the price factor, and consequently producers of natural rubber should concentrate on effecting a reduction rather than an increase in the price of their product. The development of synthetic rubber in consuming countries makes it imperative for the producer of natural rubber to rationalise his industry so as to make it competitive in world markets.

COCONUT PRODUCTS

World production and per capita consumption of fats and oils in 1956 are likely to be slightly higher than in 1955, but world exports are estimated to remain more or less unchanged. World exports of copra and coconut oil are expected to be slightly higher than in 1955, but the annual figures of Ceylon's share of these exports, when they are finally known, will probably reflect the decline in coconut production caused by the recent drought. Prices on average have not, however, shown much change in comparison with last year and foreign demand for our produce has continued to be satisfactory.

Competition from synthetic detergents still looms large both abroad and at home, but, as I have said on previous occasions, the future of our coconut oil lies rather in its use for the manufacture of margarine and cooking fats than as a raw material in the production of soap.

EXTERNAL TRADE

The declining income from our exports, chiefly tea, and the increased expenditure on larger, and sometimes more expensive, imports have necessarily reduced the balance of trade in our favour in comparison with the record results achieved last year. An examination of the composition of our exports and imports reveals that the three main export commodities still account for about 90 per cent of our total exports and that expenditure on imports of food forms about 40 per cent of total import expenditure. It has been said before, but it will bear saying again, that a diversification in the composition of our exports and less reliance on foreign countries for essential items of food are highly desirable.

The United Kingdom remains our most important trading partner in the field of both exports and imports, while India, China, Burma and the United States are also prominent in our trading transactions. Our trade with the dollar area continues to give us a fair balance in our favour and our exports to China have increased substantially. It is not the intention of the Government that Ceylon should practise a rigid conservatism in our trade relations, and the diversification of the existing pattern of trade to cover the Communist block of countries will spread our external trade over a wider field.

BANK OF CEYLON

The total deposits of all commercial banks rose during the year under review from Rs. 891 million to Rs. 1,028 million, an increase of 15.4 per cent. During the same period the total deposits of your bank rose from about Rs. 367 million to about Rs. 439 million, an increase of 19.6 per cent. Your bank continues to control over one-third of all commercial bank deposits of the country. I think you will agree that this is a very satisfactory position.

Cash on hand and Balances with Banks rose from Rs. 92.5 million to Rs. 122.5 million. The percentage of Cash to total deposits is thus 27.9. The percentage of Cash, Treasury Bills, Loans Receivable at Call and Money at Short Notice to total deposits is 37.2; and if Trade Bills and Investments maturing within one year are included the percentage is 45.8.

The net profits of the Bank are slightly higher on balance than a year ago, in spite of increasing overhead charges and the heavier burden of taxation. Your Directors are recommending payment of a final dividend of 7½ per cent, making a total of 15 per cent for the year.

As against a paid-up capital of Rs. 4,500,000 we have free published reserves aggregating Rs. 10,500,000 in addition to substantial free inner reserves.

The report and accounts were adopted.

APPOINTMENTS

UNIVERSITY OF NATAL

SOUTH AFRICA

Applications are invited from suitably qualified persons for appointment to the vacant post of LECTURER IN ECONOMICS, Durban.

Salary scale £800 x £50—£1,050 per annum

In addition to the above salary scale, a temporary cost of living allowance of £234 per annum will be paid to married men only.

Application forms and further particulars are obtainable from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close, in South Africa and London, on *February 22, 1957.*

THE UNITED KINGDOM ATOMIC ENERGY AUTHORITY

ASSISTANT CHIEF ENGINEER

Applications are invited by the Industrial Group for a senior appointment in the Inspection and Progress department of the Engineering Branch at its headquarters at Risley, near Warrington, Lancs.

The selected candidate will be responsible to the Chief Engineer for the organisation and control of staff engaged on inspection and progress duties in connection with the manufacture by outside contractors of engineering plant and equipment, the design of which is often novel in application and technique.

Applicants should have served a recognised engineering apprenticeship and be corporate members of the Institution of Mechanical or Electrical Engineers. Wide experience of control of inspection work on mechanical and electrical plant and equipment at manufacturers' works, and an up-to-date knowledge of modern manufacturing and production methods and inspection techniques are essential.

Salary will be assessed within the range £2,000 to £2,500 per annum.

A house for renting by the successful candidate (if married) may be available in due course. Alternatively, substantial assistance may be given towards legal expenses incurred in private purchase. There is a contributory pension scheme.

Application forms may be obtained from the Chief Recruitment Officer, Industrial Group Headquarters, U.K.A.E.A., Risley, near Warrington, Lancs.

Closing date—January 30, 1957.

YOUNG MEN, 23-25 years of age, single, with fluency in at least one foreign language, are required to be trained as Overseas Sales Representatives. Initial training in this country. These vacancies are within a large industrial company in the United Kingdom with associated companies abroad. Good salary offered. Write stating education, commercial experience and other qualifications to Box A.231, c/o Central News Ltd., 23 London Wall, E.C.2.

RESEARCH ASSISTANT with some qualifications in production statistics and company finance required to help in investigation into sector of British business East. Engagement for approximately fifteen months from early 1957. Free travel out and back and monthly salary of £110. Would suit appropriately qualified woman.—Box 593.

MANAGEMENT SELECTION LIMITED have been retained to advise on the appointment of an

EXECUTIVE VICE-CHAIRMAN

for a company employing upwards of 3,000 which is part of a new group and which operates a number of factories making a range of domestic products having a world-wide market, some 50 per cent of the output being exported, mostly to North America. The position of Vice-Chairman is a new one and will also carry a seat on the Board of the parent company.

The vice-chairman, apart from his general responsibilities will have special and direct responsibility for sales and marketing policy.

Candidates must be good administrators whose record shows ability to direct, maintain and develop a successful management team; they should have reached top management level in a company of comparable size by way of a successful career in marketing and sales. *Experience must have been in a consumer trade*—preferably in an industry requiring some artistic knowledge and appreciation of design.

Probable age 45 to 50. Starting salary in the order of £5,000 with pension scheme, car, etc.

Please send brief details in confidence quoting reference (S 223) to R. A. Denerley, Management Selection Limited, 17 Stratton Street, London, W.1. No information will be disclosed to our clients until candidates know their identity and have given permission.

TRADES UNION CONGRESS invites applications for post of Assistant in Research and Economic Department. Sound knowledge of economics and related subjects essential; industrial background an additional qualification. Further particulars before January 22nd from Sir Vincent Tewson, Trades Union Congress, 23-28 Great Russell Street, London, W.C.1.

LONDON COUNTY COUNCIL

GARNETT COLLEGE

(Training College for Technical Teachers)

83 New Kent Road, S.E.1.

Principal: C. Jameson, M.Ed., B.Sc.

Applications invited from suitably qualified persons for appointment as LECTURER; person appointed will be required to take part in instruction relating to General Theory and Practice of Education, with special reference to Further Education, and undertake some tutorial responsibility and other work on teaching method applicable to subjects included in the general education of Young Workers; teaching experience in an establishment of further education essential, and experience with young people in industry an advantage. Training College Salary. Appointment will be to the Council's service with assignment to this college.—Application forms and further particulars obtainable from and returnable to Principal at college (S.A.E. f'scap) by January 21. (2478)

CHIEF MECHANICAL ENGINEER

Leading, well-established and expanding Group of Companies requires Chief Mechanical Engineer. Successful candidate, 35-50, should have university degree or equivalent, and associate membership in one of the senior professional institutions.

Sale or shop experience essential with apprenticeship ten years on project design, with proved ability in the design of mechanical handling machinery, piping layouts, pressure vessels, heat exchangers, pumping installations, and associated electrics and instrumentation. Candidates must be knowledgeable in industrial economics and estimating applied to plant design. Experience of modern construction methods essential. Should be able administrator. Substantial four-figure salary, bonus, pension plan and assistance accommodation, etc.

Responsibilities include development of mechanical handling machinery, designs for industrial plants, and management of team of design engineers and related personnel.

Apply in GUARANTEED STRICTEST CONFIDENCE in accordance with professional ethics, giving details of date and place of birth, education, background, names of firms, positions held with dates and salaries to

Dr P. S. de Q. CABOT,

P. S. CABOT & COMPANY,
37-41 BEDFORD ROW,
LONDON, W.C.1.

OPERATIONAL RESEARCH

COURTAULDS LIMITED have the following two vacancies for Senior Assistants in their Central Operational Research Department in Coventry. This Department is concerned with a very wide range of problems in the management, production and technical fields and offers ample scope for originality.

(a) *Mathematical Statistician*

Applicants should hold a good degree in statistics, or in mathematics with post-graduate study or experience in statistics. This post offers considerable opportunities to suitably qualified men. Investigations in hand at present include: queueing and related topics, experimental design, programming techniques and electronic computer applications. There is also scope for mathematical research of a fundamental character into special problems in the production field. Reference number C.60.

(b) *Scientist or Engineer*

Applicants should hold a good degree in one of the following subjects: Physics, Chemistry, Mechanical, Electrical or Chemical Engineering. *Corresponding industrial experience would be an advantage.* The post requires primarily a man with practical insight and constructive imagination. He should have an interest in mathematics and candidates with some acquaintance with statistical methods are particularly welcome. Reference number C.82.

A good starting salary will be paid in both cases depending on qualifications and experience and the appointments are pensionable.

Candidates should write for a detailed form of application to the Director of Personnel, Courtaulds Limited, 16 St. Martin's-le-Grand, London, E.C.1, quoting the appropriate reference number.

SALES MANAGER

Applications are invited for the post of Sales Manager to cover the activities of a Chemical Engineering firm in the Chemical, Pharmaceutical and general industrial fields.

The position requires a good knowledge of fabrication techniques, preferably in stainless steel and aluminium, supported by engineering qualifications and a broad appreciation of chemical processes. Adequate commercial experience is required, with proved ability in management of staff.

The position, which is pensionable, will be responsible to the Sales Director of the Company, and the salary will be fully commensurate with the responsibilities which are substantial.

Applications, in confidence, should be made in writing with fullest details, to the Sales Director, the A.P.V. Company, Limited, Manor Royal, Crawley, Sussex.

AN Economist, aged about 20-25, is required to join an existing team engaged on research into commercial and operational aspects of shipping. Some practical knowledge of shipping necessary. Full scope available for personal initiative and development of fresh ideas. Salary in accordance with age and experience.—Apply Box 599.

A GRADUATE STATISTICIAN is required by the Milk Marketing Board for work in connection with statistics from their Creameries and Central Laboratory. Post is permanent and pensionable. Age 25 to 30. Experience an advantage. Commencing salary £600/£700 according to age and experience. Applications to Establishment Officer, Milk Marketing Board, Thames Ditton, Surrey.

PUBLIC RELATIONS

A leading Pharmaceutical Company is seeking the services of an Assistant to their Public Relations Officer.

Essential qualifications are lucidity of expression together with the ability to process complex scientific material for non-specialists. Formal scientific or academic qualifications are desirable but not essential.

The post offers work of a varied and interesting nature with ample scope for initiative.

A high standard of performance will be expected of the successful applicant.

A salary commensurate with experience and/or performance will be paid.

The Company operates a generous non-contributory Pension and Life Assurance Scheme.

Applications, which will be acknowledged, giving full personal details, résumé of career to date, interests, etc., should be addressed to Box 597, quoting reference F/AO/157.

A VACANCY exists for an experienced journalist to be trained as Publicity Officer of a large British technical organisation with world wide interests. Headquarters in London. A high educational standard and ability to write good English are essential. Some knowledge of ships and engineering an advantage. Applications will be treated in confidence.—Box 598.

N.Z. REPRESENTATIVE. Graduate in engineering with business experience and contacts in both New Zealand and Australian industry wishes to become associated with Principals in developing manufacture and/or sale in Australasia, preferably New Zealand. Prepared to visit U.K. immediately suitable proposition is offered.—Reply P.O. Box 2319, Wellington, N.Z.

MANAGING DIRECTOR, age 41, proved administrator after six years as M.D. of specialised manufacturing company, now seeks wider scope. Though non-technical, accustomed to lead team and co-ordinate efforts of senior executives and technicians; financial, commercial and personnel policy, successful negotiator in U.K. and overseas.

Present emoluments £5,000 p.a. Would welcome personal interview (principals only) in strict mutual confidence.—Box 596.

B.SC.(ECON.) LONDON UNIVERSITY

UNIVERSITY CORRESPONDENCE COLLEGE provides postal tuition for the above Degree (obtainable without residence), which is a valuable qualification for those seeking executive appointments in commerce or industry, government or municipal posts. The College, established 1887, is an Educational Trust. Highly qualified Tutors. Low fees. Prospectus of U.C.C. Courses for London Degrees and Diplomas, G.C.E. free from the Registrar, 60 Burlington House, Cambridge.

THE CHARTERED INSTITUTE OF SECRETARIES

Employers requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute (Dept. E), 14 New Bridge Street, London, E.C.4.

THE Economists' Bookshop has the world's widest range of books on Economics, Politics, History, Anthropology and the Social Sciences. World-wide mailing service. Second-hand books bought.—11-12 Clements Inn Passage, Aldwych, London, W.C.2.

SUCCESSFUL TUITION FOR THE B.SC.(ECON.) DEGREE

Wolsey Hall (Est. 1894) provides Postal Courses in a wide range of subjects for the two examinations for Lond. Univ. B.Sc.(Econ.) (three if Entrance is included). Moderate fees, instalments. Over 1,000 Wolsey Hall students have secured this valuable degree since 1925.—Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P.16, WOLSEY HALL, OXFORD.

IS Washington living a double life in respect of Russia's recent troubles and America's declared European strategy? This week the famous American fortnightly, *The Reporter*, discusses "The double life in Washington and Bonn." A haunting article on the crisis of civilisation in North Africa, and an account of how the U.N. troops were mobilised for Suez, help make up a fascinating issue. Order your copy or subscription from your newsagent or direct from Transworld Circulation Company, 134 Park Royal Road, London, N.W.10. Price 2s each fortnight.

EXPERT POSTAL TUITION

for Examinations—University Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus—and/or advice, mentioning examination or subjects in which interested, to the Secretary (G9/2),

METROPOLITAN COLLEGE, ST. ALBANS

or call at 30 Queen Victoria Street, London, E.C.4.

ANNUAL AIR SUBSCRIPTION RATES

Subscriptions to most countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is either because the alternative is not available or not recommended.

ATOMIC POWER FOR PEACEFUL USE . .

[some more facts of interest

IS NUCLEAR FUEL EVERLASTING? The closed-circuit boiling water type of reactor, which Mitchells believe to be ideally suitable for use in remote areas and for Commonwealth development, consumes very little fuel. A reactor producing 60 megawatts of electric power 'burns up' *230 lb* of fuel per annum out of the charge of 50 tons. The equivalent consumption of coal would be *275,000 tons*. Limited renewal is, therefore, necessary, but this is a routine job presenting no difficulty.

IS NUCLEAR POWER SAFE? The boiling water reactor is inherently safe and self-regulating. A nuclear explosion *cannot occur in it*. Any faulty operation which might cause over-rapid heating would also create pockets of steam which would automatically reduce radio-activity and heat production.

IS NUCLEAR POWER COSTLY? Nuclear fuel has to be processed and is at present expensive, but such efficiency has already been achieved in converting it into electric power that operating costs are in every way competitive for small-load units and for remote areas. These costs will be lowered progressively as nuclear fuels are themselves manufactured more cheaply.

MITCHELL DEVELOPMENTS in the field of atomic power are the logical outcome of 35 years' exceptionally wide experience in all branches of engineering and electrical supply. The agreement between Mitchell Engineering Ltd and AMF Atomics Inc of New York, will undoubtedly have far-reaching effect in applying atomic power for the benefit of mankind.

MITCHELL COMPANIES are at present engaged on the important contracts for the United Kingdom Atomic Energy Authority.

they saw this man— exports up 16 times in 10 years*

with acknowledgments to JOHN BARTHOLOMEW & SON LIMITED

At the end of the war a firm of tool makers decided to go right out and capture world markets. They asked E.C.G.D. for advice, discovered that much of the cover offered could be obtained nowhere else, and duly signed a contract. A bold and wise decision! In 1945 they were shipping £35,000 worth of tools, in 1949 £250,000 and in 1955 £589,000—a sixteenfold increase. All that time they won more and more new markets and the score is now 54. Sheer business initiative put that firm into the market limelight, but they would be the first to admit that nothing makes business expansion easier than a background of security. In this case, £3,772,000 worth at a cost of under 7/4d per £100!

Whether you are already exporting or are studying form, *see the E.C.G.D. man when he calls.* After all, you've nothing to lose—and the world to gain.

* This is a true story, but because business between E.C.G.D. and exporters is strictly confidential any details which could identify the exporter have been left out.

E·C·G·D

E.C.G.D. is a Government Department set up to help exporters. Its services are fully explained in the booklet —'Payment Secured'. Write for free copy.

SUNDAY MORNING PINT

We don't ask that you should think of Evershed when next you drink your Sunday morning pint. For one thing it is no time to talk shop and for another it can confuse the barman.

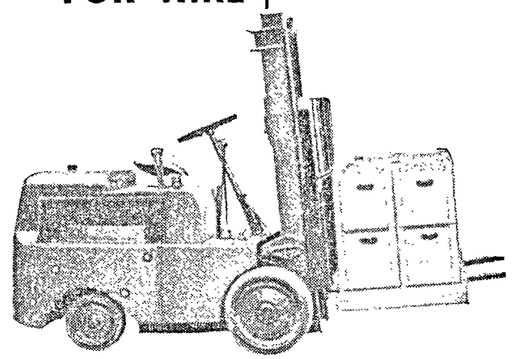
There is no beer sold under the name of Evershed and Vignoles Ltd.

And even when you drive your car home from the same Sunday morning ritual (assuming that coupons permit) we don't expect that you will think of Evershed. Think rather of your driving; after all, Evershed's do not make cars—even parts of cars.

And as you let yourself in, overtly or covertly, and absorb the appetising smells from the kitchen, you need not think of Evershed's.

There is no cooker, no food, not even a knife or fork marketed under the name of Evershed and Vignoles Ltd.

But the truth is that almost every feature of your Sunday life and, indeed, your everyday life, utilises Evershed equipment at some point. Every time you take a glass of beer, use petrol to drive a car, make a journey by public transport, eat a cooked meal—somewhere along the line Evershed instruments or instrumentation equipment will be involved. Instruments for testing, recording, analysing; small electric motors and marine equipment; specialist control systems both large and small for use in essential industries and public utilities.



This has been the expanding role of Evershed and Vignoles Ltd. for over sixty years. We don't ask you to think about it. We merely think you should know.

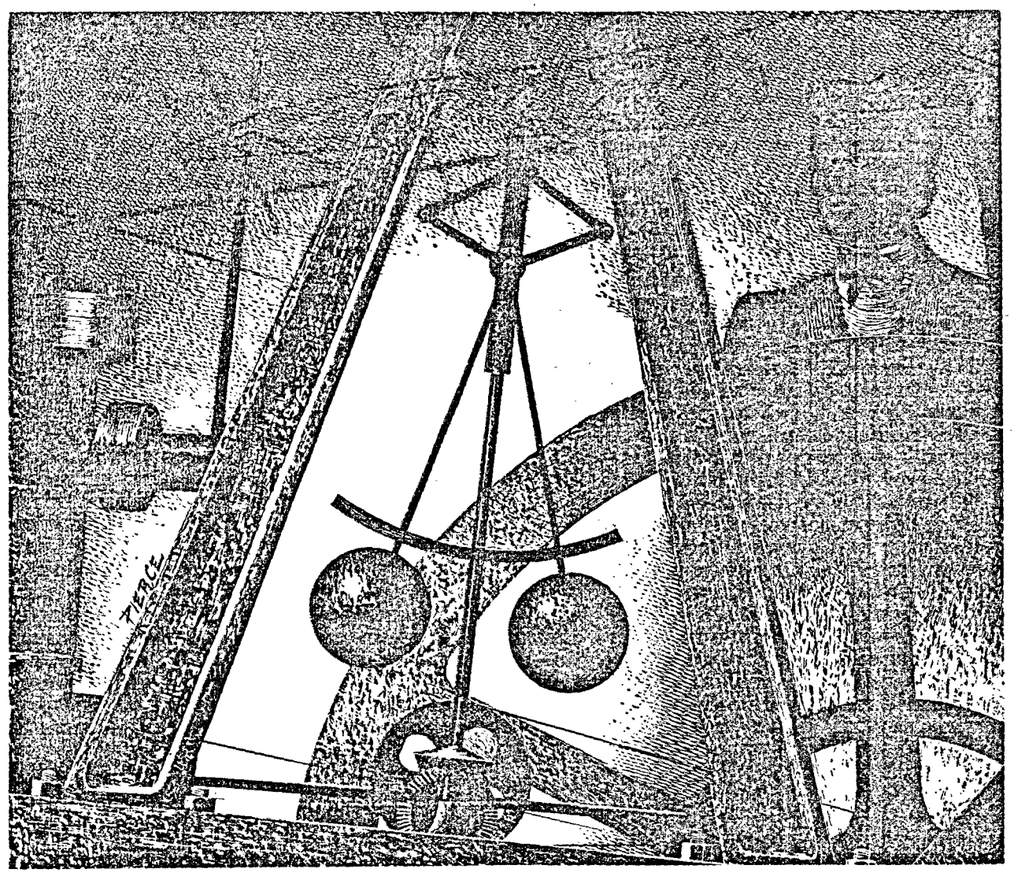
Dismantling Expert

The old clock has seen better days. Now some of the parts are put to one side for future use. In the factory across the road, something similar is happening on an industrial scale.

The old machine shop has outlived its usefulness, so Thos. W. Ward Ltd. have been called in to demolish it. Those machines and materials which are still useful are being carefully preserved to form part of the great new machine shop which will rise on the site.



An undertaking of this kind in which speed is all important, calls for long experience and careful planning. Wherever dismantling and demolition are the prelude to industrial developments, Wards are the people to handle the contract.

Industrial dismantling is just one of the many activities of the Ward Group of Companies whose scope is as broad as industry itself.

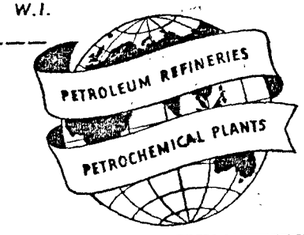
THE ONLY ANSWER...



At Kellogg House the problem has been trying to "put a quart into a pint pot". This situation developed even though the Kellogg International Corporation anticipated an expansion of the petroleum and petrochemical industries. To provide additional engineering services for this expansion, four years ago the Kellogg International Corporation moved from the City to offices nearly three times as large at Kellogg House in the West End. Since then, the Kellogg International Corporation engineers have participated in the expansion of the petroleum and petrochemical organisations in the United Kingdom, France, Belgium, Italy, Germany, Yugoslavia, the Near East, South Africa, Australia and even Canada. To supply material and equipment for these projects, the Purchasing and Procurement Groups at Kellogg House have been dealing with over four hundred British manufacturers. The offices at Kellogg House could no longer house our steadily growing staff. Doubling the size of Kellogg House was the only answer to maintaining our high standards of engineering services.

Executive material

—HOW IS IT TO BE FOUND?

For the fourth year in succession, the Manchester Guardian is helping employers tackle this problem by putting them in touch with intelligent youngsters keen on making a worthwhile career.
Beginning on January 21 and continuing until March 4, thirty-one leading companies will take turns to present a daily whole-page announcement about the careers each of them offers to graduates and school-leavers. The response to last year's announcements was so successful that many of the same firms will be taking part again, together with new ones. Here is an interesting and imaginative approach to the problem of staff-recruitment which you may well find worth looking at.

Registered as a Newspaper. Entered as Second Class Mail Matter at the New York, N.Y., Post Office. Authorised as Second Class Mail, Post Office Dept., Ottawa.

The Year is 1957

WHEN Sir Winston Churchill formed his great administration in May, 1940, he told the House of Commons that his policy was to wage war. With equal simplicity, Mr Harold Macmillan might be recommended to say that his policy will be to face facts. The shock of the Suez adventure and its aftermath has brought the country to one of those rare (and usually brief) moments when there is a willingness to question some of the taboos and to re-examine what is normally taken for granted. It is a gain to be set against the losses lately incurred that there is an opportunity now for realism to thrust some wedges into the wishful thinking which has been the bane of public opinion, and of public policy, all through the postwar years. This can do nothing but good; there is hardly a problem facing the country today that will not be eased by a dash of cold realism.

Neither party, and no section of opinion, has been exempt from this weakness. Not merely has there been a wish that the awkward facts of life did not exist, but policy has been built on the assumption that they would go away if they were not molested. The Labour party's favourite illusion is that wealth can be distributed without having to be created; that this illusion is still in full flower is demonstrated every time a trade union demands that its members should be allowed to take more out of the pot without putting any more in. The Conservatives' favourite illusion is that an appearance of dynamism can be fashioned out of a number of hard-fought rear-guard actions. There is an almost universal unwillingness to live in the present and to come to terms with its realities. Between those who try to wield the authority of 1927 long after it has vanished, and those who try to spend the wealth of 1987 long before it has been created, there is imposed on the mechanism of the British state a burden far heavier than it can carry.

This is perhaps most apparent in the external sphere of Britain's relation to the outside world, and it is here where reality has now most savagely broken in. There are few left who doubt that Britain has been trying to play a bigger role than can be sustained by the resources, political, military or financial, that it can bring to bear. Indeed, there are some signs that the reaction has gone too far; there are some people who seem to think that there are no intermediate steps between The Empire On Which The Sun Never Sets and the fate of Nineveh or Byzantium. It is hard to say whether more harm is done by the people who assert that Britain is now a second-rate power or by the plaintive defensiveness of those who write letters to the papers to say that it is very wrong even to harbour any such thought. Nobody outside this island bothers his head about these exercises of classification; prestige among the nations is not to be won by the colour of a ribbon or by words on a label.

The essential fact to be faced is that Britain, together with at least 68 out of the 70 nations of the world, is no longer fully independent,

in the sense of having a full and free choice of its course of action. There is surely no disgrace in admitting this fact, which is imposed by the realities of geography and technology. Nor need it follow that Britain must now abandon all the objects of its policy around the world; that would be to turn from pride to the sulks. The essential lesson to be learned is that the objects can only in future be attained in association with others. Other nations cannot be expected to accept our objectives, or to support us in our means of reaching them, unless they agree with them; and agreement is not to be had by incantations to the world's need for British leadership, but by patient and open debate and discussion on a basis of sincere parity and of a wish for true partnership. If the world (or parts of it) is moving towards a system of government by discussion among equals, the British should feel more flattered than affronted.

★

In this respect, one of the features of the new Government is very welcome. Whether by accident or design, there is a combination of "good Europeans" in the important offices. The new Prime Minister himself is committed to the reversal of the policy of standing aloof from Europe; Mr Peter Thorneycroft, the chief progenitor among Ministers of the policy of association with the "common market," moves to the Exchequer; and Sir David Eccles, his successor at the Board of Trade, has taken political risks in the past for his Europe-mindedness.

Nevertheless, even in this connection, a word of warning may still be needed. The cause of closer association with Europe has received many new recruits in recent months, and one cannot escape the suspicion that too many of them regard it as an alternative to, almost as a *riposte* against, the alliance with the United States, Canada and the rest of the outside world. It needs to be made unmistakably plain that any attempt to found a new policy of empire-building in Europe on the ruins of the old in Asia will founder on the opposition of the other European countries. Association with Europe, as with the Commonwealth, is possible (and desirable) only in concert with an Atlantic alliance. Talk of a "third force" as an alternative to that alliance is beating the air fully as much as the yearning for a self-sufficient Commonwealth.

★

These external illusions, disastrous though they have proved to be, have done no more harm than the great domestic illusion from which all sections of the British people have been, and still are, suffering. This is the illusion that wealth grows on trees and that growth is painless. It is true that we have been living through a decade when, for all the foolish things that were done, the economic chickens could always be persuaded to postpone their return to roost. But recent months have revealed the precariousness of the economy. It has been shown, especially, how terribly dependent it is on one commodity moving through a single ditch. Even before the Suez crisis, one industry after another was learning that the world will not always be ready to buy British out of admiration for the British moral character. The British balance of payments, which means the British standard of living, is in more danger than it has been for many years. The leeway provided by the devaluation of 1949 has been used up, and we are back in the period when special efforts and the perpetuation of what were meant to be temporary restrictions are needed simply to keep our head above water. It is another illusion that anyone can be the world's banker without being solvent.

No doubt it is possible to double the standard of living in twenty-five years: but only if limits can be set on present consumption, and if both the resources can be set free, and some incentive provided to use them, for the imaginative enterprise that can alone perform the miracle. The immediate task for the Government is not merely to reduce the burden of taxation, but to do so in such a way that the major benefit accrues to investment in the means of production and not to consumption, to rewards for work and not to "fair shares." It will be a test of the realism of the public whether such measures are attacked as "reactionary," or whether they are accepted for what they are, the necessary means to economic progress for the benefit of all.

★

To say that the great need of the moment is for the shattering of illusions is not, then, to advocate pessimism or to be despondent of the future. On the contrary, it is only by facing facts that the road ahead can be planned. This is not a lowering of ambitions; it is more akin to the way in which a good rider will "collect" his horse before a jump, which may make all the difference between getting over safely and coming a cropper. It is the effective application of accurately assessed resources.

It may be that other times have been, or will be, luckier for the British people than the present; it is certain that other times in the past have brought more satisfaction to individual British citizens, whether in the exercise of authority or in the enjoyment of wealth. But they have gone beyond recall. Those who will build the future are those who recognise and master the present. And those who will master the present are not those who wish they could live at some other time; they are those who will seize with zest the opportunities it offers.

The most essential of all the facts that Mr Macmillan and his Cabinet colleagues, and the whole British people, have to face can be read on the calendar. The year is 1957.

A New Team

ONE normally moderate newspaper has attacked Mr Macmillan's chosen Ministry as giving the impression of "an unreconstructed, almost die-hard group." This is quite unjust. In domestic affairs the new team looks—although with certain reservations—as if it could be more progressive and liberal than the old. In foreign affairs it is necessary to retain both a sense of proportion and a realisation of the problems ahead.

Mr Selwyn Lloyd returns to the Foreign Office down a long, cold arch of raised eyebrows. But fairness should prompt the reflection that he has had to carry the can of collective Cabinet blunders round the most awkward places of the world; he has deserved not a little sympathy at home, and earned much abroad, as he took all the bludgeonings. There is no real danger that Mr Selwyn Lloyd's continuance in office will revive the period of mutual pique in Anglo-American relations. What it may prolong, however, is the period of polite covering of mutual embarrassment; and this —contrary to what has been written in most circles about this reappointment—may mean that the creation of a new foreign policy, which is essential, may still have to go forward with Britain in an unduly impeding attitude of apology. For who, honestly, do the Conservatives think will have the most embarrassment to cover?

Mr Macmillan's difficulty was presumably to find an alternative. The delegation of the Foreign Secretaryship to Mr Butler—which would have been the best solution—was apparently ruled out. The appointment of Lord Salisbury (who may still have a special voice in this field) was made difficult by his peerage, by his health and by the fact that it might have been cynically—unworthily cynically—read as a personal reward by the Prime Minister for recent services rendered. There remained the choice between the reappointment of Mr Selwyn Lloyd (which has the real advantage that the Cairo newspapers will not be set crowing) or the elevation of some other minister who might have had more chance to start doing for Conservative foreign policy what Mr Butler has done for its home policy. On balance—but only on balance —the latter would have been the better course; a good choice would have been Mr Heathcoat-Amory.

★

In domestic affairs Mr Macmillan was in no such quandary. The welcome appointment is that of Mr Thorneycroft as Chancellor of the Exchequer. This is a case where virtue has been rewarded, after having threatened so often to bring Conservative party vengeance. In these last five years of remarkable achievement in internal and overseas liberalisation, Mr Thorneycroft has so often looked like Huskisson and so rarely like Mr Thorneycroft that one had sometimes come unworthily to wonder whether he really was Mr Thorneycroft.

His task now could be a delicate one, in view of the presence beside (and above?) him of his two predecessors. Mr Butler, when Chancellor, believed in an economy flat out for expansion and freedom; Mr Macmillan (partly on the advice of his Treasury staff) favoured a little more emphasis on the brakes and often threatened (without ever in fact doing so) to use physical controls as part of them. Mr Thorneycroft would be wise to steer a middle way between the two precedents, but a little nearer the Butler formula. He should now be watching out for the right moment for re-expansion (though not to the point of 1955 recklessness) and should abjure obeisances to physical controls in his perorations as well as in his policies.

★

All this presumes that the Prime Minister's interventions in domestic affairs will be neither over-cautious nor unexpectedly overbearing. On this presumption Mr Butler's influence in domestic policy could even be slightly strengthened in the new line-up. When he took up the post of Lord Privy Seal in the Eden Government, he hoped to be able to keep a watching brief over all aspects of home policy, save those that fell within the province of the Chancellor. There were two main difficulties in the arrangement. One was that the ideas passed down by Mr Butler tended to clash with the slightly different ideas intermittently passed down by the Prime Minister and constantly passed down by the Chancellor; Butlerites who compare the present situation with what was, instead of with what might have been, should take comfort from the reflection that Mr Macmillan's elevation from the Chancellorship to the Premiership—and Mr Thorneycroft's accession to the former post—may have increased the degree of Butlerism in both these offices.

Mr Butler's other main difficulty under the old Government was that he lacked the authority of a great department of state (and the help of its civil service) behind him, and this made it difficult for him to inculcate his influence into other great departments (including, especially, Mr Lloyd-George's Home Office). Mr Butler has now had that problem solved for him by being allowed to take over the Home Office himself. Paradoxically, however, the main casualty of this decision could be the many reforms that are required in the Home Office's own field: recasting of the betting laws, liquor licensing, the Shop Hours Bill, the laws of Sunday observance and obscenity, prison reform and the rest. Mr Butler will not have the time to do the

detailed thinking that is required on these matters, while still carrying on his other functions as Lord Privy Seal and Leader of the House. He would be well advised to delegate the job to whoever is to be his Under-Secretary.

The streams of influence on domestic policy coming down from the Prime Minister, Mr Butler and Mr Thorneycroft could therefore converge into something near to the right mixture. One place where the views of this triumvirate probably will, and should, meet some sensible resistance is in the Ministry of Defence. Mr Macmillan had three choices of method here. Either he could continue the tradition that this Ministry acts as part-bargainer and part-arbitrator among the competing service departments, a role which Mr Head promised to play at least as well as (probably better than) his predecessors ; or he could install an ambitious hatchet man to carry through the cuts in defence expenditure which both Mr Macmillan and Mr Butler, and the public generally, want ; or he could install a strong man who, commissioned to combine economy with efficiency, would make up his own mind and —after explaining to the Cabinet the considered reasons for his conclusions—stick to it. The third choice was the best ; and by appointing Mr Sandys, the Prime Minister may possibly have made it. Mr Sandys's pertinacious methods of securing compliance with his wishes can be criticised, but it is right to have a Minister in this office who will not mind whether he is liked in the subordinate service departments, provided that he is respected. One may hope that certain service shibboleths will now be no more inviolate than some former local authority ones, or even than Christ Church meadow.

★

Lower down the Cabinet list, but right at the top of the list of surprises, comes the appointment of Sir Percy Mills as Minister of Power. One has an uncomfortable feeling that this device of Mr Macmillan's may prove, like his premium bonds, to be not so much a device as a gimmick. The idea of bringing in an outsider of great energy, to handle a vitally important task where energy is certainly required, is one which Mr Macmillan shares with great men, such as Sir Winston Churchill and President Eisenhower ; but in British political life it has often failed. A main aim of the new Ministry should be to press forward with the atomic energy programme. There are indications that a first phase of this battle may already have been won by Sir Percy's able predecessor, but the prospect of a continuing fight remains. One obstacle for the new Minister to overcome will be the other claimants in the queue for scarce capital resources. Another obstacle will be the untimely fears of the Coal Board that in certain circumstances it might not be able to sell its coal, and of the Central Electricity Authority that atoms represent new-fangled competition with traditional methods of production ; here Sir Percy, as Minister for all Power, will have to argue with himself, or rather with groups in his own Ministry. A third obstacle is the conservatism in some parts of the Treasury. These are tasks of great political delicacy, and it remains a crucial question whether (even with Mr Maudling's aid) a businessman with no experience of politics is really the right person to handle them.

The formation of this new Ministry has been hastened by the oil shortage that has followed the Suez crisis. The elevation of the Minister of Transport to the Cabinet owes much to the same development. This, surely, is a mistake. The point about the Ministry of Transport is that it always seems to be an important job, because it could easily provide full-time employment for at least two men, but not men of Cabinet rank. Mr Macmillan's reaction to his realisation of this importance has been to make more claims on the time of the one man who is trying to do the job already. The busy Mr Watkinson, in his present office, has had many ideas (most of them rather good) and done many things (some of them rather bad). He can be counted upon by his nature to enter into the business of wider Cabinet consultation with considerable and possibly rather regrettable enthusiasm.

★

Among the other Cabinet appointments, Sir David Eccles goes to the Board of Trade as one of the three former "European Unity" devotees to get promotion (the others are Mr Sandys and the new Secretary for Scotland, Mr Maclay). This week's new stage in the discussions about a free trade area with Europe therefore starts under a fair wind. It is a necessary function of a Conservative President of the Board of Trade to get into trouble with some of his party's paymasters, and it may be useful practice for Sir David to risk his first dose of this for a cause in which he believes.

Lord Hailsham, who succeeds Sir David Eccles at the Ministry of Education, has a proper ambition to make the most of whatever is his designated province ; his departure from the Navy is therefore timely, and it is probably a mercy that he has not been moved to anything foreign or colonial. He should be warned, however, in the friendliest way, that it is probably easier to get into unexpected hot water by making unconsidered speeches in his new Ministry than in almost any other department. Finally, Mr Henry Brooke may find his great experience of local government a disadvantage in his new office as Minister of Housing and Local Government ; this Ministry properly has considerable powers of control, and it is better that a novitiate in it should start with an inclination to protect the public against local councils rather than the other way round. One would guess—and hope—however that Mr Brooke will carry through the remaining stages of the Rents Bill with courage, even although the complete freeing of "middle-class" properties is causing considerable furore in his own constituency of Hampstead.

Such, then, together with the expected appointment of Dr Hill as the Government's megaphone and the retention of the six men who remain in their former offices, is Britain's new Cabinet. Every Ministry, both in set-up and personnel, inevitably reflects the personal experience, predilections and preferences of the Prime Minister who chooses it. It also reflects the pressures upon him. Mr Macmillan's predilections have always been a bit of a mystery. Originally a man on the Fabian left of the Tory party, he seemed for a time, when the surge of postwar Conservatism went (and went much more sensibly) to the liberal left, to be less sure than other "new Tories" that change really was Conservatism's ally. But the lurch away from liberalism that was forecast in some circles after his accession cannot honestly be discerned in the men he has chosen. The test will be what they do.

Cracked Monolith

THE new year has brought much to-ing and fro-ing in the communist world. In Budapest, Marshal Bulganin and Mr Khrushchev have had a "comradely and friendly exchange of views" with communist leaders from Czechoslovakia, Bulgaria, Rumania and Hungary. Herr Grotewohl has been having talks in Moscow. Mr Chou En-lai is circulating between Moscow, Warsaw and Budapest. And last week the harassed Mr Kadar suddenly flew off to Moscow, where he was closeted with his recent guests from Russia and his prospective guests from China.

These mid-winter peregrinations are accompanied—as might be expected—by a chorus extolling the solidarity of the communist camp and urging that everything should be done to keep it this way. In fact, the monolithic empire created by Stalin is in greater danger of division, and even of disintegration, than at any time in the past ten years. The damage already done is plain to see. The lingering revolt of the Hungarian people has revealed the bankruptcy of communism's claims to be a popular system of government. The Hungarians' stubborn insistence on political freedom has shown that the answer to Moscow's problem does not simply lie in providing, or promising to provide, more food, clothes and television sets. The intervention of the Soviet army to crush the Hungarian revolt has not only troubled and divided communists throughout the world ; it has also exposed the true nature of the cement that binds the Soviet block together—a cement which would obviously be better hidden under layers of whitewash.

In Poland, Mr Gomulka has asserted a measure of independence from Russian control. This has enabled him to damp down Polish aspirations for more freedom —at any rate for the time being. But in taking advantage of Mr Khrushchev's admission that there is more than one road to socialism, he is, in the Russians' view, jeopardising their primacy. He has, moreover, taken up with the Jugoslavs (representatives of the two parties have been conferring in Warsaw) just when Soviet-Jugoslav relations have again become painfully strained. The Warsaw-Belgrade axis which seems to be forming will not appear as a welcome innovation to the Russians. Two years ago they hoped to strengthen their empire by enticing the one prodigal son back home. Instead, they now find Marshal Tito leading a second member of the communist family astray and engaging in an ideological free-for-all with the rest.

★

Finally, in counting up the damage to the communist block, one must include the consequent weakening of its military position and its economic disorganisation and difficulties. Formerly the ring of buffer states in eastern Europe was a clear military asset to the Russians. Now it looks more like a military liability ; one country is openly held down by Russian tanks, a second has circumscribed, by treaty, the rights and position of Soviet troops stationed within its borders, and the trustworthiness of the armed forces of the rest has been called in question by the behaviour of the Hungarian armed forces last November. The economic strains within eastern Europe are described in detail on page 212. Moscow's efforts to integrate the economies of the block into a close-knit whole have been riddled through by the near-collapse of the Hungarian economy, by the Poles' insistence on cutting their coat, economically, according to their cloth, and by the sheer inability of the rest to reach the production targets set.

The Russians' reaction to the present discontents is to close the ranks and, without reverting to the intense repression of Stalin's later years, to reaffirm the basic tenets of communism. In their view, the movement towards more liberal policies, which has been gathering momentum for the past year, is getting out of hand. "Proletarian internationalism" is in danger of becoming a shadow of its former self. The Poles and the Jugoslavs muddle it up with mere co-existence between communists and other workers' movements and harp on the need to avoid any "trend towards hegemony." *Pravda* rejects this definition on the revealing grounds that it lacks the essential "militant revolutionary appeal" of proletarian internationalism, tends to ignore the continued validity of the slogan "workers of the world unite," and ignores the "liberation struggle of

colonial peoples" and their need to fight against "bourgeois nationalism and reformism." The doctrine that there is more than one road to socialism, in fact, is undermining the leadership of Moscow, while the attack on "Stalinism" is threatening to develop into an attack on communism itself. The Russians still subscribe in theory to the view that every communist party must find its own way and that all have something to learn from each other. But while all are equal the Russians are, in effect, more equal than the rest; "different roads to socialism" are all right only as long as they do not challenge Soviet domination.

"The false slogan of so-called 'national communism,'" as *Pravda* puts it, has been "invented by the imperialists" with the object of splitting the communist movement. It has been taken up, says the Czech paper *Rude Pravo,* by Mr Dulles and "every child knows that Dulles is as fond of communism as the devil is of holy water." "Stalinism" is another invention of the imperialists. Stalin had all the right ideas and went astray only over the cult of personality. The Chinese communists have lent their weighty voice to this campaign of "restalinisation." After discussing Stalin's record at length they have concluded that his "mistakes take second place to his achievements."

★

Behind all these arid exchanges are two main impulses. The Jugoslavs, backed, in private at least, by Mr Gomulka and his friends, believe that if the communist system is to thrive, it cannot be confined within one ideological straitjacket manufactured in Moscow—or for that matter in any other communist capital—especially as, in their view, the Russians under Stalin committed far greater and more far-reaching mistakes than they are apparently now prepared to admit. They maintain that, far from splitting the communist movement, they are merely trying "to perceive what is rotten (in the movement) and do away with it mercilessly and honestly"; they want to avoid "ideological stagnation." The Russians, on the other hand, profess to fear that the attack on "Stalinism" is developing into an attack on the dictatorship of the proletariat and other essentials of Marxism. Backed now by the Chinese, they are strongly opposing any attempts to revise the basic principles of Marxism-Leninism.

Neither the Jugoslavs nor the Poles, nor any other communists of an independent turn of mind, would ever admit that they were guilty of "revisionism." But they do desire to shake off the close control of the Russians, and so long as Moscow seeks to preserve its empire, it will attack those communists who threaten to disrupt it, not for their real sin but for their alleged treachery to Marxism-Leninism. The fact is that, when the ideological jargon is stripped away, all communists, whether in Moscow, Peking, Warsaw or Belgrade, are seen to be exercised by the same problem; how to remain in power. Mr Gomulka believes that his regime would be stronger if it could be shown to be really independent of the Russians. Yet other communist leaders in, say, Prague or Bucharest, probably feel that unless their dependence on Russia is close and obvious, their countries may go the way of Hungary. The dilemma is plain. The Jugoslav communists have won their independence of Moscow, but they cannot feel completely secure so long as the independence of other communist regimes is not recognised in both theory and practice; and the armed Soviet intervention in Hungary has reawakened all their fears of Russia's "hegemonistic tendencies." The Chinese, too, are no great lovers of "great power chauvinism": but, in their view, the communist block must be maintained as a base from which communism can be spread; and they are willing to endorse Russian leadership for the strictly practical reason that they badly need Russian economic help.

★

In internal affairs, the argument is whether a popular explosion on the Hungarian model is more likely to be averted if the safety valve is tightly screwed down or if it is somewhat loosened. On Sunday, Mr Gomulka is putting to the test his theory that, within limits, it is best loosened. He finds himself in the unusual position—for a communist—of awaiting the verdict of the polls with some apprehension; for although the Polish voter had been given only a very circumscribed freedom of choice, he yet has a real opportunity of intimating whether or not he approves the present regime. If the elections turn out badly for Mr Gomulka, then the argument of the "Stalinists" that almost all concessions are dangerous will be greatly strengthened throughout the communist world.

But Mr Gomulka has said bluntly that, whatever happens on Sunday, the Polish communists intend to stay in power. It is this determination to hang on to power that makes it premature to regard the communist world as in danger of early dissolution. There is in fact no sign that the Poles or the Jugoslavs (or Mr Kadar) have any intention of allowing free elections or of opening the door to a return of "bourgeois democracy." All would no doubt subscribe to the Chinese party's statement that "however many twists and turns may await us . . . humanity will eventually reach its bright destiny—communism. There is no force that can stop it." But the ferment of ideas throughout the block, the accumulation of economic difficulties, the growing popular exasperation at Russian dominance and the presence of Soviet troops will continue to subject the communist regimes to very great strain. Moscow could conceivably lessen that strain by working out some more acceptable relationship with lesser communist states and by turning from an exploiter into a genuine beneficiary. But all the events of the last few months give grounds for hope that the days of communist tyranny, though they may still be prolonged, may also now be numbered.

Notes of the Week

Europe's Moment

M. SPAAK'S visit to London three days after Mr Macmillan had become Prime Minister was a remarkable conjuncture. M. Spaak came as secretary of the committees of the six continental powers which are working to create a common market and a European atomic agency. He was able to report that the treaties are nearing completion, driven by a common political will in France and Germany which could hardly have been conceived a year ago. He has been welcomed by a new British Government more sympathetic to European integration than any since the war; and he has gone home aware that the project for a wider free trade area around the six-nation common market, which Britain threw up last summer, is impelled by a keen political drive and perhaps too by a new sense among the public here that Britain cannot go it alone. "Europeans" have more cause for hope than at any time since the death of EDC.

In practical terms, however, M. Spaak's visit did more to clarify problems than to solve them. He made it clear that the common market and "Euratom" treaties are too far advanced, and the need for swift political action too great, to allow the treaties to be delayed or tailored to the requirements of the free trade area. The common market treaty, whose emerging shape is described in an article on page 210, may make some provision for later alterations, but the Six will obviously want to keep changes to the minimum. The extensive powers given to the central institutions of the common market may not, however, be easily acceptable to the countries interested in the free trade area.

Two other problems also emerged more clearly than ever. Britain reaffirmed that its preferences with the Commonwealth required it to exclude agriculture altogether from the free trade plan; if agricultural countries like Denmark and Holland are to accept the scheme, Britain may have to give them special bilateral compensation for this omission. It is also increasingly clear that Portugal, Greece and Turkey cannot face the competition which the free trade area involves; a special status may have to be worked out for them.

Seen from Westminster

THE change at 10, Downing Street will, for the moment, make for greater political stability. Mr Gaitskell was wise to discount the possibility of a Tory split. The Tory party, playing true to form, has leapt eagerly and athletically on the new leader's band wagon.

There will always be backbenchers convinced that ability (as represented by themselves) has not been given its due reward; but, by and large, Mr Macmillan's Cabinet has had a favourable party reception. He has painlessly moved out the more obvious sleeping partners, and brought in some competent new men. By slightly thinning the Etonian content (from 10 to 7) and increasing the non-U element, Mr Macmillan should have particularly pleased the fifty or so self-consciously non-U Tory backbenchers, who were beginning to complain with carefully assumed stridency that they were being forgotten.

The two big question marks at Westminster hover over Mr Selwyn Lloyd and Sir Percy Mills. Labour regards the Foreign Secretary as a sufficiently attractive target to be secretly glad that he has been kept within range, and it is sharpening even more hatchets for Sir Percy Mills: a new peer, an old industrialist and one whom the trade unionists have determinedly billed as not particularly progressive.

Prods in their Backs

BY the time MPs reassemble on Tuesday afternoon, Mr Macmillan will be not only Prime Minister but officially leader of the Conservative party. The curious mass meeting which performs this rite has been summoned for noon of that day, which indicates that Mr Macmillan's election is expected, no doubt rightly, to be as swift, unanimous and embarrassingly fulsome as that of his predecessors. There may, however, be a different sort of embarrassment by the time Ministers get to the despatch box, for most of the new team's political problems over the next few weeks will involve it with its own backbenchers rather than with its official opponents.

The list of possible revolts is formidable. Mr Sandys becomes Minister of Defence at a moment when demands for better value for money (and for less money, at that) are rising to a crescendo. Mr Butler, in his new role of Home Secretary, faces not only the complexities of the hanging controversy, but a unanimous Tory dislike of the restrictive passages of the Shops Bill. Sir Percy Mills (and Mr Maudling) will have the dubious pleasure of trying to satisfy Mr Nabarro and Co. in their ceaseless desire to better the nationalised industries. Mr Brooke will have to deal with the backbench pressure for some easing of the Rents Bill. Mr Watkinson, now promoted to the Cabinet, will not escape the grouses about the impact of petrol rationing on the road hauliers. Mr Thorneycroft and Sir David Eccles, while apparently pursuing the European free trade goal with welcome energy, will have to face the guerilla activi-

ties of those who still believe Lord Beaverbrook's chains were not self-imposed. Above all, the Tories will anxiously watch the new Prime Minister for some signs of masterful direction. More than any single policy decision, the Tories long for a government which does not seem in a constant state of breathlessness.

The Minor Ministers

THE twenty-two "second rank" ministerial appointments announced on Wednesday night completed the list of ministers with full departmental responsibilities and of Ministers of State. The under-secretaryships remain to be allotted, and in these Mr Macmillan will be expected to throw carefully-selected bones to some of the best-known backbenchers, including several who have been labelled as Suez extremists. There should be no excited criticism if he does: dogs who are eating bones can do less barking. The most interesting appointment on Wednesday was Mr Maudling's knight's move across the Government board to the peculiar post of Paymaster General, with the still more peculiar role of acting as spokesman for the new Ministry of Power in the Commons. Mr Macmillan ought to be very grateful to Mr Maudling; nobody else would be likely to fulfil this very ticklish political task half as well. The fact that Mr Maudling is to be succeeded in the Ministry of Supply by Mr Aubrey Jones presumably means that this ministry is not to be disbanded; Mr Maudling is believed to have recommended that it should be, and many of its functions handed to the Ministry of Defence, which

Constitution and Choice

THE Labour party has got hold of the wrong end of the stick in its fretting—in so far as it is fretting, and not merely ragging the Cecils—about the constitutional implications of the way in which the Prime Minister was appointed last week. It—and some unexpected allies—have given an airing to two suggested alternatives to the present constitution, on the grounds that they would "save the Queen from embarrassment." These are:

(1) *The idea of the Deputy Party Leader.* Labour is quite wrong in believing that the situation that arose last week could not arise while Labour was in power, because of the Parliamentary Labour party's system of choosing a deputy leader as well as a leader at the beginning of each Parliamentary session. If Labour were to come to power tomorrow, and Mr Gaitskell were to drop down dead the day after, is it really suggested that Labour would be unanimous that Her Majesty should then send for the present deputy leader, Mr Griffiths, instead of Mr Bevan?

(2) *The idea of the Interim Prime Minister.* In a letter on page 195 a distinguished Canadian jurist recommends the Australian system, whereby twice an interim Prime Minister has been appointed for a few days until the majority party has chosen its own leader. But the thought of the empire-building, job-bargaining, caucus-making and lobbying to which this system could give rise is surely rather shuddering. It seems much better that the party counsellors, after taking proper soundings, should advise the Queen which leader appears to have emerged, before this sort of bargaining has taken place. Thereafter—if they have advised her wrongly—the House of Commons obviously has, as always in the past, the power to reject the choice. (So—if they ever wished to—would the members of the majority party in the country, when they came to elect a new party leader.)

★

The really interesting question is how the party counsellors have interpreted their functions in the past few weeks. It is clear that there was fairly formal sounding of the views of Cabinet members; while some fascinating letters from Tory MPs in the *Daily Telegraph* this week reveal how backbench opinion made itself felt in a shoal of letters written around Christmas time to the party whips. (The people who wrote at that time will have been mostly people who wanted to block the accession of Mr Butler—then a clear favourite in the betting—but presumably the whips, whose personal inquiries were pretty extensive, made allowance for this in counting heads.) Nobody, incidentally, seems to have sounded the views of the Conservatives' rather absurd electoral college—which includes Conservative peers, prospective candidates and some party officials, as well as MPs—but the fact that this body for the election of a party leader is widely regarded as a cipher is the Tories' own concern.

Once all the information was collected and made available, however, there could still have been three attitudes on the Thursday morning to the main constitutional question:

(1) The view that the Queen should send for "the most prominent politician in the party that had a majority in the House," provided she were satisfied he could carry that majority with him.

(2) The view that the Prime Minister should be the majority choice of MPs of the majority party.

(3) The view that the Prime Minister should be the man who would command the largest and most rock-solid majority in the House.

Obviously argument (1) did not prevail last week; up to Thursday midday Mr Butler was a more "prominent politician" than Mr Macmillan, and he clearly could still have kept some sort of majority in the House. The decision was therefore taken, in so far as it was thought out, on arguments (2) or (3), or on a mixture of them. Everything that has happened since last Thursday suggests that argument (2)—which must now be assumed to be the dominating argument—was satisfied: Mr Macmillan was, in the circumstances, the majority choice of Conservative MPs. This remains true even though many of those who are now saying that they are glad Mr Macmillan was chosen might have voted for Mr Butler in any secret ballot last week.

Is there, therefore, any ground for constitutional uneasiness about what happened? There is just one shadow of a ground, though it should not be over-stressed. It is to be hoped that any part that attitude (3) may have played in the decision—and it did play some—will not be written down as a precedent for the history books. For it could be read in the future to mean that the Prime Minister must be the man who is least bitterly opposed, not the man who is most widely supported, in his party in the House; the qualification for a Prime Minister would then be not that he should do what the majority of his party wants, but that he should not do anything that might give even a wing of his own party grave offence. This would obviously be a formula for the production of sheep, not for the production of Prime Ministers.

would then be in a better position to control the subordinate service departments.

Among the other 22, no one doubts the competence of such men as Mr Molson (going to Works), Mr Vosper (to Health), Lord Selkirk (to the Admiralty) and Mr Ward (to Air), but these names will not stir one corpuscle of blood in the party; indeed the accumulation of three relatively new men in the service departments may be designed as another way to strengthen Mr Sandys's control over defence. The reappearance of Mr Marples's name in a Government list no doubt reflects Mr Macmillan's wish to reward his old No. 2 of Housing Ministry days, and there may be some virtue in the curious move of Mr Birch from Air Minister to Economic Secretary to the Treasury. He will obviously be much happier handling an economic brief; he has not been allowed to do so since Opposition days (it was he who called out so memorably, after Dr Dalton's resignation, that "they've shot our fox"). Three moves which can be wholly applauded are those of Mr Walker-Smith to help Sir David Eccles at the Board of Trade, Mr Enoch Powell (to Financial Secretary to the Treasury), and Mr David Ormsby-Gore (to Minister of State, Foreign Office). All these are able men, and, with Mr Maudling, Mr Heath (the Chief Whip) and Mr Aubrey Jones (now Supply Minister) seem to represent the only prospective Cabinet timber in the whole 22. Mr Ormsby-Gore is to be given special responsibility for European affairs; that will leave Commander Noble as the Minister of State dealing primarily with the United Nations.

Where Uno Stands or Falls

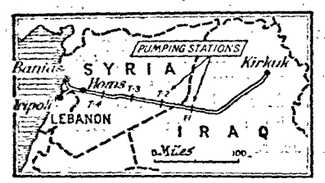
EVERYTHING the United Nations Assembly has achieved since November is at stake this week. Uno's own authority—and therefore its whole value as a peacemaking instrument—will evaporate, together with the prospect of a real settlement in the Middle East, if its members shut their eyes to their urgent duty. That duty was set before them coldly and plainly by the Secretary-General on Wednesday. He reminded the Assembly that its resolution on Sinai called for more than just a cease-fire and withdrawal; these two things were merely priorities, and now that they were nearing fulfilment it should give "urgent attention" to ensuring similar fulfilment of its other rulings and aims. Mr Hammarskjöld referred to the need for scrupulous observance of armistice terms, including an end to border raiding; to the right of free passage through the Gulf of Aqaba; and to the basic function of the UN emergency force—"to help to maintain quiet." Gently but firmly, he invited the Assembly to consider charging the force with some of the responsibilities hitherto carried by the tiny band of truce observers.

In Ottawa on Monday, Mr Lester Pearson, who originally sponsored the force, called for an extension of its life; but up to now there has been little backing for this in the Assembly, where, moreover, both the Asian-African block and the United States have been insisting on unconditional and total Israeli withdrawal without procuring any Egyptian guarantees for the future. By next week, the Israelis will hold only Gaza and the toehold in south-eastern Sinai which protects them against a renewed Egyptian blockade of the Gulf of Aqaba. If the Assembly ignores Mr Hammarskjöld and Mr Pearson, and merely persists in its present course, then either Israel will defy it and expose its impotence, or the old familiar problems that underlie the present situation will re-emerge as dangerously as ever. This week is the time of testing. It will show, incidentally, which members of the Asian-African group are capable of rising above mere racialism in order to make Uno work.

Two nettles have to be grasped. One is the future of the UN force. The other is Egypt. President Nasser evidently intends to claim that he can restrict canal traffic until the Israelis have left Gaza and south-eastern Sinai—after which, if the UN force does not replace them, Egypt will be in a position to resume its blockade and border raiding. Nothing to justify this Egyptian claim can be found in the UN resolution of November 2nd, which, on the contrary, emphasises speedy resumption of canal traffic and demands an end to border raids. The weight of international opinion should now be turned on Egypt, so that President Nasser understands clearly that UN action was taken not just to save him but to restore the peace which his actions had helped to destroy.

Two Years After Malenkov

THE Supreme Soviet is hardly the centre of Russia's political life, but its sessions often provide a platform for important declarations of policy, and the one beginning on February 5th may prove of particular interest. Shortly before Christmas the Communist party central committee announced that the current five-year plan would be pruned, and that the resources saved would be used to step up the housing programme. The Supreme Soviet will now presumably put its stamp on the revised version.



The extent to which the revision of the plan, and the budget (which, if precedent is followed, this meeting will also endorse) reflect a shift in economic thinking, will have an impact on politics and possibly on personalities. Two years ago, at a similar budgetary session in February, the post-Stalin economic controversy was clinched in favour of heavy industry and Mr Malenkov resigned the premiership on the grounds of "incompetence." Now the pendulum seems to be swinging in the opposite direction. Moscow may have concluded that more pledges to the consumer are the best insurance against ill winds blowing from Eastern Europe; but how much is it willing, or able, to pay for such insurance? If the price is high, the leadership may be due for another reshuffle.

Lean Years for Syria

THERE comes a point at which lands of transit, however ill-disposed to the traffic that wants to cross them, either feel the pinch for lack of transit profits or begin to see drawbacks in antagonising the customers at both ends of their line. Egypt has agreed to clearance of the Suez

Canal, and its Syrian satellite is wondering whether to be left behind. It is facing a budgetary deficit of unprecedented size, and seems short of certain foreign currencies; both facts may prompt it to consider how long to go on denying itself the funds obtainable from the transit of oil from Iraq.

The Iraq Petroleum Company has told the Syrian government that, contrary to first reports, pumping at a reduced rate could be resumed at short notice—it is said, within a week. The three pipelines from Iraq to the Mediterranean travel uphill as far as Homs and, of the four pumping stations which service them, the three in Syria were blown up in November. It is now known that the destruction at these three scarcely affected the pipeline manifolds, which are so arranged that the oil flow can bypass the pumps. Therefore the surviving station, which is inside Iraq, could be used to boost oil past the three wrecked stations in Syria—at the rate of 11 million tons a year, as opposed to 25 million when all four pumps were working. How long the Syrian pumps will take to repair is still unknown, as piles of rubble still conceal machinery that may be irreparable; much hangs on the expertise with which the explosives were placed.

If the pumps prove to be wrecked, none of the possibilities open to the company and the Iraq government holds out hope of quick returns for Syria. One is to recognise that all new investment inside Syria is insecure, and therefore to pump only as much oil as can be boosted by adding to the apparatus in Iraq, and then redressing the fall in Iraqi production by increasing output from the southern Iraqi field at Basra, which does not have to export through Syria. The other course, if Syria agrees, is to repair one pumping station only; even for that, the apparatus that had already been ordered for an additional line, carrying a further 9 million tons a year across Syria, would have to be used, and the project for this extra throughput would thus be indefinitely postponed. Either way, Syria's vista of an ever-increasing revenue from the transit of oil will have vanished, for a long time to come, in the puff of smoke that blew up the pumps.

Mr Head's Last Cuts

THE defence cuts announced this week have been made in accordance with two principles of defence reorganisation which were laid down long ago, but which none of Mr Head's predecessors succeeded in following to their logical conclusion. The first principle is that in terms of world war—the sort of war that would involve this island—reserve forces which would require a lengthy period of retraining no longer make any sense at all; the other is that it is just as pointless to think of home defence in terms of obsolete weapons. The pointlessness of the part-time training given to the national service men with the Territorials and Army Emergency Reserve has become increasingly obvious; and it is a gain in realism—if a grim one—that part-time training with the Mobile Defence Corps is also to be abandoned.

The decision to disband the Royal Auxiliary Air Force and the air arm of the Royal Naval Volunteer Reserve is part of the same logic. The RAF's 20 auxiliary squadrons operated Meteors, which would be useless for interception if this country were attacked; they only made sense on the assumption that there would be time to retrain the auxiliary pilots to handle modern fighters—and the decision to cut the production of Hunters suggests that "modern fighters" is now to mean machines still further up in the supersonic class. The Navy may regret its air reservists more, because carrier-based aircraft continue to be far less advanced. But the usefulness of these reserve fighter pilots would really be confined to a limited war in which the most modern aircraft would not be used—and such a war would surely usually be fought by regulars.

The recommendations of General Hull's committee on Army "streamlining," of which some details have now leaked, follow the same line of thought. Besides lopping the tail of regular and reserve formations, and getting rid of more artillery (on the reasonable assumption that atomic missiles are on their way), they propose to do some rough surgery on those excrescences in the War Office caused by the operation of Parkinson's law—the swollen directorates and command staffs. In all, the economies that have been announced or anticipated this week may come to about £20 million a year. They represent the last throw of Mr Antony Head, who had promised to be a much better Defence Minister of his type than most military commentators have realised. His successor, however, may have come into office with at least a "target figure" of defence cuts that is higher than Mr Head was willing to accept. Including perhaps—and at last—the replacement of total by selective conscription?

Dumping Needs Definition

ACCORDING to the announcement before the recess, the first business of Parliament next week is to be the second reading of the Anti-Dumping Bill and the third reading of the Railway Finances Bill on Tuesday; these will be followed by two days of the committee stage of the Homicide Bill on Wednesday and Thursday. The Anti-Dumping Bill calls for some prior comment. It is a *quid pro quo* to certain protectionist parts of British industry for the projected advance to a free trade area with Europe, and it includes the kind gesture to agriculture and horticulture (although they will not be affected by the freer trade proposals) that is usually thrown in on these occasions. No doubt Mr Thorneycroft and Sir David Eccles will have been talking about the bill to M. Spaak this week, and trying to persuade him (on the whole rightly) that the concessions to be made to British protectionism are not very big ones. The European countries could theoretically stand on the principle that—since the common market scheme itself will forbid discrimination in selling prices on grounds of nationality, although not apparently discrimination on grounds of favouritism to good customers—even small concessions are wholly unnecessary. But one presumes that they will not be too stubborn.

Nevertheless, Parliament ought to have some questions to ask about the bill. It is going to give the Board of Trade power to impose and vary customs duties on goods that are considered to be dumped here; the danger, of course, is that Sir David Eccles and his successors may be constantly waylaid by pressure groups with peculiar definitions of what dumping means. The definition in the bill seems to be a reasonably rigid one. Although a certain amount of alarm has been caused in importing circles by a vague reference in Clause I to the fact that unfair foreign subsidies may have been "directly or indirectly" given, the overriding definition of dumping seems to be that it only occurs when export prices of foreign goods are below their "fair market price" in the country of export or origin.

The fair market price means the price at which goods are actually sold for consumption or use in the producing or exporting country, "subject to any necessary adjustments, whether for differences in conditions and terms of sale, for differences in taxation or otherwise"; it would be useful to have a very precise statement about what this last phrase means, and also about the Board of Trade's intended yardsticks for assessing the fair market prices of goods that are never in fact sold in the country of origin (the Board is empowered to make its judgments here by reference to those rather vague concepts "cost of production" and "export prices of similar goods"). In theory, of course, if foreigners are foolish enough to want to sell their goods to Britain below their cost of production, British consumers should welcome their bounty; in practice the best—but also the least—that can be asked of Parliament is that, by careful clause-by-clause vetting in committee, it should ensure that the avenue now opened to protectionists will be a very narrow avenue, for those who suffer from genuine dumping only.

Zik's Bank

THE curious circumstances in which the Eastern Region Finance Corporation, a government body of the Eastern Region of Nigeria, purchased 784,000 £1 shares at par in the African-Continental Bank, founded by Dr Azikiwe, the premier—and then deposited over £1 million of its funds with the bank, at a moment when it was, in strict audit terms, insolvent—have now been probed by the Tribunal of Inquiry set up last August by the Colonial Secretary. It is an enthralling, if unedifying, tale. The tribunal is satisfied that Dr Azikiwe remained a powerful influence in the bank even when he had resigned as chairman on becoming prime minister of the region. He remained deeply interested in it through his Zik companies that banked with it. But for the Finance Corporation's purchase of shares, on terms so satisfactory to the shareholders whose scrip was in fact worthless—and equally satisfactory to the bank's creditors who stood to lose heavily—the bank would probably have been forced into liquidation. It was quite unable to meet the requirements of the banking ordinance for registration at the end of the period of grace extended to it.

The tribunal concludes that Dr Azikiwe was "guilty of misconduct as a minister," and that his conduct has "fallen short of the expectations of honest, reasonable people." Nobody who reads the tribunal's report will feel that these words are unduly strong; but it would be jumping to unwarranted conclusions to assume that they are strong enough to make Dr Azikiwe resign.

This will put the new governor in almost as awkward a position as the original intervention in the matter put the previous governor, Sir Clement Pleass, who retired so suddenly last autumn. Dr Azikiwe may, however, reflect that with this report in circulation it will be open to the delegations from the Northern and Western regions, who have had their regional elections, to cast uncomfortable doubts on his standing as the East's representative at the forthcoming constitutional conference, unless he renews his mandate at the polls. With the example of Dr Nkrumah's overwhelming victory in the Gold Coast after the (much less personal) revelations of the cocoa enquiry before him, Dr Azikiwe may well feel he runs no undue risks in going to the country: he will be able to flourish the paragraph in the tribunal's report which admits that his "primary motive was to make available an indigenous bank with the object of liberalising credit for the people." The bank is now comfortably liquid, thanks to its public depositors, and if Dr Azikiwe burks the challenge it will indeed be a sign that he is losing his grip—or else that Nigerians are fussier about clean hands in the administration than is generally thought of their sunny and tolerant mentality.

Defence in the Cairo Trial

ONLY lawyers registered at the Egyptian Bar can plead in Egyptian courts. It is thus almost certainly incorrect to say—as was asserted last weekend—that British counsel can defend the four Britons charged with espionage in Egypt; but British lawyers could presumably attend their trial, even if it is in a military court. The Egyptian Director of Information has always insisted that he wants the world to witness the trial.

British counsel might not improve the chances of the four accused; it is just possible that they would do more harm than good. The Egyptian legal system is based largely upon the French; and the indictment, which contains important summaries of evidence, and the *proces verbal*, which runs, it is said, into hundreds of pages, are in Arabic. Although some of the evidence and cross-examination must be interpreted for the accused, the pleadings will be in Arabic, and arguments in law as to what constitutes espionage seem likely to be an essential part of the defence. Reliable opinion in Egypt has held that it would be virtually impossible for a British lawyer to advise an Egyptian lawyer in these circumstances.

After careful study, the employers of two of the accused, Mr Swinburn and Mr Stanley, retained two distinguished Egyptian lawyers, Maitre Ahmed Rushdi, leader of the Egyptian Bar, and Maitre Zaki Diab. (The defence of the other two accused, Mr Pittuck and Mr Zarb, was awaiting the decision whether Maitres Rushdi and Diab could also defend them.) These two lawyers are of unquestionable integrity, ability and courage, and their prestige protects them against pressure or intimidation; but their position might be weakened if British counsel appeared at their side while the patriotic temperature of Egypt was high.

Yet there has been and still is a natural desire to have a British lawyer present. The picture of four men standing

trial on a grave charge without anyone from their own country at hand is an unhappy one. The employers might yet send out a British lawyer as an observer ; or a friendly "neutral," drawn from a country with a legal system similar to that of Egypt, might be sent to provide independent advice and observation without impairing the position of the Egyptian defence lawyers.

Financing a Free Malaya

TENGKU ABDUL RAHMAN will apparently return home reasonably satisfied with his talks in London on future relations between Britain and the soon to be sovereign Federation of Malaya. He pitched his demands high, asking in all, it is believed, for some £97 million to finance a development plan twice as extensive as the one already blessed by the World Bank. The Colonial Office, pointing out the lack of administrative machinery for such a plan, and the fact that finance on such a scale is far beyond immediate British resources, persuaded the Chief Minister to moderate his requirements. But he will launch out on independence with a substantial nest-egg. Britain is to pay £3 million annually towards the anti-terrorist "emergency" until 1961, and more in the last two years of that period up to a total of £11 millions ; to devote any unspent balance on this account towards the Federation army up to a total of £6½ million ; to provide another £5½ million for purchase of British equipment and £1,300,000 for local purchases of army equipment ; and to hand over about £4½ million to cover all uncompleted schemes started under Colonial Development and Welfare.

Under a defence treaty Britain will have the right to station the Commonwealth strategic reserve in the Far East in Malaya, and will provide British troops to help the Federation forces to fight the communists. The expenditure on these troops, which will of course fall on the British taxpayer, will benefit the Malayan economy. The Tengku is also evidently to be given facilities to raise a loan in London in the ordinary way. He has wisely prepared the way for this by emphasising that the Federation will give every encouragement to foreign investors and will protect their existing interests. He has indicated strongly that in tariff and other commercial policy the Federation would be independent of Singapore. The rubber industry is keener at present to repatriate capital than to invest more ; but if the Tengku is genuinely liberal in his approach, and shows resolution in fighting communism, he is likely to gain on balance.

Big Noise, Small War

THE Yemen has submitted the Aden frontier situation to the United Nations and has suggested that a neutral mission should study it. The British Government should be able to make out an effective case, and it could demonstrate its confidence by welcoming an international mission, however doubtful it may be about its effectiveness. But there are few people in the world and almost none at all in the Arab League who understand what the trouble in that rugged desert area is really about ; while a UN mission might elucidate it for an audience of largely uninterested nations, it is too much to expect that the inevitable spate of propaganda that would follow would yield a constructive solution.

Yemen wants the propaganda. A Yemen delegate at Uno has this week laid claim to Aden. Yemen regulars in olive green battledress are giving the necessary stiffening to the haphazard tribal warfare on the frontier. The whole business involves, according to the special correspondent of *The Times*, about 120 men on the Aden side and 300 to 400 Yemeni tribesmen on the other. It is a tiny "war," big only in the signs of more deliberate effort on the part of the Yemen government and the words that are going to the description of it.

Britain must protect the protectorate. Were its determination to do so put in doubt by debates in the General Assembly, the tribes on the Aden side of the frontier would quickly take out insurance policies in the Yemen. They are already anxious about Britain's intentions ; and the two platoons of the Durham Light Infantry in the Beihan region are perhaps as much an earnest of those intentions as a military force. But it is not enough to stand fast. Yemen should be pressed more and more to join in the demarcation of the frontier, and the intended meeting of Aden and Yemeni officials on the border is useful even if the Yemen's intentions are suspect. Furthermore, it is wise to re-examine British policy in the protectorate and check whether the federation plan is practical and useful at this time. The more right Britain is, the more wrong Yemen is. So far this obscure matter rests on the opinion of the Aden government and the Colonial Office, but there are many Arabic-speaking British specialists who could make an impartial check and produce a valuable White Paper for the education of Britain. The British must not only be right but appear to be right—if only to themselves.

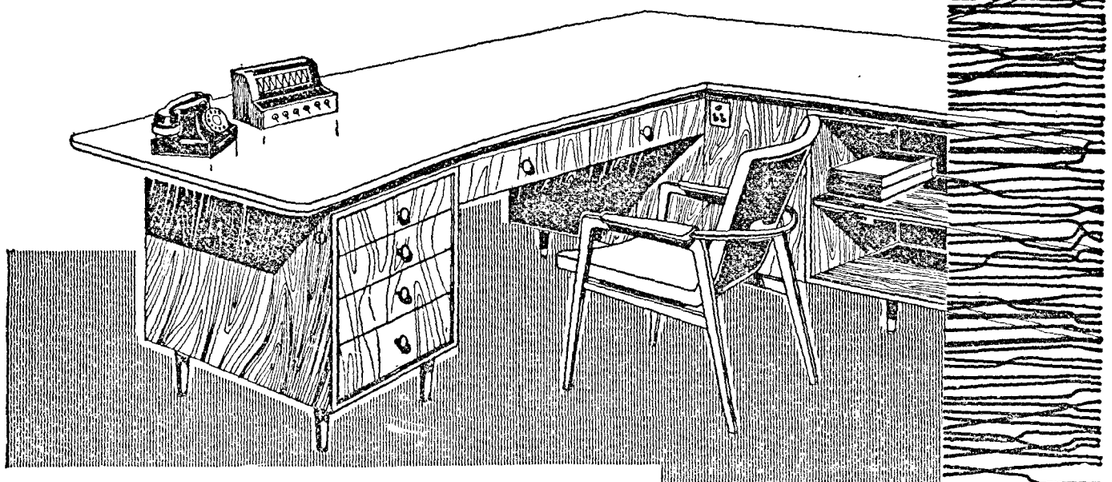
Upper Income Brackets

MR NIGEL BALCHIN once remarked that "the middle-class income is about as near to the middle of the real scatter of incomes as the thirty-third inch is to the middle of the yard." The Oxford Institute of Statistics in its experimental survey* of the financial position and savings habits of what it flatly calls the upper income classes—those with more than £1,000 a year—spurns such sophistry. The sample on which its survey is based is small, amounting to no more than 305 individuals living in and around London ; it is drawn arithmetically from names in *Debrett*, the *Directory of Directors* and other directories ; it contains a fair cross-section of professional and managerial incomes, but excludes the self-employed businessman. And it shows some surprising things.

Among these three hundred families, few non-surtax payers managed to save at all last year. Those with incomes of between £2,000 and £3,000 a year saved £150 to £200, those with incomes between £3,000 and £10,000 about £300 or £400, while the really rich put aside £1,000 or so.

* Savings and Finances of the Upper Income Classes. By L. R. Klein, K. H. Straw, Peter Vandome. Bulletin of the Oxford University Institute of Statistics. November, 1956. Basil Blackwell. 10s. 6d.

Safety Crossing



The wise man who has a banking account always uses crossed cheques, knowing that he will gain some protection if a cheque that he has issued falls into the wrong hands. For it is a rule of the banking system that a crossed cheque may not be exchanged for cash at the bank on which it is drawn, but must be paid into a banking account.

Much of this saving was through insurance, mortgage repayments and the like; non-contractual savings became significant only over £3,000 a year. A rather astonishing revelation was the extent to which most of these people ran overdrafts, rather than current accounts, at the bank; the largest amounts overdrawn—an average of rather more than £400—were by those people selected from *Debrett*. But on the credit side of the balance sheets, the personal wealth of these well-to-do people—their financial and property assets less their debts—averaged nearly £17,000, of which £1,600 was in the form of liquid assets and nearly £10,000 in securities.

Rather surprisingly, few replies showed any particular concern with the legal avoidance of taxes: this apparently becomes important only around the £6,000-a-year mark. Nor did the exploitation of expense accounts appear nearly as conspicuously as it does in popular mythology; but then the self-employed businessman was not represented, and in any case this is a point which the most conscientious of respondents would soft-pedal. The majority of these people were pessimists, looking forward to more inflation and more taxation: an even bigger majority of those with school-age children were educating them entirely without recourse to the state system, avoidance of which would seem to rank much higher as a middle-class objective than either accumulation of wealth or peace of mind. There are social, as well as statistical, morals to be drawn from this survey.

Schoolboy Earners

IT is entirely comprehensible that the Headmasters' Association should, as its recent conference made clear, be worrying about the effect of part-time jobs on the education of grammar-school pupils. The grammar-school curriculum is an exacting one; the connection between part-time work and a gradual—indeed often rapid—loss of scholastic standing has been demonstrated over and over again in teaching experience, as has a similar connection with the "wastage" of early leavers. The sort of firm that employs a bright child on Saturday mornings, with the deliberate intention of luring him into full-time earning as soon as he passes his fifteenth birthday, is becoming a national menace.

But some of the headmasters should think again about the remedies they proposed. To suggest stiffer by-laws or national legislation against the employment of teen-age pupils is surely the wrong course. There are three points one would have liked to have seen made:

(1) In a sense, every activity other than eating, sleeping, and restorative recreation competes with booklearning. Hobbies and sociability, the housework expected in reasonable or unreasonable measure of daughters, the hours devoted to television, movie-going, or the dance-hall, are just as time-consuming. They may be more or less salutary occupations than a Saturday morning tradesman's round; but they are in no way made innocuous by the mere fact of not bringing in any money.

(2) What the schools are really up against is the fact that a large and growing proportion of their pupils come from homes where the necessary conditions for adequate education, in respect not only of part-time earning but of everything else, are not yet understood. It is easy to identify the boy who is losing ground because he comes to school late and tired after a newspaper round; it is less easy to spot the one whose homework is done—or neglected—in a dimly lit family living room containing six other people, the "telly" in full blast, and no books except those in his satchel.

(3) There is something deeper-rooted than ignorance or incomprehension to deal with: a matter of popular *mores* and ethics. To be an earner, on however small a scale, is to prove one's worth in an adult world. In working-class opinion, this graduation to manhood belongs to the middle teens; whoever does not take at least the half-step constituted by a part-time job is, unless his surroundings are quite exceptional, marked out as a freak and a sissy. The middle-class ethic is different; but the joy and pride of any youngster, of whatever origin, at his first (quite possibly illegal) earnings are an object lesson to sociologists.

So long as education gets its proper, overriding priority, there is no inherent reason why part-time earning should not be simply one option among others open to the youngster with time and energy to spare: part of an out-of-school life complementing the experience of the classroom. But to make it so does call for a patient campaign of persuasion and education and the building up of co-operation between teachers and parents. Legislative interference would be no substitute for that.

Wrong Bait for "Neutrals"

IN his testimony before the committees of Congress on the Eisenhower "doctrine," Mr Dulles has said that Middle Eastern countries must be "dedicated to fighting against international communism" if they are to get any of the proposed financial aid. Thus the two parts of the plan are tied together. Mr Eisenhower proposes to fight Soviet aggression with cash and, in the last resort, with guns.

More and more the doctrine fades as a policy for the Middle East and sharpens as American policy for resisting Russia. Dr Charles Malek, the Lebanese Foreign Minister, at his press conference in London this week, said that one could judge the degree of Soviet penetration in any Arab country by the amount of fear of Russia in that country; those most deeply penetrated feared it least. The implication for the Eisenhower doctrine is that those countries which are least penetrated will get the aid, while those drifting into the Soviet camp will not.

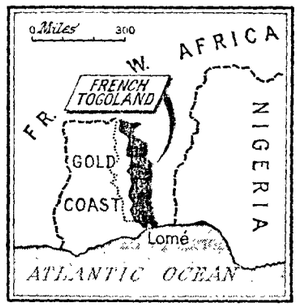
Egypt, Syria and, to an increasing extent, Jordan are in the latter group, and present the most severe threat to the western position in the Middle East. Mr Dulles has stated specifically that Egypt and Syria will get the aid only "if that aid is stipulated to fight against international communism." President Nasser does not permit a communist party in Egypt; but this can hardly be what Mr Dulles means, as he relates the plan to the boost which Egyptian policy has given to the communist powers. He is really offering to buy Egypt and Syria back into the western fold.

This can mean only one of two things. Either the State

Department still believes that sheer necessity, or cupidity, will compel drifting states such as Egypt and Syria to stop drifting; or it believes that the only thing to do is to support the Baghdad allies and others, such as the Lebanon, Libya and the Sudan, which are already inclined to resist the drift. There is no evidence that Arab states will join the western camp simply to get aid. There is much to indicate that they will resist the west more strongly if excluded for political reasons from getting aid offered to others.

A more perceptive policy lies ready to hand. Much as the Council of Europe lately called on its member countries to respect the neutrality of any east European states that free themselves from Russia, so the west should demand no more than neutrality from those Arab countries which at present, while claiming to be neutral, in fact incline towards Russia. To support their neutrality would tend to make it more genuine. Egypt and Syria might be encouraged to balance Soviet infiltration by new western connections. To ask them to commit themselves to oppose Russia—which offered them "volunteers" when Britain and France invaded Egypt—is to ensure a rebuff.

Leaning on the Law



It seems to be taken for granted, and probably quite truly, that on the assembling of Parliament, Committees of both Houses will be appointed to examine the whole subject of banking, and the laws which at present regulate that branch of business. . . . Men have a passion for leaning upon the law. The natural indolence of our nature encourages it: the habit of shrinking from individual responsibility even in the management of our own affairs favours it: the consolation of having the Government, or someone clothed in Parliamentary power, to blame if anything goes wrong, recommends all these schemes of legal guarantees. Men hate the trouble, the irksomeness of feeling that to their own watchfulness, attention, and care alone, must they look for their security. The public funds offer at once all the ease, the certainty, the security and the simplicity as an investment which they desire: but then the interest is at the most *three and a half per cent.* Joint stock banks and other public companies offer five, six, or even ten per cent. The public, always unreasoning and generally unreasonable, want the security of Consols without submitting to the low interest: they want the high profits of speculating businesses without incurring the risk attending them, and without taking the labour and trouble of looking after them. They are constantly in search of impossibilities: they seek for advantages without paying the price: and in this, as in so many other things in life, they want at the same time "*both to eat their cake and to keep it.*" The Duke of Wellington advised the Peninsular officers that "a high interest meant a bad security": and no doubt it does so, or an investment which involves certain labour, care, and responsibility in managing it. But the common practice of empirics is to persuade the public, always sufficiently gullible, that safe substitutes can be found for these essentials in Parliamentary enactments and regulations: in Government control and interference: in official forms and ceremonies. An attempt is about to be made to re-enact this farce before Committees of Parliament in relation to joint stock banks.

French Togoland in Trust

Although French Togoland is to remain a ward of the United Nations for the time being, its new political status has the UN Assembly's tempered blessing. The balance sheet for France after an acrimonious debate is more black than red. Confronted with the serried ranks of anti-colonialism in the Assembly, France dropped its request for an immediate end to UN trusteeship, and concentrated on securing recognition of the "autonomous republic" within the French Union which was established by statute and referendum last autumn. Everyone, including the French, wanted a United Nations mission to go out to Togoland and report back. But while America, Canada and others merely wanted the mission to study the working of the statute, India flatly demanded a complete re-examination. The Indian resolution was eventually passed by a large majority, but it was by then so dressed up in amendments that it looked more like the milder proposals, and, although it gave no formal recognition of the republic's existence, it was supported by France and split the Afro-Asian vote.

France has more at stake than this narrow strip of land with its jumbled loyalties. Its formula in Togoland is an experiment in empire saving. By French standards the concessions that have been made are liberal. Togoland has considerable local autonomy but—in return for economic aid—its finances, foreign policy and defence are administered from Paris. Conscious of having given too little too late in North Africa and Indo-China, France has given Togoland quite a lot in a hurry. The experiment was caught in a storm of disapproval for two reasons. The United Nations resented France's conjuring trick in presenting a ready-made republic while Togoland was still in trust. More important, nationalists no longer put much store by qualified sovereignty. The opposition leaders who pleaded against the ending of trusteeship did not demand complete sovereignty now, but they wanted the chance of it later on; and this is not provided for in the statute. Uno has postponed its decision for a year, but it will get no easier in the keeping.

Two Roads for Milk

The Milk Marketing Board is amending its policies. It is encouraging a partial switch back from winter to summer milk production. It proposes to make future price adjustments monthly instead of (as now) concentrating them at the end of the year—to the farmers' occasional disgust. And, now that nearly 70 per cent of milk is tuberculin tested, it proposes to increase the differential for TT milk as a means (a very gentle one) of persuading lagging farmers to hasten the inevitable changeover. These are wise decisions; but there is also a sinister ring in Sir Thomas Peacock's further statement that the Board will make "a serious study" of restrictive quotas and similar devices, which it thinks may be necessary some day—although "that time is not now."

It is now, however, that milk policy should be decided. Basically there are only two choices. The first is to carry on as at present, allowing production to increase very much faster than liquid consumption. There will then come a point when the rising losses incurred in the disposal of surplus milk for manufacture will lead a majority of producers to utilise Sir Thomas's "serious studies" and impose upon their colleagues some form of restrictionism. The result would be an inefficient milk industry and a severe blow to further nutritional advance.

The only alternative is for the Board to face the heavy initial unpopularity of accepting a cut in producer prices—or at any rate of not pressing for price increases when costs rise. This would slow up the rise in production but not reverse it—for there are many efficient milk producers who are eager enough to expand (if it is not too wicked to say so) at the expense of their weaker competitors. This course would make it possible to lower retail prices—thus boosting liquid milk to the joint eventual advantage of both consumers and producers, while simultaneously cutting losses upon the remaining milk surplus. To step up liquid milk consumption has always been the Board's professed aim. Do Sir Thomas Peacock and his colleagues still hold to it—or are they content to drift gradually into expedients which they know very well to be wrong?

Germany Slackens the Squeeze

In response to a slackening in investments, notably in private building, the Bank Deutscher Laender has reduced the west German bank rate by a cautious ½ per cent to 4½ per cent. The move is welcome in London, for the high German rate, intended to squeeze credit, was tending to defeat itself by attracting short-term money from abroad.

The German rate is now down to where it was in May, 1956, when, to Dr Adenauer's frank irritation, it was suddenly raised to 5½ per cent. The Chancellor then objected that the higher cost of borrowing would hurt the enterprising "little man" who has been doing so well for himself and for Germany since currency reform. But the central bank's judgment, backed at the time by the ministers of economics and finance, seems to have been sound. The cost of living has not risen as steeply as in many other parts of Europe. The loss of the mark's purchasing power in the past year is estimated at a mere 3 per cent. The "little man" is still getting along comfortably.

Yet the thirteen-week-old metal workers' strike in Schleswig-Holstein, the spread of the 45-hour week, and the pending wage concessions to farm workers all show that the inflationary danger is still present. The central bank, again supported by Herr Erhard and Herr Schaeffer, has resisted industry's powerful demand for still easier loans.

Although he resents their independence, Dr Adenauer has reason to be grateful to the shrewd men who have been looking after Germany's economy as a whole. Sometimes the politician in him seems to overlook how much their success has helped to make his government accepted.

Letters to the Editor

Choosing a Prime Minister

Sir—Might not the procedure followed in Australia by the Head of State in two cases in recent years where the Prime Minister of the day died suddenly in office have provided a sound model for the United Kingdom upon Sir Anthony Eden's resignation, especially since this procedure had the advantage in Australia of avoiding any possible criticism of the political wisdom or fairness of the choice actually made by the Head of State in those cases?

When Mr J. A. Lyons, the then Prime Minister of Australia, died in 1939, the United Australia Party, of which he was leader, had at the time no deputy leader, Mr Menzies having just resigned that office following a policy disagreement with Mr Lyons. The Governor-General of the day promptly selected the then leader of the Country Party and Deputy Prime Minister, Sir Earle Page, as Prime Minister to head a Caretaker Cabinet until such time as the UAP could meet and elect a successor to Mr Lyons: Sir Earle Page held office for 19 days as caretaker Prime Minister, resigning as Prime Minister (and, incidentally, also his Cabinet seat) on the election of Mr Menzies as UAP leader.

Some years later when Mr Curtin died in office as Prime Minister, the Governor-General of the day appointed the then deputy leader of the Labour Party and Deputy Prime Minister, Mr F. M. Forde, as Prime Minister, Mr Forde holding office for six days until the Labour Party had met to elect Mr J. B. Chifley as leader, after a ballot in which Mr Forde was an unsuccessful candidate.

Applied to the United Kingdom immediately upon the resignation of Sir Anthony Eden, such practice would have involved the commissioning of the number two ranking Cabinet Minister (or alternatively, perhaps, some elder statesman who was not a candidate for succession to the party leadership) either as Prime Minister or as Acting Prime Minister, if the latter styling be preferred, until such time as the Conservative Party could meet to make its own majority choice as party leader known. Such a procedure, besides eliminating any possibility of criticism of the Queen and the distinguished advisers with whom she consulted, would also be in line with present-day constitutional trends towards the limitation or elimination of the use of discretionary powers by the non-elective organs of government.—Yours faithfully,

Edward McWhinney
University of Toronto

The Successor

Sir—Why should you fear that right wingers could make it "impossible for the Government to tread the progressive path at home and abroad" under Mr Macmillan? In the 1930s he was the acknowledged leader of the YMCA Tories, and his book "The Middle Way" was certainly progressive. He is the grandson of a poor Scottish crofter, and because he has intimate knowledge of business on both sides of the Atlantic, he knows the wage earner's problems.

Why, therefore, should he become a prisoner of the reactionaries when the bulk of the Conservative party are liberal-minded men like himself? He knows full well that any surrender to reaction would (1) produce great pressure from the moderates; (2) stand

no chance of winning general support for the drastic economic policies he must pursue; and (3) have no hope whatever of winning the next general election. Lord Woolton (Manchester Grammar School and some time welfare worker) boasted that many Conservative leaders came from Liberal stock; and we backbenchers do not see why the practical idealism which both Mr Macmillan and Mr Butler share should be jettisoned because the one and not the other was chosen. We certainly prefer our method of choosing to the public Dutch-auction favoured by our opponents.

Surely the real problem before the new Government is not whether it is progressive or not, but whether it can make the ordinary people of these islands really understand the economic perils that lie ahead, and can inspire or frighten them into making the necessary sacrifices in work and service to ensure our national survival.—Yours faithfully,
House of Commons CYRIL OSBORNE

Lorries in a Muddle

SIR—The answer to your question regarding slowness in applying for extra commercial petrol (January 5th) is surely not "Sheer dilatoriness," but the requirement—rescinded in mid-December without adequate publicity—that applications for supplementary petrol would only be entertained when half the basic ration had been used up. This stipulation, which you described as stupid in a previous issue, is printed in italics on the application form for the basic ration. It is therefore hardly surprising that there has been some delay in the receipt of applications, for which the main blame attaches to the authorities and not to the hauliers and C licence holders.—Yours faithfully, P. KAUFMAN
Caterham, Surrey

★

SIR—The article in your issue of January 5th suggests that the railways may take advantage of an unexpected opportunity to obtain and to retain certain business which is now being forwarded by road. As one who is responsible for the carriage of some tens of thousands of tons of foodstuffs annually, I have been busily engaged in finding ways to serve my employers' customers by rail, and do not see any signs that the railways are really trying to meet the competition of road hauliers, which no matter how difficult the transport situation may become within the next few weeks is bound in the fairly near future to return to the status quo ante Suez.

The following are examples of rates offered to me during the past four weeks:

	By Road Per ton	By Rail Per ton
5 tons daily London to Midlands	32 3	83 11
5 tons daily Manchester to Midlands	35 0	86 6
5 tons daily London to East Anglia	33 9	75 6
5 tons daily London to West of England ...	43 0	65 11

The road services give delivery next day, at a specified hour, in time for redistribution on that same day by local transport. The railway offers next day delivery but actual time of receipt is problematic, and is always too late for redistribution on day of receipt.

I must add that most road hauliers accept a greater degree of responsibility for damage than do the railways, e.g., goods packed in cartons which do not bear the Railway Clearing Houses Certificate are carried by the railways as "damageable goods improperly protected by packing," and the consignor has, generally speaking, no redress for damage unless he can prove it to be due to wilful misconduct of the servants of the railway.

One staple foodstuff selling at around £300 a ton shows so small a gross margin that an increase of £2 per ton in delivery cost necessitates either increase of consumer price or cessation of delivery. The railway officials dealing with the case are efficient and understanding, but state they are still tightly bound, not by "statute" but by "costings." They cannot, therefore, spread the very heavy overheads by taking advantage of the probably very low additional actual cost of utilising existing capacity to the full.—Yours faithfully,
London TRAFFIC MANAGER

Shop Hours Bill

SIR—May I comment on your attitude to the Shop Hours Bill.

The idea that compulsory closing should not apply to the one-man shopkeeper was examined and rejected by the Gowers Committee of Enquiry into shop closing hours in its report of 1947. I do not, however, wish to debate that aspect here. It is the suggestion in the article that there is no need for statutory regulation of shop hours at all that I think calls for a word or two.

The Union of Shop, Distributive and Allied Workers is a strong union. It has throughout its existence been fully engaged in protecting the interests of shop workers. It seeks wherever possible to promote the regulation of wages and conditions in shops, including hours, by voluntary collective agreement. It does not seek legislation for legislation's sake. Unhappily, with certain noteworthy exceptions, the greatest possible opposition is put up by employers and their organisations in retail trade to any suggestion of collective bargaining on the voluntary basis traditional in this country. Approaches made by the union for agreements which will deal with conditions are flatly rejected. Indeed, the union is told that the employers will do nothing jointly with the union which they are not compelled to do by legislation. This is why, at the present time, shop workers over by far the larger field of retail trade have to rely upon the limited and restricted protection offered to them by the statutory wages councils (capable only of fixing a minimum "floor" in wages and conditions) and by the Shops Act which deals with closing hours and health and welfare conditions.

Putting it bluntly, this means that the employers will respond only to force—*this at a time when public opinion and* enlightened industrial practice expects and encourages joint action by both sides to avoid strikes and to settle labour problems by agreement, in a civilised manner. This my union is always ready to do at all times. Yet even as I write *this letter we are confronted by a flat* refusal of one large chain-store organisation to enter into discussions on proposals for an agreement on the wages and conditions of our members affected, notwithstanding the intervention of the conciliation department of the Ministry of Labour.

It is in this context that shop closing laws and other protective legislation affecting shop workers must be considered.—Yours faithfully,
J. D. HISCOCK
Assistant General Secretary,
Union of Shop, Distributive and
Manchester, 14 Allied Workers

Rents Bill

SIR—I see that you have supported the new Rents Bill. I set out my circumstances which are quite general.

I live in a flat assessed at £72 p.a. for which the landlord is responsible for internal repairs. During the last five years, *as I enjoy full security of tenure under existing legislation* I have spent several hundred pounds on internal improvements and decorations and cleared and re-stocked a large garden. I have no objection to a reasonable increase in rent provided my landlord *maintains the property in the present* condition, but I consider that the present Bill is inequitable as it takes away my security of tenure. May I suggest that the Bill should provide that existing tenancies should continue to be subject to control for the duration of their personal occupation. This would give the landlord an increased rent but would safeguard the tenant's tenure.—Yours faithfully, TENANT
Dulwich

Poland Prepares for Elections

SIR—Your special correspondent's report from Warsaw is certainly most interesting. However, very many people in Poland do not share his belief that the final election results will not be falsified. Though most anti-communist politicians favour the crossing out by voters of communist or fellow-travelling candidates, there is—according to many letters—a widespread inclination to boycott the elections completely, and this—it is feared—might make it easy for the regime to have their votes dropped into the ballot-boxes. After all, the situation for the government is much too grave to allow for the luxury of an electoral defeat.—Yours faithfully,
London, S.W.1 A. A. ROMER

Books & Publications

The Commonsense of Development

DEVELOPMENT FOR FREE ASIA.
By Maurice Zinkin.
Chatto and Windus. 271 pages. 21s.

AS the discussion on development for backward areas gathers scope and momentum, the number of points of view, analyses, prospects and judgments grows in the same measure. Between the optimists who see in it the Philosopher's Stone of all future diplomacy and the pessimists who believe it to lie beyond Asia's powers there is virtually no common ground. Nor is there much between the various dogmatisms now invading the argument—between the nationalists who see nothing but "imperialism" in foreign investment or the liberals who can accept no role for government action or the Marxists who accept nothing else.

It is one of the great merits of Mr Maurice Zinkin's timely and able study of the problems of economic development in free Asia that he avoids the preconceived ideas and fixed positions and brings to the issue of development a remarkable combination of sound commonsense, direct experience and a mind as clear as Dr Johnson himself could wish of any form of cant. This approach is possible in part because of Mr Zinkin's unique experience first as civil servant and then as business man in India; he knows from inside the possibilities and the limitations of public and private activity. But the dual experience would have hardly yielded so much shrewd inside and informed judgment if Mr Zinkin had not possessed gifts of observation and detachment to a rare degree.

As a result, his study may be read as a most valuable corrective to all the contradictions and dogmatisms of the contemporary debate on development. To the pessimists, he points out the analogies between Asia's present condition and the pre-industrial state of many European communities, reminds them of how much better the processes of economic advance are now understood and reassures them that outside aid, far from "flowing down the rathole," has an indispensable and far from impossible task to perform. For the optimists, he underlines the obstacles to any magic advance inherent in many of Asia's deeply grounded institutions—in forms of family life, inheritance, landholding, in traditional beliefs and prejudices.

To the dogmatists who believe solely in state action, he recalls the indispensable dynamism of private and indeed foreign enterprise and also the limitations of state action when, for instance, the question is the provision of credit to millions of small peasant property owners. And to the believers in private enterprise as the only instrument of advance, he demonstrates the need for state action in societies which largely lack not only an entrepreneurial class but even those primary public utilities without which such a class can hardly operate.

Above all, these distinctions and corrections are discussed and explained with so much concrete, factual illustration and such good-humoured acceptance of diversity and difference that Mr Zinkin corrects without irritating and enlarges vision while hardly seeming to have any such aim. The word "indispensable" is badly overworked in the reviewers' current vocabulary, but for those who wish to study development in backward areas not as a theory nor an abstraction, nor a political pipedream, but as practical politics in a dynamic world, Mr Zinkin's book is truly indispensable. Nowhere else will they learn so much or find information and experience marshalled with an easier style.

Squaring the Philosophic Circle

FOUNDATIONS OF INDUCTIVE LOGIC.
By R. F. Harrod.
Macmillan. 307 pages. 24s.

MR HARROD'S book is an attempt to give a general justification of argument by induction. To argue by induction is either to argue from particular observations to a general law based upon them, or to argue from particular observations to the probable truth of a general law based upon them. Neither form of argument is logically valid. Neither argument is valid, that is, in the way in which the argument from a general law to a particular application of that law is valid, or in the way in which the argument from the fact that a figure is circular to the fact that it is not square is valid. In fact the inductive argument is not even consistent, for one set of particular observations fits in with many different, incompatible, generalisations; so that predictions made by using one of these generalisations will sometimes contradict predictions made by using another. Therefore the inductive argument gives equal probability to two contradictory predictions; it gives the same probability to the assertion that an event will happen, as it gives to the assertion that it will not.

Attempts to prove that the inductive argument is logically valid have their counterpart in attempts to prove that it is possible to square the circle. But whatever the prejudice that led mathematicians to suppose that it must be possible to square the circle, philosophers are led to try to prove the logical validity of induction by the prejudice that no opinion counts as knowledge unless it is based entirely upon experience; a prejudice known as empiricism. The fact that induction is not logically valid is fatal to empiricism: we base our beliefs in scientific laws upon a limited number of observations, and the laws go beyond those observations. Therefore our belief in the laws is not entirely based upon experience: experience does not logically determine what generalisations we accept.

Mr Harrod follows Keynes into the error of supposing that, while Hume showed that the inductive argument does not establish certainty, he failed to show that it does not establish probability. But in fact Hume showed both. He proved that if opinion counts as knowledge only when it is determined entirely by experience, then we can have neither certain nor probable knowledge of the future. Mr Harrod does not accept these proofs; his own attempt to prove that the inductive argument is logically valid, when used to establish probability only, runs like this:

> A man walks along a road. As he walks he keeps on making assertions about how long the road will continue. Suppose that he keeps on asserting that the road will continue for at least as long again as it has already continued. He asserts this regularly, so that the number of assertions he makes is proportional to the distance he travels. Then his first wrong assertion is made when he has travelled half the length of the road. Therefore the proportion of his assertions which are correct is one half.

Now Mr Harrod assumes that this proportion gives the probability of any one of the man's assertions being correct. He does this by analogy with statistical probabilities, for example with the fact that the probability of being correct in asserting that a penny will fall heads is given by the proportion of heads. But the analogy does not hold: the heads and tails occur at random, while the correct and incorrect assertions of the man on the road do not, for all the correct assertions come first. If the proportion of correct assertions gives the probability of any one of the assertions, then this probability is the same for his earlier assertions as for his later ones. But as he travels farther his assertions become more ambitious, for each time his assertion is that the path will continue for as long again as it has already continued. Therefore, since the probability of his being correct about these increasingly ambitious assertions remains the same, the probability of an assertion that does not become more ambitious increases. The farther a road has gone on, the more probable is it that it will continue for another mile.

More space is needed for a proper

discussion of this argument. But a parallel application of it seems to be a *reductio ad absurdum*. Just as Mr Harrod calculates the probability of his man's assertions, so it is possible to calculate the probability of an assertion based upon a general hypothesis. The probability of such an assertion being correct will be the proportion of correct assertions based upon that hypothesis. Suppose that a man never uses an hypothesis again once it has misled him. Suppose that with a certain hypothesis he gets *ninety-nine* correct results before he gets an incorrect one. On Mr Harrod's reasoning the probability of any one of these predictions being correct is 99/100, or .99.

Although the justification of induction by the argument about the man on the road is the main purpose of the book, it is not the whole of it. The discussion of the problem of induction is straightforward, readable and often ingenious. But Mr Harrod's philosophy belongs to an Age of Reason which has gone.

Swiss Achievement

NATIONALISM AND LIBERTY: *The Swiss Example.*
By Hans Kohn.
Allen and Unwin. 133 pages. 13s. 6d.

THIS book is part of a larger study by Mr Kohn on "The Age of Nationalism"; but the author, feeling that the Swiss example in the achievement of nationalism and liberty through federation is of particular relevance to western Europe today, has brought it out as a separate essay. Mr Kohn hopes that it may help towards turning Nato into a western European federation. In any case, it stands successfully on its own merits.

The Swiss federation began in almost exactly the same way as Nato: an alliance of sovereign states for collective security. At first the small peasant states were much alike and all spoke the same language. But the Reformation divided them religiously, and new alliances and conquests added French and German speaking populations to the original German. The strand of brilliant commonsense, which had induced the original cantons to band together, began to be crossed by the other strand of plain good luck, which is such a strong feature of Swiss history. The religious divisions were exceedingly bitter, and the German cantons often treated their subject French and Italian populations almost as oppressively as the feudal lords whom they had replaced. But these unpromising factors produced surprising results. Despite the internal strains, the surrounding dangers were strong enough to hold the federation together, while the religious differences were such that Switzerland was unable to be involved in the religious wars that devastated the rest of Europe, and so remained relatively prosperous. Later on, the fact that there were large French and Italian speaking minorities saved the Confederation from being overwhelmed by the rising tide of German nationalism.

The idea of personal freedom dated back to the earliest days of the Confederation and historical liberties were jealously guarded. Up to the time of the French Revolution, patriotism in Switzerland meant participation in local affairs and respect for human rights—already a great advance over most of the rest of Europe—and when the new ideas of national unity and democracy flooded into Switzerland they could be put to more practical use there than almost anywhere else, for they found people who had always been used to managing their own affairs in town and canton. Later, when the 1848 constitution came into being, practical politicians, who had been active for many years in their own cantons as legislators and administrators, were available to make the machinery work. By contrast, the German parliament of the same year, full of high-minded and intelligent professors and journalists, but without administrative experience, wasted months on theoretical debates. There are many morals to be drawn from Mr Kohn's book, but the two most important seem to be that nationalism need not be based on common ethnic or linguistic ground, but can rest on a mixture of common outlook and expediency; and that the working of a federal democratic state depends largely upon experience in self-government locally.

Mazzini the Revolutionary

MAZZINI AND THE SECRET SOCIETIES.
By E. E. Y. Hales.
Eyre and Spottiswoode. 226 pages. 30s.

MR HALES'S book about Mazzini is scholarly, entertaining and short. True the author has confined himself to the earlier part of Mazzini's life, before the exile in London, but this is the formative period upon which the rest, including the potent Mazzini myth, was built. Mr Hales is more interested in the man than the myth and his study is revealing, though never, as it might so easily have been, unkind. He puts Mazzini into his context where he should be, and where, too often, he is not. Mazzini's "theology" has been skimmed off and served in a final chapter, apart, where the author suggests it can conveniently be studied or skipped.

This is kind to the reader but a little hard on Mazzini, for what remains is essentially the story of his deeds, and Mazzini's record as a practical revolutionary, a hatcher of abortive plots, writer and recipient of indecipherable letters in forever invisible ink, employer of false agents and promoter of a ludicrous expedition, is hard to reconcile with his established and still valid reputation as a prophet. We continually need to be reminded that, in his own day and to those contemporaries who were not, like Guerrazzi or Buonarroti, potential rivals, Mazzini's plan seemed reasonable, he himself perfectly convincing. The secret societies were a reality of the *times*. The despots trembled, and plots not apparently less hair-brained than his had succeeded, or were later to succeed. It was probably not Mazzini's fault if, during the four or five years that he so desperately tried to make them do so, the people of Italy obstinately refused to "rise."

But it is disconcerting to learn of his casuistry. Doubtless "the means are always sacred in whatever colour they may present themselves." One does not boggle much at the dagger which was to cut off Charles Albert or Louis Philippe. Kings must expect that sort of thing. What disturbs us is his idea that it might be useful to denounce innocent men as conspirators or get real conspirators arrested so that public opinion should be stirred and Italy moved to rise. These means he recommended to others, though he could not use them himself because, he said, "I am honest." Of course he reckoned the false conspirators would be given fair trial and acquitted—despots were gentlemen in those days. But what of the others?

The Strasbourg Experiment

THE COUNCIL OF EUROPE.
By A. H. Robertson. Foreword by Guy Mollet.
Published under the auspices of the London Institute of World Affairs. *Stevens.* 265 pages. 42s.

THE assertion of moral authority by the General Assembly of the United Nations over the Suez Canal crisis illustrates, if somewhat crudely, the application of the democratic process to the conduct of international relations. A similar purpose, in a different context, inspires the fumblings and gropings of the Consultative Assembly of the Council of Europe at Strasbourg. Here, for the first time in history, is an institution designed to train the searchlight of opinion on the governments' management of foreign affairs and continually to jog their elbows. Because this embryonic parliamentary control over the actions of the national executives operates as a normal process and not specifically in an emergency—and, moreover, is confined to the European sphere—its impact is limited, and its present efficacy, to say the least, doubtful. Yet Dr Robertson is justified in affirming, in this well-documented study of a far too little known institution, that the Council of Europe is an important landmark in political development.

The book has no frills. It is a clear and straightforward presentation of the council, what it is and what it is trying to do. (The story is taken up to the opening of the Assembly's Eighth Session last April.) Nor does the author, writing from inside knowledge, cherish any illusions about his subject. Just as the Assembly has no real powers and is therefore little more than a glorified debating society on European affairs, so the Committee of Ministers, by the terms of the statute, makes recommendations to member governments and no more—whereas the council of OEEC has power to take decisions for implementation by its members. Consequently, there is

little to show in the way of tangible achievement: some ten or eleven European conventions and a series of joint programmes providing for co-operation in different fields. The value of the Strasbourg experiment lies rather, as the preface has it, in "the intangible factors inherent in the evolution of new methods of international action."

The author gives good reasons for the multiplicity of organisations in the European field—which so often provokes criticism. And he does well, in this connection, to remind us of the so-called "Eden Proposals" of 1952-53, when liaison between the various bodies, existing or projected, first became an acute problem. The council seeks to be "the general framework of European policy"; it is in fact the crucible of all new projects for European unity, though the actual implementation of them may be left to other organisations (for instance, the Coal and Steel Community).

Ensa

THE THEATRE AT WAR.
By Basil Dean.
Harrap. 573 pages. 36s.

THE reader's interest in Ensa is most unlikely to match the author's, but nobody will deny that this book is written with passionate conviction and a driving sense of mission. Ex-soldiers will remember with mixed feelings what Ensa did for them, but Mr Dean is in no doubt that in organising entertainment for the services at home and abroad and for factory workers he and his "praetorians" at Drury Lane were playing a leading part in keeping up the spirits of the nation. They served a total audience of 300 million in 2,656,565 performances.

At times it was amazing that the shows could be mobilised at all, and when military and civil service obstruction were added to all the other difficulties it is enormously to Mr Dean's credit that he kept going. Of course, he had reason to regard himself as the top expert on entertaining the troops since he did it in the first war as well. To put it mildly, there were imperfections about Ensa in all its work, some of them springing from the conditions of wartime, some from the fact that neither in the theatrical profession nor in Whitehall was there unanimity about what ought to be done or how. If everybody concerned had had Mr Dean's singleness of purpose (some of his colleagues had it of course) it might all have been a good deal more satisfactory; but much of it was amazingly effective, and although it is permissible to feel doubtful whether Mr Dean's private army was as important as he thinks, it would be most unfair to pretend that it did not, at times and in places, make the war effort less tiring. As a minor volume of war history "The Theatre at War," in more than 500 pages, is designed on the grand scale—the only scale that Mr Dean really seems to approve of.

Shorter Notices

HENRY VARNUM POOR.
By Alfred D. Chandler, Jr.
Harvard University Press. London: *Oxford University Press.* 362 pages. 52s.

Standard & Poor and Moody's in America fill, very much more fully, the roles performed in Britain both by Exchange Telegraph and Moody's Services and also by the Stock Exchange Official Year Book. And Henry Varnum Poor was the man who started it all. The Manual of the Railroads of the United States is the solid achievement which he left behind. He was born in 1812 and died in 1905; so his life covered the whole Industrial Revolution in America up to the days of Henry Ford. The manual was not published till 1868; and the subject of the book is how Poor was prepared by his experience in New England and New York for the task of editing the manual and setting investment analysis on a solid basis.

In 1848 the editor of the American Railroad Journal decided to sell the paper and go to California for the gold rush; the buyer was Poor's brother and he installed Henry as editor. So Henry came from his law office in Bangor, where he had been very active in the railroad affairs of his family and of Maine, to run a trade paper in New York. It was just at this time that the New York capital market began to expand and supersede Boston and Philadelphia as the centre for railroad finance. The problem which Poor tackled in the early fifties was the raising of capital for the roads; in the late fifties he had transferred his interest to the investors whose money was being used. He told the roads that if they wanted money they must give ample and accurate information; he told the investors what information they should look for and how they should use it.

It was this experience from 1848 to 1861 which, after the Civil War and various activities in Washington and on Wall Street, equipped him so superbly for the production of the manual.

★

INTERNATIONAL ECONOMIC PAPERS: *No. 6.*
Translations prepared for the International Economic Association.
Macmillan. 211 pages. 15s.

The sixth collection of "International Economic Papers" carries on the policy inspiring its predecessors, that of intellectual cross-fertilisation. Even in the major languages, valuable contributions to the advancement of economic knowledge may fail of their full and deserved effect; the mind on which their influence might be most seminal or usefully corrective may be precisely the mind of someone who does not read, or reads only with difficulty, the language concerned, and this applies *a fortiori* to languages less widely spoken. Language difficulties apart, certain topics drop out of fashion and lose, perhaps only in appearance, their relevance to current preoccupations. Such collections as this can focus attention on contributions whose intrinsic value and interest would not otherwise save them from neglect.

Some papers here included may seem to exemplify an extreme view of this policy. The elucidation by Professor Paul Lambert of an obscure point in the history of theory is a very esoteric item; an article on railway rates by Gustav Cassel demonstrates mostly how far the relevant thinking has progressed since it was first published in 1900 (though progress might have been much more rapid had this essay enjoyed a wider circulation); and Zasserhaus's "Theory of Economic Planning" similarly offers little more than a sidelight on the controversies of the 1930s. But it is rewarding to watch an intelligent Russian trying to find a safely Marxist equivalent for the abhorred opportunity cost concept of the bourgeois economists (Novozhilov, "On Choosing between Investment Projects"); there is a fine example of Italian virtuosity in the handling of fiscal theory, two solid Scandinavian contributions to interest theory and, last but not least, either in bulk or in importance, the germ of a great unwritten book—Schumpeter's "Money and the Social Product," dating from 1917-18.

★

BRITISH HUSTINGS, 1924-1950.
By Arthur H. Booth.
Muller. 292 pages. 21s.

British politics are often difficult to understand because they are so largely conducted beyond the gaze of the newspapers and because historians wait so long before attempting to document what happened. For the inside story of politics since the first world war the main source of evidence still tends to be autobiographical. And with a few exceptions the historical value of politicians' reminiscences has been limited. Therefore every attempt, at whatever level, to provide an objective record about the events of the recent past is to be welcomed.

Unfortunately Mr Booth's book does little to fill the vacuum. He tries to describe the period between 1924 and 1950 in terms of its six general elections and the personalities and events which he thinks must have influenced them. A veteran agency correspondent, he offers a capricious essay in popular journalism, replete with irrelevances, omissions, purple passages, and, it must be added, amusing stories. What he has written is neither good history nor good psephology. It must indeed be classed as yet another political autobiography; although discreetly veiled in the third person it has exactly the quality of the reminiscences of a garrulous, opinionated, Dickens-loving back-bencher whose wealth of anecdotes and character-sketches conceal for a while his absence of any true sense of historical judgment.

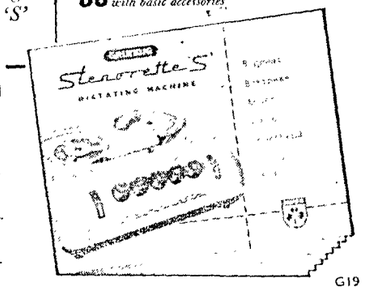
AMERICAN LOCAL GOVERNMENT AND ADMINISTRATION.
By Harold F. Alderfer.
New York and London: *The MacMillan Company.* 681 pages. 41s. 6d.

Here, as Martin Marprelate said of Hooker's "Ecclesiastical Polity," is a book that contains all knowledge and is easy to carry, "if thy mare be not too weak." Dr Alderfer's exhaustive American college textbook is offered to the English reader (complete with "Ten Subjects for Further Study" at the end of each chapter), presumably to redress the balance of detail against generality in understanding the United States. To the general reader it may offer little, but to the specialist in public administration it will appear more reliable and up to date than any similar book, and especially interesting in its clear account of American local revenues and administrative management — while the chapter on traffic control, with a section on "parking meters," should have wider interest.

"Well, you know how it is, old man, this credit squeeze ....."

Of course, I could always cut the telephone wires. That's the fifth call that's come in since we started dictation. Supposing I slipped out and got on with some of my other work? No ..... better not.

"Right. I'll do that. 'Bye." "Now Miss Sims, where were we? Oh yes. 'Further to your letter ...'."



Did he hear that tap on the door I wonder? Yes he did. Here we go again.

"Well James—what do you want?"

Oh gosh! It's him. *He'll be here for hours. Wonder if I gave a meaningful cough ... or fired two shots at the ceiling ... or bought a Stenorette 'S' out of my wages ... I wonder if he'd fill in this coupon.*

★ 25 minutes dictation

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are *written* in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

State of the Financial System

Washington, D.C.

PRESIDENT EISENHOWER'S message last week on the State of the Union had been robbed of its ceremonial impact as the opening event of the legislative year by his special message on the Middle East five days before. In any case it was a milder, more generally-phrased statement than usual ; a more complete presidential programme for the new Congress has now appeared in this week's Budget message. The one on the State of the Union referred specifically, and even then with little detail, to only a few proposals for action in the foreign field—legislation dealing with refugees and immigration, authorisation of American participation in the Organisation for Trade Co-operation and the International Atomic Energy Agency, continued negotiation over disarmament, more funds for propaganda abroad ; and to even fewer domestic questions —agricultural difficulties, the importance of water, the need for legislation to foster school building and civil rights. It seems likely that the most lasting importance may go to a single paragraph, in which Mr Eisenhower proposed the creation of a group comparable to a Royal Commission to review the country's financial and monetary system. This move may bring the major economic debate of the next few years.

Leading up to this proposal, there was throughout the address an emphasis on the perils of inflation, both to the generation currently at work, and to the citizens living on savings or pensions. In particular, the President urged businessmen to watch their pricing policies, and warned industry and labour jointly about the importance of relating wage increases to increases in productivity and sharing with the general public the benefits of improved technology. The warning was accompanied by a request to Congress to authorise the appointment of a commission of " able and qualified citizens " to inquire into the

> nature, performance and adequacy of our financial system, both in terms of its direct service to the whole economy and in terms of its function as the mechanism through which monetary and credit policy takes effect.

The last such review, by the Aldrich Committee nearly half a century ago, was undertaken as a result of the panic of 1907 ; it led to the establishment of the Federal Reserve System in 1913. A century ago, the panic of 1857 preceded passage of the National Bank Act of 1863. After the bank holiday of 1933, Congress authorised a broad group of new government agencies, some to provide special types of financing, for agriculture, housing, rural electrification, others to exercise regulatory powers. But there is no such urgency about the Administration's present desire for a comprehensive survey of America's financial institutions. The need for change, as the White House sees it, is neither critical nor specific. What is wanted is a thorough analysis of the many recent developments in the financial structure, and then, if necessary, recommendations for congressional action to ensure the soundness of money and credit. Among new factors to be analysed are the rapid growth of savings and loan associations ; the emergence of life insurance companies as large-scale lending agencies ; the rise of finance companies providing credit for consumers as they invest in durable goods ; the part to be played by pension funds and trade union welfare funds as major sources of investment capital.

In such a setting, how general in fact are " general " monetary controls ? How well equipped is the government to carry out its responsibilities for promoting maximum employment under the Act of 1946, particularly with monetary policy in the hands of the independent Federal Reserve Board ? Are there conditions under which the application of selective credit controls might be preferable to a general tightening of credit ? In a period of rising costs, how successful are efforts to give selected groups—ex-servicemen, for instance—differential access to credit ? Can traditional interest rates be maintained by state and local governments ? If not, how can they best be given access to the credit pool ? If new techniques are adopted, would additional controls have to be applied to other users ? To request that a search be made for answers to such questions is very different from calling an inquest after something has gone wrong. Nothing has now gone wrong. The White House has chosen to ask for a review at a time when, in its opinion, not only the past record but the future prospect of the economy is healthy.

★

Elsewhere in Washington and in some financial circles outside the capital the need is held to be somewhat more pressing. As long ago as last May Mr Allan Sproul, then president of the New York Federal Reserve Bank, began urging the appointment of a commission such as the President now proposes, and more recently, before a congressional committee, Mr Elliott Bell, New York State Bank Superintendent under Governor Dewey and now publisher of *Business Week*, advocated a " basic re-examination of

our entire monetary and financial networks," remarking that "there exists today more widespread concern and questioning about the working of our money system than at any time since the banking crisis of 1933." Along the corridors of the Federal Reserve building it is felt that price increases are in the offing which are beyond control and that the problem is how to restrain the further inflation which may be added to what is already unavoidable.

To what extent, Federal Reserve officials ask, have Congress and the public grasped that unemployment is more likely to result not from depression following slackened demand but from inflation pressed to the point where rising and rigid costs squeeze out profit margins and bring cutbacks in production? Among the politically-minded there is speculation on whether businessmen can be induced to continue practising the self-discipline which the President presses on them now that the election is won. Cynics credit the slogan, "Keep it sweet for November," with having had real effect last autumn in holding down to $8.50 a ton a rise in steel prices which had been expected to be half again as much.

The problem of too many claimants crowding into a limited pool of credit, moreover, may settle this year on the government's own doorstep. Two years ago the major inflationary pressure was from consumers investing in durable goods. Last year, outlays by private business for plant and facilities reached a record level. This year, and next as well, government spending is due to go up, by nearly $3 billion in the 1958 fiscal year. Most of this increase is for defence and national security purposes, and this will leave only an extra $400 million to be spread over all other functions of government. During the State of the Union message, two of the five rounds of applause were for the high priority given to the school construction Bill by the President. There is a great need for funds among educational authorities, but their need for credit is greater; they cannot now find money at anything like the traditional rates of interest. Similarly, the Budget proposes

Budget for 1958

The Budget which President Eisenhower presented to Congress this week, for the 1958 fiscal year, which begins on July 1, 1957, is his fourth; he takes no responsibility for the 1954 fiscal year, which began five months after he came to office. Mr Eisenhower is proud that, if all goes according to plan, when the accounts are finally added up on June 30, 1958, the Budget will have been balanced for the third year in succession. But the President's emphasis on this point also serves to gloss over the embarrassing fact that, although the Republican Administration has always pledged itself to economise, government expenditures are going up steadily. As a result no reductions in **taxation** are in prospect and before April 1st Congress will have to continue certain excise and corporation taxes which are due to go down then at a loss of about $2 billion in annual revenue. These estimates presume, moreover, that the country will continue to be prosperous, with a rising national income, and therefore that tax yields will continue to go up.

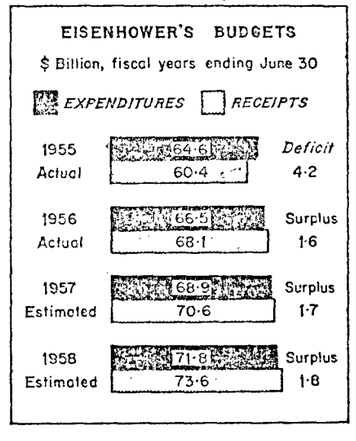
RECEIPTS

Fiscal years ($ billion)

	1956 actual	1957 estd.	1958 estd.
Income taxes:—			
Individual	35·3	38·5	41·0
Corporation	21·3	21·4	22·0
Excise taxes	10·0	9·2	8·9
Other taxes	2·2	2·4	2·6
Miscellaneous	3·0	3·0	3·3
Refunds (—)	—3·7	—3·9	—4·2
Total	**68·1**	**70·6**	**73·6**

To a limited extent the growth of the United States is responsible for the increase in **expenditures.** Mr Eisenhower points out that during the 1958 fiscal year the population will reach a total of 172 million; schools, roads, houses and hospitals are already inadequate. The government must therefore help to build more, even though the President is discouraging public investment in other fields in order to increase inflationary pressure as little as possible.

EXPENDITURES



Fiscal years ($ billion)

	1956 actual	1957 estd.	1958 estd.
Protection:—			
Defence	35·8	36·0	38·0
Mutual security	4·2	4·1	4·4
Atomic energy	1·7	1·9	2·3
Others	0·7	0·7	0·6
Civil benefits	15·3	16·5	16·9
Interest	6·8	7·3	7·4
Administration, etc.	2·0	2·4	2·2
Total	**66·5**	**68·9**	**71·8**
New obligational authority	63·2	70·5	73·3

But most of the increase in expenditure comes under "protection," which accounts for 63 per cent of the total outlays. Under this head, $2 billion more than will be spent in the current year will be needed in 1958 for military purposes alone according to the estimates. And of the total budgeted increase of $2.9 billion in expenditure, only $400 million comes under the head of "civil benefits," which make up 24 per cent of all spending and include aid for agriculture and for the development of natural resources, as well as for housing, schools and so on. The President does not hold out any hope of a coming drop in expenditures, for in 1958 he wants another increase in authorisations for future spending (new obligational authority) which affect outlays in future years.

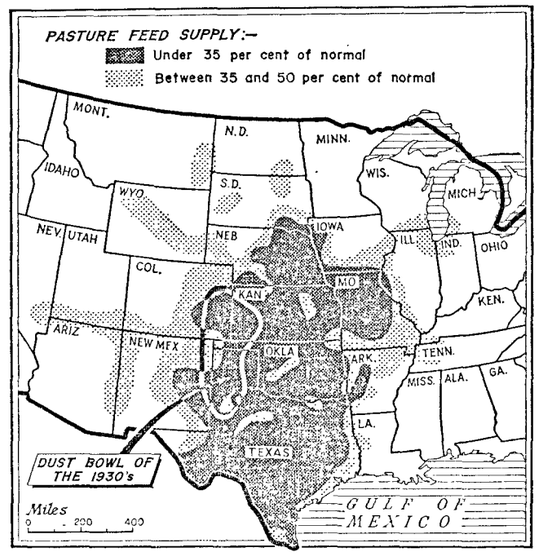
Finally, another ominous sign, from the inflationary point of view, is to be found in the so-called **cash budget**, which includes the trust funds, established to deal with old age and disability insurance and now, for the first time, with road building as well. (Financial transactions under the new highway programme, approved by Congress at its last session, are excluded from the normal Budget estimates, and figures for 1957 and 1958 are therefore not strictly comparable with previous years.) When the Budget is calculated on this cash basis, while the government is still receiving more than it is paying out, the estimated cash surplus is falling, from $3.5 billion in the current year, to $3 billion in 1958; in 1956 it was actually $4.5 billion.

But at least the **national debt** is satisfactorily going down at the close of the 1958 year, it will, it is estimated, be only $269.2 billion, compared with $272.8 billion on June 30th last year.

to make available $1 billion in new credit for the sagging housing industry; one-fifth would show up in government accounts, while the rest would be found from the money market with the help of special government guarantees. In these circumstances pressure for the recognition of "social priorities" in the allocation of credit is sure to grow.

So if the commission on the financial system is authorised, it will not lack for an agenda. But there will be a further contest over the appointment of its members. The President wants a group of independent persons outside government, while Congress fully intends to share in the undertaking, both because the Democratic leaders consider it likely that the President would "name a bunch of Republican bankers," and because several committee chairmen believe themselves well equipped to do the job. Altogether, while the State of the Union message seemed mild enough at the time, some of its repercussions are apt to be both lively and lasting.

Question-time in Congress



THE Secretary of State was subjected to a rapid fire of questions when he appeared before a joint session of the Foreign Relations and Armed Services Committees of the Senate, to explain the President's proposals for the Middle East. The determination of Senators to leave no stone unturned, coupled with the suspension of hearings until after the inauguration, means that the Administration is unlikely to see the resolution passed, as it had hoped, before the end of January. But Mr Dulles painted the risks of inaction in such lurid colours that no major changes are likely to be made in the President's authority to respond to requests for military help from countries in an area which the Secretary of State has now defined as stretching from Libya on the west to Pakistan and from Turkey to the Arabian peninsula.

To Mr Acheson, President Truman's Secretary of State, such legislation in advance on foreign policy seems both unnecessary and undesirable; before the House Foreign Affairs Committee he argued that the President already had the powers he was asking Congress to reaffirm, and that power to repel aggression would not in any case meet the real problems of subversion and Arab-Israeli hostility. Mr Dulles has refused, however, to make any concessions toward the Democratic alternatives which would simply have conveyed, without the force of law, the "sense of Congress" that the security of the Middle East must be maintained. In the Secretary's view, whatever constitutional theory may say, the Soviet Union will be more powerfully deterred and the Arab states more reassured if Congress places itself behind the President. Discontented as some Democrats are, they are not sufficiently united to defy the views of Mr Eisenhower and their own ex-President and accept responsibility for possible Russian domination of the Middle East.

On economic aid, which gives the Administration the vital authority to bargain with the Arab states, Mr Dulles has had to take account of much deeper opposition in both parties. He has promised that aid would go only to countries resisting communism—a concession to Senate opinion which he may have to pay for in the Middle East—and he has agreed to alter the language in the resolution to make it clear that it does not empower the President to enter into long-term foreign aid commitments. He has also said that the resolution in no way commits Congress to future appropriations. What is essential, in his view, if the Middle East is not to be lost before the summer is out, is that Congress should untie the restrictions on present appropriations so that the President can use as he sees fit up to $200 million at once. This is necessary because the President's emergency fund is nearly exhausted.

Return to the Dust Bowl?

NO pall of dust from Oklahoma and Texas hangs over the nation's capital as it did twenty years ago to remind Congress of the dust bowl. But President Eisenhower's flight to the southwest, the fulfilment of a promise he made during the election campaign, will draw the eyes of the whole country to the scorched ranges, dried-up rivers, and baked earth which have followed the most persistent and widespread drought on record. The last year has been in many places the driest of seven dry years on the Great Plains, stretching from Texas to the Canadian border. Texas, Oklahoma, New Mexico, Colorado, and

Kansas, all states the President saw for himself, are the worst hit; even 200-year old trees are dying. America's great prosperity has passed 20 million Americans by; in some counties in Texas three out of four farmers are lining up for free food. According to the Department of Agriculture, 29 million acres are "ready to blow" if there are fierce winds in the next three months. If they do, it will be the delayed harvest of short memories; high prices for wheat and good rainfall in the nineteen-forties led to the ploughing up of acres which should be permanently in grass.

So far, partly because farmers know better how to prevent wind erosion, damage to the topsoil has been very much less than it was twenty years ago. Nor have people been uprooted on a scale approaching the flight of the "Okies." Farmers have been able to hang on to their land (and land values have been kept up) because of government relief measures and the opportunities which now exist for work in industry. Under the great plains programme authorised by Congress last summer, farmers turning cropland into pasture can be financed by the federal government. But, if there are no soaking rains by next spring, it is doubtful whether ranchers will be able to hold on to their breeding stock.

The President, as soon as his tour was completed, said he would ask Congress for another $76 million for current programmes of relief and conservation. These have cost nearly half a billion dollars since 1952. In Texas and Colorado powerful political voices crying disaster are demanding more government purchases or leasing of land in order to force the immediate return to grass of the 25 per cent of cropland which the Conservation Service feels is necessary. But the President, for all his concern for the human tragedy, is unlikely to change his view, which he expressed in his message on the State of the Union, that conservation of land and water, however urgent, is the task of the federal and state governments and local bodies working together, not of a paternalistic government in Washington.

Filibuster on its Knees

MR LYNDON JOHNSON, the astute leader of the Democratic majority in the Senate, evidently believes that if you cannot beat the enemy you should join him—or at least go to meet him half-way. That at least is one explanation of Senator Johnson's unexpected co-operation with the almost equally unexpected attempt being made by Senator Knowland, the Republican leader, to get the Senate's rules amended after all and to curtail the filibuster—the privilege of talking a Bill to death. During the opening days of the session, Senator Johnson's masterly political manœuvres defeated the attack on the filibuster made by a coalition of progressive Senators. But the vote showed that a substantial number of members had turned against the filibuster since the matter was last argued in 1953. Moreover, a ruling by Mr Nixon, in his capacity as president of the Senate, provided a new weapon against the filibuster for future use.

As a result of all this it was widely held that at last the day of the filibuster was almost over. Senator Johnson presumably shared this view; at any rate he joined Senator Knowland in sponsoring a resolution which would limit the filibuster, although not end it entirely, by permitting debate to be closed on a vote of two-thirds of the Senators present and voting, instead of only on the almost unobtainable vote of two-thirds of the total membership. This hardly goes far enough for the progressive coalition which wants some form of simple majority vote; but Mr Johnson's move has encouraged a number of other moderate southern Democrats to support the resolution, and its prospects are good. Meanwhile, priority is apparently to be given to civil rights for Negroes, although such legislation almost always provokes a filibuster—and for that reason has been almost impossible to pass. But on this occasion, it is reported, the liberal Democrats are ready to filibuster against the inevitable filibuster by the reactionary Southerners until the Senate as a whole is so exhausted that it votes for closure on the debate under the present rule. The actual civil rights legislation to be discussed will probably go beyond the four-point programme which President Eisenhower again asked for in his State of the Union message.

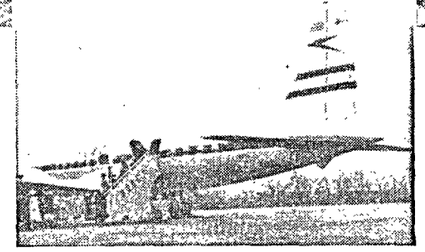
Behind all this manœuvring there are four basic situations. Violence and resistance to the Supreme Court has been mounting in the South, centring at present round the decision against separate seating for Negroes in buses. Secondly, the election showed that the Democrats must find some new attraction for the Negroes if their trend to the Republican party was to be checked. Thirdly, the progressive northern Democrats believe that in Congress their party should challenge President Eisenhower instead of playing ball with him, as Senator Johnson does. And finally, the moderate Mr Johnson is prepared to make some moderate concessions to this view for the sake of party unity.

Committee Prizes

NOTHING in the career of a Senator or Representative, apart from election itself, is so important as his congressional committee assignments. This session the Republicans have handed the prizes round with their usual orthodoxy: promotion from a lesser committee to a more interesting or influential one has gone strictly by length of service, and the new boys have been given all the boring jobs. This brings Senator Jenner of Indiana, a foaming reactionary against President Eisenhower and all his works, on to the crucial Finance Committee, which handles taxes and such matters as American membership of the Organisation for Trade Co-operation—and the British request for a waiver of interest on the American loan. It has condemned Senator Javits of New York, one of the strongest newcomers to the ranks of the Eisenhower Republicans, to the unimpressive Committees on Rules and the District of Columbia.

Senator Lyndon Johnson, the Democratic leader, on the other hand, has again been more creative in his "cabinet-making." The most interesting promotions are those of Senators Kennedy of Massachusetts and Gore of Tennessee, both young, progressive Democrats and both presidential possibles for 1960, to the Committees on Foreign Relations and Finance, respectively. Senator Gore's appointment widens the breach, opened by Senator Douglas of Illinois last year, in the monopoly of the Finance Committee hitherto preserved by the conservatives of both parties. To some extent Senator Kennedy, the women's political idol, may owe his advancement to the unpopularity among his colleagues of Senator Kefauver, who outranks Mr Kennedy in length of service. But his presence will add a touch of boyish New England dash to the solid phalanx of liberal Democrats—Senators Fulbright, Mansfield, Humphrey and Morse—who, now that Senator George is out, dominate this committee. The presence of so many vigorous and articulate partisans on the Democratic side will intensify controversy over foreign affairs, particularly

NOW! NON-STOP TO THE U.S.A.



B.O.A.C. are now progressively introducing their magnificent new DC-7C airliners on First and Tourist Class services London-New York *non-stop*. This long-range B.O.A.C. airliner offers you the *fastest* transatlantic travel for business *or* pleasure. And the DC-7C is equipped with the latest radar for fair-weather flying all the way.

First Class single fare London-New York, £157.3.0—return £282.18.0. (Fully-reclining "Slumberettes"). Sleeper berths at slight extra charge.

Tourist Class single fare £103.12.0—return £186.10.0.

SPECIAL REDUCED FARES—

15-DAY TOURIST return fares can save you nearly £35! FAMILY FARES PLAN (until March 31st)—only the head of the family pays full fare when you fly the Atlantic as a family (First Class or Tourist). Other members pay much less.

Consult your local B.O.A.C. Appointed Travel Agent or B.O.A.C., Airways Terminal, Victoria, S.W.1 (VIC 2323); 75 Regent Street, W.1 (MAY 6611); or offices in Birmingham, Leeds, Manchester, Liverpool and Glasgow (see your Telephone Directory for details).

as the Republican members, apart from Senator Knowland, are either pedestrian or eccentric. But, on the other hand, left-wing Democrats as a group tend to press the President to show initiative abroad.

Again unlike the Republicans, the Democrats have seen to it that each of their new Senators serves on one interesting committee, out of the two or three to which all Senators are assigned. Senators Carroll and Church, from Colorado and Idaho, whose constituents want federal money to help develop their natural resources, have been shrewdly allotted to the Interior Committee, which deals with such schemes. And the Democrats have shown at least one imaginative touch in the House of Representatives—Mr Saund, the first native of India to be elected to Congress, has, exceptionally for a freshman, been placed on the Foreign Affairs Committee.

Unsafe Atoms?

LAST week the Atomic Energy Commission opened the first public hearing ever held to examine local protests against the licensing of an atomic power plant. Three trade unions, including the United Autoworkers, many of whose members live and work in the great industrial centres of Detroit and Toledo, are protesting against the siting of a breeder reactor in the neighbouring town of Monroe, Michigan. The reactor, with a capacity of 100,000 kW, is being undertaken at a cost of over $43 million by a group of twenty-six firms, headed by the Detroit Edison company. The AEC hopes that, if it is ready on time, in the summer of 1960, it will be an effective answer to the charge that, by relying on private industry alone, the United States is falling behind in the race for commercially competitive atomic power. The unions, which have been advocating a "crash programme" of government-built reactors to put the United States in front, claim that in its eagerness to discredit the arguments for such a policy the AEC is taking chances with the safety of a densely-populated area.

The trade unions' case against the reactor's safety is based on the refusal of the AEC's own advisory committee to give it a clean bill of health because of an accident that had occurred in a small experimental model. Although the commission has only allowed preliminary construction on the condition that the group must overcome these misgivings before being allowed to go ahead with the actual reactor, the unions argue that, once a large investment has been made in the project, the commission will be reluctant to interpret the evidence unfavourably. Their real objection, however, is that if Mr Strauss, the chairman of the AEC, had not been so dogmatically opposed to public ownership, the government could have experimented with a full-scale breeder reactor in an out-of-the-way place; the unions allege that the present site was chosen so that the Detroit Edison company could feed the power into its grid.

The commission itself, in a further effort to overcome the charge of sluggishness, has just offered more liberal encouragement to private firms willing to try out new types of reactors and complete them by the end of June, 1962. This move is unlikely to deter the unions' Democratic friends in Congress from repeating their proposals for publicly-owned reactors. And the present hearings, with the commission acting as the ultimate judge in its own case, will fortify the argument for establishing a separate regulatory commission for the industry.

Modern Lotus Eaters

FROM A SPECIAL CORRESPONDENT

THE pursuit of happiness in the United States appears to be becoming a flight from anxiety since the introduction, two and a half years ago, of the tranquillising drugs. Bearing such not very soothing names as chlorpromazine, reserpine and meprobamate, the tranquillisers have been hailed for their efficacy in alleviating tension without being habit-forming. Apparently combining the advantages of alcohol, caffein and aspirin with none of their disadvantages, the tranquillisers have been publicised as, among other things, eliminating sleeplessness without inducing sleepiness or loss of memory, or impairing driving ability, as possibly improving ability to work, and as being generally beneficial for high blood pressure. If they live up to early expectations, they could greatly alter the treatment of mental illness by making patients calmer and more accessible to therapy. But if they are swallowed wholesale by the general public, they might create a modern land of lotus eaters.

Many Americans, thanks to the permeation of Freudian psychology, are more and more conscious of their anxieties and tensions, and they have been elevated to a state of euphoria by the very idea that such complaints could be banished with a "happiness pill." They have been besieging their doctors for prescriptions, visualising a future where men escape hangovers, dogs no longer bite postmen and the well-adjusted race-horse conserves its energy for winning the purse. According to a recent estimate, five per cent of the population is getting a possible eight million doses of meprobamate a month. The concentration of popular tranquillisation is thought to be greatest in such centres of neuroses as Hollywood and New York City whose inhabitants, several years ago, were taking benzedrine to "hop them up" and are now taking Miltown (a trade name for meprobamate) to calm them down. A special refinement, the Miltini, concocted of gin and Miltown, may accomplish both purposes simultaneously. Meanwhile, with sales of these drugs probably running at over $75 million a year and, with the addition of new ones, expected to double by the end of 1957, a second look is now being taken at the implications of the "pharmacological era," and is eliciting from some observers gloomy predictions of moral atrophy and even the advent of "1984."

Despite the legal controls exercised by the Food and Drug Administration and strong warnings from psychiatrists that indiscriminate use of the tranquillisers for the relief of everyday tensions is a danger to society, there are reports that unprescribed use of the drugs is widespread. In addition, many doctors find that perhaps two or three out of every four patients come to them with vague complaints of a possibly emotional origin, psychiatric equivalents of the common cold; they used to prescribe barbiturates for such complaints, but they are now giving "peace-of-mind" drugs. An estimated three out of every ten compounds prescribed in 1955 were tranquillisers.

Considerably more is known of the effects of the tranquillisers on psychotic patients in mental hospitals, where controlled experiments are possible, than about the reactions of normal people which cannot easily be tested clinically. Although they vary in their particular uses and effects, in general the new drugs provide a sense of detachment from life and a consequent imperviousness to its more agonising aspects. They can be extremely useful tools in assisting a mentally ill person, beset by unreal fantasies, to come closer to reality, but paradoxically they may make a normal person unable to appraise his situation realistically.

Experiments have revealed that unsuspected variables in the patient's personality and background, and his relations with the doctor, may strongly alter his reaction to drugs, and that different drugs may affect him very differently. When tranquillisers were given to 8,200 people at the University of Oregon's Medical School, 80 became depressed enough to attempt suicide and 126 felt so much better that they neglected to take other medical measures and eventually became worse. The dangers of unusual reactions to the drugs and of errors in diagnosis are clear.

★

The role of the tranquillisers in bringing about the "revolutionary" changes in state mental hospitals which are widely attributed to them is difficult to determine, according to psychiatrists in the Public Health Service. For example, a reversal in the trend towards constantly increasing numbers of patients, generally credited to the tranquillisers, may have complex causes. Admission and discharge rates are poor measures of the effectiveness of drugs since the rates depend on the varying policies of the different hospitals and on the subjective decisions of physicians in charge and are also affected strongly by attitudes in the community and family, opportunities for jobs, outpatient facilities and other conditions. The marked changes in the atmosphere of mental hospitals are the result not only of the drugs but also of improved care of patients in recent years. The "morale factor" is likely to be quite as important as specific remedies, as is shown by patients who react almost as well to dummy tablets as to tranquillisers. The drugs are altering rather than diminishing problems of staffing. By making therapy possible they are changing the kind of care which is needed, and are likely to throw additional strains on the nation's seriously limited resources of psychiatrists and trained personnel.

The tranquillisers raise new questions with every one they answer. Together with other new behaviour-influencing drugs such as lysergic acid (LSD) which produces hallucinations like those in psychoses, the tranquillisers have given new impetus to research in the whole field of behaviour, and the possible biochemical roots of mental and emotional disorders. That a "twisted thought" may be due to a "twisted molecule," which is capable of being returned to normal through the action of a drug, is the subject of a line of investigation being sponsored by the Ford Foundation. Under a congressional appropriation of $2 million, the Psychopharmacology Service Centre has been set up in the National Institute of Mental Health to develop and co-ordinate a nation-wide research programme on the whole subject.

Meanwhile, experiments conducted by pharmaceutical houses and universities on the effect of these drugs on animals make fascinating but disturbing reading for the layman. Siamese fighting fish, when given reserpine and meprobamate, stop fighting and swim backwards; guppies, on the other hand, swim backwards on a dose of LSD but stop when given reserpine. Imprinting in mallard ducklings (the rapid process by which when twelve hours old they learn to follow a moving object, usually their mother but sometimes an inquiring scientist) is prevented or postponed by doses of meprobamate. The ordinary human being who would rather not take a chance on swimming backwards and who is not sure whether or not his troubles stem from following his mother (and/or scientists) had perhaps better stick to aspirin.

Two-Party Oregon

WHEN he took the oath on Tuesday, Mr Robert Holmes, the new Governor of Oregon, established the first Democratic administration of the state in eighteen years. When President Eisenhower was first elected there was not a single Democrat in any important Oregonian office, and in the state legislature the party was too small to offer an effective opposition. Now the Democrats hold both seats in the United States Senate, the Governorship and three of the state's four seats in the House of Representatives. They enjoy a clearcut majority in the lower house of the state legislature and, to the embarrassment of all, there is a tie in the state senate, a situation for which no provision was made by the drafters of the state constitution.

This complete reversal of fortunes dramatises a recent trend in several northern states which have habitually been Republican. While the Republicans have been prospering at the national level, at the state level Democratic parties have been expanding from minority "rumps" functioning only in the big cities to the point where they are in a position to offer the voters a genuine alternative. The present development in Oregon has come about because a large influx of industrial workers and the complete revamping of the Democratic organisation by a group of young liberals aided by the trade unions has coincided with a decline in the wisdom of the Republican leadership. Conservative Republicans, known to their critics as "the Arlington Club clique," forgot that their party owed its long hegemony in Oregon to its skill in finding a place within its ranks for all shades of opinion, even including the advocates of public ownership of hydro-electric power. They began making life uncomfortable for their own left-wing just at a time when the Democratic party in the state was sloughing off its conservative, minority-minded leaders.

The interesting features of Mr Holmes's victory were, firstly, that he was the choice of the trade unions, whose political efforts were acknowledged by the Democratic chairman, when he invited them to name a candidate; and secondly, that, given this chance, the unions should have chosen a sincere and quietly attractive businessman, a person so untypical of the successful American politician. If the Republican party is to make a comeback, the Arlington Club will have to get out of the way of the progressively-minded leaders who are available if they are only given scope.

The World Overseas

Hongkong: The Persistent Colony

FROM OUR SPECIAL CORRESPONDENT

THE uniqueness of Hongkong is threefold. To the traveller from the south, it is a refreshing oasis of efficiency; secondly, it is not merely in China's shadow, it is part of China and its separate existence is an enduring miracle; finally, it is the only British colony where self-determination is an academic issue.

It is tempting to think of the efficiency of Hongkong—the split-second timing of the ferries to Kowloon, the profusion of goods and the speed of the services provided, the drive and energy of the apparently hopeless task of resettling the squatters—in western terms. True, the administrative framework is British, so are the standards set; but more than 99 per cent of the population is Chinese: in its infinite ingenuity, adaptability and industry, Hongkong is a Chinese achievement.

Not all of Hongkong's feverish activity is hay-making while the sunshine lasts, but much of it is: for instance, the lightning erection of blocks of flats or tenements, by Chinese *entrepreneurs* who hope, on the basis of past experience, to recoup their capital outlay in not more than seven years, and often in two or three years. Rents of £100 a month are not uncommon. And one should not ignore—or magnify—the significance of the actions of a few firms that have sold their premises to Chinese buyers, only to remain in business as tenants in their former homes: there is safety in liquidity. But there are equally telling examples of confidence in the further future: on the government's side, the enlargement of Hongkong's dangerous airport by land reclamation (in fact, the landing space is being extended by dumping rocky soil from the colony's backdrop of hills into the sea); in the private sector, the plan of the Chartered Bank (which has its headquarters in London and only a branch office in Hongkong), to spend more than £1 million on an 18-storey skyscraper that will top even the Peking regime's Bank of China. There are other, and even taller, buildings in the offing, too.

Over all these projects hangs the question mark of the colony's future. The leased territories—Hongkong's tiny hinterland—revert to China in 1997. Can the ceded territories—Hongkong island and Kowloon—exist after that date? Will any part of the colony remain in British hands even that long? The answer to these questions lie in the delicate and shifting balance of incentives and disincentives on China's side; in Britain's own determination, so far more ambiguous than it need be; and in Formosa and American policy. Hongkong in British hands is certainly useful to China, but less so than it would be in its own hands if the transfer of power were peaceful and agreed. In British hands, the colony is China's major source of sterling. Last year, Hongkong exported about £11,347,000 worth of goods (visible trade) to China, but imported £56,103,000 worth. Invisibles bring the balance in China's favour to probably more than £100 million. Indeed the Bank of China is reported to have accumulated sterling assets of more than £300 million in its London account, the bulk of which has probably been converted into Swiss francs and transferred to Zürich since the Suez crisis, to avoid any possibility of freezing. In addition, Hongkong is a source of American dollars, between 1,500,000 and 2 million of which change hands *every day* in the colony.

In China's hands, however, Hongkong would be an important centre of light industry—as, indeed, it already is, for the profit of Britons and expatriate Chinese—and a major port and shipbuilding area. But these advantages would accrue to China only if the transfer of power took place peacefully without destroying the Colony's installations and facilities—an empty shell is a poor reward for aggression. Moreover, aggression now would probably mean American intervention and a major war: Hongkong is the beneficiary of the obsolescence of wars, even little ones.

There are certainly other means of pressure, but in today's circumstances none of them is altogether satisfactory. One method could be the fomenting of riots or industrial unrest. The terrible disorders of last October showed how inflammable is the human material beneath the peaceful surface of the Colony's life; but, as shown in the Governor's report of January 2nd, the disorders were basically non-political, despite Peking's propaganda and the fact that they began with the tearing down of a Kuomintang flag (not because it was a Kuomintang flag but because of a minor police official's zeal in enforcing a by-law against the posting of *any* flag on any building). Besides, Hongkong's population is, almost by definition, unresponsive to communist propaganda. More than 700,000 of its people are refugees from China, economic rather than ideological refugees, it is true, but still refugees. They are in Hongkong either because they want to be there or because they do not want to be in communist China and have nowhere else to go. Most of the older established inhabitants are in the same position. This is, indeed, one reason why the question of self-government does not arise and why political activity is so anæmic compared to Singapore. Peking tolerates a British-ruled Hongkong; it could never tolerate an independent one.

Another form of pressure could be food, but much has

been done in the past few years to lessen the Colony's dependence on mainland food supplies. Regulations ensure that not more than 16 per cent of the basic food—rice—comes across the border, and in the right seasons the Colony now grows up to 60 per cent of its vegetable requirements. Against that, some 90 per cent of the Colony's pig and poultry supplies come from the mainland, but Formosa is beginning to emerge as an alternative source of these. A further and more insidious pressure—in full swing for more than a year—is the cultural offensive. Chinese business men and even government officials are being invited to Peking, offers to send "cultural" troupes are constantly made, and everything is done to make the Hongkong Chinese look towards Peking as their ultimate protector. In the nature of things, however, this is a long-term offensive.

With so many imponderables to consider, no term can be set to Hongkong's separate existence. But more and more people are coming to realise that perhaps the most important imponderable is the evolution of American-Chinese relations.

The Treaties of the Six—I

The Common Market takes Shape

FROM OUR SPECIAL CORRESPONDENT LATELY IN BRUSSELS

SHUT away from the world in a chateau outside Brussels, a small group of experts is working far into the night, completing the treaties—for years only a pipe-dream—which are to set up a European common market and a European atomic energy authority. Only three months ago the basic concept of the common market—that the six countries (France, Germany, Italy and Benelux) should commit themselves in advance to remove internal tariffs over a definite period (say twelve years)—seemed threatened by unacceptable French demands. Now a compromise has been reached. Instead of being able to opt out of the treaty after the first four-year stage, France will only be able to prolong this stage to six years; in return it has been allowed to retain certain special protective taxes and subsidies, though not customs duties. Compromises have been reached on most other vital issues and the treaties are expected to be ready for signature by mid-February.

For Britain, deeply interested in the possibility of joining with the common market in a wider free trade area, the treaty is encouragingly pragmatic: it is a good deal more flexible and practical than its rather scholastic parent, the Spaak report. The method chosen for reducing tariffs has been simplified and much improved. This is particularly important since it will be easier to set up the free trade area if it can simply adopt the same rules as the six. These now provide for a simple average tariff cut of 10 per cent in each of ten periods. The decision on which individual tariffs should be reduced is left to the discretion of each country, but an all-round minimum reduction of 5 per cent is required in each period, and a more stringent all-round minimum in each of the three four-year stages of tariff reduction.

The institutions for the common market have also been modified. The Spaak report foresaw a European Commission, on the lines of the High Authority of the Coal and Steel Community, which would execute the treaty and enjoy great powers over governments. Federalists hoped it would take on ever greater powers in the economic field, and eventually become the nucleus of a European government. This doctrinaire concept has been somewhat watered down. The treaty still assumes that the removal of trade barriers will raise a host of problems which will require permanent institutions; and a permanent executive European Commission, a Council of Ministers and an Assembly are to be set up. But the Commission is not given such sweeping general powers as in the Coal and Steel Community. In practice the Commission will have great influence because in general the Ministers may act only on its "proposals." But they will have the final say. Their decisions on certain matters must be unanimous for the first four years; beyond that, they are generally to be taken by what is called a "qualified majority"—one able to overrule a single large power by itself, but not a large power plus Belgium or the Netherlands. National sovereignty can thus be overridden in many fields, but by a council of governments, not by a "supranational" European body.

Assault on Sovereignty

In certain specific fields, however, the Commission is given great power by the treaty. The most vital of these is that of "safeguards" or escape clauses, when a country runs into balance of payments troubles or an individual industry or region is suffering badly. In the last resort it is the Commission which grants the country a "safeguard clause," giving it the right, for instance, to impose temporary import restrictions. The Council of Ministers can only modify or annul this by a qualified majority—a negative power.

The most sweeping of the Commission's specific executive powers, however, concern national finances. Export subsidies, within the common market, for example, are specifically banned. The Commission may require a country to remove any existing subsidies and examine and veto any proposed new ones. It may require a country to alter tax practices which produce a "distortion" of trade and competition within the common market—say a discriminatory purchase or turnover tax. Some form of appeal to the Council of Ministers may be introduced here but the power to order national governments or parliaments to change tax policy remains a remarkable assault on sovereignty.

Yet outside the narrow field of taxes directly affecting trade, the common market treaty is cautious about fiscal policy. France's sacred cow of "harmonisation," the demand that the countries' social burdens and taxation systems be totally aligned, has become a very thin and mangy beast. There is no compulsion to align general fiscal and monetary policies nor any mention of the notion of a European central bank, which some economists think will eventually be necessary in an effective common market. The European Commission may make suggestions for aligning fiscal policies and a committee for consultation on monetary policy has been set up. But different national policies could still be pursued and could make nonsense of the common market. No rules have been laid down to compel governments to behave in a "European way"; the common market will rely on the quiet pressures of the tariff reductions. "Supranationalism" has also suffered a defeat over the investment fund; it will be less a political body than an independent bank, lending according to economic principles.

In some matters, cartels, for instance, there has not been time to work out detailed machinery, only general rules. Price discrimination on a national basis will be banned from the start and some other trade practices—price agreements and market-sharing, for instance, at a later date. In agriculture, too, the shape of a European market is far from clear. The removal of tariffs without any compensation obviously conflicts with that measure of protection which has become a permanent political fact in every country. So the aim of the treaty is less to create a common free market than to facilitate agricultural progress within the framework of a common protection. Quotas and internal tariffs will be removed; but minimum prices will be introduced instead in the separate countries; the treaty lays down that by the end of the twelve or fifteen year transition period, either a common price level or a genuine common marketing policy, with common marketing boards for instance, will exist. One important rule is that marketing boards in each country will give preference in their buying to all common market countries, even, to some extent, when their prices are above world levels.

This concept is hardly a liberal one and may conflict with Gatt. Yet in another significant matter—that of the common tariff with the outside world—the low tariff countries, Holland and Belgium, have succeeded in gaining a fairly liberal solution. The common tariff is to be based on an arithmetical average of existing tariffs. But in working out the average, no existing tariff on a raw material will be considered to be more than 3 per cent, no tariff on semi-manufactures more than 10 per cent; there may be a maximum for manufactures too. And the difficulty of defining a "semi-manufacture" may give the external tariff a lasting flexibility.

Satisfactory compromises have been found over every vital political and economic issue but one—the relation of the common market to the overseas territories of members. France demands a common investment fund for these territories, whose spending would amount in time to some $1,000 million per year. Its five partners concur that investment and development in Africa is in their interests too. But there has not been time to work out the sort of detailed conditions for investment under the fund which will satisfy them that the money will not sink into a bottomless pit of political trouble. France may have to be content with a vague promise that a fund will be set up. In the current debate in the French Assembly critics are likely to seize upon this vagueness as the most vulnerable aspect of the treaty.

(To be concluded)

Suez Impact on the Sudan

IT was inevitable that the British position in the Sudan should have been damaged by the Anglo-French landings at Port Said. For the conglomeration of leftists and extreme nationalists and for those who have been staunch to ideas of union with Egypt, it provided the perfect ammunition for a propaganda campaign. Those Sudanese who remain deeply suspicious of Egypt, all those who believe that with British help the Sudan can most rapidly make progress, were silenced. There are many who dislike the Nasser regime in Egypt and would not readily raise a finger to save it; but their roots are also in the struggle for independence and they could not in their hearts condone what was to them an act of flagrant aggression. By political necessity and natural sentiment they were driven to isolate themselves from the British Embassy, which found itself almost cut off from contacts in the heart of Khartoum. There are, indeed, grounds for belief that the Umma Party, upon which British administrators in the Sudan based so much of their hope, is now swinging in favour of Egypt and Nasser. Meanwhile, on the other side, the campaign against Britain and particularly against the few remaining British officials reached new heights of virulence.

For Ismail el-Azhary, as he campaigns to recover the premiership, the situation was a godsend. His support still lies among the urban people and the extremists of the town see in him their best bet. The students, through whom el-Azhary created his early political position, are anti-western to a man, whether they are fanatical Moslem Brothers or communists. They still support him.

How far the present situation will affect the results of the elections, due in March or April, it is impossible to say. By that time, it is hoped, the constitution will be ready. Sub-committees are working on the first draft prepared by the Attorney-General while the leading politicians debate among themselves the primary issue of the presidential powers. The present government of Abdullah Bey Khalil appears to support the idea of a president, rather on the French style, who lacks executive power. Others, among them Azhary, want a president with executive power, as in the United States.

Persuasive Russians

Three or four months, during which a constitution must be completed, provides enough time for changes of political fortune in the Sudan. If the uneasy co-operation between Sayed Abdel Rahman el-Mahdi, leader of the Ansar sect, and Sayed Aly el-Mirghany, leader of the Khatmia, holds until the elections, the influence of the two sects should be powerful enough to secure a government something like the present coalition and to defeat Azhary. One could be certain of it except for the problem of the non-Moslem tribes of the south, whose factions can be bought with promises of independence and sometimes with money and patronage. Egyptian propaganda will undoubtedly play its part and has gained by the Port Said affair, but for the moment it is showing greater moderation than in the extravagant and, for Egypt, disastrous days of the Salah Salem period.

There are also reports that Soviet propaganda is taking a hand, particularly in the outlying areas of the cotton schemes. In these areas the congregation of peoples in co-operative enterprises provided the opportunity for primitive forms of communist propaganda. The Kosti disaster in which nearly 200 peasants lost their lives in a sealed room last year was the indirect outcome of such propaganda. The Russian approach to the urban population is also quiet and persuasive. A women's delegation from the Sudan was impressed by its reception last October for the Women's Conference in Moscow and Soviet agricultural mechanisation and hydro-engineering proved equally impressive to the Sudanese delegation to the FAO conference in Moscow. The delegates heard lectures from Soviet

agriculturists and were taken on a month-long tour of Soviet stations.

Perhaps the greatest danger of the present situation lies in the extremist propaganda being poured out by Azhary and his associates. In order to compete with him, the moderates may be forced into the competition of slogans and so commit themselves to policies from which they cannot easily retreat later. Elsewhere in the Middle East and notably in Egypt this has happened time and time again, and has often paralysed the government.

So far the Sudan has been clever at avoiding the worst evils of its wordy warfare. Azhary himself set the pace in reasonableness when, after winning the first elections with Egyptian money on a pro-Egyptian policy, he eased himself slowly but surely into support of independence when he saw that the country had clearly moved in that direction. There was a recent example in the Khartoum University, where the students exempted their 63 British teachers from their general campaign against the West and British "imperialism," realising very sensibly that there would be no one to teach them if they drove the teachers out. (The university is, in fact, seeking to recruit another 25 British teachers.) It would be a pity if the common pattern of political campaigning should unseat the foundation of Sudan's common sense.

The effects would stretch far beyond the Sudan and be more damaging than Egyptian propaganda in the adjoining colonial territories. Since the Sudan gained its independence, the peoples of these territories, notably the Belgian Congo, have been watching Khartoum closely. Belgian newspapers saw the signs very early in the day, and sent correspondents to cover the first independent elections in the Sudan.

Pakistan Ins and Outs

FROM A CORRESPONDENT

WITH the Kashmir dispute back at the Security Council this week, public expectations in Pakistan have been so intensified that any prolongation of the deadlock may have serious internal repercussions. On this issue all political factions are in line with the national mood. While Mr Suhrawardy's abundant energies have been diverted to score a foreign policy success, the opposition, too, has chosen the same field for its line of attack. The Prime Minister has received and returned Chinese hospitality, brought about some degree of rapprochement with Afghanistan, and, in the course of a hastily organised tour of the Middle East, helped to prop up the Baghdad Pact.

Mr Suhrawardy's aim is to show that within the framework of his country's defensive alliances, he can exercise a measure of independence. He has not hesitated to demand the support of Mr Chou En-lai over Kashmir, and in return he has pressed the question of China's admission to the United Nations in a personal letter to Mr Eisenhower. But it is in regard to Middle East policy that he is gambling on a success, and it is in this same sphere that he has been sharply criticised by the formidable Maulana Bhashani, a key figure in his own party, the Awami League. The gist of the complaints made against him by Bhashani and others is that instead of leaving the Commonwealth and reducing the Baghdad Pact to a purely Muslim alliance, he has tried to play down the effects of Anglo-French intervention in Egypt. He has defended his attempts at salvaging the Baghdad Pact by arguing that events in the Middle East created a breeding-ground for subversion far more serious than the intervention itself. His position was strengthened when his campaign for Muslim solidarity elicited some response in Lebanon and Saudi Arabia, while his talks this week with the neutralist Syrian President may placate the Pan-Islamists at home.

In view of these preoccupations, it is not surprising that the prime minister has been unable to give domestic problems the urgent attention which they demand. He has settled the question of communal electorates, but little headway has been made towards putting democratic principles to the test. With India about to hold its second general elections, Mr Suhrawardy's admission that Pakistan's first cannot be held before February, 1958, will only increase impatience. After its historic Dacca session last October, the National Assembly has had its meetings put off from month to month, and it is doubtful whether at the next session time will be found for enacting the electoral laws.

All this offers the "unreconstructed" elements in the Muslim League an opportunity to seek a come-back by exploiting a fierce, uncompromising Pan-Islamism. Mr Suhrawardy's ally in West Pakistan, the Republican party, which a year ago rose phoenix-like from the ashes of the discredited Muslim League, can see the writing on the wall, for two recent by-elections show that the League is regaining support. The Republicans' failure to tackle land reform, together with the defection of their secretary-general, who resigned because, as he claimed, they had neither formulated a policy nor built up an organisation, sound like echoes of the Muslim League's own past sins of omission.

A Republican setback in West Pakistan may not immediately affect the coalition at the centre. But it seems clear that the government will suffer if it goes on putting off the elections by pleading lack of preparation; that Mr Suhrawardy will have to instruct the electorate in the problems of democratic government, just as he has sought to expound the principles of his foreign policy; and that he will have to work hard to prevent his duties as prime minister from widening the distance between himself and the Awami League party apparatus which he helped to set up.

Satellites in the Red

THE searching reappraisal of economic policy going on in Moscow has been inspired not only by Russia's own problems but by economic strains in eastern Europe. The new co-ordinated five-year plans had hardly begun last year when east European leaders began to point out that they could not fulfil them without more outside help. Russia granted a loan to East Germany in July, halving its occupation costs at the same time, and further loans to Poland and Hungary in September. Autumn and winter have brought more urgent calls. In eastern Europe only the Czechs had a good harvest last year. Poland, which had a grain deficit of as much as three million tons, and the rest of the block are being baled out with deliveries of Russian grain.

In November, Mr Gomulka won from the Russians concessions which undermine the basic form of Russian economic exploitation. For years east European countries have been forced to sell key raw materials to Russia at cut prices, often under secret agreements, and to make for Russia, at uneconomic cost, engineering products which are unmarketable elsewhere. The Poles have forced the Russians to agree to pay world prices in future for their coal and uranium as well as for other goods, and to cut Russian imports of Polish coal so that they can sell it in other markets. Last month the Rumanians made pilgrimage to Moscow and came away with promises of grain and economic credits. The latest in the queue are the east Germans, who were in Moscow last week, and who got a credit of 340 million roubles and a promise of steady deliveries of coal, coke and other materials to replace Polish supplies. Finally, if the Hungarian economy is not to collapse, massive economic aid will clearly be necessary; the Russians have already promised large credits.

Chain Reaction

Eastern Europe's demands reflect chronic economic weaknesses, which have continually dogged the backward economies in their efforts to erect an industrial system by enforcing a high rate of saving and investment through a crude system of central planning. Now the weaknesses which were masked, or overcome at great human cost, so long as Russia remained in political command of eastern Europe, have been brought to a head by political change. In some countries wages have been raised and prices cut in an effort to revive production and appease the consumers; in present circumstances this policy is more likely to lead to rampant inflation than to plenty.

The weakness of each state has reacted on the others. Poland, suffering a serious fall in coal output, has slashed vital coal exports to the Czechs and Germans. The cut has widely affected east German industries and power stations, and the east Germans have in their turn fallen behind with deliveries of machinery and chemicals. Poles, Czechs and Germans have all suffered from the sudden extinction of Hungarian supplies of grain and vegetables, ores and industrial goods.

Russian help cannot quickly solve eastern Europe's problems. Rising Russian oil production and assistance with the development of atomic power will help to overcome the fuel problem in the long run; the record Russian grain crop has saved the Soviet block from famine this winter. But the harvest may not be so good another year; and in the short run eastern Europe needs coal, not oil, to keep its fires alight. But Russian plans for coal have themselves been upset by the cut in Polish exports, and last year coal was one of the sectors in which Soviet output itself fell short of its target. Western Europe has been able to turn to the United States to fill the gap in coal supplies; eastern Europe cannot do the same with Russia. Nor can Russia quickly satisfy its acute needs for certain types of capital goods, let alone the demands of the neglected consumer.

Almost all the states of eastern Europe are therefore modifying their plans. In Hungary, of course, the five-year plan has had to be completely scrapped. In Poland the economic plans that are emerging under the pressure of popular feeling involve not only more moderate aims, but a radical change of direction in favour of consumer goods, housing and agriculture. Rumania is modifying its five-year plan—it is not yet clear exactly how much—in order to improve living standards more quickly. East Germany has already announced that expansion and investment will slow down this year.

The jettisoning and changing of national plans has in turn upset the Russian attempt, begun last year, to bind the satellite economies together into an integrated whole under the guidance of the Moscow-directed Council for Mutual Economic Aid (Comecon). Poland's independent course is forcing Russia to concentrate its efforts for economic integration on the faithful Czechs and Germans. At a Comecon meeting last month new arrangements to integrate and specialise between the Czech and east German engineering industries were made.

Poland's new independence in foreign trade was shown when it announced that it will not join this year in triangular trade arrangements with Russia and Finland, as it has done in the past. The move was inspired by the wish to trade more with the West. Helped by Russia's agreement to cut coal imports, Poland has already succeeded in negotiating bigger trade agreements with France, west Germany and Britain. Western coal seems vital if the Hungarian economy is to recover, and even east Germany has shown a special interest recently in western trade.

But trade with the West, like trade with Russia, will only bring a radical improvement to the east European economies if big credits are granted. France has already made a start, granting Poland a long-term credit of 10 billion francs; Germany, too, has granted a $9 million credit in the course of normal trade. But these are mere beginnings. The Kadar regime in Hungary has been appealing repeatedly for western credits. The Poles have not disguised their great interest in credits, even from the United States, but they have made it clear that there must be no political strings. This implies criticism of the western strategic embargo, and some western traders are already putting forward the view that Poland has now attained such economic independence from Russia that the embargo on exports to Poland might be separately relaxed. The trend towards more trade with the West is not new; it began in 1953. But the Czech and east German trade offensives were directed from Moscow and aimed in particular at the under-developed world. Poland's new interest in westward trade differs in kind and purpose, being impelled by the Polish national interest alone.

The Poles are becoming more and more aware that they cannot afford to conduct their foreign trade within the framework of bilateral agreements which are politically conditioned, or within a rigid planning system which fails to make the best use of resources. With imports, as with exports, the view is gaining ground that price and quality

Now in its second year

The Paper Bulletin

This is a bulletin service for paper users and makers. It deals with the supply, demand and price trends for paper, paper products and raw materials. The eighth quarterly issue will shortly be available. Full details from:

THE ECONOMIST INTELLIGENCE UNIT LTD. 22 Ryder Street, London, S.W.1. Whitehall 1511, Extension 144.

rather than politics must be the sole criteria of purchasing, and that there must be greater flexibility in the methods of foreign trade, so that imports can stop gaps, fill emergency needs, and provide the elasticity which the liberal trading world enjoys.

Such thoughts are making progress in other east European countries as well. Just as the growing decentralisation within each planned economy can weaken economic and political power at the centre, so in the east European trading area the greater independence of one member is weakening Moscow's ability to direct the block as a whole and is pushing the other partners towards greater flexibility.

Indonesia's Army Takes A Hand

FROM OUR CORRESPONDENT IN JAKARTA

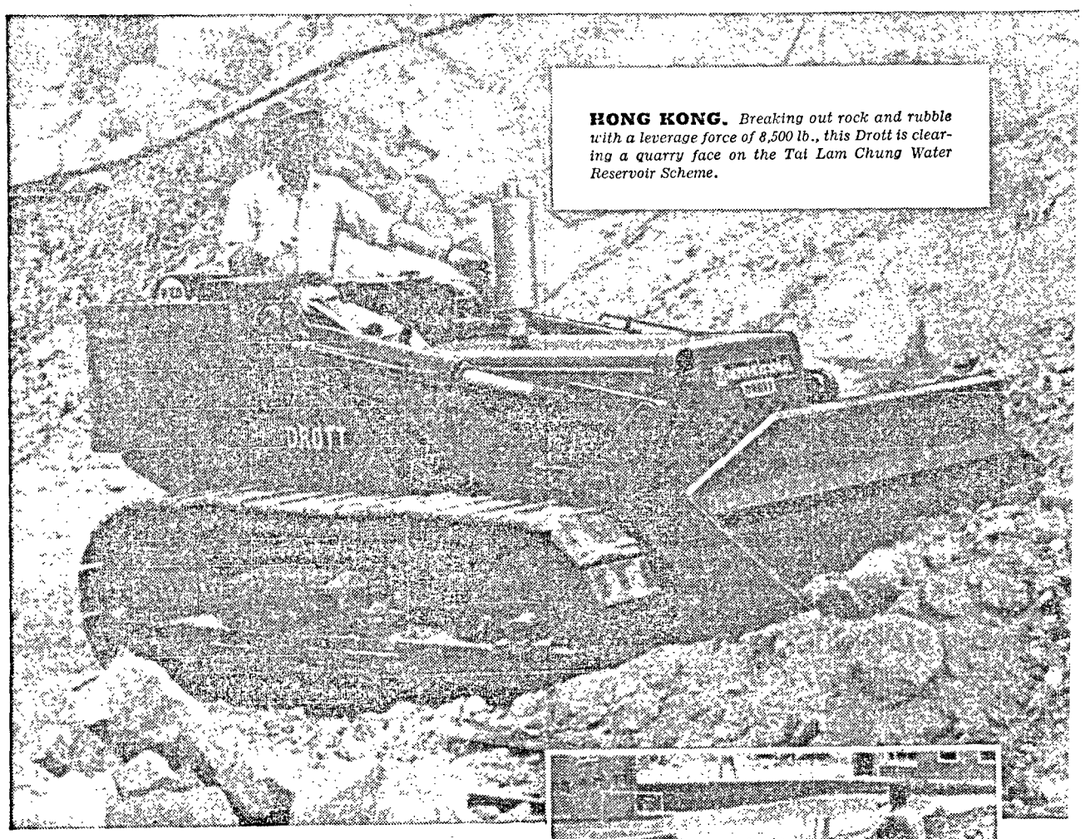
PRESIDENT SUKARNO is reported to be about to form a "Revolutionary Council," which would supersede parliament as the body to which the government is responsible. This drastic action may not provide a long-term solution to Indonesia's political troubles, but it is easy to see that the only alternative to a bold gesture of this kind might be a military dictatorship. The President's plans, reported this week in the well-informed newspaper *Merdeka,* are being formulated at a time when the Sastroamidjojo government is rapidly disintegrating as a result of the withdrawal of the moderate Islamic *Masjumi* party and two minor Moslem parties.

The month-old cabinet crisis arose out of a complicated army rebellion in Sumatra, which revealed the government's complete lack of authority in outlying areas, and made the *Masjumi,* one of the three main parties in the coalition, decide that it could no longer support a discredited administration. In common with many Sumatran leaders and a number of other political parties in the capital, it has turned to Dr Hatta, who resigned last month, believing him to be the only man capable of leading the new government. Dr Hatta, who had modestly retired to a mountain resort (conveniently near Jakarta) to start life as a private citizen, is said to be prepared to accept the premiership provided that he is given a free hand until the next general election (due in 1959), and is allowed to carry out an uninhibited anti-corruption drive.

But the Nationalist party (PNI), to which the prime minister belongs, and the Communists (whose parliamentary support has become essential to the government since the *Masjumi* resigned) have taken the strictly constitutional line that the government must not be brought down by the action of the army; "if it has to fall it must fall in parliament." (Dr Sastroamidjojo's last cabinet resigned after a dispute with army officers over an appointment in the army command, and he is determined that this shall not happen again.) The orthodox Islamic *Nahdatul Ulama* also believes that it would be irresponsible to force a complete change of government; they favour a cabinet reshuffle with the prime minister temporarily holding the offices of minister of foreign affairs and of defence.

The crisis began on December 16th when forty-eight senior army officers in Sumatra signed a resolution urging the central government to take firm steps to overcome the general dissatisfaction felt in the young Indonesian republic; they then drank to the success of their enterprise and smashed their glasses as a symbolic break with the prevailing conditions in their country. Four days later one of them, Colonel Ahmed Hussein, announced that in order to deal with the prevailing unrest he had taken over the control of central Sumatra and was administering it with the help of a Banteng (Buffalo) council of present and former army officers. Colonel Simbolon, the commander in north and central Sumatra, followed suit the next day but 27 of the officers who had signed the original protest decided that he had gone too far and refused to support him.

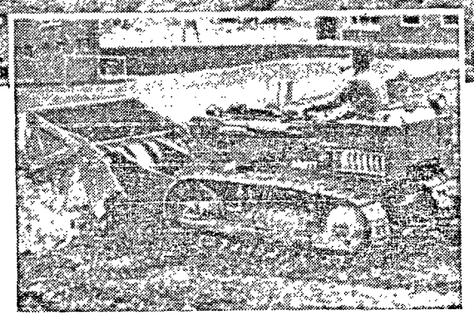
The news of the two bloodless coups rocked the capital; the coalition government was already struggling with wrangling government parties, with demands for a cabinet reshuffle, and with nation wide criticism of its failure to carry out its construction programme or deal with corruption. The attorney-general had announced that there was reason to suspect the foreign minister, Mr Abdulgani, of breaking the foreign exchange regulations; Colonel Lubis, the former deputy chief of staff, had attempted a *coup d'état;* the vice president, Dr Hatta, had resigned and it was rumoured that President Sukarno was thinking of proclaiming a state of emergency, and using his authority as commander-in-chief in order to check any further deterioration.



It was therefore essential to deal with the new problem promptly. After a series of emergency sessions the cabinet decided to relieve Colonel Simbolon of his post and sent another officer, Colonel Ginting, to take over. This, after the cabinet decision had received the full weight of President Sukarno's authority, Colonel Ginting managed to do—much to the government's relief. But his success has solved only a small part of the problem. Colonel Simbolon is at large and some troops are still loyal to him; two of the three regiments in north Sumatra have refused to obey Colonel Ginting although they recognise the authority of the army chief of staff, and in central Sumatra another regiment is quietly but firmly administering an entire province. In south Sumatra, where there was no military rebellion, the governor announced, on Christmas eve, that in order to prevent an explosion in the province he intended to use all revenues from taxes and customs to finance local development projects instead of paying them to the central government.

Sukarno and Hatta

Both in Sumatra and Jakarta many people are saying that only Dr Sukarno and Dr Hatta, working in alliance, can hope to solve the problem and every effort is being made to reunite these two men, whose opinions differ on many subjects. If these efforts succeed, Indonesia could recover its stability quickly; if not, the political crisis may continue indefinitely, even if the military problem is settled through the army's loyalty to President Sukarno, and Sumatra is placated by the granting of local autonomy. The dynamic, popular president, who is said to incline towards an Indonesian version of a people's democracy, and the anti-communist economic expert Dr Hatta, are the only two men whose authority extends throughout the archipelago; they seem complementary by nature and they have been pictured as the symbol of Indonesian unity ever since they proclaimed their country's independence. Indeed it might be concluded from the course of events since Dr Hatta's resignation, that they represent the unity of the infant democracy in more than a symbolic sense. Personality is still of prime importance in Indonesian politics.



A WORLD BEATER!

- the world over

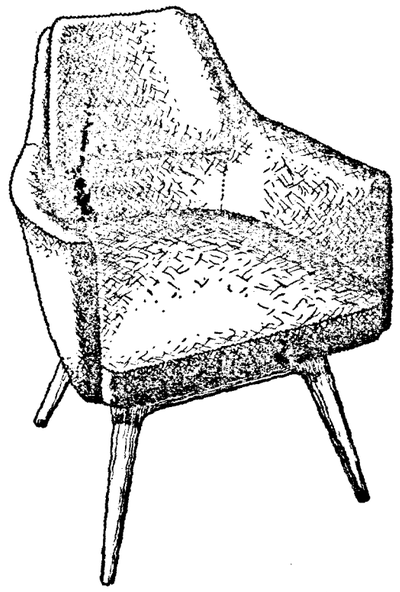
HONG KONG. *Breaking out rock and rubble with a leverage force of 8,500 lb., this Drott is clearing a quarry face on the Tai Lam Chung Water Reservoir Scheme.*

Contractors and operators in more than a score of countries are acclaiming the British-built International Drott Skid-Shovel the most flexible, most powerful machine of its kind they've ever had.
Drott's *bucket-over-shoe* leverage action gives *triple power* excavating force—removes embedded boulders, rips up concrete slabs, tears up frozen ground as no other front-end loader can. All Drott's work-boosting features are *originals:* years of experience lie behind their concept and design; all have been proven by big, economical production wherever Drott has gone to work.

DENMARK. *This Drott is speeding the laying out of a football ground at Snerlegaarden. It is fitted with the sensational 4-in-1 attachment, convertible 'on-the-go' to bulldozer, clamshell, bullclam or skid-shovel.*

INTERNATIONAL HARVESTER

INTERNATIONAL DROTT SKID-SHOVEL • MODEL B-6-K3



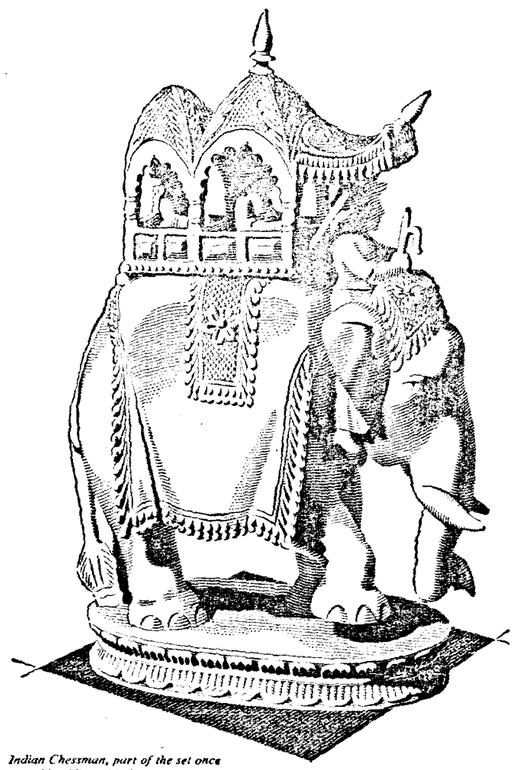
1¼ CU. YD. or 1 CU. YD. (HEAVY DUTY) BUCKET or with 4-in-1 attachment. Bullangledozer blade also available.

You are invited to write for full information, or, better still, to contact your International Construction Equipment Dealer w will glodly arrange a demonstration.

International CONSTRUCTION EQUIPMENT

INTERNATIONAL HARVESTER COMPANY OF GREAT BRITAIN LIMITED.
Harvester House, 259 City Road, London, E.C.1.

Your turn next?



Many able executives tend to doubt that comfort aids efficiency — until they take a turn in this swivel armchair. Especially designed for men of action who must spend long hours behind a desk, it provides correct *posture support and remarkable ease of* movement; makes comfort and efficiency synonymous. Based firmly on four teak legs, the well-padded seat swivels easily at the lightest touch.

Come and see it at our Contracts Showrooms, where you will see many other examples of modern furniture for offices and boardrooms. If you cannot come, please write for our leaflet, *Furniture for Special Needs.*

Chequerboard of the East

So many races . . . so many needs . . . so many markets extending over a vast area of the earth's surface. And there The Chartered Bank operates with knowledge and experience sustained by more than a century of close and intimate contact. Branches of The Chartered Bank are established in most centres of commercial importance throughout Southern and South-East Asia and the Far East. At all these branches a complete banking service is available and, in particular, facilities are provided for the financing of international trade in co-operation with the Bank's offices in London, Manchester and Liverpool, its agencies in New York and Hamburg and a world-wide range of banking correspondents. In London and Singapore the Bank is prepared to act as executor or trustee.

THE CHARTERED BANK

(Incorporated by Royal Charter, 1853)

HEAD OFFICE : 38 BISHOPSGATE, LONDON, E.C.2

THE BUSINESS WORLD

Amalgam of Accountants

IF marriages are made in heaven, wedding guests should be charitable in their judgments. But the publishing of the banns to unite the Society of Incorporated Accountants with the Institute of Chartered Accountants is an event too important for those who are concerned with the future of accountancy as a discipline and a profession to hold their peace. The courtship began about two years ago, and it remained a well-kept secret until the official announcement came at Christmas. Evidently the institute has had the dominant say in the marriage settlement.

The proposals to integrate the two bodies are outlined on the next page. But consummation, however devoutly wished by the leaders of the institute and society, depends upon two-thirds of the members of the institute of England and Wales who vote in the poll being in favour of the scheme. This is the decisive vote. If a two-third's majority is obtained, polls at the Scottish and Irish institutes will be taken. Finally, the society will have to obtain the assent of three-quarters of its members polling on a resolution to wind up.

The reactions of the small chartered practitioner are likely to be decisive. The institute's memorandum seems to have been designed deliberately to appeal to the practising chartered accountant in Middle Accountingham. It is aware of his prejudices and tries to soothe his fears (with some risk of alienating the many chartered accountants serving in industry). His prejudices are clear : he knows the cachet that the word "chartered" carries ; it may give him a valuable professional advantage over the competing incorporated accountant across the street. Why, he will say, must he share this professional totem with his rival in future ? To this it is justifiable to retort that in accountancy, as in other professions, the man counts first and the qualification second.

But this answer, just though it is, may not appease those who are jealous on points of professional pride. It is possible that the proposals will be defeated ; if so, it will be for the wrong reasons. In a generation's time accountants may look back on the integration and realise that it was inevitable. To be blunt, the society has lost its impetus. This came from the "bye-law" candidate, the accountancy clerk whose parents could not afford a premium for articles and who received a larger salary than the articled pupil. Premiums on articles have almost disappeared ; salaries have improved ; and there is no difficulty in placing a good student under articles without a premium to a chartered accountant. Members of the society, looking to the future with real foreboding, argue that it must move either towards the institute (with its insistence on training under articles in a public accountant's office) or towards the Association of Certified and Corporate Accountants (which accepts training in industry as a suitable qualification). If the scheme fails, which in itself would weaken its standing, the society may have to consider the possibilities of allying itself with the association. Such an alliance, recognising two different methods of entry and training as equally suitable qualifications, might be less desirable than the proposed integration of two bodies which have both frowned upon industrial training.

★

If the scheme goes through, a professional body, more massive than before, with rigorous standards of training and qualification, and speaking, if it chooses to speak, with a single voice for public accountants, will have been established. No one can doubt that articled service gives an accountant an invaluable foundation of professional independence and judgment, even if its inescapable concentration upon taxation and auditing leaves too little opportunity for developing accounts as a tool of managerial and industrial control. But, equally, no one can doubt that the days of effective rivalry between institute and the society were good for

both. Twenty years ago the society spoke with the powerful voice of Henry Morgan and members of the institute learned to speak up, too. But in recent years the "recommendations" of the institute have borne the stamp of the highest common factor of agreement, and to many outside the profession it has seemed too low. A docile form of agreement (if only to differ) has had an inhibiting effect on the public discussion of principles and practice. The enlarged institute will be monolithic, and unexposed to any competitive professional ideas.

More than this, an itegrated institute may see accountancy and its many problems through the frosted windows of the practitioner's office. His can be a narrow view. The scheme will widen the rift between the professionally trained and the industrially trained accountant; it may also tend to separate the chartered accountant in private practice and in industry. One sentence in the institute's memorandum reads:

> It would clearly be a retrograde step for the accountancy profession as a whole and for the public at large if the society were forced to relax the standard of its training so as to allow it to be based to a large extent on commercial rather than on professional experience.

As a comment on training this may be acceptable. But it is not the only passage that carries overtones of less than parity of esteem for qualified accountants engaged in industry. Any widening of the gap between them and their colleagues in private practice would be a retrograde step in an age when both kinds of accountants and their different viewpoints are of increasing importance not merely to the profession but also to the whole economy. The enlarged institute will have a public duty to represent the views as well as the interests of qualified accountants serving industry.

If the institute fails in this, it may ultimately find itself simply the representative body of public accountants, with accountants in industry (whether trained there or not) seeking other means to make their voices heard. Integration is not a final solution. Is there not a case for extending the period which an articled pupil can spend training in industry? Might the institute not throw the weight of its authority behind any efforts to encourage articled clerks to profit from independent views on the profession?

If the society is integrated with the institute, the new body will have to look and to think forward. In the hope that it will do so, and with a real tinge of regret that the society has almost found itself on the shelf, the business community will raise its glasses to the couple.

The Shape of the Proposals

THE outlines of the proposals to integrate the Society of Incorporated Accountants with the Institute of Chartered Accountants are as follows:

(1) The three institutes of England and Wales, Scotland and Ireland will retain their separate identities. A joint standing committee is to be formed.

(2) Members of the society whose qualifications include practical experience in the offices of public accountants in this country (these include the "bye-law" candidates of the society) are to become associates of the institute. Those who have been in practice as public accountants for five years will be eligible to become fellows of the institute.

(3) Members of the society whose qualifications do not include such experience will become incorporated accountants of the institute, with the opportunity (after three years' service in a public accountant's office in this country) of becoming chartered accountants of the institute. These include members of the society who either served their qualifying period of service abroad or in the treasurer's department of a public or local authority.

(4) Existing students will be able to complete their training with a view to becoming either chartered or incorporated accountants.

(5) All new students will have to be articled pupils for five years with a member of the institute engaged in public practice as a principal or partner. Thus "bye-law" candidates of the society will disappear and gradually over the years the incorporated accountants will disappear too. The number of pupils allowed to each partner will be increased from two to four. At the discretion of the council of the institute this number can be further increased, thus allowing the big firms with a small number of partners to keep up recruitment.

(6) The proposals to integrate members of the society with the Scottish and Irish institutes follow similar lines, with two important exceptions. First, the number of pupils (apprentices) has never been limited in Scotland and will remain unlimited. Secondly, the Irish and Scottish institutes do not propose to create a separate class of incorporated accountants. The numbers eligible for such a class are small and provision has been made for them to become incorporated accountants of the English institute.

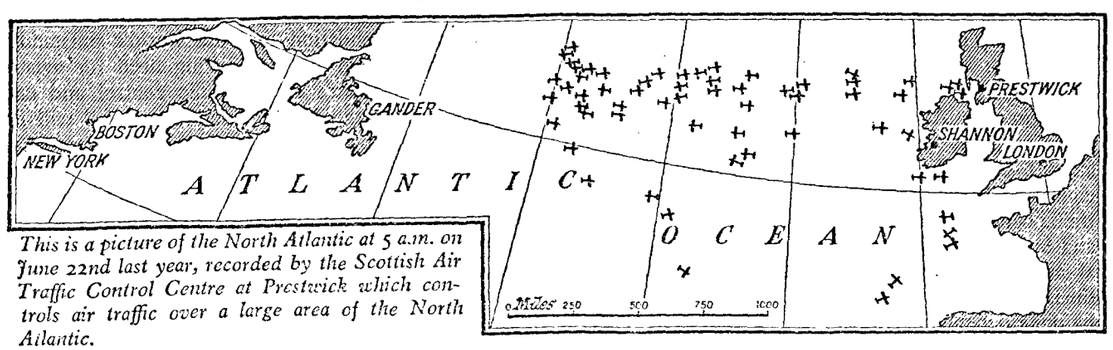
(7) *Accountancy*, the official journal journal of the society, will become the official journal of the enlarged institute.

The Numbers Involved*	English Institute	Scottish Institute	Irish Institute	Total
Incorporated accountants who are already chartered accountants	539	33	17	639
Incorporated accountants eligible for admission as chartered accountants	7,794	93	354	8,241
Incorporated accountants eligible for admission as "incorporated" accountants of the institute:				
(*a*) at home	1,140	...	...	1,140
(*b*) abroad	925	...	...	925
Membership of the Society	10,443	126	371	10,945
Membership of Institutes	19,112	5,947	936	26,045
Integrated membership†	*28,971*	*6,010*	*1,310*	*36,351*

* Estimates as on June 30th, 1956.
† After deducting incorporated accountants who are already chartered accountants.

Safety in the Crowded Air

IT takes a major disaster, like the mid-air collision of two airliners over the Grand Canyon or the crash of the Vulcan bomber at the approaches of London airport, to focus public attention even momentarily, on the traffic hazards of civil aviation Yet the race between the rising volume of air traffic and the technical and human resources at the disposal of the men attempting to control it is becoming too close for comfort. At some airports, of which London is the most successful example, the controllers have stayed in front, but at some others the system is dangerously near a breakdown.



Inadequate ground control carries some real risks. A pilot's only protection against them is to rely on his unaided judgment and put the widest safety margins between himself and any other aircraft. The alternative is heavy capital expenditure to bring ground services up to a point where they can deal adequately with the traffic offered. It is never easy to get this kind of expenditure approved, particularly as somebody not directly concerned is always asked to pay: air transport does not ordinarily provide its own terminal facilities. Even in this country the period of negotiation needed to get Treasury sanction for a new air control installation may run up to two years. In other, poorer countries, the major foreign airlines have sometimes no option but to provide the equipment themselves.

An apparently limitless sky becomes congested when an ever-growing number of aircraft converges on the main air terminals, most of them during the peak hours favoured by passengers and all attempting to approach by the most economical route. The control of this traffic is based on something approximating to a three-dimensional railway system. Aircraft flying into busy areas keep to defined traffic lanes, channels of air provided primarily for the use of transport aircraft. As the aircraft move into these channels from different directions, the ground controller becomes responsible for seeing that they keep a safe distance from each other. Under present international standards (without radar), each aircraft must fly at least 1,000 feet above the one beneath it, and must stay the equivalent of 10 minutes' flying time—in practice about 40 miles—behind the machine immediately ahead in the lane.

As the volume of air traffic increases, currently at the rate of 15 per cent a year, the only way to prevent congestion in these lanes is either to force airliners to fan out along the routes, which increases their mileage and costs (and in any case is impossible in Europe where many routes intersect) or to reduce the distance between aircraft. This can be done without compromising safety if the ground controllers know accurately the position of the aircraft in their district. At the approaches to London airport, for example, the separation between aircraft has been reduced, by the extensive use of radar, from about 40 miles, the equivalent of 10 minutes' flying, to 3 miles, and the result is that the airport can handle one aircraft every two minutes in practically every kind of weather. The degree of separation between each aircraft is set by the accuracy of the instruments monitoring them and the speed at which the controller who instructs the pilot can work. There is fairly general agreement that London airport has carried the refinement of its control system further than most; conditions at other big airports in the world range from the passable to the near-chaotic and the downright alarming.

The chances of congestion are in some ways worse outside the air lanes. Operators in the North Atlantic, where air space is nominally free, are beginning to find it uncomfortably crowded. They might not do so if navigation aids along the route were more reliable; but polar interference with radio communications can leave an aircraft for long periods without any contact with the land, so that neither pilot nor the traffic controllers to the east and west of him know precisely where the aircraft is. To give an adequate safety margin under these conditions, aircraft crossing the North Atlantic are separated from each other at

RUSH HOUR ON THE ATLANTIC

This is a picture of the North Atlantic at 5 a.m. on June 22nd last year, recorded by the Scottish Air Traffic Control Centre at Prestwick which controls air traffic over a large area of the North Atlantic.

any given altitude by the equivalent of 30 minutes' flying. At present speeds this is about 150 miles.

Because most people like to fly the Atlantic by night, the aircraft tend to take off from both sides at roughly the same time. The eastward and westward streams cross in mid-Atlantic, as the map shows ; 161 aircraft crossed on the day illustrated, and about 100 aircraft are generally crossing at the same time. With this volume of traffic it is becoming increasingly common for a pilot when he files his plan of flight for the crossing to be told by the traffic controllers that there are several other aircraft ahead flying at the heights he wants to use. This week, the International Civil Aviation Organisation showed that this happened to 40 per cent of the flights last summer, and that more than half of the total flights met difficulties that arose either from traffic control or communication hold-ups. Radio black-outs of one to two hours were quite common. Airliners are so often obliged to take the less economic routes across the Atlantic because of the traffic density ahead of them, that it is beginning to affect profits.

Few people would suggest that these safety standards are exaggerated. The instruments carried by aircraft are not 100 per cent accurate, and the most accurate of them all, the altimeter, is subject to 16 different sources of error. These errors increase as the aircraft flies higher ; this explains the recent agreement that at the high altitudes which jet airliners use, the vertical separation distances are to be doubled from 1,000 feet to 2,000 feet, if not more. Jets also increase the already real risk of mid-air collisions. Two aircraft flying at 500 miles an hour converge on each other at a thousand miles an hour. At these speeds pilots cannot see each other ; an aircraft that first appears as a dot in a clear sky several miles off could crash into another flying towards it in a matter of seconds. There is a well-documented case in the United States of a lone bomber crashing head-on through a formation of bombers, breaking five feet off the tail of one, and tearing loose the engine of another without any single one of the pilots, the intruder included, seeing each other or knowing that anything had happened until they landed.

★

The air lines are seriously concerned about what will happen when they bring their jets into service. Unless they can fly at their optimum altitudes, cost calculations will go seriously awry, but the separation distances agreed are not going to leave much room in the Atlantic for large numbers of these aircraft at any one time. These distances between aircraft could be reduced if better navigation aids could be developed (so that the North Atlantic traffic controllers at Gander on the west, and Prestwick and Shannon on the east, could tell where aircraft were at any time during their crossing) or if the aircraft themselves knew their positions. How soon this could be done depends on the success of trials soon to begin with a new Decca system of tracking aircraft by means of land stations on the east and west linked to equipment carried in the aircraft. An alternative is to separate the east and westbound traffic crossing the Atlantic, sending one north and one south of the low pressure area that lies in the centre of the shortest crossing (and is assiduously avoided by pilots who fly in a loop to make use of tailwinds). Development of the Polar route would also thin out the traffic at its worst points.

★

The volume of air traffic that is expected to develop in the early 1960s, even without the introduction of jet airliners, cannot be solved by rerouting. The North Atlantic was too small for the 43,000 aircraft that crossed it in 1956. By 1960, 70,000 aircraft, carrying one million passengers, must somehow be channelled through the same space. This will require technical aids that can fix the position of every aircraft accurately, and do so with such speed that the traffic controllers can still keep one step ahead of the aircraft crowding into their sectors. The human element of fatigue is already a factor in air traffic control, not on the North Atlantic but in regions like Europe and inside the United States when short-haul air traffic is booming. It can partly be countered by increasing the number of controllers on duty: one man can deal with about 30 aircraft an hour. But the point is reached quite soon when the confusion caused by large numbers of controllers trying to keep each other informed begins to affect the efficiency of the system. Experiments using electronic computers to take a load of mental calculation and docketing of information off the controller and leave him free to concentrate on his essential job of taking decisions are now being started.

The crash of the Vulcan at London airport serves, however, as a reminder that even the best mechanical systems are fallible. Both the bomber and the whole machinery of traffic control and landing aids that buttress London airport from such disasters were in full working order. Yet were they in fact properly co-ordinated ? Some experts point out that the essential element of experience was lacking. Neither the pilot nor the ground controller had ever taken part in a "talk-down" landing of a Vulcan, with the special handling characteristics that rise out of its odd shape.

The slightly desperate reference in this week's ICAO recommendation to "the world's outstanding case of immediate and compelling need for aviation improvement relates to air traffic control and communications in the North Atlantic region," will find echoes in other parts of the world. In Europe and other areas of dense traffic, the problem is primarily a human one of potential fatigue among controllers dealing with large numbers of short haul traffic. In less populated areas of Asia and Africa the dangers arise from inadequate equipment and control staff that lacks experience and a cool head. The North Atlantic presents a clear need and the best technical opportunity of improving navigation in the air.

Business Notes

Gilt-Edged Forge Ahead

THERE is no halt to the rise in the gilt-edged market. The table shows the extent of the rise over the week and since the low point at the end of November. The movement has gathered momentum and business in the short and short-medium dated stocks has gathered volume this week as the market, encouraged by the reduction in the West German rediscount rate and talking freely—perhaps too freely—of a fairly early reduction in bank rate here, made up its mind that the downward trend in interest rates had been confirmed. Buying by the banks at the shorter end of the list has probably continued. Outside the banks demand has been spreading towards the longer dated stocks. Some banks apparently like the 4½ per cent conversion stock of 1962. There has also been a broadening demand for the British Electricity 4½ per cent stock 1967-69 and the Treasury 3½ per cent stock 1979-81. These are all stocks that the Government broker can supply and the rising market has provided the occasion for substantial funding by selling from the official portfolio.

GILT-EDGED NET PRICES

	Nov. 30, 1956	Dec. 31, 1956	Jan. 9, 1957	Jan. 16, 1957
Funding 2½% 1952/7.....	93 27/32	99 1/2	99 5/32	99 5/16
Exchequer 3% 1960.....	94 15/32	94 1/4	94 15/32	94 15/32
Conversion 4½% 1962.....	96 1/2	96 21/32	97 11/32	97 21/32
Brit. Elect. 4½% 1967/9...	89 3/32	90 3/32	91 1/32	92 1/32
Treasury 3½% 1979/81....	74 1/16	76 1/32	77 13/32	78 5/32
Brit. Trans. 3% 1978/88 ..	65 23/32	68 1/2	69 7/32	70 11/32
Funding 3½% 1999/2004..	72 3/4	75 1/2	76 17/32	78 7/32
Consols 2½%	50 7/32	52 17/32	53 11/32	54 9/32

Speculative operators have certainly been in the movement. Their activities have something to do with the rise in the undated stocks and a great deal to do with the massive oversubscription of the Tanganyika Government's issue of £3 million stock, of which only £2½ million was offered to the public and £500,000 taken up by Colonial Government Funds. The stock carries interest at 5¾ per cent (giving it the distinction of bearing the highest interest coupon in the colonial list) and is dated 1978-82 to give a running yield at the issue price of 99½ of £5 15s. 7d. per cent and a gross redemption yield to the final date of £5 15s. 9d. per cent. The stags judged it ideally suited to the market's mood and to their own, since only £10 per cent was payable on application. The rush of applicants was so great that it was not possible to get allotments posted on Thursday and dealings could not start this week.

The buoyant tone of the gilt-edged market has not been reproduced in other sections. The industrial market, with the new account starting on Wednesday has held a little better than steady. *The Economist* Indicator reached 192.8 compared with 190.5 a week earlier. Activity, however, has centred round a few specialities. The new London and Overseas Freighters 6 per cent debenture (£20 paid) placed privately at £97½ a few weeks ago made its début in the market on Tuesday and quickly established a premium of 3¾. Great activity has accompanied the start of dealings in the ICI 5½ per cent convertible loan stock on Friday of last week. On the opening day a premium of 5⅛ was established and by Wednesday of this week the premium had risen to 7½ in a market that suggested that some of the jobbers must have been caught short of stock. There is indeed an equity flavour in the ICI stock arising from the right to convert into ordinary shares in July, 1958, 1959 or 1960. But the real demand for such stocks as the ICI and London and Overseas Freighters issues is based on the appetite of the institutions for industrial prior charges, of which they can seldom buy as much as they would like.

Power in the Cabinet

THE terms of Sir Percy Mills's appointment as Minister of Power, with their specific reference to "extending the use of atomic energy as a source of industrial power," signal a change in the importance attached to atomic electricity in Whitehall rather than any shift in the administrative responsibilities of the Atomic Energy Authority. The authority, which gives at least as much thought to the production of atomic weapons as it does to the development of atomic energy, is responsible to the Lord President of the Council, and amending legislation would be needed to alter this state of affairs. There is nothing in Sir Percy Mills's appointment to suggest that the government intends to do this or to put Sir Percy's re-vamped Ministry into the weapons business, which is what full responsibility for the AEA as such would involve.

The atomic power programme which will be carried out by the electricity supply industry always did fall within the over-riding responsibility of the old Ministry of Fuel and Power, with the AEA functioning as its technical adviser, so far as English stations are concerned: those in Scotland are formally at least the business of the Secretary of State for Scotland. It is fair to say that the claims of atomic fission to be considered as a major source of power, along with the older, fossil fuels, have taken a long time to be accepted within the Ministry and within the Central Electricity Authority. The new Minister may, however, find it the easier to exercise his particular responsibility for atomic energy through the revised organisation of the electricity supply industry, in which it has already been laid down that the new central generation board will concern itself particularly with developing nuclear generation. The new Electricty

Bill, which has had its second reading and is now in the committee stage, proposes to abolish the Central Electricity Authority. It has been criticised in some quarters for giving the Minister too much direct power over this generation and transmission board and the area boards that distribute electricity. This direct relationship, combined perhaps with the appointment of a chairman from atomic energy to the generation board, should prove convenient for a Minister given this special duty to boost nuclear development.

The Minister's only really new responsibility, iron and steel, can be transferred without legislation, but it will be exercised less directly. He is responsible for appointing the Iron and Steel Board, but this board supervises operations, development and prices in the industry; the directions that the responsible Minister can give it are confined to such matters as the import of steel products, though he can ask the board to consider matters affecting employment and "the national interest." He has the power, if advised by the board, to take over plant that might otherwise be closed down and to invest in new steel plant if private steelmakers are not prepared to take the risk. In practice, the Board has submitted its changes in price to the Government by gentleman's agreement, in the same way as the National Coal Board does; the electricity and gas industries are not ordinarily affected by this form of informal price control. The new Minister's relations with the National Coal Board are bound to be interesting; this is a vast, worried industry that is touchy about pressure from above and currently apprehensive about what changes in fuel investment policy may mean for it.

Bigger Nuclear Programme

CHANGES in the atomic power programme have been under discussion for months. They have a particular urgency because the decisions taken now cannot begin to be put into effect before 1962-63 at the earliest, and the longer the choice is delayed, the longer it will be before the economy reaps the benefits that additional atomic power in the mid-sixties can bring. The amount by which the Central Electricity Authority needs to increase its generating capacity each year is roughly fixed by the steady pattern of demand; 2 million kW each year for the time being, close upon 3 million kW in the 1970s. The choice lies between how much of this new plant should be coal-fired, or oil-fired, and how much should run on uranium.

At some critical date, the CEA will cease to build any more coal-fired stations. The original atomic power programme, drawn up two years ago, suggested that date must lie between 1965 and 1970. The principal incentives to put it forward are strategic and economic: dangers of greater dependence on the Middle East, the difficulty of finding the extra tonnage of coal each year for new power stations and the high price paid for imported fuel to fill the gap. The arguments against early action speak with two voices, one counselling caution before the first atomic power stations have had time to prove themselves, the other protesting against the immense capital expenditure that the country will have to meet if the atomic programme is accelerated. Atomic power stations cost roughly twice as much to build as a coal-fired plant; their low fuel costs tend to cancel out this difference so far as total power costs are concerned, but the fact remains that the initial investment bill is twice as high. The Treasury, in particular, is finding this a difficult pill to swallow.

No drastic changes of plan can be made effective before 1962 or 1963, because of the time that it takes to lay plans for new power stations, especially atomic power stations with their heavy demands on steel plate and special materials. The number of stations that it was originally planned to build between now and 1965 cannot be altered very radically; another three may be added to the 12 originally proposed. But the size of the stations has already been fortuitously doubled by engineering developments that had not been foreseen when the plans were drawn up two years ago, and in place of the 1.5 million to 2 million kW of atomic electricity originally expected, 5-6 million kW may have been commissioned by 1965, and the investment in atomic plant alone will have jumped from the original £300 million to £600 million with another £150 to £180 million for the initial investment in uranium fuel. The plans, in short, will have trebled, partly by choice and partly by chance, but the bill will not. This is the reward for economies of scale.

The interesting choice is what happens after 1965. It will not be surprising if the Government does in fact decide to stop building any further coal-fired stations quite early in the 1960s. The coal-fired stations already under construction at that time will gradually be coming into commission right up to the 1967-68 period, but no new ones would have been begun after, say, 1963. This time-lag between the start and completion of building makes estimates of atomic power inevitably confusing, but if these assumptions are right, by 1965 the CEA will be accepting tenders for between four and five new atom stations each year—the number that it needs to meet the whole of its annual increase in capacity.

Sharing Europe's Oil

EIGHTEEN western European governments—all the 17 OEEC members and Spain—have now given their formal assent to the scheme designed to secure each of them a fair share of Europe's reduced oil supplies. After this allocation scheme comes into effect on February 1st the oil companies will do their best to ensure that each country will receive the same percentage share of the supplies it would have received under normal conditions. There is only one exception: about 600,000 tons a month, or roughly 8 per cent of Europe's normal requirements of each product, will be dispensed at the discretion of the OEEC oil committee to countries such as Sweden, Denmark, Italy, and perhaps Greece and Turkey, which are in a peculiarly difficult position. This means that countries such as Britain, France, the Netherlands and Norway, which have special advantages derived from their control of oil supplies or tankers, or Germany, which has considerable crude oil production of its own, have agreed not only to forgo these special advantages, but even to give up some of their own shares to countries where industry is more heavily dependent on oil. Britain, for example, cannot conceivably expect to obtain any supplementary fuel oil supplies from the 330,000 tons of fuel oil put into the "kitty" each month, for British industry, which obtains only about 13 per cent

of its energy from oil, can stand a given percentage cut in fuel oil supplies far better than, say, Sweden, where industry relies on oil for about 40 per cent of its energy.

The OEEC oil committee is not yet able to assess the effectiveness of the various rationing schemes adopted by each country, and undoubtedly some countries have fared much better than others up to now. But by equalising supplies the committee hopes to achieve fair shares without meddling with internal rationing schemes, which will still remain the responsibility of the individual governments. These are all highly satisfactory arrangements, and due credit must be given to those countries, including Britain, that are making sacrifices to help the more vulnerable countries. No American administration could ask for a better evidence of European co-operation than this. The rub comes in the exceptionally low supplies of fuel oil in January.

Bigger Cuts in Fuel Oil?

AFTER the OEEC oil committee and its petroleum emergency group, OPEG, met this week, some figures were given of the probable decline in Europe's oil stocks during the four-week period from January 1st to February 10th. The demand for petrol falls off in Europe in the winter, and the supplies of petrol arriving are expected to be sufficient to maintain consumption at the level to which it has already been restricted without reducing stocks. Supplies of gas and diesel oils are likely to fall a little short of the current restricted rate of consumption, but the consequent fall in stocks should not be serious enough to warrant further restrictions on consumption. As expected the really critical shortage is of fuel oil. During the four weeks ending on February 10th, Europe's fuel oil supplies are expected to amount to no more than 65 per cent of its normal requirements. Even allowing for the current restrictions on consumption, the total stocks of fuel oil in Europe, excluding only ship's bunkers and certain government strategic reserves, are expected to fall from 3¾ million tons on January 1st to only 2½ million tons by February 10th —a mere two weeks' consumption, even at current reduced levels. Unless something happens to improve the estimates this clearly is an absolute minimum level of stocks, and for some countries it is bound to be below a safe minimum.

Whether further fuel oil restrictions will have to be imposed rests with two authorities—the Texas Railroad Commission and the Syrian government. In November American oil arrived in Europe at the rate of 231,000 barrels a day of crude and 150,000 barrels a day of products; in December the rate of arrivals was stepped up to nearly 300,000 b/d of crude and over 200,000 b/d of products. But the January arrivals will be lower, and of the products shipped, scarcely any will be in the form of fuel oil. The recent rise in American crude oil prices may squeeze a little more out of stocks, but an anxious eye is being kept on the Texas Railroad Commission, which is meeting as we go to press, to decide whether to raise its limit on the oil that may be produced in Texas in February. The other eye is on the Syrian government, which is debating whether to allow the Iraq Petroleum Company to carry out the partial repairs which after only a week's work would allow oil to flow again through the pipelines to the Mediterranean at a rate of over 200,000 barrels a day. The prospects for a favourable decision are discussed in a Note of the Week on page 187. It could make an almost immediate addition of some 8 per cent of Europe's normal requirements, but its most significant virtue is the saving it would permit in tanker tonnage. Europe's oil shortage is basically a tanker shortage, and it would require less than a third of the tanker capacity to move oil from Banias and Tripoli across the Mediterranean to Italy and the southern French ports as it takes to haul the same volume of oil round the Cape.

Bankers on Bank Rate

THOSE City circles that have been hoping for a reduction in Bank rate were again disappointed on Thursday—even though it was unrealistic, in any case, to look for a change so soon after the appointment of a new Chancellor. If Mr Thorneycroft should be wondering whether he ought to resist the growing demands for an easing of rates, he will find little support among those bank chairmen whose annual statements have appeared in the past week—Mr A. W. Tuke, of Barclays Bank, and the chairmen of the three northern banks. Admittedly, none of these bankers makes any outright appeal for an early reduction of Bank rate, and Mr Tuke plainly shows that he would not have favoured a reduction in recent months. But in discussing the effects of high rates he puts much emphasis upon their disadvantages while saying little about the advantages. In such arguments, notably about the impact upon the interest costs of the overseas sterling balances, he is paralleled by Sir Thomas Barlow, of the District Bank, and Sir Eric Carpenter, of Williams Deacon's. It is conceded that the increase in Bank rate had psychological advantages, by proving that Britain "meant business"; but, says Mr Tuke, "psychology is rather expensive at that price." Only Sir Harold Bibby, of Martins, steers clear of this particular controversy: he is content to record that, before Suez, "dearer money and the credit squeeze were slowly and surely having effect." But even he, like the other chairmen, would evidently prefer disinflation by government retrenchment to disinflation exerted by monetary policy.

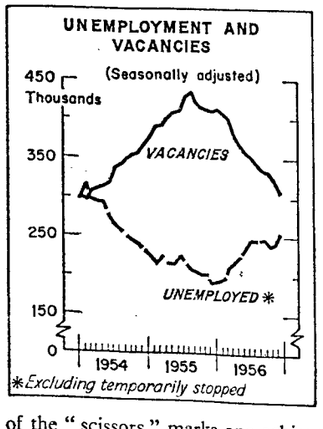
This theme again bulks large in the arguments from Mr Tuke and Sir Thomas Barlow—though the former gives the government credit for a "welcome stiffening of attitude" towards its own expenditures. For further relief he would concentrate the attack upon capital expenditure—and especially upon the device of postponement of projects. Like the other bankers—with the possible exception of Sir Harold Bibby—he thinks, however, that the time may be approaching for relaxation of restraints upon the private sector, and suggests rather surprisingly that there may soon be need to stimulate internal consumption. One would have expected the bankers to take the view that, when relaxation becomes feasible, it should rather be directed towards productive investment. That is certainly the opinion of Sir Eric Carpenter and of Sir Thomas Barlow, both of whom fear that undue damage may be done if present restrictions are kept on "for too long."

Rising Deposits

THE bank balance sheets present some interesting contrasts with those for 1955. In that year aggregate bank deposits of the clearing banks dropped sharply—gross deposits were down by £329 million—and by November last they were still showing a small decline on the annual comparison. But at the year-end both of the big banks whose accounts have so far appeared were showing a perceptible expansion on balance—the Midland's deposits are up by £13 million at £1,475 million and Barclays' are up by £23 million at £1,413 million. Increases are also shown by Martins and Glyn Mills—indeed, proportionately larger ones—but the District, Williams Deacon's and Coutts report small declines. A similar contrast is apparent in advances ; five of the seven banks whose accounts are available show increases—the Midland by £12½ million and Barclays by nearly £11 million.

In spite of this reversal of the former trend of advances, several of the banks show exceptionally high liquidity. The Midland, which has allowed its investment portfolio to run down—it has reinvested only a modest proportion of the funds accruing from the maturing of its large holding of 1954-56 War Bonds—has raised its liquid ratio from 38.2 to 41.3 per cent. Martins, in spite of a modest increase in its investments, shows an even higher ratio (42.1, against 39.8, per cent). Barclays, however, regarded its liquidity during the year as excessive, and increased its investments by no less than £29 million, with the result that the liquid ratio has declined from 37.9 to 36.3 per cent. Sharper declines than this are shown by the District and Williams Deacon's, and especially by the two smaller banks (both of which had exceptionally high ratios at end-1955). Williams Deacon's, it should be recorded, has announced a much bigger increase in its published profits than any of the other clearing banks (their profits were discussed in a Note last week), and is the only one to have raised its dividend (from 14 to 16 per cent). But, apart from Glyn Mills, it is the only clearing bank that is a subsidiary of a larger group: both these banks are controlled by the Royal Bank of Scotland.

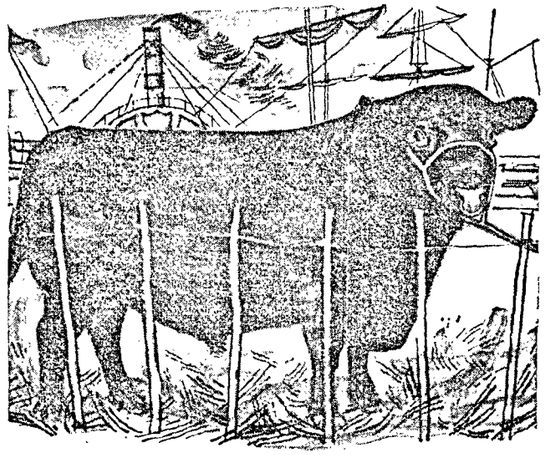
Practice in valuing investments follows the same pattern as in 1955. The northern banks and the two smaller banks adhere to the tradition of valuation at or under market worth, while the Midland and Barclays value their government securities at "under cost and below redemption price." On this basis, the Midland has succeeded in narrowing its depreciation from £23.7 million to £20.2 million (4.92 per cent, instead of 5.15 per cent). Barclays, on its increased portfolio, shows a slightly bigger depreciation—£15.5 million, instead of £15.2 million—but the proportion is down from 3.54 to 3.37 per cent. Both banks hold only dated securities ; the majority of Barclays' and all the Midland's are redeemable within 10 years. The Midland further discloses that the average life is within 5 years.



Sterling in Demand

STERLING continues in active demand against United States dollars, and, even more markedly, against most Continental currencies. The official rate against the dollar has hardened to $2.79¾, the rate for transferable sterling has been up to $2.76⅞ and that for security sterling to $2.65. Among Continental currencies the strength of sterling has been most apparent against the Swiss franc, the German mark and the guilder, which happen to be principal currencies of the bear speculators against sterling. Much of the buying of sterling may therefore represent the closing of short accounts. The movements in forward rates—particularly the narrowing of the premium on forward dollars—supports that view.

But there has also been considerable commercial business in two directions. At this time of the year seasonal demands for sterling are high and the recent firmness of sterling commodities, together with the high level of industrial activity in the United States and on the Continent, imply that the commercial purchases of sterling are well up to the seasonal normal. On the other hand the demand for dollars, not merely from Britain but from the whole of Western Europe, is being stimulated this year by the need to import dollar oil. Dollar oil purchases for Britain alone are running at around $30 million a month. Payment for them appears to be canalised through the foreign exchange market, even though the final impact on the gold and dollar reserve may be veiled by drawing on the Export-Import Bank line of credit. Including such drawings, and allowing for the fact that another substantial gold payment had to be made this week to cover the December EPU deficit, the net movement in the reserve for January has so far probably been adverse. The movement of the spot rate over the remainder of the month may, however, induce further covering of the bear account in sterling, which remains substantial. There are still hopes of a true gold and dollar surplus for January.



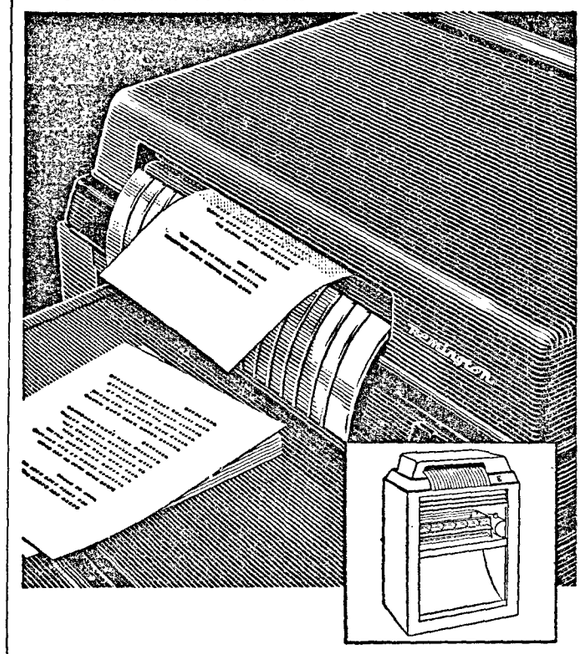
Employment Back to the Brim

UNEMPLOYMENT rose to just short of 300,000 in December and exceeded, for the first time for three years, the number of vacancies recorded by the Ministry of Labour. But nearly 30,000 of those out of work were only temporarily stopped and if the seasonal changes in employment that are customary for this time of the year are also excluded — as has been done in the accompanying chart —then the gap between jobs on offer and persons looking for them had not quite closed, though it has been narrowing steadily over the past twelve months.

This virtual closing of the "scissors" marks one achievement of recent disinflationary policy and will no doubt be used by some observers to reinforce their arguments that some more restrictions should be relaxed now rather than later in the year, when present policy and the economic

Fourteen years before the first Aberdeen-Angus

An Aberdeen-Angus was first shipped to the Argentine in 1876—fourteen years after the Bank of London & South America had opened its doors there. Since then, commerce with Latin America has increased enormously, and with it has grown the influence and interests of the Bank. Today, the Bank holds a unique position as the *only* British bank in Latin America.



It has branches in most of the important trading centres of that vast continent.

Up-to-date reports on local markets, trading regulations and general economic conditions are received regularly from Branches overseas and are summarised in the Bank's *Fortnightly Review*, which is distributed to customers and made available to those who have business in Latin America, Portugal or Spain.

THE QUICKEST WAY

to positive and permanent results

The Remington Rand Auto Process Unit simplifies the processing of photo-copying to such a degree that all the operator has to do is feed in the exposed prints and periodically replenish the machine.

This is just one example of photo-copying techniques the Remington Rand Company has developed after many years of research into the potential of every photo-process. Two versions are available — the Desk Model and the Pedestal Machine.

The Auto Process Unit is merely one of the many modern methods devised by Remington to stream-line the day-by-day efficiency of business operations. The Man from Remington Rand will gladly call upon you to discuss their application to your own problems—without obligation.

repercussions of Suez might have brought about an actual fall in industrial production. Petrol restrictions should not have affected employment figures for mid-December. But the Ministry of Labour estimates, from information, that cannot be precise, that 8,000 persons had been laid off by January 4th as the result of the oil shortage and that 66,000 had been put on short time in addition to the 74,000 who were already working less than a full week.

Disinflationary policy has not, however, had any marked success in bringing about desirable shifts in manpower between industries during 1956. The movement of labour into the "right" industries has been negligible. Manufacturing employment fell by 122,000 between the end of November, 1955, and last November, most of the losses occurring in engineering, metal goods, and vehicles, and in the textiles industry. There was hardly any change in chemicals, metal manufacture, mining, and gas, electricity and water: the numbers in agriculture fell; and employment in transport, building, distribution, and other services was a little higher. Altogether, total civilian employment fell by 84,000 while the numbers unemployed rose by only 56,000.

Australia Opens Half a Door

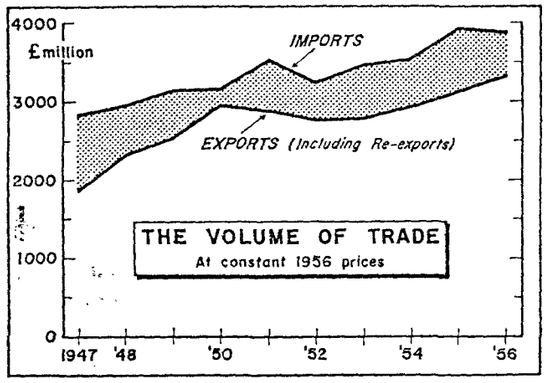
AUSTRALIA has announced a relaxation of import quotas amounting to £A30 million a year from January 1st. As this edition of *The Economist* goes to press, only the barest outlines of the relaxations are known, but it is clear that the Australian move has been cautious, significant and timely. It is cautious because Australia in its first major relaxation of import restrictions since 1954, has gone back less than all the way on its most recent restriction, the cut of £A40 million imposed in July. It is significant because it marks a notable improvement in Australia's balance of payments that has received little public recognition. And it is timely because it is announced in the week when the wool markets are taking and apparently surmounting their severest test of this selling season. All that is known so far of the details is that the increase in import quotas will include the £A3 million relaxation on certain types of textiles announced last month, and that with that inclusion it is likely to admit into Australia increased quantities of some important chemicals, unbleached piece goods from Japan and machinery.

Australia's balance of payments has been fortified by the import restrictions of last July, though significantly, relaxation comes almost before that restriction has had time to make its full effect felt. It has been eased by recent loans from the International Bank, but it stems mainly from the strength of the wool market and particularly from the big rise in wool prices since Suez. The trade balance in the second half of 1956 showed a surplus of £A99.7 million, compared with a deficit of £A26.6 million in the second half of 1955. The overseas balances of the Commonwealth (mainly held in London), accordingly rose between the end of June and early January by £A55.6 million to £A328 million. This compares with the low point of mid-April last of £A256 million.

On the wool side, the big question mark is how far the firm markets helped by Suez fears, but not entirely caused by them, will be maintained in the second half of the wool-selling season; the Australian Government has had the courage to act in the very week in which the maximum quantity of wool has come under the hammer. Altogether about a quarter of a million bales of wool have been on sale this week in Australia, New Zealand, South Africa and London. Prices in Australia and New Zealand, having eased since the November peak, have been moving upwards again, with Japan a notable buyer in the Australian auctions. In London this week Australian wools have established a modest premium over the primary markets, and prices have been firm on the close of the last London sales on December 7th,.

Record Year for Exports

IT is too early to assess the effects of the closure of the Suez Canal on the volume of British trade or its pattern. It can only be claimed so far that, though exports declined by £38.2 million in December, the first two months' figures of trading without the canal show a much smaller average adverse balance of visible trade than did the first ten months of the year with the canal in use. By December British exporters were finding it more difficult to secure shipping space for their goods on the longer trade routes. But imports (measured at their point of arrival, whereas exports are measured at the point of departure) had been sharply reduced. The adverse balance of visible trade therefore narrowed. That relief is largely statistical: if goods that would have been imported already are instead spread out along longer sea routes, or are still waiting to be shipped, the figures look better, but the British economy does not make a lasting gain.



(£ million)	Imports (cif)	Exports (fob)	Re-exports (fob)	Visible gap
Nov., 1956*	319·6	291·9	14·8	12·9
Dec., 1956*	307·8	253·7	11·2	42·9
Monthly Averages:–				
Ten months Suez Canal open:– Jan./Oct., 1956	326·5	362·7	12·0	51·8
Two months Suez Canal closed:– Nov./Dec., 1956	313·7	272·8	13·0	27·9
Annual Totals:–				
1955	3,884	2,905	119	859
1956	3,890	3,173	146	572

* Provisional.

In the latest month's figures allowance must be made for the fact that December, 1956, contained only 24 working days, compared with 26 in November, 28 in October and 23 in December, 1955. Allowing for that difference exports still showed a decline to below the year's average. For the year 1956 at a whole, however, British exports reached a record of £3,173 million, Suez notwithstanding. The record remains valid even after excluding the £20 million of lease-lend silver returned to the United States, and it is not illusory, for the volume as well as the value was unsurpassed. The Board of Trade puts the genuine increase in the value

of British exports last year at 10 per cent, of which 4 per cent was due to prices and 6 per cent to volume.

British overseas trade over the postwar decade, expressed in terms of volume, shows a rising trend in exports, and over the last five years alone the advance is 13 per cent—an

encouraging gain was won in the face of growing international competition. Imports have risen too—at times much more steeply, and then the adverse balance of visible trade has reached an unreasonable size. It has also at times been possible to check the flow of imports without apparently leaving industry short of raw materials. It was checked last year ; the volume of imports was slightly reduced though their value was a little up, and the visible adverse balance fell by £288 million.

The Old Lady's Court

IMPORTANT changes are impending in the Court of directors of the Bank of England, extending beyond those formally announced at the end of last week. As from March 1st, Mr Maurice H. Parsons and Mr John M. Stevens become directors for the standard four-year term, appointed by the Crown under the procedure laid down in the nationalisation statute, in succession to Sir Kenneth Peppiatt and Sir Andrew Naesmith, whose terms of office expire at the end of next month and who then retire. But whereas only one of the retiring members of the Court—Sir Kenneth Peppiatt—is a full-time executive director both of the new appointments are to this special category. The explanation is that one other of the present team of four executive directors—who, with the governor and deputy-governor, comprise the full-time inner group—is about to relinquish his executive appointment but will retain his seat in the Court room as a part-time director ; this director is Sir George Bolton. Hence the changes affect two of the key appointments at the Bank. Sir George has been identified with the foreign exchange and external relations side of the Bank's work from the earliest days of the Exchange Equalisation Account—he joined the Bank in 1932—and in recent years has been responsible first for the creation and then the progressive relaxation of the system of exchange control. He is now relinquishing these executive responsibilities to take up one or more outside City appointments: it has already been disclosed that he will join the Bank of London and South America as director and deputy-chairman, and hopes to be able to develop further that bank's role in the drive for British exports in Latin America. Sir Kenneth Peppiatt, whose service with the Bank dates from before the first world war, has reached retirement age. His special sphere has been home finance, including not only the handling of government borrowing operations and management of the gilt-edged market but also the Bank's relationship with the money market, which has become so important again since the revival of active monetary policy in 1951—a revival in which Sir Kenneth played a key role. He was one of the few who had experience of the Bank rate mechanism before 1932.

The sphere that has been Sir George's will now, apparently, fall to the two new executives, Mr Maurice Parsons and Mr John Stevens, at present senior officials of the Bank and both experienced in external finance. Home finance, it is understood, will now be the special concern of Mr F. C. Hawker, already an executive director. Sir Andrew Naesmith, the other retiring (part-time) director, is a former trade unionist from the cotton industry. Evidently in preparation for his retirement, the appointment was made last year of Sir Alfred Roberts (on the retirement of Lord Piercy on attaining the age of 70), who has connections similar to those of Sir Andrew.

Nationalisation in Egypt

THE Egyptian government this week announced the nationalisation of British and French banks, insurance companies and commercial firms. Other foreign banks and insurance companies are to be taken over within five years. This week's move, therefore, is more than the taking over of what the decree calls "enemy companies" ; it is also a major step in the "egyptianisation" of all banking and insurance enterprises in that country. The British and French banks in Egypt had been sequestrated and placed under the control of an administrator appointed by the Egyptian government within a day or so of the Anglo-French ultimatum to Egypt. Since the beginning of November the London offices of British banks in Egypt have had no direct contact with these branches though they have learned from third parties that they have continued to transact business under the management of the Egyptian sequestrators.

The British banks mainly involved are Barclays DC & O, the Ionian Bank, the Commercial Bank of the Near East, and the Ottoman Bank—the last being registered in Turkey but controlled by British and French nationals. The French banks mainly affected are the Comptoir National and the Credit Lyonnais. The assets involved, other than the buildings, cannot be considerable. Normal prudence has for some time induced foreign banks operating in Egypt to match their assets and liabilities in that country and to reduce hostages to political fortune to a minimum. The Egyptian decree announces that fair compensation, to be assessed by an Egyptian tribunal, will be paid. If the assessment were indeed fair, it is more than doubtful whether Egypt, desperately short of foreign currency, could pay in any form except blocked local currency. It is probable that this compensation will be one of the many items that will have to be brought into the vast exercise of claim and counter-claim that must one day mark the financial close of the Suez episode.

What Follows the Hunters ?

THE appointment of Mr Aubrey Jones to be Minister of Supply can be interpreted as a reprieve for this much discussed Ministry but not for the aircraft industry. The massive defence orders placed in the early 1950s have been forcibly docked more than once, and the latest cancellation of 100 Hunters drives the knife in further. Painful though these cuts are to the individual factories, they only bring work on those production lines to a standstill a few months before the orders would have run their course ; what is of much deeper concern to the industry is the pattern of work for the future.

The table shows how military and civil work is distributed among the industry's major companies. It shows only projects that are in production, or seem likely to lead to production orders fairly soon. Thus it excludes development contracts that have yet to prove themselves. This week's defence cuts imply that the government has decided to abandon the conventional manned fighter, epitomised by the Hunter, in favour of defence by guided missiles. This

Rolls Royce	Conway ; Avon ; Tyne ; Dart engines	Conway Avon engines rocket motor development
Vickers	Viscount : 357 ordered ; 169 delivered Vanguard : 40 ordered	Valiant bomber, production due to end this year Supermarine N.113 fighter, production just begun

is leading to the gradual concentration of all fighter production on two types, the English Electric P.1 and a small Saunders-Roe fighter that has still to fly. In the same way, bomber production seems gradually to be concentrating on the Handley Page Victor. The Canberra continues to be built in large numbers because alone of the modern aircraft it is backed by a consistent steady export demand.

Up to last October, the last date for which figures are available, the industry's employment was still rising and had reached nearly 260,000. Its future level depends on how far rising civil production can take up the slack caused by the reduction and streamlining of military orders. One of the biggest single units, the Hawker Siddeley group, is facing the end of three major production runs with no immediate civil developments on which to fall back, whereas Vickers-Armstrongs, whose Valiant orders are also near their end, is busy building jigs for Viscounts on the tail of the retreating Valiant production line.

With fighter production drastically cut, the future pattern of work in the industry depends largely on what decisions the government makes about guided missiles. Most of these companies, and some others, are working on missiles of various types. There are about five major projects in hand including the two shown on the table. Some projects have already been abandoned, and if the numbers are cut any further the industry's future will depend largely on the orders that it can wrest from the highly competitive market for civil aircraft.

Mechanising the Mines

ABOUT 18 per cent of the coal now being produced from British mines is cut and moved from the coalface by power-loading machines: the tonnage handled by them in 1956, some 35 million tons, was nearly half as much again as in 1955. This is the first result of a drive started by the board in July, 1955, to extend power-loading as widely as possible throughout the industry. If comparable increases can be achieved in the next few years, they should improve at least the productivity of the industry: these machines have a prodigious capacity for getting and moving coal, though not all the mines using them manage to make full use of this. It is less easy to be optimistic about any short-run increase in output as a result of their introduction. The board's chairman, Mr James Bowman, expects total output from the mines to rise only about a million tons this year.

Some of the most productive of the power-loading machines—for example, the Dosco, which offers a productivity of nearly 11 tons a man-shift, and the Joy Continuous Miner, which does about 21 tons a man-shift—produce a large proportion of their output as small coal. The increase in power-loaded output, therefore, accentuates the tendency towards breaking down coal into small pieces that is associated with general mechanisation in the mines ; more than 85 per cent of all British coal is cut by machine. Output of large coal in Britain accordingly declined about 5 million tons last year ; unfortunately, demand for it did not, because railway engines and householders with open grates prefer nice big lumps. The need to supplement supplies of large coal was given by the board this week as one of the reasons why it is continuing to import, although its stocks are good and it expects to be able to deal comfortably with the extra demand from customers who switch back from oil, unless there is some major stoppage in production. Over the year, however, its balance of total demand and supply does not look encouraging. Mr Bowman expects output to go up by about a million tons and inland consumption to rise by perhaps 2½ million tons (it rose by 3 million tons last year, in spite of the fact that industrial

production remained level). Its exports last year amounted to only about 8½ million tons; this year they might have to be reduced further.

Not a Golden Fleece

WOOLWORTH'S dividend is always an occasion, but this year it is an anticlimax. Before the announcement the 5s. ordinary stock units had climbed to 63s. but within a few hours after it they were back to 59s. 9d. The ordinary dividend, which has been raised from 56⅔ per cent to 60 per cent, was not a disappointment; it was as many had expected.

But investors had been hoping for a free scrip issue. There had been talk along Throgmorton Street of the possibilities of a revaluation of the company's properties and a consequential capitalisation. Moreover the upward trend in profits seems to have become much less steep. Last year gross trading profits went up from £22,523,066 to £23,319,355 but this increase of 3½ per cent compares with an increase of 10 per cent in 1955. The net ordinary dividend absorbs £7,762,500 from net earnings of £10,731,666. Whether the slackening in the rate of increase in profits is due to a rise in costs or to a slower advance in sales, the result has disappointed investors who have learned to take automatic growth in the Woolworth earnings for granted.

Control Over Steel Exports

REINTRODUCTION of a licensing system for exports of many other steel products as well as plate and sheet, which are already subject to licensing, was carried out by the Board of Trade this week on the advice of the Iron and Steel Board—but under its normal powers concerning exports, not under the powers as the "production ministry" for iron and steel that it is to transfer to the new Ministry of Power. The board advised export licensing in order "to safeguard supplies of steel for the United Kingdom constructional, engineering and shipbuilding industries." Exports of iron and steel are normally held down by an understanding between the board and the steel companies, but in its last annual report the board complained that "this did not prevent a significant increase in steel export deliveries in 1955." Steel exports last year seem to have remained at about the same level as in 1955, though many consumers continued to complain of shortage of certain steel products and large tonnages had to be imported—more finished steel, indeed, than in 1955.

IMPORTS AND EXPORTS OF FINISHED STEEL IN 1955 AND 1956
(Thousand tons)

Product	1955		1956	
	Imports	Exports	Imports	Exports
Plates	60	295	190	235
Heavy sections and bars	83	186	205	190
Light sections and bars	128	250	236	271
Wire rods	48	30	44	42
Strip	79	101	56	87
Sheet	460	397	208	303
Tinplate	89	321	46	307
Other finished steel	14	845	19	838
Total exports	961	2,424	1,004	2,374

Significant export premiums can still be earned on many steel products, even after the recent increase in British steel prices; moreover, since 1955 the industry has ceased to bear the extra cost of importing foreign finished steel, except for tinplate, and consumers here have had to buy abroad at the full foreign prices. This may have moderated their demand—though it does not seem to have prevented them from increasing their steel stocks over the year as a whole. The board has presumably decided that in today's circumstances it cannot rely on the industry's understanding to keep exports down. That being so, export licensing is logical. It is certainly distasteful to impose on any industry run by private enterprise; but the steel producers long ago bartered away freedom in pricing, and show no signs of wanting it back. Control over their access to the free price system for steel abroad is a more or less inevitable concomitant.

Slump in Premium Bonds

IN the second month of premium bond sales—December, 1956—about 5½ million £1 bonds were sold, compared with a revised figure of £48½ million in November. With the Stock Exchange offering few attractions last November many investors were prepared to have a go at the first lucky dip. The odds of winning a prize of some sort in the first draw in early June were calculable. They were roughly 2,100 to one against for the holder of a single £1 unit and no worse than one to four against for the holder of the maximum stake of 500 units. For the incalculable odds in the second draw, in July there have been few entrants. And just because the entrants in December were few, the odds against them have probably lengthened. There will be a notional six months' interest at 4 per cent per annum on £5½ million of new money ranking, and one months' notional interest on the £48½ million ranking for the second time.

"Motor Business"

The December issue of this quarterly research bulletin for the motor and allied industries is now available. It includes:
The outlook for 1957.
The French motor industry.
The East African market for motor vehicles and tractors.
The Bulletin is fully illustrated by charts, amongst which are:
Price indices of used cars and vans.
New registrations in Great Britain, and the hire purchase share of the market.

For full particulars of this Bulletin apply to:
THE ECONOMIST INTELLIGENCE UNIT LIMITED
22, Ryder Street, St. James's, London, S.W.1.
WHItehall 1511, Ext. 49.

That looks like odds of 8,300 to one against for the £1 holder and sixteen to one against for the maximum holder. The odds have indeed worsened but the actual figure should be accepted with the utmost reserve. It is based on the assumption that all £54 million of bonds will still be there at the end of June, and that assumption can hardly be true. A proportion of the original £48½ million must have come in for one draw only. Therefore the ratio between November bonds bringing in one months' interest and the December bonds bringing in 6 months' interest will not in the end be what it now appears to be. Moreover, for the November purchaser the second draw marks the start of monthly drawings at poor odds not comparable with the reward for six months' waiting which the first draw with better odds will represent.

Yardsticks for Uranium Shares

EXPECTATIONS that those South African gold mines producing uranium would soon be giving their shareholders more information are now fulfilled. The first returns for the December quarter—from the Anglo American group—set the new pattern. Shareholders are told the grade of ore treated, the production of uranium oxide, and the yield per ton. They get the development results in terms of reef width and uranium content. They already know the uranium profit; they can now calculate the profit per ton either before or after amortisation of the plants (which are to be fully written off during the present ten-year contract). What shareholders are not told is the price that the South African Atomic Energy Authority pays for uranium oxide and the working costs of the plants. But there are enough informed guesses around to fill those gaps too. The price which varies from mine to mine must nevertheless be near to £4 per lb and the lower limit of payable grade for easily accessible material must approximate to 0.2 lb per ton or a shade more.

Armed with this new information, the investor can appraise gold-cum-uranium shares with greater precision. But there are a number of pitfalls. First, the uranium development results (like the gold development returns) express values found over inches of width. For example, Vaal Reefs—one of the most promising gold-cum-uranium mines—has actually been producing about half a pound of uranium oxide per ton of ore treated; its development results show about 5 pounds per ton over about 8½ inches. That does not mean that the profits are about to be increased many times. Much more rock than the narrow band of rich ore will have to be extracted and some values will be lost in mining. In due course the investor will learn to think of inch/lbs of uranium just as he now thinks of inch/dwts of gold. Secondly, uranium ore reserves are not all of one piece. In the older mines they consist both of newly mined tailings and of old slime dumps, some of which are of a lower value. Thirdly, the process of extraction is technically less efficient than the extraction of gold. The table indicates that about 85 per cent of the uranium in the ore treated is actually being recovered. Lastly the mines of the Anglo American group in the Orange Free State are members of a pooling arrangement under which they supply their slimes to two common treatment plants. They participate in profits and contribute to costs in proportion both to grade and quantity of slimes but the plants choose the most economic slimes to work first. The mines participate fairly, but the grade treated need not in any period correspond with that shown by any one mine.

With those qualifications the profit per ton, even after amortisation of the plant, is high—comfortably over £1 10s. per lb of oxide. It is doubtless that margin of safety plus the fact that uranium is a by-product with few direct mining costs of its own that gives the directors the courage to forecast a continued market for South African uranium when the industry, with its plant written down to nothing but without a guaranteed market, has to go out and find a buyer.

SOUTH AFRICAN URANIUM VALUES

Company	Tons treated		Uranium oxide produced—lbs.		Yield lbs. per ton		Residue lbs. per ton	Values of Reserves				Profit per lb. after amortization

* Since October these and other mines have participated in a new joint production scheme and the yield in lbs. per ton is an average yield of total production. † As at 30th September, 1956. ‡ Not available.

A Smokeless Fuel for Manchester

THE smokeless fuel "Phimax" that the North Western Gas Board will market from Monday in the Manchester area is a product of the "Rochdale" process of gas making it developed some three years ago. The Rochdale system was evolved from ideas first put forward forty years ago and involves the injection of gas at the base of vertical gasmaking retorts in order to speed up the heating process and thus the rate of gas making and coal throughput. Ordinarily, steam is injected to cool the coke before it is discharged from the bottom of the retort; the carburetted water gas used in the Rochdale process

acts as a cooler and also carries most of the heat back up the retort for re-use. Thus the time required for carbonisation can be considerably reduced—with good carbonising coals throughput can be nearly doubled.

The Board has found that it is also practical to carbonise rather lower grade coals with this process and to carbonise them quickly at temperatures of 700° to 800° C., against the conventional 1100° C., which removes the smoke-producing elements in the coal while leaving most of its volatile or heat-giving elements intact. This is in fact what has been done to produce Phimax. By injecting gas to speed up the rate of carbonisation of lower grade coals drawn from the East Midlands coalfield, the Board has been able to maintain roughly the same rate of throughput as with higher grade carbonising coals, and to produce a low temperature refined coal with qualities rather similar to "Coalite" and "Rexco." The Board claims that Phimax ignites quickly and burns well, and that it can be used in ordinary stool bottom grates with a ⅜ in. grating. The delivered price at £9 7s. 9d. a ton, or 9s. 6d. a cwt, has clearly been set to make it competitive with Coalite and Rexco which sell in the Manchester area at a few more pence a cwt. Smokeless fuels are far from abundant and Phimax will be a welcome addition, but there may be a limit to its supply. The present rate of production is 130 tons a day which could be doubled or trebled by next winter. But this expansion will come from the adaptation of existing retorts to the Rochdale process: with new retorts, based on current capital costs, the economics of Phimax may be less attractive.

SHORTER NOTES

The Transport Commission has set up an Electronics Advisory Panel and appointed an Electronics Advisory Officer to take charge of its programme of developing electronic devices for use in railway operations and in its other undertakings. The new Advisory Officer, Mr G. H. Hinds, was formerly Director of Weapons Research at the Ministry of Supply.

★

The Furness Withy group of shipping companies has bought from the Treasury 405,613 £1 ordinary shares of Royal Mail Lines at a price which has not been disclosed; Royal Mail Lines stand in the market at 38s. 3d. The Furness Withy group already had a substantial interest in Royal Mail Lines, but this additional purchase of about 10 per cent of its capital will not make the company a Furness Withy subsidiary. The shares involved were collateral in respect of Trade Facilities Act loans, acquired by the Treasury owing to the Kylsant crash.

★

The Board of Trade reports that the amount of the nation's hire purchase debt at the end of November was still, but more slowly, moving downwards. The index (basis December, 1955, equals 100) was not quotably changed at 81, but the debt was estimated at 20 per cent below the end-1955 figure of "at least £450 million." New hire purchase business by the retailers increased in November to an index number of 93, compared with 88 in October, but with 106 in November, 1955. New hire purchase business done direct by the finance houses declined with the fall in the demand for second hand cars, commercial vehicles and motor cycles. The index was 86, compared with 90 in October and 112 in November, 1955.

Company Notes

COLVILLES spent over £8 million on capital account in 1955-56, turning a cash balance of about £5 million into a bank overdraft of £1,430,000. It also has capital commitments outstanding of over £10 million. Thus it is not surprising that after the end of the financial year on September 30th it called up the balance of 15s. each outstanding on 4 million £1 preference shares owned by ISHRA though it has also made arrangements with that agency to defer the date on which the balance of the 4½ per cent debenture (£10 paid) needs to be subscribed. Thanks to new equipment the group achieved an increase in production (reflected in the rise in stocks from £10.9 million to £13.7 million) and despite the ban on overtime working by the maintenance men its trading profits went up from £6,994,123 to £7,656,068. The directors say that order books are full for some time ahead "although there has been some easing in the demand from the automobile industry." At a price of 31s. 4½d., the £1 shares yield 7 per cent on the maintained dividend of 11 per cent.

Consett Iron, when its ordinary shares were sold back to the public, took the opportunity of streamlining its capital structure. It now has an issued ordinary capital of £10 million and a debenture of £4 million held by the agency. This structure was in keeping with the development programme the company has carried through. To date it has cost about £20 million and one of the attractions of the Consett Iron's ordinary shares to investors was the belief that its major programme was practically complete. Though that was true the company now has outstanding captial commitments of £2,600,000 against a cash balance of £2,400,000. And, to judge by a guarded remark made by the chairman, Mr Clive Cookson, the company may participate in any further development schemes designed to increase capacity for making steel plates and billets. This helps to explain why the dividend of 7½ per cent is no better than had been promised in the offer for sale, notwithstanding that the net profit (after putting aside £600,000 for replacement) was up from £761,246 to £1,007,574. At the current price of 23s. 1½d., which compares with the issue price of 25s. 6d., the £1 shares yield 6½ per cent.

Richard Thomas and Baldwins, like the Steel Company of Wales both in being a producer of strip steel and in being still owned by ISHRA, has reported a decline in profits. Its trading profits fell from £11,299,650 to £10,075,840 and net profits from £5,578,252 to £4,313,848. Net profits are shown before appropriating £1,200,000 (against £1,660,000) to fixed assets replacement reserve.

★

CENTRAL MINING, SELECTION TRUST AND WESTERN DECALTA. The Central Mining and Investment Corporation received the equivalent of over $25 million for its shares in Trinidad Oil. It is now going back into oil in the Western hemisphere, but this time into the much riskier business of oil development in Canada. Acting through Canadian subsidiaries, Central Mining and Selection Trust are acquiring in a 60/40 ratio an interest in Western Decalta Petroleum of Calgary, Alberta, for $6,150,000. Central Mining, putting up $3,690,000, and Selection Trust, putting up $2,460,000, have come into the field behind some of the American oil giants. No doubt Central Mining wished to re-establish its interests in oil. No doubt, too, it wished to spread its investments over a wider field than gold mining and industry in South Africa and the money from the Trinidad Oil deal has given it the means to do so. In gold mining, its interests, apart from Harmony, are in the older producers and the new venture, the first hint of redeployment, has come at a time when negotiations for a merger with Consolidated Gold Fields must be near completion.

The details of the investment follow a familiar pattern. Of the $6,150,000, $4,500,000 will be provided on a 5 per cent loan (on which repayments will begin almost immediately) and $1,650,000 by subscription to 1 million common shares at $1.65 a share. No dividend has yet been paid on the common shares, but currently they are quoted in Toronto at $2.47. The two participants have the option, arising on the convertible rights of the loan, to buy 900,000 common shares at $2.50 a share before February, 1959, and a further 750,000 shares at $3.00 each before February, 1961.

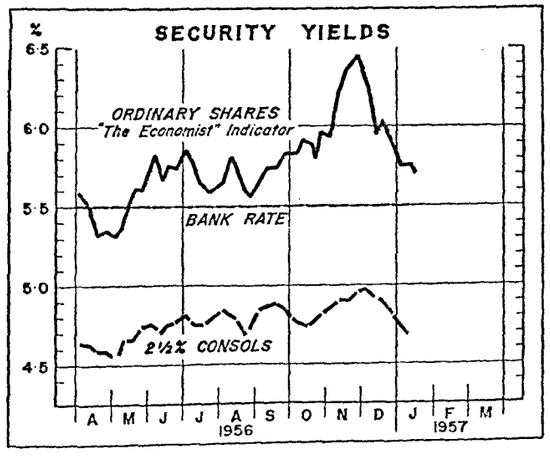
Western Decalta has interests in a number of producing wells in Alberta, but the amount of "wildcatting" development it may do is limited to the surplus revenue after servicing the loan. The company is acquiring the common stock of another oil company, Carleton Oils of Calgary. When this acquisition is complete its issued common stock (excluding the Central Mining-Selection Trust participation) will be $3,200,000. If Central Mining and Selection Trust, which will each be represented on the board of Western Decalta, exercise their share options in full they will hold about 35 per cent of the Decalta equity—a proportion big enough to ensure effective control, especially as no big American company has a large stake in the stock.

★

RADIO RENTALS. In the year to August 31st last the trading profits of Radio Rentals went up from £2,182,313 to £2,695,593. The increase in net profits, from £531,313 to £569,053, was less sharp, for the company has always written down its radio and television sets heavily and quickly. In 1955-56, the depreciation charged on these sets came to £1,466,000, bringing the total charge up to £5,803,521, against a book cost of £10,390,000.

These surprisingly good trading results and the effective increase in the ordinary dividend from 20 to 22½ per cent were discussed in these columns on December 22nd. Shareholders will now turn to the address of Mr P. Perring-Thomas, the chairman, to find out how the company continued to do so well in spite of restrictions both on hire purchase and on rental agreements. Having turned, they will admire, and perhaps still wonder. The control order on rentals led to a sharp decline in the number of radio sets rented, but television rentings were less "seriously affected." Since the introduction of the new controls, the proportion of sales orders to rental orders has "increased materially" and the results of the sales branch of the group have improved. Yet this was achieved under the hire-purchase restrictions. In the consolidated balance sheet, "the net book value of radio and television sets in course of acquisition under hire-purchase agreements" amounted to £2,218,434 and hire-purchase instalments outstanding on the sets amounted to £1,141,315; in the previous year the figures were £967,077 and £613,004 respectively.

Mr Perring-Thomas tells shareholders that in the first four months of the current financial year the demand for the company's television service was high and "a very satisfactory volume of business" was transacted. He offers no forecast, but the price of the ordinary shares, yielding only 4⅛ per cent at 23s. 3d. xd., suggest that investors believe that growth should still continue.



LONDON STOCK EXCHANGE

Next Account begins: January 30th
Next Contango Day: January 30th
Next Settlement Day January 22nd

The recovery in gilt-edged developed this week into an upward surge of prices which carried the *Financial Times* index of Government securities from 85.92 last week to 87.50 on Wednesday. The new 5½ per cent LCC stock rose 3½ over the week to 105¼. To some extent the strength of gilt-edged drew away support from industrial stocks which showed only a small improvement, *The Economist* indicator rising 2.3 to 192.8.

Insurance shares were extremely strong; London and Manchester rose 16s. 3d. to 135s. and Equity and Law Life 8s. 9d. to 153s. 9d. Westminster Bank "B" gained 2s. to 75s. 9d. xd. and Martins appreciated on the capital reorganisation scheme. Hire-purchase finance shares were also a good market. Participants in the nuclear power programme were supported; Head Wrightson gained 2s. 6d. to 118s. 1½d. xd. and Babcock and Wilcox 4s. to 76s., while AEI rose 4s. and GEC and English Electric both picked up 3s. 6d. Steel shares advanced, Dorman Long recovering 2s. 10½d. to 26s. and the new United Steel shares reaching a premium of 2s. 4½d. Rolls-Royce gained 4s. 7½d. to 116s. 10½d., but Hawker Siddeley lost 2s. 9d. to 33s. 4½d. following the cut in Government orders. Lodge Plugs fell 1s. 9d. to 12s. 6d. after the interim dividend was passed. The new ICI convertible loan stock rose strongly to 7½ premium. EMI lost 1s. 9d. to 27s. United Tobacco (South) rose 1s. 6d. to 17s. 4½d. following the increase in dividend, and BAT gained 1s. 9d. to 54s. 3d. The Woolworth results disappointed the market and caused a fall of 3s. 3d. to 59s. 9d., while the passing of interim dividends brought a set-back to Canadian and English stores. Shipping shares were active.

Kaffirs eased and copper producers lost an earlier rise. Selection Trust and Union Corporation rose on consideration of their interest in Tsumeb Corporation. Tin shares showed small rises.

(1) Annual figures are for June of each year. (2) Engineering, shipbuilding, electrical goods, vehicles, metal goods, precision instruments and jewellery. (3) Textiles, leather goods, clothing, food, drink and tobacco, manufactures of wood and cork, paper and printing. (4) Number registered *as unemployed* expressed as a percentage of the estimated number of employees. (5) From June, 1956, onwards comparison with earlier figures is affected by the revocation of the Notification of Vacancies Order, 1952. (6) United Kingdom. (7) There was a reduction in this month due to discontinued registration of persons losing title to unemployment benefit.

(1) Relates to wholesale prices in Athens and Piraeus only for Greece. Figures for Ireland from 1953 onwards are for home produced goods only. (2) July-December. (3) Relates to prices in capital cities only for Austria, France, Greece and Turkey. Belgium and Austria exclude rent. Denmark includes direct taxes. Figures for Ireland are based on August, 1953=100. (4) Including direct taxes. (5) Including trade with Faeroe Islands. (6) Index numbers of unit value which compare the current average value of trade with its value in 1953; they are influenced by changes in the composition of trade as well as price movements. (7) Deposit money and notes and coins held by business, individuals and foreigners. Except for Greece holdings of the issuing authority and other banks are excluded. (8) Holdings of the government and central bank at end of period. Figures for Greece are gold reserves only. Foreign exchange figures for Norway exclude government holdings; Norway and Sweden include foreign investments. Ireland includes some long-term securities. (9) Beginning May, 1954, a new drachma equal to 1,000 old drachmas introduced. (10) Average for second quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended January 12th, 1957, there was an "above-line" surplus (after allowing for Sinking Funds) of £134,584,000 compared with a surplus of £35,752,000 in the previous 5 days and a surplus of £164,487,000 in the corresponding period of last year. There was a net expenditure "below-line" last week of £13,695,000, bringing the total deficit to £820,037,000 (£580,337,000 in 1955-56).

THE MONEY MARKET

THE discount market made no change in its bid of £98 16s. 1d. per cent for 91-day bills at the Treasury bill tender on Friday of last week. Outside applicants, however, did make a further increase last week, and the average discount rate on the total allotment fell by 4d. to £4 15s. 5.30d. per cent.; this brought the fall since December 7th to 5s. 5d., or over 17/64, per cent.

Last week's offer of £260 million was under-allotted by £20 million (whereas total applications fell by only £5 million, to £401 million). For the bills to be taken up yesterday, which were 90-day maturities owing to the incidence of Good Friday, the market bid at £98 16s. 5d. per cent, and received a full allotment of its bid; on the 91-day bills it was allotted 35 per cent, and its average allotment dropped on the week from 54 to 40 per cent.

In Lombard Street seasonal stringency has again been eased by the additional maturities of 63-day bills. On Thursday of last week these enabled the heavy tax payments to be met with ease; though on the following day one or two houses had to take a small amount of loans at Bank rate, whilst on Saturday the Bank gave moderate assistance through special purchases. On the first three days of this week however market supplies of funds have again been adequate; on Wednesday a small surplus was mopped up by official sales.

With us SERVICE is a Tradition

WE PROVIDE a skilled and comprehensive service in every banking field, and behind this is nearly a century of tradition of association with the commercial and industrial development of South Africa.

Today, we continue to uphold this tradition by providing finance and information services to meet every need of the merchant, manufacturer and tourist alike, through some 750 offices in South, East and Central Africa.

THE STANDARD BANK OF SOUTH AFRICA LIMITED

Registered as a Commercial Bank in terms of the Union of South Africa Banking Act, 1942

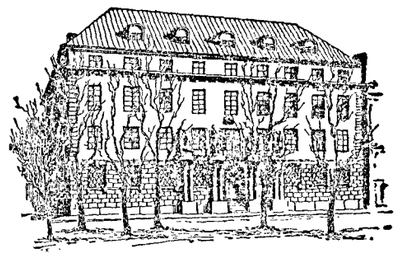
What's good for Mr. Parsons

. . . is good for expanding industry

Now that he has retired, Mr. Parsons has all the time in the world to tend that precious garden. And everything in the garden is lovely—thanks to a pension secured through Life Assurance.

Yet Mr. Parsons is not the only one to benefit. Money paid in premiums was invested by his Life Office, and much of it was used to provide vital development capital for British industry.



Through endowment and pension policies, and through staff pension schemes, Life Assurance is making provision for retirement incomes for an ever-increasing number of people. In many other ways, too, such as family protection, house purchase and educational policies, Life Assurance is providing an important social service.

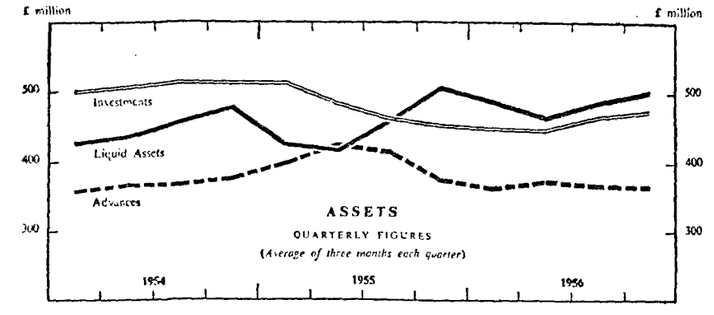
DIFFICULTIES A CHALLENGE TO OUR FAITH AND INGENUITY

MR A. W. TUKE'S REVIEW OF FINANCIAL AFFAIRS

It will be understood that this Address was in print before the resignation of Sir Anthony Eden and the appointment of Mr Harold Macmillan as Prime Minister.

The annual general meeting for the year 1957 of the Stockholders of Barclays Bank Limited will be held at the Head Office, 54 Lombard Street, London, E.C.3, on February 6th.

The following is the address by the Chairman, Mr Anthony William Tuke, which has been circulated to Stockholders with the Report and Accounts for the year ended December 31, 1956:



I have, first of all, to report with much regret the death of our colleague and friend, Mr Henry Anthony Birkbeck, who was one of our most senior Directors, having been a member of the Board since 1928 and a Local Director since 1919 in the Eastern Counties. Colonel Sir Edward Bolitho, who this year is among the Directors due to retire by rotation, has told me that on account of his age he does not wish his name to come forward for re-election. "The Colonel," as so many of us have known him for so long, joined the Board as long ago as 1925, and he has been a faithful counsellor and a firm support to successive Chairmen for over thirty years. We shall miss him very much. During the year Mr Anthony Charles Barnes who, as Stockholders will know, is a Deputy Chairman of Barclays Bank DCO, has asked to be relieved of his duties as a Vice-Chairman of our Board, and in his place we have elected as a Vice-Chairman Mr John Thomson, who has for some years past represented our Oxford District on the Board and has recently also served as a Local Director at Reading. We have also elected as a new Director Mr George Dawnay, who is a Local Director at Norwich and also at Peterborough. We have appointed as an additional General Manager Mr J. L. Northcott who has had wide experience in various executive posts in Head Office and elsewhere; and Mr E. Brimelow will retire from that office in April, after which, I am glad to say that he has agreed to continue to serve the Bank as a Local Director of our Pall Mall District.

PROFITS IN 1956

The increase in the Bank Rate at the beginning of the year to the abnormally high figure of 5½ per cent, with corresponding increases in the rates which we earn on certain of our assets, has had the effect of enabling us to show a substantially increased profit in respect of the year's working. These results, if not the underlying reason for them, are naturally a matter of considerable satisfaction to the Board, but it is necessary, I think, to sound a note of caution regarding their permanence. Costs, of which by far the largest proportion represents payments made to or on account of the Staff, have continued to increase, and this increase has not been due, except very indirectly, to the factors which have caused the increase in our gross income. When these factors no longer operate and money rates return to normal the increased expenses will probably still remain, and if profits are to be maintained at their higher figure we shall have to rely upon increasing business and greater efficiency. Fortunately, we have plenty of scope for increasing our lendings, which are our most profitable asset, as soon as we are no longer obliged in the national interest to curtail them. As Stockholders will observe, we have used the additional profit to increase our transfer to Reserve Fund on this occasion from £1,000,000 to £1,250,000, which we regard as prudent in the circumstances, and we are recommending a repetition of the same payment to Stockholders as a year ago, although there is a slight difference in its form, which is explained in the Directors' Report.

BALANCE SHEET FIGURES

If we examine the Balance Sheet, we shall find that the deposits stand at £1,413,000,000 compared with £1,390,000,000 a year earlier, but a comparison on the twelve monthly balance dates in 1956 with the corresponding dates in the previous year reveals that, on the average, current and deposit accounts have fallen by approximately £20,000,000. The further effect of the credit squeeze is more directly disclosed in the fall of £36,000,000 in the monthly average of our advances to customers bringing them down to only 27 per cent of our average deposits. On average our liquidity increased; so much so that throughout 1956 our liquid assets have formed the largest of the three main items on that side of the Balance Sheet, in spite of the fact that we have increased our investments substantially during the year. The fluctuation of these items over the past three years is shown on the chart below. This excessive liquidity has been possible only because there has been such a plentiful supply of Treasury Bills arising mainly from the expenditure by the Government of borrowed money, to which I refer more fully later, and it means, in effect, that monetary management, which some critics deride, has not yet been really put to the test in modern conditions. In this respect our position is very different from that of most of the banks in the United States and Canada, where the liquidity position has become much tighter, largely owing to the very heavy demands for bank lending, and where, in consequence, the banks have become much more susceptible to monetary policy.

FINANCE FOR EXPORTS

In recent years we have felt justified, in view of the relatively low proportion of our advances, in stretching our normal practice by giving consideration to a number of propositions for the provision of medium-term finance for the export of capital goods. This business is of the highest importance to the expansion of export markets, and this is recognised by the fact that the Government, through the Export Credits Guarantee Department, are prepared in approved cases to guarantee the eventual fulfilment of the buyers' contracts. During the past two or three years we have considered propositions of this character to the value of many millions of pounds, and have assented in principle to a large number of them. Un-

fortunately much of this business does not materialise for one reason or another, and the amount which we have outstanding under this heading at the present time is quite small.

THE VOLUME OF WORK

The number of accounts open with the Bank continues to grow steadily year by year, and this is especially marked in the current accounts which have risen in number by over 50 per cent since before the war. The activity on these accounts has increased to an even more marked extent. The number of cheque forms issued to customers for their use each year is estimated at about 150 million. The amount of cash paid out over our counters is approximately £2,000,000,000 *per annum, all of which must first have been* received by the Bank from customers or from other banks. This might be greatly reduced if the Truck Acts are amended. But even if it is made lawful to pay wages by cheque, the adoption of this method on a large scale would give rise to problems of a far reaching nature, and it is questionable whether such schemes will be of much value to the community as a whole if the cheques are immediately converted into cash. This is a matter which requires full consideration before any action is taken. Our Clearing Department at Head Office may handle in the course of a single busy day as many as 750,000 cheques drawn on Barclays Bank; and that does not include the very large number which are exchanged locally without coming to London. It will therefore easily be understood how greatly we are interested in the Bill which is now before Parliament for rendering unnecessary the endorsement of the great majority of these cheques. Provided that various questions relating to the liability of the collecting and paying banker can be satisfactorily disposed of, we shall welcome the considerable saving of time and effort which are now expended by our Staff in the examination of endorsements. In saying this I must add that, contrary to a rather fantastic estimate which has been published and frequently repeated, I cannot foresee any substantial monetary saving to the banks, as this could come about only through a large *reduction in Staff as a result of the change,* which does not appear to be probable.

REVIEW OF FINANCIAL AFFAIRS

I should like to begin my wider review of financial affairs during the past year by quoting some of the words with which I finished that part of my review of 1955: "If the Government after the recent changes can persuade people at home that they really mean to play their part in the future more adequately than they have done hitherto, the banks' task in helping them to carry out their good intentions will be greatly eased. Hitherto the weight of the restrictions has been borne almost entirely by the private sector of the economy, and it is evident that under this limitation the medicine acts too slowly. The Government are full of good intentions, but deeds, not words, are required. Appeals and exhortations are no substitute for resolute action. . . ."

It may be said at once that on the home front during the past year there has been a welcome stiffening in the attitude of the Government towards expenditure under its own control. Those who had been so busy for so long in searching for motes in the eyes of others were at last enabled to perceive the beam in their own. That is not to say that they have yet succeeded in casting it out; but they have at least acknowledged its existence. This awakening which probably occurred about the beginning of the year may have been minimised in some quarters, but it is none-the-less evident, and its effect has been noteworthy, though we have been far removed from the ideal position in a time of over-full employment, namely, that there should be at least an overall balance in the nation's annual accounts. In that sense, the only time since the war when our budgetary finances have been on a sound basis was when Sir Stafford Cripps was Chancellor. The present Chancellor has said that he could do his job better if he had at his disposal bigger and better and more up-to-date statistics When you must use statistics, I suppose there is something to be said for their being accurate and up-to-date, but I must confess that I shudder at this sublime faith in the validity of the answer which is mathematically correct, but which takes no account of the instinctive reactions of human beings. I should be much more encouraged if I heard that he had called into consultation one sensible housewife, who could tell him how many beans make five; though a Scotsman, who has had experience of business, should not really need advice on that subject.

PRICE STABILISATION

In these days stabilisation of prices at their current level, however inflated that may be, is probably the best that we can hope for; a major reduction in the price level would involve severe deflation and excessive unemployment, which any Government would would avoid at almost any cost, and rightly so. Mr Macmillan's metaphor of a plateau of stability is a very apposite one. It is possible to shave the soil off the surface; even that needs a bulldozer; but it is quite another thing to cut down into the solid rock. To have held the price level stable for six months, from April to October, thus represents a real success; and it is most regrettable that extraneous influences then intervened which are bound, if they continue, to upset the hard-won equilibrium. I refrain, advisedly, from discussing the contentious political aspect of the international problems from which these influences have sprung. For nations, as for individuals, riches bring power and power brings responsibility though not always popularity. When we were a rich and powerful nation we, on the whole, realised our responsibilities and tried to fulfil them. Riches and power have now gone elsewhere, but the sense of national responsibility remains. Let us hope that it will not evaporate in succeeding generations, whose sense of personal responsibility is being constantly whittled away by grandmotherly legislation. Our present troubles, we may hope, will pass, though with some damage to our economy remaining to be painfully repaired. The problem of controlling the volume of credit will still remain with us, and will, I fear, have been aggravated by the international crisis, though he would be a bold man who would predict whether the immediate effect in this country will be more inflationary or deflationary. A *reduction in profit margins* had begun to manifest itself in industry before this crisis arose, and this was already tending to reduce the inflationary pressure and the excessive competition for labour in certain areas. In the face of this salutary change the Chancellor's decision to increase the duty on petrol as well as rationing it is enough to make the angels weep. Intended to prevent additional inflation, and theoretically calculated to do so, it will almost certainly increase it by causing increases in price in the innumerable classes of goods which are transported by road, and it is unlikely that these increases will all be recovered when the additional impost it removed. O for that sensible housewife! She would have told him not to listen to the mathematicians on this subject, but to keep his eye on his plateau.

GOLD AND DOLLAR RESERVES

The fact that the Government's achievements in curbing demand at home have not been fully reflected in movements in the gold and dollar reserves is due, in part at least, to the extraneous influences to which I have referred; it is certain however that, but for the underlying improvement in our foreign trading position, sterling would have been that much less able to withstand the pressures to which it was subjected on the exchanges in the second half of the year. Sterling is today, for all practical purposes, a convertible currency to all the world except to those who are most concerned with it, ourselves and the rest of the sterling area; and we must, therefore, expect and prepare to meet pressures of this kind. In each of the first seven months of the year there was some improvement in our reserve of gold and dollars; but these are the more favour*able months, and in the late summer and* early autumn we met the usual seasonal pressure on the pound, the full effect of which was masked by the sale for dollars of the shares in The Trinidad Oil Company. Then in November, coinciding with the active military operations in Egypt, came the catastrophic fall in our reserves which more than wiped out in one month the painful gains of the first ten months of the year. To a large extent this loss of dollars reflects the speculative views of those whose business requires them to buy or sell sterling, and to that extent we may expect it to be counteracted in future months. In so far as it proves to be permanent it represents the price of failure, or part of it; a failure for which we may perhaps be bearing more than our fair share of the responsibility. Be that as it may, the Government were clearly right to mobilise some of our other reserves in the shape of *dollar assets to help us through a difficult* phase, of the outcome of which we may feel confident, so long as our trading position remains sound, as it has been throughout the past year. On the experience of recent years, November is a month of equilibrium on commercial account, and so also is December if the annual loan payments are excluded. In December last we appear to have lost $150,000,000 in support of sterling on the exchanges, but fortunately there are now signs that the pressure on the pound is abating.

BANK RATE

External solvency depends on internal strength, and it is right and proper, therefore, that we should continue to look first at what we have done, and ought still to do, to help ourselves, before we consider, as we must, those external problems of international economic and financial relationships which must be solved if a lasting balance is to be obtained in the world's economy. In the early weeks of the year the general financial situation was evidently considered to be far from satisfactory and on February 16th the Bank Rate was increased from 4½ per cent to 5½ per cent. This increase surprised many people and doubts have been expressed whether on balance it was helpful or the reverse. Its traditional effect of discouraging internal borrowing is, I believe, much less potent with taxation at its present levels. Similarly it no longer provides so powerful a magnet as in the past to attract additional overseas balances to this country. The foreigner has not forgotten the devaluation of 1949, and if he has any doubts about the safety of his capital, they will not be removed and may even be increased by the offer of a

higher rate of interest on it. One certain effect of the further raising of the rate was to increase by many millions the cost of servicing the overseas sterling holdings, which are in the neighbourhood of £3,500,000,000, and thus to impose an added burden on our balance of payments. One beneficial result was probably the psychological one of demonstrating to the world that we mean business, but psychology is rather expensive at that price. It would, I believe, have been *far better to concentrate on* reducing the supply of money, and to increase the Bank Rate only if that became necessary in order to give recognition to the natural results of supply being unequal to demand. That is not to say that I believe that Bank Rate ought to have been reduced in recent months. That would have carried implications quite at variance with the truth of our situation, though the time may be approaching when a different policy may be required to stimulate internal consumption, or at least to prevent the velocity of circulation from running down too quickly. When that time comes a general relaxation of the restrictions on hire-purchase will probably take effect more *quickly than any other available stimulant.* So long as depressive action is still required, the enforced artificial contraction in bank advances, known as the credit squeeze, is one factor which can bring it about; but a much more potent factor, for better or worse, in influencing the supply of money is the volume of Government expenditure which has to be financed by borrowing from the banks on Treasury Bills, because it is not covered by revenue or savings.

If the expenditure of the public sector is excessive, the efforts which the Government make to press down bank advances, and thereby to reduce the deposits in the banking system, will be negatived by the creation of additional credit in the form of Treasury Bills, which will provide the banks with abundant liquidity and have their counterpart in increased deposits. It is very discouraging, in fact infuriating, when one is laboriously pulling in rope, to find that someone else is incontinently paying it out. There is said to be virtue in not letting your left hand know what your right hand is doing; but I doubt its application to this particular set of circumstances. Perhaps it is not for me, as a banker, to complain of this when it makes life easier for me. But I know that this is not the time for an easy life, and I would much rather see the country's credit improving more rapidly, both at home and abroad.

IMPROVEMENT IN NATIONAL SAVINGS

We hear much of the need for reducing the Floating Debt, and it has therefore been encouraging to see the improvement in National Savings this year, an improvement which must have reduced official reliance on Treasury Bills. On the assumption that the Government must overspend its income, it is very desirable that the money spent should be recovered in this way. If a pail of water has been upset, it is very desirable that everyone shall turn to and help to mop up the mess. But how much better it would have been not to kick the pail over in the first instance, and not to go on kicking over more and more pails as fast as each mess is cleared up.

GOVERNMENT EXPENDITURE

The Government are never backward in telling us how difficult it is to reduce their expenditure, though they expect everyone else to do so without complaining too much. As far as current expenditure is concerned, it must be admitted that no major savings have been found possible hitherto, as witness the pitiful expedients to which the Chancellor has been reduced in order to try to make good his promise to save £100,000,000 on the budgetary estimates; a saving which, even if he is able to achieve it, will merely have reduced an estimated increase of £200,000,000 to one of £100,000,000. The succeeding troubles in Malaya, Kenya, Cyprus and now in the Middle East have made it painfully evident that up to now at any rate it would have been most unwise to make major reductions in our military preparedness. But the stupendous capital expenditure at home which is incurred or financed by the Government, or which requires Government sanction in the course of the year, is a different matter. On the assumption that the continuous extension of Government intervention in our everyday affairs is really good for us, all Government expenditure is no doubt necessary, and much of it overdue. Let that be admitted, at any rate for the sake of argument; though personally I consider that it is possible to go much too far, and that for the sake of making life easy for the feckless five per cent of the population we are in danger of pauperising the vast majority of our people who would much rather stand on their own feet. The essayist, Herbert Spencer, writing a hundred years ago on the subject of State Tamperings with Money and Banks (an activity which he evidently disliked) said "the ultimate result of shielding men from the effects of folly, is to fill the world with fools."

If, then, the country cannot afford all these luxuries at once, how are savings to be achieved in this field? In my view we should concentrate our attack on the capital expenditure, and in my experience there are two, and only two, ways of curbing that type of activity. The first, if I may use what might be called an Irishism, is to stop it before it starts; that is, before any plans are drawn up. The second, which I consider preferable for our present purpose, is to sanction the project and to allow the plans and specifications to be completed, but then to halt the machine and to consider, before going to tender, whether it can in the circumstances be postponed for a time. No doubt some projects must go straight ahead, such as those for atomic development, but some could wait for a year and others, perhaps, for six months or three. A job which is scheduled to be completed in two years will very likely take two-and-a-half years in any case; if the start is postponed for six months and its completion is delayed till the end of the third year, probably no one will be very much the worse and few any the wiser. If in any one year the start of all this work could be delayed by an average of three months, the total of this expenditure in that year would be reduced by 25 per cent and the beneficial effect on an inflationary economy would be very far-reaching.

PRIVATE ENTERPRISE

I would go so far as to say that, if the Government could have seen their way quietly to apply this simple remedy to expenditure in the public sector when they first became aware of the inflationary danger (say towards the end of 1954), they might well have been able to cure the disease without even telling the patient that he had contracted it, and without imposing damaging restrictions on the productive industry of the country, as they have done. Moreover, this method has the additional and very important advantage that it provides a ready means of stimulating the activity of the economy, if and when that becomes necessary, by the release of the pent up expenditure, the plans for which can be put into operation immediately, at least to the extent that our physical resources and external reserves permit. But why, it may be asked, should all the remedial action be applied to Government expenditure? Does it make any difference to the effect of increasing the demand for goods and services, whether the expenditure is incurred on behalf of the Government or of private enterprise? Surely expenditure incurred on behalf of private enterprise may also be inflationary? That is true; but private enterprise is apt to spend its money more economically than governments, and private expenditure normally creates assets which become immediately profit earning; whereas the capital expenditure of governments, however beneficial to the community in the long run, in the short run creates additional liabilities in the form of increased expenditure on upkeep. This doctrine is, no doubt, unpalatable to many people, but it is not for that reason untrue. The experience of the last ten years has clearly demonstrated that what is needed is fewer pleas for restraint to the private sector and more positive action in the public sector. In this regard, as I have said, we may take some encouragement from the policies which have been followed during the past year.

ATOMIC DEVELOPMENT

Another encouraging development during the year was the opening at Calder Hall of the first atomic plant in the world for the production of power for industry, and the announcement that progress in this field is likely to be much more rapid than had previously been expected. In atomic energy lies the possibility of our taking the lead in a coming industrial revolution, as we did in the first, and our best hope for a real improvement in our standard of living. But we must be prepared to pay our scientists properly and to stop robbing them of all incentive by excessive taxation of their incomes. Similar benefits should be derived from increasing mechanisation of our industrial processes, which when it reaches a certain level is now dignified with the new title of automation. Already claims are being staked for the enjoyment of whatever profit may accrue from the application of this development. "The workers must have it: it must not go to the greedy stockholders." Our foreign competitors will not be so foolish as to argue on these lines. They will use automation, and also atomic energy when it is available to them, to improve their competitive position in world markets by reducing labour costs, and that is what we must do if we want to survive. If the resultant reduction in prices is applied to the home market, as should happen, the benefit will be spread over the whole community as it should be. It needs vision as well as intelligence to see that this should be our objective in both cases.

When we look towards the almost unbounded hopes which may be founded on the discovery of a new industrial process, we may with advantage also turn our thoughts towards our oldest industry, agriculture. The recent conference, held at Brighton under the auspices of Imperial Chemical Industries, produced ample evidence that the potential growth in production of our land is still great, and now that a long-term policy has been laid down by the Government for the industry the necessary confidence to invest additional capital should be gradually built up for the purpose of winning more production and perhaps, too, of lowering costs.

EXTERNAL PROBLEMS

The account of what the country has been doing to help itself may not be as good as

we should like it to be. But I hope that it is not entirely discreditable, and I feel justified in proceeding to consider our external problems, which turn on the functions of the creditor nations. Relatively few people, I think, realise to the full the implications of the change in our status from that of a creditor to that of a debtor nation. It should never be forgotten that when England gains a dollar to augment its precious hoard, some other country loses that dollar; or alternatively that some citizen of the United States has spent that extra dollar in buying more of our goods, or has decided to invest an extra 7s temporarily or permanently in the sterling area. The whole question of investment in the sterling area is, I believe, the crux of our problem today. When we were the world's creditor there were attractive opportunities, as there are today, for individuals to invest their savings in the development of "new" countries overseas, and by doing this we accumulated a vast fund of long-term overseas investment. We were thus building up and fortifying our position as the international market in short-term finance, and were incidentally rectifying the day-to-day exchange problems of the debtors. Our great fund of overseas investments has been much reduced since 1914, first and foremost because we were forced to bear the brunt of the financing of the early stages of both world wars, and, although there has been some slow recovery in recent years, we still stand as a debtor nation on capital account. It remains true that 50 per cent of world trade is conducted in sterling, but this is an advantage which will not long endure unless we can maintain a surplus on our current balance of payments. Our position is precarious and we should all like to see it fortified; firstly, by our own exertions, and, secondly, by the willingness of all countries which have surplus earnings to spend them on imports from abroad, or to invest them in the development of the latent resources of the world.

In speaking of creditor nations I am naturally thinking first and foremost of the United States of America; secondly, on a much smaller scale, but relatively just as powerful, Switzerland; and possibly in the near future, Germany. It may well seem to be an impertinence, or worse, to suggest to the people of the United States, who since the end of the war have, as taxpayers, given away (not invested) hundreds of millions of dollars to put so many of the devastated countries of the world on their feet, that their duty is not yet complete. In this regard they have, indeed, done their duty; without this help probably nothing could have saved Europe from Communism, and it was only a very rich creditor nation who could give it. But it is not good for the recipients to live for too long on charity, and gifts or even investments by governments are to be distinguished from investments in productive enterprise by private individuals or companies. Anything which a government touches is liable to be infected by some political motive. The motive may be good, in our eyes at least, when it is designed not only to relieve destitution, but to put up barriers against the spread of the vile doctrine and practices of Communism, but, at the best, considerations other than those of pure charity or ordinary common-sense are likely to be given a weight which they do not deserve.

VALUE OF SPECULATIVE INVESTMENT

What I am advocating is speculative investment, using that term in its best sense, by private companies and individuals in projects which will take time to mature, but which, if successful, will bring benefit to the inhabitants of the area, and profit in varying degree to the investors whose capital has made the development possible. It must be recognised that not all these projects will be equally successful. If one prospects for oil, and no oil is found, the investors in that project will lose their money. On the other hand, if much oil is found, and an immensely prosperous industry is built up, it may happen that the Government of the State in which the industry is situated will become jealous of the prosperity of the foreign owners, and in the sacred name of national rights will tear up its own solemn legal obligations undertaken in earlier years. British investors have had several unhappy experiences of this description in their time. Nevertheless, between these two extremes, there are great opportunities for very profitable long-term investment, the consideration of which I would respectfully commend to those who now have the means of taking advantage of them.

In this connection an interesting and, I believe, important step has recently been taken in the setting up of the International Finance Corporation as an adjunct of the International Bank. The money initially subscribed, $78,000,000, will not in itself go very far towards solving the problem, but the judicious distribution even of this sum, perhaps, in partnership with groups of private investors, may point the way for others to follow on their own initiative. Ideally, development finance of this description should take the form of equity capital, so that no question of default arises if there is no immediate return on the investment, which there is not likely to be. I think it is, perhaps, a pity that this form of participation is specifically forbidden to the new Corporation, as this will restrict the field in which it can operate. It may mean in practice that it will concentrate much of its attention on financing the expansion of existing activities, rather than the creation of entirely new ones, relying on the income from the existing operations to provide the interest on the new money. Perhaps, after all, it is wiser, if not very enterprising, to help only those who have already proved their ability to help themselves.

CASE FOR FULL ECONOMIC INTEGRATION

I may, perhaps, be told that Barclays Bank, with its extensive interests in certain underdeveloped territories, notably on the continent of Africa, has a very special interest in the acceptance of the project which I have adumbrated. So be it, and we have a little axe of our own to grind, in the shape of the Barclays Overseas Development Corporation, which we try to keep sharp, to be used to cut away some of the tangled undergrowth in these parts so that useful and profitable enterprises may be built up. But we have a much greater interest, which we share with the whole of the population of these islands and of many countries in other parts of the world, in the removal of every obstacle which hinders the free exchange of goods and services, and therefore of money, between the nations of the world. Every expedient short of this can be only a temporary and partial solution: the ultimate and permanent solution lies, I believe, in the full economic integration of all nations, or at least those of the Western World, so that as between nations there are no debtors and no creditors, no rates of exchange and, therefore, no exchange speculators. This is a beautiful vision, which carries with it the promise of an ever-improving standard of living in the less developed countries; but reality compels me to point out that it is very difficult to reconcile it with complete national independence, the desire for which seems so very urgent today to those countries which have not hitherto enjoyed it fully. But their adherence, if it is to be permanent, must be made of their own free will, and so, perhaps, a period of complete independence is a necessary preliminary to a state of interdependence. The problem of integration is especially complicated for this country in that we have to hold a balance between the interests of Europe and the interests of the Commonwealth. The solution will not be found easily, and it goes without saying that it must be acceptable to the United States of America, which on account of its immense industrial strength must eventually form the linchpin of the organisation. It is tempting to speculate whether it might have been better to try first to find some form of integration between the Commonwealth and the United States. If that could be achieved it would act as a magnet so powerful that the countries of Western Europe would surely be drawn in. But as things are today it would seem that the first stage towards a closer association between sovereign states lies in the integration of Europe and the Commonwealth, towards which we have the ability and the duty to provide much of the motive power, though I would by no means exclude the participation of the United States from the start, if they were willing to be included. It is in this sense that I welcome the recent ministerial pronouncement that we are to participate in the forthcoming discussions on free trade in Europe, even if our attitude towards this project has at times been regrettably hesitant and apologetic. I regard the difficulties, not as insuperable obstacles, but as a challenge to our faith and ingenuity.

HOULDER LINE LIMITED

The Annual General Meeting of Houlder Line Limited will be held on January 30th in London.

In the course of his circulated statement, Mr Walter C. Warwick (the Chairman) said that general freight rates had maintained a high level throughout the year and in recent months had further increased, as a result of the Middle East emergency, to a level which could scarcely be regarded as altogether healthy.

Trading profit amounted to £859,268, and Income from Investments to £92,280. The improved trading result inevitably carried a heavy increase in liability for taxation and £500,000 had been provided to meet that prospective liability. The directors proposed to increase the Fleet Replacement Account to £1,900,000 by a transfer of £347,723. After allowing for the 5 per cent Interim Dividend on the Ordinary Stock, the Board recommended a final dividend of 7½ per cent, leaving £91,822 to be carried forward.

Mr Warwick continued: There is an increasing tendency for formation of subsidiary Companies abroad to operate ships. With the present penal level of taxation this procedure may ultimately prove the only practical method of avoiding total extinction of many shipowning Companies which are quite unable to provide the increasingly large funds necessary for replacement. We do not view with any enthusiasm the transfer of control of British Shipping outside of the Mother Country, and it is greatly to be hoped that the Chancellor will find it possible so to arrange matters that this vital industry will be able to derive the relief which it needs.

WILLIAMS DEACON'S BANK LIMITED

ECONOMIC EFFECTS OF SUEZ

SCHEME FOR FREE TRADE IN EUROPE

SIR ERIC A. CARPENTER'S ANNUAL STATEMENT

The Annual General Meeting of Williams Deacon's Bank Limited will be held in Manchester on Thursday, February 14, 1957. The following is the statement by the chairman, Sir Eric A. Carpenter, OBE, on the report and accounts for the year ended December 31, 1956:

The proceedings at the Annual General Meeting will be restricted to the transaction of formal business and I propose to continue the practice of recent years in issuing a brief statement on the Bank's affairs in advance of the Meeting.

In March Mr J. G. Beevor resigned his Directorship, following upon his appointment to the International Finance Corporation in Washington, and the good wishes of all his colleagues go with him in his new and important post. We have elected Viscount Simon, CMG, to the Board and in your name I offer him a very cordial welcome.

ACCOUNTS

I will take first the Accounts, from which you will see that Deposits stand at £135,284,888, a decrease of £1,792,460. A fall in banking deposits was not unexpected in view of the conditions which obtained during most of 1956.

On the Assets side, the liquid items, namely Cash, Money at Call and Bills Discounted, amount in total to £43,541,146 or 32 per cent of our Deposits.

British Government Securities stand at £37,280,695. Gilt-edged prices have fallen during the year, and the longer dated ones have touched new low levels. Even the short-dated securities which form so large a part of the investments of the Clearing Banks have suffered. We have, however, as always, valued our British Government Securities at market price or less.

Advances at £49,140,144 show an increase of £4,065,444 as compared with December, 1955.

The figure was inflated by some special items at the year end, but during 1956 our advances have, on the average, been less than in 1955.

NET PROFIT

Our Net Profit, after making the usual provisions (which include contributions to Staff Pension and Widows' and Orphans' Funds and appropriations to Contingencies Account), is £394,248, an increase of £62,799 on the year. With the balance brought forward of £191,528 this gives a total of £585,776 to be dealt with. After transferring £150,000 to Pension Funds we propose to pay dividends at the rate of 9 per cent on the "A" Shares (making 16 per cent for the year) and 6¼ per cent on the "B" Shares (making 12½ per cent for the year, the maximum) and to carry forward £240,815. I feel sure you will agree that these results are satisfactory.

During the year Branches have been opened at Lancaster, Mayfair (Curzon Street, London, W1) and Tottenham Court Road (London, W1). The number of offices open is therefore increased to 220.

GOLD AND DOLLAR RESERVES

I now turn to a wider field: 1956 was a chequered year dominated by the Middle East and Hungary, but on the other hand there were important events of a happier nature, including the opening of Calder Hall Atomic Power Station, the amicable settlement of the Saar problem between France and Germany, the conception of a free trade area in Europe and, lastly, the realisation of the fact that this country has established an undoubted lead in atomic development for peaceful purposes.

In the economic sphere the measures taken early in 1956 resulted in small but satisfactory increases in the gold and dollar reserves up to June, and there seemed good reason to think that inflation was in process of being halted.

Unfortunately the events set in motion by the Egyptian nationalisation of the Suez Canal in July have weakened confidence and upset the economy of all the countries of Western Europe now so dependent on Middle Eastern oil. It is to be hoped that in the near future a permanent settlement of the whole Middle East area can be arranged, including proper arrangements for the control of the Canal.

The effect, direct and indirect, of these events on our gold and dollar reserves during the second half of the year was almost catastrophic and led to the formal announcement in December of the Government's determination to maintain the value of the pound sterling and to utilise all the considerable resources at its disposal to do so. Yet the immediate trading position of the country itself is much better than the bare figures of the movements in the reserves show, as these have to bear not only speculative movements but also the drawings of other members of the Commonwealth, some of whom have recently been making heavy calls.

We now face a position in which the confidence factor should not cause a great deal of further trouble, but we shall feel the economic effects of Suez in the form of dollar oil purchases and shipping delays affecting exports.

Bank Rate was raised to 5½ per cent in February last and has remained at that figure ever since. It is the highest rate for 25 years and has lasted longer than the 6 per cent rate current for a period of five months in 1931. To find so high a rate for so long we have to go back to 1921 at the time of the boom following the First World War, though high rates lasted nearly as long in 1929. In other words, such high rates have only held for any length of time at periods of severe crisis.

Voices have been raised of late to suggest that the time is approaching when a reduction could usefully be made. A high rate increases the cost of the national debt, including that part of it held by foreigners, and to that extent is to some degree detrimental to the balance of payments. It also discourages investment in industry, and whilst there has been little evidence of this so far, the plans for 1957 show a reduction in some forms of investment which we can ill afford if we are to remain in the forefront as an industrial nation.

I should like to refer in more detail to the position of our gold and dollar reserves because there has apparently been such a complete reversal of fortune since the middle of the year. The difficulty is to assess the effects of the speculative factors. The fact remains that the gain to the end of June was almost entirely lost by the end of September if we ignore the Trinidad oil shares sale, and there were further losses of $84 million in October and $279 million in November. These were in spite of steadily increasing exports and reduced imports, the latter in part due to the closing of Suez, though the latter half of the year is normally less favourable to this country because of seasonal factors.

We must not forget, however, that the reserves are those of the whole Sterling Area and that there have been heavy drawings by some of its members. In particular, India has reduced her balances in 1956 by £150 million or by the whole amount it was expected she would use during the period of the second five-year plan.

In addition to this, the very fact that it was felt to be necessary to counter the seizure of the Suez Canal by a blocking of Egyptian balances here was bound to create some degree of nervousness since sterling is so generally used as the leading currency in international trade, and the deficits in the following months have arisen more from a reluctance to hold sterling than from an inherently unsound trading position here.

NEED FOR SOUND TRADING POSITION

The effects of these special and temporary strains on the reserves can only be mitigated in the long run by a sound trading position throughout the whole sterling area and in the short run by the sort of measures the Government has taken to show its determination to defend the pound sterling.

These have included arrangements to draw on the International Monetary Fund, to sell short-term United States securities and to borrow against American securities. In addition it was decided to ask for a waiver of the interest on the Canadian and United States war-time loans due at the end of the year. It is very encouraging that the IMF has at once agreed not only to provide dollars to the amount of this country's immediate drawing rights of $561 million, but also to "stand by" facilities making the total available no less than $1,300 million. The United States Export and Import Bank has also very promptly agreed to a loan of $500 million against the US securities. These are massive resources and mean that sterling should be safe against any assaults that can be made upon it.

INCREASE IN EXPORTS

We have every reason to be pleased with the performance of British industry in the export markets in 1956, and particularly in the all-important dollar markets. In addition the terms of trade, the relation between

import prices and export prices, improved from our point of view until towards the end of the year but even now are not unfavourable.

The increase in exports has been well spread over the metal goods section, especially iron and steel, machinery, electrical goods and vehicles. Other categories have also improved on last year, though textiles, cotton in particular, have fared less well. Perhaps the most satisfactory part of the record is the proportion of exports going to North America. The United States took more whisky, more woollen goods and appreciably more electrical apparatus and vehicles. Canada also took more cars, electrical goods and woollen fabrics.

Imports were virtually unchanged in amount for the first eleven months compared with the same period in 1955, but some of them have been delayed by the closing of the Suez Canal. On the other hand import prices rose only very slightly and allowing for these special influences and for the disturbances due to strikes in 1955 the result is much more satisfactory than our experience of the previous year. In other words, monetary policy is having its effect in discouraging imports perhaps at the expense of some reduction in stocks. Moreover, imports from the dollar area have cost us less, though we have been taking more from Western Germany.

PROPOSED FREE TRADE AREA IN EUROPE

An interesting development one might almost say in the progress of the human race has seen the light during the year. I refer to the proposal for a large free trade area in Europe. Free trade in this context is a relative term and is only a step towards *the absolute freedom of trade practised by* this country alone when it was the principal workshop of the world. It is, however, a recognition that economic forces are, in the long run, the most powerful in the world, and that this is the day of large units.

Under present arrangements France, Germany, Italy and the Benelux countries will form a common market and gradually reduce tariffs until there is free movement of capital, labour, goods and services between them, but a common tariff against the rest of the world. We, and others, would enter the arrangement to allow free entry of goods from the other members but retain our own special tariffs on other imports so as to be able to continue the preferences we give to Commonwealth countries.

The scheme is not without its difficulties, but it has been recognised that we can hardly remain aloof from a scheme which covers one-fifth of both our imports and our exports. It seems to me we would be well advised to participate in the framing of the scheme.

It is also interesting historically to see different parts of the world in different stages of evolution—Asia cultivating an intense nationalism, very resentful of anything which can remotely be considered to be interference from outside, and Europe recognising that a market of even 50 million people is no viable unit, if it ever was. It might be that by such a scheme Western Europe might regain in large part the commercial leadership of the world.

Productivity was disappointing in 1956 and when the final assessment can be made it will probably show little or no increase on the year. In so far as this follows from reduced production of consumer goods with a high import content, it is a desirable thing for the time being and what the restrictions were meant to achieve. There is some reason for thinking that this is in fact what has happened and that it is the future which needs to be carefully watched.

Fortunately the credit squeeze does not seem to have had any disastrous effect on industrial investment during 1956 and though there are differences between the various industries, plans for 1957 are similar in total amount. Such slowing down as there has been is in the rate of increase in investment and it follows therefore that British industry is in a good state to take advantage of an upsurge in activity. The risk is that it might be held back if restrictions were kept on for too long for there is no point in creating increased productive resources and then not using them fully.

In the meantime it should be borne in mind that our principal rivals, the United States and Germany, have both had further rises in productivity during the year.

Wage increases negotiated in the first half of 1956 added 6½ per cent to wage rates. In the same period retail prices rose by 2 per cent and productivity hardly at all, so there was some addition to the inflationary pressure. It was at this point that the Chancellor made his appeal for a halt to increases in wages and prices and many firms agreed to fix their prices for a period ahead. Although the TUC would not agree to wage restraint and applications have set in for further increases, they have so far been settled at a more modest figure and in the interests of the community as a whole it is to be hoped that this course will continue. There is a real danger that we could be priced out of the export markets.

Everyone wants a rising standard of living for the whole population but it can only be attained by acting with a sense of responsibility, by using our resources of brains, labour and materials in the best possible way, and avoiding all waste and inefficiency whether due to disputes, faulty methods or out of date machinery.

In his first Budget, Mr Macmillan made quite a number of changes, deliberately self-cancelling, so that the net effect on the Revenue should be small and the general effect slightly deflationary. His main object, he said, was to encourage savings and in that connection his excursion into Premium Bonds is an interesting one. This may appeal to those who are not normally savers but it has the curious effect of being particularly attractive to those in the highest income brackets, which is an endorsement, if one were needed, of the disincentive effects of our present taxation system.

The relief given to the self-employed in respect of premiums to provide pensions for their old age was long overdue and the cost of it is being obtained, *inter alia*, by yet another increase in profits tax. The two things are not necessarily unconnected since the premiums received by insurance companies will be invested, in part at least, in companies who will be liable for the increased profits tax. I have said before that the Profits Tax is a thoroughly bad tax and unfortunately to that must be added that it has become a political counter which has all the appearance of "making the other fellow pay," though, in fact, the shareholders who suffer are more usually, in these days, people of small means and their widows.

The abolition of the bread subsidy and the cut in Government expenditure, since partly negatived by the cost of the Suez crisis, must be welcomed. It is better to give direct aid to the needy than to continue a wartime expedient long after it has ceased to serve its original purpose.

THE SHIPPING POSITION

Shipowners have had another good year in respect of freight rates, both time charter rates and tramp freights having soared to the record "Korean" level of 1951. Whether fluctuations of such violence in rates are a good thing in the long run is a matter on which there must be considerable doubt, and the immediate benefits of necessity go to the tax gatherer rather than to replacement reserves. There was already a shortage of dry cargo tonnage before the Suez Canal was closed, since, though both world trade and the world's shipping fleets have increased by about a half since before the War, the increase in the fleets has been predominantly in tankers—due, of course, to the ever-increasing demand for oil. The closing of Suez has accentuated the shortage of cargo ships by reason of the longer haul round the Cape but in addition more tonnage has been called for to carry grain across the Atlantic following a poor harvest in Europe. To some extent the shortage of shipping has been offset by the greater speed of new ships since the War but this, in turn, has tended to be nullified by slower turn-round in ports.

This leads one to a topic under constant discussion in shipping circles and indeed which has resulted in a good deal of action in the past year. I refer to the operation of ships through foreign companies and under flags of convenience, of which Liberia has been the favourite recently, though British companies, including some of the largest in the industry, have announced the formation of associated companies in Bermuda, all with the object of avoiding heavy British taxation. This course has been forced upon them because of the heavy cost of replacing tonnage and the need to build up reserves. To some considerable extent the investment and depreciation allowances have given relief, but by registering ships abroad where there is little or no taxation owners can arrange that the only portion of their profits which must suffer tax is that portion paid out in dividends. Such a course ought not to be necessary. We already have stringent rules as to what can be called a British ship and fly the Union Jack, but there must be many now sailing under other colours which are British in everything but name and it should not be impossible so to arrange our affairs that British owners are not compelled to use such devices as the formation of subsidiary companies abroad, even in the Commonwealth, to keep up with their competitors.

Shipbuilders, too, have had a good year and end it with an increased order book giving prospects of employment for yards for several years. Although half the orders are still for tankers, more passenger and cargo ships have been booked in 1956.

In present conditions time of delivery is the governing factor and in this we are at a disadvantage. A favourable price for steel is offset by shortage of supplies and unevenness of delivery of parts at the yards, causing inefficient use of labour and delays in construction. Meanwhile our competitors, Japan and Germany especially, are able to give better terms both as to price and date of delivery.

INDUSTRY

Coal output has been equal to, or a little better, than, 1955, thanks to increased production from opencast sites though from a slightly smaller labour force. On the other hand, absenteeism has been greater, particularly of face workers. By way of showing what could be done, however, in the week of peak production before Christmas total output was the biggest for nearly 20 years. By reducing exports to two-thirds of 1955 it has been possible to cut expensive imports by about half, and as consumption has been slightly reduced, stocks were higher at the year end than they have been at any other time since the end of the War.

Steel output for 1956 reached yet another record and it would have been appreciably higher but for the ban on overtime by maintenance men which lasted for over three months in the middle of the year.

Pig-iron production was again easily a record and a matter for congratulation. This is due to a continuation of the considerable investment since the War which has been accompanied by reductions in fuel used per ton of output and other improvements in methods which have greatly increased output per man.

As we must in the future look more and more to metal products to help us to pay our way in the world's markets, it is most important that investment in the iron and steel industry should continue and the industry's plans to raise steel production appreciably over the next six years are to be welcomed.

The Cotton Industry has had another poor year with again a distinctly brighter outlook at the end clouded by shortage of labour to take advantage of fuller order books.

Fortunately a sizeable proportion of the large stocks of raw cotton in the United States have been disposed of at prices which have not disturbed world markets unduly, and this alone has produced more confidence in the price level and a greater willingness to place orders.

At the same time competition, particularly from India and Hongkong, continues unabated and the tendency for the industry to contract has been evidenced by the closing of more mills. In general, however, closing down has been undertaken voluntarily and before losses compelled such a course, and labour has easily been absorbed elsewhere.

Labour indeed continues to be a problem for the industry, as operatives once lost are hard to get back and new recruits are not readily forthcoming.

The wet summer seemed at one time likely to be disastrous for farmers but modern harvesting methods and a little relief from the worst of the weather in September improved matters a little. The banks were in consequence called upon to help where necessary.

The new long-term guarantees announced by the Government in November and the scheme for capital grants should give the farmers all that they need to ensure a steady income for a long period ahead. The new arrangements limit very severely the Government's power to reduce the subsidies, although the annual price review will continue.

INCREASE IN BANK'S ACTIVITIES

Towards the end of the year, you will be pleased to know, we received favourable reports of a high state of activity in nearly all the areas in which the Bank is represented. In particular, those districts concerned with various branches of the engineering industry and with iron and steel production report greater activity than ever. So far as the Bank itself is concerned, I am pleased to say that there has been a very satisfactory increase in its activities, and the Foreign Departments in particular have had a very busy year.

In conclusion, I should like to take the opportunity of expressing on behalf of myself and of all my colleagues on the Board to Mr King, the General Manager, to the Assistant General Managers and to all members of the Bank's Staff throughout the service, our best thanks for their devoted efforts in the Bank's interests during the year and our great appreciation of their efficiency and enthusiasm.

GROSVENOR CONSOLIDATED INVESTMENTS

RECORD TURNOVER AND PROFIT

The eleventh annual general meeting of Grosvenor Consolidated Investments, Limited, was held on November 30, 1956, at Johannesburg, Mr L. Donnelly, chairman, presiding. The following is an extract from his circulated statement for the year to June 30, 1956:

The tenth year of operation reflects the largest turnover and profit to date. On total sales of approximately £8,225,000 the group's trading profit was £527,000 before tax (after providing for all normal operating expenses and deducting profit on an investment of £8,750), £354,000 after tax.

Prompted by results, and resources suitably strengthened in preceding years, your directors felt that an increased ordinary dividend would be justified; accordingly 1s. 9d. was paid for the year, compared with 1s. 6d. It is interesting to note that the break-up value of each ordinary share is now 24s., against the current quoted market price of 17s.

The main features of turnover and profit performance over the last four years are set out below, and should be of interest and enlightenment.

The schedule shows that satisfactory results come mainly from a high ratio of turnover to issued and employed capital. Skill is required to manage this kind of situation which calls for close supervision and control.

Although the retail motor trade is obliged to operate on one of the lowest margins of gross profit—14.9 per cent off selling price—it is subject nowadays to more criticism than it deserves. Speaking for the retail side there is no room for further reduction of the gross profit margin; rising costs and competition are more than taking care of the situation.

The consolidated balance sheet shows that no transfer to the general reserve has been made this year; your directors felt that the round figure of £1 million should stand for the time being. The unappropriated profits balance has now risen to £596,174.

The report and accounts were adopted.

	Turnover	Shareholders' Funds	Trading Profit			Return (After Tax)	
			Before Tax	Tax	After Tax	On Turnover	On Shareholders' Funds
						%	%
1953 ..	6,035,000	1,555,000	407,000	140,000	267,000	4·4	17·2
1954 ..	6,545,000	1,705,000	396,000	139,000	256,000	3·9	15·0
1955 ..	6,845,000	1,990,000	479,000	145,000	334,000	4·9	16·8

MARTINS BANK LIMITED

STATEMENT BY THE CHAIRMAN SIR A. HAROLD BIBBY, DSO, DL

A JUST SETTLEMENT OF SUEZ NEEDED

BANK'S PROGRESSION

The one hundred and twenty-sixth Annual General Meeting of members of Martins Bank Limited will be held at Head Office, Liverpool, on February 6th. In his statement circulated to members, the Chairman, Sir A. Harold Bibby, DSO, DL, writes:

The net profit for the year ended December 31, 1956, is £944,780, which compares with £930,616 in 1955. In the light of the conditions ruling during the year the Board consider this satisfactory.

A final dividend of 8¾ per cent, less income tax, is recommended which with the interim dividend of 8¾ per cent makes 17½ per cent, less income tax, for the year, being the same as for the previous year.

After providing for the dividend, appropriations from published profits of £300,000 have been made to Reserve for contingencies and £200,000 to Premises Redemption.

Total assets as shown in the comparative balance sheet are £359,044,484 against £342,791,010 a year ago. Customers funds and other accounts are £324,455,334 against £310,299,379.

We have again deemed it wise to continue to maintain a high degree of liquidity, our total liquid resources being £136,866,747 (1955—£123,557,280) and the ratio of these resources to our deposits is 42.11 per cent compared with 39.76 per cent. It will be observed that the Bank's investments stand at £88,507,564 as compared with £84,600,018 a year ago and continue to be valued at or under market prices. All British Government securities have fixed maturity dates and the majority mature within seven years.

Our advances at £85,981,432 are reduced by £2,857,503 compared with a year ago. This is not altogether attributable to the credit squeeze but has a certain element of natural repayment of debt which has not been replaced by other borrowings of a like kind. The placing of long term finance by commercial undertakings who were temporarily borrowing on overdraft has also played a substantial part in the reduction.

THE DIRECTORATE

I have to record with deep regret the sudden and untimely death of Sir John F. R. Reynolds, Bart, MBE, in August last. He was elected to the General board in 1937 and had rendered great service to the Bank. By his death we have been deprived of a colleague whose quite exceptional qualities were recognised not only in Liverpool but over a wide area.

I also regret that Mr Wilfred Turner, OBE, a member of our Leeds board since 1927 who retired at the end of September in view of declining health, has since died. We deplore the loss of a valued colleague with his special knowledge of local affairs.

During the year Mr D. I. Crawford, CB, DSO, TD, DL, and Sir John N. Nicholson, Bart, CIE, joined the General board. Their wide knowledge and experience of business affairs generally will be an added source of strength. Both these appointments will require confirmation at the Annual General Meeting. We have also been pleased to enlist the valued collaboration of Mr J. H. Keswick, CMG, whom we have welcomed to our deliberations on the London board.

Mr T. H. Naylor, on assuming the Chairmanships of the Royal Insurance Company Limited and of The Liverpool & London & Globe Insurance Company Limited, has felt compelled not to seek re-election as Deputy Chairman of this Bank, a position he has held with distinction since 1951. The Board wish to place on record their appreciation of his services and their pleasure that he will continue as a director. I owe him my sincere thanks for all the help he has given me during his deputy chairmanship.

There have been several changes of note among the more senior officers of the Bank. Mr W. H. T. Laidlaw, who has had considerable experience on the administrative side, having held the position of Chief Accountant of the Bank over twelve years, has been appointed Assistant General Manager (Administration). His successor as Chief Accountant is Mr T. I. Bond. Mr T. A. Samuel, our Leeds District General Manager, has retired after a distinguished banking career of forty-six years. Mr J. Servant, Assistant District Manager, who has for many years been concerned in our affairs particularly in that area, has been appointed to succeed Mr Samuel. In July last, Mr W. S. Roberts, LLM, who has been our Trustee Manager for the past ten years, retired and we record our appreciation of his most valuable service to the Bank extending over forty-four years. He has been succeeded as Trustee Manager by Mr H. C. S. Whalley, ACA, hitherto Trustee Sub Manager.

CAPITAL STRUCTURE AND RESERVES

The Bank's progression reveals a satisfactory picture and perhaps if, instead of looking just at the past year, we look at the past ten years we shall get our view in better perspective.

In the past ten years £1,989,958 have been added to our published reserves and these now stand at £6,150,000 or £1,834,904 in excess of our paid up capital.

Several times in recent years your Board has discussed the desirability of eliminating the callable and reserve liability on the partly paid shares. Once again this is under consideration and if a scheme proves feasible it will be submitted for your approval at the earliest possible moment.

Our deposits have expanded more than three times since 1938 and since the end of the war we have opened sixty-two new branches affording extra facilities to our customers, old and new, and added promotion to our staff. In addition, many of our older branches have been modernised and re-equipped. Overall, the number of our customers has increased by 16 per cent in these last ten years.

The other side of the picture is not so encouraging. Over these years expenses have mounted in an alarming manner and the profit margin has fallen. For instance each debit item now costs the Bank nearly double compared with ten years ago.

We are doing our utmost to employ the most economical methods and, in conjunction with other banks, giving the closest study to electronics and every possible mechanical aid in the hope that increases in bank charges can be avoided.

We are proud of our staff. It is their service, efficiency and courtesy on which the goodwill of the Bank ultimately depends and we gratefully acknowledge our thanks to them.

In the ten years our male staff has increased by 29 per cent and our female staff by 50 per cent, the latter figure being due mainly to increased mechanisation in the medium and larger branches. The increase in our total staff is 35 per cent and in the same period the volume of our routine work has increased by over 50 per cent. Although chiefly engaged on routine work our female staff are also encouraged to take higher responsibility so that they may fill posts for which they are suited.

Our Trustee and Overseas Branches show the same trend of continuing expansion.

Our association with agriculture grows steadily and this has been assisted by the opening of new branches in the farming areas.

THE ECONOMIC SCENE

Turning from domestic to national affairs during the first seven months of this year all seemed to be going according to the national plan.

The Government of the day, through varying controls and pressures, can and does canalise and direct the main stream of the country's economy.

The dearer money policy and the credit squeeze were slowly and surely having effect.

The balance of payments position had definitely improved, an annual deficit of £100 million for the whole of 1955 was converted into a similar surplus in the first half of 1956.

The pace of inflation had been checked though not halted and the price of consumer goods rose by only 2 per cent during the first half of this year.

The value of our exports had increased overall: the floating debt had fallen.

So much for the credit side. Now let us look at the debit side.

In spite of a huge expenditure on new works and new modern machinery, there has been little or no rise in productivity as related to man hours and a positive decline as related to cost in terms of wages.

Coal production has not responded as expected to the vast expenditure on mechanical equipment.

The sum of this means that our exports cost more and this at a time when we are meeting keener competition from other manufacturing countries.

In addition to high production costs, we have to carry a higher taxation load than any of our competitors, which further weights the scales against us.

This high level of taxation is our greatest single handicap. Not only has its own weight to be earned by productive industry but it is in itself a direct discouragement to greater efforts in that it almost kills all incentive. It encourages extravagance in maintenance on plant, be it buildings, machinery or ships, which are obsolete and should be scrapped but cannot be because maintenance is a charge against untaxed income whereas a new asset has to be paid for out of taxed income.

INCENTIVES NEEDED FOR NATIONAL SAVINGS

Profits and ploughed back profits are essential if industry is to exist, let alone expand.

These undistributed profits are industry's savings and are as essential as personal savings, individual or collective, in providing the new risk capital which is vital if our economy is to expand and not contract.

The National Savings Movement is doing a most praiseworthy task in encouraging thrift and so moderating current spending power in the home market, but these very savings at present are all converted into Government funds where there is no safeguard that they are not unproductively spent and thereby serve no positive purpose.

There are two sorts of savings. Compulsory saving is forced on each of us by direct and indirect taxation and this is required for the national expenditure and the servicing of the National Debt.

The voluntary savings are undistributed profits and personal savings, and these form the sources of funds for capital investment when subscribed to new commercial issues.

However, those millions invested in National Savings schemes are denied to industry and merely add to the Treasury's harvest.

If these savings were specifically earmarked for the improvement of our roads they would materially add to the country's productive efficiency.

In normal times the man hours wasted, the petrol consumed, the wear and tear to vehicles starting and stopping and the immobilisation of a large proportion of our motor fleet by traffic congestion on the roads, must add up to some gigantic figure during the year and make even the large sum required to provide new and better roads a sound and profitable proposition.

Admittedly, many acres of good agricultural land would be required for arterial roads but this could be compensated for by restricting new building to the many vacant sites of little, if any, agricultural value within the urban areas and by demolishing old and wasteful properties and erecting modern multi-storied buildings in their place.

If this and other incentives to definite objects were given to supporters of the National Savings schemes the response would surely increase.

The whole tax structure requires a complete overhaul, free from its old inhibitions and framed to encourage and not discourage thrift, venture and reward, and is the most urgent necessity to which the Chancellor should give his immediate attention.

SELLING ABROAD

When many manufacturers could sell the bulk of their output in the home market for prompt cash, the incentive to sell abroad under fiercer competitive conditions was small.

This is especially so when foreign customers demand deferred credit and the exporter has to comply with a host of clerical obstructions relating to licences, customs formalities and so forth.

The whole emphasis should be to encourage manufacturers to sell abroad rather than at home and one of the most useful contributions to this object would be a drastic simplification and, when possible, abolition of the formalities at present inherent in carrying through the simplest shipment abroad.

The era of easy, and often too easy, profits is rapidly passing and this should call for higher efficiency and determined effort. Many firms have courageously pegged their selling prices for many months ahead. Provided prices in other directions can be held in check, these firms should reap their reward not only in adding a spur to their own efficiency but also in making a major contribution in halting inflation.

Restrictive practices whether exercised by the workmen or by the employers are suicidal to both. The worker who denies the most economic use of the latest machinery is, in the long run and not a very long run, certainly working himself out of the very job that he imagines he is thereby retaining. Equally, the employer who refuses to re-equip his works will soon find himself out of business being unable to compete with his more venturesome competitors.

In a time of full and overfull employment, employers bidding against each other, in the belief that the additional cost can easily be passed on to their customers, is all too tempting as is the practice in times of temporary transition of keeping men not fully employed or on short time when they could and should be fully employed elsewhere and making a contribution to the national effort.

If we lived in a closed economy and were nationally self-sufficient all would be easy but, unfortunately, for our existence at all we have to buy food and raw materials from the world around us and that means that we have to sell our goods to others who are as keen buyers as ourselves and under no obligation or even interested in maintaining here a standard of living which we may think we deserve.

SAFEGUARDS FOR SUEZ

Since Colonel Nasser illegally seized the Suez Canal in July and the events which have followed, the whole picture for the world, Western Europe and ourselves, in particular, has become completely blurred and will remain in a state of uncertainty for some considerable time.

What is crystal clear is that the Suez Canal must be put back into full commission at the earliest moment, the existing plans for deepening and widening must be carried through in the next few years and real and effective safeguards secured to ensure that it will be open and remain open to ships of all nations for all time without fear or favour.

These safeguards will have to be something stronger than pious resolutions passed or vetoed at UNO. Past and present experience has shown how these are scoffed at and ignored. For the past five years Colonel Nasser has flouted all UNO requests to allow passage for ships to or from Israel and the position of Hungary today does not warrant any faith that UNO orders will be carried out.

Let us pray that a sound and just basis of settlement will be reached to give the world a chance of better living where faith in international good behaviour is justified, for if these things do not come about we, in this country as in others, will see unemployment and poverty in our midst.

CORRECTIVE MEASURES NEEDED FOR TEMPORARY PROBLEMS

COTTON INDUSTRY'S VARYING FORTUNES

SIR THOMAS BARLOW REVIEWS ECONOMIC DIFFICULTIES

The Chairman, Sir Thomas D. Barlow, GBE, has circulated, with the report and accounts, the following statement to the shareholders of District Bank Limited, prior to the 127th annual general meeting, to be held on February 8th, at the Head Office, Spring Gardens, Manchester :

Since our last meeting, Sir Robert Burrows has relinquished the office of Deputy Chairman, and Mr Leslie Shaw has joined Colonel Marshall Brooks as a Deputy Chairman. Mr Shaw has also become a member of the London Committee, and I am very pleased to have his help in both capacities.

During the year there have been some changes among the higher officials of the Bank. Mr F. A. Rushton, a Joint General Manager, has been appointed Deputy Chief General Manager. In September, Mr J. L. Riley, another Joint General Manager, retired on grounds of ill health, and I should like to take this opportunity of extending to him our best wishes for the future. Mr H. J. Higginbottom, General Manager (London), and Mr K. Ashton, an Assistant General Manager, have become Joint General Managers. Mr J. F. Walker, Assistant General Manager (London) is now General Manager (London).

STATEMENT OF ACCOUNTS

Compared with the previous year, our deposits show only a small variation, and stand at £241,909,016.

Turning to the assets side of the Balance Sheet, you will see that Cash, Money at call and short notice, Treasury Bills and Bills of Exchange show a liquid position. The total of these items represents 35.8 per cent of our liability to depositors.

During the year we added £3 million to our holdings of British Government Securities : all of these are repayable at fixed dates and a high proportion reach maturity within ten years. Investments again appear in the Balance Sheet at less than their market value.

Although the total of our advances is higher, the average level of lendings has been less than that of the previous year. The Authorities have emphasised more than once during the past twelve months their wish for a continuance of credit restraint, but it is becoming increasingly difficult for our customers to curtail their requirements any more drastically. There is, in fact, much to be said for some relaxation of the present restrictions, so that enterprise and the flow of business shall not be further impeded. As a brake on inflation, the limitation of banking facilities for the conduct of industry and commerce is an imperfect substitute for economy in Government expenditure.

The higher figure for Bank Property is explained by the purchase of properties during the year and by the rebuilding and extension of some of our existing premises. In the last twelve months, new branches have been opened at Eastbourne, Gloucester, Hereford and Worthing, and plans are well advanced for opening offices in other centres.

FOREIGN AND TRUSTEE SERVICES

The facilities offered by our Foreign Department were utilised very fully last year. That our customers should have found these services increasingly useful during recent years is most satisfactory because greater recourse to them is an indication of an expansion in overseas trade. No less satisfactory is the fact that progressive relaxations in the requirements of the Exchange Control Authorities continue to ease the burden of unproductive work.

As a consequence of the unsettled state of the Foreign Exchange Market and the pressure against sterling during much of the year, foreign exchange trading has been particularly active. On the other hand, the decision of many spinners to refrain from forward covering of hedges in the New York Cotton Futures Market led to a substantial decline in the level of our outstanding liabilities under forward exchange contracts. The effect of the interruption to the normal flow of this business is plainly visible in the much lower figure recorded in the Balance Sheet for Endorsements, Guarantees and other obligations on account of Customers.

Early in the year the Chief General Manager, accompanied by the Foreign Manager, visited Canada and the United States. In the course of their extensive tour they called upon many friends in banking and business and, in view of the Bank's intimate connections with the cotton trade, they made a special point of visiting correspondents in the Cotton Belt.

The services provided by our Trustee Department are in constant and increasing demand and all the Trustee offices continue to make good progress. A record amount of new business has been undertaken during the year and the total number of trusts under administration is now greater than at any time in the history of this Department.

THE YEAR'S PROFIT

Our Net Profit for the year, after the usual provisions have been made, is £663,060. This is an increase of £26,276 over the figure for 1955 and is satisfactory bearing in mind the constantly rising level of our working costs. Adding the amount brought forward there is for disposal £1,098,639 and of this we propose to allocate £300,000 to our reserve for contingencies. After this deduction and after providing for dividend payments at the same rate as last year there remains a sum of £474,520 to be carried forward to the next account.

Mechanisation has its place in modern banking, but it cannot be a substitute for personal service and it is a tribute to the management and staff that such good results have been achieved in a year which has not been without its difficulties. I should like to express appreciation and thanks to all concerned for the excellent way in which they have performed their tasks throughout the year.

NATIONAL ANXIETIES

Although the economic difficulties of which we were all so conscious this time last year remained operative throughout 1956, it was beginning by the late summer to look as if the Chancellor's corrective measures might prove sufficiently effective to ensure a gradual stabilisation of the economy. But the Suez incident changed the situation and the outcome is so uncertain that it is foolish to indulge in prophecies.

Naturally enough we are still much preoccupied with the very serious short-term consequences of recent events. Nevertheless these should not blind us to the fact that, as a member of the North Atlantic Treaty Organisation, we have undertaken responsibilities in regard to defence altogether beyond the capacity of our resources. Without implying that we have been selfless beneficiaries or that we have not, up to a point, been wilfully impractical in the economic ordering of our way of life, it does seem that our present overstrained position is largely due to these heavy obligations. This certainly appears to be so when it is considered that compared with the rest of Western Europe we devote a much larger share of our resources to defence and that of our national expenditure on research and development two-thirds are absorbed by defence. Much to the point, too, is the fact that our acceptance of relatively heavy commitments has so lightened the load for other countries that they have been able to develop new industries. Admittedly, if we do not participate in their establishment, others will: it would moreover, be grotesque to suppose that we can survive on our internal trade. Yet industrialisation has now reached a point where many countries in the pursuit of nationalistic aspirations not only manufacture for themselves goods hitherto supplied by us, but seek an outlet for their products in our home market. Disconcerting as may be this state of affairs, we must accept the situation, and be prepared to feel an even more severe impact from these newly formed overseas industries.

Yet that is not the only adverse factor with which we have to wrestle. Whilst we have eased the burden for other countries, some of which as a consequence enjoy comparative freedom from economic anxieties, we have deflected materials and manpower to defence in such quantity as to accelerate the upward movement of prices and wages and so aggravate our inflation. This relatively heavy outlay has meant that we have the lowest rate of internal investment in Europe: in other words, that we have relatively less of our national income available for the development of our essential productive industries. Plainly inflation and the lack of capital for these industries are serious embarrassment for a country which has to live by its foreign trade, and it seems to me more than time that we took steps to restore, and thereafter greatly strengthen, their competitive power. Urgent as may be these internal investment needs, the capital requirements for our nuclear energy programme are even more pressing, since imported coal and oil form an unrealistic basis for this country's economic growth.

THE NEED FOR ECONOMIC STRENGTH

This is not to suggest a complete reversal of policy but rather that we should bring our commitments into line with our existing resources. After all, it is becoming increasingly apparent that real strength is economic strength and we shall serve ourselves and others best by making sure that we have a margin over and above our obligations sufficient to enable us to expand our economy and build up our gold and dollar reserves.

Just how successful we shall be in this will greatly depend on how speedily we can produce larger quantities of saleable and suitably priced exports. But equally important is a profitable and expanding overseas market for the increased output which will result from our efforts. Here it seems to me that we cannot ignore the European free market which is now under discussion even though it may present severe problems to particular industries. Admittedly, we shall not gain a footing in this wider trading area without encountering keen competition from other members but, provided dumping and export subsidies are controlled, this competition should act as a spur to our greater efficiency in production and salesmanship and be accounted a benefit rather than the price we should have to pay for the larger market.

THE DOMESTIC ANGLE

Since, however, the European plan is in embryo and without immediate significance, it must not be allowed to deflect our attention from present necessities. Many of these are the outcome of years of economic improvidence. With too little regard for the hard work and the saving essential for the creation of wealth, we have been over-lavish with the accumulated resources of the past on luxuries and a too easy way of life. "The fault, dear Brutus, is not in our stars, but in ourselves, that we are"—profligate. Our persistently prodigal attitude is indeed largely responsible for our present weakness and it is high time that we came down to realities in domestic as well as foreign affairs.

That there is need to fortify our internal economy is made clear by the depletion of our gold and dollar reserves. But serious as this is, the Suez trouble has made the position more precarious by giving impulse to both inflationary and deflationary forces. Dearer imported food and raw materials, with higher freight and road transport charges, are forcing prices upwards. Although the rise in the cost of living has so far been relatively small, it has already resulted in demands for more wages. It is to be hoped that any such claims, unless supported by increased productivity, will be resisted: otherwise, instead of tightening our belts as we ought, we shall again be adding to productive costs. Against these inflationary pressures has to be reckoned the fact that falling profits are bound to induce a more cautious attitude towards development plans. But of more immediate importance is the running down of industry through the dislocation of supplies consequent upon the re-routing of shipping.

THE CORRECTIVE MEASURES

In view of the exigencies of our economic position and the resultant pressure on sterling, the decision to reinforce the pound by borrowing must be regarded as unavoidable. In fact, this support was forthcoming with a readiness which amounted to an acknowledgment of the importance of sterling to international trade. However, because any loans which we accept will have to be repaid and do not therefore in the long run add to the level of our reserves, it would be disastrous if we lacked the courage to turn the breathing space these financial facilities afford us to good account. As the Chancellor considers our trading position is strong and our payments gap will be manageable, it would appear that it is temporary problems rather than any fundamental disequilibrium in our economy with which corrective measures will have to deal. To the extent that their task is to curb home consumption it is satisfactory to know that they have not included physical controls, seeing that these are so damaging to production, and it is to be hoped that the restraints will prove effective enough without the need for a further increase in taxation or more stringent monetary measures. Nevertheless the situation calls for the utmost vigilance, since in certain circumstances inflationary or deflationary forces could necessitate speedy adjustments to fiscal and monetary policies.

But whether the steps that have already been taken will restore confidence in sterling is another matter. In this connection it can be argued that existing measures will have to be reinforced by a still more repressive fiscal policy and by dearer money. But it seems to me that it is the disciplinary measures as a whole rather than the level of taxes and interest rates through which foreigners will regain their faith in the pound. In point of fact to tax further our already overtaxed economy would tend to destroy rather than to create foreign confidence and, although monetary stringency may be called for, high short-term interest rates may make things more difficult than they need be. After all a high Treasury Bill rate did not enable us to retain short-term funds in the Autumn of last year. Yet such a rate means that we are having to pay millions of pounds abroad in interest and this imposes an additional strain on our external payments. That is one aspect of the problem, but a high Treasury Bill rate also encourages the public in this country to indulge its preference for liquidity and so prevents a long overdue funding of the Floating Debt. Surely the better way to create an overseas investment interest in sterling is to make a really serious attempt to cut down all unnecessary public expenditure. Some determination here would enable us to reduce taxation and thereby stimulate the inflow of long-term capital from overseas. Determination here would also make it possible for us to quicken the reduction of both short-term interest rates and short-term indebtedness: in other words we could cut down more decisively the cost of servicing our overseas balances and the volume of Treasury Bills at one and the same time.

It will indeed be extremely serious if our present troubles do not make us realise how pressing is the need for a curtailment in State spending. But how are we to do this? Parliament's continued inability to act vigorously in this matter may well be due to Members' understandable disinclination to incur the criticism of their constituents. Logically this leads up to a measure for which there is a precedent, namely the creation of an impartial body, acceptable to both sides of the House, empowered to examine Departmental expenditure and to effect all practicable economies. In my opinion this is the only way which seems to offer any hope of achieving worth-while retrenchment.

I think it would be right to say that we have muddled through the recurrent troubles of recent years because the difficulties with which we have had to contend were not formidable enough to reveal our hidden deficiencies. The present situation, however, is of so stern a character that it ruthlessly exposes accumulated internal weaknesses as well as external dangers. If, as a consequence, we have the vision to see what is needed and the resolution to exert ourselves so that appropriate remedies and readjustments are vigorously applied, then I think we may eventually be able to record that the critical period through which we are now passing has served to redirect us towards prosperity.

THE TEXTILE INDUSTRY

Needless to say the Bank has a great interest in all branches of the textile trade. Inevitably in such a complex industry different sections experienced varying fortunes over the course of the last twelve months.

In the cotton section neither home nor export trade provided much ground for satisfaction during the first half of the year. Indeed shipments overseas were less than the disappointing figures of the previous year. The uncertainty about raw cotton was one of the main reasons for the slackness of trade. Early in 1956, owing to the large volume of visible supplies, there was considerable apprehension about the trend of prices and buyers were reluctant to enter into commitments. But later on with unexpected and heavy sales by Egypt to Czechoslovakia and other countries the finer grades of cotton available were greatly reduced and values were inevitably affected.

The most outstanding factor in the situation, however, was the policy of the United States Government which, already faced with a large carry-over from previous crops, again augmented these stocks by taking off the market a substantial quantity of the new crop. The removal of this cotton and the subsequent sale at reduced prices of a considerable amount prevented Futures Markets from functioning in a normal manner. Hedging therefore became a perilous operation and had unfortunate consequences for many firms who in the ordinary way look to such transactions as the best insurance against price fluctuations. In these circumstances and also having regard to import regulations as well as exchange controls it is understandable that the Liverpool Market has found it extremely difficult to function properly.

Another serious problem confronting the trade has been the steady increase in our imports of cheap cloth and made-up goods. Their unrestricted and duty-free inflow from India and Hong Kong, which has been so menacing, continued unabated at least until the closure of the Suez Canal curtailed shipments. Before these imports are resumed it is to be hoped that the discussions which are taking place between the representatives of Far Eastern and United Kingdom industries will, both in their interests and ours, result in a satisfactory agreement.

Despite these complications and adverse influences there has recently been some improvement in the volume of business for the industry as a whole. It remains to be seen whether this is merely reaction from the earlier reluctance to buy and whether sales to distributors at current prices will be maintained. Since with the present improvement a shortage of labour is causing delay in the execution of orders the need is emphasised for modernisation and a highly trained labour force which will permit more continuous operation of costly machinery.

Meanwhile it is encouraging to see that noticeable headway is being made in the production of new yarns and new fabrics. In these developments man-made fibres are playing an increasingly important role and are helping to broaden the basis of trade. In assessing the prospects for textiles it is therefore essential that the opportunities for expansion presented by change and innovation should be fully taken into account.

FINMECCANICA

(SOCIETÀ FINANZIARIA MECCANICA) ROME, ITALY

DURING 1956 the companies in the Finmeccanica group sold abroad machinery and equipment worth about 60,000 million lire.

The following is an indication of the group's exports:

Turbine tanker of 36,120 tons (Cantieri Riuniti dell'Adriatico Shipyard, Trieste, and Cantieri Ansaldo of Sestri) for the tanker fleets of British Petroleum, Esso Standard and Panama Transport.

Motor passenger ship *Gripsholm* of 24,000 tons (Cantieri Ansaldo, Sestri) for Sweden.

Destroyer of 1,300 tons displacement (Cantieri Ansaldo, Leghorn) for the Venezuelan navy.

Hydraulic turbines, alternators and transformers (Ansaldo San Giorgio, Genoa) for the power stations at Stugun (Sweden), Ybbs Persenburg (Austria), Los Quiroga (Chile), Bihar, Madras, Travancore, Cochin (India), Los Molinos (Argentina) and Puerto Cabello (Venezuela).

Chemical plant (Ansaldo-Montecatini) for producing fertilisers at Sindri (India).

Rotary furnaces (Ansaldo) for cement works in Brazil, Colombia and Venezuela.

Buses and trolleybuses (Alfa Romeo, Officine Meccaniche Pistoiesi, Ansaldo San Giorgio) for the municipal authorities of Montevideo and Mexico City.

Electric trains (Imam, Aerfer, Officine Meccaniche Pistoiesi) for India; locomotives (Ansaldo) for Greece, India and Chile; freight cars (Cantieri Riuniti dell'Adriatico and Officine Meccaniche Pistoiesi) for India, Pakistan, Iran and Chile; sleeping cars (Ansaldo) for the International Sleeping Car Company.

Cotton spinning and weaving plants (Nuova San Giorgio, Genoa) for Iran.

Fixed and travelling cranes of 34 to 20 tons capacity (Navalmeccanica of Naples, Ansaldo, Cantieri Riuniti dell'Adriatico) for the port installations at Valparaiso (Chile), for the Assouan dam in Egypt, and for the Indian and South African railways.

Refrigeration plants (Termomeccanica of Spezia) for Yugoslav farm produce markets.

Cartridge-making plants (Fabbrica Macchine Industriali, Naples) for the Indonesian Government.

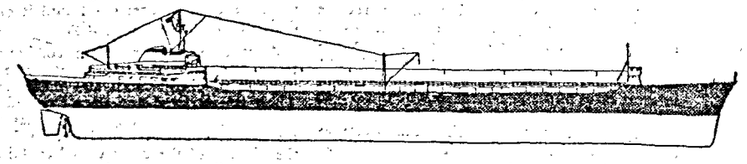
Tractors (Ansaldo-Fossati of Genoa-Sestri) of 150 hp for the Colonisation Institute at Madrid.

Motor lorry parts (Alfa Romeo) for the Fabrica Nacional de Motores of Rio de Janeiro.

"Giulietta Spider" cars (Alfa Romeo) for the United States.

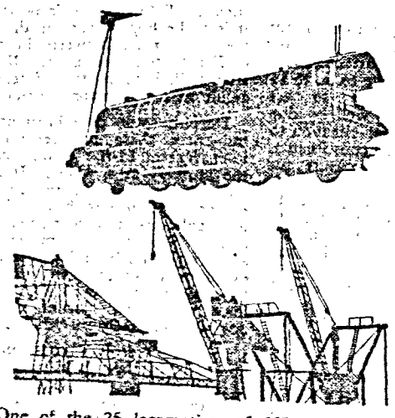
Turbo-alternators of 6,000 KW (Ansaldo) for the power station at Rioturbio in Argentina.

180-ton lathe (Stabilimenti di S. Eustacchio, Brescia) for the Argentine navy.



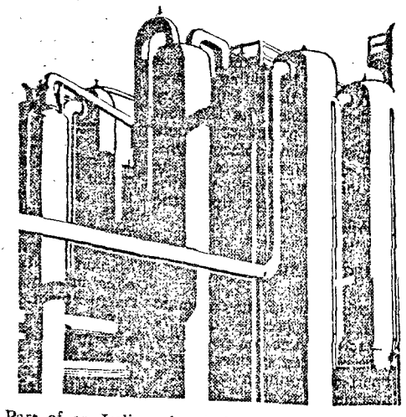
Radar equipments (Microlambda of Naples) for the Belgian navy.

FINMECCANICA'S FOREIGN ORGANISATION



Seven representative agencies at New Delhi, Karachi, Rio de Janeiro, New York, Mexico City, Buenos Aires and Madrid.

The firms which make up Finmeccanica's trading organisation abroad are 275 in number, comprising 112 in Europe, 35 in Africa, 65 in the Americas, 53 in Asia and 10 in Oceania.



FINMECCANICA—44, Via Torino—Rome.

A 52,000-ton turbine tanker now being built at the Ansaldo Shipyard, Genoa

One of the 25 locomotives of 103½ tons weight supplied by Ansaldo to the Indian railways being shipped at Genoa on February 23, 1956

Part of an Italian chemical plant under construction at Sindri in India for producing 884 tons of fertiliser per day

J. H. FENNER & COMPANY (HOLDINGS) LIMITED

The twentieth ordinary general meeting of this Company and subsidiary companies was held on January 14, 1957, at the Queen's Hotel, Leeds. The following extracts are taken from a Joint Statement by Mr C. Bradshaw, FCA, the Chairman, and Mr S. B. Hainsworth, FTI, the Deputy Chairman and Managing Director.

FINANCIAL POSITION

The consolidated net profit of the Group is £428,096, compared with £407,914 for the year ended August 31, 1955. After adding the balance brought forward from the last account of £261,597 the sum of £689,693 has been appropriated as follows: Transfer to Mortgage Debenture Stock Sinking Fund £9,518, Provision for Taxation £266,756, Transfer to Capital Reserve £42,874, Transfer to General Reserve £150,000, Dividend on Preference Shares £3,953, Dividend on Ordinary Shares £35,938, leaving a balance to carry forward to next year of £180,654. It should be noted that in the provision for taxation amounting to £266,756 we have included a sum of £20,000 to cover any increase of taxation which might be brought into effect, and that the proposed Dividend on the Ordinary Shares has been computed on the increased Ordinary Share Capital resulting from the Bonus issue which was made during the year. It has been thought expedient to bring up the General Reserve to £250,000 by transferring £150,000 from the Profit and Loss Account and £50,000 from the Dividend Equalisation Account.

The trading results shown are, in the opinion of the Directors, satisfactory, and for your further information we now summarise the activities of your Companies.

FENNER MECHANICAL POWER TRANSMISSION EQUIPMENT

It can now be said that our V-belt pulleys with Taper-Lock bushes have been standardised by most of the leading industries in the United Kingdom.

It is clear that this business has developed, and will continue to expand, at the rate which we anticipated and, in order to cater adequately for the progress, we have found it necessary to curtail our operations at Heckmondwike in West Yorkshire and to transfer the manufacture of iron goods to a new factory built on our Marfleet site at Hull, which has been erected and is being equipped with machine tools at a cost of £350,000. Much additional expense will be incurred during the removal and as the result of the training of new staff.

Thus the manufacture of our entire range of mechanical power transmission equipment will be centralised in Hull, and we make daily deliveries to the eighteen stock-carrying branches which we maintain to serve our customers quickly throughout the United Kingdom.

The increasing demand for Torque-Arm reduction units for a wide variety of uses has been most satisfactory. It is clear, from field reports received over the past two years, that a high standard of engineering skill well maintained, coupled with good design work and first quality materials, can produce goods which find ready acceptance by industry on an increasing scale.

The demand for roller chain drives from the outset of the sales campaign encouraged us to lay plans and commence development work on an extension to the initial range of equipment. Duplex and Triplex sprockets have now been designed, capable of transmitting up to 90 hp, and with the necessary Taper-Lock bushes already available as part of the standard stock carried at Fenner branches, these larger chain sprockets will be available in the coming year.

The patented "Hainsworth" Variable-Speed Drive, whereby the driven speed can be adjusted to suit the varying requirements of a machine or installation simply by rotating a hand wheel, continues to be recognised as an indispensable component by both manufacturers of original equipment and users alike. The distinctive, robust, and scientifically designed belts ensure good life and service under most arduous conditions.

Much development work has been accomplished on flame-resistant and anti-static conveyor belts for use in National Coal Board pits; but it is doubtful whether any manufacturer has solved all the problems associated with the provision of such belts for use under the new conditions which apply as the work at coal faces is mechanised. It is, however, certain that the conveyor belt is still the quietest, most simple medium which can be employed for moving coal.

OVERSEAS TRADE

The products of J. H. Fenner and Company Limited, the manufacturing Company, and its subsidiaries, are marketed abroad by the Overseas Company through a quite separate and specialist organisation conversant with the many requirements of markets for our equipment throughout the world.

The Executives of the Group, according to the particular needs of the assignment, are available to go abroad for short or extended tours. One of us, your Managing Director, Mr S. B. Hainsworth, was in India, Pakistan, and Ceylon for two months in the early part of the year for consultation with the agents in those territories, visiting also the subsidiary, J. H. Fenner and Company (India) Limited, in Calcutta, and attending the opening ceremony of the new factory which is producing Fenner and Cockill products at Madurai, South India.

Other tours undertaken for the purpose of assisting in technical field representation covered such important markets as the Scandinavian countries, Western Europe, the Middle East, British East Africa, the Central African Federation, and Australia. We know that our many good friends in such widely separated places appreciate this real interest in their affairs and the assistance which we give in developing their business still further; equally we are always pleased to extend hospitality for discussion and training to overseas visitors, who take advantage of these facilities on an increasing scale as the years go by.

FENNER COCKILL, LIMITED

During the year the new Fenner Cockill factory in India has been built and operated with the co-operation of our good friends, Messrs A. and F. Harvey Limited, of Madurai, and production for sale has started. The organisation and installation of the plant and the starting of machinery was in the hands of Mr Alfred Reeder, a Director of the new Company. At the time of the preparation of this Report, the unit at Madurai is producing woven belting, spindle tapes and industrial V-belts to a satisfactory standard of quality and in satisfactory quantities. Thus the long established Fenner and Cockill names and brands in India will continue to be made available in that market.

FENNER DODGE LIMITED

It is with real pleasure and satisfaction that we are able to report that a new Company, Fenner Dodge Limited, has been created whereby the common interests of the two companies in the development of new and improved mechanical power transmission equipments are placed on a practical basis. Mr David Firth, Vice-President in Charge of Engineering at Dodge, was nominated as a first Director of the new Company.

SCOTTISH AGRICULTURAL INDUSTRIES LIMITED

LEITH FERTILISER WORKS NEARING COMPLETION

MR W. D. SCOTT OUTLINES NEW SAI CONTRIBUTION TO PROSPERITY OF SCOTTISH AGRICULTURE

The twenty-ninth Annual General Meeting of Scottish Agricultural Industries Limited was held in the North British Hotel, Edinburgh, on January 17th. The Chairman, Mr W. D. Scott, presided. In the course of his remarks, the Chairman said:

In the Report which was sent to you before Christmas, there are certain points on which I wish to comment. You will recall that on June 7th you gave us authority to increase the capital of the Company, using £826,400 of our Capital and Revenue reserves. Your Directors recommend a final Ordinary dividend of 5 per cent, which with the interim dividend of 3 per cent makes 8 per cent for the year. Last year the dividend was 11 per cent, but this was on the old capital and is equivalent to 7 6/7th per cent on the present increased capital. There has, therefore, been a fractional increase which accords well with the views we expressed last May. We have already replaced, out of the year's profits, the sum of £174,191 taken from Revenue reserves towards last year's capitalisation. The turnover for the year reached the record figure of almost £24.2 million, compared with £23.2 million in 1955, largely due to increased consumption of fertilisers. Our profits before taxation have gone down by £71,570 from £1,162,945 to £1,091,375, but these are not unsatisfactory when we consider that during the financial year under review our dealings in farmers' grain were reduced as a result of the harvest in 1955 being early and that in 1956 being late. You will have observed that stocks have risen over the year by more than £700,000. This is due partly to a deliberate increase in our stocks of fertiliser raw materials, particularly phosphate rock, which is mentioned specifically in the Report, but it is also due in part to the fact that farmers did not take early delivery of fertilisers as they did in August and September, 1955. Then farmers had enjoyed an easy harvest and before them was the prospect of price increases for fertilisers. Last August and September there were no such incentives and the deliveries, and the trading profits to which they give rise, will come into the current year's accounts.

FUEL RATIONING

I should now like for one moment to refer to the effect of the Suez developments upon future deliveries of fertilisers. Petrol and oil rationing will seriously affect road delivery services during the peak spring months immediately before us. Costs are rising and, despite all our efforts, price increases appear to be inevitable sooner or later. There is, therefore, every reason for the farmer to take his supplies early, and we are doing all we can to persuade our customers to draw from the stocks of granular compound fertilisers which we have ready for immediate delivery.

CAPITAL EXPENDITURES

We have spent, and will be spending, large sums of money to keep in the forefront of our business. You will have read in your Directors' Report of the progress made at our Leith Works during the year under review. When this works is completed, it will have cost more than £3 million, by far the largest sum spent on one project since the founding of your Company. The Leith factory is being built on a new site and although it will incorporate all the latest techniques of fertiliser manufacture, it is still essentially a replacement of our existing manufacturing capacity with, of course, sufficient in addition to meet expansion of the market. We will accordingly, only to a limited extent be entering new markets and finding new sources of profit with the products of this new works. The money for this project will be found from the Company's existing internal resources and from further funds becoming available as the work proceeds. We expect to achieve this and at the same time maintain dividends at the present level.

Your Board believes that the money and skill which are being devoted to the building of Leith Works will make a substantial contribution both to the prosperity of Scottish agriculture and to that of your Company.

The report and accounts were adopted.

ALLIED BAKERIES LIMITED

At an Extraordinary General Meeting of Shareholders, held on January 15th, in London, the Chairman, Mr W. Garfield Weston, reviewed the background leading up to the resolutions before the meeting, and said:

As a result of large retentions of profit, our issued share capital is very much less than the actual capital employed in our businesses and we have obtained the consent of the Capital Issues Committee to the capitalisation of £2,796,426 from our Reserves. If you approve the resolutions which will be put before you this morning, that amount will be applied to the paying up in full of 5,592,851 each of our "A" and "B" Ordinary Shares which will be issued to our existing Ordinary Shareholders in the proportions of one "A" and one "B" Ordinary Share for every two "A" or "B" Ordinary Shares held.

I think I may reasonably anticipate that the profits of our year which ends on March 31st next will be not less than those for the previous year.

Your Directors have followed a very conservative policy with regard to the payment of Dividends but increased earnings resulting from the employment of additional capital justify them in deciding to make some increase in the amount to be distributed.

You will be aware that a first Interim Dividend of 15 per cent, as against 10 per cent last year, has been paid. We hope that it will be possible to maintain this higher level in the amount distributed when we come to consider the payment of the remaining two dividends in respect of the current financial year, but the rate of dividend will need to be halved to 7½ per cent on the increased capital.

The resolutions were passed.

JOSHUA HOYLE & SONS

FACTORS AFFECTING THE INDUSTRY

The Annual General Meeting of Joshua Hoyle & Sons, Limited was held on January 10th at India Mill, Bacup, Mr A. Duckett, JP, the Chairman, presiding.

The following are extracts from his circulated statement: Group trading profit amounted to £378,106, which after deducting exceptional writing down of stock of £269,237, leaves £108,869, compared with £632,983 for the previous year.

The Company has experienced another very difficult year of trading. Not the least of the very disturbing factors throughout our industry is the increasing volume of imported Commonwealth and foreign cloth, providing extremely severe competition both in our home and export trade. If the Government continues to pursue the present policy of allowing duty free goods into the country, there will necessarily be a greater contraction of the whole industry in Lancashire, the damaging effects of which on the national economy cannot be over-emphasised.

When the US Government introduced a two-price system for the marketing of raw cotton, retaining one price for their domestic market and, at the same time, subsidising raw cotton exports, we were involved in a loss of £269,237, as a direct consequence of this unforeseeable change in marketing principles.

Our Technical Research Departments continue to investigate fully the many man-made fibres at present available. In addition to our activities in the fields of filament and spun rayon and nylon, we are directing our attention to the production of cloths made from "Terylene" and acrylic fibres.

The report was adopted and the total dividend distribution of 8 per cent approved.

R. A. LISTER & COMPANY LIMITED

The Annual General Meeting of R. A. Lister & Company Limited was held on January 11th at Dursley. The following are extracts from the speech made by Sir Percy Lister, the chairman, who presided:

From the Consolidated Accounts you will observe that during the financial year ended September 30th last, once again a record year has been established by your Group of Companies, and for the first time the profits have passed the £1 million mark.

These satisfactory results have accrued as a result of the continuous and steady expansion over the past ten years of your Group's productive capacity at home, and the progressive development of your Group's distributing organisations in the domestic and overseas markets. It can be truly said that today there is no country in the world in which the products of your Company are not known and do not enjoy an enviable reputation on account of their quality and value.

It is perhaps fitting that your attention be drawn to another important contributory factor, namely the wide variety of the products of your Group of Companies which are either from a sales or production point of view, of a complementary nature. As evidence of this, you may be interested to know that the same factory that produces the many thousands of packing cases every month is also responsible for the production of the ever-growing volume of garden seats and furniture specialities, and a very large percentage of the Lister sheep shearing and horse and cattle clipping machines is driven by Lister Engines.

A year ago I made reference to the issue of 5 per cent Unsecured Loan Stock, repayable in 1965 or earlier at the Company's option, and it is of interest to note that in the last two financial years we have made a profit of £2 million of which approximately £1 million has been paid to the Chancellor in taxes, £500,000 to the shareholders, and £500,000 has been retained in the business—a healthy provision towards the future capital requirements of the business, in which today the capital employed is £3,940,000 from Share Capital and over £2,100,000 of reserves and undistributed profits, a total of over £6 million.

During the year under review, amongst the interesting contracts which have been awarded to our Group of Companies, were a repeat order from the British Railways for Blackstone Diesel Engines for Shunting Locomotives, a contract for Marine Propulsion Engines for Oil Tankers, and a substantial contract from Egypt for Pumping units for Rural Water Supply. In connection with the latter contract whilst current circumstances will not permit of any payment on account of any unshipped portion of the contract, any losses which may occur from abnormal influences on trade resulting from the "Suez Canal Problem" will, I am happy to say, be small, and have so far as is possible been provided for in the figures before you.

The expanding range of our new Lister Air-Cooled Diesel Engines and the Lister and Blackstone range of Marine Propulsion and Marine Auxiliary Engines is attracting a lively interest and growing demand in the home and export markets, and our contribution to the dollar needs of the nation shows a steady and healthy expansion. The new Multi-Level Loader and the small Diesel-Engined Runabout Truck introduced during the year under review have met with an encouraging demand, and the new products to be introduced during the current financial year will, we believe, meet with a like response.

The effect of varying forms of restriction on imports in many Overseas Markets, together with the growing tendency towards the encouragement of secondary production in such markets, coupled with the fact that, as markets for political or economic reasons close, the competition in the remaining ones left open becomes more intense, makes it essential that nationally and individually we "cut our coat according to our cloth." It will be obvious that the nation must limit the burden of taxation and the burden of the continual rises in the charges of our nationalised industries if the inflationary repercussions resulting therefrom are to be kept within reasonable bounds.

Only by the increased effort of every firm and individual can we as a nation continue to face the ever-increasing foreign competition and retain that share of the export trade which above all else is so essential to the well-being of our people.

The report was adopted.

APPOINTMENTS

THE UNIVERSITY OF SHEFFIELD

CHAIRS OF ECONOMICS

Applications are invited from economists in any branch of the subject for two CHAIRS of ECONOMICS, both vacant at the end of September, 1957, one by the retirement of Professor G. P. Jones, and the other a newly created Chair. One of the professors will be appointed Head of the Department of Economics. In addition to its present functions the Department will in future assume responsibility for the conduct of teaching and research in Business Studies, for which exceptional local facilities are available. Salary £2,150 a year, with F.S.S.U. provison and family allowance.—Further particulars should be obtained from The Registrar, The University, Sheffield 10, to whom applications (25 copies, one only from overseas candidates) should be sent by February 16, 1957.

UNIVERSITY OF WESTERN AUSTRALIA

Applications are invited for the *CHAIR OF ECONOMICS*, the present occupant of which will retire in December, 1957.

The salary of the Professor will be £A3,024 per annum, which includes a present cost of living allowance of £24. An allowance is made towards travelling expenses.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

The closing date (receipt of applications, in Australia and London, is *March* 31, 1957.

NATIONAL HEALTH SERVICE

TRAINING POSTS IN HOSPITAL ADMINISTRATION

The Minister of Health and the Secretary of State for Scotland invite applications for up to sixteen training posts in hospital administration.

Successful applicants will hold these posts for a maximum of three years, beginning in the autumn of 1957, and will be given practical experience of all branches of hospital administration, together with courses of instruction at the University of Manchester or at the Hospital Administrative Staff College of King Edward's Hospital Fund for London.

A short list of applicants will be called for interview by a Selection Committee.

Applicants should be not more than 30 years of age at 1st September, 1957, but the Selection Committee has discretion to accept applicants up to 35 years. If already employed in the hospital service they should either

(i) be a graduate of a British university, or
(ii) be the holder of a professional qualification acceptable to the Selection Committee, or
(iii) have had at least three years' experience in the hospital service on 1st September, 1957, and to have passed at least the intermediate examination for a professional qualification.

If not employed in the hospital service they should either

(i) be, in September, 1957, a graduate of a British university, or
(ii) be, in September, 1957, the holder of a professional qualification acceptable to the Selection Committee.

Applicants should have discharged their obligation for national service.

Applications will be considered from students who are due to take their final examinations in 1957.

The salary during the training period begins at £540 plus a small duration allowance, and is subject to an increment of £20 in the second and third years. Applicants already in the hospital service will retain their present salary scale if higher than this. Training fees will be met.

Further information and application forms can be obtained from University Appointments Boards or by writing to the Secretary, Department of Health for Scotland, St Andrew's House, Edinburgh, 1, or to the Secretary, Ministry of Health, Savile Row, London, W.1. Applications should be completed and returned to the Secretary, Ministry of Health, not later than Thursday, 28th February, 1957.

DUNLOP RUBBER COMPANY LIMITED

invite applications for the position of:

DEPUTY CHIEF ENGINEER

of its rubber factories, the appointment being next in line for the position of Chief Engineer.

Candidates, preferably in their forties, should have a degree in Engineering or comparable qualifications; a wide practical experience in mechanical engineering in its broadest aspects, in the U.K. or abroad, and have held positions carrying executive responsibility not necessarily in the Rubber Industry.

Foreign languages an advantage.

The post is based on the Company's Head Office in London.

Applications in writing, giving full particulars of qualifications and experience, to: Secretary, Dunlop Rubber Company Limited, St. James's House, St. James's Street, London, S.W.1.

NATIONAL COAL BOARD, East Midlands Division invite applications for a responsible post in the Training Branch of the Staff Department.

The successful candidate will deputise for the Divisional Staff Training Officer in his absence and assist him in all aspects of the education and training of non-industrial staff and junior officials and the education of industrial employees including apprentices. A degree or equivalent qualification is desirable and some previous experience in the field of Staff Training would be an advantage.

The post is superannuable, and salary will be on a scale of £1,085 to £1,475, according to qualification and experience.

Applications, in fullest detail, to Staff Director, East Midlands Division, National Coal Board, Sherwood Lodge, Arnold, Notts, not later than January 25, 1957, quoting S.V.683.

ST. ANNE'S COLLEGE, OXFORD

Applications are invited for the post of BURSAR and SECRETARY to the GOVERNING BODY, for general administrative duties and management of college property and finance. The woman appointed would be eligible for an official FELLOWSHIP after one year. The post might be combined with some academic work. Salary £900 × £25, rising to a maximum, in the case of a graduate of £1,250; starting point according to age and experience. The post is pensionable under F.S.S.U.—For further particulars apply to the Principal.

EMPLOYEE MANAGEMENT RELATIONS

MOBIL OIL COMPANY LIMITED offers opportunities to men who want a career in Employee Relations or who recognise the value of experience in this field as a qualification for promotion in another function. Due to extension of activities candidates are sought for two positions in London Headquarters Employee Relations Department. Appointment and subsequent progress will give opportunity to explore whole field of Employee Relations, including labour relations, recruitment, research, policy development, salary administration and job evaluation—at headquarters and plant levels.

Candidates, not over 30 years, and with a record of progress, must have good educational background, preferably with Honours Degree—arts or technical—and possess personal qualities colloquially described as management potential.

For one position, experience in Employee Relations is required. For the other position, several years' general experience in industry might be acceptable if combined with high personal qualities. The Company is advanced in Employee Relations policies and practices, thus salary, benefits and conditions of employment are good.

Apply in writing to Employee Relations Manager, Mobil Oil Company Limited, Caxton House, Tothill Street, S.W.1, quoting Ref. E.R.3.

McCANN-ERICKSON ADVERTISING LIMITED

In the course of further expanding its Research Department, McCann-Erickson has a vacancy for another RESEARCH EXECUTIVE. Applications are invited from men or women with recognised professional qualifications in psychology, and with sound experience in some field of practical research. Initial salary within range £900-£1200, depending on qualifications and experience. Applications in full detail to Director of Research, McCann-Erickson Advertising Ltd., McCann-Erickson House, Fetter Lane, London, E.C.4.

MANAGEMENT SELECTION LIMITED have been retained to advise on the selection of the

GENERAL SALES MANAGER

for a substantial engineering company in the South with a turnover of several millions in domestic electrical appliances. The company is preparing to augment its range of products and duties will include expansion of sales of present lines and marketing of new ones to meet targets based on market research data.

Candidates must have extensive experience of sales and sales management using modern techniques in competitive selling to a mass market: this should include marketing of consumer or industry, government or municipal posts. The degree (preferably in statistics or economics) would be an asset and desirable age 35 to 40. Starting salary will be not less than £3,000 with prospects of wider responsibilities if results give proof of ability.

Please send brief details, quoting reference (S222), to H. E. Roff, Management Selection Limited, 17 Stratton Street, London, W.1. No information will be passed to our clients until candidates have been told their identity and have given permission after personal discussion.

ASSISTANT IN LABOUR DEPARTMENT

Applications are invited for the appointment of an Assistant in the Labour Department at the Redbourn Works of Richard Thomas & Baldwins Ltd. This works is a fully integrated steel plant employing approximately three thousand people.

The successful candidate will require to have a keen mind which can be brought to bear on wage negotiation and general labour problems. Experience in these matters, although an advantage, will not be as essential as the general outlook of the applicant towards industrial labour problems, and his capacity for negotiation.

A good starting salary will be paid.

Application forms are available from the Labour Officer, Richard Thomas & Baldwins Limited, P.O. Box No. 7, Redbourn Works, Scunthorpe, Lincs.

CHARTERED or Incorporated Accountant or member of A.C.W.A. required as assistant to the Internal Auditing Section of Group of manufacturing companies, headquarters in London. Factories are situated in London and the North. The vacancy and prospects are particularly suitable to a recently qualified man or one in his final year age 23-30. Write details of age, education and experience and indication of salary level to Box 602.

YOUNG SOLICITOR required by large industrial corporation for post in their Legal Department in London. The post would suit a recently qualified man with sound training but limited experience, who will be engaged principally upon work in connection with Common Law claims and Town and Country Planning matters, including local enquiries. Good opportunities for gaining a wider experience of the law. Appointment (superannuable) with initial salary between £834 and £962, but an able and energetic man can expect advancement when he has proved his worth.

Write, with full particulars of age, education, qualifications and experience, to Box 603, before January 28, 1957.

OPERATIONAL RESEARCH

COURTAULDS LIMITED have the following two vacancies for Senior Assistants in their Central Operational Research Department in Coventry. This Department is concerned with a very wide range of problems in the management, production and technical fields and offers ample scope for originality.

(a) *Mathematical Statistician*

Applicants should hold a good degree in statistics, or in mathematics with post-graduate study or experience in statistics. This post offers considerable opportunities to suitably qualified men. Investigations in hand at present include: queueing and related topics, experimental design, programming techniques and electronic computer applications. There is also scope for mathematical research of a fundamental character into special problems in the production field. Reference number C.80.

(b) *Scientist or Engineer*

Applicants should hold a good degree in one of the following subjects: Physics, Chemistry, Mechanical, Electrical or Chemical Engineering. Corresponding industrial experience would be an advantage. The post requires primarily a man with practical insight and constructive imagination. He should have an interest in mathematics and candidates with some acquaintance with statistical methods are particularly welcome. Reference number C.82.

A good starting salary will be paid in both cases depending on qualifications and experience, and the appointments are pensionable.

Candidates should write for a detailed form of application to the Director of Personnel, Courtaulds Limited, 16 St. Martins-le-Grand, London, E.C.1, quoting the appropriate reference number.

STATISTICIAN with good knowledge of sales analysis, market research and business organisation needed by firm of international repute in the food industry. Good scope for successful applicant. Age 26-35 years. Reply to Box 601.

PERSONAL SECRETARY

to Senior Executive. Highly experienced, early 30's, proficient stenographer seeks responsible post (London) requiring intelligence and efficiency.—Box 604.

UNIVERSITY OF LONDON

A lecture on "Ministerial Responsibility in France Today" will be given by Professor R. Pinto (Paris) at 5 p.m. on January 29th at the London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2. ADMISSION FREE, WITHOUT TICKET. James Henderson, Academic Registrar.

THE HONGKONG AND SHANGHAI BANKING CORPORATION

Notice is hereby given that the SHARE TRANSFER BOOKS of this Corporation will be CLOSED from March 1 to March 15, 1957, both days inclusive, for the purpose of preparing for payment of dividend for 1956.

B.Sc.(ECON.) LONDON UNIVERSITY

UNIVERSITY CORRESPONDENCE COLLEGE provides postal tuition for the above Degree (obtainable without residence), which is a valuable qualification for those seeking executive appointments in commerce or industry, government or municipal posts. The College, established 1887, is an Educational Trust. Highly qualified Tutors. Low fees. Prospectus of U.C.C. Courses for London Degrees and Diplomas, G.C.E. free from the Registrar, 60 Burlington House, Cambridge.

CITY OF JOHANNESBURG

5 PER CENT REDEEMABLE STOCK 1959/62

NOTICE is hereby given that in order to prepare the Warrants for Interest due March 1, 1957, the Transfer Books of the above mentioned Stock will be closed from February 1st until February 8, 1957, both dates inclusive.

For Barclays Bank D.C.O.
(London Registrars of the above stock).
G. A. D. HARRISON, Manager.

Circus Place, London Wall, E.C.2.
January 8, 1957.

SUCCESSFUL TUITION FOR THE B.Sc.(ECON.) DEGREE

Wolsey Hall (Est. 1894) provides Postal Courses in a wide range of subjects for the two examinations for Lond. Univ. B.Sc.(Econ.) (three if Entrance is included). Moderate fees, instalments. Over 1,000 Wolsey Hall students have secured this valuable degree since 1925.—Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P.16, WOLSEY HALL, OXFORD.

THE ROYAL BANK OF CANADA

DIVIDEND No. 278

Notice is hereby given that a DIVIDEND of 50 cents per share upon the paid-up capital stock of this Bank has been declared for the current quarter and will be PAYABLE at the Bank and its branches on and after March 1, 1957, to shareholders of record at the close of business on January 31, 1957.

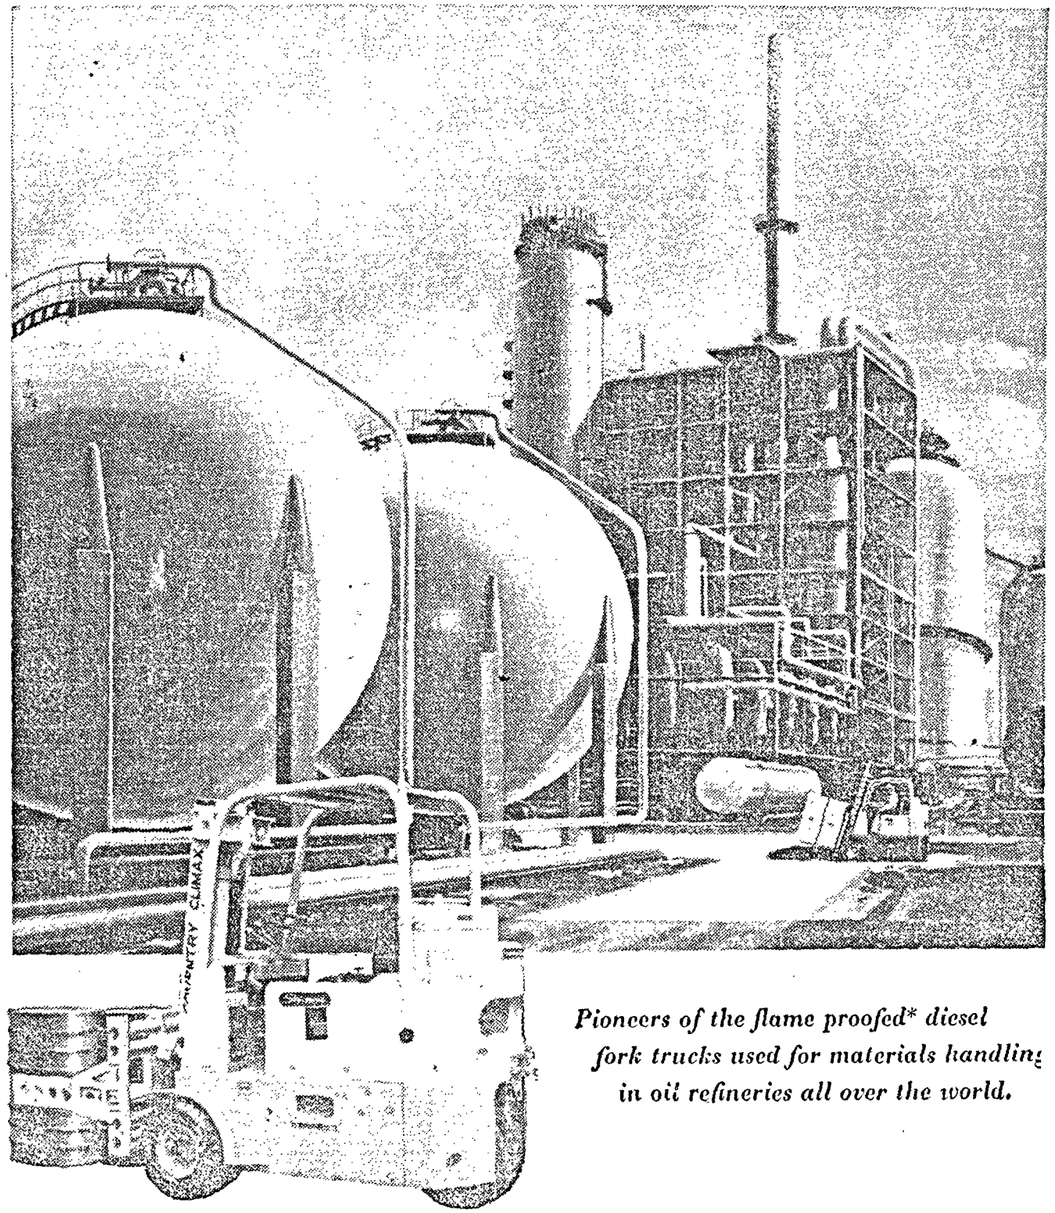
By Order of the Board.
K. M. SEDGEWICK.
General Manager.

January 16, 1957.

EXPERT POSTAL TUITION

for Examinations—University Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus—and/or advice, mentioning examination or subjects in which interested, to the Secretary (G9/2).

METROPOLITAN COLLEGE, ST. ALBANS



or call at 30 Queen Victoria Street, London, E.C.4.

ANNUAL AIR SUBSCRIPTION RATES

Subscriptions to most countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is either because the alternative is not available or not recommended.

	Airmail	Air Freight
Australia	£8 5s. strlg.	—
Canada	—	$21.50 or £7 14s.

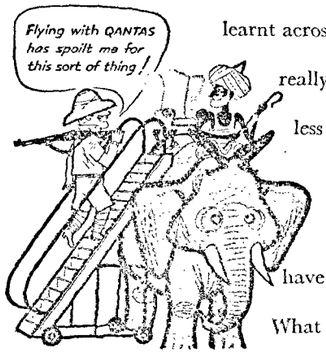
The reliability and high efficiency in design, materials and performance associated with Weir Auxiliaries for steam installations are now being applied to Weir equipment for Nuclear Power plant.

Research, development, design and manufacture of the highest standard, maintain Weir leadership in the auxiliary field, whatever the source of energy.

We invite consultation on all questions relating to design and manufacture of Pumps, Valves, Heat Exchangers and other Auxiliaries for Nuclear Power circuits.



In the rapidly changing field of power reactor technology, the expert assistance which we can give on such equipment is essential.

QANTAS believes in spoiling its passengers. QANTAS has *spent 36 fruitful years* patiently learning how to spoil them more. And since 'being spoilt', as some of us learnt across our mothers' knees, is really nothing much more or less than having things *your* way for once, QANTAS believes its passengers have every right to be spoilt. What do you feel would spoil you *most*—in a flight across the world? Physical comfort? We promise you that. Comfort that lets you relax by day, that lulls you to sleep at night and to sleep all night. Good food and drink—and intelligent interest in your likes and dislikes? We think we can surprise you there—and pleasantly. Or would it be just the sense of general friendly readiness on our part, to do things *your* way—at the drop of a hint? *If you don't know what it is to be spoilt a* QANTAS *crew can show you!*

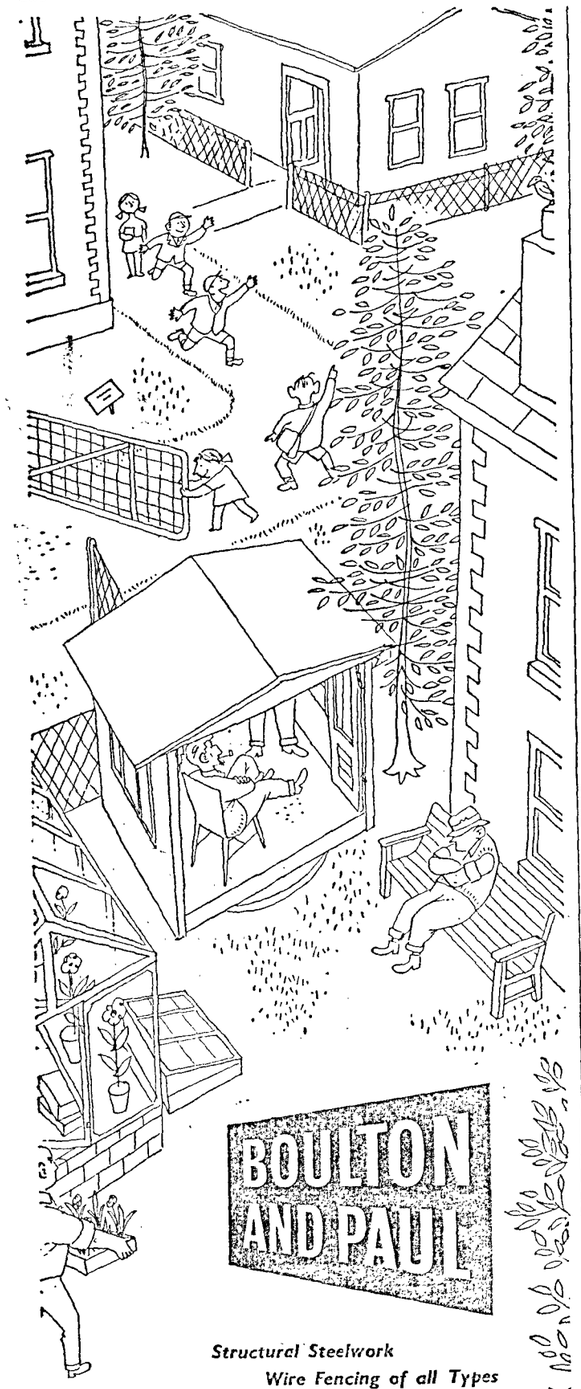
THE GOVERNMENT OF BRITISH COLUMBIA

invites you to

LOCATE YOUR PLANT IN BRITISH COLUMBIA

Canada's fastest growing province



Reasonable taxation combined with equable climate has attracted billions of dollars in new industry in the last five years . . . . including pipe mills, cement plants and giant chemical firms. They came because British Columbia offers:

- **abundant natural resources.**
- **limitless hydro power; natural gas.**
- **year-round shipping.**
- **proximity to expanding markets.**
- **excellent industrial sites, leasehold or freehold.**

For complete information write to: **Agent General for British Columbia, British Columbia House, 1 Regent St., London S.W.1, *or to:***

Hon. E. C. Westwood, Minister *T. L. Sturgess, Deputy Minister*

Britain into Europe

THE need to work closely with Europe is a favourite theme of Mr Macmillan's. As Prime Minister, he has now to put it into practice. But he, and other Conservatives, need to get their emotional impulses for and against this venture sensibly disentangled. A proper emotional impulse behind the burgeoning alliance is the recognition that, in the past twelve years, one of the saddest aspects of British policy has been the disillusion of the hopes which many Europeans placed in Britain. Britain has played a part in co-operative bodies like the Organisation for European Economic Co-operation, but it has baulked at each political gesture—like joining the Coal and Steel Community (remember Mr Strachey's talk of a " plot ") or the European Defence Community—which would have involved a wholehearted commitment. In war, Britain stood for Europe and won a great capital of affection and respect ; it was a bitter disappointment to many Europeans that it surrendered that status in peace. Mr Macmillan has a chance to recover some of the country's credit.

The wrong emotional impulse in favour of the venture, very prevalent among some Conservatives, is the desire, not so much to back up Europe and get its backing, as to back into it. Ernest Bevin's instincts were certainly right in 1949 when they told him, as the Russian threat towered over Europe, that no European relationship must ever be allowed to mar our friendship with the United States ; nor must it impair our special ties with the Commonwealth. The notion of a mythical " third force " in Europe, separate from or opposed to the United States, enjoys no more acceptance on the Continent than in Britain, and perhaps even less ; the European partners would not play such a dangerous and barren game even if—which is, it must be hoped, unlikely—Britain were to wish it.

A wrong emotional instinct *against* the change in these last ten years, however, has been the feeling that Britain can best protect these special Commonwealth ties, like a husband anxious not to compromise himself in his wife's eyes, by an attitude of huffy and uninfluential isolation towards the special ties now being forged among our neighbours. Here we have merely misinterpreted our own self-interest. To the continental countries Britain's overseas links are one of the assets which recommend Britain as a partner ; similarly, the English-speaking world would welcome stronger British links with Europe. Left to themselves, continental countries have, it is true, struggled forward with forms of integration whose federalist element has been unacceptable to Britain. But both EDC and the Coal and Steel Community might have taken very different forms if Britain had played a part in their creation from the start. The folly of Britain's European policy has been that, though Britain has moved closer to Europe than ever before and played a real part (within certain severe limits) in the inevitable trend towards greater unity, it has moved in such a grudging and reluctant way that it has earned resentment instead of credit, and European plans have been moulded by others.

Mr Macmillan's task is to dispel this mood, to see Europe's need for solidarity as a political opportunity, to take new initiatives towards greater co-operation (above all in the economic field) and yet to cast them in a liberal pattern which will guard intact Europe's political and economic ties with the wider western world. The best immediate hopes lie in three strictly practical developments. First, a good start has been made with the project for a free-trade area around the common market which six continental countries hope to set up, and with which nearly all western Europe will join provided we do. The free-trade plan was inspired in part by fear that the common market would shut out British exports. But it is also imaginative and far-seeing, presenting perspectives of growth and challenge that would outweigh its risks even if the common market were to fall by the wayside. At a time when Commonwealth preferences are rapidly dwindling away, it will open to British industry the swiftly growing markets of industrialised western Europe—competitive, but rich and diverse in promise like those which British exporters are beginning to tap in the United States. At home, it will bring new competition, but though this may be painful for certain industries, it may well be the most rewarding aspect of the plan for the British people as a whole.

Inevitably, there is some threat of Little Europeanism in this venture: preferential tariff reductions in Europe are not so good as world-wide cuts. But it has long seemed clear that some forms of protection against the dollar will be necessary to Europe and the sterling area. A free trade area linked with the overseas territories of European countries may offer the most liberal way to this, and at the same time provide Europe with a weapon to bargain for reductions in America's own tariffs in times of boom and—there is no need to burke mention of this point—with an association for maintaining prosperity if ever America should slump. By playing a leading part in these European schemes from the start, Britain has the chance to ensure that they are used in this sort of way, not as a protection in good times, but primarily as a step towards still greater freedom in world trade—which is the American desire, too.

★

This much is now almost accepted policy. But the second practical field of opportunity is one which Britain at present looks like neglecting. Now, surely, is the time for a surge of British initiative in it, like the movement in official policy that started so astonishingly a year ago and has carried Britain forward to the threshhold of the free-trade area. This field is nuclear power. The advantages for Britain of establishing a special relationship with Euratom ought to be apparent: if we stay wholly outside, Germany is eventually going to establish a preponderant position as an atomic power on the Continent (which could have awkward political, as well as economic, implications); Euratom itself might become a largely restrictive block; British atomic development would be in danger of suffering from the distortions of small scale. Britain is at present so far ahead of all other European countries in this field that it feels that the damage is not immediate, and it is naturally averse to sharing too many of its hard-won commercial secrets. But there surely must be some way, while still preserving—indeed consolidating—the advantages of our long start, of looking just a little farther than the end of our present proudly upturned nose; and in the interchange of new ideas and developing techniques there can be the opportunity of avoiding some of the possible disadvantages, eventually, of being first in the field.

The third field of opportunity is arms manufacture: the inexorable growth in costs must in time force European countries to collaborate more and more in both production and development. Collaboration with America is indispensable: Mr Sandys, as a note on page 270 discusses, will soon be on his way to Washington for talks. But it is clear that, in this age of atomic explosives and guided missiles, European countries will eventually have themselves to make at least some of the strange new weapons that are becoming the artillery and air force of modern war. They can only afford to do this collectively, and it will be in Britain's economic and political interest to be a leading member of the partnership. Rising costs will also tend to impel the European countries to common production of conventional arms. Now is the time to take an initiative, when a separate German arms industry is still unborn.

★

These large functional developments once more raise the question whether Britain must commit itself to any wider political association with Europe. But it is not a question that needs to be answered yet. Some new forms of ministerial consultation, arising out of the institutions of the common market and OEEC, will be necessary to steer the free-trade area; some executive machine, a secretariat at least, will be needed to work it; but beyond that the existing institutions should suffice. Politically, it is not new institutions, but a new and vigorous participation in the formation of common European policies, that is required from Britain. Weak in isolation, the European powers can certainly do more to protect their common world interests if they act together. Even in the Middle East, though time is very short, a common European policy, pressed on the United Nations and United States, might still play a helpful part in bringing about a settlement between Israel and Egypt. It is too often forgotten that other European countries as well as Britain have special relationships with the outside world which could be used in the common interest. Italy, for instance, which Mr Selwyn Lloyd visited last weekend, is a Mediterranean power whose many useful links both with the Arab world and with Greece and Turkey might enable it to play a special mediatory role in both the Cyprus and Middle East disputes.

With its diplomatic position so much impaired by recent events, Britain today has a special need for the support and co-operation of other European powers. But it cannot expect these to spring up at once in defence of its interests; we can only hope for a general—and self-interested—response if we reveal a clear and determined political will to work with them for defined practical ends, and if we take care to consider their interests when our own policies are being formed. That is what Mr Macmillan's new Europeanism ought to mean. The Europeans will have to be convinced that Britain's new interest in them is not a passing political distraction from less pleasant matters, but a real and lasting change of heart.

Protecting Parliament

IT is the essence of Parliament, Bagehot said, that it is a dignified assembly. The House of Commons is admirable when, whether in great matters or small, it shows that dignity, but can be deplorable when it stands on it. When the House reassembled on Tuesday, it showed both these faces. First, after all the recent acrimony and political convulsions, it greeted the new Government with good humour and paid its proper all-party tribute to the retired Prime Minister. Then, straightaway, it plunged into more complaints of the alleged breach of its privileges represented by press and broadcast criticisms of the petrol allowances for politicians.

To discuss these matters is uncommonly difficult for three reasons, one of principle and two of practice. The reason of principle is that the "ancient and undoubted privileges" which Mr Speaker demands for Parliament at the start of a new session do indeed both deserve respect and, in so far as they enable members to perform their duties unhindered and unmolested, should be upheld. One practical reason for restraint in comment is that the House of Commons, which called before it on Thursday the editor of the *Sunday Express*, who had been found guilty of contempt by its Committee of Privileges, had still to decide on the committee's report as we went to press. The other practical reason, and the most burdensome one, is that any comment is liable to be regarded as itself contemptuous.

This last risk ought to be taken. It ought to be taken, first, in order to make clear that the misgivings about the extended application of the plea of privilege—and these petrol cases are only the latest instances—are not inspired by the desire of newspapers to claim "a special privilege" for themselves; the test is whether the prestige and influence of Parliament are in fact enhanced by these enlargements. It should be made quite clear, secondly, that the misgivings do not necessarily depend upon agreeing with the protests against the ample apportionment of petrol for political activities; it might be argued that a rationing scheme which reduced too much the mobility of politicians who may wish to take up the case against it would be wrong. The argument is rather whether criticisms, misguided or not, of an administrative arrangement (administered by petroleum officers or, as in the case of MPs themselves, by the little-known Fees Office) ought to be the subject of these parliamentary comminations. Has not the time come for a new self-denying ordinance and a truce to pomposity, for Parliament's own sake?

The plea—to the Crown, it should be noted—in each new Parliament is "that the best construction shall be put upon all their proceedings." It is the product of long-gone and long-won battles to preserve parliamentary freedom against kingly and executive encroachment. Now the same plea is employed, increasingly, against the accusations and innuendoes of plebeian critics. The sole test, now as then, is whether the plea is in fact necessary to ensure the independent and indispensable discharge of MPs' functions. There can be no question of Parliament's rights in these affairs; both of its Houses have the right to pass their own judgment on breaches of their privileges and to censure or commit offenders; and, included among the offences approved by law and custom, are "indignities to its character and proceedings," as well as "assaults, insults and libels" upon its members. But it has to be asked all the time why these powers have arisen. They grew as the defence of Parliament's members against outside intimidation or interference. They are, for MPs, the safeguard that they will be able to speak their mind and speak for their constituents without fear or favour. They embody, in our parliamentary democracy, not so much a right of politicians as a right of the people whom the politicians represent. They are not, either rationally or historically, a privilege in the ordinary sense of the word. (This is true, too, of the press; its freedom is a "*right*" not of newspapers but of their readers.)

★

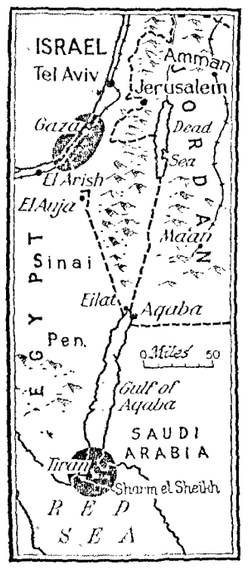
The question, then, is whether the recent claims by MPs to crack down on certain kinds of comment and criticism are, in fact, in Parliament's and the public interest. The answer, admittedly, can be given only by Parliament itself. Certain of its ancient privileges are unassailable: freedom of speech "not to be questioned in any court or place outside" is the prime immunity. Freedom from arrest, essential in the days of tussle between executive and legislature, has reasonably in more settled times been reduced within narrow limits. The issue now, it must seem to detached devotees of

the parliamentary system, is whether freedom from popular criticism, however irresponsible or inaccurate, is a proper application of the ultimate, and essential, privilege of Parliament. Or is it fast becoming a foolish presumption ?

The Leader of the House of Commons said on Tuesday of the latest cases that the questions involved in them were two: whether the critics had, in Parliament's view, committed contempt ; and what were the facts about the political petrol ration. But the two important questions are different. They are, first, whether these cases are worth Parliament's while ; and, more narrowly, whether the process of trial by parliamentarians, when such cases are taken up, is satisfactory —whether it is reassuring, from any point of view, when one offender is forgiven because he "has not sought to justify his conduct" and another, who did seek, however inadequately, to justify himself, is additionally blamed for "his demeanour."

The House of Commons acts in these matters as a court of law, and the best available legal advice is that all the rules of court privilege and contempt may apply to the reporting of, and commenting on, both the procedure adopted and the decisions made. This is the real risk of such comment as we have felt bound to make. Let us in conclusion say three things. The first is to repeat that Parliament is entirely within its rights to act in these matters as it thinks fit. The second is to admit that we have not yet come to the state foreboded by Junius when he wrote that:

> We can never really be in danger till the forms of Parliament are made use of to destroy the substance of our civil and political liberties.



But the third is that this danger will be ruled out, and the present argument be reasonably resolved, only if Parliament stops being, as it seems, ridiculously touchy.

Urgent—For Uno

SLOWLY and unsurely, the United Nations Assembly has begun to face the real problems of a Middle East settlement. In the past week it has shown signs of responding to Mr Hammarskjöld's patient coaxing. Commonwealth, European and American delegates have joined the Secretary-General in advancing the idea that the UN emergency force should soldier on. The Asian-African group, suddenly doubtful whether it could get a two-thirds majority for a mere denunciation of Israel, toned down its resolution so much that a Soviet delegate incautiously called it "inadequate." The resolution, carried by 74 votes, maintained the demand that Israel should complete its withdrawal. But, in asking the Secretary-General to report again almost at once on his efforts to secure Israel's withdrawal, the Assembly obliquely recognised the problem beyond withdrawal. It virtually invited Mr Hammarskjöld to present in an official UN document the reasons why Israel dare not now give President Nasser the free run of the Gaza strip and the Aqaba straits.

Thus the Assembly, putting one foot tentatively forward, at least held open the door that threatened to swing shut upon the hope of Middle Eastern peace. It encouraged the Secretary-General to pursue the course, which he had already sketched out, of widening the content of debate. But, by the nature of his office, Mr Hammarskjöld can do no more than that. Only the member governments can now decide whether to take a broad, constructive view of their responsibilities, or a narrowly legalistic and lazy one: whether to try to bring real peace to the Middle East, or to hand it back the same old bloodstained sword.

At present, Israel seems to intend to bargain with Uno, offering to trade withdrawal against visible guarantees. Mr Ben Gurion even told the Knesset on Wednesday that Sinai should be demilitarised (implying that Egypt must leave its Sinai oilfields and mines unprotected). Egypt will not even bargain ; it insists that, in Sinai as in Port Said, the UN force must quit as soon as it has eased out the invaders. But it is not the duty of the United Nations to defer to the susceptibilities of either party ; its duty is to work out what ought to be done to establish peace securely between the two, and to ensure, to the extent of its power, that this is done. Several factors make this a less formidable task than Uno has faced on previous occasions. Neither Egypt nor Israel is a major military power. The UN force is in being and in Sinai. The Gaza strip, one of the immediate bones of contention, is a territory over which neither Egypt nor Israel has a valid claim of sovereignty. And most of Uno's non-communist member nations have lately had a sharp reminder of their interest in Middle East stability.

Admittedly there are also unfavourable factors. The UN force was never designed to fight a war, but rather—to borrow a haunting phrase—to "interpose itself between the belligerents." The countries that contributed to it did so on the understanding that its life would be limited ; Uno has no means of stopping them if they choose to take their men away. The Soviet propaganda apparatus and its Arab dupes are ready to denounce as an "imperialist plot" any move to extend the force's life. And the prospects of mustering a two-thirds majority in the Assembly in favour of an extension are not being improved by the utterances of British Ministers, who, having had the force firmly thrust upon them in November, still claim all the credit for inventing it. Indeed, the best service the Foreign Secretary and his assistants can render to a Middle East settlement at the moment is to refrain altogether from speeches such as Mr Lloyd made on Tuesday.

What is now urgently needed is a rallying together of the broadest possible front of nations to underwrite a UN programme that will bring peace and stability, not just the old familiar bloody flux, to Sinai. To give moral weight to such a programme, the same massive majorities in the Assembly as went to the condemnation of Britain and France will need to be mobilised. The minimum elements in the programme would have to include provision against a second blockade of the Aqaba straits and against the use of the Gaza strip as a base for guerrilla raids. Uno would be justified in insisting that, to balance its retention of a position on Egyptian soil at the straits, its troops should also enter Israel. For the Assembly, the first necessary step is an extension of its resolution of November 2nd, from which all subsequent action has flowed, and a clear injunction for the Secretary-General to draw up plans to ensure that Uno's authority is confirmed in action—that the catastrophe of 1947-48 is not repeated.

If Egypt protests that its sovereignty would be violated by Uno's programme, the answer need not merely be that it has Uno to thank for the preservation of that sovereignty, nor that a country which refuses to acknowledge the sovereignty of its neighbour can expect little respect for its own. Those answers can be given, and may need to be ; but the argument needs to be lifted on to a broader plane, that of the peace-

Between Egypt and Israel

The Gaza Strip. Thirty miles long and seven wide, the Gaza strip is not legally Egyptian territory. It was part of Palestine, and was occupied by Egypt during the Palestine war of 1948-49. The armistice line, cutting between the opposing armies as they stood at the 1948 cease-fire, confirmed Egypt's tenancy until last November.

Economically, the strip is a liability. It cannot provide a livelihood for its 100,000 normal inhabitants, far less for twice that number of Arab refugees, who fled there from Palestine in 1948 and depend on the United Nations Relief and Works Agency. Even with goodwill, the opportunities for self-support are meagre in the extreme. Most of the permanent inhabitants are even worse off than the refugees.

Only a quarter of the territory is cultivated. Barley, melons, citrus fruit and dates are among the main crops. Surplus produce is sold outside the strip, and last year exports to Egypt and other Arab states were valued at £500,000, about half being citrus fruit. But imports were about four times the size of exports. Occupation of Gaza is an expensive business, entailing free and subsidised food distribution for the inhabitants, the carriage of supplies for the refugees (one of the few costs carried by the occupying power and not the Agency), maintenance of the inadequate social services, and security.

Israel has given its occupation an air of permanency. Superimposed on the conditions of a military occupation—curfew from dusk till morning, screening of teachers, strict non-fraternisation—are more positive and peaceful tactics. Arrangements have been made to sell Gaza fruit through the Israel Citrus Marketing Board ; Israeli stamps and currency have been introduced ; there has been talk of land development schemes. The refugees, who had in any case no reason to like the Israelis, were further alienated by the disruption of their supplies and by the "incidents"—a series of appalling blunders which caused the massacre of large numbers of refugees. The local population is, however, gradually being wooed.

But these schemes are only the trimmings of Israeli policy. The main issue is security. Apart from its Egyptian and Palestinian Arab garrisons, Gaza was a base for the more organised type of fedayeen raid. The Israeli police have been busy, but they can only cut down the organisation, not root it out. It is Israel's case that if its security forces leave the strip, no United Nations army can prevent the roots from branching.

Gulf of Aqaba. From the Red Sea the gulf runs for a hundred miles between the Sinai Peninsula and Saudi Arabia, the coastline on each side being harsh and almost uninhabited desert. The frontiers of Egypt, Saudi Arabia, Jordan and Israel converge at the head of the gulf, where there are two ports: Aqaba in Jordan and Eilat in Israel. For most of its length, the gulf is 12 to 17 miles wide, but at its mouth on the Red Sea the islands of Tiran and Senafir split it into two narrow streams, the navigable route being the three-mile channel between Tiran and Sinai.

The status of the islands is obscure. They lie within the six miles of territorial water claimed both by Egypt and by Saudi Arabia. Towards the end of 1949, the two countries agreed that Egypt should erect military installations on the islands. A few months later, Egypt installed a garrison at Sharm es Sheikh and gun emplacements at Ras Nasrani, two points on the Sinai coast directly overlooking the Tiran straits. From 1950 onwards only a diminishing number of specified goods was allowed through to Eilat.

The gulf is Israel's trading link with the Indian Ocean and the Far East. Since the capture of the Egyptian gun positions early in November and the re-opening of the Tiran straits to Israeli trade, Israel has publicly underscored its determination that the blockade should not be resumed by going ahead fast with development schemes. The port facilities of Eilat, which is a new town dating only from 1949, are being enlarged ; the road between Eilat and Beersheba is being asphalted and the extension of the Haifa-Beersheba railway to the gulf is planned.

Even with bad roads and no railway, Israel is experimenting with trade through the gulf. A first cargo of hides and coffee from Ethiopia destined for Genoa is being transported by lorry and rail from Eilat to Haifa. The Israelis cherish the scheme of a major pipeline running from Eilat to the Mediterranean. On a smaller scale they have started to lay an 8-inch pipeline from Eilat to Beersheba to serve their home market.

Israel is gambling on the gulf being kept open. If Egypt were put in a position to close it again, the development of Eilat as a southern outlet for Israeli trade would be too risky an investment.

maker, not the lawyer. For the United Nations peace must come first. Of course, if its members cannot agree on a constructive programme, they will presumably have to withdraw the UN force, assure President Nasser that his sovereignty is now safe from hurt at their hands—and leave Israel in possession. Egypt may have to be reminded that this is one possible alternative. But any such abdication would be as fatal for Uno as for Egypt and Israel. The United Nations now has the opportunity of establishing, as a vital precedent, its right not merely to halt a conflict but to probe and eradicate its causes. But it also confronts the bleak fact that failure to act constructively will destroy all the prestige it has gained, and more.

The present test for Uno is a far more severe one than that of November. Then, in a moment of almost universal alarm, the ranks were swiftly rallied behind a simple call for a halt. Now, in an atmosphere of relative calm, the Assembly has to devise and agree upon a long-term plan which cannot be expected to please any of the parties concerned. But the alternative is a return to anarchy in the Middle East, and, for the world as a whole, a violent setback to the prospects of organising peace. The United Nations, as an institution, might very well survive this setback, perhaps for many years; but the very nations—those that are small and weak—which look most anxiously to international institutions to protect them against the strong would have helped to ensure that they will never enjoy that protection.

Britain's Schools—I.

Eleven Minus

The junior leaving examination—which corresponds to the "eleven plus" elsewhere—was held in London this week. Our special correspondent visited two London primary schools to write the first article in a series about different types of state and private schools in Britain.

"THE trouble is the parents," said the headmistress. "One of our girls was told by her mother last week: 'If you don't pass the scholarship, I'll murder you.' That is the way they still talk, although it is officially called the junior leaving examination now, and we go to endless trouble to impress on both parents and children that its purpose is simply to help us decide what kind of secondary school would suit each pupil best, and that there is no question of passing or failing. The children themselves would be quite happy about it if it weren't for the parents."

The headmistress was obviously not talking merely to soothe or to impress. She had just been preparing the private reports which she sends to the education department of the London County Council and which, even more than the examination marks, are used to determine at what kind of school each child shall be offered a place: at a grammar school with a six or seven year course from the age of eleven; at what used to be called a "central school" with a five-year course (the parents call this "passing" too); or at a "non-selective" school with only a four-year course.

In her reports the headmistress of the primary school has to say whether the child is likely to be able to stay at school beyond the age of fifteen and to note any special circumstances which may influence his development, such as his health or his home background. The home background, in this rather tough district, is all too often a handicap. Many of the parents have gone to live with somebody else, and some are sojourning in Her Majesty's prisons. The headmistress finds therefore that much of her work is in the nature of social work. Any parent can come and see her in her cramped little office, and she finds that, as a married woman herself, she is much exposed to mothers with matrimonial troubles—to which she consents to listen if these affect the children. But she draws the line at a parents-teachers association (which many schools have), because she does not want the parents interfering with the running of the school.

Problem parents, a visitor would judge, are not the only disadvantage from which this particular primary school suffers. It has a depressing building, dating from 1874, and it looks particularly forbidding in contrast to the new Church of England primary school in the same district. No glass walls and bright colours in the council school: the corridors are dark and the bricks are grimy. But the headmistress refuses to be depressed. It is true that children choose the handsome Church school in preference to hers, but that leaves her spare space, which allows her a library and an art room, and an extra classroom or two to give flexibility to the timetable. It is true that the building is, from her point of view, over-used. It turns into an evening institute after the children have gone home, and this can lead to irritating discoveries next morning—a cigarette stubbed out in the bulb bowl, or carefully preserved information rubbed off the blackboard. As some of the grown-up pupils are about in the daytime too, complete strangers (as far as the school is concerned) are wandering about its corridors day and night. There is also a play centre, which is held in the assembly hall after school finishes when, confusingly, the children are allowed to break the rules that obtain at other times of day. However, says the headmistress, the children seem pleased enough with the eighty-year-old school building, which is luxurious compared with the houses that most of them come from. Truancy has fallen to nothing, and with it delinquency—for it is when they stay away from school that they get into trouble.

The fact that there is a bit of spare space unfortunately does not mean that there are small classes. On the average there are over 40 children in each, which is the official maximum for primary schools. This means hard work for the teachers: so many books to mark, so many children to keep in order, and such a wide range of ability to be coped with at the same time. Moreover, teachers in primary schools normally have a class each and stick to it, unlike secondary school teachers, who circulate from class to class and so get the occasional free period. Primary school teachers in general are thus rather indignant at the Ministry's recent proposal that those of their number who are suitable and willing should be encouraged to transfer to secondary schools, whither the "bulge" in the school population is now moving. They feel that they have borne their share of the bulge, and it is now their turn to have smaller classes (the secondary schools, officially, have a maximum class of 30).

In big classes, with a wide range of ability, the fashionable "project" method is often used. It is useful, because the class can work as individuals, each going at his own pace. One may take a subject such as bread and find out all about it—where the wheat comes from, how flour is made, and so on. Even the child with the IQ of 80 can stick appropriate illustrations into a scrap album and join in a visit to the local bakery; while the bright child will have learnt something of history and geography as well as something about bread, and all in painless pursuit of his chosen subject. At this primary school, begrimed with London soot, the youngest class (not one of whom had a garden) had "adopted" a farm in Kent, and were completely *au courant* with what was going on there. Some day they hope to visit it, but meanwhile they are borne along by their own imagination and the inspiration of the enthusiastic Scotswoman (in full vigour at over the retiring age) who teaches them.

★

A brief visit, indeed, certainly left the impression that the children were enjoying their schooling in this unattractive building, perhaps no less than in one of the 96 new primary schools that the LCC has built since the war. To go on from there to one of these new schools, all light and colour and meticulous planning, was not to alter that conclusion. The headmistress of the new school said she thought that to work in beautiful surroundings gave the children a pride in their school and in their work; and no doubt this is true. But she, like her colleague in the tough area, was of the opinion that a school is made or marred by its traditions, its staff, and its pupils—which means the kind of background from which they come. This headmistress has her school in a middle and lower class area, and numbers among "her parents" members of Parliament and professional people, as well as other classes. "Lovely parents," she said. They, it seems, really have grasped the idea that they must not make their children wretched with menacing remarks about "failing in the scholarship." It seems a safe bet, however, that those of middle-class parentage who do "fail" are promptly sent to an independent school, where they never abandon the hope of driving academic knowledge into the heads of the dull and unwilling.

Critics of the state system fasten on just this difference. What about all those ten-year-olds who on Tuesday will have sat in tears over the examination paper because they could not even read it? Does not this new-fangled teacher training, with its gentler methods, induce one to give up hope too easily? The answer to illiteracy, however, lies not so much in hope. It lies in more time and special classes to give backward children the individual attention that they need. It lies in better and more sympathetic homes that will help the children to learn. But quite intractably, it also lies in a higher general level of intelligence. Those who blame the primary schools forget just how stupid most people's children can be.

Recession in Trade

More symptoms of distress have been exhibited in the metropolis in the week. Large numbers of men have been roaming through the streets begging, have applied at workhouses for relief, and have received it or have rejected it when combined with the usual workhouse test of labour. Though . . . many of the sufferers themselves are much to blame . . . and the workmen are censurable for persisting in combinations and unions to force up the rate of wages beyond the fair market level—the distress cannot be passed over as undeserving notice. It is in accordance, unfortunately, with the slightly diminished consumption of some articles which we noticed last week, and with the complaints made to the Chancellor of the Exchequer by a deputation which waited on him on Tuesday. The deputation from the Society for the Protection of Trade represented tradesmen, shopkeepers, clergymen, clerks, and mechanics whose earnings fluctuated somewhere about £150 a year, and they asked that all persons having incomes less than this sum should be altogether exempt, and that "from incomes above that amount the first £150 should be allowed for." Amongst others, the principal speaker said "the grocers felt heavily the oppression of the tax, and they were a class well entitled to consideration, for they paid a large amount of indirect taxation in the duties on tea and sugar." . . . The most obtrusive consequence of the want of increasing prosperity is not however the worst. The . . . tradesmen, shopkeepers, clergymen, clerks, and mechanics, instead of bearing the infliction with patience and patriotism, seek selfishly to be relieved themselves, and seek to throw an additional burden on others. . . . The middle classes of England . . . exhibiting some of the wolfishness of human nature, under the combined pressure of a little adversity and heavy taxation, are only anxious to relieve themselves at the expense of their neighbours.

January 31, 1857

Notes of the Week

Back Towards Normal?

THE mere fact of a change of Prime Minister produced a markedly quietening effect when MPs reassembled this week. The Tories were steadier, Labour cannier and the whole temperature lower than in the frenetic weeks before Christmas. Once again, there has been a reminder of what an unpredictable business politics is. The Tories broke up before Christmas in what can most politely be described as an unusually unbalanced state, and the events of January 9th-10th were of the sort that would normally be expected to produce a split. But there is no split; and, ironically enough, the man who is being billed as hero of the rehabilitation is Mr Butler. His good wishes to the new Prime Minister, containing none of the reservations for which the gossip writers so eagerly looked, have healed the breach which yawned so privately during the 48 hours of dramatic change. To unite to cheer a good loser is an understood thing in the Tories' code book; they gave Mr Butler a notable ovation at the party meeting when they duly elected Mr Macmillan to be their leader.

There could conceivably soon be more interesting developments in personal relationships on the Labour side. After some ill-thought-out initial reactions, a more cautious Opposition attitude seems to have arrived with Mr Gaitskell from the United States. At the Shadow Cabinet meeting on Monday the constitutional hare was hastily stuffed back into its burrow; but there has been no Labour comment on another development. While Mr Gaitskell has been in the United States, Mr Bevan has been saying that a third world war will be inevitable if "we see the crisis in the communist world as an opportunity to mobilise all our resources . . . in order to bring about the destruction of communism"; and that "the proposals of President Eisenhower for the Middle East were conceived—indeed they were stated—in just that aggressive spirit." This is not precisely what Mr Gaitskell has been saying in America. Some Tories see in this apparent discrepancy a hope that politics may be returning to their normal order; in that normal order high-level splits and recriminations between party leaders are things that Tories enjoy hugely, because they occur only on the other chaps' side.

The Sandys Mission

THERE seems to be good authority for the belief that Mr Sandys has taken office as Minister of Defence after promising to try to make defence economies on a scale which Mr Head thought was either impossible or unjustified; it is with this resolve behind him that he goes to Washington next week. Mr Sandys was last in Washington as Minister of Supply in 1954, when he negotiated a concordat to exchange information about new weapons other than atomic; though it hardly came up to his hopes, it is reasonable to assume that Mr Sandys's aim now is to go further and to try to eliminate overlapping in research on, and production of, new weapons as between Britain and America.

The ideal result would be so to dovetail production that Britain should tie up its productive capacity and research resources only in projects in which the technical and industrial lead is held this side of the Atlantic; where the Americans are ahead—as they are with most types of missile—Britain should try to exchange the know-how gained in the work done so far for firm undertakings (they must be very firm) to sell or supply the equipment as part of an integrated allied defence effort. Even if such an agreement can be reached, however, until American legislation is changed Britain would have to continue work on atomic warheads for missiles. Mr Sandys should have a fair question to ask here: as British mastery of atomic technology is demonstrated, is not the American refusal to share atomic information on security grounds becoming increasingly meaningless?

★

Since the Americans are ahead not only in ballistic rockets—the future method of delivering the deterrent—but also in the ground-to-air missiles which offer the only, if slender, hope of home defence, any decision will be of far-reaching importance. For with it would go the decision, which follows logically, to cut drastically fighter command and fighter aircraft production. Does this mean that Mr Sandys will try to overcome the difficulties, hitherto insuperable, of buying American fighters and so carrying integration further? It is impossible to guess the economies which might emerge from such an agreement, but they would be considerable, though the cost of bought-in equipment must be set against them. Clearly, however, the scale of cuts which is being so widely forecast—something like £300 million—could be reached only if general conscription were also abolished, and probably if the naval building programme were also cut or abandoned. Many of the economies now being mooted would not be of full immediate benefit to the Exchequer accounts for 1957-58, because compensation would have to be paid for contracts broken; but they would bring speedier relief to the pressure on resources, which is what really matters. What is important for next week, however, is that Mr Sandys should, in the harsh light of atomic strategy, judge wisely between the projects we should keep and the projects we should try to trade.

Mr Kadar Gets Tough

MR KADAR has decided to get tougher. His decision followed his recent series of meetings with Soviet and Chinese leaders; but it has also been forced on him by non-communist political leaders who have refused to play along with him. The most prominent among them, the leader of the Smallholders' party, Mr Bela Kovacs, has announced his retirement from politics on the ground of ill-health. In his case this is not merely a diplomatic excuse, but an equally compelling reason must have been Mr Kadar's refusal to admit anyone to his government who was not prepared to be a communist stooge.

Thwarted in his efforts to give his regime a more respectable façade, Mr Kadar has abandoned all pretence that he might be moving away from a dictatorship. His minister of state, Mr Marosan, has stated bluntly that there would be no Social Democrat party because the Communists could not allow the "unity of the working class" to be destroyed. During Mr Chou En-lai's brief visit, Mr Kadar, while virtually admitting that there was a strong demand for a "general democracy" firmly denied that he would substitute this for a "socialist democracy."

In the same speech, Mr Kadar (who clearly feels he is sitting on a rumbling volcano) called for a "considerable strengthening of state and party discipline." The proceedings of the courts administering martial law have been made even more summary (or farcical) and their powers have been enlarged; they can now sentence to death anyone believed guilty of trying to cause a strike. A number of judges have resigned in protest. There has been a fresh wave of arrests; the new secret police (whose activities are described further on page 296) are coming into their own. Colonel Maleter, the popular leader of the revolt, has been sentenced to death after a secret trial. At least two other leaders of the rising have been hanged, and about 400 leading members of the revolutionary councils set up during the rising are believed to be under arrest. The Writers' Union and the Journalists' Association have been banned, and prominent writers and journalists are among those now being arrested and brought to trial. The terror now prevailing in Budapest is just as bad as it was at the height of the Rakosi regime.

Britain Stands By

WHETHER or when Britain can resume active partnership in the Baghdad Pact depends mainly on Iraq. The meeting in Ankara of the members, excluding Britain, demonstrated how strongly and how willingly they adhere to the pact, but it also drew the line more sharply between the non-Arab members and those countries of the Arab Middle East which oppose it. The Ankara meeting had no truck with ideas of neutrality; its eyes were firmly fixed on the dangers from Russia and its subversive activities. Nuri es-Said, the Iraq Prime Minister, did not yield any part of his policy in response to the nationalist pressures exerted against him ever since the invasion of Egypt, but it was too early for him to withdraw Iraq's objection to the presence of the British.

Pakistan and Iran appear to want Britain to resume membership quickly. Turkey agrees, but is less pressing. Nuri es-Said, although no doubt he desires to see Britain return, must approach the matter more circumspectly because he cannot afford to forgive Britain publicly so soon. The shock to Iraqi opinion by the Port Said landings may have subsided enough in the next few weeks for Britain's membership of the pact to be faced more calmly in Baghdad. Britain, for its part, is unlikely to press the matter as long as Nuri Pasha is embarrassed.

It might perhaps be asked whether Britain could not do as much for the pact from the outside as the inside. There is something to be said for undercutting Egyptian and Asian opposition by leaving the pact to its territorial members and giving support when called on to do so. This still appears to be the policy of the United States, even though the Eisenhower doctrine is designed to help the anti-communist powers in the region. But the pressure for actual membership, of the United States as well as Britain, has come from the members of the pact themselves, and as long as this is the case it is difficult to reconsider the wisdom or otherwise of British membership.

Confidence is An Ally

DESPITE the understandable plea of *The Times* that "rules for successful television appearances should be left to the mediocrities who have need of them," Mr Macmillan was wise to heed the reported advice of his party experts and not to crack any jokes in his television appearance last week. The television audience is used to Mr Thomas Trinder and other performers who try to amuse; they have a much less professional standard of comparison for those who try to inspire them. The Prime Minister's theme that "Britain has been great, is great, and will stay great" was deliberately poised to catch the present incoming tide of emotions. For the longer term, however, it could be of more doubtful political value. After having failed to convince the electorate in 1955 that "Tory prosperity does not work," Labour should always find it easier to persuade a jaundiced electorate that Tory promises of greatness are not being fulfilled, if only because greatness is a term less capable of instinctive definition. This may be especially true when the new Government's first step towards maintaining national greatness is apparently to be to make a sharp economy in Britain's military power.

The Tories would therefore be wise to keep the image of economic expansion as their propaganda dynamic. This is what Mr Thorneycroft appeared to be trying to do in two ebullient speeches last week. Despite the fact that his reference to the "fundamental economic strength" of Britain was immediately followed by a promise that "we are not oblivious to the need to increase it," Mr Thorneycroft has had a wigging from some stern realists for these speeches; and it is true that the comparisons of achievement he cited—"the United Kingdom's rate of increase in production from 1948 to 1956 has been as big as that of the United States" and "compared with 1938 our increase in productivity is the greatest in Europe"—relied on a rather crafty choice of

base dates. (Note, particularly, that in 1938 British, but not German, production was in a state of cyclical recession.)

But to face facts does not mean to revel in pessimism. The Chancellor would deserve censure if by shouting Dutch courage into the teeth of a storm he led foreign bankers to think how inflationary we might be going to be. But he did not in fact do this; at the beginning of this week sterling was sharply rising. Provided he is cautious in his policies, and never comes to regard these hortatory exercises in public relations as substitutes for them, Mr Thorneycroft can render one positive service in his speeches: to attempt to recapture that atmosphere of confidence about the real prospects for British expansion which, under Mr Butler's Chancellorship from 1952 to 1955, was one of the main allies of the British economy. He has made a very tolerable start, though it can be made good only by what he does, not what he says.

Bourgeois Rents

FOR the time being, the heaviest political pressure against the Rents Bill is pressure on behalf of the so-called "middle class" tenants: the 800,000 odd tenants, renting properties with a rateable value of over £40 a year in London and Scotland and over £30 in the rest of England and Wales, whose homes are the only ones that will be totally removed from control six months after the passing of the bill. To put the problem in its most brutal but honest perspective: many of these people have been getting a present of up to £100 a year from the rest of the community, and they are naturally going to suffer disturbance now that the gift is to cease.

MPs of all parties—possibly including sufficient Tories to threaten the balance of voting power on the bill—are therefore busily, but not always carefully, thinking up compromise amendments to limit that disturbance. The usual suggestion is that there should be a period of up to eighteen months of continued control, during which tenants could discuss future terms—or arrange long leases, to come into effect immediately—with their landlords. It is said that everybody will agree that there should be a sufficient period "to allow a smooth transition."

Why? It would seem to be in the best long-term interests of many of the people concerned if the change came, instead, with a bump. If houses were trickled out in small batches from the controlled to the uncontrolled list, then charges for them would inevitably gravitate towards the present high level of uncontrolled rents; if the tenant did not pay, he could be turned out. But, if, six months after the passing of the bill, these 800,000 houses and flats come suddenly on to the uncontrolled list, rents cannot possibly be moved right up to the present uncontrolled level; a lot of accommodation of the same general type would become suddenly empty if they were.

The proper way to implement the policy of gradually abolishing the Rents Acts would, indeed, be for the Minister to release fresh categories of accommodation, in largish batches, on to the uncontrolled list as soon as uncontrolled rents seemed to be getting too high. Probably there is no hope that the Government will handle the operation quite as scientifically as that. But it is to be hoped that Mr Brooke will stand firm—certainly against any amendments that would reduce the number of houses due for total decontrol (because that would mean much higher rents for those that still did come off the list) and preferably also against amendments which would merely prolong the agony under the guise of extending security of tenure. So much of the present apprehension is based on an appalling misunderstanding of the way in which a free market works.

The Bandoeng "Block"

WHETHER the 80-member UN Assembly can now assert itself for any real settlement in the Middle East depends largely on the 27 Asian and African members. Decisions require a two-thirds majority of votes cast; and the "Bandoeng" states have, therefore, a collective power of veto—with or without communist support.

Thus, if Egypt is backed by the full Asian-African group regardless of circumstances, no resolution distasteful to President Nasser can be carried. Under attack by Britain, France and Israel, Egypt could count on a combination of Arab, Moslem, anti-colonial and anti-western sentiments rallying the whole Bandoeng world behind it. But Bandoeng solidarity may not continue if Egypt itself obstructs a settlement.

The Bandoeng group is not "monolithic," like the Soviet block. In Assembly votes it splits as often as it unites, and the pattern of its splitting varies. An analysis of its attitudes during the present Assembly reveals two rival nuclei within it, of roughly equal voting strength, and a "floating" vote larger than either nucleus. The two nuclei are:

A. The Baghdad and Seato allies—Iran, Iraq, Pakistan, Philippines, Siam, Turkey—plus Ethiopia and Liberia. (8 votes.)

B. The group headed by Egypt and India, normally embracing Afghanistan, Indonesia, Saudi Arabia, Sudan, Syria and Yemen. (8 votes.)

The "floating" vote comprises Burma, Cambodia, Ceylon, Japan, Jordan, Laos, Lebanon, Libya, Morocco, Nepal, and Tunisia.

The table below shows how the total Bandoeng vote was divided between the two attitudes represented by the nuclei, A and B, on five issues: (1) postponing discussion of the Chinese seat, November 16th; (2) demanding Soviet withdrawal from Hungary, November 21st; (3) a similar demand and a condemnation of Russia's actions, December 12th; (4) resolution on Korea, January 8th; (5) resolution on French Togoland, January 14th. In each case group A voted for the resolution, group B opposing (o) or abstaining (a).

	With A	With B	Neither
China.....	10	10 (o)	6
Hungary 1 ..	13	13 (a)	–
,, 11 .	15	11 (a)	–
Korea	16	11 (a)	–
Togoland....	10	11 (o)	6

The 11 Arab states were no more agreed on these issues than were the Bandoeng members as a whole. On China, 3 Arab votes (Iraq, Lebanon, Morocco) went with group A, 4 with B, and 4 abstained. On Togoland, only Tunisia voted A; 8 Arabs, including Iraq, voted B; Lebanon and Morocco abstained. In the second Hungarian vote, Lebanon, Libya and Tunisia joined Iraq, which had been the only Arab A voter in the first vote.

The five "Colombo Powers" and their South Asian neighbours were likewise divided. Burma and Ceylon voted A with Pakistan on Hungary, went B with India and Indonesia on China and Korea, and abstained, following neither lead, on Togoland. Afghanistan broke away from India over Togoland, whereas Iran joined the B list. Nepal sided with India only over China; on Korea and Hungary it voted A. Cambodia cast 3 A votes and one B, Laos 4 As.

Since Japan's admission before Christmas it has twice sided with group A.

Egypt will probably continue to muster the full Bandoeng vote of 27, and perhaps 40 more votes, too, while it appears as the injured innocent. But a protracted obstruction of UN peacemaking efforts might leave Egypt with only its "hard core" of 8 group B votes, plus 3 or 4 other Arab and 9 or 10 communist votes. That would not suffice to block a resolution which had, say, 45 votes behind it.

The Last Posts

MR MACMILLAN'S third and final list of Government changes rounded off the most drastic reshuffle since the Churchill Government was formed just over five years ago. Apart from the whips, two jobs out of every three have changed hands. The most notable names in the third list were those of Sir Edward Boyle (as under-secretary to Lord Hailsham at the Ministry of Education) and Mr Julian Amery (as an under-secretary at the War Office). The spiking of two such potentially effective rebel guns is a sensible thing for Mr Macmillan to do, and the two young men themselves were sensible to accept the appointments. Sir Edward Boyle's return may seem, at first sight, indecently soon after his resignation; but the policy he opposed has been abandoned in practice, if not in Tory mythology, and the man who launched it has disappeared from the scene. Ironically, Mr Amery might legitimately have more qualms about joining his father-in-law's administration; however much Ministers may claim that history will justify the Suez adventure, their current policy takes its tone from the withdrawal which Mr Amery and his friends so hotly opposed. But not too much should be made of that.

Although the satisfaction of special interests should never be a main consideration, Mr Macmillan has also carefully ransacked all corners of his back benches to fill the junior posts. As with the higher posts, Old Etonian shares have slumped in the political market, and the "Non-U" element moved up. It is possible to think of another dozen or so backbenchers worthy of promotion, and to question the worth of one or two now named; but the elevation to bigger jobs of such young men as Mr Alport and Mr Ian Harvey, and the promotion from the back benches of such as Mr Simon, Mr Vaughan-Morgan and Mr Neave not only underpins the present Government but guarantees a future supply of departmental heads. For once there seems to have been less attention paid to mere party wheelhorses. Looking at the team on all levels, this is probably the most competent (though not the most characterful) Tory administration since the war, exceptionally strong on the economic side, a little more "business-like" than liberal in some of the lower reaches but not enough to be really worried about, and lacking experience only in overseas affairs.

M. Faure Meets the Sultan

FRANCE is still busy mending the North African ties that were broken in the autumn. Sunday's meeting in Cannes between M. Maurice Faure, the French deputy minister for foreign affairs, and the Sultan of Morocco was the first official contact between the two countries since five Algerian leaders were kidnapped in transit by air from Tunisia to Morocco. Both sides are trying to repair the damage; apparently they have managed to arrest the exodus of French officials from Morocco. Agreements on financial and administrative questions are to be concluded soon. At the same time, preparations are being made for M. Faure to visit Tunis, where talks with M. Bourguiba could pave the way for the resumption of diplomatic relations with Tunisia.

The kidnapping, however, was merely a tiresome symptom of the persistent Algerian disease. The Tunisian and Moroccan votes in the United Nations debate on Algeria will show the gap separating them from France. Efforts are being made in New York to devise a compromise which would enable France to accept a United Nations verdict without losing face. But in Algeria itself the situation is tense. French troops are massed to break the general strike through which the Algerian National Liberation Front wants to impress delegates to the United Nations while the debate is in progress. Is this not the moment to do what the kidnapping prevented, namely to use Moroccan and Tunisian good offices to find a compromise not merely in New York, but in Algeria itself?

Money or their Lives

WHEN it last debated a report from the director-general of UNRWA the General Assembly showed a distinct reluctance to find an extra penny for the Arab refugees. His latest report, to which reference is made on page 278, presents this year's Assembly with the problem in grimmer form: a steady decline in the standards of relief—already too low—or the provision of more money urgently.

If the Assembly wants to be brutal it can force a partial settlement of this intractable problem by refusing additional funds. This would force the Arab governments and the refugees to new efforts at self-support; but it would equally heighten the danger of disorders, of epidemics, and of financial crisis in the Arab countries. As costs are rising and the number of refugees increasing, this is the alternative to the provision of more money.

Since at present a third of the member states contribute, it ought to be possible for Uno to raise more money. But Russia, that benevolent friend of the Arabs, is apparently prepared to see the refugees die of starvation, for it pays nothing. If more money is found, Uno should see that the Arab governments cease their obstruction of UNRWA work and give much more active co-operation. It is, for example, absurd that some of the governments should tax the imports freely given by other nations to sustain the lives of destitute Arabs. If there is a fault in the report of Mr Labouisse it is that he does not present the

Assembly's responsibility in this matter in stronger language.

The mandate of UNRWA runs to 1960, but there is not the slightest chance of its task being finished by then. No major plans of resettlement have been possible because of the resistance of the refugees, their exploitation by political factions, and the opposition of the Arab governments. In these circumstances, the Assembly might well adopt Mr Labouisse's proposal that the refugees should be given the right of repatriation or compensation. If the Assembly reaffirmed strongly enough the perpetual existence of Israel, as it reasonably might, few of the refugees would then choose repatriation, for their demand is to return to an Arab Palestine, not to Israel. Almost certainly, the net effect would be the transfer of a small number to Israel and the request for compensation from a larger number. Mr Labouisse seems to exaggerate the effect of this in removing the Arab refugee problem, but it would certainly cut into it and help to disarm the propaganda against resettlement.

Indonesia in Flux

THE Sumatran crisis is destroying the present Indonesian political system, but a new system has not yet emerged. President Sukarno has announced that he will use his special powers to form an "advisory council" (not, he emphasises, a revolutionary council), which will be independent of parliament, but he has not yet defined its composition or powers. According to one report, it will contain one representative for every twelve members of parliament, so that all parties would be included. Such a body would be entirely dependent on the president, and its political divisions would prevent it from providing any effective constitutional check on him. President Sukarno has not indicated what prime minister he has in mind, and until he has defined his plans Dr Sastroamidjojo's administration will stagger on. The seven cabinet vacancies created by the resignation of three parties from the coalition have not been filled, because, it is said, the remaining government parties cannot decide how to share them. The prime minister will not have to face a vote of confidence until February 9th, and by then the whole constitution may have been altered.

In Sumatra the situation has shown little change, although the prime minister asserts that disloyal army units in the north have been disbanded and that the whole province is under control. This statement has been heard before; and even if it is true, it is of little importance, since the army revolt in the north was half-hearted from the beginning and the civilians there have never given any trouble. In central Sumatra the "Banteng council" led by Colonel Hussein is still in full control and Dr Sastroamidjojo has sent the central Sumatrans nearly £630,000, which indicates how anxious he is to placate them. But it is in the south that the situation is most serious. A revolutionary council has been formed of business men, former soldiers and tribal chieftains; it is demanding about £24 million for local construction work and has said that it could make Southern Sumatra "non-active in its relations with the government" if its demands are not complied with. This threat to cut adrift from Indonesia is open blackmail, and it is difficult to see how Dr Sastroamidjojo can deal with it; his successor may be in a stronger position.

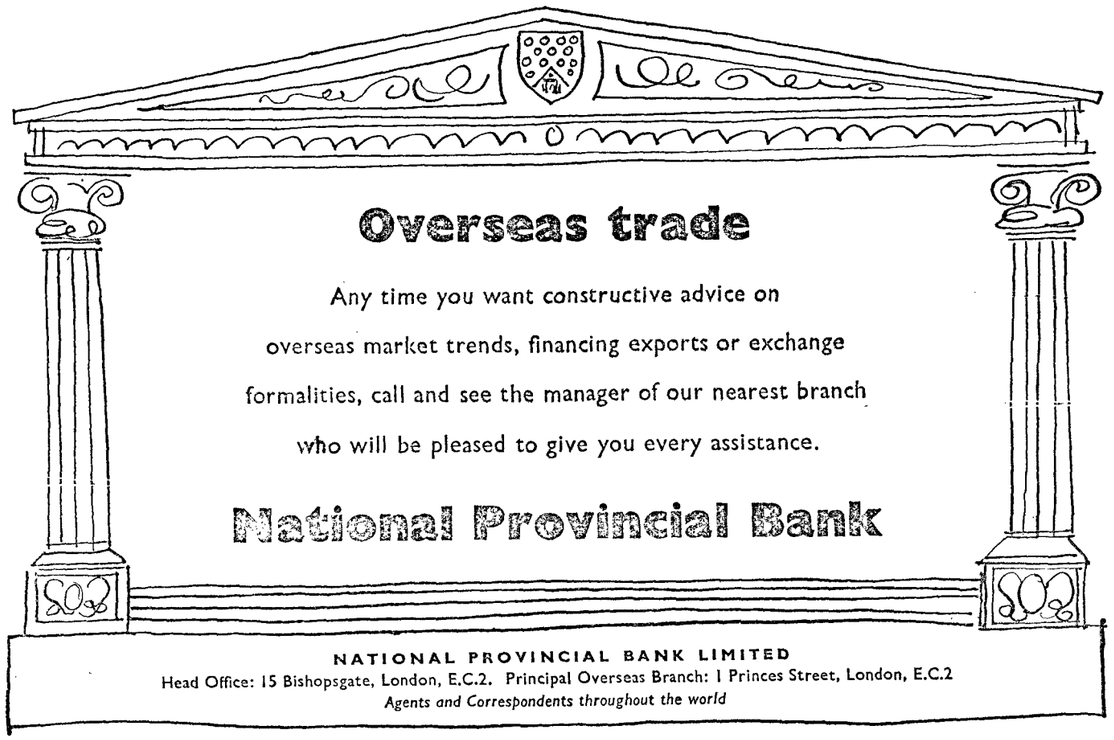
The Plateau Did Exist

DESPITE the increase in petrol tax on December 4th—and the strange things that some amateur statisticians said about it—there was virtually no increase in the cost of living index in the month to December 11th; the index therefore stood only 3½ per cent higher than it did in January and only 3 per cent higher than in the previous December. This compares very favourably with a rise of 7 per cent during 1955. Several trade unionists have said that this apparently favourable picture must be due to the inclusion of "too many luxury items" in the index. Mr Campbell, of the National Union of Railwaymen, has taken along to the Transport Commission sample budgets showing that his members spend much more than the statisticians' sample 35 per cent of their income on food. He deserves a friendly warning about what this would prove.

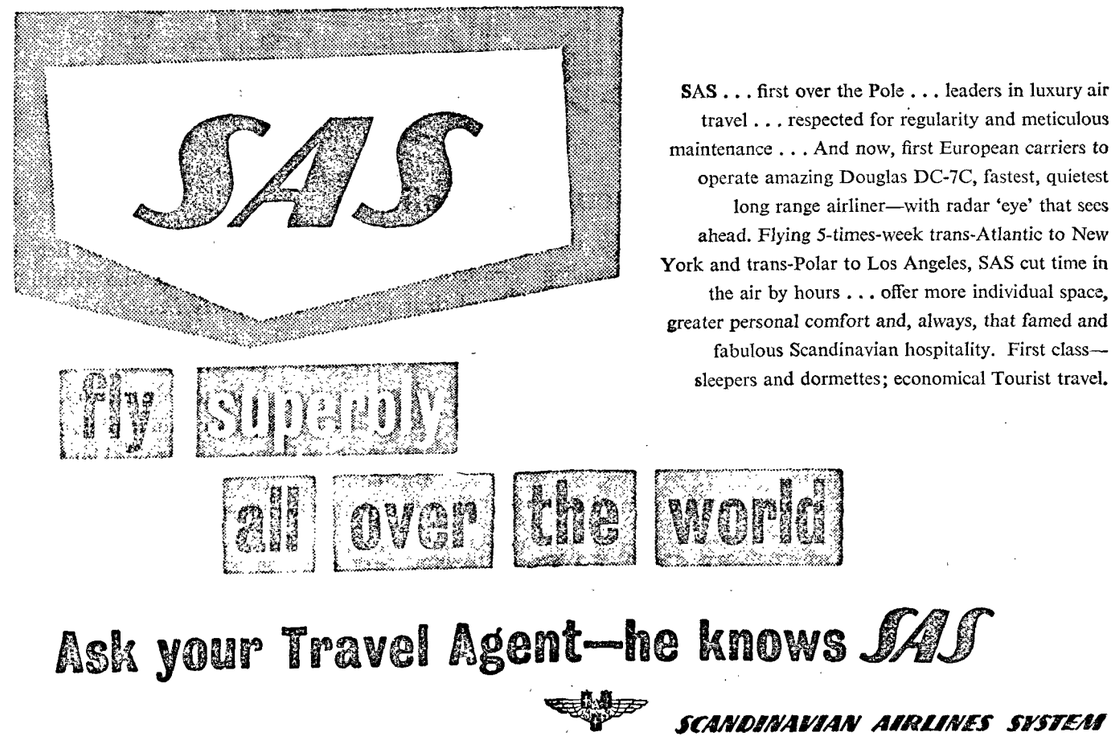
Although full details of the different items in the December index have not yet been published, enough information is available to show that the rises between January and December can be grouped in the following categories:

Between 6½ and 5 per cent. Transport and vehicles. Services (mainly hairdressing, laundering, shoe-repairing, dry cleaning, domestic help, cinema tickets, telephone charges). Fuel and light. Tobacco.

Between 5 and 4 per cent. Miscellaneous goods. Rent and rates.



Between 3 and 2 per cent. Drink. Food.



Between 1½ and 1 per cent. Household goods. Clothing.

It will be seen that food comes well down this list; dearer bread and some other increases raised food prices by 6 per cent between January and April, but since then—although not all wives may have acquainted their husbands with the fact—they have fallen by some 4 per cent. Price increases last year were not concentrated on the subsistence items; the cost of food, housing, fuel and clothing went up on the average by less than 3 per cent—that is by less than the index as a whole.

★

It would be rash to make forecasts about the immediate future. The cost of living usually does rise seasonally in the early months of the year. This year it may rise more than seasonally; increases already known to be in the pipeline—dearer milk, higher bus fares and higher costs of distribution—seem to be enough together to add about another point to the index. Even so, wage-rates, which rose 6 per cent in the first eleven months of last year, will still have something in hand. It may be significant that a recent poll of the British Institute of Public Opinion suggests that the cost of living is becoming of less importance in people's minds as a major problem facing the Government.

SAS . . . first over the Pole . . . leaders in luxury air travel . . . respected for regularity and meticulous maintenance . . . And now, first European carriers to operate amazing Douglas DC-7C, fastest, quietest long range airliner—with radar 'eye' that sees ahead. Flying 5-times-week trans-Atlantic to New York and trans-Polar to Los Angeles, SAS cut time in the air by hours . . . offer more individual space, greater personal comfort and, always, that famed and fabulous Scandinavian hospitality. First class—sleepers and dormettes; economical Tourist travel.

When Nets Profit

IN THE VILLAGES of Old Russia along the Volga, they flung a fishing-net over the bride on her wedding day to protect her from sorcerers. For similar protection the bridegroom and his companions were often girt with pieces of net. Before the wicked wizard could do any harm he had to untie all the knots in the net. A knotty problem. But problems of protection have always had a way of extending the human imagination.

Modern businessmen are keenly concerned with protection. Industry today is girt with a vast network of safeguards. But manufacturers who wish to guard their products all the way from factory to shop avoid the bizarre. For the best protection—reliable packaging—they place their trust in stout "Fiberite" cases, and crisp, attractive cartons made from "Thames Board". These economic packaging materials are made by Thames Board Mills Limited, in whose modern factories efficiency blends with skill in a fine productive effort.

THAMES BOARD MILLS LIMITED

THE LARGEST MANUFACTURERS OF BOARD AND PACKING CASES IN BRITAIN

Purfleet, Essex *Warrington, Lancs*

Zik Goes Home

DR AZIKIWE, premier of the Eastern Region of Nigeria, has lost no time in acting upon the advice of his critics and wellwishers. Following upon the appearance of the report of the tribunal of inquiry into the Anglo-Continental Bank, he has very properly resigned with his government, less properly issued a fighting repudiation of the tribunal's findings, and defiantly called elections. The successes of his party in the Lagos municipal elections last weekend suggest that he is likely at least to maintain his majority. Before resigning, Dr Azikiwe arranged to have the bank, which to the profit of the shareholders had already passed under the aegis of the government-controlled finance corporation, fully and finally nationalised by the regional government—of which he is, and is likely to remain, by a head and shoulders, the outstanding figure. With all the taxpayers' money behind the bank, instead of only the cocoa farmers', it should be able to present an insouciant face to the world, and forget the days of desperate touting for deposits when reserves ran low and of attempted tie-ups with British imperialist banking institutions.

The results are, first, that Dr Azikiwe looks like coming out of all this even stronger; and, secondly, that it is questionable whether he will arrive in London for the constitutional conference in a particularly amiable mood. But the Colonial Office presumably feels that his goodwill is well lost, so long as principle has been upheld and precedents for ministerial behaviour laid down on paper.

Cows and an Obvious Course

THE annual general meeting of the National Farmers' Union took place this week, in an atmosphere of greatly increased optimism created by the Government's new system of long-term price guarantees. But any hope that farmers might temporarily forget their economic worries was quickly dispelled: delegates lost no time in registering fresh complaints. Two complaints from small farmers were the most interesting. To one of them Mr Heathcoat-Amory should turn a deliberately deaf ear; to the other he should not.

First—and most foolishly—the union decided, by a small majority, to press this year for a price structure which would favour milk at the expense of other commodities. The profits of dairy producers are falling because of a lack of demand; the suggested policy would inevitably increase the size of the milk surplus and the losses on its disposal, which mainly fall on producers themselves in a collective capacity. For farmers deliberately to try to concentrate upon their least profitable branch of production is a most curious act—which can only be explained in terms of the vulnerability of the union leadership to the plaints of small dairy farmers (particularly Welsh ones).

Secondly, there were many complaints that the government's proposed improvement grants will not adequately aid the small farmer, because he will find it difficult to raise the stipulated two-thirds of the capital cost himself. Unfortunately, it is all too true that these grants will mainly benefit the larger and more efficient farmers, who simply do not need them. It is by a change here that Mr Heathcoat-Amory should help the small farmer, not by offering him more money to produce more milk which the market does not want.

A German Party Fusion

NOT a year ago, on February 26, 1956, sixteen of the 48 Free Democrats in the Bundestag formed their own Free People's Party in order to remain in Dr Adenauer's coalition and there represent the right-wing liberal cause. Their main assets were some financial backing here and there in industry, and two competent ministers, the deputy chancellor, Herr Blücher, and the Minister of Housing, Herr Preusker. But they had no distinguishing ideas and little support in the country. Their poor showing in the communal elections warned them clearly enough that the party is generally considered to be superfluous.

Faced with the now stiff-looking 5 per cent hurdle of the electoral law, the Free People's Party has decided to throw in its lot with the right-wing German Party, which also anticipates the need for a bit of a leg-up in September if it is to get back into the Bundestag in any sort of useful shape. The deal is scarcely impressive. The Free People's Party, which comes more and more to look like a handful of deputies only, gives up its name entirely to the German Party, except in the south and the south-west. A common programme has yet to be formulated. In the meantime the two parties claim to be united in one negative principle, "bitter resistance to collectivising tendencies."

Herr Blücher is not happy at the merger; he took no part in the negotiations and seems to be thinking seriously of going over to the Christian Democrats. Unkind Germans are calling the new partnership "the naked and the dead." To the Christian Democrats, anxious for allies in the next Bundestag, it is, however, a convenience. If a party fails to get five per cent of the votes cast in September it can yet secure seats in proportion to its strength if it can win three constituencies outright. The Christian Democratic Union will find it well worth while to refrain from opposing the new partnership in three constituencies in return for their support later; it would hardly have been willing to give the two partners separately three seats each.

Benelux Out of Step

IN the European business cycle, Belgium and Holland both seem out of step. While Germany and Britain are both thinking of easier credit, the Dutch and Belgian governments are introducing new measures against inflation. In Holland the slower growth of exports as a result of deflationary policies abroad, and the continuing growth of consumption at home, combined last year to produce gathering payments difficulties. In Belgium rising prices,

the result of boom abroad and rising import costs, have aroused alarm. Such delayed reflections of the international conjuncture are not uncommon in these two trading nations.

But they are also out of step with their neighbours in another sense. While Britain and Germany have clung fairly resolutely to credit restrictions as their main deflationary weapon, new taxes, and agreed restriction of prices and wages, backed by the threat of physical controls, promise to play the leading part in Benelux. In Holland this is no more than a continuation of a long postwar tradition, a disappointment for those who had been hoping for greater flexibility. But in Belgium the sweeping powers to control wages and prices which the government is asking are a sharp departure from a tradition of orthodoxy ; and they have met bitter political opposition.

Belgium's problem—of meeting an "imported" inflation—is a difficult one, as Germany has also found. A rise in interest rates often cannot stop a rise in prices which derives from booming exports or an increase in prices abroad. But orthodox critics hold that the past strength of the Belgian franc resulted, not from success in holding prices down, but from the fact that prices, wages and profits have been allowed to take their natural course. Belgium, land of economic freedom, has combined one of the highest price levels in Europe with one of the hardest currencies ; Holland, the planned economy, is suffering from a payments crisis despite its low prices and wages.

Finland Waits for a Leader

THE Prime Minister of Finland, Mr Fagerholm, recently remarked in a newspaper article that the leaders of his party, the Social Democrats, "have been proceeding in an atmosphere so confused that it might be said that the party is no longer being led. . . . The disagreements could be considered comic if the position were not so serious." This, although a remarkable statement for a prime minister to make, revealed nothing that the Finns did not know already, and can have no political repercussions since there is no real alternative to the present Social Democrat-Agrarian coalition. The lack of leadership, which is unlikely to be overcome until the Social Democrat Congress at Easter, would matter less if Finland did not need a government strong enough to push through unpalatable economic reforms.

Hitherto every cure suggested for the inflation which is dogging the country has been blocked, either by pressure groups whose interests would be damaged, or by experts who have different ideas of what is required. An economic council which was asked to produce a plan for stabilising the economy recommended, after months of work, a wage settlement and economic truce, combined with devaluation of the Finnish mark and the application of "rational economic principles" to the incomes of the heavily subsidised smallholders. But this was "very poorly received" by the Agrarians, and the governor of the Bank of Finland refuses to consider devaluation, so the plan was dropped. The trades union council (S. K) have refused to abandon their right to an increase in wages corresponding to the rise in the cost of living, which the employers refuse to pay, while the Bank of Finland and the commercial banks blame each other for the steady fall in savings. Not even a strong government could settle these disputes without becoming unpopular with some sections of the community, and the various factions among the Social Democrats do not intend to risk making enemies until they have settled the contest for leadership. Fortunately for them the electorate seems quite content to wait.

Arab Refugees

THE United Nations General Assembly is expected to debate the report of the Director-General of the Relief and Works Agency for Palestine Refugees next week. That report sets out clearly the fact that at present levels the subscriptions of member states are not enough to sustain existing—already low—standards of relief.

The report covers the twelve months ended June 30th last year and therefore does not include the period of the Suez crisis. A supplementary report, particularly concerning the Gaza refugees, shows, however, that the financial position was made worse by the Israeli invasion. Even so, the agency's position was already grave by last June. There was a deficit on both the relief and rehabilitation accounts, which was met by drawing on available working capital, which consequently fell from $20 million to $14 million. "At current rates of expenditure," says the report, "the available capital would last the agency less than six months."

Contributions should be seen as commodities such as food and clothing and other materials. Reluctance to increase the contributions means a reduction in actual aid because prices are rising. Moreover, the number of refugees on relief increases, because births outpace deaths and resettlement.

The problem is therefore simply to maintain the existing standards, although the Advisory Committee on refugees has supported the director-general's proposal for higher relief scales. (An extra 100 calories a refugee a day would cost about a million dollars a year.) Other, genuine, claimants for relief are not now provided for at all, and when the director-general asked for funds for them in 1955 he was referred to voluntary agencies which, as was expected, proved inadequate. Plans to provide tenting for 53,500 bedouin in Jordan could not be implemented, and now the tents of these people "are in rags." Other examples of failure for lack of funds are dotted about the report.

The problem is immense. There are now 922,279 registered refugees (as compared with 905,986 the previous year) and every plan costs a lot of money. For example, about $3.5 million would be required to house 56,000 families. But it is wrong to believe that the United Nations provides the funds ; in fact, two countries provide 94 per cent, 21 provide 6 per cent and the other members of Uno provide nothing at all. The world's resources have therefore not been mobilised.

Yet the responsibility lies with the General Assembly, which, as the director-general rightly points out, must provide adequate funds or decide what sort of relief must be eliminated. In theory, at least, the Assembly could throw health or education into the lap of the host governments and so cut costs.

His report also draws attention to other matters which should be dealt with by the Assembly. One of them is the failure of host governments to co-operate. The most notable is the refusal of the Jordan Government to co-operate on registration (*The Economist*, January 12th, page 128), but there are other cases, such as the imprisonment of two international officers by the Syrian Government and its restrictions on the movements of the agency officials. It seems clear from the report that there has been a deterioration in the relations between the Arab governments and the agency. It should have firmer backing from the Assembly.

UNRWA gets no credit as a life-saving force. On the contrary, Arab governments and refugees tend to load it with the disfavour that the Assembly acquired by its part in the creation of Israel. There is a belief that relief is a right not requiring gratitude, a suspicion that UNRWA is really a political instrument intended to disperse the Palestinian Arabs beyond any chance of return to their homeland. All this is perhaps understandable among the refugees, despairing and dejected as they are, but it is unforgivable on the part of governments.

Viewing By Halves

A NEAT statistic has been pulled out of the bag—half the population of the United Kingdom now have television sets in their homes. The Audience Research Department of the BBC estimates that at the end of last year nearly 19 million adults could receive BBC television ; of these, 7¾ million could also receive ITA programmes. Since sets are believed to be in use for about 40 per cent of programme time, this means that, when television is on in an evening, one out of every five adults is likely to be watching it: this is well over double what the audience was three years ago. Moreover, from being at the outset predominantly made up (*pace* the intellectuals' popular myth) of the wealthier classes, the audience must now come close to being a cross-section of the population. The tastes of this cross-section ? According to the BBC's own finding, out of every hundred viewers whose sets can receive both programmes it would be usual to find 38 looking at the BBC and 62 at the ITA.

Progress with the Parks

SINCE its creation seven years ago the National Parks Commission has proved itself an active and vigilant body. There are now nine (and may shortly be ten) national parks in England and Wales covering altogether 4,700 square miles—one twelfth of the country. Probably there are enough national parks, and possibly too many. The commission is now turning to the protection of other stretches of beautiful country where development might be controlled without setting up such elaborate machinery. Both in these areas and in the national parks the commission's task is often to back up local planning authorities in their resistance to such big public bodies as the Forestry Commission and the electricty boards. Much has been done to reduce the number of aerial masts by sharing, but the commission is up against cost problems in its aesthetically laudable desire to get power lines carried under rather than over the ground. The choice is often between disfiguring natural beauty and making the consumer of other things than country walks pay a very high price to preserve it by burying cables.

There has been little money to spend on national parks in recent years. In so far as this has delayed the removal of ugly shacks and hoardings, and the provision of better facilities for walkers and campers, this is a misfortune. But it would be a great mistake to have the parks, and particularly the remoter ones, too fussily planned and controlled, with rustic notices and signposts everywhere, paid wardens and the rest. Opening up the parks with new roads would destroy their distinctive beauty still more: much of their charm is dependent upon a moderate degree of inaccessibility. It is perhaps as well that there is little money for such "improvements"; far more worthwhile is the expenditure outside the parks in creating new rights of way (which now make it possible to circumambulate Devon and Cornwall) and the disciplining of outdoor advertising.

De Minimis

A LEGAL case of peculiarly esoteric charm has just been settled in the Commercial Court, Queen's Bench Division: that between the Peter Cassidy Seed Co. Ltd., and—the wildest fantasy of a Beachcomber or a Timothy Shy could devise nothing better—a Finnish firm of ant-egg exporters, Osuustukkukaupa I.L. The latter had contracted in 1953 to supply a quantity of ant eggs as soon as their export licence had been obtained ; had failed to obtain it, and so to fulfil their contract ; and had thereby, in the view of the arbitrators to whom both parties had agreed to submit disputes, rendered themselves liable for damages. This decision has now been legally confirmed.

The case is illuminating in more ways than one. It is, for one thing, a striking reminder of what planned economies can let themselves in for. Veterans of the Ministry of Food still cherish painful memories of that long, gruelling campaign which, leading the panzers of control deeper and deeper into the tangled by-ways of minor commerce, triumphed over the successive threats to the British balance of payments offered by imports of sweetened fats, icing mixtures and—ultimate manifestation of sweet-toothed resourcefulness—piping jelly. No doubt a wildly uninhibited trade in ant eggs would be equally menacing to the delicately poised economy of Finland ; in the friendliest and most sympathetic way one may suggest that it is better to avoid a poise as delicate as all that. Further, the unfortunate Osuustukkukaupa I.L. was stymied, in its attempt to get a licence, by the opposition of that majestic body the Finnish Ant Egg Exporters' Association—whose advice is legally binding on the State Board of Licences and which invariably vetoes licence applications from non-members. To establish this kind of alliance between "self-governing" business groups and official planning organs is the dearest wish of the restrictive-minded everywhere ; but its results are generally more discreetly wrapped up. It is salutary to have them demonstrated at so little cost (with all due sympathy for the frustrated aquarists and their ant-egg-starved charges) to the public weal. Finally, it is noteworthy that the law comes out of the affair rather well. It took the trade's arbitration system—one of those tortuous *ad hoc* affairs, specially designed by businessmen to short-circuit the law's delays—three expensive years to reach a provisional decision. It took Mr Justice Devlin an hour and threequarters.

Letters to the Editor

The Way to Cut Defence

SIR—In your issue of January 5th you said that the burden of armaments "falls particularly heavily on the engineering and electronics industries and on research resources, with correspondingly adverse effects on exports and industrial re-equipment."

But it may be argued that so far from being a burden the armaments programme is the only stimulus which maintains a substantial volume of research and a high level of technical skill in the electronics and engineering industries of Britain. Who stimulated (and paid for) the development of radar? Of UHF radio communication? Of electronic computers? Of jet and turbo-jet aircraft engines? Of nuclear reactors? (Is not the manufacture of plutonium even now one of the functions of Calder Hall?) Of the techniques of automatic-control (servo) systems? There is a risk that British industry may by now be so accustomed to relying on the risk-free development contract from the Ministry that it would be reluctant to undertake novel work at its own risk—the more so if the withdrawal of the Ministry contracts occurred at a time of financial uncertainty.—Yours faithfully, D. A. BELL

Birmingham.

Constitution and Choice

SIR—You are well aware that the power to reject the Sovereign's choice rested on something which has long ago disappeared: the readiness of the candidate's own party to risk a split if need be and precipitate a General Election. But it did not take the disappearance of this safeguard to make your distinguished predecessor question the procedure. In his "English Constitution," published in 1867, Bagehot wrote:

> Let us suppose the House of Commons—existing alone and by itself—to appoint the Premier quite simply, just as the shareholders of a railway choose a director. At each vacancy, whether caused by death or resignation, let any member or members have the right of nominating a successor; after a proper interval, such as the time now commonly occupied by a ministerial crisis, ten days or a fortnight, let the members present vote for the candidate they prefer; then let the Speaker count the votes and the candidate with the greatest number of votes be Premier.

Bagehot wrote before the days of the party leadership election meeting or he would have substituted this for the House of Commons. At any rate he acknowledged that "this mode of election would throw the whole choice into the hands of the party organisation, just as our present does except in so far as the Crown interferes with it." Against the "lobbying" you quote as an objection, Bagehot points to the influences behind the Crown's choice and says: "Very many will intrigue when Parliament is perplexed, when parties are divided, when alternatives are many, when many evil things are possible, when cabinet government must be difficult."

His conclusion may be found in his own words:

> The judgment of the Sovereign will often be worse than the judgment of the party and he will be very subject to the chronic danger of preferring a respectable commonplace man, such as Addington, to an independent first-rate man, such as Pitt.

There is the final point that whatever its imperfections, the electoral system in Bagehot's day managed more often than not to produce a Parliament which reflected the different moods of the country. Today not only is no independent voice heard but a party without an overall majority of votes may nevertheless secure a majority of seats. If we run the risk of being governed by a minority, should we not at least ensure that it is by a majority of that minority rather than by a minority of a minority?—Yours faithfully,

Huby, near Leeds S. E. GRAHAM

The Successor

SIR—You attempt, understandably but I think unworthily, to explain away the fact that for once one of your most confident predictions has proved wrong, namely that Mr Butler was the certain, in fact the only possible, successor to Sir Anthony Eden.

There is today a large body of opinion which believes in the sanctity of agreements and of treaties, in honest diplomacy, and which feels also that we have been shamefully treated by our American allies (so called). Now the people who hold these opinions are not just a recalcitrant minority on the right wing of the Conservative party; they are not all Conservatives, but they constitute, in my opinion, more than half the nation. They have no wish to apologise for the Suez expedition.

The fact that it was mismanaged and not pushed to its pre-ordained conclusion has left this body of opinion feeling bitter and frustrated. It is wounded, and has therefore just as much right to be included under your all-embracing "bandage" as the numerically much weaker body of opinion represented by the *Observer*, the *Manchester Guardian*, and you, Sir. Would it not be more in keeping with your traditions to admit that Mr Macmillan's appointment has proved that on occasions even the best newspapers can be wrong?—Yours faithfully, TEMPLEMORE

Arthurstown, Co. Wexford.

Kenya Line-up

SIR—As a late colleague and close friend of all the European elected members, I suggest that your article of January 12th is very wide of the mark.

There never has been during my 35 years' experience of our Legislative Council, nor is there now, any European "line-up" against the African. The basic issue always has been and is the Indian question. The Indian problem was the underlying issue in the recent general election, exacerbated by Pandit Nehru's late posturing. If it had not been for positive election assurances that they would resist any further encroachment on the Executive by Indians, as distinct from Muslims, one additional European Minister would certainly have been defeated and the other would have had a much more difficult passage.—Yours faithfully,

EWART S. GROGAN

Nairobi

Squaring the Philosophic Circle

SIR—Your reviewer of my book affirms that the Age of Reason has gone. It seems that the Age of Authority has come in with a vengeance. In his preamble to the review he tells us what we have to think about a number of difficult questions in a tone implying short shrift for deviationists.

In fairness to myself, in the face of your many readers who are unlikely to see my book, I ask leave to point out that he has made an elementary howler in relation to the one argument of mine that he deigns to discuss. He thinks that he can draw an analogy between successive experiences that vindicate a hypothesis and my argument relating to experience on a continuity. My very lengthy discussion of the many complex and subtle matters relevant to the vindication of hypotheses should have made this analogy seem to him entirely out of place. But let us waive that. He writes that, by this analogy, if a man made predictions on the basis of a general hypothesis, and if the hypothesis was verified on each of 99 successive occasions before it was falsified, the probability of any one of these predictions being correct would be 99/100. In fact by this analogy only *the last* of the predictions would have that probability of being correct. And that, on the face of it, is not so very "absurd."—Yours faithfully, ROY HARROD

Christ Church, Oxford

Amalgam of Accountants

SIR—Sir David Eccles has inherited an opportunity and a duty: he should secure the withdrawal of the proposed merger of chartered and incorporated accountants. The Board of Trade is being ignored by the Institute of Chartered Accountants in England and Wales. The slight stems from paragraph 19 of the institute's memorandum to its members, which says in effect: if the merger fails and the Society of Incorporated Accountants accepts approved accountancy service in industry, integration would probably be removed "for all time" and the Society and the Association of Certified and Corporate Accountants (which already accepts such service) would be acting "against the long-term interests both of the profession and of the public."

But it is the Board of Trade (not the institute) which has the duty under section 161 of the Companies Act, 1948, to pronounce on matters of public moment and it has done so and recognised the association equally with the institute and the society.

And why this provocation of the association? Only two years ago the institute, the society and the Board of Trade gave their blessing to a scheme whereby about 1,000 persons in non-statutory accountancy bodies were to become members of the association and therefore become eligible to audit the accounts of public companies. This scheme was later defeated by members of the association. The background to the scheme was to pave the way for amending legislation to extend statutory qualifications to exempt private companies. Yet the institute, which approved these persons gaining statutory authority through membership of the association, now says unmistakably that the association's qualification is against the interests of the public.—Yours faithfully, COLIN PERRY

Sutton, Surrey

★

SIR—A factor playing an important part in the deliberations of the "Chartered" and "Incorporated" Accountants is the question of "articles." It seems to be taken for granted that this is the most efficient method of training accountants. How can it be? Just because a person is an efficient and capable accountant, it does not make him, automatically, a good teacher of the accountants' craft. Whilst many accountants do have "training schemes" for their articled clerks and the student societies of the institute and the society are excellent there are still many cases of the articled clerk being "an unpaid human adding-up machine."

The rule that all accountants should be allowed to take articled clerks should be revised, and greater publicity should be given to the excellent scheme devised by the three main accountancy bodies whereby would-be accountants may take a three-year University course leading to B.Sc (Econ) during the course of their articles.—Yours faithfully, JOHN PAXTON

Books & Publications

Cities in the Motor Age

THE METROPOLITAN TRANSPORTATION PROBLEM.
By Wilfred Owen.
USA: *The Brookings Institution.* London: *Faber.* 311 pages. 32s. 6d. $4.50.

IN the United States, as in Britain, advocates of improved motor roads between cities are today encountering the argument that these roads will deliver so much more motor traffic into the cities as to choke traffic circulation within them, accelerating "the decay of downtown." The difference is that in the United States the motorways have come before the argument (and keep on coming): in Britain the argument has come before even the first of the motorways.

In many American cities, the complaint is true enough: the turnpikes and the urban expressways feeding in from them have created more congestion, not less. No major American city except Los Angeles is really adapted to the automobile age (and even the freeways of Los Angeles put a good deal of strain on the car commuter, while it is arguable that the meaning of the word "city" has to be stretched to include that vast encampment of motorised humanity.) Most other American cities have problems of public and private transport broadly similar in kind to those of European cities though more acute in degree: more of their travel in and out is done by car; but their roads, in the centre and on the fringes, are wider, and more off-street parking inside the city usually exists, so that the emphasis of the problem is sometimes comparable. No American city, except metropolitan New York, has nearly as small a percentage entering it by car as most European cities (and even in New York the figure is about 17 per cent, against 1-2 per cent in London): but in the United States a low percentage usually means that congestion has driven many people to leave their cars at home, while in Europe far fewer of the suburban population possess cars to give them the choice.

Another difference is that in the United States no proposals for restrictive solutions of this problem have a chance: they would be foreign to the American temper. Traffic engineers may advise the banning of cars or trucks from the centre of their cities; but in the very few cases where any measures to cut down motor circulation at the centre have in fact been put into practice, they have been complemented with off-street parking close to the centres, or with freight terminal areas fairly well in from which the goods can be delivered in fewer trucks. In most urbanised areas in America, as this well-documented study from the Brookings Institution emphasises,

> Neither economic analysis nor transportation history suggests a return to public transportation on a scale that would be decisive. . . . Planning of the urban area must recognise that car ownership has become a necessary adjunct to home ownership.

The United States is thus too far committed to the automobile age to spare thought upon freezing or recreating pre-motorised patterns of urban transport. The process is less advanced in Britain, and it is reasonable to talk about avoiding other people's mistakes: nevertheless, people who have to reckon with transport in British and European cities would do well to accept the same basic assumptions. Public transport systems on this side of the Atlantic are less moribund; but they are already facing the same problem of slackening total demand with maintained or increasing demand at peak hours that has hamstrung so many American transit services.

The trend from public to personal transport seems certain to continue if living standards rise in Britain—and London Transport, for example, recognises this. Development of public transport must be knit into the provision of improved motor circulation within cities—for example, the operation of high speed buses along lanes in urban expressways reserved exclusively to them at peak hours, and the co-ordination, in pricing and time tables, of fringe parking outside the city centre, fast tube services, and disincentive charges for kerb parking in the heart of cities.

Mr Owen is concerned more to expose the problem than to solve it by any neat formula. But he does conclude that the redesign of major surface streets, within the constant process of renewal of every city, must aim either to move traffic or to give access to urban property: the attempt to do both has failed. He holds that in the United States—as certainly in Britain—too large a proportion of highway expenditure goes on rural road improvement, too little on the city road systems, which carry the heaviest traffic (and because of land values are inherently more expensive to improve). Mr Owen also believes that more scientific pricing of transport (and parking) services is required to maximise revenues; and that the pooling of transport revenues—probably under combined transport authorities—may be the most promising way to improve city transport as a whole. Provision of better

transport facilities, he adds, can moreover only improve matters if all chances of staggering working and shopping hours are seized, and if geographical and population limits are imposed on the metropolitan sprawl—which means congestion of living and working, as well as travelling.

Mad Madge of Newcastle

MARGARET THE FIRST: *A Biography of Margaret Cavendish, Duchess of Newcastle,* 1623-1673.
By Douglas Grant.
Rupert Hart-Davis. 253 pages. 25s.

THE susceptible Pepys did not "like her at all." He thought "Mad Madge of Newcastle's" deportment "ordinary," and her "antick dress" and patches unattractive. He saw her, not as Lely painted her, but as a contemporary Gilray might have drawn her. And Mrs Evelyn and Dorothy Osborne disliked her curls, gestures and "airy rambling conversation." Yet the widowed Earl of Newcastle (Charles II made him a duke later), recently defeated at Marston Moor, fell in love with her at Henrietta Maria's exiled court; and despite a gap of thirty years in their ages, their love, attested by letters and poems as well as by her biography of him, endured.

Married in 1645, they lived precariously abroad till the Restoration; she sold her trinkets for food; creditors besieged them; he had to remain in Antwerp as a surety while she was in London in 1651 beseeching the Commonwealth Commissioners to release forfeited funds to pay his debts—a hopeless mission for the wife of "a notorious royalist"; but she relieved her prolonged frustration by writing "Poems and Fancies" published in 1653. Twenty other books followed, published at Newcastle's expense—philosophic and scientific speculations (including a theory of the atom) plays, orations (undelivered) and "space-fiction." She despised grammar, and her spelling is bewildering even by seventeenth century standards. Her renown was inflated by the readiness of college libraries (particularly in practical Cambridge) to accept her works in the hope of ducal benefactions. Trinity proclaimed her "Minerva and Athens."

The threads of autobiography in her writings are skilfully woven by Mr Grant into a story in which she lives; though both her "speculations" and his comments might well be pruned. Her prophetic enthusiasm for the scientific arguments which heralded the eighteenth century enlightenment and industrial revolution, her cheerful courage in civil war and exile, and her devotion to her husband more than counterbalance her ostentatious eccentricities. Unique among the few women writers of her day, she wished to be called "Margaret the First." Despite her versatility she was hardly "Minerva"; but perhaps one can think of her, not unkindly, as a seventeenth-century mixture of Marie Corelli and C. S. Lewis.

Supplying the Middle East

FOOD AND INFLATION IN THE MIDDLE EAST, 1940-1945.
By E. M. H. Lloyd.
Stanford University Press. London: *Oxford University Press.* 389 pages. 48s.

THE author of this important work, a publication sponsored by the Food Research Institute of Stanford University as one of a group of studies on food and agriculture in the last war, has had a long and distinguished career as a governmental expert on problems of food and agriculture. In 1943-44 he served as Economic Adviser to the Minister of State in the Middle East. This book is written, with the aid of official papers, in the light of that experience.

His theme covers a period in which British influence in the Middle East was at its zenith. British troops were stationed throughout the area. The Axis control of the Mediterranean had cut the Middle East off from many of its traditional markets and outside sources of supply. British military expenditure was pumping money into the area on an unprecedented scale, at a time when the demands of the war made any but the most essential imports and exports impossible for lack of shipping space. At the same time, Britain's power was dangerously extended, and Rommel was loose in Cyrenaica. Uncontrolled inflation and famine meant riots and civil strife throughout the Middle East at a time when tranquillity was essential.

The theoretical means of fighting inflation—increased taxation, forced loans, savings campaigns and the sale of gold—all require, except for the last of these, a degree of governmental control and competence which was not present in many of the countries concerned. Gold sales were used on a small scale, but the need to conserve Britain's gold and dollar balances made this only of limited value. Control of inflation depended on the control of food prices. This could be maintained only if the operation of a private market were prevented, and this meant the collection and distribution by government agencies of the food supplies produced in the area.

The importance of this was reinforced by the threat of famine in the Middle East after the exceptionally bad harvests of 1941, a threat that necessitated the diversion of over 600,000 tons of shipping to carrying cereals into the areas at the height of the Battle of the Atlantic. It became clear that local production would have to be expanded to avoid the recurrence of such a necessity, and that the control of imports and reserve stocks of cereals would have to be centralised. Only by the Middle East acting as a unit could its needs be met from its own resources. This became the task of the Middle East Supply Centre.

Inevitably, in the light of the present problems of the Middle East with the continuous pressure of population on resources, it is the work of the Middle East Supply Centre that is of the most interest today. Mr Lloyd provides a good deal of evidence on the economic aspects of the centre's work. But he has not set out to write a history of the centre, only to discuss the economic problems it faced. He makes it clear that the centre succeeded in avoiding any major disturbance to the customary patterns of food consumption; that its influence was important in avoiding a worse inflation than in fact occurred; and that the degree to which it was successful was governed ultimately by the amount of co-operation shown by the local governments. What he does not throw much light on, however, is the political basis on which the centre's success was founded, and the control of imports, including the vital imports of fertilisers, through the control of shipping. Plans to revive the Middle Eastern Supply Centre need to recognise the unique, the unrepeatable conditions for the centre's success.

Sex-War Correspondent

WOMAN, THE DOMINANT SEX.
By Hendrik de Leeuw.
Arco. 192 pages. 16s.

HOW bad can a book be? A real book, that is; not a horror-comic, a paperback garnished with screaming blondes, or the printed equivalent of a feelthy picture, but a book decently printed, bound in stiff covers, substantially priced, and sent to reputable periodicals for review? It is this question, rather than that of subject-matter, attitude and treatment, which is primarily posed by "Woman, the Dominant Sex"—subtitled "From Bloomers to Bikinis." Mr de Leeuw (described as a sociologist) has a theme of genuine interest and importance; the changing relation between the sexes, with special, though not exclusive, reference to America. It is a theme that can be, and has been, treated from many different angles—those, for instance, of Miss Margaret Mead, Mr Philip Wylie, Dr Kinsey, Mr James Thurber, and the anonymous composers of limericks; and in any of these classes an example may be, as the cowboy said of the pancake, good of its kind. What passes comprehension is the motive—other than that of cashing in on the word "sex" in the title—of Mr de Leeuw's publishers in producing this frenzied sputter of bad temper, ill-digested reading, irrelevance and illiteracy. Samples: "These wenches and cloth horses, who undulate and ambulate their well-proportioned torsos especially for the delectation of fusty sugar-daddies" . . . "The English surgeon, William Acton, even stressed the fact in a book that to attribute sexual feeling to a woman was a 'vile espersion.'" . . . "Using feminine pulchritude wherever same is possible, sexy sensationalism of headlines is therefore the lucrative pitch." . . . "This ushered in another changed look into, what became known as, the Edwardian or Gibson Girl era." . . . The foregoing are chosen for brevity alone; at paragraph length even worse is available.

Little new can be learned here about American women or indeed any others. What the reader does discover is that Mr de Leeuw has a card index stocked with odd facts about ceremonial defloration, frigidity, the Early Christian Church, advertisers' slogans, suffragettes, the abortion rate in Japan; that he carries a chip on his shoulder and some more noxious insect than a bee in his bonnet; and (since he has half a dozen books to what may be called his credit) that he knows what will find a publisher and, when published, sell. This last piece of information is perhaps more sociologically significant than anything contained between the shocking-pink covers of "Woman, The Dominant Sex"; it is certainly at least as depressing.

The End of Weimar

GESCHICHTE DER WEIMARER REPUBLIK: *Volume II.*
By Erich Eyck.
Eugen Rentsch Verlag, Zürich. 621 pages. DM.22.80.

NOT everyone likes Eyck. That much one learns from the author's foreword to the second volume of his history of the Weimar Republic. He pleads with his German readers not to reject the lessons they may learn from history with the facile formula of *Emigranten-Ressentiment.* In that foreword—in the need for it—is the crux of the matter.

This concluding volume takes us from the Treaty of Locarno to the torchlight procession that celebrated Hitler's accession to power. Dr Eyck has a large canvas and paints his picture in broad, sure strokes, with the care, sweep, and shrewd observation of the true historian. However much the German reader apostrophised in the foreword may disagree with the interpretation of some details, he must—he should—recognise the probity of the approach, the justice (admittedly rough in one or two places) of the whole. (Incidentally there are also a few slips and printing errors.)

Judgment is not withheld. To mince words, says the author, would be a sin against the future. The Social Democrats' ineptitude, Hindenburg's treachery, the nationalists' bestiality—from Hugenberg's impenetrable illogic to Hitler's congratulations to convicted murderers—are all set down. The atmosphere of violence is recreated and in it takes place the struggle between those to whom the recovery of their class or nation was not synonymous with the suppression or downfall of others, and those to whom it was. The latter won.

One of the things that emerges with particular clarity is how the nationalists treated the true patriots. The account of the Locarno Conference is most moving, as is Stresemann's entire story up to his early death—and beyond it, to Briand's pilgrimage to his grave. Stresemann is the hero of the book, defended even against the accusation of having ignored secret German rearmament. If he did, says the author, he was in the company of the Entente Governments, which lifted controls instead of raising permitted limits. He does not think that matters would have been helped, and German democracy preserved, by earlier or greater concessions. The nationalists were ungrateful and unappeasable. They were intransigent and violent within, and intransigent and bent on violence without; and they were as cynical about their people's misery as were the communists.

Interim Report

ENGLISH PEOPLE IN THE EIGHTEENTH CENTURY.
By Dorothy Marshall.
Longmans. 288 pages. 30s.

MISS MARSHALL'S sensible, unpretentious survey is intended as a "background book"; appropriately, the illustrations are excellent. She has her minor fads and fancies; at times she can be verbose and repetitive; while in balance between topics, and in scale of treatment, there is some puzzling differentiation. However, this is a thorough and readable account of life in eighteenth-century England, and the many readers it deserves should be grateful that so sound a scholar has undertaken a very difficult task. Yet they may also feel some disappointment and a certain irritation—which will not be entirely Miss Marshall's fault.

Historians used to see the past as a progression, in which the clear-cut stages were firmly labelled and dramatically presented. In their personal relations there was something of the same clarity and violence. Dirty linen was publicly washed, and dog ate dog in the quarterlies. Nowadays the profession is more discreet, both in ideas and behaviour. In the privacy of their journals, historians still persecute one another, and proclaim the epoch-making significance of trivialities. But when they turn to confront the outside world their manners improve and the ranks are closed. Scholarly caution becomes acute, and qualified statement the order of the day. To stress change is out of fashion, even improper; continuity is what historians look for and usually find. No wonder that much is made to seem flat, blurred and baffling; no wonder the entertaining amateurs and the academic renegades are so prosperous.

Miss Marshall is a respected professional, across whose book lie the shadows of Ashton and Namier. She would no more think of talking about "the Industrial Revolution" than of political parties in an eighteenth-century parliament. However, it is one thing to demolish the old, exciting myths, essential as this may be; it is another to make contemplation of the wreckage a satisfying substitute for the patterns broken up. Until the history of the century has been revised to take account of the brilliantly destructive criticism of almost a generation, no really adequate introduction can be provided for the common reader. Miss Marshall's agreeable volume is an interim report, which has the defects of its virtues. She is too competent an historian not to spread doubt and uncertainty as well as sweetness and light.

A Dig

THE BURIED PYRAMID.
By M. Zakaria Goneim.
Longmans. 174 pages. 18s.

THE author is the Chief Inspector of Antiquities at Saqqara, the vast cemetery of Memphis, the second capital of Egypt in antiquity, which was situated about twenty miles south of Cairo. The necropolis in his charge served almost uninterruptedly from the beginning of Egyptian history down to Roman times, well over three thousand years. In this labyrinth of tombs Zakaria Goneim chose for excavation in 1951 a site which looked on the air photographs like a vast buried rectangle. This soon revealed itself as an enclosure wall built of local limestone with a casing of finer limestone from quarries on the other side of the Nile. In workmanship it closely resembled the enclosure of King Djoser of the Third Dynasty, which lies at a short distance to the north-west. Djoser's enclosure having a step pyramid in its centre, the excavator naturally searched for one inside the new enclosure and found it there, though unfinished, for it had only a maximum of 23 feet instead of the planned 230 feet in seven steps. Outside the pyramid to the north the entrance was discovered, leading first through a deep ditch then through a rock-cut passage to the burial chamber situated under the pyramid. The passage was blocked with stones at three points and these blockages seemed undisturbed. The alabaster sarcophagus, which was the only object found in the burial chamber, could therefore still be expected to contain the mummy of the royal builder of the pyramid together with his funeral equipment, and it was a great disappointment when it was found empty, probably never having been used for a burial.

The close resemblance to the enclosure and pyramid of Djoser suggested that the new pyramid complex must also be of Third Dynasty date, though a little later than Djoser to judge by the more developed technique of its stone building, and therefore the date postulated for it is roughly 2750 BC. Owing to its unfinished state valuable indications could be ascertained about the way in which pyramids were built—a vexed and much discussed problem. The king's name was found on clay sealings—Sekhem-khet, a hitherto unknown king—but apart from these sealings and the sarcophagus the finds were rather meagre: a few hundred stone vessels, a small hoard of golden bracelets, and 61 papyri dating from the sixth century BC, still unread, but which on closer examination might easily turn out to be the most informative objects of the whole dig.

The excavator had the felicitous idea of having his manuscript recast by Leonard Cottrell, an experienced narrator and himself author of a thrilling book on excavations in Egypt. The present account is thus not only accurate, but also very readable. The selecting of the spot for the dig, the excavation with its incidents, hopes and disappointments, the description of the buildings and objects found, all are presented in an enthusiastic and fascinating manner. Moreover, there is no need for the reader to hunt in reference books for information to understand the historical and archæological aspect of the excavations, for the book opens with an introduction into the history of Egypt, containing also all the necessary information on pyramids in general and that of Djoser in particular, including their religious background. Elsewhere in the book useful digressions are found wherever required for the understanding of an archæological phenomenon.

Man and His Culture

MAN, CULTURE AND SOCIETY.
Edited by Harry L. Shapiro.
Oxford University Press. 393 pages. 45s.

THE editor of this collective work is chairman of the Department of Anthropology of the American Museum of Natural History and his fellow contributors are leading professionals in this field, mainly American, but including one French and four British. Its object is to give "the intelligent reader" and "the beginning student" an understanding of the scope of anthropology in the broad meaning of that term. How far the book will in fact appeal to "intelligent readers" who do not happen to be "beginning students" is problematic: collective authorship, however necessary for works of broad scope at an advanced level, hardly lends itself to attractive exposition and is surely unnecessary in an elementary book; nor can it be said that the volume is likely to attract by its external appearance and general make-up. Yet the book covers a subject of great human interest in a thoroughly competent, if seldom inspired, manner, and may confidently be recommended to anyone desiring to know more about anthropology.

Dr Shapiro begins with an admirably succinct account of the physical attributes of man and of his evolution, but the rest of the book is concerned with aspects of his cultural life. Of the five chapters dealing with the more or less remote past, that most likely to interest English readers deals with Pre-Columban man in North America and provides the most up-to-date outline at present available. There follow chapters based primarily on the study of contemporary societies and dealing with broad aspects of social life: the nature and growth of culture; invention and cultural change; language and writing; human groupings and the family; religion; primitive economics. Finally, as if to emphasise the relevance of modern anthropological studies, Robert Redfield writes on "How Human Society Operates."

The day is indeed long past when anthropology could be regarded as the province exclusively of those who devote themselves to primitive peoples. The categories in which modern social anthropologists deal are relevant to all societies and, indeed, the more highly integrated society becomes the greater the scope for applying the insights gained from comparative study of simpler societies. This has been recognised for some years in North America where the professional consultants hired by business corporations have for some time included experts in this field. One has the impression that in Britain such weighty matters as sales promotion, labour relations and even shareholder management have hitherto been left to the intuitive or amateur anthropology of business executives. If America is a mirror of our own future, we may expect a new profession before we are very much older. Anyone wishing to be in on the ground floor might well consider the expenditure of 45s., even if for the time being he intends to retain his amateur status.

Shorter Notice

PORTRAIT OF GREECE.
By Lord Kinross and Dimitri.
Max Parrish. 127 pages. 35s.

This is a book both for the armchair and the genuine traveller. It gives the former a very clear idea what Delphi, Olympia, Athens, Crete, Rhodes, Mount Athos and so on look like; and it gives those who can visit these places for themselves a lively and illuminating survey of their history and background. Text and photographs (by the Greek photographer, Dimitri) complement each other and are nicely balanced. The photographs are coloured—sometimes, one suspects, over-coloured; the prose is unobtrusive and always excellent. In addition there is a swift survey of 4,000 years of Greek history in not much more than four pages, which is a model of what such a survey should be.

This is not primarily a book about the Greeks of today—although there are some memorable descriptions of them, making the most of a trip between the islands, for instance, or at Epidaurus watching "in a mood of enthralled concentration . . . the work of a familiar and favourite playwright, Euripides." There are only 120-odd pages of text, so the author has eschewed most of the minutiæ of travel—the crush in the bus or the eccentric attire of the café proprietor—which make or mar most travel books. But he has clearly enjoyed describing, with light-hearted erudition, the trials and triumphs of the ancient Greeks (particularly, one feels, their dealings with the Delphic oracle). Inevitably, those who retrace some of their own travels in Greece when reading this book will sometimes feel with regret, and perhaps even a sense of grievance, that Lord Kinross has not emphasised what seemed to them the best view or the most striking mosaic. But most would agree that his attempt to describe, in two brief paragraphs, the effect that the Parthenon has on those who visit it is a very good attempt indeed.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Atomic Powers for the Services

Washington, D.C.

THE share of defence in President Eisenhower's new Budget, for the year ending on June 30, 1958, reaches the predicted grand total of $38 billion, without including spending on foreign military assistance, stockpiling or the Atomic Energy Commission. This is $2 billion more than the estimates of military spending for the current, 1957, year. As always in peacetime, it is a compromise between what the military chiefs and their supporters say is necessary for a sound defence and what the nation's fiscal authorities feel is the most that is consistent with the maintenance of a sound national economy. Despite the immediate protests of the Secretary of the Treasury against extravagance, and the soft laments of General Twining for the billions refused to the Air Force, the figures shocked no one. All the services habitually fix their "absolute minimum requirements" at a point higher than their expectations. This year their minimums totalled $47 billion, or $9 billion more than the President approved. Actually this was fairly close, by budget standards. A few years ago when the services' pleas for new money added up to $104 billion they were sheared to $60 billion.

How Congress will react during the coming months of extended committee hearings in both houses will obviously depend a good deal on world developments, in the Middle East and elsewhere. The air-minded members, who are highly vocal, will undoubtedly press for an increase in the Air Force's funds larger than the proposed rise from $16.8 billion this year to $17.6 billion. They will hardly be mollified by a defence spokesman's assurance that much of the extra $900 million forced on the Administration by Congress last year has never actually been spent and in effect is being transferred into the air funds for the coming year. Another lively subject is sure to be the question of which service is to produce which missile. The Budget says very little about this issue, which involves the ambitions of all three services. But criticisms of the defence spending which, the President says, affords "a wise and reasonable degree of protection" will have to await fuller knowledge of just what is hidden in the massive totals of expenditure.

Research and development for all three services, for example, are set down as costing only $1.66 billion, against $1.68 billion in the current year. But the figures are misleading. An immense element of research is involved in testing and evaluating new weapons. But by the peculiar magic of cost-accounting this item is buried invisibly in "operations," while "new facilities" includes another large amount, equally invisible, and also logically chargeable to research. One expert on the Budget estimates that these hidden items would bring the total to about $6 billion, against $5.2 billion this year. Only in the committee hearings, themselves largely secret, will some of these matters be made clear enough for intelligent criticism.

★

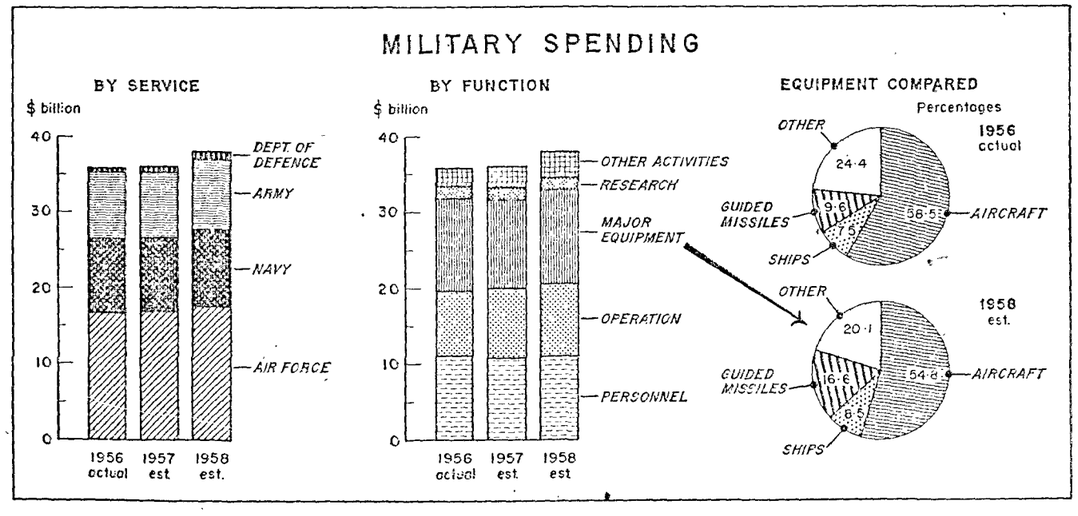
Much is in the open. There will be none of the big reductions in manpower which seemed likely a few months ago. All the armed services will remain about as they are at present (Army 1,000,000 officers and men, Navy 675,000, Marines 200,000, Air Force 925,000). Firepower, however, will be increased appreciably by the new weapons. Purchases of missiles (as distinguished from research into new missiles) will call for $2.6 billion. This represents a moderate increase. While many of the missiles will of necessity carry conventional warheads, President Eisenhower's message states plainly that the United States "will continue to increase the number and variety of nuclear weapons." It is significant that the emphasis will be on tactical weapons and those producing less radio-active fall-out. This may possibly indicate a belated admission by the Atomic Energy Commission (which contracts for all nuclear weapons) that there is, after all, some justification for the biological scientists' persistent protest against weapons with a large fall-out of the obviously perilous radio-active dust.

The emphasis to be placed on tactical nuclear weapons, rather than on strategic, long-range (and less accurate) devices, underlines the belief of the Administration, which is shared by the military, that the smaller the fission-type mechanism can become, the fuller can be the employment of nuclear warheads by the surface forces. In 1945, technology was able to produce only a nuclear bomb of immense dimensions. The 280 mm. (roughly 11 inch) gun developed by the Army showed how much smaller the atomic package could be, and encourages the belief that by this time it may be suitable for field guns of even smaller calibre and shorter range. This would mean that there has been success in reducing the fall-out; otherwise a field commander could not risk using such a weapon lest a shifting wind bring lethal radio-active dust back on his own forces.

The announcement that the Army will develop six "atomic support commands" in the coming year was one of the few surprises in the Budget. This helps to explain the decision to reduce the number of field-strength divisions from 18 to 17, and to start reducing the size of the standard division itself so as to make it more mobile. The new weapons will

provide it with even greater fire-power. The combat men squeezed out of divisional organisations will be channelled into corps and army artillery (largely missiles from now on) and notably into these new atomic support commands. Only guarded descriptions of the atomic commands are available, because they are still partly experimental. The closest prototype is provided by the Southern European Task Force (SETAF), which has been developed in the past year to help defend Italy's northern and eastern frontiers. It has about 6,000 men, is armed with the Corporal and Honest John atomic missiles and will have the newer types of weapons shortly. At present it is divided into three elements based at Leghorn, Verona and Vicenza, but by reason of its cellular construction it can be broken down into company and battalion elements of impressive firepower and extraordinary mobility. The plan to create five more units of comparable power and flexibility has a bearing on American readiness to provide some measure of atomic support to members of the North Atlantic pact.

The Air Force programme calls for 100 more of the great B-52 bombers, three of which have just completed their epochal around-the-world flight. This means that by the middle of 1958 practically all the B-36s should be replaced by this eight-jet successor. As had been expected, the much talked-of goal of 137 wings for the Air Force as a whole is cut to 128. The reductions will affect the Strategic Air Command's fighter-escorts and some of the Tactical Air Command's fighter-bombers. New developments have made the 137-wing plan seem obsolete ; time will show whether, in fact, the missiles can always take the place of the aircraft which are being discarded.



The Navy has no audible complaints. The ships it is getting include the first nuclear-propelled aircraft carrier, four more of the scheduled nuclear-propelled submarines and 13 destroyer types. Conversions of existing ships will result in another Oriskany carrier receiving her angled-deck, four radar pickets (for the greatly enlarged outer defence lines), three guided missile cruisers, a seaplane tender (apparently related to the revolutionary Seamaster jet-seaplane), and three ships designed for rapid surveying of seabottoms as an essential part of the enlarging work in undersea warfare.

Last Inaugural

THE high spirits with which Republicans celebrated their return to power four years ago gave way this year to a more sober mood as America paused to mark the start of the second Eisenhower Administration. The President, in his inaugural address, which under today's Constitution must be his last, drew on his capacity for moral fervour to lay stress on the responsibilities and sacrifices which the United States must undertake, in a " tempest of change," to build " a peace with justice in a world where moral law prevails." Former President Hoover was on hand to hear President Eisenhower pronounce the obsequies on " Fortress America " and accept " our deep involvement in the destiny of men everywhere." Alongside isolation the President buried the early excesses of his own Administration's policy of liberation. He had a warm message of friendship for the Russian people and promised that neither the captive nor the free nations would have to " barter their sovereignty " or copy American institutions to secure American aid. Though the President spoke in generalities—and it is the specifics which are in dispute—he struck a magnanimous and large-spirited note.

Mr Eisenhower and Mr Nixon, whose terms expired on Sunday, had been sworn in privately, the Vice President by his rival, Senator Knowland. The press, which in America includes all the paraphernalia of television and the newsreels, was excluded, to its indignation. For this there was good precedent ; besides, it meant that none of the shine was taken out of Monday's ceremonial and public repeat performance at the Capitol and the brilliant and costly festivities. This year's inauguration cost about a third more than that of 1953, when Republican enthusiasm was at its height, and tickets along the route of the parade were far from sold out last week.

If there was less exuberance, it was easier for Republican organisers to avoid the exhaustion, traffic-jams and gate-crashing which marred their first inauguration. The parade, which then straggled on until after dark, was severely

THE FERRANTI PEGASUS COMPUTER

The Ferranti Pegasus Computer installed at the London Computer Centre, 21 Portland Place, W.1.

The Ferranti Pegasus Computer is a new, very versatile electronic machine whose uses include many different types of accounting and statistical work. One of its principal features is the exceptionally wide range of operations which can be performed, making it much simpler to "programme" than most machines of its type. For full information on Pegasus write to Ferranti Ltd., Computer Department, West Gorton, Manchester 12, or London Computer Centre, 21 Portland Place, London, W.1.

pruned; states were allowed only one float to illustrate the difficult theme of "liberty and strength through consent of the governed," and the venerable atomic cannon was discarded as too slow in favour of today's guided missiles. In the evening, instead of two inaugural balls, there were four spinning at the same time at which the President and Vice President had to make short appearances. Among those unable to be present—presumably because a part of any profits were to go to Hungarian relief—were the Russian and Hungarian Ambassadors. Washington's merchants, who guaranteed the expenses of the whole affair, except the ceremony at the Capitol, were, however, not hopeful, on a colder day and a soberer occasion, of rivalling the $122,000 earned in 1953.

Nobody's Budget?

GRUMBLES from such fiscal purists as Senator Byrd, a Democrat, and Mr Taber, a Republican, were to be expected when President Eisenhower sent to Congress the largest peace-time Budget in history and one only $2.2 billion smaller than Mr Truman's last Korean war budget, which the Republicans came into office pledged to cut by

Herblock in the Washington Post

$14 billion. But no one expected the chorus of the frustrated to be led by Mr George Humphrey, the Secretary of the Treasury and the reputed strong man of the Cabinet. Expenditures in the last four Budgets have gone up steadily from $64.6 billion to $71.8 billion; to Mr Humphrey, such spending, much of it on unproductive armaments, is inflationary, rules out tax relief, and will lead to a depression "that would curl your hair." Asserting that there were plenty of places where the Budget could be cut, the Secretary of the Treasury in effect invited Congress to try where the Administration had failed. This is indeed a counsel of despair; Congress is too vulnerable to local pressures to wield the shears with zeal or discrimination.

Despite his office, Mr Humphrey is not responsible for drawing up the Budget; this is the task of the Director of the Budget, who views quite calmly the prospect of even larger spending in a country whose population is growing as fast as that of the United States. Mr Humphrey was careful to indict no one except the Soviet leaders and the "public psychology"; yet for a time it seemed hardly possible that so outspoken a dissenter could remain in the Cabinet. But Mr Eisenhower, whose concern about inflation reappears in this week's Economic Report, has now agreed that it is the duty of Congress to cut the Budget where it can, as long as—and there lies the rub—national security is not endangered and essential services to the country are not cut. He shares Mr Humphrey's distaste for big spending and preference for small government—but only in the long term, when relaxation in international tensions makes reductions in armaments possible. The President parted company with Mr Humphrey over deficit spending and tax reduction to fight a depression; but this is academic at the moment.

This then, is nobody's budget—except perhaps Mr Nixon's. He is said to believe that the Republicans can become the majority party only if they adopt the free spending for the public welfare favoured by Rooseveltian Democrats. The hallmark of the "New Republicanism" is its support for "civil benefits"; at $16.9 billion, these will go up next year by $1 billion, unless Congress, as the President hopes, makes the Post Office recover most of its $600 million deficit from the public. But this is still only half the increase in military spending.

Chairman Without Coat-tails

WHEN Mr Leonard Hall, chairman of the Republican national committee and organiser of the Republican campaign, handed in his final report, it contained a warning to the committee that in 1958 the party must put forward "able and attractive candidates who can win on their own merits" without clinging to a popular President's coat-tails. Mr Hall, who found those coat-tails coming away in his hands when the Republicans lost both houses of Congress, is expected to receive a high government appointment and to run in 1958 for the Governorship of New York. His successor, Mr H. Meade Alcorn, who must organise Republican victories without the benefit of President Eisenhower's popularity, was the personal choice of the White House; the committee bowed to the President's wishes despite the misgivings of many western and middle western members who feared that Mr Alcorn, the national committeeman from Connecticut, might fail to understand their problems, particularly the close relation between the discontents of farmers and Republican chances in the congressional elections.

There was a brief sensation last week when members of the committee reported that they had received telegrams, purporting to come from Mr Harold Stassen, the President's

adviser on disarmament, urging liberals to take a stand "against the Nixons and the Knowlands" by electing Mr Alcorn. Mr Stassen, whose attempt to prevent the Vice President from being nominated last summer was such a humiliating failure, stoutly denied that he had anything to do with the telegrams. In fact, the appointment of Mr Alcorn is taken as signalising both the capture of the party machinery by Eisenhower Republicans and a step in the campaign to secure the presidential nomination in 1960 for Mr Nixon. It is thus a set-back for his fellow-Californian, Senator Knowland, whose candidacy would be supported by the conservative Taft wing of the party. Mr Alcorn is a friend of Mr Sherman Adams, the powerful presidential assistant, and of former Governor Dewey, Mr Nixon's political ally. But before Mr Alcorn can think about 1960 he must clear the awkward hurdle of the congressional races in 1958.

Two Tangles in Texas

I.—Over Oil for Europe

THE refusal of the Texas Railroad Commission to permit more than a fractional increase in the output of crude oil in Texas in February is not an attempt to gouge more dollars out of hard-pressed European consumers—although it will help to maintain the increase in crude oil prices that has already occurred. The leading buyers of crude oil and those producers with ready access to the coast have consistently favoured higher output to meet Europe's needs. But the independent producers in the heart of Texas, especially in the remote western part of the state which has most of the surplus capacity, have just as consistently opposed any raising of the limit on production.

On purely economic grounds this opposition is not as unreasonable as it may look from Europe. These producers normally supply crude oil to inland refineries, and have no pipelines to carry any additional output down to the coast for export. They therefore now have two objectives: to persuade the major buyers to build more pipelines from the interior to the coast; and to ensure that a healthy demand for crude oil at present prices continues to come from the inland refiners which they normally supply. The emergency export demand may not last long enough to make it profitable to build new pipelines, and as soon as the tanker shortage eases the leading buyers are expected to revert to their normal, unpopular practice of importing cheaper oil from the Middle East. The independent producers stand to gain more, therefore, by protecting their normal home demand.

As inland stocks of crude oil cannot easily be moved to the coast they have not been much depleted, and for the same reason any general increase in crude oil output would tend to add to stocks, and weaken prices. This risk could be avoided by permitting a selective increase in fields where the whole of the additional output could be exported, but the commission maintains that all wells in Texas, however unfavourably placed, must be treated alike. A more difficult problem is posed by the stocks of petrol, which are now 30 million barrels—nearly 20 per cent—above normal. If higher output of crude oil were permitted, then refiners on the coast would make more fuel oil for export and add to the unwanted stocks of petrol in the process. The higher the stocks of petrol, the greater the danger that the inland refiners would be forced to cut their purchases of crude oil from the independent producers. The recent rise in crude oil prices, which started on the Gulf Coast in Texas and has now spread over most of the United States, has long been sought by the independent producers to cover rising costs of exploration and production. But there is only an acute shortage of crude oil on the Gulf of Mexico, and it is touch and go whether the higher prices will hold elsewhere. Any substantial increase in stocks of crude oil or petrol would almost certainly pull the price down again.

Although the price rise has so far failed to bring forth adequate supplies of crude oil for export, it has brought the emergency closer to the United States by touching the pockets of American consumers, who have retaliated with the customary charges against the oil companies of collusion and conspiracy to fix prices. The companies will indeed have to explain why the increased price for crude oil has spread from the Gulf of Mexico to inland areas where the supply was already sufficient to meet all demands for it. Moreover the refiners, squeezed between rising prices for crude oil and a sluggish demand for petrol, have pushed up petrol prices as well, even in the face of a glut of supplies, on the theory that the demand for petrol is relatively inelastic.

This apparent flouting of the law of supply and demand has naturally produced a spate of demands for inquiries by congressional committees, the Department of Justice and the Federal Trade Commission. First off the mark was the Senate's anti-trust subcommittee, which is to investigate the increases in oil prices as part of a broader study of the operations of the Middle East Emergency Committee through which 15 oil companies co-ordinate the oil lift to Europe. Senator O'Mahoney, the acting chairman of the Senate committee, is in favour of closer government control over the emergency activities of the oil companies, and opposes the Administration's view that the determination of prices should be left to the industry.

II.—Over a Senator for Washington

FROM A CORRESPONDENT IN DALLAS

A SPECIAL election for a United States Senator is to be held in Texas on April 2nd. That a date has at last been fixed has done something—although not much—to clear up the political confusion which has existed in Texas ever since last August when Senator Price Daniel won the Democratic nomination for the State Governorship and, therefore, in effect, the office itself But until two hours before he took over from Governor Shivers on January 15th there was unceasing intrigue as to how and when another United States Senator should be chosen. Then at the last moment Mr Shivers named Mr William Blakley to fill the vacancy until an election was held: one of Governor Daniel's first acts was to fix the date for that election.

After November 6th the confusion had been confounded by the fear that Governor Shivers, an Eisenhower Democrat, might appoint a Republican supporter to the vacancy and thus deprive the Democrats of their narrow majority in the Senate. This immediate danger was removed when Senator Blakley announced that he would vote with the Democrats, but it may only have been postponed until next April. For the guiding thread through the long tangle over the new Senator is to be found in the deep divisions of opinion and loyalty among Texas Democrats, divisions which may possibly give the election to the Republicans. Normally the Democrats fight out their differences and pick their candidates in a preliminary (primary) contest. But Texas law does not provide for this when a special vacancy is to be filled: then there is only a single election open to all comers from all parties. Mr Blakley does not intend to try for a permanent seat in the Senate, but even without him there are already four Democrats—and rumours of more to come—in the field and one Republican, Mr Thad Hutcheson of Houston, a young member of a distinguished Texas family.

The Democrats are Representative Martin Dies, once notorious as the head of Congress's Un-American Activities Committee; another conservative, Mr Bracewell, a State Senator who is running as an Eisenhower Democrat; and two liberals—Judge Hart, well known and respected as a former Chief Justice of the State Supreme Court and as head of the University of Texas; and Mr Ralph Yarborough, a perennial seeker after Democratic nominations in the state. Mr Yarborough is also a perennial loser, but he has gradually built up a solid block of personal support and his last race, in August against Mr Daniel for the Governorship, was his best so far; he has real ability in the rough and tumble of political campaigning, even though he is sometimes tactless and overbearing. He is expected to do better than Judge Hart and probably also better than any of the right-wing candidates, whether Democratic or Republican, who will split the substantial conservative vote in the state. But there is a movement in the State Legislature to provide for a second contest between the two leading candidates should no one win a clear majority on April 2nd; the right-wing advocates of such a law hope that Mr Dies will be the runner-up and believe he would beat Mr Yarborough in a straight fight.

Weaving a Japanese Pact

AFTER digging in their toes through months of negotiation, Japanese exporters of cotton textiles have now agreed to limit their shipments to the United States to an extent which is apparently fairly satisfactory even to the American textile manufacturers. American growers of cotton may not be so content, but the basis of the case against the Japanese is that, under the American government's programme for disposing of its surplus cotton, they have been paying less for the raw material which they buy from the United States than does the American textile industry and that they pay their labour only a tenth as much. These lower costs have enabled Japanese textiles to flood into the American market in the last few years. They have hardly swamped it, for even in 1956 imports from Japan amounted to only 2 per cent of domestic output. But in certain fabrics the wave was mounting alarmingly: imports of gingham went up from three million square yards in 1953 to 70 million in 1956, equal to a third of American output.

Now gingham imports will be held to 35 million square yards a year and velveteen imports will also be cut in half, down to 2.5 million square yards a year. There are also specific restrictions on various other fabrics and manufactured goods—blouses, in particular—within the comprehensive quota which will limit total exports of Japanese cotton textiles to the United States to 235 million square yards a year, compared with 270 million in 1955 and nearly 300 million last year. The agreement runs for five years, although the details can be renegotiated annually; it gives the American industry a welcome stability for future planning and some guarantee that the Japanese will not cause fresh uncertainties by concentrating on a few other types of cotton textiles for export as substitutes for those which are now most severely restricted, or by cramming their exports into certain months of the year in order to benefit from seasonal demands.

The particularly drastic limitations on gingham and velveteen draw attention to the threat which finally pushed the Japanese into accepting such a stringent "voluntary" agreement. The Tariff Commission is considering a plea from gingham manufacturers for either a mandatory quota or an increase in import duties, as protection against Japanese competition, and had already recommended that similar steps be taken to check imports of velveteen. President Eisenhower had postponed his decision on this recommendation—obviously, although not admittedly, in the hope that his decision might be facilitated by an agreement with Japan such as has now been arrived at. Without this agreement, Congress would almost certainly have insisted on curbing Japanese imports even more severely, and its enthusiasm for quotas on imports from other countries would have been harder to control. If the President had resisted Congress, his other efforts to loosen trade restrictions would have been frustrated endlessly. Now the atmosphere should at least be clearer.

Jurisdictional Disputes

OFFICIALS of the International Brotherhood of Teamsters, with much experience of disputes about which trade union has jurisdiction over the workers in a particular firm, have been taking advantage of a dispute about which congressional committee has jurisdiction over the trade unions. At the risk of being cited for contempt of Congress, these officials have been refusing to answer questions from Senator McClellan, chairman of the investigating subcommittee of the Senate Committee on Government Operations, on the grounds that he has no authority to investigate labour racketeering and misuse of union funds. This is also the contention of members of the Senate Labour Committee; they would like to reserve for themselves the helpful publicity which seems certain to spring from what promises to be a sensational inquiry going on all over the country for months, if not for years. Labour leaders also would prefer to have this committee conduct the hearings, since its members are far more sympathetic to trade unionists than is Senator McClellan—or Senator McCarthy, the chief Republican on the committee.

Mr McClellan admits that his committee's existing claim to jurisdiction—based on the legal requirement that trade

unions must file financial statements with a government agency, the National Labour Relations Board—is insufficient to justify a full investigation on his part. His hearings last week were intended to reinforce his demand for a special grant of additional authority—and additional funds—by displaying the evidence of wrong-doing which his agents had collected during the past few months. It seems certain that the Senator will get what he wants, although a joint group may be set up so that the Labour Committee can share the limelight.

The abuses which Mr McClellan is exposing, found mainly in smaller but strategically-placed trade unions, have long been recognised. Such legal sanctions as exist are clearly inadequate and the President has now asked for legislation to deal with an aspect of the problem which is of increasing importance. He wants a law requiring the registration of employee pension and welfare funds to protect the interests of the beneficiaries. The growth of these funds during the last ten years, as a result of the so-called fringe benefits which are now included in most wage agreements, has put new temptations in the way of trade unionists—and of their employers—and has opened up fresh and profitable opportunities for dishonesty.

Tennessee Tree Farmers

FROM A SPECIAL CORRESPONDENT

EVERY American schoolboy knows how Tennessee lost its thick carpeting of forests in a few generations, watched its topsoil slide and blow away and woke up in the late nineteen-thirties to find itself famous. The story of the Tennessee Valley Authority has become such a classic that outsiders—and, indeed, Tennesseeans themselves—are liable to believe, not only that the great project is rounded and complete, but also that all of Tennessee's remarkable progress has been an integral part of it. Reafforestation was certainly—and still is—one of the TVA's major achievements in the state, as is now readily appreciated in both the saw mills and the pulp and paper mills. But the now almost legendary Civilian Conservation Corps of unemployed, who gave back to Tennessee its indigenous southern pine to control soil erosion, never foresaw the full value of their work. Nor did they imagine how much further it would be carried by agencies outside the TVA.

About ten years ago a chemist in Georgia discovered a way of treating all varieties of southern pine to make it suitable for wood pulp. Hitherto it had been virtually useless commercially except for pit props. Between the eighteen-eighties and the nineteen-twenties Tennessee had been the leading state for production of hardwood and the TVA's reafforestation programme aimed, at first, to replant whenever possible with hardwood. Locust trees, because they are leguminous and put the much-needed nitrogen back into the soil, were the first choice. But later, when pulp and paper mills came into the state, to benefit from cheap electricity as well as the forests, huge plantations of southern pine were laid down, largely by the new industries themselves.

Many of the stands planted by the TVA during the depression have already been harvested and gone, literally, into print. That is the beauty of the southern pine. It matures in its early twenties. In other words, an average southern farmer can harvest twice in his lifetime a tree crop of his own planting. He is encouraged to regard this as a regular part of his farm rotation by the Tennessee Forest Industries Committee, set up and inspired very largely by foresters employed by the Bowater Southern Paper Corporation, a British company. This committee spreads the gospel by offering as awards Tree Farm certificates, lapel badges and conspicuous signs. Already there are over 10,000 Tree Farmers.

Tennessee has about 12 million acres of forest, much of it predominantly pine and thus eyed covetously by the big newsprint and lumber concerns. There is little doubt now that the pine will flourish, if properly cared for, almost anywhere in Tennessee. But proper care in this instance means a highly expensive control of the scrub hardwoods which not uncommonly swamp the pine and almost invariably reduce the value of a forest both to the newsprint and the lumber industries. Recently the Bowater company, which in four years has already planted nearly 40 million pine trees in Tennessee and thus outstripped even the TVA itself, has been using helicopters to spray herbicide on the worst rashes of scrub hardwood. In spite of opposition from naturalists, this programme is generally rated worth while. But the margin of success has not vastly impressed the experts. Why, they have been asking for a long time, cannot some way be discovered of utilising this hardwood?

In Coos Bay, Oregon, far away in the Pacific Northwest, Bowater recently leased a pilot plant in which to experiment. So far the prospects are encouraging. It seems more than probable that a small amount of hardwood will mix with southern pine to make good newsprint as well as being useful in the manufacture of fibre board. It is definitely not intended to use large-size trees which would give a better return as commercial timber; nor, if the experiment proves successful, will genuine hardwood forests be discouraged in Tennessee. The achievement would lie in doing away with the tree-farmer's problem of how to keep the "weeds" down and bring in the harvest without irritating delays. And one does not have to be a farmer to know what a joy it would be to find that weeds are profitable after all.

SHORTER NOTE

Two recent convictions for contempt of Congress broaden the power of congressional committees to set for themselves the limits of interrogation. Mrs Mary Knowles, who two years ago refused to answer questions about possible communist associations put by the Senate Internal Security subcommittee, failed in her plea that she was protected by the guarantees of free speech and belief contained in the First Amendment. She was sentenced to 120 days in gaol and fined $500. The same judge also convicted Mr Robert Shelton, one of four employees of the *New York Times*, who refused to answer similar questions. Mr Shelton, whose original appearance before the committee was due to confusion with another journalist of the same name, invoked the First Amendment's guarantee of freedom of the press and also argued that the questioning served no legislative purpose and was, in effect, a reprisal against the *Times* for its criticism of the subcommittee. Judge Rizley dismissed both contentions as "patently unsound."

The World Overseas

Hobson's Choice for the Poles

FROM A SPECIAL CORRESPONDENT IN WARSAW

OPINIONS will differ about the character of Sunday's general election in Poland and about the significance of its result. The high poll and the small number of voters who exercised their right of striking candidates off the lists represent, first of all, an immense personal success for Mr Gomulka, whose popularity and authority are without a recent parallel in Polish affairs. They form a principal asset of the party which made him its leader in October. Secondly, the election constitutes a victory of the new collective leadership of the communist-dominated PZPR and its allies, who were seeking a popular mandate under the collective designation of a "Front of National Unity." Thirdly, the election has demonstrated general support for the programme of national renovation, outlined by Mr Gomulka at the October plenum of the PZPR Central Committee. The chief principles of this programme, summed up in one of the election posters as "Sovereignty, Democracy, Socialism," has now received formal popular endorsement.

This is not the whole picture; it does not mean that the ultimate aims of the mass of the population and of its rulers are the same. "Sovereignty, Democracy, Socialism" on the lips of the average Pole probably do not have the same implications and nuances that they have in the mind of the "national communists," Mr Gomulka and his colleagues. Behind the appearance of uniform support, motives are diverse; this is an important fact, and it is bound to affect the work of the new Sejm and the climate of political life in the years to come. It may grow more important still as the list of immediate changes and reforms in state and society, on which agreement is strongest, is worked through and turns out, perhaps, to have merely whetted the appetite for more substantial and controversial changes. What can, however, be asserted is that the gap between the people and its communist leaders has become unusually narrow. This is caused in part by the awakening of a patriotic conscience and common sense in the party itself, in part by a striking sense of realism within the country at large, in part by the particularly difficult international position of the country. The Catholic Church joined in by exhorting people to vote. None of these factors might have prevailed if there had not been in Mr Gomulka a statesman able and willing to take over national leadership at the decisive moment.

The election of January 20th has, however, yet another aspect; it can be regarded as an experiment in democratisation. Democratisation, of course, does not mean democracy, but merely a process which seems, or is intended, to lead to democracy in some sense or other. Democratisation in Poland was not set in motion by the fiat of supreme authority, by decree from above; the people itself, under the guidance of its bolder elements, communist and non-communist alike, started it by a steady pressure on the machinery of government. After the death of Stalin and the fall of Beria, in conditions of a changed party atmosphere and a laxer censorship, and with the secret police on the defensive, the Polish masses began to enter the political arena by means of louder and freer criticism and increasing resort to representations, marches, rallies and strikes. The absence of intimidation in Sunday's election was thus an achievement of a few years' evolution. The same freedom equally manifested itself during the election compaign.

The meetings with candidates, which formed the main feature of the campaign, were frequent, long and well attended, and gave rise to many searching questions and biting criticisms of the faults and mistakes of the previous system. The candidates most exposed were naturally those of the PZPR, especially its top leaders, since they bore the largest share of responsibility for the past. But motives of a less rational kind also played their part in electioneering, and individual men sometimes fell victim to whispering campaigns based on rumours, suppositions and unverified allegations. The main question: is X fit to carry out the programme of the Front of National Unity? tended to be asked in the most personal way. Gradually a definite opinion against many candidates began to crystallise, and it became obvious that the electorate intended to make ample use of its privilege of deleting names. Its determination was accompanied and to some extent strengthened by the activities of a kind of political underground. Leaflets directed against particular men or against PZPR candidates as a body, or even calling for a complete boycott of the election, began to circulate; posters and lists of candidates were torn or defaced; provocative questions began to be heard at election meetings. It is debatable whether the trend, if it had continued unchecked, would have led to the election of a *minority* of PZPR candidates, thus compromising the party seriously; at all events, the party leadership appeared to think so, and to panic. On January 9th, at the end of an electoral meeting, Mr Gomulka made an appeal to the country to vote *en masse* for the Front of National Unity, to express confidence in it by not striking out names, and thereby to ensure the election of the top candidates nominated by the central organ of parties and associations. In an atmosphere of growing crisis Mr

Gomulka's appeal was echoed by various organisations, groups and individuals, to be finally repeated by himself in a powerful broadcast on the night before the election.

Mr Gomulka well knew that he could not rely on the rank and file of the party to stem the tide by intensive canvassing. The method was too discredited and the party too disorganised and divided to make any real impact. In the absence of any other means only an appeal of this kind had a chance of succeeding. It must be added that on the day of the election another factor seems to have reinforced it, viz., a kind of fear of displaying nonconformity before the gaze of fellow-voters and election commissioners. With real but concealed disappointment and regret the Polish electorate renounced the right which they had been looking forward with such gusto to exercising. They seemed to agree with Mr Gomulka that in the prevailing circumstances the country could not afford the luxury of choice, and that the election had in fact become a plebiscite for or against him. Rightly or wrongly they voted for him.

Mr Gomulka has got the Sejm for which he asked: a Sejm in which his party has a bare majority, which contains enough able and enough independent members to carry out its functions, but which is a good deal less popular than himself. The work of such a Sejm will probably be more closely watched and more critically examined than if it were a more direct emanation of the general will. This is not unhealthy.

Challenge to Canada's Liberals

FROM OUR OTTAWA CORRESPONDENT

CANADA has produced from an unexpected source a significant challenge to the doctrines and policies of its sempiternal Liberal government. After 21 years of Liberal rule, the orthodox economic views held by (for example) Mr C. D. Howe had become hallowed with age and hard usage and appeared almost sacrosanct. Canada has certainly prospered under them during these last ten years, but many Canadians have been growing increasingly doubtful whether the policies which may have served well so far are equally good for the decades ahead. This questioning mood has received a big stimulus from the Preliminary Report, just issued, of the Royal Commission on Canada's Economic Prospects.

The Commission's task was reviewed in *The Economist* on May 28, 1955, soon after its establishment had been announced by the then new Finance Minister, Mr Walter Harris. It was well manned and its chairman, Mr Walter Gordon, is a well-respected Toronto accountant who has several times conducted investigations of civil service operations. Its preliminary report has upset all the political pundits and confounded the prophets. Popular rumour had it that the Gordon Commission would produce a platform on which the Liberals could fight the election next June. The cynics had supposed that after all these years the only possible function of a Liberal-appointed Royal Commission would be to add a thin veneer of independence to a fresh statement of government policies. What it has actually done is to trample with hob-nailed boots on most of the most deeply-cherished policies of the government's senior ministers. Those who suffer most are Mr C. D. Howe and Mr J. G. Gardiner, both of whom have been in the cabinet ever since 1935 ; Mr Gardiner's sphere of interest is largely limited to agriculture, but Mr Howe has dominated government policies in far wider fields—trade, water-power, natural gas, resources development, foreign ownership, and wheat marketing. On all of these subjects the Commission makes recommendations which are quite unacceptable to Mr Howe, to the senior government officials who have worked under his ægis for so long, and to many of his colleagues.

One or two opposition Members of Parliament, unable to resist the opening provided by the government's evident embarrassment, have rushed in with hasty gibes suggesting an uncritical acceptance of the Commission's recommendations. But the new Conservative leader, Mr John Diefenbaker, has been far more cautious. He has been launching almost daily darts in the form of questions about when the government proposes to implement this, that or the other recommendation. He obviously means to make the most of the government's embarrassment without committing himself as either "pro-Gordon" or "anti-Gordon."

A Jigsaw Report

This preliminary report is an uneven and in some ways cryptic document. It is eventually to be backed up by a considerable series of full studies and a much longer and fuller final report. But in the meantime little of the evidence or argument behind the first set of recommendations has been revealed, and they are thrown out without any very coherent pattern as a series of proposals on a variety of subjects which the Commission felt to be important. The 110-odd pages of the report form a jigsaw containing nearly a score of separate pieces. It is possible, though it seems unlikely, that in the final report the pieces may be put together to form one new complete picture ; but as presented so far they do not appear to involve any logical interconnection. One can reject utterly the Gordon Commission on wheat and accept it wholeheartedly on, say, the problems of the Atlantic Provinces or of foreign investment. In political terms it would all be good, clean fun if only there were not going to be a general election this summer.

The subjects which fascinate the politicians—and in this case they probably judge correctly the interests of the public—are in this order: wheat, control of foreign investment, export of minerals, export of power. The section on wheat has dumbfounded more people than anything else in the report. The Commission proposes, though no one has been able to discover where it got the idea, a new system of operation for the Canadian Wheat Board. At present the Board sets an "initial price" each spring, and it pays this price to the wheat farmers for all wheat delivered at the country elevators. Supplementary payments are made to the farmers after the Wheat Board has sold the grain according to the price it actually realises. When, as in the last two years, the prairies produce more grain than the elevator system can handle, the Wheat Board has to impose a quota on farmers' deliveries ; but the farmer is paid only for the wheat which the Board can accept into the elevator system. The government has always refused to pay for grain left on the farms, though it did go so far last year as to pay the cost of storing the grain on the farm. The Commission now proposes that the Wheat Board should make a commitment early each year to pay its stated price on a specified quantity of wheat, and that it should have to buy this quantity whether it could take delivery of it or not. This would ensure that each farmer knew each year how much wheat the Board would be bound to buy within the crop year. It would require the Board to make a forecast of what it could sell each year and to allocate this amount amongst the farmers. Over-estimates might prove expensive. Under-estimates would be politically dangerous. There is no chance of the present government accepting this system.

While wheat falls under Mr Howe's authority, the Gordon Commission's proposals for the restraint of foreign control over Canadian business are pitched right into the lap of the Finance Minister, who was responsible for the Commission's appointment. It advocates, first, tax concessions to Canadian oil and gas companies which would give them as great allowances for initial development expenses as American companies now get ; second, a system of tax incentives which would give advantages to foreign-controlled companies if they sell about a quarter of their shares to Canadians and meet other possible conditions about "Canadianisation"; third, a system of accelerated write-offs for tax purposes open to Canadian secondary industry in order to help it to keep fully equipped with modern machinery and to strengthen its competitive position against American imports.

Taken singly, the most acceptable of these proposals would probably be the tax measures designed to encourage "Canadianisation" of American subsidiaries in this country. But taken together, the proposals amount to a deliberate use of the tax system to impose a measure of restraint and direction on foreign investors which this country has never before contemplated. To a good many Canadians, impressed with the overwhelming degree of control which American firms have established in some of the most dynamic sectors of the economy, the proposals will be most welcome. They seem to offer a practical means of reasserting Canada's determination to control its own housekeeping without resorting to severe measures of restriction which might discourage new foreign capital. But whether there is yet enough support, either among the public or in the government, remains to be seen.

Mr Harris, as sponsor of the Commission, will presumably want to make some use of its recommendations. Other members of the government—and notably Mr Howe, who was opposed to the Commission's appointment in the first place—would like to forget all about it as quickly as possible. The election looming in June gives them little time to devise some means of drawing electoral support from this awkward document. The decisive move will probably be Mr Harris's budget, which does not require normal Cabinet approval, but will have to be acceptable at least to the Prime Minister.

Now in its second year

The Paper Bulletin

This is a bulletin service for paper users and makers. It deals with the supply, demand and price trends for paper, paper products and raw materials. The eighth quarterly issue will shortly be available. Full details from:

Jordan's Money

FROM OUR MIDDLE EAST CORRESPONDENTS

THE government of Suleiman Nabulsi had committed itself so completely to end Jordan's financial dependence on Britain that it could not afford to fail. The Cairo agreement, by which Egypt, Saudi Arabia and Syria are pledged to pay Jordan £12.5 million annually, has therefore saved the government in the eyes of the people and delighted the nationalists ; but it is more than likely that the full gravity of the government's decision has not yet been fully realised by most Jordanians.

More than half the revenue of Jordan is obtained from Britain. The budget falls into three parts: the Regular Ministries Budget, amounting to £7.7 million, is financed almost wholly by taxes, fees and other internal revenues ; the Military Budget, £9.2 million, and the Development Board Budget, £2.3 million, are financed almost entirely by British contributions. Strictly speaking, Britain does not *give* Jordan £12 million yearly. Part of the sum consists of interest-free loans, the first of which was made in 1950. These advances now total £6 million, and repayment, which should be in 15 annual instalments, is due to start shortly. These loans are not written into the treaty and therefore could continue ; but if Jordan rejected the alliance and tied itself to states that can hardly be considered less than hostile, the British Government might well decide not to give them, particularly as the prospects of repayment are slight.

Jordan also receives from the UN Relief and Works Agency (UNRWA) about $16 million a year for the relief and rehabilitation of Palestinian refugees, who are now Jordanian citizens. The only other sources of assistance is Point IV grants for development projects which are now running at the rate of just under $8 million a year. The revenue of the Regular Ministries Budget is derived from income tax, which provides half the direct tax revenue, land and animals taxes, fees and a variety of indirect taxes, of which customs duties, providing 60 per cent of the indirect tax revenue, are the most important. Some extra income could be obtained by raising the taxes and fees, but it could never amount to more than a small fraction of the sums hitherto received from Britain.

Can They Pay?

There is already every sign of acute financial stringency in Jordan. Delay in the payment of part of the development loan, earmarked for the new desert road from Amman to Aqaba, led to considerable agitation in official quarters. A similar delay in the payment of the grant-in-aid for the armed forces gave rise to anxiety that army pay would fall into arrears—and punctual payment of the army is essential to the stability of the state.

The Cairo agreement provides that the entire sum to be given by the three Arab states will go to the armed forces, but some of it will be paid in kind rather than cash. This possibly means that Egypt can escape its immediate responsibility for £5 million by giving some unwanted British military equipment. In so far as funds go into Jordan for the armed forces, as pay for the men and to buy indigenous supplies, the grants to the forces fertilise the general economy of the country. The army's dependence on Britain has long been a sore point with the nationalists and the

Cairo agreement suggests that the main endeavour is to emancipate it. One must presume, also, that an effort will be made to secure aid for other purposes, including development, from countries outside the Arab world. The Jordan government is, however, highly critical of the Eisenhower doctrine and has so far done nothing to encourage further aid from the United States.

The most puzzling aspect is Jordan's faith that Syria and Egypt, of the three countries pledged to pay, can in fact meet the obligation. Even £2.5 million is a substantial sum for Syria to find at any time and seems clearly beyond its means at present. Indeed, the Syrian government is talking about an austerity campaign to save the nation's finances. It could, of course, remedy the situation to some extent by allowing the Iraq Petroleum Company to resume pumping oil through the Syrian lines which could quickly restore more than half Syrian transit dues; and it is probable that the IPC could be encouraged to repair the pumping stations and restore the full flow in due course. But Syria's ability to pay regularly will always remain in doubt—a season of poor rainfall immediately affects its economy; it has had to turn to Saudi Arabia for financial aid in the last few years.

Information about Egypt's economic situation is not readily available but the general opinion is that President Nasser is facing an acute economic crisis. Dr Abdel Moneim el-Kaissouni, the Finance Minister, announcing the "egyptianisation" of British and French banks and insurance companies last week, accused these banks of conducting a policy which caused a slump in cotton prices and "exhausted Egypt's entire free currency reserves." They had "undermined Egypt's economic situation." This admits a bleak economic condition which could not have been caused by the foreign banks. At the end of November, there was an adverse balance of trade of £45 million and this is worse than it appears because the net deficit disguises surpluses with the Soviet block and Japan and deficits almost everywhere else.

Furthermore, the balance of payments is affected by the loss of the greater part of the "invisible export" of Suez Canal income. It is evident that this situation will continue, not only because the income from the canal is not yet available, but because the cotton crop was below average and the stocks of cotton fell at the beginning of the current season (August) to 900,000 cantars, nearly 2 million cantars less than at the opening of the preceding season. In addition, Israeli forces put all but one of the Egyptian oilfields out of action, compelling the government to buy oil, largely with dollars, at the rate of between £2 million and £2.5 million a month. Altogether, Egypt's economic future is not by any means rosy and hardly seems to justify the assumption that £5 million a year can be found for Jordan.

New Year in Budapest

FROM A CORRESPONDENT

IN Budapest nights begin at 6 pm, when the last trams and buses leave. Most people are anxious to get home before that. Few shops keep open after midday, because there is very little to sell and even the junk peddled by street traders is snapped up quickly. Queuing for food, (which seems to require considerable expertise and knowledge of the locality) takes up hours each day. Cinemas (last performance at 2 pm) are showing old French, Italian and other quasi-capitalist films, scraped up from God knows where, but not a single Russian film is advertised on the hoardings. The government apparently has not yet got round to "restoring order" on the film front, and indeed on many other "fronts" officials with a disposition to take risks are quietly circumventing government policy. The party newspaper *Népszabadság* (People's Freedom), which those with a feeling for rhyme persist in calling *Néphazugság* (People's Lie), is still boycotted. Until recently the only other paper, *Népakarat* (a third paper is now published in the evening), published by the trade union federation, was less reticent about facts, but only early risers could get a copy, which was then passed from hand to hand; it was seriously contended in Budapest that *Népakarat* was more decent because there were only enough out-and-out traitors among journalists to turn out one paper.

Judged by Western standards, the economic situation is as bad as it could be, but Hungarians take comfort in saying that it was worse after the siege in 1945, yet Budapest recovered. Their main fear is that the five-year plan will be revived again in some form: the word "planned economy" is quite genuinely associated with "misery" and "shoddiness" in their minds. However, many young people say that "planning" could be good if it were not done by rascals and fools. Knowing their Marx, they believe that Russian policy will aim at reducing the exploitation of the workers by the State so as to eliminate the economic basis of discontent, while re-establishing, by successive turns of the screw, the terror which breeds political discipline. People will be allowed to eat better, and even to engage in small-scale capitalist activities such as retail trade and the running of "basement factories." On the other hand, they must be cured of their political presumptions.

All Six "Democratic Workers"

The Russians, acting through the "democratic workers of Hungary," of whom all six according to a popular saying, are ministers in Mr Kadar's government, seem determined to drive home the lesson that it is futile and self-destructive to challenge the political power of the State. Those who have done are trying to shelter behind an early tactical ambiguity in the official "line." The "line" at first admitted that there was a revolution in Hungary, which degenerated into a counter-revolution aimed at restoring "Horthyism" (whatever that may mean). People who took part in the revolution, and would not or could not escape to the West, are therefore adopting a tongue-in-cheek attitude. They pretend that their revolt was against "Stalinism," and not for the counter-revolutionary idea of free elections. However, the "line" has now veered around, the revolution has become an unfact, and only the counter-revolution remains in the official vocabulary. Pretensions no longer help. After sporadic arrests of individual members of the various revolutionary bodies, it is now the bodies as such which are attacked. Factory workers' councils are being bullied into reconstituting themselves. Their only remaining function will be to act in an advisory capacity to the government-appointed managers on "problems of production." Hungarian sarcasm finds much scope in quoting, with a straight face, Lenin's 1917 slogan: "All power to the soviets!"

Sarcasm, however, makes little impression on the new security police. On this curious band of men, now number-

SIMON ENGINEERING GROUP

Simon resources and experience are brought to bear on many industrial developments of national and international importance.

ALUMINIUM IN CANADA

At the great Kitimat smelter of Aluminum Company of Canada the principal raw material, alumina, is discharged from ocean-going ships at 180 tons per hour by a quay-side travelling pneumatic unloader designed and built by Simon Handling Engineers. Within the smelter several hundreds of special worm-driven jacks made by Turbine Gears play a vital part in operating the electric smelting furnaces. and a large number of motorised gear units have been ordered for operating further furnaces.

ing perhaps ten thousand, hinges the enforcement of the whole Kadar policy, for there is literally nobody who would obey the government were it not for them. "The influence of our government extends from the Parliament building all *the way to the No. 2 tram line*"—people in Budapest assure one solemnly. (The No. 2 tram runs just behind the Parliament building.) In fact, however, though as yet thinly and sporadically, it extends over the whole country, for the teams of security police are working with great industry, and people are beginning to realise that eventually these men will get round to looking into each nook and cranny of post-revolutionary Hungarian life. They are mostly former AVH professionals, reinforced by selected army officers and party and trade union officials. The latter are serving in order to save their fairly substantial salaries; they were dismissed by the Nagy government. It is said that facing the hatred and contempt of the population is a great strain on them, and they seldom venture to work alone.

On the December day when the *Washington Post* and the *Christian Science Monitor* published the inspired leak about American willingness to do a "deal" with Russia involving a mutual withdrawal from Europe, the mood of the Hungarian security police underwent a breathtaking change. The more articulate ones began rapidly to talk about democratic socialism and the "evolutionary way"; others buttonholed acquaintances and explained in undertones that they "hate Kadar as much as you do, but so long as the Russians are here, we must do this, you see." The prospect of being left alone with the population in a tête-à-tête far more terrible than the last days of October, 1956, was frightening them deeply. They argued that only a semblance of firm Communist rule could persuade the Russians to refrain from a "Baltic solution." The next day, both *Népszabadság* and *Népakorat* carried news of an official American denial of any intention to "trade" Nato for a Russian evacuation of the satellites. The people of Budapest cursed Mr Dulles and Admiral Radford, and the security police, their peace of mind restored, resumed their activities.

M. Mollet Pleads for Europe

FROM OUR PARIS CORRESPONDENT

M. MOLLET has gained a genuine victory in obtaining the French Assembly's approval, by 322 votes to 207, for the negotiations on the common market which the Six are holding in Brussels. He obtained it without putting a motion of confidence, and without submitting his negotiators in Brussels to the kind of conditional clauses that helped to wreck the European Defence Community Treaty. The resolution does lay down conditions on social charges, agriculture, and the French Union's links with the common market. But it asks, on social charges, for confirmation of what the government has obtained; on agriculture, for the preferential marketing system which it seems likely to obtain; and on the French Union for the acceptance of the principles it has already proposed. The last point will be the difficult one, and M. Mollet has accordingly suggested a conference of heads of governments to settle it before the end of February, the date when the common market—and Euratom—treaties are now due to be signed. The intransigence which the government will probably have to show on this point to satisfy the deputies, coupled with the difficulty with which M. Mollet won his victory over a host of doubts, still casts a shadow on the chances of the treaty.

The atmosphere, however, was quite unlike that which surrounded the EDC three years ago; since the Suez adventure, integration schemes, far from being suspected as "American plots," have a third force halo. Economically, too, three years' prosperity has given French industry a greater taste for expansion, and the farmers the headache of permanent surpluses to sell. Thus the employers' and farmers' associations, like the non-communist trade unions, are, with varying reservations, relatively favourable to the common market, at worst as the lesser of prospective evils. Since the convinced opponents and supporters of the common market are about 200 on either side, the parliamentary balance hinges on the conservative Independents and right-wing Radicals, who back European integration politically but are highly susceptible to protectionist arguments. Consequently the opponents of the customs union (the Communists, the Poujadists, and the few Mendèsistes in particular) have been on the defensive; they have been most effective when, as M. Mendès-France did in the Assembly, they paid lip-service to the European ideal while harping Cassandra-like on the catastrophic dangers of a common market. The result has been a searching debate on the real issues, in which the conservatives, wooed by all, have been torn between their general belief in Europe and their particular desire for more guarantees than M. Mollet has obtained in Brussels.

Flood of Demands

Those guarantees are in fact already astonishing. Nevertheless, the deputies unloosed a flood of demands for further guarantees. The massed ranks of the rural conservatives demanded that no decisions should be taken by the Council of Ministers of the customs union by a majority vote before agricultural policy had been unanimously fixed. Deputies asked, at one time or another, for the highest possible external tariff for the customs union; for the ironing out of all national differences in charges—social, and fiscal costs, transport and power included—as customs duties were lowered; for contributions to investments in the French Union fixed in strict proportion to each country's national income; and a host of other safeguards. A resolution signed by four ex-premiers, M. Edgar Faure (reputed an anti-European), but also by MM. Reynaud, Pinay and Laniel (known as "Europeans") even proposed to exclude all foreign firms established in Europe from the benefits of the common market; and to renounce the principle of an automatic, gradual lowering of duties, which is the basis not only of the common market but of Mr Macmillan's free trade zone as well. The conservatives, M. Reynaud in particular, quickly dismounted this war-horse; had they been prepared to fight on it, the outlook for ultimate ratification of the treaty would have been black. This "Four Premiers Resolution" leaves behind it a whiff of uncertainty for the future, since despite everything, deputies may plead, when ratification comes, that their votes were given the government this week essentially to strengthen it in the forthcoming Algerian debate in the United Nations. But, in fact, it seems clear the conservatives, especially M. Reynaud, an ardent European of long standing, went further than they had intended and promptly retreated.

The French negotiators at Brussels may well obtain substantial concessions on agriculture and something on the French Union. In France, the chances of the common market treaty being ratified may well depend on the government's future relations with the Independents. One great complicating factor in these relations has so far been surprisingly absent: arguments against the common market based on the coming balance of payments crisis. M. Maurice Faure, the brilliant deputy minister for foreign affairs, even won applause from the right when he said: "Supposing the common market took effect next January 1st: the first reduction of customs duties would follow on January 1, 1959. We shall have to solve our payments crisis long before two years are out." This may not be the mood in July when the bill for Suez must be met by new taxes and the country's trading difficulties will be clearer to the public. M. Mendès-France has once more argued that the French economy must be reformed before it is plunged into a common market. The European reply, best expressed by M. Pleven, is that those reforms cannot be obtained unless competition in a common market stimulates French industry and agriculture to reform themselves. The traditional French response would have been to back M. Mendès-France's view. But the majority this week chose the European thesis.

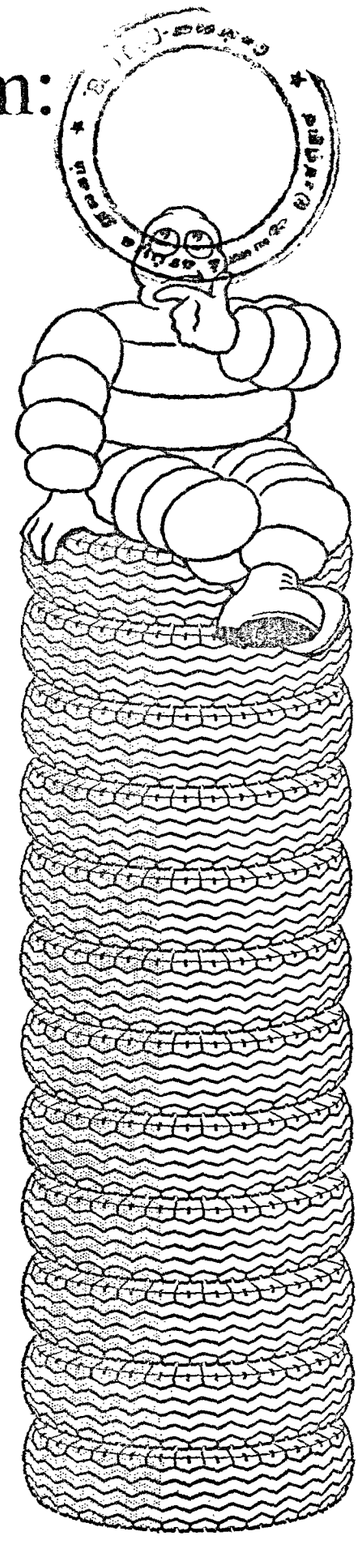
Whether temporary or not, this choice would have been unthinkable even a year ago. It may be that, though the common market involves risks, the whole point of setting up a community is, as M. Mollet said, that all are responsible for each, and that in such circumstances catastrophic situations will not be allowed to occur. It is also probably true that, as M. Pleven said, the common market, which involves only a fifth to a quarter of French trade, and is to be introduced over 12 to 17 years, can hardly be called a revolution. But the change in mental attitudes required to shift the whole direction of the protected French economy—and in the long run French policy as a whole—is a revolution. It is still unfinished, and this week's vote still leaves an element of uncertainty. Nevertheless, the vote seems a considerable step towards ratification of the treaty.

Moscow's Moslems

RUSSIA's own Moslems are now in the limelight. The Uzbek, Kazakh, Turkmen, Tadjik and Kirgiz Soviet republics of Central Asia have just been awarded the order of Lenin for their services. Mr Khrushchev himself went to Tashkent to present the Uzbeks with their medal, while President Voroshilov, Marshal Bulganin and Mr Mikoyan have been carrying out the same duty elsewhere in Soviet Central Asia. Ostensibly these republics have won their distinctions for economic achievements, but the timing of the ceremonies seems to suggest that all this fuss is not unconnected with events elsewhere in the Arab world.

Admittedly, last year was a successful one for the economy of these countries, particularly in agriculture. The bumper crop on the reclaimed virgin lands of Kazakhstan is the main reason why last year's Soviet harvest was the biggest ever; with deliveries to the state of over 16 million tons Kazakhstan has become the largest Soviet granary. Last year was apparently favourable for cotton as well and for the first time the total crop probably exceeded 4 million tons, since 3.8 million tons were delivered to the state.

Another period of rapid industrialisation is scheduled for Central Asia in the current five year plan. Kazakhstan, with a fast expanding output of coal, iron ore and copper,



leads the way. Oil production in the Uzbek and Turkmen republics is to be stepped up and the engineering industries are being fostered throughout the area on the basis of local fuel and ore resources. This continued economic expansion brings with it a rapid growth of an educated professional class in an area which after the first world war was still predominantly illiterate.

The existence of a large native *intelligentsia* normally gives rise to a nationalist movement. Although there are many Russians and some Ukrainians in key posts in Central Asia, the industrialisation drive was, and still is, compelled to rely largely on local skill. Stalin's attempts to "russify" Central Asia provoked a great deal of unrest and after his death it was decided to pay more attention to national susceptibilities. Books describing Tsarist conquests as "liberation" and national heroes as "foreign agents" were in process of being withdrawn or revised. But the campaign seems to have been suspended. The Soviet leaders may consider that a measure of economic decentralisation, foreshadowed recently in Moscow, is a safer way at this stage to keep the Central Asian republics contented.

News about nationalist unrest in recent months has been coming from the Ukraine, the Baltic states or the Caucasus rather than from Central Asia. There, the Soviet press still seems to complain chiefly about "feudal survivals," the preservation of old Moslem practices or the refusal to admit the equal status of women. The present blandishments may thus be designed as a prophylactic measure. Moscow may well fear that one does not play with Islam without risks and that the wave of nationalist feeling in Moslem countries might well spread to what many consider as Russia's soft underbelly in Central Asia. On the other hand, all this may be merely window-dressing aimed at attracting other Moslem customers.

Accounting problem:

HOW COULD MICHELIN DISCOVER THEIR OVERALL STOCK POSITION *AT A MOMENT'S NOTICE?*

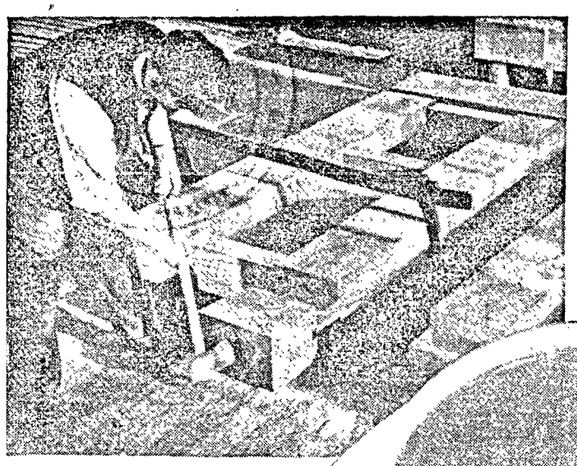
28 LEDGERS, one for each depot *plus* one for Head Office, had to be referred to before Michelin could discover the overall position for any one of their 900 items of stock. As the demand was increasing, this meant depots got dangerously low in certain items and costly last-minute transfers often had to be made.

Like many firms, big and small, faced with this kind of problem, they called in Burroughs.

SOLUTION. In co-operation with Michelin, our representative evolved a complete system, from the collecting and summarizing of original data to the storage of the final records; this system was based on six Burroughs Sensimatics. All movements of stock—despatches, sales, transfers—are recorded by the Sensimatics in such a form that the machine Supervisor can find out *within seconds* the stock position for any size of tyre. Total in the Company's possession, quantity in Central Stores, total out at depots, total in individual depots—all available at a glance. The result is more effective allocation of new stocks, fewer emergency transfers, and infinitely quicker returns of monthly figures.

HOW BURROUGHS MIGHT BE ABLE TO HELP YOU

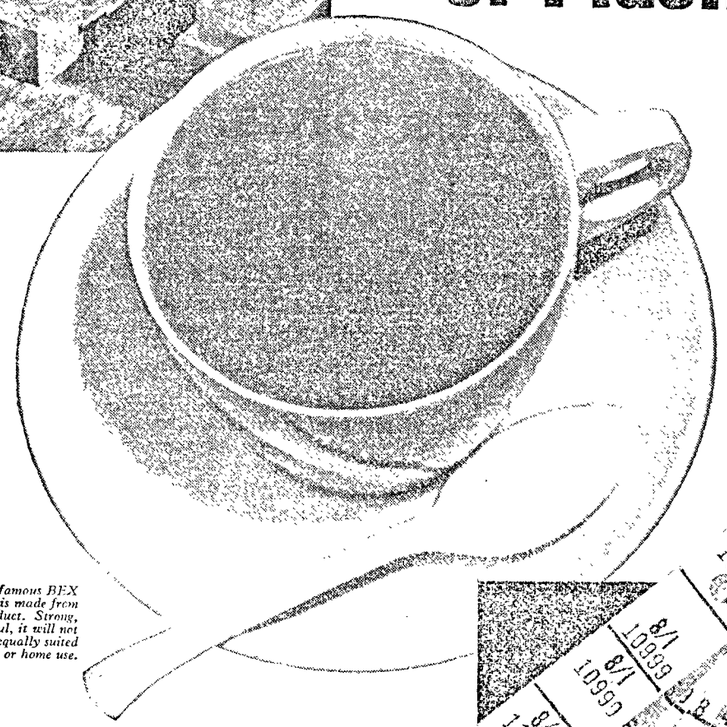
How many of your staff are engaged in figure-work? How long does it take you to get the figures you want? Are the figures always accurate when you do get them?



Burroughs Accounting Machines will do this figure-work for you without tying down a lot of staff *and* do it far more speedily and far more accurately. Burroughs make machines suited to every size of business and you have everything to gain by consulting them.

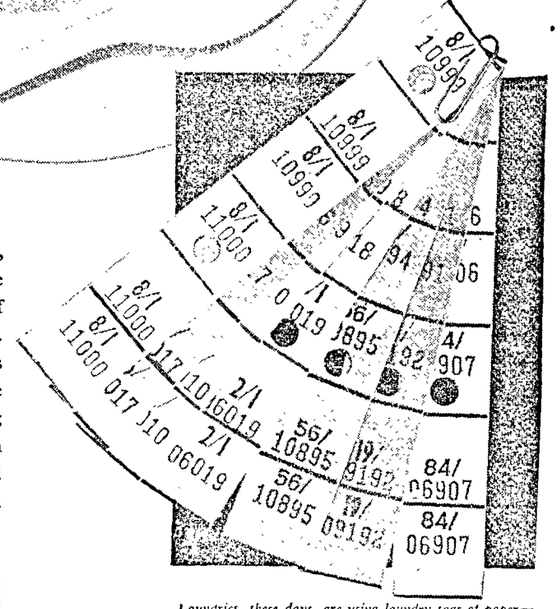
They will advise *against* buying one of their machines if they don't think you need one. Their advice, of course, is free. The local Burroughs office is in the phone book, or you can write direct to London if you prefer.

Burroughs



The most experienced manufacturers of Adding, Calculating, Accounting, Typewriter-Accounting, Statistical and Microfilm Equipment

BURROUGHS ADDING MACHINE LTD., 356-366 OXFORD STREET, LONDON, W.1



British Waterways workman assembling a lock gate at Tipton, Staffs. The gate is the first of its kind to rely on resin adhesives instead of eighty cold driven rivets, and Beetle Adhesive—a B.I.P. product—is the chosen bonding material.

the Wonder of Plastics

This new cup in the famous BEX range of housewares is made from Melmex—a B.I.P. product. Strong, shapely and colourful, it will not easily chip or crack and is equally suited to industrial catering or home use.

In laundries and locks, in tableware and textiles, plastics today play their part. Their role may be contributory, it may be fundamental, but the wonder of plastics is in their versatility, their infinite possibilities. Types and grades are innumerable, each with its own properties—and limitations—presenting a wide field of choice to the intending user. The leading plastics materials manufacturers maintain extensive consultative and development services and none is better qualified to advise and assist than B.I.P.

Laundries, these days, are using laundry tags of paper—wet-strengthened with Beetle Resins—a B.I.P. product. Even wet scrubbing has no effect on these tough tags. (Wet-strengthened paper made by Robert Craig & Son Ltd., a subsidiary of the Associated Paper Mills Ltd.)

B.I.P. SERVICES

The full resources of the B.I.P. Research, Technical Development and Design services are at the disposal of manufacturers interested in the possibilities of plastics. Advice will gladly be given on any problem concerning plastics applications, irrespective of the type of material involved.

THE BUSINESS WORLD

Bankers and Bank Rate

THURSDAY brought disappointment to the many people in the City and in the country who had convinced themselves that a reduction in Bank rate from the high level of 5½ per cent to which it was raised nearly twelve months ago would occur this week. It would have gone well with the show of confidence that Ministers have been displaying since the new government took office. It had been signalled for several weeks by the fall in the Treasury Bill rate—unusually sharp at the tender a week ago. And in a week when sterling regained and topped its parity for the first time since June last year, a reduction in Bank rate might have seemed the fitting crowning of a new and precocious mood of confidence that the country, rightly or wrongly, has caught. But it did not occur.

The arguments for a reduction in Bank rate, though not nearly as axiomatic as some would believe, have clearly drawn strength from the annual statements of the bank chairmen. This week Lord Aldenham, of the Westminster Bank, echoing the words of the Governor of the Bank of England before the Suez crisis, has emphasised that "we shall none of us feel comfortable" until short-term rates can be reduced. He rubs in the point, of which much has been made since money rates were raised, that the cost of interest on the sterling balances held by overseas countries has become burdensome—joining on this point with his colleagues, Mr A. W. Tuke, of Barclays; Sir Thomas Barlow, of the District Bank; and Sir Eric Carpenter, of Williams Deacon's.

Lord Aldenham, like Sir Eric Carpenter, also complains that high short-term interest rates check capital investment in industry. This is a criticism on a different plane. The purpose of monetary restraint is to protect the economy against inflation by cutting down an excess of demand; the restraint rise in the cost of the national debt and of the sterling balances is part of the price that has to be paid. But the argument against dear money on the ground that it impedes investment goes far deeper; it attacks the whole process, and not merely its consequential costs.

At this central point of the argument, some of the bankers and probably a majority of the laity meet on common ground. But it is ground full of pitfalls. One of the biggest is forcefully cleared by Sir Oliver Franks, of Lloyds Bank. What limits investment is the supply of savings. When the economy is inflated because investment runs ahead of spontaneous savings, then the process of disinflation can only take the form of curtailing investment, unless and until saving is increased by the stimulus of higher interest rates or by smaller Government spending. The point is made implicitly by Lord Aldenham; he would welcome "a small reduction in short-term rates," but only on condition that it could be made "without giving the green light for a faster increase in our investment programme than our current savings enable us to afford." To argue for an easing of interest rates on the ground that high rates are a deterrent to investment is to get caught in a logical *cul de sac*. The justification for an easing of high rates is not that high rates deter, but that the deterrent has become less necessary and can be safely relaxed. But the timing and conditions of a reversal of policy are matters on which the bankers are not prepared to commit themselves at this stage. Sir Eric Carpenter, for example, admits the fear that investment might be unduly limited "if restrictions were kept on for too long"; but he finds no evidence that the credit squeeze had any disastrous effect on industrial investment last year, and expresses no such apprehension about 1957. And Mr D. J. Robarts, of the National Provincial, argues that the investment programmes already under way will continue to impose "for a considerable period" an excessive

strain on the country's productive resources simply because the deterrent effects of higher rates and tighter money take so long to make themselves felt.

Among the bankers, then, there are differences in emphasis about the effects of high interest rates on investment and economic activity that run as deep as the differences in public discussion. Yet the general tone of their statements, with all their differences of emphasis, is cautionary. It is one thing to argue the feasibility of a further reduction in short-term money rates; it is quite another thing (they clearly suggest) to be too precipitate in changing the broad direction of monetary policy—to stop taking the medicine before the fever of inflation has been demonstrably reduced. The bankers, like more ordinary men, find it difficult at this moment to assess the direct and psychological effects of the Suez crisis. Several of them hold that it has provoked a mixture of inflationary and deflationary forces—though they find it impossible to guess where the balance will eventually lie. But Sir Oliver Franks, at least, is emphatic about the effects that are visible to date. Suez has "complicated still further the problem of eradicating inflation"; this remains for the present "the great danger," and he concludes that "the maintenance of overall monetary restraint is more imperative than before."

Outright views of this kind are a welcome retort to the prevalent boosting talk that is to be heard in other parts of the City. A cut in rates will make many people feel happy. But the only economic ill that would justify a major relaxation of monetary discipline would be the serious under-use of British resources now or within the predictable future. That might happen as the resultant of Suez; but it would presuppose a shattering break in business confidence of which there is, at present, no sight whatsoever. It is safer, though it may not be more popular, to resist the argument for a quick (if small) reduction in Bank rate, and to weld all acts of economic policy into a consistent whole that will, when the time comes, provide a springboard for expansion, but not so springy that the economy balloons into mid-air in yet another inflationary somersault. There are, in fact, three main ingredients of such a policy. One, when the time is plainly right for it, is a loosening of the curb of high interest rates on investment plans. Another, for which the time has long been overdue, is a reduction of government expenditures and a reversal of the whole drift of policy that has compelled Chancellors to rely upon saving enforced through budget surpluses. On this last point Sir Oliver Franks shares the views of most of the other bank chairmen, though he does not join in their plea for government retrenchment.

The third component is a more technical one, and it explains why the bankers have concentrated their arguments for a reduction in money rates on those that govern short-term bills and bonds. One main feature of last year's banking experience (clearly evident in the accompanying summary of the year-end balance sheets of the banks) was that the relatively high liquidity with which the banking system entered 1956 was still intact at the end of the year. In 1955, the liquidity of the banks had been severely squeezed (and with it their ability to lend and to hold investments); during 1956, the average ratio of liquid assets to deposits never fell below 33.1 per cent, and the banks were never forced to protect their liquid assets by the kind of massive selling of gilt-edged securities that was necessary in 1955. The result is that the banking system has ceased to be taut and has been allowed to become flaccid.

Corrective action for this state of affairs calls for a substantial funding of floating debt (which counts as liquid assets in the banks' calculations of their own policy) into long-term debt (preferably subscribed by the public by drafts on their deposits). This point is recognised by most of the bank chairmen, and most explicitly by Sir Oliver Franks, who wants to see banking liquidity so tightened that it resumes its normal place "as the major influence preventing an undue expansion of bank credit." But a dilemma now appears. The greatest scope for such funding is encouraged by a fall in short-term rates relatively to long-term rates. High short-term rates impede the process of funding because they encourage people to keep their funds in the most liquid forms. The bankers, then, are entirely logical in the emphasis that they put on the appropriateness of a reduction in short-term rates and in their silence (ambiguous though it may be) on the desirable course for long-term rates. So a Gilbertian proposition arises: a reduction in Bank rate could be disinflationary, provided that the pressure taken off the short-term market were switched to the long. And, as the final step in the argument, the tightening of liquidity that would then result should enable the authorities to dispense with the control of bank advances by reference to governmental directives—a strait-jacket that all bankers heartily dislike.

But the creation of conditions in which funding of excessive short-term debt is encouraged remains something wholly apart from a major reversal of monetary policy. Because many people want this to happen does not make it good for the British economy. The bankers reach no conclusions that the time for radical change has arrived; and most objective observers will agree.

Is Water Short?

THE one natural resource of which this country would seem to be in the least danger of running short is surely water. Rainfall averaging 40 inches a year, or rather more than 2,500 gallons a day per person, gives Britain a potential supply vastly greater than either its present or its likely future needs. Not all this water could be practically or economically tapped. But even after a generous allowance is made for normal loss by evaporation (probably about half) and for the minimum flow needs of rivers and streams, the total volume of water that could be tapped from the remainder still comfortably exceeds the present average of some 50 gallons a head that is drawn daily from the public supply system.

Bitter complaints of shortage from several areas in the last few years are therefore hardly symptoms of a genuine dearth of water. Nor do temporary and local shortages today spring wholly from the awkward fact that not all this annual bounty falls in the right part of the country or at the right times of the year. No water engineer has yet been baffled by the purely technical problem of making good deficiencies of rainfall in time and space in this country. Economic limits to the development of further water sources are also a long way off, though most of the richer sources have already been tapped and opening up new ones may become relatively more expensive. The water supply industry's chief difficulty for the best part of the last two decades, however, has been that of securing adequate financial and physical resources to undertake the replacement and expansion that it—and many of its customers—have considered necessary.

Postwar restrictions upon investment by water undertakings have in fact been continued to the point where it would seem positively harmful not to slacken the screw a notch or two. In a number of areas the total volume of water currently available from the public system has either placed definite limits upon the pace of industrial expansion for the time being or has involved restrictions upon the use of water in recent summer dry spells of a more severe nature than in most other parts of the country. For a while in 1954 and 1955 the limits placed upon capital spending by this industry were eased considerably, but restrictions were imposed again in October, 1955. Between 1948 and 1955, it has been estimated, the industry spent about £230 million gross on capital works, but in net terms this was not enough for the industry to overtake its heavy wartime arrears in its replacement and development let alone to keep abreast of all the increases and shifts in demand for water since the thirties.

In October, 1955, the Minister of Housing invited the Central Advisory Water Committee (which had been revived earlier that year after an inept economy gesture in 1952) to advise on the supply of and demand for water. Two sub-committees were appointed: one to survey the country's water resources and the other to consider the extent to which demand was increasing and the cost of meeting it. Neither sub-committee has concluded its task. The second, however, has probably found its work handicapped by the sheer lack of information about water usage in this country—and precisely where it is drawn from. Detailed consumption figures are not readily obtainable even for the public supply system, which is in the hands of nearly 1,250 separate undertakings. Total drawings are now approaching 2,500 million gallons a day, and have been growing since before the war at the rate of roughly two per cent a year. But it is virtually impossible to estimate where all this water is used. Just under two-thirds is supplied to non-metered users, which very roughly can be identified with domestic and commercial consumers, and most of the balance would probably represent drawings by industry.

★

Over and above this figure, however, a substantial quantity of water is pumped, mainly again by industry, from private bore-holes or drawn from rivers, streams, and canals. Just how much water is in fact thus obtained from outside the public supply no one can say, but industry certainly draws more from outside sources than it gets from local undertakings. It seems probable that water consumption from all sources has been rising in recent years at an annual rate of rather more than two per cent, which has given rise to guesses, ranging from 15 years to 30, of the period in which the country's demand for water might double. One can expect, presumably, that domestic consumption will continue to grow beyond the present average level of 30-40 gallons daily per person.

Agricultural demand is also likely to increase ; the value of intensive irrigation is becoming more widely recognised as an aid to higher yields, and the relatively expensive programme of linking isolated farmsteads to the public mains is still a cherished object of rural development policy. But both of these sectors of water demand may be overshadowed by the mounting needs of industry. Most of the growing industries upon which this country's hopes of higher living standards depend have enormous appetites for water, and the availability of copious supplies has become an increasingly important factor in deciding the location of their new plant.

Estimates of the present water consumption by some industries seem staggering. The electricity supply industry, which is one of the largest consumers, uses up to 15,000 million gallons a day. Nuclear power stations will need relatively more, even more than conventional stations. Dounreay, it is estimated, will need about 200,000 gallons of fresh water daily. The steel industry, which uses about 350 million gallons a day, and the chemical industry, which takes about 820 million gallons a day (against 600 million in 1946 and a possible 1,200 million in 1966) are also large users. Most of this water can, of course, be re-used and re-cycling is extensively practised, but mainly in areas where there are physical—or economic—limits to greater supplies. In steel production about nine-tenths is used again, so that actual rate of consumption is probably only about 35 million gallons a day—say 3-4 tons net of water per ton of steel. Most of this water, too, need not be good enough to drink (though it often has to meet certain specifications about quality), and is not a direct burden on local water undertakings. The paper industry, for example (which used, it estimates, about 200 million gallons daily last year and may need 250 million gallons a day by 1966), drew only four per cent of its total consumption from the public mains.

★

Nevertheless, the growing demands from industry borne by some water undertakings are causing a certain amount of alarm, particularly where the marginal capacity of existing supply and drainage arrangements is inadequate for further development. A scrutiny of recent consumption figures for twelve large undertakings gives some point to this. Between them these twelve undertakings supply about 7½ million people, a seventh of the total population but probably a rather larger part of industry. In 1955 they supplied just over 350 million gallons a day, 44 per cent more than in 1938. During this period of seventeen years their total population grew by six per cent ; consumption by users drawing unmetered supplies rose by eight per cent a head ; and metered consumption (mainly industrial) more than doubled.

The first conclusion that the second sub-committee of the Central Advisory Water Committee may well draw from its own study of demand for water is that the Ministry must expect to be rather more liberal in granting permission to the industry to undertake new schemes of development. It may also exhort industry to conserve their present supplies of water by adopting practical methods of re-cycling in areas where physical limits upon the rate of drawings have not already made this necessary. If industrial production rises at anything like the Butlerian rate, the pressure of demand for water might become acute and the cost of supplying it a major programme. This will be another powerful argument for the Ministry to intensify its pressure on the industry to re-group most of its small, local undertakings into units large enough to promote and operate large capital works. The history of the water supply industry is marked by a succession of amalgamations and absorptions of neighbouring authorities, as the demands placed upon any one of them have become too large for its own finances and its indigenous sources. Since 1945 the number of separate undertakings has fallen by about 150, but there are still nearly 1,250—which is at least six times as many as are needed.

The four largest undertakings, the Metropolitan Water Board and Birmingham, Manchester, and Liverpool Corporations, between them supply nearly a quarter of England and Wales, and the 150 largest supply three-quarters. Efficiency does not necessarily coincide with size even in an industry where overheads are as large a proportion of costs as in water supply, but the most inefficient suppliers, in terms of ability to meet present and future demands, are found among the multiplicity of puny undertakings scattered over many rural areas and on the fringe of the major centres of population and industry. Efficiency is also far from determined by the nature of the water undertaking. There are about a hundred statutory water companies, supplying nearly a fifth of Britain, including some very large and some very go-ahead concerns. Undertakings run by town or district councils, or by joint boards on which several councils are represented (which sometimes make for what seems to be a top-heavy organisation) also vary greatly in size and efficiency.

But if the Ministry, by using its powers under the 1945 Water Act, which include the power to make a compulsory order for re-grouping, can cut the present number of separate undertakings by half in the next few years it will probably be well pleased. This Act placed upon the Ministry (originally the Ministry of Health) the duty of promoting "the conservation and proper use of water resources and the provision of water supplies in England and Wales, and to secure the effective execution by water undertakers, under (its) control and direction, of a national water policy." Since 1945 the Ministry's powers of direction have been lightly used, and its main task has had to be an unpleasant one of choosing between many urgent schemes of development. Its emphasis ought now perhaps to be to secure water supply a higher place in the queue.

Business Notes

Bank Rate Markets

THE Stock Exchange at the moment is a Bank rate dominated market. It happened that the decision this week was against a change and that the market, expecting something soon rather than something immediate, was scarcely affected. Medium-dated stock rose a little further, suggesting that institutions were still buying, and long-dated stocks declined, suggesting that speculators were not. But what people expected about money rates (and what many of them still expect) seems capable of continuing to dominate markets until the issue is put beyond doubt. Gilt edged have naturally led the rally and as the table shows it can be argued that the market in general already discounts rather more than a bank rate reduction of ½ per cent. With few exceptions yields are more than a half per cent per annum lower than they were when the market reached its low point last November, and almost a quarter per cent lower than they were when bank rate was raised to 5½ per cent in February last year.

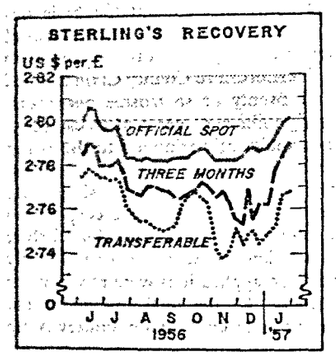
HOW INTEREST RATES HAVE MOVED

	Feb. 16, '56 Bank rate raised to 5½%	Market trough Nov. 30, '56	Latest
	%	%	%
Treasury bill rate (as a rate of interest)	5 9/16	5 9/32	4 3/8
7-day loans to Local Authorities	5 3/16	5 1/8	5 1/8
Gross Redemption yields	£ s. d.	£ s. d.	£ s. d.
Conversion 4% 1957–58	5 0 8	5 9 1	4 17 11
Exchequer 2% 1960	5 3 2	4 17 6	4 14 1
Electricity 4½% 1967–69	5 3 3	5 14 4	5 2 8
Treasury 3½% 1979–81	5 0 1	5 8 9	4 19 8
Transport 3% 1978–88	4 19 2	5 4 7	4 15 0
Funding 3½% 1999–2004	4 15 4	5 0 1	4 11 6

★

Industrial shares have moved up also. *The Economist* indicator at 198.0 shows a further rise of 5.2 on the week ended on Wednesday, and prices remained firm without much further advance on Thursday. Business has also expanded ; the number of bargains marked in the first three days of this week (which is a poor substitute for a real measure of trading volume) exceeded 40,000, the highest since the halcyon days of the summer of 1955. But buying of industrial shares has still been specialised and reasonably circumspect.

Issue Market Revival



MARKETS now offer much encouragement to the sponsors of new issues and those of them that have been lucky enough to get an early date look forward with some assurance to success. The heavily stagged 5¾ per cent Tanganyika loan set the pace. Applicants for up to £3,000 stock received only £100, and above that amount the basis was about 5 per cent of the amount applied for. A premium of 2½ points over the issue price (of £99½) was established in the first day's dealings. Hertfordshire County Council stood next on a waiting list of twenty or so trustee borrowers. The price of 98½ for its £5 million 5¼ per cent stock, 1965, as it turned out, was not sufficiently trimmed to the rising market. Hertfordshire is an excellent borrower, and the gross redemption yield of £5 10s. per cent to the single date was attractive compared with some comparable corporation stocks. The list closed promptly on Thursday (long before the Bank rate decision was known) with the issue heavily oversubscribed. Over 21,000 applications were received for about £63 million of stock. Of the total amount of the issue, £1.6 million had been taken firm on underwriting terms.

The first big borrower in the industrial market turned out to be Ranks, the flour milling company, which has not raised capital since the end of control or indeed since the end of the war. It is now to raise about £6¼ million in a one for three rights issue of 9,231,197 10s. ordinary shares at 14s. per share and to use the money to modernise mills and extend storage facilities. The issue is combined with a 100 per cent free scrip issue which takes the form of increasing the nominal value of each existing ordinary share from 5s. to 10s. The total ordinary dividend of 20 per cent for the past year thus becomes 10 per cent on the new capital. An interim payment of 5 per cent (equal to 2½ per cent on the new capital) has already been announced, and the final dividend for which the new cash issue will also rank is expected to be 7½ per cent. On a 10 per cent annual dividend the new shares yield £7 2s. 10d. per cent. The price for the existing shares is 17s. 1½d. which makes the rights worth approximately 10d. per share—a margin doubtless sufficient in a strong market to ensure success. Dealings (nil paid) in the new shares are not expected to begin until February 18th.

Further big industrial refinancing operations are queueing up to follow those already launched. This week will see the underwriting by the London and Yorkshire Trust of £15 million of convertible loan stock for the Bowater Paper Corporation. The stock, designed to appeal to investors in North America as well as in this country, is expected to be modelled on the highly popular ICI loan stock. Associated Commercial Vehicles is also planning an issue of £3½ million loan stock without conversion rights.

Sterling Touches Par

STERLING staged its third big advance at the beginning of this week since the resurgence started with the announcement of the IMF loan in mid-December; and the progress has been dramatised by the fact that on Tuesday the rate crossed the parity line of $2.80 though it slipped back to 2.79\frac{13}{16}$-$\frac{7}{8}$ on Thursday. Sterling has also advanced against most Continental currencies. The foreign exchange market has been fairly quiet and the movements in rates this week have in the main been due to genuine commercial purchases of sterling coming on to a market in which supplies can no longer be made available by continued running down of working balances and other capital transactions. The period of seasonal strength for sterling is beginning and on Tuesday, when the rate against the dollar shot up from 2.79$\frac{1}{4}$ to 2.80$\frac{1}{8}$, the most potent influence in the market appeared to be commercial buying to cover sterling area commodity transactions.

In addition to the now favourable trend of commercial operations there is also a persistent, though by no means massive, covering of bear accounts. Some speculators in the New York market have been cutting their losses—and the loss has been considerable, as may be gauged from the fact that the outright three months' rate for sterling in New York was 2.76\frac{3}{8}$ at the beginning of the year and has since risen to 2.79\frac{1}{4}$. This rise is the joint product of the improvement in the official spot rate and of a further narrowing of the discount on forward sterling. The discount on forward sterling against the dollar has now returned to the equilibrium of interest rate parity. With the New York bill rate at 3$\frac{1}{4}$ per cent and the comparable rate in London at 4$\frac{1}{2}$ per cent the interest rate differential is 1$\frac{1}{4}$ per cent. In terms of the three months' rate on sterling against the dollar, this would be equal to a discount of 0.98 cents. The three months' discount narrowed early this week to a quotation of 1 to $\frac{3}{4}$ cents so that the actual rate quoted then exactly measured the interest differential. The three months' discount subsequently widened to 1$\frac{1}{4}$-1$\frac{3}{8}$ cents but, new bear accounts are not being opened and some of the outstanding positions are being covered, usually by a purchase of spot sterling. It may be expected that more bears will be on the run before long.

Less American Oil for Europe

IN terms of Texan commercial interest, the arguments against any increase in allowable output there (which are discussed in an article on page 290) are not as unreasonable as they appear from Europe. There is no reason at present to assume that the commission will find them any less compelling when it comes to decide about Texas output in March. What, then, are the practical effects of this restriction on Europe's oil supplies?

Of the 90,000 barrels a day increase granted, probably not much more than half will be available for Europe. The increase is "across the board": it will include some wells that cannot achieve their allowable output, and others so placed that they cannot transport the extra output to the coast. The MEEC committee of oil companies in Washington now estimates that supplies of American oil to Europe in the first quarter of 1957, which had been planned to exceed 500,000 barrels a day, will now average little more than 130,000 barrels a day of crude oil and just over 200,000 barrels a day of products—and that of the products the major share would be in the form of gasoline, which Europe does not need as urgently as fuel oil. Even these crude oil figures allow for shipments of 50,000 barrels a day over the quarter out of stocks, a feat that will be hard to achieve as the most accessible stocks have already been depleted. On the most hopeful construction, therefore, supplies of oil from the United States during the quarter are likely to fall some 2-300,000 barrels a day below the least that had been expected.

Fortunately crude output in Venezuela has risen steadily and is now some 350,000 barrels a day higher than it was when the emergency began. But some of this extra output is going to refineries on the East coast of the United States, which have been unable to make good from Texas the Middle East crude that they formerly imported. For the same reason some 60-80,000 barrels a day of Middle East crude are still being hauled across the Atlantic to the eastern seaboard of the United States—a glaring exception to the planned economy in the use of scarce tanker tonnage.

Because supplies in the Gulf of Mexico have fallen below expectations a much larger number of tankers than had been intended has now been routed back to the Persian Gulf round the Cape. As a result, even an unexpected improvment in the availability of Texas crude could not help much now: these tankers could not return to the Caribbean until after making a double trip round the Cape and discharging their cargoes in Europe. There remains only the possibility of the rapid partial reopening of the IPC pipelines through Syria, but the prospects of a favourable decision by the Syrian government are now dimmer than they were last week, and in any event it would take time to re-route tankers back to the Mediterranean terminals. The sum of this depressing story is that Europe's fuel oil supplies, which are expected to amount to only 65 per cent of normal consumption in the 40-day period ending on February 10th, may fall even further in the rest of February and March.

Britain's Oil Stocks

LORD MILLS has given British industry his guarantee that further restrictions on the use of fuel oil will not be imposed before the end of February, but he has made no promises beyond that time. As the consumption of fuel oil in Britain is averaging about 80 per cent of normal, while supplies are arriving at a rate of only about 65 per cent of normal, and may fall even further in February and March, it is clear that further restrictions on consumption can be avoided only by making substantial withdrawals from stocks. Fortunately for industry, both fuel oil tankage and the actual level of fuel oil stocks in Britain are considerably higher in relation to consumption than they are in the rest of Europe, and much higher than they are in Italy, France and the Scandinavian countries. By the middle of April, moreover, some seasonal decline in the consumption of fuel should begin to make itself felt, both in Europe and in America. But nothing much can be done now to change the depressing supply picture significantly before the end of March. Therefore a decision not to impose further restrictions in March would be justified only if the prospects for an increase in arrivals of fuel oil in April were sufficiently bright to warrant running stocks down to a dangerously low level in March.

In one respect the British supply position should improve a little. Owing to their extensive ownership of overseas oil resources and tankers the British oil companies could have obtained for the British market more than its fair share of the supplies available. In fact, this "law of the jungle" was never followed, and it appears that the oil companies have leant over backwards to honour their obligations to their customers on the Continent, even at the expense of consumers in Britain, on the reasonable grounds that stocks were relatively high in Britain. Consequently the new procedures that have been agreed in the OEEC oil committee, which will equalise new supplies between all European countries (though without correcting the existing disparity in stocks), should mean that Britain will be allocated rather more oil than it would have received if the oil companies had continued to favour their Continental customers. This will be true even though Britain has made no claim on the "kitty" of supplementary supplies which is being allocated initially to Italy, France, and the Scandinavian and other countries whose position is much more desperate than Britain's.

Verdict on the Vulcan

IT will never be quite clear what happened to the Vulcan bomber that crashed in the rain at London Airport last October. Just before Christmas Mr Nigel Birch gave the House of Commons what could be called the RAF version of the accident, namely, that the pilot had left it dangerously late to break off the attempted landing if conditions looked too difficult, but that the immediate cause of the accident was failure of the ground controller to warn him that he was flying dangerously low. This did not satisfy the Ministry of Transport, which commissioned Dr Touch, electronics expert at the Ministry of Supply, to carry out a separate inquiry into the way the ground control system had worked. His findings were published this week.

Dr Touch says frankly that the evidence was conflicting and scanty. His report leaves a picture of a relatively new ground controller, who only received his rating as GCA controller late in August, monitoring an aircraft that oscillated unevenly about the glide path. It was coming in faster than civil aircraft normally do and the controller instinctively speeded up his instructions, rattling them off at 146 words a minute compared to the average of 80 to 126 words for similar landings. A more polished controller might have been able to help the pilot correct his deviations from the glide path, which probably contributed to the final disaster. Having been told that he was 80 feet too high the pilot lost height so rapidly that the aircraft hit the ground more than half a mile from the end of the runway.

Could the controller have saved the aircraft? The last information he gave the pilot about height was that he was 80 feet above the correct path; after that he was preoccupied with the Vulcan's side-to-side deviations and did not mention height again. Dr Touch stresses that there could be no excuse for not warning the pilot he was dangerously near the ground, yet the critical period of three to five seconds after the last message about height, the only time during which corrective action might have worked, was so short that the controller could not be blamed for not giving the warning. The time to save the Vulcan, if it could have been saved at all, was much earlier along its approach to the runway.

There will be widespread agreement with Dr Touch's recommendations that "military aircraft of advanced design" should not normally land at civil airports—where the controllers have not been trained to deal with them. He also touched on a point of general importance to all civil aircraft. Aircraft are landing at higher and higher speeds, and the control system has to be streamlined to keep pace with them. Unnecessary words and unnecessary information must be cut out and the GCA controller, who now gets part of his information from his assistant, ought to be able to see all the data about the aircraft on one screen in front of him. These changes are already being discussed and some of them introduced. The Vulcan accident serves to show how vital they are.

Appointments and Disappointments

ONE of the outstanding appointments to the National Coal Board was announced this week: Mr H. W. Hembry was appointed, presumably to take broad responsibility for finance. The board has been without any such finance member since Mr J. Latham became deputy chairman last year, and Mr Latham appears to have continued to carry this responsibility along with his many extra ones. Mr Hembry, who became deputy chairman of the board's Northern Division early in 1955, had been its finance director for the previous five years. A successor to Mr W. H. Sales, who leaves the Coal Board at the end of the month to become chairman of its Yorkshire Division, has still to be appointed; and since Mr Sales, an ex-miner, is responsible for the board's labour relations, this appointment is a crucial one. The new Minister of Power inherits the chance to introduce some alternative experience into the industry's top-level wage bargaining. Other "appointments and disappointments" may follow.

Arriving from outside into the sphere of nationalised industry, Sir Percy Mills has no doubt already encountered the difficulties that beset any minister trying to find the best men for the top jobs in these industries. Among members of the central and divisional boards, the

range of salaries and conditions of service is fairly narrow; key men asked to accept bigger responsibilities—and often positions much more vulnerable to public criticism—can be offered hardly any incentive in net income. This means that some of the best men in an industry such as coal prefer to stay where they are rather than move upward in the hierarchy. It also means, unfortunately, that the only moves which may attract them are moves out of the industry, when private enterprise bids; and this seems largely a one-way traffic. The last Minister of Fuel and Power made perfectly plain how he was hampered in getting the right men for the boards by the Treasury's dog-in-the-manger attitude to paying anybody more than top-grade civil servants. Sir Percy Mills may have more success in persuading Whitehall what business ability costs.

Wavering on the Waiver

THE British government's request for a waiver on the interest payments that were due at the end of last year on the US and Canadian lines of credit is running into strong political cross-currents in Washington. Under the terms of the loan agreement, the granting of the waiver seems to be a virtually automatic administrative decision by the US government, provided that the required initiative had been taken by the United Kingdom and that the International Monetary Fund found that circumstances justified the request. It was no surprise to the United Kingdom government, however, when Washington decided to submit the whole matter to Congress and requested the United Kingdom to pay the interest into a special account pending congressional investigation. For some years past the appropriate departments in Washington had advised the British government that if the waiver were ever claimed the matter would have to be referred to Congress and could not be decided by a directive from the Treasury or the White House. The main reason for this was the change in the circumstances surrounding the sterling liabilities of the United Kingdom government and the virtual impossibility of honouring the clause in the agreement which requires that, if the waiver is granted, similar reductions will be made in Britain's payments to its sterling creditors.

Since this clause cannot be made effective the situation calls for a drastic amendment of the loan agreement; that is embodied in an act and amendment must perforce go through the congressional mill. The Secretary to the US Treasury has made it plain in the discussions that have already begun that, although changing circumstances may have made the text of the agreement something of an anachronism, the spirit is perfectly plain—that some relief should be given to the United Kingdom in time of balance of payments and reserve difficulties.

The main question that has arisen in congressional discussion of this amendment of the agreement is whether the clause referring to parallel treatment of sterling obligations should be struck out without further ado, or whether the abandonment of this clause should be compensated by some provision by which any successful invocation of the waiver would involve not a cancellation but only a postponement of the interest payment due thus shifting the whole schedule of annuities payable under the agreement one year forward. Under the original schedule the annuities spread just into the next century. It may, perhaps, be of small consequence whether a payment due under the waiver clause is cancelled outright or involves a new liability due in the year 2003 or so. But if the principle incorporated in the original agreement is to be maintained, a payment forgiven under the waiver should be forgiven for good.

Atomic Progress

THE most heartening of all the statements made about atomic energy during the week-end came, not from this country, but from Japan. The technical mission that came to Calder Hall in November is reported to have advised the Atomic Energy Commission, and the Commission to have advised the Japanese government, to buy a commercial atomic power station of the Calder Hall design from Britain. Japan is one of the biggest potential export markets for atomic plants, with a fuel problem much like the one faced in this country. It has received much atomic help from the United States and the decision to come to Britain for commercial atomic power is a major victory for Sir Christopher Hinton, who first impressed the Japanese with the possibilities of the Calder Hall design. A second mission is now expected to come to this country to discuss details about the type and size of plant and the formalities of an Anglo-Japanese agreement on the provision of atomic fuels for the power station and of the necessary technical information.

The second confirmation of atomic progress came from the chairman of the Central Electricity Authority, Lord Citrine, who is usually most taciturn on the subject of atomic power. Last Friday, visiting the site of one of the CEA's two atomic power stations, he committed himself to the extent of confirming estimates that the atomic power programme would "probably" be trebled, by 1965, although this would not involve a big increase in the number of stations planned. This capacity represents the equivalent of 12 million tons or more of coal a year. Sir John Cockcroft, who was speaking in Paris during the week-end, carried the estimates a decade further to suggest that by 1975, atomic energy would be generating the equivalent of 60 to 70 million tons of coal's worth of electricity, nearly a six-fold increase in atomic capacity in ten years between 1965 and 1975.

Sir John also gave some information about the progress of work on atomic reactors for shipping. Design studies at Harwell have concentrated on two projects, a submarine engine where operating costs were a secondary consideration, and a merchant ship in which economic performance was essential. Both projects are a long way from being actually built, but some time this year a small experimental reactor will be built along the principles on which scientists think that a power unit for shipping should be designed. An atom-powered super-tanker makes, according to Sir John, an "interesting study" in the sense that a big bulk carrier would get the most advantage out of the operating characteristics of an atomic reactor. But it is likely to be some time before such a tanker is laid down in British yards.

An account of stewardship

At the end of 1956 our **Deposits** amounted to **£1,198 millions.** Here are four of the chief ways in which we have employed these vast sums entrusted to our care :—

Advanced to Trade, Industry, Agriculture and other borrowers: **£337 millions**

Invested in British Government Securities, including Treasury Bills: **£554 millions**

Loaned at Call or short notice to the Money Market: **£76 millions**

Held as Cash: £94 millions

LLOYDS BANK
LIMITED

Visiting Australia?

P&O

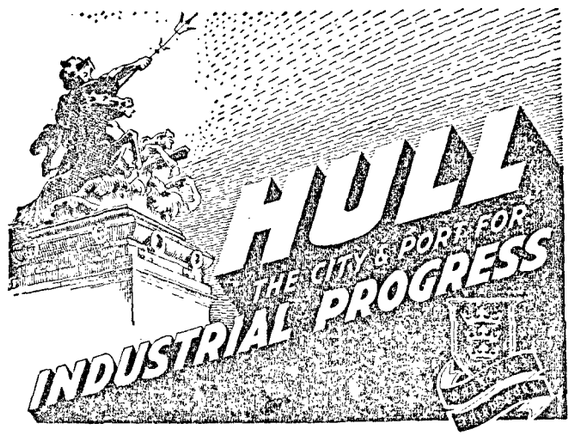
offer a saving of £140

YES! At least £140. That's the difference between the normal First Class return fare out to Sydney and the Special First Class return ticket known as 'Boomerang'.

To qualify for this concession simply arrange to sail outward between the 1st of February and the end of May—the quiet season. You can return to Britain between September 1st and December 31st of that same year or next. Thus your visit can be of 3 or 18 months duration as you wish. Why not take advantage of this special inducement?

On the journey itself you will be treated as a welcome guest. Your comfort and convenience will be studied from every angle. You will find the appointments, the service and the cuisine well up to luxury hotel standards. Ports of call normally include Port Said, Aden, Bombay, Colombo, Fremantle, Adelaide, Melbourne and Sydney.

ONE WAY ONLY



Again quiet season travelling has advantages. Travel during Feb. to May offers a wider choice of first class accommodation—more for your money.

Motor Investment Matures

NO other major British industry since the war has experienced as abrupt a decline as the motor industry's collapse from an output of more than 26,000 vehicles a week in November, 1955, to less than 14,500 a week in December, 1956. The average output for 1956 was 22 per cent down for cars and 13 per cent down for motor vehicles from the output levels of 1955; and the December figures published this week showed a decline of 41 per cent in car output from December, 1955, and of 36 per cent for commercial vehicles. About 57,000 of the industry's workers are on short time; and the labour force in "motor vehicle and cycle manufacture" has fallen by probably 40,000 since the end of 1955.

Exports have fallen less than home sales, and to that extent the industry's "export performance" may be said to have improved during this unhappy year for it: it has indeed bettered its sales to the United States and Canada during recent months. For the moment, certainly, it is the specialised makers that concentrate on export models, plus certain economy cars of the popular makes, that are managing to sell: Jaguar goes back to a five-day week on Monday. But the sharp cut in total output has enabled Germany to pass Britain in the production of motor vehicles as well as of steel.

Vauxhall, too, is going back to five-day working on Monday, and will be taking back some of the 1,800 men it has laid off in recent months. But this does not mean it is suddenly selling more cars; the extra labour is required to redeploy production at Luton throughout the company's new plant. This extension will roughly double Vauxhall's capacity; like some of the other major expansion schemes in the industry it was begun late in 1954. This one is coming into commission when the home and export markets are inadequate to absorb such an expanded output; most of the other major schemes, too, will be maturing fairly soon. The companies were too far committed by 1956 to cut this expansion back significantly, had they wished to; in fact, most of them continue to profess confidence that 1956-1957 is merely a temporary setback.

Inquest on Aircraft

THE Select Committee on Estimates spent 5½ months last year hearing evidence about the supply of military aircraft during the preceding ten years, giving the Ministry of Supply a most severe grilling. The committee's report does not reveal many new facts; moreover, it exposes a depressing poverty of ideas about how to organise the supply of aircraft in future. "Astronomical" sums of money that the Ministry has "wasted" on failures must be seen in perspective to judge the system fairly. The Ministry of Supply spent £1,800 million between 1945 and 1955 on the production and development of military aircraft; of its many projects, fifteen, for various reasons, never went into production. The bill for failures came to £18 million, one per cent of the total, which is perhaps not disproportionate to the risks. One of the biggest items on this bill was the Vickers V1000, which cost £4 million before it was abandoned half-built. The complex reasons that kept this project going long after it should have been stopped cannot be laid exclusively at the door of the Ministry of Supply, which would have acted sooner had it been free to do so. Another costly project was the Short Sperrin bomber, only two of which were built for a total of £3½ million. This bomber was scrambled together at the height of the Korean scare to have a jet bomber of some kind on the stocks in case of emergency; this was a sudden strategic decision, not one made in the normal process of supply.

This is not to suggest that the Ministry of Supply always acts wisely about military aircraft. There is a radical weakness in any organisation that has to spend £33 million on a project like the Swift, which was stopped after reaching production, before it will admit failure. But it is not possible to embark on a policy of aircraft development without being prepared for some mistakes, though it is important, as the committee stressed, to recognise them in time.

Competition in Limbo

ALTHOUGH it sifted a mass of evidence, the Select Committee on Estimates shut its eyes to the reason that predisposes the Ministry of Supply to expensive errors of judgment in developing aircraft. This is the practice of placing orders with a manufacturer which invite him to produce an aircraft to satisfy a general specification and giving him a blank cheque for doing so. The Services tell the Ministry they would like a certain type of machine; the Ministry then gives an order to whichever manufacturer offers the most promising suggestion. Experience shows that it is impossible to judge at this early stage which project is capable of translation into a successful aircraft.

At one period the Ministry tried to reduce the risk of failure by sponsoring two competing projects, of which one would be chosen for production. Seven such projects were written off at a cost of £5½ million; half of this sum was spent on the de Havilland 110 all-weather fighter, which was adopted by the Navy after it had been turned down by the RAF in favour of the Javelin. The committee condemns this policy of limited competition as being unnecessarily extravagant—though it approves its application to the Vulcan and Victor bombers which were both put into production. If the system of limited competition is abandoned, as Ministry witnesses assured the committee it had been, what can replace it? It is one thing to say that the aircraft industry has been overloaded in the past and that "preferably with the agreement of the industry, steps should be taken to limit the number of firms receiving government contracts." How would one choose the right companies—and would the remainder of "the industry" agree? This industry cannot be neatly divided into black and white.

It has been repeatedly suggested in *The Economist* that one way to reduce the odds against sponsoring the wrong project is to require the companies to show enough confidence in their own designs to produce some hard evidence of the way they are shaping before irrevocably committing

the services and the taxpayer to supporting any one of them. The number of projects independently financed by aircraft manufacturers, from the Folland Gnat to the Vickers Vanguard airliner and the fighter and air freighter both being developed within the Hawker Siddeley group, disproves the argument that the aircraft industry has insufficient resources to finance the primary stages of development. With every effort being made to find economies in the defence programme, development projects need the most careful scrutiny; the best way is not by placing curbs on the aircraft industry but by asking for something concrete to scrutinise.

Trade Keeps Flowing

BRITISH exports in December suffered surprisingly little from the closure of the Suez Canal. Though the total value of £253.7 million fob was nearly £40 million (13½ per cent) below the average of the two previous months the daily rate of shipments fell by less than three per cent (the December accounts covered 24 working days, three fewer than the October-November average). The detailed returns this week showed that while exports of ships and boats, at £11.9 million, were even higher than the October-November average, exports of most other groups of commodities fell by about 15 per cent. Shipments to the Middle East fell by a quarter, but shipments to destinations east of Suez did not fall by much more than the general average of 15 per cent. Shipments to the dollar area fell by one-fifth, owing partly to the usual winter fall in shipments to Canada, but shipments to the OEEC area fell by only 12 per cent. Does the comparatively favourable outcome for December imply that the shortage of shipping has yet to be fully reflected in the export returns, or will the shortage prove less severe than was expected? The January returns should provide the answer.

Imports fell further in December to £307.9 million cif, £11.7 million below the previous month's figure. Substantial reductions, partly seasonal, occurred in imports of

OIL IMPORTS BEFORE AND AFTER SUEZ
(million gallons)

	Jan./Oct. average	Oct.	Nov.	Dec.
Crude	650·9	684·6	419·1	507·8
All products	215·7	213·4	159·5	181·1
of which fuel oil	68·1	58·5	30·0	33·0
gas oil	45·0	57·7	29·6	42·4

certain foods and materials but arrivals of goods—other than oil—normally shipped via Suez were little lower in total than before the canal was blocked. As the table shows the quantity of oil imported recovered slightly in December, reflecting larger arrivals from the United States. The average volume of crude oil imported in November and December, however, was still 29 per cent below the average of the previous ten months, a decline that unfortunately occurred while the trend of demand was strongly upwards, and the average volume of petroleum products was 21 per cent lower. Arrivals of fuel oil were the hardest hit, falling by nearly 54 per cent. As exports of fuel oil in November and December were two per cent higher than in the previous ten months the real shortfall was larger still.

Turn in Terms of Trade

ONE part of the cost of the Suez crisis is now beginning to be reflected in the terms of trade; last month the ratio of import to export prices worsened by a further point to 101 (1954=100). The average price of imports rose by two points to 109, the highest level of the year, mainly because of a jump of 11 points to 126 in the index for fuels. That sharp rise was in turn chiefly the result of the advance in freight rates for oil; the full advance in oil prices has yet to be felt. Food prices rose by an average of two points to 106, the higher cost of sugar and tea more than offsetting the drop in butter and other dairy produce. Export prices

HOW PRICES HAVE MOVED
(1954=100)

Import Prices	Food and Tobacco	Basic Materials	Fuels	Manufactures	Total
1955	101	104	102	109	103
1956	101	106	110	110	105
1st qtr.	100	105	107	115	105
2nd qtr.	102	105	107	113	106
3rd qtr.	99	106	107	107	103
4th qtr.	104	108	119	107	107

Export Prices	Engineering products	Metals	"Other manufactures"	Total	*Terms of Trade*
1955	103	104	102	102	*101*
1956	107	112	104	106	*99*
1st qtr.	105	110	105	105	*100*
2nd qtr.	105	111	104	105	*101*
3rd qtr.	108	112	104	106	*97*
4th qtr.	109	112	104	107	*100*

rose too, by an average of one point to a new peak of 108. Engineering products, the largest single item, were one point higher at 110; metals rose by two points to 114, largely owing to the increase in steel prices, and "other manufactures" rose by two points to 105. Textiles, after falling in the previous three months, recovered by one point to 99. Though the terms of trade have recently been moving adversely, the average ratio for the year was 99, still two points more favourable than the 1955 average. Export prices rose by four per cent over the year whereas import prices rose by only two per cent.

Secrets in the Tank

THE "secret formula" for a petrol substitute recently concocted by a Sheffield engineer has been considered by the Ministry of Power, which is satisfied that at least it includes no rationed materials. As the "three liquids" used

in its manufacture are also said to be free from the excise tax on motor spirit and power alcohol, the formula cannot be merely another alcohol blend. It remains to be seen whether its inventor can fulfil his promises of an initial production rate of 30,000 gallons—say 100 tons—a month and a subsequent "great increase" in the production of a fuel "equivalent to 85 octane petrol."

Suppliers of all of the more common substitutes for petrol—ethyl alcohol, methanol, acetone and the liquified petroleum gases, butane and propane—have been asked by the Ministry of Power to ensure that the full requirements of their normal industrial customers are met before any of these fuels are diverted to emergency uses. As butane, propane and a large proportion of the industrial alcohol are all derived from petroleum there is clearly no scope at present for any significant increase in their output, and producers will have little to spare after meeting the Ministry's request. Coal gas and producer gas are not very suitable for use in vehicles owing to the complicated apparatus required to obtain satisfactory performance. Methane gas from sewage works has been used successfully in some local authority vehicles, but it would be difficult to obtain in any quantity.

The remaining possibility is ethyl alcohol made by fermentation from molasses. There is spare capacity for the production of natural ethyl alcohol in Britain, as this method of production has been progressively abandoned in favour of the more economic synthetic production from petroleum. These plants are, however, in the hands of a few large producers who regard the production of power alcohol as hopelessly uneconomic. One petrol-alcohol blend, Cleveland Discol, remains on the market, but as the anti-knock performance of ordinary petrol has risen so the special advantages of a petrol-alcohol blend have diminished. Although the most suitable and readily available molasses come mostly from Cuba, and have to be paid for in dollars, the output of sterling molasses in the West Indies could be raised, if the government were prepared to foot the extra bill. And the production and consumption of power alcohol in Britain could be stimulated by granting government subsidies or tax preferences over hydrocarbon fuels—a policy that has been followed for many years in France. But this heavy cost could only be justified if it were the most economic way of making Britain less dependent on Middle East oil. In practice it would be cheaper to import oil from the Western Hemisphere than to import the molasses to make an equivalent amount of alcohol. Moreover, the crux of Britain's problem is the shortage not of oil, but of tanker capacity. The same tankers can be used to carry either molasses or oil, and it takes five times as many tankers to transport the molasses to make a given amount of alcohol as it does to import the same quantity of oil.

New Liner for P & O

THE design of the new passenger liner ordered from Harland & Wolff, Belfast, for the Australasian and Pacific services of the Peninsular and Oriental Steam Navigation Company, represents a departure from tradition in many respects. Not only will the ship be the largest and fastest ever designed for this service, being of 45,000 tons gross and 27½ knots speed, compared with the 29,000 tons and 22½ knots of the latest ships, but it will be able to accommodate more passengers than either of the Transatlantic *Queens*—1,650 in tourist class and 600 in first class cabins. Her twin-screw turbo-electric machinery of 85,000 shaft horsepower, itself unorthodox for a ship of this size, will be situated aft, as in the Shaw Savill liner *Southern Cross*, thus eliminating engine-room space midships and allowing much greater freedom of layout for the passenger cabins and public rooms, as well as more deck space.

The new liner will be air-conditioned throughout, and a number of inboard cabins will in addition be served with natural air and light by arrangement round a central court or verandah extending to the ship's side. Other recent ideas are the use of escalators for galley service to dining rooms, and electric conveyors and elevators for baggage and stores. The lifeboats, which will be of glass-reinforced plastic, will be stowed not on the uppermost deck but nearer the waterline three decks below.

This liner, due for delivery in 1960, will run alongside the Orient Line's new ship, which has similar performance features, in the group's joint service. Since the war the group has provided six passenger liners costing some £30 million for the Australian service, and the two new ones are expected to cost not less than £25 million. These two latest ships, however, will be able to do the work of three ships of the *Iberia* class, and it is believed that they will prove more economical in operation, despite the higher speed and fuel consumption.

The Australian Import Changes

IN the relaxation of Australian import restrictions by £A30 million a year from January 1st about £A10 million is accounted for by the changes announced a few weeks ago.* Substantial increases, "some on a non-recurring basis" in licences for capital plant, machinery and agricultural implements account for the remaining £A20 million. As these goods are in the Administrative category the licences are varied as the authorities see fit, and the treatment given to particular items is unlikely to be announced.

The earlier changes affected goods in categories A and B, and do not benefit the British motor industry. Textiles are the main beneficiaries. Textiles for manufacturing purposes were transferred from B2 to category A, and the quotas were increased by 60 per cent, from 37½ to 60 per cent of actual imports in the year ending June 30, 1955. Other textiles, mainly piece goods, remained in category B2, and the quotas were increased by 20 per cent, from 37½ to 45 per cent of imports in 1954-55. A further change is that from April 1st the licensing period will cover four months instead of three.

Co-operative Building Society Progress

RESULTS of the Co-operative Permanent Building Society for 1956 announced this week may give a foretaste both of the problems and of the hopes that now confront the big societies. The Co-operative Society

* Details were given in the Board of Trade Journal of January 5th and 12th.

experienced a fall of nearly £8.5 million to £21.5 million in the amount advanced on mortgage; it shows a rise of £19.3 million to £137.8 million in investors' balances, a rise of £6.7 million to £20.9 million in liquid assets (at balance sheet values) and a rise of £20.0 million to £143.7 million in total assets. Reserves rose from £4.0 million to £4.3 million. The liquidity ratio has thus enjoyed a formidable reinforcement and amounts to 14.58 per cent against 11.49 per cent, while the reserve ratio has suffered an unfortunate shrinkage to just below 3 per cent of total assets, compared with 3.24 per cent a year ago.

The year 1956 fell into two halves—a depressing first half when the societies kept their eyes closed to a 5½ per cent Bank rate and found that they lost shareholders and depositors in consequence, and a prosperous autumn after they had raised the rate of interest on shares to 3½ per cent net. Money then poured in again. For the Co-operative the issue was complicated by the merger with the Exeter Benefit Society which has involved £69,590 of realised losses on mortgages and may involve a further £60,000, but which has brought in £66,000 of reserves and some useful new accounts. In the end it is hoped that there will be no net loss. Meanwhile investment money, checked only temporarily and to the tune of about £250,000 by the premium bond rush in November, continues to come in well. The society's loans are still below the demand, but the rate of lending has been increased and it seems possible that the society might lend on mortgage £30 million this year. If that occurred it would represent an increase of £8½ million on 1956. It would be comfortably within the funds that seem likely to be available, but the reserve ratio inevitably would suffer again in the process.

Rising Liner Freights

THE increase of 10 per cent in freight rates to North America by the North Atlantic Westbound Conference is only one of a series of rises that have taken place in recent months in most of the principal liner trades. This increase, which will come into effect on April 1st, affects cargoes from the United Kingdom and Eire to United States and Canadian ports, including the Great Lakes; a similar increase came into effect last April. Eastbound conference rates are increased with effect from February 1st. In the Australian and New Zealand trades the current increase in freight rates is one of 14 per cent, following the increase of 7½ per cent announced a year ago.

"Motor Business"

The December issue of this quarterly research bulletin for the motor and allied industries is now available. It includes:
The outlook for 1957.
The French motor industry.
The East African market for motor vehicles and tractors.
The Bulletin is fully illustrated by charts, amongst which are:
Price indices of used cars and vans.
New registrations in Great Britain, and the hire purchase share of the market.

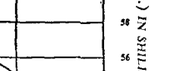
For full particulars of this Bulletin apply to:
THE ECONOMIST INTELLIGENCE UNIT LIMITED
22, Ryder Street, St. James's, London, S.W.1.
WHItehall 1511, Ext. 49.

These rises give some idea of the general increase in ship operating costs that have occurred over the last two years. In justifying the increase the liner conferences imply that a proportion of these increasing costs have been absorbed in recent years, but that they cannot continue to do so without adversely affecting the standard of service. All the main operating expenses, such as bunker prices, repairs and maintenance costs, wages, port charges and cargo-handling costs, have risen. These increases in conference tariff rates, however, are not directly attributable to the closing of the Suez Canal. The disruption of liner services by this event has affected some trades seriously and others scarcely at all; its main effect has been the big consequential increase in oil fuel prices. Temporary "Suez surcharges" have been introduced to cover these temporary extra costs: they vary according to circumstances from 5 to 50 per cent. The West African Conference lines, for example, although not directly affected by the closing of the canal, which they do not use, have imposed a temporary surcharge of 5 per cent because of the 40 per cent rise in oil bunker prices in European ports.

Strategic Stock Sells Lead

AFTER consulting the trade the Board of Trade has settled the details of its disposal of lead from the strategic stock. About 30,000 tons will be sold for delivery and pricing over the nine months beginning in March. About 4,000 tons are to be offered by open competitive tender; the remainder will be offered to the original suppliers or their agents. This is the usual practice. The total quantity is equal to only about one month's consumption in Britain and is closely in line with the trade's expectations. The effect of the announcement on prices was small: lead in London had dropped by £1 a ton before closing on Thursday at £115 10s. for prompt and £113 10s. for three months metal.

Despite the recession in the motor car industry and the lessened demand for lead as an additive to petrol, prices have held up well. The market is underpinned by the support operations of the American stockpile, which absorbs the surplus of domestic lead and zinc in the United States and also takes in the foreign metal that the Administration receives in exchange for surplus farm products. At current prices in London and New York there is no incentive to ship lead from here to the United States, but the net effect of the extra 30,000 tons becoming available here may be that an equivalent quantity moves into the American stockpile. The Board of Trade has yet to announce the details of its disposal of zinc from the strategic stock.



Windfall in Sugar

THE Sugar Board has started its career in a way that few government agencies do—by making a mint of money. The board buys 1½ million tons a year of Commonwealth sugar at a fixed price and sells it to British refiners at the

Why do fish prices go up - and down?

Winter or Summer, fair weather or foul, there is always fish for you and your family to enjoy. But why is it that the price often varies?
The answer: because trawling depends on the weather. When the weather is good, trawling is comparatively easy: the catch is large, supplies are abundant, and the price of fish goes down.
When there are storms, and you hear gale warnings on the B.B.C., our trawlers battling in distant Arctic waters find the going hard. Fishing is more difficult, the catch is smaller, and as supplies become scarce, the dockside price of fish goes up. However, trawlermen do not fix the price of their catch. Fish is sold by free auction at the dockside, in a highly competitive market.
Look at the chart below. It shows the rise and fall of prices in relation to the gale season. But remember—however bad the weather, British Trawlers are continually striving to bring a plentiful supply of good, fresh fish to these shores and fish landed in Britain is fresher, in better condition, and cheaper than anywhere else in Europe...

DESPITE STORMS AND GALES—FISH REMAINS THE CHEAPEST FIRST-CLASS FOOD MONEY CAN BUY

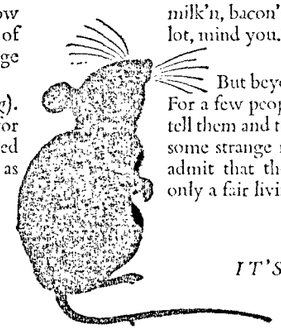
'I would like,' said the Hedgehog,
'to make a point or two on behalf of my colleague, the British farmer, with whom
I enjoy a most happy co-operation.'

BUT TOWN MOUSE SAID

What! Not again!

'Everyone around here,' he continued, 'seems obsessed by these farmers. Just what have they got that I haven't got—apart from their miles of land?'

HEDGEHOG (*severely*) 'Just what have you got to eat that they don't have a great hand in providing? I'll have you know more than half our food is now home grown! And don't talk about miles of land. Most British farms are small—average size is about 80 acres.'



TOWN MOUSE 'I know! I know! I've been told (*mimicking*). And most farmers work a 90-hour week for about £10-£12 *and* production's doubled since 1939 and there are now four times as many tractors. *I know.*'

HEDGEHOG (*even more severely*) 'Then why are you so remarkably unwilling to prick up a whisker for a fine job well done?'

TOWN MOUSE 'Because! Anyway with all the sympathy there is about, why should it matter what *I* think? Not that I don't like butter'n, cheese'n, eggs'n, milk'n, bacon'n, fruit'n, wheat'n all that lovely lot, mind you.'

* * *

But beyond that he simply wouldn't go. For a few people are just made that way. You tell them and they seem to understand. But for some strange reason they will never actually admit that the British farmer, in return for only a fair living, does us really proud.

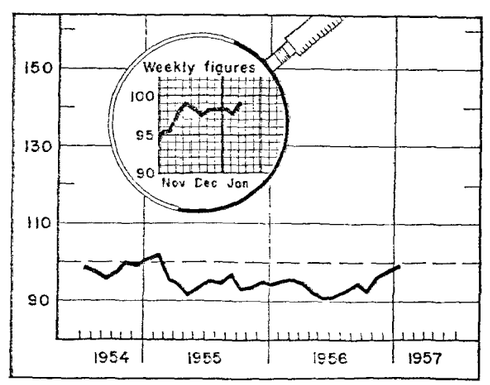
IT'S FISONS FOR THE FARMER

world price. As the chairman of Tate and Lyle, Mr Ian Lyle, pointed out this week the fixed price this year, shorn of the amount of the preference and at present rates of freight, is roughly 46s. a cwt and the world price at present is nearly 60s. a cwt cif UK (the board has to sell free at side in the country of origin, but the cif comparison is a fair indication of the surplus being made). The board is also receiving the proceeds of the surcharge levied on all imports of sugar to offset the loss incurred if the world price falls below the fixed price. As the surcharge, which is now 1s. 2d. a cwt, is to be varied at infrequent intervals there are times when, as now, no surcharge is necessary. Moreover the British Sugar Corporation, which refines home beet and sells it at the world price, is also making a windfall surplus that would in time accrue to the board.

If the world price should remain at anything like the present level the surcharge would be reduced, if not withdrawn. A part of the board's surplus could then be distributed to the persons paying sugar duty, and the domestic price would be reduced. In the long run the consumer will pay no more than the real cost of Britain's imports. There is little immediate prospect of a radical fall in world prices. World stocks are low and demand is buoyant. Since the beginning of the year the UK spot price has risen still higher, by over 11s. to 59s. 10½d. a cwt cif, and the domestic price of granulated sugar has risen by over 12s. to 85s. 9d. a cwt. There is no shortage of supplies as a whole in this country; shortages occurred in some areas because consumers anticipated a rise in retail prices by stocking up.

ISHRA Reports

TIMING is the essence of the unscrambler's art. That was recognised when in 1953 Sir John Morison as chairman of the Iron and Steel Holding and Realisation Agency was set the task of reselling the nationalised steel undertakings without time limit. He got off to a slow start, but sold vigorously in 1954 and 1955. Business dried up in the year ended September 30, 1956, partly because the agency had already sold much of what it could easily sell, but chiefly because the new issue market had died when the Stock Exchange boom died. So ISHRA sold state-owned securities to the value of only £35.9 million in its third year compared with £74.1 million in its second year and £78 million in the first.



Since the agency announces its transactions as they occur, the report contains little that is new, but some useful guidance can be obtained from a closer look at that part of the steel industry that is still government-owned. Out of the 71 nationalised companies that ISHRA took over it has 28 still in its shop window as wholly-owned subsidiaries. Most of that stock in trade does not look particularly saleable. It contains 15 companies of a book value of under £1 million each. It contains eleven medium to small companies, several of which must be described as of second quality. It includes finally the two giants, Steel of Wales and Richard Thomas and Baldwins. Here it is not quality but sheer size and the size of the projected development that make a sale by public offer difficult. In the better markets that now exist Sir John Morison is doubtless trying again to get enough City support to move ahead with one of them. Meanwhile, he will, it may be guessed, press ahead with sales by private treaty of his small companies.

It is going to be much more difficult for the Agency to show a book profit on the sales it makes at the tail-end of its list. The 37 companies that have been already wholly or partly sold represent nearly three-quarters of the British steel industry, whether it is measured by employment, by production or by sales. It is the least saleable quarter that remains. The agency claims justly to have made a profit of £9.9 million on 27 companies entirely sold during the three years. But many of its most important sales have been partial, the agency retaining substantial prior charge capital for later sale. Those prior charges were tailored to sell at about par when the capital was rearranged and the prospectuses issued. But what, for example, is the 4½ per cent debenture (1975-85) of Colvilles worth at the moment?

Export Insurance Expands

THE Suez crisis was an unpleasant reminder of the political hazards to which exporters are exposed, and it may help to explain the increase in business insured with the Export Credits Guarantee Department in the fourth quarter of last year. The number of short-term commercial policies current at the end of that quarter was 4,112, an increase of 86 on the third quarter, and of 208 on the end of the fourth quarter of 1955. The reduction in premiums introduced at the beginning of April may also have helped. For the year as a whole, however, the share of British exports insured with the department showed no increase; it remained at about 13 per cent, as it has done for many years. The rise in the value of shipments covered on commercial account—from £384 million in 1955 to £409½ million in 1956—simply kept pace with the growth of British exports. The department believes that many more exporters could profitably use its cover.

COMMODITY PRICE INDICATOR
1952 = 100 MID-MONTH FIGURES

SHORTER NOTES

Both the electricity supply industry and the gas industry promised last summer not to raise their prices until the end of their financial years on March 31st. During the last few days the electricity industry has let it be known that in some areas at least electricity prices will probably go up as soon as the period of this promise ends ; and the gas industry has said that, while making no promises, it hopes not to have to increase gas prices for some time after March.

★

The Government has decided to extend the life of the Furniture Development Council in spite of a request from the industry for its winding-up. The FDC conducts much of the research into the strength and stability of furniture on behalf of the industry and its earlier findings are the basis of furniture standards now published by the British Standards Institution and used as an indication of durability.

★

A note on the price of rough diamonds in *The Economist* of January 12th stated, on the basis of information obtained from trade sources, that the price of drilling material was not affected by the increase of 8½ per cent on certain grades of industrial diamonds. The price of this grade of diamonds was in fact increased by approximately 13 per cent in

November, 1956. Since 1953 the price of drilling material has risen in total by 26½ per cent, and the price of tool and dresser stones by approximately 14 per cent.

★

The Bombay Millowners' Association has announced that an "understanding" has been reached with a delegation from the British cotton textile industry. Details are to be published later. The delegation went to India to try to persuade the local industry to accept some limitation on exports of cotton cloth to Britain.

★

Larger cocoa crops in West Africa have led to a further fall in prices ; Accra cocoa for prompt shipment is now about 182s. 6d. a cwt cif UK, 13s. a cwt cheaper than at the beginning of January.

★

One steel company which has not found it impossible to raise its ordinary dividend is Brown Bayley, makers of stainless and alloy steels. A year ago the dividend was 8 per cent, compared with the prospectus forecast of 7½ per cent, and now it has been increased to 9 per cent in spite of a fall in net profits from £332,814 to £289,316.

Company Notes

THE STEEL COMPANY OF WALES *has the newest integrated strip* mill in Britain. In the year to September 30th it spent £19 million on capital development, of which about £9 million came from retained profits (including depreciation and the tax equalisation account). The loan made by ISHRA to the company went up by £12.6 million to £40 million. The company has to spend another £12 million to complete the second development programme and another £50 million on the third programme, due to be completed by the end of 1959. The chairman, Mr Harald Peake, says that "a substantial proportion" will be found from retained profits. In 1953-54 the company retained about £11 million, in 1954-55 nearly £15 million and in 1955-56 (when trading profits fell from £18 million to £14 million) £9 million. Present developments will cost about £20 million annually over the next three years. At the moment, though the demand for plate and tinplate continues to be good, the demand for sheet steel has been reduced.

The service charges on the company's loan capital—£15 million in debentures, £28.2 million from FCI and £40 million from ISHRA—have gone up. And the £15 million of 3 per cent debentures is due for repayment at 101 per cent on July 16th this year. Sir John Morison's ambition to sell SCOW's ordinary shares to the public has not wilted ; but figures and problems of this magnitude cannot make it easy to realise this ambition.

Richard Thomas & Baldwins has the oldest integrated strip mill in Britain. It is not old by the standard of some of Britain's other steel plants but if another strip mill is to be built Richard Thomas & Baldwins is generally considered the producer most likely to build it. The capital costs of such a mill would be higher than those of SCOW. The chairman, Sir Ernest Lever, in his statement to the sole shareholder, ISHRA, says "the broad lines of our development policy have now been considered by the directors and proposals for the first stage of such development are being discussed with the appropriate authorities." Later he refers to "major developments." In 1955-56, the group spent about £4½ million on capital account and its immediate capital commitments come to another £4½ million. The loan it made to ISHRA has been reduced from £9¾ million to £2½ million ; in addition to this nearly liquid asset it has £3½ million in tax reserve certificates and nearly £1½ million in cash.

Thus it appears that the question whether or not another strip mill is to be built, and if so who is to build it, needs to be settled before RTB's ordinary shares are sold back to the public. This question has an importance for the standing of the RTB equity.

Dorman Long's shareholders declined on Wednesday on a show of hands to approve the report and accounts. They subsequently did so after a poll had been demanded, and after the chairman had disclosed his massive proxies. The demand for a poll was then withdrawn. Nevertheless Sir Ellis Hunter can have been left in no doubt that the unchanged 8 per cent dividend was not unanimously supported. It is worth re-examining the stand that Sir Ellis maintains (a year after the steel dividend front was broken) in the light of the additional facts he produced at the meeting. In a prepared statement he dealt with the argument that a low dividend might prejudice the compensation payable to shareholders in the event of re-nationalisation. The parent company, he emphasised, had been hived off into a holding company with eight trading subsidiaries. Three of them operate wholly abroad. Only one—Dorman Long (Steel)—would be affected by re-nationalisation and that company had no market quotation that could be effected by the rate of dividend.

That may have been an answer to the demand for a higher dividend as a defence against re-nationalisation. It is no answer to the clear demand for a higher dividend just because the profits are there to pay it. Sir Ellis Hunter fell back upon the line that this is the peak year of the company's capital programme with about £20 million to find. It is being found in part from profit retentions and in part from the Finance Corporation for Industry which is charging ¾ per cent over Bank rate (6½ per cent). An extra one per cent on £15 million

capital apparently would cost only about £100,000 net—not a disproportionate sum in relation to the amounts that the company is to invest this year or to last year's undistributed profit of £1.7 million. The £1 shares may well continue to command a 6 per cent yield but that will be because shareholders believe that the weight of argument against their chairman is building up to an irresistible point.

★

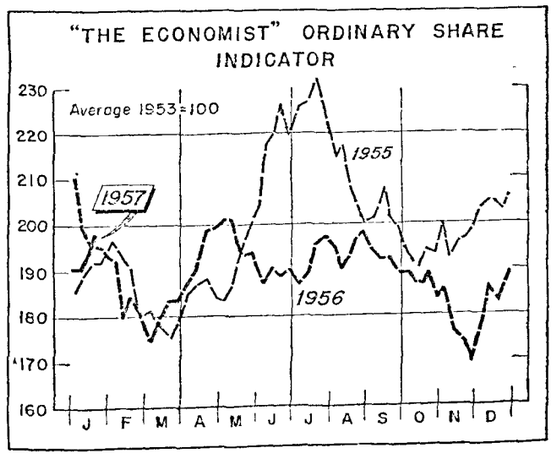
CHARTERHOUSE INVESTMENT TRUST. Sir Nutcombe Hume, chairman of the Charterhouse group, makes at least three observations that merit serious thought, though not everyone will agree with them. First he in effect declares himself a bull of the market at its present level. The parent company, the investment trust, has been holding liquid balances of £400,000. Throughout the year ended November 11th they were invested only in short-term deposits. In the last few weeks part of this cash has been invested in high class investments. Secondly the group is clearly not looking towards the new issue business of Charterhouse Finance Company capital issues as likely to produce the main source of its future profit. The current year's prospects for Charterhouse Finance Corporation (largely dependent on the new issue market) should, he says, be regarded with caution. Lastly Sir Nutcombe hopes that credit restrictions will soon end.

The last point in relation to the recent experience of the group is the most vital. Charterhouse did well last year, credit restrictions notwithstanding. The parent company's net profit before tax was £184,894, compared with £159,214. The final dividend of 6 per cent again made 10 per cent for the year, but the final payment covered £900,000 of ranking capital, against £750,000, and that was exactly what shareholders had been promised. The rub is that the industrial development company has, as Sir Nutcombe Hume explained, habitually used bank money first and funded it later by capital issues. Its nursing activities thus depend first on the availability of bank credit and secondly on a reasonably active issue market. Without those advantages it must rely on profit retentions and distribute to the parent only a small part of its earnings. There remains, however, a third possibility that it should sell to the public that already holds its preference capital some additional ordinary shares. The idea fits well with the chairman's view that in the course of time the company will both increase its dividend and issue more capital.

★

WESTINGHOUSE BRAKE AND SIGNAL. The chain reaction effect of capital development is illustrated clearly in the accounts of Westinghouse Brake and Signal Company for the year to September 29th. The parent company will be a prime beneficiary of the modernisation and re-equipment plan for British railways, and its order books for railway equipment, from customers at home and abroad, and for colliery equipment and rectifiers are at record levels. Its trading profits are rising ; in 1955-56 they went up from £1,325,059 to £1,733,122.

To meet the demands on its capacity it has to invest more, and the directors "have it very much in mind that further cash will be necessary, during the current year, to finance the group's increased activities, and they wish to be free to combine this with a capitalisation of some of the reserves." A rights-cum-scrip issue of ordinary shares thus seems probable. Last year Westinghouse acquired Douglas (Kingswood), which makes the "Vespa" in this country, but it seems to have bought the concern as much for its factory space as for the goods it makes. On the increased capital the ordinary dividend for 1955-56 was again 18 per cent. Looking ahead shareholders may see the possibility of a "bonus" element in the terms of a rights issue. Looking still further ahead they seem—to judge by the yield of 4.7 per cent at the current price of 76s. 6d. xd on £1 ordinary shares—to expect an increase in dividend payments.



LONDON STOCK EXCHANGE

Next Account begins: January 30th
Next Contango Day: January 30th
Next Settlement Day: February 5th

A FURTHER fall in the Treasury bill rate and a burst of strength by sterling in the foreign exchange market helped to carry gilt-edged prices higher this week. Medium-dated stocks were in demand and gains in excess of 1 were common. Following the heavy over-subscription, the Tanganyika loan climbed to 2¼ premium. After the decision to leave Bank rate unchanged medium-dated stocks advanced further while long-dated stocks declined slightly. A high level of activity was maintained and industrial stocks shared in the improvement. By Wednesday *The Economist* indicator reached 198.0, a gain of 5.2 over the week.

Martins were a feature among bank shares, the £1 shares rising 6s. 6d. to 70s. 6d. xd and the partly-paid stock 12s. 6d. to 178s. 9d. xd. Power shares were again prominent, constructors and boilermakers showing large gains. Morgan Crucible rose 5s. 6d. to 49s. 6d. Motor shares were firmer ; Ford improved 2s. 6d. to 33s. 3d., Jaguar rose 2s. to 20s. before the announcement of a return to five-day working, while Rolls-Royce picked up 3s. 1½d. to 120s. Before the disclosure of the proposed loan stock issue ACV dropped back to 49s. Hawker Siddeley was almost unchanged after fluctuating sharply. Marks and Spencer went further ahead, the "A" rising to 73s. 9d. and Woolworth recovered to 62s. Other stores were very firm ; GUS "A" was 2s. higher and New Day jumped 1s. 1½d. to 10s. 2½d. John Summers and United Steel rose 1s. 9d. and 1s. 6d. to 35s. 3d. xd and 33s. respectively in a steady steel market. Textiles improved and hire-purchase houses rose ; United Dominions Trust gained 3s. 6d. to 77s. 6d. and Olds Discount 1s. 6d. to 23s.

Oils were depressed, Shell losing 3s. 1½d. to 159s. 4½d. and British Petroleum 3s. 4½d. to 131s. Kaffirs were generally dull, although OFSIT improved 1s. 6d. to 50s. 9d. Some tin shares showed sharp rises, but coppers declined.

(1) This covers mining, manufacturing, electricity and manufactured gas with the following exceptions: Denmark excludes mining; Greece, mining and manufactured gas; Ireland and Sweden, electricity and manufactured gas; and Austria, manufactured gas. Germany excludes West Berlin. (2) Special trade (excluding re-exports) with the exception of Ireland which covers general trade with exports seasonally adjusted. Belgium includes Luxemburg. Italy includes Trieste. (3) New drachmas introduced May 1, 1954 (1 new drachma = 1,000 old drachmas). (4) Thousand million drachmas. (5) Bizonal area. (6) Average for second quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended January 19th, 1957, there was an "above-line" surplus (after allowing for Sinking Funds) of £129,848,000 compared with a surplus of £134,584,000 in the previous week and a surplus of £124,590,000 in the corresponding period of last year. There was a net expenditure "below-line" last week of £35,323,000, bringing the total deficit to £725,512,000 (£471,425,000 in 1955-56).

THE MONEY MARKET

THE fall in the Treasury bill rate was resumed at the tender on Friday of last week. The discount market raised its bid by 8d. to £98 16s. 9d. for the 91-day bills. A smaller increase seems to have been made by outside applicants, and the average rate of allotment fell by 2s. 4d. per cent to £4 13s. 1.40d. per cent. This is only just over ½ per cent higher than at the last tender before Bank rate was raised from 4½ per cent in February last.

The offer of £240 million included 92-day maturities offered owing to the incidence of Easter Monday. For these the market bid at £98 16s. 6d. per cent (1d. more than for the 90-day bills of the previous week) and its application was allotted in full; its allotment of 91-day bills was 53 per cent.

Credit tightened sharply at the beginning of this week; and as the Bank of England gave no special assistance the market was forced to take loans at the penal rate. On Monday five or six houses were involved, for a moderate amount, and on Tuesday one or two houses, for a very small amount. Dealing rates in April maturities hardened to 4⅞ per cent.

The Bank return shows a further fall of £22.5 million in the active note circulation in the week to Wednesday last. This brings the post-Christmas reflux to £130.4 million, compared with £117.9 million last year.

"Nothing more to pay on the house!"

When David died, I was left with only a small pension to provide for two young children—and there was still a mortgage of £1,500 on the house.

Then came the call—from the district manager of the Prudential. I shall never forget my feeling of relief as I listened to him—no more payments on the house!

It's wonderful to feel so secure—and all because David had taken out one of the Prudential's mortgage protection policies.

A YEAR OF CONTINUED EXPANSION

EFFECTS OF CREDIT SQUEEZE AND SUEZ CRISIS

NEW PHASE IN NATION'S ECONOMIC AFFAIRS

MAINTENANCE OF OVERALL MONETARY RESTRAINT IMPERATIVE

SIR OLIVER FRANKS ON LONG-TERM PROBLEMS

The annual general meeting of Lloyds Bank Limited will be held on February 15th at the head office, 71 Lombard Street, London, E.C.

The following is the statement by the chairman, The Right Honourable Sir Oliver Franks, GCMG, KCB, CBE, circulated with the report and accounts for the year to December 31, 1956:

I have to record with regret the retirement of Mr C. E. Lloyd and Lieutenant Colonel J. B. Neilson. Mr C. E. Lloyd first joined the Board in 1925 and is a direct descendant of our founder, Sampson Lloyd. His unrivalled knowledge of industry in Birmingham and the Black Country enabled him to play a distinguished part in our counsels both as a member of the Board and of the Birmingham Committee. We shall also miss the wide knowledge of the steel industry which Colonel Neilson brought with him.

We welcome as Directors Sir Wilfrid Ayre, Mr F. N. Lloyd, Sir John Carew Pole, Bt., DSO, TD, and Mr D. M. Oppenheim. The Right Honourable Viscount De L'Isle, VC, DL, has also rejoined the Board. He had been a Director but retired in 1951 on becoming Secretary of State for Air.

Sir Wilfrid Ayre, Pesident of the Burntisland Shipbuilding Company, Limited, has succeeded Mr W. H. Fraser as Chairman of our Scottish affiliate, The National Bank of Scotland, Limited. Mr F. N. Lloyd is Chairman of F. H. Lloyd and Company, Limited, iron and steel founders and engineers, and by his membership of the Board provides continued representation of the founder's family. Sir John Carew Pole has been Chairman of the Cornwall County Council since 1952 and strongly reinforces our interests in Devon and Cornwall. Mr D. M. Oppenheim brings to us a wide knowledge of commercial affairs as Chairman of the British-American Tobacco Co., Limited.

We congratulate Major Egbert Cadbury on the knighthood conferred upon him for public services in Somerset and Gloucestershire.

There have been changes on the Local Committees, especially at Birmingham. Ineluctable reasons for advancing years compel us to say farewell to Lieutenant Colonel R. K. Morcom, Chairman of the Birmingham Committee, Mr C. E. Lloyd and Mr S. P. Cherrington. Mr A. B. Waring becomes Chairman of the Birmingham Committee, of which he has been a member since joining the Board.

At Salisbury I must record with deep regret the death of Mr R. C. Chambers.

During the year Sir Austin Harris ended a long and distinguished connection with the Bank when he resigned from the Salisbury Committee. He first joined the Board of the Bank in 1910 and was Deputy Chairman from 1922 to 1947. Lord Teviot also retires from this Committee. He, too, gave years of service to the Board and has been a valued member and Chairman of the Committee.

In Yorkshire we have to record with regret the loss by death of Mr Cecil Berry, a member of the Yorkshire Committee and a former District Manager of the Bank.

To Lord Cobham, of the Birmingham Committee, we offer our congratulations upon his appointment as Governor General of New Zealand.

We also congratulate Lieutenant Colonel T. Eustace Smith, of the Newcastle-upon-Tyne Committee, and Brigadier Kenneth Hargreaves, of the Yorkshire Committee, on the conferment of the honour of Commander of the British Empire.

I regret to have to report the death of Mr W. T. C. Parker. He was until a few months ago General Manager of our Eastern Branches. He spent his life in the service of the bank, nearly all of it in the East. He was a very distinguished servant of the bank and we owe him gratitude in particular for the wisdom and judgment he displayed in the difficult circumstances after the partition of India and Pakistan.

REORGANISATION OF CAPITAL

The balance sheet reflects the reorganisation of the bank's share capital, approved by the "A" shareholders and "B" stockholders at meetings held last October and subsequently confirmed by the Court in respect of the reduction of capital involved. The issued capital of the bank in its new form, emerging from the reorganisation, consists of 18,565,070 shares of £1 each, all of one class and all fully paid. That is a modern, convenient and tidy structure. It gives the bank greater freedom of action and the shareholders a better market for their shares, both real advantages.

Your directors had no doubt that their proposals were in the best interests of the bank and of both classes of shareholders. This view was confirmed by the general welcome accorded the scheme. Proxies in favour were received from shareholders representing nearly 9 million votes, for whose active support I am most grateful; those against were negligible in number.

The only real reduction of capital involved in the scheme was the writing down of the "B" Stock by £838,425, which now appears on the liabilities side of the bank's balance sheet as part of the Reserve Fund. The security of the depositors, therefore, remains exactly as it was before, apart from the uncalled reserve liability on the former "A" Shares. Being a reserve liability, this could not be called except in the event of the winding up of the bank and then only if necessary to meet the liabilities of the bank. Such reserve liability had, in our opinion, ceased to have any material significance under today's conditions.

PROFIT AND LOSS ACCOUNT AND BALANCE SHEET

The profit for the year, at £2,541,793, is £219,354 higher than last year, and in conformity with the intention announced in the circular letter to shareholders dealing with the scheme of capital reorganisation, since carried into effect, we propose a dividend of 13 per cent per annum, an increase of 1 per cent compared with 1955.

Our earnings have benefited from the high rates for money in force throughout the year, notwithstanding the increased interest paid on deposit accounts. Any expansion in our main earning asset, Loans and Advances, has of course been limited by governmental directive.

I warned you last year that a further rise in operating costs must be expected; this in fact happened, with substantial increases both in staff costs and in all other items of expenditure. Our business in general continues to expand year by year, as evidenced, for example, by the growth in the number of accounts. We are, therefore, vitally interested in the possibility of devising more economical methods of working. Two of our officials have recently visited the United States to investigate the progress made in that country in the field of electronic book-keeping; I am sure it is in that field that we must seek an answer to the problem of continually rising costs, but a rapid start must not be expected.

British Government securities stand in our balance sheet at £326,055,546, being valued at or under cost and below redemption value. Their market value at December 31, 1956, was £317,930,506, a difference of £8,125,040.

We have made no further transfer from reserves or profit and loss account to provide for this depreciation. All the securities are redeemable at fixed dates, the majority within ten years, when any depreciation will be recovered. In the ordinary course of business the bulk of our investments are held broadly to maturity; when we need to reduce

our portfolio, we do so in the very short-dated stocks.

During the year we opened a number of branches in developing areas or in areas where our business suffered from a lack of representation, the more important being at Langham Place, London, at Morecambe, Lancashire, and at London Airport.

To all the Staff I offer my warm thanks for their good work in a year which has not been an easy one.

EXECUTOR AND TRUSTEE DEPARTMENT

The business of our Executor and Trustee Department continues to expand but we can hardly expect its growth to be maintained at the rate experienced since the end of the war. The Department has thirty area offices throughout the country with a staff fully qualified to deal with this specialised type of work.

The bank not only acts as executor and trustee under wills, but also as trustee under new settlements and deeds of covenant and as trustee of provident and pension funds. This part of the Department's activities grows steadily in importance.

REGISTRAR'S DEPARTMENT

For some years we have acted as registrars for certain public companies and, as the demands for our services in this way are on the increase, we have recently decided to open a special Department domiciled at Charles II Street, S.W.1 to deal with this type of business, in which we look for expansion as the usefulness of the service is more widely appreciated.

LLOYDS BANK (FOREIGN) LIMITED

The trading results of our subsidiary company, notwithstanding a further rise in operating costs, were satisfactory. They cover a period of a full year, against nine months in the previous accounts.

Our branches in Belgium, Switzerland and Monte Carlo contributed substantially to these results and, notwithstanding a continuance of difficult conditions for banking in France, our earnings in that country showed improvement.

The net profit shown has again been added to reserve.

THE CREDIT SQUEEZE

Throughout the year, our lending operations have been governed by the principles of the so-called "credit squeeze" initiated by the Chancellor's appeal for credit restraint originally made in July 1955 and reaffirmed, among other occasions, as recently as November last.

In my last annual Statement, I showed that this particular method of restricting lending, while no doubt unavoidable as an emergency measure, was bound to have other and less desirable effects. We look forward to the day when the directives can safely be withdrawn.

This can only come about when the Treasury are able to effect a sufficient contraction in the amount of the floating debt to enable the authorities to keep a tight rein on the liquid assets of the banking system; and that was not the situation throughout the greater part of 1956. Indeed, by late October, the tender issue of Treasury bills was running almost £200 million above the level of a year earlier. As a result, the liquidity ratios of the banks as a whole were distinctly on the high side, while between April and October the underlying trend of bank deposits was rising slightly.

It may be that conditions are now becoming more favourable to the long-awaited funding of floating debt. Since October, the over-abundance of Treasury bills has been greatly reduced, a fact reflected in declining rates at successive Treasury bill tenders. In part, this reduction in the supply of Treasury bills must reflect the inflow of funds to the Exchange Equalisation Account as the counterpart of the heavy losses of gold during the Middle East crisis. At the same time, the Treasury has had the benefit of one genuine improvement in the domestic financial situation, namely the increased flow of subscriptions into savings issues of all kinds. Then, for a few more weeks we can expect a continuance of the contraction in floating debt that always takes place at this time of year as a result of the peak revenue collections, while conditions in the gilt-edged market have become more propitious for sales of long term securities to the public.

This is a combination of factors which is likely to reflect itself in a fall in the liquid assets of the banks and in bank deposits, with a reduction in the liquidity ratio. Thus, the stage may not be too far off when liquidity ratios will resume their normal place as the major influence preventing any undue expansion of bank credit.

TREND OF ADVANCES

Meanwhile, we continue to give effect to the Chancellor's wishes. In June, 1955, our normal advances to domestic customers, falling within the purview of the Chancellor's directives, amounted to £298.5 million. By December last, their total had been reduced to £278.4 million. This contraction masks a substantial increase in our lendings to customers in a group of industries—engineering, iron and steel, shipping and chemicals, whose contribution to exports and to the strength of the economy in general has justified larger borrowings from the banking system.

These figures, of course, relate only to part of our total business. At each of the dates mentioned, the aggregate figure of loans and overdrafts appearing in our published statements was about £50 million higher than those I have just quoted. And that was the case even though our loans and overdrafts total does not include certain items that are commonly included under the heading of advances: namely "Items in transit," "Balances with banks abroad" and "Other assets and accounts." All these are shown as separate entries in our published statements.

The margin of £50 million to which I have referred was made up of three special categories of lendings falling outside the scope of the directives. One of these is advances to the nationalised industries. As is well known, finance for these industries is being provided as a temporary measure by the Treasury. Our own lendings have thus fallen substantially and in November last amounted only to about £10 million. For the rest, the margin is accounted for by two other categories of lending, both of which have been expanding during the period of the squeeze.

EASTERN BRANCHES

First, it happens that alone among the clearing banks we have a number of branches in three overseas countries, whose figures are included among our balance sheet totals. These are our twenty offices in India, Pakistan and Burma. The lendings of these Eastern branches naturally fall outside the ambit of the United Kingdom credit squeeze, since these are rupee advances made against rupee deposits. In India especially, with an economy expanding so rapidly, there is an incessant demand for bank accommodation which, owing to tightness of funds, banks do not always find easy to meet to the full. This demand is reflected in our own advances, which show material expansion.

The increasing business is being handled in a most satisfactory manner by our staff in the East, both European and Asian, and to them I would express our appreciation of their good work.

MEDIUM TERM CREDITS

The second special category of lendings consists of a relatively new form of accommodation, namely medium term credits extended to overseas buyers to enable them to purchase capital equipment manufactured in this country.

These operations are not altogether novel, since we have entered into transactions of *this kind in a number of years since* the war. The way to an expansion of this method of assisting exporters was, however, opened by the Budget of April, 1954, which authorised the Export Credits Guarantee Department to provide direct guarantees to British banks for a large proportion (normally 85 per cent) of the amounts in question.

Medium term finance is, of course, on a different footing from other advances, for it is the traditional principle of British banking that advances are repayable on demand, whereas medium term credits are repayable by instalments spread over a number of years. They represent none the less a perfectly sound banking operation; the Export Credit guarantee embraces by far the greater part of the lending and any unguaranteed portion *is covered by normal banking procedures.* And it should be understood that such credits are extended only in connection with very sizeable export contracts, which not infrequently run into millions of pounds. In one respect, too, these credits are actually more liquid than an investment in bonds of similar maturity, for under the terms of the contract a substantial proportion of the outstanding amount is coming back each year.

We have made facilities available in this form to assist the export of capital equipment for such projects as power stations, railways, steelworks and hydro-electric schemes overseas, and in some cases this has enabled British manufacturers to secure valuable contracts that would otherwise have gone elsewhere. Among the more important transactions of the kind have been medium term credits to finance the export of large numbers of civilian jet air-liners to dollar markets. So far as the bank is concerned, I am sure that these operations combine safety and enterprise, offering a profitable use for our resources. At the same time, it is satisfactory to have been able to play our part in developments so clearly and directly in the national interest.

APPROACH TO MONETARY STABILITY

The "credit squeeze" is, of course, only one strand in a far wider programme of disinflationary measures. Prior to the crisis in the Middle East, these seemed steadily to be achieving their aim. Indeed, in one most important respect they had already brought satisfactory results, namely in swinging our balance of payments back from a deficit of £107 million in the second half of 1955 to a surplus of £144 million in the first half of 1956.

This movement is one more convincing demonstration of the truth that our recurring overseas crises since the war had their origin in an excess of demand at home. Conditions in the outside world did not change substantially between 1955 and 1956. The significant change lay in the steps taken to reduce the overburden on the British economy. The improvement in the balance of payments was due to the combination of two factors: a check to the rising trend of imports and an increase of close on 10 per cent in the value of our exports. Some damping down of the domestic boom was a necessary condition, both to restrain the accumulation of inventories and to release resources for the export markets. This favourable turn in the balance of payments could not have come about but for the disinflationary measures.

Both in social and economic terms, the cost of this strengthening of our external position has been slight indeed. Unemployment has remained in the neighbourhood of 1 per cent. Capital formation by industry is still running at a high level. Consumption, too, has been slightly higher than in 1955. It is true that there has been a check to the former expansion in production: the past year brought no further advance beyond the peak level achieved towards the end of 1955; but there has been no appreciable downturn. In the light of this, we should hear no more of the cry that *any* measure of disinflation, however gently applied, can result only in wholesale slump and unemployment. On the contrary, should we find ourselves in a similar situation in future, the authorities ought to be emboldened by this experience to act more promptly and effectively, to be less inhibited by fears of overshooting the mark.

IMPORTANCE OF PRODUCTIVITY

Nevertheless, it is sometimes argued that even a temporary check to production is too high a price to pay for the achievement of monetary stability. It would indeed be difficult to exaggerate the need for this country to step up the rate of investment and thereby the rise in productivity. We have to put more horse-power and better machinery behind the efforts of every member of the labour force. Upon this depends not only our hope of greater material well-being but also our hope of keeping pace with other leading industrial nations on both sides of the Iron Curtain and ultimately, perhaps, our whole status in the world.

This being so, it is no doubt perplexing and disheartening to many to see measures being taken to check a domestic investment boom almost before this had got well under way. But let us not suppose that in the absence of corrective measures domestic production could have gone on rising without limit, and so fall into the trap of counting a less of this potential output as the price of disinflation. It cannot be sufficiently emphasised that the limiting factor is the supply of saving; it is this which sets an upper limit to the amount of investment that can be sustained. For a time, no doubt, the amount of voluntary saving which is forthcoming can be supplemented by the forced savings imposed by inflation. Even so, there comes a point at which any further increase in domestic capital formation tends to be offset by a deterioration in the external balance of payments: the resources needed to finance the extra investment at home are provided not by the savings of the domestic population —even forced savings—but by means of borrowing from the outside world or running down our gold reserves or other external assets.

Once that point has been passed, as it had been in 1955, a further rise in domestic capital formation will make no net contribution to our national wealth: the addition to our domestic assets will be offset by an increase in external debt or a loss of external assets. No advantage is to be gained from building factories and paying for them by the loss of gold. On the contrary, for a country in our position in the world, and with a gold reserve already painfully inadequate, there is a very great disadvantage. The real need, therefore, is not to press ahead with domestic capital formation regardless of what is happening to the balance of payments. It is rather to create conditions in which a revival of saving will make it possible to press on more rapidly, at one and the same time, with additions to our domestic wealth *and* with the rebuilding of our overseas capital.

Saving, however, takes many forms. The undistributed profits of companies, the current surpluses of local authorities and the public corporations, the surplus on the budget, as well as the unspent income of private persons—all these are tributary streams which combine to make up the flow of saving as a whole. It is this combined flow of saving in the aggregate that we have to augment.

REPRESSIVE EFFECTS OF TAXATION

Last April's budget was designed to produce a large surplus in order to compensate for a deficiency in other forms of saving. But, as Mr Macmillan himself pointed out, what may be necessary for an emergency cannot be erected into a permanent system. There is a danger that the high rates of taxation needed to produce a sizeable surplus will not only react adversely upon other forms of saving but in time stifle the very well-springs of enterprise. It is disquieting, for example, to see young men who could make a valuable contribution to British industry preferring to make their careers in other countries where taxation is lower and their efforts are likely to be more adequately rewarded. In his recent Stamp Memorial Lecture, Lord Heyworth pointed to the steep rate of progression of tax on managers' salaries as the greatest single handicap to the conduct of an international business in this country. Nor should we overlook the danger that it would in any case be difficult to maintain a large budget surplus for very long in the face of natural political pressures: it is almost certain to be dissipated either by remissions of taxation before these can safely be undertaken or by increased public expenditure.

Fortunately, one of the most encouraging results of the disinflationary measures has been the indication of a substantial increase in personal savings, a revival most strikingly manifest in the recent figures of the National Savings Movement. Nothing could be more welcome. There have been other signs of progress. For example, the overburden on the economy has been reflected in a great excess in the number of vacancies on offer compared with the numbers seeking work. Throughout most of 1956 the gap was narrowing rapidly, and by the end of the year had disappeared. Up to November, too, the index of retail prices showed no further rise on balance after April, notwithstanding the round of wage increases in the early months of the year.

NATIONALISED INDUSTRIES' FINANCES

In all these ways, the situation has shown improvement. Yet it cannot be taken for granted that, even in the absence of the Middle East crisis, this progress would have been maintained and the aim of monetary balance have been fully achieved. Some tendencies have been pulling in the opposite direction. In particular, the weak financial position of the nationalised industries has remained an unsatisfactory feature of the situation. Nobody questions the need for very heavy investment outlays to improve the capital equipment of these basic industries. What may be criticised is pricing policies that render the public corporations as a whole incapable of providing even for the replacement of capital used up in their current operations, far less of financing new capital expenditures.

In round figures, it appears that in 1955 more than £300 million was needed to maintain intact the capital used in these industries, yet the combined surpluses of the public corporations themselves covered barely half of this. The remaining half, together with the whole of the funds needed for new investment, had to be raised by borrowing—to the tune of more than £400 million—savings generated in other sectors of the economy. What would be thought of the future of any private enterprise that failed to provide even for the maintenance of capital? The contrast with private industry is very marked indeed. It seems clear that, in relation to their costs, the nationalised industries as a group have been fixing uneconomically low prices for their products; and this is particularly serious if the products in question are fuel and power, where the seeming impossibility of raising the output of coal means that everything should be done to stimulate economy in consumption.

PRICE RESTRAINT HAZARDOUS

We are all familiar, of course, with the argument advanced in favour of price restraint; it is the fear that any advance in price, however justified, will be made the pretext for an increase in money incomes and so give fresh impetus to the inflationary spiral. Yet the experience with the food subsidies is sufficient proof of the difficulties into which this line of thought may lead us. Inflation itself means that the flow of voluntary savings is inadequate to finance the amount of investment that is going on. Yet if prices are maintained unchanged in face of a rise in costs, this will reduce the amount of saving in the form of the surpluses of public corporations or the undistributed profits of companies. And this may go far towards offsetting an increase in personal saving resulting from anti-inflationary measures proper.

The expedient of pegging prices is thus a hazardous one. Adopted at precisely the right moment, with everything else pulling in the right direction, it could afford us a momentary breathing space and so help in breaking the price-wage spiral. But it is bound to be a gamble; for the pegging of prices will tend to increase real purchasing power when the basic problem of checking inflation is to reduce it. Unless output is falling, rising costs mean rising incomes. And rising incomes combined with stable prices mean an increase in inflationary pressure, unless one condition is satisfied: it is that the increase in incomes should be cancelled out, or more than cancelled out, by an increase in voluntary saving. In an inflationary situation, we can safely create purchasing power only if there is real assurance

that the additional claims upon output will not for a time be exercised.

WITHDRAWING PURCHASING POWER

What if the condition is not satisfied, if the broad flow of saving remains insufficient yet it is desired both to maintain the rate of investment and to avoid inflation? Clearly, some means has to be found of withdrawing purchasing power. What form is this to take? In the final analysis, there are only two ways of doing it. One is the method of the budget surplus, the limitations of which I have already stressed. The other method is to allow prices to rise.

If the method of a budget surplus is used and the enhanced surplus is provided by means of direct taxation, then it is generally accepted that nobody has a good claim for a compensating increase in money income. As a matter of logic there is not the slightest reason why the situation should be any different if Parliament decides to curtail purchasing power by imposing indirect instead of direct taxation. But under our present arrangements, the effects will in fact be quite different.

Higher indirect taxes will raise the market prices of the goods in question. And, as the cost of living index is based on market prices and not upon the cost of the factors of production, this means that particular sections of the community whose incomes are linked to the index have an automatic dispensation exempting them from increases in indirect taxation, whatever the intentions of Parliament. If the index rises, whether for this or any other reason, two million wage incomes will go up automatically and more general demands for increases will be regarded as justified, either by the rise in prices itself or by the need to preserve the usual differentials. The position is, of course, the same if prices are raised not by an increase in indirect taxation but by producers—yet a rise in price may serve not only to withdraw purchasing power in general but to curb consumption where that is most needed.

These are nothing more, in the last analysis, than so many ways of effecting a withdrawal of purchasing power that, in an inflationary situation, may be necessary. It is to be regretted that the rules of the game as practised in this country impel us almost irresistibly to choose that particular method —a budget surplus generated by penal rates of direct taxation—which is least calculated to promote our national well-being in the long run. The warning given by Mr Macmillan, as Chancellor of the Exchequer, of a possible rise in income tax shows that this is a problem that may confront us in more acute form in the near future. It is a problem, I suggest, on which there is urgent need for further thought unimpeded by the shibboleths of the past.

THE NEW PHASE

It may be, then, that the programme of disinflationary measures would have required some reinforcement if we were fully to achieve the goal of monetary stability during the coming year. That can now be no more than a matter of speculation. For, whatever else may be in doubt, it is clear that the events in the Middle East have opened a completely new phase in our economic affairs. Our long term problems are unchanged; we still have to maintain the value of sterling and to speed up the rate of accumulation. What has gone is the prospect of a smooth transition to a state of monetary equilibrium in the course of the next few months.

A new chapter has been opened. At best, we must reckon with an interruption of some months in the advance towards our long term objectives. Fortunately, American co-operation has been forthcoming in the measures taken to avert some of the more serious possibilities that were at one time feared. We can now count upon a sizeable flow of oil across the Atlantic and also upon dollar facilities to help in paying for it. Moreover, the danger to sterling arising out of speculative attacks has been dispelled by the action of the International Monetary Fund, under the leadership of Dr Per Jacobsson, in making available for use, if necessary, the whole of our quota.

MONETARY RESTRAINTS ESSENTIAL

All this gives us an excellent start in the task of facing the new situation. But we do not yet know how long it will take to find a satisfactory solution of the Middle East problem and to reopen the Suez Canal to the ships of the world. We do not know, therefore, how great the strain on our economy is going to be, nor how long it may endure.

What seems clear is that, for the time being, these events have complicated still further the problem of eradicating inflation from the system. The worldwide rise in shipping freights is bound to raise the price of some of our imports and that in turn must tend to react, however slightly, upon retail prices. For the present, inflation is still the great danger. The maintenance of over-all monetary restraint is even more imperative than before.

If, on the other hand, the crisis drags on, our problem will cease to be the clear-cut one that we have been facing for the last two years. We must face the possibility that a shortage of supplies of fuel, coupled perhaps with some loss of export markets and difficulties in shipping goods abroad, may at some stage be reflected in a fall in the level of industrial production. In such a situation, nothing could prevent some temporary loss of employment in particular industries. Some redeployment of the labour force may be inescapable, and that cannot take place rapidly without some transitional unemployment as workers move from old jobs to new. What is important to remember is that there will be no lack of purchasing power to expedite the reabsorption of large numbers of workpeople into new employment. Too much significance should not be attached during the next few months, therefore, to the over-all statistics of unemployment, including those out of a job for very short periods.

A large increase in the numbers of those out of work for an appreciable period, such as two months or more, would be a very different matter. For it is prolonged unemployment that means real social hardship. The nation as a whole may have a heavy bill to pay; but it would be contrary to natural justice and to all our principles to permit an unfairly large share of the burden to rest upon the shoulders of those who happen to become displaced from their normal employment. To combat a serious increase in prolonged unemployment, special measures certainly should be taken. If the need arises, we must be prepared at short notice to relax the general policy of monetary restraint in whatever direction may promise to be most helpful, whether by way of tax remissions and other relaxations or by stimulating investment projects. However, present indications are that this danger is still less threatening than that of a further twist of the inflationary spiral.

THE OVERRIDING PRINCIPLE

At this moment, nobody can really assess the magnitude and likelihood of these conflicting influences. The situation we face is a complex one, calling above all for flexibility and resolution. One overriding principle alone is certain: it is that we must seek to emerge from this temporary period of difficulty with our ability to achieve our long term objectives unimpaired.

Let me restate those objectives. We have to maintain the position of sterling as a world currency, fully viable on the basis of existing rates of exchange. This in turn means that we must maintain and improve our position in export markets. We must also be prepared during the emergency to draw upon the reserves to pay for necessary food and raw materials. Only so can we hope to achieve our second and parallel objective, which is to maintain a high level of production and employment. We must be thankful that the reserves now seem large enough to permit these two objectives to be reconciled —but also resolute to use the respite given to produce a lasting consolidation of the position.

A great task of reconstruction lies ahead of us. To a very large extent, this task is a political one. We have to restore relationships that have been gravely damaged with many of our overseas friends and allies, above all our relationships with the other members of the Commonwealth and with the United States. These are not subjects which the annual statement of a bank chairman can properly discuss at length. But success in these endeavours so conditions the speed with which we can hope to solve our economic problems that it would be equally inappropriate to end without stressing their paramount importance.

BROOME RUBBER PLANTATIONS

The twenty-third annual general meeting of Broome Rubber Plantations Limited was held in London on January 23rd, Sir Lionel Smith-Gordon, Bt (the Chairman), presiding.

The following is an extract from his circulated statement:

The trading profit was £135,130 compared with £94,502 the previous year. This satisfactory result was a consequence of a larger crop and a higher average selling price.

After making all necessary provisions, including taxation, £61,476, and transferring £10,000 to General Reserve, dividends have been declared totalling 17½ per cent for the year as against 15 per cent for the previous year.

The crop, which amounted to 3,364,900 lb and was nearly 5 per cent greater than in the previous year, was sold for an average of 31¾d. per lb landed London equivalent, and the cost was 23¾d. per lb London equivalent, an increase of 4d. over last year, as a result of heavy taxation and higher rates of wages.

Competition with synthetic rubber is a very pressing one and we must do our utmost to maintain and increase efficiency. Our first duty is to replace our old areas of seedling rubber with up-to-date high yielding trees. During the year under review we replanted 188 acres, and we have just completed the replanting of a further 310 acres.

As foreshadowed last November the board hope to be able to pay an interim dividend on account of the year 1956/57 within the next three months.

The report and accounts were adopted.

MIDLAND BANK LIMITED

VULNERABLE POSTWAR ECONOMY OF UNITED KINGDOM

PREREQUISITES OF MODERN PLANNING

LORD HARLECH ON HAZARDS CONFRONTING MANAGEMENT

The One hundred and twenty-first Annual General Meeting of Midland Bank Limited will be held on February 15th at the Head Office, Poultry, London, E.C.

The following are extracts from the Statement by the Chairman, The Right Honourable Lord Harlech, KG, PC, GCMG, on the report of the directors and balance sheet for the year to December 31, 1956:

In terms of business conditions in general, 1956 could scarcely be reported upon as a year of expansion, and this remark holds true of banking. Our own balance sheet for December 31st last shows a slight increase, in both deposits and advances, over the figures for a year earlier. On the other hand, the average of our deposits over the year has been very slightly below the level of 1955. Advances too, on the average, have been appreciably lower, the continued, widely spread contraction, coupled with reduced calls upon the banks for loans to nationalised undertakings, having been only partly offset by increased accommodation to essential industries, particularly engineering.

This movement, along with the reduction in investments, has been reflected in the larger volume of Treasury bills carried in our portfolio, and as a consequence our liquidity ratio has been lifted on to a higher level—well above 35 per cent on the average for the year as against less than 32 per cent in 1955. Having regard to the state of the market and the general outlook, we decided that this higher degree of liquidity was prudent and justified. With regard to investments, well over sixty per cent of our holding is due finally to mature, in successive blocks, within periods ranging from less than one to less than five years, and the rest within less than ten. The nominal depreciation on our holding, which for reasons explained in past Statements is shown in a note on the balance sheet, was proportionately a little less on December 31st last than a year earlier.

Although in respect of total resources 1956 was not an expansive year—although, further, there was a slowing down of the growth of turnover on current accounts—banking profits tended to increase. The direct effect on earnings of the decline in the average level of advances and in the investment holding would in any event have been largely offset by the fact that, in the structure of rates ruling over the past two years, the yields on short-term liquid assets have risen relatively to those on other assets. In addition, however, the whole range of rates was lifted on to a higher plane by the one per cent rise in Bank rate early last year.

Our larger trading revenue was partly absorbed by higher salaries and other running costs. Nevertheless, the net profit for 1956 after tax showed an increase of about nine per cent on the figure for the preceding year. Unfortunately, it cannot be said that stability of running costs has yet been established; the trend is still upward. Further, 1956 may prove to have been a year of exceptionally high interest rates, while the business outlook is not, on the whole, so reassuring as to support an assumption that recent banking experience as regards bad and doubtful debts will be extended indefinitely. Accordingly your Directors are of the opinion that the additional profit of the past year should be applied wholly to strengthening the position of the Bank, and recommend that the dividend be continued at the same rate as a year ago.

ECONOMIC DISTURBANCES

Turning to matters of wider concern, as already indicated, no one could describe 1956 as "a good year." The course of events in the first half was moderately gratifying, and there were signs that the national economy was moving in the right direction. The second half was marked by a sharp check to the advance towards a firm equilibrium. Once again the authorities had to resort to extreme measures to cope with an emergency that threatened to overstrain inadequate resources. Altogether, a year in which interest rates were lifted on to a still higher level, tax burdens further increased, a scheme of Government prize bonds introduced as an incentive to saving, capital investment restricted and hire-purchase controls widened and stiffened, petrol rationing reintroduced, arrangements made for fresh borrowing abroad, and a waiver of interest sought on Government debts in the United States and Canada—such a year could not be regarded otherwise than as revealing once again the narrowness of the margin of resources upon which the United Kingdom economy has been working ever since the end of the war.

With the statistics so far available it is impossible at this stage to draw up a national revenue account or balance sheet for a period of so much disturbance. Indeed, there is some ground for the argument that the publication of incomplete current figures may in some circumstances do more harm than good, as when a heavy decline in the gold and dollar reserves is recorded without enough accompanying evidence to show whether it results from over-spending or from a strengthening of the capital position by the reduction of external liabilities. This at least is certain, however, in the light of experience in 1956 as in 1951, 1949 and 1947: that Great Britain, in its exceptional position as a great trading national and financial centre, has insufficient liquid resources and economic resilience to absorb, unshaken, the shock of such unforeseen events as occurred in the latter part of last year. The margin for swift response to the challenge of violently changing circumstances is too narrow for safety. The story underlines also the magnitude and complexity of the problems of planning and management to which we have to adjust ourselves in modern conditions.

PROBLEMS OF PLANNING

If we set aside for the moment the risks of international conflict and the consequences of the oil shortage, it is possible to distinguish two contrasting attitudes towards the business situation in this country. Some people will ask, as they have been asking themselves again and again over a period of years: How long can things go on as they are; can the post-war high level of business activity and employment be maintained indefinitely? Others will ask: Why should we ever have another slump; what reason is there to fear that anything like the long depression of the thirties will ever be repeated? For the more sceptical observers, recurrently acute weakness of the balance of international payments, inadequate monetary reserves and the implications of a debtor position on international capital account all suggest that a day of reckoning may be near. For the more confident, on the other hand, the development of governmental responsibility in economic affairs, together with improved knowledge and deeper understanding, removes the ground that may have existed for fearing serious under-employment of labour and capital resources and holds out the prospect that full employment can be maintained without further depreciation of the currency.

In practice the course of business is set by a multiplicity of decisions by individuals, whether in business or administration. It can be of cardinal importance, for example, that many businesses have made up their minds to increase or diminish their stocks of raw materials or finished goods and are taking steps to do so, or that public authorities and business undertakings are enlarging and speeding up their capital extensions or have decided to modify their long-term development plans. It is, then, in the shaping and carrying through of plans by public authorities and private businesses that we find the crucial element in the determination of the ups and downs of economic activity.

It seems often to be assumed that "planning" is the simple answer to the problem of economic instability, whereas in practice the timing and balancing of plans, in such a way as to ward off or allow for economic fluctuations, is a most delicate and difficult operation. This is true for both government and business, even though government, besides full authority over its own plans, has extensive powers to influence those of other public bodies and of private business. These powers the Government of our own country has repeatedly called into use in recent years —with not altogether happy results.

A prerequisite of successful economic policy is full knowledge of the facts, obtained in time to prompt any corrective action that may be found necessary. In this respect remarkable progress has been made, and the Government is now better equipped for its new responsibilities than it ever was. It has, for example, more comprehensive estimates of consumers' expenditure and various other elements in the composition and disposal of the national income; improved measurements of industrial production; data concerning actual and prospective capital outlay; and more reliable and detailed figures about the balance of payments. Indeed, one expert (Prof. R. G. D. Allen, *Economica*,

November, 1956) has given it lately as his judgment that "British economic statistics are now amongst the best in the world," though we lag behind the United States in the frequency and promptitude of their appearance. Recently, moreover, steps have been taken to fill remaining gaps in current statistics and to reduce delay in detecting significant movements. Quite apart from the value of such material as a guide to policy, publication thereof helps to shape opinion and influence business decisions and to spread understanding of what the authorities are trying to do, and why.

Great difficulties remain, however, even when adequate statistics are forthcoming. One weakness lies in a tendency to presume that statistics are the *only valid kind* of information for economic planning. In fact, non-statistical information, particularly the day-to-day knowledge and impressions of people close to the fields of operation, may sometimes be of greater practical help than the bare statistics in detecting a turning-point in the course of affairs. A government authority concerned in such matters should take steps to ensure constant sensitiveness to the "feel" of things, especially as to the development of business plans concerning capital expenditure and stocks, the prospective course of prices, sales, orders on hand and so on.

It is important, too, that the authorities should be fully aware of changes that may be taking place in the structure and processes of business—changes that may be important in relation to the working out of an effective monetary policy. No one, for instance, can follow the fluctuations in the total volume of credit, provided outside the banking system, by manufacturers, traders, hire-purchase finance companies and other bodies whose operations have become more significant in recent times and may under some conditions move contrary to policy applied through the banking system. Again, little information is available, at least until long after the event, about fluctuations in the flow of long-term finance from various sources. No one will deny the importance of the switching of local authorities' borrowings from the Public Works Loan Board to semi-public bodies like savings banks, the new issues market and other channels of private capital, yet no one knows the changing proportions of resort to these various sources of funds. We have no information, even belated, such as is readily available in the United States, about the disposition of Government debt among various classes of holder. The regular Exchequer returns are in many ways obscure, particularly as a guide to the actual cash out-turn of Exchequer operations—an important element in monetary affairs. All these, and others that might be cited, are matters which bear upon and reflect the actual course of monetary conditions. Yet those who are responsible for shaping and carrying out monetary policy have to operate with very imperfect knowledge of what is happening.

Even when all is known, or can readily be discovered, there remains the need for judgment, and human judgment, well-trained and well-informed though it may be, is always fallible in both diagnosis and treatment. It is likely, however, to be more right than wrong *if fully equipped with up-to-date balanced* information about the direction and force of key factors in the current situation. Without balance, the availability of data about some aspects of a changing situation may attract too much attention to arithmetical tests of success or failure in monetary policy. In recent times, for instance, there has been a tendency to regard any reduction of bank advances, or any contraction of bank deposits, as something desirable in itself or as proof of something having happened that is helpful to the re-establishment of a healthier condition in the national economy. In some circumstances, however, if the facts were examined, a diminution of either deposits or advances might represent little or no curtailment of the liquid resources being used in current business and little or no diminution of the flow of public and private spending. This would be so, for example, if money which had long been standing on a deposit account at a bank were placed in Treasury bills, or if money previously held by a private individual with a bank were deposited with a hire-purchase finance company and applied by it to reducing its bank overdraft. Both of these processes have occurred within the past two years under the influence of high interest rates and the credit squeeze.

The conclusion to which all this leads is that "planning" by central authorities to keep the national economy on an even keel, while moving in an expansive direction, is a most difficult task. Success in such a task ought not to be lightly presumed. It calls for the use of a wide variety of instruments, for provision of the fullest and most up-to-date information, and for objective comment by those who, while not directly responsible for policy, can contribute much to the attainment of its aims.

HAZARDS OF PRIVATE BUSINESS

While recognising all these requirements, there is much to support the view that the world-wide extension of official responsibility for shaping the course of economic affairs has reduced the probability, if it has not ruled out the possibility, of a repetition of prolonged depression such as occurred in the 'thirties. For some purposes it has been argued that this development has correspondingly reduced the risks of private business, which has thus come to reap uncovenanted benefit accruing to the owners of the equity of business undertakings, whether they be company shareholders or partners or individual traders. We may well ask, therefore, whether official "management" of the national economy as a whole has made any easier the task of "planning" in private business. It is true that business undertakings can plan ahead with greater assurance if fears of general and prolonged depression can be set aside as outdated. It is equally true, on the other hand, that major risks and uncertainties remain, and that these, moreover, are added to by the very fact and forms of official "intervention."

A high level of business activity in general does not afford a guarantee that any particular branch of industry and trade, or any particular business undertaking, will be maintained in full prosperity. Many familiar, well-recognised risks remain—changes in demand, fluctuations in prices of raw materials, international disturbances and so on. Moreover, the maintenance of steadiness in the economy as a whole, for which governments have responsibility, calls for measures which themselves may prove highly disturbing to particular industries or undertakings. The experience of the motor industry during the past year or so provides an illustration of this fact. What business nowadays has to face, over and above the older types of risk, is the chance of changes in official regulations affecting, for example, new capital issues or the terms of hire-purchase transactions, and of variations in taxes, such as changes in rates of purchase tax or profits tax and in depreciation allowances, imposed for reasons of economic policy.

The new uncertainties of business can be illustrated by giving a few examples of this kind of experience, taken from among many that might be cited by customers of this Bank. The various forms of restriction imposed, particularly from about the middle of 1955, fell with all the greater severity on many businesses because of the optimism generated by an expansionist budget following the lifting or relaxation of controls.

Many of our customers, in both manufacture and distribution, have been affected with more or less severity by the successive steps taken in the field of hire-purchase control. Typical among them was the experience of an undertaking which, following the removal of those controls in 1954, had expanded its productive capacity, introduced new models and built up its stocks of materials and components correspondingly, to find itself suddenly confronted with all the problems arising from a sharp contraction of demand for its products. In circumstances like these some firms managed to switch to other activities, such as sub-contracting on defence orders, only at the cost of expensive re-organisation. Some had to resort to price reductions and rapid realisation of stocks before settling down on a lower level of activity than had been foreseen.. Some found themselves forced to part with specially trained employees, whether by laying them off or hastening retirement, and will have to face higher costs with new employees when conditions call for re-expansion. Here and there the benefits of shift-working had to be forgone, and even a short working week introduced. All these were necessities which not even the most enlightened management could be blamed for failing to foresee.

In many undertakings the impact of hire-purchase restrictions has been added to by the raising of rates of purchase tax. One, for example, had to report to its shareholders three distinct blows: first the restriction by nationalised industries, at the Government's request, of their activities in promoting sales of domestic heating and cooking appliances; secondly the reimposition and stiffening of hire-purchase controls; and thirdly the increase in rates of purchase tax and extension of its range to bring in articles previously tax-free. In some retail establishments the higher tax rates have forced a reduction of stocks, and of the range of choice offered, because of the amount of money that is locked up in the financing of the actual tax payments This added burden fell with particular severity upon companies which, by the seasonal nature of their business, were heavily committed, at the time of the tax-rate increase, to taking delivery of quantities of goods which they had contracted to sell at prices already fixed.

The secondary effects of these measures, again, are noticeable over a wide range. Thus, for example, a company making insulating materials has had to cut down its staff in consequence of reduced orders following hire-purchase restrictions on sales of domestic appliances, while specialised textile manufacturers have had to curtail their operations and run down stocks because of the incidence of these restrictions on the furnishing trades. Some branches of the timber trade, which ordinarily works on the planning of purchases for up to a year ahead, have similarly suffered the secondary effects of the contraction of retail trade in "consumers' durables."

Variations in the enforcement of capital issues control have been another source of disturbance of business plans—and this quite apart from voluntary response to official appeals to hold back capital expenditure that is not urgently required on current tests of national necessity. Many examples could be given of prospects of business expansion having to be set aside because of unforeseen inability to raise the required financial resources. In one case the indefinite postponement of arrangements for new finance, enforced by the increased severity of the control, is reported to have entailed cutting down the range of stock carried and a consequent loss of sales. Financial stringency has been intensified also by the reinstatement of the "initial allowance" in place of the short-lived "investment allowance" in computing the tax liability on profits.

To cite these examples is not to debate the necessity of the use of such instruments of national economic policy as have been mentioned, nor to discuss the wisdom or unwisdom with which they have been applied. The purpose is simply to show that their operation gives rise to a set of uncertainties which was unknown to business men on any wide scale down to 1939. It follows that the hazards confronting those responsible for managing a business may be just as great as ever they were. Business is still a venture; and a national policy of "full employment" does not remove the element of risk from the conduct of business undertakings large or small.

"COMMUNICATION" WITHIN THE MIDLAND BANK

We are constantly alive to the possibilities of improving our system, on both the human and the mechanical sides, just as we are actively exploring the applicability to banking of new scientific developments, for example in the field of electronics.

Efficient communication is of crucial importance for an undertaking whose management and staff are scattered widely and unevenly over the country in a head office organisation and well over two thousand branches and sub-branches, each conducting business with the public, receiving and carrying out customers' instructions and making arrangements to meet their individual needs. In such an undertaking, integration would be unattainable without constant exchange of information and guidance.

The description that follows relates solely to the Midland Bank itself. Our affiliated companies—the Belfast Banking Company in Northern Ireland, the Clydesdale and North of Scotland Bank mainly in Scotland, and the Midland Bank Executor and Trustee Company, whose records again bear ample testimony to their sustained good service—have their own arrangements within their own fields of operation.

As a matter of pure mechanics, the fact that customers of the Bank are operating on a vast number of accounts at over two thousand branch offices entails an elaborate network of inter-branch arrangements. Cash and clearing processes involve the work of a large proportion of the staff and of numerous machines and other pieces of equipment—the major concern of a special Machines Department and of accounting sections at head office and branches. This great bulk of transactions is carried through by voluminous recording operations. At our head office alone over 400 people are engaged in the clearing departments, with the aid of adding machines and photographic and other equipment.

BENEFITS FROM DIRECT CONTACT

In this Bank we speak of "head office" in the singular, since there are no district head offices to stand in the way of direct contact between the centre and the circumference. When a branch manager needs advice or requires a prompt decision on any particular proposition, he is able to make an immediate approach to head office, including any of the specialised departments maintained there for his assistance.

The entire operations of the Bank are controlled by the Management Committee at head office, which meets every morning and works on the principle of full corporate responsibility, though each joint general manager is especially concerned with affairs in a particular geographical division. It is essential to the work of the Committee that it should be fed constantly with information about the operations of branches and from officials engaged in specialised fields such as the Bank's day-to-day transactions with the money market and its foreign exchange activities. On the other hand, it is the duty of the Committee to issue clear instructions to officials operating at head office and to the branches throughout the country. The branches must be informed, too, of guiding principles, modifications of policy and mechanical arrangements for carrying on the business of the Bank.

From head office go out each day 1,600 letters to full branches and fifty or more large canvas sacks containing cheques, other bookkeeping vouchers, instructions and correspondence. A similar movement takes place from branches to head office. The outlay on postage by the Bank as a whole now exceeds £300,000 a year.

MAJOR RELIANCE ON TELEPHONIC SYSTEM

In banking business, however, innumerable occasions arise in which mail services are inadequate, most commonly for reasons of time. Telegraph and cable services are widely used, especially for prompt communications with agents and correspondents abroad—a sector of external communications which is of special importance to this Bank, with its exceptionally large volume of overseas business. Within the organisation, however, major reliance is placed upon the telephone system. The Bank's expenditure on telephone services and the like amounts to well over £120,000 a year.

All these arrangements relate to the actual transactions of the Bank: but something more is required if full and harmonious co-operation is to be maintained. There must be the more personal pooling of information and ideas that counts for so much in the working of a large and scattered organisation, involving a staff of roughly 17,700 men and women in groups ranging from nearly a thousand at our Overseas Branch in the City of London to a "three-man" branch in a small country town. The head office organisation, housed in one building and grouped around the Management Committee, is designed to secure full integration of policy and practice, and it is a vital part of the responsibility of a general manger and his assistants, not only to consult with head office colleagues, but also to maintain contact with branch managers within his division and to be accessible to them as occasion may demand. On the other hand, the comments and recommendations of the man on the spot, whether upon particular questions or upon general business conditions in his locality, are indispensable to informed decisions at head office. It is one of the tasks of a special department at head office, for instance, to sift and collect, for the use of general managers, reports regularly sent in by a wide range of branches on local business conditions. In addition, general managers and their assistants take all possible opportunities of visiting branches within the areas of their particular responsibilities.

The same kind of result is achieved, both at managerial and staff levels, by courses provided at our residential college at Oxted and at the training branches.

SIR GEORGE GODFREY AND PARTNERS (HOLDINGS) LIMITED

MR W. D. L. THEED'S REVIEW

The Second annual general meeting of Sir George Godfrey & Partners (Holdings) Limited was held on January 23rd in London, Mr W. D. L. Theed, ARAeS (the chairman), presiding.

The following is an extract from his circulated review: The combined profits before taxation have been maintained at almost the same level as those for the preceding year, namely £521,333 as against £534,131. The increased charge for taxation (£59,500) plays the major part in the reduction of the profit after taxation from £279,259 last year to £237,406 this year.

AIRCRAFT ACTIVITIES

Although it is invidious to select names, I am gratified that we are supplying our air conditioning equipment to the Viscount and Britannia aircraft which are having such success here and overseas.

We have during the year successfully concluded arrangements with the Swedish firm, Svenska Rotor Maskiner, for a licence to manufacture and develop their rotary compressor for use on aircraft. These arrangements will enable us to offer a range of cabin superchargers which will meet any requirements likely to be demanded by the civil airline operator.

Another important development during the year has been the conclusion of an agreement with the Stratos Division of the Fairchild Engine & Airplane Corporation, New York, for the interchange of technical information.

The past year has seen increased activity with many branches of the Admiralty and our cooling units are being installed in HM ships for carrying out certain specialised services. Our mobile conditioning trucks and static units have been specified for use on aircraft carriers.

GUIDED MISSILES

A large section of the Company's Research and Development personnel is devoted to this new field and we intend to press on with its development. We have to date concentrated on the design and production of apparatus to deliver cooling air to missiles. At the same time we have designed a method of distributing cold air to a missile before firing, and also of making the necessary electrical contacts for transmission of signals to the interior of the weapon.

INDUSTRIAL ACTIVITIES

The Industrial Company has continued to expand. Sales have risen steadily and considerable extensions to the Industrial factory are now in progress.

I confidently expect this expansion to continue during the coming year and I believe that the future of the Industrial Company is full of promise.

After commenting on the progress of the overseas subsidiaries, the review concluded, Our Order Book shows an increase over the figures at the same time last year and business is satisfactory.

The report and accounts were adopted and the dividend of 22½ per cent, less tax, for the year was approved.

NATIONAL PROVINCIAL BANK LIMITED

COUNTRY'S ECONOMIC PROBLEMS AND CORRECTIVE MEASURES

GREATER ECONOMIES IN GOVERNMENT EXPENDITURE URGENTLY NECESSARY

NO JUSTIFICATION FOR STERLING DEVALUATION FEARS

MR D. J. ROBARTS'S REVIEW OF FINANCIAL DEVELOPMENTS

The one hundred and twenty-fourth annual general meeting of National Provincial Bank Limited will be held on February 14th at the head office, 15 Bishopsgate, London, E.C.2.

The following is the statement by the chairman (David John Robarts, Esq.), which has been circulated with the report and accounts for the year ended December 31, 1956:

BOARD OF DIRECTORS

Since our last Annual General Meeting, Mr D. H. Illingworth, JP, has retired from the Board of the Bank and from the Local Board at Bradford. Mr Illingworth was a Director of the Bank for 14 years and a Local Director for 37. Also Sir Herbert Merrett has found it necessary for family reasons to lessen his business engagements and to resign from the Board of the Bank after 7 years' service.

Both these former colleagues carry with them into their retirement our good wishes and our sincere thanks for their loyal services during their terms of office. They leave behind them in the Bank many happy memories of friendship.

We offer our congratulations to the Right Honourable J. S. Maclay, CMG, MP, on his appointment as Secretary of State for Scotland, and we wish him all success in his high office. In accordance with custom Mr Maclay resigned from the Board of the Bank upon becoming a member of the Government, and we thank him for the services he has rendered to the Bank.

On April 1st last Mr L. J. Williams became a Director following his retirement from the post of Chief General Manager of the Bank. I will be asking you to confirm his appointment at our Annual General Meeting.

Mr Williams joined the Bank as an apprentice in Southampton in the year 1911. His talents were soon in evidence and after filling a number of responsible positions he became a Controller in the Advance Department in 1928, Joint Chief Controller in 1930, Head of the Advance Department with the status of Assistant General Manager in 1939, Joint General Manager in 1943 and Chief General Manager in 1951. Throughout these years and in these positions of increasing responsibility, Mr Williams handled many intricate problems with the skill, tact and foresight which those of us who have worked with him will always remember with high respect. There are many monuments in the business connections of the Bank to Mr Williams's work, and we count ourselves fortunate in having his wise advice and wide knowledge still available to the Bank in his position as a Director.

On May 30th last, Mr Gerald Steel, CBE, who has served as a Director of our Sheffield Local Board since 1949, was appointed to the main Board of the Bank. Mr Steel brings to our Board long experience in industry, which we are confident will be of much value to the Bank. I will ask you to confirm Mr Steel's appointment at the Annual General Meeting.

Mr W. Mauger, a member of our Guernsey Local Board since 1928, decided to retire at the end of 1956. We thank him for his past services and wish him all happiness in his retirement.

Mr K. W. Parkinson, a prominent figure in business in the Bradford area, has been elected a Director of the Bradford Local Board. We are fortunate to have his intimate knowledge of the woollen textile industry available to the Bank and we offer him our warm congratulations on the Knighthood which, as recently announced, Her Majesty has been pleased to confer upon him.

COUTTS AND COMPANY

The Balance Sheet of Coutts and Company as at December 31st last accompanies our own Report and Accounts.

STATEMENT OF ACCOUNTS

The Balance Sheet and Accounts of the Bank together with the Directors' Report are before you.

It will be seen that the liabilities of the Bank to its Current, Deposit and other Account holders have fallen during the year by £19,265,582 to £814,523,969.

The total of our liquid assets—Cash, Money lent at Call and Short Notice, and Bills—represents 37.3 per cent of our deposit liabilities. This compares with 38.7 per cent twelve months ago.

Investments in securities of, or guaranteed by, the British Government continue to be shown at a figure which is below their market value. The Balance Sheet value of £215,961,946 gives a ratio of 26.5 per cent to Deposits as against 26.2 per cent last year. We hold no undated government securities and the majority of our holdings mature within ten years.

Our Advances stand at £256,730,398, which represents 31.5 per cent of our Deposits. The corresponding figures at December 31, 1955, were £265,204,772 and 31.8 per cent.

PROFIT AND LOSS ACCOUNT

The account shows a net profit for the year of £2,030,483, compared with £1,882,139 for 1955.

Together with the amount brought in of £605,511, there is a balance for disposal of £2,635,994. An interim dividend of 9 per cent has been paid, taking £490,559, leaving available £2,145,435.

It is now proposed to deal with this balance as follows:

	£
To pay a final dividend of 9 per cent	490,560
To appropriate to Contingencies Account ...	1,000,000
This will leave to be carried forward	654,875

The proposed final dividend of 9 per cent makes, with the interim dividend of 9 per cent paid in July last, a total dividend of 18 per cent in respect of the year 1956.

MANAGEMENT AND STAFF

Mr F. Keighley was appointed to succeed Mr Williams as Chief General Manager of the Bank from April 1, 1956. Mr Keighley entered the Bank in 1915 and has occupied many important posts during his upward progress in the service. After wide experience covering most of the country, Mr Keighley was appointed an Assistant General Manager in 1951, and later that year a Joint General Manager. We are confident that in Mr Keighley we have a Chief General Manager thoroughly fitted to fulfil the heavy responsibilities attaching to this post.

Mr R. V. Abbott, who had occupied the position of Assistant General Manager since 1953, was appointed a Joint General Manager on April 1st last.

The results which are disclosed by our accounts for 1956 are made possible only by the loyalty and efficiency of our staff. The Bank is served by a fine body of men and women, and I would like, once again, on behalf of the shareholders and directors of the Bank, to express our gratitude to them for their excellent work during the past year. The maintenance of the high standard and efficiency of our staff is one of our constant preoccupations. We select our staff with the greatest care; we encourage them to acquire an adequate technical knowledge; we provide them with specialized training and give them all the mechanical and electrical aids which can be economically introduced to improve the quality of our service to the public.

TRAINING COURSES

Early in his career a new entrant to the Bank's service attends a course at our Junior Training Centre at Chalfont St. Peter. There, under ideal conditions, he learns the rudiments of banking, meets many of his colleagues, and sees something of the various jobs to which he can aspire. He is given an overall picture of the Bank and of the opportunities open to him in a career which teems with interest. Since the centre was opened in July, 1955, 403 young men have attended a residential course.

At a later stage in his career, normally when he reaches a point at which he is ready for his first important promotion, he attends a course at Unsted Park, Surrey. During this course he receives specialized training for more senior duties and is encouraged to take an active part in debates and discussions and to mix freely with his colleagues. Since Unsted Park was opened in April, 1950, 1,816 men have attended residential courses.

It is now more important than ever that our younger men should be given every opportunity to develop fully their abilities

and personalities. The proportion of men to total staff continues to decline, and in consequence a greater proportion of the male staff will be required to fill an increasing number of managerial and other executive positions. The opportunities for our younger men are greater than they have ever been, and promotion will tend to come at an earlier age.

MECHANICAL AIDS

We keep in constant touch with developments of mechanical aids over the whole range of our activities, from the handling of cash to machine book-keeping. The progress of machine book-keeping over the past 30 years is well known, and all branches where the volume of work justifies it are now in some measure mechanized.

It is probable that in the near future it will become practicable to design electronic machines capable of dealing with many of the processes involved in handling the millions of cheques which are now used more commonly than cash for making payments in this country. The very important developments which are taking place in this type of equipment are under our constant notice.

During the past few decades there has been an enormous growth in the number of current accounts and in the use of the cheque. The maintenance of such accounts has become the chief characteristic of the joint stock banks in this country. The convenience of the cheque and of the record provided by the bank statement have proved invaluable both to the business house and the private customer.

ANCILLARY SERVICES

At the same time, ancillary services have been developed to meet the convenience of customers. The standing order, the night safe, the cashing cheque authority, the safe custody of securities, the provision of foreign currency, the issue of travellers' cheques, obtaining passports and visas, the administration of estates and trusts are some of the services which have become part of modern banking.

Since our Trustee Department was opened, we have proved about 14,000 wills and, in all, administered some 20,000 trusts of all kinds, involving some hundreds of millions of pounds. This is, perhaps, sufficient evidence of the value which the public place upon this service and of their recognition of the many advantages in appointing the Bank as trustee

OVERSEAS BRANCH

Our Overseas Branch provides one of the most important services of all, particularly in present circumstances which require a further expansion of our export trade. Overseas Branch is equipped to deal with all aspects of overseas business and its services and advice are available at our local offices throughout the country. The Overseas Branch is highly specialized, is in touch with correspondents all over the world and handles a large volume of business of all kinds. It provides a complete and efficient service available to all our customers.

PERSONAL RELATIONSHIP

It has sometimes been said that the modern bank has lost some of the intimacy of the local bank where the relationship of banker and customer was more personal. We believe we have maintained this relationship to a very high degree by the careful selection of competent men of undoubted integrity for branch management and by giving them a very wide discretion in conducting their local business. At the same time we have greatly increased their effectiveness by the development of specialist central departments, the accumulated experience and specialised knowledge of which are freely accessible to all. No other method, we are convinced, could make available to customers such a vast field of knowledge and experience.

COURSE OF EVENTS IN 1956

At the Eighth Annual General Meeting of the Proprietors of the National Provincial Bank of England, held in Bishopsgate on May 13, 1841, the Chairman of the meeting during his speech made the following comment:

"The commencement of last year was marked by some favorable symptoms—by an influx of bullion—an abundance of money, and a slight revival in several branches of trade. . . . As the year advanced, political difficulties increased, the Foreign Exchanges suddenly became adverse, and the Banking and Trading interests were again placed in a state of difficulty. . . ."

These words could be used with little variation to describe the course of events in 1956.

During the early months of 1956 the credit squeeze, which had been in operation in an intensified form since the middle of 1955, began to have a noticeable effect on the economy of the country. Bank advances and hire-purchase borrowing were falling, gold and dollar reserves rising, albeit slowly, and the intense demand for consumer goods showed some signs of slackening. The policy of using the interest rate and restriction of bank credit to curb domestic expenditure and so to free goods for export was, within the limited field of the private sector of the economy, having its effect. Many months had elapsed since these policies were first adopted and perhaps the lesson to be learned from our experience of their working in a modern industrial state is that they take a great deal longer than is generally realized to achieve the ends for which they are designed. Large programmes of modernization and development had been arranged in most branches of industry—both public and private—before the squeeze began and this trend, so far from being checked, was accentuated during the course of 1955, with the result that the execution of these programmes in the prevailing conditions has imposed, and is likely for a considerable period to impose, an excessive strain on our productive resources.

The banks have had many difficult problems to face and decisions to make in carrying out the task of reducing the volume of bank lending with the minimum of inconvenience and hardship to the public who are our customers. It is worth noting that, despite the inflation which has occurred, the advances of the clearing banks are less today than they were five years ago. We shall welcome the day when the restriction of bank lending as an economic weapon is no longer necessary.

The close consultation which is maintained between the Bank of England and the banking industry is of the utmost value in conditions such as we are experiencing at this time.

BUDGET ESTIMATES

Mr Macmillan introduced a Budget last April among the main features of which was a total expenditure "above" and "below the line" of £5,766 million, of which £1,499 million was in respect of defence. The "above the line" estimates showed a prospective surplus of £460 million. The prospective deficit "below the line" was £453 million without taking account of the needs of the nationalized industries, estimated at £350 million. The decision to finance these needs from the Exchequer resulted in an overall prospective deficit of £343 million, but there would have been a small surplus if the financing of the nationalized industries had been excluded. This compares with a realized deficit of £141 million for 1955/56; £68 million for 1954/55 and an average of £220 million in the past five years, *exclusive* of the financing of the nationalized industries (other than the Coal Board—which has always been financed in this way). Thus, the estimates this year show a welcome move towards an overall balance in the national accounts.

The statement, made by Mr Macmillan as Chancellor, that the deficit "below the line" will be substantially lower than originally anticipated and that the overall outturn of the Budget will be better, and not worse, than he had forecast is all the more encouraging. The danger of inflation, which has been such a menace to our economic life since the war, cannot be exorcized until such an overall balance is achieved and regularly maintained. The effort to cut expenditure by £100 million, though modest when set against the background of the total of Government expenditure, is welcome. It is to be hoped that, despite the cost of the military operations in the Middle East, this policy of retrenchment will continue. Far greater economies in Government expenditure of all kinds are urgently necessary and the overall balance of the Budget should be achieved by such economies rather than by increasing the present excessive burden of taxation.

EMPHASIS ON SAVINGS

In his Budget speech last April, Mr Macmillan laid emphasis on savings. The need for this movement has never been greater than it is at present. It is satisfactory to see that savings are increasing. During the period April 1st to December 31st net receipts from National Savings Certificates, Defence Bonds and Premium Bonds amounted to £66.1 million, of which Premium Bonds accounted for £51.5 million. From March 31st to November 30th deposits in the Trustee Savings Banks and the Post Office Savings Bank increased by £32.1 million—a satisfactory achievement.

REASSURING MEASURES

Any survey of events during 1956 must be dominated by the Suez crisis and the strains upon the economy of Europe to which it has given rise. At this time many of these effects have probably not made themselves felt to their full extent. Clearly, sterling has been under exceptional pressure during November and December, as the movements in the gold and dollar reserves show. But the measures taken to increase our available reserves and especially the credits arranged with the International Monetary Fund are reassuring. Taken with Mr Macmillan's statement that over the year July 1, 1956 to June 30, 1957 our external current trading account will be roughly in balance, it is clear that fears of a devaluation of sterling have no justification. Her Majesty's Government have emphasized that they will take all necessary steps to maintain the exchange value of the pound, and it is salutary that their determined policy in this vital matter has the support of all parties.

CONCENTRATION ON EXPORTS

Any forecast of economic conditions in 1957 would be a rash venture at this time. Our economy is so intimately bound up with oil that any doubt about the supply of oil must dominate consideration of our trading prospects. One thing, however, seems clear. We must keep consumer demand at home in check and concentrate on production for export, and we must do our utmost to prevent an increase in the costs of production which will price us out of the export markets. Only by earning a substantial balance of export proceeds over import costs can we hope to rebuild the gold and dollar reserves we have lost and to make these reserves adequate in relation to the liabilities of this country as the banker to the sterling area. It should be borne in mind that half of the world's trade is still conducted in sterling.

APEX (TRINIDAD) OILFIELDS, LIMITED

The thirty-seventh annual general meeting of Apex (Trinidad) Oilfields Limited was held on January 23rd in London.

Mr F. R. Cottell, chairman, in submitting the accounts for the year ended September 30, 1956, said that after provision for depreciation of fixed assets, net oil revenue was £1,347,000.

After providing £833,000 for taxation in Trinidad and the United Kingdom, the net profit for the year was £616,000.

The Directors recommended the payment of a final dividend of 1s. 6d. free of income tax per 5s. unit of stock requiring £330,000, making a total dividend for the year of 1s. 9d. free of income tax per unit of stock. The dividend would be paid on January 30, 1957.

Capital and reserves employed in the business totalled £5,622,000 and current assets at £6,132,000 exceeded current liabilities and future taxation by £4,238,000.

The production for the year was 2,972,000 barrels of crude oil and 3,749,000 gallons of casinghead gasolene.

During the year 110,462 feet were drilled. Eighteen wells were drilled in the Main Field, 3 in the Synclinal area and 1 in the Cedros area of the south-west Peninsula.

The price received for oil and casinghead gasolene continued to be on a basis related to United States prices and was virtually unchanged for the year under review.

The decrease in the revenue was accounted for only in part by the slight fall in production, the main factor being the further rise in expenses.

The report was adopted.

WESTMINSTER BANK LIMITED

IMPROVEMENT IN EARNINGS

POSSIBLE BENEFITS FROM EUROPEAN FREE TRADE

LORD ALDENHAM ON SUEZ ACTION

The annual general meeting of Westminster Bank Limited will be held on February 13th at the head office, 41, Lothbury, London, E.C.

The following are extracts from the statement by the Chairman, The Right Honourable Lord Aldenham, circulated with the report and accounts for the year to December 31, 1956 :

During the year 1956 Mr Walter Worboys, a director of Imperial Chemical Industries, joined our Board, and has already proved to be a most valuable addition. Two of our colleagues, Lord Weeks and Sir Austen Anderson, received well deserved recognition of their services to the nation in the Birthday Honours List.

The Accounts for the year reveal an increase of £156,000 in our profits, an increase which is in the main attributable to the higher interest rates ruling since last February.

SATISFACTORY EXPANSION

Our Current, Deposit and Other Accounts have risen by nearly £6 million. You will recollect that this time last year I had to report a fall in this item of nearly £65 million, the result of the stringent monetary and credit policies introduced by the Government during 1955.

On the other side of the balance sheet the rise of approximately £6 million in Advances may at first seem somewhat out of line with present policy. This is not the case, however, for it is more than accounted for by the increase in our lending to the Nationalised Industries. Much as we should have liked to have been allowed to go our own way in this important side of our activities, we have continued to play our part in the credit squeeze in accordance with the Government's wishes.

Whilst our earnings have improved, the rise last February in the Bank rate not only had the immediate effect of increasing rates of interest on advances generally, but also resulted in an increase in the rate paid on deposit accounts—a fact which customers were not slow in recognising.

INVESTMENTS

Regarding Investments, our other main earning asset, we accepted redemptions during the year which, after a measure of reinvestment, reduced our figures by nearly £7 million.

The deficiency in the market value of our British Government securities is less than it was in December 1955. During a particularly difficult year, both economically and politically, the gilt-edged market has fluctuated violently and it is, and has been, very comforting to know that our Government securities are all dated, the great majority maturing within ten years, and that unless circumstances were to enforce untimely realisations, the whole deficiency, and indeed much more than that, would be recovered.

EXPENDITURE

Our principal item of expenditure continues to be that comprising payments made to or for the benefit of staff such as salaries, wages and pension fund allocations. With a serving staff of over 13,000, and the number of pensioners and annuitants increasing and now totalling over 3,500, it will not surprise you to know that these costs have grown once again—and materially—largely as a result of the introduction in January 1956 of an improved basis of remuneration for the active staff. Additionally we have continued to give greater emphasis in our consideration of rises in salaries, both annual and upon taking over new responsibilities, to the merits and achievements of the officers concerned ; we have felt that this special consideration is entirely warranted as the reward for special endeavours to augment business.

Here I should like to pay tribute to our Managers and to other members of our staff who, despite the difficulties of the day, have not forgotten that we are still in a competitive business and that we hope soon to be in even keener competition. Our business must continue to rely for its growth and prosperity upon the efforts of its officers to maintain, to improve upon, and to sell to the community—private and business alike—our high standards of service. The result of these efforts for 1956 has been extremely encouraging. I propose to digress for a few minutes to take this opportunity of telling you of certain factors which have contributed to the further progress of our Bank. Over recent years we have appreciably extended our Branch representation and thereby consolidated and improved our business. During the past year we opened 25 new banking offices. This brought the total number to 1,171 and, whilst in present economic conditions our progress in this direction may be regarded as satisfactory, I must emphasise that it in no way represents the full implementation of our plans.

MECHANISATION DEVELOPMENT

Another and very important aspect of our development over the past years has been in the field of mechanisation. I feel sure that many of you noticed the Press references last May to the completion of a scheme designed to make available to all those who bank with us, at all our Branches throughout the country, a detailed machined statement of account. We believe it is advantageous to our customers to have such a typewritten statement at their disposal indicating details of cheques paid with names of payees, credits received and day-to-day balances, representing as it does a handy and permanent record of their affairs. This achievement, for as such we regard it, is one which is unique in the field of country-wide banking and represents a milestone in our own mechanised development. It is no more than that, however, for the possibilities in this sphere are immense.

Much has been written lately on the subject of automation and electronics in banking, and in particular of the great strides made in this direction in the United States of America. That there has been a very rapid rate of progress in that country is incontrovertible but it must be remembered that conditions there are not readily comparable with those obtaining in this country where the basis is a widely dispersed Branch system. We have problems not encountered by our friends in the United States but we can, nevertheless, learn much from a study of their methods, machines and processes.

With this thought in our minds, we sent three senior officials of our Bank on a mission to the United States and Canada for a period of three months in the latter half of the year and we are most grateful to our banking friends there for the help which they gave to them. They have brought back a great deal of interesting and useful information and we hope in due time to derive considerable benefit from their visit and indeed from the further visits which will from time to time be necessary in order to keep us up to date. Inevitably, progress towards the ultimate goal of the maximum possible use of automation and electronics consistent with the highest standards of service, working conditions and economic efficiency, will be gradual, but in the meantime we shall continue the installation of such mechanical and photographic aids as prove useful.

At this point, it would be appropriate to mention that a large number of our staff who are engaged daily in the operation of machines and other equipment readily appreciate that the full advantage we have taken of new and practical developments in the field of mechanisation has greatly improved their working conditions and has provided them with the opportunity to offer our customers the best banking service available. Moreover this mechanised development has enabled us to refrain from making undue demands upon the labour market, notwithstanding the opening of new Branches and the gratifying expansion in our business activity generally.

FOREIGN BUSINESS AT HIGH LEVEL

I am pleased to be able to tell you that our foreign business has continued at a high level. I have in recent years made it a practice to report in this Statement on any overseas tours undertaken by our senior officers in furtherance of our desire to expand our business abroad. During 1956 members of our Foreign Branch Management covered a wide area in South America and Europe. These tours, I feel sure, are of very great value to our Bank, and I again commend the zeal and initiative of the officers concerned.

Our subsidiary, the Ulster Bank, has again had a successful year's trading. Mr Sloan has taken the place of Mr Cochrane as the senior Director, and we know that he shares the spirit of enthusiasm which pervades the whole of our organisation. Mr Cochrane is now enjoying his well-merited retirement and can look back with pride and satisfaction upon his 47½ years' service with the Bank.

You will notice that Westminster Foreign Bank is showing improved results ; here again it is a pleasure to record our appreciation of the efforts of Mr Rabino and the many hundreds of our staff to further our business in France and Belgium. It may well be that they will in the future have an even greater scope for the exercise of their skill and initiative and I feel sure that they will see to it that our Bank plays a full part in any expanded business activity which may in due

time result from the present discussions for a European Free Trade Area.

MIDDLE EAST CRISIS

The closing months of 1956 were darkened by the Suez Canal crisis, and it is as yet impossible to measure the economic consequences to this country of our joint action with the French in stopping the spread of war in the Middle East. But we should remember also that we shall never be able to measure what the consequences would have been had we been content to drift along, leaving the war unchecked, and leaving Egypt to continue her open defiance of the views of the United Nations on the proper use of the Canal.

All the possible courses of action were fraught with danger for this country: nothing but a choice of evils lay before our Government. The action that we did take angered the Government of the United States, and their criticism of our action angered us. It is most heartening that already the difference between the views of the two Governments as to what should be done in the Middle East seems to be lessening. Both nations must certainly regard the restoration of the unity and strength of Nato as the most important task of all for 1957.

The shock caused by the Middle East crisis coming so suddenly to a head has been all the more disappointing in the light of the economic improvement here during the first half of 1956. Both the value and the volume of our exports had steadily increased, and the gap between our exports and our imports had been narrowed in spite of the restrictions which two of our best customers, Australia and New Zealand, had been compelled to enforce. It was especially pleasing that our exports to the dollar area had grown, and that we had got nearer to paying for our essential dollar imports, the rate of growth of our exports to Canada having been more striking than that to any other of our main customers.

NINE YEARS OF ACHIEVEMENT

It is never very convincing to compare one year's figures with those of its immediate predecessor, but looking back over only nine years, it is surely a very fine achievement to have nearly doubled the volume, and nearly trebled the value of our exports.

Our gold and dollar reserves had been steadily mounting during January to June in sharp contrast to the drain which had occurred during 1955, though it must be remembered that part of the reserves used during 1955 bought raw materials which helped to provide the big increase in our exports of manufactured goods shown during the first half of 1956. But the Suez crisis has changed all that, and the dollar gap must now be greatly increased by the purchase of oil with dollars, instead of with sterling: in addition, our production of goods for export may receive a check from shortage of fuel, and already some of our exports have been frustrated by the shortage of shipping.

In these circumstances it was not unnatural that there should be some doubts abroad as to the stability of the pound sterling; and it was therefore most satisfactory to note the prompt and effective steps taken by the Chancellor of the Exchequer to make sure that there should be no new devaluation, though it is much to be deplored that one of those steps had to be the request for a waiver of the interest due in December to Canada and the United States. But this determination to defend the present value of sterling must be backed up, not only by the borrowing of dollars, but also by appropriate action here at home by both the Government and the nation to ensure that our balance of payments position continues to justify that present value. If we as a nation can show restraint in the matter of profits and wages, and quickly restore the trading position of the first six months of 1956, we shall help to make those who doubted sterling regret their doubts, and we shall help also to avert inflation, which has rightly been described as "the harshest tax of all."

CREDIT SQUEEZE INTENSIFIED

The credit squeeze by the banks had to be maintained and even intensified during the year, and has at last been reinforced by a somewhat similar squeeze in the sector of public finance; though I still feel that, by contrast wtih the Central Government and with Local Authorities, the banks have been asked to carry more than their fair share of the task of exercising monetary restriction. The published figures of the movements in the different categories of advances show clearly that the squeeze has been selective, in that advances to farmers have been but little reduced while advances to some of our chief exporting industries have actually shown increases—but these increases have been much more than offset by the decreases to those industries which are deemed to be less essential to the maintenance of the balance of payments. This selective nature of advances policy has already gone a little way towards enabling the most essential industries to attract more labour. It is sincerely to be hoped that in the relatively near future we shall be enabled to judge all applications for assistance purely on their merits from a banking standpoint and not with the spectre of "directives" looking over our shoulders.

It is natural for employers to wish to retain their best workpeople by working short time when markets are poor, but it is clearly very wasteful of the nation's resources at a time like the present when many jobs are left unfilled; and it is therefore a good thing that some steps towards making notices of redundancy less painful have been achieved in recent months.

BETTERMENT OF FACTORIES AND PLANT

Great progress has been made in bettering our factories and plant during 1955 and 1956, and, judging by plans already approved, that progress should continue during 1957. An important and far-seeing step has been taken by many leading industrialists in setting up a fund to assist in the training of more technicians for the management of those improved factories. Money is needed for both these purposes if we are to maintain and improve our competitive position; and that money must come from savings.

It was therefore wise of the Chancellor to lay so much stress on savings in his April Budget: and the stress was not only verbal, for he made the rewards of saving more attractive and endeavoured to establish his "plateau" of a stable price level in order to ensure that such savings would not lose their purchasing power.

The several channels of National Savings which were favourably affected by the Budget measures have all shown increased figures; but these increases have no doubt been drawn in part from savings which already existed in other forms, and they have not been sufficient to achieve much check to personal consumption, which has again risen a little both in volume and in value.

PRODUCTION OF MANUFACTURED GOODS

In spite of three favourable features—the improvement of our fixed assets, the larger number in civil employment than ever before, and the fewer man-hours lost in labour disputes—production of manufactured goods has not increased during 1956. Part of the explanation of this apparent contradiction lies in the fact that the overall figures for employment conceal a good deal of short-time working, particularly in the motor industry. But this is not the whole story. Government policy has aimed at securing a redeployment of manpower, reducing the numbers engaged in the manufacture of consumer goods and diverting them to the production of capital goods and to the export industries. During 1956 this process has been going on and the lag in production that has occurred is part of the price that we are having to pay to secure a redistribution of manpower.

Though our exports have increased, that has been achieved in a larger total of international trade, and some part of our percentage in that larger total has been lost to West Germany. It is to be feared that this trend will continue if we allow our costs to rise more quickly than those of Germany and the United States: judging by the retail price levels, they have again been allowed to rise rather more quickly than in those countries during the past twelve months.

Circumstances compelled the authorities to show the red light of high short-term rates of interest but, as the Governor of the Bank of England said a few months ago, we shall none of us feel comfortable until they can be reduced. They raise the cost to this country of the sterling balances held by foreigners, they hamper any attempts the Government must wish to make to fund short-term debt, and they check capital investment in industry. A small reduction in short-term rates of interest would therefore be welcomed, always provided that it can be made without giving the green light for a faster increase in our investment programme than our current savings enable us to afford.

EUROPEAN FREE TRADE AREA

One of the most interesting and most promising events of the year has been the more or less general acceptance in principle of the idea of a European Free Trade Area for manufactured goods. I believe that the creation of such an area is in the interests of this country, and that not only can we not afford to stay outside but that we should gain positive advantages from joining. Our most active competitor, West Germany, would be inside it, and such of our industries as can barely meet German competition now would inevitably lose their European markets if we were to stay outside. Our most efficient industries would benefit by such greatly increased open markets, our less efficient industries would receive a needed incentive, and throughout the Area the consumer would gain by the increase in effective competition: it is high time that the interest of the consumer should be considered. The large deficits of the Sterling Area in the European Payments Union during recent months are some indication that the project will have to be approached slowly and with many safeguards as it is bound to cause dislocation—but not, it is to be hoped, so slowly that no one will be hurt and no one be helped.

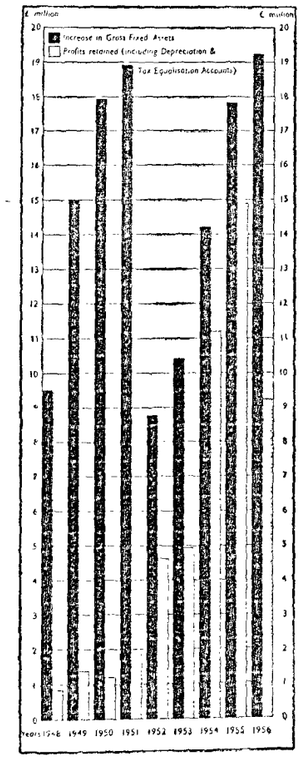
In any summary of the year 1956, it would be idle to deny that events in the Middle East have given a severe setback to the national economy, yet with so much achieved in the last few years it would be faint-hearted indeed to let that temporary setback fill us with dismay.

THE STEEL COMPANY OF WALES LIMITED

COMPANY REPORT

CHAIRMAN'S STATEMENT

MR HARALD PEAKE ANNOUNCES LOWER PROFITS BUT EXCELLENT PROGRESS WITH DEVELOPMENT



RISING OUTPUT OF TINPLATE

In a year during which excellent progress has continued to be made with development work, it is particularly disappointing to record a reduction in Trading Profit (before depreciation) from £18,313,299 to £14,228,057. The latter figure is almost identical with the 1954 result.

A year ago it seemed reasonable to hope that the higher rate of profit would at least be maintained for the reasons that important sections of the second development plan would be coming into production during the year and further improvements in production methods were being effected. The resulting profits might well have made up for the increases in costs which could then be foreseen.

The main cause of the fall in profit was the national embargo on overtime working by maintenance craftsmen which affected operations in the Steel Division from April 30th to August 7, 1956. This is estimated to have reduced the Company's production of steel ingots by 200,000 tons.

Between March and June, 1956, wage rates throughout the industry were increased by ten shillings a week. Freight charges were increased by five per cent and coal prices by six per cent. There were also increases in the prices of ingot moulds, common and refractory bricks and other articles.

The fall in profit would have been greater but for the official increases in iron, steel and tinplate prices, averaging about five per cent which became effective from May 7, 1956. These resulted from an application by the industry made in the early part of that year and based on the increased costs of imported ore and scrap.

Outstanding events of the year were the starting up of ninety additional coke ovens and of the fourth blast furnace, believed to be the largest in Europe, in January, 1956. The vast new tinplate works at Velindre, five miles north of Swansea, on which approximately £21 million is being spent, started production on a small scale in July, 1956. Units of these magnitudes take some months to achieve economic rates of production.

SECOND DEVELOPMENT PLAN

At the end of the year £42,400,000 had been spent out of the total cost estimated to be £54 million. The larger units remaining to be completed under this plan are numbers eleven and twelve open hearth furnaces in the melting shop at the Abbey Works. These should be in production in 1957. There is also a considerable amount of work to be completed at Velindre before the output reaches the full capacity.

The plan was designed to raise the annual production of steel ingots to 2,400,000 tons and it is expected that this rate of production will be reached during 1958.

THIRD DEVELOPMENT PLAN

A year ago I concluded my statement by saying that the Company was playing an important part in the economic recovery of the country and that, if, in the national interest, still greater demands were made on it, I was confident that they would be met quickly and efficiently.

At that time a third development plan was in course of consideration and in March, 1956 it was possible to announce details.

In summary, provision is made for the construction at Margam of eighty additional coke ovens and a fifth blast furnace, together with three Bessemer Converters. These are designed to increase the annual production of steel ingots from 2,400,000 to 3,000,000 tons. The existing slabbing mill will be modified to enable it to handle the increased quantity of ingots. A proportionate increase in finished products will be achieved by the installation of a new 4-stand cold reduction mill to process light gauge sheets.

It is estimated that the plan will be completed towards the end of 1959 and that it will cost approximately £50 million. A substantial proportion will be found from internal resources.

Contracts for a large part of the work have now been signed. Good progress has been made with the preparation of the sites and the driving of concrete piles to carry foundations.

Actual expenditure incurred during the year on the third development plan amounted to £747,000.

CAPITAL STRUCTURE

The only change during the year in the share and loan capital is the increase of £12,600,000 from £27,400,000 to £40 million in the loan from the Iron and Steel Holding and Realisation Agency.

Expenditure on fixed assets during the year amounted to £19,229,632 compared with £17,794,543 during the previous year.

Profits retained during the year (including depreciation, amounts set aside for future taxation and transfers to fixed assets replacement reserve) amounted to £9,216,927 compared with £14,888,613 during the previous year.

At the end of the year the average rate of dividend and interest being paid on the ordinary shares, debenture stock and the loans was 5¼ per cent.

The £15 million 3 per cent First Mortgage Debenture Stock becomes due for repayment at 101 per cent on July 16, 1957. It is too early to say how this matter will be dealt with but an announcement will be made at the earliest possible date.

THE ACCOUNTS

The Consolidated Profit and Loss Account summarises the results of the year's trading. Reference has already been made to the reduction in trading profit. Provision for depreciation increases in proportion to the additions to fixed assets.

Interest on loans has increased by £1,166,510 following the raising of interest rates by the Agency and by the Finance Corporation in March and April, 1956.

The amount provided for taxation this year is £1,950,000 compared with £5,650,000 for last year—a reduction of £3,700,000 due to the lower profit and to the fact that the charge for the year has been relieved to the extent of £1,300,000 arising from investment allowances.

The allocation to Fixed Assets Replacement Reserve is £1,700,000 this year compared with £1,400,000 last year.

The rate of dividend on the Ordinary Shares is again 4 per cent, being the rate prescribed for the time being by the Agency.

After making the provisions and allocations referred to above, the amount carried forward to the credit of Profit and Loss Account is increased by £1,910,868 from £7,991,373 to £9,902,241.

In the Consolidated Balance Sheet there is little that calls for comment on the liabilities side. Under "Other Creditors" the provision for current taxation is increased by £2,292,121 for the reason that for the first time in the history of the Company there is a current liability to income tax as well as profits tax.

On the assets side the "Freehold and Leasehold Land, Buildings, Plant and Machinery and Sundry Equipment at cost" have increased by £32,421,106 and "Expenditure to date on Plant not yet in operation" has decreased by £14,859,483, making a net increase during the year on the two headings of £17,561,623.

Increases of £1,828,785 in the value of "Loose Plant and Tools" and of £5,214,040 in "Stocks and Stores" reflect the larger requirements resulting from the starting up of new production units. Increased prices are also a contributory factor.

Amounts due by other Subsidiary Companies of the Agency and "Other Debtors and Prepayments" require to be taken together. The large variations result from the Company having set up its own selling organisation in the spring of 1956. In view of the continuing increase in annual turnover it is satisfactory to report a reduction of £320,284 under these headings.

STEEL DIVISION

The Division has had an exceptionally busy, difficult, but in many ways successful year. The lighting up of the new coke ovens, the fourth blast furnace and two of the new open hearth furnaces were all major operations and it is satisfactory to report that all of them have now achieved the outputs for which they were designed.

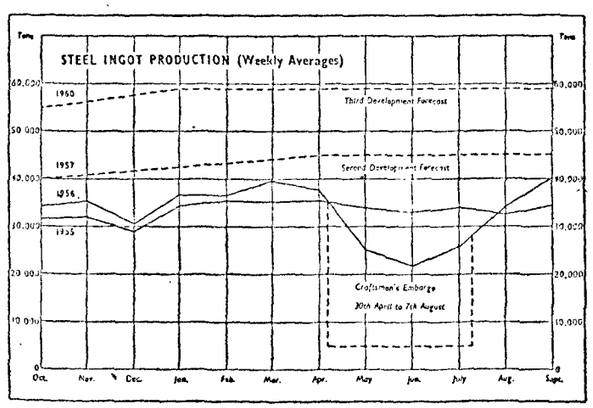
As a result of starting up the new battery of coke ovens the output of coke increased from 720,000 tons to 956,000 tons. The opportunity was subsequently taken to put in hand the replacement of a number of the older ovens.

The production of No. 4 blast furnace enabled No. 2 blast furnace to be laid off and relined during the second half of the year. This has now been blown in and No. 3 blast furnace has in turn been laid off for relining. So far as the capacity for production of iron is concerned the position is tremendously improved as compared with a year ago. The actual output of pig iron increased from 943,000 tons to 1,018,000 tons during the year.

The output of steel ingots fell from 1,748,000 tons to 1,729,000 tons. But for the embargo on overtime by the craftsmen, which has already been referred to, the output would have exceeded 1,900,000 tons. The national dispute affecting the wages of craftsmen employed on maintenance work was the subject of a Court of Inquiry appointed by the Minister of Labour and National Service. It is estimated that the loss of output resulting from the embargo accounted for a reduction in the profit for the year of £2,900,000 and that the wages lost by the workpeople during the period of the embargo amounted to over £500,000.

TINPLATE DIVISION

The highlight of the year was the coming into operation of the cold reduction tinplate plant at Velindre in July, 1956. Started in July, 1953, this works is designed to produce 450,000 tons of tinplate a year thereby doubling the present output of cold reduced tinplate. The designed capacity will not be reached until 1958 but production is building up month by month—slightly ahead of schedule.



The works at Trostre has more than fulfilled expectations and the quality of tinplate has never been better.

The old type hand mills have continued to make a valuable contribution towards meeting market requirements. With the increase in production at Velindre, a reduction in the demand for hand mills tinplate is to be expected. Not only is the cost of production at the hand mills substantially higher than at the strip mill, but the quality of the tinplate is less popular with customers.

NEWPORT DIVISION

At the Orb Works 2,260 persons are employed on the production of a complete range of electrical sheets and also in the production of galvanised sheets. A large part of the raw material is obtained from the Steel Division in the form of coiled strip. In the well-equipped laboratories much research work is done relating to the properties of the highly specialised electrical sheets for which there is an increasing demand in industry and of which this Works supplies over 50 per cent of the home market.

During the year £430,000 has been spent towards the £2 million sanctioned for the development of new processes.

MARKETS

The demand for the Company's products remained good up to the end of the financial year.

During the past year steel sheets, steel plates or tinplates have been exported to sixteen countries in the British Commonwealth and, in addition, to twenty-six foreign countries. These exports accounted for 21 per cent of the turnover of the Company last year.

In all of these countries personal investigations have been made into market requirements and questions of quality, packing and delivery have been discussed. Generally speaking the prospects for increased exports are excellent.

EMPLOYEES

The Company now employs on operations 22,350 men and women compared with 20,750 a year ago. The number of men employed on new construction is 5,140 compared with 5,750 last year.

It is interesting to compare the number of men and women employed totalling 22,350 with the net value of total fixed assets in the balance sheet amounting to £119,283,175. This shows that for every employee, whether chairman, technician, newly joined apprentice or canteen waitress, an average capital investment of over £5,000 has been made to provide the plant, tools and amenities for production. This fact should bring home to all of us the confidence which a large body of people have placed in us and also the obligation that is placed upon every one of us to see that the confidence is fully justified.

In spite of the rapid rate of expansion in the number of employees a strong team spirit is being developed, backed by a determination that SCW will become known throughout the markets of the world as a hall-mark of fine quality and of good service.

MILFORD HAVEN

Since the close of the financial year the Company has entered into an agreement, jointly with Guest Keen Iron & Steel Company Limited, to acquire a site on the south side of Milford Haven suitable for the discharge and transhipment of ore from ships of the largest tonnage that can at present be envisaged. No early developments are projected. The Directors are of the opinion that this is a wise provision for possible future requirements.

PROSPECTS

The economic consequences of the blocking of the Suez Canal are far reaching and users of our products are being adversely affected, more particularly in the motor industry. This has led to a reduction in the demand for steel sheets. The demand for plate and tinplate continues to be good. On the production side we may have to contemplate a further reduction in oil supplies, and the necessity to utilise larger quantities of pitch and creosote mixture. There have been substantial increases in freights, and costs tend to rise in other directions.

Some relief will be derived from the increases in maximum prices announced by the Iron and Steel Board and which operated from December 17, 1956. It has been made clear by the Iron and Steel Board that the increases do not take into account any of the effects of the closing of the Suez Canal.

In spite of the difficult times in which we live and work I view the prospects of the Company with confidence.

ALEXANDERS DISCOUNT COMPANY

SIR ERIC GORE BROWNE'S STATEMENT

The eighty-ninth annual general meeting of Alexanders Discount Company Limited will be held on February 14th, in London.

The following is the circulated statement of the chairman, Sir Eric Gore Browne, DSO, OBE, TD: Once again it is my privilege to present the annual Accounts of your Company to you and to make my comments upon them.

As you will see from the Report which has been circulated to you, Mr J. P. R. Glyn has been elected Deputy-Chairman of your Company. I know that I speak for all of you as for all my colleagues and for myself in congratulating Mr Glyn on this distinction.

In the year for which we now account the Government continued to pursue a dear money policy. On February 16th the Bank Rate was raised to 5½ per cent, and this was followed in March by an issue of £300 million Exchequer Bonds, carrying interest at 5 per cent and maturing in June, 1957. You will appreciate the adverse effect which the rise in the Bank Rate had on our then current portfolio of Bills and Bonds.

In the early part of the year your Board decided to reduce the holding of short-dated Government securities, which involved a realised loss but enabled us to increase our income. We were able to take this action by the employment of reserves which had been accumulated over the years. The result is reflected not only in the 1956 Balance Sheet, but also in the Profit and Loss Account.

EFFECTIVENESS OF CLASSICAL BANK RATE THEORY

In considering the value of the classical Bank Rate theory, and its effectiveness under present-day conditions, either in combating inflation, or restoring confidence abroad in our economy, and thus attracting foreign deposits—a problem to which I referred in my statements to you both in 1954 and 1955—it must not be forgotten that in the year 1957 the Government has to meet maturing liabilities on previous bond issues of about £900 million and, if the present policy is continued, the cost of this conversion must make a considerable addition to the heavy burden which is already carried by the British taxpayer in respect of interest on the National Debt. And I must remind you that overseas holdings of sterling balances are to a very considerable extent invested in Treasury Bills. It has been stated that, mainly as a result of the increase in short-term rates in the United Kingdom, disbursements made on account of dividends, interest and profits transfers have risen to the extent of about £100 million per annum since the end of 1951, a great handicap surely to our efforts to establish a satisfactory surplus in our external account. Hence it may be argued that a high Bank Rate does in fact, in some degree, have an opposite effect to that which is generally regarded as part of its object. One thing is, I think, clear, namely, that it is in the best interests of the Government and of the British taxpayer that every possible effort should be made by all concerned to reduce short-term interest rates without undue delay. Whether this policy, if adopted, can be made effective depends not only on drastic economy in Government expenditure, but on national and international confidence in the £ sterling.

THE ACCOUNTS

Now, if you will turn to the Accounts, you will see that our capital, share premium account and general reserve, subject to Note 3, remain unchanged, that the balance carried forward is reduced to £167,000, and that our holdings in Government securities, to which I have already referred, are reduced from £53,144,924 to £32,223,649, and the Profit and Loss Account shows a balance of profit of £77,400.

We propose to recommend a final dividend of 3 per cent, less tax, on the Cumulative Preference Shares, a final dividend of 5 per cent, less tax (making 7½ per cent, less tax, for the year) on the Ordinary Shares, and to reduce our carry forward from £212,000 to £167,000. As I have so often told you, the maintenance of these dividends must depend on the results of future years.

In conclusion, I have once more to express our sincere thanks to the Banks for the unfailing consideration which they show to the London Discount Market, and to Sir Antony Macnaghten, Mr Dawkins and to all our staff for the good work which they have done for us in the year for which we now account.

ALEXANDERS DISCOUNT COMPANY LIMITED.

Statement of Accounts, 31st December, 1956

LIABILITIES

	£	£
Authorised Capital:—

THE CHARTERHOUSE GROUP

PROFITS—MAIN SOURCE OF GROWTH

"A high standard of life must be earned by each succeeding generation and the history of our country shows that, in our case, it must be earned by increasing our trade overseas," states Sir Nutcombe Hume, KBE, MC (Chairman), in his Review which has been circulated to Stockholders of The Charterhouse Group, comprising Charterhouse Investment Trust, Charterhouse Industrial Development Company, Charterhouse Finance Corporation, Charterhouse Australia, Charterhouse Canada and S. Japhet and Company Limited.

"Peering ahead into the current year," says Sir Nutcombe Hume, "one can only feel inclined to refrain from any form of prophecy: but I share the view that Great Britain and its Commonwealth and Empire can remain great and grow in strength if we will refrain from adopting a frame of mind that the country is 'finished' or has become a second-class power. We must approach the future with the same determination as our forebears and realise that the high standard of living enjoyed by a small proportion of the world's inhabitants resident in the more highly developed countries, and this certainly includes our own, is not something to which they have any inherited right.

"There must be at least two thousand million people in the world who are living at a bare subsistence level and long for the means to buy more of the good things of life. The dramatic and exciting opportunities resulting particularly from the development of nuclear power, electronics and auto-

mation seem to indicate this as the great moment when dreams can be made to come true. If an increase of only one shilling each per week is placed in these people's hands, their aggregate spending power rises by the enormous sum of five thousand two hundred million pounds a year. There, surely, lie the markets of the future and it should not be beyond the wit of man to develop them. Governments must obviously take the lead by providing the basic needs for roads, railways, ports, electricity and other public services. Once they are available private enterprise can be relied upon to play its part.

"In this country there seems to be a welcome and necessary moderation in the pressure for increased wages and one sincerely hopes that responsible leaders of labour now realise that higher wages can only come from increased production and not from putting up prices to the consumer. Profits must always provide the main source from which growth can take place, and the theory that they are all available to pay away either to labour or to shareholders is now, I hope, exploded. No one can take out of the common pot more than he puts into it and each of us must in fact take out less, for from what is left in the pot comes the resources to bring about the development to which I have referred. The compulsory cutting back of personal spending by controls, credit squeezes and so on will not solve this problem. People themselves must be able to save and invest, and to do so the burden of taxation must be lightened."

WEBSTERS PUBLICATIONS (HOLDINGS)

SATISFACTORY TRADING PROFIT

The second annual general meeting of Websters Publications (Holdings) Limited was held on January 21st at the Waldorf Hotel, Aldwych, London, W.C., Lieutenant Colonel W. D. Gibbs, chairman, presiding.

The following is his statement, circulated with the report and accounts :

The Board have pleasure in presenting the Balance Sheet and Consolidated Accounts for the year ended August 31, 1956. During the year your Company acquired a further 3.1 per cent of the issued share capital of Websters Publications Limited, thus increasing its holding to 94.6 per cent.

In accordance with a request made at the last Annual General Meeting, shareholders were circularised on April 27, 1956, and an interim report on the first seven months' trading was given. This report referred to the unfavourable conditions resulting from the printers' dispute where production was first severely curtailed for four weeks as a result of the go-slow strike and then completely suspended for a further period of six weeks. It was estimated that a reduction in profit, amounting to £15,000, had, in consequence, been sustained; and it was mentioned that it was not possible to gauge the effect which the stoppage would have on future sales. I am sure you will agree that in the circumstances the trading profit of £88,992 is satisfactory.

The Board recommend the payment of a final dividend of 22½ per cent, making, with the 7½ per cent interim paid, a total of 30 per cent for the year.

I should like to add that the first three months of the present year are encouraging and the turnover figures are in advance of last year.

The report and accounts were adopted.

RICHARD THOMAS & BALDWINS, LIMITED

(Iron, Steel, Sheet and Tinplate Manufacturers)

SIR ERNEST LEVER'S STATEMENT

The annual general meeting of Richard Thomas & Baldwins, Limited, will be held on February 14, 1957, at 47 Park Street, London, W.

The following is the statement by the Chairman, Sir Ernest Lever, circulated with the report and accounts for the year ended September 29, 1956:

FINANCIAL RESULTS

As will be seen from the accounts, the Group profit before taxation and allocations for additional depreciation and to reserves is £8,370,245, a decrease of £1,651,175 compared with the corresponding figure for the previous year.

This decrease is made up as follows:

Decrease in manufacturing and trading profit	£1,223,810
Increase in depreciation	265,623
Decrease in dividends and interest receivable	182,903
	£1,672,341
Less : Decrease in interest on debentures and secured loans	21,166
	£1,651,175

Several causes contributed to the decline in the manufacturing and trading profit, some of them common to the industry as a whole, and others of a domestic character.

So far as the industry as a whole is concerned, it is common knowledge that during the financial year to which the accounts relate, the industry had to bear the burden of increases in wages and in raw material, freight and other costs without any offset in increased selling prices, and that labour difficulties, particularly in relation to maintenance workers, beset the industry in the course of the year. These events did not leave our Company unscathed.

A contributory cause of the fall in profits was that the running-in costs of the new 5-stand mill at Ebbw Vale, incurred during the year, had to be met. The profit at this works has also been affected by the necessity of continuing manufacturing operations while major developments were still in progress.

Readjustments consequent on the termination of the joint administration of Richard Thomas & Baldwins, Limited, and The Steel Company of Wales, Limited, reported last year, have now been completed so far as our Company is concerned.

SELLING ORGANISATIONS

Consequent on the discontinuance of the joint selling arrangements between Richard Thomas & Baldwins, Limited, and The Steel Company of Wales, Limited, the merchanting and selling Companies in Australia and New Zealand, Canada and the Argentine, have become wholly-owned subsidiaries of Richard Thomas & Baldwins, Limited.

PARTRIDGE JONES & JOHN PATON, LIMITED

Since the end of the financial year we have acquired from the Iron and Steel Holding and Realisation Agency, all the issued share capital of Partridge Jones & John Paton, Limited. Among the assets thus taken over are old-type steel, sheet and tinplate works, a dolomite quarry, two foundries and land and house property in the Ebbw Vale and Pontypool districts.

COLLIERY COMPANIES

The compensation values for the assets vested in the National Coal Board having been agreed, the following companies have been placed in voluntary liquidation:

Lancaster's Steam Coal Collieries, Ltd.
The New Sharlston Collieries Co., Ltd.
The Swansea Navigation Collieries, Ltd.

ANALYSIS OF INCOME

The following is an analysis of the income of the past trading year showing the disposal of each £1 of gross income. Out of each 20s. of gross income we expended on:

	s.	d.
Raw materials, and materials for maintenance work	12	0
Wages, salaries and remuneration generally	4	0
Miscellaneous expenses	1	4
Taxation	1	1
Depreciation		6
Retained in the business		11
Dividends, net		2
	20	0

FUTURE PROSPECTS AND DEVELOPMENT

In my statement last year I indicated that so far as long-term planning was concerned the Directors were faced with two main problems, namely, in what form and where to create new manufacturing capacity to replace out-of-date plant which will, sooner or later, have to be scrapped, and how best to make our contribution to the increase in manufacturing capacity necessary to meet estimated future demand.

In this context it is of the utmost importance to bear in mind that major developments in the Iron and Steel Industry take several years to complete and decisions as to the nature and magnitude of such developments must, therefore, not be too greatly influenced by current events and difficulties.

In common with the rest of the industry and with the Iron and Steel Board, we are satisfied that, after taking everything into account, the Iron and Steel Industry must increase its manufacturing capacity if estimated future demand is to be met and that, although there may be limiting factors to such expansion, such as the availability of raw materials, there is much that can be done. As a leading Company in the industry we must obviously play our part in this expansion.

The broad lines of our development policy have now been considered by the Directors and proposals for the first stage of such development are being discussed with the appropriate authorities. It must be borne in mind that no major schemes of development can take place in the Iron and Steel Industry without the consent of the Iron and Steel Board and, in our case, of the Iron and Steel Holding and Realisation Agency also.

The fact that proposals for major developments have been put forward should be evidence that the Directors not only have confidence that this country will recover from its present economic malaise but have clearly in mind the part that the Company must play in helping to bring this recovery about.

Schemes of the magnitude contemplated will require highly trained employees of all kinds and it is vital that steps be taken to ensure, so far as is humanly possible, that the necessary trained personnel will be available from within the Company when they are needed.

A comprehensive recruitment and training policy for management, supervisory grades and operatives has been worked out and, as part of this policy, a staff training college is being established at Stoke d'Abernon in Surrey and an apprentices' hostel at Llangattock Park in Breconshire.

RESEARCH

Since the end of the year central research collaboration between ourselves and The Steel Company of Wales, Limited has been discontinued. The Directors of your Company are, however, more convinced than ever of the importance of research to the future prosperity of the Company and the Central Laboratories at Aylesbury will be operated in future for Richard Thomas & Baldwins, Limited only.

PERSONAL

The somewhat difficult period through which we have satisfactorily passed has demanded of management, staff and workpeople a high degree of efficiency, adaptability and devotion to duty. These qualities have been abundantly manifest and your Directors accordingly wish once again to record their sincere appreciation of admirable teamwork.

Finally, I welcome to the Board Sir Hugh Beaver and Sir John Green, whose wide industrial experience is already proving of great value to the Company.

TATE & LYLE, LIMITED

FLOWERS BREWERIES

INCREASED TRADE

The Fifty-ninth Annual General Meeting of Flowers Breweries Limited was held at Luton on January 21, 1957, Mr Bernard Dixon, Chairman, presiding. The following are points from his statement:

The trade of your Company shows a very substantial increase, particularly relative to the national trade figures, despite unfavourable weather.

The development of our Keg Bitter organisation is effective and a considerable amount of Flowers Original Bitter is now sold in Keg form. This development is particularly suitable to Flowers Bitter.

At this stage we are mainly concerned with the retention and increasing of our existing Original Bitter trade, which might have been affected by the development of Bottled Beer. A very large capital sum has had to be employed in providing the costly plant and equipment which is essential to this Keg development. Our long established reputation as Bitter Beer Brewers has materially assisted the progress we have made with our Original Bitter in Keg.

During the year in order to improve liquidity a Debenture of £1,170,000 was raised.

PROGRESS OF CONSOLIDATION PROGRAMME

The first phase of our consolidation programme has been completed and we are now well ahead with the second phase, which involves the consolidation of Bottled Beer production. Our existing Luton Bottling Stores is having its output increased by approximately two-thirds of its previous capacity. Great difficulties in obtaining steel and machinery has involved the Company in far greater expense than was estimated. It is anticipated that in January 1957, we will be back to normal working at our Luton Bottling Stores.

It has for long been apparent that Bottling units of greatly increased capacity would come into common use. It is clear that those Breweries who could deal with very large quantities of Bottled Beer at one point will eventually be more favourably situated from the point of view of overheads. To build entirely new buildings would involve several million pounds. All our expenditure on Bottling is building up to the use of exceptionally large capacity equipment. An example is the new ferroconcrete building now being erected at the Luton Brewery. This represents the most advanced design of stainless steel equipment for fermentation of

Beer and its subsequent treatment. The process which will be carried out in this new building is the result of many years of research on the part of our technical staff.

The new Wine and Spirit Bond was completed and came into use, together with adjoining buildings which have been developed to cope with the very considerable increase which has taken place in the sales.

We are concentrating subsidiary companies' accounts at Head Office. A major feature of this plan involves Punched Card Accountancy. Powers Samas equipment was installed during the early part of 1956.

Our overall advertising allocation has been increased by 40 per cent during the year.

CHAIN OF OFF-LICENCES

On October 1, 1956, we acquired the whole of the Ordinary Shares in Thresher and Company Limited, who operate a large chain of modern Off-licences in the Metropolitan area.

Your Company has entered into a trading agreement with Friary Meux Limited, and this will be beneficial to both Companies.

We are now substantially involved in our programme for building new Licensed premises. This is going on steadily. It will reach a peak during the next two years.

Expenditure on maintenance of Licensed properties has increased and represents a heavy charge on profits.

I am pleased to report that relations between the Company, its licensees, staff and employees continue to be on a very friendly level.

The report and accounts were adopted.

THE MIDLAND BRIGHT DRAWN STEEL AND ENGINEERING COMPANY

ANOTHER FINE ACHIEVEMENT

The tenth annual general meeting of The Midland Bright Drawn Steel and Engineering Company Limited was held on January 23rd in Birmingham, Mr H. Hipkiss, MInstBE (Chairman and Managing Director), presiding.

The following is an extract from his circulated statement :

I am happy to be able to report another exceedingly profitable year. The Group Trading Profit amounted to £356,599, as against £353,664 for 1955 ; a fine achievement when you bear in mind that the profit for 1955 showed an increase of 63½ per cent over 1954.

Last year I said that the halting of inflation presented us with one of the most pressing of our immediate problems. Since that time this has become more evident, and the effects of the continued upward movement in prices and wages are reflected in the Accounts for the present year.

The group turnover increased by nearly 8 per cent, and was the highest on record, but the benefit derived from the higher sales and increased efficiency was, however, offset by these factors.

Your Board are again recommending a final Dividend of 27½ per cent, subject to Income Tax, making a total distribution of 45 per cent for the year.

The report and accounts were adopted.

MONTAGUE BURTON LIMITED

(Tailors and Manufacturing Clothiers)

STEADY INCREASE IN SALES

POSITION CONSOLIDATED

MR LIONEL JACOBSON'S STATEMENT

The Twenty-seventh Ordinary General Meeting of Montague Burton Limited was held on January 22nd at the Registered Office of the Company, Leeds.

Mr Lionel Jacobson (the Chairman) presided.

The Secretary (Mr H. V. Evans, ACA) read the notice convening the Meeting and the report of the auditors.

The following is the statement by the Chairman circulated with the report and accounts :

These accounts are for a period of twelve months ending August 31, 1956. The comparative figures cover a period of seventeen months to August 31, 1955. Your Group has succeeded in returning profits for the last twelve months broadly equal to the whole of the previous period of seventeen months. That period included two spring seasons when turnover is normally at its peak. Accordingly the results now before you clearly prove that the Group has consolidated its position at the forefront of our particular industry.

GROWTH IN NORMAL OVERHEADS

Over the past three years there has been a steady growth in normal overheads, and moreover we have had to face severe expense due to the reorganisation and the general expansion of the business. It will no doubt be a source of satisfaction to you to learn that the increase in the volume of retail sales has absorbed these additional charges although today the percentage of gross profit is lower than that ruling five years ago. Whilst the Group has continued to advance we have been able to give steadily increasing value to our many hundreds of thousands of customers.

More than 250 branches have been modernised and many have been the subject of major structural alteration. Since the abolition of building restrictions we have planned and are undertaking a prudent but full programme of rebuilding on new and war-damaged sites.

PLANT MODERNISATION

There has been a steady increase in sales figures throughout the retail organisation Two new Works have been opened, considerable modernisation and replacement of plant and machinery carried out. There is in consequence an increase of £1,442,121 in the property, plant, fixtures, etc., of the Group.

Works' output is more closely aligned to Group requirements and the manufacturing organisation makes a healthy contribution to the overall success of the Group.

You will remember that last year the Group had suffered from an acute shortage of ready-to-wear garments. This position has now been corrected and stocks are a little higher than last year but are now in conformity with the general requirements of the business.

The effect of the year's trading has been to add some £552,953 to Group revenue reserves after providing for all taxation on profits earned to date, dividends, appropriations amounting to £108,269 for the redemption of Debentures and Preference shares and £55,000 as an additional contribution to Pension Funds. I feel, therefore, we have reason to be satisfied with the accounts now presented.

TRAINING CENTRE AT GUISBOROUGH

You will be interested to know that the Group has endowed and equipped a Clothing Management Training Centre at Guisborough. This is a non-profit-making enterprise, the intention being to create an establishment to provide opportunities for learning, discussion and interchange of experience between young men from the various divisions of our manufacturing organisation and thus to equip for managerial positions those younger men who in their everyday work reveal capacity and enthusiasm. This College is not confined to our own employees who will benefit from their association with men from other undertakings. The College makes provision for a twelve-months course for some sixteen resident students. We are confident that in pursuing a policy of diffusion of experience and knowledge beyond the limits of Technical Institutes we shall make a valuable contribution to the future management of our organisation and the industry as a whole.

The Works' Pension scheme mentioned last year came into operation on January 1, 1956, and the proportionate cost of the scheme from that date has been charged to the accounts. The suggested amendments to the Staff scheme are still the subject of discussion with the Revenue Authorities, but should be resolved in the very near future.

CONFIDENCE IN THE FUTURE

It is customary for the Chairman to make some forecast with regard to the future. I am always reluctant to do so and in these uncertain times I feel it is sufficient to state that between the end of the financial year and the date of preparation of these accounts the turnover of all companies within the Group continues to give cause for satisfaction and reasonable confidence in the future.

It is my privilege at the conclusion of my first year as Chairman to present these accounts to you and at the same time to extend my grateful thanks and appreciation for the loyal support of my colleagues, staff, and personnel of both our Retail and Manufacturing divisions.

The report and accounts were unanimously adopted. The Directors retiring in accordance with the Articles of Association were re-elected to the Board and Messrs Price Waterhouse & Company and Messrs Volans, Leach & Schofield were reappointed auditors.

The Meeting concluded with a vote of thanks to the Chairman.

ALFRED CASE & CO., LIMITED

(Non-Ferrous Rolled Metal Manufacturers)

The nineteenth annual general meeting of Alfred Case & Company, Limited, was held January 12th in Birmingham, Mr K. E. West (chairman and managing director) presiding.

The following is his circulated statement: During the past year the turnover of the Company showed an increase on the previous year, though there was a slight reduction in the tonnage of metal produced. The market prices of metals fluctuated considerably (in the case of copper between £264 and £437 per ton) and it was not always possible to cover rises in the costs of production.

Having regard to the difficulties in trading, outside our control, the Directors consider that the results for the year are satisfactory. After providing for Taxation and for the Dividend of 25 per cent, the carry forward balance in the Profit and Loss Account has been increased by approximately £18,000, thus adding to the strength of the Company's reserves.

During the year the Directors appointed Mr T. M. West to the Board. Mr T. M. West has held an executive position with the Company for a number of years. The service contracts with the other three Directors expired on September 30, 1956, and, at his own request, Mr H. A. West gave up his position as Chairman and Managing Director. On the unanimous proposition of the Board I was appointed to both these offices in his place.

Mr H. A. West has worked full time in the business for over twenty years and has been Chairman and Managing Director since the business became a public Company. On behalf of the Board I wish to thank Mr H. A. West for his services to the Company over these years. He has agreed to continue service with the Company for a further five years and I am fortunate in knowing that his advice and considerable experience of the trade will be available to me.

All the Directors who were under service contracts have accepted new contracts for a further five years, but Mr H. A. West is not now required to devote himself whole time to the service of the Company. There has been some rearrangement of remuneration, but on the basis of the profit of last year the aggregate future remuneration of the Directors will not exceed the aggregate remuneration under the former agreements, after taking into account the remuneration of Mr T. M. West as a former executive.

Present orders on hand are encouraging and the Company is well equipped to deal with them.

The Company's employees, Management, Staff and Operatives have again rendered excellent service throughout the year and I thank them for their continued loyalty.

The report was adopted.

H. & G. SIMONDS, LIMITED

SUBSTANTIALLY INCREASED EARNINGS

HOME AND OVERSEAS SALES EXPANSION

The Annual General Meeting of H. & G. Simonds, Limited, was held on January 21st at Reading.

General Sir Miles Dempsey, Chairman, presided. The following are extracts from his circulated statement.

FINANCE

The balance from trading during the year showed a substantial increase at £1,016,185. This improved result reflects a greater quantity of beers and wines and spirits sold, together with larger profits from the managed house side of our business.

Production and distribution costs have risen again. On the other hand, there were several favourable factors which helped our profits, chief amongst them being the lower price of barley and the inclusion of a full year's trading results of the Octagon Brewery against nine months in the previous year.

The profit before taxation was £763,976, as compared with £629,162 for the previous year. The profit after taxation was £28,103 higher at £328,119. The Board are convinced that it is in the best interests of stockholders to maintain the ordinary dividend at the same rate as for the past four years and to strengthen the working capital by ploughing back a greater proportion of the profits.

TRADE

Our sales of beer showed a further increase during the year, due in part to the additional Octagon trade. On the home market bottled beer now represents as much as 49 per cent of our total output.

Our export trade showed a welcome improvement in which sales of our "Tavern Ale" in cans played no small part. We are confident that this product has an important future.

Once again our wa... increased substantially. ...pirit trade in-

It is impossible to make any forec... the future which is overcast by the international situation. The indications are, however, that the rationing of fuel alone will cause a fairly severe contraction in our business, which depends largely on the prosperity of industry as a whole, and to a lesser extent on the freedom of the public to travel by road.

LICENSED PROPERTIES

In common with most brewers, we find that the shifting pattern of the population, out of the centres of overcrowded towns into new towns and housing estates is likely to involve us in great expense, and we realise that over the next several years it will be necessary to find substantial sums of money out of our retained profits in order to finance new construction.

Our Hotels and Catering Department celebrated the twenty-first year of its existence by achieving a record turnover and profit and by the opening of the "Chevalier" at Exeter, a fine house in the modern manner, whose bars and restaurants we commend to any who may be travelling in the west country.

We have continued to expand the retail business under the name of Arthur Cooper during the year and now have 42 off-licence shops under our control ; more are planned. We are satisfied with the progress made in this enterprise.

PLANT

A number of improvements has been completed or put in hand during the year, which also witnessed at last the opening of our new bottling stores at Newport.

The continued pressure of our trade in bottled, and more recently in canned beer, together with the rising labour costs, have obliged us to consider further expansion and increased efficiency in our plant.

ASSOCIATED COMPANIES

Dividends and interest from our investments overseas again showed an increase.

STAFF

Once again we have received the most loyal support from our staff and employees, tenants and managers. To them all I give our thanks and appreciation.

The report and accounts were adopted and the retiring Director re-elected.

Binding Cases for The Economist . . .

are available from EASIBIND LTD. The cases are in stiff, dark blue cloth covers, and are gilt-lettered on the spine ; they provide an extremely effective and firm binding and will hold 13 issues of the normal edition together with the quarterly Index, or 26 issues of the air edition with two quarterly Indexes. The year can be stamped on the spine. The cost per case, post free throughout the world, is 11/-. Orders, stating requirements clearly and enclosing a remittance, should be sent, not to The Economist, but to EASIBIND LTD. at the address below :

EASIBIND LIMITED (DEPT. B) · 84 NEWMAN STREET · LONDON · W1

APPOINTMENTS

BUCKINGHAMSHIRE EDUCATION COMMITTEE

SLOUGH COLLEGE OF FURTHER EDUCATION

(Principal: R. Fear, M.Sc., M.A.)

Applications are invited from suitably qualified persons for the post of Senior Lecturer in Management Studies. Salary will be paid in accordance with the Report of the Burnham Committee (Silver Scales) of Salaries for Teachers in Establishments of Further Education, 1956. (£1,350 x £50 to £1,550.)

Further particulars and application forms may be obtained from the Principal, College of Further Education, William Street, Slough, Bucks, to whom completed forms must be returned within two weeks of the appearance of this advertisement.

AN AMERICAN ORGANISATION IS EXPANDING ITS ACTIVITIES IN INDIA

A European Financial Executive is required to direct the financial activities of the Indian Company in Bombay. The position would suit a man between 25-35, with a financial background, who is anxious to commence or continue a career in India. A knowledge of Company Law would be advantageous. The work will include recruiting suitable Indian Staff and dealing with all matters which normally come within the scope of Treasurer, Accountant or Controller. A challenging opportunity for the right man. The position, which will ultimately qualify for a seat on the Board, is one of trust and responsibility, and requires initiative and patience. Salary, not less than £3,000 per annum, will be commensurate with qualifications, responsibility and personality considerations in India.—Write, Box E 504, L.P.E., 55 St. Martin's Lane, London, W.C.2.

INTERNATIONAL TRADE UNION organisation (London headquarters) offers position as Translator/Interpreter/Reporter/Secretary post with non-contributory superannuation scheme. Three weeks' annual paid holiday. Applicants, whose mother-tongue should be English, must be able to translate and interpret from French, German and one or more Scandinavian languages. Should also be capable of producing reports and minutes of meetings. Previous trade union experience an asset. —Applications, stating age, qualifications, previous experience and salary required, together with references, should be forwarded to Box 611.

CENTRAL ELECTRICITY AUTHORITY

HEADQUARTERS

require the following in the Station Development Sub-Branch in London:

(a) SECOND ASSISTANT ENGINEER.
(b) THIRD ASSISTANT ENGINEER.
(c) FOURTH ASSISTANT ENGINEER.

The Sub-Branch is responsible for the planning of generating capacity throughout England and Wales; selection of station sites to implement the Nuclear Power Programme; selection of sites for ordinary power stations; obtaining statutory and other consents for both.

Candidates should possess an Honours Degree or qualifications for membership of the I.Mech.E., I.C.E. or I.E.E., and, preferably, experience of economic studies or the problems of siting power stations, e.g., geology, ground exploration, thermal and hydraulic aspects of the use of river and sea water for cooling purposes, discharge and dispersal of chimney emissions or questions of town and country planning.

Salaries within scales:
(a) £1,045—£1,395 p.a.
(b) £977—£1,190 p.a.
(c) £772—£956 p.a.
according to ability.

Application forms (AE.6), obtainable from D. Moffat, Director of Establishments, Wimley Street, London, W.1, should be returned by February 8th. Quote Ref. E/25.

ASSISTANT STATISTICIANS

required by N.C.B.'s Statistics Branch (Technical Section) at London Headquarters. A degree in mathematical statistics, or in mathematics with appropriate qualifications in statistics is required. Experience in the application of statistical techniques and a knowledge of punch card equipment is desirable. Appointments (superannuable) according to qualifications and experience within inclusive ranges £1,006-£1,286 male, or £834-£1,031 female.

Write, with full particulars of age, education, qualifications and experience, to National Coal Board, Staff Dept., Hobart House, London, S.W.1, marking envelope X/5741E, before February 11, 1957.

IBM UNITED KINGDOM LIMITED, manufacturers and distributors of Punched Card Accounting Equipment and Electronic Data Processing Machines, require men of the highest calibre for intensely interesting work, comprising the investigation of accounting and book-keeping methods and systems, the preparation of reports and proposals, and the subsequent installation of recommended machine accounting methods. Applicants should be under 35 years, preferably with a degree or professional qualification, or with a wide experience of commercial and/or industrial systems and methods, or experience in a large Punched Card installation. Recent graduates without experience will, however, be considered. Nine to eighteen months' training is given, and salaries, based on individual earnings and requirements, are paid during this period. Subsequent earnings will be in the very high income group.—Applicants for the next course (April, 1957) should write, giving full particulars of education, qualifications and experience, to the Personnel Manager, 101 Wigmore Street, London, W.1, quoting Reference E.M./7.

ASSESSORS required for Investigation Branch of East African Income Tax Department on two years' probation for admission to permanent and pensionable establishment. Salary according to age and experience in scale including Inducement Pay, £939, rising to £1,563 a year. Outfit allowance, £30 in certain circumstances. Free passages. Liberal leave on full salary. Candidates, not over 35, must be members of a recognised body of professional accountants, preferably with experience of tax work.—Write to the Crown Agents, 4 Millbank, London, S.W.1. State age, name in block letters, full qualifications and experience, and quote M1B/43/70 D.N.

QUALIFIED INTERNAL AUDITOR is required by old-established firm near Morecambe. Permanent, pensionable position. Full details of age, training, experience and salary required.—Box 606.

FINANCIAL CONTROLLER

required for
CUMMINS ENGINE COMPANY LIMITED,
an American subsidiary company, establishing facilities for manufacturing high-speed diesel engines, in Shotts, Lanarkshire, Scotland, invites applications.

Must be Chartered Accountant in the age group 30-45, with previous experience in commerce and in top level administration. Primary responsibility of the Financial Controller will be for the general accounting functions of the Company, including costing, budget control and management, reporting through a mechanised accounting system. Salary by arrangement. Pension scheme.—Apply to Personnel Manager, giving complete details of background and experience.

GENERAL SALES MANAGER

Applications are invited for the post of General Sales Manager to cover the activities of an old-established Engineering firm in Structural Steel Fabrication, General Engineering (including presswork, machining and fabrication), Grey Iron Founding. The position requires a good knowledge of engineering possibilities, commercial experience with proved ability for Sales promotion and management of Area Sales Staffs. The salary will be fully commensurate with the responsibilities which are substantial.—Applications in confidence to be made to Box 613.

DEPUTY TO CHIEF CORSETRY CONSULTANT

Able woman wanted to be Deputy to Chief Corsetry Consultant of Spirella Company of Great Britain Limited, Letchworth, makers of individually made corsets and brassieres. The female Consultancy organisation operates over all of Great Britain, and trains and maintains contact with Corsetieres who fit and sell garments in the home. This is most interesting, satisfying and constructive work for the successful applicant. Experience of garment trade desirable, but not essential. Ability to control women Consultants is necessary; also to help them continue to work efficiently and harmoniously with men in the business. Should have "stare-sense", and "presence," and be able to help organise efficient demonstrations of the fashion-show type. Preferred age, 35 to 40, but would consider up to 43 in case of exceptional merit. Do not apply unless you have had experience of being in control of sizeable number of women. Salary minimum, £800 per annum, and in range up to £1,500 per annum envisaged, according to ability and qualifications. Pension scheme. Three weeks' holiday. To live Letchworth or easy distance. To be free and entirely willing to travel during week all over Great Britain, visiting and encouraging Consultants. Must be good "mixer." Should preferably have had experience of selling in some form or other; but must have instinctive and lively appreciation of importance of salesmanship. Company's own staff are being invited to apply.—Applications, in strictest confidence, to Marketing Director, Spirella Company of Great Britain Limited, Letchworth, Herts.

CHIEF PERSONNEL OFFICER

Large and leading internationally known manufacturer of engineering products in the Midlands requires CHIEF PERSONNEL OFFICER to be in complete charge of well-established department.

Age 35-45. University degree and I.P.M. membership desirable but not essential. Must have had more than ten years practical administrative experience in personnel activities with at least five in engineering. Only applicants currently holding a senior personnel position in industry need apply. Successful applicant must be first-class administrator and thoroughly familiar with various training schemes and up-to-date recruitment and selection methods as well as being well-informed on all matters relating to engineering, Trade Unions, and Employer's Associations. This is a senior appointment with a good four figure salary and well-established staff superannuation scheme. An excellent opportunity for the right man.

Apply in GUARANTEED STRICTEST CONFIDENCE in accordance with professional ethics, giving contact telephone number, details of date and place of birth, education, background, names of firms, positions held with dates and salaries to

Dr. P. S. de Q. CABOT,
P. S. CABOT AND PARTNERS,
37-41 BEDFORD ROW,
LONDON, W.C.1.

AMERICAN Organisation in Europe wants social scientist with research and writing experience. Knowledge of Eastern Europe and experience in audience analysis particularly desirable. Good salary plus housing. —Reply to Box 609.

GENERAL SALES MANAGER required by a Printing and Packaging Group of Companies, with factories and sales offices in a number of centres. Responsibilities will include sales co-ordination, sales development and marketing research, together with a commercial study of new projects.

This is a senior appointment for a man in his early forties, who has proved his ability. A high level of general education and a wide industrial and commercial experience is essential, and for the right man there is opportunity of even higher promotion within the Group.

The salary offered is in the neighbourhood of £4,000 per annum, with an appropriate pension.—Write, giving full particulars, in confidence, to Production Engineering Ltd., 12 Grosvenor Place, London, S.W.1, and mark the letter U.M.

ASSISTANT required for research in the Faculty of Commerce and Social Science in particular in the fields of Commerce and Statistics. Degree an advantage. Initial salary up to £455 a year according to age and qualifications.—Particulars of education, experience, age to Clerk to the Faculty of Commerce and Social Science, The University, Birmingham, 15.

MARKET RESEARCH.—The Metal Box Co. requires a woman, based London, to supervise small staff of Field Investigators, and assist in the collection of information and planning of surveys. Previous experience in Market Research, preferably among retailers, essential.—Write (MJ/MR), The Langham, Portland Place, W.1.

BATTERSEA POLYTECHNIC, LONDON, S.W.11.

(COLLEGE OF ADVANCED TECHNOLOGY)

Applications are invited for a Lectureship in Professional Background Studies for Science and Engineering students from graduates with a B.Com. or B.Sc.(Econ.) (Industry and Trade) degree. Salary £1,236 or £1,248 x £30-£1,398, less statutory deductions.—Further particulars from the Clerk to the Governing Body, by whom applications should be received as soon as possible.

MILK MARKETING BOARD FOR NORTHERN IRELAND

APPOINTMENT OF GENERAL MANAGER

Applications are invited from suitably qualified persons for the post of General Manager of the Board. The Board are responsible for the marketing of over 100 million gallons of milk per annum and operate a number of factories and a large transport fleet. The post calls for a man with a flair for administration and organisation and the ability to apply modern techniques to the marketing of milk.

The salary scale is £2,300 x £100 to £2,800 per annum. If the successful candidate possesses exceptional qualifications, the commencing salary may be considerably above the minimum point on the scale.

Applicants, who must be of British nationality, must have had wide experience, in a senior administrative capacity, of the problems involved in the management of a large-scale marketing organisation, preferably in connection with milk. The successful applicant will be responsible, subject to the direction of the Board, for the general control of all the Board's activities.

Preference will be given to suitably qualified ex-Service candidates.

The appointment will be subject to the Conditions of Employment laid down by the Board, which include a provision that eligible staff shall contribute to the Northern Ireland Local Government Officers' Superannuation Scheme.

Applications must be made on the prescribed form, copies of which may be obtained from the Secretary, Milk Marketing Board for Northern Ireland, Castlehill Road, Belfast.

The closing date for the receipt of applications will be Thursday, February 28, 1957.

OPERATIONAL RESEARCH

COURTAULDS LIMITED have the following two vacancies for Senior Assistants in their Central Operational Research Department in Coventry. This Department is concerned with a very wide range of problems in the management, production and technical fields and offers ample scope for originality.

(a) *Mathematical Statistician.*

Applicants should hold a good degree in statistics, or in mathematics with post-graduate study or experience in statistics. This post offers considerable opportunities to suitably qualified men. Investigations in hand at present include: queueing and related topics, experimental design, programming techniques and electronic computer applications. There is also scope for mathematical research of a fundamental character into special problems in the production field. Reference number C.80.

(b) *Scientist or Engineer.*

Applicants should hold a good degree in one of the following subjects: Physics, Chemistry, Mechanical, Electrical or Chemical Engineering. Corresponding industrial experience would be an advantage. The post requires primarily a man with practical insight and constructive imagination. He should have an interest in mathematics, and candidates with some acquaintance with statistical methods are particularly welcome. Reference number C.82.

A good starting salary will be paid in both cases, depending on qualifications and experience, and the appointments are pensionable.

Candidates should write for a detailed form of application to the Director of Personnel, Courtaulds Limited, 16 St. Martins-le-Grand, London, E.C.1, quoting the appropriate reference number.

A NATIONAL MANUFACTURERS' Trade Association in London requires an Assistant to train in all aspects of its activities, with special emphasis upon labour relations. The position is a progressive one, and can lead to an executive appointment. The initial salary will be attractive, and increments will be full rewarded. Candidates should be under 35 years and should have had a sound education, preferably to University level, and should possess either a professional qualification in economics or accountancy or have had some industrial management study experience.—Candidates should apply, giving full details of their age, education, qualifications and experience, to Box 615.

DEXION LIMITED require a young man (25-35) to take over and develop important new work connected with Sales Statistics and Costing in their fast-growing U.K. Sales Division. The job involves contact with many aspects of the company's activities, so as to maintain constant surveillance of sales expenditure and the collection and preparation of policy-making sales information for management. Applicants should be G.C.E. at A. Level (or an equivalent qualification) in two subjects, of which one should be Mathematics. They should preferably also have at least a year's experience in a sales or commercial organisation. Some knowledge of accounts procedures, including punched-card systems, would be a great advantage. This background is important, but equally vital is the ability to develop the job creatively and with the minimum of supervision. Strong evidence of this will carry as much weight as experience and qualifications.—Write for application form to Personnel Dept. (SC4), Dexion Ltd., 65 Maygrove Road, London, N.W.6.

THE BRITISH INSTITUTE OF MANAGEMENT has the following vacancies: 1. In its EDUCATION DEPARTMENT. This post is an administrative one and involves supervision of an office concerned with examination systems. This appointment would be suitable for a woman 25-35 with a good education and some experience of office routine. University education an advantage but not essential. Salary in the range £450-£550. 2. A fully qualified Shorthand Typist is required for work of a secretarial nature for the office of the Assistant Director (Operations). Previous experience and high speeds essential.—Applications, in writing, to the Assistant Director (Operations), Ref.: AR.

AMERICAN Radio Organisation in Europe wants Polish, Czechoslovak and Hungarian language analysts with social science or journalistic background. Good salary, including housing. Thorough knowledge of English and ability to prepare audience research reports required.—Reply to Box 608.

ECONOMICS GRADUATE (23-26) required as Assistant in Economics Section of Library Intelligence Service Department. The work involves the analysis of statistical data and preparation of reports on overseas markets. Knowledge of German and French would be an advantage. Salary will be in accordance with experience.—Write to Central Staffing Department, Richard Thomas & Baldwins Limited, 47 Park Street, London, W.1.

APPOINTMENTS

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of Investigational Officer in the Department of Agricultural Economics. Candidates should have academic qualifications and/or practical experience in Agriculture, Economics or Accountancy. Salary scale £450 x £25 to £550 x £50 to £650 per annum, with membership of the F.S.S.U. and Children's Allowance Scheme; graduates would have an initial salary of £500 per annum. Investigational Officers may be considered, on reaching a salary of £550 per annum, for promotion to the grade of Senior Investigational Officer (salary scale, £650 x £50 to £1,050 per annum).—Applications should be sent not later than February 18, 1957, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

UNIVERSITY OF THE WITWATERSRAND JOHANNESBURG

SOUTH AFRICA

Applications are invited for appointment to the newly created CHAIR OF STATISTICS within the Department of Mathematics. The Professor of Statistics will be responsible to the Head of the Department, who is the Professor of Mathematics, for the courses he is called upon to give in statistics and related subjects. Duties are to be assumed on a date to be arranged.

The salary attached to the post will be according to the scale £1,700 x £50—£2,000 p.a. In addition, a married man with children will receive the cost of living allowance which at present is £234 per annum.

Membership of the Provident Fund is compulsory and involves a contribution at the rate of 7 per cent of the salary paid. Membership of the Staff Medical Aid Fund is obligatory in the case of an officer who is found eligible for membership in terms of the rules.

Applicants are advised to obtain a copy of the information sheet relating to this vacancy from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close in South Africa and London on February 28, 1957.

MANAGEMENT SELECTION LIMITED have been retained to advise on the selection of a

GENERAL MANAGER

for a large engineering company supplying components to the aircraft, motor and agricultural (machinery) industries. It is part of a world-famous group, and has the largest and most up-to-date plant of its type in the world. Turnover has increased thirty-fold in the last 15 years, and the current expansion programme creates an opportunity for a man whose breadth of experience will qualify him for a seat on the Board after an initial period as General Manager. He will be responsible to the Deputy Managing Director for all manufacturing and commercial aspects of the business. Salary subject to discussion, but would interest those at present earning about £4,000.

Candidates should have an engineering degree, A.M.I.Mech.E., or similar qualification. They will probably be aged 42 to 55, and have already acquired sound experience in (i) works administration in an engineering company making components for the general market; (ii) cost control; and (iii) business negotiations at a high level. Knowledge of aircraft or motor industries helpful.

Please send brief details in confidence, quoting Reference (S 224), to P. J. H. Fryer, Management Selection Limited, 17 Stratton Street, London, W.1. Any information will be disclosed to our clients until candidates know their identity and have given permission.

ACCOUNTANT REQUIRED by IBM United Kingdom Limited for their works at Greenock, Scotland, manufacturing electric typewriters and punched-card accounting machines. This British associate of the world-wide company has been established for five years, and now employs 1,000 at Greenock. It is extending into electronic calculators, and the works are about to be considerably enlarged. The vacancy arises due to the present accountant taking over a new department at the works. Applicants should be aged 30-40, qualified, with wide industrial and also punched-card accounting experience. The successful candidate will be responsible to the Factory Controller for accounting, costing, wages and, later, budgeting, and will be remunerated at a starting salary in the £1,500-£1,800 bracket. A free insurance plan is in operation, and removal expenses will be paid.—Apply in writing, giving full details of age, education, qualifications, experience and present salary, to the Personnel Manager, 101 Wigmore Street, London, W.1, or IBM United Kingdom Ltd., Spango Valley, Greenock, marking envelope "WA Confidential." Preliminary interviews will be arranged in London, Glasgow or Manchester.

BRITISH NYLON SPINNERS LIMITED invite applications from women, aged 21-25, for vacancies in their Consumer and Retail Research Section in Monmouthshire. The work will provide opportunities to contribute to all aspects of Market Research. Preference will be given to graduates who can offer Economics as one of their subjects. A good standard of health is important, as considerable travel is involved and much of the work takes place out of doors.—Apply in writing to Personnel Manager, Pontypool, Mon.

DIOCESE OF CHESTER.—Applications are invited for the appointment of Diocesan Secretary.—Particulars and forms of application may be obtained from Messrs. Gamon & Co., 2 White Friars, Chester.

THE UNIVERSITY OF MANCHESTER

HALLSWORTH RESEARCH FELLOWSHIPS

Applications are invited for the above Research Fellowships for advanced work in the field of Political Economy and Public Administration. The value of the Fellowships will normally be within the range of £700-£1,500 per annum, according to experience and qualifications. Regulations governing the award of the Fellowships may be obtained from the Registrar, the University, Manchester, 13, to whom applications should be sent not later than March 1, 1957.

RESEARCH FELLOWSHIPS OF THE COUNCIL OF EUROPE

Since 1953, the Council of Europe has awarded annually a number of Research Fellowships, each of the value of 300,000 French francs and tenable for a period of eight months from July 31st. The Selection Committee will meet in Strasbourg at the end of June to make the awards for 1957.

The object of the Fellowships is to encourage research into the following subjects, considered in the light of their present-day importance: (a) political, economic, social, educational and scientific problems connected with European integration; (b) European civilisation (philosophy, history, literature and the arts).

Candidates must normally be nationals of a Member State of the Council of Europe. An exception, however, is made in favour of refugees from European countries non-Member States of the Council of Europe, provided that they are legally resident in the territory of a Member State.

The British Council assists in publicity and recruitment for these Fellowships in the United Kingdom. Further particulars and forms of application, which must be submitted before March 15, 1957, may be obtained from The Controller, Education Division, The British Council, 65 Davies Street, London, W.1.

FISONS LIMITED require a SENIOR ECONOMIST. The work will consist principally in the preparation of surveys and forecasts dealing with the following:

(a) The general economic situation of the country both short and longer term.

(b) General forecasts on the future of agriculture in this country in relation particularly to world conditions.

(c) Advice on major raw material availability and price trends.

Applicants should preferably be under 40 years of age and have a First Class Honours degree in economics or commerce. Experience in this type of work is not essential. The Company employs a number of economists and has a large body of information referring to economic conditions affecting its activities. What is required is outstanding imagination and analytical ability. Contributory pension schemes.

Applications to Personnel Officer (E112), Fisons Limited, Harvest House, Felixstowe, Suffolk.

SCHOLARSHIPS ABROAD 1957-58

Applications are invited from British students for scholarships offered by Austria, Belgium, Brazil, Denmark, Finland, France, Germany, Iceland, Iran, Italy, The Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and Yugoslavia. The awards are mainly for university graduates and under-graduates and are tenable for periods varying from a few weeks to twelve months during the academic year 1957-58.—Full particulars and application forms, for which a stamped addressed foolscap envelope should be sent, are obtainable from the British Council, 65 Davies Street, London, W.1, or from any British Council office in the United Kingdom.

PERSONNEL MANAGEMENT OVERSEAS

Cambridge honours graduate, 39, ten years' experience in Middle East and India since war service, covering all phases of indigenous labour management (including trade union negotiations and industrial disputes), European staff relations and Employers' Federation work, desires permanent senior personnel management post overseas, preferably Middle East, Central or East Africa.—Box 614.

EXPORT EXECUTIVE (38) seeks opening with London area Manufacturers, Merchants or Distributors. Public School, energetic, sound all-round experience of the Export trade. Willing to travel abroad.—Box 617.

EXPERIENCED SENIOR EXECUTIVE, with 11 years active managerial background, seeks administrative appointment, preferably London area. Thorough knowledge overseas marketing. Aged 35. Fluent French. Understands hard work and difficulties.—Box 605.

DANISH ECONOMIST, 27, with industrial economics as major subject, and with some banking experience, seeks employment with British or Canadian firm of Industrial Consultants as from June or later this year.—Box 610.

PRIVATE SECRETARY, quick, presentable, reliable. Experienced politics, journalism, public relations and business, wants responsible and interesting post. Used to taking charge in absence of employer. Last post £1,000 a year.—Box 616.

MIDDLE EAST.—Graduate (43), fifteen years' service in area. Fluent Arabic (Iraqi), French, Urdu, fair Turkish, Persian; experience mainly administrative, public relations, commercial, seeks managerial or representational position. Highest references.—Box 612.

SAVILE ROW CLOTHES. Cancelled export orders direct from eminent tailors, Lesley & Roberts, Huntsman, Kilgour, etc. Lounge, Dress Suits, Overcoats, etc., from 10 gns. Regent Dress Co., (2nd floor), 17 Shaftesbury Avenue, Piccadilly Circus, W.1. GER 7180 (next to Café Monico).

THE Economists' Bookshop has the world's widest range of books on Economics, Politics, History, Anthropology and the Social Sciences. World-wide mailing service. Second-hand books bought.—11-12 Clements Inn Passage, Aldwych, London, W.C.2.

UNIVERSITY OF EDINBURGH

RESIDENTIAL COURSE FOR BUSINESS MANAGERS

The third Residential Course for Business Managers will be held in the University from July 13 to August 2, 1957. The aim is to encourage the development of a broader understanding of business problems and of the environment in which business operates, and thus to assist in the transition from specialised to general management.

PROGRAMME OF STUDY.

There will be three principal fields of study: (i) Business in a Changing World; (ii) Problems of Business Policy; (iii) Aspects of Internal Administration. In addition to syndicate work and case-studies, seminars will be led by practising business and professional men, as well as University teachers drawn from several departments, including Commerce, Political Economy, Accounting and Psychology.

ADMISSION.

To encourage the exchange of knowledge and experience among members of the course, the number admitted will be strictly limited. There are no formal educational requirements. The fee for the course, including residence, is 90 guineas. Further particulars and nomination forms may be obtained from Professor N. C. Hunt, University of Edinburgh. Early application should be made. The closing date is March 16, 1957.

CHARLES H. STEWART,
January, 1957. Secretary to the University.

FOR SALE.—The Economist, 1949-56, bound. P.C. for details to Hopwood, 30, Vicarage Lane, Poynton, Cheshire.

SUCCESSFUL TUITION FOR THE B.Sc.(ECON.) DEGREE

Wolsey Hall (Est. 1894) provides Postal Courses on a wide range of subjects for the two examinations for Lond. Univ. B.Sc.(Econ.) (three if Entrance is included). Moderate fees, instalments. Over 1,000 Wolsey Hall students have secured this valuable degree since 1925.—Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P.16, WOLSEY HALL, OXFORD.

FOR SALE: Complete set of The Economist, unbound, August 1946 to August 1950.—Box 607.

ASHANTI GOLDFIELDS CORPORATION, LIMITED

Notice is hereby given that the Board of Directors yesterday recommended a Final Dividend (No. 120) on the Issued Capital of the Corporation at the rate of 9.6d. per Unit of Stock, less Income Tax at 8s. 6d. in the £. This Dividend, which is in respect of the year ended September 30, 1956, to be payable on and after April 4, 1957, to all Stockholders on the Registers on February 13, 1957.

The Transfer Books will be Closed from February 14 to February 20, 1957, both dates inclusive, for the preparation of Dividend Lists.

By Order of the Board,
E. W. MORGAN, Secretary.

Registered Address:
10 Old Jewry, London, E.C.2.
January 16, 1957.

THE ECONOMIST and Economic Journal. Bound volumes, each complete with index covering the following important periods, offered for sale: Economist—14 volumes, 1945 to 1951, for £28 or offer. Economic Journal—4 volumes, 1948 to 1951, for £4 or offer.—Box No. 1,000, Dorland Advertising Ltd., 18-20 Regent Street, S.W.1.

WANTED—The Economist, Vols. 1-113.—Please report any to Librarian, University College of Swansea.

B.Sc.(ECON.) LONDON UNIVERSITY

UNIVERSITY CORRESPONDENCE COLLEGE

provides postal tuition for the above Degree (obtainable without residence), which is a valuable qualification for those seeking executive appointments in commerce or industry, government or municipal posts. The College, established 1887, is an Educational Trust. Highly qualified Tutors. Low fees. Prospectus of U.C.C. Courses for London Degrees and Diplomas, G.C.E. free from the Registrar, 60 Burlington House, Cambridge.

WORK STUDY.—Next four-weeks full-time course March 11th. Details of this and seven other courses, including evening and correspondence, from the School of Time & Motion Study, 29 Cork Street, Piccadilly, W.1.

MIDDLE EAST MARKETS—WHAT FUTURE? The Middle East Economic Digest, a new subscription weekly starts shortly. Accurate up-to-the-minute information from Middle East sources.—Details from Economic Features, 84 Chancery Lane, W.C.2. CHA. 8533-4.

PRIVATE CLIENT URGENTLY REQUIRES AN AGRICULTURAL INVESTMENT

The Estate should be in the Southern half of England, preferably Southern and Western Counties.

UP TO £475,000 AVAILABLE.

Units of not less than £50,000 preferred. Immature woodland an asset.—Please send particulars to "Tanker," c/o Messrs. KNIGHT, FRANK AND RUTLEY, 20 Hanover Square, London, W.1. Immediate inspection of all likely Estates.

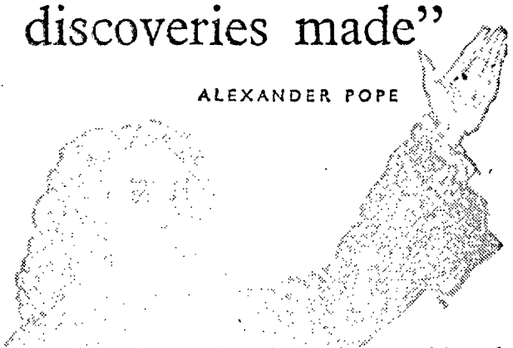
EXPERT POSTAL TUITION

for Examinations—University Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus—and/or advice, mentioning examination or subjects in which interested, to the Secretary (G9/2).

METROPOLITAN COLLEGE, ST. ALBANS

or call at 30 Queen Victoria Street, London, E.C.4.

ANNUAL AIR SUBSCRIPTION RATES



Subscriptions to most countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is either because the alternative is not available or not recommended.

	Airmail	Air Freight
Australia	£8 5s. strlg.	—
Canada	—	$21.50 or £7 14s.

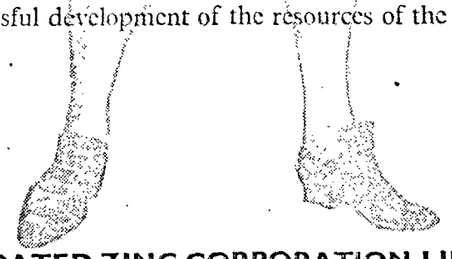
"By mutual confidence and mutual aid
great deeds are done and
great discoveries made"



ALEXANDER POPE

The discovery of a profitable mineral deposit is rarely accidental. It is the result of prolonged struggle by many men to wrest her secrets from Mother Earth. The struggle begins with a long scrutiny, as patient and as detailed as that of Sherlock Holmes, by geologists in a prospecting party. If the results of this study indicate the possible existence of an economic ore deposit the diamond drillers take over the search, working over the area to seek further evidence of the existence of ore reserves. As the shape of a profitable ore-body emerges, capital must be sought to finance its opening-up. Mining engineers move in, and design the shafts and mining works necessary to bring a mine to production.

Despite disappointments, discouragements and setbacks, great mines are successfully brought into production by the mutual confidence that the teams of geologists, geophysicists and engineers have in each other.

It is by such full and co-operative use of its resources in men, materials and finances that Consolidated Zinc carries on the searches which precede discovery, and tests the discoveries, so that they may grow into new mines which contribute to the successful development of the resources of the Commonwealth.

Duties go with Engineering Leadership

In engineering on a world-wide basis as in all large scale international activities, it is the duty of the leaders to open new frontiers. Also, it is incumbent on the leaders to share the benefits of their advanced position with others.

One important way of recognizing this duty of leadership is placing engineers, chemists, metallurgists, pilot plant time and laboratory time at the disposal of technical committees of professional societies and associations. At present Kellogg personnel are engaged with the activities and development of over seventy scientific and engineering committees and working sub-committees. Many of today's accepted advanced design concepts were first introduced to the engineering profession by Kellogg engineers serving on these committees.

Authorizing time and encouraging personnel to prepare papers for technical societies is another way of fulfilling this duty. Permitting personnel to share knowledge by writing for the industrial and technical press is another facet of acknowledging the duty of leadership. Sponsoring technical books such as the recent volume authored by Kellogg entitled "Design of Piping Systems" is still another way of respecting this duty.

The technical staff at Kellogg House are part of this international engineering leadership. They bring to their clients the most advanced engineering in the field of petroleum and petro-chemical plants. To keep this technical staff fully abreast of advances in refinery and petro-chemical process engineering, metallurgical developments, equipment design, corrosion prevention and other specialized engineering areas, department and section heads as well as group leaders periodically are rotated to the M. W. Kellogg Company offices and research laboratories in the United States. Equally important in maintaining scientific and technical leadership are the constant revisions of the Kellogg manuals on design practices, engineering procedures, and material equipment specifications. This leadership has been seasoned by the opportunity and experience of serving the leading oil and chemical organizations throughout the world.

When considering petro-chemical plants or oil refineries it will be to your advantage to consult with Kellogg International Corporation.

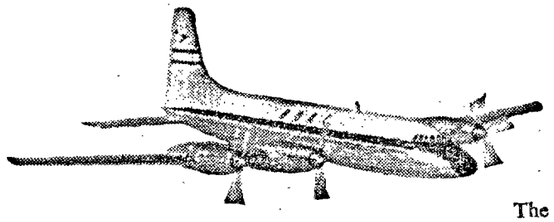
File "S"—For Sonorosis

COME and spend a few minutes in the factory hospital—the small cream and green room where a doctor and nurse minister to the needs of five hundred machinists, operators, typists and backroom boys. A room well away from the scream and crash of the factory floor.

Look round the rows of bottles, winds of bandages, walls of books and alphabets of files. A well equipped little room you think—but wait till the doctor tells you about his patients. Wait till he tells you that most of the men and women who come through his door don't suffer from a bleeding hand or a crushed foot—they don't come seeking his bandages or medicines. They come to rest, to beg something for a headache, and to escape from the eternal noise of the machines.

One thick file holds all their names : File "S"—for Sonorosis. Listen to the doctor on Sonorosis.



"Nowadays, modern machines with automatic safety devices have cut our accident rate to practically nothing. I rarely see so much as a cut finger these days. On the other hand, more and more workers are suffering from nervous complaints—Sonorosis (that's sound-irritation anxiety) is playing havoc with our work potential. Absenteeism is a direct result—and, apart from handing out a few sedatives, I can't do anything about it".

He's right, of course, *he* can't do anything about it. The only answer is to mute those huge machines, bring noise down to a bearable level, and reduce the wear and tear on nerves. And that's a job for Newalls.

Newalls have a long record of success in dealing with acoustic insulation 'headaches.' For more than fifty years they have led the way in this specialised field, and offer the benefit of this experience to any firms interested in improving working conditions and efficiency. To seek Newalls advice will cost you nothing.

Our Ref: AES PD

The British European Airways,
Dorland House,
Lower Regent Street, S.W.1.

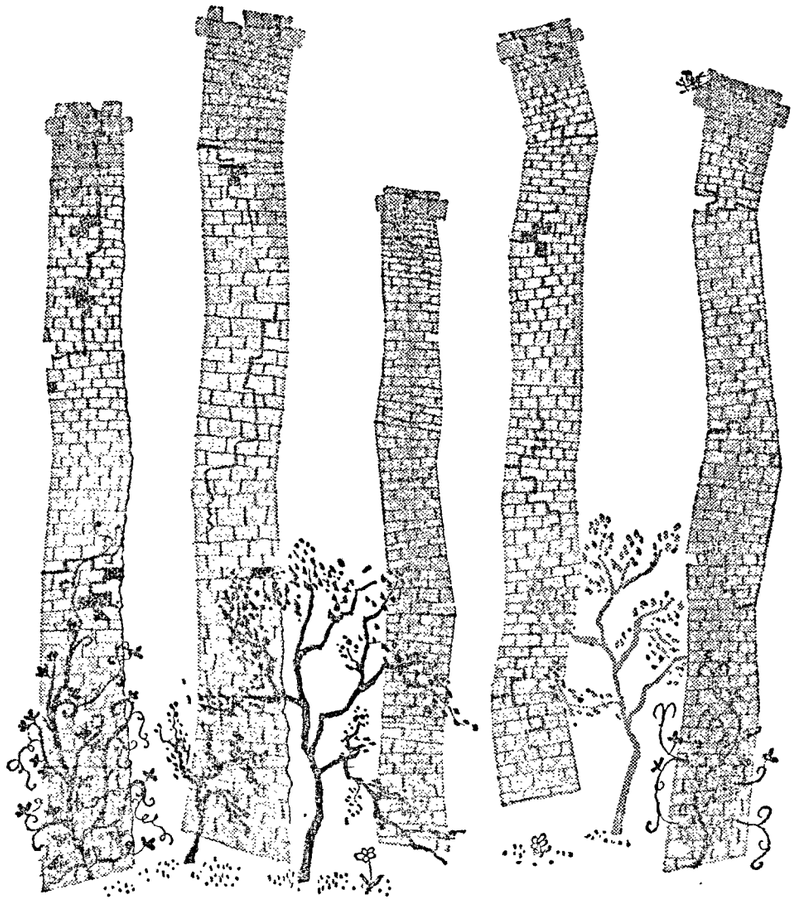
Gentlemen,

Some four weeks ago, your Representative Mr. G. R. Allen, called upon us about air-freight. . . . Quite frankly, we did not consider even a remote possibility that our machines could be transported in this manner. However, in view of the constant increase in surface transport costs, we decided to send two machines by air to the Continent for exhibition. These weighed 2100 Kg. and 2500 Kg. and owing to their design, left us in doubt as to whether this would be a reasonable experiment.

We were most impressed by the manner in which they were handled. Despatches of this nature will obviously afford us not only a considerable saving of time, but show also a reduction in overall costs, and in the instances mentioned, the saving amounted to something like 20%.

The two clients concerned have written to us recently stating that both machines arrived in first-class condition (even though they were unpacked) and commending us for the initiative taken by using this method. Finally, we have already received further orders from the Continent, with a request that we send them by air.

Yours faithfully,



A. E. Sutton.

The Adenauer Era

SINCE its foundation in 1949 the German Federal Republic has been governed at the centre by a single group of men around Dr Adenauer, whose name has become identified, to the outside world at least, with the Republic itself. The third Bundestag is to be elected in September, and the national election campaign has for practical purposes opened already. Dr Adenauer, at 81, has every intention of forming his third administration in October ; restored to health and in sparkling form, he dominates the political life of Bonn as easily as ever. Thus the Social Democratic leader, Herr Ollenhauer, was able on January 18th to state the issue for the electors with classical simplicity: the purpose of his party's campaign is, he said, "to put an end to the Adenauer era."

No statesman of 81 will complain much at hearing his name put to an era ; equally, it is understandable that this should be the call that summons the Opposition to the chase. Because "the Adenauer era" has covered the whole life of the postwar German state so far, the citizens of the German Federal Republic are tempted to regard Bonn, the Christian Democratic Union, and Dr Adenauer as one and the same thing. Until a state has changed its government at least once, it cannot be wholly certain of its continuity as a state. When the German electors become disposed to rate the attractions of a change higher than the advantage of things as they are, Bonn's western allies will have to accept the change and adjust themselves.

For the German voter, the solid advantages of things as they are must weigh heavily. Dr Adenauer and the governing group at Bonn have done, in general, very well indeed. From the position of an occupied territory and a client of the western powers, they have led the Federal Republic—admittedly, with the determined support of the former occupying powers themselves—to an independent, equal status in a powerful alliance. It is true that the great economic and social recovery in the same period has been a united national effort, which the government parties could not have achieved without practical Social Democrat and trade union support. Still, it remains true that the direction of economic policy has proved itself sagacious and enlightened ; ministers like Professor Erhard and Herr Schäffer have conducted their departments with imagination and prudence combined, and with, all told, an amazing consistency. They can show for their efforts a solid and buoyant economy, in the building of which the whole population has benefited.

The Christian Democrats, in their campaign for a third term of power, will inevitably seek to convince the electors that the benefits won will be hazarded if the Adenauer era is brought to an end this year. Once again they will argue that the country's economic policy and its foreign relations would be totally unsafe in other hands than theirs. These are legitimate arguments to use in party politics, but when Dr Adenauer used them in 1953, the present western allies of Germany (then the occupying powers) took him literally and believed

every word. This year, while as foreign countries they will be well advised not to interfere, they will be keenly interested in the two-sided argument as it unfolds. German policy concerns them. What are the candidates for the next government ? How, given power, might they be expected to behave ?

★

West Germany has not yet reached a two-party system ; the erosion of the small parties is persistent but not yet complete. Dr Adenauer's unprecedented victory of 1953 gave the Christian Democratic and (Bavarian) Christian Social Unions a majority of one in the Bundestag ; nevertheless, he formed a four-party coalition to assure himself of a two-thirds majority. Once it had served its purpose and brought the defence agreements safely home, he allowed the 1953 coalition to disintegrate ; the Christian Democrats now govern with only a remnant of allies—the small German party and a handful of secessionists from his former allies. These remnants are likely to be further thinned out in September ; unless the Christian parties can come fairly close to their 1953 performance—and that would be against the present evidence—they will need to recover some of the allies they have lost. The new Free Democrat leader, Dr Reinhold Maier, is a personal opponent of the Chancellor, and the current in his party is running against a return to the Adenauer alliance.

In 1953, when the Christian parties achieved 48.9 per cent of the popular vote, the Social Democrats gained only 31.9 per cent. The distance between them will almost certainly be narrowed in September ; but Herr Ollenhauer will not be able to introduce a new era unless the gap is sufficiently narrowed, and the Free Democrats in addition do sufficiently well, for the Socialists and Free Democrats together to form a majority in the new House.

The German Free Democrats, in their wanderings in search of the truth, have yet to decide whether they are a liberal or a nationalist party. Dr Maier has just been elected chairman with unprecedented unanimity, and he is certainly a liberal ; still, in his platform speech on his election he declared it " the task of the Free Democratic Party to make the German people into a nation once more." This was something, he added, that " the great old man " could not do. From the right, as from the left, Dr Adenauer is being attacked for his supposed lukewarmness about the German national cause. It is on this plank of German unity that the two opposition parties may join, if power comes within their grasp in September. One effect of their union would be to restrain the Social Democrats from any radical economic experiments. This would be the Free Democrats' price for their alliance: no nationalisation, no rigid planning or return to controls. Dr Adenauer has never regarded the Free Democrats as dangerous associates for his own party ; would they be dangerous as allies of his opponents ?

The struggle for the next Chancellorship in Germany will be fought out in large part on the terrain of foreign policy, with initiatives for German unity as the weapons. Foreign policy in Germany is largely concerned with the solution of the German problem itself ; thus, in German feelings and politics, it takes precedence over most matters, now that the basic tasks of reconstruction and recovery have been mastered. Defence policy in Bonn has been tempered to realities, as an article on page 389 explains, and does not offer such an easy target for attack as the Opposition at one time expected. In any event the brutal Soviet reconquest of Hungary has shocked many Germans out of the idea that it is safe to live in Central Europe without an army.

But the impression of upheaval and fissure in Eastern Europe persists, and election year is bound to maintain the restless pressure in Germany for exploration towards a German settlement. In the Bonn government the opinion decidedly prevails that the communist reaction in Russia and Eastern Europe this winter has gone too far to leave scope for German or western diplomacy there at present. But this recognition will not free the Bonn party leaders from the pressure of the currents of feeling ; pessimists or not, they will have to take pains to appear as flexible men, full of resource, receptive to any ideas which might lead to German unity. Thus Dr Adenauer suddenly declared himself on January 11th interested in a " thinned-out zone " of limited armaments in, and bordering on, Germany ; he added, to the general surprise, that his government had been studying the idea since 1953.

★

For all the implications it might have of a radical change in the present Nato system, such an excursion creates no great disturbance when it comes from Dr Adenauer. His foreign policy is known ; it has always been based on actual, not hypothetical, considerations ; it rests firmly on the western alliance and above all on the United States. No German government can afford any longer to shut the door on a possible future solution of the German problem—and any solution, unless it is to be obtained by war, will require an accommodation of some sort with the Russians. The solution is still distant ; the interest of the western powers, however, is not to prevent it but to ensure that they are parties to it if and when it comes.

When German Opposition leaders talk of loosening up the great power front that runs through their country, and of seeking new security pacts to make German unity possible, Germany's western friends are more perturbed ; they have no familiarity with the conduct of Herr Ollenhauer and his colleagues in office to reassure them. The Social Democrats still hold Germany's entry into Nato to have been a mistake, because it made the country's reunification more difficult. They still hold that Bonn ought to seek negotiations with the Russians for a European security pact and a German settlement. In doing so, they would be prepared to negotiate about Germany's future membership of Nato. This is part of their programme ; if they come to power, they will have to make the attempt.

In explaining his party's intention, however, Herr Ollenhauer said this month that he would pursue it only in concert with the western powers ; further, there would be no question of Bonn leaving Nato before a German settlement was reached. West Germany's membership of Nato would end with the entry of the new all-German state into a European security system, not before. It is just such a restriction on the future freedom of action of a reunited Germany that the present Bonn government has refused to consider. Leaving past disputes aside, this is the main difference between government and opposition at Bonn about future foreign policy. Two things narrow it down : it is hard for either party to believe that the Russians would in fact consider giving up their zone of Germany in any definable period of time ; and no west German government, however constituted, could refuse to explore such a chance if it began in fact to look possible.

West Germany has become a sovereign state since the present Bundestag was elected, but, like many other sovereign states, it is still not a wholly free agent in its foreign relations. Germany is not a prime mover in great power diplomacy, but can only hope to take advantage of situations which the Germans cannot by themselves create. When the wind blows from the east, it blows cold in Germany as in the rest of Europe, and a west German government of either political complexion, Christian or socialist, will be likely to keep the greatcoat of the western alliance well buttoned up. There are men on both sides at Bonn who incline to believe that the Soviet troubles in Eastern Europe have made a Russian withdrawal from Germany east of the Elbe for the present less likely than before, because the military risks of a withdrawal may now appear, to the Russians, prohibitive.

When the wind one day blows the other way, it will be a mistake to expect any west German government to sit tight and refuse to explore. The striving for reunification is far too commanding a theme in German life for either party to neglect it ; a change in the east-west climate will force Bonn to become active in its relations with Eastern Europe.

Voices Off

THERE is a fairly simple recipe for that much discussed and much misunderstood subject, Government information policy. It is right that Ministers should wish, by whatever means, to make quite clear both at home and abroad what their policies are, and what national interests the policies are designed to serve. It is wrong for them to suppose that there is some trick, whether it is called propaganda, publicity or public relations, whereby their policies will be understood and accepted. It is in this light, after the Suez misadventure, that the appointment of Dr Charles Hill as Chancellor of the Duchy of Lancaster—with the task of " co-ordinating Government information, especially on the overseas side "—is at present being critically examined. The struggle that some people fear may now be in prospect deserves to be discussed from a pressman's point of view ; for it is through the press that most information, to overseas countries as to the home public, still emerges.

Until early last November, the structure of Government press relations could be broadly—although in places controversially—described as follows. At the highest workaday level, in general usefulness to the press if not in strict terms of status, was the press relations adviser to the Prime Minister. This was Mr William Clark, who relinquished his post at the time of the Suez crisis; his office is now being (temporarily ?) tenanted by his relatively junior former Number 2, Mr Richardson. In undefined relationship with this office there were, and are, the well-established press relations departments attached to the individual ministries ; they range from very good ones at the Foreign Office and the Treasury to ones at certain minor departments which should be less kindly described. There is also the Central Office of Information, which produces useful speakers, tracts and facts.

The press's relations with these official publicists are supplemented in two ways. First, there are what might be called the specialist groups of correspondents with access to fairly frequent—but, as it seems, increasingly formalised—off-the-record press conferences on their particular subjects. The Parliamentary lobby can be counted as one, although of course the most senior, of these specialist groups. There are also, however, swelling groups of specialised correspondents attached to most of the main Ministries.

Although the formal press conferences given to these specialist groups seem to be growing in number, there is some case for suggesting that they may be—for that very reason—diminishing in importance. They tend to become platforms for whatever view the department concerned wants to propagate at that moment, rather than intimate (and critical) *causeries*. And this development has seemed for some time to be restoring, healthily, the importance of the second sort of unofficial Government line of communications with the press : the line of the private contact, which depends upon the journalist's own enterprise and knowledge. Sometimes these contacts take place between specialist correspondents (or, in the case of overseas newspapers, chief foreign correspondents) and sources important in their own field. They also take place when Ministers or

senior officials meet or lunch with editors, leader writers and newspaper proprietors.

The present Tory demand that this necessarily haphazard system of press relations should be co-ordinated has three roots : the belief that to understand all about British policy is to forgive all ; the conviction that therefore Government information (especially to overseas) should be given a more " purposive direction " ; and the desire to minimise the possibility, arising from the haphazardness, of muddles and misconceptions. Some of the recent comment in Parliament, however, seems to have missed the main point at issue here. The main practical issue for the press is whether Mr William Clark's former office at Downing Street is to be restored to its previous importance, under some senior incumbent (a favourite " tip " is Mr Clement Leslie, Mr Macmillan's former PRO at the Treasury) to carry on at least part of this job of co-ordination ; or whether it should be left untenanted, in the belief that the task of co-ordination can be made more " politically respectable " by being put into the hands of a Cabinet Minister, Dr Hill.

★

Most newspapers undoubtedly want a new Mr Clark to be appointed ; they are quite right about this, even though the most widely-circulated fear of the projected Dr Hill system is almost certainly exaggerated. It has been alleged that the demand for more " purposive direction " can only mean a demand for more propaganda, and that the Government might seek to turn such bodies as the overseas service of the BBC and the British Council into instruments of merely Government publicity, and so diminish their natural effectiveness. Probably, however, the pressures that could be mobilised against such a course are strong enough to make the fear far-fetched.

A more likely outcome is that the trend towards " purposive direction " will simply be for Dr Hill to make more general speeches about, say, the situation in the Yemen himself ; for more ministerial press conferences to be given (which is, in itself, a good thing) to foreign correspondents—the new Prime Minister has already met the chief American correspondents in London, but not domestic correspondents, which has caused some resentment ; but mainly for the attempt to be made to " polish up " departmental information offices without introducing any great change in their functions. After all, Ministers with very similar terms of reference to Dr Hill have been appointed before ; they have set out along their road, and never achieved very much. And that is one of the troubles about the new system ; for—it now needs to be whispered—there could be some good in the demand for more " purposive direction," provided it is exerted in the right way and through the right channels.

The best way for a policy to be stated clearly is, of course, for the responsible Minister to state it, publicly in a speech or privately to another Government. Another way, however, too little regarded in this country, is the American technique of what can be called the calculated leak. The important thing when there is misunderstanding between allies is not to cover up and retreat into an indignant shell. If, for instance, the exasperation with Mr Dulles's inactive Middle Eastern policies which simmered to the boil in British official circles during the early part of last year had gone on in America, detailed, inspired and authoritative articles about it would have appeared in the American press. As it was, all that happened here was a vague, oblique and unexplained irritation. The happiest outcome of present re-thinking about publicity would be re-thinking about this sort of delicate point. But if this is to happen, if indeed there is not to be an actual deterioration in channels of information, the question then arises: how should such authoritative " background," as well as ordinary " off-the-record," information be handled in the day-to-day press of business ? Up to a point, of course, this is a matter for the departmental information arrangements. But beyond that point there is the crucial problem. It can be posed by asking a simple question : could the sort of inquiries that previously went to Mr Clark be handled by the press departments attached to *different* ministries (under Dr Hill's co-ordinating eye) or even canalised through Dr Hill's own office ?

★

Perhaps this can be answered by taking a specific example of current newspaper speculation, and examining how journalists would have handled it in Mr Clark's day. " Look here, William, these stories that the defence cuts to be aimed at are about £300 million a year now have some reputedly high-level backing. Should I play them or underplay them ? If you say you cannot comment I am going, on the information I have available, to play them." One could not constantly be ringing up a Cabinet Minister to ask that sort of question ; if one asks a high spokesman of defence he is sure to say, up to and beyond the last ditch, that big cuts in his vote are impracticable ; and one could not easily expect any reply but " no comment " if one rang up a senior spokesman directly attached to a Cabinet Minister, whose main job was to purvey information—and who might put his job in jeopardy if more senior Ministers objected to the way some information had been purveyed. Almost certainly, the job can only be done by some sensible official, whom the press trusts, who is attached to, and also trusted by, the one Minister who cannot be sacked because of his supposed lack of caution. In other words, the job can only be done from 10, Downing Street. Otherwise it will not be done at all. It is to be hoped that Mr Macmillan will quickly come to realise this, and announce a senior appointment, to supplement Dr Hill's work, in his own private office.

Formosa Today—I

Island with a Future?

FROM OUR SPECIAL CORRESPONDENT LATELY IN TAIPEH

FORMOSA, the " island beautiful " of the Portuguese explorers, has become *terra incognita* to the British press and public. It is as though a shutter was drawn across people's minds in 1950, when the British Government decided to recognise Mao Tse-tung's communist regime. Since then, broadly speaking, attention has been drawn to the island home of President Chiang Kai-shek's Republic of China only by one of his more outrageous promises to reconquer the mainland, or by a resumption of the shooting war between the mainland and the offshore islands of Quemoy and the Matsus.

Yet it takes no more than twenty-four hours spent in Formosa's expanded provincial capital, Taipeh, to realise how false is the mental image of 1950 and how illusory are the comfortable projects for a " solution " of the Formosa problem dreamt up in western drawing rooms. Among the observers of China's final agony in 1948 and 1949 were many who saw in the Kuomintang government the ultimate brutality, inefficiency and corruption of which a government was capable. The regeneration of that government since the days of humiliation, demoralisation and defeat is the first major observation a visitor must make. Broadly speaking, the government is in the same hands as it was in 1949. The Kuomintang has become, inevitably in the circumstances, a self-perpetuating body. This question, together with the myth of the " return to the mainland," which sustains the government, will be dealt with in another article.

It may be said now, however, that the myth has not prevented the Nationalist government from successfully carrying out plans for land reform and economic development. Admittedly, the progress of the past few years could not have been accomplished without the massive American aid programme that still continues ; just as physical survival in the face of the communist threat could hardly have happened without American military help and political backing. But of itself, American aid could have accomplished nothing. In the last resort, the survival of the Nationalist regime depended on its capacity to learn from its misfortunes and recognise where its enlightened self-interest lay. This dictated the purge of the administration, the eradication of corruption and an example of austerity. The first of these points is a matter of history. The third is visible and easy to check : a cabinet minister earns about £28 a month in purchasing power and denies himself the comfort of air-conditioning for the long and sweltering summer. It cannot, however, be claimed that corruption in high places has been wiped out. A member of the Control Yuan (the Republic's " watchdog " organisation) was recently gaoled for five years and deprived of civil rights for a further three years on a bribery charge. Embezzlement charges have been pressed against a dozen senior members of the provincial forestry administration. The charges and sentences show that corruption—in the broadest sense—continues ; they also show that is is now difficult to get away with it, and that the penalties are heavy.

★

A more remarkable example of enlightened self-interest than the reform of the administration has been the land reform programme. Its full importance can be assessed only in relation to the circumstances in which it was launched. When the Nationalist government moved to Formosa in December, 1949, chaos reigned and the local population was still seething with resentment against the mainlanders for their brutal repression of the Taiwanese (Formosan) uprising of 1947. But when the Nationalists settled down at Taipeh for the long haul, they soon realised that they could not hope even to dig themselves in on Formosa unless they improved the lot of the local population, created and maintained conditions and living standards more attractive than those on the mainland, and carried out certain social reforms. The most important of these has been land reform. As a result, the proportion of farmers owning all or part of their land has increased from 57 to 75 per cent, while the proportion of tenants has fallen from 36 to 19 per cent, the remaining 6 per cent being farm labourers. The originality of the Formosan land reform consists in its scheme of compensation for landlords. Whereas on the mainland and in North Vietnam the communists murdered landlords, real or supposed, the Chinese Nationalists, in effect, transformed them into industrial capitalists. The government paid the landlord 70 per cent in land bonds, and 30 per cent in the form of stocks in government-owned industries.

The bulk of the work of the land reform programme has been carried out by the Chinese-American Joint Commission on Rural Reconstruction, probably the most successful example of American co-operation with technical personnel in a country receiving economic aid. Indeed, in more general terms, Formosa itself is probably the most successful example of American aid in Asia. Much of it has gone into the development of power resources, communications and water reservoirs for irrigation purposes. In addition, the Americans have sponsored the growth of light industries with the dual object of stimulating production for export or reducing the need for imports. As a result of these programmes and activities, and in spite of the

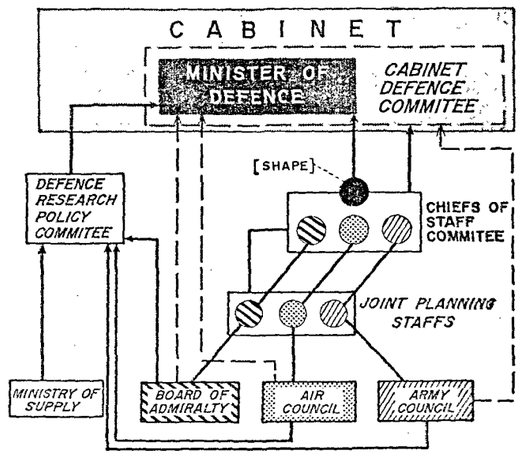
growth of the population from 7½ million in 1950 to nearly 10 million today and a rate of growth of more than 300,000 a year, the island has not merely remained self-sufficient in food, but has maintained exports at a high level, and in some sectors increased them.

It might be thought that Formosa has a promising economic future as an independent island state. But it is not an independent island state. Until the great men of China have completed their struggle over its future, it is the seat of the exiled government of the Republic of China, and it is a Chinese province, by Peking's reckoning as well as Taipeh's. This overcrowded island has to bear the crushing burden of a dual administration (" national " and provincial) and of a modern, highly trained army of *600,000 men. To be sure, it is the* United States that is bearing the burden ; without American aid, Formosa would be unable to support its army and would be ripe for the picking. It follows that the most that can be expected from the island's spectacular economic progress is some reduction in its economic dependence on America.

(To be concluded)

Defence Machine

IT was widely expected that Mr Macmillan would take the opportunity offered by the formation of a new Government to make drastic changes in defence organisation. The idea that service ministers might be reduced to the level of ministers of state was canvassed and that the Ministry of Supply would finally disappear. The changes announced last week fall well short of such centralisation. The most significant of the changes is the appointment of the chairman of the chiefs of staff committee as chief of staff to the Minister of Defence, to whom in future his first loyalty will lie. The rest of Mr Macmillan's statement amounts to a directive to all departments that the new Minister of Defence is to exert all the authority already latent in the powers given to him under existing legislation. Mr Macmillan, like George III's mother, is urging the full use of considerable if neglected prerogatives: Mr Sandys is being told to be a Minister of Defence, and not a postmaster-martial. Men matter more than the machinery.



The fairest interim judgment is that this is probably all that is called for at this stage. Mr Macmillan, as one of the six successive Tory defence ministers, must know that the machinery for organising defence has never really been tried. The idea behind the machine is that the Ministry of Defence should be responsible for long-term planning, strategy, appraisal and control of scientific developments, the allotment of resources and thus the general shape of the services ; but the carrying through of all this should be decentralised in the service ministries. These in turn should be able to deploy the basic technical experience and professional advice on which top planning must be based in all the discussions of the Ministry of Defence.

The two vital elements in the transmission system that links the Ministry of Defence (and the Cabinet) to the military know-how of the service ministries are the chiefs of staff committee and the joint planning staff. The latter, which consists of the three service directors of planning, works within the Ministry of Defence, though linked through the individuals on it to the services ; the former is the service chiefs, individually responsible to their ministers, but in their corporate capacity directly to the Government. In the past the three chiefs of staff gave their views to the Prime Minister or the defence committee of the Cabinet—an *ad hoc* meeting of ministers which is concerned with the particular matters at issue. The creation of a Ministry of Defence simply made the Minister the Prime Minister's deputy in defence matters. To help him he was given a staff officer who sat in on chiefs of staff meetings—it was, and is, open to the Minister of Defence to take the chair at such meetings. Otherwise the chairmanship rotated between the services until, a year ago, a permanent chairman was appointed. It is here that Mr Sandys has been given more leverage. The chairman (Marshal of the RAF Sir William Dickson) has now been made *Mr Sandys's own chief of staff, directly representing* the Ministry of Defence view.

This type of organisation has been evolved to avoid two dangers. The first is the creation of a type of combined general staff, like the German *Oberkommando der Wehrmacht,* which might tend to plan and organise remote from the administrative limitations and operational experience of the services themselves. The other and opposite danger is the creation of a super-ministry in which every problem of detail as well as of planning and principle could be laid at the door of the Minister of Defence, so that basic thinking about defence problems would not get done, let alone be implemented. To swamp the Ministry of Defence with administration would destroy it as a collective, multi-purpose service brain ; it is a secretariat and not a department. The need for this would remain even if the services were " integrated."

It follows, however, that there is a limit to the extent to which the three service ministers can be demoted in the interest of giving the Minister of Defence " control over the services as a whole." If under " complete integration " the service ministers became ministers of state, senior staff officers would tend to take every big issue to the minister ; in losing control over their chiefs of staff the ministers would lose their standing in the House of Commons except on *minor matters ; and they would* shrink from major decisions. But if the service ministers are, as ministers, to help carry the load of decisions, their jobs must be worth having, with true ministerial functions to perform, answer for, and found a reputation upon. The cardinal principle, as in all administration, is to make clear what the responsibility at each point is, and where it lies.

HIGHER DEFENCE ORGANISATION

It has evidently been decided that these arguments also apply to the Ministry of Supply. Perhaps the continuance of this Ministry is the one part of the new set-up on which judgment should be reserved. It is no secret that the previous Minister recommended its disbandment. He must have done so against established departmental interests, and recommendations so made are often more right than wrong. As an agent of the service ministries it is even more subordinate functionally than they are. To combine it with the Ministry of Defence would admittedly, be to load the latter with the administrative detail from which the present structure keeps it free: this detail extends to the operation of scores of complex research plants from Farnborough to Woomera. Yet the special importance of the relation between the Ministries of Defence and Supply is shown in the Defence Research Policy Committee, on which all five ministries are represented, and which is supposed to provide independent advice in the allocation of scarce research resources and scientific trends to enable the Minister of Defence to control service research and development projects. If the Ministry of Supply ever is disbanded, most of its activities as a common agency should certainly be related directly to the Ministry of Defence ; it would be retrograde to scatter its functions widely among the service ministries.

It may be argued that if the defence machine had worked to the specifications claimed, there would have been no need for overhauls—for the sudden discovery that expensively produced weapons are outmoded, strategy is wrong, commitments too heavy for the economy. Such miscalculations feed public suspicion that the shaping of the forces is usually settled not by an integrated view from above, but by deals between service vested interests. But this is what happens when the controls exist but are not applied ; the worst way to get them applied is to so overburden the Minister with responsibility for details that he has no time to think about anything. The vital proviso in the Prime Minister's brief was that the Minister is to have the powers " which in his opinion are of special importance." The control mechanism exists, the problem is to work it. That primarily depends now on two men—Mr Sandys and Sir William Dickson.

The Stoker's Dilemma

BY A CORRESPONDENT

ONE of the advantages enjoyed by the secretary of a hospital is the receipt of a regular flow of pamphlets from the Ministry of Health, guiding his footsteps, extending his duties and adding to his work. They are written by ministry experts in great detail, and the number circulated since 1948 is about 1,000. They illuminate life at many points ; bound and indexed they would make quite an encyclopædia.

A recent pamphlet is devoted to the education of steam stokers.* It announces, in effect, a new faculty which will educate all stokers in the hospital service. It is to provide classes and intensive home study. It will put every stoker (unless he be a recusant) through a six months' course and set each man under a director of studies. It ordains a curriculum on the scientific study of heat, the chemistry of fuels and kindred subjects. In conjunction with an Institute it will hold examinations and reward the successful with a Boiler Operator's Certificate. There is no conscription or compulsion, but the official attitude is very definite:

> The Ministry [the pamphlet says] hopes that every hospital steam stoker will acquire this qualification.

England expects that every stoker will do his homework.

It would be a pity to encourage wastage of fuel, and wrong to deny that many stokers are skilled modern craftsmen, operating shiny modern machines. But, equally, some hospital steam stokers are not. Let us therefore consider—perfectly seriously, taking every word of his suggested ordeal from this closely written, 11-page long pamphlet—the case of Sam

* H.M. (56) (84553) W.T. 8067. 999. 8600. 12/56. DL/372.

Binks. Sam is 48 years old and most of his life has been spent in stoking. For eight years he has stoked the boilers at St. Sebastian's hospital, working conscientiously, respected by his boss, and proud to be a government employee. Being the man he is he will certainly join this new post-graduate course, if only to please the Minister for whom he has a great regard.

Sam is married and has three children. His house has three bedrooms and a parlour, and Sam usually sits in the kitchen, which he prefers. His daughter—Eth—is being courted by a promising young fellow named Ron, and every evening the young couple have the parlour to themselves. Once a week Sam and his wife go to the pictures, and once or twice Sam walks to the local. He left school thirty-four years ago with a rather sketchy knowledge of arithmetic. On the fingers of one hand you could count the books he has read in adult life. He is not a subscriber to *The Economist,* but he gets much pleasure on Sundays from the *News of the World.* When a letter has to be written he gets his wife to write it, and his own penmanship is confined to football pool entries. His daily round is not what intellectuals call a full, free and rich life; but then he is not an intellectual. On the other hand he is honest, happy and content with his lot. In fact, a very decent bloke.

That is Sam's life as it is lived today, and so it will go on until next July. After that things will be different. On July 1st his extra-mural course begins, and Sam's daily routine will be revolutionised. He will begin by interviewing his director of studies, who will give general instructions and provide him with notes to cover his homework during the first month. The notes will deal with the theory of heat (" sensible, latent and total "), and with the chemistry of fuels (" their proximate analysis and heating value "). They will explain the difference between the qualities of " saturated steam and superheated steam," and emphasise the " importance of dry steam." In a month's time, having mastered the notes and written the necessary essays, Sam will attend the stokers' class, at which his work will be corrected by his director of studies, and any difficulties (latent or total) will be ironed out. If he cuts a lecture his name will be reported to the authorities.

*

At home, Sam will have to reorganise his household. Ron and Eth must find somewhere else for their courting. The parlour (now his study) is henceforth reserved for Sam's prep. Mrs Sam will go to the pictures alone. The local will see Sam no more. After twenty weeks of intensive private study and tuition, Sam will sit for his preliminary exam. If he gets through that he will have his practical, and later on take his intermediate. He will attend for this first exam at a hospital examination centre, at which every precaution will be taken to prevent him cheating. He will, of course, be allowed " to use a slide rule and drawing instruments," but he will be watched to see that he does not make signs to a fellow-examinee.

Five feet will separate him from his neighbour, to make sure that he does not crib. Even if he manages to dodge the precautions it is quite likely that he will gain nothing, for a good many hospital stokers are illiterate in English. They come from distant parts of the Commonwealth and, naturally, they will have the papers translated for them, each man into his own tongue—Tamil, Greek or Maltese ; so Sam could look over their shoulders till his eyes popped without getting any illicit help from their answers. Sam's examination will last three hours, and he will not be allowed to leave the hall till one hour of the three is past. If he is obliged to leave the hall (as the rules prettily put it) " for any personal reason," he " must be accompanied by an Invigilator or a person authorised by an Invigilator."

In this matter we must face facts bravely and declare that Sam's chance of reaching the Intermediate are negligible. He might perhaps wangle a medical certificate from one of the consultants, and so get an aegrotat ; but that line is not very hopeful. Sam, however, is not a man to admit defeat. Failing in December, 1957, he will try again in June, 1958 ; December, 1958 ; June, 1959 ; December, 1959 ; and so on. His studies will become more and more intensive. He will grow pale and acquire a scholar's stoop. Perhaps he will weaken, collapse and die before his time. If so, there is an epitaph all ready for his tombstone:—

Fair Science frowned not on his humble birth
And Melancholy marks him for her own.

Alternatively, of course, Sam may leave the hospital service and go and stoke boilers somewhere else. But perhaps the Ministry of Health—which has just changed its political head—has not thought of that.

Importance of Journalists

Journalism has acquired a vast influence over society, and the controversies, involving the interests, moral and physical, of mankind, which formerly originated in colleges, were embodied in huge folios, and carried on by seraphic doctors, now begin and end, the writers being anonymous, in journals, which are like the all-encompassing sea, and literature, arts, and sciences run into them. Only as they cast these treasures on their surface are they perceived and appreciated. They are not merely great teachers, but they so fill space that they stop the avenues to all other teaching. Their plaudits stimulate, and their sneers or their censure repress, our actions. If formerly it were necessary that errors should not be propagated by great BOOKS and learned doctors, it must now be necessary that they should not be propagated by unlearned scribes in either large or small journals. Being subject to no other censorship than that of the public or of one another—and none other can be desired—it is a matter of duty in the public and in the journals to check error in journalism wherever it sprouts forth. For any one journal such a task would be an impossibility ; but all to some extent perform it, and so the controversies of journalists are the real and best correctives of their own many and very important errors.

Notes of the Week

Dulles Doctrine?

MR DULLES'S ever-open mouth is an easy target, even when he is not being pressed hard. Last week he was undergoing sharp cross-examination by senators who wanted his blood (the hearings on the Middle East are further discussed in American Survey on page 383) ; and his remark about American soldiers feeling happier if British and French troops were not at their side deserves to be read in its context. Senator Morse, the maverick, had demanded an assurance that Americans would not be expected to " go it alone " in defence of any Middle Eastern country while their allies stood idly by. The Secretary of State not unnaturally asked Mr Morse to consider what reception British or French soldiers might get in present circumstances ; and then, instead of closing his mouth, he put his foot in it. The State Department might have saved itself the trouble of trying to explain that Mr Dulles meant no offence. The damage was done.

The Secretary of State's characteristically unhappy choice of words was not, however, the real point of the episode. Indeed, his clumsiness and the inevitable violent reaction to it have together obscured the point, which is an important one. Behind the Aunt Sally is the man, and behind the man the mood. The American Administration has no intention of presenting itself to the Asian-Arab world as the partner of Britain and France, except in the defined spheres of the North Atlantic and South East Asia defence treaties. It is keenly aware of the massive effort that the communist propaganda machine has been making to depict America as the real prime mover behind Anglo-French actions in the Arab world. In the event of a full-scale Soviet onslaught on the Middle East, these considerations would be swept aside. But at present the task which Mr Dulles has set himself is to check the spread of communist influences ; and, undeterred by congressional banderilleros, he has held to his entirely understandable thesis that, while a pledge of American support may stiffen some Arab backs, an offer of tripartite western backing would now get a cold shoulder. Bitterly as British ministers and back-benchers may resent this attitude, it is important that they should see it clearly for what it is, and not delude themselves into thinking that it is all just a slip of Mr Dulles's tongue.

The Big Bang
